(1) Review definition, clinical symptomatology, expected course, and hypothesized etiologies of Parry-Romberg Syndrome (PRS) and linear scleroderma/En Coup De Sabre (ECDS), disease processes characterized by progressive hemifacial atrophy. (2) Review imaging findings of facial soft tissue atrophy and intracranial abnormalities in PRS and ECDS, as derived from a review of 40 PRS patients at a single institution, including brain, neck and face CTs and MRs. (3) Atrophy in PRS and ECDS predominantly affects periorbital, midface and scalp soft tissues, typically without MR signal intensity change, distinguishing it from denervation atrophy. (4) Clinical severity of facial soft tissue atrophy does not predict intracranial lesion severity.

## **HNEE-3 Revisiting Distant Metastasis in Head and Neck Cancer**

Participants

Naoko Saito, MD, PhD, Tokyo, Japan (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

Distant metastasis (DM) in head and neck cancer (HNC) is relatively uncommon. When DM occurs, the prognosis is considered miserable, with median overall survival of under one year. Although little attention has been focused on the treatment of DM, recent reports on oligometastasis have changed the therapeutic approach to DM. For patients with oligometastasis, aggressive local treatment of metastatic sites may achieve prolonged survival. This educational exhibit reviews the epidemiology, imaging findings, and risk factors of DM of HNC and summarizes the current knowledge of the oligometastasis of HNC. The teaching points are: 1. To understand the mechanisms and patterns of DM of HNC. 2. To learn the characteristic imaging findings of DM based on the site and histopathology. 3. To learn the current knowledge about the characteristics and the therapy of oligometastasis in HNC.

### **TABLE OF CONTENTS/OUTLINE**

1. The definition of DM: the pathophysiology (hematogenous, lymphatic spread), the timing (synchronous, metachronous), the spectrum of metastasis (polymetastasis, oligometastasis, oligorecurrence, oligoprogression) 2. The site-based approach of DM (lung, bone, liver, brain, skin, etc.): pathophysiology, incidence, imaging findings 3. The cancer-based approach of DM: histopathology (SCC, EBV/HPV associated SCC, thyroid cancer, salivary gland cancer, neuroendocrine tumor, melanoma, etc.): incidence, imaging findings 4. Summary of the risk factors for DM: literature review 5. Therapy: current concepts

## **HNEE-30 Nasolacrimal System Pathologies: What a Radiologist Needs to Know**

### **TEACHING POINTS**

•While reading a CT, deliberate consideration should be given to the density of the contents within the nasolacrimal duct and for the evaluation of wall thinning. •The extent of soft tissue disease is evaluated using magnetic resonance imaging (MRI), and contrast-enhanced MR is particularly helpful in distinguishing soft tissue from fluid. •Nasolacrimal duct may act as a conduit for the transmission of pathologies from the orbit to the sinonasal cavity and vice-versa. •Primary nasolacrimal malignancies are rare and often have delayed diagnosis due to presentation mimicking benign aetiology.

### **TABLE OF CONTENTS/OUTLINE**

?Describe normal Nasolacrimal duct anatomy with images. ?Illustrate with images the Nasolacrimal duct pathologies. ?Discuss management pathway.

### **HNEE-31 Hyoid Bone: Anatomy, Embriology, Developmental Malformations and Symptomatic Cases**

Participants

Beatriz Prado, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

This panel aims to: Review the structure and function, embriology, anatomy and physiologic variants of the hyoid bone. Discuss and describe through illustrative cases the imaging patterns of the main pathologies involving the hyoid bone.

#### **TABLE OF CONTENTS/OUTLINE**

Review of the hyoid bone structure and function  
Review of the hyoid bone anatomy, including suprahyoid and infrahyoid muscles, relation to blood vessels and nerves.  
Physiologic variants  
Clinical cases involving the hyoid bone:- Hyoid bone insertion tendinitis (hyoid bone syndrome)- Calcified stylohyoid ligament and Eagle syndrome- Traumatic lesions, including body and greater horn luxation and hyoid fracture- Triticeal cartilage ankylosis in the hyoid- Thyroid lamina ankylosis in the hyoid- Ectopic thyroid gland adjacent to the hyoid bone- Vascular compression- Sistrunk procedure- Ectopic thyroid gland adjacent to the hyoid bone  
Final remarks

### **HNEE-32 How to Find CHD7 Disorder: Beyond CHARGE Syndrome**

#### **TEACHING POINTS**

CHARGE syndrome is named after an acronym for the characteristic signs (coloboma, heart defect, atresia choanae, retarded growth and development, genital hypoplasia, ear anomalies/deafness). CHD7 is the causative gene for CHARGE syndrome. Recently, CHD7 mutations have been detected in cases that do not show typical signs of CHARGE syndrome, and the concept of CHD7 disorder has been proposed to include the broader spectrum of CHD7 mutations. Even in such atypical cases, the characteristic imaging findings of CHARGE syndrome are detected. The purpose of this educational exhibit is to: 1. Present the disease concept of CHARGE syndrome. 2. Detail the characteristic imaging findings of CHARGE syndrome. 3. Outline the broader spectrum of CHD7 disorders and provide cases in which imaging findings help identify CHD7 mutations, even in atypical CHARGE syndrome

#### **TABLE OF CONTENTS/OUTLINE**

1. CHARGE syndrome a. Concept b. Clinical presentation c. Causative gene -CHD7- 2. Imaging findings a. Key finding -semicircular canal hypoplasia- b. Additional findings of the face and skull base 1) Auditory system and temporal bone 2) Eye, palate, and olfactory system 3) Clivus c. Others 3. CHD7 disorder a. Concept b. Cases that the imaging findings implicate CHD7 mutations 1) Severe combined immunodeficiency 2) Mild phenotype 3) Kallmann syndrome

### **HNEE-33 A Particular Pain in the Neck: Taking a Radiology's Journey from Imaging to Immunohistochemistry**

Participants

Karla Anabel Borgna, MD, Pilar, Argentina (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Reviewing the variability of head and neck tumor entities and their mode of presentation, excluding squamous Cell Carcinoma. Identifying radiological signs, anatomical relationships and learning how to report them. Correlating the radiological features of head and neck tumors (non-squamous cell carcinoma) with immunohistochemistry and histological findings. Emphasize the role of the radiologist as a key contributor to the orientation of the tumor's etiology.

#### **TABLE OF CONTENTS/OUTLINE**

Introduction  
Case-based approach with radiologic correlation  
Imaging findings with histologic and immunohistochemical correlation  
Take-home message  
References

### **HNEE-34 3N: Not Common Nose, Nasal Cavity and Nasopharynx Tumors**

#### **TEACHING POINTS**

Sinonasal neoplasms are rare, accounting for only 3 % of head and neck malignancies, among the most frequent tumors reported are adenocarcinoma, squamous cell carcinoma, undifferentiated carcinoma, olfactory neuroblastoma, sinonasal lymphoma, and sinonasal mucosa melanoma. The complex anatomy and histology of this region make evaluation a challenge for the clinician. Fortunately, in these kinds of tumors, Computed tomography and magnetic resonance imaging, plays an important role in surgical and therapeutic planning, especially in the involvement of those small parts such as involvement of the anterior and middle cranial fossae, pterygopalatine fossa, pterygomaxillary fissure, foramen rotundum, vidian canal, inferior orbital fissure, orbital apex, and perineural involvement, therefore some distinguishing features can help narrow the differential diagnosis and assess the true extent of the disease.

#### **TABLE OF CONTENTS/OUTLINE**

Epidermoid carcinoma, Carcinoid tumor, Peripheral nerve sheath tumor, Rhabdomyosarcoma, Sinonasal undifferentiated carcinoma, Ewing sarcoma, Sinonasal Melanoma, Lymphoma, Esthesioneuroblastoma and sinonasal juvenile angiofibroma

### **HNEE-35 Sinonasal Tumors: What the Tumor Board Wants to Know**

Participants

Alexander Moeller, MD, (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

1. There is a long differential diagnosis for tumors occurring within the sinonasal cavity with overlapping imaging features. 2. Pathology is critical in diagnosis and determining treatment. 3. Most primary tumors are staged based on the TNM classification. TNM tumor staging is predominantly based on tumor location and tumor extension, which differs between lesions that arise from the maxillary sinus and those that occur within the ethmoid/nasal cavity. 4. Esthesioneuroblastomas are staged based on the Kadish

classification system.5. Sinonasal tumors are primarily treated with surgical resection.6. Chemotherapy and radiation may be administered prior to surgery for larger lesions, following surgery for residual or recurrent disease or in place of surgery for a palliative approach.

#### **TABLE OF CONTENTS/OUTLINE**

1. Review the differential diagnosis of sinonasal tumors based on the updated WHO classification system. 2. Discuss pathology of sinonasal tumors, incorporating molecular features. 3. Discuss the TNM staging of sinonasal tumors for lesions arising from the maxillary sinus and ethmoid/nasal cavity.4. Review staging of esthesioneuroblastoma.5. Treatment strategies of Sinonasal tumors: Indications for surgery, chemotherapy and radiation using a multidisciplinary approach.6. Review imaging features of lesions that will affect treatment decisions: what the surgeon wants to know, what the medical oncologist wants to know and what the radiation oncologist wants to know.

#### **HNEE-36 Face to Face: Reviewing Facial Malformations**

Participants

Danielly Santos SR, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

This pictorial essay aims to review and synthesize the main facial malformations. The purposes of this submission are: - To review the developmental anatomy and normal embryogenesis of facial structures; - To discuss imaging features of facial malformations related to nasal cavity, frontonasal region, nasolacrimal apparatus, labiopalatine complex and craniofacial syndromes; - To present a compendium of cases involving facial malformations to exemplify;

#### **TABLE OF CONTENTS/OUTLINE**

There are a wide variety of congenital face abnormalities that originate during transformation of the first pair of pharyngeal arches into adult structures. Computed tomography and magnetic resonance imaging are important components in the comprehensive evaluation of these lesions. A detailed understanding of face embryogenesis and developmental anatomy is important in directing appropriate patient management. Familiarity with the characteristic imaging features of these anomalies along with knowledge of midface embryogenesis and normal developmental anatomy is essential to prevent misinterpretation of anatomic variations that may simulate disease.

#### **HNEE-37 Scars and Lumps Shrinking the Tunnel: Radiological Evaluation of Laryngotracheal Stenosis**

#### **TEACHING POINTS**

At the end of this exhibit, the attendees would be able to:1. Identify laryngotracheal stenosis etiologies.2. Describe the clinical and radiological classifications of laryngotracheal stenosis3. Recognize the key imaging findings encountered in the different entities of laryngotracheal stenosis

#### **TABLE OF CONTENTS/OUTLINE**

1) Introduction.2) Anatomical Review: Imaging of the Larynx and Trachea3) Diagnostic and Radiological Approach to Laryngotracheal Stenosis.4) Laryngotracheal Stenosis Measurement.5) Laryngotracheal Stenosis: Key Imaging and Clinical Findings through Case Presentationa) Laryngotracheal Trauma/Iatrogenicb) Laryngotracheal Compressionc) Infiltrative Lesionsd) Laryngotracheal Inflammation/infectione) Laryngotracheal Autoimmune Lesions6)Conclusion

#### **HNEE-38 A Nod to the Nodes In Children: A Practical Clinical Approach to Pediatric Cervical Lymphadenopathy**

Participants

Elizabeth Snyder, MD, Nashville, TN (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

- Cervical adenopathy is a common clinical scenario in children.- A wide variety of entities can present with cervical adenopathy; importantly, the spectrum of pathology and imaging appearance differs in many cases from that seen in adults.- While US is typically the first line imaging modality, CT, MRI and NM studies may all have a role in the workup of cervical adenopathy, with different strengths and limitations.- Radiologists must know when and with which modality to image.- This multi-institutional collaboration highlights imaging appearances of both common and uncommon disorders affecting cervical nodes in children in order to aid radiologists in their clinical practice. Pearls, pitfalls, and mimics will be included.

#### **TABLE OF CONTENTS/OUTLINE**

1. Introductiona. Anatomy of cervical lymph nodes (levels, etc.)b. Normal imaging appearance2. Imaging approacha. Modality selection and benefits/limitations of US, CT, MRI, NM studiesb. Systematic approach diagram highlighting helpful features (e.g., cystic, hyperenhancing, calcified, etc.)3. Infectious lymphadenopathya. Imaging appearance b. Complications: necrosis, abscessc. Specific infectious processes: e.g., bacterial, TB, MAI, cat scratch disease4. Neoplasm a. Lymphomab. Metastasis: e.g., thyroid cancer, NPC, SCC5. Histiocytosis. LCHb. Rosai-Dorfman disease6. Lymphoproliferative disorders: e.g., Castleman, HLH7. Unusual entities: Kawasaki, Kikuchi, MIS-C, HIV8. Mimics (lymphatic malformations, branchial cleft cysts, parotid neoplasms, etc.)9. DDx of common imaging findings: calcifications, cystic nodes10. Summary and conclusion

#### **HNEE-39 Don't Miss the Forest for the Trees: Parathyroid Ultrasound - Anatomy, Technique, Pearls and Pitfalls**

Participants

Alex Dias, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Review key aspects of the clinical, laboratorial, and imaging assessment of patients with primary hyperparathyroidism. Illustrate the role of ultrasound (US) for preoperative evaluation of parathyroid glands, including their localization, normal and pathological findings, with multimodality imaging correlations. Summarize in a practical approach the most important pearls and pitfalls for the accurate US assessment of parathyroid glands, highlighting the use of high-frequency transducers.

#### **TABLE OF CONTENTS/OUTLINE**

Introduction  
Anatomy of the parathyroid and adjacent structures  
Primary Hyperparathyroidism: pathophysiology and clinical aspects  
Parathyroid preoperative evaluation  
Laboratorial workup for hyperparathyroidism  
Multimodality imaging for surgical planning: US, computed tomography, magnetic resonance, and scintigraphy  
Ultrasound of the parathyroid glands  
Positioning, technique, transducers  
Typical and atypical imaging findings (B-mode, Doppler and elastography)  
US guided fine-needle aspiration (radiologic-pathologic correlations)  
Case-based review with multimodality imaging  
Pearls: novel approaches for improvement (high-frequency transducers and other strategies)  
Pitfalls: lesions of the esophagus, lymph nodes, soft tissues, and thyroid  
Take home messages

#### **HNEE-4      Look out! Conditions that Cause Proptosis**

Participants

Erica Naves, MD, Nova Lima, Brazil (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

Teaching Points The purposes of this exhibit are to review the anatomy of the orbit, including the orbital content and bone structures that delimit it. Also, to demonstrate that, due to its osseous limitations, the orbit is limited to expand if any expansive process is within its limits. Therefore, several types of expansive processes manifest with proptosis. The exhibit demonstrates through illustrative cases the different scenarios that manifest with proptosis, in the context of metabolic disorder, trauma, infection, inflammatory process, vascular lesions, primary neoplasms, metastasis, among others.

##### **TABLE OF CONTENTS/OUTLINE**

Table of Contents / Outline The exhibit initiates with annotated images of the anatomy of the orbit, including the bone limits and contents, to demonstrate the normal appearance on computed tomography and magnetic resonance imaging. The next slides include the diagnostic criteria of proptosis, and exemplifying annotated images. The majority of the presentation include illustrative cases presenting with proptosis divided by metabolic, trauma, infection, inflammatory, vascular and neoplastic sections. Cases of thyroid-associated orbitopathy, bone fracture, orbital muscle lesion, subperiosteal abscess, idiopathic orbital inflammation, IgG4-related disease, granulomatosis with polyangiitis, carotid-cavernous fistula, venous malformation, lymphangioma, optic nerve glioma, optic nerve meningioma, orbital lymphoma, rhabdomyosarcoma, sphenoid wing meningioma, metastatic melanoma, extramedullary plasmacytoma and bone metastasis are displayed. The presentation closure contains take-home messages.

#### **HNEE-40      Save Your Own Neck: A Neck Muscles Guide for Daily Practice - Anatomy, Variations, and Pathologies**

Participants

Lucas Souza, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

The purposes of this exhibit are:- Review and illustrate the anatomy and innervation of head and neck muscles, and its correlation with the cervical spaces, emphasizing the importance of understanding for the delimitation of lesions found in daily routine exams.- Describe the anatomical variations of the cervical muscles and the possible pitfalls they can cause, simulating diseases.- Determine the great injuries, separating them by their etiology, and propose an algorithm for their evaluation in cases of technical limitation.

##### **TABLE OF CONTENTS/OUTLINE**

- Cervical muscles:1) Division by compartments- masticatory.- pharynx (circular and longitudinal) and larynx.- front of the neck (suprahyoid and infrahyoid).- prevertebral (prevertebral and scalene).- paraspinal (suboccipital, extrinsic back, and intrinsic back (superficial, intermediate, and deep layer)).2) injuries:- congenital (agenesis, torticollis, and syndromes)- infectious/inflammatory (phlegmon, abscess, tropical myositis, necrotizing fasciitis)- trauma or surgery (denervation, myositis ossificans)- vascular anomalies.- tumors (benign, malignant, and metastasis).- Diagnostic Algorithm- Final remarks

#### **HNEE-41      Practical Approach to Orbital Lesions by Anatomical Compartments**

##### **TEACHING POINTS**

The purposes of this exhibit are:- Classify the different pathologies in each of the orbital compartments.- Present the essential imaging features of the main orbital lesions.- Highlight the importance of knowing the location of pathologies in the orbital compartments to facilitate the diagnosis and narrow the differential diagnoses.

##### **TABLE OF CONTENTS/OUTLINE**

? Introduction : ? Review of the anatomy of the orbital compartments ? Compartment of the optic nerve/sheath complex : ? ? Ischemic optic neuritis ? Optic nerve glioma (NF1) ? Optic nerve glioma (sporadic) ? Optic nerve meningioma ? Conal/muscular compartment : ? Graves orbitopathy ? Left sixth cranial nerve palsy ? Orbital pseudotumor ? Myositis by IgG4 ? Intraconal compartment : ? Colobomatous malformation ? Venolymphatic vascular malformation ? Cavernous hemangioma ? Extraconal compartment : ? Dermoid cyst ? Subperiosteal abscess ? Preseptal cellulitis ? Nasolacrimal apparatus : ? Non-Hodgkin lymphoma of the lacrimal glands ? Infected dacryocystocele

#### **HNEE-42      Unilateral Sinusitis: What Radiologists Should be Aware of**

Participants

Janani Asogan Vaishnavi, MD, FRCR, Dundee, United Kingdom (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

1. Rhinorrhoea and foul smelling discharge are the common clinical presentations in inflammatory / infective disease while epistaxis and/or mass effect in the cheek / palate / orbit are the common presenting features in malignancy.2. Odontogenic sinusitis is one of the most common causes of unilateral sinus opacification followed by fungal ball and antrochoanal polyp. Inverted papilloma is the most common benign pathology, while squamous cell carcinoma is the most common malignant pathology.3. Incidence of neoplastic disease is much higher in the presence of unilateral sinus opacification, with rise in incidence with increasing age.4. Site of origin of inverted papilloma is often seen as focal area of hyperostosis on CT. This can be useful identifying recurrence and malignant transformation which are frequent with inadequate excision.5. Aggressive bone destruction, especially erosion of the posterolateral wall of the maxillary sinus and extra-sinus extension is often seen in malignancy.

##### **TABLE OF CONTENTS/OUTLINE**

1. Radiological anatomy of paranasal sinuses including drainage pathways  
2. Explain various causes of unilateral sinus opacification  
3. Illustrate with images, the key radiological and pathognomonic findings to be looked for in unilateral sinus opacification  
4. Provide a pictorial review of unilateral sinus opacification encountered in our centre  
5. Briefly describe how to approach a case of unilateral sinus opacification

#### **HNEE-43 What is this Bump on the Face, Radiology? Medial Canthal Swelling, Differential Diagnosis of Angular Vein Thrombosis Radiologists Should Know**

Participants

Nahyun Jo, MD, Galveston, TX (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

The face is the first body part a physician sees when they meet a patient; it is often diagnosed and followed clinically. With the advances in imaging and increase in utilization, radiologic evaluation of facial masses is becoming more common. In certain cases, radiology plays a crucial role. Facial vein thrombosis presents as a focal facial mass-like lesion due to engorged veins. This is well-known in the traditional anatomy literature related to the "danger triangle" of the face. While thrombophlebitis is a more common etiology, more recently, facial/angular vein thrombosis secondary to periorbital cosmetic botulinum toxin injections has been reported by ophthalmologists and plastic surgeons. Due to its proximity to the sinuses, sinus-related diseases such as dacryocystocele or nasolacrimal duct obstruction often mimic angular vein pathologies. Vascular malformations such as an ophthalmic artery arteriovenous fistula, carotid-cavernous fistula, or lymphovenous malformation may also present as periorbital mass or proptosis. Other etiologies of soft tissue masses, such as skin tumors or benign masses, should also be considered.

##### **TABLE OF CONTENTS/OUTLINE**

We discuss the basic anatomical structures in the face that radiology trainees should know. Then we further discuss the imaging findings of facial masses ranging from the most common lipoma to uncommon lymphovascular malformations. Each of the common and unique cases is presented for each pathology with teaching points. - Introduction to facial anatomy- Infection-Trauma-Venous thrombosis-Vascular malformations-Sinus related-Benign cluster of tissues-Tumor-Foreign body and cosmetic injections

#### **HNEE-44 Node More Tears: Unraveling the Etiologies and Imaging of Lymph Nodes Diseases**

##### **TEACHING POINTS**

To understand patterns of lymphadenopathy in imaging methods.  
To illustrate the most common imaging findings of lymph nodes diseases and the useful hallmarks that help in differential diagnosis.  
To learn about advanced imaging methods and how they can help in the evaluation of lymphadenopathy.

##### **TABLE OF CONTENTS/OUTLINE**

Anatomy of lymph node  
Patterns of lymph nodes diseases - Hypervascular - Cystic or necrotic - Calcified  
Main imaging characteristics and differential diagnosis of the different etiologies.- Inflammatory / Infectious (Viral, Bacterial, Fungal and others).  
- Lymphomas - Castleman Disease - Neoplastic Metastasis ( Eg. Squamous cell carcinoma; Kaposi sarcoma)- Lymphadenopathy associated with systemic syndromes (eg. Kikuchi-Fujimoto Disease, Kimura, systemic lupus erythematosus)  
Take-home messages and tips and tricks to differential diagnosis.

#### **HNEE-45 Advanced Neck Ultrasound: Pearls and Pitfalls Using High-Frequency Transducers**

Participants

Alex Dias, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

Review key findings in neck ultrasound using high-frequency transducers (24-33MHz). Illustrate clinical situations where the use of high-frequency transducers was decisive for the characterization of imaging findings in neck region, including skin, thyroid, parathyroid, salivary glands and lymph nodes lesions. Provide tips and tricks in a practical approach to a successful clinical practice integration.

##### **TABLE OF CONTENTS/OUTLINE**

Introduction  
US transducer types: an overview  
Applications: a case-based review  
Skin US: benign and malignant lesions  
Thyroid US: focal and diffuse disease  
Parathyroid US: normal and abnormal findings  
Lymph node US: beyond metastatic disease  
Salivary gland US: pearls and pitfalls  
Other challenging applications  
Practical approach: tips and tricks for clinical practice integration  
Future perspectives: ultra-high frequency US  
Take home messages

#### **HNEE-46 To Infinity And Beyond: A Primer Review Of The Uncommon Disorders Of The Temporomandibular Joint Besides Internal Derangement**

##### **TEACHING POINTS**

- Review the normal anatomy of the temporomandibular joint and its relationship to adjacent structures- To illustrate a variety of rare cases in order to avoid misinterpretations and pitfalls;

##### **TABLE OF CONTENTS/OUTLINE**

INTRODUCTION:RELEVANT IMAGING ANATOMY:TEMPOROMANDIBULAR LESIONS AND ALTERATIONS: Clinical cases illustrating the spectrum of uncommon TMJ findings in CT and MRI.Condylar pathologies;Coronoid process pathologies;Extension of TMJ pathological processes to adjacent structures;Inflammations non-infectious;Infectious Other pathologies.TAKE-HOME MESSAGESREFERENCES

#### **HNEE-47 The Tongue Has People Talking**

Participants

Fernando Diego Choque Chavez, MD, Barcelona, Spain (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

Show the anatomy of the tongue through schematic illustrations and its correlation with radiological images, indicating anatomical reference points. Determine the role of each imaging technique in the analysis of the pathology of the tongue. Review the most frequent pathology of the tongue, mainly tumors outlining the radiological findings with therapeutic implications.

#### TABLE OF CONTENTS/OUTLINE

Background Embryology and Anatomy of the tongue Imaging technique Imaging findings- Oncological tongue Radiological findings with therapeutic implications- Congenital anomalies- Inflamed tongues- Lingual denervation. The tongue is the central part of the oral cavity and the oropharynx. It is the organ of taste, plays an essential role in the formation of the alimentary bolus and in swallowing and forms part of the phonatory system. Given the importance the role of the tongue plays in the patient's quality of life, the radiologist of the head and neck should be familiar with its anatomy, the optimum imaging techniques for its evaluation, as well as its spectrum of pathologies. In this way the radiological description will reflect reliably and with anatomical detail the extent of a lesion, particularly in the area of oncology, and it will be possible to select the most appropriate treatment for each patient so as to preserve function to the maximum extent possible. The radiological evaluation will also be of special significance during the surveillance period following treatment, so the radiologist should be familiar with the main therapeutic strategies and be accustomed to the image of the treated patient as well as the most appropriate techniques for detecting tumor recurrence.

#### HNEE-48 Look on the Bright Sign: Shedding Light on Mysteries of Optic Neuropathy

Participants

Alice Abreu Mota, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Optic neuropathy: It may be the only manifestation of Behçet's disease in the central nervous system. Diffusion restriction may be seen in trauma and ischemia. In induced cocaine cases, it is often unilateral, due to compression or ischemia. Methanol intoxication findings included bilateral optic nerve enhancement, putamen and caudate necrosis. Leber's hereditary optic neuropathy may show increased T2 signal in the optic nerves, chiasm, and tracts. Neuritis can also simulate a tumor. The short-segment enhancement at the optic nerve-globe junction is seen on cat scratch disease. Granulomatosis with polyangiitis (GPA) is often hypointense on T2. Direct granulomatous infiltration is one of the triggers of sarcoidosis. MOG-IgG+ exhibit long-length, bilateral, and anterior optic nerve involvement. Unilateral and short-segment involvement is seen in Multiple Sclerosis. In Neuromyelitis Optica (NMO) the impairment is bilateral on posterior optic nerves and chiasm.

#### TABLE OF CONTENTS/OUTLINE

Toxic Metanol Cocaine Medicine Granulomatosis Sarcoidosis; GPA; Tolosa Hunt; IgG4 Related Disease; Cat scratch disease; Tuberculosis. Non-demyelinating Vogt-Koyanagi-Harada; Behçet's Disease. Demyelinating Multiple Sclerosis; NMO; MOG-IgG+. Others Ischemic; Trauma; Tumor.

#### HNEE-49 Cavernous Sinus Imaging: Anatomy, Pathology and Warning Signs for Daily Practice

Participants

Ana Sanchez, Buenos Aires, Argentina (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Review the anatomy and study protocol of the cavernous sinus. Provide warning signs to quickly recognize cavernous sinus involvement and assess patient treatment. Discuss clinical cases of our Department and relevant imaging findings.

#### TABLE OF CONTENTS/OUTLINE

Anatomy Study protocol Warning Signs: Enlargement of superior ophthalmic vein/s. Morphological change. Finding Density/ Signal — Flow void. Clinical exam — multiple cranial nerve deficit. Red bulging eye. Restricted diffusion. Clinical cases: Neoplasms: meningioma, hemangioma, macroadenoma, chordoma. Inflammatory: Tolosa Hunt Syndrome. Vascular: aneurysm, carotid-cavernous fistula. Miscellaneous: intracavernous arachnoid cyst, air/fat in the cavernous sinus. References

#### HNEE-5 Facial Retaining Ligaments: Can We See It

Participants

Luciana Zattar, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

A thorough investigation of the layers and structures of facial anatomy is crucial when performing facial surgery and aesthetic procedures. The retaining ligaments of the face represent additional information of this anatomy and are essential in understanding principles of facial aging and rejuvenation. They are located in constant anatomic locations where they separate facial spaces and compartments. Their main significance relates to their anatomical understanding in fillers procedures and in surgical release in order to achieve the desired aesthetic outcome. Furthermore, they have a sentinel role in their anatomic relationship to facial nerve branches. Descriptions of the retaining ligaments are variable in the literature; due to different interpretations of anatomy, several classifications, locations, and nomenclature systems have been proposed, but there is no description of imaging findings. This study will review and clarify the anatomy and imaging aspects of the retaining ligaments of the face using High frequency ultrasound (HFUS/24-33MHz). The purpose of this exhibit is: (1) To illustrate the anatomy of the facial retaining ligaments with fresh-frozen specimen correlation; (2) To describe the correct examination technique; (3) To highlight the importance of HFUS in facial ligaments and nerves characterization; (4) To show the dynamic evaluation and characterization of facial ligaments with HFUS; (5) To describe the most important related facial ageing changes and aesthetic importance

#### TABLE OF CONTENTS/OUTLINE

1. INTRODUCTION; 2. ANATOMY; 3. FACIAL AGEING PROCESS; 3. HFUS EVALUATION TECHNIQUE; 4. UNDERSTANDING AESTHETIC PROCEDURES; 5. CONCLUSION

#### HNEE-50 Understanding Neck Dissection and Bringing the Radiologist Closer to the Surgeon

Participants

Marcos Pinheiro II, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

## TEACHING POINTS

Teaching Point 1: Understand the different types of neck dissection. There are different types of neck dissection, ranging from a selective neck dissection to a radical neck dissection. It is important for radiologists to understand the extent of surgery and the structures that are removed in each type of neck dissection to accurately recognize them and properly interpret postoperative imaging studies. Teaching Point 2: Be aware of potential complications. Neck dissection can be associated with various complications, including bleeding, infection, and injury to important structures such as the spinal accessory nerve. Radiologists must be familiar with these potential complications and be able to identify them on imaging studies.

## TABLE OF CONTENTS/OUTLINE

1. Anatomy of cervical lymph node levels and surgical techniques involved in neck dissection. 2. Role of imaging in the preoperative planning (evaluation of the primary tumor and cervical nodal status, therefore helping the surgeon decide the most appropriate type of neck dissection, if needed). 3. Recognize expected imaging findings in postoperative neck dissection, as well as potential complications, including hematoma, abscess, and injury to neurovascular structures.

## HNEE-51 Paranasal Sinuses Computed Tomography: Read It Like an Expert

### TEACHING POINTS

Learn the acquisition protocols and become familiar with the anatomy and anatomical variations of the paranasal sinuses to guide the endoscopic sinus surgeon

### TABLE OF CONTENTS/OUTLINE

Nose and paranasal sinuses anatomy is highly variable and some anatomic variants can result in complications in FESS. The nasal septum is made up of an anterior cartilaginous component and a posterior bony component including the vomer and the perpendicular plate of the ethmoid. Septum anatomic variations include septal deviation that can cause a middle turbinate displacement and interfere with surgical access to the middle meatus; septal pneumatization may narrow the sphenoidal recess and impede access to the sphenoid ostium. The middle turbinate is the site of different variations, including concha bullosa (pneumatization of the inferior bulbous portion of the middle turbinate, or "cell of Grunwald" if pneumatization is limited to the vertical lamella above the level of the ostiomeatal complex), that can obstruct the ethmoidal infundibulum, and paradoxical middle turbinate, when the turbinate shows a paradoxical lateral convexity, which can impede surgical access to the ostiomeatal complex and contribute to recurrent rhinosinusitis. Haller cells are ethmoid cells extending into the orbital floor, with variable sizes that can narrow the ostia of the maxillary sinus or ethmoid infundibulum. Onodi cells are posterior ethmoid cells extending to the sphenoid sinus, placed medially to the optic nerve. These cells can also surround the optic nerve and are linked with increased risk of nerve damage during sinus surgery.

## HNEE-52 Approach to Jaw Lesions

Participants

Mai-Lan Ho, MD, Dublin, OH (*Presenter*) Research Grant, Siemens AG; Research Grant, Cardinal Health, Inc; Research Grant, Italfarmaco SpA

### TEACHING POINTS

CT and MR can characterize jaw lesion location, composition, margins, and extent. Jaw lesions are classified into odontogenic vs. non-odontogenic, and simple/complex lytic or sclerotic. Key etiologies include developmental, inflammatory, traumatic, and neoplastic. Patient age, symptoms, and systemic findings help narrow the differential. For suspected neoplasms, biopsy helps confirm the diagnosis. The range of potential approaches includes watchful waiting, sclerotherapy, ablation, curettage, subtotal resection, and radical excision. Genetic testing is important when certain histologies and syndromes are suspected.

### TABLE OF CONTENTS/OUTLINE

1. Dentistry 101 Jaw/tooth development Anatomy eruption Imaging modalities 2. Classification Odontogenic, non-odontogenic Developmental, inflammatory, traumatic, neoplastic 3. Simple Cystic Radicular Dentigerous Buccal bifurcation Lateral periodontal Fissural Stafne Simple 4. Complex Cystic Aneurysmal bone cyst / Giant cell granuloma Langerhans cell histiocytosis Ameloblastoma Odontogenic myxoma Odontogenic fibroma Mixed odontogenic tumors 5. Sclerotic/Mixed Tori Odontomas Fibro-osseous lesions Cemento-osseous dysplasia Cementoblastoma Osteomyelitis: acute, chronic (Garré), nonbacterial (CRMO, SAPHO) Osteonecrosis 6. Syndromic Odontogenic keratocyst (Gorlin) Brown tumors (hyperparathyroidism) Gardner syndrome Cherubism Desmoplastic fibroma (TS, fibromatoses) Gorham disease

## HNEE-53 Advanced MRI of the Head and Neck

Participants

Mai-Lan Ho, MD, Dublin, OH (*Presenter*) Research Grant, Siemens AG; Research Grant, Cardinal Health, Inc; Research Grant, Italfarmaco SpA

### TEACHING POINTS

Advanced MRI techniques utilized in the head neck include anatomic, diffusion, perfusion, vascular, elastography, functional, and metabolic. Understanding of fundamental physical principles enables optimal utilization interpretation. Informed clinical use improves patient diagnosis management. Clinical applications exist for congenital, neoplastic, vascular, metabolic, and traumatic etiologies.

### TABLE OF CONTENTS/OUTLINE

1. High-resolution: T2, T1, 7 Tesla Cranial nerve lesions Midface anomalies Meningoceles Inner ear anomalies Orbital malformations, tumors 2. Phase-contrast: 2D, 3D CSF flow Angiography 3. Diffusion: non-echo-planar, intravoxel incoherent motion, diffusion tensor imaging Skull base tumor, infection Pott's puffy tumor Cord/nerve fibers 4. Perfusion: arterial spin labeling, dynamic susceptibility contrast, dynamic contrast-enhanced Vascular tumors Vascular malformations Skull base tumors Pituitary lesions Face transplant 5. Vascular: time-of-flight, phase-contrast, time-resolved, ferumoxytol, vessel wall imaging PHACES association Vasculopathies 6. Ultrashort- and zero-echo-time imaging Malformations Trauma Tumors Postoperative 7. Elastography Pituitary adenoma Vestibular schwannoma 8. Spectroscopy 9. PET/MR Epilepsy HN tumors 10. Chemical exchange saturation transfer 11. Anatomic modeling

## HNEE-54 Zero Echo-Time MRI of the Head and Neck

## Participants

Mai-Lan Ho, MD, Dublin, OH (*Presenter*) Research Grant, Siemens AG; Research Grant, Cardinal Health, Inc; Research Grant, Italfarmaco SpA

### TEACHING POINTS

- Cortical bone MRI utilizes short-TE techniques such as gradient, ultrashort, and zero echo-time.
- Short-T2 tissues appear dark, hence the term "black-bone" MRI.
- Use cases include plagiocephaly, craniosynostosis, calvarial lesions, sinonasal disease, head neck tumors, jaw lesions, trauma, surgical navigation, and postoperative evaluation.
- Postprocessing advances using point reconstructions and deep learning facilitate synthetic ("bright-bone") CT generation, 3D visualization, and surgical planning.

### TABLE OF CONTENTS/OUTLINE

1. Technique

- Gradient, ultrashort, zero echo-time
- Workflow sequence options
- Interpretation and pitfalls

2. Clinical Cases

- Plagiocephaly
- Simple craniosynostosis: metopic, sagittal, coronal
- Genetic syndromes: Apert, Saethre-Chotzen, achondroplasia
- Skull: ecchordosis physaliphora, dermoid cysts, LCH, fibrous dysplasia
- Sinonasal: midnasal stenosis, pneumosinus dilatans, sinusitis
- Tumors: orbitotemporal NF1, rhabdomyosarcoma, chordoma
- Jaw lesions: ameloblastoma, desmoplastic fibroma
- Trauma: abusive head trauma, TBI, leptomeningeal cyst, cephalohematoma
- Surgical planning: arachnoid cyst, hydrocephalus
- Shunt evaluation: tumor, craniosynostosis, overshunting
- Postoperative evaluation: craniotomy, cranioplasty, ZMC, orbital blowout, cephalocele

3. Postprocessing

- Point processing
- Deep learning: models, loss functions, generalizability
- Diagnostic use
- Surgical planning

## HNEE-55 Fetal Head and Neck Imaging

### Participants

Mai-Lan Ho, MD, Dublin, OH (*Presenter*) Research Grant, Siemens AG; Research Grant, Cardinal Health, Inc; Research Grant, Italfarmaco SpA

### TEACHING POINTS

Fetal HN anomalies can be classified into congenital, genetic, vascular, neoplastic, traumatic, and endocrine etiologies. Major diagnoses include micrognathia, facial clefts, craniosynostosis, meningocele, vascular malformations, teratoma, and airway obstruction. US and MRI have complementary roles for prenatal screening and detailed workup. Each technique has specific clinical indications and technical limitations. Fetal MRI protocols should include 3-plane ssFSE with optional balanced SSFP, diffusion, and T1. The radiology report should address brain, face, neck, and airway, along with secondary complications and multisystem associations. Several qualitative features and quantitative metrics can be applied. For at-risk patients, serial imaging can improve diagnostic yield and interventional planning. Postnatal imaging is important for confirmation of prenatal findings.

### TABLE OF CONTENTS/OUTLINE

1. Craniofacial Malformations Oro/craniofacial clefts Micrognathia, Pierre-Robin Beckwith-Wiedemann Orbital telorism, malformations Craniosynostosis Cephaloceles, meningoceles Acrania-exencephaly-anencephaly Amniotic band syndrome

2. Genetic Syndromes Apert Pfeiffer Frontonasal dysplasia DiGeorge Fraser

3. Cervicofacial Masses Vascular anomalies Hemangioma Lymphatic malformation Vein of Galen malformation Arteriovenous malformation Teratoma Goiter

4. Upper Airway Congenital high airway obstruction syndrome Laryngeal stenosis/atresia Tracheal stenosis/atresia Tracheo-esophageal fistula (VACTERL)

## HNEE-56 Pediatric Cutaneous Lesions: Below the Surface

### Participants

Mai-Lan Ho, MD, Dublin, OH (*Presenter*) Research Grant, Siemens AG; Research Grant, Cardinal Health, Inc; Research Grant, Italfarmaco SpA

### TEACHING POINTS

Pediatric skin lesions are often harbingers of more extensive or systemic disease. Unique cutaneous stigmata are seen in vascular anomalies and phakomatoses. Radiologic imaging is needed to characterize deep or multisystem involvement. Understanding of genetics helps to explain disease pathogenesis and develop targeted therapies.

### TABLE OF CONTENTS/OUTLINE

1. Background Genetic advances Ras and mTOR pathways Targeted therapies Critical point for intervention

2. Vascular Anomalies Malformations Low-flow Lymphatic (syndrome: GLA) Venous (syndromes: VMCM, BRBNS, KTW) Capillary (syndromes: M-CM, CLAPO) High-flow AVM AVF Syndromes: HHT, CM-AVM, PWS, CAMS Tumors Benign Congenital hemangioma Infantile hemangioma Syndromes: hemangiomatosis, PHACES Borderline Juvenile nasopharyngeal angiofibroma Kaposiform hemangioendothelioma Malignant

3. Phakomatoses Dysplastic NF1 NF2 NF3 Tuberous sclerosis Gorlin Cowden Proteus Encephalocraniocutaneous lipomatosis Vascular Von Hippel-Lindau Sturge-Weber Ataxia-telangiectasia Pigmentary Neurocutaneous melanosis Pigmentary mosaicism

## HNEE-57 Pediatric Orbital Lesions

### Participants

Mai-Lan Ho, MD, Dublin, OH (*Presenter*) Research Grant, Siemens AG; Research Grant, Cardinal Health, Inc; Research Grant, Italfarmaco SpA

### TEACHING POINTS

Pediatric orbital lesions can be classified into congenital, CSF, traumatic, vascular, endocrine, inflammatory, and neoplastic. Radiologic evaluation evaluates intraorbital compartments and extraorbital structures. Correlate imaging findings with ophthalmologic exam and imaging.

### TABLE OF CONTENTS/OUTLINE

1. Background Orbital anatomy development Ophthalmology: fundoscopy, US, OCT Radiology: CT, MR, XA

2. Congenital Small eye: anophthalmia, microphthalmia, phthisis bulbi Big eye: buphthalmos, staphylomas, colobomas Germ layer derivatives Syndromes: NF1, NF2, Aicardi, CHARGE, morning glory, Walker-Warburg Cranial dysinnervation

3. CSF Papilledema vs. pseudopapilledema Cephalocele Exorbitism

4. Trauma Anterior segment Posterior segment Globe rupture Fractures

5. Vascular anomalies Low-flow malformations

Varix Venous Lymphatic Sturge-Weber Coats disease High-flow malformations Carotid-cavernous fistula Wyburn-Mason Vascular tumors Hemangiomas PHACES Von Hippel-Lindau 6. Endocrine Pediatric Graves 7. Inflammation Pott's puffy tumor Aspergillosis COVID-19 Demyelination MS NMO ADEM Histiocytosis LCH JXG Granulomatosis IgG4 CRION 8. Neoplasia Intraocular Retinoblastoma Medulloepithelioma Periorbital Adenoid cystic carcinoma Hidradenocarcinoma Benign Solitary fibrous tumor Pituitary macroadenoma Small round cell Rhabdomyosarcoma Neuroblastoma Leukemia Desmoplastic sarcoma Bone lesions Osteoma Fibrous dysplasia Sickle cell infarcts

## **HNEE-58 Head Neck Vascular Anomalies and Syndromes**

Participants

Mai-Lan Ho, MD, Dublin, OH (*Presenter*) Research Grant, Siemens AG; Research Grant, Cardinal Health, Inc; Research Grant, Italfarmaco SpA

### **TEACHING POINTS**

The ISSVA classification divides vascular anomalies into vascular malformations (vasculogenesis) and vascular tumors (angiogenesis). Radiology plays an important role in diagnosis and treatment of HN vascular anomalies. Major imaging approaches include US, CT, and MR. Each modality has specific clinical indications and limitations. Imaging findings should be correlated with dermatologic examination and other clinical information. There is an emerging focus on genetic causality and targeted therapies.

### **TABLE OF CONTENTS/OUTLINE**

1. ISSVA Classification Vascular neoplasms: benign, borderline, malignant Vascular malformations: simple, combined, syndromic Genetics and targeted therapies 2. Imaging Modalities USXRCTMRXA 3. Malformations Low-flow Capillary, venous, lymphatic Syndromes: Sturge-Weber, blue rubber bleb nevus, megalencephaly-capillary malformation, CLAPO, Gorham-Stout, generalized lymphatic anomaly High-flow Arteriovenous malformation, arteriovenous fistula Syndromes: cerebral arteriovenous metamerism syndrome, hereditary hemorrhagic telangiectasia, CM-AVM 4. Tumors Congenital hemangioma RICH, NICH, PICH Infantile hemangioma Hemangiomas, PHACES Kaposiform hemangioendothelioma / Tufted angioma Epithelioid hemangioendothelioma Kaposi sarcoma Angiosarcoma 5. Overgrowth Facial infiltrating lipomatosis Epidermal nevus Megalencephaly-capillary malformation: MCAP, MPPH Proteus Cowden

## **HNEE-59 Approach to Pediatric Face and Neck Masses**

Participants

Mai-Lan Ho, MD, Dublin, OH (*Presenter*) Research Grant, Siemens AG; Research Grant, Cardinal Health, Inc; Research Grant, Italfarmaco SpA

### **TEACHING POINTS**

Evaluation of pediatric face neck masses includes clinical history, physical exam, lab values, and radiology. Diagnostic imaging can be performed with US, CT, or MR to characterize lesion location, composition, and extent. Diagnostic categories include congenital, vascular, inflammatory, and neoplastic.

### **TABLE OF CONTENTS/OUTLINE**

1. Congenital Midface Dermal sinus Glial heterotopia Encephalocele Branchial clefts Types 1-4 Branchial pouches Thymus Parathyroid Thyroid 2. Vascular Vascular malformations Low-flow syndromes Lymphatic (generalized lymphatic anomaly) Venous (blue rubber bleb nevus) Capillary (megalencephaly-capillary malformation) High-flow syndromes HHT CM-AVM CAMS Vascular tumors Congenital hemangioma Infantile hemangioma: hemangiomas, PHACES Borderline tumors Juvenile nasopharyngeal angiofibroma Kaposiform hemangioendothelioma 3. Inflammatory Tonsillar vs. peritonsillar abscess Retropharyngeal edema vs. abscess Pott's puffy tumor Salivary glands Sialadenitis Pneumoparotitis Mucocele / Ranula Autoimmune 4. Neoplastic Lipomatous lesions Congenital infiltrating lipomatosis Lipoblastoma Teratoma Fibrous lesions Fibromatosis colli Myofibromatosis Leiomyoma Desmoplastic fibroma (tuberous sclerosis) Desmoid fibromatosis (Gardner) Sarcoma Rhabdomyosarcoma Ewing Fibrosarcoma Synovial sarcoma Neuroblastoma Primary Secondary Nerve sheath tumors NF1 NF2 NF3 Neuroendocrine tumors Glomus (SDH, NF1, VHL, MEN) Thyroid Thyroiditis Thyroid CA

## **HNEE-6 Differentiating Malignant Parotid Tumors From Pleomorphic Adenomas and Warthin's Tumors: The Benefits of Tumor Blood Flow and Apparent Diffusion Coefficient Histogram Analysis**

### **TEACHING POINTS**

It is occasionally difficult to differentiate malignant parotid tumors (MTs) from two major benign tumors such as pleomorphic adenomas (PAs) and Warthin's tumors (WTs). Here, we review how to diagnose parotid tumors by the use of apparent diffusion coefficient (ADC) and tumor blood flow (TBF) obtained by pseudocontinuous arterial spin labeling (pCASL), comparing conventional methods such as tumor-to-parotid gland signal intensity ratios with histogram analysis for the following reasons: 1. to understand principle of pCASL; 2. to review conventional methods to evaluate parotid tumors by TBF and ADC; and 3. to understand the benefits of TBF and ADC histogram analysis for differentiating MTs from PAs and WTs.

### **TABLE OF CONTENTS/OUTLINE**

1. Essential knowledge of parotid tumors such as incidence rate, and major tumor types 2. Principle of pCASL 3. Conventional methods for differentiating MTs from PAs and WTs 1. TBF and ADC histogram analysis for differentiating MTs from PAs and WTs 2. Conclusion: The combination of TBF and ADC evaluated by histogram analysis may enhance the diagnostic performance for differentiating parotid MTs from PAs and WTs.

## **HNEE-60 Opportunistic Assessment for Parathyroid Adenomas: How We Do It and Why**

Participants

Karol Cardenas, MD, Quito, Ecuador (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

There are well-documented shortcomings in the diagnosis and treatment of primary hyperparathyroidism (PHPT). These gaps have prompted calls for innovative changes to how health systems approach this disease. One proposed change is for radiologists to assess for enlarged parathyroid glands on routine imaging studies with the goal of identifying individuals with undiagnosed PHPT.

This exhibit will 1) review relevant PHPT background, 2) summarize existing evidence related to opportunistic parathyroid assessment, and 3) share a practical, step-by-step approach to opportunistically screening for parathyroid adenomas (i.e., "how we do it") with illustrative case examples.

#### **TABLE OF CONTENTS/OUTLINE**

1. Opportunistic Screening - definition; potential benefits and risks  
2. PHPT Background - epidemiology, pathophysiology, diagnosis, treatment, accepted imaging role  
3. Existing Gaps - failure to diagnose, failure to treat, morbidity of untreated disease  
4. Opportunistic Assessment for Parathyroid Adenomas - anatomy, size criteria, imaging characteristics, review of the evidence, relevant aspects of Fifth International Workshop clinical guidelines, how we do it (search pattern, imaging evaluation, reporting)  
5. Illustrative Examples - opportunistically identifying parathyroid adenomas on CT, MR, US; differentiating from mimics (exophytic thyroid tissue, thyroid nodule, lymph node)  
6. Proposed Best Practices Decision Tree for "Should I Recommend Biochemical Testing for Possible PHPT?"  
7. Summary and Conclusion

#### **HNEE-61 Hmm...Is That Normal? Pediatric Skull Base Variants With A Focus on the Temporal Bone**

Participants

Asha Sarma, MD, Nashville, TN (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

-Radiologists must recognize many normal skull base variants that may be mistaken for disease in pediatric patients.  
-Differentiating normal variants from disease may be especially challenging in the temporal bone, given complex anatomy and frequently incomplete ossification.  
-This multi-institutional exhibit will provide a detailed case-based review of pediatric skull base variants including relevant companion cases, pearls, pitfalls, and mimics.  
-After viewing this exhibit, radiologists will have practical tools for differentiating normal skull base variants from disease and strategies for troubleshooting difficult cases.  
-This exhibit aims to: 1) describe relevant anatomy, embryology, and post-natal development of the skull base and temporal bones, 2) identify CT and MRI findings of common and uncommon developmental findings and variants, 3) contrast these variants with similar-appearing disease states, and 4) explain strategies for troubleshooting difficult cases.

#### **TABLE OF CONTENTS/OUTLINE**

1) Normal anterior skull base ossification and variants (e.g., skull base synchondroses, craniopharyngeal canal)  
2) Normal temporal bone development and variants (e.g., cochlear cleft, incomplete ossification of the semicircular canals)  
3) Variant middle ear findings (e.g., ossicular pneumatization, suspensory ligament calcification)  
4) Vascular variants (e.g., emissary venous channels mimicking fracture, aplastic petrous carotid canal)  
5) Skull base pneumatization variants  
6) Other salient findings (e.g., skull base sutures, foramen tympanicum)

#### **HNEE-62 Pictorial Overview of Temporomandibular Joint Pathologies**

Participants

Wen Wang, MD, Orlando, FL (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Review the anatomy of TMJ. Provide illustrative cases and clinical scenarios depicting common and rare pathologies involving TMJ.

#### **TABLE OF CONTENTS/OUTLINE**

1. Relevant anatomic review of the temporomandibular joint.  
2. Check list/Search pattern for TMJ pathologies.  
3. Congenital anomalies: i. Congenital hypoplasia ii. Ankylosis of TMJ.  
4. Infectious pathology: i. Septic arthritis of TMJ ii. Post-operative infection  
5. Degenerative disease: i. Osteoarthritis of TMJ ii. TMJ disc dislocation and subluxation.  
6. Neoplastic disease: i. Osteochondromatosis of TMJ ii. Ameloblastoma iii. Metastatic disease.  
7 Other pathologies: osteonecrosis.

#### **HNEE-63 Practical Tips for Hypopharyngeal Carcinoma Staging**

Participants

Carlos Alberto Coelho Neto, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

The hypopharynx represents the lowest portion of the pharynx and can be affected by neoplastic and non-neoplastic diseases. Squamous cell carcinoma is the most common neoplasm in this region and can affect one of its three main subsites: pyriform sinuses, posterior wall and post-cricoid region. Imaging evaluation is essential in the staging of these patients, along with clinical and endoscopic examination. The objective of this presentation is to help the radiologist in the evaluation of neoplastic lesions of the hypopharynx, with images and tips for the evaluation of primary lesions and lymph node enlargement, contributing to the TNM classification.

#### **TABLE OF CONTENTS/OUTLINE**

Discussion of imaging tips in staging the hypopharynx neoplasms by showing clinical cases with MRI and CT images. We start this presentation by detailing the anatomical limits of the hypopharynx. We will detail the three main subsites of hypopharyngeal neoplasms: pyriform sinuses, posterior wall and postcricoid region. We highlight the main points of the TNM classification and, through cases, we demonstrate the main anatomical landmarks, how to measure the lesions, besides tumor extension pathways. Lymph node aspects will also be discussed, such as dimensions, dissemination routes, extranodal extension and necrosis. The conclusion of this presentation shows that hypopharyngeal neoplasms are part of the daily clinical routine of general and head and neck radiologists. Therefore, the anatomy of the pharynx must be well known, as well as the main subsites of the hypopharynx. We also show that it is not necessary to memorize the TNM staging, but the radiologist must know how to evaluate its most important points and landmarks.

#### **HNEE-64 Orbital Trauma: A Pictorial Review**

Participants

Junaid Kalair, BS, Richardson, TX (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

1. Discuss the role of imaging in evaluation of orbital trauma  
2. Recognized normal orbital anatomy on CT and MRI  
3. Describe the spectrum of orbital trauma injuries seen on imaging  
4. Recognize mimics of orbital injuries

#### TABLE OF CONTENTS/OUTLINE

Roles of radiographs, ultrasound, CT, and MRI in orbital trauma imaging  
Normal bony and soft tissue anatomy of the orbit on CT MRI including orbital compartments  
Pictorial Review of orbital injuries including: Extra-conal injuries Preseptal vs. post-septal hemorrhage Intra-conal vs. Extra-conal hemorrhage Traumatic exophthalmos vs. enophthalmos Ocular muscle injury/entrapment Foreign bodies Globe injuries Anterior segment Aqueous humor hemorrhage Uveal Prolapse Lens Dislocation Ejection Posterior segment Vitreous humor hemorrhage Subretinal hemorrhage Subchoroidal hemorrhage Open globe Imaging findings Foreign bodies Orbital trauma mimics  
Iatrogenic intraocular gas  
Medical implants

#### HNEE-65 Internal Cacophony of Heartbeats: Rhythmic Whooshing and Buzzing in the Ear - Maddening Patient and Physician

##### TEACHING POINTS

1. Review common and uncommon etiologies of pulsatile tinnitus including vascular, structural and neoplasms.  
2. Multimodality imaging assessment and diagnostic workup.  
3. Current concepts in management and review of treatment options.

#### TABLE OF CONTENTS/OUTLINE

1. Background introduction of pulsatile tinnitus  
2. Review of common and uncommon etiologies of pulsatile tinnitus  
a. Vascular:  
i. Venous: Idiopathic intracranial hypertension, jugular bulb diverticulum, and emissary veins  
ii. Arterial: arteriovenous fistula and malformations, aberrant carotid artery, fibromuscular dysplasia and carotid dissections  
b. Structural:  
i. Skull base dehiscence, internal jugular vein compression  
ii. Conductive hearing loss, e.g. otosclerosis  
c. Tumor: Paraganglioma, meningioma, low flow vascular malformations (Hemangiomas)  
3. Diagnostic Imaging QR codes with scrollable imaging data sets will be provided, with practical clues for making the diagnosis, and will include high-resolution flat panel CT.  
a. Idiopathic intracranial hypertension CTV, MRV, and DSA.  
b. High riding jugular bulb and diverticulum CTV and DSA, and vascular Eagle syndrome.  
c. Dural arteriovenous fistula CTA, MRA, and DSA Including high resolution 14 second magnified flat-panel computed tomography  
d. Aberrant carotid artery CTA and DSA  
e. Paraganglioma MRI, MRA, and DSA  
f. Meningioma MRIg. Sigmoid sinus wall dehiscence and emissary veins CTA including treatment DSA.  
h. Otosclerosis CT  
4. Review of treatment options  
a. Transverse sinus stenosis stenting.  
b. Arteriovenous fistula embolization.  
c. Jugular vein decompression.  
d. Bony dehiscence resurfacing.  
5. Diagnostic algorithm summary

#### HNEE-66 Imaging Evaluation of Hearing Loss: Understanding Audiograms to Refine Interpretation

##### TEACHING POINTS

1) Prior to imaging, patients with hearing loss undergo audiometric assessment, which categorizes hearing loss as conductive, sensorineural, or mixed.  
2) CT is the first-line imaging modality for patients with conductive hearing loss (CHL), and an understanding of prior audiometric testing results can benefit the radiologist's temporal bone CT interpretation.  
3) Pure-tone hearing test results may be the most relevant component of the audiogram report for radiologists and are often viewable in the electronic medical record at the time of CT interpretation.  
4) Recognizing specific CHL patterns in audiograms can increase confidence and accuracy of CT interpretations.  
5) The presence or absence of the acoustic reflex informs likelihood of a third window phenomenon.

#### TABLE OF CONTENTS/OUTLINE

I. Evaluation of the patient with hearing loss  
a. Clinical assessment  
b. Audiometric evaluation  
c. Role of imaging  
i. Indications for CT  
ii. Indications for MRI  
II. Review of audiometric testing  
a. Pure-tone hearing test  
i. Basic interpretation  
ii. Patterns of conductive hearing loss  
b. Acoustic reflex  
i. Principles  
ii. Acoustic reflex testing  
III. Illustrative Cases  
a. Pattern 1: Low frequency CHL closing in at higher frequencies  
b. Pattern 2: Flat CHL  
c. Pattern 3: The Carhart notch  
d. Absent acoustic reflex

#### HNEE-67 Ultrasound Assessment of Parathyroid Disease: The Latest and Greatest

##### TEACHING POINTS

- Provide an overview of the anatomy, function, and embryology of the parathyroid gland.
- Emphasize the indications, limitations, and benefits of ultrasound in evaluating the parathyroid gland.
- Compare different imaging techniques for the parathyroid gland.
- Discuss the ultrasound protocol for evaluating the parathyroid gland.
- Become familiar with descriptive terms for normal parathyroid gland anatomy.
- Review the most common pathologies and provide case studies to illustrate the practical application of theoretical concepts.
- Analyze differential diagnoses, tips, and tricks.
- Discuss updates in ultrasound evaluation for parathyroid gland pathology.

#### TABLE OF CONTENTS/OUTLINE

1. Overview of the parathyroid gland  
1.1 Anatomy  
1.2 Function  
1.3. Embryology  
2. Ultrasound evaluation of the parathyroid gland  
2.1 Indications  
2.2 Limitations  
2.3 Benefits  
3. Comparison of imaging techniques for the parathyroid gland: ultrasound, 4DCT, and SPECT.  
4. Ultrasound and CEUS protocol for evaluating the parathyroid gland.  
5. Descriptive terms for normal parathyroid gland anatomy  
6. Common pathologies in the parathyroid gland: parathyroid adenoma, parathyroid hyperplasia, parathyroid carcinoma, atypical parathyroid adenoma/atypical parathyroid tumor.  
7. Differential diagnoses: thyroid nodules and cervical adenopathies, tips and tricks for improving radiology reports.  
8. Updates in ultrasound evaluation for parathyroid gland pathology: elastography and CEUS.  
9. Conclusion.

#### HNEE-68 Molecular Markers of Head and Neck Tumors

Participants

Amit K. Agarwal, MD, MBBS, Jacksonville, FL (*Presenter*) Stockholder, Gilead Sciences, Inc

##### TEACHING POINTS

1. To understand the basics of neuropathology and genetics  
2. Review the molecular markers genetics of head and neck tumors  
3. Discuss reclassified and newly recognized head and neck tumors

#### TABLE OF CONTENTS/OUTLINE

1. Neuropathology for the Neuroradiologist  
a. Basic histopathology (H E stains)  
b. Immunohistochemistry (immunocytology)  
c. Genetic

analysis (FISH, PCR, Next-generation sequencing,) d. Liquid biopsy<sup>2</sup>. Markers for squamous cell carcinomas (SCCa) of the head and neck. HPV (p16+ tumors) b. EBV positive tumors c. Circulating-tumor DNA (ct-DNA) for tumor surveillance<sup>3</sup>. Molecular markers for non-SCCa tumors of head and neck a. Muscle differentiation (actin, desmin) b. Neural differentiation (S100, GFAP) c. Vascular differentiation (CD markers) d. Epithelial differentiation (cytokeratin, EMA)<sup>4</sup>. Reclassified and newly recognized tumors a. SDH deficient paragangliomas b. EBV-related smooth muscle tumors c. Mammary analogue secretory carcinoma (MASC) 5. Therapeutic advances in head and neck oncology (focus on immunotherapy) 6. Summary/conclusion

## **HNEE-69 A Practical Guide for Radiologists: Localizing and Diagnosing Pathologies in the Carotid and Parapharyngeal Spaces**

### **TEACHING POINTS**

- Provides a comprehensive overview of the radiologic anatomy of the carotid and parapharyngeal space (PPS)
- Describes a practical approach for localizing the pathologies affecting the carotid and PPS.
- Reviews common and rare pathologies in the carotid and PPS using case-based examples, highlighting distinctive clinical and imaging features that can aid in the best differential diagnosis.

### **TABLE OF CONTENTS/OUTLINE**

Table of Contents 1. Terminology of the Carotid and PPS 2. Anatomy and Contents of the Carotid and PPS 3. Practical approach to Diagnosing Pathologies in the Carotid and PPS 4. Displacement Pattern of PPS Fat for Localizing Masses. 5. Case-Based Review of Primary and Secondary Pathologies in the PPS 6. Case-Based Review of Primary and Secondary Pathologies in the Carotid Space Outline • Knowledge of anatomy is essential for localizing a lesion in the Carotid or PPS. • Displacement patterns of PPS fat can aid in identifying the space of origin. • Understanding the contents and common/rare lesions of these spaces is the first step in generating a differential diagnosis. • Obtaining relevant clinical history and recognizing specific imaging appearances can help provide the best differential diagnosis.

## **HNEE-7 Hypervascular Head and Neck Tumors: Image Aspects**

### **TEACHING POINTS**

Hypervascular tumors, by definition, are arterialized and present intense and early contrast enhancement. They comprise a wide variety of pathologies, which can be didactically divided into five major groups: neuroendocrine tumors, vascular tumors, primary lymphadenopathy, metastatic lymphadenopathy and other hypervascular tumors.

### **TABLE OF CONTENTS/OUTLINE**

In this presentation we are going to review hypervascular head and neck tumors and characterize their imaging features on computed tomography (CT) and magnetic resonance imaging (MRI), focusing on features that aid in the differential diagnosis through flowcharts. Images will be presented comparing the different locations of the paragangliomas and the various patterns of growth of the Juvenile nasopharyngeal angiofibroma. Metastatic and primary lymphadenopathy will be differentiated through tables.

## **HNEE-70 Update in Imaging of Parotid Lesions and Treatment-related Findings**

### **TEACHING POINTS**

Parotid gland tumors are a rare entity among the neoplasms of the head and neck. In adults, most encountered lesions are benign, being only 10% of parotid tumors malignant. Radiological assessment of these lesions includes ultrasound (US), computed tomography (CT), and morphological and functional magnetic resonance imaging (MRI). The definition of the nature of the lesion is essential for the election of treatment methods. Benign neoplasms may be destined for follow-up or managed surgically by gland-sparing techniques with facial nerve preservation. On the contrary, malignant lesions are treated frequently with total gland resection and sacrifice of the facial nerve with corresponding posterior morbidity. The exhibit aims to present the gamut of parotid neoplasms according to their imaging characteristics in the initial study and to stress the importance of radiological support in the follow-up. Treatment options including different surgical approaches and the correlation between applied technique and imaging will be provided.

### **TABLE OF CONTENTS/OUTLINE**

1. Parotid anatomy. 2. Imaging modalities: US, CT, morphological, and functional MRI. Applications. 3. Primary and secondary parotid lesions. 4. Different types of surgical approaches. 5. Follow-up findings.

## **HNEE-71 Bone Metabolic Disorders in Pediatric Patients: Key Clues for Early Detection in Dental Imaging**

Participants

Jo-Eun Kim, DDS, Seoul, Korea, Republic Of (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

Bone metabolic disorder refers to a disease caused by a variety of causes that break the balance between bone-forming and bone-removing activities. Bone metabolic disorders can affect pediatric patients and impact their oral health. Dental imaging, such as panoramic radiographs and cone-beam computed tomography (CBCT), can provide key clues for early detection of these disorders. - Generalized loss of follicular cortex or lamina dura of tooth - Generalized widening or obliteration of pulp chamber - Generalized sclerotic or osteopenic change of trabecular bone Understanding the imaging features of bone metabolic disorders is essential for dental practitioners to identify and refer patients for appropriate medical care. Especially, it is important to distinguish it from hematopoietic malignancy (such as leukemia, or lymphoma), which can appear similar and requires urgent treatment. Collaboration between dental and medical professionals is crucial for the management and treatment of bone metabolic disorders in pediatric patients.

### **TABLE OF CONTENTS/OUTLINE**

1. Meaning of dental imaging in pediatrics 2. Schematic explanation of bone mineral metabolic disorder 3. Bone metabolic disorders which impact on teeth and jaw bone structures (summary table) 4. Example of panoramic radiographs of the pediatric patients affected by metabolic disorder 5. Differential diagnosis from hematopoietic malignancy of pediatric patients (Importance of detecting changes on dental radiography)

## **HNEE-72    Participants    **Something In Your Teeth! Dental Panoramic Radiology for Radiologists****

Logan Ryals, BS, Jackson, MS (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

Review normal dental anatomy and imaging features, highlighting digital panoramic radiography (Panorex) cross-sectional imaging correlates. Discuss the differential diagnosis of oral maxillofacial/dental pathology on Panorex and cross-sectional imaging. Recognize the importance of systematic dental imaging interpretation in the diagnosis of oral and maxillofacial diseases.

### **TABLE OF CONTENTS/OUTLINE**

The oral cavity is the intersection of dentistry and medicine. However, the relationship of oral and systemic conditions is not fully appreciated. Modalities used in dental radiology include periapical and bitewing radiography, digital panoramic radiography, and cone-beam computed tomography. Panoramic radiography is most widely encountered by radiologists, but few receive formal training, and many are uncomfortable interpreting these studies despite frequent expectations to do so. Early detection of intraoral pathologies by radiologists may improve patient care and alert clinicians to the need for dental consultation. Familiarity with the anatomy and pathology of the oral and maxillofacial region will improve radiologists' diagnostic confidence and allow for the synthesis of a timely and detailed differential diagnosis. We will review dental imaging protocols, normal dental anatomy, and common findings of oral and maxillofacial pathology. A wide range of pathology will be discussed, emphasizing their appearances on panoramic radiographs with cross-sectional imaging correlates. Pathologies to be discussed include infectious and inflammatory lesions, periodontal diseases, cystic, benign and malignant masses, sinus pathology, and bone and temporomandibular joint disorders.

## **HNEE-73    **Unlocking the Temporomandibular Joint: CT, MRI and Arthroscopic Correlation****

Participants

Silvia Cayon Somacarrera, MD, Torrelavega, Spain (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

To illustrate the spectrum of findings in temporomandibular joint derangement on MR and its correlation with arthroscopic findings when available To highlight the role of CT in temporomandibular joint derangement To show the different surgical therapeutic approaches of temporomandibular pathology

### **TABLE OF CONTENTS/OUTLINE**

The most important anatomic structure of the temporomandibular joint is the articular meniscus, therefore it is the main element to be evaluated. We must study its morphology along with its location relative to the condyle in both closed- and open-mouth positions. However, we must bear in mind that meniscus aberrant displacement is also frequently seen in asymptomatic volunteers so that other findings such as joint effusion, retrodiskal layer rupture, lateral pterygoid muscle attachments thickening, degenerative changes, osteochondromatosis and ankylosis, may be required to help guide the diagnosis. It is important for the radiologists to detect early MR imaging signs of temporomandibular dysfunction, thereby avoiding its evolution to osteoarthritis. Nevertheless, it is important to know that the therapeutic approach is made by assessing both the clinical situation of the patient and the imaging. We have selected a wide variety of temporomandibular joint derangement cases in order to show the different imaging findings as well as the arthroscopic correlation when available. We also include a description of the different treatment approaches carried out in our institution.

## **HNEE-74    **Lesions in the Optic Tracts: Clinical-radiological Manifestations****

Participants

Maria Rocha, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

- Review the basic anatomy of the visual pathway and correlation with clinical manifestations.- Present the most frequent lesions in each region of the optic tract and review the main differential diagnoses.

### **TABLE OF CONTENTS/OUTLINE**

1. Introduction 2. Anatomy review 3. Correlation the anatomy with clinical manifestations 4. Most frequent lesion in each topography

## **HNEE-75    **Temporal Bone Anatomy on Photon Counting CT: Beyond the Obvious****

Participants

Shehbaz Ansari, MD, MBBS, Chicago, IL (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

1. Describe the concept and design of photon counting CT scanners and understand its advantages over conventional CT scanners with energy integrating detectors. 2. Illustrate temporal bone anatomy with emphasis on structures that were previously not reliably or less vividly identifiable. 3. Develop a system-based approach to temporal bone radiological anatomy.

### **TABLE OF CONTENTS/OUTLINE**

The imaging anatomy of the temporal bone has seen little progress in the last decade owing to the limited progress in the detector technology. Conventional detectors suffer from the inverse relation between radiation dose and image noise along with a limit to image resolution. Photon counting detectors (PCDs) have improved contrast to noise ratio with twice the resolution at nearly half the radiation dose. The basic physics of these detectors and their potential uses will be first discussed. To highlight the advantages of PCDs, we depict temporal bone anatomy including small structures not previously identifiable on imaging. Historically, advances in imaging to clarify anatomy has led to a deeper understanding of and elucidation of new pathologies associated with these structures. We also put forward a system-based approach to the anatomy of this region along with the conventional section-based anatomy. This system-based approach, aided by diagrammatic illustrations, will aid in understanding the complex anatomy of minute neural structures and communications around the ear, the delicate ossicular support system, neural and vascular supply of the labyrinth, and minor adjacent fissures among others.

## **HNEE-76 Feast Your Eyes on US of the Eye: A Guide to Ophthalmic Sonography**

Participants

Pedro Daza, MD, Quito, Ecuador (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

The eye needs a gel pillow. Acquired planes must evaluate anterior and posterior chambers. The optic nerve must be acquired on its own, using Doppler. Extraocular structures are important. Dynamic images are strong points of the sonography.

### **TABLE OF CONTENTS/OUTLINE**

Anatomy and radiological anatomy of eye. Technique and recommendations. Pathology with case review. Conclusions.

## **HNEE-77 Imaging of Post-dental Treatment: What Radiologists Need to Know in Common and Advanced Dental Procedures**

### **TEACHING POINTS**

With recent advancements in dentistry, various new treatment methods have been clinically introduced, and many new materials are being used for treatments. Post-dental treatment CT and MR images reveal a variety of hard tissue and soft tissue changes and used dental materials which often associate image artifacts. Therefore, familiarity with post-treatment changes and dental materials is crucial to avoid misinterpretation as true pathologies, identify complications and evaluate for recurrent disease. The purpose of this exhibit is 1) to review common and uncommon dental treatments with an emphasis on recently introduced treatment and procedures, 2) to review expected and unexpected post-dental treatment changes and dental materials on CT and MR images, and 3) to discuss imaging approach to identify complications and disease recurrence or progression.

### **TABLE OF CONTENTS/OUTLINE**

1) Review of common and uncommon dental treatments, with an emphasis on recently introduced treatments and dental materials  
2) Review of expected and unexpected post-dental treatment changes and dental materials on CT and MR images  
3) Discussion on imaging approach to identify complications and disease recurrence or progression

## **HNEE-78 PET/MRI In Head and Neck Cancer: Ready For Primetime?**

Participants

Craig Foote, MD, BSc, Baltimore, MD (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

PET/MR is a relatively new modality poised to provide considerable, novel clinical value in the field of head and neck oncology by combining the functional evaluation of FDG PET with the exquisite soft tissue resolution of MR imaging. Patients with head and neck cancers already requiring MRI for TNM staging may stand to benefit the most from the use of PET/MR, which offers the ability to simultaneously acquire the optimal regional and distant metastatic evaluation offered by PET in addition to MR, as opposed to separately by MR and PET/CT. This educational exhibit will provide an overview of PET/MR and its current role in head and neck cancer, as well as discuss barriers to its widespread acceptance and predictions for the future.

### **TABLE OF CONTENTS/OUTLINE**

1) Overview of PET/MR a) Evolution of PET/MR b) Advancements in hardware c) Physics d) Coregistration  
2) Advantages of PET/MR a) Comparison to PET/CT i) Radiation dose reduction, longer acquisition times, improved radiation planning, etc. ii) Lung nodule detection compared to PET CT b) MRI for more accurate T staging  
c) Application of NIRADS (Neck imaging reporting and data system) in PET/MR  
3) Examples of PET/MR in head and neck cancer a) Evaluation of post-treatment change versus recurrence b) Head and neck cancer of unknown primary c) Orbital malignancy d) Perineural Spread  
4) Barriers to use a) Costs b) Lack of trial data showing distinct advantages  
5) Recent developments/future predictions a) Multi-parametric imaging b) Innovative radiotracers

## **HNEE-79 Laryngeal Carcinoma Evaluation with Dual Energy CT (DECT)**

Participants

Paloma Puyalto, PhD, MD, Barcelona, Spain (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

Dual-energy CT (DECT) can be used in laryngeal carcinoma (LC) evaluation. Based on the decomposition of different materials, DECT can distinguish tissues with similar Hounsfield Unit attenuations assessed in simple energy CT (SECT). The size, the identification of the margins of LC, and the evaluation of adjacent structures invasion, which could change the LC staging, is not always easy due to the small size occupied by the complex laryngeal structures in the visceral compartment and their similar attenuation values. A more accurate diagnosis can be made with DECT. The main objectives of this exhibit are: 1. To describe DECT image acquisition protocols and post-processing techniques related to the evaluation of LC. 2. To illustrate DECT findings in LC by TNM staging and its SECT correspondence. 3. To expose the differential diagnosis and potential pitfalls of LC in DECT and how to try to avoid them.

### **TABLE OF CONTENTS/OUTLINE**

1. Overview review of LC. 2. Diagnostic clinical and imaging strategies to evaluate LC. 3. DECT protocol for LC evaluation and post-processing techniques related to imaging of LC such as virtual monochromatic and material decomposition images. 4. Case-based cancer image examples with DECT and SECT correspondence for each TNM stage. 5. LC pitfalls and differential diagnosis of LC in DECT images.

## **HNEE-8 Ultrasound of Ocular Globe: Revealing What Lies Below**

Participants

Ingrid Caridade, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

Ultrasound (US) of the eye has become increasingly popular in clinical practice as a complementary tool to ophthalmoscopy as it is

Ultrasound (US) of the eye has become increasingly popular in clinical practice as a complementary tool to ophthalmoscopy, as it is a dependable and secure diagnostic technique for assessing and monitoring various ophthalmic conditions, including inflammation, tumors, and traumatic injuries, as well as measure the optic nerve and detect intracranial hypertension. The method is accessible, non-invasive, and relatively low-cost, with few contraindications. The eye's superficial location and structure make the US an ideal examination option, particularly in emergency situations. It is typically recommended when it is challenging to examine the fundus of the eye due to conditions that cause opacity of the ocular globe. In pediatrics, US can be performed without sedation or radiation, making it an especially valuable tool. Radiologists should be familiar with the basic anatomy of the eye, as well as the examination technique and ultrasonographic findings of the entities that frequently affect the ocular globe. In this presentation, we show a literature review and case analysis performed using high-frequency linear transducers with B-mode ultrasonography and color Doppler. Subsequently, the findings are compared to imaging modalities such as computed tomography (CT) and magnetic resonance imaging (MRI).

#### **TABLE OF CONTENTS/OUTLINE**

Review the normal eye anatomy. Demonstrate the US examination technique. Discuss some pathologies of the eye and its main ultrasonographic image features.

#### **HNEE-80 Delayed Gadolinium-enhanced MRI in Ménière's Disease: Imaging Findings and Clinical Application**

##### **TEACHING POINTS**

The purpose of this exhibit is to summarise current MRI techniques for hydrops imaging; to describe current diagnostic MRI criteria for Ménière's disease; and to discuss clinical application of hydrops imaging

#### **TABLE OF CONTENTS/OUTLINE**

Anatomy of inner ear structures; delayed gadolinium-enhanced inner ear MRI; MRI assessment; review of imaging findings; clinical utility

#### **HNEE-81 Mimics of Ménière's disease on delayed gadolinium-enhanced MRI**

##### **TEACHING POINTS**

The purpose of this exhibit is (1) to review imaging features of several peripheral vertigo-associated diseases on delayed gadolinium-enhanced MRI and (2) to describe the current role of MRI in differentiating Ménière's disease from other vertigo-associated diseases.

#### **TABLE OF CONTENTS/OUTLINE**

Anatomy of inner ear structures; delayed gadolinium-enhanced inner ear MRI; review of imaging findings in Ménière's disease, intralabyrinthine fistula, perilymphatic fistula, labyrinthitis, sudden sensorineural hearing loss, vestibular neuritis, vestibular migraine, vestibular schwannoma; summary of MRI findings and differentiating features.

#### **HNEE-82 Imaging Considerations for Transoral Robotic Surgery (TORS) Planning**

Participants

Niedja Santos Goncalves Tsuno, Brasilia, Brazil (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

- To learn the radiological imaging findings that represent indications and contraindications for Transoral Robotic Surgery (TORS), focusing on Head and Neck oncology. - To identify expected postsurgical status of tumors resected by TORS.

#### **TABLE OF CONTENTS/OUTLINE**

1. Simplify the anatomy of the oropharynx, hypopharynx, and larynx, with emphasis on the tonsillar regions, base of the tongue, supraglottis, hypopharynx (pyriform sinus), and also the pre-styloid parapharyngeal and retropharyngeal spaces. 2. Summarize classical TORS ideal indications for treatment of head and neck neoplasms, focusing on the role of CT and MR imaging to determine the size of the tumor, its location and relationship with adjacent structures. 3. Summarize and exemplify the major general contraindications for TORS related to the primary tumor (internal carotid artery entrapment, invasion of the prevertebral space, massive extension into the masticatory space, bone involvement) and those not related to the primary tumor (unresectable cervical nodal disease, metastases and high surgical-anesthetic risk), in addition to reviewing site-specific contraindications. 4. Conclusion.

#### **HNEE-83 What, Where and When of Imaging in Spontaneous Skull Base CSF Fistulas**

Participants

Sanchita Gupta, MBBS, MD, New Delhi, India (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

1) Understand the anatomical basis and pathophysiology of spontaneously developing CSF fistulas 2) Approach to imaging in patients with skull base fistula 3) Identify the imaging appearance of lesions, and features to differentiate these from potential mimics 4) To extract clinically relevant imaging information which translates into improved decision-making and ease during the surgical procedure

#### **TABLE OF CONTENTS/OUTLINE**

1) What is a Spontaneous Skull base CSF fistula? 2) Pathophysiology of a CSF leak 3) Anatomical considerations - Common sites - Cribriform plate - Sphenoid bone - Perisellar and Lateral recess - Temporal bone - Tegmen tympani and mastoid 4) History and Clinical Presentation 5) Imaging modalities for assessment - Indications and Technique - High-resolution Computed Tomography (HRCT) - Magnetic resonance Cisternography - Contrast-enhanced CT Cisternography - Gadolinium-enhanced MR Cisternography 6) Imaging features of spontaneous skull base CSF fistula 7) Associated features of Idiopathic Intracranial Hypertension 8) Structured reporting format for the pre-surgical evaluation of skull base CSF fistula - What the Surgeon Wants to Know.

## **HNEE-84 The External Carotid Artery: The Forgotten Carotid Branch. Tips and Tricks for the Evaluation in Different Imaging Techniques.**

Participants

Maria Galante I, MD, (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

-To review the pathway, anatomical relationships and areas supplied by the external carotid artery.-To describe the anatomy of the artery and the relationship with other structures in the different techniques, including CTA, MRA, US and DSA.-To give some tips to achieve an accurate evaluation of the artery and its main pathologies, especially while performing a diagnostic US.- To offer a US protocol for the assesment of these artery.The external carotid artery is one of the main vascular structures of the head and neck region, not only because it irrigates this area, but also because some of its branches anastomose with the internal carotid and posterior cerebral arteries, becoming an important source of collateral supply. Besides, it is well known that the number of interventional and surgical procedures has massively increased . So, being the territory supplied by this artery so extensive and sometimes tricky, it could get affected whenever any of these procedures are performed, or in the case of tumors of the head and neck region, and traumatic injuries. In this exhibit we will analyze the anatomical pathway, territory, and relations of this artery.

### **TABLE OF CONTENTS/OUTLINE**

1) General Anatomical Description2) The external carotid artery in Imaging Techiques: US, CTA, MRI , DSA3) Tips and Tricks for the evaluation in US technique: Protocol4) Superior thyroid artery5) Ascending pharyngeal artery6) Lingual artery7) Facial artery8) Occipital artery9) Posterior auricular artery10) Maxillary artery11) Superficial temporal artery

## **HNEE-85 Algorithmic Approach to Head and Neck Emergency Neuroradiology**

### **TEACHING POINTS**

1. Discuss common neuroradiology examinations of the head and neck region from the emergency department.2. Outline key anatomic structures and common emergent diagnoses of the head and neck.3. Provide algorithmic approaches for interpreting neuroradiology examinations of the neck soft tissues, skull base, face, and orbits.4. Display image rich case examples of head and neck neuroradiology emergent diagnoses which outline key features for high quality reports.

### **TABLE OF CONTENTS/OUTLINE**

1) Neuroradiology examinations of the head and neck commonly ordered in the emergency department i) CT: neck soft tissues, maxillofacial, temporal bone, orbits, cervical spine, CTA ii) MRI: neck soft tissues, face, orbits, IAC, cervical spine, MRA iii) Radiographs: Neck soft tissue, cervical spine, face, mandible 2) Neck soft tissue Algorithm i) Structured diagnostic strategy (1) Key anatomy and diagnoses ii) Case examples (1) Ludwig's Angina, Tracheal Fractures etc. 3) Skull base Algorithm i) Structured diagnostic strategy (1) Key anatomy and diagnoses ii) Case examples (1) Ossicular dislocation, Bezold abscess etc. 4) Face Algorithm i) Structured diagnostic strategy (1) Key anatomy and diagnoses ii) Case examples (1) Le Fort Fractures, Fungal sinusitis etc. 5) Orbit Algorithm i) Structured diagnostic strategy (1) Key anatomy and diagnoses ii) Case examples (1) Globe rupture, Retrobulbar hemorrhage etc.

## **HNEE-86 Breathe Easier: A Guide for Imaging Obstructive Sleep Apnea (OSA)**

### **TEACHING POINTS**

Obstructive Sleep Apnea (OSA) is a common condition characterized by repetitive episodes of partial or complete upper airway obstruction during sleep, leading to disrupted breathing and decreased oxygen levels.Imaging techniques, such as computed tomography (CT) can provide valuable information for the diagnosis of OSA and surgical planning.CT is particularly useful for assessing the upper airway anatomy and identifying anatomical factors contributing to airway obstruction.A standardized approach for evaluating CT, including measurements of relevant landmarks is useful for communicating the findings to the referring surgeon.

### **TABLE OF CONTENTS/OUTLINE**

I. IntroductionDefinition and epidemiology of OSAScanning ProtocolIII. Imaging Techniques for OSAComputed Tomography (CT)Magnetic Resonance Imaging (MRI)III. Role of Imaging in OSA Diagnosis and ManagementUpper Airway AnatomyAssessmentSoft Tissue Structure EvaluationFunctional Changes DetectionComplications IdentificationTreatment GuidanceAnatomical Measurements on CTImplantable Neurostimulator to Treat Obstructive Sleep ApneaIV. ConclusionSummary of key pointsFuture directions and challenges in OSA imaging research

## **HNEE-87 Dacryocystography using Computed Tomography: What a Radiologist Needs to Know**

### **TEACHING POINTS**

Computed Tomography Dacryocystography (CT DCG) is a valuable technique to evaluate the nasolacrimal drainage system in epiphora. It allows unequivocal demonstration of the level and causes of obstruction that include inflammatory, traumatic (fractures and iatrogenic), developmental stenosis of the bony lacrimal canal, and an occasional lacrimal sac tumor, etc. It also provides useful information about the degree of obstruction, whether obstruction is anatomical or functional, insight into reasons for failed dacryocystorhinostomy, and other useful findings like sac size, diverticuli, fistulae, etc. The technique, therefore, provides a one-stop shop for all necessary information for the diagnosis, treatment planning, and follow-up in epiphora.

### **TABLE OF CONTENTS/OUTLINE**

1)Indications 2)Technique 3)Interpretation 4)Etiologies with illustrative cases 5)Ancillary findings aided and detected by CT 5)Limitations 6)Conclusions

## **HNEE-88 Liptology or the Science Behind Beautiful Lips**

### **TEACHING POINTS**

- To describe the anatomy of lips and perioral region- What ultrasound technique is used to depict anatomy and tips to perform the exam- To assess any anatomical variants or physiological changes that affect the lips ?- To describe optimal prognostic tools during the ultrasound exam that might prevent any adverse event and also to define some common complications.

## TABLE OF CONTENTS/OUTLINE

The main focus is to describe the anatomy of simple but yet complicated organ that recently has been exposed to much attention. The other important part is to learn what anatomical variations are common and what pathological or physiological changes could be defined using Ultrasound. Due to the fact that there is unabated trend of aesthetic procedures in which complications are becoming more and more prominent, the radiologist must become familiar of them. Together we will identify what might be the ingredients of beautiful lips and their aging changes. The last but not least we will describe what the overfilled syndrome looks like and how it might affect the oral and perioral region.

### HNEE-89 Diagnostic Imaging of Enophthalmos: A Practical Approach

#### TEACHING POINTS

- Describe measures used to evaluate the normal globe position in cross-sectional imaging. - Discuss the main imaging features of entities that lead to enophthalmos and its mimics. - Demonstrate the utility of CT and MRI in the differential diagnosis of patients with enophthalmos.

## TABLE OF CONTENTS/OUTLINE

Enophthalmos, defined as inward displacement of a normal-sized globe within the orbit, can occur unilaterally or bilaterally and is relatively common. If the displacement is minimal, the diagnosis may not always be based on physical examination and these patients may be initially misdiagnosed as having contralateral exophthalmos. Various etiologies cause enophthalmos and trauma is the leading cause. CT and MRI are the imaging techniques of choice for evaluating enophthalmos, and each have distinct advantages. While CT is useful for the detailed assessment of bone structures, MRI is better suited for analyzing orbital soft tissues. Our purpose is to present an overview of the imaging characteristics of entities that can cause enophthalmos based on various mechanisms, including structural abnormalities, fat atrophy, retraction, mixed, uni- vs. bilateral, and pseudoenophthalmos.

### HNEE-9 US of the Neck Beyond the Thyroid: Parathyroids, Salivary Glands, Adenopathy, Trachea

Participants

Matheus Marcelino Dias, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The purposes of this exhibit are: - Make a multimodality-based didactic review to elucidate multiple cervical conditions at neck ultrasound; - Propose a didactic categorization of these conditions: .Gastrointestinal malformations. Congenital malformations. Infectious causes. Oncology causes. Post operative conditions - Correlate those findings with other exams; - Illustrate those conditions based on cases from our radiology group.

## TABLE OF CONTENTS/OUTLINE

We will elucidate multiple cervical conditions at neck ultrasound and focus on their imaging features using a multimodality approach in this exhibit. Gastrointestinal malformations Zenker diverticulum Congenital malformations Cystic Thyroglossal duct cyst Branched cyst Lymphangioma Ranula Solid Teratoma Glioma Vascular Hemangioma Arteriovenous malformation Infectious causes Sialadenitis Parotitis Abscess Lymph node abscess Carotidynia Oncology Lymphoma Parotid Submandibular gland Oropharynx Post operative conditions

### HNEE-90 A Practical Guide to Reporting an Oropharyngeal Videofluoroscopic Swallow Study: Anatomical Landmarks, Tips, and Tricks

Participants

Javier Azpeitia Arman, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- To describe oropharyngeal region anatomy and mechanism of swallowing. - To review the study protocols of oropharyngeal videofluoroscopic swallow study (VFSS) in the evaluation of different clinical conditions and endoscopic findings. - To illustrate the most important anatomic landmarks and signs to evaluate in different phases of a swallowing videofluoroscopy. - To analyze steps in interpretation of an VFSS, report structure and essential points in reporting.

## TABLE OF CONTENTS/OUTLINE

Oropharyngeal videofluoroscopic swallow study is the technique of choice in the diagnosis of oropharyngeal dysphagia causes. The study protocol should be tailored according to the specific clinical symptoms and endoscopic findings in each patient. Reporting an VFSS requires knowledge of the most important anatomic landmarks and a detailed report structure including findings in the different phases of deglutition. We present: - Normal anatomy of the oropharynx and mechanism of swallowing. - Study protocol: Contrast agent preparation. Swallowing protocol: bolus volumes (small or large) consistency (liquid to semisolid). Patient positioning. Image requirements. Recording. - Study evaluation. Anatomical landmarks. Deglutition phases. Implications for treatment. Meal consistency. Different manoeuvres improving swallowing. - Report: Systematic analysis of imaging findings. Motility disorders: Bolus transport from oral cavity, Laryngeal vestibular penetration, Pharynx residue, Transglottic aspiration; Intrinsic causes: cricopharyngeal bar (prominent cricopharyngeal muscle), diverticulum, web. Extrinsic compression: osteophytes, thyroid gland. Surgery (laryngectomy).

### HNEE-91 Head and Neck: It's Not a Tumor

Participants

Brian Yep, MD, Orange, CA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Describe imaging features of head and neck lesions that should raise the concern for oncologic processes. 2. Provide non-neoplastic differential considerations for head and neck lesions.

## TABLE OF CONTENTS/OUTLINE

One of the major questions that arise when encountering a head and neck lesion is to discern if it is a neoplastic or non-neoplastic

process. This educational exhibit will first highlight imaging features that should raise the concern for an aggressive neoplastic head and neck process. Then, through a case-based style, non-oncologic mimics will be presented to provide alternative benign differential diagnostic considerations including infectious, inflammatory, and variant congenital/developmental etiologies. Finally, one can put this knowledge to the test through a series of quiz questions.

## **HNEE-92 Imaging of Facial Pain and Numbness: Trigeminal Neuralgia and Neuropathy**

### **TEACHING POINTS**

1. Review the normal anatomy of the trigeminal nerve, its branches and structures normally present along its anatomic course. A combination of 2D and 3D rendered images will be used, as well as CT/MRI imaging examples. 2. Discuss the pathophysiology of classic and secondary causes of trigeminal neuralgia. 3. Present a case-based review illustrating different examples of classic and secondary trigeminal neuralgia on CT/MRI images. 4. Provide a step-by-step search pattern for trigeminal pain

### **TABLE OF CONTENTS/OUTLINE**

I. Introduction II. Normal trigeminal nerve and skull base anatomy III. Classification of common sources of trigeminal pain. Imaging review, pathophysiology, symptoms, and management will be reviewed. Cases will include but are not limited to: a. Trigeminal Neuralgia: neurovascular compression, demyelination, tumoral compression. b. Trigeminal Perineural Tumor Spread c. Post-Herpetic Neuralgia d. Post-Traumatic Trigeminal Neuropathy e. Trigeminal Trophic Syndrome: iatrogenic, brainstem infarction f. Anesthesia Dolorosa g. Trigeminal Tic Syndrome IV. Differential Diagnosis for non-trigeminal sources of facial pain: optic neuritis, nervus intermedius neuralgia, glossopharyngeal neuralgia. V. Simplified search pattern for trigeminal pain VI. Conclusion

## **HNEE-93 Dysphagia: A Pictorial Review of Common and Uncommon Causes**

Participants

Selima Siala, MD, Carrboro, NC (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

Illustrate a large spectrum of diseases causing dysphagia. Highlight key imaging findings of common diseases of the pharynx and esophagus.

### **TABLE OF CONTENTS/OUTLINE**

Dysphagia is a broad term used to describe a subjective sensation of difficulty when swallowing. Causes of dysphagia can be divided into structural and functional. Structural dysphagia includes lesions that compromise the esophageal lumen typically leading to difficulty swallowing solid food prior to liquids. Examples of structural dysphagia include congenital anomalies (esophageal web and vascular entities), acquired (Zenker's diverticulum, Longus coli tendonitis, goiter, and aortic dissection), neoplasms, inflammation (esophagitis, felinization of the esophagus, Barrett's esophagus, and scleroderma), infection (abscess and Candidiasis), iatrogenic (surgically induced) and foreign bodies. Functional dysphagia is caused by conditions that interfere with normal peristalsis including diffuse esophageal spasm and achalasia. Hence the swallowing of both solid foods and liquid is compromised at the same time. Dysphagia can also be classified based on location as oropharyngeal or substernal. Oropharyngeal dysphagia is defined as a sensation of blockage in the throat, while substernal dysphagia presents as a sensation of blockage between the thoracic inlet and the xiphoid process. The evaluation of dysphagia heavily relies on imaging, particularly fluoroscopy studies including modified barium swallow and esophagography as well as CT. Fluoroscopy studies provide an evaluation of both anatomic structure and function of the pharynx and esophagus while CT provides better anatomic evaluation outside of the lumen.

## **HNEE-94 Decoding the Language of Neoplastic Cells: Molecular Markers as Prognostic and Diagnostic Tools for Oral Squamous Cell Carcinoma**

Participants

Laura Magalhaes, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

Pedro Castro, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

To illustrate the most recent genetic alterations described in Oral Squamous Cell Carcinoma (OSCC) and correlate with the pathology, imaging, and prognosis. To show that molecular analysis can provide information on tumor biological behavior. To demonstrate the importance of incorporating molecular analysis of OSCC.

### **TABLE OF CONTENTS/OUTLINE**

1. Revision of the anatomy of the oral cavity. 2. Epidemiology, pathology, and demographics of OSCC. 3. Recent advances in molecular biology. 4. Specific genetic mutations, amplifications, or deletions associated with tumor progression, recurrence, and response to therapy. 5. Identification of human papillomavirus (HPV) leading to improved prognosis and targeted therapy. 6. Imaging strategies to depict the correct diagnosis based on the genetic profile. 7. Targeted therapies or immunotherapies. 8. Flowchart of the changes and last updates based on the neoplastic molecular profile. 9. Take-home messages.

## **HNEE-95 Lessons About Cholesteatomas. Keratinize Radiological Knowledge**

Participants

Bruna Gherardi, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

Teaching points To demonstrate the features of cross-sectional imaging cholesteatomas, indications and limitations of HRCT and MRI. To illustrate the main complications of cholesteatomas and post-operative assessment.

### **TABLE OF CONTENTS/OUTLINE**

Table of contents / Outline Background. Imaging protocol. Basic anatomy: middle and inner ear. Features of external and middle ear cholesteatomas. The role of CT and MRI in the diagnosis of cholesteatoma. Extra auricular cholesteatoma. Complications of cholesteatoma. Assessment of recurrence and postoperative findings through CT and MRI. Take home messages.

## **HNEE-96 What a Pain in the... Imaging Findings of the Painful Ear**

Participants

Bruna Gherardi, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Teaching points To detect the imaging features of the painful ear. To identify the main CT features of incipient and coalescent acute mastoiditis as a basis for recommending conservative or surgical management. To detect intracranial complications of acute inflammatory diseases.

#### **TABLE OF CONTENTS/OUTLINE**

Table of Contents/Outline Background. Basic anatomy of the external, middle and inner ear. HRCT and MRI imaging protocol. The role of CT and MRI in the diagnosis of mastoiditis. Necrotizing external otitis. Local complications: Myringosclerosis / tympanosclerosis, Ossicular fixation and erosion, Labyrinthine fistula, Labyrinthitis, Periosteal / Bezold's abscess. Extensive complications: Dural sinus thrombosis, Meningitis, Subdural effusion, Brain abscess, Petrous apicitis.

#### **HNEE-97 Nose Job: A Work in Progress... Aesthetic Procedures of the Nose - Pre and Postoperative**

#### **TEACHING POINTS**

1. Review the structural anatomy of the nasal region 2. Detail the nasal functional anatomy for a successful rhinoplasty surgery. 3. Guide the radiologist to detail anatomical changes relevant to the surgical procedure 4. To evaluate the computed tomography (CT) imaging as a tool for developing approaches or strategies for leading aesthetic nasal surgical procedures. 5. To evaluate the postoperative CT images as a tool for evaluating changes, sequels and complications after the aesthetic surgical procedure.

#### **TABLE OF CONTENTS/OUTLINE**

1. Introduction a. Nasal anatomy b. Nasal functional anatomy c. Nasal deformities d. Clinical application of CT to aesthetic procedures of the nose 2. Preoperative CT image a. What should be evaluated: bony pyramid, cartilaginous pyramid, nasal valves, nasal deformities 3. Postoperative CT image a. Surgical techniques and imaging findings: rhinoplasty, septoplasty, rhinectomy, maxillary antrostomy and uncinectomy, nasal turbinate surgery, ethmoidectomy, nasal prosthesis b. Complications c. Sequels 4. Take-home messages

#### **HNEE-98 Precision Imaging of Diplopia: MRI Protocol and Various Diseases**

#### **TEACHING POINTS**

Diplopia is a relatively common neuro-ophthalmological symptom and has a variety of causes. Here, a high-resolution MRI protocol specialized for diplopia is introduced, and various imaging findings related to diplopia are presented.

#### **TABLE OF CONTENTS/OUTLINE**

Diplopia MRI should be designed to include the entire pathway of cranial nerve (CN) III, IV, and VI, and the orbit. In general, 3D heavily T2-weighted images or 3D proton-density weighted images are often used for evaluation of the cisternal segment of CNs. However, the cisternal segment of CN4 is so small that high resolution 3D true fast imaging with steady-state free precession (Trufi) is required: a slice thickness of 0.3mm, and a scan range acquired above and below of the junction of inferior colliculus and superior medullary velum in the brainstem (figure 1). For the cavernous segment of CNs, contrast-enhanced 3D T1 Volumetric interpolated breath-hold examination (VIBE) image with fat-suppression allow us to identify normal CNs located therein (figure 2). The anatomical classification of etiologies associated with diplopia can be divided into brainstem lesions (figure 3), cistern (figure 4), cavernous (figure 5), and orbital regions. Causes that can cause diplopia include congenital diseases, vascular lesion, tumor, inflammation, infection, and trauma, etc.

Printed on: 04/12/24

## Abstract Archives of the RSNA, 2023

HNEE-1

### Don't Lose Your Nerve: Pictorial Review of Cranial Nerve Denervation in the Head and Neck

#### Participants

Rachel Saks, MD, Rego Park, NY (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Review the pathophysiology of denervation and the subsequent imaging changes that occur within the muscle over time.2. Review the anatomy of the cranial nerves with motor function, particularly focussing on the muscles innervated by each nerve and their appearances with acute and chronic denervation.3. Review potential imaging pitfalls due to denervation changes, such as misinterpretation of contralateral FDG uptake in the setting of vocal cord palsy.

#### TABLE OF CONTENTS/OUTLINE

1. Pathophysiology of denervation2. Imaging findings in acute, subacute and late denervation3. Cranial nerve anatomy and appearances of denervation of the muscles innervated by the specific nerve- Oculomotor nerve- Trochlear nerve- Abducens nerve- Trigeminal nerve- Facial nerve- Glossopharyngeal nerve- Vagus nerve- Spinal Accessory nerve- Hypoglossal nerve4. ### Don't Get Trapped: Diagnostic Errors in Emergency Head and Neck Radiology

#### Participants

Thiago Jose Pinheiro Lopes, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- An incidence of 3-4% of errors in the radiological routine is estimated. In the emergency room, the accuracy of the diagnosis becomes even more relevant, considering the need to take more immediate measures depending on the imaging findings. - Errors in diagnostic radiology can occur for a variety of reasons. Recognizing the cognitive views that favor their occurrence is important to prevent them. - Our objective is to present a series of head and neck radiological cases, unraveling the causes of errors and then providing strategies to be followed to minimize them during radiological interpretation.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction. 2. Types of errors in diagnostic radiology (Renfrew Classification). 3. Series of misdiagnosis real cases in emergency room head and neck radiology, including: a) Case discussion: anatomy review, possible complications related to an error in image interpretation. b) Identification of the error causes. c) Tips on how to avoid them. 4. Challenges, pearls and pitfalls when interpreting a head and neck radiological exam. 5. Take home messages.

HNEE-11

### Basic Principles of Nasal Imaging

#### Participants

Mina Al-Ani, MBCh, Elmsford, NY (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Nasal masses can originate in the nasal cavity or adjacent structures. Utilizing a systematic approach for evaluating nasal imaging plays a crucial role in establishing a differential diagnosis, treatment, and surgical planning. After a review of nasal anatomy using illustrations and cross-sectional images, we discuss the fundamental principles of nasal imaging and their application in the analysis of a broad spectrum of nasal abnormalities. Imaging features and clinical findings of these lesions are discussed.

#### TABLE OF CONTENTS/OUTLINE

1. Brief introduction emphasizing the role of imaging in diagnosing nasal lesions. 2. Illustration of nasal anatomy. 3. Principles of nasal imaging used in the evaluation of a wide range of nasal lesions, including but not limited to: a. Congenital lesions (e.g., encephalocele, supernumerary tooth, and nasolabial cyst) b. Benign masses (e.g., schwannoma, paraganglioma, and inverted papilloma) c. Malignant masses (e.g., squamous cell carcinoma, esthesioneuroblastoma, and nasal metastasis) d. Infectious and inflammatory lesions (e.g., fungal sinusitis, granulomatosis with polyangiitis, and rhinoscleroma) e. Pseudomasses (e.g., pneumosinus dilatans, septal hematoma, and rhinolith). 4. Conclusion.

### Orthognathic Imaging: Pre- and Post-Surgical Considerations for Craniofacial Reconstruction

#### Participants

Jeffers Nguyen, MD, New Haven, CT (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The interpretation of orthognathic imaging studies is a growing part of both general and subspecialty neuroradiology practice. These studies are performed to evaluate a wide range of conditions, including congenital anomalies, traumatic injuries, neoplastic growth, and iatrogenic complications. They are necessary for successful craniofacial reconstruction. Surgical planning and post-surgical follow-up studies are used to evaluate for appropriate jaw alignment and bite and to assess for complications. These topics may not be covered in depth by educational materials at the residency and fellowship levels. We hope to provide an accessible, illustrative review at graded levels of orthognathic imaging for the trainee, general radiologist, and neuroradiologist. Finally, we will also briefly touch on principles related to imaging for an increasingly prevalent procedure, facial feminization surgery, and we will share cases related to our institution experience.

#### TABLE OF CONTENTS/OUTLINE

1) Etiologies of Maxillofacial Deformities; 2) Important Orthognathic Terms and Concepts; 3) Orthognathic Surgical Procedures and their Indications; 4) Pre- and Post-Surgical Orthognathic Imaging Considerations; 5) Overview of Facial Feminization Surgery (FFS); 6) Utility of Orthognathic and FFS Presurgical Planning Macros and Reporting Checklists

### Hypervascular Neck Lesions: From the Most Common to Uncommon Pathology

#### Participants

Hugo Velazquez, MD, Mexico City, Mexico (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

-To describe the anatomy of the neck spaces and its contents. -To determine the protocols used in suspected neck lesions by CTA and MRA. -To list the most common and uncommon neck lesions with a hypervascular pattern enhancement. -To illustrate clinical scenarios of these lesions.

#### TABLE OF CONTENTS/OUTLINE

1. A pictorial review of the anatomy of the neck spaces and its contents. 2. CTA and MRA protocols for the approach of neck lesions. 3. Key points of the most common vascular neck lesions. 4. Examples of uncommon vascular lesions of the neck to keep in mind.

Printed on: 04/12/24

HNEE-14

### Breaking the Ultrasound Barrier: Review of Sonographic Imaging of the Neck

#### Participants

Anu Kamalasanan, FRCR, MBBS, East Renfrewshire, United Kingdom (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1) Tongue pathology can be assessed, characterized and staged with USS. 2) Thyroglossal duct pathology are better assessed with USS as avascular cystic structure in infrahyoid midline anterior to the pre epiglottic space and cranially extending deep to the hyoid towards the midline posterior tongue which move dynamically with deglutition and protrusion of tongue. 3) Tonsils are seen as predominantly hypoechoic regions of alternating hyper and hypoechoic striations in the oropharynx, at the level of and deep to submandibular gland. 4) Pre epiglottic and paraglottic fat spaces are visualized as homogeneously hyperechoic avascular fat filled spaces with pathology presenting as hypoechoic mass. 5) Thyroid cartilage involvement presents with dehiscence of the hyperechoic cortex and infiltration of medulla and extra laryngeal tissues.

#### TABLE OF CONTENTS/OUTLINE

1) Illustrate with examples the normal sonographic appearance and contents of surgical triangles of the neck. 2) Illustrate with examples the sonographic cervical lymph nodal stations, normal and pathological sonographic appearance of lymph nodes. 3) Illustrate with example the normal sonographic appearance of the soft tissues of the neck, including sonographic appearance of tongue, oropharynx, supraglottis and larynx. 4) Illustrate with examples the pathological sonographic appearance of the soft tissues of the neck, including pathology of tongue, oropharynx, supraglottis and larynx.

### Imaging of Nasal, Paranasal, and Skull Base Lesions: A Comprehensive Review

#### Participants

Kota Yokoyama, PhD, Tokyo, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The World Health Organization's (WHO) Classification of Head and Neck Tumors, Fifth Edition, is now available in 2022. This book is essential for radiologists to consider differential diagnosis and to obtain clinical information. On the other hand, the classification is based on the origin of the lesion and the genes, which makes it inconvenient as a guide for specific anatomical sites. For example, bone and soft tissue tumors, hematologic tumors, melanotic tumors, minor salivary gland tumors, germ cell tumors, and neuroendocrine tumors which can occur anywhere in the head and neck region, are classified in their own category, creating unexpected pitfalls when considering the differential diagnosis of nasal, paranasal, and skull base lesions. In addition, since the book is not intended for radiologists only, it does not cover a wide range of useful diagnostic imaging findings. Focusing on the radiologist, this exhibition will provide a comprehensive review of CT, MRI, and nuclear medicine imaging findings of lesions that can occur in the nasal, paranasal, and skull base.

#### TABLE OF CONTENTS/OUTLINE

1. Anatomy of nasal, paranasal, skull base
2. Sinonasal tract (nasal, paranasal, skull base) origin tumors
3. Other origin tumors involving the sinonasal tract
4. Inflammation involving the sinonasal tract
5. Infections involving the sinonasal tract

Printed on: 04/12/24

## Abstract Archives of the RSNA, 2023

HNEE-16

### Clinical-radiologic Correlation of Acute Disorders of the Afferent Visual Pathway

#### Participants

Kyle Robey, MD, Brookline, MA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The afferent visual pathway includes structures that perceive and process visual information, as well as the intervening nerves and white matter tracts. Acute processes affecting the globes, optic nerves, optic tracts, optic radiations, and occipital cortices may result in sudden onset of vision loss. Given the relatively large anatomical area over which the afferent visual pathway is distributed, the insults which can occur are diverse in etiology. A broad differential should initially be considered, which can be focused by relevant history. Moreover, though the entire afferent visual pathway should be scrutinized in the setting of an acute visual deficit, an ocular examination and visual field campimetry may further localize the affected anatomical structure. Therefore, familiarity with the clinical presentation and neuro-ophthalmological exam can guide the radiologist in evaluating and interpreting CT and MR images.

#### TABLE OF CONTENTS/OUTLINE

1) Review of the anatomy of the afferent visual pathway 2) Analyze and understand the main elements of a basic eye exam and correlate the findings with the affected anatomical area 3) Review common and uncommon conditions of acute vision loss which span the afferent visual pathway

Printed on: 04/12/24

### Open Your Eyes! What Every Radiologist Should Know About Orbit Vascular Lesions

#### Participants

Marcella N. Brandao, MD, MEd, Salvador, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Understand well the anatomy of the orbit and dominate the normal in the image; Distinguish the pathologies that affect the extraconal, intraconal and both compartments; Recognize and review the particularities of the main diseases in the illustrative cases, both in Computed Tomography and Magnetic Resonance;

#### TABLE OF CONTENTS/OUTLINE

Every radiologist needs to be attentive to the details involving vascular lesions of the orbit. These diseases are infrequent, some extremely rare, but they cannot go unnoticed in differential imaging diagnoses. In addition, the natural history, growth pattern and histological composition of each lesion must be taken into account for the correct diagnosis. It is essential to recognize and keep in mind the diagnosis of: capillary hemangioma; venous lymphatic malformation; arteriovenous fistula; venous cavernous malformation; cavernous carotid fistula; ophthalmic artery aneurysm. Each image finding in the different modalities will be exemplified in detail through figures, descriptions and tables. Furthermore, the present study will make you a more complete radiologist, as it will explain the anatomy of the orbit relating it to each lesion in a direct, simple and intuitive way, making your diagnosis accurate and fast. In addition to serving as a guide for quick reference on the topic.

### Multimodality Imaging of Salivary Glands

#### TEACHING POINTS

1. To discuss the anatomy of major salivary glands 2. To review salivary gland pathology categories and associated epidemiology 3. To describe ultrasound, CT/MRI features of common pathologies with pathologic correlation 4. To introduce newly described entities in salivary gland pathology 5. To highlight the utility of percutaneous biopsy, with technical considerations

#### TABLE OF CONTENTS/OUTLINE

1. Normal anatomy a. Parotid b. Submandibular c. Sublingual 2. Common salivary gland pathologies a. Sialolithiasis b. Sjogren syndrome c. Infectious/Inflammatory conditions d. Cysts e. Neoplasms (with hints based on patient demographics and risk factors)  
i. Benign 1. Pleomorphic adenoma 2. Warthin's Tumor 3. Cystadenolymphoma 4. Other- Hemangioma, Oncocytoma, Basal Cell Adenoma ii. Malignant 1. Mucoepidermoid carcinoma 2. Adenocystic carcinoma 3. Squamous cell carcinoma 4. Adenocarcinoma 5. Acinic cell carcinoma 6. Lymphoma iii. Metastases 3. Newly described salivary gland pathology a. Sclerosing polycystic adenoma b. Mucinous/secretory variant of myoepithelioma c. Mammary analog secretory carcinoma d. Cribriform adenocarcinoma e. IgG4-related disease 4. Pitfalls 5. Percutaneous biopsy a. Approach and anatomical considerations b. FNA versus Core c. US vs CT guidance d. Complications 6. Summary/conclusion

HNEE-19

### Pediatric Head and Neck: On Call Resource

#### Participants

Alexandra Foust, DO, North Royalton, OH (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. The spectrum of acute non-traumatic disease in the pediatric head and neck differs from that in adults. 2. Consider foreign body ingestion or aspiration in young child with sudden-onset respiratory distress or paroxysmal cough. 3. Meningitis, empyema, and venous sinus thrombosis are important complications of pediatric sinusitis or otomastoiditis cases.

#### TABLE OF CONTENTS/OUTLINE

The vast array of acute non-traumatic pathologies encountered in the pediatric head and neck can be an intimidating subject for residents on busy call rotations with limited time to look up information. Although there is some overlap with adult diseases, many entities are more common in the pediatric population and, thus, it is important for radiologists caring for children to be well-versed in this topic. This multi-institutional, multimodality exhibit will be structured as an on-call resource for trainees, organized by anatomic location and highlighting key points, pearls, pitfalls, and mimics of many acute non-traumatic pathologies in the pediatric head and neck: Selected Examples: 1. Orbit: peri-orbital and orbital cellulitis, dacryocystitis, optic neuritis, proptosis 2. Sinonasal: complicated sinusitis 3. Ear: labyrinthitis, otomastoiditis, petrous apicitis 4. Oral/airway: epiglottitis, laryngotracheobronchitis, tonsillitis and peritonsillar abscess, Ludwig angina 5. Neck/spine: Grisel syndrome, retropharyngeal abscess, lymphadenitis, sialadenitis, torticollis, infection of congenital cysts, osteomyelitis 6. Variable: foreign body insertion (oral/nasal), angioedema 7. Vascular: Lemierre syndrome, vasculitis, nontraumatic dissection, and complicated vascular malformations

### Proton Beam Therapy for Skull Base Chordoma and Chondrosarcoma: A Guide for the Radiologist

#### TEACHING POINTS

- High-quality CT and MRI are critical for optimising surgical and radiotherapy decision-making and treatment in skull base chordoma and chondrosarcoma
- A detailed radiology report at the time of proton planning is essential for assessment of baseline and postoperative tumor sites, including distance to critical structures, with a required gap of =3mm from brainstem and =5mm from the optic apparatus
- Radiologists should be aware of surgical approaches to skull base tumors
- Radiologists should understand imaging appearances following multilayer endoscopic skull base repair and be aware of their evolution over time

#### TABLE OF CONTENTS/OUTLINE

Skull base chordoma and chondrosarcoma are rare, locally aggressive tumors. Treatment consists of maximal surgical resection and postoperative adjuvant therapy. Proton beam therapy enables dose escalation to tumor while limiting exposure dose to critical neurologic structures (brainstem, optic apparatus). High-quality pre-operative CT and MRI are critical for proton planning. MRI should include T2, T2 fat saturation, T1, volume FLAIR, FIESTA and postcontrast T1 fat saturation, with at least one volume sequence. Preoperative CTA BrainLab with bone reconstructions enables assessment of bone erosion, vascular relations and anatomical assessment for endoscopic-approach surgery. Intraoperative MRI should be considered to confirm clearance from dose-limiting structures. Post-operative MRI is optimally performed at <48 hours to enable optimal distinction between post-operative changes relating to multilayer skull base repair and tumor residuum.

HNEE-20

### Congenital and Infantile Masses of the Head and Neck

#### Participants

Alexandra Foust, DO, North Royalton, OH (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. A rapidly growing mass lacking high vessel density (Doppler US), internal flow-voids (MRI), and arterial-phase enhancement (MRI) should raise concern for lesions other than hemangioma. 2. It is important to describe the relationship of fetal head and neck masses to the airway so that appropriate delivery plans (EXIT procedure) can be made.

#### TABLE OF CONTENTS/OUTLINE

The spectrum of congenital and infantile head and neck soft tissue masses is broad, including developmental structural deformities/deficiencies, ectopic tissues, and benign and malignant neoplasms. It is important for radiologists to be aware of the imaging features of these lesions so that timely and appropriate management can be pursued. This multi-institutional, multimodality exhibit highlights pearls and pitfalls from fetal and post-natal cases encountered during clinical practice to illustrate the imaging appearance of numerous common and rare infantile masses in the head and neck using an anatomic approach. Selected Examples: 1. Skull/scalp: Cephalohematoma and other collections 2. Nasal: nasal glial heterotopia, cephalocele 3. Orbital: dacryocystocele, orbital varix 4. Oral/airway: epulis, epignathus, nasopalatine duct cyst, vallecular cyst, hairy polyp, sialoblastoma 5. Ear: cholesteatoma 6. Neck: thyroglossal duct cyst, ectopic thyroid or thymus, fibromatosis coli 7. Variable: dermoid/epidermoid, branchial apparatus anomaly, vascular anomalies, neuroblastoma, rhabdomyosarcoma, infantile fibrosarcoma, melanotic ectodermal tumor of infancy.

HNEE-21

### Post-operative Imaging in Oncologic Skull Base Surgery Reconstructions

#### TEACHING POINTS

? There is a broad spectrum of surgical techniques in resection of skull base tumors. ? Recognizing normal aspects of post-surgical grafts is important to differentiate from recurrent disease in skull base surgery. ? Radiologist plays an important role in preoperative and post-surgical management of this lesions.

#### TABLE OF CONTENTS/OUTLINE

Anatomy and normal variants Skull base surgery is a complex procedure that involves accessing and operating on the delicate structures and the anatomical complex area at the base of the skull. It is challenging even for experienced surgeons and radiologists. It forms the floor of the cranial cavity and separates the brain from other facial and neck structures. It is divided into three regions: the anterior skull base, the middle skull base, and the posterior skull base. Each of these regions has its own unique anatomy and challenges when it comes to surgery. For a successful surgery, knowledge of the normal variants of the anatomy is crucial to avoid iatrogenic lesions during surgery. Some important normal variants include the pneumatization of the anterior clinoid process, sphenoidal (Onodi) cells, and postsellar pneumatization from the sphenoid sinus. These variants are associated with a greater risk for carotid and optic nerve injuries as well as cerebrospinal fluid (CSF) rhinorrhea. Neurosurgical options in accessing the skull base ? Frontotemporal ? Subfrontal ? Transpetrosal ? Lateral ? Endoscopic endonasal Common Neoplasms ? Pituitary adenoma ? Schwannoma ? Meningioma ? Olfactory neuroblastoma ? Skull base invasion from head and neck tumor Normal imaging characteristics of post-surgical grafts When to suspect a recurrent tumor?

### Complications of Paranasal Sinus Mucoceles: A Pictorial Review

#### Participants

Joseph Carbone, MD, Orange, CA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Teaching Points: 1. Review mucocele CT and MR imaging characteristics and their variance, as well as potential locations to be aware of with a highlight on important adjacent structures. 2. Describe complications of mucoceles with CT and MR correlates with a focus on findings requiring urgent management. 3. Provide radiologists with a framework for reporting when discussing mucoceles, adjacent structures, and their pertinent negatives as it relates to mucocele complications.

#### TABLE OF CONTENTS/OUTLINE

Mucoceles are slow-growing lesions that result from obstruction of the facial paranasal sinuses. While they are most often benign, they can sometimes lead to urgent or severe pathology in nearby structures. The severity of clinical presentation varies depending on the sinus involved, ranging from asymptomatic to intracranial extension resulting in blindness. Further, radiologists should be aware for their potential for aggressive behavior and have an understanding for relevant reportable findings when describing mucoceles pertaining to mass effect and the location of adjacent structures, superimposed infection, and intracranial extension. This educational exhibit aims to review varying imaging characteristics of mucoceles and their potential locations using CT and MRI correlates. A pictorial review of mucoceles and their severe complications will be used to highlight key reportable imaging findings for radiologists when describing mucoceles and their involvement with adjacent structures.

HNEE-23

### Imaging of the Skull and Facial Bones for Pediatric and Adult Patients

#### Participants

Minako Azuma, MD, PhD, Miyazaki, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. In pediatric and adult patients, a wide variety of abnormalities are found in the skull and facial bones, including tumors, inflammations, congenital disease, and so on. Additionally, there are also secondary changes in bone associated with some diseases. 2. It is necessary for radiologists to know radiological findings of the skull and facial bone disorders. 3. Radiologists also have to know normal variations that have no pathological significance.

#### TABLE OF CONTENTS/OUTLINE

1. Anatomy and normal development of the skull and facial bones 2. Techniques for the imaging of the skull and facial bones (1) CT (2) MRI (3) CT like bone imaging in MRI 3. Normal variants of the skull and facial bones (1) Shape and thickness (2) Bone marrow (3) Pneumatization 4. Disorders of the skull and facial bones (1) Abnormality associated with suture (craniosynostosis) (2) Tumors and allied diseases a) Benign: Chordoma, osteoma, meningioma, and so on b) Malignant: chondrosarcoma, rhabdomyosarcoma, metastasis c) Allied diseases: Epidermoid cyst, hemangioma, Langerhans Cell Histiocytosis, and so on (3) Systematic disease a) Hematologic disorders: leukemia, multiple myeloma, anemias b) Metabolic and endocrine disorders (4) Metabolic and endocrine disorders: primary hyperparathyroidism (5) Inflammation and infection: osteomyelitis (5) Secondary changes in bone: Hyperostosis, blistering 3. Take home points 4. References

### Sonographic Evaluation of Major Salivary Glands: A Pictorial Review

#### Participants

Rachita Khot, MD, Charlottesville, VA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

High-resolution ultrasound imaging plays a key role in evaluating focal versus diffuse salivary gland diseases and differentiating benign versus malignant lesions. This exhibit will discuss approaches to diagnosis and 1. Review the typical and uncommon sonographic appearances of pathologies involving the salivary glands2. Discuss the OMERACT Ultrasound Scoring System in primary Sjögren's Syndrome3. Discuss the next step in the management of the pathologies

#### TABLE OF CONTENTS/OUTLINE

1. Illustration of major salivary gland and surrounding structures2. Ultrasound imaging techniques, sonographic landmarks, and normal anatomy 3. Approach to diagnosis4. OMERACT Ultrasound Scoring System in Sjögren's Syndrome • Background • Grey-scale scoring with imaging examples: Grade 0, normal parenchyma; Grade 1, mild inhomogeneity without anechoic or hypoechoic areas and hyperechogenic bands; Grade 2, moderate inhomogeneity with focal anechoic or hypoechoic areas; Grade 3, severe inhomogeneity with diffuse anechoic or hypoechoic areas occupying the entire gland 5. Pathologies of the major salivary glands • Congenital: Lymphoepithelial cysts, Epidermoid cyst • Sialadenitis: Acute and chronic; Abscess • Sialolithiasis: Obstructing and non-obstructing stones in the duct • Sialectasis • Neoplasms: Hemangioma, Lymphangioma, Lipoma, Adenomas (Pleomorphic, Basal cell, Warthin's), Carcinoma (Adenoid cystic carcinoma (Ca), Mucoepidermoid Ca, Acinar cell Ca, Squamous cell Ca), Lymphoma, Metastasis • Others: Intraglandular lymph nodes, Trauma, AV fistula6. Management and follow-up • Role of CT and MRI in the further workup • Role of biopsy7. Conclusion

### Decoding Cystic and Cyst-Like Lesions in the Head and Neck: A Comprehensive Imaging Guide

#### Participants

Maria Lucia Brun, MD, OTTAWA, ON (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- To identify the relevant imaging features of cystic and cyst-like lesions of the head and neck. - To describe the differential diagnosis of cystic and cyst-like lesions of the head and neck, based on imaging and anatomical location.- To learn the importance of incorporating relevant/pertinent clinical information in narrowing the differential diagnoses. - To recognize the course and potential complications associated with cystic and cyst-like lesions.- To suggest appropriate follow-up and recommend effective diagnostic workup.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction/Background2. Role of Diagnostic Imaging- Ultrasound- CT - MRI3. Approach based on locationOnce the cystic nature is confirm ? evaluate differential diagnosis according to location:- Anterior neck - Midline lesions: Parapharyngeal/pharyngeal cysts, Ranula, Thyroid cysts, Parathyroid cysts, thyroglossal duct cyst, thymic cyst, dermoid/epidermoid cyst.- Lateral - Paramedian lesions: Branchial cleft cysts, Lymphatic malformations, suppurative/caseating adenopathy (infectious/inflammatory), cystic adenopathy (thyroid cancer and HPV-related SCC).- Specific spaces: Salivary glands; entities which may present as a cyst in the salivary glands: Lymphoepithelial cysts, Epidermal inclusion cysts, Warthin tumor, Mucocele, etc.4. Others- Not location-dependent: Lymphocele, Seroma, Abscesses.5. Conclusion

### Chew It All Up! Everything You Need to Know About Teeth

#### Participants

Bruna Gherardi, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The high prevalence of craniofacial trauma, sinus infection disease, and maxillomandibular procedures, among other conditions, frequently requires the interpretation of dental images in daily practice. Teeth can be the source or the extension of a pathologic process and therefore must not be overlooked by radiologists. Radiologists can use their knowledge of the main dental imaging findings in emergency radiology to add great value to image interpretation. In this study we will describe the anatomy of the structures surrounding the teeth. Identify the main dental alterations in the emergency or outpatient setting. Train the radiologist to look accurately at lesions, mainly inflammatory ones related to dental disorders.

#### TABLE OF CONTENTS/OUTLINE

General and dental anatomy. Inflammatory conditions related to teeth as pericoronitis, periodontal disease, periapical abscess, dental sinusitis, facial cellulitis and abscess, orbital cellulitis, Ludwig's angina, dental trauma, complications of dental procedures like dental implants and extraction. Most common tumor and tumor-like lesions related to teeth. Take home messages.

### Use Homemade Rice Bags to Improve the Image Quality of 3.0TMR Cervical Spine Enhancement Scans

#### TEACHING POINTS

1. Magnetic resonance cervical spine enhancement scan fat suppression current problems 2. To propose a method to improve image quality using rice bags

#### TABLE OF CONTENTS/OUTLINE

1. Magnetic resonance cervical spine enhancement scan fat suppression current problems • Contrast-enhanced scans of the cervical spine are mainly performed using the T1WI adipose inhibition sequence to better visualize the lesions • But in the actual examination, due to the irregular geometry of the neck, the local magnetic field is uneven, and the fat suppression is often uneven, which affects the image quality and the display of lesions 2. A method to improve image quality using rice bags is proposed. • Rice bags are simple to make and low cost • Place a rice bag under the patient's neck and a rice bag above the neck without causing discomfort • Comparing conventional MRI scans with neck-filled rice bag scans, we found that the use of rice bags can eliminate artifacts, improve lipid uniformity, and improve image quality

### Parry-Romberg Syndrome and En Coup De Sabre: A Pictorial Review

#### TEACHING POINTS

(1) Parry-Romberg Syndrome [PRS] and En Coup De Sabre [ECDS] are defined by acquired progressive hemifacial atrophy. (2) Patients may present with headache, facial pain/paresthesia, or epilepsy. (3) Atrophy can affect unilateral periorbital, midface bones and soft tissues. (4) Atrophic tissue does not demonstrate signal change or enhancement as might be seen with denervation. (5) Intracranial manifestations may also be present, although facial involvement does not predict intracranial lesion severity.

#### TABLE OF CONTENTS/OUTLINE

(1) Review definition, clinical symptomatology, expected course, and hypothesized etiologies of Parry-Romberg Syndrome (PRS) and linear scleroderma/En Coup De Sabre (ECDS), disease processes characterized by progressive hemifacial atrophy. (2) Review imaging findings of facial soft tissue atrophy and intracranial abnormalities in PRS and ECDS, as derived from a review of 40 PRS patients at a single institution, including brain, neck and face CTs and MRs. (3) Atrophy in PRS and ECDS predominantly affects periorbital, midface and scalp soft tissues, typically without MR signal intensity change, distinguishing it from denervation atrophy. (4) Clinical severity of facial soft tissue atrophy does not predict intracranial lesion severity.

### Revisiting Distant Metastasis in Head and Neck Cancer

#### Participants

Naoko Saito, MD, PhD, Tokyo, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Distant metastasis (DM) in head and neck cancer (HNC) is relatively uncommon. When DM occurs, the prognosis is considered miserable, with median overall survival of under one year. Although little attention has been focused on the treatment of DM, recent reports on oligometastasis have changed the therapeutic approach to DM. For patients with oligometastasis, aggressive local treatment of metastatic sites may achieve prolonged survival. This educational exhibit reviews the epidemiology, imaging findings, and risk factors of DM of HNC and summarizes the current knowledge of the oligometastasis of HNC. The teaching points are: 1. To understand the mechanisms and patterns of DM of HNC. 2. To learn the characteristic imaging findings of DM based on the site and histopathology. 3. To learn the current knowledge about the characteristics and the therapy of oligometastasis in HNC.

#### TABLE OF CONTENTS/OUTLINE

1. The definition of DM: the pathophysiology (hematogenous, lymphatic spread), the timing (synchronous, metachronous), the spectrum of metastasis (polymetastasis, oligometastasis, oligorecurrence, oligoprogression) 2. The site-based approach of DM (lung, bone, liver, brain, skin, etc.): pathophysiology, incidence, imaging findings 3. The cancer-based approach of DM: histopathology (SCC, EBV/HPV associated SCC, thyroid cancer, salivary gland cancer, neuroendocrine tumor, melanoma, etc.): incidence, imaging findings 4. Summary of the risk factors for DM: literature review 5. Therapy: current concepts

### Nasolacrimal System Pathologies: What a Radiologist Needs to Know

#### TEACHING POINTS

- While reading a CT, deliberate consideration should be given to the density of the contents within the nasolacrimal duct and for the evaluation of wall thinning.
- The extent of soft tissue disease is evaluated using magnetic resonance imaging (MRI), and contrast-enhanced MR is particularly helpful in distinguishing soft tissue from fluid.
- Nasolacrimal duct may act as a conduit for the transmission of pathologies from the orbit to the sinonasal cavity and vice-versa.
- Primary nasolacrimal malignancies are rare and often have delayed diagnosis due to presentation mimicking benign aetiology.

#### TABLE OF CONTENTS/OUTLINE

?Describe normal Nasolacrimal duct anatomy with images. ?Illustrate with images the Nasolacrimal duct pathologies. ?Discuss management pathway.

### Hyoid Bone: Anatomy, Embriology, Developmental Malformations and Symptomatic Cases

#### Participants

Beatriz Prado, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

This panel aims to: Review the structure and function, embriology, anatomy and physiologic variants of the hyoid bone. Discuss and describe through illustrative cases the imaging patterns of the main pathologies involving the hyoid bone.

#### TABLE OF CONTENTS/OUTLINE

Review of the hyoid bone structure and function  
Review of the hyoid bone anatomy, including suprahyoid and infrahyoid muscles, relation to blood vessels and nerves.  
Physiologic variants  
Clinical cases involving the hyoid bone:  
-Hyoid bone insertion tendinitis (hyoid bone syndrome)  
-Calcified stylohyoid ligament and Eagle syndrome  
-Traumatic lesions, including body and greater horn luxation and hyoid fracture  
-Triticeal cartilage ankylosis in the hyoid  
-Thyroid lamina ankylosis in the hyoid  
-Ectopic thyroid gland adjacent to the hyoid bone  
-Vascular compression  
-Sistrunk procedure  
-Ectopic thyroid gland adjacent to the hyoid bone  
Final remarks

### How to Find CHD7 Disorder: Beyond CHARGE Syndrome

#### TEACHING POINTS

CHARGE syndrome is named after an acronym for the characteristic signs (coloboma, heart defect, atresia choanae, retarded growth and development, genital hypoplasia, ear anomalies/deafness). CHD7 is the causative gene for CHARGE syndrome. Recently, CHD7 mutations have been detected in cases that do not show typical signs of CHARGE syndrome, and the concept of CHD7 disorder has been proposed to include the broader spectrum of CHD7 mutations. Even in such atypical cases, the characteristic imaging findings of CHARGE syndrome are detected. The purpose of this educational exhibit is to: 1. Present the disease concept of CHARGE syndrome<sup>2</sup>. Detail the characteristic imaging findings of CHARGE syndrome<sup>3</sup>. Outline the broader spectrum of CHD7 disorders and provide cases in which imaging findings help identify CHD7 mutations, even in atypical CHARGE syndrome

#### TABLE OF CONTENTS/OUTLINE

1. CHARGE syndrome a. Concept b. Clinical presentation c. Causative gene -CHD7- 2. Imaging findings a. Key finding -semicircular canal hypoplasia- b. Additional findings of the face and skull base 1) Auditory system and temporal bone 2) Eye, palate, and olfactory system 3) Clivus c. Others 3. CHD7 disorder a. Concept b. Cases that the imaging findings implicate CHD7 mutations 1) Severe combined immunodeficiency 2) Mild phenotype 3) Kallmann syndrome

### A Particular Pain in the Neck: Taking a Radiology's Journey from Imaging to Immunohistochemistry

#### Participants

Karla Anabel Borgna, MD, Pilar, Argentina (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Reviewing the variability of head and neck tumor entities and their mode of presentation, excluding squamous Cell Carcinoma. Identifying radiological signs, anatomical relationships and learning how to report them. Correlating the radiological features of head and neck tumors (non-squamous cell carcinoma) with immunohistochemistry and histological findings. Emphasize the role of the radiologist as a key contributor to the orientation of the tumor's etiology.

#### TABLE OF CONTENTS/OUTLINE

Introduction  
Case-based approach with radiologic correlation  
Imaging findings with histologic and immunohistochemical correlation  
Take-home message  
References

Printed on: 04/12/24

HNEE-34

### 3N: Not Common Nose, Nasal Cavity and Nasopharynx Tumors

#### TEACHING POINTS

Sinonasal neoplasms are rare, accounting for only 3 % of head and neck malignancies, among the most frequent tumors reported are adenocarcinoma, squamous cell carcinoma, undifferentiated carcinoma, olfactory neuroblastoma, sinonasal lymphoma, and sinonasal mucosa melanoma. The complex anatomy and histology of this region make evaluation a challenge for the clinician. Fortunately, in these kinds of tumors, Computed tomography and magnetic resonance imaging, plays an important role in surgical and therapeutic planning, especially in the involvement of those small parts such as involvement of the anterior and middle cranial fossae, pterygopalatine fossa, pterygomaxillary fissure, foramen rotundum, vidian canal, inferior orbital fissure, orbital apex, and perineural involvement, therefore some distinguishing features can help narrow the differential diagnosis and assess the true extent of the disease.

#### TABLE OF CONTENTS/OUTLINE

Epidermoid carcinoma, Carcinoid tumor, Peripheral nerve sheath tumor, Rhabdomyosarcoma, Sinonasal undifferentiated carcinoma, Ewing sarcoma, Sinonasal Melanoma, Lymphoma, Esthesioneuroblastoma andsinonasal juvenile angiofibroma

Printed on: 04/12/24

### Sinonasal Tumors: What the Tumor Board Wants to Know

#### Participants

Alexander Moeller, MD, (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. There is a long differential diagnosis for tumors occurring within the sinonasal cavity with overlapping imaging features. 2. Pathology is critical in diagnosis and determining treatment. 3. Most primary tumors are staged based on the TNM classification. TNM tumor staging is predominantly based on tumor location and tumor extension, which differs between lesions that arise from the maxillary sinus and those that occur within the ethmoid/nasal cavity. 4. Esthesioneuroblastomas are staged based on the Kadish classification system. 5. Sinonasal tumors are primarily treated with surgical resection. 6. Chemotherapy and radiation may be administered prior to surgery for larger lesions, following surgery for residual or recurrent disease or in place of surgery for a palliative approach.

#### TABLE OF CONTENTS/OUTLINE

1. Review the differential diagnosis of sinonasal tumors based on the updated WHO classification system. 2. Discuss pathology of sinonasal tumors, incorporating molecular features. 3. Discuss the TNM staging of sinonasal tumors for lesions arising from the maxillary sinus and ethmoid/nasal cavity. 4. Review staging of esthesioneuroblastoma. 5. Treatment strategies of Sinonasal tumors: Indications for surgery, chemotherapy and radiation using a multidisciplinary approach. 6. Review imaging features of lesions that will affect treatment decisions: what the surgeon wants to know, what the medical oncologist wants to know and what the radiation oncologist wants to know.

### Face to Face: Reviewing Facial Malformations

#### Participants

Danielly Santos SR, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

This pictorial essay aims to review and synthesize the main facial malformations. The purposes of this submission are: - To review the developmental anatomy and normal embryogenesis of facial structures; - To discuss imaging features of facial malformations related to nasal cavity, frontonasal region, nasolacrimal apparatus, labiopalatine complex and craniofacial syndromes; - To present a compendium of cases involving facial malformations to exemplify;

#### TABLE OF CONTENTS/OUTLINE

There are a wide variety of congenital face abnormalities that originate during transformation of the first pair of pharyngeal arches into adult structures. Computed tomography and magnetic resonance imaging are important components in the comprehensive evaluation of these lesions. A detailed understanding of face embryogenesis and developmental anatomy is important in directing appropriate patient management. Familiarity with the characteristic imaging features of these anomalies along with knowledge of midface embryogenesis and normal developmental anatomy is essential to prevent misinterpretation of anatomic variations that may simulate disease.

### A Nod to the Nodes In Children: A Practical Clinical Approach to Pediatric Cervical Lymphadenopathy

#### Participants

Elizabeth Snyder, MD, Nashville, TN (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Cervical adenopathy is a common clinical scenario in children.- A wide variety of entities can present with cervical adenopathy; importantly, the spectrum of pathology and imaging appearance differs in many cases from that seen in adults.- While US is typically the first line imaging modality, CT, MRI and NM studies may all have a role in the workup of cervical adenopathy, with different strengths and limitations.- Radiologists must know when and with which modality to image.- This multi-institutional collaboration highlights imaging appearances of both common and uncommon disorders affecting cervical nodes in children in order to aid radiologists in their clinical practice. Pearls, pitfalls, and mimics will be included.

#### TABLE OF CONTENTS/OUTLINE

1. Introductiona. Anatomy of cervical lymph nodes (levels, etc.)b. Normal imaging appearance2. Imaging approacha. Modality selection and benefits/limitations of US, CT, MRI, NM studiesb. Systematic approach diagram highlighting helpful features (e.g., cystic, hyperenhancing, calcified, etc.)3. Infectious lymphadenopathy a. Imaging appearance b. Complications: necrosis, abscessc. Specific infectious processes: e.g., bacterial, TB, MAI, cat scratch disease4. Neoplasm a. Lymphomab. Metastasis: e.g., thyroid cancer, NPC, SCC5. Histiocytosis a. LCHb. Rosai-Dorfman disease6. Lymphoproliferative disorders: e.g., Castleman, HLH7. Unusual entities: Kawasaki, Kikuchi, MIS-C, HIV8. Mimics (lymphatic malformations, branchial cleft cysts, parotid neoplasms, etc.)9. DDX of common imaging findings: calcifications, cystic nodes10. Summary and conclusion

### Don't Miss the Forest for the Trees: Parathyroid Ultrasound - Anatomy, Technique, Pearls and Pitfalls

#### Participants

Alex Dias, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Review key aspects of the clinical, laboratorial, and imaging assessment of patients with primary hyperparathyroidism. Illustrate the role of ultrasound (US) for preoperative evaluation of parathyroid glands, including their localization, normal and pathological findings, with multimodality imaging correlations. Summarize in a practical approach the most important pearls and pitfalls for the accurate US assessment of parathyroid glands, highlighting the use of high-frequency transducers.

#### TABLE OF CONTENTS/OUTLINE

Introduction  
Anatomy of the parathyroid and adjacent structures  
Primary Hyperparathyroidism: pathophysiology and clinical aspects  
Parathyroid preoperative evaluation  
Laboratorial workup for hyperparathyroidism  
Multimodality imaging for surgical planning: US, computed tomography, magnetic resonance, and scintigraphy  
Ultrasound of the parathyroid glands  
Positioning, technique, transducers  
Typical and atypical imaging findings (B-mode, Doppler and elastography)  
US guided fine-needle aspiration (radiologic-pathologic correlations)  
Case-based review with multimodality imaging  
Pearls: novel approaches for improvement (high-frequency transducers and other strategies)  
Pitfalls: lesions of the esophagus, lymph nodes, soft tissues, and thyroid

### Look out! Conditions that Cause Proptosis

#### Participants

Erica Naves, MD, Nova Lima, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Teaching Points The purposes of this exhibit are to review the anatomy of the orbit, including the orbital content and bone structures that delimit it. Also, to demonstrate that, due to its osseous limitations, the orbit is limited to expand if any expansive process is within its limits. Therefore, several types of expansive processes manifest with proptosis. The exhibit demonstrates through illustrative cases the different scenarios that manifest with proptosis, in the context of metabolic disorder, trauma, infection, inflammatory process, vascular lesions, primary neoplasms, metastasis, among others.

#### TABLE OF CONTENTS/OUTLINE

Table of Contents / Outline The exhibit initiates with annotated images of the anatomy of the orbit, including the bone limits and contents, to demonstrate the normal appearance on computed tomography and magnetic resonance imaging. The next slides include the diagnostic criteria of proptosis, and exemplifying annotated images. The majority of the presentation include illustrative cases presenting with proptosis divided by metabolic, trauma, infection, inflammatory, vascular and neoplastic sections. Cases of thyroid-associated orbitopathy, bone fracture, orbital muscle lesion, subperiosteal abscess, idiopathic orbital inflammation, IgG4-related disease, granulomatosis with polyangiitis, carotid-cavernous fistula, venous malformation, lymphangioma, optic nerve glioma, optic nerve meningioma, orbital lymphoma, rhabdomyosarcoma, sphenoid wing meningioma, metastatic melanoma, extramedullary plasmacytoma and bone metastasis are displayed. The presentation closure contains take-home messages.

### Save Your Own Neck: A Neck Muscles Guide for Daily Practice - Anatomy, Variations, and Pathologies

#### Participants

Lucas Souza, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The purposes of this exhibit are:- Review and illustrate the anatomy and innervation of head and neck muscles, and its correlation with the cervical spaces, emphasizing the importance of understanding for the delimitation of lesions found in daily routine exams.- Describe the anatomical variations of the cervical muscles and the possible pitfalls they can cause, simulating diseases.- Determine the great injuries, separating them by their etiology, and propose an algorithm for their evaluation in cases of technical limitation.

#### TABLE OF CONTENTS/OUTLINE

- Cervical muscles:1) Division by compartments- masticatory.- pharynx (circular and longitudinal) and larynx.- front of the neck (suprahyoid and infrahyoid).- prevertebral (prevertebral and scalene).- paraspinal (suboccipital, extrinsic back, and intrinsic back (superficial, intermediate, and deep layer)).2) injuries:- congenital (agenesis, torticollis, and syndromes)- infectious/inflammatory (phlegmon, abscess, tropical myositis, necrotizing fasciitis)- trauma or surgery (denervation, myositis ossificans)- vascular anomalies.- tumors (benign, malignant, and metastasis).- Diagnostic Algorithm- Final remarks

### Unilateral Sinusitis: What Radiologists Should be Aware of

#### Participants

Janani Asogan Vaishnavi, MD, FRCR, Dundee, United Kingdom (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Rhinorrhoea and foul smelling discharge are the common clinical presentations in inflammatory / infective disease while epistaxis and/or mass effect in the cheek / palate / orbit are the common presenting features in malignancy. 2. Odontogenic sinusitis is one of the most common causes of unilateral sinus opacification followed by fungal ball and antrochoanal polyp. Inverted papilloma is the most common benign pathology, while squamous cell carcinoma is the most common malignant pathology. 3. Incidence of neoplastic disease is much higher in the presence of unilateral sinus opacification, with rise in incidence with increasing age. 4. Site of origin of inverted papilloma is often seen as focal area of hyperostosis on CT. This can be useful identifying recurrence and malignant transformation which are frequent with inadequate excision. 5. Aggressive bone destruction, especially erosion of the posterolateral wall of the maxillary sinus and extra-sinus extension is often seen in malignancy.

#### TABLE OF CONTENTS/OUTLINE

1. Radiological anatomy of paranasal sinuses including drainage pathways 2. Explain various causes of unilateral sinus opacification 3. Illustrate with images, the key radiological and pathognomonic findings to be looked for in unilateral sinus opacification 4. Provide a pictorial review of unilateral sinus opacification encountered in our centre 5. Briefly describe how to approach a case of unilateral sinus opacification

Printed on: 04/12/24

HNEE-43

### What is this Bump on the Face, Radiology? Medial Canthal Swelling, Differential Diagnosis of Angular Vein Thrombosis Radiologists Should Know

#### Participants

Nahyun Jo, MD, Galveston, TX (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The face is the first body part a physician sees when they meet a patient; it is often diagnosed and followed clinically. With the advances in imaging and increase in utilization, radiologic evaluation of facial masses is becoming more common. In certain cases, radiology plays a crucial role. Facial vein thrombosis presents as a focal facial mass-like lesion due to engorged veins. This is well-known in the traditional anatomy literature related to the "danger triangle" of the face. While thrombophlebitis is a more common etiology, more recently, facial/angular vein thrombosis secondary to periorbital cosmetic botulinum toxin injections has been reported by ophthalmologists and plastic surgeons. Due to its proximity to the sinuses, sinus-related diseases such as dacryocystocele or nasolacrimal duct obstruction often mimic angular vein pathologies. Vascular malformations such as an ophthalmic artery arteriovenous fistula, carotid-cavernous fistula, or lymphovenous malformation may also present as periorbital mass or proptosis. Other etiologies of soft tissue masses, such as skin tumors or benign masses, should also be considered.

#### TABLE OF CONTENTS/OUTLINE

We discuss the basic anatomical structures in the face that radiology trainees should know. Then we further discuss the imaging findings of facial masses ranging from the most common lipoma to uncommon lymphovascular malformations. Each of the common and unique cases is presented for each pathology with teaching points. - Introduction to facial anatomy-Infection-Trauma-Venous thrombosis-Vascular malformations-Sinus related-Benign cluster of tissues-Tumor-Foreign body and cosmetic injections

### The Tongue Has People Talking

#### Participants

Fernando Diego Choque Chavez, MD, Barcelona, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Show the anatomy of the tongue through schematic illustrations and its correlation with radiological images, indicating anatomical reference points. Determine the role of each imaging technique in the analysis of the pathology of the tongue. Review the most frequent pathology of the tongue, mainly tumors outlining the radiological findings with therapeutic implications.

#### TABLE OF CONTENTS/OUTLINE

Background Embryology and Anatomy of the tongue Imaging technique Imaging findings- Oncological tongue Radiological findings with therapeutic implications- Congenital anomalies- Inflamed tongues- Lingual denervation. The tongue is the central part of the oral cavity and the oropharynx. It is the organ of taste, plays an essential role in the formation of the alimentary bolus and in swallowing and forms part of the phonatory system. Given the importance the role of the tongue plays in the patient's quality of life, the radiologist of the head and neck should be familiar with its anatomy, the optimum imaging techniques for its evaluation, as well as its spectrum of pathologies. In this way the radiological description will reflect reliably and with anatomical detail the extent of a lesion, particularly in the area of oncology, and it will be possible to select the most appropriate treatment for each patient so as to preserve function to the maximum extent possible. The radiological evaluation will also be of special significance during the surveillance period following treatment, so the radiologist should be familiar with the main therapeutic strategies and be accustomed to the image of the treated patient as well as the most appropriate techniques for detecting tumor recurrence.

### Look on the Bright Sign: Shedding Light on Mysteries of Optic Neuropathy

#### Participants

Alice Abreu Mota, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Optic neuropathy: It may be the only manifestation of Behçet's disease in the central nervous system. Diffusion restriction may be seen in trauma and ischemia. In induced cocaine cases, it is often unilateral, due to compression or ischemia. Methanol intoxication findings included bilateral optic nerve enhancement, putamen and caudate necrosis. Leber's hereditary optic neuropathy may show increased T2 signal in the optic nerves, chiasm, and tracts. Neuritis can also simulate a tumor. The short-segment enhancement at the optic nerve-globe junction is seen on cat scratch disease. Granulomatosis with polyangiitis (GPA) is often hypointense on T2. Direct granulomatous infiltration is one of the triggers of sarcoidosis. MOG-IgG+ exhibit long-length, bilateral, and anterior optic nerve involvement. Unilateral and short-segment involvement is seen in Multiple Sclerosis. In Neuromyelitis Optica (NMO) the impairment is bilateral on posterior optic nerves and chiasm.

#### TABLE OF CONTENTS/OUTLINE

Toxic Metanol Cocaine Medicine Granulomatosis Sarcoidosis; GPA; Tolosa Hunt; IgG4 Related Disease; Cat scratch disease; Tuberculosis. Non-demyelinating Vogt-Koyanagi-Harada; Behçet's Disease. Demyelinating Multiple Sclerosis; NMO; MOG-IgG+. Others Ischemic; Trauma; Tumor.

### Facial Retaining Ligaments: Can We See It

#### Participants

Luciana Zattar, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

A thorough investigation of the layers and structures of facial anatomy is crucial when performing facial surgery and aesthetic procedures. The retaining ligaments of the face represent additional information of this anatomy and are essential in understanding principles of facial aging and rejuvenation. They are located in constant anatomic locations where they separate facial spaces and compartments. Their main significance relates to their anatomical understanding in fillers procedures and in surgical release in order to achieve the desired aesthetic outcome. Furthermore, they have a sentinel role in their anatomic relationship to facial nerve branches. Descriptions of the retaining ligaments are variable in the literature; due to different interpretations of anatomy, several classifications, locations, and nomenclature systems have been proposed, but there is no description of imaging findings. This study will review and clarify the anatomy and imaging aspects of the retaining ligaments of the face using High frequency ultrasound (HFUS/24-33MHz). The purpose of this exhibit is: (1)To illustrate the anatomy of the facial retaining ligaments with fresh-frozen specimen correlation; (2)To describe the correct examination technique; (3)To highlight the importance of HFUS in facial ligaments and nerves characterization; (4)To show the dynamic evaluation and characterization of facial ligaments with HFUS; (5)To describe the most important related facial ageing changes and aesthetic importance

#### TABLE OF CONTENTS/OUTLINE

1. INTRODUCTION; 2. ANATOMY; 3. FACIAL AGEING PROCESS; 3. HFUS EVALUATION TECHNIQUE; 4. UNDERSTANDING AESTHETIC PROCEDURES; 5. CONCLUSION

### Understanding Neck Dissection and Bringing the Radiologist Closer to the Surgeon

#### Participants

Marcos Pinheiro II, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Teaching Point 1: Understand the different types of neck dissection. There are different types of neck dissection, ranging from a selective neck dissection to a radical neck dissection. It is important for radiologists to understand the extent of surgery and the structures that are removed in each type of neck dissection to accurately recognize them and properly interpret postoperative imaging studies. Teaching Point 2: Be aware of potential complications. Neck dissection can be associated with various complications, including bleeding, infection, and injury to important structures such as the spinal accessory nerve. Radiologists must be familiar with these potential complications and be able to identify them on imaging studies.

#### TABLE OF CONTENTS/OUTLINE

1. Anatomy of cervical lymph node levels and surgical techniques involved in neck dissection.
2. Role of imaging in the preoperative planning (evaluation of the primary tumor and cervical nodal status, therefore helping the surgeon decide the most appropriate type of neck dissection, if needed).
3. Recognize expected imaging findings in postoperative neck dissection, as well as potential complications, including hematoma, abscess, and injury to neurovascular structures.

HNEE-51

### Paranasal Sinuses Computed Tomography: Read It Like an Expert

#### TEACHING POINTS

Learn the acquisition protocols and become familiar with the anatomy and anatomical variations of the paranasal sinuses to guide the endoscopic sinus surgeon

#### TABLE OF CONTENTS/OUTLINE

Nose and paranasal sinuses anatomy is highly variable and some anatomic variants can result in complications in FESS. The nasal septum is made up of an anterior cartilaginous component and a posterior bony component including the vomer and the perpendicular plate of the ethmoid. Septum anatomic variations include septal deviation that can cause a middle turbinate displacement and interfere with surgical access to the middle meatus; septal pneumatization may narrow the sphenoethmoidal recess and impede access to the sphenoid ostium. The middle turbinate is the site of different variations, including concha bullosa (pneumatization of the inferior bulbous portion of the middle turbinate, or "cell of Grunwald" if pneumatization is limited to the vertical lamella above the level of the ostiomeatal complex), that can obstruct the ethmoidal infundibulum, and paradoxical middle turbinate, when the turbinate shows a paradoxical lateral convexity, which can impede surgical access to the ostiomeatal complex and contribute to recurrent rhinosinusitis. Haller cells are ethmoid cells extending into the orbital floor, with variable sizes that can narrow the ostia of the maxillary sinus or ethmoid infundibulum. Onodi cells are posterior ethmoid cells extending to the sphenoid sinus, placed medially to the optic nerve. These cells can also surround the optic nerve places the nerve and are linked with increased risk of nerve damage during sinus surgery.

