Pedro Castro, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Recent advances in molecular biology have led to a better understanding of the types and subtypes of these tumors based on the 2021 World Health Organization of central nervous system tumors. The study aims to: To illustrate that the molecular analysis of Central Nervous System (CNS) embryonal tumors is critical for accurate diagnosis, risk stratification, and targeted therapy. To show that molecular analysis can help identify specific genetic alterations and biomarkers that can provide valuable information for managing these tumors.

#### TABLE OF CONTENTS/OUTLINE

1. Revision of epidemiology, pathology, and demographics of CNS embryonal tumors.
2. Imaging features in CNS embryonal tumors.
3. Most recent updates on CNS embryonal tumors molecular alterations, including WNT-activated medulloblastoma, sonic hedgehog (SHH) activated, and non-WNT/non-SHH medulloblastomas.
4. Recent advances in molecular biology have led to identifying specific genetic alterations and biomarkers in non-medulloblastoma embryonal tumors, including teratoid/rhabdoid tumors (AT/RTs), embryonal tumors with multilayered rosettes (ETMRs), CNS Neuroblastoma, FOXR2-Activated, CNS Tumor with BCOR Internal Tandem Duplication, Cribriform Neuroepithelial Tumor.
5. Specific genetic mutations, amplifications, or deletions associated with tumor progression, recurrence, and response to therapy, including C19MC, DCER 1, FOXR2, BCOR-ITD, SMARCB1, SMARCB4, AT/RT (TYR), AT/RT (SHH), AT/RT (MYC).
6. Imaging strategies to depict the correct diagnosis based on the genetic profile.
7. Flowchart of the changes and last updates based on the neoplastic molecular profile.
8. Take-home messages.

### Neurogenetics and Imaging of Motor Neuron Disease

#### Participants

Maxwell Wright, BS, Mechanicsburg, PA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1.To discuss the classification and pathogenesis of motor neuron disease (MND). 2.To highlight the neurogenetics, imaging findings, and diagnostic pearls for the specific diagnosis of various upper and lower MNDs.

#### TABLE OF CONTENTS/OUTLINE

We retrospectively reviewed 113 patients from our PACS system with clinical and Imaging findings correlating with motor neuron disease (MND). All the patients underwent routine MRIs of the brain and spine. Almost 100% of these patients had CSF examinations, while genetic studies were available in 49% of the patients. All studies were read by two neuroradiologists. Imaging findings were correlated with the clinical examination, CSF, and biochemical results, which were further correlated with the genetic studies when available. For easy understanding, this exhibit is classified under the following categories: 1. Upper MND: Primary lateral sclerosis (PLS), Hereditary Spastic Paraparesis (HSP), Pseudobulbar Palsy 2. Lower MND: a) Chronic onset: Inherited- Spinal Muscular Atrophy (SMA), Progressive Muscular Atrophy (PMA), Distal hereditary motor neuropathy; Acquired- Upper limb dominance (Flail Arm, Hirayama, Segmental MND) Lower limb dominance (PMA, Monomelic Amyotrophy) b) Acute onset: Guillain Barre Syndrome, Polio; and 3. Combination of UMN and LMN: Amyotrophic lateral sclerosis (ALS). Conclusion: 1. Neurogenetics and neuroimaging complement each other in clinching the specific diagnosis of MND. 2. We discuss the neurogenetics, pathogenesis, and imaging appearance of the MND in this exhibit.

### Imaging Spectrum of Cystic Spinal Lesions

#### TEACHING POINTS

- To illustrate the compartmental spinal anatomy.
- To discuss the key imaging findings of cystic spinal lesions and their mimics.
- To demonstrate the utility of multimodality imaging in the differential diagnosis of cystic spinal lesions.

#### TABLE OF CONTENTS/OUTLINE

A wide variety of benign and malignant cystic lesions can involve the different compartments of the spine. Although an exact diagnosis may be challenging, different imaging characteristics are used in order to narrow the differential diagnosis and/or establish the exact diagnosis. In addition, spinal cysts can be divided into: intramedullary, intradural extramedullary, or extradural, depending on their location, which is only useful in planning treatment. Magnetic resonance imaging (MRI) is the imaging method of choice to identify and characterize spinal cysts, and ultrasound (US) is often used as the initial imaging modality in pediatric patients. Instead, CT is helpful for evaluating cystic lesions of the vertebral column. In this exhibit, we will review the multimodal imaging features of the most common cystic spinal lesions based on their etiology, including neoplastic, congenital, degenerative, infectious, post-traumatic, and postsurgical disorders. We will also review the main differential diagnoses that should be considered.

### **Pediatric Neurometabolic Diseases: A Pictorial Review of How the Radiologist can Approach Hypomyelinating and Dysmyelinating Disorders**

#### **TEACHING POINTS**

1: Pediatric Neurological metabolic diseases are a group of disorders affecting the brain, mostly related with a specific enzyme deficiency. 2: These disorders traditionally affect the white matter but can also affect the gray matter (both cortex and basal ganglia). 3: Pattern of white matter disease is one of the most helpful clues in the characterizing these conditions on imaging. 4: Pathologically, these disorders can be classified as hypomyelinating (with mild signal changes, with T2 hyperintensity and T1 hypo to isointensity) or other white matter diseases (pronounced T2 hyperintensity and T1 hypointensity) 5: Hypomyelinating disorders can be differentiated based on peripheral neural compromise or not. 5: Other white matter diseases (dysmyelinating) can be characterized based on the pattern of white matter disease (confluent vs multifocal). 6: Confluent white matter disease has an extensive differential, and it is critical to depict where changes are visualized (diffuse, frontal, parieto-occipital, posterior fossa, periventricular or subcortical).

#### **TABLE OF CONTENTS/OUTLINE**

1: Hypomyelinating disorders (T1 hypointensity and T2 hyperintensity). 1.1: Without typical PNS involvement: Pelizaeus Merzbacher Disease- 1.2: With typical PNS involvement: Cockayne disease2: Other white matter diseases (mild T1 hypo or isointensity and T2 mild hyperintensity). 2.1: Confluent. 2.1.1: Frontal: Infantile Neuroaxonal Dystrophy. 2.1.2: Parieto-occipital: X-Linked adrenoleukodystrophy. 2.1.3: Posterior Fossa: Leigh syndrome. 2.1.4: Periventricular: Krabbe Disease. 2.1.5: Subcortical: Kearns Sayre Syndrome. 2.2: Multifocal: Hydroxy glutaric Aciduria.

### Imaging Approach and Review of Arteriovenous Orbital Fistulae

#### TEACHING POINTS

Reinforce the knowledge and correct identification of the vascular structures involved in the orbital-venous arterial fistula. List the imaging findings through contrasted tomography and contrasted MRI, to identify the main aspects to highlight in the diagnosis of orbital arteriovenous fistula. Complications of orbital arteriovenous fistula. Management and prognosis of patients with orbital arteriovenous fistula.

#### TABLE OF CONTENTS/OUTLINE

Definition, Diagnosis and image findings, Clinical findings, Treatment. Arteriovenous orbital fistulae is a rare condition that occurs when an abnormal connection forms between an artery and a vein within the orbit; This causes blood to flow directly from the arterial system to the venous system, bypassing the capillary network. As a result, there is a high-pressure gradient in the venous system, leading to congestion and dilation of the veins. Arteriovenous orbital fistulae can be congenital or acquired. The most common cause of acquired arteriovenous orbital fistulae is trauma, such as a blunt or penetrating injury. Symptoms of arteriovenous orbital fistulae include bulging of the eye, proptosis, diplopia, visual disturbance, and in severe cases, loss of vision or even blindness. Diagnosis of arteriovenous orbital fistulae involves a thorough medical history and physical examination, including imaging studies such as ANGIO CT or enhanced MRI. Treatment options depend on the severity of the condition and may include observation, embolization or surgical removal of the abnormal vessels.

### Intradural Spinal Lesions: A Review of Common and Rare Pathologies

#### Participants

Sultan Yahya, MD, Hamilton, ON (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Review normal spinal anatomy and compartments- Approach to intradural spinal pathologies, and distinguishing intra and extramedullary pathologies- Review common and rare intra-medullary neoplasms, including ependymomas, subependymomas, astrocytomas, metastasis, hemangioblastomas and spinal involvement in diffuse leptomeningeal glioneuronal tumors. - Discuss medullary neoplastic mimics, including demyelinating/inflammatory abnormalities, infarctions, and arteriovenous malformations. - Review common and rare extramedullary neoplasms including meningiomas, schwannomas, metastasis, angioliipomas, mature cystic teratomas, paragangliomas, dermoids/epidermoid/lipomas and neuroenteric cysts.

#### TABLE OF CONTENTS/OUTLINE

- Spinal compartmental anatomy- Approach to intradural pathologies- Intramedullary abnormalities: tumors, differentials of medullary signal abnormalities and neoplastic mimics- Extramedullary lesions: common / rare tumoral entities and cystic lesions

Printed on: 04/12/24

### Cortically-Based Brain Tumors: Who is Who

#### Participants

Irene Diaz, MD, Bilbao, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Cortically-based brain tumors have some features in common. They usually clinically manifest as epilepsy refractory to anti-epileptic drugs and most frequently affect children and young adults. We can also talk about long-term epilepsy-associated tumors (LEAT), and they are usually low-grade tumors. Radiologically, they may be difficult to differentiate, but there are some imaging diagnostic clues that will help us find the correct diagnosis.

#### TABLE OF CONTENTS/OUTLINE

An image-based quiz will lead the review of different cases of cortically-based brain tumors, with its differential diagnostic clues at imaging. Most of our patients were young adults and clinically presented with focal epilepsy. We are mainly showing low-grade tumors, such as dysembryoplastic neuroepithelial tumor (DNET), ganglioglioma, pleomorphic xanthoastrocytoma, oligodendroglioma, multinodular and vacuolating neuronal tumor (MVNT) or polymorphous low-grade neuroepithelial tumor of the young (PLNTY).

### Cerebellar Ataxia: Differential Diagnosis Based on Common Imaging Patterns

#### TEACHING POINTS

- Ataxia is a physical finding characterized by impaired coordination of voluntary muscle movement, resulting in disequilibrium, vertigo and gait ataxia. - Ataxia can be caused by either impaired vestibular input to the cerebellum or by cerebellum dysfunction itself. - Brain MRI, the imaging modality of choice, has a key role in differentiating the many causes of ataxia. - Ataxia may present with different cerebellum findings: normal, hypoplastic and atrophic morphology. - Regarding clinical findings, ataxia may be further classified as acute / subacute or chronic; traumatic; autoimmune; paraneoplastic or genetic. - Combining imaging and clinical features, differential diagnosis is made.

#### TABLE OF CONTENTS/OUTLINE

- Defining ataxia. - Clinical findings that are relevant for the diagnosis based on MRI. - Differentiating normal vs hypoplastic vs atrophic cerebellum.- Further exemplifying findings in atrophic cerebellum that lead towards specific diagnosis (e.g.: superficial siderosis, basal ganglia abnormalities, white matter abnormalities). - Further exemplifying findings in hypoplastic cerebellum that lead towards specific diagnosis (e.g.: unilateral hypoplasia, posterior fossa malformations, hemorrhage). - Flowchart to the approach of cerebellar ataxia.

### Interstitial Fluidopathy: A Concept for Understanding CNS Diseases with Impaired Interstitial Fluid Dynamics

#### Participants

Toshiaki Taoka, MD, PhD, , Japan (*Presenter*) Research Grant, Canon Medical Systems Corporation

#### TEACHING POINTS

This educational presentation proposes a new concept called "Central Nervous System (CNS) Interstitial Fluidopathy," which encompasses diseases whose pathologies are associated with abnormal interstitial fluid dynamics. The glymphatic system hypothesis proposes that cerebrospinal fluid and interstitial fluid in the brain constitute a mass transport system, including waste clearance. Impairment of these functions results in protein leakage into the interstitium and impaired efflux of waste products, leading to the accumulation of waste products, tissue dysfunction, and conditions such as neuroinflammation. The term "CNS interstitial fluidopathy" describes diseases or conditions in which abnormalities in interstitial fluid dynamics are one of the significant factors in the pathological process. Various diseases, including Alzheimer's disease, Parkinson's disease, traumatic brain injury, multiple sclerosis, and small vessel diseases, develop due to abnormalities in the interstitial fluid dynamics. By categorizing these diseases as CNS interstitial fluidopathies, we can improve our understanding of their disease mechanisms, develop potential imaging methods, clinical methods, and common treatment methods or drugs. The dynamics of interstitial fluid are critical for understanding CNS diseases or disorders, and the proposed concept may promote advancements in disease treatment or prevention.

#### TABLE OF CONTENTS/OUTLINE

1. An overview of the dynamics of cerebrospinal fluid and interstitial fluid in the CNS.
2. The waste clearance system in the CNS.
3. Pathologies associated with abnormal interstitial fluid dynamics.
4. A summary of the concept of interstitial fluidopathy.

### A Night in the ER: Diagnostic Errors in Emergency Neuroradiology

#### Participants

George Vilanilam, MBBS, Little Rock, AR (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Introduction: Diagnostic errors in emergency neuroradiology are a major contributor to unnecessary healthcare costs and have been implicated in preventable deaths in the US. Errors are broadly categorized into perceptive and interpretive errors. The most common erroneous studies are CT head (32%), CT cervical spine (18%), and CTA head and neck (24%). Specific teaching points 1) Defining and understanding common sources of diagnostic errors in emergency neuroradiology. 2) Providing examples of common cognitive biases and perceptual errors. 3) Discussing methods to mitigate diagnostic errors in emergency neuroradiology.

#### TABLE OF CONTENTS/OUTLINE

Common cognitive biases/interpretive errors 1) Truncation of the search and analytical thought processes (premature closure, satisfaction of search, and satisfaction of report). 2) Affirming initial diagnosis (anchoring bias and attribution bias). 3) Recency (availability and non-availability bias). 4) Outcome-related bias (regret bias/defensive reporting, outcome bias). 5) Biases stemming from clinical parameters (framing bias, attribution bias). 6) Retrospective biases (hindsight bias, self-serving bias). Perceptual errors 1) Related to viewing technique (inappropriate windowing and fogging phenomenon). 2) Related to the finding itself (edge of film, first or last slice, bilateral or diffuse findings, subtle or poorly conspicuous). Recommendations to reduce diagnostic and reporting errors

### Nervous System MR Elastography: Current Update

#### Participants

Safa Hoodeshenas, MD, Rochester, MN (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1) How MR elastography of the nervous system is performed; From the generation of the shear waves to obtain qualitative and quantitative parameters  
2) What MRE can tell us about neural tissue biomechanical properties in physiologic and pathologic conditions

#### TABLE OF CONTENTS/OUTLINE

1) Principles of MR elastography technique in the nervous system  
2) Qualitative and quantitative obtained parameters  
3) Role of artificial intelligence in MRE  
4) Slip interface imaging  
5) MRE in neurodegenerative disease (Alzheimer's disease, Frontotemporal dementia, Lewy body dementia, Normal pressure hydrocephalus)  
6) MRE in characterizing and treatment planning of intracranial tumors (tumor subtype and grade, consistency, adhesion to surrounding tissue)  
7) MRE in traumatic brain injury  
8) MRE in neuroinflammatory disorders  
9) Functional MRE  
10) Pediatric nervous system MRE

### I Only See White Spots: Understanding the Clinical and Radiological Features of CNS Demyelination

#### Participants

Miguel Barrio Piqueras I, MD, Pamplona, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To describe the most typical imaging characteristics of secondary demyelinating processes. To know the basic notions in relation with epidemiology, clinical presentation, pathology, possibility of spinal cord involvement and differential diagnosis. To be able to assist the diagnosis of each etiological group in order to provide better and faster management, taking into account the severity of the findings and prediction of outcome.

#### TABLE OF CONTENTS/OUTLINE

1. Autoimmune a. Multiple sclerosisb. Baló (example of tumefactive autoimmune lesions)c. Devic (optic neuromyelitis)2. Infectiousa. HIV encephalopathyb. PML (progressive multifocal leukoencephalopathy)c. Subacute sclerosing encephalomyelitis3. Vasculara. Binswanger (subcortical arterioesclerotic encephalopathy)b. CADASIL (Cerebral autosomal dominant arteriopathy with subcortical infarcts and leukoencephalopathy)c. Post-anoxicd. PRES (posterior reversible encephalopathy)4. Toxic-metabolica. Osmotic demyelinationb. Toxic leukoencephalopathyc. CLOCC (cytotoxic lesions of the corpus callosum)5. Traumatica. Diffuse axonal injury

### Facets of a "Heavy Brain": Exploring Patterns of Iron Metabolism Disturbances

#### TEACHING POINTS

Iron accumulation in the brain is common in several neurodegenerative disorders and normal aging. It likely contributes to the pathophysiology of neurodegenerative changes in these conditions by inducing oxidative stress, inflammation, and cell death. The patterns of iron deposits in the central nervous system vary between different conditions, both at the macroscopic and microscopic level. The role of iron in the pathogenesis and response to iron chelation therapy varies between individual disorders.

#### TABLE OF CONTENTS/OUTLINE

This review summarizes the whole brain, cellular, and subcellular patterns of iron accumulation in neurodegenerative diseases of genetic and sporadic origin, and also other associations as an neuroinfections. We also provide an update on mechanisms, biomarkers, and effects of brain iron accumulation in these disorders, focusing on recent publications. This pictorial review will also show how we can systematize the role of iron in brain and provide a practical guide to identify the main pathologies.

### Beyond the Basic: Advanced MRI Techniques in Neuroimaging

#### Participants

Marina Da Cruz, Fernandopolis, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Advanced magnetic resonance imaging (MRI) techniques allow expanding the range of diagnostic tools with the potential to assess functional parameters in neuroimaging, complementary to traditional sequences, that can and should be used by radiologists to aid in the differential diagnosis. The purposes of this submission are: - To review advanced MRI techniques in neuroimaging, such as spectroscopy, perfusion weighted imaging, tractography, nigrosome and neuromelanine avaiation and vessel wall study; - To expose the main indications of each method; - To discuss possible imaging features in some groups of pathologies;

#### TABLE OF CONTENTS/OUTLINE

1. Review technique and indications of spectroscopy;2. Technique and indications of perfusion weighted imaging;3. Discuss technique, indications and basic interpretation of tractography;4. Assessment of nigrosome and neuromelanine;5. Discuss technique, indications and basic interpretation of vessel wall study;

### **Progressive Multifocal Leukoencephalopathy (PML): A Thorough Overview from Traditional to Contemporary Findings, Including Inflammatory Subtype, IRIS, Drug-associated, and Asymptomatic Cases**

#### **TEACHING POINTS**

1: Discuss PML imaging findings from classical observations to the latest insights. Explain the progression of lesions, taking into account the pathological findings. 2: Contrast-enhanced PML lesions are extremely important in clinical management, and discussing their significance in imaging findings is essential. 3: Address the key points of imaging findings for recently discussed drug-related PML and asymptomatic PML.

#### **TABLE OF CONTENTS/OUTLINE**

1: About progressive multifocal leukoencephalopathy (PML) 1-1: Classification of JCV diseases of the Brain! 2: PML progresses through the following 3 steps, reflecting pathological findings 2-1: First step: "Initiation" as a small demyelinating lesion 2-2: Second step: "Expansion" and "Extension" of demyelinating lesions 2-3: Third step: "Fusion" of demyelinating lesions, resulting in axonal destruction! 3: Interpretation of contrast enhancement in PML lesions! 4: New MRI findings related to PML 4-1: low signal intensity on T2\*WI and SWI in U-fibers and deep gray matter adjacent to the lesions 4-2: hyperintense cortical sign (HCS) on T1WI! 5: Drug-associated PML 5-1: natalizumab-associated PML 5-2: punctate lesions

### Neurological Emergencies in Oncologic Patients: Understanding the Importance of Early Imaging Evaluation

#### Participants

THARYN Goncalves FRANCO DE GODOY, Sao PAULO, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Neurological emergencies are common and life-threatening conditions, particularly in oncologic patients who are at higher risk due to factors, including immunosuppression, coagulopathy, and treatments such as chemotherapy and radiation therapy. Due to their compromised status, early diagnosis can be challenging, and imaging exams are often required for proper evaluation. Radiologists, especially those working in cancer centers, must be familiar with these emergencies to ensure prompt treatment and reduce morbidity and mortality. Our aim is to review the neurologic emergencies to oncologic patients dividing them into pre and post-treatment, including early and late complications. To increment the discussion, risk factors, clinical presentation, imaging findings and treatment will be in illustrative cases.

#### TABLE OF CONTENTS/OUTLINE

Introduction: review neurologic emergencies to oncologic patients. To divide the emergencies in two groups: related to cancer itself or its treatment (early and late complications), through a visual flowchart. To discuss, for each condition risk factors, clinical presentation, imaging findings and treatment. Following conditions: Pre-treatment: intracranial hypertension, vasogenic edema, herniations, spinal cord compression, paraneoplastic syndromes, ischemic and hemorrhagic stroke, venous sinus thrombosis. Post-treatment: radiation-induced vasogenic edema and leukoencephalopathy, infections, hemorrhages, radiation necrosis, SMART syndrome, radiation vasculopathy, encephalopathy, PRES, opportunistic infections. To highlight the particular aspects to oncologic patients, discussing the clinical and imaging for early diagnosis and treatment.

### Beyond the Lumen: Unraveling the Vessel Wall Technique

#### Participants

Maria Laura Piassa, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- A method that is here to stay, the vessel wall study, aims to evaluate the vascular wall and characterize the pathologies that compromise it, whether inflammatory, dissection, or atheromatous plaques.- It is a study that requires a high spatial resolution, with homogeneous signal suppression of the intravascular lumen, 2D or 3D multiplanar acquisitions, allowing several acquisitions.- In the evaluation of atherosclerotic diseases, VW-MRI demonstrates parietal thickening that eccentrically involves the circumference of the arterial wall, showing different characteristics on T1 and T2 sequences, depending on its internal content. Active/unstable plaques present a thin fibrous cap, large lipid core, presence of hemorrhage, contrast uptake and vascular remodeling.- Other differential diagnoses of intracranial luminal stenosis would be dissection, vasculitis (primary or secondary), reversible vasoconstriction and Moya-moya. VW-MRI is also used in the evaluation of aneurysms.- Pitfalls are points that deserve full attention, highlighting low flow, in which incomplete suppression can mimic wall thickening and vasa vasorum, mimicking vasculitis.

#### TABLE OF CONTENTS/OUTLINE

- Raise the importance of the VW-RM, including its techniques and applications.- Assess atherosclerotic disease and its differential diagnoses more precisely, stratifying individual risks, with potential influence on treatment decisions.

### Help When You're Feeling Low: Intracranial Hypotension and Algorithms for Diagnosis

#### Participants

Rahim Ismail, MD, Rochester, NY (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Familiarize radiologists with the pathology and pathophysiology of spinal CSF leaks resulting in spontaneous intracranial hypotension (SIH).2. Localization of the culprit spinal CSF leak in SIH patients can be difficult. At our institution we use a combination of brain and spinal MRI to guide the type of myelographic imaging and patient positioning for the myelogram to help localize the CSF leak.3. Role of dynamic CT myelogram (DCM) and digital subtraction myelogram (DSM) in patients demonstrating a spinal longitudinally extensive collection (SLEC) on spinal MRI4. Role of lateral decubitus DSM in patients with SLEC negative MRI in evaluating for a CSF venous fistula (CVF) or distal tears of the nerve root sleeve.5. Role of DSM for precise localization in patients with suspected fast flow CSF leaks, such as dural tears from sharp osteophytes .6. Role of DCM in patients with suspected CSF leaks from proximal nerve root sleeve tears/perineural cysts.7. Describe our institutional protocols for performing DCM and DSM including tips for optimizing timing and provocative assessments.

#### TABLE OF CONTENTS/OUTLINE

The following illustrative examples will be shown:1. Pathology: Different etiologies of spinal CSF leaks will be shown including:a. Microspurs b. perineural cysts c. CSF venous fistula (CVF) d. distal dural tears.2. We will describe our institutional algorithm for the work up of these complex subsets of patients.

### Connecting the Dots: A Step-by-Step Guide of Brain Myelination

#### Participants

Afonso Santos, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The purposes of this exhibit are: To review the normal appearance of myelination on imaging studies To define a step-by-step analysis algorithm to facilitate the assessment of myelination To display a compendium of cases involving myelination disorders

#### TABLE OF CONTENTS/OUTLINE

Myelin is a vital component of the nervous system, serving as an insulator for neurons and found in both the central and peripheral nervous systems. It not only insulates but also speeds up action potentials by 10-100 times that of an unmyelinated axon. Moreover, it regulates ion composition and fluid volume around the axon, which is crucial for maintaining its health and integrity. MRI is the best noninvasive way to assess myelin and myelination in the pediatric brain. Mature myelin usually appears hyperintense to the gray matter cortex on T1 and hypointense to the gray matter cortex on T2. The process of myelination starts during fetal development with the cranial nerves, which are essential for our survival, and continues throughout life. As myelination progresses, it generally follows a pattern of development from bottom to top (caudocranial), back to front (posterior to anterior), and central to peripheral (deep to superficial). In conclusion, myelin is a vital component of the nervous system and plays a critical role in proper functioning. Understanding the process of myelination and the appearance of mature myelin on imaging is essential for the evaluation of many neurological conditions.

### **Nigrosome 1: Anatomy, Variants and Pathologies**

#### **Participants**

Danielly Santos SR, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

The purpose of this exhibit is to help the readers to determine the presence or absence of an abnormality in the N1 and establish diagnostic reasoning in cases of parkinsonism. The objectives of this electronic exhibit are:- to revisit the anatomical definition of the N1 region using schematic illustrations and imaging MRI;- to illustrate the anatomical variants of the N1;- to exhibit parkinsonism diagnostic algorithm;- provide imaging findings of various patients who presented with parkinsonism.

#### **TABLE OF CONTENTS/OUTLINE**

Parkinson's disease is a clinically heterogeneous chronic progressive neurodegenerative disease with loss of dopaminergic neurons in Nigrosome 1 (N1). Nigrosomes are small clusters of dopaminergic cells within the substance nigra. Five nigrosomes have been described with the largest labeled as N1, located in the posterior third of the substantia nigra. The N1 is the key structure in the midbrain that is very important in movement disorders, particularly those associated with parkinsonism. Interpreting the N1 sign can be difficult because it can take many forms but the high-resolution data and clear characterization of the N1 appearance help to make that decision easier.

### Stroke of Luck: Imaging of Hyperacute Stroke and Selecting Patients Effectively

#### TEACHING POINTS

? Stroke management was revolutionized recently by the proven benefit of intervention with a larger time window on selected patients ? Time is brain: CT perfusion helps identifying salvageable brain tissue ? Radiologists play a crucial role on helping the multidisciplinary team select patients who will benefit from intervention based on imaging criteria ? Perfusion studies should be routinely assessed to avoid misinterpretation and excluding patients from therapy

#### TABLE OF CONTENTS/OUTLINE

Introduction Over the past few years, after publication of the results of the DEFUSE 3, EXTEND and DAWN trials, stroke management has been revolutionized. These studies proved the benefit from intervention with a larger time window based on certain perfusion imaging criteria. This educational exhibit's goal is to review the role of conventional and advanced imaging on hyperacute stroke, ending with a proposed interpretation algorithm for selecting patients effectively. Current treatment options and inclusion criteria Imaging of hyperacute stroke ? Acquisition protocols ? CT ? MR ? Perfusion CT/MR ? ASPECTS ? AI (Rapid, Brainomix) ? Assessing study's quality ? Pitfalls ? Proposed interpretation algorithm

### Headache, Dizziness, and Leaks. May the Balance be with You. A Pictorial Review of Intracranial Hypo and Hypertension

#### Participants

Fernanda Avalos, MD, Quito, Ecuador (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Cerebrospinal fluid (CSF) homeostasis is essential to maintain normal intracranial pressure. Even a small imbalance in CSF production, absorption, or flow can lead to altered intracranial pressure. Imaging in increased intracranial pressure (ICP): Although there are no specific imaging findings of idiopathic intracranial hypertension, enlarged arachnoid outpouchings such as an empty sella, enlarged Meckel's cave, or signs in the optic nerve such as vertical tortuosity or flattening of the posterior sclera should raise suspicion, as these signs have been identified in 23-80% of patients. ICP may be due to secondary causes such as disturbances in CSF production and absorption or obstructive hydrocephalus that can result from lesions such as intracranial masses. Imaging in intracranial hypotension: the major radiological features can be summarized with the acronym SPACE (Sagging of the brain, Pituitary enlargement, Angles, Collections, and Enhancement of the pachymeninges). Dural membrane leaks contribute to the majority of causes of intracranial hypotension. Therefore, understanding the imaging methods and findings can guide definitive treatment and improve patient outcomes.

#### TABLE OF CONTENTS/OUTLINE

1. Understand the physiological mechanism of CSF in the central nervous system.
2. Describe the common symptoms of intracranial hypo- and hypertension, and recall clinical findings during neurological examination.
3. Radiological findings of intracranial hypertension with differential diagnosis.
4. Radiological and clinical evolution of a patient with intracranial hypotension, from the first study with unspecified headache, through spinal leak diagnosis, to control after treatment

### **Meningiomas - Do You Know Their Presentations: Brief Pictorial Review of Intracranial Meningiomas Presentations and Their Radiological Findings. Our Image Experience**

#### **TEACHING POINTS**

Remember the definition of meningiomas and its most relevant epidemiological data. Review the current classification of intracranial meningiomas according to the World Health Organization (WHO) and their different imaging characteristics. Overhaul a brief pictorial review with exemplified cases of typical and atypical meningiomas from our institute.

#### **TABLE OF CONTENTS/OUTLINE**

Meningiomas are the most common nonglial primary tumors of the Central Nervous System and the most common extraaxial neoplasms. They may originate in unexpected locations such as the orbit, paranasal sinus, or ventricles or be entirely intraosseous (within the calvaria). The radiologist must be aware of their less frequent and uncharacteristic the imaging features in order to suggest the right diagnoses in cases that are atypical. The present educational exhibit intends to make a brief pictorial review of the main presentations of intracranial meningiomas, their current classification and imaging characteristics, and exemplify them with cases of patients from our institute.

### Don't be Afraid of Neuroimaging Epilepsy: A Case-based Review of a Myriad of Etiologies and Findings

#### TEACHING POINTS

Epilepsy is seen as a clinical manifestation due to excessive or synchronous abnormal neuronal activity in the brain, defined as recurrent, unprovoked seizures. The prevalence is high, and patients have an increased risk of premature death, injuries, psychosocial dysfunction, and reduced quality of life. The etiologies encompass multiple causes. Neuroimaging studies (particularly magnetic resonance imaging) are essential in evaluating epilepsy, mainly in cases refractory to pharmacotherapy, once the location of the epileptogenic focus is a turning point in a successful neurosurgery approach. The purpose of this exhibit is to present, through illustrative cases, a practical approach to imaging findings within multiple epilepsy etiologies.

#### TABLE OF CONTENTS/OUTLINE

Education Exhibit Presentation ? Introduction. ? Clinical and epidemiological aspects. ? A case-based review of original cases from the neuroradiology department of a tertiary hospital showing imaging features of a range of etiological substrates of epilepsy (from the common ones to the rarest), always through the perspective and purpose of a practical approach. Key and ancillary imaging features will be highlighted in each case. ? Take-home messages ? References.

### Maxillo-mandibular Lesions: Gnawing Through the Differentials

#### Participants

Gillean Cortes, DO, Orange, CA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To provide an overview and differential diagnosis for maxillo-mandibular lesions encountered during imaging of the head and neck.
2. To present the multimodal radiologic features with case-based review of maxillo-mandibular lesions.
3. To highlight the approach of maxillo-mandibular lesions including diagnosis and management.

#### TABLE OF CONTENTS/OUTLINE

Maxillo-mandibular lesions are commonly encountered and usually incidental during head and neck imaging. There is a broad spectrum of lesions, which may be of odontogenic and non-odontogenic origin and can be further classified by cystic, solid, infectious/inflammatory, benign, and malignant processes. Patient characteristics and location of the lesion may be helpful; however, without pathognomonic imaging features, tissue sampling is frequently required. Several key cases presented at our institution will be reviewed such as: periapical cyst, dentigerous cyst, odontogenic keratocyst, non-odontogenic developmental cystic lesions, aneurysmal bone cyst, ameloblastoma, fibrous dysplasia, osteosclerosis, condensing osteitis, cementoblastoma, ossifying fibroma, osteomyelitis, odontogenic carcinoma, invasive squamous cell carcinoma, and osteoradionecrosis. Accurate diagnosis is essential to prevent further complications, as otherwise treatable lesions with destructive potential may be missed.

### Looking Back: Everything You Need to Know on Infratentorial Malformations

#### Participants

Taisa Guarilha, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The purpose of this exhibit is:- To review normal anatomy of the posterior fossa- To explain in a simplified way normal embryology and the modifications that result in these malformations- To demonstrate how infratentorial malformations can present themselves- Exemplify with cases- Present a flow chart

#### TABLE OF CONTENTS/OUTLINE

1. Normal anatomy  
2. Embryology: - Normal- Malformations  
3. Cases:  
3.a. Cystic malformations: Dandy-Walker continuum, Blake Pouch, Cyst, Mega Cisterna Magna, Arachnoid cyst  
3.b. Non-cystic malformations:-  
- Predominant cerebellar involvement:- Rhombencephalosynapsis- Macrocerebellum- Microcerebellum- Cerebellar Hypoplasia - bilateral, unilateral - Cortical cerebellar malformation- Cobblestone-  
- Predominant brainstem involvement:- Pontine tegmental cap dysplasia- Horizontal gaze palsy with progressive scoliosis- Möbius Syndrome-  
- Predominant cerebellar and brainstem involvement:- Molar tooth malformations - including Joubert Syndrome- Pontocerebellar hypoplasia- Walker-Walburg- Lhermitte-Duclos syndrome - Craniocervical junction: Chiari spectrum  
3.c. Others- Masiner-Santino Syndrome- Quadrigeminal cistern lipoma  
4. Flowchart  
5. Take home messages

Printed on: 04/12/24

### **No More Conflict: Imaging of Neurovascular Compression Syndromes, Related Anatomy and Surgical Approach**

#### **TEACHING POINTS**

Neurovascular compression (or conflict) is one of the causes that must be considered in patients presenting with cranial nerve related symptoms. MR imaging is key to rule out differential diagnosis. Knowing the involved anatomy is fundamental to identify possible sites of compression. Communication with the surgeon plays a major role and the reports must include necessary information to surgical planning.

#### **TABLE OF CONTENTS/OUTLINE**

Neurovascular conflict syndromes (NVCS) consist of symptoms related to compression of the V, VII, VIII or XII cranial nerves by vascular structures, usually at the transition zone near the nerve root entry zone. When indicated microsurgical decompression can be done. Trigeminal Nerve NVCS of the V CN usually presents as trigeminal neuralgia and is caused by compression at its REZ at the level of the pons by an elongated superior cerebellar or anterior inferior cerebellar arteries. Facial and Vestibulocochlear Nerves Facial hemispasm (VII CN) / vertigo and tinnitus (VIII CN) may come from compression at the inferior pons level by the AICA. Glossopharyngeal Nerve IX CN compression at its REZ on the upper medulla by the PICA may cause glossopharyngeal neuralgia.

NREE-33

### Emergency Neuroradiology Misses: Case Examples and Lessons Learned

#### TEACHING POINTS

Diagnostic errors are the 3rd leading cause of death in the United States. In diagnostic radiology, the rate of errors increases significantly in the emergency setting, this is particularly critical in neuroradiology, where misinterpretation or misidentification may significantly delay treatment and adversely impact patient outcome. In this educational exhibit, readers will be able to: Recognize the two types of thought processing in human decision making, Recognize common diagnostic errors and underlying cognitive biases in image interpretation, See examples of real life missed/misinterpreted cases in emergency neuroradiology and Understand different approaches to reduce diagnostic errors.

#### TABLE OF CONTENTS/OUTLINE

1. Background of diagnostic errors in radiology (statistics and common misses in emergency neuroradiology). 2. Type 1 and Type 2 Processing in Clinical Decision Making (heuristic vs analytical approaches). 3. Different Types of Errors During Image Interpretation (cognitive/interpretive biases, perceptual errors). 4. Sample cases to illustrate different types of misses in emergency neuroradiology (perceptual errors - blind spot; cognitive error/lack of knowledge; perceptive error - satisfaction of search; inadequate history). 5. How do we reduce diagnostic errors (strategies from the literature and our institution will be provided such as non-random peer review, double reading, interdisciplinary rounds and tumor boards, reducing interruptions, computer-aided decision making support system)

### Teratomas of the Brain, Head and Neck, and Spine: Imaging Appearances

#### TEACHING POINTS

- Illustrate the different imaging appearances of teratomas in the brain, head and neck, and spine.
- Discuss their locations and associated complications.
- Understand the usefulness of CT and MRI in the diagnosis and characterization of teratomas.

#### TABLE OF CONTENTS/OUTLINE

Intracranial and spine teratomas, as well as those in the head and neck, are rare tumors that originate from all three embryonic germ layers (ectoderm, mesoderm, endoderm). They can be classified depending on their differentiation as mature, immature, and teratoma with malignant transformation. Clinical manifestations vary according to location and size. Intracranial teratomas are usually located in the midline, generally in the pineal and suprasellar regions, and represent more than two-thirds of brain tumors diagnosed before birth. In the spine, teratomas can occur at any level and compartment (extradural, intradural, or intramedullary). Characteristically, all show distinct components with fat, calcification, and soft-tissue attenuation on CT. Predominantly cystic teratomas also occur. MRI offers better characterization of these tumors and detection of their complications. In this exhibit, we will discuss typical and unusual appearances of teratomas on CT and MRI approaching them by location:

- Intracranial: congenital, midline, and off-midline location
- Head and Neck
- Spine: intramedullary, intradural extramedullary, and extradural/sacroccygeal

### Radiographic Findings in Hypoxic-Ischemic Brain Injury and the Role of Imaging in Brain Death Determination

#### Participants

Min Tae Kim, MD, BSC, Torrance, CA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The purpose of this exhibit is to 1. Discuss patterns of hypoxic-ischemic brain injury in pediatric and adult patients 2. Review the utility of imaging in prognostication 3. Review brain death determination using clinical criteria and imaging support 4. Present select cases from our institution

#### TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Patterns of hypoxic-ischemic brain injury in neonates- Normal MRI appearance of the neonatal brain- Patterns of mild, moderate, and severe injury 3. Patterns of hypoxic-ischemic brain injury in infants, young children, and adults- Commonly involved regions of the brain - cortex, deep gray matter, perirolandic cortex, watershed distribution, white matter, cerebellum- Review of radiographic findings on CT- Review of radiographic findings on MR 4. How imaging can assist in determining prognosis 5. Radiographic imaging in the brain death examination- CT angiography- Digital subtraction angiography (DSA) - gold standard- Nuclear medicine 6. Select cases from our institution

NREE-37

### Don't Get Trapped: Diagnostic Errors in Emergency Neuroradiology

#### Participants

Julia Brunelli, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Diagnostic errors in neuroradiology in the emergency department can have serious consequences for patients. The prevalence of errors in diagnostic radiology is around 3-5%. Factors such as less time to prepare the report and discuss the case with peers, the patient's clinical condition evolving rapidly, and dependence on the radiological report to take immediate actions according to the imaging findings can all contribute to errors. In this educational presentation, we will review a series of cases to address a series of etiologies that are present in a neurological emergency room and provide tips to improve accuracy and patient outcomes.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction• Overview of diagnostic errors• Renfrew Classification (revised by Kim and Mansfield in 2014)2. Case based review• Etiologies that are present in the emergency• Learning with the case: tips about that etiology3. Do it yourself• Cases as a diagnostic challenge for the audience

### A to Z of Motor Neuron Diseases

#### Participants

Amit Desai, MD, Jacksonville, FL (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Review neuroanatomy of the motor system  
2. Discuss common upper and lower motor neuron diseases  
3. Provide a multi-disciplinary and radiologic pattern based approach to diagnosis of motor neuron diseases

#### TABLE OF CONTENTS/OUTLINE

1. Introduction  
2. Neuroanatomy Review  
3. Classification of Upper and Lower Motor Neuron Diseases. Imaging features, pathophysiology, genetics, clinical symptoms, and management will be reviewed.  
A. Upper Motor Neuron Involvement Only: i. Primary Lateral Sclerosis  
ii. Hereditary Spastic Paraplegia  
iii. Spinal AVM/AVF  
iv. Radiation Myelitis  
B. Lower Motor Neuron Involvement Only: i. Progressive Muscular Atrophy  
ii. Flail Arm/Leg Syndrome  
iii. Post-Polio Syndrome  
iv. AIDP  
v. CIDP  
vi. Motor Neuron Lymphoproliferative Disorders  
C. Upper and Lower Motor Neuron Involvement: i. Amyotrophic Lateral Sclerosis (ALS)  
ii. ALS Plus Syndrome, Progressive Bulbar Atrophy  
iii. Bulbar-onset ALS  
D. Diseases affecting the Muscle/Neuromuscular Junction: i. Myasthenia Gravis  
ii. Lambert Eaton  
iii. Inclusion Body Myositis  
4. Simplified Diagnostic Approach Based Upon Clinical Symptomatology and Radiologic Imaging Pattern  
5. Conclusion

### Neurovascular Devices and Related Complications: A Case-based Approach

#### Participants

Victor De Carvalho, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The purpose of this exhibit is to: 1. Showcase the mainly used neurovascular devices, highlighting the preferred imaging modalities and what to avoid in the postoperative evaluation of each device. 2. Review the most relevant complications assessed by imaging related to each neurovascular device : what to look for?

#### TABLE OF CONTENTS/OUTLINE

- Introduction with a brief and illustrative review of the main neurovascular devices used in clinical practice and the modalities of choice for assessment of each device.
- Provide a guide on what to look for when assessing neurovascular devices with the most commonly associated complications.
- Provide didactic cases to illustrate the most important complications related to each neurovascular device and consolidate the acquired knowledge.
- Conclusions.
- Bibliographical references.

### Impact of Deep Learning-Based Reconstruction on Neuro MR Imaging: Image Noise Reduction and Super Spatial Resolution

#### Participants

Hiroyuki Uetani, Kumamoto, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To understand the principle of deep learning-based reconstruction (DLR) for reducing image noise and enhancing spatial resolution of neuro MRI. 2. To illustrate the applications of DLR with/without compressed sensing (CS) and parallel imaging and super spatial resolution-DLR (SR-DLR) for neuro MRI, and discuss the strengths of this techniques. 3. To discuss the pitfalls and limitations of DLR with/without CS and parallel imaging and SR-DLR techniques.

#### TABLE OF CONTENTS/OUTLINE

Introduction: 1) What is DLR with/without CS and parallel imaging, and SR-DLR techniques? 2) The advantages and disadvantages of DLR with/without CS and parallel imaging, and SR-DLR techniques. Clinical application of DLR with/without CS and parallel imaging and SR-DLR in neuro MR imaging: 1) DLR: High signal-to-noise ratio (SNR) images without long acquisition times A) High-resolution 3D T2 weighted imaging (HR-3D T2WI) B) MR angiography 1) Combination of DLR and CS/parallel imaging: High SNR images in a short acquisition time without sacrificing spatial resolution A) 2D-T2WI on the sellar region or spine B) MR angiography C) High-resolution 3D-T2WI 2) SR-DLR: High SNR images with super spatial resolution without long acquisition times A) 2D-T2WI on the hippocampus B) MR angiography C) Double inversion recovery (DIR) imaging D) Contrast-enhanced 3D T1WI E) Bone imaging Pitfalls and limitations of DLR with/without CS and parallel imaging, and SR-DLR in neuro MR imaging.

NREE-44

### Practical Guide for Young Radiologists: Basic Sequences in Neuroradiology

#### Participants

Taisa Santos, MD, Salvador, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Describe the aspects and physical parameters of basic magnetic resonance imaging sequences of the brain. Identify the main evaluation structures and tissue signal patterns in each sequence. Correlate brain diseases with signal changes.

#### TABLE OF CONTENTS/OUTLINE

Different Magnetic Resonance (MRI) imaging sequences are used together for brain evaluation. Knowledge of the physical aspects and signal patterns of basic MR sequences are essential for elucidation of neurological pathologies. Variables such as the number of radiofrequency (RF) pulses, angle, period between excitations (repetition time - TR) and period between excitation to echo (echo time - TE) determine the different signals between tissues on T1, T2 and image density proton weights. Some tissues and contents show different signals in each sequence. In the T1 sequence, fat, lesions with high protein content, some stages of hemoglobin degradation and melanin have high signal. In this sequence, it is important to analyze bone structures, brain parenchyma, flow-void, pineal and pituitary glands. In the T2/FLAIR sequence, most lesions have high signal, is a good sequence to see white lesions. In T2\*/SWI, blood, calcium, air have low signal. Some neoplastic, infectious, and ischemic changes show diffusion restriction on the DWI sequence and characteristic postcontrast enhancement. The correlation of signal patterns from different tissues in the evaluation of basic sequences helps in the recognition of patterns of normality and pathological alterations, being an important knowledge for young radiologists to begin to understand the findings of magnetic resonance imaging of the brain.

NREE-45

### The Art of Arteritis: Imaging Primary CNS Vasculitis

#### Participants

Eleanor Taylor, MSc, MBBS, London, United Kingdom (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. A practical approach to the investigation of PCSNV, covering the diagnostic criteria, presentation, and laboratory tests, but with a primary focus on imaging. 2. A structured discussion of the radiological manifestations of PCNSV. 3. An awareness of the common mimics and their differentiating clinical and radiological features. 4. Insight into the role of imaging in the process of diagnosis and treatment from a multidisciplinary perspective.

#### TABLE OF CONTENTS/OUTLINE

Primary central nervous system (CNS) vasculitis (PCNSV) is an extremely rare diagnosis but a common clinical concern. The presentation is non-specific; it typically manifests in middle-aged patients with subacute headache, altered cognition, and variable additional neurological features. Cerebrospinal fluid analysis can be normal in up to one third of cases. The radiological phenotype is protean, with no pathognomonic findings and innumerable mimics. Luminal vascular imaging has variable sensitivity and poor specificity. Assessment can be augmented by the use of vessel wall imaging, but this is not a panacea. Definitive diagnosis requires biopsy, not always an attractive prospect, but the risks need to be weighed against those of the disease and its treatment, both of which are considerable. To meet this formidable challenge, we will outline a practical approach to the investigation of suspected PCSNV, review the imaging findings, and explore the common mimics and their differentiating features. This will be illustrated with a series of cases compiled from a neurosciences centre in London.

Printed on: 04/12/24

NREE-46

### The Hidden Dangers of Hypothalamic and Hypophyseal Lesions: Not Everything is Neoplastic

#### Participants

Taisa Santos, MD, Salvador, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Review the normal anatomy and embryology of hypothalamic-pituitary axis using schematic illustrations and imaging MRI. Identify the main imaging features to guide differential diagnosis in non-neoplastic hypothalamic-pituitary involvement. To display a compendium of cases of non-neoplastic hypothalamic-pituitary axis.

#### TABLE OF CONTENTS/OUTLINE

The hypothalamic-pituitary axis is responsible to regulate many other endocrine glands through its hormone, and the pituitary being known as the master gland, is divided into two distinct parts: the anterior pituitary (adenohypophysis) and the posterior pituitary (neurohypophysis), differ in embryologic origin and function. There are several diseases that can affect the function and morphology of the hypothalamic-pituitary axis. It is susceptible to involvement by a variety of processes, including congenital, infectious or inflammatory, neoplastic or toxic-metabolic diseases. Imaging plays a key role in determining the most probable diagnosis and the Magnetic resonance (MR) imaging is the modality of choice for evaluating the anatomy and pathologic conditions of the hypothalamic-pituitary axis, helping to distinguish neoplastic and non-neoplastic lesions. The MRI differential diagnosis depends on anatomic recognition and characterization of associated imaging findings such as volumetric changes, stalk thickening, cystic appearance, intensity of signal in T1 and T2-weighted imaging. Therefore, we propose a systematic approach to address non-neoplastic pituitary changes based on the most important imaging patterns.

### Cranial Surgical Approaches: What the Radiologist Needs to Know

#### Participants

Taisa Santos, MD, Salvador, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To correlate the topography of brain lesions with surgical approaches through illustrations and imaging tests. Assist in the identification of surgical accesses through imaging exams. Establish anatomical relationships and correlate with the surgical approaches crania.

#### TABLE OF CONTENTS/OUTLINE

In addition to the pre-surgical evaluation for neurosurgeries, the imaging study is extremely important in identifying postoperative findings. Post-surgical changes include repercussions on the brain parenchyma, soft tissues and recognition of the cranial approaches used. The evolution of the location of the pathology helps in the interpretation of the surgical approach. Some topographies favor the use of specific accesses to allow manipulation of certain structures. Access to the skull base, brainstem, supratentorial and intraventricular are well established in the literature and the correct description in the medical report is part of the post-surgical evaluation. Therefore, we proposed to correlate surgical procedures with the location of encephalic pathologies. The demonstration of these aspects is facilitated through schematic illustrations that make it possible to associate these findings with the topography of the lesion in the surgical approach.

### Old but Gold: A Primer of Spine Radiography

#### Participants

Bianca Bianco, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The spine is made up of a complex anatomy and its evaluation could be challenging sometimes. It is a curved structure composed of bony vertebrae that are connected through cartilaginous intervertebral discs. It ensures proper posture, spinal cord protection, communication with the brain, body mobility and sensation through the complex interplay between the bones, ligaments and muscle structures. The radiography is the first method for its evaluation. Although this a simple imaging method, the correct analysis is very important for the clinical management of the patient. A well-performed radiography, with an appropriate position and adequate beam increases the accuracy of the diagnosis, besides the low-cost exam and high availability in the health care system. The purpose of this presentation is to review the normal anatomy of the cervical, thoracic and lumbar spine, to provide a didactic approach about the main characteristics of the evaluation, and to guide young physicians through the analysis of spine radiography.

#### TABLE OF CONTENTS/OUTLINE

Didactic review of how to evaluate the spine radiography, including the aspects of the technique, anatomy of the cervical, thoracic and lumbar spine as well as the most common pathologies, based on our service's digital archive.

### Encephalitis and Encephalopathy: Differential Diagnosis of Infectious and Autoimmune Diseases Based on Imaging Patterns and Topography

#### Participants

Beatriz Prado, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The purpose of this exhibit is: To review and discuss the differential diagnosis and brain MRI imaging patterns of infectious and autoimmune diseases by brain topography. Discuss and illustrate through illustrative cases different imaging patterns and emphasize the key findings that may lead to a specific diagnosis.

#### TABLE OF CONTENTS/OUTLINE

**Introduction** Describe the most common brain MRI imaging features of encephalitis and encephalopathy, including images that illustrate each feature, such as swelling, inflammation, bleeding, among others. Discuss the differential diagnosis of encephalitis and encephalopathy on brain MRI, divided by topography: -Cortical: Anti-NMDAR encephalitis, Herpes simplex encephalitis, Progressive Multifocal Leukoencephalopathy -White matter: Multiple Sclerosis, Susac Syndrome, FLAMES -Basal ganglia and/or thalamus: Auto-immune striatal encephalitis, FLAMES, acute necrotizing encephalitis, Neurocysticercosis -Cerebellum: Paraneoplastic cerebellar degeneration with anti-TR, Paraneoplastic cerebellar degeneration with anti-GAD, Aseptic meningitis with systemic lupus erythematosus, Acute disseminated encephalomyelitis -Brainstem: Progressive Multifocal Leukoencephalopathy, enterovirus rhomboencephalitis, Listeria rhomboencephalitis, NMSOD Key findings and diagnostic tips Diagnostic Approach Final remarks

NREE-51

### Motor Neuron Diseases: Diagnostic Approach, Imaging Findings, and Mimics

#### Participants

Tatiana Iutaka, BDS, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

This panel aims to: Study the diagnostic approach and clinical indications of imaging in motor neuron disease (MND); Review the MRI acquisition protocols, including advanced MRI techniques; Explain and demonstrate through illustrative cases different imaging patterns of MND; Discuss the main MND mimics and their imaging findings

#### TABLE OF CONTENTS/OUTLINE

Review of the definition and clinical syndrome of MND  
Review the clinical indications of imaging in MND  
Review the main imaging techniques used for the evaluation of MND  
Standard MRI acquisition protocol  
MRI signs that might support the diagnosis directly: T2WI, FLAIR, and magnetization transfer hyperintensities in the corticospinal tract (CST) in the brain or sometimes in the spinal cord  
Atrophy of the precentral gyrus  
The 'motor dark line' in T2WI and susceptibility sequences  
The bright tongue sign  
Illustrative cases of motor neuron diseases: Amyotrophic lateral sclerosis (ALS) Bulbar ALS Primary lateral sclerosis Mills syndrome  
Imaging findings of the main MND mimics, divided by clinical feature (e.g.: upper motor neuron (UMN) onset, purely UMN, bulbar onset): Ischemia (e.g., stroke) Mass (e.g., tumor, vascular malformation) Radiculopathies (cervical, lumbosacral) Demyelinating disease (e.g., multiple sclerosis) Advanced imaging and respective findings: DWI: Lower mean fractional anisotropy in the CST  
Volumetric or morphometric analyses of T1WI 3D MRI: Volume changes mainly in classical motor areas  
Proton (1H) magnetic resonance spectroscopy (MRS): NAA decline over time in the motor cortex  
Functional MRI: Altered cortical activity in patients with ALS  
PET and SPECT: Hypometabolism and hypoperfusion are most prominent in the motor cortex

Printed on: 04/12/24

NREE-52

### The Fascinating Limbic System: Anatomy, Pathology and Involvement Patterns

#### Participants

Lucas Souza, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The purposes of this exhibit are:- Review and illustrate the imaging anatomy of the limbic system, correlating with the main imaging methods, emphasizing the potential of each in identifying the structures.- To describe the main imaging patterns of lesions involving the limbic system, including dementia and psychiatric disorders, inflammatory and infectious diseases, temporal lobe epilepsy, neoplasms, Wernicke's encephalopathy, ischemic events, among others, highlighting key points for approaching the diagnosis differential.- Determine an algorithm for the systematic evaluation of differential diagnosis, emphasizing the main clinical features and imaging red flags.

#### TABLE OF CONTENTS/OUTLINE

- Anatomy of the limbic system, emphasizing the functional aspects.- Imaging patterns of diseases that affect the limbic system.- Differential diagnosis based on a pictorial review using representative cases from our institutional database: - Neoplasms - Infection and inflammation- Dementia and neuropsychiatric disorders- Ischemia and Infarction - Metabolic diseases - Developmental malformations- Diagnostic Algorithm- Final remarks

NREE-53

### Imaging the Sick Neonate: Neurosonogram in Hypoxic Ischemic Injury

#### TEACHING POINTS

1. Hypoxic-ischemic injury (HII) of the neonatal brain and resulting encephalopathy sequel remains a significant cause of morbidity and mortality in the neonatal population. 2. Ultrasound of skull (neurosonogram) is a powerful and effective screening tool in the evaluation of sick neonates with clinical hypoxia as it determines the pattern, timing, and extent of injury in HII and differentiates it from other conditions with similar clinical picture. 3. The pattern of injury on brain imaging has crucial implications in therapies and predicted neurodevelopmental outcomes. 4. Major role of neurosonogram is identifying the diagnosis, directing appropriate therapy, monitoring evolution of disease, predicting outcomes and detecting complications of therapy. 5. Addition of Doppler and shear wave elastography (SWE) in determining the difference in brain stiffness in neonates with birth asphyxia can increase the specificity of grey-scale ultrasound.

#### TABLE OF CONTENTS/OUTLINE

1. Normal neurosonogram appearance and technique in neonates. 2. Pathogenesis, grading and evolution of HII in term and preterm neonates with less profound and severe injury. 3. Patterns of HII in term and preterm neonates with illustration. 4. Role of ultrasound Doppler and SWE in evaluation of HII. 5. Ultrasound illustration of few clinical mimics of HII. 6. Uses and limitations of neurosonography.

### Errors in the Neuroradiological Emergency: An Escape Room Experience

#### Participants

Nathalia Santos, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

TEACHING POINTS The purposes of this exhibit are:- Discuss and illustrate clinical cases of the neuroradiological emergency in a quiz and gamification format, simulating an Escape Room experience.- Highlight the imaging points and red flags to make right diagnoses in the context of emergency. - Describe the most common possible errors in neuroradiological emergency, highlighting tips and challenges in the cases presented.

#### TABLE OF CONTENTS/OUTLINE

TABLE OF CONTENTS: - Neuroradiological emergency cases in an escape room dynamic:- The most emblematic cases in the context of neuroradiological emergency- Types of errors that can occur while the radiologist is analyzing a case- Series of cases that leads to escape and to finish the call and escape the room- Clinical cases - Quiz format- Ischemic stroke - Early and late signs of stroke- Main trials and treatment windows- Hemorrhagic lesions- Trauma - Fracture and anatomic pitfalls - Pseudofractures in a child skull - Hematic collections- Brain herniations- Headache- Arterial dissection- Metabolic disorders in the emergency- Most common intoxications- Key tips and challenges from the cases demonstrated- Escaping the room: conclusions and lessons learned

NREE-55

### Temporal Lobe Tumors: A Pattern-based Imaging Approach

#### Participants

Afonso Santos, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Review the anatomy of the temporal lobe; 2. Group the main primary central nervous system (CNS) tumors that affect the temporal lobe according to imaging characteristics; 3. Synthesize the main imaging features of each tumor that help in the differential diagnosis on flashcards for quick reference; 4. Show some differential diagnoses that can be confused with temporal lobe tumors

#### TABLE OF CONTENTS/OUTLINE

Temporal lobe disorders are associated with several conditions, including seizures, dementia, and memory impairment, followed by a spectrum of behavioral disorders. It is noteworthy that about 10% of temporal lobe epilepsies are caused by focal temporal lesions. In this context, this work has as main objectives: In this sense, most primary CNS tumors can potentially occur in the temporal lobe, but entities with a predilection for being diagnosed in this location include: ganglioglioma (40%), DNET (20%), diffuse low-grade astrocytoma (20%) and others (20%). Some of these lesions may present specific imaging characteristics, which allow narrowing the differential diagnosis. Didactically, these lesions can be grouped based on imaging features into solid-cystic, bullous, or solid. Besides any primary CNS tumor can arise from temporal lobe, this location has specific clinical symptoms, and some tumors has a particular predilection for the temporal lobe. The radiologist has a special rule to recognize and narrow the differential diagnosis that will guide the treatment or follow up on each case.

NREE-56

### Embryonal Tumors - Correlations Between Imaging Findings and Molecular Subtypes

#### Participants

Larissa Freitas, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The purposes of this exhibit are: • To present the essential embryonal malignancies of the Central Nervous System. • To review the WHO CNS5 classification, considering the new modifications in nomenclature and distribution of embryonal tumors. • To make a parallel between radiophenotypic imaging and genomic features. • To present the essential imaging features correlated to tumor's genetic pattern. • To highlight the importance of recognizing the imaging pattern of embryonal tumors to therapeutics and prognosis.

#### TABLE OF CONTENTS/OUTLINE

• Introduction - Essential embryonal malignancies of the Central Nervous System. - Review the WHO CNS5 classification making a parallel between radiophenotypic imaging and genomic features. • Medulloblastoma - Medulloblastoma WNT-activated - Medulloblastoma SHH-activated - Medulloblastoma, non-WNT / non-SHH - Group 3 - Group 4 - Other embryonal tumors - Atypical teratoid rhabdoid tumor - Embryonal tumor with multilayered rosettes - CNS Neuroblastoma, FOXR2-activated

### A Pocket Guide of the Main Side Effects, from Common to Rare, of Radiation Therapy in the Brain

#### Participants

Marta Calvo-Imirizaldu, MD, Pamplona, Spain (*Presenter*) Research Grant, Siemens AG

#### TEACHING POINTS

- To review the different techniques of brain radiation therapy available for primary or metastatic tumors, that radiologists need to know. Basic pathophysiology. Novel approaches and indications.- To recognize the main radiation-related findings on brain studies, from common to unexpected, and its differential diagnosis. Focus on radiation necrosis, radiation induced tumors, and mimics of vascular diseases (SMART syndrome, vasculitis, PRES).

#### TABLE OF CONTENTS/OUTLINE

1. Background and basics pathophysiology of radiation therapy.i. Clinical relevance statement ii. Basic pathophysiology iii. Risk factors. Benefits and risks iv. Radiation therapy techniques: conventional radiation therapy (external beam radiation therapy), stereotactic radiosurgery, proton therapy. v. Dosimetry2. MRI features and pictorial review of the main radiation-related findings on brain imaging, with differential diagnosis:- Common: a. Atrophy b. Leukoencephalopathy c. Microhemorrhages/cavernomas d. Hypoperfusion e. Mastoiditis- Less common: a. Pseudoprogression b. Radionecrosis c. Intratumoral bleeding d. Radiation-induced vasculitis- Rare: a. Radiation-induced tumors (most commonly meningioma) b. SMART syndrome: stroke-like migraine attack after radiation therapyc. PRES3. Reporting tips4. Conclusion

NREE-58

### Radiological Evaluation of the Spectrum of Pathologies Involving Medullary Veins in Neonates and Young Children

#### Participants

Esther Martin Ramirez, MD, MADRID, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To describe the anatomy and the venous drainage pathways of the intracranial venous system, with emphasis on medullary veins. To review the main pathologies that can cause medullary veins injury in newborns and young children. To explain the pathophysiology of diseases associated with medullary veins injury and their characteristic radiological findings, especially based on magnetic resonance imaging (MRI). To review the guideline-recommended MRI technique for medullary veins evaluation.

#### TABLE OF CONTENTS/OUTLINE

There are two types of medullary veins: superficial veins (SMV) and deep veins (DMV). SMV drain the subcortical white matter centrifugally into pial veins, whereas DMV drain the deep white and grey matter centripetally into subependymal veins, with a characteristic distribution consisting of a radial pattern with four convergence zones in frontal horns and trigons, and a parallel pattern in bodies and inferior horns of lateral ventricles. The unique disposition of medullary veins allows us to detect their involvement in different pathologies through different imaging techniques, especially on MRI with susceptibility-weighted imaging sequences. The aim of this educational exhibit is to review the most frequent pathologies related to medullary veins seen in neonates and young children, including vascular anomalies, thrombosis, hemorrhage and infectious encephalitis, among others.

NREE-59

### Fungus on the Mind: There's Much Room for Improvement

#### Participants

Karthik Rajendran, MBChB, London, United Kingdom (*Presenter*) Nothing to Disclose

Girija Agarwal, MBBS, Harrow, United Kingdom (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. An overview of the epidemiology, pathophysiology and clinical features of fungal CNS infections. 2. A structured review of the imaging features of various fungal CNS infections and their complications. 3. An approach to the differentiation of fungal CNS infections from other common infectious and non-infectious mimics, with a focus on clinico-radiologic correlation.

#### TABLE OF CONTENTS/OUTLINE

Fungal infections of the central nervous system (CNS) typically occur in immunocompromised patients and can be caused by yeasts (e.g. *Cryptococcus*), molds (e.g. *Aspergillus*), and dimorphic fungi (e.g. *Coccidioides*). The prognosis is influenced by the specific organism and patient factors but is frequently poor with mortality generally exceeding >50%. The imaging features, whilst often non-specific with a broad differential in a majority of cases, can also be distinctive and sometimes organism specific. Pathophysiological knowledge of varying fungal infections aids understanding the pathognomonic features to aid in narrowing the differential. Querying fungal etiology, even if the findings are less specific, at an early-stage aids directed laboratory testing and empirical treatment. Prolonged iatrogenic immunosuppression is on the rise, with increasing organ transplantation and cancer incidence. Old foes like HIV remain common. Radiologists are therefore increasingly likely to encounter fungal CNS infections sporadically and must be familiar with the imaging manifestations to aid early diagnosis and improve clinical outcomes.

NREE-6

### Neuroradiologic Complications of Immunotherapy in the Treatment of Cancer

#### Participants

John A. Arrington, MD, Tampa, FL (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

• As immune modulation in the treatment of cancer is becoming more common, its complications become more prevalent and the radiologist should be aware of these to aid rapid diagnosis and appropriate therapy. Unlike conventional chemotherapy which typically will cause immune suppression, immune modulation therapy generates an increase in systemic immune response and therefore a different spectrum of complications. This exhibit will explain the nomenclature, mechanism of action, and imaging features of more common complications of immunotherapy in the treatment of neoplasm.

#### TABLE OF CONTENTS/OUTLINE

• Mechanism of action of Immune Checkpoint Inhibitor (ICI) therapy • Mechanism of action of Chimeric Antigen Receptor T Cell (CAR-T) therapy • Recognizing ICI nomenclature (\*mab) is helpful to know to determine if a patient's therapeutic regimen includes ICI • Neuroimaging examples • Hypophysitis • Pseudoprogession • Myositis • Acute Idiopathic Demyelinating Polyneuropathy (AIDP). • Acute myelitis (CAR-T) • Thyoiditis • CAR-T related infarction

### Diffuse High-Grade Gliomas - New Concepts

#### Participants

Bruna Carvalho, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The purposes of this exhibit are: • To present the current classification of central nervous system tumors and genetic biomarker roles. • To define pediatric-type and adult-type diffuse high-grade gliomas and their molecular pathways. • To present the essential imaging features correlated to the tumor's genetic pattern. • To correlate radiophenotypic imaging and genomic features with prognosis and determination of treatment approaches.

#### TABLE OF CONTENTS/OUTLINE

- Adult-type diffuse high-grade gliomas - Glioblastoma, IDH wildtype - Astrocytoma, IDH-mutant, grade 4 - Astrocytoma, IDHm, CDKN2A/B homozygous deletion, grade 4
- Pediatric-type diffuse high-grade gliomas - Diffuse midline glioma, H3 K27-altered - Diffuse hemispheric glioma, H3 G34-mutant

### **Anoxic Brain Injury Patterns. What Can't I miss? Reviewing Patterns and Differential Diagnosis of Anoxic Brain Injury in Newborns, Children and Adults**

#### **Participants**

Bernardo Pillar Quadros, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

The purposes of this exhibit are: - Review and illustrate the imaging findings of the main anoxic brain injuries patterns, classified according to age: newborns, children and adults. - Describe the main imaging patterns of the anoxic brain injuries, including brainstem lesion, thalamic lesion, periventricular leukomalacia, ventrolateral thalamic lesion, posterior putamen lesion, perirolandic cortex lesion, cortical laminar necrosis, delayed post-hypoxic leukoencephalopathy, HACE, diffuse edema, some intoxication hypoxia patterns and some differential diagnosis, highlighting key points to differential diagnosis approach. - Determine an algorithm for the systematic evaluation of differential diagnosis, emphasizing the main clinical features and imaging red flags.

#### **TABLE OF CONTENTS/OUTLINE**

- Imaging patterns of main anoxic brain injuries in newborns, children and adults. - Preterm newborn patterns lesions - Term newborn patterns lesions - Children/ adults patterns lesions - Intoxication hypoxia patterns lesions - Differential diagnosis based on a pictorial review using representative cases from our institutional database - Hypoglycemia - Creutzfeldt-Jakob disease - Uremic Encephalopathy - Metabolic disorders - Diagnostic Algorithm- Final Remarks

NREE-62

### Cerebrovascular Reserve Imaging Evaluation: How Much of a Challenge Can it Be

#### TEACHING POINTS

Cerebrovascular reserve imaging with arterial spin labeling (ASL) and acetazolamide challenge is a non-invasive MRI-based technique that evaluates cerebrovascular reactivity. ASL measures cerebral blood flow by magnetically labeling arterial blood water protons, allowing for quantification of regional cerebral blood flow (CBF) without exogenous contrast agents. Acetazolamide (a vasodilator) challenge can be used to estimate cerebrovascular reserve (CVR). ASL with acetazolamide challenge is useful for assessing CVR in neurological conditions such as cerebrovascular disease and neurodegenerative disease.

#### TABLE OF CONTENTS/OUTLINE

I. Introduction II. Arterial Spin Labeling III. Acetazolamide Challenge IV. Cerebrovascular Reserve Imaging with ASL and Acetazolamide Challenge Protocol, applications and analysis. V. Clinical Utility in Various Neurological Disorders VI. Conclusion

Printed on: 04/12/24

### **Glioneuronal and Neuronal Tumors: What Can Molecular Pathways Teach Us**

#### **Participants**

Giovanna Calfi, MD, Sao PAULO, Brazil (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

- List the essential information on various glioneuronal and neuronal tumors according to the 5th Edition of the WHO Classification of Tumors of the Central Nervous System. - Identify the main imaging features and molecular pathway involved in these brain tumors. - Highlight the importance of recognizing those patterns to help neuroradiologists narrow their diagnostic hypotheses, thus saving time and resources.

#### **TABLE OF CONTENTS/OUTLINE**

- Introduction: Brief review of the inclusion of glioneuronal and neuronal tumors in the 5th edition of the 2021 WHO Classification of Tumors of the Central Nervous System; Presentation of the main common characteristics of glioneuronal and neuronal tumors; Illustration of the MAPK pathway - The radiological, epidemiological and clinical characteristics correlated based on the most known genetic mutations of each tumor, namely: Dysembryoplastic neuroepithelial tumor (DNET); Multinodular and vacuolating neuronal tumor (MVNT); Central neurocytoma; Extraventricular neurocytoma; Ganglioglioma; Rosette-forming glioneuronal tumor; Dysplastic cerebellar gangliocytoma (Lhermitte-Duclos disease); Diffuse leptomeningeal glioneuronal tumor; Desmoplastic infantile astrocytoma; Papillary glioneuronal tumor; Gangliocytoma; Myxoid glioneuronal tumor

### Practical Guide to Fetal Craniospinal MRI: Essentials for General Neuroradiologists and Trainees

#### TEACHING POINTS

After review of this exhibit, the radiologist should: Be able to recognize the normal fetal anatomy of the craniospinal axis. Be familiar with common indications for fetal MRI and protocol for fetal Neuroimaging. Recognize and diagnose a broad range of pathologies that can be assessed with fetal MRI.

#### TABLE OF CONTENTS/OUTLINE

Fetal ultrasound is the primary diagnostic tool used for fetal imaging, but there are limitations to imaging the fetal brain, face and neck, and spinal canal. Fetal MRI is often performed to characterize ultrasound findings and provide better prognostic information for obstetric patients. Common indications for fetal craniospinal MRI include ventriculomegaly, midline anomalies, posterior fossa malformations, fetal intracranial mass, encephaloceles, cleft lip and palate, spinal malformations, and in utero disruptive events. With increased demand for these exams for pre- and post-natal health, more general neuroradiologists will be needed for interpretation. This comprehensive review has the potential to improve patient access to fetal craniospinal MRI by increasing general neuroradiologist's and trainee's comfort with interpretation of these exams. We will review imaging protocols, normal fetal anatomy, common indications, case examples, and postnatal MRI correlates. Case examples will include the Pierre Robin sequence, congenital epulis, Dandy Walker variants, open and closed dysraphism, intrauterine fetal demise with intracranial hemorrhage, oro-facial-digital syndrome, and multiple midline abnormalities including alobar holoprosencephaly with synophthalmia.

### The Hidden Face of Gliomas: Decoding the Pathophysiology and Infiltrative Patterns of Gliomas

#### Participants

Marta Calvo-Imirizaldu, MD, Pamplona, Spain (*Presenter*) Research Grant, Siemens AG

#### TEACHING POINTS

- To review the current knowledge of the pathophysiology of gliomas and the challenges of their study and management.- To outline different imaging presentations of gliomas and the role of MRI in the presurgical workup of these tumors. Pearls on imaging biomarkers available and potential diagnostic pitfalls.

#### TABLE OF CONTENTS/OUTLINE

1. Background. Pathophysiological aspects of glioma  
2. Imaging protocol recommended for brain tumors  
3. Pictorial review of the main different infiltrative patterns of gliomas, from isolated hyperintense signal on T2-FLAIR to ring-enhancing necrotic gliomas:  
a. Non-contrast enhancing gliomas  
b. Gliomatosis pattern of gliomas  
c. Non-enhancing with contrast enhancing components gliomas  
d. Homogeneous enhancing gliomas  
e. "Ring enhancing" with necrosis gliomas  
f. Cystic gliomas  
g. Butterfly gliomas  
h. Multifocal gliomas  
With the following information applying for each: clinical issues and pearls on the updated 2021 World Health Organization classification, imaging biomarkers available and potential diagnostic pitfalls.  
4. Reporting tips  
5. Conclusion

### Myelination and Inborn Errors of Metabolism: Learning That Goes Hand in Hand

#### Participants

Lucas Souza, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The purposes of this exhibit are:- Review and illustrate the classic patterns of myelination, emphasizing the main findings for age delimitation, as well as signs of developmental delay.- To describe the main imaging patterns of Inborn Errors of Metabolism, including hypomyelination and demyelination, exemplifying cases of Pelizaeus disease, Alexander disease, Canavan disease, Krabbe disease, Metachromatic leukodystrophy, among others, highlighting key points for approaching the differential diagnosis.- Determine an algorithm for the systematic evaluation of differential diagnosis, emphasizing the main clinical features and imaging red flags.

#### TABLE OF CONTENTS/OUTLINE

- Imaging patterns of white matter myelination, emphasizing the key findings.- Neuroimaging of Inborn Errors of Metabolism.- Differential diagnosis based on a pictorial review using representative cases from our institutional database:- Organelle-based approach- Imaging pattern approach: white matter predominance versus gray matter predominance; diffuse white matter involvement (vanishing white matter disease), involvement of the basal ganglia (PKAN, MELAS), periventricular predominance (metachromatic leukodystrophy and Krabbe disease), subcortical predominance (L2-hydroxyglutaric aciduria), among other patterns.- Diagnostic Algorithm- Final remarks

### Neurovascular Potpourri: Disentangling the Differentials

#### Participants

Eugene Shin, MD, Orange, CA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Vascular pathology may be the primary reason for, or an incidental finding on contrast enhanced exams. The goal of this presentation is to provide a broad overview of the range of neurovascular findings one may encounter, from benign congenital variations to neoplasms.

#### TABLE OF CONTENTS/OUTLINE

Neurovascular topics covered include the following:1. Congenital/anatomic variants, including aortic arch and major branches, Circle of Willis and persistent carotid-vertebrobasilar anastomoses, arterial fenestration, and junctional dilatation of the basilar artery tip.2. Review International Society for the Study of Vascular Anomalies characterization of vascular anomalies, primarily discerning vascular malformations from tumors with case examples. Tips will be provided to help discern vascular lesions from similar appearing processes in the head and neck region.3. Examine other vascular disorders including moyamoya disease, fibromuscular dysplasia (including carotid intimal variant), reversible cerebral vasoconstriction syndrome, and amyloid angiopathy.

### 'To Bleed or Not to Bleed'- The DVA Conundrum

#### TEACHING POINTS

- Delineate the angioanatomy of developmental venous anomalies.
- Classify the various mechanisms that render DVAs symptomatic.
- The following are illustrated with sample cases: •"Flow related" pathomechanisms. •decreased outflow; collector vein thrombosis and DVA thrombosis.
- Increased inflow in the form of arterialisiation of DVA .
- DVAs associated with cavernomas
- DVAs with no overt neuroparenchymal signal changes but with resistant epilepsy with metabolic abnormality on PET.
- DVAs associated with grey matter abnormalities.
- DVAs in tandem with high grade gliomas.

#### TABLE OF CONTENTS/OUTLINE

- Angioanatomy of developmental venous anomalies
- Classification of the various pathomechanisms of symptomatic DVAs
- The following are illustrated with sample cases: •"Flow related" pathomechanisms (as would be illustrated in our case series) -decreased outflow; collector vein thrombosis and DVA thrombosis.
- Collector vein stenosis culminating in outflow restricted DVAs.
- Increased inflow in the form of arterialisiation of DVA .
- DVAs associated with cavernomas
- DVAs with no overt neuroparenchymal signal changes but with resistant epilepsy with metabolic abnormality on PET.
- DVAs associated with grey matter abnormalities.
- DVAs in tandem with high grade gliomas.
- Overview of the treatment strategies both endovascular and conservative in the management of these vascular lesions.

### Easy Come, Easy Go - Transient Brain Findings

#### Participants

Samya Alves, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Despite the notability of sequelae left by neurological diseases, many conditions may present as transient abnormalities. Toxic-metabolic encephalopathies comprise one of the groups which classically presents in such manner and is part of the radiologists' daily practice - most of them having a pattern of symmetrical restricted diffusion. Other entities, like some vasculopathies and genetic determined diseases - although instinctively associated with permanent brain damage - might also portray themselves as temporary imaging alterations. In these cases, the follow-up would be critical in determining the diagnosis as it is in differentiating a post-ictal change (typically reversible) from an autoimmune encephalitis (more enduring).- Present a didactic manner for sorting of transient findings and reversible conditions by pathophysiology.- Illustrate transient imaging features in a case-based review.

#### TABLE OF CONTENTS/OUTLINE

Suggestion for sorting of reversible imaging findings and conditions

- Toxic-metabolic: exogenous intoxications (medication, recreational drugs), endogenous intoxications , cytotoxic lesions of corpus callosum (CLOC)
- Vascular: PRESS, vasoconstriction syndromes, hemiplegic migraine, transient global amnesia, focal cerebral arteriopathy of childhood
- Genetic determined: phenylketonuria, urea cycle disorders, mitochondrial encephalopathy with lactic acidosis (MELAS).
- Neoplastic: some brain tumors may exhibit temporary post contrast enhancement or cystic changes without meaning tumor progression (e.g., pilocytic astrocytoma).
- Miscellaneous: stroke-like migraine attacks after radiation therapy, benign external hydrocephalus, torcular pseudomass

Printed on: 04/12/24

### Post-operative Spine Imaging: Evolution of Percutaneous and Surgical Devices

#### TEACHING POINTS

? Percutaneous devices, such as pedicle screws and vertebral augmentation, are often used in minimally invasive procedures and have lower complication rates. ? Post-operative imaging is essential to assess the success of spine surgery, detect complications, and guide further treatment. ? Radiologists should be familiar with the different surgical approaches and devices used in spinal surgery to accurately describe the post-operative imaging findings and identify any complications that may arise.

#### TABLE OF CONTENTS/OUTLINE

Arthrosis Degenerative changes in the lumbar spine are a common source of back pain and disability, affecting millions of people around the world. A great part is discogenic. Degenerative disc changes can take several forms, including disc herniation, spinal stenosis, and osteoarthritis, all of which can cause nerve compression and pain. Surgical approaches ? Anterior lumbar interbody fusion (ALIF) ? Lateral lumbar interbody fusion (LLIF) ? Transforaminal lumbar interbody fusion (TLIF) ? Posterior lumbar interbody fusion (PLIF) Common devices used for arthrodesis How do surgeons decide which approach option? Some challenging cases

### From A to V: Arterial and Venous Intracranial Anatomy, Variants and Malformations

#### Participants

Eduardo Valadares, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Describe the anatomy of arterial and venous intracranial systems  
Exhibit the normal appearance and common variations of the arterial and venous intracranial systems  
Summarize the most common and some rare congenital and acquired intracranial vascular malformations

#### TABLE OF CONTENTS/OUTLINE

Anatomy of Intracranial Arteries and Veins  
Normal CT and MRI Appearance  
Common Arterial Variations  
Fenestrations and Duplications  
Internal Carotid Arteries Variants  
Anterior Cerebral Artery Variants  
Middle Cerebral Artery Variants  
Posterior cerebral Artery Variants  
Persistent Carotid-Basilar Artery Anastomoses  
Common Venous Variations  
Hypoplastic Venous Sinus  
Absent Venous Sinus  
Arachnoid Granulations  
Pure Arterial Malformations  
Anterior Cerebral Artery Dolichoectasia  
Associated with Cortical Dysplasia  
CVM with Arteriovenous Shunting  
Arteriovenous Malformation  
Cerebral Proliferative Angiopathy  
Dural AV Fistula  
Carotid-Cavernous Fistula  
Vein of Galen Aneurysmal Malformation  
CVM without Arteriovenous Shunting  
Developmental Venous Anomaly  
Sinus Pericranii  
Cerebral Cavernous Malformation  
Capillary Telangiectasia  
Vascular Neurocutaneous Syndromes  
Sturge-Weber Syndrome  
PHACE Syndrome  
Wyburn-Mason Syndrome

### A Radiologist Guide to Evaluating White Matter Lesions in Pediatric Patients

#### Participants

Roberto Bastos, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The purposes of this exhibit are:- Review and illustrate the classic imaging patterns of white matter lesions in pediatric patients, with a step-by-step approach.- To describe the main imaging patterns of white matter lesions, including hypomyelination and demyelination diseases, highlighting key points for approaching the differential diagnosis.- Determine an algorithm for the systematic evaluation of differential diagnosis, emphasizing the main clinical features and imaging red flags.

#### TABLE OF CONTENTS/OUTLINE

Imaging patterns of white matter lesions in pediatric patients  
Differential diagnosis of pediatric conditions that may course with white matter lesions, discussing the main recognizable image patterns:- Terminal myelination- Periventricular leukomalacia- Hypoxic ischemic encephalopathy- Posterior reversible encephalopathy syndrome (PRES)- Hypoglycemic encephalopathy- Adrenoleukodystrophy- Kearns Sayre syndrome- L-2-hydroxyglutaric aciduria- Methotrexate-related leukoencephalopathy- Focal cortical dysplasia- Multiple sclerosis- Acute disseminated encephalomyelitis (ADEM)- Vascular malformation- Ischemic stroke- Hemorrhagic stroke- Perivascular spaces- Other conditions including aggressive and non-aggressive neoplasms, infection of CNS, phakomatosis, autoimmune and neurodegenerative disorders  
Limitations and tips for the correct diagnosis  
Practical Diagnostic Algorithm  
Final remarks

### CNS Tumor on Drugs - Nuts and Bolts of Neuro-oncology Agents for the Radiologist in the Age of Personalized Medicine

#### TEACHING POINTS

To introduce both common and newly emerging targeted neuro-oncology agents, typical imaging response patterns, and the imaging manifestation of associated toxicities. To highlight targeted agents with actionable molecular markers in primary brain tumors and brain metastasis, focusing on their mechanism of action in oncogenesis. To recognize atypical imaging response patterns and describe the crucial role of radiologists in providing crucial input for the management of CNS neoplasms in the age of personalized medicine.

#### TABLE OF CONTENTS/OUTLINE

1. Introduce commonly used traditional chemotherapy agents as well as emerging targeted chemotherapy with their mechanism of actions• Traditional alkylating agents, including Wafer• Anti-metabolites• Targeted chemotherapy i. ALK ii. HER2 iii. EGFR iv. VEGF v. PD-1 vi. CTLA-4 vii. mTOR viii. BRAF ix. MEK x. HIF xi. CAR T-cell therapy xii. IDH inhibitor• Combination therapy• Experimental drugs2. Usual imaging findings of favorable treatment response and/or disease progression.3. Unique atypical response patterns of different neuro-oncology agents and their clinical implications in cancer management.4. Important chemotherapy-related adverse events and corresponding imaging presentation.5. Illustration of imaging manifestations of newly emerging therapies in the era of personalized medicine.

### A Rose by Any Other Name? Non-Alzheimer Neurodegenerative Conditions

#### Participants

Samya Alves, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Alzheimer Disease (AD) is the most common cause of dementia worldwide. However, recent studies continue to demonstrate an overlapping of clinical syndromes among neurodegenerative disorders other than DA, as well as have been presenting new biomarkers for differentiating them. As imaging and nuclear techniques advance, the role of the neuroradiologist becomes more essential to provide at least a narrowing of the differential diagnosis in order to offer the best treatment options as early as possible. - Review neurodegenerative conditions besides DA and their pathophysiology. - Mention newly recognized biomarkers, entities, and classifications. - Summarize imaging and nuclear medicine aspects for the differential diagnosis of the neurodegenerative diseases.

#### TABLE OF CONTENTS/OUTLINE

- Introduction- Neurodegenerative conditionso Clinical phenotypes and molecular subdivisionso Imaging and nuclear medicine featureso Differential diagnosis - Case-based review

Printed on: 04/12/24

### **ECASS Radiological Classification of Hemorrhagic Transformation of Infarcted Brain Tissue: Don't Miss the Blood**

#### **TEACHING POINTS**

Define the characteristics of hemorrhagic transformation of infarcted brain tissue, recognize the pitfalls and mimics of this entity and reproduce the new classification system: ECCAS II. Recall the different possible etiologies and clinical factors for developing this hemorrhagic complication.

#### **TABLE OF CONTENTS/OUTLINE**

Introduction The hemorrhagic transformation of the infarcted brain tissue is a frequent complication of acute stroke, because of the extravasation of blood across a disrupted blood brain barrier. There are many risk factors and contributors for this disruption. By the ECASS classification system, the types of hemorrhage can be divided in two: hemorrhagic infarction (HI) and parenchymal hematoma (PH). The recognition and classification of this entity is important because the PH2 is found to be a significant predictor of neurological deterioration with higher mortality rates. Teaching points Illustrate the characteristics of an intracranial hemorrhage, specifically the hemorrhagic transformation of infarcted brain tissue. Employ the ECASS classification for hemorrhagic transformation of infarcted brain tissue. Recognize the patterns and learn how to report the different types of hemorrhagic transformation. Distinguish the pitfalls that can mimic a hemorrhagic transformation of infarcted brain tissue. Describe the possible etiologies and clinical factors for developing an intracranial hemorrhagic transformation of infarcted brain tissue.

### Vein of Galen Aneurysmal Malformations: A Resident's Approach

#### Participants

Sameer Chandra, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- What is a Vein of Galen aneurysmal malformations (VGAM), and how does it appear in a CT and MRI scan. - Highlight the differences between Mural and choroidal Vein of Galen aneurysmal malformations (VGAM). - Exemplify the natural evolution of VGAMs, when treated vs left untreated.

#### TABLE OF CONTENTS/OUTLINE

Vein of Galen aneurysmal malformations (VGAM) are characterized by an embryonic choroidal arteriovenous malformation supplied by the choroidal arteries (ACA, AChoA, PChoA). The venous drainage in VGAMs is towards the median prosencephalic vein. VGAMs are formed between 6th and 11th weeks of embryological development, and corresponds to 30-50% of all vascular malformations in infants. VGAMs can be subdivided into two types Choroidal and Mural. Choroidal VGAMs are characterized by multiple feeders including thalamoperforating, choroidal and pericallosal arteries are located in the subarachnoid space in the choroidal fissure. Choroidal VGAMs converge on a fistula at the anterior aspect of the median prosencephalic vein (MPV); Tend to present earlier (neonates) with more severe shunts. Choroidal VGAMs result in high output cardiac failure because of multiple high flow fistulas with less outflow restriction. Mural VGAMs are characterized by fistulae in the subarachnoid space in the wall of the median prosencephalic vein; supply may be unilateral or bilateral. They are associated with absence or stenosis of Dural sinuses and stenosis at the level of the jugular foramen. Present later (infants) and with hydrocephalus. Mural VGAMs presents with fewer fistulas with high outflow restriction.

### Review of a HIV-associated Pathology in the Central Nervous System (CNS) Head and Neck

#### Participants

Ahmed Abdelhalim, Los Angeles, CA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To review clinical presentation and imaging manifestations of HIV-associated CNS and head neck pathology, including infectious, inflammatory and neoplastic etiologies  
2. To discuss differential diagnoses and management considerations  
3. To present select cases from our institution that highlight these imaging features

#### TABLE OF CONTENTS/OUTLINE

1. Introduction  
2. Infectious etiologies: presentation, imaging features, differential diagnosis  
a. Virali. HIV encephalopathy  
ii. Progressive multifocal leukoencephalopathy  
iii. Cytomegalovirus  
iv. AIDS encephalopathy and atrophy  
b. Fungali. Cryptococcus  
c. Bacteriali. Tuberculosis  
ii. Neurosyphilis  
d. Parasitici. Toxoplasmosis  
3. Immune reconstitution inflammatory syndrome (IRIS)  
4. CNS Lymphoma  
5. Select head and neck case review: HIV myelopathy, Kaposi sarcoma, lymphadenopathy, lymphoepithelial parotid cysts

### Anatomy and Congenital Variations of the Sella Turcica, Suprasellar Cistern and Hypothalamus

#### Participants

Alex Dias, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Review the normal embryology and anatomy of the pituitary gland, the suprasellar cistern and the hypothalamus. Summarize the imaging characteristics of the sellar region on CT and MRI. Provide tools to identify anomalies in the sellar region; discuss differential diagnosis and common pitfalls.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction  
2. Anatomy and embryology review- sella turcica and hypophysis- parasellar region, suprasellar region and hypothalamus  
3. Clinical-radiological correlation of congenital sellar variations  
4. Case-based review of congenital variations and pathology: - osseous - intrasellar - suprasellar - justasellar  
5. Take-home points

### Beyond Myelopathy: Imaging Findings Associated with Under-recognized Neurologic Manifestations of HTLV-1

#### Participants

Jedrzey Krawczyk, MD, London, United Kingdom (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Human T-cell lymphotropic virus type-1 (HTLV-1) was first described in the early 1980s. Presently, where testing occurs, HTLV-1 has a prevalence of approximately 10 million (which is likely an underestimate) and is endemic in areas such as southwestern Japan and South America. Whilst in most, the infection is asymptomatic, the infection is lifelong, and there are several, likely under-recognized and potentially devastating neurological complications. The best described is HTLV-1-associated myelopathy (HAM), which typically presents with chronic progressive spastic paraparesis and bladder disturbance, but there are rarer conditions, such as acute myelopathy, encephalopathy, and inflammatory myositis. Raising awareness of these less common presentations is crucial to facilitate prompt diagnosis and treatment, especially as prompt medical intervention may limit and even potentially reverse damage. Here we describe the range of neurological and neuromuscular presentations of HTLV-1, focusing on their imaging findings illustrated by a selection of cases from our tertiary care center.

#### TABLE OF CONTENTS/OUTLINE

1) To briefly outline clinical and imaging manifestations of HTLV-1-associated myelopathy. 2) To provide an illustrative review of rarer presentations of HTLV-1-related neurological disorders. 3) To describe the differential diagnoses and their main discriminating imaging features.

### Detangling the Knots of Pediatric Neurometabolic Disorders, One at a Time

#### TEACHING POINTS

- Discuss the pathophysiology of neurometabolic disorders in the pediatric age group.
- Review the imaging findings of common and rare neurometabolic conditions.
- Review the overlap in imaging manifestations and discern subtleties in differentiating various neurometabolic conditions.
- Recognise neurometabolic disorders amenable to treatment with emphasis on current and developing treatment options

#### TABLE OF CONTENTS/OUTLINE

- Introduction to the pathophysiology with glimpses of the pattern of CNS involvement in pediatric neurometabolic disorders.
- Extensive in depth review of the imaging of various subtypes including : 1.Disorders of aminoacid metabolism 2.Organic acidemias 3.Peroxisomal disorders 4.Lysosomal storage disorders 5.Neurodegenerative diseases of childhood 6.Channelopathies
- Imaging overview along with clinical correlation.
- Emphasis on treatment amenable cases.

### Beware of the Railway Crossing, Neuralgia Awaits You. A Resident's Guide to Neurovascular Conflict

#### Participants

Andres Haro Laverde, MD, Quito, Ecuador (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Not all vascular conflicts may lead to a clinical condition; therefore, the topographical finding must correlate with the symptoms.
2. Peripheral nerves have critical segments, where they run without a myelin sheath; this is called the transition zone.
3. The correct imaging protocol can lead to the diagnosis; nevertheless, the best pulse sequences are prone to artifacts, and it is important to identify them.
4. Infectious, neoplastic, or inflammatory causes may overlap; therefore, be aware of differentials.

#### TABLE OF CONTENTS/OUTLINE

1. Anatomical review of the cranial nerves with a hub in the most common trapped roots
2. Physiopathology of vascular palsy and the common clinical findings.
3. Types of cranial nerve vascular conflicts and pitfalls.

Printed on: 04/12/24

### A Comprehensive Guide of Neurovascular Imaging: Discovering Pearls and Overcoming Pitfalls

#### Participants

Niels Vinicius Padua Carvalho, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The aim of this exhibition is to:

- Thoroughly review the technical aspects of neurovascular imaging (arterial and venous angiotomography and magnetic resonance angiography) and vessel wall imaging.
- Illustrate the role of these imaging methods, overall CT and MRI, highlighting advantages and disadvantages of each modality.
- Unify the most important methods in a single article/presentation.
- Summarize the pearls of these methods for diagnosis purpose and how to overcome the main pitfalls.

#### TABLE OF CONTENTS/OUTLINE

- **INTRODUCTION**o Importance of neurovascular imaging through the time and where we stand today
- **IMAGING TECHNIQUE**o Neurovascular imaging techniques, including:§ Protocol: when to choose each method§ Sequences: which sequences are preferred for each modality§ Imaging acquisition: the physical aspects and time of acquisition.
- **INTERACTIVE CASE-BASED DIDACTIC**o Sample cases to illustrate and consolidate the main pearls and pitfalls of neurovascular imaging, separated by imaging method and type of errors
- **FUTURE DIRECTIONS AND TAKE HOME MESSAGES**o Where do we need improvement?o What is on the horizon for neurovascular imaging?

### INTRA-ARTERIAL CHEMOTHERAPY FOR RETINOBLASTOMA: ANATOMICAL HEMODYNAMIC CHALLENGES

#### Participants

Matteo Zanoni, Siena, Italy (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- In the hope of salvaging eyes with retinoblastoma (RB) from enucleation, intra-arterial chemotherapy (IAC) has been proposed in 2008.- The main goal of IAC is to deliver a high dose of drugs directly to the tumor while avoiding the side effects and risks of systemic chemotherapy.- In the ideal scenario, an adequate blush is visualized from the internal carotid artery, ophthalmic artery origin is favorable for catheterization and no prominent cutaneous branches from the ophthalmic artery are seen.- IAC is not always as straightforward as expected and some challenges may be seen.- The first scenario is a difficult and unstable catheterization of the OA, in spite of its visualization by selective angiography, usually due to a too angulated origin of the OA.- The second scenario occurs when OA is not visible from ICA injection or the blush is not visible and contrast medium flows back into the ICA when catheterization of the OA is properly achieved. One anastomosis with the external carotid artery could be in place providing alternative pathways for the orbital supply and drug administration.- Distribution volume of the drug, which correlates to effectiveness of the IAC, could increase because of cutaneous branches originating from OA, thus increasing local side effects.

#### TABLE OF CONTENTS/OUTLINE

- Intra-arterial chemotherapy for retinoblastoma- IAC technique and ideal scenario- Anatomical challenges and solutions- Hemodynamic challenges and solutions- Distribution volume understanding

### **Pictorial Review of the Applications of Dynamic Susceptibility Contrast (DSC) MRI Perfusion in the Characterization of Meningiomas**

#### **Participants**

Theodore Wang, South Pasadena, CA (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

1. Background review on the key characteristics of meningiomas and basics of dynamic susceptibility contrast (DSC) MRI perfusion. 2. Literature and pictorial review of the applications of DSC perfusion in the evaluation of meningioma characteristics, including grade, histologic subtypes, consistency, and vascularity. 3. Future applications of DSC in the evaluation of meningiomas.

#### **TABLE OF CONTENTS/OUTLINE**

1. Background on meningiomas and DSC MRI perfusion: (a) Brief background on meningiomas, including differences in grade, histologic subtype, consistency, and vascularity. (b) Background on the clinical importance of these different characteristics and current imaging evaluation. (c) Review of the current literature on the application of DSC for meningioma evaluation. 2. Applications of DSC perfusion in meningioma evaluation: (a) Pictorial review of applications of DSC perfusion in meningioma evaluation. (i) Review the differences in perfusion between histologic subtypes of meningiomas, including the correlation of higher perfusion values with higher grade tumors and surrounding brain parenchyma. (ii) Discuss the role of DSC in predicting vascularity and consistency of meningiomas. 3. Discussion of future directions of DSC for meningioma evaluation.

### Neuroinfectious Disorders in the Emergency: From Usual to Bizarre

#### TEACHING POINTS

To depict the pattern of CNS infections in different compartments of the brain. To illustrate characteristic imaging findings attributable to specific pathogens. To be familiar with atypical infectious etiologies in the neuroparenchyma.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction to CNS infections  
2. CT and MRI imaging protocol of CNS infections: Impact of delayed CT images and Post Gadolinium FLAIR sequences.  
3. Infectious involvement of different compartments of brain.  
4. Meningitis: Bacterial, Cryptococcal, Viral, Rickettsial, Scrub typhus  
5. Brain Parenchymal involvement in CNS infections  
Restricted to white matter  
Both grey and white matter involvement  
Involvement of basal ganglia/thalami or brainstem  
6. Infectious Mass lesions  
Fungal abscess  
Pyogenic abscess  
Tuberculoma  
Parasitic infections  
Fungal granulomatous lesions.  
7. Atypical neuroparenchymal infections  
Neurocysticercosis  
Leptospirosis  
Scrub typhus  
Nocardiosis

### Arteriovenous Malformations: Practical Application of Spetzler Martin Classification

#### TEACHING POINTS

Brain arteriovenous malformations are a type of intracranial high flow vascular malformation composed of enlarged feeding arteries, a nidus of vessels closely associated with the brain parenchyma through which arteriovenous shunting occurs, and draining veins. These malformations are characterized by a nidus forming the transition between the feeding artery and draining vein. If this transition is made directly, then it is considered an arteriovenous fistula, which is a separate type of cerebral vascular anomaly.

### Advances in NOWinBRAIN 3D Neuroimage Large Repository: Cortical and Cranial Openings and Neurologic Disorders

#### TEACHING POINTS

The exhibit: 1) Demonstrates a novel image display and exploration method using sequences of cortical and cranial openings; 2) Enables skull-brain correlation via cranial openings exposing the underlying parcellated and labeled brain (divided into lobes, gyri, and sulci) and intracranial arteries and venous system; 3) Facilitates brain-intracranial arteries correlation by opening 64 gyri and 6 lobules exposing the white matter and the arteries usually hidden deep in the sulci; 4) Provides a correspondence between brain damage (lesion) and the resulting disorder for vascular, cranial nerve and regional anatomy-related synthesized lesions, each lesion labeled with a disorder, signs, symptoms, and/or syndromes; 5) Presents a wide spectrum of over 8,600 3D neuroimages systematically organized, named and grouped into over 630 folders; 6) Is a valuable resource for medical students and residents as well as educators to prepare presentations.

#### TABLE OF CONTENTS/OUTLINE

The NOWinBRAIN repository contains 12 galleries (G1-G12) with 3D neuroimages derived from 3D brain atlases constructed from multiple 3/7 T MR and CT scans of a living brain. Galleries G1-G6 with 5000+ images were earlier presented at RSNA. For RSNA 2023 this repository is extended, enhanced, and two new galleries are created with cortical and cranial openings (G8) and 3D simulated neurologic disorders with outcomes (G11). The NOWinBRAIN repository is web-based and publically available at [www.nowinbrain.org](http://www.nowinbrain.org)

### Brain Bubbles: Updates on Intracranial Cystic Lesions

#### Participants

Azza Reda, MD, Ottawa, ON (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- To describe the intra- and extra-axial cystic lesions based on the anatomical location.
- To highlight the recently described and updated cystic lesions.
- To provide an algorithmic approach describing incidental lesions elucidating the differential diagnosis with an aim to recognize do not touch lesions, aid in appropriate management, and prevent inadvertent surgical intervention.

#### TABLE OF CONTENTS/OUTLINE

Updated approach to diagnose neoplastic and neoplastic intracranial cystic lesions A. Intra-axial: supra and infratentorial parenchymal lesions. B. Extra-axial: supra and infratentorial; and each divided, into midline, off midline, and intraventricular lesions. Intra-axial cystic lesions • Non neoplastic lesions: Enlarged perivascular spaces (Glymphatic system and tumefactive type), Neuroglial cyst, porencephalic cyst, and ependymal cyst. • Infectious cysts: Cryptococcosis, Neurocysticercosis, and abscess. • Neoplastic lesions: MVNT and MVNT plus, DNET, ganglioglioma, metastasis, glioblastoma and oligodendroglioma, pilocytic astrocytoma, haemangioblastoma, medulloblastoma, pleomorphic xanthoastrocytoma, and rarely ependymoma. Extra-axial cystic lesions • Non neoplastic lesions: Pineal cyst, Rathke's cleft cyst, normal, arachnoid cyst, dermoid, epidermoid cyst, choroid plexus cyst and fissure, colloid cyst, Neurocysticercosis and neuroenteric cyst. • Neoplastic lesions: craniopharyngioma, schwannoma, ependymoma and pituitary apoplexy. Significant emphasis would be on the atypical cystic brain metastatic lesions and don't touch lesions.

### Caught in the Web: Imaging Techniques in Identifying Ischemic Stroke Due to Carotid Web

#### Participants

Ana Luiza Basilio Franca, Rio De Janeiro, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The carotid web is a rare vascular anomaly that can lead to ischemic stroke. Its diagnosis and management can be challenging due to its limited pathophysiology and presentation understanding. However, advanced diagnostic imaging techniques have greatly enhanced the identification and management of the carotid web. This educational exhibit highlights the importance of early detection, accurate diagnosis, and interdisciplinary approach to carotid web management: To illustrate carotid web radiologic highlights. To explain the complications involved with the finding. To explain the imaging assessment.

#### TABLE OF CONTENTS/OUTLINE

1. Definition of carotid web and revision of epidemiology, clinical presentation, and etiology, including prevalence and incidence of the carotid web, common clinical presentations, and etiological factors contributing to carotid web. 2. CT angiography highlights. 3. Underlying factors contributing to carotid web development, including early detection and management importance. 4. Differential diagnosis of carotid web and the importance of accurate diagnosis for appropriate management. 5. Potential complications associated with carotid web and the importance of identifying and managing complications promptly. 6. Clinical perspective: current management strategies for carotid web and the importance of an interdisciplinary approach to the patient. 7. Take-home messages.

### Big Vents: Causes of Hydrocephalus

#### TEACHING POINTS

Classification and terminology of hydrocephalus continue to be sources of confusion and debate in the literature. This exhibit provides an overview of the ventricular system and hydrocephalus classification scheme, covering typical pathologies and their imaging findings to enable the reader to approach hydrocephalus confidently. Normal ventricular anatomy consists of four interconnected choroid plexus-lined cavities and two canals. Anatomic variants can mimic hydrocephalus. Hydrocephalus is a disorder of flow, formation, or resorption of cerebrospinal fluid (CSF). Hydrocephalus classification is based on obstruction site and includes high pressure, normal pressure (NPH), and low-pressure subtypes. Intraventricular obstructive hydrocephalus (IVOH) inhibits CSF outflow due to obstruction at or before the 4th ventricle. Extraventricular obstructive hydrocephalus (EVOH) is due to obstruction anywhere from the 4th ventricular outlet foramina to the arachnoid granulations. Overproduction hydrocephalus is frequently caused by choroid plexus papilloma. NPH is diagnosed via a combination of history, neurological examination, and specific imaging findings. Syndrome of Inappropriately Low-Pressure Acute Hydrocephalus (SILPAH) is a rare and unrecognized condition with imaging findings mirroring severe obstructive hydrocephalus.

#### TABLE OF CONTENTS/OUTLINE

Ventricular Anatomy CSF Production and Circulation Models Normal Variants Hydrocephalus Classification High Pressure subtypes IVOH EVOH Overproduction NPH SILPAH Summary

### CNS Imaging Correlates of an FDA Cleared Diagnostic Meningitis/Encephalitis Panel

#### Participants

Norbert Campeau, MD, (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Diagnosis of CNS infections from cerebrospinal fluid collected by lumbar puncture is increasingly performed using comprehensive diagnostic panels. 2. This exhibit serves as a useful imaging reference atlas for the 14 microbial entities of meningitis/encephalitis included on an FDA cleared diagnostic panel which includes 6 bacteria, 7 viruses, and 1 yeast. 3. Knowledge of the imaging findings for these entities is clinically useful to monitor the extent of CSF involvement in known positive cases, or to suggest CSF testing in suspected cases undergoing CNS imaging. 4. The relative merits of CT, MRI and cranial ultrasound imaging modalities and contrast use will be discussed.

#### TABLE OF CONTENTS/OUTLINE

A. The 14 microbial entities included on the diagnostic panel are: - 6 bacteria (*Haemophilus Influenza*, *Streptococcus pneumoniae*, *Neisseria meningitidis*, *Escherichia coli* K1, *Streptococcus agalactiae*, *Listeria monocytogenes*) - 7 viruses (*Enterovirus*, *Cytomegalovirus*, *Herpes Simplex 1*, *Herpes Simplex 2*, *Human Herpesvirus 6*, *Human parechovirus*, and *Varicella zoster*) - 1 yeast (*Cryptococcus neoformans/C. gattii*) B. The CNS imaging findings for each of the above microbial entities will be presented, including a brief synopsis of the epidemiology and clinical presentation. C. Summary Table of Imaging Findings.

### **Radiologist's Guide to Image-guided Spinal Steroid Injections: Anatomy, Procedural Technique, and Potential Pitfalls**

#### **Participants**

Jeffrey Ling, MD, Joint Base Lewis-McChord, WA (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Review pertinent spinal anatomy with emphasis on key radiographic landmarks for epidural needle access. Discuss the utility and indications for spinal steroid injections in the setting of neck or back pain. Provide a brief overview of image guided approaches that can be utilized for spinal steroid injections. Understand potential procedural pitfalls and complications.

#### **TABLE OF CONTENTS/OUTLINE**

Introduction Epidemiology of painful spine conditions and associated imaging findings. Relevant anatomy of the lumbar and cervical spine. Indications and contraindications of image-guided steroid injections. Choice of corticosteroid and/or local anesthetics. Potential procedural risks and complications. Procedure approach and technique Preprocedural planning: evaluate degenerative disease at the target level, assess epidural target and adjacent structures, anticipate distance to target and optimal needle length; CT versus fluoroscopy technique. Interlaminar epidural steroid injections. Transforaminal epidural steroid injections: supraneural approach, infraneural approach. Complications Common: temporary local discomfort during needle placement; inadvertent dural puncture (CSF leak). Rare, serious: contrast reaction; hemorrhage, epidural hematoma; spinal cord infarct (intravascular injection). Discussion Evaluation of post-procedural improvement in pain. CT versus fluoroscopy. Review of tips and tricks for technical procedural success. Alternative options for pain relief.

NREE-94

### The Big Picture: A Radiologist's Guide to Unlocking the Intricacies of Pediatric Neurometabolic Diseases

#### TEACHING POINTS

1. Brain MRI is the primary imaging modality for assessing neurometabolic disease in children. 2. MR spectroscopy should be considered as a supplemental imaging tool when neurometabolic disease is suspected. 3. Symmetric signal abnormalities involving white matter, basal ganglia, thalami, brainstem, and cerebellum can be major clues on imaging for neurometabolic disease. 4. Narrowing down the differential diagnosis requires further assessment of anatomic distribution, temporal progression, and additional imaging findings such as cysts and calcifications. 5. Age at presentation, particularly neonatal onset, is an important factor to consider when diagnosing devastating metabolic diseases in newborns.

#### TABLE OF CONTENTS/OUTLINE

Introduction Brief overview of the importance of radiological assessment in pediatric neurometabolic disease  
Imaging Modalities for Neurometabolic Disease Highlighting brain MRI as the primary imaging modality  
Discussing the added value of MR spectroscopy  
Clues on Imaging for Neurometabolic Disease Describing specific patterns and findings on imaging, such as symmetric signal abnormalities involving white matter, basal ganglia, thalami, brainstem, and cerebellum  
Emphasizing the importance of pattern recognition in identifying potential neurometabolic disease  
Narrowing Down the Differential Diagnosis Discussing the role of further assessment, including anatomic distribution, temporal progression, and additional imaging findings such as cysts and calcifications  
Highlighting the significance of age at presentation, particularly neonatal onset  
Conclusion Summarizing the key take-home messages for radiologists in imaging pediatric neurometabolic disease

### Multimodality Imaging of Cerebral Vasospasm

#### Participants

Mikel Elgezabal, MD, Barrika, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To highlight key concepts such as symptomatic vasospasm, radiographic vasospasm and delayed cerebral ischemia, that will help the reader understand cerebral vasospasm and its consequences. 2. To describe different diagnostic methods for detection of cerebral vasospasm, each with their advantages and disadvantages, providing illustrative examples. 3. To propose a practical diagnostic-therapeutic approach of severe SAH and vasospasm.

#### TABLE OF CONTENTS/OUTLINE

1. Cerebral vasospasm: key concepts 1.1. Definitions: SAH, radiographic vasospasm, symptomatic vasospasm, delayed cerebral ischemia (DCI). 1.2. Etiology: SAH. Risk factors, diagnostic protocol, prognosis. 2. Diagnosis of cerebral vasospasm 2.1. Clinical signs and symptoms and other monitoring tools. 2.2. Transcranial Doppler ultrasound. 2.3. CT (NECT, CT perfusion, CTA) 2.4. DSA 2.5. Diagnostic management - proposed algorithm 3. Treatment: the fight against DCI 3.1. Medical treatment. 3.2. Angiographic/Interventional treatment and its complications. 4. Take home points

Printed on: 04/12/24

## Abstract Archives of the RSNA, 2023

NREE-96

### A Trip Through Gyriform Enhancement

#### Participants

Adria Roset Altadill, MD, Girona, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Gyriform enhancement is mainly secondary to vascular and infectious causes. - Gyriform enhancement should be discerned at imaging from leptomeningeal enhancement.- Distinction between the different etiologies of gyriform enhancement has to be made based on clinical history, brain distribution and ancillary radiologic findings.

#### TABLE OF CONTENTS/OUTLINE

Gyriform enhancement, also called gyral or cortical enhancement, is an uncommon brain pattern that refers to contrast deposition on the superficial grey matter of the cerebral cortex. The main causes of this enhancement pattern are vascular and infectious. Vascular causes can be related to arterial or venous infarctions, seizures, migraine syndromes, posterior reversible encephalopathy syndrome (PRES) and subarachnoid hemorrhage. Infectious processes include mainly herpes encephalitis, cerebritis and meningitis. Finally, gyral enhancement may also rarely occur in neoplastic diseases or cases of neurotoxicity. Cortical enhancement can be detected by contrast-enhanced head CT or brain MRI, although the latter is much more sensitive due to its higher contrast resolution. It is important to differentiate cortical enhancement from leptomeningeal enhancement, which can demonstrate a similar "serpentine" morphology but affects the subarachnoid space and the pia matter instead. In order to narrow the differential diagnosis between the spectrum of causes of cortical enhancement, a focus should be placed on clinical history, distribution of the gyral enhancement and ancillary radiologic findings.

NREE-97

### Cerebrovascular Disease in Young Adults: A Case-Based Review

#### Participants

Huijuan Wang, MD, Pontiac, MI (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Cerebrovascular disease (CVD) can result from blood vessel narrowing, rupture, or a hypercoagulable state, which may present on imaging as vascular stenosis, hemorrhage, or occlusion, respectively. As an emerging public health issue with debilitating effects on young adults, recognizing the similarities and differences between young adults and elderly patients for the etiologies and prevalence of various types of CVD is imperative for optimal patient outcomes.

#### TABLE OF CONTENTS/OUTLINE

1. Review the common etiologies and prevalence of cerebrovascular disease (CVD) in young adults and how this compares to elderly patients.
2. Categorize the differential diagnosis based on the general imaging appearance of vascular stenosis, hemorrhage, and occlusion in conjunction with the location of the abnormality.
3. Practice the diagnostic approach previously reviewed with multiple vignette-style young adult CVD cases with questions accompanying each case focused on differential diagnosis, prognosis, and management.
4. Discuss clinical presentation, key imaging findings, differential diagnosis, and management of each presented case.

Printed on: 04/12/24

### Imaging of Deep Brain Stimulation Systems

#### Participants

Alexandre Boutet, MD,MSc, Toronto, ON (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

(1) Deep brain stimulation (DBS) surgery, which is the most common functional neurosurgery treatment, is increasingly being performed worldwide. (2) Its therapeutic effect hinges upon accurate and precise targeting of the intended brain structure—maximizing therapeutic benefits while minimizing spillover onto neighbouring structures that may produce adverse effects. (3) Knowledge of the anatomical relationships of the most common targets including the subthalamic nucleus and pallidum is essential for accurate reporting. (4) Postoperative imaging of DBS patients is subject to strict MRI safety guidelines to prevent heating at the electrode tips, which is the main risk. Knowledge of the factors influencing safety such as specific absorption rate (SAR) is crucial to provide these patients with optimal MRI when it is required. (5) Interpretation of DBS postoperative imaging requires knowledge of the expected appearances and the complications. (6) Functional neurosurgery is a rapidly evolving field with considerable scope for the role of radiologists to grow beyond their current contributions.

#### TABLE OF CONTENTS/OUTLINE

(1) Brief background of functional neurosurgery focusing on DBS. (2) Anatomical relationships of the most common targets. (3) Framework on how to safely acquire MRI in postoperative DBS patients. (4) Expected and complicated postoperative imaging appearances of DBS. (5) Future directions and opportunities for radiologists.

### MRI Characteristics of Chemotherapy Related Central Neurotoxicity: A Pictorial Review

#### Participants

Rugaiyah Alkhatib, MBBS, FRCR, Singapore, Singapore (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Due to the increasing incidence of cancer and advancements in cancer treatment, the prevalence of chemotherapy-related neurotoxicity has also seen an increasing trend. Chemotherapy-related neurotoxicity is a well-recognized complication in oncologic patients, with a wide range of patients, from 19% to more than 85% receiving chemotherapeutic agents experiencing symptoms of neurotoxicity. This may present with a wide range of neurological manifestations, which can pose diagnostic challenges, particularly, in distinguishing it from tumor progression and paraneoplastic syndrome. Therefore, imaging plays a crucial role in the management of these patients. MRI can reveal various imaging patterns of chemotherapy-induced neurotoxicity, including acute-subacute leukoencephalopathy with reversible DWI pattern, commonly observed with methotrexate use, as well as acute cerebellar syndrome and reversible acute cerebellar toxicity patterns, which is most often induced by high-dose cytarabine. Other imaging patterns include posterior reversible encephalopathy syndrome, neurovascular complications pattern, progressive multifocal leukoencephalopathy pattern and spinal cord toxicity. In this pictorial review, we will highlight the MRI characteristics and patterns related to chemotherapy-induced neurotoxicity, as well as provide case-based examples to better illustrate these features.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction  
2. Types of chemotherapeutic agents and mechanism of action  
3. Characteristics MRI features of chemotherapy-induced central neurotoxicity  
4. Conclusion

Printed on: 04/12/24

## Abstract Archives of the RSNA, 2023

OBEE

### OB/Gynecology Education Exhibits

#### Sub-Events

#### OBEE-1 Isthmocele: A Simplified Guide

##### Participants

Isabela Ferracini, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

Isthmocele may be present in 24-69% of women evaluated with transvaginal ultrasound and may be the cause of several clinical dysfunctions: dysmenorrhea, abnormal uterine bleeding, obstetric complications and perhaps even subfertility. When found in an ultrasound examination, there are several criteria to be considered. Accurate reporting of the description and measurement of this area in ultrasound examinations becomes important not only for research, but also for the clinical approach and planning of surgical treatment and to standardize the language in the documentation of the examination and the performance of reports. The objective of this work is to carry out a didactic review of how to examine an isthmocele in non-pregnant women, based on the first European consensus.

##### TABLE OF CONTENTS/OUTLINE

A literature review was carried out and cases of ultrasound, magnetic resonance imaging and hysterospingography obtained from the digital archive of our institution. We approach a didactic review of the imaging aspects and how to measure them adequately, including teaching points and additional cases.

#### OBEE-10 Diaphragmatic Endometriosis: A Breathtaking Challenge

##### Participants

Nathalie Burger, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

1) This study aims to demonstrate MR's feasibility and accuracy in detecting diaphragmatic endometriosis, which can cause long-standing disability and pain, negatively impacting quality of life. 2) Symptomatic diaphragmatic endometriosis is part of thoracic endometriosis syndrome, usually diagnosed later than pelvic endometriosis. The symptoms include chest pain, shortness of breath and coughing, worsening during menses, and associated with pneumothorax and phrenic nerve irradiation. 3) Endometrial cells follow peritoneal circulation through the right paracolic gutter towards the right subdiaphragmatic area, where they can aggregate and form nodules, favored by a preferred stagnation site in the posterior portion of the right side of the diaphragm. 4) MR allows high-sensitivity diagnosis of diaphragmatic endometriosis, offering better characterization of hemorrhagic lesions on fat-suppressed T1-weighted sequences and requiring no radiation exposure. 5) Diaphragmatic lesions present hyperintense nodules on fat-suppressed weighted sequences. Herniation is less frequent and can result from repeated proliferation, bleeding, and necrosis of endometriotic lesions leading to fenestrations and partial or complete diaphragmatic rupture.

##### TABLE OF CONTENTS/OUTLINE

1) Know What You're Dealing With: Anatomy and main symptoms 2) Active Search: MRI Protocol 3) Behold the visual representation of diaphragmatic lesions on magnetic resonance 4) What information should the gynecologist look for in the report? 5) Pearls and pitfalls in the differential diagnosis.

#### OBEE-11 Unfolding Endometriosis Clinical Cases Controls: What to Look For

##### Participants

Brainer Brandao Salomao, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

Endometriosis is a chronic disease that impacts women from adolescence to menopause. Treatment options can vary from hormonal suppression to radical surgery and should be individualized and personalized. This educational exhibit presentation aims to: ? Discuss the clinical management of endometriosis including the different drugs available; ? Discuss the imaging methods available for hormonal treatment controls; ? Discuss imaging findings of endometriosis clinical controls.

##### TABLE OF CONTENTS/OUTLINE

? To discuss the available drugs used in the clinical management of endometriosis, including its mechanisms of action and therapeutic efficacy, such as: ? Combined oral contraceptives; ? Selective estrogen receptors modulators; ? Hormonal intrauterine device (IUD); ? Progestins; ? Selective progesterone; ? GnRH agonists; ? Oral GnRH antagonists; ? Aromatase inhibitors; ? Review clinical cases undergoing medical treatment and the correlation between clinical response and imaging findings in different sites such as: ? Retrocervical disease; ? Deep endometriosis with myometrial infiltration; ? Endometriomas; ? Intestinal lesions; ? Diaphragmatic lesions; ? To discuss genetic and immunological aspects that can interfere with clinical response.

## **OBEE-12 Uterine Sarcomas: Update on Pathologic and Imaging Findings**

### **TEACHING POINTS**

Demonstrate the imaging features that favor the diagnosis of uterine sarcomas and the particularities of each subtype; review staging and the role of imaging in monitoring response and suspected recurrence. Recognize their mimickers.

### **TABLE OF CONTENTS/OUTLINE**

Gynecologic sarcomas are rare tumors and usually have an unfavorable prognosis. Magnetic resonance imaging (MRI) is the best method for characterization of these tumors, initial staging and treatment planning. MRI shows features that can be used to try to differentiate between subtypes of uterine sarcomas. Combined DWI and DCE techniques allow more accurate assessment of the degree of myometrial and cervical invasion and characterization of potential metastatic sites. Although several findings increase the suspicion of malignancy in gynecologic tumors (including irregular contouring, intratumoral necrosis/hemorrhage, and low ADC values), some particular features may suggest the diagnosis of sarcoma, such as macroscopic lymphovascular invasion in cases of endometrial stromal sarcomas, the "bag of worms" aspect of low-grade endometrial stromal sarcoma, and the "lattice-like" appearance of adenocarcinomas that result from the mixed composition of solid and cystic multiseptate components. Their diagnosis remains a challenge in the radiologist's practice.

## **OBEE-13 Imaging in Pregnancy: Safe and Sound With Contrast-Enhanced US**

Participants

Stephanie Nguyen, MD, MSc, Calgary, AB (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

(1) Contrast-enhanced US (CEUS) is safe in pregnancy (2) Microbubble contrast agents do not cross the placental barrier (3) CEUS in pregnancy is an effective alternate to CT and MRI when enhanced imaging is required (4) A major indication is in the determination of malignancy when masses anywhere in the abdomen or pelvis are found in a pregnant patient (5) Ability of CEUS to differentiate benign from malignant processes allows prompt diagnosis and management with significant implications on maternal and fetal outcomes (6) CEUS is capable of evaluating more than one organ in any patient

### **TABLE OF CONTENTS/OUTLINE**

(1) Review of the safety record of CEUS in pregnancy (2) CEUS technique in the pregnant patient (3) Case examples (3a) Malignant lesions (3b) Benign diseases (3c) Assessment of acute pain in pregnancy

## **OBEE-14 Beyond the Scar: A Comprehensive Guide to Postoperative Endometriosis Imaging**

Participants

Sofia Maksoud, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

Endometriosis affects approximately 176 million women worldwide, with a prevalence of one in ten women during the reproductive period. Treatment can be clinical or surgical. The main surgical indications include clinical failure, lesions in the appendix, small bowel lesions, intrinsic ureter involvement and rectosigmoid (greater than 50% of the circumference). The goals of surgery include radical removal of all lesions and the restoration of normal pelvic anatomy. Postoperative evaluation is the new challenge of imaging studies, as the number of radical surgeries to treat endometriosis has increased enormously. Radiologists must be familiar with the common imaging findings, possible complications and the differentiation between residual disease and fibrotic scar.

### **TABLE OF CONTENTS/OUTLINE**

- Review the common post-surgical findings following surgery for deep endometriosis.- Differentiate residual / recurrence disease and fibrotic scar. - Illustrate didactical cases with pre and post-surgical imaging.- Be familiar with possible complications after surgery.

## **OBEE-15 What Not to Miss in Obstetric Ultrasounds - Multifetal Pregnancies: Chorionicity and Amnionicity**

Participants

Laura Santiago Caobi, Ponce, PR (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

- Review the embryologic division in multifetal pregnancies and its significance for prenatal care. - Discuss the criteria for the classification of twin pregnancies using ultrasounds. - Provide case examples for classic imaging for each type of multifetal pregnancy. - Use an algorithm to assist in ultrasound monitoring and surveillance of multifetal pregnancies.

### **TABLE OF CONTENTS/OUTLINE**

Multifetal pregnancies pose a significant risk for adverse outcomes compared to singleton pregnancies. Early and accurate diagnosis requires a comprehensive understanding of chorionicity and amnionicity. Ultrasound evaluation of placental number, interposed membranes, fetal genders, amniotic fluid volume, and presence of lambda sign are key for successful assessment of chorionicity and amnionicity. The use of an algorithm for ultrasound monitoring and surveillance of multifetal pregnancies can aid facilitate early interventions that will benefit the health of both, mother and fetus. Outline: (1) Introduction Objectives, (2) Multifetal Pregnancies, (3) Division Timing, (4) Classic Imaging Findings for Each Type of Multifetal Pregnancy, (5) Ultrasound Criteria for Diagnosis of Type of Multifetal Pregnancy, (6) Comparison of Fetal and Infant Mortality Rates, (7) Algorithm for Ultrasound Monitoring and Surveillance, (8) Case Examples, (9) Conclusion

## **OBEE-16 Don't Forget the Bowel: Imaging Techniques, Associations and Treatment Implications of Bowel Endometriosis**

Participants

Haatal Macer, MD, MS, Rolling Hills Estates, CA (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

1. As the GI tract is the most common extragenital organ involved with endometriosis, imagers need to actively look for bowel involvement. Therefore, our exhibit will highlight the associations of bowel endometriosis leading imagers to actively look for bowel implants. 2. Practical tips on Ultrasound and MRI technique of bowel endometriosis imaging and how to improve lesion detection. 3. Discussion of detailed assessment of large and small bowel involvement with implications on management, especially related to pain and fertility, will be highlighted.

#### TABLE OF CONTENTS/OUTLINE

1. Background of GI tract endometriosis. 2. Associations: Incidence and prevalence with ovarian endometriomas; deep pelvic endometriosis especially with posterior compartment (rectovaginal and uterosacral ligament) involvement. 3. Ultrasound Technique: Bowel preparation; transvaginal technique for delineating normal anatomy and pathology; tips on separating bowel layers on ultrasound enabling detection of depth of muscle invasion. 4. MR Enterography: bowel preparation; role of antispasmodics; MR protocol favoring detection of appendiceal, ileocecal junction, small bowel and rectosigmoid deep endometriosis. 5. Detailed anatomic reporting of small and large bowel disease that have implications on management, particularly related to pain and fertility.

#### OBEE-17 Unmasking Atypical Adenomyosis: Imaging Spectrum with Laparoscopic and Pathologic Correlation

Participants

Brainer Brandao Salomao, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Adenomyosis is a prevalent gynecologic condition defined by the presence of endometrial glands and stroma within the myometrium. 2. It remains poorly understood with severe implications on fertility and quality of life. 3. Although there is no agreement on the imaging classification of adenomyosis, the typical features are more discussed and widely known. 4. MUSA statement consensus is an important available tool to recognize and describe the typical forms of adenomyosis on ultrasound. 5. Atypical presentations of adenomyosis are less discussed, remaining a diagnostic challenge. 6. This presentation aims to review imaging findings of atypical adenomyosis, highlighting their potential differential diagnosis, as well as their impact on clinical management and patients outcome.

#### TABLE OF CONTENTS/OUTLINE

- Overview of adenomyosis. - Review imaging-based adenomyosis classification. - Ultrasound and MRI imaging findings of atypical adenomyosis, including: Solid adenomyoma; Cystic adenomyoma; Submucosal adenomyoma; Subserosal adenomyoma; Accessory cavitated uterine mass; Polypoid adenomyoma; Adenomatoid tumor. - Differential diagnosis, such as: Adenosarcoma; Cystic / hemorrhagic degeneration of leiomyoma; Cellular degeneration of leiomyoma; Isthmocele; Unicornuate uterus. - Present clinical cases with laparoscopic and pathological correlation. - Summary of key concepts.

#### OBEE-18 Exploring the Pelvic Floor through MRI - A Comprehensive Trainee's Handbook

Participants

Jessica A. Marques Silva, MD, Houston, TX (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1) This review highlights the benefits and recent updates in defecography, a radiological examination used to evaluate patients with defecatory and pelvic floor dysfunction. This functional anatomical condition affects support structures and is more common in women over 50 years old. 2) MR defecography evaluates multicompartamental dysfunction, etiologies of defecation dysfunction, and postoperative complications and recurrence, providing both anatomical and functional information while allowing simultaneous assessment of the anal sphincters. 3) Most patients present changes in more than one compartment, and the reoperation rate after initial pelvic floor surgery is high. Understanding changes in various compartments can contribute to reducing the need for reapproaches. 4) Examples of pathologies found in defecography include cystocele, urethral hypermobility, uterine and vaginal prolapse, background hernias, and intussusception. This review discusses the implications of these findings for clinical practice.

#### TABLE OF CONTENTS/OUTLINE

1) 1) General Aspects: A Little Bit of Everything; 2) Essential MR Protocol - What you need to remember; 3) Assessing the dynamic study on MR; 4) MR images evaluation - Is defecating three times really necessary?

#### OBEE-19 Adeno-My-Goodness: Comprehensive Review of Adenomyosis

Participants

Paulo Miro, MD, Salt Lake City, UT (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Adenomyosis is a prevalent condition which may cause symptoms (such as abnormal uterine bleeding and pain), and affect pregnancy outcomes. Ectopic endometrial glandular tissue within the uterine myometrium with associated smooth muscle hypertrophy may have a variety of appearances across the imaging modalities. Imaging findings may be further confounded by hemorrhage or development of myometrial cysts, and changes under the hormonal influence (particularly during pregnancy). Cases may arise when adenomyosis mimics uterine malignancy, and uncommonly, malignancy may arise from the glandular tissue within adenomyosis. This exhibit is a comprehensive review of adenomyosis across multiple imaging modalities with pathologic and graphical correlation.

#### TABLE OF CONTENTS/OUTLINE

Relevant uterine anatomy  
1. Classic Imaging Findings of Adenomyosis  
A) Ultrasound "Adeno"  
• Echogenic striations/buds  
• Myometrial cysts  
• "Myosis"  
• Myometrial thickening (focal or diffuse)  
• Globular uterus  
• Thickened inner myometrium  
• "Venetian blinds" shadowing  
B) MRI "Adeno"  
• T2 hyperintense foci and myometrial cysts  
• T1 hypointense foci  
• "Myosis"  
• T2 hypointense junctional zone thickening  
• Myometrial thickening (focal or diffuse)  
C) CTD  
• Hysterosalpingogram  
2. Atypical findings of adenomyosis  
A) Cystic/hemorrhagic  
B) Pedunculated  
3. Adenomyosis in pregnancy  
4. Clearing up the confusion between focal adenomyosis and adenomyoma (the mixed Mullerian tumor)  
5. Malignancy arising within adenomyosis

## **OBEE-2 Postpartum Woman in the ER? A Surviving Guide for the On-Call Radiologist**

Participants

Marta Barrios Lopez, MD, Santander, Spain (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

1. To learn what are the main puerperal obstetric complications and their imaging findings. 2. To understand the importance of clinical correlation in the diagnosis of many of these conditions: some can only be diagnosed in the proper clinical setting and a high suspicion is essential. 3. To review the anatomy landmarks necessary to locate certain types of hematomas.

### **TABLE OF CONTENTS/OUTLINE**

1. Normal imaging findings during the puerperium: Vaginal delivery. 2. Normal imaging findings during the puerperium: Cesarean delivery. 3. Surgical technique for Cesarean section and potential complications at each step. 4. Thromboembolic conditions: 4.1. Ovarian vein thrombosis/ thrombophlebitis and their complications. 5. Infectious complications 5.1. Postpartum endometritis. 6. Hemorrhagic complications 6.1. Lower genital tract injury: supra and infralevator hematomas. 6.2. Abnormal placentation: placenta accreta, increta, percreta. 7. Cesarean-related complications 7.1. Wound cellulitis/ abscess 7.2. Uterine dehiscence 7.3. Bladder flap hematoma 7.4. Subfascial hematoma 7.5. Rectus sheath hematoma 7.6. Urinary tract injury

## **OBEE-20 Imaging of Functional Ovarian Tumors and Tumor Like Conditions with Pathological Correlation**

Participants

Khaled M. Elsayes, MD, PhD, Houston, TX (*Presenter*) Nothing to Disclose

Niloofer Karbasian, MD, (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

1. Describe the ovarian histology and the hormone axes. 2. Discuss clinical features of hormone excess as secondary signs of hormone producing tumors and tumor like conditions. 3. Explain different categories of functional ovarian tumors and tumor like conditions. 4. Illustrate multimodality imaging characteristics of different tumors.

### **TABLE OF CONTENTS/OUTLINE**

1. Ovarian histological anatomy a. Including role of different cell types within the ovary 2. Hypothalamus-Pituitary-Ovary axis a. Introduce sex hormones and their role b. Flowchart demonstrating the hormone pathways 3. Clinical features of hormonal excess. a. Excess androgen and symptoms b. Excess estrogen and symptoms 4. Subtypes of functional ovarian tumors. a. Sex cord-stromal b. Surface epithelial c. Stroma d. Tumor-like lesions and conditions 5. Approach to diagnosing functional ovarian tumors a. Multidisciplinary approach i. Role of imaging. ii. Hormonal analysis in follow up. iii. Tissue sample often needed for diagnosis. b. Imaging direct and indirect signs of hormonal excess. i. Contribution of different modalities: US, MRI, CT. ii. Features of malignancy. iii. Radiologic examples of different functional tumors. c. Pathology correlation 6. Treatment options a. Conservative b. Surgical c. Prognosis

## **OBEE-21 Decoding the Pandora's Box With Fetal MRI: A Comprehensive Pictorial Review of Fetal Abdominal Abnormalities**

Participants

Taruna Yadav, MD, Alwar, India (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

1. To study indications, advantages and limitations of fetal MRI for antenatal assessment of various abdominal anomalies. 2. To define a standard MRI protocol for assessment of fetal abdominal anomalies. 3. Using a case-based approach, to learn about myriad of common and rare fetal abdominal anomalies including gastrointestinal (bowel atresias, meconium peritonitis), genitourinary (posterior urethral valve, urethral atresia, pelviureteric junction obstruction, cystic renal dysplasia, fetal pyelectasis, ectopic kidney, syndromic associations like Meckel Gruber and Joubert syndrome), ventral wall defects (gastroschisis, omphalocele, limb body wall defects, pentalogy of Cantrell, bladder exstrophy, amniotic band syndrome), pelvic disorders including presacral masses (sacroccygeal teratoma, anterior meningocele) with syndromic associations and follow up (wherever available). 4. To develop an imaging approach to complex fetal abdominal anomalies including ventral abdominal wall defects.

### **TABLE OF CONTENTS/OUTLINE**

1. Role of MRI for assessment of fetal abdomen: indications, advantages and limitations 2. Fetal MR protocol to assess various abdominal anomalies 3. Fetal Abdominal Anomalies (A Case Based Approach): 3A. Gastrointestinal anomalies 3B. Genitourinary anomalies 3C. Ventral wall defects: spectrum of anomalies and simplified imaging approach 3D. Pelvic disorders: presacral masses 3E. Syndromic associations 3F. Miscellaneous 4. Conclusion

## **OBEE-22 Magnetic Resonance Imaging in Obstetric Patients: How Can We Help?**

### **TEACHING POINTS**

? Brief review of indications and protocols of obstetric magnetic resonance imaging (MRI)? Illustrate the characteristics of image in cases of normal anatomy obstetric patients, when appropriate? Review most common pathologies in obstetric cases? Highlight the impact of imaging in the management

### **TABLE OF CONTENTS/OUTLINE**

? MRI indications and protocols? MRI obstetric normal anatomy, when appropriate? MRI aspects of obstetrics patients: pathologies and complications: ? Placenta accreta? Different locations of ectopic pregnancies? Heterotopic pregnancy? Angular pregnancy? Uterine perforation? Per vaginal bleeding in pregnancy? Miscarriage / Retained products of conception? Uterine arteriovenous malformation? Gestational trophoblastic disease? Applications in fetal pathologies or malformations (for example: fetus with cervical mass, congenital diaphragmatic hernia, congenital pulmonary airway malformation and fetal urinary tract anomalies)

## **OBEE-23 Placenta 101: A Pictorial Review of Normal and Pathological Findings by US and MRI**

### **TEACHING POINTS**

To normal thickness of the placenta is 2 to 4 cm, and it must be measured where the umbilical cord is inserted. Placental grading maturity (Grannum classification) is divided into 4 grades by ultrasound and it is based on the extent of calcifications. To differentiate a retroplacental hematoma from a uterine contraction, it is recommended to wait a few minutes for the contraction to disappear. An easy Doppler finding for the differentiation of hematomas from other placental masses is the absence of internal blood flow. Currently, when the placental edge is less than 20 mm away from the internal cervical orifice (ICO) is a low-lying placenta, and when the placenta covers partially or completely the ICO, it is called placenta previa.

#### TABLE OF CONTENTS/OUTLINE

History. Embryology. Normal appearance and grades of maturation. Variations in placental morphology. Placental hematoma. Placenta previa. Placental accretion. Placental tumors. Teaching points. Conclusion. Bibliography.

#### OBEE-24 FOMO, No More - A Comprehensive Guide for Identifying Head to Toe Fetal Anomalies

##### TEACHING POINTS

To highlight the importance of level I scan and develop an algorithmic approach to diagnose structural anomalies at the earliest. To diagnose progressive anomalies on subsequent scans and devise a trimester based checklist to avoid missing abnormalities. To assess the maternal risk factors in conjunction with fetal parameters to be able to assess growth of the fetus as well as restriction. To know the importance of color doppler in all the scans and how it affects further management. Scanning beyond fetus- to diagnose various placental, uterine and adnexal abnormalities for effective management. An obstetric ultrasound plays a pivotal role in each stage of pregnancy in providing a non-invasive diagnostic method, yielding immediate, extensive and accurate results for evaluating the fetus as well as the health of the mother. Protocol based screening reduces the "fear of missing out" an abnormality.

#### TABLE OF CONTENTS/OUTLINE

1. First Trimester Scan A) Early First Trimester: • Ectopic pregnancy • Twin or higher order pregnancy with correct labelling • Adnexal abnormality B) Late First Trimester: Detectable 9 • Anencephaly • Holoprosencephaly • Encephalocele • Omphalocele • Gastroschisis • Iniencephaly • Limb abnormality • Megacystis • Major cardiac defects • First trimester markers for chromosomal abnormalities • Abnormal UAD 2. Second Trimester Scan • Detectable 9 • Cardiac defect • Situs abnormalities • Spinal abnormalities • Placental abnormalities 3. Fetal Echocardiography 4. Third Trimester Scan • Evolving cardiac abnormalities • Placental abnormalities • Abnormal Doppler

#### OBEE-25 Patterns of Ovarian Cancer Recurrence on MDCT: Early Imaging Features

Participants

Sharad Maheshwari, MD, (Presenter) Nothing to Disclose

##### TEACHING POINTS

1. Review of Ovarian ca 2. Review the pattern of recurrence in ovarian ca 3. Review Application of clinical laboratory findings with Imaging 4. Understand the role of imaging, how it can potentially accelerate time to treatment.

#### TABLE OF CONTENTS/OUTLINE

1. General overview of ovarian ca a. Epidemiology recurrence rates b. Pathogenesis how tumour spreads c. Clinical presentation Tumour markers d. quick review of treatment options 2. Multimodality imaging appearance a. Why cross sectional Imaging b. Benefits of MDCT c. Role of MRI PET c. Scanning protocol d. Recurrence sites appearance on Imaging: - Peritoneum - Mesentery - Nodes - Perihepatic and fissural spread - The muscle planes - Urinary bladder surface - Serosal deposits on the bowel surface - Miscellaneous sites e. Review protocol: Region wise f. Examples of early recurrence that would have been missed on routine imaging

#### OBEE-26 See What's Inside: A Look at Pelvic Devices

Participants

Flavia M. Starling, MD, Sao Paulo, Brazil (Presenter) Nothing to Disclose

##### TEACHING POINTS

The female pelvis has a complex anatomy; thus, it requires deep study and its image can be challenging. Besides the anatomy knowledge, radiologists need to keep up with the daily devices and techniques, used by doctors and by the patients. It is important to be prepared to face unknown figures like foreign bodies, and also to recognize these devices in the pelvis, such as contraceptive methods (vaginal ring and intrauterine devices), tampons, menstrual cups, vaginal pessaries, catheters and slings. Questionnaires are often vague when referring to these devices and most women forget to mention actively whether they have or are using any of them. This study has the objective of reviewing common devices placed in the pelvis, especially in gynecology, urogynecology and its possible complications, helping radiologists to interpret these images. An understanding of the radiological appearance of some of these devices in the many imaging methods such as X-ray, ultrasound, CT and MRI is useful to avoid misinterpreting them, as well as obtaining a diagnosis more quickly and accurately.

#### TABLE OF CONTENTS/OUTLINE

For this education exhibit, we obtained clinical and epidemiological information in literature and selected images of cases that show different findings of women's vaginal and uterine devices, including normal aspects or complications.

#### OBEE-27 This Is Rare, but It Happens: Atypical Presentation of Teratomas

Participants

TATIANA GONCALVES, Rio de Janeiro, Brazil (Presenter) Nothing to Disclose

##### TEACHING POINTS

Teratomas are germ cell tumors composed of multiple tissues derived from two or three germ layers. Mature teratomas are the most common benign ovarian neoplasms. They are easily diagnosed on imaging studies because of their characteristic intratumoral fat and calcification components. However, a minor percentage of teratomas have no visible fat on imaging studies. Malignancy is an uncommon presentation, which may be suspected in the presence of an enhancing, irregularly marginated solid component. Gliomatosis peritonei (GP) is another unusual form, that it is characterized by the implantation of mature glial tissue in the

peritoneum or omentum. Mature teratomas have also an high complication rate compared with other ovarian tumors, however, there is a low rate of spontaneous rupture. The purpose of this presentation is to discuss the various atypical imaging features of teratoma that can be particularly misleading for radiologists.

#### **TABLE OF CONTENTS/OUTLINE**

Index 1. Introduction 2. Mature teratoma 3. Mature teratoma simulating malignant lesion 4. Gliomatosis peritonei 5. Immature teratoma 6. Ruptured teratoma 7. Pre sacral teratoma 8. Pre sacral myelolipoma and dermoid 9. Retrorectal dermoid 10. Cul-de-sac dermoid 11. Currarino syndrome

#### **OBEE-28 Adenomyosis: MRI for Diagnosis and Problem-Solving**

Participants

Lauren F. Alexander, MD, Jacksonville Beach, FL (*Presenter*) Spouse, Stockholder, Abbott Laboratories; Spouse, Stockholder, AbbVie Inc; Spouse, Stockholder, General Electric Company; Spouse, Stockholder, Myriad Genetics, Inc

#### **TEACHING POINTS**

Uterine adenomyosis develops from the abnormal proliferation of heterotopic endometrial glands and stroma in the myometrium. Recognizing the characteristic magnetic resonance imaging (MRI) findings is essential for accurate diagnosis and appropriate patient management, as clinical symptoms such as dysmenorrhea, menorrhagia and pelvic pain overlap with other gynecologic diagnoses. After reviewing this exhibit on adenomyosis, the learner will be able to -- Discuss how to optimize MRI sequences to evaluate for adenomyosis. -- Identify typical and atypical MRI findings of adenomyosis. -- Distinguish other diagnoses which can mimic or have overlapping findings with adenomyosis. -- Describe treatment options for patients with adenomyosis.

#### **TABLE OF CONTENTS/OUTLINE**

(1) Background: Pathophysiology of adenomyosis, Clinical findings, Role of imaging for diagnosis and management. (2) MRI protocol: Key sequences, Tips for optimization. (3) Imaging features on MRI: Normal anatomy, Typical adenomyosis findings, Atypical findings (Polypoid, External adenomyosis, Cystic adenomyosis without with hemorrhage, Pregnancy related changes, Endometrial ablation changes). (4) Differential diagnosis mimics: Deep infiltrating endometriosis, Leiomyoma, Neoplasms (endometrial cancer, Mullerian adenocarcinoma), Accessory and cavitated uterine mass, Pitfalls/Mimics (Uterine contraction, pseudo-thickening of junctional zone). (5) Treatment options: Medical, Procedural (ablation, excision, hysterectomy).

#### **OBEE-29 What Not to Miss in Obstetric Ultrasounds - Fetal Skeletal System Evaluation**

Participants

Oswaldo Guevara Tirado, BS, MS, Coto Laurel, PR (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Review the essential components of an ultrasound based fetal skeletal assessment. Discuss common sources of error when evaluating the fetal skeletal system using ultrasound. Analyze case examples of classic images with normal findings that are frequently misinterpreted. Follow a systematic approach to avoid missing significant skeletal defects.

#### **TABLE OF CONTENTS/OUTLINE**

Obstetric ultrasounds play a crucial role in the accurate identification of fetal skeletal abnormalities, allowing physicians to optimize management in order to improve both fetal and maternal outcomes. Fetal skeletal abnormalities can manifest early during embryonic life. Therefore, proper evaluation and identification of developmental anomalies requires a profound understanding of normal fetal development and knowledge about ultrasound imaging techniques. Moreover, it is important to take into consideration the various sources of error that exist when performing a fetal skeletal assessment. Ultrasound is the primary imaging modality used to assess fetal well-being by providing a non-invasive method to precisely identify fetal skeletal abnormalities, amongst other irregularities, and intervene in a timely manner. 1. Introduction Objectives 2. How to Approach the Fetal Skeletal System 3. Skeletal Assessment: Ultrasound Findings 3a. Long Bones 3b. Hands Feet 3c. Fetal Head 3d. Fetal Thorax 3e. Fetal Movement 4. Femur Length Measurement Sources of Error 5. Review of cases in quiz format 6. Conclusion

#### **OBEE-3 Get the Fluoroscopic Vibes: Hysterosalpingography, a Guide for Residents**

#### **TEACHING POINTS**

1. Illustrate the main normal imaging findings and technical procedures of hysterosalpingography including normal variants, non-pathological findings and technical artifacts. 2. Recognize abnormalities of the uterine cavity and fallopian tubes by hysterosalpingographic images and analyze the pathology and its impact on fertility. 3. Emphasize when further imaging modality such as sonohysterogram and magnetic resonance imaging or even hysteroscopic direct visualization is required in order to reach to the final diagnosis. 4. Discuss adequate surgical and non-surgical treatment options and possibilities of pregnancy post-treatment.

#### **TABLE OF CONTENTS/OUTLINE**

1. Review the key points of the female pelvic anatomy, indications and contraindications, technical procedures and normal hysterosalpingographic features. 2. Identify the most common anatomical variants (with and without proven influence on fertility), non-pathological findings and technical artifacts that may simulate causes of infertility. 3. Illustrate the characteristic hysterosalpingographic and other image modalities findings of uterine cavity and Fallopian tubes pathologies by analyzing representative cases and review several treatment options and assess the possibilities of fertility of each case. - Benign and malignant neoplasms - Tubal patency - Hormonal disorders - Post-surgical findings - Miscellaneous

#### **OBEE-30 Incidental Findings of Pelvic Endometriosis in Routine Transvaginal Ultrasound: A Pictorial Essay**

Participants

Alexandre Minoda, MD, Recife, Brazil (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

The aim of this exhibit is: • To conduct a review and illustrate through ultrasound images the female pelvic compartments. • To describe and disseminate the main ultrasound findings suggestive of deep infiltrating endometriosis (DIE) and ovarian endometriomas on transvaginal ultrasounds performed as part of a routine gynecological evaluation. • To demonstrate how the unique capabilities of

ultrasound can help in the diagnosis and management of patients.

#### TABLE OF CONTENTS/OUTLINE

INTRODUCTION / BACKGROUND• Epidemiology, clinical symptoms and classifications of endometriosisROUTINE TRANSVAGINAL ULTRASOUND AND TRANSVAGINAL ULTRASOUND AFTER BOWEL PREPARATION• International Deep Endometriosis Analysis (IDEA) group consensusPELVIC COMPARTMENTS• Anatomy and normal findings in routine transvaginal ultrasoundINCIDENTAL FINDINGS OF PELVIC ENDOMETRIOSIS IN ROUTINE TRANSVAGINAL ULTRASOUND• Anterior compartment• Middle compartment• Posterior compartment• Other findings that may optimize the diagnosis of endometriosis on routine transvaginal ultrasound

#### OBEE-31 How Far Can We Go With Computed Tomography in the Diagnosis of Endometriosis:- Correlation With MRI and US

Participants

Gabriel Faria Medeiros, Santo Andre, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Recognize the most common CT findings associated with endometriosis and how to describe them 2. Discuss and highlight the role of CT in aiding endometriosis management, by suggesting the diagnosis and prompting MRI recommendation, accelerating diagnosis and improving patient outcomes. 3. Illustrate cases where CT and MRI were both used in the diagnosis of endometriosis, with emphasis on how the correlation between the two modalities aided in the diagnosis. 4. Identify post-treatment changes and potential pitfalls

#### TABLE OF CONTENTS/OUTLINE

1. Introduction: Epidemiology, pathophysiology and clinical aspects of endometriosis Currently available treatment options 2. Role of different imaging techniques in diagnosis and assessment of disease extension (benefits and limitations) Hysterosalpingography Transvaginal ultrasound (with bowel preparation) CT MRI Videolaparoscopy 3. CT findings of endometriosis, with MRI correlation - Case-by-case discussion 4. Post-operative changes and confounding factors Salpingo-oophorectomy Hysterectomy Rectosigmoidectomy Post-radiation therapy Adhesions Inflammatory pelvic disease 5. Summary and take-home messages

#### OBEE-32 Smooth Seas Never Made Skilled Sailors: Navigating the Challenges That Arise After Cervical Cancer Treatments

#### TEACHING POINTS

To review the different radiotherapy modalities and the clinical indications in cervical cancer treatment.To identify the most frequent early and late complications of radiotherapy. To demonstrate that high doses of radiotherapy are associated with a greater risk of complications. To provide key points and radiologic tools in order to differentiate post-actinic changes from residual or recurrent disease.

#### TABLE OF CONTENTS/OUTLINE

Introduction: Epidemiology and clinical importance -FIGO staging review in cervical cancer -The role of radiotherapy treating cervical cancer. Early and late complications in the uterus, ovaries, intestines, bones, and bladder. Case based approach with radiologic correlation.Imaging findings with histologic and colonoscopy correlation. Conclusion.

#### OBEE-33 Imaging Uterus After Endometrial Ablation

Participants

Margarita Revzin, MD, MS, Wilton, CT (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Endometrial ablation is a minimally invasive surgical procedures available for the management of patients with abnormal uterine bleeding. Post endometrial ablation expected imaging findings and post procedural complications have a characteristic pattern on imaging and if not readily recognized by the radiologists may lead to misinterpretation and unnecessary follow up imaging and inadequate management. Teaching points The goal of this study is to familiarize radiologists with imaging findings of uterus after endometrial ablation therapy. This will serve to enhance recognition of normal imaging findings and life threatening conditions and help radiologists create a focused differential diagnosis for various complications after the procedure.

#### TABLE OF CONTENTS/OUTLINE

A. Review pathophysiology of dysfunctional uterine bleeding.B. Review of treatment options in management of DUB with emphasis on endometrial ablation C. Discuss imaging options available for the assessment of uterus after ablation: US, CT, MRI and their strengths and weaknesses D. Review key imaging features of the post endometrial ablation 1. Expected post-op changes (early: intracavitary air, intrauterine /cervical hematoma, uterus edema; late: endometrial cavity contracture, endometrial thinning) 2. Complications (immediate: infectious (endometritis, myometritis, salpingitis); cornual hematometra, hematosalpinx; chronic: synechia, infertility from post-ablation tubal sterilization syndrome, ectopic pregnancy, abnormal placentation, endometriosis, malignancy (adenocarcinoma of the uterus)E. Management of the presented post-ablation complications will be reviewed.

#### OBEE-34 Dedicated MR Imaging for Endometriosis: What You Can't Miss in Your Report

#### TEACHING POINTS

MR imaging is an important tool for diagnosis of deep pelvic endometriosis. Understanding and recognizing the MRI manifestations of this disease may be challenging. In this presentation, we will summarize the most important points to include in our reports considering a region-based reading and reporting system

#### TABLE OF CONTENTS/OUTLINE

Anterior compartment: -Differentiating bladder endometriosis from peritoneal endometriosis: bladder endometriosis is diagnosed when the muscular layer of the bladder is involved. If a bladder lesion is identified, informing the location, distance from vesical trigone and distal ureters are mandatory.Middle compartment: Characterization of endometriomas and differentiation with hemorrhagic ovarian cysts- it is a daily point of attention. -Malignant transformation of ovarian endometriosis: it should be

considered if vascular solid tissue is identified with Diffusion imaging and Dynamic post contrast sequences.-Endometriotic tissue infiltrating the uterus: including this information and its differential diagnosis is relevant for treatment planning. Posterior compartment: -Differentiating deep rectal endometriosis from superficial endometriosis: characterization of penetration from endometriotic tissue into muscular layer of rectal wall will be definitive. Location of the lesion (intraabdominal or extraabdominal) will also impact in treatment options. -Superficial endometriosis: this is a challenge in diagnostic imaging. Small deposits of glandular tissue are missed frequently. An indirect sign to look for is the peritoneal pocket sign, defined as a peritoneal defect that collects fluid, frequently identified in posterior cul de sac.

### **OBEE-35 Current Concepts in Imaging of Uterine Adenomyosis: What Radiologists Should Know**

Participants

Alexandre Minoda, MD, Recife, Brazil (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

The aim of this exhibit is:• To discuss the pathophysiology of adenomyosis and how it relates to imaging findings. • To describe the various US and MR imaging manifestations of adenomyosis. • To discuss the classifications of adenomyosis based on US and MR imaging findings. • To provide the diagnostic clues that allow differentiation of adenomyosis from its mimics.