### Approach to Jaw Lesions

#### Participants

Mai-Lan Ho, MD, Dublin, OH (*Presenter*) Research Grant, Siemens AG; Research Grant, Cardinal Health, Inc; Research Grant, Italfarmaco SpA

#### TEACHING POINTS

CT and MR can characterize jaw lesion location, composition, margins, and extent. Jaw lesions are classified into odontogenic vs. non-odontogenic, and simple/complex lytic or sclerotic. Key etiologies include developmental, inflammatory, traumatic, and neoplastic. Patient age, symptoms, and systemic findings help narrow the differential. For suspected neoplasms, biopsy helps confirm the diagnosis. The range of potential approaches includes watchful waiting, sclerotherapy, ablation, curettage, subtotal resection, and radical excision. Genetic testing is important when certain histologies and syndromes are suspected.

#### TABLE OF CONTENTS/OUTLINE

### Advanced MRI of the Head and Neck

#### Participants

Mai-Lan Ho, MD, Dublin, OH (*Presenter*) Research Grant, Siemens AG; Research Grant, Cardinal Health, Inc; Research Grant, Italfarmaco SpA

#### TEACHING POINTS

Advanced MRI techniques utilized in the head neck include anatomic, diffusion, perfusion, vascular, elastography, functional, and metabolic. Understanding of fundamental physical principles enables optimal utilization interpretation. Informed clinical use improves patient diagnosis management. Clinical applications exist for congenital, neoplastic, vascular, metabolic, and traumatic etiologies.

#### TABLE OF CONTENTS/OUTLINE

1. High-resolution: T2, T1, 7 Tesla Cranial nerve lesions Midface anomalies Meningoceles Inner ear anomalies Orbital malformations, tumors  
2. Phase-contrast: 2D, 3D CSF flow Angiography  
3. Diffusion: non-echo-planar, intravoxel incoherent motion, diffusion tensor imaging Skull base tumor, infection Pott's puffy tumor Cord/nerve fibers  
4. Perfusion: arterial spin labeling, dynamic susceptibility contrast, dynamic contrast-enhanced Vascular tumors Vascular malformations Skull base tumors Pituitary lesions Face transplant  
5. Vascular: time-of-flight, phase-contrast, time-resolved, ferumoxytol, vessel wall imaging PHACES association Vasculopathies  
6. Ultrashort- and zero-echo-time imaging Malformations Trauma Tumors Postoperative  
7. Elastography Pituitary adenoma Vestibular schwannoma  
8. Spectroscopy  
9. PET/MR Epilepsy HN tumors

### Zero Echo-Time MRI of the Head and Neck

#### Participants

Mai-Lan Ho, MD, Dublin, OH (*Presenter*) Research Grant, Siemens AG; Research Grant, Cardinal Health, Inc; Research Grant, Italfarmaco SpA

#### TEACHING POINTS

- Cortical bone MRI utilizes short-TE techniques such as gradient, ultrashort, and zero echo-time.
- Short-T2 tissues appear dark, hence the term "black-bone" MRI.
- Use cases include plagiocephaly, craniosynostosis, calvarial lesions, sinonasal disease, head neck tumors, jaw lesions, trauma, surgical navigation, and postoperative evaluation.
- Postprocessing advances using point reconstructions and deep learning facilitate synthetic ("bright-bone") CT generation, 3D visualization, and surgical planning.

#### TABLE OF CONTENTS/OUTLINE

1. Technique• Gradient, ultrashort, zero echo-time• Workflow sequence options• Interpretation and pitfalls2. Clinical Cases• Plagiocephaly• Simple craniosynostosis: metopic, sagittal, coronal• Genetic syndromes: Apert, Saethre-Chotzen, achondroplasia• Skull: ecchordosis physaliphora, dermoid cysts, LCH, fibrous dysplasia• Sinonasal: midnasal stenosis, pneumosinus dilatans, sinusitis• Tumors: orbitotemporal NF1, rhabdomyosarcoma, chordoma• Jaw lesions: ameloblastoma, desmoplastic fibroma• Trauma: abusive head trauma, TBI, leptomeningeal cyst, cephalohematoma• Surgical planning: arachnoid cyst, hydrocephalus• Shunt evaluation: tumor, craniosynostosis, overshunting• Postoperative evaluation: craniotomy, cranioplasty, ZMC, orbital blowout, cephalocele3. Postprocessing• Point processing• Deep learning: models, loss functions, generalizability• Diagnostic use• Surgical planning

### Fetal Head and Neck Imaging

#### Participants

Mai-Lan Ho, MD, Dublin, OH (*Presenter*) Research Grant, Siemens AG; Research Grant, Cardinal Health, Inc; Research Grant, Italfarmaco SpA

#### TEACHING POINTS

Fetal HN anomalies can be classified into congenital, genetic, vascular, neoplastic, traumatic, and endocrine etiologies. Major diagnoses include micrognathia, facial clefts, craniosynostosis, meningocele, vascular malformations, teratoma, and airway obstruction. US and MRI have complementary roles for prenatal screening and detailed workup. Each technique has specific clinical indications and technical limitations. Fetal MRI protocols should include 3-plane ssFSE with optional balanced SSFP, diffusion, and T1. The radiology report should address brain, face, neck, and airway, along with secondary complications and multisystem associations. Several qualitative features and quantitative metrics can be applied. For at-risk patients, serial imaging can improve diagnostic yield and interventional planning. Postnatal imaging is important for confirmation of prenatal findings.

#### TABLE OF CONTENTS/OUTLINE

1. Craniofacial Malformations Oro/craniofacial clefts Micrognathia, Pierre-Robin Beckwith-Wiedemann Orbital telorism, malformations Craniosynostosis Cephaloceles, meningoceles Acrania-exencephaly-anencephaly Amniotic band syndrome 2. ### Head Neck Vascular Anomalies and Syndromes

#### Participants

Mai-Lan Ho, MD, Dublin, OH (*Presenter*) Research Grant, Siemens AG; Research Grant, Cardinal Health, Inc; Research Grant, Italfarmaco SpA

#### TEACHING POINTS

The ISSVA classification divides vascular anomalies into vascular malformations (vasculogenesis) and vascular tumors (angiogenesis). Radiology plays an important role in diagnosis and treatment of HN vascular anomalies. Major imaging approaches include US, CT, and MR. Each modality has specific clinical indications and limitations. Imaging findings should be correlated with dermatologic examination and other clinical information. There is an emerging focus on genetic causality and targeted therapies.

#### TABLE OF CONTENTS/OUTLINE

1. ISSVA Classification Vascular neoplasms: benign, borderline, malignant Vascular malformations: simple, combined, syndromic Genetics and targeted therapies 2. Imaging Modalities USXRCTMRXA 3. ### **Differentiating Malignant Parotid Tumors From Pleomorphic Adenomas and Warthin's Tumors: The Benefits of Tumor Blood Flow and Apparent Diffusion Coefficient Histogram Analysis**

#### **TEACHING POINTS**

It is occasionally difficult to differentiate malignant parotid tumors (MTs) from two major benign tumors such as pleomorphic adenomas (PAs) and Warthin's tumors (WTs). Here, we review how to diagnose parotid tumors by the use of apparent diffusion coefficient (ADC) and tumor blood flow (TBF) obtained by pseudocontinuous arterial spin labeling (pCASL), comparing conventional methods such as tumor-to-parotid gland signal intensity ratios with histogram analysis for the following reasons: 1. to understand principle of pCASL; 2. to review conventional methods to evaluate parotid tumors by TBF and ADC; and 3. to understand the benefits of TBF and ADC histogram analysis for differentiating MTs from PAs and WTs.

#### **TABLE OF CONTENTS/OUTLINE**

1. Essential knowledge of parotid tumors such as incidence rate, and major tumor types 2. Principle of pCASL 3. Conventional methods for differentiating MTs from PAs and WTs 1. TBF and ADC histogram analysis for differentiating MTs from PAs and WTs 2. Conclusion: The combination of TBF and ADC evaluated by histogram analysis may enhance the diagnostic performance for differentiating parotid MTs from PAs and WTs.

### Opportunistic Assessment for Parathyroid Adenomas: How We Do It and Why

#### Participants

Karol Cardenas, MD, Quito, Ecuador (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

There are well-documented shortcomings in the diagnosis and treatment of primary hyperparathyroidism (PHPT). These gaps have prompted calls for innovative changes to how health systems approach this disease. One proposed change is for radiologists to assess for enlarged parathyroid glands on routine imaging studies with the goal of identifying individuals with undiagnosed PHPT. This exhibit will 1) review relevant PHPT background, 2) summarize existing evidence related to opportunistic parathyroid assessment, and 3) share a practical, step-by-step approach to opportunistically screening for parathyroid adenomas (i.e., "how we do it") with illustrative case examples.

#### TABLE OF CONTENTS/OUTLINE

1. Opportunistic Screening - definition; potential benefits and risks
2. PHPT Background - epidemiology, pathophysiology, diagnosis, treatment, accepted imaging role
3. Existing Gaps - failure to diagnose, failure to treat, morbidity of untreated disease
4. Opportunistic Assessment for Parathyroid Adenomas - anatomy, size criteria, imaging characteristics, review of the evidence, relevant aspects of Fifth International Workshop clinical guidelines, how we do it (search pattern, imaging evaluation, reporting)
5. Illustrative Examples - opportunistically identifying parathyroid adenomas on CT, MR, US; differentiating from mimics (exophytic thyroid tissue, thyroid nodule, lymph node)
6. Proposed Best Practices Decision Tree for "Should I Recommend Biochemical Testing for Possible PHPT?"
7. Summary and Conclusion

### Hmm...Is That Normal? Pediatric Skull Base Variants With A Focus on the Temporal Bone

#### Participants

Asha Sarma, MD, Nashville, TN (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

-Radiologists must recognize many normal skull base variants that may be mistaken for disease in pediatric patients.-Differentiating normal variants from disease may be especially challenging in the temporal bone, given complex anatomy and frequently incomplete ossification.-This multi-institutional exhibit will provide a detailed case-based review of pediatric skull base variants including relevant companion cases, pearls, pitfalls, and mimics.-After viewing this exhibit, radiologists will have practical tools for differentiating normal skull base variants from disease and strategies for troubleshooting difficult cases.-This exhibit aims to: 1) describe relevant anatomy, embryology, and post-natal development of the skull base and temporal bones, 2) identify CT and MRI findings of common and uncommon developmental findings and variants, 3) contrast these variants with similar-appearing disease states, and 4) explain strategies for troubleshooting difficult cases.

#### TABLE OF CONTENTS/OUTLINE

1) Normal anterior skull base ossification and variants (e.g., skull base synchondroses, craniopharyngeal canal) 2) Normal temporal bone development and variants (e.g., cochlear cleft, incomplete ossification of the semicircular canals) 3) Variant middle ear findings (e.g., ossicular pneumatization, suspensory ligament calcification) 4) Vascular variants (e.g., emissary venous channels mimicking fracture, aplastic petrous carotid canal); 5) Skull base pneumatization variants; 6) Other salient findings (e.g., skull base sutures, foramen tympanicum)

### Practical Tips for Hypopharyngeal Carcinoma Staging

#### Participants

Carlos Alberto Coelho Neto, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The hypopharynx represents the lowest portion of the pharynx and can be affected by neoplastic and non-neoplastic diseases. Squamous cell carcinoma is the most common neoplasm in this region and can affect one of its three main subsites: pyriform sinuses, posterior wall and post-cricoid region. Imaging evaluation is essential in the staging of these patients, along with clinical and endoscopic examination. The objective of this presentation is to help the radiologist in the evaluation of neoplastic lesions of the hypopharynx, with images and tips for the evaluation of primary lesions and lymph node enlargement, contributing to the TNM classification.

#### TABLE OF CONTENTS/OUTLINE

Discussion of imaging tips in staging the hypopharynx neoplasms by showing clinical cases with MRI and CT images. We start this presentation by detailing the anatomical limits of the hypopharynx. We will detail the three main subsites of hypopharyngeal neoplasms: pyriform sinuses, posterior wall and postcricoid region. We highlight the main points of the TNM classification and, through cases, we demonstrate the main anatomical landmarks, how to measure the lesions, besides tumor extension pathways. Lymph node aspects will also be discussed, such as dimensions, dissemination routes, extranodal extension and necrosis. The conclusion of this presentation shows that hypopharyngeal neoplasms are part of the daily clinical routine of general and head and neck radiologists. Therefore, the anatomy of the pharynx must be well known, as well as the main subsites of the hypopharynx. We also show that it is not necessary to memorize the TNM staging, but the radiologist must know how to evaluate its most important points and landmarks.

### Internal Cacophony of Heartbeats: Rhythmic Whooshing and Buzzing in the Ear - Maddening Patient and Physician

#### TEACHING POINTS

1. Review common and uncommon etiologies of pulsatile tinnitus including vascular, structural and neoplasms. 2. Multimodality imaging assessment and diagnostic workup. 3. Current concepts in management and review of treatment options.

#### TABLE OF CONTENTS/OUTLINE

1. Background introduction of pulsatile tinnitus 2. Review of common and uncommon etiologies of pulsatile tinnitus a. Vascular: i. Venous: Idiopathic intracranial hypertension, jugular bulb diverticulum, and emissary veins ii. Arterial: arteriovenous fistula and malformations, aberrant carotid artery, fibromuscular dysplasia and carotid dissections b. Structural: i. Skull base dehiscence, internal jugular vein compression ii. Conductive hearing loss, e.g. otosclerosis c. Tumor: Paraganglioma, meningioma, low flow vascular malformations (Hemangiomas) 3. Diagnostic Imaging QR codes with scrollable imaging data sets will be provided, with practical clues for making the diagnosis, and will include high-resolution flat panel CT. a. Idiopathic intracranial hypertension CTV, MRV, and DSA. b. High riding jugular bulb and diverticulum CTV and DSA, and vascular Eagle syndrome. c. Dural arteriovenous fistula CTA, MRA, and DSA including high resolution 14 second magnified flat-panel computed tomography d. Aberrant carotid artery CTA and DSA e. Paraganglioma MRI, MRA, and DSA f. Meningioma MRI g. Sigmoid sinus wall dehiscence and emissary veins CTA including treatment DSA. h. Otosclerosis CT 4. Review of treatment options a. Transverse sinus stenosis stenting. b. Arteriovenous fistula embolization. c. Jugular vein decompression. d. Bony dehiscence resurfacing. 5. Diagnostic algorithm summary

### Imaging Evaluation of Hearing Loss: Understanding Audiograms to Refine Interpretation

#### TEACHING POINTS

1) Prior to imaging, patients with hearing loss undergo audiometric assessment, which categorizes hearing loss as conductive, sensorineural, or mixed. 2) CT is the first-line imaging modality for patients with conductive hearing loss (CHL), and an understanding of prior audiometric testing results can benefit the radiologist's temporal bone CT interpretation. 3) Pure-tone hearing test results may be the most relevant component of the audiogram report for radiologists and are often viewable in the electronic medical record at the time of CT interpretation. 4) Recognizing specific CHL patterns in audiograms can increase confidence and accuracy of CT interpretations. 5) The presence or absence of the acoustic reflex informs likelihood of a third window phenomenon.

#### TABLE OF CONTENTS/OUTLINE

I. Evaluation of the patient with hearing lossa. Clinical assessmentb. Audiometric evaluationc. Role of imagingi. Indications for CTii. Indications for MRII. Review of audiometric testinga. Pure-tone hearing testi. Basic interpretationii. Patterns of conductive hearing lossb. Acoustic reflexi. Principlesii. Acoustic reflex testingIII. Illustrative Casesa. ### Ultrasound Assessment of Parathyroid Disease: The Latest and Greatest

#### TEACHING POINTS

- Provide an overview of the anatomy, function, and embryology of the parathyroid gland.
- Emphasize the indications, limitations, and benefits of ultrasound in evaluating the parathyroid gland.
- Compare different imaging techniques for the parathyroid gland.
- Discuss the ultrasound protocol for evaluating the parathyroid gland.
- Become familiar with descriptive terms for normal parathyroid gland anatomy.
- Review the most common pathologies and provide case studies to illustrate the practical application of theoretical concepts.
- Analyze differential diagnoses, tips, and tricks.
- Discuss updates in ultrasound evaluation for parathyroid gland pathology.

#### TABLE OF CONTENTS/OUTLINE

1. Overview of the parathyroid gland 1.1 Anatomy 1.2 Function 1.3. Embryology 2. Ultrasound evaluation of the parathyroid gland 2.1 Indications 2.2 Limitations 2.3 Benefits 3. Comparison of imaging techniques for the parathyroid gland: ultrasound, 4DCT, and SPECT. 4. Ultrasound and CEUS protocol for evaluating the parathyroid gland. 5. Descriptive terms for normal parathyroid gland anatomy 6. Common pathologies in the parathyroid gland: parathyroid adenoma, parathyroid hyperplasia, parathyroid carcinoma, atypical parathyroid adenoma/atypical parathyroid tumor. 7. Differential diagnoses: thyroid nodules and cervical adenopathies, tips and tricks for improving radiology reports. 8. Updates in ultrasound evaluation for parathyroid gland pathology: elastography and CEUS. 9. Conclusion.

### Molecular Markers of Head and Neck Tumors

#### Participants

Amit K. Agarwal, MD, MBBS, Jacksonville, FL (*Presenter*) Stockholder, Gilead Sciences, Inc

#### TEACHING POINTS

1. To understand the basics of neuropathology and genetics  
2. Review the molecular markers genetics of head and neck tumors  
3. Discuss reclassified and newly recognized head and neck tumors

#### TABLE OF CONTENTS/OUTLINE

1. Neuropathology for the Neuroradiologist  
a. Basic histopathology (H E stains)  
b. Immunohistochemistry (immunocytology)  
c. Genetic analysis (FISH, PCR, Next-generation sequencing,) d. Liquid biopsy  
2. Markers for squamous cell carcinomas (SCCa) of the head and neck  
a. HPV (p16+ tumors) b. EBV positive tumors c. Circulating-tumor DNA (ct-DNA) for tumor surveillance  
3. Molecular markers for non-SCCa tumors of head and neck  
a. Muscle differentiation (actin, desmin) b. Neural differentiation (S100, GFAP) c. Vascular differentiation (CD markers) d. Epithelial differentiation (cytokeratin, EMA)  
4. Reclassified and newly recognized tumors  
a. SDH deficient paragangliomas b. EBV-related smooth muscle tumors c. Mammary analogue secretory carcinoma (MASC)  
5. Therapeutic advances in head and neck oncology (focus on immunotherapy)  
6. Summary/conclusion

### **A Practical Guide for Radiologists: Localizing and Diagnosing Pathologies in the Carotid and Parapharyngeal Spaces**

#### **TEACHING POINTS**

- Provides a comprehensive overview of the radiologic anatomy of the carotid and parapharyngeal space (PPS)
- Describes a practical approach for localizing the pathologies affecting the carotid and PPS.
- Reviews common and rare pathologies in the carotid and PPS using case-based examples, highlighting distinctive clinical and imaging features that can aid in the best differential diagnosis.

#### **TABLE OF CONTENTS/OUTLINE**

Table of Contents 1. Terminology of the Carotid and PPS 2. Anatomy and Contents of the Carotid and PPS 3. Practical approach to Diagnosing Pathologies in the Carotid and PPS 4. Displacement Pattern of PPS Fat for Localizing Masses. 5. Case-Based Review of Primary and Secondary Pathologies in the PPS 6. Case-Based Review of Primary and Secondary Pathologies in the Carotid Space Outline

- Knowledge of anatomy is essential for localizing a lesion in the Carotid or PPS.
- Displacement patterns of PPS fat can aid in identifying the space of origin.
- Understanding the contents and common/rare lesions of these spaces is the first step in generating a differential diagnosis.
- Obtaining relevant clinical history and recognizing specific imaging appearances can help provide the best differential diagnosis.

### Hypervascular Head and Neck Tumors: Image Aspects

#### TEACHING POINTS

Hypervascular tumors, by definition, are arterialized and present intense and early contrast enhancement. They comprise a wide variety of pathologies, which can be didactically divided into five major groups: neuroendocrine tumors, vascular tumors, primary lymphadenopathy, metastatic lymphadenopathy and other hypervascular tumors.

#### TABLE OF CONTENTS/OUTLINE

In this presentation we are going to review hypervascular head and neck tumors and characterize their imaging features on computed tomography (CT) and magnetic resonance imaging (MRI), focusing on features that aid in the differential diagnosis through flowcharts. Images will be presented comparing the different locations of the paragangliomas and the various patterns of growth of the Juvenile nasopharyngeal angiofibroma. Metastatic and primary lymphadenopathy will be differentiated through tables.

HNEE-70

### Update in Imaging of Parotid Lesions and Treatment-related Findings

#### TEACHING POINTS

Parotid gland tumors are a rare entity among the neoplasms of the head and neck. In adults, most encountered lesions are benign, being only 10% of parotid tumors malignant. Radiological assessment of these lesions includes ultrasound (US), computed tomography (CT), and morphological and functional magnetic resonance imaging (MRI). The definition of the nature of the lesion is essential for the election of treatment methods. Benign neoplasms may be destined for follow-up or managed surgically by gland-sparing techniques with facial nerve preservation. On the contrary, malignant lesions are treated frequently with total gland resection and sacrifice of the facial nerve with corresponding posterior morbidity. The exhibit aims to present the gamut of parotid neoplasms according to their imaging characteristics in the initial study and to stress the importance of radiological support in the follow-up. Treatment options including different surgical approaches and the correlation between applied technique and imaging will be provided.

#### TABLE OF CONTENTS/OUTLINE

1. Parotid anatomy. 2. Imaging modalities: US, CT, morphological, and functional MRI. Applications. 3. Primary and secondary parotid lesions. 4. Different types of surgical approaches. 5. Follow-up findings.

Printed on: 04/12/24

HNEE-71

### Bone Metabolic Disorders in Pediatric Patients: Key Clues for Early Detection in Dental Imaging

#### Participants

Jo-Eun Kim, DDS, Seoul, Korea, Republic Of (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Bone metabolic disorder refers to a disease caused by a variety of causes that break the balance between bone-forming and bone-removing activities. Bone metabolic disorders can affect pediatric patients and impact their oral health. Dental imaging, such as panoramic radiographs and cone-beam computed tomography (CBCT), can provide key clues for early detection of these disorders.

- Generalized loss of follicular cortex or lamina dura of tooth
- Generalized widening or obliteration of pulp chamber
- Generalized sclerotic or osteopenic change of trabecular bone

Understanding the imaging features of bone metabolic disorders is essential for dental practitioners to identify and refer patients for appropriate medical care. Especially, it is important to distinguish it from hematopoietic malignancy (such as leukemia, or lymphoma), which can appear similar and requires urgent treatment. Collaboration between dental and medical professionals is crucial for the management and treatment of bone metabolic disorders in pediatric patients.

#### TABLE OF CONTENTS/OUTLINE

1. Meaning of dental imaging in pediatrics
2. Schematic explanation of bone mineral metabolic disorder
3. Bone metabolic disorders which impact on teeth and jaw bone structures (summary table)
4. Example of panoramic radiographs of the pediatric patients affected by metabolic disorder
5. Differential diagnosis from hematopoietic malignancy of pediatric patients (Importance of detecting changes on dental radiography)

### There's Something In Your Teeth! Dental Panoramic Radiology for Radiologists

#### Participants

Logan Ryals, BS, Jackson, MS (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Review normal dental anatomy and imaging features, highlighting digital panoramic radiography (Panorex) cross-sectional imaging correlates. Discuss the differential diagnosis of oral maxillofacial/dental pathology on Panorex and cross-sectional imaging. Recognize the importance of systematic dental imaging interpretation in the diagnosis of oral and maxillofacial diseases.

#### TABLE OF CONTENTS/OUTLINE

The oral cavity is the intersection of dentistry and medicine. However, the relationship of oral and systemic conditions is not fully appreciated. Modalities used in dental radiology include periapical and bitewing radiography, digital panoramic radiography, and cone-beam computed tomography. Panoramic radiography is most widely encountered by radiologists, but few receive formal training, and many are uncomfortable interpreting these studies despite frequent expectations to do so. Early detection of intraoral pathologies by radiologists may improve patient care and alert clinicians to the need for dental consultation. Familiarity with the anatomy and pathology of the oral and maxillofacial region will improve radiologists' diagnostic confidence and allow for the synthesis of a timely and detailed differential diagnosis. We will review dental imaging protocols, normal dental anatomy, and common findings of oral and maxillofacial pathology. A wide range of pathology will be discussed, emphasizing their appearances on panoramic radiographs with cross-sectional imaging correlates. Pathologies to be discussed include infectious and inflammatory lesions, periodontal diseases, cystic, benign and malignant masses, sinus pathology, and bone and temporomandibular joint disorders.

### Unlocking the Temporomandibular Joint: CT, MRI and Arthroscopic Correlation

#### Participants

Silvia Cayon Somacarrera, MD, Torrelavega, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To illustrate the spectrum of findings in temporomandibular joint derangement on MR and its correlation with arthroscopic findings when available To highlight the role of CT in temporomandibular joint derangement To show the different surgical therapeutic approaches of temporomandibular pathology

#### TABLE OF CONTENTS/OUTLINE

The most important anatomic structure of the temporomandibular joint is the articular meniscus, therefore it is the main element to be evaluated. We must study its morphology along with its location relative to the condyle in both closed- and open-mouth positions. However, we must bear in mind that meniscus aberrant displacement is also frequently seen in asymptomatic volunteers so that other findings such as joint effusion, retrodiskal layer rupture, lateral pterygoid muscle attachments thickening, degenerative changes, osteochondromatosis and ankylosis, may be required to help guide the diagnosis. It is important for the radiologists to detect early MR imaging signs of temporomandibular dysfunction, thereby avoiding its evolution to osteoarthritis. Nevertheless, it is important to know that the therapeutic approach is made by assessing both the clinical situation of the patient and the imaging. We have selected a wide variety of temporomandibular joint derangement cases in order to show the different imaging findings as well as the arthroscopic correlation when available. We also include a description of the different treatment approaches carried out in our institution.

### Temporal Bone Anatomy on Photon Counting CT: Beyond the Obvious

#### Participants

Shehbaz Ansari, MD, MBBS, Chicago, IL (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Describe the concept and design of photon counting CT scanners and understand its advantages over conventional CT scanners with energy integrating detectors. 2. Illustrate temporal bone anatomy with emphasis on structures that were previously not reliably or less vividly identifiable. 3. Develop a system-based approach to temporal bone radiological anatomy.

#### TABLE OF CONTENTS/OUTLINE

The imaging anatomy of the temporal bone has seen little progress in the last decade owing to the limited progress in the detector technology. Conventional detectors suffer from the inverse relation between radiation dose and image noise along with a limit to image resolution. Photon counting detectors (PCDs) have improved contrast to noise ratio with twice the resolution at nearly half the radiation dose. The basic physics of these detectors and their potential uses will be first discussed. To highlight the advantages of PCDs, we depict temporal bone anatomy including small structures not previously identifiable on imaging. Historically, advances in imaging to clarify anatomy has led to a deeper understanding of and elucidation of new pathologies associated with these structures. We also put forward a system-based approach to the anatomy of this region along with the conventional section-based anatomy. This system-based approach, aided by diagrammatic illustrations, will aid in understanding the complex anatomy of minute neural structures and communications around the ear, the delicate ossicular support system, neural and vascular supply of the labyrinth, and minor adjacent fissures among others.

### Imaging of Post-dental Treatment: What Radiologists Need to Know in Common and Advanced Dental Procedures

#### TEACHING POINTS

With recent advancements in dentistry, various new treatment methods have been clinically introduced, and many new materials are being used for treatments. Post-dental treatment CT and MR images reveal a variety of hard tissue and soft tissue changes and used dental materials which often associate image artifacts. Therefore, familiarity with post-treatment changes and dental materials is crucial to avoid misinterpretation as true pathologies, identify complications and evaluate for recurrent disease. The purpose of this exhibit is 1) to review common and uncommon dental treatments with an emphasis on recently introduced treatment and procedures, 2) to review expected and unexpected post-dental treatment changes and dental materials on CT and MR images, and 3) to discuss imaging approach to identify complications and disease recurrence or progression.

#### TABLE OF CONTENTS/OUTLINE

- 1) Review of common and uncommon dental treatments, with an emphasis on recently introduced treatments and dental materials
- 2) Review of expected and unexpected post-dental treatment changes and dental materials on CT and MR images
- 3) Discussion on imaging approach to identify complications and disease recurrence or progression

### PET/MRI In Head and Neck Cancer: Ready For Primetime?

#### Participants

Craig Foote, MD, BSc, Baltimore, MD (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

PET/MR is a relatively new modality poised to provide considerable, novel clinical value in the field of head and neck oncology by combining the functional evaluation of FDG PET with the exquisite soft tissue resolution of MR imaging. Patients with head and neck cancers already requiring MRI for TNM staging may stand to benefit the most from the use of PET/MR, which offers the ability to simultaneously acquire the optimal regional and distant metastatic evaluation offered by PET in addition to MR, as opposed to separately by MR and PET/CT. This educational exhibit will provide an overview of PET/MR and its current role in head and neck cancer, as well as discuss barriers to its widespread acceptance and predictions for the future.

#### TABLE OF CONTENTS/OUTLINE

1) Overview of PET/MR a) Evolution of PET/MR b) Advancements in hardware c) Physics d) Coregistration  
2) Advantages of PET/MR a) Comparison to PET/CT i) Radiation dose reduction, longer acquisition times, improved radiation planning, etc. ii) Lung nodule detection compared to PET/CT b) MRI for more accurate T staging c) Application of NIRADS (Neck imaging reporting and data system) in PET/MR  
3) Examples of PET/MR in head and neck cancer a) Evaluation of post-treatment change versus recurrence b) Head and neck cancer of unknown primary c) Orbital malignancy d) Perineural Spread  
4) Barriers to use a) Costs b) Lack of trial data showing distinct advantages  
5) Recent developments/future predictions a) Multi-parametric imaging b) Innovative radiotracers

HNEE-79

### Laryngeal Carcinoma Evaluation with Dual Energy CT (DECT)

#### Participants

Paloma Puyalto, PhD, MD, Barcelona, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Dual-energy CT (DECT) can be used in laryngeal carcinoma (LC) evaluation. Based on the decomposition of different materials, DECT can distinguish tissues with similar Hounsfield Unit attenuations assessed in simple energy CT (SECT). The size, the identification of the margins of LC, and the evaluation of adjacent structures invasion, which could change the LC staging, is not always easy due to the small size occupied by the complex laryngeal structures in the visceral compartment and their similar attenuation values. A more accurate diagnosis can be made with DECT. The main objectives of this exhibit are: 1. To describe DECT image acquisition protocols and post-processing techniques related to the evaluation of LC. 2. To illustrate DECT findings in LC by TNM staging and its SECT correspondence. 3. To expose the differential diagnosis and potential pitfalls of LC in DECT and how to try to avoid them.

#### TABLE OF CONTENTS/OUTLINE

1. Overview review of LC. 2. Diagnostic clinical and imaging strategies to evaluate LC. 3. DECT protocol for LC evaluation and post-processing techniques related to imaging of LC such as virtual monochromatic and material decomposition images. 4. Case-based cancer image examples with DECT and SECT correspondence for each TNM stage. 5. LC pitfalls and differential diagnosis of LC in DECT images.

### Ultrasound of Ocular Globe: Revealing What Lies Below

#### Participants

Ingrid Caridade, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Ultrasound (US) of the eye has become increasingly popular in clinical practice as a complementary tool to ophthalmoscopy, as it is a dependable and secure diagnostic technique for assessing and monitoring various ophthalmic conditions, including inflammation, tumors, and traumatic injuries, as well as measure the optic nerve and detect intracranial hypertension. The method is accessible, non-invasive, and relatively low-cost, with few contraindications. The eye's superficial location and structure make the US an ideal examination option, particularly in emergency situations. It is typically recommended when it is challenging to examine the fundus of the eye due to conditions that cause opacity of the ocular globe. In pediatrics, US can be performed without sedation or radiation, making it an especially valuable tool. Radiologists should be familiar with the basic anatomy of the eye, as well as the examination technique and ultrasonographic findings of the entities that frequently affect the ocular globe. In this presentation, we show a literature review and case analysis performed using high-frequency linear transducers with B-mode ultrasonography and color Doppler. Subsequently, the findings are compared to imaging modalities such as computed tomography (CT) and magnetic resonance imaging (MRI).

#### TABLE OF CONTENTS/OUTLINE

Review the normal eye anatomy. Demonstrate the US examination technique. Discuss some pathologies of the eye and its main ultrasonographic image features.

### Imaging Considerations for Transoral Robotic Surgery (TORS) Planning

#### Participants

Niedja Santos Goncalves Tsuno, Brasilia, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- To learn the radiological imaging findings that represent indications and contraindications for Transoral Robotic Surgery (TORS), focusing on Head and Neck oncology. - To identify expected postsurgical status of tumors resected by TORS.

#### TABLE OF CONTENTS/OUTLINE

1. Simplify the anatomy of the oropharynx, hypopharynx, and larynx, with emphasis on the tonsillar regions, base of the tongue, supraglottis, hypopharynx (pyriform sinus), and also the pre-styloid parapharyngeal and retropharyngeal spaces. 2. Summarize classical TORS ideal indications for treatment of head and neck neoplasms, focusing on the role of CT and MR imaging to determine the size of the tumor, its location and relationship with adjacent structures. 3. Summarize and exemplify the major general contraindications for TORS related to the primary tumor (internal carotid artery entrapment, invasion of the prevertebral space, massive extension into the masticatory space, bone involvement) and those not related to the primary tumor (unresectable cervical nodal disease, metastases and high surgical-anesthetic risk), in addition to reviewing site-specific contraindications. 4. Conclusion.

### What, Where and When of Imaging in Spontaneous Skull Base CSF Fistulas

#### Participants

Sanchita Gupta, MBBS, MD, New Delhi, India (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1) Understand the anatomical basis and pathophysiology of spontaneously developing CSF fistulas  
2) Approach to imaging in patients with skull base fistula  
3) Identify the imaging appearance of lesions, and features to differentiate these from potential mimics  
4) To extract clinically relevant imaging information which translates into improved decision-making and ease during the surgical procedure

#### TABLE OF CONTENTS/OUTLINE

1) What is a Spontaneous Skull base CSF fistula?  
2) Pathophysiology of a CSF leak  
3) Anatomical considerations - Common sites - Cribriform plate - Sphenoid bone - Perisellar and Lateral recess - Temporal bone - Tegmen tympani and mastoideum  
4) History and Clinical Presentation  
5) Imaging modalities for assessment - Indications and Technique - High-resolution Computed Tomography (HRCT) - Magnetic resonance Cisternography - Contrast-enhanced CT Cisternography - Gadolinium-enhanced MR Cisternography  
6) Imaging features of spontaneous skull base CSF fistula  
7) Associated features of Idiopathic Intracranial Hypertension  
8) Structured reporting format for the pre-surgical evaluation of skull base CSF fistula - What the Surgeon Wants to Know.

### **The External Carotid Artery: The Forgotten Carotid Branch. Tips and Tricks for the Evaluation in Different Imaging Techniques.**

#### **Participants**

Maria Galante I, MD, (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

-To review the pathway, anatomical relationships and areas supplied by the external carotid artery.-To describe the anatomy of the artery and the relationship with other structures in the different techniques, including CTA, MRA, US and DSA.-To give some tips to achieve an accurate evaluation of the artery and its main pathologies, especially while performing a diagnostic US.- To offer a US protocol for the assesment of these artery.The external carotid artery is one of the main vascular structures of the head and neck region, not only because it irrigates this area, but also because some of its branches anastomose with the internal carotid and posterior cerebral arteries, becoming an important source of collateral supply. Besides, it is well known that the number of interventional and surgical procedures has massively increased . So, being the territory supplied by this artery so extensive and sometimes tricky, it could get affected whenever any of these procedures are performed, or in the case of tumors of the head and neck region, and traumatic injuries. In this exhibit we will analyze the anatomical pathway, territory, and relations of this artery.

#### **TABLE OF CONTENTS/OUTLINE**

1) General Anatomical Description2) The external carotid artery in Imaging Techiques: US, CTA, MRI , DSA3) Tips and Tricks for the evaluation in US technique: Protocol4) Superior thyroid artery5) Ascending pharyngeal artery6) Lingual artery7) Facial artery8) Occipital artery9) Posterior auricular artery10) Maxillary artery11) Superficial temporal artery

### Breathe Easier: A Guide for Imaging Obstructive Sleep Apnea (OSA)

#### TEACHING POINTS

Obstructive Sleep Apnea (OSA) is a common condition characterized by repetitive episodes of partial or complete upper airway obstruction during sleep, leading to disrupted breathing and decreased oxygen levels. Imaging techniques, such as computed tomography (CT) can provide valuable information for the diagnosis of OSA and surgical planning. CT is particularly useful for assessing the upper airway anatomy and identifying anatomical factors contributing to airway obstruction. A standardized approach for evaluating CT, including measurements of relevant landmarks is useful for communicating the findings to the referring surgeon.

#### TABLE OF CONTENTS/OUTLINE

I. Introduction  
Definition and epidemiology of OSA  
Scanning Protocol  
II. Imaging Techniques for OSA  
Computed Tomography (CT)  
Magnetic Resonance Imaging (MRI)  
III. Role of Imaging in OSA Diagnosis and Management  
Upper Airway Anatomy  
Assessment  
Soft Tissue Structure Evaluation  
Functional Changes  
Detection  
Complications Identification  
Treatment Guidance  
Anatomical Measurements on CT  
Implantable Neurostimulator to Treat Obstructive Sleep Apnea  
IV. Conclusion  
Summary of key points  
Future directions and challenges in OSA imaging research

### Dacryocystography using Computed Tomography: What a Radiologist Needs to Know

#### TEACHING POINTS

Computed Tomography Dacryocystography (CT DCG) is a valuable technique to evaluate the nasolacrimal drainage system in epiphora. It allows unequivocal demonstration of the level and causes of obstruction that include inflammatory, traumatic (fractures and iatrogenic), developmental stenosis of the bony lacrimal canal, and an occasional lacrimal sac tumor, etc. It also provides useful information about the degree of obstruction, whether obstruction is anatomical or functional, insight into reasons for failed dacryocystorhinostomy, and other useful findings like sac size, diverticuli, fistulae, etc. The technique, therefore, provides a one-stop shop for all necessary information for the diagnosis, treatment planning, and follow-up in epiphora.

#### TABLE OF CONTENTS/OUTLINE

1)Indications 2)Technique 3)Interpretation 4)Etiologies with illustrative cases 5)Ancillary findings aided and detected by CT  
5)Limitations 6)Conclusions

HNEE-88

### Liptology or the Science Behind Beautiful Lips

#### TEACHING POINTS

- To describe the anatomy of lips and perioral region- What ultrasound technique is used to depict anatomy and tips to perform the exam- To assess any anatomical variants or physiological changes that affect the lips ?- To describe optimal prognostic tools during the ultrasound exam that might prevent any adverse event and also to define some common complications.

#### TABLE OF CONTENTS/OUTLINE

The main focus is to describe the anatomy of simple but yet complicate organ that recently has been exposed to much attention. The other important part is to learn what anatomical variations are common and what pathological or physiological changes could be defined using Ultrasound. Due to the fact that there is unabated trend of aesthetic procedures in which complications are becoming more and more prominent, the radiologist must become familiar of them. Together we will identify what might be the ingredients of beautiful lips and their aging changes. The last but not least we will describe what the overfilled syndrome looks like and how it might affect the oral and perioral region.

### Diagnostic Imaging of Enophthalmos: A Practical Approach

#### TEACHING POINTS

- Describe measures used to evaluate the normal globe position in cross-sectional imaging.- Discuss the main imaging features of entities that lead to enophthalmos and its mimics.- Demonstrate the utility of CT and MRI in the differential diagnosis of patients with enophthalmos.

#### TABLE OF CONTENTS/OUTLINE

Enophthalmos, defined as inward displacement of a normal-sized globe within the orbit, can occur unilaterally or bilaterally and is relatively common. If the displacement is minimal, the diagnosis may not always be based on physical examination and these patients may be initially misdiagnosed as having contralateral exophthalmos. Various etiologies cause enophthalmos and trauma is the leading cause. CT and MRI are the imaging techniques of choice for evaluating enophthalmos, and each have distinct advantages. While CT is useful for the detailed assessment of bone structures, MRI is better suited for analyzing orbital soft tissues. Our purpose is to present an overview of the imaging characteristics of entities that can cause enophthalmos based on various mechanisms, including structural abnormalities, fat atrophy, retraction, mixed, uni- vs. bilateral, and pseudoenophthalmos.

### **A Practical Guide to Reporting an Oropharyngeal Videofluoroscopic Swallow Study: Anatomical Landmarks, Tips, and Tricks**

#### **Participants**

Javier Azpeitia Arman, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

-To describe oropharyngeal region anatomy and mechanism of swallowing. -To review the study protocols of oropharyngeal videofluoroscopic swallow study (VFSS) in the evaluation of different clinical conditions and endoscopic findings. -To illustrate the most important anatomic landmarks and signs to evaluate in different phases of a swallowing videofluoroscopy. - To analyze steps in interpretation of an VFSS, report structure and essential points in reporting.

#### **TABLE OF CONTENTS/OUTLINE**

Oropharyngeal videofluoroscopic swallow study is the technique of choice in the diagnosis of oropharyngeal dysphagia causes. The study protocol should be tailored according to the specific clinical symptoms and endoscopic findings in each patient. Reporting an VFSS requires knowledge of the most important anatomic landmarks and a detailed report structure including findings in the different phases of deglutition. We present: -Normal anatomy of the oropharynx and mechanism of swallowing. - Study protocol: Contrast agent preparation. Swallowing protocol: bolus volumes (small or large) consistency (liquid to semisolid). Patient positioning. Image requirements. Recording. -Study evaluation. Anatomical landmarks. Deglutition phases. Implications for treatment. Meal consistency. Different manoeuvres improving swallowing. -Report: Systematic analysis of imaging findings. Motility disorders: Bolus transport from oral cavity, Laryngeal vestibular penetration, Pharynx residue, Transglottic aspiration; Intrinsic causes: cricopharyngeal bar (prominent cricopharyngeal muscle), diverticulum, web. Extrinsic compression: osteophytes, thyroid gland. Surgery (laryngectomy).

### Head and Neck: It's Not a Tumor

#### Participants

Brian Yep, MD, Orange, CA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Describe imaging features of head and neck lesions that should raise the concern for oncologic processes. 2. Provide non-neoplastic differential considerations for head and neck lesions.

#### TABLE OF CONTENTS/OUTLINE

One of the major questions that arise when encountering a head and neck lesion is to discern if it is a neoplastic or non-neoplastic process. This educational exhibit will first highlight imaging features that should raise the concern for an aggressive neoplastic head and neck process. Then, through a case-based style, non-oncologic mimics will be presented to provide alternative benign differential diagnostic considerations including infectious, inflammatory, and variant congenital/developmental etiologies. Finally, one can put this knowledge to the test through a series of quiz questions.

### Dysphagia: A Pictorial Review of Common and Uncommon Causes

#### Participants

Selima Siala, MD, Carrboro, NC (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Illustrate a large spectrum of diseases causing dysphagia. Highlight key imaging findings of common diseases of the pharynx and esophagus.

#### TABLE OF CONTENTS/OUTLINE

Dysphagia is a broad term used to describe a subjective sensation of difficulty when swallowing. Causes of dysphagia can be divided into structural and functional. Structural dysphagia includes lesions that compromise the esophageal lumen typically leading to difficulty swallowing solid food prior to liquids. Examples of structural dysphagia include congenital anomalies (esophageal web and vascular entities), acquired (Zenker's diverticulum, Longus coli tendonitis, goiter, and aortic dissection), neoplasms, inflammation (esophagitis, felonization of the esophagus, Barrett's esophagus, and scleroderma), infection (abscess and Candidiasis), iatrogenic (surgically induced) and foreign bodies. Functional dysphagia is caused by conditions that interfere with normal peristalsis including diffuse esophageal spasm and achalasia. Hence the swallowing of both solid foods and liquid is compromised at the same time. Dysphagia can also be classified based on location as oropharyngeal or substernal. Oropharyngeal dysphagia is defined as a sensation of blockage in the throat, while substernal dysphagia presents as a sensation of blockage between the thoracic inlet and the xiphoid process. The evaluation of dysphagia heavily relies on imaging, particularly fluoroscopy studies including modified barium swallow and esophagography as well as CT. Fluoroscopy studies provide an evaluation of both anatomic structure and function of the pharynx and esophagus while CT provides better anatomic evaluation outside of the lumen.

HNEE-97

### Nose Job: A Work in Progress... Aesthetic Procedures of the Nose - Pre and Postoperative

#### TEACHING POINTS

1. Review the structural anatomy of the nasal region  
2. Detail the nasal functional anatomy for a successful rhinoplasty surgery.  
3. Guide the radiologist to detail anatomical changes relevant to the surgical procedure  
4. To evaluate the computed tomography (CT) imaging as a tool for developing approaches or strategies for leading aesthetic nasal surgical procedures.  
5. To evaluate the postoperative CT images as a tool for evaluating changes, sequels and complications after the aesthetic surgical procedure.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction  
a. Nasal anatomy  
b. Nasal functional anatomy  
c. Nasal deformities  
d. Clinical application of CT to aesthetic procedures of the nose  
2. Preoperative CT image  
a. What should be evaluated: bony pyramid, cartilaginous pyramid, nasal valves, nasal deformities  
3. Postoperative CT image  
a. Surgical techniques and imaging findings: rhinoplasty, septoplasty, rhinectomy, maxillary antrostomy and uncinectomy, nasal turbinate surgery, ethmoidectomy, nasal prosthesis  
b. Complications  
c. Sequels  
4. Take-home messages

Printed on: 04/12/24

## Abstract Archives of the RSNA, 2023

HNEE-98

### Precision Imaging of Diplopia: MRI Protocol and Various Diseases

#### TEACHING POINTS

Diplopia is a relatively common neuro-ophthalmological symptom and has a variety of causes. Here, a high-resolution MRI protocol specialized for diplopia is introduced, and various imaging findings related to diplopia are presented.

#### TABLE OF CONTENTS/OUTLINE

Diplopia MRI should be designed to include the entire pathway of cranial nerve(CN) III, IV, and VI, and the orbit. In general, 3D heavily T2-weighted images or 3D proton-density weighted images are often used for evaluation of the cisternal segment of CNs. However, the cisternal segment of CN4 is so small that high resolution 3D true fast imaging with steady-state free precession (Trufi) is required: a slice thickness of 0.3mm, and a scan range acquired above and below of the junction of inferior colliculus and superior medullary velum in the brainstem (figure 1). For the cavernous segment of CNs, contrast-enhanced 3D T1 Volumetric interpolated breath-hold examination (VIBE) image with fat-suppression allow us to identify normal CNs located therein (figure 2). The anatomical classification of etiologies associated with diplopia can be divided into brainstem lesions (figure 3), cistern (figure 4), cavernous (figure 5), and orbital regions. Causes that can cause diplopia include congenital diseases, vascular lesion, tumor, inflammation, infection, and trauma, etc.

### Imaging Informatics Education Exhibits

#### Sub-Events

#### **INEE-1      What Will Happen to AI Technology in Radiology? Systematic Review of Natural Language Processing for Radiological Image Processing**

##### TEACHING POINTS

In recent years, the application of artificial intelligence (AI) technology in the medical field has been advancing rapidly. In radiology, AI technology is expected to improve the accuracy of physician diagnosis through image analysis and automated diagnosis. Specifically, these include automated diagnostic technologies using deep learning and the prediction of patient health status. Many of the technologies that use AI include systems that use Natural Language Processing (NLP). Improvements in NLP models have made it possible to handle not only text data but also image data, and many applications in the medical field have been reported. The purpose of this exhibit is to show the application of NLP model in radiology and our work applying the Vision Transformer to atrial fibrillation types classification. The major teaching points of this exhibit are 1.AI technology in radiology is expected to improve the accuracy of physician diagnosis through image analysis and automated diagnosis. 2.NLP enables the processing and extraction of large amounts of natural language generated in the medical field. 3.How can NLP be used for medical imaging?

##### TABLE OF CONTENTS/OUTLINE

1. AI Technology in Radiology 2. What is NLP? -Familiar Applications of NLP Models -Typical models used for NLP -Examples of Image Applications of NLP Models 3. Introduction to this study -Atrial Fibrillation Types Classification Using the Vision Transformer

#### **INEE-10      Establishing a Radiology Research Laboratory, from A-Z**

Participants

Hussain Al Yousif, MD, Hershey, PA (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

Quantitative image analysis for clinical trials is poorly managed using standard clinical workflows. Radiology Research laboratories standardize the workflows for trials that use imaging endpoints. Radiology Research laboratories can provide more value to support institutional research objectives beyond image interpretation and should be set up to serve as central point of contact for all clinical researchers and medical imaging.

##### TABLE OF CONTENTS/OUTLINE

Defining the problem - addressing the needValue of radiologists and medical imaging personnel at the various stages of clinical research:• Research protocol development• Feasibility assessments• Access to radiologists and technical resourcesPartnering for success - working with your customers and end users to know what service are needed:• Image review with quality quantitative image assessment• Image transfer• Protocol review• Feasibility assessments• Trial budget developmentTake advantage of existing institutional core lab infrastructure:• List of provided services accessible via website.• Billing for services• OperationsIdentify the key components and personnel required for functioning of the lab:• Hardware and software• PersonnelDeveloping a budget and list of provided services.Research lab operational workflow in context of clinical operationsAnnual reviews, with budget and performance adjustments.

#### **INEE-11      Lung Cancer Screening and AI: Challenges and Opportunities**

Participants

Leonardo Rosolen Iunes, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

To discuss the potential role of artificial intelligence (AI) in lung cancer screening (LCS), highlighting: - AI applications in LCS: machine learning versus deep learning strategies - AI limitations in LCS: data collection, reproducibility, generalizability, validation - Responsible AI: fairness, accountability, and transparency - Addressing gender and racial bias in LCS programs - Future perspectives: combining the strengths of radiologists and AI for best LCS practices

##### TABLE OF CONTENTS/OUTLINE

1. Introduction a. Ongoing challenges in implementation of LCS b. AI in healthcare: basic concepts 2. AI and lung cancer: an overview a. Screening b. Radiomics and Radiogenomics c. Decision making and prognosis prediction 3. AI in LCS: potential applications a. Early detection b. Nodule classification c. Radiography versus Computed tomography d. Retrospective versus Prospective Studies 4. Limitations and Challenges: AI in the real world a. Bias in underserved and underrepresented populations 5. Responsible AI: transparency and regulation 6. Future perspectives 7. Take home messages

#### **INEE-12      AI-Driven Tools and Techniques in Radiology Education: Empowering the Next Generation of Radiologists**

Participants

Matteo Mancino, MD, Roma, Italy (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The integration of AI into radiology education is crucial, as state-of-art AI applications such as deep learning and machine learning are transforming decision making and patient care. Radiology trainees must be well-versed in AI technologies to effectively leverage their potential in delivering value-based clinical practice. The aim of this poster is to provide an overview of AI's role in radiology trainee education, addressing challenges, state-of-art resources and future directions.

#### TABLE OF CONTENTS/OUTLINE

1. Curriculum development Building an AI curriculum including ethics, data quality, privacy, and AI's impact on clinical workflows. 2. Interdisciplinary learning: Encouraging trainees to collaborate with other medical specialties to understand AI's broader implications in healthcare. 3. Collaboration Encouraging cooperation between radiology departments, AI experts, and industry partners to develop tailored educational content and resources. 4. Assessments: Leveraging AI for performance assessment in radiology board examinations and multidisciplinary meetings to enhance clinical decision-making skills. 5. AI-augmented education Using AI to provide learning experiences, such as personalized case selection. 6. Barriers and challenges: Addressing barriers to AI education, and developing strategies to overcome these challenges. 7. Future directions: Exploring innovative ways to integrate AI into radiology education, such as AI-driven simulations, virtual reality, and gamification.

#### INEE-13 **Generative AI Predicts the Survival of Patients with Progressive Fibrosing Interstitial Lung Disease**

Participants

Masaki Okamoto, Boston, MA (*Presenter*) Stockholder, TOKYO analytica

#### TEACHING POINTS

Progressive fibrosing interstitial lung disease (PF-ILD) is a group of diseases characterized by increasing self-sustaining fibrosis, progressive decline in lung function, and high mortality. Due to the highly variable rates of decline and poor prognosis of PF-ILD, accurate, individualized mortality prediction is crucial for therapeutic decision-making and management of the patients. However, PF-ILD does not have any formal prognosis-based staging system, and none of the developed existing prognostic biomarkers have been considered accurate enough for establishing such a system. The teaching points of this exhibit are to (1) review currently available clinical prognostic biomarkers for PF-ILD, (2) review an emerging generative AI-based biomarker for imaging-based prediction of survival in PF-ILD, and (3) review the comparative performance between the clinical and generative-AI-based prognostic biomarkers in the prediction of the survival in PF-ILD.

#### TABLE OF CONTENTS/OUTLINE

(1) Unmet need for accurate prognostic biomarkers for PF-ILD. (2) Clinically established prognostic biomarkers for PF-ILD (gender, age, and physiology (GAP) index; composite physiologic index (CPI); visual high-resolution CT pattern). (3) Radiomic biomarkers (traditional radiomics; hyper-curvature features) for survival analysis. (4) Emerging generative AI-based imaging biomarker (gen2surv). (5) Comparative performance of biomarkers in terms of survival prediction and Kaplan-Meier survival curves. (6) Clinical case studies.

#### INEE-14 **AI as a Medical Device: Demystifying FDA Regulation for AI Tools in Clinical Radiology Practice**

Participants

Anjali Patel, Ocala, FL (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Understand the FDA's role in regulating AI radiology tools categorized as software as a medical device. Gain a fundamental understanding of FDA regulations, crucial for algorithm developers and end users to ensure appropriate and optimal use. Distinguish between FDA clearance and different classifications for radiological software as a medical device. Appreciate the importance of various classifications concerning algorithm development, validation rigor, and intended use. Assess the real-world implications of device classifications on the adoption of AI tools in clinical radiology practice. Explore ongoing debates and potential future developments in FDA regulation of AI radiology tools.

#### TABLE OF CONTENTS/OUTLINE

Introduction Overview of FDA classifications for AI medical software Class I devices Class II devices Class III devices Discerning intended use and its influence on device classification Motivations behind seeking lower category classifications and potential pitfalls in clinical practice Different category FDA classifications and impact on AI tool adoption and usability in clinical practice Controversial aspects and future optimization of FDA regulation in AI radiology tools Conclusions

#### INEE-15 **Streamlining Emergency and General Radiology Reporting Through Customized Macros for Incidental Findings: A Primer and Online Repository**

Participants

Jeffers Nguyen, MD, New Haven, CT (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Modern radiologic practice demands higher volume study interpretation, which may be facilitated by improvements in dictation workflow. There is a large variety of incidental findings that may be made during the course of general, multi-modality, or emergency radiologic practice whose accepted follow-up recommendations may be difficult to recall for general radiologists, or those practicing outside of a subspecialty area. Furthermore, existing solutions to streamline the reporting of incidental findings are cumbersome and require too many clicks or keystrokes to rapidly implement. We present customized, pick list type macros that allow easy selection of up-to-date recommendations for the most common incidental findings that may be encountered in routine practice. We demonstrate how these may be used and provide an online repository from which they may be downloaded and imported for personal use.

#### TABLE OF CONTENTS/OUTLINE

1) A brief review of incidental findings; 2) How to create, export, and import pick list macros (PowerScribe); 3) How to use pick list macros (video demonstration); 4) Demonstrating the value of pick list macros for incidentally detected lesions, including adnexal

masses, pituitary lesions, pulmonary nodules, liver lesions, pancreatic cystic lesions, renal masses, and more;5) URL for online repository of macro resources

## **INEE-16 The OpenAI Ecosystem and Potential Applications in Radiology**

Participants

Reza Sirous, MD, MPH, Washington DC, DC (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

1) Explaining Large Language models (LLM) and Large multimodal models (LMM) 2) Explaining about OpenAI ecosystem and its extensive list of AI-powered tools 3) Explaining potential applications of OpenAI tools in Radiology 4) Explaining other LLMs competing with OpenAI tools and their potential applications in Radiology

### **TABLE OF CONTENTS/OUTLINE**

1) LLM vs. LMM: a) Background, evolution, examples, and comparison of LLM vs. LMM b) Discussing and comparing major LLM platforms (including ChatGPT, LaMDA, MT-NLG, BLOOM, Galactica, PaLM, LLaMA, etc.) 2) OpenAI ecosystem: Introducing the below tools, their general applications, strengths, weaknesses, opportunities, and threats: a) ChatGPT b) Playground c) Plugins d) Application Programming Interface (API) e) Whisper f) Dall.E g) Codex h) ImageGPT i) CLIP j) Alignment k) Microscope l) Gym m) Baselines 3) Discussing potential applications of each OpenAI tool in Radiology, strengths, weaknesses, opportunities, and threats: a) Clinical Applications (for radiologists, referring physicians, patients, etc.) b) Research Publications (for journals/reviewers, authors, etc.) c) Education Admission Process (for radiology trainees, faculty, etc.) d) Public Health Health Policy (for policy makers, screening campaigns, etc.) 4) Introducing alternatives to the OpenAI tools, pros, and cons: a) Chatbots (alternatives to ChatGPT), including Google Bard, Baidu ERNIE Bot, etc. b) Text-to-Image convertors (alternatives to DALL.E) including Midjourney, Stable Diffusion, Google Parti c) Speech-to-text convertors (alternatives to Whisper) including Kaldi, Nuance, Microsoft Azure Speech, Google Cloud Speech-to-text, Amazon Transcribe, Deepgram 5) Conclusion

## **INEE-17 Improving Workstation Ergonomics and Productivity with Input Devices: Saving Time and Your Wrists**

Participants

Nitin Venugopal, MD, Seattle, WA (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

- Discuss the biomechanics and ergonomic factors affecting radiology input devices.- Review common repetitive stress injuries experienced by radiologists caused by input device use.- Systematic product review with pros and cons of popular computer mice, dictation devices and non-traditional input devices (named below) in terms of ergonomics, effectiveness and programmability.- Tutorial on how to customize commonly available input devices with recommended profiles.

### **TABLE OF CONTENTS/OUTLINE**

Radiologist's productivity and wellness are influenced by tools used to interact with clinical images. Software and hardware can augment efficiency but also have the potential to lead to burnout via poor ergonomics. We review the relevant biomechanics and anatomy involved in using computer mice and dictaphones with review of primary literature and of common repetitive stress injuries experienced by radiologists. We offer alternatives to commonly used input devices (mouse, keyboard, handheld dictaphone) used to review clinical images. We share the factors important in choosing a device (e.g. on-board memory) and the results of a systematic review of devices that could augment radiologists' productivity and improve ergonomics including: A) Pointing Devices:- Gaming mice- Ergonomic mice- Trackballs/Trackpads B) Dictation Devices:- Traditional Nuance PowerMic-style- Wearable headsets- Table-top microphones (e.g. podcasting microphone) C) Non-traditional input devices for example:- Elgato stream deck- Contour ShuttlePro- Contour Roller Mouse Finally, we provide tested templates for the above programmable devices to get a new user started with improving their ergonomics and efficiency in the reading room.

## **INEE-18 Transforming Radiology with Large Language Models: Opportunities and Challenges**

### **TEACHING POINTS**

Personalizing Imaging Examinations LLMs can guide patients through imaging procedures based on medical history, including preparation and potential risks. Improving Clinical Documentation LLMs can flag discrepancies and provide decision support, improving accuracy and reducing errors in medical records. Streamlining Insurance Prior Authorization LLMs can assist clinicians in submitting complete prior authorization requests and automating insurance review, reducing manual review time. Increasing Patient Engagement LLMs can convert complex medical information into easily understandable language and provide personalized education, increasing patient engagement. Decreasing Barriers to Access to Healthcare: LLMs can facilitate remote consultations, appointment scheduling, and educational resources, overcoming barriers to healthcare access. Security and Privacy Considerations The use of LLMs in healthcare raises privacy and cybersecurity concerns that must be addressed to protect patient data and comply with laws and regulations.

### **TABLE OF CONTENTS/OUTLINE**

1. Introduction to Large Language Models (LLMs) 2. The Current State of LLMs 3. Compliance and Security 4. Aid in Patient Care 4.1. Personalizing Information for Imaging Examinations 4.2. Decreasing Barriers to Access to Healthcare 4.3. Personalizing Imaging Examinations Resources 4.3. Increasing Patient Engagement 5. Aid in Radiology Workflow 5.1. Automating Routine Tasks (such as appointment scheduling and reminder notifications) 5.2. Facilitating Insurance Prior Authorization 5.3. Improving Clinical Documentation 5.4. Easier EMR Transfer from Different Facility 6. Future Directions 7. Conclusions

## **INEE-19 Unlocking a New Era in Radiology: Leveraging GPT for Accurate Diagnosis of Diseases**

Participants

Matheus Fritzen, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

Understanding the role of ChatGPT in radiologic diagnosis through real-world cases; Evaluating the impact of ChatGPT on hypothesis formulation and diagnostic accuracy; Analyzing ChatGPT's role in providing diagnostic tips and guidance; Assessing the potential of

ChatGPT for improved clinical decision-making

## TABLE OF CONTENTS/OUTLINE

Table of Contents/Outline:  
I. Introduction to ChatGPT in Radiologic Diagnosis  
A. Overview of ChatGPT's capabilities  
B. The potential for AI-assisted diagnosis  
II. Case Studies: ChatGPT in Diagnostic Process  
A. Real-world examples of ChatGPT-enhanced diagnoses  
B. Hypothesis formulation and diagnostic accuracy improvements  
III. ChatGPT's Role in Providing Diagnostic Tips and Guidance  
A. Case examples illustrating diagnostic assistance  
B. The impact of ChatGPT on radiologists' decision-making process  
IV. Assessing ChatGPT's Potential for Clinical Decision Support  
A. Evaluation of case study outcomes  
B. Implications for radiology practice  
V. Conclusion  
A. The real-world impact of ChatGPT on radiologic diagnosis  
B. Future advancements and integration in radiology practice  
This abstract presents a series of case studies that demonstrate the practical applications of ChatGPT in radiologic diagnosis, hypothesis formulation, and clinical decision support. The guide provides an in-depth analysis of how ChatGPT can be utilized to enhance diagnostic accuracy, offer diagnostic tips and guidance, and improve clinical decision-making in real-world scenarios. By showcasing the tangible benefits of ChatGPT through these case studies, the presentation aims to highlight the potential of AI-assisted diagnosis in revolutionizing radiology practice.

## INEE-2 Anatomy of an Ontology

### TEACHING POINTS

1. Understand the distinction between a taxonomy and an ontology.  
2. Comprehend the need for ontologies in medical reporting and electronic records to support interoperability.  
3. Survey the strengths and weaknesses of existing medical ontologies applicable to radiology reporting.  
4. Learn about an effort to create an ontology that has evolved from the concept of the now antiquated American College of Radiology's Index of Radiological Diagnoses.

### TABLE OF CONTENTS/OUTLINE

1. Define what is a taxonomy and what is an ontology. 1a. Illustrate the concepts of CUI, AUI, TUI, and SUI.  
2. Demonstrate why an ontology is important for use in radiology reporting. 2a. Illustrate how an ontology is essential for natural language processing and the creation of mineable, structured data.  
3. Provide an overview of the major medical ontologies applicable to radiology reporting, including SNOMED, RadLex, ICD-10, FMA, MedDRA, and others. 3a. Show where there are deficiencies in the major ontologies, including knowledge gaps pertinent to diagnostic radiology reporting.  
4. Review the original concept of the American College of Radiology's Index of Radiological Diagnoses and how it was used to create teaching files before the existence of desktop computers.  
5. Illustrate how a new ontology is being constructed inspired by the Index of Radiological Diagnoses but in a more pragmatic fashion to accommodate interactive multimedia reporting. 5a. Show cross-mappings between this new ontology and existing ontologies. 5b. Demonstrate the importance of incorporating synoptic phrase for use in radiology reporting.

## INEE-20 Using a Workflow Engine to Improve Data Retrieval and Curation in Multi-modal Research Studies

Participants

Ali Ganjizadeh, MD, Rochester, MN (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Introduction to workflow concepts and their importance in research studies  
2. Overview of the technologies used in the retrieval system: MongoDB, FastAPI, Camunda and NextJS  
3. Understanding the retrieval system architecture  
3a. A modular data retrieval browser-based program to collect multiple data types from multiple data sources  
3b. Setting up a browser-based user interface to create and execute tasks for each subject to retrieve its data from servers  
4. Handling errors and failures in retrieving data using the workflow engine  
5. Additional steps in the workflow system, such as de-identification and data storage  
6. Conclusion and impact of the workflow system on research studies

### TABLE OF CONTENTS/OUTLINE

1. Introduction  
1a. Overview of workflow systems  
1b. Importance of workflow-based systems in research studies  
2. Technologies Used  
2a. MongoDB  
2b. FastAPI  
2c. NextJS  
2d. Tailwind CSS  
2e. Camunda  
3. Workflow System Architecture  
3a. Overview of the system architecture  
3b. Explanation of the workflow engine  
4. Modular Data Retrieval Program  
4a. Setting up the program to collect multiple data types from multiple sources  
4b. Creating tasks for each subject to retrieve data  
5. Browser-Based User Interface  
5a. Designing a user interface to execute tasks for data retrieval  
5b. Graphical user interface for selecting patients to include in the study  
6. Handling Errors and Failures  
6a. How the workflow engine handles errors and failures in data retrieval  
7. Conclusion and Impact  
7a. Significance of the workflow system in research studies  
7b. Lessons learned from the development and implementation of the system

## INEE-21 Use of Chat GPT in Radiology Research

Participants

Andrew Benza, MD, Cleveland, OH (*Presenter*) Nothing to Disclose

Andrew Benza, MD, Cleveland, OH (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- Highlight unique and generalizable prompts to leverage large language models in research.  
- Discuss the art of prompt engineering and key phrases to improve outputs.  
- Demonstrate the variety of functionalities of ChatGPT and Bing AI Search and how it pertains to research.  
- Discuss the future of research with AI as a supplemental tool.

### TABLE OF CONTENTS/OUTLINE

1. History of AI.  
2. New AI systems and their functionalities.  
3. Prompt engineering and key phrases to leverage ChatGPT.  
4. Illustrate how ChatGPT can be used throughout the entire research process for example during the following stages:  
a. Formulate the idea  
b. Write an IRB proposal  
c. Design a research study  
d. Analyze data  
e. Interpret results  
f. Prepare publication  
5. The future of AI and what it means for research/education.

## INEE-22 Beyond Writing and Reporting: Opportunities and Challenges of GPT-based Models in Radiology

Participants

Jose Maluf, MD, (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- To learn definitions and basic concepts of generative AI, natural language processing (NLP) and large language models (LLM) applied to healthcare; - To understand the potential impact of generative pre-trained transformer (GPT)-based models in the radiology practice; - To be familiar with some potential applications of GPT-based models in radiology, including image manipulation, report generation, educational support, clinical decision support, and data analysis; - To emphasize the challenges and limitations before implementation of these models in clinical practice, with focus on ethical and regulatory issues.

#### TABLE OF CONTENTS/OUTLINE

Introduction: AI in healthcare Generative AI, NLP and LLM: Definitions and Basic Concepts Applications in Radiology Image manipulation and improving Medical writing and reporting Clinical decision support Health insurance and advocacy issues Education Other emerging applications Limitations and Challenges Hallucinations and other common mistakes Privacy, security and other risks on clinical implementation Ethical issues: Transparency, bias and discrimination Regulation Future perspectives: what is next? Take home messages

#### INEE-23 Artificial Intelligence: Missed steps and a double edge sword

Participants

Anisa Chowdhary, MD, Milford, CT (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Radiologists should be vigilant and careful as AI can certainly make incorrect diagnosis or miss the diagnosis in certain case scenarios.
- Radiologists should use AI as a secondary adjunct. AI can underperform in specific subset of patients where a radiologist approach is crucial to avoid any diagnostic error.
- AI will continue to serve as a secondary adjunct rather than an alternative to a radiologist.
- AI can certainly help improve work flow and patient care by looking at flagged cases to do a quick triage of which cases to dictate first.

#### TABLE OF CONTENTS/OUTLINE

- Introduction
- Overview
- Missed diagnosis and missed cases by Artificial intelligence
- Teaching points

#### INEE-24 How Federated Learning Improves Pancreatic Segmentation Using Three Distributed Training

Participants

Chen Shen, Nagoya, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To learn Federated Learning, a method for learning from several remote datasets without centralized processing.
2. To learn a new robust aggregation method for Federated Learning
3. To learn the effectiveness of using Federated Learning for pancreatic segmentation.

#### TABLE OF CONTENTS/OUTLINE

Why Federated Learning is useful in healthcare applications?- Distinct from natural images, collecting data from various resources may lead to multiple technical, legal, and privacy issues.- Can produce a model with features from several dispersed sources without requiring the training data to be centralized.Demonstrate the pancreatic segmentation process using Federated Learning.- How does Federated Learning work?- How does the server use FedAvg, a standard aggregation method, to aggregate models from multiple clients?- Introduce a dynamic weight aggregation method to aggregate the model updates properly.A comparison of the pancreatic segmentation performance.- Introduce the datasets and the segmentation models.- Compares the performance of Federated Learning over standalone training on three pancreas datasets.- Compares the effectiveness of dynamic weight aggregation with the original FedAvg algorithm.

1. Qualitative evaluation results.
2. Quantitative segmentation accuracy to show the Federated Learning and our proposed aggregation method improve the segmentation performance on pancreas.

#### INEE-25 Achieving Trustworthy Artificial Intelligence in Clinical Applications: A Comprehensive Review of Key Concepts and Solutions in Medical Imaging

Participants

Pouria Rouzrokh, MD, MPH, Rochester, MN (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

In this exhibit, radiologists will learn to:1) Understand why predictive power doesn't ensure AI models' clinical trustworthiness; 2) name and describe methods to explain AI models, quantify their uncertainty, and detect outlier data for their predictions; 3) analyze the clinical trustworthiness of AI models introduced in scientific studies or commercial products.

#### TABLE OF CONTENTS/OUTLINE

Problem Statement: Is predictive power (e.g., accuracy) all we need?; A review of scenarios where AI fails in clinical deployment.The Triangle of Trustworthiness: Model explainability; Uncertainty quantification; Out-of-distribution detection.Model Explainability: Can we explain the black box of AI models?; A review of interpretation maps (e.g., saliency maps, occlusion sensitivity, integrated maps, etc.) and their use cases; A review of SHAP values and their use cases; Limitations of model explainability.Uncertainty Quantification (UQ): What is vs. what is not model uncertainty?; Where do we expect AI to be uncertain?; UQ methods (Bayesian methods, evidential deep learning methods, posthoc calibration methods); Pros and cons of UQ Methods.Outlier Detection: Out-of-distribution vs. out-of-domain data: what's the difference?; How can outlier data harm your model?; Potential sources of outlier data (covariate drift, dataset drift, concept drift); a review of outlier detection methods (threshold-based, classifier-based, generative AI-based, distance-based, Nearest-neighbor-based); Pros and cons of outlier detection methods.How to shift gears toward trustworthy AI in radiology? Recommendations for AI developers, scientific journals/reviewers, and end-user organizations/radiologists.

#### INEE-26 From Pixels to Diagnosis: Unleashing the Power of Generative AI in Radiology

Participants

Mostafa Shehata, MD, Houston, TX (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Understand basic concepts of image-based neural networks in radiology. Understand how generative AI models architecture and how they are built and trained on radiological images. Most notable applications of Generative AI in radiology. Impact of Generative AI on radiology practice.

#### TABLE OF CONTENTS/OUTLINE

1- Understand basic concepts of deep learning and image-based neural networks. a) What is deep learning? b) How neural networks train and Backpropagation c) The significance of convolutional neural networks d) Dissection of a basic convolutional neural network architecture  
2- Understand how generative AI models architecture and how they are built and trained on radiological images. a) generator models architectures b) How are generative models trained to create radiology images? c) Emphasis on CycleGan models d) What are diffusion models and their potential in imaging?  
3- Provide examples of current and possible applications of generative AI in abdominal radiology a) Synthesizing CT images from MRI b) Image segmentation c) Image reconstruction from image space  
4- Impact of Generative AI on radiology practice with different applications of generative models in abdominal imaging ( image synthesis from noise, CT synthesis from MRI, image reconstruction, segmentation)

#### INEE-27 3D Printing in Pectus Excavatum Surgical Planning

Participants

Mikel Garcia, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Pectus excavatum is the most common deformity of the chest wall, characterized by a concave depression of the sternum. - While diagnosis can often be made without imaging, chest radiographs and CT scans can be useful in cases where the diagnosis is uncertain or to assess the severity of the deformity. Haller's index is commonly used in this evaluation. - The Nuss procedure is a minimally invasive technique used to treat pectus excavatum. It involves inserting a metal bar behind the sternum to correct the deformity, with the bar typically being shaped during the operation based on the patient's chest. - By utilizing 3D printing of the patient's chest CT, the bar can be shaped prior to the surgery, which can help decrease the duration of the operation.

#### TABLE OF CONTENTS/OUTLINE

- Imaging of pectus excavatum- Nuss procedure- 3D reconstruction and segmentation- 3D printing- Presurgical planning using a 3D printed model

#### INEE-28 Promoting Equitable AI in Radiology: Harnessing Open Source Tools for Bias and Fairness Estimation

Participants

Vasanth Venugopal, MD, New Delhi, India (*Presenter*) Officer, CARPL.AI Inc

#### TEACHING POINTS

1. Identifying and addressing biases in AI radiology applications is crucial for promoting equitable healthcare and accurate patient outcomes.  
2. Open-source tools such as AI Fairness 360, Fairlearn, What-If Tool, and Scikit offer tailored techniques for bias estimation and fairness assessment in radiology.  
3. Implementing bias mitigation strategies in AI radiology applications can help reduce disparities in diagnoses and treatment recommendations  
4. Collaborative efforts within the radiology and AI research community are essential for developing robust, up-to-date tools and methodologies  
5. Integrating multiple tools enables comprehensive evaluations across diverse radiological scenarios and patient demographics.

#### TABLE OF CONTENTS/OUTLINE

I. Introduction - Importance of assessing bias and fairness in AI radiology applications  
A. Equitable patient outcomes  
B. Open source tools for evaluation  
II. Variety of Open Source Tools  
A. Comprehensive fairness evaluation  
B. Identification of potential biases  
III. Available Packages for Bias Estimation  
Scikit-fairness/scikit-lego  
IBM Fairness 360  
Aequitas  
Google What-if tool  
PyMetrics audit-ai  
Microsoft Fairlearn  
IV. Comparison and integration of tools  
V. Assessing Fairness Across Multiple Dimensions  
A. Demographic attributes  
B. Clinical attributes  
C. Mitigating disparities in AI radiology systems  
V. Collaboration and Regular Updates  
A. Engaging with the research community  
B. Addressing evolving fairness challenges  
C. Ensuring up-to-date tools and methodologies  
VI. Conclusion - The critical role of open source tools for bias and fairness estimation in radiology AI

#### INEE-29 Effective Program Management for an Artificial Intelligence Team: Optimizing Performance and Productivity

#### TEACHING POINTS

1. Provide insight on how to effectively build, recruit and manage multidisciplinary teams whose collective goal is to deliver AI solutions to the radiology practice.  
2. Share lessons learned from the challenges encountered when trying to optimize an AI program management structure.

#### TABLE OF CONTENTS/OUTLINE

1. Purpose  
a. Provide requirements for creating an effective program management structure that optimizes team performance and productivity.  
2. Building a Radiology AI Team  
a. Master FTE Plan  
b. Job Descriptions  
c. Roles and Responsibilities  
d. Org Chart  
e. Governance  
f. Recruitment  
g. Training Education  
3. Program/Project Management

#### INEE-3 Generative AI (Gen AI) Based Electronic Cleansing: Unlocking the Potential of Photon-counting CT Colonography

Participants

Rie Tachibana, PhD, (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Electronic cleansing (EC) plays a crucial role in enhancing the sensitivity of polyp detection during virtual endoscopic fly-through reading in CT colonography (CTC) by subtracting orally tagged residual materials from the images. This exhibit aims to (1) provide insights into recent advances in generative AI (GenAI) based EC for CTC; (2) explore the benefits and potential applications of photon-counting CTC; and (3) present clinical outcomes.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction: Review the history and recent developments in GenAI-based EC for CTC, including the emergence of photon-counting CT technology. 2. How GenAI-based EC works: (2.1) Explain the basic ideas of GenAI; (2.2) Discuss how self-supervised GenAI-based EC differs from traditional EC; (2.3) Explain diffusion-based EC. 3. Photon-counting CT colonography: (3.1) Provide overview of photon-counting CT; (3.2) Discuss advantages and potential applications in CTC; (3.3) Explain Gen AI-based EC for photon-counting CTC. 4. Case studies: (4.1) Compare the image quality and outcomes of various GenAI-based EC techniques in clinical conventional and photon-counting CTC cases; (4.2) Review potential diagnostic challenges.

#### INEE-30 Take the Right Path: Overview of Artificial Intelligence Guidelines

Participants

Carlos Felipe Reyna, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Present the different kinds of guidelines. Describe guidelines for development, application and implementation, and the evaluation of Artificial Intelligence (AI), created to direct and conduct research in a standardized way, avoiding process errors. To evaluate which of these guidelines is more useful for a specific interest.

#### TABLE OF CONTENTS/OUTLINE

Describe and compare such guides in terms of: purpose and format. Which contexts they fit using flowcharts and schematic images.

#### INEE-31 Federated Learning - Game Changing AI Concept to Train AI without Sending Patient Data Out from Hospitals

#### TEACHING POINTS

(1) To understand the concept of federated learning to address data security and privacy concerns. (2) To learn the application and advantages of federated learning for liver tumor segmentation in hepatic CT. (3) To study the process of the development and performance of federated learning with a patch-wise massive-training artificial neural network (MTANN) model for liver tumor segmentation.

#### TABLE OF CONTENTS/OUTLINE

A. Introduction to Federated Learning - Challenges in acquiring extensive training datasets for a deep learning model from multiple hospitals - Role of federated learning in collaborative learning without sharing data - Issues of federated learning: 1) small local training data, 2) high computational demands, and 3) heavy network loads B. Federated Learning for Tumor Segmentation in Medical Imaging - Overview of federated learning models and their applications to tumor segmentation in medical imaging - Federated learning coupled with MTANN models for addressing the above three issues of the current federated learning C. Clinical Relevance and Performance of Federated Learning for Tumor Segmentation - Ensuring data privacy while achieving accurate tumor segmentation - Performance of federated learning for tumor segmentation - Comparisons with the current-state-of-the-art model and "gold-standard" centralized training model

#### INEE-32 Use of Generative AI for Non-interpretative Tasks in Radiology

Participants

Vinit Balyan, MBBS, MD, Boston, MA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To provide an overview of the current state-of-the-art in generative artificial intelligence (AI) and its applications for non-interpretative tasks in radiology. 2. To showcase examples of how generative AI is being used in radiology today. 3. To highlight the challenges associated with using generative AI in radiology. 4. To touch upon the potential future developments in the field of generative AI and their potential impact on radiology.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction to Generative AI Key concepts and applications 2. Specific ways in which generative AI can be used in non-interpretative tasks in radiology, including: a. Reporting; checking grammar and syntax, generating summary, making reports more readable for non-specialists/patients b. Communication of important findings c. Managing work scheduled. Writing emails 3. Real-world examples of how generative AI has been used to enhance the accuracy and speed of radiological diagnoses 4. Challenges associated with using generative AI in radiology, including Data privacy and security concerns, Ethical considerations, The need for human oversight 5. Potential future developments in the field of generative AI and their potential impact on radiology Conclusion: Overall, the exhibit aims to educate and inform visitors about the latest advances in generative AI and its potential applications in radiology. By providing real-world examples and highlighting the challenges associated with using generative AI in radiology, the exhibit offers an opportunity for visitors to learn about cutting-edge technology that could help improve the efficiency of radiologists, ultimately benefiting patients and medical professionals alike.

#### INEE-33 R Programming Language Basics for Radiologists

#### TEACHING POINTS

1. Learn how to install R 2. Know how to import and process data 3. Run common statistical tests 4. Explore and understand large datasets better

#### TABLE OF CONTENTS/OUTLINE

The R programming language serves as an invaluable resource for managing and analyzing large datasets effectively and efficiently.

As a free and open-source software, R presents a cost-effective solution for performing common statistical tests, crafting visualizations, and even implementing machine learning algorithms. Exhibit Outline: Software installation: -Installing the R programming language-Setting up an Integrated Development Environment (IDE) -Installing essential packagesData import and processing: -File handling and manipulation-Data cleaning and preprocessing -Data transformation and aggregationCommon statistical tests in radiology: Sample code and examples for:- Descriptive statistics -T-test -Analysis of Variance (ANOVA) - Pearson's correlation coefficient -Spearman's rank correlation coefficient -Chi-square test -Logistic regression and more.Large dataset analysis:-Data visualization techniques- Exploratory data analysis (EDA)-Machine learning and predictive modeling-Text mining and natural language processing (NLP)

### **INEE-34 Leveraging Medical Image Annotation with Practical Annotation Quality Check Tools**

Participants

Henrique Lee, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Prepare the data for an artificial intelligence (AI) models often involves intensive annotation work to ensure accurate ground truth. However, radiologists who participate in AI projects may lack practical training in annotation, leading to doubts that increase the variability of annotations. To address this, we developed an automated tool that evaluates bounding box and segmentation annotations and provides feedback to the annotator. The tool uses .json files for bounding box annotations and NifTY files for segmentation annotations, both exported from 3D Slicer. Python scripts compare the locations and categories of findings in the bounding box annotations, as well as the distance and similarity of binary masks in the segmentation annotations with those generated by experts. Results are presented in an HTML report. In a pilot study, we used 5 chest radiographs and 2 head CT scans from publicly available datasets (Montgomery and CQ-500) previously annotated by experts. The availability of reports in an introductory AI course for medical radiologists allowed instructors to monitor participants' progress and identify areas for further emphasis.

#### **TABLE OF CONTENTS/OUTLINE**

Our workflow resulted improved the overall quality of instruction, enhancing the professionalism of the annotations. Annotation tools can increase student engagement and productivity, with teacher supervision facilitating consensus-building and optimizing the laborious task of annotation. Our solution can be applied to various 2D and 3D images studied by radiologists. User-friendly applications that facilitate the teaching of high-quality image annotation are crucial for fostering the development and validation of novel AI models.

### **INEE-35 Automatic Detection of Contrast Enhancement in T1-weighted Brain MRI Images Using Artificial Intelligence**

#### **TEACHING POINTS**

The purposes of this exhibit are: . Development and validation of a tool for post-contrast enhancement detection in T1-weighted MRI images. . Implementation of this tool in the clinical routine of the radiology and diagnostic imaging service of Clinical Hospital of Ribeirao Preto.

#### **TABLE OF CONTENTS/OUTLINE**

The use of magnetic resonance imaging (MRI) in medical practice is extensive and encompasses the diagnosis of multiple conditions such as neoplasms, infections, inflammatory diseases, among others. In these contexts, the analysis of post-contrast enhancement is essential. The detection and quantification of enhancement in T1-weighted cerebral MRI images is a challenging task due to the complexity of the images and the variability in the appearance of contrast enhancement. Artificial intelligence (AI) techniques have the potential to improve the efficiency and accuracy of this process, but the development and evaluation of AI-based approaches for this purpose is a laborious task.

### **INEE-36 A Practical Primer on the Radiomics Quality Score: How to Interpret the Results of Radiomics Studies**

Participants

Mohammad Mirza-aghazadeh-Attari, MD, MPH, Baltimore, MD (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Radiomics quality scores are used to assess the quality of radiomics studies and are based on a set of criteria related to study design, image acquisition, segmentation, feature extraction, and statistical analysis. The purpose of a radiomics quality score is to provide a standardized method for evaluating the quality of radiomics studies and to aid in the interpretation and comparison of study results. Interpreting a radiomics quality score involves understanding the specific criteria used to evaluate the study and the scoring system employed. Typically, a higher score indicates a higher quality study that is more likely to produce reliable and reproducible results. It is important to note that a radiomics quality score is just one factor to consider when evaluating the results of a radiomics study. Other factors such as sample size, patient demographics, and clinical relevance of the results should also be taken into account. Ultimately, the interpretation of radiomics study results should be made in the context of the specific clinical question being addressed and in consultation with a radiologist or other medical expert. Here we present a step by step approach to understanding and applying the RQS.

#### **TABLE OF CONTENTS/OUTLINE**

1- Radiomics Quality Score: A short introduction on its History 2- Methodologic considerations covered in RQS: - 2.1 Extraction of features -2.2 Development of predictive models and classifiers - 2.3 Performance evaluation of models - 2.4 Utility considerations 3- Reporting RQS results 4-Applications of RQS in clinical practice and research 5-Prospectives to enhancing RQS: RQS V2 6- useful tools

### **INEE-37 From Models to Masks, Barriers to Roadblocks, Posters to Presentations: Experience in Forming Cross Institutional Collaborations for Artificial Intelligence Research**

Participants

Nader Refai, MD,BS, Dearborn, MI (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

1. Review of key collaborations necessary for AI related research. 2. Review of potential roadblocks and barriers during project creation and execution. 3. Infrastructure considerations needed for a successful project.

#### TABLE OF CONTENTS/OUTLINE

-Review of key collaborations which facilitate AI research--Domain Experts---Subspecialty radiologist involvement---Trainee involvement (resident/medical student)--AI Expertise---Programmers, data scientists--IT support--Graduate Students-Potential Roadblocks and Barriers--IRB and Data use agreements--DICOM de-identification at scale--De-identified DICOM storage--Image transfer between institutions--EHR data extraction at scale-Infrastructure considerations needed for a successful project.--Image or Data labeling---Example of open-source solutions for DICOM labeling/masking--GPU processing for model creation and testing--Project Management--Conclusion/Summary

#### INEE-38 Imaging Feature as a Function: A Novel Radiomics Framework

Participants

Nicolo Gennaro, MD, Chicago, IL (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Radiomic features exhibit functional correlation with tumor size. Large datasets of pre-treatment scans of liver metastasis can uncover the functional association between tumor size and heterogeneity, providing potential insights into tumor growth and treatment. Harmonization allows to remove scanner-associated effects while preserving cancer-specific functional dependence. Texture features show functional size-dependence that allow to generate delta-radiomics data by utilizing post-treatment imaging data only.

#### TABLE OF CONTENTS/OUTLINE

Introduction: Size measurement is a critical task for radiology and represents the pillar of response assessment to antitumor therapies. Size-dependence of radiomic features: We illustrate why radiomics features are affected by tumor size and how radiomic features might not be comparable even within ROIs of the same tumor but manually delineated by different operators. Harmonization in radiomics: The importance of feature harmonization to remove scanner-related biases and preserve size-dependence. Response Assessment: How size-dependence of texture features can be exploited to obtain delta-radiomics without baseline imaging.

#### INEE-39 The Comprehensive Open Federated Ecosystem (COFE): Enabling Impactful Healthcare Studies

Participants

Sarthak Pati, MSc, Philadelphia, PA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

There is a growing body of literature offering evidence of the potential impact that artificial intelligence (AI) methods can have on healthcare. To ensure robustness evaluate generalizability of AI methods, ample diverse multi-site patient datasets are desired. However, there are various factors that hinder access to such data in the current paradigm of multi-site collaborations, which include the tedious bureaucratic processes, data ownership concerns, legal considerations reflected in patient privacy regulations. To tackle these issues, we introduce the community-driven Comprehensive Open Federated Ecosystem (COFE), which includes multiple open-source software tools to make distributed healthcare AI more accessible by leveraging zero/low code principles to get models to learn across data silos using Federated Learning (FL), to evaluate their performance on diverse datasets that they were not used to train with using Federated Evaluation (FE). The goals of the exhibit are to: broaden the understanding of the general community regarding FL FE, showcase how a user can leverage FL to train a model across various sites, present results of the first real-world federation across 71 collaborating sites, focusing on brain tumors, discuss privacy data protection concerns how COFE hopes to solve it, showcase how a user can leverage FE to generate generalizable statistics for AI methods.

#### TABLE OF CONTENTS/OUTLINE

This exhibit will present a community-driven open-source ecosystem to train evaluate AI models across multiple clinical sites in a data-private paradigm. Specific principles to protect data privacy will be described, along with common pitfalls to avoid when performing FL-based studies.

#### INEE-4 Data Curation in Minutes not Days: Efficient Large Scale Dataset Preparation for Machine Learning Applications in Kaapana

#### TEACHING POINTS

In the era of rapidly growing medical imaging datasets and federated learning, efficient management and processing of medical images is crucial. Current medical image viewers, however, lack the capability for large-scale dataset curation. To address this, we introduce a data curation tool integrated into the Kaapana open-source framework, designed to streamline organization, management, and processing of extensive medical imaging datasets. Radiologists can easily filter for metadata, annotate and structure datasets, visualize dataset distributions, and quickly inspect individual studies. State-of-the-art machine learning algorithms, such as body part regression, nnUNet, and TotalSegmentator, can be applied to automatically annotate studies based on algorithm outcomes, which can accelerate the curation workflow by allowing filtering for specific organs, bone structures and body parts. This tool fosters collaboration between multidisciplinary teams, with machine learning researchers creating algorithms to support radiologists, who in turn annotate and curate the data. In conclusion, the proposed tool offers an intuitive interface for radiologists to efficiently curate datasets for use in machine learning algorithms.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Data Curation Tool 2.1. Features 2.2. Metadata Annotation 2.3. Structuring Visualization 3. ML Algorithm Integrations 4. Conclusion Future Directions

#### INEE-40 Beyond the Hype: The Power of GANs in Restoring MRI Texture

Participants

Kensuke Umehara, PhD, Chiba, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Generative adversarial networks (GANs) are one of the deep learning-based image generation models that have been widely used in medical imaging research, such as modality conversion and data augmentation. However, their application in diagnostic imaging is still met with resistance due to the perception that "GANs easily generate fake images." On the other hand, it is not widely known that with proper model selection and training, GANs can be a useful tool for generating high-quality images from low-quality ones. The teaching points of this exhibit are to 1) provide an overview of GANs using supervised learning, 2) showcase the application of one of the representative supervised GANs, super-resolution GAN, to MRI images, achieving high-quality imaging while enabling short-time imaging, and 3) demonstrate the high-accuracy restoration of the texture of MRI images by applying super-resolution GAN.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Super-resolution GAN for Accelerating MRI 3. Radiomics Analysis 4. Clinical Showcases

#### INEE-41 Accelerating Machine Learning for Medical Imaging by Integrating AIM and AI Federated Learning into Clinical Workflow

Participants

Pattanasak Mongkolwat, PhD, (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. The incorporation of Annotation and Image Markup (AIM) and AI Federated Learning (FL) framework into an imaging workflow can expedite the creation of deep neural network models without compromising the confidentiality and sharing of imaging data. Furthermore, this integration can standardize the creation of annotations for supervised or semi-supervised deep learning approaches in annotated images. 2. Integrating an AIM image annotation tool into clinical workflows can speed up the process of creating annotated images based on an AIM template. The user wants to make simple and constrained annotations. The annotation results can be stored as an AIM XML document, JSON object, or DICOM SR PS3.21 object. Combining the AIM information with corresponding image can facilitate the development and training of multimodal deep learning models. 3. The proposed software tools in this framework simplify the setup and usage of FL and enable the creation of standardized annotations, allowing radiologists and AI researchers to focus on data quality and deep learning model development.

#### TABLE OF CONTENTS/OUTLINE

1. Overview of AIM, AI Federated Learning, and Multimodal Deep Learning 2. Imaging Workflow Architecture and Tools: modified ePAD, Fuji Synapse (example integration), DICOM anonymizer, Mini-PACS, AIM database, AI image inference, cohort creator, image and AIM staging location, Cohort worklist, DICOM reader, AIM transform, FL Web Admin Management, web-based AIM template builder. 3. Framework and Software Tool Requirements 4. Installation and Configuration Guide for Participating Institutions 5. Preparing Your DL Model and Data for AI Training 6. Live and Video Demonstration of the Installed Environments

#### INEE-42 AI-assisted Decision Making for Prostate Cancer Diagnosis

#### TEACHING POINTS

The interpretation of prostate multiparametric MRI is challenging. Up to 30% of clinically significant cancers (PCa) are missed even by expert, and there is large inter-reader variation. Artificial intelligence (AI) shows promise in diagnosing PCa using MR images. To leverage the power of AI, it is crucial to determine if AI can assist radiologists in the diagnostic process and if radiology trainees can learn from AI-generated insights. We trained a state-of-the-art AI model (nnUnet) on a large-scale MRI dataset for PCa diagnosis. We have developed a web-based system for interactive and learning resources, incorporating the AI. This system assists radiologists in PCa diagnosis by providing AI-generated predictions (lesion maps). With this information at their disposal, radiologists make their own predictions and annotations using our web application. We will compare the diagnostic performance of human-only, AI-only, and human+AI. We will also examine the interaction between radiologists and AI to inform better teaching processes. Ultimately, we hope the tool will improve radiologists diagnostic performance and patient outcomes by leveraging the power of AI.

#### TABLE OF CONTENTS/OUTLINE

Preliminary teaching results on simple AI assisted reader tasks. An AI model (nnUnet) trained on PI-CAI dataset: mpMRI images - T2W, DWI/ADC, DCE for human-only reader performance (we random sampled 80 cases for testing purposes). AI-assisted decision making: AI predicted lesion maps. Annotation tool: radiologists annotate prostate cancer with AI assistance at their disposal. Assessment: the performance of human-only, AI-only, and human+AI will be analyzed to generate insights to improve the task performance and teaching.

#### INEE-43 Harnessing AI for Improved Workflow in Radiology: Beyond Image Analysis

Participants

Kevin Pierre, Port Saint Lucie, FL (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

AI can be employed in numerous aspects of the radiology exam's electronic roundtrip, extending beyond image interpretation. This technology holds the potential to increase efficiency, reduce unnecessary scans, improve image quality and patient safety, and expedite the interpretation process. AI assisted reporting has tremendous potential to enhance practice and efficiency. By leveraging AI in these areas, healthcare professionals can save time and resources while enhancing the overall quality of patient care.

#### TABLE OF CONTENTS/OUTLINE

1) Introduction 2) AI Applications Prior to Image Acquisition • Scan Ordering Optimization • Pre-exam Screening • Protocols • Scheduling 3) AI Applications During Image Acquisition • Patient Positioning • Contrast and Radiation Dosimetry • Scan Time Reduction • Image Reconstruction and Postprocessing 4) AI Applications Following Image Acquisition • Worklist Prioritization • Urgent Finding Notification • Hanging Protocol Optimization • Assisted Reporting a) Next generation reporting b) AI-generated preliminary reporting 5) Other Applications • Resident Education • Quality Assurance and Patient Safety • Billing and Compliance 6) Conclusion

## **INEE-44      Designing and Implementing a DICOM Collector for Analytics, Quality Improvement, and Regulatory Compliance**

Participants

William Sensakovic, PhD, Cave Creek, AZ (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

1) Understand the magnitude of DICOM data and architecture necessary to handle such large volumes, 2) Describe the utility that can be derived from DICOM data through additional applications, 3) Understand the pitfalls of naively scraping data without expert input

### **TABLE OF CONTENTS/OUTLINE**

1) What are you collecting and why?, 2) How much data are we talking about?, 3) what kind of architecture do you need?, 4) You collected it, now what do you do with it? (applications), 5) Why is a team necessary for what database - seems like a summer project for a graduate computer science student?, 6) Does use justify the effort expended?

## **INEE-45      NCI Imaging Data Commons: Towards Transparency and Reproducibility in Imaging AI**

Participants

Andriy Fedorov, PhD, Arlington, MA (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

NCI Imaging Data Commons (IDC) is a cloud-based repository of publicly available cancer imaging data co-located with analysis and exploration tools and resources. IDC, part of the NCI Cancer Research Data Commons (CRDC), provides secure access to a large, comprehensive, and expanding collection of cancer research data. IDC uses a combination of commercially available (Google Cloud Platform (GCP), Amazon Web Services (AWS)) and open source components. The IDC portal (<https://imaging.datacommons.cancer.gov>) and SQL interface enable exploration and visualization of data and cohort building. As of Spring 2023, IDC hosts over 40 TB of radiology and digital pathology image data encoded using the DICOM standard, and available in both GCP and AWS. While the IDC is intended for cloud-based data processing, data can be freely downloaded for on-premise analysis. Cloud-based workflows enable reproducible analysis and results. We will present the scope and status of IDC (e.g., new datasets and features), learning resources (e.g., interactive notebooks with reproducible AI workflows applied to the data within IDC), use cases (including those demonstrating large scale time- and cost-efficient analysis workflows) and plans for future development, along with live interactive demonstrations.

### **TABLE OF CONTENTS/OUTLINE**

Overview of CRDC and IDC; Data curation and the role of The Cancer Imaging Archive; Portal; Viewer; Organization of data; Integration of tools; Use case development; Documentation and user support resources; Large scale computing using CRDC Cloud Resources; IDC cloud credit program; Status update and plans for future development.

## **INEE-46      Image-to-text and Text-to-image Models: A Primer for Radiologists**

Participants

An Ni Wu, MD, Gatineau, QC (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

1. Review key concepts of neural network models connecting text and images; 2. Discuss potential applications of image-to-text and text-to-image models in medical imaging; 3. Illustrate key components involved in zero-shot prediction models; 4. Understand the overall design and architectures of text-to-image models; 5. Discuss future directions applicable in radiology.

### **TABLE OF CONTENTS/OUTLINE**

1. Trend: groundbreaking emergence of neural network models connecting text and images. 2. Relevance for radiology: a discipline connecting text reports with medical images. 3. Illustration of key components involved in zero-shot prediction models: text vectorization, image vectorization, vector-space, attribute predictions, image attribute mapping, text classifier, and zero-shot prediction. 4. Illustration of recent models connecting image to text (i.e., CLIP) and text to images (i.e., DALL-E, Stable Diffusion, Imagen). 5. Architecture of CLIP and key messages: convolutional neural networks for text and image encoding, dataset classifier creation, zero-shot prediction model, transfer learning, natural language supervision, generalization, efficiency, flexibility, and limitations. 6. Applications of text-to-image models in radiology: image classification, automated caption generation, synthetic image generation. 7. Future directions: new applications in radiology and technical innovations.

## **INEE-47      Rapid Clinical Deployment of AI Applications for Radiology Using Mercure - An Open Source DICOM Orchestration Platform**

Participants

James O'Callaghan, PhD, MEng, New York, NY (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

The aim of this presentation is to inform the audience of available open-source software that can be used to rapidly integrate Radiology Artificial Intelligence (AI) applications into their clinical infrastructure. We will outline the need for software tools to address practical challenges in translating medical imaging research techniques into real world settings. This will be followed by a description of DICOM orchestrators and how they can help to bridge this gap by handling interactions and requirements of clinical environments. Mercure - an open-source and freely available DICOM orchestrator, will be used to demonstrate how attendees can easily integrate AI applications into their clinical workflow using an intuitive web-based user interface. MONAI (Medical Open Network for Artificial Intelligence) is a popular open-source framework for medical imaging AI. In the concluding section, we will give guidance on how MONAI can be used with Mercure to deploy AI applications for Radiology in a rapid and standardized manner.

### **TABLE OF CONTENTS/OUTLINE**

1. The increasing demand for Artificial Intelligence in Radiology 2. Challenges in clinical translation of AI 3. Integration of AI applications into clinical environments using Mercure 4. Standardization and rapid deployment of AI applications

## **INEE-48 AI Adoption in Clinical Practice: A Practical Guide for the Practicing Radiologist**

Participants

Kevin Pierre, Port Saint Lucie, FL (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

- There is an increasing number of commercial AI algorithms. However, the actual value and useability of these algorithms requires more than evaluation of diagnostic performance metrics alone.
- We will review and provide practical suggestions for radiologists to use when evaluating AI software for their clinical practice.
- We will discuss important practical barriers that should be considered in order to properly assess useability and seamless integration into radiological practice.
- We will discuss pitfalls and opportunities for the use of AI to enhance clinical practice, including efficiency.

### **TABLE OF CONTENTS/OUTLINE**

1. Introduction 2. Discuss basic diagnostic metrics, relevance, and why diagnostic performance alone will not ensure impactful adoption 3. Importance of seamless workflow integration and avoiding pitfalls a. Time to image processing and transfer to viewer b. Pitfalls for algorithms requiring expert-viewer interactions c. AI data transfer and reporting module 4. Importance of seamless workflow integration: Opportunities a. Review increasing number of report augmentation and semi-automated reporting tools providing opportunities for reporting efficiency b. Future areas of efficiency improvement 5. Algorithm testing and deployment challenges and opportunities 6. Non-interpretive AI applications 7. Conclusions

## **INEE-49 Prompting Language Models 101: A Primer for Radiologists**

Participants

Bardia Khosravi, MD, MPH, Rochester, MN (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

Large language model (LLMs) inception was four years ago; however, the advent of ChatGPT provides a unique user experience, showcasing the power of LLMs. Although the chat interface is exceedingly helpful, some nuances exist in creating a correctly structured prompt for a better answer, with less back and forth. This exhibit will cover three main points: 1. Introduction to Language Models 2. The Importance of Prompting 3. Popular Prompting Strategies

### **TABLE OF CONTENTS/OUTLINE**

1. Introduction to Language Models: This section covers large language model basics. What makes them a significant breakthrough in the natural language processing domain? We will focus on some of the applications of LLMs in radiology, specifically in report structuring. 2. The Importance of Prompting: The chat interface of LLMs, like ChatGPT, can cover many personal use cases. On the contrary, this interface may not be helpful for automated information extraction. Additionally, using open source LLMs (as an alternative to ChatGPT, which requires sending data outside of the institution), requires proper prompting to guide the LLM to output the desired results with only one question asked. 3. Popular Prompting Strategies: This section will cover three main prompting strategies: (a) zero-shot prompting, (b) few-shot prompting, (c) chain-of-thought prompting. We use the example of abstracting cervical vertebral fractures from radiology reports. We will provide examples of the model's output based on each prompt to give a better understanding of the importance of prompt engineering.

## **INEE-5 Explainable Artificial Intelligence (XAI) in Computer Vision Explained for the Radiologist**

Participants

Adarsh Ghosh, MD, MBBS, (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

1. Computer vision applications use deep neural networks composed of multiple convolutional layers. The radiological images pass through these layers, and the complex interrelationships are incomprehensible. The resultant algorithm's black-box nature impairs understanding of its decision. 2. Deep learning algorithms address both mundane and critical medical problems. The black-box nature of deep learning algorithms is more problematic in high-stakes situations, such as decisions resulting in patient surgery or intervention. 3. Several approaches are available to develop explainable AI models. Each approach has specific limitations, advantages, and applicability.

### **TABLE OF CONTENTS/OUTLINE**

Introduction: Models with high accuracy may be less transparent: The story of Clever Hans Explainable AI (XAI): What is explainable AI and how is it classified. Importance of XAI in radiology XAI methods: The methods available to explain an algorithm's output and their limitations. Visual Explanations (saliency maps) Back propagation-based approach Perturbation-based approach Text explanations Example-based explanations The limitations of XAI: Additional computing costs. Interpreting interpretable AI

## **INEE-50 Further Possibilities of Deep Learning in the Ultrasound Field**

### **TEACHING POINTS**

In recent years, deep learning technology has become a necessity in the medical field. These technologies have been widely used in mammography, CT, and MRI in clinical applications. In the ultrasound field, a wide range of techniques using deep learning, such as noise reduction and automated detection, have been reported. However, it is clear that deep learning is still in its developing stage compared to other modalities. Why is this? The purpose of this exhibition is to describe the current situation, challenges, and future possibilities of deep learning applications in the ultrasound field. As an example of research using deep learning, we will go into deep learning in the ultrasound field from our research on carotid plaque region extraction and composition differentiation using ultrasound images. The major teaching points of this exhibit are: 1. Introduction of research on deep learning in the ultrasound field 2. Current situation and challenges of deep learning in the ultrasound field 3. Future possibilities with deep learning

### **TABLE OF CONTENTS/OUTLINE**

1. Current situation of AI application to the ultrasound field -Noise Reduction -Segmentation -Classification 2. Introduction of our study 3. Potential AI applications in the ultrasound field

## **INEE-51 How Nationwide Medical Image Database and AI-based Image and Finding-text Analysis Work for**

## **Nation-wide Disease Spread Surveillance: Three years of experience on CT Image-based COVID-19 Monitoring**

### Participants

Kensaku Mori, PhD, Nagoya, Japan (*Presenter*) Research Grant, Cybernet Systems Co, Ltd;Intellectual Property, Cybernet Systems Co, Ltd;Research Grant, J Morita Corporation;Intellectual Property, J Morita Corporation;Developer, J Morita Corporation

### TEACHING POINTS

- To understand how nation-wide medical image database works for nationwide disease surveillance using AI-based medical image and finding-text analysis- To understand how national medical image database collects medical images from participating hospitals- To understand how AI analyzes national medical image database on a cloud computing platform- To understand what kind of data are stored on national medical image database- To understand how COVID-19 infection spread monitoring are performed on national medical image database

### TABLE OF CONTENTS/OUTLINE

National medical image database- National Institute of Informatics, Japan, hosts the National Medical Image Database (NII-MID).- Participating hospitals automate daily image transfers to NII-MID.- AI-image and findings-text analyses are performed on incoming medical images.- Daily analysis utilizes AI-based methods.COVID-19 surveillance using CT images- AI -based (Convolutional Neural Network) analysis of CT images following RSNA COVID-19 CT scan classification guideline for images sent to NII-MID.- Automated data selection of CT images for analysis from NII-MID, using findings-texts.- COVID-19-related word analysis from findings-texts.- Calculation of daily COVID-19 suspicious image rates from data transfers.- Three years of experience monitoring COVID-19 cases through NII-MID.- Demonstrating the relationship between COVID-19 suspicious CT image rates and the daily number of COVID-19 related deaths.Future outlook- Expanding the functionality of NII-MID as a nationwide disease monitoring tool.- Broadening the scope of AI-based analysis targets.- Preparing for the prediction of the next unknown pandemic.

### **INEE-52 Advanced and Versatile AI System for 3D Medical Image Super-resolution**

### Participants

Tong Zheng, Nagoya, Japan (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Gain an understanding of the concept of super-resolution (SR) and the differences between SR in RGB color images and medical images. 2. Identify the main challenges involved in performing SR on medical images. 3. Learn about a specialized AI system designed to overcome these challenges in medical image SR. 4. Explore the exceptional performance of our SR AI on two medical image datasets and its potential in aiding radiologists' diagnoses.

### TABLE OF CONTENTS/OUTLINE

1. AI-based super-resolution (SR): fundamental concepts -SR is a technique that enhances the resolution of an image. -In medical imaging, SR can help radiologists observe precise anatomical structures in low-resolution (LR) images. 2. Challenges of medical image SR -AI for RGB image SR is typically trained using LR-high-resolution (HR) image pairs. - It is difficult to use AI for medical images' SR: LR and HR medical images are often acquired from different devices or scanning conditions. 3. Our specialized AI for medical image SR -We use a real-time registration network to minimize coordinate differences between LR and HR images. -We use a pre-trained generative model to minimize differences in intensity and scanning devices. 4. Two original medical image datasets to validate our SR AI -Dataset-A: micro CT (HR) - clinical CT (LR) dataset. LR-HR images differ in intensity, coordinate, and scanning device. -Dataset-B: Brain MRI dataset. LR-HR images differ in coordinate. 5. Radiologists' diagnostic process is aided by our SR AI - Our AI successfully performed SR on both medical image datasets, making it easier for radiologists to observe precise anatomical structures and make diagnosis. -Statistical analysis showed that our AI outperformed other recent AIs.

### **INEE-53 Preparing for the (Un)Expected: Preventing Ransomware Attacks Before They Happen**

### TEACHING POINTS

Cyberattacks continue to be one of the toughest problems and biggest threats to have hit the healthcare industry in recent years. When hackers gain entry into a hospital's computer network, not only are the hospital operations, financials and data in jeopardy, but there is a direct threat to patient care and safety. As reported by SOPHOS, 34% of hospitals were hit by ransomware in the last year alone. With many hospitals expanding their digital landscape to include cloud computing, telemedicine and remote work, the vulnerability of being a target of an attack remains a risk. Sky Lakes Medical Center fell victim to a ransomware attack in October 2020. In this session, the director of information systems will discuss how his team was able to successfully recover 650 servers and 150 applications in just four weeks' time. He will share best practices of lessons learned and outline the necessary infrastructure and technology systems to have in place so other organizations can prevent disaster before it happens and ultimately help to reduce the number of ransomware attacks in healthcare.

### TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Ransomware numbers within healthcare 3. Top vulnerabilities within healthcare organizations 4. Necessary informatics, infrastructure, and technologies to have in place 5. Key priorities and step by step on how to recover if it does happen to you 6. Conclusion

### **INEE-54 Collaborative Development of a PACS-Integrated Quality Control Dashboard : A Single Institutional Experience**

### Participants

Vijaya Kosaraju, MD, Cleveland, OH (*Presenter*) Nothing to Disclose

### TEACHING POINTS

(1) Designing and implementing a Technologist Quality assessment (Tech QA) dashboard that is integrated with PACS (2) Determine the appropriate QA metrics over a period of time to set up the baseline and target areas for improvement (3) Design a way to deploy the right interventions and measure the resulting response (4) Analyze the intervention response to measure improvement over baseline as a way to improve patient care and radiologist satisfaction.

## TABLE OF CONTENTS/OUTLINE

(1) Introduction to Tech QA (2) How we did it over time (3) Developing the current PACS integrated QA system (4) Challenges associated with implementation and deployment a) Challenges in the backend b) Challenges to educate radiologists and technologists c) Make an efficient path for review of the QAs d) Design a closed feedback loop for efficient processing (5) Initial results of the Tech QA process (6) Interventions deployed as a result of baseline metrics (7) Analyzing the results of the interventions (8) Conclusion (9) Future goals

### INEE-55 Programmatically Generating Radiology Report Fields to Facilitate Structured Reporting Utilizing RadElements.org

Participants

Andrew Gomella, MD, Philadelphia, PA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

-A significant barrier to adoption of structured reporting and use of standardized data elements is the need for each element/concept to be manually created within individual institution's production reporting software-The ability to programmatically create complex report fields and templates helps reduce the barrier to entry-With a relatively short python script the entirety of the RSNA/ACR RadElement.org common data element library can be converted to Powerscribe macros, which can be dragged-and-dropped into reports or batch loaded into the dictation system for department wide use

## TABLE OF CONTENTS/OUTLINE

1. Motivation for creating a programmatic interface for generating radiology report fields and reports2. Reverse engineering the structure of a standard radiology report file (from Powerscribe)3. Approach to generating the report fields and templates in python utilizing XML (Extensible Markup Language) and raw text functions4. Generating autotext snippets for use in reports from RSNA's radelement.org5. Demo of drag and drop functionality adding rad elements or rad element sets to a report template

### INEE-56 How Graph Neural Network Works for Automated Nomenclature of Abdominal Blood Vessels

Participants

Kensaku Mori, PhD, Nagoya, Japan (*Presenter*) Research Grant, Cybernet Systems Co, Ltd;Intellectual Property, Cybernet Systems Co, Ltd;Research Grant, J Morita Corporation;Intellectual Property, J Morita Corporation;Developer, J Morita Corporation

#### TEACHING POINTS

- To understand what is graph convolutional network (GCN)- To understand how GCN is applied for vasculature nomenclature- To understand automated nomenclature performance by GCN- To understand anatomical annotation for 3D blood vessel regions by GCN-based automated nomenclature

## TABLE OF CONTENTS/OUTLINE

Introduction- The importance of automated vasculature nomenclature as a key function in future CAD systems.- Enhancing CT image reading workflow with automated vasculature nomenclature.- Overview of abdominal vasculature systems and their anatomical names.Spectral based graph convolution and graph convolutional network- Review of the theoretical aspects of Graph Convolutional Networks (GCN).-Review of spectral-based graph convolution operations in GCN and their computer implementation.How to apply GCN for automated nomenclature of abdominal blood vessels- Extracting blood vessel tree structures from CT images.- Feature extraction from tree structure.- GCN training methodology.- Automated nomenclature using GCN.Experiments- Configuration of training data.- Annotation of training data.- Evaluating nomenclature performance.- Automated annotation of 3D-rendered blood vessels based on automated nomenclature.- Performance changes for different convolutional areas.Discussion- Limitations of GNN-based automated nomenclature for blood vessels.- Enhancing radiological and surgical readings of CT images with automated nomenclature.- The effectiveness of automated nomenclature in constructing symbolic logic-based CAD systems.

### INEE-6 Designing a Radiomics study: Hurdles and Pitfalls

Participants

Adarsh Ghosh, MD,MBBS, (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Radiomic studies are complex, requiring a unique trial design, data preparation, informatics tools, and infrastructure.2. Radiomic studies are often designed to be hypothesis-generating rather than to answer a hypothesis. This difference in study design requires researchers to identify key comparative data such as patient outcome or histologic diagnosis before the study begins.3. Because radiomics is still a nascent field of imaging research, there are unique challenges and potential pitfalls at every step of the research process.

## TABLE OF CONTENTS/OUTLINE

Radiomics 101 Tools needed to perform a radiomics study Steps of a radiomics study Asking the right questions: -- Is there clinical value? -- Finding the right comparative measure Data curation: the curse and blessing of electronic medical records Imaging data: - - Not all data is created equally: Data Preparation -- Managing multi-institutional data Image segmentation: -- So many circles, so much time -- Managing multiple series Feature extraction: IBSI and open source -- Pyradiomics and more Data modelling: Feature selection and dimensional reduction Data analysis and validation: Finding signal in the noise Common errors in study design and strategies to avoid them: -- Overfitting -- Data leakage -- Data peeking Significance does not equal importance

### INEE-7 Fight for Fairness in AI for Medical Imaging

#### TEACHING POINTS

1. To highlight the critical importance of fairness in AI for medical imaging, emphasizing the negative impacts of biased algorithms on patient outcomes.2. To provide an overview of various evaluation metrics that can be used to assess fairness in AI models, including equality of opportunity and demographic parity, with a particular focus on their application in medical imaging.3. To introduce debiasing methods such as pre-processing techniques and adversarial training, and discuss their effectiveness in

addressing bias in AI models for medical imaging.4. To encourage ongoing discussion and action to promote fairness and equity in healthcare AI and identify future challenges in this rapidly evolving field.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction1.1. Importance of fairness and bias in AI for medical imaging1.2. Brief review of previous studies addressing fairness issues2. Definitions of fairness and bias2.1. Explanation of fairness and bias2.2. Types of bias3. Methods to mitigate bias3.1. Pre-processing techniques (e.g., data cleaning, re-sampling, feature selection)3.2. In-processing techniques (e.g., pruning, contrastive learning, adversarial training)3.3. Post-processing techniques (e.g., calibration)4. Evaluation metrics for fairness4.1. Explanation of evaluation metrics used to assess fairness: demographic parity, equalized odds, and equality of opportunity4.2. Advantages and limitations of each metric5. Challenges5.1. Lack of diversity and representation in healthcare data5.2. Technical limitations of current debiasing methods5.3. Action to promote fairness and equity in AI for healthcare

#### INEE-8 Approaches to Writing and Implementing Custom Software as a Trainee at a Large Academic Health Center

Participants

Andrew Gomella, MD, Philadelphia, PA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Coding is an increasingly popular and important skill, with more non-career programmers picking up coding skills.- Recently released large language models have decreased the entry barrier for coding by demonstrating the possibility of generating complex software from natural language prompts.- Writing, implementing, and testing code in a health system presents unique barriers and challenges, but it is possible even as a trainee.- Significant variation in practice/hospital IT infrastructure, security policies, and the suite of radiology/EHR combinations unfortunately limits cross-institutional development of software.- The software approach, including whether to use a specific language, how to distribute to colleagues, and attention to IT security, depends on the specific problem at hand and can range from surprisingly trivial to prohibitively complex.

#### TABLE OF CONTENTS/OUTLINE

- Motivation- A general approach to tackling software ideas, from feasibility to production- Is there an API(Application Programming Interface)? and what can be done if there isn't?- Institutional variation in IT and software suites, and why it matters- Security considerations- Low code solutions: Example of a program that can be completely run within our hospital infrastructure without any installation or 'writing' code.- Scripting solutions: Example of AutoHotKey scripts including a few line solutions, to dynamically modify open radiology report text.- Python: Swiss army knife, with limitless possibilities and vast online community- Browser plugins: Example of a Chrome plugin used to add features to intranet web pages.- PACS and EHR plugins

#### INEE-9 Maximizing Generative AI's Potential in Radiology: Fine-Tuning and Prompt Engineering

Participants

Theodore Kim, Washington, DC (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- ChatGPT and other generative AI tools have the potential to play significant roles in education, research and clinical practice for diagnostic radiology- One way to maximize their use and potential is by focusing on improving the quality of its output through the processes of fine-tuning and prompt engineering- Fine-tuning is the process of training a pre-trained model on a smaller, task-specific datasets to improve its performance on that task. For example, training a model with specific terminology and recommendations associated with updated Fleischner criteria to guide management of pulmonary nodules on a model already trained on a larger dataset of radiologic imaging- Prompt engineering focuses on designing and refining input queries to obtain the most accurate and relevant desired output. These methods can include using radiology-specific terminology, providing necessary medical context, crafting precise prompts with specific constraints, and using iterative processes to identify and develop the most effective prompt structures.

#### TABLE OF CONTENTS/OUTLINE

1. Principles of Fine Tuning2. Commonly used Algorithms for Fine Tuning3. Fine Tuning in ChatGPT4. Principles of Prompt Engineering5. Prompt Engineering in ChatGPT

Printed on: 04/12/24

## Abstract Archives of the RSNA, 2023

INEE-1

### What Will Happen to AI Technology in Radiology? Systematic Review of Natural Language Processing for Radiological Image Processing

#### TEACHING POINTS

In recent years, the application of artificial intelligence (AI) technology in the medical field has been advancing rapidly. In radiology, AI technology is expected to improve the accuracy of physician diagnosis through image analysis and automated diagnosis. Specifically, these include automated diagnostic technologies using deep learning and the prediction of patient health status. Many of the technologies that use AI include systems that use Natural Language Processing (NLP). Improvements in NLP models have made it possible to handle not only text data but also image data, and many applications in the medical field have been reported. The purpose of this exhibit is to show the application of NLP model in radiology and our work applying the Vision Transformer to atrial fibrillation types classification. The major teaching points of this exhibit are 1.AI technology in radiology is expected to improve the accuracy of physician diagnosis through image analysis and automated diagnosis. 2.NLP enables the processing and extraction of large amounts of natural language generated in the medical field. 3.How can NLP be used for medical imaging?

#### TABLE OF CONTENTS/OUTLINE

1. AI Technology in Radiology 2. What is NLP? -Familiar Applications of NLP Models -Typical models used for NLP -Examples of Image Applications of NLP Models 3. Introduction to this study -Atrial Fibrillation Types Classification Using the Vision Transformer

Printed on: 04/12/24

## Abstract Archives of the RSNA, 2023

INEE-10

### Establishing a Radiology Research Laboratory, from A-Z

#### Participants

Hussain Al Yousif, MD, Hershey, PA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Quantitative image analysis for clinical trials is poorly managed using standard clinical workflows. Radiology Research laboratories standardize the workflows for trials that use imaging endpoints. Radiology Research laboratories can provide more value to support institutional research objectives beyond image interpretation and should be set up to serve as central point of contact for all clinical researchers and medical imaging.

#### TABLE OF CONTENTS/OUTLINE

Defining the problem - addressing the needValue of radiologists and medical imaging personnel at the various stages of clinical research:

- Research protocol development
- Feasibility assessments
- Access to radiologists and technical resources

Partnering for success - working with your customers and end users to know what service are needed:

- Image review with quality quantitative image assessment
- Image transfer
- Protocol review
- Feasibility assessments
- Trial budget development

Take advantage of existing institutional core lab infrastructure:

- List of provided services accessible via website.
- Billing for services
- Operations

Identify the key components and personnel required for functioning of the lab:

- Hardware and software
- Personnel

Developing a budget and list of provided services. Research lab operational workflow in context of clinical operations Annual reviews, with budget and performance adjustments.

INEE-11

### Lung Cancer Screening and AI: Challenges and Opportunities

#### Participants

Leonardo Rosolen Iunes, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To discuss the potential role of artificial intelligence (AI) in lung cancer screening (LCS), highlighting: - AI applications in LCS: machine learning versus deep learning strategies - AI limitations in LCS: data collection, reproducibility, generalizability, validation - Responsible AI: fairness, accountability, and transparency - Addressing gender and racial bias in LCS programs - Future perspectives: combining the strengths of radiologists and AI for best LCS practices

#### TABLE OF CONTENTS/OUTLINE

1. Introduction a. Ongoing challenges in implementation of LCS b. AI in healthcare: basic concepts 2. AI and lung cancer: an overview a. Screening b. Radiomics and Radiogenomics c. Decision making and prognosis prediction 3. AI in LCS: potential applications a. Early detection b. Nodule classification c. Radiography versus Computed tomography d. Retrospective versus Prospective Studies 4. Limitations and Challenges: AI in the real world a. Bias in underserved and underrepresented populations 5. Responsible AI: transparency and regulation 6. Future perspectives 7. Take home messages

INEE-12

### AI-Driven Tools and Techniques in Radiology Education: Empowering the Next Generation of Radiologists

#### Participants

Matteo Mancino, MD, Roma, Italy (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The integration of AI into radiology education is crucial, as state-of-art AI applications such as deep learning and machine learning are transforming decision making and patient care. Radiology trainees must be well-versed in AI technologies to effectively leverage their potential in delivering value-based clinical practice. The aim of this poster is to provide an overview of AI's role in radiology trainee education, addressing challenges, state-of-art resources and future directions.

#### TABLE OF CONTENTS/OUTLINE

1. Curriculum development Building an AI curriculum including ethics, data quality, privacy, and AI's impact on clinical workflows. 2. Interdisciplinary learning: Encouraging trainees to collaborate with other medical specialties to understand AI's broader implications in healthcare. 3. Collaboration Encouraging cooperation between radiology departments, AI experts, and industry partners to develop tailored educational content and resources. 4. Assessments: Leveraging AI for performance assessment in radiology board examinations and multidisciplinary meetings to enhance clinical decision-making skills. 5. AI-augmented education Using AI to provide learning experiences, such as personalized case selection. 6. Barriers and challenges: Addressing barriers to AI education, and developing strategies to overcome these challenges. 7. Future directions: Exploring innovative ways to integrate AI into radiology education, such as AI-driven simulations, virtual reality, and gamification.

### Generative AI Predicts the Survival of Patients with Progressive Fibrosing Interstitial Lung Disease

#### Participants

Masaki Okamoto, Boston, MA (*Presenter*) Stockholder, TOKYO analytica

#### TEACHING POINTS

Progressive fibrosing interstitial lung disease (PF-ILD) is a group of diseases characterized by increasing self-sustaining fibrosis, progressive decline in lung function, and high mortality. Due to the highly variable rates of decline and poor prognosis of PF-ILD, accurate, individualized mortality prediction is crucial for therapeutic decision-making and management of the patients. However, PF-ILD does not have any formal prognosis-based staging system, and none of the developed existing prognostic biomarkers have been considered accurate enough for establishing such a system. The teaching points of this exhibit are to (1) review currently available clinical prognostic biomarkers for PF-ILD, (2) review an emerging generative AI-based biomarker for imaging-based prediction of survival in PF-ILD, and (3) review the comparative performance between the clinical and generative-AI-based prognostic biomarkers in the prediction of the survival in PF-ILD.

#### TABLE OF CONTENTS/OUTLINE

(1) Unmet need for accurate prognostic biomarkers for PF-ILD. (2) Clinically established prognostic biomarkers for PF-ILD (gender, age, and physiology (GAP) index; composite physiologic index (CPI); visual high-resolution CT pattern). (3) Radiomic biomarkers (traditional radiomics; hyper-curvature features) for survival analysis. (4) Emerging generative AI-based imaging biomarker (gen2surv). (5) Comparative performance of biomarkers in terms of survival prediction and Kaplan-Meier survival curves. (6) Clinical case studies.

### AI as a Medical Device: Demystifying FDA Regulation for AI Tools in Clinical Radiology Practice

#### Participants

Anjali Patel, Ocala, FL (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Understand the FDA's role in regulating AI radiology tools categorized as software as a medical device. Gain a fundamental understanding of FDA regulations, crucial for algorithm developers and end users to ensure appropriate and optimal use. Distinguish between FDA clearance and different classifications for radiological software as a medical device. Appreciate the importance of various classifications concerning algorithm development, validation rigor, and intended use. Assess the real-world implications of device classifications on the adoption of AI tools in clinical radiology practice. Explore ongoing debates and potential future developments in FDA regulation of AI radiology tools.

#### TABLE OF CONTENTS/OUTLINE

Introduction Overview of FDA classifications for AI medical software Class I devices Class II devices Class III devices Discerning intended use and its influence on device classification Motivations behind seeking lower category classifications and potential pitfalls in clinical practice Different category FDA classifications and impact on AI tool adoption and usability in clinical practice Controversial aspects and future optimization of FDA regulation in AI radiology tools Conclusions

### Streamlining Emergency and General Radiology Reporting Through Customized Macros for Incidental Findings: A Primer and Online Repository

#### Participants

Jeffers Nguyen, MD, New Haven, CT (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Modern radiologic practice demands higher volume study interpretation, which may be facilitated by improvements in dictation workflow. There is a large variety of incidental findings that may be made during the course of general, multi-modality, or emergency radiologic practice whose accepted follow-up recommendations may be difficult to recall for general radiologists, or those practicing outside of a subspecialty area. Furthermore, existing solutions to streamline the reporting of incidental findings are cumbersome and require too many clicks or keystrokes to rapidly implement. We present customized, pick list type macros that allow easy selection of up-to-date recommendations for the most common incidental findings that may be encountered in routine practice. We demonstrate how these may be used and provide an online repository from which they may be downloaded and imported for personal use.

#### TABLE OF CONTENTS/OUTLINE

1) A brief review of incidental findings; 2) How to create, export, and import pick list macros (PowerScribe); 3) How to use pick list macros (video demonstration); 4) Demonstrating the value of pick list macros for incidentally detected lesions, including adnexal masses, pituitary lesions, pulmonary nodules, liver lesions, pancreatic cystic lesions, renal masses, and more; 5) URL for online repository of macro resources

Printed on: 04/12/24

## Abstract Archives of the RSNA, 2023

### The OpenAI Ecosystem and Potential Applications in Radiology

#### Participants

Reza Sirous, MD, MPH, Washington DC, DC (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1) Explaining Large Language models (LLM) and Large multimodal models (LMM) 2) Explaining about OpenAI ecosystem and its extensive list of AI-powered tools 3) Explaining potential applications of OpenAI tools in Radiology 4) Explaining other LLMs competing with OpenAI tools and their potential applications in Radiology

#### TABLE OF CONTENTS/OUTLINE

1) LLM vs. LMM: a) Background, evolution, examples, and comparison of LLM vs. LMM b) Discussing and comparing major LLM platforms (including ChatGPT, LaMDA, MT-NLG, BLOOM, Galactica, PaLM, LLaMA, etc.) 2) OpenAI ecosystem: Introducing the below tools, their general applications, strengths, weaknesses, opportunities, and threats: a) ChatGPT b) Playground c) Plugins d) Application Programming Interface (API) e) Whisper f) Dall.E g) Codex h) ImageGPT i) CLIP j) Alignment k) Microscope l) Gym m) Baselines 3) Discussing potential applications of each OpenAI tool in Radiology, strengths, weaknesses, opportunities, and threats: a) Clinical Applications (for radiologists, referring physicians, patients, etc.) b) Research Publications (for journals/reviewers, authors, etc.) c) Education Admission Process (for radiology trainees, faculty, etc.) d) Public Health Health Policy (for policy makers, screening campaigns, etc.) 4) Introducing alternatives to the OpenAI tools, pros, and cons: a) Chatbots (alternatives to ChatGPT), including Google Bard, Baidu ERNIE Bot, etc. b) Text-to-Image convertors (alternatives to DALL.E) including Midjourney, Stable Diffusion, Google Parti c) Speech-to-text convertors (alternatives to Whisper) including Kaldi, Nuance, Microsoft Azure Speech, Google Cloud Speech-to-text, Amazon Transcribe, Deepgram 5) Conclusion

### Improving Workstation Ergonomics and Productivity with Input Devices: Saving Time and Your Wrists

#### Participants

Nitin Venugopal, MD, Seattle, WA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Discuss the biomechanics and ergonomic factors affecting radiology input devices.- Review common repetitive stress injuries experienced by radiologists caused by input device use.- Systematic product review with pros and cons of popular computer mice, dictation devices and non-traditional input devices (named below) in terms of ergonomics, effectiveness and programmability.- Tutorial on how to customize commonly available input devices with recommended profiles.

#### TABLE OF CONTENTS/OUTLINE

Radiologist's productivity and wellness are influenced by tools used to interact with clinical images. Software and hardware can augment efficiency but also have the potential to lead to burnout via poor ergonomics. We review the relevant biomechanics and anatomy involved in using computer mice and dictaphones with review of primary literature and of common repetitive stress injuries experienced by radiologists. We offer alternatives to commonly used input devices (mouse, keyboard, handheld dictaphone) used to review clinical images. We share the factors important in choosing a device (e.g. on-board memory) and the results of a systematic review of devices that could augment radiologists' productivity and improve ergonomics including: A) Pointing Devices:- Gaming mice- Ergonomic mice- Trackballs/Trackpads B) Dictation Devices:- Traditional Nuance PowerMic-style- Wearable headsets- Table-top microphones (e.g. podcasting microphone) C) Non-traditional input devices for example:- Elgato stream deck- Contour ShuttlePro- Contour Roller Mouse Finally, we provide tested templates for the above programmable devices to get a new user started with improving their ergonomics and efficiency in the reading room.

### Transforming Radiology with Large Language Models: Opportunities and Challenges

#### TEACHING POINTS

Personalizing Imaging Examinations LLMs can guide patients through imaging procedures based on medical history, including preparation and potential risks. Improving Clinical Documentation LLMs can flag discrepancies and provide decision support, improving accuracy and reducing errors in medical records. Streamlining Insurance Prior Authorization LLMs can assist clinicians in submitting complete prior authorization requests and automating insurance review, reducing manual review time. Increasing Patient Engagement LLMs can convert complex medical information into easily understandable language and provide personalized education, increasing patient engagement. Decreasing Barriers to Access to Healthcare: LLMs can facilitate remote consultations, appointment scheduling, and educational resources, overcoming barriers to healthcare access. Security and Privacy Considerations The use of LLMs in healthcare raises privacy and cybersecurity concerns that must be addressed to protect patient data and comply with laws and regulations.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction to Large Language Models (LLMs) 2. The Current State of LLMs 3. Compliance and Security 4. Aid in Patient Care 4.1. Personalizing Information for Imaging Examinations 4.2. Decreasing Barriers to Access to Healthcare 4.3. Personalizing Imaging Examinations Resources 4.3. Increasing Patient Engagement 5. Aid in Radiology Workflow 5.1. Automating Routine Tasks (such as appointment scheduling and reminder notifications) 5.2. Facilitating Insurance Prior Authorization 5.3. Improving Clinical Documentation 5.4. Easier EMR Transfer from Different Facility 6. Future Directions 7. Conclusions

### Unlocking a New Era in Radiology: Leveraging GPT for Accurate Diagnosis of Diseases

#### Participants

Matheus Fritzen, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Understanding the role of ChatGPT in radiologic diagnosis through real-world cases; Evaluating the impact of ChatGPT on hypothesis formulation and diagnostic accuracy; Analyzing ChatGPT's role in providing diagnostic tips and guidance; Assessing the potential of ChatGPT for improved clinical decision-making

#### TABLE OF CONTENTS/OUTLINE

Table of Contents/Outline:  
I. Introduction to ChatGPT in Radiologic Diagnosis  
A. Overview of ChatGPT's capabilities  
B. The potential for AI-assisted diagnosis  
II. Case Studies: ChatGPT in Diagnostic Process  
A. Real-world examples of ChatGPT-enhanced diagnoses  
B. Hypothesis formulation and diagnostic accuracy improvements  
III. ChatGPT's Role in Providing Diagnostic Tips and Guidance  
A. Case examples illustrating diagnostic assistance  
B. The impact of ChatGPT on radiologists' decision-making process  
IV. Assessing ChatGPT's Potential for Clinical Decision Support  
A. Evaluation of case study outcomes  
B. Implications for radiology practice  
V. Conclusion  
A. The real-world impact of ChatGPT on radiologic diagnosis  
B. Future advancements and integration in radiology practice  
This abstract presents a series of case studies that demonstrate the practical applications of ChatGPT in radiologic diagnosis, hypothesis formulation, and clinical decision support. The guide provides an in-depth analysis of how ChatGPT can be utilized to enhance diagnostic accuracy, offer diagnostic tips and guidance, and improve clinical decision-making in real-world scenarios. By showcasing the tangible benefits of ChatGPT through these case studies, the presentation aims to highlight the potential of AI-assisted diagnosis in revolutionizing radiology practice.

### Anatomy of an Ontology

#### TEACHING POINTS

1. Understand the distinction between a taxonomy and an ontology. 2. Comprehend the need for ontologies in medical reporting and electronic records to support interoperability. 3. Survey the strengths and weaknesses of existing medical ontologies applicable to radiology reporting. 4. Learn about an effort to create an ontology that has evolved from the concept of the now antiquated American College of Radiology's Index of Radiological Diagnoses.

#### TABLE OF CONTENTS/OUTLINE

1. Define what is a taxonomy and what is an ontology. 1a. Illustrate the concepts of CUI, AUI, TUI, and SUI. 2. Demonstrate why an ontology is important for use in radiology reporting. 2a. Illustrate how an ontology is essential for natural language processing and the creation of mineable, structured data. 3. Provide an overview of the major medical ontologies applicable to radiology reporting, including SNOMED, RadLex, ICD-10, FMA, MedDRA, and others. 3a. Show where there are deficiencies in the major ontologies, including knowledge gaps pertinent to diagnostic radiology reporting. 4. Review the original concept of the American College of Radiology's Index of Radiological Diagnoses and how it was used to create teaching files before the existence of desktop computers. 5. Illustrate how a new ontology is being constructed inspired by the Index of Radiological Diagnoses but in a more pragmatic fashion to accommodate interactive multimedia reporting. 5a. Show cross-mappings between this new ontology and existing ontologies. 5b. Demonstrate the importance of incorporating synoptic phrase for use in radiology reporting.

### Using a Workflow Engine to Improve Data Retrieval and Curation in Multi-modal Research Studies

#### Participants

Ali Ganjizadeh, MD, Rochester, MN (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Introduction to workflow concepts and their importance in research studies  
2. Overview of the technologies used in the retrieval system: MongoDB, FastAPI, Camunda and NextJS  
3. Understanding the retrieval system architecture  
3a. A modular data retrieval browser-based program to collect multiple data types from multiple data sources  
3b. Setting up a browser-based user interface to create and execute tasks for each subject to retrieve its data from servers  
4. Handling errors and failures in retrieving data using the workflow engine  
5. Additional steps in the workflow system, such as de-identification and data storage  
6. Conclusion and impact of the workflow system on research studies

#### TABLE OF CONTENTS/OUTLINE

1. Introduction  
1a. Overview of workflow systems  
1b. Importance of workflow-based systems in research studies  
2. Technologies Used  
2a. MongoDB  
2b. FastAPI  
2c. NextJS  
2d. Tailwind CSS  
2e. Camunda  
3. Workflow System Architecture  
3a. Overview of the system architecture  
3b. Explanation of the workflow engine  
4. Modular Data Retrieval Program  
4a. Setting up the program to collect multiple data types from multiple sources  
4b. Creating tasks for each subject to retrieve data  
5. Browser-Based User Interface  
5a. Designing a user interface to execute tasks for data retrieval  
5b. Graphical user interface for selecting patients to include in the study  
6. Handling Errors and Failures  
6a. How the workflow engine handles errors and failures in data retrieval  
7. Conclusion and Impact  
7a. Significance of the workflow system in research studies  
7b. Lessons learned from the development and implementation of the system

### Use of Chat GPT in Radiology Research

#### Participants

Andrew Benza, MD, Cleveland, OH (*Presenter*) Nothing to Disclose

Andrew Benza, MD, Cleveland, OH (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Highlight unique and generalizable prompts to leverage large language models in research.- Discuss the art of prompt engineering and key phrases to improve outputs.- Demonstrate the variety of functionalities of ChatGPT and Bing AI Search and how it pertains to research.-Discuss the future of research with AI as a supplemental tool.

#### TABLE OF CONTENTS/OUTLINE

1. History of AI.2. New AI systems and their functionalities.3. Prompt engineering and key phrases to leverage ChatGPT.4. Illustrate how ChatGPT can be used throughout the entire research process for example during the following stages: a. Formulate the idea. b. Write an IRB proposal. c. Design a research study. d. Analyze data. e. Interpret results. f. Prepare publication.5. The future of AI and what it means for research/education.

### Beyond Writing and Reporting: Opportunities and Challenges of GPT-based Models in Radiology

#### Participants

Jose Maluf, MD, (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- To learn definitions and basic concepts of generative AI, natural language processing (NLP) and large language models (LLM) applied to healthcare; - To understand the potential impact of generative pre-trained transformer (GPT)-based models in the radiology practice; - To be familiar with some potential applications of GPT-based models in radiology, including image manipulation, report generation, educational support, clinical decision support, and data analysis; - To emphasize the challenges and limitations before implementation of these models in clinical practice, with focus on ethical and regulatory issues.

#### TABLE OF CONTENTS/OUTLINE

Introduction: AI in healthcare Generative AI, NLP and LLM: Definitions and Basic Concepts Applications in Radiology Image manipulation and improving Medical writing and reporting Clinical decision support Health insurance and advocacy issues Education Other emerging applications Limitations and Challenges Hallucinations and other common mistakes Privacy, security and other risks on clinical implementation Ethical issues: Transparency, bias and discrimination Regulation Future perspectives: what is next? Take home messages

### Artificial Intelligence: Missed steps and a double edge sword

#### Participants

Anisa Chowdhary, MD, Milford, CT (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Radiologists should be vigilant and careful as AI can certainly make incorrect diagnosis or miss the diagnosis in certain case scenarios.
- Radiologists should use AI as a secondary adjunct. AI can underperform in specific subset of patients where a radiologist approach is crucial to avoid any diagnostic error.
- AI will continue to serve as a secondary adjunct rather than an alternative to a radiologist.
- AI can certainly help improve work flow and patient care by looking at flagged cases to do a quick triage of which cases to dictate first.

#### TABLE OF CONTENTS/OUTLINE

- Introduction
- Overview
- Missed diagnosis and missed cases by Artificial intelligence
- Teaching points

### How Federated Learning Improves Pancreatic Segmentation Using Three Distributed Training

#### Participants

Chen Shen, Nagoya, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To learn Federated Learning, a method for learning from several remote datasets without centralized processing.2. To learn a new robust aggregation method for Federated Learning3. To learn the effectiveness of using Federated Learning for pancreatic segmentation.

#### TABLE OF CONTENTS/OUTLINE

Why Federated Learning is useful in healthcare applications?- Distinct from natural images, collecting data from various resources may lead to multiple technical, legal, and privacy issues.- Can produce a model with features from several dispersed sources without requiring the training data to be centralized.Demonstrate the pancreatic segmentation process using Federated Learning.- How does Federated Learning work?- How does the server use FedAvg, a standard aggregation method, to aggregate models from multiple clients?- Introduce a dynamic weight aggregation method to aggregate the model updates properly.A comparison of the pancreatic segmentation performance.- Introduce the datasets and the segmentation models.- Compares the performance of Federated Learning over standalone training on three pancreas datasets.- Compares the effectiveness of dynamic weight aggregation with the original FedAvg algorithm.1. Qualitative evaluation results.2. Quantitative segmentation accuracy to show the Federated Learning and our proposed aggregation method improve the segmentation performance on pancreas.

### Achieving Trustworthy Artificial Intelligence in Clinical Applications: A Comprehensive Review of Key Concepts and Solutions in Medical Imaging

#### Participants

Pouria Rouzrokh, MD, MPH, Rochester, MN (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

In this exhibit, radiologists will learn to: 1) Understand why predictive power doesn't ensure AI models' clinical trustworthiness; 2) name and describe methods to explain AI models, quantify their uncertainty, and detect outlier data for their predictions; 3) analyze the clinical trustworthiness of AI models introduced in scientific studies or commercial products.

#### TABLE OF CONTENTS/OUTLINE

Problem Statement: Is predictive power (e.g., accuracy) all we need?; A review of scenarios where AI fails in clinical deployment. The Triangle of Trustworthiness: Model explainability; Uncertainty quantification; Out-of-distribution detection. Model Explainability: Can we explain the black box of AI models?; A review of interpretation maps (e.g., saliency maps, occlusion sensitivity, integrated maps, etc.) and their use cases; A review of SHAP values and their use cases; Limitations of model explainability. Uncertainty Quantification (UQ): What is vs. what is not model uncertainty?; Where do we expect AI to be uncertain?; UQ methods (Bayesian methods, evidential deep learning methods, posthoc calibration methods); Pros and cons of UQ Methods. Outlier Detection: Out-of-distribution vs. out-of-domain data: what's the difference?; How can outlier data harm your model?; Potential sources of outlier data (covariate drift, dataset drift, concept drift); a review of outlier detection methods (threshold-based, classifier-based, generative AI-based, distance-based, Nearest-neighbor-based); Pros and cons of outlier detection methods. How to shift gears toward trustworthy AI in radiology? Recommendations for AI developers, scientific journals/reviewers, and end-user organizations/radiologists.

### From Pixels to Diagnosis: Unleashing the Power of Generative AI in Radiology

#### Participants

Mostafa Shehata, MD, Houston, TX (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Understand basic concepts of image-based neural networks in radiology. Understand how generative AI models architecture and how they are built and trained on radiological images. Most notable applications of Generative AI in radiology. Impact of Generative AI on radiology practice.

#### TABLE OF CONTENTS/OUTLINE

1- Understand basic concepts of deep learning and image-based neural networks. a) What is deep learning? b) How neural networks train and Backpropagation c) The significance of convolutional neural networks d) Dissection of a basic convolutional neural network architecture  
2- Understand how generative AI models architecture and how they are built and trained on radiological images. a) generator models architectures b) How are generative models trained to create radiology images? c) Emphasis on CycleGan models d) What are diffusion models and their potential in imaging?  
3- Provide examples of current and possible applications of generative AI in abdominal radiology a) Synthesizing CT images from MRI b) Image segmentation c) Image reconstruction from image space  
4- Impact of Generative AI on radiology practice with different applications of generative models in abdominal imaging ( image synthesis from noise, CT synthesis from MRI, image reconstruction, segmentation)

### 3D Printing in Pectus Excavatum Surgical Planning

#### Participants

Mikel Garcia, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Pectus excavatum is the most common deformity of the chest wall, characterized by a concave depression of the sternum.-While diagnosis can often be made without imaging, chest radiographs and CT scans can be useful in cases where the diagnosis is uncertain or to assess the severity of the deformity. Haller's index is commonly used in this evaluation. - The Nuss procedure is a minimally invasive technique used to treat pectus excavatum. It involves inserting a metal bar behind the sternum to correct the deformity, with the bar typically being shaped during the operation based on the patient's chest.- By utilizing 3D printing of the patient's chest CT, the bar can be shaped prior to the surgery, which can help decrease the duration of the operation.

#### TABLE OF CONTENTS/OUTLINE

- Imaging of pectus excavatum- Nuss procedure- 3D reconstruction and segmentation- 3D printing- Presurgical planning using a 3D printed model

Printed on: 04/12/24

### Promoting Equitable AI in Radiology: Harnessing Open Source Tools for Bias and Fairness Estimation

#### Participants

Vasanth Venugopal, MD, New Delhi, India (*Presenter*) Officer, CARPL.AI Inc

#### TEACHING POINTS

1. Identifying and addressing biases in AI radiology applications is crucial for promoting equitable healthcare and accurate patient outcomes. 2. Open-source tools such as AI Fairness 360, Fairlearn, What-If Tool, and Scikit offer tailored techniques for bias estimation and fairness assessment in radiology. 3. Implementing bias mitigation strategies in AI radiology applications can help reduce disparities in diagnoses and treatment recommendations. 4. Collaborative efforts within the radiology and AI research community are essential for developing robust, up-to-date tools and methodologies. 5. Integrating multiple tools enables comprehensive evaluations across diverse radiological scenarios and patient demographics.

#### TABLE OF CONTENTS/OUTLINE

I. Introduction - Importance of assessing bias and fairness in AI radiology applications  
A. Equitable patient outcomes  
B. Open source tools for evaluation  
II. Variety of Open Source Tools  
A. Comprehensive fairness evaluation  
B. Identification of potential biases  
III. Available Packages for Bias Estimation  
Scikit-fairness/scikit-lego  
IBM Fairness 360  
Aequitas  
Google What-if tool  
PyMetrics  
audit-ai  
Microsoft Fairlearn  
IV. Comparison and integration of tools  
IV. Assessing Fairness Across Multiple Dimensions  
A. Demographic attributes  
B. Clinical attributes  
C. Mitigating disparities in AI radiology systems  
V. Collaboration and Regular Updates  
A. Engaging with the research community  
B. Addressing evolving fairness challenges  
C. Ensuring up-to-date tools and methodologies  
VI. Conclusion - The critical role of open source tools for bias and fairness estimation in radiology AI

### Effective Program Management for an Artificial Intelligence Team: Optimizing Performance and Productivity

#### TEACHING POINTS

1. Provide insight on how to effectively build, recruit and manage multidisciplinary teams whose collective goal is to deliver AI solutions to the radiology practice. 2. Share lessons learned from the challenges encountered when trying to optimize an AI program management structure.

#### TABLE OF CONTENTS/OUTLINE

1. Purpose a. Provide requirements for creating an effective program management structure that optimizes team performance and productivity. 2. Building a Radiology AI Team a. Master FTE Plan b. Job Descriptions c. Roles and Responsibilities d. Org Chart e. Governance f. Recruitment g. Training Education 3. Program/Project Management a. Organization b. Methodology i. Hybrid c. Electronic Tools i. Monday.com ii. Azure Dev Ops iii. Microsoft Teams iv. OneNote v. SharePoint d. Quality Management System (QMS) Compliance e. Meeting Structure f. Communication 4. Lessons Learned a. Challenges b. Successes 5. Conclusion a. Building and managing a multidisciplinary team of individuals whose goal is to deliver AI solutions to the radiology practice in a safe and efficient manner requires careful consideration to the overall program management structure and associated tool sets. ### Generative AI (Gen AI) Based Electronic Cleansing: Unlocking the Potential of Photon-counting CT Colonography

#### Participants

Rie Tachibana, PhD, (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Electronic cleansing (EC) plays a crucial role in enhancing the sensitivity of polyp detection during virtual endoscopic fly-through reading in CT colonography (CTC) by subtracting orally tagged residual materials from the images. This exhibit aims to (1) provide insights into recent advances in generative AI (GenAI) based EC for CTC; (2) explore the benefits and potential applications of photon-counting CTC; and (3) present clinical outcomes.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction: Review the history and recent developments in GenAI-based EC for CTC, including the emergence of photon-counting CT technology. 2. How GenAI-based EC works: (2.1) Explain the basic ideas of GenAI; (2.2) Discuss how self-supervised GenAI-based EC differs from traditional EC; (2.3) Explain diffusion-based EC. 3. Photon-counting CT colonography: (3.1) Provide overview of photon-counting CT; (3.2) Discuss advantages and potential applications in CTC; (3.3) Explain Gen AI-based EC for photon-counting CTC. 4. Case studies: (4.1) Compare the image quality and outcomes of various GenAI-based EC techniques in clinical conventional and photon-counting CTC cases; (4.2) Review potential diagnostic challenges.

### Take the Right Path: Overview of Artificial Intelligence Guidelines

#### Participants

Carlos Felipe Reyna, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Present the different kinds of guidelines. Describe guidelines for development, application and implementation, and the evaluation of Artificial Intelligence (AI), created to direct and conduct research in a standardized way, avoiding process errors. To evaluate which of these guidelines is more useful for a specific interest.

#### TABLE OF CONTENTS/OUTLINE

Describe and compare such guides in terms of: purpose and format. Which contexts they fit using flowcharts and schematic images.

### Federated Learning - Game Changing AI Concept to Train AI without Sending Patient Data Out from Hospitals

#### TEACHING POINTS

(1) To understand the concept of federated learning to address data security and privacy concerns. (2) To learn the application and advantages of federated learning for liver tumor segmentation in hepatic CT. (3) To study the process of the development and performance of federated learning with a patch-wise massive-training artificial neural network (MTANN) model for liver tumor segmentation.

#### TABLE OF CONTENTS/OUTLINE

A. Introduction to Federated Learning - Challenges in acquiring extensive training datasets for a deep learning model from multiple hospitals - Role of federated learning in collaborative learning without sharing data - Issues of federated learning: 1) small local training data, 2) high computational demands, and 3) heavy network loads B. Federated Learning for Tumor Segmentation in Medical Imaging - Overview of federated learning models and their applications to tumor segmentation in medical imaging - Federated learning coupled with MTANN models for addressing the above three issues of the current federated learning C. Clinical Relevance and Performance of Federated Learning for Tumor Segmentation - Ensuring data privacy while achieving accurate tumor segmentation - Performance of federated learning for tumor segmentation - Comparisons with the current-state-of-the art model and "gold-standard" centralized training model

### Use of Generative AI for Non-interpretative Tasks in Radiology

#### Participants

Vinit Baliyan, MBBS, MD, Boston, MA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To provide an overview of the current state-of-the-art in generative artificial intelligence (AI) and its applications for non-interpretative tasks in radiology. 2. To showcase examples of how generative AI is being used in radiology today. 3. To highlight the challenges associated with using generative AI in radiology. 4. To touch upon the potential future developments in the field of generative AI and their potential impact on radiology.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction to Generative AI Key concepts and applications 2. Specific ways in which generative AI can be used used in for non-interpretative tasks in radiology, including: a. Reporting; checking grammar and syntax, generating summary, making reports more readable for non-specialists/patients b. Communication of important findings c. Managing work scheduled. Writing emails 3. Real-world examples of how generative AI has been used to enhance the accuracy and speed of radiological diagnoses 4. Challenges associated with using generative AI in radiology, including Data privacy and security concerns, Ethical considerations, The need for human oversight 5. Potential future developments in the field of generative AI and their potential impact on radiology Conclusion: Overall, the exhibit aims to educate and inform visitors about the latest advances in generative AI and its potential applications in radiology. By providing real-world examples and highlighting the challenges associated with using generative AI in radiology, the exhibit offers an opportunity for visitors to learn about cutting-edge technology that could help improve the efficiency of radiologists, ultimately benefiting patients and medical professionals alike.

### R Programming Language Basics for Radiologists

#### TEACHING POINTS

1. Learn how to install R 2. Know how to import and process data 3. Run common statistical tests 4. Explore and understand large datasets better

#### TABLE OF CONTENTS/OUTLINE

The R programming language serves as an invaluable resource for managing and analyzing large datasets effectively and efficiently. As a free and open-source software, R presents a cost-effective solution for performing common statistical tests, crafting visualizations, and even implementing machine learning algorithms. Exhibit Outline: Software installation: -Installing the R programming language-Setting up an Integrated Development Environment (IDE) -Installing essential packagesData import and processing: -File handling and manipulation-Data cleaning and preprocessing -Data transformation and aggregationCommon statistical tests in radiology: Sample code and examples for:- Descriptive statistics -T-test -Analysis of Variance (ANOVA) - Pearson's correlation coefficient -Spearman's rank correlation coefficient -Chi-square test -Logistic regression and more.Large dataset analysis:-Data visualization techniques- Exploratory data analysis (EDA)-Machine learning and predictive modeling-Text mining and natural language processing (NLP)

### Leveraging Medical Image Annotation with Practical Annotation Quality Check Tools

#### Participants

Henrique Lee, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Prepare the data for an artificial intelligence (AI) models often involves intensive annotation work to ensure accurate ground truth. However, radiologists who participate in AI projects may lack practical training in annotation, leading to doubts that increase the variability of annotations. To address this, we developed an automated tool that evaluates bounding box and segmentation annotations and provides feedback to the annotator. The tool uses .json files for bounding box annotations and NifTY files for segmentation annotations, both exported from 3D Slicer. Python scripts compare the locations and categories of findings in the bounding box annotations, as well as the distance and similarity of binary masks in the segmentation annotations with those generated by experts. Results are presented in an HTML report. In a pilot study, we used 5 chest radiographs and 2 head CT scans from publicly available datasets (Montgomery and CQ-500) previously annotated by experts. The availability of reports in an introductory AI course for medical radiologists allowed instructors to monitor participants' progress and identify areas for further emphasis.

#### TABLE OF CONTENTS/OUTLINE

Our workflow resulted improved the overall quality of instruction, enhancing the professionalism of the annotations. Annotation tools can increase student engagement and productivity, with teacher supervision facilitating consensus-building and optimizing the laborious task of annotation. Our solution can be applied to various 2D and 3D images studied by radiologists. User-friendly applications that facilitate the teaching of high-quality image annotation are crucial for fostering the development and validation of novel AI models.

INEE-35

### Automatic Detection of Contrast Enhancement in T1-weighted Brain MRI Images Using Artificial Intelligence

#### TEACHING POINTS

The purposes of this exhibit are: . Development and validation of a tool for post-contrast enhancement detection in T1-weighted MRI images.. Implementation of this tool in the clinical routine of the radiology and diagnostic imaging service of Clinical Hospital of Ribeirao Preto.

#### TABLE OF CONTENTS/OUTLINE

The use of magnetic resonance imaging (MRI) in medical practice is extensive and encompasses the diagnosis of multiple conditions such as neoplasms, infections, inflammatory diseases, among others. In these contexts, the analysis of post-contrast enhancement is essential. The detection and quantification of enhancement in T1-weighted cerebral MRI images is a challenging task due to the complexity of the images and the variability in the appearance of contrast enhancement. Artificial intelligence (AI) techniques have the potential to improve the efficiency and accuracy of this process, but the development and evaluation of AI-based approaches for this purpose is a laborious task.

### A Practical Primer on the Radiomics Quality Score: How to Interpret the Results of Radiomics Studies

#### Participants

Mohammad Mirza-aghazadeh-Attari, MD, MPH, Baltimore, MD (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Radiomics quality scores are used to assess the quality of radiomics studies and are based on a set of criteria related to study design, image acquisition, segmentation, feature extraction, and statistical analysis. The purpose of a radiomics quality score is to provide a standardized method for evaluating the quality of radiomics studies and to aid in the interpretation and comparison of study results. Interpreting a radiomics quality score involves understanding the specific criteria used to evaluate the study and the scoring system employed. Typically, a higher score indicates a higher quality study that is more likely to produce reliable and reproducible results. It is important to note that a radiomics quality score is just one factor to consider when evaluating the results of a radiomics study. Other factors such as sample size, patient demographics, and clinical relevance of the results should also be taken into account. Ultimately, the interpretation of radiomics study results should be made in the context of the specific clinical question being addressed and in consultation with a radiologist or other medical expert. Here we present a step by step approach to understanding and applying the RQS.

#### TABLE OF CONTENTS/OUTLINE

1- Radiomics Quality Score: A short introduction on its History 2- Methodologic considerations covered in RQS: - 2.1 Extraction of features -2.2 Development of predictive models and classifiers - 2.3 Performance evaluation of models - 2.4 Utility considerations 3- Reporting RQS results 4-Applications of RQS in clinical practice and research 5-Prospectives to enhancing RQS: RQS V2 6- useful tools

### Imaging Feature as a Function: A Novel Radiomics Framework

#### Participants

Nicolo Gennaro, MD, Chicago, IL (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Radiomic features exhibit functional correlation with tumor size. Large datasets of pre-treatment scans of liver metastasis can uncover the functional association between tumor size and heterogeneity, providing potential insights into tumor growth and treatment. Harmonization allows to remove scanner-associated effects while preserving cancer-specific functional dependence. Texture features show functional size-dependence that allow to generate delta-radiomics data by utilizing post-treatment imaging data only.

#### TABLE OF CONTENTS/OUTLINE

Introduction: Size measurement is a critical task for radiology and represents the pillar of response assessment to antitumor therapies. Size-dependence of radiomic features: We illustrate why radiomics features are affected by tumor size and how radiomic features might not be comparable even within ROIs of the same tumor but manually delineated by different operators. Harmonization in radiomics: The importance of feature harmonization to remove scanner-related biases and preserve size-dependence. Response Assessment: How size-dependence of texture features can be exploited to obtain delta-radiomics without baseline imaging.

### The Comprehensive Open Federated Ecosystem (COFE): Enabling Impactful Healthcare Studies

#### Participants

Sarthak Pati, MSc, Philadelphia, PA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

There is a growing body of literature offering evidence of the potential impact that artificial intelligence (AI) methods can have on healthcare. To ensure robustness evaluate generalizability of AI methods, ample diverse multi-site patient datasets are desired. However, there are various factors that hinder access to such data in the current paradigm of multi-site collaborations, which include the tedious bureaucratic processes, data ownership concerns, legal considerations reflected in patient privacy regulations. To tackle these issues, we introduce the community-driven Comprehensive Open Federated Ecosystem (COFE), which includes multiple open-source software tools to make distributed healthcare AI more accessible by leveraging zero/low code principles to get models to learn across data silos using Federated Learning (FL), to evaluate their performance on diverse datasets that they were not used to train with using Federated Evaluation (FE). The goals of the exhibit are to: broaden the understanding of the general community regarding FL FE, showcase how a user can leverage FL to train a model across various sites, present results of the first real-world federation across 71 collaborating sites, focusing on brain tumors, discuss privacy data protection concerns how COFE hopes to solve it, showcase how a user can leverage FE to generate generalizable statistics for AI methods.

#### TABLE OF CONTENTS/OUTLINE

This exhibit will present a community-driven open-source ecosystem to train evaluate AI models across multiple clinical sites in a data-private paradigm. Specific principles to protect data privacy will be described, along with common pitfalls to avoid when performing FL-based studies.

### **Data Curation in Minutes not Days: Efficient Large Scale Dataset Preparation for Machine Learning Applications in Kaapana**

#### **TEACHING POINTS**

In the era of rapidly growing medical imaging datasets and federated learning, efficient management and processing of medical images is crucial. Current medical image viewers, however, lack the capability for large-scale dataset curation. To address this, we introduce a data curation tool integrated into the Kaapana open-source framework, designed to streamline organization, management, and processing of extensive medical imaging datasets. Radiologists can easily filter for metadata, annotate and structure datasets, visualize dataset distributions, and quickly inspect individual studies. State-of-the-art machine learning algorithms, such as body part regression, nnUNet, and TotalSegmentator, can be applied to automatically annotate studies based on algorithm outcomes, which can accelerate the curation workflow by allowing filtering for specific organs, bone structures and body parts. This tool fosters collaboration between multidisciplinary teams, with machine learning researchers creating algorithms to support radiologists, who in turn annotate and curate the data. In conclusion, the proposed tool offers an intuitive interface for radiologists to efficiently curate datasets for use in machine learning algorithms.

#### **TABLE OF CONTENTS/OUTLINE**

1. Introduction 2. Data Curation Tool 2.1. Features 2.2. Metadata Annotation 2.3. Structuring Visualization 3. ML Algorithm Integrations 4. Conclusion Future Directions

### Beyond the Hype: The Power of GANs in Restoring MRI Texture

#### Participants

Kensuke Umehara, PhD, Chiba, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Generative adversarial networks (GANs) are one of the deep learning-based image generation models that have been widely used in medical imaging research, such as modality conversion and data augmentation. However, their application in diagnostic imaging is still met with resistance due to the perception that "GANs easily generate fake images." On the other hand, it is not widely known that with proper model selection and training, GANs can be a useful tool for generating high-quality images from low-quality ones. The teaching points of this exhibit are to 1) provide an overview of GANs using supervised learning, 2) showcase the application of one of the representative supervised GANs, super-resolution GAN, to MRI images, achieving high-quality imaging while enabling short-time imaging, and 3) demonstrate the high-accuracy restoration of the texture of MRI images by applying super-resolution GAN.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Super-resolution GAN for Accelerating MRI 3. Radiomics Analysis 4. Clinical Showcases

### Accelerating Machine Learning for Medical Imaging by Integrating AIM and AI Federated Learning into Clinical Workflow

#### Participants

Pattanasak Mongkolwat, PhD, (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. The incorporation of Annotation and Image Markup (AIM) and AI Federated Learning (FL) framework into an imaging workflow can expedite the creation of deep neural network models without compromising the confidentiality and sharing of imaging data. Furthermore, this integration can standardize the creation of annotations for supervised or semi-supervised deep learning approaches in annotated images. 2. Integrating an AIM image annotation tool into clinical workflows can speed up the process of creating annotated images based on an AIM template. The user wants to make simple and constrained annotations. The annotation results can be stored as an AIM XML document, JSON object, or DICOM SR PS3.21 object. Combining the AIM information with corresponding image can facilitate the development and training of multimodal deep learning models. 3. The proposed software tools in this framework simplify the setup and usage of FL and enable the creation of standardized annotations, allowing radiologists and AI researchers to focus on data quality and deep learning model development.

#### TABLE OF CONTENTS/OUTLINE

1. Overview of AIM, AI Federated Learning, and Multimodal Deep Learning 2. Imaging Workflow Architecture and Tools: modified ePAD, Fuji Synapse (example integration), DICOM anonymizer, Mini-PACS, AIM database, AI image inference, cohort creator, image and AIM staging location, Cohort worklist, DICOM reader, AIM transform, FL Web Admin Management, web-based AIM template builder. 3. Framework and Software Tool Requirements 4. Installation and Configuration Guide for Participating Institutions 5. Preparing Your DL Model and Data for AI Training 6. Live and Video Demonstration of the Installed Environments

### AI-assisted Decision Making for Prostate Cancer Diagnosis

#### TEACHING POINTS

The interpretation of prostate multiparametric MRI is challenging. Up to 30% of clinically significant cancers (PCa) are missed even by expert, and there is large inter-reader variation. Artificial intelligence (AI) shows promise in diagnosing PCa using MR images. To leverage the power of AI, it is crucial to determine if AI can assist radiologists in the diagnostic process and if radiology trainees can learn from AI-generated insights. We trained a state-of-the-art AI model (nnUnet) on a large-scale MRI dataset for PCa diagnosis. We have developed a web-based system for interactive and learning resources, incorporating the AI. This system assists radiologists in PCa diagnosis by providing AI-generated predictions (lesion maps). With this information at their disposal, radiologists make their own predictions and annotations using our web application. We will compare the diagnostic performance of human-only, AI-only, and human+AI. We will also examine the interaction between radiologists and AI to inform better teaching processes. Ultimately, we hope the tool will improve radiologists diagnostic performance and patient outcomes by leveraging the power of AI.

#### TABLE OF CONTENTS/OUTLINE

Preliminary teaching results on simple AI assisted reader tasks. An AI model (nnUnet) trained on PI-CAI dataset: mpMRI images - T2W, DWI/ADC, DCE for human-only reader performance (we random sampled 80 cases for testing purposes). AI-assisted decision making: AI predicted lesion maps. Annotation tool: radiologists annotate prostate cancer with AI assistance at their disposal. Assessment: the performance of human-only, AI-only, and human+AI will be analyzed to generate insights to improve the task performance and teaching.

### Harnessing AI for Improved Workflow in Radiology: Beyond Image Analysis

#### Participants

Kevin Pierre, Port Saint Lucie, FL (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

AI can be employed in numerous aspects of the radiology exam's electronic roundtrip, extending beyond image interpretation. This technology holds the potential to increase efficiency, reduce unnecessary scans, improve image quality and patient safety, and expedite the interpretation process. AI assisted reporting has tremendous potential to enhance practice and efficiency. By leveraging AI in these areas, healthcare professionals can save time and resources while enhancing the overall quality of patient care.

#### TABLE OF CONTENTS/OUTLINE

1) Introduction  
2) AI Applications Prior to Image Acquisition • Scan Ordering Optimization • Pre-exam Screening • Protocoling • Scheduling  
3) AI Applications During Image Acquisition • Patient Positioning • Contrast and Radiation Dosimetry • Scan Time Reduction • Image Reconstruction and Postprocessing  
4) AI Applications Following Image Acquisition • Worklist Prioritization • Urgent Finding Notification • Hanging Protocol Optimization • Assisted Reporting  
a) Next generation reporting  
b) AI-generated preliminary reporting  
5) Other Applications • Resident Education • Quality Assurance and Patient Safety • Billing and Compliance  
6) Conclusion

### Designing and Implementing a DICOM Collector for Analytics, Quality Improvement, and Regulatory Compliance

#### Participants

William Sensakovic, PhD, Cave Creek, AZ (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1) Understand the magnitude of DICOM data and architecture necessary to handle such large volumes, 2) Describe the utility that can be derived from DICOM data through additional applications, 3) Understand the pitfalls of naively scraping data without expert input

#### TABLE OF CONTENTS/OUTLINE

1) What are you collecting and why?, 2) How much data are we talking about?, 3) what kind of architecture do you need?, 4) You collected it, now what do you do with it? (applications), 5) Why is a team necessary for what database - seems like a summer project for a graduate computer science student?, 6) Does use justify the effort expended?

### NCI Imaging Data Commons: Towards Transparency and Reproducibility in Imaging AI

#### Participants

Andriy Fedorov, PhD, Arlington, MA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

NCI Imaging Data Commons (IDC) is a cloud-based repository of publicly available cancer imaging data co-located with analysis and exploration tools and resources. IDC, part of the NCI Cancer Research Data Commons (CRDC), provides secure access to a large, comprehensive, and expanding collection of cancer research data. IDC uses a combination of commercially available (Google Cloud Platform (GCP), Amazon Web Services (AWS)) and open source components. The IDC portal (<https://imaging.datacommons.cancer.gov>) and SQL interface enable exploration and visualization of data and cohort building. As of Spring 2023, IDC hosts over 40 TB of radiology and digital pathology image data encoded using the DICOM standard, and available in both GCP and AWS. While the IDC is intended for cloud-based data processing, data can be freely downloaded for on-premise analysis. Cloud-based workflows enable reproducible analysis and results. We will present the scope and status of IDC (e.g., new datasets and features), learning resources (e.g., interactive notebooks with reproducible AI workflows applied to the data within IDC), use cases (including those demonstrating large scale time- and cost-efficient analysis workflows) and plans for future development, along with live interactive demonstrations.

#### TABLE OF CONTENTS/OUTLINE

Overview of CRDC and IDC; Data curation and the role of The Cancer Imaging Archive; Portal; Viewer; Organization of data; Integration of tools; Use case development; Documentation and user support resources; Large scale computing using CRDC Cloud Resources; IDC cloud credit program; Status update and plans for future development.

### Image-to-text and Text-to-image Models: A Primer for Radiologists

#### Participants

An Ni Wu, MD, Gatineau, QC (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Review key concepts of neural network models connecting text and images; 2. Discuss potential applications of image-to-text and text-to-image models in medical imaging; 3. Illustrate key components involved in zero-shot prediction models; 4. Understand the overall design and architectures of text-to-image models; 5. Discuss future directions applicable in radiology.

#### TABLE OF CONTENTS/OUTLINE

1. Trend: groundbreaking emergence of neural network models connecting text and images. 2. Relevance for radiology: a discipline connecting text reports with medical images. 3. Illustration of key components involved in zero-shot prediction models: text vectorization, image vectorization, vector-space, attribute predictions, image attribute mapping, text classifier, and zero-shot prediction. 4. Illustration of recent models connecting image to text (i.e., CLIP) and text to images (i.e., DALL-E, Stable Diffusion, Imagen). 5. Architecture of CLIP and key messages: convolutional neural networks for text and image encoding, dataset classifier creation, zero-shot prediction model, transfer learning, natural language supervision, generalization, efficiency, flexibility, and limitations. 6. Applications of text-to-image models in radiology: image classification, automated caption generation, synthetic image generation. 7. Future directions: new applications in radiology and technical innovations.

### Rapid Clinical Deployment of AI Applications for Radiology Using Mercure - An Open Source DICOM Orchestration Platform

#### Participants

James O'Callaghan, PhD, MEng, New York, NY (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The aim of this presentation is to inform the audience of available open-source software that can be used to rapidly integrate Radiology Artificial Intelligence (AI) applications into their clinical infrastructure. We will outline the need for software tools to address practical challenges in translating medical imaging research techniques into real world settings. This will be followed by a description of DICOM orchestrators and how they can help to bridge this gap by handling interactions and requirements of clinical environments. Mercure - an open-source and freely available DICOM orchestrator, will be used to demonstrate how attendees can easily integrate AI applications into their clinical workflow using an intuitive web-based user interface. MONAI (Medical Open Network for Artificial Intelligence) is a popular open-source framework for medical imaging AI. In the concluding section, we will give guidance on how MONAI can be used with Mercure to deploy AI applications for Radiology in a rapid and standardized manner.

#### TABLE OF CONTENTS/OUTLINE

1. The increasing demand for Artificial Intelligence in Radiology 2. Challenges in clinical translation of AI 3. Integration of AI applications into clinical environments using Mercure 4. Standardization and rapid deployment of AI applications

Printed on: 04/12/24

INEE-48

### AI Adoption in Clinical Practice: A Practical Guide for the Practicing Radiologist

#### Participants

Kevin Pierre, Port Saint Lucie, FL (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- There is an increasing number of commercial AI algorithms. However, the actual value and useability of these algorithms requires more than evaluation of diagnostic performance metrics alone.
- We will review and provide practical suggestions for radiologists to use when evaluating AI software for their clinical practice.
- We will discuss important practical barriers that should be considered in order to properly assess useability and seamless integration into radiological practice.
- We will discuss pitfalls and opportunities for the use of AI to enhance clinical practice, including efficiency.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Discuss basic diagnostic metrics, relevance, and why diagnostic performance alone will not ensure impactful adoption 3. Importance of seamless workflow integration and avoiding pitfalls a. Time to image processing and transfer to viewer b. Pitfalls for algorithms requiring expert-viewer interactions c. AI data transfer and reporting module 4. Importance of seamless workflow integration: Opportunities a. Review increasing number of report augmentation and semi-automated reporting tools providing opportunities for reporting efficiency b. Future areas of efficiency improvement 5. Algorithm testing and deployment challenges and opportunities 6. Non-interpretive AI applications 7. Conclusions

### Prompting Language Models 101: A Primer for Radiologists

#### Participants

Bardia Khosravi, MD, MPH, Rochester, MN (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Large language model (LLMs) inception was four years ago; however, the advent of ChatGPT provides a unique user experience, showcasing the power of LLMs. Although the chat interface is exceedingly helpful, some nuances exist in creating a correctly structured prompt for a better answer, with less back and forth. This exhibit will cover three main points: 1. Introduction to Language Models 2. The Importance of Prompting 3. Popular Prompting Strategies

#### TABLE OF CONTENTS/OUTLINE

1. Introduction to Language Models: This section covers large language model basics. What makes them a significant breakthrough in the natural language processing domain? We will focus on some of the applications of LLMs in radiology, specifically in report structuring. 2. The Importance of Prompting: The chat interface of LLMs, like ChatGPT, can cover many personal use cases. On the contrary, this interface may not be helpful for automated information extraction. Additionally, using open source LLMs (as an alternative to ChatGPT, which requires sending data outside of the institution), requires proper prompting to guide the LLM to output the desired results with only one question asked. 3. Popular Prompting Strategies: This section will cover three main prompting strategies: (a) zero-shot prompting, (b) few-shot prompting, (c) chain-of-thought prompting. We use the example of abstracting cervical vertebral fractures from radiology reports. We will provide examples of the model's output based on each prompt to give a better understanding of the importance of prompt engineering.

### Explainable Artificial Intelligence (XAI) in Computer Vision Explained for the Radiologist

#### Participants

Adarsh Ghosh, MD,MBBS, (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Computer vision applications use deep neural networks composed of multiple convolutional layers. The radiological images pass through these layers, and the complex interrelationships are incomprehensible. The resultant algorithm's black-box nature impairs understanding of its decision. 2. Deep learning algorithms address both mundane and critical medical problems. The black-box nature of deep learning algorithms is more problematic in high-stakes situations, such as decisions resulting in patient surgery or intervention. 3. Several approaches are available to develop explainable AI models. Each approach has specific limitations, advantages, and applicability.

#### TABLE OF CONTENTS/OUTLINE

Introduction: Models with high accuracy may be less transparent: The story of Clever Hans Explainable AI (XAI): What is explainable AI and how is it classified. Importance of XAI in radiology XAI methods: The methods available to explain an algorithm's output and their limitations. Visual Explanations (saliency maps) Back propagation-based approach Perturbation-based approach Text explanations Example-based explanations The limitations of XAI: Additional computing costs. Interpreting interpretable AI

### Further Possibilities of Deep Learning in the Ultrasound Field

#### TEACHING POINTS

In recent years, deep learning technology has become a necessity in the medical field. These technologies have been widely used in mammography, CT, and MRI in clinical applications. In the ultrasound field, a wide range of techniques using deep learning, such as noise reduction and automated detection, have been reported. However, it is clear that deep learning is still in its developing stage compared to other modalities. Why is this? The purpose of this exhibition is to describe the current situation, challenges, and future possibilities of deep learning applications in the ultrasound field. As an example of research using deep learning, we will go into deep learning in the ultrasound field from our research on carotid plaque region extraction and composition differentiation using ultrasound images. The major teaching points of this exhibit are: 1. Introduction of research on deep learning in the ultrasound field 2. Current situation and challenges of deep learning in the ultrasound field 3. Future possibilities with deep learning

#### TABLE OF CONTENTS/OUTLINE

1. Current situation of AI application to the ultrasound field -Noise Reduction -Segmentation -Classification 2. Introduction of our study 3. Potential AI applications in the ultrasound field

INEE-51

### How Nationwide Medical Image Database and AI-based Image and Finding-text Analysis Work for Nationwide Disease Spread Surveillance: Three years of experience on CT Image-based COVID-19 Monitoring

#### Participants

Kensaku Mori, PhD, Nagoya, Japan (*Presenter*) Research Grant, Cybernet Systems Co, Ltd;Intellectual Property, Cybernet Systems Co, Ltd;Research Grant, J Morita Corporation;Intellectual Property, J Morita Corporation;Developer, J Morita Corporation

#### TEACHING POINTS

- To understand how nation-wide medical image database works for nationwide disease surveillance using AI-based medical image and finding-text analysis- To understand how national medical image database collects medical images from participating hospitals- To understand how AI analyzes national medical image database on a cloud computing platform- To understand what kind of data are stored on national medical image database- To understand how COVID-19 infection spread monitoring are performed on national medical image database

#### TABLE OF CONTENTS/OUTLINE

National medical image database- National Institute of Informatics, Japan, hosts the National Medical Image Database (NII-MID).- Participating hospitals automate daily image transfers to NII-MID.- AI-image and findings-text analyses are performed on incoming medical images.- Daily analysis utilizes AI-based methods.COVID-19 surveillance using CT images- AI -based (Convolutional Neural Network) analysis of CT images following RSNA COVID-19 CT scan classification guideline for images sent to NII-MID.- Automated data selection of CT images for analysis from NII-MID, using findings-texts.- COVID-19-related word analysis from findings-texts.- Calculation of daily COVID-19 suspicious image rates from data transfers.- Three years of experience monitoring COVID-19 cases through NII-MID.- Demonstrating the relationship between COVID-19 suspicious CT image rates and the daily number of COVID-19 related deaths.Future outlook- Expanding the functionality of NII-MID as a nationwide disease monitoring tool.- Broadening the scope of AI-based analysis targets.- Preparing for the prediction of the next unknown pandemic.

### Advanced and Versatile AI System for 3D Medical Image Super-resolution

#### Participants

Tong Zheng, Nagoya, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Gain an understanding of the concept of super-resolution (SR) and the differences between SR in RGB color images and medical images. 2. Identify the main challenges involved in performing SR on medical images. 3. Learn about a specialized AI system designed to overcome these challenges in medical image SR. 4. Explore the exceptional performance of our SR AI on two medical image datasets and its potential in aiding radiologists' diagnoses.

#### TABLE OF CONTENTS/OUTLINE

1. AI-based super-resolution (SR): fundamental concepts -SR is a technique that enhances the resolution of an image. -In medical imaging, SR can help radiologists observe precise anatomical structures in low-resolution (LR) images. 2. Challenges of medical image SR -AI for RGB image SR is typically trained using LR-high-resolution (HR) image pairs. - It is difficult to use AI for medical images' SR: LR and HR medical images are often acquired from different devices or scanning conditions. 3. Our specialized AI for medical image SR -We use a real-time registration network to minimize coordinate differences between LR and HR images. -We use a pre-trained generative model to minimize differences in intensity and scanning devices. 4. Two original medical image datasets to validate our SR AI -Dataset-A: micro CT (HR) - clinical CT (LR) dataset. LR-HR images differ in intensity, coordinate, and scanning device. -Dataset-B: Brain MRI dataset. LR-HR images differ in coordinate. 5. Radiologists' diagnostic process is aided by our SR AI - Our AI successfully performed SR on both medical image datasets, making it easier for radiologists to observe precise anatomical structures and make diagnosis. -Statistical analysis showed that our AI outperformed other recent AIs.

### Preparing for the (Un)Expected: Preventing Ransomware Attacks Before They Happen

#### TEACHING POINTS

Cyberattacks continue to be one of the toughest problems and biggest threats to have hit the healthcare industry in recent years. When hackers gain entry into a hospital's computer network, not only are the hospital operations, financials and data in jeopardy, but there is a direct threat to patient care and safety. As reported by SOPHOS, 34% of hospitals were hit by ransomware in the last year alone. With many hospitals expanding their digital landscape to include cloud computing, telemedicine and remote work, the vulnerability of being a target of an attack remains a risk. Sky Lakes Medical Center fell victim to a ransomware attack in October 2020. In this session, the director of information systems will discuss how his team was able to successfully recover 650 servers and 150 applications in just four weeks' time. He will share best practices of lessons learned and outline the necessary infrastructure and technology systems to have in place so other organizations can prevent disaster before it happens and ultimately help to reduce the number of ransomware attacks in healthcare.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Ransomware numbers within healthcare 3. Top vulnerabilities within healthcare organizations 4. Necessary informatics, infrastructure, and technologies to have in place 5. Key priorities and step by step on how to recover if it does happen to you 6. Conclusion

### Collaborative Development of a PACS-Integrated Quality Control Dashboard : A Single Institutional Experience

#### Participants

Vijaya Kosaraju, MD, Cleveland, OH (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

(1) Designing and implementing a Technologist Quality assessment (Tech QA) dashboard that is integrated with PACS (2) Determine the appropriate QA metrics over a period of time to set up the baseline and target areas for improvement (3) Design a way to deploy the right interventions and measure the resulting response (4) Analyze the intervention response to measure improvement over baseline as a way to improve patient care and radiologist satisfaction.

#### TABLE OF CONTENTS/OUTLINE

(1) Introduction to Tech QA (2) How we did it over time (3) Developing the current PACS integrated QA system (4) Challenges associated with implementation and deployment a) Challenges in the backend b) Challenges to educate radiologists and technologists c) Make an efficient path for review of the QAs d) Design a closed feedback loop for efficient processing (5) Initial results of the Tech QA process (6) Interventions deployed as a result of baseline metrics (7) Analyzing the results of the interventions (8) Conclusion (9) Future goals

### Programmatically Generating Radiology Report Fields to Facilitate Structured Reporting Utilizing RadElements.org

#### Participants

Andrew Gomella, MD, Philadelphia, PA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

-A significant barrier to adoption of structured reporting and use of standardized data elements is the need for each element/concept to be manually created within individual institution's production reporting software-The ability to programmatically create complex report fields and templates helps reduce the barrier to entry-With a relatively short python script the entirety of the RSNA/ACR RadElement.org common data element library can be converted to Powerscribe macros, which can be dragged-and-dropped into reports or batch loaded into the dictation system for department wide use

#### TABLE OF CONTENTS/OUTLINE

1. Motivation for creating a programmatic interface for generating radiology report fields and reports
2. Reverse engineering the structure of a standard radiology report file (from Powerscribe)
3. Approach to generating the report fields and templates in python utilizing XML (Extensible Markup Language) and raw text functions
4. Generating autotext snippets for use in reports from RSNA's radelement.org
5. Demo of drag and drop functionality adding rad elements or rad element sets to a report template

### How Graph Neural Network Works for Automated Nomenclature of Abdominal Blood Vessels

#### Participants

Kensaku Mori, PhD, Nagoya, Japan (*Presenter*) Research Grant, Cybernet Systems Co, Ltd;Intellectual Property, Cybernet Systems Co, Ltd;Research Grant, J Morita Corporation;Intellectual Property, J Morita Corporation;Developer, J Morita Corporation

#### TEACHING POINTS

- To understand what is graph convolutional network (GCN)- To understand how GCN is applied for vasculature nomenclature- To understand automated nomenclature performance by GCN- To understand anatomical annotation for 3D blood vessel regions by GCN-based automated nomenclature

#### TABLE OF CONTENTS/OUTLINE

Introduction- The importance of automated vasculature nomenclature as a key function in future CAD systems.- Enhancing CT image reading workflow with automated vasculature nomenclature.- Overview of abdominal vasculature systems and their anatomical names.Spectral based graph convolution and graph convolutional network- Review of the theoretical aspects of Graph Convolutional Networks (GCN).-Review of spectral-based graph convolution operations in GCN and their computer implementation.How to apply GCN for automated nomenclature of abdominal blood vessels- Extracting blood vessel tree structures from CT images.- Feature extraction from tree structure.- GCN training methodology.- Automated nomenclature using GCN.Experiments- Configuration of training data.- Annotation of training data.- Evaluating nomenclature performance.- Automated annotation of 3D-rendered blood vessels based on automated nomenclature.- Performance changes for different convolutional areas.Discussion- Limitations of GNN-based automated nomenclature for blood vessels.- Enhancing radiological and surgical readings of CT images with automated nomenclature.- The effectiveness of automated nomenclature in constructing symbolic logic-based CAD systems.

### Designing a Radiomics study: Hurdles and Pitfalls

#### Participants

Adarsh Ghosh, MD,MBBS, (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Radiomic studies are complex, requiring a unique trial design, data preparation, informatics tools, and infrastructure. 2. Radiomic studies are often designed to be hypothesis-generating rather than to answer a hypothesis. This difference in study design requires researchers to identify key comparative data such as patient outcome or histologic diagnosis before the study begins. 3. Because radiomics is still a nascent field of imaging research, there are unique challenges and potential pitfalls at every step of the research process.

#### TABLE OF CONTENTS/OUTLINE

Radiomics 101 Tools needed to perform a radiomics study Steps of a radiomics study Asking the right questions: -- Is there clinical value? -- Finding the right comparative measure Data curation: the curse and blessing of electronic medical records Imaging data: - - Not all data is created equally: Data Preparation -- Managing multi-institutional data Image segmentation: -- So many circles, so much time -- Managing multiple series Feature extraction: IBSI and open source -- Pyradiomics and more Data modelling: Feature selection and dimensional reduction Data analysis and validation: Finding signal in the noise Common errors in study design and strategies to avoid them: -- Overfitting -- Data leakage -- Data peeking Significance does not equal importance

### Fight for Fairness in AI for Medical Imaging

#### TEACHING POINTS

1. To highlight the critical importance of fairness in AI for medical imaging, emphasizing the negative impacts of biased algorithms on patient outcomes. 2. To provide an overview of various evaluation metrics that can be used to assess fairness in AI models, including equality of opportunity and demographic parity, with a particular focus on their application in medical imaging. 3. To introduce debiasing methods such as pre-processing techniques and adversarial training, and discuss their effectiveness in addressing bias in AI models for medical imaging. 4. To encourage ongoing discussion and action to promote fairness and equity in healthcare AI and identify future challenges in this rapidly evolving field.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction  
1.1. Importance of fairness and bias in AI for medical imaging  
1.2. Brief review of previous studies addressing fairness issues  
2. Definitions of fairness and bias  
2.1. Explanation of fairness and bias  
2.2. Types of bias  
3. Methods to mitigate bias  
3.1. Pre-processing techniques (e.g., data cleaning, re-sampling, feature selection)  
3.2. In-processing techniques (e.g., pruning, contrastive learning, adversarial training)  
3.3. Post-processing techniques (e.g., calibration)  
4. Evaluation metrics for fairness  
4.1. Explanation of evaluation metrics used to assess fairness: demographic parity, equalized odds, and equality of opportunity  
4.2. Advantages and limitations of each metric  
5. Challenges  
5.1. Lack of diversity and representation in healthcare data  
5.2. Technical limitations of current debiasing methods  
5.3. Action to promote fairness and equity in AI for healthcare

### Approaches to Writing and Implementing Custom Software as a Trainee at a Large Academic Health Center

#### Participants

Andrew Gomella, MD, Philadelphia, PA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Coding is an increasingly popular and important skill, with more non-career programmers picking up coding skills.- Recently released large language models have decreased the entry barrier for coding by demonstrating the possibility of generating complex software from natural language prompts.- Writing, implementing, and testing code in a health system presents unique barriers and challenges, but it is possible even as a trainee.- Significant variation in practice/hospital IT infrastructure, security policies, and the suite of radiology/EHR combinations unfortunately limits cross-institutional development of software.- The software approach, including whether to use a specific language, how to distribute to colleagues, and attention to IT security, depends on the specific problem at hand and can range from surprisingly trivial to prohibitively complex.

#### TABLE OF CONTENTS/OUTLINE

- Motivation- A general approach to tackling software ideas, from feasibility to production- Is there an API(Application Programming Interface)? and what can be done if there isn't?- Institutional variation in IT and software suites, and why it matters- Security considerations- Low code solutions: Example of a program that can be completely run within our hospital infrastructure without any installation or 'writing' code.- Scripting solutions: Example of AutoHotKey scripts including a few line solutions, to dynamically modify open radiology report text.- Python: Swiss army knife, with limitless possibilities and vast online community- Browser plugins: Example of a Chrome plugin used to add features to intranet web pages.- PACS and EHR plugins

### Maximizing Generative AI's Potential in Radiology: Fine-Tuning and Prompt Engineering

#### Participants

Theodore Kim, Washington, DC (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- ChatGPT and other generative AI tools have the potential to play significant roles in education, research and clinical practice for diagnostic radiology- One way to maximize their use and potential is by focusing on improving the quality of its output through the processes of fine-tuning and prompt engineering- Fine-tuning is the process of training a pre-trained model on a smaller, task-specific datasets to improve its performance on that task. For example, training a model with specific terminology and recommendations associated with updated Fleischner criteria to guide management of pulmonary nodules on a model already trained on a larger dataset of radiologic imaging- Prompt engineering focuses on designing and refining input queries to obtain the most accurate and relevant desired output. These methods can include using radiology-specific terminology, providing necessary medical context, crafting precise prompts with specific constraints, and using iterative processes to identify and develop the most effective prompt structures.

#### TABLE OF CONTENTS/OUTLINE

1. Principles of Fine Tuning  
2. Commonly used Algorithms for Fine Tuning  
3. Fine Tuning in ChatGPT  
4. Principles of Prompt Engineering  
5. Prompt Engineering in ChatGPT

### Interventional Radiology Education Exhibits

#### Sub-Events

#### **IREE-1 Pre-operative Osseous Tumor Embolization: A Review of Presentation, Benefits, and Technical Details**

##### Participants

Ashini Patel, MBA, BS, Davie, FL (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

1. Preoperative tumor embolization is a safe and effective adjunctive to tumor resection that has benefits including decreased estimated blood loss, and less complications. 2. There are only few contraindications to pre-operative embolizations, and most patients that undergo the procedure will benefit for later tumor resection. 3. Importance of tumor feeding arteries. 4. It is valuable to consider all patients with suspected hypervascular osseous for preoperative tumor angiography and embolization.

##### TABLE OF CONTENTS/OUTLINE

1. A review on osseous tumors, their typical management and how preoperative embolization can improve outcomes. 2. Selection of patients that would benefit from this procedure before tumor resection. 3. Review of example cases outlining the technical details of the embolization procedure, to include devices used and the importance of tumor feeding arteries. 4. Analyze the efficacy and safety of pre-operative embolization and its value in decreased estimated blood loss and transfusion need, and complications. Compare this data to surgical resection without embolization.

#### **IREE-10 To Sclerose or Decompress? Comparing BRTO and TIPS for Gastric Variceal Management**

##### TEACHING POINTS

Objectives\* Understand gastric variceal (GV) anatomy\* Identify indications and contraindications for BRTO and TIPS\* List conventional and alternative procedure steps\* Recognize common and rare intra- and post-procedural complications

##### TABLE OF CONTENTS/OUTLINE

Outline: 1. Introduction (epidemiology, mortality) 2. Anatomy: \* Location (GOV and IGV classification) \* Afferent/efferent anatomy (Kiyosue classification) \* Uphill/downhill drainage patterns 3. Indications: \* Variceal bleeding (active or prophylaxis) \* BRTO: HCC, refractory HE, preserving liver function \* TIPS: Portal HTN with  $\geq 12$  mmHg 4. Contraindications: \* BRTO: Portal/splenic vein thrombosis, refractory ascites, uncontrolled EV, absent gastroduodenal shunt, severe portal HTN \* TIPS: HE, Child-Pugh C, CHF, pulmonary HTN, cystic liver disease 5. Procedural Steps: \* BRTO (including both conventional approaches as well as modified approaches, including CARTO and PARTO) \* TIPS (including CO<sub>2</sub> venography, portography, various vascular approaches, and embolization) 6. Complications: BRTO: \* Intra-procedural: sclerosant extravasation, balloon rupture, premature balloon deflation \* Post-procedural: ARF, hemolysis, cardiogenic shock, pulmonary edema, DIC, PE, portal/splenic/renal vein thrombosis, adrenal infarct TIPS: \* Intra-procedural: Liver capsule/parenchyma/biliary injury, PV rupture, arrhythmias \* Post-procedural: HE, hepatic failure, TIPS migration/dysfunction, infection

#### **IREE-11 Microwave Ablation of the Liver Lesions in Critical Locations: Are there No-No Zones**

##### Participants

Merve Ozen, MD, Lexington, KY (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

1. Thermal ablation is the mainstay of treatment for small hepatic tumors (<2 cm). Thermal ablation may not be preferred in these patients if the tumors are in high-risk locations, however. These high-risk locations include, but are not limited to, tumors adjacent to the main portal vein, the inferior vena cava, the gall bladder, the diaphragm, and the heart. 2. By discussing the literature and showing cases of successful microwave ablation of tumors in high-risk locations, we show that MWA can be a safe and effective.

##### TABLE OF CONTENTS/OUTLINE

1. The major differences between radiofrequency ablation and microwave ablation as it pertains to the management of malignancy. 2. Cases of microwave ablation of tumors in high-risk locations and a discussion of the current literature on the safety and efficacy of such procedures. 3. The cases display the ablation of tumors adjacent to the main portal vein, the inferior vena cava, the gall bladder, the diaphragm, and the heart. 4. Technical maneuvers will be described to increase safety and efficacy for the difficult lesions.

#### **IREE-12 Ablation vs Free Life. Colorectal Cancer with Lung Metastases: Evaluation of Local Recurrence and Chemotherapy-free Interval in Patients Treated with Ablative Therapy**

##### Participants

Pedro L. Lino, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

## TEACHING POINTS

To discuss percutaneous ablation and its role as a safe and effective treatment option for colorectal cancer lung metastases, and the benefits of its minimally invasive nature. To determine patient selection characteristics, preprocedural planning, and tactics involved in a safe and successful outcome, particularly in challenging cases. To examine the impact of ablation (RFA and MWA) on overall survival and chemotherapy-free interval in patients with lung metastases from colorectal cancer.

## TABLE OF CONTENTS/OUTLINE

1.Introduction and epidemiology 2.Procedure applied anatomy 3.RFA treatment techniques a.Patient positioning; b.Tactical pneumothorax; c.Leverage; d.Hydrodissection. 4.Acute complications 5.Evaluation of disease progression

### **IREE-13 Thermal Protection: Heightened Safety for Minimally Invasive Percutaneous Thermal Ablation of Musculoskeletal Tumors**

Participants

Anderanik Tomasian, MD, Los Angeles, CA (*Presenter*) Nothing to Disclose

## TEACHING POINTS

Over the past two decades, minimally invasive percutaneous image-guided thermal ablations have been progressively incorporated in the management paradigm of patients with musculoskeletal tumors and endorsed by the National Comprehensive Cancer Network and American College of Radiology. The high clinical success rates and durability of therapeutic effects of such interventions to achieve local tumor control, pain palliation, and cure have been documented in the recent literature. Therefore, safety of musculoskeletal thermal ablations is critical and must be ensured by radiologists in care of patients with bone tumors for improved patient outcomes. To enhance safety and minimize undesired thermal injury to surrounding vital tissues as a result of non-target ablation, several thermal protection strategies have been successfully implemented in clinical practice.

## TABLE OF CONTENTS/OUTLINE

• General considerations • Neuroanatomic considerations • Tissues at risk (Spinal cord, spinal and peripheral nerves, torso organs, articular cartilage, subchondral bone plate/physis, skin) • Thermal protection techniques (Indications and Choice of technique) • Passive thermal protection (Patient Biofeedback and Clinical Assessment, Temperature Monitoring strategies, Neurophysiological Monitoring with somatosensory and motor-evoked potentials, Electrostimulation) Active thermal protection (Thermal Insulation strategies, Thermal Modification techniques) • Thermal Injuries/Complications and their management

### **IREE-14 The Rise of Robotics in Interventional Radiology**

## TEACHING POINTS

• The use of robotics in interventional radiology is an emerging trend following medical technology and engineering developments in recent years. • Robotic-assisted interventional radiology is beginning to play a key role in cardiac and neurovascular interventions and expanding rapidly. • Endovascular robotic systems can help facilitate precise and stable catheter navigation while reducing radiation exposure during procedures.

## TABLE OF CONTENTS/OUTLINE

1. Overview of the history and timeline of robotics in interventional radiology. 2. Introduction and summary of robotic systems and their advantages and disadvantages. 3. Key studies demonstrating the role of robotics for endovascular interventions. 4. Telerobotics in interventional radiology and its roles and limitations. 5. Future prospects for robotic-assisted interventional radiology.

### **IREE-15 How to Perform a Correct Access for Minimally Invasive Lumbar Spine Procedures**

Participants

Natalia Parra, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

## TEACHING POINTS

Fluoroscopy guided interventions in lumbar spine involve a variety of minimally invasive procedures for improving pain management. Three of the main approaches typically used to get access to the targeted structure are transforaminal, interlaminar and transpedicular. The aim of the proposed exhibit is to provide radiology residents and fellows with a quick guide to better understand the basics of these techniques and thus be able to perform a safer and more effective access. At the outset, the exhibit will list the different types of procedures enabled by the abovementioned approaches. Following, it will provide a pictorial review of the anatomical keys in preprocedural imaging studies. Finally, the exhibit will explain how to perform the approaches step-by-step, from the positioning of the angiograph and the anatomical references to the needle insertion, and will conclude by describing how to check its correct positioning.

## TABLE OF CONTENTS/OUTLINE

1. Types of procedures and related approaches. 2. Imaging studies: what to look at and how to do it. 3. Angiograph positioning and anatomical references. 4. How to perform and correct the approaches in real time. 5. How to check the positioning of the needle.

### **IREE-16 Percutaneous Cryoablation: A Comprehensive Review of Whole-body Application**

## TEACHING POINTS

1) Percutaneous cryoablation is a minimally invasive procedure that is safe and effective in treating various solid benign and malignant lesions throughout the human body. 2) Imaging and tissue diagnosis is necessary before ablation to ensure that cryoablation is the most appropriate modality of treatment. 3) Percutaneous cryoablation can be performed with ultrasound, fluoroscopy, computed tomography, or magnetic resonance imaging guidance. Knowing the risks and benefits of each modality is important for choosing the best modality for individual patient lesions. 4) Cryoshock is a feared clinical syndrome after cryoablation for which early diagnosis and management is crucial. 5) Abscopal effect is a unique effect of cryoablation based on immune-mediated post-ablation antigen presentation.

## TABLE OF CONTENTS/OUTLINE

1) Mechanism of action and physics of cryoablation leading to induction of cellular apoptosis and the understanding of ablation

1) Mechanism of action and physics of cryoablation leading to induction of cellular apoptosis and the understanding of ablation artifacts. 2) Indications and contraindications, diagnostic workup, and imaging diagnosis for lesions amenable to cryoablation. 3) Procedural protocols for the management of lung/kidney solid tumors, metastasis, bone and soft tissue solid/cystic lesions, nerve pain, and vascular malformations. 4) Adverse effects of cryoablation including cryoshock and the mitigation of these effects. 5) Abscopal effect and future directions for the use of cryoablation to prevent lesion recurrence and treat metastatic disease.

### **IREE-17 The Need for Virtual Fluoroscopic Imaging in Bronchial Artery Embolization: The Best for Radiation Exposure Dose Reduction**

Participants

Yoshihiro Tanaka, BA, Ibaraki, Japan (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

In this study, we investigated the relationship between supporting images of a new concept and exposure reduction in bronchial artery embolization <BAE>. This is research on exposure reduction aimed at shortening the procedure time by creating a support image similar to the IR image using CT volume data, in contrast to the existing exposure protection and exposure reduction mechanisms of IR equipment.

#### **TABLE OF CONTENTS/OUTLINE**

A virtual fluoroscopic image <VFI> is a Ray-summation image that is similar to a fluoroscopic image, and blood vessel running and the lesioned part are superimposed and displayed (Fig.1). Thereby it possible to use information intuitively alongside fluoroscopic images, and to avoid unnecessary mapping imaging for bronchial artery identification and time waste due to blind catheterization under fluoroscopy, aiming at rapid vascular selection and hemostasis (Fig.2,3). Also, a workstation can be easily installed and implemented, and the CT volume data obtained in advance is used so that there is no need to purchase new and expensive IR equipment. As a result, the number of angiographies required for dissection can be minimized, which not only reduces the amount of contrast agent and exposure, but also reduces complications by shortening the procedure time (Table 1,2).

### **IREE-18 2022 Barcelona Clinic Liver Cancer Update for the Interventional Radiologist**

#### **TEACHING POINTS**

1) Understand the updates to the 2022 Barcelona Clinic Liver Cancer (BCLC) guidelines for managing patients with hepatocellular carcinoma (HCC) 2) Review supporting evidence for transarterial chemoembolization (TACE) and percutaneous ablation 3) Highlight recent evidence surrounding transarterial radioembolization (TARE) that warranted its inclusion in the new guidelines 4) Discuss the new systemic agents included in the 2022 BCLC guidelines and their supporting evidence

#### **TABLE OF CONTENTS/OUTLINE**

1) Introduction, including epidemiology of HCC and interventional radiology (IR) management options in the previous BCLC guidelines 2) BCLC framework for classifying HCC 3) Review of existing literature on TACE and percutaneous ablation for patients with HCC 4) Overview of updates in the 2022 BCLC guidelines for IRs: Sub-division of Intermediate Stage (Stage B) patients, extending the existing liver transplant criterion to include more patients and include systemic options for other patients at this stage 5) Overview of updates in the 2022 BCLC guidelines for IRs: Inclusion of TARE for the first time in the guidelines, with a review of new, high impact studies leading to the inclusion of TARE 6) Overview of updates in the 2022 BCLC guidelines for IRs: New systemic agents for patients with advanced stage disease, including a review of high impact studies leading to the addition of the new systemic agents in the guidelines 7) Discussion of combination therapies for HCC such as TACE + systemic therapy, TARE + systemic therapy, TACE + percutaneous ablation, and percutaneous ablation combined with adjuvant systemic therapy 8) Conclusion and summary

### **IREE-19 Imaging and Interventional Management of Lymphatic System Disorders**

Participants

Eric Castane, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

1. Review the lymphatic system disorders. 2. Describe the radiologic management of the lymphatic system disorders.

#### **TABLE OF CONTENTS/OUTLINE**

1. Material and Methods / Background Lymphatic. 2. Anatomy and Physiology. 3. Disorders of the Lymphatic System. 3.1. Classification. 3.2. Diagnosis. 4. Imaging of the Lymphatic System. 4.1. Ultrasound. 4.2. Magnetic Resonance. 4.3. Nodal Lymphangiography. 4.4. Imaging in Lymphatic Disorders. 5. Interventional Management of Lymphatic Disorders. 5.1. Chylothorax. 5.2. Chyle Ascites. 5.3. Peripheral Lymphatic Leak. 5.4. Lymphatic Plastic Bronchitis. 6. Post Procedure 6.1. Complications. 6.2. Post Procedure Imaging. 7. Conclusions.

### **IREE-2 Shoot Your Shot: Techniques and Pitfalls of Pelvic Collection Drainage**

Participants

Kateryna Burlak, MBBS, Melbourne, Australia (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Most pelvic collections can be drained safely and effectively through a percutaneous image-guided approach. Collections in locations that are difficult to access pose a unique challenge and invite consideration of alternative approaches. We aim to discuss the techniques and pitfalls of these approaches, to encourage drainage of collections initially considered difficult or inaccessible and to raise awareness about potential complications. Teaching points of this exhibit include the following: 1 - To review the methods and anatomy of potential approaches involved in drainage of pelvic collections (including transperineal, transgluteal, transrectal and transvaginal approaches) 2- To demonstrate general techniques used (Trocar vs Seldinger techniques) 3- To discuss potential complications which can occur in drainage of pelvic collections and how to avoid them

#### **TABLE OF CONTENTS/OUTLINE**

1. Methods and anatomy of potential approaches: Lateral abdominal wall, Anterior abdominal wall, Transgluteal, Transperineal,

Transrectal, Transvaginal 2. General techniques used 3. Examples of potential pitfalls and complications 4. Summary and teaching points

## **IREE-20 Next Step for Colorectal Liver Metastasis Ablation: Computed Tomography During Hepatic Arteriography Guidance in Percutaneous Thermal Ablation**

Participants

Jessica A. Marques Silva, MD, Houston, TX (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

1) This study aims to show the feasibility and accuracy of using computed tomography during hepatic arteriography (CTHA) as a percutaneous ablation guidance tool for colorectal liver metastasis (CLM) patients. 2) CTHA is performed via a transarterial catheter inserted into the hepatic artery for arterial assessment. It involves dual-phase contrast medium acquisition with specific rates and acquisition delays during a breath hold on expiration. 3) CTHA improves CLM visibility due to high contrast resolution and absence of portal venous system contrast-media deposition. CLMs appear hypoattenuating with a necrotic center and ill-defined enhancing rim visible on the arterial phase. 4) In contrast to its high sensitivity, CTHA specificity for detecting small tumors is often limited by the presence of pseudolesions. Moreover, limitations include potential complications related to sheath and catheter placement, physician's costs and time, and arterial anatomy variants. 5) CTHA enables precise oncologic intervention planning, combined therapies, and intraprocedural treatment response monitoring. Further research is needed to fully evaluate its clinical utility for guiding CLM ablation.

### **TABLE OF CONTENTS/OUTLINE**

1) 'Let's Put a Ring on It' - CLM imaging presentation on CTHA; 2) Setting the Target - Image-guiding techniques in percutaneous liver tumor ablation and CTHA protocol; 3) Tips or tricks - Pseudolesions or CLMs? 4) Thinking Outside the Box - Future Perspectives

## **IREE-21 Minimally Invasive Thoracic Tumor Treatment and Palliation**

### **TEACHING POINTS**

Percutaneous ablation is an established safe treatment for primary and metastatic lung tumors. Adjunct intra-procedural maneuvers, such as creation of artificial pleural effusions or pneumothoraces, can permit treatment of tumors adjacent to critical structures. Emerging approaches such as arterial chemoembolization are altering the landscape of intervention for thoracic malignancies. Minimally invasive procedures such as percutaneous tumor localization, thoracic tumor embolization, and image-guided brachytherapy seed implantation can enable multidisciplinary treatment. Palliative interventions, ranging from embolization to shunt implantation, can provide palliation for thoracic oncology patients.

### **TABLE OF CONTENTS/OUTLINE**

Tumor treatment Percutaneous ablation Radiofrequency ablation Cryoablation Microwave ablation Technical considerations during ablation Chemoembolization of lung tumors Interdisciplinary procedures Tumor localization prior to surgical resection Preoperative embolization of central thoracic tumors Image guided brachytherapy seed implantation Palliation Glue embolization of bronchopleural fistulas Bronchial artery embolization for hemoptysis Recurrent pleural effusion management Tunneled indwelling pleural catheters Denver pleurovenous shunt

## **IREE-22 The Effects of Artificial Intelligence and ChatGPT on Interventional Radiology**

### **TEACHING POINTS**

\*Artificial intelligence (AI) learns from data, and processes it to perform tasks requiring human intelligence\*AI can help create customized treatment plans for patients\*Fluoroscopy systems with AI reduce radiation exposure to make procedures safer\*Pre-operative and intraoperative images integrated by AI, provide more accurate guidance for image-guided procedures\*AI can create virtual angiography, which can be used for education and planning purposes\*ChatGPT can assist radiologists in creating educational and research materials more efficiently

### **TABLE OF CONTENTS/OUTLINE**

Artificial intelligence (AI) refers to computational models that use algorithms to process data, learn from it using the output to perform tasks traditionally associated with human intelligence. AI models utilize patient diagnostic images and clinical findings to anticipate procedural outcomes. This enables interventional radiologists to customize treatment plans for each patient beforehand. AI has enabled fluoroscopy systems to substantially decrease radiation exposure to patients and staff. This is evidenced by a significant reduction in median dose area product from 5,708 mGy·cm<sup>2</sup> to 2,178 mGy·cm<sup>2</sup> (P < 0.001). AI can integrate pre-operative 3D with intraoperative 2D images, improving guidance for biopsies and image-guided procedures. This added augmented-reality element enhances the accuracy and safety of interventional procedures. AI employs preoperative imaging to create virtual angiography, which acts as an educational and real-time planning aid for both trainees and seasoned interventionalists. With the advent of chatGPT radiologists can harness AI to aid in the composition of educational and research material.

## **IREE-23 Intercostal Neurolysis: A Primer**

Participants

Omar Al-Daoud, MD, Philadelphia, PA (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

Review relevant anatomy of the intercostal nerves. Describe indications for neurolysis. Describe risks of intercostal neurolysis. Highlight tips and tricks for risk mitigation.

### **TABLE OF CONTENTS/OUTLINE**

Goals and Objectives, Case Presentation, Intercostal Nerve Anatomy, Indications for Intercostal Nerve Block and Neurolysis, Risks of Intercostal Neurolysis, Mitigating Risks, Nerve Block Cocktail, Additional Case Presentations, Learning Points

## **IREE-24      Gastrointestinal Tract Tumors: Imaging and Interventional Management of Bleeding**

Participants

Forrest Linch, MD, Rochester, MN (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

1. Learn mesenteric angiographic anatomy with special attention to anatomical variations and the blood supply to specific portions of the GI tract, which may affect treatment approach. 2. Learn common primary and metastatic etiologies of gastrointestinal tract bleeding requiring intravascular intervention. 3. Understand diagnostic imaging findings and interventional radiologic techniques for managing gastrointestinal tract bleeding

### **TABLE OF CONTENTS/OUTLINE**

1. Mesenteric angiography: A) Standard technique and anatomy, B) Normal variant anatomy, C) Blood supply to specific portions of the GI tract; 2. Angiography of gastrointestinal tract malignancies: A) Common pathologies by location, B) Angiographic finding of tumors; 3. Diagnostic imaging of gastrointestinal tract malignancies: A) Modality selection (CT, MRI, NM), B) Expected findings and treatment implications; 4. Intravascular management of bleeding gastrointestinal tract malignancies: A) Indications, contraindications, B) Pre-procedure planning - i) Clinical evaluation, ii) Role of cross-sectional imaging and endoscopy, iii) Anatomic/vascular considerations (arterial supply, collaterals, variants), C) Technique - i) Particle versus coil embolization, ii) Coil embolization for protection of non-target structures, D) Outcomes and complications;

## **IREE-25      Advancing Frontiers in Lung Malignancy Treatment: Unraveling the Potential of Interventional Radiology in the Ablation of Lung Malignancies**

Participants

Izzet Altun, MD, Baltimore, MD (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

Interventional radiology has evolved as a promising modality for the ablation of lung malignancies. Various techniques such as Radiofrequency Ablation (RFA), Microwave Ablation (MWA), and Cryoablation are extensively utilized, each with unique benefits and limitations. The choice of technique is determined by factors such as lesion size, location, and patient condition. These image-guided percutaneous ablation techniques are particularly advantageous for patients unsuitable for surgery or stereotactic radiation therapy. Future directions point towards refining these techniques, improving patient selection criteria, and integrating these modalities with novel systemic and loco-regional therapies for comprehensive patient care.

### **TABLE OF CONTENTS/OUTLINE**

The report provides an overview of image guided ablation of lung malignancies. The goal is to present mechanism, advantages, and limitations of RFA, MWA, cryoablation and other less common techniques such as laser ablation. Discussion on patient selection, pre and post-procedural evaluation for lung ablation will be presented. Outline: 1- Introduction to IR in lung ablation, highlighting the scope of RFA, MWA, and cryoablation. 2- Detailed exploration of ablative techniques, focusing on mechanisms, optimal application, and potential drawbacks. 3- Examination of patient selection criteria, pre and post-procedural evaluation, and contraindications. 4- Analysis of the anesthesia management, CT protocols, and periprocedural considerations for lung ablation. 5- Discussion on the current state of research and future directions, emphasizing the potential for improved techniques and integrative treatment approaches. 6- Conclusion

## **IREE-26      Creating Transvenous Intrahepatic Portosystemic Shunts (TIPS) with the Aid of Ultrasound (US): Tips for US**

### **TEACHING POINTS**

Learning Objectives Review standard steps for conventional TIPS creation. Provide steps and tips for using intracardiac echography (ICE) catheters and transabdominal ultrasound for aiding in TIPS creation. Discuss advantages and disadvantages of the various equipment used for TIPS creation and when to consider each.

### **TABLE OF CONTENTS/OUTLINE**

Content/Outline Introduction Review steps for performing TIPS creation using fluoroscopic guidance Review cross sectional imaging to aid in procedure planning Demonstrate indirect portography and limitations. Demonstrate each of the key steps for creating a TIPS. Review ICE catheter setup Jugular vs Femoral approach Tips for orienting user to key anatomy and needle directing Tips to improve efficiency Review Transabdominal US set up Tips for orienting user to key anatomy and needle directing Tips to improve efficiency Discuss advantages and disadvantages each approach Unique cases best managed by each guidance modality Prevention of complications by each guidance modality Cost accessibility of each guidance modality While TIPS procedures are most commonly done using conventional fluoroscopy guidance, ultrasound may be used in conjunction with benefit. This presentation reviews guidance modalities for TIPS creation focusing on key imaging and circumstances favorable and unfavorable to each guidance modality.

## **IREE-27      The ABCs of CT-guided Lung Biopsy: Tips and Tricks for Optimal Outcomes**

Participants

Miriana Mariussi, MD, Pilar, Argentina (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

The purpose of this exhibit is to: • Review the indications for the percutaneous CT-Guided lung biopsy • Comprehend the pre-procedural imaging analysis and planning • Assess the principles of the percutaneous biopsy techniques and co-axial techniques • Knowledge the common complications after the procedures and their management • Highlight the recommendations to avoid pneumothorax and other complications • Recognize common CT image findings observed in the post-procedural follow-up

### **TABLE OF CONTENTS/OUTLINE**

Percutaneous biopsy of lung lesions is increasing due to the rise of cancer incidence and the growing need for molecular and immunohistologic analyses. The size of the lesion, the size of the biopsy needle and the chosen technique have a direct impact on

the success of the procedure. A case based pictorial essay allows for a comprehensive assessment of: • Indications and patient selection for percutaneous CT-Guided lung biopsy • Establishing a concise pre-procedural imaging analysis and planning • Percutaneous technique and co-axial techniques • Needle positioning, trajectory and lesion sampling • Recognizing expected complications after the procedure • Strategies and tips for achieving a successful outcome • Reducing the risk of pneumothorax and other complications • Highlighting important post-procedural management steps • Understanding biopsy results and follow up

### **IREE-28 CT Guided Trans-osseous Biopsy, a Road Less Traveled: A review of Indications, Technical Aspects and Literature Summary**

#### **TEACHING POINTS**

CT guided transosseous biopsy is an alternative technique for lesions blocked by vital structures or apparently directly inaccessible. Coaxial technique is essential in transosseous biopsy, as it allows taking various samples through a secure access diminishing the number of skin punctures and risks of tumor seeding. The success of these procedures depends on the knowledge of regional anatomy, a correct planning and experience of the operator.

#### **TABLE OF CONTENTS/OUTLINE**

Introduction: Usually when performing an image guided percutaneous biopsy, the access is selected using the shortest path, avoiding vessels, nerves, or organs. Sometimes, this is not possible and more aggressive procedures, such as surgery, are required. A transosseous access can be used as an alternative approach to tackle this setback and sample deep and challenging targets. Furthermore, CT guided transosseous biopsies can be performed in order to reduce complication risks. Approaches: -Trans-sternal: lesions in anterior mediastinum. -Trans-rib: for pleural-based lung lesions or immediately deep to a rib -Trans-scapular: for apical lung lesions abutting superior margin of major fissure. -Trans-vertebral: for lesions anterior to the vertebral body, aortic lymph nodes. -Trans-iliac, pubic or sacral for internal iliac lymph nodes, other deep pelvic nodes in patients with pelvic malignancy or presacral lesions. Technical considerations. Complications. Take home messages

### **IREE-29 Multiple Cavitory Lung Lesions on CT: Biopsy Approach, Accuracy and Safety**

Participants

Juan Wang, Beijing, China (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

1. Understand the different biopsy approaches available for multiple cavitory lung lesions on CT, including transthoracic needle biopsy, bronchoscopy, and surgical biopsy, and their relative advantages and disadvantages. 2. Learn how to assess the accuracy of biopsy results, including sensitivity, specificity, and positive predictive value. 3. Become familiar with the potential complications associated with each biopsy approach, such as pneumothorax, bleeding, and infection, and how to manage them. 4. Appreciate the role of image guidance in improving the accuracy and safety of biopsy procedures for multiple cavitory lung lesions on CT. 5. Understand the importance of multidisciplinary collaboration among radiologists, pulmonologists, and thoracic surgeons in developing a biopsy strategy.

#### **TABLE OF CONTENTS/OUTLINE**

1. Introduction: This section will provide an overview of multiple cavitory lung lesions and the importance of accurate diagnosis and treatment. 2. Biopsy approaches: This section will discuss the different biopsy approaches for multiple cavitory lung lesions, including CT-guided biopsy, bronchoscopy, and surgical biopsy. 3. Accuracy of biopsy: This section will focus on the accuracy of biopsy for multiple cavitory lung lesions. It will discuss factors that can affect the accuracy of biopsy, such as lesion size, location, and underlying pathology. 4. Safety of biopsy: This section will review the safety of biopsy for multiple cavitory lung lesions. It will discuss potential complications associated with each biopsy approach, such as bleeding, pneumothorax, and infection. 5. Conclusion: This section will summarize the key takeaways from the education exhibit.

### **IREE-3 Sticky Situations: Expanding the Role of Glue in Trauma**

#### **TEACHING POINTS**

Discuss the properties of liquid embolic (glue); Characterize ideal uses for glue in traumatic injuries; Use cases to review diagnostic trauma CT findings, angiographic correlates and post glue embolization appearances; Review potential complications and pitfalls of glue embolization.

#### **TABLE OF CONTENTS/OUTLINE**

Outline: Introduction; Review of traumatic injuries and ideal cases for liquid embolics; Properties of glue (N-butyl cyanoacrylate), how to prepare, mixtures and delivery techniques; CT findings before and after glue embolization and how to differentiate from evolving injuries; Case presentations: Pseudoaneurysms (Spleen, Liver, Renal, Pelvis, Extremity), Active Extravasation (Spleen, Liver, Pelvis), and Traumatic AV Fistulas; Complications of glue embolization (non-target embolization, portal vein embolization, pulmonary emboli, skin injury) and how to prevent them. Conclusion: Glue is a versatile embolic which can be safely deployed in traumatic intervention. As glue becomes more frequently used, an understanding of expected post embolization changes is necessary to minimize erroneous reporting.

### **IREE-30 Thoracic Vent for Management of Pneumothorax: Review of Technique and Comparison to Conventional Thoracostomy**

Participants

Latika Baranga, MD, Brooklyn, NY (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Incidence of pneumothorax in patients undergoing transthoracic needle biopsy reported varying from 9-54%. Current treatment options include observation/conservative, simple aspiration, thoracostomy tube placement, ambulatory management with Thoracic vent placement or thoracostomy tube with or without Heimlich valve. Here we describe Thoracic vent device as an alternative to chest tube for iatrogenic pneumothorax. It is a simple one-piece device made of polyurethane catheter connected to a plastic chamber containing a one-way valve and comes with an adhesive tape to secure it. It does not require suture or additional securing devices nor additional tubing or bag/container attachments enabling early mobilization and outpatient monitoring. It's simple design without attachment makes it easier and safer to manage as an outpatient compared to thoracostomy with or without

a Heimlich valve.

#### TABLE OF CONTENTS/OUTLINE

1. Brief introduction discussing epidemiology, and treatment options for management of pneumothorax including technique such as thoracostomy tube with Heimlich valve and Thoracic vent. 2. Description of Thoracic vent device components, mechanism of action, placement technique. 3. and 4. Case describing steps of CT guided Thoracic vent placement, and follow up imaging. Appearance of the device on chest radiograph is demonstrated to assist in recognition of the device by diagnostic radiologist. 5. Comparison of Thoracic vent with conventional thoracostomy with and without Heimlich valve.

#### **IRRE-31 Look Before You Leap: Anatomical and Technical Considerations of Image-guided C2 Dorsal Root Ganglion Ablation and C1-C2 Lateral Joint Injections**

Participants

Bahram Mohajer, MD, MPH, Baltimore, MD (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

i. Discuss the cervicogenic headache as the primary indication of Image-guided C2 dorsal root ganglion (DRG) ablation and C1-C2 lateral joint injections. ii. Review the general anatomy of C2 DRG and C1-C2 lateral articulation and notable anatomical structures. iii. Illustrate CT-guided C2 DRG ablation technique and considerations. iv. Illustrate Computed Tomography and Fluoroscopic-guided C1-C2 lateral articulation injection techniques and considerations.

#### TABLE OF CONTENTS/OUTLINE

i. Cervicogenic headache (1. Presentation 2. Prevalence and efficacy of intra-articular injections). 3. General anatomy of the C2 DRG and C1-C2 lateral articulation. 4. Degenerative arthritis of C1-C2 lateral articulation presentation on STIR MRI (a) and CT (b). ii. Important anatomical proximities of C2 DRG and lateral atlanto-axial joints (1. Vertebral artery 2. Thecal sac 3. C2 ventral ramus). iii. CT-guided C2 DRG ablation procedure, technique, and considerations (1. Patient positioning, 2. Trajectory selection, 3. Needle insertion, contrast administration, and ablation). iv. CT-guided intra-articular injection, technique, and considerations (1. Patient positioning, 2. Trajectory selection, 3. Needle insertion, contrast administration, and injection). v. Fluoroscopy-guided procedure, technique, and considerations (1. Trajectory selection, 2. Needle insertion, contrast administration, and injection).

#### **IRRE-32 Utility Of Spectral CT During Percutaneous Thermal Ablation**

Participants

Ahmad Parvinian, MD, Rochester, MN (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The purpose of this exhibit is to demonstrate the utility of spectral CT for interventional ablation procedures. Recently, an interventional suite was developed which combined a dual-layer detector spectral CT scanner on rails with an image guided-therapy system (Spectral Angio CT, Philips Healthcare). In this exhibit, case examples will highlight use cases for spectral CT in procedure planning, probe placement, iceball visualization, and post-ablation assessment. Teaching points include: (1) technical background on spectral CT, (2) clinical background on minimally invasive ablations, and (3) overcoming interventional challenges with spectral CT.

#### TABLE OF CONTENTS/OUTLINE

1. Title page: Utility Of Spectral CT During Percutaneous Thermal Ablation. 2. Teaching points: Technical background, clinical background, and overcoming interventional challenges. 3. Interventional ablations clinical background: Procedure planning, probe placement, treatment monitoring, and post-ablation assessment. 4. Background on spectral CT for interventions: Dual-layer spectral detector technology, visualization modes for spectral imaging, and spectral CT on rails for interventions. 5. Case examples: (A.) Procedure planning with low MonoE for lesion visualization. (B.) Probe placement with high MonoE to reduce needle artifact. (C.) Treatment monitoring with z-effective and low MonoE. (D.) Bone ablations with bone removal. (E.) Post-ablation assessment with low MonoE to reduce contrast dose. 6. Conclusions

#### **IRRE-33 Transperineal Ultrasound-Guided Prostate Biopsy: Why and How**

Participants

Izabel Karam, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The purposes of this exhibit are: Review different prostatic biopsies approaches, emphasizing the transperineal technique and its peculiarities. Illustrate with cases different applications of the technique (systematic biopsy, cognitive guidance and MR imaging fusion). Identifying the radiological features of common postprocedural complications

#### TABLE OF CONTENTS/OUTLINE

Prostate cancer: epidemiology and imaging findings; Indications and patient selection for prostate biopsy; Different biopsy approaches and its characteristics; Technique steps; Illustrative cases of different applications of the transperineal prostate biopsy technique; Understanding and managing common complications post-procedure; Recognizing common image findings observed after the procedure; Interpreting biopsy outcomes and ensuring proper follow-up.

#### **IRRE-34 Too Hot to Handle? Non-worrisome Extrahepatic Localization of 99mTc MAA and Yttrium-90 During Planning and Radioembolization Procedures**

Participants

Merve Ozen, MD, Lexington, KY (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. In the work-up of patients for Y-90 radioembolization of hepatic tumors, it is often revealed that 99mTc-macroaggregated albumin (MAA) has accumulated in extrahepatic organs and blood vessels. While substantial Y-90 localization in some extrahepatic sites, such as the lungs, is an absolute contraindication for treatment, other sites do not have strict guidelines. 2. We show the

safe, complication-free administration of Y-90 to five patients with off-target uptake in each the following locations: a persistent falciform artery, the gall bladder, a portal vein tumor thrombus, a perihepatic lymph node, and the spleen.<sup>3</sup> The literature is consistent with the conclusion that uptake of Y-90 in the falciform artery, the gall bladder, and a tumor thromboses is generally safe and should not be an absolute contraindication to therapy. It has yet to be elucidated whether this is the case for uptake in the spleen and lymph nodes.<sup>4</sup> Off-target Y-90 uptake in the spleen may actually be beneficial and help treat/prevent post-radioembolization hypersplenism and thrombocytopenia.

#### TABLE OF CONTENTS/OUTLINE

1. Cases of safe and successful Y-90 therapy to patients with extrahepatic uptake in the extrahepatic following locations<sup>2</sup>. Along with each case, the current literature regarding the safety of treatment of patients with these off-target uptakes is discussed.

#### IREE-35 Contrast Enhanced CT Lymphangiography For Various Lymphatic Disorders

Participants

Yura Ahn, MD, Seoul, Korea, Republic Of (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Despite the physiologic and clinical significance of the lymphatic system, lymphatic imaging remains difficult and in the developmental stages. In recent years, MR lymphangiography has enabled the depiction of lymphatic structure, but its widespread use is limited by its inherent limitations: high cost, limited accessibility, contraindications to MR, inability to position change, and inability of bedside needle insertion in MR suite is still obstacles. CT, which is not restricted by these constraints, may be a solution for more accessible lymphatic imaging. We have utilized contrast enhanced CT lymphangiography for characterization of various thoracoabdominal lymphatic diseases and pre-interventional planning. Herein, we introduce our practice of CT lymphangiography.<sup>1</sup> Learn the protocol and technical aspect of contrast-enhanced CT lymphangiography<sup>2</sup>. Describe normal lymphatics anatomy with contrast-enhanced CT lymphangiography<sup>3</sup>. Learn the characteristics of various thoracoabdominal lymphatic diseases with CT lymphangiography

#### TABLE OF CONTENTS/OUTLINE

1. Protocol<sup>1</sup> Procedure: Inguinal LN cannulation under US guidance<sup>2</sup> CT technique for imaging the central lymphatics<sup>2</sup>. Technical aspect of CT lymphangiography<sup>1</sup> Acquisition time and CT dose<sup>2</sup> Comparison with MR lymphangiography<sup>3</sup>. Normal anatomy of the central lymphatics<sup>4</sup>. Various lymphatic disorders<sup>1</sup> Iatrogenic thoracic duct injury with chylothorax<sup>2</sup> Lymphatic anomaly

#### IREE-36 Artificial Intelligence in Interventional Radiology: A Primer for Residents

#### TEACHING POINTS

Artificial Intelligence (AI) has already demonstrated an ability to significantly improve efficiency in diagnostic radiology. There are however, unique challenges which need to be addressed to completely realise the potential of AI in Interventional Radiology (IR). Apart from key issues including data storage, lack of interoperability and non-standard practices, there are significant concerns about legal accountability and potential risks in interventions that prevent AI from being used independently or clinically without the oversight of an expert radiologist. Research and innovation involving AI in IR is limited to few higher centres, thus preventing adequate exposure of AI to Interventional Radiology residents, compared to their Diagnostic Radiology (DR) counterparts. Our Educational Exhibit aims to introduce IR residents and fellows to the vast possibilities of incorporating AI into their regular clinical practice (ranging from decision support and triaging of patients to prognostication and outcome prediction) and also introduce them to various open-source software and modules which can assist them in their day-to-day IR practice.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction 1A. AI in Medical Imaging 1B. Types of Data in DR and IR 2. Unique Challenges in IR 3. Opportunities of AI Implementation 3A. Pre-Procedural Support 3B. Peri-Procedural Support 3C. Post-Procedural Support 4. Established AI algorithms in Interventions 5. Open-Source software and modules 6. Opportunities for AI innovation in IR 7. Can AI Replace Us? 8. The way ahead for an AI-assisted Interventional Radiology practice

#### IREE-37 Portosystemic Shunts: A Comprehensive Review

Participants

John Walker, MD, PhD, San Antonio, TX (*Presenter*) Speaker, Shionogi & Co, Ltd; Consultant, Shionogi & Co, Ltd

#### TEACHING POINTS

1. To review the development of the portal system and teach normal and variant anatomy.<sup>2</sup> To become familiar with cross sectional and angiographic appearances of both common and uncommon portosystemic shunts.<sup>3</sup> To understand the clinical relevance of portosystemic shunts form congenital to acquired.<sup>4</sup> To demonstrate minimally invasive treatment options for portosystemic shunts.

#### TABLE OF CONTENTS/OUTLINE

1. Review the development of normal portal venous anatomy and subsequently congenital variant anatomy. In addition, understand shared territories with systemic veins that may allow shunts to form 2. Use cross sectional and angiographic images to teach the anatomy of portosystemic shunts to include congenital intra-hepatic and extrahepatic (Abernethy) shunts, as well as common acquired gastroesophageal, splenorenal, paraumbilical shunts and less common acquired mesenteric to retroperitoneal territories and consider surgically altered sites allowing for unique shunts 3. Discuss clinical implications of untreated portosystemic shunt and 4. Explore indications and techniques for treating shunts by type and location, to include discussion on expected sequelae of treating and potential complications.

#### IREE-38 Training of Interventional Radiology Procedures Using Virtual Reality: Current Status and Potential Metaverse

Participants

Yukiko Honda, MD, Kure, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The COVID-19 pandemic made it difficult to train learners on procedures that involve direct patient contact, such as interventional radiology (IR). For this reason, we developed training materials for learners on endovascular procedures of the abdominal pelvis in IR using virtual reality (VR). Advantages of VR-based IR education include the ability to conduct training at any time, repeated training exercises, no invasiveness to the patients, and no risk of infection to both the patient and the learner. Even after the pandemic, to further develop the good points of VR education, many educators are attempting to apply metaverse to the education of their specialty. Although metaverse education is considered useful in IR education, it is not widely used at present. This educational exhibit will provide a brief overview of simulators available for purchase, benefits of metaverse education, and our VR-based training software, and discuss its advantages, current issues, and future prospects.

#### TABLE OF CONTENTS/OUTLINE

1. Features of the currently commercially available VR simulators of endovascular procedures. 2. Benefits of metaverse education. 3. What is needed to spread metaverse education. a. Three components: hardware, software, and contents, b. High-speed networks, c. Computing technologies: edge computing, and cloud computing, d. Modeling and rendering technologies: Unity or Blender, e. Interaction technologies: Sensors, or real-time tracking, f. Authentication technologies: blockchain, g. Wearable device: head-mounted displays or smart glasses, h. Concerning the learner: learning logging, and analysis. 4. Review of reports on the cases of metaverse education. 5. Future challenges and our approach.

#### IREE-39 **Interventional Radiology Role in Treating Primary Pancreatic Cancer: Current Treatments and Future Prospects**

Participants

Fereshteh Khorshidi, MD, Baltimore, MD (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Review primary pancreatic cancer epidemiology, current therapies and prognosis- Review interventional radiology role in diagnosis of pancreatic cancer and palliative care- Review percutaneous and transarterial image-guided treatment options for unresectable primary pancreatic cancer offered by interventional radiology.- Importance of having a multidisciplinary approach and individually tailored treatment plan.

#### TABLE OF CONTENTS/OUTLINE

Primary pancreatic cancer- Prevalence- Significance- Clinical stages- Survival rate- Current therapies for resectable tumors Minimally invasive treatments of unresectable pancreatic cancer, their advantages, effectiveness and complications Treatments- Transarterial therapieso Regional intra-arterial chemotherapy with double-balloon catheter (RenovoCath)• Mechanism of action• Safety and efficacy• Ongoing Trials- Percutaneous ablative therapies:o Non-thermal ablation: Irreversible electroporation• Mechanism of action• Safety and efficacy• Ongoing Trials Synergetic effect of ablative therapies and immunotherapy; a future prospective Cases?. A few cases of ablation?

#### IREE-4 **Superior Vena Cava Syndrome Imaging and Management**

#### TEACHING POINTS

1. Review central venous anatomy and highlight potential collateral pathways. 2. Review the historical and current superior vena cava (SVC) syndrome etiologies. 3. Review the pathophysiology of SVC syndrome. 4. Present SVC syndrome classification systems. 5. Discuss SVC syndrome treatment and management. 6. Detail indications, benefits, and complications of endovascular treatment of SVC syndrome.

#### TABLE OF CONTENTS/OUTLINE

I. History and evolution of SVC syndrome etiologies. II. Central venous anatomy. III. Pathophysiology and symptoms of SVC syndrome. IV. SVC syndrome classification systems. V. SVC syndrome treatment algorithm. VI. Endovascular therapy cases. VII. Endovascular therapy techniques. VIII. SVC syndrome endovascular complications. IX. Projected future of SVC syndrome therapy.

#### IREE-40 **Thermoprotective Techniques in Musculoskeletal Ablation**

Participants

Ahmad Parvinian, MD, Rochester, MN (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The purpose of this exhibit is to provide a case-based review of thermoprotective techniques used during percutaneous thermal ablation of musculoskeletal tumors. The exhibit will demonstrate the basic principles of musculoskeletal ablations performed using ultrasound, CT, fluoroscopic, and MRI guidance, depict the various active and passive thermoprotective techniques that are critical to safe and effective ablation, and provide a framework for recognizing and addressing complications. Teaching points include: (1) clinical background and principles of musculoskeletal ablation, (2) active thermoprotective techniques, (3) passive thermoprotective techniques, (4) complication management.

#### TABLE OF CONTENTS/OUTLINE

1. Title page 2. Teaching points 3. Musculoskeletal ablation background 4. Preprocedural Considerations 5. Passive thermoprotection- Ablation zone monitoring- Temperature monitoring- Neurophysiologic monitoring 6. Active thermoprotection- Hydrodisplacement- Pneumodisplacement- Balloon interposition- Probe traction- Internal warming- External warming 7. Complication recognition and management 8. Conclusions

#### IREE-41 **Thyroid Nodule Fine Needle Aspiration: What the Pathologist Wants You to Know**

#### TEACHING POINTS

- Fine needle aspiration (FNA) is an optimal diagnostic tool for thyroid nodules because it is cost-effective, safe, and accurate .
- The Bethesda guidelines for thyroid FNA consider that the unsatisfactory rate on cytopathology is of about 10% , however different studies have shown that the unsatisfactory rate can range from 0.4% up to 40% .
- Some of the reasons why FNA results may be inaccurate include: 1. Sampling error: the sample may not accurately represent the entire nodule. 2. Inadequate sample size: the sample taken during FNA may be too small to yield accurate results. 3. Technical error: The accuracy of FNA results can be affected

by technical errors, such as improper handling or processing of the tissue sample.4. Nodule size: multiple studies have shown that the diagnostic accuracy of FNA is limited in large thyroid nodules. • The technique of the specimen collection and evaluation and the preparation of the slide can play a decisive role in the diagnostic accuracy therefore it's important for the radiologist to recognize the correct technique. • The "classic" technique uses three slides and generates two slides for interpretation. A slide to be deposited in fixative, a slide to be air dried, and a spreader slide. • The two-slide technique has been called the "butterfly" or "book-end" technique. It has the advantage of simplicity and better reproducibility. It produces a relatively uniform and rounded imprint of FNA material for evaluation on two mirror image slides.

#### TABLE OF CONTENTS/OUTLINE

1. Patient selection2. Equipment needed for thyroid biopsy3. Patient preparation4. Needle based sample collection techniques5. Sample preparation6. Pathologist recommendations in order to reduce inconclusive results

#### IREE-42 Nutcracker Syndrome: Diagnosis and the Role of Minimally Invasive Interventions

Participants

Alina Hasanain, MD, Baltimore, MD (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Nutcracker phenomenon is an anatomic condition characterized by extrinsic compression of the left renal vein, causing entrapment, and subsequent diminished outflow to the inferior vena cava.2. Nutcracker syndrome refers to Nutcracker phenomenon with clinically apparent sequelae, which include hematuria, abdominal pain, and gonadal varices among a variety of other symptoms, the severity of which can depend on the severity of the anatomic findings.3. The role of interventions, especially minimally invasive interventions such as endovascular treatment, has become more prominent in the treatment of severe Nutcracker syndrome. This exhibit will outline diagnostic methods and management options for Nutcracker syndrome with a focus on endovascular approaches.

#### TABLE OF CONTENTS/OUTLINE

1. Review the pathophysiology of Nutcracker syndrome with anatomic causes and variations2. Discuss diagnostic methods doppler ultrasound, CT, MRI and angiography, venography and intravascular ultrasound.a. Imaging criteria and classificationb. Examples of cases from a single institution3. Discuss management options including conservative management and surgical options with an emphasis on endovascular approaches (stenting, coil embolization of varices).a. Advantages over open or laparoscopic interventionsb. Complications and pitfallsc. Future directions

#### IREE-43 Managing Hemoptysis from Diagnosis to the Angio Suite: A How-to Guide for the Radiologist

#### TEACHING POINTS

Hemoptysis is the airway bleeding, ranging from blood-tinged mucus to gross hemorrhage: when massive -almost defined as a >300mL/24h bleeding- it is a life-threatening and challenging condition. Angiography with embolization is the front-line therapy for emergent cases of hemoptysis. The aim of this study is to give a concise guide to the diagnostic and interventional management of hemoptysis in the angiography suite.

#### TABLE OF CONTENTS/OUTLINE

Hemoptysis generally arises from the bronchial arteries (BAs,~90%) and encompasses infectious, inflammatory and malignant causes, being tuberculosis the most common worldwide. After airway securing, underlying conditions and laterality must be assessed: CT angiogram -eventually along with bronchoscopy- is a useful tool to review and report origin (orthotopic/ectopic), course and morphology of BAs or to identify nonbronchial systemic/pulmonary bleeding source. On conventional bronchial arteriograms, selective catheterization of BAs origins is mandatory, while the anterior spinal artery and its medullary branches must be identified in order to avoid iatrogenic transverse myelitis or paralysis, the major complications. Hypertrophied vessels, parenchymal hyperemia, blushing or pseudoaneurysm suggest bleed source. For BAs, embolic particles (350-700microm) are usually preferred, while coils and plugs preclude reintervention if hemoptysis recurs and are thus limited to bronchial aneurysms and pulmonary arteries embolization. Recurrence rates range from 10 to 58% and increase over time and in certain diseases (e.g. cystic fibrosis).

#### IREE-44 Abernethy Malformations: Making Sense of Congenital Portosystemic Shunts

#### TEACHING POINTS

Abernethy malformation, or congenital portosystemic shunt, is a rare abnormality of the portal venous system. The portal vein either fails to form or forms abnormally, resulting in an anomalous shunt that diverts blood from the portal vein to the systemic circulation without passing through the liver. The clinical manifestations of Abernethy malformation can vary depending on the severity and location of the shunt, and may include encephalopathy, portal hypertension, and liver failure. Abernethy malformation can be detected via ultrasound, computed tomography (CT), or magnetic resonance imaging (MRI). Patients with Abernethy malformation are at risk for liver lesions, thus particular attention must be paid to the liver parenchyma. The orientation and size of the shunt can be confirmed via catheter-directed angiography and balloon occlusion. Treatment options for Abernethy malformation include interventional or surgical shunt closure, liver transplantation, or conservative medical management of symptoms. The choice of treatment depends on the severity of the malformation and the patient's clinical condition.

#### TABLE OF CONTENTS/OUTLINE

(1) Introduction: Overview of Abernethy malformation(2) Clinical presentation: Signs and symptoms(3) Imaging: Detection, associated findings, characterization, and confirmation(4) Treatment: To close or not to close?

#### IREE-45 Sharp Recanalization for Central Venous Occlusive Disease: Advanced Techniques and Evidence-Based Outcomes

Participants

John Domini, Columbus, OH (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Define the role of and indications for sharp endovascular recanalization in the management of central venous occlusive disease

(CVOD). Examine relevant clinical and vascular anatomy relevant to CVOD. Describe the conventional interventional methods of central venous recanalization. Discuss pertinent procedural techniques, devices, technical challenges, and special considerations of sharp central venous recanalization. Review risks, evidence-based outcomes, complications, and post-procedural care.

#### TABLE OF CONTENTS/OUTLINE

A review of indications and rationale for patient selection will be discussed. Central venous anatomy with marked implications on technical approaches will be examined. Procedural details will review the conventional methods and highlight indications for sharp recanalization and advanced techniques. Technical aspects including equipment choices, procedural techniques, practical pearls and potential pitfalls will be discussed, guided by a case-based review. Interpretation of clinical results, evidence-based outcomes will also be reviewed with a focus on complications, risks and post-procedural care.

#### IREE-46 Vasculitis: Clinical Evaluation, Imaging, and Treatment

Participants

Kausthubh Hegde, MBBS, Boston, MA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Review the definition and types of Vasculitis. 2. Discuss the signs, symptoms, and clinical evaluation of the most common types of Vasculitis. 3. Diagnosis with an emphasis on the role of imaging in diagnosing Vasculitis. 4. Case-based examples of IR treatment options and follow-up care.

#### TABLE OF CONTENTS/OUTLINE

1. Vasculitis: definition and pathophysiology of the disease. 2. Classification of vasculitis - Lie classification of vasculitis (1994) - 2012 revised International Chapel Hill Consensus Conference nomenclature of vasculitides 3. Review of the signs and symptoms of different types of vasculitis. 4. Role of diagnostic imaging modalities in the evaluation of vasculitis (with case-based examples). 5. Indications and contraindications for endovascular treatment of vasculitis (with case-based examples). 6. Complications and follow-up care after IR procedures.

#### IREE-47 Embolization of Extracranial Arteriovenous Malformations: Strategies of Interventional Approaches According to the Yakes Classification

#### TEACHING POINTS

Learn imaging findings associated with arteriovenous malformations (AVM) and present the Yakes classification Present briefly the main genetic mutations associated pathways and potential drug therapies Understand interventional management of AVM according to the Yakes classification Discuss embolization strategies according to the Yakes classification and AVM territory Discuss outcomes, follow-up and complications Propose a therapeutic algorithm based on the Yakes classification, clinical staging and genotyping

#### TABLE OF CONTENTS/OUTLINE

Overview and classification of AVM according to the Yakes classification Clinical and imaging evaluation before procedure Presentation of the Shobinger classification and discussion of the relative roles of Doppler ultrasound, CT, MRI, DSA Embolization techniques Presentation of liquid and mechanical embolizing agents and their use according to the approach (endovascular transarterial approach, direct puncture, retrograde venous approach). The safe use of ethanol and bleomycin will be also discussed Treatment techniques according to AVM territory and Yakes classification Discuss specific considerations for head and neck, limbs, thoracic, abdominal and pelvic AVMs Yakes Type I (transarterial, transvenous, coils, plug) Yakes Type II (transarterial, direct puncture, retrograde venous, liquid agent) Yakes IIIa (transvenous, coils, plug liquid agents) Yakes IIIb (transarterial, direct puncture, retrograde venous, liquid agent, coils) Yakes IV (direct puncture ethanol, interstitial infiltration bleomycin) Follow-up and outcomes evaluation Clinical and imaging criteria to assess therapeutic response Conclusion Therapeutic algorithm proposed

#### IREE-48 Fluid Solutions for Complex Cases: A Comprehensive Guide to Sclerosant and Liquid Embolic Agents for Radiologists

Participants

Keith Ameyaw, MD, New York, NY (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Liquid embolic and sclerosant agents are vital tools in interventional procedures capable of achieving targeted vessel occlusion, space occupation or tissue fibrosis. 2. Understanding the mechanism of action of these agents is essential for optimal use, procedural technique, and informing operator preference. 3. Different agents have unique advantages and complications. Selecting the appropriate agent is critical for optimizing patient outcomes. 4. Radiologists must be intimately familiar with the unique post-procedural imaging characteristics of liquid embolics/sclerosants. These imaging findings play a crucial role in assessing both the success of the procedure and informing follow-up care.

#### TABLE OF CONTENTS/OUTLINE

1. Mechanism of action of sclerosant and liquid embolic agents. 2. Indications for use in several disease entities, including: intracranial and extracranial vascular malformations, lymphatic malformations, tumors, cysts, benign prostatic hyperplasia, venous insufficiency, arterial hemorrhage, portal hypertensive variceal hemorrhage, aortic graft endoleak, lymphatic leak/chylothorax, lymphoceles, post-operative seroma, and gonadal vein embolization. 3. Technique and procedural considerations. 4. Advantages and associated complications of different agents. 5. Imaging findings with descriptions of associated artifacts necessary for appropriately assessing procedural success and informing follow-up care.

#### IREE-49 Benefits of Hybrid CT/Angiography Utilization for Microsphere Trans-arterial Radioembolization with Yttrium-90

#### TEACHING POINTS

Hybrid angiography/CT (Angio-CT) employs both traditional CT imaging with concurrent fluoroscopic angiography in the same procedure room. Although introduced prior to cone-beam CT, Angio-CT has been under-utilized due to cost and availability. The resurgence of Angio-CT has proven to be a very useful tool in interventional oncology; however, its application in microsphere

trans-arterial radioembolization is not well documented through the literature. Angio-CT shows unique advantages in the image resolution regardless of patient preparation, catheter directed contrast imaging in the planned treatment field to precisely calculate more accurate dosimetry in routine and multifocal lesions, to more accurately characterize lesions and any potential changes in lesions with higher sensitivity and specificity, and to more accurately detect anatomic variants and/or accessory tumor feeding vessels. Lastly, early data suggests Angio-CT systems utilization could improve survival in patients with HCC when performing trans-arterial therapy, likely due to more accurate and precise pre-treatment and intraprocedural imaging.

#### TABLE OF CONTENTS/OUTLINE

1. What is Angio/CT? 2. Practical points and precision of dosimetry with Angio/CT 3. Unique Advantages in image quality and predicting success 4. Optimal Utility of Each Modality 5. The Unknowns and the Research Potential 6. Case Examples a. Improved detection and characterization b. Anatomic variants potentially unnoticed with cone-beam c. Improving dosimetry accuracy 7. Quantifiable benefit in outcome?

#### IREE-5 Advances in Percutaneous Jejunostomy: Novel Techniques and Their Clinical Implications

##### TEACHING POINTS

Percutaneous radiologic jejunostomy (PRJ) is a minimally invasive procedure for patients requiring enteral feeding and access for biliary interventions, especially in patients who have altered anatomy, such as after gastric resection, gastric bypass surgery, Whipple procedure, or liver transplant. After reviewing this exhibit learners should be able to: 1. Recognize common indications for PRJ 2. Understand novel techniques to aid in successful PRJ access 3. Recognize and address complications related to PRJ

#### TABLE OF CONTENTS/OUTLINE

This exhibit will: 1. Review imaging and anatomical considerations for jejunal access 2. Discuss common indications, contraindications and patient selection for PRJ 3. Introduce procedural advancements in PRJ through a case-based approach- Traditional techniques in PRJ- Modified coaxial technique for T fastener deployment through a sheath- Utilizing cone beam CT to ensure proper T fastener placement- Using an orogastric magnetic balloon and ultrasound guidance to assist in complicated cases where traditional methods fail 4. Address pitfalls and potential complications of PRJ Summary Clinical Implications: As the number of liver transplants, cholecystectomies and gastric surgeries increase every year, there may be more demand for jejunal access to manage potential complications of these procedures. PRJ can allow for enteral nutrition and access for repeated biliary interventions.

#### IREE-50 A Review of Superior Vena Cava Interventions

Participants

Jorge Lopera, MD, San Antonio, TX (*Presenter*) Shareholder, Tecnostent SA; Consultant, Merit Medical Systems, Inc; Research Grant, AngioDynamics, Inc

##### TEACHING POINTS

To review the clinical presentation and treatment options for SVC syndrome. To understand the role of different endovascular techniques to treat stenoses, occlusions and thrombosis of the SVC. To illustrate the challenges when treating SVC stenoses in patients with existing central lines. To discuss the different recanalization techniques to treat complex chronic occlusions of the SVC. To review the different complications with SVC interventions and how to treat them.

#### TABLE OF CONTENTS/OUTLINE

1. Clinical presentations and imaging of central venous and SVC stenoses and occlusions. 2. Review of treatment options in malignant SVC syndrome. 3. Treatment options in SVC syndrome - special situations: a. SVC syndrome with existing ports and dialysis lines. b. SVC syndrome with thrombus c. Endovascular stenting : single or kissing stents. Covered or bare stents. d. Recanalization techniques for complex chronic occlusions. 4. Complications .

#### IREE-51 Percutaneously Induced Neuroregeneration for Treatment of Chronic Neuropathic Pain

##### TEACHING POINTS

1) Review the pathophysiology of neuropathic pain and the Sunderland classification of nerve injury. 2) Explain how percutaneous cryoneurolysis can induce regeneration of damaged peripheral nerves causing chronic pain. 3) Demonstrate the ability of percutaneous cryoneurolysis to provide long term relief and neuroregeneration for the treatment of chronic neuropathic pain. 4) Discuss current indications and potential new applications of cryoneurolysis.

#### TABLE OF CONTENTS/OUTLINE

1) Incidence and causes of neuropathic pain. 2) Pathophysiology of nerve injury and chronic peripheral nerve pain. 3) Mechanism of cryoneurolysis and neuroregeneration. 4) Current indications and patient selection. 5) Techniques for cryoneurolysis, including approaches and duration/temperature of ablation. 6) Post-procedure follow-up and outcomes. 7) Case examples of cryoneurolysis for pain relief and neuroregeneration. 8) The pre-operative use of cryoneurolysis to reduce pain caused by other interventions including ablation, embolization, and post-mastectomy pain. 9) Exploring new applications of cryoneurolysis.

#### IREE-52 Super Selective Radioembolization for Hepatocellular Carcinoma: Radiation Segmentectomy and Beyond

##### TEACHING POINTS

Radioembolization has emerged as an effective treatment option for hepatocellular carcinoma that cannot be surgically removed. The procedure involves the preferential deposition of radioactive microspheres into the hypervascular tumor through a siphoning effect, typically achieved by injecting the microspheres at the lobar artery level. However, to improve tumor response and minimize potential complications, superselective radioembolization is recommended. The purpose of this exhibit is : (1) To review the rationale behind radiation segmentectomy. (2) To learn when superselective radioembolization is necessary, (3) to offer technical tips for performing superselective radioembolization.

#### TABLE OF CONTENTS/OUTLINE

1) Radiation segmentectomy : rationale and evidence 2) Dosimetry : Practical guide for dosimetry of superselective radioembolization 3) When superselective radioembolization is needed A. small single tumor : radiation segmentectomy B. Large

single tumor saddling on both lobes C. Small remnant liver D. Hepatic artery branching at acute angle E. Extrahepatic collateral artery supplying the tumor 4) Technical consideration of superselective radioembolization A. Protection of distal normal liver by using balloon microcatheter and detachable coil B. Combination treatment of lobar and segmental artery C. Combination treatment of 1st and 2nd week dosing of glass microsphere 5) Follow-up imaging after superselective radioembolization A. Early loss of arterial enhancement of the tumor B. Focal radiation necrosis mimicking new hypovascular tumor

### **IREE-53 TESLA: The Future in Treatment for Malignant Perihilar Obstruction**

#### **TEACHING POINTS**

In malignant bile duct obstructions the most common treatment in the Netherlands is endoscopic drainage (ERCP) with placing plastic tubes, combined with biliary drainage. Cholangitis due to ERCP occurs often, in 40-60% of the patients, probably caused by colonization of bowel bacteria and infection of undrained segments. Patients often need multiple re-interventions. The 90days mortality after diagnosis is 35%. In the TESLA trial the hypothesis is that primary percutaneous stenting, without placing a biliary drain and without stenting the ampulla of Vater, provides less infectious complications and less reinterventions compared to endoscopic drainage. Ensuring a decrease in morbidity and mortality and improving the quality of life.

#### **TABLE OF CONTENTS/OUTLINE**

Compare primary percutaneous stenting above the ampulla versus endoscopic drainage for palliative treatment of malignant hilar biliary obstruction in the TESLA study. Primary providing a lower complication rate and furthermore lowering the absolute and relative bilirubin levels, decreasing the number of reinterventions and providing a better quality of life. This abstract provides an overview of the TESLA trial, an education of the interventional procedure and materials and provides the first promising data retrieved from the TESLA trial.

### **IREE-54 Advancing Interventional Procedures With Mixed Reality**

#### **TEACHING POINTS**

Introduction: The presentation focuses on Microsoft's HoloLens2 for visualization on an angiography biplane system. The HoloLens2 device is a mixed reality device that uses depth, light, and infrared cameras to track its environment and anchor multiple virtual displays to view ultrasound and fluoroscopy in real-time during image-guided interventions. Teaching Points: • Overview of the HoloLens2 device and its functionalities as they relate to interventional procedures • Demonstrate improvements in customization, decrease visual field discrepancies, and reduce ergonomic challenges associated with the current angiography systems • Evaluation of the image quality, latency, customization capabilities, and overall user experience • Demonstrate functionality like voice, gaze, and gesture controls in the live angiography environment • Case examples of the HoloLens2 integration in image-guided interventions on secondary personnel and primary phantom work

#### **TABLE OF CONTENTS/OUTLINE**

Outline: The presentation will cover the various teaching points related to HoloLens2 integration into an angiography suite. Attendees will learn how the device facilitates the clinician seeing what they want and where they want. The presentation will conclude with a summary of the promising role the HoloLens2 provides in advancing the clinician experience in interventional radiology and answer the question of why integrating this emerging technology will be beneficial in the clinical environment.

### **IREE-55 Percutaneous Cryoneurolysis for Complex Pain: Indications, Technique, and Expectations**

#### **TEACHING POINTS**

1. Review the epidemiology of complex pain syndromes and current need for analgesic adjuncts in pain management 2. Discuss the mechanisms of how percutaneous cryoneurolysis affects pain 3. Review the uses and techniques of various procedures including intercostal, ilioinguinal, intercostobrachial, and pudendal nerve cryoneurolysis 4. Demonstrate successful approaches to complex pain including pathologies involving the rib, hip, arm, and groin 5. Discuss common complications after percutaneous cryoneurolysis, including their diagnosis and management

#### **TABLE OF CONTENTS/OUTLINE**

1. Introduction, including epidemiology of complex pain syndromes 2. Mechanism and physiology behind cryoneurolysis effect on pain 3. Indication, technique, and successful case of intercostal nerve cryoneurolysis 4. Indication, technique, and successful case of ilioinguinal nerve cryoneurolysis 5. Indication, technique, and successful case of intercostobrachial nerve cryoneurolysis 6. Indication, technique, and successful case of pudendal nerve cryoneurolysis 7. Recognition and management of common complications 8. Conclusion and summary

### **IREE-56 Ectopic Varices: Anatomic and Hemodynamic Features and Endovascular Techniques**

#### **TEACHING POINTS**

Ectopic varices arise in the hepatopetal or hepatofugal collateral vessels outside the gastro-esophageal region account for up to 5% of variceal bleeding. Various endovascular techniques can be effectively applied based upon their anatomic and hemodynamic features. Duodenal varices (DVs) are the most common type and arise in either hepatopetal collaterals or hepatofugal collaterals. DVs with hepatopetal collaterals are treated by portal vein (PV) stenting and those with hepatofugal collateral are treated by antegrade and/or retrograde obliteration techniques with or without TIPS. Rectal varices (RVs) are common complication in portal hypertension and arise in hepatofugal collaterals from the superior rectal vein to the bilateral internal iliac veins. Antegrade obliteration is often required to eradication of RVs because of their complicated drainage system. TIPS is effective to prevent recurrent bleeding. (Peri)stomal varices (SVs) can develop after ileostomy. SVs are supplied by the ileal veins and drains into the epigastric veins. They are often associated with portal hypertension but also with local hemodynamic abnormality. SVs with refractory bleeding have been treated by direct puncture embolization, antegrade obliteration and TIPS. Choledochal (-jejunal) varices arise in hepatopetal collaterals with extrahepatic PV occlusion often associated with choledocojejunostomy. They are treated by PV stenting with additional endovascular techniques.

#### **TABLE OF CONTENTS/OUTLINE**

Table of Contents/Outline 1. Basics of ectopic varices and various endovascular techniques 2. Duodenal varices 3. Rectal varices 4. Stomal varices 5. Choledochal (-jejunal) varices 6. Miscellaneous/ infrequent varices

## **IREE-57 Thermoablation of Pulmonary Metastasis: A Standard for a Secure Approach**

Participants

Barbara Nunes, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

- To illustrate noble structures in the pulmonary ablation areas under risk, which should be minded during the procedure.- To discuss patient selection, positioning, rationale of safe routes for the probe, and safety maneuvers in order to avoid and protect the above structures.- To assess the criterias of an adequate ablation zone and its expected course.- To illustrate the most important complications involved in the thermoablation of pulmonary metastasis.

### **TABLE OF CONTENTS/OUTLINE**

- Anatomy- Thermoablation mechanics- Patient positioning rationale and safe routes on pulmonary nodules ablation- Protective maneuvers- Defining an adequate ablation zone- Expected course of an adequate ablation zone- Most important acute complications

## **IREE-58 Buffalo Lung: A Human Complication after Lung Biopsy**

Participants

Nicole Law, MD, Salt Lake City, UT (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

1. Buffalo lung is a rare occurrence of bilateral pneumothoracies due to an abnormal physical communication between the two pleural spaces.2. Iatrogenic buffalo lung can occur following intrathoracic procedures such as median sternotomy, laparoscopic surgery and heart-lung transplantation, putting these patients at higher risk for bilateral pneumothoracies during a lung biopsy procedure.3. Presentation of buffalo chest can be worse than that of unilateral pneumothorax, including severe and sudden onset of dyspnea and pleuritic chest pain, tachycardia, hypotension, and even cardiac arrest or death.4. Quick action should be taken in these patients to place bilateral chest tubes in order to re-expand the collapsed lungs. For this reason, it is important for IR physicians to be aware of the risk of buffalo lung in lung biopsy patients.

### **TABLE OF CONTENTS/OUTLINE**

Introduction.Patient case example.Picture examples.Discussion of buffalo lung and its' presentations.Patient risk factors.Treatment and case outcome.

## **IREE-59 Anatomic Variants of the Hepatic Arteries and Technical Considerations for Y90 Radioembolization**

Participants

Taylor Loon, MD, Syracuse, NY (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

1) Review hepatic arterial variants that a radiologist should be able to recognize using the MICHEL classification. 2) Identify and familiarize the most common hepatic arterial variants encountered in pre-treatment mapping for Yttrium-90 radioembolization based on imaging findings. 3) Highlight the possible complications of Y90 microsphere diffusion into replaced right and left hepatic arteries and technical considerations when encountering variants.

### **TABLE OF CONTENTS/OUTLINE**

1) Review standard hepatic artery anatomy and the relevant imaging findings trainees should know to quickly evaluate using CT and digital subtraction angiography. 2)Introduce the MICHEL classification and subclassify based on right, left and common hepatic arterial origins. Present digitally drawn visual diagrams demonstrating each MICHEL classification. 3) Present cases from our institution depicting hepatic arterial anatomic variants using CT angiography and 3D-rendered images (MICHEL Classification, II, III and IV, which have a prevalence of 12.5%, 7.5% and 1% respectively). 4)Using cases from our institution, review relevant imaging findings on digital subtraction angiography for identifying hepatic arterial variants during pre-procedure mapping for Y90 chemoembolization. 5) Discuss possible branches of replaced/accessory left and right hepatic arteries and impact of diffusion of Y90 spheres. 6) Discuss technical considerations when encountering hepatic arterial variants including; injection rate for mapping DSA, prophylactic embolization of branches, and microcatheter tip position.

## **IREE-6 Purchasing Decisions for an Interventional CT Program**

### **TEACHING POINTS**

(1) Interventional CT fluoroscopy is becoming widely used and scanner features that meet both diagnostic and interventional needs are becoming increasingly complex. In this paper, the most important scanner features are discussed and ranked for both diagnostic and interventional purposes. (2) Vendors provide different offerings for the features, so hypothetical comparisons for three vendors are included to facilitate explaining various tradeoffs in purchasing decisions.

### **TABLE OF CONTENTS/OUTLINE**

This education exhibit provides a complete overview of CT scanner features which are necessary, desired, or useful for meeting both diagnostic and interventional purposes. The viewer will become familiar with the nuances of each feature and leave more comfortable with purchasing decisions in an increasingly complex market.

## **IREE-60 Vascular Interventions in Angiosarcoma with Pulmonary Hemorrhage**

Participants

Denes Szekeres, BS, Rochester, NY (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

The aim of this exhibit is to identify the role of the radiologist in diagnosis and management of vascular tumors. We begin with a review the epidemiology and presentation of angiosarcoma, a rare and diverse subset of malignant soft tissue sarcoma that is often

insidious. We discuss the broad range of imaging findings for a variety of common sites of primary and secondary angiosarcoma through a review of SEER data and prior studies. We tie together the educational points with a case report of a cardiac angiosarcoma, including a review of the multidisciplinary approach to diagnostic workup and oncologic management. We end with a description of endovascular interventions (coil embolization) in treating pulmonary hemorrhage, a common complication of metastatic disease.

#### TABLE OF CONTENTS/OUTLINE

1. Statistics and clinical pearls of angiosarcoma
2. Review of multimodality imaging findings
3. Case presentation of primary cardiac angiosarcoma
4. Technique for coil embolization of pulmonary arterial hemorrhage
5. Summary of educational points

#### IREE-61 **Oops, We Did It Again: A Review of CT- and US-Guided Thoracic Interventional Procedure Complications**

##### TEACHING POINTS

To review the potential complications of CT- and US-guided thoracic interventional procedures. To analyze the causes and risk factors of these complications and discuss how they could be prevented. To explain the different treatment options for these complications.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction- Lung biopsy and lung abscess drainage indications - Pleural biopsy indications- Thoracocentesis and pleural drainage indications - Techniques: CT- and US guided- Procedure: patient preparation, materials, technical considerations 2. Complications 2.1. Pneumothorax - Risk factors - Treatment 2.2. Lung Hemorrhage- Risk factors - Treatment 2.3. Subcutaneous Hematoma- Causes - Treatment 2.4. Seeding 2.5. Gas embolism- Clinical manifestations, causes - Treatment 2.6. Hemothorax- Causes - Treatment 2.7. Non-diagnostic biopsy- Risk factors - FNA vs CNB - Methods to increase biopsy performance 2.8. Non-productive pleural drainage- Causes- Treatment 3. Prevention of complications 4. Summary 5. Conclusion

#### IREE-62 **Intra-procedural Ablation Margin Confirmation for Thermal Ablation of Liver Tumors Using Open Source Software**

Participants

Iwan Paolucci, PhD, Houston, TX (*Presenter*) Stockholder, Intuitive Surgical, Inc ; Stockholder, SOPHiA GENETICS

##### TEACHING POINTS

- 1) Dedicated software for confirmation of ablation margins is commercially available but expensive and often unavailable to in health care centers and research laboratories with limited budgets - even in developed nations. This abstract presents a workflow for ablation confirmation using free and open source software.
- 2) The minimum ablation margin (MAM) after thermal ablation of liver tumors is the most important predictor of local tumor progression.
- 3) Detecting an insufficient minimum ablation margin during the procedure allows for immediate re-ablation during the same treatment session.
- 4) Intra-operative images acquired using controlled breathing (e.g. apnea, high frequency jet ventilation) yield the most accurate results as they involve minimal tissue deformation.

#### TABLE OF CONTENTS/OUTLINE

- 1) Software requirements
- 2) Loading and organizing the data
- 3) Registering the pre- and post-ablation CT images
- 4) Segmentation of the tumor and ablation zone
- 5) Calculation and visualization of the minimum ablation margin

#### IREE-63 **The Role of Cone Beam Computed Tomography in Embolization of a Technically Challenging Distal Pulmonary Artery Mycotic Aneurysm**

##### TEACHING POINTS

Cone-Beam Computed Tomography (CBCT) has many potential applications for both diagnostic and interventional radiology. The use of CBCT, as exemplified by the following case, allowed for the expeditious identification and treatment of a distal pulmonary artery mycotic aneurysm. This exhibit will enable participants to directly compare the differences in appearance between traditional CT and CBCT of the same entity and to display how CBCT data can be fused to live fluoroscopy to hasten the time to intervention.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction of the case example a. 42-year-old female with a complex medical history most notable for recent endocarditis treated with antibiotics and mitral valve replacement who presented with hemoptysis. 2. Description of traditional CTA findings a. CTA Chest demonstrated a distal, fourth-order pulmonary artery mycotic aneurysm. Axial images and coronal reformat provided. 3. Description of the CBCT findings a. Redemonstration of the aneurysm, comparing appearance to that of the CTA 4. Tutorial of fusing CBCT with live fluoroscopic images using guidance software, specifically using GE EMBO ASSIST ® as an example a. Images of the 3D reconstruction of the CBCT data b. Discussion of how guidance software is applied to the fluoroscopic images 5. Conclusion of case a. Successful, expeditious coil embolization of a difficult-to-access distal pulmonary artery mycotic aneurysm 6. Discussion of additional applications of this technique to other entities

#### IREE-64 **Overview of Diagnosis and Treatment of Large or Medium-sized Vessel Vasculitis**

##### TEACHING POINTS

Vasculitis is a group of disorders characterized by inflammation of the walls of blood vessels, and they are classified based on the diameter of the predominantly affected vessels. The clinical manifestations of vasculitis can be non-specific and may overlap with other disorders. Imaging techniques allow for direct evaluation of the arteries in large or medium-sized vessel vasculitis, and various interventional procedures may be used in these cases. However, the vessels involved in small vessel vasculitis are smaller than the current imaging resolution, meaning that only end organ changes secondary to the involvement of small vessels can be examined. This review presents the most important imaging modalities and typical findings in large and medium-sized vasculitis. The purpose of this exhibit is : (1) To list the vasculitis according to the vessel size affected. (2) To review the clinical and radiological manifestation of various vasculitis. (3) To learn the indication and technical tips for interventional procedures for vasculitis.

#### TABLE OF CONTENTS/OUTLINE

- 1) List of vasculitis A: large vessels (eg, giant cell arteritis, Takayasu arteritis), B: medium-sized vessels (eg, polyarteritis nodosa,

Kawasaki disease, primary granulomatous central nervous system vasculitis), C : small vessels (eg, Wegener granulomatosis, Churg-Strauss syndrome, microscopic polyangiitis, Henoch-Schönlein syndrome, systemic lupus erythematosus, rheumatoid vasculitis, Behçet syndrome). 2) Clinical manifestation and diagnostic criteria 3) Imaging modality and angiographic appearance 4) Treatment options : medical vs interventional 5) interventional procedures and their indication

## **IREE-65 Intra-arterial Treatment for Hepatocellular Carcinomas: How to Manage Shunting from the Artery**

### **TEACHING POINTS**

In the treatment of hepatocellular carcinomas, intra-arterial therapy such as chemoembolization and radioembolization is commonly used. However, operators may encounter shunts from the artery (such as arterioportal, arteriovenous, and arteriopulmonary shunts) that can hinder effective treatment. These shunts can be caused by various factors such as tumor invasion, previous percutaneous procedures, chronic inflammation, or congenital acquisition. If not properly occluded, embolic material can pass through the shunt and cause non-target embolization or serious complications. This exhibit aims to achieve three goals: (1) Review the radiologic appearance of arterioportal, arteriovenous, and arteriopulmonary shunts; (2) Learn how to manage these shunts with proper embolic materials; and (3) List the possible complications and their management.

### **TABLE OF CONTENTS/OUTLINE**

1) List of shunts Arterioportal shunt (hepatic artery - portal vein), Arteriovenous shunt (hepatic artery - hepatic vein), Arteriopulmonary shunt (hepatic artery - pulmonary artery/vein), 2) Imaging findings on CT/MR and angiography according to the cause (tumorous vs non-tumorous condition) 3) Embolization strategy and materials for shunts 4) Complications related with non-target embolization and their management

## **IREE-66 Nonsurgical Management of Renal Masses**

Participants

Laura Jorgenson, Rochester, MN (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

Learn the nonsurgical approaches to treat renal masses, including ablation, embolization, and SBRT, the indications for treatment and intraprocedural tips and tricks to optimize response. Understand post ablation, embolization and SBRT changes in the renal tumor and how to avoid pitfalls in interpretation. How to evaluate for tumor recurrence post treatment and avoid pitfalls in assessment. Understand common complications following ablation, embolization, and SBRT.

### **TABLE OF CONTENTS/OUTLINE**

1. Ablation, embolization, and SBRT technique Discuss evolution of nonsurgical management of renal tumors as a viable treatment option. Discuss indications and fundamentals of ablation, embolization, and SBRT: Patient selection Tumor types Treatment planning Procedural insights to avoid complications Role of spectral CT during ablation 2. Post ablation SBRT and embolization changes in renal tumors and assessment of tumor response Response of renal masses to nonsurgical management Typical features on imaging (CT/MRI) which depict normal evolution of typical changes on imaging - acute, subacute and chronic changes Tips on how to avoid pitfalls in interpretation 3. Potential Complications and related imaging features in each modality Intraprocedural complications Immediate post-procedural complications Delayed complications

## **IREE-67 Radioembolization of Hepatocellular Carcinoma with Extrahepatic Collateral Blood Supply: Anatomic and Technical Considerations**

### **TEACHING POINTS**

The utilization of radioembolization as a treatment method for hepatocellular carcinoma (HCC) has significantly increased in recent years. Typically, HCC derives its blood supply from the hepatic artery; however, it can also obtain a parasitic blood supply from extrahepatic collateral arteries (EHC). While chemoembolization has been carried out through EHC without significant complications, there is limited experience with radioembolization via EHC. The aim of this exhibit is threefold: (1) to examine the critical anatomy of EHC utilizing cone-beam CT, (2) To review when we suspect the presence of EHC supplying HCC, (3) To learn how to do safe radioembolization through EHC.

### **TABLE OF CONTENTS/OUTLINE**

1) List of treated EHC, 2) Vascular anatomy of EHC by using cone-beam CT and safe point of each EHC, 3) Suggestive findings of EHC on CT/MR and cone-beam CT, 4) Special considerations for radioembolization through EHC: dosimetry, embolization of pulmonary shunt, protection of normal vessel, and redistribution by proximal embolization.

## **IREE-68 Reducing the Learning Curve: The Use of an Ex Vivo Model for Teaching Double J Ureteral Stent Insertion and Retrograde Exchange**

### **TEACHING POINTS**

Discuss the benefits of simulation-based training for procedure competence. To describe our experience with a new training model for learning double J ureteral stent (DJS) insertion and retrograde exchange.

### **TABLE OF CONTENTS/OUTLINE**

Introduction. Urinary tract obstruction and how the performance of DJS can provide relief. The current master-apprentice model and the importance of procedure competence for trainees before practicing on patients. Benefits of simulation-based training and the current models available. Illustration of a developed ex vivo model for simulating a DJS procedure. Conclusion: Percutaneous access into the renal collecting system is a crucial step when performing DJS. This developed model allows for training on this technical skill as well as the remaining steps in a realistic and safe environment.

## **IREE-69 Diagnostic and Interventional Radiology for Budd-Chiari: An Update on BCS Classification and IVUS**

Participants

Anne Sailer, MD, New Haven, CT (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

1. Budd-Chiari syndrome (BCS) is the occlusion of one or more veins of the liver due to various disorders that result in sinusoidal congestion, portal hypertension, fibrosis, cirrhosis, and nodular regeneration. 2. The new BCS classifications can provide more appropriate treatment options; accurately determining the type of obstructor, number of blocked vessels, and length of the obstruction and categorizing the patients according to the updated BCS classification can improve the success of the patient's therapeutic treatment plan.

#### TABLE OF CONTENTS/OUTLINE

1. Review pathophysiology of Budd Chiari and the BCS classifications. 2. Briefly review potential mimics of Budd Chiari (i.e. other cause of sinusoidal or post hepatic obstruction). 3. Discuss general concepts of assessing the liver Doppler US, CTA, MRA, venography, and intravascular ultrasound (IVUS) with emphasis on technique, protocol, and image optimization for diagnosing Budd Chiari. a. Describe differentiating imaging features of various BCS presentations depending on the location of the occlusion. b. Review complications associated with BCS. c. Briefly demonstrate pitfalls of BCS. 4. Discuss management options with interventional radiology procedures (venoplasty and stenting, local pharmacologic and mechanical thrombolysis, transjugular intrahepatic portosystemic shunt (TIPS) placement), and potential complications.

#### IREE-7 Prophylactic Intervention for Placenta Accreta Spectrum

##### TEACHING POINTS

Placenta accreta spectrum (PAS) is an abnormal placentation with invasion of myometrium or extrauterine structures and can be associated with maternal morbidity and mortality. Not only the prenatal diagnosis but also the management are important to reach a better outcome. To date, pre-operative prophylactic balloon occlusion is developing with balloon placement in various sites including internal iliac arteries, common iliac arteries, uterine arteries and abdominal aorta. The purpose of this exhibit is: 1) to review the MRI features of PAS. 2) to review different treatment options including procedural risk, benefit and outcome. 3) to demonstrate techniques of balloon occlusion of internal iliac arteries. 4) to enhance the value of MRI image for preprocedural guidance or predictive indicator.

#### TABLE OF CONTENTS/OUTLINE

1) Introduction of placenta accreta spectrum (PAS) 2) MRI diagnosis of PAS. 3) Management for abnormal placentation a. traditional approach b. prophylactic balloon occlusion in various anatomic regions c. outcome for each treatment 4) Case demonstration: balloon occlusion of internal iliac arteries. 5) Additional MRI role for interventional radiologist

#### IREE-70 Image-guided Percutaneous Cryoablation for Lung Malignancies: Giving the Tumor a Cold Send-off

Participants

Angel Castillo Fortuno, MD, Barcelona, Spain (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

- To describe the physical and therapeutical mechanisms of image-guided percutaneous lung cryoablation (L-CYOA).
- To discuss the clinical and imaging features and the diagnostic and therapeutical algorithms of patients with lung malignancies amenable to treatment L-CYOA, including a proposed systematic pre-procedural evaluation protocol.
- To explain the technique, intraprocedural considerations, imaging findings, and most common complications related to L-CYOA.
- To describe the short-, mid-, and long-term follow-up imaging findings, clinical outcomes, and prospects of L-CYOA in the treatment of lung malignancies.

#### TABLE OF CONTENTS/OUTLINE

1.- Introduction 1.1- Background 1.2 - Surgery, SBRT or lung ablation? 1.3.- Heat vs. cold ablation techniques: Why CYOA? 1.4.- CYOA: Basic principles 2.- Indications 2.1.- Non-small cell lung carcinoma (NSCLC). 2.2.- Oligometastatic lung disease (OLD). 3.- Assessment before L-CYOA 3.1.- Patient selection. 3.2.- Preprocedural evaluation and preparation. 3.3.- Proposal of a systematic protocol. 4.- L-CYOA procedure 4.1.- Technical considerations: CYOA equipment and CT protocol. 4.2.- Technique. 4.3.- Intraprocedural clinical and imaging evaluation. 4.4.- Immediate clinical and imaging findings. 4.5.- Complications. 5.- Post-L-CYOA follow-up 5.1.- Clinical and imaging follow-up scheme. 5.2.- Short-, mid-, and long-term follow-up imaging and clinical findings. 6.- Clinical outcomes 6.1.- Stage I NSCLC. 6.2.- Alternatives indications in NSCLC. 6.3.- OLD. 6.4.- Immunotherapy synergy. 7.- Summarize 8.- Conclusion

#### IREE-71 Superior Vena Cava Interventions

Participants

Irene Dixe de Oliveira Santo, MD, New Haven, CT (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

Review the causes, anatomic considerations, presentation, and grading of superior vena cava syndrome (SVCS); Describe the main treatment options for SVCS with a special focus upon the endovascular therapies (ET), including angioplasty, stenting and catheter-based thrombus removal; Provide a brief case-based overview of ET, including stent selection; Review the main complications of ET.

#### TABLE OF CONTENTS/OUTLINE

Causes of superior vena cava syndrome (SVCS); Review of the main anatomic considerations, including patterns of obstruction and collateral pathways; Clinical presentation and grading system of SVCS; Diagnostic approach for SVCS; Main treatment options including chemotherapy with or without RT, surgical bypass or ET, including angioplasty, stenting and catheter-based thrombus removal, with pros and cons of each modality; Selected cases from our institution to illustrate several ET options; Venous Stents: types, descriptions, benefits and drawbacks; Complications of ET: hematoma, local infection, pericardial tamponade, SVC rupture, stent migration, in-stent restenosis, pulmonary edema, major bleeding, pulmonary embolism, and cardiac injury.

#### IREE-72 Combined Y90 Radioembolization and Immunotherapy for the Treatment of Hepatocellular Carcinoma: Is it Effective or Harmful Due to Adverse Effects

Participants

Justin Ling Leblanc, MD, JACKSON, MS (*Presenter*) Nothing to Disclose

Johnny Yang, BS, BA, Fresh Meadows, NY (*Presenter*) Nothing to Disclose

## TEACHING POINTS

Review the mechanism of immunotherapy and Yttrium-90 radioembolization for the treatment of hepatocellular carcinoma (HCC). Explore the risks, benefits, and safety of combined immunotherapy and radioembolization treatment. Review outcomes of real-life cases of combined therapy.

## TABLE OF CONTENTS/OUTLINE

Understanding the Hepatocellular carcinoma (HCC) immune microenvironment is important for developing effective immunotherapies. Suppression of the cytotoxic immune response - including CD8+ T lymphocytes, Natural Killer (NK) cells, and their associated cytokines - is associated with HCC progression. New drugs targeting immune checkpoint inhibitors, such as nivolumab, pembrolizumab, and atezolizumab have revolutionized the treatment of HCC. The latest research is exploring combination therapy with multiple immunotherapy agents and/or locoregional therapies such as surgical resection, ablation, or embolization. We reviewed stand alone widely used radioembolization with yttrium-90 (Y-90) therapy versus the safety of combining radioembolization with the PD-1 inhibitor nivolumab in HCC. Several Studies looked at the safety of the combination therapy by examining adverse events and overall survival. Results have shown that the combination therapy was well-tolerated, with no major adverse events reported. The most common side effects were fatigue, nausea, and abdominal pain. The median overall survival for the patients was 17 months, which is similar to prior studies. Some studies showed similar survival between these two therapies. Personalized selection based on age, burden of disease and other favorable criteria are important on which patient will benefit from single or combined therapy.

## IREE-73 Understanding the Complex Mechanisms of Complications in IR

Participants

Jorge Lopera, MD, San Antonio, TX (*Presenter*) Shareholder, Tecnostent SA; Consultant, Merit Medical Systems, Inc; Research Grant, AngioDynamics, Inc

## TEACHING POINTS

- To review how complications affect our performance in IR
- To understand the most common mechanism of IR complications
- To learn how to prevent and deal with complications
- To illustrate healthy and unhealthy ways to deal with complications

## TABLE OF CONTENTS/OUTLINE

Introduction : Error or complication ? Most common cause of complications : Judgmental errors : incorrect strategy of treatment is chosen. (1) overly heroic procedures (2) failure to intervene when the situation demands. Technical errors : poor technique , poor selection of devices . Normative or moral errors: irresponsible or unethical behavior. IR specific complications: Choosing the wrong materials . Not knowing your patient's history well. Poor communication. Rushing through cases. Poor technique . Bad luck? . Simple steps to prevent complications Coping with complications : What to do next . Healthy and unhealthy ways to deal with complications Economic and social cost of complications Conclusions

## IREE-74 Considerations for the Nonconventional Transjugular Intrahepatic Portosystemic Shunt (TIPS) Creation in Cancer Patients: Alternative Techniques and When to Use Them

## TEACHING POINTS

1. Review the indications and potential interfering factors to performing a TIPS procedure in cancer patients. 2. Present the standard technique for performing a TIPS; modifications that can be made; and when to use them to circumvent difficulties of the pre-, intra-, and post-operative process in cancer patients with altered post-surgical anatomy and acute or chronic splenoportal venous thrombosis.

## TABLE OF CONTENTS/OUTLINE

The transjugular intrahepatic portosystemic shunt (TIPS) is widely used in relieving pressure in the portal venous system (~90% success rate) in patients with refractory variceal bleeding or ascites, often due to cirrhosis. The standard process involves catheter guidance from a hepatic vein to a target portal vein branch. Several factors in cancer patients can complicate this procedure. These patients routinely have altered post-surgical anatomy such as a partial hepatectomy. Additionally, an association with increased thrombophilia can cause portal vein thrombosis. Moreover, certain tumors can compress or invade into splenic or mesenteric veins and result in occlusions interfering with a TIPS creation. For such cases, modifications to recanalize or bypass the obstruction have been demonstrated. We review the literature and present alternative techniques for shunt creation in a nonconventional TIPS: 1. The diagnostic presentation of patient factors that can interfere with a successful TIPS creation. 2. Case-based discussion regarding modifications to the TIPS technique to circumvent complicating factors.

## IREE-75 Local and Systemic Immune Cell Landscape after Transcatheter Arterial Embolotherapies for Hepatocellular Carcinoma

## TEACHING POINTS

- Review the magnitude and influence of post embolization hypoxic microenvironment on the local and systemic immune cell landscape in hepatocellular carcinoma (HCC)
- Illustrate preclinical and clinical data on T-cell and myeloid populations in post embolization and radioembolization in tumor microenvironment
- Describe the current status of systemic immune cell response after catheter-based therapies for HCC

## TABLE OF CONTENTS/OUTLINE

1. Introduction to catheter-based interventions for HCC and technical impact on post embolization hypoxia 2. Overview of the role of hypoxic stress and angiogenic factors induced by embolization on HCC cell survival 3. Characterize T-cell and myeloid cell local landscape after catheter-based interventions. 4. Discuss changes to splenic and plasma levels of inflammatory markers after HCC embolotherapies. 5. Demonstrate sustained immune responses after Y90 Radioembolization in Hepatocellular Carcinoma 6. Discuss future applications of embolization therapies in treating liver tumors.

## IREE-76 Imaging Findings and Interventional Management in Benign and Malignant Biliary Disease

Participants

Daniel Freedman, MD, New York, NY (*Presenter*) Nothing to Disclose

## TEACHING POINTS

1. Biliary disease consists of benign and malignant entities with a diverse spectrum of clinical presentation and imaging findings. 2. Benign biliary disease includes choledochal cysts, hamartomas, autoimmune diseases, chronic pancreatitis, HIV cholangiopathy, iatrogenic injury, gallstones, infection (cholangitis), and may develop after liver transplantation. 3. Malignant biliary disease includes primary biliary cancers (cholangiocarcinoma) and secondary tumor/metastatic disease, and causes severe illness secondary to local obstruction. 4. Multimodality imaging plays a critical role in guiding diagnosis and treatment options executed by interventional radiologists and advanced endoscopists including PTC, PTBD, ERCP, biliary stents, and surgery.

## TABLE OF CONTENTS/OUTLINE

1. Review of the clinical presentation and diagnostic imaging workup for benign and malignant biliary disease. 2. Multimodal imaging and procedural approach to the diagnosis, management, and treatment of benign and malignant biliary disease, including: a. Percutaneous transhepatic cholangiography and drain placement (PTC, PTBD) b. Endoscopic retrograde cholangiopancreatography (ERCP) c. Percutaneous transhepatic cholangioscopy d. Biliary stenting e. Surgical intervention

## IREE-77 Deep Gluteal Syndrome: Anatomy, Imaging and CT-guided Treatment (Sciatic Nerve Neurolysis)

Participants

Cristina Candelaria Linares Bello, MD, Santa Cruz De Tenerife, Spain (*Presenter*) Nothing to Disclose

## TEACHING POINTS

Remember the anatomy of the subgluteal space and the sciatic nerve. Explain the causes of deep gluteal syndrome and the different imaging findings. Explain the procedure of CT-guided treatment (sciatic neurolysis).

## TABLE OF CONTENTS/OUTLINE

Deep gluteal syndrome is considered an underdiagnosed entity and defined as the compression or irritation of a non-discogenic origin of the sciatic nerve in the anatomical region of the subgluteal space. The typical symptoms are: dysesthesias and/or pain in the buttock and hip. There are many etiologies that can produce this syndrome: Specific musculoskeletal entrapments: fibrous, fibrovascular or vascular bands, piriformis syndrome, gemelli-obturator internus syndrome, pathology of the quadratus femoris muscle and the ischiofemoral space and insertional pathology of the hamstring muscles. Non-specific pathologies: iatrogenic, inflammatory, traumatic, infectious, gynecologic, vascular and tumors. For its diagnosis, physical examination and an adequate clinical history are of great importance. MR imaging is the procedure of choice for diagnosis. On the other hand, the CT-guided procedure to perform sciatic nerve neurolysis is both a diagnostic and therapeutic procedure and an alternative to surgical treatments. The deep gluteal syndrome is an underdiagnosed entity with multiple etiologies. The CT-guided sciatic nerve neurolysis is a safe procedure and an alternative to surgical treatments.

## IREE-78 Hidden Time Bombs: Image Features of Abdominal Visceral Pseudoaneurysms and Treatment

## TEACHING POINTS

- Describe the common locations of, and clinical presentation including the complications of abdominal visceral artery pseudoaneurysms.
- Review the key imaging features of abdominal pseudoaneurysms on different modalities.
- Discuss the non-surgical endovascular and percutaneous treatment approaches to abdominal pseudoaneurysms.

## TABLE OF CONTENTS/OUTLINE

- Definition of pseudoaneurysms and location of visceral abdominal aneurysm such as-Splenic Artery Pseudoaneurysm-Hepatic Artery Pseudoaneurysm -Renal Artery Pseudoaneurysm -Pancreatic Artery Pseudoaneurysm-Mesenteric Artery Pseudoaneurysm
- Clinical presentation of pseudoaneurysms
- Imaging features of pseudoaneurysms - Findings on doppler and contrast enhanced ultrasound- Features on computed tomography (CT) angiogram- Vasculature characteristics and assessment of pseudoaneurysm features on conventional angiogram.
- Indication of pseudoaneurysm treatment and non-surgical treatment options - Symptomatic versus non symptomatic pseudoaneurysm- Endovascular fluoroscopic guided pseudoaneurysm treatment.- Percutaneous CT guided treatment - Percutaneous US (doppler and or contrast enhanced) guided treatment.

## IREE-79 Non-invasive Radiofrequency Hyperthermia Enhances the Effect of OK-432 for Hepatocellular Carcinoma Via Activation of cGAS-STING Pathway

## TEACHING POINTS

1. OK-432 could activate cGAS-STING pathway in DC cells in the treatment of HCC. RFH could enhance the effect of cGAS-STING activation of OK-432. 2. The combination demonstrated an antitumorigenic immunologic microenvironment and an encouraging anti-cancer effect in the treatment of HCC.

## TABLE OF CONTENTS/OUTLINE

Abstract RFA has been accepted as an effective alternative to surgery in the treatment of early-stage HCC. However, a clear safety margin beyond the tumor confinement is difficult to obtain when the tumor is large or irregular HCC. Thus, generated a sublethal radiofrequency hyperthermia at the ablated tumor margin during RFA. This study aimed to investigate the feasibility of using RFH to enhance treatment the effect of OK-432 for HCC and explore the potential mechanisms. Our study showed OK-432 could activate the cGAS-STING pathway, and RFH could significantly enhance the effect of OK-432 by a stronger activation of STING pathway. The expression of IFN- $\beta$  and the pro-inflammatory cytokines were significantly higher in the RFH+OK-432 group. Meanwhile, we found RFH could cause a higher expression of TLR4. The administration of the shTLR4 in vitro and TLR4 antibody in vivo to eliminate the role of TLR4, the activation of Sting by OK-432 decreased significantly. In addition, the combination treatment augmented the maturation of DCs and the infiltration of the functional CD8+ T cells. Furthermore, this combined treatment resulted in a better tumor response and a prolonged survival. In conclusion, the combination therapy might be a new treatment strategy in reducing the residual tumor after RFA of medium-to-large or irregular HCCs, bringing a new option for other types of malignancies treated by RFA.

## IREE-8 Minimally Invasive Thoracic Oncology Treatments: Comprehensive Review and Comparison of RFA, MWA, Cryoablation, and Chemoembolization Techniques

Participants

Shakthi Ramasamy, MD, (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

This educational exhibit aims to provide a comprehensive overview of minimally invasive thoracic oncology treatments, focusing on radiofrequency ablation (RFA), microwave ablation (MWA), cryoablation, and bronchial/pulmonary artery chemoembolization. RFA and MWA offer reduced morbidity and mortality, while preserving pulmonary function and allowing for repeatability. Cryoablation has shown promise in the treatment of early-stage lung cancer and advanced-stage palliative care, as well as in emerging applications such as ground-glass nodules. When lung metastases that are inoperable and unsuitable for ablation cease to respond to systemic chemotherapy, the prognosis becomes poor. Bronchial and pulmonary artery chemoembolization provide alternative treatment options for patients with large, multifocal lung tumors and those experiencing hemoptysis. The exhibit will delve into the principles, applications, imaging guidance, and outcomes associated with each technique, as well as the comparative efficacy of these treatments.

#### TABLE OF CONTENTS/OUTLINE

I. RFA, MWA, Cryoablation and Bronchial and Pulmonary Artery Chemoembolization will be discussed under the following categories:  
A. Principles and techniques B. Imaging guidance C. Patient selection and indications D. Treatment outcomes and comparisons E. Potential complications and management strategies  
II. Comparing the Treatments A. RFA, MWA, Cryoablation, and Chemoembolization B. Factors influencing treatment selection C. Efficacy and safety of each technique  
III. Future Directions and Research A. Ongoing clinical trials and studies B. Potential applications in personalized medicine and targeted therapy

#### **IREE-80 Gonadal Vein Embolization for the Management of Varicocele, Infertility, and Pelvic Congestion: Patient Anatomy, Evaluation, and Technique for Successful Treatment**

Participants  
Younes Attlassy, New York, NY (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Varicocele and PCS are similar disorders associated with vascular dysfunction. Varicocele occurs due to the pooling of venous blood while PCS is the result of vascular pressure buildup in the pelvic region. 2. Understanding the diagnostic and imaging workup for both conditions is imperative for radiologists and treatment teams to identify, grade, and treat both conditions. 3. Several interventions and treatments, including gonadal vein embolization, are available for patients with these conditions with varying success and complication rates. Information regarding the risks and benefits surrounding these interventions is paramount to ensuring the proper standard of care for each individual patient. 4. Interventional radiology percutaneous embolization has become a safe and effective minimally invasive option for varicocele and PCS treatment with high success rates and few complications.

#### TABLE OF CONTENTS/OUTLINE

1. Understanding the anatomy and pathophysiology of both PCS and varicocele including the anatomical variants and attributes that make gonadal vein embolization a more attractive treatment modality in certain cases. 2. A review of the clinical presentation, diagnostic imaging, workup, grading/classification systems, and the interventions for each one. 3. A look at the various treatment options and the risk-benefit analysis around each one. 4. An in-depth guide on IR-guided procedural protocol for the management of varicocele and PCS including how to address anatomical variants, contraindications, and expected post-procedural outcomes.

#### **IREE-81 Endovascular Interventions of the Mesenteric Vasculature Through Collaterals: A Technical Savior**

#### TEACHING POINTS

Vascular pathologies involving the arteries distal to stenosed or occluded main mesenteric arterial trunk is difficult to access. In these situations, one should be aware of arterial arcades and knowledge about these collateral pathways can bail the interventionalist out. We present four cases of endovascular interventions performed through the mesenteric collateral pathways.

#### TABLE OF CONTENTS/OUTLINE

Case 1. GLUE EMBOLIZATION OF SPLENIC ARTERY ANEURYSM (SAA) VIA HYPERTROPHIED RIGHT GASTRO-EPIPLOIC ARTERY (RGEA). 28-year/female - acute necrotizing pancreatitis with intraabdominal bleed. Status post proximal splenic artery embolization using coils. Embolization of the SAA was done via the hypertrophied RGEA. Case 2. SPLENIC PARENCHYMAL EMBOLIZATION (SPE) VIA INFERIOR PANCREATICO-DUODENAL (IPD) ARTERY - RIGHT GASTRIC ARTERY (RGA) COLLATERALS. 58-year/male - Post liver transplant and SA ligation. Refractory ascites due to persistent portal hypertension. Distal SA is reformed through collaterals from the RGEA (minor) and the IPD artery. Embolization was performed using PVA particles. Case 3. COIL EMBOLIZATION OF LEFT HEPATIC ARTERY (LHA) PSEUDOANEURYSM VIA THE IPD ARTERY. 32-year/male - Pseudoaneurysm arising from the LHA branch after removal of biliary catheter. Celiac artery stenosis was noted. Celiac axis reformed through IPD artery. A microcatheter was navigated across the hypertrophied collaterals and the pseudoaneurysm was coiled. Case 4. SPE VIA HYPERTROPHIED RGEA COLLATERALS. 42 years/male - Post liver transplant and SA ligation. Persistent hypersplenism and Splenomegaly. Splenic parenchymal embolization was done via the hypertrophied RGEA by injection of PVA particles

#### **IREE-82 From Classic to Quirky: A Journey through the Aunt Minnie's" of Angiography**

#### TEACHING POINTS

Provide radiology resident level review of classic, "Aunt Minnie" angiographic signs and findings. Briefly discuss pertinent management aspects of underlying pathology diagnosed on angiography. Review intravenous contrast agent selection, contrast injection rates and fluoroscopic projections as key technical components for optimizing image acquisition in angiography and venography.

#### TABLE OF CONTENTS/OUTLINE

Introduction:- Considerations for contrast selection- Contrast injection rates in angiography and venography- Common fluoroscopic projections for image acquisition  
Abdominal Angiography- Aortic dissection with Floating Viscera Sign- Budd Chiari- Non-inflammatory, non-atherosclerotic arteriopathies- Fibromuscular Dysplasia- Segmental Arterial Mediolysis- Standing Wave- Polyarteritis Nodosa  
Peripheral Angiography- Sciatic artery- Dissection- Popliteal Artery Entrapment Syndrome- Hypothenar Hammer Syndrome- Arterial Thoracic Outlet Syndrome  
Pelvic Angiography- Uterine Arteriovenous Malformation- Postpartum hemorrhage- Trauma- Corona Mortis- Pruning, truncation, petechial hemorrhage and vasospasm- Cavemosal Blush  
Angiography of Collateral

Pathways:- Arc of Buhler and Riolo- Subclavian Steal- Aortic occlusion and Winslow's pathway  
Venography- Venous Thoracic Outlet Syndrome- Paget-Schroetter Syndrome- Deep Vein Thrombosis- Azygos Continuation of the Inferior Vena Cava

### **IREE-83 Mechanical Thrombectomy for the Treatment of Deep Vein Thrombosis: A Primer for Interventional Radiologists**

Participants

Abinaya Ramakrishnan, Los Angeles, CA (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Teaching Points: Review treatment strategies using percutaneous mechanical thrombectomy devices including its indications and current state of literature. Review data from a single institution's experience and discuss factors that impact post-procedure outcomes.

#### **TABLE OF CONTENTS/OUTLINE**

Table of Contents/ Outlines: Background of management for acute deep vein thrombosis Discuss indications for percutaneous mechanical thrombectomy vs thrombolysis vs anticoagulation Discuss the diagnosis of May Thurner on incidence of recurrent DVT Discussion of major clinical trials of thrombectomy devices CLOUT Registry (Inari Medical) ATTRACT trial (Angiojet Rheolytic Thrombectomy System, Boston Scientific) Overview of current percutaneous mechanical thrombectomy devices on the market Data from a single-institution's experience with percutaneous mechanical thrombectomy Discuss findings from a single institution's retrospective analysis of thrombectomy procedures (n=82) Discuss specific factors that may influence post-procedure outcomes of re-thrombectomy, specifically sex, location of clot, chronicity of clot. Discuss intraprocedural characteristics that improve outcomes like placement of a stent and venoplasty. Review some of the contraindications for the use of percutaneous mechanical thrombectomy Highlight 2 successful cases with pre- and post-procedure imaging.

### **IREE-84 Straight to the Heart: State of the Art Thoracic Central Vein (Superior Vena Cava) Endovascular Recanalization, Thrombectomy and Stent Reconstruction**

#### **TEACHING POINTS**

Review anatomy and embryology of mediastinum and central thoracic veins. Recognize common etiologies and classifications of thoracic central vein obstruction (TCVO) including lesions of the brachiocephalic veins and superior vena cava. Describe endovascular treatment of TCVO including access, recanalization, thrombectomy, stent reconstruction, and extra-anatomic bypass creation as well as intraprocedural adverse event management. Discuss comprehensive care from initial work-up to post-procedure management.

#### **TABLE OF CONTENTS/OUTLINE**

Upper extremity and thoracic central vein anatomic review Common etiologies for TCVO Benign Malignant Patient evaluation Presentation, physical examination, and imaging evaluation Acute and chronic occlusive symptoms Patient centered care Technical aspects of procedure Sedation Access Venography Blunt and sharp recanalizations Thrombectomy and tissue sampling Stent selection and reconstruction Use of intravascular ultrasound (IVUS) Adverse event management Hemothorax and hemo-pericardium Stent migration Extra-anatomic bypass creation Post-procedure care and follow-up Antiplatelet and anticoagulation regimen Imaging surveillance Outcomes and patency Pediatric considerations

### **IREE-85 Extra Abdominal Desmoid Tumors and Image Guided Percutaneous Cryoablation**

Participants

Roberto Luigi Cazzato, Strasbourg, France (*Presenter*) Proctor, Medtronic plc

#### **TEACHING POINTS**

- Unique anatomy and pathophysiology of extra-abdominal desmoid tumors- Treatment planning including image and clinical evaluation- Procedural techniques of image guided percutaneous cryoablation- Adjunctive techniques including thermoprotection- Necessary clinical and imaging follow-up after treatment - Treatment guidelines for extra abdominal desmoids and the role of ablation

#### **TABLE OF CONTENTS/OUTLINE**

- Sporadic vs familial desmoid tumors- Rationale for using cryoablation to treat extra-abdominal desmoid tumors- Selection criteria for proposing cryoablation of extra-abdominal desmoid tumors- Follow-up

### **IREE-86 Minimally Invasive Treatment of Postoperative Pancreatic Fistula Using Interventional Radiology**

#### **TEACHING POINTS**

Although the incidence of surgical complications has gradually decreased with the advancement of minimally invasive surgical techniques and instruments, such as laparoscopic surgery and robot-assisted technology, postoperative pancreatic fistula remains a severe complication requiring prompt management. Percutaneous and endoscopic postoperative management has a lower mortality rate than surgical methods, and expectations for interventional radiology (IR) are increasing. Therefore, it is necessary to understand the etiology, diagnosis, and indications of postoperative pancreatic fistula and be familiar with appropriate IR intervention methods. Knowledge of technical tips in treatment is essential for successful procedures. The aims of this presentation are as follows: To explain the etiology, diagnosis, indications, and imaging features of postoperative pancreatic fistula. To discuss the treatment methods, management strategies, advancements, and complications in interventional radiology for postoperative pancreatic fistula, including techniques.

#### **TABLE OF CONTENTS/OUTLINE**

1. Introduction. 2. Overview Etiology, Diagnostic Criteria, and Treatment Indications for Postoperative Pancreatic Fistula Management Strategies for Postoperative Pancreatic Fistula 3. Illustrated Case Studies Management of Pancreatic Fistula after Pancreaticoduodenectomy Management of pancreatic fistula after combined resection of the body and tail of the pancreas Management of Pancreatic Fistula after Gastric Surgery Complications and Difficult Cases 4. Conclusion

### **IREE-9 Acute Massive Hematochezia Due to Colonic Varix: Antegrade Transsplenic Embolization of Abdominal**

## Garland Vein

### TEACHING POINTS

In patients with cirrhosis of liver, acute variceal bleeding can be a fatal complication. Varices may develop anywhere in GIT, in cirrhotic patient. Ectopic varices, are not so common, accounting less than 5% of all variceal bleeding. Among these, colonic varices are very rare. Here, in this report, we emphasize the role of endovascular intervention in the management of acute massively bleeding colonic varix in a hemodynamically unstable cirrhotic patient.

### TABLE OF CONTENTS/OUTLINE

In patients with cirrhosis of liver, acute variceal bleeding can be a fatal complication. Colonic varices are very rare cause of lower gastrointestinal bleeding that can bleed spontaneously and result in massive haemorrhage in patients with liver cirrhosis and portal hypertension. Here we present a case of 50-year-Male, known case of non-alcoholic cirrhosis of liver with portal hypertension (for past 15 years) and type 2 diabetes mellitus, who presented with massive fresh bleeding per rectum. Despite early colonoscopy and glue injection of the colonic varix, patient continued to bleed. Triple phase CT scan of abdomen was done which showed large portosystemic shunt (mesocaval shunt) arising from superior mesenteric vein (SMV) traversing around the ascending colon and forming sub mucosal varices protruding into the colon lumen and joining the right renal vein and draining into the inferior vena cava (IVC) giving a garland appearance. He underwent successful transsplenic antegrade obliteration of the varix by coil embolization and glue injection. There are no clear-cut established management guidelines for such patients. Endovascular embolization could be an effective treatment option of colonic variceal bleeding.

IREE-1

### Pre-operative Osseous Tumor Embolization: A Review of Presentation, Benefits, and Technical Details

#### Participants

Ashini Patel, MBA, BS, Davie, FL (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Preoperative tumor embolization is a safe and effective adjunctive to tumor resection that has benefits including decreased estimated blood loss, and less complications. 2. There are only few contraindications to pre-operative embolizations, and most patients that undergo the procedure will benefit for later tumor resection.3. Importance of tumor feeding arteries.4. It is valuable to consider all patients with suspected hypervascular osseous for preoperative tumor angiography and embolization.

#### TABLE OF CONTENTS/OUTLINE

1. A review on osseous tumors, their typical management and and how preoperative embolization can improve outcomes.2. Selection of patients that would benefit from this procedure before tumor resection.3. Review of example cases outlining the technical details of the embolization procedure,to include devices used and the importance of tumor feeding arteries.4. Analyze the efficacy and safety of pre-operative embolization and its value in decreased estimated blood loss and transfusion need, and complications. Compare this data to surgical resection without embolization.