#### **TABLE OF CONTENTS/OUTLINE**

INTRODUCTION• Historical background, epidemiology, pathophysiology, clinical features and phenotypes of adenomyosisTHE UTERINE JUNCTIONAL ZONE• Normal zonal anatomy, physiologic variations and alterations in adenomyosisIMAGING FINDINGS IN ADENOMYOSIS• Direct and indirect sonographic signs of adenomyosis• Direct and indirect MRI signs of adenomyosisCLASSIFICATIONS OF ADENOMYOSIS AND PHENOTYPES IN IMAGING• Atypical presentationsDIFFERENTIAL DIAGNOSIS AND PITFALLS IN DIAGNOSIS OF ADENOMYOSIS

### **OBEE-36 Practical Approach to Ovarian Masses - The ABC's**

Participants

Antonio Michael-Fernandez, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

- To know how to properly identify ovaries and its organ dependency when facing pelvic lesions.- Going over the most common and specific characteristics and radiological features of the different ovarian lesions

#### **TABLE OF CONTENTS/OUTLINE**

The differential diagnosis of ovarian lesions is broad and complex. It is not only a diagnostic challenge due to the existence of multiple tumour lineages, but also to the proper differentiation of their ovarian dependence, which is often unclear. First of all, it is important to properly identify the ovaries by knowing pelvic anatomy, their location and their vascular relations. In the same way, when facing pelvic lesions of possible ovarian origin, there are some radiological signs that can help us to better determine their organ dependence (such as the "phantom organ" or the "beak sign"). Once we have confirmed that the dependence is ovarian, it is important to know the different possible lesions that may exist, and their most common radiological characteristics, both in CT and (mostly) in MRI. According to their T1, T2 signal, and internal component (solid, cystic or mixed), we propose a simple diagnostic algorithm that helps to approximate the diagnosis, based on the most frequent radiological characteristics of ovarian tumours.

### **OBEE-37 First Things First! First Trimester Obstetric Ultrasound From the Basics to the Pearls**

Participants

Niels Vinicius Padua Carvalho, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

The aim of this exhibition is to:• Review the recommendations for screening and diagnostic ultrasound in pregnant women during the first trimester of pregnancy. • Demonstrate how the obstetric ultrasound should be documented in this context. • Discuss how to use ultrasound for risk assessment of common forms of aneuploidies, malformations and gestational diseases/complications, in a practical approach. • Highlight the pearls and pitfalls in that evaluation.

#### **TABLE OF CONTENTS/OUTLINE**

• INTRODUCTIONo Purpose of a first trimester ultrasoundo Standard equipment and protocols o Documentation requirements• GUIDELINE FOR EXAMINATIONo Demonstrate by case-based images the minimum requirements for a 11-14 weeks gestation examination, including:§ Assessment of viability§ Confirmation of intrauterine pregnancy and uterine integrity§ Fetal biometry§ Fetal anatomy§ Risk assessment for common forms of aneuploidy• SCREENINGSo Describe the pretest counseling, biomarkers and ultrasound-based assessment for aneuploidies, malformations and gestational diseases• SUMMARY AND SYSTEMATIC APPROACH• TAKE HOME MESSAGES

### **OBEE-38 A Multimodality Review of Gynecologic Medical Devices in the Pelvis**

Participants

Kaitlin Zaki-Metias, MD, Windsor, ON (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Given the frequency with which gynecologic pelvic devices are encountered on imaging, understanding the imaging characteristics and appropriate positioning on various modalities is important for radiologists to recognize. Positioning and integrity of all pelvic devices should be evaluated on all studies when visualized. Radiologists should be able to confidently communicate pertinent findings of pelvic device malposition to referring clinicians.

#### **TABLE OF CONTENTS/OUTLINE**

Understand the importance and clinical implications of gynecologic medical devices in the pelvis, including intrauterine contraceptive devices (IUCD), pessaries, contraceptive vaginal rings, tubal occlusion and ligation devices, brachytherapy seeds, and menstrual products. Describe the normal appearance and appropriate positioning of gynecologic medical devices in the pelvis and be familiar

with their appearance on various imaging modalities. Describe the strengths and pitfalls of various imaging modalities in the assessment of medical pelvic devices.

### **OBEE-39 Pelvic Venous Congestion Syndrome: The Forgotten Culprit of Chronic Pelvic Pain**

#### **TEACHING POINTS**

1. To raise awareness of pelvic venous congestion syndrome as an underdiagnosed etiology for chronic pelvic pain. 2. Review the clinical and multimodality (CT, MR and Angiography) imaging work-up of diagnosing pelvic venous congestion syndrome. 3. Discuss various differential diagnoses such as Nutcracker Syndrome, May-Thurner Syndrome, and arteriovenous malformation and understand the importance of an accurate diagnosis as there are different treatment methods for each entity.

#### **TABLE OF CONTENTS/OUTLINE**

1. Pelvic Venous Congestion Syndrome (PVCS) - Clinical Presentation - Epidemiology - Pathogenesis - Multimodality Imaging (CT, MRA, Angiography) - Treatment/Prognosis 2. Differential Diagnoses a) Nutcracker Syndrome - Clinical Presentation - Epidemiology - Pathogenesis - Multimodality Imaging - Treatment/Prognosis b) May-Thurner Syndrome - Clinical Presentation - Epidemiology - Pathogenesis - Multimodality Imaging - Treatment/Prognosis c) Arteriovenous Malformation (AVM) - Clinical Presentation - Epidemiology - Pathogenesis - Multimodality Imaging - Treatment/Prognosis d) Inferior vena cava (IVC) thrombosis - Clinical Presentation - Epidemiology - Pathogenesis - Multimodality Imaging - Treatment/Prognosis 3. Summary Chart

### **OBEE-4 First-Trimester US and Current Methods of Genetic Screening**

Participants

Ami Gokli, MD, (Presenter) Nothing to Disclose

#### **TEACHING POINTS**

Describe first trimester ultrasound findings including normal, abnormal and indeterminate with imaging correlates, as well as criteria diagnostic for failed pregnancy and pitfalls. Discuss the current methods of genetic screening including carrier testing and all maternal blood tests in conjunction with fetal ultrasound. Review current methods of diagnostic testing in conjunction with fetal ultrasound including common complications, sensitivity/specificity, false neg/pos, how often these occur and why. Review clinical management of the most common diseases and necessary details to include in radiology reports that guide management.

#### **TABLE OF CONTENTS/OUTLINE**

Overview of first trimester US and screening tests - what can be detected in the first trimester, limitations of sonography in the first trimester, and safety issues. First trimester ultrasound imaging findings (pictorial review) of detailed fetal anatomic survey including normal anatomy, standard views. Most common methods of genetic screening and diagnostic testing in conjunction with US. Examples of common pathology encountered with sonographic imaging correlation and management discussion. Case examples with explanations including: Early hydrops, Anencephaly, Body stalk anomaly, Ectopic cordis, omphalocele, gastroschisis, Megacystis. Carrier testing, when and why. 10-13 week blood test with nuchal translucency and intracranial translucency ultrasound. Integrated screening/sequential screening. Cell-free DNA screening. Clinical indications for advanced imaging such as fetal MRI. Clinical management guidance and reporting. Future directions for improving diagnostic capabilities.

### **OBEE-40 MR Imaging of Gynecologic Emergencies in the Pregnant Patient: An Overview of Clinical Indications, Proper Sequence Choice and Not to Miss Emergencies**

#### **TEACHING POINTS**

Describe the clinical indications for MR imaging in pregnancy based upon the risks of fetal harm with ionizing radiation and recommendations from organizations including the American College of Radiology (ACR) and American College of Obstetricians and Gynecologists (ACOG). Outline the sequences included in the protocol for an MRI abdomen/pelvis of a pregnant female with examples of the features best evaluated on each sequence. Review the imaging features of gynecologic emergencies including ovarian torsion, ectopic pregnancy, placenta accreta spectrum and acute uterine rupture based on an understanding of the associated pathophysiology. Understand pertinent positive and negative information that should be conveyed to the primary team and characteristics that may portend prognosis.

#### **TABLE OF CONTENTS/OUTLINE**

Background discussing the difficulty of diagnosing pathology in pregnancy and crucial role of the radiologist. Clinical indications for MR in pregnancy - outline the ACR and ACOG recommendations and reason to avoid gadolinium contrast. Discussion of the risk of fetal harm with ionizing radiation including the difference between stochastic and deterministic effects, absorbed dose of different radiology exams and impact on fetus based on gestational age. List of the sequences included in a typical MR abdomen/pelvis protocol followed by slides with pictures demonstrating the pertinent features evaluated in each sequence. Examples of gynecologic emergencies seen in pregnancy with slides specifically focused on ovarian torsion, ectopic pregnancy (ruptured tubal ectopic, abdominal ectopic and interstitial ectopic), placenta accreta spectrum, and acute uterine rupture.

### **OBEE-41 First Trimester Ultrasound Screening**

Participants

Shannon Navarro, MD, MPH, Sacramento, CA (Presenter) Nothing to Disclose

#### **TEACHING POINTS**

-The importance of the nuchal translucency exam and significance of a widened nuchal translucency -Quality standards - Correlation with blood work for first trimester screen-significance of the ossification of the nasal bone

#### **TABLE OF CONTENTS/OUTLINE**

A. What is the nuchal translucency? Pictorial review of a normal nuchal translucency. B. Pitfalls! the amnion before fusion with the chorion, quality standards for appropriate neck flexion/extension, how the ultrasound should be performed. C. Abnormal nuchal translucencies: the movement from screening to diagnostic exams. A pictorial review of abnormal nuchal translucency screening exams with correlation from diagnostic tests. D. Pictorial review of normal nasal bone ossification. E. Pictorial review of abnormal nasal bone ossification.

## **OBEE-42 Pitfalls in Ovarian Imaging: Limits of the ORAD's System**

### **TEACHING POINTS**

The first step in characterizing a pelvic mass using the ORAD'S system is to determine its ovarian origin. The second step is to avoid misdiagnosing infections and inflammatory conditions. The third step is to identify features of peritoneal carcinomatosis. Finally, the adnexal lesions are analyzed according to the ORADS criteria. Although this system is standardized and clear, care must be taken to avoid the many pitfalls that can occur at each stage of the reasoning.

### **TABLE OF CONTENTS/OUTLINE**

We will report our experience on the pitfalls of the ORAD's system from a series of 3000 MRI's obtained over the past 5 years in a large tertiary institution by : - Presenting a variety of extra-ovarian lesions that mimic ovarian lesions such as exophytic myometrial masses, lymphocele, lymph node and other tumors arising from other structures of the pelvis. - Presenting confusing infections and inflammatory conditions such as complicated endometriosis or actinomycosis - Discussing and illustrating lesions that mimic peritoneal carcinomatosis, such as Demons-Meigs syndrome and functionally hyper-stimulated ovaries - Discussing and illustrating some benign ovarian tumors that mimic malignancy, such as cellular fibromas, sclerosing stromal tumors and necrotic, infected or distorted lesions. - Discussing and illustrating some malignant lesions that mimic benignity, such as calcified tumors (low-grade serous ovarian carcinoma) and serous cystadenofibromas associated with a borderline component.

## **OBEE-43 Serous Tumors in the Female Pelvis: Comprehensive Review of Diagnostic and Therapeutic Strategy**

### **TEACHING POINTS**

1. Serous tumors are common female pelvic neoplasm presenting a variety of clinical and imaging manifestations. Recently, there has been a paradigm shift that most extrauterine pelvic high-grade serous carcinomas (HGSC) are metastases of STIC. While HGSC is the majority of serous carcinomas, but also low-grade serous carcinoma (LGSC) developing through serous borderline tumor (SBT) may be occur. This exhibit provides an overview of diagnostic and treatment strategies including Hereditary Breast and Ovarian Cancer (HBOC) managements. 2. 3D-DCE-MRI and reduced FOV/computed DWI are useful in detecting early-stage HGSC, or small mural nodules of LGSC. Characteristic imaging findings such as black sponge in adenofibroma, papillary architecture with internal branching in SBT, dense calcification in psammocarcinoma, and CT pattern classifications for genomic subtypes estimation of advanced HGSC, and differentiation of invasive/non-invasive peritoneal implants of SBT are demonstrated.

### **TABLE OF CONTENTS/OUTLINE**

Benign: Surface epithelial inclusion /Cystadenoma /Adenofibroma SBT: Exophytic /intra-cystic papillary growth; Micropapillary subtype /Adenofibromatous SBT; Peritoneal implants /LN involvement; Fertility-preserving treatment options LGSC Psammoma body /Psammocarcinoma; HGSC arising from LGSC/SBTHGSC STIC /Tubal /Peritoneal cancers; Advanced MR techniques: SWS, MRS, CEST; Therapeutic strategies for HBOC (BRCA1/2): Risk-reducing surgery /Molecularly targeted drug; Radiomics/Radiogenomics

## **OBEE-44 Pelvic Perspectives: Unveiling the Imaging Findings and Complications of Female Pelvic Devices**

### **TEACHING POINTS**

1. Review normal imaging findings of the female pelvis, including CT, US, and MRI. 2. Review normal and abnormal placement of intrauterine devices (IUDs) and required imaging studies for emergent cases, as in perforation. 3. Review indications for pessary placement and imaging findings for pelvic organ prolapse (POP) and describe their appearance on imaging. 4. Review normal imaging appearance of catheter placement in female patients and discuss potential complications that are visible on imaging. 5. Discuss imaging findings for menstrual devices, including tampons and menstrual cups.

### **TABLE OF CONTENTS/OUTLINE**

1. Review of normal pelvic anatomy and imaging: CT, MRI, Ultrasound 2. Contraceptive devices: Types of IUDs (Copper, hormonal), Intrauterine contraception (NuvaRing), CT, KUB, MRI and safety note, Ultrasound, Malpositioned IUDs 3. Pelvic organ prolapse (POP) and pessaries: Anatomy of POP and imaging before treatment, Pessary types (ring, cube, Gellhorn), CT, MRI, Complications of pessaries (migration, fistulization, forgotten pessary) 4. Catheter placement in female patients: Indications for catheter placement and review of normal placement, CT, MRI, Misplaced catheters and complications (vaginal placement, bladder perforation from traumatic insertion) 5. Menstrual Products: Imaging findings of tampons, menstrual cups, CT, MRI 6. Quick cases with multiple choice questions: Malpositioned IUD, Pessary on CT of patient with POP, Vaginal placement of catheter

## **OBEE-45 Achy Breaky Baby Heart: Guide to Understanding Normal Fetal Cardiac Views**

### **TEACHING POINTS**

1) Fetal cardiac assessment is a key component of the fetal anatomic survey. An understanding of the different cardiac views is crucial to accurate image interpretation during a level 1 fetal anatomic survey. 2) Use of 5 standard scan planes and systematic assessment of the fetal cardiovascular system is the initial step in screening for congenital heart disease. 3) Features at risk for congenital heart disease should be further examined using a detailed echocardiogram, which includes 5 additional views.

### **TABLE OF CONTENTS/OUTLINE**

A. Overview of basic cardiac exam components B. Standardized scan planes, including a graphic schema, US anatomy, CT correlate of the same view, and significance/associated pathologies: 1) Transabdominal (determining fetal situs and cardiac axis) 2) 4 chamber view 3) Left ventricular outflow tract 4) Right ventricular outflow tract 5) 3 vessel and 3 vessel trachea C. Fetal echocardiography planes, including a graphic schema, US anatomy, CT correlate of the same view, and significance/associated pathologies: 6) Bicaval 7) Long axis view of the aortic arch 8) Long axis view of the ductal arch 9) Low short axis view of the ventricles 10) High short axis view of the great arteries D. Pictorial review of common congenital heart diseases detected on fetal cardiac views with key diagnostic findings

## **OBEE-46 Endometrioma - Beyond the Basics: Examining the Nuances and Variations of This Condition**

Participants  
Soumyadeep Ghosh, MBBS, MD, Cambridge, MA (Presenter) Nothing to Disclose

### **TEACHING POINTS**

1) To apprise radiologists of the imaging features of endometrioma/endometriotic cysts. 2) Case-based illustrations of the atypical locations to watch out for in the appropriate clinical context. 3) To illustrate the imaging predictors of malignancy in endometriotic cysts. 4) To outline the common pitfalls encountered on various imaging techniques. 5) To highlight the implications of endometriomas on fertility. 6) To emphasize the important of pain management techniques in patients with endometriotic cysts.

#### TABLE OF CONTENTS/OUTLINE

1) Background 2) Typical/ovarian endometrioma - Introduction - Classic ultrasound findings - Classic MRI findings 3) Atypical locations - a) Peritoneal Endometrioma b) Perihepatic Endometrioma 4) Imaging predictors of malignancy - Locations - Pathology - Imaging - Pitfalls on Imaging 5) Decidualized endometrioma - What is Decidualization? - Ultrasound appearance - MR imaging 6) Complications 7) Associations - Deep infiltrative endometriosis - Extra gynecological organ involvement 8) Implications on fertility 9) Implications on pain management

#### OBEE-47 Don't Miss - Understand: Solving Pitfalls in the Diagnosis of Endometriosis and Adenomyosis

##### TEACHING POINTS

Endometriosis and adenomyosis are prevalent diseases among reproductive age women with a negative impact on their quality of life and reproductive outcomes. Their imaging manifestations may be challenging due to a wide imaging spectrum of both diseases, leading to incorrect interpretations even by experienced radiologists. This presentation aims to demonstrate common imaging pitfalls of endometriosis and adenomyosis, with a comprehensive and instructive problem-solving guide.

#### TABLE OF CONTENTS/OUTLINE

1) Overview of endometriosis and adenomyosis, emphasizing the imaging diagnosis: ultrasound and magnetic resonance. 2) Imaging pitfalls in the diagnosis of endometriosis, including: Posterior compartment: Folds in the sigmoid colon; Vessels in the parametrium and paracolpos; Diverticulitis; Pericolic lymph nodes; Middle compartment: Adenomyosis; Fallopian tubes; Functional ovarian cysts; Pelvic Varices; Anterior compartment: Leiomyomas; Fibrocicatricial changes; Folds in the bladder wall; 3) Imaging pitfalls in the diagnosis of adenomyosis, such as: Myometrial contractions; Physiologic thickening of the junctional zone in the menstrual phase; Deep endometriosis with myometrial infiltration; Leiomyomas with cystic or red degeneration; Unicornuate uterus with functional non-communicating uterine remnant 4) A didactic guide for problem-solving pitfalls.

#### OBEE-48 Magnetic Resonance Imaging (MRI) of Mayer-Rokitansky-Kuster-Hauser Syndrome, Herlyn-Werner-Wunderlich Syndrome and Related Complex Mullerian Duct Anomalies With Special Emphasis on Surgical Reconstruction Management;- What the Radiologist Should Know to Guide the Reconstruction Surgeon

##### TEACHING POINTS

1) Explain Embryology of Mullerian Duct Anomalies (MDA) and Mayer-Rokitansky-Kuster-Hauser Syndrome (MRKHS) and Herlyn-Werner-Wunderlich Syndrome (HWWS) 2) ASRM Classification of MDA with demography 3) Case based introduction to MRKHS, HWWS other complex MDA, associations with Renal, ovarian, spine anomalies 4) Clinico-social aspects of MDA, effect on menarche, fertility pregnancy 5) MRI protocols, Imaging features of MRKHS, HWWS and MDA with sample cases 6) Document MRI findings and dimensions specially for reconstructive surgeon. Detailed analysis of structures - Cervix, Vagina, Plica palmatae, uterine/vaginal septa, uterine buds and extent of uterovaginal aplasia 7) MRI evaluation of Neovagina, other vaginoplasties follow up their complications (with example cases)

#### TABLE OF CONTENTS/OUTLINE

1) Developmental Embryology of MDA genetics 2) Classification of MDA (classes 1-VII) with cases 3) Case based description of MRKHS (type 1II), HWWS and MDA with MRI imaging features imaging pearls, coexistent extragenital genital anomalies, fibroids, endometriosis etc influencing surgical management prognosis 4) Clinical presentations, amenorrhea, subfertility pregnancy complications with sample cases 5) Targeted MRI reporting of MRKHS, HWWS, MDA associated extragenital anomalies. Specific points/dimensions useful for reconstruction, implants, surgery and for assisted reproduction. Describe uterine buds, triangular cord sign etc 6. Introduction to neovagina, vaginoplasty, uterine transplant and other surgical options with MRI features 7. Case based review of MRI of post reconstruction and post treatment follow up their complications (stenosis, fistulae, infections, hernia etc)

#### OBEE-49 Pelvic Endometriosis: Lexicon on Magnetic Resonance Imaging (MRI)

Participants

Claudia Hurtado, Valladolid, Spain (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

The most common sites of involvement are the vesicouterine space (in the anterior compartment) and the uterosacral ligaments (in the posterior compartment). The "T2 black dot sign" is a specific sign of endometriosis. Malignant transformation should be suspected when a nodule enhances, nodule more than 3 cm, growth or loss of T2 shading.

#### TABLE OF CONTENTS/OUTLINE

- Introduction- Objectives- Teaching points- MRI protocol- Gross anatomy- Morphological subtypes- Endometriomas- Structured Report- Conclusions

#### OBEE-5 MRI of Müllerian Duct Anomalies Based on the New ASRM Classification

Participants

Marianna Konidari, MD, London, Greece (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

- Müllerian duct anomalies (MDAs) consist of a wide spectrum of congenital malformations of the uterus, cervix, fallopian tubes and upper 2/3 of the vagina and are the result of abnormal development, fusion or resorption of the Müllerian ducts.
- The new 2021 American Society of Reproductive Medicine-ASRM (previously, American Fertility Society-AFS) MDAs classification (MAC2021) expands the 1988 classification to include cervical and vaginal anomalies; it classifies MDAs into nine categories using standardized descriptive terminology.
- Imaging is crucial in the diagnostic workup of individuals with suspected MDAs, particularly adolescents

with primary amenorrhea and adults with infertility, since identification of these anomalies and their complications allows tailored clinical management. • MRI is the modality of choice for detailed pelvic anatomy evaluation, accurate MDA classification and preoperative planning.

#### TABLE OF CONTENTS/OUTLINE

• Embryology overview and imaging anatomy of internal female genitalia • MDAs: how do they develop and what are the clinical implications • ASRM Müllerian anomalies classification 2021: overview and differences with the AFS 1988 classification • Imaging evaluation: rationale behind imaging of congenital uterovaginal anomalies, available techniques and the role of MRI • Case-based discussion on MRI appearances, clinical presentation and treatment management of MDAs, according to the new ASRM classification • Diagnostic algorithm for imaging approach of MDAs

#### OBEE-50 Endometriosis Revisited: Current Concept of Pathophysiology, Diagnosis, and Therapeutic Strategy

##### TEACHING POINTS

1. Endometriosis, which significantly impairs women's QOL with chronic pain and reduced fertility, is a benign, common, but controversial disease due to its enigmatic etiopathogenesis and biologic behavior. Recent studies suggest multiple genetic, and environmental factors: endocrinic, inflammatory, immunological, and angiogenetic may affect its onset and development. Genomic analysis revealed the presence of cancer-associated gene mutations, which may reflect the neoplastic aspect of endometriosis. The management has changed dramatically with the development of fertility-preserving, minimally invasive therapies. 2. The appropriate examinations with advanced MR techniques (3D-T2WI, reduced FOV DWI, computed DWI, SWI, DCE-MRI, cine MRI), and careful imaging interpretation are considered useful in evaluating endometriosis and associated lesions, which may be effective for therapeutic strategy with improved patient's outcome.

#### TABLE OF CONTENTS/OUTLINE

Imaging manifestations of endometrioma (shading sign; T2 dark spot; hemosiderin deposition on SWI), deep endometriosis, adenomyosis, less common site and rare site endometriosis, endometriosis-associated tumor-like lesions (polypoid endometriosis; decidualized endometriosis), and malignant transformation, with pathophysiologic conditions, clinical classification, optimal treatment options and clinical outcomes.

#### OBEE-51 Pearls and Pitfalls of First-Trimester US Screening and Prenatal Testing: A Pictorial Review

Participants

Cynthia De la Garza Ramos, MD, Jacksonville, FL (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

1. First trimester ultrasound (US) is key in establishing pregnancy viability, number, and location. 2. Early intrauterine pregnancy (IUP) sonographic milestones, including appearance of a gestational sac, yolk sac, embryo, and cardiac activity, follow a consistent timeline. 3. Prenatal genetic testing and sonographic fetal structural assessment serve as initial screening tools for chromosomal disorders and facilitate detection of patients who may benefit from subsequent amniocentesis, chorionic villous sampling, or fetal intervention. 4. Beta human chorionic gonadotropin ( $\beta$ -hCG) in combination with pelvic US can be used to evaluate early pregnancy complications, but threshold  $\beta$ -hCG values should not be used as a sole decision-making tool.

#### TABLE OF CONTENTS/OUTLINE

1. Review the indications for first trimester US. 2. Recognize the normal appearance of an IUP and identify the sonographic milestones of the first trimester. 3. Illustrate the components of a first trimester fetal anatomy scan. 4. Describe the current prenatal genetic screening recommendations for chromosomal defects and their relationship with US fetal anatomy, including nuchal translucency (NT) measurement. 5. Understand the role of  $\beta$ -hCG and its correlation with US findings in the evaluation of early pregnancy complications. 6. Review the Society of Radiologists in Ultrasound (SRU) consensus statement for diagnosing a nonviable pregnancy in the first trimester. 7. Identify US findings that may be associated with poor pregnancy outcomes and require follow-up. 8. Case Examples.

#### OBEE-52 Nothing Complex about Ovarian Lesions: Expert Guidance from the O-RADS US Committee

Participants

Catherine Phillips, MD, Nashville, TN (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

1. Based on validation studies feedback, the Ovarian-Adnexal Reporting and Data System (O-RADS) US has been updated to address clinical application challenges, improve system specificity, harmonize with other consensus statements and O-RADS MRI. 2. New lexicon terms include bilocular for cystic lesions shadowing for smooth solid lesions, features which favor benignity and may improve specificity by down-scoring lesions. 3. Features of classic benign lesions were further refined to capture their typical appearance and also aim to improve specificity. 4. Updated surveillance and growth parameters optimize management better align with existing consensus statements. 5. Emerging data suggests O-RADS US 3 lesions are at the lower end of the risk of malignancy range (1- <10%); management recommendations have thus been updated to allow short-term US follow-up.

#### TABLE OF CONTENTS/OUTLINE

1. Clarification of updated O-RADS US v2022 governing concepts on applicability criteria, definitions/technique, and rules for system use with diagrammatic depictions illustrative examples. 2. Image rich example cases featuring new lexicon descriptors with an explanation of how their presence alters risk score assessment and management options. 3. Algorithmic approach to assessment and diagnosis using O-RADS US v2022 lexicon terms demonstrating ease use for daily clinical practice.

#### OBEE-53 Unusual Presentations of Common Female Pelvic Lesions

Participants

May Shaaban, Salt Lake City, UT (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

Uterine leiomyomas, uterine adenomyosis, ovarian mature cystic teratomas and endometriomas represent the most common

pathologies in everyday practice. They have characteristic imaging features that allow confident diagnosis. Occasionally these common lesions present with atypical features which makes it more challenging. Teaching points: Describe the classic imaging features of Uterine leiomyomas, uterine adenomyosis, ovarian mature cystic teratomas and endometriomas Describe unusual imaging features of variant or complicated lesions Provide differential possibilities based on the imaging features

#### TABLE OF CONTENTS/OUTLINE

Atypical leiomyomas: I. Degenerated and variant leiomyomas: 1. Cellular leiomyoma 2. Cystic degeneration 3. Myxoid degeneration 4. Red degeneration 5. Lipoleiomyoma II. Infected leiomyoma III. Torsion of leiomyoma IV. Prolapsed leiomyoma Atypical adenomyosis/adenomyomas: Focal adenomyosis (adenomyoma) Cystic adenomyosis Adenomyosis in pregnancy Exophytic adenomyoma Atypical endometriomas: Mural nodules and decidualization Malignant transformation Rupture Atypical presentations of dermoid cysts: Rupture Malignant transformation

#### OBEE-54 Medical Devices of the Female Pelvis: Multimodality Patterns, Pitfalls, and Pearls

##### TEACHING POINTS

Medical devices in the female pelvis are less frequently encountered than those in the chest or abdomen. Nevertheless, radiologist familiarity with these devices is critical for appropriate imaging evaluation. This exhibit reviews normal and abnormal radiologic presentations of medical devices commonly found in the female pelvis on multiple imaging modalities as well as examples of complications that may arise from device placement. Finally, we will present radiologic examples of device mimics that could lead to pitfalls in imaging evaluation.

#### TABLE OF CONTENTS/OUTLINE

Pessaries Pessary Mimic: Menstrual cup Pessary Mimic: NuvaRing Pessary Mimic: Tampon Intrauterine devices (IUDs) Essure devices Tubal ligation clips Embolization coils Ureteral stents Foley catheter Rectal tube

#### OBEE-55 Don't Be Fooled by Uterine Masses: How MRI Can Help You Spot Atypical and Malignant Impostors Among Leiomyomas

##### TEACHING POINTS

Review the specific MRI features of usual leiomyomas. Explain the known and emerging MRI features of atypical leiomyomas and describe how to differentiate them. Describe MRI characteristics of uterine sarcomas and compare them with those of leiomyomas. Develop a systematic image-based approach to recognize these entities.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction- Uterine anatomy - Clinical relevance - Definitions 2. MRI protocol 3. Usual leiomyomas - MR typical findings - Other RM signs: flow void sign, bridging vascular sign, high signal intensity rim on T2 4. Atypical leiomyomas: MR findings correlation with Histology 4.1. Atypical location- Subserosal - Submucosal 4.2. Degenerated leiomyomas- Hyaline degeneration - Myxoid degeneration - Red degeneration - Cystic degeneration 4.3. Histologic subtypes- Cellular leiomyoma - Lipoleiomyoma - STUMP 5. Uterine sarcomas: MR findings correlation with Histology 5.1. Uterine leiomyosarcoma 5.2. Endometrial stromal sarcoma 6. Differential Diagnosis 7. Conclusion

#### OBEE-56 3D Ultrasound - Troubleshooting in Gynaecological Imaging

Participants  
Sanchita Gupta, MBBS, MD, New Delhi, India (Presenter) Nothing to Disclose

##### TEACHING POINTS

The purpose of this exhibit is to -1) Provide information about system requirements and scanning techniques to obtain a standard 3D dataset, rendering and image reconstruction. 2) Explore newer techniques and software in 3D USG for improving diagnosis. 3) Know common clinical scenarios where 3D provides additional information over simple 2D USG.

#### TABLE OF CONTENTS/OUTLINE

1) 2D vs 3D ultrasound 2) System requirements for 3D dataset acquisition 3) Rendering and multiplanar reconstructions 4) Transvaginal 3D USG - Importance of the coronal plane 5) Newer techniques and software in 3D USG: - Walk thru mode - Virtual Hysteroscopy - 3D USG with Saline infusion sonography (SIS) - Translabial 3D USG - 3D Power Doppler - Endometrial volume calculation using VOCAL (Virtual Organ Computer-Aided Analysis) - Sono AVC (Automated volume calculation) 6) Common clinical scenarios where 3D imaging can help provide a diagnosis - Evaluation of the external and internal uterine contour 1) Congenital uterine anomalies 2) Subserosal and pedunculated fibroids deforming external contour 3) Submucosal fibroids deforming internal contour - Pathologies of the endometrial cavity 1) Identifying intrauterine adhesions 2) Locating polyps and Retained products of conception 3) Placement of Intra-uterine contraceptive devices - Assessment of endo-myometrial junction in adenomyosis and carcinoma endometrium

#### OBEE-57 How to Handle Hydrops

Participants  
April Griffith, MD, Salt Lake City, UT (Presenter) Nothing to Disclose

##### TEACHING POINTS

1: Hydrops fetalis is defined as the presence of fluid in two spaces - skin, pericardium, pleural space, peritoneal cavity. 2: The prognosis is generally poor due to lack of treatment options. 3: Fetal tachycardia and fetal anemia are treatable causes. Middle cerebral artery (MCA) Doppler is a non-invasive method to screen for fetal anemia which can be treated by intrauterine transfusion. 4: Fetal intervention may be lifesaving - shunt placement in large cysts in a lung mass, laser ablation for twin twin transfusion syndrome, radiofrequency ablation for twin reversed arterial perfusion sequence. 5: For some tumors (e.g., sacrococcygeal teratoma) elective preterm delivery with immediate resection is preferable to expectant management. The decision to deliver in such cases is based on multiple factors including the combined cardiac output calculated by echocardiography. 6: Some causes of hydrops can recur. Correct diagnosis of the cause is essential for management of current and future pregnancies.

#### TABLE OF CONTENTS/OUTLINE

1: Pitfalls in diagnosis of abnormal fluid locations. 2: Immune vs Non immune hydrops: Antibody screening, MCA Doppler velocimetry. 3: Cardiac - rhythm disturbance more likely than structural defects. 4: Genetic - Aneuploidy, syndromic. 5: Infection - Serology, growth restriction, hepatosplenomegaly, intracranial and abdominal calcifications. 6: High output states - Vascular malformation, vascular tumor, chorangioma. 7: Mechanical compression - Large lung mass, mediastinal mass. 8: Multiple gestations - Twin twin transfusion, monochorionic twin demise, twin reversed arterial perfusion. 9: Metabolic - Lysosomal storage disorders, gestational alloimmune liver disease.

#### **OBEE-58 A Headache Free Approach to Hydrocephalus**

Participants

April Griffith, MD, Salt Lake City, UT (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

1: The prognosis for fetal ventriculomegaly depends on the underlying etiology thus a systematic approach is recommended. 2: Scan technique is critical to ensure correct measurements for grading (mild, moderate, severe) and tracking for progression over time. 3: Accurate diagnosis is essential for pregnancy management and delivery planning. 4: Some conditions with ventriculomegaly can recur in future pregnancies (e.g., autosomal recessive Walker Warburg syndrome). 5: Fetal MRI plays an essential role in characterizing the underlying pathology. 6: Isolated mild ventriculomegaly is a diagnosis of exclusion, generally associated with good intellectual outcome. It may be unilateral (usually left), in males.

##### **TABLE OF CONTENTS/OUTLINE**

A: Technique to measure ventricles - US and MRIB: Evaluate the posterior fossa: Exclude Chiari malformation, Dandy Walker syndrome, aqueductal stenosis, rhombencephalosynapsis C: Systematic assessment of the supratentorial brain: Midline: Is the falx present, is the cavum septi pellucidi normal? Cortical mantle: Gyral and sulcal development, thickness, symmetry, defects? Ventricles: Shape, lining, contents? D: Is there a mass? E: Is there a vascular malformation? F: Are there cystic areas? G: Perform a detailed anatomy scan to look for signs of syndromes, infection, aneuploidy, growth restriction and complications of monochorionic twinning.

#### **OBEE-59 Medical Devices in Female Genital System: What Radiologists Need to Know**

Participants

Guan Guan, MD, PhD, Guangzhou, China (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

1. To review the classification and function of medical devices in female genital system (uterus, vagina and adnexa). 2. To realize the normal, abnormal and special imaging findings of medical devices in female genital system. 3. To introduce complications related to medical devices in female genital system (including imaging appearance, diagnosis and differential diagnosis). 4. To learn assistance in imaging diagnosis of medical devices in female genital system.

##### **TABLE OF CONTENTS/OUTLINE**

1. Classifications of medical devices in female genital system (1) Medical devices of the uterus (IUDs, uterine suspension mesh, etc.); (2) Medical devices of the vagina (pessary, vaginal occluder, vaginal tamponade, etc.); (3) Medical devices of the ovary and adnexa (tubal ligation clips, ovarian suspension clips, etc.). 2. Medical devices of the uterus (1) Function and normal imaging appearance; (2) Abnormal imaging appearance and related complications; (3) Assistance in imaging diagnosis. 3. Medical devices of the vagina (1) Function and normal imaging appearance; (2) Abnormal imaging appearance and related complications; (3) Assistance in imaging diagnosis. 4. Medical devices of the ovary and adnexa (1) Function and normal imaging appearance; (2) Differential diagnosis of post-ovarian suspension findings (e.g. ovarian maldescent, supernumerary ovary); (3) Abnormal imaging appearance and related complications; (4) Assistance in imaging diagnosis.

#### **OBEE-6 Role of Fetal MRI in Antenatal Assessment of Central Nervous System Anomalies: What a Radiologist Should Know**

Participants

Smily Sharma, MD, MBBS, Jodhpur, India (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

1. To study the role of fetal MRI for antenatal assessment of various central nervous system anomalies including indications, added advantage over obstetric ultrasound as well as certain limitations. 2. To define a fetal MRI protocol for central nervous system assessment. 3. To learn about normal appearances of sulcation and gyration of brain at various periods of gestation and beware of MR pitfalls in fetal CNS imaging. 4. Using state of the art cases, to learn about myriad of CNS anomalies that can be detected in fetus, their syndromic and non-syndromic associations and their antenatal or postnatal follow up (wherever available).

##### **TABLE OF CONTENTS/OUTLINE**

1. Introduction to fetal MR for antenatal central nervous system anomalies: Indications, advantages/ disadvantages and comparison with obstetric ultrasound 2. MR protocol to assess various central nervous system anomalies in fetus 3. MRI appearances of fetal brain at different periods of gestation (Pearls and Pitfalls) 4. Various CNS anomalies on fetal MRI with postnatal follow up wherever available: 4A. Fetal Ventriculomegaly 4B. Malformations of cortical development and midline brain anomalies 4C. Corpus Callosal Agenesis/ Dysgenesis and associations 4D. Posterior Fossa Malformations 4E. Neural Tube defects and Spinal Dysraphism 4F. Vascular anomalies 4G. Syndromic associations 4H. Miscellaneous CNS Disorders including ischemic insults, germinal matrix and intraventricular hemorrhage in fetus 5. Conclusion

#### **OBEE-60 Once in a Lifetime Gynecological Cases: Seen One, Seen Them All**

Participants

Ana Villanueva, MD, Toronto, Spain (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

1. To illustrate and review unusual gynecological cases, some of them with classic appearance as well as common gynecological

cases with rare presentation.2. Role of radiologist in evaluation of challenging gynecological cases.

#### TABLE OF CONTENTS/OUTLINE

1. Background How do abdominal radiologists like to report gynecological cases? And what about general radiologists? Many colleagues say that they find themselves in trouble when reporting these cases. And why is that? Probably it is a combination of lack of knowledge or experience; not familiar reporting different techniques TV US, CT and MRI; etc. We as radiologist look for entities that we know. If we do not know about a disease, we will not think about it and therefore we will not reach a correct diagnosis. However, there are certain entities that even they are challenging because they are uncommon, they have a classic appearance (for example malignant adenoma of the cervix). Once you see one case, you will not forget. Also, common gynecological diseases can present in a very unusual way (for example ileal and appendiceal endometriosis without pelvic endometriotic findings). 2. Identification of characteristic imaging features • Different imaging techniques will be shown: Transvaginal US, CT, MRI • To propose key points to accurately reach the diagnosis • Algorithm of differential diagnosis based on imaging features along with relevant clinical and analytical information 3. Understand the clinical and treatment implications of diseases with characteristic radiologic appearance 4. Radiologic- pathologic correlation will be shown for most of the cases 5. Conclusion 6. References

#### OBEE-61 First Trimester Ultrasound (FTUS): Screening Techniques

##### TEACHING POINTS

Increased nuchal translucency (NT) remains an internationally recognized indication for invasive testing (amniocentesis or CVS). By the end of this educational exhibit, the reader/listener would be able to: 1. Understand the various screening policies for chromosomal abnormalities utilized in the first trimester (Combined screening vs Contingent screening policies). 2. Learn about the importance and technique of measuring NT in the first trimester. 3. Learn about new ultrasound markers utilized in first-trimester screening. 4. Identify important fetal structural abnormalities and their significance system-wise. 5. Algorithmically co-relate first-trimester ultrasound findings to the next steps in the screening process.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction to FTUS 2. Combined screening vs Contingent screening for chromosomal abnormalities 3. Nuchal translucency (NT) i. Significance and efficiency ii. The technique of measuring NT 4. New FTUS markers i. Nasal bone ii. Tricuspid flow iii. Ductus Venosus flow 5. Cell-free DNA (cfDNA) i. The utility of cfDNA in relation to FTUS- When to use and when NOT to use? ii. Advantages and limitations of cfDNA compared to FTUS 6. Fetal structural abnormalities NOT to miss in FTUS i. CNS abnormalities ii. GI and GU abnormalities iii. Skeletal abnormalities iv. Cardiac abnormalities 7. Summary

#### OBEE-62 The Hidden Enemy: A Visual Journey Through Ovarian Tumor Imaging

Participants

Sofia Maksoud, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

Ovarian tumors are classified according to their origin: epithelial cell tumors, germ cell tumors, sex cord-stromal tumors and metastatic tumors. Among them, epithelial tumors are the most common, with a higher prevalence between 60 and 70 years of age. Imaging exams have the capability to predict the risk of malignancy: mural nodules, papillary projections, solid components, thickened walls and septa (greater than 3.0 mm) with associated vascularization are some aspects that suggest malignancy, while of fat components suggests benignity. Pelvic ultrasound is commonly the first exam to be performed due to its high availability and low cost. However, for adequate characterization of the ovarian mass, additional tests such as magnetic resonance imaging may be requested, with the aim of helping to distinguish between benign and malignant tumors and, mainly, in staging and surgical planning. The results of radiological examinations associated with the clinical features, family history and laboratory tests allow the diagnosis of ovarian lesions. A thorough evaluation provides part of data that may be associated with the histology of these tumors. This information plays a fundamental role in choosing the appropriate therapy.

#### TABLE OF CONTENTS/OUTLINE

To demonstrate cases of malignant and benign ovarian tumors and to review their presentations in different imaging modalities, including pelvic ultrasonography and magnetic resonance imaging, correlating with anatomopathological results and surgical specimens.

#### OBEE-63 Placenta Accreta Spectrum and the Emergence of MRI

Participants

Leslie Nelson, DO, Lexington, KY (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

1. Placenta Accreta Spectrum (PAS) refers to abnormal placental adherence and/or invasion into the uterine wall due to a defective decidualization process. Difficult placental separation can cause life threatening peripartum hemorrhage if not diagnosed prenatally. 2. The prevalence of PAS has increased 10-fold over the last 4 decades and has been linked to increased rate of cesarean deliveries. 3. Ultrasound is the first line modality for placenta imaging, however, MRI is an emerging modality that provides superior soft tissue contrast and is vital for surgical planning in Placenta percreta. 4. In 2020, SAR and ESUR published a joint consensus statement to standardize MRI acquisition, interpretation and reporting of PAS. 5. This educational exhibit will help the learner understand and identify the described MRI signs associated with PAS and their pathophysiologic subcategories.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction of PAS 2. Compare and contrast use of ultrasound versus MRI 3. Normal MRI appearance of the placenta 4. Review of the MRI features described by SAR and ESUR joint consensus statement 5. Review the three pathophysiological oriented classifications (gross morphologic signs, interface signs and tissue architecture signs) 6. Review pathology proven cases (accreta, increta and percreta)

#### OBEE-64 CT Imaging of the IUD: Expected Findings, Unexpected Findings, and Complications

Participants

Grace Zhu, MD, Saint Louis, MO (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

After viewing this exhibit, the reader will be able to: 1. Understand the approach in evaluating the CT appearance of an intrauterine device and recognize a normally positioned intrauterine device. 2. Recognize the CT imaging appearance of wide spectrum of complications involving the intrauterine device.

#### TABLE OF CONTENTS/OUTLINE

Outline: 1. Introductiona. Types of IUDsb. Approach to evaluating IUDs on CTc. Normal Imaging appearance of an appropriately positioned IUD2. Complicated IUDsa. Malpositioned IUDi. Low lying IUDii. Intracervical IUDiii. Rotated IUD/Upside Down IUDb. Embedded IUDc. Extrauterine IUDd. Fragmented IUDE. Pregnancy and IUDi. Ectopic pregnancyii. Intrauterine pregnancyf. Miscellaneousi. Actinomycoses and IUDsii. Fibroids and IUDSiii. Mullerian abnormalities and IUDs

#### OBEE-65 To Treat, or Not to Treat, That is the Question: Multimodality Approach to Secondary Post Pregnancy Hemorrhage

#### TEACHING POINTS

- Secondary post pregnancy hemorrhage occurs 24 hours to 12 weeks following delivery. Etiologies include retained products of conception (RPOC), subinvolution of the placental site (SIPS), arteriovenous malformation/arteriovenous fistula (AVM/AVF) spectrum.- Ultrasound is often a first line imaging modality in the identification of causes of secondary post pregnancy hemorrhage. However, CT and MRI may also be used in the imaging work up. Recognizing key features of each etiology is essential to timely diagnosis and clinical management.- Certain pathology may mimic causes of secondary post pregnancy hemorrhage such as endometritis and gestational trophoblastic disease.

#### TABLE OF CONTENTS/OUTLINE

- Explanation of causes, pathophysiology, and management of secondary post pregnancy hemorrhage including RPOC, SIPS, and AVM/AVF- Case-based, multimodality imaging review of secondary post pregnancy hemorrhage including US, CT, and MRI with discussion of management options- Imaging review of mimics of retained products of conception including endometritis and gestational trophoblastic disease- Proposed algorithmic approach to management of secondary post pregnancy hemorrhage based on imaging findings and how to differentiate from mimickers

#### OBEE-66 Malignant Transformation of Endometriosis and Its Mimics

Participants

Cesar Resino Sanchez, PhD, Madrid, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To review the types of malignant transformation of endometriosis, taking into account the typical and atypical locations. 2. To recognize the usefulness of magnetic resonance imaging (MRI) in the early diagnosis of malignant transformation of endometriosis. 3. To describe forms of presentation of endometriosis that can simulate malignant transformation.

#### TABLE OF CONTENTS/OUTLINE

Definition, types and typical and atypical locations of endometriosis. Pathological mechanisms of malignant transformation: genomic alterations, oxidative stress, inflammation, and hormonal influences. Types of ovarian tumors in endometriosis (endometrioid adenocarcinoma and clear cell carcinoma as the most frequent). Optimal protocol and MRI findings suggestive of malignancy: appearance of enhancing intramural nodules, enlargement of the endometrioma and disappearance of shading sign on T2-weighted images. Imaging findings in cancers arising from extraovarian endometriosis. Malignancy simulators: decidualization during pregnancy, polypoid endometriosis, extraovarian endometriosis mimicking peritoneal carcinomatosis, etc.

#### OBEE-67 Hysterosalpingography: What's Current and What's Next

Participants

Erica Cruz, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Hysterosalpingography is an exam with consolidated use in medical practice, with well-established indications and contraindications in the literature. The main indications for the exam are: human reproduction (infertility), preoperative uterine fibroids, repeat abortions and reversal of tubal ligation. Although new technologies and imaging methods have been developed in the past years, it currently persists as the method of choice and gold standard for evaluating the thickening of the mucous pleats of the fallopian tube. The objective of this study is to provide a didact review of hysterosalpingography, from the examination technique to its main findings, since the images acquired's quality depends on the correct preparation and technique. We also provide a comparative study of hysterosalpingography with other emerging imaging methods, such as magnetic resonance hysterosalpingography (HSG-MRI) and hysterosonosalpingography, with future perspectives related to these methods.

#### TABLE OF CONTENTS/OUTLINE

Case-based review of hysterosalpingography exams, including the technique, most common findings and pitfalls, with a literature review, teaching points, and references. We also provide correlation with other imaging methods, such as ultrasonography and magnetic resonance imaging (MRI).

#### OBEE-68 Highlighting the Updates in Mid-Trimester Fetal Ultrasound Scan According to the Updated International Society of Ultrasound in Obstetrics and Gynecology (ISUOG) Practice Guideline

#### TEACHING POINTS

The mid-trimester ultrasound scan is performed for anatomic evaluation of the fetus and is accepted as a part of routine prenatal care by many countries. The International Society of Ultrasound in Obstetrics and Gynecology (ISUOG) published a guideline for the performance of the routine mid-trimester fetal ultrasound scan in 2011 and updated the guideline in 2022. According to these guidelines, a routine mid-trimester fetal ultrasound examination should include an evaluation of the cardiac activity; fetal number

(and chorionicity and amnionity in cases of multiple pregnancy); gestational age/fetal size; basic fetal anatomy; placental appearance and location. In the updated ISUOG guideline, amniotic fluid volume assessment and measurement of cervical length for prediction and prevention of preterm birth are also recommended. Pregnancies in which the umbilical cord inserts into the amniotic membranes (velamentous cord insertion) or at the edge of the placenta (marginal cord insertion) should be reported. Suggested minimum (and optional) requirements for the fetal anatomic survey were also updated and will be discussed in the exhibition. Technical challenges to obtaining these standard images will also be discussed.

#### TABLE OF CONTENTS/OUTLINE

The suggested basic mid-trimester fetal anatomic survey according to ISUOG is updated in 2022. Knowledge of minimum and optional requirements according to the current guideline is important for the appropriate evaluation of the fetus. This exhibit aims to highlight the updates as well as remaining unchanged requirements with ultrasound images.

#### OBEE-69 Postmenopausal Endometriosis: Clinical Insights and Imaging Considerations

##### TEACHING POINTS

- Postmenopausal endometriosis is estimated to affect around 2-4% of women and is more commonly seen in patients undergoing hormone replacement therapy.
- There is no current guidelines for management of postmenopausal women with endometriosis.
- Transvaginal ultrasound and magnetic resonance imaging are the primary imaging modalities for assessing extent of endometriosis.
- Imaging findings will demonstrate a predominance of the fibrotic component associated with anatomical distortion.

#### TABLE OF CONTENTS/OUTLINE

- To review the clinical presentation of endometriosis in the postmenopausal population
- To understand how hormonal status affects the pathogenesis of endometriosis, including both exogenous and endogenous sources
- To use a case-based approach to illustrate the sonographic and MRI findings of endometriosis in patients undergoing hormonal replacement therapy, as well as in those who are not undergoing hormonal treatment. Laparoscopic correlation will be included, when available.
- To describe the risk of malignant transformation for specific lesions such as endometriomas and deep invasive lesions, while using cases to demonstrate imaging features of neoplasm.
- To explore proposed non-invasive screening imaging methods.

#### OBEE-7 Hysterosalpingography and Infertility: Beyond Tube Obstruction

Participants

Leticia Cardoso Em, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

The causes of infertility can be genetic or acquired. When anatomically compartmentalized, it is possible to determine some groups of causes: uterine, tubal, ovarian, and central (pituitary and hypothalamic). Hysterosalpingography (HSG) is a contrast-enhanced examination of the female genital tract that uses serial radiographs to assess uterine and tubal anatomy. It is known to be the first-line test for assessing tubal obstruction, as it can determine the local anatomy in a relatively simple and inexpensive way. There are several other findings that HSG can offer and suggest diagnoses of other causes of infertility, such as endometriosis, adenomyosis, Müllerian duct malformations, and uterine synechiae. By the end of this study, the reader will be able to define the importance of fluoroscopy in the investigation of infertility, understand the methodology of HSG and identify its causes based on imaging findings.

#### TABLE OF CONTENTS/OUTLINE

Define the role of imaging exams in the investigation of infertility; Determine the methodology of HSG and its usefulness; Explain the causes of infertility and illustrate their compatible findings in HSG through image examples.

#### OBEE-70 From the Pathology Lab to the Radiology Suite: Navigating Neuroendocrine Tumors of the Female Reproductive System

Participants

Ana Bavaresco, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

Mayara Dos Santos Cruz, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

To present a rare subtype of gynecological tumor, the Neuroendocrine gynecological tumors (NEG). To review clinical-pathological features of NEG, highlighting the pathologic differences between NEG and non-NEG cancers. To expose the aggressive clinical behavior of NEG tumors by evolutive imaging examples and well-documented cases, with emphasis on the radiological role for staging and follow-up. To become aware of the different prognostic data between NEG and non-NEG tumors with a brief overview on the suggested treatment.

#### TABLE OF CONTENTS/OUTLINE

Neuroendocrine gynecological tumors can dramatically affect the cervix, ovary, endometrium, vagina, and vulva. As extremely rare tumors, studies on NEG are scarce and most are based on case reports. Although the imaging features are non-specific for diagnosis, imaging is quintessential in staging, treatment response assessment, and surveillance. To demonstrate with clinical cases, imaging exams, and temporal evolution the regional and advanced involvement of NEG. Review in a didactical way the disease-related pathology, and its differentials, based on illustrations, pathology / immunohistochemistry analysis. Case-based discussion and review of the essential information for the radiological report, that will imply the follow-up and treatment of the patient. Discuss the clinical prognosis associated with the disease, and demonstrate briefly the limitations related to the therapies available.

#### OBEE-71 Many Faces of Uterine Fibroids: Imaging Findings of Degenerations, Differential Diagnoses, and Complications

Participants

Shintaro Ichikawa, MD, PhD, Hamamatsu, Japan (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

Uterine fibroids are benign tumors composed of smooth muscle and are the most common tumors in gynecology. Because uterine fibroids tend to produce different symptoms depending on their site of origin, accurate assessment of the site and size of the fibroids using diagnostic imaging is required. Although typical uterine fibroids are easy to diagnose using imaging, there are a variety of degenerations, and it is important to know the characteristics of each.

#### TABLE OF CONTENTS/OUTLINE

The following typical and degenerated uterine fibroids are discussed along with their key imaging findings: 1. Typical fibroids (intramural, subserosal, submucosal, and cervical) 2. Hyaline degeneration 3. Hydropic degeneration 4. Myxoid degeneration 5. Fatty degeneration 6. Red degeneration The following differential diagnoses and complications are discussed, along with their key imaging findings: 1. Uterine lipoleiomyoma 2. Hypercellular uterine fibroid 3. Uterine leiomyosarcoma 4. Focal adenomyosis 5. Low-grade endometrial stromal sarcoma 6. Submucosal uterine fibroid prolapse into the vagina (vaginal delivery) 7. Uterine intravenous leiomyomatosis 8. Peritoneal leiomyomatosis following uterine fibroid morcellation 9. Rupture of fibroid 10. Torsion of subserosal fibroid 11. Infection of fibroid

#### OBEE-72 Comprehensive Imaging of Pelvic Medical Devices: Beyond IUDs

##### TEACHING POINTS

Recognize the usual appearance of the main pelvic devices in different imaging methods (Radiographic, Ultrasound, CT and MRI): Vaginal tampon Menstrual cup Contraceptive devices (IUDs, Female sterilization device, Vaginal ring) Therapeutic devices (Pessaries, Brachytherapy applicator, etc) Post-surgical devices (Suture artifacts, catheters, etc) How to assess the proper placement of the most common pelvic devices and what points and measurements should be included in the report Recognize the main complications related to Intrauterine contraceptive devices (IUDs) displacement

#### TABLE OF CONTENTS/OUTLINE

INTRODUCTION Main pelvic devices and their radiographic features How to assess correct placement of pelvic devices and practical points COMPLICATIONS RELATED TO INTRAUTERINE CONTRACEPTIVE DEVICES DISPLACEMENT. Case based Review of:- Displacement- Embedment- Complete perforation

#### OBEE-73 Piecing Together the Puzzles: Imaging Diagnostic Approach to Genetic Diseases Affecting the Female Reproductive Organs and Beyond

Participants

Tsukasa Saida, MD, Tsukuba, Japan (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

The genetic links to various tumors have become more apparent, and it is crucial for radiologists to understand them in order to make an accurate diagnosis and establish an appropriate testing strategy. This exhibit will describe the genetic diseases associated with neoplastic lesions in gynecology, including the specific characteristics of each tumor and lesions that occur in other regions of the same disease. The teaching points of this exhibit are: 1. Description of the inheritance pattern and characteristics of each genetic disease 2. Presentation of key imaging findings that contribute to the diagnosis of various genetic diseases

#### TABLE OF CONTENTS/OUTLINE

A. Inheritance pattern B. Characteristics of the genetic disease C. Imaging features of gynecologic tumors associated with genetic diseases D. Imaging features of lesions that occur in other regions of the body

#### OBEE-74 Hystero-Salpingography in Current Clinical Practice - Old Flames, Die Hard!

Participants

Nitin P. Ghonge, MD, New Delhi, India (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

1. To review the clinical status of Hysterosalpingography [HSG] in infertility work-up in the current era of cross-sectional imaging. 2. To revisit the nuances of HSG procedure and image interpretation for better understanding of uterine, tubo-ovarian and peritoneal lesions in these patients. 3. To understand the spectrum of findings on the initial HSG study and impact on the subsequent infertility work-up.

#### TABLE OF CONTENTS/OUTLINE

1. Status of HSG in current clinical practice as an initial first-line investigation for infertility work-up. 2. Procedural nuances in HSG and the image interpretation skills play an important role in diagnostic accuracy of HSG in patients with infertility and the overall utility. 3. Implications of slow continuous injection of contrast with acquisition of standard set of images: early filling phase, late distended phase, peritoneal spillage phase and post-cannula removal phase. 4. Review of basic principles in Radiation hygiene as applicable to HSG. 5. Image interpretation includes evaluation of endometrial cavity in terms of shape, distension and the mucosal surface. Tubal and peritoneal evaluation is not restricted to contrast spillage alone. Apart from tubal patency, evaluation of tubal mucosa is an important component of tubal evaluation. Apart from the tubal opacification and luminal caliber, the course of fallopian tubes should also be carefully evaluated as it provides vital clues about the status of peri-tubal peritoneum and peritubal adhesions.

#### OBEE-75 Hereditary and Non-Hereditary Syndromes with Gynecologic Manifestations: What the Radiologist Needs to Know

Participants

Ekta Maheshwari, MD, Pittsburgh, PA (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

1. A number of key hereditary and non-hereditary syndromes are associated with gynecologic manifestations. 2. Awareness of these syndromes and their associations is integral to optimal patient management, facilitating recommendations for ancillary imaging and follow up.

## TABLE OF CONTENTS/OUTLINE

Hereditary Cancer Predisposition Syndromes Some examples of hereditary cancer predisposition syndromes include Lynch syndrome (mismatch repair genes), Cowden Syndrome (PTEN), hereditary breast and ovarian cancer syndrome (BRCA1/ BRCA2), Peutz-Jeghers syndrome (STK 11) and hereditary leiomyomatosis and renal cell cancer syndrome (FH). These syndromes can predispose individuals to distinct uterine and ovarian neoplasms. Congenital Syndromes with Benign associations • Gynecologic manifestations observed in multiple congenital and acquired syndromes can also be associated with benign entities • Congenital malformation of the reproductive tract can be seen in Mayer-Rokitansky-Küster-Hauser syndrome. Familial clustering of these cases suggests a genetic basis of inheritance. Acquired Syndromes Acquired syndromes with gynecologic manifestations include • Meig's syndrome • Ovarian hyperstimulation syndrome • Ovarian remnant syndrome • Fitz-Hugh-Curtis syndrome • Growing teratoma syndrome AIMS • Summarize and illustrate imaging findings observed for key hereditary and non-hereditary syndromes associated with gynecologic manifestations, including features of malignancy and those features overlapping and mimicking malignancy. • Describe the clinical implications, most current imaging recommendations and screening and surveillance guidelines for these syndromes.

### OBEE-8 Quantification in Fetal MRI: Why, When, and How

Participants

Haithuy N. Nguyen, MD, Los Angeles, CA (*Presenter*) Research Grant, Siemens AG

#### TEACHING POINTS

1. Recognize the fetal abnormalities that require a radiologist to use the measuring tool. 2. Understand the impact of measurements on prognostication and/or family counseling. 3. How to correctly perform the measurements and compare to previously published normative values or thresholds.

## TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Why, when, how to measure lung volumes - Congenital diaphragmatic hernia (CDH), congenital lung malformation, giant omphalocele, anhydramnios, skeletal dysplasia, and cervical teratoma. 3. Why, when, how to measure tracheoesophageal displacement index and tumor volume to fetal weight ratio for cervical and sacrococcygeal teratomas, respectively. 4. Why, when, how to measure liver volumes - CDH. 5. Future work - lung signal ratios, estimating CDH defect size, open neural tube myelomeningocele sac size, and amniotic fluid maximum vertical pocket.

### OBEE-9 Imaging Cervical Cancer: Beyond Diagnosis

#### TEACHING POINTS

Abdominal imaging plays an essential role in the contemporary management of cervical cancer. MRI is a key imaging modality due to excellent tissue contrast resolution, enabling superior accuracy for tumor size, parametrial and pelvic sidewall invasion and evaluation of nodal metastases, all of which are key prognostic factors for cervical cancer. 18F-FDG-PETCT is essential in the assessment of advanced stage disease to evaluate for distant metastasis and can also aid in the detection of involved locoregional lymph nodes. Imaging also plays an integral role in brachytherapy treatment planning and execution. Ultrasound, MRI, CT and, on occasionally radiography, are used for guidance of brachytherapy applicator placement and to confirm appropriate implant positioning prior to the delivery of therapeutic radiation. Imaging is integral in the post-treatment surveillance to detect treatment-related complications and identify recurrent disease.

## TABLE OF CONTENTS/OUTLINE

Review the current FIGO staging system of cervical cancer and illustrate the role of imaging as it relates to stage determination and stage-specific treatment options. Demonstrate the role of imaging for brachytherapy treatment planning and execution, including structured reporting recommendations for brachytherapy implant assessment. Illustrate expected post-therapy imaging findings and the role for MRI, PETCT and CT. Show imaging findings of common and uncommon post-therapy complications. Illustrate cases of recurrence vs. expected benign post treatment changes.

## Abstract Archives of the RSNA, 2023

OBEE-1

### Isthmocele: A Simplified Guide

#### Participants

Isabela Ferracini, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Isthmocele may be present in 24-69% of women evaluated with transvaginal ultrasound and may be the cause of several clinical dysfunctions: dysmenorrhea, abnormal uterine bleeding, obstetric complications and perhaps even subfertility. When found in an ultrasound examination, there are several criteria to be considered. Accurate reporting of the description and measurement of this area in ultrasound examinations becomes important not only for research, but also for the clinical approach and planning of surgical treatment and to standardize the language in the documentation of the examination and the performance of reports. The objective of this work is to carry out a didactic review of how to examine an isthmocele in non-pregnant women, based on the first European consensus.

#### TABLE OF CONTENTS/OUTLINE

A literature review was carried out and cases of ultrasound, magnetic resonance imaging and hysterospingography obtained from the digital archive of our institution. We approach a didact review of the imaging aspects and how to measure them adequately, including teaching points and additional cases.

Printed on: 04/12/24

## Abstract Archives of the RSNA, 2023

OBEE-10

### Diaphragmatic Endometriosis: A Breathtaking Challenge

#### Participants

Nathalie Burger, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1) This study aims to demonstrate MR's feasibility and accuracy in detecting diaphragmatic endometriosis, which can cause long-standing disability and pain, negatively impacting quality of life. 2) Symptomatic diaphragmatic endometriosis is part of thoracic endometriosis syndrome, usually diagnosed later than pelvic endometriosis. The symptoms include chest pain, shortness of breath and coughing, worsening during menses, and associated with pneumothorax and phrenic nerve irradiation. 3) Endometrial cells follow peritoneal circulation through the right paracolic gutter towards the right subdiaphragmatic area, where they can aggregate and form nodules, favored by a preferred stagnation site in the posterior portion of the right side of the diaphragm. 4) MR allows high-sensitivity diagnosis of diaphragmatic endometriosis, offering better characterization of hemorrhagic lesions on fat-suppressed T1-weighted sequences and requiring no radiation exposure. 5) Diaphragmatic lesions present hyperintense nodules on fat-suppressed weighted sequences. Herniation is less frequent and can result from repeated proliferation, bleeding, and necrosis of endometriotic lesions leading to fenestrations and partial or complete diaphragmatic rupture.

#### TABLE OF CONTENTS/OUTLINE

1) Know What You're Dealing With: Anatomy and main symptoms 2) Active Search: MRI Protocol 3) Behold the visual representation of diaphragmatic lesions on magnetic resonance 4) What information should the gynecologist look for in the report? 5) Pearls and pitfalls in the differential diagnosis.

Printed on: 04/12/24

## Abstract Archives of the RSNA, 2023

OBEE-11

### Unfolding Endometriosis Clinical Cases Controls: What to Look For

#### Participants

Brainer Brandao Salomao, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Endometriosis is a chronic disease that impacts women from adolescence to menopause. Treatment options can vary from hormonal suppression to radical surgery and should be individualized and personalized. This educational exhibit presentation aims to: Discuss the clinical management of endometriosis including the different drugs available; Discuss the imaging methods available for hormonal treatment controls; Discuss imaging findings of endometriosis clinical controls.

#### TABLE OF CONTENTS/OUTLINE

To discuss the available drugs used in the clinical management of endometriosis, including its mechanisms of action and therapeutic efficacy, such as: Combined oral contraceptives; Selective estrogen receptors modulators; Hormonal intrauterine device (IUD); Progestins; Selective progesterone; GnRH agonists; Oral GnRH antagonists; Aromatase inhibitors; Review clinical cases undergoing medical treatment and the correlation between clinical response and imaging findings in different sites such as: Retrocervical disease; Deep endometriosis with myometrial infiltration; Endometriomas; Intestinal lesions; Diafragmatic lesions; To discuss genetic and immunological aspects that can interfere with clinical response.

Printed on: 04/12/24

## Abstract Archives of the RSNA, 2023

OBEE-12

### Uterine Sarcomas: Update on Pathologic and Imaging Findings

#### TEACHING POINTS

Demonstrate the imaging features that favor the diagnosis of uterine sarcomas and the particularities of each subtype; review staging and the role of imaging in monitoring response and suspected recurrence. Recognize their mimickers.

#### TABLE OF CONTENTS/OUTLINE

Gynecologic sarcomas are rare tumors and usually have an unfavorable prognosis. Magnetic resonance imaging (MRI) is the best method for characterization of these tumors, initial staging and treatment planning. MRI shows features that can be used to try to differentiate between subtypes of uterine sarcomas. Combined DWI and DCE techniques allow more accurate assessment of the degree of myometrial and cervical invasion and characterization of potential metastatic sites. Although several findings increase the suspicion of malignancy in gynecologic tumors (including irregular contouring, intratumoral necrosis/hemorrhage, and low ADC values), some particular features may suggest the diagnosis of sarcoma, such as macroscopic lymphovascular invasion in cases of endometrial stromal sarcomas, the "bag of worms" aspect of low-grade endometrial stromal sarcoma, and the "lattice-like" appearance of adenosarcomas that result from the mixed composition of solid and cystic multiseptate components. Their diagnosis remains a challenge in the radiologist's practice.

OBEE-13

### Imaging in Pregnancy: Safe and Sound With Contrast-Enhanced US

#### Participants

Stephanie Nguyen, MD, MSc, Calgary, AB (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

(1) Contrast-enhanced US (CEUS) is safe in pregnancy (2) Microbubble contrast agents do not cross the placental barrier (3) CEUS in pregnancy is an effective alternate to CT and MRI when enhanced imaging is required (4) A major indication is in the determination of malignancy when masses anywhere in the abdomen or pelvis are found in a pregnant patient (5) Ability of CEUS to differentiate benign from malignant processes allows prompt diagnosis and management with significant implications on maternal and fetal outcomes (6) CEUS is capable of evaluating more than one organ in any patient

#### TABLE OF CONTENTS/OUTLINE

(1) Review of the safety record of CEUS in pregnancy (2) CEUS technique in the pregnant patient (3) Case examples (3a) Malignant lesions (3b) Benign diseases (3c) Assessment of acute pain in pregnancy

Printed on: 04/12/24

OBEE-14

### Beyond the Scar: A Comprehensive Guide to Postoperative Endometrioses Imaging

#### Participants

Sofia Maksoud, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Endometriosis affects approximately 176 million women worldwide, with a prevalence of one in ten women during the reproductive period. Treatment can be clinical or surgical. The main surgical indications include clinical failure, lesions in the appendix, small bowel lesions, intrinsic ureter involvement and rectosigmoid (greater than 50% of the circumference). The goals of surgery include radical removal of all lesions and the restoration of normal pelvic anatomy. Postoperative evaluation is the new challenge of imaging studies, as the number of radical surgeries to treat endometriosis has increased enormously. Radiologists must be familiar with the common imaging findings, possible complications and the differentiation between residual disease and fibrotic scar.

#### TABLE OF CONTENTS/OUTLINE

- Review the common post-surgical findings following surgery for deep endometriosis.- Differentiate residual / recurrence disease and fibrotic scar. - Illustrate didactical cases with pre and post-surgical imaging.- Be familiar with possible complications after surgery.

Printed on: 04/12/24

OBEE-15

### What Not to Miss in Obstetric Ultrasounds - Multifetal Pregnancies: Chorionicity and Amnionicity

#### Participants

Laura Santiago Caobi, Ponce, PR (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Review the embryologic division in multifetal pregnancies and its significance for prenatal care. - Discuss the criteria for the classification of twin pregnancies using ultrasounds. - Provide case examples for classic imaging for each type of multifetal pregnancy. - Use an algorithm to assist in ultrasound monitoring and surveillance of multifetal pregnancies.

#### TABLE OF CONTENTS/OUTLINE

Multifetal pregnancies pose a significant risk for adverse outcomes compared to singleton pregnancies. Early and accurate diagnosis requires a comprehensive understanding of chorionicity and amnionicity. Ultrasound evaluation of placental number, interposed membranes, fetal genders, amniotic fluid volume, and presence of lambda sign are key for successful assessment of chorionicity and amnionicity. The use of an algorithm for ultrasound monitoring and surveillance of multifetal pregnancies can aid facilitate early interventions that will benefit the health of both, mother and fetus. Outline: (1) Introduction Objectives, (2) Multifetal Pregnancies, (3) Division Timing, (4) Classic Imaging Findings for Each Type of Multifetal Pregnancy, (5) Ultrasound Criteria for Diagnosis of Type of Multifetal Pregnancy, (6) Comparison of Fetal and Infant Mortality Rates, (7) Algorithm for Ultrasound Monitoring and Surveillance, (8) Case Examples, (9) Conclusion

OBEE-16

### Don't Forget the Bowel: Imaging Techniques, Associations and Treatment Implications of Bowel Endometriosis

#### Participants

Haatal Macer, MD, MS, Rolling Hills Estates, CA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. As the GI tract is the most common extragenital organ involved with endometriosis, imagers need to actively look for bowel involvement. Therefore, our exhibit will highlight the associations of bowel endometriosis leading imagers to actively look for bowel implants. 2. Practical tips on Ultrasound and MRI technique of bowel endometriosis imaging and how to improve lesion detection. 3. Discussion of detailed assessment of large and small bowel involvement with implications on management, especially related to pain and fertility, will be highlighted.

#### TABLE OF CONTENTS/OUTLINE

1. Background of GI tract endometriosis. 2. Associations: Incidence and prevalence with ovarian endometriomas; deep pelvic endometriosis especially with posterior compartment (rectovaginal and uterosacral ligament) involvement. 3. Ultrasound Technique: Bowel preparation; transvaginal technique for delineating normal anatomy and pathology; tips on separating bowel layers on ultrasound enabling detection of depth of muscle invasion. 4. MR Enterography: bowel preparation; role of antispasmodics; MR protocol favoring detection of appendiceal, ileocecal junction, small bowel and rectosigmoid deep endometriosis. 5. Detailed anatomic reporting of small and large bowel disease that have implications on management, particularly related to pain and fertility.

OBEE-17

### Unmasking Atypical Adenomyosis: Imaging Spectrum with Laparoscopic and Pathologic Correlation

#### Participants

Brainer Brandao Salomao, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Adenomyosis is a prevalent gynecologic condition defined by the presence of endometrial glands and stroma within the myometrium. 2. It remains poorly understood with severe implications on fertility and quality of life. 3. Although there is no agreement on the imaging classification of adenomyosis, the typical features are more discussed and widely known. 4. MUSA statement consensus is an important available tool to recognize and describe the typical forms of adenomyosis on ultrasound. 5. Atypical presentations of adenomyosis are less discussed, remaining a diagnostic challenge. 6. This presentation aims to review imaging findings of atypical adenomyosis, highlighting their potential differential diagnosis, as well as their impact on clinical management and patients outcome.

#### TABLE OF CONTENTS/OUTLINE

- Overview of adenomyosis. - Review imaging-based adenomyosis classification. - Ultrasound and MRI imaging findings of atypical adenomyosis, including: Solid adenomyoma; Cystic adenomyoma; Submucosal adenomyoma; Subserosal adenomyoma; Accessory cavitated uterine mass; Polypoid adenomyoma; Adenomatoid tumor. - Differential diagnosis, such as: Adenosarcoma; Cystic / hemorrhagic degeneration of leiomyoma; Cellular degeneration of leiomyoma; Isthmocele; Unicornuate uterus. - Present clinical cases with laparoscopic and pathological correlation. - Summary of key concepts.

Printed on: 04/12/24

OBEE-18

### Exploring the Pelvic Floor through MRI - A Comprehensive Trainee's Handbook

#### Participants

Jessica A. Marques Silva, MD, Houston, TX (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1) This review highlights the benefits and recent updates in defecography, a radiological examination used to evaluate patients with defecatory and pelvic floor dysfunction. This functional anatomical condition affects support structures and is more common in women over 50 years old. 2) MR defecography evaluates multicompartamental dysfunction, etiologies of defecation dysfunction, and postoperative complications and recurrence, providing both anatomical and functional information while allowing simultaneous assessment of the anal sphincters. 3) Most patients present changes in more than one compartment, and the reoperation rate after initial pelvic floor surgery is high. Understanding changes in various compartments can contribute to reducing the need for reapproaches. 4) Examples of pathologies found in defecography include cystocele, urethral hypermobility, uterine and vaginal prolapse, background hernias, and intussusception. This review discusses the implications of these findings for clinical practice.

#### TABLE OF CONTENTS/OUTLINE

1) 1) General Aspects: A Little Bit of Everything; 2) Essential MR Protocol - What you need to remember; 3) Assessing the dynamic study on MR; 4) MR images evaluation - Is defecating three times really necessary?

Printed on: 04/12/24

OBEE-19

### Adeno-My-Goodness: Comprehensive Review of Adenomyosis

#### Participants

Paulo Miro, MD, Salt Lake City, UT (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Adenomyosis is a prevalent condition which may cause symptoms (such as abnormal uterine bleeding and pain), and affect pregnancy outcomes. Ectopic endometrial glandular tissue within the uterine myometrium with associated smooth muscle hypertrophy may have a variety of appearances across the imaging modalities. Imaging findings may be further confounded by hemorrhage or development of myometrial cysts, and changes under the hormonal influence (particularly during pregnancy). Cases may arise when adenomyosis mimics uterine malignancy, and uncommonly, malignancy may arise from the glandular tissue within adenomyosis. This exhibit is a comprehensive review of adenomyosis across multiple imaging modalities with pathologic and graphical correlation.

#### TABLE OF CONTENTS/OUTLINE

Relevant uterine anatomy  
1. Classic Imaging Findings of Adenomyosis  
A) Ultrasound "Adeno"  
• Echogenic striations/buds  
• Myometrial cysts  
• "Myosis"  
• Myometrial thickening (focal or diffuse)  
• Globular uterus  
• Thickened inner myometrium  
• "Venetian blinds" shadowing  
B) MRI "Adeno"  
• T2 hyperintense foci and myometrial cysts  
• T1 hypointense foci  
• "Myosis"  
• T2 hypointense junctional zone thickening  
• Myometrial thickening (focal or diffuse)  
C) CTD Hysterosalpingogram  
2. Atypical findings of adenomyosis  
A) Cystic/hemorrhagic  
B) Pedunculated  
3. Adenomyosis in pregnancy  
4. Clearing up the confusion between focal adenomyosis and adenomyoma (the mixed Mullerian tumor)  
5. Malignancy arising within adenomyosis

### Postpartum Woman in the ER? A Surviving Guide for the On-Call Radiologist

#### Participants

Marta Barrios Lopez, MD, Santander, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To learn what are the main puerperal obstetric complications and their imaging findings. 2. To understand the importance of clinical correlation in the diagnosis of many of these conditions: some can only be diagnosed in the proper clinical setting and a high suspicion is essential. 3. To review the anatomy landmarks necessary to locate certain types of hematomas.

#### TABLE OF CONTENTS/OUTLINE

1. Normal imaging findings during the puerperium: Vaginal delivery. 2. Normal imaging findings during the puerperium: Cesarean delivery. 3. Surgical technique for Cesarean section and potential complications at each step. 4. Thromboembolic conditions: 4.1. Ovarian vein thrombosis/ thrombophlebitis and their complications. 5. Infectious complications 5.1. Postpartum endometritis. 6. Hemorrhagic complications 6.1. Lower genital tract injury: supra and infralevator hematomas. 6.2. Abnormal placentation: placenta accreta, increta, percreta. 7. Cesarean-related complications 7.1. Wound cellulitis/ abscess 7.2. Uterine dehiscence 7.3. Bladder flap hematoma 7.4. Subfascial hematoma 7.5. Rectus sheath hematoma 7.6. Urinary tract injury

### Imaging of Functional Ovarian Tumors and Tumor Like Conditions with Pathological Correlation

#### Participants

Khaled M. Elsayes, MD, PhD, Houston, TX (*Presenter*) Nothing to Disclose  
Niloofer Karbasian, MD, (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Describe the ovarian histology and the hormone axes. 2. Discuss clinical features of hormone excess as secondary signs of hormone producing tumors and tumor like conditions. 3. Explain different categories of functional ovarian tumors and tumor like conditions. 4. Illustrate multimodality imaging characteristics of different tumors.

#### TABLE OF CONTENTS/OUTLINE

1. Ovarian histological anatomy a. Including role of different cell types within the ovary 2. Hypothalamus-Pituitary-Ovary axis a. Introduce sex hormones and their role b. Flowchart demonstrating the hormone pathways 3. Clinical features of hormonal excess. a. Excess androgen and symptoms b. Excess estrogen and symptoms 4. Subtypes of functional ovarian tumors. a. Sex cord-stromal b. Surface epithelial c. Stroma d. Tumor-like lesions and conditions 5. Approach to diagnosing functional ovarian tumors a. Multidisciplinary approach i. Role of imaging. ii. Hormonal analysis in follow up. iii. Tissue sample often needed for diagnosis. b. Imaging direct and indirect signs of hormonal excess. i. Contribution of different modalities: US, MRI, CT. ii. Features of malignancy. iii. Radiologic examples of different functional tumors. c. Pathology correlation 6. Treatment options a. Conservative b. Surgical c. Prognosis

### Decoding the Pandora's Box With Fetal MRI: A Comprehensive Pictorial Review of Fetal Abdominal Abnormalities

#### Participants

Taruna Yadav, MD, Alwar, India (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To study indications, advantages and limitations of fetal MRI for antenatal assessment of various abdominal anomalies. 2. To define a standard MRI protocol for assessment of fetal abdominal anomalies. 3. Using a case-based approach, to learn about myriad of common and rare fetal abdominal anomalies including gastrointestinal (bowel atresias, meconium peritonitis), genitourinary (posterior urethral valve, urethral atresia, pelviureteric junction obstruction, cystic renal dysplasia, fetal pyelectasis, ectopic kidney, syndromic associations like Meckel Gruber and Joubert syndrome), ventral wall defects (gastroschisis, omphalocele, limb body wall defects, pentalogy of Cantrell, bladder exstrophy, amniotic band syndrome), pelvic disorders including presacral masses (sacrococcygeal teratoma, anterior meningocele) with syndromic associations and follow up (wherever available). 4. To develop an imaging approach to complex fetal abdominal anomalies including ventral abdominal wall defects.

#### TABLE OF CONTENTS/OUTLINE

1. Role of MRI for assessment of fetal abdomen: indications, advantages and limitations 2. Fetal MR protocol to assess various abdominal anomalies 3. Fetal Abdominal Anomalies (A Case Based Approach): 3A. Gastrointestinal anomalies 3B. Genitourinary anomalies 3C. Ventral wall defects: spectrum of anomalies and simplified imaging approach 3D. Pelvic disorders: presacral masses 3E. Syndromic associations 3F. Miscellaneous 4. Conclusion

OBEE-23

### Placenta 101: A Pictorial Review of Normal and Pathological Findings by US and MRI

#### TEACHING POINTS

To normal thickness of the placenta is 2 to 4 cm, and it must be measured where the umbilical cord is inserted. Placental grading maturity (Grannum classification) is divided into 4 grades by ultrasound and it is based on the extent of calcifications. To differentiate a retroplacental hematoma from a uterine contraction, it is recommended to wait a few minutes for the contraction to disappear. An easy Doppler finding for the differentiation of hematomas from other placental masses is the absence of internal blood flow. Currently, when the placental edge is less than 20 mm away from the internal cervical orifice (ICO) is a low-lying placenta, and when the placenta covers partially or completely the ICO, it is called placenta previa.

#### TABLE OF CONTENTS/OUTLINE

History. Embryology. Normal appearance and grades of maturation. Variations in placental morphology. Placental hematoma. Placenta previa. Placental accretism. Placental tumors. Teaching points. Conclusion. Bibliography.

Printed on: 04/12/24

OBEE-24

### FOMO, No More - A Comprehensive Guide for Identifying Head to Toe Fetal Anomalies

#### TEACHING POINTS

To highlight the importance of level I scan and develop an algorithmic approach to diagnose structural anomalies at the earliest. To diagnose progressive anomalies on subsequent scans and devise a trimester based checklist to avoid missing abnormalities. To assess the maternal risk factors in conjunction with fetal parameters to be able to assess growth of the fetus as well as restriction. To know the importance of color doppler in all the scans and how it affects further management. Scanning beyond fetus- to diagnose various placental, uterine and adnexal abnormalities for effective management. An obstetric ultrasound plays a pivotal role in each stage of pregnancy in providing a non-invasive diagnostic method, yielding immediate, extensive and accurate results for evaluating the fetus as well as the health of the mother. Protocol based screening reduces the "fear of missing out" an abnormality.

#### TABLE OF CONTENTS/OUTLINE

1. First Trimester Scan A) Early First Trimester: • Ectopic pregnancy • Twin or higher order pregnancy with correct labelling • Adnexal abnormality B) Late First Trimester: Detectable 9 • Anencephaly • Holoprosencephaly • Encephalocele • Omphalocele • Gastroschisis • Iniencephaly • Limb abnormality • Megacystis • Major cardiac defects • First trimester markers for chromosomal abnormalities • Abnormal UAD 2. Second Trimester Scan • Detectable 9 • Cardiac defect • Situs abnormalities • Spinal abnormalities • Placental abnormalities 3. Fetal Echocardiography 4. Third Trimester Scan • Evolving cardiac abnormalities • Placental abnormalities • Abnormal Doppler

Printed on: 04/12/24

### See What's Inside: A Look at Pelvic Devices

#### Participants

Flavia M. Starling, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The female pelvis has a complex anatomy; thus, it requires deep study and its image can be challenging. Besides the anatomy knowledge, radiologists need to keep up with the daily devices and techniques, used by doctors and by the patients. It is important to be prepared to face unknown figures like foreign bodies, and also to recognize these devices in the pelvis, such as contraceptive methods (vaginal ring and intrauterine devices), tampons, menstrual cups, vaginal pessaries, catheters and slings. Questionnaires are often vague when referring to these devices and most women forget to mention actively whether they have or are using any of them. This study has the objective of reviewing common devices placed in the pelvis, especially in gynecology, urogynecology and its possible complications, helping radiologists to interpret these images. An understanding of the radiological appearance of some of these devices in the many imaging methods such as X-ray, ultrasound, CT and MRI is useful to avoid misinterpreting them, as well as obtaining a diagnosis more quickly and accurately.

#### TABLE OF CONTENTS/OUTLINE

For this education exhibit, we obtained clinical and epidemiological information in literature and selected images of cases that show different findings of women's vaginal and uterine devices, including normal aspects or complications.

OBEE-27

### This Is Rare, but It Happens: Atypical Presentation of Teratomas

#### Participants

TATIANA GONCALVES, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Teratomas are germ cell tumors composed of multiple tissues derived from two or three germ layers. Mature teratomas are the most common benign ovarian neoplasms. They are easily diagnosed on imaging studies because of their characteristic intratumoral fat and calcification components. However, a minor percentage of teratomas have no visible fat on imaging studies. Malignancy is an uncommon presentation, which may be suspected in the presence of an enhancing, irregularly marginated solid component. Gliomatosis peritonei (GP) is another unusual form, that it is characterized by the implantation of mature glial tissue in the peritoneum or omentum. Mature teratomas have also an high complication rate compared with other ovarian tumors, however, there is a low rate of spontaneous rupture. The purpose of this presentation is to discuss the various atypical imaging features of teratoma that can be particularly misleading for radiologists.

#### TABLE OF CONTENTS/OUTLINE

Index 1. Introduction 2. Mature teratoma 3. Mature teratoma simulating malignant lesion 4. Gliomatosis peritonei 5. Immature teratoma 6. Ruptured teratoma 7. Pre sacral teratoma 8. Pre sacral myelolipoma and dermoid 9. Retrorectal dermoid 10. Cul-de-sac dermoid 11. Currarino syndrom

OBEE-28

### Adenomyosis: MRI for Diagnosis and Problem-Solving

#### Participants

Lauren F. Alexander, MD, Jacksonville Beach, FL (*Presenter*) Spouse, Stockholder, Abbott Laboratories; Spouse, Stockholder, AbbVie Inc; Spouse, Stockholder, General Electric Company; Spouse, Stockholder, Myriad Genetics, Inc

#### TEACHING POINTS

Uterine adenomyosis develops from the abnormal proliferation of heterotopic endometrial glands and stroma in the myometrium. Recognizing the characteristic magnetic resonance imaging (MRI) findings is essential for accurate diagnosis and appropriate patient management, as clinical symptoms such as dysmenorrhea, menorrhagia and pelvic pain overlap with other gynecologic diagnoses. After reviewing this exhibit on adenomyosis, the learner will be able to -- Discuss how to optimize MRI sequences to evaluate for adenomyosis. -- Identify typical and atypical MRI findings of adenomyosis. -- Distinguish other diagnoses which can mimic or have overlapping findings with adenomyosis. -- Describe treatment options for patients with adenomyosis.

#### TABLE OF CONTENTS/OUTLINE

(1) Background: Pathophysiology of adenomyosis, Clinical findings, Role of imaging for diagnosis and management. (2) MRI protocol: Key sequences, Tips for optimization. (3) Imaging features on MRI: Normal anatomy, Typical adenomyosis findings, Atypical findings (Polypoid, External adenomyosis, Cystic adenomyosis without with hemorrhage, Pregnancy related changes, Endometrial ablation changes). (4) Differential diagnosis mimics: Deep infiltrating endometriosis, Leiomyoma, Neoplasms (endometrial cancer, Mullerian adenosarcoma), Accessory and cavitated uterine mass, Pitfalls/Mimics (Uterine contraction, pseudo-thickening of junctional zone). (5) Treatment options: Medical, Procedural (ablation, excision, hysterectomy).

OBEE-29

### What Not to Miss in Obstetric Ultrasounds - Fetal Skeletal System Evaluation

#### Participants

Oswaldo Guevara Tirado, BS, MS, Coto Laurel, PR (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Review the essential components of an ultrasound based fetal skeletal assessment. Discuss common sources of error when evaluating the fetal skeletal system using ultrasound. Analyze case examples of classic images with normal findings that are frequently misinterpreted. Follow a systematic approach to avoid missing significant skeletal defects.

#### TABLE OF CONTENTS/OUTLINE

Obstetric ultrasounds play a crucial role in the accurate identification of fetal skeletal abnormalities, allowing physicians to optimize management in order to improve both fetal and maternal outcomes. Fetal skeletal abnormalities can manifest early during embryonic life. Therefore, proper evaluation and identification of developmental anomalies requires a profound understanding of normal fetal development and knowledge about ultrasound imaging techniques. Moreover, it is important to take into consideration the various sources of error that exist when performing a fetal skeletal assessment. Ultrasound is the primary imaging modality used to assess fetal well-being by providing a non-invasive method to precisely identify fetal skeletal abnormalities, amongst other irregularities, and intervene in a timely manner. 1. Introduction Objectives 2. How to Approach the Fetal Skeletal System 3. Skeletal Assessment: Ultrasound Findings 3a. Long Bones 3b. Hands Feet 3c. Fetal Head 3d. Fetal Thorax 3e. Fetal Movement 4. Femur Length Measurement Sources of Error 5. Review of cases in quiz format 6. Conclusion

### Get the Fluoroscopic Vibes: Hysterosalpingography, a Guide for Residents

#### TEACHING POINTS

1. Illustrate the main normal imaging findings and technical procedures of hysterosalpingography including normal variants, non-pathological findings and technical artifacts. 2. Recognize abnormalities of the uterine cavity and fallopian tubes by hysterosalpingographic images and analyze the pathology and its impact on fertility. 3. Emphasize when further imaging modality such as sonohysterogram and magnetic resonance imaging or even hysteroscopic direct visualization is required in order to reach to the final diagnosis. 4. Discuss adequate surgical and non-surgical treatment options and possibilities of pregnancy post-treatment.

#### TABLE OF CONTENTS/OUTLINE

1. Review the key points of the female pelvic anatomy, indications and contraindications, technical procedures and normal hysterosalpingographic features. 2. Identify the most common anatomical variants (with and without proven influence on fertility), non-pathological findings and technical artifacts that may simulate causes of infertility. 3. Illustrate the characteristic hysterosalpingographic and other image modalities findings of uterine cavity and Fallopian tubes pathologies by analyzing representative cases and review several treatment options and assess the possibilities of fertility of each case. - Benign and malignant neoplasms- Tubal patency- Hormonal disorders- Post-surgical findings - Miscellaneous

### Incidental Findings of Pelvic Endometriosis in Routine Transvaginal Ultrasound: A Pictorial Essay

#### Participants

Alexandre Minoda, MD, Recife, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The aim of this exhibit is:• To conduct a review and illustrate through ultrasound images the female pelvic compartments. • To describe and disseminate the main ultrasound findings suggestive of deep infiltrating endometriosis (DIE) and ovarian endometriomas on transvaginal ultrasounds performed as part of a routine gynecological evaluation. • To demonstrate how the unique capabilities of ultrasound can help in the diagnosis and management of patients.

#### TABLE OF CONTENTS/OUTLINE

INTRODUCTION / BACKGROUND• Epidemiology, clinical symptoms and classifications of endometriosisROUTINE TRANSVAGINAL ULTRASOUND AND TRANSVAGINAL ULTRASOUND AFTER BOWEL PREPARATION• International Deep Endometriosis Analysis (IDEA) group consensusPELVIC COMPARTMENTS• Anatomy and normal findings in routine transvaginal ultrasoundINCIDENTAL FINDINGS OF PELVIC ENDOMETRIOSIS IN ROUTINE TRANSVAGINAL ULTRASOUND• Anterior compartment• Middle compartment• Posterior compartment• Other findings that may optimize the diagnosis of endometriosis on routine transvaginal ultrasound

OBEE-31

### How Far Can We Go With Computed Tomography in the Diagnosis of Endometriosis:- Correlation With MRI and US

#### Participants

Gabriel Faria Medeiros, Santo Andre, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Recognize the most common CT findings associated with endometriosis and how to describe them 2. Discuss and highlight the role of CT in aiding endometriosis management, by suggesting the diagnosis and prompting MRI recommendation, accelerating diagnosis and improving patient outcomes. 3. Illustrate cases where CT and MRI were both used in the diagnosis of endometriosis, with emphasis on how the correlation between the two modalities aided in the diagnosis. 4. Identify post-treatment changes and potential pitfalls

#### TABLE OF CONTENTS/OUTLINE

1. Introduction: Epidemiology, pathophysiology and clinical aspects of endometriosis Currently available treatment options 2. Role of different imaging techniques in diagnosis and assessment of disease extension (benefits and limitations) Hysterosalpingography Transvaginal ultrasound (with bowel preparation) CT MRI Videolaparoscopy 3. CT findings of endometriosis, with MRI correlation - Case-by-case discussion 4. Post-operative changes and confounding factors Salpingo-oophorectomy Hysterectomy Rectosigmoidectomy Post-radiation therapy Adhesions Inflammatory pelvic disease 5. Summary and take-home messages

OBEE-32

### Smooth Seas Never Made Skilled Sailors: Navigating the Challenges That Arise After Cervical Cancer Treatments

#### TEACHING POINTS

To review the different radiotherapy modalities and the clinical indications in cervical cancer treatment. To identify the most frequent early and late complications of radiotherapy. To demonstrate that high doses of radiotherapy are associated with a greater risk of complications. To provide key points and radiologic tools in order to differentiate post-actinic changes from residual or recurrent disease.

#### TABLE OF CONTENTS/OUTLINE

Introduction: Epidemiology and clinical importance -FIGO staging review in cervical cancer -The role of radiotherapy treating cervical cancer. Early and late complications in the uterus, ovaries, intestines, bones, and bladder. Case based approach with radiologic correlation. Imaging findings with histologic and colonoscopy correlation. Conclusion.

OBEE-33

### Imaging Uterus After Endometrial Ablation

#### Participants

Margarita Revzin, MD, MS, Wilton, CT (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Endometrial ablation is a minimally invasive surgical procedures available for the management of patients with abnormal uterine bleeding. Post endometrial ablation expected imaging findings and post procedural complications have a characteristic pattern on imaging and if not readily recognized by the radiologists may lead to misinterpretation and unnecessary follow up imaging and inadequate management. Teaching points The goal of this study is to familiarize radiologists with imaging findings of uterus after endometrial ablation therapy. This will serve to enhance recognition of normal imaging findings and life threatening conditions and help radiologists create a focused differential diagnosis for various complications after the procedure.

#### TABLE OF CONTENTS/OUTLINE

A. Review pathophysiology of dysfunctional uterine bleeding.B. Review of treatment options in management of DUB with emphasis on endometrial ablation C. Discuss imaging options available for the assessment of uterus after ablation: US, CT, MRI and their strengths and weaknesses D. Review key imaging features of the post endometrial ablation 1. Expected post-op changes (early: intracavitary air, intrauterine /cervical hematoma, uterus edema; late: endometrial cavity contracture, endometrial thinning) 2. Complications (immediate: infectious (endometritis, myometritis, salpingitis); cornual hematometra, hematosalpinx; chronic: synechia, infertility from post-ablation tubal sterilization syndrome, ectopic pregnancy, abnormal placentation, endometriosis, malignancy (adenocarcinoma of the uterus)E. Management of the presented post-ablation complications will be reviewed.

### Dedicated MR Imaging for Endometriosis: What You Can't Miss in Your Report

#### TEACHING POINTS

MR imaging is an important tool for diagnosis of deep pelvic endometriosis. Understanding and recognizing the MRI manifestations of this disease may be challenging. In this presentation, we will summarize the most important points to include in our reports considering a region-based reading and reporting system

#### TABLE OF CONTENTS/OUTLINE

Anterior compartment: -Differentiating bladder endometriosis from peritoneal endometriosis: bladder endometriosis is diagnosed when the muscular layer of the bladder is involved. If a bladder lesion is identified, informing the location, distance from vesical trigone and distal ureters are mandatory. Middle compartment: Characterization of endometriomas and differentiation with hemorrhagic ovarian cysts- it is a daily point of attention. -Malignant transformation of ovarian endometriosis: it should be considered if vascular solid tissue is identified with Diffusion imaging and Dynamic post contrast sequences.-Endometriotic tissue infiltrating the uterus: including this information and its differential diagnosis is relevant for treatment planning. Posterior compartment: -Differentiating deep rectal endometriosis from superficial endometriosis: characterization of penetration from endometriotic tissue into muscular layer of rectal wall will be definitive. Location of the lesion (intraperitoneal or extraperitoneal) will also impact in treatment options. -Superficial endometriosis: this is a challenge in diagnostic imaging. Small deposits of glandular tissue are missed frequently. An indirect sign to look for is the peritoneal pocket sign, defined as a peritoneal defect that collects fluid, frequently identified in posterior cul de sac.

### Practical Approach to Ovarian Masses - The ABC's

#### Participants

Antonio Michael-Fernandez, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- To know how to properly identify ovaries and its organ dependency when facing pelvic lesions.- Going over the most common and specific characteristics and radiological features of the different ovarian lesions

#### TABLE OF CONTENTS/OUTLINE

The differential diagnosis of ovarian lesions is broad and complex. It is not only a diagnostic challenge due to the existence of multiple tumour lineages, but also to the proper differentiation of their ovarian dependence, which is often unclear. First of all, it is important to properly identify the ovaries by knowing pelvic anatomy, their location and their vascular relations. In the same way, when facing pelvic lesions of possible ovarian origin, there are some radiological signs that can help us to better determine their organ dependence (such as the "phantom organ" or the "beak sign"). Once we have confirmed that the dependence is ovarian, it is important to know the different possible lesions that may exist, and their most common radiological characteristics, both in CT and (mostly) in MRI. According to their T1, T2 signal, and internal component (solid, cystic or mixed), we propose a simple diagnostic algorithm that helps to approximate the diagnosis, based on the most frequent radiological characteristics of ovarian tumours.

### First Things First! First Trimester Obstetric Ultrasound From the Basics to the Pearls

#### Participants

Niels Vinicius Padua Carvalho, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The aim of this exhibition is to:• Review the recommendations for screening and diagnostic ultrasound in pregnant women during the first trimester of pregnancy.• Demonstrate how the obstetric ultrasound should be documented in this context.• Discuss how to use ultrasound for risk assessment of common forms of aneuploidies, malformations and gestational diseases/complications, in a practical approach.• Highlight the pearls and pitfalls in that evaluation.

#### TABLE OF CONTENTS/OUTLINE

- INTRODUCTIONo Purpose of a first trimester ultrasoundo Standard equipment and protocolo Documentation requirements
- GUIDELINE FOR EXAMINATIONo Demonstrate by case-based images the minimum requirements for a 11-14 weeks gestation examination, including:§ Assessment of viability§ Confirmation of intrauterine pregnancy and uterine integrity§ Fetal biometry§ Fetal anatomy§ Risk assessment for common forms of aneuploidy
- SCREENINGSo Describe the pretest counseling, biomarkers and ultrasound-based assessment for aneuploidies, malformations and gestational diseases
- SUMMARY AND SYSTEMATIC APPROACH
- TAKE HOME MESSAGES

OBEE-38

### A Multimodality Review of Gynecologic Medical Devices in the Pelvis

#### Participants

Kaitlin Zaki-Metias, MD, Windsor, ON (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Given the frequency with which gynecologic pelvic devices are encountered on imaging, understanding the imaging characteristics and appropriate positioning on various modalities is important for radiologists to recognize. Positioning and integrity of all pelvic devices should be evaluated on all studies when visualized. Radiologists should be able to confidently communicate pertinent findings of pelvic device malposition to referring clinicians.

#### TABLE OF CONTENTS/OUTLINE

Understand the importance and clinical implications of gynecologic medical devices in the pelvis, including intrauterine contraceptive devices (IUCD), pessaries, contraceptive vaginal rings, tubal occlusion and ligation devices, brachytherapy seeds, and menstrual products. Describe the normal appearance and appropriate positioning of gynecologic medical devices in the pelvis and be familiar with their appearance on various imaging modalities. Describe the strengths and pitfalls of various imaging modalities in the assessment of medical pelvic devices.

Printed on: 04/12/24

### **MR Imaging of Gynecologic Emergencies in the Pregnant Patient: An Overview of Clinical Indications, Proper Sequence Choice and Not to Miss Emergencies**

#### **TEACHING POINTS**

Describe the clinical indications for MR imaging in pregnancy based upon the risks of fetal harm with ionizing radiation and recommendations from organizations including the American College of Radiology (ACR) and American College of Obstetricians and Gynecologists (ACOG). Outline the sequences included in the protocol for an MRI abdomen/pelvis of a pregnant female with examples of the features best evaluated on each sequence. Review the imaging features of gynecologic emergencies including ovarian torsion, ectopic pregnancy, placenta accreta spectrum and acute uterine rupture based on an understanding of the associated pathophysiology. Understand pertinent positive and negative information that should be conveyed to the primary team and characteristics that may portend prognosis.

#### **TABLE OF CONTENTS/OUTLINE**

Background discussing the difficulty of diagnosing pathology in pregnancy and crucial role of the radiologist. Clinical indications for MR in pregnancy - outline the ACR and ACOG recommendations and reason to avoid gadolinium contrast. Discussion of the risk of fetal harm with ionizing radiation including the difference between stochastic and deterministic effects, absorbed dose of different radiology exams and impact on fetus based on gestational age. List of the sequences included in a typical MR abdomen/pelvis protocol followed by slides with pictures demonstrating the pertinent features evaluated in each sequence. Examples of gynecologic emergencies seen in pregnancy with slides specifically focused on ovarian torsion, ectopic pregnancy (ruptured tubal ectopic, abdominal ectopic and interstitial ectopic), placenta accreta spectrum, and acute uterine rupture.

OBEE-42

### Pitfalls in Ovarian Imaging: Limits of the ORAD's System

#### TEACHING POINTS

The first step in characterizing a pelvic mass using the ORAD'S system is to determine its ovarian origin. The second step is to avoid misdiagnosing infections and inflammatory conditions. The third step is to identify features of peritoneal carcinomatosis. Finally, the adnexal lesions are analyzed according to the ORADS criteria. Although this system is standardized and clear, care must be taken to avoid the many pitfalls that can occur at each stage of the reasoning.

#### TABLE OF CONTENTS/OUTLINE

We will report our experience on the pitfalls of the ORAD's system from a series of 3000 MRI's obtained over the past 5 years in a large tertiary institution by : - Presenting a variety of extra-ovarian lesions that mimic ovarian lesions such as exophytic myometrial masses, lymphocele, lymph node and other tumors arising from other structures of the pelvis. - Presenting confusing infections and inflammatory conditions such as complicated endometriosis or actinomycosis - Discussing and illustrating lesions that mimic peritoneal carcinomatosis, such as Demons-Meigs syndrome and functionally hyper-stimulated ovaries - Discussing and illustrating some benign ovarian tumors that mimic malignancy, such as cellular fibromas, sclerosing stromal tumors and necrotic, infected or distorted lesions. - Discussing and illustrating some malignant lesions that mimic benignity, such as calcified tumors (low-grade serous ovarian carcinoma) and serous cystadenofibromas associated with a borderline component.

OBEE-43

### Serous Tumors in the Female Pelvis: Comprehensive Review of Diagnostic and Therapeutic Strategy

#### TEACHING POINTS

1. Serous tumors are common female pelvic neoplasm presenting a variety of clinical and imaging manifestations. Recently, there has been a paradigm shift that most extrauterine pelvic high-grade serous carcinomas (HGSC) are metastases of STIC. While HGSC is the majority of serous carcinomas, but also low-grade serous carcinoma (LGSC) developing through serous borderline tumor (SBT) may be occur. This exhibit provides an overview of diagnostic and treatment strategies including Hereditary Breast and Ovarian Cancer (HBOC) managements. 2. 3D-DCE-MRI and reduced FOV/computed DWI are useful in detecting early-stage HGSC, or small mural nodules of LGSC. Characteristic imaging findings such as black sponge in adenofibroma, papillary architecture with internal branching in SBT, dense calcification in psammocarcinoma, and CT pattern classifications for genomic subtypes estimation of advanced HGSC, and differentiation of invasive/non-invasive peritoneal implants of SBT are demonstrated.

#### TABLE OF CONTENTS/OUTLINE

Benign: Surface epithelial inclusion /Cystadenoma /Adenofibroma  
SBT: Exophytic /intra-cystic papillary growth; Micropapillary subtype /Adenofibromatous SBT; Peritoneal implants /LN involvement; Fertility-preserving treatment options  
LGSC Psammoma body /Psammocarcinoma; HGSC arising from LGSC/SBT  
HGSC STIC /Tubal /Peritoneal cancers; Advanced MR techniques: SWS, MRS, CEST; Therapeutic strategies for HBOC (BRCA1/2): Risk-reducing surgery /Molecularly targeted drug; Radiomics/Radiogenomics

### Pelvic Perspectives: Unveiling the Imaging Findings and Complications of Female Pelvic Devices

#### TEACHING POINTS

1. Review normal imaging findings of the female pelvis, including CT, US, and MRI. 2. Review normal and abnormal placement of intrauterine devices (IUDs) and required imaging studies for emergent cases, as in perforation. 3. Review indications for pessary placement and imaging findings for pelvic organ prolapse (POP) and describe their appearance on imaging. 4. Review normal imaging appearance of catheter placement in female patients and discuss potential complications that are visible on imaging. 5. Discuss imaging findings for menstrual devices, including tampons and menstrual cups.

#### TABLE OF CONTENTS/OUTLINE

1. Review of normal pelvic anatomy and imaging: CT, MRI, Ultrasound  
2. Contraceptive devices: Types of IUDs (Copper, hormonal), Intravaginal contraception (NuvaRing), CT, KUB, MRI and safety note, Ultrasound, Malpositioned IUDs  
3. Pelvic organ prolapse (POP) and pessaries: Anatomy of POP and imaging before treatment, Pessary types (ring, cube, Gellhorn), CT, MRI, Complications of pessaries (migration, fistulization, forgotten pessary)  
4. Catheter placement in female patients: Indications for catheter placement and review of normal placement, CT, MRI, Misplaced catheters and complications (vaginal placement, bladder perforation from traumatic insertion)  
5. Menstrual Products: Imaging findings of tampons, menstrual cups, CT, MRI  
6. Quick cases with multiple choice questions: Malpositioned IUD, Pessary on CT of patient with POP, Vaginal placement of catheter

### Achy Breaky Baby Heart: Guide to Understanding Normal Fetal Cardiac Views

#### TEACHING POINTS

1) Fetal cardiac assessment is a key component of the fetal anatomic survey. An understanding of the different cardiac views is crucial to accurate image interpretation during a level 1 fetal anatomic survey. 2) Use of 5 standard scan planes and systematic assessment of the fetal cardiovascular system is the initial step in screening for congenital heart disease. 3) Features at risk for congenital heart disease should be further examined using a detailed echocardiogram, which includes 5 additional views.

#### TABLE OF CONTENTS/OUTLINE

A. Overview of basic cardiac exam components  
B. Standardized scan planes, including a graphic schema, US anatomy, CT correlate of the same view, and significance/associated pathologies:  
1) Transabdominal (determining fetal situs and cardiac axis)  
2) 4 chamber view  
3) Left ventricular outflow tract  
4) Right ventricular outflow tract  
5) 3 vessel and 3 vessel trachea  
C. Fetal echocardiography planes, including a graphic schema, US anatomy, CT correlate of the same view, and significance/associated pathologies:  
6) Bicaval  
7) Long axis view of the aortic arch  
8) Long axis view of the ductal arch  
9) Low short axis view of the ventricles  
10) High short axis view of the great arteries  
D. Pictorial review of common congenital heart diseases detected on fetal cardiac views with key diagnostic findings

### Don't Miss - Understand: Solving Pitfalls in the Diagnosis of Endometriosis and Adenomyosis

#### TEACHING POINTS

Endometriosis and adenomyosis are prevalent diseases among reproductive age women with a negative impact on their quality of life and reproductive outcomes. Their imaging manifestations may be challenging due to a wide imaging spectrum of both diseases, leading to incorrect interpretations even by experienced radiologists. This presentation aims to demonstrate common imaging pitfalls of endometriosis and adenomyosis, with a comprehensive and instructive problem-solving guide.

#### TABLE OF CONTENTS/OUTLINE

1) Overview of endometriosis and adenomyosis, emphasizing the imaging diagnosis: ultrasound and magnetic resonance. 2) Imaging pitfalls in the diagnosis of endometriosis, including: Posterior compartment: Folds in the sigmoid colon; Vessels in the parametrium and paracolpos; Diverticulitis; Pericolic lymph nodes; Middle compartment: Adenomyosis; Fallopian tubes; Functional ovarian cysts; Pelvic Varices; Anterior compartment: Leiomyomas; Fibrocicatricial changes; Folds in the bladder wall; 3) Imaging pitfalls in the diagnosis of adenomyosis, such as: Myometrial contractions; Physiologic thickening of the junctional zone in the menstrual phase; Deep endometriosis with myometrial infiltration; Leiomyomas with cystic or red degeneration; Unicornuate uterus with functional non-communicating uterine remnant 4) A didactic guide for problem-solving pitfalls.

OBEE-48

### **Magnetic Resonance Imaging (MRI) of Mayer-Rokitansky- Kuster-Hauser Syndrome, Herlyn-Werner-Wunderlich Syndrome and Related Complex Mullerian Duct Anomalies With Special Emphasis on Surgical Reconstruction Management;- What the Radiologist Should Know to Guide the Reconstruction Surgeon**

#### **TEACHING POINTS**

1) Explain Embryology of Mullerian Duct Anomalies (MDA) and Mayer-Rokitansky-Kuster-Hauser Syndrome(MRKHS) and Herlyn-Wener-Wunderlich Syndrome(HWWS) 2) ASRM Classification of MDA with demography 3) Case based introduction to MRKHS, HWWS other complex MDA, associations with Renal, ovarian, spine anomalies 4) Clinico-social aspects of MDA, effect on menarche, fertility pregnancy 5) MRI protocols, Imaging features of MRKHS,HWWS and MDA with sample cases 6) Document MRI findings and dimensions specially for reconstructive surgeon. Detailed analysis of structures -Cervix,Vagina,Plica palmatae,uterine/vaginal septa, uterine buds and extent of uterovaginal aplasia 7) MRI evaluation of Neovagina, other vaginoplasties follow up their complications (with example cases)

#### **TABLE OF CONTENTS/OUTLINE**

1) Developmental Embryology of MDA genetics 2) Classification of MDA(classes 1-VII) with cases 3) Case based description of MRKHS (type 1II), HWWS and MDA with MRI imaging features imaging pearls, coexistent extragenital genital anomalies, fibroids, endometriosis etc influencing surgical management prognosis 4) Clinical presentations, amenorrhea, subfertility pregnancy complications with sample cases 5) Targeted MRI reporting of MRKHS, HWWS, MDA associated extragenital anomalies. Specific points/dimensions useful for reconstruction, implants, surgery and for assisted reproduction. Describe uterine buds, triangular cord sign etc 6. Introduction to neovagina, vaginoplasty, uterine transplant and other surgical options with MRI features 7. Case based review of MRI of post reconstruction and post treatment follow up their complications (stenosis, fistulae, infections, hernia etc)

Printed on: 04/12/24

### Pelvic Endometriosis: Lexicon on Magnetic Resonance Imaging (MRI)

#### Participants

Claudia Hurtado, Valladolid, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The most common sites of involvement are the vesicouterine space (in the anterior compartment) and the uterosacral ligaments (in the posterior compartment). The "T2 black dot sign" is a specific sign of endometriosis. Malignant transformation should be suspected when a nodule enhances, nodule more than 3 cm, growth or loss of T2 shading.

#### TABLE OF CONTENTS/OUTLINE

- Introduction- Objectives- Teaching points- MRI protocol- Gross anatomy- Morphological subtypes- Endometriomas- Structured Report- Conclusions

Printed on: 04/12/24

## Abstract Archives of the RSNA, 2023

OBEE-5

### MRI of Müllerian Duct Anomalies Based on the New ASRM Classification

#### Participants

Marianna Konidari, MD, London, Greece (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Müllerian duct anomalies (MDAs) consist of a wide spectrum of congenital malformations of the uterus, cervix, fallopian tubes and upper 2/3 of the vagina and are the result of abnormal development, fusion or resorption of the Müllerian ducts.
- The new 2021 American Society of Reproductive Medicine-ASRM (previously, American Fertility Society-AFS) MDAs classification (MAC2021) expands the 1988 classification to include cervical and vaginal anomalies; it classifies MDAs into nine categories using standardized descriptive terminology.
- Imaging is crucial in the diagnostic workup of individuals with suspected MDAs, particularly adolescents with primary amenorrhea and adults with infertility, since identification of these anomalies and their complications allows tailored clinical management.
- MRI is the modality of choice for detailed pelvic anatomy evaluation, accurate MDA classification and preoperative planning.

#### TABLE OF CONTENTS/OUTLINE

- Embryology overview and imaging anatomy of internal female genitalia
- MDAs: how do they develop and what are the clinical implications
- ASRM Müllerian anomalies classification 2021: overview and differences with the AFS 1988 classification
- Imaging evaluation: rationale behind imaging of congenital uterovaginal anomalies, available techniques and the role of MRI
- Case-based discussion on MRI appearances, clinical presentation and treatment management of MDAs, according to the new ASRM classification
- Diagnostic algorithm for imaging approach of MDAs

Printed on: 04/12/24

OBEE-50

### Endometriosis Revisited: Current Concept of Pathophysiology, Diagnosis, and Therapeutic Strategy

#### TEACHING POINTS

1. Endometriosis, which significantly impairs women's QOL with chronic pain and reduced fertility, is a benign, common, but controversial disease due to its enigmatic etiopathogenesis and biologic behavior. Recent studies suggest multiple genetic, and environmental factors: endocrinic, inflammatory, immunological, and angiogenetic may affect its onset and development. Genomic analysis revealed the presence of cancer-associated gene mutations, which may reflect the neoplastic aspect of endometriosis. The management has changed dramatically with the development of fertility-preserving, minimally invasive therapies. 2. The appropriate examinations with advanced MR techniques (3D-T2WI, reduced FOV DWI, computed DWI, SWI, DCE-MRI, cine MRI), and careful imaging interpretation are considered useful in evaluating endometriosis and associated lesions, which may be effective for therapeutic strategy with improved patient's outcome.

#### TABLE OF CONTENTS/OUTLINE

Imaging manifestations of endometrioma (shading sign; T2 dark spot; hemosiderin deposition on SWI), deep endometriosis, adenomyosis, less common site and rare site endometriosis, endometriosis-associated tumor-like lesions (polypoid endometriosis; decidualized endometriosis), and malignant transformation, with pathophysiologic conditions, clinical classification, optimal treatment options and clinical outcomes.

### Pearls and Pitfalls of First-Trimester US Screening and Prenatal Testing: A Pictorial Review

#### Participants

Cynthia De la Garza Ramos, MD, Jacksonville, FL (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. First trimester ultrasound (US) is key in establishing pregnancy viability, number, and location. 2. Early intrauterine pregnancy (IUP) sonographic milestones, including appearance of a gestational sac, yolk sac, embryo, and cardiac activity, follow a consistent timeline. 3. Prenatal genetic testing and sonographic fetal structural assessment serve as initial screening tools for chromosomal disorders and facilitate detection of patients who may benefit from subsequent amniocentesis, chorionic villous sampling, or fetal intervention. 4. Beta human chorionic gonadotropin ( $\beta$ -hCG) in combination with pelvic US can be used to evaluate early pregnancy complications, but threshold  $\beta$ -hCG values should not be used as a sole decision-making tool.

#### TABLE OF CONTENTS/OUTLINE

1. Review the indications for first trimester US. 2. Recognize the normal appearance of an IUP and identify the sonographic milestones of the first trimester. 3. Illustrate the components of a first trimester fetal anatomy scan. 4. Describe the current prenatal genetic screening recommendations for chromosomal defects and their relationship with US fetal anatomy, including nuchal translucency (NT) measurement. 5. Understand the role of  $\beta$ -hCG and its correlation with US findings in the evaluation of early pregnancy complications. 6. Review the Society of Radiologists in Ultrasound (SRU) consensus statement for diagnosing a nonviable pregnancy in the first trimester. 7. Identify US findings that may be associated with poor pregnancy outcomes and require follow-up. 8. Case Examples.

### Nothing Complex about Ovarian Lesions: Expert Guidance from the O-RADS US Committee

#### Participants

Catherine Phillips, MD, Nashville, TN (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Based on validation studies feedback, the Ovarian-Adnexal Reporting and Data System (O-RADS) US has been updated to address clinical application challenges, improve system specificity, harmonize with other consensus statements and O-RADS MRI. 2. New lexicon terms include bilocular for cystic lesions shadowing for smooth solid lesions, features which favor benignity and may improve specificity by down-scoring lesions. 3. Features of classic benign lesions were further refined to capture their typical appearance and also aim to improve specificity. 4. Updated surveillance and growth parameters optimize management better align with existing consensus statements. 5. Emerging data suggests O-RADS US 3 lesions are at the lower end of the risk of malignancy range (1- <10%); management recommendations have thus been updated to allow short-term US follow-up.

#### TABLE OF CONTENTS/OUTLINE

1. Clarification of updated O-RADS US v2022 governing concepts on applicability criteria, definitions/technique, and rules for system use with diagrammatic depictions illustrative examples. 2. Image rich example cases featuring new lexicon descriptors with an explanation of how their presence alters risk score assessment and management options. 3. Algorithmic approach to assessment and diagnosis using O-RADS US v2022 lexicon terms demonstrating ease use for daily clinical practice.

### Unusual Presentations of Common Female Pelvic Lesions

#### Participants

May Shaaban, Salt Lake City, UT (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Uterine leiomyomas, uterine adenomyosis, ovarian mature cystic teratomas and endometriomas represent the most common pathologies in everyday practice. They have characteristic imaging features that allow confident diagnosis. Occasionally these common lesions present with atypical features which makes it more challenging. Teaching points: Describe the classic imaging features of Uterine leiomyomas, uterine adenomyosis, ovarian mature cystic teratomas and endometriomas Describe unusual imaging features of variant or complicated lesions Provide differential possibilities based on the imaging features

#### TABLE OF CONTENTS/OUTLINE

Atypical leiomyomas: I. Degenerated and variant leiomyomas: 1. Cellular leiomyoma 2. Cystic degeneration 3. Myxoid degeneration 4. Red degeneration 5. Lipoleiomyoma II. Infected leiomyoma III. Torsion of leiomyoma IV. Prolapsed leiomyoma Atypical adenomyosis/adenomyomas: Focal adenomyosis (adenomyoma) Cystic adenomyosis Adenomyosis in pregnancy Exophytic adenomyoma Atypical endometriomas: Mural nodules and decidualization Malignant transformation Rupture Atypical presentations of dermoid cysts: Rupture Malignant transformation

### Medical Devices of the Female Pelvis: Multimodality Patterns, Pitfalls, and Pearls

#### TEACHING POINTS

Medical devices in the female pelvis are less frequently encountered than those in the chest or abdomen. Nevertheless, radiologist familiarity with these devices is critical for appropriate imaging evaluation. This exhibit reviews normal and abnormal radiologic presentations of medical devices commonly found in the female pelvis on multiple imaging modalities as well as examples of complications that may arise from device placement. Finally, we will present radiologic examples of device mimics that could lead to pitfalls in imaging evaluation.

#### TABLE OF CONTENTS/OUTLINE

Pessaries Pessary Mimic: Menstrual cup Pessary Mimic: NuvaRing Pessary Mimic: Tampon Intrauterine devices (IUDs) Essure devices  
Tubal ligation clips Embolization coils Ureteral stents Foley catheter Rectal tube

OBEE-55

### Don't Be Fooled by Uterine Masses: How MRI Can Help You Spot Atypical and Malignant Impostors Among Leiomyomas

#### TEACHING POINTS

Review the specific MRI features of usual leiomyomas. Explain the known and emerging MRI features of atypical leiomyomas and describe how to differentiate them. Describe MRI characteristics of uterine sarcomas and compare them with those of leiomyomas. Develop a systematic image-based approach to recognize these entities.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction- Uterine anatomy - Clinical relevance - Definitions  
2. MRI protocol  
3. Usual leiomyomas - MR typical findings - Other RM signs: flow void sign, bridging vascular sign, high signal intensity rim on T2  
4. Atypical leiomyomas: MR findings correlation with Histology  
4.1. Atypical location- Subserosal - Submucosal  
4.2. Degenerated leiomyomas- Hyaline degeneration - Mixoid degeneration - Red degeneration - Cystic degeneration  
4.3. Histologic subtypes- Cellular leiomyoma - Lipoleiomyoma - STUMP  
5. Uterine sarcomas: MR findings correlation with Histology  
5.1. Uterine leiomyosarcoma  
5.2. Endometrial stromal sarcoma  
6. Differential Diagnosis  
7. Conclusion

### 3D Ultrasound - Troubleshooting in Gynaecological Imaging

#### Participants

Sanchita Gupta, MBBS, MD, New Delhi, India (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The purpose of this exhibit is to -1) Provide information about system requirements and scanning techniques to obtain a standard 3D dataset, rendering and image reconstruction.2) Explore newer techniques and software in 3D USG for improving diagnosis.3) Know common clinical scenarios where 3D provides additional information over simple 2D USG.

#### TABLE OF CONTENTS/OUTLINE

1) 2D vs 3D ultrasound2) System requirements for 3D dataset acquisition3) Rendering and multiplanar reconstructions4) Transvaginal 3D USG - Importance of the coronal plane5) Newer techniques and software in 3D USG:- Walk thru mode - Virtual Hysteroscopy- 3D USG with Saline infusion sonography (SIS)- Translabial 3D USG- 3D Power Doppler- Endometrial volume calculation using VOCAL (Virtual Organ Computer-Aided Analysis)- Sono AVC (Automated volume calculation)6) Common clinical scenarios where 3D imaging can help provide a diagnosis- Evaluation of the external and internal uterine contour1) Congenital uterine anomalies2) Subserosal and pedunculated fibroids deforming external contour3) Submucosal fibroids deforming internal contour- Pathologies of the endometrial cavity1) Identifying intrauterine adhesions2) Locating polyps and Retained products of conception3) Placement of Intra-uterine contraceptive devices- Assessment of endo-myometrial junction in adenomyosis and carcinoma endometrium

OBEE-57

### How to Handle Hydrops

#### Participants

April Griffith, MD, Salt Lake City, UT (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1: Hydrops fetalis is defined as the presence of fluid in two spaces -skin, pericardium, pleural space, peritoneal cavity.2: The prognosis is generally poor due to lack of treatment options.3: Fetal tachycardia and fetal anemia are treatable causes. Middle cerebral artery (MCA) Doppler is a non-invasive method to screen for fetal anemia which can be treated by intrauterine transfusion.4: Fetal intervention may be lifesaving - shunt placement in large cysts in a lung mass, laser ablation for twin twin transfusion syndrome, radiofrequency ablation for twin reversed arterial perfusion sequence.5: For some tumors (e.g., sacrococcygeal teratoma) elective preterm delivery with immediate resection is preferable to expectant management. The decision to deliver in such cases is based on multiple factors including the combined cardiac output calculated by echocardiography. 6: Some causes of hydrops can recur. Correct diagnosis of the cause is essential for management of current and future pregnancies.

#### TABLE OF CONTENTS/OUTLINE

1: Pitfalls in diagnosis of abnormal fluid locations. 2: Immune vs Non immune hydrops: Antibody screening, MCA Doppler velocimetry. 3: Cardiac - rhythm disturbance more likely than structural defects. 4: Genetic - Aneuploidy, syndromic. 5: Infection - Serology, growth restriction, hepatosplenomegaly, intracranial and abdominal calcifications. 6: High output states - Vascular malformation, vascular tumor, chorangioma. 7: Mechanical compression - Large lung mass, mediastinal mass. 8: Multiple gestations - Twin twin transfusion, monozygotic twin demise, twin reversed arterial perfusion. 9: Metabolic - Lysosomal storage disorders, gestational alloimmune liver disease.

OBEE-58

### A Headache Free Approach to Hydrocephalus

#### Participants

April Griffith, MD, Salt Lake City, UT (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1: The prognosis for fetal ventriculomegaly depends on the underlying etiology thus a systematic approach is recommended. 2: Scan technique is critical to ensure correct measurements for grading (mild, moderate, severe) and tracking for progression over time. 3: Accurate diagnosis is essential for pregnancy management and delivery planning. 4: Some conditions with ventriculomegaly can recur in future pregnancies (e.g., autosomal recessive Walker Warburg syndrome). 5: Fetal MRI plays an essential role in characterizing the underlying pathology. 6: Isolated mild ventriculomegaly is a diagnosis of exclusion, generally associated with good intellectual outcome. It may be unilateral (usually left), in males.

#### TABLE OF CONTENTS/OUTLINE

A: Technique to measure ventricles - US and MRIB: Evaluate the posterior fossa: Exclude Chiari malformation, Dandy Walker syndrome, aqueductal stenosis, rhombencephalosynapsisC: Systematic assessment of the supratentorial brain: Midline: Is the falx present, is the cavum septi pellucidi normal? Cortical mantle: Gyral and sulcal development, thickness, symmetry, defects? Ventricles: Shape, lining, contents? D: Is there a mass? E: Is there a vascular malformation? F: Are there cystic areas?G: Perform a detailed anatomy scan to look for signs of syndromes, infection, aneuploidy, growth restriction and complications of monochorionic twinning.

### Medical Devices in Female Genital System: What Radiologists Need to Know

#### Participants

Guan Guan, MD, PhD, Guangzhou, China (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To review the classification and function of medical devices in female genital system (uterus, vagina and adnexa).2. To realize the normal, abnormal and special imaging findings of medical devices in female genital system.3. To introduce complications related to medical devices in female genital system (including imaging appearance, diagnosis and differential diagnosis).4. To learn assistance in imaging diagnosis of medical devices in female genital system.

#### TABLE OF CONTENTS/OUTLINE

1. Classifications of medical devices in female genital system (1) Medical devices of the uterus (IUDs, uterine suspension mesh, etc.); (2) Medical devices of the vagina (pessary, vaginal occluder, vaginal tamponade, etc.); (3) Medical devices of the ovary and adnexa (tubal ligation clips, ovarian suspension clips, etc.).2. Medical devices of the uterus (1) Function and normal imaging appearance; (2) Abnormal imaging appearance and related complications; (3) Assistance in imaging diagnosis.3. Medical devices of the vagina (1) Function and normal imaging appearance; (2) Abnormal imaging appearance and related complications; (3) Assistance in imaging diagnosis.4. Medical devices of the ovary and adnexa (1) Function and normal imaging appearance; (2) Differential diagnosis of post-ovarian suspension findings (e.g. ovarian maldescent, supernumerary ovary); (3) Abnormal imaging appearance and related complications; (4) Assistance in imaging diagnosis.

### Role of Fetal MRI in Antenatal Assessment of Central Nervous System Anomalies: What a Radiologist Should Know

#### Participants

Smily Sharma, MD, MBBS, Jodhpur, India (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To study the role of fetal MRI for antenatal assessment of various central nervous system anomalies including indications, added advantage over obstetric ultrasound as well as certain limitations. 2. To define a fetal MRI protocol for central nervous system assessment. 3. To learn about normal appearances of sulcation and gyration of brain at various periods of gestation and beware of MR pitfalls in fetal CNS imaging. 4. Using state of the art cases, to learn about myriad of CNS anomalies that can be detected in fetus, their syndromic and non-syndromic associations and their antenatal or postnatal follow up (wherever available).

#### TABLE OF CONTENTS/OUTLINE

1. Introduction to fetal MR for antenatal central nervous system anomalies: Indications, advantages/ disadvantages and comparison with obstetric ultrasound 2. MR protocol to assess various central nervous system anomalies in fetus 3. MRI appearances of fetal brain at different periods of gestation (Pearls and Pitfalls) 4. Various CNS anomalies on fetal MRI with postnatal follow up wherever available: 4A. Fetal Ventriculomegaly 4B. Malformations of cortical development and midline brain anomalies 4C. Corpus Callosal Agenesis/ Dysgenesis and associations 4D. Posterior Fossa Malformations 4E. Neural Tube defects and Spinal Dysraphism 4F. Vascular anomalies 4G. Syndromic associations 4H. Miscellaneous CNS Disorders including ischemic insults, germinal matrix and intraventricular hemorrhage in fetus 5. Conclusion

OBEE-60

### Once in a Lifetime Gynecological Cases: Seen One, Seen Them All

#### Participants

Ana Villanueva, MD, Toronto, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To illustrate and review unusual gynecological cases, some of them with classic appearance as well as common gynecological cases with rare presentation. 2. Role of radiologist in evaluation of challenging gynecological cases.

#### TABLE OF CONTENTS/OUTLINE

1. Background How do abdominal radiologists like to report gynecological cases? And what about general radiologists? Many colleagues say that they find themselves in trouble when reporting these cases. And why is that? Probably it is a combination of lack of knowledge or experience; not familiar reporting different techniques TV US, CT and MRI; etc. We as radiologist look for entities that we know. If we do not know about a disease, we will not think about it and therefore we will not reach a correct diagnosis. However, there are certain entities that even they are challenging because they are uncommon, they have a classic appearance (for example malignant adenoma of the cervix). Once you see one case, you will not forget. Also, common gynecological diseases can present in a very unusual way (for example ileal and appendiceal endometriosis without pelvic endometriotic findings). 2. Identification of characteristic imaging features • Different imaging techniques will be shown: Transvaginal US, CT, MRI • To propose key points to accurately reach the diagnosis • Algorithm of differential diagnosis based on imaging features along with relevant clinical and analytical information 3. Understand the clinical and treatment implications of diseases with characteristic radiologic appearance 4. Radiologic- pathologic correlation will be shown for most of the cases 5. Conclusion 6. References

### First Trimester Ultrasound (FTUS): Screening Techniques

#### TEACHING POINTS

Increased nuchal translucency (NT) remains an internationally recognized indication for invasive testing (amniocentesis or CVS). By the end of this educational exhibit, the reader/listener would be able to: 1. Understand the various screening policies for chromosomal abnormalities utilized in the first trimester (Combined screening vs Contingent screening policies). 2. Learn about the importance and technique of measuring NT in the first trimester. 3. Learn about new ultrasound markers utilized in first-trimester screening. 4. Identify important fetal structural abnormalities and their significance system-wise. 5. Algorithmically co-relate first-trimester ultrasound findings to the next steps in the screening process.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction to FTUS  
2. Combined screening vs Contingent screening for chromosomal abnormalities  
3. Nuchal translucency (NT)  
i. Significance and efficiency  
ii. The technique of measuring NT  
4. New FTUS markers  
i. Nasal bone  
ii. Tricuspid flow  
iii. Ductus Venosus flow  
5. Cell-free DNA (cfDNA)  
i. The utility of cfDNA in relation to FTUS- When to use and when NOT to use?  
ii. Advantages and limitations of cfDNA compared to FTUS  
6. Fetal structural abnormalities NOT to miss in FTUS  
i. CNS abnormalities  
ii. GI and GU abnormalities  
iii. Skeletal abnormalities  
iv. Cardiac abnormalities  
7. Summary

Printed on: 04/12/24

OBEE-62

### The Hidden Enemy: A Visual Journey Through Ovarian Tumor Imaging

#### Participants

Sofia Maksoud, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Ovarian tumors are classified according to their origin: epithelial cell tumors, germ cell tumors, sex cord-stromal tumors and metastatic tumors. Among them, epithelial tumors are the most common, with a higher prevalence between 60 and 70 years of age. Imaging exams have the capability to predict the risk of malignancy: mural nodules, papillary projections, solid components, thickened walls and septa (greater than 3.0 mm) with associated vascularization are some aspects that suggest malignancy, while of fat components suggests benignity. Pelvic ultrasound is commonly the first exam to be performed due to its high availability and low cost. However, for adequate characterization of the ovarian mass, additional tests such as magnetic resonance imaging may be requested, with the aim of helping to distinguish between benign and malignant tumors and, mainly, in staging and surgical planning. The results of radiological examinations associated with the clinical features, family history and laboratory tests allow the diagnosis of ovarian lesions. A thorough evaluation provides part of data that may be associated with the histology of these tumors. This information plays a fundamental role in choosing the appropriate therapy.

#### TABLE OF CONTENTS/OUTLINE

To demonstrate cases of malignant and benign ovarian tumors and to review their presentations in different imaging modalities, including pelvic ultrasonography and magnetic resonance imaging, correlating with anatomopathological results and surgical specimens.

Printed on: 04/12/24

OBEE-63

### Placenta Accreta Spectrum and the Emergence of MRI

#### Participants

Leslie Nelson, DO, Lexington, KY (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Placenta Accreta Spectrum (PAS) refers to abnormal placental adherence and/or invasion into the uterine wall due to a defective decidualization process. Difficult placental separation can cause life threatening peripartum hemorrhage if not diagnosed prenatally. 2. The prevalence of PAS has increased 10-fold over the last 4 decades and has been linked to increased rate of cesarean deliveries. 3. Ultrasound is the first line modality for placenta imaging, however, MRI is an emerging modality that provides superior soft tissue contrast and is vital for surgical planning in Placenta percreta. 4. In 2020, SAR and ESUR published a joint consensus statement to standardize MRI acquisition, interpretation and reporting of PAS. 5. This educational exhibit will help the learner understand and identify the described MRI signs associated with PAS and their pathophysiologic subcategories.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction of PAS 2. Compare and contrast use of ultrasound versus MRI 3. Normal MRI appearance of the placenta 4. Review of the MRI features described by SAR and ESUR joint consensus statement 5. Review the three pathophysiological oriented classifications (gross morphologic signs, interface signs and tissue architecture signs) 6. Review pathology proven cases (accreta, increta and percreta)

OBEE-65

### To Treat, or Not to Treat, That is the Question: Multimodality Approach to Secondary Post Pregnancy Hemorrhage

#### TEACHING POINTS

- Secondary post pregnancy hemorrhage occurs 24 hours to 12 weeks following delivery. Etiologies include retained products of conception (RPOC), subinvolution of the placental site (SIPS), arteriovenous malformation/arteriovenous fistula (AVM/AVF) spectrum.- Ultrasound is often a first line imaging modality in the identification of causes of secondary post pregnancy hemorrhage. However, CT and MRI may also be used in the imaging work up. Recognizing key features of each etiology is essential to timely diagnosis and clinical management.- Certain pathology may mimic causes of secondary post pregnancy hemorrhage such as endometritis and gestational trophoblastic disease.

#### TABLE OF CONTENTS/OUTLINE

- Explanation of causes, pathophysiology, and management of secondary post pregnancy hemorrhage including RPOC, SIPS, and AVM/AVF- Case-based, multimodality imaging review of secondary post pregnancy hemorrhage including US, CT, and MRI with discussion of management options- Imaging review of mimics of retained products of conception including endometritis and gestational trophoblastic disease- Proposed algorithmic approach to management of secondary post pregnancy hemorrhage based on imaging findings and how to differentiate from mimickers

OBEE-66

### Malignant Transformation of Endometriosis and Its Mimics

#### Participants

Cesar Resino Sanchez, PhD, Madrid, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To review the types of malignant transformation of endometriosis, taking into account the typical and atypical locations.
2. To recognize the usefulness of magnetic resonance imaging (MRI) in the early diagnosis of malignant transformation of endometriosis.
3. To describe forms of presentation of endometriosis that can simulate malignant transformation.

#### TABLE OF CONTENTS/OUTLINE

Definition, types and typical and atypical locations of endometriosis. Pathological mechanisms of malignant transformation: genomic alterations, oxidative stress, inflammation, and hormonal influences. Types of ovarian tumors in endometriosis (endometrioid adenocarcinoma and clear cell carcinoma as the most frequent). Optimal protocol and MRI findings suggestive of malignancy: appearance of enhancing intramural nodules, enlargement of the endometrioma and disappearance of shading sign on T2-weighted images. Imaging findings in cancers arising from extraovarian endometriosis. Malignancy simulators: decidualization during pregnancy, polypoid endometriosis, extraovarian endometriosis mimicking peritoneal carcinomatosis, etc.

OBEE-67

### Hysterosalpingography: What's Current and What's Next

#### Participants

Erica Cruz, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Hysterosalpingography is an exam with consolidated use in medical practice, with well-established indications and contraindications in the literature. The main indications for the exam are: human reproduction (infertility), preoperative uterine fibroids, repeat abortions and reversal of tubal ligation. Although new technologies and imaging methods have been developed in the past years, it currently persists as the method of choice and gold standard for evaluating the thickening of the mucous pleats of the fallopian tube. The objective of this study is to provide a didact review of hysterosalpingography, from the examination technique to its main findings, since the images acquired's quality depends on the correct preparation and technique. We also provide a comparative study of hysterosalpingography with other emerging imaging methods, such as magnetic resonance hysterosalpingography (HSG-MRI) and hysterosonosalpingography, with future perspectives related to these methods.

#### TABLE OF CONTENTS/OUTLINE

Case-based review of hysterosalpingography exams, including the technique, most common findings and pitfalls, with a literature review, teaching points, and references. We also provide correlation with other imaging methods, such as ultrasonography and magnetic resonance imaging (MRI).

OBEE-68

### Highlighting the Updates in Mid-Trimester Fetal Ultrasound Scan According to the Updated International Society of Ultrasound in Obstetrics and Gynecology (ISUOG) Practice Guideline

#### TEACHING POINTS

The mid-trimester ultrasound scan is performed for anatomic evaluation of the fetus and is accepted as a part of routine prenatal care by many countries. The International Society of Ultrasound in Obstetrics and Gynecology (ISUOG) published a guideline for the performance of the routine mid-trimester fetal ultrasound scan in 2011 and updated the guideline in 2022. According to these guidelines, a routine mid-trimester fetal ultrasound examination should include an evaluation of the cardiac activity; fetal number (and chorionicity and amnionicity in cases of multiple pregnancy); gestational age/fetal size; basic fetal anatomy; placental appearance and location. In the updated ISUOG guideline, amniotic fluid volume assessment and measurement of cervical length for prediction and prevention of preterm birth are also recommended. Pregnancies in which the umbilical cord inserts into the amniotic membranes (velamentous cord insertion) or at the edge of the placenta (marginal cord insertion) should be reported. Suggested minimum (and optional) requirements for the fetal anatomic survey were also updated and will be discussed in the exhibition. Technical challenges to obtaining these standard images will also be discussed.

#### TABLE OF CONTENTS/OUTLINE

The suggested basic mid-trimester fetal anatomic survey according to ISUOG is updated in 2022. Knowledge of minimum and optional requirements according to the current guideline is important for the appropriate evaluation of the fetus. This exhibit aims to highlight the updates as well as remaining unchanged requirements with ultrasound images.

OBEE-69

### Postmenopausal Endometriosis: Clinical Insights and Imaging Considerations

#### TEACHING POINTS

- Postmenopausal endometriosis is estimated to affect around 2-4% of women and is more commonly seen in patients undergoing hormone replacement therapy.
- There is no current guidelines for management of postmenopausal women with endometriosis.
- Transvaginal ultrasound and magnetic resonance imaging are the primary imaging modalities for assessing extent of endometriosis.
- Imaging findings will demonstrate a predominance of the fibrotic component associated with anatomical distortion.

#### TABLE OF CONTENTS/OUTLINE

- To review the clinical presentation of endometriosis in the postmenopausal population
- To understand how hormonal status affects the pathogenesis of endometriosis, including both exogenous and endogenous sources
- To use a case-based approach to illustrate the sonographic and MRI findings of endometriosis in patients undergoing hormonal replacement therapy, as well as in those who are not undergoing hormonal treatment. Laparoscopic correlation will be included, when available.
- To describe the risk of malignant transformation for specific lesions such as endometriomas and deep invasive lesions, while using cases to demonstrate imaging features of neoplasm.
- To explore proposed non-invasive screening imaging methods.

OBEE-7

### Hysterosalpingography and Infertility: Beyond Tube Obstruction

#### Participants

Leticia Cardoso Ern, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The causes of infertility can be genetic or acquired. When anatomically compartmentalized, it is possible to determine some groups of causes: uterine, tubal, ovarian, and central (pituitary and hypothalamic). Hysterosalpingography (HSG) is a contrast-enhanced examination of the female genital tract that uses serial radiographs to assess uterine and tubal anatomy. It is known to be the first-line test for assessing tubal obstruction, as it can determine the local anatomy in a relatively simple and inexpensive way. There are several other findings that HSG can offer and suggest diagnoses of other causes of infertility, such as endometriosis, adenomyosis, Müllerian duct malformations, and uterine synechiae. By the end of this study, the reader will be able to define the importance of fluoroscopy in the investigation of infertility, understand the methodology of HSG and identify its causes based on imaging findings.

#### TABLE OF CONTENTS/OUTLINE

Define the role of imaging exams in the investigation of infertility; Determine the methodology of HSG and its usefulness; Explain the causes of infertility and illustrate their compatible findings in HSG through image examples.

### From the Pathology Lab to the Radiology Suite: Navigating Neuroendocrine Tumors of the Female Reproductive System

#### Participants

Ana Bavaresco, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

Mayara Dos Santos Cruz, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To present a rare subtype of gynecological tumor, the Neuroendocrine gynecological tumors (NEG). To review clinical-pathological features of NEG, highlighting the pathologic differences between NEG and non-NEG cancers. To expose the aggressive clinical behavior of NEG tumors by evolutive imaging examples and well-documented cases, with emphasis on the radiological role for staging and follow-up. To become aware of the different prognostic data between NEG and non-NEG tumors with a brief overview on the suggested treatment.

#### TABLE OF CONTENTS/OUTLINE

Neuroendocrine gynecological tumors can dramatically affect the cervix, ovary, endometrium, vagina, and vulva. As extremely rare tumors, studies on NEG are scarce and most are based on case reports. Although the imaging features are non-specific for diagnosis, imaging is quintessential in staging, treatment response assessment, and surveillance. To demonstrate with clinical cases, imaging exams, and temporal evolution the regional and advanced involvement of NEG. Review in a didactical way the disease-related pathology, and its differentials, based on illustrations, pathology / immunohistochemistry analysis. Case-based discussion and review of the essential information for the radiological report, that will imply the follow-up and treatment of the patient. Discuss the clinical prognosis associated with the disease, and demonstrate briefly the limitations related to the therapies available.

OBEE-71

### Many Faces of Uterine Fibroids: Imaging Findings of Degenerations, Differential Diagnoses, and Complications

#### Participants

Shintaro Ichikawa, MD, PhD, Hamamatsu, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Uterine fibroids are benign tumors composed of smooth muscle and are the most common tumors in gynecology. Because uterine fibroids tend to produce different symptoms depending on their site of origin, accurate assessment of the site and size of the fibroids using diagnostic imaging is required. Although typical uterine fibroids are easy to diagnose using imaging, there are a variety of degenerations, and it is important to know the characteristics of each.

#### TABLE OF CONTENTS/OUTLINE

The following typical and degenerated uterine fibroids are discussed along with their key imaging findings: 1. Typical fibroids (intramural, subserosal, submucosal, and cervical) 2. Hyaline degeneration 3. Hydropic degeneration 4. Myxoid degeneration 5. Fatty degeneration 6. Red degeneration The following differential diagnoses and complications are discussed, along with their key imaging findings: 1. Uterine lipoleiomyoma 2. Hypercellular uterine fibroid 3. Uterine leiomyosarcoma 4. Focal adenomyosis 5. Low-grade endometrial stromal sarcoma 6. Submucosal uterine fibroid prolapse into the vagina (vaginal delivery) 7. Uterine intravenous leiomyomatosis 8. Peritoneal leiomyomatosis following uterine fibroid morcellation 9. Rupture of fibroid 10. Torsion of subserosal fibroid 11. Infection of fibroid

Printed on: 04/12/24

### Comprehensive Imaging of Pelvic Medical Devices: Beyond IUDs

#### TEACHING POINTS

Recognize the usual appearance of the main pelvic devices in different imaging methods (Radiographic, Ultrasound, CT and MRI):  
Vaginal tampon  
Menstrual cup  
Contraceptive devices (IUDs, Female sterilization device, Vaginal ring)  
Therapeutic devices (Pessaries, Brachytherapy applicator, etc)  
Post-surgical devices (Suture artifacts, catheters, etc)  
How to assess the proper placement of the most common pelvic devices and what points and measurements should be included in the report  
Recognize the main complications related to Intrauterine contraceptive devices (IUDs) displacement

#### TABLE OF CONTENTS/OUTLINE

INTRODUCTION  
Main pelvic devices and their radiographic features  
How to assess correct placement of pelvic devices and practical points  
COMPLICATIONS RELATED TO INTRAUTERINE CONTRACEPTIVE DEVICES DISPLACEMENT.  
Case based Review of:-  
Displacement- Embedment- Complete perforation

Printed on: 04/12/24

OBEE-73

### **Piecing Together the Puzzles: Imaging Diagnostic Approach to Genetic Diseases Affecting the Female Reproductive Organs and Beyond**

#### **Participants**

Tsukasa Saida, MD, Tsukuba, Japan (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

The genetic links to various tumors have become more apparent, and it is crucial for radiologists to understand them in order to make an accurate diagnosis and establish an appropriate testing strategy. This exhibit will describe the genetic diseases associated with neoplastic lesions in gynecology, including the specific characteristics of each tumor and lesions that occur in other regions of the same disease. The teaching points of this exhibit are: 1. Description of the inheritance pattern and characteristics of each genetic disease 2. Presentation of key imaging findings that contribute to the diagnosis of various genetic diseases

#### **TABLE OF CONTENTS/OUTLINE**

A. Inheritance pattern  
B. Characteristics of the genetic disease  
C. Imaging features of gynecologic tumors associated with genetic diseases  
D. Imaging features of lesions that occur in other regions of the body

Printed on: 04/12/24

OBEE-74

### Hystero-Salpingography in Current Clinical Practice - Old Flames, Die Hard!

#### Participants

Nitin P. Ghonge, MD, New Delhi, India (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To review the clinical status of Hysterosalpingography[HSG] in infertility work-up in the current era of cross-sectional imaging.
2. To revisit the nuances of HSG procedure and image interpretation for better understanding of uterine, tubo-ovarian and peritoneal lesions in these patients.
3. To understand the spectrum of findings on the initial HSG study and impact on the subsequent infertility work-up.

#### TABLE OF CONTENTS/OUTLINE

1. Status of HSG in current clinical practice as an initial first-line investigation for infertility work-up.
2. Procedural nuances in HSG and the image interpretation skills play an important role in diagnostic accuracy of HSG in patients with infertility and the overall utility.
3. Implications of slow continuous injection of contrast with acquisition of standard set of images: early filling phase, late distended phase, peritoneal spillage phase and post-cannula removal phase.
4. Review of basic principles in Radiation hygiene as applicable to HSG.
5. Image interpretation includes evaluation of endometrial cavity in terms of shape, distension and the mucosal surface. Tubal and peritoneal evaluation is not restricted to contrast spillage alone. Apart from tubal patency, evaluation of tubal mucosa is an important component of tubal evaluation. Apart from the tubal opacification and luminal caliber, the course of fallopian tubes should also be carefully evaluated as it provides vital clues about the status of peri-tubal peritoneum and peritubal adhesions.

### Hereditary and Non-Hereditary Syndromes with Gynecologic Manifestations: What the Radiologist Needs to Know

#### Participants

Ekta Maheshwari, MD, Pittsburgh, PA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. A number of key hereditary and non-hereditary syndromes are associated with gynecologic manifestations. 2. Awareness of these syndromes and their associations is integral to optimal patient management, facilitating recommendations for ancillary imaging and follow up.

#### TABLE OF CONTENTS/OUTLINE

Hereditary Cancer Predisposition Syndromes Some examples of hereditary cancer predisposition syndromes include Lynch syndrome (mismatch repair genes), Cowden Syndrome (PTEN), hereditary breast and ovarian cancer syndrome (BRCA1/ BRCA2), Peutz-Jeghers syndrome (STK 11) and hereditary leiomyomatosis and renal cell cancer syndrome (FH). These syndromes can predispose individuals to distinct uterine and ovarian neoplasms. Congenital Syndromes with Benign associations • Gynecologic manifestations observed in multiple congenital and acquired syndromes can also be associated with benign entities • Congenital malformation of the reproductive tract can be seen in Mayer-Rokitansky-Küster-Hauser syndrome. Familial clustering of these cases suggests a genetic basis of inheritance. Acquired Syndromes Acquired syndromes with gynecologic manifestations include- • Meig's syndrome • Ovarian hyperstimulation syndrome • Ovarian remnant syndrome • Fitz-Hugh-Curtis syndrome • Growing teratoma syndrome AIMS • Summarize and illustrate imaging findings observed for key hereditary and non-hereditary syndromes associated with gynecologic manifestations, including features of malignancy and those features overlapping and mimicking malignancy. • Describe the clinical implications, most current imaging recommendations and screening and surveillance guidelines for these syndromes.

### Quantification in Fetal MRI: Why, When, and How

#### Participants

Haithuy N. Nguyen, MD, Los Angeles, CA (*Presenter*) Research Grant, Siemens AG

#### TEACHING POINTS

1. Recognize the fetal abnormalities that require a radiologist to use the measuring tool. 2. Understand the impact of measurements on prognostication and/or family counseling. 3. How to correctly perform the measurements and compare to previously published normative values or thresholds.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Why, when, how to measure lung volumes - Congenital diaphragmatic hernia (CDH), congenital lung malformation, giant omphalocele, anhydramnios, skeletal dysplasia, and cervical teratoma. 3. Why, when, how to measure tracheoesophageal displacement index and tumor volume to fetal weight ratio for cervical and sacrococcygeal teratomas, respectively. 4. Why, when, how to measure liver volumes - CDH. 5. Future work - lung signal ratios, estimating CDH defect size, open neural tube myelomeningocele sac size, and amniotic fluid maximum vertical pocket.

Printed on: 04/12/24

## Abstract Archives of the RSNA, 2023

OBEE-9

### Imaging Cervical Cancer: Beyond Diagnosis

#### TEACHING POINTS

Abdominal imaging plays an essential role in the contemporary management of cervical cancer. MRI is a key imaging modality due to excellent tissue contrast resolution, enabling superior accuracy for tumor size, parametrial and pelvic sidewall invasion and evaluation of nodal metastases, all of which are key prognostic factors for cervical cancer. 18F-FDG-PETCT is essential in the assessment of advanced stage disease to evaluate for distant metastasis and can also aid in the detection of involved locoregional lymph nodes. Imaging also plays an integral role in brachytherapy treatment planning and execution. Ultrasound, MRI, CT and, on occasion radiography, are used for guidance of brachytherapy applicator placement and to confirm appropriate implant positioning prior to the delivery of therapeutic radiation. Imaging is integral in the post-treatment surveillance to detect treatment-related complications and identify recurrent disease.

#### TABLE OF CONTENTS/OUTLINE

Review the current FIGO staging system of cervical cancer and illustrate the role of imaging as it relates to stage determination and stage-specific treatment options. Demonstrate the role of imaging for brachytherapy treatment planning and execution, including structured reporting recommendations for brachytherapy implant assessment. Illustrate expected post-therapy imaging findings and the role for MRI, PETCT and CT. Show imaging findings of common and uncommon post-therapy complications. Illustrate cases of recurrence vs. expected benign post treatment changes.

### Pediatric Imaging Education Exhibits

#### Sub-Events

#### **PDEE-1 Ear Anatomy and Anomalies in Fetal MRI**

##### Participants

Matheus Dorigatti Soldatelli, MD, PhD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

Describe ear anatomy and anomalies using in-vivo MRI in fetuses between 16 and 41 weeks of gestational age (GA). Additional 3D skin-surface reconstructions and postnatal or post-mortem imaging were performed in selected cases.

##### TABLE OF CONTENTS/OUTLINE

- Illustrate the ease of visualization of the pinna, external auditory meatus, cochlea, modiolus, vestibule, and semicircular canals at different GAs.- Demonstrate ear malformations in syndromic and non-syndromic patients and the associated extra-labyrinthine anomalies, such as facial and extremity abnormalities, that aid in phenotype-genotype correlation.

#### **PDEE-10 Bone Deep: Exploring Musculoskeletal Health with Nuclear Medicine**

##### TEACHING POINTS

1.Nuclear medicine imaging of the musculoskeletal system is a valuable tool for diagnosing a variety of conditions and should be performed with appropriate considerations, including image acquisition and radiation dose. 2.Skeletal scintigraphy is a useful tool for evaluating various musculoskeletal conditions, including osteomyelitis, and proper image acquisition is essential for accurate diagnosis. 3.Bone scintigraphy can also be used in the context of non-accidental trauma in children to identify occult lesions and patterns of distribution and interpretation of the images must be done carefully. 4.18 F-fluoride PET/CT is an imaging modality that can be used for low back pain and can also identify conditions such as pseudoarthrosis and hardware loosening. 5.Bone scintigraphy can also lead to unexpected diagnoses, including Langerhans Cell Histiocytosis and various oncologic diseases, emphasizing the importance of thorough interpretation.

##### TABLE OF CONTENTS/OUTLINE

Introduction 1.Pediatric Considerations 2.Image acquisition 3.Radiation dose Skeletal Scintigraphy 1.Indications 2.Image acquisition 3.In the context of Osteomyelitis Bone Scintigraphy and Non-accidental Trauma 1.Image acquisition 2.Interpretation 3.Occult lesions 4.Patterns of distribution 18F-fluoride PET/CT 1.Image acquisition 2.Low back pain 3.Pseudoarthrosis 4.Hardware loosening 5.Skeletal Trauma in non-accidental trauma Bone Scintigraphy and Unexpected Diagnosis 1.Langerhans Cell Histiocytosis 2.Oncologic diseases Conclusions

#### **PDEE-11 Synapses and Signals: Nuclear Medicine Applications in Neurology and Endocrinology**

##### TEACHING POINTS

1. Nuclear medicine imaging can provide valuable diagnostic and therapeutic information in the evaluation of central nervous system and thyroid diseases, but appropriate dose optimization and imaging protocols are essential to minimize the potential risks associated with radiation exposure. 2. Epilepsy evaluation can benefit from various nuclear medicine imaging techniques such as CSF flow studies, CNS radionuclide angiography, and SISCOM, which can provide valuable information about brain function and blood flow. 3. 18F-FDG PET is a useful tool for evaluating epilepsy, as it can provide information on brain metabolism and can help identify the location of seizure foci. 4. Pediatric thyroid diseases, such as hyperthyroidism, nodular thyroid disease, thyroid cancer, Graves Disease, and subacute thyroiditis, can be evaluated using a range of nuclear medicine imaging techniques, including thyroid uptake and scan, 123I whole-body scan, and 99mTc-MIBI imaging. 5. Nuclear medicine imaging can play a crucial role in the diagnosis and management of thyroid cancer, including the use of radioiodine therapy to target and destroy cancerous thyroid cells.

##### TABLE OF CONTENTS/OUTLINE

Introduction 1.PET 2.Image acquisition 3.Radiation dose Epilepsy 1.Epilepsy Evaluation 2.Tracers for Targeted Epilepsy PET Imaging 3.CSF Flow Studies 4.CNS Radionuclide Angiography 5.SISCOM 6.18F-FDG PET Pediatric Thyroid Disease 1.Hyperthyroidism 2.Nodular thyroid disease 3.Thyroid Cancer 4.Graves Disease 5.Subacute Thyroiditis Conclusions

#### **PDEE-12 Cortical Development Evaluation on Fetal Brain MRI Between 22 and 28 weeks: A Practical Guideline**

##### Participants

Mariana Cerdeira Machado, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

- To demonstrate the correct protocols for the adequate acquisition of the necessary sequences for the analysis of the cortical development; - To illustrate the morphological aspects of the principal sulci and gyri of the fetal brain between 22 and 28 weeks in

a fetal MRI; - To learn the timing of the appearance of each new sulci between 22 and 28 weeks in a fetal MRI; - To recognize the early signs of cortical development abnormalities.

#### **TABLE OF CONTENTS/OUTLINE**

The purpose of this work is to illustrate the morphological aspects of the principal sulci and gyri and their time of appearance in the fetal brain between 22 and 28 weeks in a fetal MRI. For this, we will briefly discuss cortical development (neuronal proliferation, migration, and organization) and explore anatomic landmarks and their normal morphology throughout this period. Furthermore, we will demonstrate how to adequately perform an MRI exam and use it to evaluate the fetal brain cortex. Finally, we shall explore the early signs of cortex developmental abnormalities and the importance of a prompt diagnosis on the outcomes and prognoses.

#### **PDEE-13 Abdominopelvic Emergencies in Pediatric Oncology Patients: A Pictorial Review**

Participants

Sara Garcia, MD, Barakaldo, Spain (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

- Pediatric cancer patients are at increased risk for life-threatening emergencies that can affect all organs and systems. Such emergencies may be directly related to the disease at its debut or during its evolution or be secondary to the treatment administered.- Abdominal emergencies are frequent in these patients, and the imaging technique of choice for their study is ultrasound. Plain abdominal radiography, CT and MRI are usually used as complementary studies in case of specific suspicions or for better characterization.- Among the pathology affecting the intestinal loops at the debut intestinal obstruction stands out, especially intussusception, which is very typical in the pediatric population. Typhlitis or neutropenic colitis usually occurs as a complication of QT treatment in patients with ALL.- Among the hepato-biliary emergencies secondary to treatment, hepatotoxicity and sinusoidal obstruction syndrome are the most frequent, the latter presenting typical characteristics on Doppler study.- Acute pancreatitis is a possible complication of chemotherapy with L-asparaginase.- Hemorrhagic cystitis occurs as a complication treatment with cyclophosphamide in patients with HSCT. The bladder is the most affected organ.- Testicular neoplasms do not increase the risk of torsion but can present at onset as acute scrotal syndrome.

#### **TABLE OF CONTENTS/OUTLINE**

1. General classification of emergencies in pediatric oncology patients. Classification of abdominal emergencies, both those that occur at the onset of the disease and those that are secondary to oncological treatment.2. Description of the main clinical features and imaging findings of abdominal emergencies in these patients.

#### **PDEE-14 Mind the Gaps: Avoiding Fracture Pitfalls in Pediatric Musculoskeletal Radiology**

Participants

Lucas Medeiros, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

The purpose of this exhibit is: 1. To review normal pediatric musculoskeletal imaging findings that can mimic fractures in a multimodality approach 2. To discuss hard-to-identify and pediatric-specific fractures 3. To assess the differential diagnosis of pediatric pathological conditions 4. To analyze treatment-related findings that can simulate pathologies

#### **TABLE OF CONTENTS/OUTLINE**

1. Salter-Harris fractures 2. Green-stick fractures 3. Plastic deformation fractures 4. Torus fractures 5. Non-accidental injury fractures 6. Ossification centers mimicking fractures 7. Secondary fracture findings 8. Metabolic and genetic conditions (e.g. rickets, osteogenesis imperfecta) 9. Skeletal dysplasias 10. Obstetric injury 11. Anatomical variations

#### **PDEE-15 Temporosquamous Suture: An Updated View of the Importance of this Finding in Craniosynostosis**

Participants

Yuree Herenio SR, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

The squamous suture is the main object of our work. While the phenotypic appearances and sequelae of synostosis of the major cranial vault sutures are well documented, little is reported concerning synostosis of the squamous suture. Involvement of this suture can be individual or associated with other sutures, both in syndromic cases and in primary craniosynostosis. This work has the objective to demonstrate the importance of the temporosquamous suture, which has been undervalued over the years in literature. Recent studies and their surgical correlations show different types of cranial deformity, depending on the location of partial or complete closure of this suture. Deformities include scaphocephaly, plagiocephaly or brachycephaly. Our work shows different types of closure evaluated in our department. We also consider fundamental the use of the Maximum Intensity Projection protocol (MIP) to demonstrate the real shape of the sutures and to investigate craniolacunia, which constitutes a relevant finding in the surgical decision, as it may represent signs of intracranial hypertension.

#### **TABLE OF CONTENTS/OUTLINE**

The work shows a literature review about the squamous suture, showing part of the cases of CT with Maximum Intensity Projection protocol (MIP) and volume rendering 3D reconstruction of different types of closure, evaluated in our department.

#### **PDEE-16 Epiphanyes about Epiphyses: Distinguishing Epiphyseal Mass Lesions in Children**

Participants

Eric Tung, MD, Boston, MA (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Epiphyses have unique histology and play an important role in osseous development. The differential diagnosis for epiphyseal mass lesions in children is one that radiologists interpreting pediatric imaging should be familiar with. Overlapping imaging findings of epiphyseal tumors and other focal lesions on radiography and magnetic resonance imaging can hinder the ability of radiologists to establish specific diagnoses by imaging alone. However, knowledge of characteristic imaging features for each lesion can improve

the accuracy and specificity of radiologists' interpretations. By the end of this exhibit, learners should be able to provide a differential diagnosis for pediatric epiphyseal mass lesions, recognize the unique imaging features of each diagnosis, and apply a framework for MRI evaluation of epiphyseal lesions to unknown cases.

#### **TABLE OF CONTENTS/OUTLINE**

1. Background: Epiphyseal development, structure, equivalents; 2. Differential diagnosis for epiphyseal tumors and other focal lesions in children; 3. Review of characteristic imaging findings for each diagnosis; 4. Framework for MRI interpretation to help narrow differential diagnosis; 5. Unknown cases to reinforce learning objectives

#### **PDEE-17 Pediatric Metabolic Bone Disorders - A Comprehensive Review**

##### **TEACHING POINTS**

Illustrate the common and uncommon metabolic bone disorders in children. Identify imaging features that can help differentiate the various metabolic disorders.

##### **TABLE OF CONTENTS/OUTLINE**

Metabolic bone disease in children includes hereditary and acquired conditions of varying etiologies. The purpose of this educational exhibit is to describe the characteristic imaging findings of metabolic bone disorders to include endocrine and nutritional deficiencies. Entities such as rickets, scurvy/ hypovitaminosis C, osteogenesis imperfecta, hyperparathyroidism, renal osteodystrophy, celiac disease, inflammatory bowel disease, hypophosphatasia, osteopetrosis, sickle cell anemia, Gaucher's, heavy metal poisoning, and bone disease secondary to medication such as prolonged steroid treatment will be discussed. Early recognition and treatment of potential risk factors is important to avoid significant clinical consequences.

#### **PDEE-18 Pediatric Skull Lesions**

##### **TEACHING POINTS**

• To discuss the common pathologies affecting the pediatric skull. • To discuss imaging appearance of various skull lesions seen in children. • To develop a systematic approach to diagnosing skull lesions.

##### **TABLE OF CONTENTS/OUTLINE**

Goals and objectives -Background information -Common and uncommon skull lesions in children -Imaging spectrum of pediatric skull lesions -Indications for further imaging -Summary. Pediatric skull lesions can be congenital, traumatic, vascular, inflammatory, infectious, or malignant. These lesions can be clinically palpable or incidentally detected on imaging. The incidentally detected lesions include parietal foramina, sinus pericranii, and venous lakes. The palpable abnormalities can be present at birth, such as cephalohematoma, birth trauma, meningocele/encephalocele, venous malformation, and dermoid/epidermoid cysts. Thalassemia, intraosseous hemangioma, osteoma, lipoma, Langerhans Cell Histiocytosis (LCH), Fibrous dysplasia, Neuroblastoma metastases, Ewing's sarcoma usually present later in life. Most of these lesions are visible on skull radiographs. Further evaluation is performed by ultrasound, computed tomography (CT), and Magnetic Resonance Imaging (MRI). Cephalohematoma and Parietal foramina are identified on ultrasound and radiographs respectively. Dermoid /Epidermoid cysts are commonly seen in the midline, frontal and temporal regions. LCH is usually seen as a beveled edge skull lesion. Fibrous dysplasia presents as expansile lesions with a ground glass matrix seen on CT. Our exhibit will discuss various skull lesions seen in the pediatric age group, their imaging appearance, and a systematic approach to the correct diagnosis.

#### **PDEE-19 Focused Thoracic Ultrasonography for the Elucidation of Radiolucent Areas in Pediatric Patient's Chest X-ray: Approach Based on Cases**

Participants

Taila Moura Fe, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

The main objectives of this exhibit are to: 1- Review the importance of thoracic ultrasonography in critical pediatric care and its potential benefits in reducing radiation exposure in neonates and infants. 2- Discuss various conditions that present as lucent lesions on chest X-rays and review sonographic findings of these conditions. 3- Emphasize the use of Focused Thoracic Ultrasound as a reliable tool in critical pediatric care and expand the use of bedside thoracic ultrasound helping physical examination.

##### **TABLE OF CONTENTS/OUTLINE**

Introduction; Review of the use of thoracic ultrasonography; Case-based review of conditions that present as lucent lesions, with a challenging chest x-ray at the beginning of each case, followed by sonographic findings; Conditions included: Diaphragmatic hernia (Morgagni's and Bochdalek's hernia); Pneumothorax; Pneumomediastinum; Necrotizing pneumonia; Pulmonary cavitation/pneumatocele; Poland syndrome; Subcutaneous emphysema; Congenital deficiency of surfactant production; Congenital pulmonary airway malformation (CPAM)

#### **PDEE-2 Imaging Review of the Pediatric Spine: Do Abnormalities Always Indicate Disease?**

Participants

Ana Carolina Augusto, MD, MSc, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

The purpose of this study is: • To review the development of the spine, focusing on the formation and malformations of vertebrae. • To illustrate and discuss the normal appearance, anatomical variations, and common pathologies involving the spine during skeletal growth.

##### **TABLE OF CONTENTS/OUTLINE**

• Embryology: The vertebral column and spinal cord develop in a precise, sequential manner during gestation. Any deviation from this normal process can cause structural variations in the spine and spinal cord. • Congenital and acquired deformities of the vertebral bodies: defects related to fusion, formation, and segmentation of the vertebral bodies may lead to congenital scoliosis and could be linked with spinal dysraphisms, skeletal, cardiac, genitourinary, and gastrointestinal anomalies. Acquired deformities of

the vertebral bodies can be caused by different factors, including trauma, infection, malignancies, systemic diseases, among others. • Bone marrow: bone marrow conversion from red to yellow marrow follows a well-established pattern during childhood. Understanding the normal signal intensity changes on MRI is crucial to detect deviations that may represent disease. • Normal developmental events, pitfalls, and common abnormalities during skeletal maturation: recognizing these developmental events and common abnormalities can assist in image interpretation, guiding treatment and management decisions.

#### **PDEE-20 Osteogenesis Imperfecta: A Pictorial Review**

Participants

Adriano Silveira Moreira Novaes, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

Osteogenesis imperfecta (OI) is a genetic disease characterized by increased bone fragility, low bone mass and other connective tissue manifestations. The most common cause of OI is mutations in one of the two genes encoding collagen type 1, which is a major component of bone and other connective tissues. OI can present with a wide range of symptoms, and there are now seven recognized types of the disorder. The radiologist must be prepared to recognize the image patterns, determining a correct diagnosis, which facilitates the early and adequate treatment of the patient. Excluding differential diagnoses, such as non-accidental injury, is of fundamental importance. The purpose of the present study is to exhibit imaging findings of types I, III, IV, V and VI of OI; to demonstrate how to differentiate the types based on imaging findings; to demonstrate how to differentiate OI from non-accidental injuries.

##### **TABLE OF CONTENTS/OUTLINE**

Introduction. Epidemiology and clinical finds. Main findings of type I, II, III, IV, V and VI. How to differentiate the types based on imaging findings. Excluding differential diagnoses, such as non-accidental injury, is of fundamental importance. Conclusion/Take home message.

#### **PDEE-21 Pediatric Renovascular Hypertension A-Z: Diagnostic Work-up, Imaging, Interventions, and Troubleshooting**

##### **TEACHING POINTS**

1. Renovascular hypertension (RVH) is caused by an upregulation of the renin-angiotensin-aldosterone system due to flow-limiting renovascular disease (RVD). In pediatric patients, the differential includes fibromuscular dysplasia, neurofibromatosis, vasculitis, abnormal arterial supply and trauma. 2. Although ultrasound is the initial imaging modality for diagnosing RVD, it is limited in evaluation of segmental branches. Angiography is the gold standard for diagnosis. 3. Interventional radiology can offer a variety of interventions for RVD, including angioplasty and embolization. Surgical interventions can be offered in angioplasty-refractory stenosis. 4. A multidisciplinary care team consisting of nephrologists, diagnostic and interventional radiologists, and transplant and vascular surgeons is necessary for the global care of young patients with RVH.

##### **TABLE OF CONTENTS/OUTLINE**

1. Differential diagnosis, diagnostic work-up and medical management for pediatric RVH. 2. Multi-modality approach to the imaging diagnosis for pediatric RVD including: renal artery Doppler ultrasound, contrast-enhanced ultrasound, computed tomography angiography, magnetic resonance angiography, and catheter angiography. 3. Endovascular renal artery interventions and technique for RVH management. 4. Indications for surgical intervention. 5. Surveillance and follow-up; troubleshooting for persistent hypertension.

#### **PDEE-22 Radiogenomics of PIK3CA Related Disorders: A New Era**

Participants

Jada Hislop, BA, Decatur, GA (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

Vascular anomalies are traditionally classified based on clinical characteristics, imaging and pathology. Diagnosis is challenging due to overlapping phenotype and inconsistent naming conventions. With the rapid development of new technologies in oncology, radiogenomics has emerged as a science which is beginning to change our understanding and treatment of vascular anomalies as well. Advances aid in clarifying etiology and elucidate previously unknown pathomechanisms. Through sequencing of tissue samples, postzygotic somatic variants have been discovered for several vascular anomalies with and without overgrowth as is the case with PIK3CA. PIK3CA driven vascular anomalies may now be treated with mTOR inhibitors and newly approved PIK3CA inhibitors. This exhibit will be a case-based approach to review recent advances in diagnosis including imaging finds, genetic testing, and review management of these disorders. Review the clinical spectrum of disorders associated with pathogenic variants in PIK3CA gene - from isolated vascular malformations to recognizable disorders. Highlight the manifestations of some PIK3CA-related disorders presenting with overgrowth (PROS). Review MRI imaging findings and pathology in patients with confirmed variants in PIK3CA. Discuss the evolving nature of genetic testing in somatic disorders and suitable tissue samples for testing. Briefly discuss therapeutic options including new medical managements

##### **TABLE OF CONTENTS/OUTLINE**

Introduction to PROS/PIK3CA Genetic Pathway  
Selected examples and isolated vascular anomalies and overgrowth disorders  
Diagnostic approaches with imaging  
Diagnostic approaches with genetic  
Therapeutic approaches  
Conclusion

#### **PDEE-23 The Top 10 Most Feared Diagnostic Errors by Radiology Trainees in Pediatric Neuroradiology Emergencies: Practical Tips and Tricks for Early Detection and Prevention**

Participants

Agustin Cardenas, MD, (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

1. Recognize the key imaging findings of the "top 10" Pediatric Neuroradiology Emergencies considered most challenging by Radiology trainees. 2. Identify the most feared potential errors and pitfalls made by Radiology trainees when interpreting these type of cases. 3. Learn potential contributing factors to developing these errors. 4. Provide practical tips and tricks to help prevent these potential errors. Provide specific strategies to apply them, in order to improve diagnostic confidence of Radiology trainees in clinical

practice.

#### TABLE OF CONTENTS/OUTLINE

I. IntroductionII. Top 10 challenging Pediatric Neuroradiology cases during call1. Detection of early cerebral edema. 2. Detection of dural sinus thrombosis in noncontrast head CT. 3. Retropharyngeal edema vs early abscess.4. Detection of early shunt failure. 5. Craniocervical junction fracture vs normal developing ossification center.6. Calvarial fracture vs suture. 7. Branchial cleft cyst vs retropharyngeal abscess. 8. Time estimation of heterogeneous subdural collections. 9. Porencephalic cyst vs ventriculomegaly 10. Detection of early orbital cellulitis.III. Take home pointsIV. References

#### **PDEE-24 The Role of Imaging in Radiotherapy Planning: An Illustrated Review of Common Pediatric Tumors Treated with Radiotherapy**

Participants

Susan Gowdy, FRCPC,MBBS, Newcastle, (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Review some of the more common paediatric tumours treated with radiotherapy. Understand the role of imaging in the decision-making process regarding type of radiation therapy and mode of delivery. Consider how different imaging modalities may be incorporated into planning a radiation therapy field. Evaluate the potential role of imaging surveillance following radiotherapy.

#### TABLE OF CONTENTS/OUTLINE

Successful management of pediatric malignancies requires a multidisciplinary team approach. This educational exhibit aims to highlight the importance of close collaboration between radiologists, nuclear medicine physicians and radiation oncologists when assessing tumours of childhood which can be treated with radiotherapy. Using case examples of a medulloblastoma, Hodgkin's lymphoma and neuroblastoma, we will present imaging to review radiological features at diagnosis, relevant staging systems and response criteria that are important considerations for radiation oncologists planning radiotherapy treatment. The role of the different imaging modalities including various MRI sequences will be illustrated as the process of planning a radiation therapy field is discussed. Potential treatment complications including current literature regarding the role of imaging in surveillance will be reviewed.

#### **PDEE-25 MRI Findings in Hypovitaminosis C: Separating Scurvy from the Crowd**

#### TEACHING POINTS

1. Symmetric metaphyseal edema involving the lower extremities is an uncommon finding. Causes include metabolic disorders, multifocal infection, autoimmune disorders, inherited diseases, and malignancy. Recognizing that bilateral lower extremity metaphyseal edema is a consistent finding in hypovitaminosis C can lead to early diagnosis and avoidance of further unnecessary testing and procedures.2. Differential diagnoses for symmetric metaphyseal edema include focal periphyseal edema zones, chronic noninfectious osteitis, malignancy, osteomyelitis, and sickle cell disease.3. Although subperiosteal hemorrhage can be seen with other etiologies such as bone infarct from sickle cell disease it can be a specific finding in hypovitaminosis C.4. Since the diagnosis of hypovitaminosis C may not be initially considered, recognition of the imaging findings is important for early diagnosis. This allows for timely treatment and avoidance of further testing.5. Scurvy has several clinical and laboratory findings that overlap with more common pathologies.a. Clinical: (Early) Gingival hyperplasia, joint swelling and bruising. (Late) Fever, jaundice, hemolysis, spontaneous bleeding and neuropathy.b. Laboratory: Mild leukocytosis. Elevated ESR and CRP.

#### TABLE OF CONTENTS/OUTLINE

1. Case series of 4 patients with hypovitaminosis C.a. Historyb. Clinical presentationc. Laboratory valuesd. Imaging2. Review of the differential diagnosis of symmetric metaphyseal edemaa. Imaging features that can be specific for hypovitaminosis C.b. Imaging findings suggestive of an alternative diagnosis.c. Nonspecific clinical findings of hypovitaminosis C.

#### **PDEE-26 Pediatric Rhabdomyosarcoma: Imaging Evaluation from Diagnosis to Treatment Monitoring**

Participants

Dana Alkhulaifat, MD, Philadelphia, PA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Rhabdomyosarcomas (RMS) are the most common type of soft tissue sarcomas in children. Risk factors include cancer predisposition syndromes such as Li- Fraumeni, Noonan and Beckwith-Wiedemann.
- Prognosis depends on several factors including location of the tumor, size, histopathology, genetics and imaging findings.
- The most optimal imaging modality for measuring local tumor involvement is cross sectional imaging by CT or MRI.
- For regional lymph node and metastatic assessment, whole-body fluorodeoxyglucose (FDG) PET/CT or PET/MRI in combination with chest CT is recommended.
- Treatment is multimodal and consists of multi-agent chemotherapy, along with surgical resection and radiotherapy of the primary tumor.
- MRI is the recommended modality for monitoring chemotherapy response for primary tumor, while FDG PET/CT or PET/MRI in combination with chest CT is recommended for lymph nodal and metastatic disease.

#### TABLE OF CONTENTS/OUTLINE

1. Brief overview of pediatric rhabdomyosarcomas: epidemiology, risk factors and clinical presentation. 2. Initial tumor assessment: a. Primary tumor b. Regional lymph nodes c. Metastatic lesions 3. Stratification of severity a. Tumor location b. Histological subtype c. Cytogenetic information d. Imaging staging (CT, MRI and PET) 4. Treatment regimens and response monitoring a. Imaging modalities b. Frequency of monitoring c. Definitions of remission or progression.

#### **PDEE-27 Central Nervous System Involvement in Mucopolysaccharidoses: Understanding Pathophysiology and Radiological Findings**

Participants

Miguel Barrio Piqueras I, MD, Pamplona, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To understand the basic pathophysiology that directly or indirectly affects the central nervous system, including bone instability.To

be able to recognize the main radiological findings of the different subtypes of this disease. To inform about new imaging diagnostic strategies such as spectroscopy.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction: Definition and general characteristics  
2. Clinical presentation in the central nervous system. I: Alpha-L-iduronidase - Hurler (I H): mental retardation, dysostosis - Scheie (I S): normal intelligence - Hurler-Scheie (I H-S): Intermediate between both above II: Iduronate sulphatase - Hunter: dysostosis III: Profound mental deterioration - Sanfilippo A: Heparan sulphamidase - Sanfilippo B: N-acetyl-glucosaminidase - Sanfilippo C: Acetyl-CoA: alpha-glucosaminide acetyltransferase - Sanfilippo D: N-acetylglucosamine 6-sulphatase IV: Galactose-6-sulphate sulphatase, Beta-galactosidase: Dysostosis, motor dysfunction - Morquio A - Morquio B VI: N-acetylgalactosamine-4-sulphatase - Maroteaux-Lamy: dysostosis, kyphosis VII: Beta-glucuronidase - Sly: dysostosis  
3. Diagnostic methods. Imaging findings and protocols.  
4. Treatment options for mucopolysaccharidoses.  
5. Future directions in imaging of mucopolysaccharidoses - Spectroscopy: diagnosis and future applications  
7. Case series

#### PDEE-28 Easy-peasy! Simplifying the Myelination Progress in Term Newborn

Participants

Marcella N. Brandao, MD, MEd, Salvador, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Review the normal myelination process in term newborn, as well as its progression. Tips for standardizing the evaluation of the myelination process. Guide step by step the myelination milestones, the main differential diagnoses and the disturbances in the myelination process that must be recognized.

#### TABLE OF CONTENTS/OUTLINE

Infant brain magnetic resonance imaging (MRI) interpretation presents unique challenges due to different appearances depending on age. This occurs through the myelination process which, despite starting in utero, has acceleration and predictability between individuals in the first postnatal year, with a predetermined scheme of chronological and topographical sequences, serving as an important normal brain maturation marker on MRI. Myelination occurs by a gradual myelin sheath dehydration, at the same time that lipids and proteins are deposited. This process is dynamic and the molecular interactions of water with lipids and myelin membrane proteins are modified and affect the relaxation time in the T1W and T2W sequences. T1W weighted images are most useful up to 8 months old with the myelinated white matter showing hypersignal, and T2W weighted images are useful in the later stages of myelination, showing hyposignal in the face of reduced myelin water content. Although predictable, the evaluation of myelination on MRI is still a challenge for many radiologists, so the authors structure a step-by-step guide with the myelination milestones, the main differential diagnoses and the disturbances in the myelination process that must be recognized.

#### PDEE-29 Anatomic Approach to Non-Traumatic Lesions of the Pediatric Visual Pathway

Participants

Vivek Pai, MBBS, MD, Toronto, ON (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Most of the visual pathway is inaccessible for histopathology; radiology is the only diagnostic modality available. Hence accuracy is of utmost importance for adequate management and optimal outcome  
2. Having an anatomic approach will help narrow differentials.

#### TABLE OF CONTENTS/OUTLINE

A. Discussion on the anatomy of the visual pathway. B. Pictorial essay on lesions affecting the visual pathway with discussion on etiopathogenesis and presentation. Lesions are divided according to the anatomic location: 1. Retina: Retinal Detachment, Retinal hemorrhage, Panophthalmitis, Medulloepithelioma, Retinoma, Retinoblastoma. 2. Optic disc: Papilledema and IIH, Optic Drusen, Coloboma, CHARGE syndrome, Morning Glory syndrome  
3. Optic nerve: Anophthalmia-related aplasia, hypoplasia, demyelinating disorders, mitochondrial disorders, visual pathway gliomas  
4. Optic chiasm: Septo-optic dysplasia, Krabbe disease, Opto-Chiasmatic tuberculosis, hypothalamic-chiasmatic glioma.  
5. Occipital lobes: Adrenoleukodystrophy, hypoxic-ischemic encephalopathy, hypoglycemic encephalopathy, PCA territory infarction, Posterior Reversible Encephalopathy Syndrome, occipital cephalocele, focal cortical dysplasia

#### PDEE-3 US Evaluation of the Pediatric Hand Trauma: From One Through Five

Participants

Emilio Inarejos Clemente, MD, Barcelona, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

After reviewing this exhibit, the learner should be able to: 1. Recognize the normal US appearance of the pediatric hand. 2. Describe the use of high-resolution US, Doppler US and microvascular imaging for the evaluation of trauma-related conditions of the hand in children. 3. Review the most common traumatic conditions affecting the hand in children. 4. Discuss the US findings of the most frequent traumatic entities occurring in hand and wrist.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction. 2. Transducers and technical US parameters to optimize the examination of the hand. 3. Normal US appearance of the pediatric hand, including tendons, ligaments, vessels, and nerves. 4. Authors will focus on five compartments (from one through five): 4.1. Ligaments 4.2. Tendons 4.3. Vessels 4.4. Nerves 4.5. Bone. 5. Ligament injuries: Collateral ligaments (Stener lesion), pulley lesions, volar plate lesions. 6. Tendon injuries: Superficial and profundus flexor tendon lacerations and transections, extensor tendon injuries, impingements, tenosynovitis. 7. Vessels: Venous/arterial thrombosis, post-traumatic pseudoaneurysm. 8. Nerves: Laceration and transection, post-traumatic neuroma. 9. Bone: Fractures, callus formation with secondary impingement. 10. Foreign bodies characterization and removal with US guidance. 11. Injuries will be correlated with anatomical draws, as well as with MRI images. 12. Summary

#### PDEE-30 Diagnostic Error in Pediatric Neuroradiology

#### TEACHING POINTS

(1) Medical error has significant impacts on patient outcomes and society as a whole. (2) Error in diagnostic radiology can be organized in terms of types of thinking. (3) Metacognition, self-awareness, and understanding of specific strategies related to types of error can help radiologists reduce error. (4) Case-specific teaching to reduce error in pediatric emergency neuroradiology.

#### TABLE OF CONTENTS/OUTLINE

For each error type there will be: A pediatric neuroimaging case, a definition of error type, lessons learned, and known strategies to prevent this error. (1) Perceptive Error; (2) Cognitive Error: a) Anchoring bias, b) Confirmation bias, c) Availability bias, d) Satisfaction of report, e) Framing bias, f) Attribution bias, g) Satisfaction of search, h) Premature closure, i) Inattentive bias, k) Hindsight bias; (3) Communication Error; (4) Process Error

#### **PDEE-32 Polymorphous Low Grade Neuroepithelial Tumor of the Young: An Institutional Case Series with Radiological and Pathological Correlation**

##### TEACHING POINTS

Polymorphous low grade neuroepithelial tumor of the young (PLNTY) is a rare, epileptogenic brain tumor that was recently described as a distinct entity in the 2021 World Health Organization classification of CNS tumors. Teaching points include: 1) PLNTY usually occurs in children and adolescents, although is occasionally diagnosed in adults. Clinically, patients often present with refractory seizures. 2) Histological characteristics of PLNTY include an infiltrative growth pattern, intense CD34 expression, cellular components resembling oligodendroglioma, and calcifications. 3) Imaging characteristics of PLNTY include T1 hypo/iso-intensity, T2 hyperintensity, GRE blooming artifact, non- (or slight) enhancement on contrast imaging, cystic components, and internal calcifications. Morphologically, PLNTY is often well-circumscribed and located in the temporal lobe. 4) At a molecular level, PLNTY is characterized by the presence of either a BRAF V600E mutation or chromosomal translocations involving FGFR2 and FGFR3. Both genetic alterations activate the MAP kinase pathway. 5) Imaging differential diagnoses include other low grade cortically based tumors such as oligodendroglioma (usually found in adults), dysembryoplastic neuroepithelial tumor (DNET), ganglioglioma, pleomorphic xanthoastrocytoma, and pilocytic astrocytoma. 6) Surgical resection is usually curative of seizures.

#### TABLE OF CONTENTS/OUTLINE

-Introduction, PLNTY's place in the WHO 2021 Classification of CNS tumors -Imaging characteristics of PLNTY -Histological characteristics of PLNTY -Discussion of pathophysiology and molecular subtypes -Imaging comparisons of differential diagnoses

#### **PDEE-33 Inside the Womb: A Fascinating Look at Congenital Kidney Pathology through Fetal MRI**

Participants

Lizbet Perez-Marrero, Santiago De Chile, Chile (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

1) Fetal MRI has emerged as a valuable and high-resolution imaging modality for the comprehensive assessment of fetal renal anomalies. 2) By utilizing a systematic review approach, radiologists can effectively characterize the fetal kidneys, providing a comprehensive understanding of the extent and severity of the anomalies. 3) Incorporating functional kidney assessments and measuring total lung volume during fetal MRI can enhance the overall evaluation of the fetus, providing a better understanding of the patient's condition and enabling more informed parental counseling.

#### TABLE OF CONTENTS/OUTLINE

When evaluating the kidneys, the following topics should be assessed, as combined alterations may be found associated with different pathologies:- position: situs solitus versus ectopia.- morphology: duplex, horseshoe.- size: duplex, autosomal recessive polycystic kidney disease (ARPKD)/ autosomal dominant polycystic kidney disease (ADPKD).- focal lesions: cysts, tumors.- excretory system: posterior urethral valves.- renal function: hypofunctioning - related systems: amniotic fluid, assessment of lung volume (hypoplasia cutoff value?), uterus/annexa.

#### **PDEE-34 Neonatal Liver Imaging: Techniques, Normal Variations and Common Pathologies**

Participants

Govind Chavhan, MD, Toronto, ON (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

Neonatal liver has some unique aspects in terms of imaging and imaging appearances as compared to older children. Choosing and tailoring of imaging for each indication in neonate is therefore important for optimal care with minimal invasiveness. Common indications for imaging include incidental focal lesions, neonatal liver failure, cholestasis and sepsis. Imaging is important component of work up in neonatal liver failure helping to narrow differentials. It may help to salvage liver and potential transplant by timely diagnosis of conditions such as neonatal hemochromatosis.

#### TABLE OF CONTENTS/OUTLINE

Introduction (overview of neonatal liver pathology, incidence, etc.; role of imaging) Imaging modalities- (discussion of specific roles, pros/cons, with relevant summary tables) What changes and what is normal at birth? (discussion of normal imaging appearance of structures related to neonatal liver) Indications for imaging (Incidental lesions, liver failure/dysfunction, cholestasis, sepsis, etc) Common pathologies (work up and role of imaging in the work up) - Congenital calcifications (causes, natural course, imaging) - Line related complications (hematoma, abscess) - Infections (TORCH, herpes, bacterial) - Neoplastic lesions (common lesions- hemangioma/HB/mesenchymal hamartoma /mets) - Vascular abnormalities (thrombosis, portosystemic shunts, AVMs, Heterotaxy) - Neonatal liver failure- causes, workup and role of imaging (NH, HLH, metabolic diseases, infection, cholestatic diseases) Summary

#### **PDEE-35 Pediatric Neck Cystic Lesions**

##### TEACHING POINTS

Cystic lesions are common findings in pediatric patients. Imaging plays a crucial role guiding the diagnosis and depicting the anatomical extent of the lesion. Multimodality imaging narrows the differential diagnosis by demonstrating the lesion's components. Age groups and anatomic location in the neck are also diagnostic clues. It is important to recognize potential complications, especially infections.

## TABLE OF CONTENTS/OUTLINE

o Congenital and Developmental Disorders § Thyroglossal duct cyst § Branchial cleft anomalies § Dermoid/Epidermoid cyst § Thymopharyngeal duct cyst o Vascular § Lymphatic malformations § Venous malformations § Cervical hemangioma § Pseudoaneurysms § Internal jugular phlebectasia o Infectious § Suppurative lymphadenitis § Tuberculous lymphadenitis § Abscess o Neoplastic § Schwannoma § Warthin tumor § Congenital cervical teratoma § Cervical lymph node metastases o Miscellaneous § Ranula § Thyroid colloid cyst § Laryngeal cyst

### PDEE-36 Imaging of DDH: An Update on Diagnostic, Follow-up and Post-operative Findings

#### TEACHING POINTS

The purpose of this exhibit is: To review the anatomy of the infant hip. To discuss the incidence, risk factors and pathophysiology of Developmental Dysplasia of the Hip. To review the clinical and imaging diagnostic criteria for DDH. To discuss the role of each imaging method in the context of DDH. To demonstrate the importance of early diagnosis and proper treatment of DDH with successful cases and adequate treatment, as well as late diagnosis and its complications.

## TABLE OF CONTENTS/OUTLINE

Theoretical introduction containing epidemiology, risk factors and pathophysiology. Anatomy of the infant hip, including bone structures and the most relevant anatomic landmarks in DDH's diagnosis and follow-up. Images of clinical cases demonstrating some of the long-term complications, with emphasis on the importance of early diagnosis and proper treatment to avoid them. Brief discussion and illustration of the main current treatments as well as imaging follow-up evaluation with expected and unfavorable outcomes. Latest updates on diagnosis and treatment of DDH.

### PDEE-37 Imaging Appearance of Common and Less Common Fetal Masses from Head to Toe

Participants

Elizabeth Snyder, MD, Nashville, TN (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1) Masses detected prenatally range from congenital malformations to tumors; knowledge of the imaging appearance of common and uncommon fetal masses is important for appropriate pregnancy management, delivery planning and immediate postnatal management-2) Both US and fetal MRI play important and complementary roles in the evaluation of fetal masses.3) Using an anatomic approach to fetal masses, the differential diagnosis can be narrowed, allowing for more accurate prenatal counseling and management.

## TABLE OF CONTENTS/OUTLINE

1. Introduction: a. Epidemiology of fetal masses, b. Overview of categories of fetal masses: congenital malformations, benign tumors, malignant tumors2. Imaging approach to fetal masses: a. Prenatal ultrasound, including 3-D ultrasound b. Role of fetal MRI3. Anatomic approach to the prenatal diagnosis of fetal masses: a. Head neck: teratoma, lymphatic malformations, etc. b. Chest: congenital lung lesions, mediastinal teratoma, congenital myofibroblastic tumor, cardiac rhabdomyoma, etc. c. Abdomen/pelvis: hepatic congenital hemangiomas, neuroblastoma, congenital mesoblastic nephroma, sacrococcygeal teratoma, ovarian cyst, etc. d. Extremities: infantile fibrosarcoma, etc.4. Conclusion

### PDEE-38 Detection of Aspirated Food in Pediatric Airway using Computed Tomography (CT)

Participants

Joseph Swicklik, RT, BS, Byron, MN (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

•Explain clinical significance challenges detecting aspirated food in pediatric airway. •Describe challenges solutions for CT imaging. •Explain method for optimal imaging of radiopaque food matter. •Illustrate benefits of CT in detecting aspirated food particles in clinical applications.

## TABLE OF CONTENTS/OUTLINE

1. Foreign body aspiration in pediatric airways a. Common issue in pediatric patients b. The most common type of foreign bodies aspirated is food c. Challenges with plain film radiography in visualizing food due to low contrast 2. How computed tomography can be used to achieve improved visualization of aspirated food particles in the pediatric airway a. CT offers thin slice axial images without superimposition of anatomy b. Multiplanar reformats offer views from multiple angles to better detect food stuck in the airway 3. Challenges of CT imaging and solutions a. CT has a longer exposure time which increases the chance of motion b. Flash scanning to reduce scan time c. Determining the best scanning factors to best visualize radio-translucent food 4. Phantom studies a. Food items commonly aspired in peds seen in the ED b. Tubes representing realistic sizes of airways in children c. Tubes filled with food items placed inside anthropomorphic chest phantoms representing pediatric patients of different ages d. Optimal scanning, reconstruction, and display techniques to visualize food items e. CT number look-up table of commonly aspirated foods 5. Clinical examples and applications a. Gummy bear detected in airway b. Thoracic c. Pediatrics d. Adults at high risk for aspiration

### PDEE-39 Spectrum of Pediatric Distal Bowel Pathology Imaging from Prenatal Period to Adolescence

Participants

Hajer Jarraya, (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. The differential diagnosis of neonatal colonic obstruction includes Hirschsprung's disease, colonic atresia, congenital segmental dilation of the colon, NEC, anorectal malformation, and meconium plug syndrome. 2. The differential diagnosis of colonic obstruction in infants and children includes incarcerated intestinal hernia, sigmoid, cecal and transverse volvulus, intussusception, and rectal obstruction related to abdominopelvic masses or cysts. 3. The differential diagnosis of colonic wall thickening in older children includes infectious colitis, typhlitis, inflammatory (Crohn's or ulcerative colitis), vasculitis, ischemia, and neoplasm. 4. The differential diagnosis of colonic pathology can be classified based on age at presentation and primary imaging features (wall thickening, dilation/obstruction, transition point).

## TABLE OF CONTENTS/OUTLINE

1.Epidemiology and classification of colonic pathology, 2.Imaging Findings A) Colonic pathology in the prenatal period B) Colonic obstruction in neonates, infants, children and adolescents C) Colonic wall thickening: infectious, inflammatory and neoplastic 3.Differential diagnosis 4.Algorithm of differential diagnosis based on age and primary imaging features

### PDEE-4 Lymphoscintigraphy: A Pictorial Review with Focus on Pediatric Patients

#### TEACHING POINTS

1. Classification of lymphedema and lymphatic dysplasias via illustrative mixed-modality case-examples 2. Sentinel node mapping in pediatric patients 3. Important pitfalls of the technical and interpretive aspects of lymphoscintigraphy

#### TABLE OF CONTENTS/OUTLINE

Introduction: Lymphoscintigraphy is a minimally invasive imaging technique that uses radiolabeled colloidal particles to evaluate lymphatic function Technique: 1. Radiopharmaceuticals 2. Administered activity/radiation dose 3. Imaging Protocols Indications for Lymphoscintigraphy: 1. Primary Lymphedema including Lymphatic Dysplasia 2 .Secondary Lymphedema 3. Chylous Leaks 4. Sentinel Lymph Node Mapping Imaging Findings with Illustrative Case Discussions: 1. Lymphedema 2. Absent Visualization of Regional Lymph Nodes 3. Delayed or Asymmetric lymphatic Transit 4. Collateral Lymphatic Channels 5.Dermal Backflow 6.Chylous Effusion or Ascites 7.Sentinel Lymph Node Visualization Pitfalls Summary:Lymphoscintigraphy plays a unique role in evaluation disorders of lymphatic development, acquired lymphatic disorders, and assessment of chylous fluid collections. Familiarity with normal patterns of lymphatic transit, abnormal lymphatic transit, and common pitfalls are crucial for radiologists performing and interpreting these examinations.

### PDEE-40 Imaging of Congenital Hearing Loss: A Practical Approach

Participants

Rafael Loureiro, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To review important anatomic landmarks in the pediatric temporal bone. 2. To discuss the imaging technique and protocols for the evaluation of congenital hearing loss.3. To present a practical guide to facilitate comprehension of radiologic findings and the role of imaging in the evaluation of congenital hearing loss.

#### TABLE OF CONTENTS/OUTLINE

IntroductionPrinciples of the basic workout investigation- Screening for hearing loss in newborns- Functional evaluation: quick review of audiometric studies for radiologistsTemporal Bone AnatomyClassification of congenital hearing loss- by severity: slight, mild, moderate, severe and profound- by type: conductive, sensorineural, mixed- by causes: genetic (syndromic and non-syndromic); environmental; congenital lesions and malformationsImaging studies: CT and MRI of the temporal bone- imaging protocol and special considerations for congenital hearing loss evaluationInstructive cases by causes and main imaging features A step-by-step guide to diagnose congenital malformationsPrinciples of imaging evaluation for guiding treatmentTake home messages

### PDEE-41 Systematic Approach to Congenital Brain Tumor

Participants

Ana Paula Fonseca, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

Felipe Scortegagna SR, MD, Porto Alegre, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The purposes of this exhibit are to:- Describe through illustrative cases the classification and imaging patterns of neonatal brain and spine tumors.- Correlate imaging with molecular and genetic alterations.- Present comprehensive imaging protocols.- Highlight important differential diagnoses to consider.

#### TABLE OF CONTENTS/OUTLINE

- Definition of congenital tumors.- Classification of congenital CNS tumors- Based on location, age and updated WHO Classification 2021.- Overview of common predisposing genetic syndromes.- Recommended fetal and neonatal imaging protocols.- Typical imaging features of each tumor type.- Teratoma Astrocytic tumors.- Neuronal and mixed neuronal-glial tumors.- Choroid plexus papilloma.- Embryonal tumorso Craniopharyngioma.- Ependymoma.- Important tumor mimics to consider.- Hemorrhage.- Vascular malformations.- Infections.- Hamartomas.- Cortical malformations.- Treatment challenges and developments.- Diagnostic algorithm.- Final remarks.

### PDEE-42 Bridging the Gap Between the Symptoms to Radiology Beyond the Anatomy of Temporal Bones in Pediatrics and Young Adults

Participants

Nahyun Jo, MD, Galveston, TX (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The ear is a highly specialized organ in a tightly packed space. Trainees are used to the classification of temporal bone pathology with respect to their anatomical locations; inner, middle, and outer ear. Although anatomical search patterns allow a thorough evaluation of complex ear structures, understanding symptomologic categorization not only aids in an active search for differential diagnosis but also broadens the understanding of the pathophysiology and management.

#### TABLE OF CONTENTS/OUTLINE

The introduction is a basic review of temporal bone anatomy and commonly used modality. The second section, "Bridging the gap," discusses a quick guide to understanding relevant clinical information, such as audiometry or otoscopy. In the third section, "Symptoms to radiology," each ear pathology is categorized by each clinical scenario. For each symptom and appropriate pathology, key points to report or "what surgeons want to know" are detailed. The symptoms are divided into otalgia, hearing loss, tinnitus, and otorrhea. Otolgia is subdivided into the acute and chronic onset of symptoms. Hearing loss is subdivided into

conductive hearing loss and sensory hearing loss. Both conductive and sensory hearing loss has congenital, infectious/inflammatory, tumor, trauma, and miscellaneous etiologies. Tinnitus has vascular, tumor, and various etiologies. Otorrhea may occur with otalgia due to infection, but CSF otorrhea is discussed separately as it can be the sole reason for the exam without other overlapping symptoms.

#### **PDEE-43 Palpable Head and Neck Lumps in Pediatrics: Tips and Tricks in Ultrasound**

Participants

Ana Berasategui Criado, MD, Santander, Spain (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

To illustrate the ultrasound appearance of the most frequent pediatric head and neck palpable lumps, acknowledge the imaging hallmarks of each condition, and correlate with other imaging tools. To highlight the warning signs on ultrasound, recognize when additional testing is necessary and discuss subsequent management.

##### **TABLE OF CONTENTS/OUTLINE**

The presence of palpable lumps of the head and neck is a frequent complaint in children, including a broad spectrum of infectious, tumoral conditions, embryologic remnants, and vascular malformations, with the large majority proven benign. The radiologist must recognize the warning signs that allow early management of those with potential malignancy or those leading to space compromise over vascular and respiratory structures, including onset during the neonatal period, firm consistency, rapid growth, or location underneath the fascia. Ultrasound has arisen as the first-line imaging modality for initial evaluation. It represents a fast and safe technique, which can provide essential information for the characterization of the lesion, acting as a guide in diagnostic and therapeutic procedures. This ultrasound approach guides subsequent decision-making, including follow-up, complementary testing, or treatment through interventional drainage or surgical excision. Further investigation with cross-sectional imaging is warranted if the characteristics of the mass are beyond the scope of ultrasound or if malignancy is suspected. We provide a pictorial review of illustrative cases from our institution to help identify the key imaging findings and emphasize the role of ultrasound in the diagnosis and interventional treatment of pediatric lumps.

#### **PDEE-44 Atlas of Secondary Ossification Centers, Physeal Variations, and Cortical Buckles" in the Pediatric Skeleton: Radiographic and MRI Correlation of Normal and Abnormal Findings.**

Participants

Jade Iwasaka-Neder, MD, Boston, MA (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

- Systematically illustrate the variable radiographic appearances of secondary ossification centers and physes at different stages of skeletal development
- Compare and contrast MRI appearances of normal versus abnormal growth centers to highlight their differences and improve their diagnosis
- Elucidate normal and abnormal areas of cortical buckling in children
- Illustrative examples of pathologic mimickers

##### **TABLE OF CONTENTS/OUTLINE**

o Secondary ossification centers on radiography and MRI: imaging characteristics, expected time of appearance, and locational differences.

- Sternum (Manubrium; Sternebrae; Xiphisternum; Unfused sternbrae sternal foramen)
- Scapula (Coracoid centers; Acromion centers)
- Upper limb (Greater humeral tuberosity; Lesser humeral tuberosity; Elbow mnemonics: CRITOE and CRITOL; Carpal bones)
- Pelvis (Iliac spines; Ischial tuberosity; Acetabular rim)
- Lower limb (Distal femoral condyles; Tibial tubercle; Medial and lateral malleoli; Patella; Calcaneus)

o Cortical buckles and nutrient canals. Do they belong here? (Tibia; Fibula; Femur; Clavicle; Tarsal bones; Metacarpals and phalanges; Metatarsals)

o Physeal variations (Distal fibula; Distal tibia; Proximal humerus; Distal radius; Distal ulna; Different types of normal physes)

o Normal versus Fracture (Case review)

#### **PDEE-45 Childhood Constipation: How Imaging Evaluation Can Help**

Participants

Lívia Alves, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

Constipation in the pediatric population is a prevalent diagnosis worldwide. Frequent imaging examinations are required to investigate the diagnosis, and generally to differentiate the functional etiology and its degrees from an organic cause. Therefore, the radiologist must know the particularities of each imaging method, know how to indicate the ideal exam in the face of clinical suspicion, and interpret the most diverse findings to arrive at the final diagnosis. This presentation aims to: (1) point out the main imaging tests that can be used in the diagnosis of constipation in pediatric patients, detail their characteristics and help in choosing the method in the face of clinical suspicion. (2) review the imaging findings in cases of functional and organic constipation, highlighting the main related pathologies: Hirschsprung's disease, visceral myopathy and chronic intestinal pseudo-obstruction. (3) debate the imaging findings of the most frequent complications.

##### **TABLE OF CONTENTS/OUTLINE**

Imaging methods used in the diagnosis of constipation, its characteristics, and main indications in the face of clinical suspicion include abdominal radiography, barium enema and colonic transit, computed tomography, magnetic resonance imaging and ultrasound. Case-based review of the functional and organic etiology of constipation (Hirschsprung's disease, visceral myopathy, chronic intestinal pseudo-obstruction, intra-abdominal tumor and VACTERL association). Case-based review of complications (fecaloma, stercoral colitis, and perforation) and associated diseases (voiding dysfunction).

#### **PDEE-46 The PRETEXT Staging System for Primary Liver Tumors in the Pediatric Population. A Cases-based Pictorial Review**

Participants

Mariano Lorea, Barracas, Argentina (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

The PRE-Treatment EXTent of tumor (PRETEXT) system aims to standardize imaging evaluation and risk stratification of

hepatoblastoma and hepatocellular carcinoma before implementation of any treatment. PRETEXT grades provide valuable information regarding prognosis and overall survival. Liver is divided into four sections: left lateral (LL), left medial (LM), right anterior (RA) and right posterior (RP). Liver tumors are separated in four groups (I-IV) based on the number of contiguous tumor-free liver sections. Higher groups are related to worst outcomes.

#### TABLE OF CONTENTS/OUTLINE

Introduction What means PRETEXT? Prognosis implications Liver segmentation How to divide the liver? From Couinaud's segmentation to PRETEXT segments. PRETEXT groups Groups I to IV. Cases-based pictorial review. Imaging clues to precise PRETEXT group assignment. Additional PRETEXT criteria. Hepatic venous involvement (V and P) Extrahepatic disease (E) Multifocality (F) Tumor rupture (R) Caudate lobe involvement (C) Lymph nodes (N) and distant metastasis (M)

#### PDEE-47 Pediatric Primary Intracranial Sarcoma with Features of DICER1 Mutation: A Challenging Diagnosis

Participants

Jossue Espinoza SR, MD, Lima 01, Peru (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

TEACHING POINTS Pediatric primary intracranial sarcomas have an aggressive clinical course. The incidence of pediatric primary intracranial sarcoma with features of DICER1 mutation has been increasing. Imaging features of pediatric primary intracranial sarcomas with features of DICER1 mutation are not well documented. MRI and CT imaging play a crucial role in establishing a diagnosis. MRI plays a crucial role in follow up during treatment and evaluation for residual disease after surgery. Since there are several differential diagnoses, radio-pathologic correlation of these tumors is essential to confirm the diagnosis.

#### TABLE OF CONTENTS/OUTLINE

The goals of this exhibit are to: Provide a pictorial review of the diverse imaging appearances of pediatric primary intracranial sarcoma with features of DICER1 mutation and differential diagnoses. Discuss specific imaging and pathological characteristics of pediatric primary intracranial sarcoma with features of DICER1 mutation and differential diagnoses. Familiarize the audience with the imaging of pediatric primary intracranial sarcoma with features of DICER1 mutation and emphasize the importance of radio-pathologic correlation. These entities include: • Pediatric Primary intracranial sarcomas with features of DICER1 mutation. • Potential pitfalls and differential diagnoses of these tumors including other mesenchymal non-meningothelial tumors of the central nervous system, cavernous malformation (cavernous angioma or cavernoma) and high-grade brain tumors in pediatric patients.

#### PDEE-48 The Lung and Winding Road - A Pictorial Essay on Cystic Lung Diseases in Pediatric Radiology

Participants

Victor Nishimura, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

PNEUMATOCELE is a transient round and variable sized cyst, adjacent to consolidation or ground glass opacities. INTERSTITIAL LUNG EMPHYSEMA cystic or linear radiolucencies in the interstitium radiating from the hilum can be seen. CONGENITAL LUNG HYPERINFLATION increased lung volume and transparency can be seen. NEURENTERIC CYST is a fluid attenuating paravertebral lesion. BRONCHOGENIC CYST well circumscribed spherical or ovoid masses of variable attenuation can be seen. PULMONARY SEQUESTRATION multiple cystic lesions and anomalous artery nutrition can be seen. CYSTIC LYMPHANGIECTASY can be associated with syndromes, also congenital cardiac anomalies. CONGENITAL PULMONARY AIRWAY MALFORMATION usually presents as a solitary well defined thin walled cyst or multiple cysts of varying sizes. Multiple irregular shaped cysts are characteristic of LANGERHANS CELL HISTIOCYTOSIS. LYMPHANGIOLEIOMYOMATOSIS characterized by diffuse thin walled cysts surrounded by normal lung without regional sparing, accompanied by small centrilobular nodules.

#### TABLE OF CONTENTS/OUTLINE

ACQUIRED PNEUMATOCELE INTERSTITIAL LUNG EMPHYSEMA CONGENITAL CONGENITAL LUNG HYPERINFLATION NEURENTERIC CYST BRONCHOGENIC CYST PULMONARY SEQUESTRATION CYSTIC LYMPHANGIECTASY CONGENITAL PULMONARY AIRWAY MALFORMATION NEOPLASTIC LANGERHANS CELL HISTIOCYTOSIS LYMPHANGIOLEIOMYOMATOSIS

#### PDEE-49 Neonatal Subpial Hemorrhage: A Closer Look

Participants

Eman Marie, MSc, Hamilton, ON (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1- Understand the anatomy and physiology of the subpial space. 2- Describe causes of subpial hemorrhage in neonates. 3- Discuss the clinical presentation and the indications of imaging. 4- Identify the different imaging modalities used to identify and evaluate the subpial hemorrhage. 5- Discuss and exemplify the imaging features of subpial hemorrhage. 6- Classify the different types of subpial hemorrhage, comorbid conditions, and prognosis.

#### TABLE OF CONTENTS/OUTLINE

1- Embryology and early development of brain meninges with a focus on the pia mater. 2- Anatomy (gross and microscopic) and physiology of the subpial space. 3- Incidence and potential risk factors linked to subpial hemorrhage in neonates. 4- Imaging of neonatal subpial hemorrhage: US, CT and MRI findings, standard protocols and special considerations during neonatal brain imaging. 5- Diagnostic accuracy of each imaging modality and factors that may affect the accuracy of interpretation. 6- Pitfalls and differential diagnosis of subpial hemorrhage. 7- What the referring physician needs to know: diagnosis and extent of abnormalities. 8- Proposed imaging-based prognostication. 9- Neonatal subpial hemorrhage and abusive head trauma. 10- Management strategies of neonatal subpial hemorrhage and the role of imaging follow up. 11- Recent research and future directions on neonatal subpial hemorrhage.

#### PDEE-5 Pediatric Lung and Heart Evaluation: A Pictorial Review of Scintigraphy, Salivagram, and Cardiac Shunts

#### TEACHING POINTS

1. Lung scintigraphy is a useful tool for evaluating pulmonary function in children, with both perfusion and ventilation/perfusion scans providing valuable information about lung physiology. 2. In the context of congenital diaphragmatic hernia, scintigraphy can be used to predict inadequate lung development and assist with surgical planning. 3. When evaluating suspected pulmonary embolism in children, ventilation/perfusion scintigraphy can be a useful alternative to CT angiography. 4. Salivagram can be helpful in the context of concern for silent aspiration and GE reflux in neurologically impaired children.

#### TABLE OF CONTENTS/OUTLINE

Introduction 1. Pediatric Considerations 2. Image acquisition 3. Radiation dose Lung Scintigraphy in Children 1. Indications 2. Lung perfusion Scintigraphy 3. Ventilation/Perfusion scintigraphy 4. Technique in Lung Perfusion Scintigraphy Cardiac Imaging 1. Right to left shunting 2. Left to right shunting Lung Scintigraphy in the Context of Congenital Diaphragmatic Hernia 1. Ventilation/Perfusion in the prediction of inadequate lung development 2. Role of scintigraphy in predicting outcomes and surgical planning 3. Dynamic ventilation abnormalities and matched defects Pulmonary Embolism 1. Indications 2. Ventilation/Perfusion scintigraphy 3. Ventilation/Perfusion vs CT angiography Salivagram 1. Indications 2. Image technique and acquisition Conclusions

#### PDEE-50 Growing Pains: Navigating Pediatric Metabolic Bone Disorder

Participants

Ami Gokli, MD, (Presenter) Nothing to Disclose

#### TEACHING POINTS

- Discuss with illustrative examples the anatomy and physiology of normal bone growth in the pediatric population- Review common pediatric metabolic bone diseases including the pathophysiology and characteristic imaging features associated with these diseases using a multimodality approach- Describe clinical management, necessary details to include in radiologic reports, and the importance of radiologists role in these diseases

#### TABLE OF CONTENTS/OUTLINE

Overview:- Anatomy and physiology of pediatric bone growth/turnover including Identifying regions in the bone growth process particularly susceptible to disease Etiology:- Hereditary-Acquired (Nutritional deficiencies, Drug Treatments, etc) Pathology:- Diseases that can be discussed including discussion of pathophysiology with an image rich, multimodality approach; identify pathognomonic radiographic findings/tools that can aid in diagnosis Primary/Secondary osteoporosis, Osteogenesis imperfecta, Rickets, Skeletal dysplasias (Achondroplasia, cleidocranial dysplasia, achondroplasia), Albright hereditary osteodystrophy, (pseudohypoparathyroidism)/renal osteodystrophy, Fibrous dysplasia/McCune Albright syndrome, Juvenile Paget disease, Sclerosing bone disorders (osteoporosis, pyknodysostosis, osteopoikilosis, osteopathy striata, melorheostosis), Hypophosphatasia- Describe necessary details to include in radiologic reports Treatment/management:- Pediatric metabolic bone disorders require an extensive Team (endocrine, ortho, medical genetics, PM+R, physical/occupational therapy, pediatric radiology, nursing), detailed description of what is involved and the central role radiologists play Conclusion

#### PDEE-51 Imaging Findings and Management Strategies to Liver Masses in Children with Underlying Predispositions: A Review from the ACR Pediatric LI-RADS Working Group

Participants

Amy B. Kolbe, MD, Rochester, MN (Presenter) Nothing to Disclose

#### TEACHING POINTS

1. Review the imaging approach and differential diagnosis for liver masses in children with underlying genetic syndromes, congenital abnormalities, vascular abnormalities, and other conditions that predispose to liver lesions. 2. Illustrate the characteristic imaging findings of benign and malignant liver tumors in children with predisposing conditions. 3. Discuss the screening guidelines and management approach to liver masses encountered in the predisposed child.

#### TABLE OF CONTENTS/OUTLINE

Spectrum of pediatric liver tumors and pseudotumors in: 1. Genetic syndromes: Beckwith Wiedemann syndrome, familial adenomatous polyposis, progressive familial intrahepatic cholestasis, tuberous sclerosis, cystic fibrosis, glycogen storage disease, tyrosinemia, Wilson disease, hereditary hemochromatosis 2. Congenital abnormalities: Biliary atresia, Alagille syndrome, Abernethy malformation 3. Miscellaneous: Metabolic syndrome, Fontan associated liver disease, Budd Chiari syndrome For each entity we will discuss the underlying pathogenesis of liver disease, types of liver masses described with the entity, characteristic imaging findings of each liver mass, surveillance strategies, and key findings that warrant further intervention

#### PDEE-52 Fetal Magnetic Resonance Imaging Findings in Conjoined Twin Pregnancies

#### TEACHING POINTS

The learner will understand how to differentiate the various conjoined twin variants by their fetal MRI appearance. The learner will understand which features of conjoined twin shared anatomy predict survival and the potential for separation and how fetal MRI can be used in this assessment. The learner will review fetal MRI examples of additional congenital anomalies within the context of conjoined twinning.

#### TABLE OF CONTENTS/OUTLINE

Conjoined twins are a rare complication of monozygotic twinning. Fetal MRI can provide a detailed evaluation of these twins' shared anatomy and identify additional congenital anomalies, thereby allowing the fetal care team to anticipate the potential for survival and separation in these complex twin pairs. This exhibit will review the fetal MRI appearance of the different morphological variants of conjoined twins, including several unusual cases of minimally conjoined twins. Emphasis will be placed on those anatomical features most important for determining conjoined twin prognosis and potential for separation. Fetal MRI cases demonstrating additional important congenital anomalies within the context of conjoined twinning will be presented as part of a comprehensive fetal assessment.

#### PDEE-53 Sonographic Evaluation of the Umbilical Region in Children

Participants

Lizbet Perez-Marrero, Santiago De Chile, Chile (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

o To describe the normal sonographic appearance of the umbilicus and the midline structures of the anterior abdominal wall. To recognize ultrasound findings of the most common lesions of the umbilicus, including anomalies of the embryonic remnants.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Ultrasound protocol of the umbilical region and anterior abdominal wall. 3. Normal anatomy of the umbilicus and midline anterior abdominal wall 4. Umbilical lesions a. Umbilical granuloma b. Omphalitis b. Epidermal cyst c. Cutaneous ciliated cyst d. Tumors (hemangioma) e. Keloid f. Polyp g. Cutaneous umbilicus h. Umbilical hernia i. Paraumbilical hernia j. Epigastric hernia 5. Embryonal anomalies a. Umbilical vessels i. Omphaloarteritis ii. Omphalophlebitis iii. Thrombosis of umbilical vein varix b. Urachus: i. Urachal cyst ii. Infected urachal cyst iii. Urachal diverticulum iv. Urachal sinus v. Urachal fistula c. Omphalomesenteric duct i. Vitelline cyst ii. Persistent vitelline vessel iii. Meckel diverticulum iv. Omphalomesenteric fistula v. Omphalomesenteric fibrotic cord 6. Conclusions

#### PDEE-54 **Malignant Rhabdoids and Related Pediatric Tumors: A Multimodality Imaging Review and Pathologic Correlation**

Participants  
Apeksha Chaturvedi, MD, Rochester, NY (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Malignant rhabdoid tumors of childhood include malignant rhabdoid tumor of kidney (MRTK), extrarenal malignant rhabdoid (eMRT) and atypical rhabdoid-teratoid tumors (AT/RT); tumors are highly aggressive, carry a dismal prognosis and may develop in utero 2. "Rhabdoid" morphology on histology- large polygonal cells with eosinophilic cytoplasm, vesicular nuclei and central prominent nucleolus 3. Underlying SMARCB1 mutations, a gene encoding a core subunit of the SWI/SNF chromatin-remodeling complex 4. Imaging appearances overlap with those of other entities, with certain imaging features aiding distinction; eg. cerebellopontine angle involvement and intratumoral hemorrhage favor AT/RT over medulloblastoma 5. Rhabdoid tumor predisposition syndrome (RTPS) is characterized by proband with rhabdoid tumor and/or family history of rhabdoid tumors and/or multiple SMARCB1- and/or SMARCB1-deficient tumors (synchronous or metachronous) and a heterozygous germline variant in SMARCB1 or SMARCB1; imaging surveillance guidelines have been proposed

#### TABLE OF CONTENTS/OUTLINE

1. Spectrum of malignant rhabdoid and related SMARCB1-deficient neoplasms of childhood 2. Updated WHO classification (2021) for malignant rhabdoids and related pediatric tumors 3. Underlying SMARCB1 deficiency and mechanisms by which it drives rhabdoid tumor growth 4. Multimodality imaging manifestations of malignant rhabdoid tumors, with emphasis on PET-CT and PET-MR 5. Role of ultrasound and whole-body MRI in surveillance in patients with RTPS 6. Pathologic correlation

#### PDEE-55 **A Trainee's Guide to Neonatal Abdominal Radiographs**

#### TEACHING POINTS

1. Abdominal radiographs are an important tool to diagnose and screen acute intra-abdominal pathologies in the neonatal population. 2. The widespread availability and portable nature of radiographs make it ideal for the bedside evaluation of unstable neonates. 3. Knowledge of pathologies and their appearance on abdominal radiographs are crucial for timely and accurate diagnoses of life-threatening conditions and to guide further imaging and management.

#### TABLE OF CONTENTS/OUTLINE

1. Technique and views to obtain neonatal abdominal radiographs: Assessment of quality, tips for mobile exams, and use of shielding (ie. gonadal shielding and update on recommendations). 2. Review of lines and tubes on abdominal radiographs in neonates (ie. Umbilical artery and vein catheters, PICC, NG tube and port location). 3. Review of normal findings (ie. Expected gas pattern based on hours of life). 4. Do-not-miss findings: Pneumoperitoneum, pneumatosis, portovenous gas, bowel obstruction, pneumomediastinum/pneumothorax in the lung bases. 5. Review of acute pathologies and findings on abdominal radiographs (abnormal patterns): Necrotizing enterocolitis, congenital causes of bowel obstructions (upper/lower) (ie. Malrotation/volvulus, duodenal/jejunal atresia, Hirschsprung's disease, imperforate anus), gasless abdomen

#### PDEE-56 **From Head to Tail: Exploring Applications of Pediatric Neurological Ultrasound**

#### TEACHING POINTS

1. Ultrasound for neurological pathologies is a useful adjunct to conventional imaging (CT/MRI) as a screening and diagnostic tool in pediatric patients due to its universal availability and low cost. 2. Lack of ionizing radiation and IV contrast, and incomplete pediatric bone ossification and unfused fontanelle make ultrasound an excellent modality for evaluation of neurological pathologies in young patients. 3. Optimal ultrasound technique and understanding of the relevant pathophysiology of pediatric neurological conditions that can be assessed with ultrasound can significantly improve timely access to screening, diagnosis and patient care.

#### TABLE OF CONTENTS/OUTLINE

1. Brain ultrasound: Indication (ie. Premature screen, cooling therapy), Technique, Normal structures, variants and measurements (ie. ventricular index), Vascular assessment, Pathologies (ie. germinal matrix bleed, periventricular leukomalacia). 2. Transcranial doppler ultrasound: Indications (ie. Sickle cell disease), Technique, Vessel anatomy, Normal measurements, Abnormal findings and clinical significance. 3. Cranial sutures ultrasound: Indications (ie. Abnormal skull shape), Technique, Cranial suture anatomy, Normal findings (ie. fontanelles, suture closure), Craniosynostosis and clinical significance. 4. Spine ultrasound: Indication (ie. sacral dimple, suspected spinal dysraphism), Technique, Normal findings and anatomy, Pathologies (ie. low conus, thickened filum, myelomeningocele, intraspinal collections, masses).

#### PDEE-57 **US Evaluation with CT/MRI Correlation of Neonatal and Infantile Brain Tumors and Other Intracranial Masses**

Participants

Samantha Gerrie, MBChB, FRANZCR, Vancouver, BC (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

While some neonatal brain tumors are suspected on antenatal US imaging, most are diagnosed postnatally. Head US may be the first imaging modality for work-up of an intracranial mass which can present with non-specific clinical features. Most cases will require further imaging work-up, usually with MRI. Recognition of the US features of the most common neonatal and infantile intracranial masses and their complications can aid in appropriate and timely subspecialty referral. Objectives: 1. Discuss the US features of the most common neonatal and infantile intracranial masses. 2. Describe the correlation between antenatal US and fetal MRI and postnatal US and CT/MRI in the imaging work-up of these masses. 3. Explain the use of US to identify any associated complications which require urgent neurosurgical assessment.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Pseudomass 2a. Intraventricular hemorrhage 3. Non-neoplastic masses 3a. Arachnoid cyst 3b. Choroid fissure cyst 3c. Hypothalamic hamartoma 4. Supratentorial neoplasms 4a. Teratoma 4b. Low-grade glioma 4c. High-grade glioma 4d. Embryonal tumor with multilayered rosettes 4e. Choroid plexus tumors 4f. Osteochondrolipoma 5. Posterior fossa neoplasms 5a. Atypical teratoid/rhabdoid tumor 5b. High-grade glioma 6. Conclusion

#### PDEE-58 US Evaluation with Fetal MRI and CT/MRI Correlation of Pediatric Congenital and Inherited Brain Anomalies

Participants

Samantha Gerrie, MBChB, FRANZCR, Vancouver, BC (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. While many congenital and inherited brain anomalies are suspected from antenatal US and fetal MRI, postnatal head US may be the first imaging modality in the work-up of these heterogeneous anomalies 2. Most cases will require further imaging work-up with CT and/or MRI 3. Recognition of the US features of the most common of these lesions is important in order to direct appropriate additional imaging and timely subspecialty referral Objectives 1. Discuss the US features of the most common pediatric congenital and inherited brain anomalies 2. Describe the correlation between antenatal US and fetal MRI and postnatal US and CT/MRI 3. Explain the use of US to narrow the differential diagnosis and direct appropriate additional imaging work-up and management

#### TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Midline anomalies a. Agenesis of corpus callosum (ACC) b. Dysgenesis of corpus callosum variants i. Asymmetric ventriculomegaly, interhemispheric cyst and dysgenesis of corpus callosum (AVID) ii. Dysgenesis of corpus callosum with pericallosal lipoma c. Septo-optic dysplasia 3. Malformations of cortical development a. Periventricular nodular heterotopia b. Lissencephaly c. Hemimegalencephaly d. Tuberous sclerosis 4. Metabolic a. Ornithine transcarbamylase (OTC) deficiency 5. Brainstem and posterior fossa anomalies a. Diencephalic mesencephalic junction dysplasia b. Dandy-Walker malformation c. Joubert syndrome and related disorders (JSRD) d. Chiari 2 malformation secondary to myelomeningocele e. Arachnoid cyst f. Mega cisterna magna 6. Vascular anomalies a. COL4A1 mutation b. Vein of Galen malformation 7. Conclusion

#### PDEE-59 Differential Diagnosis of Hyperechoic Lesions on Neonatal Head US

Participants

Samantha Gerrie, MBChB, FRANZCR, Vancouver, BC (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. There are normal areas of increased echogenicity on neonatal head US which should not be mistaken for pathology, including choroid, midline vermiformis, hyperechoic caudate heads, periventricular white matter "halo", and white matter tracts including the corticospinal tracts 2. The differential diagnosis of hyperechoic lesions depends on their location 3. Many lesions can be confidently diagnosed and follow on US, while others require further imaging work-up to narrow the differential diagnosis and assist in ongoing management

#### TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Normal areas of increased echogenicity a. Choroid b. Midline vermiformis c. Hyperechoic caudate heads d. Mineralizing vasculopathy e. Periventricular white matter "halo" f. Transmantle speckled increased echogenicity g. Corticospinal tracts 3. Caudothalamic groove a. Grade 1 germinal matrix hemorrhage b. Grades 2 and 3 germinal matrix hemorrhage 4. Periventricular/deep white matter a. Periventricular hemorrhagic infarction b. White matter injury c. Deep medullary venous thrombosis d. Infection e.g. Citrobacter koseri e. ECMO-related hemorrhage f. Water-shed infarct g. Punctate foci of white matter injury 5. Diffuse white matter a. Arterial infarction b. Hypoxic-ischemic encephalopathy 6. Deep gray matter a. Central cerebral venous sinus thrombosis 7. Peripheral parenchyma a. Peripheral cerebral venous sinus thrombosis b. Vein of Labbé hemorrhagic venous infarction 8. Cerebellum a. Cerebellar hemorrhage 9. Extraaxial a. Subdural hemorrhage b. Extradural hemorrhage c. Subpial hemorrhage 10. Conclusion

#### PDEE-6 Pictorial Review of Pediatric Neuroimmune Disease

Participants

Alejandra Aguado, MD, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Neuroimmune diseases are a group of inflammatory disorders with varying pathogenic mechanisms, including autoantibodies against self-targets, cell-mediated, infection-triggered, paraneoplastic, and genetically determined diseases. This group continues to expand with the discovery of new clinicopathologic entities. Radiologists should be familiar with these diseases and able to make a differential diagnosis, as early diagnosis and appropriate treatment with immunotherapy can modify disease course in some cases. Additionally, different diseases within this group can present with varied evolution and prognosis. The main teaching points of this exhibit include: 1. Review of the most frequent entities within each group 2. Description of key imaging features that aid in differential diagnosis among different entities.

#### TABLE OF CONTENTS/OUTLINE

This exhibit presents a range of disease pathologies encountered in clinical practice, including: 1. Demyelinating diseases: a) Acute

disseminated encephalomyelitis (ADEM) b) Pediatric multiple sclerosis (MS) c) Neuromyelitis optica spectrum disorders (NMOSDs) d) Anti-MOG associated disease 2. AntiNMDAR encephalitis, including one triggered by herpes simplex virus encephalitis 3. Lupus erythematosus 4. Rasmussen encephalitis 5. Hemophagocytic lymphohistiocytosis.

#### **PDEE-60 Navigating the Fine Line of Pediatric Lines: A Primer on Pediatric Intravascular Catheters**

Participants

Narendra Shet, MD, (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

1. To review various reasons and approaches for vascular access in pediatric patients. 2. To discuss the role of the radiologist in assessment of pediatric vascular access. 3. To review optimal and suboptimal line placement in pediatric patients in a variety of clinical scenarios, including neonates and patients with congenital heart disease.

##### **TABLE OF CONTENTS/OUTLINE**

1. Overview of vascular access in pediatric patients - reasons for short and long term access and means of guidance (non-guided versus image-guided), and role of radiologist (for diagnostic radiologist, assessing adequacy of line position, and for interventional radiologist, line placement using means of image guidance). 2. Central lines in pediatric patients, including PICC, Non-PICC (IJ/Femoral), and long-term Access including hemodialysis catheters/tunneled central venous lines, as well as ports. 3. Neonatal specific catheters, including umbilical arterial and venous catheters. 4. Cardiac catheters, such as intra-cardiac catheters, ECMO cannulae, and ventricular assist devices. 5. Where relevant, photographs of support devices, either in vivo or ex vivo, will be included in figures to allow for comparison to radiographic appearance.

#### **PDEE-61 Imaging Evaluation of Pediatric Cystic Neck Masses**

Participants

Samantha Gerrie, MBChB, FRANZCR, Vancouver, BC (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

1. Pediatric neck masses are a common indication for imaging referral and US is often the first imaging modality in their work-up. 2. Following detection of a cystic neck mass on US, the radiologist must determine whether the lesion has a characteristic US appearance and requires no further imaging work-up or whether further imaging work-up is required. 3. Appropriate use of CT/MRI can aid in narrowing the differential diagnosis and assist in surgical planning. Objectives: 1. List the sonographic features of pediatric cystic neck masses which have a characteristic sonographic appearance and require no further imaging work-up 2. Recognize those lesions which require additional imaging work-up 3. Discuss the appropriate use of CT/MRI to aid in narrowing the differential diagnosis

##### **TABLE OF CONTENTS/OUTLINE**

1. Introduction 2. Congenital anomalies a. First branchial cleft anomalies b. Second branchial cleft anomalies c. Pyriform fossa sinus tract (PFST) lesions d. Dermoid cyst e. Lymphatic malformation f. Thyroglossal duct cyst 3. Inflammatory a. Ranula 4. Infectious a. Suppurative pyogenic lymphadenitis b. Non-tuberculous mycobacterial cervical lymphadenitis (MAIC) c. Retropharyngeal abscess 5. Neoplastic a. Teratoma 6. Conclusion

#### **PDEE-62 Twist and Turns: Comprehensive Radiological Review of Intestinal Malrotation and Midgut Volvulus**

##### **TEACHING POINTS**

1. Describe the imaging findings of intestinal malrotation and midgut volvulus in upper gastrointestinal (UGI) studies. 2. Discuss the utility of ultrasound (US) in intestinal malrotation and midgut volvulus. 3. Highlight the imaging pearls and pitfalls in cases of intestinal malrotation and midgut volvulus. 4. Illustrate different clinical presentations of malrotation and midgut volvulus through a variety of clinical cases.

##### **TABLE OF CONTENTS/OUTLINE**

1. Introduction: Describe the normal orientation and fetal development of the intestine. Highlight the importance of early detection and management of intestinal malrotation. 2. Pathophysiology of intestinal malrotation and midgut volvulus: Discuss the mechanism of midgut volvulus in intestinal malrotation along with clinical presentation and complications. 3. Upper GI studies: Review the standard views in UGI studies with emphasis on imaging landmarks to insure proper position and quality. Discuss the imaging pearls and pitfalls in diagnosing intestinal malrotation/midgut volvulus in UGI studies. 4. Other radiological modalities: Role of other imaging modalities in intestinal malrotation/midgut volvulus as a problem solver in challenging cases including US, computed tomography (CT) and lower GI studies. 5. Atypical cases of midgut volvulus: Examples of atypical cases of midgut volvulus including recurrent and chronic presentations. Use different cases as a teaching key points in diagnosis and management of midgut volvulus. 6. Conclusion: Summary of the radiological approach in intestinal malrotation and midgut volvulus.

#### **PDEE-63 Intestinal Ultrasound in Pediatric Inflammatory Bowel Disease: What Radiology Residents Should Know**

Participants

Paola Aguirre Camino, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

1) Become familiar with the correct performance of pediatric bowel ultrasound scan. 2) Propose a standardized ultrasound report. 3) Recognize the ultrasound appearance of the normal and pathological bowel pattern. 4) Learn the typical sonographic findings, evaluate the activity and assess the presence of possible complications in Inflammatory Bowel Disease.

##### **TABLE OF CONTENTS/OUTLINE**

Crohn's disease and ulcerative colitis are chronic inflammatory bowel diseases frequently diagnosed in childhood, being imaging methods fundamental in the diagnostic approach, severity assessment, treatment monitoring and in the suspicion of complications. Due to the need to frequently evaluate these children, intestinal ultrasound becomes especially important compared to colonoscopy and MRI, as it is a non-invasive technique, easy for the child to accept, accessible and repeatable; however, as it is an operator-

dependent examination, it requires certain experience and should be performed systematically using the appropriate technique. Intestinal ultrasound is a useful modality for intestinal bowel disease imaging and a valuable screening tool in the preliminary diagnostic workup of pediatric patients with suspected Inflammatory Bowel Disease. It assesses the presence of thickening of the intestinal wall as an indicator of inflammation, as well as the location and extent of the disease. It also allows evaluating the activity by quantifying the hyperemia of the intestinal wall using color Doppler, being a useful tool in the follow-up and control of the response to the treatment.

## **PDEE-64 Slipped Capital Femoral Epiphysis: Emphasis on Early Recognition and Potential Pitfalls**

### **TEACHING POINTS**

\* Slipped capital femoral epiphysis (SCFE) is the most common hip disorder in adolescence, however the diagnosis is often delayed or missed due to vague clinical presentation, subtle radiographic findings, and technical variability.\* Early detection of SCFE hinges on close scrutiny of physeal morphology with particular attention to the epiphyseal tubercle, an important stabilizer of the physis in children.\* An AP and frog-lateral view of the pelvis including both hips is the mainstay of radiographic assessment of SCFE, and failure to diagnose SCFE is often a product of improper technique.\* Cross-sectional imaging is not routinely performed in SCFE patients, but can be helpful to identify radiographically occult early slips, assess femoral head perfusion, and better understand anatomy for surgical planning purposes.

### **TABLE OF CONTENTS/OUTLINE**

\* Learning objectives\* Background including rationale for focus on SCFE, definition and epidemiology, pathophysiology and histology, and clinical findings and classification\* Early physeal changes in SCFE, introduction of the epiphyseal tubercle and rotational microinstability, and illustration of the peritubercle lucency on radiographs\* Later radiographic findings and severity grading on frontal and frog-lateral radiographs\* Technical pitfalls on radiography with emphasis on the importance of imaging both hips on all views\* Role of cross-sectional imaging including MRI for early slips, prognostic relevance of femoral head perfusion, and use of CT or Zero-TE MRI to assess callus preoperatively

## **PDEE-65 Imaging Approach to Pediatric Neurometabolic Imaging**

Participants

Samantha Gerrie, MBChB, FRANZCR, Vancouver, BC (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

1. Describe the most commonly used classification systems for pediatric neurometabolic diseases 2. Discuss the clinical features and imaging patterns which aid in narrowing the differential diagnosis in the work-up of pediatric neurometabolic diseases 3. Illustrate the MR features of the most common pediatric neurometabolic diseases, including the MR spectra suggestive of specific disorders

### **TABLE OF CONTENTS/OUTLINE**

1. Introduction 2. Classification systems a. Organelle dysfunction i. Mitochondrial disorders ii. Lysosomal storage disorders iii. Peroxisomal biosynthesis disorders b. Laboratory markers i. Lactate ii. Ammonia iii. Inborn errors of metabolism c. Presentation i. Neonatal metabolic encephalopathy ii. Head size d. Imaging pattern i. Deep gray matter involvement - striatum, globus pallidus, hyperdense thalami ii. White matter involvement - subcortical U-fibres, central white matter, anterior vs posterior iii. Hypomyelination disorders iv. MR spectroscopy suggestive of specific diseases v. Enhancement pattern 3. 16 "must know" imaging patterns suggestive of a specific neurometabolic disease: a. Maple syrup urine disease b. Canavan disease c. Alexander disease d. X-linked adrenoleucodystrophy e. Metachromatic leucodystrophy f. Pelizaeus-Merzbacher disease g. Mitochondrial encephalopathy with lactic acidosis and stroke-like episodes h. Non-ketotic hyperglycinemia i. Zellweger syndrome j. Mucopolysaccharidosis k. Leigh syndrome l. Panthothenate kinase-associated neurodegeneration m. Creatine kinase deficiency n. Megaloencephalic leucodystrophy with subcortical cysts o. Vigabatrin-related changes p. Methotrexate-related changes 4. Future directions 5. Conclusion

## **PDEE-66 Newborn Skeletal Radiographs: A Practical Guide**

Participants

Marcelo Takahashi, MD, PhD, (*Presenter*) Speaker, Vertex Pharmaceuticals Incorporated

### **TEACHING POINTS**

Neonatal skeletal abnormalities are rare occurrences in pediatric practice with a wide variety of causes and often overlapping radiographic features. The main teaching points of this exhibit are: 1) Illustrate the expected normal plain film appearance of the neonatal bone, including and what the most common pitfalls, regarding both normal development as well as technical imaging aspects. 2) Explain specific diseases radiographic findings with key clinical and epidemiological considerations 3) Illustrate the different imaging patterns with differential diagnosis checklist and explanation for each one

### **TABLE OF CONTENTS/OUTLINE**

&5; &5; Normal newborn particularities and pitfalls&5; Normal Anatomy&5; Physiologic Neonatal Periostitis&5; &5; Trauma:&5; Delivery related fractures&5; Non accidental trauma&5; &5; Diffuse bone disease:&5; Rickets&5; Metabolic Bone Disease of Prematurity&5; Caffey Disease&5; Osteopetrosis&5; &5; Congenital abnormalities and malformations&5; Amniotic band syndrome&5; Hemimelia&5; Proximal Femoral Focal Deficiencies&5; Spine malformations&5; Chondrodysplasia punctata&5; Developmental Dysplasia of the Hip&5; &5; Infections:&5; Congenital Syphilis&5; Neonatal osteomyelitis

## **PDEE-67 Entering a New Dimension: Novel Use of Transabdominal 3D Ultrasound in Pediatric Gynecology**

### **TEACHING POINTS**

3D transvaginal pelvic ultrasound is a well-established imaging technique in the adult population for gynecologic applications. However, transvaginal ultrasound is not commonly utilized in the pediatric population. There are only sparse reports in the literature on the use of 3D transabdominal pelvic ultrasound in the pediatric population for gynecologic applications. In this educational exhibit, we will share our experience with 3D transabdominal pelvic ultrasound in the pediatric population, particularly for the evaluation of Mullerian duct anomalies and IUD positioning. We will begin with a review of scan technique and post-processing. Instructions for creation of a simple homemade ultrasound phantom for practicing these techniques will also be reviewed. We will then share several illustrative cases where 3D ultrasound provided useful information beyond standard 2D imaging in the assessment

of Mullerian duct anomalies and IUD positioning. The challenges and limitations to this technique will also be discussed.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Review of scan technique and post-processing 3. Homemade ultrasound phantom: instructions and utility 4. Example cases of Mullerian duct anomalies 5. Example cases of IUD positioning

#### PDEE-68 Ultra Low Dose Fetal CT: A Simple Way to Understand the Various Exposure Doses to the Fetus

##### TEACHING POINTS

(1) When skeletal dysplasia is suspected by fetal ultrasound, it is often difficult to make an accurate prenatal diagnosis using ultrasound alone. (2) In such case, fetal skeletal CT is recommended because it has diagnostic power comparable to postnatal bone survey, but the only drawback is fetal radiation exposure. For this reason, we have devised Ultra low dose fetal CT (ULDFCT) from the viewpoint of ALARA. (3) On the other hand, estimating fetal radiation dose involves complex calculations, and methods that are easily understood by pediatric radiologists and CT technicians are needed. (4) This exhibition introduces a method to insufflate the exposure dose of the fetus and maternal body by simple calculation using the CT dose index (CTDI), which is available immediately before and after scanning.

#### TABLE OF CONTENTS/OUTLINE

A. Data acquisition (n=36); Patients with ULDFCT throughout of 2014 to 2021. CTDIvol : mean 0.48mGy, DLP : mean 18.62mGy.cm. These are the lowest exposure doses in fetal CT scans in the literature search. B. Estimation of various exposure doses of the fetus Fetal dose: mean; 0.36mGy. Fetal dose = CTDIvol x 0.8 mGy Organ dose of uterus; mean 0.58mGy. Organ dose of uterus = CTDIvol x 1.2; SSDE; mean: 0.57mGy, SSDE= = CTDIvol x 1.18 Effective dose (ED) of maternal body; 0.39mSv. ED = CTDIvol x 0.81

#### PDEE-69 Neonatal Chest X-ray: How to Spot Abnormal Gas Patterns and Potential Pitfalls

Participants

Marta Sanmartin Lopez, MD, Santiago De Compostela, Spain (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

1. Review the main projections and technical guidelines of neonatal chest radiography. 2. Review the systematic analysis of chest X-rays performed in neonates. 3. Emphasize some normal findings that differ from X-rays performed in older children and adults. 4. Analyze the typical radiological signs of pneumothorax, pneumomediastinum, pneumopericardium and pneumoperitoneum, and provide some practical examples that may help to differentiate pathology from potential pitfalls and mimics.

#### TABLE OF CONTENTS/OUTLINE

1. Analysis of neonatal chest X-ray a) Radiographic technique b) Systematic interpretation of neonatal chest X-ray. 2. Abnormal gas patterns a) Pneumothorax b) Pneumomediastinum c) Pneumopericardium d) Pneumoperitoneum

#### PDEE-7 Going with the Flow: Implementing a 4D Flow MRI Program at a Children's Hospital

##### TEACHING POINTS

Four-dimensional flow MRI (4D flow) is a three dimensional spatial and velocity encoded phase contrast sequence that has emerged as a versatile imaging technique for qualitative as well as quantitative characterization of cardiovascular flow. The benefits of 4D flow include an easily prescribed volumetric acquisition with the ability to retrospectively quantify flow in any plane, in the acquired field of view. In the past, long scan times and complex post-processing workflows hindered 4D flow adoption into routine clinical practice for cardiovascular velocity and flow assessment, but improvements in image acquisition and processing have enabled standard clinical workflows. Additionally, there are unique in-vivo flow investigative parameters that provide newer insights into understanding cardiovascular physiology and pathophysiology. Our purpose is to: 1. Explain the utility of 4D flow. 2. Describe 4D flow acquisition parameters designed for imaging children with various congenital or acquired cardiovascular diseases. 3. Demonstrate a streamlined clinical 4D flow post-processing workflow. 4. Discuss research 4D flow applications.

#### TABLE OF CONTENTS/OUTLINE

1. General overview of 4D flow and key applications in the pediatric setting 2. Advantages of 4D flow over 2D phase contrast imaging 3. Image acquisition and post-processing using clinical cases (i) 9-years-old male with Fontan (ii) 19-years-old female with Bicuspid Aortic Valve 4. Research utility of 4D flow and future directions

#### PDEE-70 Acute Upper Airway Obstruction in the Pediatric Population: What's Behind the Stridor

Participants

Nahia Lizarraga Oroz, MD, Donostia, Spain (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

- Review the anatomic features of the pediatric airway. - Establish a systematic approach to radiographic evaluation. - Identify the key radiographic findings of common causes of acute upper airway obstruction through cases studied in our center.

#### TABLE OF CONTENTS/OUTLINE

Acute upper airway obstruction is more common in the pediatric population due to its various anatomical and physiological peculiarities. Several causes of airway obstruction have been described, such as foreign body obstruction, infection, neoplasm, congenital or vascular entities. Since the clinical presentation is often nonspecific and the evaluation of pediatric patients in the emergency setting is complicated, imaging techniques play a critical role in achieving an accurate diagnosis. The aim of this review is to evaluate the specific radiologic features that can be found in the different imaging modalities, with special emphasis on plain radiography, which is often sufficient to reach a correct diagnosis. As acute airway obstruction can be a life-threatening condition, it is essential that the radiologist recognizes the key imaging findings in order to ensure prompt management.

## **PDEE-71 What Every Radiologist Should Know About Cranial Ultrasound: A Systematic Approach and Common Pathologies**

Participants

Nahia Lizarraga Oroz, MD, Donostia, Spain (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

- Define the technical procedure of standard cranial ultrasound (CUS) and review the normal anatomic structures of the brain. - Identify the spectrum of pathologies seen in clinical practice. - Highlight some tips and tricks for diagnosis.

### **TABLE OF CONTENTS/OUTLINE**

CUS is an extremely valuable tool for evaluating the brain in the first year of life and has become an essential part of routine pediatric radiology practice. It is an accessible, portable, inexpensive, and safe technique that can be used as often as needed. Because of its great advantages, it is imperative for the radiologist to know how to perform CUS and correctly interpret the findings. This review attempts to establish the clinical indications, define a systematic technique to adequately visualize and document all relevant intracranial structures, and highlight the most common pathologies seen in neonates, including - Hypoxic-ischemic encephalopathy in preterm infants (germinal matrix hemorrhage, cerebellar hemorrhage, and periventricular leukomalacia) - Hypoxic-ischemic encephalopathy in term patients - Cerebrovascular disease - Trauma-associated hematomas - Macrocephaly However, the usefulness of CUS is still highly dependent on the skill, knowledge and experience of the observer.

## **PDEE-73 Congenital Anomalies of the Posterior Fossa - An Imaging Travelogue**

Participants

Shivaprakash Hiremath, DMRD,FRCR, Toronto, ON (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

This educational exhibit aims to: 1. Review the embryology and cross-sectional imaging anatomy of the posterior fossa. 2. Describe typical congenital malformations based on predominant cerebellar involvement, cerebellar and brainstem involvement, and predominant brainstem involvement.

### **TABLE OF CONTENTS/OUTLINE**

- Describe the embryology and anatomical assessment of the posterior fossa along with diffusion tensor imaging.
- Depict the imaging findings in malformations predominantly affecting the cerebellum including cerebellar hypoplasia, hyperplasia and dysplasia (Chudley-mccullough syndrome, and Poretti-Bolthausen syndrome).
- Highlight the malformations affecting the cerebellum and brainstem such as alpha dystroglycanopathies, tubulinopathy, molar tooth malformations, and pontocerebellar hypoplasia.
- Illustrate the malformations predominantly affecting the brainstem such as pontine tegmental cap dysplasia, horizontal gaze palsy with progressive scoliosis, and diencephalic-mesencephalic junction dysplasia along with malformations with no known genetic cause such as Rhombencephalosynapsis, PHACE syndrome, and oculocerebrocutaneous syndrome.

## **PDEE-74 Imaging in Pediatric Neuroinflammatory Disorders and Mimics**

Participants

Shivaprakash Hiremath, DMRD,FRCR, Toronto, ON (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

This educational exhibit aims to: 1. Review the basic concepts of neuroinflammatory disorders in childhood 2. Describe the imaging manifestations of Myelin Oligodendrocyte Glycoprotein antibody-associated disease (MOGAD) in different age groups 3. Illustrate both common and uncommon findings in Neuromyelitis Optica Spectrum Disorder (NMOSD) and Multiple Sclerosis in the pediatric age range 4. Illustrate mimics of these entities based on imaging phenotypes encompassing pathologies that target the optic nerves, deep grey nuclei, white matter, and spinal cord.

### **TABLE OF CONTENTS/OUTLINE**

- Review the pathophysiological basis of pediatric neuroinflammatory diseases.
- Illustrate the common and uncommon imaging manifestations in myelin oligodendrocyte glycoprotein antibody-associated disease (MOGAD) including acute disseminated encephalomyelitis (ADEM)-like phenotype, encephalitis-like phenotype, and leukodystrophy like phenotype.
- Depict common and uncommon findings in AQP4-associated neuromyelitis optica spectrum disorder (NMOSD), and Multiple Sclerosis (MS) including tumefactive demyelinating lesions.
- Provide localization related illustrations of mimics of demyelinating diseases including infectious, inflammatory, and metabolic disorders along with tumors that mimic demyelinating diseases.

## **PDEE-75 Mastering Neck Ultrasound in Pediatric Patients**

Participants

Mikel Elgezabal, MD, Barrika, Spain (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

1. Neck anatomy from the ultrasound perspective: key structures and sonographic landmarks. 2. Ultrasound protocol focusing on children's peculiarities. 3. Clinical and US findings of common and not-so-common pediatric neck entities. 4. Radiologic approach to a neck lump in a child.

### **TABLE OF CONTENTS/OUTLINE**

1. US technique for the pediatric neck 1.1. Technical recommendations 1.2. Anatomy: spaces of the head and neck and landmarks from the US perspective. 1.3. Basic US protocol and further tricks to get to more unusual locations (palatine tonsils, vocal cords). 2. Pathology of the pediatric neck 2.1. Lymph nodes: Anatomy, node levels. Pathology: reactive, suppurative, malignant. Tips: malignant vs. benign. 2.2. Thyroid: dysgenesias, nodes, thyroiditis. 2.3. Vascular anomalies: tumors, malformations and subtypes. 2.4. Salivary glands: parotitis, submaxillitis, ranula of the sublingual gland. 2.5. Cysts: thyroglossal duct, branchial cleft, dermoid, epidermoid. 2.6. Fibromatosis colli. 2.7. Cervical thymus. 2.8. Soft tissue tumours: sarcoma, schwannoma, neuroblastoma. 2.9. Pilomatricoma. 3. Summary: approach to a neck lump in a child. 4. Take home points

## **PDEE-76 Keeping it Straight: A Guide to Pediatric Renal Neoplasms**

Participants

Hassan Aboughalia, MD, Washington, WA (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

1. Ultrasound is the first-line imaging modality for suspected abdominal masses, followed by contrast-enhanced CT or MRI renal mass protocol. 2. When a renal tumor is suspected, the patient's age, imaging characteristics, distribution of metastases, and co-morbid conditions are the most important factors to consider. 3. Synchronous ipsilateral and contralateral renal lesions, metastatic disease, lymphadenopathy, invasion of the renal vein/IVC, and signs of tumor rupture are essential features to be evaluated. 4. Suprarenal pathologies can mimic a renal tumor such as neuroblastoma.

### **TABLE OF CONTENTS/OUTLINE**

1. Imaging approach to a patient with a suspected renal tumor, emphasizing optimal imaging techniques 2. Solid renal neoplasms, including mesoblastic nephroma, nephrogenic rests, Wilms tumor, rhabdoid tumor, clear cell sarcoma, angiomyolipoma, renal cell carcinoma, lymphoma, and metastases. 3. Cystic renal neoplasms, including cystic nephroma, cystic partially differentiated neuroblastoma, and cystic Wilms tumor. 4. Mimics of renal neoplasms, including hypertrophied column of Bertin, focal pyelonephritis and abscess, infarct, granulomatous diseases, suprarenal pathologies, and cystic renal diseases. 5. Diagram slide of pediatric renal neoplasms underscoring key factors differentiating these entities.

## **PDEE-77 Craniovertebral Junction Instability, Fixation and Stenosis in Children**

Participants

Stephen B. Little, MD, Atlanta, GA (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

1. Radiographs of the cervical spine are often inadequate or falsely reassuring in children with torticollis. A high-risk mechanism of injury or high clinical suspicion should prompt further evaluation with CT or MRI. 2. Early recognition and treatment of atlantoaxial rotatory fixation (AARF) is essential to limit morbidity. 3. AARF may be neither purely atlantoaxial, merely rotatory, nor completely fixed. 4. Significant lateral inclination of C1, facet deformity, new bone and multi-ligament insufficiency are associated with irreducible AARF. 5. An increased atlantodental interval (ADI) is a poor indicator of symptomatic atlantoaxial instability in children with trisomy 21. Furthermore, a normal ADI does not exclude craniovertebral junction instability. 6. Symptomatic CVJ instability in children with trisomy 21 is more frequent in those with associated osseous anomalies, particularly os odontoideum. 7. Osseous anomalies in children with CVJ instability include assimilation of the atlas, split atlas, odontoid hypoplasia or aplasia, os odontoideum, and Klippel-Feil syndrome. 8. A variety of skeletal dysplasias are associated with CVJ instability or stenosis. 9. Narrow C2 pedicles increase the risk of vertebral artery groove violation with pedicle screw placement, possibly producing devastating neurovascular consequences.

### **TABLE OF CONTENTS/OUTLINE**

1. Osseous and ligamentous anatomy 2. Key morphometry 3. Rotatory dynamics 4. Atlantoaxial rotatory fixation 5. Trisomy 21 and CVJ instability 6. Osseous anomalies and CVJ instability 7. Skeletal dysplasias 8. Surgical considerations

## **PDEE-78 Pediatric Dural Arteriovenous Fistulas: An Unusual Connection**

### **TEACHING POINTS**

Dural arteriovenous fistulas (DAVFs) are vascular abnormalities in which a meningeal artery drains directly into a meningeal vein or dural venous sinus. DAVFs are rare in children, accounting for around 10% of all intracranial shunts in the pediatric population. The transverse-sigmoid, superior sagittal sinus, and torcular herophili are commonly involved fistula sites in pediatric DAVFs. Pediatric DAVFs can be classified into three types: dural sinus malformations, infantile/juvenile-type dural shunts, or adult-type dural shunts. Younger children with DAVFs tend to present with cardiopulmonary symptoms (congestive heart failure and/or respiratory distress), while older children present with neurological symptoms (headaches, intracranial hemorrhage, focal deficits). The primary treatment for DAVFs is endovascular embolization, commonly with microcoils or liquid adhesives. Challenges in the endovascular treatment of DAVFs include high-flow fistulas, tortuous intracranial feeding arteries, and small femoral artery access sites.

### **TABLE OF CONTENTS/OUTLINE**

- Review neurovascular anatomy relevant to dural arteriovenous fistulas (DAVFs).  
- Recognize DAVFs in the pediatric population using a case-based approach.  
- Review the multimodal imaging appearance of pediatric DAVFs.  
- Understand the treatment of pediatric DAVFs and the application of neurovascular interventional techniques.  
- Discuss the complications and challenges in the treatment of pediatric DAVFs.

## **PDEE-79 Pediatric Coronary Artery Anomalies**

Participants

Maria Navallas, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

1. Recognize the anatomic variations of coronary origin and course. 2. Understand the high risk imaging features in anomalous aortic origin of the coronary arteries. 3. Discuss acquired and post surgical anomalies of the coronary arteries.

### **TABLE OF CONTENTS/OUTLINE**

1. Introduction 2. Cardiac CT technique 2.1. Type of scanner 2.2. Patient preparation 2.3. Electrocardiogram gating 2.4. Contrast administration 3. Classification of congenital coronary artery anomalies 3.1. Anomalies of origin/course- High take-off- Single coronary artery- ALCAPA/ASCAPA- Origin of coronary artery or branch from opposite or noncoronary sinus and anomalous course: Retroaortic, interarterial, prepulmonic, septal (subpulmonic) 3.2. Anomalies of intrinsic coronary anatomy: Myocardial bridging 3.3. Anomalies of coronary termination: Coronary artery fistula 4. High risk imaging features and risk of sudden death 5. Acquired coronary artery abnormalities: 5.1. Kawasaki disease 5.2. Multisystem inflammatory syndrome in children associated with COVID-19 5.3. Postsurgical anomalies 6. Conclusion

## **PDEE-8 Picture Perfect: A Pictorial Review of Nuclear Medicine in Gastrointestinal and Hepatobiliary Disorders**

### **TEACHING POINTS**

1. Esophageal motility study is a useful tool for evaluating esophageal function, with the test providing valuable information about swallowing mechanics and esophageal peristalsis. 2. Gastric emptying study is commonly used to evaluate delayed gastric emptying, with the test providing valuable information about gastric function and potential causes of vomiting and other symptoms. 3. Hepatobiliary scintigraphy can be used to evaluate neonatal jaundice and to diagnose or rule out biliary atresia, a rare but serious liver condition that can lead to liver failure if left untreated. 4. Colonic scintigraphy is a useful tool for evaluating colon transit time and identifying potential causes of constipation or diarrhea. 5. Heterotaxy syndrome is a rare and complex condition that affects the development of organs in the body. Nuclear medicine imaging can be used to evaluate the function of the liver and other organs in children with this condition. 6. Nuclear medicine imaging can be used to diagnose Meckel's diverticulum and evaluate its function in the gastrointestinal tract.

### **TABLE OF CONTENTS/OUTLINE**

Introduction 1. Image acquisition 2. Radiation dose Esophageal Motility Study 1. Motility disorders 2. Repaired Esophageal Atresia 3. Trauma 4. Achalasia 5. Technique Gastric Emptying Study 1. Image acquisition and techniques 2. Early Satiety 3. Gastroesophageal reflux Hepatobiliary Scintigraphy 1. Neonatal Jaundice 2. Biliary Atresia Colonic Scintigraphy 1. Colon Transit Technique 2. Chronic Constipation 3. Hirschsprung disease 4. Tethered cord 5. Chronic diarrhea 6. Angiotensin converting enzyme patients Others 1. Heterotaxy Syndrome 2. Meckel's Diverticulum Conclusions

## **PDEE-80 Transcranial Doppler Ultrasound in Children with Sickle Cell Disease: All What You Have to Know**

Participants

Joseph Abi Ghanem, Beirut, Lebanon (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

1- Sickle cell disease (SCD) has an incidence of 4/10000 births. It is characterized by a chronic proinflammatory state, prothrombotic state and increased aggregation of red blood cells (RBC). Children with the SCD HbSS and HbSBthal0 phenotypes have a 200-fold increased risk of stroke compared to healthy children. 2- Radiologists play a major role in treatment decision plan as Transcranial Doppler ultrasound (TCD) is the only radiologic test of choice to detect SCD children at higher risk for stroke. 3- The stroke prevention trial in sickle cell anemia (STOP) and The Silent Cerebral Infarct Transfusion (SIT) multicentric trial are pivotal studies demonstrating the benefit of chronic transfusion program based on screening with TCD velocities to prevent symptomatic and silent ischemia in SCD children between 2 and 16 years. 4- The tracings on the TCD reflect, the size of the artery, type of flow and flow velocities related to rheologic and hemodynamic factors.

### **TABLE OF CONTENTS/OUTLINE**

1- Introduction of the STOP and SIT trials. 2- Indications and recommendations on when and how to perform TCD. 3- How to interpret Doppler tracing on TCD. 4- Case based presentation of threshold velocities for a conditional and an abnormal TCD. 5- Quantitative ultrasound for RBC aggregation estimation as potential new test to decrease the number needed to treat and avoid unnecessary transfusion.

## **PDEE-81 Dermatologic Ultrasound in Children: Benign and Pseudo-Tumoral Lesions**

Participants

Luis Tierradentro-Garcia, MD, Philadelphia, PA (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

- 1. To overview the current applications of dermatologic ultrasound in children. - 2. To illustrate the utility of ultrasound to differentiate benign and pseudo-tumoral dermatologic lesions in children. - 3. To describe the role of conventional and advanced ultrasound as a complementary tool to CT and MRI in making diagnoses and assisting in surgical planning.

### **TABLE OF CONTENTS/OUTLINE**

1. Background: Skin lesions in children are common, most lesions are benign. Clinical findings can be non-specific. 2. Technical aspects: - Image acquisition is non-invasive and harmless. - Frequency > 15 MHz. - Protocol: grayscale, Color Doppler, Pulsed-wave Doppler, microvascular flow imaging. - Normal sonographic appearance of the skin layers. 3. Pseudo-tumoral lesions 3.1 Cystic lesions - Epidermal inclusion cyst. - Trichilemmal cyst. - Dermoid cyst. - Cutaneous bronchogenic cyst. 3.2 Pilomatricoma 3.3 Dermatofibroma 3.4 Neurofibroma 3.5 Lipoma 4. Inflammatory lesions 4.1 Warts 4.2 Foreign body 4.3 Morphea 4.4 Insect bite 4.5 Kerion celsi 4.6 Juvenile xanthogranuloma 4.7 Congenital aplasia cutis 4.8 Annular granuloma 4.9 Keloid 5. Differential diagnosis 6. Take Home points

## **PDEE-82 Pediatric Magnetic Resonance Neurography: Technical Considerations, Indications, and Findings**

### **TEACHING POINTS**

1) Review technical considerations and imaging challenges of pediatric patients referred for magnetic resonance (MR) neurography. 2) Discuss the most common indications and anatomic regions referred for MR Neurography. 3) Illustrate typical imaging findings, their clinical correlation, and management strategies.

### **TABLE OF CONTENTS/OUTLINE**

1) Technical aspects of MR Neurography (3.0 T, conformable phased-array coils) and unique challenges of the pediatric population (e.g. SNR limitations due to small body habitus and size of peripheral nerves, sedation, motion artifact, flexion contracture (developmental or posttraumatic)). 2) Demographics and characteristics of a pediatric database at a tertiary orthopedic referral center 3) Imaging examples of both traumatic (e.g. median nerve entrapment following elbow fracture, drop foot post knee dislocation) and atraumatic (Charcot-Marie-Tooth, neurofibromatosis, limb hemihypoplasia) peripheral neuropathies and their clinical management 4) Strengths and weaknesses of MR Neurography for assessing pediatric patients, role of ultrasound, and discussion of future directions in this field

## **PDEE-83 Acute Pediatric Elbow Trauma - Adding the Orthopedist's Perspective to Imaging Interpretation**

## TEACHING POINTS

1. Knowledge of the specific developmental sequence of pediatric elbow apophyses is key to accurate interpretation of pediatric elbow trauma. 2. Knowledge of pitfalls is important, e.g., normal developmental irregularity of the apophyses can be mistaken for trauma. 3. In younger children, assessment of apophyseal avulsion/displacement on radiographs may be difficult due to incomplete ossification; MR may be necessary for more complete evaluation. 4. Chondroepiphyseal separation/ transphyseal fracture of the distal humerus is a rare manifestation of mechanical birth related trauma of the newborn and may be difficult to diagnose on radiographs. Ultrasound and MRI may aid in further assessment. 5. Optimal orthopedic management of pediatric patients with elbow trauma is hinged on accurate imaging interpretation. Radiology reports should include entity-specific information that will benefit patient management. For example, a radial neck fracture is a sentinel fracture, often accompanied by additional fractures. Post reduction of elbow dislocation, the developing medial epicondyle can be entrapped in joint. A nursemaid's elbow may not manifest any imaging abnormalities.

## TABLE OF CONTENTS/OUTLINE

1. Embryology and normal developmental anatomy of the elbow. 2. Radiographic views used for elbow trauma and technique of acquisition. 3. Role of MRI and CT acquisition parameters. 4. Imaging manifestations of pediatric elbow trauma. 5. Entity-specific additional information to be included in radiology reports that aid in orthopedic management. 6. Complications and mimics of acute elbow trauma. 7. Imaging spectrum of chronic overuse injuries of the developing elbow.

## PDEE-84 Masqueraders of Clarity - Tumor Mimics in Pediatric Oncology

Participants

Manisha Jana, MD, FRCR, New Delhi, India (*Presenter*) Nothing to Disclose

## TEACHING POINTS

Pitfalls in oncologic imaging are inflammatory, infective and vascular disorders which mimic tumors. Post-treatment changes and complications must be differentiated from residual or recurrent disease. Problem-solving tools include a multimodality approach, functional imaging and serial follow-up.

## TABLE OF CONTENTS/OUTLINE

Non-neoplastic entities that mimic tumors lead to diagnostic confusion and delay appropriate therapy. In a patient with focal neurologic deficit or seizures, the cause may be demyelination, sarcoidosis or infections such as fungal, parasitic, tuberculosis and neurocysticercosis. Bone tumors are commonly mistaken in the setting of osteomyelitis, bone cysts, fracture, scurvy and osteogenesis imperfecta. Clinical context and plain radiographs must be correlated with MRI. Intrapulmonary nodes or granuloma mimic lung metastases. Abscesses, focal steatosis, cysts and arterioportal shunting are tumor mimics in the liver. Infarcts, cysts and perfusion abnormalities mimic tumors in the spleen, while adrenal hemorrhage can be mistaken for an adrenal mass. A hypertrophied column of Bertin, sludge and stones in the renal collecting system can mimic a renal mass - CEUS can help in the distinction. In a known cancer patient, radiotherapy-induced organ injury, post-chemotherapy infections, bone marrow changes and thymic rebound hyperplasia are common. Diffusion-weighted imaging and dynamic contrast-enhanced MRI can help in problem-solving.

## PDEE-85 Don't Ovary-act: A Sonographic Approach to Benign Pediatric Ovarian Pathology

Participants

Fatemeh Hadian, MBChB, FRCR, Toronto, ON (*Presenter*) Nothing to Disclose

## TEACHING POINTS

1. A multi-follicular appearance is normal in neonates and teenagers and can be seen in prepubertal children. 2. Doppler flow may still be present in a twisted ovary and should not preclude making a diagnosis of torsion. 3. Benign ovarian lesions include ovarian cysts, para-ovarian cysts, mature cystic teratomas, cystadenomas and benign sex cord stromal tumors. 4. Diagnosing polycystic ovaries in adolescent females is challenging, but at-risk females can be identified for assessment at reproductive maturity. 5. Clinical history is crucial in differentiating between ovarian lesions with similar sonographic characteristics.

## TABLE OF CONTENTS/OUTLINE

Introduction - Normal ovaries, ovarian development, ovum development  
Acute ovarian pathology - ovarian torsion, antenatal ovarian torsion, canal of Nuck hernia, tubo-ovarian abscess  
Benign ovarian lesions  
Ovarian cysts - neonatal cysts, physiological and functional cysts, para-ovarian cysts  
Benign cystic tumors - mature cystic teratoma, cystadenoma  
Other benign ovarian tumors - benign subtypes of sex cord stromal tumors, gonadoblastoma  
Key points in differentiating benign vs malignant ovarian lesions  
Special considerations in adolescents - polycystic ovaries, endometriosis  
Role of O-RADS in children  
Conclusion

## PDEE-86 Imaging Approach for Pediatric Thyroid Diseases

Participants

Yuko Tsujioka, PhD, Tokyo, Japan (*Presenter*) Nothing to Disclose

## TEACHING POINTS

Pediatric thyroid diseases have unique problems not seen in adult diseases. For example, congenital hypothyroidism is a common disorder that is usually detected on neonatal screening, but if missed, it causes serious intellectual disabilities. Juvenile thyroid dysfunction often manifest with non-specific symptoms (e.g., personality changes, declined school performance, weight fluctuation, decreased growth velocity), and may be fraught with diagnostic errors. Diagnostic imaging can be used to determine the underlying etiologies of endocrine thyroid diseases and provide supplementary information for thyroid hormone replacement therapy and antithyroid medication as well as to aid in the diagnosis of focal thyroid diseases, i.e., severity and extent of thyroid tumors and inflammatory diseases. In this educational exhibit, learners understand 1) the etiology, clinical features, and imaging findings in common pediatric thyroid diseases, 2) their unique features, and 3) how to use imaging modalities in the diagnostic approach for the diverse group of the disorders.

## TABLE OF CONTENTS/OUTLINE

Introduction - Thyroid development - Modalities of thyroid imaging - Congenital thyroid diseases including congenital hypothyroidism

(thyroid dysgenesis, thyroid dysmorphogenesis, transient hypothyroidism, congenital central hypothyroidism) and congenital hyperthyroidism - Acquired thyroid diseases including autoimmune thyroiditis, non-autoimmune thyroiditis, secondary thyroid dysfunction, acquired central hypo- and hyperthyroidism, and tumor and tumor like lesions

### **PDEE-87 Skeletal Disorders Due to Abnormal Aggrecan Biosynthesis**

Participants

Yuko Tsujioka, PhD, Tokyo, Japan (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

We review the imaging findings of disorders associated with abnormal biosynthesis of aggrecan, a major proteoglycan of cartilage. Proteoglycans are widely distributed in the extracellular matrix, and impaired aggrecan synthesis interferes with normal bone and joint development and causes disorders with abnormal bone and joint. With development of massively parallel sequencing technology and increased understanding of proteoglycan biology, disorders once considered separate entities have been lumped together as a group of disorders called "aggrecanopathies." All aggrecanopathies are autosomal recessive disorders with 25% of recurrence risk, and the accurate diagnosis is crucial for genetic counseling. Aggrecanopathies manifest with growth failure and multiple joint abnormalities that often lead to a misdiagnosis of joint hypermobility/contracture syndromes, such as arthrogyposis and Larsen's syndrome. However, radiological examination allows the differential diagnosis. The skeletal hallmarks of aggrecanopathies include stunted tubular bones due to impaired endochondral ossification and an abnormal "pattern formation" due to maldevelopment of embryonic cartilage templates, such as distal humeral bifurcation, double-layered patella, monkey wrench-like proximal femora, hyperphalangy, and accelerated carpal ossification.

#### **TABLE OF CONTENTS/OUTLINE**

Introduction - Aggrecan synthesis process and related genes - Sulfation disorders (DTDST related, and others) - UDP-sugar deficiency (CANT1-related Desbuquios syndrome and others) - Linkeopathies

### **PDEE-88 High Negative Appendectomy Rates in Under-18-year-old Patients - A 10-year Review with Radiologic-Pathologic Correlation: And Then There Were None**

Participants

Juan Carlos Monte Gonzalez, MD, (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

- Radiologist-performed ultrasound (R-US) is a reliable diagnostic technique for acute appendicitis in under-18-year-old (U18) patients. - In inconclusive R-US studies (9% in this sample), positive second-look techniques were CT (55,6%), R-US (33,3%) and MRI (11,1%). - Discordance with pathology findings/negative appendectomy rate (NAR) was 6%, lower than other series.

#### **TABLE OF CONTENTS/OUTLINE**

One of our institution's pediatric surgeons suspected high NAR due to R-US low accuracy. This motivated a review of every appendectomy (610) in U18 patients, since the inauguration of our hospital (2012-2022). For this abstract, we sampled 100 patients that underwent appendectomy. We classified the cases by:- Age: 6-17 years-old (mean: 11,27 yo).- Gender: 41% female, 59% male.- Symptoms: 99% right lower quadrant pain, 63% nausea/vomiting, 18% temperature >37.3°C/99.1°F, 13% diarrhea, 12% hyporexia/anorexia.- Clinical signs: 67% Blumberg, 22% Psoas.- Laboratory values: 83% Leukocytosis >10,000, 68% leukocyte left shift (>75% PMNs), 67% CRP > 0.5.- Alvarado Score: 2-10 points (mean: 7,2).- R-US results: 90% positive, 1% negative, 9% inconclusive.- Second-look positive technique for inconclusive cases: 55,6% CT, 33,3% R-US, 11,1% MRI.- Appendix diameter: 5-20 mm (mean: 8,5 mm).- Surgical findings: 62% phlegmonous/suppurative, 17% phlegmonogangrenous/gangrenous.- Surgical technique: 53% open, 47% laparoscopic.- Pathology findings: 83% phlegmonous, 11% gangrenous, 5% reactive follicular lymphoid hyperplasia, 1% normal.- Discordance with pathology findings/NAR: 6%.- Evolution: 93% favorable, 4% complicated (1% dehiscence, 3% post-operative collections that resolved with antibiotics), 3% N/A.

### **PDEE-89 The Many Faces of Pediatric Langerhans Cell Histiocytosis: A Pictorial Review**

Participants

Maria Dien Esquivel, MD, (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

1. Recognizing the typical imaging findings on different modalities of this rare disease is key to an early diagnosis and to guide management.2. MR imaging is the modality of choice to evaluate central nervous system involvement.3. FDG PET/CT plays a crucial role in the diagnosis, staging, surveillance and assessment of response to treatment of patients with LCH.

#### **TABLE OF CONTENTS/OUTLINE**

-Epidemiology-Classification-Etiopathogenesis and molecular findings-Pathology-Clinical Presentation-Treatment-Imaging Modalities• Radiography (skeletal survey)• Computed Tomography• Magnetic Resonance Imaging• Bone scintigraphy• PET/CT -Imaging Features by system• Central Nervous System• Axial and appendicular skeleton (bone marrow)• Chest• Abdomen• Nodal involvement• Other sites: Skin-Role of imaging• At diagnosis/initial staging• To assess response to treatment• During surveillance/follow up

### **PDEE-9 Nuclear Medicine Renal Studies: Indications, Techniques and Limitations for Optimal Patient Care**

#### **TEACHING POINTS**

1.Radiation dose is an important consideration in nuclear medicine imaging, and techniques for dose reduction should be employed whenever possible to minimize radiation exposure in children undergoing renal studies. 2.Radionuclide cystography is a valuable imaging modality for assessing vesicoureteral reflux and other bladder abnormalities in children and is often preferred over fluoroscopy due to lower radiation exposure.3.Renal cortical scintigraphy using DMSA is a common method for evaluating renal function and detecting renal parenchymal abnormalities. Proper image acquisition and technique are crucial for obtaining accurate and reliable results. 4.Diuresis renography using MAG3 is a useful tool for evaluating the functional status of the kidneys and detecting obstructive uropathy. Its role in renal transplant assessment and monitoring is also significant. 5.The appropriate use and interpretation of nuclear medicine renal studies in patients requires an understanding of the indications, techniques, and limitations of each modality, as well as consideration of the unique aspects of renal physiology and pathology.

## TABLE OF CONTENTS/OUTLINE

Introduction Radionuclide Cystography 1. Indications 2. Technique 3. Radionuclide Cystography vs Fluoroscopy Renal Cortical Scintigraphy: DMSA 1. Vesicouretral reflux 2. Cortical Scarring 3. Image acquisition 4. Technique Diuresis Renography-MAG3 1. Neonatal hydronephrosis 2. Uretropelvic junction obstruction 3. Acute intermittent obstruction 4. Image acquisition 5. Role in Renal Transplant Conclusions

### PDEE-90 Intravascular Catheters in Pediatrics: Methods, Imaging and Complications

#### TEACHING POINTS

1. Intravascular catheter insertion in the pediatric population can be challenging, especially in infants. 2. The radiologist must be familiar with the imaging appearance of intravascular catheters, and recognize catheter malposition as well as other complications. In selected cases, a linogram may be diagnostic. 3. Pediatric patients may experience unique complications such as thrombosis of the portal vein associated with umbilical vein catheterization. 4. In some complications, such as malposition, it may be possible to perform an 'over-the-wire exchange.' However, in other cases, the only option may be to insert a new catheter.

#### TABLE OF CONTENTS/OUTLINE

1. Important anatomy highlights. 2. Types of catheters. 3. Insertion methods and pitfalls. 4. Intravascular catheters on pediatric imaging: pearls and pitfalls. 5. Neonatal lines-special considerations. 6. Cases. 7. Diagnosis and management of complications.

### PDEE-91 Little Bellies, Big Impact: Blunt Abdominal Trauma in Pediatric Patients

Participants

Fabiana Gual, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The purposes of this exhibit are: To emphasize that trauma is a leading cause of death in the pediatric population, with abdominal injuries being a common and often unrecognized cause; To discuss the factors contributing to the higher risk of abdominal injuries in children, such as thinner abdominal wall and reduced adipose tissue; To highlight the importance of using the appropriate imaging test (including radiography, ultrasonography, contrast-enhanced CT and eventually magnetic resonance) based on the severity of the trauma and the stability of the patient; To provide examples of cases of low- and high-energy blunt abdominal trauma to demonstrate the utility of these imaging tests in diagnosing injuries to specific organs, such as the pancreas, liver, spleen, and kidneys; To acknowledge the challenges in evaluating children with blunt abdominal injury, especially pre-verbal children, and the need for diagnostic imaging to guide management decisions.

#### TABLE OF CONTENTS/OUTLINE

A flowchart illustrating the use of diagnostic imaging in low- and high-energy blunt abdominal trauma in children. A table listing the "packages of injuries" that can be identified based on force vectors when the pancreas, liver, spleen, and kidney are injured. Illustrated teaching cases of patients who were treated at the pediatric emergency department of a quaternary hospital and underwent imaging tests. The cases involve low- and high-energy blunt abdominal trauma resulting in pancreatic, hepatic, splenic and renal injuries. The Pediatric Organ Injury Scale was used to classify the severity of these injuries.

### PDEE-92 Multimodality Imaging Review of Inherited Collagen Disorders

#### TEACHING POINTS

1. Describe the epidemiology and pathophysiology of inherited collagen disorders in children. 2. Identify typical and atypical features of inherited collagen disorders. 3. Provide a comprehensive review of the key imaging findings for each disorder using a multi-system and multi-modality approach. 4. Discuss complications of disease and treatment options.

#### TABLE OF CONTENTS/OUTLINE

I. General Introduction to Inherited Collagen Disorders II. Conditions A. Epidemiology B. Diagnostic Imaging Findings and Complications a. Osteogenesis Imperfecta: Wormian bones, multiple fractures, osteoporosis, in-utero manifestations, zebra stripe sign b. Ehlers-Danlos joint dislocations, fractures, hemarthrosis, sigmoid colon rupture, splenic artery aneurysm c. Stickler Syndrome facial deformities, articular manifestations d. Epidermolysis Bullosa cutaneous blisters and erosions with transformation to squamous cell carcinoma, pseudosyndactyly with mitten hand/sock toe deformities, esophageal stricture, pyloric atresia, osteomyelitis e. Alport Syndrome end-stage renal disease manifestations, esophageal leiomyomatosis C. Treatment III. Conclusion

### PDEE-93 Fetal MRI to Detect Congenital Anomalies of the Kidney and Urinary Tract

Participants

Chihiro Tani, MD, Hiroshima, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

As congenital anomalies of the kidney and urinary tract (CAKUT) account for 40% of childhood end-stage renal failure, an early diagnosis and appropriate treatment are important. Fetal ultrasonography and MRI help to diagnose some of the diseases included in CAKUT. Fetal MRI is important for postnatal treatment and follow-up. We discuss the development of the renal and urinary system in fetuses and present fetal MRI findings of major diseases in CAKUT.

#### TABLE OF CONTENTS/OUTLINE

(1) The development of the renal and urinary system during the fetal period; kidney, ureter, bladder, urethra (2) Fetal MRI findings of major diseases in CAKUT a. Renal anomalies; multicystic dysplastic kidney, autosomal recessive polycystic kidney disease, horseshoe kidney, pelvic kidney, etc b. Renal pelvis, calyx, and ureter anomalies; ureteropelvic junction obstruction, megaureter, etc c. Bladder and urethral anomalies; bladder exstrophy, posterior urethral valves, etc Outline CAKUT accounts for childhood end-stage renal failure. Therefore, an early diagnosis and appropriate treatment are important. As some of the diseases included in CAKUT can be diagnosed prenatally, radiologists must be cognizant of fetal MRI findings of major diseases in CAKUT.

### PDEE-94 It's all about location! A Practical Compartment-Based Approach to Diagnosing Pediatric Head and Neck Masses

## TEACHING POINTS

1. Provide a practical compartment-based approach to create the best differential diagnosis of pediatric neck masses. 2. Review the anatomy and content of each compartment. 3. Review relevant clinical and specific imaging findings of common and rare pediatric neck lesions based on a compartmentalized approach.

## TABLE OF CONTENTS/OUTLINE

A. Background  
How to diagnose a pediatric neck mass? Why should we prefer a compartment-based approach for diagnosing pediatric neck masses?  
B. Head and neck compartments and compartment-based pediatric head and neck masses • Superficial Fascia • Parapharyngeal Space • Pharyngeal Mucosal Space • Submandibular space • Sublingual Space • Masticator Space • Buccal Space • Parotid Space • Carotid Space • Retropharyngeal Space • Perivertebral Space • Posterior Cervical Space • Visceral Space • Transspatial-multispatial • Miscellaneous  
Summary  
1. Evaluation of pediatric head and neck masses can be challenging due to their embryologic origin, complex anatomy, and various affecting pathologies.  
2. Using a practical compartment-based approach with careful consideration of the clinical details and specific imaging findings will enable the best differential diagnosis.

### Ear Anatomy and Anomalies in Fetal MRI

#### Participants

Matheus Dorigatti Soldatelli, MD, PhD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Describe ear anatomy and anomalies using in-vivo MRI in fetuses between 16 and 41 weeks of gestational age (GA). Additional 3D skin-surface reconstructions and postnatal or post-mortem imaging were performed in selected cases.

#### TABLE OF CONTENTS/OUTLINE

- Illustrate the ease of visualization of the pinna, external auditory meatus, cochlea, modiolus, vestibule, and semicircular canals at different GAs.- Demonstrate ear malformations in syndromic and non-syndromic patients and the associated extra-labyrinthine anomalies, such as facial and extremity abnormalities, that aid in phenotype-genotype correlation.

Printed on: 04/12/24

PDEE-10

### Bone Deep: Exploring Musculoskeletal Health with Nuclear Medicine

#### TEACHING POINTS

1. Nuclear medicine imaging of the musculoskeletal system is a valuable tool for diagnosing a variety of conditions and should be performed with appropriate considerations, including image acquisition and radiation dose. 2. Skeletal scintigraphy is a useful tool for evaluating various musculoskeletal conditions, including osteomyelitis, and proper image acquisition is essential for accurate diagnosis. 3. Bone scintigraphy can also be used in the context of non-accidental trauma in children to identify occult lesions and patterns of distribution and interpretation of the images must be done carefully. 4. 18 F-fluoride PET/CT is an imaging modality that can be used for low back pain and can also identify conditions such as pseudoarthrosis and hardware loosening. 5. Bone scintigraphy can also lead to unexpected diagnoses, including Langerhans Cell Histiocytosis and various oncologic diseases, emphasizing the importance of thorough interpretation.

#### TABLE OF CONTENTS/OUTLINE

Introduction 1. Pediatric Considerations 2. Image acquisition 3. Radiation dose Skeletal Scintigraphy 1. Indications 2. Image acquisition 3. In the context of Osteomyelitis Bone Scintigraphy and Non-accidental Trauma 1. Image acquisition 2. Interpretation 3. Occult lesions 4. Patterns of distribution 18F-fluoride PET/CT 1. Image acquisition 2. Low back pain 3. Pseudoarthrosis 4. Hardware loosening 5. Skeletal Trauma in non-accidental trauma Bone Scintigraphy and Unexpected Diagnosis 1. Langerhans Cell Histiocytosis 2. Oncologic diseases Conclusions

PDEE-11

### Synapses and Signals: Nuclear Medicine Applications in Neurology and Endocrinology

#### TEACHING POINTS

1. Nuclear medicine imaging can provide valuable diagnostic and therapeutic information in the evaluation of central nervous system and thyroid diseases, but appropriate dose optimization and imaging protocols are essential to minimize the potential risks associated with radiation exposure. 2. Epilepsy evaluation can benefit from various nuclear medicine imaging techniques such as CSF flow studies, CNS radionuclide angiography, and SISCO, which can provide valuable information about brain function and blood flow. 3. 18F-FDG PET is a useful tool for evaluating epilepsy, as it can provide information on brain metabolism and can help identify the location of seizure foci. 4. Pediatric thyroid diseases, such as hyperthyroidism, nodular thyroid disease, thyroid cancer, Graves Disease, and subacute thyroiditis, can be evaluated using a range of nuclear medicine imaging techniques, including thyroid uptake and scan, 123I whole-body scan, and 99mTc-MIBI imaging. 5. Nuclear medicine imaging can play a crucial role in the diagnosis and management of thyroid cancer, including the use of radioiodine therapy to target and destroy cancerous thyroid cells.

#### TABLE OF CONTENTS/OUTLINE

Introduction 1.PET 2.Image acquisition 3.Radiation dose Epilepsy 1.Epilepsy Evaluation 2.Tracers for Targeted Epilepsy PET Imaging 3.CSF Flow Studies 4.CNS Radionuclide Angiography 5.SISCO 6.18F-FDG PET Pediatric Thyroid Disease 1.Hyperthyroidism 2.Nodular thyroid disease 3.Thyroid Cancer 4.Graves Disease 5.Subacute Thyroiditis Conclusions

PDEE-12

### Cortical Development Evaluation on Fetal Brain MRI Between 22 and 28 weeks: A Practical Guideline

#### Participants

Mariana Cerdeira Machado, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- To demonstrate the correct protocols for the adequate acquisition of the necessary sequences for the analysis of the cortical development; - To illustrate the morphological aspects of the principal sulci and gyri of the fetal brain between 22 and 28 weeks in a fetal MRI; - To learn the timing of the appearance of each new sulci between 22 and 28 weeks in a fetal MRI; - To recognize the early signs of cortical development abnormalities.

#### TABLE OF CONTENTS/OUTLINE

The purpose of this work is to illustrate the morphological aspects of the principal sulci and gyri and their time of appearance in the fetal brain between 22 and 28 weeks in a fetal MRI. For this, we will briefly discuss cortical development (neuronal proliferation, migration, and organization) and explore anatomic landmarks and their normal morphology throughout this period. Furthermore, we will demonstrate how to adequately perform an MRI exam and use it to evaluate the fetal brain cortex. Finally, we shall explore the early signs of cortex developmental abnormalities and the importance of a prompt diagnosis on the outcomes and prognoses.

PDEE-13

### Abdominopelvic Emergencies in Pediatric Oncology Patients: A Pictorial Review

#### Participants

Sara Garcia, MD, Barakaldo, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Pediatric cancer patients are at increased risk for life-threatening emergencies that can affect all organs and systems. Such emergencies may be directly related to the disease at its debut or during its evolution or be secondary to the treatment administered.- Abdominal emergencies are frequent in these patients, and the imaging technique of choice for their study is ultrasound. Plain abdominal radiography, CT and MRI are usually used as complementary studies in case of specific suspicions or for better characterization.- Among the pathology affecting the intestinal loops at the debut intestinal obstruction stands out, especially intussusception, which is very typical in the pediatric population. Typhlitis or neutropenic colitis usually occurs as a complication of QT treatment in patients with ALL.- Among the hepato-biliary emergencies secondary to treatment, hepatotoxicity and sinusoidal obstruction syndrome are the most frequent, the latter presenting typical characteristics on Doppler study.- Acute pancreatitis is a possible complication of chemotherapy with L-asparaginase.- Hemorrhagic cystitis occurs as a complication treatment with cyclophosphamide in patients with HSCT. The bladder is the most affected organ.- Testicular neoplasms do not increase the risk of torsion but can present at onset as acute scrotal syndrome.

#### TABLE OF CONTENTS/OUTLINE

1. General classification of emergencies in pediatric oncology patients. Classification of abdominal emergencies, both those that occur at the onset of the disease and those that are secondary to oncological treatment.2. Description of the main clinical features and imaging findings of abdominal emergencies in these patients.

PDEE-14

### Mind the Gaps: Avoiding Fracture Pitfalls in Pediatric Musculoskeletal Radiology

#### Participants

Lucas Medeiros, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The purpose of this exhibit is: 1. To review normal pediatric musculoskeletal imaging findings that can mimic fractures in a multimodality approach 2. To discuss hard-to-identify and pediatric-specific fractures 3. To assess the differential diagnosis of pediatric pathological conditions 4. To analyze treatment-related findings that can simulate pathologies

#### TABLE OF CONTENTS/OUTLINE

1. Salter-Harris fractures 2. Green-stick fractures 3. Plastic deformation fractures 4. Torus fractures 5. Non-accidental injury fractures 6. Ossification centers mimicking fractures 7. Secondary fracture findings 8. Metabolic and genetic conditions (e.g. rickets, osteogenesis imperfecta) 9. Skeletal dysplasias 10. Obstetric injury 11. Anatomical variations

Printed on: 04/12/24

PDEE-15

### Temporosquamous Suture: An Updated View of the Importance of this Finding in Craniosynostosis

#### Participants

Yuree Herenio SR, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The squamous suture is the main object of our work. While the phenotypic appearances and sequelae of synostosis of the major cranial vault sutures are well documented, little is reported concerning synostosis of the squamous suture. Involvement of this suture can be individual or associated with other sutures, both in syndromic cases and in primary craniosynostosis. This work has the objective to demonstrate the importance of the temporosquamous suture, which has been undervalued over the years in literature. Recent studies and their surgical correlations show different types of cranial deformity, depending on the location of partial or complete closure of this suture. Deformities include scaphocephaly, plagiocephaly or brachycephaly. Our work shows different types of closure evaluated in our department. We also consider fundamental the use of the Maximum Intensity Projection protocol (MIP) to demonstrate the real shape of the sutures and to investigate craniolacunia, which constitutes a relevant finding in the surgical decision, as it may represent signs of intracranial hypertension.

#### TABLE OF CONTENTS/OUTLINE

The work shows a literature review about the squamous suture, showing part of the cases of CT with Maximum Intensity Projection protocol (MIP) and volume rendering 3D reconstruction of different types of closure, evaluated in our department.

PDEE-16

### Epiphany about Epiphyses: Distinguishing Epiphyseal Mass Lesions in Children

#### Participants

Eric Tung, MD, Boston, MA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Epiphyses have unique histology and play an important role in osseous development. The differential diagnosis for epiphyseal mass lesions in children is one that radiologists interpreting pediatric imaging should be familiar with. Overlapping imaging findings of epiphyseal tumors and other focal lesions on radiography and magnetic resonance imaging can hinder the ability of radiologists to establish specific diagnoses by imaging alone. However, knowledge of characteristic imaging features for each lesion can improve the accuracy and specificity of radiologists' interpretations. By the end of this exhibit, learners should be able to provide a differential diagnosis for pediatric epiphyseal mass lesions, recognize the unique imaging features of each diagnosis, and apply a framework for MRI evaluation of epiphyseal lesions to unknown cases.

#### TABLE OF CONTENTS/OUTLINE

1. Background: Epiphyseal development, structure, equivalents; 2. Differential diagnosis for epiphyseal tumors and other focal lesions in children; 3. Review of characteristic imaging findings for each diagnosis; 4. Framework for MRI interpretation to help narrow differential diagnosis; 5. Unknown cases to reinforce learning objectives

Printed on: 04/12/24

PDEE-17

### Pediatric Metabolic Bone Disorders - A Comprehensive Review

#### TEACHING POINTS

Illustrate the common and uncommon metabolic bone disorders in children. Identify imaging features that can help differentiate the various metabolic disorders.

#### TABLE OF CONTENTS/OUTLINE

Metabolic bone disease in children includes hereditary and acquired conditions of varying etiologies. The purpose of this educational exhibit is to describe the characteristic imaging findings of metabolic bone disorders to include endocrine and nutritional deficiencies. Entities such as rickets, scurvy/ hypovitaminosis C, osteogenesis imperfecta, hyperparathyroidism, renal osteodystrophy, celiac disease, inflammatory bowel disease, hypophosphatasia, osteopetrosis, sickle cell anemia, Gaucher's, heavy metal poisoning, and bone disease secondary to medication such as prolonged steroid treatment will be discussed. Early recognition and treatment of potential risk factors is important to avoid significant clinical consequences.

Printed on: 04/12/24

## Abstract Archives of the RSNA, 2023

PDEE-18

### Pediatric Skull Lesions

#### TEACHING POINTS

- To discuss the common pathologies affecting the pediatric skull.
- To discuss imaging appearance of various skull lesions seen in children.
- To develop a systematic approach to diagnosing skull lesions.

#### TABLE OF CONTENTS/OUTLINE

Goals and objectives -Background information -Common and uncommon skull lesions in children -Imaging spectrum of pediatric skull lesions -Indications for further imaging -Summary. Pediatric skull lesions can be congenital, traumatic, vascular, inflammatory, infectious, or malignant. These lesions can be clinically palpable or incidentally detected on imaging. The incidentally detected lesions include parietal foramina, sinus pericranii, and venous lakes. The palpable abnormalities can be present at birth, such as cephalohematoma, birth trauma, meningocele/encephalocele, venous malformation, and dermoid/epidermoid cysts. Thalassemia, intraosseous hemangioma, osteoma, lipoma, Langerhans Cell Histiocytosis (LCH), Fibrous dysplasia, Neuroblastoma metastases, Ewing's sarcoma usually present later in life. Most of these lesions are visible on skull radiographs. Further evaluation is performed by ultrasound, computed tomography (CT), and Magnetic Resonance Imaging (MRI). Cephalohematoma and Parietal foramina are identified on ultrasound and radiographs respectively. Dermoid /Epidermoid cysts are commonly seen in the midline, frontal and temporal regions. LCH is usually seen as a beveled edge skull lesion. Fibrous dysplasia presents as expansile lesions with a ground glass matrix seen on CT. Our exhibit will discuss various skull lesions seen in the pediatric age group, their imaging appearance, and a systematic approach to the correct diagnosis.

### **Focused Thoracic Ultrasonography for the Elucidation of Radiolucent Areas in Pediatric Patient's Chest X-ray: Approach Based on Cases**

#### **Participants**

Taila Moura Fe, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

The main objectives of this exhibit are to: 1- Review the importance of thoracic ultrasonography in critical pediatric care and its potential benefits in reducing radiation exposure in neonates and infants. 2- Discuss various conditions that present as lucent lesions on chest X-rays and review sonographic findings of these conditions. 3- Emphasize the use of Focused Thoracic Ultrasound as a reliable tool in critical pediatric care and expand the use of bedside thoracic ultrasound helping physical examination.

#### **TABLE OF CONTENTS/OUTLINE**

Introduction; Review of the use of thoracic ultrasonography; Case-based review of conditions that present as lucent lesions, with a challenging chest x-ray at the beginning of each case, followed by sonographic findings; Conditions included: Diaphragmatic hernia (Morgagni's and Bochdalek's hernia); Pneumothorax; Pneumomediastinum; Necrotizing pneumonia; Pulmonary cavitation/pneumatocele; Poland syndrome; Subcutaneous emphysema; Congenital deficiency of surfactant production; Congenital pulmonary airway malformation (CPAM)

### Imaging Review of the Pediatric Spine: Do Abnormalities Always Indicate Disease?

#### Participants

Ana Carolina Augusto, MD, MSc, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The purpose of this study is: • To review the development of the spine, focusing on the formation and malformations of vertebrae. • To illustrate and discuss the normal appearance, anatomical variations, and common pathologies involving the spine during skeletal growth.

#### TABLE OF CONTENTS/OUTLINE

- Embryology: The vertebral column and spinal cord develop in a precise, sequential manner during gestation. Any deviation from this normal process can cause structural variations in the spine and spinal cord.
- Congenital and acquired deformities of the vertebral bodies: defects related to fusion, formation, and segmentation of the vertebral bodies may lead to congenital scoliosis and could be linked with spinal dysraphisms, skeletal, cardiac, genitourinary, and gastrointestinal anomalies. Acquired deformities of the vertebral bodies can be caused by different factors, including trauma, infection, malignancies, systemic diseases, among others.
- Bone marrow: bone marrow conversion from red to yellow marrow follows a well-established pattern during childhood. Understanding the normal signal intensity changes on MRI is crucial to detect deviations that may represent disease.
- Normal developmental events, pitfalls, and common abnormalities during skeletal maturation: recognizing these developmental events and common abnormalities can assist in image interpretation, guiding treatment and management decisions.

PDEE-20

### Osteogenesis Imperfecta: A Pictorial Review

#### Participants

Adriano Silveira Moreira Novaes, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Osteogenesis imperfecta (OI) is a genetic disease characterized by increased bone fragility, low bone mass and other connective tissue manifestations. The most common cause of OI is mutations in one of the two genes encoding collagen type 1, which is a major component of bone and other connective tissues. OI can present with a wide range of symptoms, and there are now seven recognized types of the disorder. The radiologist must be prepared to recognize the image patterns, determining a correct diagnosis, which facilitates the early and adequate treatment of the patient. Excluding differential diagnoses, such as non-accidental injury, is of fundamental importance. The purpose of the present study is to exhibit imaging findings of types I, III, IV, V and VI of OI; to demonstrate how to differentiate the types based on imaging findings; to demonstrate how to differentiate OI from non-accidental injuries.

#### TABLE OF CONTENTS/OUTLINE

Introduction. Epidemiology and clinical finds. Main findings of type I, II, III, IV, V and VI. How to differentiate the types based on imaging findings. Excluding differential diagnoses, such as non-accidental injury, is of fundamental importance. Conclusion/Take home message.

PDEE-21

### Pediatric Renovascular Hypertension A-Z: Diagnostic Work-up, Imaging, Interventions, and Troubleshooting

#### TEACHING POINTS

1. Renovascular hypertension (RVH) is caused by an upregulation of the renin-angiotensin-aldosterone system due to flow-limiting renovascular disease (RVD). In pediatric patients, the differential includes fibromuscular dysplasia, neurofibromatosis, vasculitis, abnormal arterial supply and trauma.2. Although ultrasound is the initial imaging modality for diagnosing RVD, it is limited in evaluation of segmental branches. Angiography is the gold standard for diagnosis.3. Interventional radiology can offer a variety of interventions for RVD, including angioplasty and embolization. Surgical interventions can be offered in angioplasty-refractory stenosis.4. A multidisciplinary care team consisting of nephrologists, diagnostic and interventional radiologists, and transplant and vascular surgeons is necessary for the global care of young patients with RVH.

#### TABLE OF CONTENTS/OUTLINE

1. Differential diagnosis, diagnostic work-up and medical management for pediatric RVH2. Multi-modality approach to the imaging diagnosis for pediatric RVD including: renal artery Doppler ultrasound, contrast-enhanced ultrasound, computed tomography angiography, magnetic resonance angiography, and catheter angiography3. Endovascular renal artery interventions and technique for RVH management4. Indications for surgical intervention5. Surveillance and follow-up; troubleshooting for persistent hypertension

### Radiogenomics of PIK3CA Related Disorders: A New Era

#### Participants

Jada Hislop, BA, Decatur, GA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Vascular anomalies are traditionally classified based on clinical characteristics, imaging and pathology. Diagnosis is challenging due to overlapping phenotype and inconsistent naming conventions. With the rapid development of new technologies in oncology, radiogenomics has emerged as a science which is beginning to change our understanding and treatment of vascular anomalies as well. Advances aid in clarifying etiology and elucidate previously unknown pathomechanisms. Through sequencing of tissue samples, postzygotic somatic variants have been discovered for several vascular anomalies with and without overgrowth as is the case with PIK3CA. PIK3CA driven vascular anomalies may now be treated with mTOR inhibitors and newly approved PIK3CA inhibitors. This exhibit will be a case-based approach to review recent advances in diagnosis including imaging finds, genetic testing, and review management of these disorders. Review the clinical spectrum of disorders associated with pathogenic variants in PIK3CA gene - from isolated vascular malformations to recognizable disorders. Highlight the manifestations of some PIK3CA-related disorders presenting with overgrowth (PROS). Review MRI imaging findings and pathology in patients with confirmed variants in PIK3CA. Discuss the evolving nature of genetic testing in somatic disorders and suitable tissue samples for testing. Briefly discuss therapeutic options including new medical managements

#### TABLE OF CONTENTS/OUTLINE

Introduction to PROSPIK3CA Genetic Pathway  
Selected examples and isolated vascular anomalies and overgrowth disorders  
Diagnostic approaches with imaging  
Diagnostic approaches with genetic  
Therapeutic approaches  
Conclusion

### **The Role of Imaging in Radiotherapy Planning: An Illustrated Review of Common Pediatric Tumors Treated with Radiotherapy**

#### **Participants**

Susan Gowdy, FRCPC, MBBS, Newcastle, (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Review some of the more common paediatric tumours treated with radiotherapy. Understand the role of imaging in the decision-making process regarding type of radiation therapy and mode of delivery. Consider how different imaging modalities may be incorporated into planning a radiation therapy field. Evaluate the potential role of imaging surveillance following radiotherapy.

#### **TABLE OF CONTENTS/OUTLINE**

Successful management of pediatric malignancies requires a multidisciplinary team approach. This educational exhibit aims to highlight the importance of close collaboration between radiologists, nuclear medicine physicians and radiation oncologists when assessing tumours of childhood which can be treated with radiotherapy. Using case examples of a medulloblastoma, Hodgkin's lymphoma and neuroblastoma, we will present imaging to review radiological features at diagnosis, relevant staging systems and response criteria that are important considerations for radiation oncologists planning radiotherapy treatment. The role of the different imaging modalities including various MRI sequences will be illustrated as the process of planning a radiation therapy field is discussed. Potential treatment complications including current literature regarding the role of imaging in surveillance will be reviewed.

### MRI Findings in Hypovitaminosis C: Separating Scurvy from the Crowd

#### TEACHING POINTS

1. Symmetric metaphyseal edema involving the lower extremities is an uncommon finding. Causes include metabolic disorders, multifocal infection, autoimmune disorders, inherited diseases, and malignancy. Recognizing that bilateral lower extremity metaphyseal edema is a consistent finding in hypovitaminosis C can lead to early diagnosis and avoidance of further unnecessary testing and procedures. 2. Differential diagnoses for symmetric metaphyseal edema include focal periphyseal edema zones, chronic noninfectious osteitis, malignancy, osteomyelitis, and sickle cell disease. 3. Although subperiosteal hemorrhage can be seen with other etiologies such as bone infarct from sickle cell disease it can be a specific finding in hypovitaminosis C. 4. Since the diagnosis of hypovitaminosis C may not be initially considered, recognition of the imaging findings is important for early diagnosis. This allows for timely treatment and avoidance of further testing. 5. Scurvy has several clinical and laboratory findings that overlap with more common pathologies. a. Clinical: (Early) Gingival hyperplasia, joint swelling and bruising. (Late) Fever, jaundice, hemolysis, spontaneous bleeding and neuropathy. b. Laboratory: Mild leukocytosis. Elevated ESR and CRP.

#### TABLE OF CONTENTS/OUTLINE

1. Case series of 4 patients with hypovitaminosis C. a. History b. Clinical presentation c. Laboratory values d. Imaging 2. Review of the differential diagnosis of symmetric metaphyseal edema. a. Imaging features that can be specific for hypovitaminosis C. b. Imaging findings suggestive of an alternative diagnosis. c. Nonspecific clinical findings of hypovitaminosis C.

### Pediatric Rhabdomyosarcoma: Imaging Evaluation from Diagnosis to Treatment Monitoring

#### Participants

Dana Alkhulaifat, MD, Philadelphia, PA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Rhabdomyosarcomas (RMS) are the most common type of soft tissue sarcomas in children. Risk factors include cancer predisposition syndromes such as Li- Fraumeni, Noonan and Beckwith-Wiedemann.
- Prognosis depends on several factors including location of the tumor, size, histopathology, genetics and imaging findings.
- The most optimal imaging modality for measuring local tumor involvement is cross sectional imaging by CT or MRI.
- For regional lymph node and metastatic assessment, whole-body fluorodeoxyglucose (FDG) PET/CT or PET/MRI in combination with chest CT is recommended.
- Treatment is multimodal and consists of multi-agent chemotherapy, along with surgical resection and radiotherapy of the primary tumor.
- MRI is the recommended modality for monitoring chemotherapy response for primary tumor, while FDG PET/CT or PET/MRI in combination with chest CT is recommended for lymph nodal and metastatic disease.

#### TABLE OF CONTENTS/OUTLINE

1. Brief overview of pediatric rhabdomyosarcomas: epidemiology, risk factors and clinical presentation.
2. Initial tumor assessment:
  - a. Primary tumor
  - b. Regional lymph nodes
  - c. Metastatic lesions
3. Stratification of severity
  - a. Tumor location
  - b. Histological subtype
  - c. Cytogenetic information
  - d. Imaging staging (CT, MRI and PET)
4. Treatment regimens and response monitoring
  - a. Imaging modalities
  - b. Frequency of monitoring
  - c. Definitions of remission or progression.

### Central Nervous System Involvement in Mucopolysaccharidoses: Understanding Pathophysiology and Radiological Findings

#### Participants

Miguel Barrio Piqueras I, MD, Pamplona, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To understand the basic pathophysiology that directly or indirectly affects the central nervous system, including bone instability. To be able to recognize the main radiological findings of the different subtypes of this disease. To inform about new imaging diagnostic strategies such as spectroscopy.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction: Definition and general characteristics  
2. Clinical presentation in the central nervous system. I: Alpha-L-iduronidase - Hurler (I H): mental retardation, dysostosis - Scheie (I S): normal intelligence - Hurler-Scheie (I H-S): Intermediate between both above II: Iduronate sulphatase - Hunter: dysostosis III: Profound mental deterioration - Sanfilippo A: Heparan sulphamidase - Sanfilippo B: N-acetyl-glucosaminidase - Sanfilippo C: Acetyl-CoA: alpha-glucosaminide acetyltransferase - Sanfilippo D: N-acetylglucosamine 6-sulphatase IV: Galactose-6-sulphate sulphatase, Beta-galactosidase: Dysostosis, motor dysfunction - Morquio A - Morquio B VI: N-acetylgalactosamine-4-sulphatase - Maroteaux-Lamy: dysostosis, kyphosis VII: Beta-glucuronidase - Sly: dysostosis  
3. Diagnostic methods. Imaging findings and protocols.  
4. Treatment options for mucopolysaccharidoses.  
5. Future directions in imaging of mucopolysaccharidoses - Spectroscopy: diagnosis and future applications  
7. Case series

Printed on: 04/12/24

PDEE-28

### Easy-peasy! Simplifying the Myelination Progress in Term Newborn

#### Participants

Marcella N. Brandao, MD, MEd, Salvador, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Review the normal myelination process in term newborn, as well as its progression. Tips for standardizing the evaluation of the myelination process. Guide step by step the myelination milestones, the main differential diagnoses and the disturbances in the myelination process that must be recognized.

#### TABLE OF CONTENTS/OUTLINE

Infant brain magnetic resonance imaging (MRI) interpretation presents unique challenges due to different appearances depending on age. This occurs through the myelination process which, despite starting in utero, has acceleration and predictability between individuals in the first postnatal year, with a predetermined scheme of chronological and topographical sequences, serving as an important normal brain maturation marker on MRI. Myelination occurs by a gradual myelin sheath dehydration, at the same time that lipids and proteins are deposited. This process is dynamic and the molecular interactions of water with lipids and myelin membrane proteins are modified and affect the relaxation time in the T1W and T2W sequences. T1W weighted images are most useful up to 8 months old with the myelinated white matter showing hypersignal, and T2W weighted images are useful in the later stages of myelination, showing hyposignal in the face of reduced myelin water content. Although predictable, the evaluation of myelination on MRI is still a challenge for many radiologists, so the authors structure a step-by-step guide with the myelination milestones, the main differential diagnoses and the disturbances in the myelination process that must be recognized.

PDEE-29

### Anatomic Approach to Non-Traumatic Lesions of the Pediatric Visual Pathway

#### Participants

Vivek Pai, MBBS, MD, Toronto, ON (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Most of the visual pathway is inaccessible for histopathology; radiology is the only diagnostic modality available. Hence accuracy is of utmost importance for adequate management and optimal outcome 2. Having an anatomic approach will help narrow differentials.