IREE-10

### To Sclerose or Decompress? Comparing BRTO and TIPS for Gastric Variceal Management

#### TEACHING POINTS

Objectives\* Understand gastric variceal (GV) anatomy\* Identify indications and contraindications for BRTO and TIPS\* List conventional and alternative procedure steps\* Recognize common and rare intra- and post-procedural complications

#### TABLE OF CONTENTS/OUTLINE

Outline:1. Introduction (epidemiology, mortality)2. Anatomy:\* Location (GOV and IGV classification)\* Afferent/efferent anatomy (Kiyosue classification)\* Uphill/downhill drainage patterns3. Indications:\* Variceal bleeding (active or prophylaxis)\* BRTO: HCC, refractory HE, preserving liver function\* TIPS: Portal HTN with  $\geq 12$  mmHg4. Contraindications:\* BRTO: Portal/splenic vein thrombosis, refractory ascites, uncontrolled EV, absent gastrosplenic shunt, severe portal HTN\* TIPS: HE, Child-Pugh C, CHF, pulmonary HTN, cystic liver disease5. Procedural Steps:\* BRTO (including both conventional approaches as well as modified approaches, including CARTO and PARTO)\* TIPS (including CO<sub>2</sub> venography, portography, various vascular approaches, and embolization)6. Complications:BRTO:\* Intra-procedural: sclerosant extravasation, balloon rupture, premature balloon deflation\* Post-procedural: ARF, hemolysis, cardiogenic shock, pulmonary edema, DIC, PE, portal/splenic/renal vein thrombosis, adrenal infarctTIPS:\* Intra-procedural: Liver capsule/parenchyma/biliary injury, PV rupture, arrhythmias\* Post-procedural: HE, hepatic failure, TIPS migration/dysfunction, infection

### Microwave Ablation of the Liver Lesions in Critical Locations: Are there No-No Zones

#### Participants

Merve Ozen, MD, Lexington, KY (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Thermal ablation is the mainstay of treatment for small hepatic tumors (<2 cm). Thermal ablation may not be preferred in these patients if the tumors are in high-risk locations, however. These high-risk locations include, but are not limited to, tumors adjacent to the main portal vein, the inferior vena cava, the gall bladder, the diaphragm, and the heart. 2. By discussing the literature and showing cases of successful microwave ablation of tumors in high-risk locations, we show that MWA can be a safe and effective.

#### TABLE OF CONTENTS/OUTLINE

1. The major differences between radiofrequency ablation and microwave ablation as it pertains to the management of malignancy. 2. Cases of microwave ablation of tumors in high-risk locations and a discussion of the current literature on the safety and efficacy of such procedures. 3. The cases display the ablation of tumors adjacent to the main portal vein, the inferior vena cava, the gall bladder, the diaphragm, and the heart. 4. Technical maneuvers will be described to increase safety and efficacy for the difficult lesions.

Printed on: 04/12/24

### **Ablation vs Free Life. Colorectal Cancer with Lung Metastases: Evaluation of Local Recurrence and Chemotherapy-free Interval in Patients Treated with Ablative Therapy**

#### **Participants**

Pedro L. Lino, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

To discuss percutaneous ablation and its role as a safe and effective treatment option for colorectal cancer lung metastases, and the benefits of its minimally invasive nature. To determine patient selection characteristics, preprocedural planning, and tactics involved in a safe and successful outcome, particularly in challenging cases. To examine the impact of ablation (RFA and MWA) on overall survival and chemotherapy-free interval in patients with lung metastases from colorectal cancer.

#### **TABLE OF CONTENTS/OUTLINE**

1.Introduction and epidemiology 2.Procedure applied anatomy 3.RFA treatment techniques a.Patient positioning; b.Tactical pneumothorax; c.Leverage; d.Hydrodissection. 4.Acute complications 5.Evaluation of disease progression

### Thermal Protection: Heightened Safety for Minimally Invasive Percutaneous Thermal Ablation of Musculoskeletal Tumors

#### Participants

Anderanik Tomasian, MD, Los Angeles, CA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Over the past two decades, minimally invasive percutaneous image-guided thermal ablations have been progressively incorporated in the management paradigm of patients with musculoskeletal tumors and endorsed by the National Comprehensive Cancer Network and American College of Radiology. The high clinical success rates and durability of therapeutic effects of such interventions to achieve local tumor control, pain palliation, and cure have been documented in the recent literature. Therefore, safety of musculoskeletal thermal ablations is critical and must be ensured by radiologists in care of patients with bone tumors for improved patient outcomes. To enhance safety and minimize undesired thermal injury to surrounding vital tissues as a result of non-target ablation, several thermal protection strategies have been successfully implemented in clinical practice.

#### TABLE OF CONTENTS/OUTLINE

- General considerations
- Neuroanatomic considerations
- Tissues at risk (Spinal cord, spinal and peripheral nerves, torso organs, articular cartilage, subchondral bone plate/physis, skin)
- Thermal protection techniques (Indications and Choice of technique)
- Passive thermal protection (Patient Biofeedback and Clinical Assessment, Temperature Monitoring strategies, Neurophysiological Monitoring with somatosensory and motor-evoked potentials, Electrostimulation)
- Active thermal protection (Thermal Insulation strategies, Thermal Modification techniques)
- Thermal Injuries/Complications and their management

IREE-14

### The Rise of Robotics in Interventional Radiology

#### TEACHING POINTS

- The use of robotics in interventional radiology is an emerging trend following medical technology and engineering developments in recent years.
- Robotic-assisted interventional radiology is beginning to play a key role in cardiac and neurovascular interventions and expanding rapidly.
- Endovascular robotic systems can help facilitate precise and stable catheter navigation while reducing radiation exposure during procedures.

#### TABLE OF CONTENTS/OUTLINE

1. Overview of the history and timeline of robotics in interventional radiology.
2. Introduction and summary of robotic systems and their advantages and disadvantages.
3. Key studies demonstrating the role of robotics for endovascular interventions.
4. Telerobotics in interventional radiology and its roles and limitations.
5. Future prospects for robotic-assisted interventional radiology.

### How to Perform a Correct Access for Minimally Invasive Lumbar Spine Procedures

#### Participants

Natalia Parra, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Fluoroscopy guided interventions in lumbar spine involve a variety of minimally invasive procedures for improving pain management. Three of the main approaches typically used to get access to the targeted structure are transforaminal, interlaminar and transpedicular. The aim of the proposed exhibit is to provide radiology residents and fellows with a quick guide to better understand the basics of these techniques and thus be able to perform a safer and more effective access. At the outset, the exhibit will list the different types of procedures enabled by the abovementioned approaches. Following, it will provide a pictorial review of the anatomical keys in preprocedural imaging studies. Finally, the exhibit will explain how to perform the approaches step-by-step, from the positioning of the angiograph and the anatomical references to the needle insertion, and will conclude by describing how to check its correct positioning.

#### TABLE OF CONTENTS/OUTLINE

1. Types of procedures and related approaches. 2. Imaging studies: what to look at and how to do it.3. Angiograph positioning and anatomical references.4. How to perform and correct the approaches in real time.5. How to check the positioning of the needle.

Printed on: 04/12/24

IREE-16

### Percutaneous Cryoablation: A Comprehensive Review of Whole-body Application

#### TEACHING POINTS

1) Percutaneous cryoablation is a minimally invasive procedure that is safe and effective in treating various solid benign and malignant lesions throughout the human body. 2) Imaging and tissue diagnosis is necessary before ablation to ensure that cryoablation is the most appropriate modality of treatment. 3) Percutaneous cryoablation can be performed with ultrasound, fluoroscopy, computed tomography, or magnetic resonance imaging guidance. Knowing the risks and benefits of each modality is important for choosing the best modality for individual patient lesions. 4) Cryoshock is a feared clinical syndrome after cryoablation for which early diagnosis and management is crucial. 5) Abscopal effect is a unique effect of cryoablation based on immune-mediated post-ablation antigen presentation.

#### TABLE OF CONTENTS/OUTLINE

1) Mechanism of action and physics of cryoablation leading to induction of cellular apoptosis and the understanding of ablation artifacts. 2) Indications and contraindications, diagnostic workup, and imaging diagnosis for lesions amenable to cryoablation. 3) Procedural protocols for the management of lung/kidney solid tumors, metastasis, bone and soft tissue solid/cystic lesions, nerve pain, and vascular malformations. 4) Adverse effects of cryoablation including cryoshock and the mitigation of these effects. 5) Abscopal effect and future directions for the use of cryoablation to prevent lesion recurrence and treat metastatic disease.

### **The Need for Virtual Fluoroscopic Imaging in Bronchial Artery Embolization: The Best for Radiation Exposure Dose Reduction**

#### **Participants**

Yoshihiro Tanaka, BA, Ibaraki, Japan (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

In this study, we investigated the relationship between supporting images of a new concept and exposure reduction in bronchial artery embolization <BAE>. This is research on exposure reduction aimed at shortening the procedure time by creating a support image similar to the IR image using CT volume data, in contrast to the existing exposure protection and exposure reduction mechanisms of IR equipment.

#### **TABLE OF CONTENTS/OUTLINE**

A virtual fluoroscopic image <VFI> is a Ray-summation image that is similar to a fluoroscopic image, and blood vessel running and the lesioned part are superimposed and displayed (Fig.1). Thereby it possible to use information intuitively alongside fluoroscopic images, and to avoid unnecessary mapping imaging for bronchial artery identification and time waste due to blind catheterization under fluoroscopy, aiming at rapid vascular selection and hemostasis (Fig.2,3). Also, a workstation can be easily installed and implemented, and the CT volume data obtained in advance is used so that there is no need to purchase new and expensive IR equipment. As a result, the number of angiographies required for dissection can be minimized, which not only reduces the amount of contrast agent and exposure, but also reduces complications by shortening the procedure time (Table1,2).

### 2022 Barcelona Clinic Liver Cancer Update for the Interventional Radiologist

#### TEACHING POINTS

1) Understand the updates to the 2022 Barcelona Clinic Liver Cancer (BCLC) guidelines for managing patients with hepatocellular carcinoma (HCC) 2) Review supporting evidence for transarterial chemoembolization (TACE) and percutaneous ablation 3) Highlight recent evidence surrounding transarterial radioembolization (TARE) that warranted its inclusion in the new guidelines 4) Discuss the new systemic agents included in the 2022 BCLC guidelines and their supporting evidence

#### TABLE OF CONTENTS/OUTLINE

1) Introduction, including epidemiology of HCC and interventional radiology (IR) management options in the previous BCLC guidelines 2) BCLC framework for classifying HCC 3) Review of existing literature on TACE and percutaneous ablation for patients with HCC 4) Overview of updates in the 2022 BCLC guidelines for IRs: Sub-division of Intermediate Stage (Stage B) patients, extending the existing liver transplant criterion to include more patients and include systemic options for other patients at this stage 5) Overview of updates in the 2022 BCLC guidelines for IRs: Inclusion of TARE for the first time in the guidelines, with a review of new, high impact studies leading to the inclusion of TARE 6) Overview of updates in the 2022 BCLC guidelines for IRs: New systemic agents for patients with advanced stage disease, including a review of high impact studies leading to the addition of the new systemic agents in the guidelines 7) Discussion of combination therapies for HCC such as TACE + systemic therapy, TARE + systemic therapy, TACE + percutaneous ablation, and percutaneous ablation combined with adjuvant systemic therapy 8) Conclusion and summary

### Shoot Your Shot: Techniques and Pitfalls of Pelvic Collection Drainage

#### Participants

Kateryna Burlak, MBBS, Melbourne, Australia (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Most pelvic collections can be drained safely and effectively through a percutaneous image-guided approach. Collections in locations that are difficult to access pose a unique challenge and invite consideration of alternative approaches. We aim to discuss the techniques and pitfalls of these approaches, to encourage drainage of collections initially considered difficult or inaccessible and to raise awareness about potential complications. Teaching points of this exhibit include the following: 1 - To review the methods and anatomy of potential approaches involved in drainage of pelvic collections (including transperineal, transgluteal, transrectal and transvaginal approaches) 2- To demonstrate general techniques used (Trocar vs Seldinger techniques) 3- To discuss potential complications which can occur in drainage of pelvic collections and how to avoid them

#### TABLE OF CONTENTS/OUTLINE

1. Methods and anatomy of potential approaches: Lateral abdominal wall, Anterior abdominal wall, Transgluteal, Transperineal, Transrectal, Transvaginal 2. General techniques used 3. Examples of potential pitfalls and complications 4. Summary and teaching points

### Next Step for Colorectal Liver Metastasis Ablation: Computed Tomography During Hepatic Arteriography Guidance in Percutaneous Thermal Ablation

#### Participants

Jessica A. Marques Silva, MD, Houston, TX (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1) This study aims to show the feasibility and accuracy of using computed tomography during hepatic arteriography (CTHA) as a percutaneous ablation guidance tool for colorectal liver metastasis (CLM) patients. 2) CTHA is performed via a transarterial catheter inserted into the hepatic artery for arterial assessment. It involves dual-phase contrast medium acquisition with specific rates and acquisition delays during a breath hold on expiration. 3) CTHA improves CLM visibility due to high contrast resolution and absence of portal venous system contrast-media deposition. CLMs appear hypoattenuating with a necrotic center and ill-defined enhancing rim visible on the arterial phase. 4) In contrast to its high sensitivity, CTHA specificity for detecting small tumors is often limited by the presence of pseudolesions. Moreover, limitations include potential complications related to sheath and catheter placement, physician's costs and time, and arterial anatomy variants. 5) CTHA enables precise oncologic intervention planning, combined therapies, and intraprocedural treatment response monitoring. Further research is needed to fully evaluate its clinical utility for guiding CLM ablation.

#### TABLE OF CONTENTS/OUTLINE

1) 'Let's Put a Ring on It' - CLM imaging presentation on CTHA; 2) Setting the Target - Image-guiding techniques in percutaneous liver tumor ablation and CTHA protocol; 3) Tips or tricks - Pseudolesions or CLMs? 4) Thinking Outside the Box - Future Perspectives

Printed on: 04/12/24

### Minimally Invasive Thoracic Tumor Treatment and Palliation

#### TEACHING POINTS

Percutaneous ablation is an established safe treatment for primary and metastatic lung tumors. Adjunct intra-procedural maneuvers, such as creation of artificial pleural effusions or pneumothoraces, can permit treatment of tumors adjacent to critical structures. Emerging approaches such as arterial chemoembolization are altering the landscape of intervention for thoracic malignancies. Minimally invasive procedures such as percutaneous tumor localization, thoracic tumor embolization, and image-guided brachytherapy seed implantation can enable multidisciplinary treatment. Palliative interventions, ranging from embolization to shunt implantation, can provide palliation for thoracic oncology patients.

#### TABLE OF CONTENTS/OUTLINE

Tumor treatment  
Percutaneous ablation  
Radiofrequency ablation  
Cryoablation  
Microwave ablation  
Technical considerations during ablation  
Chemoembolization of lung tumors  
Interdisciplinary procedures  
Tumor localization prior to surgical resection  
Preoperative embolization of central thoracic tumors  
Image guided brachytherapy seed implantation  
Palliation  
Glue embolization of bronchopleural fistulas  
Bronchial artery embolization for hemoptysis  
Recurrent pleural effusion management  
Tunneled indwelling pleural catheters  
Denver pleurovenous shunt

### The Effects of Artificial Intelligence and ChatGPT on Interventional Radiology

#### TEACHING POINTS

\*Artificial intelligence (AI) learns from data, and processes it to perform tasks requiring human intelligence\*AI can help create customized treatment plans for patients\*Fluoroscopy systems with AI reduce radiation exposure to make procedures safer\*Pre-operative and intraoperative images integrated by AI, provide more accurate guidance for image-guided procedures\*AI can create virtual angiography, which can be used for education and planning purposes\*ChatGPT can assist radiologists in creating educational and research materials more efficiently

#### TABLE OF CONTENTS/OUTLINE

Artificial intelligence (AI) refers to computational models that use algorithms to process data, learn from it using the output to perform tasks traditionally associated with human intelligence. AI models utilize patient diagnostic images and clinical findings to anticipate procedural outcomes. This enables interventional radiologists to customize treatment plans for each patient beforehand. AI has enabled fluoroscopy systems to substantially decrease radiation exposure to patients and staff. This is evidenced by a significant reduction in median dose area product from 5,708 mGy·cm<sup>2</sup> to 2,178 mGy·cm<sup>2</sup> (P < 0.001). AI can integrate pre-operative 3D with intraoperative 2D images, improving guidance for biopsies and image-guided procedures. This added augmented-reality element enhances the accuracy and safety of interventional procedures. AI employs preoperative imaging to create virtual angiography, which acts as an educational and real-time planning aid for both trainees and seasoned interventionalists. With the advent of chatGPT radiologists can harness AI to aid in the composition of educational and research material.

### Gastrointestinal Tract Tumors: Imaging and Interventional Management of Bleeding

#### Participants

Forrest Linch, MD, Rochester, MN (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Learn mesenteric angiographic anatomy with special attention to anatomical variations and the blood supply to specific portions of the GI tract, which may affect treatment approach. 2. Learn common primary and metastatic etiologies of gastrointestinal tract bleeding requiring intravascular intervention. 3. Understand diagnostic imaging findings and interventional radiologic techniques for managing gastrointestinal tract bleeding

#### TABLE OF CONTENTS/OUTLINE

1. Mesenteric angiography: A) Standard technique and anatomy, B) Normal variant anatomy, C) Blood supply to specific portions of the GI tract; 2. Angiography of gastrointestinal tract malignancies: A) Common pathologies by location, B) Angiographic finding of tumors; 3. Diagnostic imaging of gastrointestinal tract malignancies: A) Modality selection (CT, MRI, NM), B) Expected findings and treatment implications; 4. Intravascular management of bleeding gastrointestinal tract malignancies: A) Indications, contraindications, B) Pre-procedure planning - i) Clinical evaluation, ii) Role of cross-sectional imaging and endoscopy, iii) Anatomic/vascular considerations (arterial supply, collaterals, variants), C) Technique - i) Particle versus coil embolization, ii) Coil embolization for protection of non-target structures, D) Outcomes and complications;

### **Advancing Frontiers in Lung Malignancy Treatment: Unraveling the Potential of Interventional Radiology in the Ablation of Lung Malignancies**

#### **Participants**

Izzet Altun, MD, Baltimore, MD (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Interventional radiology has evolved as a promising modality for the ablation of lung malignancies. Various techniques such as Radiofrequency Ablation (RFA), Microwave Ablation (MWA), and Cryoablation are extensively utilized, each with unique benefits and limitations. The choice of technique is determined by factors such as lesion size, location, and patient condition. These image-guided percutaneous ablation techniques are particularly advantageous for patients unsuitable for surgery or stereotactic radiation therapy. Future directions point towards refining these techniques, improving patient selection criteria, and integrating these modalities with novel systemic and loco-regional therapies for comprehensive patient care.

#### **TABLE OF CONTENTS/OUTLINE**

The report provides an overview of image guided ablation of lung malignancies. The goal is to present mechanism, advantages, and limitations of RFA, MWA, cryoablation and other less common techniques such as laser ablation. Discussion on patient selection, pre and post-procedural evaluation for lung ablation will be presented. Outline: 1- Introduction to IR in lung ablation, highlighting the scope of RFA, MWA, and cryoablation. 2- Detailed exploration of ablative techniques, focusing on mechanisms, optimal application, and potential drawbacks. 3- Examination of patient selection criteria, pre and post-procedural evaluation, and contraindications. 4- Analysis of the anesthesia management, CT protocols, and periprocedural considerations for lung ablation. 5- Discussion on the current state of research and future directions, emphasizing the potential for improved techniques and integrative treatment approaches. 6- Conclusion

### Creating Transvenous Intrahepatic Portosystemic Shunts (TIPS) with the Aid of Ultrasound (US): Tips for US

#### TEACHING POINTS

Learning Objectives Review standard steps for conventional TIPS creation. Provide steps and tips for using intracardiac echography (ICE) catheters and transabdominal ultrasound for aiding in TIPS creation. Discuss advantages and disadvantages of the various equipment used for TIPS creation and when to consider each.

#### TABLE OF CONTENTS/OUTLINE

Content/Outline Introduction Review steps for performing TIPS creation using fluoroscopic guidance Review cross sectional imaging to aid in procedure planning Demonstrate indirect portography and limitations. Demonstrate each of the key steps for creating a TIPS. Review ICE catheter setup Jugular vs Femoral approach Tips for orienting user to key anatomy and needle directing Tips to improve efficiency Review Transabdominal US set up Tips for orienting user to key anatomy and needle directing Tips to improve efficiency Discuss advantages and disadvantages each approach Unique cases best managed by each guidance modality Prevention of complications by each guidance modality Cost accessibility of each guidance modality While TIPS procedures are most commonly done using conventional fluoroscopy guidance, ultrasound may be used in conjunction with benefit. This presentation reviews guidance modalities for TIPS creation focusing on key imaging and circumstances favorable and unfavorable to each guidance modality.

### The ABCs of CT-guided Lung Biopsy: Tips and Tricks for Optimal Outcomes

#### Participants

Miriana Mariussi, MD, Pilar, Argentina (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The purpose of this exhibit is to: • Review the indications for the percutaneous CT-Guided lung biopsy • Comprehend the pre-procedural imaging analysis and planning • Assess the principles of the percutaneous biopsy techniques and co-axial techniques • Knowledge the common complications after the procedures and their management • Highlight the recommendations to avoid pneumothorax and other complications • Recognize common CT image findings observed in the post-procedural follow-up

#### TABLE OF CONTENTS/OUTLINE

Percutaneous biopsy of lung lesions is increasing due to the rise of cancer incidence and the growing need for molecular and immunohistologic analyses. The size of the lesion, the size of the biopsy needle and the chosen technique have a direct impact on the success of the procedure. A case based pictorial essay allows for a comprehensive assessment of: • Indications and patient selection for percutaneous CT-Guided lung biopsy • Establishing a concise pre-procedural imaging analysis and planning • Percutaneous technique and co-axial techniques • Needle positioning, trajectory and lesion sampling • Recognizing expected complications after the procedure • Strategies and tips for achieving a successful outcome • Reducing the risk of pneumothorax and other complications • Highlighting important post-procedural management steps • Understanding biopsy results and follow up

IREE-28

### CT Guided Trans-osseous Biopsy, a Road Less Traveled: A review of Indications, Technical Aspects and Literature Summary

#### TEACHING POINTS

CT guided transosseous biopsy is an alternative technique for lesions blocked by vital structures or apparently directly inaccessible. Coaxial technique is essential in transosseous biopsy, as it allows taking various samples through a secure access diminishing the number of skin punctures and risks of tumor seeding. The success of these procedures depends on the knowledge of regional anatomy, a correct planning and experience of the operator.

#### TABLE OF CONTENTS/OUTLINE

Introduction: Usually when performing an image guided percutaneous biopsy, the access is selected using the shortest path, avoiding vessels, nerves, or organs. Sometimes, this is not possible and more aggressive procedures, such as surgery, are required. A transosseous access can be used as an alternative approach to tackle this setback and sample deep and challenging targets. Furthermore, CT guided transosseous biopsies can be performed in order to reduce complication risks. Approaches: -Trans-sternal: lesions in anterior mediastinum. -Trans-rib: for pleural-based lung lesions or immediately deep to a rib -Trans-scapular: for apical lung lesions abutting superior margin of major fissure. -Trans-vertebral: for lesions anterior to the vertebral body, aortocaval lymph nodes. -Trans-iliac, pubic or sacral for internal iliac lymph nodes, other deep pelvic nodes in patients with pelvic malignancy or presacral lesions. Technical considerations. Complications. Take home messages

### Multiple Cavitory Lung Lesions on CT: Biopsy Approach, Accuracy and Safety

#### Participants

Juan Wang, Beijing, China (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Understand the different biopsy approaches available for multiple cavitory lung lesions on CT, including transthoracic needle biopsy, bronchoscopy, and surgical biopsy, and their relative advantages and disadvantages.2. Learn how to assess the accuracy of biopsy results, including sensitivity, specificity, and positive predictive value.3. Become familiar with the potential complications associated with each biopsy approach, such as pneumothorax, bleeding, and infection, and how to manage them.4. Appreciate the role of image guidance in improving the accuracy and safety of biopsy procedures for multiple cavitory lung lesions on CT.5. Understand the importance of multidisciplinary collaboration among radiologists, pulmonologists, and thoracic surgeons in developing a biopsy strategy.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction: This section will provide an overview of multiple cavitory lung lesions and the importance of accurate diagnosis and treatment.2. Biopsy approaches: This section will discuss the different biopsy approaches for multiple cavitory lung lesions, including CT-guided biopsy, bronchoscopy, and surgical biopsy.3. Accuracy of biopsy: This section will focus on the accuracy of biopsy for multiple cavitory lung lesions. It will discuss factors that can affect the accuracy of biopsy, such as lesion size, location, and underlying pathology.4. Safety of biopsy: This section will review the safety of biopsy for multiple cavitory lung lesions. It will discuss potential complications associated with each biopsy approach, such as bleeding, pneumothorax, and infection.5. Conclusion: This section will summarize the key takeaways from the education exhibit.

### Sticky Situations: Expanding the Role of Glue in Trauma

#### TEACHING POINTS

Discuss the properties of liquid embolic (glue); Characterize ideal uses for glue in traumatic injuries; Use cases to review diagnostic trauma CT findings, angiographic correlates and post glue embolization appearances; Review potential complications and pitfalls of glue embolization.

#### TABLE OF CONTENTS/OUTLINE

Outline: Introduction; Review of traumatic injuries and ideal cases for liquid embolics; Properties of glue (N-butyl cyanoacrylate), how to prepare, mixtures and delivery techniques; CT findings before and after glue embolization and how to differentiate from evolving injuries; Case presentations: Pseudoaneurysms (Spleen, Liver, Renal, Pelvis, Extremity), Active Extravasation (Spleen, Liver, Pelvis), and Traumatic AV Fistulas; Complications of glue embolization (non-target embolization, portal vein embolization, pulmonary emboli, skin injury) and how to prevent them. Conclusion: Glue is a versatile embolic which can be safely deployed in traumatic intervention. As glue becomes more frequently used, an understanding of expected post embolization changes is necessary to minimize erroneous reporting.

### Thoracic Vent for Management of Pneumothorax: Review of Technique and Comparison to Conventional Thoracostomy

#### Participants

Latika Baranga, MD, Brooklyn, NY (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Incidence of pneumothorax in patients undergoing transthoracic needle biopsy reported varying from 9-54%. Current treatment options include observation/conservative, simple aspiration, thoracostomy tube placement, ambulatory management with Thoracic vent placement or thoracostomy tube with or without Heimlich valve. Here we describe Thoracic vent device as an alternative to chest tube for iatrogenic pneumothorax. It is a simple one-piece device made of polyurethane catheter connected to a plastic chamber containing a one-way valve and comes with an adhesive tape to secure it. It does not require suture or additional securing devices nor additional tubing or bag/container attachments enabling early mobilization and outpatient monitoring. It's simple design without attachment makes it easier and safer to manage as an outpatient compared to thoracostomy with or without a Heimlich valve.

#### TABLE OF CONTENTS/OUTLINE

1. Brief introduction discussing epidemiology, and treatment options for management of pneumothorax including technique such as thoracostomy tube with Heimlich valve and Thoracic vent. 2. Description of Thoracic vent device components, mechanism of action, placement technique. 3. and 4. Case describing steps of CT guided Thoracic vent placement, and follow up imaging. Appearance of the device on chest radiograph is demonstrated to assist in recognition of the device by diagnostic radiologist. 5. Comparison of Thoracic vent with conventional thoracostomy with and without Heimlich valve.

### **Look Before You Leap: Anatomical and Technical Considerations of Image-guided C2 Dorsal Root Ganglion Ablation and C1-C2 Lateral Joint Injections**

#### **Participants**

Bahram Mohajer, MD,MPH, Baltimore, MD (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

i. Discuss the cervicogenic headache as the primary indication of Image-guided C2 dorsal root ganglion (DRG) ablation and C1-C2 lateral joint injections. ii. Review the general anatomy of C2 DRG and C1-C2 lateral articulation and notable anatomical structures. iii. Illustrate CT-guided C2 DRG ablation technique and considerations. iv. Illustrate Computed Tomography and Fluoroscopic-guided C1-C2 lateral articulation injection techniques and considerations.

#### **TABLE OF CONTENTS/OUTLINE**

i. Cervicogenic headache (1. Presentation 2. Prevalence and efficacy of intra-articular injections). 3. General anatomy of the C2 DRG and C1-C2 lateral articulation. 4. Degenerative arthritis of C1-C2 lateral articulation presentation on STIR MRI (a) and CT (b). ii. Important anatomical proximities of C2 DRG and lateral atlanto-axial joints (1. Vertebral artery 2. Thecal sac 3. C2 ventral ramus). iii. CT-guided C2 DRG ablation procedure, technique, and considerations (1. Patient positioning, 2. Trajectory selection, 3. Needle insertion, contrast administration, and ablation). iv. CT-guided intra-articular injection, technique, and considerations (1. Patient positioning, 2. Trajectory selection, 3. Needle insertion, contrast administration, and injection). v. Fluoroscopy-guided procedure, technique, and considerations (1. Trajectory selection, 2. Needle insertion, contrast administration, and injection).

### Utility Of Spectral CT During Percutaneous Thermal Ablation

#### Participants

Ahmad Parvinian, MD, Rochester, MN (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The purpose of this exhibit is to demonstrate the utility of spectral CT for interventional ablation procedures. Recently, an interventional suite was developed which combined a dual-layer detector spectral CT scanner on rails with an image guided-therapy system (Spectral Angio CT, Philips Healthcare). In this exhibit, case examples will highlight use cases for spectral CT in procedure planning, probe placement, iceball visualization, and post-ablation assessment. Teaching points include: (1) technical background on spectral CT, (2) clinical background on minimally invasive ablations, and (3) overcoming interventional challenges with spectral CT.

#### TABLE OF CONTENTS/OUTLINE

1. Title page: Utility Of Spectral CT During Percutaneous Thermal Ablation. 2. Teaching points: Technical background, clinical background, and overcoming interventional challenges. 3. Interventional ablations clinical background: Procedure planning, probe placement, treatment monitoring, and post-ablation assessment. 4. Background on spectral CT for interventions: Dual-layer spectral detector technology, visualization modes for spectral imaging, and spectral CT on rails for interventions. 5. Case examples: (A.) Procedure planning with low MonoE for lesion visualization. (B.) Probe placement with high MonoE to reduce needle artifact. (C.) Treatment monitoring with z-effective and low MonoE. (D.) Bone ablations with bone removal. (E.) Post-ablation assessment with low MonoE to reduce contrast dose. 6. Conclusions

### Transperineal Ultrasound-Guided Prostate Biopsy: Why and How

#### Participants

Izabel Karam, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The purposes of this exhibit are: Review different prostatic biopsies approaches, emphasizing the transperineal technique and its peculiarities. Illustrate with cases different applications of the technique (systematic biopsy, cognitive guidance and MR imaging fusion). Identifying the radiological features of common postprocedural complications

#### TABLE OF CONTENTS/OUTLINE

Prostate cancer: epidemiology and imaging findings; Indications and patient selection for prostate biopsy; Different biopsy approaches and its characteristics; Technique steps; Illustrative cases of different applications of the transperineal prostate biopsy technique; Understanding and managing common complications post-procedure; Recognizing common image findings observed after the procedure; Interpreting biopsy outcomes and ensuring proper follow-up.

### Too Hot to Handle?" Non-worrisome Extrahepatic Localization of 99mTc MAA and Yttrium-90 During Planning and Radioembolization Procedures

#### Participants

Merve Ozen, MD, Lexington, KY (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. In the work-up of patients for Y-90 radioembolization of hepatic tumors, it is often revealed that 99mTc-macroaggregated albumin (MAA) has accumulated in extrahepatic organs and blood vessels. While substantial Y-90 localization in some extrahepatic sites, such as the lungs, is an absolute contraindication for treatment, other sites do not have strict guidelines.2. We show the safe, complication-free administration of Y-90 to five patients with off-target uptake in each the following locations: a persistent falciform artery, the gall bladder, a portal vein tumor thrombus, a perihepatic lymph node, and the spleen.3. The literature is consistent with the conclusion that uptake of Y-90 in the falciform artery, the gall bladder, and a tumor thromboses is generally safe and should not be an absolute contraindication to therapy. It has yet to be elucidated whether this is the case for uptake in the spleen and lymph nodes.4. Off-target Y-90 uptake in the spleen may actually be beneficial and help treat/prevent post-radioembolization hypersplenism and thrombocytopenia.

#### TABLE OF CONTENTS/OUTLINE

1. Cases of safe and successful Y-90 therapy to patients with extrahepatic uptake in the extrahepatic following locations2. Along with each case, the current literature regarding the safety of treatment of patients with these off-target uptakes is discussed.

### Contrast Enhanced CT Lymphangiography For Various Lymphatic Disorders

#### Participants

Yura Ahn, MD, Seoul, Korea, Republic Of (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Despite the physiologic and clinical significance of the lymphatic system, lymphatic imaging remains difficult and in the developmental stages. In recent years, MR lymphangiography has enabled the depiction of lymphatic structure, but its widespread use is limited by its inherent limitations: high cost, limited accessibility, contraindications to MR, inability to position change, and inability of bedside needle insertion in MR suite is still obstacles. CT, which is not restricted by these constraints, may be a solution for more accessible lymphatic imaging. We have utilized contrast enhanced CT lymphangiography for characterization of various thoracoabdominal lymphatic diseases and pre-interventional planning. Herein, we introduce our practice of CT lymphangiography. 1. Learn the protocol and technical aspect of contrast-enhanced CT lymphangiography 2. Describe normal lymphatics anatomy with contrast-enhanced CT lymphangiography 3. Learn the characteristics of various thoracoabdominal lymphatic diseases with CT lymphangiography

#### TABLE OF CONTENTS/OUTLINE

1. Protocol 1) Procedure: Inguinal LN cannulation under US guidance 2) CT technique for imaging the central lymphatics 2. Technical aspect of CT lymphangiography 1) Acquisition time and CT dose 2) Comparison with MR lymphangiography 3. Normal anatomy of the central lymphatics 4. Various lymphatic disorders 1) Iatrogenic thoracic duct injury with chylothorax 2) Lymphatic anomaly

### Artificial Intelligence in Interventional Radiology: A Primer for Residents

#### TEACHING POINTS

Artificial Intelligence (AI) has already demonstrated an ability to significantly improve efficiency in diagnostic radiology. There are however, unique challenges which need to be addressed to completely realise the potential of AI in Interventional Radiology (IR). Apart from key issues including data storage, lack of interoperability and non-standard practices, there are significant concerns about legal accountability and potential risks in interventions that prevent AI from being used independently or clinically without the oversight of an expert radiologist. Research and innovation involving AI in IR is limited to few higher centres, thus preventing adequate exposure of AI to Interventional Radiology residents, compared to their Diagnostic Radiology (DR) counterparts. Our Educational Exhibit aims to introduce IR residents and fellows to the vast possibilities of incorporating AI into their regular clinical practice (ranging from decision support and triaging of patients to prognostication and outcome prediction) and also introduce them to various open-source software and modules which can assist them in their day-to-day IR practice.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction 1A. AI in Medical Imaging 1B. Types of Data in DR and IR 2. Unique Challenges in IR 3. Opportunities of AI Implementation 3A. Pre-Procedural Support 3B. Peri-Procedural Support 3C. Post-Procedural Support 4. Established AI algorithms in Interventions 5. Open-Source software and modules 6. Opportunities for AI innovation in IR 7. Can AI Replace Us? 8. The way ahead for an AI-assisted Interventional Radiology practice

### Portosystemic Shunts: A Comprehensive Review

#### Participants

John Walker, MD, PhD, San Antonio, TX (*Presenter*) Speaker, Shionogi & Co, Ltd; Consultant, Shionogi & Co, Ltd

#### TEACHING POINTS

1. To review the development of the portal system and teach normal and variant anatomy. 2. To become familiar with cross sectional and angiographic appearances of both common and uncommon portosystemic shunts. 3. To understand the clinical relevance of portosystemic shunts from congenital to acquired. 4. To demonstrate minimally invasive treatment options for portosystemic shunts.

#### TABLE OF CONTENTS/OUTLINE

1. Review the development of normal portal venous anatomy and subsequently congenital variant anatomy. In addition, understand shared territories with systemic veins that may allow shunts to form 2. Use cross sectional and angiographic images to teach the anatomy of portosystemic shunts to include congenital intra-hepatic and extrahepatic (Abernethy) shunts, as well as common acquired gastroesophageal, splenorenal, paraumbilical shunts and less common acquired mesenteric to retroperitoneal territories and consider surgically altered sites allowing for unique shunts 3. Discuss clinical implications of untreated portosystemic shunt and 4. Explore indications and techniques for treating shunts by type and location, to include discussion on expected sequelae of treating and potential complications.

### Training of Interventional Radiology Procedures Using Virtual Reality: Current Status and Potential Metaverse

#### Participants

Yukiko Honda, MD, Kure, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The COVID-19 pandemic made it difficult to train learners on procedures that involve direct patient contact, such as interventional radiology (IR). For this reason, we developed training materials for learners on endovascular procedures of the abdominal pelvis in IR using virtual reality (VR). Advantages of VR-based IR education include the ability to conduct training at any time, repeated training exercises, no invasiveness to the patients, and no risk of infection to both the patient and the learner. Even after the pandemic, to further develop the good points of VR education, many educators are attempting to apply metaverse to the education of their specialty. Although metaverse education is considered useful in IR education, it is not widely used at present. This educational exhibit will provide a brief overview of simulators available for purchase, benefits of metaverse education, and our VR-based training software, and discuss its advantages, current issues, and future prospects.

#### TABLE OF CONTENTS/OUTLINE

1. Features of the currently commercially available VR simulators of endovascular procedures.
2. Benefits of metaverse education.
3. What is needed to spread metaverse education.
  - a. Three components: hardware, software, and contents,
  - b. High-speed networks,
  - c. Computing technologies: edge computing, and cloud computing,
  - d. Modeling and rendering technologies: Unity or Blender,
  - e. Interaction technologies: Sensors, or real-time tracking,
  - f. Authentication technologies: blockchain,
  - g. Wearable device: head-mounted displays or smart glasses,
  - h. Concerning the learner: learning logging, and analysis.
4. Review of reports on the cases of metaverse education.
5. Future challenges and our approach.

### Interventional Radiology Role in Treating Primary Pancreatic Cancer: Current Treatments and Future Prospects

#### Participants

Fereshteh Khorshidi, MD, Baltimore, MD (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Review primary pancreatic cancer epidemiology, current therapies and prognosis- Review interventional radiology role in diagnosis of pancreatic cancer and palliative care- Review percutaneous and transarterial image-guided treatment options for unresectable primary pancreatic cancer offered by interventional radiology.- Importance of having a multidisciplinary approach and individually tailored treatment plan.

#### TABLE OF CONTENTS/OUTLINE

Primary pancreatic cancer- Prevalence- Significance- Clinical stages- Survival rate- Current therapies for resectable tumors Minimally invasive treatments of unresectable pancreatic cancer, their advantages, effectiveness and complications  
Treatments- Transarterial therapies  
o Regional intra-arterial chemotherapy with double-balloon catheter (RenovoCath)  
• Mechanism of action  
• Safety and efficacy  
• Ongoing Trials  
- Percutaneous ablative therapies:  
o Non-thermal ablation: Irreversible electroporation  
• Mechanism of action  
• Safety and efficacy  
• Ongoing Trials  
Synergetic effect of ablative therapies and immunotherapy; a future prospective  
Cases?. A few cases of ablation?

### Thermoprotective Techniques in Musculoskeletal Ablation

#### Participants

Ahmad Parvinian, MD, Rochester, MN (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The purpose of this exhibit is to provide a case-based review of thermoprotective techniques used during percutaneous thermal ablation of musculoskeletal tumors. The exhibit will demonstrate the basic principles of musculoskeletal ablations performed using ultrasound, CT, fluoroscopic, and MRI guidance, depict the various active and passive thermoprotective techniques that are critical to safe and effective ablation, and provide a framework for recognizing and addressing complications. Teaching points include: (1) clinical background and principles of musculoskeletal ablation, (2) active thermoprotective techniques, (3) passive thermoprotective techniques, (4) complication management.

#### TABLE OF CONTENTS/OUTLINE

1. Title page  
2. Teaching points  
3. Musculoskeletal ablation background  
4. Preprocedural Considerations  
5. Passive thermoprotection- Ablation zone monitoring- Temperature monitoring- Neurophysiologic monitoring  
6. Active thermoprotection- Hydrodisplacement- Pneumodisplacement- Balloon interposition- Probe traction- Internal warming- External warming  
7. Complication recognition and management  
8. Conclusions

Printed on: 04/12/24

### Thyroid Nodule Fine Needle Aspiration: What the Pathologist Wants You to Know

#### TEACHING POINTS

- Fine needle aspiration (FNA) is an optimal diagnostic tool for thyroid nodules because it is cost-effective, safe, and accurate .
- The Bethesda guidelines for thyroid FNA consider that the unsatisfactory rate on cytopathology is of about 10% , however different studies have shown that the unsatisfactory rate can range from 0.4% up to 40% .
- Some of the reasons why FNA results may be inaccurate include:
  1. Sampling error: the sample may not accurately represent the entire nodule.
  2. Inadequate sample size: the sample taken during FNA may be too small to yield accurate results.
  3. Technical error: The accuracy of FNA results can be affected by technical errors, such as improper handling or processing of the tissue sample.
  4. Nodule size: multiple studies have shown that the diagnostic accuracy of FNA is limited in large thyroid nodules.
- The technique of the specimen collection and evaluation and the preparation of the slide can play a decisive role in the diagnostic accuracy therefore it's important for the radiologist to recognize the correct technique.
- The "classic" technique uses three slides and generates two slides for interpretation. A slide to be deposited in fixative, a slide to be air dried , and a spreader slide.
- The two-slide technique has been called the "butterfly" or "book-end" technique. It has the advantage of simplicity and better reproducibility. It produces a relatively uniform and rounded imprint of FNA material for evaluation on two mirror image slides.

#### TABLE OF CONTENTS/OUTLINE

1. Patient selection
2. Equipment needed for thyroid biopsy
3. Patient preparation
4. Needle based sample collection techniques
5. Sample preparation
6. Pathologist recommendations in order to reduce inconclusive results

### Nutcracker Syndrome: Diagnosis and the Role of Minimally Invasive Interventions

#### Participants

Alina Hasanain, MD, Baltimore, MD (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Nutcracker phenomenon is an anatomic condition characterized by extrinsic compression of the left renal vein, causing entrapment, and subsequent diminished outflow to the inferior vena cava. 2. Nutcracker syndrome refers to Nutcracker phenomenon with clinically apparent sequelae, which include hematuria, abdominal pain, and gonadal varices among a variety of other symptoms, the severity of which can depend on the severity of the anatomic findings. 3. The role of interventions, especially minimally invasive interventions such as endovascular treatment, has become more prominent in the treatment of severe Nutcracker syndrome. This exhibit will outline diagnostic methods and management options for Nutcracker syndrome with a focus on endovascular approaches.

#### TABLE OF CONTENTS/OUTLINE

1. Review the pathophysiology of Nutcracker syndrome with anatomic causes and variations. 2. Discuss diagnostic methods: doppler ultrasound, CT, MRI and angiography, venography and intravascular ultrasound. a. Imaging criteria and classification. b. Examples of cases from a single institution. 3. Discuss management options including conservative management and surgical options with an emphasis on endovascular approaches (stenting, coil embolization of varices). a. Advantages over open or laparoscopic interventions. b. Complications and pitfalls. c. Future directions.

Printed on: 04/12/24

IREE-43

### Managing Hemoptysis from Diagnosis to the Angio Suite: A How-to Guide for the Radiologist

#### TEACHING POINTS

Hemoptysis is the airway bleeding, ranging from blood-tinged mucus to gross hemorrhage: when massive -almost defined as a >300mL/24h bleeding- it is a life-threatening and challenging condition. Angiography with embolization is the front-line therapy for emergent cases of hemoptysis. The aim of this study is to give a concise guide to the diagnostic and interventional management of hemoptysis in the angiography suite.

#### TABLE OF CONTENTS/OUTLINE

Hemoptysis generally arises from the bronchial arteries (BAs,~90%) and encompasses infectious, inflammatory and malignant causes, being tuberculosis the most common worldwide. After airway securing, underlying conditions and laterality must be assessed: CT angiogram -eventually along with bronchoscopy- is a useful tool to review and report origin (orthotopic/ectopic), course and morphology of BAs or to identify nonbronchial systemic/pulmonary bleeding source. On conventional bronchial arteriograms, selective catheterization of BAs origins is mandatory, while the anterior spinal artery and its medullary branches must be identified in order to avoid iatrogenic transverse myelitis or paralysis, the major complications. Hypertrophied vessels, parenchymal hyperemia, blushing or pseudoaneurysm suggest bleed source. For BAs, embolic particles (350-700microm) are usually preferred, while coils and plugs preclude reintervention if hemoptysis recurs and are thus limited to bronchial aneurysms and pulmonary arteries embolization. Recurrence rates range from 10 to 58% and increase over time and in certain diseases (e.g. cystic fibrosis).

IREE-44

### Abernethy Malformations: Making Sense of Congenital Portosystemic Shunts

#### TEACHING POINTS

Abernethy malformation, or congenital portosystemic shunt, is a rare abnormality of the portal venous system. The portal vein either fails to form or forms abnormally, resulting in an anomalous shunt that diverts blood from the portal vein to the systemic circulation without passing through the liver. The clinical manifestations of Abernethy malformation can vary depending on the severity and location of the shunt, and may include encephalopathy, portal hypertension, and liver failure. Abernethy malformation can be detected via ultrasound, computed tomography (CT), or magnetic resonance imaging (MRI). Patients with Abernethy malformation are at risk for liver lesions, thus particular attention must be paid to the liver parenchyma. The orientation and size of the shunt can be confirmed via catheter-directed angiography and balloon occlusion. Treatment options for Abernethy malformation include interventional or surgical shunt closure, liver transplantation, or conservative medical management of symptoms. The choice of treatment depends on the severity of the malformation and the patient's clinical condition.

#### TABLE OF CONTENTS/OUTLINE

(1) Introduction: Overview of Abernethy malformation (2) Clinical presentation: Signs and symptoms (3) Imaging: Detection, associated findings, characterization, and confirmation (4) Treatment: To close or not to close?

### Sharp Recanalization for Central Venous Occlusive Disease: Advanced Techniques and Evidence-Based Outcomes

#### Participants

John Domini, Columbus, OH (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Define the role of and indications for sharp endovascular recanalization in the management of central venous occlusive disease (CVOD). Examine relevant clinical and vascular anatomy relevant to CVOD. Describe the conventional interventional methods of central venous recanalization. Discuss pertinent procedural techniques, devices, technical challenges, and special considerations of sharp central venous recanalization. Review risks, evidence-based outcomes, complications, and post-procedural care.

#### TABLE OF CONTENTS/OUTLINE

A review of indications and rationale for patient selection will be discussed. Central venous anatomy with marked implications on technical approaches will be examined. Procedural details will review the conventional methods and highlight indications for sharp recanalization and advanced techniques. Technical aspects including equipment choices, procedural techniques, practical pearls and potential pitfalls will be discussed, guided by a case-based review. Interpretation of clinical results, evidence-based outcomes will also be reviewed with a focus on complications, risks and post-procedural care.

### Vasculitis: Clinical Evaluation, Imaging, and Treatment

#### Participants

Kausthubh Hegde, MBBS, Boston, MA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Review the definition and types of Vasculitis. 2. Discuss the signs, symptoms, and clinical evaluation of the most common types of Vasculitis. 3. Diagnosis with an emphasis on the role of imaging in diagnosing Vasculitis. 4. Case-based examples of IR treatment options and follow-up care.

#### TABLE OF CONTENTS/OUTLINE

1. Vasculitis: definition and pathophysiology of the disease. 2. Classification of vasculitis - Lie classification of vasculitis (1994) - 2012 revised International Chapel Hill Consensus Conference nomenclature of vasculitides 3. Review of the signs and symptoms of different types of vasculitis. 4. Role of diagnostic imaging modalities in the evaluation of vasculitis (with case-based examples). 5. Indications and contraindications for endovascular treatment of vasculitis (with case-based examples). 6. Complications and follow-up care after IR procedures.

### Embolization of Extracranial Arteriovenous Malformations: Strategies of Interventional Approaches According to the Yakes Classification

#### TEACHING POINTS

Learn imaging findings associated with arteriovenous malformations (AVM) and present the Yakes classification  
Present briefly the main genetic mutations associated pathways and potential drug therapies  
Understand interventional management of AVM according to the Yakes classification  
Discuss embolization strategies according to the Yakes classification and AVM territory  
Discuss outcomes, follow-up and complications  
Propose a therapeutic algorithm based on the Yakes classification, clinical staging and genotyping

#### TABLE OF CONTENTS/OUTLINE

Overview and classification of AVM according to the Yakes classification  
Clinical and imaging evaluation before procedure  
Presentation of the Shobinger classification and discussion of the relative roles of Doppler ultrasound, CT, MRI, DSA  
Embolization techniques  
Presentation of liquid and mechanical embolizing agents and their use according to the approach (endovascular transarterial approach, direct puncture, retrograde venous approach). The safe use of ethanol and bleomycin will be also discussed  
Treatment techniques according to AVM territory and Yakes classification  
Discuss specific considerations for head and neck, limbs, thoracic, abdominal and pelvic AVMs  
Yakes Type I (transarterial, transvenous, coils, plug)  
Yakes Type II (transarterial, direct puncture, retrograde venous, liquid agent)  
Yakes IIIa (transvenous, coils, plug ± liquid agents)  
Yakes IIIb (transarterial, direct puncture, retrograde venous, liquid agent, coils)  
Yakes IV (direct puncture ethanol, interstitial infiltration bleomycin)  
Follow-up and outcomes evaluation  
Clinical and imaging criteria to assess therapeutic response  
Conclusion  
Therapeutic algorithm proposed

### Fluid Solutions for Complex Cases: A Comprehensive Guide to Sclerosant and Liquid Embolic Agents for Radiologists

#### Participants

Keith Ameyaw, MD, New York, NY (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Liquid embolic and sclerosant agents are vital tools in interventional procedures capable of achieving targeted vessel occlusion, space occupation or tissue fibrosis. 2. Understanding the mechanism of action of these agents is essential for optimal use, procedural technique, and informing operator preference. 3. Different agents have unique advantages and complications. Selecting the appropriate agent is critical for optimizing patient outcomes. 4. Radiologists must be intimately familiar with the unique post-procedural imaging characteristics of liquid embolics/sclerosants. These imaging findings play a crucial role in assessing both the success of the procedure and informing follow-up care.

#### TABLE OF CONTENTS/OUTLINE

1. Mechanism of action of sclerosant and liquid embolic agents. 2. Indications for use in several disease entities, including: intracranial and extracranial vascular malformations, lymphatic malformations, tumors, cysts, benign prostatic hyperplasia, venous insufficiency, arterial hemorrhage, portal hypertensive variceal hemorrhage, aortic graft endoleak, lymphatic leak/chylothorax, lymphoceles, post-operative seroma, and gonadal vein embolization. 3. Technique and procedural considerations. 4. Advantages and associated complications of different agents. 5. Imaging findings with descriptions of associated artifacts necessary for appropriately assessing procedural success and informing follow-up care.

### Benefits of Hybrid CT/Angiography Utilization for Microsphere Trans-arterial Radioembolization with Yttrium-90

#### TEACHING POINTS

Hybrid angiography/CT (Angio-CT) employs both traditional CT imaging with concurrent fluoroscopic angiography in the same procedure room. Although introduced prior to cone-beam CT, Angio-CT has been under-utilized due to cost and availability. The resurgence of Angio-CT has proven to be a very useful tool in interventional oncology; however, its application in microsphere trans-arterial radioembolization is not well documented through the literature. Angio-CT shows unique advantages in the image resolution regardless of patient preparation, catheter directed contrast imaging in the planned treatment field to precisely calculate more accurate dosimetry in routine and multifocal lesions, to more accurately characterize lesions and any potential changes in lesions with higher sensitivity and specificity, and to more accurately detect anatomic variants and/or accessory tumor feeding vessels. Lastly, early data suggests Angio-CT systems utilization could improve survival in patients with HCC when performing trans-arterial therapy, likely due to more accurate and precise pre-treatment and intraprocedural imaging.

#### TABLE OF CONTENTS/OUTLINE

1. What is Angio/CT? 2. Practical points and precision of dosimetry with Angio/CT 3. Unique Advantages in image quality and predicting success 4. Optimal Utility of Each Modality 5. The Unknowns and the Research Potential 6. Case Examples a. Improved detection and characterization b. Anatomic variants potentially unnoticed with cone-beam c. Improving dosimetry accuracy 7. Quantifiable benefit in outcome?

IREE-5

### Advances in Percutaneous Jejunostomy: Novel Techniques and Their Clinical Implications

#### TEACHING POINTS

Percutaneous radiologic jejunostomy (PRJ) is a minimally invasive procedure for patients requiring enteral feeding and access for biliary interventions, especially in patients who have altered anatomy, such as after gastric resection, gastric bypass surgery, Whipple procedure, or liver transplant. After reviewing this exhibit learners should be able to: 1. Recognize common indications for PRJ. 2. Understand novel techniques to aid in successful PRJ access. 3. Recognize and address complications related to PRJ.

#### TABLE OF CONTENTS/OUTLINE

This exhibit will: 1. Review imaging and anatomical considerations for jejunal access. 2. Discuss common indications, contraindications and patient selection for PRJ. 3. Introduce procedural advancements in PRJ through a case-based approach- Traditional techniques in PRJ- Modified coaxial technique for T fastener deployment through a sheath- Utilizing cone beam CT to ensure proper T fastener placement- Using an orogastric magnetic balloon and ultrasound guidance to assist in complicated cases where traditional methods fail. 4. Address pitfalls and potential complications of PRJ. Summary Clinical Implications: As the number of liver transplants, cholecystectomies and gastric surgeries increase every year, there may be more demand for jejunal access to manage potential complications of these procedures. PRJ can allow for enteral nutrition and access for repeated biliary interventions.

IREE-50

### A Review of Superior Vena Cava Interventions

#### Participants

Jorge Lopera, MD, San Antonio, TX (*Presenter*) Shareholder, Tecnostent SA; Consultant, Merit Medical Systems, Inc; Research Grant, AngioDynamics, Inc

#### TEACHING POINTS

To review the clinical presentation and treatment options for SVC syndrome. To understand the role of different endovascular techniques to treat stenoses, occlusions and thrombosis of the SVC. To illustrate the challenges when treating SVC stenoses in patients with existing central lines. To discuss the different recanalization techniques to treat complex chronic occlusions of the SVC. To review the different complications with SVC interventions and how to treat them .

#### TABLE OF CONTENTS/OUTLINE

1. Clinical presentations and imaging of central venous and SVC stenoses and occlusions. 2. Review of treatment options in malignant SVC syndrome. 3. Treatment options in SVC syndrome - special situations: a. SVC syndrome with existing ports and dialysis lines. b. SVC syndrome with thrombus c. Endovascular stenting : single or kissing stents. Covered or bare stents. d. Recanalization techniques for complex chronic occlusions. 4. Complications .

### Percutaneously Induced Neuroregeneration for Treatment of Chronic Neuropathic Pain

#### TEACHING POINTS

1) Review the pathophysiology of neuropathic pain and the Sunderland classification of nerve injury. 2) Explain how percutaneous cryoneurolysis can induce regeneration of damaged peripheral nerves causing chronic pain. 3) Demonstrate the ability of percutaneous cryoneurolysis to provide long term relief and neuroregeneration for the treatment of chronic neuropathic pain. 4) Discuss current indications and potential new applications of cryoneurolysis.

#### TABLE OF CONTENTS/OUTLINE

1) Incidence and causes of neuropathic pain. 2) Pathophysiology of nerve injury and chronic peripheral nerve pain. 3) Mechanism of cryoneurolysis and neuroregeneration. 4) Current indications and patient selection. 5) Techniques for cryoneurolysis, including approaches and duration/temperature of ablation. 6) Post-procedure follow-up and outcomes. 7) Case examples of cryoneurolysis for pain relief and neuroregeneration. 8) The pre-operative use of cryoneurolysis to reduce pain caused by other interventions including ablation, embolization, and post-mastectomy pain. 9) Exploring new applications of cryoneurolysis.

### Super Selective Radioembolization for Hepatocellular Carcinoma: Radiation Segmentectomy and Beyond

#### TEACHING POINTS

Radioembolization has emerged as an effective treatment option for hepatocellular carcinoma that cannot be surgically removed. The procedure involves the preferential deposition of radioactive microspheres into the hypervascular tumor through a siphoning effect, typically achieved by injecting the microspheres at the lobar artery level. However, to improve tumor response and minimize potential complications, superselective radioembolization is recommended. The purpose of this exhibit is : (1) To review the rationale behind radiation segmentectomy. (2) To learn when superselective radioembolization is necessary, (3) to offer technical tips for performing superselective radioembolization.

#### TABLE OF CONTENTS/OUTLINE

1) Radiation segmentectomy : rationale and evidence 2) Dosimetry : Practical guide for dosimetry of superselective radioembolization 3) When superselective radioembolization is needed A. small single tumor : radiation segmentectomy B. Large single tumor saddling on both lobes C. Small remnant liver D. Hepatic artery branching at acute angle E. Extrahepatic collateral artery supplying the tumor 4) Technical consideration of superselective radioembolization A. Protection of distal normal liver by using balloon microcatheter and detachable coil B. Combination treatment of lobar and segmental artery C. Combination treatment of 1st and 2nd week dosing of glass microsphere 5) Follow-up imaging after superselective radioembolization A. Early loss of arterial enhancement of the tumor B. Focal radiation necrosis mimicking new hypovascular tumor

### TESLA: The Future in Treatment for Malignant Perihilar Obstruction

#### TEACHING POINTS

In malignant bile duct obstructions the most common treatment in the Netherlands is endoscopic drainage (ERCP) with placing plastic tubes, combined with biliary drainage. Cholangitis due to ERCP occurs often, in 40-60% of the patients, probably caused by colonization of bowel bacteria and infection of undrained segments. Patients often need multiple re-interventions. The 90days mortality after diagnosis is 35%. In the TESLA trial the hypothesis is that primary percutaneous stenting, without placing a biliary drain and without stenting the ampulla of Vater, provides less infectious complications and less reinterventions compared to endoscopic drainage. Ensuring a decrease in morbidity and mortality and improving the quality of life.

#### TABLE OF CONTENTS/OUTLINE

Compare primary percutaneous stenting above the ampulla versus endoscopic drainage for palliative treatment of malignant hilar biliary obstruction in the TESLA study. Primary providing a lower complication rate and furthermore lowering the absolute and relative bilirubin levels, decreasing the number of reinterventions and providing a better quality of life. This abstract provides an overview of the TESLA trial, an education of the interventional procedure and materials and provides the first promising data retrieved from the TESLA trial.

### Advancing Interventional Procedures With Mixed Reality

#### TEACHING POINTS

Introduction: The presentation focuses on Microsoft's HoloLens2 for visualization on an angiography biplane system. The HoloLens2 device is a mixed reality device that uses depth, light, and infrared cameras to track its environment and anchor multiple virtual displays to view ultrasound and fluoroscopy in real-time during image-guided interventions. Teaching Points: • Overview of the HoloLens2 device and its functionalities as they relate to interventional procedures • Demonstrate improvements in customization, decrease visual field discrepancies, and reduce ergonomic challenges associated with the current angiography systems • Evaluation of the image quality, latency, customization capabilities, and overall user experience • Demonstrate functionality like voice, gaze, and gesture controls in the live angiography environment • Case examples of the HoloLens2 integration in image-guided interventions on secondary personnel and primary phantom work

#### TABLE OF CONTENTS/OUTLINE

Outline: The presentation will cover the various teaching points related to HoloLens2 integration into an angiography suite. Attendees will learn how the device facilitates the clinician seeing what they want and where they want. The presentation will conclude with a summary of the promising role the HoloLens2 provides in advancing the clinician experience in interventional radiology and answer the question of why integrating this emerging technology will be beneficial in the clinical environment.

### Percutaneous Cryoneurolysis for Complex Pain: Indications, Technique, and Expectations

#### TEACHING POINTS

1. Review the epidemiology of complex pain syndromes and current need for analgesic adjuncts in pain management  
2. Discuss the mechanisms of how percutaneous cryoneurolysis affects pain  
3. Review the uses and techniques of various procedures including intercostal, ilioinguinal, intercostobrachial, and pudendal nerve cryoneurolysis  
4. Demonstrate successful approaches to complex pain including pathologies involving the rib, hip, arm, and groin  
5. Discuss common complications after percutaneous cryoneurolysis, including their diagnosis and management

#### TABLE OF CONTENTS/OUTLINE

1. Introduction, including epidemiology of complex pain syndromes  
2. Mechanism and physiology behind cryoneurolysis effect on pain  
3. Indication, technique, and successful case of intercostal nerve cryoneurolysis  
4. Indication, technique, and successful case of ilioinguinal nerve cryoneurolysis  
5. Indication, technique, and successful case of intercostobrachial nerve cryoneurolysis  
6. Indication, technique, and successful case of pudendal nerve cryoneurolysis  
7. Recognition and management of common complications  
8. Conclusion and summary

### Ectopic Varices: Anatomic and Hemodynamic Features and Endovascular Techniques

#### TEACHING POINTS

Ectopic varices arise in the hepatopetal or hepatofugal collateral vessels outside the gastro-esophageal region account for up to 5% of variceal bleeding. Various endovascular techniques can be effectively applied based upon their anatomic and hemodynamic features. Duodenal varices (DVs) are the most common type and arise in either hepatopetal collaterals or hepatofugal collaterals. DVs with hepatopetal collaterals are treated by portal vein (PV) stenting and those with hepatofugal collateral are treated by antegrade and/or retrograde obliteration techniques with or without TIPS. Rectal varices (RVs) are common complication in portal hypertension and arise in hepatofugal collaterals from the superior rectal vein to the bilateral internal iliac veins. Antegrade obliteration is often required to eradication of RVs because of their complicated drainage system. TIPS is effective to prevent recurrent bleeding. (Peri)stomal varices (SVs) can develop after ileostomy. SVs are supplied by the ileal veins and drains into the epigastric veins. They are often associated with portal hypertension but also with local hemodynamic abnormality. SVs with refractory bleeding have been treated by direct puncture embolization, antegrade obliteration and TIPS. Choledochal (-jejunal) varices arise in hepatopetal collaterals with extrahepatic PV occlusion often associated with choledocojejunostomy. They are treated by PV stenting with additional endovascular techniques.

#### TABLE OF CONTENTS/OUTLINE

Table of Contents/Outline 1. Basics of ectopic varices and various endovascular techniques 2. Duodenal varices 3. Rectal varices 4. Stomal varices 5. Choledochal (-jejunal) varices 6. Miscellaneous/ infrequent varices

IREE-58

### Buffalo Lung: A Human Complication after Lung Biopsy

#### Participants

Nicole Law, MD, Salt Lake City, UT (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Buffalo lung is a rare occurrence of bilateral pneumothoracies due to an abnormal physical communication between the two pleural spaces. 2. Iatrogenic buffalo lung can occur following intrathoracic procedures such as median sternotomy, laparoscopic surgery and heart-lung transplantation, putting these patients at higher risk for bilateral pneumothoracies during a lung biopsy procedure. 3. Presentation of buffalo chest can be worse than that of unilateral pneumothorax, including severe and sudden onset of dyspnea and pleuritic chest pain, tachycardia, hypotension, and even cardiac arrest or death. 4. Quick action should be taken in these patients to place bilateral chest tubes in order to re-expand the collapsed lungs. For this reason, it is important for IR physicians to be aware of the risk of buffalo lung in lung biopsy patients.

#### TABLE OF CONTENTS/OUTLINE

Introduction. Patient case example. Picture examples. Discussion of buffalo lung and its' presentations. Patient risk factors. Treatment and case outcome.

### Anatomic Variants of the Hepatic Arteries and Technical Considerations for Y90 Radioembolization

#### Participants

Taylor Loon, MD, Syracuse, NY (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1) Review hepatic arterial variants that a radiologist should be able to recognize using the MICHEL classification. 2) Identify and familiarize the most common hepatic arterial variants encountered in pre-treatment mapping for Yttrium-90 radioembolization based on imaging findings. 3) Highlight the possible complications of Y90 microsphere diffusion into replaced right and left hepatic arteries and technical considerations when encountering variants.

#### TABLE OF CONTENTS/OUTLINE

1) Review standard hepatic artery anatomy and the relevant imaging findings trainees should know to quickly evaluate using CT and digital subtraction angiography. 2) Introduce the MICHEL classification and subclassify based on right, left and common hepatic arterial origins. Present digitally drawn visual diagrams demonstrating each MICHEL classification. 3) Present cases from our institution depicting hepatic arterial anatomic variants using CT angiography and 3D-rendered images (MICHEL Classification, II, III and IV, which have a prevalence of 12.5%, 7.5% and 1% respectively). 4) Using cases from our institution, review relevant imaging findings on digital subtraction angiography for identifying hepatic arterial variants during pre-procedure mapping for Y90 chemoembolization. 5) Discuss possible branches of replaced/accessory left and right hepatic arteries and impact of diffusion of Y90 spheres. 6) Discuss technical considerations when encountering hepatic arterial variants including; injection rate for mapping DSA, prophylactic embolization of branches, and microcatheter tip position.

### Purchasing Decisions for an Interventional CT Program

#### TEACHING POINTS

(1) Interventional CT fluoroscopy is becoming widely used and scanner features that meet both diagnostic and interventional needs are becoming increasingly complex. In this paper, the most important scanner features are discussed and ranked for both diagnostic and interventional purposes. (2) Vendors provide different offerings for the features, so hypothetical comparisons for three vendors are included to facilitate explaining various tradeoffs in purchasing decisions.

#### TABLE OF CONTENTS/OUTLINE

This education exhibit provides a complete overview of CT scanner features which are necessary, desired, or useful for meeting both diagnostic and interventional purposes. The viewer will become familiar with the nuances of each feature and leave more comfortable with purchasing decisions in an increasingly complex market.

### Vascular Interventions in Angiosarcoma with Pulmonary Hemorrhage

#### Participants

Denes Szekeres, BS, Rochester, NY (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The aim of this exhibit is to identify the role of the radiologist in diagnosis and management of vascular tumors. We begin with a review the epidemiology and presentation of angiosarcoma, a rare and diverse subset of malignant soft tissue sarcoma that is often insidious. We discuss the broad range of imaging findings for a variety of common sites of primary and secondary angiosarcoma through a review of SEER data and prior studies. We tie together the educational points with a case report of a cardiac angiosarcoma, including a review of the multidisciplinary approach to diagnostic workup and oncologic management. We end with a description of endovascular interventions (coil embolization) in treating pulmonary hemorrhage, a common complication of metastatic disease.

#### TABLE OF CONTENTS/OUTLINE

1. Statistics and clinical pearls of angiosarcoma  
2. Review of multimodality imaging findings  
3. Case presentation of primary cardiac angiosarcoma  
4. Technique for coil embolization of pulmonary arterial hemorrhage  
5. Summary of educational points

Printed on: 04/12/24

### Oops, We Did It Again: A Review of CT- and US-Guided Thoracic Interventional Procedure Complications

#### TEACHING POINTS

To review the potential complications of CT- and US-guided thoracic interventional procedures. To analyze the causes and risk factors of these complications and discuss how they could be prevented. To explain the different treatment options for these complications.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction- Lung biopsy and lung abscess drainage indications - Pleural biopsy indications- Thoracocentesis and pleural drainage indications - Techniques: CT- and US guided- Procedure: patient preparation, materials, technical considerations 2. Complications 2.1. Pneumothorax - Risk factors - Treatment 2.2. Lung Hemorrhage- Risk factors - Treatment 2.3. Subcutaneous Hematoma- Causes - Treatment 2.4. Seeding 2.5. Gas embolism- Clinical manifestations, causes - Treatment 2.6. Hemothorax- Causes - Treatment 2.7. Non-diagnostic biopsy- Risk factors - FNA vs CNB - Methods to increase biopsy performance 2.8. Non-productive pleural drainage- Causes- Treatment 3. Prevention of complications 4. Summary 5. Conclusion

### Intra-procedural Ablation Margin Confirmation for Thermal Ablation of Liver Tumors Using Open Source Software

#### Participants

Iwan Paolucci, PhD, Houston, TX (*Presenter*) Stockholder, Intuitive Surgical, Inc ;Stockholder, SOPHiA GENETICS

#### TEACHING POINTS

1) Dedicated software for confirmation of ablation margins is commercially available but expensive and often unavailable to in health care centers and research laboratories with limited budgets - even in developed nations. This abstract presents a workflow for ablation confirmation using free and open source software.2) The minimum ablation margin (MAM) after thermal ablation of liver tumors is the most important predictor of local tumor progression.3) Detecting an insufficient minimum ablation margin during the procedure allows for immediate re-ablation during the same treatment session.4) Intra-operative images acquired using controlled breathing (e.g. apnea, high frequency jet ventilation) yield the most accurate results as they involve minimal tissue deformation.

#### TABLE OF CONTENTS/OUTLINE

1) Software requirements2) Loading and organizing the data3) Registering the pre- and post-ablation CT images4) Segmentation of the tumor and ablation zone5) Calculation and visualization of the minimum ablation margin

### **The Role of Cone Beam Computed Tomography in Embolization of a Technically Challenging Distal Pulmonary Artery Mycotic Aneurysm**

#### **TEACHING POINTS**

Cone-Beam Computed Tomography (CBCT) has many potential applications for both diagnostic and interventional radiology. The use of CBCT, as exemplified by the following case, allowed for the expeditious identification and treatment of a distal pulmonary artery mycotic aneurysm. This exhibit will enable participants to directly compare the differences in appearance between traditional CT and CBCT of the same entity and to display how CBCT data can be fused to live fluoroscopy to hasten the time to intervention.

#### **TABLE OF CONTENTS/OUTLINE**

1. Introduction of the case example a. 42-year-old female with a complex medical history most notable for recent endocarditis treated with antibiotics and mitral valve replacement who presented with hemoptysis. 2. Description of traditional CTA findings a. CTA Chest demonstrated a distal, fourth-order pulmonary artery mycotic aneurysm. Axial images and coronal reformat provided. 3. Description of the CBCT findings a. Redemonstration of the aneurysm, comparing appearance to that of the CTA 4. Tutorial of fusing CBCT with live fluoroscopic images using guidance software, specifically using GE EMBO ASSIST ® as an example a. Images of the 3D reconstruction of the CBCT data b. Discussion of how guidance software is applied to the fluoroscopic images 5. Conclusion of case a. Successful, expeditious coil embolization of a difficult-to-access distal pulmonary artery mycotic aneurysm 6. Discussion of additional applications of this technique to other entities

IREE-64

### Overview of Diagnosis and Treatment of Large or Medium-sized Vessel Vasculitis

#### TEACHING POINTS

Vasculitis is a group of disorders characterized by inflammation of the walls of blood vessels, and they are classified based on the diameter of the predominantly affected vessels. The clinical manifestations of vasculitis can be non-specific and may overlap with other disorders. Imaging techniques allow for direct evaluation of the arteries in large or medium-sized vessel vasculitis, and various interventional procedures may be used in these cases. However, the vessels involved in small vessel vasculitis are smaller than the current imaging resolution, meaning that only end organ changes secondary to the involvement of small vessels can be examined. This review presents the most important imaging modalities and typical findings in large and medium-sized vasculitis. The purpose of this exhibit is : (1) To list the vascularitis according to the vessel size affected. (2) To review the clinical and radiological manifestation of various vascularitis. (3) To learn the indication and technical tips for interventional procedures for vascularitis.

#### TABLE OF CONTENTS/OUTLINE

1) List of vascularitis A: large vessels (eg, giant cell arteritis, Takayasu arteritis), B: medium-sized vessels (eg, polyarteritis nodosa, Kawasaki disease, primary granulomatous central nervous system vasculitis), C : small vessels (eg, Wegener granulomatosis, Churg-Strauss syndrome, microscopic polyangiitis, Henoch-Schönlein syndrome, systemic lupus erythematosus, rheumatoid vasculitis, Behçet syndrome). 2) Clinical manifestation and diagnostic criteria 3) Imaging modality and angiographic appearance 4) Treatment options : medical vs interventional 5) interventional procedures and their indication

### Intra-arterial Treatment for Hepatocellular Carcinomas: How to Manage Shunting from the Artery

#### TEACHING POINTS

In the treatment of hepatocellular carcinomas, intra-arterial therapy such as chemoembolization and radioembolization is commonly used. However, operators may encounter shunts from the artery (such as arterioportal, arteriovenous, and arteriopulmonary shunts) that can hinder effective treatment. These shunts can be caused by various factors such as tumor invasion, previous percutaneous procedures, chronic inflammation, or congenital acquisition. If not properly occluded, embolic material can pass through the shunt and cause non-target embolization or serious complications. This exhibit aims to achieve three goals: (1) Review the radiologic appearance of arterioportal, arteriovenous, and arteriopulmonary shunts; (2) Learn how to manage these shunts with proper embolic materials; and (3) List the possible complications and their management.

#### TABLE OF CONTENTS/OUTLINE

1) List of shunts Arterioportal shunt (hepatic artery - portal vein), Arteriovenous shunt (hepatic artery - hepatic vein), Arteriopulmonary shunt (hepatic artery - pulmonary artery/vein), 2) Imaging findings on CT/MR and angiography according to the cause (tumorous vs non-tumorous condition) 3) Embolization strategy and materials for shunts 4) Complications related with non-target embolization and their management

### Nonsurgical Management of Renal Masses

#### Participants

Laura Jorgenson, Rochester, MN (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Learn the nonsurgical approaches to treat renal masses, including ablation, embolization, and SBRT, the indications for treatment and intra-procedural tips and tricks to optimize response. Understand post ablation, embolization and SBRT changes in the renal tumor and how to avoid pitfalls in interpretation. How to evaluate for tumor recurrence post treatment and avoid pitfalls in assessment. Understand common complications following ablation, embolization, and SBRT.

#### TABLE OF CONTENTS/OUTLINE

1. Ablation, embolization, and SBRT technique Discuss evolution of nonsurgical management of renal tumors as a viable treatment option. Discuss indications and fundamentals of ablation, embolization, and SBRT: Patient selection Tumor types Treatment planning Procedural insights to avoid complications Role of spectral CT during ablation 2. Post ablation SBRT and embolization changes in renal tumors and assessment of tumor response Response of renal masses to nonsurgical management Typical features on imaging (CT/MRI) which depict normal evolution of typical changes on imaging - acute, subacute and chronic changes Tips on how to avoid pitfalls in interpretation 3. Potential Complications and related imaging features in each modality Intra-procedural complications Immediate post-procedural complications Delayed complications

### Radioembolization of Hepatocellular Carcinoma with Extrahepatic Collateral Blood Supply: Anatomic and Technical Considerations

#### TEACHING POINTS

The utilization of radioembolization as a treatment method for hepatocellular carcinoma (HCC) has significantly increased in recent years. Typically, HCC derives its blood supply from the hepatic artery; however, it can also obtain a parasitic blood supply from extrahepatic collateral arteries (EHC). While chemoembolization has been carried out through EHC without significant complications, there is limited experience with radioembolization via EHC. The aim of this exhibit is threefold: (1) to examine the critical anatomy of EHC utilizing cone-beam CT, (2) To review when we suspect the presence of EHC supplying HCC, (3) To learn how to do safe radioembolization through EHC.

#### TABLE OF CONTENTS/OUTLINE

1) List of treated EHC, 2) Vascular anatomy of EHC by using cone-beam CT and safe point of each EHC, 3) Suggestive findings of EHC on CT/MR and cone-beam CT, 4) Special considerations for radioembolization through EHC: dosimetry, embolization of pulmonary shunt, protection of normal vessel, and redistribution by proximal embolization.

### Reducing the Learning Curve: The Use of an Ex Vivo Model for Teaching Double J Ureteral Stent Insertion and Retrograde Exchange

#### TEACHING POINTS

Discuss the benefits of simulation-based training for procedure competence. To describe our experience with a new training model for learning double J ureteral stent (DJS) insertion and retrograde exchange.

#### TABLE OF CONTENTS/OUTLINE

Introduction. Urinary tract obstruction and how the performance of DJS can provide relief. The current master-apprentice model and the importance of procedure competence for trainees before practicing on patients. Benefits of simulation-based training and the current models available. Illustration of a developed ex vivo model for simulating a DJS procedure. Conclusion: Percutaneous access into the renal collecting system is a crucial step when performing DJS. This developed model allows for training on this technical skill as well as the remaining steps in a realistic and safe environment.

### Diagnostic and Interventional Radiology for Budd-Chiari: An Update on BCS Classification and IVUS

#### Participants

Anne Sailer, MD, New Haven, CT (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Budd-Chiari syndrome (BCS) is the occlusion of one or more veins of the liver due to various disorders that result in sinusoidal congestion, portal hypertension, fibrosis, cirrhosis, and nodular regeneration. 2. The new BCS classifications can provide more appropriate treatment options; accurately determining the type of obstructor, number of blocked vessels, and length of the obstruction and categorizing the patients according to the updated BCS classification can improve the success of the patient's therapeutic treatment plan.

#### TABLE OF CONTENTS/OUTLINE

1. Review pathophysiology of Budd Chiari and the BCS classifications. 2. Briefly review potential mimics of Budd Chiari (i.e. other cause of sinusoidal or post hepatic obstruction). 3. Discuss general concepts of assessing the liver Doppler US, CTA, MRA, venography, and intravascular ultrasound (IVUS) with emphasis on technique, protocol, and image optimization for diagnosing Budd Chiari. a. Describe differentiating imaging features of various BCS presentations depending on the location of the occlusion. b. Review complications associated with BCS. c. Briefly demonstrate pitfalls of BCS. 4. Discuss management options with interventional radiology procedures (venoplasty and stenting, local pharmacologic and mechanical thrombolysis, transjugular intrahepatic portosystemic shunt (TIPS) placement), and potential complications.

### Prophylactic Intervention for Placenta Accreta Spectrum

#### TEACHING POINTS

Placenta accreta spectrum (PAS) is an abnormal placentation with invasion of myometrium or extrauterine structures and can be associated with maternal morbidity and mortality. Not only the prenatal diagnosis but also the management are important to reach a better outcome. To date, pre-operative prophylactic balloon occlusion is developing with balloon placement in various sites including internal iliac arteries, common iliac arteries, uterine arteries and abdominal aorta. The purpose of this exhibit is: 1) to review the MRI features of PAS. 2) to review different treatment options including procedural risk, benefit and outcome. 3) to demonstrate techniques of balloon occlusion of internal iliac arteries. 4) to enhance the value of MRI image for preprocedural guidance or predictive indicator.

#### TABLE OF CONTENTS/OUTLINE

1) Introduction of placenta accreta spectrum (PAS) 2) MRI diagnosis of PAS. 3) Management for abnormal placentation a. traditional approach b. prophylactic balloon occlusion in various anatomic regions c. outcome for each treatment 4) Case demonstration: balloon occlusion of internal iliac arteries. 5) Additional MRI role for interventional radiologist

### Image-guided Percutaneous Cryoablation for Lung Malignancies: Giving the Tumor a Cold Send-off

#### Participants

Angel Castillo Fortuno, MD, Barcelona, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- To describe the physical and therapeutical mechanisms of image-guided percutaneous lung cryoablation (L-CYOA).
- To discuss the clinical and imaging features and the diagnostic and therapeutical algorithms of patients with lung malignancies amenable to treatment L-CYOA, including a proposed systematic pre-procedural evaluation protocol.
- To explain the technique, intraprocedural considerations, imaging findings, and most common complications related to L-CYOA.
- To describe the short-, mid-, and long-term follow-up imaging findings, clinical outcomes, and prospects of L-CYOA in the treatment of lung malignancies.

#### TABLE OF CONTENTS/OUTLINE

1.- Introduction 1.1- Background 1.2 - Surgery, SBRT or lung ablation? 1.3.- Heat vs. cold ablation techniques: Why CYOA? 1.4.- CYOA: Basic principles 2.- Indications 2.1.- Non-small cell lung carcinoma (NSCLC). 2.2.- Oligometastatic lung disease (OLD). 3.- Assessment before L-CYOA 3.1.- Patient selection. 3.2.- Preprocedural evaluation and preparation. 3.3.- Proposal of a systematic protocol. 4.- L-CYOA procedure 4.1.- Technical considerations: CYOA equipment and CT protocol. 4.2.- Technique. 4.3.- Intraprocedural clinical and imaging evaluation. 4.4.- Immediate clinical and imaging findings. 4.5.- Complications. 5.- Post-L-CYOA follow-up 5.1.- Clinical and imaging follow-up scheme. 5.2.- Short-, mid-, and long-term follow-up imaging and clinical findings. 6.- Clinical outcomes 6.1.- Stage I NSCLC. 6.2.- Alternatives indications in NSCLC. 6.3.- OLD. 6.4.- Immunotherapy synergy. 7.- Summarize 8.- Conclusion

### Superior Vena Cava Interventions

#### Participants

Irene Dixe de Oliveira Santo, MD, New Haven, CT (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Review the causes, anatomic considerations, presentation, and grading of superior vena cava syndrome (SVCS); Describe the main treatment options for SVCS with a special focus upon the endovascular therapies (ET), including angioplasty, stenting and catheter-based thrombus removal; Provide a brief case-based overview of ET, including stent selection; Review the main complications of ET.

#### TABLE OF CONTENTS/OUTLINE

Causes of superior vena cava syndrome (SVCS); Review of the main anatomic considerations, including patterns of obstruction and collateral pathways; Clinical presentation and grading system of SVCS; Diagnostic approach for SVCS; Main treatment options including chemotherapy with or without RT, surgical bypass or ET, including angioplasty, stenting and catheter-based thrombus removal, with pros and cons of each modality; Selected cases from our institution to illustrate several ET options; Venous Stents: types, descriptions, benefits and drawbacks; Complications of ET: hematoma, local infection, pericardial tamponade, SVC rupture, stent migration, in-stent restenosis, pulmonary edema, major bleeding, pulmonary embolism, and cardiac injury.

### Combined Y90 Radioembolization and Immunotherapy for the Treatment of Hepatocellular Carcinoma: Is it Effective or Harmful Due to Adverse Effects

#### Participants

Justin Ling Leblanc, MD, JACKSON, MS (*Presenter*) Nothing to Disclose

Johnny Yang, BS, BA, Fresh Meadows, NY (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Review the mechanism of immunotherapy and Yttrium-90 radioembolization for the treatment of hepatocellular carcinoma (HCC). Explore the risks, benefits, and safety of combined immunotherapy and radioembolization treatment. Review outcomes of real-life cases of combined therapy.

#### TABLE OF CONTENTS/OUTLINE

Understanding the Hepatocellular carcinoma (HCC) immune microenvironment is important for developing effective immunotherapies. Suppression of the cytotoxic immune response - including CD8+ T lymphocytes, Natural Killer (NK) cells, and their associated cytokines - is associated with HCC progression. New drugs targeting immune checkpoint inhibitors, such as nivolumab, pembrolizumab, and atezolizumab have revolutionized the treatment of HCC. The latest research is exploring combination therapy with multiple immunotherapy agents and/or locoregional therapies such as surgical resection, ablation, or embolization. We reviewed stand alone widely used radioembolization with yttrium-90 (Y-90) therapy versus the safety of combining radioembolization with the PD-1 inhibitor nivolumab in HCC. Several Studies looked at the safety of the combination therapy by examining adverse events and overall survival. Results have shown that the combination therapy was well-tolerated, with no major adverse events reported. The most common side effects were fatigue, nausea, and abdominal pain. The median overall survival for the patients was 17 months, which is similar to prior studies. Some studies showed similar survival between these two therapies. Personalized selection based on age, burden of disease and other favorable criteria are important on which patient will benefit from single or combined therapy.

### Understanding the Complex Mechanisms of Complications in IR

#### Participants

Jorge Lopera, MD, San Antonio, TX (*Presenter*) Shareholder, Tecnostent SA; Consultant, Merit Medical Systems, Inc; Research Grant, AngioDynamics, Inc

#### TEACHING POINTS

- To review how complications affect our performance in IR
- To understand the most common mechanism of IR complications
- To learn how to prevent and deal with complications
- To illustrate healthy and unhealthy ways to deal with complications

#### TABLE OF CONTENTS/OUTLINE

Introduction : Error or complication ? Most common cause of complications : Judgmental errors : incorrect strategy of treatment is chosen.(1) overly heroic procedures(2) failure to intervene when the situation demands. Technical errors : poor technique , poor selection of devices .Normative or moral errors: irresponsible or unethical behavior. IR specific complications: Choosing the wrong materials .Not knowing your patient's history well. Poor communication. Rushing through cases. Poor technique .Bad luck? . Simple steps to prevent complications Coping with complications : What to do next . Healthy and unhealthy ways to deal with complications Economic and social cost of complications Conclusions

### Considerations for the Nonconventional Transjugular Intrahepatic Portosystemic Shunt (TIPS) Creation in Cancer Patients: Alternative Techniques and When to Use Them

#### TEACHING POINTS

1. Review the indications and potential interfering factors to performing a TIPS procedure in cancer patients. 2. Present the standard technique for performing a TIPS; modifications that can be made; and when to use them to circumvent difficulties of the pre-, intra-, and post-operative process in cancer patients with altered post-surgical anatomy and acute or chronic splenoportal venous thrombosis.

#### TABLE OF CONTENTS/OUTLINE

The transjugular intrahepatic portosystemic shunt (TIPS) is widely used in relieving pressure in the portal venous system (~90% success rate) in patients with refractory variceal bleeding or ascites, often due to cirrhosis. The standard process involves catheter guidance from a hepatic vein to a target portal vein branch. Several factors in cancer patients can complicate this procedure. These patients routinely have altered post-surgical anatomy such as a partial hepatectomy. Additionally, an association with increased thrombophilia can cause portal vein thrombosis. Moreover, certain tumors can compress or invade into splenic or mesenteric veins and result in occlusions interfering with a TIPS creation. For such cases, modifications to recanalize or bypass the obstruction have been demonstrated. We review the literature and present alternative techniques for shunt creation in a nonconventional TIPS: 1. The diagnostic presentation of patient factors that can interfere with a successful TIPS creation. 2. Case-based discussion regarding modifications to the TIPS technique to circumvent complicating factors.

### Local and Systemic Immune Cell Landscape after Transcatheter Arterial Embolotherapies for Hepatocellular Carcinoma

#### TEACHING POINTS

- Review the magnitude and influence of post embolization hypoxic microenvironment on the local and systemic immune cell landscape in hepatocellular carcinoma (HCC)• Illustrate preclinical and clinical data on T-cell and myeloid populations in post embolization and radioembolization in tumor microenvironment• Describe the current status of systemic immune cell response after catheter-based therapies for HCC

#### TABLE OF CONTENTS/OUTLINE

1.Introduction to catheter-based interventions for HCC and technical impact on post embolization hypoxia 2. Overview of the role of hypoxic stress and angiogenic factors induced by embolization on HCC cell survival 3. Characterize T-cell and myeloid cell local landscape after catheter-based interventions. 4. Discuss changes to splenic and plasma levels of inflammatory markers after HCC embolotherapies. 5. Demonstrate sustained immune responses after Y90 Radioembolization in Hepatocellular Carcinoma 6. Discuss future applications of embolization therapies in treating liver tumors.

### Imaging Findings and Interventional Management in Benign and Malignant Biliary Disease

#### Participants

Daniel Freedman, MD, New York, NY (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Biliary disease consists of benign and malignant entities with a diverse spectrum of clinical presentation and imaging findings.2. Benign biliary disease includes choledochal cysts, hamartomas, autoimmune diseases, chronic pancreatitis, HIV cholangiopathy, iatrogenic injury, gallstones, infection (cholangitis), and may develop after liver transplantation.3. Malignant biliary disease includes primary biliary cancers (cholangiocarcinoma) and secondary tumor/metastatic disease, and causes severe illness secondary to local obstruction.4. Multimodality imaging plays a critical role in guiding diagnosis and treatment options executed by interventional radiologists and advanced endoscopists including PTC, PTBD, ERCP, biliary stents, and surgery.

#### TABLE OF CONTENTS/OUTLINE

1. Review of the clinical presentation and diagnostic imaging workup for benign and malignant biliary disease.2. Multimodal imaging and procedural approach to the diagnosis, management, and treatment of benign and malignant biliary disease, including: a. Percutaneous transhepatic cholangiography and drain placement (PTC, PTBD)b. Endoscopic retrograde cholangiopancreatography (ERCP)c. Percutaneous transhepatic cholangioscopyd. Biliary stentinge. Surgical intervention

### Deep Gluteal Syndrome: Anatomy, Imaging and CT-guided Treatment (Sciatic Nerve Neurolysis)

#### Participants

Cristina Candelaria Linares Bello, MD, Santa Cruz De Tenerife, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Remember the anatomy of the subgluteal space and the sciatic nerve. Explain the causes of deep gluteal syndrome and the different imaging findings. Explain the procedure of CT-guided treatment (sciatic neurolysis).

#### TABLE OF CONTENTS/OUTLINE

Deep gluteal syndrome is considered an underdiagnosed entity and defined as the compression or irritation of a non-discogenic origin of the sciatic nerve in the anatomical region of the subgluteal space. The typical symptoms are: dysesthesias and/or pain in the buttock and hip. There are many etiologies that can produce this syndrome: Specific musculoskeletal entrapments: fibrous, fibrovascular or vascular bands, piriformis syndrome, gemelli-obturator internus syndrome, pathology of the quadratus femoris muscle and the ischiofemoral space and insertional pathology of the hamstring muscles. Non-specific pathologies: iatrogenic, inflammatory, traumatic, infectious, gynecologic, vascular and tumors. For its diagnosis, physical examination and an adequate clinical history are of great importance. MR imaging is the procedure of choice for diagnosis. On the other hand, the CT-guided procedure to perform sciatic nerve neurolysis is both a diagnostic and therapeutic procedure and an alternative to surgical treatments. The deep gluteal syndrome is an underdiagnosed entity with multiple etiologies. The CT-guided sciatic nerve neurolysis is a safe procedure and an alternative to surgical treatments.

### Hidden Time Bombs: Image Features of Abdominal Visceral Pseudoaneurysms and Treatment

#### TEACHING POINTS

- Describe the common locations of, and clinical presentation including the complications of abdominal visceral artery pseudoaneurysms.
- Review the key imaging features of abdominal pseudoaneurysms on different modalities.
- Discuss the non-surgical endovascular and percutaneous treatment approaches to abdominal pseudoaneurysms.

#### TABLE OF CONTENTS/OUTLINE

- Definition of pseudoaneurysms and location of visceral abdominal aneurysm such as-Splenic Artery Pseudoaneurysm-Hepatic Artery Pseudoaneurysm -Renal Artery Pseudoaneurysm -Pancreatic Artery Pseudoaneurysm-Mesenteric Artery Pseudoaneurysm
- Clinical presentation of pseudoaneurysms
- Imaging features of pseudoaneurysms - Findings on doppler and contrast enhanced ultrasound- Features on computed tomography (CT) angiogram- Vasculature characteristics and assessment of pseudoaneurysm features on conventional angiogram.
- Indication of pseudoaneurysm treatment and non-surgical treatment options - Symptomatic versus non symptomatic pseudoaneurysm- Endovascular fluoroscopic guided pseudoaneurysm treatment.- Percutaneous CT guided treatment - Percutaneous US (doppler and or contrast enhanced) guided treatment.

### Non-invasive Radiofrequency Hyperthermia Enhances the Effect of OK-432 for Hepatocellular Carcinoma Via Activation of cGAS-STING Pathway

#### TEACHING POINTS

1.OK-432 could activate cGAS-STING pathway in DC cells in the treatment of HCC. RFH could enhance the effect of cGAS- STING activation of OK-432. 2.The combination demonstrated an antitumorigenic immunologic microenvironment and an encouraging anti-cancer effect in the treatment of HCC.

#### TABLE OF CONTENTS/OUTLINE

Abstract RFA has been accepted as an effective alternative to surgery in the treatment of early-stage HCC. However, a clear safety margin beyond the tumor confinement is difficult to obtain when the tumor for large or irregular HCC. Thus, generated a sublethal radiofrequency hyperthermia at the ablated tumor margin during RFA. This study aimed to investigate the feasibility of using RFH to enhance treatment the effect of OK-432 for HCC and explore the potential mechanisms. Our study showed OK-432 could activate the cGAS-STING pathway, and RFH could significantly enhance the effect of OK-432 by a stronger activation of STING pathway. The expression of IFN- $\beta$  and the pro-inflammatory cytokines were significantly higher in the RFH+OK-432 group. Meanwhile, we found RFH could cause a higher expression of TLR4. The administration of the shTLR4 in vitro and TLR4 antibody in vivo to eliminate the role of TLR4, the activation of Sting by OK-432 decreased significantly. In addition, the combination treatment augmented the maturation of DCs and the infiltration of the functional CD8+ T cells. Furthermore, this combined treatment resulted in a better tumor response and a prolonged survival. In conclusion, the combination therapy might be a new treatment strategy in reducing the residual tumor after RFA of medium-to-large or irregular HCCs, bringing a new option for other types of malignancies treated by RFA.

### Minimally Invasive Thoracic Oncology Treatments: Comprehensive Review and Comparison of RFA, MWA, Cryoablation, and Chemoembolization Techniques

#### Participants

Shakthi Ramasamy, MD, (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

This educational exhibit aims to provide a comprehensive overview of minimally invasive thoracic oncology treatments, focusing on radiofrequency ablation (RFA), microwave ablation (MWA), cryoablation, and bronchial/pulmonary artery chemoembolization. RFA and MWA offer reduced morbidity and mortality, while preserving pulmonary function and allowing for repeatability. Cryoablation has shown promise in the treatment of early-stage lung cancer and advanced-stage palliative care, as well as in emerging applications such as ground-glass nodules. When lung metastases that are inoperable and unsuitable for ablation cease to respond to systemic chemotherapy, the prognosis becomes poor. Bronchial and pulmonary artery chemoembolization provide alternative treatment options for patients with large, multifocal lung tumors and those experiencing hemoptysis. The exhibit will delve into the principles, applications, imaging guidance, and outcomes associated with each technique, as well as the comparative efficacy of these treatments.

#### TABLE OF CONTENTS/OUTLINE

I. RFA, MWA, Cryoablation and Bronchial and Pulmonary Artery Chemoembolization will be discussed under the following categories:  
A. Principles and techniques B. Imaging guidance C. Patient selection and indications D. Treatment outcomes and comparisons E. Potential complications and management strategies  
II. Comparing the Treatments A. RFA, MWA, Cryoablation, and Chemoembolization B. Factors influencing treatment selection C. Efficacy and safety of each technique  
III. Future Directions and Research A. Ongoing clinical trials and studies B. Potential applications in personalized medicine and targeted therapy

### **Gonadal Vein Embolization for the Management of Varicocele, Infertility, and Pelvic Congestion: Patient Anatomy, Evaluation, and Technique for Successful Treatment**

#### **Participants**

Younes Attlassy, New York, NY (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

1. Varicocele and PCS are similar disorders associated with vascular dysfunction. Varicocele occurs due to the pooling of venous blood while PCS is the result of vascular pressure buildup in the pelvic region. 2. Understanding the diagnostic and imaging workup for both conditions is imperative for radiologists and treatment teams to identify, grade, and treat both conditions. 3. Several interventions and treatments, including gonadal vein embolization, are available for patients with these conditions with varying success and complication rates. Information regarding the risks and benefits surrounding these interventions is paramount to ensuring the proper standard of care for each individual patient. 4. Interventional radiology percutaneous embolization has become a safe and effective minimally invasive option for varicocele and PCS treatment with high success rates and few complications.

#### **TABLE OF CONTENTS/OUTLINE**

1. Understanding the anatomy and pathophysiology of both PCS and varicocele including the anatomical variants and attributes that make gonadal vein embolization a more attractive treatment modality in certain cases. 2. A review of the clinical presentation, diagnostic imaging, workup, grading/classification systems, and the interventions for each one. 3. A look at the various treatment options and the risk-benefit analysis around each one. 4. An in-depth guide on IR-guided procedural protocol for the management of varicocele and PCS including how to address anatomical variants, contraindications, and expected post-procedural outcomes.

### Endovascular Interventions of the Mesenteric Vasculature Through Collaterals: A Technical Savior

#### TEACHING POINTS

Vascular pathologies involving the arteries distal to stenosed or occluded main mesenteric arterial trunk is difficult to access. In these situations, one should be aware of arterial arcades and knowledge about these collateral pathways can bail the interventionalist out. We present four cases of endovascular interventions performed through the mesenteric collateral pathways.

#### TABLE OF CONTENTS/OUTLINE

Case 1. GLUE EMBOLIZATION OF SPLENIC ARTERY ANEURYSM (SAA) VIA HYPERTROPHIED RIGHT GASTRO-EPIPLOIC ARTERY (RGEA). 28-year/female - acute necrotizing pancreatitis with intraabdominal bleed. Status post proximal splenic artery embolization using coils. Embolization of the SAA was done via the hypertrophied RGEA. Case 2. SPLENIC PARENCHYMAL EMBOLIZATION (SPE) VIA INFERIOR PANCREATICO-DUODENAL (IPD) ARTERY - RIGHT GASTRIC ARTERY (RGA) COLLATERALS. 58-year/male - Post liver transplant and SA ligation. Refractory ascites due to persistent portal hypertension. Distal SA is reformed through collaterals from the RGEA (minor) and the IPD artery. Embolization was performed using PVA particles. Case 3. COIL EMBOLIZATION OF LEFT HEPATIC ARTERY (LHA) PSEUDOANEURYSM VIA THE IPD ARTERY. 32-year/male - Pseudoaneurysm arising from the LHA branch after removal of biliary catheter. Celiac artery stenosis was noted. Celiac axis reformed through IPD artery. A microcatheter was navigated across the hypertrophied collaterals and the pseudoaneurysm was coiled. Case 4. SPE VIA HYPERTROPHIED RGEA COLLATERALS. 42 years/male - Post liver transplant and SA ligation. Persistent hypersplenism and Splenomegaly. Splenic parenchymal embolization was done via the hypertrophied RGEA by injection of PVA particles

### From Classic to Quirky: A Journey through the Aunt Minnie's" of Angiography

#### TEACHING POINTS

Provide radiology resident level review of classic, "Aunt Minnie" angiographic signs and findings. Briefly discuss pertinent management aspects of underlying pathology diagnosed on angiography. Review intravenous contrast agent selection, contrast injection rates and fluoroscopic projections as key technical components for optimizing image acquisition in angiography and venography.

#### TABLE OF CONTENTS/OUTLINE

Introduction:- Considerations for contrast selection- Contrast injection rates in angiography and venography- Common fluoroscopic projections for image acquisition  
Abdominal Angiography- Aortic dissection with Floating Viscera Sign- Budd Chiari- Non-inflammatory, non-atherosclerotic arteriopathies- Fibromuscular Dysplasia- Segmental Arterial Mediolysis- Standing Wave- Polyarteritis Nodosa  
Peripheral Angiography- Sciatic artery- Dissection- Popliteal Artery Entrapment Syndrome- Hypothenar Hammer Syndrome- Arterial Thoracic Outlet Syndrome  
Pelvic Angiography- Uterine Arteriovenous Malformation- Postpartum hemorrhage- Trauma- Corona Mortis- Pruning, truncation, petechial hemorrhage and vasospasm- Cavemosal Blush  
Angiography of Collateral Pathways:- Arc of Buhler and Riolo- Subclavian Steal- Aortic occlusion and Winslow's pathway  
Venography- Venous Thoracic Outlet Syndrome- Paget-Schroetter Syndrome- Deep Vein Thrombosis- Azygos Continuation of the Inferior Vena Cava

### **Straight to the Heart: State of the Art Thoracic Central Vein (Superior Vena Cava) Endovascular Recanalization, Thrombectomy and Stent Reconstruction**

#### **TEACHING POINTS**

Review anatomy and embryology of mediastinum and central thoracic veins. Recognize common etiologies and classifications of thoracic central vein obstruction (TCVO) including lesions of the brachiocephalic veins and superior vena cava. Describe endovascular treatment of TCVO including access, recanalization, thrombectomy, stent reconstruction, and extra-anatomic bypass creation as well as intraprocedural adverse event management. Discuss comprehensive care from initial work-up to post-procedure management.

#### **TABLE OF CONTENTS/OUTLINE**

Upper extremity and thoracic central vein anatomic review  
Common etiologies for TCVO  
Benign Malignant Patient evaluation  
Presentation, physical examination, and imaging evaluation  
Acute and chronic occlusive symptoms  
Patient centered care  
Technical aspects of procedure  
Sedation Access  
Venography  
Blunt and sharp recanalizations  
Thrombectomy and tissue sampling  
Stent selection and reconstruction  
Use of intravascular ultrasound (IVUS)  
Adverse event management  
Hemothorax and hemopericardium  
Stent migration  
Extra-anatomic bypass creation  
Post-procedure care and follow-up  
Antiplatelet and anticoagulation regimen  
Imaging surveillance  
Outcomes and patency  
Pediatric considerations

### Minimally Invasive Treatment of Postoperative Pancreatic Fistula Using Interventional Radiology

#### TEACHING POINTS

Although the incidence of surgical complications has gradually decreased with the advancement of minimally invasive surgical techniques and instruments, such as laparoscopic surgery and robot-assisted technology, postoperative pancreatic fistula remains a severe complication requiring prompt management. Percutaneous and endoscopic postoperative management has a lower mortality rate than surgical methods, and expectations for interventional radiology (IR) are increasing. Therefore, it is necessary to understand the etiology, diagnosis, and indications of postoperative pancreatic fistula and be familiar with appropriate IR intervention methods. Knowledge of technical tips in treatment is essential for successful procedures. The aims of this presentation are as follows: To explain the etiology, diagnosis, indications, and imaging features of postoperative pancreatic fistula. To discuss the treatment methods, management strategies, advancements, and complications in interventional radiology for postoperative pancreatic fistula, including techniques.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction. 2. Overview Etiology, Diagnostic Criteria, and Treatment Indications for Postoperative Pancreatic Fistula Management Strategies for Postoperative Pancreatic Fistula 3. Illustrated Case Studies Management of Pancreatic Fistula after Pancreaticoduodenectomy Management of pancreatic fistula after combined resection of the body and tail of the pancreas Management of Pancreatic Fistula after Gastric Surgery Complications and Difficult Cases 4. ### Acute Massive Hematochezia Due to Colonic Varix: Antegrade Transsplenic Embolization of Abdominal Garland Vein

#### TEACHING POINTS

In patients with cirrhosis of liver, acute variceal bleeding can be a fatal complication. Varices may develop anywhere in GIT, in cirrhotic patient. Ectopic varices, are not so common, accounting less than 5% of all variceal bleeding. Among these, colonic varices are very rare. Here, in this report, we emphasize the role of endovascular intervention in the management of acute massively bleeding colonic varix in a hemodynamically unstable cirrhotic patient.

#### TABLE OF CONTENTS/OUTLINE

In patients with cirrhosis of liver, acute variceal bleeding can be a fatal complication. Colonic varices are very rare cause of lower gastrointestinal bleeding that can bleed spontaneously and result in massive haemorrhage in patients with liver cirrhosis and portal hypertension. Here we present a case of 50-year-Male, known case of non-alcoholic cirrhosis of liver with portal hypertension (for past 15 years) and type 2 diabetes mellitus, who presented with massive fresh bleeding per rectum. Despite early colonoscopy and glue injection of the colonic varix, patient continued to bleed. Triple phase CT scan of abdomen was done which showed large portosystemic shunt (mesocaval shunt) arising from superior mesenteric vein (SMV) traversing around the ascending colon and forming sub mucosal varices protruding into the colon lumen and joining the right renal vein and draining into the inferior venacava (IVC) giving a garland appearance. He underwent successful transsplenic antegrade obliteration of the varix by coil embolization and glue injection. There are no clear-cut established management guidelines for such patients. Endovascular embolization could be an effective treatment option of colonic variceal bleeding.

#### **MKEE-1 Imaging-Guided Perineural Injections of the Lower Extremity from the Pelvis to the Foot**

##### Participants

Tanya L. Tivorsak, MD, (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

1. Perineural injections can be performed under CT or ultrasound guidance for diagnostic and therapeutic purposes. 2. Ultrasound guidance can be used for peripheral nerve injections as peripheral nerves can be localized well on ultrasound and with real-time guidance. 3. CT guidance can be used for certain perineural injections such as in the pelvis that may be difficult to visualize under ultrasound. 4. This exhibit will provide a guide for injecting certain nerves that are commonly requested at our institution.

##### TABLE OF CONTENTS/OUTLINE

1. Introduction and indications for perineural injections - relieve nerve pain, pinpoint site of potential nerve injury prior to nerve surgery. 2. Procedure preparation - pre-procedure imaging review (MR neurography), ultrasound transducers, needle size, and volume of injectant. 3. Technique for injecting certain nerves from the pelvis to the foot including lateral femoral cutaneous, pudendal, genitofemoral, sciatic and piriformis muscle, saphenous (adductor canal), common peroneal, sural, superficial peroneal, and tibial nerves. 4. Risks and complications. 5. Overview of cryoneurolysis application and techniques.

#### **MKEE-10 Out of Shape: Musculoskeletal Manifestations of Sickle Cell Disease**

##### Participants

Leonardo Kazunori Tsuji, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

1. Review the main aspects related to musculoskeletal findings of sickle cell disease, including etiology, pathophysiology, epidemiology, clinical classification. 2. To illustrate the main imaging findings and how to assess this condition in a multimodality approach, focusing on radiographs, CT and MRI studies, including new concepts and advanced sequences.

##### TABLE OF CONTENTS/OUTLINE

1. Review the main aspects related to musculoskeletal findings of sickle cell disease, including etiology, pathophysiology, epidemiology, clinical classification. 2. Clinical and imaging findings in a multimodality approach, focusing on radiographs, CT and MRI studies. 3. Musculoskeletal findings of sickle cell disease, as microcirculation or anemia related, and major complications (including septic arthritis and osteomyelitis). 4. Bring the most updated concepts of the disease and the imaging role, including advanced MRI sequences, involving diagnosis and patient care.

#### **MKEE-100 Energy Spectrum CT Application: Analysis of Changes in Bone Density of Vertebral and Paravertebral Muscle Composition Before and After Kidney Transplantation**

##### TEACHING POINTS

1) To illustrate most patients with chronic kidney disease before and after renal transplantation have abnormal mineral and bone metabolism due to chronic kidney disease-mineral bone disorder (CKD-MBD). 2) To illustrate energy spectrum CT can quantify vertebral bone mineral density and paravertebral tissue composition through base material separation. 3) To demonstrate energy spectrum CT can apply the separation and quantitative analysis of base substances to provide more data for clinical treatment.

##### TABLE OF CONTENTS/OUTLINE

1) The abnormal bone metabolism and the changes of paravertebral constitution components caused by CKD-MBD before and after kidney transplantation. ·Long term dialysis treatment and drug treatment may cause abnormal bone loss and paravertebral component changes. ·The bone mass of renal transplant recipients decreased rapidly within 1 year after transplantation. 2) Accurate and flexible analysis of basic substances by energy spectrum CT. ·Energy spectrum CT can quickly switch between high and low energies (80/140kVp) to obtain the two energies of the substance, so as to separate the base substance. ·Base material separation: Hydroxyapatite (HAP) is the main similar component of bone in the vertebral body. ·A variety of energy attenuation and image quality pictures are generated under different keV. 3) More imaging information at low radiation dose. ·Energy spectrum CT (80/140kVp) fast switching scanning, lower radiation dose. ·Energy spectrum CT plain scan mono energy diagram: base material pair analysis at 70keV for HAP (water), HAP (fat), calcium (water) to obtain vertebral bone density, and muscle (fat) analysis to obtain paravertebral muscle composition.

#### **MKEE-101 Rewriting the story back: Spondyloarthritis**

##### Participants

Sara Siguenza-Gonzalez, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

## TEACHING POINTS

Bone marrow edema (BME) is the key requirement for a "MRI positive of sacroiliitis" in the Assessment of Spondyloarthritis international Society (ASAS). The radiologist should be careful when applying the ASAS classification criteria, because BME could also be found in early mechanical and degenerative changes, which are much more common than inflammatory disorders. Knowing the type of BME pattern, other radiological features (bone erosion, ankylosis or the spine disease), as well as the clinical picture, increase radiologists diagnostic confidence and reduce overdiagnosis of inflammatory sacroiliitis.

## TABLE OF CONTENTS/OUTLINE

Anatomy and biomechanics of the Sacroiliac Joints (SIJs) and Spine. Including anatomical variants and pitfalls. Some clues to difference between mechanical issues and inflammatory disorders. Subchondral BME in the SIJs is a common finding in both entities, so radiologists should be careful when interpreting. Recognise principal features of spondyloarthritis in the main radiological techniques (Rx, TC, MRI and also with new techniques). Describe and illustrate general features and typical image findings in the spondyloarthritis: Ankylosing Spondylitis (AS), Psoriatic Arthritis (PsA), Reactive Arthritis (RA), enteropathy-associated arthritis and undifferentiated spondylitis. Common pitfalls and differential diagnosis with other diseases that affect the axial bone: infection, amyloidosis, tumors, DISH and traumatism.

## MKEE-102 Deep Learning Imaging Reconstruction Based Virtual Non-calcium Image Can Improve the Bone Metastasis Detection Compared with Conventional CT, Hybrid IR Based Virtual Non-calcium Image

Participants  
Hirota Nakashima, MSc, RT, Sapporo, Japan (*Presenter*) Nothing to Disclose

## TEACHING POINTS

1. Deep learning imaging reconstruction (DLIR)-based virtual non-calcium (VNCa) images were created by two-material decomposition processing based on dual-energy acquisition using a fast kV switching method.
2. Compared the diagnostic performance of DLIR-based VNCa images with conventional CT in 57 patients with clinically confirmed bone metastasis.
3. Compared the diagnostic performance of DLIR-based VNCa images with hybrid IR-based VNCa images.
4. DLIR-based VNCa images were superior to the diagnostic performance of conventional CT and Hybrid IR-based VNCa images.

## TABLE OF CONTENTS/OUTLINE

Bone metastasis is a possible disease of all carcinomas and reduces the quality of life of patients. Since CT can detect bone calcification sensitively, it is excellent in diagnosing bone metastasis with bone destruction, but bone metastasis without bone destruction is difficult to diagnose and has a problem that it is easy to overlook. Virtual non-calcium image (VNCa) is one of the material decomposition images created by dual energy CT, which is also a density image obtained by emphasizing the water component and removing the calcium component. While previous studies have reported that VNCa images are superior in detecting bone metastases, DLIR-based VNCa images offer better discrimination of metastatic lesions due to their noise reduction effect. In this exhibition, we compared the diagnostic performance of DLIR-based VNCa images with that of conventional CT and hybrid IR-based VNCa images. The results show that DLIR-based VNCa images have a higher discrimination ability than conventional images for bone metastasis.

## MKEE-103 Osteoid Osteoma in Small Bones of Hands and Feet: 'Not' So Common with 'Not' So Small Challenges in RF Ablation

## TEACHING POINTS

1. Osteoid osteomas are benign painful lesions usually seen in the long bones. Less commonly they may be seen in the small bones of hands and feet especially in the pediatric age group.
2. They have typical imaging features on MRI and CT which are diagnostic.
3. RF ablation is the recommended treatment for osteoid osteomas and are regularly done. However, the small size of the bones results in challenges that can be dealt with by using some modifications.

## TABLE OF CONTENTS/OUTLINE

Osteoid osteomas are common benign tumor found commonly in children and young adults. They classically present with night pain that is relieved by non steroidal anti-inflammatory drugs. They are usually cortical lesions and most commonly occur in the long bones, with proximal femur being the most common location. Less commonly they may be seen in the spine and small bones of the hands and feet. CT is excellent at diagnosing the lesion and shows small lucent nidus and surrounding reactive bone sclerosis. MRI may be confusing due to the disproportionate marrow edema and the poor delineation of nidus if it is very tiny. CT guided radiofrequency ablation is the current accepted standard treatment for osteoid osteomas. However in small bones, this may be challenging due to the very small size as well as proximity of neurovascular structures. We will discuss the imaging appearances of osteoid osteomas in small bones of hands and feet as well as highlight the challenges faced during RF ablation is some of these cases and some of the ways these can be overcome.

## MKEE-104 Zero Echo Time Magnetic Resonance Imaging: Physics and Clinical Utility in Musculoskeletal System

Participants  
Takatoshi Aoki, MD, PhD, Kitakyushu, Japan (*Presenter*) Nothing to Disclose

## TEACHING POINTS

1. To recognize the clinical utilities of zero echo-time (ZTE) sequences in various disorders of the musculoskeletal system.
2. To understand the imaging physics of ZTE sequence, practical limitations, and image reconstruction.
3. To discuss how to incorporate ZTE sequence into the clinical workflow.

## TABLE OF CONTENTS/OUTLINE

Physics of ZTE imaging 1 Pulse sequence design 2 Image reconstruction 3 Parameter optimization Clinical utility of ZTE in musculoskeletal system 1 Inflammatory arthritis 2 Soft tissue calcification/ossification 3 Bone and soft tissue tumors and tumor-like lesions 4 Osteoarthritis and spondylitis 5 Trauma 6 Morphometric evaluation before surgery 7 Children and fetuses Summary ZTE MRI can be readily incorporated into the clinical workflow, and CT-like images generated by ZTE MRI would minimize the need for CT contemporaneously with MRI in various musculoskeletal disorders. We systematically review the imaging physics of these sequences, practical limitations, and image reconstruction, and then discuss the clinical utilities in the musculoskeletal system while

presenting several imaging examples.

### **MKEE-105 Hamstring Sport Injuries: What, How, Why and Where**

Participants

Agustin Marrero SR, MD, La Plata, Argentina (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

To know the anatomy, function, and biodynamic aspects of the hamstrings complex. To recognize the spectrum of tearing of hamstring muscles and tendons during sports practice analyzing their mechanism of injury. To evaluate the imaging methods in the different hamstrings lesions to describe the precise location and characteristics. To describe ultrasound and magnetic resonance signs of these tears, emphasizing the prognostic criteria for recovery, return to play, and re-injury.

#### **TABLE OF CONTENTS/OUTLINE**

Most of muscle tears occur in the lower extremities and commonly in the hamstrings. The hamstrings complex consists of the semimembranosus (SM), semitendinosus (ST) and biceps femoris (BF) muscles. They originate from the ischial tuberosity. BF muscle has two portions, the long and short head and its distal insertion is at fibular head. ST and SM are medial, and their distal insertion is in the medial aspect of the leg. BF and ST are close to the sciatic nerve. Except for BF's short head, the hamstrings are primarily hip extensors and knee flexors. Hamstring injuries are grouped and classified, with typical tear sites that recur in sports practices during forceful stretching or high-speed running. Proximal injuries result in a large amount of time away from sports and a high risk of re-injury. Sprint tears are generally located on BF. Depending on its extent and location, we can estimate the evolution of injuries and the return to play. Finally, we will include insertional injuries in children.

### **MKEE-106 Acute Traumatic Craniocervical Injuries: What to Look for and Not to Miss**

Participants

María Carvajo, MD, Seville, Spain (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

- To describe acute traumatic craniocervical injuries and its classification based on a revision of cervical CTs performed in the emergency setting at 3rd level hospital. - To show key imaging features to identify stable and unstable injuries. - To present most common errors and missed craniocervical injuries as well as tips to avoid them.

#### **TABLE OF CONTENTS/OUTLINE**

1. Anatomy and biomechanics of craniocervical junction and ligaments. 2. Key measurements and anatomy landmarks to assess alignment of craniocervical junction. 3. Craniocervical injuries classification. 3.1. Atlanto-occipital dissociation. 3.1.1. Traynelis classification. 3.2. Occipital condyle fractures. 3.2.1. Anderson-Montesano classification. 3.2.2. Alar ligament injuries. 3.2.3. Stable and unstable injuries. 3.3. Atlas fractures. 3.3.1. Gehweiler classification. 3.3.2. Transverse ligament injuries. Dickson classification. 3.3.3. Stable and unstable injuries. 3.4. Axis fractures. 3.4.1. Odontoid fractures. Anderson and D'Alonzo classification. 3.4.2. Hangman fractures. Effendi/Francis modified by Levine classification. 3.4.3. Non-odontoid non-hangman fractures (axis body fractures). 3.4.4. Teardrop fractures. 3.4.5. Stable and unstable injuries. 3.5. Atlantoaxial subluxation. 3.5.1. Atlantoaxial rotatory fixation. Fielding and Hawkins classification. 3.5.2. Stable and unstable injuries. 4. Pitfalls of craniocervical injuries at CT imaging. 5. Conclusions.

### **MKEE-107 Ultrasound Guide to Have at Your Fingertips: Wrist and Hand Evaluation**

Participants

Elena Julian Gomez, MD, Santander, Spain (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

1. To emphasize the potential of ultrasound in the assessment of musculoskeletal structures. 2. To become familiar with the normal sonographic appearance of the wrist, hand and fingers. 3. To propose a systematic approach to perform a complete ultrasound of the wrist, hand and fingers. 4. To show the correlation of the ultrasound findings with MR images and anatomical drawings for a better understanding.

#### **TABLE OF CONTENTS/OUTLINE**

Ultrasound is an imaging technique very useful in the assessment of musculoskeletal structures. However, for its correct interpretation, it is essential for the explorer to be familiar with the ultrasound appearance of normal anatomical structures, which can be difficult at the beginning. This work is intended to be an aid for anyone who wants to get started in musculoskeletal ultrasound of the wrist, hand and fingers. First of all, we will check the basic requirements to perform a proper musculoskeletal ultrasound. Then, we will systematically review the normal ultrasound anatomy of the different musculoskeletal structures of the wrist, hand and fingers, dividing them according to their dorsal or ventral location. We will also propose some tips and tricks, and we will highlight the importance of dynamic maneuvers. In order to make our work more visual, we will correlate the different ultrasound images with anatomical drawings and MR images, which will allow a better understanding.

### **MKEE-108 MR Imaging of Traumatic Injury of the Fingers**

#### **TEACHING POINTS**

1. To review the anatomy of the fingers, focusing on the extensor and flexor complexes, as well as the passive stabilizers of their joints. 2. To detail the MRI protocol used for the study of traumatic pathology of the fingers. 3. To illustrate by means of representative cases the most frequent pathology of the fingers after blunt trauma. 4. To teach instability patterns, which may be useful when understanding and describing the MRI findings in these patients.

#### **TABLE OF CONTENTS/OUTLINE**

Traumatic injuries of the fingers are one of the frequent reasons for musculoskeletal MRI evaluation. It is important to know the specific anatomy of the tendon structures and ligaments, as well as the most frequent injury patterns. Extensor finger complex, including central and lateral slips, as well as sagittal bands; flexor tendon, pulleys and articular structures (main and accessory collateral ligaments, and volar plate) play a capital role in finger biomechanics. Closed finger trauma frequently causes instability

patterns (in coronal, sagittal or combined planes) that should be recognized and that facilitate the understanding of the lesion mechanism and its diagnosis. Thus favoring an adequate treatment and a prompt recovery. Injuries secondary to closed trauma of the fingers will be reviewed, with a detailed description of their semiology and the injured structures and their complications.

#### **MKEE-109 Read It Like a Pro: Tips And Tricks To Interpret Lumbar Spine MRI**

Participants

Ana Cristina Delgado, MD, Porto Alegre, Brazil (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

1. Describe the normal spine anatomy of lumbar spine 2. review lumbar spine MRI protocol 3. Analyze step by step the systematic of lecture of spine lumbar MRI, learn how to make a good MRI report, describe findings with standardized nomenclature. 4. Identify, review the most common findings in lumbar benign-malignant pathology.

##### **TABLE OF CONTENTS/OUTLINE**

Description of general characteristics in lumbar spine a) Anatomy review b) MRI protocol sequences c) Systematic lecture of lumbar spine MRI, how to elaborate a good report. Review of MRI cases, common findings in lumbar spine pathology Pathologies included: a) Degenerative changes of intervertebral disc. b) Degenerative changes of vertebral body. c) Degenerative changes of facet joint. d) Malignant pathology. e) Others: infection, cystic lesions, trauma.

#### **MKEE-11 Exploring Osteochondral Lesions of the Talus: Imaging Evaluation and Treatment Options**

##### **TEACHING POINTS**

The purpose of this exhibit is to: 1. Review the talar dome anatomy, and pathophysiology of osteochondral lesions 2. Illustrate and discuss the patterns of osteochondral injuries and main surgical options with didactic cases. 3. Highlight the main information that radiologists should include in the report when analyzing an osteochondral lesion of the talus and their postoperative imaging.

##### **TABLE OF CONTENTS/OUTLINE**

Osteochondral lesions of the talus are lesions of the articular cartilage of the talus and underlying subchondral bone. Trauma accounts for the majority of osteochondral lesions, with an osteochondral lesion occurring with over half of ankle sprains, especially if there is a fracture. Introduction: General review of talar dome anatomy, and pathophysiology of osteochondral lesions. Preoperative evaluation: Main information that should be included in the radiological report. Clinical relevance of the findings. Staging: Didactic illustration about the historical classic staging systems. Postoperative evaluation: Main surgical techniques considerations. Main information that should be included in the radiological report. Bibliographical references.

#### **MKEE-110 Under Pressure: Exploring Normal Anatomy and Entrapment Neuropathy of the Ulnar Nerve**

##### **TEACHING POINTS**

1. Describe the normal course and imaging appearance of the ulnar nerve with emphasis on the cubital tunnel and Guyon's Canal. 2. Describe the anatomical boundaries of both the cubital tunnel and Guyon's Canal. 3. Discuss ulnar neuropathy symptoms. 4. List common etiologies of ulnar nerve compression. 5. Discuss the MR appearances of ulnar nerve impingement in the cubital tunnel and Guyon's Canal. 6. Identify the normal motion of the ulnar nerve within the cubital fossa under ultrasound as well as the abnormal motion of the nerve in the setting of symptomatic anterior dislocation and snapping triceps syndrome.

##### **TABLE OF CONTENTS/OUTLINE**

We review the normal course of the ulnar nerve with attention to sites of potential compression, namely the cubital tunnel and Guyon's Canal. We review the anatomical boundaries of the cubital tunnel and Guyon's canal on MR imaging. We examine the structures innervated by the ulnar nerve and the clinical signs/symptoms of ulnar neuropathy corresponding to the site of impingement. We list common etiologies of entrapment neuropathies. We review the normal MR appearance of the ulnar nerve and utilize MR cases to illustrate the abnormal appearance of impingement in the setting of cubital tunnel and Guyon's canal syndrome. We present dynamic ultrasound examples demonstrating both the typical movement of the ulnar nerve in the cubital fossa, as well as abnormal motion in the setting of dislocation and snapping triceps syndrome. We discuss common surgical treatments of ulnar nerve dislocation and review the expected MR appearance of ulnar nerve anterior transposition.

#### **MKEE-111 Fight of Phyte Calcification Ossification Around Spine**

Participants

Kengo Ikejima, MD, Tokyo, Japan (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

1. Understand the mechanism of perivertebral sclerotic changes 2. Learn the imaging findings of representative perivertebral sclerotic changes along with specific cases 3. Learn about complications associated with perivertebral sclerotic changes 4. Learn key points for differentiating perivertebral sclerotic changes

##### **TABLE OF CONTENTS/OUTLINE**

Spine anatomy, particularly joint structures and ligaments Pathophysiology of Osteophytes Pathophysiology of Syndesmophytes Pathophysiology of common calcium deposition diseases that occur in the perivertebral region Cases:- Spondylosis-Ossification of the posterior longitudinal ligament- Ossification of the ligamentum flavum- Calcium pyrophosphate dihydrate deposition disease- Calcific tendinitis of the longus colli muscle- Ankylosing Spondylitis- Psoriatic arthritis- Diffuse idiopathic skeletal hyperostosis (DISH)- SAPHO syndrome- Osteitis condensans ilii- Dystrophic calcification- Intervertebral disc calcification

#### **MKEE-112 Looking Beneath the Surface: Imaging of Bone Surface Lesions**

Participants

Utkarsh Parwal, MD, Saint Louis, MO (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

1. Define intracortical, subperiosteal, periosteal, and parosteal/juxtacortical locations along the bone surface 2. Understand that

1. Define intracortical, subperiosteal, periosteal, and parosteal/juxtacortical locations along the bone surface. Understand that multiple cell types within the bone surface give rise to bone-forming, cartilage-forming, and fibrous surface lesions. 2. Case based review of multiple surface lesions. Bone forming: Osteoid osteoma, Surface osteosarcomas (OS) - periosteal OS, parosteal OS, high grade surface OS. Cartilage forming: Osteochondroma, Periosteal chondroma, Bizarre parosteal osteochondromatous proliferation, Periosteal chondrosarcoma. Fibrous: Nonossifying fibroma, Juxtacortical desmoid tumor, Osteofibrous dysplasia. Infectious: Cortical osteomyelitis, Subperiosteal abscess. Traumatic: Stress reaction, Periostitis ossificans

#### TABLE OF CONTENTS/OUTLINE

1. Bone surface anatomy and terminology. Define intracortical, subperiosteal, periosteal, and parosteal/juxtacortical locations. Illustrate the two layers of the periosteum: inner cambial and outer fibrous. Briefly discuss important cell types within the bone surface as the originators of bone-forming, cartilage-forming, and fibrous surface lesions. 2. Case based review of multiple surface lesions. Bone forming: Osteoid osteoma, Surface osteosarcomas (OS) - periosteal OS, parosteal OS, high grade surface OS. Cartilage forming: Osteochondroma, Periosteal chondroma, Bizarre parosteal osteochondromatous proliferation, Periosteal chondrosarcoma. Fibrous: Nonossifying fibroma, Juxtacortical desmoid tumor, Osteofibrous dysplasia. Infectious: Cortical osteomyelitis, Subperiosteal abscess. Traumatic: Stress reaction, Periostitis ossificans

#### MKEE-113 Can you See Me Now? A Case Based Quiz Of Shoulder Instability Lesions

Participants

Ana Cristina Delgado, MD, Porto Alegre, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Describe and recognize the different key clinical/imaging features that help diagnose each glenohumeral instability entity. 2. Identify through a series of MRI/ Arthrography MRI image based cases the different glenohumeral anterior, posterior instability lesions. 3. Describe the role of different imaging modalities in the diagnosis of glenohumeral instability, evaluate the MRI/ Arthrography MRI imaging findings that can help radiologists discriminate differential diagnosis. 4. Review static dynamic glenohumeral stabilizers.

#### TABLE OF CONTENTS/OUTLINE

-Pathologies will be presented in a case based format with pertinent MRI/ Arthrography MRI images and a brief clinical history. - Diagnostic clue section divided in clinical facts ( general features, miscellaneous information) radiological facts ( key imaging findings, best image modality for further evaluation). -Review the concepts and important tips for image diagnosis. -Review anatomy of static dynamic glenohumeral stabilizers. -Pathologies included: a) Anterior instability: Classic Bankart, HAGL ( Humeral avulsion of glenohumeral ligament), GLAD ( Gleno labral articular disruption), Perthes, ALPSA ( Anterior Labroligamentous sleeve avulsion), Hillsachs. b) Posterior Instability: Reverse Bankart, POLPSA: Posterior labro capsular periosteal sleeve avulsion), Kim, Bennet, Reverse Hillsachs. c) Variants Pitfalls: Sublabral Recess, Sublabral foramen, Buford Complex.

#### MKEE-114 Elasticity Matters: Role of Shear Wave Elastography in Rheumatology

Participants

Alejandra Micolich Vergara, MD, Barcelona, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

General principles of shear wave elastography in musculoskeletal radiology. Potential applications in the assessment of rheumatologic diseases. Future directions and limitations.

#### TABLE OF CONTENTS/OUTLINE

Elasticity is a fundamental characteristic closely related to the pathological state of tissues. Elastasonography is a diagnostic technique that assesses the biomechanical properties such as stiffness and elasticity of tissues by exposing them to a specific ultrasound beam. Shear Wave Elastasonography (SWE) is a non-invasive and objective method that determines the absolute stiffness value of various tissues. SWE has been validated in liver disease, thyroid, breast, prostate, skin and ocular pathologies and is being considered a promising tool in rheumatologic disorders. Greyscale and Power Doppler ultrasound as well as Magnetic Resonance Imaging (MRI) have been extensively studied as diagnostic techniques in rheumatologic pathologies and in 2021 the European League Against Rheumatism (EULAR) recommends elastasonography in the reporting of ultrasound studies in musculoskeletal disease. There has been advancements in recognizing the role of SWE in entities such as Primary Sjögren's Syndrome and Gout Arthritis, however, future prospects include exploring its utility in the early diagnosis and therapeutic response monitoring in Rheumatoid Arthritis, Systemic Lupus Erythematosus and Thumb Osteoarthritis. We will review the potential applications of SWE in different rheumatologic disorders using a case based approach.

#### MKEE-115 Not Normal: An Illustrated Guide to Potentially Symptomatic Musculoskeletal Anatomic Variants

#### TEACHING POINTS

- Review commonly discovered anatomic variants on routine musculoskeletal imaging that may be symptomatic or become symptomatic.
- Recognize what imaging features suggest a given variant may be at risk of being symptomatic or require treatment, and what additional imaging may be required for a more definitive diagnosis.
- Discuss treatment options available for the management of pain associated with anatomic variants, including: activity modification, physical therapy, image-guided injection, and surgery.

#### TABLE OF CONTENTS/OUTLINE

- Spinal variants
  - o Upper cervical § Dens retroversion § Posterior arch agenesis § Short arch
  - o Rib anomalies cervical ribs
  - o Segmentation anomalies § Congenital block § Occipitalization § Hemivertebra § Butterfly
  - o Oppenheimer ossicle
  - o Lumbosacral transitional vertebra
  - o Sacroiliac variants
  - o Coccyx angulation
  - o Posterior elements § Baastrup pseudoarthrosis § Hypoplastic facets § Facet tropism
  - o Piriformis sciatic nerve
  - o Other • Hip
  - o Developmental dysplasia
  - o Cam/pincer
  - o Coxa profunda protrusio
  - o AIIS morphology
  - o Coxa vara valga
  - Wrist hand
  - o Ulnar variance
  - o Type 2 lunate
  - o Coalition
  - o Os styloideum
  - Shoulder
  - o Acromion shape slope
  - o subcoracoid
  - o Coracoclavicular joint
  - o glenoid dysplasia hypoplasia
  - o Luschka tubercle
  - o Os acromiale
  - Elbow
  - o Anconeus epitrochlearis
  - o Gantzer's muscle
  - o Synovial fold
  - o Os supratrochlear dorsale
  - Knee
  - o Patellofemoral anomalies § Patella type § Trochlear groove § Patella alta/baja § Bi/multipartite patella
  - o Aberrant popliteal and anterior tibial artery
  - o Discoid meniscus
  - o Plica
  - Foot ankle
  - o Os trigonum syndrome
  - o Painful os peroneum
  - o Accessory muscles
  - o Type II os naviculare
  - o Coalition
  - o Os intermetatarsium
  - o Sesamoid anomalies

## **MKEE-116 Calcifications as Harbingers of Malignancy in Soft Tissue Tumors: A Case-Based Review**

Participants

Atefe Pooyan, MD, MPH, Seattle, WA (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

1. Gain familiarity with the morphology of calcifications in soft tissues 2. Demonstrate that approaching soft tissue calcifications based on morphologic appearance, distribution, and tumor cell-type can yield clues when triaging lesions 3. Present scenarios in which soft tissue calcifications are helpful in assessing the malignancy or benignity of a lesion

### **TABLE OF CONTENTS/OUTLINE**

Key Anatomic or Pathophysiologic Issues, Imaging Findings or Imaging Technique This case-based exhibit will review the morphology of soft tissue calcifications (e.g. stippled, chondroid, coarse, osseous, amorphous), with imaging correlation using multiple modalities (i.e. radiographs, CT, and MR), as demonstrated by various cases of benign and malignant pathophysiologic processes of calcification. Conclusion 1. Approaching soft tissue calcifications according to their descriptive morphology and location can yield clues into interpreting a lesion's malignant potential. 2. Calcifications are disproportionately represented by the most common high-grade soft tissue neoplasms, including synovial sarcoma, liposarcoma, and undifferentiated pleomorphic sarcoma, which comprise more than half of all soft tissue malignancies. 3. Malignant tumors can have a characteristic morphology of calcifications, such as stippled calcifications in synovial sarcoma and central osseous calcifications in extra-skeletal

## **MKEE-117 Posterior Ankle Pain: Pathologies Surrounding the Kager Fat Pad**

Participants

Leandro Mazza, MD, La Plata, Argentina (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

To describe the anatomy of the Kager fat pad (KFP) and its relationships with the rest of the structures of the posterior region of the ankle. To analyze the different pathologies responsible for posterior ankle pain and the degree of involvement of the KFP in each of them. To discuss the role of KFP in the symptomatology of these entities

### **TABLE OF CONTENTS/OUTLINE**

KFP is a mass of adipose tissue that occupies the Kager triangle, located between the Achilles tendon, the flexor hallucis longus and the calcaneus. Although its content is predominantly fatty, it also contains nerves and small vessels. It presents multiple connections with the different anatomical structures that surround. Three regions that are closely related to the sides of this triangle have been described. The most firmly linked to the Achilles tendon being an important part of its entheses. The more mobile, wedge-shaped and closely related to the calcaneus moves passively and actively towards the retrocalcaneal bursa during plantarflexion. These relationships make the KFP a necessary participant, to a greater or lesser extent, in a large part of the different entities that present with posterior ankle pain. We will describe tendinopathies, os trigonum syndrome and other causes, with particular interest in the degree of involvement of the KFP.

## **MKEE-118 Don't Touch Lesions: How Can We Avoid the Misdiagnosis**

Participants

Janaina Moreira, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

Don't touch lesions are incidental findings, that are divided into three categories: Post traumatic, normal variants, and lesions that are real but obviously benign. Radiography is the first method used for the identification, characterization, and classification of these type of lesions. However, some cases can be so challenging that computed tomography or magnetic resonance imaging are used to evaluate the lesion, therefore increasing the accuracy of the diagnosis. The purpose of this presentation is to review the imaging characteristics of typical skeletal "don't touch" lesions in the many imaging methods such as X-Ray, computed tomography (CT) and magnetic resonance imaging (MRI) therefore avoiding misdiagnosis and invasive procedures, which reduces the morbidity and costs in the health care system.

### **TABLE OF CONTENTS/OUTLINE**

Case based didactic review of the radiological appearance of the "don't touch" lesions including clinical and epidemiological aspects of bone infarction, osteopoikilosis, intraosseous migration of tendinous calcification, myositis ossificans, aggressive vertebral hemangioma, among others, based on our service's digital archive.

## **MKEE-119 High-Resolution Ultrasound of the Nerves of the Foot and Ankle: A Landmark Approach to Scanning and Review of Common Pathologies**

### **TEACHING POINTS**

The purpose of this exhibit is to: 1. Review the anatomy of the nerves at the level of the foot and ankle, using a landmark approach with cadaveric correlation. 2. Highlight clinical signs and symptoms warranting a detailed ultrasound nerve assessment, relating them to specific nerves. 3. Review common sites and causes of nerve injury and entrapment at the foot and ankle and demonstrate associated abnormal direct and indirect sonographic findings using diagrams, images and video clips from case-examples.

### **TABLE OF CONTENTS/OUTLINE**

1. OBJECTIVES 2. INTRODUCTION 3. ANATOMY, ULTRASOUND TECHNIQUE, PATHOLOGY WITH CASE EXAMPLES FOR THE: a) Tibial nerve and medial and lateral plantar branches b) Plantar digital nerves c) Sural nerve d) Saphenous nerve e) Deep peroneal nerve f) Superficial peroneal nerve 4. TAKE HOME POINTS

## **MKEE-12 PET-MR Imaging Applications in Pediatric Musculoskeletal Tumors**

### **TEACHING POINTS**

3 PET-MR imaging is a powerful tool for the assessment of pediatric musculoskeletal tumors, with specific applications in

? PET-MRI imaging is emerging as a suitable technique for the assessment of pediatric malignancies, with specific applications in musculoskeletal tumors. ? Its utility includes primary tumor characterization, local / distant staging and post-treatment follow-up. ? Dose reduction of ionizing radiation and overall scanning time decrease are remarkable advantages. ? However, it has low sensibility for detection of pulmonary nodules. Chest CT remains essential in thoracic staging of pediatric musculoskeletal malignancies.

#### TABLE OF CONTENTS/OUTLINE

? Introduction: Integrated MRI and PET provide efficient staging of children and adolescents with malignant bone tumors by evaluating the primary tumor and the whole body in one session. ? Our protocol included a whole-body and a local tumor scan. ? Applications in pediatric musculoskeletal tumors: PET-MRI is useful in the study of osteosarcoma, Ewing sarcoma, bone lymphoma, Langerhans cell histiocytosis and bone and bone marrow metastases. We report our experience in the last ten years. ? Conclusions: the combination of functional PET imaging with the lack of non-ionizing radiation of MRI is ideal in a pediatric population.

#### MKEE-120 Do Not Harm: Thermal Protection in Musculoskeletal Abdominal Wall Soft Tissue Tumors Cryoablation

Participants

Albert Castillo Pinar, MD, Barcelona, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Teaching points: To review the main characteristics of thermoablation in musculoskeletal soft tissue tumors. To illustrate different techniques and indications of thermoprotection procedures. To show possible complications if the thermoprotection techniques are not performed correctly. Thermoablation of musculoskeletal tumors is a growing technique with good results; however, it can be limited by the location of the tumors. There are close anatomical relationships related to the tumor such as different intra-abdominal structures or the skin itself which can contraindicate the technique, make it difficult or lead to complications if the correct thermo-protection techniques are not applied. Radiologists must be familiar with the thermoprotective techniques in order to be able to choose the most appropriate in each case.

#### TABLE OF CONTENTS/OUTLINE

Table of contents/Outline Introduction. Classification and description of thermoprotective technique. Case series illustrating clinical situations and the application of thermoprotection techniques. Conclusion.

#### MKEE-121 Non-infectious Spinal Diseases Mimicking Infection

#### TEACHING POINTS

Infectious spinal disease may be suspected if inflammatory markers are increased in blood tests in patients with acute spinal pain and limited range of motion. These clinical findings can also be seen in spinal crystal deposition disease and intraspinal rupture of synovial cysts located in facet joints. In cases of acute inflammation in these two diseases, there is a risk of unnecessary biopsies and antibiotic treatments because the clinical and imaging findings overlap with those of infectious spinal diseases. Recognizing the radiographic characteristics of these diseases and raising awareness of these findings will be helpful in accurate diagnosis and treatment. We present various cases of spinal crystal deposition disease (crowned dens syndrome, calcific tendinitis of longus colli, calcific tendinitis of levator scapulae, facet joint crystal arthropathy, and interspinous bursitis with crystal deposition) and intraspinal rupture of facet joint synovial cyst, and present their clinical and imaging findings. This aims to raise awareness of these diseases and facilitate accurate diagnosis.

#### TABLE OF CONTENTS/OUTLINE

Introduction Case 1: Calcified tendinitis of longus colli Case 2: Calcific tendinitis of levator scapulae Case 3: Crowned Dens syndrome Case 4: Crystal arthropathy of facet joint Case 5: Facet joint infection

#### MKEE-122 The Bubble Trouble: Differential Diagnosis of Cystic Bone Tumors and the Importance of Not Missing the Mark

Participants

Leticia dos Reis Morimoto, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The purpose of this exhibit is: 1. To review the main differential diagnosis of cystic bone lesions. 2. To expose the general evaluation of cystic bone tumors - what is necessary to report: review of the characteristics by image that must be reported and propose a structured report for bone tumors in a multimodality approach (CR, US, CT and MRI). 3. To review the main combined injuries and when to think about them. 4. To demonstrate through didactic illustrative cases the main complications that can be found due to cystic bone lesions. 5. To demonstrate currently available treatment modalities for those conditions.

#### TABLE OF CONTENTS/OUTLINE

1 - Radiological propaedeutics of cystic bone tumors. 2 - Radiograph, ultrasound (US) computed tomography (CT), and MRI findings in: 2.1 - Unicameral bone cyst 2.2 - Multicameral bone cyst 2.3 - Aneurysmal bone cyst 2.4 - Cystic fibrous dysplasia 2.5 - Vascular malformation (cystic angiomas) 2.6 - Telangiectatic osteosarcoma 2.7 - Other miscellaneous cystic tumors 3 - General evaluation of cystic bone tumors - what is necessary to report? - review of the main image characteristics. 4 - When to be suspicious of concomitant lesions and their primary associations. 5 - Propose a structured report for cystic bone tumors in a multimodality approach (CR, US, CT, and MRI). 6 - Complications related to cystic bone tumors. 7 - Therapies currently used in cystic bone tumors. 8 - Last updates and trendings of cystic bone tumors 9 - Summary and take-home message

#### MKEE-123 Knee-ding a Closer Look: MRI Evaluation of Cartilage Surgical Repair

Participants

Leticia dos Reis Morimoto, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The purpose of this exhibit is: 1. Revisit the anatomy and biomechanics of knee joint and focusing in cartilage 2. To demonstrate the MRI image findings in chondral lesions of the knee, with the main classifications 3. To illustrate the main operative techniques involved in knee cartilage surgery with radiology and surgery imaging correlation 4. Demonstrate through didactic illustrative cases

the normal and pathological postoperative image findings, focusing on MRI

#### TABLE OF CONTENTS/OUTLINE

1 - Anatomy and biomechanics of knee joint and cartilage  
2 - MRI findings in chondral lesions of the knee  
3 - Modified Outerbridge classification (MRI and arthroscopy imaging)  
4 - Noyes Classification (MRI and arthroscopy imaging)  
5 - International Cartilage Repair Society (ICRS) classification (MRI and arthroscopy imaging)  
6 - Surgery and radiologic imaging of:  
6.1 - Marrow-Stimulating Procedures (microfracture) (surgery and radiologic imaging)  
6.2 - Osteochondral Autograft Transplantation  
6.3 - Osteochondral Allograft Transplantation  
6.4 - Autologous Chondrocyte Implantation  
7 - Normal postoperative findings after surgical repair of the knee cartilage  
8 - Pathological postoperative findings after surgical repair of the knee cartilage

#### MKEE-124 Dual Energy CT in Spinal Disease: Application Review

##### TEACHING POINTS

Dual-energy CT (DECT) separately acquires high and low energy X-ray data to enable material characterization applications for substances that exhibit different energy-dependent x-ray absorption behavior. Based on conventional CT imaging, DECT significantly improves the detection ability of spinal lesions and adds more quantitative indicators. Virtual non-calcium (VNCa), virtual monochromatic imaging (VMI), and other parameters have unique advantages over traditional CT imaging in displaying bone marrow edema and tumor, detecting spinal urate crystal deposition, reducing spinal related metal artifacts, and intervertebral disc degeneration, showing a good clinical application prospect.

#### TABLE OF CONTENTS/OUTLINE

Vertebral fracture, Bone Marrow Lesions and Mimics, Herniation of intervertebral disc, Gout, Artifact Suppression

#### MKEE-125 Myopathies: Radiologist's Essential Tips for Clinical, Pathological, and Imaging Findings

Participants

Yumi Tai, Kashihara, Japan (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

1) To review inherited and acquired myopathies including clinical, pathological, and diagnostic imaging findings. 2) To discuss clinico-radiological key findings in the differential diagnosis of myopathies for radiologists.

#### TABLE OF CONTENTS/OUTLINE

1) Imaging techniques and general imaging findings of muscle  
2) Illustrated findings of the following myopathies:  
1. Hereditary myopathies: Congenital myopathies (Nemaline myopathies, Central core disease, Congenital fiber type disproportion myopathy), Muscular dystrophies (Duchenne, Becker, Limb-girdle, Myotonic, Facioscapulohumeral, Emery-Dreifuss, Oculopharyngeal), Distal myopathies (GNE myopathy, Oculopharyngodistal myopathy), Metabolic myopathies (Mitochondrial disease, Lipid storage myopathies).  
2. Acquired myopathies: Inflammatory myopathies (Dermatomyositis, Antisynthetase syndrome, Immune-mediated necrotizing myopathy, Inclusion body myositis, Eosinophilic myositis, Drug-induced (Immune checkpoint inhibitor (ICI)-related myositis), Associated with GVHD), Associated with systemic disease (Overlap myositis, Muscle Sarcoidosis)  
3) Clinico-radiological key findings in the differential diagnosis

#### MKEE-126 Winging It: The Radiologist's Guide to the Scapula

##### TEACHING POINTS

[1] Understanding the anatomy and bony landmarks of the scapula is important for identifying a range of pathologies, including fractures, tumors, and degenerative changes. [2] The scapula has a number of anatomic variants, particularly in the pediatric population, that may mimic trauma or other pathologies. [3] While radiographs can provide an initial assessment of the scapula, CT and MRI are useful imaging modalities to evaluate complex or subtle bony and adjacent soft tissue pathologies.

#### TABLE OF CONTENTS/OUTLINE

[1] Overview [2] Normal anatomy: important radiological landmarks [3] Imaging technique: dedicated scapula radiographs and the importance of CT/MRI [4] Case-based review by pathology [5] Congenital/developmental variants: acromial ossification centers; os acromiale; Sprengel deformity; glenoid dysplasia [6] Traumatic processes: different fracture patterns (including of the scapular body, neck, glenoid, acromion, and coracoid process) and stress fractures [7] Degenerative/inflammatory processes: osteoarthritis; rheumatic conditions; elastofibroma dorsi; scapulothoracic bursitis [8] Infection and inflammation: osteomyelitis; septic arthritis [9] Neoplasm: benign and malignant [10] Hardware and related complications: curettage and graft; shoulder arthroplasty notching [11] Miscellaneous conditions: Looser's zones in osteomalacia [12] Conclusion

#### MKEE-127 Worth the Weight: Weight-bearing Cone-beam CT in Foot and Ankle Pathology

Participants

Maryam Soltanolkotabi, MD, Salt Lake City, UT (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

1. Weight-bearing computed tomography (WBCT) has advantages over conventional CT and radiography, namely the ability to identify alignment issues and evaluate joint line congruencies. 2. WBCT can be used for the assessment of fracture healing, pre-operative planning, and evaluation of treatment efficacy. 3. WBCT offers technical and logistic advantages over conventional CT including decreased radiation dose, less technical training for use, and decreased space and energy demands. 4. WBCT enables reliable 3D measurements in a functionally relevant position (weight-bearing).

#### TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Objectives/goals 3. What is weight-bearing CT and how does it work? 4. What are the advantages and disadvantages of WBCT? 5. What is the impact of WBCT on radiation dose, cost, and workflow? 6. What are the indications of WBCT? a. Fracture detection b. Alignment evaluation c. Pre-operative planning d. Evaluation of fracture healing e. Post-operative evaluation 7. How to measure in 3D? 8. What further developments are to be expected? 9. Summary/conclusion

## **MKEE-128 Percutaneous Bone Consolidation in Cancer Patients: Who and How**

Participants

Roberto Luigi Cazzato, Strasbourg, France (*Presenter*) Proctor, Medtronic plc

### **TEACHING POINTS**

- To promote the indications of percutaneous bone and spine consolidation in multi disciplinary tumor boards- To present the interventional techniques applied to consolidate impending, pathological, and secondary bone insufficiency fractures in cancer patients- To propose an algorithm useful to select the best consolidative method based on the biomechanics of the affected bone

### **TABLE OF CONTENTS/OUTLINE**

- Indications- Techniques available based on biomechanics- Definition of the target fracture- Algorithm for bone consolidation

## **MKEE-129 Spectrum of Common and Uncommon Multiple Bone Tumors: Imaging Findings with Pathologic Correlations**

### **TEACHING POINTS**

1. Multifocality is common in metastasis, myeloma, histiocytosis, and vascular tumors, including the location of spine; occasional in fibrous dysplasia, osteofibrous dysplasia, adamantinoma, enchondroma, and osteochondroma; extremely rare in osteosarcoma and giant cell tumor. 2. Multiple bone tumors carry an increased risk of malignant transformation, especially in the enchondroma, osteochondroma, and giant cell tumor. 3. Non-ossifying fibroma are typically cortically based; osteofibrous dysplasia and osteofibrous dysplasia-like adamantinoma can be pure cortical lesions, or with medullary cavity involvement; the majority of the adamantinoma involve the cortex and complete medullary cavity; fibrous dysplasia and metastasis primarily involve the medullary cavity and occasional the cortex. 4. A stippled or ring-like pattern indicates cartilage calcification, cloud-like appearance indicates osteoid mineralization, and a ground-glass density indicates fiber matrix. 5. Age needs to be considered in solid tumors with non-specific imaging features. Metastasis, myeloma, lymphoma, and Erdheim-Chester disease are common in adults; whereas, multiple chondrogenic tumours, fibrous dysplasia, langerhans cell histiocytosis, and osteosarcoma are more frequent in young individuals.

### **TABLE OF CONTENTS/OUTLINE**

1. Enchondroma 2. Osteochondroma 3. Osteoma 4. Osteosarcoma 5. Haemangioma 6. Epithelioid haemangioendothelioma 7. Giant cell tumour 8. Non-ossifying fibroma 9. Simple bone cyst 10. Osteofibrous dysplasia 11. Adamantinoma 12. Fibrous dysplasia 13. Metastasis 14. Myeloma 15. Lymphoma 16. Langerhans cell histiocytosis 17. Erdheim-Chester disease 18. Rosai-Dorfman disease

## **MKEE-13 Thermal Protection Techniques During Musculoskeletal Ablation**

Participants

Arash Azhideh, MD, MPH, Seattle, WA (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

Percutaneous thermal ablation of benign and malignant musculoskeletal tumors has expanded in scope and popularity in recent years. Although safe and efficacious, thermal ablation requires a thorough knowledge of the range of thermal protection techniques in order to limit the risk of thermal injury to adjacent nerves and other sensitive structures. In this educational exhibit, we briefly review the most commonly used musculoskeletal thermal ablation techniques, describe the spectrum of thermal protection techniques utilized during musculoskeletal thermal ablation, and discuss the mitigation techniques employed prophylactically or once nerve injury has occurred.

### **TABLE OF CONTENTS/OUTLINE**

1. Overview of Musculoskeletal Thermal Ablation Techniques a. Radiofrequency Ablation b. Cryoablation c. Microwave Ablation d. Other 2. Thermal Protection Techniques a. Active Thermoprotection Techniques i. Hydrodissection ii. Gas Dissection iii. Dissection with Other Agents iv. Physical displacement methods 1. Balloon interposition 2. Blunt needle displacement b. Passive Thermoprotection Techniques i. Biofeedback ii. Neurophysiologic intraoperative monitoring 1. Somatosensory evoked potentials 2. Motor evoked potentials 3. Electromyography iii. Temperature monitoring 3. Mitigation strategies to reduce thermal nerve injury

## **MKEE-14 Post-treatment Changes in Bone and Soft Tissue Tumors: A Primer for Radiologists**

Participants

Daniel Lobo, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

• To review the normal and pathologic findings following different therapeutic modalities in bone and soft tissue tumors: systemic treatment (chemotherapy, immunotherapy), radiotherapy and surgery. • To illustrate complications and signs of tumor response to treatment, persistent or recurrent disease, as well as non-neoplastic complications.