#### TABLE OF CONTENTS/OUTLINE

A. Discussion on the anatomy of the visual pathway. B. Pictorial essay on lesions affecting the visual pathway with discussion on etiopathogenesis and presentation. Lesions are divided according to the anatomic location: 1. Retina: Retinal Detachment, Retinal hemorrhage, Panophthalmitis, Medulloepithelioma, Retinoma, Retinoblastoma. 2. Optic disc: Papilledema and IIH, Optic Drusen, Coloboma, CHARGE syndrome, Morning Glory syndrome. 3. Optic nerve: Anophthalmia-related aplasia, hypoplasia, demyelinating disorders, mitochondrial disorders, visual pathway gliomas. 4. Optic chiasm: Septo-optic dysplasia, Krabbe disease, Opto-Chiasmatic tuberculosis, hypothalamic-chiasmatic glioma. 5. Occipital lobes: Adrenoleukodystrophy, hypoxic-ischemic encephalopathy, hypoglycemic encephalopathy, PCA territory infarction, Posterior Reversible Encephalopathy Syndrome, occipital cephalocele, focal cortical dysplasia

### US Evaluation of the Pediatric Hand Trauma: From One Through Five

#### Participants

Emilio Inarejos Clemente, MD, Barcelona, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

After reviewing this exhibit, the learner should be able to:1. Recognize the normal US appearance of the pediatric hand.2. Describe the use of high-resolution US, Doppler US and microvascular imaging for the evaluation of trauma-related conditions of the hand in children.3. Review the most common traumatic conditions affecting the hand in children.4. Discuss the US findings of the most frequent traumatic entities occurring in hand and wrist.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction.2. Transducers and technical US parameters to optimize the examination of the hand.3. Normal US appearance of the pediatric hand, including tendons, ligaments, vessels, and nerves.4. Authors will focus on five compartments (from one through five):4.1. Ligaments4.2. Tendons4.3. Vessels4.4. Nerves4.5. Bone5. Ligament injuries: Collateral ligaments (Stener lesion), pulley lesions, volar plate lesions.6. Tendon injuries: Superficial and profundus flexor tendon lacerations and transections, extensor tendon injuries, impingements, tenosynovitis.7. Vessels: Venous/arterial thrombosis, post-traumatic pseudoaneurysm8. Nerves: Laceration and transection, post-traumatic neuroma9. Bone: Fractures, callus formation with secondary impingement10. Foreign bodies characterization and removal with US guidance11. Injuries will be correlated with anatomical draws, as well as with MRI images.12. Summary

### Diagnostic Error in Pediatric Neuroradiology

#### TEACHING POINTS

(1) Medical error has significant impacts on patient outcomes and society as a whole. (2) Error in diagnostic radiology can be organized in terms of types of thinking. (3) Metacognition, self-awareness, and understanding of specific strategies related to types of error can help radiologists reduce error. (4) Case-specific teaching to reduce error in pediatric emergency neuroradiology.

#### TABLE OF CONTENTS/OUTLINE

For each error type there will be: A pediatric neuroimaging case, a definition of error type, lessons learned, and known strategies to prevent this error. (1) Perceptive Error; (2) Cognitive Error: a) Anchoring bias, b) Confirmation bias, c) Availability bias, d) Satisfaction of report, e) Framing bias, f) Attribution bias, g) Satisfaction of search, h) Premature closure, i) Inattentive bias, k) Hindsight bias; (3) Communication Error; (4) Process Error

### **Polymorphous Low Grade Neuroepithelial Tumor of the Young: An Institutional Case Series with Radiological and Pathological Correlation**

#### **TEACHING POINTS**

Polymorphous low grade neuroepithelial tumor of the young (PLNTY) is a rare, epileptogenic brain tumor that was recently described as a distinct entity in the 2021 World Health Organization classification of CNS tumors. Teaching points include: 1) PLNTY usually occurs in children and adolescents, although is occasionally diagnosed in adults. Clinically, patients often present with refractory seizures. 2) Histological characteristics of PLNTY include an infiltrative growth pattern, intense CD34 expression, cellular components resembling oligodendroglioma, and calcifications. 3) Imaging characteristics of PLNTY include T1 hypo/iso-intensity, T2 hyperintensity, GRE blooming artifact, non- (or slight) enhancement on contrast imaging, cystic components, and internal calcifications. Morphologically, PLNTY is often well-circumscribed and located in the temporal lobe. 4) At a molecular level, PLNTY is characterized by the presence of either a BRAF V600E mutation or chromosomal translocations involving FGFR2 and FGFR3. Both genetic alterations activate the MAP kinase pathway. 5) Imaging differential diagnoses include other low grade cortically based tumors such as oligodendroglioma (usually found in adults), dysembryoplastic neuroepithelial tumor (DNET), ganglioglioma, pleomorphic xanthoastrocytoma, and pilocytic astrocytoma. 6) Surgical resection is usually curative of seizures.

#### **TABLE OF CONTENTS/OUTLINE**

-Introduction, PLNTY's place in the WHO 2021 Classification of CNS tumors -Imaging characteristics of PLNTY -Histological characteristics of PLNTY -Discussion of pathophysiology and molecular subtypes -Imaging comparisons of differential diagnoses

PDEE-33

### Inside the Womb: A Fascinating Look at Congenital Kidney Pathology through Fetal MRI

#### Participants

Lizbet Perez-Marrero, Santiago De Chile, Chile (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1) Fetal MRI has emerged as a valuable and high-resolution imaging modality for the comprehensive assessment of fetal renal anomalies. 2) By utilizing a systematic review approach, radiologists can effectively characterize the fetal kidneys, providing a comprehensive understanding of the extent and severity of the anomalies. 3) Incorporating functional kidney assessments and measuring total lung volume during fetal MRI can enhance the overall evaluation of the fetus, providing a better understanding of the patient's condition and enabling more informed parental counseling.

#### TABLE OF CONTENTS/OUTLINE

When evaluating the kidneys, the following topics should be assessed, as combined alterations may be found associated with different pathologies:- position: situs solitus versus ectopia.- morphology: duplex, horseshoe.- size: duplex, autosomal recessive polycystic kidney disease (ARPKD)/ autosomal dominant polycystic kidney disease (ADPKD).- focal lesions: cysts, tumors.- excretory system: posterior urethral valves.- renal function: hypofunctioning - related systems: amniotic fluid, assessment of lung volume (hypoplasia cutoff value?), uterus/annexa.

### Neonatal Liver Imaging: Techniques, Normal Variations and Common Pathologies

#### Participants

Govind Chavhan, MD, Toronto, ON (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Neonatal liver has some unique aspects in terms of imaging and imaging appearances as compared to older children. Choosing and tailoring of imaging for each indication in neonate is therefore important for optimal care with minimal invasiveness. Common indications for imaging include incidental focal lesions, neonatal liver failure, cholestasis and sepsis. Imaging is important component of work up in neonatal liver failure helping to narrow differentials. It may help to salvage liver and potential transplant by timely diagnosis of conditions such as neonatal hemochromatosis.

#### TABLE OF CONTENTS/OUTLINE

Introduction (overview of neonatal liver pathology, incidence, etc.; role of imaging) Imaging modalities- (discussion of specific roles, pros/cons, with relevant summary tables) What changes and what is normal at birth? (discussion of normal imaging appearance of structures related to neonatal liver) Indications for imaging (Incidental lesions, liver failure/dysfunction, cholestasis, sepsis, etc) Common pathologies (work up and role of imaging in the work up) - Congenital calcifications (causes, natural course, imaging) - Line related complications (hematoma, abscess) - Infections (TORCH, herpes, bacterial) - Neoplastic lesions (common lesions- hemangioma/HB/mesenchymal hamartoma /mets) - Vascular abnormalities (thrombosis, portosystemic shunts, AVMs, Heterotaxy) - Neonatal liver failure- causes, workup and role of imaging (NH, HLH, metabolic diseases, infection, cholestatic diseases)Summary

PDEE-35

### Pediatric Neck Cystic Lesions

#### TEACHING POINTS

Cystic lesions are common findings in pediatric patients. Imaging plays a crucial role guiding the diagnosis and depicting the anatomical extent of the lesion. Multimodality imaging narrows the differential diagnosis by demonstrating the lesion's components. Age groups and anatomic location in the neck are also diagnostic clues. It is important to recognize potential complications, especially infections.

#### TABLE OF CONTENTS/OUTLINE

o Congenital and Developmental Disorders § Thyroglossal duct cyst § Branchial cleft anomalies § Dermoid/Epidermoid cyst § Thymopharyngeal duct cyst o Vascular § Lymphatic malformations § Venous malformations § Cervical hemangioma § Pseudoaneurysms § Internal jugular phlebectasia o Infectious § Suppurative lymphadenitis § Tuberculous lymphadenitis § Abscess o Neoplastic § Schwannoma § Warthin tumor § Congenital cervical teratoma § Cervical lymph node metastases o Miscellaneous § Ranula § Thyroid colloid cyst § Laryngeal cyst

### Imaging of DDH: An Update on Diagnostic, Follow-up and Post-operative Findings

#### TEACHING POINTS

The purpose of this exhibit is: To review the anatomy of the infant hip. To discuss the incidence, risk factors and pathophysiology of Developmental Dysplasia of the Hip. To review the clinical and imaging diagnostic criteria for DDH. To discuss the role of each imaging method in the context of DDH. To demonstrate the importance of early diagnosis and proper treatment of DDH with successful cases and adequate treatment, as well as late diagnosis and its complications.

#### TABLE OF CONTENTS/OUTLINE

Theoretical introduction containing epidemiology, risk factors and pathophysiology. Anatomy of the infant hip, including bone structures and the most relevant anatomic landmarks in DDH's diagnosis and follow-up. Images of clinical cases demonstrating some of the long-term complications, with emphasis on the importance of early diagnosis and proper treatment to avoid them. Brief discussion and illustration of the main current treatments as well as imaging follow-up evaluation with expected and unfavorable outcomes. Latest updates on diagnosis and treatment of DDH.

PDEE-37

### Imaging Appearance of Common and Less Common Fetal Masses from Head to Toe

#### Participants

Elizabeth Snyder, MD, Nashville, TN (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1) Masses detected prenatally range from congenital malformations to tumors; knowledge of the imaging appearance of common and uncommon fetal masses is important for appropriate pregnancy. management, delivery planning and immediate postnatal management-2) Both US and fetal MRI play important and complementary roles in the evaluation of fetal masses.3) Using an anatomic approach to fetal masses, the differential diagnosis can be narrowed, allowing for more accurate prenatal counseling and management.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction: a. Epidemiology of fetal masses, b. Overview of categories of fetal masses: congenital malformations, benign tumors, malignant tumors2. Imaging approach to fetal masses: a. Prenatal ultrasound, including 3-D ultrasound b. Role of fetal MRI3. Anatomic approach to the prenatal diagnosis of fetal masses: a. Head neck: teratoma, lymphatic malformations, etc. b. Chest: congenital lung lesions, mediastinal teratoma, congenital myofibroblastic tumor, cardiac rhabdomyoma, etc. c. Abdomen/pelvis: hepatic congenital hemangiomas, neuroblastoma, congenital mesoblastic nephroma, sacrococcygeal teratoma, ovarian cyst, etc. d. Extremities: infantile fibrosarcoma, etc.4. Conclusion

### Detection of Aspirated Food in Pediatric Airway using Computed Tomography (CT)

#### Participants

Joseph Swicklik, RT, BS, Byron, MN (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Explain clinical significance challenges detecting aspirated food in pediatric airway.
- Describe challenges solutions for CT imaging.
- Explain method for optimal imaging of radiopaque food matter.
- Illustrate benefits of CT in detecting aspirated food particles in clinical applications.

#### TABLE OF CONTENTS/OUTLINE

1. Foreign body aspiration in pediatric airways
  - a. Common issue in pediatric patients
  - b. The most common type of foreign bodies aspirated is food
  - c. Challenges with plain film radiography in visualizing food due to low contrast
2. How computed tomography can be used to achieve improved visualization of aspirated food particles in the pediatric airway
  - a. CT offers thin slice axial images without superimposition of anatomy
  - b. Multiplanar reformats offer views from multiple angles to better detect food stuck in the airway
3. Challenges of CT imaging and solutions
  - a. CT has a longer exposure time which increases the chance of motion
  - b. Flash scanning to reduce scan time
  - c. Determining the best scanning factors to best visualize radio-translucent food
4. Phantom studies
  - a. Food items commonly aspired in peds seen in the ED
  - b. Tubes representing realistic sizes of airways in children
  - c. Tubes filled with food items placed inside anthropomorphic chest phantoms representing pediatric patients of different ages
  - d. Optimal scanning, reconstruction, and display techniques to visualize food items
  - e. CT number look-up table of commonly aspirated foods
5. Clinical examples and applications
  - a. Gummy bear detected in airway
  - b. Thoracic
  - c. Pediatrics
  - d. Adults at high risk for aspiration

Printed on: 04/12/24

PDEE-39

### Spectrum of Pediatric Distal Bowel Pathology Imaging from Prenatal Period to Adolescence

#### Participants

Hajer Jarraya, (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. The differential diagnosis of neonatal colonic obstruction includes Hirschsprung's disease, colonic atresia, congenital segmental dilation of the colon, NEC, anorectal malformation, and meconium plug syndrome. 2. The differential diagnosis of colonic obstruction in infants and children includes incarcerated intestinal hernia, sigmoid, cecal and transverse volvulus, intussusception, and rectal obstruction related to abdominopelvic masses or cysts. 3. The differential diagnosis of colonic wall thickening in older children includes infectious colitis, typhlitis, inflammatory (Crohn's or ulcerative colitis), vasculitis, ischemia, and neoplasm. 4. The differential diagnosis of colonic pathology can be classified based on age at presentation and primary imaging features (wall thickening, dilation/obstruction, transition point).

#### TABLE OF CONTENTS/OUTLINE

1.Epidemiology and classification of colonic pathology, 2.Imaging Findings A) Colonic pathology in the prenatal period B) Colonic obstruction in neonates, infants, children and adolescents C) Colonic wall thickening: infectious, inflammatory and neoplastic 3.Differential diagnosis 4.Algorithm of differential diagnosis based on age and primary imaging features

Printed on: 04/12/24

PDEE-4

### Lymphoscintigraphy: A Pictorial Review with Focus on Pediatric Patients

#### TEACHING POINTS

1. Classification of lymphedema and lymphatic dysplasias via illustrative mixed-modality case-examples 2. Sentinel node mapping in pediatric patients 3. Important pitfalls of the technical and interpretive aspects of lymphoscintigraphy

#### TABLE OF CONTENTS/OUTLINE

Introduction: Lymphoscintigraphy is a minimally invasive imaging technique that uses radiolabeled colloidal particles to evaluate lymphatic function  
Technique: 1. Radiopharmaceuticals 2. Administered activity/radiation dose 3. Imaging Protocols  
Indications for Lymphoscintigraphy: 1. Primary Lymphedema including Lymphatic Dysplasia 2. Secondary Lymphedema 3. Chylous Leaks 4. Sentinel Lymph Node Mapping  
Imaging Findings with Illustrative Case Discussions: 1. Lymphedema 2. Absent Visualization of Regional Lymph Nodes 3. Delayed or Asymmetric lymphatic Transit 4. Collateral Lymphatic Channels 5. Dermal Backflow 6. Chylous Effusion or Ascites 7. Sentinel Lymph Node Visualization Pitfalls  
Summary: Lymphoscintigraphy plays a unique role in evaluation disorders of lymphatic development, acquired lymphatic disorders, and assessment of chylous fluid collections. Familiarity with normal patterns of lymphatic transit, abnormal lymphatic transit, and common pitfalls are crucial for radiologists performing and interpreting these examinations.

### Imaging of Congenital Hearing Loss: A Practical Approach

#### Participants

Rafael Loureiro, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To review important anatomic landmarks in the pediatric temporal bone. 2. To discuss the imaging technique and protocols for the evaluation of congenital hearing loss. 3. To present a practical guide to facilitate comprehension of radiologic findings and the role of imaging in the evaluation of congenital hearing loss.

#### TABLE OF CONTENTS/OUTLINE

Introduction  
Principles of the basic workout investigation- Screening for hearing loss in newborns- Functional evaluation: quick review of audiometric studies for radiologists  
Temporal Bone Anatomy  
Classification of congenital hearing loss- by severity: slight, mild, moderate, severe and profound- by type: conductive, sensorineural, mixed- by causes: genetic (syndromic and non-syndromic); environmental; congenital lesions and malformations  
Imaging studies: CT and MRI of the temporal bone- imaging protocol and special considerations for congenital hearing loss evaluation  
Instructive cases by causes and main imaging features  
A step-by-step guide to diagnose congenital malformations  
Principles of imaging evaluation for guiding treatment  
Take home messages

PDEE-42

### **Bridging the Gap Between the Symptoms to Radiology Beyond the Anatomy of Temporal Bones in Pediatrics and Young Adults**

#### **Participants**

Nahyun Jo, MD, Galveston, TX (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

The ear is a highly specialized organ in a tightly packed space. Trainees are used to the classification of temporal bone pathology with respect to their anatomical locations; inner, middle, and outer ear. Although anatomical search patterns allow a thorough evaluation of complex ear structures, understanding symptomatologic categorization not only aids in an active search for differential diagnosis but also broadens the understanding of the pathophysiology and management.

#### **TABLE OF CONTENTS/OUTLINE**

The introduction is a basic review of temporal bone anatomy and commonly used modality. The second section, "Bridging the gap," discusses a quick guide to understanding relevant clinical information, such as audiometry or otoscopy. In the third section, "Symptoms to radiology," each ear pathology is categorized by each clinical scenario. For each symptom and appropriate pathology, key points to report or "what surgeons want to know" are detailed. The symptoms are divided into otalgia, hearing loss, tinnitus, and otorrhea. Otalgia is subdivided into the acute and chronic onset of symptoms. Hearing loss is subdivided into conductive hearing loss and sensory hearing loss. Both conductive and sensory hearing loss has congenital, infectious/inflammatory, tumor, trauma, and miscellaneous etiologies. Tinnitus has vascular, tumor, and various etiologies. Otorrhea may occur with otalgia due to infection, but CSF otorrhea is discussed separately as it can be the sole reason for the exam without other overlapping symptoms.

### Palpable Head and Neck Lumps in Pediatrics: Tips and Tricks in Ultrasound

#### Participants

Ana Berasategui Criado, MD, Santander, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To illustrate the ultrasound appearance of the most frequent pediatric head and neck palpable lumps, acknowledge the imaging hallmarks of each condition, and correlate with other imaging tools. To Highlight the warning signs on ultrasound, recognize when additional testing is necessary and discuss subsequent management.

#### TABLE OF CONTENTS/OUTLINE

The presence of palpable lumps of the head and neck is a frequent complaint in children, including a broad spectrum of infectious, tumoral conditions, embryologic remnants, and vascular malformations, with the large majority proven benign. The radiologist must recognize the warning signs that allow early management of those with potential malignancy or those leading to space compromise over vascular and respiratory structures, including onset during the neonatal period, firm consistency, rapid growth, or location underneath the fascia. Ultrasound has arisen as the first-line imaging modality for initial evaluation. It represents a fast and safe technique, which can provide essential information for the characterization of the lesion, acting as a guide in diagnostic and therapeutic procedures. This ultrasound approach guides subsequent decision-making, including follow-up, complementary testing, or treatment through interventional drainage or surgical excision. Further investigation with cross-sectional imaging is warranted if the characteristics of the mass are beyond the scope of ultrasound or if malignancy is suspected. We provide a pictorial review of illustrative cases from our institution to help identify the key imaging findings and emphasize the role of ultrasound in the diagnosis and interventional treatment of pediatric lumps.

PDEE-44

### Atlas of Secondary Ossification Centers, Physeal Variations, and Cortical Buckles” in the Pediatric Skeleton: Radiographic and MRI Correlation of Normal and Abnormal Findings.

#### Participants

Jade Iwasaka-Neder, MD, Boston, MA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Systematically illustrate the variable radiographic appearances of secondary ossification centers and physes at different stages of skeletal development
- Compare and contrast MRI appearances of normal versus abnormal growth centers to highlight their differences and improve their diagnosis
- Elucidate normal and abnormal areas of cortical buckling in children
- Illustrative examples of pathologic mimickers

#### TABLE OF CONTENTS/OUTLINE

- o Secondary ossification centers on radiography and MRI: imaging characteristics, expected time of appearance, and locational differences.
- Sternum (Manubrium; Sternebrae; Xiphisternum; Unfused sternebrae sternal foramen)
- Scapula (Coracoid centers; Acromion centers)
- Upper limb (Greater humeral tuberosity; Lesser humeral tuberosity; Elbow mnemonics: CRITOE and CRITOL; Carpal bones)
- Pelvis (Iliac spines; Ischial tuberosity; Acetabular rim)
- Lower limb (Distal femoral condyles; Tibial tubercle; Medial and lateral malleoli; Patella; Calcaneus)
- o Cortical buckles and nutrient canals. Do they belong here? (Tibia; Fibula; Femur; Clavicle; Tarsal bones; Metacarpals and phalanges; Metatarsals)
- o Physeal variations (Distal fibula; Distal tibia; Proximal humerus; Distal radius; Distal ulna; Different types of normal physes)
- o Normal versus Fracture (Case review)

### Childhood Constipation: How Imaging Evaluation Can Help

#### Participants

Lívia Alves, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Constipation in the pediatric population is a prevalent diagnosis worldwide. Frequent imaging examinations are required to investigate the diagnosis, and generally to differentiate the functional etiology and its degrees from an organic cause. Therefore, the radiologist must know the particularities of each imaging method, know how to indicate the ideal exam in the face of clinical suspicion, and interpret the most diverse findings to arrive at the final diagnosis. This presentation aims to: (1) point out the main imaging tests that can be used in the diagnosis of constipation in pediatric patients, detail their characteristics and help in choosing the method in the face of clinical suspicion. (2) review the imaging findings in cases of functional and organic constipation, highlighting the main related pathologies: Hirschsprung's disease, visceral myopathy and chronic intestinal pseudo-obstruction. (3) debate the imaging findings of the most frequent complications.

#### TABLE OF CONTENTS/OUTLINE

Imaging methods used in the diagnosis of constipation, its characteristics, and main indications in the face of clinical suspicion include abdominal radiography, barium enema and colonic transit, computed tomography, magnetic resonance imaging and ultrasound. Case-based review of the functional and organic etiology of constipation (Hirschsprung's disease, visceral myopathy, chronic intestinal pseudo-obstruction, intra-abdominal tumor and VACTERL association). Case-based review of complications (fecaloma, stercoral colitis, and perforation) and associated diseases (voiding dysfunction).

### The PRETEXT Staging System for Primary Liver Tumors in the Pediatric Population. A Cases-based Pictorial Review

#### Participants

Mariano Lorea, Barracas, Argentina (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The PRE-Treatment EXTent of tumor (PRETEXT) system aims to standardize imaging evaluation and risk stratification of hepatoblastoma and hepatocellular carcinoma before implementation of any treatment. PRETEXT grades provide valuable information regarding prognosis and overall survival. Liver is divided into four sections: left lateral (LL), left medial (LM), right anterior (RA) and right posterior (RP). Liver tumors are separated in four groups (I-IV) based on the number of contiguous tumor-free liver sections. Higher groups are related to worst outcomes.

#### TABLE OF CONTENTS/OUTLINE

Introduction  
What means PRETEXT?  
Prognosis implications  
Liver segmentation  
How to divide the liver? From Couinaud's segmentation to PRETEXT segments.  
PRETEXT groups  
Groups I to IV. Cases-based pictorial review. Imaging clues to precise PRETEXT group assignment.  
Additional PRETEXT criteria.  
Hepatic venous involvement (V and P)  
Extrahepatic disease (E)  
Multifocality (F)  
Tumor rupture (R)  
Caudate lobe involvement (C)  
Lymph nodes (N) and distant metastasis (M)

### Pediatric Primary Intracranial Sarcoma with Features of DICER1 Mutation: A Challenging Diagnosis

#### Participants

Jossue Espinoza SR, MD, Lima 01, Peru (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

TEACHING POINTS Pediatric primary intracranial sarcomas have an aggressive clinical course. The incidence of pediatric primary intracranial sarcoma with features of DICER1 mutation has been increasing. Imaging features of pediatric primary intracranial sarcomas with features of DICER1 mutation are not well documented. MRI and CT imaging play a crucial role in establishing a diagnosis. MRI plays a crucial role in follow up during treatment and evaluation for residual disease after surgery. Since there are several differential diagnoses, radio-pathologic correlation of these tumors is essential to confirm the diagnosis.

#### TABLE OF CONTENTS/OUTLINE

The goals of this exhibit are to: Provide a pictorial review of the diverse imaging appearances of pediatric primary intracranial sarcoma with features of DICER1 mutation and differential diagnoses. Discuss specific imaging and pathological characteristics of pediatric primary intracranial sarcoma with features of DICER1 mutation and differential diagnoses. Familiarize the audience with the imaging of pediatric primary intracranial sarcoma with features of DICER1 mutation and emphasize the importance of radio-pathologic correlation. These entities include:

- Pediatric Primary intracranial sarcomas with features of DICER1 mutation.
- Potential pitfalls and differential diagnoses of these tumors including other mesenchymal non-meningothelial tumors of the central nervous system, cavernous malformation (cavernous angioma or cavernoma) and high-grade brain tumors in pediatric patients.

### The Lung and Winding Road - A Pictorial Essay on Cystic Lung Diseases in Pediatric Radiology

#### Participants

Victor Nishimura, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

PNEUMATOCELE is a transient round and variable sized cyst, adjacent to consolidation or ground glass opacities. INTERSTITIAL LUNG EMPHYSEMA cystic or linear radiolucencies in the interstitium radiating from the hilum can be seen. CONGENITAL LUNG HYPERINFLATION increased lung volume and transparency can be seen. NEURENTERIC CYST is a fluid attenuating paravertebral lesion. BRONCHOGENIC CYST well circumscribed spherical or ovoid masses of variable attenuation can be seen. PULMONARY SEQUESTRATION multiple cystic lesions and anomalous artery nutrition can be seen. CYSTIC LYMPHANGIECTASY can be associated with syndromes, also congenital cardiac anomalies. CONGENITAL PULMONARY AIRWAY MALFORMATION usually presents as a solitary well defined thin walled cyst or multiple cysts of varying sizes. Multiple irregular shaped cysts are characteristic of LANGERHANS CELL HISTIOCYTOSIS. LYMPHANGIOLEIOMYOMATOSIS characterized by diffuse thin walled cysts surrounded by normal lung without regional sparing, accompanied by small centrilobular nodules.

#### TABLE OF CONTENTS/OUTLINE

### Neonatal Subpial Hemorrhage: A Closer Look

#### Participants

Eman Marie, MSc, Hamilton, ON (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1- Understand the anatomy and physiology of the subpial space. 2- Describe causes of subpial hemorrhage in neonates. 3- Discuss the clinical presentation and the indications of imaging. 4- Identify the different imaging modalities used to identify and evaluate the subpial hemorrhage. 5- Discuss and exemplify the imaging features of subpial hemorrhage. 6- Classify the different types of subpial hemorrhage, comorbid conditions, and prognosis.

#### TABLE OF CONTENTS/OUTLINE

1- Embryology and early development of brain meninges with a focus on the pia mater. 2- Anatomy (gross and microscopic) and physiology of the subpial space. 3- Incidence and potential risk factors linked to subpial hemorrhage in neonates. 4- Imaging of neonatal subpial hemorrhage: US, CT and MRI findings, standard protocols and special considerations during neonatal brain imaging. 5- Diagnostic accuracy of each imaging modality and factors that may affect the accuracy of interpretation. 6- Pitfalls and differential diagnosis of subpial hemorrhage. 7- What the referring physician needs to know: diagnosis and extent of abnormalities. 8- Proposed imaging-based prognostication. 9- Neonatal subpial hemorrhage and abusive head trauma. 10- Management strategies of neonatal subpial hemorrhage and the role of imaging follow up. 11- Recent research and future directions on neonatal subpial hemorrhage.

PDEE-5

### Pediatric Lung and Heart Evaluation: A Pictorial Review of Scintigraphy, Salivagram, and Cardiac Shunts

#### TEACHING POINTS

1.Lung scintigraphy is a useful tool for evaluating pulmonary function in children, with both perfusion and ventilation/perfusion scans providing valuable information about lung physiology. 2.In the context of congenital diaphragmatic hernia, scintigraphy can be used to predict inadequate lung development and assist with surgical planning. 3.When evaluating suspected pulmonary embolism in children, ventilation/perfusion scintigraphy can be a useful alternative to CT angiography. 4.Salivagram can be helpful in the context of concern for silent aspiration and GE reflux in neurologically impaired children.

#### TABLE OF CONTENTS/OUTLINE

Introduction 1.Pediatric Considerations 2.Image acquisition 3.Radiation dose Lung Scintigraphy in Children 1.Indications 2.Lung perfusion Scintigraphy 3.Ventilation/Perfusion scintigraphy 4.Technique in Lung Perfusion Scintigraphy Cardiac Imaging 1. Right to left shunting 2. Left to right shunting Lung Scintigraphy in the Context of Congenital Diaphragmatic Hernia 1.Ventilation/Perfusion in the prediction of inadequate lung development 2.Role of scintigraphy in predicting outcomes and surgical planning 3.Dynamic ventilation abnormalities and matched defects Pulmonary Embolism 1.Indications 2.Ventilation/Perfusion scintigraphy 3.Ventilation/Perfusion vs CT angiography Salivagram 1. Indications 2. Image technique and acquisition Conclusions

PDEE-51

### Imaging Findings and Management Strategies to Liver Masses in Children with Underlying Predispositions: A Review from the ACR Pediatric LI-RADS Working Group

#### Participants

Amy B. Kolbe, MD, Rochester, MN (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Review the imaging approach and differential diagnosis for liver masses in children with underlying genetic syndromes, congenital abnormalities, vascular abnormalities, and other conditions that predispose to liver lesions. 2. Illustrate the characteristic imaging findings of benign and malignant liver tumors in children with predisposing conditions. 3. Discuss the screening guidelines and management approach to liver masses encountered in the predisposed child.

#### TABLE OF CONTENTS/OUTLINE

Spectrum of pediatric liver tumors and pseudotumors in: 1. Genetic syndromes: Beckwith Wiedemann syndrome, familial adenomatous polyposis, progressive familial intrahepatic cholestasis, tuberous sclerosis, cystic fibrosis, glycogen storage disease, tyrosinemia, Wilson disease, hereditary hemochromatosis 2. Congenital abnormalities: Biliary atresia, Alagille syndrome, Abernethy malformation 3. Miscellaneous: Metabolic syndrome, Fontan associated liver disease, Budd Chiari syndrome For each entity we will discuss the underlying pathogenesis of liver disease, types of liver masses described with the entity, characteristic imaging findings of each liver mass, surveillance strategies, and key findings that warrant further intervention

Printed on: 04/12/24

PDEE-52

### Fetal Magnetic Resonance Imaging Findings in Conjoined Twin Pregnancies

#### TEACHING POINTS

The learner will understand how to differentiate the various conjoined twin variants by their fetal MRI appearance. The learner will understand which features of conjoined twin shared anatomy predict survival and the potential for separation and how fetal MRI can be used in this assessment. The learner will review fetal MRI examples of additional congenital anomalies within the context of conjoined twinning.

#### TABLE OF CONTENTS/OUTLINE

Conjoined twins are a rare complication of monozygotic twinning. Fetal MRI can provide a detailed evaluation of these twins' shared anatomy and identify additional congenital anomalies, thereby allowing the fetal care team to anticipate the potential for survival and separation in these complex twin pairs. This exhibit will review the fetal MRI appearance of the different morphological variants of conjoined twins, including several unusual cases of minimally conjoined twins. Emphasis will be placed on those anatomical features most important for determining conjoined twin prognosis and potential for separation. Fetal MRI cases demonstrating additional important congenital anomalies within the context of conjoined twinning will be presented as part of a comprehensive fetal assessment.

### Sonographic Evaluation of the Umbilical Region in Children

#### Participants

Lizbet Perez-Marrero, Santiago De Chile, Chile (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To describe the normal sonographic appearance of the umbilicus and the midline structures of the anterior abdominal wall. To recognize ultrasound findings of the most common lesions of the umbilicus, including anomalies of the embryonic remnants.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Ultrasound protocol of the umbilical region and anterior abdominal wall. 3. Normal anatomy of the umbilicus and midline anterior abdominal wall 4. Umbilical lesions a. Umbilical granuloma b. Omphalitis b. Epidermal cyst c. Cutaneous ciliated cyst d. Tumors (hemangioma) e. Keloid f. Polyp g. Cutaneous umbilicus h. Umbilical hernia i. Paraumbilical hernia j. Epigastric hernia 5. Embryonal anomalies a. Umbilical vessels i. Omphaloarteritis ii. Omphalophlebitis iii. Thrombosis of umbilical vein varix b. Urachus: i. Urachal cyst ii. Infected urachal cyst iii. Urachal diverticulum iv. Urachal sinus v. Urachal fistula c. Omphalomesenteric duct i. Vitelline cyst ii. Persistent vitelline vessel iii. Meckel diverticulum iv. Omphalomesenteric fistula v. Omphalomesenteric fibrotic cord 6. Conclusions

PDEE-54

### Malignant Rhabdoids and Related Pediatric Tumors: A Multimodality Imaging Review and Pathologic Correlation

#### Participants

Apeksha Chaturvedi, MD, Rochester, NY (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Malignant rhabdoid tumors of childhood include malignant rhabdoid tumor of kidney (MRTK), extrarenal malignant rhabdoid (eMRT) and atypical rhabdoid-teratoid tumors (AT/RT); tumors are highly aggressive, carry a dismal prognosis and may develop in utero 2. "Rhabdoid" morphology on histology- large polygonal cells with eosinophilic cytoplasm, vesicular nuclei and central prominent nucleolus 3. Underlying SMARCB1 mutations, a gene encoding a core subunit of the SWI/SNF chromatin-remodeling complex 4. Imaging appearances overlap with those of other entities, with certain imaging features aiding distinction; eg. cerebellopontine angle involvement and intratumoral hemorrhage favor AT/RT over medulloblastoma 5. Rhabdoid tumor predisposition syndrome (RTPS) is characterized by proband with rhabdoid tumor and/or family history of rhabdoid tumors and/or multiple SMARCB1- and/or SMARCB1-deficient tumors (synchronous or metachronous) and a heterozygous germline variant in SMARCB1 or SMARCB1; imaging surveillance guidelines have been proposed

#### TABLE OF CONTENTS/OUTLINE

1. Spectrum of malignant rhabdoid and related SMARCB1-deficient neoplasms of childhood 2. Updated WHO classification (2021) for malignant rhabdoids and related pediatric tumors 3. Underlying SMARCB1 deficiency and mechanisms by which it drives rhabdoid tumor growth 4. Multimodality imaging manifestations of malignant rhabdoid tumors, with emphasis on PET-CT and PET-MR 5. Role of ultrasound and whole-body MRI in surveillance in patients with RTPS 6. Pathologic correlation

PDEE-55

### A Trainee's Guide to Neonatal Abdominal Radiographs

#### TEACHING POINTS

1. Abdominal radiographs are an important tool to diagnose and screen acute intra-abdominal pathologies in the neonatal population. 2. The widespread availability and portable nature of radiographs make it ideal for the bedside evaluation of unstable neonates. 3. Knowledge of pathologies and their appearance on abdominal radiographs are crucial for timely and accurate diagnoses of life-threatening conditions and to guide further imaging and management.

#### TABLE OF CONTENTS/OUTLINE

1. Technique and views to obtain neonatal abdominal radiographs: Assessment of quality, tips for mobile exams, and use of shielding (ie. gonadal shielding and update on recommendations). 2. Review of lines and tubes on abdominal radiographs in neonates (ie. Umbilical artery and vein catheters, PICC, NG tube and port location). 3. Review of normal findings (ie. Expected gas pattern based on hours of life). 4. Do-not-miss findings: Pneumoperitoneum, pneumatosis, portovenous gas, bowel obstruction, pneumomediastinum/pneumothorax in the lung bases. 5. Review of acute pathologies and findings on abdominal radiographs (abnormal patterns): Necrotizing enterocolitis, congenital causes of bowel obstructions (upper/lower) (ie. Malrotation/volvulus, duodenal/jejunal atresia, Hirschsprung's disease, imperforate anus), gasless abdomen

PDEE-56

### From Head to Tail: Exploring Applications of Pediatric Neurological Ultrasound

#### TEACHING POINTS

1. Ultrasound for neurological pathologies is a useful adjunct to conventional imaging (CT/MRI) as a screening and diagnostic tool in pediatric patients due to its universal availability and low cost. 2. Lack of ionizing radiation and IV contrast, and incomplete pediatric bone ossification and unfused fontanelle make ultrasound an excellent modality for evaluation of neurological pathologies in young patients. 3. Optimal ultrasound technique and understanding of the relevant pathophysiology of pediatric neurological conditions that can be assessed with ultrasound can significantly improve timely access to screening, diagnosis and patient care.

#### TABLE OF CONTENTS/OUTLINE

1. Brain ultrasound: Indication (ie. Premature screen, cooling therapy), Technique, Normal structures, variants and measurements (ie. ventricular index), Vascular assessment, Pathologies (ie. germinal matrix bleed, periventricular leukomalacia). 2. Transcranial doppler ultrasound: Indications (ie. Sickle cell disease), Technique, Vessel anatomy, Normal measurements, Abnormal findings and clinical significance. 3. Cranial sutures ultrasound: Indications (ie. Abnormal skull shape), Technique, Cranial suture anatomy, Normal findings (ie. fontanelles, suture closure), Craniosynostosis and clinical significance. 4. Spine ultrasound: Indication (ie. sacral dimple, suspected spinal dysraphism), Technique, Normal findings and anatomy, Pathologies (ie. low conus, thickened filum, myelomeningocele, intraspinal collections, masses).

### US Evaluation with CT/MRI Correlation of Neonatal and Infantile Brain Tumors and Other Intracranial Masses

#### Participants

Samantha Gerrie, MBChB, FRANZCR, Vancouver, BC (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

While some neonatal brain tumors are suspected on antenatal US imaging, most are diagnosed postnatally. Head US may be the first imaging modality for work-up of an intracranial mass which can present with non-specific clinical features. Most cases will require further imaging work-up, usually with MRI. Recognition of the US features of the most common neonatal and infantile intracranial masses and their complications can aid in appropriate and timely subspecialty referral. Objectives: 1. Discuss the US features of the most common neonatal and infantile intracranial masses. 2. Describe the correlation between antenatal US and fetal MRI and postnatal US and CT/MRI in the imaging work-up of these masses. 3. Explain the use of US to identify any associated complications which require urgent neurosurgical assessment.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Pseudomass 2a. Intraventricular hemorrhage 3. Non-neoplastic masses 3a. Arachnoid cyst 3b. Choroid fissure cyst 3c. Hypothalamic hamartoma 4. Supratentorial neoplasms 4a. Teratoma 4b. Low-grade glioma 4c. High-grade glioma 4d. Embryonal tumor with multilayered rosettes 4e. Choroid plexus tumors 4f. Osteochondrolipoma 5. Posterior fossa neoplasms 5a. Atypical teratoid/rhabdoid tumor 5b. High-grade glioma 6. Conclusion

### US Evaluation with Fetal MRI and CT/MRI Correlation of Pediatric Congenital and Inherited Brain Anomalies

#### Participants

Samantha Gerrie, MBChB, FRANZCR, Vancouver, BC (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. While many congenital and inherited brain anomalies are suspected from antenatal US and fetal MRI, postnatal head US may be the first imaging modality in the work-up of these heterogeneous anomalies 2. Most cases will require further imaging work-up with CT and/or MRI 3. Recognition of the US features of the most common of these lesions is important in order to direct appropriate additional imaging and timely subspecialty referral Objectives 1. Discuss the US features of the most common pediatric congenital and inherited brain anomalies 2. Describe the correlation between antenatal US and fetal MRI and postnatal US and CT/MRI 3. Explain the use of US to narrow the differential diagnosis and direct appropriate additional imaging work-up and management

#### TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Midline anomalies a. Agenesis of corpus callosum (ACC) b. Dysgenesis of corpus callosum variants i. Asymmetric ventriculomegaly, interhemispheric cyst and dysgenesis of corpus callosum (AVID) ii. Dysgenesis of corpus callosum with pericallosal lipoma c. Septo-optic dysplasia 3. Malformations of cortical development a. Periventricular nodular heterotopia b. Lissencephaly c. Hemimegalencephaly d. Tuberous sclerosis 4. Metabolic a. Ornithine transcarbamylase (OTC) deficiency 5. Brainstem and posterior fossa anomalies a. Diencephalic mesencephalic junction dysplasia b. Dandy-Walker malformation c. Joubert syndrome and related disorders (JSRD) d. Chiari 2 malformation secondary to myelomeningocele e. Arachnoid cyst f. Mega cisterna magna 6. Vascular anomalies a. COL4A1 mutation b. Vein of Galen malformation 7. Conclusion

PDEE-59

### Differential Diagnosis of Hyperechoic Lesions on Neonatal Head US

#### Participants

Samantha Gerrie, MBChB, FRANZCR, Vancouver, BC (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. There are normal areas of increased echogenicity on neonatal head US which should not be mistaken for pathology, including choroid, midline vermis, hyperechoic caudate heads, periventricular white matter "halo", and white matter tracts including the corticospinal tracts 2. The differential diagnosis of hyperechoic lesions depends on their location 3. Many lesions can be confidently diagnosed and follow on US, while others require further imaging work-up to narrow the differential diagnosis and assist in ongoing management

#### TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Normal areas of increased echogenicity a. Choroid b. Midline vermis c. Hyperechoic caudate heads d. Mineralizing vasculopathy e. Periventricular white matter "halo" f. Transmantle speckled increased echogenicity g. Corticospinal tracts 3. Caudothalamic groove a. Grade 1 germinal matrix hemorrhage b. Grades 2 and 3 germinal matrix hemorrhage 4. Periventricular/deep white matter a. Periventricular hemorrhagic infarction b. White matter injury c. Deep medullary venous thrombosis d. Infection e.g. *Citrobacter koseri* e. ECMO-related hemorrhage f. Water-shed infarct g. Punctate foci of white matter injury 5. Diffuse white matter a. Arterial infarction b. Hypoxic-ischemic encephalopathy 6. Deep gray matter a. Central cerebral venous sinus thrombosis 7. Peripheral parenchyma a. Peripheral cerebral venous sinus thrombosis b. Vein of Labbé hemorrhagic venous infarction 8. Cerebellum a. Cerebellar hemorrhage 9. Extraaxial a. Subdural hemorrhage b. Extradural hemorrhage c. Subpial hemorrhage 10. Conclusion

### Pictorial Review of Pediatric Neuroimmune Disease

#### Participants

Alejandra Aguado, MD, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Neuroimmune diseases are a group of inflammatory disorders with varying pathogenic mechanisms, including autoantibodies against self-targets, cell-mediated, infection-triggered, paraneoplastic, and genetically determined diseases. This group continues to expand with the discovery of new clinicopathologic entities. Radiologists should be familiar with these diseases and able to make a differential diagnosis, as early diagnosis and appropriate treatment with immunotherapy can modify disease course in some cases. Additionally, different diseases within this group can present with varied evolution and prognosis. The main teaching points of this exhibit include: 1. Review of the most frequent entities within each group 2. Description of key imaging features that aid in differential diagnosis among different entities.

#### TABLE OF CONTENTS/OUTLINE

This exhibit presents a range of disease pathologies encountered in clinical practice, including: 1. Demyelinating diseases: a) Acute disseminated encephalomyelitis (ADEM) b) Pediatric multiple sclerosis (MS) c) Neuromyelitis optica spectrum disorders (NMOSDs) d) Anti-MOG associated disease 2. AntiNMDAR encephalitis, including one triggered by herpes simplex virus encephalitis 3. Lupus erythematosus 4. Rasmussen encephalitis 5. Hemophagocytic lymphohistiocytosis.

### Navigating the Fine Line of Pediatric Lines: A Primer on Pediatric Intravascular Catheters

#### Participants

Narendra Shet, MD, (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To review various reasons and approaches for vascular access in pediatric patients. 2. To discuss the role of the radiologist in assessment of pediatric vascular access. 3. To review optimal and suboptimal line placement in pediatric patients in a variety of clinical scenarios, including neonates and patients with congenital heart disease.

#### TABLE OF CONTENTS/OUTLINE

1. Overview of vascular access in pediatric patients - reasons for short and long term access and means of guidance (non-guided versus image-guided), and role of radiologist (for diagnostic radiologist, assessing adequacy of line position, and for interventional radiologist, line placement using means of image guidance). 2. Central lines in pediatric patients, including PICC, Non-PICC (IJ/Femoral), and long-term Access including hemodialysis catheters/tunneled central venous lines, as well as ports. 3. Neonatal specific catheters, including umbilical arterial and venous catheters. 4. Cardiac catheters, such as intra-cardiac catheters, ECMO cannulae, and ventricular assist devices. 5. Where relevant, photographs of support devices, either in vivo or ex vivo, will be included in figures to allow for comparison to radiographic appearance.

PDEE-61

### Imaging Evaluation of Pediatric Cystic Neck Masses

#### Participants

Samantha Gerrie, MBChB, FRANZCR, Vancouver, BC (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Pediatric neck masses are a common indication for imaging referral and US is often the first imaging modality in their work-up. 2. Following detection of a cystic neck mass on US, the radiologist must determine whether the lesion has a characteristic US appearance and requires no further imaging work-up or whether further imaging work-up is required. 3. Appropriate use of CT/MRI can aid in narrowing the differential diagnosis and assist in surgical planning

Objectives: 1. List the sonographic features of pediatric cystic neck masses which have a characteristic sonographic appearance and require no further imaging work-up 2. Recognize those lesions which require additional imaging work-up 3. Discuss the appropriate use of CT/MRI to aid in narrowing the differential diagnosis

#### TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Congenital anomalies a. First branchial cleft anomalies b. Second branchial cleft anomalies c. Pyriform fossa sinus tract (PFST) lesions d. Dermoid cyst e. Lymphatic malformation f. Thyroglossal duct cyst 3. Inflammatory a. Ranula 4. Infectious a. Suppurative pyogenic lymphadenitis b. Non-tuberculous mycobacterial cervical lymphadenitis (MAIC) c. Retropharyngeal abscess 5. Neoplastic a. Teratoma 6. Conclusion

### Twist and Turns: Comprehensive Radiological Review of Intestinal Malrotation and Midgut Volvulus

#### TEACHING POINTS

1. Describe the imaging findings of intestinal malrotation and midgut volvulus in upper gastrointestinal (UGI) studies. 2. Discuss the utility of ultrasound (US) in intestinal malrotation and midgut volvulus. 3. Highlight the imaging pearls and pitfalls in cases of intestinal malrotation and midgut volvulus. 4. Illustrate different clinical presentations of malrotation and midgut volvulus through a variety of clinical cases.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction: Describe the normal orientation and fetal development of the intestine. Highlight the importance of early detection and management of intestinal malrotation. 2. Pathophysiology of intestinal malrotation and midgut volvulus: Discuss the mechanism of midgut volvulus in intestinal malrotation along with clinical presentation and complications. 3. Upper GI studies: Review the standard views in UGI studies with emphasis on imaging landmarks to insure proper position and quality. Discuss the imaging pearls and pitfalls in diagnosing intestinal malrotation/midgut volvulus in UGI studies. 4. Other radiological modalities: Role of other imaging modalities in intestinal malrotation/midgut volvulus as a problem solver in challenging cases including US, computed tomography (CT) and lower GI studies. 5. Atypical cases of midgut volvulus: Examples of atypical cases of midgut volvulus including recurrent and chronic presentations. Use different cases as a teaching key points in diagnosis and management of midgut volvulus. 6. Conclusion: Summary of the radiological approach in intestinal malrotation and midgut volvulus.

PDEE-63

### Intestinal Ultrasound in Pediatric Inflammatory Bowel Disease: What Radiology Residents Should Know

#### Participants

Paola Aguirre Camino, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1) Become familiar with the correct performance of pediatric bowel ultrasound scan. 2) Propose a standardized ultrasound report. 3) Recognize the ultrasound appearance of the normal and pathological bowel pattern. 4) Learn the typical sonographic findings, evaluate the activity and assess the presence of possible complications in Inflammatory Bowel Disease.

#### TABLE OF CONTENTS/OUTLINE

Crohn's disease and ulcerative colitis are chronic inflammatory bowel diseases frequently diagnosed in childhood, being imaging methods fundamental in the diagnostic approach, severity assessment, treatment monitoring and in the suspicion of complications. Due to the need to frequently evaluate these children, intestinal ultrasound becomes especially important compared to colonoscopy and MRI, as it is a non-invasive technique, easy for the child to accept, accessible and repeatable; however, as it is an operator-dependent examination, it requires certain experience and should be performed systematically using the appropriate technique. Intestinal ultrasound is a useful modality for intestinal bowel disease imaging and a valuable screening tool in the preliminary diagnostic workup of pediatric patients with suspected Inflammatory Bowel Disease. It assesses the presence of thickening of the intestinal wall as an indicator of inflammation, as well as the location and extent of the disease. It also allows evaluating the activity by quantifying the hyperemia of the intestinal wall using color Doppler, being a useful tool in the follow-up and control of the response to the treatment.

PDEE-64

### Slipped Capital Femoral Epiphysis: Emphasis on Early Recognition and Potential Pitfalls

#### TEACHING POINTS

\* Slipped capital femoral epiphysis (SCFE) is the most common hip disorder in adolescence, however the diagnosis is often delayed or missed due to vague clinical presentation, subtle radiographic findings, and technical variability.\* Early detection of SCFE hinges on close scrutiny of physeal morphology with particular attention to the epiphyseal tubercle, an important stabilizer of the physis in children.\* An AP and frog-lateral view of the pelvis including both hips is the mainstay of radiographic assessment of SCFE, and failure to diagnose SCFE is often a product of improper technique.\* Cross-sectional imaging is not routinely performed in SCFE patients, but can be helpful to identify radiographically occult early slips, assess femoral head perfusion, and better understand anatomy for surgical planning purposes.

#### TABLE OF CONTENTS/OUTLINE

\* Learning objectives\* Background including rationale for focus on SCFE, definition and epidemiology, pathophysiology and histology, and clinical findings and classification\* Early physeal changes in SCFE, introduction of the epiphyseal tubercle and rotational microinstability, and illustration of the peritubercle lucency on radiographs\* Later radiographic findings and severity grading on frontal and frog-lateral radiographs\* Technical pitfalls on radiography with emphasis on the importance of imaging both hips on all views\* Role of cross-sectional imaging including MRI for early slips, prognostic relevance of femoral head perfusion, and use of CT or Zero-TE MRI to assess callus preoperatively

### Imaging Approach to Pediatric Neurometabolic Imaging

#### Participants

Samantha Gerrie, MBChB, FRANZCR, Vancouver, BC (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Describe the most commonly used classification systems for pediatric neurometabolic diseases 2. Discuss the clinical features and imaging patterns which aid in narrowing the differential diagnosis in the work-up of pediatric neurometabolic diseases 3. Illustrate the MR features of the most common pediatric neurometabolic diseases, including the MR spectra suggestive of specific disorders

#### TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Classification systems a. Organelle dysfunction i. Mitochondrial disorders ii. Lysosomal storage disorders iii. Peroxisomal biosynthesis disorders b. Laboratory markers i. Lactate ii. Ammonia iii. Inborn errors of metabolism c. Presentation i. Neonatal metabolic encephalopathy ii. Head size d. Imaging pattern i. Deep gray matter involvement - striatum, globus pallidus, hyperdense thalami ii. White matter involvement - subcortical U-fibres, central white matter, anterior vs posterior iii. Hypomyelination disorders iv. MR spectroscopy suggestive of specific diseases v. Enhancement pattern 3. 16 "must know" imaging patterns suggestive of a specific neurometabolic disease: a. Maple syrup urine disease b. Canavan disease c. Alexander disease d. X-linked adrenoleucodystrophy e. Metachromatic leucodystrophy f. Pelizaeus-Merzbacher disease g. Mitochondrial encephalopathy with lactic acidosis and stroke-like episodes h. Non-ketotic hyperglycinemia i. Zellweger syndrome j. Mucopolysaccharidosis k. Leigh syndrome l. Panthothenate kinase-associated neurodegeneration m. Creatine kinase deficiency n. Megaloencephalic leucodystrophy with subcortical cysts o. Vigabatrin-related changes p. Methotrexate-related changes 4. Future directions 5. Conclusion

### Newborn Skeletal Radiographs: A Practical Guide

#### Participants

Marcelo Takahashi, MD, PhD, (*Presenter*) Speaker, Vertex Pharmaceuticals Incorporated

#### TEACHING POINTS

Neonatal skeletal abnormalities are rare occurrences in pediatric practice with a wide variety of causes and often overlapping radiographic features. The main teaching points of this exhibit are: 1) Illustrate the expected normal plain film appearance of the neonatal bone, including and what the most common pitfalls, regarding both normal development as well as technical imaging aspects. 2) Explain specific diseases radiographic findings with key clinical and epidemiological considerations 3) Illustrate the different imaging patterns with differential diagnosis checklist and explanation for each one

#### TABLE OF CONTENTS/OUTLINE

&5; &5; Normal newborn particularities and pitfalls&5; Normal Anatomy&5; Physiologic Neonatal Periostitis&5; &5; Trauma:&5; Delivery related fractures&5; Non accidental trauma&5; &5; Diffuse bone disease:&5; Rickets&5; Metabolic Bone Disease of Prematurity&5; Caffey Disease&5; Osteopetrosis&5; &5; Congenital abnormalities and malformations&5; Amniotic band syndrome&5; Hemimelia&5; Proximal Femoral Focal Deficiencies&5; Spine malformations&5; Chondrodysplasia punctata&5; Developmental Dysplasia of the Hip&5; &5; Infections:&5; Congenital Syphilis&5; Neonatal osteomyelitis

### Entering a New Dimension: Novel Use of Transabdominal 3D Ultrasound in Pediatric Gynecology

#### TEACHING POINTS

3D transvaginal pelvic ultrasound is a well-established imaging technique in the adult population for gynecologic applications. However, transvaginal ultrasound is not commonly utilized in the pediatric population. There are only sparse reports in the literature on the use of 3D transabdominal pelvic ultrasound in the pediatric population for gynecologic applications. In this educational exhibit, we will share our experience with 3D transabdominal pelvic ultrasound in the pediatric population, particularly for the evaluation of Mullerian duct anomalies and IUD positioning. We will begin with a review of scan technique and post-processing. Instructions for creation of a simple homemade ultrasound phantom for practicing these techniques will also be reviewed. We will then share several illustrative cases where 3D ultrasound provided useful information beyond standard 2D imaging in the assessment of Mullerian duct anomalies and IUD positioning. The challenges and limitations to this technique will also be discussed.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Review of scan technique and post-processing 3. Homemade ultrasound phantom: instructions and utility 4. Example cases of Mullerian duct anomalies 5. Example cases of IUD positioning

### Ultra Low Dose Fetal CT: A Simple Way to Understand the Various Exposure Doses to the Fetus

#### TEACHING POINTS

(1) When skeletal dysplasia is suspected by fetal ultrasound, it is often difficult to make an accurate prenatal diagnosis using ultrasound alone. (2) In such case, fetal skeletal CT is recommended because it has diagnostic power comparable to postnatal bone survey, but the only drawback is fetal radiation exposure. For this reason, we have devised Ultra low dose fetal CT (ULDFCT) from the viewpoint of ALARA. (3) On the other hand, estimating fetal radiation dose involves complex calculations, and methods that are easily understood by pediatric radiologists and CT technicians are needed. (4) This exhibition introduces a method to insuflate the exposure dose of the fetus and maternal body by simple calculation using the CT dose index (CTDI), which is available immediately before and after scanning.

#### TABLE OF CONTENTS/OUTLINE

A. Data acquisition (n=36); Patients with ULDFCT throughout of 2014 to 2021. CTDIvol : mean 0.48mGy, DLP : mean 18.62mGy.cm. These are the lowest exposure doses in fetal CT scans in the literature search. B. Estimation of various exposure doses of the fetus  
Fetal dose: mean; 0.36mGy. Fetal dose = CTDIvol x 0.8 mGy  
Organ dose of uterus; mean 0.58mGy. Organ dose of uterus = CTDIvol x 1.2; SSDE; mean: 0.57mGy, SSDE= = CTDIvol x 1.18  
Effective dose (ED) of maternal body; 0.39mSv. ED = CTDIvol x 0.81

### Neonatal Chest X-ray: How to Spot Abnormal Gas Patterns and Potential Pitfalls

#### Participants

Marta Sanmartin Lopez, MD, Santiago De Compostela, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Review the main projections and technical guidelines of neonatal chest radiography. 2. Review the systematic analysis of chest X-rays performed in neonates. 3. Emphasize some normal findings that differ from X-rays performed in older children and adults. 4. Analyze the typical radiological signs of pneumothorax, pneumomediastinum, pneumopericardium and pneumoperitoneum, and provide some practical examples that may help to differentiate pathology from potential pitfalls and mimics.

#### TABLE OF CONTENTS/OUTLINE

1. Analysis of neonatal chest X-ray a) Radiographic technique b) Systematic interpretation of neonatal chest X-ray. 2. Abnormal gas patterns a) Pneumothorax b) Pneumomediastinum c) Pneumopericardium d) Pneumoperitoneum

PDEE-7

### Going with the Flow: Implementing a 4D Flow MRI Program at a Children's Hospital

#### TEACHING POINTS

Four-dimensional flow MRI (4D flow) is a three dimensional spatial and velocity encoded phase contrast sequence that has emerged as a versatile imaging technique for qualitative as well as quantitative characterization of cardiovascular flow. The benefits of 4D flow include an easily prescribed volumetric acquisition with the ability to retrospectively quantify flow in any plane, in the acquired field of view. In the past, long scan times and complex post-processing workflows hindered 4D flow adoption into routine clinical practice for cardiovascular velocity and flow assessment, but improvements in image acquisition and processing have enabled standard clinical workflows. Additionally, there are unique in-vivo flow investigative parameters that provide newer insights into understanding cardiovascular physiology and pathophysiology. Our purpose is to: 1. Explain the utility of 4D flow. 2. Describe 4D flow acquisition parameters designed for imaging children with various congenital or acquired cardiovascular diseases. 3. Demonstrate a streamlined clinical 4D flow post-processing workflow. 4. Discuss research 4D flow applications.

#### TABLE OF CONTENTS/OUTLINE

1. General overview of 4D flow and key applications in the pediatric setting 2. Advantages of 4D flow over 2D phase contrast imaging 3. Image acquisition and post-processing using clinical cases (i) 9-years-old male with Fontan (ii) 19-years-old female with Bicuspid Aortic Valve 4. Research utility of 4D flow and future directions

### Acute Upper Airway Obstruction in the Pediatric Population: What's Behind the Stridor

#### Participants

Nahia Lizarraga Oroz, MD, Donostia, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Review the anatomic features of the pediatric airway. - Establish a systematic approach to radiographic evaluation. - Identify the key radiographic findings of common causes of acute upper airway obstruction through cases studied in our center.

#### TABLE OF CONTENTS/OUTLINE

Acute upper airway obstruction is more common in the pediatric population due to its various anatomical and physiological peculiarities. Several causes of airway obstruction have been described, such as foreign body obstruction, infection, neoplasm, congenital or vascular entities. Since the clinical presentation is often nonspecific and the evaluation of pediatric patients in the emergency setting is complicated, imaging techniques play a critical role in achieving an accurate diagnosis. The aim of this review is to evaluate the specific radiologic features that can be found in the different imaging modalities, with special emphasis on plain radiography, which is often sufficient to reach a correct diagnosis. As acute airway obstruction can be a life-threatening condition, it is essential that the radiologist recognizes the key imaging findings in order to ensure prompt management.

Printed on: 04/12/24

PDEE-71

### What Every Radiologist Should Know About Cranial Ultrasound: A Systematic Approach and Common Pathologies

#### Participants

Nahia Lizarraga Oroz, MD, Donostia, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Define the technical procedure of standard cranial ultrasound (CUS) and review the normal anatomic structures of the brain. - Identify the spectrum of pathologies seen in clinical practice. - Highlight some tips and tricks for diagnosis.

#### TABLE OF CONTENTS/OUTLINE

CUS is an extremely valuable tool for evaluating the brain in the first year of life and has become an essential part of routine pediatric radiology practice. It is an accessible, portable, inexpensive, and safe technique that can be used as often as needed. Because of its great advantages, it is imperative for the radiologist to know how to perform CUS and correctly interpret the findings. This review attempts to establish the clinical indications, define a systematic technique to adequately visualize and document all relevant intracranial structures, and highlight the most common pathologies seen in neonates, including - Hypoxic-ischemic encephalopathy in preterm infants (germinal matrix hemorrhage, cerebellar hemorrhage, and periventricular leukomalacia) - Hypoxic-ischemic encephalopathy in term patients - Cerebrovascular disease - Trauma-associated hematomas - Macrocephaly However, the usefulness of CUS is still highly dependent on the skill, knowledge and experience of the observer.

### Congenital Anomalies of the Posterior Fossa - An Imaging Travelogue

#### Participants

Shivaprakash Hiremath, DMRD, FRCR, Toronto, ON (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

This educational exhibit aims to: 1. Review the embryology and cross-sectional imaging anatomy of the posterior fossa. 2. Describe typical congenital malformations based on predominant cerebellar involvement, cerebellar and brainstem involvement, and predominant brainstem involvement.

#### TABLE OF CONTENTS/OUTLINE

- Describe the embryology and anatomical assessment of the posterior fossa along with diffusion tensor imaging.
- Depict the imaging findings in malformations predominantly affecting the cerebellum including cerebellar hypoplasia, hyperplasia and dysplasia (Chudley-mccullough syndrome, and Poretti-Bolthausen syndrome).
- Highlight the malformations affecting the cerebellum and brainstem such as alpha dystroglycanopathies, tubulinopathy, molar tooth malformations, and pontocerebellar hypoplasia.
- Illustrate the malformations predominantly affecting the brainstem such as pontine tegmental cap dysplasia, horizontal gaze palsy with progressive scoliosis, and diencephalic-mesencephalic junction dysplasia along with malformations with no known genetic cause such as Rhombencephalosynapsis, PHACE syndrome, and oculocerebrocutaneous syndrome.

### Imaging in Pediatric Neuroinflammatory Disorders and Mimics

#### Participants

Shivaprakash Hiremath, DMRD, FRCR, Toronto, ON (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

This educational exhibit aims to: 1. Review the basic concepts of neuroinflammatory disorders in childhood 2. Describe the imaging manifestations of Myelin Oligodendrocyte Glycoprotein antibody-associated disease (MOGAD) in different age groups 3. Illustrate both common and uncommon findings in Neuromyelitis Optica Spectrum Disorder (NMOSD) and Multiple Sclerosis in the pediatric age range 4. Illustrate mimics of these entities based on imaging phenotypes encompassing pathologies that target the optic nerves, deep grey nuclei, white matter, and spinal cord.

#### TABLE OF CONTENTS/OUTLINE

- Review the pathophysiological basis of pediatric neuroinflammatory diseases.
- Illustrate the common and uncommon imaging manifestations in myelin oligodendrocyte glycoprotein antibody-associated disease (MOGAD) including acute disseminated encephalomyelitis (ADEM)-like phenotype, encephalitis-like phenotype, and leukodystrophy like phenotype.
- Depict common and uncommon findings in AQP4-associated neuromyelitis optica spectrum disorder (NMOSD), and Multiple Sclerosis (MS) including tumefactive demyelinating lesions.
- Provide localization related illustrations of mimics of demyelinating diseases including infectious, inflammatory, and metabolic disorders along with tumors that mimic demyelinating diseases.

### Mastering Neck Ultrasound in Pediatric Patients

#### Participants

Mikel Elgezabal, MD, Barrika, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Neck anatomy from the ultrasound perspective: key structures and sonographic landmarks. 2. Ultrasound protocol focusing on children's peculiarities. 3. Clinical and US findings of common and not-so-common pediatric neck entities. 4. Radiologic approach to a neck lump in a child.

#### TABLE OF CONTENTS/OUTLINE

1. US technique for the pediatric neck 1.1. Technical recommendations 1.2. Anatomy: spaces of the head and neck and landmarks from the US perspective. 1.3. Basic US protocol and further tricks to get to more unusual locations (palatine tonsils, vocal cords). 2. Pathology of the pediatric neck 2.1. Lymph nodes: Anatomy, node levels. Pathology: reactive, suppurative, malignant. Tips: malignant vs. benign. 2.2. Thyroid: dysgenesias, nodes, thyroiditis. 2.3. Vascular anomalies: tumors, malformations and subtypes. 2.4. Salivary glands: parotitis, submaxillitis, ranula of the sublingual gland. 2.5. Cysts: thyroglossal duct, branchial cleft, dermoid, epidermoid. 2.6. Fibromatosis colli. 2.7. Cervical thymus. 2.8. Soft tissue tumours: sarcoma, schwannoma, neuroblastoma. 2.9. Pilomatricoma. 3. Summary: approach to a neck lump in a child. 4. Take home points

### Keeping it Straight: A Guide to Pediatric Renal Neoplasms

#### Participants

Hassan Aboughalia, MD, Washington, WA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Ultrasound is the first-line imaging modality for suspected abdominal masses, followed by contrast-enhanced CT or MRI renal mass protocol. 2. When a renal tumor is suspected, the patient's age, imaging characteristics, distribution of metastases, and co-morbid conditions are the most important factors to consider. 3. Synchronous ipsilateral and contralateral renal lesions, metastatic disease, lymphadenopathy, invasion of the renal vein/IVC, and signs of tumor rupture are essential features to be evaluated. 4. Suprarenal pathologies can mimic a renal tumor such as neuroblastoma.

#### TABLE OF CONTENTS/OUTLINE

1. Imaging approach to a patient with a suspected renal tumor, emphasizing optimal imaging techniques 2. Solid renal neoplasms, including mesoblastic nephroma, nephrogenic rests, Wilms tumor, rhabdoid tumor, clear cell sarcoma, angiomyolipoma, renal cell carcinoma, lymphoma, and metastases. 3. Cystic renal neoplasms, including cystic nephroma, cystic partially differentiated neuroblastoma, and cystic Wilms tumor. 4. Mimics of renal neoplasms, including hypertrophied column of Bertin, focal pyelonephritis and abscess, infarct, granulomatous diseases, suprarenal pathologies, and cystic renal diseases. 5. Diagram slide of pediatric renal neoplasms underscoring key factors differentiating these entities.

### Craniovertebral Junction Instability, Fixation and Stenosis in Children

#### Participants

Stephen B. Little, MD, Atlanta, GA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Radiographs of the cervical spine are often inadequate or falsely reassuring in children with torticollis. A high-risk mechanism of injury or high clinical suspicion should prompt further evaluation with CT or MRI. 2. Early recognition and treatment of atlantoaxial rotatory fixation (AARF) is essential to limit morbidity. 3. AARF may be neither purely atlantoaxial, merely rotatory, nor completely fixed. 4. Significant lateral inclination of C1, facet deformity, new bone and multi-ligament insufficiency are associated with irreducible AARF. 5. An increased atlantodental interval (ADI) is a poor indicator of symptomatic atlantoaxial instability in children with trisomy 21. Furthermore, a normal ADI does not exclude craniovertebral junction instability. 6. Symptomatic CVJ instability in children with trisomy 21 is more frequent in those with associated osseous anomalies, particularly os odontoideum. 7. Osseous anomalies in children with CVJ instability include assimilation of the atlas, split atlas, odontoid hypoplasia or aplasia, os odontoideum, and Klippel-Feil syndrome. 8. A variety of skeletal dysplasias are associated with CVJ instability or stenosis. 9. Narrow C2 pedicles increase the risk of vertebral artery groove violation with pedicle screw placement, possibly producing devastating neurovascular consequences.

#### TABLE OF CONTENTS/OUTLINE

1. Osseous and ligamentous anatomy 2. Key morphometry 3. Rotatory dynamics 4. Atlantoaxial rotatory fixation 5. Trisomy 21 and CVJ instability 6. Osseous anomalies and CVJ instability 7. Skeletal dysplasias 8. Surgical considerations

PDEE-78

### Pediatric Dural Arteriovenous Fistulas: An Unusual Connection

#### TEACHING POINTS

Dural arteriovenous fistulas (DAVFs) are vascular abnormalities in which a meningeal artery drains directly into a meningeal vein or dural venous sinus. DAVFs are rare in children, accounting for around 10% of all intracranial shunts in the pediatric population. The transverse-sigmoid, superior sagittal sinus, and torcular herophili are commonly involved fistula sites in pediatric DAVFs. Pediatric DAVFs can be classified into three types: dural sinus malformations, infantile/juvenile-type dural shunts, or adult-type dural shunts. Younger children with DAVFs tend to present with cardiopulmonary symptoms (congestive heart failure and/or respiratory distress), while older children present with neurological symptoms (headaches, intracranial hemorrhage, focal deficits). The primary treatment for DAVFs is endovascular embolization, commonly with microcoils or liquid adhesives. Challenges in the endovascular treatment of DAVFs include high-flow fistulas, tortuous intracranial feeding arteries, and small femoral artery access sites.

#### TABLE OF CONTENTS/OUTLINE

- Review neurovascular anatomy relevant to dural arteriovenous fistulas (DAVFs).
- Recognize DAVFs in the pediatric population using a case-based approach.
- Review the multimodal imaging appearance of pediatric DAVFs.
- Understand the treatment of pediatric DAVFs and the application of neurovascular interventional techniques.
- Discuss the complications and challenges in the treatment of pediatric DAVFs.

### Picture Perfect: A Pictorial Review of Nuclear Medicine in Gastrointestinal and Hepatobiliary Disorders

#### TEACHING POINTS

1. Esophageal motility study is a useful tool for evaluating esophageal function, with the test providing valuable information about swallowing mechanics and esophageal peristalsis. 2. Gastric emptying study is commonly used to evaluate delayed gastric emptying, with the test providing valuable information about gastric function and potential causes of vomiting and other symptoms. 3. Hepatobiliary scintigraphy can be used to evaluate neonatal jaundice and to diagnose or rule out biliary atresia, a rare but serious liver condition that can lead to liver failure if left untreated. 4. Colonic scintigraphy is a useful tool for evaluating colon transit time and identifying potential causes of constipation or diarrhea. 5. Heterotaxy syndrome is a rare and complex condition that affects the development of organs in the body. Nuclear medicine imaging can be used to evaluate the function of the liver and other organs in children with this condition. 6. Nuclear medicine imaging can be used to diagnose Meckel's diverticulum and evaluate its function in the gastrointestinal tract.

#### TABLE OF CONTENTS/OUTLINE

Introduction 1. Image acquisition 2. Radiation dose Esophageal Motility Study 1. Motility disorders 2. Repaired Esophageal Atresia 3. Trauma 4. Achalasia 5. Technique Gastric Emptying Study 1. Image acquisition and techniques 2. Early Satiety 3. Gastroesophageal reflux Hepatobiliary Scintigraphy 1. Neonatal Jaundice 2. Biliary Atresia Colonic Scintigraphy 1. Colon Transit Technique 2. Chronic Constipation 3. Hirschsprung disease 4. Tethered cord 5. Chronic diarrhea 6. Angiotensin converting enzyme patients Others 1. Heterotaxy Syndrome 2. Meckel's Diverticulum Conclusions

### Transcranial Doppler Ultrasound in Children with SickleCell Disease: All What You Have to Know

#### Participants

Joseph Abi Ghanem, Beirut, Lebanon (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1- Sickle cell disease (SCD) has an incidence of 4/10000 births. It is characterized by a chronic proinflammatory state, prothrombotic state and increased aggregation of red blood cells (RBC). Children with the SCD HbSS and HbSBthal0 phenotypes have a 200-fold increased risk of stroke compared to healthy children. 2- Radiologists play a major role in treatment decision plan as Transcranial Doppler ultrasound (TCD) is the only radiologic test of choice to detect SCD children at higher risk for stroke. 3- The stroke prevention trial in sickle cell anemia (STOP) and The Silent Cerebral Infarct Transfusion (SIT) multicentric trial are pivotal studies demonstrating the benefit of chronic transfusion program based on screening with TCD velocities to prevent symptomatic and silent ischemia in SCD children between 2 and 16 years. 4-The tracings on the TCD reflect, the size of the artery, type of flow and flow velocities related to rheologic and hemodynamic factors.

#### TABLE OF CONTENTS/OUTLINE

1- Introduction of the STOP and SIT trials. 2- Indications and recommendations on when and how to perform TCD. 3- How to interpret Doppler tracing on TCD. 4- Case based presentation of threshold velocities for a conditional and an abnormal TCD. 5- Quantitative ultrasound for RBC aggregation estimation as potential new test to decrease the number needed to treat and avoid unnecessary transfusion.

### Dermatologic Ultrasound in Children: Benign and Pseudo-Tumoral Lesions

#### Participants

Luis Tierradentro-Garcia, MD, Philadelphia, PA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- 1. To overview the current applications of dermatologic ultrasound in children. - 2. To illustrate the utility of ultrasound to differentiate benign and pseudo-tumoral dermatologic lesions in children. - 3. To describe the role of conventional and advanced ultrasound as a complementary tool to CT and MRI in making diagnoses and assisting in surgical planning.

#### TABLE OF CONTENTS/OUTLINE

1. Background: Skin lesions in children are common, most lesions are benign. Clinical findings can be non-specific. 2. Technical aspects: - Image acquisition is non-invasive and harmless. - Frequency > 15 MHz. - Protocol: grayscale, Color Doppler, Pulsed-wave Doppler, microvascular flow imaging. - Normal sonographic appearance of the skin layers. 3. Pseudo-tumoral lesions 3.1 Cystic lesions - Epidermal inclusion cyst. - Trichilemmal cyst. - Dermoid cyst. - Cutaneous bronchogenic cyst. 3.3 Pilomatricoma 3.4 Dermatofibroma 3.5 Neurofibroma 3.6 Lipoma 4. Inflammatory lesions 4.1 Warts 4.2 Foreign body 4.3 Morphea 4.4 Insect bite 4.5 Kerion celsi 4.6 Juvenile xanthogranuloma 4.7 Congenital aplasia cutis 4.8 Annular granuloma 4.9 Keloid 5. PDEE-83

### Acute Pediatric Elbow Trauma - Adding the Orthopedist's Perspective to Imaging Interpretation

#### TEACHING POINTS

1. Knowledge of the specific developmental sequence of pediatric elbow apophyses is key to accurate interpretation of pediatric elbow trauma. 2. Knowledge of pitfalls is important, e.g., normal developmental irregularity of the apophyses can be mistaken for trauma. 3. In younger children, assessment of apophyseal avulsion/displacement on radiographs may be difficult due to incomplete ossification; MR may be necessary for more complete evaluation. 4. Chondroepiphyseal separation/transphyseal fracture of the distal humerus is a rare manifestation of mechanical birth related trauma of the newborn and may be difficult to diagnose on radiographs. Ultrasound and MRI may aid in further assessment. 5. Optimal orthopedic management of pediatric patients with elbow trauma is hinged on accurate imaging interpretation. Radiology reports should include entity-specific information that will benefit patient management. For example, a radial neck fracture is a sentinel fracture, often accompanied by additional fractures. Post reduction of elbow dislocation, the developing medial epicondyle can be entrapped in joint. A nursemaid's elbow may not manifest any imaging abnormalities.

#### TABLE OF CONTENTS/OUTLINE

1. Embryology and normal developmental anatomy of the elbow. 2. Radiographic views used for elbow trauma and technique of acquisition. 3. Role of MRI and CT acquisition parameters. 4. Imaging manifestations of pediatric elbow trauma. 5. Entity-specific additional information to be included in radiology reports that aid in orthopedic management. 6. Complications and mimics of acute elbow trauma. 7. Imaging spectrum of chronic overuse injuries of the developing elbow.

Manisha Jana, MD, FRCR, New Delhi, India (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Pitfalls in oncologic imaging are inflammatory, infective and vascular disorders which mimic tumors. Post-treatment changes and complications must be differentiated from residual or recurrent disease. Problem-solving tools include a multimodality approach, functional imaging and serial follow-up.

#### TABLE OF CONTENTS/OUTLINE

Non-neoplastic entities that mimic tumors lead to diagnostic confusion and delay appropriate therapy. In a patient with focal neurologic deficit or seizures, the cause may be demyelination, sarcoidosis or infections such as fungal, parasitic, tuberculosis and neurocysticercosis. Bone tumors are commonly mistaken in the setting of osteomyelitis, bone cysts, fracture, scurvy and osteogenesis imperfecta. Clinical context and plain radiographs must be correlated with MRI. Intrapulmonary nodes or granuloma mimic lung metastases. Abscesses, focal steatosis, cysts and arterioportal shunting are tumor mimics in the liver. Infarcts, cysts and perfusion abnormalities mimic tumors in the spleen, while adrenal hemorrhage can be mistaken for an adrenal mass. A hypertrophied column of Bertin, sludge and stones in the renal collecting system can mimic a renal mass - CEUS can help in the distinction. In a known cancer patient, radiotherapy-induced organ injury, post-chemotherapy infections, bone marrow changes and thymic rebound hyperplasia are common. Diffusion-weighted imaging and dynamic contrast-enhanced MRI can help in problem-solving.

### Don't Ovary-act: A Sonographic Approach to Benign Pediatric Ovarian Pathology

#### Participants

Fatemeh Hadian, MBChB, FRCR, Toronto, ON (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. A multi-follicular appearance is normal in neonates and teenagers and can be seen in prepubertal children. 2. Doppler flow may still be present in a twisted ovary and should not preclude making a diagnosis of torsion. 3. Benign ovarian lesions include ovarian cysts, para-ovarian cysts, mature cystic teratomas, cystadenomas and benign sex cord stromal tumors. 4. Diagnosing polycystic ovaries in adolescent females is challenging, but at-risk females can be identified for assessment at reproductive maturity. 5. Clinical history is crucial in differentiating between ovarian lesions with similar sonographic characteristics.

#### TABLE OF CONTENTS/OUTLINE

Introduction - Normal ovaries, ovarian development, ovum development  
Acute ovarian pathology - ovarian torsion, antenatal ovarian torsion, canal of Nuck hernia, tubo-ovarian abscess  
Benign ovarian lesions  
Ovarian cysts - neonatal cysts, physiological and functional cysts, para-ovarian cysts  
Benign cystic tumors - mature cystic teratoma, cystadenoma  
Other benign ovarian tumors - benign subtypes of sex cord stromal tumors, gonadoblastoma  
Key points in differentiating benign vs malignant ovarian lesions  
Special considerations in adolescents - polycystic ovaries, endometriosis  
Role of O-RADS in children  
Conclusion

### Imaging Approach for Pediatric Thyroid Diseases

#### Participants

Yuko Tsujioka, PhD, Tokyo, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Pediatric thyroid diseases have unique problems not seen in adult diseases. For example, congenital hypothyroidism is a common disorder that is usually detected on neonatal screening, but if missed, it causes serious intellectual disabilities. Juvenile thyroid dysfunction often manifest with non-specific symptoms (e.g., personality changes, declined school performance, weight fluctuation, decreased growth velocity), and may be fraught with diagnostic errors. Diagnostic imaging can be used to determine the underlying etiologies of endocrine thyroid diseases and provide supplementary information for thyroid hormone replacement therapy and antithyroid medication as well as to aid in the diagnosis of focal thyroid diseases, i.e., severity and extent of thyroid tumors and inflammatory diseases. In this educational exhibit, learners understand 1) the etiology, clinical features, and imaging findings in common pediatric thyroid diseases, 2) their unique features, and 3) how to use imaging modalities in the diagnostic approach for the diverse group of the disorders.

#### TABLE OF CONTENTS/OUTLINE

Introduction - Thyroid development - Modalities of thyroid imaging - Congenital thyroid diseases including congenital hypothyroidism (thyroid dysgenesis, thyroid dysmorphogenesis, transient hypothyroidism, congenital central hypothyroidism) and congenital hyperthyroidism - Acquired thyroid diseases including autoimmune thyroiditis, non-autoimmune thyroiditis, secondary thyroid dysfunction, acquired central hypo- and hyperthyroidism, and tumor and tumor like lesions

### Skeletal Disorders Due to Abnormal Aggrecan Biosynthesis

#### Participants

Yuko Tsujioka, PhD, Tokyo, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

We review the imaging findings of disorders associated with abnormal biosynthesis of aggrecan, a major proteoglycan of cartilage. Proteoglycans are widely distributed in the extracellular matrix, and impaired aggrecan synthesis interferes with normal bone and joint development and causes disorders with abnormal bone and joint. With development of massively parallel sequencing technology and increased understanding of proteoglycan biology, disorders once considered separate entities have been lumped together as a group of disorders called "aggrecanopathies.". All aggrecanopathies are autosomal recessive disorders with 25% of recurrence risk, and the accurate diagnosis is crucial for genetic counseling. Aggrecanopathies manifest with growth failure and multiple joint abnormalities that often lead to a misdiagnosis of joint hypermobility/contracture syndromes, such as arthrogryposis and Larsen's syndrome. However, radiological examination allows the differential diagnosis. The skeletal hallmarks of aggrecanopathies include stunted tubular bones due to impaired endochondral ossification and an abnormal "pattern formation" due to maldevelopment of embryonic cartilage templates, such as distal humeral bifurcation, double-layered patella, monkey wrench-like proximal femora, hyperphalangy, and accelerated carpal ossification.

#### TABLE OF CONTENTS/OUTLINE

Introduction - Aggrecan synthesis process and related genes - Sulfation disorders (DTDST related, and others) - UDP-sugar deficiency (CANT1-related Desbuquios syndrome and others) - Linkeopathies

### High Negative Appendectomy Rates in Under-18-year-old Patients - A 10-year Review with Radiologic-Pathologic Correlation: And Then There Were None

#### Participants

Juan Carlos Monte Gonzalez, MD, (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Radiologist-performed ultrasound (R-US) is a reliable diagnostic technique for acute appendicitis in under-18-year-old (U18) patients. - In inconclusive R-US studies (9% in this sample), positive second-look techniques were CT (55,6%), R-US (33,3%) and MRI (11,1%). - Discordance with pathology findings/negative appendectomy rate (NAR) was 6%, lower than other series.

#### TABLE OF CONTENTS/OUTLINE

One of our institution's pediatric surgeons suspected high NAR due to R-US low accuracy. This motivated a review of every appendectomy (610) in U18 patients, since the inauguration of our hospital (2012-2022). For this abstract, we sampled 100 patients that underwent appendectomy. We classified the cases by:- Age: 6-17 years-old (mean: 11,27 yo).- Gender: 41% female, 59% male.- Symptoms: 99% right lower quadrant pain, 63% nausea/vomiting, 18% temperature >37.3°C/99.1°F, 13% diarrhea, 12% hyporexia/anorexia.- Clinical signs: 67% Blumberg, 22% Psoas.- Laboratory values: 83% Leukocytosis >10,000, 68% leukocyte left shift (>75% PMNs), 67% CRP > 0.5.- Alvarado Score: 2-10 points (mean: 7,2).- R-US results: 90% positive, 1% negative, 9% inconclusive.- Second-look positive technique for inconclusive cases: 55,6% CT, 33,3% R-US, 11,1% MRI.- Appendix diameter: 5-20 mm (mean: 8,5 mm).- Surgical findings: 62% phlegmonous/suppurative, 17% phlegmonogangrenous/gangrenous.- Surgical technique: 53% open, 47% laparoscopic.- Pathology findings: 83% phlegmonous, 11% gangrenous, 5% reactive follicular lymphoid hyperplasia, 1% normal.- Discordance with pathology findings/NAR: 6%.- Evolution: 93% favorable, 4% complicated (1% dehiscence, 3% post-operative collections that resolved with antibiotics), 3% N/A.

### Nuclear Medicine Renal Studies: Indications, Techniques and Limitations for Optimal Patient Care

#### TEACHING POINTS

1. Radiation dose is an important consideration in nuclear medicine imaging, and techniques for dose reduction should be employed whenever possible to minimize radiation exposure in children undergoing renal studies. 2. Radionuclide cystography is a valuable imaging modality for assessing vesicoureteral reflux and other bladder abnormalities in children and is often preferred over fluoroscopy due to lower radiation exposure. 3. Renal cortical scintigraphy using DMSA is a common method for evaluating renal function and detecting renal parenchymal abnormalities. Proper image acquisition and technique are crucial for obtaining accurate and reliable results. 4. Diuresis renography using MAG3 is a useful tool for evaluating the functional status of the kidneys and detecting obstructive uropathy. Its role in renal transplant assessment and monitoring is also significant. 5. The appropriate use and interpretation of nuclear medicine renal studies in patients requires an understanding of the indications, techniques, and limitations of each modality, as well as consideration of the unique aspects of renal physiology and pathology.

#### TABLE OF CONTENTS/OUTLINE

Introduction Radionuclide Cystography 1. Indications 2. Technique 3. Radionuclide Cystography vs Fluoroscopy Renal Cortical Scintigraphy: DMSA 1. Vesicoureteral reflux 2. Cortical Scarring 3. Image acquisition 4. Technique Diuresis Renography-MAG3 1. Neonatal hydronephrosis 2. Uretropelvic junction obstruction 3. Acute intermittent obstruction 4. Image acquisition 5. Role in Renal Transplant Conclusions

PDEE-90

### Intravascular Catheters in Pediatrics: Methods, Imaging and Complications

#### TEACHING POINTS

1. Intravascular catheter insertion in the pediatric population can be challenging, especially in infants. 2. The radiologist must be familiar with the imaging appearance of intravascular catheters, and recognize catheter malposition as well as other complications. In selected cases, a linogram may be diagnostic. 3. Pediatric patients may experience unique complications such as thrombosis of the portal vein associated with umbilical vein catheterization. 4. In some complications, such as malposition, it may be possible to perform an 'over-the-wire exchange.' However, in other cases, the only option may be to insert a new catheter.

#### TABLE OF CONTENTS/OUTLINE

1. Important anatomy highlights. 2. Types of catheters. 3. Insertion methods and pitfalls. 4. Intravascular catheters on pediatric imaging: pearls and pitfalls. 5. Neonatal lines-special considerations. 6. Cases. 7. Diagnosis and management of complications.

PDEE-91

### Little Bellies, Big Impact: Blunt Abdominal Trauma in Pediatric Patients

#### Participants

Fabiana Gual, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The purposes of this exhibit are: To emphasize that trauma is a leading cause of death in the pediatric population, with abdominal injuries being a common and often unrecognized cause; To discuss the factors contributing to the higher risk of abdominal injuries in children, such as thinner abdominal wall and reduced adipose tissue; To highlight the importance of using the appropriate imaging test (including radiography, ultrasonography, contrast-enhanced CT and eventually magnetic resonance) based on the severity of the trauma and the stability of the patient; To provide examples of cases of low- and high-energy blunt abdominal trauma to demonstrate the utility of these imaging tests in diagnosing injuries to specific organs, such as the pancreas, liver, spleen, and kidneys; To acknowledge the challenges in evaluating children with blunt abdominal injury, especially pre-verbal children, and the need for diagnostic imaging to guide management decisions.

#### TABLE OF CONTENTS/OUTLINE

A flowchart illustrating the use of diagnostic imaging in low- and high-energy blunt abdominal trauma in children. A table listing the "packages of injuries" that can be identified based on force vectors when the pancreas, liver, spleen, and kidney are injured. Illustrated teaching cases of patients who were treated at the pediatric emergency department of a quaternary hospital and underwent imaging tests. The cases involve low- and high-energy blunt abdominal trauma resulting in pancreatic, hepatic, splenic and renal injuries. The Pediatric Organ Injury Scale was used to classify the severity of these injuries.

### Multimodality Imaging Review of Inherited Collagen Disorders

#### TEACHING POINTS

1. Describe the epidemiology and pathophysiology of inherited collagen disorders in children. 2. Identify typical and atypical features of inherited collagen disorders. 3. Provide a comprehensive review of the key imaging findings for each disorder using a multi-system and multi-modality approach. 4. Discuss complications of disease and treatment options.

#### TABLE OF CONTENTS/OUTLINE

I. General Introduction to Inherited Collagen Disorders  
II. Conditions  
A. Epidemiology  
B. Diagnostic Imaging Findings and Complications  
a. Osteogenesis Imperfecta: Wormian bones, multiple fractures, osteoporosis, in-utero manifestations, zebra stripe sign  
b. Ehlers-Danlos joint dislocations, fractures, hemarthrosis, sigmoid colon rupture, splenic artery aneurysm  
c. Stickler Syndrome facial deformities, articular manifestations  
d. Epidermolysis Bullosa cutaneous blisters and erosions with transformation to squamous cell carcinoma, pseudosyndactyly with mitten hand/sock toe deformities, esophageal stricture, pyloric atresia, osteomyelitis  
e. Alport Syndrome end-stage renal disease manifestations, esophageal leiomyomatosis  
C. Treatment  
III. Conclusion

### Fetal MRI to Detect Congenital Anomalies of the Kidney and Urinary Tract

#### Participants

Chihiro Tani, MD, Hiroshima, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

As congenital anomalies of the kidney and urinary tract (CAKUT) account for 40% of childhood end-stage renal failure, an early diagnosis and appropriate treatment are important. Fetal ultrasonography and MRI help to diagnose some of the diseases included in CAKUT. Fetal MRI is important for postnatal treatment and follow-up. We discuss the development of the renal and urinary system in fetuses and present fetal MRI findings of major diseases in CAKUT.

#### TABLE OF CONTENTS/OUTLINE

(1) The development of the renal and urinary system during the fetal period; kidney, ureter, bladder, urethra(2) Fetal MRI findings of major diseases in CAKUTa. Renal anomalies; multicystic dysplastic kidney, autosomal recessive polycystic kidney disease, horseshoe kidney, pelvic kidney, etcb. Renal pelvis, calyx, and ureter anomalies; ureteropelvic junction obstruction, megaureter, etc. Bladder and urethral anomalies; bladder exstrophy, posterior urethral valves, etc.OutlineCAKUT accounts for childhood end-stage renal failure. Therefore, an early diagnosis and appropriate treatment are important. As some of the diseases included in CAKUT can be diagnosed prenatally, radiologists must be cognizant of fetal MRI findings of major diseases in CAKUT.

### **It's all about location! A Practical Compartment-Based Approach to Diagnosing Pediatric Head and Neck Masses**

#### **TEACHING POINTS**

1. Provide a practical compartment-based approach to create the best differential diagnosis of pediatric neck masses. 2. Review the anatomy and content of each compartment. 3. Review relevant clinical and specific imaging findings of common and rare pediatric neck lesions based on a compartmentalized approach.

#### **TABLE OF CONTENTS/OUTLINE**

A. Background  
How to diagnose a pediatric neck mass? Why should we prefer a compartment-based approach for diagnosing pediatric neck masses?  
B. Head and neck compartments and compartment-based pediatric head and neck masses • Superficial Fascia • Parapharyngeal Space • Pharyngeal Mucosal Space • Submandibular space • Sublingual Space • Masticator Space • Buccal Space • Parotid Space • Carotid Space • Retropharyngeal Space • Perivertebral Space • Posterior Cervical Space • Visceral Space • Transspatial-multispatial • Miscellaneous  
Summary  
1. Evaluation of pediatric head and neck masses can be challenging due to their embryologic origin, complex anatomy, and various affecting pathologies.  
2. Using a practical compartment-based approach with careful consideration of the clinical details and specific imaging findings will enable the best differential diagnosis.

#### **PHEE-1 CT Dose Evaluation by Monte Carlo Simulation: Challenges for Personalized Dosimetry**

##### Participants

Kosuke Matsubara, PhD, Kanazawa, Japan (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

The teaching points of this exhibit include the following: (1) Monte Carlo simulation is an effective tool for achieving personalized dosimetry in CT. (2) To improve the accuracy of radiation dose calculation on Monte Carlo simulation, the optimization of the patient or phantom model, energy spectrum, bow-tie filter model, patient support model, number of projections, and tube current modulation method are essential. (3) Radiation dose calculation in dual-energy CT is also feasible by modifying the calculation code of single-energy CT.

##### TABLE OF CONTENTS/OUTLINE

1. Monte Carlo simulation for radiation dose calculation: a) Principles, b) Monte Carlo simulation code, and c) Advantages and disadvantages of Monte Carlo simulation. 2. Optimization of Monte Carlo simulation in CT: a) Patient or phantom model, b) Energy spectrum, c) Bow-tie filter model, d) Patient support model, e) Number of projections, and f) Tube current modulation. 3. Monte Carlo simulation in dual-energy CT: a) Dual-source system and b) Rapid kV switching system. 4. Summary.

#### **PHEE-10 How Can We Establish Direct Radiation Dose Measurement During CT Examinations?**

##### Participants

Hiroaki Hayashi, PhD, Kanazawa, Japan (*Presenter*) Research collaboration, Meditec Japan Co., Ltd; Research collaboration, JOB Corporation

##### TEACHING POINTS

<<1>> Because the surface dose distribution fluctuates approximately twice during helical scanning CT, it is difficult to estimate proper radiation exposure dose when using a small number of dosimeters. <<2>> By estimating the X-ray incident direction from the standard deviation (SD) distribution of the X-ray (CT) image and fitting the predetermined dose function to the measured point dose, it is possible to evaluate the surface dose distribution regardless of both the incident angle of X-rays and heterogeneity of the subject.

##### TABLE OF CONTENTS/OUTLINE

<<1>> The surface dose distribution fluctuates due to the influence of the incident direction of X-rays during helical scanning CT. The information concerning the incident direction of the X-ray can be analyzed from the SD distribution of the X-ray image. <<2>> The proposed algorithm for analyzing doses combines the dose distribution and the SD distribution of the X-ray image. <<3>> A phantom study was conducted using the latest X-ray CT equipment. <<4>> It was demonstrated that consistent mean values could be calculated regardless of the incident direction of X-rays. <<5>> We proved that the measurement data using only one dosimeter showed the same results as the data when using many dosimeters. From this experiment it was determined that our method using only one dosimeter can be applied to actual clinical examinations.

#### **PHEE-11 Artificial Intelligence and MRI Artifacts: A Pictorial Review of MR Artifacts and AI Techniques for Reduction**

##### Participants

Joseph Carbone, MD, Orange, CA (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

Teaching Points: 1. To provide a pictorial review of MRI artifacts and their specific causes as it relates to MR physics, with imaging correlates illustrating their significance in hindering radiologists' interpretation of images. 2. To describe emerging artificial intelligence and deep learning architecture as it pertains to the minimization of artifacts and image augmentation. 3. To illustrate how radiologists may benefit in interpretive ability from MRI artifact reduction and image enhancement, and describe future aims pertaining to image augmentation.

##### TABLE OF CONTENTS/OUTLINE

MRI artifacts result from an array of factors and are troublesome for radiologists as they may mimic or obscure structures of interest or disease conditions. Artificial intelligence and deep learning have emerged as a post-processing tool to augment radiologist's interpretation of MRI by eliminating or diminishing various artifacts, increasing signal to noise (SNR), and enhancing image resolution. It is important for radiologists to be familiar with MRI artifacts and emerging methods of negating these artifacts with deep learning and artificial intelligence. This abstract will serve as a pictorial review of varying MRI artifacts, as well as an update on the various methods that deep learning and artificial intelligence can be used as a post-processing tool to negate various

MRI artifacts and augment radiologist's ability to interpret MRI images.

## **PHEE-12 What is Trustworthy AI and How It Contributes in Diagnosis**

Participants

Masahiro Oda, PhD, (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

The purposes of our exhibit are: 1. To confirm difficulty of using AIs that have black box nature in diagnosis assistance 2. To learn what is trustworthy AI that unboxes black box AI 3. To learn explainable AI that clarifies the reason of decision 4. To learn uncertainty in AI that clarifies cases where AI is difficult to decide

### **TABLE OF CONTENTS/OUTLINE**

AI in diagnosis assistance - Provide decision assistance information- How AI decides is difficult to understand for radiologists Trustworthy AI - What is trustable AI for radiologists- Clarification including the reason of decision by AI and what AI doesn't know is necessary- Important research fields in trustworthy AI: Explainable AI, Uncertainty in AI Explainable AI - What is Explainable AI- Outcome explanation: provide explanations for AI outcomes- Model explanation: provide interpretable model that approximates black box model- Model inspection: understand model from its inputs and outcomes- Transparent box design: make parts of black box model interpretable Uncertainty in AI - What is Uncertainty in AI- Aleatoric uncertainty (data uncertainty): uncertainty in AI decision caused by noise or variance in data- Epistemic uncertainty (model uncertainty): uncertainty in AI decision caused by variance in model parameter determination Trustworthy AI in diagnosis assistance - Provide reasons of decisions made by AI- Provide a degree of confidence in AI decision

## **PHEE-13 Contrast Enhancement at CT: Principles and Clinical Applications**

Participants

Toru Higaki, PhD, Minami-ku, Hiroshima, Japan (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

Contrast enhancement is important in CT examinations to evaluate the vessel morphology and the blood supply in tissues. The enhancement degree of iodine contrast media changes with the injection volume and speed. We describe the properties and pharmacokinetics of contrast agents, the theory of contrast enhancement, present optimized contrast administration methods, and discuss side-effects of contrast media.

### **TABLE OF CONTENTS/OUTLINE**

1. Pharmacokinetics of iodine contrast media (PDF-p.1) 2. Basics of the contrast enhancement protocol for CT- Effect of the injection volume (PDF-p.2)- Effect of the injection duration/speed (PDF-p.3)- Effect of the patient body weight (PDF-p.4) 3. Optimization of contrast protocols- Target organ-based optimization- Body weight-based optimization- Optimization by other body indexes- Low-kV scan / Dual-energy scan (PDF-p.5) 4. Side-effects of contrast media

## **PHEE-14 Spreading a Culture of MR Safety Outside of the Academic Practice: Regional Practices and other Departments**

Participants

Avery Scripture, DO, Hershey, PA (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

· With the development and growth of "Health Systems", and the use of MR units outside of radiology departments, a culture of MR safety must be fostered and maintained at all sites. · Academic medical centers typically image patients with the greatest level of risk related to MR safety, including untested and off-label implants. · Partnering between the Academic Medical Center with Regional Radiology Practices and other off-site MR users helps to establish a uniform culture of safety while maintaining effective clinical operations. · MR safety has a significant role in creating or eliminating MR access disparities, especially in rural areas. · Other non-imaging modalities that utilize magnetic fields, such as transcranial magnetic stimulation, can also benefit from collaboration with the MR safety committee.

### **TABLE OF CONTENTS/OUTLINE**

What is a Culture of MR Safety and how was it established Growth of the MRI fleet from acquisitions of practices and expanding use of technology Regional radiology growth MR-Linac and Intra-op MR units Culture change is difficult - how to do it effectively? Finding partners - benefit of local MDRD Shared expertise - such as one MRSO for all sites Engage all relevant personnel at early stages, to plant the seed of MR Safety Establishing local MR Safety Committees Practices vary, so can help meet specific needs Improves relevance to specific Clinical Operations and maintains efficiency Importance of Quality Assurance Recording at the time of the incident Emphasize non-punitive culture Record "near misses" Review by MR Safety Committee Role of MR safety in imaging access and equity

## **PHEE-15 Alleviating MR Artifacts Induced by Programmable Shunt for Hydrocephalus Patients**

Participants

Kuan Zhang, PhD, Rochester, MN (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

1) The primary treatment for idiopathic normal pressure hydrocephalus (iNPH) is surgical insertion of a shunt system, such as the Certas Plus valve (VP shunt), to drain the excess cerebrospinal fluid. 2) MRI is typically used for diagnosis and postoperative monitoring of patients with iNPH. However, susceptibility artifacts may arise due to the metal component in the shunt. 3) Although 3T MRI could provide higher imaging quality than 1.5T, post-shunt imaging with iNPH is usually conducted at 1.5T, due to the recognition that metal artifacts are generally more prominent at higher field strength. 4) Our experience with patient and phantom scans indicates that shunt-induced artifacts demonstrated similar metal artifacts on 3T and 1.5T for some routine clinical imaging sequences, including MPRAGE, DWI, and GRE, due to differences in acquisition parameters between field strengths. Nevertheless, T2 FSE and T2 FLAIR show larger artifacts at 3T, compared to 1.5T. 5) To further improve the quality of post-shunt MRI with the

programmable shunt at 3T, techniques that could be helpful in reducing metal artifacts were shown. 6) The effect of metal presence was demonstrated with advanced technologies such as parallel imaging and deep learning algorithm. 7) With imaging protocol optimization, 3T programmable shunt imaging was feasible and could achieve comparable or superior image quality than 1.5T.

#### TABLE OF CONTENTS/OUTLINE

1) Introduction 2) Routine clinical post-shunt imaging sequences at 1.5T vs 3T. 3) Commonly used strategies to alleviate shunt-induced artifacts. 4) Advanced techniques related to shunt-induced artifacts. 5) Conclusion

#### **PHEE-16 Will General Radiography Become More Valuable When Exploiting the Performance of a Photon Counting Detector?**

Participants

Daiki Kobayashi, BS, Kanazawa, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Quantitative diagnosis can be established using Energy Resolving Photon Counting Detectors (ERPCD). 2. Because a functional image can be generated via several calculation processes, the quality of a functional image degrades. High-quality images can be obtained by optimizing the imaging parameters. 3. Image blurring interferes with quantitative analysis. Therefore, we should devise a novel blurring correction method instead of using the conventional Unsharp Masking method.

#### TABLE OF CONTENTS/OUTLINE

1. Impact of developing ERPCD. When obtaining functional images using ERPCD, quantitative diagnosis can be performed. The ERPCD system can also generate conventional qualitative diagnosis which can be performed using a traditional Energy Integrating Detector (EID). 2. An in-house program is available to simulate the actual X-ray imaging process in an imaging detector. In the program, X-ray attenuation, detector response, and statistics are taken into consideration. 3. When optimizing the settings of an ERPCD system, we found that a high kV system can generate a higher-quality functional image. 4. Image blurring should be corrected to analyze the object edge of functional images. 5. If ERPCD is used for general radiography, we can extract more information from X-ray images. For example, in the diagnosis of the fractures, we can obtain not only the visual information about the broken bones but also BMD information. ERPCD makes it possible to perform the screening test for osteoporosis.

#### **PHEE-17 DXA Quality Control Review**

Participants

William Sensakovic, PhD, Cave Creek, AZ (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Understand the types and reasons for different QC tests, 2. Appraise suggested quality control tests based on key limits and elements, 3. Implement a DXA quality control program

#### TABLE OF CONTENTS/OUTLINE

1. Why Establish a DXA QC Program?, 2. Least Significant Change, 3. Elements of a Good QC test, 4. Types of DXA QC Tests, 4a. Cross-calibration of Machines, 5. Example QC Program, 6. Recommendations from National and International Societies

#### **PHEE-18 A Comprehensive Review of Ultrasound-guided Vascular Access for Residents, Fellows, and Medical Students**

Participants

Atlee Witt, Nashville, TN (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The purpose of this exhibit is: 1) To detail different ultrasound techniques for vascular access 2) To explore the indications, contraindications, and potential complications of ultrasound-guided vascular access 3) To examine the utility of ultrasound-guided access for arterial, systemic venous, portomesenteric venous, and AV fistula procedures

#### TABLE OF CONTENTS/OUTLINE

1) Introduction: a) Indications for US vascular access (i. difficult or high-risk IV access ii. delivery of medications, fluids, or blood iii. diagnostic and interventional procedures) b) Relative contraindications (i. time limitations in emergent situations ii. ultrasound resolution with increasing depth iii. subcutaneous emphysema iv. volume depletion v. infection at the site of access) 2) Procedure: a) Equipment (i. ultrasound machine with high-frequency capable probe, ii. supplies for vascular access [1. IV starting kit, sterile gel, IV flushes, sterile probe cover]) b) Pre-procedure (i. consent ii. site identification and preparation) c) Technique (i. static approach ii. real-time approach [1. longitudinal approach 2. transverse or short-access approach]) d) Post-procedure (i. infection prevention) e) Complications (i. vessel puncture ii. malpositioning iii. injury to surrounding structures iv. infection) 3) Access sites: a) Artery (i. radial, brachial, femoral, and dorsalis pedis arteries) b) Systemic vein (i. internal jugular vein ii. subclavian vein iii. femoral vein) c) Portomesenteric vein (i. access to portal vein system ii. portography and portal pressure iii. embolization) d) AV fistula or graft

#### **PHEE-19 Would You Like to Ride the Wave Called CT Images? As a Novel Frequency Analysis Tool**

Participants

Yoichiro Ota, RT, Yokohama, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The spatial resolution CT images is expressed by a wave so-called Modulation Transfer Function. It is difficult to associate clinical CT images with MTFs, which is confusing to interpret. This can be explained by using the proposed method Band-limited CT images. This study will lecture on the contribution of high-frequency components to the image and the interpretation of MTFs intersections.

#### TABLE OF CONTENTS/OUTLINE

The process of Band limited image is based on Fast Fourier Transformation and frequency band limitation of CT images. Each band-limited CT image can contribute to characterizing how much information is in a signal of original CT images. The inclusion of high-frequency components results in high CT value and high resolution. Even if MTFs have an intersection, The band-limited image shows the difference in the amount of information that images have. We can associate clinical CT images MTFs and interpret the feature of CT images from physical point of view.

## **PHEE-2 3D Fast Spin Echo MRI with Variable Refocusing Flip Angles: Principles, Techniques, and Applications**

### **TEACHING POINTS**

3D FSE MRI with variable refocusing flip angles provides high-quality images with good contrast in various clinical applications. Its speed and versatility have made it a workhorse in MRI. The purposes of this Education Exhibit are 1. Overview of 3D FSE MRI acquisition schemes and the rationale of the variable flip angle strategies. 2. Explain the constant low flip angle refocusing and Pseudo Steady State (PSS) Principle, the transitions between pseudo steady states (TRAPS) principle, Mugler's Relaxation-specific Method, and Busse's General method for refocusing flip angle modulation. 3. Discuss the common-used RF excitation techniques such as non-selective/slab-selective RF excitation, inner volume RF excitation, etc. 4. k-space view ordering. 5. Review the RF modules used for magnetization preparation and contrast optimization. 6. T1-preparation (inversion recovery), T2-preparation, magnetization transfer contrast, fat suppression, diffusion weighting, flow suppression or enhancement, etc. are discussed in detail. Clinical protocols along with representative images are given for each magnetization preparation approach. 7. Review acceleration techniques including GRAPPA, CAIPIRINHA, and compressed sensing (CS) MRI.

### **TABLE OF CONTENTS/OUTLINE**

1. Introduction; 2. The Constant Low Flip Angle Refocusing and PSS Principle; 3. The TRAPS principle; 4. Mugler's Relaxation-specific method; 5. Busse's General Method; 6. RF excitation techniques; 7. K-space view ordering; 8. Magnetization preparation and contrast optimization; 9. T1-preparation; 10. T2-preparation; 11. MTC; 12. Fat suppression; 13. Diffusion weighting; 14. Flow suppression and enhancement; 15. Acceleration techniques.

## **PHEE-20 Photon-Counting Detector CT in Comparison to Energy-Integrating Detector CT: Optimization and Implementation of a Non-contrast Enhanced Chest Protocol for All Patient Sizes**

Participants

Danielle Vialle, MSc, Den Haag, Netherlands (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

o To demonstrate how to measure the diagnostic image quality (IQ) of a photon-counting detector (PCD) CT protocol  
o To learn how to assess and evaluate IQ of a PCD-CT protocol compared to energy-integrating detector (EID) CT  
o To provide tips and learn how to adjust the imaging protocol for a specific task and patient size

### **TABLE OF CONTENTS/OUTLINE**

With the introduction of PCD-CT in clinical practice, question rises how the IQ relates to the IQ of EID-CT scanners, and what the possibilities are for further dose reduction and/or image quality improvements. This exhibit provides you with knowledge on how IQ could be determined and evaluated by objective and subjective measures.

- o What is image quality and how can it be evaluated?
- Objective IQ quantified by noise, contrast, resolution and combined into the detectability index (d')
- Subjective IQ assessed by radiologists with 5-point Likert Scale
- o Effect on IQ and dose (phantom study examples)
- Determination of your site reference standard
- Determination of differences in scan and reconstruction parameters between scanners (EID-CT and PCD-CT)
- Influence of scan and reconstruction parameters
- Effect of differences in patient size
- Effect of dose adjustment
- o Guidelines on protocol adaptation
- How to find the right balance between IQ and dose
- Tips and tricks in adaptation of current EID- and PCD-CT protocols
- Tips for utilizing the full potential of a PCD-CT

## **PHEE-21 Radiation Protection Essentials for Interventional Radiology Workers**

Participants

Koichi Chida, PhD, Sendai, Japan (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

-To understand the present status of medical interventional radiology (IVR) occupational radiation protection/shielding.-To understand the advantages/disadvantages of various radiation-shielding equipment.-To understand current protection/reduction methods and identify methods to improve these methods.-To understand the necessity of combining various reduction methods (tools) to reduce occupational radiation—shielding is only one such component.-To understand that the methods used to reduce the patient radiation dose are the same as the methods employed to reduce staff doses.

### **TABLE OF CONTENTS/OUTLINE**

Advantages/disadvantages of various shielding devices. There is no perfect device! Relationship between the patient radiation dose and medical worker exposure. Physician-received scattered radiation during IVR was strongly correlated with the patient dose. Therefore, reduction of the patient dose will decrease the staff dose. Outline The regulation dose limit is seldom exceeded when protection is appropriate. However, radiation injuries such as cataracts have recently been reported in physicians and staff who perform IVR. There is no perfect shield. Combinations of shields are required. Radiology workers must be appropriately educated in terms of reducing the radiation exposure among both patients and staff; such workers must understand the various methods used to estimate occupational exposure. Decreasing the patient dose reduces occupational exposure. Although shielding is critical, it is only one component of radiation protection. Patient dose optimization means that the patient never receives a higher dose than is necessary, which also reduces the dose received by the staff.

## **PHEE-22 Fluoroscopy: An Overview and Refresher for Radiologists**

### **TEACHING POINTS**

Note to reviewer: this submission is in response to the call of Dr. Christine Cooky Menias for a Physics educational exhibit on Fluoroscopy. 1. Provide an introduction to fluoroscopy and its history. 2. Describe the major components of a fluoroscopy system. 3. Explore principles and techniques, with a focus on image quality and radiation dose. 4. Discuss clinical applications across multiple

subspecialties in diagnostic and interventional radiology.5. Identify similarities and differences between projection radiography and fluoroscopy

#### TABLE OF CONTENTS/OUTLINE

1. Introduction to Fluoroscopy and Historya. Invention, early uses, evolution, current state of the art2. Major Components of a Fluoroscopy Systema. Imaging chain from x-ray tube to control consoleb. Image intensifier and flat panel detector systems3. Principles and Techniquesa. Continuous vs. pulsed fluoroscopyb. Automatic brightness controlc. Last-image holdd. Factors influencing image quality and radiation dose4. Clinical Applications Across Subspecialtiesa. Pediatric radiology, body imaging, neuroradiology, musculoskeletal radiology, thoracic radiologyb. Interventional radiology5. Comparing Projection Radiography and Fluoroscopya. Nomenclatureb. Image formation and technologyc. Location and mobility differencesd. Target, filter, and grid similarities and differencese. Continuous exposure vs. pulsatile exposuref. Radiation dose and exposure considerations6. Radiation Protection in Fluoroscopya. Stochastic and deterministic effectsb. Radiation safety for patientsc. Radiation safety for personnel

#### **PHEE-23 Automated Evaluation of Radiograph Accuracy Using Deep Learning With Explainable Artificial Intelligence**

##### TEACHING POINTS

In radiography, it is vital to maintain precise positioning to guarantee consistent image reproducibility. However, the decision to retake a radiograph is the responsibility of the supervising radiological technologists, whose evaluation methods are subjective. With the development of artificial intelligence (AI), deep learning is effectively used to guarantee the accuracy of radiographs. The focus of this study is to develop a deep learning-based automated quantitative evaluation method for radiography. It can guarantee the quality of radiographs and provide useful information for retaking radiography. Furthermore, explainable AI was utilized to determine the typical sources of information that AI relies on when making decisions. Analyzing data from the explainable AI could facilitate enhancements to the network's architecture. The major teaching points of this exhibit are to: 1. Evaluate automatically the radiograph accuracy. 2. Understand how to classify schemes using deep learning. 3. Clarify the typical sources of information that AI relies on when making decisions using explainable AI.

#### TABLE OF CONTENTS/OUTLINE

To provide automated quantitative evaluation of radiograph accuracy using deep learning with explainable artificial intelligence and to discuss clinical usefulness toward an accurate diagnosis in radiography. To reduce variability in individual assessments and achieve a quantitative index. Ultimately, the aim is to reveal the network structure using explainable AI in order to construct an appropriate network.

#### **PHEE-24 Don't Get Burned: Hot Topics in MRI Safety**

##### TEACHING POINTS

Note to reviewer: this submission is in response to the call of Dr. Christine Cooky Menias for a Physics educational exhibit on MRI Safety. This educational exhibit provides a comprehensive overview of MRI safety for radiologists. It covers foundational principles, safety zones, personnel and patient screening, handling of special cases, and emergency procedures. The importance of continuous learning and adherence to guidelines by regulatory bodies is emphasized. Case studies and scenarios supplement the understanding of topics and foster application of knowledge.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction• Safety Ethics in MRI• Importance of MRI Safety2. Understanding the MRI Environment• Safety Zones• MRI Zone Protections3. Staff and Patient Considerations• Personnel Screening• Patient Screening• Special Case: Inability to Obtain Consent4. MRI Hazards• Radiofrequency (RF)-Induced Heating• Metallic Foreign Bodies• Medical Implants• Quenching in MRI5. Safety Guidelines and Emergency Procedures• MRI Safety Guidelines and Standards• Emergency Procedures in MRI6. Case Studies and Scenarios• Case Studies: Stents, Pacemakers, Pregnant Patient, Unconscious Patient• Safety Scenarios and Answers7. Special Topics in MRI Safety• High Field Strength Magnets• MRI and Pregnancy

#### **PHEE-25 Super-resolution Deep Learning Reconstruction of MR Imaging: Technical Features and Clinical Impact on Abdominal and Pelvic MR Imaging**

Participants

Atsushi Nakamoto, MD, PhD, Suita, Japan (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

Deep learning reconstruction (DLR) has recently been introduced by several vendors to improve MR image quality by reducing image noise. Super-resolution deep learning reconstruction (SR-DLR) is a newly developed MR image reconstruction method that not only reduces image noise but also improves spatial resolution. SR-DLR is expected to provide even higher image quality and improved diagnostic performance compared to DLR. The aims of this exhibit are: 1. To illustrate the technical features of SR-DLR, 2. To discuss the image quality of MR imaging using SR-DLR, and 3. To discuss the clinical impact on MR studies in the diagnosis of abdominal and pelvic disease.

#### TABLE OF CONTENTS/OUTLINE

1. Overview 2. Principle of SR-DLR 3. Sequences applicable to SR-DLR: fast spin echo T2WI, single-shot fast spin echo T2WI, DWI, steady-state free precession (SSFP), 3D T1-weighted gradient-echo with or without contrast enhancement, etc. 4. Effective reduction of image noise with SR-DLR 5. Improved spatial resolution with SR-DLR 6. Differences in image quality and spatial resolution from the conventional image reconstruction technique and DLR 7. Clinical impact on the diagnosis of abdominal diseases (liver, biliary tract, and pancreas) 8. Clinical impact on the diagnosis of pelvic diseases (uterus, ovaries, prostate, bladder, and rectum) 9. Summary

#### **PHEE-26 Optimal Acquisition and Reconstruction Techniques of Coronary CT Angiography: Current Status and Trends Over the Past Decade**

Participants

Rika Fukui, Tokyo, Japan (*Presenter*) Nothing to Disclose

## TEACHING POINTS

1) To introduce recent technological developments in coronary CT angiography (CCTA); 2) To describe optimal acquisition and reconstruction techniques in CCTA based on these developments; 3) To illustrate clinical utilities of these techniques in CCTA by presenting various clinical data and images.

## TABLE OF CONTENTS/OUTLINE

1) Recent technological developments in CCTA (a) Hardware: high-output/fast-rotating x-ray tube, high-definition/ultra-high-resolution CT (HD/UHRCT), area-detector CT (ADCT), dual-source CT (DSCT), dual-energy CT (DECT); (b) Software: automatic selection of optimal acquisition parameters/cardiac phase (Auto gating/Smart phase), motion correction algorithm (MCA), iterative/deep learning reconstruction (IR/DLR). 2) Optimal acquisition and reconstruction techniques in CCTA (a) HD/UHRCT, DECT vs. coronary artery calcification/stent; (b) Fast-rotating x-ray tube, DSCT, Smart phase, MCA: motion artifact reduction; (c) ADCT: misalignment (banding/stair-step) artifact reduction; (d) Low kV acquisition by high-output x-ray tube, Auto gating, IR/DLR: radiation dose reduction; (e) Low kV acquisition by high-output x-ray tube, DECT vs. poor contrast; (f) Auto gating, Smart phase, MCA: workflow improvement; (g) DECT: detailed coronary plaque assessment. 3) Clinical utilities of these techniques in CCTA (a) Better image quality/interpretability/diagnostic accuracy/workflow; (b) Lower radiation/contrast media dose.

## **PHEE-27 Low kV or Low keV, That Is the Question: What the Radiologist and Radiology Technologist Need to Know in Contrast-Enhanced Body CT With Current and Novel Technologies**

Participants  
Haruhiko Machida, MD, Tokyo, Japan (*Presenter*) Nothing to Disclose

## TEACHING POINTS

1) To introduce basic principles and clinical usefulness of single-energy CT (SECT) at low tube voltage (kV)/virtual monochromatic imaging (VMI) at low energy (keV) by dual-energy CT (DECT) in contrast-enhanced body CT; 2) To illustrate factors affecting image quality (IQ) of SECT at low kV/VMI at low keV and current and novel technologies for improving the IQ; 3) To demonstrate strategies to determine the optimal imaging option.

## TABLE OF CONTENTS/OUTLINE

1) Basic principles clinical usefulness of SECT at low kV/VMI at low keV (a) Basic principles: SECT/DECT/VMI; (b) Clinical usefulness: improved contrast enhancement/reduced iodine load/reduced radiation dose (for SECT)/reduced beam-hardening (BH) metallic artifact (for DECT)/flexible keV selection (for DECT)/improved material decomposition (MD) various DECT-specific imaging/analysis options (for DECT). 2) Factors affecting IQ of SECT at low kV/VMI at low keV technologies for improving the IQ (a) IQ factors: CT value/image noise/contrast-noise ratio/spatial resolution/BH metallic artifact; (b) Current novel technologies: high output x-ray tube/kV mA synchronized switching/highly efficient detector/iterative deep-learning reconstruction/metallic artifact reduction software. 3) Strategies to determine the optimal imaging option (a) Better spatial resolution for SECT; (b) Better image contrast/less BH metallic artifact/better MD for DECT.

## **PHEE-28 Development of 3D Performance Phantom in UHR-CT (Evaluation of MPR, MIP, VR and VE images)**

Participants  
Katsumi Tsujioka, RT, Toyota-city, Japan (*Presenter*) Researcher, Canon Medical Systems Corporation

## TEACHING POINTS

We report on the new phantom to evaluate the 3D performance. Its name is "Spiral Micro Holes Phantom". This phantom is made of an acrylic cylinder with 40mm diameter. We used two types of phantoms. Phantom A has holes with diameter of 0.5mm and phantom B has holes with diameter of 0.3mm. CT scans were performed with the long axis of phantom placed parallel to the X-Y plane of the CT system. For the experiment, we used a conventional CT system and an ultra-high-resolution CT (UHR-CT) system. The multi planar reconstruction (MPR), maximum intensity projection (MIP), volume rendering (VR), and virtual endoscopy (VE) were performed on the obtained volume data, and the displaying of the holes in each direction was studied. In the MIP image, since the air layer of the acrylic pillar is detected, the comparison between the X-Y plane to the Z axis was performed accurately. VR, VE and curved MPR were able to be evaluated continuously from the X - Y plane to the Z axis. In clinical image diagnosis, MPR, MIP, VR and VE are performed for each case. Evaluation by Spiral Micro Holes Phantom is also useful for explaining the characteristics of each display method to the radiologist.

## TABLE OF CONTENTS/OUTLINE

(1) What is 3D performance (2) Development of Spiral Micro Holes Phantom (3) Development of evaluation method (MPR, MIP, VR and VE images) (4) Experiment using phantom (Positioning and scan) (5) Conclusion and clinical use (For example, CT colonography and CT angiography)

## **PHEE-29 Will That X-Ray Harm My Unborn Child? - A Meta-Analysis of Fetal Health Effects Indicates Very Low Risk to Fetus Following Occupational Exposure of Pregnant Interventional Physicians**

Participants  
Jelena Mihailovic, PhD, Rochester, MN (*Presenter*) Nothing to Disclose

## TEACHING POINTS

For our interventional physicians with proper radiation safety practices, fetal radiation dose is predicted to be <4 mGy per term. Compared with known risk of childhood disorders, the predicted risk of cancer following fetal occupational radiation exposure is very low.

## TABLE OF CONTENTS/OUTLINE

Concern of radiation-induced fetal health effects deters women from entering interventional practices. If proper radiation safety practices are applied, radiation dose to the fetus is expected to be <4mGy per term for physician performing interventional fluoroscopy procedures. In this work we compared predicted risk of early childhood cancer from in-utero fetal radiation exposure to risks associated with maternal BMI, age, and hormonal therapy. We performed random effect meta-analysis of 15 studies (1970-2020) investigating early childhood cancer following in-utero exposure from 0.3 to 1000 mGy. The natural incidence of early

childhood cancer is ~0.3%. Linear no-threshold model fit to the meta-analysis predicted cancer HR of 1.01 (incremental risk 0.003%) for fetal dose 4 mGy. The natural incidence of childhood disorder is 1.3%. Maternal BMI of =30kg/m<sup>2</sup>, age >35yrs, or hormonal therapy were associated with HR in the range 1.14-1.40 [95% CI 0.99-1.75]. The predicted risk of childhood cancer following fetal occupational radiation exposure is very low compared with other fetal risks.

### **PHEE-3 ChatGPT in Medical Physics: What You Need to Know**

Participants

Jie Zhang, PhD, Lexington, KY (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

1. Learn the basics of ChatGPT and its potential applications in medical physics 2. Identify the types of questions ChatGPT can answer, such as those related to radiation safety, imaging protocols, and quality assurance 3. Understand how to integrate ChatGPT with existing systems, such as quality assurance programs, to improve efficiency and accuracy 4. Discuss the limitations of ChatGPT and ethical considerations 5. Recognize the importance of training and validating ChatGPT, including the need to continually update its knowledge base and monitor its performance over time

#### **TABLE OF CONTENTS/OUTLINE**

Since its introduction in November 2022, ChatGPT has become a topic of discussion across various fields, including medicine. A literature search using the keyword ChatGPT on PubMed yielded 340 results as of April 30, 2023, with 335 published in the first four months of 2023. As this number continues to grow, medical physicists may be curious about the potential applications of ChatGPT in their field. This education provides a comprehensive review of ChatGPT and its potential applications in medical physics, along with other relevant considerations. The content is organized as follows: 1. An overview of ChatGPT and its potential applications in Medical Physics 2. Types of questions ChatGPT can answer, including radiation safety, imaging protocols, and quality assurance 3. Integration of ChatGPT with existing systems to improve efficiency and accuracy 4. Limitations of ChatGPT and ethical considerations 5. Continued training and validation of ChatGPT to maintain accuracy and relevance over time.

### **PHEE-30 How Should We Set Tube Voltage for Pediatric Cardiac CT Examination Using Photon-Counting CT?: A Phantom Study**

Participants

Junya Nakamura, BS, Okayama-Shi, Japan (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

1) We explain the proper tube voltage setting during a pediatric cardiac CT based on the image quality analysis and exposure dose evaluation. 2) The photon-counting CT scanner can always derive the virtual monoenergetic image (VMI) and high contrast can be obtained by applying lower energy VMI. In addition, using energy integrated image (T3D) at low tube voltage can also create high contrast image. 3) The operator should take into consideration not only exposure dose inside the scanning range but also that outside the range.

#### **TABLE OF CONTENTS/OUTLINE**

1) Explanation of VMI and T3D image obtained by photon counting CT. When the high tube voltage is used, image contrast can be adjusted based on the reconstruction energy of VMI. On the other hand, low tube voltage has been historically applied to pediatric cardiac CT scans. 2) Comparison of image quality of low and high tube voltages. When the same CT DIvol was set for each tube voltage, the image quality was similar trend. 3) A key issue in selecting the tube voltage. The scattered X-rays increase when using high tube voltage, therefore the dose outside the scanning region needs to be considered. 4) Experimental results of dose measurement. When the low tube voltage was adopted, the dose outside the scanning region was reduced. 5) What the operator should know how to determine tube voltage for pediatric cardiac CT.

### **PHEE-4 What You Should Know About CT NCLSC Radiomics: Uncertainties in Data Preparation, Feature Extraction, Feature and Model Selection, and Outcomes**

#### **TEACHING POINTS**

1. Provide overview of radiomics workflow and key components related to inconsistent outcomes 2. Examine data types appropriate for inclusion in effective model training, e.g., high-order, low-order, clinical 3. Learn key aspects of cohort selection for robust models 4. Provide overview of common feature selection methods and predictive models used in literature and their use in different clinical endpoints, e.g., classification and prognosis 5. Understand uncertainty of feature selection methods and predictive models during implementation 6. Provide relative performance of aforementioned teaching points based on actual study outcomes

#### **TABLE OF CONTENTS/OUTLINE**

In radiomics, key components include but are not limited to data quality, feature extraction, feature and model selection, and training/validation. Based on our recent review of more than 160 published papers there is a current emphasis on data quality and feature reproducibility, however, feature and model selection are not yet well defined. In this education exhibit, we provide a review of feature and model selection methods and their effects on outcomes as well as findings from our systemic evaluation of radiomic feature selection and predictive models. The content is organized as follows: 1. Describe the radiomics workflow in clinical studies 2. Overview commonly used feature selection methods and predictive methods 3. Show feature selection method and predictive model selection for different end-points 4. Familiarize sources of uncertainty from feature selection and predictive models in study design

### **PHEE-5 The Echo Chamber: Unraveling the Mysteries of Spin Echo and Gradient Echo MRI Pulse Sequences**

#### **TEACHING POINTS**

MRI sequences and their clinical utility can be difficult to keep track of, particularly for radiology residents and trainees. Understanding the underlying properties of MRI sequences and their image contrast is critical for proper diagnosis. Additionally, understanding the differences between various spin echo and gradient echo sequences is critical for the evaluation of images and for future optimization and design. Once learned, the clinical applications of these techniques are critical for training of radiology and medical physics residents.

## TABLE OF CONTENTS/OUTLINE

1. Basic Pulse Sequence Tenetsa. Review of MRI signal and T1, T2 and T2\* relaxation times.b. Review of basic pulse sequence block including TE and TR2. Review of Basic Spin Echo and Gradient Echo Sequences a. Basic pulse sequence block for spin and gradient echo sequencesb. Comparison of spin echo to fast spin echo sequences and effects on image qualityc. Comparison between bSSFP and RF spoiled sequences and their tradeoffsd. Introduction of inversion prepared sequences (STIR, FLAIR)3. Clinical Applications of FSE, bSSFP, and RF spoiled sequencesa. Clinical examples of FSE sequences- T1 weighted FSE of osteosarcoma- T2 weighted FSE of oligodendroglioma. Clinical examples of gradient echo sequences- bSSFP of multicystic mass in heart- bSSFP in abdomen and B0 artifacts- FLASH imaging in the abdomen- FLASH T2w imaging in the brain, including gliomas- Susceptibility T2\* imaging of brainc. Clinical examples of inversion prepared sequences- STIR imaging of spine- FLAIR imaging of multiple sclerosis

### **PHEE-6 Impact of Reconstruction Field of View, Matrix Size, and Kernel on Spatial Resolution of Photon Counting CT**

Participants

Zhongxing Zhou, PhD, Rochester, MN (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Limited by pixel size (determined by reconstruction FOV and matrix size), the visual spatial resolution on clinical images is often below that allowed by the acquisition geometry and reconstruction kernel. 2. Use of an ultra-sharp kernel without considering the combined effect of pixel size, noise, visual and system spatial resolution may lead to suboptimal image quality. 3. For a given CT acquisition and reconstruction kernel, there is a threshold pixel size, above which the visual spatial resolution will be sacrificed. 4. Dramatically increased image noise associated with small pixel size and high-resolution reconstruction kernels may be controlled using deep-learning-based noise reduction methods.

## TABLE OF CONTENTS/OUTLINE

1. Describe difference between system limit spatial resolution and visual spatial resolution on images: 1). System limit spatial resolution is determined by the CT acquisition geometry and reconstruction kernel. It is often measured and quantified using pre-sampling modulation transfer function. 2). Visual spatial resolution is affected by pixel size in addition to the system limit spatial resolution. 2. Explain how pixel size (determined by reconstruction FOV and matrix size) and reconstruction kernel affect the visual spatial resolution in images and provide a guide on how to determine reconstruction kernel and pixel size. 3. Demonstrate the combined effect of pixel size, matrix size, reconstruction FOV and kernel using clinical image examples. 4. Demonstrate benefit of deep-learning-based noise reduction to improve visual spatial resolution.

### **PHEE-7 The Physics and Clinical Considerations of Radionuclide Therapy**

#### TEACHING POINTS

1. Review the physical properties of different modes of radionuclide decay and their relevant clinical applications.2. Discussion production of radioisotopes and radiopharmaceuticals, and the radiation biophysics that result in tumor cell death and DNA damage. 3. Discuss the physical properties of various radioisotopes used in therapy, as well as emerging clinical applications, and clinical considerations. 4. Describe the management considerations regarding dose limiting properties and off-target biological effects associated with radionuclide therapies. 5. Review patient and general public safety considerations for radiation emitted by patients after discharge.

## TABLE OF CONTENTS/OUTLINE

1. Physics - Types of radionuclide decay and Linear Energy Transfer- Review of radioisotope production2. Biological Effects- Principles of radiotherapy- Ionizing radiation effects (Direct and Indirect Effects)- Implications for treatment3. Dosimetry - how to perform and clinical importance4. Review current and future Radioisotopes and Radiopharmaceuticals- Production, logistics, clinical administration/dosing5. Radiation Safety- Spillage considerations- Precursors to patient discharge, dosage to general public

### **PHEE-8 I Want You To Improve My Abdominal MRI Quality**

Participants

Martin Horwarth, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1 - In an interactive form of a quiz, be able to identify magnetic resonance (MR) artifacts on abdominal studies and how to avoid them if needed.2 - Be able to recognize unwanted MR artifacts or imaging errors, especially the ones that can lead to erroneous reports.3 - Understand the sources of these imaging artifacts.4 - Improve radiologists' and technicians' knowledge of MR physics regarding abdominal imaging with practical cases.

## TABLE OF CONTENTS/OUTLINE

1 - Introduction on MR physics, imaging errors and what are some imaging artifacts that we do need.2 - A series of interactive cases with questions. The first question on how to identify the imaging error.3 - The answer is followed by an explanation about the physics of the error and why they occur.4 - Divide these artifacts and imaging errors into the ones we can change and the ones we can not.5 - Those avoidable artifacts are followed by another question on how to do so.6 - Explanation on how to avoid or minimize artifacts.7 - Summary and take home notes.

### **PHEE-9 Multilingual Nuggets or Snippets: Microlearning Video Lessons on CT Radiation Dose Optimization**

Participants

Lina Karout, MD, Boston, MA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Using author-created, multilingual microlearning video lessons, we empower the audience on keys aspects of CT radiation dose optimization with the understanding of 1. Justification 2. Indication-driven CT protocols3. Optimum acquisition parameters 4. Dose metrics and monitoring 5. Diagnostic reference levels (DRLs)

## **TABLE OF CONTENTS/OUTLINE**

We will use several author-created microlearning videos to describe the learning objectives. Each video will be created in three languages (English, Spanish, and Portuguese) with voice and subtitles. The videos will bring real-world examples to help the audience understand the critical aspects of radiation dose optimization in CT. Pre and post short 5 questionnaire will be applied before and after the educational activity. All content will be released online for free open access following the RSNA presentation. The videos will be based on recommendations based on IAEA, ACR and international validated documents.

Printed on: 04/12/24

## Abstract Archives of the RSNA, 2023

PHEE-1

### CT Dose Evaluation by Monte Carlo Simulation: Challenges for Personalized Dosimetry

#### Participants

Kosuke Matsubara, PhD, Kanazawa, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The teaching points of this exhibit include the following: (1) Monte Carlo simulation is an effective tool for achieving personalized dosimetry in CT. (2) To improve the accuracy of radiation dose calculation on Monte Carlo simulation, the optimization of the patient or phantom model, energy spectrum, bow-tie filter model, patient support model, number of projections, and tube current modulation method are essential. (3) Radiation dose calculation in dual-energy CT is also feasible by modifying the calculation code of single-energy CT.

#### TABLE OF CONTENTS/OUTLINE

1. Monte Carlo simulation for radiation dose calculation: a) Principles, b) Monte Carlo simulation code, and c) Advantages and disadvantages of Monte Carlo simulation. 2. Optimization of Monte Carlo simulation in CT: a) Patient or phantom model, b) Energy spectrum, c) Bow-tie filter model, d) Patient support model, e) Number of projections, and f) Tube current modulation. 3. Monte Carlo simulation in dual-energy CT: a) Dual-source system and b) Rapid kV switching system. 4. Summary.

Printed on: 04/12/24

## Abstract Archives of the RSNA, 2023

PHEE-10

### How Can We Establish Direct Radiation Dose Measurement During CT Examinations?

#### Participants

Hiroaki Hayashi, PhD, Kanazawa, Japan (*Presenter*) Research collaboration, Meditec Japan Co., Ltd; Research collaboration, JOB Corporation

#### TEACHING POINTS

<<1>> Because the surface dose distribution fluctuates approximately twice during helical scanning CT, it is difficult to estimate proper radiation exposure dose when using a small number of dosimeters. <<2>> By estimating the X-ray incident direction from the standard deviation (SD) distribution of the X-ray (CT) image and fitting the predetermined dose function to the measured point dose, it is possible to evaluate the surface dose distribution regardless of both the incident angle of X-rays and heterogeneity of the subject.

#### TABLE OF CONTENTS/OUTLINE

<<1>> The surface dose distribution fluctuates due to the influence of the incident direction of X-rays during helical scanning CT. The information concerning the incident direction of the X-ray can be analyzed from the SD distribution of the X-ray image. <<2>> The proposed algorithm for analyzing doses combines the dose distribution and the SD distribution of the X-ray image. <<3>> A phantom study was conducted using the latest X-ray CT equipment. <<4>> It was demonstrated that consistent mean values could be calculated regardless of the incident direction of X-rays. <<5>> We proved that the measurement data using only one dosimeter showed the same results as the data when using many dosimeters. From this experiment it was determined that our method using only one dosimeter can be applied to actual clinical examinations.

Printed on: 04/12/24

## Abstract Archives of the RSNA, 2023

PHEE-11

### Artificial Intelligence and MRI Artifacts: A Pictorial Review of MR Artifacts and AI Techniques for Reduction

#### Participants

Joseph Carbone, MD, Orange, CA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Teaching Points: 1. To provide a pictorial review of MRI artifacts and their specific causes as it relates to MR physics, with imaging correlates illustrating their significance in hindering radiologists' interpretation of images. 2. To describe emerging artificial intelligence and deep learning architecture as it pertains to the minimization of artifacts and image augmentation. 3. To illustrate how radiologists may benefit in interpretive ability from MRI artifact reduction and image enhancement, and describe future aims pertaining to image augmentation.

#### TABLE OF CONTENTS/OUTLINE

MRI artifacts result from an array of factors and are troublesome for radiologists as they may mimic or obscure structures of interest or disease conditions. Artificial intelligence and deep learning have emerged as a post-processing tool to augment radiologist's interpretation of MRI by eliminating or diminishing various artifacts, increasing signal to noise (SNR), and enhancing image resolution. It is important for radiologists to be familiar with MRI artifacts and emerging methods of negating these artifacts with deep learning and artificial intelligence. This abstract will serve as a pictorial review of varying MRI artifacts, as well as an update on the various methods that deep learning and artificial intelligence can be used as a post-processing tool to negate various MRI artifacts and augment radiologist's ability to interpret MRI images.

Printed on: 04/12/24

PHEE-12

### What is Trustworthy AI and How It Contributes in Diagnosis

#### Participants

Masahiro Oda, PhD, (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The purposes of our exhibit are: 1. To confirm difficulty of using AIs that have black box nature in diagnosis assistance 2. To learn what is trustworthy AI that unboxes black box AI 3. To learn explainable AI that clarifies the reason of decision 4. To learn uncertainty in AI that clarifies cases where AI is difficult to decide

#### TABLE OF CONTENTS/OUTLINE

AI in diagnosis assistance - Provide decision assistance information- How AI decides is difficult to understand for radiologists Trustworthy AI - What is trustable AI for radiologists- Clarification including the reason of decision by AI and what AI doesn't know is necessary- Important research fields in trustworthy AI: Explainable AI, Uncertainty in AI Explainable AI - What is Explainable AI- Outcome explanation: provide explanations for AI outcomes- Model explanation: provide interpretable model that approximates black box model- Model inspection: understand model from its inputs and outcomes- Transparent box design: make parts of black box model interpretable Uncertainty in AI - What is Uncertainty in AI- Aleatoric uncertainty (data uncertainty): uncertainty in AI decision caused by noise or variance in data- Epistemic uncertainty (model uncertainty): uncertainty in AI decision caused by variance in model parameter determination Trustworthy AI in diagnosis assistance - Provide reasons of decisions made by AI- Provide a degree of confidence in AI decision

PHEE-13

### Contrast Enhancement at CT: Principles and Clinical Applications

#### Participants

Toru Higaki, PhD, Minami-ku, Hiroshima, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Contrast enhancement is important in CT examinations to evaluate the vessel morphology and the blood supply in tissues. The enhancement degree of iodine contrast media changes with the injection volume and speed. We describe the properties and pharmacokinetics of contrast agents, the theory of contrast enhancement, present optimized contrast administration methods, and discuss side-effects of contrast media.

#### TABLE OF CONTENTS/OUTLINE

1. Pharmacokinetics of iodine contrast media (PDF-p.1)2. Basics of the contrast enhancement protocol for CT- Effect of the injection volume (PDF-p.2)- Effect of the injection duration/speed (PDF-p.3)- Effect of the patient body weight (PDF-p.4)3. Optimization of contrast protocols- Target organ-based optimization- Body weight-based optimization- Optimization by other body indexes- Low-kV scan / Dual-energy scan (PDF-p.5)4. Side-effects of contrast media

### Spreading a Culture of MR Safety Outside of the Academic Practice: Regional Practices and other Departments

#### Participants

Avery Scripture, DO, Hershey, PA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- With the development and growth of "Health Systems", and the use of MR units outside of radiology departments, a culture of MR safety must be fostered and maintained at all sites.
- Academic medical centers typically image patients with the greatest level of risk related to MR safety, including untested and off-label implants.
- Partnering between the Academic Medical Center with Regional Radiology Practices and other off-site MR users helps to establish a uniform culture of safety while maintaining effective clinical operations.
- MR safety has a significant role in creating or eliminating MR access disparities, especially in rural areas.
- Other non-imaging modalities that utilize magnetic fields, such as transcranial magnetic stimulation, can also benefit from collaboration with the MR safety committee.

#### TABLE OF CONTENTS/OUTLINE

What is a Culture of MR Safety and how was it established Growth of the MRI fleet from acquisitions of practices and expanding use of technology Regional radiology growth MR-Linac and Intra-op MR units Culture change is difficult - how to do it effectively? Finding partners - benefit of local MDRD Shared expertise - such as one MRSO for all sites Engage all relevant personnel at early stages, to plant the seed of MR Safety Establishing local MR Safety Committees Practices vary, so can help meet specific needs Improves relevance to specific Clinical Operations and maintains efficiency Importance of Quality Assurance Recording at the time of the incident Emphasize non-punitive culture Record "near misses" Review by MR Safety Committee Role of MR safety in imaging access and equity

### Alleviating MR Artifacts Induced by Programmable Shunt for Hydrocephalus Patients

#### Participants

Kuan Zhang, PhD, Rochester, MN (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1) The primary treatment for idiopathic normal pressure hydrocephalus (iNPH) is surgical insertion of a shunt system, such as the Certas Plus valve (VP shunt), to drain the excess cerebrospinal fluid. 2) MRI is typically used for diagnosis and postoperative monitoring of patients with iNPH. However, susceptibility artifacts may arise due to the metal component in the shunt. 3) Although 3T MRI could provide higher imaging quality than 1.5T, post-shunt imaging with iNPH is usually conducted at 1.5T, due to the recognition that metal artifacts are generally more prominent at higher field strength. 4) Our experience with patient and phantom scans indicates that shunt-induced artifacts demonstrated similar metal artifacts on 3T and 1.5T for some routine clinical imaging sequences, including MPRAGE, DWI, and GRE, due to differences in acquisition parameters between field strengths. Nevertheless, T2 FSE and T2 FLAIR show larger artifacts at 3T, compared to 1.5T. 5) To further improve the quality of post-shunt MRI with the programmable shunt at 3T, techniques that could be helpful in reducing metal artifacts were shown. 6) The effect of metal presence was demonstrated with advanced technologies such as parallel imaging and deep learning algorithm. 7) With imaging protocol optimization, 3T programmable shunt imaging was feasible and could achieve comparable or superior image quality than 1.5T.

#### TABLE OF CONTENTS/OUTLINE

1) Introduction 2) Routine clinical post-shunt imaging sequences at 1.5T vs 3T. 3) Commonly used strategies to alleviate shunt-induced artifacts. 4) Advanced techniques related to shunt-induced artifacts. 5) Conclusion

PHEE-16

### Will General Radiography Become More Valuable When Exploiting the Performance of a Photon Counting Detector?

#### Participants

Daiki Kobayashi, BS, Kanazawa, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Quantitative diagnosis can be established using Energy Resolving Photon Counting Detectors (ERPCD).2. Because a functional image can be generated via several calculation processes, the quality of a functional image degrades. High-quality images can be obtained by optimizing the imaging parameters.3. Image blurring interferes with quantitative analysis. Therefore, we should devise a novel blurring correction method instead of using the conventional Unsharp Masking method.

#### TABLE OF CONTENTS/OUTLINE

1. Impact of developing ERPCD. When obtaining functional images using ERPCD, quantitative diagnosis can be performed. The ERPCD system can also generate conventional qualitative diagnosis which can be performed using a traditional Energy Integrating Detector (EID).2. An in-house program is available to simulate the actual X-ray imaging process in an imaging detector. In the program, X-ray attenuation, detector response, and statistics are taken into consideration.3. When optimizing the settings of an ERPCD system, we found that a high kV system can generate a higher-quality functional image.4. Image blurring should be corrected to analyze the object edge of functional images.5. If ERPCD is used for general radiography, we can extract more information from X-ray images. For example, in the diagnosis of the fractures, we can obtain not only the visual information about the broken bones but also BMD information. ERPCD makes it possible to perform the screening test for osteoporosis.

### A Comprehensive Review of Ultrasound-guided Vascular Access for Residents, Fellows, and Medical Students

#### Participants

Atlee Witt, Nashville, TN (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The purpose of this exhibit is: 1) To detail different ultrasound techniques for vascular access 2) To explore the indications, contraindications, and potential complications of ultrasound-guided vascular access 3) To examine the utility of ultrasound-guided access for arterial, systemic venous, portomesenteric venous, and AV fistula procedures

#### TABLE OF CONTENTS/OUTLINE

1) Introduction: a) Indications for US vascular access (i. difficult or high-risk IV access ii. delivery of medications, fluids, or blood iii. diagnostic and interventional procedures) b) Relative contraindications (i. time limitations in emergent situations ii. ultrasound resolution with increasing depth iii. subcutaneous emphysema iv. volume depletion v. infection at the site of access) 2) Procedure: a) Equipment (i. ultrasound machine with high-frequency capable probe, ii. supplies for vascular access [1. IV starting kit, sterile gel, IV flushes, sterile probe cover]) b) Pre-procedure (i. consent ii. site identification and preparation) c) Technique (i. static approach ii. real-time approach [1. longitudinal approach 2. transverse or short-access approach]) d) Post-procedure (i. infection prevention) e) Complications (i. vessel puncture ii. malpositioning iii. injury to surrounding structures iv. infection) 3) Access sites: a) Artery (i. radial, brachial, femoral, and dorsalis pedis arteries) b) Systemic vein (i. internal jugular vein ii. subclavian vein iii. femoral vein) c) Portomesenteric vein (i. access to portal vein system ii. portography and portal pressure iii. embolization) d) AV fistula or graft

### Would You Like to Ride the Wave Called CT Images? As a Novel Frequency Analysis Tool

#### Participants

Yoichiro Ota, RT, Yokohama, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The spatial resolution CT images is expressed by a wave so-called Modulation Transfer Function. It is difficult to associate clinical CT images with MTFs, which is confusing to interpret. This can be explained by using the proposed method Band-limited CT images. This study will lecture on the contribution of high-frequency components to the image and the interpretation of MTFs intersections.

#### TABLE OF CONTENTS/OUTLINE

The process of Band limited image is based on Fast Fourier Transformation and frequency band limitation of CT images. Each band-limited CT image can contribute to characterizing how much information is in a signal of original CT images. The inclusion of high-frequency components results in high CT value and high resolution. Even if MTFs have an intersection, The band-limited image shows the difference in the amount of information that images have. We can associate clinical CT images MTFs and interpret the feature of CT images from physical point of view.

### 3D Fast Spin Echo MRI with Variable Refocusing Flip Angles: Principles, Techniques, and Applications

#### TEACHING POINTS

3D FSE MRI with variable refocusing flip angles provides high-quality images with good contrast in various clinical applications. Its speed and versatility have made it a workhorse in MRI. The purposes of this Education Exhibit are 1. Overview of 3D FSE MRI acquisition schemes and the rationale of the variable flip angle strategies. 2. Explain the constant low flip angle refocusing and Pseudo Steady State (PSS) Principle, the transitions between pseudo steady states (TRAPS) principle, Mugler's Relaxation-specific Method, and Busse's General method for refocusing flip angle modulation. 3. Discuss the common-used RF excitation techniques such as non-selective/slab-selective RF excitation, inner volume RF excitation, etc. 4. k-space view ordering. 5. Review the RF modules used for magnetization preparation and contrast optimization. 6. T1-preparation (inversion recovery), T2-preparation, magnetization transfer contrast, fat suppression, diffusion weighting, flow suppression or enhancement, etc. are discussed in detail. Clinical protocols along with representative images are given for each magnetization preparation approach. 7. Review acceleration techniques including GRAPPA, CAIPIRINHA, and compressed sensing (CS) MRI.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction; 2. The Constant Low Flip Angle Refocusing and PSS Principle; 3. The TRAPS principle; 4. Mugler's Relaxation-specific method; 5. Busse's General Method; 6. RF excitation techniques; 7. K-space view ordering; 8. Magnetization preparation and contrast optimization; 9. T1-preparation; 10. T2-preparation; 11. MTC; 12. Fat suppression; 13. Diffusion weighting; 14. Flow suppression and enhancement; 15. Acceleration techniques.

### Photon-Counting Detector CT in Comparison to Energy-Integrating Detector CT: Optimization and Implementation of a Non-contrast Enhanced Chest Protocol for All Patient Sizes

#### Participants

Danielle Vialle, MSc, Den Haag, Netherlands (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

o To demonstrate how to measure the diagnostic image quality (IQ) of a photon-counting detector (PCD) CT protocol  
o To learn how to assess and evaluate IQ of a PCD-CT protocol compared to energy-integrating detector (EID) CT  
o To provide tips and learn how to adjust the imaging protocol for a specific task and patient size

#### TABLE OF CONTENTS/OUTLINE

With the introduction of PCD-CT in clinical practice, question rises how the IQ relates to the IQ of EID-CT scanners, and what the possibilities are for further dose reduction and/or image quality improvements. This exhibit provides you with knowledge on how IQ could be determined and evaluated by objective and subjective measures.

- o What is image quality and how can it be evaluated?
- Objective IQ quantified by noise, contrast, resolution and combined into the detectability index ( $d'$ )
- Subjective IQ assessed by radiologists with 5-point Likert Scale
- o Effect on IQ and dose (phantom study examples)
- Determination of your site reference standard
- Determination of differences in scan and reconstruction parameters between scanners (EID-CT and PCD-CT)
- Influence of scan and reconstruction parameters
- Effect of differences in patient size
- Effect of dose adjustment
- o Guidelines on protocol adaptation
- How to find the right balance between IQ and dose
- Tips and tricks in adaptation of current EID- and PCD-CT protocols
- Tips for utilizing the full potential of a PCD-CT

PHEE-21

### Radiation Protection Essentials for Interventional Radiology Workers

#### Participants

Koichi Chida, PhD, Sendai, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

-To understand the present status of medical interventional radiology (IVR) occupational radiation protection/shielding.-To understand the advantages/disadvantages of various radiation-shielding equipment.-To understand current protection/reduction methods and identify methods to improve these methods.-To understand the necessity of combining various reduction methods (tools) to reduce occupational radiation—shielding is only one such component.-To understand that the methods used to reduce the patient radiation dose are the same as the methods employed to reduce staff doses.

#### TABLE OF CONTENTS/OUTLINE

Advantages/disadvantages of various shielding devices. There is no perfect device! Relationship between the patient radiation dose and medical worker exposure. Physician-received scattered radiation during IVR was strongly correlated with the patient dose. Therefore, reduction of the patient dose will decrease the staff dose. Outline The regulation dose limit is seldom exceeded when protection is appropriate. However, radiation injuries such as cataracts have recently been reported in physicians and staff who perform IVR. There is no perfect shield. Combinations of shields are required. Radiology workers must be appropriately educated in terms of reducing the radiation exposure among both patients and staff; such workers must understand the various methods used to estimate occupational exposure. Decreasing the patient dose reduces occupational exposure. Although shielding is critical, it is only one component of radiation protection. Patient dose optimization means that the patient never receives a higher dose than is necessary, which also reduces the dose received by the staff.

### Fluoroscopy: An Overview and Refresher for Radiologists

#### TEACHING POINTS

Note to reviewer: this submission is in response to the call of Dr. Christine Cooky Menias for a Physics educational exhibit on Fluoroscopy.1. Provide an introduction to fluoroscopy and its history.2. Describe the major components of a fluoroscopy system.3. Explore principles and techniques, with a focus on image quality and radiation dose.4. Discuss clinical applications across multiple subspecialties in diagnostic and interventional radiology.5. Identify similarities and differences between projection radiography and fluoroscopy

#### TABLE OF CONTENTS/OUTLINE

1. Introduction to Fluoroscopy and Historya. Invention, early uses, evolution, current state of the art2. Major Components of a Fluoroscopy Systema. Imaging chain from x-ray tube to control consoleb. Image intensifier and flat panel detector systems3. Principles and Techniquesa. Continuous vs. pulsed fluoroscopyb. Automatic brightness controlc. Last-image holdd. Factors influencing image quality and radiation dose4. Clinical Applications Across Subspecialtiesa. Pediatric radiology, body imaging, neuroradiology, musculoskeletal radiology, thoracic radiologyb. Interventional radiology5. Comparing Projection Radiography and Fluoroscopya. Nomenclatureb. Image formation and technologyc. Location and mobility differencesd. Target, filter, and grid similarities and differencese. Continuous exposure vs. pulsatile exposuref. Radiation dose and exposure considerations6. Radiation Protection in Fluoroscopya. Stochastic and deterministic effectsb. Radiation safety for patientsc. Radiation safety for personnel

### Automated Evaluation of Radiograph Accuracy Using Deep Learning With Explainable Artificial Intelligence

#### TEACHING POINTS

In radiography, it is vital to maintain precise positioning to guarantee consistent image reproducibility. However, the decision to retake a radiograph is the responsibility of the supervising radiological technologists, whose evaluation methods are subjective. With the development of artificial intelligence (AI), deep learning is effectively used to guarantee the accuracy of radiographs. The focus of this study is to develop a deep learning-based automated quantitative evaluation method for radiography. It can guarantee the quality of radiographs and provide useful information for retaking radiography. Furthermore, explainable AI was utilized to determine the typical sources of information that AI relies on when making decisions. Analyzing data from the explainable AI could facilitate enhancements to the network's architecture. The major teaching points of this exhibit are to: 1. Evaluate automatically the radiograph accuracy. 2. Understand how to classify schemes using deep learning. 3. Clarify the typical sources of information that AI relies on when making decisions using explainable AI.

#### TABLE OF CONTENTS/OUTLINE

To provide automated quantitative evaluation of radiograph accuracy using deep learning with explainable artificial intelligence and to discuss clinical usefulness toward an accurate diagnosis in radiography. To reduce variability in individual assessments and achieve a quantitative index. Ultimately, the aim is to reveal the network structure using explainable AI in order to construct an appropriate network.

### Don't Get Burned: Hot Topics in MRI Safety

#### TEACHING POINTS

Note to reviewer: this submission is in response to the call of Dr. Christine Cooky Menias for a Physics educational exhibit on MRI Safety. This educational exhibit provides a comprehensive overview of MRI safety for radiologists. It covers foundational principles, safety zones, personnel and patient screening, handling of special cases, and emergency procedures. The importance of continuous learning and adherence to guidelines by regulatory bodies is emphasized. Case studies and scenarios supplement the understanding of topics and foster application of knowledge.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction • Safety Ethics in MRI • Importance of MRI Safety  
2. Understanding the MRI Environment • Safety Zones • MRI Zone Protections  
3. Staff and Patient Considerations • Personnel Screening • Patient Screening • Special Case: Inability to Obtain Consent  
4. MRI Hazards • Radiofrequency (RF)-Induced Heating • Metallic Foreign Bodies • Medical Implants • Quenching in MRI  
5. Safety Guidelines and Emergency Procedures • MRI Safety Guidelines and Standards • Emergency Procedures in MRI  
6. Case Studies and Scenarios • Case Studies: Stents, Pacemakers, Pregnant Patient, Unconscious Patient • Safety Scenarios and Answers  
7. Special Topics in MRI Safety • High Field Strength Magnets • MRI and Pregnancy

### Super-resolution Deep Learning Reconstruction of MR Imaging: Technical Features and Clinical Impact on Abdominal and Pelvic MR Imaging

#### Participants

Atsushi Nakamoto, MD, PhD, Suita, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Deep learning reconstruction (DLR) has recently been introduced by several vendors to improve MR image quality by reducing image noise. Super-resolution deep learning reconstruction (SR-DLR) is a newly developed MR image reconstruction method that not only reduces image noise but also improves spatial resolution. SR-DLR is expected to provide even higher image quality and improved diagnostic performance compared to DLR. The aims of this exhibit are: 1. To illustrate the technical features of SR-DLR, 2. To discuss the image quality of MR imaging using SR-DLR, and 3. To discuss the clinical impact on MR studies in the diagnosis of abdominal and pelvic disease.

#### TABLE OF CONTENTS/OUTLINE

1. Overview 2. Principle of SR-DLR 3. Sequences applicable to SR-DLR: fast spin echo T2WI, single-shot fast spin echo T2WI, DWI, steady-state free precession (SSFP), 3D T1-weighted gradient-echo with or without contrast enhancement, etc. 4. Effective reduction of image noise with SR-DLR 5. Improved spatial resolution with SR-DLR 6. Differences in image quality and spatial resolution from the conventional image reconstruction technique and DLR 7. Clinical impact on the diagnosis of abdominal diseases (liver, biliary tract, and pancreas) 8. Clinical impact on the diagnosis of pelvic diseases (uterus, ovaries, prostate, bladder, and rectum) 9. Summary

### Optimal Acquisition and Reconstruction Techniques of Coronary CT Angiography: Current Status and Trends Over the Past Decade

#### Participants

Rika Fukui, Tokyo, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1) To introduce recent technological developments in coronary CT angiography (CCTA); 2) To describe optimal acquisition and reconstruction techniques in CCTA based on these developments; 3) To illustrate clinical utilities of these techniques in CCTA by presenting various clinical data and images.

#### TABLE OF CONTENTS/OUTLINE

1) Recent technological developments in CCTA (a) Hardware: high-output/fast-rotating x-ray tube, high-definition/ultra-high-resolution CT (HD/UHRCT), area-detector CT (ADCT), dual-source CT (DSCT), dual-energy CT (DECT); (b) Software: automatic selection of optimal acquisition parameters/cardiac phase (Auto gating/Smart phase), motion correction algorithm (MCA), iterative/deep learning reconstruction (IR/DLR). 2) Optimal acquisition and reconstruction techniques in CCTA (a) HD/UHRCT, DECT vs. coronary artery calcification/stent; (b) Fast-rotating x-ray tube, DSCT, Smart phase, MCA: motion artifact reduction; (c) ADCT: misalignment (banding/stair-step) artifact reduction; (d) Low kV acquisition by high-output x-ray tube, Auto gating, IR/DLR: radiation dose reduction; (e) Low kV acquisition by high-output x-ray tube, DECT vs. poor contrast; (f) Auto gating, Smart phase, MCA: workflow improvement; (g) DECT: detailed coronary plaque assessment. 3) Clinical utilities of these techniques in CCTA (a) Better image quality/interpretability/diagnostic accuracy/workflow; (b) Lower radiation/contrast media dose.

### Development of 3D Performance Phantom in UHR-CT (Evaluation of MPR, MIP, VR and VE images)

#### Participants

Katsumi Tsujioka, RT, Toyota-city, Japan (*Presenter*) Researcher, Canon Medical Systems Corporation

#### TEACHING POINTS

We report on the new phantom to evaluate the 3D performance. Its name is "Spiral Micro Holes Phantom". This phantom is made of an acrylic cylinder with 40mm diameter. We used two types of phantoms. Phantom A has holes with diameter of 0.5mm and phantom B has holes with diameter of 0.3mm. CT scans were performed with the long axis of phantom placed parallel to the X-Y plane of the CT system. For the experiment, we used a conventional CT system and an ultra-high-resolution CT (UHR-CT) system. The multi planar reconstruction (MPR), maximum intensity projection (MIP), volume rendering (VR), and virtual endoscopy (VE) were performed on the obtained volume data, and the displaying of the holes in each direction was studied. In the MIP image, since the air layer of the acrylic pillar is detected, the comparison between the X-Y plane to the Z axis was performed accurately. VR, VE and curved MPR were able to be evaluated continuously from the X - Y plane to the Z axis. In clinical image diagnosis, MPR, MIP, VR and VE are performed for each case. Evaluation by Spiral Micro Holes Phantom is also useful for explaining the characteristics of each display method to the radiologist.

#### TABLE OF CONTENTS/OUTLINE

(1) What is 3D performance (2) Development of Spiral Micro Holes Phantom (3) Development of evaluation method (MPR, MIP, VR and VE images) (4) Experiment using phantom (Positioning and scan) (5) Conclusion and clinical use (For example, CT colonography and CT angiography)

### Will That X-Ray Harm My Unborn Child?" - A Meta-Analysis of Fetal Health Effects Indicates Very Low Risk to Fetus Following Occupational Exposure of Pregnant Interventional Physicians

#### Participants

Jelena Mihailovic, PhD, Rochester, MN (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

For our interventional physicians with proper radiation safety practices, fetal radiation dose is predicted to be <4 mGy per term. Compared with known risk of childhood disorders, the predicted risk of cancer following fetal occupational radiation exposure is very low.

#### TABLE OF CONTENTS/OUTLINE

Concern of radiation-induced fetal health effects deters women from entering interventional practices. If proper radiation safety practices are applied, radiation dose to the fetus is expected to be <4mGy per term for physician performing interventional fluoroscopy procedures. In this work we compared predicted risk of early childhood cancer from in-utero fetal radiation exposure to risks associated with maternal BMI, age, and hormonal therapy. We performed random effect meta-analysis of 15 studies (1970-2020) investigating early childhood cancer following in-utero exposure from 0.3 to 1000 mGy. The natural incidence of early childhood cancer is ~0.3%. Linear no-threshold model fit to the meta-analysis predicted cancer HR of 1.01 (incremental risk 0.003%) for fetal dose 4 mGy. The natural incidence of childhood disorder is 1.3%. Maternal BMI of =30kg/m<sup>2</sup>, age >35yrs, or hormonal therapy were associated with HR in the range 1.14-1.40 [95% CI 0.99-1.75]. The predicted risk of childhood cancer following fetal occupational radiation exposure is very low compared with other fetal risks.

### ChatGPT in Medical Physics: What You Need to Know

#### Participants

Jie Zhang, PhD, Lexington, KY (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Learn the basics of ChatGPT and its potential applications in medical physics 2. Identify the types of questions ChatGPT can answer, such as those related to radiation safety, imaging protocols, and quality assurance 3. Understand how to integrate ChatGPT with existing systems, such as quality assurance programs, to improve efficiency and accuracy 4. Discuss the limitations of ChatGPT and ethical considerations 5. Recognize the importance of training and validating ChatGPT, including the need to continually update its knowledge base and monitor its performance over time

#### TABLE OF CONTENTS/OUTLINE

Since its introduction in November 2022, ChatGPT has become a topic of discussion across various fields, including medicine. A literature search using the keyword ChatGPT on PubMed yielded 340 results as of April 30, 2023, with 335 published in the first four months of 2023. As this number continues to grow, medical physicists may be curious about the potential applications of ChatGPT in their field. This education provides a comprehensive review of ChatGPT and its potential applications in medical physics, along with other relevant considerations. The content is organized as follows: 1. An overview of ChatGPT and its potential applications in Medical Physics 2. Types of questions ChatGPT can answer, including radiation safety, imaging protocols, and quality assurance 3. Integration of ChatGPT with existing systems to improve efficiency and accuracy 4. Limitations of ChatGPT and ethical considerations 5. Continued training and validation of ChatGPT to maintain accuracy and relevance over time.

PHEE-30

### How Should We Set Tube Voltage for Pediatric Cardiac CT Examination Using Photon-Counting CT?: A Phantom Study

#### Participants

Junya Nakamura, BS, Okayama-Shi, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1) We explain the proper tube voltage setting during a pediatric cardiac CT based on the image quality analysis and exposure dose evaluation. 2) The photon-counting CT scanner can always derive the virtual monoenergetic image (VMI) and high contrast can be obtained by applying lower energy VMI. In addition, using energy integrated image (T3D) at low tube voltage can also create high contrast image. 3) The operator should take into consideration not only exposure dose inside the scanning range but also that outside the range.

#### TABLE OF CONTENTS/OUTLINE

1) Explanation of VMI and T3D image obtained by photon counting CT. When the high tube voltage is used, image contrast can be adjusted based on the reconstruction energy of VMI. On the other hand, low tube voltage has been historically applied to pediatric cardiac CT scans. 2) Comparison of image quality of low and high tube voltages. When the same CTDIvol was set for each tube voltage, the image quality was similar trend. 3) A key issue in selecting the tube voltage. The scattered X-rays increase when using high tube voltage, therefore the dose outside the scanning region needs to be considered. 4) Experimental results of dose measurement. When the low tube voltage was adopted, the dose outside the scanning region was reduced. 5) What the operator should know how to determine tube voltage for pediatric cardiac CT.

### What You Should Know About CT NCLSC Radiomics: Uncertainties in Data Preparation, Feature Extraction, Feature and Model Selection, and Outcomes

#### TEACHING POINTS

1. Provide overview of radiomics workflow and key components related to inconsistent outcomes 2. Examine data types appropriate for inclusion in effective model training, e.g., high-order, low-order, clinical 3. Learn key aspects of cohort selection for robust models 4. Provide overview of common feature selection methods and predictive models used in literature and their use in different clinical endpoints, e.g., classification and prognosis 5. Understand uncertainty of feature selection methods and predictive models during implementation 6. Provide relative performance of aforementioned teaching points based on actual study outcomes

#### TABLE OF CONTENTS/OUTLINE

In radiomics, key components include but are not limited to data quality, feature extraction, feature and model selection, and training/validation. Based on our recent review of more than 160 published papers there is a current emphasis on data quality and feature reproducibility, however, feature and model selection are not yet well defined. In this education exhibit, we provide a review of feature and model selection methods and their effects on outcomes as well as findings from our systemic evaluation of radiomic feature selection and predictive models. The content is organized as follows: 1. Describe the radiomics workflow in clinical studies 2. Overview commonly used feature selection methods and predictive methods 3. Show feature selection method and predictive model selection for different end-points 4. Familiarize sources of uncertainty from feature selection and predictive models in study design

PHEE-5

### The Echo Chamber: Unraveling the Mysteries of Spin Echo and Gradient Echo MRI Pulse Sequences

#### TEACHING POINTS

MRI sequences and their clinical utility can be difficult to keep track of, particularly for radiology residents and trainees. Understanding the underlying properties of MRI sequences and their image contrast is critical for proper diagnosis. Additionally, understanding the differences between various spin echo and gradient echo sequences is critical for the evaluation of images and for future optimization and design. Once learned, the clinical applications of these techniques are critical for training of radiology and medical physics residents.

#### TABLE OF CONTENTS/OUTLINE

1. Basic Pulse Sequence Tenetsa. Review of MRI signal and T1, T2 and T2\* relaxation times.b. Review of basic pulse sequence block including TE and TR2. Review of Basic Spin Echo and Gradient Echo Sequences a. Basic pulse sequence block for spin and gradient echo sequencesb. Comparison of spin echo to fast spin echo sequences and effects on image qualityc. Comparison between bSSFP and RF spoiled sequences and their tradeoffsd. Introduction of inversion prepared sequences (STIR, FLAIR)3. Clinical Applications of FSE, bSSFP, and RF spoiled sequencesa. Clinical examples of FSE sequences- T1 weighted FSE of osteosarcoma- T2 weighted FSE of oligodendrogliomab. Clinical examples of gradient echo sequences- bSSFP of multicystic mass in heart- bSSFP in abdomen and B0 artifacts- FLASH imaging in the abdomen- FLASH T2w imaging in the brain, including gliomas- Susceptibility T2\* imaging of brainc. Clinical examples of inversion prepared sequences- STIR imaging of spine- FLAIR imaging of multiple sclerosis

### Impact of Reconstruction Field of View, Matrix Size, and Kernel on Spatial Resolution of Photon Counting CT

#### Participants

Zhongxing Zhou, PhD, Rochester, MN (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Limited by pixel size (determined by reconstruction FOV and matrix size), the visual spatial resolution on clinical images is often below that allowed by the acquisition geometry and reconstruction kernel. 2. Use of an ultra-sharp kernel without considering the combined effect of pixel size, noise, visual and system spatial resolution may lead to suboptimal image quality. 3. For a given CT acquisition and reconstruction kernel, there is a threshold pixel size, above which the visual spatial resolution will be sacrificed. 4. Dramatically increased image noise associated with small pixel size and high-resolution reconstruction kernels may be controlled using deep-learning-based noise reduction methods.

#### TABLE OF CONTENTS/OUTLINE

1. Describe difference between system limit spatial resolution and visual spatial resolution on images: 1). System limit spatial resolution is determined by the CT acquisition geometry and reconstruction kernel. It is often measured and quantified using pre-sampling modulation transfer function. 2). Visual spatial resolution is affected by pixel size in addition to the system limit spatial resolution. 2. Explain how pixel size (determined by reconstruction FOV and matrix size) and reconstruction kernel affect the visual spatial resolution in images and provide a guide on how to determine reconstruction kernel and pixel size. 3. Demonstrate the combined effect of pixel size, matrix size, reconstruction FOV and kernel using clinical image examples. 4. Demonstrate benefit of deep-learning-based noise reduction to improve visual spatial resolution.

### The Physics and Clinical Considerations of Radionuclide Therapy

#### TEACHING POINTS

1. Review the physical properties of different modes of radionuclide decay and their relevant clinical applications. 2. Discussion production of radioisotopes and radiopharmaceuticals, and the radiation biophysics that result in tumor cell death and DNA damage. 3. Discuss the physical properties of various radioisotopes used in therapy, as well as emerging clinical applications, and clinical considerations. 4. Describe the management considerations regarding dose limiting properties and off-target biological effects associated with radionuclide therapies. 5. Review patient and general public safety considerations for radiation emitted by patients after discharge.

#### TABLE OF CONTENTS/OUTLINE

1. Physics - Types of radionuclide decay and Linear Energy Transfer- Review of radioisotope production 2. Biological Effects- Principles of radiotherapy- Ionizing radiation effects (Direct and Indirect Effects)- Implications for treatment 3. Dosimetry - how to perform and clinical importance 4. Review current and future Radioisotopes and Radiopharmaceuticals- Production, logistics, clinical administration/dosing 5. Radiation Safety- Spillage considerations- Precursors to patient discharge, dosage to general public

### I Want You To Improve My Abdominal MRI Quality

#### Participants

Martin Horwarth, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1 - In an interactive form of a quiz, be able to identify magnetic resonance (MR) artifacts on abdominal studies and how to avoid them if needed.2 - Be able to recognize unwanted MR artifacts or imaging errors, especially the ones that can lead to erroneous reports.3 - Understand the sources of these imaging artifacts.4 - Improve radiologists' and technicians' knowledge of MR physics regarding abdominal imaging with practical cases.

#### TABLE OF CONTENTS/OUTLINE

1 - Introduction on MR physics, imaging errors and what are some imaging artifacts that we do need.2 - A series of interactive cases with questions. The first question on how to identify the imaging error.3 - The answer is followed by an explanation about the physics of the error and why they occur.4 - Divide these artifacts and imaging errors into the ones we can change and the ones we can not.5 - Those avoidable artifacts are followed by another question on how to do so.6 - Explanation on how to avoid or minimize artifacts.7 - Summary and take home notes.

PHEE-9

### Multilingual Nuggets or Snippets: Microlearning Video Lessons on CT Radiation Dose Optimization

#### Participants

Lina Karout, MD, Boston, MA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Using author-created, multilingual microlearning video lessons, we empower the audience on keys aspects of CT radiation dose optimization with the understanding of 1. Justification 2. Indication-driven CT protocols 3. Optimum acquisition parameters 4. Dose metrics and monitoring 5. Diagnostic reference levels (DRLs)

#### TABLE OF CONTENTS/OUTLINE

We will use several author-created microlearning videos to describe the learning objectives. Each video will be created in three languages (English, Spanish, and Portuguese) with voice and subtitles. The videos will bring real-world examples to help the audience understand the critical aspects of radiation dose optimization in CT. Pre and post short 5 questionnaire will be applied before and after the educational activity. All content will be released online for free open access following the RSNA presentation. The videos will be based on recommendations based on IAEA, ACR and international validated documents.

ROEE

### Radiation Oncology Education Exhibits

#### Sub-Events

#### ROEE-1 Artificial Intelligence for Detecting Interstitial Lung Disease in Radiation Therapy

##### Participants

Sonja Kandel, MD, Toronto, ON (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

1. Every patient planned for Radiation Therapy (SBRT) must have a CT available for treatment field contouring. 2. The presence of Interstitial Lung Disease (ILD) can be detected on these CTs 3. Reviewing CTs performed for treatment planning is labour-intensive and may cause delays in treatment planning 4. The presence of ILD puts patients at a significantly higher risk of radiation pneumonitis (increased lung toxicity) 5. The use of an automated ILD detection algorithm improves workflow and helps detect patients with high-risk for radiation pneumonitis

##### TABLE OF CONTENTS/OUTLINE

1. Training the AI was performed on 4393 historical patient CTs performed for treatment planning (ethics board approval was obtained, the requirement for consent was waived). In this cohort, 1366 patient CTs showed the presence of interstitial lung disease. 2. Validation in 537 patients. 3. Prospective testing: After go-live, 111 patients have been screened by the AI so far, 15 patients have been flagged by the AI for suspected lung changes indicative for ILD 4. Automated e-mail notification to the treating radiation oncologist under an ongoing quality improvement ethics framework 5. Two patients were caught by the AI with ILD previously unknown to the radiation oncologist 6. Conclusion: An AI-based screening tool for ILD in planning CTs for SBRT may help detect patients with unknown ILD who would otherwise undergo treatment with an increased risk of radiation pneumonitis

#### ROEE-2 More than Skin Deep: Imaging of Dermatologic Disease in the Head and Neck

##### Participants

Cameron Overfield, MD, Jacksonville, FL (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

1. Radiologist should be aware of the current trends and guidelines for cutaneous malignancies. After reviewing this presentation, the audience will understand the basics of the different treatment modalities and the major decision pathways available to patients and clinicians. 2. The skin is the largest organ of the human body and present on every radiologic exam. The audience learn how to report pertinent findings, both positive and negative, to the referring clinician as well as recommend the appropriate imaging modality to properly stage a cutaneous malignancy. 3. The audience will be presented with gross images and comparison radiologic exams of both primary and recurrent cutaneous malignancies. The Radiologist should be able to distinguish normal post-treatment changes from findings would prompt further investigation.

##### TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Teaching Points and Target Audience 3. Decision-points for Surgical, Systemic, and Radiation therapies a. Surgical techniques b. Systemic therapies (immuno- and chemotherapy) c. Radiation therapy 4. The Role of Imaging for Cutaneous Malignancies a. When should imaging be considered? b. What is the modality of choice? c. What are the goals of imaging? d. How does imaging guide management or treatment options? 5. What the Dermatologist wants to know a. Checklist of pertinent positive and negative findings b. Lesion extent, size, perineural invasion, osseous spread, dermal spread, and metastatic nodal disease 6. Follow-up after treatment a. When to image for recurrence? b. What are the major risk factors for recurrence? (Perineural spread on initial histopathology) 7. Conclusion 8. References

#### ROEE-3 Protect Your Heart and Lungs - Usefulness of Left Side Breast Radiotherapy Using Deep Inspiration Breath Hold Technique

##### TEACHING POINTS

Radiation therapy for postoperative breast cancer significantly reduces intra breast recurrence and improves survival. However, adverse events in normal tissues such as the heart and lungs due to left side breast radiotherapy is a problem. The use of deep inspiration breath hold for left side breast radiotherapy can significantly reduce cardiac and pulmonary doses compared with free breathing treatment.

##### TABLE OF CONTENTS/OUTLINE

Radiation therapy for postoperative breast cancer has been shown to significantly reduce breast recurrence and improve survival. However, adverse events such as pericarditis, myocardial infarction, ischemic heart disease, and pneumonia are problems with left side breast radiotherapy. Left side breast radiation therapy should strive to minimize the dose delivered to the heart and lungs. Deep inspiration breath hold irradiation is a method to reduce the exposure dose to the heart and lungs. The treatment plans were compared from deep inspiration breath hold and free breathing CT images of 36 patients who underwent left side breast radiotherapy. Deep inspiration breath hold radiotherapy performed better than free breathing in most categories. It is useful to use

deep inspiration breath hold technique for radiotherapy after left breast cancer surgery. When performing radiation therapy after surgery for left side breast cancer, it is important to obtain CT images of both deep inspiration breath hold and free breathing to create a treatment plan and compare the results.

#### **ROEE-4 Imaging Features of Anal Carcinoma after Chemoradiation**

Participants

Kyungmin Kim, BMBS, Manchester, United Kingdom (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Anal cancer is a rare type of cancer primarily treated with chemoradiation. Surgical resection can be considered for residual or recurrent anal canal tumors in suitable patients after chemoradiation. Early salvage surgery is associated with better outcomes. Clinical examination after chemoradiation is often limited by canal stenosis and pain. Therefore, radiological surveillance with pelvic MR and PET-CT plays a fundamental role in assessment of both local treatment response and presence of distant metastasis. Imaging features post-treatment include: Resolution of tumor; Stereotypical patterns of fibrosis; Tumor necrosis/post-treatment inflammation; and Viable tumor residuum or recurrence. It can be challenging to differentiate post-treatment changes from tumor residuum or recurrence. It is important to recognize and differentiate imaging features of incomplete response/recurrence from other post-treatment changes, such that early and timely salvage surgery can be offered to patients.

#### **TABLE OF CONTENTS/OUTLINE**

1. Introduction  
2. Treatment options for anal cancer  
2.1 Chemoradiation therapy  
2.2 Surgery  
3. Methods of monitoring treatment response  
3.1 Clinical examination  
3.2 Contrast enhanced CT  
3.3 Pelvic MR  
3.3.1 Recommended sequences  
3.4 PET-CT  
4. Imaging appearance of anal cancer after chemoradiation  
4.1 Complete resolution  
4.2 Fibrosis  
4.3 Residual disease  
4.4 Frank progression  
4.5 Pearls and pitfalls  
4.5.1 Tram-track sign  
4.5.2 Pseudotumor  
4.5.3 Post-treatment mucositis  
4.5.4 MR correlation with PET-CT  
5. Summary

#### **ROEE-5 Application of CT Energy Spectrum Curve and Iodine Base Map in Differential Diagnosis of Different Pathological Types of Urinary Tract Tumors**

#### **TEACHING POINTS**

1) Urethral tumor is relatively rare, which is easy to be missed and misdiagnosed clinically.  
2) Energy spectrum CT can convert different single energies, so as to obtain the image with the lowest noise, the best tissue structure contrast, and the clearest anatomical details.  
3) Energy spectrum CT low-energy image can effectively eliminate the problem of hardening artifacts that cannot be solved by conventional CT scanning, and overcome the shortcomings of mixed energy image.  
4) Energy spectrum CT separates each energy level to form a CT value change curve under different keV conditions. Different tissues and diseases have different energy spectrum curves.

#### **TABLE OF CONTENTS/OUTLINE**

1) Urinary tract tumors are mostly malignant, and their pathological types include squamous cell carcinoma, transitional cell carcinoma, adenocarcinoma, clear cell carcinoma, leiomyoma, hemangioma, malignant melanoma and other pathological types. At present, the clinical differentiation of urinary tract tumors mainly depends on a series of invasive examinations such as ureteroscopy biopsy.  
2) According to the comparison of energy spectrum curve, it is helpful for us to determine the pathological type and compare whether there is homology or difference between lesions, so as to determine the depth of invasion of lesions and whether the metastatic lesions are homologous.  
3) The iodine density map separated from the energy spectrum CT can also accurately reflect the absorption of iodine contrast agent by the tumor, that is, the blood supply; at the same time, it can accurately analyze tumor angiogenesis and hemodynamics.

VAEE

### Vascular Imaging Education Exhibits

#### Sub-Events

#### **VAEE-1 Hepatic Vascular Pathology: A Journey From the Hilum to the Cava**

##### Participants

Ignacio De Garcillan, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

Review hepatic vascular anatomy. Revise most common anatomic variants. Understand most frequent pathology.

##### TABLE OF CONTENTS/OUTLINE

The liver has a double vascular supply through the portal vein and the hepatic artery. The drainage takes place into the hepatic veins and inferior vena cava. In this poster, pathology that can affect these vascular structures will be reviewed and illustrated with different cases from our hospital. The portal vein and its branches are involved in the main hepatic vascular pathologies. Portal vein thrombosis is one of the most common vascular complications. It can be acute or chronic and produced by bland, tumoral or infected thrombus (thrombophlebitis). Thrombosis can lead to cavernomatous transformation, portal hypertension and portosystemic collateral channels. Understanding hepatic artery anatomy and its variants is mandatory especially in presurgical studies. Pathology is less frequent and it is mainly surgery related. The most frequent anomaly involving the hepatic veins is thrombosis leading to Budd-Chiari syndrome and passive hepatic congestion due to cardiac disease. Within the hepatic sinusoid's pathology, it is important to be familiar with the sinusoidal obstruction syndrome. Connections can develop between vascular structures, leading to arterioportal, arteriovenous and portosystemic shunts. Radiologists must be familiar with all of these in order to make a correct diagnosis and guide appropriate treatment.

#### **VAEE-10 A to Z of Whole-Body Vasculitis Imaging: A Comprehensive Review for Radiologists**

##### Participants

Seyedarash Mahdavi Anari, MD, Seattle, WA (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

Familiarize radiologists with classification of vasculitis. Review the most common arteries involved in different vasculitis. Provide ideal CT, MR, PET, and US imaging protocols for assessment of vasculitis. Review complications of vasculitis and non-vascular findings in vasculitis cases.

##### TABLE OF CONTENTS/OUTLINE

Vasculitis: definition and classification. Overview of different types of vasculitis with their associated immune markers. An algorithmic approach to diagnosis of vasculitis using combination of imaging and non-imaging data. Imaging protocols for vascular imaging: MRI, CT, PET, and US. Pros and cons of each imaging modality for assessment of vasculitis. Pictorial review of expected vascular findings in vasculitis cases. Review of non-vascular findings in vasculitis cases. Pitfalls in vascular imaging related to diagnosis and assessment of response to treatment of vasculitis.

#### **VAEE-11 Let the Waveform Lead the Way: What There Is to Know About Vertebral Arteries Doppler Ultrasound**

##### Participants

Sofia Arizaga, MD, Mexico City, Mexico (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

after the exhibit the reader would be able- To review the normal anatomy regarding vertebral arteries. To identify normal and abnormal vertebral arteries waveform which may provide useful clues regarding pathology in the subclavian, carotid, brachiocephalic, and intracranial arteries. To recognize the most common vertebral arteries pathology using Color Doppler-ultrasonography.

##### TABLE OF CONTENTS/OUTLINE

Introduction. Normal vertebral arteries anatomy. Ultrasound: Technical requirements and examination techniques. Morphological assessment (B-mode), Color Doppler and spectral normal vertebral arteries waveform. Color Doppler and spectral abnormal vertebral arteries waveform. Subclavian Steal Syndrome: definitions, etiology, clinical presentation and Pre-steal and Steal Waveform. Vertebral arteries stenosis and occlusion: Definitions, Etiology, and Clinical Presentation. Differential diagnosis of changes in vertebral artery waveforms. Illustrative cases- Summary

#### **VAEE-12 Vascular Malformation: From Classification to Characterization**

##### TEACHING POINTS

Vascular malformations and tumors are a heterogeneous group of lesions that may affect the arterial, capillary, venous or lymphatic system or any combination thereof. They encompass a bewildering range of lesions, syndromes, and masses ranging from the relatively common to the rare. The classification available for these lesions is complex and involves various histopathological aspects. Creating a classification system primarily based on different radiological modalities is beneficial. Understanding differentiating features between low flow and high flow vascular malformations is essential as they have different treatment protocols. Understanding differentiating features between arterial, venous and lymphatic malformations helps to understand the different components in a mixed vascular malformation. In case of histopathological dilemma, radiological features play a major role. Knowing different locations, imaging features and progression with age of hemangioma helps to understand their etiology and natural history.

#### TABLE OF CONTENTS/OUTLINE

Imaging features of vascular malformations on ultrasound, color Doppler, CT angiography, MRI. Characterization of vascular malformations. Algorithmic approach to classify vascular malformations. Various syndromes associated with vascular malformations.

#### VAEE-13 **Hands Up! This Is An... Upper Extremities CT Angiography**

Participants

Vanessa Hernandez Olivera, MD, Tlalpan, Mexico (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Explain an overview of current imaging guidelines for upper extremities CT angiography. Pictorial review of the most frequent pathologies and atypical cases and their diagnosis in our medical center.

#### TABLE OF CONTENTS/OUTLINE

Introduction Review current imaging guidelines for upper extremities CT angiography. Anatomy and anatomical variations of the upper extremities arteries. CT angiography protocols in different clinical scenarios. Upper extremities arterial diseases: • In situ thrombosis. • Aneurysm or pseudoaneurysm. • Vasculitides. • AVF complications. • Trauma. • Post procedure complications. • Thoracic outlet syndrome. Conclusions

#### VAEE-14 **Too Soon to Enhance: Pearls and Pitfalls of Early Venous Enhancement**

Participants

Iza Vieira, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Revisit through cases and recall the characteristics of the main pathological and physiological causes of early venous enhancement. - Demonstrate protocols and techniques for optimizing venous studies (CTA/CTV and MRA), allowing differentiation of the various conditions associated with early venous enhancement.

#### TABLE OF CONTENTS/OUTLINE

- Pictorial review of the main physiological causes of early venous enhancement (commonly associated with rapid venous return), including the territories of the jugular veins, venous sinus, renal veins, inferior vena cava and hepatic veins. - Demonstration of the main methods of venous phase acquisition and discussion of techniques and methods. Show examples of techniques that can facilitate specific diagnosis, such as injection of contrast through alternative venous access (e.g. podalic vein). - Demonstrate that in the same venous territory, early enhancement can represent either a pathological or physiological finding depending on the evaluation of the other venous territories and associated pathologies, including territories of left gonadal vein and left iliac vein. - Display selected cases of uncommon causes of early venous enhancement: portosystemic shunt, cecal angiodysplasia, congenital and acquired arteriovenous fistula. - Summary of teaching points.

#### VAEE-15 **Inflammatory and Infectious Conditions of the Aorta: A Review of Concepts and Imaging Findings**

Participants

Vitor Bichuette, MD, Uberaba, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

? To review concepts involving epidemiology, clinical presentation and imaging findings of inflammatory and infectious conditions of the aorta. ? To identify the main imaging features of diseases that affect the aorta and its branches. ? To differentiate pathological and treatment-related imaging patterns of aortic disease. ? To discuss how radiologists can help in the management of aortitis.

#### TABLE OF CONTENTS/OUTLINE

• Introduction - General concepts o The use of different imaging modalities to assess the aorta. • Aortitis classification: o Involvement of the branches of the aorta in the main diseases. o Definition, clinical presentation and imaging features of diseases involving the aorta. • Case-Based Review: o Sample cases explaining and demonstrating imaging findings of aortitis and how imaging modalities can be used before and after the treatment. This section will present illustrative cases of: § Takayasu arteritis § Giant cell arteritis § Granulomatosis with polyangiitis § Polyarteritis nodosa § IgG4-related disease § Idiopathic aortitis § Syphilitic aortitis § Staphylococcus aureus aortitis § Mycobacterium tuberculosis aortitis § COVID-19 aortitis • Future Directions: new perspectives in the assessment of the aorta. • Conclusion and key takeaways.

#### VAEE-16 **Multimodality Imaging in Large Vessel Vasculitides**

Participants

Sahar Alizada, Istanbul, Turkey (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Large Vessel Vasculitides (LVV) encompass a range of pathologies classified as non-infectious/inflammatory (primary and secondary vasculitides) and infectious vasculitides. • Various imaging modalities are available for diagnosis, including Ultrasound, CTA, MA, and FDG-PET/CT, each with its own advantages and disadvantages. • Each modality has specific imaging features that aid in the

diagnosis of vasculitis, such as the halo sign in ultrasound or circumferential thickening and vessel wall enhancement on CTA or MRA, which are consistent with inflammatory vasculitis. Conversely, crescentic-shaped thickening with adjacent fat stranding are features of infectious vasculitis. Moderate to intense circumferential FDG uptake along the vessel wall on FDG-PET/CT indicates active vasculitis. Recent publications suggest that FDG uptake in the temporal or maxillary arteries has similar sensitivity/specificity in diagnosing LV (GA). • This educational exhibit proposes an algorithm for patients suspected of having either inflammatory large vessel vasculitis or infectious vasculitis. For inflammatory vasculitis, ultrasound should be the first-line imaging modality.

#### TABLE OF CONTENTS/OUTLINE

• LVV classifications. • Available imaging modalities that can be utilized in LVV. • Key imaging features • Proposed algorithm for patients with LVV

#### VAEE-17 **Doppler High Frequency Ultrasound in Vascular Complications: What Radiologists Should Know Before, During or After Injectable Procedures**

Participants

Luciana Zattar, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Facial injections with different dermal fillers have become increasingly common. The explosion in the use of these injectable materials has brought a concomitant rise in the incidence of complications. Vascular compromise is the most concerning complication of all, caused either by intravascular injection (arterial or venous), external compression (mostly of the veins), thrombosis or embolization. As a result, blood flow may be interrupted in the occluded facial arteries, leading to ischemia, necrosis or ulcerations. Fortunately, Doppler high frequency ultrasound (DHFUS) is valuable to avoid, to diagnose and to treat vascular complications in most clinical scenarios. However, the clinicians should be alerted that many factors will affect the sensitivity of this examination. And, in this context, the radiologists may be requested to recognize and evaluate patients before, during or after injectable procedures, for safe and effective injections. This study aims: (1) To review and clarify the facial vascular anatomy and major variations. (2) To describe the correct examination technique: basic probe positions. (3) To teach how to recognize different dermal filler substances and signs of vascular occlusion. (4) To list different possible imaging findings of vascular occlusion (new pattern based on angiosome with fresh-frozen specimen correlation). (5) To describe guided procedures to avoid or treat complications.

#### TABLE OF CONTENTS/OUTLINE

1. INTRODUCTION. 2. VASCULAR FACIAL ANATOMY. 3. IMAGING TECHNIQUE. 4. DERMAL FILLERS DESCRIPTION. 5. DHFUS FINDINGS IN VASCULAR OCCLUSIONS: a new finding. 6. GUIDED PROCEDURES. 7. CONCLUSION.

#### VAEE-18 **Collateral Networks in Superior Vena Cava Obstruction**

Participants

Joao Sarmiento Santos, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To illustrate with schematic figures and cases the patterns of collateral venous pathways depending on the level of superior vena cava (SVC) obstruction (above or below the junction of the azygos arch). To discuss the technical aspects related to vena cava imaging. To describe the mechanisms and illustrate with cases the different etiologies of SVC obstruction. To discuss the treatment options, the role of imaging to plan therapy, as well as post-therapeutic findings.

#### TABLE OF CONTENTS/OUTLINE

SCV obstruction is a relatively common entity in the everyday practice of different radiology subspecialties, including head and neck, thoracic, abdominal, vascular and interventional radiologists. Hence, to schematize in an easy way the collateral venous pathways developed secondary to caval obstruction is of wide interest to facilitate diagnosis and treatment. We herein describe the collateral pathways resulting from SCV obstruction and correlate the opacification of those collaterals to the site of contrast injection in CT and MR angiography exams. Graphic representations of the sites of obstruction and respective formed collaterals are depicted, as well as the azygos / hemiazygos system participation to the collateral venous return. The normal anatomy and anatomical variations which might play a role in the collateral system development are detailed. The main causes of obstruction are discussed: extrinsic compressions, tumoral invasion, thrombosis and traumatic injury.

#### VAEE-19 **When The Lifeline Becomes a Liability: Comprehensive Analysis of Arterio-Venous Fistula and Graft Complications in Hemodialysis Patient**

Participants

Kamlesh Kumar Ratte, MD, New Delhi, India (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Simplifying the approach to Doppler ultrasound of Arterio-Venous fistula through a tabular form, and displaying normal imaging findings of patent fistula in gray scale sonography, color Doppler and CT Angiogram Venogram. Understanding the normal post graft hemodynamic changes. To highlight various types of haemodialysis access sites ranging from radiocephalic fistula to transposition basilic vein fistula and less frequently used arterio-venous graft. To demonstrate various possible complications of A-V fistula like infection, aneurysmal dilatation, pseudoaneurysm, stenosis, thrombosis and arterial steal phenomenon. To help the budding radiologists in identifying these complications for prompt diagnosis leading to early intervention and better patient management.

#### TABLE OF CONTENTS/OUTLINE

Simplified version of Arterio-Venous fistula Doppler technique. Normal anatomy on CT Angiogram Venogram. Approach to normal and altered hemodynamics of Arterio-Venous fistula on colour Doppler. Identification of mature Arterio-Venous through Doppler parameter. Comprehensive review of complications of Arterio-Venous fistulae graft.

#### VAEE-2 **Spontaneous Abdominal Wall Hemorrhage: A Practical Diagnostic Guide to Aid the Interventional Radiologist**

Participants

Claudia Campos Bas, Palma De Mallorca, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To describe the diagnostic process using Angio-CT of spontaneous soft tissue haemorrhage (SSTH) in the abdominal wall and the key findings to guide interventional treatment. To share practical advice on identifying the probable bleeding artery in angio-TC using vascular territory mapping and correlating with arteriography.

#### TABLE OF CONTENTS/OUTLINE

SSTH in the abdominal wall characterizes by sudden extravasation of blood into a muscle group without an underlying medical condition. Whilst most cases remain confined, some may become extensive and life-threatening. In such situations, radiological management may be both diagnostic and interventional. Angio-TC is the gold standard for the detection of haemorrhage, allowing a fast and non-invasive diagnosis. Moreover, it enables us to differentiate between arterial and venous bleeding and to approximate the most probable bleeding artery, serving as a road map for targeted angiography and embolization. We retrospectively reviewed 28 patients (aged 59-88) admitted to our angiography suite due to acute anemia in the setting of active arterial abdominal wall bleeding described on triphasic CT. We determined the presence of active arterial bleeding and identifies the responsible vascular pedicle when possible. In all other cases, we inferred the most probable bleeding vessel based on location of contrast extravasation, known as "arterial mapping". We compared our results with the subsequent arteriography. Angio-TC is essential in the setting of SSTH as it enables to determine the presence and origin of bleeding. Differentiating arterial from venous bleeding and identifying the potentially damaged vessel is of paramount to manage these patients.

#### VAEE-20 **Chronic Mesenteric Ischemia: Mesenteric Artery Duplex Sonography and the Utility of Postprandial Imaging**

Participants

Kaitlin Zaki-Metias, MD, Windsor, ON (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Duplex sonography performed in the fasting state serves as a good initial screening tool for chronic mesenteric ischemia. 2. There is a wide range and lack of consensus of established cut-offs for peak systolic velocity criteria suggestive of hemodynamically significant mesenteric arterial stenosis in the literature. 3. The evidence supporting the utility of postprandial assessment of the mesenteric arteries is inconclusive. 4. Failure of peak systolic velocity to increase 20-30% between fasting and postprandial states may indicate hemodynamically significant stenosis. 5. Given the lack of clarity surrounding postprandial duplex sonography of the mesenteric arteries, inclusion of postprandial assessment in the imaging protocol may lead to confusion.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Epidemiology and clinical presentation of chronic mesenteric ischemia 3. Pathophysiology of chronic mesenteric ischemia 4. Duplex sonography of the mesenteric arteries: common protocols and pitfalls 5. Postprandial imaging of the mesenteric arteries and associated challenges 6. ACR appropriateness criteria for imaging of mesenteric ischemia 7. Case-based review of mesenteric artery duplex sonography including normal cases, abnormal cases, and cases mistakenly interpreted as abnormal 8. Management of chronic mesenteric ischemia 9. Conclusion

#### VAEE-21 **The Forgotten Vessels: Imaging of the Inferior Mesenteric Vasculature**

Participants

Anup Shetty, MD, Saint Louis, MO (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The inferior mesenteric artery (IMA) and vein (IMV) supply and drain the distal colon and rectum, but can be neglected as part of a standard search pattern. This exhibit will: 1) Familiarize the reader with the embryology, anatomy, and physiology of the inferior mesenteric vessels 2) Discuss modalities used to image the IMA/IMV 3) Illustrate a broad spectrum of diseases affecting the IMA/IMV through a series of illustrative cases

#### TABLE OF CONTENTS/OUTLINE

Outline- Embryology, Anatomy (and variants), and Physiology- Imaging Modalities (CT, US, MR, angiography)\* IMA abnormalities - acute thromboembolic disease - chronic occlusion (AAA, Leriche) and collateral pathways - dissection, aneurysm, pseudoaneurysm, and arteriovenous fistula - vasculitis - hemorrhage - tumor invasion\* IMV abnormalities - thrombosis - septic thrombophlebitis - intravenous gas in the setting of pneumatosis - tumor invasion - rectal varices in portal hypertension - mass effect from sigmoid volvulus leading to rectal edema\* diagnostic clues- displacement from internal hernia - lymphadenopathy from rectal cancer - flow artifact at portosplenic confluence

#### VAEE-22 **CT Angiography of the Upper Extremity: Purpose, Protocols, Problems, and Pathology**

Participants

Alexander Satei, MBBS, Birmingham, MI (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. CT angiography is a key diagnostic imaging tool to evaluate for upper extremity arterial pathology. 2. Understanding the vascular anatomy of the upper extremity, including variant anatomy, is critical for interpretation of CT angiography of the upper extremity. 3. Benefits of CT angiography include rapid noninvasive image acquisition, lower cost and radiation exposure than digital subtraction angiography, and simultaneous evaluation of the adjacent osseous structures and soft tissues. 4. Limitations of CT angiography include patient positioning for optimal imaging, contrast bolus timing, increased cost and radiation exposure relative to sonographic evaluation, and artifact relating to arterial calcification, implanted hardware, or metallic foreign bodies. 5. CT angiography of the upper extremity is ideal for evaluation of traumatic arterial injury, vasculitides, congenital vascular anomalies, arteriovenous fistulae for hemodialysis, and pre- and post-operative evaluation relating to vascular and surgical intervention.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction. 2. Vascular anatomy of the upper extremity. 3. Review of important variant vascular anomalies of the upper extremity. 4. Indications for CTA of the upper extremity. 5. Benefits and limitations of CTA of the upper extremity. 6. Extended

case-based review of CTA upper extremity including subclavian steal syndrome, active post-traumatic extravasation, arteriovenous fistulae, pseudoaneurysm and aneurysm, mycotic aneurysm, dissection, transection, hematoma, fibromuscular dysplasia, and thoracic outlet syndrome, among others. 7. Conclusion.

### **VAEE-23 Hearts on Fire: Imaging the Coronary Arteries in Systemic Vasculitis**

Participants

Sean Johnson, Los Angeles, CA (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Overview of systemic vasculitis, highlighting entities which can involve the coronary arteries. Review the incidence and prevalence of coronary artery vasculitis. Demonstrate coronary artery manifestation of systemic vasculitis with case-based reviews. Discuss various diagnostic modalities and protocols used to identify and characterize coronary artery vasculitis.

#### **TABLE OF CONTENTS/OUTLINE**

1. Incidence and prevalence of coronary artery vasculitides. 2. Review forms of systemic vasculitis, coronary artery manifestations and pathophysiology, including: Takayasu arteritis, Kawasaki disease, microscopic polyangiitis, Erdheim-Chester disease, IgG4-related vasculitis and polyarteritis nodosa. 3. Case-based review of coronary artery vasculitides, including both acute and chronic manifestations. 4. Brief discussion of non-coronary thoracic aortic disease in systemic vasculitis. 5. An approach evaluating the coronary arteries for involvement in systemic vasculitis, including review of imaging selection and protocols.

### **VAEE-24 Advanced Multimodal MRA Techniques for Cerebrovascular Disease: A Comprehensive Guide**

#### **TEACHING POINTS**

Cerebrovascular disorder treatment has evolved, now employing a range of advanced devices. While time-of-flight MR angiography (TOF-MRA) can suffer from image degradation, innovative multimodal MRA techniques such as phase contrast (PC), ultrashort echo time (UTE), and 4D offer improved image quality. Embracing these cutting-edge imaging methods is crucial in managing cerebrovascular disorders. Our presentation aims to: 1. Provide a comprehensive overview of cerebrovascular diseases. 2. Highlight the technical details of state-of-the-art multimodal MRA imaging techniques. 3. Showcase the clinical applications of multimodal MRA imaging in diagnosis, treatment, and postoperative care for cerebrovascular diseases.

#### **TABLE OF CONTENTS/OUTLINE**

1. Exploring the significance and recent advancements in multimodal MRA imaging for cerebrovascular diseases. 2. Diving deep into the technical aspects of various MRA sequences, including TOF, PC, UTE, and 4D. 3. Unveiling the latest clinical applications of multimodal MRA imaging for cerebrovascular conditions, such as intracranial aneurysms, arteriovenous malformation (AVM), dural arteriovenous fistula (dAVF), and moyamoya disease, through real-life case studies.

### **VAEE-25 US of Lower Extremity Deep Vein Thrombosis: A Review**

#### **TEACHING POINTS**

· Describe SRU Multidisciplinary 2018 Consensus protocol for complete duplex ultrasound (CDUS) of lower extremity · Differentiate acute thrombosis, chronic post thrombotic change · Discuss implications of slow flow · Describe normal and abnormal spectral Doppler and how it can be used to infer more central thrombosis · Describe pitfalls related to anatomy, gray scale and color Doppler

#### **TABLE OF CONTENTS/OUTLINE**

Table of Contents/Outline 1. Ultrasound Protocols a. SRU consensus for complete duplex ultrasound (CDUS) b. Alternative (limited protocols) i. Appropriate situations ii. Follow up c. Example of imaging and labeling for CDUS 2. Acute DVT a. Gray scale b. Types: Occlusive, Non-occlusive, Mobile c. Appearance over time d. "Acute on chronic" and indeterminate acuity e. Phlegmasia cerulea dolans 3. Post thrombotic change a. Diminutive size of veins b. Wall thickening c. Synechiae d. Calcification e. Collaterals and deep reflux f. Neovascularization /arterialization 4. Other Issues a. Central DVT implied by abnormal spectral Doppler b. Slow Flow i. Normal ii. Progression to DVT c. Isolated calf thrombus d. Increased venous pulsatility e. Positive DVT with ipsilateral renal transplant 5. Follow up US, alternative imaging and treatment recommendations based on US appearance and extent of thrombus 6. Pitfalls a. Related to frequency of transducers b. Anatomic variations c. Poor color Doppler settings

### **VAEE-26 A Novel Approach to Deforming Device for Optimal Frozen Elephant Trunk Technique via Patient Specific 3D Printed Model**

#### **TEACHING POINTS**

Frozen elephant trunk implantation for thoracic aortic aneurysms is recognized as a less invasive surgical technique. However, because intraoperative fluoroscopy is not available, device insertion must be done with blind operation. To avoid complications, we developed a novel approach for deforming device in advance and simulating surgical procedures via life size 3D model.

#### **TABLE OF CONTENTS/OUTLINE**

Datasets for printing were converted, using CT data which has submillimeter spatial resolution. Patient specific life size 3D printed models were faithfully reproduced luminal surface of thoracic aorta. 3D printed model enables surgeon to assess physiological morphology including stenosis or spiculated atheroma, practically, though it is impossible to see that intraoperatively. Furthermore, this method allowed surgeon to simulate surgical procedures, considering precise device size in advance. 3D printed model is clinically available and promising for facilitating the operation strategy optimization, and assistant for frozen elephant trunk technique safely. There will be contributions to clinical practice for preoperative accurate assessment and simulation.

### **VAEE-27 Nonatherosclerotic Conditions of Peripheral Arteries**

Participants

Taila Moura Fe, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

The purposes of this exhibit are: Make a didactic review of the nonatherosclerotic conditions of peripheral arteries, including the

following conditions: Aneurysm, Pseudoaneurysm, Dissection, Vascular prosthesis and grafts, Embolism, Arteriovenous fistula, Arterial adventitial cystic disease, Locked-in arterial syndrome. To illustrate these conditions based on cases from our ultrasonography team. Correlate sonography findings with different image methods.

#### **TABLE OF CONTENTS/OUTLINE**

Introduction including the nonatherosclerotic conditions of peripheral arteries, including the following conditions: Aneurysm, Pseudoaneurysm, Dissection, Vascular prosthesis and graft, Embolism Arteriovenous fistula, Arterial adventitial cystic disease, Locked-in arterial syndrome. Describe the main information of each condition. Illustrated teaching cases from our ultrasonography team, each condition. Correlate the ultrasound findings with other image methods.

#### **VAEE-28 Development of a Double Bolus Tracking Method for Individualized CT Angiography Scan Timing**

##### **TEACHING POINTS**

To perform surgical procedures safely, understanding the anatomical variations of the veins in preoperative computed tomography (CT) angiography is critical. The scan timing of the venous phase is generally performed via fixed scan delay, but the contrast effect is often inadequate owing to individual differences in the peak timing of the veins. We have developed the double bolus tracking (DBT) method, which effectively utilizes low-dose monitoring in preoperative CT angiography to individualize the timing of the venous and the arterial phases. The advantage of the DBT method is that the CT angiography enhances the contrast effect in complex anatomical regions such as the portal venous system. Consequently, it might improve the surgical outcomes and patients' quality of life.

##### **TABLE OF CONTENTS/OUTLINE**

A) An overview of the DBT method B) Scanning techniques used for low dose monitoring C) Differences in contrast effects between the fixed scan delay and the DBT methods D) Clinical applications of preoperative vascular mapping E) Advantages of using the DBT method in complex anatomical regions such as the portal venous system F) Limitations and future directions of the DBT method G) Conclusions and clinical relevance of using DBT in preoperative screening methods for colon cancer surgery

#### **VAEE-29 The Anatomy of Danger: Exploring Hemodynamic Perils in Type B Aortic Dissection**

Participants

Hyun Jung Koo, MD, PhD, Seoul, Korea, Republic Of (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

- To explore the debated issues regarding the relationship between the number of entries and aneurysm progression in patients with type B aortic dissection (AD)- To simulate in-vitro dissection model for assessing the relationship between the flow and entries in the dissection- To demonstrate the utility of 4D flow magnetic resonance imaging (MRI) and computational fluid dynamics (CFD) for assessing hemodynamic flow in patients with type B AD - To suggest potential applications of CT and 4D flow MRI in personalized treatment planning for aortic dissection, such as selecting the optimal timing for surgical intervention based on hemodynamic parameters and individual patient factors.

##### **TABLE OF CONTENTS/OUTLINE**

1. CT features - Predictors of high-risk adverse outcome in patients with type B AD2. Controversies - Entry and re-entries - Hemodynamic flow and thrombosis in false lumen3. Assessment of Hemodynamics 1) In-vitro Fluid Dynamics Study- Aorta modeling method - In-vitro 4D flow2) In-vivo 4D flow MRI Study- Wall shear stress, flow displacement, and flow velocity - The role in predicting aortic dissection progression3) CT-based CFD Analysis- In-vivo patient study- In-vitro model matching

#### **VAEE-3 Abdominal Aortic Aneurysm: Pre and Post Operative Evaluation**

Participants

Matheus Marcelino Dias, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

The purposes of this exhibit are: Make a multimodality-based didactic review of the main topics of infradiaphragmatic aneurysm at pre and post operative evaluation. Make a practice guide on how to perform an evaluation with all the necessary variables for follow-up or surgical planning using different imaging methods. Propose a didactic categorization of these topics: Ultrasound evaluation of Abdominal aortic aneurysm. Postoperative Endovascular Ultrasound Evaluation. Postoperative complications d. Ultrasound with microbubbles contrast. Correlate those findings with other exams. Adequate evaluation and early recognition of post operative complications of endovascular repair of aneurysms. Illustrate those conditions based on cases from our radiology group.

##### **TABLE OF CONTENTS/OUTLINE**

We will discuss the principles of the abdominal aortic aneurysm at pre and post operative evaluation and focus on their imaging features using a multimodality approach in this exhibit. Ultrasound evaluation of infradiaphragmatic aneurysm. Postoperative Endovascular Ultrasound Evaluation. Postoperative complications. Ultrasound with microbubbles contrast.

#### **VAEE-30 Why is CT Useful in the Diagnosis of Klippel-Trenaunay-Weber Syndrome?**

##### **TEACHING POINTS**

The purpose of this exhibit is: 1. Klippel-Trenaunay-Weber syndrome (KTWS) is a rare and intractable disorder characterized by unilateral hypertrophy associated with one or more mixed vascular malformations of the extremities. 2. The main imaging modalities used at KTWS are US, MRI, angiography and CT. 3. CT images can clearly depict the vascular malformations of KTWS. 4. In addition, volume measurement and histogram analysis of the extremity by CT imaging can be used to help diagnose KTWS and guide treatment.

##### **TABLE OF CONTENTS/OUTLINE**

Major headings: 1. Describe KTWS. 2. How to create a CT Venography. 3. Usefulness of volume rendering (VR) images by CT. - About VR images of superficial veins. - About VR images of deep veins. 4. Volumetric measurements with CT imaging of the lower extremities are useful in the diagnosis of KTWS. - The volume of the affected and healthy side can be measured reliably and

easily.5. Histogram analysis with CT images of the lower extremity is useful in the treatment strategy for KTWS.- Histogram analysis can determine the components within the analysis area from the CT number.- In the present case, the enlargement of the lower extremities was determined to be due to an increase in the fat component (CT number indicates a negative value), not edema (CT number indicates near zero).

### **VAEE-31 Vascular Malformations and the Mimickers: A Spectrum of Imaging Features**

Participants

Mayu Uka, , Japan (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

The purpose of this exhibit is: 1) To review contrast-enhanced MRI and other imaging features of vascular malformations and vascular tumors compared to imaging features of other similar diseases and 2) to discuss the differential diagnosis of vascular malformations and vascular tumors with other lesion types.

#### **TABLE OF CONTENTS/OUTLINE**

The cause of most vascular tumors and vascular malformations of the body surface and soft tissue is unknown. Hemangiomas, which are benign vascular tumors, and vascular malformations are often referred to idiomatically as "hemangiomas," but the International Society for the Study of Vascular Anomalies (ISSVA) classifies them as separate diseases. Vascular malformations, which include venous malformations, arteriovenous malformations, lymphatic malformations, capillary malformations, and combined types, whose clinical and imaging findings sometimes resemble not only vascular tumors but also other neoplastic and non-neoplastic lesions. In this presentation, we will present common vascular malformations, vascular tumors, and other rare conditions, and review the imaging features and pathological findings of "mimickers," which sometimes have imaging similarities to vascular malformations and are difficult to diagnose.

### **VAEE-32 Aortitis and Large Vessel Arteritis: Diagnosis, Follow-up, Treatment and Mimics**

Participants

Miltiadis Tembelis, MD, Mineola, NY (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Aortitis and large vessel arteritis encompass both infections and noninfectious causes of vascular wall inflammation. These pathologies often produce non-specific clinical presentations and inflammatory markers, complicating the diagnosis. Correlation with demographics, key clinical features and recognition of typical imaging features and distribution can allow radiologist to assist in the diagnosis. Diagnosis is not the only difficult aspect of these pathologies though, as recommendations for appropriate follow-up and the definitions of remission in the literature are heterogeneous.

#### **TABLE OF CONTENTS/OUTLINE**

This review will demonstrate different imaging features of infectious and noninfectious large vessel arteritis and aortitis across different modalities to help radiologists clue in on the diagnosis. Common complications and post-interventional appearances will also be exemplified. In addition, treatments and post-treatment follow-up will be addressed.

### **VAEE-33 Which Vascular Variations Are Important to Colorectal Surgeons for Right Colon Surgery?**

Participants

Minho Lee, Seoul, Korea, Republic Of (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

In right colic surgery, the choice of surgical methods, such as right hemicolectomy, transverse colectomy, or extended right colectomy, depends on the location of the colon cancer. However, vascular variations can occasionally necessitate a change in the planned surgical approach, preventing the originally intended reduced surgery and leading to an extended right colectomy instead. The diverse and frequent vascular anatomy variations in the right colon, if not identified preoperatively, can contribute to increased morbidity and mortality rates. Unexpected arterial variations can prolong surgical time, while venous variations can result in bleeding complications. To assess the impact of vascular variations on surgical methods, we will review approximately 380 CT angiographies and determine the type and incidence of right colic and middle colic arterial and venous variations. We will also identify vascular ligation points according to the type of surgery. Additionally, common mistakes and prevention strategies when inexperienced radiologists evaluate CT angiographies will be discussed. Readers will understand that preoperative CT angiographic evaluations can help shorten surgical time, minimize unexpected bleeding risks, and ultimately improve surgical outcomes.

#### **TABLE OF CONTENTS/OUTLINE**

1. Arterial and venous anatomy of the right colon. 2. Various types of right colon surgery and corresponding vascular ligation points for each procedure. 3. Important measurements of right and middle colic arteries relevant to right colon surgery. 4. Incidence and representative cases of vascular variations. 5. Pitfalls in interpretation and associated cases.

### **VAEE-34 Clinical Applications of MR Angiography Based on Arterial Spin Labeling to Cerebrovascular Disorders**

#### **TEACHING POINTS**

1) To explain the basic principles of 3D or 4D arterial spin labeling (ASL)-based MR angiography (MRA) 2) To discuss the advantages of ASL-based MRA over other imaging techniques 3) To review clinical applications of ASL-based MRA for various cerebrovascular diseases

#### **TABLE OF CONTENTS/OUTLINE**

1) Basic principles of ASL-based MRA •Labeling schemes, Pulsed ASL; Pseudo-Continuous ASL (PCASL); Superselective PCASL; Acceleration-selective ASL (AccASL) •3D or 4D imaging acquisition techniques2) Advantages of ASL-based MRA over time-of-flight MRA or digital subtraction angiography •Readily available •No need for contrast media •No radiation exposure •Short acquisition time •Non-invasive •Cost effective •Time-resolved information •Selective vascular visualization •Easy follow-up after treatment •Easily applicable to children3) Specific techniques for ASL-based MRA •3D-MRA using PCASL -Silent MRA •4D-MRA using pulsed ASL - Contrast inherent inflow enhanced multi-phase angiography (CINEMA) •4D-MRA using PCASL -4D-MRA based on PCASL with

CENTRA-Keyhole and view-sharing (4D-PACK) •Vessel-selective 4D-MRA using superselective PCASL (4D-S-PACK) • AccASL MRA 4) Clinical applications •Intracranial steno-occlusive arterial diseases (e.g. Moyamoya disease) •Brain arteriovenous malformation • Intracranial dural arteriovenous fistula •Assessment of extra-intracranial bypass arteries 5) Limitations of each ASL-based MRA technique

### **VAEE-35 Clinical Applications and Implementation of Photon Counting Detector CT in Vascular Imaging**

Participants

Prabhakar Rajiah, MD, FRCR, Rochester, MN (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

1. To discuss the advantages of photon-counting detector (PCD) CT in vascular imaging 2. To review the modes, kernels, and protocols of PCD CT in vascular imaging 3. To illustrate the clinical applications of PCD CT in vascular imaging

#### **TABLE OF CONTENTS/OUTLINE**

1. PCD CT TECHNOLOGIES- Single source, Dual-source 2. BENEFITS OF PCD-CT-Ultra-high spatial resolution;Multi energy (ME)/spectral imaging;K-edge imaging ;High vascular signal;Low electronic noise artifacts;Lower radiation and contrast doses; 3. TECHNICAL ASPECTS RELEVANT TO VASCULAR IMAGING-Modes Ultra-high resolution, ME, HR-ME, Flash-ME, gated/ungated;Kernels, denoising;Collimation;Images- Single energy like (T3D), VMI, iodine, VNC, virtual non calcium, spectral post-processing;Radiation doses, CARE keV;4. VASCULAR APPLICATIONS OF PCD CT WITH CASE EXAMPLES-Ultra-high resolution- Improved visualization of small vessels (Flaps ,eg. DIEP, fibular perforators; Artery of Adamkiewicz; distal arteries of hand, feet, head), calcified plaques, small stents;High iodine CNR - Low dose of iodinated contrast, salvage of suboptimal-enhanced studies;Decreased artifacts- Calcium blooming, beam hardening, metal;ME calcium separation- Improved lumen visualization;ME bone subtraction- Rapid and accurate;ME lesion characterization-hematoma vs active bleed vs calcification;Vascular perfusion- Lung, myocardium, extremities;Multi-contrast and novel contrast media- e.g. iodine and gadolinium;Advanced material separation- Calcium;Radiation dose reduction- VNC images in multiphasic studies, lower noise profile; 5. LIMITATIONS, PITFALLS-Increased data - storage and transfer issues; Noise in high resolution mode

### **VAEE-36 Review of CTA Findings in Patients With Circulatory Assisted Devices**

#### **TEACHING POINTS**

Present CT imaging findings and clinical presentations of complications associated with circulatory assisted devices. Review entities that may present as pitfalls in CT imaging of circulatory assisted devices.

#### **TABLE OF CONTENTS/OUTLINE**

This educational exhibit will present pictorial review of multiple CT findings of complications associated with circulatory assisted devices to increase Radiologists awareness. Highlight challenges associated with CT imaging of circulatory assisted devices and also provide tips to overcome the challenges.

### **VAEE-37 CT Angiography's Role in Virtual Surgical Planning for Craniomaxillofacial Reconstruction with Scapular Free Flap**

#### **TEACHING POINTS**

1. Virtual surgical planning plays an important role in craniomaxillofacial (CMF) reconstruction with scapular free flap. 2. Scapular free flaps are preferred over fibular or deep circumflex artery free flaps for CMF reconstruction when there is variant anatomy, significant atherosclerosis, or prior utilization of lower extremity vessels. 3. Preoperative virtual surgical planning (VSP) has numerous advantages over traditional intraoperative decision making including shortened operative times, improved patient matched custom implant design, improved patient specific oncologic margins and anatomic understanding, and decreased rate of nonunion and flap related complications. 4. Virtual surgical planning and 3D printing sterilizable guides at the point of care requires a centralized manufacturing ecosystem and collaboration between surgeons, radiologists, engineers, and support staff. 5. CT angiography is an important first step in the pre-surgical planning for scapular free flap harvesting because of common variant anatomy and localization of perforating branches.

#### **TABLE OF CONTENTS/OUTLINE**

- Scapular free flap advantages over fibular and deep circumflex artery flaps. - CT angiography's role in virtual surgical planning. - Optimal imaging acquisition to achieve optimal radiologic planning. - Role of 3D modeling and medical device design in virtual surgical planning.

### **VAEE-4 Segmental Arterial Mediolytic: A Visual Journey Through Its Imaging Findings**

Participants

Camila Reifegerste, MD, Curitiba, Brazil (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Segmental arterial mediolysis (SAM) is a nonatherosclerotic and noninflammatory arteriopathy, unknown to many radiologists. It can lead to severe complications, which have a high mortality rate, thus it is important for us to be aware of this disease. SAM is characterized by lysis of the medial arterial layer, normally compromising visceral and renal arteries, coursing with dissections, aneurysms and even arterial rupture. The imaging findings on computed tomography angiography (CTA) of SAM can be very similar to others vasculitides, such as polyarteritis nodosa and granulomatosis with polyangiitis, but most vasculitides can be diagnosed based on clinical, laboratory and imaging findings, while SAM's diagnosis is based majorly on imaging findings and exclusion of other vasculitides. The aim of this presentation is to show some cases of segmental arterial mediolysis from our institution, its complications and some differential diagnosis, for the purpose of making radiologists more familiar with this pathology.

#### **TABLE OF CONTENTS/OUTLINE**

Brief literature review of segmental arterial mediolysis; didactic cases of SMA from the digital archive of our hospital's radiology department, to show SAM typical findings, complications and differential diagnosis on multiple imaging modalities, including computed tomography angiography (CTA), magnetic resonance angiography (MRA), Doppler ultrasound and arterial angiography

## **VAEE-5 The Aortic Isthmus from A to Z**

Participants

Juliana Da Trindade, Niteroi, Brazil (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

To describe the embryology of the aortic isthmus, and its developmental stages. To demonstrate with cases the peculiar anatomical variations of this segment. To exemplify with cases the congenital malformations and pathological states.

### **TABLE OF CONTENTS/OUTLINE**

The aortic isthmus is a small aortic segment located between the left subclavian artery and the ductus arteriosus. This segment undergoes singular changes to allow flow adjustments necessary for the blood circulation from intra to extra-uterine life. The process of closure of the ductus arteriosus after birth normally results in a fibrous band called ligamentum arteriosus. However, different factors as prematurity, genetics, prenatal infections, concomitance of congenital heart diseases, the extension of the ductal tissue to the aortic wall may lead to either persistence of the ductus arteriosus or to variable patterns of ductal involution (aortic knobs or ampullas, aortic-coarctation, etc). The presence of fibrotic tissue within the aortic wall and flow disturbances due to focal ectasia may additionally predispose to aneurysm formation, ulcerations and dissection during adulthood. Therefore, the aortic isthmus is an extremely complex region covering several anatomical variations and a wide spectrum of pathologies that may affect all age groups in a congenital or acquired form. Our goals are to review the isthmic developmental changes along intra to extra-uterine life, and to discuss the imaging findings of different anatomical variations and pathological states of this intricate aortic segment.

## **VAEE-6 Abdominal Vascular Compression Syndromes: What the Radiologist Needs to Know (and Let the Surgeons Know)**

Participants

Daniel Cardoso, MD, Fortaleza, Brazil (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

Recognize the key structures of the abdominal vasculature and its anatomical relations. Understand the causes of Abdominal Vascular Compression Syndromes (AVCS) and related clinical features. Comprehend computed tomography angiography (CTA) imaging patterns of AVCS. Recognize the complications associated to AVCS and its imaging patterns. Understand AVCS treatment methods and criteria.

### **TABLE OF CONTENTS/OUTLINE**

INTRODUCTION: Anatomy of the abdominal vasculature and its relation to other structures. Definition of AVCS. Epidemiology of the most common causes of AVCS. Signs and symptoms. associated to the Median Arcuate Ligament Syndrome (MALS), Superior Mesenteric Artery Syndrome (SMAS), Nutcracker Syndrome (NCS), and May-Thurner Syndrome (MTS). DIAGNOSING, AND IDENTIFYING POST TREATMENT IMAGING PATTERNS - MALS, SMAS, NCS, and MTS: Imaging findings. Complications, and its imaging patterns. Treatment methods, and what to evaluate

## **VAEE-7 Pelvic Congestion Syndrome. CT Angiography and Doppler Ultrasound Findings**

Participants

Carlos Capunay, MD, Vicente Lopez, Argentina (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

To be aware of pelvic congestion syndrome as a cause of female chronic pelvic pain. To recognize the anatomic variants and pathologic conditions that can cause the pelvic congestion syndrome To illustrate the spectrum of CT and Doppler US findings in these patients. To emphasize the most representative imaging features on this clinical syndrome.

### **TABLE OF CONTENTS/OUTLINE**

Anatomy of the normal female pelvic venous plexus. Pathogenesis of the pelvic congestion syndrome. Description of the Doppler US technique. Description of the CTA scan protocol: technical parameters and IV contrast administration CT image analysis and post-processing algorithms in the different clinical setting. Sample cases of compression syndromes (including superior mesenteric artery compression of the left renal vein, and compression of the left common iliac vein by the right common iliac artery). Summary.

## **VAEE-8 The Use of Ferumoxytol for High-Resolution Vascular Imaging and Troubleshooting for Solid Organ Transplantation**

Participants

Amar Shah, MD, Phoenix, AZ (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

1. Ferumoxytol, a novel MR contrast agent in off-label use, is safe for patients with renal dysfunction. 2. Due to its prolonged intravascular half-life and lack of parenchymal extravasation, high-resolution vascular imaging, including distal intraparenchymal branches, is feasible. 3. Ferumoxytol MRA can identify clinically actionable vascular complications of solid organ transplant several weeks to months before ultrasound or traditional MRA. 4. 3D reconstructions facilitate procedural planning and may obviate unnecessary intervention in select patients.

### **TABLE OF CONTENTS/OUTLINE**

1. Introduction to ferumoxytol as a contrast agent: imaging characteristics, protocol details, and safety/administration. 2. Advantages and utility in comparison to GBCA. a. High-resolution vascular imaging without background parenchymal enhancement. b. Curved planar MIP reformats. c. Virtual angiography (Time-Resolved contrast-enhanced MRA) d. Coadministration with GBCA. e. Repeat imaging up to 72 hours. 3. Catalogue of example cases with preceding equivocal or normal ultrasound and/or GBCA MRA (highlighting above techniques). a. Transplant renal artery stenosis (TRAS) b. Transplant renal vein thrombosis (TRVT) with capsular neovascularization (CV) c. TRVT with CV d. TRAS and transplant pancreas artery stenosis (TPAS). e. Transplant pancreas vein thrombosis. f. Transplant pancreas intraparenchymal AVF. g. Transplant hepatic artery stenosis. h. Transplant hepatic vein

thrombosis.

**VAEE-9      Imaging of Primary Malignancies of Inferior VenaCava and its Involvement in Secondary Abdominal Malignancies**

Participants

Veeraiah Koppula, MD, Hyderabad, India (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

After reviewing this educational exhibit, the learner will be able to:• Learn the key imaging features of primary malignancies of Inferior Vena cava• Identify the clinical scenarios in which abdominal malignancies can extrinsically or intrinsically involve the IVC• Review the normal anatomy of IVC and its tributaries

**TABLE OF CONTENTS/OUTLINE**

• Introduction• Normal anatomy and variants of IVC• Clinical and radiological features and management of primary leiomyosarcoma and angiosarcoma of Inferior Vena cava.• Case based discussion of abdominal malignancies involving IVC• Relevance of IVC involvement in staging of malignancies and undertaking oncological surgeries• Conclusion

VAEE-1

### Hepatic Vascular Pathology: A Journey From the Hilum to the Cava

#### Participants

Ignacio De Garcillan, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Review hepatic vascular anatomy. Revise most common anatomic variants. Understand most frequent pathology.

#### TABLE OF CONTENTS/OUTLINE

The liver has a double vascular supply through the portal vein and the hepatic artery. The drainage takes place into the hepatic veins and inferior vena cava. In this poster, pathology that can affect these vascular structures will be reviewed and illustrated with different cases from our hospital. The portal vein and its branches are involved in the main hepatic vascular pathologies. Portal vein thrombosis is one of the most common vascular complications. It can be acute or chronic and produced by bland, tumoral or infected thrombus (thrombophlebitis). Thrombosis can lead to cavernomatous transformation, portal hypertension and portosystemic collateral channels. Understanding hepatic artery anatomy and its variants is mandatory especially in presurgical studies. Pathology is less frequent and it is mainly surgery related. The most frequent anomaly involving the hepatic veins is thrombosis leading to Budd-Chiari syndrome and passive hepatic congestion due to cardiac disease. Within the hepatic sinusoid's pathology, it is important to be familiar with the sinusoidal obstruction syndrome. Connections can develop between vascular structures, leading to arterioportal, arteriovenous and portosystemic shunts. Radiologists must be familiar with all of these in order to make a correct diagnosis and guide appropriate treatment.

VAEE-10

### A to Z of Whole-Body Vasculitis Imaging: A Comprehensive Review for Radiologists

#### Participants

Seyedarash Mahdavi Anari, MD, Seattle, WA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Familiarize radiologists with classification of vasculitis. Review the most common arteries involved in different vasculitis. Provide ideal CT, MR, PET, and US imaging protocols for assessment of vasculitis. Review complications of vasculitis and non-vascular findings in vasculitis cases.

#### TABLE OF CONTENTS/OUTLINE

Vasculitis: definition and classification. Overview of different types of vasculitis with their associated immune markers. An algorithmic approach to diagnosis of vasculitis using combination of imaging and non-imaging data. Imaging protocols for vascular imaging: MRI, CT, PET, and US. Pros and cons of each imaging modality for assessment of vasculitis. Pictorial review of expected vascular findings in vasculitis cases. Review of non-vascular findings in vasculitis cases. Pitfalls in vascular imaging related to diagnosis and assessment of response to treatment of vasculitis.

Printed on: 04/12/24

VAEE-11

### Let the Waveform Lead the Way: What There Is to Know About Vertebral Arteries Doppler Ultrasound

#### Participants

Sofia Arizaga, MD, Mexico City, Mexico (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

after the exhibit the reader would be able- To review the normal anatomy regarding vertebral arteries. To identify normal and abnormal vertebral arteries waveform which may provide useful clues regarding pathology in the subclavian, carotid, brachiocephalic, and intracranial arteries. To recognize the most common vertebral arteries pathology using Color Doppler-ultrasonography.

#### TABLE OF CONTENTS/OUTLINE

Introduction. Normal vertebral arteries anatomy. Ultrasound: Technical requirements and examination techniques. Morphological assessment (B-mode), Color Doppler and spectral normal vertebral arteries waveform. Color Doppler and spectral abnormal vertebral arteries waveform. Subclavian Steal Syndrome: definitions, etiology, clinical presentation and Pre-steal and Steal Waveform. Vertebral arteries stenosis and occlusion: Definitions, Etiology, and Clinical Presentation. Differential diagnosis of changes in vertebral artery waveforms. Illustrative cases- Summary

### Hands Up! This Is An... Upper Extremities CT Angiography

#### Participants

Vanessa Hernandez Olivera, MD, Tlalpan, Mexico (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Explain an overview of current imaging guidelines for upper extremities CT angiography. Pictorial review of the most frequent pathologies and atypical cases and their diagnosis in our medical center.

#### TABLE OF CONTENTS/OUTLINE

Introduction Review current imaging guidelines for upper extremities CT angiography. Anatomy and anatomical variations of the upper extremities arteries. CT angiography protocols in different clinical scenarios. Upper extremities arterial diseases: • In situ thrombosis. • Aneurysm or pseudoaneurysm. • Vasculitides. • AVF complications. • Trauma. • Post procedure complications. • Thoracic outlet syndrome. Conclusions

Printed on: 04/12/24

VAEE-14

### Too Soon to Enhance: Pearls and Pitfalls of Early Venous Enhancement

#### Participants

Iza Vieira, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Revisit through cases and recall the characteristics of the main pathological and physiological causes of early venous enhancement.- Demonstrate protocols and techniques for optimizing venous studies (CTA/CTV and MRA), allowing differentiation of the various conditions associated with early venous enhancement.

#### TABLE OF CONTENTS/OUTLINE

- Pictorial review of the main physiological causes of early venous enhancement (commonly associated with rapid venous return), including the territories of the jugular veins, venous sinus, renal veins, inferior vena cava and hepatic veins.- Demonstration of the main methods of venous phase acquisition and discussion of techniques and methods. Show examples of techniques that can facilitate specific diagnosis, such as injection of contrast through alternative venous access (e.g. podalic vein). - Demonstrate that in the same venous territory, early enhancement can represent either a pathological or physiological finding depending on the evaluation of the other venous territories and associated pathologies, including territories of left gonadal vein and left iliac vein.- Display selected cases of uncommon causes of early venous enhancement: portosystemic shunt, cecal angiodysplasia, congenital and acquired arteriovenous fistula.- Summary of teaching points.

Printed on: 04/12/24

VAEE-15

### Inflammatory and Infectious Conditions of the Aorta: A Review of Concepts and Imaging Findings

#### Participants

Vitor Bichuette, MD, Uberaba, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

? To review concepts involving epidemiology, clinical presentation and imaging findings of inflammatory and infectious conditions of the aorta. ? To identify the main imaging features of diseases that affect the aorta and its branches. ? To differentiate pathological and treatment-related imaging patterns of aortic disease. ? To discuss how radiologists can help in the management of aortitis.

#### TABLE OF CONTENTS/OUTLINE

- Introduction - General concepts
  - o The use of different images modalities to assess the aorta.
- Aortitis classification:
  - o Involvement of the branches of the aorta in the main diseases.
  - o Definition, clinical presentation and imaging features of diseases involving the aorta.
- Case-Based Review:
  - o Sample cases explaining and demonstrating image findings of aortitis and how imaging modalities can be used before and after the treatment. This section will present illustrative cases of:
    - § Takayasu arteritis
    - § Giant cell arteritis
    - § Granulomatosis with polyangiitis
    - § Polyarteritis nodosa
    - § IgG4-related disease
    - § Idiopathic aortitis
    - § Siphilitic aortitis
    - § Staphylococcus aureus aortitis
    - § Mycobacterium tuberculosis aortitis
    - § COVID-19 aortitis
- Future Directions: new perspectives in the assessment of the aorta.
- Conclusion and key takeaways.

Printed on: 04/12/24

VAEE-16

### Multimodality Imaging in Large Vessel Vasculitides

#### Participants

Sahar Alizada, Istanbul, Turkey (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Large Vessel Vasculitides (LVV) encompass a range of pathologies classified as non-infectious/inflammatory (primary and secondary vasculitides) and infectious vasculitides. • Various imaging modalities are available for diagnosis, including Ultrasound, CTA, MA, and FDG-PET/CT, each with its own advantages and disadvantages. • Each modality has specific imaging features that aid in the diagnosis of vasculitis, such as the halo sign in ultrasound or circumferential thickening and vessel wall enhancement on CTA or MA, which are consistent with inflammatory vasculitis. Conversely, crescentic-shaped thickening with adjacent fat stranding are features of infectious vasculitis. Moderate to intense circumferential FDG uptake along the vessel wall on FDG-PET/CT indicates active vasculitis. Recent publications suggest that FDG uptake in the temporal or maxillary arteries has similar sensitivity/specificity in diagnosing LV (GA). • This educational exhibit proposes an algorithm for patients suspected of having either inflammatory large vessel vasculitis or infectious vasculitis. For inflammatory vasculitis, ultrasound should be the first-line imaging modality.

#### TABLE OF CONTENTS/OUTLINE

- LVV classifications.
- Available imaging modalities that can be utilized in LVV.
- Key imaging features
- Proposed algorithm for patients with LVV

VAEE-17

### **Doppler High Frequency Ultrasound in Vascular Complications: What Radiologists Should Know Before, During or After Injectable Procedures**

#### **Participants**

Luciana Zattar, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Facial injections with different dermal fillers have become increasingly common. The explosion in the use of these injectable materials has brought a concomitant rise in the incidence of complications. Vascular compromise is the most concerning complication of all, caused either by intravascular injection (arterial or venous), external compression (mostly of the veins), thrombosis or embolization. As a result, blood flow may be interrupted in the occluded facial arteries, leading to ischemia, necrosis or ulcerations. Fortunately, Doppler high frequency ultrasound (DHFUS) is valuable to avoid, to diagnose and to treat vascular complications in most clinical scenarios. However, the clinicians should be alerted that many factors will affect the sensitivity of this examination. And, in this context, the radiologists may be requested to recognize and evaluate patients before, during or after injectable procedures, for safe and effective injections. This study aims: (1) To review and clarify the facial vascular anatomy and major variations. (2) To describe the correct examination technique: basic probe positions. (3) To teach how to recognize different dermal fillers substances and signs of vascular occlusion. (4) To list different possible imaging findings of vascular occlusion (new pattern based on angiosome with fresh-frozen specimen correlation). (5) To describe guided procedures to avoid or treat complications.

#### **TABLE OF CONTENTS/OUTLINE**

1. INTRODUCTION. 2. VASCULAR FACIAL ANATOMY. 3. IMAGING TECHNIQUE. 4. DERMAL FILLERS DESCRIPTION. 5. DHFUS FINDINGS IN VASCULAR OCCLUSIONS: a new finding. 6. GUIDED PROCEDURES. 7. CONCLUSION.

### Collateral Networks in Superior Vena Cava Obstruction

#### Participants

Joao Sarmiento Santos, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To illustrate with schematic figures and cases the patterns of collateral venous pathways depending on the level of superior vena cava (SVC) obstruction (above or below the junction of the azygos arch). To discuss the technical aspects related to vena cava imaging To describe the mechanisms and illustrate with cases the different etiologies of SVC obstruction. To discuss the treatment options, the role of imaging to plan therapy, as well as post-therapeutic findings.

#### TABLE OF CONTENTS/OUTLINE

SCV obstruction is a relatively common entity in the everyday practice of different radiology subspecialties, including head and neck, thoracic, abdominal, vascular and interventional radiologists. Hence, to schematize in an easy way the collateral venous pathways developed secondary to caval obstruction is of wide interest to facilitate diagnosis and treatment. We herein describe the collateral pathways resulting from SCV obstruction and correlate the opacification of those collaterals to the site of contrast injection in CT and MR angiography exams. Graphic representations of the sites of obstruction and respective formed collaterals are depicted, as well as the azygos / hemiazygos system participation to the collateral venous return. The normal anatomy and anatomical variations which might play a role in the collateral system development are detailed. The main causes of obstruction are discussed: extrinsic compressions, tumoral invasion, thrombosis and traumatic injury.

### **When The Lifeline Becomes a Liability: Comprehensive Analysis of Arterio-Venous Fistula and Graft Complications in Hemodialysis Patient**

#### **Participants**

Kamlesh Kumar Ratre, MD, New Delhi, India (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Simplifying the approach to Doppler ultrasound of Arterio-Venous fistula through a tabular form, and displaying normal imaging findings of patent fistula in gray scale sonography, color Doppler and CT Angiogram Venogram. Understanding the normal post graft hemodynamic changes. To highlight various types of haemodialysis access sites ranging from radiocephalic fistula to transposition basilic vein fistula and less frequently used arterio-venous graft. To demonstrate various possible complications of A-V fistula like infection, aneurysmal dilatation, pseudoaneurysm, stenosis, thrombosis and arterial steal phenomenon. To help the budding radiologists in identifying these complications for prompt diagnosis leading to early intervention and better patient management.

#### **TABLE OF CONTENTS/OUTLINE**

Simplified version of Arterio-Venous fistula Doppler technique. Normal anatomy on CT Angiogram Venogram. Approach to normal and altered hemodynamics of Arterio-Venous fistula on colour Doppler. Identification of mature Arterio-Venous through Doppler parameter. Comprehensive review of complications of Arterio-Venous fistulae graft.

VAEE-2

### Spontaneous Abdominal Wall Hemorrhage: A Practical Diagnostic Guide to Aid the Interventional Radiologist

#### Participants

Claudia Campos Bas, Palma De Mallorca, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To describe the diagnostic process using Angio-CT of spontaneous soft tissue haemorrhage ( SSTH) in the abdominal wall and the key findings to guide interventional treatment.To share practical advice on identifying the probable bleeding artery in angio-TC using vascular territory mapping and correlating with arteriography.

#### TABLE OF CONTENTS/OUTLINE

SSTH in the abdominal wall characterizes by sudden extravasation of blood into a muscle group without an underlying medical condition. Whilst most cases remain confined, some may become extensive and life-threatening. In such situations, radiological management may be both diagnostic and interventional.Angio-TC is the gold standard for the detection of haemorrhage, allowing a fast and non-invasive diagnosis. Moreover, it enables us to differentiate between arterial and venous bleeding and to approximate the most probable bleeding artery, serving as a road map for targeted angiography and embolization. We retrospectively reviewed 28 patients (aged 59-88) admitted to our angiography suite due to acute anemia in the setting of active arterial abdominal wall bleeding described on triphasic CT. We determined the presence of active arterial bleeding and identifies the responsible vascular pedicle when possible. In all other cases, we inferred the most probable bleeding vessel based on location of contrast extravasation, known as "arterial mapping". We compared our results with the subsequent arteriography. Angio-TC is essential in the setting of SSTH as it enables to determine the presence and origin of bleeding. Differentiating arterial from venous bleeding and identifying the potentially damaged vessel is of paramount to manage these patients.

### Chronic Mesenteric Ischemia: Mesenteric Artery Duplex Sonography and the Utility of Postprandial Imaging

#### Participants

Kaitlin Zaki-Metias, MD, Windsor, ON (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Duplex sonography performed in the fasting state serves as a good initial screening tool for chronic mesenteric ischemia. 2. There is a wide range and lack of consensus of established cut-offs for peak systolic velocity criteria suggestive of hemodynamically significant mesenteric arterial stenosis in the literature. 3. The evidence supporting the utility of postprandial assessment of the mesenteric arteries is inconclusive. 4. Failure of peak systolic velocity to increase 20-30% between fasting and postprandial states may indicate hemodynamically significant stenosis. 5. Given the lack of clarity surrounding postprandial duplex sonography of the mesenteric arteries, inclusion of postprandial assessment in the imaging protocol may lead to confusion.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Epidemiology and clinical presentation of chronic mesenteric ischemia 3. Pathophysiology of chronic mesenteric ischemia 4. Duplex sonography of the mesenteric arteries: common protocols and pitfalls 5. Postprandial imaging of the mesenteric arteries and associated challenges 6. ACR appropriateness criteria for imaging of mesenteric ischemia 7. Case-based review of mesenteric artery duplex sonography including normal cases, abnormal cases, and cases mistakenly interpreted as abnormal 8. Management of chronic mesenteric ischemia 9. Conclusion

Printed on: 04/12/24

### CT Angiography of the Upper Extremity: Purpose, Protocols, Problems, and Pathology

#### Participants

Alexander Satei, MBBS, Birmingham, MI (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. CT angiography is a key diagnostic imaging tool to evaluate for upper extremity arterial pathology. 2. Understanding the vascular anatomy of the upper extremity, including variant anatomy, is critical for interpretation of CT angiography of the upper extremity. 3. Benefits of CT angiography include rapid noninvasive image acquisition, lower cost and radiation exposure than digital subtraction angiography, and simultaneous evaluation of the adjacent osseous structures and soft tissues. 4. Limitations of CT angiography include patient positioning for optimal imaging, contrast bolus timing, increased cost and radiation exposure relative to sonographic evaluation, and artifact relating to arterial calcification, implanted hardware, or metallic foreign bodies. 5. CT angiography of the upper extremity is ideal for evaluation of traumatic arterial injury, vasculitides, congenital vascular anomalies, arteriovenous fistulae for hemodialysis, and pre- and post-operative evaluation relating to vascular and surgical intervention.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction. 2. Vascular anatomy of the upper extremity. 3. Review of important variant vascular anomalies of the upper extremity. 4. Indications for CTA of the upper extremity. 5. Benefits and limitations of CTA of the upper extremity. 6. Extended case-based review of CTA upper extremity including subclavian steal syndrome, active post-traumatic extravasation, arteriovenous fistulae, pseudoaneurysm and aneurysm, mycotic aneurysm, dissection, transection, hematoma, fibromuscular dysplasia, and thoracic outlet syndrome, among others. 7. Conclusion.

### Hearts on Fire: Imaging the Coronary Arteries in Systemic Vasculitis

#### Participants

Sean Johnson, Los Angeles, CA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Overview of systemic vasculitis, highlighting entities which can involve the coronary arteries. Review the incidence and prevalence of coronary artery vasculitis. Demonstrate coronary artery manifestation of systemic vasculitis with case-based reviews. Discuss various diagnostic modalities and protocols used to identify and characterize coronary artery vasculitis.

#### TABLE OF CONTENTS/OUTLINE

1. Incidence and prevalence of coronary artery vasculitides. 2. Review forms of systemic vasculitis, coronary artery manifestations and pathophysiology, including: Takayasu arteritis, Kawasaki disease, microscopic polyangiitis, Erdheim-Chester disease, IgG4-related vasculitis and polyarteritis nodosa. 3. Case-based review of coronary artery vasculitides, including both acute and chronic manifestations. 4. Brief discussion of non-coronary thoracic aortic disease in systemic vasculitis. 5. An approach evaluating the coronary arteries for involvement in systemic vasculitis, including review of imaging selection and protocols.

### Advanced Multimodal MRA Techniques for Cerebrovascular Disease: A Comprehensive Guide

#### TEACHING POINTS

Cerebrovascular disorder treatment has evolved, now employing a range of advanced devices. While time-of-flight MR angiography (TOF-MRA) can suffer from image degradation, innovative multimodal MRA techniques such as phase contrast (PC), ultrashort echo time (UTE), and 4D offer improved image quality. Embracing these cutting-edge imaging methods is crucial in managing cerebrovascular disorders. Our presentation aims to:

1. Provide a comprehensive overview of cerebrovascular diseases.
2. Highlight the technical details of state-of-the-art multimodal MRA imaging techniques.
3. Showcase the clinical applications of multimodal MRA imaging in diagnosis, treatment, and postoperative care for cerebrovascular diseases.

#### TABLE OF CONTENTS/OUTLINE

1. Exploring the significance and recent advancements in multimodal MRA imaging for cerebrovascular diseases.
2. Diving deep into the technical aspects of various MRA sequences, including TOF, PC, UTE, and 4D.
3. Unveiling the latest clinical applications of multimodal MRA imaging for cerebrovascular conditions, such as intracranial aneurysms, arteriovenous malformation (AVM), dural arteriovenous fistula (dAVF), and moyamoya disease, through real-life case studies.

### **A Novel Approach to Deforming Device for Optimal Frozen Elephant Trunk Technique via Patient Specific 3D Printed Model**

#### **TEACHING POINTS**

Frozen elephant trunk implantation for thoracic aortic aneurysms is recognized as a less invasive surgical technique. However, because intraoperative fluoroscopy is not available, device insertion must be done with blind operation. To avoid complications, we developed a novel approach for deforming device in advance and simulating surgical procedures via life size 3D model.

#### **TABLE OF CONTENTS/OUTLINE**

Datasets for printing were converted, using CT data which has submillimeter spatial resolution. Patient specific life size 3D printed models were faithfully reproduced luminal surface of thoracic aorta. 3D printed model enables surgeon to assess physiological morphology including stenosis or spiculated atheroma, practically, though it is impossible to see that intraoperatively. Furthermore, this method allowed surgeon to simulate surgical procedures, considering precise device size in advance. 3D printed model is clinically available and promising for facilitating the operation strategy optimization, and assistant for frozen elephant trunk technique safely. There will be contributions to clinical practice for preoperative accurate assessment and simulation.

VAEE-28

### Development of a Double Bolus Tracking Method for Individualized CT Angiography Scan Timing

#### TEACHING POINTS

To perform surgical procedures safely, understanding the anatomical variations of the veins in preoperative computed tomography (CT) angiography is critical. The scan timing of the venous phase is generally performed via fixed scan delay, but the contrast effect is often inadequate owing to individual differences in the peak timing of the veins. We have developed the double bolus tracking (DBT) method, which effectively utilizes low-dose monitoring in preoperative CT angiography to individualize the timing of the venous and the arterial phases. The advantage of the DBT method is that the CT angiography enhances the contrast effect in complex anatomical regions such as the portal venous system. Consequently, it might improve the surgical outcomes and patients' quality of life.

#### TABLE OF CONTENTS/OUTLINE

A) An overview of the DBT method B) Scanning techniques used for low dose monitoring C) Differences in contrast effects between the fixed scan delay and the DBT methods D) Clinical applications of preoperative vascular mapping E) Advantages of using the DBT method in complex anatomical regions such as the portal venous system F) Limitations and future directions of the DBT method G) Conclusions and clinical relevance of using DBT in preoperative screening methods for colon cancer surgery

### Abdominal Aortic Aneurysm: Pre and Post Operative Evaluation

#### Participants

Matheus Marcelino Dias, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The purposes of this exhibit are: Make a multimodality-based didactic review of the main topics of infradiaphragmatic aneurysm at pre and post operative evaluation. Make a practice guide on how to perform an evaluation with all the necessary variables for follow-up or surgical planning using different imaging methods. Propose a didactic categorization of these topics: Ultrasound evaluation of Abdominal aortic aneurysm. Postoperative Endovascular Ultrasound Evaluation. Postoperative complications d. Ultrasound with microbubbles contrast. Correlate those findings with other exams. Adequate evaluation and early recognition of post operative complications of endovascular repair of aneurysms. Illustrate those conditions based on cases from our radiology group.

#### TABLE OF CONTENTS/OUTLINE

We will discuss the principles of the abdominal aortic aneurysm at pre and post operative evaluation and focus on their imaging features using a multimodality approach in this exhibit. Ultrasound evaluation of infradiaphragmatic aneurysm. Postoperative Endovascular Ultrasound Evaluation. Postoperative complications. Ultrasound with microbubbles contrast.

VAEE-30

### Why is CT Useful in the Diagnosis of Klippel-Trenaunay-Weber Syndrome?

#### TEACHING POINTS

The purpose of this exhibit is:1. Klippel-Trenaunay-Weber syndrome (KTWS) is a rare and intractable disorder characterized by unilateral hypertrophy associated with one or more mixed vascular malformations of the extremities.2. The main imaging modalities used at KTWS are US, MRI, angiography and CT.3. CT images can clearly depict the vascular malformations of KTWS.4. In addition, volume measurement and histogram analysis of the extremity by CT imaging can be used to help diagnose KTWS and guide treatment.

#### TABLE OF CONTENTS/OUTLINE

Major headings:1. Describe KTWS.2. How to create a CT Venography.3. Usefulness of volume rendering (VR) images by CT.- About VR images of superficial veins.- About VR images of deep veins.4. Volumetric measurements with CT imaging of the lower extremities are useful in the diagnosis of KTWS.- The volume of the affected and healthy side can be measured reliably and easily.5. Histogram analysis with CT images of the lower extremity is useful in the treatment strategy for KTWS.- Histogram analysis can determine the components within the analysis area from the CT number.- In the present case, the enlargement of the lower extremities was determined to be due to an increase in the fat component (CT number indicates a negative value), not edema (CT number indicates near zero).

### Vascular Malformations and the Mimickers: A Spectrum of Imaging Features

#### Participants

Mayu Uka, , Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The purpose of this exhibit is: 1) To review contrast-enhanced MRI and other imaging features of vascular malformations and vascular tumors compared to imaging features of other similar diseases and 2) to discuss the differential diagnosis of vascular malformations and vascular tumors with other lesion types.

#### TABLE OF CONTENTS/OUTLINE

The cause of most vascular tumors and vascular malformations of the body surface and soft tissue is unknown. Hemangiomas, which are benign vascular tumors, and vascular malformations are often referred to idiomatically as "hemangiomas," but the International Society for the Study of Vascular Anomalies (ISSVA) classifies them as separate diseases. Vascular malformations, which include venous malformations, arteriovenous malformations, lymphatic malformations, capillary malformations, and combined types, whose clinical and imaging findings sometimes resemble not only vascular tumors but also other neoplastic and non-neoplastic lesions. In this presentation, we will present common vascular malformations, vascular tumors, and other rare conditions, and review the imaging features and pathological findings of "mimickers," which sometimes have imaging similarities to vascular malformations and are difficult to diagnose.

### Aortitis and Large Vessel Arteritis: Diagnosis, Follow-up, Treatment and Mimics

#### Participants

Miltiadis Tembelis, MD, Mineola, NY (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Aortitis and large vessel arteritis encompass both infections and noninfectious causes of vascular wall inflammation. These pathologies often produce non-specific clinical presentations and inflammatory markers, complicating the diagnosis. Correlation with demographics, key clinical features and recognition of typical imaging features and distribution can allow radiologist to assist in the diagnosis. Diagnosis is not the only difficult aspect of these pathologies though, as recommendations for appropriate follow-up and the definitions of remission in the literature are heterogeneous.

#### TABLE OF CONTENTS/OUTLINE

This review will demonstrate different imaging features of infectious and noninfectious large vessel arteritis and aortitis across different modalities to help radiologists clue in on the diagnosis. Common complications and post-interventional appearances will also be exemplified. In addition, treatments and post-treatment follow-up will be addressed.

VAEE-33

### Which Vascular Variations Are Important to Colorectal Surgeons for Right Colon Surgery?

#### Participants

Minho Lee, Seoul, Korea, Republic Of (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

In right colic surgery, the choice of surgical methods, such as right hemicolectomy, transverse colectomy, or extended right colectomy, depends on the location of the colon cancer. However, vascular variations can occasionally necessitate a change in the planned surgical approach, preventing the originally intended reduced surgery and leading to an extended right colectomy instead. The diverse and frequent vascular anatomy variations in the right colon, if not identified preoperatively, can contribute to increased morbidity and mortality rates. Unexpected arterial variations can prolong surgical time, while venous variations can result in bleeding complications. To assess the impact of vascular variations on surgical methods, we will review approximately 380 CT angiographies and determine the type and incidence of right colic and middle colic arterial and venous variations. We will also identify vascular ligation points according to the type of surgery. Additionally, common mistakes and prevention strategies when inexperienced radiologists evaluate CT angiographies will be discussed. Readers will understand that preoperative CT angiographic evaluations can help shorten surgical time, minimize unexpected bleeding risks, and ultimately improve surgical outcomes.

#### TABLE OF CONTENTS/OUTLINE

1. Arterial and venous anatomy of the right colon. 2. Various types of right colon surgery and corresponding vascular ligation points for each procedure. 3. Important measurements of right and middle colic arteries relevant to right colon surgery. 4. Incidence and representative cases of vascular variations. 5. Pitfalls in interpretation and associated cases.

### Clinical Applications of MR Angiography Based on Arterial Spin Labeling to Cerebrovascular Disorders

#### TEACHING POINTS

1) To explain the basic principles of 3D or 4D arterial spin labeling (ASL)-based MR angiography (MRA) 2) To discuss the advantages of ASL-based MRA over other imaging techniques 3) To review clinical applications of ASL-based MRA for various cerebrovascular diseases

#### TABLE OF CONTENTS/OUTLINE

1) Basic principles of ASL-based MRA •Labeling schemes, Pulsed ASL; Pseudo-Continuous ASL (PCASL); Superselective PCASL; Acceleration-selective ASL (AccASL) •3D or 4D imaging acquisition techniques2) Advantages of ASL-based MRA over time-of-flight MRA or digital subtraction angiography •Readily available •No need for contrast media •No radiation exposure •Short acquisition time •Non-invasive •Cost effective •Time-resolved information •Selective vascular visualization •Easy follow-up after treatment •Easily applicable to children3) Specific techniques for ASL-based MRA •3D-MRA using PCASL -Silent MRA •4D-MRA using pulsed ASL - Contrast inherent inflow enhanced multi-phase angiography (CINEMA) •4D-MRA using PCASL -4D-MRA based on PCASL with CENTRA-Keyhole and view-sharing (4D-PACK) •Vessel-selective 4D-MRA using superselective PCASL (4D-S-PACK) • AccASL MRA 4) Clinical applications •Intracranial steno-occlusive arterial diseases (e.g. Moyamoya disease) •Brain arteriovenous malformation • Intracranial dural arteriovenous fistula •Assessment of extra-intracranial bypass arteries 5) Limitations of each ASL-based MRA technique

### Clinical Applications and Implementation of Photon Counting Detector CT in Vascular Imaging

#### Participants

Prabhakar Rajiah, MD, FRCR, Rochester, MN (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To discuss the advantages of photon-counting detector (PCD) CT in vascular imaging 2. To review the modes, kernels, and protocols of PCD CT in vascular imaging 3. To illustrate the clinical applications of PCD CT in vascular imaging

#### TABLE OF CONTENTS/OUTLINE

1. PCD CT TECHNOLOGIES- Single source, Dual-source 2. BENEFITS OF PCD-CT-Ultra-high spatial resolution;Multi energy (ME)/spectral imaging;K-edge imaging ;High vascular signal;Low electronic noise artifacts;Lower radiation and contrast doses; 3. TECHNICAL ASPECTS RELEVANT TO VASCULAR IMAGING-Modes Ultra-high resolution, ME, HR-ME, Flash-ME, gated/ungated;Kernels, denoising;Collimation;Images- Single energy like (T3D), VMI, iodine, VNC, virtual non calcium, spectral post-processing;Radiation doses, CARE keV;4. VASCULAR APPLICATIONS OF PCD CT WITH CASE EXAMPLES-Ultra-high resolution- Improved visualization of small vessels (Flaps ,eg. DIEP, fibular perforators; Artery of Adamkiewicz; distal arteries of hand, feet, head), calcified plaques, small stents;High iodine CNR - Low dose of iodinated contrast, salvage of suboptimal-enhanced studies;Decreased artifacts- Calcium blooming, beam hardening, metal;ME calcium separation- Improved lumen visualization;ME bone subtraction- Rapid and accurate;ME lesion characterization-hematoma vs active bleed vs calcification;Vascular perfusion- Lung, myocardium, extremities;Multi-contrast and novel contrast media- e.g. iodine and gadolinium;Advanced material separation- Calcium;Radiation dose reduction- VNC images in multiphasic studies, lower noise profile; 5. LIMITATIONS, PITFALLS-Increased data - storage and transfer issues; Noise in high resolution mode

### CT Angiography's Role in Virtual Surgical Planning for Craniomaxillofacial Reconstruction with Scapular Free Flap

#### TEACHING POINTS

1. Virtual surgical planning plays an important role in craniomaxillofacial (CMF) reconstruction with scapular free flap. 2. Scapular free flaps are preferred over fibular or deep circumflex artery free flaps for CMF reconstruction when there is variant anatomy, significant atherosclerosis, or prior utilization of lower extremity vessels. 3. Preoperative virtual surgical planning (VSP) has numerous advantages over traditional intraoperative decision making including shortened operative times, improved patient matched custom implant design, improved patient specific oncologic margins and anatomic understanding, and decreased rate of nonunion and flap related complications. 4. Virtual surgical planning and 3D printing sterilizable guides at the point of care requires a centralized manufacturing ecosystem and collaboration between surgeons, radiologists, engineers, and support staff. 5. CT angiography is an important first step in the pre-surgical planning for scapular free flap harvesting because of common variant anatomy and localization of perforating branches.

#### TABLE OF CONTENTS/OUTLINE

- Scapular free flap advantages over fibular and deep circumflex artery flaps. - CT angiography's role in virtual surgical planning. - Optimal imaging acquisition to achieve optimal radiologic planning. - Role of 3D modeling and medical device design in virtual surgical planning.

### Segmental Arterial Mediolytic: A Visual Journey Through Its Imaging Findings

#### Participants

Camila Reifegerste, MD, Curitiba, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Segmental arterial mediolysis (SAM) is a nonatherosclerotic and noninflammatory arteriopathy, unknown to many radiologists. It can lead to severe complications, which have a high mortality rate, thus it is important for us to be aware of this disease. SAM is characterized by lysis of the medial arterial layer, normally compromising visceral and renal arteries, coursing with dissections, aneurysms and even arterial rupture. The imaging findings on computed tomography angiography (CTA) of SAM can be very similar to others vasculitides, such as polyarteritis nodosa and granulomatosis with polyangiitis, but most vasculitides can be diagnosed based on clinical, laboratory and imaging findings, while SAM's diagnosis is based majorly on imaging findings and exclusion of other vasculitides. The aim of this presentation is to show some cases of segmental arterial mediolysis from our institution, its complications and some differential diagnosis, for the purpose of making radiologists more familiar with this pathology.

#### TABLE OF CONTENTS/OUTLINE

Brief literature review of segmental arterial mediolysis; didactic cases of SMA from the digital archive of our hospital's radiology department, to show SAM typical findings, complications and differential diagnosis on multiple imaging modalities, including computed tomography angiography (CTA), magnetic resonance angiography (MRA), Doppler ultrasound and arterial angiography

### The Aortic Isthmus from A to Z

#### Participants

Juliana Da Trindade, Niteroi, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To describe the embryology of the aortic isthmus, and its developmental stages. To demonstrate with cases the peculiar anatomical variations of this segment. To exemplify with cases the congenital malformations and pathological states.

#### TABLE OF CONTENTS/OUTLINE

The aortic isthmus is a small aortic segment located between the left subclavian artery and the ductus arteriosus. This segment undergoes singular changes to allow flow adjustments necessary for the blood circulation from intra to extra-uterine life. The process of closure of the ductus arteriosus after birth normally results in a fibrous band called ligamentum arteriosus. However, different factors as prematurity, genetics, prenatal infections, concomitance of congenital heart diseases, the extension of the ductal tissue to the aortic wall may lead to either persistence of the ductus arteriosus or to variable patterns of ductal involution (aortic knobs or ampullas, aortic-coarctation, etc). The presence of fibrotic tissue within the aortic wall and flow disturbances due to focal ectasia may additionally predispose to aneurysm formation, ulcerations and dissection during adulthood. Therefore, the aortic isthmus is an extremely complex region covering several anatomical variations and a wide spectrum of pathologies that may affect all age groups in a congenital or acquired form. Our goals are to review the isthmic developmental changes along intra to extra-uterine life, and to discuss the imaging findings of different anatomical variations and pathological states of this intricate aortic segment.

### Pelvic Congestion Syndrome. CT Angiography and Doppler Ultrasound Findings

#### Participants

Carlos Capunay, MD, Vicente Lopez, Argentina (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To be aware of pelvic congestion syndrome as a cause of female chronic pelvic pain. To recognize the anatomic variants and pathologic conditions that can cause the pelvic congestion syndrome To illustrate the spectrum of CT and Doppler US findings in these patients. To emphasize the most representative imaging features on this clinical syndrome.

#### TABLE OF CONTENTS/OUTLINE

Anatomy of the normal female pelvic venous plexus. Pathogenesis of the pelvic congestion syndrome. Description of the Doppler US technique. Description of the CTA scan protocol: technical parameters and IV contrast administration CT image analysis and post-processing algorithms in the different clinical setting. Sample cases of compression syndromes (including superior mesenteric artery compression of the left renal vein, and compression of the left common iliac vein by the right common iliac artery). Summary.

### The Use of Ferumoxytol for High-Resolution Vascular Imaging and Troubleshooting for Solid Organ Transplantation

#### Participants

Amar Shah, MD, Phoenix, AZ (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Ferumoxytol, a novel MR contrast agent in off-label use, is safe for patients with renal dysfunction. 2. Due to its prolonged intravascular half-life and lack of parenchymal extravasation, high-resolution vascular imaging, including distal intraparenchymal branches, is feasible. 3. Ferumoxytol MRA can identify clinically actionable vascular complications of solid organ transplant several weeks to months before ultrasound or traditional MRA. 4. 3D reconstructions facilitate procedural planning and may obviate unnecessary intervention in select patients.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction to ferumoxytol as a contrast agent: imaging characteristics, protocol details, and safety/administration. 2. Advantages and utility in comparison to GBCA. a. High-resolution vascular imaging without background parenchymal enhancement. b. Curved planar MIP reformats. c. Virtual angiography (Time-Resolved contrast-enhanced MRA) d. Coadministration with GBCA. e. Repeat imaging up to 72 hours. 3. Catalogue of example cases with preceding equivocal or normal ultrasound and/or GBCA MRA (highlighting above techniques). a. Transplant renal artery stenosis (TRAS) b. Transplant renal vein thrombosis (TRVT) with capsular neovascularization (CV) c. TRVT with CV d. TRAS and transplant pancreas artery stenosis (TPAS). e. Transplant pancreas vein thrombosis. f. Transplant pancreas intraparenchymal AVF. g. Transplant hepatic artery stenosis. h. Transplant hepatic vein thrombosis.

### RSNA Deep Learning Lab: Basics of NLP in Radiology (Beginner Friendly)

#### LEARNING OBJECTIVES

1) Understand common terminology and preprocessing techniques in NLP. 2) Identify several classic and modern approaches used to capture semantic meaning in text. 3) Learn how to implement a basic NLP pipeline from preprocessing to performance evaluation.\*Course Description In Person Session Only. Tickets must be purchased in advance for this course. This course can be added through the registration portal or by stopping by the Registration Desk. Space is limited. This session will feature a brief lecture introducing the basics of natural language processing (NLP) and highlight potential uses for it in radiology. The goal is to survey standard text preprocessing techniques and traditional NLP approaches as well as modern neural network based approaches. We will follow up the didactic portion with a hands-on Google Colab demo implementing discussed concepts for a text classification task. For best experience, we highly recommend attendees bring a laptop with a keyboard as well as have a Gmail account to access Google Colab.

1) Learn about the functionality of NCI imaging data commons related to selection and preparation of data cohorts for developing AI workflows. 2) Introduce the basic capabilities of IDC in support of development of reproducible AI workflows. 3) Experiment with the application of open source AI tools to public imaging datasets.\*Course Description In Person Session Only. Tickets must be purchased in advance for this course. This course can be added through the registration portal or by stopping by the Registration Desk. Space is limited. NCI Imaging Data Commons (IDC), <https://imaging.datacommons.cancer.gov>, is a cloud-based repository of publicly available cancer imaging data co-located with the analysis and exploration tools and resources. IDC contains over 40TB of publicly available images and image annotations spanning a variety of cancer types and modalities. Attendees of this course will learn how to search, visualize and download IDC data, and how to build reproducible and shareable analysis workflows using Google Colab. The educational format will combine a lecture followed by a hands-on component and interactive discussions to gain familiarity with this resource.

#### COURSE DESCRIPTION

In Person Session Only. Tickets must be purchased in advance for this course. This course can be added through the registration portal or by stopping by the Registration Desk. Space is limited. NCI Imaging Data Commons (IDC), <https://imaging.datacommons.cancer.gov>, is a cloud-based repository of publicly available cancer imaging data co-located with the analysis and exploration tools and resources. IDC contains over 40TB of publicly available images and image annotations spanning a variety of cancer types and modalities. Attendees of this course will learn how to search, visualize and download IDC data, and how to build reproducible and shareable analysis workflows using Google Colab. ### RSNA Deep Learning Lab: ChatCTP - DICOM de-identification using ChatGPT (Beginner Friendly)

#### LEARNING OBJECTIVES

1) Introduction to DICOM tags and PHI stored in these tags. 2) Explain the issues around DICOM de-identification (DeID) and provide examples of DeID tools. 3) Leverage Large Language Model (eg, ChatGPT / GPT-4) to create a script to assist with DICOM DeID. 4) Hands-On DICOM DeID using GPT-4 generated scripts. 5) Other ways to leverage GPT-4 for DICOM DeID. 6) DICOM Pixel DeID\*Course Description In Person Session Only. Tickets must be purchased in advance for this course. This course can be added through the registration portal or by stopping by the Registration Desk. Space is limited.Hands-On learning lab that leverages conventional and AI tools (LLMs like ChatGPT / GPT-4) to help with DICOM de-identification (DeID). Will practice DeID using scripts generated by LLMs and leverage GPT-4 in other ways for the de-identification process.

### RSNA Deep Learning Lab: NLP - Text Classification with RNNs & Transformers (Beginner Friendly)

#### LEARNING OBJECTIVES

1) Develop a general understanding of how large language models (LLMs) for natural language processing (NLP) are trained. 2) Define the basic concepts of NLP preprocessing for text analysis (e.g. tokenization, embedding). 3) Use embeddings from an LLM to classify chest x-ray reports as positive or negative for specific findings.\*Course Description In Person Session Only. Tickets must be purchased in advance for this course. This course can be added through the registration portal or by stopping by the Registration Desk. Space is limited. This interactive course will provide participants with the opportunity to learn the basic principles of information extraction from radiology reports by working through a step-by-step example using radiology reports from a chest x-ray data set. Learners will use a large language model (LLM) to classify radiology reports as positive or negative for specific findings. This session will cover basic concepts in preparing data and training LLMs, as well as using a pre-trained LLM to classify radiology reports. No prior coding or machine learning experience is necessary.

### RSNA Deep Learning Lab: Accessing Freely Available Public Datasets from The Cancer Imaging Archive (TCIA) (Beginner Friendly)

#### LEARNING OBJECTIVES

1) Learn how TCIA makes data sharing easier for researchers and hear a summary of existing datasets that are freely available for download. 2) Practice utilizing TCIA for data exploration, cohort definition, and downloading of data. 3) Learn how to access public and restricted access datasets using TCIA's REST APIs and other command line tools via Jupyter Notebooks.\*Course Description In Person Session Only. Tickets must be purchased in advance for this course. This course can be added through the registration portal or by stopping by the Registration Desk. Space is limited. Access to large, high quality data is essential for researchers to understand disease and precision medicine pathways, especially in cancer. However HIPAA constraints make sharing medical images outside an individual institution a complex process. The Cancer Imaging Archive (TCIA) is a public service funded by the National Cancer Institute which addresses this challenge by providing de-identification and data publication services to take major burdens of data sharing off researchers. TCIA has published over 200 unique data collections containing more than 70 million images. Recognizing that images alone are not enough to conduct meaningful research, most collections are linked to rich supporting data including patient outcomes, treatment information, genomic / proteomic analyses, and expert image analyses (segmentations, annotations, and radiomic / radiogenomic features). In this course we will address basic use cases for identifying TCIA datasets of interest and downloading them via Jupyter Notebooks.

### RSNA Deep Learning Lab: Zero-code Implementation of Federated Learning for Radiology Tasks (Beginner Friendly)

#### LEARNING OBJECTIVES

1) Identify the processes and tools used to curate and process raw DICOM imaging data. 2) Learn how to train a robust AI model with zero/low code. 3) Recognize the practical applications of the model, deploy it in a clinical setting, and leverage federated learning to train from other institutions' data.\*Course Description In Person Session Only. Tickets must be purchased in advance for this course. This course can be added through the registration portal or by stopping by the Registration Desk. Space is limited. This course aims to enable participants to conduct federated learning studies without writing any code. The main use case will focus on training and deploying a fully automated image segmentation model. The course will cover the end-to-end workflow to develop an AI model, starting from curating and preprocessing DICOM data all the way to using supervised and human-in-the-loop learning to train robust models. Finally, participants will learn how to deploy their models in the clinic and as federated studies. All the tools and code used will be open-source and be made available to the participants prior to the course.

### RSNA Deep Learning Lab: MIDRC - Building and using AI-ready Datasets from a Massive Open Data Commons (Beginner Friendly)

#### LEARNING OBJECTIVES

1) Understand the genesis and development of the Medical Imaging and Data Resource Center (MIDRC). 2) Appreciate how an imaging based data commons that links to clinical metadata can accelerate machine learning research. 3) Experience how to build your own data cohort for AI research using the MIDRC publication platform - Gen3.\*Course Description In Person Session Only. Tickets must be purchased in advance for this course. This course can be added through the registration portal or by stopping by the Registration Desk. Space is limited. The Medical Imaging Data and Resource Center (MIDRC) is a multi-institutional effort supported by the AAPM, ACR and RSNA that is funded by the National Institute of Biomedical Imaging and Bioengineering (NIBIB) to collect and publish imaging and related clinical data to accelerate research into uses of imaging based AI. MIDRC provides a model for collecting and publishing data to support research that can be applied across all areas of medical imaging. MIDRC initially began in 2020 by aggregating hundreds of thousands of imaging studies of COVID-19 patients. MIDRC has now transitioned into collecting patient data relevant to post-acute sequelae of COVID or "long COVID" and will be pivoting into other medical use cases in the future. This session, led by principal investigators of MIDRC will give an overview of the structure of the MIDRC data commons and a tour of the open access data portal published on the Gen3 platform. During this session, attendees will have the opportunity to experience how to build a selected data cohort direct from the MIDRC data commons for AI research.

### RSNA Deep Learning Lab: MedNIST Exam Classification with MONAI (Beginner Friendly)

#### LEARNING OBJECTIVES

1) Collect, format, and standardize medical image data. Use MONAI transforms to pre-process data. 2) Architect and train a convolutional neural network (CNN) in Pytorch for classification. 3) Evaluate the trained model on test dataset.\*Course Description  
In Person Session Only. Tickets must be purchased in advance for this course. This course can be added through the registration portal or by stopping by the Registration Desk. Space is limited. Medical image classification plays an essential role in aiding clinical diagnosis and treatment. With the rapid development of artificial intelligence (AI) and computer vision (CV), deep learning-based methods become more accurate and applicable to a variety of clinical tasks ---- potentially serving as a valuable ally for radiologists and pathologists. In this course, learners will get a hands-on practical introduction to deep learning for radiology and medical imaging. An end-to-end training and evaluation example based on the MedNIST dataset will be covered. We will introduce the "MONAI" deep learning platform, which is a Pytorch-based, open-source framework for deep learning in healthcare imaging.

### RSNA Deep Learning Lab: Evaluating for Fairness of AI Models in Radiology

#### LEARNING OBJECTIVES

1) Learn basic concepts of fairness evaluation in AI for radiology. 2) Learn how to evaluate for fairness in AI models in radiology.\*Course Description In Person Session Only. Tickets must be purchased in advance for this course. This course can be added through the registration portal or by stopping by the Registration Desk. Space is limited.This hands-on session will comprise a short tutorial about fairness in AI for radiology followed by hands-on, interactive coding session to learn how to evaluate for fairness in trained AI models.

#### COURSE DESCRIPTION

### RSNA Deep Learning Lab: Object Detection in Medical Imaging

#### LEARNING OBJECTIVES

1) To become familiar with the use cases for generative models in radiology. 2) To understand the strengths and weaknesses of GANS and DDPMS, with particular emphasis on diffusion models.\*Course Description In Person Session Only. Tickets must be purchased in advance for this course. This course can be added through the registration portal or by stopping by the Registration Desk. Space is limited.This course will introduce you to generative models for radiology. There will be a brief description of some of the technologies being used. We will then develop a more in depth investigation of diffusion models, including hands-on coding of a diffusion model for radiology image generaiton.

### RSNA Deep Learning Lab: Medical Image Generation

#### LEARNING OBJECTIVES

1) Identify the applications of generative adversarial networks (GANs) in Radiology. 2) Explain the general intuition behind GAN training. 3) Train a GAN-based model to create synthetic lesions to augment the real data.\*Course Description In Person Session Only. Tickets must be purchased in advance for this course. This course can be added through the registration portal or by stopping by the Registration Desk. Space is limited. Generative adversarial networks (GANs) have evolved over the past several years and are being widely used for faster image acquisition, image quality improvement, and data augmentation, among many other applications. This hands-on workshop will cover the theoretical bases of GAN training and its applications in Radiology and introduce some of the well-known algorithms in this field. Finally, we will train a GAN to create synthetic lesions for data augmentation.

### RSNA Deep Learning Lab: Deploy Your Own Model in Huggingface

#### LEARNING OBJECTIVES

1) Learn the fundamentals of deep learning by training a model in PyTorch. 2) Build and deploy a custom pneumonia classification model in Hugging Face.\*Course Description In Person Session Only. Tickets must be purchased in advance for this course. This course can be added through the registration portal or by stopping by the Registration Desk. Space is limited. Dive into applied deep learning in this focused, hands-on course. You'll directly engage with the process of constructing a pneumonia classification model in PyTorch and deploying it using the Hugging Face platform. This session emphasizes learning through action. You won't be lost in theory but rather immersed in the practical application of deep learning technologies.

### Fundamentals of Abdominopelvic Trauma

#### LEARNING OBJECTIVES

1) Explore the role of CT, including CT protocols, in the diagnosis of patients who have sustained abdominopelvic trauma specifically with respect to pancreatic trauma, splenic trauma, and bowel and mesenteric trauma. 2) Identify key CT imaging findings in these organ injury types through case examples. 3) Discuss the imaging findings crucial to patient triage and management.\*Course Description In this didactic course on Abdominopelvic trauma, learn state-of-the-art imaging of pancreatic trauma, splenic trauma and bowel and mesenteric trauma from expert emergency radiologists. Radiologists at all levels of training will benefit from the material presented as it can be readily incorporated into their core knowledge base to care for acutely injured patients.

#### COURSE DESCRIPTION

In this didactic course on Abdominopelvic trauma, learn state-of-the-art imaging of pancreatic trauma, splenic trauma and bowel and mesenteric trauma from expert emergency radiologists. Radiologists at all levels of training will benefit from the material presented as it can be readily incorporated into their core knowledge base to care for acutely injured patients.

### Crohn's Disease Imaging

#### LEARNING OBJECTIVES

1) Refresh understanding of pathophysiology and presentation of Crohn's disease. 2) Identify up to date imaging techniques and advances in diagnosing and reporting Crohn's disease. 3) Appreciate the role of the Radiologist in multidisciplinary care of patients with Crohn's disease.\*Course Description This course will include 5 short lectures to provide up to date knowledge regarding current concepts in imaging of Crohn's disease including CT, MRI and Ultrasound technology with a focus on identification and reporting of disease activity and response to treatment.

#### COURSE DESCRIPTION

This course will include 5 short lectures to provide up to date knowledge regarding current concepts in imaging of Crohn's disease including CT, MRI and Ultrasound technology with a focus on identification and reporting of disease activity and response to treatment.

### The MIDRC Experience with Curating DICOM Images for use in AI Research

#### LEARNING OBJECTIVES

1) Develop artificial intelligence (AI) methods with improved repeatability and reproducibility, a recognized need is for large, publicly available, and curated imaging data sets. 2) Near-universal adoption of the Digital Imaging and Communications in Medicine (DICOM) standard enables this goal using a well-defined common data model. 3) As useful as DICOM is, improvements are needed in harmonization and standardization to better achieve FAIR (Findable, Accessible, Interoperable, Reusable) principles, which we will describe.\*Course Description

M1-CMK11

### Imaging in Sports: Common Patterns of Muscle Injury

#### LEARNING OBJECTIVES

1) Knowledge of normal anatomy and anatomical variants in the key regions for sports injury – hamstring, calf, proximal thigh chest wall, and abdominal wall. 2) To become familiar with the common injury patterns in these regions. 3) To be able to describe the injury patterns accurately with emphasis on clinically relevant factors. 4) To have an awareness of the relevant grading systems – understanding both the strengths and weaknesses of grading of injuries.\*Course Description This is a sports imaging session based around common and interesting areas of sports injury. Experts in sports imaging will cover: Pectoralis major injury, hamstring, calf, proximal thigh and chest wall injuries. The series of short lectures will cover the anatomy and typical injury patterns for these commonly injured areas of the body, appearances of the usual injury patterns and description of associated grading systems used in these regions. Knowledge of sports specific injury is important in providing a clear report to the team and will aid the reporter in producing a clear, concise and helpful report.

### CTMW Overview

#### Participants

Susanna Lee, MD, PhD, Boston, MA (*Presenter*) Royalties, Wolters Kluwer nv

#### LEARNING OBJECTIVES

1) Review how and why clinical trial protocols change through the development process. 2) Learn about potential facilitators and barriers to launching a clinical trial initially “workshopped” at the CTMW course. 3) Learn key biostatistical lessons regarding trial design and data analysis directly from CTMW biostatisticians using the trials presented by the Principal Investigators.\*Course Description RSNA’s Clinical Trials Methodology Workshop (CTMW) has provided first-class education in clinical trials methodology and has greatly expanded interest and successful efforts in radiology and radiation oncology clinical research. While previously available exclusively to those accepted to the in-person CTMW, this course will make accessible to all RSNA annual meeting attendees the rigor and expertise of the CTMW in a lecture course format. This course highlights the development of clinical trial protocols and pragmatic real world lessons from implementing them, presented by two alumni of the successful RSNA Clinical Trials Methodology Workshop, with biostatistical commentary from a course faculty member. The session will conclude with Q&A with the audience.

### Case Based Review of Crazy OB/GYN Cases

#### Participants

Roya Sohaey, MD, Portland, OR (*Presenter*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Develop a logical, systematic approach to complex OB and GYN cases. 2) Identify strategies to reduce a broad differential to a specific diagnosis or a short list of likely options.\*Course Description This will be a case-based interactive session. We will present cases with multiple choice questions for audience response using Poll Everywhere. We will review the correct diagnosis with tips for problem solving and narrowing a lengthy, generic list of differential diagnoses down to more focused list relevant to the case in hand. For OB cases we will provide postnatal or autopsy confirmation and for GYN cases operative results and pathology confirmation. Attendees will have a better visual database of unusual OBGYN pathology and learn a practical approach to complex cases.

### Head Neck Case Based Multidisciplinary Review

#### Participants

Chad Zender, MD, Cincinnati, OH (*Presenter*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Expose the attendees to multidisciplinary discussion when treating head and neck cancer. 2) Demonstrate specific imaging findings that directly affect staging and treatment decisions. 3) Provide the audience with specific information they should include in their reports that directly affect prognosis and management.\*Course Description The purpose of this course will be to replicate a real-world Head & Neck tumor. We will discuss actual cases with a focus on how imaging findings directly change stage, modify treatment and predict outcome.

### RSNA Hands-On Lab: Ultrasound Doppler Hands-On Course of the Carotid System and Abdominal Vasculature

#### Participants

Wui K. Chong, MD, Houston, TX (*Presenter*) Research Consultant, Koios Medical, Inc

#### LEARNING OBJECTIVES

1) Identify essential scanning techniques in ultrasound evaluation of the carotid system and abdominal vasculature that ensure accurate assessment and diagnosis. 2) Explain changes in the arterial waveforms encountered in various pathological processes affecting the carotid system and abdominal vasculature. 3) Describe most accepted diagnostic criteria for significant diseases in the carotid and abdominal vascular systems.\*Course Description In Person Session Only. Tickets must be purchased in advance for this course. This course can be added through the registration portal or by stopping by the Registration Desk. Space is limited. This is a hands-on course which will provide a brief didactic review followed by detailed hands-on instructions of basic scanning techniques utilized in the evaluation of the carotid system and abdominal vasculature, including, aorta, IVC, hepatic, mesenteric, and renal systems. Main accepted sonographic criteria for significant diseases of the aorta and its branches and the carotid system will be described. Tips and tricks in scanning will also be provided.

### GI causes of Acute Abdominal Pain: Case-Based Approach

#### LEARNING OBJECTIVES

1) Review GI causes of acute abdominal pain that may be seen on imaging in the acute setting. 2) Identify key imaging findings seen in acute GI related conditions causing acute abdominal pain, including tricky bowel obstruction, hepatobiliary-related, and lower abdominal pain related cases. 3) Discuss potential diagnostic pitfalls.\*Course Description Patients presenting with acute abdominal pain can represent a diagnostic challenge. The differential diagnosis may be vast, ranging from minor to life-threatening conditions, and the clinical symptoms may be nonspecific. Radiologist familiarity with the potential range of imaging findings for cases of acute abdominal pain is important for optimal imaging diagnosis. In this case-based session, cases of acute GI-related conditions will be presented with discussion of pertinent imaging features. This includes cases of hepatobiliary conditions, tricky bowel obstruction, GI causes of lower abdominal pain.

#### COURSE DESCRIPTION

Patients presenting with acute abdominal pain can represent a diagnostic challenge. The differential diagnosis may be vast, ranging from minor to life-threatening conditions, and the clinical symptoms may be nonspecific. Radiologist familiarity with the potential range of imaging findings for cases of acute abdominal pain is important for optimal imaging diagnosis. #### M3-CGU08 Ovarian Cancer: A Glimpse into the Future of Personalized Care

##### Participants

Evis Sala, MD, PhD, Rome, Italy (*Presenter*) Co-founder, Lucida Medical Ltd

#### LEARNING OBJECTIVES

1) Learn the current treatment paradigms available to patients with ovarian cancer. 2) Review the role of multi-modality imaging in treatment selection and planning of patients with ovarian cancer. 3) Highlight the potential added value of radiogenomics and AI in prediction of treatment response and outcome in patients with ovarian cancer.\*Course Description This course will provide a comprehensive review of the current and state of the art treatments for patients with ovarian cancer. It will review the role of multimodality imaging in treatment selection and planning focusing on the added value of various imaging modalities for detection of peritoneal implants that change management. It will also provide a glimpse into the future of personalized care by highlighting the role of artificial intelligence and radiogenomics in improving prediction of response to neoadjuvant chemotherapy and early detection of treatment resistance which determines patient outcome.

#### M3-CHN05 Workup of Thyroid Nodules: TI-RADS and K-TIRADS

##### Participants

Ji-Hoon Kim, MD, PhD, Seoul, Korea, Republic Of (*Presenter*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Implement a standardized risk-stratification system for reporting thyroid nodules on ultrasound. 2) Describe the typical and atypical imaging characteristics of thyroid cancer, parathyroid adenomas, and paragangliomas in the head and neck. 3) Identify clinically consequential findings during the imaging workup of thyroid nodules, thyroid cancer, hyperparathyroidism, and paragangliomas in the head and neck.\*Course Description This session offers an exploration of head and neck endocrine imaging, blending lectures with case studies and audience response. Topics include risk stratification of thyroid nodules using ACR TI-RADS and K-TIRADS, imaging approaches for thyroid cancer, parathyroid adenoma preoperative localization, and head and neck paragangliomas. Typical and atypical imaging examples will be shared, emphasizing differentiation from common mimics, interpretation pitfalls, and clinical management considerations with which radiologists should be familiar. Get ready to hone your interpretation skills to razor sharpness under the guidance of world experts!

### Managing Complications in IR

#### LEARNING OBJECTIVES

1) Key imaging findings of complications of interventional radiology procedures. 2) How to decide which complications of interventional radiology procedures require treatment and which complications can be managed conservatively. 3) How to treat complications of interventional radiology procedures.\*Course Description The aim of this course is to describe the key complications of the wide range interventional radiology procedures including vascular, non-vascular and ablation procedures. Important imaging findings will be discussed and methods will be described regarding how to manage complications. Many complications will be presented and discussed in a case-based format and discussion after each lecture will be encouraged.

### Imaging Differentials of Hip and Groin Pain

#### LEARNING OBJECTIVES

1) Improve understanding of pre- and postoperative imaging for femoroacetabular impingement. 2) Learn to recognize clinically important tendon derangements about the hip and groin. 3) Assess the value of advanced imaging methods in acute hip trauma.\*Course Description This five part lecture course focuses on common, clinically important disorders associated with hip and groin pain. Attendees will hear from experts on key issues in assessment of femoroacetabular impingement, including how to assess the painful postoperative hip. Acute hip trauma will be highlighted including how to assess for bone marrow changes on CT as well as MRI in fracture diagnosis. Tendon disorders about the hip and pubis will also be covered, with an aim to understand which abnormalities are more likely to be clinically relevant.

#### **LEARNING OBJECTIVES**

1) Acquire knowledge of the etiologies and risk factors associated with stroke in children and understand how imaging can aid in their diagnosis and management. 2) Interpret neuroimaging findings and genetic profiles to establish a comprehensive understanding of congenital brain malformations. 3) Recognize the role of neuroimaging and molecular profiling in the diagnosis and management of pediatric brain tumors.\*Course Description This is an educational session designed to provide in-depth knowledge and practical insights into three critical areas of pediatric neuroradiology: neuroimaging of pediatric stroke, neuroimaging of brain tumors, and neuroimaging of congenital brain malformations. Through lecture format and detailed discussion, participants will gain the necessary tools to accurately diagnose these entities on imaging ultimately improving patient care and outcomes.

#### **COURSE DESCRIPTION**

This is an educational session designed to provide in-depth knowledge and practical insights into three critical areas of pediatric neuroradiology: neuroimaging of pediatric stroke, neuroimaging of brain tumors, and neuroimaging of congenital brain malformations. Through lecture format and detailed discussion, participants will gain the necessary tools to accurately diagnose these entities on imaging ultimately improving patient care and outcomes.

**Informatics and Patient Centered Care- Creating the Tools For a Better Radiology Experience (Supported in part by an Unrestricted Medical Education Grant from Siemens Healthineers of Siemens Medical Solutions, USA, Inc.)**

### LEARNING OBJECTIVES

1) Explain the challenges and opportunities to make price transparency tools useful for patients. 2) Describe how informatics tools can minimize missed care opportunities. 3) Understand how to partner with a patient and family advisory council to develop informatics tools that improve patient experience.\*Course Description In this educational session and panel discussion, informatics innovations that improve the patient experience and promote patient and family centered care will be presented. Hot topics including price transparency, follow up recommendations and missed care opportunities, and incorporation of patient feedback into practice operations will be discussed. This session will present practical informatics solutions that can be implemented in a variety of radiology practice settings.

### Immediate Release of Results: A CMIO Report from the Front Lines of a 12-Hospital, 800-Clinic Organization

#### Participants

CT Lin, MD, Denver, CO (*Presenter*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Recognize the potential benefits of patient access to radiology reports, including improved patient education, increased transparency, and the ability to make more informed healthcare decisions. 2) Evaluate the potential harms associated with patient access to reports that patients may not fully understand, including increased patient anxiety, confusion, and potential misinterpretation of medical information. 3) Explore the perspective of referring physicians from a large academic center on patients having immediate access to radiology reports, including potential benefits, concerns, and impact on patient care and the physician-patient relationship.\*Course Description In this thought-provoking course, we delve into the complex and controversial topic of the Information Blocking Provision within the 21st Century Cures Act. The course features three engaging lectures, each presenting a different perspective on the impact and implications of this provision. Through a lively debate-style format, we aim to explore the benefits, challenges, and potential unintended consequences of this regulatory change.

### GU Causes of Acute Abdominal Pain: Case-Based Approach

#### LEARNING OBJECTIVES

1) To point out the role of CT and MRI in the management of patients with acute gynecological diseases. 2) To be able to identify the specific findings that help correctly classify the etiology of obstructive urinary symptoms, that are not always due to urolithiasis. 3) To be aware of the possible differential diagnoses of renal colic in patients with flank pain. 4) To know the imaging findings of infectious processes of the genitourinary system and the particularities of some of them to make a more accurate diagnosis. 5) To remember that postoperative patients, both urologic and non-urologic, are at high risk for damage to the urinary tract. 6) Do not ignore findings suggestive of this and perform special imaging protocols to properly characterize Scrotal and penile emergencies are relatively uncommon but need to be diagnosed and treated urgently. The focus of this talk is on imaging techniques, interpretation and differential diagnosis as well as on clinical pictures of non-traumatic causes of scrotal and penile emergencies.\*Course Description Discuss the common and uncommon causes of gynecological, genitourinary and scrotal emergencies. The session will focus on imaging findings on US, CT, and MRI.

#### COURSE DESCRIPTION

Discuss the common and uncommon causes of gynecological, genitourinary and scrotal emergencies. The session will focus on imaging findings on US, CT, and MRI.

### Dual- and Multi-energy CT of the Abdomen and Pelvis

#### LEARNING OBJECTIVES

1) Identify ways that multi-energy CT can improve clinical image interpretation. 2) Explain how to introduce multi-energy CT imaging to everyday clinical practice. 3) Describe advantages of photon counting CT for reducing radiation dose and medical errors. 4) Identify strategies for use of contrast agents with multi-energy CT.\*Course Description Multi-energy CT is increasingly utilized and the scanners are rapidly evolving. In particular, abdominal imaging benefits from the ability of multi-energy CT to emphasize iodine signal, differentiate iodine from non-iodine radiodensities, reduce artifacts, and improve lesion detection. This course will explore ways to adopt multi-energy CT in every day clinical practice. The basics of photon counting as they pertain to clinical imaging will be reviewed, and the advantages of photon counting CT for body imaging applications will be explored. New considerations for contrast agent usage for body applications in the setting of multi energy CT will be explored.

#### COURSE DESCRIPTION

### Cutting Edge HCC Management

#### LEARNING OBJECTIVES

1) Explore the latest advancements in data science of HCC and familiarize themselves with breakthroughs in image-analysis, machine learning, and novel forms of outcome prediction and clinical endpoints relevant to HCC diagnosis and therapy. 2) Understand the role of a multi-disciplinary tumor board in a rapidly evolving landscape of novel ablative modalities, image-guided navigational support, therapy guidelines, and staging systems pertinent to HCC. 3) Gain insights into current recommendations and ongoing trials combining loco-regional therapies with immunotherapy of HCC, with focus on novel concepts in adjuvant, and neoadjuvant therapy. 4) Identify emerging trends in combining radioembolization and chemoembolization with immunotherapy across stages. 5) Discuss the multidisciplinary approach to oncology imaging endpoints, including novel tumor response assessment techniques and standards pertinent to targeted HCC therapies.\*Course Description The educational course session is a comprehensive learning opportunity that focuses on the latest developments, cutting-edge technologies, and emerging trends in the field of primary liver cancer interventions. Attendees will be provided with a rich learning experience that explores innovative imaging techniques, novel guidelines and therapeutics and their impact on hepatocellular carcinoma (HCC) management, with lectures provided by global experts in the field of image-guided intervention in HCC.

#### **Participants**

Jon Jacobson, MD, Ann Arbor, MI (*Presenter*) Research Consultant, BioClinica, Inc; Advisory Board, Koninklijke Philips NV; Royalties, RELX; Contactor, POCUS PRO

#### **LEARNING OBJECTIVES**

1) Review anatomy and ultrasound imaging techniques for evaluation of the shoulder. 2) Describe useful dynamic imaging techniques to enhance assessment of the shoulder. 3) Discuss ultrasound imaging of common pathologic musculoskeletal conditions at the shoulder.\*Course Description In Person Session Only. Tickets must be purchased in advance for this course. This course can be added through the registration portal or by stopping by the Registration Desk. Space is limited. This session will review an approach to ultrasound of the shoulder including dynamic maneuvers. Part 1: There will be a hands-on demonstration by an instructor showing an approach to ultrasound examination of the shoulder. This will include assessment of the long head of biceps tendon, rotator cuff tendons, acromioclavicular joint, subacromial/subdeltoid bursa, posterior labrum, spinoglenoid notch and will include dynamic evaluation for biceps subluxation and subacromial impingement. This will be followed by a brief presentation highlighting common pathologic musculoskeletal conditions about the shoulder that are seen on ultrasound. Part 2: The participants will be divided into small groups and will practice an approach to ultrasound of the shoulder on a model with an instructor teaching the participants. Proper patient positioning will be shown. Tips on how to optimize ultrasound imaging to best evaluate the area of concern will be discussed.

M6-CNR03

### Multidisciplinary (Adult) Brain Tumor Board

#### LEARNING OBJECTIVES

1) Explain the current standard of care for diagnosis and treatment of adult diffuse gliomas. 2) Demonstrate the importance of role various sub-specialists play in multidisciplinary tumor board.\*Course Description We will present multiple cases of adult diffuse gliomas in a setting similar to multidisciplinary tumor board. Each case will be discussed by a neuro-radiologist, followed by a neuropathologist and a neurosurgeon to enhance various aspects of multidisciplinary contribution to patient care. Each specialist will discuss pertinent important aspects of adult diffuse glioma diagnosis, treatment and surveillance.

#### COURSE DESCRIPTION

We will present multiple cases of adult diffuse gliomas in a setting similar to multidisciplinary tumor board. Each case will be discussed by a neuro-radiologist, followed by a neuropathologist and a neurosurgeon to enhance various aspects of multidisciplinary contribution to patient care. Each specialist will discuss pertinent important aspects of adult diffuse glioma diagnosis, treatment and surveillance.

###### Participants

Angela Tong, MD, New York, NY (*Presenter*) Equipment support, Siemens AG

#### LEARNING OBJECTIVES

1) Review current clinical challenges for Gynecologists in surgical resection of symptomatic fibroids- role of laparoscopic myomectomy and morcellation. 2) Identify role of MR imaging in risk-stratification of uterine masses that have features suspicious for leiomyosarcoma. 3) Learn to apply an imaging flow chart to uterine masses to differentiate subtypes of uterine fibroids. 4) Review a management flowchart that balances preserving fertility with optimal treatment of suspicious uterine masses.\*Course Description The prevalence of uterine leiomyosarcoma is greater than previously believed, with the American College of Obstetricians and Gynecologists reporting a prevalence of 1 in 770 (0.1%). The high profile deaths of previously healthy women after iatrogenic spread of an unsuspected uterine leiomyosarcoma had reverberating effects in the gynecologic community and affected subsequent FDA policies around surgical techniques from 2014 to the present. MR imaging can serve as an important role in pre-operative risk stratification for symptomatic uterine fibroids that are planned for surgery. This course will review the background of this clinical need, and apply an MR imaging evaluation of fibroids and a proposed management algorithm.

### **Dose Calculation Tools for Fluoroscopic Imaging: An Overview of Their Development, Accessibility, and What Role They Play in Communicating and Managing Patient Risk**

#### **LEARNING OBJECTIVES**

1) Explain the limitations and challenges in estimating radiation dose to the patient. 2) Evaluate the various dose metrics available and how these may be useful within their clinical workflow in communicating with patients and managing their risk. 3) Discuss the current state and future needs of radiation dosimetry in the context of low-dose research studies and what role attendees may play as stakeholders in the field. \*Course Description There are several tools and resources available to estimate the amount of radiation delivered to patients during fluoroscopic imaging procedures. This session, with a special emphasis on pediatric fluoroscopic imaging, will provide an overview of the current state of radiation dosimetry, the challenges in estimating patient dose, and what role these tools may play in improving communication and the management of patient risk. Attendees will leave the course with a developed understanding of appropriate applications and limitations of radiation dose estimates and tools available for their own educational use. This course, delivered lecture style, will provide practitioners the background needed to confidently produce, explain, and contextualize patient dose and risk following fluoroscopic imaging procedures.

### Practical Implementation of Radiography Quality Assurance

#### Participants

Nicole Lafata, MS, (*Presenter*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Define and examine the roles of technologists, QA techs, physicists, radiologists, and engineers with respect to quality assurance. 2) Recognize and describe methods of quality assurance for application to routine clinical practice. 3) Understand the importance of regular quality control testing in radiographic imaging and its impact on clinical image quality and patient radiation exposure. 4) Understand the principles and application of the IAEA's remote, automated quality control solution.\*Course Description Enhance your understanding of routine quality assurance (QA) practices in radiography through this two-part lecture. Emphasizing teamwork, this course delves into the roles and relationships of technologists, physicists, engineers, and radiologists pertaining to QA. The course examines the QA significance of routine tasks performed by technologists such as reviewing images for proper exposure, positioning, and artifacts to maintain high standards in image quality. Course participants also gain valuable insights into annual QA procedures performed by physicists. In addition, the course dives into the use of remote and automated tools as part of a quality assurance program. Participants explore the IAEA's novel solution for cost-effective, automated quality control using simple test objects and free software. A practical guide is provided on use of the IAEA dedicated software & supplementary material to ensure consistent and superior image quality.

### Neoplasias del Pancreas/Pancreatic Neoplasms (CIR)

#### LEARNING OBJECTIVES

1) Learn how to diagnose the most common malignant tumors of the pancreas using computed tomography and magnetic resonance imaging. 2) Learn how to image pancreatic tumors undergoing chemotherapy treatment and how to differentiate fibrosis from recurrence. 3) Learn the radiological features of neuroendocrine neoplasms of the pancreas and how to differentiate them from other types of tumors. 4) Learn to detect and characterize the most frequent cystic neoplasms of the pancreas and what are their signs of aggressiveness and malignancy.\*Course Description In this course, attendees will be able to refresh their knowledge about pancreatic neoplasms and their different forms of presentation. The most frequent malignant neoplasms, such as adenocarcinoma, will be reviewed, emphasizing the criteria of resectability and irresectability. It will also discuss how to follow up these tumors after starting chemotherapy treatment and how to detect fibrosis from recurrences. A review of the diagnostic criteria for neuroendocrine tumors of the pancreas and expert recommendations for their detection and follow-up will be presented. Finally, the spectrum of cystic neoplasms of the pancreas will be shown, highlighting when aggressiveness or malignancy should be suspected.

### Shift Work and Mental Health Among R.T.s

#### Participants

Kevin Clark, RT, Houston, TX (*Presenter*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Discuss the current state of mental health in the United States and assess anxiety and depression among a working sample of radiologic technologists. 2) Evaluate the relationship between mental health and working various shifts, including weekends, and taking call. 3) Identify coping strategies used to deal with anxiety and depression.\*Course Description Shift work is essential in health care where 24-hour access and service are expected. Engaging in shift work, however, is associated with mental health issues like depression and anxiety. Shift workers are also at a high risk for adverse health outcomes, such as stroke, obesity, gastrointestinal issues, and various types of cancer. This lecture (a) emphasizes the importance of assessing and managing mental health among health care professionals and (b) shares results from an original research study that explored shift work and mental health among a sample of working medical imaging and radiation therapy professionals.

M7-CER14

### Hot Topics in Emergency Radiology

#### LEARNING OBJECTIVES

1) To understand how emergency radiology practices are being covered following the COVID pandemic and how the paradigm has changed in Canada, the US, and elsewhere. 2) To review the current practice of peer review and peer learning in emergency radiology and how quality assurance in radiology has changed, with examples from recent practice. 3) To overview the current role of point-of-care ultrasound and to understand how radiologists, emergency medicine practitioners, and other clinical providers are utilizing ultrasound at the patient's bedside, and the implications for other imaging and patient practice. \*Course Description The ER 'hot topics' session will include three relevant current topics in emergency radiology practice: staffing given the challenges of COVID and following the COVID pandemic, with changes in practice and remote coverage; peer learning and peer review, with evolution of how quality assurance is being performed in emergency radiology and in radiology in general; and the current use of point-of-care ultrasound and how it fits in with emergency radiology practice during the day time and after hours, and the implications for other imaging and for coverage.

#### COURSE DESCRIPTION

The ER 'hot topics' session will include three relevant current topics in emergency radiology practice: staffing given the challenges of COVID and following the COVID pandemic, with changes in practice and remote coverage; peer learning and peer review, with evolution of how quality assurance is being performed in emergency radiology and in radiology in general; and the current use of point-of-care ultrasound and how it fits in with emergency radiology practice during the day time and after hours, and the implications for other imaging and for coverage.

### Pancreatic Tumor Imaging

#### LEARNING OBJECTIVES

1) Describe the key updates in the imaging diagnosis of pancreatic cancer. 2) Explain the current role of imaging in assessment of therapeutic response in pancreatic cancer. 3) Discuss the importance of structured reporting in pancreatic cancer and implications for patient management. 4) Review the current and emerging applications of artificial intelligence in pancreatic cancer. 5) Explain recent advances in pancreatic neuroendocrine tumor imaging.\*Course Description This course will review the current state-of-the-art and recent advances in imaging of pancreatic cancer and pancreatic neuroendocrine tumors. The attendees will also learn the role of structured reporting and emerging applications of artificial intelligence in pancreatic cancer.

#### COURSE DESCRIPTION

This course will review the current state-of-the-art and recent advances in imaging of pancreatic cancer and pancreatic neuroendocrine tumors. The attendees will also learn the role of structured reporting and emerging applications of artificial intelligence in pancreatic cancer.

Participants

Shandong Wu, PhD, Pittsburgh, PA (*Presenter*) Nothing to Disclose

### LEARNING OBJECTIVES

1) Describe the FDA clearance and approval process for AI models including the necessary steps, timelines, and costs. Attendees will gain an understanding of the regulatory landscape and learn how to access up-to-date information about FDA regulated AI models. 2) Examine regulatory compliance when implementing AI models in the healthcare setting. 3) Illustrate practical strategies for enhancing human-AI interaction.\*Course Description This course is part of the "Best Practices in AI" series, designed to assist practicing radiologists and administrators in comprehending and enhancing process related to AI regulation and human-AI interaction. The course is comprised of three lectures by industry experts followed by an open Q and A session. The discussion will focus on two key topics. The first two lectures will provide an overview of the FDA process, covering important aspects such as timelines, costs associated with FDA clearance/approval, how to access an up-to-date list of FDA regulated AI models, understanding clearance documents, and ensuring compliant with regulatory guidelines when implementing an AI model. The second topic and final lecture will explore strategies to optimize human-machine interaction. It will delve into methods for integrating AI capabilities with clinical intelligence (medical knowledge) to improve the accuracy of AI systems, enhance explainability of AI-generated results, and expedite the development of clinician trust in AI technology.

### Protecting the Innocent: Recognizing Child Abuse on Imaging

#### Sub-Events

#### **M7-CPD02 The Pediatric Skeleton: Differentiating Metabolic Bone Disease and Child Abuse**

##### Participants

Jeannette M. Perez-Rossello, MD, Wellesley, MA (*Presenter*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Differentiating metabolic bone disease and child abuse. 2) Develop an understanding of pathophysiology of neuroimaging findings in non-accidental trauma and recognize suspicious imaging findings. 3) Differentiating accidental and non-accidental abdominal injuries in children.\*Course Description This comprehensive series of lectures focuses on various aspects of child abuse recognition and diagnosis through imaging techniques. Participants will learn how to protect innocent children by recognizing signs of abuse on imaging, including skeletal injuries, head trauma, and abdominal injuries. The lectures cover differentiating between metabolic bone diseases and child abuse, identifying abusive head trauma and describing it accurately, as well as determining whether abdominal injuries in children are accidental or non-accidental. By acquiring these skills and knowledge, attendees will be better equipped to safeguard vulnerable children and provide appropriate care and intervention when necessary.

### Chicago Fireside Chat: Best of AAPM Summer School - MRgRT (MR-guided Radiation Therapy)

#### LEARNING OBJECTIVES

1) Overview the state of the art in MRgRT. 2) Understand the basic clinical implementation of MRgRT. 3) Understand the promise and challenges of MRgRT.\*Course Description With the introduction of MRgRT systems, Magnetic Resonance Imaging-Guided Radiation Therapy has expanded into community practice settings. Using an interactive Q and A session with participants, this session aims to educate new and seasoned users on the practical implementation of MRgRT and the workflows related to online adapted therapy as discussed at the AAPM Summer School. (<https://w4.aapm.org/meetings/2021SS/programInfo/postMeetingAccess.php>).

### Chest Imaging: When Molecular Imaging Helps

#### LEARNING OBJECTIVES

1) A case-based review discussing the emerging of Molecular Imaging techniques, which can improve detection of ischemic heart disease, infiltrative cardiomyopathies, and inflammatory cardiomyopathies, with a focus on sarcoidosis. 2) Provide a discussion of new Molecular Imaging techniques that are available for routine clinical diagnosis of pathologies related to coronary artery disease and infiltrative/inflammatory cardiomyopathies. Further, the rationale of the examinations will be provided by explaining the medical and imaging sciences that necessitate when and how to perform these examinations. 3) The case-based approach will discuss the key imaging findings that can be used to improve diagnosis of cardiothoracic diseases. Given the novelty of these exams, a review of important incidental findings and imaging pitfalls will also be provided to improve examination implementation and interpretation.\*Course Description Imaging of the heart and lungs has increasingly become a multi-modality approach. With numerous recent advances in Molecular Imaging, physicians increasingly need an approach as to when hybrid or targeted Molecular Imaging examinations can confirm pathophysiologic processes affecting the Cardiothoracic system.