### **TABLE OF CONTENTS/OUTLINE**

• Brief introduction: relevance and challenges associated with post-treatment musculoskeletal tumors cases in the daily practice of the radiologist. • Post-systemic treatment (chemotherapy and immunotherapy): Signs of treatment response; Signs of tumor progression; Systemic effect on the musculoskeletal system. • Post-radiotherapy changes: Signs of treatment response; Local progression; Actinic changes; Others (infection, radioinduced tumors). • Post-operative changes: Normal post-operative findings; Non-neoplastic complication; Signs of recidivant lesion. • Conclusion and key takeaways.

## **MKEE-15 Temporomandibular Joint: A Jaw-Some Multimodality Guide of TMJ Disorders**

### **TEACHING POINTS**

1. Review anatomy of the Temporomandibular joint (TMJ) and its biomechanics. 2. Review clinical presentation of temporomandibular joint disorder (TMJD) 3. Discuss different causes of TMJD. 4. Multimodality overview of TMJD with emphasis on pertinent MRI findings. 5. Overview of management of TMJD.

## TABLE OF CONTENTS/OUTLINE

Background- Temporomandibular anatomy- Clinical presentation of TMJD Causes of TMJD- Biomechanical/Traumatic- Internal derangement (Disk Displacement with reduction and Disk displacement without reduction)- Fractures- Dislocation.- Inflammatory Arthritis (Rheumatoid Arthritis, Psoriatic Arthritis Juvenile and Inflammatory Arthritis)- Degenerative Arthritis- Crystal Arthropathy- Neoplastic/Variant (Synovial chondromatosis, Tenosynovial giant cell tumor, TMJ aplasia/hypoplasia and TMJ hyperplasia) Pertinent MRI Findings- Direct Signs (Abnormal disk morphology Abnormal disk displacement in closed-mouth position Abnormal disk movement in open-mouth position Osteoarthritic changes)- Indirect Signs (Joint Effusion and Rupture of retrodiscal layers) Management (Physical Therapy, Joint Injection, TMJ Arthroplasty, Disc Plication, Discectomy and Recontouring of the articular eminence)

### MKEE-16 Augmented Bone Remodeling: An Emerging Concept in Bone Marrow MRI

#### TEACHING POINTS

1. Normal bone remodeling, the lifelong process of bone removal and reconstruction, can not be seen at CT and MRI. 2. Bone remodeling can accelerate as a physiological response to many non destructive insults to bone such as a change in biomechanical load, or adjacent bone and soft tissue lesions. 3. Accelerated bone remodeling can be seen at MRI as a marrow area with a moderate increase in signal intensity on fat-saturated fluid-sensitive images with limited or no signal changes on fat-sensitive images. 4. Signal changes patterns in accelerated bone remodeling can be linear subcortical, patchy or diffuse. 5. Knowledge of these marrow patterns at MRI is important to increase our understanding of bone pathophysiology and avoid confusion with more destructive bone lesions.

## TABLE OF CONTENTS/OUTLINE

A/ Bone remodeling in normal and abnormal situations B/ The « regional acceleratory phenomenon » concept developed by H. Frost C/ MRI of accelerated bone remodeling Signal patterns Signal distribution D/ Correlations with pathological, radionuclide and radiological findings E/ Limitations and perspectives

### MKEE-17 Uncovering Common Lesions in the Sternoclavicular Joint and Costal Cartilages: A Diagnostic Guide

Participants

Giancarlo Domingues, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The purpose of this study is: • To provide a comprehensive review of the normal anatomy and imaging appearance of the sternoclavicular joint and costal cartilages. • To improve understanding and diagnostic accuracy of the pathologies by didactically categorizing them into five distinct groups: degenerative, inflammatory, metabolic, traumatic, and infection.

## TABLE OF CONTENTS/OUTLINE

The sternoclavicular joint is a critical structure that connects the axial skeleton and upper extremities and enables the movement of the upper limbs. This synovial joint can undergo degenerative alterations, with osteoarthritis being the most prevalent pathology. Additionally, degenerative calcifications in the costal cartilages are frequently observed. Inflammatory conditions, such as costochondritis, SAPHO syndrome, rheumatoid arthritis and spondyloarthritis also affect these structures. Differentiating between metabolic and inflammatory disorders often requires a detailed clinical history. Infections usually occur in immunosuppressed patients and spread hematogenously. Traumatic injuries are often misdiagnosed, leading to persistent chronic pain. Although rare, posterior sternoclavicular dislocation is potentially dangerous as it can compress vital structures.

### MKEE-18 Opportunistic Imaging in Musculoskeletal Radiology

Participants

Vivek Kalia, MD, MPH, Frisco, TX (*Presenter*) Research Consultant, Hyalex Orthopaedics, Inc

#### TEACHING POINTS

1. Opportunistic imaging is leveraging existing imaging data, commonly in the form of DICOM-format CT images, to extract potentially useful clinical information unrelated to the examination's original indication. 2. Opportunistic imaging, currently employed for a fairly narrow list of indications such as osteoporosis screening, is poised to enable large-scale population-based screening in the very near future. 3. At-scale deployment of opportunistic imaging creates opportunities and challenges in MSK radiology.

## TABLE OF CONTENTS/OUTLINE

1. Definition and technical requirements a. Artificial intelligence (AI)/machine learning (ML) algorithms 2. Areas of Current Use a. Osteoporosis screening to predict fractures i. Bone mineral density (BMD) assessment ii. Finite element analysis for bone strength assessment b. Body composition analysis to predict cardiometabolic risk and mortality i. Muscle mass (sarcopenia) and quality (fatty infiltration) ii. Visceral adiposity iii. Hepatic steatosis iv. Atherosclerotic calcifications 3. Opportunities / Areas of Potential Use in the Future a. Individual risk stratification and customization of therapy b. Large-scale population screening c. Integration into electronic health records 4. Ongoing Challenges Considerations a. Potentially important and/or confounding information will be revealed by opportunistic imaging b. Potential for overdiagnosis and patient anxiety c. Potential for increased costs of care to healthcare system and/or individual patient

### MKEE-19 Scapulothoracic Disorders: Anatomy, Kinematics and Imaging Approach

Participants

Marília Da Cruz Fagundes, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The scapulothoracic is a functional joint and an important part of the shoulder kinematic chain, supporting the center of the humeral head correctly aligned with the glenoid fossa during arm elevation and increasing the range of motion and strength of the rotator cuff muscles. Scapulothoracic disorders usually result in abnormal contact between scapula and chest wall. Pathophysiology includes structural abnormalities (such as scapula anatomic variants and bone and soft tissue expansive lesions), scapular dyskinesia (caused by denervation injuries or imbalance in muscle strength) and microtrauma (associated with overuse). Rarely, the joint may experience acute trauma leading to scapulothoracic dissociation. Primary pathologies are more frequent in young athletes, especially in throwing sports. Due to its functional nature, the identification of disorders related to scapulothoracic joint can be a

diagnostic challenge for radiologists. Radiography and Computed Tomography allows the assessment of bone anatomy and anomalies, while Magnetic Resonance Imaging provides information on soft tissue causes and consequences of these disorders. Finally, imaging plays an important role in guiding treatment, whether clinical, including physiotherapy and other conservative measures, or surgical if necessary.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction; 2. Anatomy and Kinematics; 3. Pathophysiology: a. Morphological causes; b. Functional causes; 4. Imaging Assessment; 5. Management.

#### MKEE-2 Beyond the Surface: The Power of Ultrasound in Diagnosing Epidermal Inclusion Cysts

Participants

Elena Julian Gomez, MD, Santander, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- To know the typical sonographic features of the epidermal inclusion cyst. - To describe the different complications of epidermal inclusion cysts and their characteristic sonographic findings. - To review other cysts and tumors that, given their location, are part of the differential diagnosis of the epidermal inclusion cyst, as well as the sonographic features that allow us to suspect them.

#### TABLE OF CONTENTS/OUTLINE

Epidermal inclusion cysts are very frequent lesions, and their ultrasound evaluation is a daily request. As radiologists, we must be able to recognize their representative characteristics, as well as other atypical findings that should make us think of other lesions of the same location. Our work is organized as follows: 1. The epidermal inclusion cyst: brief review of its definition, etiopathogenesis, clinical presentation and histopathology. 2. Ultrasonographic features of the epidermal inclusion cyst: everything we should take into account. - Location/relation to the dermis. - Morphology. - Echostructure. - Relation with adjacent tissues. - Vascularization. - Elastography. 3. Ultrasonographic features of the different complications of the epidermal inclusion cyst, including: - Rupture. - Inflammation and infection. - Degeneration in giant cysts. 4. Differential diagnosis of the epidermal inclusion cyst: when to suspect other lesions? - Cystic lesions of adnexal origin. - True dermal and hair follicle sweat gland derived tumors. - Differential diagnosis of complicated inclusion cysts.

#### MKEE-20 The Weight of the Neck: Understanding Subaxial Cervical Spine Injuries

Participants

Francis Cedeno Rodriguez, Caguas, PR (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Subaxial cervical spine injuries occur in the lower part of the neck (C3-C7) due to trauma and can range from mild to life-threatening. 2. Compression fractures are the most common, these fractures consist of a collapse of the vertebral body height due to trauma. Burst fractures involve posterior vertebral body wall fracture and can compromise the spinal canal. 3. Flexion and extension teardrop fractures present with typical corner fractures at typical locations. 4. Translation injuries are seen in high energy trauma mechanisms with severe flexion distraction and often associated with severe neurological sequelae. 5. Unilateral and bilateral facet dislocation result from rotational and/or flexion distraction injuries.

#### TABLE OF CONTENTS/OUTLINE

I. Introduction  
A. Overview of Subaxial Cervical Spine Injuries  
B. Review of AO Spine Subaxial Cervical Spine Classification  
II. Radiologic Review of Types of Fractures  
A. Compression Fracture (CF)  
B. Burst Fracture (BF)  
C. Flexion Teardrop Fracture versus Linear Nondisplaced Anterior Inferior Corner Fracture  
D. Extension Teardrop Fracture (ETF)  
III. Rotation and Translation Injuries  
A. Facet Subluxation  
B. Facet Dislocation  
C. Vertebral Translation  
IV. Complications of Cervical Spine Injury  
A. Vascular Injury  
B. Spinal Cord and/or Exiting Nerve Injury  
C. Hematomas (Epidural / Prevertebral)  
D. Ligament Injury  
E. Disc Injury  
V. Conclusion  
VI. Self Assessment

#### MKEE-21 Flying High and Falling Hard: A Radiological Review of Ultimate Frisbee Injury Patterns

Participants

Shaun Johnson, BS, Cleveland Heights, OH (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Understand the game of ultimate frisbee Learn how injuries commonly occur in this sport Understand commonly reported injuries from previous literature Review imaging findings in these patients

#### TABLE OF CONTENTS/OUTLINE

Introduction to ultimate frisbee Defining terminology and gameplay Discussion of rules Common maneuvers Prior reports of common injuries, epidemiology Literature review of common ultimate frisbee related injuries Fajardo Pulido et al 2020 Demonstrated a high lifetime prevalence of injury with injury to the knee, thigh, ankle, and shoulder being most common Akinbola et al 2015 Ultimate frisbee accounts for a high percentage of collegiate athlete injuries with similar trends to other sports Imaging review of patients with ultimate frisbee related injuries Discussion of diagnosis, mechanism injury, correlation with activity, and management strategies, from most common to least common Knee Ligament, meniscal, tendon pathologies Overuse injuries Foot/Ankle Ankle sprains Overuse injuries Shoulder Glenohumeral dislocation Acromioclavicular joint injuries Clavicular fractures Head Concussion Wrist Injuries related to fall on outstretched hand Chest Contusions Thigh Muscle strains Elbow Conclusion Discuss similarities and differences with various sports and known injury patterns such as soccer (football), American football, rugby.

#### MKEE-22 Did You Know that Your Slot-Scan Radiograph for Scoliosis can Artefactually Cause a Worsening Spinal Curvature? Plus Other Stories of Artifacts Associated with Digital Slot-Scanning Radiography

Participants

Sean Schoeman, Philadelphia, PA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Digital slot scanning technology is a stereoradiography imaging (SDI) system that reduces radiation exposure for patients

Biplanar digital slot-scanning technology is a stereoradiography imaging (SRI) system that reduces radiation exposure for patients requiring serial imaging for chronic and progressive skeletal conditions (1). This has become preferred to standard x-ray additionally because of the ability to image full length spine and lower limbs for follow-up of children with scoliosis and leg-length discrepancy - images are interpreted by pediatric radiologists and orthopedic surgeons. Here we use our experience reviewing multiple images of patients at different time points to demonstrate distinct types of imaging artifact with this imaging modality. Reviewing physicians should be aware of such artifacts so as not to confuse artifacts with pathology which may lead to misdiagnosis or unnecessary management. The purpose of this educational abstract is to demonstrate common artifacts found at our institution.1. Melhem E, Assi A, El Rachkidi R, Ghanem I. EOS(®) biplanar X-ray imaging: concept, developments, benefits, and limitations. J Child Orthop. 2016 Feb 16;10(1):1-14.

#### TABLE OF CONTENTS/OUTLINE

1. Image acquisition technique for slot-scanning and resultant artifacts 2. Incorrect image centering artifact - causing change in Cobb angle and mimicking worsening scoliosis 3. Movement artifacts a. Wavy cardiac margin b. Wavy bones c. Wavy hardware 4. Edge enhancement artifacts a. Halo around hardware b. Pseudo-pneumomediastinum c. Lucency above diaphragm

#### MKEE-23 Improving Bone Tissue Characterization on MRI Using Gradient-echo: The Role of Simulated CT (sCT) Sequences

Participants

Felipe Correa, MD, Ribeirao Preto, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Conventional MRI has limited ability to assess trabecular and cortical bone due to low proton density and markedly reduced T2 decay time. The FRACTURE sequence (Fast field echo Resembling A CT Using Restricted Echo-spacing) aims to improve the visualization of trabecular and cortical bone on MRI by simulating CT tissue contrast. In FRACTURE multiple echoes are acquired at a precise echo-spacing that corresponds to in-phase TEs. Following acquisition, the first post-processing step consists of a magnitude summation of all echoes. After summation, the images from the last echo are subtracted from the summated images to invert the grayscale and give bone a CT-like contrast. Simulated CT contrast sequences have great potential to assist in the diagnosis of inflammatory diseases, neoplasms, trauma, and normal variants. These sequences are useful for demonstrating bone fragmentation, resorption, and bone reaction, which facilitates the identification and understanding of deformities and complex bone remodeling. The great advantages of the FRACTURE sequence are the possibility of using gradient sequences available in all MRI devices and simple post-processing steps.

#### TABLE OF CONTENTS/OUTLINE

How sCT sequence acquisition and post-processing are performed. Role of the sCT sequence to evaluate the trabecular and cortical bone in routine examinations. Cases of clinical practice in which the sCT sequence turned out to be superior to conventional MRI for trabecular and cortical bone abnormalities.

#### MKEE-24 Shouldering the Load: Bridging the Gap of Rotator Cuff Tears with Patch Augmentation

Participants

Sirui Jiang, MD, PhD, Cleveland, OH (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Anatomy of the rotator cuff 2. Common patterns of rotator cuff tears 3. Standard of practice for surgical repair 4. Emerging treatments in graft augmentation 5. Advanced imaging characteristics of graft-augmented versus conventional repairs

#### TABLE OF CONTENTS/OUTLINE

1. Review of rotator cuff anatomy, 2. Clinical presentations of rotator cuff tears 3. Spectrum of rotator cuff disease 3a. Prevalence of tears and common tear patterns, 3a.i. Acute versus chronic tear presentations and diagnosis, 3a.ii. MRI findings and Goutallier classification, 3a.iii. Ellman classification of partial-thickness rotator cuff tears, 3a. iv. Massive rotator cuff tears, 4. Arthroscopic Repair Techniques, 4a. Single versus double row repair, 4b. MRI findings after conventional arthroscopic repair, 4b.i. Failure findings, 4b.ii. Assessment of repaired tendon quality (Sugaya Classification), 5. Patch augmentation, 5a. Indications for patch augmentation, 5b. Benefits and complications of patch augmentation, 5b.i. Reduction in retear rate and improvement in tendon thickness/quality, 5b.ii. Complications with xenografts, 5c. Types of patch augments, 5c.i. Collagen Scaffold (Regeneten), 5c.i.a. Clinical outcomes and MRI features of healed Regeneten patch, 5c.ii. Acellular dermal allograft (Dermis-on-demand), 5c.ii.a. Clinical outcomes and MRI features of healed Dermis-on-demand, 6. Future directions, 6a. Anticipated advancements, 6b. Biologic injections (PRP, stem cells) with concomitant patch augmentation

#### MKEE-25 Checkmate to Chest Wall Tumors: A Strategical Approach to Diagnosis

Participants

Rebeca Francelino, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Although chest wall tumors and tumor-like lesions are rare, familiarity with the main diagnostic entities is important. There is a large 'overlap' between the different etiologies, with many non-specific features between benign and malignant tumors. In the absence of other auxiliary tests, such knowledge allows narrowing the differential diagnoses, in addition to facilitating the decision to recommend further investigation when necessary. The purpose of this exhibit is: 1. To review the most common tumors and their characteristic imaging findings. 2. To discuss the diagnosis and management of benign and malignant tumors. 3. To correlate the imaging findings and clinical clues on a systematic approach to help narrowing the differential diagnosis.

#### TABLE OF CONTENTS/OUTLINE

1- Institutional Protocol to evaluate the chest wall; 2- Epidemiological assessment of the main lesions and best imaging modality 3- Benign bone and cartilaginous tumors Osteochondroma Fibrous dysplasia Aneurysmal bone cyst (ABC) Giant cell tumor (GCT) Ossifying fibromyxoid tumor Chondromyxoid fibroma 4- Malignant bone and cartilaginous tumors Chondrosarcoma Multiple Myeloma Metastasis Osteosarcoma 5- Benign soft tissue lesions Hemangioma Elastofibroma dorsi Fibrous Hamartoma of Infancy Lipoma Schwannoma Desmoid Tumor Neurofibroma Ganglioneuroma Paraganglioma Hemangiopericytoma 6- Malignant soft tissue lesions Ewing sarcoma Rhabdomyosarcoma Synovial sarcoma Pleomorphic

sarcomaGanglioneuroblastomaNeuroblastomaAngiosarcomaLeiomyosarcomaMalignant fibrous histiocytoma (MFH)Malignant peripheral nerve sheath tumorDermatofibrosarcoma protuberans7- Miscellaneous Brown Tumor

## **MKEE-26 Navigating the Lumbosacral Plexus: A Guide to Understanding its Normal Anatomy and Injuries.**

### **TEACHING POINTS**

The aim of this study is: 1. Review with didactic illustrations the anatomy of the lumbosacral plexus, including how to recognize it on MRI. 2. Demonstrate how various lumbosacral plex injuries manifest clinically and on imaging studies. 3. Present didactic cases of lumbosacral plexus injuries, highlighting the main findings that the radiologist should expect.

### **TABLE OF CONTENTS/OUTLINE**

- Introduction and review of lumbosacral brachial anatomy, with didactic illustration.
- Review normal anatomy without MRI, highlighting anatomical landmarks.
- Overview of the main lumbosacral plexus injuries, their clinical and epidemiological manifestations and their imaging findings.
- Demonstrate with challenging clinical cases traumatic and non-traumatic pathologies, such as inflammatory polyneuropathy, other neuropathies, and associated alterations such as piriformis syndrome.
- Present a case series of lumbosacral plexus injuries and what you should actively look for depending on the clinical history.
- Propose a diagnostic checklist for evaluating lumbosacral plexus injuries, simplifying the reading of these challenging exams.
- Summary.

## **MKEE-27 Crystal Spine: Findings of Spinal Crystal Deposition Disease on CT and MRI**

Participants

Andrea S. Costacurta, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

1- Crystal Deposition Disease must be considered in the differential of spinal pain.2- Findings are often located outside de spinal canal, in the soft tissues, and can be overlooked. 3- MRI has a high sensitivity in detecting inflammation but poorly detects calcification. CT on the other hand has high sensitivity to calcification however the amount of associated inflammation is often underestimated. Awareness of the disease may help in the diagnosis.

### **TABLE OF CONTENTS/OUTLINE**

1. Definition and clinical aspects of Crystal Deposition Disease.2. Classification. 3. Brief review of pathophysiology. 4. Description of the main imaging findings in the spine: longus colli tendinitis, crowned dens syndrome, aseptic spondylodiscitis, disc, ligament or dural calcifications, facet joint arthropathy. 5. Discussion of the differential diagnosis.

## **MKEE-28 Assessment of Sagittal Balance in Degenerative Spine Disease: Role of Imaging Modalities in Post-operative Follow-up**

Participants

Pedro Arruda, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

The sagittal balance depends on the correlation of the spine, pelvis and lower limbs for proper body alignment, which is crucial for maintaining a healthy posture and optimal body functioning. The pelvis sets the foundation of this alignment through pelvic incidence, which is a fixed anatomical parameter that determines the amount of lumbar lordosis required to maintain a proper balance. An increase in spinal fusion for degenerative diseases has led to a rise in postoperative complications, such as sagittal imbalance. Spinal fusion can result in a reduction of the lumbar lordosis, thus shifting forward the body's center of gravity. The body tries to compensate by pelvis retroversion or knee flexion, leading to an altered gait pattern and pain. Increased stress on the discs and facet joints adjacent to the fused spine segment may also be depicted. Imaging modalities play a crucial role in alignment monitoring. X-rays provide an orthostatic two-dimensional image of the spine or lower limbs, while MRI and CT scans identify structural abnormalities that predispose to spine imbalance, as well as disc herniation, spinal stenosis or adjacent disc syndrome. EOS imaging is a recently specialized modality that provides an orthostatic full-body and low-dose tridimensional image. Therefore, it is important to know the concept of sagittal alignment of the spine, the main measures performed, and how to interpret and describe the normal and abnormal findings.

### **TABLE OF CONTENTS/OUTLINE**

1. Introduction 2. Sagittal imbalance and compensatory mechanisms 3. Sagittal Alignment assessment A- Care in image acquisition B- What measures to perform C- How to interpret and describe 4. Pre and postoperative spine balance analysis 5. Conclusion

## **MKEE-29 Back to the Future: Automatic Deep Learning Approaches to Opportunistically Assess Spine Health**

### **TEACHING POINTS**

Complications from spine diseases are highly prevalent across the world. For example, over 1.5 million individuals suffer from back pain due to vertebral fractures and millions more are afflicted with neurogenic back pain. One way to prevent these diseases from developing is to opportunistically assess imaging studies for overall spine health by trending changes in quantitative spine metrics. However, the process of making measurements necessary to diagnose such pathologies is time-consuming, resulting in high underreporting rates for some of the aforementioned conditions (as high as 85%). This exhibit will focus on explaining how deep learning algorithms can be used for detecting vertebral body and disc deformities, trending Cobb angle, assessing paraspinal muscle fat content, and quantifying spinal cord/foramen compression.

### **TABLE OF CONTENTS/OUTLINE**

At the end of this presentation the learner should have knowledge about the following:1. Overview of the prevalence of vertebral fractures, disc herniation, spinal cord compression, scoliosis and current manual methods used to quantify severity of these pathologies.2. How neural networks can be used for anatomic object detection across multiple modalities using novel visual transformer and deep convolutional neural networks.3. How keypoint detection networks can be used for automated quantitative vertebral deformity diagnoses.4. How segmentation networks can be used to extract vertebral bodies, intervertebral discs, paraspinal muscles, spinal canal/cord/foramina using 2D and 3D UNets and Swin3D transformer networks.5. A framework for how these measurements can be used for comprehensive spine health assessment in an opportunistic manner.

### **MKEE-3 Imaging of Meniscal Root Tears: A Practical Review**

Participants

Bruno Watabe, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

The purpose of this exhibit is to: • Review and illustrate the anatomy of the meniscal roots and their specific characteristics. • Illustrate and discuss patterns and classifications of injuries involving these structures, along with their clinical relevance. • Illustrate and discuss various surgical treatments, arthroscopic correlation, and postoperative imaging findings of meniscectomy and repair with suture techniques.

#### **TABLE OF CONTENTS/OUTLINE**

The meniscal roots and supporting structures anchor the menisci to the tibial plateau, resisting hoop stress and preventing radial displacement of the menisci and subsequent degeneration of the tibiofemoral compartment. Imaging helps determine the type and location of lesions, guiding treatment decisions. An accurate description of lesions and associated imaging findings helps orthopedic surgeons determine the best surgical technique and improve patient outcomes. • Anatomy: Illustration and imaging of the tibial plateau and sites of meniscal root fixation, highlighting their specific characteristics. • Pathological Conditions: Recognition of degenerative changes and various types of traumatic tears in the meniscal roots, along with commonly associated findings, can aid in treatment decisions and potentially delay the onset of secondary osteoarthritis due to meniscal lesions. • Surgical Treatment and Postoperative Imaging: Illustration of different surgical techniques, including partial meniscectomy and meniscus repair, along with their indications and contraindications. Arthroscopic correlation and postoperative images showing follow-up within a certain time interval and potential outcomes.

### **MKEE-30 Hip Instability Beyond Dislocation: An Overview of New Concepts and Current Radiological Approaches**

Participants

Julio Guimaraes, MD, Sorocaba, Brazil (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Hip instability is conceptually divided into traumatic and atraumatic causes, eventually leading to long-term complications, such as osteoarthritis. Hip dislocation and subluxation are well-established entities associated with high and low-energy trauma. Conversely, microinstability is a developing concept, mainly atraumatic, characterized by the inability to keep the femoral head centered within the acetabular fossa in extra physiological movements, which diagnosis involves detailed anamnesis and physical examination, as well as imaging approach. Bone markers for instability are classified into acetabular and femoral subgroups, which can be evaluated by radiographs and CT scans. Acetabular coverage and orientation are assessed to diagnose developmental hip dysplasia. In patients with borderline acetabular coverage, the concomitant evaluation of the Shenton line and femoral physeal scar orientation can determine microinstability diagnosis. The femoral head is assessed for bone morphology, CAM deformity, femoral torsion and neck-shaft angle. Connective tissue disorders are best depicted with MRI, related to capsular laxity, thinning or redundancy. Iatrogenic causes are related to capsular disruption due to intra-articular assessment during hip procedures. MRI can also reveal specific secondary chondral and labral lesions resulting from those structural abnormalities.

#### **TABLE OF CONTENTS/OUTLINE**

1. Definition; 2. Anatomy; 3. Pathophysiology: a. Traumatic: i. Dislocation and subluxation; b. Microinstability (atraumatic): i. Bone insufficiency; ii. Soft tissue insufficiency; iii. Post-surgical; 4. Imaging Assessment; 5. Management.

### **MKEE-31 Imaging Spectrum of Foot Infections: A Practical Guide to Radiologists**

Participants

Carlos Francisco Kallas Pereira, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

The differentiation between foot infection imaging patterns is a common challenge for radiologists. Imaging methods provide detailed anatomical information in the assessment of infections, thus helping clinicians to reach the most accurate diagnosis. CT scans play a key role in providing multi planar reconstructions for bone evaluations, whereas MRI is highly sensitive for detecting osteomyelitis in initial stages and can help particularly in looking for soft tissues' complications. In this evaluation it is also important to understand the particularities of each etiological agent. Bacteria is the most common cause of infection, frequently associated with synovitis and osteomyelitis. Tuberculosis can also be related to tenosynovitis and osteomyelitis, especially in immunocompromised patients. Fungal infections have been described to have the classic "dot in a circle" sign on T2 weighted images. It is also important to remember foreign bodies related infections, to avoid misdiagnosis. The diabetic foot is another condition that requires special attention by radiologists. Neuropathic arthropathy predisposes to a greater risk of infection, mostly due to the loss of sensitivity, repetitive trauma and poor healing. Osteomyelitis and Charcot arthropathy frequently coexists, therefore, it is essential radiologists to understand the particular imaging features of these conditions and how they affect the foot compartments, to aid in diagnosis and proper management.

#### **TABLE OF CONTENTS/OUTLINE**

Background/epidemiology Anatomy, vascularity and foot compartments Etiological agents Diabetic foot Imaging techniques Diagnostic approach: what to report? Differential diagnosis Take-home Points

### **MKEE-32 MRI and US Evaluation of the Carpal Tunnel and Guyon's Canal: Normal Anatomy, Pathological and Postoperative Findings**

Participants

Diego dos Santos, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

- Report general information about the carpal tunnel and Guyon's canal. - Review the normal anatomy of these canals and their main anatomical variations. - Describe its pathological involvement and its imaging patterns and postoperative evaluation on

ultrasonography (US) and magnetic resonance imaging (MRI), through clinical cases from our service.

#### TABLE OF CONTENTS/OUTLINE

Introduction:- General information about the carpal tunnel and Guyon's canal. Normal anatomy of carpal tunnel and Guyon's canal. Clinical cases of pathological and postoperative findings and its imaging patterns on US and MRI.\* Carpal Tunnel:- Carpal tunnel syndrome- Anatomical variation of carpal bones with tunnel reduction- Accessory tendon of the superficial flexor muscle- Arthrosynovial cyst determining median nerve neuropathy- Calcium deposit in the carpal tunnel- Thrombosis of the ulnar tributary artery\* Guyon's canal:- Arthrosynovial cyst in Guyon's canal- Thrombosis of the ulnar artery\* Other structures:- Neuropathy of the palmar cutaneous branch of the median nerve\* Postoperative findings:- Postoperative changes from carpal tunnel decompression / median nerve injury- Postoperative median nerve neuroma\* Other cases

#### MKEE-33 Plain Film Evaluation of the Traumatic Knee: A Case-Based Primer

##### TEACHING POINTS

The knee is a commonly injured joint in both children and adults. Plain film evaluation is often first line and familiarity with knee anatomy on plain films is critical for appropriate imaging evaluation. This exhibit reviews normal anatomy of the knee on plain films and illustrates the utility and limitations of plain films in evaluation of the knee joint in the setting of trauma. Utilizing a case-based approach, it reviews common and uncommon knee injuries, their mechanisms, and offers pearls and pitfalls to aid the radiologist in comprehensive radiographic assessment.

#### TABLE OF CONTENTS/OUTLINE

Anatomy Intercondylar Fractures Tibial Plateau Fractures Patellar Fractures Patellar Dislocation Avulsion Injuries Physeal Injuries Stress Fractures Knee Dislocation

#### MKEE-34 Avoiding the Iceberg and the Ring of Fire: Thermal Protection on Musculoskeletal Ablations

##### TEACHING POINTS

1 - Review and explain the methods that can be used to protect the tissues surrounding thermoablation areas. 2 - Discuss the monitoring methods and devices to evaluate sensitive structures near procedure sites. 3 - Didactic clinical cases with images of musculoskeletal ablations, each kind of protecting measures and potential complications.

#### TABLE OF CONTENTS/OUTLINE

1 - Types of musculoskeletal ablations; 2 - Radiofrequency; 3 - Cryoablation; 4 - Microwave; 5 - Interstitial laser; 6 - Complications; 7 - Safety measures on ablations; 8 - Preparation and monitoring; 9 - Thermal protection types; 10 - Hydrodissection; 11 - Pneumodissection; 12 - Mechanical manipulation; 13 - Skin temperature control.

#### MKEE-35 Anterior Glenohumeral Instability: Biomechanics, Preoperative and Postoperative Evaluations

Participants

Thais Kuwazuru, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

Renata Leao, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

-Traumatic dislocation of the shoulder leads to labral detachment and elongation of the capsular ligamentous restraints, as well as bone loss on the glenoid, humerus or both.-Characterization of the bone loss, with glenoid track, allows an accurate treatment choice.-Most common procedures: Labral repair, glenoid augmentation and humeral reconstruction.-Labral retear: 1.fluid insinuation between the labrum and the glenoid bone margin; 2. Fluid insinuation within the labrum; 3. Morphologic abnormality greater than expected; 4. Anchor detachment.-Latarjet: 1.Graft complications: non-union, dislocation, mispositioning; 2.Hardware complications: loosening, fracture, dislocation; 3.Others: glenohumeral arthritis, neurovascular injuries, subscapularis muscle injury.-Remplissage: indications and normal/abnormal postoperative findings.

#### TABLE OF CONTENTS/OUTLINE

1.Glenohumeral biomechanics and anterior instability2.Anterior glenohumeral dislocation and associated injuries3.Glenoid labrum tears4.Bone compression and bone loss - glenoid - humerus and bipolar bone loss5.Labral repair procedure: indications, normal and abnormal postoperative imaging6.Glenoid reconstruction techniques: indications, Latarjet/Bristow and others7.Normal and abnormal imaging findings in glenoid reconstruction techniques8.Humeral head reconstruction: indications, normal and abnormal findings9.Conclusion: the correct assessment of glenohumeral instability is important for the surgical decision. It is essential to know the expected imaging patterns of each surgical technique and the corresponding pathological findings to properly manage potential complications in patients.

#### MKEE-36 Giant Cell Tumor of Bone: Atypical Imaging Features, Treatment and Complications

Participants

Adriano Silveira Moreira Novaes, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

The purpose of this exhibit is: 1. Briefly review of the most important features suggesting the diagnosis of the giant cell tumors (GCT) of bone. 2. Demonstrate the unusual locations of the GCT. 3. Review de atypical imaging findings of the GCT and complications in follow-up.

#### TABLE OF CONTENTS/OUTLINE

Giant cell tumor (GCT) of the bone is a generally benign tumor that has recently been reclassified as osteoclastic giant cell-rich tumors according to WHO 2020 classification.It is typically diagnosed through conventional radiographs that show a lytic lesion with a well-defined, non-sclerotic margin, eccentric location, extension to the subchondral bone, and centered in the metaepiphysis of mature long bones. Fluid-fluid levels are seen in 15% of cases, consistent with secondary formation of aneurysmal bone cyst. GCT commonly develops in long bones, particularly around the knee, but can occur in atypical locations with less characteristic radiographic features.Pediatric patients with open epiphyseal growth plates are infrequently affected. Lung metastases are rare,

occurring in 1-6% of cases. Recurrence after curettage with cement placement is a possible complication, but this has become less common with the use of adjuvant therapies such as Denosumab.

### **MKEE-37 Congenital Hand Malformations: A Review in the Palm of Your Hand**

Participants

Karla Ortega Rivera, MD, Queretaro, Mexico (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

1. Congenital hand malformations can have a significant impact on hand function and aesthetics, and thus, management should be multidisciplinary and involve specialists in plastic surgery, orthopedics, radiology, and psychology. 2. Radiographic imaging allows for visualization of bone structures, assessment of alignment, and morphology of the hand. 3. Radiographic evaluation is a crucial tool in the assessment of congenital hand malformations. Radiographic findings can help determine the type and severity of the malformation, which can be useful in treatment planning. 4. The aim is to provide a review of the most common congenital hand malformations, their radiographic findings, classifications, and therapeutic approaches, along with illustrative cases both pre- and post-surgery.

#### **TABLE OF CONTENTS/OUTLINE**

I. Introduction II. Embryology III. Classification IV. Specific types of congenital hand malformations and radiographic evaluation Polydactyly, syndactyly, camptodactyly, brachydactyly, clinodactyly, constriction ring syndrome V. Management of congenital hand malformations VI. Cases

### **MKEE-38 The Muscle Fascia: From Anatomy to Pathological Findings**

Participants

Diego dos Santos, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

- Report some concepts related to the muscle fascia, clarifying its definition. - Review the normal anatomy of the muscle fascia through illustrative schemes and correlation with imaging methods - magnetic resonance imaging (MRI) and ultrasonography (US). - Describe its pathological findings and its imaging patterns, through clinical cases gathered in our service.

#### **TABLE OF CONTENTS/OUTLINE**

Introduction:- Definition and general information about the muscle fascia: fascia superficialis, deep peripheral fascia and deep intermuscular fascia Normal anatomy of the muscle fascia and correlation with MRI and US. Clinical cases of pathological findings and its imaging patterns on US and MRI: \* Traumatic:- Morel-Lavallée lesion- Plantar fascia injury- Muscle hernia / Myo-aponeurotic injuries\* Inflammatory:- Post viral inflammatory fasciitis- Nodular fasciitis- Plantar fasciitis\* Infectious:- Necrotizing and non-necrotizing cellulitis and fasciitis\* Autoimmune: - Eosinophilic fasciitis- Systemic lupus erythematosus- Polymyalgia rheumatica\* Neoplastic:- Superficial fibromatosis- Desmoid tumor / Hibernoma- Sarcoma\* Postoperative:- Assessment of muscle fascia after fasciotomy\* Other:- Compartment syndromes- Granulomatous disease\* Other cases

### **MKEE-39 The Resident's Thriller: A Pictorial Essay on Benign Bone Tumors**

Participants

Izabel Karam, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

This essay aims to review the main benign bone tumors and its multimodality radiological features. Although many tumors' diagnoses are histopathological, radiologists and radiology residents must be able to identify several entities, especially those whose correct identification are imaging-made.

#### **TABLE OF CONTENTS/OUTLINE**

Bone cysts. Chondroblastoma. Chondromyxoid fibroma. Enchondroma. Eosinophilic granuloma. Fibrous dysplasia. Giant cell tumor. Intraosseous hemangioma. Lipoma of the bone. Non-ossifying fibroma. Osteochondroma. Osteoid osteoma.

### **MKEE-4 Glenohumeral Osteoarthritis: Overview, Imaging Approach and Preoperative Assessment**

Participants

Marco Aurelio Soato Ratti, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Glenohumeral osteoarthritis (GHOA) has a prevalence as high as 20% in the middle-age and elderly population, predominantly observed as the primary form (no specific risk factors). Conversely, secondary GHOA is associated with diverse causes, including rotator cuff tear, post-traumatic degeneration, gleno-humeral morphology (retroversion and glenoid dysplasia), shoulder instability, inflammatory arthropathies and microcrystal deposition. Imaging plays a pivotal role for GHOA diagnosis, investigation of underlying predisposing factors, evaluation of the extent of degeneration and of local complications. Since surgery can be considered in symptomatic patients with moderate to severe degenerative changes, unresponsive to conservative treatment, preoperative assessment by imaging is fundamental. A multimodality approach including radiographic images, computed tomography and magnetic resonance imaging helps the surgeon to choose the ideal technique for better outcomes. Pathologic glenoid version, bone loss and rotator cuff atrophy, as examples, have established association with poor clinical outcomes and hardware complications following arthroplasty. Thus, complete preoperative assessment of glenohumeral joint includes the following aspects: evaluation of bone stock, glenoid version, glenoid tilt, assessment of the rotator cuff with Goutallier classification and Walch classification.

#### **TABLE OF CONTENTS/OUTLINE**

1. Introduction; 2. Epidemiology; 3. Definition and pathophysiology; 4. Etiology, a. Primary form (or non-specific risk factors), b. Secondary form (or specific risk factors); 5. Multimodality imaging evaluation; 6. Preoperative imaging assessment: what to report.

### **MKEE-40 CT Myelography and Blood Patches in Intracranial Hypotension: A Primer**

## TEACHING POINTS

1 - Review and explain the intracranial hypotension syndrome, its image manifestations, causes and treatments. 2 - Present didactic clinical cases with images of cerebrospinal fluid (CSF) leaks and fistulas. 3 - Discuss CT myelography technique and interpretation. 4- Show the treatment options for CSF leaks and fistulas. 5 - Demonstrate guided epidural blood patch treatment with real cases images.

## TABLE OF CONTENTS/OUTLINE

1 - Intracranial hypotension syndrome; 2 - Etiologies; 3 - Diagnostic criteria; 4 - Most common image manifestations; 5 - Imaging methods for etiology investigation. 6 - Spine MRI; 7 - CT myelography; 8 - CSF leaks; 9 - CSF-venous fistulas; 10 - Conservative, interventional and surgical treatments. 11 - Epidural blood patch: how to.

## MKEE-41 Distal Tibiofibular Syndesmosis: Stabilize Your Knowledge and Leave the Instability to the Injuries

Participants

Izabel Karam, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

## TEACHING POINTS

The purpose of this exhibit is: To review the anatomy and biomechanics of the distal tibiofibular syndesmosis; Discuss the role of each imaging method, including indications, advantages and disadvantages of each modality; To illustrate the main acute and chronic alterations in radiological and orthopedic practice, through didactic cases illustrating our institution through a multimodality approach; Discuss surgical indications and the importance of the findings for the orthopaedic surgeon, according to the imaging methods.

## TABLE OF CONTENTS/OUTLINE

Anatomy. Biomechanics. Indication for requesting imaging exams in general. Role of radiography, main views and how to evaluate. Role of ultrasonography. Role of CT in neutral. Role of CT with stress maneuvers. Role of Weight-bearing CT. Role of MRI. Surgical indications, importance of radiological findings, and radiological and surgical correlation. Summary and proposed evaluation and test request flowchart. Future perspectives.

## MKEE-42 Capturing Psoriatic Arthritis on Film: A Comprehensive Guide to Radiographic Assessment

## TEACHING POINTS

- Provide an overview of psoriatic arthritis.
- Emphasize the indications, limitations, and benefits of radiography in psoriatic arthritis.
- Compare different imaging techniques for psoriatic arthritis.
- Discuss the normal anatomy of the hand on plain film radiography.
- Emphasize the importance of a systematic approach to hand radiography.
- Become familiar with descriptive terms for common bone and soft tissue abnormalities seen in psoriatic arthritis.
- Provide case studies to illustrate the practical application of theoretical concepts.
- Analyze differential diagnostics, tips, and tricks.

## TABLE OF CONTENTS/OUTLINE

Overview of psoriatic arthritis: definition, epidemiology, pathogenesis, and clinical manifestations. Radiography in psoriatic arthritis: indications, limitations, and benefits. Comparison of imaging techniques for psoriatic arthritis: radiography, ultrasound, and MRI. Normal anatomy and systematic approach to the hand on plain film radiography. X-rays and psoriatic arthritis: descriptive terms for common bone and soft tissue abnormalities. Case studies: practical application of theoretical concepts. Differential diagnostics: osteoarthritis, gout, and rheumatoid arthritis. Tips and tricks for improving radiology reports. Conclusions: What rheumatologists want to know?

## MKEE-43 Bad to the Bone! Understanding and Applying Bone-RADS: A Standardized Scoring System for Bone Lesions

Participants

Ellis Mejias Febres, BS, Carolina, PR (*Presenter*) Nothing to Disclose

## TEACHING POINTS

-Review pathology of bone anatomy-Bone-RADS provides an algorithmic-type approach to assessing differential diagnosis of bone tumors -Each Bone-RADS score is determined by certain criteria that includes the clinical implications for each -Provision of case examples on conventional radiography and computed tomography (CT) to better understand Bone-RADS In this educational exhibit, we will review the standardized scoring system Bone-RADS, as well as provide radiologists and other health professionals with an understanding of Bone-RADS. The scoring system itself will be explained, supported by imaging from real cases. Finally, we will explain the implications every score has on the management of individual cases based on the Bone-RADS score assigned.

## TABLE OF CONTENTS/OUTLINE

I. Introduction-Review of bony anatomy Creation of Bone-RADS II. Overview of the criteria used in Bone-RADS III. Clinical implications/management of bone tumors based on Bone Rads-How Bone-RADS serves as a guide to assessing bone lesions. IV. Imaging examples-Case by case analysis of how Bone-RADS scores are determined. V. Conclusion-Recap of teaching points.

## MKEE-44 Anterior Cruciate Ligament Reconstruction: Imaging Evaluation of the Techniques, Normal Appearance and Complications

Participants

Andre Y. Aihara, MD, PhD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

## TEACHING POINTS

Anterior cruciate ligament (ACL) reconstruction aims to restore knee stability. The surgical techniques for ACL reconstruction include single and double bundle, while the most frequently used autografts are bone-patellar tendon-bone and hamstring tendons. CT is the gold standard for evaluating tunnel placement, while MRI is best for assessing graft continuity and soft tissue complications. MRI signal intensity of the graft changes over time, with low signal immediately after surgery, increased signal in the

first year due to remodeling, and low signal at 18 months. The objectives of this exhibit are: 1. To review ACL reconstruction techniques 2. Discuss imaging findings of normal postoperative ACL 3. Illustrate post-operative complications according to the potential sources: graft, technical and hardware complications, and soft tissues.

#### TABLE OF CONTENTS/OUTLINE

ACL reconstruction Techniques Normal postoperative Imaging • Femoral and tibial tunnels: position and size • Signal intensity of the graft over time • Harvest sites • Radiographic findings • CT findings • MRI findings Complications • Graft Partial tear Complete tear Porto-Knee Testing Device • Technical and hardware complications Anterior tibial tunnel with impingement Anterior femoral tunnel Tunnel widening Hardware migration Hardware fracture • Soft tissues Arthrofibrosis Infection Adventitious Bursitis

#### MKEE-45 Imaging Evaluation of the Patella as the Largest Sesamoid Bone

Participants

Andre Rosenfeld, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The patella is the largest sesamoid bone in the human body, developing within the quadriceps tendon and becoming a part of the knee's extensor mechanism. Ossification centers can be associated with congenital disorders. Forceful contraction of the extensor mechanism can lead to chronic apophysitis or acute avulsion fractures. Although rare, tumors of the patella can occur, with the majority being benign. Additionally, crystal arthropathies such as gout and CPPD can affect the patella through the deposit of crystals in the tendons or cartilage. Certain diseases are associated with typical patellar morphologies. For example, multiple epiphyseal dysplasia is characterized by a double-layered patella, Cryopyrin-Associated periodic syndromes result in a disproportionately diffuse increase in size, and CPPD deposits cause a gear-like morphology. The purpose of this study is to Review the normal development and anatomy of the patella. Discuss and illustrate the imaging findings of pathologies of the patella, which can be didactically divided into congenital disorders, mechanical/trauma, tumors, and crystal arthropathies. For this purpose, radiographs, CT scans, and MR images will be used. Highlight the typical patellar morphologies associated with various diseases. Elucidate how to differentiate normal variants from pathological conditions.

#### TABLE OF CONTENTS/OUTLINE

Normal development of the patella and anatomy Pathologies • Congenital: Bipartite, tripartite, double-layered patella, absence of the patella • Mechanical/trauma: Fracture, sleeve avulsion, Sinding-Larsen-Johansson • Tumors: benign and malign • Cryopyrin-Associated periodic syndromes • Crystal arthropathies: gout and CPPD

#### MKEE-46 3D Printing and Metaverse in Musculoskeletal Tumors - A New Assessment Tool

Participants

Flavia M. Costa, MD, PhD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- 3D printing preoperative planning for the treatment of MSK tumors (soft tissue and bone tumors). a. Segmentation. Virtual modeling. Build preparations. Quality assessment • Patient-specific devices - Personal surgical instruments (PSIs); • Identify what sequences should be used for Preoperative planning in many oncological patients with computed tomography (CT) (maximum slice thickness of 1 mm) and contrast-enhanced magnetic resonance (MR- 3 Tesla -Siemens) and multiplanar reconstruction; • Mixed Reality (MR) is a technology of real and virtual worlds to enhance visualizations, where physical and digital objects coexist and allow users to interact with both in real-time • Special considerations and Pitfalls.

#### TABLE OF CONTENTS/OUTLINE

1) The value of the combination of 3D printing and metaverse in surgical planning procedures in soft tissue and bone tumors; 2) These techniques promise improvements and outcomes for complex bone tumor resection 2) Case discussion: • Osteosarcomas resection and prosthesis manufacture • Pleomorphic liposarcomas recidive assessment • Schwannomas • Condrossarcomas • Bone marrow metastasis 3) To demonstrate many indirect effects of 3D printing on surgical procedures: • reduced surgery time; • to a reduced complication rate of wound infections and wound healing disorders and therefore enable earlier adjuvant therapy initiation 4) Common pitfalls 5) Conclusion Surgical planning using 3D printing and metaverse/ may result in negative tumor resection margins that reduce the risk of local recurrence and adversely affect patients' survival. Computer navigation and 3D-printed resection guides have been reported to be surgical accurate.

#### MKEE-47 What, Where, and Why - A Primer on Sonographic Evaluation of Traumatic Injuries to the Tendons of the Wrist and Hand

Participants

Kevin Sweetwood, MD, San Francisco, CA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Ultrasound of the tendons of the wrist and hand can provide a high spatial resolution evaluation of tendon pathology which is augmented by the ability to perform dynamic maneuvers that are unavailable with MRI studies. 2. Knowledge of the sonographic appearance and anatomy of these tendons and their associated structures is essential in correctly identifying pathology, providing relevant information to the referring physicians to guide appropriate management, and avoiding pitfalls leading to misdiagnosis. 3. Review of common injuries to the tendons of the wrist and hand focusing on relevant anatomy, sonographic findings, mechanisms of injury, and associated complications and classification schema that are significant for surgical planning.

#### TABLE OF CONTENTS/OUTLINE

1. What - Different traumatic pathologies of the tendons with review of terminology, sonographic appearance, and image acquisition techniques a. Partial versus complete tendon tears, tendon stump separation and retraction b. Pulley injuries c. Sagittal band injuries 2. Where - Review of relevant anatomy, sonographic landmarks, and surgical classification a. Appearance and relationships of the flexor digitorum profundus tendon, flexor digitorum superficialis tendon slips, and pulleys b. Identification of flexor tendon zones utilizing landmarks c. Appearance and relationships of the extensor tendons and sagittal bands 3. Why - Isolated tendon injury versus secondary post-traumatic injuries and significance of findings for surgical approach a. Distal radius fractures b. Hardware complications c. Surgical management

## **MKEE-48 Solving the Puzzle: Trying to Simplify Postsurgical Shoulder Images**

### **TEACHING POINTS**

To explain the main surgical shoulder techniques performed for the treatment of the rotator cuff lesions, long biceps tendon injuries and shoulder instability. Characterize the normal findings frequently seen in post surgery images, and differentiate them from potential pitfalls. Analyze the most common post surgical complications and describe the most frequent lesion recurrences.

### **TABLE OF CONTENTS/OUTLINE**

Postsurgical evaluation of the shoulder can be challenging for radiologists due to the complexity of the shoulder's anatomy and the variety of surgical techniques. The main surgeries involve repairing the rotator cuff and or long head of the biceps tendon injuries, and treating glenohumeral instability. Imaging methods play a fundamental role, particularly in cases where there are suspected surgical complications or reinjuries. They have precise indications, and sometimes, they need to be used in combination for the best accuracy. Misinterpretation of expected findings in postsurgical imaging studies is common due to changes in the anatomy and a lack of knowledge about surgical techniques. This can lead to incorrect reports, unnecessary reinterventions, and even legal issues to the surgeon. This work aims to provide a practical and organized overview of the different surgical techniques, normal postsurgical anatomical changes, common complications, and reinjuries on the operated shoulder, so as to allow the radiologist to perform an adequate interpretation of the images.

## **MKEE-49 Carpal Instability: Current Concepts and Diagnostic Approach**

### **TEACHING POINTS**

To show the complex anatomy of the wrist ligaments and its assess in imaging studies. Describe the different types of carpal instability, its pathomechanism, clinical prognosis and treatment implications. Review the different stages of nondissociative carpal instability, integrating images into the pathological process and clinical stages.

### **TABLE OF CONTENTS/OUTLINE**

Carpal instability refers to a group of ligament injuries that are responsible for a considerable degree of wrist pain and dysfunction, interfering with sports and daily life activities. Scapholunate and lunotriquetral ligament injuries are the most frequent cause of carpal instability. Depending on the type of injury, these ligaments may be the harbinger of a relentless progression to abnormal joint mechanics, cartilage wear, and degenerative changes. Imaging methods play a crucial role in the diagnosis and staging of this type of injuries which, if not treated, can lead to wrist osteoarthritis

## **MKEE-5 Diagnostic Evaluation of Very Small Peripheral Nerves: When Ultrasonography Made the Difference**

Participants

Marcos Felipe Correa, MD, (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

Describe the role of the high frequency ultrasound (US) in the assessment of very small peripheral nerves and its comparison with magnetic resonance imaging (MRI). Review the sonoanatomy and the topographic anatomy of the reported nerves and its correlation with MRI. Report selected clinical cases from our service, highlighting pathological involvement of very small peripheral nerves on US and its correlation with MRI, through illustrative images and videos.

### **TABLE OF CONTENTS/OUTLINE**

Introduction  
The role of the high frequency US in the assessment of the very small peripheral nerves  
Clinical cases of pathological involvement of very small peripheral nerves on US and its correlation with MRI:  
Palmar cutaneous neuropathy  
Posterior interosseous nerve syndrome  
Digital palmar proper nerve injury (stump neuroma neurotmesis)  
Lateral femoral cutaneous neuropathy (meralgia paresthetica)  
Postoperative radial nerve neuropathy  
Postoperative sural nerve (stump neuroma neurotmesis)

## **MKEE-50 An Ounce of Prevention is Worth a Pound of Cure**

### **TEACHING POINTS**

The purpose of this exhibit is:  
A. Discuss the classic concepts of instability and the relatively new concepts of microinstability of the spine;  
B. Demonstrate the cascade of degenerative instability going through three stages: (1) temporary dysfunction, (2) unstable dysfunction and a (3) final phase of restabilization;  
C. Correlate the phases of spinal instability and radiological findings in a multimodality approach;  
D. To review the main therapeutic options in the context of chronic spinal pain, microinstability and instability.

### **TABLE OF CONTENTS/OUTLINE**

A. Spine anatomy and biomechanics of spinal pain; B. Classic spinal instability concepts and degenerative stages; C. Concepts of microinstability and imaging findings in a multimodality approach; D. Discussion of the therapy decision, including conservative treatment measures, surgical indications and modalities of intervention.

## **MKEE-51 MR Neurography of the Lumbosacral Plexus- Tips on Technique and Injury Patterns**

### **TEACHING POINTS**

Pelvic and lower extremity sensorimotor disturbances frequently present a diagnostic challenge for referring clinicians and radiologists. Complex anatomy of the lumbosacral plexus in addition to varied clinical presentations make it difficult to pinpoint the site of pathology accounting for patients' symptoms. MR Neurography is a useful modality for evaluation of the nerves in the lumbosacral plexus and can serve as an adjunct to conventional MRI lumbar spine. 1-5 Significant improvements in signal to noise ratio and spatial resolution, particularly with 3D isotropic sequences, and emerging techniques such as deep learning reconstruction facilitate improved nerve visualization. When performing MR neurography, it is important for the radiologist to understand the anatomy of the lumbosacral plexus and to be aware of technical considerations in the pelvis.

### **TABLE OF CONTENTS/OUTLINE**

Background Anatomy Overview; Technical Considerations; Protocol/Sequences: high field strength, heavily T2W FS images

perpendicular to nerve, 2D/3D; Fat suppression: STIR, DIXON; Vascular suppression: DESS/MENSA; Motion reduction; Contrast-Gadolinium, Ferrumoxytol; Imaging around Metal; Deep learning reconstruction; Imaging features; Normal Injury Patterns; Case examples Iatrogenic, Traumatic

## **MKEE-52 Whole Body of MRI of Castration-Resistant Prostate Bone Metastasis: How and When**

Participants

Javier Hernandez Ganan, Hospitalet, Spain (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

1. To explain Whole-Body MRI protocol focusing on Dixon and Dwi sequences. 2. To discuss main indications. 3. To select target lesion to biopsy. Whole-body MRI is becoming increasingly important in patients diagnosed with disseminated prostate neoplasia, not only in clinical trials but also in daily practice. Specifically in patients with biochemical progression with bone disease, where more scenarios open up for adequate therapeutic guidance.

### **TABLE OF CONTENTS/OUTLINE**

Natural history of prostate cancer. WB MRI protocol: MET RADS. Role of Dixon and DWI sequences. Indications. 1. Before starting a new treatment. 2. Follow-up. 3. Select viable lesion to perform percutaneous biopsy. Current developments. 1. WB MRI at diagnosis in patients at high risk for prostate cancer: 'all in one' study. 2. PET MRI future indications.

## **MKEE-53 Hematopoietic Tumors of Bone - Growing Your Knowledge**

Participants

Bruno Cardoso, MD, Barbacena, Brazil (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

Obtaining a differential diagnosis for hematopoietic bone tumors is often challenging due to their varied features. Hematopoietic bone tumors encompass a wide spectrum, including multiple myeloma, lymphoma, histiocytosis, Erdheim-Chester disease, and Rosai-Dorfman disease. In some cases, these pathologies can mimic osteomyelitis or bone metastasis, making an accurate diagnosis crucial prior to treatment. X-rays are often the initial imaging study used to evaluate hematopoietic bone tumors, but they have limited sensitivity and specificity in some cases. CT scans, which provide detailed images of the spine and pelvis, are particularly useful for evaluating bony structures while avoiding the effects of overlapping structures. On the other hand, MRI provides better soft tissue contrast, aiding in the differentiation of benign and malignant conditions. Overall, the DWI technique can provide information about tumor cellularity and aggressiveness, potentially improving the accuracy and efficiency of MRI and enhancing patient care.

### **TABLE OF CONTENTS/OUTLINE**

I. Introduction, II. Imaging Modalities, III. Multiple myeloma, IV. Lymphoma, V. Langerhans cell histiocytosis, VI. Erdheim-Chester disease, VII. Rosai-Dorfman disease, IX. Differential diagnosis, X. Conclusion.

## **MKEE-54 Measurement of Bone Mineral Density in CT: Current Status and Future Perspectives**

### **TEACHING POINTS**

Screening bone mineral density at opportunistic CT is under active research to be adopted in daily practice. The major teaching points of this exhibit are 1) the history of measuring bone mineral density at CT, 2) the pros and cons of measuring bone mineral density at CT in comparison with DEXA, 3) technical considerations of measuring bone mineral density at CT, and 4) future perspectives of measuring bone mineral density at CT including deep learning technique.

### **TABLE OF CONTENTS/OUTLINE**

1. History of measuring bone mineral density using CT: QCT and opportunistic CT. 2. Pros and cons of measuring bone mineral density at CT in comparison with DEXA. 3. Technical considerations when measuring bone mineral density at CT. 4. Future perspectives of measuring bone mineral density at CT: deep learning technique and finite element analysis. 5. References

## **MKEE-55 Inside the Spinal Canal: A Journey Through Intraspinial Pathologies**

Participants

Alan Strapasson, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

Lesions within the spinal canal can range from benign to highly malignant, with only 20% of these lesions being intramedullary. Other possible origins include nerves, meninges, and vessels. The main objective of this exhibit are: 1. Review the anatomy, imaging protocols, and main pathologies affecting the medullary canal of the lumbar spine or the thoracolumbar transition. 2. Create a diagnostic flowchart for main intraspinal lesions based on age and comorbidities. 3. Describe the main imaging characteristics used to narrow down differentials. 4. Provide an updated classification of intramedullary lesions according to the World Health Organization's 5th edition.

### **TABLE OF CONTENTS/OUTLINE**

1. Introduction to lumbar spine anatomy, including transitional vertebra classification. 2. MRI protocols for the lumbar spine. 3. Diagnostic flowchart for lesions categorized by age and comorbidities. 4. Discussion of main imaging findings for various conditions such as Mixopapillary ependymoma, Intradural spinal lipoma, Schwannoma, Lipoma of the filum terminale, Plexiform neurofibroma, Metastases, Vertebral body hemangioma with epidural component, Chordoma, Dermoid cyst, and Epidermoid cyst, using illustrative cases. 5. Highlighting the main clinical and imaging aspects that differentiate lesions within the vertebral canal, to aid in prompt diagnosis and proper treatment. Overall, this exhibit provides a comprehensive overview of intraspinal lesions and their characteristics, contributing to accurate diagnosis and treatment planning.

## **MKEE-56 So, You Have a Trained AI Model, Now What? Step-by-step Guide to Deploying a Prototype Interface Using Open-source Python Tools to Test Newly Developed Internal MSK AI Tools**

Participants

Brendan Franz, MD, Detroit, MI (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

1. A brief overview of the initial process of training, and validation of an AI model. 2. Overview of open-source tools in python which can be used to deploy a test of an AI solution. 3. Walkthrough of implementation of tools to create a platform to internally test custom AI tools.

### **TABLE OF CONTENTS/OUTLINE**

-A brief overview of the initial process of training, and validation of an AI model.--Expected output of a training/validation process during AI model creation.--Walkthrough of open-source tools to deploy a test of an AI solution--Anaconda / Python Flask--Flask--Streamlit--Walkthrough of implementation of a web-based interface to test internally create AI tools--Conda installation--Installation of Flask, Streamlit and other related dependencies--Creating a simple HTML website to take an MSK radiograph and predict the image projection using a custom model file--Using Streamlit to visualize imaging data, masks and output.--Review of the utility of open-source software in healthcare--Conclusion/Summary

## **MKEE-57 MR Arthrograms: Expecting the Unexpected**

### **TEACHING POINTS**

After reviewing this education exhibit, the reader will understand: 1. Technique of normal arthrograms discussing the major large and medium joints with brief overview of normal post direct arthrogram anatomy. 2. Pitfalls and imaging findings related to common errors or unexpected findings in MR arthrography of larger and medium joints with focus on shoulder and knee. 3. Genesis of common errors and general procedural techniques to avoid these.

### **TABLE OF CONTENTS/OUTLINE**

1. Basic technique of fluoroscopic guided direct MR arthrogram for major joints. 2. Overview of normal appearance of common joint spaces post direct arthrogram 3. Unexpected findings or errors related to: a. Contrast media preparation -Over dilution -Increased concentration b. Injection technique -Over distention and contrast extravasation -Extra-articular injection -Intra-articular gas -Extra-articular local anesthetic c. Soft tissue injury d. Unexpected findings related to -Enhancing lesions e.g. fracture, vascular malformation -Anatomic variants e. Scanning -Timing -Incorrect sequence

## **MKEE-58 Cervical and Lumbar Spinal Fusion and Arthroplasty Beyond the Basics: From Surgical Techniques to Postoperative Imaging**

Participants

Gabriel Miranda, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

I) Discuss the role of each imaging method in postoperative evaluation of patients who have undergone cervical/lumbar spinal fusion or total disc replacement/disc arthroplasty. II) Review the different techniques of cervical and lumbar spinal surgery (indications, advantages and limitations), and describe the various surgical instrumentations/devices used in spinal fusion and total disc replacement (TDR)/disc arthroplasty procedures. III) Discuss a basic primer/checklist for radiological evaluation after cervical and lumbar spinal fusion or total disc replacement/disc arthroplasty, to help identify normal and abnormal postoperative findings on the various imaging modalities. IV) List the main early and late postoperative complications.

### **TABLE OF CONTENTS/OUTLINE**

Introduction: The importance of imaging in the evaluation after cervical/lumbar spinal fusion or disc arthroplasty. The main uses of each imaging modalities Spinal instrumentation nomenclature: Spinal fusion instrumentation: screws, plates, rods, interbody cages, bone grafts. Disc arthroplasty devices: disc prosthesis and its various models. Surgery techniques: Cervical spine: anterior cervical corpectomy and fusion, anterior cervical discectomy and fusion, posterior laminoforaminotomy, cervical disc arthroplasty. Lumbar spine: anterior lumbar interbody fusion, oblique lumbar interbody fusion, lateral/extreme/direct lumbar interbody fusion, transforaminal lumbar interbody fusion, posterior lumbar interbody fusion, and lumbar disc arthroplasty. Checklist for radiological postoperative evaluation: Normal postoperative findings. Early and late postoperative complications.

## **MKEE-59 Blossom with Artificial Intelligence: Hidden MSK Imaging Biomarkers for Cardiothoracic Diseases from Conventional Chest CT Examination**

### **TEACHING POINTS**

\*Definition and benefits: Opportunistic CT imaging means analyzing CT scans initially taken for other purposes but with potential to contribute to medical screening levels (primary, secondary, and tertiary screening), and identify incidental pathologies at zero additional costs or radiation exposure. \*Extraction of important musculoskeletal biomarkers is now feasible from conventional CT scans as predictors of cardiothoracic diseases, such as: -Bone density, osteoporosis and osteopenia, using phantomless measures of bone density- Thoracic spine degeneration, using modified Pfirrmann grading- Detailed pectoralis muscle composition measures loss (subcutaneous adipose tissue, intermuscular and perimuscular adipose tissue, extramyocellular lipids), sarcopenia, and prevention of adverse outcomes- Measures of costochondral and tracheal calcification as a marker for extraosseous calcium deposition \*Implementation of artificial intelligence (AI): AI algorithms hold promise for enhancing the precision and speed of the opportunistic CT imaging and can generate robust, reliable, and fast quantitative measurements that may not be readily apparent to the human eye.

### **TABLE OF CONTENTS/OUTLINE**

-Introduction-Methodology: Development of deep-learning algorithm -Clinical application: Current evidences for predictive values for various common cardiothoracic disease-Future directions: AI role for efficient implementation in routine clinical practice

## **MKEE-6 All Grown Up: Pictorial Review of Premalignant Bone and Soft Tissue Lesions**

## TEACHING POINTS

• There are several bones and soft tissue lesions that can undergo malignant transformation. • It is important to understand the characteristic imaging appearance and pitfalls of these lesions. • Radiologists should be familiar with the clinical and imaging management of these premalignant lesions to prevent misdiagnosis.

## TABLE OF CONTENTS/OUTLINE

Several bones and soft tissue lesions can undergo malignant transformation. This includes premalignant benign tumors and non-neoplastic conditions that injure bone and soft tissue. Both groups require an understanding of key clinical and imaging features to arrive at the correct diagnosis. Enlargement, new pain, or aggressive imaging features can raise suspicion for malignant transformation. This exhibit will discuss 3 main categories of premalignant musculoskeletal lesions: Benign tumors • Osteochondroma/multiple hereditary exostoses (MHE) ? chondrosarcoma • Enchondroma (Maffucci, Olliers) ? chondrosarcoma • Fibrous dysplasia? osteosarcoma • Giant cell tumor of bone? malignant giant cell tumor Prior bone injury (non-neoplastic) • Osteomyelitis ? squamous cell carcinoma, osteosarcoma. • Radiation ? osteosarcomas, soft tissue sarcomas • Bone infarct ? secondary osteosarcoma • Paget disease ? osteosarcomas, chondrosarcomas, or fibrosarcoma. Soft tissue lesions • Burns/scars ? squamous cell carcinoma, basal cell carcinoma • Synovial Chondromatosis ? chondrosarcoma • Neurofibroma ? Malignant peripheral nerve sheath tumor • Atypical lipomatous tumor (ALT) ? dedifferentiated Liposarcoma

## MKEE-60 Unraveling Wrist Radiographs: A Review of Traumatic Wrist Injuries Focusing on Radiographic Imaging

### TEACHING POINTS

?? After reviewing this education exhibit, the reader will: 1. Understand how various views of the wrist are obtained and the indications of different special views. 2. Understand normal anatomy and imaging appearance of the wrist on radiographs. 3. Understand the imaging appearance and clinical context of common and uncommon traumatic carpal injuries and carpal joint disruptions.?

### TABLE OF CONTENTS/OUTLINE

1. Wrist radiographs - indications of various views (including standard views and less common views such as carpal tunnel) and optimal patient positioning. 2. Normal wrist anatomy on standard radiographs. 3. Approach to interpretation?? 4. Relevant anatomy, mechanism of injury/ pathogenesis, imaging examples, brief review of clinical presentation and implications, and management of: a. Different carpal bone fractures b. Different types of carpal dislocations c. Carpo-metacarpal joint fracture-dislocations? ??

## MKEE-61 Microinstability and MRI: Unveiling the Invisible

Participants

Natan Ribeiro, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- Introduce microinstability as a disorder with subtle joint instability- Understand the significance of MRI in diagnosing microinstability- Explore the application of MRI in various joints affected by microinstability- Discuss advanced MRI techniques for accurate detection and staging of joint lesions- Review the evolving relationship between MRI and arthroscopy for microinstability diagnosis and treatment

### TABLE OF CONTENTS/OUTLINE

1. Introduction to Microinstability and MRI 2. The Role of MRI in the Diagnosis and Management of Joint Microinstability 3. Comprehensive Imaging Evaluation of Microinstability in Various Joints 4. Dynamic MRI for Detection of Functional Causes of Joint Instability 5. Quantitative MRI Techniques for Objective Evaluation of Cartilage Health 6. The Benefits of Functional MRI in Understanding Joint Microinstability 7. Advanced MRI Techniques for Accurate Detection and Staging of Joint Lesions 8. The Evolving Relationship Between MRI and Arthroscopy for Microinstability Diagnosis and Treatment 9. The Pivotal Role of Radiologists in Microinstability Diagnosis and Management 10. Imaging Findings in Anterior Shoulder Microinstability: An MRI-Based Approach 11. MRI Findings Suggestive of Knee Microinstability: A Comprehensive Review 12. Management of Microinstability in Different Joints: An Evidence-Based Approach 13. Role of MRI in Guiding Surgical Intervention for Joint Microinstability 14. Understanding the Pathophysiology and Anatomy of Joint Microinstability for Accurate MRI Interpretation 15. Advancements in MR Imaging Technology for Improved Detection and Characterization of Microinstability

## MKEE-62 Lateral Meniscus Instability: Understanding Its Anatomy and Unraveling Posterior Attachment Lesions

Participants

Carlos H. Longo, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The lateral meniscus is more mobile than the medial meniscus due to its less extensive attachments, and its posterior attachment anatomy has been less studied than the medial meniscus. The posterior root attachment and meniscotibial (coronary) ligaments serve as important static stabilizers, but it is the thin popliteomeniscal fascicles (PMF) that play an important role in the dynamic stabilization of the lateral meniscus during knee flexion. The anterior (Humphrey) and posterior (Wrisberg) meniscofemoral ligaments also contribute to stabilization. The absence of popliteomeniscal ligaments (congenital or traumatic origin) allows an anterior displacement of the posterior horn of the lateral meniscus during the flexion of the knee (hypermobile meniscus). It can cause symptoms, including pain, blockage and snapping ("snapping knee syndrome"). Peripheric tears of the posterior horn can be associated with buckle-handle tears and meniscal flap dislocation. Posterior root tear is less common in the lateral meniscus than the medial meniscus. The purpose of this study is to: - Review the normal anatomy of the posterior horn of the lateral meniscus and its attachments. - Discuss and illustrate cases of hypermobile meniscus associated with absence of the PMF on MRI. - Illustrate cases of posterior attachments tear on MRI

### TABLE OF CONTENTS/OUTLINE

Normal anatomy of the posterior attachments of the lateral meniscus and its normal appearance on MRI Hypermobile meniscus

associated with tear of the PMFBuckle-handle tearPosterior root tearMeniscofemoral ligaments tear

### **MKEE-63 Geographic Superficial Soft Tissue Masses: A Guide for Ill-defined Masses**

Participants

Rachel Bass, MD, Birmingham, AL (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

1. Masses in the superficial soft tissues often have ill-defined borders, and are often benign. Framing the differential into dermal, lipomatous, fibrous, lymphatic and vascular categories may be helpful. 2. Skin thickening with ill-defined underlying edema without enhancement suggests lymphatic origin. This may be localized, and correspond to a pedunculated mass in the morbidly obese, known as a "pseudosarcoma". 3. Ill-defined mass with a fascial tail suggests fibromatosis, which may be desmoid type or superficial. Degree of hyperintensity of fluid weighted sequences corresponds to immature collagen and active tumor. 4. Diffuse fibromatosis is a unique form of neurofibroma that is uncommonly associated with NF-1, and presents with geographic skin thickening with ill-defined subcutaneous edema, nodularity and enhancement. 5. Superficial angiosarcoma will be a nodular, vascular tumor with enhancement and increased activity hot on PET. Often metastatic at presentation.

#### **TABLE OF CONTENTS/OUTLINE**

1. Introduction 2. Lymphatic: Massive localized lymphedema, papillomatosis cutis lymphocystica, Proteus syndrome, cutaneous lymphoma 3. Vascular: Vascular malformation, angiosarcoma 4. Lipomatous: Fat necrosis, adiposis delorosa 5. Fibrous: Desmoid type fibromatosis, superficial fibromatosis, fibrosarcoma 5. Neurogenic: Diffuse neurofibroma 6. Dermal: Squamous cell carcinoma

### **MKEE-64 "Thinking On Your Feet" - A Step Forward on the Evaluation and Treatment of Morton Neuromas**

Participants

Mary Creedon, MD, Ann Arbor, MI (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

1. Overview of Morton neuromas and relevant anatomy 2. Review of the sonographic evaluation of Morton neuromas including patient position, transducer position, and dynamic maneuvers 3. Review of the MRI protocol and findings related to Morton neuromas 4. Differential diagnoses and pitfalls 5. Treatment overview including ultrasound-guided procedure indications, required materials, and technique for steroid, anesthetic, and alcohol Morton neuroma injections

#### **TABLE OF CONTENTS/OUTLINE**

Introduction and overview Pathophysiology and types of traumatic neuromas Nomenclature Epidemiology Clinical Findings Most common locations Ultrasound evaluation Transducer selection and settings Patient and transducer position (dorsal versus plantar imaging) Dynamic maneuvers Sonographic findings Differential diagnoses (including plantar plate tears and intermetatarsal bursitis) and ways to differentiate sonographically MRI evaluation MRI protocol and the use of intravenous gadolinium contrast Literature favoring prone vs supine patient position for MRI and US Differential diagnoses and pitfalls Treatment options Non-operative, non-invasive treatments Ultrasound-guided procedures: a. Indications, risks, and precautions, b. Required materials for steroid, anesthetic, and alcohol injections, c. Technique details Surgical excision Summary

### **MKEE-65 Post-operative Fluid Collections Following Lumbar Spine Surgery: Differential Diagnosis and Surgical Considerations**

#### **TEACHING POINTS**

Post-operative fluid collections represent a common imaging finding in patients who have undergone recent lumbar spine surgery. Radiologists must be familiar with different types of post-operative fluid collections that can occur following lumbar spine surgery and their salient imaging findings to guide patient management. 1) Recognize different types of lumbar spine surgical techniques including posterior spinal, transforaminal, anterior, extreme lateral, and oblique lateral interbody fusions 2) Review different types of lumbar spine post-operative fluid collections, including cerebrospinal fluid leak (CSF) and pseudomeningocele, lymphocele, bone morphogenetic protein (BMP)-related fluid collection, hematoma, abscess, and urinoma 3) Identify which types of surgical techniques are associated with different post-operative lumbar fluid collections 4) Review treatment considerations for different types of post-operative lumbar spine fluid collections

#### **TABLE OF CONTENTS/OUTLINE**

Review anterior and posterior approach lumbar spine fusion techniques, relevant anatomy, and post-operative imaging appearance Anterior approach - Anterior lumbar interbody fusion (ALIF) - Oblique lateral interbody fusion (OLIF) - Extreme lateral lumbar interbody fusion (XLIF) Posterior approach - Posterior lumbar interbody fusion (PLIF) - Transforaminal lumbar interbody fusion (TLIF) Review the imaging appearance and management, of different types of post-operative fluid collections after lumbar spine fusion - Pseudomeningocele/CSF leak - Bone morphogenetic protein (BMP)-related fluid collections - Lymphocele - Hematoma - Abscess with discitis/osteomyelitis - Urinoma

### **MKEE-66 MRI Evaluation of Oblique Injuries: Introduction of the Deadrise Sign**

#### **TEACHING POINTS**

Importance of oblique injuries in sports imaging Primary muscle involved and location of injuries Common MRI findings Basic MRI protocol and treatment algorithm

#### **TABLE OF CONTENTS/OUTLINE**

Epidemiology of oblique injuries - Target population - Mechanism of injury - Value of MRI Anatomy of the lateral abdominal wall - Muscle layers, fiber orientation, and important attachments - Normal variations in the lower "floating" ribs Single institution retrospective cohort of 29 unique injuries in 23 patients - Primary muscle involved - Surrounding injury - Location - Average length of injury Common MRI findings and pitfalls - Introduction of the "deadrise" imaging sign - Severity grading considerations Case examples - Low grade strain (muscle edema only; no macroscopic tear) - Tears at the lower rib insertions (deadrise sign) - Tears at the iliac attachment (less common) - Differential diagnosis MRI protocol considerations - Sequences, scanning time, and short and long-axis views of the rib/cartilage at the site of injury - Common MRI artifacts - Rib level identification Treatment algorithm -

Collaboration with orthopedic surgery

## **MKEE-67 The Musculoskeletal Manifestations of Aging: What the Radiologist Needs to Know in Caring for Our Growing Elderly Population**

### **TEACHING POINTS**

1. Briefly discuss the multifactorial biochemical processes that contribute to normal aging of the musculoskeletal system. 2. Familiarize the radiologist with the normal radiologic manifestations seen in the musculoskeletal system that arise from aging. 3. Review the radiologic manifestations of the most common musculoskeletal pathologies that occur in the elderly population resulting from normal aging.

### **TABLE OF CONTENTS/OUTLINE**

A. Brief review of the biochemical processes that contribute to normal aging in the context of musculoskeletal manifestations. B. Illustrate normal and pathologic radiologic manifestations of aging in the musculoskeletal system a) Changes in bone homeostasis i. Osteopenia/osteoporosis, Paget's disease ii. Insufficiency fractures iii. Fragility fractures b) Architectural changes in skeletal muscle composition i. Sarcopenia c) Architectural changes in articular cartilage composition i. Osteoarthritis d) Architectural changes in tendon composition decreased cellular response to injury i. Tendinopathy and tendon tears e) Metabolic derangement and predisposing co-morbidities seen in the elderly population i. Diffuse idiopathic skeletal hyperostosis ii. Crystal deposition disease f) Genomic instability from accumulated oxidative damage and decreased repair mechanisms i. Multiple myeloma ii. Metastatic disease

## **MKEE-68 Where is the Contrast? Patterns to Recognize and Pitfalls to Avoid for Successful MSK Arthrography**

Participants

Maxine Kresse, MD, (Presenter) Nothing to Disclose

### **TEACHING POINTS**

-Review of arthrogram techniques of the major joints to include range of normal appearances and demonstrate pathology with successful injection-Recognition of extra-articular injection, with cross-sectional correlates-How to avoid and correct for common pitfalls

### **TABLE OF CONTENTS/OUTLINE**

-Brief introduction to fluoroscopy guided arthrograms of the major joints (including shoulder, elbow, wrist, hip, knee, and ankle)-For each of the major joints: a. Normal arthrogram appearance, including normal bursa/recess communications with the joint; b. Successful intra-articular injection with pathology diagnosed by the arthrogram fluoroscopy images (i.e. full thickness rotator cuff tear); c. Numerous examples of extra-articular injections, with cross sectional correlates on the location of the contrast; d. Tips to avoid common pitfalls and ways to adjust to achieve an intra-articular injection-Summarize pearls and pitfalls to aid in troubleshooting to avoid compromised cross-sectional exams

## **MKEE-69 "Untangling the Nerves" - Sonographic Findings of Upper Extremity Nerve Entrapments and Injuries with MRI Correlation**

Participants

Preethi Kesavan, MD, Ann Arbor, MI (Presenter) Nothing to Disclose

### **TEACHING POINTS**

1. Benefits in the use of ultrasound with technique details 2. Classification and sonographic imaging of peripheral nerve injuries with MRI correlation 3. Ultrasound of nerve entrapment syndromes of the upper extremity with MRI correlation 4. Ultrasound-guided peripheral nerve interventions

### **TABLE OF CONTENTS/OUTLINE**

Why ultrasound and how? Benefits and advantages in the use of ultrasound Technique details, including transducer selection and machine settings Dynamic imaging and the use of Doppler (including newer microvascular imaging techniques) Sonographic findings including normal reference cross-sectional measurements Types of peripheral nerve injuries Classification and types of peripheral nerve injuries Sonographic findings of normal versus abnormal peripheral nerves MRI correlative imaging Ultrasound imaging of upper extremity nerve entrapment syndromes Sites of entrapment, relevant anatomy, and associated pathophysiology Sonographic imaging findings with MRI correlation Secondary imaging findings including muscle denervation edema, atrophy, and myosteatosis Ultrasound-guided peripheral nerve interventions Indications, risks, precautions, and benefits of ultrasound. Required materials including what to inject (e.g., nonparticulate versus particulate corticosteroids) Ultrasound-guided diagnostic and therapeutic injections including hydrodissection and alcohol/ethanol neurolysis Ultrasound-guided cyst aspiration/decompression to relieve nerve compression Summary

## **MKEE-7 Tibial Plateau Fractures: Common Classification Systems and Clinical Considerations**

Participants

Rachel Bass, MD, Birmingham, AL (Presenter) Nothing to Disclose

### **TEACHING POINTS**

1. The Schatzker classification of tibial plateau fractures is commonly used but lacks description for coronally oriented fractures. The three column approach highlights the importance of the posterior tibial plateau. 2. The Kfuri (modified Schatzker) classification system was introduced in 2018, and marries the Schatzker classification with anterior and posterior modifiers, and is accepted among orthopedic surgeons. 3. Involvement of the posterior column affects surgical approach and technique, and stabilization of the posterior medial column and tibial rim is critical for good functional outcome. 4. Preoperative CT provides critical information regarding fracture orientation, depression, and vascular injury. 5. Preoperative MRI following external fixation may provide critical information to the orthopedic surgeon regarding meniscus and ligamentous injury that will be addressed at the time of definitive internal fixation.

### **TABLE OF CONTENTS/OUTLINE**

1. Tibial Plateau Classification systems: AO/OTA, Schatzker, Three Column, Kfuri (Modified Schatzker) 2. Surgical Approach and

clinical importance: Buttress fixation, posterior column fixation, graft placement 3. Soft tissue injury: Open fracture, vascular injury, meniscal tear, cruciate ligament tear, compartment syndrome 4. Long term outcomes: Expected healing, postoperative osteoarthritis leading to arthroplasty.

## **MKEE-70 Don't Miss a Step: Ligament Injury in Midtarsal Sprain**

### **TEACHING POINTS**

Review anatomy of themidtarsal (Chopart) joint complexDescribe variant anatomy and common pitfallsProvide recommendations for best visualization of ligaments ofmidtarsal joint complex in MRI-scansDiscuss trauma mechanisms ofmidtarsal sprain and deduce possible injury patternsProvide imaging examples ofmidtarsal sprains (MRI and X-ray)Discuss treatment

### **TABLE OF CONTENTS/OUTLINE**

Background: • Epidemiology• Role of imagingLigament anatomy visualized by 3D-renderings and MRI-imaging examples (with common variant appearances):Talocalcaneonavicular joint • Dorsal talonavicular ligament• Calcaneonavicular portion of bifurcate ligament• Spring ligament complexCalcaneocuboid joint• Dorsal calcaneocuboid ligament• Calcaneocuboid portion of bifurcate ligament• Short and long plantar ligamentsPathomechanisms ofmidtarsal sprain:• Inversion-type trauma (most common): lateral and possible dorsal distraction with medial compression• Eversion-type trauma: medial distraction with lateral compressionImaging examples ofmidtarsal ligament injuries:• Ligament tear and sprain• Common findings accompanying ligament injuriesTreatment

## **MKEE-71 Keeping Cool: Thermoprotection Strategies for Musculoskeletal Ablations**

### **TEACHING POINTS**

Basic principles of how to ablate targeted tissues and minimize damage to surrounding structures.-Review passive monitoring and active protection techniques during thermoablation.

### **TABLE OF CONTENTS/OUTLINE**

Percutaneous thermal ablation is being increasingly performed for oncologic treatment within bone and non-visceral soft tissue.- Certain risks are of interest during musculoskeletal ablation, namely skin and neurovascular bundle injury when compared to other deep organ ablations. Given this, concurrent multi-modal thermoprotective measures should be used to prevent non-target destruction of overlying skin and adjacent structures. Both active and passive protective measures are outlined in our presentation.-Passive techniques are utilised to monitor the patient and can include clinical monitoring and real-time intra-procedural imaging. Direct patient interaction and instruction, such as asking the patient to move intermittently or report altered sensation is a subjective method of clinical monitoring in order to detect neural injury. In contrast, intra-procedural imaging is more objective, whereby the radiologist can view the ablation zone in real-time, allowing confident treatment of the target lesion while avoiding non-target structures.-By comparison, active techniques are utilised to protect non-target structures and can be subdivided into temperature modulation and displacement techniques. Temperature modulation can be achieved with warmed/cooled saline gloves on the skin or subcutaneous fluid injection to dissipate temperature. Displacement of non-target adjacent structures is usually achieved with hydrodisplacement or pneumodisplacement.

## **MKEE-72 Dual Energy X-ray Absorptiometry (DXA): Principles and Tips in Classic and New Applications**

### **TEACHING POINTS**

• To review the basics of dual energy x-ray absorptiometry (DXA) • To discuss the use of DXA in the assessment of bone density, also reviewing the contribution of new developments such as trabecular bone score (TBS) in the diagnosis of osteoporosis. • To analyze the evolving role of DXA in the evaluation of soft tissues especially for body composition such as quantification of fat and estimation of skeletal muscle mass in sarcopenia. • To emphasize pitfalls, diagnostic difficulties, and provide clue points in order to improve performance in DXA exams.

### **TABLE OF CONTENTS/OUTLINE**

DXA is the 'gold-standard' in quantitative assessment of bone mineral density in the diagnosis of osteoporosis. The use of DXA has been also recommended in sarcopenia, to assess lean mass as an estimation of all non-fat/non-bone tissues, fat mass and bone mineral content. We review: 1. Basics and technique of DXA. DXA principle is based on attenuation coefficient of different tissues with low energy X-ray beams. 2. Uses of DXA. BMD study. Body composition and sarcopenia studies 3. BMD study. DXA performance. Causes of mistakes in different steps of DXA study: 3.1 Before the study: technologist training and competence, daily calibration, anthropometric data, regions to scan. 3.2 During the study: Patient positioning, Image acquisition: regions of interest. 4. Osteoporosis diagnosis. Image interpretation: Parameters. Adequate use of T-score and Z-score; Report. Detection of vertebral fractures or bone diseases (osteoarthritis, metastases, Paget's disease), soft tissue lesions, detection of artifacts-foreign bodies. New developments: TBS. 5. Body composition. Sarcopenia. DXA software analysis. Comparison with different techniques.

## **MKEE-73 A Radiological Overview of Elbow Arthroplasty: Practical Keys in the Assessment of Elbow Replacement**

Participants

Javier Azpeitia Arman, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

-To know the different types of elbow replacement. -To review the role of imaging techniques (plain radiograph, CT, MR, US, scintigraphy) in the evaluation of elbow replacements. -To understand usefulness and limitations of plain radiographs and CT in the evaluation of elbow replacements, emphasizing useful parameters and illustrating image analysis and interpretation. -To become familiar with normal and abnormal postoperative imaging findings and signs of complications

### **TABLE OF CONTENTS/OUTLINE**

We review imaging of elbow replacement, highlighting key concepts perceived as important variables by the surgeon and correlating images with clinical considerations and functional outcomes. We present: 1. A review of types of replacement. 2. Surgery. Aims. 3. Imaging. Plain radiographs: -Technique and views. Standard image acquisition: beam and anatomical landmarks -Parameters that should be evaluated: description of the components, alignment relative to normal anatomic alignment. 4. Imaging. CT: -Technique. -Parameters that should be evaluated. -Imaging of complications: Aseptic loosening, infections, ulnar nerve complications,

instability, disassembly, dislocation, subluxation, intraoperative fractures, mechanical failure of prosthetic components, and ectopic bone formation 5. Role of MRI, US and scintigraphy. .

#### **MKEE-74 Beyond the Surface: Exploring Extradigital Glomus Tumors - A Comprehensive Review of 64 Cases with Radiologic-Pathologic Correlation**

Participants

Gabriela Serra Del Carpio, Madrid, Spain (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

- In our study males outnumbered females with a male-female ratio of 2.1:1. - The mean age at the time of diagnosis was 55,8 years. - The tumors had a mean size of 1 cm and were located in the lower limbs in most cases (38/64).- In 17 cases (27%) a diagnostic imaging test was performed (US, MRI or both). - The radiological appearance of a glomus tumor on ultrasound was in most cases as a circumscribed hypoechoic oval nodule located in the subcutaneous layer and horizontally oriented. - Spectral Doppler can demonstrate both venous and arterial intralesional flow and in some cases a "Vascular stalk sign". - Images obtained by ultrasound are not specific but they play an important role in early diagnosis, give precise information on location, and provide guidance for excision of glomus tumors.

##### **TABLE OF CONTENTS/OUTLINE**

IntroductionMaterials and Methods1.Results- Clinical findings - Radiological findings- Histological, cytological and immunohistochemical features- Differential diagnosis- Discussion2. Conclusions

#### **MKEE-75 Weight-Bearing MRI: A New Technology for Changing the Approach to Pathology from Diagnosis to Therapy**

Participants

Joan C. Vilanova, MD, PhD, Girona, Spain (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

• Learn the technical methodology to perform a weight bearing MRI (WB) for the different areas of the body/joints • Show the proper analysis of the weight bearing examination to distinguish physiological changes from pathology on a clinical-radiological correlation • Know the most common and appropriate indications for weight bearing MRI from the different areas/joints of the body

##### **TABLE OF CONTENTS/OUTLINE**

•Introduction • WB MRI equipment characteristics • WB MRI technique of different areas/joints, procedure to perform the upright examination: craniovertebral junction (CVJ), spine, shoulder, knee, hip, ankle, foot, temporomandibular joint (TMJ); showing dynamic MRI evaluation • WB postprocessing: quantification of the changes from non-WB to the WB examination • Indications: CVJ: instability; Spine: instability, postural alignments changes, discopathy, lateral recess - foramen - central canal, postsurgical evaluation; Shoulder: instability, impingement; Knee: meniscal-ligamentous instability, patellar shift, Impingement; Hip: impingement, microinstability; Ankle: ligamentous instability, impingement, plantar fascia; Foot: metatarsalgia evaluation; TMJ: internal joint disorders • Benefits and limitations • Conclusions

#### **MKEE-76 Radiologic Stranger Thing: Phosphaturic Mesenchymal Tumor (PMT) and Pitfalls**

Participants

Jacobo Porto Alvarez, MD, Vedra, Spain (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

-To describe and understand the physiopathology of PMT. -To learn about the most typical presentation of PMT. -To describe that the diagnosis is based on pathologic and biochemical analysis, but the imaging techniques are crucial in the tumor location for surgery treatment. -To alert about PMT and emphasise the radiologist's role in the management of PMT and when a radiologist can be crucial in raising the suspicion of PMT. -To describe some of the most common radiologic pitfalls.

##### **TABLE OF CONTENTS/OUTLINE**

-Introduction: Actions of FGF-23, analytic changes and the bone implication. -Location and symptoms of PMT.-Diagnoses and treatment of PMT.-The radiologist's role in the management of PMT.-Pitfalls of PMT.

#### **MKEE-77 Soft Tissue Tumours: Anatomic-Based Approach**

Participants

Imran Ladak, MD,BSC, London, ON (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

Review the 2020 World Health Organization (WHO) classification of soft tissue tumours. Understand the role of imaging in the diagnosis and management of soft tissue tumours Learn an approach to benign and malignant soft tissue tumours based on characteristic location and imaging appearance.

##### **TABLE OF CONTENTS/OUTLINE**

Introduction Introduction to soft tissue tumours 2020 World Health Organization classification of soft tissue tumours Role of imaging in soft tissue tumours Soft tissue tumours by location and appearance Common/benign soft tissue tumours Lipoma Venous hemangioma Peripheral nerve sheath tumour Skin Dermatofibrosarcoma protuberans Chest Elastofibroma dorsi Solitary fibrous tumour of the pleura Arm Desmoid-type fibromatosis Nodular fasciitis Trunk Desmoid tumour Leiomyosarcoma Retroperitoneal liposarcoma Hand Fibrolipomatous hamartoma Giant cell tumour of tendon sheath Palmar fibromatosis Thigh Intramuscular myxoma Liposarcoma Undifferentiated pleomorphic sarcoma Leg/foot Synovial sarcoma Palmar fibromatosis

#### **MKEE-78 Breaking Down Bone and Muscle: The Nitty-gritty of MSK Infections**

Participants

Alba Salgado Parente, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To revise the physiopathology and imaging findings of musculoskeletal infections (soft tissue, bone and joint, spine and periprosthetic infections) with different imaging modalities (conventional radiography, US, CT, MRI, PET)2. To discuss the differential entities that can mimic septic arthritis and osteomyelitis, focusing on pearls and potential pitfalls to make a correct diagnosis3. To develop a systematic approach for interpreting imaging findings of MSK infections, including evaluation of the extent and severity of infection and potential complications

#### TABLE OF CONTENTS/OUTLINE

1. Introduction2. Imaging techniques in the evaluation of MSK infections: conventional radiography, ultrasound, CT, MRI and nuclear medicine techniques3. MSK infections: Pathophysiology and key conceptsa. Soft tissue infections: Cellulitis, abscess/phlegmon, myositis/pyomyositis, superficial, deep and necrotizing fasciitisb. Bone and joint infections: Septic arthritis, septic bursitis, tenosynovitis, acute osteomyelitis, chronic osteomyelitis, Diabetic footc. Spine infections: Spondylodiscitis, facet joint septic arthritisd. Periprosthetic infections: Technical considerations and imaging4. Pitfalls and mimics - How to avoid them: Is this septic arthritis?, Is this osteomyelitis?5. Systematic approach to MSK infections: What steps to follow6. Conclusions7. References

#### MKEE-79 **Spotlight on Musculoskeletal Lymphoma: A Radiological Exploration of an Uncommon Entity**

Participants

Maxine Kresse, MD, (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Radiology plays a central role in the diagnosis of musculoskeletal lymphoma.2. Musculoskeletal lymphoma can present with different patterns.3. Lymphoma involving the muscle, skin, and bones can occur at nearly every age and may present with atypical features that can distinguish it from other entities.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction-Overview of musculoskeletal lymphoma-Importance of radiology in diagnosis2. Imaging modalities for musculoskeletal lymphoma, including Radiography, Ultrasound (US), Computed Tomography (CT), Positron Emission Tomography (PET), and Magnetic Resonance Imaging (MRI)3. Imaging features and patterns of musculoskeletal lymphoma-Osseous lymphoma: lytic pattern, sclerotic pattern, and "near normal" radiographic findings-Soft tissue lymphoma-Trans-spatial lymphoma4. Differential diagnosis-Other primary bone and soft tissue neoplasms-Metastatic lesions-Inflammatory and infectious conditions5. Conclusion: key takeaways from radiologic evaluation of musculoskeletal lymphoma

#### MKEE-8 **Non-Tumoral Spine Bone Lesions: A Pictorial Review of Common and Uncommon Pathologies**

Participants

Andre Mannato, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The features of non-neoplastic bone lesions in the spine are often similar to those of malignant tumors, and a differential diagnosis is challenging to obtain in some cases. Non-tumoral bone lesions of the spine have a broad spectrum, including mechanical, infectious, inflammatory, vascular, and other causes. The clinical manifestations of ranging from back pain to neurological deficits mimicking myelopathy or radiculopathy. A careful and attentive imaging evaluation can help narrow differential diagnosis and potentially avoid unnecessary biopsy. Therefore, an accurate diagnosis is important prior to treatment.X-rays are often the first imaging study used to evaluate spinal tumors, but they have limited sensitivity and specificity for diagnosing benign tumors. CT scans provide detailed images of the spine and are particularly useful for evaluating the bony structures, such as in the case of vertebral hemangiomas. MRI, on the other hand, provides better soft tissue contrast and can help differentiate between benign and malignant tumors.Overall, the DWI and Dixon techniques offer several advantages in magnetic resonance imaging, including improved detection of diseases, improved visualization of structures, can help distinguish between benign and malignant tumors and provide information about tumor cellularity and aggressiveness. These techniques have the potential to improve the accuracy and efficiency of MRI and enhance patient care.

#### TABLE OF CONTENTS/OUTLINE

I. Introduction; II. Imaging Modalities; III. Mechanical Causes; IV. Infectious Lesions of the Spine; V. Inflammatory Causes; VI. Vascular; VII. Miscellaneous; IX. Conclusion.

#### MKEE-80 **Imaging Review of Knee Ligament Reconstructions Other Than the ACL**

Participants

Thurl Hugh Cledera, MD, Taguig, Philippines (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Knee ligament injuries are common and operative techniques are continually evolving. Accurate clinical information along with imaging diagnosis aids in selection of the appropriate operative technique. While imaging features of anterior cruciate ligament (ACL) reconstruction are well-described in literature, data on indications, postoperative imaging findings and complications of reconstructions of other ligaments of the knee are limited. In this education exhibit, we discuss the imaging findings and complications of reconstructions of knee ligaments other than the ACL.The objectives of this education exhibit are:1. Recognize normal radiographic and MR appearing of non-ACL ligament reconstructions 2. Understand the basic operative concepts and techniques for each type of reconstruction including indications and common grafts used 3. Recognize commonly encountered postoperative complications to aid in providing a precise and meaningful radiologic report

#### TABLE OF CONTENTS/OUTLINE

TECHNICAL CONSIDERATIONS •Conventional radiographs •Stress radiographs•Pre and postoperative MRI BASIC INDICATIONS AND NORMAL RADIOGRAPHS AND MRI OF THE FOLLOWING PROCEDURES Posterior cruciate ligament (PCL) reconstruction Posterolateral corner reconstruction •Laprade technique •Andrews technique •Lemaire technique Anterolateral knee reconstruction •Lateral extra-

articular tenodesis (LET) •Anterolateral ligament (ALL) reconstruction Posteromedial corner reconstruction Medial patellofemoral ligament (MPFL) reconstruction Multiligament reconstruction COMPLICATIONS •Graft failure •Malpositioned graft •Femoral and/or tibial tunnel widening •Arthrofibrosis •Graft impingement

### **MKEE-81 Radiographs and MRI of Tendon and Ligament Surgeries: A Resident's Primer**

Participants

Juvel Lee, MD, Richmond, BC (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Radiodense hardware such as in metallic fixation and arthroplasties are easily evaluated on radiographs by both trainees and nontrainees alike. On the other hand, surgeries that utilize mostly radiolucent or nonmetallic components such as tendon transfer, ligament reconstruction and other soft tissue procedures may be more challenging to assess, especially by trainees. These procedures may manifest with nodular or tubular lucencies that may be mistaken for cysts, infection or tumors.??In this education exhibit, we provide a concise review or "pocket guide" of normal and abnormal imaging appearance of commonly encountered soft tissue procedures to aid the radiology resident/trainee in appropriate assessment of non-radiodense operative hardware. ??The objectives of this education exhibit are: ?1. Recognize normal radiographic appearance of commonly encountered non-radiodense operative hardware ?2. Understand the basic operative concepts and indications of these soft tissue procedures?3. Recognize radiographic and basic MR appearance of complications of these soft tissue procedures?

#### **TABLE OF CONTENTS/OUTLINE**

For each procedure, the following will be discussed: PROCEDURE: INDICATIONS: RADIOGRAPHS: MRI: COMPLICATIONS: SHOULDER Rotator cuff repair Biceps tenodesis Anterior stabilization ELBOW UCL reconstruction Distal biceps repair WRIST and HAND Volar oblique ligament reconstruction Thumb UCL reconstruction KNEE ACL reconstruction MPFL reconstruction Patellar tendon transfer ANKLE Tendon transfer procedures Lateral ligament reconstruction

### **MKEE-82 Utilizing Dual Energy CT for Evaluating Gout: A Review of Imaging Artifacts and Pitfalls for Trainees to Avoid**

#### **TEACHING POINTS**

Discuss the basics of dual-energy CT (DECT) technology and its current clinical application in the detection of gout. Demonstrate typical imaging findings of gout on DECT. Review imaging artifacts commonly seen when utilizing DECT gout protocol, including those related to keratin, metallic objects, and image noise. Explore additional pitfalls for trainees to avoid including the physiologic deposition of monosodium urate in various tissues. Understand techniques to minimize DECT artifacts.

#### **TABLE OF CONTENTS/OUTLINE**

Epidemiology and clinical presentation of gout, a crystal arthropathy caused by the deposition of monosodium urate (MSU) crystals Typical imaging findings of gout on radiography, conventional CT and MRI Physics of DECT and its clinical application for the evaluation of gout Reviewing artifacts causing misregistration of non-MSU crystals as gout: Keratin: Nailbed keratin and skin callous Metallic objects: Foreign bodies, CT table and orthopedic hardware including intervertebral disc spacer material Image noise: Quantum mottle causing image noise artifact with incorrectly-labeled submillimeter foci of MSU crystals Additional miscellaneous pitfalls for trainees to avoid: Limitations of DECT for evaluating chronic gout Physiologic deposition of MSU crystals in non-gout patients Troubleshooting and minimizing DECT artifacts Physiologic deposition of MSU crystals in non-gout patients Troubleshooting and minimizing DECT artifacts

### **MKEE-83 CUP - A Novel Comprehensive Classification System for Triangular Fibrocartilage Complex Lesions**

Participants

Jan Grunz, MD, Wuerzburg, Germany (*Presenter*) Research Consultant, Siemens AG

#### **TEACHING POINTS**

The classifications of Palmer (1989) and Atzei/Luchetti (2011) constitute the current standard to characterize lesions of the triangular fibrocartilage complex (TFCC). However, both systems have substantial drawbacks that limit clinical applicability. The Palmer classification does not discern between the foveal and styloid insertions of the radioulnar ligaments, which is essential for treatment, while differentiating between traumatic and degenerative lesions is often not feasible. In contrast, the Atzei classification focuses exclusively on the ulnar-sided periphery. Several less common lesion types are not included in either system. These limitations motivated us to develop a new comprehensive and clinically-oriented classification for lesions of the TFCC. In the proposed system, the acronym 'CUP' refers to central lesions (C) limited to the articular disc, ulnar lesions (U) affecting the insertions of the radioulnar ligaments, and peripheral lesions (P), which comprise injuries of the ulnocarpal meniscus and ligaments, the dorsal joint capsule, and the extensor carpi ulnaris tendon sheath. Each group is subdivided into three grades of severity with adequate treatment recommendations.

#### **TABLE OF CONTENTS/OUTLINE**

1. TFCC anatomy 1.1 Biomechanical properties 1.2 Vascularization 2. Imaging 2.1 MRI with and without intravenous contrast enhancement 2.2 CT and MR arthrography 3. Lesion types 3.1 Central lesions 3.2 Ulnar lesions 3.3 Peripheral lesions 3.4 Combinations with fractures and avulsion injuries 4. Therapy 4.1 Surgery versus conservative treatment 4.2 Overview of surgical procedures 5. Discussion

### **MKEE-84 There's Light at the End of the Carpal Tunnel - But is it a Good Thing**

Participants

Jan Grunz, MD, Wuerzburg, Germany (*Presenter*) Research Consultant, Siemens AG

#### **TEACHING POINTS**

Constituting the most common entrapment neuropathy by far, carpal tunnel syndrome (CTS) is caused by compression of the median nerve within a narrow passage on the palmar side of the wrist. The carpal tunnel is located beneath the transverse carpal ligament and extends from the scaphoid and trapezium to the hamate and pisiform bone. Containing the deep and superficial flexor tendons in addition to the median nerve, entrapment neuropathy can occur in case of mismatches between the tunnel's size and

the volume of its contents. CTS patients typically report painful paresthesia of digits I-III with aggravation at night, when provoked by tapping the median nerve at the carpal tunnel entrance (Hoffmann-Tinel sign), and when flexing the wrist (Phalen test). Chronic CTS results in atrophy of the thenar muscles with limited opposition and abduction of the thumb. Among several causes, tenosynovialitis of the flexor tendons is the most frequent. While CTS is usually diagnosed in clinical and electrophysiological examinations, radiologists can provide valuable insights by performing cross-sectional measurements and qualitative assessment of the edematous nerve structure in ultrasound and MRI. Particularly if symptoms persist after carpal tunnel release surgery, both imaging methods are of great importance.

#### TABLE OF CONTENTS/OUTLINE

1. Anatomy of the carpal tunnel 2. Imaging techniques 2.1 Ultrasound 2.2 MRI with and without i.v. contrast enhancement 3. Pathophysiology of CTS 3.1 Tenosynovialitis 3.2 Congenital anatomical variants 3.2 Bony stenoses 3.4. Tumors 4. Postoperative imaging 5. Discussion

#### **MKEE-85 The Many Faces of Heterotopic Ossification: Pathogenesis, Imaging Features and Differential Diagnosis**

Participants  
Ustun Aydingoz, MD, Ankara, Turkey (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Three requisites stand out for heterotopic ossification (HO) formation: osteogenic precursor cells, multiple inducing factors and pertinent biochemical signaling pathways, a favorable microenvironment.
- Recent evidence suggests that the initiation of HO particularly necessitates local hypoxia in the microenvironment.
- Heterotopic ossification is a commonly encountered condition on imaging with characteristic—if not pathognomonic—findings involving musculoskeletal soft tissues such as muscles, ligaments, and tendons.
- A host of differential diagnostic possibilities need to be considered when there is concern for heterotopic ossification.

#### TABLE OF CONTENTS/OUTLINE

- Pathophysiologic background of HO.
- Case examples of various manifestations of HO on imaging with pearls and pitfalls (e.g., myositis ossificans [traumatic, neurogenic], periostitis ossificans, arachnoiditis ossificans, panniculitis ossificans, Pellegrini-Stieda lesion [HO of the medial collateral ligament of the knee], HO of the posterior longitudinal ligament [OPLL] or nuchal ligament, Bennett lesion [HO of the posterior band of the inferior glenohumeral ligament], other enthesal ossifications [diffuse idiopathic skeletal hyperostosis], tendon ossifications [Achilles, hip abductors, rotator cuff], fibrodysplasia ossificans progressiva).
- Differential diagnostic considerations for HO on imaging (e.g., calcific tendinitis, calcific periarthritis, dystrophic calcifications, extraskeletal bone tumors, synovial sarcoma, calcinosis cutis, calcinosis of chronic renal failure).

#### **MKEE-86 Spectrum of Calcaneal Tumors and Tumor-like Lesions: Imaging Findings with Pathological Correlations**

#### TEACHING POINTS

1. Lipomas can be distinguished from simple bone cysts based on central dystrophic calcification, particularly with fat necrosis and cyst formation. 2. An associated primary bone lesion should always be considered in older patients with aneurysmal bone cyst-like changes. The differential diagnosis can be narrowed down using a combination of imaging features (lesion components, location) and clinical information (age). 3. The age for some calcaneal tumors is different from tumors in other locations. This makes it difficult to differentiate between chondroblastomas, characterized by marginal sclerosis and calcifications, and giant cell tumors (GCTs). 4. The tumor matrix pattern should be emphasized. A stippled or ring-like pattern indicates cartilage calcification, cloud-like appearance indicates osteoid mineralization, and a ground-glass density indicates fiber matrix. 5. Age needs to be considered in solid tumors with non-specific imaging features. Enchondromas, chondrosarcomas, metastatic tumors, myelomas, lymphomas, and undifferentiated pleomorphic sarcomas are common in adults, whereas, GCTs, chondroblastomas, osteosarcomas, Ewing sarcomas, and Langerhans cell histiocytosis are more common in young individuals.

#### TABLE OF CONTENTS/OUTLINE

1. Chondroblastoma 2. Chondromyxoid fibroma 3. Secondary peripheral atypical cartilaginous tumor 4. Chondrosarcoma 5. Osteoid osteoma 6. Osteosarcoma 7. Hemangioma 8. Epithelioid hemangioendothelioma 9. Aneurysmal bone cyst 10. Giant cell tumor 11. Simple bone cyst 12. Fibrous dysplasia 13. Lipoma 14. Undifferentiated pleomorphic sarcoma 15. Metastases 16. Myeloma 17. Primary lymphoma 18. Ewing sarcoma

#### **MKEE-87 Discordance Between Bone Mineral Density and Trabecular Bone Scores for the Lumbar Spine in the Setting of Intra-Abdominal Calcifications and Dense Surgical Materials**

#### TEACHING POINTS

Spinal vertebrae contain the most metabolically active components, and they are therefore commonly the first site to manifest the osteoporotic process. Calcifications (i.e., fibroids, vascular calcifications, and degenerative joint disease) and dense surgical material (i.e., vertebroplasty, stents, embolization coils, and IVC filters) within the field of view falsely elevate bone mineral density (BMD) measurements. To mitigate such artifactual elevation of BMD measurements, the International Society of Clinical Densitometry (ISCD) has come up with guidelines for BMD reporting such as excluding affected vertebrae from analysis. Trabecular Bone Score (TBS), on the other hand, is a novel tool for assessing fracture risk by analyzing bone trabecular microarchitecture. Despite being adherent to ISCD guidelines, we have found in clinical practice that many patients with intra-abdominal calcifications and surgical material have normal lumbar spine BMD measurements but low TBS scores. These inconsistencies suggest that the utilization of DXA BMD measurements alone may under-predict fracture risk, especially in patients with calcifications or surgical material, and that TBS may be especially helpful as an adjunct to DXA in this patient population.

#### TABLE OF CONTENTS/OUTLINE

1. Fundamentals of DXA. 2. Pathophysiology of osteoporosis. 3. Fundamentals of TBS. 4. Limitations of DXA in the setting of intra-abdominal calcifications and surgical material. 5. Case comparisons of DXA and TBS scores to demonstrate discordances. 6. Conclusion.

## **MKEE-88 Peripheral Arthropathies: Step by Step**

Participants

Raquel Acosta Hernandez, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

Introduction: Despite the development of CT and MRI, plain radiography stands as the irreplaceable test of first diagnostic approach in peripheral arthropathies. Following a complete diagnostic algorithm helps to emphasize the key points in the differential diagnosis between inflammatory versus osteoarthritis disease. Once joint space narrowing is evaluated, the presence of bone erosions (as a hallmark of joint inflammatory arthritis in ankylosing spondylitis, psoriatic arthritis, and reactive arthritis), osteophytes (typical of degenerative arthritis), and their distribution are basic pillars on guiding an accurate diagnosis. Teaching points Approach the radiographic algorithm evaluation of peripheral arthropathies based on classification into inflammatory or degenerative pattern: joint space narrowing (uniform and non-uniform), bone erosion and distribution pattern. Introduced a systematic reading of hands and feet plain radiographs following the ABCDs acronym: articular, bone, cartilage, distribution and soft tissue. Correlate typical plain radiographic of peripheral arthritis findings with CT and MRI studies.

### **TABLE OF CONTENTS/OUTLINE**

- Radiographic algorithm evaluation of peripheral arthropathies based on joint space narrowing and typical examples of articular erosions patterns.- Systematic ABCDs acronym reading: articular (deformity and destruction), bone (erosion, osteopenia, proliferative changes and distal affectation), cartilage, distribution and soft tissue (soft tissue swelling).

## **MKEE-89 Imaging Findings of Monoclonal Gammopathy of Clinical Significance**

Participants

Anika Dutta, MD, Rochester, MN (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

Monoclonal Gammopathy of Clinical Significance (MGCS) describes a constellation of diseases involving clonal B cells or plasma cells which produce monoclonal proteins and cause organ damage. MGCSs can be divided into groups based on which organ systems are most affected. Some of these entities have distinct imaging findings that suggest the diagnosis. By the end of this education exhibit, the viewer should be able to identify those findings and clinical symptoms that characterize them. Recognizing these findings may help lead to an expedited and accurate diagnosis.

### **TABLE OF CONTENTS/OUTLINE**

1. Introduction - what is MGCS? 2. MGCS definition and symptom classes 3. Detailed description of syndromes, for example: -POEMS syndrome (polyradiculoneuropathy, organomegaly, endocrinopathy, monoclonal plasma cell disorder, and skin changes): Description, Imaging findings with case example -AL Amyloid: Description, Imaging findings with examples 4. Conclusions 5. References

## **MKEE-9 Patellofemoral Dysfunction: A Practical Approach and New Radiological Insights**

Participants

Lucas Bettin, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

Patellofemoral dysfunction occurs as a result of an imbalance in the dynamic relationship between the patella and the trochlea during knee flexion, secondary to anatomical or functional abnormalities. Classic risk factors are usually limited to local anatomy, such as trochlear dysplasia, patella alta, patellar tilt and increased TT-GT distance. Recently, new concepts on the functional evaluation of the lower limbs and their relationship with the pelvis have earned more attention, including muscle function. Imaging of the patellofemoral joint includes standard radiographs of the knee to evaluate bone morphology and patellofemoral relationship. MR imaging is important to also assess cartilage, capsule and ligaments. For preoperative planning, computed tomography can assess the knee in different degrees of flexion, besides providing multiplanar reconstructions. The evaluation of the entire mechanical axis of the lower limb is also of fundamental importance. Findings such as the anterior tilt of the pelvis, femoral or tibial torsion abnormalities, increased femorotibial rotation and deviations of the mechanical axis significantly modify the dynamics of the extensor mechanism. Clinical treatment and physiotherapy are typically the first-line approach, taking into account the particularities of the mechanical axis. Surgical intervention is indicated for recurrent dislocations. Therefore, anatomical and functional concepts of the patellofemoral joint and the entire lower limb are necessary to determine the optimal treatment.

### **TABLE OF CONTENTS/OUTLINE**

1. Introduction; 2. Anatomy biomechanics; 3. Dysfunction vs. instability; 4. Radiological approach; 5. Beyond Dejour; 6. Conclusion.

## **MKEE-90 What's New and Not So New in Postoperative MRI of Rotator Cuff Tendon Repair: Conventional and New Surgical Techniques, Normal and Abnormal Postoperative Findings**

Participants

Yeongseo Yoo, MD, Hwaseong, Korea, Republic Of (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

1. To review conventional techniques for rotator cuff tendon (RCT) repair, including correlation with postoperative MRI findings 2. To introduce newer techniques of RCT repair with MRI correlation 3. To diagnose normal and abnormal postoperative MRI findings of RCT repair, including complications and RCT repair failures

### **TABLE OF CONTENTS/OUTLINE**

I. Surgical techniques on postoperative MRI of RCT repair A. Conventional suture techniques (single, double row, transosseous equivalent suture bridge) B. Newer techniques- Augmentation, pectoralis major transfer, biceps transfer, Polyglycolic acid insertion, allograft patch graft (fascia lata, dermis), biceps splinting, Others (biceps tenotomy, deltoidoplasty) II. Normal postoperative MRI findings 1. MR appearance of repaired SST tendon (SI, morphology changes, gap) - thinning, high SI (Sugaya type I, II -Sugaya classification) 2. Significance of fluid collections: glenohumeral joint, subacromial-subdeltoid bursa, subcoracoid bursa 3. Susceptibility artifacts (air, anchor, metal from burr) 4. Suture anchor positions: absorbable vs. non-absorbable 5. Rotator interval

change: arthroscopy portal III. Abnormal postoperative MRI findings 1. Thinning of repaired tendon (Sugaya type III) 2. Focal defect/minor discontinuity of repaired tendon (Sugaya type IV) 3. Major discontinuity/full thickness tear with retraction (Sugaya type V) 4. Displacement of anchors 5. Infection (arthritis, bursitis, soft tissue infection) 6. Fracture

### **MKEE-91 The Key Determinant of Purely Lytic Diaphyseal Lesion Visibility on Radiographs: Exclusively Trabecular Versus Concurrent Endosteal Cortical Involvement**

Participants

Ustun Aydingoz, MD, Ankara, Turkey (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

- Location of a lytic lesion within a long bone (i.e., metaphyseal versus diaphyseal; trabecular versus cortical involvement) is a key determinant of the lesion's conspicuity on conventional radiographs.
- Due to the sparseness of trabeculae at diaphysis, lytic diaphyseal bone lesions without matrix mineralization are visible on radiographs only if they involve the endosteal cortex.
- The oft-repeated statement that "30%-50% of trabecular bone must be removed before radiolucency becomes visible on radiographs" can be misleading: A large diaphyseal trabecular lytic lesion involving 100% of the cancellous bone may not be visible on radiographs, if it is confined to the medullary space and does not also involve at least the endosteal surface of the cortex—constituting a major limitation for conventional radiography.
- This is true for lytic lesions of all Lodwick grades: Moth-eaten or permeative lytic bone lesions that involve the diaphysis are not be visible on radiographs at sites where they spare the cortex.
- Such lytic lesions that are obscure on conventional radiography are readily detected on MRI; when a primary bone tumor is suspected and radiographs are negative, MRI is appropriate.

#### **TABLE OF CONTENTS/OUTLINE**

- The modified Lodwick classification of lytic bone lesions on conventional radiographs.
- Radiographic/anatomic explanation of the crucial role the location plays in lytic lesion conspicuity on radiography at different sites (i.e., metaphyseal versus diaphyseal; trabecular versus trabecular plus cortical) on anatomic specimens.
- Case examples of lytic lesions that are obscure on conventional radiographs (due to their diaphyseal medullary space involvement) but are visible on CT or MRI.

### **MKEE-92 Ultrasound of Acute Tendon Tears with Emphasis on Anatomic Landmarks**

Participants

Juvel Lee, MD, Richmond, BC (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Ultrasound of acute tendon tears with emphasis on anatomic landmarks Sonography has become an essential imaging tool in musculoskeletal imaging, with precision nearly equal to that of MRI for imaging tendon abnormalities. In emergency setting, the rarity of acute tendon tears compared to overuse tendon abnormalities may result in a challenging scan for trainees, sonographers, emergency and musculoskeletal radiologists. In this education exhibit, we present an approach to sonography of acute tendon tears that may be encountered in the emergency or radiology department. The objectives of this educational exhibit are: Brief review of scanning techniques of the various tendons Recognize the normal appearance of the outlined tendons with MRI correlation and emphasizing important anatomic landmarks Recognize imaging presentation of the various traumatic tendon tears

#### **TABLE OF CONTENTS/OUTLINE**

For each structure, the following will be discussed:1. US scanning technique2. US anatomy and landmarks with MRI correlate3. Pathology (strains, partial, complete tears)Pectoralis Distal biceps Triceps Quadriceps Hamstrings Achilles tendon and related structures

### **MKEE-93 A 360-degree Imaging Tour of Sports Injuries in the Elbow**

Participants

Lauren Pringle, MD, Columbia, MO (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

1. Review of anatomy of the elbow, with detail of the ulnar collateral ligament bundles and bands of the anterior bundle.
2. Phases of throwing mechanism are important in understanding forces applied to different structures of the elbow and how injuries then develop.
3. Pediatric throwers are susceptible to injuries also seen in adults but can experience additional injuries seen only during certain phases of development.
4. Medial elbow injuries are among the most common and well-known in athletes but specific injuries in the posterior elbow, lateral elbow, and anterior elbow are not infrequent and will be described.
5. Illustrative cases of these injuries demonstrate important imaging findings and diagnostic tools to improve detection for learners.
6. Treatment/surgical strategies and the surgeon's perspective will also be reviewed for some of these conditions.

#### **TABLE OF CONTENTS/OUTLINE**

1. Anatomy review
2. Throwing mechanism and stresses
3. Medial elbow injuries
  - a. Ulnar collateral ligament
  - b. Medial epicondylitis
  - c. Medial epicondylar apophysitis
  - d. Ulnar neuritis
  - e. Posteromedial impingement syndrome
4. Posterior elbow injuries
  - a. Olecranon stress fractures
  - b. Triceps
  - i. Tendon
  - ii. Muscle
  - c. Snapping triceps
5. Lateral elbow injuries
  - a. Panner's disease
  - b. Capitellum osteochondral lesion
  - c. Tennis elbow
6. Anterior elbow injuries
  - a. Biceps
  - b. Brachialis

### **MKEE-94 Image-guided Symphyseal and Perisymphiseal Musculoskeletal Interventions: Indications, Challenges and Authors' Experience**

Participants

Juvel Lee, MD, Richmond, BC (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Image-guided musculoskeletal interventions in and about the symphysis pubis can be technically challenging. The joint and surrounding region are small, resulting in limited ability to maneuver and an often cumbersome procedure. Important neurovascular and visceral structures are present nearby, including the dorsal vessels of the penis in males, pudendal nerve, branches of the ilioinguinal nerve and urinary bladder, necessitating judicious pre-procedure planning. Lastly, most procedures require inguinal or

groin exposure thereby making careful draping of the pelvis of paramount importance. The main benefits of image guidance are improved precision of needle placement and simultaneous visualization of the needle and critical neurovascular structures that must be avoided during needle insertion. In this education exhibit, we provide an overview of symphyseal and perisymphyseal interventions including injections, aspirations, percutaneous tendon treatments and biopsies, their indications, risks, and complications, focusing on approaches, tips and tricks to a successful procedure.

#### TABLE OF CONTENTS/OUTLINE

Relevant anatomy of the symphysis and parasymphyseal spaces  
Pre-procedural considerations  
General technical considerations  
For each specific procedure, the following will be outlined: Purpose, patient position, equipment, technique, anatomic considerations (critical structures to avoid)  
Specific procedures: Fluoroscopy-guided diagnostic injection  
US and fluoroscopy-guided therapeutic injection  
US and fluoroscopy-guided joint and soft tissue aspiration  
Percutaneous tendon treatments  
US and CT-guided bone biopsies

#### MKEE-95 Solitary Bone Metastasis: Multimodality Imaging Approach and Ten Years Experience

Participants

Fernando Rodado Aranguren, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

-To analyze the radiological presentation and spectrum of solitary bone metastasis (SBM) through the different techniques: plain x-ray, Computed Tomography (CT), Magnetic Resonance imaging and Positron Emission Tomography/CT (PET/CT).  
-To present our ten year experience in two centers.

#### TABLE OF CONTENTS/OUTLINE

Metastatic bone disease occurs frequently in malignant tumors, but isolated involvement is unusual and has been proposed as a favorable prognostic factor against multiple bone metastatic involvement. This study aims to analyze the radiological presentation of these unique metastasis. We reviewed all bone metastases diagnosed in the last 10 years in two centers and we included patients with SBM with histological confirmation and no visceral, brain or lymph node metastases (n= 79). The primary tumors, in order of frequency, were lung, breast, prostate and melanoma. In up to 36% of SBM, the primary tumor was unknown at the time of diagnosis. 86% of the lesions were located in the spine, pelvis or femur. The most frequent radiological and clinical presentation was osteolytic lesion without periosteal reaction (75%) causing pain (42%). 68% were treated, mostly with radiotherapy. The detection of these lesions depends on their size, so the methods of choice are MR or PET/CT, with good correlation for the evaluation of the associated soft tissue mass component. In the presence of a solitary bone lesion, metastasis should be included in the differential diagnosis along with primary bone tumors, especially osteolytic lesions in patients older than 40 years with or without cancer disease history. Radiologists should be aware of the characteristics of suspicious malignant lesions that would require biopsy.

#### MKEE-96 Musculoskeletal Paraneoplastic Syndromes

#### TEACHING POINTS

Early recognition of a paraneoplastic syndrome allows for diagnosis of an occult malignancy, and earlier treatment. This review describes unique imaging findings and clinical associations of musculoskeletal paraneoplastic disorders.  
1. Oncogenic osteomalacia is associated with phosphaturic mesenchymal tumors (PMT), which produces FGF23, leading to decreased calcium/phosphate absorption, and consequently insufficiency fractures.  
2. Secondary hypertrophic osteoarthropathy, associated with non-small cell lung cancer, manifests with digital clubbing or joint effusions and symmetric long bone periostitis.  
3. Cancer-associated myositis, most commonly dermatomyositis, occurs within 3 years of the diagnosis of an underlying malignancy.  
4. Palmar fasciitis and polyarthritits presents with painful hand swelling and palmar skin thickening. It is associated with breast and female genitourinary malignancies.  
5. Remitting seronegative symmetric synovitis with pitting edema presents with nonerosive polyarthritits and is associated with hematopoietic and lung malignancies.  
6. Pancreatic panniculitis with polyarthritits, associated with pancreatic neoplasms, shows osteolytic lesions of the distal extremities with increased periarticular edema and synovitis on MRI.  
7. Sweet Syndrome, associated with acute myeloid leukemia, presents with fever and erythematous skin lesions.  
8. Eosinophilic fasciitis presents with fascial edema and enhancement, and is associated with hematologic malignancies.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction  
2. Musculoskeletal Paraneoplastic Syndromes including malignant associations, clinical manifestations, and imaging features.

#### MKEE-97 Principles, Anatomy and Imaging of Ankle and Foot Tendon Transfers

Participants

Dyan V. Flores, MD, Ottawa, ON (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The goals of any tendon transfer are to create a stable, functioning, and plantigrade foot. Tendon transfers were reported first in the literature as early as 1881; the first case was transfer of peroneal tendons to the Achilles in a young patient who had poliomyelitis. With the eradication of polio in developed countries, experience with a variety of tendon transfers has been lost. Aside from correction of foot deformities, tendon transfer can be performed for tendon dysfunction and tendinopathy and correction of lateral ankle instability. In this education exhibit, we discuss common foot and ankle tendon transfers highlighting principles, anatomy and imaging.

#### TABLE OF CONTENTS/OUTLINE

Anatomy and biomechanics of ankle tendon transfers  
Principles of tendon transfers  
Types of ankle tendon transfers:  
1. For correction of foot deformity  
PTT transfer for adult acquired flatfoot deformity  
Extensor tendon transfer for equinovarus deformity  
Peroneus longus to peroneus brevis tendon transfer for Charcot-Marie-Tooth disease  
2. For reinforcement of a diseased tendon (tendinopathy or tendon tear)  
FHL transfer for Achilles tendon  
FHL transfer for peroneal tendons  
FDL transfer for tibialis posterior tendon  
3. For correction of lateral ankle instability  
Lee procedure  
Evans procedure  
Chrisman Snook procedure  
Ancillary osseous (i.e. calcaneal osteotomy) and soft tissue (i.e. Achilles tendon lengthening) procedures

#### MKEE-98 Cricket is Coming; Are You Ready to Image

## TEACHING POINTS

1. Cricket is one of the fastest growing sports in the world, with popularity growth in non-traditional cricketing nations like the United States and continental Europe. 2. Understanding player roles and biomechanics is key to understanding common injury patterns.

## TABLE OF CONTENTS/OUTLINE

From starting in south east England in the 1600s and traditionally played in the Commonwealth countries, played over 5 days with a rest day to the current 100 ball and 20 over three to four hour formats with night games, entertainment value, advertisement, immigration, universal online access and money spinning leagues have resulted in unprecedented growth in popularity of cricket across the world. In the United States alone, from 30,000 people watching/playing cricket in 2006, there are now more than 200,000 people playing cricket in over 6000 teams. The Indian premier league (IPL) is the most popular league, and had a value of \$10.9 billion in 2022. Specific player roles actions in cricket predispose them to different injury patterns. This exhibit provides a comprehensive overview of common cricketing injuries based on player role actions. The three basic roles in cricket are batting, bowling and fielding, each with sub specializations. Fast/medium pace bowlers are most prone to injuries in the spine (pars/pedicle stress), elbow, ankle (instability, posterior impingement), abdominal wall (side strain) and groin (athletic pubalgia) due to the nature of bowling action. Batsmen and fielders are prone to hamstring and quadriceps strains due to sudden sprints. Acrobatic fielding attempts diving result in shoulder injuries. Contact injuries of the fingers like dislocations fractures are common in the wicketkeeper and fielders.

## MKEE-99 Microinstability in the Musculoskeletal System: Biomechanical Concepts to Imaging Interpretation

Participants

Aurea Mohana-Borges, MD, MSc, (*Presenter*) Nothing to Disclose

## TEACHING POINTS

To introduce joint biomechanics as a guide for imaging interpretation of microinstability, emphasizing its relationship with osseous and soft tissue (capsule, ligaments, and muscles) integrity and the role of imaging [Radiographs (Rx), Computed Tomography (CT), and Magnetic Resonance Imaging (MRI)] in its diagnosis. This guide will highlight anatomic landmarks implicated in joint stability, their relevance in different types of synovial joints, and implications in joint biomechanics. It will compare and contrast normal anatomy with examples of commonly encountered pathologies associated with microinstability.

## TABLE OF CONTENTS/OUTLINE

Explanation of the concept of microinstability. Demonstration of types of movements in different synovial joints. Demonstration of normal anatomy of joint stabilizers with Rx, CT, and MRI. Examples of microinstability with corresponding commonly encountered pathologies in the osseous structure and soft tissues, with emphasis on the shoulder, hip, knee, and ankle joints.

MKEE-1

### Imaging-Guided Perineural Injections of the Lower Extremity from the Pelvis to the Foot

#### Participants

Tanya L. Tivorsak, MD, (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Perineural injections can be performed under CT or ultrasound guidance for diagnostic and therapeutic purposes. 2. Ultrasound guidance can be used for peripheral nerve injections as peripheral nerves can be localized well on ultrasound and with real-time guidance. 3. CT guidance can be used for certain perineural injections such as in the pelvis that may be difficult to visualize under ultrasound. 4. This exhibit will provide a guide for injecting certain nerves that are commonly requested at our institution.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction and indications for perineural injections - relieve nerve pain, pinpoint site of potential nerve injury prior to nerve surgery. 2. Procedure preparation - pre-procedure imaging review (MR neurography), ultrasound transducers, needle size, and volume of injectant. 3. Technique for injecting certain nerves from the pelvis to the foot including lateral femoral cutaneous, pudendal, genitofemoral, sciatic and piriformis muscle, saphenous (adductor canal), common peroneal, sural, superficial peroneal, and tibial nerves. 4. Risks and complications. 5. Overview of cryoneurolysis application and techniques.

MKEE-10

### Out of Shape: Musculoskeletal Manifestations of Sickle Cell Disease

#### Participants

Leonardo Kazunori Tsuji, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Review the main aspects related to musculoskeletal findings of sickle cell disease, including etiology, pathophysiology, epidemiology, clinical classification. 2. To illustrate the main imaging findings and how to assess this condition in a multimodality approach, focusing on radiographs, CT and MRI studies, including new concepts and advanced sequences.

#### TABLE OF CONTENTS/OUTLINE

1. Review the main aspects related to musculoskeletal findings of sickle cell disease, including etiology, pathophysiology, epidemiology, clinical classification. 2. Clinical and imaging findings in a multimodality approach, focusing on radiographs, CT and MRI studies. 3. Musculoskeletal findings of sickle cell disease, as microcirculation or anemia related, and major complications (including septic arthritis and osteomyelitis). 4. Bring the most updated concepts of the disease and the imaging role, including advanced MRI sequences, involving diagnosis and patient care.

Printed on: 04/12/24

MKEE-100

### Energy Spectrum CT Application: Analysis of Changes in Bone Density of Vertebral and Paravertebral Muscle Composition Before and After Kidney Transplantation

#### TEACHING POINTS

1) To illustrate most patients with chronic kidney disease before and after renal transplantation have abnormal mineral and bone metabolism due to chronic kidney disease-mineral bone disorder (CKD-MBD). 2) To illustrate energy spectrum CT can quantify vertebral bone mineral density and paravertebral tissue composition through base material separation. 3) To demonstrate energy spectrum CT can apply the separation and quantitative analysis of base substances to provide more data for clinical treatment.

#### TABLE OF CONTENTS/OUTLINE

1) The abnormal bone metabolism and the changes of paravertebral constitution components caused by CKD-MBD before and after kidney transplantation. · Long term dialysis treatment and drug treatment may cause abnormal bone loss and paravertebral component changes. · The bone mass of renal transplant recipients decreased rapidly within 1 year after transplantation. 2) Accurate and flexible analysis of basic substances by energy spectrum CT. · Energy spectrum CT can quickly switch between high and low energies (80/140kVp) to obtain the two energies of the substance, so as to separate the base substance. · Base material separation: Hydroxyapatite (HAP) is the main similar component of bone in the vertebral body. · A variety of energy attenuation and image quality pictures are generated under different keV. 3) More imaging information at low radiation dose. · Energy spectrum CT (80/140kVp) fast switching scanning, lower radiation dose. · Energy spectrum CT plain scan mono energy diagram: base material pair analysis at 70keV for HAP (water), HAP (fat), calcium (water) to obtain vertebral bone density, and muscle (fat) analysis to obtain paravertebral muscle composition.

MKEE-101

### Rewriting the story back: Spondyloarthritis

#### Participants

Sara Siguenza-Gonzalez, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Bone marrow edema (BME) is the key requirement for a “MRI positive of sacroiliitis” in the Assessment of Spondyloarthritis international Society (ASAS). The radiologist should be careful when applying the ASAS classification criteria, because BME could also be found in early mechanical and degenerative changes, which are much more common than inflammatory disorders. Knowing the type of BME pattern, other radiological features (bone erosion, ankylosis or the spine disease), as well as the clinical picture, increase radiologists diagnostic confidence and reduce overdiagnosis of inflammatory sacroiliitis.

#### TABLE OF CONTENTS/OUTLINE

Anatomy and biomechanics of the Sacroiliac Joints (SIJs) and Spine. Including anatomical variants and pitfalls. Some clues to difference between mechanical issues and inflammatory disorders. Subchondral BME in the SIJs is a common finding in both entities, so radiologists should be careful when interpreting. Recognise principal features of spondyloarthritis in the main radiological techniques (Rx, TC, MRI and also with new techniques). Describe and illustrate general features and typical image findings in the spondyloarthritis: Ankylosing Spondylitis (AS), Psoriatic Arthritis (PsA), Reactive Arthritis (RA), enteropathy-associated arthritis and undifferentiated spondylitis. Common pitfalls and differential diagnosis with other diseases that affect the axial bone: infection, amiloidosis, tumors, DISH and traumatism.

### Deep Learning Imaging Reconstruction Based Virtual Non-calcium Image Can Improve the Bone Metastasis Detection Compared with Conventional CT, Hybrid IR Based Virtual Non-calcium Image

#### Participants

Hirotaaka Nakashima, MSc, RT, Sapporo, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Deep learning imaging reconstruction (DLIR)-based virtual non-calcium (VNCA) images were created by two-material decomposition processing based on dual-energy acquisition using a fast kV switching method. 2. Compared the diagnostic performance of DLIR-based VNCA images with conventional CT in 57 patients with clinically confirmed bone metastasis. 3. Compared the diagnostic performance of DLIR-based VNCA images with hybrid IR-based VNCA images. 4. DLIR-based VNCA images were superior to the diagnostic performance of conventional CT and Hybrid IR-based VNCA images.

#### TABLE OF CONTENTS/OUTLINE

Bone metastasis is a possible disease of all carcinomas and reduces the quality of life of patients. Since CT can detect bone calcification sensitively, it is excellent in diagnosing bone metastasis with bone destruction, but bone metastasis without bone destruction is difficult to diagnose and has a problem that it is easy to overlook. Virtual non-calcium image (VNCA) is one of the material decomposition images created by dual energy CT, which is also a density image obtained by emphasizing the water component and removing the calcium component. While previous studies have reported that VNCA images are superior in detecting bone metastases, DLIR-based VNCA images offer better discrimination of metastatic lesions due to their noise reduction effect. In this exhibition, we compared the diagnostic performance of DLIR-based VNCA images with that of conventional CT and hybrid IR-based VNCA images. The results show that DLIR-based VNCA images have a higher discrimination ability than conventional images for bone metastasis.

MKEE-103

### **Osteoid Osteoma in Small Bones of Hands and Feet: 'Not' So Common with 'Not' So Small Challenges in RF Ablation**

#### **TEACHING POINTS**

1. Osteoid osteomas are benign painful lesions usually seen in the long bones. Less commonly they may be seen in the small bones of hands and feet especially in the pediatric age group. 2. They have typical imaging features on MRI and CT which are diagnostic. 3. RF ablation is the recommended treatment for osteoid osteomas and are regularly done. However, the small size of the bones results in challenges that can be dealt with by using some modifications.

#### **TABLE OF CONTENTS/OUTLINE**

Osteoid osteomas are common benign tumor found commonly in children and young adults. They classically present with night pain that is relieved by non steroidal anti-inflammatory drugs. They are usually cortical lesions and most commonly occur in the long bones, with proximal femur being the most common location. Less commonly they may be seen in the spine and small bones of the hands and feet. CT is excellent at diagnosing the lesion and shows small lucent nidus and surrounding reactive bone sclerosis. MRI may be confusing due to the disproportionate marrow edema and the poor delineation of nidus if it is very tiny. CT guided radiofrequency ablation is the current accepted standard treatment for osteoid osteomas. However in small bones, this may be challenging due to the very small size as well as proximity of neurovascular structures. We will discuss the imaging appearances of osteoid osteomas in small bones of hands and feet as well as highlight the challenges faced during RF ablation in some of these cases and some of the ways these can be overcome.

MKEE-104

### Zero Echo Time Magnetic Resonance Imaging: Physics and Clinical Utility in Musculoskeletal System

#### Participants

Takatoshi Aoki, MD, PhD, Kitakyushu, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To recognize the clinical utilities of zero echo-time (ZTE) sequences in various disorders of the musculoskeletal system. 2. To understand the imaging physics of ZTE sequence, practical limitations, and image reconstruction. 3. To discuss how to incorporate ZTE sequence into the clinical workflow.

#### TABLE OF CONTENTS/OUTLINE

Physics of ZTE imaging 1 Pulse sequence design 2 Image reconstruction 3 Parameter optimization Clinical utility of ZTE in musculoskeletal system 1 Inflammatory arthritis 2 Soft tissue calcification/ossification 3 Bone and soft tissue tumors and tumor-like lesions 4 Osteoarthritis and spondylitis 5 Trauma 6 Morphometric evaluation before surgery 7 Children and fetuses Summary ZTE MRI can be readily incorporated into the clinical workflow, and CT-like images generated by ZTE MRI would minimize the need for CT contemporaneously with MRI in various musculoskeletal disorders. We systematically review the imaging physics of these sequences, practical limitations, and image reconstruction, and then discuss the clinical utilities in the musculoskeletal system while presenting several imaging examples.

MKEE-105

### Hamstring Sport Injuries: What, How, Why and Where

#### Participants

Agustin Marrero SR, MD, La Plata, Argentina (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To know the anatomy, function, and biodynamic aspects of the hamstrings complex. To recognize the spectrum of tearing of hamstring muscles and tendons during sports practice analyzing their mechanism of injury. To evaluate the imaging methods in the different hamstrings lesions to describe the precise location and characteristics. To describe ultrasound and magnetic resonance signs of these tears, emphasizing the prognostic criteria for recovery, return to play, and re-injury.

#### TABLE OF CONTENTS/OUTLINE

Most of muscle tears occur in the lower extremities and commonly in the hamstrings. The hamstrings complex consists of the semimembranosus (SM), semitendinosus (ST) and biceps femoris (BF) muscles. They originate from the ischial tuberosity. BF muscle has two portions, the long and short head and its distal insertion is at fibular head. ST and SM are medial, and their distal insertion is in the medial aspect of the leg. BF and ST are close to the sciatic nerve. Except for BF's short head, the hamstrings are primarily hip extensors and knee flexors. Hamstring injuries are grouped and classified, with typical tear sites that recur in sports practices during forceful stretching or high-speed running. Proximal injuries result in a large amount of time away from sports and a high risk of re-injury. Sprint tears are generally located on BF. Depending on its extent and location, we can estimate the evolution of injuries and the return to play. Finally, we will include insertional injuries in children.

### Acute Traumatic Craniocervical Injuries: What to Look for and Not to Miss

#### Participants

María Carvajo, MD, Seville, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- To describe acute traumatic craniocervical injuries and its classification based on a revision of cervical CTs performed in the emergency setting at 3rd level hospital. - To show key imaging features to identify stable and unstable injuries. - To present most common errors and missed craniocervical injuries as well as tips to avoid them.

#### TABLE OF CONTENTS/OUTLINE

1. Anatomy and biomechanics of craniocervical junction and ligaments. 2. Key measurements and anatomy landmarks to assess alignment of craniocervical junction. 3. Craniocervical injuries classification. 3.1. Atlanto-occipital dissociation. 3.1.1. Traynelis classification. 3.2. Occipital condyle fractures. 3.2.1. Anderson-Montesano classification. 3.2.2. Alar ligament injuries. 3.2.3. Stable and unstable injuries. 3.3. Atlas fractures. 3.3.1. Gehweiler classification. 3.3.2. Transverse ligament injuries. Dickson classification. 3.3.3. Stable and unstable injuries. 3.4. Axis fractures. 3.4.1. Odontoid fractures. Anderson and D'Alonzo classification. 3.4.2. Hangman fractures. Effendi/Francis modified by Levine classification. 3.4.3. Non-odontoid non-hangman fractures (axis body fractures). 3.4.4. Teardrop fractures. 3.4.5. Stable and unstable injuries. 3.5. Atlantoaxial subluxation. 3.5.1. Atlantoaxial rotatory fixation. Fielding and Hawkins classification. 3.5.2. Stable and unstable injuries. 4. Pitfalls of craniocervical injuries at CT imaging. 5. Conclusions.

### Ultrasound Guide to Have at Your Fingertips: Wrist and Hand Evaluation

#### Participants

Elena Julian Gomez, MD, Santander, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To emphasize the potential of ultrasound in the assessment of musculoskeletal structures. 2. To become familiar with the normal sonographic appearance of the wrist, hand and fingers. 3. To propose a systematic approach to perform a complete ultrasound of the wrist, hand and fingers. 4. To show the correlation of the ultrasound findings with MR images and anatomical drawings for a better understanding.

#### TABLE OF CONTENTS/OUTLINE

Ultrasound is an imaging technique very useful in the assessment of musculoskeletal structures. However, for its correct interpretation, it is essential for the explorer to be familiar with the ultrasound appearance of normal anatomical structures, which can be difficult at the beginning. This work is intended to be an aid for anyone who wants to get started in musculoskeletal ultrasound of the wrist, hand and fingers. First of all, we will check the basic requirements to perform a proper musculoskeletal ultrasound. Then, we will systematically review the normal ultrasound anatomy of the different musculoskeletal structures of the wrist, hand and fingers, dividing them according to their dorsal or ventral location. We will also propose some tips and tricks, and we will highlight the importance of dynamic maneuvers. In order to make our work more visual, we will correlate the different ultrasound images with anatomical drawings and MR images, which will allow a better understanding.

MKEE-108

### MR Imaging of Traumatic Injury of the Fingers

#### TEACHING POINTS

1. To review the anatomy of the fingers, focusing on the extensor and flexor complexes, as well as the passive stabilizers of their joints. 2. To detail the MRI protocol used for the study of traumatic pathology of the fingers. 3. To illustrate by means of representative cases the most frequent pathology of the fingers after blunt trauma. 4. To teach instability patterns, which may be useful when understanding and describing the MRI findings in these patients.

#### TABLE OF CONTENTS/OUTLINE

Traumatic injuries of the fingers are one of the frequent reasons for musculoskeletal MRI evaluation. It is important to know the specific anatomy of the tendon structures and ligaments, as well as the most frequent injury patterns. Extensor finger complex, including central and lateral slips, as well as sagittal bands; flexor tendon, pulleys and articular structures (main and accessory collateral ligaments, and volar plate) play a capital role in finger biomechanics. Closed finger trauma frequently causes instability patterns (in coronal, sagittal or combined planes) that should be recognized and that facilitate the understanding of the lesion mechanism and its diagnosis. Thus favoring an adequate treatment and a prompt recovery. Injuries secondary to closed trauma of the fingers will be reviewed, with a detailed description of their semiology and the injured structures and their complications.

### Exploring Osteochondral Lesions of the Talus: Imaging Evaluation and Treatment Options

#### TEACHING POINTS

The purpose of this exhibit is to: 1. Review the talar dome anatomy, and pathophysiology of osteochondral lesions 2. Illustrate and discuss the patterns of osteochondral injuries and main surgical options with didactic cases. 3. Highlight the main information that radiologists should include in the report when analyzing an osteochondral lesion of the talus and their postoperative imaging.

#### TABLE OF CONTENTS/OUTLINE

Osteochondral lesions of the talus are lesions of the articular cartilage of the talus and underlying subchondral bone. Trauma accounts for the majority of osteochondral lesions, with an osteochondral lesion occurring with over half of ankle sprains, especially if there is a fracture. Introduction: General review of talar dome anatomy, and pathophysiology of osteochondral lesions. Preoperative evaluation: Main information that should be included in the radiological report. Clinical relevance of the findings. Staging: Didactic illustration about the historical classic staging systems. Postoperative evaluation: Main surgical techniques considerations. Main information that should be included in the radiological report. Bibliographical references.

### Under Pressure: Exploring Normal Anatomy and Entrapment Neuropathy of the Ulnar Nerve

#### TEACHING POINTS

1. Describe the normal course and imaging appearance of the ulnar nerve with emphasis on the cubital tunnel and Guyon's Canal. 2. Describe the anatomical boundaries of both the cubital tunnel and Guyon's Canal. 3. Discuss ulnar neuropathy symptoms. 4. List common etiologies of ulnar nerve compression. 5. Discuss the MR appearances of ulnar nerve impingement in the cubital tunnel and Guyon's Canal. 6. Identify the normal motion of the ulnar nerve within the cubital fossa under ultrasound as well as the abnormal motion of the nerve in the setting of symptomatic anterior dislocation and snapping triceps syndrome.

#### TABLE OF CONTENTS/OUTLINE

We review the normal course of the ulnar nerve with attention to sites of potential compression, namely the cubital tunnel and Guyon's Canal. We review the anatomical boundaries of the cubital tunnel and Guyon's canal on MR imaging. We examine the structures innervated by the ulnar nerve and the clinical signs/symptoms of ulnar neuropathy corresponding to the site of impingement. We list common etiologies of entrapment neuropathies. We review the normal MR appearance of the ulnar nerve and utilize MR cases to illustrate the abnormal appearance of impingement in the setting of cubital tunnel and Guyon's canal syndrome. We present dynamic ultrasound examples demonstrating both the typical movement of the ulnar nerve in the cubital fossa, as well as abnormal motion in the setting of dislocation and snapping triceps syndrome. We discuss common surgical treatments of ulnar nerve dislocation and review the expected MR appearance of ulnar nerve anterior transposition.

### Fight of Phyte Calcification Ossification Around Spine

#### Participants

Kengo Ikejima, MD, Tokyo, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Understand the mechanism of perivertebral sclerotic changes  
2. Learn the imaging findings of representative perivertebral sclerotic changes along with specific cases  
3. Learn about complications associated with perivertebral sclerotic changes  
4. Learn key points for differentiating perivertebral sclerotic changes

#### TABLE OF CONTENTS/OUTLINE

Spine anatomy, particularly joint structures and ligaments  
Pathophysiology of Osteophytes  
Pathophysiology of Syndesmophytes  
Pathophysiology of common calcium deposition diseases that occur in the perivertebral region  
Cases:- Spondylosis- Ossification of the posterior longitudinal ligament- Ossification of the ligamentum flavum- Calcium pyrophosphate dihydrate deposition disease- Calcific tendinitis of the longus colli muscle- Ankylosing Spondylitis- Psoriatic arthritis- Diffuse idiopathic skeletal hyperostosis (DISH)- SAPHO syndrome- Osteitis condensans ilii- Dystrophic calcification- Intervertebral disc calcification

### Looking Beneath the Surface: Imaging of Bone Surface Lesions

#### Participants

Utkarsh Parwal, MD, Saint Louis, MO (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Define intracortical, subperiosteal, periosteal, and parosteal/juxtacortical locations along the bone surface. 2. Understand that multiple cell types within the bone surface give rise to bone-forming, cartilage-forming, and fibrous surface lesions. 3. Generate a differential diagnosis for surface lesions spanning benign, malignant, infectious, and traumatic etiologies.

#### TABLE OF CONTENTS/OUTLINE

1. Bone surface anatomy and terminology. a. Define intracortical, subperiosteal, periosteal, and parosteal/juxtacortical locations. b. Illustrate the two layers of the periosteum: inner cambrial and outer fibrous. Briefly discuss important cell types within the bone surface as the originators of bone-forming, cartilage-forming, and fibrous surface lesions. 2. Case based review of multiple surface lesions. a. Bone forming: Osteoid osteoma, Surface osteosarcomas (OS) - periosteal OS, parosteal OS, high grade surface OS. b. Cartilage forming: Osteochondroma, Periosteal chondroma, Bizarre parosteal osteochondromatous proliferation, Periosteal chondrosarcoma. c. Fibrous: Nonossifying fibroma, Juxtacortical desmoid tumor, Osteofibrous dysplasia. d. Infectious: Cortical osteomyelitis, Subperiosteal abscess. e. Traumatic: Stress reaction, Periostitis ossificans

### Can you See Me Now? A Case Based Quiz Of Shoulder Instability Lesions

#### Participants

Ana Cristina Delgado, MD, Porto Alegre, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Describe and recognize the different key clinical/imaging features that help diagnose each glenohumeral instability entity. 2. Identify through a series of MRI/ Arthrography MRI image based cases the different glenohumeral anterior, posterior instability lesions. 3. Describe the role of different imaging modalities in the diagnosis of glenohumeral instability, evaluate the MRI/ Arthrography MRI imaging findings that can help radiologists discriminate differential diagnosis. 4. Review static dynamic glenohumeral stabilizers.

#### TABLE OF CONTENTS/OUTLINE

-Pathologies will be presented in a case based format with pertinent MRI/ Arthrography MRI images and a brief clinical history. - Diagnostic clue section divided in clinical facts ( general features, miscellaneous information) radiological facts ( key imaging findings, best image modality for further evaluation). -Review the concepts and important tips for image diagnosis. -Review anatomy of static dynamic glenohumeral stabilizers. -Pathologies included: a) Anterior instability: Classic Bankart, HAGL ( Humeral avulsion of glenohumeral ligament), GLAD ( Gleno labral articular disruption), Perthes, ALPSA ( Anterior Labroligamentous sleeve avulsion), Hillsachs. b) Posterior Instability: Reverse Bankart, POLPSA: Posterior labro capsular periosteal sleeve avulsion), Kim, Bennet, Reverse Hillsachs. c) Variants Pitfalls: Sublabral Recess, Sublabral foramen, Buford Complex.

### Elasticity Matters: Role of Shear Wave Elastography in Rheumatology

#### Participants

Alejandra Micolich Vergara, MD, Barcelona, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

General principles of shear wave elastography in musculoskeletal radiology. Potential applications in the assessment of rheumatologic diseases. Future directions and limitations.

#### TABLE OF CONTENTS/OUTLINE

Elasticity is a fundamental characteristic closely related to the pathological state of tissues. Elastasonography is a diagnostic technique that assesses the biomechanical properties such as stiffness and elasticity of tissues by exposing them to a specific ultrasound beam. Shear Wave Elastasonography (SWE) is a non-invasive and objective method that determines the absolute stiffness value of various tissues. SWE has been validated in liver disease, thyroid, breast, prostate, skin and ocular pathologies and is being considered a promising tool in rheumatologic disorders. Greyscale and Power Doppler ultrasound as well as Magnetic Resonance Imaging (MRI) have been extensively studied as diagnostic techniques in rheumatologic pathologies and in 2021 the European League Against Rheumatism (EULAR) recommends elastasonography in the reporting of ultrasound studies in musculoskeletal disease. There has been advancements in recognizing the role of SWE in entities such as Primary Sjögren's Syndrome and Gout Arthritis, however, future prospects include exploring its utility in the early diagnosis and therapeutic response monitoring in Rheumatoid Arthritis, Systemic Lupus Erythematosus and Thumb Osteoarthritis. We will review the potential applications of SWE in different rheumatologic disorders using a case based approach.