#### COURSE DESCRIPTION

##### M8-CNPM06 History of Safety Net Hospitals in the US: Are They Still Needed?

###### Participants

Jinel A. Scott, MD, Brooklyn, NY (*Presenter*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Explain the history of safety net hospitals in the United States and the role of these hospitals in current day healthcare. 2) Identify unique barriers to radiologic care for rural populations. 3) Discuss developing breast and lung cancer screening programs for underserved populations.\*Course Description This course will spotlight safety net hospitals, health disparities, challenges to providing care for underserved and rural populations, and strategies to overcome these challenges. Many physicians and other members of the health care team are unaware of the history and purpose of the safety net hospital system in the United States. The safety net hospital system addresses unique barriers to care that marginalized and diverse populations endure, including rural populations. Many health care team members have limited understanding of how safety net hospitals meet these challenges. This course will provide an opportunity to gain an understanding of unique barriers to care for marginalized populations, immigrant, rural, urban, and gender diverse groups so that we might improve and become more helpful during our physician-patient interactions.

### Clinical Implementation and Standardization of Proton Magnetic Resonance Spectroscopy

#### LEARNING OBJECTIVES

1) Review the physical principles of magnetic resonance spectroscopy (MRS) and MRS pulse sequences. 2) Describe strategies to effectively acquire, analyze, and quantify the quality of MRS data. 3) Discuss emerging applications of MRS in clinical practice. 4) Provide MRS reporting standards and discuss future perspectives in clinical reality.\*Course Description Magnetic resonance spectroscopy (MRS) permits the quantification of metabolites within a diverse range of tissues and pathologies. This metabolic information has been shown to enable better diagnoses, personalized treatments, and rapid assessment of treatment response. However, implementation of MRS remains challenging and consistent acquisition of high-quality data remains difficult due to the lack of technical standardization. This session will provide experts' advice, consensus recommendations, standardization of MRS acquisition, analysis and reporting to improve MRS quality in routine clinical practice. First, this educational course will introduce the physical principles of MRS and describe the latest clinically available MRS pulse sequences. Next, this course will present strategies to effectively and consistently acquire high-quality MRS data, robustly analyze this data, and perform MRS quality management in routine clinical practice. Finally, this session will discuss established and emerging applications of MRS, reporting standards and future perspectives in clinical reality.

### The Academy for Radiology & Biomedical Imaging Research's 2023 Imaging Shark Bait Session

#### LEARNING OBJECTIVES

1) Identifying strategies for bringing research to the competitive marketplace. 2) Presenting a proposal in a way that elicits interest from potential investors. 3) Taking steps to secure investor funding while developing and protecting their intellectual property. 4) Identifying ways to generate business value through licensing and collaborations.\*Course Description An educational session, where three nominated "Pitch Teams" are chosen through a competitive process in advance of the final live session held during the RSNA annual meeting. The chosen Pitch Teams, generally comprised of early-mid career investigators, then have a timed period during which the pitch their ideas to a panel consisting of representatives from industry, academia and venture capital, who in turn offer advice and critique on each specific pitch. This ninety-minute session offers an interactive educational opportunity for investigators to test their skills at pitching new technologies and product development ideas to an expert panel of sharks. A winner is chosen, during the live session, through a rubric scoring system developed by our expert panel with the top pitch team walking away with a \$1000.00 cash prize and are invited to pitch the Academy's partners in industry during the annual CIBR Steering Committee meeting during the RSNA. 2023 will mark the 8th session we've held at RSNA - this is a widely attended event that becomes more and more popular each year, with a higher level of engagement year to year.

#### COURSE DESCRIPTION

An educational session, where three nominated "Pitch Teams" are chosen through a competitive process in advance of the final live session held during the RSNA annual meeting. ### Moral Distress and Its Impact on Burn-out

#### Participants

Rama Ayyala, MD, (*Presenter*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Describe the impact of moral distress on radiologists' well-being and staff retention. 2) Identify the most common contributors to moral distress in radiologists. 3) Identify countermeasures to moral distress in radiology practice.\*Course Description 18% of radiologists have left a position because of moral distress and 28% have considered doing. This course will explore the impact of moral distress on radiologists' well-being and explore its connection to burn-out. Common causes of moral distress will be discussed as well as countermeasures mitigating its impact. The course consists of five 10-minutes lectures with time for discussion. Participants will be provided with practical action items for implementation in their work environment to decrease moral distress.

### Trauma and the ER Pregnant Patient

#### Participants

Kedar Sharbidre, MD, Birmingham, AL (*Presenter*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Diagnose normal and abnormal intrauterine and ectopic pregnancy. 2) Diagnose or exclude placental abruption based on sonographic findings. 3) Understand how best to use imaging modalities in pregnant women who present to the emergency room following trauma.\*Course Description This course will cover the use of diagnostic imaging in evaluating pregnant woman who present to the emergency room. One focus will be on women who present following trauma, where the course will address the appropriate use of imaging modalities, including ultrasound and computed tomography, and approaches to diagnosis (including the FAST ultrasound exam). A second focus will be on women who present with emergency symptoms, most commonly pain or vaginal bleeding, in the first trimester, where the course will address diagnosis of ectopic pregnancy, miscarriage of intrauterine pregnancy, and ovarian torsion. The third focus will be on women who present with emergency symptoms in the second and third trimesters, where the course will address diagnosis of placenta previa or abruption, cervical shortening, and assessment of fetal well-being.

### Coronary Artery Calcium Opportunistic Screening with Real-World Implementation Experience

#### LEARNING OBJECTIVES

1) Understand the utility and expanded screening population enabled by this technology. 2) Learn about real-world implementation challenges, opportunities, and considerations. 3) Consider how to establish care pathways with cardiology and other specialties.\*Course Description Coronary artery calcium (CAC) scoring is one of the cornerstones of cardiology risk assessment providing an opportunity to intervene on patients at risk and to save lives. Artificial intelligence now allows us to reliably obtain a CAC score on routine non-gated chest CTs and establish care pathways for referral and treatment. Learn about the underlying technology but also important regulatory and deployment considerations as well as how to establish a care pathway with an important perspective from a cardiologist.

#### COURSE DESCRIPTION

### From Skin to Bone: Imaging of Infection

#### LEARNING OBJECTIVES

1) To recognize the characteristic imaging findings of bone and soft tissue infection. 2) To review important pearls and common pitfalls in the diagnosis of musculoskeletal infection.\*Course Description This course will include lectures which review in detail the imaging of musculoskeletal infection. The attendee will gain understanding of the imaging of osteomyelitis, chronic bone infection, and spine infection, as well as joint, tendon sheath, bursa, and soft tissue infection.

#### COURSE DESCRIPTION

This course will include lectures which review in detail the imaging of musculoskeletal infection. The attendee will gain understanding of the imaging of osteomyelitis, chronic bone infection, and spine infection, as well as joint, tendon sheath, bursa, and soft tissue infection.

#### **LEARNING OBJECTIVES**

1) Understand the importance of using mentorship, sponsorship and coaching to help decrease the loss of mid career women and URiM in radiology. 2) Identify the challenges of invisible minorities including LGBTQ radiologists and how we can provide support. 3) Learn how to implement institution and department specific strategies to assure that all radiologists thrive after hire.\*Course Description The percentage of women and URiM faculty in radiology has remained stagnant despite an increase in medical school matriculants who have been traditionally underrepresented. There is a distinct need to increase the number of women and URiM entering radiology and to assure that they receive appropriate mentorship, sponsorship and coaching to succeed and to be promoted to higher ranks. This session will focus on the mid-career leaky pipeline that occurs for women and URiM and will provide potential solutions. The perspective of invisible minorities including LGBTQ faculty will be provided and how we can also provide support. Because institutions can be quite different, understanding the local culture is key to successfully implementing strategies to help with fixing the leaky pipeline.

### AI in Pediatric Radiology: What is a Reality Now and in the Near Future

#### LEARNING OBJECTIVES

1) Learn about how both interpretive and non-interpretive AI tools can help improve efficiency and productivity in a pediatric radiology practice. 2) Understand why AI designed for adults may not be expected to perform similarly in pediatric patients and what may be done to mitigate this risk.\*Course Description We will explore the current state of understanding regarding benefits, challenges, and risks in implementing AI in a pediatric radiology practice, including risks associated with the use of AI models trained on adults applied to pediatric populations. The session will feature four expert presenters followed by a panel Q&A.

### Artificial Intelligence (AI) in Medical Imaging - The Pathway to Translation (Translational Research Educational Course (TREC) (Sponsored by the RSNA Research Development Committee)

#### LEARNING OBJECTIVES

1) Describe the current landscape for translating new AI tools to the clinic. 2) Understand aspects needed to move a new AI tool from an academic research lab to a commercial product. 3) Recognize essential needs of startup companies in this environment.\*Course Description This 1-hour session is designed to address the knowledge gap concerning guiding researchers to successfully translate research into clinical practice. This year it will provide a specific example on Artificial Intelligence (AI) as applied to robotics for image-guided intervention in the context of a startup company. This course will cover some of the steps needed such as developing the idea, assessing the clinical need, commercial demand, securing funding, making a team of collaborators to translate and commercialize the product. These topics will be addressed by speakers with expertise on different aspects of translational imaging research in the context of AI. The format will be presentations by 1) Translational clinician-investigator involved in the AI tool development and testing, 2) Computer/data scientist that helped developed the AI tools used and 3) the company CEO considering the commercialization, regulatory approval and marketing, with a Q&A panel session. The outcome of the course will be to provide the audience with a representative example of such translation efforts and the opportunity to discuss with the speakers their experiences.

#### R3-CBR12 Tomo Guided Biopsy and Localization Techniques

##### Participants

Sarah M. Friedewald, MD, Chicago, IL (*Presenter*) Consultant, Hologic, Inc; Research Grant, Alphabet Inc

#### LEARNING OBJECTIVES

1) Identify different ways to optimize tomosynthesis, US and MRI guided biopsies. 2) Appreciate different methods of image guided localizations, and understand their strengths and limitations.\*Course Description In this course, the attendee will learn the basics of DBT, US and MRI guided biopsies as well as different localization techniques. The most recent literature supporting these techniques will be reviewed. Additionally, through imaging examples, different scenarios will be presented that the radiologist may encounter during these procedures. A practical guide on how to troubleshoot various issues that might arise will be presented.

R3-CCH10

### Lung Cancer Screening

#### Sub-Events

##### R3-CCH10 Moderator

###### Participants

Caroline Chiles, MD, Winston-salem, NC (*Moderator*) Advisory Board, AstraZeneca PLC

##### R3-CCH10 Tools for Tracking Lung Nodule Follow-up

###### Participants

Debra Dyer, MD, (*Presenter*) Consultant, AstraZeneca PLC;Clinical Advisory Board, IMIDEX Inc

#### LEARNING OBJECTIVES

1) Recognize important additions to Lung-RADS 2022. 2) Understand how radiologists can optimize the risk: benefit ratio in their lung cancer screening patients. 3) Compare human intelligence and artificial intelligence in the interpretation and reporting of lung screening CT. 4) Appreciate the need for lung nodule tracking tools in lung cancer screening and incidental pulmonary nodule programs.\*Course Description Lung-RADS 2022 contains significant revisions that, in part, move suspected infectious lesions to "Lung-RADS 0, incomplete" rather than Lung-RADS 4, suspicious, allow juxtapleural nodules the same assessment as perifissural nodules, and define a Stepped Management to the follow-up of nodules. CT screening for lung cancer can reduce lung-cancer specific mortality, but this benefit must be weighed in each patient against potential risks. We describe how radiologists can mitigate the risks associated with CT screening. As the number of lung screening CTs increases, radiologists may benefit from artificial intelligence that can not only identify nodules but also provide risk assessment. Appropriate follow-up of lung nodules is necessary for the early detection of lung cancer. Tools for tracking lung nodules are essential for successful lung nodule management in lung cancer screening and incidental pulmonary nodule programs.

#### COURSE DESCRIPTION

Lung-RADS 2022 contains significant revisions that, in part, move suspected infectious lesions to "Lung-RADS 0, incomplete" rather than Lung-RADS 4, suspicious, allow juxtapleural nodules the same assessment as perifissural nodules, and define a Stepped Management to the follow-up of nodules. CT screening for lung cancer can reduce lung-cancer specific mortality, but this benefit must be weighed in each patient against potential risks. We describe how radiologists can mitigate the risks associated with CT screening. As the number of lung screening CTs increases, radiologists may benefit from artificial intelligence that can not only identify nodules but also provide risk assessment. Appropriate follow-up of lung nodules is necessary for the early detection of lung cancer. Tools for tracking lung nodules are essential for successful lung nodule management in lung cancer screening and incidental pulmonary nodule programs.

### Tools for Tracking Lung Nodule Follow-up

#### Participants

Debra Dyer, MD, (*Presenter*) Consultant, AstraZeneca PLC; Clinical Advisory Board, IMIDEX Inc

#### LEARNING OBJECTIVES

1) Recognize important additions to Lung-RADS 2022. 2) Understand how radiologists can optimize the risk: benefit ratio in their lung cancer screening patients. 3) Compare human intelligence and artificial intelligence in the interpretation and reporting of lung screening CT. 4) Appreciate the need for lung nodule tracking tools in lung cancer screening and incidental pulmonary nodule programs.\*Course Description Lung-RADS 2022 contains significant revisions that, in part, move suspected infectious lesions to "Lung-RADS 0, incomplete" rather than Lung-RADS 4, suspicious, allow juxtaleural nodules the same assessment as perifissural nodules, and define a Stepped Management to the follow-up of nodules. CT screening for lung cancer can reduce lung-cancer specific mortality, but this benefit must be weighed in each patient against potential risks. We describe how radiologists can mitigate the risks associated with CT screening. As the number of lung screening CTs increases, radiologists may benefit from artificial intelligence that can not only identify nodules but also provide risk assessment. Appropriate follow-up of lung nodules is necessary for the early detection of lung cancer. Tools for tracking lung nodules are essential for successful lung nodule management in lung cancer screening and incidental pulmonary nodule programs.

### Revolution in Alzheimer's Disease Therapy is Finally Here: What does the Radiologist Need to Know

#### LEARNING OBJECTIVES

1) Understand the roles of amyloid PET and MRI in the treatment protocol for anti-amyloid therapy. 2) Review appropriate use criteria of amyloid PET in the era of anti-amyloid therapy. 3) Discuss the neurologist's perspective on what the radiologist/ nuclear medicine physician needs to know.\*Course Description We are on the cusp of a revolution in dementia therapy. In particular, new anti-amyloid therapy may have a meaningful impact in slowing cognitive impairment. Neurologists, neuroradiologists and nuclear medicine specialists will play key role determining the impact of this therapy.

#### COURSE DESCRIPTION

### Abnormal Premenopausal Bleeding

#### Participants

Catherine Phillips, MD, Nashville, TN (*Presenter*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Define normal and abnormal uterine bleeding in premenopausal, pregnant and postmenopausal patients. 2) Outline etiologies of abnormal uterine bleeding in premenopausal, pregnant and postmenopausal patients. 3) Explain the role of appropriate imaging algorithms in different clinical scenarios.\*Course Description This course will enhance skills in formulating accurate and comprehensive radiology reports for patients with dysfunctional uterine bleeding throughout the life cycle. Structural and nonstructural causes of dysfunctional uterine bleeding in premenopausal: pregnant, non pregnant and in postmenopausal patients will be reviewed. A detailed explanation of appropriate imaging approach including US, CT, MRI, Hysterosalpingography will be provided for all entities involving the premenopausal, pregnant and postmenopausal patients who present with dysfunctional uterine bleeding. After completion of this course the attendees will have a comprehensive understanding and have developed an expertise in most common causes to rare etiologies of dysfunctional uterine bleeding.

#### LEARNING OBJECTIVES

1) Identify safety issues related to active implants. 2) Describe strategies to meet implant scanning requirements. 3) Review considerations for scanning off-label. 4) Understand actions to take when a safety incident occurs.\*Course Description Description of Program: A unique challenge to MR safety is the logistics of managing patients with active implants due to the diversity of device safety labeling and large number of requested exams. In this session, there are four talks presenting case-based examples of managing patients with active implants. These talks progress from initial screening, to MR scanning protocol modifications, to off-label considerations, to managing safety events.

#### COURSE DESCRIPTION

### What to Do When an Incident, or Near Miss, Occurs

#### Participants

Andrew Bowman, MD, PhD, Jacksonville, FL (*Presenter*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Identify safety issues related to active implants. 2) Describe strategies to meet implant scanning requirements. 3) Review considerations for scanning off-label. 4) Understand actions to take when a safety incident occurs.\*Course Description Description of Program: A unique challenge to MR safety is the logistics of managing patients with active implants due to the diversity of device safety labeling and large number of requested exams. In this session, there are four talks presenting case-based examples of managing patients with active implants. These talks progress from initial screening, to MR scanning protocol modifications, to off-label considerations, to managing safety events.

#### COURSE DESCRIPTION

### Colorectal Imaging

#### LEARNING OBJECTIVES

1) Explain the disparities in colorectal cancer screening and how CT Colonography can be used to improve health equity. 2) Provide best practices for state-of-the-art CTC technique. 3) Understand MRI staging and reporting of rectal cancer and evaluation following neoadjuvant treatment.\*Course Description The drivers of disparities in colorectal cancer screening and treatment are based in the social determinants of health. Current state-of-the art CT Colonography technique will be provided and we will describe how CTC can positively impact health equity. Additionally, the use of MR for accurate rectal cancer staging and efficient reporting will be included as well as a review of MR findings following neoadjuvant therapy.

#### COURSE DESCRIPTION

### Algorithms Without Borders

#### LEARNING OBJECTIVES

1) Understand the use cases for AI in LMICs. 2) Appreciate the opportunities and challenges of implementing an AI product. 3) Appreciate the importance of big data in Africa. 4) Appreciate the role of radiologists in facilitating the adoption of AI in LMICs.\*Course Description In LMICs, where there's a shortage of radiologists, AI algorithms improves access to imaging. Thus, AI is an equity promoting technology and its widespread use in LMICs is an example of reverse innovation. The state of AI in LMICs is discussed. The implications of reverse innovation for AI in the American market are analyzed.

#### COURSE DESCRIPTION

### Advanced Pediatric Interventions

#### LEARNING OBJECTIVES

1) Recognize pediatric pathologies that can be treated with Interventional Radiology. 2) Learn some pediatric techniques in Genitourinary, MSK, Oncologic, Gastrointestinal, Vascular Malformations, and Vascular Access interventions that differ from Adult Interventional Radiology. 3) Learn some tips and tricks on Pediatric Interventional Radiology.\*Course Description Advanced Pediatric Interventions is a course for the Adult Interventional Radiologist that is familiar with interventional techniques but has limited experience with pediatric patients, and for the General and/ or Pediatric Radiologist who performs some procedures in children but would like to expand their practice. This course will consist of a series of lectures given by experts on the field. It will showcase a broad spectrum of common pediatric procedures, including Genitourinary, MSK, Oncologic, Gastrointestinal, Vascular Malformations and Vascular Access interventions. Of particular importance is the fact that, although similar in many aspects, Pediatric Interventional Radiology techniques have several subtle differences in comparison to Adult Interventional Radiology. These include the type of disease, the longer life expectancy, the proper clinical management and the appropriate material/ device to be used in children. Lecturers will focus on pediatric indications and how these procedures may differ from adult interventions. There will be an opportunity for some questions and brief discussion at the end of each lecture. Attendees will be able to learn some tips and tricks and refine their knowledge in Pediatric Interventional Radiology.

### Role of Whole-Body MRI in Peripheral Nerve Tumor Syndromes

#### Participants

Shivani Ahlawat, MD, (*Presenter*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Explain strategies to improve diagnostic image quality in qualitative and quantitative MR neurography. 2) Identify the role of whole-body MRI in peripheral nerve tumor assessment. 3) Appreciate the role of high-resolution ultrasound for diagnostic and therapeutic management of peripheral neuropathies.\*Course Description Imaging plays an increasingly important role in the diagnostic and therapeutic management of peripheral neuropathies. This educational program, in the form of lectures and question/answer sessions and geared towards both clinical radiologists and researchers, will focus on the latest ultrasound and MRI techniques for peripheral nerve evaluation. Emerging research topics, in particular use of quantitative diffusion MRI for evaluation of muscle denervation, will be presented. At the program's conclusion, attendees will gain a deeper appreciation of the role of both imaging modalities in clinical and research practice.

Emerging research topics, in particular use of quantitative diffusion MRI for evaluation of muscle denervation, will be presented. At the program's conclusion, attendees will gain a deeper appreciation of the role of both imaging modalities in clinical and research practice.

### Pitfalls and Mimics in Oncologic Imaging

#### LEARNING OBJECTIVES

1) Identify various pitfalls in Oncological imaging that can lead to erroneous diagnoses. 2) Describe relevant technical background, pathophysiology, and hemodynamics of these pitfalls. 3) Be familiar with various clues to reach a specific diagnosis.\*Course Description The purpose of this course is to illustrate the various pitfalls, mimics, and atypical features that can lead to inaccurate diagnosis in cancer patients. The content includes relevant pathogenesis and background as well as specific clues that can be used to reach an accurate diagnosis. It is important to avoid pitfalls and misdiagnoses that can alter the management plan. Helpful strategies for avoiding pitfalls include paying close attention to the clinical history of the patient, carefully evaluating all of the available imaging studies, and being aware of the various radiologic mimics.

#### COURSE DESCRIPTION

The purpose of this course is to illustrate the various pitfalls, mimics, and atypical features that can lead to inaccurate diagnosis in cancer patients. The content includes relevant pathogenesis and background as well as specific clues that can be used to reach an accurate diagnosis. It is important to avoid pitfalls and misdiagnoses that can alter the management plan. **Appropriate Use of Intravascular Contrast in Children: It Ain't Just Water! (Supported in part by an Unrestricted Medical Education Grant from GE Healthcare, Inc.)**

### LEARNING OBJECTIVES

1) Review different types of contrast media and safety considerations in ultrasound, CT, and MRI, as well as availability, considerations for use, and possible substitutions. 2) Review considerations for implementing contrast-enhanced ultrasound in pediatric practice. 4) Evaluate potential methods to improve sustainability in pediatric radiology practice, including decreasing contrast media utilization.\*Course Description Many diagnostic imaging studies require the use of IV and/or enteric contrast media, however, emerging technologies are decreasing the need in some circumstances. When contrast is necessary, there are different types of contrast, with some better suited for use in certain clinical scenarios. Additionally, there are many important short and long term safety considerations when using contrast media. Finally, contrast media have unique considerations for institutional, regulatory, and supply chain constraints. This course will review important considerations when using contrast media in children for imaging at ultrasound, CT, and MRI, including possible alternatives, safety considerations, and anticipated upcoming advancements.

### From Bench to Bedside: Practical Considerations for AI in Medical Imaging

#### LEARNING OBJECTIVES

1) Understand the importance of data (in terms of sources, demographic distributions, and ethical uses) for training CAD-AI systems in a manner that promotes generalizability. 2) Describe the role of clinical acceptance testing from the perspectives of generalizability, efficiency in a clinical workflow, output explainability, and performance stability over time. 3) Identify practical considerations for the translation of CAD-AI tools to the clinic, including the human-machine interface, user training, and prospective surveillance.\*Course Description Rapid advances in artificial intelligence (AI) and machine learning (specifically, deep learning techniques) have enabled broad application of these methods in healthcare. The promise of deep-learning has promoted further interest in computer-aided diagnosis (CAD) development and applications using both "traditional" machine learning and newer deep-learning-based approaches; this expanded clinical decision support environment is referred to as "CAD-AI." It is of paramount importance to ensure that a clinical decision support tool undergoes proper training and rigorous validation of its generalizability and robustness before adoption for patient care. A task group of the American Association of Physicists in Medicine (AAPM) developed recommendations on practices and standards for the development and performance assessment of decision support systems in a CAD-AI environment. With CAD applications expanding to new stages of the patient care process, this educational session will explore the broader issues common to the development of CAD-AI applications and their translation from the bench to the clinic. The goal of this lecture-based session (followed by discussion) is to bring attention to the proper training and validation of machine learning algorithms that may improve their generalizability and reliability, thus accelerating the adoption of CAD-AI systems for clinical decision support.

### Best Head and Neck Cases of 2023 From the Experts

#### LEARNING OBJECTIVES

1) Recognize typical and atypical entities that occur within the head and neck. 2) Differentiate between common head and neck pathologies from relevant mimics. \*Course Description In this case-based head and neck imaging session, attendees will be presented with classic, unusual and diagnostic dilemma cases within the head and neck as selected by the experts. Speakers will emphasize pearls for differentiating each entity from common mimics, pitfalls of interpretation to avoid, and relevant clinical management considerations with which radiologists should be familiar. This session offers attendees the opportunity to refine their interpretation of complex head and neck imaging studies by incorporating tips from world experts.

### Practice Issues and Reimbursement Improvement

#### LEARNING OBJECTIVES

1) Identify & describe strategies to improve reimbursement & overall profitability of your practice in the fragmented US healthcare payer landscape. 2) Understand the sources of practice dissatisfaction/burnout & explain strategies for staff engagement/retention. 3) Discuss Post-Pandemic practice issues & how to implement changes to overcome a reduced workforce.\*Course Description This session will focus on the unique ways to improve practice issues and profitability, including methods to achieve staff retention, in the Post-Pandemic era. The course is applicable to radiologists and technologists of all career levels. The educational format of this course is lecture form with discussion.

### Cardiac Rapid Fire: 60 Cases in 60 minutes

#### LEARNING OBJECTIVES

1) Interpret and recognize cardiac and pericardial masses through the review of clinical cases and enabling participants to feel more confident in their ability to identify such conditions in their patients. 2) Improve the management of valvular disease by understanding the different imaging techniques used and by gaining a thorough knowledge of the diagnosis and treatment of such diseases. 3) Implement a better understanding of congenital heart disease in clinical scenarios and explain the imaging methods used for the diagnosis, management, and treatment plans for patients with this condition.\*Course Description This advanced course is designed to provide attendees with an extensive review of cardiac imaging, with a particular focus on cardiac CT and cardiac MRI. Through the presentation of clinical cases, participants will be able to better identify and manage the diverse range of cardiovascular issues that they may encounter in their practice. The course is composed of primary topics that aim to explore the problems cardiovascular specialists typically encounter. Attendees will gain a greater understanding of cardiac and pericardial masses, valvular disease, and congenital heart disease. Radiology professionals at all levels of experience are encouraged to participate. This session will be delivered as a rapid-fire case presentation format with summary knowledge review. Attendees will be able to interact with the presenter and ask questions at the end of the session. After completing the course, attendees will be able to apply their enhanced knowledge of cardiac imaging in practical, real-world situations. Join us at #RSNA23 for an engaging and fast-paced educational experience that will enrich your practice and benefit your patients. #CV60in60

#### R7-CCH12 If These Images Could Talk: Diffuse ILD on Chest Radiography

##### Participants

Andetta R. Hunsaker, MD, Boston, MA (*Presenter*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) To recognize the various chest radiographic features of diffuse interstitial lung diseases and their respective CT correlates. 2) To recognize the various chest radiographic features of pleural diseases and their respective CT correlates. 3) To learn the normal anatomy demonstrated on lateral chest radiography and recognize imaging abnormalities unique to the lateral view with their respective CT correlations.\*Course Description The chest radiograph is a foundational modality in thoracic imaging that remains one of the most frequently ordered diagnostic studies. It serves an important function in multiple healthcare settings – in emergency departments, intensive care units, outpatient clinics –and in the diagnosis and monitoring of oncologic disease. The effective interpretation of chest radiographs requires experience and a knowledge of radiographic anatomy, imaging signs of disease, and important pitfalls to avoid. This session will feature three case-based lectures presented by experienced thoracic radiologists whose teaching skills will be focused on giving attendees an expanded appreciation and skill in the interpretation of chest radiographs.

### Disaster Preparedness - Are you Ready for Chaos?

#### LEARNING OBJECTIVES

1) To understand what changes when disaster strikes and (examples of) things to consider to be well prepared. 2) To explore the value provided by your residency and how to embed it in your disaster preparedness plan. 3) To explain the use of exercises for plan development and testing.\*Course Description Disaster can happen at any time and any place to anyone, so your hospital and department and you should be prepared to deal with the consequences of a variety of types of potential disasters in your region. This course will provide insight in how operations may have to change in this setting and how to best include and prepare your personnel for these rare occasions. Your residency is a valuable part and thinking about its role and preparedness is a unique feature that will be highlighted in this session.

### Radiology Informatics Legislation Update

#### LEARNING OBJECTIVES

1) Know when, in what context and under what names the most impactful recent legislation on informatics has presented. 2) Understand implications of current legislative product or debate on Informatics. 3) Perceive the political context in which Informatics-relevant legislation has occurred.\*Course Description This course is will help attendees stay updated and informed about the latest legislative developments relevant to radiology informatics. During this traditional lecture format, we will address crucial issues related to informatics such as the cybersecurity implications of new regulations, the political context in which informatics-relevant legislation occurs, and the history and updates of significant acts like the No Surprise Act. Additionally, we will discuss the new rules on data sharing introduced by the Office of the National Coordinator for Health Information Technology (ONC). Attending this session will give you a deep understanding of the legislative landscape and its impact on informatics.

### T2 Dixon Imaging of Tumors: Advantages and Disadvantages

#### Participants

Stephanie Bernard, MD, Helotes, TX (*Presenter*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Recognize imaging differences between lipoma and well differentiated liposarcoma and current cytogenetic aberrations used in this distinction. 2) Understand recent advances in multidisciplinary management of spinal bone metastases and imaging of post-tumor resection reconstructions. 3) Identify updates to musculoskeletal tumor staging and use of T2 Dixon imaging of musculoskeletal tumors.\*Course Description This lecture format course includes a discussion of a range of topics concerning musculoskeletal tumor imaging and both current trends and recent advances. Topics range from a discussion of adipocytic neoplasms and use of cytogenetic aberrations that allow their distinction, imaging of post-resection reconstructions, the use of T2 Dixon imaging of neoplasms, recent advances in multidisciplinary management of spinal bone metastases and an update on musculoskeletal tumor staging. Attendees should expect a review and update on these important topics on imaging of musculoskeletal tumors.

#### R7-CMK08 T2 Dixon Imaging of Tumors: Advantages and Disadvantages

##### Participants

Stephanie Bernard, MD, Helotes, TX (*Presenter*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Recognize imaging differences between lipoma and well differentiated liposarcoma and current cytogenetic aberrations used in this distinction. 2) Understand recent advances in multidisciplinary management of spinal bone metastases and imaging of post-tumor resection reconstructions. 3) Identify updates to musculoskeletal tumor staging and use of T2 Dixon imaging of musculoskeletal tumors.\*Course Description This lecture format course includes a discussion of a range of topics concerning musculoskeletal tumor imaging and both current trends and recent advances. Topics range from a discussion of adipocytic neoplasms and use of cytogenetic aberrations that allow their distinction, imaging of post-resection reconstructions, the use of T2 Dixon imaging of neoplasms, recent advances in multidisciplinary management of spinal bone metastases and an update on musculoskeletal tumor staging. Attendees should expect a review and update on these important topics on imaging of musculoskeletal tumors.

#### COURSE DESCRIPTION

This lecture format course includes a discussion of a range of topics concerning musculoskeletal tumor imaging and both current trends and recent advances. Topics range from a discussion of adipocytic neoplasms and use of cytogenetic aberrations that allow their distinction, imaging of post-resection reconstructions, the use of T2 Dixon imaging of neoplasms, recent advances in multidisciplinary management of spinal bone metastases and an update on musculoskeletal tumor staging. Attendees should expect a review and update on these important topics on imaging of musculoskeletal tumors.

### Challenging Pediatric Ultrasound Cases

#### Participants

Edward Lee, MD, MPH, Boston, MA (*Presenter*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Identify the role of ultrasound in common and uncommon pediatric emergencies. 2) Understand some common and uncommon causes of acute pelvic pain in women. 3) Identify the ultrasound findings of musculoskeletal pathologies presenting in the acute setting.\*Course Description This course is designed to highlight the vital role ultrasound plays in imaging and diagnosis throughout the body with a focus on challenging emergent cases. A wide range of applications will be covered including vascular, pelvic, pediatric, and musculoskeletal. Attendees will have the opportunity to test their knowledge in real time as interesting unknown cases are presented in question/answer format with topic review by the speakers. Our goal is to provide a broad update in the field while addressing new opportunities and challenges for everyday practice

### Unprofessionalism in the Workplace

#### LEARNING OBJECTIVES

1) Recognize the manifestations of professional disruptions in the workplace. 2) Identify mitigation strategies for professional disruptions in the workplace.\*Course Description Unprofessional and disruptive behavior in the radiology workplace can be on the spectrum of overt to insidious. In this course, we will explore microaggressions, sexual harassment, and professionalism transgressions, and consider trainee professionalism and wellness. We will discuss how these behaviors may manifest themselves and provide examples of mitigation strategies.

Participants

Andrea S. Doria, PhD, Toronto, ON (*Presenter*) Baxalta-Shire (Research Grant), Novo Nordisk (Research Grant), Terry Fox Foundation (Research Grant), PSI Foundation (Research Grant), Society of Pediatric Radiology (Research Grant), Garron Family Cancer Centre (Research Grant)

#### LEARNING OBJECTIVES

1) Discuss the protocols and current clinical applications of whole body MRI and Rapid Abdominal MRI in children. 2) Identify pitfalls of MR Enterography in children and describe its applications beyond inflammatory bowel disease. 3) List the benefits and methods to use reporting template effectively in clinical practice.\*Course Description MR imaging is playing important role in body imaging in children with ever expanding clinical applications in various disease process. Update on new techniques and protocols as well as new emerging clinical applications of MR in pediatric body is essential. This educational session is designed to provide learners with updates on current techniques, protocols and pitfalls in pediatric body MR imaging via lectures. Clinical applications of whole-body MRI in screening of children with oncologic and non-oncologic disease processes, and applications of MR Enterography in evaluations of gastrointestinal diseases other than inflammatory bowel disease will be discussed. Strategies to use rapid abdominal MRI and its potential applications in children will be illustrated. Finally, importance and methods in communicating the imaging findings effectively through standardized reporting will be discussed.

### Data Curation for AI with Proper Medical Imaging Physics Context

#### LEARNING OBJECTIVES

1) To review the process and to demonstrate methods and tools to collect and prepare clinical data for AI model development and related research. 2) To learn how data quality and data size affect the performance and generalizability of deep neural network models. 3) To understand practical methods for series and study selection for clinically deployed AI models, common issues that arise in deployment, and several techniques for evaluating AI in an ongoing fashion.\*Course Description This course reviews the selection, procurement, quality and evaluation of data for AI development and deployment in radiology. With a focus on the technical and imaging physics aspects of AI in radiology, it is of high educational value to those interested in active involvement in such activities.

#### LEARNING OBJECTIVES

1) Describe the latest advances in breast cancer imaging before, during, and after treatment. 2) Facilitate a multidisciplinary approach to the diagnosis, management, and treatment of breast cancer.\*Course Description This course utilizes a case-based multi-disciplinary approach to discuss appropriate breast imaging examinations, radiologic-pathologic correlation, available radiotherapy options, as well as medical and surgical oncologic treatment planning in the setting of breast cancer.

#### COURSE DESCRIPTION

This course utilizes a case-based multi-disciplinary approach to discuss appropriate breast imaging examinations, radiologic-pathologic correlation, available radiotherapy options, as well as medical and surgical oncologic treatment planning in the setting of breast cancer.

### AI in Breast Imaging

#### Sub-Events

##### S1-CBR02 Moderator

###### Participants

Constance Lehman, MD, PhD, Boston, MA (*Moderator*) Institutional Grant, General Electric Company; Institutional Grant, Hologic, Inc; Co-founder, Clarity, Inc.

##### S1-CBR02 AI in Breast Imaging: Pearls and Pitfalls of Implementation

###### Participants

Constance Lehman, MD, PhD, Boston, MA (*Presenter*) Institutional Grant, General Electric Company; Institutional Grant, Hologic, Inc; Co-founder, Clarity, Inc.

#### LEARNING OBJECTIVES

1) Develop critical thinking and understanding of the terminology in the development and evaluation of AI systems for breast cancer screening, diagnosis and treatment. 2) Gain insights from prospective interventional studies including diagnostic improvements, biases, and limitations. 3) Attain a realistic appreciation for the opportunities and challenges in the implementation of AI in clinical practice. \*Course Description Build your knowledge with top experts in evaluating, implementing, and understanding the wider impact of AI systems in breast cancer screening, diagnosis and intervention. There will be three lectures followed by an open panel discussion. We will cover the full cycle from development and evaluation of AI systems, including how the FDA evaluates AI algorithms, what developers might expect for post-market surveillance requirements, implications of results of large clinical trials, and future opportunities and challenges when implementing AI in routine clinical practice. In the final panel discussion, all presenters are available to discuss important topics brought forward by the panel and audience.

### Mapping the Target & Pushing the Limits: Imaging Guidance for Electrophysiology Procedure Planning

#### LEARNING OBJECTIVES

1) Identify the MR biomarkers in electrophysiology (EP) planning and learn how to guide procedure by the use of biomarkers. 2) Discover the latest advanced CT techniques for EP imaging. 3) Learn how to use interactive 3D modeling to plan EP procedure.\*Course Description Pre-procedural imaging is essential for guiding electrophysiology procedure planning. Learning the advanced EP imaging techniques is of educational importance for radiologists and cardiologists. This 1-hour course includes lectures from 3 distinguished professors, focusing on CMR, CT and 3D modelling respectively. In this session, you will be guided through the up-to-date MR and CT application in pre-procedural EP imaging and learn how to perform in clinical practice.

### Pearls and Pitfalls of 3D Printing from Imaging Data

#### LEARNING OBJECTIVES

1) Understand how to evaluate and optimize the accuracy of clinical 3D printing. 2) Identify strategies to improve efficiency of 3D printing workflows. 3) Explain how to pitch the business case for 3D printing in healthcare facilities.\*Course Description Safety and quality in clinical 3D printing depend on many technical and operational factors. 3D printed anatomic models must reliably represent the patient's anatomy to be useful to the clinician, but the workflow required to create these models from medical imaging data is complex and time consuming. The inherent complexity of image-based 3D printing allows the possibility of errors at any stage of the process. These stages include imaging acquisition, fusion of multiple exam types, segmentation, computer aided design, 3D printing, and post processing of the final 3D printed product. In this educational course, the stages where variances in the 3D printing workflow can occur will be reviewed. Specific clinical scenarios and challenges will be used to illustrate strategies for successful 3D printing. Tips on how to assess quality as well as improve efficiency and address variances will be described. From an operational standpoint, strategies for making the business case for 3D printing capabilities in health care facilities will also be discussed. 3D printed models will be circulated as examples. Interactive polling questions will be used throughout the session to engage the audience and assess their knowledge base. This interactive didactic session addresses the needs outlined above and provides a framework to address potential pitfalls in performing clinical 3D printing. This topic is relevant to trainees and practicing radiologists engaged in the management of complex surgical conditions, as well as technologists and scientists involved in image optimization and processing for visualization and 3D modeling.

### From Careerism to Professionalism: A Personal and Institutional Imperative (Sponsored by the RSNA Professionalism Committee)

#### LEARNING OBJECTIVES

1) Learn how to fit in and stand out by developing self-awareness of personal strengths/weaknesses and institutional culture and opportunities. 2) Learn how to avoid career self-sabotage by focusing on productive habits rather than goals, negotiating resources and authority commensurate with authority, engaging in supportive rather than exploitative relationships, and responding to challenges with resilience and antifragility. 3) Learn how to lead with or without titles to guide and inspire others to thrive and move beyond status-seeking careerism to professionalism based on a commitment to excellence and magnanimity.\*Course Description This course will be comprised of several presentations addressing how to best facilitate a successful transition from trainee to early and mid career radiologist and recognize the important distinction between "careerism" and professionalism. Advice will be provided on how to fit in and stand out by achieving the self-awareness to determine what practice setting and roles are best aligned to take advantage of personal strengths and promote professional growth. Tips for avoiding career self-sabotage will be offered, including focusing on productive habits rather than all-or-none goals, negotiating resources and authority commensurate with responsibility, engaging in supportive rather than exploitative relationships, developing resilience and antifragility in response to challenges, and adapting to cultural norms. While professional success can be measured in terms of metrics such as publications, citations, invited lectures, awards, grants, degrees, and titles, status-seeking "careerism" is ultimately much less fulfilling than building a strong sense of professionalism based on a passion for excellence and magnanimity that guides and inspires others to thrive.

### Essential Updates in Ischemic Stroke Imaging and Treatment

#### LEARNING OBJECTIVES

1) To describe new large artery occlusion targets for thrombectomy treatment in acute ischemic stroke patients. 2) To understand existing evidence for the treatment of medium and small artery occlusion targets by thrombectomy. 3) To understand new thrombectomy eligibility criteria based upon non-invasive imaging studies. 4) To describe new frontiers in endovascular thrombectomy and how they may impact ischemic stroke treatment in the near future.\*Course Description Acute ischemic stroke is the leading cause of disability in the United States and results in significant mortality worldwide. New randomized trials published in the past two years have substantially increased patient eligibility for endovascular thrombectomy. In this course, we will review new selection criteria for endovascular thrombectomy (such as patients with large ischemic cores and low ASPECTS) and the evidence for expanded treatment of vessel occlusions (such as basilar artery occlusions and small/medium vessel occlusions). In addition, we will describe existing and emerging changes in hospital systems to facilitate expeditious transfer and treatment of thrombectomy-eligible patients and discuss commonly encountered challenges in patient treatment through a case-based discussion.

#### COURSE DESCRIPTION

Acute ischemic stroke is the leading cause of disability in the United States and results in significant mortality worldwide. New randomized trials published in the past two years have substantially increased patient eligibility for endovascular thrombectomy. In this course, we will review new selection criteria for endovascular thrombectomy (such as patients with large ischemic cores and low ASPECTS) and the evidence for expanded treatment of vessel occlusions (such as basilar artery occlusions and small/medium vessel occlusions). In addition, we will describe existing and emerging changes in hospital systems to facilitate expeditious transfer and treatment of thrombectomy-eligible patients and discuss commonly encountered challenges in patient treatment through a case-based discussion.

#### S1-COB05 Perspectives of the Pathologist: FIGO Classifications and Case Review

##### Participants

Jonathan Hecht, MD, PhD, Boston, MA (*Presenter*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Explain current clinical implications of placenta accreta spectrum (PAS) diagnosis. 2) Evaluate 1st trimester PAS with US, and PAS beyond 14 weeks gestation with US and MRI. 3) Understand the pathology of PAS and current FIGO classifications.\*Course Description Placenta Accreta Spectrum is a serious complication of pregnancy. This lecture will address how imaging with US and MRI can affect surgical planning that improves outcomes. Current US and MRI evaluation recommendations of PAS in pregnancy will be reviewed, including case presentations. The importance of correlation with pathologic outcomes and recommended FIGO classifications will be discussed.

#### COURSE DESCRIPTION

### RSNA Hands-On Lab: Pediatric Musculoskeletal Ultrasound

#### LEARNING OBJECTIVES

1) Review the anatomy and common pediatric pathologic musculoskeletal conditions in three pediatric joints: the elbow, hand and ankle. 2) Use dynamic scanning of the joints to better demonstrate the anatomy of soft tissue and osteochondral components of three pediatric joints and will point out the distinction of soft tissue structures by a compression technique. 3) Discuss pathologies in the aforementioned joints as an overview of common pediatric pathologic musculoskeletal conditions.\*Course Description In Person Session Only. Tickets must be purchased in advance for this course. This course can be added through the registration portal or by stopping by the Registration Desk. Space is limited. This 90-min pediatric musculoskeletal hands-on session is targeted to general radiologists who aim to get an overview of technical and clinical application perspectives on ultrasound scanning and interpreting pathology of elbows, hands and ankles of children and adolescents. The information provided in this session adds value to the diagnostic tools that can be used for assessment of musculoskeletal disorders that affect growing joints, particularly in young children who may require general anesthesia for MRI assessment of their joints. The session has two parts, a 60-min hands-on part where pre-assigned radiologists scan teenager models' joints in real time and a second 30-min knowledge application part where the audience has the opportunity to scan models' joints by themselves. In the first part of the session lecturers will demonstrate ultrasound protocols for scanning of pediatric elbows, hands and ankles in real-time and will discuss ultrasound findings of pathologies in these joints. In the second part of the session tutoring to scanning by the audience will be provided by assigned radiologists in a controlled educational environment where the audience will have the opportunity to apply the a priori discussed ultrasound protocols into scanning the models' joints.

#### S1-CRO09 Lung/Mediastinum Case Based Multidisciplinary Review

##### Participants

Michelle S. Ginsberg, MD, New York, NY (*Presenter*) Speaker, Ultimate Opinions In Medicine LLC

#### LEARNING OBJECTIVES

1) Identify imaging strategies in the diagnosis and staging of thoracic malignancies. 2) Explain the current multidisciplinary management of thoracic malignancies. 3) Identify imaging strategies for post-treatment evaluation.\*Course Description This case-based discussion will expose the attendees to multidisciplinary discussion when treating thoracic malignancies. The panel will demonstrate specific imaging findings that directly affect staging and treatment decisions and will provide the audience with specific information they should include in their reports that directly affect prognosis and management. The cases to be discussed will be stage III non-small cell lung cancer, superior vena cava obstruction from small cell lung carcinoma, and mesothelioma.

#### COURSE DESCRIPTION

### Aortic Dissection

#### LEARNING OBJECTIVES

1) Understand the subtypes and imaging appearance of aortic pathologies that are associated with acute aortic syndrome. 2) Explain the role of imaging for interventional planning in aortic dissection. 3) Describe the changes in imaging appearance of aortic dissection over time and the implications for patient risk.\*Course Description Aortic dissection and acute aortic syndromes are frequently encountered in clinical practice, but there is often confusion related to appropriate imaging and creating clinically impactful radiology reports. This session will review imaging approaches in acute aortic syndrome while providing learners with expert recommendation on reporting terminology and measurements, imaging for interventional planning in aortic dissection, and imaging in chronic aortic dissection.

#### COURSE DESCRIPTION

##### S2-CCH01 Organizing Pneumonia

###### Participants

Jeffrey Galvin, MD, Silver Spring, MD (*Presenter*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Describe the typical findings of different patterns of injury within the lungs. 2) Understand the histologic, clinical, and radiologic aspects of organizing pneumonia. 3) Describe the role of HRCT in the setting of connective tissue disease and drug induced lung disease. 4) Explain the spectrum of findings and patterns seen in patients with hypersensitivity pneumonitis.\*Course Description The course will be a review of several topics in the field of diffuse lung disease. It will focus on a practical approach to reading high-resolution chest CTs, and identifying common findings and patterns of disease. A particular emphasis will be on patterns of injury seen in connective tissue disease and drug induced lung disease. It will also include a review of the multi-disciplinary approach to hypersensitivity pneumonitis and organizing pneumonia.

### Organizing Pneumonia

#### Participants

Jeffrey Galvin, MD, Silver Spring, MD (*Presenter*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Describe the typical findings of different patterns of injury within the lungs. 2) Understand the histologic, clinical, and radiologic aspects of organizing pneumonia. 3) Describe the role of HRCT in the setting of connective tissue disease and drug induced lung disease. 4) Explain the spectrum of findings and patterns seen in patients with hypersensitivity pneumonitis.\*Course Description  
The course will be a review of several topics in the field of diffuse lung disease. It will focus on a practical approach to reading high-resolution chest CTs, and identifying common findings and patterns of disease. A particular emphasis will be on patterns of injury seen in connective tissue disease and drug induced lung disease. It will also include a review of the multi-disciplinary approach to hypersensitivity pneumonitis and organizing pneumonia.

### Essentials of Spine Trauma

#### LEARNING OBJECTIVES

1) Describe mechanisms and associated injury patterns of cervical and thoracolumbar spine trauma. 2) Demonstrate common classifications used for spine trauma and understand their clinical relevance. 3) Recognize significant traumatic spine soft tissue injuries on MRI.\*Course Description The anatomy of the spine is complex and traumatic spine injuries can be subtle, which can make it challenging to correctly diagnosis significant traumatic spine injuries. In this three-part didactic session, the typical injury patterns and classification systems used for diagnosing traumatic spine injuries on CT will be presented along with the role and interpretation of MRI in imaging spine trauma.

#### COURSE DESCRIPTION

The anatomy of the spine is complex and traumatic spine injuries can be subtle, which can make it challenging to correctly diagnosis significant traumatic spine injuries. ### The Symbiotic Relationship of AI and Patient Centered Radiology (Sponsored by the RSNA Public Information Committee)

#### LEARNING OBJECTIVES

1) How to include patients as our partner in AI implementation. 2) List 5 uses of AI to improve patient experience. 3) Learn how AI is seen by patients around the world.\*Course Description Both Artificial Intelligence and Patient Centered Care are hot topics in radiology, but the concepts at first glance may seem contradictory. This course will help its audience better understand how these two concepts can have a symbiotic relationship. Listeners will learn what patients want to know about AI and how to discuss how AI may affect their care. Specific AI tools to improve the patient experience in the radiologic care journey will be discussed. AI and patient-centric radiology may look different depending on practice demographics and geographic locations; how can we learn from each other?

### Trauma Interventions

#### LEARNING OBJECTIVES

1) Understand the principles and techniques of interventions for trauma, including the use of imaging modalities, and vascular and non-vascular interventions. 2) Assess and prioritize traumatic injuries in the context of interventional radiology, recognizing indications and contraindications for different interventional procedures, and developing appropriate treatment plans. 3) Effectively communicate and collaborate with interdisciplinary teams involved in trauma care, contributing their knowledge and expertise in interventional radiology to facilitate comprehensive and coordinated management of trauma patients.\*Course Description The session is a comprehensive course that delves into the vital connection between interventional radiology and trauma. This session is designed to provide healthcare professionals with a deep understanding of the key topics in this field, including imaging workup, indications for trauma interventions, and management of various traumatic injuries. Through a combination of engaging lectures and interactive discussions, participants will gain the knowledge and skills necessary to effectively utilize interventional radiology techniques in trauma care. By the end of this session, participants will have a comprehensive understanding of the principles and techniques involved in interventional radiology for trauma intervention. They will be able to apply this knowledge to make informed decisions. Additionally, participants will develop the skills to effectively collaborate with multidisciplinary teams, facilitating improved outcomes for trauma patients through the integration of interventional radiology into trauma care protocols.

### Radiology Workforce Shortage: Considerations for Rural and Sprawling Systems

#### LEARNING OBJECTIVES

1) Identify the economic challenges in bringing radiology to rural areas. 2) Understand how policy and radiology financing can improve access to radiology in rural areas.\*Course Description Despite the public and private sector investment in imaging, access to imaging remains anemic in rural and underserved areas in the US. Increasingly responsibility for providing imaging to underserved populations falls on large hospitals. However, small practices have an important role, too. What can radiology leverage to improve access to imaging across the income gradient?

#### COURSE DESCRIPTION

Despite the public and private sector investment in imaging, access to imaging remains anemic in rural and underserved areas in the US. Increasingly responsibility for providing imaging to underserved populations falls on large hospitals. However, small practices have an important role, too. What can radiology leverage to improve access to imaging across the income gradient?

#### S2-CNR05 Imaging of Alzheimer's Disease: An Update

##### Participants

Petrice Cogswell, PhD, Rochester, MN (*Presenter*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Review the imaging biomarkers of common neurodegenerative diseases that are encountered in routine clinical practice, including the sequences that should be included in a dementia protocol. 2) Describe the role of neuroradiologists in diagnosing and monitoring amyloid-related imaging abnormalities (ARIA). 3) Identify new imaging biomarkers that could play a role in understanding Alzheimer's disease, including vascular, glymphatic, and inflammatory biomarkers.\*Course Description The diagnosis of Alzheimer's disease has shifted dramatically in the last 10 years from clinical/phenotypic criteria to a biological definition of the disease, for which imaging is crucial. Beyond assessing atrophy on MRI and hypometabolism on FDG-PET, radiologists play a key role in reviewing amyloid and tau PET scans, both clinically and in research, and performing lumbar punctures for CSF biomarkers. In the new era of anti-amyloid immunotherapies, imaging will also form the basis for diagnosing and monitoring amyloid-related imaging abnormalities (ARIA) in patients receiving aducanumab and lecanemab. This course will provide an update on state-of-the-art imaging of Alzheimer's disease, both in the context of differential diagnosis and therapy.

#### COURSE DESCRIPTION

The diagnosis of Alzheimer's disease has shifted dramatically in the last 10 years from clinical/phenotypic criteria to a biological definition of the disease, for which imaging is crucial. Beyond assessing atrophy on MRI and hypometabolism on FDG-PET, radiologists play a key role in reviewing amyloid and tau PET scans, both clinically and in research, and performing lumbar punctures for CSF biomarkers. In the new era of anti-amyloid immunotherapies, imaging will also form the basis for diagnosing and monitoring amyloid-related imaging abnormalities (ARIA) in patients receiving aducanumab and lecanemab. **Updates to MRI Safety Guidance for Varied MR Environments and Devices (Supported in part by an Unrestricted Medical Education Grant from GE Healthcare, Inc.)**

### LEARNING OBJECTIVES

1) Describe unique MRI safety considerations and corresponding guidance in radiation oncology environments. 2) Describe unique MRI safety considerations and corresponding guidance in low field, high field, and alternate layout MR environments. 3) Understand unique concerns of implants and devices within the context of new MR environments.\*Course Description MRI safety guidance is continually evolving to keep pace with the changing MRI landscape. Recent years have seen the introduction of novel clinical MR environments, including those with the MR/LINAC and ultra-high and low field systems, challenging the abilities of institutions, governing bodies, and regulators to stay abreast of the wave of change. It is not only essential that new safety standards for these diverse environments are established, but it is also necessary to clearly communicate new guidance to radiological personnel in a timely fashion. These lectures will outline key MRI safety considerations involving radiation oncology, variable magnetic fields, and patients with implants and devices, with special attention paid to the unique challenges in each environment, how radiologists, physicists, and technologists can address them.

### COURSE DESCRIPTION

MRI safety guidance is continually evolving to keep pace with the changing MRI landscape. Recent years have seen the introduction of novel clinical MR environments, including those with the MR/LINAC and ultra-high and low field systems, challenging the abilities of institutions, governing bodies, and regulators to stay abreast of the wave of change. ### Reducing Overtreatment in Early Stage Breast Cancer

#### Participants

Nisha Sharma, MBChB, FRCR, Leeds, United Kingdom (*Presenter*) Nothing to Disclose  
Nisha Sharma, MBChB, FRCR, Leeds, United Kingdom (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Describe overtreatment and the implications for patient care. 2) Explain the limitations of current strategies to identify patients at risk for overtreatment. 3) Identify promising new approaches in development that can triage patients away from overtreatment.\*  
Course Description Overtreatment is one of the principal harms of breast cancer screening programs that primarily originates new diagnosed early stage breast cancers. Identifying which patients will be overtreated is a key challenge as the underlying natural history of breast cancer is poorly understood. Drs. Grimm, Niell, and Wallis will lecture on key elements of the overtreatment debate including radiology, radiomics, and population data. At the completion of the session, attendees should understand the current up to date thinking about overtreatment, identify which patients are at risk, and understand new and emerging strategies for triage currently in development.

##### S4-CGI06 AI Bias and Fairness

###### Participants

George L. Shih, MD, MS, New York, NY (*Presenter*) Consultant, MD.ai, Inc;Shareholder, MD.ai, Inc

#### LEARNING OBJECTIVES

1) Learn about AI applied in GI Imaging. 2) Learn about the application of natural language processing in radiology, including about large language models (eg, ChatGPT). 3) Learn about different aspects of AI in medical imaging including bias, fairness, and safety.\*Course Description This session will focus on various aspects of Abdominal AI including specific applications in GI Imaging. Natural language processing (NLP) including newer techniques like Large Language Models (LLMs) and other AI issues like bias, fairness, and safety will also be discussed.

#### COURSE DESCRIPTION

This session will focus on various aspects of Abdominal AI including specific applications in GI Imaging. Natural language processing (NLP) including newer techniques like Large Language Models (LLMs) and other AI issues like bias, fairness, and safety will also be discussed.

Barr, MD, PhD, Canfield, OH (*Presenter*) Consultant, Siemens AG;Speakers Bureau, Siemens AG;Research Grant, Siemens AG;Consultant, Koninklijke Philips NV;Speakers Bureau, Koninklijke Philips NV;Consultant, Canon Medical Systems Corporation;Advisor, Hologic, Inc;Research Grant, Hologic, Inc

#### LEARNING OBJECTIVES

1) Review the protocol required for accurate liver stiffness measurements. 2) Discuss the confounding factors needed to be considered when interpreting results. 3) Identify the various quantitative ultrasound methods for liver fat quantification.\*Course Description In Person Session Only. Tickets must be purchased in advance for this course. This course can be added through the registration portal or by stopping by the Registration Desk. Space is limited.Chronic Liver disease is a world-wide health problem. The use of multiparametric ultrasound can assess the presence of disease, severity of the disease, and monitor treatment. This course will review how to perform and interpret liver elastography. For accurate measurements a strict protocol is required. The protocol will be reviewed, and potential acquisition errors will be discussed. Confounding factors will be discussed as they can significantly affect the interpretation of the results. The course will also review the state-of-the-art for quantitative ultrasound assessment of liver fat content which is critical in making the diagnosis of non-alcoholic fatty liver disease. The combination of these techniques will be discussed on how to evaluate chronic liver disease.

### Horse or Zebra: Case Based Review of Common Mimics in the Brain, Spine, Head and Neck (Joint Session)

#### LEARNING OBJECTIVES

1) Recognize typical and atypical imaging features of stroke, degenerative disc disease, inflammatory sinus disease, and metastatic cervical lymph nodes. 2) Differentiate stroke, degenerative disc disease, inflammatory sinus disease, and metastatic cervical lymph nodes from relevant mimics.\*Course Description In this case-based combined Neuroradiology and Head and Neck session, attendees will be presented with frequent imaging diagnoses in the brain, spine, sinuses and neck. Speakers will emphasize imaging pearls that distinguish these diagnoses from common mimics. This session offers attendees the opportunity to refine their interpretation of complex neuroradiology and head and neck imaging studies by incorporating tips from world experts.

Grace S. Mitchell, MD, MBA, Fairway, KS (*Presenter*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Understand the basics of budgeting, debt reduction, and planning for retirement. 2) Recognize the importance of wealth building and advantages of major asset classes for radiologists. 3) Gain insight into asset protection, insurance and loan forgiveness programs.\*Course Description Many radiologists are unable to translate their high income into a high net worth. This is due to high student debt, poor financial literacy and lifestyle creep. High debt drives choices in career path for trainees and practicing radiologists and contributes to physician burnout and mental health issues. Despite the importance of personal financial health, education on finances is absent from the majority of radiology training programs. Some highly successful and intelligent radiologists who contribute enormously to research, radiology education, and clinical care have not spent the necessary time learning about finances and preparing for retirement. The gap in financial literacy for women is even greater.

### Tutorial on Ultrasound Imaging

#### LEARNING OBJECTIVES

1) Explain the advantages and challenges of software beamforming, and its impact for the sonographer. 2) Describe ultrasound methods of tissue property quantification, including elastography, tomography, and backscatter methods. 3) Summarize advancements in transducer technology and their impact on image quality.\*Course Description This lecture will review the physics and principles underlying current diagnostic ultrasound imaging. Advances in computing power and transducer technology have driven significant changes in how ultrasound can be used to form images, map blood flow, measure tissue elasticity, and track contrast agents. Developments in both conventional and tomographic ultrasound are further enabling quantitative tissue characterization. This course will describe the fundamentals of these technologies and provide the student with an understanding of their capabilities and current challenges.

Perry J. Pickhardt, MD, Madison, WI (*Presenter*) Advisor, Bracco Group; Advisor, Zebra Medical Vision Ltd; Advisor, Nano X Imaging;

#### **S5-CIN01 Technical Considerations for Implementation**

##### Participants

John Garrett, PhD, Madison, WI (*Presenter*) Nothing to Disclose

### LEARNING OBJECTIVES

1) Explain the systematic opportunistic use of quantitative imaging findings on CT for population health purposes. 2) Explain how Artificial intelligence (AI) may facilitate the widespread implementation of opportunistic CT screening. 3) Identify barriers to acceptance of opportunistic screening, including managing regulatory clearance, demonstrating cost-effectiveness, and achieving reimbursement.\*Course Description This session will cover the promise and challenges related to the implementation of AI-based opportunistic CT screening for population health. All speakers are members of the recently convened Radiology Scientific Expert Panel on this topic, which recently published its findings in Radiology.

### COURSE DESCRIPTION

#### LEARNING OBJECTIVES

1) Gained the knowledge and expertise necessary to optimize patient outcomes through advanced diagnostic and therapeutic interventions in biliary disorders. 2) Identify what is cutting-edge right now and what may come next. \*Course Description The Advanced Biliary Interventions lecture series is a didactic program designed to provide IR physicians with knowledge and skills in biliary interventions. This course aims to equip participants with an advanced understanding of complex biliary disorders' diagnosis, management, and treatment through interactive lectures and case-based discussions. Throughout the course, participants will delve into the latest advancements, techniques, and evidence-based practices in biliary interventions, focusing on therapeutic and diagnostic procedures. The course will cover a wide range of topics, including but not limited to: Emerging Technologies and Innovations: Examining emerging technologies, minimally invasive approaches, and novel therapeutic options in biliary interventions, emphasizing what is cutting-edge right now and what may come next. Interventional Techniques: Detailed exploration of advanced interventional techniques, such as percutaneous transhepatic cholangiography and drainage (PTCD), endoscopic interventions, biliary stenting, and ablation. Biliary Anatomy and Physiology: A review of the anatomy and physiology of the biliary system, gallbladder, bile ducts, and connections. Benign Biliary Disorders: Discussion of the diagnosis and management of benign biliary conditions, including biliary strictures, stones, bile leaks, and other lesions. Malignant Biliary Disorders: Overview of the diagnostic and therapeutic approaches for malignant biliary disorders, including cholangiocarcinoma and metastatic disease. Complications and Management: Understanding the potential complications associated with biliary interventions and developing strategies for their prevention and management. The course will be delivered through a combination of didactic lectures, interactive case discussions, and multimedia presentations. Expert faculty, comprising experienced clinicians and researchers in the field, will guide participants through the course material, emphasizing evidence-based practice and clinical decision-making. Upon completion of the Advanced Biliary Interventions lecture series, participants will have gained the knowledge and expertise necessary to optimize patient outcomes through advanced diagnostic and therapeutic interventions in biliary disorders.

### Shoulder Imaging: Fundamentals

#### LEARNING OBJECTIVES

1) Recognize frequently encountered imaging findings of pathologic processes of the acromioclavicular joint on radiographic and cross section imaging. 2) To review the post-operative imaging appearance of common shoulder surgeries involving the labrum, rotator cuff tendons, and shoulder joints. 3) To review MRI and US findings of rotator cuff abnormalities.\*Course Description Shoulder Imaging: Fundamentals will provide an overview of the important clinical and imaging findings for common shoulder conditions. Expert musculoskeletal radiologists will present live lectures on topics including shoulder instability, acromioclavicular pathologies, rotator cuff tears, superior labral tears, and post-operative shoulder imaging. Individuals who attend this course will leave with crucial pearls and pitfalls of shoulder imaging, including MRI, CT, ultrasound, and x-ray, that can be easily applied to everyday practice. This is a can't miss session for all RSNA attendees, from medical students to attending physicians!

### Imaging Considerations in Challenging Population

#### LEARNING OBJECTIVES

1) Gain increased awareness about caring for vulnerable or marginalized patients in the Radiology Department. 2) Understand the imaging modalities best suited to safe and appropriate personalized care of these populations. 3) Recognize and respond quickly and effectively to urgent and emergent conditions requiring imaging triage to essential treatment and intervention.\*Course Description This session will review imaging challenges and specific health related issues in obese, elderly, pediatric, and pregnant patients. Relevant problem-solving techniques, clinical information and multidisciplinary collaboration will be discussed. Imaging pearls and pitfalls will be provided. The format will be lectures and some discussion.

### **Beyond Binary: Supporting Gender Diversity in Radiology (Sponsored by the RSNA Committee on Diversity, Equity & Inclusion)**

#### **LEARNING OBJECTIVES**

1) Describe the foundational terms and concepts used within the transgender community and discuss the experiences of transgender patients in healthcare and radiologic subspecialties. 2) Understand the challenges faced by TGD people in the radiology workforce and learn how radiology practices can adapt facilities and practices to be more inclusive. 3) Present the importance of collecting robust Gender Data for radiology health care and for radiology research. Discuss how robust data leads to a better understanding of health outcomes and effectiveness of preventive interventions. 4) Discuss examples and tools to foster a supportive workplace environment and facilitate change, including: pronoun usage, being a vocal and visible ally, reviewing & updating local policies.\*Course Description The field of Radiology must adapt to support patients and workforce members whose identity extends beyond traditional binary gender models of male and female. In this session, participants will learn about experiences of transgender and/or gender diverse (TGD) persons as they navigate the current healthcare environment. Employees in the Radiology workforce will also discuss challenges faced by TGD persons and how Radiology practices can adapt facilities and practices to be more inclusive. We will discuss how to accurately collect more inclusive and comprehensive gender data to drive initiatives for recruitment and retention in Radiology. The session will close with a panel discussion offering tangible examples for supporting TGD peers and patients in our Radiology community.

Melissa Chen, MD, Houston, TX (*Moderator*) Nothing to Disclose

##### S5-CNR14 RVU: Is it an Effective Measurement of Productivity?

#### Participants

Melissa Chen, MD, Houston, TX (*Presenter*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Understand how work RVUs are derived and potential consequences of using these values as measurements of productivity. 2) Explore ways to objectively measure non-clinical work efforts. 3) Review academic work practice volumes and potential need for establishing limits.\*Course Description Demand for imaging continues to increase and will likely outpace the workforce supply. Academic and private radiology practice will face significant challenges. Sustaining the academic mission of radiology will also be a challenge. This session will review common metrics and benchmarks used to measure productivity of radiologists. Limitations of the systems will be discussed. Attendees will learn potential ways to measure non-clinical work efforts and productivity. Data from recent work survey of neuroradiology academic department productivity will be reviewed. Finally, the session will explore whether it is time for work limits for radiologists and what types of limits should be established.

#### COURSE DESCRIPTION

### Overview of Cone Beam CT and the Challenges in Quality Control

#### Participants

Jeffrey Siewerdsen, PhD, Houston, TX (*Presenter*) Research Grant, Siemens AG; Advisory Board, Siemens AG; Research Grant, Medtronic plc; Advisory Board, Carestream Health, Inc; License agreement, Carestream Health, Inc; License agreement, Precision X-Ray, Inc; License agreement, Elekta AB;;;

#### LEARNING OBJECTIVES

1) To learn the principles of CBCT and cone beam breast CT systems. 2) To understand image acquisition and dose measurement in cone beam breast CT. 3) To become familiar with clinical application of cone beam breast CT.\*Course Description Cone-beam CT (CBCT) is increasingly used in diagnostic imaging and image-guided procedures, ranging from interventional radiology to breast imaging, radiation therapy and surgery. The proliferation of CBCT systems that are used as standalone or as part of the fluoroscopy systems are used not only in radiology but in surgery, pain clinic, dental clinics, etc. Even though the fundamentals of cone beam breast CT are similar to CBCT, there are distinct differences between the two technologies, in terms of acquisition, image processing and radiation dose estimation. This course is aimed to cover the general principles of CBCT and Cone Beam Breast CT systems, along with the challenges of quality control evaluation, radiation dose measurements and clinical applications. The course has three presentations with first two aimed at describing the physics principles of CBCT and cone beam breast CT, while the final presentation will focus on clinical applications of breast CT.

### Tutorial on the Use of Ultrasound Contrast Agent and Parametric Imaging

#### LEARNING OBJECTIVES

1) To understand the basics of contrast-enhanced ultrasound (CEUS) and ultrasound parametric imaging. 2) To gain knowledge of these emerging ultrasound technologies in various clinical applications. 3) To identify the technical considerations when implementing CEUS and parametric imaging in clinical applications.\*Course Description The first half of the course will provide a comprehensive understanding of contrast-enhanced ultrasound (CEUS) and its clinical applications by introducing the basics of contrast-enhanced ultrasound (CEUS), describing the technical considerations specific to CEUS, and explaining its clinical implementations as well as utilities. The second half of the course will showcase the emerging ultrasound parametric imaging. You will learn the basic physics principles underlying this technology. Various clinical applications of ultrasound parametric imaging will be explored.

### Lymphoma: Imaging for Diagnosis and Prognosis

#### LEARNING OBJECTIVES

1) To enable participants to use standardized tools for response assessment in lymphoma.2) To identify strategies for diagnosis of lymphoma in the head and neck.3) To recognize current clinical challenges in lymphoma diagnosis and treatment.\*Course Description Imaging of lymphoma will be encountered by radiologists in all subspecialties and general practice. Accurate diagnosis and response assessment are of great clinical importance for lymphoma patients. This series of case-based lectures will enable participants to become comfortable with diagnosis and response assessment for imaging of lymphoma.

### Supporting Patients with Neuro Diverse Needs Within Radiology (Sponsored by the RSNA Associated Sciences Consortium)

#### LEARNING OBJECTIVES

1) Explore the factors which influenced the experiences of autistic children and their parents in a diagnostic imaging department. 2) Discuss various types of dementia and how to identify patients who may have dementia. 3) Discuss lessons learned and recommend strategies to enhance patient and family centered care for neuro diverse individuals.\*Course Description Neurodiverse individuals have cognitive differences that affects how their brain works, resulting in unique strengths and challenges. These individuals may experience barriers in healthcare related to access, communication, sensory challenges, and provider knowledge, which can affect their experiences in medical imaging settings. This presentation will explore the experiences of autistic children and patients with dementia in medical imaging departments and discuss strategies to enhance patient-centered care for individuals with neuro diverse needs.

### The Heart of the Matter: MRI Case Based Review in Nonischemic Cardiomyopathies (Supported in part by an Independent Medical Education Grant from Pfizer, Inc.)

#### LEARNING OBJECTIVES

1) Review current best-practices for CMR evaluation of non-ischemic cardiomyopathy. 2) Demonstrate through cases the role of CMR in non-ischemic cardiomyopathy for diagnosis and risk-stratification. 3) Highlight areas of uncertainty in the current imaging approach and when other modalities can be used to aid in diagnosis.\*Course Description Cardiac MRI (CMR) is an important tool for providing accurate diagnosis and risk-stratification for non-ischemic cardiomyopathies. In this course, learners will be presented with a broad overview of the current state-of-the-art for CMR evaluation of multiple non-ischemic cardiomyopathies. Topics will be presented in a case-based lecture format highlighting relevant CMR acquisitions and interpretation approaches, with a data-driven focus on current best-practices.

### Prostate MRI and Molecular Imaging: Core and Advanced Applications

#### Sub-Events

#### T1-CGU02 Moderator

##### Participants

Aytekin Oto, MD, Chicago, IL (*Moderator*) Research Grant, Koninklijke Philips NV; Medical Advisory Board, Profound Medical Inc; Consultant, IBM Corporation; Co-founder, Qmis LLC; Co-owner, Qmis LLC

#### T1-CGU02 Prostate MR Update: What is in the Horizon?

##### Participants

Aytekin Oto, MD, Chicago, IL (*Presenter*) Research Grant, Koninklijke Philips NV; Medical Advisory Board, Profound Medical Inc; Consultant, IBM Corporation; Co-founder, Qmis LLC; Co-owner, Qmis LLC

#### LEARNING OBJECTIVES

1) Learn about the latest updates on prostate imaging with special emphasis on MRI and PET imaging. 2) Review the quality control efforts for prostate MR and explain the current and future applications of artificial intelligence on prostate imaging. 3) Understand the potential roles and added value of PSMA PET and PET MR in the management of patients with prostate cancer. 4) Identify how MRI could be optimized for and be used to mitigate the harm of prostate cancer screening.\*Course Description This session aims to provide a comprehensive update on the latest developments in prostate imaging with a special focus on MRI and PET imaging. The presentations are well-balanced and broad in scope, from practical updated tips for optimized prostate MR acquisition and interpretation to new techniques such as PET-MRI and PSMA-PET imaging. The role in the management of prostate cancer patients will be reviewed in addition to other hot topics including molecular imaging impacts, quality control, artificial intelligence applications, screening and disparities in prostate imaging.

### Best Practices for AI Model Deployment

#### LEARNING OBJECTIVES

1) To identify the key areas of consideration when deploying AI into clinical radiology practice. 2) To explore the approaches to change management and governance in AI. 3) Outline the key technological considerations in deploying AI into real world practice.\*Course Description This one hour session is an overview of the key areas essential to the safe, responsible and effective deployment of artificial intelligence (AI) into clinical radiological practice. The session is split into three lectures - change management strategies, AI governance considerations and an overview of the technological decision making process in AI deployment. This session is important for any radiologists, allied health professionals and medical imaging managers interested in incorporating AI into their practice.

#### COURSE DESCRIPTION

This one hour session is an overview of the key areas essential to the safe, responsible and effective deployment of artificial intelligence (AI) into clinical radiological practice. The session is split into three lectures - change management strategies, AI governance considerations and an overview of the technological decision making process in AI deployment. ### Head to Toe Tumor Challenging Cases: Lessons Learned

#### LEARNING OBJECTIVES

1) Understand key principles in radiologic-pathologic correlation as applicable to a variety of head & neck, thoracic, abdominal and musculoskeletal malignancies. 2) Formulate a focused differential diagnosis for head & neck, thoracic, abdominal, and musculoskeletal malignancies based on these principles. 3) The differential diagnoses would cover cases with infection, inflammation, and hemorrhage.\*Course Description This course will use a case-based format and highlight the role of imaging in the diagnosis of challenging oncology cases using a multimodality approach. The session will focus on a variety of head and neck, pediatric, chest, musculoskeletal, and abdominal malignancies. Clinical presentation and pathological correlations will be provided when possible. Differential diagnoses will include infection, inflammation, neoplasm, ischemia, hemorrhage. The session will provide a broad update in imaging advances that help to make the correct diagnosis.

#### Participants

Shadi Aminololama-Shakeri, MD, Sacramento, CA (*Presenter*) Consultant, Becton, Dickinson and Company; Consultant, Izotropic Corporation; Stock options, Izotropic Corporation

#### LEARNING OBJECTIVES

1) Attendees will review various needle biopsy devices for ultrasound guided procedures along with opportunity to perform needle biopsy procedures under the supervision of breast radiologists. 2) Review of cyst aspiration and wire localization procedures will be performed along with clip placement.\*Course Description In Person Session Only. Tickets must be purchased in advance for this course. This course can be added through the registration portal or by stopping by the Registration Desk. Space is limited. Hands on opportunity for cyst aspiration, needle biopsy and wire localization procedures under ultrasound guidance and direct supervision by expert radiologists. Didactic lecture on the performance of the most common biopsy procedures in the breast followed by hands on opportunity to perform procedures.

#### COURSE DESCRIPTION

In Person Session Only. Tickets must be purchased in advance for this course. This course can be added through the registration portal or by stopping by the Registration Desk. Space is limited. Hands on opportunity for cyst aspiration, needle biopsy and wire localization procedures under ultrasound guidance and direct supervision by expert radiologists. Didactic lecture on the performance of the most common biopsy procedures in the breast followed by hands on opportunity to perform procedures.

##### T3-CAS08 Diversity, Women, Minority Platform in the Imaging World

#### Participants

Wei Yang, MD, FRCR, Houston, TX (*Presenter*) Royalties, Reed Elsevier; Advisory Board, Lux Capital

#### LEARNING OBJECTIVES

1) Understand the barriers to access in breast imaging that are related to diversity. 2) Describe data reflecting breast cancer screening center element disparities. 3) Describe potential solutions for addressing diversity-related barriers to breast imaging access.\*Course Description Asymmetries in health care access related to health care disparities have been amplified through and after the COVID pandemic. This course will include two interactive presentations (lectures) reviewing diversity-related barriers to access in breast imaging. Barriers reviewed include costs of care as a function of household income and insurance carriers, national screening guideline inconsistencies and variability, patient education and awareness, geocoding indicators of social determinants of health. Data on screening center element disparities will be described. Potential solutions and strategic plans to address this widening asymmetry in access to breast imaging care across vulnerable populations will be discussed.

#### COURSE DESCRIPTION

Asymmetries in health care access related to health care disparities have been amplified through and after the COVID pandemic. ### Acute Lung Injury

#### LEARNING OBJECTIVES

1) To evaluate appearances of acute lung injury and their clinical/pathological correlates. 2) To understand specific lung injuries in inhalation disorders and oncological patients. 3) Imaging assessment of patients with lung injury treated by ECMO.\*Course Description Lecture format with 4 lectures: 1. Differentiating diffuse alveolar damage and acute fibrinous and organizing pneumonia, radiology and pathology. 2. E-cigarette or vaping use-associated lung injury (EVALI). 3. Oncological lung emergencies: common and uncommon imaging scenarios to be aware of. 4. Assessing expected appearances and complications in ICU extracorporeal membrane oxygenation (ECMO) patients.

### Challenges and Opportunities in LI-RADS Reporting

#### Participants

Alexandra Roudenko, MD, Ossining, NY (*Presenter*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Apply the updated LI-RADS guidelines in the interpretation and reporting of liver imaging studies, ensuring accurate identification, and characterization of liver lesions. 2) Evaluate treatment response of liver lesions using CEUS techniques within the LI-RADS framework, enabling participants to assess therapeutic outcomes effectively. 3) Discuss challenging areas encountered in CT/MRI interpretation according to LI-RADS guidelines, enhancing participants' proficiency, and confidence in the assessment of liver lesions.\*Course Description This course is meticulously designed to keep radiologists informed and updated on the latest developments in LI-RADS (Liver Imaging Reporting and Data System) through focused educational sessions. Esteemed experts will deliver an all-encompassing overview of the latest advancements in LI-RADS assessment and reporting. This course is an opportunity to cultivate practical skills for accurately interpreting liver imaging studies by leveraging the latest guidelines, assessing treatment response with CEUS, and adeptly managing complex areas in CT/MRI interpretation. This training aims to elevate your proficiency and instill confidence in LI-RADS reporting, thereby promoting standardized and superior-quality reports. We invite you to join us, expand your understanding of LI-RADS, stay abreast of current developments, and polish your proficiency in liver imaging.

### Change (People) Management

#### Participants

Peter S. Liu, MD, Cleveland, OH (*Presenter*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Discuss challenges and considerations of integrating disparate radiology technology systems (EHR, RIS, PACS, Dictation systems) during merger and acquisitions. 2) Discuss radiology operational challenges and change management which go hand in hand when integrating technology from different organizations.\*Course Description Mergers and acquisitions (M & As) are becoming a common practice in healthcare. For M & As to be successful, the IT teams are usually asked to integrate the (often) disparate technologies across the different organizations. A successful integration is not only dependant on technological integration but also on change management and addressing operational considerations. In this course, we will discuss challenges and considerations for all three pillars of a successful IT integration - technology, people and processes, along with post go live optimization strategies.

#### LEARNING OBJECTIVES

1) Discuss challenges and considerations of integrating disparate radiology technology systems (EHR, RIS, PACS, Dictation systems) during merger and acquisitions. 2) Discuss radiology operational challenges and change management which go hand in hand when integrating technology from different organizations.\*Course Description Mergers and acquisitions (M & As) are becoming a common practice in healthcare. For M & As to be successful, the IT teams are usually asked to integrate the (often) disparate technologies across the different organizations. A successful integration is not only dependant on technological integration but also on change management and addressing operational considerations. In this course, we will discuss challenges and considerations for all three pillars of a successful IT integration - technology, people and processes, along with post go live optimization strategies.

#### COURSE DESCRIPTION

Mergers and acquisitions (M & As) are becoming a common practice in healthcare. For M & As to be successful, the IT teams are usually asked to integrate the (often) disparate technologies across the different organizations. A successful integration is not only dependant on technological integration but also on change management and addressing operational considerations. In this course, we will discuss challenges and considerations for all three pillars of a successful IT integration - technology, people and processes, along with post go live optimization strategies.

### Educating the Care Team and Our Patients About AI

#### Participants

Tessa S. Cook, MD, PhD, Philadelphia, PA (*Presenter*) Grant, Independence Blue Cross; *Speaker*, Sectra AB;

#### LEARNING OBJECTIVES

1) Introduce the concept of an educational framework, and how to educate radiologists and residents on AI. 2) Demonstrate how to concretely show radiologists the value of AI beyond the hype, and how it can integrate into the imaging workflow. 3) Discuss strategies for educating the entire care team (including our technologists and referring clinicians) as well as our patients about AI.\*  
Course Description AI isn't just coming; it's here. Do you know how you'll educate your fellow radiologists or our future colleagues about AI? What about our technologists, referring clinicians, and patients? In this didactic session, three experts will discuss best practices for AI education across the care continuum.

### Case-based Review of PET/CT: Breast Cancer

#### LEARNING OBJECTIVES

1) Understand best clinical practices for use and interpretation of PET imaging in patient with lung cancer. 2) Understand best clinical practices for use and interpretation of FES PET/CT in patients with breast cancer.\*Course Description PET/CT has greatly impacted the imaging and therapy of chest malignancies, including longstanding value for staging of lung cancer, as well as novel Estrogen Receptor targeted imaging for breast cancer. In this session, experts on lung and breast cancers will use clinical cases to demonstrate fundamentals of interpretation, as well as pearls and pitfalls to help improve interpretation of FES (Cerianna) PET.

### Pediatric Thoracic Abnormalities: Congenital and Acquired

#### LEARNING OBJECTIVES

1) Develop the appropriate imaging approach in children to be able to characterize vascular rings and slings, lung lucencies as well as disorders of the diaphragm and chest wall.\*Course Description The types of thoracic disorders as well as the imaging approach to best characterize may be unique in the pediatric population. In this didactic session, four pediatric imaging experts will focus on four different regions of the chest: the lungs, vascular system, chest wall and diaphragm and discuss relevant, often commonly encountered disorders. Objectives include gaining an understanding of the benefits and challenges with imaging approaches for regional thoracic disorders and enhancing the ability to characterize abnormalities especially for guiding clinical management.

#### LEARNING OBJECTIVES

1) Gain insight into the evolving Singapore healthcare structure and financing. 2) Understand the current and emerging trends in Singapore Radiology. 3) Appreciate how the future Singapore Radiology workforce may evolve. 4) Know key Radiology research interests and Interventional Radiology practices in the Singapore context.\*Course Description This course provides an overview of the Singapore healthcare system as a prelude to understanding how recent trends have impacted the practice of Radiology in our country, including the drive towards value-based imaging and shift towards population health in the face of an ageing population. The challenges placed on the Radiology workforce and how it may evolve in response to these demands are also discussed. Finally, we share highlights of Radiology research and future directions of Interventional Radiology practice in our country.

### IR Practice in the Far East: Status Quo and Future Directions

#### Participants

Uei Pua, MBBS, FRCR, Singapore, Singapore (*Presenter*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Gain insight into the evolving Singapore healthcare structure and financing. 2) Understand the current and emerging trends in Singapore Radiology. 3) Appreciate how the future Singapore Radiology workforce may evolve. 4) Know key Radiology research interests and Interventional Radiology practices in the Singapore context.\*Course Description This course provides an overview of the Singapore healthcare system as a prelude to understanding how recent trends have impacted the practice of Radiology in our country, including the drive towards value-based imaging and shift towards population health in the face of an ageing population. The challenges placed on the Radiology workforce and how it may evolve in response to these demands are also discussed. Finally, we share highlights of Radiology research and future directions of Interventional Radiology practice in our country.

#### COURSE DESCRIPTION

This course provides an overview of the Singapore healthcare system as a prelude to understanding how recent trends have impacted the practice of Radiology in our country, including the drive towards value-based imaging and shift towards population health in the face of an ageing population. ### How To's of Publishing Your Research: Ask the Trainee Editors

#### LEARNING OBJECTIVES

1) Describe the the editorial training opportunities for residents, fellows, graduate students, and postdocs offered by the Radiology suite of journals. 2) Understand the manuscript submission and peer review process. 3) Identify resources to assist with research and publishing in imaging.\*Course Description This interactive panel discussion is intended familiarize radiology residents, fellows, graduate students, and postdocs on the process of journal publishing. The panel will be comprised of members of the trainee editorial boards of the RSNA suite of journals (Radiology, Radiology Imaging Cancer, Radiology Artificial Intelligence, Radiology Cardiothoracic) and moderated by the journal editors. Each panel member will present a brief introduction of their journal's trainee activities and how it contributes to career development. This will be followed by a Q&A discussion where questions from the audience will be encouraged. Sample questions from past sessions include "How do you select the right journal?" "How do you handle peer reviewer comments?" "Should I publish first in a preprint server?" "How do I become a peer reviewer for a journal?" Resources and platforms available to authors for writing, statistical analysis, graphics design, and reporting criteria will be discussed.

### Best Practices for Continuous AI Model Evaluation

#### Sub-Events

#### T4-CIN19 Moderator

##### Participants

Matthew P. Lungren, MD, Palo Alto, CA (*Moderator*) Advisor, Segmed, Inc; Shareholder, Segmed, Inc; Advisor, Bunkerhill Health; Shareholder, Bunkerhill Health; Employee, Microsoft Corporation

#### T4-CIN19 Post Deployment Monitoring

##### Participants

Matthew P. Lungren, MD, Palo Alto, CA (*Presenter*) Advisor, Segmed, Inc; Shareholder, Segmed, Inc; Advisor, Bunkerhill Health; Shareholder, Bunkerhill Health; Employee, Microsoft Corporation

#### LEARNING OBJECTIVES

1) Understand the necessity and significance of continuous AI model evaluation in the field of radiology. 2) Identify key performance indicators for AI model monitoring, and learn strategies for their ongoing tracking and evaluation. 3) Gain insights into best practices for validation, recalibration, and adjustment of AI models to ensure their robustness and relevance over time. 4) Recognize ethical considerations and regulatory guidelines related to the application of AI in radiology, contributing to the responsible use of these technologies. 5) Apply practical techniques for continuous AI model evaluation in their own clinical or research context, enhancing the effectiveness of AI implementation in radiology.\*Course Description With the surge in the application of Artificial Intelligence (AI) in radiology, maintaining the performance of these models becomes paramount. This course will focus on the strategies and techniques required to continuously evaluate and improve AI models in order to maintain their reliability, safety, and efficacy in radiological practice. Drawing from a wealth of expertise and research, attendees will learn the key principles of AI model lifecycle management, performance monitoring, validation, recalibration techniques, and the ethics and regulations surrounding AI in radiology. Attendees will leave the session equipped with practical knowledge and resources that they can apply to their own AI models and radiological practices. This session is perfect for radiologists, AI researchers, clinicians, data scientists, and healthcare professionals who are leveraging or planning to leverage AI in their work and want to ensure the optimum performance of their AI models over time. With a blend of theory and practice, the session will provide essential knowledge and tools to help you navigate the rapidly evolving landscape of AI in radiology.

### What Does Climate Change Have to do With Radiology? Impetus for Change and a Call to Action (Sponsored by the RSNA Professionalism Committee)

#### LEARNING OBJECTIVES

1) Discuss climate change and radiology. 2) Describe the impact of medical imaging on climate change and highlight opportunities for change. 3) Discuss research considerations with respect to studying the energy expenditure and other contributions to greenhouse gas emissions in radiology including the impact of interventions to mitigate emissions from our departments. 4) Evaluate actions that we can all take to address climate change outside of work in our personal lives including lighting, diet, and waste.\*Course Description The purpose of this course is to discuss the impact of radiology on climate change, impetus for change, and outline actionable steps we can take to address climate change in our personal and professional lives linked to the anticipated impact.

### ASRT@RSNA: Strategies to Reduce Retraumatization in Medical Imaging and Radiation Therapy

#### LEARNING OBJECTIVES

1) Recognize challenges when caring for trauma patients in imaging and therapy departments. 2) Identify potential triggers for retraumatization in medical imaging and radiation therapy. 3) Apply trauma-informed interventions in a sexual assault case study.\*Course Description Delivery of health care often involves assessment and interventions in locations on the patient's body where trauma has previously occurred, increasing the probability of retraumatization and manifestation of signs and symptoms of trauma. Considering professionals providing imaging studies and radiation therapy treatment for patients who may have a high probability of a history of trauma, specific interventions should be employed to reduce retraumatizing a patient. This lecture offers strategies to provide quality care to a patient who has been unintentionally retraumatized in medical imaging and radiation therapy.

#### LEARNING OBJECTIVES

1) To understand what is needed to start an imaging research study. 2) To learn about imaging hypothesis generation. 3) To learn about basic statistical consideration for such a study. 4) To learn about imaging based measurements and its validation. 5) To understand how the above comes together with legal, ethical, clinical and other considerations to make an imaging study a reality.\*Course Description This course is intended to encourage you to start your own imaging research study. All necessary elements are discussed using a real life example. Experienced experts will share their insights. An interactive component is included in the workshop.

### Toolbelt of Cardiac Devices: X-ray and CT Appearance

#### Participants

Byoung Wook Choi, MD, PhD, Seoul, Korea, Republic Of (*Presenter*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Identify and describe the X-ray and CT appearances of different cardiac devices used in heart failure patients. 2) Recognize and overcome technical challenges in CT imaging of severe heart failure to optimize image quality and diagnostic accuracy. 3) Understand the imaging considerations, protocols, and potential complications associated with left ventricular assist devices (LVAD) and right ventricular assist devices (RVAD).\*Course Description This educational session is a comprehensive exploration of cardiac devices and their imaging appearances in heart failure patients. The session consists of three lectures that cover essential aspects of cardiac device imaging, including X-ray and CT appearances, technical challenges in CT imaging of severe heart failure, and imaging of left ventricular assist devices (LVAD) and right ventricular assist devices (RVAD). The session aims to enhance participants' knowledge and proficiency in imaging heart failure patients with various cardiac devices, ultimately improving patient care and diagnostic accuracy.

#### COURSE DESCRIPTION

This educational session is a comprehensive exploration of cardiac devices and their imaging appearances in heart failure patients. The session consists of three lectures that cover essential aspects of cardiac device imaging, including X-ray and CT appearances, technical challenges in CT imaging of severe heart failure, and imaging of left ventricular assist devices (LVAD) and right ventricular assist devices (RVAD). The session aims to enhance participants' knowledge and proficiency in imaging heart failure patients with various cardiac devices, ultimately improving patient care and diagnostic accuracy.

#### T6-CCA04 Technical Challenges in CT: Imaging Severe Heart Failure

##### Participants

Carole Dennie, MD, FRCPC, Ottawa, ON (*Presenter*) Research Consultant, AstraZeneca PLC

#### T6-CCA04 Who Needs Assistance? Imaging of LVAD RVAD

##### Participants

Daniel Vargas, MD, (*Presenter*) Nothing to Disclose

### Role of AI in Emergency Radiology-What you need to know in 2023

#### LEARNING OBJECTIVES

1) Understand the impact of AI tools within emergent radiology. 2) Gain insight on new tools within the emergent radiology space. \*Course Description AI tools have become increasingly common within the emergency radiology space. In this session we will discuss the impact of those tools including how they may and/or may not be useful, how they are expanding throughout our departments and new tools on the horizon.

#### COURSE DESCRIPTION

AI tools have become increasingly common within the emergency radiology space. In this session we will discuss the impact of those tools including how they may and/or may not be useful, how they are expanding throughout our departments and new tools on the horizon.

### Focused/Fast Abdomino-Pelvic MRI Protocols

#### LEARNING OBJECTIVES

1) Explain developments in artificial intelligence that enable fast acquisitions and opportunities to maximize efficiency in the reporting of abbreviated MRI exams. 2) Understand opportunities and challenges of implementing abbreviated and fast MRI techniques in clinical practice. 3) Identify the clinical, financial, and medico-legal implications of abbreviated MRI exams.\*Course Description Indications for fast/focused MRI in abdomino-pelvic conditions continue to increase. We review challenges and opportunities to maximize the efficiency in the implementation of such protocols in a busy clinical practice.

#### COURSE DESCRIPTION

### Management of Portal Hypertension

#### LEARNING OBJECTIVES

1) Review the medical management of portal hypertension. 2) Understand the pathophysiology of portal hypertension. 3) Discuss recent advancement in imaging of portal hypertension. 4) Discuss the role of interventional radiology in portal hypertension, from TIPSS creation to portosystemic collaterals embolization with especial attention to complications that IRs can encounter during specific therapies.\*Course Description In the last few decades, there have been significant advancements in understanding the pathophysiology of portal hypertension. This knowledge has led to the development of safer and more effective minimally invasive approaches. The main objective is to provide alternatives to prevent life-threatening complications from clinically significant portal hypertension and to allow the continuation of treatments that would otherwise be stopped. Clinicians involved in portal hypertension care should be aware of risk factors, associated complications, and management of portal hypertension. Interventional radiology offers minimally invasive alternatives that play a central role in improving clinical outcomes and survival of these patients.

### Musculoskeletal Ultrasound: Normal Appearances, Pathologic Conditions and Hands-on Demo (Elbow, Ankle, Peripheral Nerves of the Upper Extremity)

#### LEARNING OBJECTIVES

1) Learn the relevant US anatomy for each of the 3 body areas. 2) Gain knowledge of techniques to optimally visualise the relevant anatomical structures. 3) Apply that knowledge to be able to perform US examination of clinical cases. 4) Understand the limitations of US and when to consider alternative image modalities.\*Course Description The 90-minute Ultrasound module will include the following topics: - The elbow- The ankle - Peripheral nerves of the upper limbEach 30-minute section will comprise a "live demonstration" of normal US anatomy followed by a case-based presentation of pathological cases discussing the utility of MSK Ultrasound in clinical practice. This session will provide a basis on which to develop your skills in MSK US.

### Error Disclosure: Legal Perspective

#### Participants

Kelly Yousem, JD, Owings Mills, MD (*Presenter*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Identify systems processes that facilitate open communication with patients and families about medical errors. 2) Understand practical legal perspectives regarding open communication with patients and families about medical errors. 3) Describe executive level considerations regarding the implementation of coordinated enterprise-wide open communication practices around medical errors.\*Course Description This course will explore several timely issues relevant to communication with patients and families about adverse events and errors. 1) Process Considerations: Responsibly discussing medical errors with patients and families requires the implementation of principled, coordinated, enterprise-wide processes that support both patients and providers. This presentation, by a pediatric radiologist with extensive experience speaking on ethics, communication, professionalism, and error disclosure, will discuss systems processes that facilitate open communication with patients and families about medical errors. 3) Legal Perspective: Lofty ideals about "doing the right thing" in communicating honestly and transparently with patients and families about preventable adverse events feel unattainable to many physicians fearful of the legal consequences. This presentation, by an attorney with extensive malpractice expertise, will offer perspectives about the practical realities involved and consequences for physicians when considering whether and how to bring open communication about errors to patients and families. 3) Executive Perspective: Establishing institutional expectations regarding direct, transparent communication with patients and families about medical errors requires top-down leadership articulation of priorities, principles, and culture, coupled with integration of a complex web of stakeholders including insurers and risk managers, offices of legal counsel, quality and safety leaders, patient and personnel support systems, and front-line staff. The speaker, a senior academic radiologist and healthcare system executive, will present perspectives and experiences regarding management of disclosure processes at the broad enterprise level.

### AI - Applications of Neuroradiology

#### LEARNING OBJECTIVES

1. Understand the breadth of neuroimaging applications being addressed by machine learning approaches including less-talked about applications in spine imaging and pediatric neuroradiology. 2. Know the current state-of-the-art in terms of machine learning in MR image reconstruction. 3. Have a basic, working knowledge of the use of machine learning in radiomics for brain tumors. \*Course Description What's the buzz? Get yourself up-to-date on deep learning and Neuroradiology! This course will cover cutting-edge advances in neuroimaging applications of machine learning from image reconstruction to radiogenomics to practical clinical advances including in pediatric populations. The course will cover state-of-the-art techniques and approaches in an accessible way and give you an easily digestible update overview on the topic. This course will equip you with relevant information to engage with colleagues, referring physicians, scientists, and vendors on this topic.

#### COURSE DESCRIPTION

What's the buzz? Get yourself up-to-date on deep learning and Neuroradiology! ##### T6-CPD04 Lesions in the Pediatric Breast: Differential Diagnosis and When to Biopsy

#### Participants

Tess Chapman, MD, MA, Madison, WI (*Presenter*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Discuss how to recognize the sonographic features of solid pediatric breast masses and how to apply an appropriate lexicon. 2) Learn how to appreciate features of the normal breast to avoid iatrogenic injury to the developing breast and how to differentiate benign from concerning breast masses in children to guide an appropriate management. 3) Discuss sonographic appearances of pediatric thyroid nodules, using a practical approach for characterization and management. 4) Provide detailed explanations of various lumps and bumps encountered in children, describing the sonographic technique, highlighting the role of ultrasound and the clinical information when assessing these lesions, that can help to differentiate those that are best to watch versus those that should be removed. \*Course Description This lecture course will address the sonographic features of lesions of the breast, thyroid and various lumps and bumps in children. Lesions of these small parts in children can be benign or malignant, and reaching a final diagnosis based on imaging alone can be challenging. Awareness of the distinct imaging features of these lesions, can help in guiding a management approach, deciding when it is best to biopsy or to watch.

#### COURSE DESCRIPTION

This lecture course will address the sonographic features of lesions of the breast, thyroid and various lumps and bumps in children. ### ASRT@RSNA: Combatting Exclusive Behaviors in the Workplace

#### LEARNING OBJECTIVES

1) Recognize the subtle and covert ways that exclusionary behaviors are conveyed through speech and behavior. 2) Understand the impact that exclusionary behaviors have in the workplace. 3) Implement strategies to pro-actively address exclusionary behaviors.\*Course Description Inclusive workplaces are associated with improved job satisfaction, reduced turnover, and increased organizational commitment. Creating an inclusive workplace requires leaders, teams, and individuals to pay attention to the subtle ways in which they may exclude team members. This course includes a practical lecture focused on equipping radiology professionals with discrete tools and resources to identify and pro-actively address exclusionary behaviors.

### Framing Health Equity Through the Lens of Organizational Readiness and Accountability (Sponsored by the RSNA Health Equity Committee)

#### Participants

Gezzer Ortega, MD,MPH, Boston, MA (*Presenter*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Participants will be competent to describe the concept of health equity from a radiology perspective and its importance of addressing disparities seen in healthcare organizations. 2) Participants will gain insight about key policies set by the Joint Commission and the CMS, learning about their requirements and the evolving national frameworks used to advance health equity. 3) Participants will learn how to employ existing quality tools and metrics to identify healthcare gaps measure progress in programs aimed to improve health equity within radiology. 4) Participants will be gain an understanding of the application of cultural dexterity in radiology to promote an organizations' accountability towards improving health equity. 5) Participants will be equipped to understand the implications of health equity-based payment models within radiology departments. They will be confident to align existing efforts made in the radiology departments with these new models to ensure readiness for change.\*Course Description Health equity is a vehicle for organizational change and a catalyst for personalized care. This growing role has resulted in an increase attention by national quality and safety organizations, private and public payors, and government and industry collaborators. Radiology continues to play a central role in patient care and are poised to lead health equity efforts at their respective institutions. Therefore, it is paramount that radiologists are equipped with a knowledge toolkit that will enable them to lead institutional readiness efforts to successfully comply with the evolving accountability requirements to reduce health disparities and future equity-based payment models. Beyond the increasing focus on health equity by healthcare and academic institutions and industry collaborators, addressing health care disparities has become a quality and safety priority in radiology. New and revised requirements to reduce health care disparities will apply to radiology practices and health organizations as part of the Joint Commission's accreditation requirements. Additionally, the Centers for Medicare and Medicaid Services (CMS) have updated their framework to further advance health equity, and the President's Cancer Panel and the Cancer Moonshot have made health equity in cancer screening a key pillar of these efforts. These frameworks set the foundation and priorities to eliminate health disparities and drive structural change with evolving payment models that will impact all health care systems and radiology practices. Therefore, it is vital that radiologists are equipped with a knowledge toolkit to lead healthcare institutional readiness efforts to ensure radiology practices and healthcare systems are compliant with these evolving requirements. Leveraging the CMS framework for health equity and the Department of Health and Human Services Health People 2030, the purpose of this session is to discuss high-yield topics that will provide practical examples and on how to lead data-driven institutional efforts and system-wide outcomes measures that will support organizational readiness to advance health equity. The topics covered will be discussed with national radiology leaders and will include the following: 1. Effective standardization of sociodemographic data collection and root cause analyses to identify care gaps in radiology. 2. Building capacity by enhancing diversity efforts in radiology. 3. Understanding and successfully navigating the health equity Joint Commission requirements 4. Developing and implementing system-wide outcomes metrics to measure progress in disparities. 5. Aligning radiology efforts to ensure readiness for evolving payment models.

##### T7-CCH06 Introduction to CTEPH/PH

###### Participants

Ann N. Leung, MD, Stanford, CA (*Presenter*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Recognize and diagnose CTEPH on imaging studies. 2) Distinguish CTEPH from other conditions that affect the pulmonary vasculature.\*Course Description Chronic thromboembolic pulmonary hypertension (CTEPH) is a potentially curable form of pulmonary hypertension that develops in approximately 3% of patients with pulmonary embolism. CTEPH is a dual vascular disorder characterized by obstruction of the pulmonary vasculature by organized thromboembolic material and a secondary arteriopathic process affecting small resistance vessels. Untreated, CTEPH can lead to right heart failure and death. Diagnosis of CTEPH is made on the basis of imaging. This course presented in lecture-style format will discuss the relative strengths and weaknesses of the different diagnostic modality options as well as the characteristic imaging features of CTEPH on each. The session will include a case-based review to reinforce the imaging appearance of CTEPH and allow its differentiation from mimics.

### GU Essentials! A Case-Based Audience Participation Session

#### LEARNING OBJECTIVES

1) Develop a systematic approach to assess genitourinary imaging studies, accurately identifying anatomical structures, abnormalities, and pathology. 2) Apply advanced imaging techniques and protocols for the evaluation of various genitourinary disorders. 3) Differentiate between benign and malignant genitourinary lesions based on imaging characteristics and implement appropriate management strategies. 4) Incorporate evidence-based guidelines and best practices into clinical practice, ensuring accurate diagnoses, appropriate patient selection, and timely interventions in genitourinary imaging. 5) Evaluate the limitations and potential pitfalls of genitourinary imaging techniques, enabling participants to make informed decisions and prevent diagnostic errors.\*Course Description "GU Essentials! A Case-Based Audience Participation Session" is an engaging and interactive lecture series designed to provide a comprehensive understanding of genitourinary imaging for radiologists, trainees, and healthcare professionals involved in diagnosing and managing genitourinary conditions. Through dynamic case-based discussions and active audience participation, this series aims to enhance participants' interpretation skills and provide valuable insights into genitourinary imaging studies.

### Case-based Review of PET/CT: Neuroendocrine Cancers

#### LEARNING OBJECTIVES

1) Understand best clinical practices for use and interpretation of PET/CT in patients with neuroendocrine tumors. 2) Compared and contrast Ga68-Dotatate with 64Cu-Dotatate.\*Course Description PET/CT has greatly impacted the imaging and therapy of neuroendocrine malignancies, including continuing improvements in somatostatin receptor-targeted PET. In this session, experts on neuroendocrine tumors will use clinical cases to demonstrate fundamentals of interpretation, as well as pearls and pitfalls to help improve interpretation of PET studies.

#### COURSE DESCRIPTION

PET/CT has greatly impacted the imaging and therapy of neuroendocrine malignancies, including continuing improvements in somatostatin receptor-targeted PET. In this session, experts on neuroendocrine tumors will use clinical cases to demonstrate fundamentals of interpretation, as well as pearls and pitfalls to help improve interpretation of PET studies.

### Spine Imaging - Core Concepts & Cutting Edge

#### LEARNING OBJECTIVES

1) Review core concepts essential for all radiologists interpreting spine imaging: adjacent-segment degeneration and imaging of painful facet joints. 2) Explain cutting-edge techniques that will shape spine imaging in the future: AI and CSF-venous fistula imaging.\*Course Description This session will consist of 4 lectures targeted to both general practice radiologists and spine imaging specialists. Content will include two lectures addressing core concepts of that are commonly encountered in practice, and are crucial to understand how spine imaging interfaces with clinical decision-making. In addition, two lectures will address cutting-edge topics expected to influence spine imaging and shape changes in practice in the near future.

### Endometriosis: US, MR, and Surgical Correlations

#### LEARNING OBJECTIVES

1) Understand the MR appearance of endometriosis phenotypes: superficial endometriosis, endometrioma, and deep endometriosis. 2) Learn the sonographic appearance of common sites of deep endometriosis, how to acquire high-yield ultrasound images of DE in the posterior compartment, and how to report DE on augmented routine pelvic ultrasound in compliance with Society of Radiologists in Ultrasound (SRU) Consensus Statement on ultrasound of endometriosis. 3) Understand the utility of preoperative imaging in the management and resection of advanced-stage endometriosis.\*Course Description Endometriosis is a prevalent condition affecting approximately 10% of individuals, especially during reproductive age. Currently, affected persons undergo significant diagnostic delay and suboptimal medical and surgical treatment due to a lack of awareness. Imaging plays an increasingly vital role in diagnosis and management. Lecturers will provide critical information on how to decrease diagnostic delay, improve communication of important imaging observations, and the impact of imaging information on surgical treatment and medical management.

#### COURSE DESCRIPTION

**ASRT@RSNA: AI for Good: How Collaboration Should Inform Responsible Future Practice (Supported in part by an Unrestricted Medical Education Grant from Siemens Healthineers of Siemens Medical Solutions, USA, Inc.)**

### LEARNING OBJECTIVES

1) Appreciate the ways in which AI is poised to impact medical imaging and radiation therapy practice from a clinical, technical, professional, and ethical lens. 2) Champion the value of equipping medical radiation technologists (MRTs) to be literate in relevant technologies, data, and system level considerations. 3) Leverage the unique perspective and expertise of MRTs to inform an AI-enabled future through advocacy and collaboration.\*Course Description Artificial intelligence (AI) is emerging as an important tool in medical imaging and radiation therapy – but it should only ever be considered exactly that – a tool, leveraged to inform responsible and high quality care. To realize a desired future state that makes most appropriate use of technology and most effective use of diverse skill sets within the interprofessional team, it is important that medical radiation technologists (MRTs) equip themselves to be part of relevant conversations and decisions. Education, advocacy, and collaboration are all necessary as we build towards AI-enabled medical imaging and radiation therapy practice. This presentation will highlight the diverse applications of AI, and the considerations for responsible implementation from the perspective of MRTs as members of the interprofessional team, at both the practice and system level.

#### LEARNING OBJECTIVES

1) Describe how to optimize CT protocols for the diagnosis of acute mesenteric ischemia or the localization of gastrointestinal hemorrhage, and the imaging findings most helpful in making a diagnosis. 2) Identify which imaging modalities are most appropriate for the investigation of pelvic congestion syndrome or renal arterial pathology in 2023, and associated radiologic findings. \*Course Description Abdominal vascular pathology crosses subspecialties and can be challenging for general radiologists, the abdominal radiologist who rarely interprets CT/MR angiography or the cardiovascular radiologist/interventionalist who is less familiar with visceral abdominal imaging. This Refresher Course consists of four lectures covering the vascular and visceral findings seen in acute mesenteric ischemia, gastrointestinal hemorrhage, renal arterial disease and pelvic congestion syndrome, as well as the appropriate selection of imaging modalities and protocols for these constantly evolving diagnoses. At the end of the course, attendees should feel comfortable prescribing and interpreting studies for all of these indications.

### Italy Presents: Radiology in the NextGenerationEU Plan

#### LEARNING OBJECTIVES

1) Vision and transformation of an historical scientific society born in 1913 and now representing more than 12,000 members in Italy. 2) Italy best practices for success stories such as its main journal, La Radiologia Medica, which hit an IF of 6.313 in 2021. 3) Italian radiologists' contributions to the National Recovery and Resilience Plan, a Similar Marshall plan post- pandemic. 4) Evolution of society reflecting in the scientific and professional area: How to embrace diversity and inclusion to express radiologists' full potential. The Italian initiatives to strengthen connections and synergies among regions. 5) Insight into the Italian College of Interventional radiology: SIRM's role in guiding and training young IR residents. 6) An innovative partnership between radiology and the Italian Winter Olympic games 2026: Among the branches of sports medicines radiology can excel to become an ally of winter sport athletes.\*Course Description Giovanni Malagò – CONI President - Italian National Olympic CommitteeDiana Bianchedi - Olympic Champion, Milanocortina 2026 Olympic Winter Games Project Director, Doctor in Sport MedicineMaria Rosario Squeo - Institute of Sports Medicine, Head of the Olympic AreaThis course is structured to provide an overview of the Italian Society of Medical and Interventional Radiology, one of the largest Italian and European scientific societies which experienced an accelerated growth in recent years (up to 12K members, 46% are women and 49% of members belong to the young age groups, 25-44y, that is progressively increasing). The pandemic experience brought a new perspective on the structure of educational activities, opening to a multidisciplinary approach and involving younger radiologist to take an active part in the society. The National Recovery and Resilience Plan (PNRR) is part of an extraordinary post-pandemic European funding program involving the Italian university system in the field of Precision Medicine. The contributions of the Italian radiologists involved in the project in the development of pre clinical studies and clinical trials for new therapeutic approaches will be presented. The project includes 12 universities, the Italian National Institute of Health, 5 scientific research and treatment institutes (IRCCS), 6 companies and a research foundation, and represents the first national network of scientists, technologists and young researchers who, with holistic and multidisciplinary approach, they share and develop knowledge, research and innovative technologies in order to bring the National Health System into the contemporary era of Precision Medicine. SIRM has a long-standing commitment to supporting IR education and making resources available to interventional radiologists. SIRM have played an important role in this framework by establishing high-quality standards in the training and practice of IRs throughout country. Several activities will be described to support IR residents throughout their careers and are regularly revised by IR experts to ensure that they reflect the most up-to-date techniques and technologies. A recent partnership with the National Olympic Committee at last 2022 SIRM Annual Meeting opened to a new form of collaboration between Italian radiology and the sports universe, showing the importance of diagnostic imaging not just in health but also in sports medicine.

### Planning for Your Future: How to Minimize Taxes and Create Your Legacy

#### LEARNING OBJECTIVES

1) What you need for a solid estate plan. 2) How to save on taxes and be charitable at the same time. 3) Popular ways to leave a legacy at R&E Foundation.\*Course Description In today's uncertain economic environment, creating a solid estate plan can be a challenge. It can be difficult to determine how to manage your assets to save on taxes, protect your loved ones, and support the future of organizations important to you such as the R&E Foundation. Many RSNA members are motivated to "give back" to our field by making a legacy gift to R&E Foundation to help us support the next generation of radiologists. In addition to the comprehensive discussion outlined above, the session will include ample opportunity for Q&A at the end of the session.

### Case Based Breast Review: Focus on CEM MRI US

#### Participants

Maxine S. Jochelson, MD, (*Presenter*) Speaker, General Electric Company

#### LEARNING OBJECTIVES

1) Identify the differences in accuracy when using pure anatomic imaging compared to anatomic imaging plus vascular imaging. 2) Demonstrate the best approach to interpreting DBT, US, CEM and breast MRI\*Course Description During this session, the three presenters Drs. Jochelson, Lewin and Bitencourt will lecture on various breast imaging modalities and show clinical examples of cases imaged by Digital Breast Tomosynthesis (DBT), Breast Ultrasound, Contrast Enhanced Mammography (CEM) and MRI to demonstrate interpretive pearls of wisdom, utility of these modalities and limitations of these modalities. This course is important as it will address the pros and cons of breast imaging using anatomic imaging technology vs vascular imaging as well as the best approaches to imaging in various clinical situations.

#### LEARNING OBJECTIVES

1) Identify the differences in accuracy when using pure anatomic imaging compared to anatomic imaging plus vascular imaging. 2) Demonstrate the best approach to interpreting DBT, US, CEM and breast MRI\*Course Description During this session, the three presenters Drs. Jochelson, Lewin and Bitencourt will lecture on various breast imaging modalities and show clinical examples of cases imaged by Digital Breast Tomosynthesis (DBT), Breast Ultrasound, Contrast Enhanced Mammography (CEM) and MRI to demonstrate interpretive pearls of wisdom, utility of these modalities and limitations of these modalities. This course is important as it will address the pros and cons of breast imaging using anatomic imaging technology vs vascular imaging as well as the best approaches to imaging in various clinical situations.

#### COURSE DESCRIPTION

During this session, the three presenters Drs. Jochelson, Lewin and Bitencourt will lecture on various breast imaging modalities and show clinical examples of cases imaged by Digital Breast Tomosynthesis (DBT), Breast Ultrasound, Contrast Enhanced Mammography (CEM) and MRI to demonstrate interpretive pearls of wisdom, utility of these modalities and limitations of these modalities. This course is important as it will address the pros and cons of breast imaging using anatomic imaging technology vs vascular imaging as well as the best approaches to imaging in various clinical situations.

### AI in Cardiac MRI Pipeline: From Protocol to Classification

#### Participants

Albert Hsiao, MD, PhD, (*Presenter*) Co-founder, Arterys Inc; Shareholder, Arterys Inc; Co-founder, Vektor.AI; Shareholder, Vektor.AI; Research Grant, Bayer AG; Research Grant, General Electric Company; Research Grant, KA Imaging

#### LEARNING OBJECTIVES

1) Identify current opportunities for artificial intelligence (AI) to improve clinical workflows and diagnostic capabilities in cardiac imaging. 2) Apply foundational concepts necessary for evaluation of new AI technologies. 3) Recognize fields of interest for future AI development to improve diagnosis and management of cardiovascular disease.\*Course Description This course will provide practical examples of the daily application of artificial intelligence (AI) technologies to clinical practice of cardiac imaging, including cardiac MRI and CT. We will review the rapid advancement of new technologies that have become necessary components of every day practice and clinical workflows at several institutions, current data supporting their effectiveness, and opportunities ahead for AI and related technologies to improve the diagnosis and management of cardiovascular disease.

### Practical Multi-Energy CT in the ER

#### LEARNING OBJECTIVES

1) Demonstrate proficient understanding of multi-energy CT principles and technical aspects, enabling participants to effectively utilize this advanced imaging technique in emergency medicine. 2) Apply knowledge of multi-energy CT image interpretation and analysis to accurately diagnose and triage emergency conditions, resulting in improved patient care and optimized treatment planning. 3) Collaborate with radiologists and other healthcare professionals in a multidisciplinary approach, leveraging multi-energy CT findings to enhance decision-making, and facilitate seamless communication in emergency scenarios.\*Course Description Course Description:Join us for an engaging educational session on Practical Multi-Energy CT in the ER, where we delve into the powerful applications of this cutting-edge imaging technology in emergency medicine. This course is designed to equip healthcare professionals with the knowledge and skills to harness the full potential of multi-energy CT, enabling them to deliver enhanced patient care and expedite critical decision-making in emergency scenarios.Through a combination of dynamic lectures, interactive discussions, hands-on training, and case-based workshops, participants will gain a comprehensive understanding of multi-energy CT principles, technical aspects, and clinical applications. This course addresses the crucial need for accurate and efficient diagnostic imaging in the emergency room, providing valuable insights into the optimized use of multi-energy CT for prompt and precise diagnosis, treatment planning, and triage.Educational Format:• Engaging lectures led by renowned experts in the field of emergency radiology• Interactive discussions and case-based workshops for collaborative learning• Hands-on training sessions on multi-energy CT scanner operation and image acquisition optimization• Utilization of advanced post-processing techniques and software tools through practical demonstrations• Integration of real-life emergency scenarios for enhanced learning and skill applicationExpected Outcome:By the end of this educational session, participants will have acquired a solid foundation in multi-energy CT imaging, enabling them to:• Understand the principles and technical aspects of multi-energy CT• Identify and differentiate energy levels for specific emergency conditions• Optimize image acquisition parameters for accurate diagnostic imaging• Interpret multi-energy CT images to facilitate prompt and precise diagnoses• Apply advanced post-processing techniques to enhance image analysis• Collaborate effectively with radiologists and other healthcare professionals in emergency management• Overcome challenges and limitations associated with multi-energy CT• Stay updated with the latest advancements in the fieldCourse Structure and Subspecialties:Module 1: Introduction to Multi-Energy CT in the Emergency Room• Understanding the principles and physics of multi-energy CT• Clinical advantages and applications of multi-energy CT in emergency medicine• Role of multi-energy CT in trauma assessment and triageModule 2: Technical Aspects and Image Acquisition• Multi-energy CT scanner technology and workflow• Selection of appropriate energy levels and protocols for different emergency scenarios• Optimization of image acquisition parametersModule 3: Image Interpretation and Diagnosis• Evaluation and interpretation of multi-energy CT images in emergency cases• Identification of acute pathologies and critical findings• Case-based discussions and interactive sessionsModule 4: Advanced Post-Processing Techniques• Utilizing advanced post-processing tools for accurate image analysis• Virtual monoenergetic imaging and material decomposition techniques• 3D visualization and volume rendering in emergency medicineModule 5: Clinical Applications in Specific Emergency Subspecialties• Multi-energy CT in

### GI Post-Operative Imaging

#### LEARNING OBJECTIVES

1) Understand the common GI surgical interventions. 2) Be able to identify typical post-surgical imaging findings and complications.\*Course Description This course is designed to be an "all you need to know" course that covers the typical post-surgical findings following common hepatic, pancreatic, bariatric and gastrointestinal surgeries. Topics will be discussed through a multimodality approach with CT, MR, US, and fluoroscopy findings highlighted throughout the session. With continued advances in surgical interventions and institutional variations in surgical technique, radiologists are expected to have a broad understanding of the post-surgical abdomen. Throughout the four didactic lectures, participants should be familiar with common gastrointestinal surgical interventions and the typical post-surgical findings and complications.

### Imaging of Sinonasal Tumors

#### Participants

Luke Ledbetter, MD, Los Angeles, CA (*Presenter*) Royalties, RELX

#### LEARNING OBJECTIVES

1) Review the key imaging findings in evaluation of head and neck cancer patients, including at staging, treatment response and surveillance time points. 2) Recognize the important imaging findings that impact clinical management of patients with head and neck cancer. \*Course Description In this "Best of" head and neck imaging session, attendees will hear short talks from experts focusing on the key information the multidisciplinary tumor board (surgeons, radiation oncologists and oncologists) needs to know from the imaging at diagnosis and follow-up of tumors in the head and neck. Speakers will emphasize imaging pearls and important clinical management considerations with which radiologists should be familiar. These talks will be followed by a case-based discussion by a panel of experts in a simulated tumor board session. Sample cases will be presented and discussed by radiologists, a head and neck cancer surgeon and a radiation oncologist. This session offers attendees a real world glimpse into how imaging interpretation impacts decision-making in the clinical management of head and neck cancer patients.

### MIDRC: Using a Massive Multi-Institutional Open Imaging Data Commons for Machine Learning Research

#### LEARNING OBJECTIVES

1) Become familiar with MIDRC, including how to contribute and how to use its open medical imaging data. 2) Understand the need for appropriate data curation processes and annotation in order to train and test AI algorithms. 3) Realize the potential for biases in AI systems and means with which to mitigate them. 4) Understand the benefit of a sequestered imaging data commons in effectively and efficiently enabling translation of AI algorithms through regulatory for public health.\*Course Description This course will describe the Medical Imaging and Data Resource Center (<https://www.midrc.org/>), the first and only national COVID-19 image repository in the United States, which has collected over 300,000 studies from dozens of sites around the country. MIDRC is a collaborative project between the Radiological Society of North America (RSNA), the American College of Radiology (ACR), and the American Association of Physicists in Medicine (AAPM), funded by the National Institute of Biomedical Imaging and Bioengineering (NIBIB). Its underlying technology can support repositories for other diseases. We will describe how you can use its open medical data, and how to contribute new data. We will discuss the challenges and opportunities presented by such a national imaging research repository and review its role in supporting machine learning research.

#### **T8-CIR08 Getting Certified in IR by the ABR**

##### Participants

Anne M. Covey, MD, New York, NY (*Presenter*) Stockholder, Amgen Inc

#### LEARNING OBJECTIVES

1) Review the current options to obtain IR/DR certification. 2) Understand controversies in the ESIR pathway, the potential merits of additional post-residency training options, and the T32 pathway for research during residency.\*Course Description IR/DR became a primary specialty in 2012 and there are several options for candidates to achieve ABR certification. The purpose of this course is to provide an update on the status of the IR/DR training pathways and highlight current challenges and opportunities.

#### COURSE DESCRIPTION

IR/DR became a primary specialty in 2012 and there are several options for candidates to achieve ABR certification. The purpose of this course is to provide an update on the status of the IR/DR training pathways and highlight current challenges and opportunities.

#### **T8-CIR08 Moderator**

##### T8-CMK06 Disease Mimickers and Variants

###### Participants

Reto Sutter, MD, Zurich, Switzerland (*Presenter*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Identify common abnormalities and normal variants of ankle imaging. 2) Describe easily overlooked features of ankle pathologies and how to recognize them on imaging.\*Course Description Imaging the ankle can be easy and difficult at the same time. Some pathologies are very common and are easily recognized, while others are uncommon or easily overlooked. This course will shine spotlights on various aspects of ankle imaging, including common abnormalities and normal variants as well as less common and easily overlooked pathologies that are important to keep in mind and should not be missed.

#### COURSE DESCRIPTION

### Fundamentals of Learning Health Systems: Special Considerations for Radiology

#### Participants

Elizabeth S. Burnside, MD, MPH, Madison, WI (*Presenter*) Research Grant, Hologic, Inc

#### LEARNING OBJECTIVES

1) Review fundamentals of learning healthcare systems and special considerations for radiology. 2) Discuss the strengths and limitations of leveraging your organizational electronic medical record for clinical operational quality improvement initiatives and clinical research studies. 3) Introduce the concept of culture as learning healthcare system infrastructure and why buy-in from teams and key stakeholders is critical for successful implementation.\*Course Description Radiologists have little exposure to the ideas that are fundamental to learning healthcare systems (LHS). This course will introduce radiologists to key concepts underlying LHS, and explain why LHS are important to radiologists and their health systems, clinicians, patients, and researchers. We will focus on special considerations for radiology LHS. We will focus on leveraging the electronic medical record and why addressing the culture of the system, by getting a commitment from teams and individuals to integrate the LHS framework into routine care processes, is important.

### Is It A Tumor? Pediatric Body and Skeletal Neoplasms Made Easy

#### LEARNING OBJECTIVES

1) List the common and uncommon solid and cystic focal liver lesions that occur in children. 2) Recognize the key imaging features that enable differentiation of pediatric gynecological tumors. 3) Identify imaging features of pediatric bone lesions requiring biopsy.\*Course Description This lecture-based session will provide learners with an in depth understanding of the differential diagnosis of tumors that occur in children with a focus on lesions found in the liver, pediatric female pelvis, and bones. Updates in diagnostic tools, protocols and techniques will be provided for each topic. After this session, the participant will be able to formulate a focused differential and recommend an approach to diagnosis, as well as be able to update current protocols to create a state-of-the art practice for pediatric patients.

### VCT in Service of Clinical Practice

#### Participants

Hilde Bosmans, PhD, Leuven, Belgium (*Presenter*) Stockholder, Qaelum NV; Research Grant, Siemens AG; Research Grant, General Electric Company

#### LEARNING OBJECTIVES

1) Understand the role of virtual trials in medicine and in radiology. 2) Understand the components of virtual imaging trials. 3) Understand the research, clinical, and regulatory potentials of virtual trials.\*Course Description The complexity and diversity of medical imaging technologies have continued to accelerate, outpacing our ability to optimize their use. This has become a significant challenge across the spectra of scientific inquires, product designs, and clinical applications. New imaging technology has been traditionally evaluated through clinical trials. However, such trials are often not feasible or even definitive due to ethical limitations, expense, time requirements, difficulty in accruing enough subjects - especially with low prevalence conditions, or the fundamental lack of ground truth. Virtual Clinical Trials (VCT) provide a new paradigm to assess the impact of medical imaging innovations on patient care. VCTs offer a new disease-known approach to conduct medical trials that can be clinically relevant, timely, and accurate while reflecting the variabilities of human subjects and disease, as well as the complexities of technologies, providing answers that would otherwise be impractical to obtain or simply unattainable. A VCT consists of 1) realistic populations of computational patients spanning ages and a range of phenotypical characteristics including sex and race with realistic models of disease, 2) detailed models of clinical imaging systems, and 3) computational models of the image interpretation processes. This session offers a summary of VCT methods and processes in the field of radiology and highlights applications in clinical practice and in the regulatory assessment of imaging products.

### Pancreatic Cancer Case Based Multidisciplinary Review

#### Participants

Katelyn Atkins, MD, PhD, Boston, MA (*Presenter*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Expose the attendees to multidisciplinary discussion when treating pancreatic cancer. 2) Demonstrate specific imaging findings that directly affect staging and treatment decisions. 3) Provide the audience with specific information they should include in their reports that directly affect prognosis and management.\*Course Description This comprehensive course aims to provide attendees with a multidisciplinary understanding of pancreatic cancer diagnosis and management. Through interactive discussions, expert opinions, and case studies, participants will gain valuable insights into the integration of various disciplines in the treatment of this challenging disease. The course will focus on the critical role of imaging findings, their impact on staging and treatment decisions, and the specific information that should be included in reports to guide management.

This comprehensive course aims to provide attendees with a multidisciplinary understanding of pancreatic cancer diagnosis and management. Through interactive discussions, expert opinions, and case studies, participants will gain valuable insights into the integration of various disciplines in the treatment of this challenging disease. The course will focus on the critical role of imaging findings, their impact on staging and treatment decisions, and the specific information that should be included in reports to guide management.

##### Participants

Katelyn Atkins, MD, PhD, Boston, MA (*Presenter*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Expose the attendees to multidisciplinary discussion when treating pancreatic cancer. 2) Demonstrate specific imaging findings that directly affect staging and treatment decisions. 3) Provide the audience with specific information they should include in their reports that directly affect prognosis and management.\*Course Description This comprehensive course aims to provide attendees with a multidisciplinary understanding of pancreatic cancer diagnosis and management. Through interactive discussions, expert opinions, and case studies, participants will gain valuable insights into the integration of various disciplines in the treatment of this challenging disease. The course will focus on the critical role of imaging findings, their impact on staging and treatment decisions, and the specific information that should be included in reports to guide management.

### Vice Chair of DEI? What does that Mean? (Sponsored by the RSNA Committee on Diversity, Equity & Inclusion)

#### LEARNING OBJECTIVES

1) Discuss selection criteria for DEI leaders. 2) Share strategies for Departmental and Institutional Support. 3) Discuss metrics to assess the success and impact of your DEI leader and program. 4) Share early experiences of DEI leaders.\*Course Description As the position of Vice Chair of DEI is a relatively new position in leadership of Radiology Departments, the session will offer information and guidance on how to craft this position to reflect the needs of your individual Departments.

### Management of Elevated Risk Breast Lesions: European View

#### Participants

Husain Sattar, MD, BA, Chicago, IL (*Presenter*) Nothing to Disclose

Sarah J. Vinnicombe, FRCR, MRCP, Cheltenham, United Kingdom (*Presenter*) Consultant, Bayer AG

#### LEARNING OBJECTIVES

1) Gain an understanding of the nature of high risk breast lesions. 2) Appreciate the differing strategies to manage these lesions from an international perspective.\*Course Description This course will review the management of high risk breast lesions, which are diagnosed through breast core needle biopsy. High risk lesions are a heterogeneous group of pathologies which, while not malignant, are associated with malignancy, either synchronous or metachronous. This series of three lectures will discuss the challenges in diagnosing these lesions and the differing management approaches in the USA and Europe.

### Cardiac Imaging in Private Practice: Maximizing Efficiency with Quality

#### LEARNING OBJECTIVES

1) Understand how CT protocols can drive output. 2) Explore how blending imaging modalities in cardiovascular imaging can provide customized and optimized care to the patient. 3) Discuss the role of a 3D Lab can solve imaging problems.\*Course Description As the utilization of Cardiac CTA increase, imagers are challenged to expand services while maintaining a high standard of image quality, accuracy and identify the ideal use of the technology to optimize patient care. The speakers in the session will review imaging protocol tips, the role of complementary imaging modalities and how technology processing teams and labs can support a program and drive quality care.

#### LEARNING OBJECTIVES

1) Compare and contrast artificial intelligence (AI) and machine learning strategies used in thoracic imaging. 2) Interpret radiomics research trial outcomes. 3) Explain the benefits and pitfalls of applications of AI in thoracic imaging.\*Course Description Artificial intelligence (AI) and radiomics are increasingly used in thoracic imaging research and clinical practice. This session aims to provide attendees a basic understanding of these tools and their applications in thoracic imaging. The knowledge should facilitate appropriate interpretation and utilization of the results generated by these techniques.

#### W1-CIN03 Common Data Elements, FHIR Observations, and the Future of Radiology Reports

##### Participants

Tarik Alkasab, MD, PhD, Boston, MA (*Presenter*) Consultant, Nuance Communications, Inc; Medical Advisory Board, Nuance Communications, Inc

#### LEARNING OBJECTIVES

1) Understand the importance and benefits of using structured reporting templates. 2) Acquire practical knowledge on how to create and use structured reporting to maximize efficiency, quality and compliance with real-life examples. 3) Discuss future applications of structured reporting.\*Course Description This course explores the importance, creation, and future implementation of structured reporting in radiology. Speakers will delve into key topics including the use of structured report templates and macros, the influence of radiology report elements on patient care, and the evolving future of radiology reports in the context of Common Data Elements and FHIR observations. Participants can anticipate an engaging format combining lectures and interactive panel discussion. The vital role structured reporting plays in enhancing clinical decision-making, improving communication, promoting standardization, and improving quality of care will be discussed with real-life examples. The expected outcome is for attendees to gain an enriched understanding of structured reporting and the capability to implement learned strategies into their practices for enhanced patient outcomes.

### Advanced MSK, Head & Neck Interventions

#### LEARNING OBJECTIVES

1) Identify scenarios where Interventional Radiology modalities (embolization, ablation) can enable and complement surgical and medical treatment plans for benign and malignant head and neck conditions. 2) Understand vertebroplasty, including devices that are yet to become available in the United States. 3) Understand novel musculoskeletal interventional image guidance platforms. 4) Understand the approach to Desmoid tumors including NCCN guideline updates.\*Course Description With major updates to the NCCN Guidelines completed (MSK) and to the ATA guidelines imminent in 2023-2024 (Thyroid) this session aims to provide advanced pearls for Interventional Radiologists entering the MSKIR and ThyroidIR domains.

#### COURSE DESCRIPTION

With major updates to the NCCN Guidelines completed (MSK) and to the ATA guidelines imminent in 2023-2024 (Thyroid) this session aims to provide advanced pearls for Interventional Radiologists entering the MSKIR and ThyroidIR domains.

### Arthritis and Body Composition: How Imaging Influences Clinical Decision Making

#### LEARNING OBJECTIVES

1) Describe how imaging findings can influence the choice of drugs and assess their effectiveness in patients with rheumatoid arthritis and seronegative spondyloarthropathies. 2) Explain the impact of imaging for predicting natural history and prognosticating disease course in patients with arthritis and disorders of body composition. 3) Discuss the role of imaging in disease surveillance for arthritis and disorders of body composition.\*Course Description This lecture-based educational course will review how imaging findings influence clinical decision-making for patients with osteoarthritis, rheumatoid arthritis, seronegative spondyloarthritis, and disorders of body composition. Presenters will use case-examples and data from the literature to emphasize the ways in which advanced imaging informs management decisions, disease surveillance, prognostication, and assessment of drug responses, remission, and progression.

#### COURSE DESCRIPTION

### Neuroradiologists Under Pressure – Global Perspectives

#### LEARNING OBJECTIVES

1) To review the diversity or similarity of burden of health delivery workload on practicing neuroradiologists in different parts of the world: including emerging trends/challenges in clinical/academic/reimbursement issues. 2) To understand what steps neuroradiologists are taking to relieve the pressure, and if this is working, if this is generalizable. 3) To discuss how to balance clinical workload and academic mission for neuroradiologists.\*Course Description Post-pandemic, clinical workload for neuroradiologists has increased, exacerbating pre-existing difficult working conditions; but is this increased pressure on us the same around the world? There's a sense that the altruistic, ethical and academic missions are under threat, to the detriment of our patients. This session will explore problems and possible solutions in diverse parts of the world.

### Photon Counting CT

#### LEARNING OBJECTIVES

1) Understand principles of photon counting detector (PCD) and PCD-CT. 2) Explore benefits of PCD-CT in comparison with energy integrating detector CT. 3) Identify potential applications of PCD-CT in various clinical areas.\*Course Description Photon counting detector (PCD) has been an active research area in recent years. Commercial PCD-CT has been available for routine clinical use since the FDA cleared the first PCD-CT in late 2021, representing a major imaging device advancement for CT. In this lecture, we will discuss the fundamental principles of PCD and explain major benefits of this technology relative to energy integrating detectors which are used on most commercial CT scanners. History and current status of PCD-CT will also be discussed. Potential applications in various clinical areas will be demonstrated using sample phantom and patient images. Challenges and opportunities will also be discussed.

### RSNA/ESR Symposium: Imaging of Neurodegenerative Disorders - Basics of Neuroimaging in Neurodegeneration

#### LEARNING OBJECTIVES

1) To understand the standard MR Imaging protocol, normal aging findings, as well as Alzheimer disease mimic on structural brain MR imaging. 2) To become familiar with existing and new molecular imaging tracers for dementia and parkinsonian disorders. 3) To comprehend the evolving role of imaging biomarkers in standard clinical practice as well as trials (including imaging of side effects such as ARIA). \*Course Description Structural MRI and molecular imaging techniques are key modalities in the diagnosis (and increasingly also in early detection) of neurodegenerative disorders. This session is part of an educational ESR-RSNA transatlantic course (of 4 sessions in total) that discusses imaging in neurodegeneration, from basics to advanced applications. This first educational session will discuss the basics of MRI and PET imaging, choices of imaging protocols, PET tracers and MR sequences, changes that occur with normal aging and other mimics, and what the role is of imaging biomarkers in general in clinical practice versus trials. At the end of the course, the participants will better understand the basics of molecular and structural imaging in neurodegenerative disorders.

### Ensuring Patient Safety and Workflow Efficiency in Radiology

#### Participants

Michael Recht, MD, New York, NY (*Presenter*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Ensuring patient safety and workflow efficiency in radiology. This lecture will discuss strategies to optimize and standardize radiology workflow to improve patient safety, eases pressure on radiologists and supporting staff. 2) Investing in education to mobilize and develop our imaging workforce. This lecture will discuss learning and development initiatives to engage and upskill the radiology staff to improve work quality and patient safety. 3) Improving recruitment and retention in radiology. This lecture will address reasons behind the "Great Resignation" and discuss strategies to create an enjoyable workplace in radiology practice to improve recruitment and retention of clinical staff. 4) Implementing artificial intelligence in different aspects of radiology practice. This lecture will discuss appropriate clinical implications of artificial intelligence in different aspects of radiology practice, such as patient scheduling, image acquisition and reporting, to increase work efficiency and improve patient safety.\*Course Description The shortage of healthcare staff is becoming the nation's top patient safety concern. The prompt and accurate results of imaging studies can be the difference between life and death. Yet shortage of practicing radiologists in the United States is projected to worsen while demands for radiology services continue to grow. Radiology practices have been experiencing staff shortages across various positions, struggling to both maintain staffing and bring in new talent. Thus, many patients have been forced to endure long wait when seeking care in radiology. The goal of our course is to discuss strategies to ensure patient safety and address workforce challenges facing radiology.

### Who is Paying for Radiology Education? (Sponsored by the American Association for Women in Radiology)

#### LEARNING OBJECTIVES

1) Discuss who is and who should pay for radiology education. 2) Consider whether our current compensation models are disincentivizing radiologists from pursuing careers in academics. 3) Examine the potential impact of under-funding radiology education on the gender pay-gap in radiology.\*Course Description The demand for medical imaging is outstripping the supply of radiologists. From 2010 to 2020, the number of DR trainees entering the workforce increased just 2.5% (1), compared to a 180% increase in the number of CT and US examinations in the same decade. (2) On March 29, 2023, the Resident Physician Shortage Reduction Act of 2023 was proposed; if passed, it would expand the number of Medicare-supported medical residency positions by 14,000 over seven years. A similar bill was proposed in 2021 but did not pass. As lawmakers struggle to provide additional funding for medical workforce education, medical trainees in the United States continue to take on debt for medical education and training. As of 2018, early-career radiologists owed an average of \$190,000 after graduate programs. (3) Once trained, early-career radiologists encounter a decision regarding whether to choose academics or to enter private practice. If they choose academics, they will earn an average of \$141,628 less per year than their private practice counterparts. (4) Radiology education does not end with employment. All radiologists must participate in continuing medical education (CME). The average CME allowance of a physician was \$3,691 in 2022 (5), which is typically considered part of a physician's overall compensation package. Providing and paying for CME is big business. The worldwide sales of academic publishing will exceed 19 billion dollars in 2023 and Elsevier, a leader in academic publishing, has a profit margin approaching 40%, which is higher than that of Microsoft, Google and Coca Cola. (6) Academic radiologists are expected to author, review, and edit articles for these academic journals for nominal, if any, compensation. Similarly, many radiologists earn CME at radiology conferences, typically organized, and staffed by academic radiologists for nominal, if any, compensation. Please join us as we discuss these observations and the question of who is and who should pay for radiology education. This question particularly impacts women in radiology, since, while the percentage of women in radiology has hovered around 25% since 2007 (7), there is a greater percentage of women in academic radiology (34.7%). (8) Please join us as we consider whether our current compensation models are disincentivizing radiologists from pursuing careers in academics; examine what impact, if any, the under-funding of radiology education has on the gender pay-gap in radiology; and contemplate how we as a field can overcome these challenges. #### COURSE DESCRIPTION

The demand for medical imaging is outstripping the supply of radiologists. From 2010 to 2020, the number of DR trainees entering the workforce increased just 2.5% (1), compared to a 180% increase in the number of CT and US examinations in the same decade. (2) On March 29, 2023, the Resident Physician Shortage Reduction Act of 2023 was proposed; if passed, it would expand the number of Medicare-supported medical residency positions by 14,000 over seven years. A similar bill was proposed in 2021 but did not pass. As lawmakers struggle to provide additional funding for medical workforce education, medical trainees in the United States continue to take on debt for medical education and training. As of 2018, early-career radiologists owed an average of \$190,000 after graduate programs. (3) Once trained, early-career radiologists encounter a decision regarding whether to choose academics or to enter private practice. If they choose academics, they will earn an average of \$141,628 less per year than their private practice counterparts. (4) Radiology education does not end with employment. All radiologists must participate in continuing medical education (CME). The average CME allowance of a physician was \$3,691 in 2022 (5), which is typically considered part of a physician's overall compensation package. Providing and paying for CME is big business. The worldwide sales of academic publishing will exceed 19 billion dollars in 2023 and Elsevier, a leader in academic publishing, has a profit margin approaching 40%, which is higher than that of Microsoft, Google and Coca Cola. (6) Academic radiologists are expected to author, review, and edit articles for these academic journals for nominal, if any, compensation. ### RSNA Hands-On Lab: Contrast Reaction Management

#### Participants

Mohamed Shaif Yusufishaq, MD, BEng, Des Plaines, IL (*Presenter*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Recognize various types of contrast reactions and the proper management of various types of contrast reactions through simulation-based training. 2) Learn with hands-on practice the proper administration of various routes of epinephrine as well as other medications to treat the more common allergic-like contrast reactions. 3) Recognize and manage a contrast reaction in a sedated patient. 4) Recognize and manage a contrast reaction in a pediatric patient 5) Recognize and practice team communication skills necessary for high stress infrequent scenarios using simulation-based training.\*Course Description In Person Session Only. Tickets must be purchased in advance for this course. This course can be added through the registration portal or by stopping by the Registration Desk. Space is limited. Through hands-on high-fidelity simulation scenario training, learners will practice recognizing and managing various types of contrast reactions. Following a brief lecture, learners will rotate through multiple stations during the course to gain individual hands-on experience. To enhance the learner's experience and allow for more time in the hands-on stations, we ask all learners for the course to watch this short 15 min. video on contrast reaction management prior to the course [https://youtu.be/9r-\\_E8dmJ0A](https://youtu.be/9r-_E8dmJ0A).

### Imaging Workup of Eye Pain

#### Participants

Blair Winegar, MD, Salt Lake City, UT (*Presenter*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Understand the imaging algorithm and search patterns for patients presenting with eye pain, diplopia, and vision loss. 2) Understand the imaging algorithm and search patterns in the pediatric orbit.\*Course Description In this Head and Neck session devoted to the orbit, attendees will review the imaging approach and will be presented with clinical case examples of patients with eye pain, diplopia, and vision loss. Attendees will also review the imaging approaches and pathologies in the pediatric orbit. Speakers will emphasize pearls for imaging evaluation and differentiating each entity from common mimics, pitfalls of interpretation to avoid, and relevant clinical management considerations with which radiologists should be familiar. This session offers attendees the opportunity to refine their interpretation of complex head and neck imaging studies by incorporating tips from world experts.

##### W3-CNPM09 My Radiologist Performance Metrics Dashboard- What Makes the Most Sense

###### Participants

Michael M. Moore, MD, Hummelstown, PA (*Presenter*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) To describe sensible radiologist performance metrics. 2) To weigh the role of metrics use in achieving health equity. 3) To implement dashboarding in your practice.\*Course Description Dashboards help us understand how our departments function. It is important for radiologists to know how to leverage these tools to make decisions within their practices. In this session we will discuss how to leverage dashboards in our operations, educational initiatives, and in regard to equitable decision making.

### Pediatric Musculoskeletal Imaging: Cutting-edge Updates for Common Conditions

#### LEARNING OBJECTIVES

1) Understand perfusion imaging and current applications of artificial intelligence (AI) in evaluation of hip dysplasia. 2) Construct an imaging algorithm for the work up of the limping child and recognize common and uncommon etiologies of acute limp. 3) Define updated imaging protocols for evaluation of pediatric musculoskeletal infections with an emphasis on high resolution US, vascular imaging, and MR DWI.\*Course Description This 3-lecture session will review state-of-the-art, updated multimodality techniques for imaging common pediatric musculoskeletal conditions at diagnosis and during follow-up.

#### COURSE DESCRIPTION

This 3-lecture session will review state-of-the-art, updated multimodality techniques for imaging common pediatric musculoskeletal conditions at diagnosis and during follow-up.

##### Participants

Michael S. Gee, MD, PhD, Boston, MA (*Presenter*) Researcher, General Electric Company Researcher, Siemens AG Researcher, Motilent LLC

#### LEARNING OBJECTIVES

1) Engage in a multidisciplinary discussion concerning three complex pediatric oncology cases, focusing on their clinical and imaging characteristics. 2) Present recommendations from the COG/SPR consensus papers pertaining to image acquisition and interpretation. 3) Examine the role of radiation therapy in these cases, emphasizing strategic planning, and delivery considerations.\*Course Description This interactive panel discussion will delve into three complex pediatric oncology cases. The panel, composed of two pediatric radiologists, a radiation oncologist, and a medical oncologist, will guide the conversation. Each case will be introduced through its clinical presentation and initial imaging. The medical oncologist will provide insights into the biology of the tumor, its staging, and the standard medical management. Following this, the radiation oncologist will discuss treatment alternatives, intricacies of radiation planning, and crucial aspects of delivery. The discussion will emphasize key aspects of medical imaging for each case, drawing on the recent recommendations from the Children's Oncology Group (COG)/Society for Pediatric Radiology (SPR) guidelines.

### ASRT@RSNA: Cybersecurity Primer for Radiology Professionals

#### LEARNING OBJECTIVES

1) Recognize the sources of cyber threats and how our equipment and people make us vulnerable. 2) Prepare in advance of cyberattacks. 3) Describe the business continuity and recovery processes in the hours and days after an attack.\*Course Description Cybersecurity is relevant to all modern industries – especially radiology, as imaging is leading the way as the first truly digital specialty, fully dependent on networked computer systems. We all need to take a thoughtful and systematic approach to preventing cyberattack, including all radiology infrastructure and staff. This effort must include investment in technology, deployment, and management. We must practice good "cyber hygiene" to protect infrastructure and ensure that staff are educated and aware of the threats. The human element is one of the most common points of failure against cyberattacks. This lecture will cover the most likely sources of cyber threats, how to prepare for these attacks in advance, and how to maintain business continuity in the event of an attack.

### RSNA/ESR Symposium: Imaging of Neurodegenerative Disorders - Dementia: Towards an Aetiologic Diagnosis

#### LEARNING OBJECTIVES

1) Explain the current use of MRI for etiologic dementia diagnosis. 2) Explain the current use of molecular imaging for etiologic dementia diagnosis. 3) Demonstrate structured selection and assessment of imaging exams through cases.\*Course Description Structural MRI and molecular imaging techniques are key modalities in the diagnosis (and increasingly also in early detection) of neurodegenerative disorders. This session is part of an educational ESR-RSNA transatlantic course (of 4 sessions in total) that discusses imaging in neurodegeneration, from basics to advanced applications. This second educational session will discuss how in current clinical practice imaging modalities such as MRI and molecular imaging techniques can be used to support an etiologic diagnosis of dementia. This session will give general radiologists and those interested in neuroradiology and nuclear medicine/molecular imaging the knowledge needed for appropriate selection and structured assessment of imaging exams in diagnostic work-up of dementia. The session format consist of in part lectures, followed by an interactive case-based discussion.

### Informatics Strategy and Initiatives to Enhance the Pre Imaging Exam Journey

#### Participants

Namita S. Gandhi, MD, MSc, (*Presenter*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Informatics strategy and initiatives to enhance the pre imaging exam journey. 2) Informatics strategy and challenges with patient friendly report. 3) Informatics strategies for patient friendly image exchange. 4) Informatics considerations for patient reported outcomes.\*Course Description Patient journey refers to patient's experience throughout an episode of care; for radiology this begins at the time when an imaging order is placed and carries through till the patients receive their imaging reports. The reports impact further patient care and outcomes. Traditionally, strategies to improve patient experience and care in radiology are focused on enhancing only the radiology encounter. This course will focus on the entire episode of care (pre and post radiology encounter) in a patient's imaging journey and discuss informatics strategies and considerations to enhance the entire journey. The session will be organized as short presentations by the speakers followed by a panel discussion at the end. The panel will be available for audience questions.

### US Radiology Reimbursement in Context: What Comes Next?

#### LEARNING OBJECTIVES

1) Identify the macroeconomic forces that are influencing reimbursement for radiology services. 2) Identify actions that private, commercial health insurance companies are taking that influence reimbursement for radiology services. 3) Explain the challenges facing radiology under the Medicare Physician Fee Schedule. 4) List actions that medical practices and physicians can take to help protect patients' access to high quality medical imaging. \*Course Description The session will focus on the future of radiology reimbursement within the broader context of health care reform and macroeconomic forces in the United States. This includes value-based payment, Medicare and the physician fee schedule, private payor issues, digital medicine and others. This will be a hybrid session, pairing presentations with moderated dialogue and Q/A.

The session will focus on the future of radiology reimbursement within the broader context of health care reform and macroeconomic forces in the United States. This includes value-based payment, Medicare and the physician fee schedule, private payor issues, digital medicine and others. This will be a hybrid session, pairing presentations with moderated dialogue and Q/A.

#### Sub-Events

##### W4-CNPM14 Moderator

Participants

Richard Heller III, MD, Chicago, IL (*Moderator*) Consultant, Gerson Lehrman Group, Inc;

##### W4-CNPM14 Radiology Reimbursement in the Academic Setting: What Comes Next?

Participants

Geraldine McGinty, MD, MBA, New York, NY (*Presenter*) Board Member, NextGen Healthcare ;Stockholder, NextGen Healthcare

##### W4-CNPM14 Private Practice Radiology: Challenges, Opportunities, and Uncertainties

Participants

Ezequiel Silva III, MD, San Antonio, TX (*Presenter*) Nothing to Disclose

##### W4-CNPM14 The Future Economics of Health Care in the US: Doing More for Less

Participants

David Meltzer, Chicago, IL (*Presenter*) Nothing to Disclose

Printed on: 04/12/24

### ASRT@RSNA: Interventional Radiology & Pediatric Care: The Changing Role of the Technologist/Radiographer

#### Sub-Events

##### W4-CRT06 Moderator

#### Participants

Susie Moseley, MS, RT, Albuquerque, NM (*Moderator*) Nothing to Disclose

##### W4-CRT06 ASRT@RSNA: Topic: Interventional Radiology: The Technologists/ Radiographers Changing Role Changing Techniques in Pediatric Care

#### Participants

Emma Rose, MSc, BSc, London, United Kingdom (*Presenter*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Gain an overview of Pediatric Interventional Radiology. 2) Learn about advanced practice roles within Interventional Radiology and how these could be applied to their own clinical practice. 3) Learn how advanced practice roles benefit patients, and the wider healthcare system.\*Course Description This session will provide an overview of interventional procedures performed for pediatric patients, including recent innovations. It will also examine the technologist/radiographer role in Interventional Radiology and how this is developing to include advanced roles.

#### COURSE DESCRIPTION

This session will provide an overview of interventional procedures performed for pediatric patients, including recent innovations. It will also examine the technologist/radiographer role in Interventional Radiology and how this is developing to include advanced roles.

### Breast Screening with US: Should We Do It?

#### Participants

Wendie A. Berg, MD, PhD, Gibsonia, PA (*Presenter*) Institutional Research Grant, Koios Medical, Inc

#### LEARNING OBJECTIVES

1) Identify patients who should have breast screening beyond mammography. 2) Describe expected results from MRI screening. 3) Discuss alternatives to MRI screening for those recommended for it but unable to tolerate it, including ultrasound or, potentially, contrast-enhanced mammography.\*Course Description This session will detail which people meet current guidelines for supplemental breast cancer screening beyond mammography based on risk, including ages to start and stop screening. The latest ACR, NCCN, and EUSOBI guidelines will be discussed.

W6-CER08

### Pediatric Trauma: A Case-Based Approach

#### LEARNING OBJECTIVES

1) Explain common mechanisms of injury in the child. 2) Become familiar with normal developmental anatomic changes in the child and understand how these can mimic pathology and will result in different patterns of injury compared to an adult. 3) Review optimized imaging strategies for the pediatric patient.\*Course Description A sampling of common and/or critical injuries will be covered in a case-based format with attention to the pediatric spine, extremities, and thoraco-abdominal regions. This will include brief reviews of key developmental features that can mimic pathology by imaging and alter the results of trauma applied to these levels as compared to adults. Both accidental and nonaccidental traumatic mechanisms will be discussed, and imaging strategies appropriate to the pediatric patient will be shared.

#### COURSE DESCRIPTION

### GU Tumor Boards: How to Bring Value and Become Indispensable

#### LEARNING OBJECTIVES

1) Use case-based format to identify key imaging features that significantly impact management. 2) Understand the common pitfalls in imaging assessment of GU tumors. 3) Improve communication with referring providers to help improve outcomes.\*Course Description With advances in oncology, the role of radiologist in management of GU cancers is rapidly evolving. At GU tumor boards, the radiologist plays a key role in diagnosis, staging, and clinical decision-making. This course guides the attendees through the various challenges and pitfalls faced by the radiologist at the GU tumor boards to successfully guide patient management.

#### COURSE DESCRIPTION

With advances in oncology, the role of radiologist in management of GU cancers is rapidly evolving. At GU tumor boards, the radiologist plays a key role in diagnosis, staging, and clinical decision-making. ### Ransomware: Principles, Detection, and Recovery

#### LEARNING OBJECTIVES

1) Evaluate the growing impact of ransomware. 2) Describe how to detect early signs of compromise from a cyberattack. 3) Describe the lessons learned from recovery after a ransomware attack.\*Course Description Cybercrime against healthcare institutions has exploded in recent years. Seven years ago, the Hollywood Presbyterian Medical Center paid a \$17,000 ransom to regain access to its medical records blocked by ransomware. In 2021, more than 1 in 3 organizations, and in 2022, more than 2 in 3 organizations reported being hit by ransomware. The Russia-tied Ryuk group hit over 235 healthcare facilities, raking in more than \$100 million in ransoms. Although paying ever-increasing ransoms can be costly for medical centers, refusing to pay them often leads to even bigger losses. The University of Vermont Health system lost \$50 million and Universal Health System lost \$67 million for refusing to pay ransoms in 2020. The Scripps Institute was recently victim of a ransomware attack and lost \$100 million in revenue in the recovery process. The situation has been considerably worsened by the pandemic, which produced a triple threat for healthcare systems: (1) a rapid expansion of internet-connected technologies and services causing an expanded attack surface, (2) an increase in many types of cyberattacks, and (3) fewer available resources to defend against cyberattacks. Recently, the zero-day vulnerability Log4j in Apache software has been leading to hundreds of cyber-attacks around the world since December 2021. Cybersecurity has become an important part of healthcare, and we must address this topic at RSNA since every radiology practice can become a victim of a cyber-attack. This explosion in cyber-attacks against medical centers is the result of (1) the increased connectivity of hospitals through medical devices and networks, (2) the commoditization of cyber-attack tools, and (3) the US Justice System penalizing cyber-attack victims, rather than going after the perpetrators. In this refresher course, we will provide an update on ransomware on hospitals, how to recover from it and the increased interconnectivity of medical devices which worsens the consequences of these attacks. In more details: The status of ransomware in 2023. This will be discussed by Dr Desjardins, an academic radiologist and ex-hacker and specialist in cybersecurity in healthcare. He will not only describe the evolution of ransomware over the past several years, but also explain the basic operating principles of ransomware and how ransomware attacks against hospitals are getting more prevalent and costly. He will also provide an overview of national initiatives to defend against ransomware. Detecting compromise and attacks against medical devices. This will be discussed by Prof Fu, a well-known leader in the cybersecurity of medical devices, who just finished his term as Acting Director of Medical Device Cybersecurity at the FDA. He will not only describe the common, easily avoided, cybersecurity design problems in medical devices, but how to detect early signs of compromise from a pending cyberattack, and how to improve the security of medical devices. Lessons learned from hospital ransomware recovery and planning considerations. This will be discussed by Dr Chen from the Cleveland Clinic. One of the facilities in Cleveland Clinic's network was recently victim of a huge ransomware attack, and Dr Chen published a great overview of lessons learned from this attack and developed a four-phase plan for the recovery from such a cyberattack (J Digit Imaging. 2021 Jun). He will provide a practical overview of these lessons and plan. This refresher course will bring the radiology community up to date on the exponentially growing threat of ransomware affecting healthcare, including recent attacks, and techniques of defense. The course will be presented by radiologists and top cybersecurity experts. The information technology issues will be addressed.

#### COURSE DESCRIPTION

Cybercrime against healthcare institutions has exploded in recent years. Seven years ago, the Hollywood Presbyterian Medical Center paid a \$17,000 ransom to regain access to its medical records blocked by ransomware. In 2021, more than 1 in 3 organizations, and in 2022, more than 2 in 3 organizations reported being hit by ransomware. The Russia-tied Ryuk group hit over 235 healthcare facilities, raking in more than \$100 million in ransoms. Although paying ever-increasing ransoms can be costly for medical centers, refusing to pay them often leads to even bigger losses. The University of Vermont Health system lost \$50 million and Universal Health System lost \$67 million for refusing to pay ransoms in 2020. The Scripps Institute was recently victim of a ransomware attack and lost \$100 million in revenue in the recovery process. The situation has been considerably worsened by the pandemic, which produced a triple threat for healthcare systems: (1) a rapid expansion of internet-connected technologies and services causing an expanded attack surface, (2) an increase in many types of cyberattacks, and (3) fewer available resources to defend against cyberattacks. Recently, the zero-day vulnerability Log4j in Apache software has been leading to hundreds of cyber-attacks around the world since December 2021. Cybersecurity has become an important part of healthcare, and we must address this topic at RSNA since every radiology practice can become a victim of a cyber-attack. This explosion in cyber-attacks against medical centers is the result of (1) the increased connectivity of hospitals through medical devices and networks, (2) the commoditization of cyber-attack tools, and (3) the US Justice System penalizing cyber-attack victims, rather than going after the perpetrators. In this refresher course, we will provide an update on ransomware on hospitals, how to recover from it and the increased interconnectivity of medical devices which worsens the consequences of these attacks. In more details: The status of ransomware in 2023. This will be discussed by Dr Desjardins, an academic radiologist and ex-hacker and specialist in cybersecurity in healthcare. He will not only describe the evolution of ransomware over the past several years, but also explain the basic operating principles of ransomware and how ransomware attacks against hospitals are getting more prevalent and costly. He will provide a practical overview of these lessons and plan. This refresher course will bring the radiology community up to date on the exponentially growing threat of ransomware

affecting healthcare, including recent attacks, and techniques of defense. The course will be presented by radiologists and top cybersecurity experts. The information technology issues will be addressed at a technical level appropriate for the radiology community at large, to make the community aware of this growing era of digital warfare and its implications for radiology practices. Our refresher course will have

### Patellofemoral Joint Assessment: What Matters

#### Participants

Jan Fritz, MD, (*Presenter*) Institutional research support, Siemens AG;Scientific Advisor, Siemens AG;Patent agreement, Siemens AG;Institutional research support, Johnson & Johnson;Institutional research support, Zimmer Biomet Holdings, Inc;Institutional research support, BTG International Ltd

#### LEARNING OBJECTIVES

1) Understand areas of knee imaging and intervention that offer particular challenges to the radiologist. 2) Develop strategies to review and report knee MRI that avoid these challenging pitfalls. 3) Understand techniques and their rationale for the imaging guided intervention of patellar tendon disease.\*Course Description The knee is one of the most commonly imaged peripheral joints. However, advances in surgical techniques and our understanding of the functional anatomy of the knee mean that new challenges to the radiologist exist. This course aims to highlight particularly challenging areas in the interpretation of knee imaging studies. It will primarily focus on MRI, but an additional presentation will discuss the role that radiology has in the management of patellar tendon disease.

### Health Equity in Radiology: Research (Sponsored by the RSNA Research Development Committee and the RSNA Health Equity Committee)

#### LEARNING OBJECTIVES

1) Implement best practices in the use and reporting of race and ethnicity in radiology research studies. 2) Incorporate social determinants of health data in health services research. 3) Reduce biases and improve fairness in the design and use of artificial intelligence methods in medical imaging. 4) Develop a research proposal or action plan that addresses health equity issues.\*Course Description As a result of participation in this course, radiology researchers will be able to incorporate best practices in health equity and inclusive writing into their own clinical research studies. The course will include practical, high yield, lectures focused on equipping radiology researchers with discrete tools and resources for their own research studies.

#### Sub-Events

#### W6-CNR04 Spine Emergencies--An Algorithmic Approach

##### Participants

Jason F. Talbott, MD, PhD, Novato, CA (*Presenter*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Gain familiarity with key CT and MRI findings and up-to-date classification systems in the setting of spine, head and neck, and intracranial emergencies. 2) Review appropriate indications for obtaining MRI and key MRI imaging findings in patients with acute spine emergency. 3) Review an algorithmic approach for evaluating spinal, head and neck, and intracranial imaging findings in the setting of suspected neurological emergencies. \*Course Description The radiologist plays a critical role in the evaluation, triage, and management planning for patients with neurological emergencies. Often, subtle imaging findings on CT and MRI are important for accurate diagnosis, timely triage, and appropriate management of patients with neurological emergencies. The primary focus of this session is to familiarize the radiologist with the spectrum of imaging findings that must be included in the search pattern for CT and MRI exams of the head, neck, and spine in the setting of non-traumatic neurologic emergency. A case-based approach will be utilized implementing up-to-date classification systems for a variety of neurological emergencies. Evidenced-based indications for obtaining follow-up and/or advanced imaging such as MRI for subtle CT findings will also be emphasized.

### Pediatric Radiology Protocols: Everyday and Advanced Techniques

#### LEARNING OBJECTIVES

1) Recognize indications suitable for real-time MRI in children. 2) Explain technical parameters of photon counting CT using different scan modes, as well as their limitations. 3) Illustrate state-of-the-art cartilage imaging in children.\*Course Description This session will review everyday and advanced imaging techniques in children. Real-time MRI will be discussed as an entirely new imaging option for children, which can significantly reduce the need for sedation. State-of-the-art imaging of pediatric cartilage disorders will be illustrated. Best uses of photon counting CT in children will also be discussed, including technical parameters and protocol details.

**ASRT@RSNA: Reflection in Practice: An Approach for Reducing Patients' Radiation Dose (Supported in part by an Independent Medical Education Grant from Bayer HealthCare Pharmaceuticals Inc.)**

### LEARNING OBJECTIVES

1) Explain reflective practice, its purpose, and the reflective cycle. 2) Discuss the three components of reflective practice and four levels of individual reflection. 3) Apply reflection before, during, and after practice.\*Course Description Reflective practice is a term coined by Donald Schon in the 1980s, which is based in the idea that practitioners should think about what they are doing while they are doing it. Reflective practice is based on identifying a problem and devising ways to address the problem, thereby formulating best practice. It results in the development of profession practice into professional artistry. The reflective cycle, along with the application of the reflection before, during, and after practice, lends the ability to evaluate one's practice critically, thereby reducing errors. This approach can be used to reduce patients' radiation dose. This lecture will address practical applications of reflective practice.

### Peripheral Vascular Imaging

#### LEARNING OBJECTIVES

1) Understand the principles, techniques, and roles of peripheral vascular CTA and MRA. 2) Characterize vascular pathologies in thoracic outlet syndrome (TOS) and peripheral arterial disease (PAD). 3) Understand clinical implications and applications of peripheral vascular imaging in endovascular treatment planning.\*Course Description This educational course emphasizes the importance of peripheral vascular imaging in diagnosing and characterizing vascular conditions affecting the upper and lower extremities and highlights how vascular imaging contributes to endovascular treatment planning. Global peripheral vascular disease burden is high and substantially contributes to major cardiovascular event rate. With increasing endovascular treatment options, anatomic assessment is important. Imaging peripheral vessels, however, presents significant challenges, requiring a comprehensive understanding of acquisition techniques for optimal patient assessment. Participate and gain insights to support clinical decisions effectively.

### RSNA/ESR Symposium: Imaging of Neurodegenerative Disorders - Movement Disorders

#### LEARNING OBJECTIVES

1) Explain the current use of MRI in Lewy body disease and movement disorders. 2) Explain the current use of molecular imaging in Lewy body disease and movement disorders. 3) Demonstrate structured selection and assessment of imaging exams through cases.\*Course Description Structural MRI and molecular imaging techniques are key modalities in the diagnosis (and increasingly also in early detection) of neurodegenerative disorders. This session is part of an educational ESR-RSNA transatlantic course (of 4 sessions in total) that discusses imaging in neurodegeneration, from basics to advanced applications. This third educational session will discuss how MRI and molecular imaging techniques can be used to understand the underlying pathology in patients with Parkinson's Disease, atypical parkinsonism and other movement disorders. This session will give general radiologists and those interested in neuroradiology and nuclear medicine/molecular imaging the knowledge needed for appropriate selection and structured assessment of imaging exams in diagnostic work-up of movement disorders. The session format consists of in part lectures, followed by an interactive case-based discussion.

#### COURSE DESCRIPTION

Structural MRI and molecular imaging techniques are key modalities in the diagnosis (and increasingly also in early detection) of neurodegenerative disorders. This session is part of an educational ESR-RSNA transatlantic course (of 4 sessions in total) that discusses imaging in neurodegeneration, from basics to advanced applications. This third educational session will discuss how MRI and molecular imaging techniques can be used to understand the underlying pathology in patients with Parkinson's Disease, atypical parkinsonism and other movement disorders. This session will give general radiologists and those interested in neuroradiology and nuclear medicine/molecular imaging the knowledge needed for appropriate selection and structured assessment of imaging exams in diagnostic work-up of movement disorders. The session format consists of in part lectures, followed by an interactive case-based discussion.

### Dysarthria: Hypoglossal Nerve Palsy

#### Participants

Xin Wu, MD, San Francisco, CA (*Presenter*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Identify various causes of cranial nerve deficits based on clinical features and imaging findings.\*  
\*Course Description This lecture series will explore various clinical imaging scenarios with special focus on cranial neuropathies. Several classic entities as well as more rare pathologies will be shared on this whirlwind through the skull base! Come join us to deepen your understanding (and enjoyment) of Head & Neck imaging!

#### COURSE DESCRIPTION

### Writing AI Abstracts: Tips for Success

#### LEARNING OBJECTIVES

1) Understand key elements of an abstract on artificial intelligence (AI) in imaging. 2) Learn to structure an abstract using pertinent components of the Checklist for Artificial Intelligence in Medical Imaging (CLAIM). 3) Identify and correct errors in example imaging AI abstracts. 4) Evaluate example abstracts to augment one's skills as a reviewer.\*Course Description It can be daunting to write a concise, yet sufficiently detailed abstract about a radiology artificial intelligence (AI) application. Abstracts often lack key information that allows readers to determine the quality and reproducibility of the submitted work. This session will help participants improve the quality of abstracts they submit to journals and conferences. Presenters will introduce the Checklist for Artificial Intelligence in Medical Imaging (CLAIM), share their experiences as AI abstract reviewers, describe best practices, and identify frequently seen errors. Participants will be equipped to build upon this course's lessons to write high-quality abstracts and to serve as abstract reviewers. This session will feature both a discussion with an expert panel and an interactive session to allow participants to evaluate and edit intentionally flawed AI abstracts.

### Criteria for Resectability for Metastatic Disease of the Liver

#### Participants

Kiran Turaga, New Haven, CT (*Presenter*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Explain current criteria used to determine whether patients with liver metastases can undergo surgical resection. 2) Explain how hepatic venous deprivation is performed and when it should be used to induce pre-operative liver hypertrophy. 3) Be familiar with current clinical outcome data for thermal ablation, TACE, and Y90-TARE used to treat intrahepatic cholangiocarcinoma and colorectal liver metastases. 4) Explain how Interventional Radiology treatments are used in locally-advanced and metastatic pancreatic cancer.\*Course Description Interventional and surgical treatments for cholangiocarcinoma, hepatic colorectal metastases, and pancreatic cancer can lead to good clinical outcomes in well-selected patients. This lecture-based course will review how Interventional Oncology, Surgery, and Combined approaches are applied in these cancers, and the current clinical data in each of these diseases. Attendees of this course will learn how interventional radiology and surgery can be used and combined to achieve optimal patient outcomes, and will be familiar with the most recent literature on these approaches.

### Neuroendocrine Theranostics

#### LEARNING OBJECTIVES

- 1) Learn applications, pitfalls, and recommendations for imaging neuroendocrine neoplasms with DOTATATE and MIBG radiotracers.
- 2) Understand clinical applications, patient selection, and the different practical aspects of treating patients with <sup>177</sup>Lu-DOTATATE and <sup>131</sup>I-MIBG radiopharmaceuticals.\*Course Description This course will include two lectures followed by a panel discussion. Theranostic approaches have been used to treat neuroendocrine tumors for decades, first using MIBG for imaging and therapy, and more recently somatostatin receptor based imaging and therapy with DOTATATE. This course will provide an update on the imaging and patient selection as well as practical aspects of providing these treatments.

#### COURSE DESCRIPTION

### A Brief Introduction to Economic Evaluation for Imaging

#### Participants

Stella Kang, MD, MSc, New York, NY (*Presenter*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Describe principles of cost effectiveness analysis, one of the major forms of economic evaluation. 2) Identify economic tools and methods to convey programmatic costs and projected impact on desired clinical goals. 3) Understand the role of economic evaluation in shaping policies and clinical practice internationally. \*Course Description How do we allocate resources towards programs and strategies that will make the biggest impact on gains in health? In this course, participants will understand principles underlying economic evaluation for healthcare. We will describe cost effectiveness analysis and its roots in outcomes as well as costs (both as an input and as an output reflecting downstream effects). We will also explore the forms of economic analyses that influence health policy and practices, both by government and locally by decision-makers of health systems. Practical tools and applications for imagers will be a major emphasis of the session.

##### W7-CRT02 Leading and Developing Remote Imaging in a Radiology Department

#### Participants

Paul McElvogue, ARRT, Gold Canyon, AZ (*Presenter*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Understand the general challenges and benefits of remote imaging. 2) Identify safety and regulatory aspects of remote imaging. 3) Develop and implement a plan to incorporate remote technology in your radiology department or imaging center.\*Course Description Remote Scanning or Remote Imaging has been an increasingly important topic of radiology meetings and discussion boards, especially regarding CT and MRI. With the technical improvements over the years, it has become feasible to image a patient from a remote location. This session will discuss the overall challenges and benefits of remote scanning in the radiology department, as well as the various leadership perceptions of remote scanning, from vendor solutions to the technologists' implementation of the technology. Our discussion will also include the important safety aspects of remote scanning in general terms for radiology and more specific details of safety regulations with CT and MRI. Other topics will include how remote imaging currently and, in the future, can serve as an adjunct in supporting leaders' ability to increase staff coverage, competence, retention, and improved department safety profiles.

#### COURSE DESCRIPTION

Remote Scanning or Remote Imaging has been an increasingly important topic of radiology meetings and discussion boards, especially regarding CT and MRI. With the technical improvements over the years, it has become feasible to image a patient from a remote location. This session will discuss the overall challenges and benefits of remote scanning in the radiology department, as well as the various leadership perceptions of remote scanning, from vendor solutions to the technologists' implementation of the technology. Our discussion will also include the important safety aspects of remote scanning in general terms for radiology and more specific details of safety regulations with CT and MRI. Other topics will include how remote imaging currently and, in the future, can serve as an adjunct in supporting leaders' ability to increase staff coverage, competence, retention, and improved department safety profiles.

### Leading and Developing Remote Imaging in a Radiology Department

#### Participants

Paul McElvogue, ARRT, Gold Canyon, AZ (*Presenter*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Understand the general challenges and benefits of remote imaging. 2) Identify safety and regulatory aspects of remote imaging. 3) Develop and implement a plan to incorporate remote technology in your radiology department or imaging center.\*Course Description Remote Scanning or Remote Imaging has been an increasingly important topic of radiology meetings and discussion boards, especially regarding CT and MRI. With the technical improvements over the years, it has become feasible to image a patient from a remote location. This session will discuss the overall challenges and benefits of remote scanning in the radiology department, as well as the various leadership perceptions of remote scanning, from vendor solutions to the technologists' implementation of the technology. ### The Future of your Dementia Imaging Practice: MRI

#### Participants

Yoshimi Anzai, MD, MPH, Salt Lake City, UT (*Presenter*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) To describe the changing role of anatomical and molecular imaging for patients with neurodegenerative disorders, and the shift from nosological diagnosis to a biomarker-defined diagnosis. 2) To identify newest developments in PET tracers for specific neurodegenerative diseases. 3) To explain the role of advances in AI and imaging hardware in the diagnosis of neurodegenerative disease.\*Course Description Structural MRI and molecular imaging techniques are key modalities in the diagnosis (and increasingly also in early detection) of neurodegenerative disorders. This session is part of an educational ESR-RSNA transatlantic course (of 4 sessions in total) that discusses imaging in neurodegeneration, from basics to advanced applications. This final educational session will give a broader perspective of in which direction the field of imaging in neurodegeneration is moving, including biomarker-based diagnoses, advanced hardware and software applications for novel imaging and AI-based diagnoses.

### Opportunities for Community Engagement in Radiology Research

#### Participants

Lucy Spalluto, MD, MPH, Nashville, TN (*Presenter*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Participants will learn the best practices to foster trust and longitudinal relationships to establish meaningful partnerships between key community members and enhance effectiveness of collaborations. 2) Participants will be able to identify how to effectively engage with patients and community members to identify the social determinants of health that influence access to radiology care in their practice. 3) Participants will learn to bring in a cultural lens to community engagement to foster bi-directional learning, learn to acknowledge and respect the distinctive values of individuals coming from diverse communities. 4) Participants will be able to describe the importance of Community-Based Participatory Research in health equity efforts and other community-based grass roots efforts and outreach that can be employed in the advancement of program development to advance health equity.\*Course Description In many instances, radiologists are seeking opportunities to learn practical ways to engage in community outreach in their practices. This session will provide participants with an opportunity to participate in an interactive session with radiologists and community organizations that have successfully established meaningful partnerships that foster trust and longitudinal partnerships to advance health equity and care delivery transformation in radiology. Radiology practices and the communities of the patients they serve are directly impacted by the social determinants of health that influence their radiology care. Radiology is a leader in healthcare innovation and care delivery transformation, but often the communities served are not included in the creative process or implementation of novel care models and technologies aimed to benefit them. Therefore, the implementation of new technologies in radiology without the input of the community creates a disconnect that ultimately results in the health disparities we see in our radiology practices. Meaningful community engagement requires working transdisciplinary collaborations that breaks silos between healthcare, public health, and community health sectors. This type of engagement is one that foster trusts and sustainable relationships that result in community partnerships and coalitions across healthcare organizations to serve as catalysts for transformational change in radiology. Thus, the purpose of this session is to engage in an interactive session with the audience and members of the panel in a discussion on how to successfully form community partnerships between radiologists and community organizations. The Chicago Southwest Organizing Project (SWOP) is a local transdisciplinary community organization that is collaborating with the RSNA Health Equity Committee representative members will be invited to participate in this session as well as radiologists that have successfully established community relationships in their practices and improve access to care. Leveraging the National Academy of Medicine framework for Health Equity and Community Engagement, topics to be covered will include: 1. Strengthening Community Partnerships Through Diversity, Inclusion and Trust 2. Designing and Implementing community-aligned programs to increase access to care. 3. Culturally-centered, sustainable partnerships to foster bi-directional learning 4. The role of community-based participatory research in guiding health equity efforts. 5. Transforming the radiology education experience and fostering well-being through community outreach experiences.

### Case Based Review: Challenging Cases with Focus on DBT

#### Participants

Steven P. Poplack, MD, Redwood City, CA (*Presenter*) Faculty, Ultimate Opinions in Medicine LLC; Speaker, Efficiency Learning Systems Inc

#### LEARNING OBJECTIVES

1) Recognize digital tomosynthesis artifacts that mimic breast cancer. 2) Define the role of breast ultrasound in personalized breast cancer screening. 3) Understand when and how MRI can help manage patients presenting with breast symptoms.\*Course Description This is a case-based interactive educational session focused on challenging breast imaging cases. Each presentation will highlight diagnostic challenges and / or potential pitfalls inherent to each modality (DBT, US, MRI). This is relevant to clinical practice, wherein recognition of interpretive challenges is critical to establishing appropriate differential diagnosis and management. Whenever possible speakers will relate discussion and learning points to accepted peer reviewed standards. We look forward to a thought provoking session with active audience participation.

#### LEARNING OBJECTIVES

1) Describe health equity as a Joint Commission national patient safety goal. 2) Explore ways in which radiology practices can contribute to achieving health equity. 3) Understand state of the EU for ER and discuss challenges to its growth and success. 4) Discuss sustainability and explore the business case for growing a thriving ER practice. 5) Realize the shared goals, values, and mission of ER in the US and Europe.\*Course Description As Emergency Radiology continues its growth and expansion in the US and around the world, its singular vantage point at the intersection of healthcare for all and 24/7 service provision highlights unique challenges in the domains of quality and sustainability, and sparks debate on the costs of doing business. In this session, we focus on health equity as a national patient safety goal, discuss the challenges facing our European colleagues as the global mandate for emergency radiology marches onward, and explore the business case for sustainability in successful ER practices.

#### COURSE DESCRIPTION

As Emergency Radiology continues its growth and expansion in the US and around the world, its singular vantage point at the intersection of healthcare for all and 24/7 service provision highlights unique challenges in the domains of quality and sustainability, and sparks debate on the costs of doing business. In this session, we focus on health equity as a national patient safety goal, discuss the challenges facing our European colleagues as the global mandate for emergency radiology marches onward, and explore the business case for sustainability in successful ER practices.

### Case-Based Review of GI

#### LEARNING OBJECTIVES

1) Review a series of cases using interactive technology with the audience of various challenging patients. 2) Review a variety of disorders of the biliary tract, of COVID in the abdomen, or fluoroscopy applications and demonstration of disorders in the abdomen, and of the spleen and pancreas. 3) Understand the differential diagnosis of these conditions, if there is one, and the implications for patient management.\*Course Description Case-based interactive review of patients at various levels of difficult on various imaging modalities of the abdomen will be reviewed by experienced faculty for several organs/organ systems in the abdomen, with review of the current relevant literature. The expected outcome is that the learner/attendee will understand the differential diagnosis - if there is one (some of the cases may have just one diagnosis), and the implications for patient management.

#### COURSE DESCRIPTION

Case-based interactive review of patients at various levels of difficult on various imaging modalities of the abdomen will be reviewed by experienced faculty for several organs/organ systems in the abdomen, with review of the current relevant literature. The expected outcome is that the learner/attendee will understand the differential diagnosis - if there is one (some of the cases may have just one diagnosis), and the implications for patient management.

### CRASH COURSE! Traumatic Injuries of the Brain, Cerebrovasculature, Orbits, and Skull Base

#### LEARNING OBJECTIVES

1) Review the primary injury patterns of traumatic brain injuries and secondary injuries that can occur as complications of mass effect and herniation. When to use advanced neuroimaging as well as Identify and describe the mechanism associated with traumatic cerebrovascular injuries. 2) Review the imaging manifestations of various traumatic injuries of the orbits, potential complications, and the current imaging approach for evaluation. 3) Review the imaging manifestations of various traumatic injuries of the temporal bones, potential complications, and the current imaging approach for evaluation.\*Course Description This session is comprised of 4 high-yield lectures focused on the spectrum of traumatic imaging findings related to the brain, cerebrovasculature, orbits, and temporal bones. Discussion will address the relevant anatomy, interesting cases, potential complications, and current imaging strategies for evaluating these injuries.

### Practical Aspects of MRI

#### LEARNING OBJECTIVES

1) Describe how differences in contrast can be induced by the selection of particular pulse sequence settings to differentiate tissues using MRI. 2) Explain how data collection in MRI is related to image resolution and scan time, and make practical tradeoffs between these factors. 3) Describe several common artifacts encountered in MRI, what causes them, and how to mitigate them.\*Course Description In this course, comprised of three 20-minute lectures, practical aspects of deploying Magnetic Resonance Imaging will be discussed. The aim of this course is to help radiologists to better understand the basics of MRI, and why clinical MRI exams are structured the way that they are. A detailed understanding of MRI physics is not required. MRI is complex due to the large number of parameters that can be adjusted and the unexpected artifacts that can arise, especially in the presence of motion. Determining an appropriate protocol for a clinical question balances the need for contrast between healthy and diseased tissue, the speed of the individual sequences, exam length, and the incremental diagnostic utility provided by adding to the protocol. This course will tackle these questions by focusing on three topics: 1) image contrast, and how it is generated and used to discriminate different tissues; 2) image resolution and how it relates to data collection, and 3) common artifacts, their causes, and how to mitigate them.

##### R4-PL07 Moderator

###### Participants

Guang-Hong Chen, PhD, Madison, WI (*Moderator*) Nothing to Disclose

##### R4-PL07 Total Body PET Imaging (Technical)

###### Participants

Simon R. Cherry, PhD, Davis, CA (*Presenter*) Research Grant, Canon Medical Systems Corporation; Researcher, Shanghai United Imaging Healthcare Co, Ltd; Support, Shanghai United Imaging Healthcare Co, Ltd;

#### LEARNING OBJECTIVES

1) Explain how the technological developers can work with clinical radiologists to impact current and future clinical care.

#### COURSE DESCRIPTION

Radiologists employ innovative imaging technologies to conduct clinical diagnoses, while developers specializing in medical physics and biomedical imaging relentlessly introduce new concepts and techniques to optimize patient care. However, outstanding ideas and technological notions do not always translate into clinically viable products for real-world practice. Consequently, technological innovators and clinicians must collaborate synergistically to realize a shared goal: enhancing patient care. For the past three years, this objective has been the focal point of the RSNA/AAPM Plenary sessions. This year, we aim to showcase another successful collaboration that brought total-body PET imaging to clinical practices.

### Total Body PET Imaging (Technical)

#### Participants

Simon R. Cherry, PhD, Davis, CA (*Presenter*) Research Grant, Canon Medical Systems Corporation; Researcher, Shanghai United Imaging Healthcare Co, Ltd; Support, Shanghai United Imaging Healthcare Co, Ltd;

#### LEARNING OBJECTIVES

1) Explain how the technological developers can work with clinical radiologists to impact current and future clinical care.

#### COURSE DESCRIPTION

Radiologists employ innovative imaging technologies to conduct clinical diagnoses, while developers specializing in medical physics and biomedical imaging relentlessly introduce new concepts and techniques to optimize patient care. However, outstanding ideas and technological notions do not always translate into clinically viable products for real-world practice. Consequently, technological innovators and clinicians must collaborate synergistically to realize a shared goal: enhancing patient care. For the past three years, this objective has been the focal point of the RSNA/AAPM Plenary sessions. This year, we aim to showcase another successful collaboration that brought total-body PET imaging to clinical practices.

### Plenary Session Game Show: Oncology Imaging and Interventions: The Radiology Jeopardy

#### LEARNING OBJECTIVES

1) Explore the latest advancements in oncology imaging modalities: Understand the recent breakthroughs in imaging technologies and their application in the diagnosis and staging of various malignancies. 2) Stay updated on evidence-based practice in radiation oncology: Review recent clinical trials that have influenced the standard of care and the implications of these findings on treatment decision-making and patient outcomes. 3) Gain insights into functional and molecular imaging: Learn about novel imaging techniques, including diffusion-weighted imaging (DWI), perfusion imaging, spectroscopy, and radiomics, and understand their utility in evaluating tumor heterogeneity, angiogenesis, metabolic activity, and treatment response. 4) Identify emerging trends in image-guided interventions: Discover the evolving role of interventional oncology in minimally invasive tumor treatments and understand the current challenges and future prospects in this domain. 5) Discuss the multidisciplinary approach to oncology imaging and interventions: Recognize the importance of collaboration among radiologists, oncologists, surgeons, and pathologists to optimize patient care through integrated imaging protocols, clinical decision support systems, and standardized reporting.

#### COURSE DESCRIPTION

The plenary session is a comprehensive educational opportunity that focuses on the latest developments, cutting-edge technologies, and emerging trends in the field of oncology imaging and intervention. Attendees will be provided with a rich learning experience that explores innovative imaging techniques and their impact on cancer diagnosis, treatment planning, and therapies presented in a game-show format with participation of leading experts in the fields of Diagnostic Radiology, Interventional Radiology, Radiation Oncology and Nuclear Medicine.

### Quality Improvement Reports Monday Poster Discussions

#### Sub-Events

#### **M2-QI-1 Expanded Scope of Practice Fellowships for Radiologists: a Survey of Interest Amongst Current Canadian Radiology Residents**

##### Participants

Nick Maizlin, MD, London, ON (*Presenter*) Nothing to Disclose

##### **METHODS**

Using the Canadian family medicine Enhanced Skills Program as a model, we conducted a Canada-wide survey of radiology residents to assess interest in additional fellowship training to expand their scope of practice. We undertook a national survey of radiology residents in Canada to determine their interest in completing further fellowship training in expanded scope of practice fellowships (referred to herein as "clinical fellowship"). We define a "clinical fellowship" as distinct from traditional diagnostic imaging and interventional fellowships and include low risk anesthesia, non-surgical breast disease, cancer screening, chronic pain, clinician scholar, diabetes and wound care, emergency medicine, hospital medicine, incidentaloma management, low risk obstetrics, medical oncology, palliative care, public or environmental health, renal stone disease, sports and exercise medicine, vascular/atherosclerosis medicine and "other", where we queried resident's interest.

##### **RESULTS**

Our results indicate that a majority of residents (69.2%) would like to routinely see patients in clinic and more than half (52%) are willing to undergo an additional year of fellowship to enhance their skill set. The most popular choices for such fellowships were sports medicine (22.8%), emergency medicine (19.6%) and vascular medicine (18.5%). In addition, a majority (52.9%) of residents felt capable of offering incidentaloma clinics without additional training beyond their core radiology residency. \*Discussion Traditional diagnostic and interventional radiology fellowships must be reconsidered to reflect the interests and capabilities of modern radiology trainees. Expansion of training options into the domain of direct patient management will likely prove popular among current residents.

#### **M2-QI-2 Effect of standardization on time spent by patients in recovery nursing units after interventional radiology procedures**

##### Participants

Ashok Srinivasan, MD, Ann Arbor, MI (*Presenter*) Nothing to Disclose

##### **METHODS**

Post procedural recovery units at our institution cater to 3 cohorts of patients: Vascular interventional radiology (VIR), Neurointerventional Radiology (NIR) and Neurodiagnostic Radiology (NDR). A list of all procedures performed in each of the 3 areas was compiled and sent to the respective services to create a consensus list for recovery times per procedure. The final list was circulated to the proceduralist teams and nursing teams in recovery units for implementation. We monitored the overall time spent by patients in recovery units in each cohort before and after implementation. We also monitored risk reports prior to and after implementation to determine if there was any change in number or types of complications. Lastly, informal surveys of the nursing staff were conducted to understand whether standardization changed the frequency of phone calls to clarify orders.

##### **RESULTS**

Pre implementation spanned Jan-Dec 2021 and post implementation Jan-Dec 2022. Our data demonstrated the following pre and post implementation recovery times (in minutes): - MEDIAN: Overall (56 vs 49), NIR (140 vs 134), NDR (123 vs 61), VIR (45 vs 45) AVERAGE: Overall (85 vs 73), NIR (154 vs 143), NDR (119 vs 61), VIR (69 vs 66) There were no changes in the number of risk reports related to post procedural complications after implementation. Informal surveys of the nursing staff post implementation revealed a significant drop in phone calls placed for order clarification. \*Discussion Post implementation, greater than 10% reduction in average and median times was achieved overall for all procedures. The largest effect was seen in NDR procedures with nearly 50% reduction (both median average) whereas the change in NIR procedures was 4/8% (median/average) and VIR procedures was 0/4% (median/average). Our results probably indicate that standardization can work in reducing variations but have limitations as well; the impact may be different from segment to segment based on the degree of pre-existing variations. However, even in areas where standardization did not change the times substantially, there was tangible benefit in terms of eliminating many phone calls for order clarification.

#### **M2-QI-3 Quality Improvement of Transcatheter Aortic Valve Replacement With Femoral Access: Identifying The Femoral Artery Bifurcation Using CT and 3D Modeling**

##### **METHODS**

The protocol involved radiologists identifying the location of the femoral artery bifurcation relative to the inguinal ligament using CT with contrast and communicating it to interventional cardiologists through a report on eRecord as well as a visual representation from the university's 3D lab. The interventional cardiologists then used this information to determine whether there was an access

site of adequate length for femoral access or if the femoral bifurcation was too high. In this scenario, they would avoid the femoral vessel.

## RESULTS

The implementation of the protocol led to greater confidence with femoral vessel access among cardiac proceduralists by adding an extra check to the existing methods of physical exam and ultrasound to prevent retroperitoneal bleeds. It led to a reduction in the incidence of retroperitoneal hematomas during TAVR procedures using femoral access with 0.47% of procedures resulting in a retroperitoneal hematoma from 2012 to 2016 compared to 0.29% from 2017 to 2023, representing a marked improvement in patient safety. Proceduralists at the institution continue to rely on the model between multidisciplinary meetings and the day of the procedure to inform their choice of access.\*Discussion The implementation of the protocol highlights the importance of effective communication and collaboration between radiologists and interventional cardiologists during TAVR procedures using femoral access. By ensuring clear communication between radiologists and proceduralists and creating 3D visual models as reference, patients can receive safer care with more safety measures to prevent retroperitoneal bleeds in TAVR procedures. This protocol can serve as a model for improving planning and reducing complications during other vascular procedures.

### M2-QI-4 Assessment Driven Approach to Integrating Volumetric Software for MRI in Dementia

Participants

Michelle Pisa, DO, Andover, MA (*Presenter*) Nothing to Disclose

## METHODS

We used an AI platform (Blackford) to sequentially enable QR from two different software vendors, Cortechs.ai (NeuroQuant Age-related Atrophy) and Icometrix (Icobrain DM). For both products, the manufacturer-specified imaging sequence was incorporated into our existing MRI Dementia protocol. The routine MR images were interpreted by 1 of 6 CAQ-certified Neuroradiologists. Several months later, they were presented with the corresponding QR, asked to re-review the MRI exam in context, and prompted with a questionnaire to assess the impact of the QR on their original interpretation. The QR was also sent to 1 of 4 participating Neurologists, who were asked to review the routine MR images, the QR, and prompted with a questionnaire to assess the impact of the QR on the imaging interpretation and their clinical management.

## RESULTS

For Radiologists and Neurologists, the QR presented from both products affected the interpretation of the conventional MRI imaging in 1 of every 4/5 cases (19-29%). The most frequently reported change was the detection of atrophy, in particular hippocampal atrophy. For both products, and compared with Radiologists, the Neurologists indicated increased confidence in both the imaging exam and the interpretation with the addition of the QR. For both products, Neurologists indicated the influence of QR on their clinical interpretation in 9 out of 10 cases (90-97%), with a strong influence in 1 out of 3 cases (27-37%). Neurologists also indicated a change in management in 1 of 3 cases (27-34%) based on the input of QR.\*Discussion Addition of QR affected the MR imaging interpretation for both Neurologists and Neuroradiologists, mainly with regard to hippocampal atrophy. Neurologists indicated a stronger influence of the additional data on their interpretation of the MRI and on clinical management. Assessment data was used to inform the purchasing decision, establish interpretation standards, and outline a clinical workflow.

### M2-QI-5 Implementation of a structured observership program for improving recruitment of radiology trainees: A novel analysis

## METHODS

Over the course of one year, our department of radiology ran a programme for rotating junior doctors. A feedback form was distributed. Candidates were asked multiple of questions, including ranking options on a Likert scale and free text responses.

## RESULTS

A total of 22 responses were obtained. 100% met their aims. The experience influenced the likelihood of applying to radiology in 92% of respondents; 4% were less likely to apply, 88% were more likely to apply for a radiology program. All sessions were well received. Interventional radiology was the highest rated activity (83% very satisfied), followed by emergency room duty radiology (75% very satisfied) and acute CT reporting (69% very satisfied). Free text comments suggested that participants found the MDT difficult to engage with and experienced lower levels of satisfaction compared to other activities.\*Discussion All participants met their aim. A total of 88% of participants were more likely to apply for Radiology, supporting the evidence that an observership is an influential factor in specialty selection. The high satisfaction with IR demonstrates that practical opportunities were very well received. The same trend was not observed for ultrasound. Simulation offers a potential adjunctive solution. Generally, participants were most satisfied with one-to-one sessions. This highlights the importance of a named mentor, and adds further support that role models are a crucial part of the experience. The MDT content was too advanced their level, highlighting an educational gap. Future work should identify strategies to improve engagement with this activity e.g. virtual MDTs to present practice cases. In conclusion, providing high value educational opportunities is vital to ensure future recruitment to radiology. To our knowledge, our study is the first to analyse the activities within an observership week. Maximising engagement and participation as well as role models are crucial in these settings.

### M2-QI-6 Reducing Unnecessary OR Calls Related to Specimen Imaging

Participants

Shannon Lanzo, MD, Stanford, CA (*Presenter*) Nothing to Disclose

Uzma Waheed, MD, (*Presenter*) Consultant, Becton, Dickinson and Company

## METHODS

At our center, specimen imaging is performed in the OR by surgical staff on a dedicated specimen x-ray unit. Surgical staff transfer tissue to the specimen radiograph unit, select the correct patient/accession number, obtain the image, which is sent to PACS, and call the breast imaging on-call phone to discuss results with the breast radiologist. Should technical issues arise during this process, the OR staff calls the lead breast imaging technologist for assistance. During 5-day data collection periods, the breast radiologists and lead breast imaging technologist completed a standardized form when they received unnecessary phone calls including: images not available in PACS, images in the wrong accession number, or calling the wrong phone number for image interpretation. These forms were compiled and reviewed, and a root cause analysis was performed. Unnecessary calls were categorized into workflow error and equipment error. We then designed and implemented interventions targeted to address these causes including updated signage, and easy to read operating instructions for specimen radiograph units.

## RESULTS

Pre-intervention data showed 17 OR specimen radiographs were ordered in a 5-day period. 35% (6/17) of OR specimen had unnecessary phone calls. 83% (5/6) of calls were workflow related and 17% (1/6) were equipment error. Our interventions were aimed at improving workflow by (1) providing clear, written instructions for OR staff and (2) promoting engagement with OR staff, (3) creating reference user-guides posted in the OR and (4) providing OR technologist in-service training. These interventions reduced unnecessary OR specimen phone calls from 35% to 0% between December 2022 and April 2023.\*Discussion With multidisciplinary engagement and basic interventions, we were able to reduce unnecessary interruptions in our department from 35% to 0%. These interventions enabled OR staff to independently troubleshoot prior to engaging with the breast imaging department.Limitations: Our OR specimen workflow may not be consistent with all breast imaging/surgery departments. Our data collection periods were short (5 days) with a small sample size. We did not directly measure time savings achieved by workflow improvements.

### **M2-QI-7 New Approach to Staff Performance Evaluation- A Proof of Concept Pilot**

Participants

Nadja Kadom, MD, Atlanta, GA (*Presenter*) Nothing to Disclose

## METHODS

Context and Intervention: The new performance evaluation system was piloted throughout 2022 at one of our Healthcare System sites ("test site"). Staff are evaluated on a number of metrics reflecting various experience levels (Figure 1).Study of the Intervention: We compared retention rates and distribution of performance categories between the test site and another site ("comparison site") from 2020 through 2022.Measures/Metrics: Retention rates, Percent of performance ratings in the categories: (1) Needs improvement, (2) Meets expectations, (3) Does NOT meet expectations, (4) Exceeds expectations, (5) Commendable.Analysis: We used staff retention rates and staff engagement scores and simple descriptive statistics

## RESULTS

Retention rates: After a significant decrease in staff retention in 2020 and 2021, the test site almost completely recovered to pre-pandemic retention rates in 2022. The comparison site experienced only a minimal decrease in the retention rate in 2021, but a dramatic drop in 2022. Performance categories in 2022: The test site added a new performance category of "commendable" and almost 10% of staff met the criteria for this category, the comparison site did not have this category. Staff at the test site met the criteria for "exceeds expectations" in almost 35%, while this category was met by only 21% of staff at the comparison site. The "needs improvement" category applied to 4% at the test site versus 11% at the comparison site. In addition, the staff engagement scores (maximum score 5.0), unavailable for 2020) continuously improved at the test site (2019: 3.65, 2021:4.16, 2022: 4.25) while they trended downward at the comparison site (2019: 4.04, 2021: 3.83, 2022: 3.78).\*Discussion We successfully piloted a new performance evaluation system at one of our radiology service sites. We developed a set of performance metrics with definitions and explanations on how performance is measured and that was shared with our staff. The data has us hypothesize that the new process may have an effect on higher retention and that it may serve as a driver for better employee performance. Engagement scores at the test site are more favorable, which could, at least in part, be attributed to the new performance evaluation system.

The largest effect was seen in NDR procedures with nearly 50% reduction (both median average) whereas the change in NIR procedures was 4/8% (median/average) and VIR procedures was 0/4% (median/average). Our results probably indicate that standardization can work in reducing variations but have limitations as well; the impact may be different from segment to segment based on the degree of pre-existing variations. However, even in areas where standardization did not change the times substantially, there was tangible benefit in terms of eliminating many phone calls placed for order clarification.

### Quality Improvement of Transcatheter Aortic Valve Replacement With Femoral Access: Identifying The Femoral Artery Bifurcation Using CT and 3D Modeling

#### METHODS

The protocol involved radiologists identifying the location of the femoral artery bifurcation relative to the inguinal ligament using CT with contrast and communicating it to interventional cardiologists through a report on eRecord as well as a visual representation from the university's 3D lab . The interventional cardiologists then used this information to determine whether there was an access site of adequate length for femoral access or if the femoral bifurcation was too high. In this scenario, they would avoid the femoral vessel.

#### RESULTS

The implementation of the protocol led to greater confidence with femoral vessel access among cardiac proceduralists by adding an extra check to the existing methods of physical exam and ultrasound to prevent retroperitoneal bleeds. It led to a reduction in the incidence of retroperitoneal hematomas during TAVR procedures using femoral access with 0.47% of procedures resulting in a retroperitoneal hematoma from 2012 to 2016 compared to 0.29% from 2017 to 2023, representing a marked improvement in patient safety. Proceduralists at the institution continue to rely on the model between multidisciplinary meetings and the day of the procedure to inform their choice of access.\*Discussion The implementation of the protocol highlights the importance of effective communication and collaboration between radiologists and interventional cardiologists during TAVR procedures using femoral access. By ensuring clear communication between radiologists and proceduralists and creating 3D visual models as reference, patients can receive safer care with more safety measures to prevent retroperitoneal bleeds in TAVR procedures. This protocol can serve as a model for improving planning and reducing complications during other vascular procedures.

### Assessment Driven Approach to Integrating Volumetric Software for MRI in Dementia

#### Participants

Michelle Pisa, DO, Andover, MA (*Presenter*) Nothing to Disclose

#### METHODS

We used an Ai platform (Blackford) to sequentially enable QR from two different software vendors, Cortechs.ai (NeuroQuant Age-related Atrophy) and Icometrix (Icobrain DM). For both products, the manufacturer-specified imaging sequence was incorporated into our existing MRI Dementia protocol. The routine MR images were interpreted by 1 of 6 CAQ-certified Neuroradiologists. Several months later, they were presented with the corresponding QR, asked to re-review the MRI exam in context, and prompted with a questionnaire to assess the impact of the QR on their original interpretation. The QR was also sent to 1 of 4 participating Neurologists, who were asked to review the routine MR images, the QR, and prompted with a questionnaire to assess the impact of the QR on the imaging interpretation and their clinical management.

#### RESULTS

For Radiologists and Neurologists, the QR presented from both products affected the interpretation of the conventional MRI imaging in 1 of every 4/5 cases (19-29%). The most frequently reported change was the detection of atrophy, in particular hippocampal atrophy. For both products, and compared with Radiologists, the Neurologists indicated increased confidence in both the imaging exam and the interpretation with the addition of the QR. For both products, Neurologists indicated the influence of QR on their clinical interpretation in 9 out of 10 cases (90-97%), with a strong influence in 1 out of 3 cases (27-37%). Neurologists also indicated a change in management in 1 of 3 cases (27-34%) based on the input of QR.\*Discussion Addition of QR affected the MR imaging interpretation for both Neurologists and Neuroradiologists, mainly with regard to hippocampal atrophy. Neurologists indicated a stronger influence of the additional data on their interpretation of the MRI and on clinical management. Assessment data was used to inform the purchasing decision, establish interpretation standards, and outline a clinical workflow.

### Implementation of a structured observership program for improving recruitment of radiology trainees: A novel analysis

#### METHODS

Over the course of one year, our department of radiology ran a programme for rotating junior doctors. A feedback form was distributed. Candidates were asked multiple of questions, including ranking options on a Likert scale and free text responses.

#### RESULTS

A total of 22 responses were obtained. 100% met their aims. The experience influenced the likelihood of applying to radiology in 92% of respondents; 4% were less likely to apply, 88% were more likely to apply for a radiology program. All sessions were well received. Interventional radiology was the highest rated activity (83% very satisfied), followed by emergency room duty radiology (75% very satisfied) and acute CT reporting (69% very satisfied). Free text comments suggested that participants found the MDT difficult to engage with and experienced lower levels of satisfaction compared to other activities. \*Discussion All participants met their aim. A total of 88% of participants were more likely to apply for Radiology, supporting the evidence that an observership is an influential factor in specialty selection. The high satisfaction with IR demonstrates that practical opportunities were very well received. The same trend was not observed for ultrasound. Simulation offers a potential adjunctive solution. Generally, participants were most satisfied with one-to-one sessions. This highlights the importance of a named mentor, and adds further support that role models are a crucial part of the experience. The MDT content was too advanced their level, highlighting an educational gap. Future work should identify strategies to improve engagement with this activity e.g. virtual MDTs to present practice cases. In conclusion, providing high value educational opportunities is vital to ensure future recruitment to radiology. To our knowledge, our study is the first to analyse the activities within an observership week. Maximising engagement and participation as well as role models are crucial in these settings.

M2-QI-6

### Reducing Unnecessary OR Calls Related to Specimen Imaging

#### Participants

Shannon Lanzo, MD, Stanford, CA (*Presenter*) Nothing to Disclose  
Uzma Waheed, MD, (*Presenter*) Consultant, Becton, Dickinson and Company

#### METHODS

At our center, specimen imaging is performed in the OR by surgical staff on a dedicated specimen x-ray unit. Surgical staff transfer tissue to the specimen radiograph unit, select the correct patient/accession number, obtain the image, which is sent to PACS, and call the breast imaging on-call phone to discuss results with the breast radiologist. Should technical issues arise during this process, the OR staff calls the lead breast imaging technologist for assistance. During 5-day data collection periods, the breast radiologists and lead breast imaging technologist completed a standardized form when they received unnecessary phone calls including: images not available in PACS, images in the wrong accession number, or calling the wrong phone number for image interpretation. These forms were compiled and reviewed, and a root cause analysis was performed. Unnecessary calls were categorized into workflow error and equipment error. We then designed and implemented interventions targeted to address these causes including updated signage, and easy to read operating instructions for specimen radiograph units.

#### RESULTS

Pre-intervention data showed 17 OR specimen radiographs were ordered in a 5-day period. 35% (6/17) of OR specimen had unnecessary phone calls. 83% (5/6) of calls were workflow related and 17% (1/6) were equipment error. Our interventions were aimed at improving workflow by (1) providing clear, written instructions for OR staff and (2) promoting engagement with OR staff, (3) creating reference user-guides posted in the OR and (4) providing OR technologist in-service training. These interventions reduced unnecessary OR specimen phone calls from 35% to 0% between December 2022 and April 2023.\*Discussion With multidisciplinary engagement and basic interventions, we were able to reduce unnecessary interruptions in our department from 35% to 0%. These interventions enabled OR staff to independently troubleshoot prior to engaging with the breast imaging department. Limitations: Our OR specimen workflow may not be consistent with all breast imaging/surgery departments. Our data collection periods were short (5 days) with a small sample size. We did not directly measure time savings achieved by workflow improvements.

### New Approach to Staff Performance Evaluation- A Proof of Concept Pilot

#### Participants

Nadja Kadom, MD, Atlanta, GA (*Presenter*) Nothing to Disclose

#### METHODS

**Context and Intervention:** The new performance evaluation system was piloted throughout 2022 at one of our Healthcare System sites ("test site"). Staff are evaluated on a number of metrics reflecting various experience levels (Figure 1).  
**Study of the Intervention:** We compared retention rates and distribution of performance categories between the test site and another site ("comparison site") from 2020 through 2022.  
**Measures/Metrics:** Retention rates, Percent of performance ratings in the categories: (1) Needs improvement, (2) Meets expectations, (3) Does NOT meet expectations, (4) Exceeds expectations, (5) Commendable.  
**Analysis:** We used staff retention rates and staff engagement scores and simple descriptive statistics

#### RESULTS

**Retention rates:** After a significant decrease in staff retention in 2020 and 2021, the test site almost completely recovered to pre-pandemic retention rates in 2022. The comparison site experienced only a minimal decrease in the retention rate in 2021, but a dramatic drop in 2022.  
**Performance categories in 2022:** The test site added a new performance category of "commendable" and almost 10% of staff met the criteria for this category, the comparison site did not have this category. Staff at the test site met the criteria for "exceeds expectations" in almost 35%, while this category was met by only 21% of staff at the comparison site. The "needs improvement" category applied to 4% at the test site versus 11% at the comparison site. In addition, the staff engagement scores (maximum score 5.0), unavailable for 2020) continuously improved at the test site (2019: 3.65, 2021:4.16, 2022: 4.25) while they trended downward at the comparison site (2019: 4.04, 2021: 3.83, 2022: 3.78).  
**\*Discussion** We successfully piloted a new performance evaluation system at one of our radiology service sites. We developed a set of performance metrics with definitions and explanations on how performance is measured and that was shared with our staff. The data has us hypothesize that the new process may have an effect on higher retention and that it may serve as a driver for better employee performance. Engagement scores at the test site are more favorable, which could, at least in part, be attributed to the new performance evaluation system.

### Quality Improvement Reports Monday Poster Discussions I

#### Sub-Events

#### M5A-QI-1 Revamping Feedback from Radiologists to Technologists

##### Participants

Nadja Kadom, MD, Atlanta, GA (*Presenter*) Nothing to Disclose

##### METHODS

**Context and Intervention:** The study was performed in an academic pediatric radiology department. New feedback categories were developed iteratively using a team approach. **Study of the Intervention:** A proposed feedback system containing various feedback categories specific to each modality along with examples for each category and a survey were sent to radiologist modality champions, leaders, technologists, modality managers, and members of the quality team. Respondents rated each category and explanation and were able to submit feedback. **Measures/Metrics:** Survey response rates, agreement rates, and qualitative feedback. **Analysis:** Descriptive statistics were used to analyze survey responses.

##### RESULTS

The survey was sent to 40 members of the department and here were 36 responses inclusive of all imaging modalities, the response rate was 90%. We received 8 suggestions for improvement that were incorporated in the final version of the feedback categories and explanations, otherwise respondents agreed with the proposed categories and explanations/examples. After incorporation of the suggestions from the survey, the final feedback system covers six modalities (CT, MRI, radiography, Ultrasound, fluoroscopy and nuclear medicine) (Table 1). **\*Discussion** We used an iterative interprofessional approach to develop modality specific feedback categories and examples that can be implemented through our electronic medical record system, where each feedback category can be selected as a button, hovering the mouse over the button gives examples for that category, and an open comment box invites the radiologist to add more detail. Technologists felt strongly that the "Excellent!" feedback should be included, but should be defined more clearly. In addition, technologists requested that radiologists can submit interesting learning cases for technologists. The new feedback categories and process reflect a change in our culture that emphasizes learning, coaching, and quality improvement. As a result, our departmental performance assessment policy for technologists was revised.

#### M5A-QI-2 Effect of Financial Incentive on Radiologist Compliance with Quality Metric Placement in Knee Radiograph Reports

##### Participants

Shuda Xia, Plano, TX (*Presenter*) Nothing to Disclose

##### METHODS

Knee x-ray reports stored in our PACS system were searched to determine the percentages of all knee radiograph reports that contained KL grading with standardized follow-up recommendations before and after introduction of the new quality-based incentive bonus. The radiologists were made aware of the new incentive plan in May 2022 during the general faculty meeting and again in June 2022 during the MSK divisional meeting. We compared compliance rates during the first six months of 2022 to the last six months of the same year. Rates of compliance by musculoskeletal radiologists were compared to rates of compliance by general radiologists.

##### RESULTS

There was a 10% increase in KL grading statement compliance by MSK radiologists during the three months immediately after the introduction of the new incentive bonus. Both musculoskeletal radiologists and general radiologists demonstrated steady improvement in compliance over time before and after introduction of incentive plan averaging 2% of improvement per month. Musculoskeletal radiologists' rates of compliance were on average 24% higher than general radiologists. **\*Discussion** Introduction of financial incentives results in accelerated adoption of the required QA practice with steady and progressive improvements, more so among MSK than the non-incentivized general radiologists.

#### M5A-QI-3 Online teaching promotes equity in radiology education by improving outreach and reducing disparity

##### Participants

Akshay Baheti, MD, Mumbai, India (*Presenter*) Nothing to Disclose

##### METHODS

The webinars were conducted on Zoom™ platform as triweekly one-hour sessions (Wednesday, Saturday and Sunday evenings). A national speaker spoke every Wednesday and an international speaker every Sunday, while an interactive case-based session was conducted on Saturdays. No pre-registration was required. The schedule was made available on website, email, Whatsapp, Facebook, Telegram and Twitter. Majority sessions had two-four panelists (speaker and moderators). Attendance related data from the last 307 consecutive webinars was available on Zoom and was downloaded as a .csv file. Unique viewers were defined as those who viewed the webinar via their computers; phone logins were excluded. Attendees who logged in multiple times or using multiple devices were counted only once. Maximum concurrent viewers were defined as the maximum viewers logged in at the same time,

excluding panelists. Country wise login data was available for analysis. The data was analyzed using descriptive statistics.

## RESULTS

307 consecutive webinars by 236 different speakers were conducted between Oct 2020 - Apr 2023. The webinars had a median of 256 unique attendees (mean: 278.5; range: 67-654). They had a median of 194 maximum concurrent viewers (mean: 212.6; range: 46-514). Overall, viewers from a median of 28 countries (mean: 27.6; range:14-41) across all six continents attended the webinars.\*Discussion Our webinars had a median of 256 unique and 194 maximum concurrent attendees from 28 countries. More granular level data as for example audience feedback and duration of attendance per attendee was not available for analysis. Regular online webinars are a sustainable model of radiology education and cut across local, national and international barriers. The individual and country-wise attendance per session exceeds that of most conferences. Educators should consider focusing more on the webinar model of education.

### **M5A-QI-4 Frequency and impact of using incomplete information when assessing patients with active implants for MR scanning**

#### Participants

William Sensakovic, PhD, Cave Creek, AZ (*Presenter*) Nothing to Disclose

#### METHODS

A workflow management system for active implant scanning was implemented in April of 2020. Information in each patient (including vendor device manual) is collected by the MR Safety Officer and sent to the MR Safety Expert for analysis and determination. Summary statistics related to percentage of cases where information was incomplete was determined. Further, whether the incomplete data impacted decisions or scanning was determined. Finally, on December 27th of 2021, a "two-click" option for the MR safety officer to collect the most recent information was implemented. Success of this intervention is determined.

#### RESULTS

The MR safety Officer report was assessed for 755 cases (518 unique patients). The assessing physicist recorded incomplete or incorrect data in 122 cases (16.2%). Of the 122 cases with incomplete/incorrect data 109 cases (89.3%) recorded the reason. Of the cases with a recorded reason 81 cases (74.3%) were due to upload of an outdated manual. The system recorded whether the error/omission could impact decision or scanning in 66 cases (54.1%). Of those, 31 cases (47%) could have impacted decisions or scanning. An improvement to ease access to the most recent manual was implemented. Initially the completion rate plummeted due to increased surveillance of old manuals, but quickly recovered and improved.\*Discussion This project reports rates of incomplete information being used for assessment of MR active implant patients. While the percentage is low, does indicate a potential issue. It identified the largest source of incomplete data (old device manuals) and implemented a method to make pulling manuals easier. The intervention resulted in improvement in of the completion percentage once the new methods diffused through the pool of MR Safety Officers.

### **M5A-QI-5 The Implementation and Impact of a Medical-Student Reading Room Assistant Program**

#### METHODS

Jan 2020- Jun 2020 was utilized to document the extent of interruptions for the Radiology residents. Jun 2020- Aug 2021 was spent creating the RRA position and training modules. Six medical students were selected for the position in Fall 2021 with training completed by May 2022. RRAs worked 5-hour segments on the busiest weekend shifts; data was collected on the position over a subsequent 10-month period. Interruptions, scans protocolled by RRAs, and brief medical student RRA feedback was collected in a survey at the end of each RRA shift. Further feedback on the position was collected from the RRAs 10 months into the program. Data and responses were analyzed.

#### RESULTS

During Jan 2020- Jun 2020, on-call residents were interrupted an average of 10.3 times per hour by incoming pages and clinician calls, technologist questions, protocol requests, and outgoing pages. Over the 10-month data collection period, RRAs responded to 854 incoming calls, 474 pages, 765 technologist questions, and made 688 outgoing calls. They also protocolled 3681 chest CTs, 145 neuro MRIs, and 169 abdominal CTs. Per resident survey responses, 100% reported being better physicians while working with an RRA and preferred the RRA program to continue. The majority of medical student RRAs reported in a survey being "Extremely likely" to apply to Radiology residency positions following involvement with the program. Respondents reported the most valuable aspects of the program to be exposure to Radiology, learning the flow of the reading room, and getting to know the residents.\*Discussion The implementation of the RRA program at our institution was successful and valuable as medical students were able to significantly decrease interruptions, protocol thousands of non-contrast CT and MRI exams, and improve resident reported quality of work. Further, this program allowed medical student RRAs to explore their interest in Radiology and has the benefit of attracting hard-working, motivated candidates to the field.

### **M5A-QI-6 Communicating Urgent Discrepancies Between Preliminary and Final Reports: Increasing Trust Between Radiology and Emergency Departments.**

#### Participants

Andrew Johnston, MD, MBA, Palo Alto, CA (*Presenter*) Nothing to Disclose

#### METHODS

A team of stakeholders from radiology and emergency medicine developed an improvement process via a guided quality improvement curriculum. The team performed a detailed analysis of the current state and identified potential root causes and key drivers. We documented our analysis using a structured problem-solving tool. All radiology reports for studies ordered through the emergency department during the intervention period were queried via the PowerScribe web API and categorized according to modality (cross-sectional or plain film) and type of report discrepancy (no change, non-urgent change, or urgent change). Key drivers and interventions were developed and refined through Plan-Do-Study-Act cycles. Interventions implemented during this project included linking a secure messaging system to our PACS, adding options for multiple methods of communication to our standard reporting template, and educating radiologists about the process for communicating report discrepancies.

#### RESULTS

The run chart shows an increase in the percentage of documented communication events for urgent changes of cross-sectional

study reports from 75% to 90.6%. Additionally, the interventions increased the percentage of documented communication events for all report discrepancies from 6.6% to 7.0%.\*Discussion Our study showed an increased rate of communication for urgent changes between preliminary and final reports of cross-sectional studies. Limitations of the study include variation in opinions of what constitutes an urgent or non-urgent change, interventions were performed with a small subset of the radiology department, and our reliance on report text to identify communication events may underestimate the true volume of communication. The next steps for our project aim to increase communication across all study types and urgency levels. We will do this by developing a reliable process for rapidly identifying report discrepancies not communicated, organizing focused interdepartmental meetings to operationalize the definition of urgent and non-urgent changes, and incorporating a review of communication errors into peer learning meetings.

## **M5A-QI-7 QI Bootcamp - A Novel Approach to Engage Radiology Residents in QI**

### **METHODS**

1st and 4th year DR, IR and NM residents were emailed to voluntarily sign up for a 4.5-hour "QI Bootcamp" in March 2023. We invited 1st and 4th year residents as they tend to have the most time available for a QI project. The QI bootcamp was led by a 1st year QI Track resident (QI Track is one of the several tracks available to trainees to enhance their skills beyond clinical radiology) and by the Interim Medical Director for Quality in Radiology. A list of potential QI projects, and agenda was emailed to attendees in advance. Measures We administered a pre- and post-knowledge assessment survey. Post survey included supplemental questions to assess bootcamp objectives. Survey data was analyzed using Microsoft Excel.

### **RESULTS**

19 residents signed up and 13 attended the session. 13 residents completed the pre-survey and 12 completed the post-survey resulting in a 92% response rate. In aggregate, correct response to knowledge items improved from 55% to 74% pre and post-survey respectively. A detailed review showed baseline proficiency with Lean concepts (waste, value add vs. non-value add, and process mapping) where 92% of the respondents selected correct responses. Residents were less knowledgeable of driver diagram, fishbone diagram, run charts and change management for which the pre-survey correct response rate ranged from 15-50%. However, residents made the most improvement in those concepts after the didactics. Pre and post-survey analysis showed resident QI project participation improved from 31% to 82%, respectively. Analysis of the feedback questions indicated that 85% of respondents rated the bootcamp favorably. Review of "what went well?" and "what could be improved?" questions gave perspective for future improvement.\*Discussion The QI bootcamp was well perceived and is probably best suited for R1 and R4. The event resulted in increased knowledge and a higher number of residents committed to a QI project. Group activities were most popular, especially brainstorming QI project ideas.

### The Implementation and Impact of a Medical-Student Reading Room Assistant Program

#### METHODS

Jan 2020- Jun 2020 was utilized to document the extent of interruptions for the Radiology residents. Jun 2020- Aug 2021 was spent creating the RRA position and training modules. Six medical students were selected for the position in Fall 2021 with training completed by May 2022. RRAs worked 5-hour segments on the busiest weekend shifts; data was collected on the position over a subsequent 10-month period. Interruptions, scans protocolled by RRAs, and brief medical student RRA feedback was collected in a survey at the end of each RRA shift. Further feedback on the position was collected from the RRAs 10 months into the program. Data and responses were analyzed.

#### RESULTS

During Jan 2020- Jun 2020, on-call residents were interrupted an average of 10.3 times per hour by incoming pages and clinician calls, technologist questions, protocol requests, and outgoing pages. Over the 10-month data collection period, RRAs responded to 854 incoming calls, 474 pages, 765 technologist questions, and made 688 outgoing calls. They also protocolled 3681 chest CTs, 145 neuro MRIs, and 169 abdominal CTs. Per resident survey responses, 100% reported being better physicians while working with an RRA and preferred the RRA program to continue. The majority of medical student RRAs reported in a survey being "Extremely likely" to apply to Radiology residency positions following involvement with the program. Respondents reported the most valuable aspects of the program to be exposure to Radiology, learning the flow of the reading room, and getting to know the residents.\*Discussion The implementation of the RRA program at our institution was successful and valuable as medical students were able to significantly decrease interruptions, protocol thousands of non-contrast CT and MRI exams, and improve resident reported quality of work. Further, this program allowed medical student RRAs to explore their interest in Radiology and has the benefit of attracting hard-working, motivated candidates to the field.

### Communicating Urgent Discrepancies Between Preliminary and Final Reports: Increasing Trust Between Radiology and Emergency Departments.

#### Participants

Andrew Johnston, MD, MBA, Palo Alto, CA (*Presenter*) Nothing to Disclose

#### METHODS

A team of stakeholders from radiology and emergency medicine developed an improvement process via a guided quality improvement curriculum. The team performed a detailed analysis of the current state and identified potential root causes and key drivers. We documented our analysis using a structured problem-solving tool. All radiology reports for studies ordered through the emergency department during the intervention period were queried via the PowerScribe web API and categorized according to modality (cross-sectional or plain film) and type of report discrepancy (no change, non-urgent change, or urgent change). Key drivers and interventions were developed and refined through Plan-Do-Study-Act cycles. Interventions implemented during this project included linking a secure messaging system to our PACS, adding options for multiple methods of communication to our standard reporting template, and educating radiologists about the process for communicating report discrepancies.

#### RESULTS

The run chart shows an increase in the percentage of documented communication events for urgent changes of cross-sectional study reports from 75% to 90.6%. Additionally, the interventions increased the percentage of documented communication events for all report discrepancies from 6.6% to 7.0%.\*Discussion Our study showed an increased rate of communication for urgent changes between preliminary and final reports of cross-sectional studies. Limitations of the study include variation in opinions of what constitutes an urgent or non-urgent change, interventions were performed with a small subset of the radiology department, and our reliance on report text to identify communication events may underestimate the true volume of communication. The next steps for our project aim to increase communication across all study types and urgency levels. We will do this by developing a reliable process for rapidly identifying report discrepancies not communicated, organizing focused interdepartmental meetings to operationalize the definition of urgent and non-urgent changes, and incorporating a review of communication errors into peer learning meetings.

### QI Bootcamp - A Novel Approach to Engage Radiology Residents in QI

#### METHODS

1st and 4th year DR, IR and NM residents were emailed to voluntarily sign up for a 4.5-hour "QI Bootcamp" in March 2023. We invited 1st and 4th year residents as they tend to have the most time available for a QI project. The QI bootcamp was led by a 1st year QI Track resident (QI Track is one of the several tracks available to trainees to enhance their skills beyond clinical radiology) and by the Interim Medical Director for Quality in Radiology. A list of potential QI projects, and agenda was emailed to attendees in advance. We administered a pre- and post-knowledge assessment survey. Post survey included supplemental questions to assess bootcamp objectives. Survey data was analyzed using Microsoft Excel.

#### RESULTS

19 residents signed up and 13 attended the session. 13 residents completed the pre-survey and 12 completed the post-survey resulting in a 92% response rate. In aggregate, correct response to knowledge items improved from 55% to 74% pre and post-survey respectively. A detailed review showed baseline proficiency with Lean concepts (waste, value add vs. non-value add, and process mapping) where 92% of the respondents selected correct responses. Residents were less knowledgeable of driver diagram, fishbone diagram, run charts and change management for which the pre-survey correct response rate ranged from 15-50%. However, residents made the most improvement in those concepts after the didactics. Pre and post-survey analysis showed resident QI project participation improved from 31% to 82%, respectively. Analysis of the feedback questions indicated that 85% of respondents rated the bootcamp favorably. Review of "what went well?" and "what could be improved?" questions gave perspective for future improvement.\*Discussion The QI bootcamp was well perceived and is probably best suited for R1 and R4. The event resulted in increased knowledge and a higher number of residents committed to a QI project. Group activities were most popular, especially brainstorming QI project ideas.

### Quality Improvement Reports Monday Poster Discussions II

#### Sub-Events

#### M5B-QI-1 Reducing radiation dose of routine CT chest scan to healthcare cluster recommendation

##### METHODS

This study was conducted from Nov 2020 to Dec 2022. Study team members went through the statistic meeting report to determine the root cause. Team had decided to select Routine CT Chest protocol as a region to be improved first due to its high feasibility of improvement based on previous plain low dose CT chest project. Consultation with both scanner application specialist and radiologist were done. A total of 3 PDSA cycles was carried out during study period with the image quality being closely monitored to achieve the best possible protocol to use for this study. First improvement was targeted to reduce scan coverage length. Instead of scanning up to adrenals in routine scan, scan will clear lung base only. This is done as an updated management for cancer patients where if lung cancer is found, only then proper CT abdomen or nuclear imaging will be done for staging purpose. Preliminary test was performed on phantom with dose indicators CTDI and DLP found to be reduced from 3 to 15%. Second improvement was on adjusting scanning parameter which is the Standard Deviation(SD). Bigger actual sample size of 10 for each scanner was collated with SD adjusted from 10.5 to 12.5. Radiologist was requested to check on the image quality. Third improvement was to further amend the scanning parameter by adjusting SD to 13.5 as patient weighing above 70kg was still exceeding the recommended dose. For this phase, sample size was collected regardless of patient's body weight. CT chest scanning protocol in the different scanners was then updated. Radiographers were informed to utilise the updated protocols. Data on the number of modified scan performed, dose in CTDIvol, DLP, and effective dose were collected. Image quality was rated by two radiologists and image audit was monitored continuously.

##### RESULTS

The effective dose was successfully reduced ranging from 39-48% (Figure 2). Image quality was scored = 3 for all image quality criteria. The modified protocol had no significant different image quality scores compared to the standard protocol.\*Discussion This modified lower radiation dose CT chest protocol produced similar diagnostic capability to previous routine chest protocol when applied on patients with different body weight.

#### M5B-QI-2 Improving Workflow in Nuclear Medicine to Ensure Correct Radiopharmaceutical Injection

##### METHODS

The study was carried out from February 2020 to February 2023. In early Jan 2020, a wrong radiopharmaceutical injection happened when the staff who prepared the bone radiopharmaceutical syringe injected it into a cardiac patient. A team was immediately set up to rectify the problem. We used root-cause analysis and plan-do-study-act to identify the best solution. The first PDSA is to have staff carry a laptop for verification purposes before injection. However, this method was not promising as they need to handle both the laptop and syringe at the same time which may compromise the hygiene. The second PDSA introduces the tagging of patient sticky labels on the radiopharmaceutical syringes. The label contains the patient's name, identity card number, and type of scan which could help in the verification process before injection. This method is further improved with a second staff verifying the information on the radiopharmaceutical syringe and the patient's sticky label against the patient before injection. Both staffs needs to ensure the correct patient's two identifiers, type of scan, type of radiopharmaceutical, and radioactivity. The training was done for all the staff working in Nuclear Medicine. Measurements on the number of wrongful injections, the confidence level of staff when performing injections, and the compliance rate to the changed workflow were collected as the success indicators.

##### RESULTS

The results showed that there have been zero wrong radiopharmaceutical injections since the implementation of the patient label and the second verifier. Random audits were performed and found that 100% of the staff complied since the chances were implemented. A survey was conducted among 38 Nuclear Medicine staff (5 radiographers, 2 doctors, 11 cardiac technologists, and 1 other) on their confidence level in performing injections. It showed that the average confidence level for the patient label with a second verifier scored the highest (8.11) and with a 100% compliance rate\*Discussion This improved workflow has ensured the correct radiopharmaceutical injection is performed by the staff at all times. Having a patient label tag on syringes and the presence of a second verifier do minimize the possibility of selecting the wrong syringe.

#### M5B-QI-3 Quality Assessment of Fluoroscopic Imaging Obtained during Neonatal Contrast Enema Exams

##### Participants

Devyn Rigsby, Philadelphia, PA (Presenter) Nothing to Disclose

##### METHODS

Image database review identified all CE exams performed on children = 2 days old at our institution from February 2019 to August 2022. 6 subjective and 7 objective quality assurance criteria for CE exams were defined. Two pediatric radiologists conducted independent review of CE imaging and reports for subjective quality criteria. One radiologist also assessed for objective quality metrics. Data were summarized as counts and percentages for each reviewer. Observed inter-reviewer agreement po was calculated for metrics evaluated by two readers.

## RESULTS

70 neonatal CEs met inclusion criteria and were reviewed. For the objective quality metrics: 83% of CEs included a scout image. Lateral rectal imaging included visualization of the sacrum in 91% of cases. Radiation dose and fluoroscopy time were documented in 90% of cases. 63% of cases were performed without direct exposures, and 70% included a post-evacuation film. Complications were not documented for any CE. For the subjective quality criteria: A small-caliber rectal catheter was used in 93% (R1) to 94% (R2) of cases. 96-97% of exams included a true lateral rectal view; this view was obtained at early filling in 83-86% of cases. The rectosigmoid index was readily assessed in nearly all studies (100% R1; 97% R2). The entirety of the colon was visualized through to the cecum in 87% of studies. In 74-76% of cases, the appendix and/or terminal ileum were visualized. Observed inter-reader agreement was substantial for all metrics, ranging from 83% to 97%.\*Discussion Lateral rectal imaging generally met quality metrics, though further education regarding imaging timing at early filling may be warranted. Although the majority of studies included a scout image, radiation dose, fluoroscopy time, and post-evacuation film, operators should be reminded to collect and store these basic components for every exam. Similarly, while most cases used an appropriately small rectal catheter, staff should be aware to do so in every exam. Approximately one-fourth of studies did not include visualization of the appendix and/or terminal ileum, which may reflect the difficulty of obtaining these views for certain pathologic entities in neonatal practice. Finally, although ACR-SPR guidelines discourage direct exposures during CE exams, 37% of cases included such images; promoting use of last-image hold instead of direct exposure can reduce patient radiation dose.

### M5B-QI-4 Radiographers' Perceptions regarding establishing a self regulatory body

#### METHODS

A qualitative, exploratory and descriptive research approach was undertaken. Radiographers currently registered and practicing in Eswatini were purposively selected and invited to participate. Data was collected using semi-structured interviews. Audiotapes and field notes were used. Audio taped interviews were transcribed verbatim and then analyzed using qualitative content analysis.

#### RESULTS

Six themes emerged from the analysis of data, namely; a) awareness of the need for QC tests, b) radiation protection and safety in the radiography departments, c) radiographers' responsibility towards radiation protection, d) education and training in radiation safety for radiographers and other stakeholders, e) support from governmental and management structures and f) the need for the self-regulatory body in the radiography departments.\*Discussion The study demonstrated that there is awareness among radiographers in Eswatini that radiation safety practices are necessary in the radiography departments. Continuous education and training were deemed as imperative to improve radiation safety in the radiography departments. There is also support for the idea of establishing the self-regulatory body. Implications for practice: The need for monitoring structures in order to ensure radiation safety in the radiography departments is highlighted in this study. Government officials and hospital management are crucial in ensuring radiation safety in radiography departments.

### M5B-QI-5 More Bang for the Healthcare Buck: Addressing the Emergency and Urgent Care Elephant in Pulmonary Nodule Follow-up Loss with Smart HL7 Workflow

#### Participants

Kyle Jackson, BSc, MSc, Norcross, GA (*Presenter*) Nothing to Disclose

#### METHODS

Monitoring at a southeastern academic medical center interpreting 1.2M imaging exams annually revealed most (71%) lost pulmonary nodule follow-up exams were from ED and UC settings. We previously reported on a LSTM AI model recognizing pulmonary nodule follow-up recommendations (1,970 retrospectively annotated reports, 60/20/20% training/validation/test split, accuracy 94%). To generate ED/UC-capable workflow, we paired this LSTM with a knowledge-based AI to assign patients into follow-up intervals: high risk (= 3 months), medium risk (> 3 months but = 6 months), and low risk (> 6 months and = 12 months). Clinical performance was assessed by retrospective manual validation of 200 reports (CT 85, XR 16, US 3, uncategorized 96) followed by key word inclusion/exclusion modifications. Real-time clinical performance was again assessed by prospective manual validation of 200 reports (CT 125, XR 64, MR 6, US 5). Fleischner Society Guidelines and logic governing NLP system-to-EMR communication were leveraged to develop risk-stratified ED/UC-capable HL7-based workflow.

#### RESULTS

The macro-averaged F0.5 score for retrospective performance was 0.79 (accuracy by risk class: high risk 94.5%, medium risk 99%, low risk 97%) and for prospective performance was 0.93 (accuracy by risk class: high risk 98.5%, medium risk 100%, low risk 95%). F0.5 score was selected to optimize clinical practice performance by penalizing false positives more than false negatives, where false reminders would undermine provider system use. Knowledge-based AI modifications resulted in 14% improvement in prospective performance.\*Discussion There are no published automated system workflows addressing the safety gap presented by ED/UC settings. The proposed ED/UC-capable HL7 logic and knowledge-based AI can help hospitals implement tracking and reminder systems capable of capturing the overwhelming majority of lost follow-up and meet ACR-issued Closing the Recommendations Follow-Up Loop measures. High-level clinical performance evaluation underscored the validity of this approach.

### M5B-QI-6 Reinterpretation of Hepatopancreaticobiliary Imaging Exams by Subspecialty Radiologists: Assessment of Clinical Impact, Radiologist Peer Learning, and Referring Physician Satisfaction

#### METHODS

This quality improvement project included HPB CT and MRI exams that were reinterpreted by two subspecialty radiologists between March 2021 to August 2022. Agreement with the primary report was categorized using the American College of Radiology RADPEER system. Electronic medical records were reviewed for information regarding change in management (yes/no/unavailable). Separate surveys using 5-point Likert scale questions were sent to radiologists who issued primary reports and referring physicians. Quantitative results were reported using descriptive statistics.

#### RESULTS

250 imaging exams (122 CT, 128 MRI) reported by 96 radiologists were reinterpreted as requested by 19 referring physicians. RADPEER scores 1-3 distribution was 131/250 (52%), 86/250 (34%) and 33/250 (13%), respectively. Of 213 cases with adequate clinical data, 75/213 (35%) were associated with a change in management; of these, 71/75 (95%) were RADPEER 2 or 3. Survey response rates were 34/86 (40%) for radiologists and 7/18 (39%) for referring physicians practicing in the region. Most radiologists

agreed or strongly agreed with the following: prefer to receive reinterpretations (32/34, 94%); reinterpretations changed reporting practices (22/34, 65%); and reinterpretations support peer learning and quality assurance (32/34, 94%). Referring physicians agreed or strongly agreed that reinterpretations assist complex HPB disease management (7/7, 100%) and subspecialty radiologists should reinterpret more cases (6/7, 86%).\*Discussion Our study found a high discrepancy rate with HPB imaging reinterpretations, congruent with the literature. A change in clinical management was found in over one-third of cases. Reinterpretation reports were almost unanimously well received by radiologists and referring physicians. Strengths of this study include the large sample size and good survey response rates. Limitations include the retrospective design and potential lack of generalizability. In conclusion, radiologists and referring physicians are in strong agreement that HPB imaging reinterpretations support peer learning and patient management, respectively.

#### **M5B-QI-7 The Sliding Sign Initiative: Facilitating Earlier Detection of Deep Endometriosis in an Academic Ultrasound Department.**

Participants

Emily Pang, MD,FRCPC, Vancouver, BC (*Presenter*) Nothing to Disclose

#### **METHODS**

Plan-Do-Study-Act (PDSA) methodology was used for this project, which took place in the ultrasound department of a tertiary-care teaching hospital between Oct 2021 and May 2023. The reports and imaging for pelvic ultrasounds performed in patients meeting inclusion criteria were reviewed by two ultrasound experts in consensus during a baseline period and during each intervention to assess for 1) whether the SS was performed and 2) whether SS results were reported and interpreted correctly. Additionally, in patients for whom follow-up was available, confirmation of a new endometriosis diagnosis was recorded. Initial planning involved consultation with gynecology, radiology and sonographer stakeholders. For the first PDSA cycle, a protocol was distributed by e-mail alongside an educational campaign which included in-service training and grand rounds. PDSA cycle 2 involved an updated protocol emailed and posted in the staff lounge, as well as a reminder poster displayed in the probe sanitation room. For PDSA cycle 3, the posters were revised to improve readability in low-lighting conditions and displayed in individual ultrasound rooms. Sonographer worksheets were modified to include a SS field.

#### **RESULTS**

The SS was not performed on any patients at baseline prior to the initiative. The number of eligible patients per month ranged from n=28 to 52. On average, the SS was performed on 57.7%, 68.2% and 85.2% of eligible patients and reported and interpreted correctly 66.7%, 83.3% and 73.9% of the time after PDSA cycles 1, 2, and 3 respectively. All abnormal SS cases were reported. Over a period of 1 year for which 6 month follow-up data was available (Oct 2021-Oct 2022), a total of 22 patients had a new confirmed diagnosis of endometriosis as a result of the initiative, with 2 false positives.\*Discussion The sliding sign initiative is a relatively simple protocol modification but has made a significant impact on the early diagnosis of endometriosis, allowing for earlier treatment and improved quality of life. Interventions aimed at increasing consistent performance of the SS amongst sonographers have proven successful. Limitations included difficulties performing the SS in retroverted uteri, variable buy-in/familiarity with the SS amongst radiologists, and lack of follow-up data on every patient. Additional interventions targeting reporting radiologists will be needed for future work.

#### **M5B-QI-8HC Improving Outpatient CT Access by Reducing CT Backlogs**

### Reinterpretation of Hepatopancreaticobiliary Imaging Exams by Subspecialty Radiologists: Assessment of Clinical Impact, Radiologist Peer Learning, and Referring Physician Satisfaction

#### METHODS

This quality improvement project included HPB CT and MRI exams that were reinterpreted by two subspecialty radiologists between March 2021 to August 2022. Agreement with the primary report was categorized using the American College of Radiology RADPEER system. Electronic medical records were reviewed for information regarding change in management (yes/no/unavailable). Separate surveys using 5-point Likert scale questions were sent to radiologists who issued primary reports and referring physicians. Quantitative results were reported using descriptive statistics.

#### RESULTS

250 imaging exams (122 CT, 128 MRI) reported by 96 radiologists were reinterpreted as requested by 19 referring physicians. RADPEER scores 1-3 distribution was 131/250 (52%), 86/250 (34%) and 33/250 (13%), respectively. Of 213 cases with adequate clinical data, 75/213 (35%) were associated with a change in management; of these, 71/75 (95%) were RADPEER 2 or 3. Survey response rates were 34/86 (40%) for radiologists and 7/18 (39%) for referring physicians practicing in the region. Most radiologists agreed or strongly agreed with the following: prefer to receive reinterpretations (32/34, 94%); reinterpretations changed reporting practices (22/34, 65%); and reinterpretations support peer learning and quality assurance (32/34, 94%). Referring physicians agreed or strongly agreed that reinterpretations assist complex HPB disease management (7/7, 100%) and subspecialty radiologists should reinterpret more cases (6/7, 86%).\*Discussion Our study found a high discrepancy rate with HPB imaging reinterpretations, congruent with the literature. A change in clinical management was found in over one-third of cases. Reinterpretation reports were almost unanimously well received by radiologists and referring physicians. Strengths of this study include the large sample size and good survey response rates. Limitations include the retrospective design and potential lack of generalizability. In conclusion, radiologists and referring physicians are in strong agreement that HPB imaging reinterpretations support peer learning and patient management, respectively.

### The Sliding Sign Initiative: Facilitating Earlier Detection of Deep Endometriosis in an Academic Ultrasound Department.

#### Participants

Emily Pang, MD, FRCPC, Vancouver, BC (*Presenter*) Nothing to Disclose

#### METHODS

Plan-Do-Study-Act (PDSA) methodology was used for this project, which took place in the ultrasound department of a tertiary-care teaching hospital between Oct 2021 and May 2023. The reports and imaging for pelvic ultrasounds performed in patients meeting inclusion criteria were reviewed by two ultrasound experts in consensus during a baseline period and during each intervention to assess for 1) whether the SS was performed and 2) whether SS results were reported and interpreted correctly. Additionally, in patients for whom follow-up was available, confirmation of a new endometriosis diagnosis was recorded. Initial planning involved consultation with gynecology, radiology and sonographer stakeholders. For the first PDSA cycle, a protocol was distributed by e-mail alongside an educational campaign which included in-service training and grand rounds. PDSA cycle 2 involved an updated protocol emailed and posted in the staff lounge, as well as a reminder poster displayed in the probe sanitation room. For PDSA cycle 3, the posters were revised to improve readability in low-lighting conditions and displayed in individual ultrasound rooms. Sonographer worksheets were modified to include a SS field.

#### RESULTS

The SS was not performed on any patients at baseline prior to the initiative. The number of eligible patients per month ranged from n=28 to 52. On average, the SS was performed on 57.7%, 68.2% and 85.2% of eligible patients and reported and interpreted correctly 66.7%, 83.3% and 73.9% of the time after PDSA cycles 1, 2, and 3 respectively. All abnormal SS cases were reported. Over a period of 1 year for which 6 month follow-up data was available (Oct 2021-Oct 2022), a total of 22 patients had a new confirmed diagnosis of endometriosis as a result of the initiative, with 2 false positives. \*Discussion The sliding sign initiative is a relatively simple protocol modification but has made a significant impact on the early diagnosis of endometriosis, allowing for earlier treatment and improved quality of life. Interventions aimed at increasing consistent performance of the SS amongst sonographers have proven successful. Limitations included difficulties performing the SS in retroverted uteri, variable buy-in/familiarity with the SS amongst radiologists, and lack of follow-up data on every patient. Additional interventions targeting reporting radiologists will be needed for future work.

### Quality Improvement Reports Thursday Poster Discussions

#### Sub-Events

#### **R2-QI-1 Switching Neutral Oral contrast from VoLumen® to Breeza® to improve patient tolerance and acceptability of MRE (Magnetic Resonance Enterography) and CTE (Computed tomography enterography)**

##### Participants

Sindhura Tadisetty, MBBS, Lexington, KY (*Presenter*) Nothing to Disclose

##### **METHODS**

Adult patients undergoing MRE and CTE at our institution were given both contrast media along with a questionnaire for each media; they were asked to choose one for their exam. The questionnaire contained questions such as "How do you rate the taste and texture of the contrast given to you?", "Would you be willing to consume this contrast again" and "What is your perceived state of health post consuming the contrast." Their choice of contrast was also noted. We analyzed the answers to these questions to determine which contrast was better tolerated. Patient registered-Arrives at MR/CT waiting room-MRI Screening- Labs checked-Peripheral IV placed-Oral contrast administration in Zone II -Questionnaire to assess the taste perseveres and comfort level post oral contrast> MRE/CTE protocol- patient returns to the clinic/inpatient or ER room.

##### **RESULTS**

We recruited 20 patients undergoing MRE and CTE between March 15th, 2023, to April 15th, 2023. Among them, 19 patients chose Breeza® over Volumen®, which is a 95% acceptance rate for Breeza®. Among the people who chose Breeza®, the taste, and texture were ranked superior to Volumen®. None of the patients who chose Breeza® had problems consuming the contrast and keeping it down.\*Discussion Breeza® has shown to have increased tolerance and better taste and texture profile when compared to Volumen®. We advocate for the shift to Breeza as the preferred contrast in adult patients who undergo CTE and MRE. We did not compare the image quality of studies performed with Breeza® and those performed with Volumen® in the short duration. We intend to perform this comparison in the coming months.

#### **R2-QI-2 Structured Computed Tomography Quality Assurance Program in Neuroradiology**

##### Participants

Kayla Nakashima, BS, La Mirada, CA (*Presenter*) Nothing to Disclose

##### **METHODS**

This study was conducted in the Department of Radiology at UC Irvine Medical Center, an academic hospital. The QA process proceeds as follows: first, a radiologist flags an error in the Picture Archiving and Communication System (PACS) with (1) a categorization of either "protocol," "technique," "reconstruction," "scanner," or "other," (2) a severity of "0" or "1" (0 patient care is not affected; 1 patient care is affected), and (3) comments. Next, the Quality Nurse collects this information and also acquires the following data: date performed, patient information, study description, scanner, radiologist, and technologist. This data is logged using a HIPAA compliant tracker. This tracker is sent to CT leadership (CT supervisor and Senior CT Technologist), who discusses each QA flag with the technologists. To ensure change and accountability, each technologist with a QA flag is emailed an explanation of the issue and how to improve that must be acknowledged within one week. Additionally, CT leadership anonymizes and discusses common QA trends at department group huddles and during one-on-one technologist training. To increase communication with the neuroradiologists, a group message between CT leadership and the neuroradiologists was created to discuss day to day questions about study protocols. Additionally, CT leadership and the neuroradiologists meet monthly to review each QA flag to identify trends and develop resolutions efficiently. This process was repeated monthly for the past year.

##### **RESULTS**

The number of QA flags per month decreased after implementation of the QA process. The number of QA flags per category each month.\*Discussion The marking of QA flags, followed by the implementation of structured documentation and action toward reducing errors, has increased technologist and radiologist engagement and improved image quality. By creating a multidisciplinary approach to standardizing CT scans, radiologists can use automated feedback to enhance image quality, ultimately contributing to better patient care. Although continued research is needed, the goal is to use this form of standard documentation and quality assurance program for image quality improvement in all radiology sections.

#### **R2-QI-3 Improving Quantitative Report turn-around time using Digital Technology for clinical trials**

##### Participants

Ceylan Taslicay, MD, Houston, TX (*Presenter*) Nothing to Disclose

##### **METHODS**

The automated digital alert was deployed to decrease submitted to finalized-SOF of QIAC reports, i.e. the TAT for expedited and non-expedited cases. IRS preliminary report submitted time and the radiologist report finalized time was recorded digitally in the database. Data before and after implementing the digital system was extracted from the QIAC digital database. TAT time was

calculated in hours by comparing the pre-deployment (12193 reports) and post-deployment (6504 reports). TAT was summarized using mean, standard deviation, median, Q1 (25th) and Q3 (75th) quantiles. Comparison between pre and post-deployment was performed using Wilcoxon Rank Sum test. The categorical time difference was summarized using frequencies and percentages. P-value less than 0.05 was considered statistically significant. Statistical analyses were conducted using R-version 3.6.3 R Development Core Team, Vienna, Austria.

## RESULTS

Distribution of TAT was heavily right-skewed and close to an exponential distribution, with a mean of 33.2 (SD = 76.8) for post-deployment and a mean of 83.4 (SD = 166.9) for pre-deployment. There was a statistically significant difference in TAT between the pre-deployment and post-deployment of the digital alert system. TAT was significantly less post-deployment than pre-deployment overall ( $p=0.0016$ ). For expedited reports,  $p<0.020$ , and for non-expedited  $p<0.001$ . The digital alert system significantly decreased mean TAT from 44.9 hours to 16.4 hours for expedited cases  $p=0.0022$  (Table 1 Graph 1). Discussion There were several limitations. While deploying the alerts it was challenging to track if the radiologist were out of the office, on paid time off, or on a rotation where they were away from their computers and could not sign the reports. It was thus difficult to account for these unforeseen consequences and may have caused a delay in signing the reports despite the digital alert. However, using the digital alert system, the TAT for all reports decreased whether they were expedited or non-expedited providing the QIAC reports in time for patient appointments and facilitating better therapeutic decision-making and clinical care.

### R2-QI-4 Enhancing patient safety by implementing a digital centralized dose management program within a large-scale healthcare organization across 13 countries and 120 CT scanners

## METHODS

A DMP was launched in 2014 in a European Healthcare Organization and has been gradually deployed in 13 countries. The dose management process uses a list of 104 CT protocols per anatomical area and clinical indication, mapped to a RadLex Playbook radiology lexicon code (RPID) with established Organizational Diagnostic Reference Levels (DRLs). A unique RDIM system (DoseWatch, GE) is connected to 120 CT scanners and is used to collect exam data. Exams performed with mapped CT protocols are considered standardized while those performed with dose within DRLs are considered optimized. Data is monitored on local and global level using a business intelligence tool (Imaging Insights, GE). Dose Optimization is achieved by creating a culture of dose awareness, training of people involved, data analysis and CT protocol parameters optimization. A multidisciplinary team in center, country and group level collaborates to achieve best practice. Program's success is monitored using a set of Key Performance Indicators (KPIs): Standardization >75% and Optimization >70%. More than 70,000 exams are collected monthly, allowing for analysis at Group, country and center level and gives the ability for targeted improvement actions. Patient safety is ensured by real time monitoring of standardization and optimization of CT practice.

## RESULTS

For each country, data were collected for 30 days for benchmarking. During this period, several educational sessions were organized while best practice from other countries was shared. CT protocol parameters were adjusted to reduce dose while preserve image quality. As a result of the DMP implementation the percentage of standard exams across 13 countries and 120 centers is 90% while the percentage of exams performed with dose within DRLs is 71%. Discussion The implementation of a DMP within a large-scale organization allows practice unification, best practice sharing and optimized dose across countries. Results analysis leads to improvement initiatives like training on Dose Management and optimization of CT protocol parameters. Knowledge, experience, and image quality feedback is shared between different countries to achieve optimum results to enhance patient safety.

### R2-QI-5 Strategies to improve communication in Clinical Imaging in Manaus - AM during Covid-19 pandemic

#### Participants

Aline Souza, MD, MSc, Manaus, Brazil (Presenter) Nothing to Disclose

## METHODS

This cross-sectional study consisted of theoretical-practical training with realistic simulation and formative evaluation, aimed at professionals who work in imaging clinic in Brazil. The training took place between 2020 and 2021, in small groups of 8 people, following the recommendation of The Brazil Ministry of Health. In January 2021, during the peak of the COVID-19 pandemic in Manaus, face to face training was replaced by remote training.

## RESULTS

A total of 111 (one hundred and eleven) employees participated, representing 82% of the staff. The study occurred in two parts. In the first, participants attended an interactive 60 minutes lecture, which included video demonstration and encouraged participation. At this stage, two tools were presented to improve communication: SBAR (Situation, Background, Assessment and Recommendation), to improve communication between the healthcare team, and AIDET® (Acknowledge, Introduce, Duration, Explanation and Thank You), to improve communication between healthcare professionals and patient/families. In the second part of the training, professionals were individually evaluated according to Table 1, by two evaluators (Picture 1). At the end, they received feedback on their performance, and those who obtained the highest scores in the formative evaluation were awarded. As a product of the training, a small book was created with recommendation for best practices, addressing communication with the patient and among the work team, communication with the requestor physician and value-based radiology. Discussion The implementation of SBAR and AIDET protocols proved effective in improving communication between healthcare teams and patients/families in imaging clinic. Despite the difficulties imposed by the COVID-19 pandemic, the training had significant adherence from the participants. However, further studies are needed to evaluate the effectiveness in developing specific communication skills for radiology. The book with best practice recommendations offers a useful source of information and can encourage professionals in the field to adopt a new behavior, with patient-centered actions.

### R2-QI-6 My Attending Really Wants it! Manual Clinical Decision Support Adjudicating the Better Look" Inpatient MRI at an Academic Medical Center

#### Participants

Ashlesha Udare, MBBS, MD, Philadelphia, PA (Presenter) Nothing to Disclose

## METHODS

To address overutilization of inpatient body MRI, a 9-item questionnaire was incorporated into our protocoling process to gather

information about clinical decision making and necessity of inpatient MRI orders and the final disposition was recorded and compared with the baseline cancellation rate of 0.6%. The percentage of orders with no appropriate indication, orders recommended by consultants or radiology reports and reasons why MRI cannot be performed as an outpatient were recorded.

## **RESULTS**

Among 846 orders, 112 (13%) had no specific clinical question. 582 (69%) were recommended by non-radiology consulting services and 136 (16%) were recommended in radiology reports. 144 (17%) were considered appropriate for and 197 (23%) were considered possibly appropriate for outpatient imaging. The most frequent reason cited for inpatient imaging was "attending really wants it" (34%), followed by potential to be "lost to follow-up" (13%) and patient/family pressure (2%). 27% were not associated with an urgent procedure or inpatient management decision. Responses to whether the MRI could be performed after discharge were: No (60%), Maybe (23%), and Yes (17%). Final dispositions for the orders included routine inpatient study (68%), urgent inpatient study (18%), outpatient imaging (5%), on hold pending more information (5%), and study not performed (4%).\*Discussion The questionnaire served a consultative role by prompting discussion between radiology and the clinical services to assess appropriateness and appropriately triage inpatient orders. The implementation of the questionnaire resulted in a reduction of inpatient body MRI utilization up to 8% (from 0.6% cancellation to 9% cancellation + conversion). 85% of orders were recommended by consultants (69%) and radiology reports (16%) and frequent lack of understanding of the indication by the ordering clinician was evident. Limitations of our study include absent data on the disposition of "on hold" orders, the manual approach not sustainable in most practices and the retrospective analysis. Our study shows limited understanding of inpatient MRI appropriateness and potential for reducing utilization and outpatient conversion.

### Quality Improvement Reports Thursday Poster Discussions I

#### Sub-Events

#### **R5A-QI-1 Anesthesia and MRI Safety: Burning Questions and the Road to Better Practice**

##### Participants

Hamilton Shoji, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

##### METHODS

Review of the current literature of proposed mechanisms of burns in the MRI and strategies to avoid them. Redesign the workflow (from scheduling to patient positioning and monitoring) to capitalize on opportunities to clear known risks.

##### RESULTS

Decrease in the proportion of MRI under full anesthesia (100% to 59,9%). Increase in the proportion of MRI under mild sedation or anxiolysis (0 to 31%), or fully awoken (from 0 to 7,5%). Decrease in continuous scanning time in patients under anesthesia, both with reduced or optimized protocols (19%), or by withdrawals of segments for examination. Register of a checklist for patient positioning with special attention to correct padding and isolation of wires, cables and other devices. Register of patient temperatures monitoring during scan. Register of skin conditions prior and after the examinations.\*Discussion Although known as a safe procedure and with more widespread use of Choosing Wisely based strategies for diagnostic imaging that shifts CT to other methods, the MRI may impose health risks that are not fully understood. We hope that a deeper knowledge of the mechanisms involved in adverse events will help to avoid serious complications. Until then, we are focused on honing our workflow to decrease incidents to a minimum, without limiting access to adequate diagnostic testing.

#### **R5A-QI-2 Patient safety in diagnostic imaging: proposal to mitigate identification errors**

##### Participants

Aline Souza, MD, MSc, Manaus, Brazil (*Presenter*) Nothing to Disclose

##### METHODS

Design Thinking, as an approach to solving complex problems. The following steps were taken: 1) Discovery of the problem, through a questionnaire about the safety culture, process mapping and event notification. 2) Summary, registration of the NSP at ANVISA and development of the action plan. 3) Ideation, which consisted into the creation of the electronic notification model and 4) Prototyping, system validation and standardization of successful strategies.

##### RESULTS

In 18 months, 608 events were reported. Near miss represented 68.6% (n=417), event without harm 28.1% (n=171) and adverse event 3.3% (n=20). The most reported isolated error was the patient's name, corresponding to 20.6% (n=125). When classified by categories, document errors represented 44.2% (n=269) and patient identification 29.4% (n=179). The number of events corresponded to 0.36% of all exams performed and adverse events represented 0.01% of them. The highest percentage of errors was in MRI scans (0.88%, n=227), CT scans (0.67%, n=122) and x-rays (0.49% n=101), that correspond to the exams most performed in the organization. After adoption of healthcare policies, there was a reduction in events related to patient identification, from 13.6% to 4.8%; the sum of type, side and site errors from 21.2% to 7.6% and procedural error from 28.8% to 12.4% (Table 1).\*Discussion The association of an electronic notification system, process improvement and training reduced 64,7% patient identification errors. Additionally, there was also a 64,1% reduction in the sum of type, side and site exam errors, and 56,9% in procedural errors.

#### **R5A-QI-3 Quality process design to change radiodiagnostic equipment to minimize the impact on waiting lists in a public health imaging diagnostic provider**

##### Participants

Virginia Benavente, Barcelona, Spain (*Presenter*) Nothing to Disclose

##### METHODS

The process involves the radiological protection area (RPA) and the infrastructure area (AU). As it can be seen in Figure 1, it involves equipment deregistration (in orange) and installation (in blue) with tasks requiring the collaboration between RPA, IA and external stakeholders. Before the redesigning it took 117 days to complete the process. The process redesign was focused on all administrative procedures. To this end, a digital documentation structure and workflow were implemented for each work team depending on members roles, the step of the process and deadlines and milestones to meet.

##### RESULTS

The new process takes 95 days after the redesigning (Figure 2). The actions implemented were the following:\*Discussion This redesigned process involving actions on the administrative tasks to improve communication and team building is useful and allows us to reduce the whole process of deregistration, removal, installation and start-up in 22 days. Compliance with this new working

procedure is key to obtaining optimal results and reducing the impact on waiting lists. The critical point of this procedure is the interdependence between the parts involved. Most of documentation required also depends on the external companies and it can affect the flow of the process.

#### **R5A-QI-4 Improving overnight turn-around-time and restoring on-call resident responsibility in an Academic Medical Center**

##### **METHODS**

To review resident contribution (No Contribution, Draft, Prelim) over our phased transition, we summarize weekly call data for 2 categories of cross-sectional exams - adult Non-Neuro (Body, Chest, CVI, MSK) and adult Neuro. No Contribution indicates a fellow/attending reported the exam directly. Draft indicates a resident created an initial draft without publishing. Prelim indicates a resident published a preliminary report. Attending-signed final reports (final TAT) were expected within 90 minutes of the end of an exam. Data included studies between the hours of 8:45 PM - 7:30 AM 7-days a week. Baseline (12/2018 - 12/2019): Fellows publish prelims overnight, residents draft reports (discouraged from publishing prelims). Final reports followed in the morning. 1st Intervention (01/2020): Instituted neuro attending finals overnight, residents encouraged but not required to publish prelims. 2nd Intervention (11/2021): Instituted non-neuro teleradiology attending finals overnight, residents encouraged but not required to publish prelims. To accommodate increased volume, an additional swing resident (5 PM - 2 AM) was added 07/2020.

##### **RESULTS**

At baseline, median final TAT was around 6-10 hours. Residents issued drafts for 75% and 90% of Neuro and Non-Neuro ED studies, and 40% and 50% of Neuro and Non-Neuro IP studies, rarely publishing prelims. After implementation of Neuro attending overnight final reads, median Neuro final TAT decreased to 60 minutes (excluding weeks with 1st year fellow coverage). Resident publication of prelim reports for Neuro ED studies increased: 30% (early 2020), 70% (early 2021), 84% (early 2022), and 65% (early 2023). After implementation of Non-Neuro teleradiology to provide overnight attending final reads, median Non-Neuro final TAT decreased to 40 minutes. Residents published prelim reports for most Non-Neuro ED studies (90%). No increase in ED-reported safety events arising from overread changes was seen despite increases in resident published preliminary reports. No increase in preliminary TAT. \*Discussion Providing attending overnight coverage improved final TAT for ED reports. This change also facilitated resident comfort with voluntarily publishing preliminary reports, a marker of call autonomy, while mitigating patient risk.

#### **R5A-QI-5 Applying Lean Six Sigma Techniques to Patient Flow in the Breast Imaging Service: A Tertiary Center's Experience and Process of Improvement**

##### **Participants**

Nader Ashraf, MD, Riyadh, Saudi Arabia (*Presenter*) Nothing to Disclose

##### **METHODS**

An electronic medical record integrated system was put in place to track the TTR from the time the screening study is input until diagnostic resolution is reached. A baseline audit followed by a post-implementation audit were conducted. Multidisciplinary meetings, alongside a study of patient complaint data, were utilized to identify issues that were causing prolonged TTR leading to patient flow inefficiencies. The resulting sources of variability were recognized and analyzed using an Ishikawa fishbone diagram to classify sources of variation. To address these root causes, possible solutions were proposed and implemented. Significant differences in TTR were assessed using the Mann-Whitney-U test.

##### **RESULTS**

During the baseline audit of 8 months, 589 cases of mammographic recalls (BI-RADS 0) were recruited. The average TTR for this group was 86.3 days. To reflect the required change in the mindset to adopt a patient-centric approach instead of the traditional exam/modality-focused one, there will be proposed improvement plans. Due to the lack of funding received for this project, some gaps, like staff shortages, were not able to be addressed. During the post-implementation period of 3 months, 370 cases of mammographic recalls (BI-RADS 0) were made. The average TTR for this group was 36.0 days. After applying LSSM, we managed to significantly reduce our TTR by at least 58% ( $P < 0.01$ ). \*Discussion With the application of LSSM in our breast imaging service, we managed to reduce our TTR by 58%. This was mainly related to the effect of training the coordinators to capture the screening recalls and schedule the recommended examinations. Moreover, there was an observed increase in the numbers of same-day nonscheduled targeted US generated and performed by the radiologist due to their commitment to embracing patient-centered care. These changes should be there to stay, incorporated into our culture, to facilitate continuous improvement and cost reduction. As the need for healthcare resources grows in the future, LSSM may play an increasingly essential role in enhancing healthcare service delivery.

#### **R5A-QI-6 Lateral Knee Radiograph Quality Improvement Project**

##### **METHODS**

Intervention: Initial assessment included a survey of 50 lateral knee images with the scoring rubric. A fishbone diagram was used to identify potential causes contributing to a gap in quality. The potential causes identified were: Incorrect position, rotation, radiation techniques and missing required elements like marking and measuring tools. A staff satisfaction survey was given to the participating staff as a balancing measure. Then, education was implemented focusing on positioning, marking, centering and techniques. Also, standardization of image marking supplies were reviewed and replenished. Study of the intervention: The Define Measure Analyze Improve Control (DMAIC) method of quality improvement was used for this project. Initial assessment found that 62% of images surveyed were above the 11-point threshold. Measures: A scoring rubric was used to analyze each image. Points are given for technical aspects of the image. The staff survey was used to ensure the staff did not feel the education measures were punitive. Analysis: Post intervention, 59 lateral knee images were surveyed. A second staff satisfaction survey was provided and analyzed.

##### **RESULTS**

Post intervention, 90% of the lateral knee radiographs surveyed scored 11 points or more. Lateral knee images scoring more than 11 points had an increase of 28%. The survey of job satisfaction initially scored an average of 50%. The post intervention survey scored an average of 73%. In addition, lateral knee examination times were reduced by 15.9 minutes per month due to a decrease in repeat radiographs. \*Discussion Continuous education for technologists is critical for maintaining image quality. The score of the post intervention staff satisfaction survey proved that the techs were appreciative of the education and desired to improve the image quality for their patients.

## **R5A-QI-7 Minimising Claustrophobia and Scanxiety in Radiology**

Participants

Kenneth Jacob, Oxford, United Kingdom (*Presenter*) Nothing to Disclose

### **METHODS**

Total scanning time can be reduced by customising scan parameters according to the need of the patients, balancing the quality vs time. Position of the patient in the scanner also plays a key role in reducing claustrophobia. In some cases feet first is a more preferred position for claustrophobic patients. If the patient prefers the eye mask and headphones with relaxing music also helps calm patients with claustrophobia and helps them tolerate a scan.

### **RESULTS**

Our analysis indicates up to a 50% reduction in the number of abandoned MRI scans since the introduction of new technology. We assess this as occurring across the period of time that wider bores and faster scans were introduced.\*Discussion Many studies conducted show that patients with claustrophobic anxiety are more likely to be frightened and experience a feeling of confinement or being closed in during imaging (BMC Med Imaging 2011 Feb).A Research study at our site is underway to test a virtual tour of the PET-CT procedure and environment to reduce anxiety in claustrophobic patients. Wider bore scanners reduce claustrophobia to a limit however training patients prior to a scan is the most successful method, which could also be done using VR headset under testing which could enable the patient to experience the whole procedure in a safe and immersive way before the real scan and potentially help utilise the scanner and staff time more efficiently. If this is successful in PET then we can test this in the MRI environment.

### Anesthesia and MRI Safety: Burning Questions and the Road to Better Practice

#### Participants

Hamilton Shoji, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### METHODS

Review of the current literature of proposed mechanisms of burns in the MRI and strategies to avoid them. Redesign the workflow (from scheduling to patient positioning and monitoring) to capitalize on opportunities to clear known risks.

#### RESULTS

Decrease in the proportion of MRI under full anesthesia (100% to 59,9%). Increase in the proportion of MRI under mild sedation or anxiolysis (0 to 31%), or fully awoken (from 0 to 7,5%). Decrease in continuous scanning time in patients under anesthesia, both with reduced or optimized protocols (19%), or by withdrawals of segments for examination. Register of a checklist for patient positioning with special attention to correct padding and isolation of wires, cables and other devices. Register of patient temperatures monitoring during scan. Register of skin conditions prior and after the examinations.\*Discussion Although known as a safe procedure and with more widespread use of Choosing Wisely based strategies for diagnostic imaging that shifts CT to other methods, the MRI may impose health risks that are not fully understood. We hope that a deeper knowledge of the mechanisms involved in adverse events will help to avoid serious complications. Until then, we are focused on honing our workflow to decrease incidents to a minimum, without limiting access to adequate diagnostic testing.

### Patient safety in diagnostic imaging: proposal to mitigate identification errors

#### Participants

Aline Souza, MD, MSc, Manaus, Brazil (*Presenter*) Nothing to Disclose

#### METHODS

Design Thinking, as an approach to solving complex problems. The following steps were taken: 1) Discovery of the problem, through a questionnaire about the safety culture, process mapping and event notification. 2) Summary, registration of the NSP at ANVISA and development of the action plan. 3) Ideation, which consisted into the creation of the electronic notification model and 4) Prototyping, system validation and standardization of successful strategies.

#### RESULTS

In 18 months, 608 events were reported. Near miss represented 68.6% (n=417), event without harm 28.1% (n=171) and adverse event 3.3% (n=20). The most reported isolated error was the patient's name, corresponding to 20.6% (n=125). When classified by categories, document errors represented 44.2% (n=269) and patient identification 29.4% (n=179). The number of events corresponded to 0.36% of all exams performed and adverse events represented 0.01% of them. The highest percentage of errors was in MRI scans (0.88%, n=227), CT scans (0.67%, n=122) and x-rays (0.49% n=101), that correspond to the exams most performed in the organization. After adoption of healthcare policies, there was a reduction in events related to patient identification, from 13.6% to 4.8%; the sum of type, side and site errors from 21.2% to 7.6% and procedural error from 28.8% to 12.4% (Table 1). \*Discussion The association of an electronic notification system, process improvement and training reduced 64,7% patient identification errors. Additionally, there was also a 64,1% reduction in the sum of type, side and site exam errors, and 56,9% in procedural errors.

### Quality Improvement Reports Thursday Poster Discussions II

#### Sub-Events

#### **R5B-QI-1 A Novel Contrast extravasation intake form To Foster Standardized Data Collection and Quality Improvement**

##### **METHODS**

Review current reporting system - Safety Net, and identify shortages of reporting system to 1) create standardized and mandatory data collecting system; 2) reduce data input time; 3) better track risk factors; 4) facilitate future data retrieval, analysis quality improvement; 5) improve patient care safety.

##### **RESULTS**

Feedback from circulating novel input form: 1) Data/information being collected: satisfactory 2) Mostly quick-input process 3) Risk factor collection: thorough inclusive 4) Educational intake form 5) Informative form\* Discussion Quality improvement activities include: 1) Frequent small improvement efforts conducted in close association with the management front-line technicians, as well as spreadsheet design constant improvement 2) Dedicated improvement projects: To identify potential risk factors reduce contrast extravasation rate. 3) Regular follow-up 4) Frequent visit to the CT/MRI scan room 5) Forming a project team 6) Project Leader 7) Project Coach

#### **R5B-QI-10HC Implementation and Assessment of a Novel Online Cardiac MRI Anatomy Atlas: A Quality Improvement Project in Cardiac Radiology Trainee Education**

#### **R5B-QI-2 Machine learning for identification of acute adverse reactions to iodinated contrast media using routine clinical and laboratory data in cancer patients**

##### Participants

Qiong Li, Guangzhou, China (*Presenter*) Nothing to Disclose

##### **METHODS**

Between January 2019 to December 2021, a total of 208035 cancer patients who underwent ICM administration were enrolled from our hospital. Their demographic information, clinical and laboratory data, CT scan protocol and AARs of iodinated contrast media were collected. Several machine learning methods were performed to construct the prediction model. We also used feature selection and analysis techniques to identify risk factors that predict occurrence of AAR.

##### **RESULTS**

Among 208035 cancer patients who underwent ICM administration, the overall prevalence of AARs was 0.205%. A CatBoost model was more accurate than other machine learning models, with an AUC of 0.959, a sensitivity of 0.929. Several variables significantly associated with AARs were history of hypersensitivity reaction to ICM, iopromide, immunotherapy, excessive MRI enhancement scan, and younger age.\* Discussion A large number of radiological examinations, mainly contrast-enhanced CT scans, are conducted worldwide each year, especially in cancer patients. A machine-learning model was more accurate for predict the occurrence of AARs associated with iodinated contrast media, which can offer useful guidance to clinicians and patients for individually adjuvant therapy. This result indicates that radiologists need to pay greater attention to a patient's cancer history, especially with regard to current antineoplastic treatments.

#### **R5B-QI-3 Improving on-time starts for pediatric cardiac magnetic resonance imaging (cMRI)**

##### **METHODS**

A multidisciplinary team from Cardiac and Radiology Services utilized a local version of the Stanford RITE improvement methodology to target several process improvements to patient flow. We focused on understanding our current state by enhancing data visualization to easily identify where delays were occurring. Two key causes of delay were late outpatient arrival and variations in patient prep timing for anesthesia patients. Families were surveyed to identify reasons for late arrivals, which led to a standard script for pre-visit calls with detailed instructions for traffic, parking, and registration location. A patient-ready time stamp was utilized for anesthesia patients to better coordinate patient prep activities and timely induction. Finally, process mapping demonstrated a rework pattern that required a complete redesign of the scheduling and protocolling process steps. A new workflow that allows protocolling before scheduling has been developed and is currently in the testing phase.

##### **RESULTS**

Defining performance and visualizing it in a meaningful way created a slight Hawthorne effect with an increase in on-time starts from 10% to 21% during our current state analysis. Timing of standard script implementation right before Thanksgiving and through the winter holidays impacted our measurable improvement with significantly lower volumes. We attribute the "rebound" in January to the continued use of the script as well as the efforts to improve anesthesia patient prep times. Shared situational awareness of patient flow time points, equipment readiness, and efforts by the sedation team to orchestrate IV placement, physical examination, and the consent process brought our on-time starts to 34% by the end of the program.\* Discussion There was value in using a

systematic team approach to understanding and solving this problem. Team members were unaware of what the process looked like to our patients because they only knew their small piece of the larger workflow. Team members Gemba walked all areas of the process to gain perspective, build engagement, and facilitate teamwork. Areas of focus initially centered on low-effort interventions because redesigning the scheduling and protocolling steps of the process required more time and outside resources than expected. We anticipate this much-needed change will have a dramatic effect on our metric when we are able to go live.

#### **R5B-QI-4 Imaging Stewardship: Defining STAT exams in the Cardiac Intensive Care Unit**

##### **METHODS**

The team included clinicians from the Cardiac Intensive Care unit and Radiology. The Quality improvement approach used was Realizing Improvement through Team Empowerment (RITE) process improvement program. The program guides teams through didactic education and practical application of quality improvement tools. The tools used included a process map to understand the workflow. Gemba walks to see how the work is done and factors that contributed to the problem. The data collected was used to create fishbone diagrams and Pareto charts to quantify key causes of the problem. From that information the top key drivers for improvement were identified and included the need for technologist to have a consistent workflow, and the need for closed loop communications between clinicians and technologists. One of the most impactful communication interventions was the creation of the Clinical criteria for STAT priority exams. That and other interventions were tested using small test of change, Plan-Do-Study-Act cycles. Improvement was measured by quantifying the time from notice of exam need to the time of exam completion.

##### **RESULTS**

Using RITE methodology helped the team to decrease the turn-around time for STAT portable exams from a median of 24 minutes to a median of 15 minutes by the end of the six-month program. The key interventions that lead to this improvement were changing the notification from a phone call to a secure chat notification which allowed the Technologist to better triage STAT request. Also, development of the clinical criteria list decreased the number of STAT requests to those of the highest clinical priority.\*Discussion Development of a shared understanding between the Cardiac ICU and Radiology as to what makes an exam STAT and how we best communicate that to illicit a timely response was crucial. Using a systematic, team-based approach to improvement contributed to the success by improving communication between the two departments. Subsequently, the key interventions have been spread to the neonatal intensive care unit and improved data analysis methods of current performance are underway.

#### **R5B-QI-5 Teach The Mentor: A six week intensive program universally improves mentorship skills among a diverse group of faculty**

##### **Participants**

Hannah Milch, MD, (*Presenter*) Nothing to Disclose

##### **METHODS**

Faculty were recruited to participate in a mentorship course aimed at improving the pool of high quality mentors in the radiology department. Selection of participants focused on creating a balanced group with diverse backgrounds and levels of experience. The course curriculum was adopted from established predicates and was developed for clinician scientists, with prior proven success. Participants met weekly for two hours over 6 weeks in an informal and confidential setting. Participants completed a 19 question survey about mentorship skills before the first session (pre-test) and within one week following the last session (post-test). Respondents rated their mentorship skills based on a Likert scale ranging from 1 (not at all skilled) to 7 (highly skilled). Paired t-tests were performed to assess differences in mean responses.

##### **RESULTS**

Eleven faculty completed the course and their survey response rate was 100%. The group was gender balanced (six women and five men) and at varying career stages (4 Professors, 2 Associate Professors, and 5 Assistant Professors). Mean score for each of the 19 survey questions significantly increased on the post-test by an average of 2.22 points, from 3.78-6.00 ( $p < 0.001$ ). Scores demonstrated high reliability across all questions (Cronbach's alpha of 0.96). For 18 of the 19 questions there was no significant difference in score improvement between Professors and Associate/Assistant Professors. For a single question (Question 10: Working with trainees to set research goals), Professors demonstrated less improvement compared to Associate/Assistant Professors (mean score difference of 1 versus 3,  $p = 0.014$ ).\*Discussion By discussing provocative mentorship dilemmas in a confidential small group of peers, radiology faculty with all levels of experience reported a large improvement in mentorship skills after just six weekly sessions. Strengthening faculty mentorship through an in-person case-based course may help narrow gender and race disparities in radiology, improve departmental collegiality, and lead to greater overall job satisfaction and academic success.

#### **R5B-QI-6 Reimagining a Virtual Radiology QI Structured Problem Solving Program**

##### **Participants**

Amin Etemad, MBA, Stanford, CA (*Presenter*) Nothing to Disclose

##### **METHODS**

Opportunities for improvement were gathered by program managers through 1:1 interviews and surveys directed at stakeholders, which included modality leaders, department education leaders, operational leaders, and prior resident and staff participants. Based on the feedback, the following interventions were successfully implemented: 1. Modifying the program frequency to 3 cohorts per year, with cohorts lasting approximately 14 weeks. 2. Implemented virtual check-ins for project leaders, stakeholders, and program leaders. 3. Developing an "idea repository" for potential improvement projects. 4. Utilizing a committee of faculty division performance leaders to vet and approve project ideas submitted by trainees.

##### **RESULTS**

Following our QI efforts, participation increased from an average of 1.5 project proposals per cohort submitted at baseline after the COVID pandemic began to 4.5 proposals per cohort. The program included two multi-departmental projects: breast surgery partnered with mammography to reduce the number of unnecessary phone calls regarding specimen imaging questions, and orthopedic surgery partnered with diagnostic x-ray to reduce the number of incorrect orders being placed by referring providers. Resident participation in operations-led projects increased 65% since FY2021.\*Discussion Sustaining an intra-departmental project-based improvement program during and after the COVID pandemic required rethinking the fundamental aspects of program, with the goal of maintaining the outcomes of increasing improvement capability within the department and providing a structured venue for problem solving. Through stakeholder feedback, the program management team implemented changes that have allowed the

program to continue to serve as a valuable resource for the department, despite pandemic and post-pandemic related challenges.

### **R5B-QI-7 From Exclusion to Inclusion: Embracing Gender Diversity in Radiology Reports**

Participants

Waqas Ahmad I, MBBS, Vancouver, BC (*Presenter*) Nothing to Disclose

#### **METHODS**

A survey was conducted among radiologists across the hospital. It was designed to assess radiologists' attitudes towards gender-neutral language and their current practices in using it in their reports. The survey was administered online and consisted of three sections: demographics, attitudes towards gender-neutral language, and current practices. Age, gender, and practice setting, importance of gender-neutral language, familiarity with the concept, and potential barriers to implementation and current use of gender-neutral language in reports and whether they had received any training or guidance on the topic were included in the survey.

#### **RESULTS**

A total of 50 radiologists completed the survey. Regarding attitudes towards gender-neutral language, 85% of respondents believed it was important to use such language in radiology reports, while 15% did not think it was necessary. However, only 30% of respondents were familiar with the concept of gender-neutral language, indicating a need for further education on the topic. In terms of current practices, only 2% of respondents reported using gender-neutral language in their radiology reports. Among those who did not use gender-neutral language, the most common reason cited was a lack of guidance or training on the topic. Interestingly, gender did not appear to have a significant impact on whether radiologists used gender-neutral language in their reports. \*Discussion Many radiologists believe that gender-neutral language is important, there is still a lack of familiarity and implementation of such language in practice. There is need for education and training on the topic to promote more widespread adoption of gender-neutral language in radiology reports. Implementing gender-neutral language in radiology reports is the complexity of the medical terminology itself. Radiologists may be hesitant to adopt unfamiliar terms and may require additional resources and support to do so effectively. Despite challenges, it is crucial to promote the use of gender-neutral language in radiology reports to promote inclusivity and respect for all patients, regardless of gender identity. Radiologists can help create a more welcoming and equitable healthcare environment.

### **R5B-QI-8 Improving Radiologist Interpretation Confidence for Appendix Ultrasound through Standardized Performance and Reporting**

Participants

Harpreet Grewal, MD, Pensacola, FL (*Presenter*) Nothing to Disclose

#### **METHODS**

This project was performed in a combined adult and children's hospital in a suburban setting with two other affiliated FSEDs. A nationally standardized pediatric appendix ultrasound protocol, sonographer worksheet and reporting template were implemented after offering live training to all sonographers and radiologists in September 2021. In March of 2022 a 2-hour virtual training with CME was mandated for all reading radiologists and all sonographers. We tracked utilization of each component over time, additional imaging post-appendix ultrasound, length of stay, diagnostic accuracy and certainty of report impression defined as: positive for appendicitis, negative for appendicitis, equivocal (conflicting US findings), or merely descriptive. Seven radiologists (five pediatric and two body imagers) retrospectively reviewed the data from before live training (n=61), after live training (n= 159) and after virtual mandated training (n=63) for 285 patients requiring undergoing appendix ultrasound between December 2020 and June 2022.

#### **RESULTS**

Patients ranged in age from 1-70 years with a mean of 10.2 years for the before-training group, 13.6 years for the after-live training group and 11.9 years for the after-virtual training group. Fifteen-minute mean scan times were the same in all groups. There was a significant decrease in both descriptive and equivocal impressions following training (graph 1). Length of stay was not significantly different between the three groups, 15.5 hours before training, 38.8 hours after live training and 16.1 hours after mandatory training. There were 2 false positive cases before training, none after live training and one after virtual training. There was one false negative study in each of the groups. There was a 74 percent decrease in descriptive interpretations. \*Discussion While there was a 74 percent decrease in descriptive US impressions, we did not see any significant change in length of stay or post-appendix ultrasound imaging utilization in our care setting during this time frame. Limitations include undefined impact of Covid 19 pandemic on healthcare utilization and other variable.

### A Novel Contrast extravasation intake form To Foster Standardized Data Collection and Quality Improvement

#### **METHODS**

Review current reporting system - Safety Net, and identify shortages of reporting system to 1) create standardized and mandatory data collecting system; 2) reduce data input time; 3) better track risk factors; 4) facilitate future data retrieval, analysis quality improvement; 5) improve patient care safety.

#### **RESULTS**

Feedback from circulating novel input form: 1) Data/information being collected: satisfactory 2) Mostly quick-input process 3) Risk factor collection: thorough inclusive 4) Educational intake form 5) Informative form\* Discussion Quality improvement activities include: 1) Frequent small improvement efforts conducted in close association with the management front-line technicians, as well as spreadsheet design constant improvement 2) Dedicated improvement projects: To identify potential risk factors reduce contrast extravasation rate. 3) Regular follow-up 4) Frequent visit to the CT/MRI scan room 5) Forming a project team 6) Project Leader 7) Project Coach

### Machine learning for identification of acute adverse reactions to iodinated contrast media using routine clinical and laboratory data in cancer patients

#### Participants

Qiong Li, Guangzhou, China (*Presenter*) Nothing to Disclose

#### METHODS

Between January 2019 to December 2021, a total of 208035 cancer patients who underwent ICM administration were enrolled from our hospital. Their demographic information, clinical and laboratory data, CT scan protocol and AARs of iodinated contrast media were collected. Several machine learning methods were performed to construct the prediction model, We also used feature selection and analysis techniques to identify risk factors that predict occurrence of AAR.

#### RESULTS

Among 208035 cancer patients who underwent ICM administration, the overall prevalence of AARs was 0.205%. A CatBoost model was more accurate than other machine learning models, with an AUC of 0.959 , a sensitivity of 0.929. Several variates significantly associated with AARs were history of hypersensitivity reaction to ICM, iopromide , immunotherapy, excessive MRI enhancement scan, and younger age.\*Discussion A large number of radiological examinations, mainly contrast-enhanced CT scans, are conducted worldwide each year, especially in cancer patients. A machine-learning model was more accurate for predict the occurrence of AARs associated with iodinated contrast media, which can offer useful guidance to clinicians and patients for individually adjuvant therapy. This result indicates that radiologists need to pay greater attention to a patient's cancer history, especially with ragard to current antineoplastic treatments.

### Improving on-time starts for pediatric cardiac magnetic resonance imaging (cMRI)

#### METHODS

A multidisciplinary team from Cardiac and Radiology Services utilized a local version of the Stanford RITE improvement methodology to target several process improvements to patient flow. We focused on understanding our current state by enhancing data visualization to easily identify where delays were occurring. Two key causes of delay were late outpatient arrival and variations in patient prep timing for anesthesia patients. Families were surveyed to identify reasons for late arrivals, which led to a standard script for pre-visit calls with detailed instructions for traffic, parking, and registration location. A patient-ready time stamp was utilized for anesthesia patients to better coordinate patient prep activities and timely induction. Finally, process mapping demonstrated a rework pattern that required a complete redesign of the scheduling and protocolling process steps. A new workflow that allows protocolling before scheduling has been developed and is currently in the testing phase.

#### RESULTS

Defining performance and visualizing it in a meaningful way created a slight Hawthorne effect with an increase in on-time starts from 10% to 21% during our current state analysis. Timing of standard script implementation right before Thanksgiving and through the winter holidays impacted our measurable improvement with significantly lower volumes. We attribute the "rebound" in January to the continued use of the script as well as the efforts to improve anesthesia patient prep times. Shared situational awareness of patient flow time points, equipment readiness, and efforts by the sedation team to orchestrate IV placement, physical examination, and the consent process brought our on-time starts to 34% by the end of the program.\*Discussion There was value in using a systematic team approach to understanding and solving this problem. Team members were unaware of what the process looked like to our patients because they only knew their small piece of the larger workflow. Team members Gemba walked all areas of the process to gain perspective, build engagement, and facilitate teamwork. Areas of focus initially centered on low-effort interventions because redesigning the scheduling and protocolling steps of the process required more time and outside resources than expected. We anticipate this much-needed change will have a dramatic effect on our metric when we are able to go live.

R5B-QI-4

### Imaging Stewardship: Defining STAT exams in the Cardiac Intensive Care Unit

#### METHODS

The team included clinicians from the Cardiac Intensive Care unit and Radiology. The Quality improvement approach used was Realizing Improvement through Team Empowerment (RITE) process improvement program. The program guides teams through didactic education and practical application of quality improvement tools. The tools used included a process map to understand the workflow. Gemba walks to see how the work is done and factors that contributed to the problem. The data collected was used to create fishbone diagrams and Pareto charts to quantify key causes of the problem. From that information the top key drivers for improvement were identified and included the need for technologist to have a consistent workflow, and the need for closed loop communications between clinicians and technologists. One of the most impactful communication interventions was the creation of the Clinical criteria for STAT priority exams. That and other interventions were tested using small test of change, Plan-Do-Study-Act cycles. Improvement was measured by quantifying the time from notice of exam need to the time of exam completion.

#### RESULTS

Using RITE methodology helped the team to decrease the turn-a-round time for STAT portable exams from a median of 24 minutes to a median of 15 minutes by the end of the six-month program. The key interventions that lead to this improvement were changing the notification from a phone call to a secure chat notification which allowed the Technologist to better triage STAT request. Also, development of the clinical criteria list decreased the number of STAT requests to those of the highest clinical priority.\*Discussion Development of a shared understanding between the Cardiac ICU and Radiology as to what makes an exam STAT and how we best communicate that to illicit a timely response was crucial. Using a systematic, team-based approach to improvement contributed to the success by improving communication between the two departments. Subsequently, the key interventions have been spread to the neonatal intensive care unit and improved data analysis methods of current performance are underway.

R5B-QI-5

### Teach The Mentor: A six week intensive program universally improves mentorship skills among a diverse group of faculty

#### Participants

Hannah Milch, MD, (Presenter) Nothing to Disclose

#### METHODS

Faculty were recruited to participate in a mentorship course aimed at improving the pool of high quality mentors in the radiology department. Selection of participants focused on creating a balanced group with diverse backgrounds and levels of experience. The course curriculum was adopted from established predicates and was developed for clinician scientists, with prior proven success. Participants met weekly for two hours over 6 weeks in an informal and confidential setting. Participants completed a 19 question survey about mentorship skills before the first session (pre-test) and within one week following the last session (post-test). Respondents rated their mentorship skills based on a Likert scale ranging from 1 (not at all skilled) to 7 (highly skilled). Paired t-tests were performed to assess differences in mean responses.

#### RESULTS

Eleven faculty completed the course and their survey response rate was 100%. The group was gender balanced (six women and five men) and at varying career stages (4 Professors, 2 Associate Professors, and 5 Assistant Professors). Mean score for each of the 19 survey questions significantly increased on the post-test by an average of 2.22 points, from 3.78-6.00 ( $p < 0.001$ ). Scores demonstrated high reliability across all questions (Cronbach's alpha of 0.96). For 18 of the 19 questions there was no significant difference in score improvement between Professors and Associate/Assistant Professors. For a single question (Question 10: Working with trainees to set research goals), Professors demonstrated less improvement compared to Associate/Assistant Professors (mean score difference of 1 versus 3,  $p = 0.014$ ). \*Discussion By discussing provocative mentorship dilemmas in a confidential small group of peers, radiology faculty with all levels of experience reported a large improvement in mentorship skills after just six weekly sessions. Strengthening faculty mentorship through an in-person case-based course may help narrow gender and race disparities in radiology, improve departmental collegiality, and lead to greater overall job satisfaction and academic success.

S3A-QI

### Quality Improvement Reports Sunday Poster Discussions I

#### Sub-Events

#### **S3A-QI-1 Community Centered Process Mapping to Identify Breast Cancer Screening Barriers**

##### Participants

Arissa Milton, BS, Madison, WI (*Presenter*) Nothing to Disclose

##### **METHODS**

To develop the community centered process map, we included participants from the Wisconsin Network for Research Support (WINRS) Community Advisory on Research Design and Strategies (CARDS). CARDS participants are recruited from community centers and food banks that serve individuals from diverse racial, socioeconomic, and educational backgrounds. A community-centered process map describing the screening mammography process was developed from the lived experiences, concerns, and storytelling of community advisory group members. Patients, clinicians, and academic researchers were involved in the map development using structured quality improvement guidelines. After development of the process map, structured brainstorming exercises were conducted to facilitate divergent thinking. Barriers and potential solutions were identified by CARDS participants and categorized. Four 90-minute group meetings were held between May and September 2022. Members were compensated for their time and participation. All sessions were audio-recorded and transcribed verbatim by HIPAA-trained transcribers to prepare for analysis.

##### **RESULTS**

Community advisory focus group was composed of 22 adults from low-income neighborhoods in Madison, including 17 African Americans and 1 Latinx member. Community centered process mapping led to the creation of a mammography screening timeline (Figure 1). Steps in the mammography screening timeline included: 1) due for mammogram 2) schedule and prepare for mammogram 3) transportation to the breast center 4) check-in and waiting area 5) complete mammogram exam 6) results 7) billing. Top barriers (cited 6 times or more) were 1) pain/ discomfort 2) cost/coverage 3) fear/anxiety 4) lack of information/ unfamiliarity. Top solutions (cited 7 times or more) were 1) relationships, reassurance and safe or comforting physicians 2) reminders 3) more information 4) free/ low-cost mammograms.\*Discussion Community centered process maps can be used to create step by step breakdowns of the mammographic screening process. Multiple barriers and potential solutions were identified to improve access and adherence to mammography screening. Future studies will use structured quality improvement methods to test the impact of these potential interventions on improving mammography screening percentages.

#### **S3A-QI-2 The Impact of Online Self-Scheduling Platform Optimization on Patient Directed Access to Screening Mammography Appointments During the COVID-19 Pandemic**

##### Participants

Megan Kalambo, MD, Missouri City, TX (*Presenter*) Nothing to Disclose

##### **METHODS**

A retrospective review of online SM scheduling utilization between October 1, 2019, and December 31, 2022 was performed. The electronic health record (EHR) was queried to extract the total number of SMs performed, online scheduling, rescheduling and cancellation rates during the busiest screening mammography months of October through December in 2019 and 2022.

##### **RESULTS**

October to December online SM scheduling patient activity rose from 57 to 1481 patients when comparing 2019 and 2022 performance, representing a 26-fold increase in online platform utilization after EHR-tethered scheduling integration ( $p=0.013$ ). This resulted in a concurrent 16x fold reduction in patient access specialist SM scheduling engagement. Concurrently, SM scheduling automation resulted in increases in appointment rescheduling and cancellation rates, from 14% to 22% ( $p=0.005$ ) and 18% to 38% ( $p=0.000$ ), respectively.\*Discussion Optimization of our online self-scheduling platform with EHR integration resulted in a 26-fold increase in online self-scheduling patient utilization and a 16x fold reduction in DI-PAS hands on SM scheduling engagement. The rates of OSS patient appointment rescheduling and cancellation also increased but the overall net gain in self-scheduling automation should not deter continued use and implementation of this program.

#### **S3A-QI-3 Let It Shine! 5S + Safety: A Biopsy Training Equipment Quality Improvement Example**

##### Participants

Haydee Ojeda-Fournier, MD, San Diego, CA (*Presenter*) Research Consultant, View Point Medical, Inc; Stock options, CureMetrix, Inc

##### **METHODS**

Utilizing the concepts of sort, set in order, shine, standardize, and sustain, the 5S project was undertaken. First, the stakeholders were identified and included in the process. A plan of action was devised, and a location was identified to consolidate the biopsy training material. Facilities workers were involved in the process since moving furniture was a necessary step. A cabinet was organized with biopsy probes, guide wires, wireless localizers, and commercial and institution-created breast phantoms. The sharps were decluttered and disposed of properly. Only the required biopsy probes and needles were maintained. Finally, a plan to sustain

the organized cabinet was devised. This included communicating to nurses and technologists not to dump sharps in the training area unless requested by the lead radiologists involved in the project.

## RESULTS

Before and after photographs documented the 5S project, labeled cabinets make it easy to identify the materials needed by trainees.\*Discussion Messines and clutter lead to mistakes and present a safety hazard. Therefore, a 6th S (safety) is often included in the 5S projects to decrease or eliminate risk. The success of a 5S depends on communication, standardization, and general cleanliness. The process included proper quantities of biopsy probes for training and eliminating unnecessary items. We keep only what is needed on hand, and those items are consolidated into one location accessible to the point of use. We also relied on visual labeling to make finding what is needed efficient. 5S involves SORT - throw away items that are not used, adjust the quantity to keep on hand only what is required, SET IN ORDER - even when the residents are unfamiliar with the space, they can find what they need. This is achieved by using labels/colors, arranging by frequency of use, and grouping like items together. SHINE - like it is new! That way, people feel comfortable in the environment (another safety item- mental health). STANDARDIZE - a regular cleaning schedule and audit are performed, and communication with our technologists not to dump expired or unused probes in the biopsy training cabinet has been vital to keeping the system going. SUSTAIN - ensure that everything is maintained by creating a plan and making 5S part of the culture. And the 6th S: SAFETY - in our example, numerous sharps hazards were decluttered and organized to create a safe environment.

### S3A-QI-4 Taking Time for Timing Out: An Improvement Initiative for Time-out Documentation

#### Participants

Kerry L. Thomas, MD, Chapel Hill, NC (*Presenter*) Stockholder, Medtronic plc;Stockholder, UnitedHealth Group;Stockholder, Amgen Inc;Stockholder, AbbVie Inc

## METHODS

A random audit time out documentation for procedures completed in the 3 months before intervention documented 61% compliance. Key stakeholder (physicians, nurses, technologists) focus group discussions were held to evaluate how different team members understood the required time-out processes. These discussions exposed barriers to adherence, including lack of nursing support or real time access to the EMR for documentation, no standard wording for dictated procedural reports, and no specific education of necessary components of the time out process. Several interventions were introduced to address barriers. A standardized time-out process was created and attending physicians were designated as the individual responsible for initiating the time out. Education on the standard process was provided to faculty and trainees as well as to technologist and nurse supervisors, who disseminated this material to their respective units. Computers with real time EMR access were placed in the procedure area. A dictation template was also created for facile inclusion to the procedural report. We performed monthly audits to assess compliance, with a goal of 100% compliance.

## RESULTS

Monthly auditing revealed successful response to interventions. Rate of documented time out completion increased from m 61% to 97% month following intervention. Improvement was sustained over the following months, reaching 100% at 5 months. Approximately 6 months after the interventions began, a status update was disseminated to the relevant stakeholders, which also served as a reminder for continued compliance.\*Discussion Our objective was to improve adherence to The Universal Protocol to reduce the risk of wrong site/wrong patient procedures in diagnostic radiology. Compliance after intervention was at or nearly at goal. Because multiple interventions were introduced simultaneously, it is difficult to discern which had greatest impact, which interventions worked synergistically, or if any were ineffective. It would be ideal to directly quantify the effect of this initiative on patient, but because wrong site/patient procedures are infrequent, this would rely on "near miss" documentation, which was unavailable.

### S3A-QI-5 Reducing Turnaround Time For Routine Neurology Inpatient MRIs to Improve Length of Stay

## METHODS

We developed a "demand signal" in the EMR to signify which inpatients could be discharged within 24 hours of receiving the imaging results back. The demand signal would help technologist and radiologists prioritize orders of these inpatients ahead of other routine inpatient studies. The target was to reduce turnaround time for routine Neuro inpatient and observation patients between MRI ordered, MRI performed, and results dictated for these patients. Our study excluded MRIs ordered for septic and obstetric patients. We measured the use of the demand signal from March 2022 through August 2022, annualized the results and compared to the baseline metrics from May 2020 through May 2021.

## RESULTS

Initial pilot data demonstrates over 50% of patients selected "pending discharge" were discharged in less than 24 hours and 70% were discharged within 48 hours. The average time reduction between scan ordered and scan begin, scan end to dictation, and dictation to discharge were all significantly reduced ( $p < 0.001$ ). The annualized data analysis shows that demand signal patients were associated with 300 inpatient days and 34.5 observation days less compared to controls, with variance annualized savings of \$170,595. The demand signal was used consistently across all campuses of our health system (Figure 5).\*Discussion Implementing the demand signal was associated with significant impact on LOS and reduced health care costs. This has other secondary effects such as reducing ED holds by opening bed faster, especially when systems are seeing record patient volumes. Next steps include identifying similar opportunities and scaling the demand signal to inpatients undergoing other imaging exams such as CT and ultrasound with the goal of achieving a larger impact for the health system.

### S3A-QI-6 Reducing Redundant Imaging Orders using a Targeted Best Practice Advisory

## METHODS

We developed a targeted best practice advisory (BPA) to alert ordering physicians of an existing CTA that had been completed within seven days and would likely address the diagnostic need. The BPA provided a live link bringing the provider directly to the existing CTA report. We measured the use of the BPA over a one-year period and calculated the BPA effectiveness . Our data was compared to a one-year control period. A BPA is considered effective with a minimum score of 35-40%. We determined the total labor cost per MRA head and MRA neck that can be utilized to estimate the potential reduction of cost.

## RESULTS

Control Period (n=100) BPA Score 100% (100/100) BPA Score 50-70% (50/70) BPA Score 35-40% (35/40) BPA Score 10-20% (10/20) BPA Score 0-10% (0/10)

Over a one-year period, the neuro BPA fired 247 times. For all BPA fires, 58.7% of orders were completely cancelled and 10.5% of orders were changed to a different study. Only 30.8% of original orders were performed. This resulted in a potential maximal direct financial impact of \$42,834 in one year based on total average cost per MRA. The data analysis shows the percentage of MRA studies performed on inpatients with recent CTA studies decreased from 5.8% to 3.01% ( $p < 0.009$ ). The calculated neuro MRA BPA effectiveness rate is 58.7%, which is well above the standard and even further above the average effectiveness rates of other physician-based BPAs in the Health System (=10%).\*Discussion The implementation of the BPA had a significant impact on reducing redundant MRA head/neck studies. A three-month pre and post BPA implementation analysis demonstrated significant reduction in reducing MRAs performed within seven days of a completed CTA ( $p=0.009$ ). The data shows that our highly targeted "non-nuisance" BPA achieved the intended impact and next steps include identifying other similar opportunities in the system.

### **S3A-QI-7 Trends in the Proportion of Female Presenters, Keynote Speakers and Award Recipients at the Radiology Society of North America Conferences from 2013 till 2019**

#### **METHODS**

Design, settings and participants This is a cross sectional study aiming at determining the gender of presenters, keynote speakers and award recipients at the RSNA conferences of the years 2013, 2015, 2017 and 2019. The validated genderize.io tool was used to find the gender of the radiologists. Main outcomes and measures Evaluate the trend over the years of the percentage of women presenting in educational versus scientific sessions, during the second day of the conference versus the last day and in conventional radiology versus interventional radiology.

#### **RESULTS**

Four RSNA conferences were evaluated for the years 2013, 2015, 2017 and 2019 with a total of 2049 presenters between scientific and educational sessions, 115 keynote speakers and 2225 award recipients. The proportion of female presenters significantly increased from 2013 to 2017 ( $p=0.001$ ). However women are still less represented with a maximum of female presenters of 35.9% reached for the year 2017. For keynote speakers and for awards recipients, the trends of female representation is not statistically significant, and women continue to be underrepresented reaching a maximum of 33.3% of keynote speakers in 2013 and around 35% for award recipients for the different years. The proportion of female presenting educational sessions significantly increased ( $p=0.01$ ) from 2013 (20.5%) to reach 40.6% in 2017. The proportion of female presenting scientific sessions also significantly increased ( $p=0.04$ ) from 2013 (26%) to 2015 (36.2%). It slightly dropped in 2017 to reach 32.5% and slightly increased again in 2019 to 33.9%. The proportion of women presenting for conventional radiology (34.8%) is significantly higher than those for interventional radiology (18.6%) in all years ( $p < 0.0001$ ). We found no significant change between day 2 and Day 7 in the proportion of females and males \*Discussion The proportion of female presenters increased over the years at the RSNA conferences, however women continue to be underrepresented as presenters in medical conferences. This disparity is noted for the radiology specialty in general and especially in the field of interventional radiology.

### Community Centered Process Mapping to Identify Breast Cancer Screening Barriers

#### Participants

Arissa Milton, BS, Madison, WI (*Presenter*) Nothing to Disclose

#### METHODS

To develop the community centered process map, we included participants from the Wisconsin Network for Research Support (WINRS) Community Advisory on Research Design and Strategies (CARDS). CARDS participants are recruited from community centers and food banks that serve individuals from diverse racial, socioeconomic, and educational backgrounds. A community-centered process map describing the screening mammography process was developed from the lived experiences, concerns, and storytelling of community advisory group members. Patients, clinicians, and academic researchers were involved in the map development using structured quality improvement guidelines. After development of the process map, structured brainstorming exercises were conducted to facilitate divergent thinking. Barriers and potential solutions were identified by CARDS participants and categorized. Four 90-minute group meetings were held between May and September 2022. Members were compensated for their time and participation. All sessions were audio- recorded and transcribed verbatim by HIPAA-trained transcribers to prepare for analysis.

#### RESULTS

Community advisory focus group was composed of 22 adults from low-income neighborhoods in Madison, including 17 African Americans and 1 Latinx member. Community centered process mapping led to the creation of a mammography screening timeline (Figure 1). Steps in the mammography screening timeline included: 1) due for mammogram 2) schedule and prepare for mammogram 3) transportation to the breast center 4) check-in and waiting area 5) complete mammogram exam 6) results 7) billing. Top barriers (cited 6 times or more) were 1) pain/ discomfort 2) cost/coverage 3) fear/anxiety 4) lack of information/ unfamiliarity. Top solutions (cited 7 times or more) were 1) relationships, reassurance and safe or comforting physicians 2) reminders 3) more information 4) free/ low-cost mammograms.\*Discussion Community centered process maps can be used to create step by step breakdowns of the mammographic screening process. Multiple barriers and potential solutions were identified to improve access and adherence to mammography screening. Future studies will use structured quality improvement methods to test the impact of these potential interventions on improving mammography screening percentages.

S3A-QI-2

### The Impact of Online Self-Scheduling Platform Optimization on Patient Directed Access to Screening Mammography Appointments During the COVID-19 Pandemic

#### Participants

Megan Kalambo, MD, Missouri City, TX (*Presenter*) Nothing to Disclose

#### METHODS

A retrospective review of online SM scheduling utilization between October 1, 2019, and December 31, 2022 was performed. The electronic health record (EHR) was queried to extract the total number of SMs performed, online scheduling, rescheduling and cancellation rates during the busiest screening mammography months of October through December in 2019 and 2022.

#### RESULTS

October to December online SM scheduling patient activity rose from 57 to 1481 patients when comparing 2019 and 2022 performance, representing a 26-fold increase in online platform utilization after EHR-tethered scheduling integration ( $p=0.013$ ). This resulted in a concurrent 16x fold reduction in patient access specialist SM scheduling engagement. Concurrently, SM scheduling automation resulted in increases in appointment rescheduling and cancellation rates, from 14% to 22% ( $p=0.005$ ) and 18% to 38% ( $p=0.000$ ), respectively. \*Discussion Optimization of our online self-scheduling platform with EHR integration resulted in a 26-fold increase in online self-scheduling patient utilization and a 16x fold reduction in DI-PAS hands on SM scheduling engagement. The rates of OSS patient appointment rescheduling and cancellation also increased but the overall net gain in self-scheduling automation should not deter continued use and implementation of this program.

### Let It Shine! 5S + Safety: A Biopsy Training Equipment Quality Improvement Example

#### Participants

Haydee Ojeda-Fournier, MD, San Diego, CA (*Presenter*) Research Consultant, View Point Medical, Inc; Stock options, CureMetrix, Inc

#### METHODS

Utilizing the concepts of sort, set in order, shine, standardize, and sustain, the 5S project was undertaken. First, the stakeholders were identified and included in the process. A plan of action was devised, and a location was identified to consolidate the biopsy training material. Facilities workers were involved in the process since moving furniture was a necessary step. A cabinet was organized with biopsy probes, guide wires, wireless localizers, and commercial and institution-created breast phantoms. The sharps were decluttered and disposed of properly. Only the required biopsy probes and needles were maintained. Finally, a plan to sustain the organized cabinet was devised. This included communicating to nurses and technologists not to dump sharps in the training area unless requested by the lead radiologists involved in the project.

#### RESULTS

Before and after photographs documented the 5S project, labeled cabinets make it easy to identify the materials needed by trainees. \*Discussion Messines and clutter lead to mistakes and present a safety hazard. Therefore, a 6th S (safety) is often included in the 5S projects to decrease or eliminate risk. The success of a 5S depends on communication, standardization, and general cleanliness. The process included proper quantities of biopsy probes for training and eliminating unnecessary items. We keep only what is needed on hand, and those items are consolidated into one location accessible to the point of use. We also relied on visual labeling to make finding what is needed efficient. 5S involves SORT - throw away items that are not used, adjust the quantity to keep on hand only what is required, SET IN ORDER - even when the residents are unfamiliar with the space, they can find what they need. This is achieved by using labels/colors, arranging by frequency of use, and grouping like items together. SHINE - like it is new! That way, people feel comfortable in the environment (another safety item- mental health). STANDARDIZE - a regular cleaning schedule and audit are performed, and communication with our technologists not to dump expired or unused probes in the biopsy training cabinet has been vital to keeping the system going. SUSTAIN - ensure that everything is maintained by creating a plan and making 5S part of the culture. And the 6th S: SAFETY - in our example, numerous sharps hazards were decluttered and organized to create a safe environment.

### Taking Time for Timing Out: An Improvement Initiative for Time-out Documentation

#### Participants

Kerry L. Thomas, MD, Chapel Hill, NC (*Presenter*) Stockholder, Medtronic plc; Stockholder, UnitedHealth Group; Stockholder, Amgen Inc; Stockholder, AbbVie Inc

#### METHODS

A random audit time out documentation for procedures completed in the 3 months before intervention documented 61% compliance. Key stakeholder (physicians, nurses, technologists) focus group discussions were held to evaluate how different team members understood the required time-out processes. These discussions exposed barriers to adherence, including lack of nursing support or real time access to the EMR for documentation, no standard wording for dictated procedural reports, and no specific education of necessary components of the time out process. Several interventions were introduced to address barriers. A standardized time-out process was created and attending physicians were designated as the individual responsible for initiating the time out. Education on the standard process was provided to faculty and trainees as well as to technologist and nurse supervisors, who disseminated this material to their respective units. Computers with real time EMR access were placed in the procedure area. A dictation template was also created for facile inclusion to the procedural report. We performed monthly audits to assess compliance, with a goal of 100% compliance.

#### RESULTS

Monthly auditing revealed successful response to interventions. Rate of documented time out completion increased from 61% to 97% month following intervention. Improvement was sustained over the following months, reaching 100% at 5 months. Approximately 6 months after the interventions began, a status update was disseminated to the relevant stakeholders, which also served as a reminder for continued compliance.\*Discussion Our objective was to improve adherence to The Universal Protocol to reduce the risk of wrong site/wrong patient procedures in diagnostic radiology. Compliance after intervention was at or nearly at goal. Because multiple interventions were introduced simultaneously, it is difficult to discern which had greatest impact, which interventions worked synergistically, or if any were ineffective. It would be ideal to directly quantify the effect of this initiative on patient, but because wrong site/patient procedures are infrequent, this would rely on "near miss" documentation, which was unavailable.