MKEE-115

### Not Normal: An Illustrated Guide to Potentially Symptomatic Musculoskeletal Anatomic Variants

#### TEACHING POINTS

- Review commonly discovered anatomic variants on routine musculoskeletal imaging that may be symptomatic or become symptomatic.
- Recognize what imaging features suggest a given variant may be at risk of being symptomatic or require treatment, and what additional imaging may be required for a more definitive diagnosis.
- Discuss treatment options available for the management of pain associated with anatomic variants, including: activity modification, physical therapy, image-guided injection, and surgery.

#### TABLE OF CONTENTS/OUTLINE

- Spinal variants o Upper cervical § Dens retroversion § Posterior arch agenesis § Short arch o Rib anomalies cervical ribs o Segmentation anomalies § Congenital block § Occipitalization § Hemivertebra § Butterfly o Oppenheimer ossicle o Lumbosacral transitional vertebra o Sacroiliac variants o Coccyx angulation o Posterior elements § Bastrup pseudoarthrosis § Hypoplastic facets § Facet tropism o Piriformis sciatic nerve o Other
- Hip o Developmental dysplasia o Cam/pincer o Coxa profunda protrusio o AIIS morphology o Coxa vara valga
- Wrist hand o Ulnar variance o Type 2 lunate o Coalition o Os styloideum
- Shoulder o Acromion shape slope o subcoracoid o Coracoclavicular joint o glenoid dysplasia hypoplasia o Luschka tubercle o Os acromiale
- Elbow o Anconeus epitrochlearis o Gantzer's muscle o Synovial fold o Os supratrochlear dorsale
- Knee o Patellofemoral anomalies § Patella type § Trochlear groove § Patella alta/baja § Bi/multipartite patella o Aberrant popliteal and anterior tibial artery o Discoid meniscus o Plica
- Foot ankle o Os trigonum syndrome o Painful os peroneum o Accessory muscles o Type II os naviculare o Coalition o Os intermetatarsium o Sesamoid anomalies

### Calcifications as Harbingers of Malignancy in Soft Tissue Tumors: A Case-Based Review

#### Participants

Atefe Pooyan, MD, MPH, Seattle, WA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Gain familiarity with the morphology of calcifications in soft tissues 2. Demonstrate that approaching soft tissue calcifications based on morphologic appearance, distribution, and tumor cell-type can yield clues when triaging lesions 3. Present scenarios in which soft tissue calcifications are helpful in assessing the malignancy or benignity of a lesion

#### TABLE OF CONTENTS/OUTLINE

Key Anatomic or Pathophysiologic Issues, Imaging Findings or Imaging Technique This case-based exhibit will review the morphology of soft tissue calcifications (e.g. stippled, chondroid, coarse, osseous, amorphous), with imaging correlation using multiple modalities (i.e. radiographs, CT, and MR), as demonstrated by various cases of benign and malignant pathophysiologic processes of calcification. Conclusion 1. Approaching soft tissue calcifications according to their descriptive morphology and location can yield clues into interpreting a lesion's malignant potential. 2. Calcifications are disproportionately represented by the most common high-grade soft tissue neoplasms, including synovial sarcoma, liposarcoma, and undifferentiated pleomorphic sarcoma, which comprise more than half of all soft tissue malignancies. 3. Malignant tumors can have a characteristic morphology of calcifications, such as stippled calcifications in synovial sarcoma and central osseous calcifications in extra-skeletal

MKEE-117

### Posterior Ankle Pain: Pathologies Surrounding the Kager Fat Pad

#### Participants

Leandro Mazza, MD, La Plata, Argentina (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To describe the anatomy of the Kager fat pad (KFP) and its relationships with the rest of the structures of the posterior region of the ankle. To analyze the different pathologies responsible for posterior ankle pain and the degree of involvement of the KFP in each of them. To discuss the role of KFP in the symptomatology of these entities

#### TABLE OF CONTENTS/OUTLINE

KFP is a mass of adipose tissue that occupies the Kager triangle, located between the Achilles tendon, the flexor hallucis longus and the calcaneus. Although its content is predominantly fatty, it also contains nerves and small vessels. It presents multiple connections with the different anatomical structures that surround. Three regions that are closely related to the sides of this triangle have been described. The most firmly linked to the Achilles tendon being an important part of its entheses. The more mobile, wedge-shaped and closely related to the calcaneus moves passively and actively towards the retrocalcaneal bursa during plantarflexion. These relationships make the KFP a necessary participant, to a greater or lesser extent, in a large part of the different entities that present with posterior ankle pain. We will describe tendinopathies, os trigonum syndrome and other causes, with particular interest in the degree of involvement of the KFP.

### Don't Touch Lesions: How Can We Avoid the Misdiagnosis

#### Participants

Janaina Moreira, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Don't touch lesions are incidental findings, that are divided into three categories: Post traumatic, normal variants, and lesions that are real but obviously benign. Radiography is the first method used for the identification, characterization, and classification of these type of lesions. However, some cases can be so challenging that computed tomography or magnetic resonance imaging are used to evaluate the lesion, therefore increasing the accuracy of the diagnosis. The purpose of this presentation is to review the imaging characteristics of typical skeletal "don't touch" lesions in the many imaging methods such as X-Ray, computed tomography (CT) and magnetic resonance imaging (MRI) therefore avoiding misdiagnosis and invasive procedures, which reduces the morbidity and costs in the health care system.

#### TABLE OF CONTENTS/OUTLINE

Case based didactic review of the radiological appearance of the "don't touch" lesions including clinical and epidemiological aspects of bone infarction, osteopoikilosis, intraosseous migration of tendinous calcification, myositis ossificans, aggressive vertebral hemangioma, among others, based on our service's digital archive.

### High-Resolution Ultrasound of the Nerves of the Foot and Ankle: A Landmark Approach to Scanning and Review of Common Pathologies

#### TEACHING POINTS

The purpose of this exhibit is to: 1. Review the anatomy of the nerves at the level of the foot and ankle, using a landmark approach with cadaveric correlation. 2. Highlight clinical signs and symptoms warranting a detailed ultrasound nerve assessment, relating them to specific nerves. 3. Review common sites and causes of nerve injury and entrapment at the foot and ankle and demonstrate associated abnormal direct and indirect sonographic findings using diagrams, images and video clips from case-examples.

#### TABLE OF CONTENTS/OUTLINE

1. OBJECTIVES 2. INTRODUCTION 3. ANATOMY, ULTRASOUND TECHNIQUE, PATHOLOGY WITH CASE EXAMPLES FOR THE: a) Tibial nerve and medial and lateral plantar branches b) Plantar digital nerves c) Sural nerve d) Saphenous nerve e) Deep peroneal nerve f) Superficial peroneal nerve 4. TAKE HOME POINTS

### PET-MR Imaging Applications in Pediatric Musculoskeletal Tumors

#### TEACHING POINTS

? PET-MR imaging is emerging as a suitable technique for the assessment of pediatric malignancies, with specific applications in musculoskeletal tumors. ? Its utility includes primary tumor characterization, local / distant staging and post-treatment follow-up. ? Dose reduction of ionizing radiation and overall scanning time decrease are remarkable advantages. ? However, it has low sensibility for detection of pulmonary nodules. Chest CT remains essential in thoracic staging of pediatric musculoskeletal malignancies.

#### TABLE OF CONTENTS/OUTLINE

? Introduction: Integrated MRI and PET provide efficient staging of children and adolescents with malignant bone tumors by evaluating the primary tumor and the whole body in one session. ? Our protocol included a whole-body and a local tumor scan. ? Applications in pediatric musculoskeletal tumors: PET-MRI is useful in the study of osteosarcoma, Ewing sarcoma, bone lymphoma, Langerhans cell histiocytosis and bone and bone marrow metastases. We report our experience in the last ten years. ? Conclusions: the combination of functional PET imaging with the lack of non-ionizing radiation of MRI is ideal in a pediatric population.

### Do Not Harm: Thermal Protection in Musculoskeletal Abdominal Wall Soft Tissue Tumors Cryoablation

#### Participants

Albert Castillo Pinar, MD, Barcelona, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Teaching points: To review the main characteristics of thermoablation in musculoskeletal soft tissue tumors. To illustrate different techniques and indications of thermoprotection procedures. To show possible complications if the thermoprotection techniques are not performed correctly. Thermoablation of musculoskeletal tumors is a growing technique with good results; however, it can be limited by the location of the tumors. There are close anatomical relationships related to the tumor such as different intra-abdominal structures or the skin itself which can contraindicate the technique, make it difficult or lead to complications if the correct thermo-protection techniques are not applied. Radiologists must be familiar with the thermoprotective techniques in order to be able to choose the most appropriate in each case.

#### TABLE OF CONTENTS/OUTLINE

Table of contents/Outline Introduction. Classification and description of thermoprotective technique. Case series illustrating clinical situations and the application of thermoprotection techniques. Conclusion.

MKEE-121

### Non-infectious Spinal Diseases Mimicking Infection

#### TEACHING POINTS

Infectious spinal disease may be suspected if inflammatory markers are increased in blood tests in patients with acute spinal pain and limited range of motion. These clinical findings can also be seen in spinal crystal deposition disease and intraspinal rupture of synovial cysts located in facet joints. In cases of acute inflammation in these two diseases, there is a risk of unnecessary biopsies and antibiotic treatments because the clinical and imaging findings overlap with those of infectious spinal diseases. Recognizing the radiographic characteristics of these diseases and raising awareness of these findings will be helpful in accurate diagnosis and treatment. We present various cases of spinal crystal deposition disease (crowned dens syndrome, calcific tendinitis of longus colli, calcific tendinitis of levator scapulae, facet joint crystal arthropathy, and interspinous bursitis with crystal deposition) and intraspinal rupture of facet joint synovial cyst, and present their clinical and imaging findings. This aims to raise awareness of these diseases and facilitate accurate diagnosis.

#### TABLE OF CONTENTS/OUTLINE

Introduction  
Case 1: Calcified tendinitis of longus colli  
Case 2: Calcific tendinitis of levator scapulae  
Case 3: Crowned Dens syndrome  
Case 4: Crystal arthropathy of facet joint  
Case 5: Facet joint infection

### The Bubble Trouble: Differential Diagnosis of Cystic Bone Tumors and the Importance of Not Missing the Mark

#### Participants

Leticia dos Reis Morimoto, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The purpose of this exhibit is:1. To review the main differential diagnosis of cystic bone lesions.2. To expose the general evaluation of cystic bone tumors - what is necessary to report: review of the characteristics by image that must be reported and propose a structured report for bone tumors in a multimodality approach (CR, US, CT and MRI).3. To review the main combined injuries and when to think about them.4. To demonstrate through didactic illustrative cases the main complications that can be found due to cystic bone lesions.5. To demonstrate currently available treatment modalities for those conditions.

#### TABLE OF CONTENTS/OUTLINE

1 - Radiological propaedeutics of cystic bone tumors.2 - Radiograph, ultrasound (US) computed tomography (CT), and MRI findings in:  
2.1 - Unicameral bone cyst  
2.2 - Multicameral bone cyst  
2.3 - Aneurysmal bone cyst  
2.4 - Cystic fibrous dysplasia  
2.5 - Vascular malformation (cystic angiomatosis)  
2.6 - Telangiectasic osteosarcoma  
2.7 - Other miscellaneous cystic tumors  
3 - General evaluation of cystic bone tumors - what is necessary to report? - review of the main image characteristics.  
4 - When to be suspicious of concomitant lesions and their primary associations.  
5 - Propose a structured report for cystic bone tumors in a multimodality approach (CR, US, CT, and MRI).  
6 - Complications related to cystic bone tumors.  
7 - Therapies currently used in cystic bone tumors.  
8 - Last updates and trendings of cystic bone tumors  
9 - Summary and take-home message

### Knee-ding a Closer Look: MRI Evaluation of Cartilage Surgical Repair

#### Participants

Leticia dos Reis Morimoto, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The purpose of this exhibit is: 1. Revisit the anatomy and biomechanics of knee joint and focusing in cartilage 2. To demonstrate the MRI image findings in chondral lesions of the knee, with the main classifications 3. To illustrate the main operative techniques involved in knee cartilage surgery with radiology and surgery imagings correlation 4. Demonstrate through didactic illustrative cases the normal and pathological postoperative image findings, focusing on MRI

#### TABLE OF CONTENTS/OUTLINE

1 - Anatomy and biomechanics of knee joint and cartilage 2 - MRI findings in chondral lesions of the knee 3 - Modified Outerbridge classification (MRI and arthroscopy imaging) 4 - Noyes Classification (MRI and arthroscopy imaging) 5 - International Cartilage Repair Society (ICRS) classification (MRI and arthroscopy imaging) 6 - Surgery and radiologic imagings of: 6.1 - Marrow-Stimulating Procedures (microfracture) (surgery and radiologic imagings) 6.2 - Osteochondral Autograft Transplantation 6.3 - Osteochondral Allograft Transplantation 6.4 - Autologous Chondrocyte Implantation 7 - Normal postoperative findings after surgical repair of the knee cartilage 8 - Pathological postoperative findings after surgical repair of the knee cartilage

### Dual Energy CT in Spinal Disease: Application Review

#### TEACHING POINTS

Dual-energy CT (DECT) separately acquires high and low energy X-ray data to enable material characterization applications for substances that exhibit different energy-dependent x-ray absorption behavior. Based on conventional CT imaging, DECT significantly improves the detection ability of spinal lesions and adds more quantitative indicators. Virtual non-calcium (VNCa), virtual monochromatic imaging (VMI), and other parameters have unique advantages over traditional CT imaging in displaying bone marrow edema and tumor, detecting spinal urate crystal deposition, reducing spinal related metal artifacts, and intervertebral disc degeneration, showing a good clinical application prospect.

### Myopathies: Radiologist's Essential Tips for Clinical, Pathological, and Imaging Findings

#### Participants

Yumi Tai, Kashihara, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1) To review inherited and acquired myopathies including clinical, pathological, and diagnostic imaging findings. 2) To discuss clinico-radiological key findings in the differential diagnosis of myopathies for radiologists.

#### TABLE OF CONTENTS/OUTLINE

1) Imaging techniques and general imaging findings of muscle 2) Illustrated findings of the following myopathies: 1. Hereditary myopathies : Congenital myopathies (Nemaline myopathies, Central core disease, Congenital fiber type disproportion myopathy), Muscular dystrophies (Duchenne, Becker, Limb-girdle, Myotonic, Facioscapulohumeral, Emery-Dreifuss, Oculopharyngeal), Distal myopathies (GNE myopathy, Oculopharyngodistal myopathy), Metabolic myopathies (Mitochondrial disease, Lipid storage myopathies). 2 Acquired myopathies : Inflammatory myopathies (Dermatomyositis, Antisynthetase syndrome, Immune-mediated necrotizing myopathy, Inclusion body myositis, Eosinophilic myositis, Drug-induced (Immune checkpoint inhibitor (ICI)-related myositis), Associated with GVHD), Associated with systemic disease (Overlap myositis, Muscle Sarcoidosis) 3) Clinico-radiological key findings in the differential diagnosis

### Winging It: The Radiologist's Guide to the Scapula

#### TEACHING POINTS

[1] Understanding the anatomy and bony landmarks of the scapula is important for identifying a range of pathologies, including fractures, tumors, and degenerative changes.[2] The scapula has a number of anatomic variants, particularly in the pediatric population, that may mimic trauma or other pathologies.[3] While radiographs can provide an initial assessment of the scapula, CT and MRI are useful imaging modalities to evaluate complex or subtle bony and adjacent soft tissue pathologies.

#### TABLE OF CONTENTS/OUTLINE

[1] Overview[2] Normal anatomy: important radiological landmarks[3] Imaging technique: dedicated scapula radiographs and the importance of CT/MRI[4] Cased-based review by pathology[5] Congenital/developmental variants: acromial ossification centers; os acromiale; Sprengel deformity; glenoid dysplasia[6] Traumatic processes: different fracture patterns (including of the scapular body, neck, glenoid, acromion, and coracoid process) and stress fractures[7] Degenerative/inflammatory processes: osteoarthritis; rheumatic conditions; elastofibroma dorsi; scapulothoracic bursitis[8] Infection and inflammation: osteomyelitis; septic arthritis[9] Neoplasm: benign and malignant[10] Hardware and related complications: curettage and graft; shoulder arthroplasty notching[11] Miscellaneous conditions: Looser's zones in osteomalacia[12] Conclusion

### Worth the Weight: Weight-bearing Cone-beam CT in Foot and Ankle Pathology

#### Participants

Maryam Soltanolkotabi, MD, Salt Lake City, UT (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Weight-bearing computed tomography (WBCT) has advantages over conventional CT and radiography, namely the ability to identify alignment issues and evaluate joint line congruencies. 2. WBCT can be used for the assessment of fracture healing, pre-operative planning, and evaluation of treatment efficacy. 3. WBCT offers technical and logistic advantages over conventional CT including decreased radiation dose, less technical training for use, and decreased space and energy demands. 4. WBCT enables reliable 3D measurements in a functionally relevant position (weight-bearing).

#### TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Objectives/goals 3. What is weight-bearing CT and how does it work? 4. What are the advantages and disadvantages of WBCT? 5. What is the impact of WBCT on radiation dose, cost, and workflow? 6. What are the indications of WBCT? a. Fracture detection b. Alignment evaluation c. Pre-operative planning d. Evaluation of fracture healing e. Post-operative evaluation 7. How to measure in 3D? 8. What further developments are to be expected? 9. Summary/conclusion

MKEE-129

### Spectrum of Common and Uncommon Multiple Bone Tumors: Imaging Findings with Pathologic Correlations

#### TEACHING POINTS

1. Multifocality is common in metastasis, myeloma, histiocytosis, and vascular tumors, including the location of spine; occasional in fibrous dysplasia, osteofibrous dysplasia, adamantinoma, enchondroma, and osteochondroma; extremely rare in osteosarcoma and giant cell tumor. 2. Multiple bone tumors carry an increased risk of malignant transformation, especially in the enchondroma, osteochondroma, and giant cell tumor. 3. Non-ossifying fibroma are typically cortically based; osteofibrous dysplasia and osteofibrous dysplasia-like adamantinoma can be pure cortical lesions, or with medullary cavity involvement; the majority of the adamantinoma involve the cortex and complete medullary cavity; fibrous dysplasia and metastasis primarily involve the medullary cavity and occasional the cortex. 4. A stippled or ring-like pattern indicates cartilage calcification, cloud-like appearance indicates osteoid mineralization, and a ground-glass density indicates fiber matrix. 5. Age needs to be considered in solid tumors with non-specific imaging features. Metastasis, myeloma, lymphoma, and Erdheim-Chester disease are common in adults; whereas, multiple chondrogenic tumours, fibrous dysplasia, langerhans cell histiocytosis, and osteosarcoma are more frequent in young individuals.

#### TABLE OF CONTENTS/OUTLINE

1. Enchondroma 2. Osteochondroma 3. Osteoma 4. Osteosarcoma 5. Haemangioma 6. Epithelioid haemangioendothelioma 7. Giant cell tumour 8. Non-ossifying fibroma 9. Simple bone cyst 10. Osteofibrous dysplasia 11. Adamantinoma 12. Fibrous dysplasia 13. Metastasis 14. Myeloma 15. Lymphoma 16. Langerhans cell histiocytosis 17. Erdheim-Chester disease 18. Rosai-Dorfman disease

### Thermal Protection Techniques During Musculoskeletal Ablation

#### Participants

Arash Azhideh, MD,MPH, Seattle, WA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Percutaneous thermal ablation of benign and malignant musculoskeletal tumors has expanded in scope and popularity in recent years. Although safe and efficacious, thermal ablation requires a thorough knowledge of the range of thermal protection techniques in order to limit the risk of thermal injury to adjacent nerves and other sensitive structures. In this educational exhibit, we briefly review the most commonly used musculoskeletal thermal ablation techniques, describe the spectrum of thermal protection techniques utilized during musculoskeletal thermal ablation, and discuss the mitigation techniques employed prophylactically or once nerve injury has occurred.

#### TABLE OF CONTENTS/OUTLINE

1. Overview of Musculoskeletal Thermal Ablation Techniques a. Radiofrequency Ablation b. Cryoablation c. Microwave Ablation d. Other 2. Thermal Protection Techniques a. Active Thermoprotection Techniques i. Hydrodissection ii. Gas Dissection iii. Dissection with Other Agents iv. Physical displacement methods 1. Balloon interposition 2. Blunt needle displacement b. Passive Thermoprotection Techniques i. Biofeedback ii. Neurophysiologic intraoperative monitoring 1. Somatosensory evoked potentials 2. Motor evoked potentials 3. Electromyography iii. Temperature monitoring 3. Mitigation strategies to reduce thermal nerve injury

### Post-treatment Changes in Bone and Soft Tissue Tumors: A Primer for Radiologists

#### Participants

Daniel Lobo, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- To review the normal and pathologic findings following different therapeutic modalities in bone and soft tissue tumors: systemic treatment (chemotherapy, immunotherapy), radiotherapy and surgery.
- To illustrate complications and signs of tumor response to treatment, persistent or recurrent disease, as well as non-neoplastic complications.

#### TABLE OF CONTENTS/OUTLINE

- Brief introduction: relevance and challenges associated with post-treatment musculoskeletal tumors cases in the daily practice of the radiologist.
- Post-systemic treatment (chemotherapy and immunotherapy): Signs of treatment response; Signs of tumor progression; Systemic effect on the musculoskeletal system.
- Post-radiotherapy changes: Signs of treatment response; Local progression; Actinic changes; Others (infection, radioinduced tumors).
- Post-operative changes: Normal post-operative findings; Non-neoplastic complication; Signs of recidivant lesion.
- Conclusion and key takeaways.

MKEE-16

### Augmented Bone Remodeling: An Emerging Concept in Bone Marrow MRI

#### TEACHING POINTS

1. Normal bone remodeling, the lifelong process of bone removal and reconstruction, can not be seen at CT and MRI. 2. Bone remodeling can accelerate as a physiological response to many non destructive insults to bone such as a change in biomechanical load, or adjacent bone and soft tissue lesions. 3. Accelerated bone remodeling can be seen at MRI as a marrow area with a moderate increase in signal intensity on fat-saturated fluid-sensitive images with limited or no signal changes on fat-sensitive images. 4. Signal changes patterns in accelerated bone remodeling can be linear subcortical, patchy or diffuse. 5. Knowledge of these marrow patterns at MRI is important to increase our understanding of bone pathophysiology and avoid confusion with more destructive bone lesions.

#### TABLE OF CONTENTS/OUTLINE

A/ Bone remodeling in normal and abnormal situations B/ The « regional acceleratory phenomenon » concept developed by H. Frost  
C/ MRI of accelerated bone remodeling Signal patterns Signal distribution D/ Correlations with pathological, radionuclide and radiological findings E/ Limitations and perspectives

### Uncovering Common Lesions in the Sternoclavicular Joint and Costal Cartilages: A Diagnostic Guide

#### Participants

Giancarlo Domingues, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The purpose of this study is: • To provide a comprehensive review of the normal anatomy and imaging appearance of the sternoclavicular joint and costal cartilages. • To improve understanding and diagnostic accuracy of the pathologies by didactically categorizing them into five distinct groups: degenerative, inflammatory, metabolic, traumatic, and infection.

#### TABLE OF CONTENTS/OUTLINE

The sternoclavicular joint is a critical structure that connects the axial skeleton and upper extremities and enables the movement of the upper limbs. This synovial joint can undergo degenerative alterations, with osteoarthritis being the most prevalent pathology. Additionally, degenerative calcifications in the costal cartilages are frequently observed. Inflammatory conditions, such as costochondritis, SAPHO syndrome, rheumatoid arthritis and spondyloarthritis also affect these structures. Differentiating between metabolic and inflammatory disorders often requires a detailed clinical history. Infections usually occur in immunosuppressed patients and spread hematogenously. Traumatic injuries are often misdiagnosed, leading to persistent chronic pain. Although rare, posterior sternoclavicular dislocation is potentially dangerous as it can compress vital structures.

Printed on: 04/12/24

MKEE-18

### Opportunistic Imaging in Musculoskeletal Radiology

#### Participants

Vivek Kalia, MD, MPH, Frisco, TX (*Presenter*) Research Consultant, Hyalex Orthopaedics, Inc

#### TEACHING POINTS

1. Opportunistic imaging is leveraging existing imaging data, commonly in the form of DICOM-format CT images, to extract potentially useful clinical information unrelated to the examination's original indication. 2. Opportunistic imaging, currently employed for a fairly narrow list of indications such as osteoporosis screening, is poised to enable large-scale population-based screening in the very near future. 3. At-scale deployment of opportunistic imaging creates opportunities and challenges in MSK radiology.

#### TABLE OF CONTENTS/OUTLINE

1. Definition and technical requirements a. Artificial intelligence (AI)/machine learning (ML) algorithms 2. Areas of Current Use a. Osteoporosis screening to predict fractures i. Bone mineral density (BMD) assessment ii. Finite element analysis for bone strength assessment b. Body composition analysis to predict cardiometabolic risk and mortality i. Muscle mass (sarcopenia) and quality (fatty infiltration) ii. Visceral adiposity iii. Hepatic steatosis iv. Atherosclerotic calcifications 3. Opportunities / Areas of Potential Use in the Future a. Individual risk stratification and customization of therapy b. Large-scale population screening c. Integration into electronic health records 4. Ongoing Challenges Considerations a. Potentially important and/or confounding information will be revealed by opportunistic imaging b. Potential for overdiagnosis and patient anxiety c. Potential for increased costs of care to healthcare system and/or individual patient

### Scapulothoracic Disorders: Anatomy, Kinematics and Imaging Approach

#### Participants

Marília Da Cruz Fagundes, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The scapulothoracic is a functional joint and an important part of the shoulder kinematic chain, supporting the center of the humeral head correctly aligned with the glenoid fossa during arm elevation and increasing the range of motion and strength of the rotator cuff muscles. Scapulothoracic disorders usually result in abnormal contact between scapula and chest wall. Pathophysiology includes structural abnormalities (such as scapula anatomic variants and bone and soft tissue expansive lesions), scapular dyskinesia (caused by denervation injuries or imbalance in muscle strength) and microtrauma (associated with overuse). Rarely, the joint may experience acute trauma leading to scapulothoracic dissociation. Primary pathologies are more frequent in young athletes, especially in throwing sports. Due to its functional nature, the identification of disorders related to scapulothoracic joint can be a diagnostic challenge for radiologists. Radiography and Computed Tomography allows the assessment of bone anatomy and anomalies, while Magnetic Resonance Imaging provides information on soft tissue causes and consequences of these disorders. Finally, imaging plays an important role in guiding treatment, whether clinical, including physiotherapy and other conservative measures, or surgical if necessary.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction; 2. Anatomy and Kinematics; 3. Pathophysiology: a. Morphological causes; b. Functional causes; 4. Imaging Assessment; 5. Management.

### Beyond the Surface: The Power of Ultrasound in Diagnosing Epidermal Inclusion Cysts

#### Participants

Elena Julian Gomez, MD, Santander, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- To know the typical sonographic features of the epidermal inclusion cyst. - To describe the different complications of epidermal inclusion cysts and their characteristic sonographic findings. - To review other cysts and tumors that, given their location, are part of the differential diagnosis of the epidermal inclusion cyst, as well as the sonographic features that allow us to suspect them.

#### TABLE OF CONTENTS/OUTLINE

Epidermal inclusion cysts are very frequent lesions, and their ultrasound evaluation is a daily request. As radiologists, we must be able to recognize their representative characteristics, as well as other atypical findings that should make us think of other lesions of the same location. Our work is organized as follows: 1. The epidermal inclusion cyst: brief review of its definition, etiopathogenesis, clinical presentation and histopathology. 2. Ultrasonographic features of the epidermal inclusion cyst: everything we should take into account. - Location/relation to the dermis. - Morphology. - Echostructure. - Relation with adjacent tissues. - Vascularization. - Elastography. 3. Ultrasonographic features of the different complications of the epidermal inclusion cyst, including: - Rupture. - Inflammation and infection. - Degeneration in giant cysts. 4. Differential diagnosis of the epidermal inclusion cyst: when to suspect other lesions? - Cystic lesions of adnexal origin. - True dermal and hair follicle sweat gland derived tumors. - Differential diagnosis of complicated inclusion cysts.

### The Weight of the Neck: Understanding Subaxial Cervical Spine Injuries

#### Participants

Francis Ceden Rodriguez, Caguas, PR (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Subaxial cervical spine injuries occur in the lower part of the neck (C3-C7) due to trauma and can range from mild to life-threatening. 2. Compression fractures are the most common, these fractures consist of a collapse of the vertebral body height due to trauma. Burst fractures involve posterior vertebral body wall fracture and can compromise the spinal canal. 3. Flexion and extension teardrop fractures present with typical corner fractures at typical locations. 4. Translation injuries are seen in high energy trauma mechanisms with severe flexion distraction and often associated with severe neurological sequelae. 5. Unilateral and bilateral facet dislocation result from rotational and/or flexion distraction injuries.

#### TABLE OF CONTENTS/OUTLINE

I. Introduction  
A. Overview of Subaxial Cervical Spine Injuries  
B. Review of AO Spine Subaxial Cervical Spine Classification  
II. Radiologic Review of Types of Fractures  
A. Compression Fracture (CF)  
B. Burst Fracture (BF)  
C. Flexion Teardrop Fracture versus Linear Nondisplaced Anterior Inferior Corner Fracture  
D. Extension Teardrop Fracture (ETF)  
III. Rotation and Translation Injuries  
A. Facet Subluxation  
B. Facet Dislocation  
C. Vertebral Translation  
IV. Complications of Cervical Spine Injury  
A. Vascular Injury  
B. Spinal Cord and/or Exiting Nerve Injury  
C. Hematomas (Epidural / Prevertebral)  
D. Ligament Injury  
E. Disc Injury  
V. Conclusion

### Did You Know that Your Slot-Scan Radiograph for Scoliosis can Artefactually Cause a Worsening Spinal Curvature? Plus Other Stories of Artifacts Associated with Digital Slot-Scanning Radiography

#### Participants

Sean Schoeman, Philadelphia, PA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Biplanar digital slot-scanning technology is a stereoradiography imaging (SRI) system that reduces radiation exposure for patients requiring serial imaging for chronic and progressive skeletal conditions (1). This has become preferred to standard x-ray additionally because of the ability to image full length spine and lower limbs for follow-up of children with scoliosis and leg-length discrepancy - images are interpreted by pediatric radiologists and orthopedic surgeons. Here we use our experience reviewing multiple images of patients at different time points to demonstrate distinct types of imaging artifact with this imaging modality. Reviewing physicians should be aware of such artifacts so as not to confuse artifacts with pathology which may lead to misdiagnosis or unnecessary management. The purpose of this educational abstract is to demonstrate common artifacts found at our institution.1. Melhem E, Assi A, El Rachkidi R, Ghanem I. EOS(®) biplanar X-ray imaging: concept, developments, benefits, and limitations. J Child Orthop. 2016 Feb 16;10(1):1-14.

#### TABLE OF CONTENTS/OUTLINE

1. Image acquisition technique for slot-scanning and resultant artifacts 2. Incorrect image centering artifact - causing change in Cobb angle and mimicking worsening scoliosis 3. Movement artifacts a. Wavy cardiac margin b. Wavy bones c. Wavy hardware 4. Edge enhancement artifacts a. Halo around hardware b. Pseudo-pneumomediastinum c. Lucency above diaphragm

### Improving Bone Tissue Characterization on MRI Using Gradient-echo: The Role of Simulated CT (sCT) Sequences

#### Participants

Felipe Correa, MD, Ribeirao Preto, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

.Conventional MRI has limited ability to assess trabecular and cortical bone due to low proton density and markedly reduced T2 decay time..The FRACTURE sequence (Fast field echo Resembling A CT Using Restricted Echo-spacing) aims to improve the visualization of trabecular and cortical bone on MRI by simulating CT tissue contrast..In FRACTURE multiple echoes are acquired at a precise echo-spacing that corresponds to in-phase TEs. Following acquisition, the first post-processing step consists of a magnitude summation of all echoes. After summation, the images from the last echo are subtracted from the summated images to invert the grayscale and give bone a CT-like contrast..Simulated CT contrast sequences have great potential to assist in the diagnosis of inflammatory diseases, neoplasms, trauma, and normal variants. These sequences are useful for demonstrating bone fragmentation, resorption, and bone reaction, which facilitates the identification and understanding of deformities and complex bone remodeling..The great advantages of the FRACTURE sequence are the possibility of using gradient sequences available in all MRI devices and simple post-processing steps.

#### TABLE OF CONTENTS/OUTLINE

.How sCT sequence acquisition and post-processing are performed..Role of the sCT sequence to evaluate the trabecular and cortical bone in routine examinations..Cases of clinical practice in which the sCT sequence turned out to be superior to conventional MRI for trabecular and cortical bone abnormalities.

### Shouldering the Load: Bridging the Gap of Rotator Cuff Tears with Patch Augmentation

#### Participants

Sirui Jiang, MD, PhD, Cleveland, OH (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Anatomy of the rotator cuff  
2. Common patterns of rotator cuff tears  
3. Standard of practice for surgical repair  
4. Emerging treatments in graft augmentation  
5. Advanced imaging characteristics of graft-augmented versus conventional repairs

#### TABLE OF CONTENTS/OUTLINE

1. Review of rotator cuff anatomy,  
2. Clinical presentations of rotator cuff tears  
3. Spectrum of rotator cuff disease  
3a. Prevalence of tears and common tear patterns,  
3a.i. Acute versus chronic tear presentations and diagnosis,  
3a.ii. MRI findings and Goutallier classification,  
3a.iii. Ellman classification of partial-thickness rotator cuff tears,  
3a. iv. Massive rotator cuff tears,  
4. Arthroscopic Repair Techniques,  
4a. Single versus double row repair,  
4b. MRI findings after conventional arthroscopic repair,  
4b.i. Failure findings,  
4b.ii. Assessment of repaired tendon quality (Sugaya Classification),  
5. Patch augmentation,  
5a. Indications for patch augmentation,  
5b. Benefits and complications of patch augmentation,  
5b.i. Reduction in retear rate and improvement in tendon thickness/quality,  
5b.ii. Complications with xenografts,  
5c. Types of patch augments,  
5c.i. Collagen Scaffold (Regeneten),  
5c.i.a. Clinical outcomes and MRI features of healed Regeneten patch,  
5c.ii. Acellular dermal allograft (Dermis-on-demand),  
5c.ii.a. Clinical outcomes and MRI features of healed Dermis-on-demand,  
6. Future directions,  
6a. Anticipated advancements,  
6b. Biologic injections (PRP, stem cells) with concomitant patch augmentation

### Checkmate to Chest Wall Tumors: A Strategic Approach to Diagnosis

#### Participants

Rebeca Francelino, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Although chest wall tumors and tumor-like lesions are rare, familiarity with the main diagnostic entities is important. There is a large 'overlap' between the different etiologies, with many non-specific features between benign and malignant tumors. In the absence of other auxiliary tests, such knowledge allows narrowing the differential diagnoses, in addition to facilitating the decision to recommend further investigation when necessary. The purpose of this exhibit is: 1. To review the most common tumors and their characteristic imaging findings. 2. To discuss the diagnosis and management of benign and malignant tumors. 3. To correlate the imaging findings and clinical clues on a systematic approach to help narrowing the differential diagnosis.

#### TABLE OF CONTENTS/OUTLINE

1- Institutional Protocol to evaluate the chest wall; 2- Epidemiological assessment of the main lesions and best imaging modality 3- Benign bone and cartilaginous tumors Osteochondroma Fibrous dysplasia Aneurysmal bone cyst (ABC) Giant cell tumor (GCT) Ossifying fibromyxoid tumor Chondromyxoid fibroma 4- Malignant bone and cartilaginous tumors Chondrosarcoma Multiple Myeloma Metastasis Osteosarcoma 5- Benign soft tissue lesions Hemangioma Elastofibroma dorsi Fibrous Hamartoma of Infancy Lipoma Schwannoma Desmoid Tumor Neurofibroma Ganglioneuroma Paraganglioma Hemangiopericytoma 6- Malignant soft tissue lesions Ewing sarcoma Rhabdomyosarcoma Synovial sarcoma Pleomorphic sarcoma Ganglioneuroblastoma Neuroblastoma Angiosarcoma Leiomyosarcoma Malignant fibrous histiocytoma (MFH) Malignant peripheral nerve sheath tumor Dermatofibrosarcoma protuberans 7- Miscellaneous Brown Tumor

MKEE-26

### Navigating the Lumbosacral Plexus: A Guide to Understanding its Normal Anatomy and Injuries.

#### TEACHING POINTS

The aim of this study is: 1. Review with didactic illustrations the anatomy of the lumbosacral plexus, including how to recognize it on MRI. 2. Demonstrate how various lumbosacral plex injuries manifest clinically and on imaging studies. 3. Present didactic cases of lumbosacral plexus injuries, highlighting the main findings that the radiologist should expect.

#### TABLE OF CONTENTS/OUTLINE

- Introduction and review of lumbosacral brachial anatomy, with didactic illustration.
- Review normal anatomy without MRI, highlighting anatomical landmarks.
- Overview of the main lumbosacral plexus injuries, their clinical and epidemiological manifestations and their imaging findings.
- Demonstrate with challenging clinical cases traumatic and non-traumatic pathologies, such as inflammatory polyneuropathy, other neuropathies, and associated alterations such as piriformis syndrome.
- Present a case series of lumbosacral plexus injuries and what you should actively look for depending on the clinical history.
- Propose a diagnostic checklist for evaluating lumbosacral plexus injuries, simplifying the reading of these challenging exams.
- Summary.

MKEE-27

### Crystal Spine: Findings of Spinal Crystal Deposition Disease on CT and MRI

#### Participants

Andrea S. Costacurta, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1- Crystal Deposition Disease must be considered in the differential of spinal pain. 2- Findings are often located outside the spinal canal, in the soft tissues, and can be overlooked. 3- MRI has a high sensitivity in detecting inflammation but poorly detects calcification. CT on the other hand has high sensitivity to calcification however the amount of associated inflammation is often underestimated. Awareness of the disease may help in the diagnosis.

#### TABLE OF CONTENTS/OUTLINE

1. Definition and clinical aspects of Crystal Deposition Disease. 2. Classification. 3. Brief review of pathophysiology. 4. Description of the main imaging findings in the spine: longus colli tendinitis, crowned dens syndrome, aseptic spondylodiscitis, disc, ligament or dural calcifications, facet joint arthropathy. 5. Discussion of the differential diagnosis.

### Back to the Future: Automatic Deep Learning Approaches to Opportunistically Assess Spine Health

#### TEACHING POINTS

Complications from spine diseases are highly prevalent across the world. For example, over 1.5 million individuals suffer from back pain due to vertebral fractures and millions more are afflicted with neurogenic back pain. One way to prevent these diseases from developing is to opportunistically assess imaging studies for overall spine health by trending changes in quantitative spine metrics. However, the process of making measurements necessary to diagnose such pathologies is time-consuming, resulting in high underreporting rates for some of the aforementioned conditions (as high as 85%). This exhibit will focus on explaining how deep learning algorithms can be used for detecting vertebral body and disc deformities, trending Cobb angle, assessing paraspinal muscle fat content, and quantifying spinal cord/foramen compression.

#### TABLE OF CONTENTS/OUTLINE

At the end of this presentation the learner should have knowledge about the following:1. Overview of the prevalence of vertebral fractures, disc herniation, spinal cord compression, scoliosis and current manual methods used to quantify severity of these pathologies.2. How neural networks can be used for anatomic object detection across multiple modalities using novel visual transformer and deep convolutional neural networks.3. How keypoint detection networks can be used for automated quantitative vertebral deformity diagnoses.4. How segmentation networks can be used to extract vertebral bodies, intervertebral discs, paraspinal muscles, spinal canal/cord/foramina using 2D and 3D UNets and Swin3D transformer networks.5. A framework for how these measurements can be used for comprehensive spine health assessment in an opportunistic manner.

### Imaging of Meniscal Root Tears: A Practical Review

#### Participants

Bruno Watabe, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The purpose of this exhibit is to: •Review and illustrate the anatomy of the meniscal roots and their specific characteristics. •Illustrate and discuss patterns and classifications of injuries involving these structures, along with their clinical relevance. •Illustrate and discuss various surgical treatments, arthroscopic correlation, and postoperative imaging findings of meniscectomy and repair with suture techniques.

#### TABLE OF CONTENTS/OUTLINE

The meniscal roots and supporting structures anchor the menisci to the tibial plateau, resisting hoop stress and preventing radial displacement of the menisci and subsequent degeneration of the tibiofemoral compartment. Imaging helps determine the type and location of lesions, guiding treatment decisions. An accurate description of lesions and associated imaging findings helps orthopedic surgeons determine the best surgical technique and improve patient outcomes. • Anatomy: Illustration and imaging of the tibial plateau and sites of meniscal root fixation, highlighting their specific characteristics. • Pathological Conditions: Recognition of degenerative changes and various types of traumatic tears in the meniscal roots, along with commonly associated findings, can aid in treatment decisions and potentially delay the onset of secondary osteoarthritis due to meniscal lesions. • Surgical Treatment and Postoperative Imaging: Illustration of different surgical techniques, including partial meniscectomy and meniscus repair, along with their indications and contraindications. Arthroscopic correlation and postoperative images showing follow-up within a certain time interval and potential outcomes.

### Hip Instability Beyond Dislocation: An Overview of New Concepts and Current Radiological Approaches

#### Participants

Julio Guimaraes, MD, Sorocaba, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Hip instability is conceptually divided into traumatic and atraumatic causes, eventually leading to long-term complications, such as osteoarthritis. Hip dislocation and subluxation are well-established entities associated with high and low-energy trauma. Conversely, microinstability is a developing concept, mainly atraumatic, characterized by the inability to keep the femoral head centered within the acetabular fossa in extra physiological movements, which diagnosis involves detailed anamnesis and physical examination, as well as imaging approach. Bone markers for instability are classified into acetabular and femoral subgroups, which can be evaluated by radiographs and CT scans. Acetabular coverage and orientation are assessed to diagnose developmental hip dysplasia. In patients with borderline acetabular coverage, the concomitant evaluation of the Shenton line and femoral physeal scar orientation can determine microinstability diagnosis. The femoral head is assessed for bone morphology, CAM deformity, femoral torsion and neck-shaft angle. Connective tissue disorders are best depicted with MRI, related to capsular laxity, thinning or redundancy. Iatrogenic causes are related to capsular disruption due to intra-articular assessment during hip procedures. MRI can also reveal specific secondary chondral and labral lesions resulting from those structural abnormalities.

#### TABLE OF CONTENTS/OUTLINE

1. Definition; 2. Anatomy; 3. Pathophysiology: a. Traumatic: i. Dislocation and subluxation; b. Microinstability (atraumatic): i. Bone insufficiency; ii. Soft tissue insufficiency; iii. Post-surgical; 4. Imaging Assessment; 5. Management.

### Imaging Spectrum of Foot Infections: A Practical Guide to Radiologists

#### Participants

Carlos Francisco Kallas Pereira, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The differentiation between foot infection imaging patterns is a common challenge for radiologists. Imaging methods provide detailed anatomical information in the assessment of infections, thus helping clinicians to reach the most accurate diagnosis. CT scans play a key role in providing multi planar reconstructions for bone evaluations, whereas MRI is highly sensitive for detecting osteomyelitis in initial stages and can help particularly in looking for soft tissues' complications. In this evaluation it is also important to understand the particularities of each etiological agent. Bacteria is the most common cause of infection, frequently associated with synovitis and osteomyelitis. Tuberculosis can also be related to tenosynovitis and osteomyelitis, especially in immunocompromised patients. Fungal infections have been described to have the classic "dot in a circle" sign on T2 weighted images. It is also important to remember foreign bodies related infections, to avoid misdiagnosis. The diabetic foot is another condition that requires special attention by radiologists. Neuropathic arthropathy predisposes to a greater risk of infection, mostly due to the loss of sensitivity, repetitive trauma and poor healing. Osteomyelitis and Charcot arthropathy frequently coexists, therefore, it is essential radiologists to understand the particular imaging features of these conditions and how they affect the foot compartments, to aid in diagnosis and proper management.

#### TABLE OF CONTENTS/OUTLINE

### Plain Film Evaluation of the Traumatic Knee: A Case-Based Primer

#### TEACHING POINTS

The knee is a commonly injured joint in both children and adults. Plain film evaluation is often first line and familiarity with knee anatomy on plain films is critical for appropriate imaging evaluation. This exhibit reviews normal anatomy of the knee on plain films and illustrates the utility and limitations of plain films in evaluation of the knee joint in the setting of trauma. Utilizing a case-based approach, it reviews common and uncommon knee injuries, their mechanisms, and offers pearls and pitfalls to aid the radiologist in comprehensive radiographic assessment.

### Anterior Glenohumeral Instability: Biomechanics, Preoperative and Postoperative Evaluations

#### Participants

Thais Kuwazuru, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose  
Renata Leao, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

-Traumatic dislocation of the shoulder leads to labral detachment and elongation of the capsular ligamentous restraints, as well as bone loss on the glenoid, humerus or both.-Characterization of the bone loss, with glenoid track, allows an accurate treatment choice.-Most common procedures: Labral repair, glenoid augmentation and humeral reconstruction.-Labral retear: 1.fluid insinuation between the labrum and the glenoid bone margin; 2. Fluid insinuation within the labrum; 3. Morphologic abnormality greater than expected; 4. Anchor detachment.-Latarjet: 1.Graft complications: non-union, dislocation, mispositioning; 2.Hardware complications: loosening, fracture, dislocation; 3.Others: glenohumeral arthritis, neurovascular injuries, subscapularis muscle injury.-Remplissage: indications and normal/abnormal postoperative findings.

#### TABLE OF CONTENTS/OUTLINE

1.Glenohumeral biomechanics and anterior instability2.Anterior glenohumeral dislocation and associated injures3.Glenoid labrum tears4.Bone compression and bone loss - glenoid - humerus and bipolar bone loss5.Labral repair procedure: indications, normal and abnormal postoperative imaging6.Glenoid reconstruction techniques: indications, Latarjet/Bristow and others7.Normal and abnormal imaging findings in glenoid reconstruction techniques8.Humeral head reconstruction: indications, normal and abnormal findings9.Conclusion: the correct assessment of glenohumeral instability is important for the surgical decision. It is essential to know the expected imaging patterns of each surgical technique and the corresponding pathological findings to properly manage potential complications in patients.

### Giant Cell Tumor of Bone: Atypical Imaging Features, Treatment and Complications

#### Participants

Adriano Silveira Moreira Novaes, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The purpose of this exhibit is: 1. Briefly review of the most important features suggesting the diagnosis of the giant cell tumors (GCT) of bone. 2. Demonstrate the unusual locations of the GCT. 3. Review de atypical imaging findings of the GCT and complications in follow-up.

#### TABLE OF CONTENTS/OUTLINE

Giant cell tumor (GCT) of the bone is a generally benign tumor that has recently been reclassified as osteoclastic giant cell-rich tumors according to WHO 2020 classification. It is typically diagnosed through conventional radiographs that show a lytic lesion with a well-defined, non-sclerotic margin, eccentric location, extension to the subchondral bone, and centered in the metaepiphysis of mature long bones. Fluid-fluid levels are seen in 15% of cases, consistent with secondary formation of aneurysmal bone cyst. GCT commonly develops in long bones, particularly around the knee, but can occur in atypical locations with less characteristic radiographic features. Pediatric patients with open epiphyseal growth plates are infrequently affected. Lung metastases are rare, occurring in 1-6% of cases. Recurrence after curettage with cement placement is a possible complication, but this has become less common with the use of adjuvant therapies such as Denosumab.

### **Congenital Hand Malformations: A Review in the Palm of Your Hand**

#### **Participants**

Karla Ortega Rivera, MD, Queretaro, Mexico (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

1. Congenital hand malformations can have a significant impact on hand function and aesthetics, and thus, management should be multidisciplinary and involve specialists in plastic surgery, orthopedics, radiology, and psychology. 2. Radiographic imaging allows for visualization of bone structures, assessment of alignment, and morphology of the hand. 3. Radiographic evaluation is a crucial tool in the assessment of congenital hand malformations. Radiographic findings can help determine the type and severity of the malformation, which can be useful in treatment planning. 4. The aim is to provide a review of the most common congenital hand malformations, their radiographic findings, classifications, and therapeutic approaches, along with illustrative cases both pre- and post-surgery.

#### **TABLE OF CONTENTS/OUTLINE**

I. Introduction  
II. Embryology  
III. Classification  
IV. Specific types of congenital hand malformations and radiographic evaluation  
Polydactyly, syndactyly, camptodactyly, brachydactyly, clinodactyly, constriction ring syndrome

Marco Aurelio Soato Ratti, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Glenohumeral osteoarthritis (GHOA) has a prevalence as high as 20% in the middle-age and elderly population, predominantly observed as the primary form (no specific risk factors). Conversely, secondary GHOA is associated with diverse causes, including rotator cuff tear, post-traumatic degeneration, gleno-humeral morphology (retroversion and glenoid dysplasia), shoulder instability, inflammatory arthropathies and microcrystal deposition. Imaging plays a pivotal role for GHOA diagnosis, investigation of underlying predisposing factors, evaluation of the extent of degeneration and of local complications. Since surgery can be considered in symptomatic patients with moderate to severe degenerative changes, unresponsive to conservative treatment, preoperative assessment by imaging is fundamental. A multimodality approach including radiographic images, computed tomography and magnetic resonance imaging helps the surgeon to choose the ideal technique for better outcomes. Pathologic glenoid version, bone loss and rotator cuff atrophy, as examples, have established association with poor clinical outcomes and hardware complications following arthroplasty. Thus, complete preoperative assessment of glenohumeral joint includes the following aspects: evaluation of bone stock, glenoid version, glenoid tilt, assessment of the rotator cuff with Goutallier classification and Walch classification.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction; 2. Epidemiology; 3. Definition and pathophysiology; 4. Etiology, a. Primary form (or non-specific risk factors), b. Secondary form (or specific risk factors); 5. Multimodality imaging evaluation; 6. Preoperative imaging assessment: what to report.

### CT Myelography and Blood Patches in Intracranial Hypotension: A Primer

#### TEACHING POINTS

1 - Review and explain the intracranial hypotension syndrome, its image manifestations, causes and treatments. 2 - Present didactic clinical cases with images of cerebrospinal fluid (CSF) leaks and fistulas. 3 - Discuss CT myelography technique and interpretation. 4- Show the treatment options for CSF leaks and fistulas. 5 - Demonstrate guided epidural blood patch treatment with real cases images.

#### TABLE OF CONTENTS/OUTLINE

1 - Intracranial hypotension syndrome; 2 - Etiologies; 3 - Diagnostic criteria; 4 - Most common image manifestations; 5 - Imaging methods for etiology investigation. 6 - Spine MRI; 7 - CT myelography; 8 - CSF leaks; 9 - CSF-venous fistulas; 10 - Conservative, interventional and surgical treatments. 11 - Epidural blood patch: how to.

### Distal Tibiofibular Syndesmosis: Stabilize Your Knowledge and Leave the Instability to the Injuries

#### Participants

Izabel Karam, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The purpose of this exhibit is: To review the anatomy and biomechanics of the distal tibiofibular syndesmosis; Discuss the role of each imaging method, including indications, advantages and disadvantages of each modality; To illustrate the main acute and chronic alterations in radiological and orthopedic practice, through didactic cases illustrating our institution through a multimodality approach; Discuss surgical indications and the importance of the findings for the orthopaedic surgeon, according to the imaging methods.

#### TABLE OF CONTENTS/OUTLINE

Anatomy. Biomechanics. Indication for requesting imaging exams in general. Role of radiography, main views and how to evaluate. Role of ultrasonography. Role of CT in neutral. Role of CT with stress maneuvers. Role of Weight-bearing CT. Role of MRI. Surgical indications, importance of radiological findings, and radiological and surgical correlation. Summary and proposed evaluation and test request flowchart. Future perspectives.

### Capturing Psoriatic Arthritis on Film: A Comprehensive Guide to Radiographic Assessment

#### TEACHING POINTS

- Provide an overview of psoriatic arthritis.
- Emphasize the indications, limitations, and benefits of radiography in psoriatic arthritis.
- Compare different imaging techniques for psoriatic arthritis.
- Discuss the normal anatomy of the hand on plain film radiography.
- Emphasize the importance of a systematic approach to hand radiography.
- Become familiar with descriptive terms for common bone and soft tissue abnormalities seen in psoriatic arthritis.
- Provide case studies to illustrate the practical application of theoretical concepts.
- Analyze differential diagnostics, tips, and tricks.

#### TABLE OF CONTENTS/OUTLINE

Overview of psoriatic arthritis: definition, epidemiology, pathogenesis, and clinical manifestations. Radiography in psoriatic arthritis: indications, limitations, and benefits. Comparison of imaging techniques for psoriatic arthritis: radiography, ultrasound, and MRI. Normal anatomy and systematic approach to the hand on plain film radiography. X-rays and psoriatic arthritis: descriptive terms for common bone and soft tissue abnormalities. Case studies: practical application of theoretical concepts. Differential diagnostics: osteoarthritis, gout, and rheumatoid arthritis. Tips and tricks for improving radiology reports. Conclusions: What rheumatologists want to know?

### Bad to the Bone! Understanding and Applying Bone-RADS: A Standardized Scoring System for Bone Lesions

#### Participants

Ellis Mejias Febres, BS, Carolina, PR (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

-Review pathology of bone anatomy-Bone-RADS provides an algorithmic-type approach to assessing differential diagnosis of bone tumors -Each Bone-RADS score is determined by certain criteria that includes the clinical implications for each -Provision of case examples on conventional radiography and computed tomography (CT) to better understand Bone-RADSIn this educational exhibit, we will review the standardized scoring system Bone-RADS, as well as provide radiologists and other health professionals with an understanding of Bone-RADS. the scoring system itself will be explained, supported by imaging from real cases. Finally, we will explain the implications every score has on the management of individual cases based on the Bone-RADS score assigned.

#### TABLE OF CONTENTS/OUTLINE

I. Introduction-Review of bony anatomyCreation of Bone-RADSII. Overview of the criteria used in Bone-RADSIII. Clinical implications/management of bone tumors based on Bone Rads-How Bone-RADS serves as a guide to assessing bone lesions.IV. Imaging examples-Case by case analysis of how Bone-RADS scores are determined.V. Conclusion-Recap of teaching points.

### Anterior Cruciate Ligament Reconstruction: Imaging Evaluation of the Techniques, Normal Appearance and Complications

#### Participants

Andre Y. Aihara, MD, PhD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Anterior cruciate ligament (ACL) reconstruction aims to restore knee stability. The surgical techniques for ACL reconstruction include single and double bundle, while the most frequently used autografts are bone-patellar tendon-bone and hamstring tendons. CT is the gold standard for evaluating tunnel placement, while MRI is best for assessing graft continuity and soft tissue complications. MRI signal intensity of the graft changes over time, with low signal immediately after surgery, increased signal in the first year due to remodeling, and low signal at 18 months. The objectives of this exhibit are: 1. To review ACL reconstruction techniques 2. Discuss imaging findings of normal postoperative ACL 3. Illustrate post-operative complications according to the potential sources: graft, technical and hardware complications, and soft tissues.

#### TABLE OF CONTENTS/OUTLINE

ACL reconstruction Techniques Normal postoperative Imaging • Femoral and tibial tunnels: position and size • Signal intensity of the graft over time • Harvest sites • Radiographic findings • CT findings • MRI findings Complications • Graft Partial tear Complete tear Porto-Knee Testing Device • Technical and hardware complications Anterior tibial tunnel with impingement Anterior femoral tunnel Tunnel widening Hardware migration Hardware fracture • Soft tissues Arthrofibrosis Infection Adventitious Bursitis

Printed on: 04/12/24

MKEE-45

### Imaging Evaluation of the Patella as the Largest Sesamoid Bone

#### Participants

Andre Rosenfeld, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The patella is the largest sesamoid bone in the human body, developing within the quadriceps tendon and becoming a part of the knee's extensor mechanism. Ossification centers can be associated with congenital disorders. Forceful contraction of the extensor mechanism can lead to chronic apophysitis or acute avulsion fractures. Although rare, tumors of the patella can occur, with the majority being benign. Additionally, crystal arthropathies such as gout and CPPD can affect the patella through the deposit of crystals in the tendons or cartilage. Certain diseases are associated with typical patellar morphologies. For example, multiple epiphyseal dysplasia is characterized by a double-layered patella, Cryopyrin-Associated periodic syndromes result in a disproportionately diffuse increase in size, and CPPD deposits cause a gear-like morphology. The purpose of this study is to review the normal development and anatomy of the patella. Discuss and illustrate the imaging findings of pathologies of the patella, which can be didactically divided into congenital disorders, mechanical/trauma, tumors, and crystal arthropathies. For this purpose, radiographs, CT scans, and MR images will be used. Highlight the typical patellar morphologies associated with various diseases. Elucidate how to differentiate normal variants from pathological conditions.

#### TABLE OF CONTENTS/OUTLINE

Normal development of the patella and anatomy Pathologies • Congenital: Bipartite, tripartite, double-layered patella, absence of the patella • Mechanical/trauma: Fracture, sleeve avulsion, Sinding-Larsen-Johansson • Tumors: benign and malign • Cryopyrin-Associated periodic syndromes • Crystal arthropathies: gout and CPPD

### 3D Printing and Metaverse in Musculoskeletal Tumors - A New Assessment Tool

#### Participants

Flavia M. Costa, MD, PhD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- 3D printing preoperative planning for the treatment of MSK tumors ( soft tissue and bone tumors).a. Segmentation. Virtual modeling. Build preparations. Quality assessment• Patient-specific devices - Personal surgical instruments ( PSIs);• Identify what sequences should be used for Preoperative planning in many oncological patients with computed tomography (CT) ( maximum slice thickness of 1 mm) and contrast-enhanced magnetic resonance (MR- 3 Tesla -Siemens) and multiplanar reconstruction;• Mixed Reality (MR) is a technology of real and virtual worlds to enhance visualizations, where physical and digital objects coexist and allow users to interact with both in real-time• Special considerations and Pitfalls.

#### TABLE OF CONTENTS/OUTLINE

1) The value of the combination of 3D printing and metaverse in surgical planning procedures in soft tissue and bone tumors;2) These techniques promise improvements and outcomes for complex bone tumor resection2) Case discussion:• Osteosarcomas resection and prosthesis manufacture• Pleomorphic liposarcomas recidive assessment• Schwannomas• Condrossarcomas• Bone marrow metastasis3) To demonstrate many indirect effects of 3D printing on surgical procedures: • reduced surgery time;• to a reduced complication rate of wound infections and wound healing disorders and therefore enable earlier adjuvant therapy initiation 4) Common pitfalls 5) Conclusion Surgical planning using 3D printing and metaverse/ may result in negative tumor resection margins that reduce the risk of local recurrence and adversely affect patients' survival. Computer navigation and 3D-printed resection guides have been reported to be surgical accurate.

### What, Where, and Why - A Primer on Sonographic Evaluation of Traumatic Injuries to the Tendons of the Wrist and Hand

#### Participants

Kevin Sweetwood, MD, San Francisco, CA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Ultrasound of the tendons of the wrist and hand can provide a high spatial resolution evaluation of tendon pathology which is augmented by the ability to perform dynamic maneuvers that are unavailable with MRI studies. 2. Knowledge of the sonographic appearance and anatomy of these tendons and their associated structures is essential in correctly identifying pathology, providing relevant information to the referring physicians to guide appropriate management, and avoiding pitfalls leading to misdiagnosis. 3. Review of common injuries to the tendons of the wrist and hand focusing on relevant anatomy, sonographic findings, mechanisms of injury, and associated complications and classification schema that are significant for surgical planning.

#### TABLE OF CONTENTS/OUTLINE

1. What - Different traumatic pathologies of the tendons with review of terminology, sonographic appearance, and image acquisition techniques. a. Partial versus complete tendon tears, tendon stump separation and retraction. b. Pulley injuries. c. Sagittal band injuries. 2. Where - Review of relevant anatomy, sonographic landmarks, and surgical classification. a. Appearance and relationships of the flexor digitorum profundus tendon, flexor digitorum superficialis tendon slips, and pulleys. b. Identification of flexor tendon zones utilizing landmarks. c. Appearance and relationships of the extensor tendons and sagittal bands. 3. Why - Isolated tendon injury versus secondary post-traumatic injuries and significance of findings for surgical approach. a. Distal radius fractures. b. Hardware complications. c. Surgical management.

MKEE-48

### Solving the Puzzle: Trying to Simplify Postsurgical Shoulder Images

#### TEACHING POINTS

To explain the main surgical shoulder techniques performed for the treatment of the rotator cuff lesions, long biceps tendon injuries and shoulder instability. Characterize the normal findings frequently seen in post surgery images, and differentiate them from potential pitfalls. Analyze the most common post surgical complications and describe the most frequent lesion recurrences.

#### TABLE OF CONTENTS/OUTLINE

Postsurgical evaluation of the shoulder can be challenging for radiologists due to the complexity of the shoulder's anatomy and the variety of surgical techniques. The main surgeries involve repairing the rotator cuff and or long head of the biceps tendon injuries, and treating glenohumeral instability. Imaging methods play a fundamental role, particularly in cases where there are suspected surgical complications or reinjuries. They have precise indications, and sometimes, they need to be used in combination for the best accuracy. Misinterpretation of expected findings in postsurgical imaging studies is common due to changes in the anatomy and a lack of knowledge about surgical techniques. This can lead to incorrect reports, unnecessary reinterventions, and even legal issues to the surgeon. This work aims to provide a practical and organized overview of the different surgical techniques, normal postsurgical anatomical changes, common complications, and reinjuries on the operated shoulder, so as to allow the radiologist to perform an adequate interpretation of the images.

MKEE-49

### Carpal Instability: Current Concepts and Diagnostic Approach

#### TEACHING POINTS

To show the complex anatomy of the wrist ligaments and its assess in imaging studies. Describe the different types of carpal instability, its pathomechanism, clinical prognosis and treatment implications .Review the different stages of nondissociative carpal instability, integrating images into the pathological process and clinical stages.

#### TABLE OF CONTENTS/OUTLINE

Carpal instability refers to a group of ligament injuries that are responsible for a considerable degree of wrist pain and dysfunction, interfering with sports and daily life activities. Scapholunate and lunotriquetral ligament injuries are the most frequent cause of carpal instability. Depending on the type of injury, these ligaments may be the harbinger of a relentless progression to abnormal joint mechanics, cartilage wear, and degenerative changes. Imaging methods play a crucial role in the diagnosis and staging of this type of injuries which, if not treated, can lead to wrist osteoarthritis

### Diagnostic Evaluation of Very Small Peripheral Nerves: When Ultrasonography Made the Difference

#### Participants

Marcos Felipe Correa, MD, (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Describe the role of the high frequency ultrasound (US) in the assessment of very small peripheral nerves and its comparison with magnetic resonance imaging (MRI). Review the sonoanatomy and the topographic anatomy of the reported nerves and its correlation with MRI. Report selected clinical cases from our service, highlighting pathological involvement of very small peripheral nerves on US and its correlation with MRI, through illustrative images and videos.

#### TABLE OF CONTENTS/OUTLINE

Introduction  
The role of the high frequency US in the assessment of the very small peripheral nerves  
Clinical cases of pathological involvement of very small peripheral nerves on US and its correlation with MRI:  
Palmar cutaneous neuropathy  
Posterior interosseous nerve syndrome  
Digital palmar proper nerve injury (stump neuroma neurotmesis)  
Lateral femoral cutaneous neuropathy (meralgia paresthetica)  
Postoperative radial nerve neuropathy  
Postoperative sural nerve (stump neuroma neurotmesis)

### An Ounce of Prevention is Worth a Pound of Cure

#### TEACHING POINTS

The purpose of this exhibit is: A. Discuss the classic concepts of instability and the relatively new concepts of microinstability of the spine; B. Demonstrate the cascade of degenerative instability going through three stages: (1) temporary dysfunction, (2) unstable dysfunction and a (3) final phase of restabilization; C. Correlate the phases of spinal instability and radiological findings in a multimodality approach; D. To review the main therapeutic options in the context of chronic spinal pain, microinstability and instability.

#### TABLE OF CONTENTS/OUTLINE

A. Spine anatomy and biomechanics of spinal pain; B. Classic spinal instability concepts and degenerative stages; C. Concepts of microinstability and imaging findings in a multimodality approach; D. Discussion of the therapy decision, including conservative treatment measures, surgical indications and modalities of intervention.

Printed on: 04/12/24

### MR Neurography of the Lumbosacral Plexus- Tips on Technique and Injury Patterns

#### TEACHING POINTS

Pelvic and lower extremity sensorimotor disturbances frequently present a diagnostic challenge for referring clinicians and radiologists. Complex anatomy of the lumbosacral plexus in addition to varied clinical presentations make it difficult to pinpoint the site of pathology accounting for patients' symptoms. MR Neurography is a useful modality for evaluation of the nerves in the lumbosacral plexus and can serve as an adjunct to conventional MRI lumbar spine.<sup>1-5</sup> Significant improvements in signal to noise ratio and spatial resolution, particularly with 3D isotropic sequences, and emerging techniques such as deep learning reconstruction facilitate improved nerve visualization. When performing MR neurography, it is important for the radiologist to understand the anatomy of the lumbosacral plexus and to be aware of technical considerations in the pelvis.

#### TABLE OF CONTENTS/OUTLINE

Background Anatomy Overview; Technical Considerations; Protocol/Sequences: high field strength, heavily T2W FS images perpendicular to nerve, 2D/3D; Fat suppression: STIR, DIXON; Vascular suppression: DESS/MENSA; Motion reduction; Contrast-Gadolinium, Ferrumoxytol; Imaging around Metal; Deep learning reconstruction; Imaging features; Normal Injury Patterns; Case examples Iatrogenic, Traumatic

### Whole Body of MRI of Castration-Resistant Prostate Bone Metastasis: How and When

#### Participants

Javier Hernandez Ganan, Hospitalet, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To explain Whole-Body MRI protocol focusing on Dixon and Dwi sequences. 2. To discuss main indications. 3. To select target lesion to biopsy. Whole-body MRI is becoming increasingly important in patients diagnosed with disseminated prostate neoplasia, not only in clinical trials but also in daily practice. Specifically in patients with biochemical progression with bone disease, where more scenarios open up for adequate therapeutic guidance.

#### TABLE OF CONTENTS/OUTLINE

Natural history of prostate cancer. WB MRI protocol: MET RADS. Role of Dixon and DWI sequences. Indications 1. Before starting a new treatment. 2. Follow-up. 3. Select viable lesion to perform percutaneous biopsy. Current developments 1. WB MRI at diagnosis in patients at high risk for prostate cancer: 'all in one' study. 2. PET MRI future indications.

MKEE-53

### Hematopoietic Tumors of Bone - Growing Your Knowledge

#### Participants

Bruno Cardoso, MD, Barbacena, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Obtaining a differential diagnosis for hematopoietic bone tumors is often challenging due to their varied features. Hematopoietic bone tumors encompass a wide spectrum, including multiple myeloma, lymphoma, histiocytosis, Erdheim-Chester disease, and Rosai-Dorfman disease. In some cases, these pathologies can mimic osteomyelitis or bone metastasis, making an accurate diagnosis crucial prior to treatment. X-rays are often the initial imaging study used to evaluate hematopoietic bone tumors, but they have limited sensitivity and specificity in some cases. CT scans, which provide detailed images of the spine and pelvis, are particularly useful for evaluating bony structures while avoiding the effects of overlapping structures. On the other hand, MRI provides better soft tissue contrast, aiding in the differentiation of benign and malignant conditions. Overall, the DWI technique can provide information about tumor cellularity and aggressiveness, potentially improving the accuracy and efficiency of MRI and enhancing patient care.

#### TABLE OF CONTENTS/OUTLINE

I. Introduction, II. Imaging Modalities, III. Multiple myeloma, IV. Lymphoma, V. Langerhans cell histiocytosis, VI. Erdheim-Chester disease, VII. Rosai-Dorfman disease, IX. Differential diagnosis, X. Conclusion.

### Inside the Spinal Canal: A Journey Through Intraspinial Pathologies

#### Participants

Alan Strapasson, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Lesions within the spinal canal can range from benign to highly malignant, with only 20% of these lesions being intramedullary. Other possible origins include nerves, meninges, and vessels. The main objective of this exhibit are: 1. Review the anatomy, imaging protocols, and main pathologies affecting the medullary canal of the lumbar spine or the thoracolumbar transition. 2. Create a diagnostic flowchart for main intraspinal lesions based on age and comorbidities. 3. Describe the main imaging characteristics used to narrow down differentials. 4. Provide an updated classification of intramedullary lesions according to the World Health Organization's 5th edition.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction to lumbar spine anatomy, including transitional vertebra classification. 2. MRI protocols for the lumbar spine. 3. Diagnostic flowchart for lesions categorized by age and comorbidities. 4. Discussion of main imaging findings for various conditions such as Mixopapillary ependymoma, Intradural spinal lipoma, Schwannoma, Lipoma of the filum terminale, Plexiform neurofibroma, Metastases, Vertebral body hemangioma with epidural component, Chordoma, Dermoid cyst, and Epidermoid cyst, using illustrative cases. 5. Highlighting the main clinical and imaging aspects that differentiate lesions within the vertebral canal, to aid in prompt diagnosis and proper treatment. Overall, this exhibit provides a comprehensive overview of intraspinal lesions and their characteristics, contributing to accurate diagnosis and treatment planning.

### MR Arthrograms: Expecting the Unexpected

#### TEACHING POINTS

After reviewing this education exhibit, the reader will understand: 1. Technique of normal arthrograms discussing the major large and medium joints with brief overview of normal post direct arthrogram anatomy. 2. Pitfalls and imaging findings related to common errors or unexpected findings in MR arthrography of larger and medium joints with focus on shoulder and knee. 3. Genesis of common errors and general procedural techniques to avoid these.

#### TABLE OF CONTENTS/OUTLINE

1. Basic technique of fluoroscopic guided direct MR arthrogram for major joints. 2. Overview of normal appearance of common joint spaces post direct arthrogram 3. Unexpected findings or errors related to: a. Contrast media preparation -Over dilution -Increased concentration b. Injection technique -Over distention and contrast extravasation -Extra-articular injection -Intra-articular gas -Extra-articular local anesthetic c. Soft tissue injury d. Unexpected findings related to -Enhancing lesions e.g. fracture, vascular malformation -Anatomic variants e. Scanning -Timing -Incorrect sequence

### **Cervical and Lumbar Spinal Fusion and Arthroplasty Beyond the Basics: From Surgical Techniques to Postoperative Imaging**

#### **Participants**

Gabriel Miranda, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

I) Discuss the role of each imaging method in postoperative evaluation of patients who have undergone cervical/lumbar spinal fusion or total disc replacement/disc arthroplasty. II) Review the different techniques of cervical and lumbar spinal surgery (indications, advantages and limitations), and describe the various surgical instrumentations/devices used in spinal fusion and total disc replacement (TDR)/disc arthroplasty procedures. III) Discuss a basic primer/checklist for radiological evaluation after cervical and lumbar spinal fusion or total disc replacement/disc arthroplasty, to help identify normal and abnormal postoperative findings on the various imaging modalities. IV) List the main early and late postoperative complications.

#### **TABLE OF CONTENTS/OUTLINE**

Introduction: The importance of imaging in the evaluation after cervical/lumbar spinal fusion or disc arthroplasty. The main uses of each imaging modalities  
Spinal instrumentation nomenclature: Spinal fusion instrumentation: screws, plates, rods, interbody cages, bone grafts. Disc arthroplasty devices: disc prosthesis and its various models. Surgery techniques: Cervical spine: anterior cervical corpectomy and fusion, anterior cervical discectomy and fusion, posterior laminoforaminotomy, cervical disc arthroplasty. Lumbar spine: anterior lumbar interbody fusion, oblique lumbar interbody fusion, lateral/extreme/direct lumbar interbody fusion, transforaminal lumbar interbody fusion, posterior lumbar interbody fusion, and lumbar disc arthroplasty. Checklist for radiological postoperative evaluation: Normal postoperative findings. Early and late postoperative complications.

### **Blossom with Artificial Intelligence: Hidden MSK Imaging Biomarkers for Cardiothoracic Diseases from Conventional Chest CT Examination**

#### **TEACHING POINTS**

\*Definition and benefits: Opportunistic CT imaging means analyzing CT scans initially taken for other purposes but with potential to contribute to medical screening levels (primary, secondary, and tertiary screening), and identify incidental pathologies at zero additional costs or radiation exposure. \*Extraction of important musculoskeletal biomarkers is now feasible from conventional CT scans as predictors of cardiothoracic diseases, such as: -Bone density, osteoporosis and osteopenia, using phantomless measures of bone density- Thoracic spine degeneration, using modified Pfirrmann grading- Detailed pectoralis muscle composition measures loss (subcutaneous adipose tissue, intermuscular and perimuscular adipose tissue, extramyocellular lipids), sarcopenia, and prevention of adverse outcomes- Measures of costochondral and tracheal calcification as a marker for extraosseous calcium deposition  
\*Implementation of artificial intelligence (AI): AI algorithms hold promise for enhancing the precision and speed of the opportunistic CT imaging and can generate robust, reliable, and fast quantitative measurements that may not be readily apparent to the human eye.

#### **TABLE OF CONTENTS/OUTLINE**

-Introduction-Methodology: Development of deep-learning algorithm -Clinical application: Current evidences for predictive values for various common cardiothoracic disease-Future directions: AI role for efficient implementation in routine clinical practice

### All Grown Up: Pictorial Review of Premalignant Bone and Soft Tissue Lesions

#### TEACHING POINTS

- There are several bones and soft tissue lesions that can undergo malignant transformation.
- It is important to understand the characteristic imaging appearance and pitfalls of these lesions.
- Radiologists should be familiar with the clinical and imaging management of these premalignant lesions to prevent misdiagnosis.

#### TABLE OF CONTENTS/OUTLINE

Several bones and soft tissue lesions can undergo malignant transformation. This includes premalignant benign tumors and non-neoplastic conditions that injure bone and soft tissue. Both groups require an understanding of key clinical and imaging features to arrive at the correct diagnosis. Enlargement, new pain, or aggressive imaging features can raise suspicion for malignant transformation. This exhibit will discuss 3 main categories of premalignant musculoskeletal lesions:

- Benign tumors
  - Osteochondroma/multiple hereditary exostoses (MHE) ? chondrosarcoma
  - Enchondroma (Maffucci, Olliers) ? chondrosarcoma
  - Fibrous dysplasia? osteosarcoma
  - Giant cell tumor of bone? malignant giant cell tumor
  - Prior bone injury (non-neoplastic)
  - Osteomyelitis ? squamous cell carcinoma, osteosarcoma
  - Radiation ? osteosarcomas, soft tissue sarcomas
  - Bone infarct ? secondary osteosarcoma
  - Paget disease ? osteosarcomas, chondrosarcomas, or fibrosarcoma
- Soft tissue lesions
  - Burns/scars ? squamous cell carcinoma, basal cell carcinoma
  - Synovial Chondromatosis ? chondrosarcoma
  - Neurofibroma ? Malignant peripheral nerve sheath tumor
  - Atypical lipomatous tumor (ALT) ? dedifferentiated Liposarcoma

### Unraveling Wrist Radiographs: A Review of Traumatic Wrist Injuries Focusing on Radiographic Imaging

#### TEACHING POINTS

?? After reviewing this education exhibit, the reader will:? 1. Understand how various views of the wrist are obtained and the indications of different special views. 2. Understand normal anatomy and imaging appearance of the wrist on radiographs. 3. Understand the imaging appearance and clinical context of common and uncommon traumatic carpal injuries and carpal joint disruptions.?

#### TABLE OF CONTENTS/OUTLINE

1. Wrist radiographs - indications of various views (including standard views and less common views such as carpal tunnel) and optimal patient positioning.? 2. Normal wrist anatomy on standard radiographs. 3. Approach to interpretation?? 4. Relevant anatomy, mechanism of injury/ pathogenesis, imaging examples, brief review of clinical presentation and implications, and management of:? a. Different carpal bone fractures b. Different types of carpal dislocations c. Carpo-metacarpal joint fracture-dislocations? ??

### Microinstability and MRI: Unveiling the Invisible

#### Participants

Natan Ribeiro, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Introduce microinstability as a disorder with subtle joint instability- Understand the significance of MRI in diagnosing microinstability- Explore the application of MRI in various joints affected by microinstability- Discuss advanced MRI techniques for accurate detection and staging of joint lesions- Review the evolving relationship between MRI and arthroscopy for microinstability diagnosis and treatment

#### TABLE OF CONTENTS/OUTLINE

1. Introduction to Microinstability and MRI  
2. The Role of MRI in the Diagnosis and Management of Joint Microinstability  
3. Comprehensive Imaging Evaluation of Microinstability in Various Joints  
4. Dynamic MRI for Detection of Functional Causes of Joint Instability  
5. Quantitative MRI Techniques for Objective Evaluation of Cartilage Health  
6. The Benefits of Functional MRI in Understanding Joint Microinstability  
7. Advanced MRI Techniques for Accurate Detection and Staging of Joint Lesions  
8. The Evolving Relationship Between MRI and Arthroscopy for Microinstability Diagnosis and Treatment  
9. The Pivotal Role of Radiologists in Microinstability Diagnosis and Management  
10. Imaging Findings in Anterior Shoulder Microinstability: An MRI-Based Approach  
11. MRI Findings Suggestive of Knee Microinstability: A Comprehensive Review  
12. Management of Microinstability in Different Joints: An Evidence-Based Approach  
13. Role of MRI in Guiding Surgical Intervention for Joint Microinstability  
14. Understanding the Pathophysiology and Anatomy of Joint Microinstability for Accurate MRI Interpretation  
15. Advancements in MR Imaging Technology for Improved Detection and Characterization of Microinstability

### Lateral Meniscus Instability: Understanding Its Anatomy and Unraveling Posterior Attachment Lesions

#### Participants

Carlos H. Longo, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The lateral meniscus is more mobile than the medial meniscus due to its less extensive attachments, and its posterior attachment anatomy has been less studied than the medial meniscus. The posterior root attachment and meniscotibial (coronary) ligaments serve as important static stabilizers, but it is the thin popliteomeniscal fascicles (PMF) that play an important role in the dynamic stabilization of the lateral meniscus during knee flexion. The anterior (Humphrey) and posterior (Wrisberg) meniscomfemoral ligaments also contribute to stabilization. The absence of popliteomeniscal ligaments (congenital or traumatic origin) allows an anterior displacement of the posterior horn of the lateral meniscus during the flexion of the knee (hypermobile meniscus). It can cause symptoms, including pain, blockage and snapping ("snapping knee syndrome"). Peripheric tears of the posterior horn can be associated with buckle-handle tears and meniscal flap dislocation. Posterior root tear is less common in the lateral meniscus than the medial meniscus. The purpose of this study is to:- Review the normal anatomy of the posterior horn of the lateral meniscus and its attachments.- Discuss and illustrate cases of hypermobile meniscus associated with absence of the PMF on MRI.- Illustrate cases of posterior attachments tear on MRI

#### TABLE OF CONTENTS/OUTLINE

Normal anatomy of the posterior attachments of the lateral meniscus and its normal appearance on MRI  
Hypermobile meniscus associated with tear of the PMF  
Buckle-handle tear  
Posterior root tear  
Meniscomfemoral ligaments tear

### Geographic Superficial Soft Tissue Masses: A Guide for Ill-defined Masses

#### Participants

Rachel Bass, MD, Birmingham, AL (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Masses in the superficial soft tissues often have ill-defined borders, and are often benign. Framing the differential into dermal, lipomatous, fibrous, lymphatic and vascular categories may be helpful. 2. Skin thickening with ill-defined underlying edema without enhancement suggests lymphatic origin. This may be localized, and correspond to a pedunculated mass in the morbidly obese, known as a "pseudosarcoma". 3. Ill-defined mass with a fascial tail suggests fibromatosis, which may be desmoid type or superficial. Degree of hyperintensity of fluid weighted sequences corresponds to immature collagen and active tumor. 4. Diffuse fibromatosis is a unique form of neurofibroma that is uncommonly associated with NF-1, and presents with geographic skin thickening with ill-defined subcutaneous edema, nodularity and enhancement. 5. Superficial angiosarcoma will be a nodular, vascular tumor with enhancement and increased activity hot on PET. Often metastatic at presentation.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Lymphatic: Massive localized lymphedema, papillomatosis cutis lymphocystica, Proteus syndrome, cutaneous lymphoma 3. Vascular: Vascular malformation, angiosarcoma 4. Lipomatous: Fat necrosis, adiposis delorosa 5. Fibrous: Desmoid type fibromatosis, superficial fibromatosis, fibrosarcoma 6. Neurogenic: Diffuse neurofibroma 6. Dermal: Squamous cell carcinoma

### "Thinking On Your Feet" - A Step Forward on the Evaluation and Treatment of Morton Neuromas

#### Participants

Mary Creedon, MD, Ann Arbor, MI (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Overview of Morton neuromas and relevant anatomy
2. Review of the sonographic evaluation of Morton neuromas including patient position, transducer position, and dynamic maneuvers
3. Review of the MRI protocol and findings related to Morton neuromas
4. Differential diagnoses and pitfalls
5. Treatment overview including ultrasound-guided procedure indications, required materials, and technique for steroid, anesthetic, and alcohol Morton neuroma injections

#### TABLE OF CONTENTS/OUTLINE

Introduction and overview Pathophysiology and types of traumatic neuromas Nomenclature Epidemiology Clinical Findings Most common locations Ultrasound evaluation Transducer selection and settings Patient and transducer position (dorsal versus plantar imaging) Dynamic maneuvers Sonographic findings Differential diagnoses (including plantar plate tears and intermetatarsal bursitis) and ways to differentiate sonographically MRI evaluation MRI protocol and the use of intravenous gadolinium contrast Literature favoring prone vs supine patient position for MRI and US Differential diagnoses and pitfalls Treatment options Non-operative, non-invasive treatments Ultrasound-guided procedures: a. Indications, risks, and precautions, b. Required materials for steroid, anesthetic, and alcohol injections, c. Technique details Surgical excision Summary

### Post-operative Fluid Collections Following Lumbar Spine Surgery: Differential Diagnosis and Surgical Considerations

#### TEACHING POINTS

Post-operative fluid collections represent a common imaging finding in patients who have undergone recent lumbar spine surgery. Radiologists must be familiar with different types of post-operative fluid collections that can occur following lumbar spine surgery and their salient imaging findings to guide patient management. 1) Recognize different types of lumbar spine surgical techniques including posterior spinal, transforaminal, anterior, extreme lateral, and oblique lateral interbody fusions 2) Review different types of lumbar spine post-operative fluid collections, including cerebrospinal fluid leak (CSF) and pseudomeningocele, lymphocele, bone morphogenetic protein (BMP)-related fluid collection, hematoma, abscess, and urinoma 3) Identify which types of surgical techniques are associated with different post-operative lumbar fluid collections 4) Review treatment considerations for different types of post-operative lumbar spine fluid collections

#### TABLE OF CONTENTS/OUTLINE

Review anterior and posterior approach lumbar spine fusion techniques, relevant anatomy, and post-operative imaging appearance  
Anterior approach- Anterior lumbar interbody fusion (ALIF)- Oblique lateral interbody fusion (OLIF)- Extreme lateral lumbar interbody fusion (XLIF)  
Posterior approach- Posterior lumbar interbody fusion (PLIF)- Transforaminal lumbar interbody fusion (TLIF)  
Review the imaging appearance and management, of different types of post-operative fluid collections after lumbar spine fusion- Pseudomeningocele/CSF leak- Bone morphogenetic protein (BMP)-related fluid collections- Lymphocele- Hematoma- Abscess with discitis/osteomyelitis- Urinoma

Printed on: 04/12/24

## Abstract Archives of the RSNA, 2023

### MRI Evaluation of Oblique Injuries: Introduction of the Deadrise Sign

#### TEACHING POINTS

Importance of oblique injuries in sports imaging  
Primary muscle involved and location of injuries  
Common MRI findings  
Basic MRI protocol and treatment algorithm

#### TABLE OF CONTENTS/OUTLINE

Epidemiology of oblique injuries - Target population - Mechanism of injury - Value of MRI  
Anatomy of the lateral abdominal wall - Muscle layers, fiber orientation, and important attachments - Normal variations in the lower "floating" ribs  
Single institution retrospective cohort of 29 unique injuries in 23 patients - Primary muscle involved - Surrounding injury - Location - Average length of injury  
Common MRI findings and pitfalls - Introduction of the "deadrise" imaging sign - Severity grading considerations  
Case examples - Low grade strain (muscle edema only; no macroscopic tear) - Tears at the lower rib insertions (deadrise sign) - Tears at the iliac attachment (less common) - Differential diagnosis  
MRI protocol considerations - Sequences, scanning time, and short and long-axis views of the rib/cartilage at the site of injury - Common MRI artifacts - Rib level identification  
Treatment algorithm - Collaboration with orthopedic surgery

Printed on: 04/12/24

## Abstract Archives of the RSNA, 2023

### The Musculoskeletal Manifestations of Aging: What the Radiologist Needs to Know in Caring for Our Growing Elderly Population

#### TEACHING POINTS

1. Briefly discuss the multifactorial biochemical processes that contribute to normal aging of the musculoskeletal system.2. Familiarize the radiologist with the normal radiologic manifestations seen in the musculoskeletal system that arise from aging.3. Review the radiologic manifestations of the most common musculoskeletal pathologies that occur in the elderly population resulting from normal aging.

#### TABLE OF CONTENTS/OUTLINE

A. Brief review of the biochemical processes that contribute to normal aging in the context of musculoskeletal manifestations.B. Illustrate normal and pathologic radiologic manifestations of aging in the musculoskeletal system a) Changes in bone homeostasis i. Osteopenia/osteoporosis, Paget's disease ii. Insufficiency fractures iii. Fragility fractures b) Architectural changes in skeletal muscle composition i. Sarcopenia c) Architectural changes in articular cartilage composition i. Osteoarthritis d) Architectural changes in tendon composition decreased cellular response to injury i. Tendinopathy and tendon tears e) Metabolic derangement and predisposing co-morbidities seen in the elderly population i. Diffuse idiopathic skeletal hyperostosis ii. Crystal deposition disease f) Genomic instability from accumulated oxidative damage and decreased repair mechanisms i. Multiple myeloma ii. Metastatic disease

### Where is the Contrast? Patterns to Recognize and Pitfalls to Avoid for Successful MSK Arthrography

#### Participants

Maxine Kresse, MD, (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

-Review of arthrogram techniques of the major joints to include range of normal appearances and demonstrate pathology with successful injection-Recognition of extra-articular injection, with cross-sectional correlates-How to avoid and correct for common pitfalls

#### TABLE OF CONTENTS/OUTLINE

-Brief introduction to fluoroscopy guided arthrograms of the major joints (including shoulder, elbow, wrist, hip, knee, and ankle)-For each of the major joints: a. Normal arthrogram appearance, including normal bursa/recess communications with the joint; b. Successful intra-articular injection with pathology diagnosed by the arthrogram fluoroscopy images (i.e. full thickness rotator cuff tear); c. Numerous examples of extra-articular injections, with cross sectional correlates on the location of the contrast; d. Tips to avoid common pitfalls and ways to adjust to achieve an intra-articular injection-Summarize pearls and pitfalls to aid in troubleshooting to avoid compromised cross-sectional exams

MKEE-69

### "Untangling the Nerves" - Sonographic Findings of Upper Extremity Nerve Entrapments and Injuries with MRI Correlation

#### Participants

Preethi Kesavan, MD, Ann Arbor, MI (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Benefits in the use of ultrasound with technique details  
2. Classification and sonographic imaging of peripheral nerve injuries with MRI correlation  
3. Ultrasound of nerve entrapment syndromes of the upper extremity with MRI correlation  
4. Ultrasound-guided peripheral nerve interventions

#### TABLE OF CONTENTS/OUTLINE

Why ultrasound and how? Benefits and advantages in the use of ultrasound  
Technique details, including transducer selection and machine settings  
Dynamic imaging and the use of Doppler (including newer microvascular imaging techniques)  
Sonographic findings including normal reference cross-sectional measurements  
Types of peripheral nerve injuries  
Classification and types of peripheral nerve injuries  
Sonographic findings of normal versus abnormal peripheral nerves  
MRI correlative imaging  
Ultrasound imaging of upper extremity nerve entrapment syndromes  
Sites of entrapment, relevant anatomy, and associated pathophysiology  
Sonographic imaging findings with MRI correlation  
Secondary imaging findings including muscle denervation edema, atrophy, and myosteatosis  
Ultrasound-guided peripheral nerve interventions  
Indications, risks, precautions, and benefits of ultrasound. Required materials including what to inject (e.g., nonparticulate versus particulate corticosteroids)  
Ultrasound-guided diagnostic and therapeutic injections including hydrodissection and alcohol/ethanol neurolysis  
Ultrasound-guided cyst aspiration/decompression to relieve nerve compression  
Summary

### Tibial Plateau Fractures: Common Classification Systems and Clinical Considerations

#### Participants

Rachel Bass, MD, Birmingham, AL (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. The Schatzker classification of tibial plateau fractures is commonly used but lacks description for coronally oriented fractures. The three column approach highlights the importance of the posterior tibial plateau. 2. The Kfuri (modified Schatzker) classification system was introduced in 2018, and marries the Schatzker classification with anterior and posterior modifiers, and is accepted among orthopedic surgeons. 3. Involvement of the posterior column affects surgical approach and technique, and stabilization of the posterior medial column and tibial rim is critical for good functional outcome. 4. Preoperative CT provides critical information regarding fracture orientation, depression, and vascular injury. 5. Preoperative MRI following external fixation may provide critical information to the orthopedic surgeon regarding meniscus and ligamentous injury that will be addressed at the time of definitive internal fixation.

#### TABLE OF CONTENTS/OUTLINE

1. Tibial Plateau Classification systems: AO/OTA, Schatzker, Three Column, Kfuri (Modified Schatzker) 2. Surgical Approach and clinical importance: Buttress fixation, posterior column fixation, graft placement 3. Soft tissue injury: Open fracture, vascular injury, meniscal tear, cruciate ligament tear, compartment syndrome 4. Long term outcomes: Expected healing, postoperative osteoarthritis leading to arthroplasty.

### Keeping Cool: Thermoprotection Strategies for Musculoskeletal Ablations

#### TEACHING POINTS

Basic principles of how to ablate targeted tissues and minimize damage to surrounding structures.-Review passive monitoring and active protection techniques during thermoablation.

#### TABLE OF CONTENTS/OUTLINE

Percutaneous thermal ablation is being increasingly performed for oncologic treatment within bone and non-visceral soft tissue.- Certain risks are of interest during musculoskeletal ablation, namely skin and neurovascular bundle injury when compared to other deep organ ablations. Given this, concurrent multi-modal thermoprotective measures should be used to prevent non-target destruction of overlying skin and adjacent structures. Both active and passive protective measures are outlined in our presentation.-Passive techniques are utilised to monitor the patient and can include clinical monitoring and real-time intra-procedural imaging. Direct patient interaction and instruction, such as asking the patient to move intermittently or report altered sensation is a subjective method of clinical monitoring in order to detect neural injury. In contrast, intra-procedural imaging is more objective, whereby the radiologist can view the ablation zone in real-time, allowing confident treatment of the target lesion while avoiding non-target structures.-By comparison, active techniques are utilised to protect non-target structures and can be subdivided into temperature modulation and displacement techniques. Temperature modulation can be achieved with warmed/cooled saline gloves on the skin or subcutaneous fluid injection to dissipate temperature. Displacement of non-target adjacent structures is usually achieved with hydrodisplacement or pneumodisplacement.

### Dual Energy X-ray Absorptiometry (DXA): Principles and Tips in Classic and New Applications

#### TEACHING POINTS

- To review the basics of dual energy x-ray absorptiometry (DXA)
- To discuss the use of DXA in the assessment of bone density, also reviewing the contribution of new developments such as trabecular bone score (TBS) in the diagnosis of osteoporosis.
- To analyze the evolving role of DXA in the evaluation of soft tissues especially for body composition such as quantification of fat and estimation of skeletal muscle mass in sarcopenia.
- To emphasize pitfalls, diagnostic difficulties, and provide clue points in order to improve performance in DXA exams.

#### TABLE OF CONTENTS/OUTLINE

DXA is the 'gold-standard' in quantitative assessment of bone mineral density in the diagnosis of osteoporosis. The use of DXA has been also recommended in sarcopenia, to assess lean mass as an estimation of all non-fat/non-bone tissues, fat mass and bone mineral content. We review: 1. Basics and technique of DXA. DXA principle is based on attenuation coefficient of different tissues with low energy X-ray beams. 2. Uses of DXA. BMD study. Body composition and sarcopenia studies 3. BMD study. DXA performance. Causes of mistakes in different steps of DXA study: 3.1 Before the study: technologist training and competence, daily calibration, anthropometric data, regions to scan. 3.2 During the study: Patient positioning, Image acquisition: regions of interest. 4. Osteoporosis diagnosis. Image interpretation: Parameters. Adequate use of T-score and Z-score; Report. Detection of vertebral fractures or bone diseases (osteoarthritis, metastases, Paget's disease), soft tissue lesions, detection of artifacts-foreign bodies. New developments: TBS. 5. Body composition. Sarcopenia. DXA software analysis. Comparison with different techniques.

### A Radiological Overview of Elbow Arthroplasty: Practical Keys in the Assessment of Elbow Replacement

#### Participants

Javier Azpeitia Arman, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

-To know the different types of elbow replacement. -To review the role of imaging techniques (plain radiograph, CT, MR, US, scintigraphy) in the evaluation of elbow replacements. -To understand usefulness and limitations of plain radiographs and CT in the evaluation of elbow replacements, emphasizing useful parameters and illustrating image analysis and interpretation. -To become familiar with normal and abnormal postoperative imaging findings and signs of complications

#### TABLE OF CONTENTS/OUTLINE

We review imaging of elbow replacement, highlighting key concepts perceived as important variables by the surgeon and correlating images with clinical considerations and functional outcomes. We present: 1. A review of types of replacement. 2. Surgery. Aims. 3. Imaging. Plain radiographs: -Technique and views. Standard image acquisition: beam and anatomical landmarks -Parameters that should be evaluated: description of the components, alignment relative to normal anatomic alignment. 4. Imaging. CT: -Technique. -Parameters that should be evaluated. -Imaging of complications: Aseptic loosening, infections, ulnar nerve complications, instability, disassembly, dislocation, subluxation, intraoperative fractures, mechanical failure of prosthetic components, and ectopic bone formation 5. Role of MRI, US and scintigraphy. .

### **Beyond the Surface: Exploring Extradigital Glomus Tumors - A Comprehensive Review of 64 Cases with Radiologic-Pathologic Correlation**

#### **Participants**

Gabriela Serra Del Carpio, Madrid, Spain (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

- In our study males outnumbered females with a male-female ratio of 2.1:1. - The mean age at the time of diagnosis was 55,8 years. - The tumors had a mean size of 1 cm and were located in the lower limbs in most cases (38/64).- In 17 cases (27%) a diagnostic imaging test was performed (US, MRI or both). - The radiological appearance of a glomus tumor on ultrasound was in most cases as a circumscribed hypoechoic oval nodule located in the subcutaneous layer and horizontally oriented. - Spectral Doppler can demonstrate both venous and arterial intralesional flow and in some cases a "Vascular stalk sign". - Images obtained by ultrasound are not specific but they play an important role in early diagnosis, give precise information on location, and provide guidance for excision of glomus tumors.

#### **TABLE OF CONTENTS/OUTLINE**

Introduction  
Materials and Methods  
1. Results- Clinical findings - Radiological findings- Histological, cytological and immunohistochemical features- Differential diagnosis- Discussion

### Weight-Bearing MRI: A New Technology for Changing the Approach to Pathology from Diagnosis to Therapy

#### Participants

Joan C. Vilanova, MD, PhD, Girona, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Learn the technical methodology to perform a weight bearing MRI (WB) for the different areas of the body/joints
- Show the proper analysis of the weight bearing examination to distinguish physiological changes from pathology on a clinical-radiological correlation
- Know the most common and appropriate indications for weight bearing MRI from the different areas/joints of the body

#### TABLE OF CONTENTS/OUTLINE

•Introduction • WB MRI equipment characteristics • WB MRI technique of different areas/joints, procedure to perform the upright examination: craniocervical junction (CVJ), spine, shoulder, knee, hip, ankle, foot, temporomandibular joint (TMJ); showing dynamic MRI evaluation • WB postprocessing: quantification of the changes from non-WB to the WB examination • Indications: CVJ: instability; Spine: instability, postural alignments changes, discopathy, lateral recess - foramen - central canal, postsurgical evaluation; Shoulder: instability, impingement; Knee: meniscal-ligamentous instability, patellar shift, Impingement; Hip: impingement, microinstability; Ankle: ligamentous instability, impingement, plantar fascia; Foot: metatarsalgia evaluation; TMJ: internal joint disorders • Benefits and limitations • Conclusions

### Breaking Down Bone and Muscle: The Nitty-gritty of MSK Infections

#### Participants

Alba Salgado Parente, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To revise the physiopathology and imaging findings of musculoskeletal infections (soft tissue, bone and joint, spine and periprosthetic infections) with different imaging modalities (conventional radiography, US, CT, MRI, PET)  
2. To discuss the differential entities that can mimic septic arthritis and osteomyelitis, focusing on pearls and potential pitfalls to make a correct diagnosis  
3. To develop a systematic approach for interpreting imaging findings of MSK infections, including evaluation of the extent and severity of infection and potential complications

#### TABLE OF CONTENTS/OUTLINE

1. Introduction  
2. Imaging techniques in the evaluation of MSK infections: conventional radiography, ultrasound, CT, MRI and nuclear medicine techniques  
3. MSK infections: Pathophysiology and key concepts  
a. Soft tissue infections: Cellulitis, abscess/phlegmon, myositis/pyomyositis, superficial, deep and necrotizing fasciitis  
b. Bone and joint infections: Septic arthritis, septic bursitis, tenosynovitis, acute osteomyelitis, chronic osteomyelitis, Diabetic foot  
c. Spine infections: Spondylodiscitis, facet joint septic arthritis  
d. Periprosthetic infections: Technical considerations and imaging  
4. Pitfalls and mimics - How to avoid them: Is this septic arthritis?, Is this osteomyelitis?  
5. Systematic approach to MSK infections: What steps to follow  
6. Conclusions  
7. References

### Spotlight on Musculoskeletal Lymphoma: A Radiological Exploration of an Uncommon Entity

#### Participants

Maxine Kresse, MD, (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Radiology plays a central role in the diagnosis of musculoskeletal lymphoma. 2. Musculoskeletal lymphoma can present with different patterns. 3. Lymphoma involving the muscle, skin, and bones can occur at nearly every age and may present with atypical features that can distinguish it from other entities.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction-Overview of musculoskeletal lymphoma-Importance of radiology in diagnosis 2. Imaging modalities for musculoskeletal lymphoma, including Radiography, Ultrasound (US), Computed Tomography (CT), Positron Emission Tomography (PET), and Magnetic Resonance Imaging (MRI) 3. Imaging features and patterns of musculoskeletal lymphoma-Osseous lymphoma: lytic pattern, sclerotic pattern, and "near normal" radiographic findings-Soft tissue lymphoma-Trans-spatial lymphoma 4. Differential diagnosis-Other primary bone and soft tissue neoplasms-Metastatic lesions-Inflammatory and infectious conditions 5. Conclusion: key takeaways from radiologic evaluation of musculoskeletal lymphoma

MKEE-8

### Non-Tumoral Spine Bone Lesions: A Pictorial Review of Common and Uncommon Pathologies

#### Participants

Andre Mannato, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The features of non-neoplastic bone lesions in the spine are often similar to those of malignant tumors, and a differential diagnosis is challenging to obtain in some cases. Non-tumoral bone lesions of the spine have a broad spectrum, including mechanical, infectious, inflammatory, vascular, and other causes. The clinical manifestations of ranging from back pain to neurological deficits mimicking myelopathy or radiculopathy. A careful and attentive imaging evaluation can help narrow differential diagnosis and potentially avoid unnecessary biopsy. Therefore, an accurate diagnosis is important prior to treatment. X-rays are often the first imaging study used to evaluate spinal tumors, but they have limited sensitivity and specificity for diagnosing benign tumors. CT scans provide detailed images of the spine and are particularly useful for evaluating the bony structures, such as in the case of vertebral hemangiomas. MRI, on the other hand, provides better soft tissue contrast and can help differentiate between benign and malignant tumors. Overall, the DWI and Dixon techniques offer several advantages in magnetic resonance imaging, including improved detection of diseases, improved visualization of structures, can help distinguish between benign and malignant tumors and provide information about tumor cellularity and aggressiveness. These techniques have the potential to improve the accuracy and efficiency of MRI and enhance patient care.

#### TABLE OF CONTENTS/OUTLINE

I. Introduction; II. Imaging Modalities; III. Mechanical Causes; IV. Infectious Lesions of the Spine; V. Inflammatory Causes; VI. Vascular; VII. Miscellaneous; IX. Conclusion.

### Imaging Review of Knee Ligament Reconstructions Other Than the ACL

#### Participants

Thurl Hugh Cledera, MD, Taguig, Philippines (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Knee ligament injuries are common and operative techniques are continually evolving. Accurate clinical information along with imaging diagnosis aids in selection of the appropriate operative technique. While imaging features of anterior cruciate ligament (ACL) reconstruction are well-described in literature, data on indications, postoperative imaging findings and complications of reconstructions of other ligaments of the knee are limited. In this education exhibit, we discuss the imaging findings and complications of reconstructions of knee ligaments other than the ACL. The objectives of this education exhibit are: 1. Recognize normal radiographic and MR appearance of non-ACL ligament reconstructions 2. Understand the basic operative concepts and techniques for each type of reconstruction including indications and common grafts used 3. Recognize commonly encountered postoperative complications to aid in providing a precise and meaningful radiologic report

#### TABLE OF CONTENTS/OUTLINE

TECHNICAL CONSIDERATIONS • Conventional radiographs • Stress radiographs • Pre and postoperative MRI BASIC INDICATIONS AND NORMAL RADIOGRAPHS AND MRI OF THE FOLLOWING PROCEDURES Posterior cruciate ligament (PCL) reconstruction Posterolateral corner reconstruction • Laprade technique • Andrews technique • Lemaire technique Anterolateral knee reconstruction • Lateral extra-articular tenodesis (LET) • Anterolateral ligament (ALL) reconstruction Posteromedial corner reconstruction Medial patellofemoral ligament (MPFL) reconstruction Multiligament reconstruction COMPLICATIONS • Graft failure • Malpositioned graft • Femoral and/or tibial tunnel widening • Arthrofibrosis • Graft impingement

### Radiographs and MRI of Tendon and Ligament Surgeries: A Resident's Primer

#### Participants

Juvel Lee, MD, Richmond, BC (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Radiodense hardware such as in metallic fixation and arthroplasties are easily evaluated on radiographs by both trainees and nontrainees alike. On the other hand, surgeries that utilize mostly radiolucent or nonmetallic components such as tendon transfer, ligament reconstruction and other soft tissue procedures may be more challenging to assess, especially by trainees. These procedures may manifest with nodular or tubular lucencies that may be mistaken for cysts, infection or tumors. In this education exhibit, we provide a concise review or "pocket guide" of normal and abnormal imaging appearance of commonly encountered soft tissue procedures to aid the radiology resident/trainee in appropriate assessment of non-radiodense operative hardware. The objectives of this education exhibit are: 1. Recognize normal radiographic appearance of commonly encountered non-radiodense operative hardware 2. Understand the basic operative concepts and indications of these soft tissue procedures 3. Recognize radiographic and basic MR appearance of complications of these soft tissue procedures?

#### TABLE OF CONTENTS/OUTLINE

For each procedure, the following will be discussed: PROCEDURE: INDICATIONS: RADIOGRAPHS: MRI: COMPLICATIONS: SHOULDER Rotator cuff repair Biceps tenodesis Anterior stabilization ELBOW UCL reconstruction Distal biceps repair WRIST and HAND Volar oblique ligament reconstruction Thumb UCL reconstruction KNEE ACL reconstruction MPFL reconstruction Patellar tendon transfer ANKLE Tendon transfer procedures Lateral ligament reconstruction

### Utilizing Dual Energy CT for Evaluating Gout: A Review of Imaging Artifacts and Pitfalls for Trainees to Avoid

#### TEACHING POINTS

Discuss the basics of dual-energy CT (DECT) technology and its current clinical application in the detection of gout. Demonstrate typical imaging findings of gout on DECT. Review imaging artifacts commonly seen when utilizing DECT gout protocol, including those related to keratin, metallic objects, and image noise. Explore additional pitfalls for trainees to avoid including the physiologic deposition of monosodium urate in various tissues. Understand techniques to minimize DECT artifacts.

#### TABLE OF CONTENTS/OUTLINE

Epidemiology and clinical presentation of gout, a crystal arthropathy caused by the deposition of monosodium urate (MSU) crystals  
Typical imaging findings of gout on radiography, conventional CT and MRI  
Physics of DECT and its clinical application for the evaluation of gout  
Reviewing artifacts causing misregistration of non-MSU crystals as gout: Keratin: Nailbed keratin and skin callous  
Metallic objects: Foreign bodies, CT table and orthopedic hardware including intervertebral disc spacer material  
Image noise: Quantum mottle causing image noise artifact with incorrectly-labeled submillimeter foci of MSU crystals  
Additional miscellaneous pitfalls for trainees to avoid: Limitations of DECT for evaluating chronic gout  
Physiologic deposition of MSU crystals in non-gout patients  
Troubleshooting and minimizing DECT artifacts  
Physiologic deposition of MSU crystals in non-gout patients  
Troubleshooting and minimizing DECT artifacts

### CUP - A Novel Comprehensive Classification System for Triangular Fibrocartilage Complex Lesions

#### Participants

Jan Grunz, MD, Wuerzburg, Germany (*Presenter*) Research Consultant, Siemens AG

#### TEACHING POINTS

The classifications of Palmer (1989) and Atzei/Luchetti (2011) constitute the current standard to characterize lesions of the triangular fibrocartilage complex (TFCC). However, both systems have substantial drawbacks that limit clinical applicability. The Palmer classification does not discern between the foveal and styloid insertions of the radioulnar ligaments, which is essential for treatment, while differentiating between traumatic and degenerative lesions is often not feasible. In contrast, the Atzei classification focuses exclusively on the ulnar-sided periphery. Several less common lesion types are not included in either system. These limitations motivated us to develop a new comprehensive and clinically-oriented classification for lesions of the TFCC. In the proposed system, the acronym 'CUP' refers to central lesions (C) limited to the articular disc, ulnar lesions (U) affecting the insertions of the radioulnar ligaments, and peripheral lesions (P), which comprise injuries of the ulnocarpal meniscus and ligaments, the dorsal joint capsule, and the extensor carpi ulnaris tendon sheath. Each group is subdivided into three grades of severity with adequate treatment recommendations.

#### TABLE OF CONTENTS/OUTLINE

1. TFCC anatomy 1.1 Biomechanical properties 1.2 Vascularization 2. Imaging 2.1 MRI with and without intravenous contrast enhancement 2.2 CT and MR arthrography 3. Lesion types 3.1 Central lesions 3.2 Ulnar lesions 3.3 Peripheral lesions 3.4 Combinations with fractures and avulsion injuries 4. Therapy 4.1 Surgery versus conservative treatment 4.2 Overview of surgical procedures 5. Discussion

### There's Light at the End of the Carpal Tunnel - But is it a Good Thing

#### Participants

Jan Grunz, MD, Wuerzburg, Germany (*Presenter*) Research Consultant, Siemens AG

#### TEACHING POINTS

Constituting the most common entrapment neuropathy by far, carpal tunnel syndrome (CTS) is caused by compression of the median nerve within a narrow passage on the palmar side of the wrist. The carpal tunnel is located beneath the transverse carpal ligament and extends from the scaphoid and trapezium to the hamate and pisiforme bone. Containing the deep and superficial flexor tendons in addition to the median nerve, entrapment neuropathy can occur in case of mismatches between the tunnel's size and the volume of its contents. CTS patients typically report painful paresthesia of digits I-III with aggravation at night, when provoked by tapping the median nerve at the carpal tunnel entrance (Hoffmann-Tinel sign), and when flexing the wrist (Phalen test). Chronic CTS results in atrophy of the thenar muscles with limited opposition and abduction of the thumb. Among several causes, tenosynovialitis of the flexor tendons is the most frequent. While CTS is usually diagnosed in clinical and electrophysiological examinations, radiologists can provide valuable insights by performing cross-sectional measurements and qualitative assessment of the edematous nerve structure in ultrasound and MRI. Particularly if symptoms persist after carpal tunnel release surgery, both imaging methods are of great importance.

#### TABLE OF CONTENTS/OUTLINE

1. Anatomy of the carpal tunnel 2. Imaging techniques 2.1 Ultrasound 2.2 MRI with and without i.v. contrast enhancement 3. Pathophysiology of CTS 3.1 Tenosynovialitis 3.2 Congenital anatomical variants 3.2 Bony stenoses 3.4. Tumors 4. Postoperative imaging 5. Discussion

MKEE-85

### The Many Faces of Heterotopic Ossification: Pathogenesis, Imaging Features and Differential Diagnosis

#### Participants

Ustun Aydingoz, MD, Ankara, Turkey (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Three requisites stand out for heterotopic ossification (HO) formation: osteogenic precursor cells, multiple inducing factors and pertinent biochemical signaling pathways, a favorable microenvironment.
- Recent evidence suggests that the initiation of HO particularly necessitates local hypoxia in the microenvironment.
- Heterotopic ossification is a commonly encountered condition on imaging with characteristic—if not pathognomonic—findings involving musculoskeletal soft tissues such as muscles, ligaments, and tendons.
- A host of differential diagnostic possibilities need to be considered when there is concern for heterotopic ossification.

#### TABLE OF CONTENTS/OUTLINE

- Pathophysiologic background of HO.
- Case examples of various manifestations of HO on imaging with pearls and pitfalls (e.g., myositis ossificans [traumatic, neurogenic], periostitis ossificans, arachnoiditis ossificans, panniculitis ossificans, Pellegrini-Stieda lesion [HO of the medial collateral ligament of the knee], HO of the posterior longitudinal ligament [OPLL] or nuchal ligament, Bennett lesion [HO of the posterior band of the inferior glenohumeral ligament], other enthesal ossifications [diffuse idiopathic skeletal hyperostosis], tendon ossifications [Achilles, hip abductors, rotator cuff], fibrodysplasia ossificans progressiva).
- Differential diagnostic considerations for HO on imaging (e.g., calcific tendinitis, calcific peri-arthritis, dystrophic calcifications, extraskeletal bone tumors, synovial sarcoma, calcinosis cutis, calcinosis of chronic renal failure).

Printed on: 04/12/24

## Abstract Archives of the RSNA, 2023

MKEE-86

### Spectrum of Calcaneal Tumors and Tumor-like Lesions: Imaging Findings with Pathological Correlations

#### TEACHING POINTS

1. Lipomas can be distinguished from simple bone cysts based on central dystrophic calcification, particularly with fat necrosis and cyst formation. 2. An associated primary bone lesion should always be considered in older patients with aneurysmal bone cyst-like changes. The differential diagnosis can be narrowed down using a combination of imaging features (lesion components, location) and clinical information (age). 3. The age for some calcaneal tumors is different from tumors in other locations. This makes it difficult to differentiate between chondroblastomas, characterized by marginal sclerosis and calcifications, and giant cell tumors (GCTs). 4. The tumor matrix pattern should be emphasized. A stippled or ring-like pattern indicates cartilage calcification, cloud-like appearance indicates osteoid mineralization, and a ground-glass density indicates fiber matrix. 5. Age needs to be considered in solid tumors with non-specific imaging features. Enchondromas, chondrosarcomas, metastatic tumors, myelomas, lymphomas, and undifferentiated pleomorphic sarcomas are common in adults, whereas, GCTs, chondroblastomas, osteosarcomas, Ewing sarcomas, and Langerhans cell histiocytosis are more common in young individuals.

#### TABLE OF CONTENTS/OUTLINE

1. Chondroblastoma 2. Chondromyxoid fibroma 3. Secondary peripheral atypical cartilaginous tumor 4. Chondrosarcoma 5. Osteoid osteoma 6. Osteosarcoma 7. Hemangioma 8. Epithelioid hemangioendothelioma 9. Aneurysmal bone cyst 10. Giant cell tumor 11. Simple bone cyst 12. Fibrous dysplasia 13. Lipoma 14. Undifferentiated pleomorphic sarcoma 15. Metastases 16. Myeloma 17. Primary lymphoma 18. Ewing sarcoma

### **Discordance Between Bone Mineral Density and Trabecular Bone Scores for the Lumbar Spine in the Setting of Intra-Abdominal Calcifications and Dense Surgical Materials**

#### **TEACHING POINTS**

Spinal vertebrae contain the most metabolically active components, and they are therefore commonly the first site to manifest the osteoporotic process. Calcifications (i.e., fibroids, vascular calcifications, and degenerative joint disease) and dense surgical material (i.e., vertebroplasty, stents, embolization coils, and IVC filters) within the field of view falsely elevate bone mineral density (BMD) measurements. To mitigate such artifactual elevation of BMD measurements, the International Society of Clinical Densitometry (ISCD) has come up with guidelines for BMD reporting such as excluding affected vertebrae from analysis. Trabecular Bone Score (TBS), on the other hand, is a novel tool for assessing fracture risk by analyzing bone trabecular microarchitecture. Despite being adherent to ISCD guidelines, we have found in clinical practice that many patients with intra-abdominal calcifications and surgical material have normal lumbar spine BMD measurements but low TBS scores. These inconsistencies suggest that the utilization of DXA BMD measurements alone may under-predict fracture risk, especially in patients with calcifications or surgical material, and that TBS may be especially helpful as an adjunct to DXA in this patient population.

#### **TABLE OF CONTENTS/OUTLINE**

1. Fundamentals of DXA. 2. Pathophysiology of osteoporosis. 3. Fundamentals of TBS. 4. Limitations of DXA in the setting of intra-abdominal calcifications and surgical material. 5. Case comparisons of DXA and TBS scores to demonstrate discordances. 6. Conclusion.

### Peripheral Arthropathies: Step by Step

#### Participants

Raquel Acosta Hernandez, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Introduction: Despite the development of CT and MRI, plain radiography stands as the irreplaceable test of first diagnostic approach in peripheral arthropathies. Following a complete diagnostic algorithm helps to emphasize the key points in the differential diagnosis between inflammatory versus osteoarthritis disease. Once joint space narrowing is evaluated, the presence of bone erosions (as a hallmark of joint inflammatory arthritis in ankylosing spondylitis, psoriatic arthritis, and reactive arthritis), osteophytes (typical of degenerative arthritis), and their distribution are basic pillars on guiding an accurate diagnosis. Teaching points Approach the radiographic algorithm evaluation of peripheral arthropathies based on classification into inflammatory or degenerative pattern: joint space narrowing (uniform and non-uniform), bone erosion and distribution pattern. Introduced a systematic reading of hands and feet plain radiographs following the ABCDs acronym: articular, bone, cartilage, distribution and soft tissue. Correlate typical plain radiographic of peripheral arthritis findings with CT and MRI studies.

#### TABLE OF CONTENTS/OUTLINE

- Radiographic algorithm evaluation of peripheral arthropathies based on joint space narrowing and typical examples of articular erosions patterns. - Systematic ABCDs acronym reading: articular (deformity and destruction), bone (erosion, osteopenia, proliferative changes and distal affectation), cartilage, distribution and soft tissue (soft tissue swelling).

### Imaging Findings of Monoclonal Gammopathy of Clinical Significance

#### Participants

Anika Dutta, MD, Rochester, MN (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Monoclonal Gammopathy of Clinical Significance (MGCS) describes a constellation of diseases involving clonal B cells or plasma cells which produce monoclonal proteins and cause organ damage. MGCSs can be divided into groups based on which organ systems are most affected. Some of these entities have distinct imaging findings that suggest the diagnosis. By the end of this education exhibit, the viewer should be able to identify those findings and clinical symptoms that characterize them. Recognizing these findings may help lead to an expedited and accurate diagnosis.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction - what is MGCS?
2. MGCS definition and symptom classes
3. Detailed description of syndromes, for example:-POEMS syndrome (polyradiculoneuropathy, organomegaly, endocrinopathy, monoclonal plasma cell disorder, and skin changes): Description, Imaging findings with case example-AL Amyloid: Description, Imaging findings with examples
4. Conclusions
5. References

Printed on: 04/12/24

### Patellofemoral Dysfunction: A Practical Approach and New Radiological Insights

#### Participants

Lucas Bettin, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Patellofemoral dysfunction occurs as a result of an imbalance in the dynamic relationship between the patella and the trochlea during knee flexion, secondary to anatomical or functional abnormalities. Classic risk factors are usually limited to local anatomy, such as trochlear dysplasia, patella alta, patellar tilt and increased TT-GT distance. Recently, new concepts on the functional evaluation of the lower limbs and their relationship with the pelvis have earned more attention, including muscle function. Imaging of the patellofemoral joint includes standard radiographs of the knee to evaluate bone morphology and patellofemoral relationship. MR imaging is important to also assess cartilage, capsule and ligaments. For preoperative planning, computed tomography can assess the knee in different degrees of flexion, besides providing multiplanar reconstructions. The evaluation of the entire mechanical axis of the lower limb is also of fundamental importance. Findings such as the anterior tilt of the pelvis, femoral or tibial torsion abnormalities, increased femorotibial rotation and deviations of the mechanical axis significantly modify the dynamics of the extensor mechanism. Clinical treatment and physiotherapy are typically the first-line approach, taking into account the particularities of the mechanical axis. Surgical intervention is indicated for recurrent dislocations. Therefore, anatomical and functional concepts of the patellofemoral joint and the entire lower limb are necessary to determine the optimal treatment.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction; 2. Anatomy biomechanics; 3. Dysfunction vs. instability; 4. Radiological approach; 5. Beyond Dejour; 6. Conclusion.

### What's New and Not So New in Postoperative MRI of Rotator Cuff Tendon Repair: Conventional and New Surgical Techniques, Normal and Abnormal Postoperative Findings

#### Participants

Yeongseo Yoo, MD, Hwaseong, Korea, Republic Of (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To review conventional techniques for rotator cuff tendon (RCT) repair, including correlation with postoperative MRI findings  
2. To introduce newer techniques of RCT repair with MRI correlation  
3. To diagnose normal and abnormal postoperative MRI findings of RCT repair, including complications and RCT repair failures

#### TABLE OF CONTENTS/OUTLINE

I. Surgical techniques on postoperative MRI of RCT repair  
A. Conventional suture techniques (single, double row, transosseous equivalent suture bridge)  
B. Newer techniques- Augmentation, pectoralis major transfer, biceps transfer, Polyglycolic acid insertion, allograft patch graft (fascia lata, dermis), biceps splinting, Others (biceps tenotomy, deltoidoplasty)  
II. Normal postoperative MRI findings  
1. MR appearance of repaired SST tendon (SI, morphology changes, gap) - thinning, high SI (Sugaya type I, II -Sugaya classification)  
2. Significance of fluid collections: glenohumeral joint, subacromial-subdeltoid bursa, subcoracoid bursa  
3. Susceptibility artifacts (air, anchor, metal from burr)  
4. Suture anchor positions: absorbable vs. non-absorbable  
5. Rotator interval change: arthroscopy portal  
III. Abnormal postoperative MRI findings  
1. Thinning of repaired tendon (Sugaya type III)  
2. Focal defect/minor discontinuity of repaired tendon (Sugaya type IV)  
3. Major discontinuity/full thickness tear with retraction (Sugaya type V)  
4. Displacement of anchors  
5. Infection (arthritis, bursitis, soft tissue infection)  
6. Fracture

### The Key Determinant of Purely Lytic Diaphyseal Lesion Visibility on Radiographs: Exclusively Trabecular Versus Concurrent Endosteal Cortical Involvement

#### Participants

Ustun Aydingoz, MD, Ankara, Turkey (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Location of a lytic lesion within a long bone (i.e., metaphyseal versus diaphyseal; trabecular versus cortical involvement) is a key determinant of the lesion's conspicuity on conventional radiographs.
- Due to the sparseness of trabeculae at diaphysis, lytic diaphyseal bone lesions without matrix mineralization are visible on radiographs only if they involve the endosteal cortex.
- The oft-repeated statement that "30%-50% of trabecular bone must be removed before radiolucency becomes visible on radiographs" can be misleading: A large diaphyseal trabecular lytic lesion involving 100% of the cancellous bone may not be visible on radiographs, if it is confined to the medullary space and does not also involve at least the endosteal surface of the cortex—constituting a major limitation for conventional radiography.
- This is true for lytic lesions of all Lodwick grades: Moth-eaten or permeative lytic bone lesions that involve the diaphysis are not be visible on radiographs at sites where they spare the cortex.
- Such lytic lesions that are obscure on conventional radiography are readily detected on MRI; when a primary bone tumor is suspected and radiographs are negative, MRI is appropriate.

#### TABLE OF CONTENTS/OUTLINE

- The modified Lodwick classification of lytic bone lesions on conventional radiographs.
- Radiographic/anatomic explanation of the crucial role the location plays in lytic lesion conspicuity on radiography at different sites (i.e., metaphyseal versus diaphyseal; trabecular versus trabecular plus cortical) on anatomic specimens.
- Case examples of lytic lesions that are obscure on conventional radiographs (due to their diaphyseal medullary space involvement) but are visible on CT or MRI.

### Ultrasound of Acute Tendon Tears with Emphasis on Anatomic Landmarks

#### Participants

Juvel Lee, MD, Richmond, BC (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Ultrasound of acute tendon tears with emphasis on anatomic landmarks Sonography has become an essential imaging tool in musculoskeletal imaging, with precision nearly equal to that of MRI for imaging tendon abnormalities. In emergency setting, the rarity of acute tendon tears compared to overuse tendon abnormalities may result in a challenging scan for trainees, sonographers, emergency and musculoskeletal radiologists. In this education exhibit, we present an approach to sonography of acute tendon tears that may be encountered in the emergency or radiology department. The objectives of this educational exhibit are: Brief review of scanning techniques of the various tendons Recognize the normal appearance of the outlined tendons with MRI correlation and emphasizing important anatomic landmarks Recognize imaging presentation of the various traumatic tendon tears

#### TABLE OF CONTENTS/OUTLINE

For each structure, the following will be discussed:1. US scanning technique2. US anatomy and landmarks with MRI correlate3. Pathology (strains, partial, complete tears)Pectoralis Distal biceps Triceps Quadriceps Hamstrings Achilles tendon and related structures

### A 360-degree Imaging Tour of Sports Injuries in the Elbow

#### Participants

Lauren Pringle, MD, Columbia, MO (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Review of anatomy of the elbow, with detail of the ulnar collateral ligament bundles and bands of the anterior bundle. 2. Phases of throwing mechanism are important in understanding forces applied to different structures of the elbow and how injuries then develop. 3. Pediatric throwers are susceptible to injuries also seen in adults but can experience additional injuries seen only during certain phases of development. 4. Medial elbow injuries are among the most common and well-known in athletes but specific injuries in the posterior elbow, lateral elbow, and anterior elbow are not infrequent and will be described. 5. Illustrative cases of these injuries demonstrate important imaging findings and diagnostic tools to improve detection for learners. 6. Treatment/surgical strategies and the surgeon's perspective will also be reviewed for some of these conditions.

#### TABLE OF CONTENTS/OUTLINE

1. Anatomy review 2. Throwing mechanism and stresses 3. Medial elbow injuries a. Ulnar collateral ligament b. Medial epicondylitis c. Medial epicondylar apophysitis d. Ulnar neuritis e. Posteromedial impingement syndrome 4. Posterior elbow injuries a. Olecranon stress fractures b. Triceps i. Tendon ii. Muscle c. Snapping triceps 5. Lateral elbow injuries a. Panner's disease b. Capitellum osteochondral lesion c. Tennis elbow d. Synovial fold 6. Anterior elbow injuries a. Biceps b. Brachialis

### Image-guided Symphyseal and Perisymphyseal Musculoskeletal Interventions: Indications, Challenges and Authors' Experience

#### Participants

Juvel Lee, MD, Richmond, BC (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Image-guided musculoskeletal interventions in and about the symphysis pubis can be technically challenging. The joint and surrounding region are small, resulting in limited ability to maneuver and an often cumbersome procedure. Important neurovascular and visceral structures are present nearby, including the dorsal vessels of the penis in males, pudendal nerve, branches of the ilioinguinal nerve and urinary bladder, necessitating judicious pre-procedure planning. Lastly, most procedures require inguinal or groin exposure thereby making careful draping of the pelvis of paramount importance. The main benefits of image guidance are improved precision of needle placement and simultaneous visualization of the needle and critical neurovascular structures that must be avoided during needle insertion. In this education exhibit, we provide an overview of symphyseal and perisymphyseal interventions including injections, aspirations, percutaneous tendon treatments and biopsies, their indications, risks, and complications, focusing on approaches, tips and tricks to a successful procedure.

#### TABLE OF CONTENTS/OUTLINE

Relevant anatomy of the symphysis and parasymphyseal spaces  
Pre-procedural considerations  
General technical considerations  
For each specific procedure, the following will be outlined: Purpose, patient position, equipment, technique, anatomic considerations (critical structures to avoid)  
Specific procedures:  
Fluoroscopy-guided diagnostic injection  
US and fluoroscopy-guided therapeutic injection  
US and fluoroscopy-guided joint and soft tissue aspiration  
Percutaneous tendon treatments  
US and CT-guided bone biopsies

Printed on: 04/12/24

## Abstract Archives of the RSNA, 2023

### Solitary Bone Metastasis: Multimodality Imaging Approach and Ten Years Experience

#### Participants

Fernando Rodado Aranguren, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

-To analyze the radiological presentation and spectrum of solitary bone metastasis (SBM) through the different techniques: plain x-ray, Computed Tomography (CT), Magnetic Resonance imaging and Positron Emission Tomography/CT (PET/CT).-To present our ten year experience in two centers.

#### TABLE OF CONTENTS/OUTLINE

Metastatic bone disease occurs frequently in malignant tumors, but isolated involvement is unusual and has been proposed as a favorable prognostic factor against multiple bone metastatic involvement. This study aims to analyze the radiological presentation of these unique metastasis. We reviewed all bone metastases diagnosed in the last 10 years in two centers and we included patients with SBM with histological confirmation and no visceral, brain or lymph node metastases (n= 79). The primary tumors, in order of frequency, were lung, breast, prostate and melanoma. In up to 36% of SBM, the primary tumor was unknown at the time of diagnosis. 86% of the lesions were located in the spine, pelvis or femur. The most frequent radiological and clinical presentation was osteolytic lesion without periosteal reaction (75%) causing pain (42%). 68% were treated, mostly with radiotherapy. The detection of these lesions depends on their size, so the methods of choice are MR or PET/CT, with good correlation for the evaluation of the associated soft tissue mass component. In the presence of a solitary bone lesion, metastasis should be included in the differential diagnosis along with primary bone tumors, especially osteolytic lesions in patients older than 40 years with or without cancer disease history. Radiologists should be aware of the characteristics of suspicious malignant lesions that would require biopsy.

Printed on: 04/12/24

MKEE-96

### Musculoskeletal Paraneoplastic Syndromes

#### TEACHING POINTS

Early recognition of a paraneoplastic syndrome allows for diagnosis of an occult malignancy, and earlier treatment. This review describes unique imaging findings and clinical associations of musculoskeletal paraneoplastic disorders. 1. Oncogenic osteomalacia is associated with phosphaturic mesenchymal tumors (PMT), which produces FGF23, leading to decreased calcium/phosphate absorption, and consequently insufficiency fractures. 2. Secondary hypertrophic osteoarthropathy, associated with non-small cell lung cancer, manifests with digital clubbing or joint effusions and symmetric long bone periostitis. 3. Cancer-associated myositis, most commonly dermatomyositis, occurs within 3 years of the diagnosis of an underlying malignancy. 4. Palmar fasciitis and polyarthrititis presents with painful hand swelling and palmar skin thickening. It is associated with breast and female genitourinary malignancies. 5. Remitting seronegative symmetric synovitis with pitting edema presents with nonerosive polyarthrititis and is associated with hematopoietic and lung malignancies. 6. Pancreatic panniculitis with polyarthrititis, associated with pancreatic neoplasms, shows osteolytic lesions of the distal extremities with increased periarticular edema and synovitis on MRI. 7. Sweet Syndrome, associated with acute myeloid leukemia, presents with fever and erythematous skin lesions. 8. Eosinophilic fasciitis presents with fascial edema and enhancement, and is associated with hematologic malignancies.

#### TABLE OF CONTENTS/OUTLINE

### Principles, Anatomy and Imaging of Ankle and Foot Tendon Transfers

#### Participants

Dyan V. Flores, MD, Ottawa, ON (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The goals of any tendon transfer are to create a stable, functioning, and plantigrade foot. Tendon transfers were reported first in the literature as early as 1881; the first case was transfer of peroneal tendons to the Achilles in a young patient who had poliomyelitis. With the eradication of polio in developed countries, experience with a variety of tendon transfers has been lost. Aside from correction of foot deformities, tendon transfer can be performed for tendon dysfunction and tendinopathy and correction of lateral ankle instability. In this education exhibit, we discuss common foot and ankle tendon transfers highlighting principles, anatomy and imaging.

#### TABLE OF CONTENTS/OUTLINE

Anatomy and biomechanics of ankle tendon transfers Principles of tendon transfers Types of ankle tendon transfers: 1. For correction of foot deformity PTT transfer for adult acquired flatfoot deformity Extensor tendon transfer for equinovarus deformity Peroneus longus to peroneus brevis tendon transfer for Charcot-Marie-Tooth disease 2. For reinforcement of a diseased tendon (tendinopathy or tendon tear) FHL transfer for Achilles tendon FHL transfer for peroneal tendons FDL transfer for tibialis posterior tendon 3. For correction of lateral ankle instability Lee procedure Evans procedure Chrisman Snook procedure Ancillary osseous (i.e. calcaneal osteotomy) and soft tissue (i.e. Achilles tendon lengthening) procedures

### Cricket is Coming; Are You Ready to Image

#### TEACHING POINTS

1. Cricket is one of the fastest growing sports in the world, with popularity growth in non-traditional cricketing nations like the United States and continental Europe. 2. Understanding player roles and biomechanics is key to understanding common injury patterns.

#### TABLE OF CONTENTS/OUTLINE

From starting in south east England in the 1600s and traditionally played in the Commonwealth countries, played over 5 days with a rest day to the current 100 ball and 20 over three to four hour formats with night games, entertainment value, advertisement, immigration, universal online access and money spinning leagues have resulted in unprecedented growth in popularity of cricket across the world. In the United States alone, from 30,000 people watching/playing cricket in 2006, there are now more than 200,000 people playing cricket in over 6000 teams. The Indian premier league (IPL) is the most popular league, and had a value of \$10.9 billion in 2022. Specific player roles actions in cricket predispose them to different injury patterns. This exhibit provides a comprehensive overview of common cricketing injuries based on player role actions. The three basic roles in cricket are batting, bowling and fielding, each with sub specializations. Fast/medium pace bowlers are most prone to injuries in the spine (pars/pedicle stress), elbow, ankle (instability, posterior impingement), abdominal wall (side strain) and groin (athletic pubalgia) due to the nature of bowling action. Batsmen and fielders are prone to hamstring and quadriceps strains due to sudden sprints. Acrobatic fielding attempts diving result in shoulder injuries. Contact injuries of the fingers like dislocations fractures are common in the wicketkeeper and fielders.

### Microinstability in the Musculoskeletal System: Biomechanical Concepts to Imaging Interpretation

#### Participants

Aurea Mohana-Borges, MD, MSc, (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To introduce joint biomechanics as a guide for imaging interpretation of microinstability, emphasizing its relationship with osseous and soft tissue (capsule, ligaments, and muscles) integrity and the role of imaging [Radiographs (Rx), Computed Tomography (CT), and Magnetic Resonance Imaging (MRI)] in its diagnosis. This guide will highlight anatomic landmarks implicated in joint stability, their relevance in different types of synovial joints, and implications in joint biomechanics. It will compare and contrast normal anatomy with examples of commonly encountered pathologies associated with microinstability.

#### TABLE OF CONTENTS/OUTLINE

Explanation of the concept of microinstability. Demonstration of types of movements in different synovial joints. Demonstration of normal anatomy of joint stabilizers with Rx, CT, and MRI. Examples of microinstability with corresponding commonly encountered pathologies in the osseous structure and soft tissues, with emphasis on the shoulder, hip, knee, and ankle joints.

Printed on: 04/12/24

MSEE

### Multisystem Education Exhibits

#### Sub-Events

#### MSEE-1 Rosai-Dorfman Disease- Multimodality Imaging

Participants

Babina Gosangi, MPH, (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Rosai-Dorfman disease is a benign proliferative disease characterized by sinus-histiocytosis with massive lymphadenopathy. The mean age of presentation is 21-years with a male preponderance. It is a result of immune dysregulation following a viral infection. Lymphadenopathy is the key finding but extranodal involvement is also seen.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction. 2. Examples of cases: a. Multistation lymphadenopathy b. Extranodal involvement • Nasal cavity- Pansinusitis • Orbital involvement- cranial nerve thickening • Intracranial lesions- Brain neoplasms, meningitis • Lung lesions- perilymphatic nodules, interstitial thickening, endobronchial nodules, pleural lesions • Renal masses • Mesenteric masses • Lytic lesions in the bone • Soft tissue lesions 3. Conclusion.

#### MSEE-10 Another Great Pretender: Extragenital Endometriosis, A Pictorial Review

#### TEACHING POINTS

Extragenital endometriosis (EE) is a relatively infrequent occurrence with a broad spectrum of clinical and phenotypic presentations, posing significant diagnostic difficulties, particularly outside the pelvic region. Radiologists play a pivotal role in suspecting the presence of EE by identifying its characteristic imaging hallmarks even before the onset of clinical symptoms. As such, they can facilitate timely diagnosis and intervention for better patient outcomes. MRI is the imaging modality of choice for EE evaluation, owing to its high specificity and sensitivity in detecting EE-specific imaging signs.

#### TABLE OF CONTENTS/OUTLINE

a) Introduction: General characteristics of EE, demographics, and imaging features, mostly in CT and MRI. b) Description of the case series: The experience in extragenital endometriosis in two tertiary care centers. A retrospective review of last 5 years cases was performed. c) MRI protocol d) Extragenital endometriosis distribution: Pelvic non gynecological organs, gastrointestinal, genitourinary, musculoskeletal, thoracic, nervous system, miscellaneous e) Conclusions: Endometriosis is a commonly underdiagnosed disease, and the diagnostic challenge is further enhanced by the non-specific clinical and phenotypic features of EE. When radiologists are aware to these complexities, they can be the first physician to suspect and propose this diagnosis, allowing timely intervention and improved patient outcomes. MRI is the backbone of EE diagnosis, thanks to its characteristics.

#### MSEE-11 Didactic Cases of Oncologic Emergencies in Radiology

Participants

Miguel Barrio Piqueras I, MD, Pamplona, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To be able to recognize the main urgent pathologies related to oncological diseases and treatments. To be able to distinguish the severity level of these conditions and properly guide the clinician regarding the causative agent. To raise awareness among radiologists about the significant prevalence of these complications in general medical care.

#### TABLE OF CONTENTS/OUTLINE

1. Oncologic diagnosis in the emergency department (not previously known malignancy) 2. Tumor-related complications and emergencies a) Superior vena cava b) Intestinal obstruction c) Obstructive hydrocephalus d) Spinal cord compression e) Hypercoagulability f) Carcinoid syndrome 3. Complications arising from diagnostic procedures and classic treatments a) Surgical (suture dehiscence) b) Chemo-radiotherapy c) Vasculitis d) Fistula e) Esophagitis/esophageal necrosis f) Hemorrhagic complications g) Post-radioembolization cholecystitis h) Leukoencephalopathy due to chemotherapeutics 4. Post-hematopoietic stem cell transplantation (HSCT) a) Pulmonary infections: febrile neutropenia (aspergillus may occur in all time segments) 0-30 days post-HSCT (fungal): Aspergillus 31-100 days post-HSCT (early): CMV and PJ >100 days post-HSCT (late): Bacterial and viral infections (common infections) b) Sinusoidal obstructive syndrome and intestinal graft versus host disease c) Neutropenic colitis (typhlitis) 5. Emergencies related with new therapies and targeted therapies a) Immune-related adverse events and complications b) Pancolitis due to TKI c) Pancolitis secondary to immune-checkpoint inhibitors d) Immune-mediated pancreatitis e) Hyperprogesion f) Cytokine release syndrome (CRS) and immune effector cell-associated neurotoxicity syndrome (ICANS)

#### MSEE-12 ctDNA in the Reading Room: A Guide for Radiologists

#### TEACHING POINTS

? Review applications of circulating tumor DNA (ctDNA) in oncology? Summarize current clinical guidelines for use of ctDNA? Review role of ctDNA in everyday practice

#### TABLE OF CONTENTS/OUTLINE

-Overview of circulating tumor DNA (ctDNA).? What is ctDNA? Lexicon and definitions (tumor microenvironment, liquid biopsy, ctDNA, cell free DNA)? Available techniques and most commonly used platforms for liquid biopsy and ctDNA? ctDNA as a biomarker-ctDNA current oncology guidelines include National Comprehensive Cancer Network, American Society of Clinical Oncology, European Society of Molecular Oncology.-ctDNA in cancer surveillance, prognosis, and treatment response for:? Lung? Breast? Colorectal? Lung? Pancreas? Sarcomas(Detectable targetable mutations, imaging examples, and indications in clinical practice are presented for each tumor)-ctDNA Strengths for imaging interpretation, Limitations in cancer surveillance, prognosis, and treatment-Future Directions and Promising Future Applications? Non-invasive tissue characterization? ctDNA and radiomics? Personalized patient management and therapy selection

#### MSEE-13 When Suspect Nonneoplastic Lymphadenopathy on PET/CT

##### TEACHING POINTS

1. Morphological changes of lymph nodes or their metabolism are not enough to predict tumoral compromise.2. The distribution pattern, relation with a primary tumor and its typical extension, inflammatory or posttreatment changes, and clinical conditions should be considered. 3. Different nonneoplastic pathologies characteristically manifest with lymph node enlargement and are frequently confused with malignancy, such as connective tissue diseases, infections, IgG4-related disease, granulomatous inflammation, non-clonal lymphoproliferative disorders, and others.

#### TABLE OF CONTENTS/OUTLINE

1. Clues to suspect nonneoplastic lymphadenopathy: Morphological characteristics, distribution pattern, relation with the drainage pathways of a primary tumor or inflammatory process, and association with other findings.2. Nonneoplastic diseases related to lymphadenopathies: a) Connective tissue diseases: lupus and rheumatoid arthritis; b) Infections: HIV, tuberculosis, toxoplasmosis, histoplasmosis, Epstein-Barr virus, and Bartonella; c) IgG4-related disease; d) Granulomatous inflammation: sarcoidosis, sarcoid-like reaction, and pneumoconiosis; e) Non-clonal lymphoproliferative disorders: Castleman disease and Amyloidosis; f) Kikuchi and Kimura disease; g) Posttreatment lymphadenopathies: immunotherapy, target therapy, surgical and radiation inflammatory changes; h) COVID-19 vaccine; i) Others: pulmonary edema, interstitial lung disease, emphysema, chronic liver disease, and reactive lymph nodes in young patients3. Conclusions

#### MSEE-14 Potential Pitfalls of Splitting Interpretation of Concurrent Chest and Abdominal CTs

Participants

Eyal Ron, MD, Rochester, MN (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

1. Simultaneously obtained chest and abdomen/pelvis CTs are sometimes read by separate subspecialized radiologists. This creates the potential for missed, incomplete, and conflicting diagnoses involving the scanned areas that overlap.2. Chest findings can sometimes be more conspicuous on the "abdomen" CT and vice-versa. This can be due to differences in contrast timing and CT reconstruction technique.3. Some processes require synthesizing findings from both the chest and abdomen CT for optimal radiology analysis.

#### TABLE OF CONTENTS/OUTLINE

We provide example cases demonstrating how splitting radiology interpretations either did or potentially could have led to misdiagnoses of abdominal findings seen on chest CT and vice versa. Additionally, we provide guidelines to avoid these potential pitfalls. Examples include:1. Missed pancreatic adenocarcinoma conspicuous only on the chest CT portion.2. Pulmonary embolism poorly visualized on chest CT with contrast but more conspicuous on the arterial phase of the concurrently obtained abdominal CT.3. Area of slow flow seen on chest CT misinterpreted as pulmonary embolism when a concurrently obtained abdominal shows these arteries are adequately opacified. The patient later developed an intra-abdominal bleed related to the anti-coagulation started for the false positive pulmonary embolism call.4. Intrathoracic extent of a metastatic GIST tumor and reactive pericardial effusion, challenging to synthesize without strong collaboration between the chest and abdominal radiologists.

#### MSEE-15 Facial Mapping: High Frequency Ultrasound Step-by-step Approach in Facial Anatomical Evaluation for Aesthetics

Participants

Luciana Zattar, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

Facial aesthetic procedures are increasingly being performed. Different aesthetic surgery techniques, injectable materials and technologies aimed at improving skin quality and restoring the redistributed volume of facial layers have been used against the multifactorial process of the facial aging. The correct evaluation and characterization of the facial layers is crucial for safe and effective rejuvenation procedures, specially the minimally invasive, since a wrong manipulation might yield an aesthetically undesirable result and lead to serious complications. In this context, the radiologists may be requested to recognize and evaluate the facial layers, compartments and their contents. To achieve accurate and timely detection and appropriate approach of each case, High frequency ultrasound (HFUS/24-33MHz) is the most effective method since it provides optimal anatomical information of the skin and allows facial layers differentiation as well as aesthetic anti-ageing procedures identification. This study aims to discuss and illustrate the radiologist's role in the evaluation of facial anatomy with HFUS, and purposes: (1)To describe the correct examination technique / HFUS advantages. (2)To illustrate the anatomy of the skin/facial layers. (3)To show a step-by-step approach of the most important facial structures. (4)To discuss the course of the main facial neurovascular structures and its variations.(5)To list and describe the anatomy of the Facial Danger Zones. (6)To highlight the importance of HFUS in pre and post-procedural evaluation.

#### TABLE OF CONTENTS/OUTLINE

1.INTRODUCTION. 2. FACIAL LAYERS. 3.VASCULAR MAPPING. 4. FRESH FROZEN SPECIMEN CORRELATION. 5.CONCLUSION

## **MSEE-16 State of the Heart: A Pictorial Review of Classic and Novel Cardiac Devices**

### Participants

Nikhil Gupta, MD, MS, Boston, MA (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

Outline the indication, function, and imaging of classic cardiac implant devices. Review commonly encountered complications of classic implanted cardiac devices. Understand the role of novel implanted cardiac devices and their appearance on plain film radiography and computed tomography.

### **TABLE OF CONTENTS/OUTLINE**

1. Introduction to Classic Implanted Devices in the Chest Chest Ports, Heart Valve Prostheses, Pacemakers/Implanted Defibrillators, Coronary Artery Bypass Stents, Implantable Loop Recorder  
2. Outline complications of Classic Implanted Devices  
3. New Implanted Devices Left Atrial Appendage Closure Devices, Atrial Septal Occlusion Devices, Ventricular Support Devices, ECMO

## **MSEE-17 Imaging in Sexagenarians and Beyond: What Clinicians Want to Know and What Radiologists Need to Know**

### Participants

Sirui Jiang, MD, PhD, Cleveland, OH (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

1. By 2030 approximately 20% of all Americans or about 70 million people will be 65 years or older. This population utilizes about 30% of our imaging resources yearly and is ever increasing.  
2. How to incorporate the geriatric scoring systems to risk stratify and prioritize treatment in the reading room.  
3. Review the common imaging findings in the geriatric population with special emphasis in the emergency/trauma and oncology settings using multimodality images.  
4. Review imaging differences of pathology in a young versus an elderly patient.

### **TABLE OF CONTENTS/OUTLINE**

Background  
History of geriatrics  
Importance of geriatric care and management  
Development of multiple geriatric scoring systems  
Succinctly synthesizing common geriatric imaging findings  
Common Scenarios of Geriatric Population in the Reading Room  
Head and Neck: subdural hematomas, cerebral atrophy, vascular calcifications  
Chest: rib fractures, emphysema, cardiovascular (coronary and valvular calcifications), lung/esophageal primary malignancies, acute/chronic lung infection  
Abdomen: steatosis, chronic renal failure, chronic cystitis, pancreatic issues (malignancy/insufficiency), adrenal issues (insufficiency/hyperplasia/atrophy)  
Pelvis: prostate, diverticulitis  
Musculoskeletal: osteopenia, multiple myeloma, osteoarthritis, steroid associated changes, vertebral compression fractures  
Collaborative Approach for Geriatric Care  
Templates with these common findings to help create a concise report  
Multidisciplinary approach with geriatric subspecialties  
Is it time for a geriatric radiology fellowship/subspecialty?

## **MSEE-18 SBRT and Isolated Metastases: A Primer for Radiologists**

### Participants

Raelyne MacBeth, MD, South Euclid, OH (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

1. Review the natural history of stereotactic radiation therapy (SBRT) and how it has progressed to treatment of intra-thoracic and intra-abdominal malignancies. 2. To review the different types of malignancies SBRT is used to treat and the potential toxicities associated with each. 3. To discuss the multimodality appearance and evaluation of tumor burden after SBRT. 4. To discuss the multimodality appearance of SBRT associated toxicities after treatment. 5. To discuss the multimodality appearance of recurrence patterns after SBRT.

### **TABLE OF CONTENTS/OUTLINE**

1. Define stereotactic body radiation therapy (SBRT) and how it differs from other modes of radiation therapy.  
2. Review the pathophysiology of radiation therapy-induced cellular damage.  
3. Review the natural evolution of SBRT and how it has progressed to treatment of malignancies in the chest, abdomen, and pelvis.  
4. Discuss the indications for utilizing SBRT in selected malignancies and their common associated toxicities.  
5. Discuss the typical and atypical response patterns after SBRT and their multimodality appearance.  
6. Discuss the typical and atypical toxicity profiles after SBRT and their multimodality appearance.  
7. Examine the multimodality appearance of local recurrence patterns after SBRT.  
8. Discuss distant recurrence patterns after SBRT and their multimodality appearance.  
9. Discuss the financial toxicities associated with SBRT.

## **MSEE-19 Syphilis: The Re-emerging Great Mimicker - A Case-based Review from Head to Toe**

### Participants

Kano Shintaro, MD, Shinagawa-Ku, Japan (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

Syphilis, a sexually transmitted disease caused by the spirochete bacterium *T. Pallidum*, is a multisystemic infection that can affect various organs. Recently, the number of syphilitic patients has been rapidly increasing worldwide. Clinical manifestations of syphilis are often inconspicuous and imaging examinations performed for other purposes may lead to potential overlook or misdiagnosis of syphilis, making it challenging for radiologists to diagnose it accurately. Therefore, it is crucial for radiologists to understand the imaging spectrums and differential diagnosis of syphilis to ensure accurate diagnosis and appropriate patient management. The purposes of this exhibit are (1) to review the imaging spectrums of syphilis through case-based studies for the improved ability to identify potential cases of syphilis and (2) to discuss approaches to distinguish syphilis from other diseases that can mimic it.

### **TABLE OF CONTENTS/OUTLINE**

1. Introduction  
1-1. Epidemiology  
1-2. Clinical manifestation therapy  
2. Case presentations: Body imaging  
2-1. head and neck  
2-2. chest  
2-3. cardiovascular  
2-4. abdomen urogenital  
3. Case presentations: Neuroimaging  
3-1. brain  
3-2. spinal cord  
4. Case presentations: Pediatric imaging  
5. Summary

## **MSEE-2 Body MRI Approach Fundamentals: A Guide for Beginners**

Participants

Mark Hoegger, MD, PhD, Saint Louis, MO (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

Body MRI interpretation can be daunting for the inexperienced reader because 1) the relevance of key clinical parameters may be unknown, 2) the importance of certain sequences in diagnosis may be unclear, and 3) a routine search pattern may not be established. To aid those inexperienced in body MRI, this exhibit's purpose is to:- Discuss the general body MRI sequences and their uses.- Identify and explain key clinical factors for the most commonly encountered clinical questions that can be answered with body MRI.- Describe the sequences and their relevance for these common body MRI indications. The intent of this exhibit is not provide an exhaustive overview of body MRI, but to arm a trainee starting on service, or a radiologist in practice who has been called upon to read body MRI exams but may be inexperienced or out of practice, with the tools needed to be successful.

### **TABLE OF CONTENTS/OUTLINE**

- General body MRI sequences and their uses: T1-weighted imaging pre- and post-contrast, chemical shift imaging, T2-weighted imaging, and DWI.- Body MRI search pattern fundamentals: CT versus MR approach, flexibility in body MRI, lesion finding versus lesion characterization, and pitfalls.- Disease-specific clinical parameters and sequences for common indications: liver lesions and hepatocellular carcinoma (LI-RADS), rectal cancer, renal masses, prostate adenocarcinoma (PI-RADS), pancreatic cysts and solid masses, inflammatory bowel disease, biliary disease, and uterine and ovarian masses.

## **MSEE-20 Monitoring the Abdomen: How to Do It - Tumor Surveillance and Follow-up**

### **TEACHING POINTS**

Different imaging modalities are used for follow-up Surveillance increases accuracy compared with clinical follow-up alone Detecting recurrence early allows potentially curative salvage therapy Protocols reflect tumor risk stratification. Guidelines outline imaging follow-up of abdominopelvic tumours Radiomics and liquid biopsies may augment surveillance protocols to identify patients at higher risk of relapse

### **TABLE OF CONTENTS/OUTLINE**

Imaging modality pearls and pitfalls for follow-up CT - role of MPR, MIP, dual-energy MRI - anatomical and functional sequences; merits and practicalities of whole-body MRI Nuclear Medicine - including novel radiotracers System based overview of abdominopelvic cancers, how and where to detect relapse- Practical tips for spotting recurrence early and avoiding mimics Understanding routes of disease spread eg. in peritoneal disease Specific challenges of detecting skeletal disease recurrence Assessing lymph node recurrence - not just size Differentiating expected post treatment changes from recurrent disease Immunotherapy and pseudoprogression Guidelines for imaging surveillance post curative treatment Upper, lower, gynaecological and urological tumors Key similarities and differences in international guidelines for follow up of abdominopelvic cancers, why this matters clinically Role of clinical and laboratory markers to augment radiology Tumor markers Liquid biopsy - a new era in cancer surveillance? AI and radiomics in disease surveillance, hype or reality?

## **MSEE-21 Congenital and Acquired Causes, Mimickers and Treatment of Diaphragmatic Paralysis**

Participants

Achala Donuru, MD, (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

Phrenic nerves originate from cervical nerves C3-C5. Injury of the phrenic nerve can occur by multiple mechanisms. Due to the long course of the left phrenic nerve in the thorax, left-side diaphragmatic weakness is more common compared to right side. One of the most frequent causes of unilateral diaphragmatic paralysis is iatrogenic. In bilateral diaphragmatic paralysis, one of the most common causes is a motor neuron disease. Most cases of DP are idiopathic (70%), other causes include congenital (birth trauma), tumors, infections, muscular disorders, and iatrogenic (medication induced, from nerve block, post-surgical). The main differentials to consider when an elevated hemidiaphragm is noted on a chest radiograph are diaphragmatic eventration, lobar collapse, subphrenic abscess and subdiaphragmatic mass.

### **TABLE OF CONTENTS/OUTLINE**

On a chest radiograph, the right dome of the diaphragm is higher in position when compared to the left dome. If the left dome of the diaphragm is elevated by more than 2 cm, DP should be suspected. Functional imaging with a sniff test is very useful in diagnosing DP, the affected side demonstrates a paradoxical upward movement. Performance of dynamic MR imaging for evaluation of diaphragmatic function has also been described. Most patients with unilateral DP are detected incidentally and do not require any specific management. Most patients with bilateral DP require permanent ventilator support. Selected patients with persistent respiratory failure can benefit from diaphragmatic plication or phrenic nerve pacing. It is important for the radiologists to recognize diaphragmatic paralysis and look for pathology along the course of the phrenic nerve.

## **MSEE-22 It's Not Always Cancer: A Pictorial Essay on Nonneoplastic Lymphadenopathies with Histopathologic Correlation**

Participants

Brenda N. Lahlou, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

1. List and compartmentalize the different causes of nonneoplastic lymphadenopathies. 2. Recognize typical radiological aspects of certain etiologies of lymphadenopathies. 3. Improve the approach of differential diagnosis of lymph node enlargement by correlating multimodality imaging and clinical findings. 4. Recognize the most common histopathological patterns found in lymph node enlargement caused by benign conditions.

### **TABLE OF CONTENTS/OUTLINE**

1. Introduction 2. Overview of normal lymph node anatomy and its radiological and histological aspects 3. Subdivision of various

pathologies that can encompass lymphadenopathy based on etiology 4. Localized lymphadenopathy a. Foreign-body related b. Idiopathic diseases c. Reactive conditions d. Infections 5. Generalized lymphadenopathy a. Autoimmune diseases b. Idiopathic diseases c. Reactive conditions d. Infections 6. A practical diagnostic approach in the presence of lymph node enlargement 7. Take home message

### **MSEE-23 From Brain to Bones: A Radiological Saga Through Multisystemic Tuberos Sclerosis**

Participants

Fernanda Limonge, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

To review radiological manifestations of Tuberos Sclerosis To illustrate the imaging findings of the most important features of Tuberos Sclerosis (ultrasound, MRI, CT) Discuss the radiologist's role on establishing clinical diagnosis

#### **TABLE OF CONTENTS/OUTLINE**

Clinical criteria for Tuberos Sclerosis Diagnostic Radiological manifestations of Tuberos Sclerosis- Neurological features- Cardiological features- Thoracic features- Abdominal features- Musculoskeletal features

### **MSEE-24 What on Earth is That: Newer Medical Devices on Chest Radiographs**

Participants

Ashrith Kandula, Wallingford, PA (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

There has been a constant influx of newer medical devices as technology veers towards more noninvasive methods of treating diseases. Plethora of new devices are seen on today's plain radiographs. Cardiovascular devices are further divided into- cardiac devices comprising of rhythm monitors such as Pacemakers, Implantable cardioverter defibrillators, Ventricular Assist Devices, Occlusion devices, Valve prosthesis- (Open heart and Trans catheter placement), Loop recorders. Vascular devices range from Central venous catheters, Swan Ganz catheter , remote pulmonary artery pressure monitoring devices, devices used for catheter directed thrombolysis, IABP, ECMO to many more. Non-Cardiovascular devices include- esophageal devices- LINX for reflux, nerve stimulators including Vagal, Trigeminal and Hypoglossal, phrenic nerve stimulators, diaphragmatic pacers.

#### **TABLE OF CONTENTS/OUTLINE**

To review the newer medical devices seen on plain radiographs of the chest. Pictorial review of the optimal location, function and complications of the different devices. Organization: Introduction, classification, pictorial review of device along with in-vitro images, optimal location, function and evaluation of complications associated with the device. Entities discussed: Cardio Microelectromechanical device (CardioMEMS), Pulmonary Artery catheters for thrombolysis , Cordella Pulmonary Artery Pressure Monitor, Mitraclip, Transcatheter Mitral Valve Replacement (TMVR), Transcatheter Pulmonary Valve Replacement (TPVR), LINX - device for reflux management, Endoscopic clips from POEMS, Hypoglossal nerve stimulators, Diaphragmatic pacers.

### **MSEE-25 Nail it: A Guide to Diagnosing Nail Disorders**

Participants

Isabela Ribeiro, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Ultrasonography serves as a valuable tool for assessing the nail unit, providing real-time evaluation of its components, which includes the periungual tissue's appearance and thickness, vascularization via color Doppler application, and possible involvement of underlying bone structures. It is crucial to understand not only the normal anatomy of the nail bed on ultrasonography but also the main points of some pathologies encountered in daily clinical and radiological practice. While nail tumors are rare anomalies, a detailed prior anatomical knowledge allows for their easy identification. In addition, it is important to highlight the ultrasonographic findings of other common conditions, such as retronychia, foreign bodies, and paronychia, in order to better define the appropriate course of action. Given its ability to diagnose, localize, and differentiate various nail disorders, it is not surprising that nail unit assessment through ultrasonography can significantly improve patient outcomes.

#### **TABLE OF CONTENTS/OUTLINE**

Highlight the importance of ultrasonographic assessment for the nail unit. Review the advantages and limitations of high-frequency ultrasound for evaluating the nail compartment. Identify the ultrasonographic characteristics of common nail pathologies.

### **MSEE-26 "To Cyst or Not to Cyst," Imaging Spectrum of Mucinous Neoplasms in the Abdomen and Pelvis**

Participants

Nabih Nakrou, MD, Watertown, MA (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

The purpose of this exhibit is to: • Review imaging features of mucin-producing neoplasms in the abdomen and pelvis with attention to organ-specific involvement. • Discuss worrisome findings that favor malignant potentials over benign tumors. • Demonstrate imaging role in management including pre-surgical planning and imaging follow-ups. • Address misdiagnosis, pitfalls, and mimicking pathologies that may resemble mucinous neoplasms

#### **TABLE OF CONTENTS/OUTLINE**

Present multi-modality imaging review of mucinous neoplasms involving the following organs Pancreas Intrahepatic and extrahepatic biliary tree GI tract (Esophagus, stomach, small bowel, colon, appendix and rectum) GU system (ovaries, epididymis, bladder, kidney, renal collecting system) Peritoneum and serosal involvement List syndromic association and predisposing systemic conditions

## **MSEE-27 Make Every Connection Matter: Multi-modality Imaging Features of Fistulas in the Chest, Abdomen and Pelvis**

Participants

Ayman H. Gaballah, MD, FRCR, Columbia, MO (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

1. Review the definition, classifications, and types of fistulas 2. Discuss multi-modality imaging features of fistulas in the chest, abdomen, and pelvis 3. Point out the appropriate imaging workup and pitfalls according to the anatomic region 4. Illustrate the long-term complications of chronic and untreated fistulas 5. Highlight some of the management options

### **TABLE OF CONTENTS/OUTLINE**

1- Introduction 2- Etiology and types of fistulas a. Congenital: Congenital fistulae arise from remnants of embryonic ducts that persist (e.g., tracheoesophageal, vitello-intestinal, urachal, etc.) b. Acquired: Acquired fistulae are secondary to variety of causes. i. Traumatic ii. Iatrogenic iii. Inflammatory/infectious iv. Neoplastic v. Post-radiation therapy vi. Vascular vii. Miscellaneous c. Types according to fistula opening i. External opening (e.g., enterocutaneous fistula) ii. Internal opening (e.g., tracheoesophageal, rectovesical, cholecysto-duodenal, perianal, arteriovenous fistula, etc.) 3- Multimodality imaging features of fistulas in different body parts from head to toe with related classifications as applicable 4- Complications of fistulas 5- Case presentation and imaging pitfalls 6- Management options

## **MSEE-28 You'll Float Too: A Guide of Ectopic Gas for the Radiology Resident**

Participants

Sofia Arizaga, MD, Mexico City, Mexico (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

after the exhibit the reader would be able: To describe the imaging features and differentiate normal air/gas in the different tissues and potential body spaces. To identify the origin and causes of ectopic gas. To analyze abnormal gas location in order to detect situations and diseases that involve high mortality rate.

### **TABLE OF CONTENTS/OUTLINE**

Introduction- Pathways of Ectopic Gas Distribution.- Imaging assessment of abnormal gas.- Etiopathogenesis of ectopic Gas: Iatrogenic, trauma, inflammatory/infectious, ischemic, neoplastic, others.- Recognize alarm signs.- Summary

## **MSEE-29 Alohomora: Opening the Mind and Demystifying Abdominal Tuberculosis Findings**

Participants

Kamila Albuquerque, MD, Vila Velha, Brazil (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

Brazil is one of the countries with the highest incidence of tuberculosis in the world, ranking among the top 22, according to the WHO. Abdominal tuberculosis is considered a great mimic of other abdominal diseases, and can affect the gastrointestinal tract (GIT), peritoneum, lymph nodes and other organs. It often represents a diagnostic challenge due to its nonspecific findings, which may result in diagnostic delay and the development of complications. Imaging tests play an important role in its diagnosis, with an impact on the morbidity and mortality of the disease. This study aims to carry out an iconographic review of the most common abdominal manifestations of the disease, atypical presentations and complications from the perspective of different types of imaging methods, which include tomography and magnetic resonance imaging and even CT / PET.

### **TABLE OF CONTENTS/OUTLINE**

In this educational exhibition, we address the different abdominal radiological manifestations related to tuberculosis bacillus infection, in addition to epidemiological and pathophysiological data, as well as some differential diagnoses and miscellaneous.

## **MSEE-3 Visualizing Beyond the Joints: Imaging the Extra-articular Manifestations of Rheumatoid Arthritis**

Participants

Marco Tsuno, Brasilia, Brazil (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

- To understand the prevalence and significance of extra-articular manifestations in rheumatoid arthritis.- To recognize the characteristic imaging features of common extra-articular manifestations in rheumatoid arthritis.- To recognize the role of imaging in monitoring disease progression and detecting new or worsening extra-articular manifestations in rheumatoid arthritis.

### **TABLE OF CONTENTS/OUTLINE**

1. Introduction. 2. Pathophysiology. 3. Diagnostic criteria. 4. Articular manifestations. 4.1. Imaging: articular manifestations (Temporomandibular Joint, Spine, Shoulder, Elbow, Wrist and Hand, Hip, Knee, Ankle and Foot). 5. Extra-articular manifestations. 5.1. Imaging: extra-articular manifestations (Central Nervous System, Pulmonary, Cardiovascular, Rheumatoid Nodules). 6. Conclusion. 7. Bibliographic references.

## **MSEE-30 Beyond Genetics: A Review of Current Renal Cancer Screening Guidelines for Hereditary Renal Cancer Syndromes**

Participants

Shiva Singh, MBBS, Bethesda, MD (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

Hereditary renal cancer syndromes, including von Hippel-Lindau (VHL), Birt-Hogg-Dubé (BHD), Hereditary Leiomyomatosis and Renal Cell Carcinoma (HLRCC), Tuberous Sclerosis Complex (TSC), Succinate Dehydrogenase (SDH)-deficient renal cell carcinoma (RCC),

and BRCA1-associated Protein-1 (BAP1) tumor predisposition syndrome, are associated with an increased risk of developing renal tumors. Early detection of renal cancer in individuals with hereditary renal cancer syndromes is of extreme importance as it facilitates timely intervention and improves the prognosis. Owing to differences in their extra-renal manifestations and age of onset, the screening guidelines for each hereditary renal cancer syndrome are unique. Here, we provide a summary of the current recommendations for screening of renal cancer in each of these hereditary renal cancer syndromes.

#### **TABLE OF CONTENTS/OUTLINE**

Table of Contents/OutlineI. Introduction: (a) Hereditary renal cancer syndromes: Renal and extra-renal manifestations; (b) Importance of screeningII. Screening guidelines for hereditary renal cancer syndromesIII. CT/MRI images of patients with extra-renal manifestations undergoing renal cancer screening and eventually detecting renal tumor in each syndrome:(a) Von Hippel-Lindau syndrome (vHL); (b) Birt Hogg Dubé syndrome (BHD); (c) Hereditary Leiomyomatosis and Renal Cell Cancer syndrome; (d) Tuberous Sclerosis Complex; (e) Succinate Dehydrogenase-deficient RCC; (f) BAP1 tumor predisposition syndromeIV. Conclusion

#### **MSEE-31 DWI vs 18-FDG PET/CT in Oncology: Which Technique for Which Clinical Scenario**

Participants

Antonio Luna, MD, PhD, Jaen, Spain (*Presenter*) Speaker, General Electric Company

#### **TEACHING POINTS**

Learn how to introduce whole-body diffusion-weighted imaging (WB-DWI) for tumor assessment. Review the technological adjustments including parallel imaging, compressed sensing, and deep learning to optimize WB-DWI protocols. Learn how WB-DWI/MRI is a valid alternative to 18-FDG PET/CT for tumor staging and is particularly advantageous in the assessment of peritoneum, bone marrow, liver, and brain metastases. Analyze the complementary role in tumor detection and staging and therapy monitoring of both techniques, using a head-to-head comparison, defining the most adequate technique for common clinical scenarios in oncology and including their applications in special populations (i.e., pregnant, or pediatric patients). Establish the range of clinical applications of PET/MRI combining DWI and 18-FDG PET acquisitions in oncology.

#### **TABLE OF CONTENTS/OUTLINE**

1. Introduction.2. Technical adjustments in WB-DWI 3. Tumor staging: 3a. WB-DWI vs 18-FDG PET-CT. 3b. N staging. 3c. M staging. 3d. Specific tumors: NSCLC, breast cancer, prostate cancer, malignant melanoma. colorectal cancer, lymphoma, multiple myeloma and others. 4. Therapy monitoring. 5. Prediction of treatment response. 6. Posttreatment surveillance. 8. Conclusions

#### **MSEE-32 An Easy Approach to Cheson-Lungano Criteria: From Staging to Treatment Response Assessment**

Participants

Antonio Michael-Fernandez, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

-To know how to evaluate a lymphoma staging study and treatment response interpretation according to Cheson-Lungano criteria.- Learning how to manage complex situations where this criteria seems to be unclear and its limitations.- Discussing the differences between Cheson-Lungano criteria and other evaluation systems such as RECIST 1.1

#### **TABLE OF CONTENTS/OUTLINE**

Standard criteria for radiological evaluation lymphoma response allowed to optimise the therapeutic management in a more accurate way in this type of patients.It is based on the selection of target and non-target disease in a first staging study, and the evaluation of their presence and change in size in follow-up studies, allowing a global assessment of treatment response.These criteria can be applied by radiologists by evaluating CT studies (Cheson criteria) or CT and PET together (Cheson-Lungano criteria).It should be noted that although these criteria may be similar to the RECIST 1.1 criteria for the evaluation of other solid tumours, there are important differences in their interpretation (number of target lesions, required diameters, percentage limits to consider response/progression...), as well as the specific assessment of splenic involvement (which is more infrequent in other solid tumours).This paper reviews the importance of a correct use of Cheson-Lungano criteria in: 1) performing an adequate staging study inform; 2) interpretate the treatment response in follo-up studies; 3) other special situations where this criteria is sometimes unclear and are discussed in this article.

#### **MSEE-33 POCUS: Radiology Vs Other Medical Professions Perspectives - Where Do We Stand**

Participants

Margarita Revzin, MD, MS, Wilton, CT (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Point-of-care ultrasonography (POCUS) refers to a focused ultrasound performed at the patient's bedside by a clinician who both performs the US and interprets the images. The protocols usually answer a specific question that helps guide treatment. Goals: Understand what is point of care US (POCUS), its benefits and applications. Discuss differences in US training pathways among the different specialties vs Radiology. Review current issues of US Quality assurance and reimbursement, image archiving and accountability. Understand areas of potential threats and conflicts, and explore potential areas for collaboration and growth.

#### **TABLE OF CONTENTS/OUTLINE**

Define Point-of-care ultrasonography (POCUS) Review benefits and various applications of POCUS ( cardiovascular, ophthalmology, nervous system assessment, procedures ( line placement, nerve block, FAST) Discuss training pathways for POCUS, their strengths and limitations vs Radiology, review accreditation processs for POCUS vs Radiology. Discuss training in medical school Review available methods of US Quality assurance and reimbursement, provide examples of misinterpretation/misdiagnosis and role of Radiology in detailed evaluation of the POCUS findings. Discuss issues related to image archiving and accountability. Understand areas of potential threats and conflicts among Radiology and other fields of medicine utilizing POCUS. Explore potential areas for collaboration and growth.

## **MSEE-34 Diffusion-weighted Imaging (DWI) in the Era of Abbreviated MRI: How to Make the Most Out of it for Abdominal MRI Applications**

Participants

Claudio Lagos, MD, Santiago, Chile (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

1. Introduce and briefly review abbreviated-MRI concepts. 2. Discuss detectability of lesions through abdominal organs using DWI alone, and review evidence comparing it with other imaging modalities, with emphasis in most and least useful applications. 3. Review DWI utility for characterizing abdominal lesions based on patterns and its correlate with pathology and aggressiveness, with emphasis in liver - pancreas. 4. Review last evidence regarding ADC value as a biomarker and a quantitative parameter in oncology imaging, prognosis and treatment response. 5. Illustrate frequent artifact and how they lead to interpretation pitfalls.

### **TABLE OF CONTENTS/OUTLINE**

- Physics principles of diffusion- DWI image acquisition, ADC value and ADC map. Role of increasing b values in detectability.- Review abbreviated-MRI concept, goals and applicability.- Evidence based review of detectability of different lesions with emphasis in liver and pancreas.- Comparison of diagnostic yield with other techniques (ie. PET-CT, CECT) and other MR sequences, for different organs and frequent lesions, including peritoneal disease.- Practical approach in liver and pancreatic lesions for predicting histology / aggressiveness using a pattern based fashion.- Case based review of high performance situations: Liver mets, LIRADS evaluation, pancreatic nodules, extra - abdominal metastatic disease.- Case based review of low performance situations: Aggressiveness in renal nodules.- Role of quantitative DWI and its evidence, with emphasis in oncology.- Detectability and interpretation pitfalls, and how to avoid them.- Summary.- References.

## **MSEE-35 From Head to Toe Non-Langerhans Cell Histiocytosis (Erdheim-Chester Disease): Understanding a Rare Pathology in the Era of Hybrid Imaging**

Participants

Yumi Kimura Sandoval, MD, Mexico City, Mexico (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

- Understand the epidemiology and pathology behind Erdheim- Chester disease, as well as its clinical presentation- Learn the importance of 18F-FDG PET/CT in the diagnosis, detection of disease extent, and severity- Identify the radiological signs with which the disease can manifest- Case-based review of the main radiologic signs and features observed in this rare disease

### **TABLE OF CONTENTS/OUTLINE**

1. Epidemiology 2. Clinical presentation 3. Pathology 4. Radiographic features A) Central Nervous system: - Pituitary Gland - Posterior Fossa B) Orbits C) Thorax - Lung - Mediastinum D) Vasculature - Thoracic and abdominal aorta E) Kidneys and retroperitoneum F) Musculoskeletal system

## **MSEE-36 Imaging in Erdheim Chester disease**

Participants

Yashant Aswani, MD, Iowa City, IA (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

1. Discuss recent updates in classification and pathogenesis of Erdheim-Chester disease 2. Describe role of imaging and clinical and radiologic findings of Erdheim-Chester disease 3. Review new treatment options and therapeutic response evaluation

### **TABLE OF CONTENTS/OUTLINE**

1. Introduction 2. Epidemiology 3. Pathology 4. Pathogenesis 5. Newer classification systems (2016 WHO classification of lymphoid neoplasms and 2016 Working group of Histiocytic Society Classification) 6. Mixed histiocytosis: an overlap syndrome 7. Diagnosis 8. Role of Imaging 9. Manifestations of Erdheim-Chester disease 10. Skeletal involvement 11. Retroperitoneal disease 12. CNS involvement 13. Cutaneous disease 14. Pulmonary involvement 15. Cardiothoracic disease 16. Endocrine involvement 17. Orbital disease 18. Miscellaneous: Craniofacial bones and skull base 19. Miscellaneous: Hepatobiliary disease 20. Newer imaging findings 21. Association with non-histiocytic malignancies and autoimmune diseases 22. Markers of prognosis 23. Molecular targets for treatment 24. Treatment approach 25. Therapeutic response evaluation modified PERCIST criteria

## **MSEE-37 Response Assessment in Solid Tumors Criteria: Similarities and Differences**

### **TEACHING POINTS**

To review the history and evolution of solid tumor response criteria; To compare similarities and differences across various response criteria; To describe RECIST, RECIST-related criteria adaptations, and immune-related criteria; To recognize the challenges of applying these criteria; To provide case-based scenarios and identify the response categories with particular emphasis on immune-related criteria.

### **TABLE OF CONTENTS/OUTLINE**

Timeline of Response Assessment in Solid Tumor; Terminology and rules for solid tumor response assessment; Similarities and differences across various response assessment criteria; Case-based scenarios to demonstrate assessment variations in response criteria/categories; Challenges in image metrics assessment using these different criteria; Summary and future directions; References.

## **MSEE-38 Bugs that Suck (Your Blood): Imaging Manifestations of Vector-Borne Diseases**

Participants

Francisco Calle, MD, Bogota, Colombia (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

• Familiarize the radiologist with the range of pathogens transmitted by arthropod vectors and the diseases they cause. • Discuss

• Familiarize the radiologist with the range of pathogens transmitted by arthropod vectors and the diseases they cause. • Discuss the epidemiology of these diseases, including areas of endemicity, types of arthropod vectors, transmission dynamics, and prior outbreaks. • Discuss the clinical presentations and medical complications associated with vector-borne diseases. • Describe the imaging features associated with infection on ultrasound, CT, and MRI. • Provide a brief overview of management and treatment.

#### TABLE OF CONTENTS/OUTLINE

Introduction to vector-borne diseases, including types of vectors and variety of pathogens, as well as epidemiology and major outbreaks. Role of imaging and imaging features in detecting infection and identifying complications: • Neurologic (e.g., viral encephalitis, Lyme encephalitis, cerebral malaria) • Chest/cardiac (e.g., Chagas dilated cardiomyopathy) • Gastrointestinal (e.g., yellow fever, malaria) • Urogenital (e.g., arbovirus-associated acute kidney injury, acute tubular necrosis, and renal failure) • Musculoskeletal: (e.g., cutaneous and mucocutaneous leishmaniasis, ectoparasites). Brief overview of management and treatment of vector-borne diseases and their complications

#### MSEE-39 Whole-Body MRI in Hereditary Tumor Syndromes: How We Do It

##### TEACHING POINTS

- Whole-body MRI can be helpful for screening, detection, and follow-up of bone and soft tissue tumors in patients with hereditary tumor syndromes - Different tumor syndromes require appropriate MRI acquisition protocols to highlight the different pathological findings - Whole-body fluid and cartilage sensitive MRI sequences are necessary for patients with multiple hereditary exostoses (MHE) and enchondromatosis to reveal the cartilaginous portion of the tumors and the associated bursitis - Post-contrast imaging is critical in patients with familial paragangliomatosis to identify small mediastinal and retroperitoneal paragangliomas - Diffusion-weighted imaging is useful in patients with an increased risk of malignant tumors (for example, in Li-Fraumeni syndrome) or when a malignant degeneration of a benign lesion is suspected

#### TABLE OF CONTENTS/OUTLINE

- Imaging approach in hereditary tumor syndromes - Role of Whole-Body MRI for screening, detection, and follow-up of hereditary multisystem and multisite tumors - MR imaging acquisition protocol and evaluation in MHE, Enchondromatosis, and Maffucci syndrome - MR imaging acquisition and evaluation in familial paragangliomatosis - MR imaging acquisition and evaluation in Neurofibromatosis - MR imaging acquisition and evaluation in Li-Fraumeni syndrome - When to use DW imaging - When to use post-contrast imaging

#### MSEE-4 Getting Started with PCCT: Lessons Learned

Participants

Fides Schwartz, MD, Durham, NC (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

Photon-counting computed tomography (PCCT) uses energy-resolving detectors whereas conventional CT detectors integrate the entire x-ray signal. Decision trees for protocol selection and scan mode are different from EID and must be defined at scanner setup. Technologists need to learn the use of a new interface. Automatic monoenergetic reconstructions with PCCT need to be optimized by imaging protocol including display window levels. Higher spatial resolution may increase image noise, but can be beneficial for many applications. Detector based spectral information collected, creates the need to set up what reconstructions automatically get sent to PACS. This project is geared toward helping new users in the RSNA imaging community in their decision-making processes when setting up a new clinical photon-counting CT. Patient case examples from the PCCTs installed at three major US institutions are shown to underline benefits of the new scanner system.

#### TABLE OF CONTENTS/OUTLINE

Overview of differences between PCCT and EID scanner systems. New Terminology. What do I need to set up. Setting up your exam cards: scan modes, reconstruction kernels. Reviewing the images: adjusting window level settings, sending thinner slices. Comparison of PCCT and EID images from three major US institutions. Abdominal imaging. Pediatric imaging.

#### MSEE-40 How Multiple Joint CT Scanning Would Benefit from Artificial Intelligence

##### TEACHING POINTS

Teaching Points: 1. Artificial intelligence (AI) diagnosis platforms are playing more and more important role in clinical imaging diagnosis. 2. Multi-part joint CT scanning can highly reduce the radiation dose and contrast injection volume, effectively reduce the scanning time to protect patients and improve diagnosis efficiency while remaining image quality. 3. Taking coronary and carotid-cerebral joint scanning as example, the diagnosis time and mouse click number using AI platform can be reduced to 80% - 90% and 20% - 60% comparing to manual diagnosis. There is more diagnosis time reduction for junior radiologists than senior radiologists. And the diagnosis accuracy is comparable between AI platform and senior manual diagnosis. 4. We assume AI platform can help make the whole-body CT diagnosis more efficient and reduce 70 - 90% diagnosis time with body auto-segmentation and auto-diagnosis. AI platform offers over-sensitive diagnosis results and radiologists only need to double check to screen out wrong results.

#### TABLE OF CONTENTS/OUTLINE

Table of Contents/Outline: The purpose of this educational exhibit is to: 1. Review the current development and application of AI diagnosis platforms. Review the clinical benefit and outcome of multi-part joint CT scanning. 2. Demonstrate the role of AI platform for coronary and carotid-cerebral atherosclerosis diagnosis using one-step heart-brain CT angiography. 3. Illustrate the potential application value of AI platform for whole-body CT scanning using auto-segmentation and auto-diagnosis.

#### MSEE-41 Imaging-based Response Criteria in Oncologic Clinical Trials: What Radiologists Need to Know

Participants

Guilherme M. Cunha, MD, (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

1) Discuss the role of imaging for assessing treatment response as endpoint of oncologic clinical trials. 2) Summarize differences and similarities of treatment response assessment in clinical practice vs for clinical trials. 3) Review the most common imaging-

based treatment response criteria used in oncologic clinical trials. 4) Provide guidance on tumor response interpretation and reporting. 5) Discuss future directions.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction: a. Relevance of clinical trials for advances in medicine and patient care. b. Oncologic clinical trials: Definitions and practical points. c. The role of imaging in oncologic clinical trials. 2. Assessment of response during oncologic treatment: a. Differences to clinical practice. b. Standardization. c. Blind and independent review. d. Need for objective metrics and endpoints. 3. Imaging-based treatment response criteria: a. Rationale for different criteria. b. Target vs non-target lesions. c. Pictorial review of the most used response criteria. 4. Imaging-based treatment response assessment: a. Image analysis and interpretation. b. Reporting. 5. Future directions: a. Criteria updates. b. Technical Innovations.

#### MSEE-42 Evaluation of Hidradenitis Suppurativa Through Imaging Methods

Participants

Carolina Almeida, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1) Hidradenitis suppurativa is a chronic inflammatory skin condition with lesions including deep-seated nodules and abscesses, draining tracts, and fibrotic scars. 2) The classification of the severity of hidradenitis suppurativa is done clinically using the Hurley scale. Correct severity classification allows for appropriate treatment. 3) Currently, high-frequency ultrasound has been used to map lesions and proposes a new classification: clinical-sonographic scoring system (SOS-HS). 4) Explain how lesions are classified using ultrasonography and the standardization of nomenclature. 5) Clarify doubts about magnetic resonance imaging protocols in the evaluation of hidradenitis suppurativa and when to use this method. 6) To present 3D reconstruction as a useful tool for the pre-surgical study of lesions. 7) Correlate clinical and ultrasound findings, magnetic resonance imaging and 3D reconstruction.

#### TABLE OF CONTENTS/OUTLINE

1) Overview of hidradenitis suppurativa. 2) Hurley classification. 3) Criteria for diagnosing hidradenitis suppurativa by ultrasonography. 4) Hidradenitis suppurativa 3T MRI protocol. 5) Cases exemplifying the importance of imaging exams in the clinical and surgical management of the disease.

#### MSEE-43 Beyond the Neonatal Intensive Care Unit: Imaging of Long-term Sequel of Prematurity

#### TEACHING POINTS

Radiologists should be aware of the potential for late imaging manifestations in patients with a remote history of prematurity, and carefully evaluate imaging studies to identify these complications. Late common CNS manifestations include white matter injury and post-hemorrhagic hydrocephalus. Both frequently co-exist and may have distinctive features on imaging. Advanced chest imaging techniques, including CT and MRI, can enhance the accurate diagnosis and monitoring of late lung complications of prematurity such as bronchopulmonary dysplasia. Late complications of necrotizing enterocolitis, such as strictures and short bowel syndrome, can be accurately identified and monitored using appropriate abdominal imaging techniques, which should be tailored specifically to the patient.

#### TABLE OF CONTENTS/OUTLINE

Outline. I. Introduction Premature birth rates and associated health risks Role of imaging in the management of premature infants II. Late Imaging Features of Prematurity Brain abnormalities: periventricular leukomalacia, cerebral atrophy, post-hemorrhagic hydrocephalus, etc. Lung abnormalities: bronchopulmonary dysplasia. Gastrointestinal abnormalities: long term sequel of necrotizing enterocolitis Bone abnormalities: osteopenia, fractures, etc. Differentiating late imaging features from other conditions III. Clinical Case Studies and Outcomes VI. Conclusion Recap of key points Future directions for research and clinical practice.

#### MSEE-44 The Perirenal Space: Anatomy and Spectrum of Disease

Participants

Mikel Elgezabal, MD, Barrika, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Anatomy of the perirenal space with boundaries, key landmarks and pathways for the spread of disease. 2. Complete revision of pathology that can arise in the perirenal space. Radiologic clues to approach the final diagnosis.

#### TABLE OF CONTENTS/OUTLINE

1. Anatomy of the perirenal space: The Inverted Cone 1.1. Perirenal space anatomy with illustrations. 1.2. Key relations. 2. Pathology of the perirenal space 2.1. Masses/Pseudomasses: Pattern based diagnostic approach to perirenal masses and pseudomasses. Renal cell carcinoma. Lymphoma. Leukaemia. Sarcoma and liposarcoma. Myeloma. Lymphangioma. Angiomyolipoma. Extraadrenal myelolipoma. Pancreatic pseudocyst. GIST. 2.2. Collections/Fluid: Infectious: perirenal abscess, xantogranulomatous pyelonephritis, emphysematous pyelonephritis. Perirenal hematoma. Perirenal urinoma. 2.3. Inflammation/Systemic: Retroperitoneal fibrosis. IgG4-related-disease. Erdheim-Chester disease. Castleman disease. Rosai-Dorfman disease. 2.4. Others/Miscellaneous: Extramedullary hematopoiesis. Spilled lithiasis after nephrolithotripsy. Congested kidneys. 2.5. Summary. 3. Take home points

#### MSEE-45 No Worming Your Way Out of This One: Multimodality Imaging of Helminthic Infections

Participants

Nadia Solomon, MD, MSc, (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Familiarize the radiologist with the variety of helminths which infect humans. Discuss the epidemiology, clinical presentation, and medical complications/sequelae of helminthic infections in humans. Describe the imaging features associated with common and uncommon sequelae of helminthic infections across imaging modalities (ultrasound, CT, MRI). Provide an overview of management and treatment of helminthic infections.

#### TABLE OF CONTENTS/OUTLINE

Classification of helminths, helminth lifecycles, and epidemiology. Potential complications of helminthic infection. Role of imaging and imaging features associated with helminthic infections, including: Neurologic (e.g., neurocysticercosis, ocular cysticercosis, ocular toxocariasis); Pulmonary (e.g., paragonimiasis); Cardiac (e.g., filariasis-associated tropical hyper-eosinophilia with Loeffler endocarditis and restrictive cardiomyopathy); Gastrointestinal (e.g., ascariasis, fascioliasis, cystic/alveolar/polycystic echinococcosis); Urogenital (e.g., genital schistosomiasis); Musculoskeletal: (e.g., onchocercomata, filarial elephantiasis, dirofilariasis). Management of helminthic infections and their sequelae.

#### **MSEE-46 Getting Under Your Skin: Multimodality Imaging of Protozoan Infections**

Participants

Jannatun Sikder, MD, New Haven, CT (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

Familiarize the radiologist with the variety of protozoa which infect humans. Discuss the epidemiology, clinical presentation, and medical complications/sequelae of protozoan infections in humans. Describe the imaging features associated with common and uncommon sequelae of protozoan infections across imaging modalities (ultrasound, CT, MRI). Provide an overview of management and treatment of protozoan infections.

##### **TABLE OF CONTENTS/OUTLINE**

Classification of protozoa. Epidemiology of protozoan infections. Role of imaging in diagnosing protozoan infections, including imaging features associated with protozoan infections and their complications: Neurologic (e.g., cerebral malaria, toxoplasmosis); Chest/Cardiac (e.g., pleuropulmonary amoebiasis, acute myopericarditis and chronic fibrosing cardiomyopathy from Chagas disease); Gastrointestinal (e.g., Chagasic megaesophagus and achalasia, amoebic dysentery and hepatic abscess, giardiasis, visceral leishmaniasis); Urogenital (e.g., trichomoniasis resulting in Fitz-Hugh-Curtis syndrome, ureteric dilatation from Chagas disease); Musculoskeletal: (e.g., Giardia synovitis, sarcocystis myositis). Management of protozoan infections and their sequelae.

#### **MSEE-47 The Beauty And The Botched: A Pictorial of Usual, Unusual, and Botched Cosmetic Procedures for the Unsuspecting Radiologist**

Participants

Alexander Sasse, BA, New Haven, CT (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

- Familiarize the radiologist with the diversity of implant procedures performed, with particular focus on the sociocultural phenomenon that is cosmetic implant surgery (including historical context and evolution of the practice).
- Describe typical and atypical implant locations of implants, and their appearances on medical imaging studies.
- Describe potential complications of cosmetic implants and imaging findings associated with "botched" implant procedures.
- Discuss management of "botched" and otherwise complicated implants, where applicable.

##### **TABLE OF CONTENTS/OUTLINE**

Discuss history of cosmetic implant procedures and diversity of current practices/implant placements. Discuss complications and appearance of "botched" implants. Discuss the role of imaging and imaging features in visualizing both appropriately placed and "botched" or otherwise complicated implants: • Head and Neck (e.g., chin implant) • Breast (e.g., saline and silicone implants) • Urogenital (e.g., scrotal and penile implants) • Extremities (e.g., muscle-simulating implants) • Soft tissue: (e.g., buttock implants). Discuss the management of botched cosmetic implants and other associated complications.

#### **MSEE-48 Alcohol-use Related Diseases and Disorders: Head to Toe Imaging Findings**

##### **TEACHING POINTS**

Alcohol is a significant contributor to the global burden of diseases. Understand the metabolism of alcohol, and effects of alcohol and its metabolites on various organs. Review imaging findings of alcohol-use related diseases and disorders head to toe.

##### **TABLE OF CONTENTS/OUTLINE**

Metabolism of alcohol and factors affecting metabolism. Pathophysiology of alcohol induced damage to various organs. Imaging findings: Central nervous system: Wernicke-Korsakoff syndrome, hyperammonemic encephalopathy, subacute combined degeneration of the spinal cord, diffuse cerebral atrophy, osmotic demyelination syndrome, Marchiafava-Bignami disease Cardiovascular system: Alcoholic cardiomyopathy Lungs: Aspiration and bacterial pneumonia, acute respiratory distress syndrome Gastrointestinal tract: Fatty liver, acute alcoholic hepatitis, acute and chronic alcoholic steatohepatitis, alcoholic cirrhosis, hepatocellular carcinoma, acute and chronic pancreatitis, GI dysbiosis, Boerhaave syndrome, alcoholic gastritis Genitourinary tract: Renal stones, hypogonadism Musculoskeletal system: Alcohol induced muscle disease, avascular necrosis of the femoral heads, osteoporosis, gout Cancers of the head and neck, esophagus, breast, colon, and rectum Fetus: Fetal alcohol syndrome

#### **MSEE-49 Extrapulmonary Tuberculosis: Imaging Findings Beyond the Chest**

Participants

Irene Diaz, MD, Bilbao, Spain (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

Extrapulmonary tuberculosis affects the lymph nodes most frequently, but it can affect any other organ of the body. The presence of necrotic lymph nodes and other organ-specific imaging features increases the diagnostic probability of extrapulmonary disease.

##### **TABLE OF CONTENTS/OUTLINE**

Objectives To identify imaging features that are suggestive of extrapulmonary tuberculosis and its differential diagnosis. Findings Extrapulmonary tuberculosis can be challenging to diagnose as it can mimic many other diseases, so a biopsy is often required. An image-based quiz will lead the review of: Cases of central nervous system, head and neck, lymphatic, abdominal, genitourinary, and musculoskeletal tuberculosis; describing some key imaging features and including its main differential diagnosis. Conclusion Extrapulmonary tuberculosis remains a challenge to diagnose. It is essential to know its key imaging features for an early and

successful diagnosis.

## **MSEE-5 Demystifying Mucin in the Abdomen and Pelvis: Tissue Characterization and Spectrum of Disease**

### **TEACHING POINTS**

1. Mucinous neoplasms are a diverse group of benign and malignant tumors arising from mucin-producing epithelial cells. 2. Mucinous neoplasms arise from a wide range of organs including the appendix, ovary, pancreas, colon, and rectum. 3. Mucin has a characteristic imaging appearance at each modality and differs from other types of tumors that have higher cellular density. 4. Pseudomyxoma peritonei is characterized by the spread of mucinous material throughout the peritoneal cavity and has specific imaging findings. 5. Diagnosis and treatment of mucinous tumors requires a multidisciplinary approach that includes imaging, surgery, and systemic therapies, including hyperthermic intraperitoneal chemotherapy in the case of pseudomyxoma peritonei.

### **TABLE OF CONTENTS/OUTLINE**

I. Introductiona. Overview of mucinous neoplasmsII. Imaging features of mucinous neoplasms with case examplesa. Mucinous cystic neoplasms of the pancreasb. Appendiceal mucinous neoplasmsc. Colon and rectal mucinous adenocarcinomad. Ovarian mucinous cystadenoma and cystadenocarcinomae. Miscellaneous (seminal vesicle, primary peritoneal)III. Pseudomyxoma peritoneia. Imaging featuresb. Treatment, including hyperthermic intraperitoneal chemotherapyIV. Conclusiona. Summary of key teaching points

## **MSEE-50 Technical Aspects in Imaging Patients Under Extracorporeal Membrane Oxygenation (ECMO) Support**

Participants

Fernando Diego Choque Chavez, MD, Barcelona, Spain (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

- Review recommendations to perform optimal CT examinations in patients under extracorporeal membrane oxygenation (ECMO) support according to clinical suspicion and within possible clinical scenarios.- Illustrate examples of optimal and suboptimal examinations in this populations.- Describe the key technical aspects to obtain adequate images and avoid errors.

### **TABLE OF CONTENTS/OUTLINE**

1. Introduction and physiology during ECMO support 2. Optimizing the technique: protocol recommendations regarding access, contrast dose and rate injection 2.1. General considerations 2.2. Venovenous ECMO 2.3. Venoarterial ECMO 2.3.1. Central nervous system evaluation 2.3.2. Pulmonary embolism 2.3.3. Aorta evaluation 2.3.4. Abdomen and pelvis 3. Summary and conclusions

## **MSEE-51 I CT Dead People: Exploring the Application of Postmortem Imaging to Cause of Death Investigation in a Hospital Setting**

Participants

Nadia Solomon, MD, MSc, (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

• Familiarize the radiologist with the growing field of forensic radiology, primarily as it pertains to postmortem imaging and cause-of-death investigation. • Provide an introduction to postmortem computed tomography (CT), including its benefits and limitations. • Describe the application of and experiences with postmortem CT at an academic teaching hospital.

### **TABLE OF CONTENTS/OUTLINE**

• Introduction to forensic radiology with focus on role in cause-of-death investigation. • Benefits of postmortem CT as a supplement to autopsy. • Common postmortem changes on imaging and how to mitigate them, where applicable. • Application of and experience with postmortem CT at an academic teaching hospital, including: integration with the Autopsy Service; types of cases performed; imaging methods utilized; and correlation with autopsy. • Case image integration throughout, as illustrative examples.

## **MSEE-52 Microvascular Imaging Ultrasound (MVI) in Children: Current Use and Potential Applications**

Participants

Santiago Martinez-Correa, MD, Philadelphia, PA (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

1. To overview the current knowledge of MVI in children. 2. To illustrate MVI benefits in specific pediatric conditions. 3. To describe possible clinical applications of MVI in the future.

### **TABLE OF CONTENTS/OUTLINE**

- Disclosures. - Background Current use and advantages of advanced ultrasound techniques. - Microvascular Imaging Ultrasound 1. Technique description Advanced ultrasound technology that allows high-resolution visualization of slow-flow microvasculature by using clutter suppression algorithms. 2. Protocol Acoustic windows and settings adjustment. 3. Advantages and pitfalls: non-invasive tool, can be used at the bedside. Depends on the scan settings and operator. - Clinical use: 1. Brain Evaluation of vascularity in hypoxic-ischemic injury, hydrocephalus, and infections. 2. Thyroid Approach to vasculature architecture, and focal lesions. 3. Liver Characterization of focal lesions. 4. Spleen Use in assessing trauma, infarcts, focal lesions, and infections. 5. Kidney Evaluation of solid and cystic lesions. 6. Reproductive (Ovaries/Testes): Use in gonadal torsion, and infections. 7. Bowel Assessing small bowel infection and/or inflammation. 8. Lymph nodes Blood flow evaluation in benign and malignant nodes. 9. Skin Evaluation of infected subcutaneous nodules. - Potential future use: 1. MVI as an ancillary method in assessing pediatric brain death. 2. Liver and renal post-transplant perfusion follow-up. 3. Diagnostic and prognostic tool during ECMO therapy. - Take Home Points.

## **MSEE-53 Immunotherapy-Related Adverse Events - A Review of the Breadth of Toxicities and Imaging Findings**

### **TEACHING POINTS**

- Blocking of immune checkpoints by immune checkpoint inhibitors (ICIs) can cause novel autoimmune disease or uncover subclinical

- Blocking of immune checkpoints by immune checkpoint inhibitors (ICIs) can cause novel autoimmune disease or uncover subclinical autoimmune disease.- These toxicities are termed immune-related adverse events (irAEs) and can involve any organ.- irAEs can be mistaken for disease progression or non-autoimmune processes.- Incidence of irAEs is 25% with anti-CTLA-4 inhibitors, 10% with anti-PD(L)-1 inhibitors, and 50% for combination therapy.- The lungs and colon are the most common organs affected radiologically, although cutaneous manifestations are the most common overall.- irAEs are graded from 1 (asymptomatic) to 5 (death) and management options include continuing immunotherapy, holding immunotherapy and initiating corticosteroids, and discontinuing immunotherapy permanently.

#### TABLE OF CONTENTS/OUTLINE

- Pneumonitis: o Organizing pneumonia o Nonspecific interstitial pneumonia o Hypersensitivity pneumonitis o Bronchiolitis Acute interstitial pneumonitis/ARDS o Radiation-recall pneumonitis- Sarcoid-like reaction- Enterocolitis- Pancreatitis- Hepatitis- Nephritis- Hypophysitis- Adrenalitis- Thyroiditis- Aortitis- Pericarditis- Serositis: o Pericardial effusion o Pleural effusion o Peritoneal effusion- Sinusoidal obstruction syndrome- Arthritis- Myositis- Polymyalgia rheumatica-like syndrome

#### MSEE-54 Phenotypic Diversity of Germinal Center-Derived Malignancies: Implications on Diagnosis and Management

Participants

Steven Chua, MD, PhD, Houston, TX (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The germinal center (GC) is a unique and dynamic microenvironment within lymphoid follicles where selection, maturation and antibody production by activated B lymphocytes occur in response to infections. A multitude of unique malignancies arise within the GC that display characteristic histogenesis, genetic abnormalities, tumor pathways, molecular biology and varied clinical behavior. PET/CT is the mainstay for the diagnosis and staging of these tumors and is critical for the assessment of treatment response. Neoplastic B cells within different GC compartments and maturation stages give rise to follicular lymphoma, Burkitt's lymphoma and diffuse large B cell lymphoma that harbor distinctive genetic mutations. While the follicular T cell lymphoma and angioimmunoblastic T cell lymphoma originate from helper T cells, the follicular dendritic cell sarcomas evolve from the follicular dendritic cells of mesenchymal origin. We present salient imaging features of GC-derived malignancies and correlate with histopathology and tumor genetics. We discuss the implications of the diagnosis on tailored therapeutics and prognosis.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction, epidemiology, clinical features this group of germinal center-derived tumors. 2. Histopathology, clinical features, molecular biology of these tumors. 3. Multimodality cross-section delineation of imaging features with CT, MR and PET/CT. 4. Prognosis and management. \* Follicular lymphoma.\* Burkitt's lymphoma.\* Diffuse large B cell lymphoma.\* Angioimmunoblastic T-cell lymphoma.\* Follicular T cell lymphoma.\* Peripheral T cell lymphoma with Tfh phenotype.\* Follicular dendritic cell sarcomas.

#### MSEE-55 Diversity of Epstein-Barr Virus-associated Diseases

Participants

Moto Nakaya, MD, Tokyo, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

•Summarize the clinical and radiological findings of Epstein-Barr virus (EBV)-associated diseases caused by various etiologies. •Describe radiological findings in EBV-associated neoplasms in contrast to those observed in uninfected conventional tumors. •Recognize important imaging points that lead to a definitive diagnosis in patients with suspected EBV-associated diseases.

#### TABLE OF CONTENTS/OUTLINE

I. What are EBV-associated diseases? •Pathomechanisms •The role of EBV in tumorigenesis and progression •Recommended workups  
II. Content Infection: infectious mononucleosis, human immunodeficiency virus co-infection Autoimmune: multiple sclerosis, systemic lupus erythematosus, rheumatoid arthritis, inflammatory bowel disease, type 1 diabetes mellitus, juvenile idiopathic arthritis, celiac disease Neoplasm: lymphomas (primary central nervous system lymphoma, natural killer/T-cell lymphoma, diffuse large B-cell lymphoma, lymphomatoid granulomatosis, and post-transplantation lymphoproliferative disorder), solid tumor (gastric cancer, squamous cell carcinoma, EBV-associated smooth muscle tumor, leiomyosarcoma, breast cancer, hepatocellular carcinoma, and follicular dendritic cell sarcoma), others (EBV-associated inflammatory pseudotumor - like follicular/fibroblastic dendritic cell sarcoma) Medication-related EBV infection: methotrexate-related malignant lymphoma Miscellaneous: EBV-positive mucocutaneous ulcer  
III. Summary 1. The entities associated with EBV are diverse. 2. Clinical and radiological findings can be the diagnostic indicators of the etiology. 3. Appropriate workup is necessary for timely diagnosis and management.

#### MSEE-56 Beyond the Skeletal Survey: Multimodality Imaging Manifestations of Plasma Cell Dyscrasias

Participants

Kenneth Huynh, DO, Orange, CA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To review the wide spectrum of plasma cell dyscrasias, including common and rare subtypes, and their pathophysiology. 2. To present the multimodality imaging features seen in the spectrum of plasma cell dyscrasias to aid in accurate diagnosis and staging, as well as subsequent evaluation of post-therapeutic response.

#### TABLE OF CONTENTS/OUTLINE

Plasma cell dyscrasias are a group of hematological disorders that arise from the abnormal proliferation of plasma cells, which are responsible for producing antibodies. These disorders include monoclonal gammopathy of undetermined significance (MGUS), Waldenström macroglobulinemia, multiple myeloma (MM) and its variants, including smoldering myeloma (SMM), plasma cell leukemia (PCL), solitary and extramedullary plasmacytoma, and amyloidosis. Recent advances in treatment with chemotherapy and immunotherapies have led to improved outcomes, with some patients achieving long-term remission. Early detection and diagnosis allow for appropriate initiation of surveillance and treatment, which will improve outcomes as well as preserve organ function. The imaging manifestations of plasma cell dyscrasias can provide crucial information for diagnosis, prognosis, and management of these diseases. This educational exhibit will (1) review the pathophysiology of plasma cell dyscrasias and the wide spectrum of subtypes, and (2) present the multimodality imaging features of the common and rare subtypes of plasma cell dyscrasias.

## **MSEE-57 Practical Imaging Approach to Unraveling the Causes of Non-neoplastic Lymphadenopathy**

Participants

Sota Masuoka, MD, Kashiwa, Japan (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

Non-neoplastic lymphadenopathy may not have specific histopathologic features within the lymph node itself, but determining its underlying cause is still important. Radiologists play a critical role in identifying the cause of lymphadenopathy in three scenarios: (1) when infection or inflammation is clinically suspected, (2) during initial or follow-up imaging for malignancy, and (3) when abnormal lymph nodes are detected incidentally on imaging. Careful observation of the imaging characteristics and anatomical distribution of the abnormal lymph nodes, along with other ancillary imaging findings and clinical information, can help establish an accurate diagnosis of the etiology of the lymphadenopathy, leading to appropriate treatment and avoiding unnecessary further testing for the patient. This exhibit aims to: 1. Review the diverse underlying conditions that cause non-neoplastic lymphadenopathy and their characteristic imaging findings. 2. Discuss an imaging-based approach for diagnosing the underlying causes of non-neoplastic lymphadenopathy.

### **TABLE OF CONTENTS/OUTLINE**

1. Overview of non-neoplastic lymphadenopathy 2. Imaging approach for non-neoplastic lymphadenopathy: Focus on inferring the underlying cause- Based on the distribution of abnormal lymph nodes- Based on the imaging characteristics of abnormal lymph nodes 3. Case illustrations- (1) Clinically suspected inflammation or infection- (2) Initial/follow-up imaging for malignancies- (3) Incidental detection of abnormal lymph nodes on imaging 4. Summary

## **MSEE-58 Stroma-Derived Neoplasms and Tumor-Like Lesions of the Lymphoid Tissues: 2022 WHO Classification System Updates**

Participants

Steven Chua, MD, PhD, Houston, TX (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

A new category of mesenchymal neoplasms and tumor-like lesions that involve the lymphatic and reticuloendothelial system has been introduced in the 2022 WHO classification of hematolymphoid tumors. This diverse group of tumors includes mesenchymal dendritic cell tumors like follicular dendritic cell sarcoma (FDCS) and its inflammatory pseudotumor-like variant (EBV positive inflammatory FDCS), Epstein-Barr virus associated smooth muscle tumor, vascular/vascular-stromal tumors and tumor-like lesions including littoral cell angioma (LCA), hemangioma, bacillary angiomatosis, hemangioendothelioma, angiosarcoma and sclerosing angiomatoid nodular transformation (SANT). These tumors vary in biological potential and prognosis from the indolent littoral cell angioma to the aggressive angiosarcoma. Correlating the salient imaging and histopathological features can facilitate proper identification and optimize treatment to improve morbidity and mortality of patients.

### **TABLE OF CONTENTS/OUTLINE**

1. To review the diverse histopathological spectrum of stroma-derived tumors of the lymphoid tissues. 2. To describe epidemiology, tumor genetics, molecular biology and cross-sectional imaging findings of diverse tumors and to correlate them to histopathological features. 3. To discuss the implications of the diagnosis on management and prognostication of these tumors. \* Follicular dendritic cell sarcoma. \* EBV positive inflammatory follicular dendritic cell sarcoma. \* Inflammatory pseudotumor. \* Epstein-Barr associated smooth muscle tumor. \* Littoral Cell Angioma. \* Bacillary angiomatosis. \* Hemangioendothelioma. \* Angiosarcoma. \* Sclerosing angiomatoid nodular transformation.

## **MSEE-59 Imaging Diagnostic Odyssey of Germ Cell Tumors: Illuminating the Path with Insights into Epigenetic Pathogenesis**

Participants

Toshitaka Ishiguro, MD, Tsukuba, Japan (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

Germ cell tumors (GCTs) are neoplasms derived from cells committed to the germ cell lineage, but exhibit diverse histologies, including embryonic and extraembryonic components. GCTs also arise at various sites throughout the body, from neonates to adults, making their imaging diagnosis challenging. However, recent progress in understanding the biology of GCTs has allowed them to be categorized into several types based on the latent developmental potential of their cells of origin with different epigenomic features, facilitating our understanding of their anatomical distribution, age of onset, male-to-female ratio, and possible histologies. This exhibit aims to explain this recent classification of GCT types and apply insights into epigenetic pathogenesis to the imaging diagnosis of GCTs, which will contribute to accurate diagnosis leading to better patient outcomes. The purposes of this exhibit are: 1. To explain the recent classification of GCT types based on epigenetic pathogenesis. 2. To review the imaging findings of each histology of GCTs. 3. To discuss the imaging diagnostic approach for GCTs combined with the knowledge of epigenetic pathogenesis.

### **TABLE OF CONTENTS/OUTLINE**

1. Minimal essentials of epigenetics for radiologists 2. Classification of GCT types based on epigenetic pathogenesis 3. Imaging findings of each histology of GCTs 4. Imaging diagnostic approach for each type of GCTs combined with the knowledge of epigenetic pathogenesis 5. Summary

## **MSEE-6 Multimodality Imaging of Large and Medium Vessel Vasculitis**

Participants

Mitesh Naik, MBBS, London, United Kingdom (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

- To outline classification, clinical presentation, pathogenesis and management of large and medium vessel vasculitis
- To define the role of non-invasive imaging in diagnosis and response to therapy
- To describe the range of modalities used and their relative merits
- To review multimodality appearances of large and medium vessel vasculitis

## TABLE OF CONTENTS/OUTLINE

Background • Epidemiology, clinical presentation, pathogenesis and management • Classification of Large vessel vasculitis: Takayasu arteritis, giant cell arteritis of Medium vessel vasculitis: Polyarteritis nodosa, Kawasaki disease of Variable vessel vasculitis: Behçet syndrome of Secondary vasculitis Review of international guidance on utilization and interpretation of imaging • Diagnosis • Response assessment • Surveillance • Imaging parameters • Imaging criteria - e.g. PET vascular activity score (PETVAS) Multimodality appearances including pros and cons • Ultrasound • CT angiography • MR angiography and MR vessel wall imaging • 18F-fluorodeoxyglucose-PET/CT • Adjunctive modalities - e.g. renography Case examples with interpretive pearls and pitfalls; differential diagnoses; and complex scenarios

### MSEE-60 Multimodality Imaging Features of Hepatoid Adenocarcinoma and its Mimics

Participants

Kenneth Huynh, DO, Orange, CA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To review the pathophysiology of hepatoid adenocarcinoma and the common sites involved, including the liver, stomach, pancreas, lung, and ovary. 2. To present, through case-based review, the multimodality imaging features of hepatoid adenocarcinoma, with differential clues to aid in diagnosis.

## TABLE OF CONTENTS/OUTLINE

Hepatoid adenocarcinoma (HAC) is a rare and aggressive type of cancer that has a histologic appearance similar to hepatocellular carcinoma (HCC) through metaplastic transformation to hepatocyte-like cells. HAC can involve various organs, including the liver, stomach, pancreas, lung, and ovary. Imaging features of HAC may overlap with other extrahepatic tumors, including gastric adenocarcinoma, pancreatic adenocarcinoma, primary lung adenocarcinoma, ovarian adenocarcinoma, or lymphoma, making accurate diagnosis challenging. HAC can produce alpha-fetoprotein (AFP) like HCC, which may be useful in differentiating HAC from tumors in extrahepatic organs. However, given its rarity, unfamiliarity, non-specific clinical presentation, and overlapping imaging features, differentiation of HAC remains difficult and is often diagnosed at an advanced stage or with metastases. At this stage, prognosis of HAC is poor with a median survival of less than one year. Early detection and aggressive treatment, including surgical resection and systemic chemotherapy, are crucial for improving the prognosis of patients with HAC. This educational exhibit will (1) review the pathophysiology of HAC and the common sites of involvement, and (2) present the multimodality imaging features of HAC and differentiation from its imaging mimics.

### MSEE-61 Multi-system Imaging Manifestations of Large Vessel Vasculitis

Participants

Anne Sailer, MD, New Haven, CT (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Large-vessel vasculitis (LVV) results in inflammation of the aorta and its major branches and is the most common primary vasculitis in adults. LVV comprises two distinct conditions, giant cell arteritis (GCA), and Takayasu arteritis. LVV can have substantial complications including luminal stenosis, arterial thrombosis and infarction of the corresponding organs and structures. Development of pseudoaneurysms and dissections, and rarely arterial ruptures are potentially serious complications in this patient population. 2. Doppler US is a first-line imaging modality utilized for the assessment of the peripheral arterial system, abdominal aorta, and its branches. Review of normal arterial wall anatomy and pathophysiology of waveforms on Doppler ultrasound, with multi-imaging correlation with particular focus on CTA and MRA.

## TABLE OF CONTENTS/OUTLINE

1. Review pathophysiology of Takayasu and giant cell arteritis and their multi-system potential complications. 2. Discuss general concepts of the assessment of the peripheral arterial system and aorta using Doppler US, CTA, and MRA with emphasis on technique, protocol, image optimization. 3. Demonstrate key multi-modality imaging features LVV. Review role of various imaging applications in diagnosis and surveillance of complications in this group of patients. 4. Discuss management options with interventional radiology procedures.

### MSEE-62 COVID-associated Mucormycosis - Imaging Spectrum

Participants

Nidhi Goyal, MD, FRCR, Noida, India (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To review the spectrum of imaging findings in patients with COVID-associated Mucormycosis. 2. To correlate imaging findings and the clinical-laboratory parameters in patients with COVID-associated Mucormycosis.

## TABLE OF CONTENTS/OUTLINE

1. Overview of Clinical profile of patients with COVID-associated Mucormycosis. 2. The spectrum of imaging findings in patients with COVID-associated Mucormycosis across different organ systems. 3. Correlation of imaging findings and clinical - laboratory parameters in patients with COVID-associated Mucormycosis. 4. Enlist the key imaging findings which helps in early diagnosis and allows prompt treatment in these patients.

### MSEE-63 Role of Imaging in Endocrine Hypertension

Participants

Azfar Siddiqui, MD, (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Assess the epidemiology, classification, and etiopathogenesis of the endocrine hypertension. 2. Review the role of imaging in localizing the pathology.

## TABLE OF CONTENTS/OUTLINE

1. Epidemiology and etiopathogenesis of the endocrine hypertension.2. Incidence and risk factors.3. Classification and imaging findings:A. Primary Aldosteronism (Conn's syndrome): Adrenal adenoma, carcinoma, hyperplasiaB. PheochromocytomaC. Congenital adrenal hyperplasiaD. Cushing syndromeE. Adrenal disordersii. ACTH secreting tumor: Pituitary adenoma (Cushing disease), Ectopic production-Small cell cancers of the lung thymus, carcinoid, Pancreatic NET, Ovarian steroid cell tumorsE. HyperthyroidismF. HyperparathyroidismG. Acromegaly

#### **MSEE-64 Spectrum of Imaging Appearances of Perivascular Epithelioid Cell Tumors (PEComas)**

Participants

Lam Tu, DO, Newark, NJ (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

1. PEComas are very rare mesenchymal tumors of variable malignant potential characterized by smooth muscle and melanocytic differentiation, perivascular distribution and frequent infiltration of small to medium sized vessels.2. Up to 60% of PEComas are associated with Tuberous Sclerosis Complex (TSC) and TSC and TFE3 gene mutations. Angiomyolipomas and lymphangiomyomatosis are the most common PEComa subtypes seen with TSC.3. PEComa - NOS most commonly arise in the retroperitoneum, uterus and kidneys.4. Hypervascularity and vessel encasement are common imaging features of PEComas. Vascular invasion, size greater than 5 cm, necrosis and tumor thrombus suggest malignant subtypes.5. Definitive treatment is surgical resection; massive blood loss may result if extent of vascular invasion is not recognized. TSC-related PEComas may be treated with mTOR inhibitors. The only FDA approved treatment for advanced/metastatic/inoperable PEComa is FYARRO™ (Sirolimus protein-bound particles for injectable suspension).

##### **TABLE OF CONTENTS/OUTLINE**

Introduction - PEComa definition and etiologyBackground: epidemiology, genetics and classificationSpectrum of Imaging Features of:- Various PEComa subtypes;- PEComas in most common locations - Common PEComa mimickers: leiomyosarcoma, GIST, RCC - Invasive/malignant PEComas (size, necrosis, tumor thrombus)- Common metastatic sites: lung, liver and peritoneumTreatment options

#### **MSEE-65 The 'New' 2022 World Health Organization (WHO) Classification of Lymphoid Neoplasms: A Primer for Radiologists**

Participants

Diego Cebrian Chaustre, MD, San Antonio, TX (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

- Familiarize radiologists with new 2022 WHO classification of lymphoid neoplasms review major changes
- Discuss pathology, genetics, and imaging findings of tumor-like lesions select updated lymphomas pertinent to radiologists
- Familiarize the audience with clinically significant, and most important aspects of lymphoma imaging, including the role of CT PET-CT for staging response assessment.
- Review potential therapeutic management implications of the new classification system with special emphasis on novel therapies.

##### **TABLE OF CONTENTS/OUTLINE**

Introduction 2022 WHO Classification Tumor-like lesions, new tumors changes in existing tumors B-cell lymphoid proliferations lymphomas IgG4-related disease, Castleman's disease, small lymphocytic, splenic B-cell, marginal zone, follicular, mantle cell, diffuse large B-cell, Burkitt, Immunosuppressed-associated lymphomas Hodgkin lymphoma. T-cell lymphoid proliferations lymphomas Kikuchi disease, primary cutaneous T-cell, intestinal T-cell, anaplastic large cell EBV-positive lymphomas Stromal-derived dendritic cell sarcoma, littoral cell angioma, splenic hamartoma SANT Imaging findings Role of Imaging in Staging Response Assessment-CT PET-CT: Lugano classification Deauville scoring system Management Novel therapies ConclusionThe current WHO classification of lymphoid neoplasms added new tumors reorganized previous categories based on updated molecular/genetic findings that change management decisions. Select lymphomas demonstrate characteristic genetic/pathology imaging findings. Imaging with CT PET/CT plays a pivotal role in staging, response assessment testing the efficacy of novel drugs.

#### **MSEE-66 A Pictorial Review of Extrapulmonary Tuberculosis: From Head to Toe**

Participants

Masatoshi Hotta, MD, PhD, Los Angeles, CA (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

Extrapulmonary tuberculosis (EPTB) is a form of tuberculosis that affects parts of the body other than the lungs and accounts for 10-20% of all TB infections. A diagnosis of EPTB is challenging and can mimic malignancy, often requiring a biopsy. Therefore, radiologists should be familiar with the imaging features of EPTB, even when there is no active pulmonary involvement. This exhibit aims to: 1) review the pathophysiology of EPTB, 2) present characteristic EPTB images of various organ systems, and 3) identify the key imaging findings of EPTB.

##### **TABLE OF CONTENTS/OUTLINE**

1) Introduction; 2) Central Nervous System (tuberculous leptomeningitis, brain TB, spinal TB); 3) Head and Neck (tuberculous uveitis, pharyngeal TB, tuberculous otitis media); 4) Chest (esophageal TB, endobronchial TB, pericostal TB); 5) Abdomen (hepatic TB, splenic TB, adrenal TB, intestinal TB, peritoneal TB); 6) Genitourinary (renal TB, seminal vesicle TB, epididymis/testicular TB); 7) Musculoskeletal (tuberculous spondylitis, tuberculous arthritis, tuberculous osteomyelitis)

#### **MSEE-67 Multisystem Imaging Manifestations of Fibromuscular Dysplasia**

Participants

Anne Sailer, MD, New Haven, CT (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

1. Fibromuscular dysplasia (FMD) is an idiopathic segmentary, non-inflammatory, non-atherosclerotic disease that can affect all layers of both small and medium-caliber arteries. Clinical manifestations are primarily dependent on the vessels affected by FMD,

most frequently affecting the renal, carotid, and vertebral arteries.<sup>2</sup> Complications of FMD can include severe stenosis, hypoperfusion, aneurysm, dissection, arterial occlusion, and subarachnoid hemorrhage in the brain.

#### **TABLE OF CONTENTS/OUTLINE**

1. Review pathophysiology of FMD and its multi-system potential complications, and associated disorders.<sup>2</sup> Discuss general concepts of the assessment of the peripheral arterial system and aorta using Doppler US, CTA, and with MRA, with emphasis on technique, protocol, and image optimization.<sup>3</sup> Demonstrate key multi-modality imaging features FMD. Review role of various imaging applications in diagnosis and surveillance of FMD and its potential complications.<sup>4</sup> Discuss management options with review of available interventional radiology procedures.<sup>5</sup> Discuss the shared features and difference between FMD and polyarteritis nodosa, Takayasu, and other mimics.

#### **MSEE-68 Imaging Manifestations and Treatment of Renovascular Hypertension**

Participants

Anne Sailer, MD, New Haven, CT (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

1. Renovascular hypertension is a type of secondary hypertension where high blood pressure develops secondary to renal artery disease.<sup>2</sup> Doppler US is a first line imaging modality utilized for the assessment of the renal arterial system. CTA and MRA are useful confirmatory tests in equivocal or nondiagnostic ultrasonographic exams and can be preferred in specific clinical situations.

#### **TABLE OF CONTENTS/OUTLINE**

1. Review pathophysiology of renovascular hypertension and its multisystem complications. Causes include atherosclerotic renal artery stenosis, fibromuscular dysplasia, renal artery dissection, renal infarction, Page kidney, polyarteritis nodosa, post EVAR RAS, etc.<sup>2</sup> Discuss general concepts of the assessment of the renal arterial system and abdominal aorta using Doppler US: technique protocol, image optimization, and common pitfalls in diagnosis.<sup>3</sup> Demonstrate key multimodality imaging features of renovascular hypertension. Review role of various imaging modalities in diagnosis and surveillance of complications in this group of patients.<sup>4</sup> Discuss management options with emphasis on interventional radiology procedures.

#### **MSEE-69 US of the Neck Beyond the Thyroid: Parathyroids**

Participants

Irene Dixe de Oliveira Santo, MD, New Haven, CT (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

1. Discuss the role of ultrasound in the evaluation of parathyroid gland pathologies;<sup>2</sup> Discuss the advantages of ultrasound including the possibility of evaluation for concurrent nodular thyroid disease which may alter the surgical approach and treatment planning;<sup>3</sup> Review the role and advantages of complementary imaging modalities in the diagnosis and management of parathyroid gland pathologies including SPECT with technetium-99m sestamibi, 4D computed tomography, and venous sampling

#### **TABLE OF CONTENTS/OUTLINE**

1. Embryology, anatomy, and function of the parathyroid glands;<sup>2</sup> Clinical manifestations of hyper- and hypoparathyroidism;<sup>3</sup> Role of ultrasound in the assessment of the parathyroid glands: advantages, limitations, technical considerations;<sup>4</sup> Ultrasound imaging of parathyroid pathologies: parathyroid adenoma(s) involving one or multiple parathyroid glands, parathyroid carcinoma, multiple endocrine neoplasia, Cowden's disease, parathyromatosis, ectopic or intrathyroidal parathyroid glands;<sup>5</sup> Distinguish parathyroid gland pathologies from its mimics such as exophytic thyroid nodules, normal and abnormal lymph nodes, the esophagus, and the longus colli muscle;<sup>6</sup> Role of additional imaging modalities: SPECT with Tc-99m sestamibi, 4D computed tomography, and venous sampling;<sup>7</sup> Treatment options and clinical challenges

#### **MSEE-7 Review of MRI Defecography: Technique, Indication, Diagnosis and Limitations**

Participants

Alice Schuch, MD, Porto Alegre, Brazil (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Pelvic floor disorders are commonly encountered in clinical practice and can significantly affect patient quality of life. MR defecography is a non-invasive exam that provides high spatial resolution, multiplanar capability, and superior soft tissue differentiation for assessing the pelvic floor compartments at rest and during defecation maneuvers. Abdominal radiologists should be able to recognize normal and abnormal anatomy, as well as the most common pelvic floor pathologies.

#### **TABLE OF CONTENTS/OUTLINE**

MRI defecography is a non-invasive diagnostic technique used to evaluate the function of the pelvic floor compartments during rest, squeezing, valsalva and defecation, in patients with obstructed defecation, constipation, pelvic pain, incontinence and pelvic organ prolapse and others, providing a more accurate diagnosis of pelvic floor disorders that can guide treatment and surgical planning. Usual findings include cystocele, uterine prolapse, enteroceles, perineal descent, and rectal intussusception, and the association between these alterations. While MRI defecography is a valuable diagnostic tool for assessing pelvic floor disorders, it does have some limitations, such as cost, availability, interpretation variability, and patient discomfort. Abdominal radiologists should be able to recognize normal and abnormal anatomy, and evaluate the common pathologies that can affect the three pelvic floor compartments, especially those that may appear only through dynamic images of the pelvis.

#### **MSEE-70 Bigger Butt Not Better: A Radiologist's Guide to the Lifecycle of Cosmetic Injectables**

Participants

Nadia Solomon, MD, MSc, (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

- Familiarize the radiologist with the composition and use of cosmetic injectables, with a focus on illegal and unregulated substances and practices.
- Describe the appearances of injectables on imaging throughout the body, as well as potential

complications and their associated imaging findings. • Provide guidance to radiologists for how to report findings related to injectables and their complications to best guide surgical management. • Describe how patients with injectables are surgically managed, including post-operative imaging findings and imaging of post-operative complications.

#### TABLE OF CONTENTS/OUTLINE

• Introduction to cosmetic injectables, their composition (legal and illegal substances), and common and uncommon injection locations. • Imaging appearance of injectables throughout the body and associated complications. • Important features to report on (i.e., foreign material migration, intramuscular location). • Approach to surgical management. • Imaging of post-operative findings and common post-operative complications.

#### MSEE-71 Opportunistic Imaging in Musculoskeletal Radiology: The Data Scavengers

Participants

Seyedarash Mahdavi Anari, MD, Seattle, WA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Each radiologic examination contains robust additional data that can be leveraged for opportunistic screening of disease and risk assessment of future adverse clinical events. 2. With the radiology transition from volume-based to value-based practice the interest in opportunistic imaging is growing. 3. AI models enabling fully automated evaluation of biometric measures provide the opportunity of individualized patient risk assessment and pre-symptomatic diseases detection. 4. Opportunistic imaging in musculoskeletal radiology can be used in: ü Detecting clinically important musculoskeletal findings (e.g., screening for osteoporosis). ü Systematically discovering non-musculoskeletal findings in musculoskeletal studies (e.g., screening for abdominal aorta aneurysm in lumbosacral MRI).

#### TABLE OF CONTENTS/OUTLINE

• Assess opportunistic imaging for detection of sarcopenia in cancer patients and its clinical relevance • Review opportunistic screening for osteoporosis in abdominopelvic or thoracic CT examinations • Review opportunistic screening for abdominal aorta aneurysm in lumbosacral MRI examinations • Discuss the role of radiomic features extracted from imaging specially in oncology imaging as an opportunity to improve diagnosis and prognostication • Explain the capacity of AI models to fully automate assessment of biometric measures for the use in musculoskeletal imaging

#### MSEE-72 Dual-Energy CT: Still Haven't Found What You Are Looking For

Participants

Roberto Garcia Figueiras, PhD, Santiago De Compostela, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Dual-energy CT (DECT) imaging has broadened the potential of CT imaging by offering multiple postprocessing datasets which are achieved using discrete acquisitions at more than one energy level. DECT shows profound capabilities to improve diagnosis based on its superior material differentiation, but alsoThe aim of this exhibit is:-To review physical concepts of DECT, parameters influencing image quality, postprocessing methods, and daily routine workflow.-To describe the strengths and weaknesses of different DECT platforms.-To discuss advantages and limitations of DECT in different clinical scenarios.-To provide a comprehensive and practical overview of diagnostic pitfalls and possible artifacts that may be encountered at DECT.-To evaluate future perspectives for DECT imaging and photon-counting technology.

#### TABLE OF CONTENTS/OUTLINE

-Basic concepts of DECT: atomic numbers, energy levels, and other physics concepts.-Strengths and weaknesses of different DECT platforms: "one does not fit all".-Understanding the puzzle of the different types of DECT images.-What you can and cannot expect from a DECT scan: opportunities and limitations (that you need to know) of DECT in daily practice.-Pitfalls and artifacts: how to avoid them?-Cutting-edge applications of DECT: iodine concentration and tumor response, advanced material characterization, electron-density maps in radiotherapy, etc.-Future directions: from dual-energy to photon-counting CT.-Conclusions

#### MSEE-73 Multimodality Imaging of Sarcoidosis and Sarcoid-like Reaction

Participants

Nitin Venugopal, MD, Seattle, WA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

• Review the clinical findings, prognosis, management and imaging guidelines for sarcoidosis and associated complications. • Describe the imaging appearance of sarcoidosis across multiple organ systems and modalities. • Discuss the differential diagnoses for imaging findings of for sarcoidosis. • Discuss radiology-pathology correlation as it applies to sarcoidosis.

#### TABLE OF CONTENTS/OUTLINE

Sarcoidosis is a systemic disease but presents most commonly in the lungs. While up to 90% of patients will have an abnormal chest radiograph, less than 20% of patients will exhibit respiratory symptoms. Extrapulmonary manifestations are seen in up to 40% of patients with involvement of central nervous system, circulatory system, abdomen, musculoskeletal system, or skin. In this educational exhibit we describe the imaging appearance and differential diagnosis of the following pulmonary and extrapulmonary manifestations of sarcoidosis: • Pulmonary o Natural history stages of pulmonary sarcoidosis, imaging timeline o Chest radiograph findings and signs o Chest CT findings and signs o FDG and Gallium PET • Cardiac • Intra-abdominal o Hepatic o Splenic o Renal o Peritoneal • Neurosarcoidosis o Leptomeningeal Dural o Pituitary Endocrine o Cranial nerves o Spine: leptomeningeal, myelopathy • Musculoskeletal Cutaneous Sarcoidosis o Bone lesions o Arthropathy o Myopathy o Lofgren syndrome • Pitfalls o Immunotherapy-induced sarcoid-like reaction Finally, we discuss the relevant radiology-pathology relationships in the systemic manifestations of sarcoidosis with a rich complement of histologic images.

#### MSEE-74 Nontraditional Uses of CT Contrast Agents

#### TEACHING POINTS

- This abstract discusses the basics of tomographic technique and anatomy, with a focus on the appropriate choice of imaging

modality for the evaluation of the specific alterations- Assurance of a valid clinical indication for each contrast medium administration. - To compare positive versus neutral oral contrast material for detecting pathological thoracoabdominal conditions. - Recognize appropriate uses of CT in clinical practice.

#### TABLE OF CONTENTS/OUTLINE

CT scanning is fast, painless, noninvasive, and accurate. The CT exam can now be more effectively tailored to the presumed diagnosis. Specifics related to oral and IV contrast protocols in terms of timing and volume regimens will be covered in detail in this presentation. Table of contents: 1- CT pharyngography 2- CT esophagography 3- CT gastrography 4- CT enterography 5- CT fistulography 6- CT urography 7- CT cystography 8- CT angiography. To illustrate the spectrum of MDCT findings based on our series of CT studies performed between 2015 and 2022. Conclusions: - On-site radiologist supervision is essential? These exams are always radiologist-guided. - Optimal performance of CT requires knowledge of anatomy and pathophysiology, familiarity with the basic physics and techniques of CT, and knowledge of radiation safety. - Specifics related to oral and IV contrast protocols in terms of timing and volume regimens will be covered in detail in this presentation. - Radiologists must be familiar with the radiologic findings for both accurate diagnosis and, in many cases, guidance of management planning. - A practical case-based review.

#### MSEE-75 Multimodality Imaging of Systemic and Localized Amyloidosis

Participants

Nitin Venugopal, MD, Seattle, WA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Review the etiologies, pathophysiology and clinical findings of systemic and localized amyloidosis
- Describe the imaging appearance of amyloidosis across multiple organ systems and imaging modalities
- Discuss the differential diagnoses for imaging findings of amyloidosis
- Discuss radiology-pathology correlation as it applies to amyloidosis

#### TABLE OF CONTENTS/OUTLINE

Amyloidosis is a condition secondary to a range of pathologic processes resulting in deposition of abnormal protein in tissues (amyloid). Amyloid deposition may be due to neoplastic, infectious, inflammatory, and even congenital processes, leading to marked heterogeneity in clinical and imaging manifestations. In this exhibit, we will discuss the varying etiologies of systemic amyloidosis including AL, AA,  $\beta_2$ -microglobulin, ATTR (transthyretin), and hereditary forms. We will also discuss the etiologies of localized amyloidosis including:  $\beta$ -amyloid (Alzheimer's), AANF (isolated atrial amyloid), and AIAPP (DM2). The focus of our work is the imaging appearance and differential diagnosis for the following organ-specific manifestations of amyloidosis with accompanying clinical images: 1. Pulmonary Amyloidosis o Nodular parenchymal o Diffuse parenchymal o Tracheobronchial laryngeal 2. Cardiac with specific MR and NM findings 3. Intra-abdominal o Hepatosplenic o Renal o Bowel o Bladder 4. Cerebral o Angiopathy o Alzheimer's disease 5. Musculoskeletal o Arthropathy o Myopathy o Carpal tunnel syndrome 6. Amyloidomas Soft Tissue Amyloid Finally, we will describe radiology-pathology relationships that influence imaging findings of amyloidosis.

#### MSEE-76 Characteristic Imaging Features and Screening/Surveillance Recommendations for Hereditary Syndromes

#### TEACHING POINTS

I. Many heritable syndromes have characteristic imaging features. Recognizing common multi-system findings in heritable syndromes allows radiologists to make a unifying diagnosis and guide surveillance strategies. II. Heritable syndromes can have overlapping imaging features. a. Multiple endocrine neoplasia (MEN) type 1, tuberous sclerosis complex (TSC), neurofibromatosis (NF), and von Hippel Lindau (VHL) have characteristic findings in the central nervous system (CNS). b. Lynch, Gardner, and Peutz-Jegher (PJS) syndromes are characterized by gastrointestinal tract malignancies. c. Renal tumors can be seen in Birt-Hogg-Dubé (BHD), TSC, and VHL. d. Pheochromocytomas can be seen in NF type 1, VHL, and MEN type 2. III. While oncologic screening is a critical part of heritable syndrome monitoring, it is equally important to recognize acute pathologies that can result from heritable syndromes. a. CNS tumors can cause acute neurologic problems such as mass effect and obstructive hydrocephalus. b. Small bowel polyps in PJS can lead to intussusceptions and small bowel obstructions. c. Angiomyolipomas, seen in BHD and TSC, can bleed or rupture if large or rapidly growing. This is the second most common cause of morbidity in these patients.

#### TABLE OF CONTENTS/OUTLINE

I. General concepts about hereditary syndromes II. Review of key imaging findings and screening recommendations for the following diagnoses: Lynch syndrome, Gardner syndrome, PJS, MEN, NF, TSC, BHD, VHL, hereditary breast and ovarian cancer syndrome III. Summary of key concepts

#### MSEE-8 Paraganglioma Imaging: Radiology and Nuclear Medicine

Participants

Aurelie Choucair, MD, Villejuif, France (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Describe the different hereditary forms of paragangliomas insisting on Succinate Dehydrogenase Mutations. Review the genetic associations predisposing to paragangliomas including Von Hippel-Lindau, Multiple Endocrine Neoplasia Type 2 NEM2, Neurofibromatosis Type 1 NF1 and Carney Triad. Define the secreting or non-secreting character. Provide a detailed overview of anatomical imaging (CT and MRI) features. Improve knowledge about the different Nuclear Medicine and functional imaging techniques, and the multiple radiopharmaceuticals available for Scintigraphy and PET/CT, according to paraganglioma site and mutational pattern. Analyse the different functional imaging modalities and review the strengths and weaknesses of each modality in detecting lesions depending on their location, secretory function and underlying genetic mutation. Prognosis of paragangliomas, frequent sites of metastasis and therapeutic options.

#### TABLE OF CONTENTS/OUTLINE

Definition of Paraganglioma Epidemiology Succinate Dehydrogenase Mutations Genetic Association: - Von Hippel-Lindau- NEM2- NF1- Carney Triad Characteristics (secreting / non secreting), and clinical presentation Location: - Parasympathetic Paraganglioma: Carotid Body Tumor, Glomus Tympanicum, Jugulotympanicum, Jugulare, and Vagale- Sympathetic Paraganglioma: Adrenal: Pheochromocytoma Extra-adrenal Imaging of Paraganglioma Radiology CT Scan MRI Nuclear Medicine Scintigraphy PET Differential diagnosis Complications Prognosis and Treatment

## MSEE-9 Eponyms in Radiology: The Controversies Worth Re-examining

Participants

Madeleine Sertic, MBBCh, Boston, MA (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- Eponymous diseases are a long-standing tradition in Western medicine, however, there are numerous arguments against the practice.
  - o Plain-language descriptive names are easier to understand for both patients and health care providers
  - o Eponyms often only recognize individuals, when in reality discoveries are often collaborative
  - o Bias toward recognizing Western, male and non-minority figures
- Eponyms may serve to honor figures that are controversial.
  - o Affiliations with totalitarian regimes
  - o Documented views of intolerance based on race, disability, age, etc.
  - o Professional scandals involving venality, fraud, etc.
- Stigler's Law of Eponymy states that no scientific eponym is named for its original discoverer.

### TABLE OF CONTENTS/OUTLINE

- Introduction
  - o The concept of "controversy"
  - o Holding historical figures to modern standards
- Multi-system overview of controversial eponymous figures
  - o Breast
  - o Cardiothoracic
  - o Emergency
  - o Gastrointestinal and Genitourinary
  - o Musculoskeletal
  - o Neuroradiology
  - o Nuclear Medicine
  - o Pediatrics
  - o Vascular/Interventional
- Stigler's Law of Eponymy
- Conclusion

Printed on: 04/12/24

## Abstract Archives of the RSNA, 2023

### Rosai-Dorfman Disease- Multimodality Imaging

#### Participants

Babina Gosangi, MPH, (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Rosai-Dorfman disease is a benign proliferative disease characterized by sinus-histiocytosis with massive lymphadenopathy. The mean age of presentation is 21-years with a male preponderance. It is a result of immune dysregulation following a viral infection. Lymphadenopathy is the key finding but extranodal involvement is also seen.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction. 2. Examples of cases: a. Multistation lymphadenopathy b. Extranodal involvement • Nasal cavity- Pansinusitis • Orbital involvement- cranial nerve thickening • Intracranial lesions- Brain neoplasms, meningitis • Lung lesions- perilymphatic nodules, interstitial thickening, endobronchial nodules, pleural lesions • Renal masses • Mesenteric masses • Lytic lesions in the bone • Soft tissue lesions 3. Conclusion.

### Another Great Pretender: Extragenital Endometriosis, A Pictorial Review

#### TEACHING POINTS

Extragenital endometriosis (EE) is a relatively infrequent occurrence with a broad spectrum of clinical and phenotypic presentations, posing significant diagnostic difficulties, particularly outside the pelvic region. Radiologists play a pivotal role in suspecting the presence of EE by identifying its characteristic imaging hallmarks even before the onset of clinical symptoms. As such, they can facilitate timely diagnosis and intervention for better patient outcomes. MRI is the imaging modality of choice for EE evaluation, owing to its high specificity and sensitivity in detecting EE-specific imaging signs.

#### TABLE OF CONTENTS/OUTLINE

a) Introduction: General characteristics of EE, demographics, and imaging features, mostly in CT and MRI. b) Description of the case series: The experience in extragenital endometriosis in two tertiary care centers. A retrospective review of last 5 years cases was performed. c) MRI protocol d) Extragenital endometriosis distribution: Pelvic non gynecological organs, gastrointestinal, genitourinary, musculoskeletal, thoracic, nervous system, miscellaneous e) Conclusions: Endometriosis is a commonly underdiagnosed disease, and the diagnostic challenge is further enhanced by the non-specific clinical and phenotypic features of EE. When radiologists are aware to these complexities, they can be the first physician to suspect and propose this diagnosis, allowing timely intervention and improved patient outcomes. MRI is the backbone of EE diagnosis, thanks to its characteristics.

### Didactic Cases of Oncologic Emergencies in Radiology

#### Participants

Miguel Barrio Piqueras I, MD, Pamplona, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To be able to recognize the main urgent pathologies related to oncological diseases and treatments. To be able to distinguish the severity level of these conditions and properly guide the clinician regarding the causative agent. To raise awareness among radiologists about the significant prevalence of these complications in general medical care.

#### TABLE OF CONTENTS/OUTLINE

1. Oncologic diagnosis in the emergency department (not previously known malignancy)  
2. Tumor-related complications and emergencies  
a Superior vena cavab Intestinal obstructionc Obstructive hydrocephalusd Spinal cord compressione Hypercoagulabilityf Carcinoid syndrome  
3. Complications arising from diagnostic procedures and classic treatments  
a Surgical (suture dehiscence)  
b Chemo-radiotherapy  
c Vasculitisc Fistulad Esophagitis/esophageal necrosis  
e Hemorrhagic complications  
f Post-radioembolization cholecystitis  
g Leukoencephalopathy due to chemotherapeutics  
4. Post-hematopoietic stem cell transplantation (HSCT)  
a Pulmonary infections: febrile neutropenia (aspergillus may occur in all time segments)  
0-30 days post-HSCT (fungal): Aspergillus  
31-100 days post-HSCT (early): CMV and PJ  
>100 days post-HSCT (late): Bacterial and viral infections (common infections)  
b Sinusoidal obstructive syndrome and intestinal graft versus host disease  
c Neutropenic colitis (typhlitis)  
5. Emergencies related with new therapies and targeted therapies  
a Immune-related adverse events and complications  
Pancolitis due to TKIPancolitis secondary to immune-checkpoint inhibitors  
Immune-mediated pancreatitis  
b Hyperprogresionc Cytokine release syndrome (CRS) and immune effector cell-associated neurotoxicity syndrome (ICANS)

MSEE-13

### When Suspect Nonneoplastic Lymphadenopathy on PET/CT

#### TEACHING POINTS

1. Morphological changes of lymph nodes or their metabolism are not enough to predict tumoral compromise. 2. The distribution pattern, relation with a primary tumor and its typical extension, inflammatory or posttreatment changes, and clinical conditions should be considered. 3. Different nonneoplastic pathologies characteristically manifest with lymph node enlargement and are frequently confused with malignancy, such as connective tissue diseases, infections, IgG4-related disease, granulomatous inflammation, non-clonal lymphoproliferative disorders, and others.

#### TABLE OF CONTENTS/OUTLINE

1. Clues to suspect nonneoplastic lymphadenopathy: Morphological characteristics, distribution pattern, relation with the drainage pathways of a primary tumor or inflammatory process, and association with other findings. 2. Nonneoplastic diseases related to lymphadenopathies: a) Connective tissue diseases: lupus and rheumatoid arthritis; b) Infections: HIV, tuberculosis, toxoplasmosis, histoplasmosis, Epstein-Barr virus, and Bartonella; c) IgG4-related disease; d) Granulomatous inflammation: sarcoidosis, sarcoid-like reaction, and pneumoconiosis; e) Non-clonal lymphoproliferative disorders: Castleman disease and Amyloidosis; f) Kikuchi and Kimura disease; g) Posttreatment lymphadenopathies: immunotherapy, target therapy, surgical and radiation inflammatory changes; h) COVID-19 vaccine; i) Others: pulmonary edema, interstitial lung disease, emphysema, chronic liver disease, and reactive lymph nodes in young patients. 3. Conclusions

### Potential Pitfalls of Splitting Interpretation of Concurrent Chest and Abdominal CTs

#### Participants

Eyal Ron, MD, Rochester, MN (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Simultaneously obtained chest and abdomen/pelvis CTs are sometimes read by separate subspecialized radiologists. This creates the potential for missed, incomplete, and conflicting diagnoses involving the scanned areas that overlap. 2. Chest findings can sometimes be more conspicuous on the "abdomen" CT and vice-versa. This can be due to differences in contrast timing and CT reconstruction technique. 3. Some processes require synthesizing findings from both the chest and abdomen CT for optimal radiology analysis.

#### TABLE OF CONTENTS/OUTLINE

We provide example cases demonstrating how splitting radiology interpretations either did or potentially could have led to misdiagnoses of abdominal findings seen on chest CT and vice versa. Additionally, we provide guidelines to avoid these potential pitfalls. Examples include: 1. Missed pancreatic adenocarcinoma conspicuous only on the chest CT portion. 2. Pulmonary embolism poorly visualized on chest CT with contrast but more conspicuous on the arterial phase of the concurrently obtained abdominal CT. 3. Area of slow flow seen on chest CT misinterpreted as pulmonary embolism when a concurrently obtained abdominal shows these arteries are adequately opacified. The patient later developed an intra-abdominal bleed related to the anti-coagulation started for the false positive pulmonary embolism call. 4. Intrathoracic extent of a metastatic GIST tumor and reactive pericardial effusion, challenging to synthesize without strong collaboration between the chest and abdominal radiologists.

MSEE-15

### **Facial Mapping: High Frequency Ultrasound Step-by-step Approach in Facial Anatomical Evaluation for Aesthetics**

#### **Participants**

Luciana Zattar, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Facial aesthetic procedures are increasingly being performed. Different aesthetic surgery techniques, injectable materials and technologies aimed at improving skin quality and restoring the redistributed volume of facial layers have been used against the multifactorial process of the facial aging. The correct evaluation and characterization of the facial layers is crucial for safe and effective rejuvenation procedures, specially the minimally invasive, since a wrong manipulation might yield an aesthetically undesirable result and lead to serious complications. In this context, the radiologists may be requested to recognize and evaluate the facial layers, compartments and their contents. To achieve accurate and timely detection and appropriate approach of each case, High frequency ultrasound (HFUS/24-33MHz) is the most effective method since it provides optimal anatomical information of the skin and allows facial layers differentiation as well as aesthetic anti-ageing procedures identification. This study aims to discuss and illustrate the radiologist's role in the evaluation of facial anatomy with HFUS, and purposes: (1)To describe the correct examination technique / HFUS advantages. (2)To illustrate the anatomy of the skin/facial layers. (3)To show a step-by-step approach of the most important facial structures. (4)To discuss the course of the main facial neurovascular structures and its variations.(5)To list and describe the anatomy of the Facial Danger Zones. (6)To highlight the importance of HFUS in pre and post-procedural evaluation.

#### **TABLE OF CONTENTS/OUTLINE**

1.INTRODUCTION. 2. FACIAL LAYERS. 3.VASCULAR MAPPING. 4. FRESH FROZEN SPECIMEN CORRELATION. 5.CONCLUSION

### Imaging in Sexagenarians and Beyond: What Clinicians Want to Know and What Radiologists Need to Know

#### Participants

Sirui Jiang, MD, PhD, Cleveland, OH (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. By 2030 approximately 20% of all Americans or about 70 million people will be 65 years or older. This population utilizes about 30% of our imaging resources yearly and is ever increasing. 2. How to incorporate the geriatric scoring systems to risk stratify and prioritize treatment in the reading room. 3. Review the common imaging findings in the geriatric population with special emphasis in the emergency/trauma and oncology settings using multimodality images. 4. Review imaging differences of pathology in a young versus an elderly patient.

#### TABLE OF CONTENTS/OUTLINE

Background  
History of geriatrics  
Importance of geriatric care and management  
Development of multiple geriatric scoring systems  
Succinctly synthesizing common geriatric imaging findings  
Common Scenarios of Geriatric Population in the Reading Room  
Head and Neck: subdural hematomas, cerebral atrophy, vascular calcifications  
Chest: rib fractures, emphysema, cardiovascular (coronary and valvular calcifications), lung/esophageal primary malignancies, acute/chronic lung infection  
Abdomen: steatosis, chronic renal failure, chronic cystitis, pancreatic issues (malignancy/insufficiency), adrenal issues (insufficiency/hyperplasia/atrophy)  
Pelvis: prostate, diverticulitis  
Musculoskeletal: osteopenia, multiple myeloma, osteoarthritis, steroid associated changes, vertebral compression fractures  
Collaborative Approach for Geriatric Care  
Templates with these common findings to help create a concise report  
Multidisciplinary approach with geriatric subspecialties  
Is it time for a geriatric radiology fellowship/subspecialty?

### SBRT and Isolated Metastases: A Primer for Radiologists

#### Participants

Raelynne MacBeth, MD, South Euclid, OH (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Review the natural history of stereotactic radiation therapy (SBRT) and how it has progressed to treatment of intra-thoracic and intra-abdominal malignancies. 2. To review the different types of malignancies SBRT is used to treat and the potential toxicities associated with each. 3. To discuss the multimodality appearance and evaluation of tumor burden after SBRT. 4. To discuss the multimodality appearance of SBRT associated toxicities after treatment. 5. To discuss the multimodality appearance of recurrence patterns after SBRT.

#### TABLE OF CONTENTS/OUTLINE

1. Define stereotactic body radiation therapy (SBRT) and how it differs from other modes of radiation therapy. 2. Review the pathophysiology of radiation therapy-induced cellular damage. 3. Review the natural evolution of SBRT and how it has progressed to treatment of malignancies in the chest, abdomen, and pelvis. 4. Discuss the indications for utilizing SBRT in selected malignancies and their common associated toxicities. 5. Discuss the typical and atypical response patterns after SBRT and their multimodality appearance. 6. Discuss the typical and atypical toxicity profiles after SBRT and their multimodality appearance. 7. Examine the multimodality appearance of local recurrence patterns after SBRT. 8. Discuss distant recurrence patterns after SBRT and their multimodality appearance. 9. Discuss the financial toxicities associated with SBRT.

### Syphilis: The Re-emerging Great Mimicker - A Case-based Review from Head to Toe

#### Participants

Kano Shintaro, MD, Shinagawa-Ku, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Syphilis, a sexually transmitted disease caused by the spirochete bacterium *T. Pallidum*, is a multisystemic infection that can affect various organs. Recently, the number of syphilitic patients has been rapidly increasing worldwide. Clinical manifestations of syphilis are often inconspicuous and imaging examinations performed for other purposes may lead to potential overlook or misdiagnosis of syphilis, making it challenging for radiologists to diagnose it accurately. Therefore, it is crucial for radiologists to understand the imaging spectrums and differential diagnosis of syphilis to ensure accurate diagnosis and appropriate patient management. The purposes of this exhibit are (1) to review the imaging spectrums of syphilis through case-based studies for the improved ability to identify potential cases of syphilis and (2) to discuss approaches to distinguish syphilis from other diseases that can mimic it.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction 1-1.Epidemiology 1-2.Clinical manifestation therapy 2. Case presentations: Body imaging 2-1.head and neck 2-2.chest 2-3.cardiovascular 2-4.abdomen urogenital 3.Case presentations: Neuroimaging 3-1.brain 3-2.spinal cord 4.Case presentations:Pediatric imaging 5. Summary

### Body MRI Approach Fundamentals: A Guide for Beginners

#### Participants

Mark Hoegger, MD, PhD, Saint Louis, MO (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Body MRI interpretation can be daunting for the inexperienced reader because 1) the relevance of key clinical parameters may be unknown, 2) the importance of certain sequences in diagnosis may be unclear, and 3) a routine search pattern may not be established. To aid those inexperienced in body MRI, this exhibit's purpose is to:- Discuss the general body MRI sequences and their uses.- Identify and explain key clinical factors for the most commonly encountered clinical questions that can be answered with body MRI.- Describe the sequences and their relevance for these common body MRI indications. The intent of this exhibit is not provide an exhaustive overview of body MRI, but to arm a trainee starting on service, or a radiologist in practice who has been called upon to read body MRI exams but may be inexperienced or out of practice, with the tools needed to be successful.

#### TABLE OF CONTENTS/OUTLINE

- General body MRI sequences and their uses: T1-weighted imaging pre- and post-contrast, chemical shift imaging, T2-weighted imaging, and DWI.- Body MRI search pattern fundamentals: CT versus MR approach, flexibility in body MRI, lesion finding versus lesion characterization, and pitfalls.- Disease-specific clinical parameters and sequences for common indications: liver lesions and hepatocellular carcinoma (LI-RADS), rectal cancer, renal masses, prostate adenocarcinoma (PI-RADS), pancreatic cysts and solid masses, inflammatory bowel disease, biliary disease, and uterine and ovarian masses.

MSEE-21

### Congenital and Acquired Causes, Mimickers and Treatment of Diaphragmatic Paralysis

#### Participants

Achala Donuru, MD, (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Phrenic nerves originate from cervical nerves C3-C5. Injury of the phrenic nerve can occur by multiple mechanisms. Due to the long course of the left phrenic nerve in the thorax, left-side diaphragmatic weakness is more common compared to right side. One of the most frequent causes of unilateral diaphragmatic paralysis is iatrogenic. In bilateral diaphragmatic paralysis, one of the most common causes is a motor neuron disease. Most cases of DP are idiopathic (70%), other causes include congenital (birth trauma), tumors, infections, muscular disorders, and iatrogenic (medication induced, from nerve block, post-surgical). The main differentials to consider when an elevated hemidiaphragm is noted on a chest radiograph are diaphragmatic eventration, lobar collapse, subphrenic abscess and subdiaphragmatic mass.

#### TABLE OF CONTENTS/OUTLINE

On a chest radiograph, the right dome of the diaphragm is higher in position when compared to the left dome. If the left dome of the diaphragm is elevated by more than 2 cm, DP should be suspected. Functional imaging with a sniff test is very useful in diagnosing DP, the affected side demonstrates a paradoxical upward movement. Performance of dynamic MR imaging for evaluation of diaphragmatic function has also been described. Most patients with unilateral DP are detected incidentally and do not require any specific management. Most patients with bilateral DP require permanent ventilator support. Selected patients with persistent respiratory failure can benefit from diaphragmatic plication or phrenic nerve pacing. It is important for the radiologists to recognize diaphragmatic paralysis and look for pathology along the course of the phrenic nerve.

### What on Earth is That: Newer Medical Devices on Chest Radiographs

#### Participants

Ashrith Kandula, Wallingford, PA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

There has been a constant influx of newer medical devices as technology veers towards more noninvasive methods of treating diseases. Plethora of new devices are seen on today's plain radiographs. Cardiovascular devices are further divided into- cardiac devices comprising of rhythm monitors such as Pacemakers, Implantable cardioverter defibrillators, Ventricular Assist Devices, Occlusion devices, Valve prosthesis- (Open heart and Trans catheter placement), Loop recorders. Vascular devices range from Central venous catheters, Swan Ganz catheter , remote pulmonary artery pressure monitoring devices, devices used for catheter directed thrombolysis, IABP, ECMO to many more. Non-Cardiovascular devices include- esophageal devices- LINX for reflux, nerve stimulators including Vagal, Trigeminal and Hypoglossal, phrenic nerve stimulators, diaphragmatic pacers.

#### TABLE OF CONTENTS/OUTLINE

To review the newer medical devices seen on plain radiographs of the chest. Pictorial review of the optimal location, function and complications of the different devices. Organization: Introduction, classification, pictorial review of device along with in-vitro images, optimal location, function and evaluation of complications associated with the device. Entities discussed: Cardio Microelectromechanical device (CardioMEMS), Pulmonary Artery catheters for thrombolysis , Cordella Pulmonary Artery Pressure Monitor, Mitraclip, Transcatheter Mitral Valve Replacement (TMVR), Transcatheter Pulmonary Valve Replacement (TPVR), LINX - device for reflux management, Endoscopic clips from POEMS, Hypoglossal nerve stimulators, Diaphragmatic pacers.

### Nail it: A Guide to Diagnosing Nail Disorders

#### Participants

Isabela Ribeiro, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Ultrasonography serves as a valuable tool for assessing the nail unit, providing real-time evaluation of its components, which includes the periungual tissue's appearance and thickness, vascularization via color Doppler application, and possible involvement of underlying bone structures. It is crucial to understand not only the normal anatomy of the nail bed on ultrasonography but also the main points of some pathologies encountered in daily clinical and radiological practice. While nail tumors are rare anomalies, a detailed prior anatomical knowledge allows for their easy identification. In addition, it is important to highlight the ultrasonographic findings of other common conditions, such as retronychia, foreign bodies, and paronychia, in order to better define the appropriate course of action. Given its ability to diagnose, localize, and differentiate various nail disorders, it is not surprising that nail unit assessment through ultrasonography can significantly improve patient outcomes.

#### TABLE OF CONTENTS/OUTLINE

Highlight the importance of ultrasonographic assessment for the nail unit. Review the advantages and limitations of high-frequency ultrasound for evaluating the nail compartment. Identify the ultrasonographic characteristics of common nail pathologies.

### **Alohomora: Opening the Mind and Demystifying Abdominal Tuberculosis Findings**

#### **Participants**

Kamila Albuquerque, MD, Vila Velha, Brazil (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Brazil is one of the countries with the highest incidence of tuberculosis in the world, ranking among the top 22, according to the WHO. Abdominal tuberculosis is considered a great mimic of other abdominal diseases, and can affect the gastrointestinal tract (GIT), peritoneum, lymph nodes and other organs. It often represents a diagnostic challenge due to its nonspecific findings, which may result in diagnostic delay and the development of complications. Imaging tests play an important role in its diagnosis, with an impact on the morbidity and mortality of the disease. This study aims to carry out an iconographic review of the most common abdominal manifestations of the disease, atypical presentations and complications from the perspective of different types of imaging methods, which include tomography and magnetic resonance imaging and even CT / PET.

#### **TABLE OF CONTENTS/OUTLINE**

In this educational exhibition, we address the different abdominal radiological manifestations related to tuberculosis bacillus infection, in addition to epidemiological and pathophysiological data, as well as some differential diagnoses and miscellaneous.

### Beyond Genetics: A Review of Current Renal Cancer Screening Guidelines for Hereditary Renal Cancer Syndromes

#### Participants

Shiva Singh, MBBS, Bethesda, MD (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Hereditary renal cancer syndromes, including von Hippel-Lindau (VHL), Birt-Hogg-Dubé (BHD), Hereditary Leiomyomatosis and Renal Cell Carcinoma (HLRCC), Tuberous Sclerosis Complex (TSC), Succinate Dehydrogenase (SDH)-deficient renal cell carcinoma (RCC), and BRCA1-associated Protein-1 (BAP1) tumor predisposition syndrome, are associated with an increased risk of developing renal tumors. Early detection of renal cancer in individuals with hereditary renal cancer syndromes is of extreme importance as it facilitates timely intervention and improves the prognosis. Owing to differences in their extra-renal manifestations and age of onset, the screening guidelines for each hereditary renal cancer syndrome are unique. Here, we provide a summary of the current recommendations for screening of renal cancer in each of these hereditary renal cancer syndromes.

#### TABLE OF CONTENTS/OUTLINE

Table of Contents/OutlineI. Introduction: (a) Hereditary renal cancer syndromes: Renal and extra-renal manifestations; (b) Importance of screeningII. Screening guidelines for hereditary renal cancer syndromesIII. CT/MRI images of patients with extra-renal manifestations undergoing renal cancer screening and eventually detecting renal tumor in each syndrome:(a) Von Hippel-Lindau syndrome (vHL); (b) Birt Hogg Dubé syndrome (BHD); (c) Hereditary Leiomyomatosis and Renal Cell Cancer syndrome; (d) Tuberous Sclerosis Complex; (e) Succinate Dehydrogenase-deficient RCC; (f) BAP1 tumor predisposition syndromeIV. ### DWI vs 18-FDG PET/CT in Oncology: Which Technique for Which Clinical Scenario

#### Participants

Antonio Luna, MD, PhD, Jaen, Spain (*Presenter*) Speaker, General Electric Company

#### TEACHING POINTS

Learn how to introduce whole-body diffusion-weighted imaging (WB-DWI) for tumor assessment. Review the technological adjustments including parallel imaging, compressed sensing, and deep learning to optimize WB-DWI protocols. Learn how WB-DWI/MRI is a valid alternative to 18-FDG PET/CT for tumor staging and is particularly advantageous in the assessment of peritoneum, bone marrow, liver, and brain metastases. Analyze the complementary role in tumor detection and staging and therapy monitoring of both techniques, using a head-to-head comparison, defining the most adequate technique for common clinical scenarios in oncology and including their applications in special populations (i.e., pregnant, or pediatric patients). Establish the range of clinical applications of PET/MRI combining DWI and 18-FDG PET acquisitions in oncology.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction. 2. Technical adjustments in WB-DWI 3. Tumor staging: 3a. WB-DWI vs 18-FDG PET-CT. 3b. N staging. 3c. M staging. 3d. Specific tumors: NSCLC, breast cancer, prostate cancer, malignant melanoma, colorectal cancer, lymphoma, multiple myeloma and others. 4. Therapy monitoring. 5. Prediction of treatment response. 6. Posttreatment surveillance. 8. Conclusions

MSEE-32

### An Easy Approach to Cheson-Lungano Criteria: From Staging to Treatment Response Assessment

#### Participants

Antonio Michael-Fernandez, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

-To know how to evaluate a lymphoma staging study and treatment response interpretation according to Cheson-Lungano criteria.- Learning how to manage complex situations where this criteria seems to be unclear and its limitations.- Discussing the differences between Cheson-Lungano criteria and other evaluation systems such as RECIST 1.1

#### TABLE OF CONTENTS/OUTLINE

Standard criteria for radiological evaluation lymphoma response allowed to optimise the therapeutic management in a more accurate way in this type of patients. It is based on the selection of target and non-target disease in a first staging study, and the evaluation of their presence and change in size in follow-up studies, allowing a global assessment of treatment response. These criteria can be applied by radiologists by evaluating CT studies (Cheson criteria) or CT and PET together (Cheson-Lungano criteria). It should be noted that although these criteria may be similar to the RECIST 1.1 criteria for the evaluation of other solid tumours, there are important differences in their interpretation (number of target lesions, required diameters, percentage limits to consider response/progression...), as well as the specific assessment of splenic involvement (which is more infrequent in other solid tumours). This paper reviews the importance of a correct use of Cheson-Lungano criteria in: 1) performing an adequate staging study inform; 2) interpretate the treatment response in follo-up studies; 3) other special situations where this criteria is sometimes unclear and are discussed in this article.

MSEE-33

### POCUS: Radiology Vs Other Medical Professions Perspectives - Where Do We Stand

#### Participants

Margarita Revzin, MD, MS, Wilton, CT (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Point-of-care ultrasonography (POCUS) refers to a focused ultrasound performed at the patient's bedside by a clinician who both performs the US and interprets the images. The protocols usually answer a specific question that helps guide treatment. Goals: Understand what is point of care US (POCUS), its benefits and applications. Discuss differences in US training pathways among the different specialties vs Radiology. Review current issues of US Quality assurance and reimbursement, image archiving and accountability. Understand areas of potential threats and conflicts, and explore potential areas for collaboration and growth.

#### TABLE OF CONTENTS/OUTLINE

Define Point-of-care ultrasonography (POCUS) Review benefits and various applications of POCUS ( cardiovascular, ophthalmology, nervous system assessment, procedures ( line placement, nerve block, FAST) Discuss training pathways for POCUS, their strengths and limitations vs Radiology, review accreditation processs for POCUS vs Radiology. Discuss training in medical school Review available methods of US Quality assurance and reimbursement, provide examples of misinterpretation/misdiagnosis and role of Radiology in detailed evaluation of the POCUS findings. Discuss issues related to image archiving and accountability. Understand areas of potential threats and conflicts among Radiology and other fields of medicine utilizing POCUS. Explore potential areas for collaboration and growth.

MSEE-34

### Diffusion-weighted Imaging (DWI) in the Era of Abbreviated MRI: How to Make the Most Out of it for Abdominal MRI Applications

#### Participants

Claudio Lagos, MD, Santiago, Chile (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Introduce and briefly review abbreviated-MRI concepts. 2. Discuss detectability of lesions through abdominal organs using DWI alone, and review evidence comparing it with other imaging modalities, with emphasis in most and least useful applications. 3. Review DWI utility for characterizing abdominal lesions based on patterns and its correlate with pathology and aggressiveness, with emphasis in liver - pancreas. 4. Review last evidence regarding ADC value as a biomarker and a quantitative parameter in oncology imaging, prognosis and treatment response. 5. Illustrate frequent artifact and how they lead to interpretation pitfalls.

#### TABLE OF CONTENTS/OUTLINE

- Physics principles of diffusion- DWI image acquisition, ADC value and ADC map. Role of increasing b values in detectability.- Review abbreviated-MRI concept, goals and applicability.- Evidence based review of detectability of different lesions with emphasis in liver and pancreas.- Comparison of diagnostic yield with other techniques (ie. PET-CT, CECT) and other MR sequences, for different organs and frequent lesions, including peritoneal disease.- Practical approach in liver and pancreatic lesions for predicting histology / aggressiveness using a pattern based fashion.- Case based review of high performance situations: Liver mets, LIRADS evaluation, pancreatic nodules, extra - abdominal metastatic disease.- Case based review of low performance situations: Aggressiveness in renal nodules.- Role of quantitative DWI and its evidence, with emphasis in oncology.- Detectability and interpretation pitfalls, and how to avoid them.- Summary.- References.

### From Head to Toe Non-Langerhans Cell Histiocytosis (Erdheim-Chester Disease): Understanding a Rare Pathology in the Era of Hybrid Imaging

#### Participants

Yumi Kimura Sandoval, MD, Mexico City, Mexico (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Understand the epidemiology and pathology behind Erdheim- Chester disease, as well as its clinical presentation- Learn the importance of 18F-FDG PET/CT in the diagnosis, detection of disease extent, and severity- Identify the radiological signs with which the disease can manifest- Case-based review of the main radiologic signs and features observed in this rare disease

#### TABLE OF CONTENTS/OUTLINE

1. Epidemiology 2. Clinical presentation 3. Pathology 4. Radiographic features  
A) Central Nervous system: - Pituitary Gland - Posterior Fossa  
B) Orbits  
C) Thorax - Lung - Mediastinum  
D) Vasculature - Thoracic and abdominal aorta  
E) Kidneys and retroperitoneum  
F) Musculoskeletal system

Printed on: 04/12/24

MSEE-36

### Imaging in Erdheim Chester disease

#### Participants

Yashant Aswani, MD, Iowa City, IA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Discuss recent updates in classification and pathogenesis of Erdheim-Chester disease  
2. Describe role of imaging and clinical and radiologic findings of Erdheim-Chester disease  
3. Review new treatment options and therapeutic response evaluation

#### TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Epidemiology 3. Pathology 4. Pathogenesis 5. Newer classification systems (2016 WHO classification of lymphoid neoplasms and 2016 Working group of Histiocytic Society Classification) 6. Mixed histiocytosis: an overlap syndrome 7. Diagnosis 8. Role of Imaging 9. Manifestations of Erdheim-Chester disease 10. Skeletal involvement 11. Retroperitoneal disease 12. CNS involvement 13. Cutaneous disease 14. Pulmonary involvement 15. Cardiothoracic disease 16. Endocrine involvement 17. Orbital disease 18. Miscellaneous: Craniofacial bones and skull base 19. Miscellaneous: Hepatobiliary disease 20. Newer imaging findings 21. Association with non-histiocytic malignancies and autoimmune diseases 22. Markers of prognosis 23. Molecular targets for treatment 24. Treatment approach 25. Therapeutic response evaluation modified PERCIST criteria

MSEE-38

### Bugs that Suck (Your Blood): Imaging Manifestations of Vector-Borne Diseases

#### Participants

Francisco Calle, MD, Bogota, Colombia (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Familiarize the radiologist with the range of pathogens transmitted by arthropod vectors and the diseases they cause.
- Discuss the epidemiology of these diseases, including areas of endemicity, types of arthropod vectors, transmission dynamics, and prior outbreaks.
- Discuss the clinical presentations and medical complications associated with vector-borne diseases.
- Describe the imaging features associated with infection on ultrasound, CT, and MRI.
- Provide a brief overview of management and treatment.

#### TABLE OF CONTENTS/OUTLINE

Introduction to vector-borne diseases, including types of vectors and variety of pathogens, as well as epidemiology and major outbreaks. Role of imaging and imaging features in detecting infection and identifying complications: • Neurologic (e.g., viral encephalitis, lyme encephalitis, cerebral malaria) • Chest/cardiac (e.g., Chagas dilated cardiomyopathy) • Gastrointestinal (e.g., yellow fever, malaria) • Urogenital (e.g., arbovirus-associated acute kidney injury, acute tubular necrosis, and renal failure) • Musculoskeletal: (e.g., cutaneous and mucocutaneous leishmaniasis, ectoparasites). Brief overview of management and treatment of vector-borne diseases and their complications

MSEE-39

### Whole-Body MRI in Hereditary Tumor Syndromes: How We Do It

#### TEACHING POINTS

- Whole-body MRI can be helpful for screening, detection, and follow-up of bone and soft tissue tumors in patients with hereditary tumor syndromes - Different tumor syndromes require appropriate MRI acquisition protocols to highlight the different pathological findings - Whole-body fluid and cartilage sensitive MRI sequences are necessary for patients with multiple hereditary exostoses (MHE) and enchondromatosis to reveal the cartilaginous portion of the tumors and the associated bursitis - Post-contrast imaging is critical in patients with familiar Paragangliomatosis to identify small mediastinal and retroperitoneal paragangliomas - Diffusion-weighted imaging is useful in patients with an increased risk of malignant tumors (for example, in Li-Fraumeni syndrome) or when a malignant degeneration of a benign lesion is suspected

#### TABLE OF CONTENTS/OUTLINE

- Imaging approach in hereditary tumor syndromes - Role of Whole-Body MRI for screening, detection, and follow-up of hereditary multisystem and multisite tumors - MR imaging acquisition protocol and evaluation in MHE, Enchondromatosis, and Maffucci syndrome - MR imaging acquisition and evaluation in familiar Paragangliomatosis - MR imaging acquisition and evaluation in Neurofibromatosis - MR imaging acquisition and evaluation in Li-Fraumeni syndrome - When to use Dw imaging - When to use post-contrast imaging

MSEE-4

### Getting Started with PCCT: Lessons Learned

#### Participants

Fides Schwartz, MD, Durham, NC (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Photon-counting computed tomography (PCCT) uses energy-resolving detectors whereas conventional CT detectors integrate the entire x-ray signal. Decision trees for protocol selection and scan mode are different from EID and must be defined at scanner setup. Technologists need to learn the use of a new interface. Automatic monoenergetic reconstructions with PCCT need to be optimized by imaging protocol including display window levels. Higher spatial resolution may increase image noise, but can be beneficial for many applications. Detector based spectral information collected, creates the need to set up what reconstructions automatically get sent to PACS. This project is geared toward helping new users in the RSNA imaging community in their decision-making processes when setting up a new clinical photon-counting CT. Patient case examples from the PCCTs installed at three major US institutions are shown to underline benefits of the new scanner system.

#### TABLE OF CONTENTS/OUTLINE

Overview of differences between PCCT and EID scanner systems  
New Terminology  
What do I need to set up  
Setting up your exam cards: scan modes, reconstruction kernels  
Reviewing the images: adjusting window level settings, sending thinner slices  
Comparison of PCCT and EID images from three major US institutions  
Abdominal imaging  
Pediatric imaging

MSEE-40

### How Multiple Joint CT Scanning Would Benefit from Artificial Intelligence

#### TEACHING POINTS

Teaching Points: 1. Artificial intelligence (AI) diagnosis platforms are playing more and more important role in clinical imaging diagnosis. 2. Multi-part joint CT scanning can highly reduce the radiation dose and contrast injection volume, effectively reduce the scanning time to protect patients and improve diagnosis efficiency while remaining image quality. 3. Taking coronary and carotid-cerebral joint scanning as example, the diagnosis time and mouse click number using AI platform can be reduced to 80% - 90% and 20% - 60% comparing to manual diagnosis. There is more diagnosis time reduction for junior radiologists than senior radiologists. And the diagnosis accuracy is comparable between AI platform and senior manual diagnosis. 4. We assume AI platform can help make the whole-body CT diagnosis more efficient and reduce 70 - 90% diagnosis time with body auto-segmentation and auto-diagnosis. AI platform offers over-sensitive diagnosis results and radiologists only need to double check to screen out wrong results.

#### TABLE OF CONTENTS/OUTLINE

Table of Contents/Outline: The purpose of this educational exhibit is to: 1. Review the current development and application of AI diagnosis platforms. Review the clinical benefit and outcome of multi-part joint CT scanning. 2. Demonstrate the role of AI platform for coronary and carotid-cerebral atherosclerosis diagnosis using one-step heart-brain CT angiography. 3. Illustrate the potential application value of AI platform for whole-body CT scanning using auto-segmentation and auto-diagnosis.

### Imaging-based Response Criteria in Oncologic Clinical Trials: What Radiologists Need to Know

#### Participants

Guilherme M. Cunha, MD, (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1) Discuss the role of imaging for assessing treatment response as endpoint of oncologic clinical trials. 2) Summarize differences and similarities of treatment response assessment in clinical practice vs for clinical trials. 3) Review the most common imaging-based treatment response criteria used in oncologic clinical trials. 4) Provide guidance on tumor response interpretation and reporting. 5) Discuss future directions.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction: a. Relevance of clinical trials for advances in medicine and patient care. b. Oncologic clinical trials: Definitions and practical points. c. The role of imaging in oncologic clinical trials. 2. Assessment of response during oncologic treatment: a. Differences to clinical practice. b. Standardization. c. Blind and independent review. d. Need for objective metrics and endpoints. 3. Imaging-based treatment response criteria: a. Rationale for different criteria. b. Target vs non-target lesions. c. Pictorial review of the most used response criteria. 4. Imaging-based treatment response assessment: a. Image analysis and interpretation. b. Reporting. 5. Future directions: a. Criteria updates. b. Technical Innovations.

### Evaluation of Hidradenitis Suppurativa Through Imaging Methods

#### Participants

Carolina Almeida, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1) Hidradenitis suppurativa is a chronic inflammatory skin condition with lesions including deep-seated nodules and abscesses, draining tracts, and fibrotic scars. 2) The classification of the severity of hidradenitis suppurativa is done clinically using the Hurley scale. Correct severity classification allows for appropriate treatment. 3) Currently, high-frequency ultrasound has been used to map lesions and proposes a new classification: clinical-sonographic scoring system (SOS-HS). 4) Explain how lesions are classified using ultrasonography and the standardization of nomenclature. 5) Clarify doubts about magnetic resonance imaging protocols in the evaluation of hidradenitis suppurativa and when to use this method. 6) To present 3D reconstruction as a useful tool for the pre-surgical study of lesions. 7) Correlate clinical and ultrasound findings, magnetic resonance imaging and 3D reconstruction.

#### TABLE OF CONTENTS/OUTLINE

1) Overview of hidradenitis suppurativa. 2) Hurley classification. 3) Criteria for diagnosing hidradenitis suppurativa by ultrasonography. 4) Hidradenitis suppurativa 3T MRI protocol. 5) Cases exemplifying the importance of imaging exams in the clinical and surgical management of the disease.

MSEE-43

### Beyond the Neonatal Intensive Care Unit: Imaging of Long-term Sequel of Prematurity

#### TEACHING POINTS

Radiologists should be aware of the potential for late imaging manifestations in patients with a remote history of prematurity, and carefully evaluate imaging studies to identify these complications. Late common CNS manifestations include white matter injury and post-hemorrhagic hydrocephalus. Both frequently co-exist and may have distinctive features on imaging. Advanced chest imaging techniques, including CT and MRI, can enhance the accurate diagnosis and monitoring of late lung complications of prematurity such as bronchopulmonary dysplasia. Late complications of necrotizing enterocolitis, such as strictures and short bowel syndrome, can be accurately identified and monitored using appropriate abdominal imaging techniques, which should be tailored specifically to the patient.

#### TABLE OF CONTENTS/OUTLINE

Outline I. Introduction Premature birth rates and associated health risks Role of imaging in the management of premature infants II. Late Imaging Features of Prematurity Brain abnormalities: periventricular leukomalacia, cerebral atrophy, post-hemorrhagic hydrocephalus, etc. Lung abnormalities: bronchopulmonary dysplasia. Gastrointestinal abnormalities: long term sequel of necrotizing enterocolitis Bone abnormalities: osteopenia, fractures, etc. Differentiating late imaging features from other conditions III. Clinical Case Studies and Outcomes VI. Conclusion Recap of key points Future directions for research and clinical practice.

### The Perirenal Space: Anatomy and Spectrum of Disease

#### Participants

Mikel Elgezabal, MD, Barrika, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Anatomy of the perirenal space with boundaries, key landmarks and pathways for the spread of disease. 2. Complete revision of pathology that can arise in the perirenal space. Radiologic clues to approach the final diagnosis.

#### TABLE OF CONTENTS/OUTLINE

1. Anatomy of the perirenal space: The Inverted Cone 1.1. Perirenal space anatomy with illustrations. 1.2. Key relations. 2. Pathology of the perirenal space 2.1. Masses/Pseudomasses: Pattern based diagnostic approach to perirenal masses and pseudomasses. Renal cell carcinoma. Lymphoma. Leukaemia. Sarcoma and liposarcoma. Myeloma. Lymphangioma. Angiomyolipoma. Extraadrenal myelolipoma. Pancreatic pseudocyst. GIST. 2.2. Collections/Fluid: Infectious: perirenal abscess, xantogranulomatous pyelonephritis, emphysematous pyelonephritis. Perirenal hematoma. Perirenal urinoma. 2.3. Inflammation/Systemic: Retroperitoneal fibrosis. IgG4-related-disease. Erdheim-Chester disease. Castleman disease. Rosai-Dorfman disease. 2.4. Others/Miscellaneous: Extramedullary hematopoiesis. Spilled lithiasis after nephrolithotripsy. Congested kidneys. 2.5. Summary. 3. Take home points

### No Worming Your Way Out of This One: Multimodality Imaging of Helminthic Infections

#### Participants

Nadia Solomon, MD, MSc, (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Familiarize the radiologist with the variety of helminths which infect humans. Discuss the epidemiology, clinical presentation, and medical complications/sequelae of helminthic infections in humans. Describe the imaging features associated with common and uncommon sequelae of helminthic infections across imaging modalities (ultrasound, CT, MRI). Provide an overview of management and treatment of helminthic infections.

#### TABLE OF CONTENTS/OUTLINE

Classification of helminths, helminth lifecycles, and epidemiology. Potential complications of helminthic infection. Role of imaging and imaging features associated with helminthic infections, including: Neurologic (e.g., neurocysticercosis, ocular cysticercosis, ocular toxocariasis); Pulmonary (e.g., paragonimiasis); Cardiac (e.g., filariasis-associated tropical hyper-eosinophilia with Loeffler endocarditis and restrictive cardiomyopathy); Gastrointestinal (e.g., ascariasis, fascioliasis, cystic/alveolar/polycystic echinococcosis); Urogenital (e.g., genital schistosomiasis); Musculoskeletal: (e.g., onchocercosmata, filarial elephantiasis, dirofilariasis). Management of helminthic infections and their sequelae.

### Getting Under Your Skin: Multimodality Imaging of Protozoan Infections

#### Participants

Jannatun Sikder, MD, New Haven, CT (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Familiarize the radiologist with the variety of protozoa which infect humans. Discuss the epidemiology, clinical presentation, and medical complications/sequelae of protozoan infections in humans. Describe the imaging features associated with common and uncommon sequelae of protozoan infections across imaging modalities (ultrasound, CT, MRI). Provide an overview of management and treatment of protozoan infections.

#### TABLE OF CONTENTS/OUTLINE

Classification of protozoa. Epidemiology of protozoan infections. Role of imaging in diagnosing protozoan infections, including imaging features associated with protozoan infections and their complications: Neurologic (e.g., cerebral malaria, toxoplasmosis); Chest/Cardiac (e.g., pleuropulmonary amoebiasis, acute myopericarditis and chronic fibrosing cardiomyopathy from Chagas disease); Gastrointestinal (e.g., Chagasic megaesophagus and achalasia, amoebic dysentery and hepatic abscess, giardiasis, visceral leishmaniasis); Urogenital (e.g., trichomoniasis resulting in Fitz-Hugh-Curtis syndrome, ureteric dilatation from Chagas disease); Musculoskeletal: (e.g., Giardia synovitis, sarcocystis myositis). Management of protozoan infections and their sequelae.

### **The Beauty And The Botched: A Pictorial of Usual, Unusual, and Botched Cosmetic Procedures for the Unsuspecting Radiologist**

#### **Participants**

Alexander Sasse, BA, New Haven, CT (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

- Familiarize the radiologist with the diversity of implant procedures performed, with particular focus on the sociocultural phenomenon that is cosmetic implant surgery (including historical context and evolution of the practice).
- Describe typical and atypical implant locations of implants, and their appearances on medical imaging studies.
- Describe potential complications of cosmetic implants and imaging findings associated with “botched” implant procedures.
- Discuss management of “botched” and otherwise complicated implants, where applicable.

#### **TABLE OF CONTENTS/OUTLINE**

Discuss history of cosmetic implant procedures and diversity of current practices/implant placements. Discuss complications and appearance of “botched” implants. Discuss the role of imaging and imaging features in visualizing both appropriately placed and “botched” or otherwise complicated implants: • Head and Neck (e.g., chin implant) • Breast (e.g., saline and silicone implants) • Urogenital (e.g., scrotal and penile implants) • Extremities (e.g., muscle-simulating implants) • Soft tissue: (e.g., buttock implants). Discuss the management of botched cosmetic implants and other associated complications.

### Extrapulmonary Tuberculosis: Imaging Findings Beyond the Chest

#### Participants

Irene Diaz, MD, Bilbao, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Extrapulmonary tuberculosis affects the lymph nodes most frequently, but it can affect any other organ of the body. The presence of necrotic lymph nodes and other organ-specific imaging features increases the diagnostic probability of extrapulmonary disease.

#### TABLE OF CONTENTS/OUTLINE

Objectives To identify imaging features that are suggestive of extrapulmonary tuberculosis and its differential diagnosis. Findings Extrapulmonary tuberculosis can be challenging to diagnose as it can mimic many other diseases, so a biopsy is often required. An image-based quiz will lead the review of: Cases of central nervous system, head and neck, lymphatic, abdominal, genitourinary, and musculoskeletal tuberculosis; describing some key imaging features and including its main differential diagnosis. Conclusion Extrapulmonary tuberculosis remains a challenge to diagnose. It is essential to know its key imaging features for an early and successful diagnosis.

### Demystifying Mucin in the Abdomen and Pelvis: Tissue Characterization and Spectrum of Disease

#### TEACHING POINTS

1. Mucinous neoplasms are a diverse group of benign and malignant tumors arising from mucin-producing epithelial cells. 2. Mucinous neoplasms arise from a wide range of organs including the appendix, ovary, pancreas, colon, and rectum. 3. Mucin has a characteristic imaging appearance at each modality and differs from other types of tumors that have higher cellular density. 4. Pseudomyxoma peritonei is characterized by the spread of mucinous material throughout the peritoneal cavity and has specific imaging findings. 5. Diagnosis and treatment of mucinous tumors requires a multidisciplinary approach that includes imaging, surgery, and systemic therapies, including hyperthermic intraperitoneal chemotherapy in the case of pseudomyxoma peritonei.

#### TABLE OF CONTENTS/OUTLINE

I. Introduction  
a. Overview of mucinous neoplasms  
II. Imaging features of mucinous neoplasms with case examples  
a. Mucinous cystic neoplasms of the pancreas  
b. Appendiceal mucinous neoplasms  
c. Colon and rectal mucinous adenocarcinoma  
d. Ovarian mucinous cystadenoma and cystadenocarcinoma  
e. Miscellaneous (seminal vesicle, primary peritoneal)  
III. Pseudomyxoma peritonei  
a. Imaging features  
b. Treatment, including hyperthermic intraperitoneal chemotherapy  
IV. Conclusion  
a. Summary of key teaching points

### **I CT Dead People: Exploring the Application of Postmortem Imaging to Cause of Death Investigation in a Hospital Setting**

#### **Participants**

Nadia Solomon, MD, MSc, (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

- Familiarize the radiologist with the growing field of forensic radiology, primarily as it pertains to postmortem imaging and cause-of-death investigation.
- Provide an introduction to postmortem computed tomography (CT), including its benefits and limitations.
- Describe the application of and experiences with postmortem CT at an academic teaching hospital.

#### **TABLE OF CONTENTS/OUTLINE**

- Introduction to forensic radiology with focus on role in cause-of-death investigation.
- Benefits of postmortem CT as a supplement to autopsy.
- Common postmortem changes on imaging and how to mitigate them, where applicable.
- Application of and experience with postmortem CT at an academic teaching hospital, including: integration with the Autopsy Service; types of cases performed; imaging methods utilized; and correlation with autopsy.
- Case image integration throughout, as illustrative examples.

### Microvascular Imaging Ultrasound (MVI) in Children: Current Use and Potential Applications

#### Participants

Santiago Martinez-Correa, MD, Philadelphia, PA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To overview the current knowledge of MVI in children. 2. To illustrate MVI benefits in specific pediatric conditions. 3. To describe possible clinical applications of MVI in the future.

#### TABLE OF CONTENTS/OUTLINE

- Disclosures. - Background Current use and advantages of advanced ultrasound techniques. - Microvascular Imaging Ultrasound 1. Technique description Advanced ultrasound technology that allows high-resolution visualization of slow-flow microvasculature by using clutter suppression algorithms. 2. Protocol Acoustic windows and settings adjustment. 3. Advantages and pitfalls: non-invasive tool, can be used at the bedside. Depends on the scan settings and operator. - Clinical use: 1. Brain Evaluation of vascularity in hypoxic-ischemic injury, hydrocephalus, and infections. 2. Thyroid Approach to vasculature architecture, and focal lesions. 3. Liver Characterization of focal lesions. 4. Spleen Use in assessing trauma, infarcts, focal lesions, and infections. 5. Kidney Evaluation of solid and cystic lesions. 6. Reproductive (Ovaries/Testes): Use in gonadal torsion, and infections. 7. Bowel Assessing small bowel infection and/or inflammation. 8. Lymph nodes Blood flow evaluation in benign and malignant nodes. 9. Skin Evaluation of infected subcutaneous nodules. - Potential future use: 1. MVI as an ancillary method in assessing pediatric brain death. 2. Liver and renal post-transplant perfusion follow-up. 3. Diagnostic and prognostic tool during ECMO therapy. - Take Home Points.

### Immunotherapy-Related Adverse Events - A Review of the Breadth of Toxicities and Imaging Findings

#### TEACHING POINTS

- Blocking of immune checkpoints by immune checkpoint inhibitors (ICIs) can cause novel autoimmune disease or uncover subclinical autoimmune disease.- These toxicities are termed immune-related adverse events (irAEs) and can involve any organ.- IrAEs can be mistaken for disease progression or non-autoimmune processes.- Incidence of irAEs is 25% with anti-CTLA-4 inhibitors, 10% with anti-PD(L)-1 inhibitors, and 50% for combination therapy.- The lungs and colon are the most common organs affected radiologically, although cutaneous manifestations are the most common overall.- IrAEs are graded from 1 (asymptomatic) to 5 (death) and management options include continuing immunotherapy, holding immunotherapy and initiating corticosteroids, and discontinuing immunotherapy permanently.

#### TABLE OF CONTENTS/OUTLINE

- Pneumonitis: o Organizing pneumonia o Nonspecific interstitial pneumonia o Hypersensitivity pneumonitis o Bronchiolitis o Acute interstitial pneumonitis/ARDS o Radiation-recall pneumonitis- Sarcoid-like reaction- Enterocolitis- Pancreatitis- Hepatitis- Nephritis- Hypophysitis- Adrenalitis- Thyroiditis- Aortitis- Pericarditis- Serositis: o Pericardial effusion o Pleural effusion o Peritoneal effusion- Sinusoidal obstruction syndrome- Arthritis- Myositis- Polymyalgia rheumatica-like syndrome

### Phenotypic Diversity of Germinal Center-Derived Malignancies: Implications on Diagnosis and Management

#### Participants

Steven Chua, MD, PhD, Houston, TX (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The germinal center (GC) is a unique and dynamic microenvironment within lymphoid follicles where selection, maturation and antibody production by activated B lymphocytes occur in response to infections. A multitude of unique malignancies arise within the GC that display characteristic histogenesis, genetic abnormalities, tumor pathways, molecular biology and varied clinical behavior. PET/CT is the mainstay for the diagnosis and staging of these tumors and is critical for the assessment of treatment response. Neoplastic B cells within different GC compartments and maturation stages give rise to follicular lymphoma, Burkitt's lymphoma and diffuse large B cell lymphoma that harbor distinctive genetic mutations. While the follicular T cell lymphoma and angioimmunoblastic T cell lymphoma originate from helper T cells, the follicular dendritic cell sarcomas evolve from the follicular dendritic cells of mesenchymal origin. We present salient imaging features of GC-derived malignancies and correlate with histopathology and tumor genetics. We discuss the implications of the diagnosis on tailored therapeutics and prognosis.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction, epidemiology, clinical features this group of germinal center-derived tumors. 2. Histopathology, clinical features, molecular biology of these tumors. 3. Multimodality cross-section delineation of imaging features with CT, MR and PET/CT. 4. Prognosis and management. \* Follicular lymphoma.\* Burkitt's lymphoma.\* Diffuse large B cell lymphoma.\* Angioimmunoblastic T-cell lymphoma.\* Follicular T cell lymphoma.\* Peripheral T cell lymphoma with Tfh phenotype.\* Follicular dendritic cell sarcomas.

MSEE-55

### Diversity of Epstein-Barr Virus-associated Diseases

#### Participants

Moto Nakaya, MD, Tokyo, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Summarize the clinical and radiological findings of Epstein-Barr virus (EBV)-associated diseases caused by various etiologies.
- Describe radiological findings in EBV-associated neoplasms in contrast to those observed in uninfected conventional tumors.
- Recognize important imaging points that lead to a definitive diagnosis in patients with suspected EBV-associated diseases.

#### TABLE OF CONTENTS/OUTLINE

I. What are EBV-associated diseases? • Pathomechanisms • The role of EBV in tumorigenesis and progression • Recommended workups

II. Content

Infection: infectious mononucleosis, human immunodeficiency virus co-infection

Autoimmune: multiple sclerosis, systemic lupus erythematosus, rheumatoid arthritis, inflammatory bowel disease, type 1 diabetes mellitus, juvenile idiopathic arthritis, celiac disease

Neoplasm: lymphomas (primary central nervous system lymphoma, natural killer/T-cell lymphoma, diffuse large B-cell lymphoma, lymphomatoid granulomatosis, and post-transplantation lymphoproliferative disorder), solid tumor (gastric cancer, squamous cell carcinoma, EBV-associated smooth muscle tumor, leiomyosarcoma, breast cancer, hepatocellular carcinoma, and follicular dendritic cell sarcoma), others (EBV-associated inflammatory pseudotumor - like follicular/fibroblastic dendritic cell sarcoma)

Medication-related EBV infection: methotrexate-related malignant lymphoma

Miscellaneous: EBV-positive mucocutaneous ulcer

III. Summary

1. The entities associated with EBV are diverse.
2. Clinical and radiological findings can be the diagnostic indicators of the etiology.
3. Appropriate workup is necessary for timely diagnosis and management.

### Beyond the Skeletal Survey: Multimodality Imaging Manifestations of Plasma Cell Dyscrasias

#### Participants

Kenneth Huynh, DO, Orange, CA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To review the wide spectrum of plasma cell dyscrasias, including common and rare subtypes, and their pathophysiology. 2. To present the multimodality imaging features seen in the spectrum of plasma cell dyscrasias to aid in accurate diagnosis and staging, as well as subsequent evaluation of post-therapeutic response.

#### TABLE OF CONTENTS/OUTLINE

Plasma cell dyscrasias are a group of hematological disorders that arise from the abnormal proliferation of plasma cells, which are responsible for producing antibodies. These disorders include monoclonal gammopathy of undetermined significance (MGUS), Waldenström macroglobulinemia, multiple myeloma (MM) and its variants, including smoldering myeloma (SMM), plasma cell leukemia (PCL), solitary and extramedullary plasmacytoma, and amyloidosis. Recent advances in treatment with chemotherapy and immunotherapies have led to improved outcomes, with some patients achieving long-term remission. Early detection and diagnosis allow for appropriate initiation of surveillance and treatment, which will improve outcomes as well as preserve organ function. The imaging manifestations of plasma cell dyscrasias can provide crucial information for diagnosis, prognosis, and management of these diseases. This educational exhibit will (1) review the pathophysiology of plasma cell dyscrasias and the wide spectrum of subtypes, and (2) present the multimodality imaging features of the common and rare subtypes of plasma cell dyscrasias.

MSEE-57

### Practical Imaging Approach to Unraveling the Causes of Non-neoplastic Lymphadenopathy

#### Participants

Sota Masuoka, MD, kashiwa, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Non-neoplastic lymphadenopathy may not have specific histopathologic features within the lymph node itself, but determining its underlying cause is still important. Radiologists play a critical role in identifying the cause of lymphadenopathy in three scenarios: (1) when infection or inflammation is clinically suspected, (2) during initial or follow-up imaging for malignancy, and (3) when abnormal lymph nodes are detected incidentally on imaging. Careful observation of the imaging characteristics and anatomical distribution of the abnormal lymph nodes, along with other ancillary imaging findings and clinical information, can help establish an accurate diagnosis of the etiology of the lymphadenopathy, leading to appropriate treatment and avoiding unnecessary further testing for the patient. This exhibit aims to: 1. Review the diverse underlying conditions that cause non-neoplastic lymphadenopathy and their characteristic imaging findings. 2. Discuss an imaging-based approach for diagnosing the underlying causes of non-neoplastic lymphadenopathy.

#### TABLE OF CONTENTS/OUTLINE

1. Overview of non-neoplastic lymphadenopathy  
2. Imaging approach for non-neoplastic lymphadenopathy: Focus on inferring the underlying cause- Based on the distribution of abnormal lymph nodes- Based on the imaging characteristics of abnormal lymph nodes  
3. Case illustrations- (1) Clinically suspected inflammation or infection- (2) Initial/follow-up imaging for malignancies- (3) Incidental detection of abnormal lymph nodes on imaging  
4. Summary

Printed on: 04/12/24

### Stroma-Derived Neoplasms and Tumor-Like Lesions of the Lymphoid Tissues: 2022 WHO Classification System Updates

#### Participants

Steven Chua, MD, PhD, Houston, TX (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

A new category of mesenchymal neoplasms and tumor-like lesions that involve the lymphatic and reticuloendothelial system has been introduced in the 2022 WHO classification of hematolymphoid tumors. This diverse group of tumors include mesenchymal dendritic cell tumors like follicular dendritic cell sarcoma (FDCS) and its inflammatory pseudotumor-like variant (EBV positive inflammatory FDCS), Epstein-Barr virus associated smooth muscle tumor, vascular/vascular-stromal tumors and tumor-like lesions including littoral cell angioma (LCA), hemangioma, bacillary angiomatosis, hemangioendothelioma, angiosarcoma and sclerosing angiomatoid nodular transformation (SANT). These tumors vary in biological potential and prognosis from the indolent littoral cell angioma to the aggressive angiosarcoma. Correlating the salient imaging and histopathological features can facilitate proper identification and optimize treatment to improve morbidity and mortality of patients.

#### TABLE OF CONTENTS/OUTLINE

1. To review the diverse histopathological spectrum of stroma-derived tumors of the lymphoid tissues. 2. To describe epidemiology, tumor genetics, molecular biology and cross-sectional imaging findings of diverse tumors and to correlate them to histopathological features. 3. To discuss the implications of the diagnosis on management and prognostication of these tumors. \* Follicular dendritic cell sarcoma. \* EBV positive inflammatory follicular dendritic cell sarcoma. \* Inflammatory pseudotumor. \* Epstein-Barr associated smooth muscle tumor. \* Littoral Cell Angioma. \* Bacillary angiomatosis. \* Hemangioendothelioma. \* Angiosarcoma. \* Sclerosing angiomatoid nodular transformation.

### Imaging Diagnostic Odyssey of Germ Cell Tumors: Illuminating the Path with Insights into Epigenetic Pathogenesis

#### Participants

Toshitaka Ishiguro, MD, Tsukuba, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Germ cell tumors (GCTs) are neoplasms derived from cells committed to the germ cell lineage, but exhibit diverse histologies, including embryonic and extraembryonic components. GCTs also arise at various sites throughout the body, from neonates to adults, making their imaging diagnosis challenging. However, recent progress in understanding the biology of GCTs has allowed them to be categorized into several types based on the latent developmental potential of their cells of origin with different epigenomic features, facilitating our understanding of their anatomical distribution, age of onset, male-to-female ratio, and possible histologies. This exhibit aims to explain this recent classification of GCT types and apply insights into epigenetic pathogenesis to the imaging diagnosis of GCTs, which will contribute to accurate diagnosis leading to better patient outcomes. The purposes of this exhibit are: 1. To explain the recent classification of GCT types based on epigenetic pathogenesis. 2. To review the imaging findings of each histology of GCTs. 3. To discuss the imaging diagnostic approach for GCTs combined with the knowledge of epigenetic pathogenesis.

#### TABLE OF CONTENTS/OUTLINE

1. Minimal essentials of epigenetics for radiologists  
2. Classification of GCT types based on epigenetic pathogenesis  
3. Imaging findings of each histology of GCTs  
4. Imaging diagnostic approach for each type of GCTs combined with the knowledge of epigenetic pathogenesis  
5. Summary

MSEE-60

### Multimodality Imaging Features of Hepatoid Adenocarcinoma and its Mimics

#### Participants

Kenneth Huynh, DO, Orange, CA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To review the pathophysiology of hepatoid adenocarcinoma and the common sites involved, including the liver, stomach, pancreas, lung, and ovary. 2. To present, through case-based review, the multimodality imaging features of hepatoid adenocarcinoma, with differential clues to aid in diagnosis.

#### TABLE OF CONTENTS/OUTLINE

Hepatoid adenocarcinoma (HAC) is a rare and aggressive type of cancer that has a histologic appearance similar to hepatocellular carcinoma (HCC) through metaplastic transformation to hepatocyte-like cells. HAC can involve various organs, including the liver, stomach, pancreas, lung, and ovary. Imaging features of HAC may overlap with other extrahepatic tumors, including gastric adenocarcinoma, pancreatic adenocarcinoma, primary lung adenocarcinoma, ovarian adenocarcinoma, or lymphoma, making accurate diagnosis challenging. HAC can produce alpha-fetoprotein (AFP) like HCC, which may be useful in differentiating HAC from tumors in extrahepatic organs. However, given its rarity, unfamiliarity, non-specific clinical presentation, and overlapping imaging features, differentiation of HAC remains difficult and is often diagnosed at an advanced stage or with metastases. At this stage, prognosis of HAC is poor with a median survival of less than one year. Early detection and aggressive treatment, including surgical resection and systemic chemotherapy, are crucial for improving the prognosis of patients with HAC. This educational exhibit will (1) review the pathophysiology of HAC and the common sites of involvement, and (2) present the multimodality imaging features of HAC and differentiation from its imaging mimics.

### Multi-system Imaging Manifestations of Large Vessel Vasculitis

#### Participants

Anne Sailer, MD, New Haven, CT (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Large-vessel vasculitis (LVV) results in inflammation of the aorta and its major branches and is the most common primary vasculitis in adults. LVV comprises two distinct conditions, giant cell arteritis (GCA), and Takayasu arteritis. LVV can have substantial complications including luminal stenosis, arterial thrombosis and infarction of the corresponding organs and structures. Development of pseudoaneurysms and dissections, and rarely arterial ruptures are potentially serious complications in this patient population. 2. Doppler US is a first-line imaging modality utilized for the assessment of the peripheral arterial system, abdominal aorta, and its branches. Review of normal arterial wall anatomy and pathophysiology of waveforms on Doppler ultrasound, with multi-imaging correlation with particular focus on CTA and MRA.

#### TABLE OF CONTENTS/OUTLINE

1. Review pathophysiology of Takayasu and giant cell arteritis and their multi-system potential complications. 2. Discuss general concepts of the assessment of the peripheral arterial system and aorta using Doppler US, CTA, and MRA with emphasis on technique, protocol, image optimization. 3. Demonstrate key multi-modality imaging features LVV. Review role of various imaging applications in diagnosis and surveillance of complications in this group of patients. 4. Discuss management options with interventional radiology procedures.

### Spectrum of Imaging Appearances of Perivascular Epithelioid Cell Tumors (PEComas)

#### Participants

Lam Tu, DO, Newark, NJ (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. PEComas are very rare mesenchymal tumors of variable malignant potential characterized by smooth muscle and melanocytic differentiation, perivascular distribution and frequent infiltration of small to medium sized vessels. 2. Up to 60% of PEComas are associated with Tuberous Sclerosis Complex (TSC) and TSC and TFE3 gene mutations. Angiomyolipomas and lymphangioleiomyomatosis are the most common PEComa subtypes seen with TSC. 3. PEComa - NOS most commonly arise in the retroperitoneum, uterus and kidneys. 4. Hypervascularity and vessel encasement are common imaging features of PEComas. Vascular invasion, size greater than 5 cm, necrosis and tumor thrombus suggest malignant subtypes. 5. Definitive treatment is surgical resection; massive blood loss may result if extent of vascular invasion is not recognized. TSC-related PEComas may be treated with mTOR inhibitors. The only FDA approved treatment for advanced/metastatic/inoperable PEComa is FYARRO™ (Sirolimus protein-bound particles for injectable suspension).

#### TABLE OF CONTENTS/OUTLINE

Introduction - PEComa definition and etiology  
Background: epidemiology, genetics and classification  
Spectrum of Imaging Features of:  
- Various PEComa subtypes;  
- PEComas in most common locations - Common PEComa mimickers: leiomyosarcoma, GIST, RCC -  
Invasive/malignant PEComas (size, necrosis, tumor thrombus)- Common metastatic sites: lung, liver and peritoneum  
Treatment options

### The 'New' 2022 World Health Organization (WHO) Classification of Lymphoid Neoplasms: A Primer for Radiologists

#### Participants

Diego Cebrian Chaustre, MD, San Antonio, TX (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Familiarize radiologists with new 2022 WHO classification of lymphoid neoplasms review major changes
- Discuss pathology, genetics, and imaging findings of tumor-like lesions select updated lymphomas pertinent to radiologists
- Familiarize the audience with clinically significant, and most important aspects of lymphoma imaging, including the role of CT PET-CT for staging response assessment.
- Review potential therapeutic management implications of the new classification system with special emphasis on novel therapies.

#### TABLE OF CONTENTS/OUTLINE

Introduction 2022 WHO Classification Tumor-like lesions, new tumors changes in existing tumors B-cell lymphoid proliferations lymphomas IgG4-related disease, Castleman's disease, small lymphocytic, splenic B-cell, marginal zone, follicular, mantle cell, diffuse large B-cell, Burkitt, Immunosuppressed-associated lymphomas Hodgkin lymphoma. T-cell lymphoid proliferations lymphomas Kikuchi disease, primary cutaneous T-cell, intestinal T-cell, anaplastic large cell EBV-positive lymphomas Stromal-derived dendritic cell sarcoma, littoral cell angioma, splenic hamartoma SANT Imaging findings Role of Imaging in Staging Response Assessment-CT PET-CT: Lugano classification Deauville scoring system Management Novel therapies ConclusionThe current WHO classification of lymphoid neoplasms added new tumors reorganized previous categories based on updated molecular/genetic findings that change management decisions. Select lymphomas demonstrate characteristic genetic/pathology imaging findings. Imaging with CT PET/CT plays a pivotal role in staging, response assessment testing the efficacy of novel drugs.

### A Pictorial Review of Extrapulmonary Tuberculosis: From Head to Toe

#### Participants

Masatoshi Hotta, MD, PhD, Los Angeles, CA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Extrapulmonary tuberculosis (EPTB) is a form of tuberculosis that affects parts of the body other than the lungs and accounts for 10-20% of all TB infections. A diagnosis of EPTB is challenging and can mimic malignancy, often requiring a biopsy. Therefore, radiologists should be familiar with the imaging features of EPTB, even when there is no active pulmonary involvement. This exhibit aims to: 1) review the pathophysiology of EPTB, 2) present characteristic EPTB images of various organ systems, and 3) identify the key imaging findings of EPTB.

#### TABLE OF CONTENTS/OUTLINE

1) Introduction; 2) Central Nervous System (tuberculous leptomeningitis, brain TB, spinal TB); 3) Head and Neck (tuberculous uveitis, pharyngeal TB, tuberculous otitis media); 4) Chest (esophageal TB, endobronchial TB, pericostal TB); 5) Abdomen (hepatic TB, splenic TB, adrenal TB, intestinal TB, peritoneal TB); 6) Genitourinary (renal TB, seminal vesicle TB, epididymis/testicular TB); 7) Musculoskeletal (tuberculous spondylitis, tuberculous arthritis, tuberculous osteomyelitis)

### Multisystem Imaging Manifestations of Fibromuscular Dysplasia

#### Participants

Anne Sailer, MD, New Haven, CT (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Fibromuscular dysplasia (FMD) is an idiopathic segmentary, non-inflammatory, non-atherosclerotic disease that can affect all layers of both small and medium-caliber arteries. Clinical manifestations are primarily dependent on the vessels affected by FMD, most frequently affecting the renal, carotid, and vertebral arteries. 2. Complications of FMD can include severe stenosis, hypoperfusion, aneurysm, dissection, arterial occlusion, and subarachnoid hemorrhage in the brain.