S3A-QI-5

### Reducing Turnaround Time For Routine Neurology Inpatient MRIs to Improve Length of Stay

#### METHODS

We developed a "demand signal" in the EMR to signify which inpatients could be discharged within 24 hours of receiving the imaging results back. The demand signal would help technologist and radiologists prioritize orders of these inpatients ahead of other routine inpatient studies. The target was to reduce turnaround time for routine Neuro inpatient and observation patients between MRI ordered, MRI performed, and results dictated for these patients. Our study excluded MRIs ordered for septic and obstetric patients. We measured the use of the demand signal from March 2022 through August 2022, annualized the results and compared to the baseline metrics from May 2020 through May 2021.

#### RESULTS

Initial pilot data demonstrates over 50% of patients selected "pending discharge" were discharged in less than 24 hours and 70% were discharged within 48 hours. The average time reduction between scan ordered and scan begin, scan end to dictation, and dictation to discharge were all significantly reduced ( $p < 0.001$ ). The annualized data analysis shows that demand signal patients were associated with 300 inpatient days and 34.5 observation days less compared to controls, with variance annualized savings of \$170,595. The demand signal was used consistently across all campuses of our health system (Figure 5). \*Discussion Implementing the demand signal was associated with significant impact on LOS and reduced health care costs. This has other secondary effects such as reducing ED holds by opening bed faster, especially when systems are seeing record patient volumes. Next steps include identifying similar opportunities and scaling the demand signal to inpatients undergoing other imaging exams such as CT and ultrasound with the goal of achieving a larger impact for the health system.

S3A-QI-6

### Reducing Redundant Imaging Orders using a Targeted Best Practice Advisory

#### METHODS

We developed a targeted best practice advisory (BPA) to alert ordering physicians of an existing CTA that had been completed within seven days and would likely address the diagnostic need. The BPA provided a live link bringing the provider directly to the existing CTA report. We measured the use of the BPA over a one-year period and calculated the BPA effectiveness. Our data was compared to a one-year control period. A BPA is considered effective with a minimum score of 35-40%. We determined the total labor cost per MRA head and MRA neck that can be utilized to estimate the potential reduction of cost.

#### RESULTS

Over a one-year period, the neuro BPA fired 247 times. For all BPA fires, 58.7% of orders were completely cancelled and 10.5% of orders were changed to a different study. Only 30.8% of original orders were performed. This resulted in a potential maximal direct financial impact of \$42,834 in one year based on total average cost per MRA. The data analysis shows the percentage of MRA studies performed on inpatients with recent CTA studies decreased from 5.8% to 3.01% ( $p < 0.009$ ). The calculated neuro MRA BPA effectiveness rate is 58.7%, which is well above the standard and even further above the average effectiveness rates of other physician-based BPAs in the Health System (=10%).\*Discussion The implementation of the BPA had a significant impact on reducing redundant MRA head/neck studies. A three-month pre and post BPA implementation analysis demonstrated significant reduction in reducing MRAs performed within seven days of a completed CTA ( $p=0.009$ ). The data shows that our highly targeted "non- nuisance" BPA achieved the intended impact and next steps include identifying other similar opportunities in the system.

### Quality Improvement Reports Sunday Poster Discussions II

#### Sub-Events

#### S3B-QI-1 A New Peer Learning Tool - Concepts, Iterative Improvement, and Scaling Up

##### Participants

Nadja Kadom, MD, Atlanta, GA (*Presenter*) Nothing to Disclose

##### METHODS

**Context and Intervention:** This tool was developed in free-standing pediatric hospital with academic affiliation. A peer learning program was established for the neuroradiology group in 2021 and was scaled up to include pediatric body imaging in January 2023. There was no budget for this intervention.

##### RESULTS

**The Intervention:** We developed a PL tool using an existing research database tool (REDCap®) and set-up a workflow between existing members of our team, such a physician PL leader(s), radiologists, administrative assistants, and film library staff (Figure 1). A team approach was used to design and iteratively refine the PL tool. **Concepts:** Case submission: submit a wide variety of learning and improvement opportunities such as discrepancies, interesting cases, great catch, issues related to protocols, communication etc). **Clinical care:** accountability for providing appropriate clinical care lies with the radiologist submitting a case. **PL Conference preparation:** radiologists indicate whether the case is worth discussing in the PL conference. **PL Conference:** Each conference is recorded and can be viewed asynchronously. **Anonymized case review in PACS.** Program targets: case submissions per month per faculty and 50% attendance of PL sessions. **ACR Annual Reporting:** The database tool tracks case submissions per faculty per month. **PL Conference attendance** tracked by an administrative assistant. **Iterative Improvements:** most impactful was blinding who submitted a case in the feedback document that is sent to the original reviewer. **Scaling Up:** The tool was tested in the neuroradiology section for 1 year, then reviewed by the general pediatric imaging group, and adopted in January 2023. **Analysis:** For the neuroradiology faculty, there have been 147 case submissions in 2022, which represents a monthly submission average of 12 cases. After the final modification to the tool, blinding who submitted a case in the feedback document that is sent to the original reviewer, the monthly case submission average for this group in 2023 has increased to 29 cases. **Summary:** We used existing resources to build a PL tool as part of a PL process which facilitates clinical accountability, fosters individual and group learning through feedback and discussion, and meets the requirements for ACR accreditation under the PL pathway. **\*Discussion** We are working with OPPE to define qualitative/quantitative data stewardship for The Joint Commission reporting, and delineate the radiology process for monitoring radiologist competency/performance.

#### S3B-QI-2 Pre-appointment Texting for Screening Breast Exams- Impact on Reducing Patient No Shows and Improving Exam Completion

##### Participants

Jay K. Pahade, MD, Southport, IL (*Presenter*) Consultant, General Electric Company; Consultant, Clario Medical Imaging, Inc;

##### METHODS

A retrospective analysis was completed assessing same day cancellation / no show rate and number of screening or diagnostic breast imaging exams completed at our tertiary care center (5 independent locations) for 3 months prior (5/1 - 7/31/22) and 3 months after (9/1 - 11/30/22) the communication program was launched on 8/20/22. Chi square analysis was performed to assess change in rates. Breast biopsy procedures and breast MRI were excluded.

##### RESULTS

After launching the pre-appointment communication program, the mean no show/same day cancel rate for breast exams significantly declined from 13% to 6% (54% relative reduction,  $p < 0.001$ ). Overall response rate from patients was 49% (19103 reminders sent, 9435 responses). Most reminders were sent via text (14386/19103, 75%) and response rate with texting (59%) was greater than IVR (21%). Most reminders were in English (94% English, 6% Spanish). Of those that responded, 3% (290/9435) canceled their appointment electronically through the program. **\*Discussion** Creation of a pre-appointment communication program for screening breast imaging exams which incorporates exam reminders, exam preparation information, and way finding can significantly decrease (54% relative reduction) no show / same day cancel rates thereby reducing missed care opportunities for a critical important cancer detection program spearheaded by Radiology. Patient engagement with the messaging was high (49% overall response rate) with texting eliciting more patient responses compared to IVR.

#### S3B-QI-3 5-year Quality Improvement in Radiology Specialty Training At a UK Tertiary Cardiothoracic Centre

##### Participants

Monika Radike, MD, PhD, Liverpool, United Kingdom (*Presenter*) Nothing to Disclose

##### METHODS

To study the problem and intervene timely, simultaneous methods were applied: 1.A local post-placement feedback survey created; 2.Placement reorganisation: rotas revised based on training goals and Consultant-led clinical sessions with added hands-on cardiac

imaging training; pre-placement info and reading emailed; Journal Club start; pre-scheduled Consultant- /Radiographer-led teaching sessions; formal trainee encouragement for audit and academic activities; trainee study room optimisation; Consultants encouraged to train in supervision with protected time; a departmental education portal created; public publication board with trainees' academic output. 3.Unpaid Visiting Fellowships from 2018; 4.Salaried Clinical Fellowships from 2019. Alongside the project, the following were addressed: a)radiologists and radiographers recruited, b)regular departmental audit days scheduled. Regional ranking was monitored (available 2017-2019). Local feedback survey was distributed (2017-2022) and analysed (descriptive statistics).

## RESULTS

The site regionally ranked 9/19 in 2 years. 55 obtained local survey responses showed continuous improvement; cardiothoracic subspecialty interest increased after (37%) and before (23%) the placement; audit/academic project involvement increased (+36%). 14 Visiting and 6.5 1-year Clinical Fellowships completed. Consultant number increased (5 to 11), 8/11 trained as supervisors. Unintended consequences: per increased demand, compulsory posts were changed to motivation-based (2020). An additional salaried training post was offered by the deanery (2021). International externally funded Visiting Fellowships were agreed (2021). 5 Fellows were retained in the region as subspecialist consultants.\*Discussion Unexpected challenges: space and workstations (incl. trainee room) were lost/under-sourced with service expansion; no regional surveys since 2019, global pandemic. Regardless, the results were overwhelmingly positive with increase in the subspecialty interest and projected reputational effect. Local long-term survey was a sustainable data source in detecting improvement areas. Local improvement, along with rising regional ranking and reputation, showed increased national and international interest. Given the national radiologist shortage, the results show a positive impact of similar interventions including workforce retention/recruitment and thus improving patient care. Continuous feedback and QI maintenance are valuable to enhance training quality locally and beyond.

### S3B-QI-4 Improving First Case Start Times in the NORA IR Setting

Participants

Benjamin Tran, MONTGOMERY, AL (*Presenter*) Nothing to Disclose

## METHODS

A detailed table of time metrics was introduced into the perioperative workflow in January of 2023. The new workflow included time targets for the following elements: Patient arrival in registration, to pre-op time, IV placement and lab draws, CRNA assessment and MDA sign-off, Wheels in time, and Procedure start time. On time start data was collected for the 3 months prior to and 3 months following implementation (Oct 2022-March 2023). Primary metric for on time start was defined as Procedure start time for the First case of the day in all procedural rooms. All reasons for delay were categorized into Patient, Provider, or Process origins.

## RESULTS

All anesthesia-supported first start cases in our interventional radiology suite were included, totaling 124 across the study period. On-time first start percentage improved from around 34% pre-implementation to 55% post implementation, resulting from an 11-minute improvement in average procedure start time. However, the greatest on-time start percentage (~60%) was seen in the first two months after implementation, with a subsequent decrease (47%) in March. Improved on-time first starts were also coupled with an increase in room utilization (57% pre-intervention; 59% post-intervention), an increase in average monthly case count (62 pre-intervention; 69 post-intervention), and a decrease in average monthly end-of-day block overrun minutes (170 pre-intervention; 134 post-intervention).\*Discussion Development of more detailed time metrics to modify daily workflow improved overall on-time first start rate, particularly on non-Tuesdays. This improvement in efficiency and throughput results in increased room utilization, improved case throughput, and decreased block overrun times, all of which contribute toward increased revenues, decreased costs, and thus improved return on investment. Despite our successes, additional opportunities for sustained improvement remain beyond simply staff education and goal identification. Next steps include identification of barriers to each step of the delineated time table as well as a critical path analysis.

### S3B-QI-5 Design and Impact of an Imaging-Based Health Disparities Lecture in the Medical Student Radiology Curriculum

Participants

Siddhant Dogra, MD, New York, NY (*Presenter*) Nothing to Disclose

## METHODS

A 45-minute teaching session was developed utilizing PowerPoint. Learning objectives focus on highlighting sources of imaging-based inequities through open-ended audience questions, clinical case examples with real imaging exams, and review of pertinent literature. In order to evaluate educational impact, pre- and post-session surveys are administered using a combination of multiple-choice questions and 5-point Likert scale questions to measure knowledge gain and improved student confidence with discussion of imaging-based disparities. The session was initially presented in March 2023, embedded in a highly subscribed introductory diagnostic radiology course in our medical school curriculum. As this new session is only recently implemented, sample size is currently low and statistical analysis is therefore not yet performed.

## RESULTS

Our session focuses on four disparity categories: (1) race, (2) social, cultural, and economic factors, (3) sexual orientation and gender identity, and (4) physical and mental disability. 11 students attended the initial learning session and completed pre-and-post surveys. For each category, students reported improved confidence in discussing examples following the lecture (Figure 1). The percentage of students selecting the correct answer on multiple-choice questions also improved for each question after completion of the teaching session.\*Discussion We developed an interactive learning session for medical students to promote understanding of potential imaging-based health care disparities and strategies to counteract them. Following the session, students felt more comfortable discussing examples of imaging-based health disparities across all four of our selected categories. Our results are limited by a low sample size. However, the session is being presented on a monthly basis; we anticipate data from approximately 100 participants as we approach the end of the calendar year. Based on the success of this initial work, the session may be expanded to our radiology resident curriculum.

### S3B-QI-6 Repurposing Radiological Data for Different Needs Using Interactive Multimedia Reporting

## METHODS

We developed an IMR system that works by recording key images and voice descriptions of radiological findings, tagging the information with metadata (i.e., anatomy, diagnosis, common data elements) from an ontology using natural language processing,

and assembling a composite multimedia report with related items linked in timelines to represent findings. Each finding is tagged with additional elements including a number indicating when it first appeared in the report, disease metrics, target lesion assignment (i.e., for use in disease response assessment such as RECIST), and user-defined labels. The ontology used to label findings includes attributes indicating to which physiological category a particular anatomical location belongs and common data elements to provide details about each diagnosis. The combination of tags/labels assigned to each radiological finding enables them to be dynamically sorted and displayed to meet the needs of different users, including arranging findings by an anatomical hierarchy to mimic a conventional report, sorting findings by physiological categories for use by clinical specialists, grouping findings by TNM (tumor, nodes, metastasis) to facilitate disease staging, or sorting findings by disease metrics or sequence of appearance in the report.

## **RESULTS**

The IMR system is in use at our institution where it supports 40 clinical trials with the purpose of performing disease response assessments. To date the system has generated 2,956 reports on 639 patients with a total of 50,563 items of information linked in timelines representing 17,157 findings. Radiologists typically use the anatomical presentation of findings when interpreting exams and linking new findings to prior reports, whereas clinicians prefer the TNM display of findings for disease staging.\*Discussion IMR represents a significant advance over conventional radiology reporting, especially as it can repurpose radiological data to meet the needs of different stakeholders. By tagging radiological findings with an array of metadata, findings can be sorted and presented in several ways, including by anatomical hierarchies, physiological groups, or TNM staging categories. IMR transforms a radiology report from a static document to a dynamic set of elements with greater utility.

### **S3B-QI-7 Strategies to get the most out of an Journal Club: our experience after ten years and more than two million visits**

Participants

Dario Herran de la Gala, MD, Santander, Spain (*Presenter*) Nothing to Disclose

## **METHODS**

Define the workflow strategies within CB SERAM. Analyze the statistics of CB SERAM since its creation (march 2013). Analyze the number of visits and the number of entries on CB SERAM's website and possible strategies for future improvement.

## **RESULTS**

A Journal Club with a peer-review based review process favors scientific writing but also constructive criticism between members. Monthly frequency of content seems to be ideal. Webinars about critical article review help members to better read scientific literature. Since its creation in 2013, the CB SERAM has had 155 reviewers from 54 different hospitals from 2 different countries (Spain and Argentina). The annual number of reviewers has grown progressively, being most notable during the COVID-19 pandemic. Web entries and published content has also increased, as well as the number of visits to our website, which now averages 4000 visits per month, mostly from the Spanish-speaking community. - The use of social network managers favors the dissemination of content.\*Discussion By participating in a journal club, members can learn about the latest research methodologies, experimental techniques, and findings in their field, as well as engage in meaningful discussions with peers about the implications of the research. This not only creates a supportive and inclusive environment but also encourages members to stay motivated and engaged in their work. The use of technology can make the journal club experience more interactive and engaging. With the help of virtual meeting platforms, members can join meetings from anywhere and discussions can take place in real-time. Keeping up-to-date with technology and social media trends is essential for journal clubs to increase their reach and appeal to medicine residents. By utilizing these tools, journal club experience can be more engaging, interactive, and accessible, ultimately improving the quality of medical education.

### A New Peer Learning Tool - Concepts, Iterative Improvement, and Scaling Up

#### Participants

Nadja Kadom, MD, Atlanta, GA (*Presenter*) Nothing to Disclose

#### METHODS

**Context and Intervention:** This tool was developed in free-standing pediatric hospital with academic affiliation. A peer learning program was established for the neuroradiology group in 2021 and was scaled up to include pediatric body imaging in January 2023. There was no budget for this intervention.

#### RESULTS

**The Intervention:** We developed a PL tool using an existing research database tool (REDCap®) and set-up a workflow between existing members of our team, such a physician PL leader(s), radiologists, administrative assistants, and film library staff (Figure 1). A team approach was used to design and iteratively refine the PL tool. **Concepts:** Case submission: submit a wide variety of learning and improvement opportunities such as discrepancies, interesting cases, great catch, issues related to protocols, communication etc). **Clinical care:** accountability for providing appropriate clinical care lies with the radiologist submitting a case. **PL Conference preparation:** radiologists indicate whether the case is worth discussing in the PL conference. **PL Conference:** Each conference is recorded and can be viewed asynchronously. **Anonymized case review in PACS.** **Program targets:** case submissions per month per faculty and 50% attendance of PL sessions. **ACR Annual Reporting:** The database tool tracks case submissions per faculty per month. **PL Conference attendance** tracked by an administrative assistant. **Iterative Improvements:** most impactful was blinding who submitted a case in the feedback document that is sent to the original reviewer. **Scaling Up:** The tool was tested in the neuroradiology section for 1 year, then reviewed by the general pediatric imaging group, and adopted in January 2023. **Analysis:** For the neuroradiology faculty, there have been 147 case submissions in 2022, which represents a monthly submission average of 12 cases. After the final modification to the tool, blinding who submitted a case in the feedback document that is sent to the original reviewer, the monthly case submission average for this group in 2023 has increased to 29 cases. **Summary:** We used existing resources to build a PL tool as part of a PL process which facilitates clinical accountability, fosters individual and group learning through feedback and discussion, and meets the requirements for ACR accreditation under the PL pathway. **\*Discussion** We are working with OPPE to define qualitative/quantitative data stewardship for The Joint Commission reporting, and delineate the radiology process for monitoring radiologist competency/performance.

### Pre-appointment Texting for Screening Breast Exams- Impact on Reducing Patient No Shows and Improving Exam Completion

#### Participants

Jay K. Pahade, MD, Southport, IL (*Presenter*) Consultant, General Electric Company; Consultant, Clario Medical Imaging, Inc;

#### METHODS

A retrospective analysis was completed assessing same day cancelation / no show rate and number of screening or diagnostic breast imaging exams completed at our tertiary care center (5 independent locations) for 3 months prior (5/1 - 7/31/22) and 3 months after (9/1 - 11/30/22) the communication program was launched on 8/20/22. Chi square analysis was performed to assess change in rates. Breast biopsy procedures and breast MRI were excluded.

#### RESULTS

After launching the pre-appointment communication program, the mean no show/same day cancel rate for breast exams significantly declined from 13% to 6% (54% relative reduction,  $p < 0.001$ ). Overall response rate from patients was 49% (19103 reminders sent, 9435 responses). Most reminders were sent via text (14386/19103, 75%) and response rate with texting (59%) was greater than IVR (21%). Most reminders were in English (94% English, 6% Spanish). Of those that responded, 3% (290/9435) canceled their appointment electronically through the program.\*Discussion Creation of a pre-appointment communication program for screening breast imaging exams which incorporates exam reminders, exam preparation information, and way finding can significantly decrease (54% relative reduction) no show / same day cancel rates thereby reducing missed care opportunities for a critical important cancer detection program spearheaded by Radiology. Patient engagement with the messaging was high (49% overall response rate) with texting eliciting more patient responses compared to IVR .

### 5-year Quality Improvement in Radiology Specialty Training At a UK Tertiary Cardiothoracic Centre

#### Participants

Monika Radike, MD, PhD, Liverpool, United Kingdom (*Presenter*) Nothing to Disclose

#### METHODS

To study the problem and intervene timely, simultaneous methods were applied: 1.A local post-placement feedback survey created; 2.Placement reorganisation: rotas revised based on training goals and Consultant-led clinical sessions with added hands-on cardiac imaging training; pre-placement info and reading emailed; Journal Club start; pre-scheduled Consultant- /Radiographer-led teaching sessions; formal trainee encouragement for audit and academic activities; trainee study room optimisation; Consultants encouraged to train in supervision with protected time; a departmental education portal created; public publication board with trainees' academic output. 3.Unpaid Visiting Fellowships from 2018; 4.Salaried Clinical Fellowships from 2019. Alongside the project, the following were addressed: a)radiologists and radiographers recruited, b)regular departmental audit days scheduled. Regional ranking was monitored (available 2017-2019). Local feedback survey was distributed (2017-2022) and analysed (descriptive statistics).

#### RESULTS

The site regionally ranked 9/19 in 2 years. 55 obtained local survey responses showed continuous improvement; cardiothoracic subspecialty interest increased after (37%) and before (23%) the placement; audit/academic project involvement increased (+36%). 14 Visiting and 6.5 1-year Clinical Fellowships completed. Consultant number increased (5 to 11), 8/11 trained as supervisors. Unintended consequences: per increased demand, compulsory posts were changed to motivation-based (2020). An additional salaried training post was offered by the deanery (2021). International externally funded Visiting Fellowships were agreed (2021). 5 Fellows were retained in the region as subspecialist consultants.\*Discussion Unexpected challenges: space and workstations (incl. trainee room) were lost/under-sourced with service expansion; no regional surveys since 2019, global pandemic. Regardless, the results were overwhelmingly positive with increase in the subspecialty interest and projected reputational effect. Local long-term survey was a sustainable data source in detecting improvement areas. Local improvement, along with rising regional ranking and reputation, showed increased national and international interest. Given the national radiologist shortage, the results show a positive impact of similar interventions including workforce retention/recruitment and thus improving patient care. Continuous feedback and QI maintenance are valuable to enhance training quality locally and beyond.

### Improving First Case Start Times in the NORA IR Setting

#### Participants

Benjamin Tran, MONTGOMERY, AL (*Presenter*) Nothing to Disclose

#### METHODS

A detailed table of time metrics was introduced into the perioperative workflow in January of 2023. The new workflow included time targets for the following elements: Patient arrival in registration, to pre-op time, IV placement and lab draws, CRNA assessment and MDA sign-off, Wheels in time, and Procedure start time. On time start data was collected for the 3 months prior to and 3 months following implementation (Oct 2022-March 2023). Primary metric for on time start was defined as Procedure start time for the First case of the day in all procedural rooms. All reasons for delay were categorized into Patient, Provider, or Process origins.

#### RESULTS

All anesthesia-supported first start cases in our interventional radiology suite were included, totaling 124 across the study period. On-time first start percentage improved from around 34% pre-implementation to 55% post implementation, resulting from an 11-minute improvement in average procedure start time. However, the greatest on-time start percentage (~60%) was seen in the first two months after implementation, with a subsequent decrease (47%) in March. Improved on-time first starts were also coupled with an increase in room utilization (57% pre-intervention; 59% post-intervention), an increase in average monthly case count (62 pre-intervention; 69 post-intervention), and a decrease in average monthly end-of-day block overrun minutes (170 pre-intervention; 134 post-intervention). \*Discussion Development of more detailed time metrics to modify daily workflow improved overall on-time first start rate, particularly on non-Tuesdays. This improvement in efficiency and throughput results in increased room utilization, improved case throughput, and decreased block overrun times, all of which contribute toward increased revenues, decreased costs, and thus improved return on investment. Despite our successes, additional opportunities for sustained improvement remain beyond simply staff education and goal identification. Next steps include identification of barriers to each step of the delineated time table as well as a critical path analysis.

### Design and Impact of an Imaging-Based Health Disparities Lecture in the Medical Student Radiology Curriculum

#### Participants

Siddhant Dogra, MD, New York, NY (*Presenter*) Nothing to Disclose

#### METHODS

A 45-minute teaching session was developed utilizing PowerPoint. Learning objectives focus on highlighting sources of imaging-based inequities through open-ended audience questions, clinical case examples with real imaging exams, and review of pertinent literature. In order to evaluate educational impact, pre- and post-session surveys are administered using a combination of multiple-choice questions and 5-point Likert scale questions to measure knowledge gain and improved student confidence with discussion of imaging-based disparities. The session was initially presented in March 2023, embedded in a highly subscribed introductory diagnostic radiology course in our medical school curriculum. As this new session is only recently implemented, sample size is currently low and statistical analysis is therefore not yet performed.

#### RESULTS

Our session focuses on four disparity categories: (1) race, (2) social, cultural, and economic factors, (3) sexual orientation and gender identity, and (4) physical and mental disability. 11 students attended the initial learning session and completed pre-and-post surveys. For each category, students reported improved confidence in discussing examples following the lecture (Figure 1). The percentage of students selecting the correct answer on multiple-choice questions also improved for each question after completion of the teaching session.\*Discussion We developed an interactive learning session for medical students to promote understanding of potential imaging-based health care disparities and strategies to counteract them. Following the session, students felt more comfortable discussing examples of imaging-based health disparities across all four of our selected categories. Our results are limited by a low sample size. However, the session is being presented on a monthly basis; we anticipate data from approximately 100 participants as we approach the end of the calendar year. Based on the success of this initial work, the session may be expanded to our radiology resident curriculum.

### Repurposing Radiological Data for Different Needs Using Interactive Multimedia Reporting

#### METHODS

We developed an IMR system that works by recording key images and voice descriptions of radiological findings, tagging the information with metadata (i.e., anatomy, diagnosis, common data elements) from an ontology using natural language processing, and assembling a composite multimedia report with related items linked in timelines to represent findings. Each finding is tagged with additional elements including a number indicating when it first appeared in the report, disease metrics, target lesion assignment (i.e., for use in disease response assessment such as RECIST), and user-defined labels. The ontology used to label findings includes attributes indicating to which physiological category a particular anatomical location belongs and common data elements to provide details about each diagnosis. The combination of tags/labels assigned to each radiological finding enables them to be dynamically sorted and displayed to meet the needs of different users, including arranging findings by an anatomical hierarchy to mimic a conventional report, sorting findings by physiological categories for use by clinical specialists, grouping findings by TNM (tumor, nodes, metastasis) to facilitate disease staging, or sorting findings by disease metrics or sequence of appearance in the report.

#### RESULTS

The IMR system is in use at our institution where it supports 40 clinical trials with the purpose of performing disease response assessments. To date the system has generated 2,956 reports on 639 patients with a total of 50,563 items of information linked in timelines representing 17,157 findings. Radiologists typically use the anatomical presentation of findings when interpreting exams and linking new findings to prior reports, whereas clinicians prefer the TNM display of findings for disease staging.\*Discussion IMR represents a significant advance over conventional radiology reporting, especially as it can repurpose radiological data to meet the needs of different stakeholders. By tagging radiological findings with an array of metadata, findings can be sorted and presented in several ways, including by anatomical hierarchies, physiological groups, or TNM staging categories. IMR transforms a radiology report from a static document to a dynamic set of elements with greater utility.

### Strategies to get the most out of an Journal Club: our experience after ten years and more than two million visits

#### Participants

Dario Herran de la Gala, MD, Santander, Spain (*Presenter*) Nothing to Disclose

#### METHODS

Define the workflow strategies within CB SERAM. Analyze the statistics of CB SERAM since its creation (march 2013). Analyze the number of visits and the number of entries on CB SERAM's website and possible strategies for future improvement.

#### RESULTS

A Journal Club with a peer-review based review process favors scientific writing but also constructive criticism between members. Monthly frequency of content seems to be ideal. Webinars about critical article review help members to better read scientific literature. Since its creation in 2013, the CB SERAM has had 155 reviewers from 54 different hospitals from 2 different countries (Spain and Argentina). The annual number of reviewers has grown progressively, being most notable during the COVID-19 pandemic. Web entries and published content has also increased, as well as the number of visits to our website, which now averages 4000 visits per month, mostly from the Spanish-speaking community. - The use of social network managers favors the dissemination of content.\*Discussion By participating in a journal club, members can learn about the latest research methodologies, experimental techniques, and findings in their field, as well as engage in meaningful discussions with peers about the implications of the research. This not only creates a supportive and inclusive environment but also encourages members to stay motivated and engaged in their work. The use of technology can make the journal club experience more interactive and engaging. With the help of virtual meeting platforms, members can join meetings from anywhere and discussions can take place in real-time. Keeping up-to-date with technology and social media trends is essential for journal clubs to increase their reach and appeal to medicine residents. By utilizing these tools, journal club experience can be more engaging, interactive, and accessible, ultimately improving the quality of medical education.

### Quality Improvement Reports Tuesday Poster Discussions

#### Sub-Events

#### **T2-QI-1 Development Of Structured Percutaneous Transhepatic Cholangial Drainage Tube Home Care Educational Curriculum For Malignant Obstructive Jaundice Patients**

#### **METHODS**

The initial framework of structured education for malignant obstructive jaundice after PTCd was revised by expert consultation. Based on the revised results, the curriculum was developed and modified to form a preliminary curriculum. The research team verified the clinical effect of the revised curriculum and completed the curriculum optimization. Then we recruited 20 patients with their main caregivers to participate in this curriculum, and have an examination (theoretical and operational) to test the understanding of this curriculum as well as its satisfaction and practicability.

#### **RESULTS**

The initial framework of structured education course for tube home care included 4 topics from 4 curriculum dimensions. Experts reached consensus on all 4 topics after consultation, and split "tube management" into 2 topics and put forward suggestions for modification, thus the optimized final version of the course identified 4 dimensions and a total of 5 topics. The scores of the theoretical test were 80-100 ( $93.90 \pm 4.07$ ), the scores of the operational test were 94-100 ( $97.40 \pm 1.53$ ). The degree of satisfaction and practicability of the course were evaluated by patients and their family members at 95% or above. \*Discussion This study successfully set up a structured education curriculum for the home care of patients after PTCd for malignant obstructive jaundice, which combined the Chinese cultural background and the characteristics of Chinese patients, and shown to be applicable under local medical, social, and cultural environment. The limitations of this study are as follows: First, the sample size is small; second, we haven't do the follow up study.

#### **T2-QI-2 Establishing Access to Obstetric Ultrasound Services in Remote Areas through a teleradiology platform for reporting**

#### **METHODS**

A 4-week curriculum was developed to train 3 midwives with no ultrasound experience. Midwives were selected from clinics at varying distances from the study centre to assess image transfer times and teleradiology system efficacy. After scanning patients, writing provisional reports and uploading these to the Philips website, radiologists were informed who then reviewed and validated the studies. Feedback was given to the midwives. Validated reports were released to the patient if no further imaging was needed. The study utilized Philips tablets, modems, computers, and a 3G network to connect the equipment. Initially, the images and reports that were uploaded to the website were not of diagnostic quality. Our challenge was to transfer lossless images which was achieved by modifying the teleradiology algorithm using a second network configured to connect the tablets to a PACS server. This allowed improved image quality for diagnosis.

#### **RESULTS**

282 ultrasound exams were performed and evaluated. Reporting accuracy was 99.63% for scans performed by midwives, confirming that the training was adequate. Data analysis also showed that no further imaging was necessary after radiologist review. Report validation took 15 minutes after scan completion. Study success was achieved with a 10-minute scan time and 35-minute maximum turnaround. No problem arose with the equipment and no difference in transmission time, or image quality deterioration occurred. \*Discussion This study was limited by small catchment area and suboptimal image quality on the website. Despite this, the sample size sufficiently powered the study. Cell phone communication between the radiologist and midwife was successful and connectivity was constant. Distance from the primary centre did not affect transmission time or image quality. Post-delivery tracing determined the final outcome for 220 patients, while 51 could not be contacted. Training midwives to perform obstetric ultrasound can help practically address the shortage of trained personnel in resource-limited countries. Collaborating with radiologists and using modern technology can be cost-effective and efficient. Future research should focus on scalability, sustainability, and long-term impact.

#### **T2-QI-3 Evaluation of Diagnostic Reference Levels and Achievable Doses for Digital Radiographic Images**

#### **METHODS**

The study utilized a Siemens DR Multix Fusion Max using the Siemens recommended PA chest protocol at 125 kVp, automatic exposure control (AEC), and 72" source to image distance (SID). The AP abdomen protocol was 81 kVp, AEC, and 40" SID. The digital detectors utilized were a PIXIIUM 4343 RCE for chest protocols and a PIXIIUM 3543 EZH for abdomen protocols. An aluminum block, 19 mm thick, and copper sheet, 1 mm thick, were used to simulate a 20 cm thick patient. Evaluation of high and low contrast resolution was performed with a Leeds Torr 18FG phantom. EAK measurements were taken with a RaySafe X2 RAD probe. Three mAs settings were used for EAK and image quality determinations, starting with the current protocol in use.

#### **RESULTS**

The initial EAK results, representing the techniques in clinical use were 0.132 mGy and 3.41 mGy for the chest and abdomen protocols respectively. The NCRP Report 172 PA Chest DRL is 0.15 mGy and AD is 0.11 mGy. The AP abdomen DRL is 3.4 mGy and

AD is 2.4 mGy. These results reveal current EAK values slightly lower than (chest) or the same (abdomen) as the referenced DRL but above the AD. The spatial resolution for the initial chest protocol technique was consistently 2.34-line pairs/mm. After reducing the mAs by 25% and 50%, the spatial resolution for the abdomen protocol reduced from 2.24 lp/mm to 2 lp/mm. Both protocols showed a reduction of low contrast detection from 1.7% to 2.2% as the EAK dropped.\*Discussion Following NCRP 172, the measured EAK values for the current clinical PA chest and AP abdomen protocols were slightly below or at the DRL, but above the AD, thus allowing further dose reduction with minimal impact on image quality. Based on the phantom image quality testing, the EAK can potentially be reduced by 25% or even 50% to be below the AD while maintaining essentially equivalent image quality. The limitations of these physics tests are that they aren't necessarily representative of real patients. The clinical image testing is ongoing with radiologist image quality evaluation. This quality improvement program is expected to also encompass lumbosacral spine EAK, DRL and AD.

## **T2-QI-4 How was My Experience? Well, Thanks for Asking!"**

Participants

Latasha Paige, MEng, RN, South Bend, IN (*Presenter*) Nothing to Disclose

### **METHODS**

The Kano Diagram technique explores 3 dimensions of customer needs along the axes of provided services and impact on customer satisfaction:1. Unspoken Basics - assumed basic services.2. Spoken Performers - articulated services seen as competitive advantages. 3. Unspoken Delighters - unexpected services that delight the customer.The Empathy Map technique gauges four dimensions of the Patient's persona:1. The observable: what the Patient:a. Does b. Says2. The non-observable: what the Patient:a. Thinksb. FeelsWe conducted 3 web-based interviews with patients who regularly experience the MRI process. We used the collaborative software LucidChart.

### **RESULTS**

1. Empathy map revealed that we are not:a. Informing patients of delays.b. Valuing Patient's time.c. Customer service oriented.d. Fixing wasteful processes.e. Addressing patients' frustrated-, annoyed-, anxious-, and overwhelmed feelings.2. Kano diagram revealed:a. Basics - wayfinding, customer service, efficient processes, and clean/organized environment.b. Performers - minimal waiting, excellent doctors, good overall experience.c. Delighters - timely results, rapport with physicians, and improving their experience.3. Technique Feedback:a. Found digital post its distracting. Asked to have conversation instead. b. Appreciative of us asking questions.c. Interested in improvements that would come from interviews.\*Discussion • Learn when and how to use the Empathy map and Kano diagram for patients as well as team members to create an improvement plan where all key stakeholders' perspectives are considered. • Learn how to respond to criticism from patients and team members. This is a skill set that for many is not developed because: oHCAHPS Press Ganey surveys do not provide the same level of personal and emotional feedback that the Kano and Empathy maps do.oHCAHPS Press Ganey also do not require direct conversations with patients and team members.

## **T2-QI-5 Patient Navigation Improves Diagnostic Imaging Timeliness Among Mammography Van Patients with BIRADS-0**

### **METHODS**

This IRB exempted study began with creating a Process Map and Driver Diagram, which identified possible barriers to timely BIRADS-0 follow-up, namely delay in patient communication, lack of patient education, and complexity of scheduling workflow. Baseline follow-up time (7/1/2021-6/30/2022) and variables including location of screening van were collected from Epic Hyperspace (Verona, WI) and internal database to validate hypotheses. Intervention on 8/16/2022 aimed to improve patient communication of abnormal results and increase scheduling ease. Patient at four pilot sites, who previously relied on local community health centers for follow-up arrangements, were instead outreach by institutional patient navigators to schedule follow-up. Outcome data (follow-up time in days) was collected for 6 months before and after the intervention and analyzed by Statistical Process Controlled (SPC) X Chart by Rule for Special Cause (QI Macro, Denver, CO). Percent of patients reached by institutional staff pre vs post intervention were collected as process data to ensure intervention's functionality.

### **RESULTS**

Baseline callback rate was 12.9% (239/1848). Mean follow-up time was 49.7 days (range = 6-345) with 62% of patients (148/239) with follow-up delay. Mean follow-up time at different van sites ranged 7-96 days. Four sites with mean follow-up time >49.7 days agreed to participate in the pilot. Six patients (3/period) were lost to follow-up and excluded. Pre intervention (2/1/2022-8/15/2022), 17% (6/35) of patients at piloted sites were contacted by patient navigators to schedule follow-up compared to 74% (23/31) post intervention (collected during 8/17/2022-2/28/2023; however, van did not service pilot sites during 2/1/2023-2/28/2023). SPC-X chart demonstrated significant (3s) downward trend in follow-up time after intervention (fig. 1), with decrease in mean follow-up time by 12.9 days (from 50.1 to 37.2) and decreased in patients with follow-up delays by 11% (from 66% to 55%).\*Discussion Patient outreach by language concordant, culturally competent, and knowledgeable navigators has potential to improve timely follow-up, a vital step in achieving equitable early cancer diagnosis. Planned future PDSA cycles include standardizing follow-up scheduling, synergizing with community health sites to streamline communication and patient education.

## **T2-QI-6 Increasing Provider Awareness and Adoption of a Health Information Exchange to Improve Patient Record Sharing and Reduce Burden of Repeat Imaging**

### **METHODS**

We performed interviews with local physicians to determine existing utilization and sentiment about the HIE. From the qualitative data collected, we partnered with physician leaders across multiple hospital and clinic systems, as well as the HIE leadership team, to increase provider awareness of the platform and promote provider registration.

### **RESULTS**

Interviews showed that providers were frustrated by not being able to access patient records from outside health systems. Examples include delays in appropriate diagnostic imaging as a result of waiting for external hospital records, providers driving to an outside hospital to request or retrieve records, and patients receiving duplicate CT or MRI scans. The majority of providers were not aware of the existence of this HIE and were surprised to find that the HIE contained patient records across the nine hospital and clinic systems in this county. Providers who were aware of the HIE noted multiple barriers to adoption, including a lengthy onboarding process and the lack of patient data from select hospitals that were part of the HIE. From this qualitative survey, we initiated efforts to increase provider awareness which resulted in the distribution of registration forms to all providers within two

health systems, with plans to begin similar efforts at other hospitals later this year.\*Discussion Studies have shown HIEs to be beneficial in driving cost savings by decreasing the need for repeat imaging and other diagnostic tests. This project highlights that the existence of a centralized HIE alone is insufficient. A successful HIE requires provider awareness and adoption, along with sufficient quality and quantity of patient data. Awareness and adoption of an HIE platform can facilitate improved information exchange and decrease the need for repeat imaging orders and diagnostics, increasing value-based decision making in a timely manner.

## **T2-QI-7 Evaluating the resident call structure in Canadian diagnostic radiology postgraduate medical education programs**

### **METHODS**

A questionnaire was distributed to the senior/chief/lead residents at each of the 16 Canadian DR residency programs. The questions pertained to: 1) Institutional information such as affiliated university and hospitals, city and catchment size, and resident body demographics; 2) Call structure including shift type, the start and end of independent call, and ability for home call/remote PACS access; 3) Call responsibilities such as modality and procedural responsibilities, preliminary report requirements, and protocoling responsibilities; 4) Call support by attendings, fellows, and technologists; 5) Preparation for call including dedicated resources and a summary of the "buddy call" system; and 5) Pre- and post-call including pre-call time off, and requirements for post-call review or performance evaluation.

### **RESULTS**

All 16 Canadian DR residency programs completed our questionnaire. The data collected reflects call structures in these programs as of December 2022. There is considerable heterogeneity across the 16 Canadian DR residency programs regarding call structure. Notably, 12 (75%) programs have call shifts that necessitate residents to work continuously for =24 hours. All programs cover CT and 15 (94%) cover ultrasound—out of the 15, eight (53%) have scanning responsibilities for residents. Nine (56%) institutions require residents dictate full reports. Although 7 (44%) programs allow remote PACS access, none allow residents to be on-call remotely. Seven (44%) programs require residents to stay post-call to review their cases with attendings in the morning.\*Discussion Independent call is a major stressor for DR residents. We hope this data can serve as a transparent and informative resource for Canadian DR residency programs to understand successful call structure strategies being implemented across the country and target areas for improvement at their home institution in the face of growing diagnostic imaging volumes and call burden nationwide. Future research directions include studying resident satisfaction after implementation of new call structure strategies.

### Evaluation of Diagnostic Reference Levels and Achievable Doses for Digital Radiographic Images

#### METHODS

The study utilized a Siemens DR Multix Fusion Max using the Siemens recommended PA chest protocol at 125 kVp, automatic exposure control (AEC), and 72" source to image distance (SID). The AP abdomen protocol was 81 kVp, AEC, and 40" SID. The digital detectors utilized were a PIXIUM 4343 RCE for chest protocols and a PIXIUM 3543 EZH for abdomen protocols. An aluminum blocks, 19 mm thick, and copper sheet, 1 mm thick, were used to simulate a 20 cm thick patient. Evaluation of high and low contrast resolution was performed with a Leeds Torr 18FG phantom. EAK measurements were taken with a RaySafe X2 RAD probe. Three mAs settings were used for EAK and image quality determinations, starting with the current protocol in use.

#### RESULTS

The initial EAK results, representing the techniques in clinical use were 0.132 mGy and 3.41 mGy for the chest and abdomen protocols respectively. The NCRP Report 172 PA Chest DRL is 0.15 mGy and AD is 0.11 mGy. The AP abdomen DRL is 3.4 mGy and AD is 2.4 mGy. These results reveal current EAK values slightly lower than (chest) or the same (abdomen) as the referenced DRL but above the AD. The spatial resolution for the initial chest protocol technique was consistently 2.34-line pairs/mm. After reducing the mAs by 25% and 50%, the spatial resolution for the abdomen protocol reduced from 2.24 lp/mm to 2 lp/mm. Both protocols showed a reduction of low contrast detection from 1.7% to 2.2% as the EAK dropped. \*Discussion Following NCRP 172, the measured EAK values for the current clinical PA chest and AP abdomen protocols were slightly below or at the DRL, but above the AD, thus allowing further dose reduction with minimal impact on image quality. Based on the phantom image quality testing, the EAK can potentially be reduced by 25% or even 50% to be below the AD while maintaining essentially equivalent image quality. The limitations of these physics tests are that they aren't necessarily representative of real patients. The clinical image testing is ongoing with radiologist image quality evaluation. This quality improvement program is expected to also encompass lumbosacral spine EAK, DRL and AD.

**How was My Experience? Well, Thanks for Asking!"**

### Participants

Latasha Paige, MEng, RN, South Bend, IN (*Presenter*) Nothing to Disclose

### METHODS

The Kano Diagram technique explores 3 dimensions of customer needs along the axes of provided services and impact on customer satisfaction: 1. Unspoken Basics - assumed basic services. 2. Spoken Performers - articulated services seen as competitive advantages. 3. Unspoken Delighters - unexpected services that delight the customer. The Empathy Map technique gauges four dimensions of the Patient's persona: 1. The observable: what the Patient: a. Does b. Says 2. The non-observable: what the Patient: a. Thinks b. Feels We conducted 3 web-based interviews with patients who regularly experience the MRI process. We used the collaborative software LucidChart.

### RESULTS

1. Empathy map revealed that we are not: a. Informing patients of delays. b. Valuing Patient's time. c. Customer service oriented. d. Fixing wasteful processes. e. Addressing patients' frustrated-, annoyed-, anxious-, and overwhelmed feelings. 2. Kano diagram revealed: a. Basics - wayfinding, customer service, efficient processes, and clean/organized environment. b. Performers - minimal waiting, excellent doctors, good overall experience. c. Delighters - timely results, rapport with physicians, and improving their experience. 3. Technique Feedback: a. Found digital post its distracting. Asked to have conversation instead. b. Appreciative of us asking questions. c. Interested in improvements that would come from interviews. \*Discussion • Learn when and how to use the Empathy map and Kano diagram for patients as well as team members to create an improvement plan where all key stakeholders' perspectives are considered. • Learn how to respond to criticism from patients and team members. This is a skill set that for many is not developed because: oHCAHPS Press Ganey surveys do not provide the same level of personal and emotional feedback that the Kano and Empathy maps do. oHCAHPS Press Ganey also do not require direct conversations with patients and team members.

### Patient Navigation Improves Diagnostic Imaging Timeliness Among Mammography Van Patients with BIRADS-0

#### METHODS

This IRB exempted study began with creating a Process Map and Driver Diagram, which identified possible barriers to timely BIRADS-0 follow-up, namely delay in patient communication, lack of patient education, and complexity of scheduling workflow. Baseline follow-up time (7/1/2021-6/30/2022) and variables including location of screening van were collected from Epic Hyperspace (Verona, WI) and internal database to validate hypotheses. Intervention on 8/16/2022 aimed to improve patient communication of abnormal results and increase scheduling ease. Patient at four pilot sites, who previously relied on local community health centers for follow-up arrangements, were instead outreach by institutional patient navigators to schedule follow-up. Outcome data (follow-up time in days) was collected for 6 months before and after the intervention and analyzed by Statistical Process Controlled (SPC) X Chart by Rule for Special Cause (QI Macro, Denver, CO). Percent of patients reached by institutional staff pre vs post intervention were collected as process data to ensure intervention's functionality.

#### RESULTS

Baseline callback rate was 12.9% (239/1848). Mean follow-up time was 49.7 days (range = 6-345) with 62% of patients (148/239) with follow-up delay. Mean follow-up time at different van sites ranged 7-96 days. Four sites with mean follow-up time >49.7 days agreed to participate in the pilot. Six patients (3/period) were lost to follow-up and excluded. Pre intervention (2/1/2022-8/15/2022), 17% (6/35) of patients at piloted sites were contacted by patient navigators to schedule follow-up compared to 74% (23/31) post intervention (collected during 8/17/2022-2/28/2023; however, van did not service pilot sites during 2/1/2023-2/28/2023). SPC-X chart demonstrated significant (3s) downward trend in follow-up time after intervention (fig. 1), with decrease in mean follow-up time by 12.9 days (from 50.1 to 37.2) and decreased in patients with follow-up delays by 11% (from 66% to 55%).\*Discussion Patient outreach by language concordant, culturally competent, and knowledgeable navigators has potential to improve timely follow-up, a vital step in achieving equitable early cancer diagnosis. Planned future PDSA cycles include standardizing follow-up scheduling, synergizing with community health sites to streamline communication and patient education.

T2-QI-6

### **Increasing Provider Awareness and Adoption of a Health Information Exchange to Improve Patient Record Sharing and Reduce Burden of Repeat Imaging**

#### **METHODS**

We performed interviews with local physicians to determine existing utilization and sentiment about the HIE. From the qualitative data collected, we partnered with physician leaders across multiple hospital and clinic systems, as well as the HIE leadership team, to increase provider awareness of the platform and promote provider registration.

#### **RESULTS**

Interviews showed that providers were frustrated by not being able to access patient records from outside health systems. Examples include delays in appropriate diagnostic imaging as a result of waiting for external hospital records, providers driving to an outside hospital to request or retrieve records, and patients receiving duplicate CT or MRI scans. The majority of providers were not aware of the existence of this HIE and were surprised to find that the HIE contained patient records across the nine hospital and clinic systems in this county. Providers who were aware of the HIE noted multiple barriers to adoption, including a lengthy onboarding process and the lack of patient data from select hospitals that were part of the HIE. From this qualitative survey, we initiated efforts to increase provider awareness which resulted in the distribution of registration forms to all providers within two health systems, with plans to begin similar efforts at other hospitals later this year.\*Discussion Studies have shown HIEs to be beneficial in driving cost savings by decreasing the need for repeat imaging and other diagnostic tests. This project highlights that the existence of a centralized HIE alone is insufficient. A successful HIE requires provider awareness and adoption, along with sufficient quality and quantity of patient data. Awareness and adoption of an HIE platform can facilitate improved information exchange and decrease the need for repeat imaging orders and diagnostics, increasing value-based decision making in a timely manner.

### Evaluating the resident call structure in Canadian diagnostic radiology postgraduate medical education programs

#### METHODS

A questionnaire was distributed to the senior/chief/lead residents at each of the 16 Canadian DR residency programs. The questions pertained to: 1) Institutional information such as affiliated university and hospitals, city and catchment size, and resident body demographics; 2) Call structure including shift type, the start and end of independent call, and ability for home call/remote PACS access; 3) Call responsibilities such as modality and procedural responsibilities, preliminary report requirements, and protocoling responsibilities; 4) Call support by attendings, fellows, and technologists; 5) Preparation for call including dedicated resources and a summary of the "buddy call" system; and 5) Pre- and post-call including pre-call time off, and requirements for post-call review or performance evaluation.

#### RESULTS

All 16 Canadian DR residency programs completed our questionnaire. The data collected reflects call structures in these programs as of December 2022. There is considerable heterogeneity across the 16 Canadian DR residency programs regarding call structure. Notably, 12 (75%) programs have call shifts that necessitate residents to work continuously for =24 hours. All programs cover CT and 15 (94%) cover ultrasound—out of the 15, eight (53%) have scanning responsibilities for residents. Nine (56%) institutions require residents dictate full reports. Although 7 (44%) programs allow remote PACS access, none allow residents to be on-call remotely. Seven (44%) programs require residents to stay post-call to review their cases with attendings in the morning.\*Discussion Independent call is a major stressor for DR residents. We hope this data can serve as a transparent and informative resource for Canadian DR residency programs to understand successful call structure strategies being implemented across the country and target areas for improvement at their home institution in the face of growing diagnostic imaging volumes and call burden nationwide. Future research directions include studying resident satisfaction after implementation of new call structure strategies.

### Quality Improvement Reports Tuesday Poster Discussions I

#### Sub-Events

**T5A-QI-1 Too Much Information? A clinical audit on patient access to a digital record system and discrepancies between clinical notes and radiology reports causing potential emotional harm to pediatric scoliosis patients**

#### METHODS

This study was done in the radiology department of an academic children's hospital. At our institution, pediatric scoliosis patients are followed by orthopedic surgeons where they receive a baseline radiograph, followed by serial radiographs to measure progression/ stability. A search was conducted on our local PACS system for all scoliosis radiographs from July to September 2022. The search was limited to patients < 18 years old. Post-surgical patients, curves described as "kyphosis", and studies that did not report measurements in the radiology report and/or orthopedic note were excluded. A total of 159 radiographs were reviewed. The corresponding radiology report and orthopedic clinic notes were reviewed. Patient identification numbers, ages and scoliosis measurements were recorded.

#### RESULTS

Out of 159 radiographs, 121 met inclusion criteria. In 53.7% of studies, the radiologist report and orthopedic clinic note differed by > 5 degrees. Of these 65 studies, 34 had additional differences in the vertebral levels of curves or the number of curves reported. The largest discrepancy found was 20 degrees with mean differences of 9.85, 6.79, and 13.25 for the upper, lower, and middle curves respectively.\*Discussion A large proportion of reported scoliosis radiographs differ from the corresponding orthopedic clinic note beyond the accepted standard. Even small differences in reports can induce patient anxiety and confusion particularly when measurements meet thresholds for changes in treatment. To improve patient experiences, recommendations include liaising with orthopedic surgeons to gauge patient feedback and review standard measurement protocols to improve consistency between orthopedics and radiology. Limitations of the study include its retrospective nature.

**T5A-QI-2 The Measure of Truth: Determining whether absolute values of leg lengths are incorrectly being measured and reported on pediatric teleoroentgenogram leg length studies: A clinical audit.**

#### METHODS

This study was conducted at an academic children's hospital. A search was conducted on our local PACS system for all teleoroentgenogram radiographs from April to May 2022. One hundred pediatric (age <18) lower limb teleoroentgenogram reports were reviewed. Patient identification numbers and ages were recorded. "Yes" or "No" was assigned and recorded based on whether there was inclusion of leg lengths on the report. For the studies in the "Yes" category, leg length measurements were recorded. On 4 of these teleoroentgenograms, a technologist added a ruler to confirm magnification error between the ruler measurement and the PACS system measurement tool. Results were analyzed using frequency counts.

#### RESULTS

Leg length measurements were included in 31/100 of teleoroentgenograms reports. Right leg lengths were reported in all 31 studies, whereas left leg lengths were only reported in 30 studies. There was only one case where the discrepancy was > 2 cm and therefore clinically significant. The PACS system measurement tool overestimated leg lengths by an average of 1.6 cm. The older the patient, the greater the overestimation with the highest difference being 2.2 cm.\*Discussion Absolute leg length values were included in 30% of leg length teleoroentgenogram reports. The literature has shown that teleoroentgenograms can have magnifications errors up to 5% when measuring leg lengths. While this seems insignificant, it can have implications for orthopedic management. Instead of providing absolute leg length measurements, we suggest reporting relative leg lengths; that is, the percentage difference between both legs. The goal of this would be to minimize inaccuracy in radiology reports while also including clinically relevant information. Study limitations include the small sample size. Although we preliminarily showed leg length measurement differed between teleoroentgenograms and orthoroentgenograms, further studies using a larger sample size can be performed to confirm this generally accepted notion

**T5A-QI-3 Patient Perspectives on AI Implementation in Radiology, From Generation to Generation**

#### METHODS

Surveys on AI usage in radiology were distributed to patients at an outpatient imaging center associated with an academic hospital. Survey questions provided scenarios and statements regarding AI in radiology in which the participant could pick 'Yes', 'No' or 'Neutral'. Descriptive statistics of the survey answers were calculated from total number of participants and with respect to cohorts. A Chi-square test of independence was done with each survey question to determine if a survey response had a significant association with a cohort.

#### RESULTS

Our ongoing survey has collected over 100 survey results to date, with 3% of responses from the Post-war generation, 50% from the Baby Boomer generation, 27% from Gen X, 18% from Millennial, and 2% from Gen Z. Initial results show that only 7% of all participants were not in favor of AI algorithms assisting the radiologist in daily practice (48% were in favor, 47% were neutral).

Moreover, 20% of those in favor were willing to pay extra for reports interpreted by both a radiologist and an AI algorithm, which increased to 52% if it was proven that less findings were missed with AI assistance. Only 14% are in favor of reports completely generated by AI. If there were diagnostic errors with AI implementation, 70% of participants would find the AI developer, the hospital, and the radiologist all at fault and legally liable, while only 5% would find just the radiologist at fault.\*Discussion Millennials were most aware that AI was already being used in radiology at our institution, having 55% of 'Yes' responses to the respective question. Currently, this is the only statistically significant association in our study. 60% of participants said 'Yes' to being asked if they wanted to learn more about how AI algorithms work in radiology, which did not have a significant association with a cohort. In fact, many written comments stated that the participant did not know enough about the subject to formulate a stance. These insights will aid discussions between the radiologist and patient regarding AI-incorporated imaging reports (and possibly AI generated follow-up recommendations), in outlining legal responsibilities of all parties involved, and in the design of educational material that will keep patients informed of the changing healthcare landscape.

#### **T5A-QI-4 Case-Based Intro to Radiology: Enhancing Radiology Education through an e-Learning Platform**

Participants

Kevin Pierre, Port Saint Lucie, FL (*Presenter*) Nothing to Disclose

#### **METHODS**

A "Case-Based Intro to Radiology" section with 80+ modules was developed on our departmental e-learning platform. Modules include patient history, physical findings, lab results, and guided learners through diagnosis, imaging selection, interpretation, and developing a working diagnosis, assessment, and disposition. Interactive features comprise immediate feedback, short videos, full Digital Imaging and Communications in Medicine (DICOM) image sets, learning points, and socioeconomic factors. A focus group of 20 MD, PA, PhD, and undergraduate students assessed module quality, educational content, and instructional methods through a survey. Descriptive statistics analyzed survey responses.

#### **RESULTS**

Most students agreed that the modules enhanced imaging interpretation, complemented curricula, encouraged critical thinking, and covered appropriate clinical and imaging details. They rated module quality, educational content, and videos as very good. Students preferred flipped classroom or proctored didactic approaches over traditional methods.\*Discussion The study relied on a small sample size and self-reported outcomes. More research is needed to determine the long-term impact on performance and clinical practice. The case-based e-learning platform section showed potential in improving radiology education for medical and PA students. Next steps involve integrating the platform into the PA school curriculum, completing 140 proposed cases, developing an educator and user guide, conducting external peer reviews, and performing outcome studies.

#### **T5A-QI-5 Developing an AI Model to Identify Malignancy Results on Imaging Reports to Delay Release to the Electronic Patient Portal**

Participants

Lucy Chow, MD, Los Angeles, CA (*Presenter*) Nothing to Disclose

#### **METHODS**

The dataset is comprised of approximately 61,000 multi-modality diagnostic imaging reports from 12/01/2022-12/31/2022, while procedure reports were excluded. Subsets from this dataset were extracted using two rule-based approaches to preprocess the training data. The first rule identified any report containing -RADS classification categories (i.e., BI-RADS), which yielded 8,345 reports. Of this set, 341 reports were identified to be withheld from immediate release based on predetermined criteria (i.e., BI-RADS=4). A second rule was applied to the remaining 53,000 reports, which identified approximately 4,500 reports that contained one of 12 malignancy-related keywords (i.e., cancer). This formed the training set for the NLP deep neural network (DNN) model, which was independently labeled by a group of 22 physician informaticists (PIs) as either 'withhold' or 'release.' Any indeterminate reports were discussed to reach consensus and develop labeling guidelines. Upon review, withholding scans demonstrating progressive malignancy became clinically necessary and rational. About 40% of the training set was reviewed, and 2,677 labeled reports were used for initial DNN model development. Subsequently, 49,318 reports generated between 01/19/2023- 02/12/2023 were analyzed for model validation.

#### **RESULTS**

In the model validation dataset, 293 reports (0.6%) contained the -RADS classification and 996 reports (2.0%) were identified from DNN, resulting in 1,289 reports (2.6%) withheld from immediate release. Preliminary results of the model performance yielded a 99.4% accuracy based on the final test set, consisting of 14,759 cases.\*Discussion The model has demonstrated promising results, and the existing IT infrastructure was leveraged to incorporate the functionality into the electronic health record. Both manual flagging by the radiologist and automated flagging by the AI algorithm will be implemented. Manually flagged reports will further train and refine the AI model's accuracy. The two methods will be compared to determine if manual flagging remains necessary for the workflow.

#### **T5A-QI-6 An Artificial Intelligence (AI) Boost to MRI Lumbar Spine Reporting**

#### **METHODS**

MRI lumbar spine studies of patients aged 18 and older performed for back pain from 1 to 10 December 2022 were randomly selected. These studies were initially read by four board-certified musculoskeletal and neuroradiologists with at least 8 years of consultant experience. Studies with instrumentation and scoliosis were excluded. The time taken to verify the radiology reports for each study was extracted from the RIS logs - this was deemed time taken without AI assistance. The DICOM data for these studies were processed by a commercial deep learning-based solution - Columbo (Smart Soft Healthcare, Bulgaria) on an AI orchestration platform (CARPL.AI, US). The AI solution segments, measures, and classifies MR images to provide suspected pathology descriptions, findings, and measurements. It then outputs annotated post-processed MRI images and an auto-generated report which is editable. These studies were randomly assigned to three final-year radiology residents who were blinded to the original finalized reports. The reporting time and corrections to the pre-populated report were logged. The time taken with and without AI assistance was documented and compared. A paired t-test was performed for the calculation of statistical significance.

#### **RESULTS**

A total of 31 MRI studies were processed. The mean interpretation time with AI assistance was significantly lower than without (8.47 ± 3.77 minutes versus 22.44 ± 10.90 minutes,  $p < 0.001$ ). The interquartile range (IQR) for interpretation time with AI

assistance was 4.78 minutes, while the IQR for interpretation time without AI assistance was 14.15 minutes. The smaller IQR indicates that the interpretation times were more consistent and less variable when radiologists used the AI-powered assistive tool. A paired t-test showed that the mean difference in interpretation times between the two groups was -13.97 minutes (95% CI: -16.66 to -11.28), which was statistically significant ( $p < 0.001$ ). Diagnostic accuracy (stenosis grading and incidental findings) was not significantly different between the two groups.\*Discussion AI assistance for MRI lumbar spine reporting resulted in a significant reduction in reporting time with equivalent diagnostic accuracy compared to experienced radiologists without AI assistance. The more objective and consistent AI evaluation also provides a more standardized report and reduces interobserver variation.

#### **T5A-QI-7 Learning styles and preferences of current generation of training radiologists: A survey analysis**

##### **METHODS**

Qualitative study was undertaken in 2022 targeting RT recent Board-certified radiologists(0-5 years experience). A questionnaire(Qn) of 10 questions consisted of understanding preferences for learning tools(LT) styles, problem solving(PS) skills, type of individual learner, preferences for teaching modules, awareness of their role in the department, preferences for exit-exam pattern was issued on social media. Each question had several choices (eg."which is most preferred mode of learning?" had responses such as textbook, teaching website(TW) etc). Each choice had a response option from least-likely to most-likely on a scale of 1to5(5 pointer Likert's scale). Of 119participants, 68were males, 50females 1 other category. Analysis of the responses was done by calculating percentage and weighted average. The association for age, gender, years of experience(YoE) practicing institute(PI) with every aspect of study Qn was assessed using Chi Square test. SPSS version 20 was used P-value lt0.05 was considered significant.

##### **RESULTS**

TW were most preferred mode of LT followed by textbooks among journals, conferences, lectures video media channels, latter being the least preferred. For PS, responders tend to prefer consulting teachers peers(60%) followed by utilising help of TW journals. In our survey, only 36% 1st RT preferred TW as compared to 81% of 4thyr RT, indicating increasing trend with increase YoE. However,63% of 4thyr. RT tend to prefer textbook among others. Majority(74%) of them consider to be visual-learners followed by logical kinaesthetic. Linguistic were only45%. However, no significant statistical difference was found for gender, YoE or PI. For preference in teaching modules, majority preferred interactive case-based discussions(CBD)(70%) followed by simulations. With increase in YoE, CBD flipped classroom(FC) were preferred. Preference for FC was significantly differed among type of PI.( $p < 0.05$ ) Statistically significant increasing trend was seen for awareness of curricular goals with gender age. In a preference for mode of exam, institutional exam(64%) was most favoured. Online exam was least preferred had no statistical difference among PI.\*Discussion Current GEN's learning styles are different from preceding GEN which relied on didactic lectures textbooks. However, they do require precise instructions, simulations mentoring. This requires consideration when framing radiology training curriculum. The limitation of study is the subjective nature of the assessment by the participants which needs to be validated by objective methods.

### Case-Based Intro to Radiology: Enhancing Radiology Education through an e-Learning Platform

#### Participants

Kevin Pierre, Port Saint Lucie, FL (*Presenter*) Nothing to Disclose

#### METHODS

A "Case-Based Intro to Radiology" section with 80+ modules was developed on our departmental e-learning platform. Modules include patient history, physical findings, lab results, and guided learners through diagnosis, imaging selection, interpretation, and developing a working diagnosis, assessment, and disposition. Interactive features comprise immediate feedback, short videos, full Digital Imaging and Communications in Medicine (DICOM) image sets, learning points, and socioeconomic factors. A focus group of 20 MD, PA, PhD, and undergraduate students assessed module quality, educational content, and instructional methods through a survey. Descriptive statistics analyzed survey responses.

#### RESULTS

Most students agreed that the modules enhanced imaging interpretation, complemented curricula, encouraged critical thinking, and covered appropriate clinical and imaging details. They rated module quality, educational content, and videos as very good. Students preferred flipped classroom or proctored didactic approaches over traditional methods.\*Discussion The study relied on a small sample size and self-reported outcomes. More research is needed to determine the long-term impact on performance and clinical practice. The case-based e-learning platform section showed potential in improving radiology education for medical and PA students. Next steps involve integrating the platform into the PA school curriculum, completing 140 proposed cases, developing an educator and user guide, conducting external peer reviews, and performing outcome studies.

### Developing an AI Model to Identify Malignancy Results on Imaging Reports to Delay Release to the Electronic Patient Portal

#### Participants

Lucy Chow, MD, Los Angeles, CA (*Presenter*) Nothing to Disclose

#### METHODS

The dataset is comprised of approximately 61,000 multi-modality diagnostic imaging reports from 12/01/2022-12/31/2022, while procedure reports were excluded. Subsets from this dataset were extracted using two rule-based approaches to preprocess the training data. The first rule identified any report containing -RADS classification categories (i.e., BI-RADS), which yielded 8,345 reports. Of this set, 341 reports were identified to be withheld from immediate release based on predetermined criteria (i.e., BI-RADS=4). A second rule was applied to the remaining 53,000 reports, which identified approximately 4,500 reports that contained one of 12 malignancy-related keywords (i.e., cancer). This formed the training set for the NLP deep neural network (DNN) model, which was independently labeled by a group of 22 physician informaticists (PIs) as either 'withhold' or 'release.' Any indeterminate reports were discussed to reach consensus and develop labeling guidelines. Upon review, withholding scans demonstrating progressive malignancy became clinically necessary and rational. About 40% of the training set was reviewed, and 2,677 labeled reports were used for initial DNN model development. Subsequently, 49,318 reports generated between 01/19/2023- 02/12/2023 were analyzed for model validation.

#### RESULTS

In the model validation dataset, 293 reports (0.6%) contained the -RADS classification and 996 reports (2.0%) were identified from DNN, resulting in 1,289 reports (2.6%) withheld from immediate release. Preliminary results of the model performance yielded a 99.4% accuracy based on the final test set, consisting of 14,759 cases.\*Discussion The model has demonstrated promising results, and the existing IT infrastructure was leveraged to incorporate the functionality into the electronic health record. Both manual flagging by the radiologist and automated flagging by the AI algorithm will be implemented. Manually flagged reports will further train and refine the AI model's accuracy. The two methods will be compared to determine if manual flagging remains necessary for the workflow.

### An Artificial Intelligence (AI) Boost to MRI Lumbar Spine Reporting

#### METHODS

MRI lumbar spine studies of patients aged 18 and older performed for back pain from 1 to 10 December 2022 were randomly selected. These studies were initially read by four board-certified musculoskeletal and neuroradiologists with at least 8 years of consultant experience. Studies with instrumentation and scoliosis were excluded. The time taken to verify the radiology reports for each study was extracted from the RIS logs - this was deemed time taken without AI assistance. The DICOM data for these studies were processed by a commercial deep learning-based solution - CoLumbo (Smart Soft Healthcare, Bulgaria) on an AI orchestration platform (CARPL.AI, US). The AI solution segments, measures, and classifies MR images to provide suspected pathology descriptions, findings, and measurements. It then outputs annotated post-processed MRI images and an auto-generated report which is editable. These studies were randomly assigned to three final-year radiology residents who were blinded to the original finalized reports. The reporting time and corrections to the pre-populated report were logged. The time taken with and without AI assistance was documented and compared. A paired t-test was performed for the calculation of statistical significance.

#### RESULTS

A total of 31 MRI studies were processed. The mean interpretation time with AI assistance was significantly lower than without ( $8.47 \pm 3.77$  minutes versus  $22.44 \pm 10.90$  minutes,  $p < 0.001$ ). The interquartile range (IQR) for interpretation time with AI assistance was 4.78 minutes, while the IQR for interpretation time without AI assistance was 14.15 minutes. The smaller IQR indicates that the interpretation times were more consistent and less variable when radiologists used the AI-powered assistive tool. A paired t-test showed that the mean difference in interpretation times between the two groups was -13.97 minutes (95% CI: -16.66 to -11.28), which was statistically significant ( $p < 0.001$ ). Diagnostic accuracy (stenosis grading and incidental findings) was not significantly different between the two groups.\*Discussion AI assistance for MRI lumbar spine reporting resulted in a significant reduction in reporting time with equivalent diagnostic accuracy compared to experienced radiologists without AI assistance. The more objective and consistent AI evaluation also provides a more standardized report and reduces interobserver variation.

### Learning styles and preferences of current generation of training radiologists: A survey analysis

#### METHODS

Qualitative study was undertaken in 2022 targeting RT recent Board-certified radiologists(0-5 years experience). A questionnaire(Qn) of 10 questions consisted of understanding preferences for learning tools(LT) styles, problem solving(PS) skills, type of individual learner, preferences for teaching modules, awareness of their role in the department, preferences for exit-exam pattern was issued on social media. Each question had several choices (eg."which is most preferred mode of learning?" had responses such as textbook, teaching website(TW) etc). Each choice had a response option from least-likely to most-likely on a scale of 1to5(5 pointer Likert's scale). Of 119participants, 68were males, 50females 1 other category. Analysis of the responses was done by calculating percentage and weighted average. The association for age, gender, years of experience(YoE) practicing institute(PI) with every aspect of study Qn was assessed using Chi Square test. SPSS version 20 was used P-value  $\leq 0.05$  was considered significant.

#### RESULTS

TW were most preferred mode of LT followed by textbooks among journals, conferences, lectures video media channels, latter being the least preferred. For PS, responders tend to prefer consulting teachers peers(60%) followed by utilising help of TW journals. In our survey, only 36% 1st RT preferred TW as compared to 81% of 4thyr RT, indicating increasing trend with increase YoE. However,63% of 4thyr. RT tend to prefer textbook among others. Majority(74%) of them consider to be visual-learners followed by logical kinaesthetic. Linguistic were only45%. However, no significant statistical difference was found for gender, YoE or PI. For preference in teaching modules, majority preferred interactive case-based discussions(CBD)(70%) followed by simulations. With increase in YoE, CBD flipped classroom(FC) were preferred. Preference for FC was significantly differed among type of PI.( $p < 0.05$ ) Statistically significant increasing trend was seen for awareness of curricular goals with gender age. In a preference for mode of exam, institutional exam(64%) was most favoured. Online exam was least preferred had no statistical difference among PI.\*Discussion Current GEN's learning styles are different from preceding GEN which relied on didactic lectures textbooks. However, they do require precise instructions, simulations mentoring. This requires consideration when framing radiology training curriculum. The limitation of study is the subjective nature of the assessment by the participants which needs to be validated by objective methods.

### Quality Improvement Reports Tuesday Poster Discussions II

#### Sub-Events

**T5B-QI-1 Criteria for placing extravasation sensor devices on patients to prevent massive extravasation of contrast material at contrast enhanced CT**

#### METHODS

This retrospective study included 144,277 patients who underwent CECT at our hospital between April 2012 and July 2022. We performed multivariate logistic regression analysis between patients with- (n = 350) and randomly-selected patients without CM extravasation (n = 350). The outcome variable was the presence or absence of extravasation; the explanatory variables were the age, sex, body mass index, hospitalization status, hemodialysis and diabetes mellitus, the use of anticancer drugs, total serum protein, the injection rate, catheter gauge, catheter location, use of existing catheters, and the years of nurse CT experience. We investigated the percentage of patients with sensor devices (50-100%, 5% steps) and their sensitivity for detecting extravasation using receiver-operating characteristic curve analysis.

#### RESULTS

The extravasation rate was 0.27%. The median estimated extravasation volume was 10 ml (range, 1-140 ml). Multivariate logistic regression analysis showed that the injection rate [odds ratio (OR) = 1.61; 95% confidence interval (CI): 1.33-1.95, p < 0.001], a small-diameter catheter gauge (OR = 3.86, 95% CI = 1.92-7.76; p < 0.001), the use of anticancer drugs (OR = 1.81, 95% CI = 1.32-2.50; p < 0.001), and existing catheters (OR = 1.52, 95% CI = 1.10-2.11; p = 0.009) were significantly associated with extravasation (Table 1). To achieve a sensitivity of 90-, 80-, 70-, 60-, and 50%; 80, 50, 40, and 28% of all patients required the placement of a sensor device (Table 2). \*Discussion Consistent with earlier reports, risk factors for extravasation were the injection rate, catheter gauge, and the use of anticancer drugs and of existing catheters. The sensitivity for detecting extravasation decreased as the proportion of patients with sensors decreased. The percentage of patients appropriately fit with sensors must consider the time required for their placement, their cost, and their sensitivity for detecting extravasation. We think that placing a sensor on 40% of patients, and a sensor sensitivity of 60% are reasonable in clinical practice.

**T5B-QI-2 Time-Cost Efficiencies and Experiences with Implementation of a Peer Learning System from a Tertiary Academic Center**

#### METHODS

Faculty radiologists (N = 27) of a multispecialty radiology group at a single tertiary academic center completed 5-point Likert scale surveys prior to and 1-year following the transition to the new peer learning system in June 2021. Eight questions inquired about the positive aspects of each system, while two questions inquired about the negative aspects. Differences in survey responses prior to and following intervention were evaluated by Mann-Whitney U test.

#### RESULTS

There was a significantly decreased amount of time per month used to complete the peer learning exercises versus the peer review exercises ( $1.71 \pm 1.84$  hours, N = 34 vs.  $0.76 \pm 0.45$  hours, N = 27, p = 0.011). The result was a difference of  $0.95 \pm 1.89$  hours per month ( $11.4 \pm 22.7$  hours per year), which translated to an estimated direct salary time-cost saving of \$1653.68 per year per radiologists and a direct productivity time-cost saving of \$3,469.39 per year per radiologist when utilizing the peer learning system. Percent differences between expected and actual case submissions for each subspecialty section were as follows: Abdominal (+33.3%), Breast (-10.0%), Chest (+73.3%), ED (-93.3%), Musculoskeletal (+6.7%), Neuroradiology (-36.7%), Nuclear Medicine (+23.3%), and Pediatric (-53.3%). All positive impacts were rated significantly higher for the peer learning system. There was a significantly lower rating with respect to workflow disruption for the peer learning system. There was no significant difference in rating with respect to negative impact on the radiologist as an individual. When asked directly which system they preferred, 70.4% (19 of 27) of radiologists preferred the new system, 25.9% (7 of 27) preferred the old system, and 3.7% (1 of 27) did not respond. \*Discussion There was a strongly positive perception of the new peer learning system; however, the level of participation in the system was highly dependent on subspecialty section. There was a substantial implied direct time-cost saving from the cost-neutral transition to the peer learning system.

**T5B-QI-3 Objective improvements in mammography image quality following individualized breast positioning training informed by artificial intelligence**

#### Participants

Melissa L. Hill, PHD, Issy les Moulineaux, France (*Presenter*) Consultant, Volpara Health Technologies Limited  
Sally Grady, Kettering, OH (*Presenter*) Nothing to Disclose

#### METHODS

The prospective study was conducted at 2 private breast imaging organizations, which had installations of commercially available Volpara Analytics™ AI software for >2 years prior to the study. Techs at the Intervention Site (55 Techs, 15 clinics; OH, USA) received individualized training from Mammography Educator trainers. The Control Site (45 Techs, 8 clinics; NC, AL IL, USA) continued to use the software as per usual. Five 30-day evaluation phases ran in parallel for both sites, including pre-training (Eval 12) and post-training (Eval 3-5). Prior to training, the IQ software's automated performance reports were used to create Targeted

Training Profiles for each Tech to identify breast positioning metrics to focus on in training. After excluding Techs who had not completed training (Intervention Site) or acquired >90 images per evaluation phase (both Sites), 33 and 22 Techs were included in final analyses. De-identified study data included exam and patient characteristics, automated Perfect/Good/Moderate/Inadequate (PGMI) scores, % images with target compression pressure (7-15 kPa), and Quality Score (QS; a weighted breast positioning and compression score from 0-4). Paired t-test was used to compare IQ between evaluation periods.

## RESULTS

A 4.8% relative increase in QS was observed for the Intervention Site Techs post-training (Eval 2-3, 2.29 to 2.4;  $p < 0.05$ ) and QS improvement was sustained for the remaining post-training phases (Eval 45, 2.4 to 2.38;  $p < 0.05$ ). The early post-training improvements were driven by an increase in %P+G (57.8 to 61.4 to 60.8%;  $p < 0.05$ ). Whereas the last evaluation period saw an increase in %target compression (55.6 to 58.3%,  $p < 0.05$ ). In the same period, no changes across any of the aggregated IQ metrics were observed for Control Site Techs (QS=2.12–2.11,  $p=0.96$ ; %P+G=53.6–54.1%,  $p=0.78$ ; %target compression=50.1–48.8%,  $p=0.85$ ). \*Discussion Personalized Tech training informed by AI IQ assessment resulted in significant and sustained improvements in QS. Although the QS increase remained 180 days post-training, the underlying drivers of quality improvement changed over time, suggesting monitoring is important to identify changing areas of focus and new training opportunities on an ongoing basis. Limitations include differences in gantry vendors between Sites, a lack of multivariate analysis, and use of a single AI IQ Software.

### **T5B-QI-4 Evaluating the Usefulness of Contrast Medium Injection Protocol Changes to Prevent Large Amounts of Air Injection in Contrast-enhanced CT Scans**

## METHODS

Nemoto Dual Shot Alpha 7 injector was used; it recognized that air was injected when the psi remained below 4 during the initial 10cc injection, and stopped the injection. In consideration of this, the protocol was altered by injecting a contrast medium for contrast enhancement after the injection of volume 10cc and the flow rate was 0.5, 1.0, and 1.5cc/sec; experiments were conducted by changing factors that could affect psi to reproduce the environment while injecting a contrast medium into actual patients. The syringe internal contrast medium, air ratio with the total amount being 100cc, contrast medium concentration was 350, 400 mgI/mL, needle gauge, and IV cannula angle was 45, 90 were finally tested by changing the upper and lower directions of the injector with regards to the pressure tube method. After measuring one time, the air inside the syringe was compressed to fully emit all of the air and air was injected again for this experiment.

## RESULTS

At the flow rate of 1.0cc/sec or lower, the injector recognized air injection, but not at 1.5cc/sec. Among other variables, only the ratio of the syringe's internal contrast medium and the air was a factor affecting psi, whereas other factors did not affect psi changes. In contrast to the air ratio, the higher the contrast medium ratio, the higher the psi, and the injection was not stopped at 7:3, 8:2, and 9:1. \*Discussion Initially, it was important to lower the pressure inside the syringe. At first, the psi remained low, then the air was compressed. Even when there was no ejection from the syringe, the psi rose and the injector did not recognize the air. Depending on the ratio of Syringe internal contrast medium to air, the injection stop system may sometimes not work, so it is recommended that the injector be used facing down. In addition, injecting 10cc of contrast medium first at a low flow rate before an injection can prevent an examiner's carelessness without affecting the contrast enhancement. Therefore, in the case of an injector that does not have an air detector and recognizes air injection based on psi, injecting first at a low flow rate before injecting a contrast medium can be useful to prevent a large amount of air injection.

### **T5B-QI-5 Improving the efficiency of a LVEF measurement service through adoption of AI auto-contouring for MUGA scans**

## METHODS

Algorithm development: 1793 historical MUGA images and associated 24-frame segmentations were used for algorithm training. An automated segmentation tool was created using an established network architecture (U-net). The algorithm was packaged as a DICOM service, configured to send segmented images to the NM server where users could check and edit results. Auditing: The time taken for 4 experienced users to process MUGA data using conventional manual methods (in commercial NM software) was assessed through self-reporting for 20 consecutive scans. Following AI tool implementation, the time taken for users to review, edit and approve AI-generated contours and associated LVEF results was automatically captured in a mysql database. The LVEF results generated from the AI contour alone and with the addition of human edits were automatically recorded in the same database. Database records were extracted 6 months after the introduction of AI-assisted processing. Records were screened in order to exclude cases where the outcome of processing wasn't clear.

## RESULTS

Mean processing time for the manual MUGA processing method was 9.7 min (SD 4.5 min). After the introduction of AI-assisted processing mean processing time reduced to 3.5 min (SD 2.5 min) across 92 cases (56 records were excluded). There was a mean absolute difference in LVEF of 2.1% (SD 2.1%) between MUGA processing with the AI contour alone and following user editing. \*Discussion An AI tool was successfully trained for segmentation of MUGA scans and was subsequently integrated in clinic. Results demonstrated a significant time saving for AI-assisted processing compared to manual processing (6.2 minutes saved per case). Results also showed that LVEF figures calculated from the AI contour alone were very similar to those recorded after user editing. This suggests that much less human interaction is now required for processing MUGA scans, reducing overall inter-operator variability. Results provide impetus for greater use of AI to increase efficiency, and show that it is possible to achieve noticeable performance gains from in-house developed and deployed algorithms.

### **T5B-QI-6 Improving Mammography Positioning at two Community Mammography Centers by Asking Why?**

Participants

Chirag R. Parghi, MD, MBA, (Presenter) Nothing to Disclose

## METHODS

Two imaging facilities within the same organization in non-contiguous states enrolled in the ACR Learning Collaborative focused on Mammographic Positioning with an emphasis on behavioral modification, which consisted of a 27-week improvement program. Both sites were part of the first cohort of this program and had previously passed all MQSA accreditations over the last 5 years. The collaborative developed a performance measure that consisted of 7 major and 6 minor positioning criteria. Each week, the teams

performed an internal audit of at least 45 screening mammograms (after an initial audit of 263 mammograms) according to the identified positioning criteria, and displayed aggregate results on a run chart. The teams participated in a structured improvement program to evaluate the current state, understand root causes of problems, develop and test various interventions and gauge improvement.

## RESULTS

The baseline audit revealed a pass rate of 55% of total screening mammograms at both facilities. An image auditing process that included participation from the frontline technologists was developed and shared at group and individual levels. Frontline staff empowerment yielded an increase to an 85% of images passing. That level of performance was sustained for 10 weeks through additional interventions such as improving tech and radiologist communication, standardization of new technologist onboarding, and structured and frequent feedback to the technologists.\*Discussion The binary (pass/fail) threshold of MQSA Accreditation is inadequate by itself for quality assessment. Mammography positioning is a dynamic target that is comprised of individual, varying attributes. Identifying root causes with heightened attention to behaviors and conditions can result in sustainable improvement in image quality. Given the success of the facilities that participated in the first cohort of the Mammography Positioning Improvement Collaborative, three additional sites from the same organization have enrolled in the second cohort of the collaborative, with goals of expanding the learnings across the Solis enterprise to over 100 clinics. Applying these lessons at scale requires maintaining the essence of the improvement collaborative while customizing the process in order to minimize resource redundancy.

### **T5B-QI-7 The impact of new Inflammatory Bowel Disease (IBD)-specific materials on patients' preparedness and image quality of MR Enterography (MRE).**

## METHODS

IBD patients with upcoming MRE scans were asked to participate and assigned to the control (Con) or intervention (Int) cohorts. The proportion of patients with unanswered questions was compared using the Chi-squared test. MRE images were reviewed by a blinded radiologist for image quality. Small bowel distention was scored between 0 (very poor distention) and 4 (excellent); respiratory motion artefact was graded between 0 (significant artefact) and 2 (no artefact) and compared with the Wilcoxon-sign test.

## RESULTS

152 patients were contacted, 78 Int, and 74 Con; response rate was 36% vs 45% ( $p = 0.35$ ). 36% of the Int cohort were attending their first MR vs 39% of Con ( $p = 0.98$ ). 75% of Int watched all videos before completing the survey. In both groups, =85% of questionnaire respondents read the information provided but in the Con group, 10 / 33 (30%) had unanswered questions compared to 1 / 28 (4%) in the Int group ( $p = 0.02$ ). Free text questions included what the mannitol was, taking medication and what happened following the scan. MRE images from 55 patients from the Int ( $N = 26$ ) or Con ( $N = 29$ ) groups, were included in the image quality analysis. Patients with prior small bowel resection ( $N = 13$ ) were excluded from the TI diameter measurements ( $N = 17$  intervention;  $N = 22$  control). The median (Q1; Q3) respiratory motion score was 2 'No artefact' (2; 2) in the Int and 2 'No artefact' (1; 2) in the Con groups ( $p = 0.49$ ). The median (Q1; Q3) distension score was 3 'Good' (2; 4) in the Int and 3 'Good' (3; 4) in the Con groups ( $p = 0.16$ ). The mean  $\pm$  S.D TI diameter was  $16 \pm 4$  mm in both groups ( $p = 0.85$ ).\*Discussion We had similar response rates across our groups. Our results indicate the new patient-focused materials reduced the number of unanswered questions patients had prior to scans. Given IBD patients have life-long imaging and continuous follow-up, educating them well early in the patient journey is vital for a positive experience. This may improve patient compliance with follow-up imaging, a potential area of study. There was no statistically significant difference seen in this gross assessment of scan quality on this particular study. We believe this is mostly due to methodological limitations including subjective assessment of distention, professional patient cohort (IBD patients for many years) and pathology on scans affecting TI measurements. Developing a validated and objective method to assess small bowel distention in an MR naive cohort as part of a longitudinal study would be useful.

### Objective improvements in mammography image quality following individualized breast positioning training informed by artificial intelligence

#### Participants

Melissa L. Hill, PHD, Issy les Moulineaux, France (*Presenter*) Consultant, Volpara Health Technologies Limited  
Sally Grady, Kettering, OH (*Presenter*) Nothing to Disclose

#### METHODS

The prospective study was conducted at 2 private breast imaging organizations, which had installations of commercially available Volpara Analytics™ AI software for >2 years prior to the study. Techs at the Intervention Site (55 Techs, 15 clinics; OH, USA) received individualized training from Mammography Educator trainers. The Control Site (45 Techs, 8 clinics; NC, AL IL, USA) continued to use the software as per usual. Five 30-day evaluation phases ran in parallel for both sites, including pre-training (Eval 1-2) and post-training (Eval 3-5). Prior to training, the IQ software's automated performance reports were used to create Targeted Training Profiles for each Tech to identify breast positioning metrics to focus on in training. After excluding Techs who had not completed training (Intervention Site) or acquired >90 images per evaluation phase (both Sites), 33 and 22 Techs were included in final analyses. De-identified study data included exam and patient characteristics, automated Perfect/Good/Moderate/Inadequate (PGMI) scores, % images with target compression pressure (7-15 kPa), and Quality Score (QS; a weighted breast positioning and compression score from 0-4). Paired t-test was used to compare IQ between evaluation periods.

#### RESULTS

A 4.8% relative increase in QS was observed for the Intervention Site Techs post-training (Eval 2-3, 2.29 to 2.4;  $p < 0.05$ ) and QS improvement was sustained for the remaining post-training phases (Eval 4-5, 2.4 to 2.38;  $p < 0.05$ ). The early post-training improvements were driven by an increase in %P+G (57.8 to 61.4 60.8%;  $p < 0.05$ ). Whereas the last evaluation period saw an increase in %target compression (55.6 to 58.3%,  $p < 0.05$ ). In the same period, no changes across any of the aggregated IQ metrics were observed for Control Site Techs (QS=2.12—2.11,  $p=0.96$ ; %P+G=53.6—54.1%,  $p=0.78$ ; %target compression=50.1—48.8%,  $p=0.85$ ). \*Discussion Personalized Tech training informed by AI IQ assessment resulted in significant and sustained improvements in QS. Although the QS increase remained 180 days post-training, the underlying drivers of quality improvement changed over time, suggesting monitoring is important to identify changing areas of focus and new training opportunities on an ongoing basis. Limitations include differences in gantry vendors between Sites, a lack of multivariate analysis, and use of a single AI IQ Software.

### Evaluating the Usefulness of Contrast Medium Injection Protocol Changes to Prevent Large Amounts of Air Injection in Contrast-enhanced CT Scans

#### METHODS

Nemoto Dual Shot Alpha 7 injector was used; it recognized that air was injected when the psi remained below 4 during the initial 10cc injection, and stopped the injection. In consideration of this, the protocol was altered by injecting a contrast medium for contrast enhancement after the injection of volume 10cc and the flow rate was 0.5, 1.0, and 1.5cc/sec; experiments were conducted by changing factors that could affect psi to reproduce the environment while injecting a contrast medium into actual patients. The syringe internal contrast medium, air ratio with the total amount being 100cc, contrast medium concentration was 350, 400 mgI/mL, needle gauge, and IV cannula angle was 45, 90 were finally tested by changing the upper and lower directions of the injector with regards to the pressure tube method. After measuring one time, the air inside the syringe was compressed to fully emit all of the air and air was injected again for this experiment.

#### RESULTS

At the flow rate of 1.0cc/sec or lower, the injector recognized air injection, but not at 1.5cc/sec. Among other variables, only the ratio of the syringe's internal contrast medium and the air was a factor affecting psi, whereas other factors did not affect psi changes. In contrast to the air ratio, the higher the contrast medium ratio, the higher the psi, and the injection was not stopped at 7:3, 8:2, and 9:1.\*Discussion Initially, it was important to lower the pressure inside the syringe. At first, the psi remained low, then the air was compressed. Even when there was no ejection from the syringe, the psi rose and the injector did not recognize the air. Depending on the ratio of Syringe internal contrast medium to air, the injection stop system may sometimes not work, so it is recommended that the injector be used facing down. In addition, injecting 10cc of contrast medium first at a low flow rate before an injection can prevent an examiner's carelessness without affecting the contrast enhancement. Therefore, in the case of an injector that does not have an air detector and recognizes air injection based on psi, injecting first at a low flow rate before injecting a contrast medium can be useful to prevent a large amount of air injection.

### Improving the efficiency of a LVEF measurement service through adoption of AI auto-contouring for MUGA scans

#### METHODS

Algorithm development: 1793 historical MUGA images and associated 24-frame segmentations were used for algorithm training. An automated segmentation tool was created using an established network architecture (U-net). The algorithm was packaged as a DICOM service, configured to send segmented images to the NM server where users could check and edit results. Auditing: The time taken for 4 experienced users to process MUGA data using conventional manual methods (in commercial NM software) was assessed through self-reporting for 20 consecutive scans. Following AI tool implementation, the time taken for users to review, edit and approve AI-generated contours and associated LVEF results was automatically captured in a mysql database. The LVEF results generated from the AI contour alone and with the addition of human edits were automatically recorded in the same database. Database records were extracted 6 months after the introduction of AI-assisted processing. Records were screened in order to exclude cases where the outcome of processing wasn't clear.

#### RESULTS

Mean processing time for the manual MUGA processing method was 9.7 min (SD 4.5 min). After the introduction of AI-assisted processing mean processing time reduced to 3.5 min (SD 2.5 min) across 92 cases (56 records were excluded). There was a mean absolute difference in LVEF of 2.1% (SD 2.1%) between MUGA processing with the AI contour alone and following user editing.\*Discussion An AI tool was successfully trained for segmentation of MUGA scans and was subsequently integrated in clinic. Results demonstrated a significant time saving for AI-assisted processing compared to manual processing (6.2 minutes saved per case). Results also showed that LVEF figures calculated from the AI contour alone were very similar to those recorded after user editing. This suggests that much less human interaction is now required for processing MUGA scans, reducing overall inter-operator variability. Results provide impetus for greater use of AI to increase efficiency, and show that it is possible to achieve noticeable performance gains from in-house developed and deployed algorithms.

### Improving Mammography Positioning at two Community Mammography Centers by Asking Why?

#### Participants

Chirag R. Parghi, MD,MBA, (*Presenter*) Nothing to Disclose

#### METHODS

Two imaging facilities within the same organization in non-contiguous states enrolled in the ACR Learning Collaborative focused on Mammographic Positioning with an emphasis on behavioral modification, which consisted of a 27-week improvement program. Both sites were part of the first cohort of this program and had previously passed all MQSA accreditations over the last 5 years. The collaborative developed a performance measure that consisted of 7 major and 6 minor positioning criteria. Each week, the teams performed an internal audit of at least 45 screening mammograms (after an initial audit of 263 mammograms) according to the identified positioning criteria, and displayed aggregate results on a run chart. The teams participated in a structured improvement program to evaluate the current state, understand root causes of problems, develop and test various interventions and gauge improvement.

#### RESULTS

The baseline audit revealed a pass rate of 55% of total screening mammograms at both facilities. An image auditing process that included participation from the frontline technologists was developed and shared at group and individual levels. Frontline staff empowerment yielded an increase to an 85% of images passing. That level of performance was sustained for 10 weeks through additional interventions such as improving tech and radiologist communication, standardization of new technologist onboarding, and structured and frequent feedback to the technologists.\*Discussion The binary (pass/fail) threshold of MQSA Accreditation is inadequate by itself for quality assessment. Mammography positioning is a dynamic target that is comprised of individual, varying attributes. Identifying root causes with heightened attention to behaviors and conditions can result in sustainable improvement in image quality. Given the success of the facilities that participated in the first cohort of the Mammography Positioning Improvement Collaborative, three additional sites from the same organization have enrolled in the second cohort of the collaborative, with goals of expanding the learnings across the Solis enterprise to over 100 clinics. Applying these lessons at scale requires maintaining the essence of the improvement collaborative while customizing the process in order to minimize resource redundancy.

### The impact of new Inflammatory Bowel Disease (IBD)-specific materials on patients' preparedness and image quality of MR Enterography (MRE).

#### METHODS

IBD patients with upcoming MRE scans were asked to participate and assigned to the control (Con) or intervention (Int) cohorts. The proportion of patients with unanswered questions was compared using the Chi-squared test. MRE images were reviewed by a blinded radiologist for image quality. Small bowel distention was scored between 0 (very poor distention) and 4 (excellent); respiratory motion artefact was graded between 0 (significant artefact) and 2 (no artefact) and compared with the Wilcoxon-sign test.

#### RESULTS

152 patients were contacted, 78 Int, and 74 Con; response rate was 36% vs 45% ( $p = 0.35$ ). 36% of the Int cohort were attending their first MR vs 39% of Con ( $p = 0.98$ ). 75% of Int watched all videos before completing the survey. In both groups, 85% of questionnaire respondents read the information provided but in the Con group, 10 / 33 (30%) had unanswered questions compared to 1 / 28 (4%) in the Int group ( $p = 0.02$ ). Free text questions included what the mannitol was, taking medication and what happened following the scan. MRE images from 55 patients from the Int ( $N = 26$ ) or Con ( $N = 29$ ) groups, were included in the image quality analysis. Patients with prior small bowel resection ( $N = 13$ ) were excluded from the TI diameter measurements ( $N = 17$  intervention;  $N = 22$  control). The median (Q1; Q3) respiratory motion score was 2 'No artefact' (2; 2) in the Int and 2 'No artefact' (1; 2) in the Con groups ( $p = 0.49$ ). The median (Q1; Q3) distension score was 3 'Good' (2; 4) in the Int and 3 'Good' (3; 4) in the Con groups ( $p = 0.16$ ). The mean  $\pm$  S.D TI diameter was  $16 \pm 4$  mm in both groups ( $p = 0.85$ ). \*Discussion We had similar response rates across our groups. Our results indicate the new patient-focused materials reduced the number of unanswered questions patients had prior to scans. Given IBD patients have life-long imaging and continuous follow-up, educating them well early in the patient journey is vital for a positive experience. This may improve patient compliance with follow-up imaging, a potential area of study. There was no statistically significant difference seen in this gross assessment of scan quality on this particular study. We believe this is mostly due to methodological limitations including subjective assessment of distention, professional patient cohort (IBD patients for many years) and pathology on scans affecting TI measurements. Developing a validated and objective method to assess small bowel distention in an MR naive cohort as part of a longitudinal study would be useful.

### Quality Improvement Reports Wednesday Poster Discussions

#### Sub-Events

#### W2-QI-1 Optimizing patient safety and clinical work-flow with digital radiation management system

##### METHODS

11 radiologists were enrolled in patient safety optimization program (Fig. 1) from Dec. 2021 to Jan. 2023. The patient radiation information and imaging device information were analyzed using Radimetrics, a digital radiation management system. The patient who cumulative dose over threshold were collected and analyze the primary reason. Among the most common four CT protocols, the number of radiation dose over threshold were recorded every quarter. The device operation information and radiologists working details were also analyzed and improved along the program.

##### RESULTS

The radiation doses of 21,839 CT examinations performed on 15,372 patients from Jan. 2022 to Jan. 2023 were collected and analyzed. The median DLP (mGy.cm) for each scanning region was 225 (heart), 205 (chest), 450 (abdomen) and 610 (head). With dose tracking, the number of radiation dose over threshold constantly decreased among all four CT protocols. The main reasons for over-high radiation dose were shown as follow: improper imaging protocols, wrong patient action, improper imaging operation.\*Discussion The preliminary result shows the program can highly protect patients from excessive radiation dose, and also improve radiologists operation and patient care sense. The program should be promoted to other hospitals.

#### W2-QI-2 Data Driven Strategies for an Education Program to Improve Diversity, Equity, and Inclusion in Radiology

##### METHODS

Events were conducted at an urban, academic medical school and affiliated university. Medical student events included two shadowing/mentorship programs, two faculty-led career advising events, three M4-led post-MATCH panels, five skills workshops, one women and URM in radiology panel, and three procedure workshops; two introduction to radiology events were held for undergraduates. At the end of each event, students completed a demographics and knowledge questionnaire. The demographics questionnaire gathered information regarding gender, race/ethnicity, school year, and radiology exposure; the knowledge questionnaire assessed students' misconceptions and perception of work-life balance along with event quality and future interest. Responses were obtained using a Likert scale. Surveys were analyzed for trends by question type, race/ethnicity, gender, radiology exposure, and school year. There were 222 attendees with a 45% survey completion rate (100 responses). Two-tailed test assessed statistical significance for race/ethnicity, gender, radiology exposure, and year in medical school trends.

##### RESULTS

Data demonstrates a statistically significant positive impact in addressing misconceptions, promoting work-life balance, and increasing interest of undergraduates. Significantly higher positive ranks are seen in procedure workshops and undergraduate events. There was a positive trend in promoting work-life balance for women. Programs were effective; undergraduate events and shadowing/mentorship programs significantly peaked interest.\*Discussion Limitations include limited emphasis on the 5C's coaching and collaborating factors. Future programming includes undergraduate events for women and URM, skills and procedure workshops, and shadowing. Events will be expanded upon in the upcoming semesters. Future data analysis includes results from targeted outreach to underrepresented groups in undergraduate and preclinical medical students.

#### W2-QI-3 Reducing Radiology Reporting Workstation Energy Consumption

##### METHODS

Electricity consumption metered plugs were used to calculate workstation electricity consumption (kWh) over 12 hours. Each workstation consists of a central processing unit (CPU) and two large high resolution diagnostic monitors. Workstation energy states (WES) were categorized as either IN-USE, ACTIVE NOT IN-USE (CPU and monitors switched ON but not in use), IDLE (CPU switched ON but monitors OFF), SLEEP or OFF. The energy states of 41 workstations were manually assessed on three occasions at the end of a working week and taken to represent energy states throughout a night shift. WES for evening/weekend and daytime hours were estimated based on night shift workstation states and the highest number of rostered radiologists on duty during these shifts. Current annual workstation energy consumption was calculated. Workstations cannot be safely switched OFF every night, as essential cybersecurity and software updates cannot be missed. To reduce energy consumption, workstations should ideally be scheduled to SLEEP when not IN-USE. We therefore compared estimated energy savings for scenarios in which all workstations are programmed to either SLEEP or OFF when not IN-USE.

##### RESULTS

The average WES for night shifts (84 h/week) were 3 IN-USE, 17 ACTIVE NOT IN-USE, 15.7 IDLE, 0 SLEEP and 5.3 OFF. For evening/weekend shifts (44 h/week), estimated WES were 6 IN-USE, 14 ACTIVE NOT IN-USE, 15.7 IDLE, 0 SLEEP and 5.3 OFF. During day shifts (40h/week), estimated WES were 41 IN-USE and 0 for all other energy states. Based on the activity of 41 workstations, annual energy consumption totalled 51,414.6 kWh, costing £17,481/y at the current energy cost rate of £0.34/kWh. If workstations are programmed to either SLEEP or OFF when not IN-USE, energy consumption is predicted to fall to 27,440.1

kWh/y (£9,329.6) or 25,291 kWh/y (£8,599) respectively. Annual estimated energy savings are 23,974.4 kWh (£8151.3) or 26,123.5 kWh (£8882) respectively.\*Discussion Long periods of workstations remaining IDLE or ACTIVE NOT IN-USE contribute to high energy consumption in our radiology department. A simple green initiative to programme these workstations to SLEEP when not IN-USE is estimated to reduce departmental energy consumption by approximately 23,974kWh/y, also saving the department £8,151 per year.

#### **W2-QI-4 Improving the Performance of Technicians Using an Artificial Intelligence-Based System for Breast Positioning and Image Quality Control in Mammography**

##### **METHODS**

A total of 90 mammography examinations conducted after the implementation of an AI assisted quality control system were enrolled in this study. The AI system will use machine learning algorithms to analyze images and provide feedback to technicians, enabling them to adjust the breast position and optimize image quality. Images of same view (CC LMO) before and after technical repeat were evaluated by radiologist with the standards of Mammography Quality Standards Act (MQSA) on a four-point-scale (1 = poor, 4 = excellent). Incidence of inadequate positioning, which was defined by AI system as any of the following errors were recorded and compared: incomplete gland coverage, incomplete pectoralis major muscle inclusion, over or insufficient exposure, skin fold, nipple not in the contour line, shoulder overlap shadow, abdominal skin, contralateral breast, and foreign body.

##### **RESULTS**

A total of 70 images were evaluated in this study. The distribution of the image scores showed a significant difference ( $p < 0.001$ ) between the control group ( $M=2.2$ ,  $SD=0.8$ ) and the Technical Repeated group ( $M=3.5$ ,  $SD=0.5$ ). The percentage of mammography images with high quality image was significantly higher in the technical repeat group compared to the control group (96.7% vs. 70%,  $p < 0.001$ ). The proportion of mammograms with inadequate positioning was significantly lower ( $p < 0.001$ ) in the technical repeat group (8%) than in the control group (23%).\*Discussion The use of an automated breast positioning and image quality control system can reduce the likelihood of inadequate positioning and increase the overall image quality of mammography. It can significantly improve the performance of technicians in mammography and assess images faster than radiologists, potentially reducing the time and cost of breast cancer screening quality control.

#### **W2-QI-5 Effect of Senior Resident to Junior Resident Feedback in creating a culture of support and to help avoid reporting Errors and enhance learning: A Prospective Quality Improvement Program.**

Participants

Muhammad Malik, MD, (Presenter) Nothing to Disclose

##### **METHODS**

Methods: -Every R1 class moving on to R2 would receive a lecture series towards the end of the first academic year on how to provide feedback to the incoming class by program directors and faculty. - The feedback would follow the STAROS Model proposed by Dr. Noronha and Dr. Ananthakrishnan, stating feedback should be Specific, Timely, Actionable, Realistic, Observable, and Skills-based. -The session's goal would be to emphasize the importance of formative and summative feedback. To help the new R1s and R2s improve, a 5-point questionnaire will be provided to the R1 class regarding R2 feedback at the end of each rotation to be discussed with the program director at semi-annual and annual evaluations. Proposed Techniques of feedback class for Senior Residents: The classes could consist of case-based scenarios with faculty members and residents, covering important topics such as dealing with errors, professional growth, autonomy, and the extent of supervision. There would be role-play scenarios to promote faculty and resident development and to encourage ideas and discussion.

##### **RESULTS**

Proposed Results -To create a safe and supportive workplace where junior residents feel comfortable addressing their questions to the senior resident without fear or hesitation to avoid reporting errors and improve learning. -To encourage professional academic development amongst senior residents to promote collegiality camaraderie between residents.- Through goal-directed feedback amongst both junior residents and senior residents through evaluations, questionnaires can areas of improvement be identified and create a system of accountability with the aim of self-improvement and safety.\*Discussion •The goal of this proposal is to encourage growth, enhance learning and prepare future educators. Trainees want to feel supported, have someone they can trust, and ask for advice, and the first person they turn to will be their senior. •Through continuous efforts, can there be improvements and increase interest in learning and growth. <!--EndFragment-->

#### **W2-QI-6 Automated Assessment of Breast positioning and Image Quality in digital breast tomosynthesis (DBT) screening using synthetically reconstructed projection images**

##### **METHODS**

A total of 150 mammography examinations were enrolled in this study. Subjects underwent screening mammography including DBT with 2D-SM and FFDM. The AI-assisted system automatically evaluated the quality of breast positioning in each image set. Nine image quality criteria evaluating the appearance of the nipple, breast rotation, pectoral muscle, inframammary fold, pectoral nipple line, shoulder overlap shadow, abdominal skin, contralateral breast and foreign body were used for craniocaudal and mediolateral-oblique views. Image quality of cases were also evaluated with the standards of Mammography Quality Standards Act (MQSA) as grade "adequate" or "inadequate". The performance of the AI system was evaluated using accuracy, sensitivity, and specificity. The inter-rater agreement and comparison of their findings with those reported by the AI system was calculated using Cohen's kappa coefficient.

##### **RESULTS**

The AI algorithm demonstrated high accuracy in distinguishing between adequate and inadequate images, with an overall accuracy of 93%, sensitivity of 94% and specificity of 92% for FFDM and an accuracy of 92%, sensitivity of 95 and specificity of 91% for DBT with 2D-SM. In terms of breast positioning, the AUC of poor imaging quality prediction by AI system according to incomplete gland, incomplete pectoralis muscle, over or insufficient exposure was (0.903 vs 0.937 vs 0.982). Overall accuracy of AI system was 0.958 for FFDM and 0.932 for DBT with 2D-SM. Inter-observer agreement for image quality assessment was found to be 0.82 (95% confidence interval [CI]: 0.77-0.87), indicating substantial agreement between radiologists and AI system using 2D-SM images. The kappa coefficients for breast positioning assessment were also calculated and found to be moderate to substantial, with values ranging from 0.57 to 0.83 (95% CI: 0.48-0.67 and 0.78-0.88, respectively).\*Discussion The results showed a high degree of agreement between the automated and manual assessments, also indicating the performance of the AI tool in assessing breast positioning and image quality in DBT using 2D-SM images was comparable with that in FFDM. The use of synthetic projection images

may be a reliable option for the automated assessment of breast positioning and image quality in DBT screening, but caution should be noted in the interpretation of the diagnostic accuracy of DBT images obtained using synthetic projection images.

## **W2-QI-7 Automating and Integrating Breast Imaging Workflows to Improve Efficiency and Quality**

Participants

Clayton Taylor, MD, Upper Arlington, OH (*Presenter*) Nothing to Disclose

### **METHODS**

Our breast center is a part of a tertiary care academic medical center providing breast cancer screening and diagnostic evaluations as well as supporting busy breast specialty practices. Before our process improvement project, our lead technologists would intermittently drag and drop screening mammograms to static worklists. This was inefficient, time-consuming and led to delays in the assignment of mammograms. Our project addressed this problem by integrating our scheduling software with our worklist application and leveraging a function within our worklist application to immediately, equitably and automatically assign screening mammograms, screening breast ultrasound and breast MRIs to each radiologist working a shift. Separately, our technologists add a modifier to each screening mammogram for patients seen by practitioners in the clinic the same day, moving the study to the diagnostic (immediate interpretation) worklist. At the same time, we deployed a solution allowing radiologists to instantly request priors or ask for technical repeats causing those studies to immediately populate unique worklists monitored by our lead technologists and assistants who upload priors or address the issues before releasing the studies to be assigned automatically once again, creating a closed loop quality workflow.

### **RESULTS**

Our process improvement project has allowed for an automated system that immediately and equally distributes breast imaging cases amongst radiologists and creates closed loop workflows for technical repeats and obtaining prior imaging studies. This has led to a significant reduction in report turnaround times (TAT) for screening mammograms from 109 minutes prior to implementation to 90 minutes post implementation and for breast MRI median from 287 minutes prior to implementation to 169 minutes post implementation. At least 7.5 hours per week of time is saved each week by our lead technologists by the use of these automated workflows.\*Discussion Our improved breast imaging workflows improved efficiency with a direct positive impact on report turnaround times. These changes have also eliminated time consuming manual processes and created closed loop systems to improve quality by obtaining prior imaging studies and addressing technical issues.

### Reducing Radiology Reporting Workstation Energy Consumption

#### METHODS

Electricity consumption metered plugs were used to calculate workstation electricity consumption (kWh) over 12 hours. Each workstation consists of a central processing unit (CPU) and two large high resolution diagnostic monitors. Workstation energy states (WES) were categorised as either IN-USE, ACTIVE NOT IN-USE (CPU and monitors switched ON but not in use), IDLE (CPU switched ON but monitors OFF), SLEEP or OFF. The energy states of 41 workstations were manually assessed on three occasions at the end of a working week and taken to represent energy states throughout a night shift. WES for evening/weekend and daytime hours were estimated based on night shift workstation states and the highest number of rostered radiologists on duty during these shifts. Current annual workstation energy consumption was calculated. Workstations cannot be safely switched OFF every night, as essential cybersecurity and software updates cannot be missed. To reduce energy consumption, workstations should ideally be scheduled to SLEEP when not IN-USE. We therefore compared estimated energy savings for scenarios in which all workstations are programmed to either SLEEP or OFF when not IN-USE.

#### RESULTS

The average WES for night shifts (84 h/week) were 3 IN-USE, 17 ACTIVE NOT IN-USE, 15.7 IDLE, 0 SLEEP and 5.3 OFF. For evening/weekend shifts (44 h/week), estimated WES were 6 IN-USE, 14 ACTIVE NOT IN-USE, 15.7 IDLE, 0 SLEEP and 5.3 OFF. During day shifts (40h/week), estimated WES were 41 IN-USE and 0 for all other energy states. Based on the activity of 41 workstations, annual energy consumption totalled 51,414.6 kWh, costing £17,481/y at the current energy cost rate of £0.34/kWh. If workstations are programmed to either SLEEP or OFF when not IN-USE, energy consumption is predicted to fall to 27,440.1 kWh/y (£9,329.6) or 25,291 kWh/y (£8,599) respectively. Annual estimated energy savings are 23,974.4 kWh (£8151.3) or 26,123.5 kWh (£8882) respectively. \*Discussion Long periods of workstations remaining IDLE or ACTIVE NOT IN-USE contribute to high energy consumption in our radiology department. A simple green initiative to programme these workstations to SLEEP when not IN-USE is estimated to reduce departmental energy consumption by approximately 23,974kWh/y, also saving the department £8,151 per year.

### Improving the Performance of Technicians Using an Artificial Intelligence-Based System for Breast Positioning and Image Quality Control in Mammography

#### METHODS

A total of 90 mammography examinations conducted after the implementation of an AI assisted quality control system were enrolled in this study. The AI system will use machine learning algorithms to analyze images and provide feedback to technicians, enabling them to adjust the breast position and optimize image quality. Images of same view (CC LMO) before and after technical repeat were evaluated by radiologist with the standards of Mammography Quality Standards Act (MQSA) on a four-point-scale (1 = poor, 4 = excellent). Incidence of inadequate positioning, which was defined by AI system as any of the following errors were recorded and compared: incomplete gland coverage, incomplete pectoralis major muscle inclusion, over or insufficient exposure, skin fold, nipple not in the contour line, shoulder overlap shadow, abdominal skin, contralateral breast, and foreign body.

#### RESULTS

A total of 70 images were evaluated in this study. The distribution of the image scores showed a significant difference ( $p < 0.001$ ) between the control group ( $M=2.2$ ,  $SD=0.8$ ) and the Technical Repeated group ( $M=3.5$ ,  $SD=0.5$ ). The percentage of mammography images with high quality image was significantly higher in the technical repeat group compared to the control group (96.7% vs. 70%,  $p < 0.001$ ). The proportion of mammograms with inadequate positioning was significantly lower ( $p < 0.001$ ) in the technical repeat group (8%) than in the control group (23%). \*Discussion The use of an automated breast positioning and image quality control system can reduce the likelihood of inadequate positioning and increase the overall image quality of mammography. It can significantly improve the performance of technicians in mammography and assess images faster than radiologists, potentially reducing the time and cost of breast cancer screening quality control.

**Effect of Senior Resident to Junior Resident Feedback in creating a culture of support and to help avoid reporting Errors and enhance learning: A Prospective Quality Improvement Program.**

### Participants

Muhammad Malik, MD, (*Presenter*) Nothing to Disclose

### METHODS

Methods: -Every R1 class moving on to R2 would receive a lecture series towards the end of the first academic year on how to provide feedback to the incoming class by program directors and faculty. - The feedback would follow the STAROS Model proposed by Dr. Noronha and Dr. Ananthakrishnan, stating feedback should be Specific, Timely, Actionable, Realistic, Observable, and Skills-based. -The session's goal would be to emphasize the importance of formative and summative feedback. To help the new R1s and R2s improve, a 5-point questionnaire will be provided to the R1 class regarding R2 feedback at the end of each rotation to be discussed with the program director at semi-annual and annual evaluations. Proposed Techniques of feedback class for Senior Residents: The classes could consist of case-based scenarios with faculty members and residents, covering important topics such as dealing with errors, professional growth, autonomy, and the extent of supervision. There would be role-play scenarios to promote faculty and resident development and to encourage ideas and discussion.

### RESULTS

Proposed Results -To create a safe and supportive workplace where junior residents feel comfortable addressing their questions to the senior resident without fear or hesitation to avoid reporting errors and improve learning. -To encourage professional academic development amongst senior residents to promote collegiality camaraderie between residents.- Through goal-directed feedback amongst both junior residents and senior residents through evaluations, questionnaires can areas of improvement be identified and create a system of accountability with the aim of self-improvement and safety.\*Discussion •The goal of this proposal is to encourage growth, enhance learning and prepare future educators. Trainees want to feel supported, have someone they can trust, and ask for advice, and the first person they turn to will be their senior. •Through continuous efforts, can there be improvements and increase interest in learning and growth. <!--EndFragment-->

### Automated Assessment of Breast positioning and Image Quality in digital breast tomosynthesis (DBT) screening using synthetically reconstructed projection images

#### METHODS

A total of 150 mammography examinations were enrolled in this study. Subjects underwent screening mammography including DBT with 2D-SM and FFDM. The AI-assisted system automatically evaluated the quality of breast positioning in each image set. Nine image quality criteria evaluating the appearance of the nipple, breast rotation, pectoral muscle, inframammary fold, pectoral nipple line, shoulder overlap shadow, abdominal skin, contralateral breast and foreign body were used for craniocaudal and mediolateral-oblique views. Image quality of cases were also evaluated with the standards of Mammography Quality Standards Act (MQSA) as grade "adequate" or "inadequate". The performance of the AI system was evaluated using accuracy, sensitivity, and specificity. The inter-rater agreement and comparison of their findings with those reported by the AI system was calculated using Cohen's kappa coefficient.

#### RESULTS

The AI algorithm demonstrated high accuracy in distinguishing between adequate and inadequate images, with an overall accuracy of 93%, sensitivity of 94% and specificity of 92% for FFDM and an accuracy of 92%, sensitivity of 95 and specificity of 91% for DBT with 2D-SM. In terms of breast positioning, the AUC of poor imaging quality prediction by AI system according to incomplete gland, incomplete pectoralis muscle, over or insufficient exposure was (0.903 vs 0.937 vs 0.982). Overall accuracy of AI system was 0.958 for FFDM and 0.932 for DBT with 2D-SM. Inter-observer agreement for image quality assessment was found to be 0.82 (95% confidence interval [CI]: 0.77-0.87), indicating substantial agreement between radiologists and AI system using 2D-SM images. The kappa coefficients for breast positioning assessment were also calculated and found to be moderate to substantial, with values ranging from 0.57 to 0.83 (95% CI: 0.48-0.67 and 0.78-0.88, respectively). \*Discussion The results showed a high degree of agreement between the automated and manual assessments, also indicating the performance of the AI tool in assessing breast positioning and image quality in DBT using 2D-SM images was comparable with that in FFDM. The use of synthetic projection images may be a reliable option for the automated assessment of breast positioning and image quality in DBT screening, but caution should be noted in the interpretation of the diagnostic accuracy of DBT images obtained using synthetic projection images.

### Automating and Integrating Breast Imaging Workflows to Improve Efficiency and Quality

#### Participants

Clayton Taylor, MD, Upper Arlington, OH (*Presenter*) Nothing to Disclose

#### METHODS

Our breast center is a part of a tertiary care academic medical center providing breast cancer screening and diagnostic evaluations as well as supporting busy breast specialty practices. Before our process improvement project, our lead technologists would intermittently drag and drop screening mammograms to static worklists. This was inefficient, time-consuming and led to delays in the assignment of mammograms. Our project addressed this problem by integrating our scheduling software with our worklist application and leveraging a function within our worklist application to immediately, equitably and automatically assign screening mammograms, screening breast ultrasound and breast MRIs to each radiologist working a shift. Separately, our technologists add a modifier to each screening mammogram for patients seen by practitioners in the clinic the same day, moving the study to the diagnostic (immediate interpretation) worklist. At the same time, we deployed a solution allowing radiologists to instantly request priors or ask for technical repeats causing those studies to immediately populate unique worklists monitored by our lead technologists and assistants who upload priors or address the issues before releasing the studies to be assigned automatically once again, creating a closed loop quality workflow.

#### RESULTS

Our process improvement project has allowed for an automated system that immediately and equally distributes breast imaging cases amongst radiologists and creates closed loop workflows for technical repeats and obtaining prior imaging studies. This has led to a significant reduction in report turnaround times (TAT) for screening mammograms from 109 minutes prior to implementation to 90 minutes post implementation and for breast MRI median from 287 minutes prior to implementation to 169 minutes post implementation. At least 7.5 hours per week of time is saved each week by our lead technologists by the use of these automated workflows.\*Discussion Our improved breast imaging workflows improved efficiency with a direct positive impact on report turnaround times. These changes have also eliminated time consuming manual processes and created closed loop systems to improve quality by obtaining prior imaging studies and addressing technical issues.

### Quality Improvement Reports Wednesday Poster Discussions I

#### Sub-Events

#### W5A-QI-1 Impact of EHR Driven Force Function on Pregnancy Screening Compliance Rates in Fluoroscopy

##### Participants

Janelle Van Luling, BS, RT, Milford, CT (*Presenter*) Nothing to Disclose

##### METHODS

A team composed of subspecialty radiologists, x-ray technologists and quality improvement specialists worked to identify contributing factors leading to non-compliance in pregnancy screening on fluoroscopy exams. A3 methodology, process mapping, manual chart audits and frontline staff feedback were utilized to focus our interventions. An EHR-driven force function reminder was created using human-centered design principles. This mandatory question only fires on relevant exams (fluoroscopic studies that radiate the abdomen and/or pelvic regions) and a specific patient population (female sex assigned at birth and age 10-55). Interventional Radiology exam codes were excluded. To avoid click fatigue, the hard stop question was designed to incorporate recent negative pregnancy test results within 48 hours (or current hospital stay) creating a targeted, logical reminder. Screening compliance rate was analyzed before and after implementation.

##### RESULTS

Baseline data obtained from February 1, 2022-January 29, 2023, for a randomized cohort of 50 female patients (4-5 patients per month) between ages 10 and 55 with an order for a fluoroscopic exam involving the abdomen/pelvic regions revealed 65% compliance in documenting appropriate pregnancy screening. EHR-driven question was implemented on January 30, 2023. Post intervention random audit of 27 exams performed from February 1 - April 20, 2023 revealed 100% screening documentation compliance (Figure 1). \*Discussion While institutional radiation safety and pregnancy testing policies are designed to optimize patient safety and avoid unintended fetal radiation, compliance in following the policy by front line staff is variable due to environment and human factors. Confusion on who needs pregnancy screening, what exact exams require screening and lack of standard process can all contribute to non-compliance. Originally built for our CT technologists, this QI initiative expanded a successfully implemented logical reminder in our EHR to our fluoroscopy department. This project successfully increased compliance in having pregnancy status verified from 65% to 100%. Following success at our main tertiary center, the initiative was expanded to 4 other hospitals within our health system.

#### W5A-QI-2 Reporting backlog clearance campaign

##### Participants

Pravin Ghadge, MBBS, FRCR, (*Presenter*) Nothing to Disclose

##### METHODS

To tackle this biggest challenge, we introduced a new system for additional reporting with some added monetary incentives, wherein scans would be allocated to individual radiologists, mapping the pattern of unreported scans. We set different worklist configurations named as 'Packets'. Each packet consisting of 12 to 17 scans, about 50-70% of complex/ time consuming scans and remainder with different subspecialty interests. This configuration was intended to prevent preferential reporting as per individual liking. This was not a time bound activity, but we set a goal of completing each packet within 48 hours of assignment with a penalty clause for delay in reporting. We also ensured escalating any new diagnosis or disease progression to be acted upon to keep the patient as safe as possible.

##### RESULTS

Total 22 out of 38 radiologists (58%) participated in this initiative, 7 out of these (18%) newly started contributing to additional reporting, 5 (13%) switched over from traditional system to new system, whereas 10 (26%) participated through both systems with more inclination towards the 'Packets'. Under this activity, we could report 6,229 scans helping 55% of the total backlog with maximum turnaround time being 2 days bringing down the backlog from 11,180 to 476 in 15 weeks. The waiting time for reporting CT and MRI scans from request to report came down to less than 6 weeks. \*Discussion Wider participation from the radiologists showcased motivation and teamwork. Apart from clearing the reporting backlog this project prevented any further addition to the backlog. The improvement has positively impacted multidisciplinary team meetings, overall patient experience, patient care, and patient safety. With the various advantages and success, we have achieved with this project, other NHS Trusts with backlog could also consider this approach while tackling their backlog.

#### W5A-QI-3 Deferral of eGFR testing in low risk patients prior to contrast enhanced CT: Impact on emergency room (ER) imaging throughput

##### Participants

Gowthaman Gunabushanam, MD, New Haven, CT (*Presenter*) Nothing to Disclose

##### METHODS

Baseline (12/28/2021 - 3/7/2022, weeks 1-10) CECT order-to-protocol (O to P) and order-to-exam begin (O to B) times were

measured. A question was added to the ordering screen in the EHR for all CECTs ordered in the ER which allowed providers the option of scanning without an eGFR value if the patient was deemed low risk. Low risk was defined as: (a) no history of chronic kidney disease (CKD), (b) no risk factors for CKD (diabetes, hypertension, prior kidney surgery, etc) or known to be on dialysis, and (c) no risk factors for AKI (sepsis, dehydration, drug toxicity, altered mental status, etc).

## RESULTS

In the initial pilot phase (3/8/2022 - 6/13/2022, weeks 11-24), the EHR question was implemented as optional, resulting in low utilization rates (5-14%). Subsequently, in the launch phase (6/14/2022 - 8/15/2022, weeks 25-33), the question was implemented as a hard-stop requiring an answer to proceed (100% utilization). A total of 16,446 CECT exams were included in this study (4,456 baseline, 6,933 pilot phase, 5,057 launch phase) for 4 ERs within our health system: 2 adult 1 pediatric hospital-based ER, and 1 freestanding ER. In the launch phase, 68% (3,451 of 5,057) studies were categorized by ER providers as low risk for kidney disease (OK to scan without eGFR value). In the launch phase, 0.3% (2/646) studies deemed low risk were completed that had an eGFR subsequently result as < 30 mL/min/1.73m<sup>2</sup>. Median O to P time across all ERs improved from 23.93 min at baseline to 13.02 min in the launch phase. Median O to B time across all ERs improved from 80.34 min at baseline to 76.48 min in the launch phase with median O to B times for low risk patients improving to 72.08 min. Sub analysis showed net improvements in the median O to B were greater in the freestanding ER (36.33 vs. 22.98 min) and pediatric ER (147.65 min vs. 132.80 min).\*Discussion This QI project successfully created an eGFR deferral process embedded into our EHR based on risk factor assessment. Slightly over two-thirds of patients were deemed as low risk and safe to scan without an eGFR value. Patient safety was preserved with only 0.3% of patients having severe renal impairment (eGFR < 30) discovered after CECT that were deemed low risk upon order entry. This project led to improved study CECT order-to-begin times for low risk patients in the ER by 8 minutes, potentially allowing for improved throughput and earlier time to diagnosis.

## W5A-QI-4 Evaluation of a medical decision support system for the prescription of medical imaging examinations: qualitative and quantitative studies with radiologists and radiology residents in France

### METHODS

Qualitative then quantitative studies carried out with radiologists and radiology residents in France to evaluate our tool. The qualitative study consisted of data collection during focus group interviews then thematic analysis using the SWOT technique. Based on this preliminary work, a questionnaire was developed and sent to radiologists on a broader scale to collect their opinions on the website.

### RESULTS

Radiologists' initial opinion of the guide was mostly positive, particularly as to the layout, the ease of use, and the quick turnaround. However, modifications and additions had to be made to the first version in order to accommodate clinicians' requests, i.e. reasons for consultations, optimization of users experience and quality of information. The guide was also redesigned to address a more specialized audience, such as radiologists. In order to promote the use of our guide, its name was modified for a more intuitive one, active promotion and ultimately, the development of a smartphone application were done.\*Discussion Our study has identified many opportunities for improvement to facilitate the use of this tool in order to optimize the relevance and efficiency of imaging examinations for requesting physicians. Learning from other decision support systems, in particular the ACR Appropriateness Criteria (AC), and creating an application with a decision algorithm were found to be useful toward more comprehensive, generalize and optimal care for patients.

## W5A-QI-5 Enhancing Efficiency in MRI Protocoling: A Quality Improvement Initiative

### Participants

Marie Hausner, RT, New Haven, CT (*Presenter*) Nothing to Disclose

### METHODS

The intervention enrolled a selected group of MRI codes, as determined by the QI team and divisional leadership, into an auto-protocol program eliminating the need for manual protocol assignment by radiologists or technologists. Codes that were selected for enrollment were removed from protocol lists. They received a protocol designation in our health system's EHR (Epic, Verona WI) through creation of a programming script that automatically inserted the words "Perform as ordered per policy" into the protocol field. The program was implemented for ten MRI sites across three hospital networks covered by our academic radiology group on 1/12/23. Three months of baseline data was collected (October-December 2022) to assess baseline rate of exams that received a human-assigned manual protocol from a radiologist and to predict the expected reduction in manual protocoling after project launch. Three months of post intervention data (January-April 2023) was collected to assess project impact. A time savings calculation was also calculated.

### RESULTS

The auto-protocol program enrolled 58 of 300 (19% of available MRI codes). Analysis of the baseline data revealed that these codes reflected 23% of the exams protocolled by our academic radiology practice. At baseline 98% of MR orders received a radiologist protocol monthly which decreased to 76-78% (mean = 77%) after project launch (Figure 1). Mean time to protocol an MRI was approximated at 15 seconds. Based on this, we estimated the project would reduce time spent protocoling by 5 hours monthly and 60.5 hours annually.\*Discussion The implementation of an auto-protocol program for MRI exams has been successful in enhancing efficiency and reducing protocol workload for radiologists while maintaining the quality and safety of patient care. The project has resulted in a 21% decrease in the number MRI orders needing manual assignment of a protocol with estimated time savings of 60.5 hours annually.

## W5A-QI-6 Breaking Bad News to Patients on the Breast Imaging Service: Designing a Resident Curriculum.

### METHODS

At the start of the rotation residents will complete a self-evaluation utilizing a 5-point Likert scale determining their comfort level with delivering results. Each resident then undergoes two SP encounters representing common clinical scenarios seen in breast radiology. Residents will be evaluated by an attending with a standardized scoring sheet utilizing the established SPIKES protocol outlining a six-step technique on how to appropriately deliver bad news. An attending will debrief with the resident, providing feedback and constructive criticism. The resident will then watch the educational video. At the end of the rotation, they will undergo two additional SP encounters and again be evaluated by an attending with the same scoring sheet as before. Lastly, the resident will complete the same self-evaluation.

## RESULTS

Resident 1 showed a 20% increase in the SP encounter score while resident 2 showed a 5% increase in the SP encounter score. The overall average percent change between pre- and post-curriculum encounters is +12.5%. Post-curriculum self-evaluation scores showed a general increase in resident confidence in their ability to deliver news to patients. Residents do not begin rotating through breast imaging at UCLA until R2 year. As such there is currently a small sample size as only two new R2's have rotated through the breast department since implementation. There is an anticipated increase in response data beginning July 2023 once the new academic year begins which will give us more data points to analyze.\*Discussion Implementing a standardized curriculum for radiology residents completing their first breast imaging rotation will increase their confidence and ability to effectively deliver patient results. The overall goal is to ease patients allowing them to feel as comfortable and confident with their providers as possible, thus decreasing anxiety when presenting to the breast imaging department. We believe that this standardized curriculum will be successful at our institution, and hope that it will ultimately be adopted by other institutions in training their residents.

### **W5A-QI-7 Iodine Contrast Media Volume and CT Enhancement: When Less is More**

#### **METHODS**

In order to promote CM reduction protocol, this project was developed in the CT unit of a Brazilian tertiary hospital (4 CT scanners) during January 1st and 1st February , 2023. The following steps were implemented: \*Step 1- high iodine concentration CM multidose injection in order to save iodine CM due to Global iodine CM shortage during the study duration; \*Step 2- Optimization of protocol parameters according to manufactures recommendations in order to improve abdominal contrast CT image quality with reduced CM volume; \*Step 3- Application of a new formula to calculate CM volume for abdominal CT exams according to manufactures kVp reduction recommendations; \*Step 4- Qualitative and quantitative data analyses and comparisons.

#### **RESULTS**

100 CT scans were performed during the study period. Our results demonstrated a nearly 40% reduction in CM volume with no image quality loss. We also ensure ideal hepatic parenchyma enhancement level (around 50 HU) as recommend in the literature.\*Discussion Global iodine CM shortage in the second semester of 2022, and beginning of 2023 led to its rational in health centers and clinical practice. It is possible to achieve ideal vessels and parenchyma enhancement with low volume and/or low flow rate injection using high iodine concentration CM. Reducing CM volume is beneficial in patients with risk factors for kidney injury. Reducing CM volume requires a balance between injection flow rate and other protocols parameters, such as kVp modulation and IR technology, in order to improve image diagnostic quality.

### Impact of EHR Driven Force Function on Pregnancy Screening Compliance Rates in Fluoroscopy

#### Participants

Janelle Van Luling, BS, RT, Milford, CT (*Presenter*) Nothing to Disclose

#### METHODS

A team composed of subspecialty radiologists, x-ray technologists and quality improvement specialists worked to identify contributing factors leading to non-compliance in pregnancy screening on fluoroscopy exams. A3 methodology, process mapping, manual chart audits and frontline staff feedback were utilized to focus our interventions. An EHR-driven force function reminder was created using human-centered design principles. This mandatory question only fires on relevant exams (fluoroscopic studies that radiate the abdomen and/or pelvic regions) and a specific patient population (female sex assigned at birth and age 10-55). Interventional Radiology exam codes were excluded. To avoid click fatigue, the hard stop question was designed to incorporate recent negative pregnancy test results within 48 hours (or current hospital stay) creating a targeted, logical reminder. Screening compliance rate was analyzed before and after implementation.

#### RESULTS

Baseline data obtained from February 1, 2022-January 29, 2023, for a randomized cohort of 50 female patients (4-5 patients per month) between ages 10 and 55 with an order for a fluoroscopic exam involving the abdomen/pelvic regions revealed 65% compliance in documenting appropriate pregnancy screening. EHR-driven question was implemented on January 30, 2023. Post intervention random audit of 27 exams performed from February 1 - April 20, 2023 revealed 100% screening documentation compliance (Figure 1).\*Discussion While institutional radiation safety and pregnancy testing policies are designed to optimize patient safety and avoid unintended fetal radiation, compliance in following the policy by front line staff is variable due to environment and human factors. Confusion on who needs pregnancy screening, what exact exams require screening and lack of standard process can all contribute to non-compliance. Originally built for our CT technologists, this QI initiative expanded a successfully implemented logical reminder in our EHR to our fluoroscopy department. This project successfully increased compliance in having pregnancy status verified from 65% to 100%. Following success at our main tertiary center, the initiative was expanded to 4 other hospitals within our health system.

### Deferral of eGFR testing in low risk patients prior to contrast enhanced CT: Impact on emergency room (ER) imaging throughput

#### Participants

Gowthaman Gunabushanam, MD, New Haven, CT (*Presenter*) Nothing to Disclose

#### METHODS

Baseline (12/28/2021 - 3/7/2022, weeks 1-10) CECT order-to-protocol (O to P) and order-to-exam begin (O to B) times were measured. A question was added to the ordering screen in the EHR for all CECTs ordered in the ER which allowed providers the option of scanning without an eGFR value if the patient was deemed low risk. Low risk was defined as: (a) no history of chronic kidney disease (CKD), (b) no risk factors for CKD (diabetes, hypertension, prior kidney surgery, etc) or known to be on dialysis, and (c) no risk factors for AKI (sepsis, dehydration, drug toxicity, altered mental status, etc).

#### RESULTS

In the initial pilot phase (3/8/2022 - 6/13/2022, weeks 11-24), the EHR question was implemented as optional, resulting in low utilization rates (5-14%). Subsequently, in the launch phase (6/14/2022 - 8/15/2022, weeks 25-33), the question was implemented as a hard-stop requiring an answer to proceed (100% utilization). A total of 16,446 CECT exams were included in this study (4,456 baseline, 6,933 pilot phase, 5,057 launch phase) for 4 ERs within our health system: 2 adult 1 pediatric hospital-based ER, and 1 freestanding ER. In the launch phase, 68% (3,451 of 5,057) studies were categorized by ER providers as low risk for kidney disease (OK to scan without eGFR value). In the launch phase, 0.3% (2/646) studies deemed low risk were completed that had an eGFR subsequently result as  $< 30$  mL/min/1.73m<sup>2</sup>. Median O to P time across all ERs improved from 23.93 min at baseline to 13.02 min in the launch phase. Median O to B time across all ERs improved from 80.34 min at baseline to 76.48 min in the launch phase with median O to B times for low risk patients improving to 72.08 min. Sub analysis showed net improvements in the median O to B were greater in the freestanding ER (36.33 vs. 22.98 min) and pediatric ER (147.65 min vs. 132.80 min).\*Discussion This QI project successfully created an eGFR deferral process embedded into our EHR based on risk factor assessment. Slightly over two-thirds of patients were deemed as low risk and safe to scan without an eGFR value. Patient safety was preserved with only 0.3% of patients having severe renal impairment (eGFR  $< 30$ ) discovered after CECT that were deemed low risk upon order entry. This project led to improved study CECT order-to-begin times for low risk patients in the ER by 8 minutes, potentially allowing for improved throughput and earlier time to diagnosis.

### Enhancing Efficiency in MRI Protocols: A Quality Improvement Initiative

#### Participants

Marie Hausner, RT, New Haven, CT (*Presenter*) Nothing to Disclose

#### METHODS

The intervention enrolled a selected group of MRI codes, as determined by the QI team and divisional leadership, into an auto-protocol program eliminating the need for manual protocol assignment by radiologists or technologists. Codes that were selected for enrollment were removed from protocol lists. They received a protocol designation in our health system's EHR (Epic, Verona WI) through creation of a programming script that automatically inserted the words "Perform as ordered per policy" into the protocol field. The program was implemented for ten MRI sites across three hospital networks covered by our academic radiology group on 1/12/23. Three months of baseline data was collected (October-December 2022) to assess baseline rate of exams that received a human-assigned manual protocol from a radiologist and to predict the expected reduction in manual protocoling after project launch. Three months of post intervention data (January-April 2023) was collected to assess project impact. A time savings calculation was also calculated.

#### RESULTS

The auto-protocol program enrolled 58 of 300 (19% of available MRI codes). Analysis of the baseline data revealed that these codes reflected 23% of the exams protocolled by our academic radiology practice. At baseline 98% of MR orders received a radiologist protocol monthly which decreased to 76-78% (mean = 77%) after project launch (Figure 1). Mean time to protocol an MRI was approximated at 15 seconds. Based on this, we estimated the project would reduce time spent protocoling by 5 hours monthly and 60.5 hours annually.\*Discussion The implementation of an auto-protocol program for MRI exams has been successful in enhancing efficiency and reducing protocol workload for radiologists while maintaining the quality and safety of patient care. The project has resulted in a 21% decrease in the number MRI orders needing manual assignment of a protocol with estimated time savings of 60.5 hours annually.

### Breaking Bad News to Patients on the Breast Imaging Service: Designing a Resident Curriculum.

#### METHODS

At the start of the rotation residents will complete a self-evaluation utilizing a 5-point Likert scale determining their comfort level with delivering results. Each resident then undergoes two SP encounters representing common clinical scenarios seen in breast radiology. Residents will be evaluated by an attending with a standardized scoring sheet utilizing the established SPIKES protocol outlining a six-step technique on how to appropriately deliver bad news. An attending will debrief with the resident, providing feedback and constructive criticism. The resident will then watch the educational video. At the end of the rotation, they will undergo two additional SP encounters and again be evaluated by an attending with the same scoring sheet as before. Lastly, the resident will complete the same self-evaluation.

#### RESULTS

Resident 1 showed a 20% increase in the SP encounter score while resident 2 showed a 5% increase in the SP encounter score. The overall average percent change between pre- and post-curriculum encounters is +12.5%. Post-curriculum self-evaluation scores showed a general increase in resident confidence in their ability to deliver news to patients. Residents do not begin rotating through breast imaging at UCLA until R2 year. As such there is currently a small sample size as only two new R2's have rotated through the breast department since implementation. There is an anticipated increase in response data beginning July 2023 once the new academic year begins which will give us more data points to analyze.\*Discussion Implementing a standardized curriculum for radiology residents completing their first breast imaging rotation will increase their confidence and ability to effectively deliver patient results. The overall goal is to ease patients allowing them to feel as comfortable and confident with their providers as possible, thus decreasing anxiety when presenting to the breast imaging department. We believe that this standardized curriculum will be successful at our institution, and hope that it will ultimately be adopted by other institutions in training their residents.

### Iodine Contrast Media Volume and CT Enhancement: When Less is More

#### METHODS

In order to promote CM reduction protocol, this project was developed in the CT unit of a Brazilian tertiary hospital (4 CT scanners) during January 1st and 1st February, 2023. The following steps were implemented: \*Step 1- high iodine concentration CM multidose injection in order to save iodine CM due to Global iodine CM shortage during the study duration; \*Step 2- Optimization of protocol parameters according to manufactures recommendations in order to improve abdominal contrast CT image quality with reduced CM volume; \*Step 3- Application of a new formula to calculate CM volume for abdominal CT exams according to manufactures kVp reduction recommendations; \*Step 4- Qualitative and quantitative data analyses and comparisons.

#### RESULTS

100 CT scans were performed during the study period. Our results demonstrated a nearly 40% reduction in CM volume with no image quality loss. We also ensure ideal hepatic parenchyma enhancement level (around 50 HU) as recommend in the literature.\*Discussion Global iodine CM shortage in the second semester of 2022, and beginning of 2023 led to its rational in health centers and clinical practice. It is possible to achieve ideal vessels and parenchyma enhancement with low volume and/or low flow rate injection using high iodine concentration CM. Reducing CM volume is beneficial in patients with risk factors for kidney injury. Reducing CM volume requires a balance between injection flow rate and other protocols parameters, such as kVp modulation and IR technology, in order to improve image diagnostic quality.

### Quality Improvement Reports Wednesday Poster Discussions II

#### Sub-Events

#### W5B-QI-1 Credenciamento de Qualidade CBR em Mamografia para o diagnóstico correto

##### Participants

Adriano Tachibana, MD, MBA, Sao Paulo, Brazil (*Presenter*) Research Grant, Guerbet SA

##### METHODS

We surveyed the number of clinics that failed the program due to the incorrect BI-RADS classification, from September 2018 to September 2021, a period in which there was no obligation to take the course, and we compared the number of clinics that failed from September 2021 to September 2022, when it was established that the course was mandatory.

##### RESULTS

Of the 106 clinics that participated in the certification process from September 2018 to September 2021, 9 clinics failed the program due to incorrect BI-RADS classification. After the mandatory completion of the course, the clinics that had their exams failed, were informed that all doctors who performed mammography exams at the clinic, were obliged to present the certificate of conclusion of the PEC-BIRADS course, in order to return to the certification program Of Quality. After completing the course, the service could resend new exams for a new quality assessment. This process started in September 2021. Of the 43 clinics that entered the certification process from September 2021 to September 2022, 10 clinics had failed exams in the first evaluation, took the course and were approved in the second post-course evaluation. All clinics achieved quality certification in mammography.\*Discussion We conclude that the implementation of the PEC BI-RADS course was effective, since the physicians who carried out the course were able to correctly classify the BI-RADS in the mammography exams evaluated, avoiding diagnostic errors and failures in indicating the best treatment for the patient.

#### W5B-QI-2 Coronary CTA Retrospective Protocol: Is More Always Better?

##### METHODS

In order to promote improvements in image quality in CCTA exams, protocol parameters optimization in computed tomography (CT) unit of Brazil tertiary hospital (2 dual source CT scanners) were made: use of different iterative reconstruction (IR) algorithm and new protocols implementation according to patient's body mass index (BMI). In order to reduce patient's radiation exposure undergone CCTA retrospective acquisition, it was established the following steps: 1. Data from 120 CCTA retrospective scans were collected; 2. Observed average phase for image reconstruction selected by the CT scanner (FLASH versus FORCE CT); 3. Established shorter acquisition range for each CT dual source scanner according to the average observed; 4. Team update regarding the new range and awareness about increase in dose length product (DLP) when larger ranges were used.

##### RESULTS

A median reduction of 33.9% in Dose-Length Product (DLP) values was observed across all scans, with no apparent compromise to image quality. We observed 30,7% and 36,7% DLP median values reduction in FLASH and FORCE CT scanners, respectively.\*Discussion Greater image quality and reduction of radiation exposure during CCTA exams can be achieved through simple measures, such as good patient positioning, correct planning of the study area and control of cardiac heart rate by the use of beta-blockers. Protocol parameters optimization, as interactive reconstruction and automatic exposure control can also be used. In ECG triggered retrospective acquisition, the maximum radiation dose is given only in a pre-established range of the cardiac cycle, preferably in diastole. Therefore, determining more restricted reconstruction range in this acquisition mode implies in reducing patient's radiation exposure CCTA exams, without compromising image quality. Limitation of our study include use of larger ranges in cases of patients with limitations to perform the exam, as elderly patients with difficulty to follow apnea orders and patients with beta-blockers contraindications.

#### W5B-QI-3 Evaluation of MRI images and reports in an Accreditation Program

##### Participants

Adriano Tachibana, MD, MBA, Sao Paulo, Brazil (*Presenter*) Research Grant, Guerbet SA

##### METHODS

During the year 2022, 72 exams from 6 different services were evaluated. Thirteen criteria were evaluated for each exam, where each criterion was classified as "Adequate" or "Inadequate", regarding the quality of the images, congruence of laterality and efficacy of the report.

##### RESULTS

Of a total of 852 (eight hundred and fifty-two) criteria evaluated, 694 (81%) were considered adequate and 158 (19%) inadequate. Of the evaluated criteria, 40% were considered adequate in terms of image quality, 28% had the congruence of the report considered adequate and 14% of the criteria were adequate in terms of laterality. The item with the highest percentage of inadequate was the Report. The criteria with the highest disapproval were related to the content of the medical report, with 54%

of the evaluated criteria considered inadequate; the criterion related to the description of the pathology in the report had 53% of inadequacy.\*Discussion Most of the problems found in magnetic resonance images and reports concerned the content of the medical report in relation to the demonstration and description of the pathology, respectively.

#### **W5B-QI-4 Implementating a Mindfulness Training Program for Healthcare Professionals at Radiology Department of a Tertiary Hospital: A Brazilian Experience**

Participants

Paula Lucio, MSc, Barueri, Brazil (*Presenter*) Nothing to Disclose

##### **METHODS**

The intervention consisted of an eight-week training program comprising virtual sessions with guided mindfulness practices, supplemented by daily meditation practices, offered to healthcare professionals. Eight workshop sessions were conducted between June and July 2022, and voluntary participation was sought from the target audience. Daily meditative practices were shared, and forums were created for the possibility of clarifying doubts. Information was collected through standardized forms and instruments, including Conscientious Attention Awareness Scale (MAAS) and Perceived Stress Scale (PSS10), in a before-and-after design to assess changes in well-being outcomes

##### **RESULTS**

The final sample was composed of 22 health professionals (mostly nurses and biomedical scientists) that volunteered to participate, and ten professionals (45%) fully adhered to the training (group 1). For the PSS10 questionnaire, all the participants obtained the highest score for question 12 ("Have you been thinking about the things you should do?") before the intervention. Following the intervention, all the participants agreed with two specific statements of MASS: "I tend to walk fast to reach my destination, without paying attention to what I experience on the way" (answer 4) and "I am worried about the future and the past" (answer 13); irrespective of whether they completed all eight sessions (group 1) or not (group 2). Of note, the group 2 had higher response scores for a specific question of MASS after the intervention: "I don't usually notice pain or physical discomfort until they really call my attention"(question 5); when compared to the group 1.\*Discussion The described intervention was related to response changes regarding to the perception of pain and physical discomfort among all participants of the program, even if they were unable to adhere to the eight weeks of practice. Following the intervention, both groups exhibited greater attention to the present moment and reduced concern for future events, indicating that the program may have provided benefits in terms of self-perception and attention. These results suggest that the intervention was effective in enhancing participants' well-being, despite incomplete adherence to the practice.

#### **W5B-QI-5 Technologist experience implementing a mammographic image quality improvement program using automated artificial intelligence based software**

Participants

Melissa L. Hill, PHD, Issy les Moulineaux, France (*Presenter*) Consultant, Volpara Health Technologies Limited

Sally Grady, Kettering, OH (*Presenter*) Nothing to Disclose

##### **METHODS**

The prospective study included 55 Techs at a private breast imaging organization (15 clinics, OH, USA), already using a commercially available AI-based IQ software, Volpara Analytics™, for >2 years prior to study commencement. Hands-on breast positioning training was carried out by Mammography Educators, with feedback individualized for Techs in a Targeted Training Profile (TTP) according to the IQ software's automated performance reports. Five 30-day Evaluation periods were included to measure IQ changes pre (Eval. 1-2) and post-training (Eval. 3-5). Software login frequencies were also measured. Surveys were electronically delivered to Techs pre- and post-training. The pre-training survey captured prior experience. Four post-training surveys (2-5) focused on experience and engagement behaviors with the AI IQ software. Analysis included data from 46 Techs who completed all surveys.

##### **RESULTS**

Immediately post-training, survey responses showed 87% and 91.3% of Techs were satisfied or very satisfied with the TTP consultation and hands-on training, respectively. Furthermore, 71.8% responded that their software engagement would increase. The proportion of Techs that had not used the software reduced from 45.7% to 23.9% post-training (Eval 2-3), with a trend ( $p < 0.05$ ) for persistence of these login behaviors. Post-training survey responses show Techs planned for software use to improve breast positioning (>67%, Survey 3-5) and compression (>73%, Survey 3-5). At baseline, 52.2% of Techs reported physical discomfort believed to be related to acquiring mammograms. Post-training, most Techs (87%) responded that they frequently implemented changes that improved ergonomics. Also, >45% of Techs reported increased frequency of feeling confident in communicating with patients.\*Discussion Following a training intervention, individualized with objectively measured breast positioning metrics, most Techs reported and showed a positive response toward the AI IQ software. While software use and positioning training is explicitly intended to improve IQ, results suggest additional benefits may be realized that support the staff and clinical practice, such as improved ergonomics and confidence in communication. Limitations include analysis did not factor experience level.

#### **W5B-QI-6 Implementation of a Radiology Patient Experience Council in an Academic Institution**

Participants

Stephanie Shieh, RN, MS, Orange, CA (*Presenter*) Nothing to Disclose

##### **METHODS**

Starting in September 2022, a Radiology Patient Experience Council was created at the department of radiology of a tertiary academic health center in southern California. The council had member representation from quality and business systems, imaging modality supervisors, operation managers, radiology physicians, patient experience leaders and a Patient Family Advisory Council member. The council had an hour monthly meeting to review the Department National Research Corporation (NRC) Health data, prioritize patient-centered quality improvement initiatives, and discuss strategies to implement and sustain practice changes. Department NRC data from May to August 2022 was analyzed and patient feedbacks were categorized to determine action plans. We then performed literature review to guide the implementation of the initiatives. The initiatives included improving communication to inform about delays, addressing perception of staff caring and professionalism, increasing comfort during exam, improving scheduling process, improving wayfinding experiences.

## RESULTS

Some of our successful initiatives included training staff on standardized scripting for communication delays and improving patients' comfort in our radiology environment. We have also discussed patient experiences with regard to price transparency, scheduling as well as issues that concern the LGBTQIA+ community. There was an increase in likelihood to recommend the Radiology department from 81.3% in August 2022 to 83.9% in March 2023 (Figure 1). \*Discussion Keeping patient experience as a topic that is at top of mind is critical to improving the patient's experience. Having a dedicated council where the patient experience data is reviewed monthly by the radiology leadership team to ensure that appropriate patient-centric initiatives can be implemented to address patients' concerns and information can be disseminated to the radiology team members will help the entire department keep committed and accountable to improving patient care.

### **W5B-QI-7 AI Automated Opportunistic Screening for Cardiomegaly on CT**

Participants

Asser Abou Elkassem, MD, (*Presenter*) Nothing to Disclose

## METHODS

We manually segmented the heart and inner chest on a multi-institutional set of CT exams (N=1500) to train an AI algorithm (AI Cardiomegaly v1.0) to quantify area-based CTR. The patented algorithm was validated in a large study and implemented on an iMac server receiving all CT exams. The output includes a PDF report and a spreadsheet with CTR and patient information. We assessed the medical records of patients in the top 10th percentile for heart disease management. A startup was formed, and an FDA 510(k) application was submitted in May 2023.

## RESULTS

The AI Cardiomegaly algorithm processes 220 CT exams daily (around 80,000 per year). Over two weeks, we found that 40% of the top 10th percentile (N=3,200 patients) had unmanaged cardiomegaly. Unmanaged cardiomegaly occurs in 4% of routine CT exams, corresponding to nearly 1.6 million patients yearly in the U.S. We expect issued patent claims and FDA 510(k) clearance in late 2023. \*Discussion Opportunistic screening for unmanaged cardiomegaly in routine CT exams could reduce the healthcare burden of CVD. We're partnering with cardiologists to coordinate care and arrange echocardiograms and clinical visits for identified patients. Most patients will receive ongoing care, while a subset will undergo advanced cardiac imaging, stress tests, coronary studies/interventions, valvular heart repair, and pacemaker/defibrillator placement. The average Medicare reimbursement for severe CVD is nearly \$20,000. Providing appropriate management for 25% of patients with unmanaged cardiomegaly detected through screening at our institution could generate \$16M in total reimbursement annually.

### AI Automated Opportunistic Screening for Cardiomegaly on CT

#### Participants

Asser Abou Elkassem, MD, (*Presenter*) Nothing to Disclose

#### METHODS

We manually segmented the heart and inner chest on a multi-institutional set of CT exams (N=1500) to train an AI algorithm (AI Cardiomegaly v1.0) to quantify area-based CTR. The patented algorithm was validated in a large study and implemented on an iMac server receiving all CT exams. The output includes a PDF report and a spreadsheet with CTR and patient information. We assessed the medical records of patients in the top 10th percentile for heart disease management. A startup was formed, and an FDA 510(k) application was submitted in May 2023.

#### RESULTS

The AI Cardiomegaly algorithm processes 220 CT exams daily (around 80,000 per year). Over two weeks, we found that 40% of the top 10th percentile (N=3,200 patients) had unmanaged cardiomegaly. Unmanaged cardiomegaly occurs in 4% of routine CT exams, corresponding to nearly 1.6 million patients yearly in the U.S. We expect issued patent claims and FDA 510(k) clearance in late 2023.\*Discussion Opportunistic screening for unmanaged cardiomegaly in routine CT exams could reduce the healthcare burden of CVD. We're partnering with cardiologists to coordinate care and arrange echocardiograms and clinical visits for identified patients. Most patients will receive ongoing care, while a subset will undergo advanced cardiac imaging, stress tests, coronary studies/interventions, valvular heart repair, and pacemaker/defibrillator placement. The average Medicare reimbursement for severe CVD is nearly \$20,000. Providing appropriate management for 25% of patients with unmanaged cardiomegaly detected through screening at our institution could generate \$16M in total reimbursement annually.