#### TABLE OF CONTENTS/OUTLINE

1. Review pathophysiology of FMD and its multi-system potential complications, and associated disorders. 2. Discuss general concepts of the assessment of the peripheral arterial system and aorta using Doppler US, CTA, and with MRA, with emphasis on technique, protocol, and image optimization. 3. Demonstrate key multi-modality imaging features FMD. Review role of various imaging applications in diagnosis and surveillance of FMD and its potential complications. 4. Discuss management options with review of available interventional radiology procedures. 5. Discuss the shared features and difference between FMD and polyarteritis nodosa, Takayasu, and other mimics.

### Imaging Manifestations and Treatment of Renovascular Hypertension

#### Participants

Anne Sailer, MD, New Haven, CT (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Renovascular hypertension is a type of secondary hypertension where high blood pressure develops secondary to renal artery disease. 2. Doppler US is a first line imaging modality utilized for the assessment of the renal arterial system. CTA and MRA are useful confirmatory tests in equivocal or nondiagnostic ultrasonographic exams and can be preferred in specific clinical situations.

#### TABLE OF CONTENTS/OUTLINE

1. Review pathophysiology of renovascular hypertension and its multisystem complications. Causes include atherosclerotic renal artery stenosis, fibromuscular dysplasia, renal artery dissection, renal infarction, Page kidney, polyarteritis nodosa, post EVAR RAS, etc. 2. Discuss general concepts of the assessment of the renal arterial system and abdominal aorta using Doppler US: technique protocol, image optimization, and common pitfalls in diagnosis. 3. Demonstrate key multimodality imaging features of renovascular hypertension. Review role of various imaging modalities in diagnosis and surveillance of complications in this group of patients. 4. Discuss management options with emphasis on interventional radiology procedures.

### US of the Neck Beyond the Thyroid: Parathyroids

#### Participants

Irene Dixe de Oliveira Santo, MD, New Haven, CT (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Discuss the role of ultrasound in the evaluation of parathyroid gland pathologies; 2. Discuss the advantages of ultrasound including the possibility of evaluation for concurrent nodular thyroid disease which may alter the surgical approach and treatment planning; 3. Review the role and advantages of complementary imaging modalities in the diagnosis and management of parathyroid gland pathologies including SPECT with technetium-99m sestamibi, 4D computed tomography, and venous sampling

#### TABLE OF CONTENTS/OUTLINE

1. Embryology, anatomy, and function of the parathyroid glands; 2. Clinical manifestations of hyper- and hypoparathyroidism; 3. Role of ultrasound in the assessment of the parathyroid glands: advantages, limitations, technical considerations; 4. Ultrasound imaging of parathyroid pathologies: parathyroid adenoma(s) involving one or multiple parathyroid glands, parathyroid carcinoma, multiple endocrine neoplasia, Cowden's disease, parathyromatosis, ectopic or intrathyroidal parathyroid glands; 5. Distinguish parathyroid gland pathologies from its mimics such as exophytic thyroid nodules, normal and abnormal lymph nodes, the esophagus, and the longus colli muscle; 6. Role of additional imaging modalities: SPECT with Tc-99m sestamibi, 4D computed tomography, and venous sampling; 7. Treatment options and clinical challenges

### Review of MRI Defecography: Technique, Indication, Diagnosis and Limitations

#### Participants

Alice Schuch, MD, Porto Alegre, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Pelvic floor disorders are commonly encountered in clinical practice and can significantly affect patient quality of life. MR defecography is a non-invasive exam that provides high spatial resolution, multiplanar capability, and superior soft tissue differentiation for assessing the pelvic floor compartments at rest and during defecation maneuvers. Abdominal radiologists should be able to recognize normal and abnormal anatomy, as well as the most common pelvic floor pathologies.

#### TABLE OF CONTENTS/OUTLINE

MRI defecography is a non-invasive diagnostic technique used to evaluate the function of the pelvic floor compartments during rest, squeezing, valsalva and defecation, in patients with obstructed defecation, constipation, pelvic pain, incontinence and pelvic organ prolapse and others, providing a more accurate diagnosis of pelvic floor disorders that can guide treatment and surgical planning. Usual findings include cystocele, uterine prolapse, enteroceles, perineal descent, and rectal intussusception, and the association between these alterations. While MRI defecography is a valuable diagnostic tool for assessing pelvic floor disorders, it does have some limitations, such as cost, availability, interpretation variability, and patient discomfort. Abdominal radiologists should be able to recognize normal and abnormal anatomy, and evaluate the common pathologies that can affect the three pelvic floor compartments, especially those that may appear only through dynamic images of the pelvis.

### Bigger Butt Not Better: A Radiologist's Guide to the Lifecycle of Cosmetic Injectables

#### Participants

Nadia Solomon, MD, MSc, (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Familiarize the radiologist with the composition and use of cosmetic injectables, with a focus on illegal and unregulated substances and practices.
- Describe the appearances of injectables on imaging throughout the body, as well as potential complications and their associated imaging findings.
- Provide guidance to radiologists for how to report findings related to injectables and their complications to best guide surgical management.
- Describe how patients with injectables are surgically managed, including post-operative imaging findings and imaging of post-operative complications.

#### TABLE OF CONTENTS/OUTLINE

- Introduction to cosmetic injectables, their composition (legal and illegal substances), and common and uncommon injection locations.
- Imaging appearance of injectables throughout the body and associated complications.
- Important features to report on (i.e., foreign material migration, intramuscular location).
- Approach to surgical management.
- Imaging of post-operative findings and common post-operative complications.

### Opportunistic Imaging in Musculoskeletal Radiology: The Data Scavengers

#### Participants

Seyedarash Mahdavi Anari, MD, Seattle, WA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Each radiologic examination contains robust additional data that can be leveraged for opportunistic screening of disease and risk assessment of future adverse clinical events. 2. With the radiology transition from volume-based to value-based practice the interest in opportunistic imaging is growing. 3. AI models enabling fully automated evaluation of biometric measures provide the opportunity of individualized patient risk assessment and pre-symptomatic diseases detection. 4. Opportunistic imaging in musculoskeletal radiology can be used in: ü Detecting clinically important musculoskeletal findings (e.g., screening for osteoporosis). ü Systematically discovering non-musculoskeletal findings in musculoskeletal studies (e.g., screening for abdominal aorta aneurysm in lumbosacral MRI).

#### TABLE OF CONTENTS/OUTLINE

- Assess opportunistic imaging for detection of sarcopenia in cancer patients and its clinical relevance
- Review opportunistic screening for osteoporosis in abdominopelvic or thoracic CT examinations
- Review opportunistic screening for abdominal aorta aneurysm in lumbosacral MRI examinations
- Discuss the role of radiomic features extracted from imaging specially in oncology imaging as an opportunity to improve diagnosis and prognostication
- Explain the capacity of AI models to fully automate assessment of biometric measures for the use in musculoskeletal imaging

### Dual-Energy CT: Still Haven't Found What You Are Looking For

#### Participants

Roberto Garcia Figueiras, PhD, Santiago De Compostela, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Dual-energy CT (DECT) imaging has broadened the potential of CT imaging by offering multiple postprocessing datasets which are achieved using discrete acquisitions at more than one energy level. DECT shows profound capabilities to improve diagnosis based on its superior material differentiation, but alsoThe aim of this exhibit is:-To review physical concepts of DECT, parameters influencing image quality, postprocessing methods, and daily routine workflow.-To describe the strengths and weaknesses of different DECT platforms.-To discuss advantages and limitations of DECT in different clinical scenarios.-To provide a comprehensive and practical overview of diagnostic pitfalls and possible artifacts that may be encountered at DECT.-To evaluate future perspectives for DECT imaging and photon-counting technology.

#### TABLE OF CONTENTS/OUTLINE

-Basic concepts of DECT: atomic numbers, energy levels, and other physics concepts.-Strengths and weaknesses of different DECT platforms: "one does not fit all".-Understanding the puzzle of the different types of DECT images.-What you can and cannot expect from a DECT scan: opportunities and limitations (that you need to know) of DECT in daily practice.-Pitfalls and artifacts: how to avoid them?-Cutting-edge applications of DECT: iodine concentration and tumor response, advanced material characterization, electron-density maps in radiotherapy, etc.-Future directions: from dual-energy to photon-counting CT.-Conclusions

MSEE-73

### Multimodality Imaging of Sarcoidosis and Sarcoid-like Reaction

#### Participants

Nitin Venugopal, MD, Seattle, WA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Review the clinical findings, prognosis, management and imaging guidelines for sarcoidosis and associated complications.
- Describe the imaging appearance of sarcoidosis across multiple organ systems and modalities.
- Discuss the differential diagnoses for imaging findings of for sarcoidosis.
- Discuss radiology-pathology correlation as it applies to sarcoidosis.

#### TABLE OF CONTENTS/OUTLINE

Sarcoidosis is a systemic disease but presents most commonly in the lungs. While up to 90% of patients will have an abnormal chest radiograph, less than 20% of patients will exhibit respiratory symptoms. Extrapulmonary manifestations are seen in up to 40% of patients with involvement of central nervous system, circulatory system, abdomen, musculoskeletal system, or skin. In this educational exhibit we describe the imaging appearance and differential diagnosis of the following pulmonary and extrapulmonary manifestations of sarcoidosis:

- Pulmonary
  - o Natural history stages of pulmonary sarcoidosis, imaging timeline
  - o Chest radiograph findings and signs
  - o Chest CT findings and signs
  - o FDG and Gallium PET
- Cardiac
- Intra-abdominal
  - o Hepatic
  - o Splenic
  - o Renal
  - o Peritoneal
- Neurosarcoidosis
  - o Leptomeningeal
  - o Dural
  - o Pituitary
  - o Endocrine
  - o Cranial nerves
  - o Spine: leptomeningeal, myelopathy
- Musculoskeletal
  - o Cutaneous Sarcoidosis
  - o Bone lesions
  - o Arthropathy
  - o Myopathy
  - o Lofgren syndrome
- Pitfalls
- o Immunotherapy-induced sarcoid-like reaction

Finally, we discuss the relevant radiology-pathology relationships in the systemic manifestations of sarcoidosis with a rich complement of histologic images.

MSEE-74

### Nontraditional Uses of CT Contrast Agents

#### TEACHING POINTS

- This abstract discusses the basics of tomographic technique and anatomy, with a focus on the appropriate choice of imaging modality for the evaluation of the specific alterations- Assurance of a valid clinical indication for each contrast medium administration. - To compare positive versus neutral oral contrast material for detecting pathological thoracoabdominal conditions. - Recognize appropriate uses of CT in clinical practice.

#### TABLE OF CONTENTS/OUTLINE

CT scanning is fast, painless, noninvasive, and accurate. The CT exam can now be more effectively tailored to the presumed diagnosis. Specifics related to oral and IV contrast protocols in terms of timing and volume regimens will be covered in detail in this presentation. Table of contents: 1- CT pharyngography 2- CT esophagography 3- CT gastrography 4- CT enterography 5- CT fistulography 6- CT urography 7- CT cystography 8- CT angiography. To illustrate the spectrum of MDCT findings based on our series of CT studies performed between 2015 and 2022. Conclusions: - On-site radiologist supervision is essential? These exams are always radiologist-guided. - Optimal performance of CT requires knowledge of anatomy and pathophysiology, familiarity with the basic physics and techniques of CT, and knowledge of radiation safety. - Specifics related to oral and IV contrast protocols in terms of timing and volume regimens will be covered in detail in this presentation. - Radiologists must be familiar with the radiologic findings for both accurate diagnosis and, in many cases, guidance of management planning. - A practical case-based review.

MSEE-75

### Multimodality Imaging of Systemic and Localized Amyloidosis

#### Participants

Nitin Venugopal, MD, Seattle, WA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Review the etiologies, pathophysiology and clinical findings of systemic and localized amyloidosis
- Describe the imaging appearance of amyloidosis across multiple organ systems and imaging modalities
- Discuss the differential diagnoses for imaging findings of amyloidosis
- Discuss radiology-pathology correlation as it applies to amyloidosis

#### TABLE OF CONTENTS/OUTLINE

Amyloidosis is a condition secondary to a range of pathologic processes resulting in deposition of abnormal protein in tissues (amyloid). Amyloid deposition may be due to neoplastic, infectious, inflammatory, and even congenital processes, leading to marked heterogeneity in clinical and imaging manifestations. In this exhibit, we will discuss the varying etiologies of systemic amyloidosis including AL, AA,  $\beta$ 2- microglobulin, ATTR (transthyretin), and hereditary forms. We will also discuss the etiologies of localized amyloidosis including:  $\beta$ -amyloid (Alzheimer's), AANF (isolated atrial amyloid), and AIAPP (DM2). The focus of our work is the imaging appearance and differential diagnosis for the following organ-specific manifestations of amyloidosis with accompanying clinical images: 1. Pulmonary Amyloidosis o Nodular parenchymal o Diffuse parenchymal o Tracheobronchial laryngeal 2. Cardiac with specific MR and NM findings 3. Intra-abdominal o Hepatosplenic o Renal o Bowel o Bladder 4. Cerebral o Angiopathy o Alzheimer's disease 5. Musculoskeletal o Arthropathy o Myopathy o Carpal tunnel syndrome 6. Amyloidomas Soft Tissue Amyloid Finally, we will describe radiology-pathology relationships that influence imaging findings of amyloidosis.

MSEE-76

### Characteristic Imaging Features and Screening/Surveillance Recommendations for Hereditary Syndromes

#### TEACHING POINTS

I. Many heritable syndromes have characteristic imaging features. Recognizing common multi-system findings in heritable syndromes allows radiologists to make a unifying diagnosis and guide surveillance strategies. II. Heritable syndromes can have overlapping imaging features. a. Multiple endocrine neoplasia (MEN) type 1, tuberous sclerosis complex (TSC), neurofibromatosis (NF), and von Hippel Lindau (VHL) have characteristic findings in the central nervous system (CNS). b. Lynch, Gardner, and Peutz-Jegher (PJS) syndromes are characterized by gastrointestinal tract malignancies. c. Renal tumors can be seen in Birt-Hogg-Dubé (BHD), TSC, and VHL. d. Pheochromocytomas can be seen in NF type 1, VHL, and MEN type 2. III. While oncologic screening is a critical part of heritable syndrome monitoring, it is equally important to recognize acute pathologies that can result from heritable syndromes. a. CNS tumors can cause acute neurologic problems such as mass effect and obstructive hydrocephalus. b. Small bowel polyps in PJS can lead to intussusceptions and small bowel obstructions. c. Angiomyolipomas, seen in BHD and TSC, can bleed or rupture if large or rapidly growing. This is the second most common cause of morbidity in these patients.

#### TABLE OF CONTENTS/OUTLINE

I. General concepts about hereditary syndromes II. Review of key imaging findings and screening recommendations for the following diagnoses: Lynch syndrome, Gardner syndrome, PJS, MEN, NF, TSC, BHD, VHL, hereditary breast and ovarian cancer syndrome III. Summary of key concepts

Printed on: 04/12/24

### Paraganglioma Imaging: Radiology and Nuclear Medicine

#### Participants

Aurelie Choucair, MD, Villejuif, France (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Describe the different hereditary forms of paragangliomas insisting on Succinate Dehydrogenase Mutations. Review the genetic associations predisposing to paragangliomas including Von Hippel- Lindau, Multiple Endocrine Neoplasia Type 2 NEM2, Neurofibromatosis Type 1 NF1 and Carney Triad. Define the secreting or non-secreting character. Provide a detailed overview of anatomical imaging (CT and MRI) features. Improve knowledge about the different Nuclear Medicine and functional imaging techniques, and the multiple radiopharmaceuticals available for Scintigraphy and PET/CT, according to paraganglioma site and mutational pattern. Analyse the different functional imaging modalities and review the strengths and weaknesses of each modality in detecting lesions depending on their location, secretory function and underlying genetic mutation. Prognosis of paragangliomas, frequent sites of metastasis and therapeutic options.

#### TABLE OF CONTENTS/OUTLINE

Definition of Paraganglioma  
Epidemiology  
Succinate Dehydrogenase Mutations  
Genetic Association: - Von Hippel-Lindau- NEM2- NF1- Carney Triad  
Characteristics (secreting / non secreting), and clinical presentation  
Location:- Parasympathetic Paraganglioma: Carotid Body Tumor, Glomus Tympanicum, Jugulotympanicum, Jugulare, and Vagale- Sympathetic Paraganglioma: Adrenal: Pheochromocytoma Extra-adrenal  
Imaging of Paraganglioma  
Radiology CT Scan MRI Nuclear Medicine Scintigraphy PET  
Differential diagnosis  
Complications  
Prognosis and Treatment

### Eponyms in Radiology: The Controversies Worth Re-examining

#### Participants

Madeleine Sertic, MBBCh, Boston, MA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Eponymous diseases are a long-standing tradition in Western medicine, however, there are numerous arguments against the practice.
  - o Plain-language descriptive names are easier to understand for both patients and health care providers
  - o Eponyms often only recognize individuals, when in reality discoveries are often collaborative
  - o Bias toward recognizing Western, male and non-minority figures
- Eponyms may serve to honor figures that are controversial.
  - o Affiliations with totalitarian regimes
  - o Documented views of intolerance based on race, disability, age, etc.
  - o Professional scandals involving venality, fraud, etc.
- Stigler's Law of Eponymy states that no scientific eponym is named for its original discoverer.

#### TABLE OF CONTENTS/OUTLINE

- Introduction
  - o The concept of "controversy"
  - o Holding historical figures to modern standards
- Multi-system overview of controversial eponymous figures
  - o Breast
  - o Cardiothoracic
  - o Emergency
  - o Gastrointestinal and Genitourinary
  - o Musculoskeletal
  - o Neuroradiology
  - o Nuclear Medicine
  - o Pediatrics
  - o Vascular/Interventional
- Stigler's Law of Eponymy
- Conclusion

Printed on: 04/12/24

## Abstract Archives of the RSNA, 2023

NMMIEE

### Nuclear Medicine & Molecular Imaging Education Exhibits

#### Sub-Events

#### **NMMIEE-1 What Radiologists Need to Know About Immune-related Adverse Events: Clinical Significance of FDG-PET/CT Diagnosis of Immune-related Adverse Events**

##### Participants

Mana Ishibashi, Hiroshima, Japan (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

Immune-related adverse events (irAE) are common in patients receiving immune checkpoint inhibitors. Frequency varies by molecular target of the agent in use, with irAE of any grade reported approximately 80-90%. Pneumonitis, hypothyroidism, arthralgias, and cutaneous reactions are most often seen with PD-1/PD-L1 inhibitors, and colitis and hypophysitis with CTLA-4 inhibitors. FDG-PET/CT is used to assess the malignancy; it is also able to detect tissue inflammation, one of the hallmarks of irAE. This unique ability sets FDG-PET/CT apart from CT and MRI and potentially enables the early identification and therapeutic intervention in patients with irAE prior to their developing clinical symptoms. Depending on the site, particularly in lymph nodes, an irAE-related uptake may mimic metastases or disease progression.

##### TABLE OF CONTENTS/OUTLINE

1. Basic information about immune checkpoint inhibitors 2. The mechanism of autoimmune-reactions in patients receiving immune checkpoint inhibitors 3. FDG-PET/CT findings of irAE 4. Differential diagnosis of irAE and other pathologies

#### **NMMIEE-10 Imaging of Thyroid Cancer Post-thyroidectomy: Primer for Radiologists**

##### TEACHING POINTS

1. Differentiated thyroid cancer (DTC) arising from thyroid follicular epithelial cells, comprising > 90% of all thyroid cancers. 2. After thyroidectomy, depending on post-operative risk stratification, the primary goal of radioactive iodine (RAI) can include remnant ablation, adjuvant therapy or treatment of known disease. A whole-body scan performed following administration of therapeutic RAI identifies the presence of iodine-avid thyroid tissue, both normal and malignant, allowing staging of the disease. 3. Cervical ultrasound is recommended for surveillance of the thyroid bed and regional lymphadenopathy post-thyroidectomy. 4. Serum Thyroglobulin (Tg) and anti-Tg antibodies are important in the follow-up of these patients; rising levels would warrant further evaluation with RAI imaging. 5. 18F-FDG-PET scanning should be considered in high-risk DTC with elevated serum Tg but negative RAI imaging. Alternatives would include CT imaging of the chest and if negative CT imaging of the abdomen.

##### TABLE OF CONTENTS/OUTLINE

1. Overview of differentiated thyroid cancer 2. Goals of treatment, including the role of radioactive iodine 3. Basics of Thyroglobulin and anti-Thyroglobulin interpretation for monitoring for thyroid cancer recurrence/disease 4. Common sites of disease recurrence and metastasis 5. Role of US and other imaging modalities (RAI, CT, MRI, PET/CT) in the follow-up of thyroid cancer 6. Spectrum of imaging appearances on the various modalities after primary treatment of thyroid cancer 7. Important imaging pitfalls leading to diagnostic errors and misinterpretation

#### **NMMIEE-11 Imaging of Dementias using 18F-FDG PET: Unique and Overlapping Features**

##### Participants

Rita Maria Lahoud, MD, Shelton, CT (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

- Establishing a specific diagnosis in cases of dementia may be challenging as symptoms and features often overlap. Characteristic metabolic patterns on 18F-FDG PET, in concert with clinical features, aid in reaching an accurate and timely diagnosis.
- Technical considerations and proper patient preparation are necessary to minimize confounders.
- Alzheimer's dementia represents the most common neurodegenerative process encountered on PET/CT and manifests with regional hypometabolism of the posterior temporoparietal regions and cingulate gyrus, although there are variations and overlap with other neurodegenerative processes.
- Reduced radiotracer uptake predominantly involves the frontal and anterior temporal lobes in frontotemporal dementia.
- In Lewy body dementia, the occipital cortex is mainly affected with sparing of the posterior cingulate gyrus, "the cingulate island sign".
- Asymmetric cortical involvement and decreased uptake in the basal ganglia and thalami are characteristic of corticobasal degeneration.

##### TABLE OF CONTENTS/OUTLINE

1. Introduction to Dementias a. Alzheimer's b. Frontotemporal c. Lewy Body d. Posterior Cerebral Atrophy e. Corticobasal Degeneration f. NMDA Encephalitis 2. 18F-FDG PET in the evaluation of dementias a. Rationale for use b. Normal brain metabolic patterns c. Patient preparation and technique 3. Metabolic pattern interpretation: a. Unique and overlapping imaging patterns b. Confounding factors

## **NMMIEE-12 Hybrid Imaging in Infective Endocarditis**

Participants

Antonio Lopez, BA, West Reading, PA (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

Infective endocarditis (IE) is a serious infection of the heart valves caused by microorganisms, resulting in inflammation and potential complications such as heart failure, stroke, or sepsis. IE is typically diagnosed using the modified Duke criteria, which examines pathologic and clinical criteria; however, due to a variety in presentation and complicating patient factors, I remains a diagnostic challenge. Patients with prosthetic valves (PV) or intracardiac devices (ICD) are at a higher risk for IE, are more difficult to diagnose with IE, and have higher mortality than patients without these cardiac interventions. Combination of cardiac CT and FDG-PET/CT is currently being investigated for adjunct use in I diagnosis in this patient population, which preliminary data shows improve diagnostic accuracy. Here we examine the use of FDG-PET and cardiac CT in diagnosing I in patients with PV and ICD, including a discussion on common cardiac and non-cardiac manifestations of IE on imaging and an examination of its role in future diagnostic algorithms.

### **TABLE OF CONTENTS/OUTLINE**

Describe current diagnostic methods for IE. Examine the use of Cardiac CT and PET/CT in I diagnosis for patients with PV and ICD, including key imaging features. Discuss the future incorporation of hybrid imaging in I diagnosis.

## **NMMIEE-13 Theory into Action: A Step-by-Step Guide to Interpreting Scintigraphy Images for Sentinel Node Assessment**

Participants

Juan Tempra SR, MD, Pilar, Argentina (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

-Review the basics of the sentinel node and its importance in the diagnosis and staging in cancer.-Describe the technique and methods of optimizing the procedure and the resulting images.-Illustrate different imaging patterns and their clinical significance.-Learn the limitations and pitfalls.

### **TABLE OF CONTENTS/OUTLINE**

-Introduction.-Sentinel lymph node Scintigraphy: principles and technique.-Interpretation of sentinel lymph node mapping images.-Advantages and limitations.-Conclusions.

## **NMMIEE-14 Findings of Primary and Secondary Breast Malignancies on Dotatate PET/CT**

Participants

Lauren Hubbard, MD, Salt Lake City, UT (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

Review somatostatin receptor-based PET imaging and normal distribution. Positive radiotracer uptake in the breast on Dotatate PET can be seen with metastatic neuroendocrine tumors. Metastatic neuroendocrine tumors to the breast can result in corresponding mammogram findings indistinguishable from a primary breast malignancy. Primary breast malignancies can also demonstrate positive Dotatate PET uptake due to variable somatostatin receptor expression. Invasive lobular carcinoma can demonstrate low to absent abnormal uptake on FDG-PET/CT, but can demonstrate positive uptake on Dotatate-PET/CT.

### **TABLE OF CONTENTS/OUTLINE**

a. Review of somatostatin receptor-based PET imaging and normal distribution. b. Case presentations of 5 cases of dotatate PET findings of primary and secondary breast malignancies i. A case of biopsy-proven incidentally discovered invasive ductal carcinoma on Dotatate-PET/CT for evaluation of metastatic neuroendocrine tumor. ii. A case of incidentally discovered invasive lobular carcinoma on Dotatate-PET/CT for metastatic neuroendocrine tumor with comparison to FDG- and 18F-Fluoroestradiol-PET/CT. iii. A case of neuroendocrine tumor metastases to the bilateral breasts with corresponding mammographic findings. iv. A case of neuroendocrine tumor metastases to the left breast with additional systemic sites of metastatic disease. v. A case of bilateral dotatate PET avid breast lesions, histologically proven to be atypical carcinoid tumors of the breast. c. Conclusions/Future Directions

## **NMMIEE-15 PET-CT 18F-FES: Selecting Patients Who Will Benefit from Endocrine Therapy**

Participants

Victor Osaki, BMedSc, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

- Invasive lobular carcinoma (ILC), the second-most prevalent invasive breast cancer subtype comprising approximately 15% of breast cancers;
- ILC is nearly always (95%) estrogen receptor (ER) positive;
- The determination of ER expression by immunohistochemistry has several limitations;
- PET-CT with 18F-fluoroestradiol (PET-FES) has emerged as a diagnostic method that allows evaluating the ER expression status of breast cancer lesions in a non-invasive way;
- Patients with estrogen receptor positive breast cancer benefit from endocrine therapy by blocking these receptors on tumor cells, preventing tumor progression. Some patients, though, have immunohistochemistry showing positive receptors and PET-CT with 18F-FES with lesions not showing uptake. In these cases we suppose the estrogen receptors are non-functioning ones and, therefore, patient will not benefit from endocrine therapy.

### **TABLE OF CONTENTS/OUTLINE**

- Introduction;
- Objective;
- Discussion;
- Clinical and epidemiologic aspects;
- Show cases that are functioning estrogen receptor positive and non-functioning estrogen receptor;
- Discuss endocrine therapy in non-functioning ER+ cancer;
- Take home messages;
- References.

## **NMMIEE-16 The Value of 18F-FDG-PET-CT in the Management of Head and Neck Tumors**

## TEACHING POINTS

To understand the role of 18F-FDG PET CT in the diagnosis, staging, treatment response assessment and radiotherapy treatment planning in head and neck tumors.

## TABLE OF CONTENTS/OUTLINE

18F-FDG PET-CT is a widely used diagnostic tool in the evaluation of head and neck squamous cell cancers. It is at least as sensitive as MRI or CT in detecting the primary head and neck tumors, but there is no clear evidence of routine use in T staging, due to low spatial resolution and the presence of physiologic uptake on PET. The meta-analysis shows 18F-FDG PET-CT has high sensitivity (79%) and specificity (86%) for N staging, being superior to CT and MRI. For distant spread and second primary cancer detection, 18F-FDG PET-CT may be superior to whole body MRI, while both have high NPV. For the detection of synchronous primary tumor the pooled sensitivity and specificity is above 95%. The meta-analysis of 27 studies shows the high rate of detection of recurrence or residual tumor with 18F-FDG PET-CT (PPV-75 %, NPV-94%). Performed 12 months after therapy for detection of recurrence, the sensitivity and specificity has been reported as high as 100%. The recent response evaluation criteria-so called Hopkins criteria-has high NPV and is characterized by high inter-reader agreement. PET-CT based contouring during radiotherapy treatment planning is more accurate than CT based contouring in terms of gross tumor volume (GTV). Recent advances in hybrid imaging of head and neck tumors include the introduction of integrated PET MRI systems. Studies have shown the intratumoral heterogeneity of FDG uptake, as well as PET-derived volumetric parameters, such as MTV and TLG to be important prognostic factors for disease recurrence, progression and survival.

## NMMIEE-17 PET-CT 18F-FES: The Use in Clinical Practice in One of the Largest Private Health Centers in Brazil

Participants

Victor Osaki, BMedSc, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

## TEACHING POINTS

- PET-Fluorestradiol (FES) is a type of Positron Emission Tomography (PET) imaging agent used to detect estrogen receptor-positive (ER+) breast cancer. FES is a synthetic form of estrogen that has been radiolabeled with a positron-emitting isotope, the fluorine-18;
- When 18F-FES is injected into the body, it binds to estrogen receptors on breast cancer cells, allowing PET imaging to detect the presence and location of these cancer cells;
- PET-FES imaging can provide valuable information to healthcare professionals about the extent of ER+ breast cancer, as well as guide treatment decisions;
- PET-FES has emerged as a diagnostic method that allows evaluating the ER expression status of breast cancer lesions in a non-invasive way;
- In addition to breast cancer, PET-FES imaging has also been used in research to investigate other estrogen-receptor positive cancers, such as ovarian and endometrial cancer.

## TABLE OF CONTENTS/OUTLINE

- Clinical and epidemiologic aspects;
- Show the possible applications of PET-CT with 18F-FES and show its applicability in clinical practice in our hospital.
- Take home messages;
- References.

## NMMIEE-18 Gallium-68 DOTATATE PET for the Imaging of Non-Gastrointestinal Neoplasm: A Review

Participants

Amar Shah, MD, Phoenix, AZ (*Presenter*) Nothing to Disclose

## TEACHING POINTS

Somatostatin-receptor analogue based imaging, including Gallium(Ga)-68 DOTATATE PET/CT, has long played a central role in the evaluation of gastroenteropancreatic neuroendocrine tumor. However, Ga-68 DOTATATE has a variety of clinical applications beyond this, both in oncologic pathologies. In this exhibit, we aim to review Ga-68 DOTATATE physiology and its use beyond gastroenteropancreatic neuroendocrine tumor. 1. Review physiology of Ga68-DOTATATE distribution and uptake. 2. Catalogue non-gastrointestinal uses, both oncologic and nononcologic, of Ga-68 DOTATATE based imaging. 3. Highlight pitfalls of Ga68-DOTATATE imaging.

## TABLE OF CONTENTS/OUTLINE

1. Review normal Ga-68 DOTATATE distribution and mechanism of uptake.
2. Non-gastrointestinal tumoral indications. a. Meningioma b. Medullary thyroid cancer c. Paraganglioma d. Phosphaturic mesenchymal tumor e. Pulmonary carcinoid
3. Pitfalls of Ga-68 DOTATATE PET/CT.

## NMMIEE-19 FDG PET/CT in Evaluation of Cardiac Device Infections: What an Imager Should Know

## TEACHING POINTS

FDG PET/CT is increasingly utilized for the diagnosis and evaluation of cardiac device infections. The objective of this case-based educational exhibit is to 1) review established and emerging applications of FDG PET/CT in the diagnosis of cardiac device infections 2) review protocols and guidelines for integrating FDG PET/CT in the diagnosis of cardiac device infections 3) highlight interpretation criteria, pearls, and pitfalls of FDG PET/CT for cardiac device infections. Implementing this knowledge is important to avoid errors and provide accurate imaging interpretation for cardiac device infection.

## TABLE OF CONTENTS/OUTLINE

The most demonstrative cases of cardiac device infections noted on FDG PET/CT performed at our tertiary care academic institution for evaluation of cardiac device infections were selected to highlight the teaching points for this exhibit, including: 1) cardiac implantable electronic device (CIED) infection 2) left ventricular assist device (LVAD) infection 3) prosthetic valve endocarditis. We will summarize take-home points to facilitate transfer of knowledge.

## NMMIEE-2 Skeletal Muscle Uptake in FDG-PET: Physiology and Pathology, Pearls and Pitfalls

Participants

Jessica Dobson, MD, Halifax, NS (*Presenter*) Nothing to Disclose

## TEACHING POINTS

18F-fluorodeoxyglucose (FDG)-PET is commonly used in oncology, and while key for staging may also reveal nonspecific findings related to any number of neoplastic, infectious, and inflammatory etiologies. Despite the ubiquity of FDG-PET, intense skeletal muscle uptake remains an uncommon and sometimes unexpected finding. Patterns of uptake are often similar between vastly different entities, and the interpreting physician must be familiar with these entities to provide a useful diagnosis or differential. This exhibit will review a series of local cases demonstrating skeletal muscle FDG uptake and discuss the clinical and imaging context leading to the diagnosis, with the goal of conveying an understanding of skeletal muscle uptake on FDG-PET and considerations to provide a relevant differential diagnosis and advise on appropriate next steps.

#### TABLE OF CONTENTS/OUTLINE

1. Overview normal physiologic distribution of FDG; 2. Review the biochemical basis of physiologic and pathologic skeletal muscle FDG uptake; 3. Discuss the differential considerations for skeletal muscle uptake, including physiologic, inflammatory, infectious, and neoplastic etiologies, and possible mimics of skeletal muscle uptake on FDG-PET; 4. Analyze local cases of skeletal muscle uptake with emphasis on imaging patterns and clinical indicators guiding diagnosis.

#### NMMIEE-20 PET-CT Utility in Aortic Disease: Applications and Observations - A Comprehensive Review

##### TEACHING POINTS

PET/CT allows for the non-invasive evaluation of aortic inflammation, wall instability, and clinical symptoms, thereby improving the prediction of individual aneurysm rupture risk. Additionally, PET/CT imaging can aid in determining the age and degree of risk in patients with acute aortic dissection (AAD) and the need for surgery. Stratification of AAD patients based on FDG uptake may predict short- and midterm outcomes. PET/CT imaging has also allowed for preoperative localization of areas with increased risk of rupture correlating with increased FDG uptake within the aneurysm wall in abdominal aortic aneurysm suggesting that FDG-PET/CT imaging may be a novel approach to identifying AAA at risk for rupture. FDG uptake in the aortic wall can also be used as a biomarker for the evaluation of vulnerable atherosclerotic activity. PET/CT can also aid in distinguishing between acute and chronic aortic dissection. In patients with acute dissection, PET/CT imaging showed elevated metabolic activity in fresh lacerated segments of the aortic wall, while stable chronic aortic dissection showed no increased metabolic activity. This differentiation is crucial for appropriate management and predicting outcomes.

#### TABLE OF CONTENTS/OUTLINE

I. Introduction II. PET/CT in the evaluation of aortic disease A. Aortic aneurysms 1. Prediction of individual rupture risk 2. Preoperative localization of areas with increased FDG uptake B. Aortic dissection 1. Determining the need for surgery 2. Distinguishing between acute and chronic dissection 3. Vasculitis/infectious Aortitis III. PET/CT in the evaluation of arterial atherosclerotic activity A. FDG Uptake as an index for atheroma cellular content and vulnerability V. Conclusion

#### NMMIEE-21 PSMA PET/CT and Spectrum of Nonprostatic Disease

Participants  
Qiubai Li, Dallas, TX (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

- Prostate-specific membrane antigen (PSMA) based radiopharmaceutical 18F-PSMA and 68Ga-PSMA for imaging of prostate cancer.
- PSMA PET/CT plays a key role in diagnosis, staging and evaluation of treatment response of prostate cancer
- PSMA uptake on PET/CT can be divided into prostatic disease and nonprostatic disease. Comparison between cytoplasmic PSMA expression in nonprostatic disease and apical PSMA expression in prostate cancer can help to differentiate these conditions.
- The purpose of this presentation is to introduce of spectrum of nonprostatic disease on PSMA PET/CT which may be interpreted as metastatic disease.
- Recognizing the false positive imaging findings can help narrow the differential diagnosis and triage appropriate patient care

#### TABLE OF CONTENTS/OUTLINE

- PSMA uptake and CNS disease
- PSMA uptake and PNS disease
- PSMA uptake and lacrimal gland disease
- PSMA uptake and thyroid disease
- PSMA uptake and inflammatory/inflammatory disease
- PSMA uptake and lung disease
- PSMA uptake and liver disease
- PSMA uptake and kidney disease
- PSMA uptake and adrenal gland disease
- PSMA uptake and bone disease
- PSMA uptake and chronic lymphocytic leukemia

#### NMMIEE-22 FDG PET: Not Just a One-trick Pony: Non-oncologic Uses of FDG PET Imaging

##### TEACHING POINTS

The purpose of this exhibit is to:- Understand the underlying physiologic mechanism of FDG PET and conventional clinical applications- Discuss non-oncologic pathologies that can be evaluated on FDG PET, including those which may mimic other neoplastic processes.- Examine the pros and cons of utilizing FDG PET versus conventional imaging modalities in non-oncologic applications.

#### TABLE OF CONTENTS/OUTLINE

Mechanism of Action of FDG PET  
Head and Neck applications- Seizures- Dementia/neurocognitive disease- Differentiating CNS lymphoma versus toxoplasmosis  
Chest and Cardiac applications- Sarcoidosis- Evaluating for hibernating myocardium- Cardiac/pericardiac infection myocarditis- Incidental infection/inflammation, including organizing pneumonia  
Abdominal- Infection in polycystic liver or kidney disease- Infection in mucinous peritoneal carcinomatosis- Autoimmune pancreatitis/ IgG4 related disease- Incidental infection/inflammation including: inflammatory bowel disease, hepatitis, pyelonephritis  
Vascular- Aortitis vasculitis- Inflammatory plaques- Incidental findings including: endoleak and deep vein thrombosis  
Musculoskeletal- Chronic recurrent multifocal osteomyelitis (CRMO) synovitis, acne, pustulosis, hyperostosis, and osteitis (SAPHO) syndrome- Non-post-operative spinal infections- Peripheral bone osteomyelitis- Septic arthritis  
Multisystem- Sarcoidosis, tuberculosis, granulomatous infections- Non-Langerhans cell histiocytosis- Fever of unknown origin neoplastic mimics- Sequelae of endocarditis- HIV/Covid reactive adenopathy reactive adenopathy

#### NMMIEE-23 Why PET/MRI in Pediatric Oncology? A Pictorial Review of Advantages and Challenges

##### TEACHING POINTS

- PET/MRI has better soft tissue resolution and lower radiation dose than PET/CT - PET/MRI is a one stop shop that may decrease

• PET/MRI has better soft tissue resolution and lower radiation dose than PET/CT. • PET/MRI is a one-stop-shop that may decrease the number of anesthesia events and patient visits to complete imaging work-up. • PET/MRI provides simultaneous anatomic and functional images, facilitating both initial staging and restaging of various oncologic conditions.

#### TABLE OF CONTENTS/OUTLINE

• Introduction of PET/MRI: an overview of technical aspects and protocol • Case-based approach of oncologic pediatric body PET/MRI: advantages and limitations:- Lymphoma: initial staging and follow up- Sarcoma: soft tissue and osseous sarcoma- Predisposing Conditions: malignant transformation in neurofibromatosis- Congenital hyperinsulinism: focal versus diffuse lesions • Case-based approach of PET/MRI in pediatric neuro-oncology: advantages and limitations- FDG-PET/MRI: is it a helpful tool?- Amino acid PET: in non-enhancing tumor and anti-angiogenic therapy • Current and future role of PET/MRI in theragnostic (diagnosis and therapy) in pediatric oncology • Conclusions

#### NMMIEE-24 Bringing PET/MRI into Practice- Challenges and Considerations

Participants  
Naveen Rajamohan, MD, Dallas, TX (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1) Developing a PET/MRI program involves planning for optimal physical layout and incorporation of unique safety considerations. 2) Truly simultaneous PET and MRI data acquisition in modern PET/MRI systems minimize the likelihood of image misregistration and provide more robust anatomic co-localization comparison to PET/CT. 3) Identification of appropriate oncologic and non-oncologic clinical indications, education of referring physicians, development of scheduling, protocoling, and image interpretation workflows and dedicated order sets are imperative for successful implementation of a clinical PET/MRI program.

#### TABLE OF CONTENTS/OUTLINE

Safety regulations • Facility guidelines and regulatory requirements • Challenges of working in the PET/MRI environment (governance, safety, technologist training, emergency responses, etc.) • Radiotracers in the PET/MRI environment. PET/MR hardware/data acquisition • Hardware components, data acquisition systems • Technical considerations including attenuation correction and image co-registration Indications, imaging findings, programmatic and workflow considerations • Billing challenges and CPT codes • Protocol development, order sets and education of referring physicians • Clinical workflow including protocoling, scheduling, and image interpretation models. Case-based review of oncologic and non-oncologic clinical indications appropriate for PET/MRI including classic imaging findings and pitfalls

#### NMMIEE-25 Is There a Role for Radium-223 in the Era of 177Lu PSMA?

Participants  
Flavia Lopes, PhD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

In cases of prostate bone metastasis, a destructive cycle of bone formation and resorption occurs, making it imperative for treatment to focus on the microenvironment through various mechanisms. This can be achieved through direct targeting of tumor cells, osteoblasts, osteoclasts, inflammatory cells, and bystander effects, which affect non-irradiated cells in the surrounding area by producing cytokines and growth factors. For patients who have previously received Radium-223, it is possible to administer 177LuPSMA and/or chemotherapy as subsequent treatments. Patients with a good medullary reserve who have shown a positive response to initial treatment may receive additional cycles of Radium-223, as it is well-tolerated with minimal toxicity and effectively controls bone progression. For patients with exclusively bone metastatic prostate cancer, Radium-223 may be initiated to control bone progression when first-line therapy fails to achieve optimal control of disease progression. Subsequently, in the treatment sequence, 177Lu-PSMA may be employed as an effective tool in the management of progressive disease involving bone and soft tissue metastases.

#### TABLE OF CONTENTS/OUTLINE

Theranostics in Prostate Cancer: Current Treatment Options Radium-223: Indications and Contraindications Treatment Sequencing: Discussion of Primary Guidelines 177Lu-PSMA and Radium-223: Partners or Competitors?

#### NMMIEE-26 DEXA - It's Not Just About the Numbers

#### TEACHING POINTS

• To describe the classification, clinical presentation, pathogenesis and management of osteopenia and osteoporosis • To outline indications for performing dual-energy x-ray absorptiometry (DEXA) • To review technical aspects of DEXA • To interpret DEXA outputs including quality assurance and recognition of pitfalls

#### TABLE OF CONTENTS/OUTLINE

Background • Epidemiology, clinical presentation, pathogenesis and management of osteopenia and osteoporosis • Classification of bone mineral density • Review of international guidance on DEXA - e.g. American Association of Clinical Endocrinologists consensus statement • Technical aspects of DEXA • Underlying scientific basis • Acquisition parameters • Regions of interest • Outputs including reference standards • Interpretation • Defining Z-scores and T-scores • Monitoring changes in bone mineral density • Fracture risk assessment tool - e.g. FRAX • Clinical application and relevance • Suggested reporting templates • Pearls and pitfalls • Case examples including less typical and challenging scenarios • Summary

#### NMMIEE-27 Utility of FDG PET/CT in Pyrexia of Unknown Origin: A Pictorial Essay

#### TEACHING POINTS

/div>

#### TABLE OF CONTENTS/OUTLINE

Pyrexia of unknown origin (PUO) is defined as fever higher than 38.3 °C/101°F, lasting more than 3 weeks and remaining undiagnosed after 1 week of thorough investigation. Identifying the cause of pyrexia of unknown origin is a clinical challenge. Early identification of source of PUO helps guide further diagnostic invasive procedures and initiation of prompt appropriate treatment.

The current diagnostic approach includes initially first-line procedures such as general examination and various laboratory tests and basic imaging techniques followed by second-line tests like FDG PET/CT and tissue biopsies. Conventional imaging modalities can have limited sensitivity. Understanding imaging patterns of FDG uptake in common and uncommon causes of PUO helps to accurately identify the potential source. Advantages of 18F-FDG PET/CT as first line modality : high sensitivity, whole body imaging can identify pathologic focus at clinically unsuspected sites, high negative predictive value, can identify the source of infection or inflammation before morphological changes on conventional anatomical imaging techniques, no hazardous manipulation of blood for labeling in WBC imaging, no need for complementary bone or bone marrow scan, ability to perform quantitative analysis, cost-effective as first line modality. Images attached of Common and uncommon sites detected on FDG PET/CT in PUO: Fig1) infected aortic stent Fig 2) infected central venous catheters Fig 3) Tuberculous Osteomyelitis Fig 4) Renal Mucormycosis Fig 5) Acute Pyelonephritis in Transplant Kidney Fig 6) Tracheobronchitis

### **NMMIEE-28 How to Master Nuclear CSF Imaging: A Comprehensive Guide to Procedures and Interpretation**

Participants

Megan Mercer, MD, Charleston, SC (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

This presentation aims to educate the learner on: 1- Indications and imaging protocol of nuclear CSF imaging (Nuclear cisternography and shuntogram). 2- Patterns of normal and abnormal findings. 3- Complementary role of anatomic imaging (Xray, CT, MRI). 4- Pearls and pitfalls for performing the procedures and imaging interpretation.

#### **TABLE OF CONTENTS/OUTLINE**

1- Nuclear Cisternography: A. Review CSF physiology and the common indications for nuclear cisternography. B. Review Imaging protocol: Patient preparation, radiopharmaceutical, imaging timing, the role of pledgets in cases of CSF leak. C. Review normal and abnormal findings (normal pressure hydrocephalus, spontaneous hypotension, CSF leaks). D. Describe classic signs that are helpful for the interpretation. E. Discuss pitfalls for injection and interpretation and the importance of correlation with anatomic imaging. 2- Nuclear Shuntogram: A. Present a background on hydrocephalus, different types of CSF shunts, and their complications. B. Review multimodality imaging evaluation of shunts with a focus on nuclear shuntogram. C. Present an overview of the nuclear shuntogram procedure (shunt reservoir access, measuring opening pressure, types of radiopharmaceutical, radiopharmaceutical injection, and imaging protocol). D. Review interpretation checklist (opening pressure, T1/2 clearance, flow into the proximal and distal limbs, documentation of free dispersion). E. Present an algorithmic approach for differentiating normal and abnormal drainage patterns (proximal and distal obstruction, shunt over-drainage, CSF pseudocyst, gravity-dependent drainage). F. Review pitfalls of inappropriate injection and falsely elevated pressure.

### **NMMIEE-29 Hybrid DOTATATE PET/MRI Imaging of the Head and Neck**

Participants

Graham Keir, MD, Manhasset, NY (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

1. The superior soft tissue resolution of MRI improves lesion localization and helps to delineate fine anatomic detail. 2. DOTATATE-PET/MRI detects extent of disease and lesions not detected by MRI alone. 3. DOTATATE-PET may improve surveillance and radiation therapy planning. 4. DOTATATE-PET/MRI may detect more lesions than MRI alone, providing valuable genetic information in cases of multiple paragangliomas. 5. DOTATATE PET is useful for determining lesions that may respond to somatostatin analogue therapy.

#### **TABLE OF CONTENTS/OUTLINE**

1. Overview of Somatostatin Receptor Imaging 2. PET/MRI Fusion Protocols 3. Meningiomas 4. Paragangliomas 5. Olfactor Neuroblastoma (Esthesioneuroblastoma) 6. Pituitary Lesions 7. Conclusion

### **NMMIEE-3 Neo-adjuvant Immune-checkpoint Inhibitors in Lung Cancer - Pearls and Pitfalls in Imaging**

#### **TEACHING POINTS**

1) Neo-adjuvant chemo-immunotherapy results in a high rate of pathologic complete remissions. 2) Residual tumor size and changes (eg., decrease) in tumor size do not necessarily correlate with histopathological response. 3) Metabolic examinations such as [18F]-FDG-PET/CT better assess treatment response compared to morphological changes. 4) Immune mediated increased lymphatic FDG uptake and/or increased lymph node size is called "nodal immune flare".

#### **TABLE OF CONTENTS/OUTLINE**

1) Pathological response patterns in patients with early-stage, non-small cell lung cancer (NSCLC) receiving neo-adjuvant chemo-immune checkpoint inhibitor therapy (ICIT): - Complete pathological response (cPR): no vital tumor cells, - Major pathological response (MPR):  $\geq 10\%$  vital tumor; 2) Radiological response patterns in patients with early-stage NSCLC receiving neo-adjuvant chemo-ICIT: - Radiological response may be consistent or inconsistent with pathological response, - Some patients with partial radiological response show a poor pathological response compared to others who show a cPR, - Nodal immune flare; 3) Current role of imaging in patients with early-stage, NSCLC receiving neo-adjuvant chemo-ICIT: - CT, - [18F]-FDG-PET/CT, - Limitation and pitfalls; 4) Limitations

### **NMMIEE-30 Nuclear Medicine Lymphoscintigraphy: Established and Emerging Applications with Technical Overview**

Participants

Saeed Elojeimy, MD, PhD, Charleston, SC (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

The goal of this presentation is to educate the learner on: 1- The clinical approach and role of nuclear scintigraphy in the assessment and management of patients with lymphedema. 2- The imaging protocol for performing nuclear scintigraphy. 3- The imaging patterns of normal and abnormal lymphoscintigraphy. 4- The potential limitations of nuclear medicine examinations for lymphedema assessment. 5- The complementary role of nuclear scintigraphy and MR lymphangiography. 6- The treatment options available for patients with lymphedema.

## TABLE OF CONTENTS/OUTLINE

1- Introduction a. Review the epidemiology and pathophysiology of lymphedema. b. Review the clinical approach to the diagnosis of lymphedema, as well as the role of nuclear lymphoscintigraphy in evaluating these patients. 2- Review Lymphoscintigraphy protocols: a. Patient preparation, radiopharmaceutical, imaging timing, and areas of interest. 3- Review how to evaluate lymphoscintigraphy examinations. a. Provide examples of normal and abnormal lymphoscintigraphy studies (unilateral or bilateral, upper or lower extremity), lymphatic malformations, and lymphatic leak (recurrent chylous ascites or pleural effusions). b. Provide MR lymphangiography correlative features for lymphoscintigraphy to highlight the strengths, limitations, and complementary roles of both modalities. 4- Emerging applications, treatments, and future directions

### NMMIEE-31 PET/MRI: Pictorial Review of Hepatobiliary and Pancreatic Applications

Participants

Malak Itani, MD, Saint Louis, MO (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

PET/MRI combines physiologic information with superior soft-tissue contrast resolution from MRI, improving assessment of the following hepatopancreaticobiliary diseases:(1) Biliary: assess disease severity, screen for cholangiocarcinoma, delineate local tumor extent and regional spread, and assess treatment response.(2) Hepatic metastases: detecting metastases and evaluating response to treatment.(3) Hepatocellular carcinoma: Y-90 PET/MRI dosimetry, extrahepatic metastases.(4) Pancreatic neoplasms: characterization and local staging, assessing spread to lymph nodes, metastatic disease in the liver, and assessing treatment response.(5) Liver transplant: detecting recurrent HCC, recurrent sclerosing cholangitis, and post-transplant lymphoproliferative disorder.

## TABLE OF CONTENTS/OUTLINE

(1) Hepatobiliary PET/MRI techniques, clinical workflow, and reimbursement issues.(2) Applications:(A) Neoplastic evaluation:(i) Cholangiocarcinoma. (ii) Metastatic liver disease. (iii) Hepatocellular carcinoma. (iv) Pancreatic ductal adenocarcinoma. (v) Pancreatic neuroendocrine neoplasms.(B) Differentiating tumor from non-neoplastic processes:(i) Infectious: Cholangitis, hepatic abscesses. (ii) Inflammatory: Risk-stratifying benign versus malignant biliary strictures. (iii) Post-treatment: Perilesional hemorrhage/necrosis versus residual/recurrent tumor. (iv) Problem solving after locoregional therapy. (v) Follow-up of liver transplant.(3) Emerging tracers and advanced applications.

### NMMIEE-32 Patterns of Response and Progression on Post-treatment SPECT/CT Scans in Patients Treated with Lu-177-PSMA

Participants

Ridvan Demirci, MD, Seattle, WA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

With the wider availability of Lu-177-psma therapy, imaging of this population became more important. Post-treatment imaging with SPECT/CT is a helpful tool for response assessment by providing functional and anatomical imaging information. This educational exhibit aims to present certain response and progression patterns in post-treatment SPECT/CT scans.

## TABLE OF CONTENTS/OUTLINE

Non-contrast enhanced CT portion of SPECT/CT needs to be closely reviewed for monitoring of low or no PSMA-expressing disease (defined as lesional uptake equal or less than liver), particularly in the liver, and temporal changes of the osseous disease on CT in relation to intensity of PSMA expression. In addition, patterns of response or progression could be used for clinical decision-making. Below, is the summary of patterns. 1. Response Patterns a. Rapid Response (Rapid decline in disease burden before 4 cycles of treatment) b. Slow Response (Continued response after 4 cycles of treatment) c. Stable Disease 2. Progression Patterns a. Primary Progression (Progression without initial response) i. Increased burden of preexisting disease (bone, soft tissue or both) ii. New lesions (PSMA avid, non or low PSMA avid either in bone or soft tissues) b. Secondary Progression (after initial response) i. Increased burden of preexisting disease (bone, soft tissue or both) ii. New lesions (PSMA avid, non or low PSMA avid either in bone or soft tissues) 3. Mixed Pattern a. Non-uniform response pattern: While being responsive in certain sites/organs, showing progression in other sites/organs.

### NMMIEE-33 Evolving role of PETCT in Systemic Vasculitis

Participants

Vani Vijayakumar, MD, Jackson, MS (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Learn different Systemic Vasculitides Different PET CT Scoring systems Role of PET CT in Treatment response

## TABLE OF CONTENTS/OUTLINE

Large vessel vasculitis (LVV) and medium-sized vessel vasculitis such as giant cell arteritis (GCA) and Takayasu arteritis (TAK) are three common autoimmune systemic Vasculitides. 18F-FDG PET visual and semiquantitative criteria has been proposed. A standardized 4-point visual grading scale (arterial to liver uptake) is recommended with grade 0, no uptake; grade 1, uptake lower than liver; grade 2, uptake similar to liver; and grade 3, uptake higher than liver. Grade 3 is considered positive for LVV, whereas grade 2 may be indicative of LVV. In addition, a quantitative composite score, based on the visual grading scale of several individual arterial segments (typically between 7 and 15 segments), known as PET vascular activity score (PETVAS). PETVAS provides an overall assessment of disease burden, with little interobserver variability, in evaluating treatment response. 18F-FDG uptake in cranial arteries are scored as 3-point visual grading (0-2), with grade 0 representing uptake not above the surrounding tissue, grade 1 uptake just above the surrounding tissue, and grade 2 uptake significantly above the surrounding tissue. In PMR, The PET CT Leuven score is the best validated one, with sensitivity of 89.6% and specificity of 93.3%. The Leuven score is the summed score of visual 18F-FDG uptake at the cervical and lumbar interspinous bursae, sternoclavicular joints, ischial tuberosities, greater trochanters, hips, and shoulders. 18F-FDG PET/CT plays a role in diagnostic and therapeutic monitoring of patients with vasculitides and PMR.

### NMMIEE-34 Avoid False Positives with Quantitation and Tc 99m Pyrophosphate (Pyp) SPECT with CT Fusion in

## ATTR Cardiac Amyloidosis (ATTR- CA)

### Participants

Vani Vijayakumar, MD, Jackson, MS (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- Update on the role of Pyp Imaging cardiac amyloidosis - How to improve Image interpretation with SPECT and CT fusion - Correlate with Anatomic imaging with CT And MRI - Quantitative SPECT Parameters SUV and advanced metrics

### TABLE OF CONTENTS/OUTLINE

Transthyretin (ATTR) cardiac amyloidosis (CA) is a form of heart failure (HF) in the elderly representing approximately 13% to 18% with preserved ejection fraction (HFpEF). Until recently, ATTR-CA was very underdiagnosed. Due to advances in cardiac scintigraphy using the old Bone radiotracer Tc 99m Pyrophosphate single-photon emission computed tomography [SPECT], there is increased awareness to diagnose ATTR -CA. In addition there have been new ATTR stabilizing and silencing medications currently being available for use. Because of these rapid advances in diagnostic and therapeutic approaches, ATTR-CA, once known as a rare and progressive disorder, now can be accurately diagnosed and treated in the elderly with HFpEF. Whole heart SPECT/CT absolute quantification shows strong correlation with the visual Perugini score and high diagnostic performance with SUV<sub>max</sub> cut-off of more than 6.1. Specificity of this approach can be increased to 99% by ruling out elevated monoclonal proteins. 99mTc-DPD and 99mTc-PYP, are the most common cardiac scintigraphy agents used for the diagnosis of ATTR- CA. Planar scintigraphy with SPECT can help with more detailed assessment of the myocardial radiotracer uptake. In addition, Fusion with cardiac CT or MRI improves the correct interpretation avoiding false positives due to blood pool activity. In addition Quantitative measures may help early diagnosis. Risk assessment and therapy response.

### NMMIEE-35 Lymphoscintigraphy of Lymphedema

### Participants

Sara Babapour, MD, Boston, MA (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Definition and pathophysiology of lymphedema. 2. Progressive clinical signs in lymphedema and correlating imaging stages. 3. How different lymphoscintigraphic techniques (agents, planar imaging, and SPECT) can be helpful for defining lymphatic function. 4. How to plan treatment based on imaging. 5. Describe post-treatment findings in lymphoscintigraphy.

### TABLE OF CONTENTS/OUTLINE

Introduction to Lymphedema 1.Primary 2.Secondary 3.Treatment options for lymphedema Lymphoscintigraphy Technique 1.Tracer types 2.Imaging protocols 3.Equipment Lymphoscintigraphy signs 1.Normal 2.Early lymphedema 3.Severe lymphedema 4.Correlation with other imaging techniques and clinical measures Post-treatment Lymphoscintigraphy monitoring 1.Lymphovenous bypass 2.Fat debulking 3.Lymph node transplant Current Research and Innovations in Lymphoscintigraphy, Summary

### NMMIEE-36 PET-CT Goes Large: Its Main Role in Large-vessel Vasculitis

### Participants

Javier Collada, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. To review the leading role of PET-CT in large-vessel systemic vasculitis.2. To describe our experience in a tertiary hospital during the last 5 years.

### TABLE OF CONTENTS/OUTLINE

PET-CT is the best imaging technique in large-vessel vasculitis. Metabolic findings may suggest the diagnosis of cranial and large vessel-giant cell arteritis (C-GCA and LV-GCA) or Takayasu arteritis (TAK), the latter often affecting carotid, renal and mesenteric branches. Sensitivity/specificity for them are around 80%.In addition, PET-CT may detect features of polymyalgia rheumatica (PMR) (by means of Leuven score); and helps differentiating perivascular or atherosclerotic inflammation from "true" vasculitis. Metabolic activity (assessed using Meller scale) and extent diminish with treatment response, although it remains challenging to differentiate remission from smoldering mild disease.From 2018 to 2023 we performed 5082 PET-CT, 41 positive for vasculitis in diagnostic or follow-up stage: 71% women, mean age 70; 63% were GCA, the rest of them TAK, aortitis and one Behçet's disease. PET-CT diagnosis was definitive in 61%, only half the cases of GCA needing confirmatory biopsy. MRI was also used. The majority of GCA associated PMR clinical diagnosis, though just 30% had PET-CT signs.During follow-up, 52% had significant response on PET-CT, most of them complete. However, 40% didn't have pre-treatment PET-CT available.In conclusion, regarding our experience and the literature published to date, we deduce that PET-CT stands out as the main technique to assess large-vessel vasculitis, allowing accurate diagnosis, assessment of comorbid disorders and follow-up.

### NMMIEE-37 Radiotheranostics for Prostate Cancer Management: a New and Evolving Standard of Care

### Participants

Moozhan Nikpanah, MD, Birmingham, AL (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Radiotheranostics, which combines diagnostic and therapeutic capabilities, is changing the clinical management of prostate cancer. Radiopharmaceuticals, specifically prostate-specific membrane antigen (PSMA)-targeting tracers, play a vital role not only in initial diagnosis, staging, and detecting biochemical recurrence of prostate cancer, but also in targeted therapy. Cutting-edge imaging and therapeutic applications of radiotheranostics, such as 177Lu-PSMA-617, are improving patient outcomes. Additionally, there are a number of clinical trials investigating the expanding use of PSMA-based radiopharmaceuticals and other targeted radionuclide therapies. The objective of this educational exhibit is to familiarize radiology and nuclear medicine physicians and trainees with the pivotal role of radiopharmaceuticals in the management of prostate cancer.

### TABLE OF CONTENTS/OUTLINE

1) Overview of prostate cancer (PCa). 2) Concise review of radiotracers used for initial diagnosis, staging, and biochemical

recurrence of PCa, with a focus on PSMA ligands. 3) PSMA PET imaging for PCa: 3a) Application of PSMA PET for treatment guidance and management: implications and considerations. 3b) Pitfalls of PSMA PET imaging. 4) Radioligands and radiopharmaceuticals: advanced imaging and therapeutic applications: 4a) 68Ga-PSMA-11. 4b) 18F-DCFPyL (Piflufolostat F-18). 4c) 177Lu-PSMA-617. 4c-i) Clinical applications and ongoing challenges. 4c-ii) Predictive biomarkers for assessing efficacy of 177Lu-PSMA therapy. 4d) 223Ra-Dichloride. 5) Conclusion and future directions.

### **NMMIEE-38 Multimodality Imaging of Epstein-Barr Virus-Associated Diseases with Emphasis on PET/CT**

Participants

Kenneth Huynh, DO, Orange, CA (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

To review the spectrum of diseases associated with Epstein-Barr virus (EBV), including infectious mononucleosis, lymphoproliferative diseases, malignancies, and systemic autoimmune diseases. To present the multimodality imaging of the EBV-associated disease spectrum, with emphasis on F-18 FDG PET/CT in the initial staging and subsequent evaluation of therapeutic response.

#### **TABLE OF CONTENTS/OUTLINE**

Epstein-Barr virus (EBV) is an oncogenic herpesvirus that infects over 90% of the population worldwide. Although usually asymptomatic, EBV is associated with a wide spectrum of lymphoproliferative diseases and malignancies, especially in patients with immunologic suppression or compromise. EBV has been implicated in the pathogenesis of a variety of diseases, including but not limited to infectious mononucleosis, Burkitt's lymphoma, Hodgkin's and non-Hodgkin's lymphoma, nasopharyngeal carcinoma, gastric carcinoma, post-transplant lymphoproliferative disorders (PTLD), smooth muscle tumors, and autoimmune diseases. While chemotherapy and immunotherapy are therapeutic considerations for many of these diseases, modulation of immunosuppression is considered the first-line management, when applicable, with a regression rate of up to 50%. PET/CT imaging is a critical tool for initial disease staging, assessment of treatment response, and monitoring for disease recurrence. This educational exhibit will (1) review the multimodality imaging features of EBV-associated spectrum of diseases such as infectious mononucleosis, lymphoproliferative diseases, malignancies, and autoimmune diseases and (2) emphasize the role of PET/CT in the detection and surveillance of EBV-associated diseases.

### **NMMIEE-39 Revealing the Hidden Mysteries of the Brain: A Guide to Brain Perfusion Single Photon Emission Computed Tomography (SPECT)**

Participants

Tomoki Imokawa, MD, Tokyo, Japan (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Single Photon Emission Computed Tomography (SPECT) is one of the nuclear medicine imaging modalities to evaluate cerebral hemodynamics. Cerebral perfusion studies are important in the diagnosis of a variety of diseases. Sometimes, cerebral perfusion studies are the only diagnostic clue. This presentation introduces the use of SPECT in the diagnosis of epilepsy and dementia. We also present cases in which SPECT played a decisive role in the diagnosis of inflammatory diseases and tumors, as well as cases in which SPECT served as an objective indicator of psychiatric symptoms and treatment efficacy. The results of SPECT research have important implications in clinical practice, and the application of its findings to MR perfusion imaging is also expected.

#### **TABLE OF CONTENTS/OUTLINE**

1. Basics of SPECT 2. Epilepsy 3. Neurodegenerative Diseases 4. Cerebrovascular Diseases 5. Tumor 6. Inflammatory Diseases 7. Psychiatric Disorders 8. Others

### **NMMIEE-4 Feasibility of Performing SPECT/CT Imaging on a CZT Scanner to Monitor Lutetium-177-PSMA-617 Therapy**

#### **TEACHING POINTS**

Lutetium-177-PSMA-617 (Pluvicto) is a novel radioligand therapy for treatment of metastatic prostate cancer. Current time points for PSMA PET/CT include pre- and post- therapy imaging for patient selection and evaluation of treatment response, respectively. To date, there is no clinical imaging available to monitor the treatment progress during cycles of Pluvicto administration. Current Pluvicto treatment monitoring relies on non-imaging clinical tools, such as PSA levels. Sequential imaging (SPECT/CT) during treatment cycles provides imaging direction to monitor Pluvicto treatment targets and perform organ-based dosimetry. Technical challenges, image quality, and sensitivity of Lu SPECT/CT acquisition will be discussed with its implications in the future of image-guided personalized adaptive dosimetry and diagnosis.

#### **TABLE OF CONTENTS/OUTLINE**

F-18 PET/CT diagnostic scan for metastatic prostate cancer. Lutetium-177-PSMA-617 (Pluvicto) treatment of metastatic castration resistant prostate cancer. Use of Lu-177 SPECT/CT for sequential monitoring over Pluvicto treatment cycles Acquisition of Lu SPECT/CT at 24 hours post cycle 1 of Pluvicto treatment Evaluation of Pluvicto treatment target with SPECT/CT, avidity for metastatic and primary lesions, sparing of nonaffected essential organs F-18 PET/CT and Lu SPECT/CT imaging qualitative concordance and discordance. Ongoing feasibility study to perform advanced quantification and dosimetry across treatment duration Future possibility to tailor Pluvicto treatment and minimize patient risk across treatment cycles

### **NMMIEE-40 Incremental Value of PET/CT in Identification of Infections Associated with Cardiac Devices**

Participants

Matthew Koh, MD, Rochester, NY (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

The diagnosis and anatomic localization of cardiac device-related infections is a presently challenging and clinically relevant topic. Historically, transthoracic and transesophageal echocardiography has been the gold standard of cardiac imaging, however, they are limited in the evaluation of implantable cardiac devices and prostheses, particularly left ventricular assist devices and prosthetic valves. 18F-fluoro-2-deoxyglucose positron emission tomography with CT (FDG PET/CT) has gained increased attention in recent years for the diagnosis of cardiac infections in these select populations. In this educational exhibit, we intend to provide relevant

background information on this topic, review the essential components of left ventricular devices and prosthetic valves, outline the current standards regarding cardiac device-related infections, and finally provide cases that demonstrate the utility of FDG PET/CT in imaging cardiac device-related infection in both initial diagnosis and follow-up.

#### **TABLE OF CONTENTS/OUTLINE**

Introduction/Relevant background information. Review of essential components of left ventricular assist devices. Review of prosthetic cardiac valves. Current standards regarding imaging of cardiac device-related infections. Case collection of PET/CT in imaging cardiac device-related infections in initial diagnosis and follow-up. Conclusion/Final points.

#### **NMMIEE-41 FDG PET/CT Imaging Pitfalls in Current Era of Immunotherapy: Watch Out for Sarcoid Like Reactions**

##### **TEACHING POINTS**

Recognize the imaging features of sarcoidosis, sarcoid like reaction post immunotherapy on FDG PET/CT. Distinguish between tumor progression vs sarcoid like reaction on FDG PET/CT.

#### **TABLE OF CONTENTS/OUTLINE**

The imaging features of sarcoidosis are diverse and can be shown on a variety of imaging techniques. FDG avidity on PET/CT in patients with sarcoidosis is variable and can mimic malignancies (lymphoma, metastatic disease, post immunotherapy). Sarcoidosis typically demonstrates FDG avid supraclavicular, mediastinal, and bilateral hilar lymph nodes on PET/CT. Biopsy demonstrates non caseating granulomas. Immunologic toxicities in cancer patients are often referred to as immune-related adverse events (irAEs). Among various irAEs, sarcoid-like granulomatous lymphadenopathy occurs in 5% to 7% of patients, and typically presents as asymptomatic mediastinal/hilar lymphadenopathy, sometimes with accompanying multifocal pulmonary nodularity. Resolution or decrease in the original tumor burden on restaging PET/CT, and development of new FDG avid mediastinal/hilar lymphadenopathy in patients receiving immunotherapy indicates probable sarcoid like reaction. Recognition of this pattern of distribution is essential in interpreting the post treatment PET/CT. In equivocal cases, a biopsy or short interval PET scan may be necessary. Using a case based approach, we'll demonstrate PET/CT images of patients with sarcoidosis, evolution of sarcoid like reaction to various immunotherapeutic agents and sarcoid like distribution of metastatic disease.

#### **NMMIEE-42 Boning Up on DXA in Adults: A Radiologist's Guide to Interpretation and Quality Control**

Participants

Saeed Elojeimy, MD, PhD, Charleston, SC (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

1- List DXA indications. 2- Recognize appropriate and inappropriate acquisition techniques. 3- Review the pathologic conditions detectable on DXA. 4- Recognize pitfalls that can arise on DXA and how to troubleshoot.

#### **TABLE OF CONTENTS/OUTLINE**

1- Introduction 2- DXA's role in assessing bone mineral density a. Imaging preparation and technique: Patient preparation, imaging technique (describe when to image spine, hip, and forearm and appropriate techniques for ROI placement) b. Interpretation (Comparative databases, T-score, Z-score) c. Review WHO criteria for diagnosing normal bone density, low bone mass, and osteoporosis d. Fracture Risk Assessment (Role of FRAX and Trabecular bone score) e. Pitfalls (improper positioning, artifacts, incidental findings) 3- DXA's emerging role in evaluating and tracking body lean mass and fat composition (review indications, technique, interpretation, available comparison databases, reporting) 4- Summary

#### **NMMIEE-43 18F-FDG PET/CT Focus on Inflammatory-infectious Diseases. Beyond Tumor-related Processes**

Participants

Maria Baladron, MD, Santiago, Chile (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

Review the applications and importance of non-oncologic 18F-FDG PET-CT in various infectious and inflammatory cases. Demonstrate the utility of 18F-FDG PET/CT in evaluating fever of unknown origin. Case-based review of common and uncommon inflammatory and infectious pathologies, including sarcoidosis, osteomyelitis, spondylodiscitis, and vasculitis, among others. Demonstrate the utility of 18F-FDG PET/CT in evaluating the extension of the disease and treatment response in some of these pathologies. Be aware that these pathologies sometimes are incidental findings in routine oncology follow up.

#### **TABLE OF CONTENTS/OUTLINE**

A brief theoretical basis of PET-CT imaging and mechanism of 18F-FDG interaction with cells. Fever of unknown origin as a clinical entity that benefits from the sensitivity of FDG uptake. Metabolic findings before morphologic variations challenge conventional imaging. Different potential uses of 18F-FDG PET/CT in infectious and inflammatory cases; assessing active inflammation, disease extent, occult disease, treatment response and sometimes determining the most suitable biopsy site. Display specific FDG uptake patterns in rare conditions like recurrent aseptic osteomyelitis. Illustrate cases of incidental inflammatory-infectious finding during oncologic patient evaluation.

#### **NMMIEE-44 FDG PET/CT Imaging of Systemic Vasculitis: A Pictorial Review**

Participants

Masatoshi Hotta, MD, PhD, Los Angeles, CA (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

Vasculitis can be classified into primary or secondary types based on its etiology or by the size of the affected blood vessels according to the Chapel Hill Consensus Conference criteria. As any size of vessel in any organ may be affected, the imaging findings vary widely. The heterogeneous nature of vasculitis poses a diagnostic challenge. The aims of this review are to: 1) present FDG-PET/CT images of primary and secondary systemic vasculitis affecting vessels of various sizes, including large, medium, small, and variable-sized vessels, 2) describe the FDG-PET/CT features of each systemic vasculitis type and discuss non-vascular findings that can aid in the differential diagnosis, and 3) review the role of FDG-PET/CT in the management of systemic vasculitis.

## TABLE OF CONTENTS/OUTLINE

1. Introduction | 2. Primary vasculitis: a) Large-vessel vasculitis (Takayasu arteritis, giant cell arteritis); b) Medium-vessel vasculitis (polyarteritis nodosa); c) ANCA-associated small-vessel vasculitis (microscopic polyangiitis, granulomatosis with polyangiitis, eosinophilic granulomatosis with polyangiitis); d) Variable-vessel vasculitis (Behçet's disease, Cogan's syndrome). | 3. Secondary vasculitis: a) Vasculitis associated with systemic disease (IgG4-related disease, sarcoidosis, relapsing polychondritis, Erdheim-Chester disease); b) Vasculitis associated with probable etiology (drugs, infection)

### **NMMIEE-45 Transthyretin Cardiac Amyloidosis (ATTR-CM) and Alzheimer's Disease: Is There a Real Correlation or Age-related Specific to Certain Population**

#### TEACHING POINTS

-Review the relationship between cerebral amyloidosis (Alzheimer disease) and Transthyretin cardiac amyloidosis (ATTR-CM). - Review the imaging technique and radiotracer used for cerebral and cardiac amyloidosis. -Illustrate cases with cardiac and cerebral amyloidosis who presented to our institution

## TABLE OF CONTENTS/OUTLINE

The term "cardiac dementia" (ATTR - CM) is referred to heart failure (HF) as a risk factor for Alzheimer disease (AD). It is thought that the correlation between these two entities is through perfusion defects, angiopathy, and inflammation. Some studies suggest that AD is a multiorgan, systemic disease that may contribute to diminished cardiovascular function. Moreover, recent studies have shown common molecular and pathological features in the brain and heart of the patients with AD, including intramyocardial deposits of A $\beta$ . Whether this amount of A $\beta$  deposit can play a role in compromised myocardial function in patients with AD is yet unknown. High A $\beta$  level in the brain is detected on PET imaging. Although the intramyocardial deposits of A $\beta$  are at a much lower concentration than those seen in the brain, cardiac PET imaging with C-PIB, 18F-florbetapir, and 18F-florbetaben can detect light chain and transthyretin amyloidosis and identify cardiac amyloidosis early in the course of the disease. In ATTR-CM, Tc PYP Cardiac SPECT CT improves the differentiation from blood pool and myocardial uptake and decreases false negatives. Alzheimer's disease and heart failure are two common age-related diseases that can coexist. However, whether there is a real correlation between the two is still a subject of debate and more large-scale population studies are being conducted to further investigate this.

### **NMMIEE-46 Preoperative and Postoperative 18F-Choline PET/CT Value in Patients with Primary Hyperparathyroidism**

#### TEACHING POINTS

- To learn about 18F-Choline (FCH) molecule and recognize its physiologic biodistribution, pathological uptake and potential pitfalls.- To understand the acquisition protocol and recognize the importance of early phase PET scan combined with iodine contrast-enhanced CT.- To review current recommendations for the use of FCH PET/CT in patients with primary hyperparathyroidism (PHPT) and related clinical conditions (eg. tertiary hyperparathyroidism, MEN syndromes).

## TABLE OF CONTENTS/OUTLINE

Choline is a chemical precursor for the synthesis of phospholipids that form the cell membrane. Parathyroid (PT) active tissue has a high uptake of FCH due to the upregulation of choline kinase. Hyperparathyroidism causes urinary, bone, neurologic, and gastrointestinal symptoms and complications. Most cases of PHPT are caused by a solitary PT adenoma. Surgery is the appropriate treatment, but the main reasons for surgical failure are ectopic glands and multiple active tissues. Precise preoperative location of PT tissue remains a difficult task with conventional imaging (99Tc-MIBI scan, CT, MRI) and it is more challenging in patients with previous neck surgery. FCH PET/CT has a high sensitivity for preoperative localization of PT adenomas and postoperative search of active PT tissue. FCH PET/CT is becoming a first-line imaging modality for preoperative and postoperative localization of active PT tissue in PHPT patients. Table of Contents- FCH physiologic uptake and normal biodistribution.- Imaging acquisition protocol. - Preoperative and postoperative localization of orthotopic and ectopic active PT tissue. - Recommendations for the use of FCH PET/CT in patients with PHPT. - Illustrative cases.

### **NMMIEE-47 Brain Death: Review of Neuroimaging criteria, Techniques and Pitfalls**

#### TEACHING POINTS

1) Overview of brain death imaging with a focus on the role of radionuclide perfusion scintigraphy for early and accurate determination of brain death. 2) Review brain death physiology, medical standards, clinical and imaging criteria, confounding variables and inconsistencies in the concept of brain death documentation.3) Highlight the imaging indications, patient preparation, techniques/protocols, instrumentation, imaging artifacts and pitfalls.

## TABLE OF CONTENTS/OUTLINE

• Introduction: Review of brain death imaging to assist radiologists in performing, interpreting and appropriate reporting of the results for the confirmation of brain death. Outline • Confirmatory examinations: Includes tests that show absence of brain electrical activity (EEG and somatosensory evoked potentials) and those that evaluate blood flow (radionuclide studies, multivessel angiography, CT/MR angiography). • Methods of evaluating blood flow: Contrast enhanced angiography, Transcranial Doppler ultrasound, Radionuclide brain flow scintigraphy. • Review of radionuclides-Tc-99m HMPAO-Tc-99m ECD-Tc-99 m DTPA-Tc-99 m Glucoheptonate-Tc-99 m TcO $_4$  • Pitfalls of radionuclide scintigraphy -False positive tracer activity due to infection, tumors, scalp hyperemia due to head trauma, CSF shunts, intracranial pressure transducer.-False negative results due to disruptions in the skull and scalp, as well as pressure on the portion of the scalp resting on a hard surface causing photopenic area on the flow study.

### **NMMIEE-48 The Utility of Brain Perfusion Single Photon Emission Computed Tomography (SPECT) in the Assessment of Neurodegenerative Diseases**

Participants  
Tomoki Imokawa, MD, Tokyo, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

SPECT, or Single Photon Emission Computed Tomography, is one of the nuclear medicine imaging modalities to evaluate cerebral hemodynamics. Cerebral perfusion studies contain much information useful for the diagnosis of various diseases, especially neurodegenerative diseases. This presentation will highlight the use of SPECT in the diagnosis of neurodegenerative diseases and

other conditions that cause dementia, such as cerebrovascular disease and idiopathic normal pressure hydrocephalus. The findings of SPECT have important clinical implications, and the application of the knowledge to MR perfusion imaging is also expected.

#### **TABLE OF CONTENTS/OUTLINE**

1. The Basics of SPECT 2. Alzheimer's Disease 3. Dementia with Lewy Bodies 4. Frontotemporal Dementia 5. Corticobasal Syndrome 6. Idiopathic Normal Pressure Hydrocephalus 7. Progressive Supranuclear Palsy 8. Multiple System Atrophy 9. Spinocerebellar Ataxia 10. Cerebrovascular Diseases 11. Creutzfeldt-Jakob Disease 12. Others

#### **NMMIEE-49 Advanced Cancer Imaging with Hyperpolarized<sup>13</sup>C-MRI: Techniques and Applications**

##### **TEACHING POINTS**

1. Hyperpolarized carbon-13 MRI (HP <sup>13</sup>C-MRI) is a promising metabolic imaging for oncology that employs dynamic nuclear polarization to enhance the polarization of solid-state compounds labeled with carbon-13, increasing signal by up to 50,000-fold, and allowing the detection of the probe and its downstream metabolites using a clinical MRI scanner. 2. HP <sup>13</sup>C-MRI using [1-<sup>13</sup>C]pyruvate enables non-invasive and rapid monitoring of the upregulated anaerobic glycolysis in cancer cells. MCT in the cellular membrane enables the uptake of [1-<sup>13</sup>C]pyruvate, which is then converted into [1-<sup>13</sup>C]lactate by LDH or into [1-<sup>13</sup>C]alanine by ALT or into <sup>13</sup>C-bicarbonate by PDH. 3. Hyperpolarization is transient and relaxes back to thermal equilibrium once leaving polarizer, providing an acquisition window of 2-3 minutes. MRI sequences are optimized to utilize the unrecoverable magnetization rapidly and efficiently. 4. Kinetic modeling involves developing a mathematical model that describes the rates at which probes are converted to products, while model-free metrics rely on metabolite ratios. 5. HP <sup>13</sup>C-MRI has been applied to prostate cancer, renal cell carcinoma, brain tumors, and breast cancer, showing its potential to distinguish between benign and malignant tumors, determine tumor aggressiveness, monitor response to therapy, and predict patient outcomes.

##### **TABLE OF CONTENTS/OUTLINE**

1. Introduction of HP <sup>13</sup>C-MRI. 2. Technical aspects: (a) <sup>13</sup>C labeled probes; (b) Probe preparation and pharmacy kit assembly; (c) Hyperpolarization, dissolution, and quality control; (d) Patient injection, imaging acquisition, and data analysis. 3. Clinical applications. 4. Conclusions.

#### **NMMIEE-5 Molecular Imaging of Dementia: A Case-Based Review**

##### **TEACHING POINTS**

Introduction: Molecular imaging plays an increasingly important role in the early identification and monitoring of various forms of dementia, as well as in selecting appropriate patients for therapy in these disorders. In this educational exhibit, we aim to review the pathologic basis and salient imaging findings of the most common causes of dementia, drawing on case examples from our institution. Teaching points/ Learning objectives: 1. Understand the basic pathologic processes responsible for the most common neurodegenerative processes as well as their relative prevalence. 2. Learn the normal and abnormal uptake patterns in the brain on various nuclear medicine studies, including FDG PET, amyloid PET, and DaTScan. 3. Learn what further imaging workup would be recommended for indeterminate findings on FDG PET.

##### **TABLE OF CONTENTS/OUTLINE**

Outline: 1. Background of dementia a. Definition b. Review of different neurocognitive domains i. Perceptual-motor function ii. Language iii. Executive function iv. Learning and memory v. Complex attention vi. Social cognition c. Review of the most common causes of dementia and their pathologic basis d. Review of various proteinopathies 2. Review of findings of most common causes of dementia on FDG and amyloid PET as well as DaTScan with associated case examples i. Alzheimer's disease ii. Vascular dementia iii. Mixed dementia iv. Dementia with Lewy Bodies v. Frontotemporal dementia vi. Corticobasal degeneration vii. Creutzfeldt-Jakob disease 3. Imaging using F-18-DOPA in parkinsonism 4. Suggested further workup based on imaging findings 5. Review amyloid and Tau imaging tracers and briefly discuss other functional tracers useful in neurodegenerative diseases

#### **NMMIEE-50 Radiation Safety in Theragnostics: Educational Simulated Real-life Scenarios**

Participants  
Kip Guja, MD, PhD, Stanford, CA (Presenter) Nothing to Disclose

##### **TEACHING POINTS**

Theragnostics is a rapidly growing field in nuclear medicine in the era of personalized medicine. Knowledge of radiation safety issues in targeted radionuclide therapies (TRT) is vital for delivering safe and effective patient care, and for maintaining the safety of healthcare workers involved in patient care. The objective of this educational exhibit is to address fundamental issues in radiation safety related to TRT in an engaging way by presenting educational real-life scenarios which may be encountered in a theragnostics clinic.

##### **TABLE OF CONTENTS/OUTLINE**

Educational real-life scenarios to be discussed in this exhibit include: (1) Dose calibrator fails quality control testing, (2) Discrepancy >20% between assayed and prescribed dose, (3) Misadministration of the wrong therapeutic radiopharmaceutical, (4) Preparation of the theragnostics treatment room and restroom, and (5) Patients with nephrostomy tubes referred for Lu-177 therapy, (6) Management of Lu-177 radionuclide spill, (7) Management of radioiodine spill (8) Precautions related to liquid I-131 therapy. The appropriate actions/response to each scenario will be summarized.

#### **NMMIEE-51 Prostate Cancer Theragnostics: Review and Early Insights**

##### **TEACHING POINTS**

1. Review the general characteristics of prostate cancer 2. Explore current treatment options and algorithms for prostate cancer, focusing on the increasing role of PSMA theragnostics 3. Establish a framework for the evaluation and selection of patients who would benefit from PSMA RLT 4. Understand the factors behind successful PSMA RLT therapy; including protocols for treatment, side effects/contraindications and the role of imaging/laboratory monitoring during treatment 5. Identify current ongoing research and unanswered questions in the role of PSMA RLT

##### **TABLE OF CONTENTS/OUTLINE**

I. Overview of prostate cancer. Epidemiology, diagnosis, and progressionb. Localized versus metastatic; Castration sensitive versus resistantII. Overview of current treatmenta. Medical and surgicali. Surgery and radiotherapyii. Androgen basediii. Chemotherapyb. Nuclear medicinei. Radium-223ii. 177Lu-PSMA-617III. Overview of 177Lu-PSMA-617a. Mechanism of actionb. Overview of trial results and evidenceIV. Treatment with 177Lu-PSMA-617a. Patient selectioni. Inclusion criteria and contraindicationsii. Choosing between Ra-223 and PSMA RLtb. Treatment protocolsV. Evaluation and monitoring of 177Lu-PSMA-617 treatment responsea. Adverse effects and managementb. SPECT monitoring between cyclesi. Range of responsesii. Imaging monitoring and adjusting therapyc. Criteria for cessation of therapyd. Case based review and examples.VI. Future directions and unanswered questionsa. Review of ongoing trials

## **NMMIEE-52 Beyond the Glowing Hues: A Comprehensive Review of False Positive Cases on FDG PET/CT**

Participants

Kota Yokoyama, PhD, Tokyo, Japan (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

FDG PET is one of the most widely used nuclear medicine examination in clinical use today, with high detection capability for malignant tumors and inflammatory diseases. On the other hand, its specificity for tumors is not high, making it difficult to distinguish between inflammation and tumors. In addition, with the recent rise in the price of therapeutic drugs, there are more opportunities to use it for treatment response assessment, and it is important to understand the changes that may be encountered after various types of treatment. This section will provide an overview of the physiologic accumulation of FDG PET/CT and the frequently encountered and somewhat rare false-positive cases (non-neoplastic lesions), presenting a wide range of cases from initial presentation to post-treatment.

### **TABLE OF CONTENTS/OUTLINE**

1. The basics of FDG PET/CT 2. Physiological uptake, Artifacts, reactive change, lipomatous hypertrophy, brown adipose3. Iatrogenic or post-treatment changes: radiation pneumonitis, radiation pulmonary fibrosis, radiation sialadenitis, radiation liver disease, postoperative PPFE, foreign body granuloma, thymic rebound, G-CSF reactive bone marrow, vaccine reactive accumulation, etc.4. Benign lesions: Pituitary adenoma, chronic thyroiditis, hypercellular bone marrow, desmoids, hypercellular bone marrow, etc.5. Inflammatory disease Sarcoidosis/sarcoid-like reaction, vasculitis, IgG4-related disease, Cattleman's disease, TAFRO syndrome, etc.6. Infectious diseases: Tuberculosis, mycosi fungoides, actinomyces/nocardia, echinococcosis, etc.

## **NMMIEE-53 New Era of Imaging of Parkinson's Disease and Atypical Parkinsonian Syndrome**

Participants

Yoshiaki Ota, MD, Ann Arbor, MI (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

1. Early diagnosis and treatment of movement disorders including Parkinson's disease are highly important to reducing the risk of disease progression and improving the quality of life. 2. Brain MRI, FDG-PET, dopaminergic imaging, cholinergic imaging and 123I cardiac meta-iodobenzylguanidine (MIBG) have been clinically utilized not only for differential diagnosis but also for providing disease prognosis. 3. Novel molecular imaging and brain MRI can aid in deepening the pathophysiology of movement disorders and in treatment development.

### **TABLE OF CONTENTS/OUTLINE**

1. Parkinson's disease and atypical Parkinsonian syndromes: (a) Parkinson's disease, (b) Progressive supranuclear palsy (PSP), (c) Multiple system atrophy (MSA), (d) Corticobasal degeneration (CBD), (e) Dementia with Lewy bodies (DLB) 2. Pathophysiology of Parkinson's disease: (a) Dual-hit hypothesis: a-synuclein pathology arises simultaneously in the olfactory bulb (OB) and dorsal motor nucleus of the vagus (DMV) and in the enteric nervous system (ENS) plexus. (b) Single-hit hypothesis: a-synuclein pathology arises in OB/DMV first or in ENS first. 3. Imaging modalities of Parkinson's disease and atypical Parkinsonian syndrome and common imaging features: (a) Brain MRI, (b) Advanced neuroimaging: Diffusion tensor imaging (DTI) and functional MRI (fMRI), neuromelanin-sensitive MRI (NM-MRI), (c) FDG-PET, (e) Dopaminergic imaging, (f) Cholinergic imaging, (g) Cardiac MIBG 4. Treatment options and imaging assessment of treatment response of Parkinson's disease and atypical Parkinsonian syndromes

## **NMMIEE-54 Nuclear Medicine Imaging in Epilepsy: What the Radiologist Needs to Know**

### **TEACHING POINTS**

1. Nuclear medicine imaging plays an essential role in the evaluation of medically refractory epilepsy patients. For these patients, surgery is effective provided there is a well-delineated epileptogenic focus. 2. Functional imaging methods—SPECT and PET—complement structural imaging, allowing accurate ictal focus localization even in the absence of a structural abnormality. 3. Comparison of ictal and interictal SPECT combined with MRI (SISCOM) increases the sensitivity for epileptogenic focus detection. 4. Interictal F-18 FDG PET helps to lateralize the epileptogenic focus, assess for other abnormalities, and guide further testing in pre-surgical planning. 5. Future endeavors include quantitative analysis improvements, neuroreceptor PET radiotracers, and multimodality imaging integration.

### **TABLE OF CONTENTS/OUTLINE**

1. Introduction of medically refractory epilepsy. 2. Overview of surgical options. 3. Description of the pre-surgical evaluation process, focusing on ictal and interictal SPECT and interictal FDG PET. 4. Presentation of radiopharmaceuticals and their characteristics. 5. Review of methodology, imaging protocols, and post-processing techniques. • Ictal and interictal SPECT • Interictal F-18 FDG PET 6. Illustration of SPECT and PET usage in ictal focus localization and pre-surgical guidance through a series of commonly encountered pathologies- temporal and extratemporal epilepsy, cortical dysplasia, arteriovenous malformations, encephalocele, tumors. 7. Review of emerging radiopharmaceutical imaging options.

## **NMMIEE-55 PSMA Radiotheranostics in Prostate Cancer: Principles, Practice, and Future Prospects**

Participants

Laszlo Szidonya, MD, PhD, Portland, OR (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

1. 177Lu-PSMA is a safe and effective therapy in metastatic castration-resistant prostate cancer. 2. Eligibility for treatment is

based on the uptake of lesions on PSMA PET.3. The degree of uptake on PSMA and FDG PET offers predictive and prognostic information.4. Post-therapy imaging is important to confirm tumor uptake of the therapeutic agent, monitor response, and identify progressing lesions.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction:a. Clinical overview of prostate cancer and treatment options.b. Concept of radiotheranostics.c. Data from the VISION and TheraP trials.2. Current practice:a. Eligibility for treatment.b. Therapy administration and dosing.c. Toxicity and side effects.3. Added value of imaging:a. Prognostic/predictive PET biomarkers:i. Qualitative parameters:1. Level of PSMA uptake relative to liver/spleen and salivary glands.ii. Quantitative parameters:1. Absolute uptake values (e.g. SUVmax).2. Total tumor burden.iii. PSMA/FDG concordance/discordance.b. Post-therapy imaging:i. SPECT quantification to predict response.ii. Detection of disease progression.4. Future directions:a. Timing, sequencing, and dose optimization.b. Potential role of personalized dosimetry.c. Alternative PSMA targeting molecules.d. PSMA therapy using alpha emitters.e. Combination therapy.

#### NMMIEE-56 Improving the Diagnostic Sensitivity of 13N-Ammonia PET Imaging: Creating Age- and Gender-Matched Normal Databases for Myocardial Flow Reserve Measurements

Participants

Takuji Nanno, Suita, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

13N-Ammonia myocardial perfusion PET imaging (ammonia PET), is a non-invasive, quantitative imaging method that enables the evaluation of myocardial blood flow (MBF) for detecting myocardial ischemia and assessing disease severity. Myocardial flow reserve (MFR) measurements, obtained by comparing stress and rest MBF ratios, provide important diagnostic and prognostic information for ischemic heart disease. However, clinical interpretation of MFR values depends on the normal population values, and the normal database (NDB) for MFR has not been sufficiently evaluated. Since MFR measurements vary, it is desirable to create age- and gender-matched NDBs for individuals under 70 years old as well as NDB for individuals over 70 years old. By comparing MFR values with the appropriate reference NDB, it is possible to evaluate the severity of ischemia in a more detailed and objective manner. This presentation aims to introduce the methods for creating age- and gender-matched NDBs and their usefulness in clinical cases, thereby improving the diagnostic sensitivity in ammonia PET.

#### TABLE OF CONTENTS/OUTLINE

1. Age and Gender Differences in MFR in ammonia PET 2. Creation of age- and gender-matched NDBs for MFR using Syngo MBF software 3. Clinical case 1: Normal perfusion with normal coronary artery 4. Clinical case 2: Mild ischemia with significant stenosis in RCA and D1 5. Clinical case 3: Multi-vessel CAD

#### NMMIEE-57 Nuclear Medicine Lung Perfusion (Q) Imaging: SPECT/CT Indications and Interpretation Pearls and Pitfalls

#### TEACHING POINTS

1. Highlight the PISAPED interpretation criteria for perfusion-only lung scans 2. Understand indications for and utility of SPECT/CT in lung perfusion scans 3. Recognize common pearls and pitfalls in the interpretation of Q scans

#### TABLE OF CONTENTS/OUTLINE

1. Perfusion-only lung imaginga. Historic use of V/Q scansb. COVID pandemic and perfusion-only scansc. 2022 Global contrast shortage crisis 2. Interpretation Criteriaa. PISAPED perfusion-only criteria b. PLOPED perfusion-only criteria 3. SPECT/CT Indicationsa. Non-wedge shaped perfusion defects b. Heterogeneous radiotracer uptake and distribution 4. Case Examplesa. COVID pneumonia with and without pulmonary embolism (PE) b. Emphysema as a mimic of PE c. Bronchopneumonia with and without PE d. CTEPH - missed on CTPA and better seen on Q scan e. PE with pulmonary infarct f. Pleural effusion masking PE on planar images g. Pulmonary masses as a mimic of PE h. Fibrosis as a mimic of PE 5. Teaching Pointsa. Indications and utility of SPECT/CT b. Common pitfalls of interpretation

#### NMMIEE-58 COVID-19 Pandemic and Its Impact on Nuclear Medicine with Teaching Pearls

Participants

Nick Balanda, BSc, Chicago, IL (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

COVID-19 is a multi-systemic viral disease also known as SARS-CoV-2 or severe acute respiratory syndrome coronavirus 2. Worldwide rapid emergence of the COVID-19 pandemic altered the practice of medicine including nuclear medicine. It is considered to be one of the most massive and chaotic challenges confronting global public health of our times. This educational exhibit aims to: 1. Summarize economic impact of COVID 19 in a tertiary care university teaching hospital. 2. Describe the adaptation to the pandemic by modification of various imaging protocols (for example Myocardial perfusion, V/Q scan, scheduling of PET CT after COVID-19 vaccination), highlighting the importance of CT portion of SPECT CT and PET CT, especially for lung findings. 3. Offer Teaching Pearls and a case-based multi-modality correlation of interesting COVID-19-related findings in nuclear medicine and PET CT imaging with a focus on the impact on patient management.

#### TABLE OF CONTENTS/OUTLINE

We present 15 interesting COVID-19-related findings in nuclear medicine and PET CT imaging with a focus on the impact on patient management. These cases include incidental findings secondary to vaccination and COVID-19 infection as well as modified imaging protocols and highlight important considerations for radiologists interpreting images in the era of COVID-19.

#### NMMIEE-59 Role of 18F FDG PET CT in Patients with Lymphoma Treated with CAR-T Cell Therapy: Current Concepts

Participants

Vanessa Murad, MD, Bogota, Colombia (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1) Understand the principles and biological effects of CAR-T cell therapy. CAR-T cell therapy is a novel cancer treatment based on the genetic modification of the patient-derived T cells by adding synthetic functional chimeric antigen receptors (CARs), which permit the identification of specific tumor antigens. 18F -FDG PET/CT (=PET CT) is the imaging of choice for pre and post CAR-T cell therapy assessment, in patients with metabolically active lymphomas. 2) Recognize the role of PET CT in pre-therapy assessment. Highly metabolically active disease and high tumor burden at baseline PET CT, are predictors of unfavorable patients' outcomes and risk of therapy related toxicities. 3) Define the optimal timing of PET CT in therapy response assessment, as well as its impact on management (with demonstrative cases). PET CT 1-month after the infusion is the preferable timing for therapy response assessment, and may trigger a possible therapeutic intervention. A few cases of pseudo-progression after therapy have been described; however, all have been during the first few days after the infusion, with complete resolution at 1-month PET/CT. 4) Identify the main toxicities associated with CAR-T cell therapy and the role of PET CT in their evaluation.

#### **TABLE OF CONTENTS/OUTLINE**

1) Introduction to CAR-T cell therapy, brief history and indications. 2) Role of PET CT in CAR-T cell therapy: 2.1) Pre-therapy considerations. 2.2) Post-therapy response assessment: timing, impact and imaging interpretation including pseudo-progression evaluation. Demonstrative cases. 2.3) Evaluation of toxicities during CAR-T cell therapy: Cytokine release syndrome, immune effector cell-associated neurotoxicity syndrome and infection.

#### **NMMIEE-6 Acute Adverse Events in Theragnostics: Educational Simulated Real-life Scenarios**

Participants

Kip Guja, MD, PhD, Stanford, CA (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Theragnostics is a rapidly growing field in nuclear medicine in the era of personalized medicine. Recognizing and appropriately managing acute adverse events associated with targeted radionuclide therapies (TRT) is vital for delivering safe and effective patient care. The objective of this educational exhibit is to highlight management of acute adverse associated with TRT in an engaging way by presenting simulated real-life scenarios which may be encountered in a theragnostics clinic.

#### **TABLE OF CONTENTS/OUTLINE**

Educational simulated real-life scenarios to be discussed in this exhibit include: (1) Extravasation of 177-Lu radionuclide, (2) Management of potential complications associated with amino acid infusion during Lu-177 DOTATATE therapy, (3) Management of carcinoid crisis after Lu-177 DOTATATE therapy, and (4) Mitigation of flare reaction to TRT (5) Management of acute sialadenitis with Lu-177 PSMA-617 therapy. The appropriate actions/response to each scenario will be summarized.

#### **NMMIEE-60 Pediatric PET/MRI: The How and Why**

Participants

Helen Nadel, MD, FRCPC, Menlo Park, CA (*Presenter*) Consultant, ICON plc;;

#### **TEACHING POINTS**

Since its introduction a decade ago, integrated PET/MRI has been established as a hybrid imaging modality that provides unique diagnostic information. A key application of PET/MRI is pediatric imaging for oncologic, neurologic, inflammatory, and metabolic conditions given its reduced radiation exposure and potential for reduction of administered radiotracer dose. Despite its successful clinical adoption, the availability of PET/MRI for pediatric patients is still limited to larger academic and clinical centers due to high complexity studies which require thorough patient preparation and exam planning, skilled image acquisition and careful image analysis and interpretation. These factors limit the accessibility of PET/MRI not only for imaging specialists in training, but also for experienced radiologists and nuclear medicine physicians. The purpose of this contribution is to provide guidance and the value of pediatric PET/MRI with clinical examples drawn from pediatric PET/MRI programs world-wide.

#### **TABLE OF CONTENTS/OUTLINE**

1. Common clinical indications for PET/MRI in pediatric patients 2. Commonly used PET tracers for these indications 3. PET/MRI instrumentation 4. Patient preparation (patient information, dietary aspects, sedation, anesthesia) 5. Examination planning and protocol definition 6. Examination execution 7. Aspects of image processing 8. Interpretation and reporting 9. Pitfalls and troubleshooting

#### **NMMIEE-61 Role of FDG PET/CT in Therapeutic Decision Making in Lymphoma**

#### **TEACHING POINTS**

1. Therapeutic options for lymphoma include chemotherapy, monoclonal antibody therapy, radiation therapy, stem cell transplant and chimeric antigen receptor therapy (CAR-T). FDG PET/CT plays an integral part in therapeutic decision making. 2. Interim FDG PET/CT allows response-adapted treatment with either reduction in the number of chemotherapy cycles or early use of more aggressive treatment. 3. In patients receiving CAR-T, response assessment on FDG PET/CT should be guided by LYRIC response criteria. 4. Interpretation of interim and post treatment FDG PET/CT can be confounded by thymic hyperplasia, infection/inflammation, immune related adverse events, marrow stimulation by granulocyte colony-stimulating factor (G-CSF). 5. FDG PET/CT plays a role in evaluating disease relapse or transformation and provides guide to biopsy.

#### **TABLE OF CONTENTS/OUTLINE**

1. NCCN treatment guidelines- illustrations of role of FDG PET/CT in therapeutic decision making. 2. Overview of CAR-T3. Illustrate staging by FDG PET/CT 4. Illustrate Lugano and LYRIC treatment response criteria for interim and end of treatment FDG PET/CT 5. Illustrate pitfalls in treatment response assessment- thymic hyperplasia, infection/inflammation, irAEs (immune related adverse events), marrow stimulation by G-CSF 6. Illustrate role of PET/CT in identifying disease relapse or transformation

#### **NMMIEE-62 Functional Imaging of Liver and Spleen Using Tc 99m Sulphur Colloid. A Case Based Multi-modality Pictorial Review with Teaching Pearls**

Participants

Nick Balanda, BSc, Chicago, IL (*Presenter*) Nothing to Disclose

## TEACHING POINTS

Nuclear Medicine Tc-99m Sulphur colloid liver-spleen scan has declined over recent years, however, it is still very useful in certain specific scenarios where it can be virtually diagnostic or confirmatory. Our case-based educational exhibit aims to: 1. Evaluate functional abnormalities of the liver and spleen based on the location and amount of radiotracer uptake. 2. Review specific scenarios for evaluating intra-pancreatic, left hemi abdominal, mediastinal, and left lung masses by liver spleen scan as questioned on conventional anatomic imaging with multi-modality correlation. 3. Evaluate a few specific space-occupying hepatic and splenic masses with multi-modality correlation. 4. Importance of SPECT CT over planar imaging.

## TABLE OF CONTENTS/OUTLINE

Our case-based educational exhibit includes: Assessment for Hypersplenism in patients with thrombocytopenia, evaluating for cirrhosis, evaluating/confirming the presence of accessory/ectopic splenic tissue, evaluating specific intrapancreatic lesions, Hepatic cysts, hepatic hemangiomas, FNH, splenic infarcts, Budd-Chiari syndrome.

## NMMIEE-63 Pictorial Review of MRI Fused with Somatostatin Receptor PET Tracers in Meningiomas: Does the Integration of Molecular and Anatomic Imaging Impact Clinical Management

### TEACHING POINTS

1. Physiologic avidity of somatostatin receptor PET tracers is minimal in the brain parenchyma, providing an excellent tumor background ratio (TBR), unlike FDG PET. 2. Somatostatin receptor PET assists in targeting meningiomas in complex anatomic regions such as the skull base and identifying additional sites. 3. MRI fused somatostatin receptor PET allows for distinguishing enhancing scar tissue from meningiomas. 4. Somatostatin receptor PET impacts clinical and radiation therapy (RT) management leading to changes in the clinical approach and/or modifications in radiation treatment volumes. 5. Somatostatin receptor PET has potential in neurotheranostics to provide diagnostic imaging to guide molecular therapeutic radionuclides, such as <sup>177</sup>Lutetium-DOTATATE.

### TABLE OF CONTENTS/OUTLINE

1. General considerations: § Imaging evaluation of intracranial meningiomas in NM and anatomic modalities § Review the mechanism of Somatostatin Receptor Targeted PET Imaging 2. Integration of PET and imaging guided therapy: Radiotherapy fundamentals. 3. Case-based approach of impact on patient's treatment decisions. 4. Somatostatin receptor PET pitfalls: What you need to know? Summary: Our preliminary experience of MRI fused with somatostatin receptor PET has shown to enhance identification of disease extent compared to MRI only, especially in patients with prior treatments and extracranial components, impacting management decisions and providing information for potential radionuclide targeted therapy.

## NMMIEE-64 Radiotheranostics in Prostate Cancer: Current Practice and Future Outlook

Participants

Daniel Kwon, MD, PhD, Coquitlam, BC (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Next generation radiotheranostics are effective in patients with prostate cancer, with studies supporting imaging- and treatment-based on the molecular determinants of patient's disease. 2. Prostate-specific membrane antigen (PSMA)-targeted radiotheranostics represent the frontier of this paradigm, with PSMA-targeted imaging showing superiority compared to conventional imaging for staging and monitoring patients during therapy. 3. <sup>177</sup>Lu-based PSMA-targeted and <sup>223</sup>Ra radioligand therapy are effective in metastatic prostate cancer, and multiple clinical trials are exploring further indications. 4. Dosimetry will personalize doses per patient to maximize therapeutic benefit while minimizing toxicity. 5. Other radioisotopes (e.g. <sup>225</sup>Ac, <sup>161</sup>Tb) and molecular targets (e.g. gastrin-releasing peptide receptor (GRPR)) are being explored for radiotheranostic applications in prostate cancer.

### TABLE OF CONTENTS/OUTLINE

- Overview of prostate cancer: current diagnosis and treatment
- Introduction to radiotheranostics: common theranostic radioisotopes and their selection
- PSMA-targeted imaging and radioligand therapy: recent trial data, indications, clinical pearls, image-guided monitoring, and case examples
- Radium-223: indications, clinical pearls, and case examples in bone metastases in prostate cancer
- Dosimetry: principles and applications for personalized radioligand therapy
- The Future: Ongoing PSMA-targeting radiotheranostic clinical trials, emerging theranostic radioisotopes and radiotheranostic agents (e.g. GRPR)
- Conclusions and Summary

## NMMIEE-65 18F-FDG PET/CT: Least Useful to Most Important Imaging Modality for Evaluation of Prostate Cancer

### TEACHING POINTS

1. Understand the roles and mechanism of PSMA and FDG PET/CT imaging in evaluating prostate cancer at different stages of the disease. 2. When reading PSMA PET/CT scans, interpreters should always correlate with clinical history such as PSA level, disease stage, and prior treatments. If PSMA positive lesions are not in proportion to high PSA level or if lesions are only seen on CT without PSMA avidity, think of transformation of prostatic adenocarcinoma (CRPC-Adeno) to treatment-induced neuroendocrine prostate cancer (t-NEPC). Consider <sup>18</sup>F-FDG PET/CT for further evaluation. In some cases, <sup>68</sup>Ga-DOTATATE PET/CT may be helpful.

### TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Case examples 3. Educational objectives 4. Summary

## NMMIEE-7 Perineural Tumoral Spread- A Search Pattern for PET Scan Readers

### TEACHING POINTS

1. Perineural tumor spread is the macroscopic analogue of perineural tumor invasion. 2. F-18 FDG PET CT is often used in staging and response assessment in head and neck malignancies and has an important role in identification of perineural tumor spread. 3. Familiarity with relevant cranial and peripheral nerve anatomy, pattern of perineural tumor spread and associated PET imaging appearance will lead to improved detection of this important prognosticating factor. 4. FDG uptake resulting from postsurgical and post-radiotherapy inflammation in addition to other infectious and inflammatory causes may lead to false positive cases mimicking perineural tumor spread.

## TABLE OF CONTENTS/OUTLINE

1. Background- what's in a name- perineural tumor spread versus perineural tumor invasion.2. Overview of relevant cranial nerve and peripheral nerve anatomy.3. Pathophysiology of perineural tumor invasion and perineural tumor spread.4. Tumor types, sites, and clinical presentation of perineural tumor spread.5. Case based review of PET patterns of perineural tumor spread in the head and neck.6. Other usual and unusual locations for perineural tumor spread on PET imaging.7. Search pattern for peritumoral spread for PET scan readers.8. Imaging differentials for consideration and false positives. 9. Prognosis and treatment considerations in patients with perineural tumor spread.

### **NMMIEE-8 Imaging Appearances of Large Vessel Vasculitis on 18F-FDG PET/CT: The Dark, the Bright, and the In-between**

Participants

Rita Maria Lahoud, MD, Shelton, CT (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- 18F- FDG PET/CT can be used in the diagnostic evaluation of vasculitis, to determine the distribution of involvement, the activity status of the disease, and to assess treatment response.
- Where possible, CT angiography should be added to 18F-FDG PET/CT as it not only improves diagnostic accuracy but can identify frequent complications such as aneurysm formation or vascular dissection.
- PET vascular activity score (PETVAS) is a grading system that provides qualitative and quantitative assessment.
- Limitations include superficial cranial vessel involvement, extensive atherosclerosis, and persistent uptake in remission limiting the use of PET/CT for routine follow-up.
- Systemic rheumatologic conditions, including Erdheim Chester and IgG4 Related Disease can have secondary involvement of the large vessels, mimicking a large vessel vasculitis. It is important to recognize their distinguishing features and patterns of involvement on 18F- FDG PET/CT.

## TABLE OF CONTENTS/OUTLINE

1. Introduction to Large Vessel Vasculitis: a. GCA and PMR b. Takaysu's 2. Role of PET/CT in the Evaluation of LVV a. Disease activity b. Extent of involvement c. Biopsy Target d. Response Assessment 3. PET/CT protocol a. General patient preparation b. Impact of glucocorticoids c. Incubation time d. Contemporaneous CT angiogram 4. Common Imaging Appearances of LVV on PET/CT a. GCA pre and post therapy b. Takayasu's c. TIPIC variant of GCA 5. Differential Considerations a. Erdheim Chester b. IgG4 related disease 6. Diagnostic Accuracy of PET/CT

### **NMMIEE-9 Epilepsy Beyond HARNESS-MRI Protocol through Hybrid PET-MRI and Advanced MRI Imaging**

Participants

Piedad Acosta Mora, MD, Mexico City, Mexico (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- To learn the causes of drug-resistant epilepsy and structural alterations in neuroimaging.- To recognize the spectrum of MRI sequences optimized for epilepsy and to implement the use of HARNESS MRI protocol.- To review advanced neuroimaging techniques (functional, metabolic, post-processing.) and to explain the utility in the drug-resistant epilepsy - To evaluate the clinical impact of hybrid FDG -PETMRI in decision-making in drug-resistant epilepsy- To understand how hybrid imaging with PETMRI optimizes the subtle epileptogenic lesions detections and improves postsurgical seizure outcome.

## TABLE OF CONTENTS/OUTLINE

1.Introduction2.Classification of seizure types3.Causes of drug-resistant epilepsy 4.MRI sequences optimized for epilepsy - HARNESS MRI protocol5.Advanced neuroimaging techniques - BOLD- MRI functional - Texture analysis - Spectroscopy - Diffusion tensor imaging (DTI) and fiber tractography 6.Role of hybrid FDG-PETMRI in epilepsy - Indications - Preparation - Technique and recommendations for acquisition - Normal patterns of brain FDG uptake - Cortical analysis 7.Case-based learning 8.Conclusions

NMMIEE-1

### What Radiologists Need to Know About Immune-related Adverse Events: Clinical Significance of FDG-PET/CT Diagnosis of Immune-related Adverse Events

#### Participants

Mana Ishibashi, Hiroshima, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Immune-related adverse events (irAE) are common in patients receiving immune checkpoint inhibitors. Frequency varies by molecular target of the agent in use, with irAE of any grade reported approximately 80-90%. Pneumonitis, hypothyroidism, arthralgias, and cutaneous reactions are most often seen with PD-1/PD-L1 inhibitors, and colitis and hypophysitis with CTLA-4 inhibitors. FDG-PET/CT is used to assess the malignancy; it is also able to detect tissue inflammation, one of the hallmarks of irAE. This unique ability sets FDG-PET/CT apart from CT and MRI and potentially enables the early identification and therapeutic intervention in patients with irAE prior to their developing clinical symptoms. Depending on the site, particularly in lymph nodes, an irAE-related uptake may mimic metastases or disease progression.

#### TABLE OF CONTENTS/OUTLINE

1. Basic information about immune checkpoint inhibitors  
2. The mechanism of autoimmune-reactions in patients receiving immune checkpoint inhibitors  
3. FDG-PET/CT findings of irAE  
4. Differential diagnosis of irAE and other pathologies

Printed on: 04/12/24

NMMIEE-10

### Imaging of Thyroid Cancer Post-thyroidectomy: Primer for Radiologists

#### TEACHING POINTS

1. Differentiated thyroid cancer (DTC) arising from thyroid follicular epithelial cells, comprising > 90% of all thyroid cancers. 2. After thyroidectomy, depending on post-operative risk stratification, the primary goal of radioactive iodine (RAI) can include remnant ablation, adjuvant therapy or treatment of known disease. A whole-body scan performed following administration of therapeutic RAI identifies the presence of iodine-avid thyroid tissue, both normal and malignant, allowing staging of the disease. 3. Cervical ultrasound is recommended for surveillance of the thyroid bed and regional lymphadenopathy post-thyroidectomy. 4. Serum Thyroglobulin (Tg) and anti-Tg antibodies are important in the follow-up of these patients; rising levels would warrant further evaluation with RAI imaging. 5. 18FDG-PET scanning should be considered in high-risk DTC with elevated serum Tg but negative RAI imaging. Alternatives would include CT imaging of the chest and if negative CT imaging of the abdomen.

#### TABLE OF CONTENTS/OUTLINE

1. Overview of differentiated thyroid cancer 2. Goals of treatment, including the role of radioactive iodine 3. Basics of Thyroglobulin and anti-Thyroglobulin interpretation for monitoring for thyroid cancer recurrence/disease 4. Common sites of disease recurrence and metastasis 5. Role of US and other imaging modalities (RAI, CT, MRI, PET/CT) in the follow-up of thyroid cancer 6. Spectrum of imaging appearances on the various modalities after primary treatment of thyroid cancer 7. Important imaging pitfalls leading to diagnostic errors and misinterpretation

Printed on: 04/12/24

### Imaging of Dementias using 18F-FDG PET: Unique and Overlapping Features

#### Participants

Rita Maria Lahoud, MD, Shelton, CT (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Establishing a specific diagnosis in cases of dementia may be challenging as symptoms and features often overlap. Characteristic metabolic patterns on 18F-FDG PET, in concert with clinical features, aid in reaching an accurate and timely diagnosis.
- Technical considerations and proper patient preparation are necessary to minimize confounders.
- Alzheimer's dementia represents the most common neurodegenerative process encountered on PET/CT and manifests with regional hypometabolism of the posterior temporoparietal regions and cingulate gyrus, although there are variations and overlap with other neurodegenerative processes.
- Reduced radiotracer uptake predominantly involves the frontal and anterior temporal lobes in frontotemporal dementia.
- In Lewy body dementia, the occipital cortex is mainly affected with sparing of the posterior cingulate gyrus, "the cingulate island sign".
- Asymmetric cortical involvement and decreased uptake in the basal ganglia and thalami are characteristic of corticobasal degeneration.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction to Dementias a. Alzheimer's b. Frontotemporal c. Lewy Body d. Posterior Cerebral Atrophy e. Corticobasal Degeneration f. NMDA Encephalitis  
2. 18F-FDG PET in the evaluation of dementias a. Rationale for use b. Normal brain metabolic patterns c. Patient preparation and technique  
3. Metabolic pattern interpretation: a. Unique and overlapping imaging patterns b. Confounding factors

NMMIEE-12

### Hybrid Imaging in Infective Endocarditis

#### Participants

Antonio Lopez, BA, West Reading, PA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Infective endocarditis (IE) is a serious infection of the heart valves caused by microorganisms, resulting in inflammation and potential complications such as heart failure, stroke, or sepsis. IE is typically diagnosed using the modified Duke criteria, which examines pathologic and clinical criteria; however, due to a variety in presentation and complicating patient factors, I remains a diagnostic challenge. Patients with prosthetic valves (PV) or intracardiac devices (ICD) are at a higher risk for IE, are more difficult to diagnose with IE, and have higher mortality than patients without these cardiac interventions. Combination of cardiac CT and FDG-PET/CT is currently being investigated for adjunct use in I diagnosis in this patient population, which preliminary data shows improve diagnostic accuracy. Here we examine the use of FDG-PET and cardiac CT in diagnosing I in patients with PV and ICD, including a discussion on common cardiac and non-cardiac manifestations of IE on imaging and an examination of its role in future diagnostic algorithms.

#### TABLE OF CONTENTS/OUTLINE

Describe current diagnostic methods for IE. Examine the use of Cardiac CT and PET/CT in I diagnosis for patients with PV and ICD, including key imaging features. Discuss the future incorporation of hybrid imaging in I diagnosis.

NMMIEE-14

### Findings of Primary and Secondary Breast Malignancies on Dotatate PET/CT

#### Participants

Lauren Hubbard, MD, Salt Lake City, UT (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Review somatostatin receptor-based PET imaging and normal distribution. Positive radiotracer uptake in the breast on Dotatate PET can be seen with metastatic neuroendocrine tumors. Metastatic neuroendocrine tumors to the breast can result in corresponding mammogram findings indistinguishable from a primary breast malignancy. Primary breast malignancies can also demonstrate positive Dotatate PET uptake due to variable somatostatin receptor expression. Invasive lobular carcinoma can demonstrate low to absent abnormal uptake on FDG-PET/CT, but can demonstrate positive uptake on Dotatate-PET/CT.

#### TABLE OF CONTENTS/OUTLINE

a. Review of somatostatin receptor-based PET imaging and normal distribution. b. Case presentations of 5 cases of dotatate PET findings of primary and secondary breast malignancies i. A case of biopsy-proven incidentally discovered invasive ductal carcinoma on Dotatate-PET/CT for evaluation of metastatic neuroendocrine tumor. ii. A case of incidentally discovered invasive lobular carcinoma on Dotatate-PET/CT for metastatic neuroendocrine tumor with comparison to FDG- and 18F-Fluoroestradiol-PET/CT. iii. A case of neuroendocrine tumor metastases to the bilateral breasts with corresponding mammographic findings. iv. A case of neuroendocrine tumor metastases to the left breast with additional systemic sites of metastatic disease. v. A case of bilateral dotatate PET avid breast lesions, histologically proven to be atypical carcinoid tumors of the breast. c. Conclusions/Future Directions

Printed on: 04/12/24

### PET-CT 18F-FES: Selecting Patients Who Will Benefit from Endocrine Therapy

#### Participants

Victor Osaki, BMedSc, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Invasive lobular carcinoma (ILC), the second-most prevalent invasive breast cancer subtype comprising approximately 15% of breast cancers;
- ILC is nearly always (95%) estrogen receptor (ER) positive;
- The determination of ER expression by immunohistochemistry has several limitations;
- PET-CT with 18F-fluoroestradiol (PET-FES) has emerged as a diagnostic method that allows evaluating the ER expression status of breast cancer lesions in a non-invasive way;
- Patients with estrogen receptor positive breast cancer benefit from endocrine therapy by blocking these receptors on tumor cells, preventing tumor progression. Some patients, though, have immunochemistry showing positive receptors and PET-CT with 18F-FES with lesions not showing uptake. In these cases we suppose the estrogen receptors are non-functioning ones and, therefore, patient will not benefit from endocrine therapy.

#### TABLE OF CONTENTS/OUTLINE

- Introduction;
- Objective;
- Discussion;
- Clinical and epidemiologic aspects;
- Show cases that are functioning estrogen receptor positive and non-functioning estrogen receptor;
- Discuss endocrine therapy in non-functioning ER+ cancer;
- Take home messages;
- References.

NMMIEE-16

### The Value of 18F-FDG-PET-CT in the Management of Head and Neck Tumors

#### TEACHING POINTS

To understand the role of 18F-FDG PET CT in the diagnosis, staging, treatment response assessment and radiotherapy treatment planning in head and neck tumors.

#### TABLE OF CONTENTS/OUTLINE

18F-FDG PET-CT is a widely used diagnostic tool in the evaluation of head and neck squamous cell cancers. It is at least as sensitive as MRI or CT in detecting the primary head and neck tumors, but there is no clear evidence of routine use in T staging, due to low spatial resolution and the presence of physiologic uptake on PET. The meta-analysis shows 18F-FDG PET-CT has high sensitivity (79%) and specificity (86%) for N staging, being superior to CT and MRI. For distant spread and second primary cancer detection, 18F-FDG PET-CT may be superior to whole body MRI, while both have high NPV. For the detection of synchronous primary tumor the pooled sensitivity and specificity is above 95%. The meta-analysis of 27 studies shows the high rate of detection of recurrence or residual tumor with 18F-FDG PET-CT (PPV-75 %, NPV-94%). Performed 12 months after therapy for detection of recurrence, the sensitivity and specificity has been reported as high as 100%. The recent response evaluation criteria-so called Hopkins criteria-has high NPV and is characterized by high inter-reader agreement. PET-CT based contouring during radiotherapy treatment planning is more accurate than CT based contouring in terms of gross tumor volume (GTV). Recent advances in hybrid imaging of head and neck tumors include the introduction of integrated PET MRI systems. Studies have shown the intratumoral heterogeneity of FDG uptake, as well as PET-derived volumetric parameters, such as MTV and TLG to be important prognostic factors for disease recurrence, progression and survival.

### **PET-CT 18F-FES: The Use in Clinical Practice in One of the Largest Private Health Centers in Brazil**

#### **Participants**

Victor Osaki, BMedSc, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

- PET-Fluorestradiol (FES) is a type of Positron Emission Tomography (PET) imaging agent used to detect estrogen receptor-positive (ER+) breast cancer. FES is a synthetic form of estrogen that has been radiolabeled with a positron-emitting isotope, the fluorine-18;
- When 18F-FES is injected into the body, it binds to estrogen receptors on breast cancer cells, allowing PET imaging to detect the presence and location of these cancer cells;
- PET-FES imaging can provide valuable information to healthcare professionals about the extent of ER+ breast cancer, as well as guide treatment decisions;
- PET-FES has emerged as a diagnostic method that allows evaluating the ER expression status of breast cancer lesions in a non-invasive way;
- In addition to breast cancer, PET-FES imaging has also been used in research to investigate other estrogen-receptor positive cancers, such as ovarian and endometrial cancer.

#### **TABLE OF CONTENTS/OUTLINE**

- Clinical and epidemiologic aspects;
- Show the possible applications of PET-CT with 18F-FES and show its applicability in clinical practice in our hospital.
- Take home messages;
- References.

### Gallium-68 DOTATATE PET for the Imaging of Non-Gastrointestinal Neoplasm: A Review

#### Participants

Amar Shah, MD, Phoenix, AZ (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Somatostatin-receptor analogue based imaging, including Gallium(Ga)-68 DOTATATE PET/CT, has long played a central role in the evaluation of gastroenteropancreatic neuroendocrine tumor. However, Ga-68 DOTATATE has a variety of clinical applications beyond this, both in oncologic pathologies. In this exhibit, we aim to review Ga-68 DOTATATE physiology and its use beyond gastroenteropancreatic neuroendocrine tumor. 1. Review physiology of Ga68-DOTATATE distribution and uptake. 2. Catalogue non-gastrointestinal uses, both oncologic and nononcologic, of Ga-68 DOTATATE based imaging. 3. Highlight pitfalls of Ga68-DOTATATE imaging.

#### TABLE OF CONTENTS/OUTLINE

1. Review normal Ga-68 DOTATATE distribution and mechanism of uptake. 2. Non-gastrointestinal tumoral indications. a. Meningioma b. Medullary thyroid cancer c. Paraganglioma d. Phosphaturic mesenchymal tumor e. Pulmonary carcinoid 3. Pitfalls of Ga-68 DOTATATE PET/CT.

### FDG PET/CT in Evaluation of Cardiac Device Infections: What an Imager Should Know

#### TEACHING POINTS

FDG PET/CT is increasingly utilized for the diagnosis and evaluation of cardiac device infections. The objective of this case-based educational exhibit is to 1) review established and emerging applications of FDG PET/CT in the diagnosis of cardiac device infections 2) review protocols and guidelines for integrating FDG PET/CT in the diagnosis of cardiac device infections 3) highlight interpretation criteria, pearls, and pitfalls of FDG PET/CT for cardiac device infections. Implementing this knowledge is important to avoid errors and provide accurate imaging interpretation for cardiac device infection.

#### TABLE OF CONTENTS/OUTLINE

The most demonstrative cases of cardiac device infections noted on FDG PET/CT performed at our tertiary care academic institution for evaluation of cardiac device infections were selected to highlight the teaching points for this exhibit, including: 1) cardiac implantable electronic device (CIED) infection 2) left ventricular assist device (LVAD) infection 3) prosthetic valve endocarditis. We will summarize take-home points to facilitate transfer of knowledge.

### Skeletal Muscle Uptake in FDG-PET: Physiology and Pathology, Pearls and Pitfalls

#### Participants

Jessica Dobson, MD, Halifax, NS (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

<sup>18</sup>F-fluorodeoxyglucose (FDG)-PET is commonly used in oncology, and while key for staging may also reveal nonspecific findings related to any number of neoplastic, infectious, and inflammatory etiologies. Despite the ubiquity of FDG-PET, intense skeletal muscle uptake remains an uncommon and sometimes unexpected finding. Patterns of uptake are often similar between vastly different entities, and the interpreting physician must be familiar with these entities to provide a useful diagnosis or differential. This exhibit will review a series of local cases demonstrating skeletal muscle FDG uptake and discuss the clinical and imaging context leading to the diagnosis, with the goal of conveying an understanding of skeletal muscle uptake on FDG-PET and considerations to provide a relevant differential diagnosis and advise on appropriate next steps.

#### TABLE OF CONTENTS/OUTLINE

1. Overview normal physiologic distribution of FDG; 2. Review the biochemical basis of physiologic and pathologic skeletal muscle FDG uptake; 3. Discuss the differential considerations for skeletal muscle uptake, including physiologic, inflammatory, infectious, and neoplastic etiologies, and possible mimics of skeletal muscle uptake on FDG-PET; 4. Analyze local cases of skeletal muscle uptake with emphasis on imaging patterns and clinical indicators guiding diagnosis.

Printed on: 04/12/24

NMMIEE-20

### PET-CT Utility in Aortic Disease: Applications and Observations - A Comprehensive Review

#### TEACHING POINTS

PET/CT allows for the non-invasive evaluation of aortic inflammation, wall instability, and clinical symptoms, thereby improving the prediction of individual aneurysm rupture risk. Additionally, PET/CT imaging can aid in determining the age and degree of risk in patients with acute aortic dissection (AAD) and the need for surgery. Stratification of AAD patients based on FDG uptake may predict short- and midterm outcomes. PET/CT imaging has also allowed for preoperative localization of areas with increased risk of rupture correlating with increased FDG uptake within the aneurysm wall in abdominal aortic aneurysm suggesting that FDG-PET/CT imaging may be a novel approach to identifying AAA at risk for rupture. FDG uptake in the aortic wall can also be used as a biomarker for the evaluation of vulnerable atherosclerotic activity. PET/CT can also aid in distinguishing between acute and chronic aortic dissection. In patients with acute dissection, PET/CT imaging showed elevated metabolic activity in fresh lacerated segments of the aortic wall, while stable chronic aortic dissection showed no increased metabolic activity. This differentiation is crucial for appropriate management and predicting outcomes.

#### TABLE OF CONTENTS/OUTLINE

I. Introduction II. PET/CT in the evaluation of aortic disease A. Aortic aneurysms 1. Prediction of individual rupture risk 2. Preoperative localization of areas with increased FDG uptake B. Aortic dissection 1. Determining the need for surgery 2. Distinguishing between acute and chronic dissection 3. Vasculitis/infectious Aortitis III. PET/CT in the evaluation of arterial atherosclerotic activity A. FDG Uptake as an index for atheroma cellular content and vulnerability V. Conclusion

### PSMA PET/CT and Spectrum of Nonprostatic Disease

#### Participants

Qiubai Li, Dallas, TX (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Prostate-specific membrane antigen (PSMA) based radiopharmaceutical 18F-PSMA and 68Ga-PSMA for imaging of prostate cancer.
- PSMA PET/CT plays a key role in diagnosis, staging and evaluation of treatment response of prostate cancer
- PSMA uptake on PET/CT can be divided into prostatic disease and nonprostatic disease. Comparison between cytoplasmic PSMA expression in nonprostatic disease and apical PSMA expression in prostate cancer can help to differentiate these conditions.
- The purpose of this presentation is to introduce of spectrum of nonprostatic disease on PSMA PET/CT which may be interpreted as metastatic disease.
- Recognizing the false positive imaging findings can help narrow the differential diagnosis and triage appropriate patient care

#### TABLE OF CONTENTS/OUTLINE

- PSMA uptake and CNS disease
- PSMA uptake and PNS disease
- PSMA uptake and lacrimal gland disease
- PSMA uptake and thyroid disease
- PSMA uptake and inflammatory/inflammatory disease
- PSMA uptake and lung disease
- PSMA uptake and liver disease
- PSMA uptake and kidney disease
- PSMA uptake and adrenal gland disease
- PSMA uptake and bone disease
- PSMA uptake and chronic lymphocytic leukemia

### FDG PET: Not Just a One-trick Pony: Non-oncologic Uses of FDG PET Imaging

#### TEACHING POINTS

The purpose of this exhibit is to:- Understand the underlying physiologic mechanism of FDG PET and conventional clinical applications- Discuss non-oncologic pathologies that can be evaluated on FDG PET, including those which may mimic other neoplastic processes.- Examine the pros and cons of utilizing FDG PET versus conventional imaging modalities in non-oncologic applications.

#### TABLE OF CONTENTS/OUTLINE

Mechanism of Action of FDG PET  
Head and Neck applications- Seizures- Dementia/neurocognitive disease- Differentiating CNS lymphoma versus toxoplasmosis  
Chest and Cardiac applications- Sarcoidosis- Evaluating for hibernating myocardium- Cardiac/pericardiac infection myocarditis- Incidental infection/inflammation, including organizing pneumonia  
Abdominal- Infection in polycystic liver or kidney disease- Infection in mucinous peritoneal carcinomatosis- Autoimmune pancreatitis/ IgG4 related disease- Incidental infection/inflammation including: inflammatory bowel disease, hepatitis, pyelonephritis  
Vascular- Aortitis vasculitis- Inflammatory plaques- Incidental findings including: endoleak and deep vein thrombosis  
Musculoskeletal- Chronic recurrent multifocal osteomyelitis (CRMO) synovitis, acne, pustulosis, hyperostosis, and osteitis (SAPHO) syndrome- Non-post-operative spinal infections- Peripheral bone osteomyelitis- Septic arthritis  
Multisystem- Sarcoidosis, tuberculosis, granulomatous infections- Non-Langerhans cell histiocytosis- Fever of unknown origin neoplastic mimics- Sequelae of endocarditis- HIV/Covid reactive adenopathy reactive adenopathy

### Why PET/MRI in Pediatric Oncology? A Pictorial Review of Advantages and Challenges

#### TEACHING POINTS

- PET/MRI has better soft tissue resolution and lower radiation dose than PET/CT.
- PET/MRI is a one-stop-shop that may decrease the number of anesthesia events and patient visits to complete imaging work-up.
- PET/MRI provides simultaneous anatomic and functional images, facilitating both initial staging and restaging of various oncologic conditions.

#### TABLE OF CONTENTS/OUTLINE

- Introduction of PET/MRI: an overview of technical aspects and protocol
- Case-based approach of oncologic pediatric body
- PET/MRI: advantages and limitations:- Lymphoma: initial staging and follow up- Sarcoma: soft tissue and osseous sarcoma-
- Predisposing Conditions: malignant transformation in neurofibromatosis- Congenital hyperinsulinism: focal versus diffuse lesions
- Case-based approach of PET/MRI in pediatric neuro-oncology: advantages and limitations- FDG-PET/MRI: is it a helpful tool?- Amino acid PET: in non-enhancing tumor and anti-angiogenic therapy
- Current and future role of PET/MRI in theragnostic (diagnosis and therapy) in pediatric oncology
- Conclusions

### Bringing PET/MRI into Practice- Challenges and Considerations

#### Participants

Naveen Rajamohan, MD, Dallas, TX (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1) Developing a PET/MRI program involves planning for optimal physical layout and incorporation of unique safety considerations. 2) Truly simultaneous PET and MRI data acquisition in modern PET/MRI systems minimize the likelihood of image misregistration and provide more robust anatomic co-localization comparison to PET/CT. 3) Identification of appropriate oncologic and non-oncologic clinical indications, education of referring physicians, development of scheduling, protocoling and image interpretation workflows and dedicated order sets are imperative for successful implementation of a clinical PET/MRI program.

#### TABLE OF CONTENTS/OUTLINE

Safety regulations • Facility guidelines and regulatory requirements • Challenges of working in the PET/MRI environment (governance, safety, technologist training, emergency responses, etc.) • Radiotracers in the PET/MRI environment. PET/MR hardware/data acquisition • Hardware components, data acquisition systems • Technical considerations including attenuation correction and image co-registration Indications, imaging findings, programmatic and workflow considerations • Billing challenges and CPT codes • Protocol development, order sets and education of referring physicians • Clinical workflow including protocoling, scheduling, and image interpretation models. Case-based review of oncologic and non-oncologic clinical indications appropriate for PET/MRI including classic imaging findings and pitfalls

### Is There a Role for Radium-223 in the Era of 177Lu PSMA?

#### Participants

Flavia Lopes, PhD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

In cases of prostate bone metastasis, a destructive cycle of bone formation and resorption occurs, making it imperative for treatment to focus on the microenvironment through various mechanisms. This can be achieved through direct targeting of tumor cells, osteoblasts, osteoclasts, inflammatory cells, and bystander effects, which affect non-irradiated cells in the surrounding area by producing cytokines and growth factors. For patients who have previously received Radium-223, it is possible to administer 177LuPSMA and/or chemotherapy as subsequent treatments. Patients with a good medullary reserve who have shown a positive response to initial treatment may receive additional cycles of Radium-223, as it is well-tolerated with minimal toxicity and effectively controls bone progression. For patients with exclusively bone metastatic prostate cancer, Radium-223 may be initiated to control bone progression when first-line therapy fails to achieve optimal control of disease progression. Subsequently, in the treatment sequence, 177Lu-PSMA may be employed as an effective tool in the management of progressive disease involving bone and soft tissue metastases.

### Utility of FDG PET/CT in Pyrexia of Unknown Origin: A Pictorial Essay

#### TEACHING POINTS

/div>

#### TABLE OF CONTENTS/OUTLINE

Pyrexia of unknown origin (PUO) is defined as fever higher than 38.3 °C/101°F, lasting more than 3 weeks and remaining undiagnosed after 1 week of thorough investigation. Identifying the cause of pyrexia of unknown origin is a clinical challenge. Early identification of source of PUO helps guide further diagnostic invasive procedures and initiation of prompt appropriate treatment. The current diagnostic approach includes initially first-line procedures such as general examination and various laboratory tests and basic imaging techniques followed by second-line tests like FDG PET/CT and tissue biopsies. Conventional imaging modalities can have limited sensitivity. Understanding imaging patterns of FDG uptake in common and uncommon causes of PUO helps to accurately identify the potential source. Advantages of 18F-FDG PET/CT as first line modality : high sensitivity, whole body imaging can identify pathologic focus at clinically unsuspected sites, high negative predictive value, can identify the source of infection or inflammation before morphological changes on conventional anatomical imaging techniques, no hazardous manipulation of blood for labeling in WBC imaging, no need for complementary bone or bone marrow scan, ability to perform quantitative analysis, cost-effective as first line modality. Images attached of Common and uncommon sites detected on FDG PET/CT in PUO: Fig1) infected aortic stent Fig 2) infected central venous catheters Fig 3) Tuberculous Osteomyelitis Fig 4) Renal Mucormycosis Fig 5) Acute Pyelonephritis in Transplant Kidney Fig 6) Tracheobronchitis

### How to Master Nuclear CSF Imaging: A Comprehensive Guide to Procedures and Interpretation

#### Participants

Megan Mercer, MD, Charleston, SC (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

This presentation aims to educate the learner on: 1- Indications and imaging protocol of nuclear CSF imaging (Nuclear cisternography and shuntogram). 2- Patterns of normal and abnormal findings. 3- Complementary role of anatomic imaging (Xray, CT, MRI). 4- Pearls and pitfalls for performing the procedures and imaging interpretation.

#### TABLE OF CONTENTS/OUTLINE

1- Nuclear Cisternography: A. Review CSF physiology and the common indications for nuclear cisternography. B. Review Imaging protocol: Patient preparation, radiopharmaceutical, imaging timing, the role of pledgets in cases of CSF leak. C. Review normal and abnormal findings (normal pressure hydrocephalus, spontaneous hypotension, CSF leaks). D. Describe classic signs that are helpful for the interpretation. E. Discuss pitfalls for injection and interpretation and the importance of correlation with anatomic imaging. 2- Nuclear Shuntogram: A. Present a background on hydrocephalus, different types of CSF shunts, and their complications. B. Review multimodality imaging evaluation of shunts with a focus on nuclear shuntogram. C. Present an overview of the nuclear shuntogram procedure (shunt reservoir access, measuring opening pressure, types of radiopharmaceutical, radiopharmaceutical injection, and imaging protocol). D. Review interpretation checklist (opening pressure, T1/2 clearance, flow into the proximal and distal limbs, documentation of free dispersion). E. Present an algorithmic approach for differentiating normal and abnormal drainage patterns (proximal and distal obstruction, shunt over-drainage, CSF pseudocyst, gravity-dependent drainage). F. Review pitfalls of inappropriate injection and falsely elevated pressure.

### Hybrid DOTATATE PET/MRI Imaging of the Head and Neck

#### Participants

Graham Keir, MD, Manhasset, NY (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. The superior soft tissue resolution of MRI improves lesion localization and helps to delineate fine anatomic detail. 2. DOTATATE-PET/MRI detects extent of disease and lesions not detected by MRI alone. 3. DOTATATE-PET may improve surveillance and radiation therapy planning. 4. DOTATATE-PET/MRI may detect more lesions than MRI alone, providing valuable genetic information in cases of multiple paragangliomas. 5. DOTATATE PET is useful for determining lesions that may respond to somatostatin analogue therapy.

#### TABLE OF CONTENTS/OUTLINE

1. Overview of Somatostatin Receptor Imaging 2. PET/MRI Fusion Protocols 3. Meningiomas 4. Paragangliomas 5. Olfactor Neuroblastoma (Esthesioneuroblastoma) 6. Pituitary Lesions 7. Conclusion

### Neo-adjuvant Immune-checkpoint Inhibitors in Lung Cancer - Pearls and Pitfalls in Imaging

#### TEACHING POINTS

1) Neo-adjuvant chemo-immunotherapy results in a high rate of pathologic complete remissions. 2) Residual tumor size and changes (eg., decrease) in tumor size do not necessarily correlate with histopathological response. 3) Metabolic examinations such as [18F]-FDG-PET/CT better assess treatment response compared to morphological changes. 4) Immune mediated increased lymphatic FDG uptake and/or increased lymph node size is called "nodal immune flare".

#### TABLE OF CONTENTS/OUTLINE

1) Pathological response patterns in patients with early-stage, non-small cell lung cancer (NSCLC) receiving neo-adjuvant chemo-immune checkpoint inhibitor therapy (ICIT): - Complete pathological response (cPR): no vital tumor cells, - Major pathological response (MPR): =10% vital tumor; 2) Radiological response patterns in patients with early-stage NSCLC receiving neo-adjuvant chemo-ICIT: - Radiological response may be consistent or inconsistent with pathological response, - Some patients with partial radiological response show a poor pathological response compared to others who show a cPR, - Nodal immune flare; 3) Current role of imaging in patients with early-stage, NSCLC receiving neo-adjuvant chemo-ICIT: - CT, - [18F]-FDG-PET/CT, - Limitation and pitfalls; 4) Limitations

### Nuclear Medicine Lymphoscintigraphy: Established and Emerging Applications with Technical Overview

#### Participants

Saeed Elojeimy, MD, PhD, Charleston, SC (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The goal of this presentation is to educate the learner on: 1- The clinical approach and role of nuclear scintigraphy in the assessment and management of patients with lymphedema. 2- The imaging protocol for performing nuclear scintigraphy. 3- The imaging patterns of normal and abnormal lymphoscintigraphy. 4- The potential limitations of nuclear medicine examinations for lymphedema assessment. 5- The complementary role of nuclear scintigraphy and MR lymphangiography. 6- The treatment options available for patients with lymphedema.

#### TABLE OF CONTENTS/OUTLINE

1- Introduction a. Review the epidemiology and pathophysiology of lymphedema. b. Review the clinical approach to the diagnosis of lymphedema, as well as the role of nuclear lymphoscintigraphy in evaluating these patients. 2- Review Lymphoscintigraphy protocols: a. Patient preparation, radiopharmaceutical, imaging timing, and areas of interest. 3- Review how to evaluate lymphoscintigraphy examinations. a. Provide examples of normal and abnormal lymphoscintigraphy studies (unilateral or bilateral, upper or lower extremity), lymphatic malformations, and lymphatic leak (recurrent chylous ascites or pleural effusions). b. Provide MR lymphangiography correlative features for lymphoscintigraphy to highlight the strengths, limitations, and complementary roles of both modalities. 4- Emerging applications, treatments, and future directions

### PET/MRI: Pictorial Review of Hepatobiliary and Pancreatic Applications

#### Participants

Malak Itani, MD, Saint Louis, MO (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

PET/MRI combines physiologic information with superior soft-tissue contrast resolution from MRI, improving assessment of the following hepatopancreaticobiliary diseases:(1) Biliary: assess disease severity, screen for cholangiocarcinoma, delineate local tumor extent and regional spread, and assess treatment response.(2) Hepatic metastases: detecting metastases and evaluating response to treatment.(3) Hepatocellular carcinoma: Y-90 PET/MRI dosimetry, extrahepatic metastases.(4) Pancreatic neoplasms: characterization and local staging, assessing spread to lymph nodes, metastatic disease in the liver, and assessing treatment response.(5) Liver transplant: detecting recurrent HCC, recurrent sclerosing cholangitis, and post-transplant lymphoproliferative disorder.

#### TABLE OF CONTENTS/OUTLINE

(1) Hepatobiliary PET/MRI techniques, clinical workflow, and reimbursement issues.(2) Applications:(A) Neoplastic evaluation:(i) Cholangiocarcinoma. (ii) Metastatic liver disease. (iii) Hepatocellular carcinoma. (iv) Pancreatic ductal adenocarcinoma. (v) Pancreatic neuroendocrine neoplasms.(B) Differentiating tumor from non-neoplastic processes:(i) Infectious: Cholangitis, hepatic abscesses. (ii) Inflammatory: Risk-stratifying benign versus malignant biliary strictures. (iii) Post-treatment: Perilesional hemorrhage/necrosis versus residual/recurrent tumor. (iv) Problem solving after locoregional therapy. (v) Follow-up of liver transplant.(3) Emerging tracers and advanced applications.

### Patterns of Response and Progression on Post-treatment SPECT/CT Scans in Patients Treated with Lu-177-PSMA

#### Participants

Ridvan Demirci, MD, Seattle, WA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

With the wider availability of Lu-177-psma therapy, imaging of this population became more important. Post-treatment imaging with SPECT/CT is a helpful tool for response assessment by providing functional and anatomical imaging information. This educational exhibit aims to present certain response and progression patterns in post-treatment SPECT/CT scans.

#### TABLE OF CONTENTS/OUTLINE

Non-contrast enhanced CT portion of SPECT/CT needs to be closely reviewed for monitoring of low or no PSMA-expressing disease (defined as lesional uptake equal or less than liver), particularly in the liver, and temporal changes of the osseous disease on CT in relation to intensity of PSMA expression. In addition, patterns of response or progression could be used for clinical decision-making. Below, is the summary of patterns. 1. Response Patterns a. Rapid Response (Rapid decline in disease burden before 4 cycles of treatment) b. Slow Response (Continued response after 4 cycles of treatment) c. Stable Disease 2. Progression Patterns a. Primary Progression (Progression without initial response) i. Increased burden of preexisting disease (bone, soft tissue or both) ii. New lesions (PSMA avid, non or low PSMA avid either in bone or soft tissues) b. Secondary Progression (after initial response) i. Increased burden of preexisting disease (bone, soft tissue or both) ii. New lesions (PSMA avid, non or low PSMA avid either in bone or soft tissues) 3. Mixed Pattern a. Non-uniform response pattern: While being responsive in certain sites/organs, showing progression in other sites/organs.

### Evolving role of PETCT in Systemic Vasculitis

#### Participants

Vani Vijayakumar, MD, Jackson, MS (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Learn different Systemic Vasculitides Different PET CT Scoring systems Role of PET CT in Treatment response

#### TABLE OF CONTENTS/OUTLINE

Large vessel vasculitis (LVV) and medium-sized vessel vasculitis such as giant cell arteritis (GCA) and Takayasu arteritis (TAK) are three common autoimmune systemic Vasculitides. 18F-FDG PET visual and semiquantitative criteria has been proposed. A standardized 4-point visual grading scale (arterial to liver uptake) is recommended with grade 0, no uptake; grade 1, uptake lower than liver; grade 2, uptake similar to liver; and grade 3, uptake higher than liver. Grade 3 is considered positive for LVV, whereas grade 2 may be indicative of LVV. In addition, a quantitative composite score, based on the visual grading scale of several individual arterial segments (typically between 7 and 15 segments), known as PET vascular activity score (PETVAS). PETVAS provides an overall assessment of disease burden, with little interobserver variability, in evaluating treatment response. 18F-FDG uptake in cranial arteries are scored as 3-point visual grading (0-2), with grade 0 representing uptake not above the surrounding tissue, grade 1 uptake just above the surrounding tissue, and grade 2 uptake significantly above the surrounding tissue. In PMR, The PET CT Leuven score is the best validated one, with sensitivity of 89.6% and specificity of 93.3%. The Leuven score is the summed score of visual 18F-FDG uptake at the cervical and lumbar interspinous bursae, sternoclavicular joints, ischial tuberosities, greater trochanters, hips, and shoulders. 18F-FDG PET/CT plays a role in diagnostic and therapeutic monitoring of patients with vasculitides and PMR.

### Avoid False Positives with Quantitation and Tc 99m Pyrophosphate (Pyp) SPECT with CT Fusion in ATTR Cardiac Amyloidosis (ATTR- CA)

#### Participants

Vani Vijayakumar, MD, Jackson, MS (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Update on the role of Pyp Imaging cardiac amyloidosis - How to improve Image interpretation with SPECT and CT fusion - Correlate with Anatomic imaging with CT And MRI - Quantitative SPECT Parameters SUV and advanced metrics

#### TABLE OF CONTENTS/OUTLINE

Transthyretin (ATTR) cardiac amyloidosis (CA) is a form of heart failure (HF) in the elderly representing approximately 13% to 18% with preserved ejection fraction (HFpEF). Until recently, ATTR-CA was very underdiagnosed. Due to advances in cardiac scintigraphy using the old Bone radiotracer Tc 99m Pyrophosphate single-photon emission computed tomography [SPECT], there is increased awareness to diagnose ATTR -CA. In addition there have been new ATTR stabilizing and silencing medications currently being available for use. Because of these rapid advances in diagnostic and therapeutic approaches, ATTR-CA, once known as a rare and progressive disorder, now can be accurately diagnosed and treated in the elderly with HFpEF. Whole heart SPECT/CT absolute quantification shows strong correlation with the visual Perugini score and high diagnostic performance with SUVmax cut-off of more than 6.1. Specificity of this approach can be increased to 99% by ruling out elevated monoclonal proteins. 99mTc-DPD and 99mTc-PYP, are the most common cardiac scintigraphy agents used for the diagnosis of ATTR- CA. Planar scintigraphy with SPECT can help with more detailed assessment of the myocardial radiotracer uptake. In addition, Fusion with cardiac CT or MRI improves the correct interpretation avoiding false positives due to blood pool activity. In addition Quantitative measures may help early diagnosis. Risk assessment and therapy response.

### PET-CT Goes Large: Its Main Role in Large-vessel Vasculitis

#### Participants

Javier Collada, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To review the leading role of PET-CT in large-vessel systemic vasculitis. 2. To describe our experience in a tertiary hospital during the last 5 years.

#### TABLE OF CONTENTS/OUTLINE

PET-CT is the best imaging technique in large-vessel vasculitis. Metabolic findings may suggest the diagnosis of cranial and large vessel-giant cell arteritis (C-GCA and LV-GCA) or Takayasu arteritis (TAK), the latter often affecting carotid, renal and mesenteric branches. Sensitivity/specificity for them are around 80%. In addition, PET-CT may detect features of polymyalgia rheumatica (PMR) (by means of Leuven score); and helps differentiating perivascular or atherosclerotic inflammation from "true" vasculitis. Metabolic activity (assessed using Meller scale) and extent diminish with treatment response, although it remains challenging to differentiate remission from smoldering mild disease. From 2018 to 2023 we performed 5082 PET-CT, 41 positive for vasculitis in diagnostic or follow-up stage: 71% women, mean age 70; 63% were GCA, the rest of them TAK, aortitis and one Behçet's disease. PET-CT diagnosis was definitive in 61%, only half the cases of GCA needing confirmatory biopsy. MRI was also used. The majority of GCA associated PMR clinical diagnosis, though just 30% had PET-CT signs. During follow-up, 52% had significant response on PET-CT, most of them complete. However, 40% didn't have pre-treatment PET-CT available. In conclusion, regarding our experience and the literature published to date, we deduce that PET-CT stands out as the main technique to assess large-vessel vasculitis, allowing accurate diagnosis, assessment of comorbid disorders and follow-up.

### Radiotheranostics for Prostate Cancer Management: a New and Evolving Standard of Care

#### Participants

Moozhan Nikpanah, MD, Birmingham, AL (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Radiotheranostics, which combines diagnostic and therapeutic capabilities, is changing the clinical management of prostate cancer. Radiopharmaceuticals, specifically prostate-specific membrane antigen (PSMA)-targeting tracers, play a vital role not only in initial diagnosis, staging, and detecting biochemical recurrence of prostate cancer, but also in targeted therapy. Cutting-edge imaging and therapeutic applications of radiotheranostics, such as <sup>177</sup>Lu-PSMA-617, are improving patient outcomes. Additionally, there are a number of clinical trials investigating the expanding use of PSMA-based radiopharmaceuticals and other targeted radionuclide therapies. The objective of this educational exhibit is to familiarize radiology and nuclear medicine physicians and trainees with the pivotal role of radiopharmaceuticals in the management of prostate cancer.

#### TABLE OF CONTENTS/OUTLINE

1) Overview of prostate cancer (PCa). 2) Concise review of radiotracers used for initial diagnosis, staging, and biochemical recurrence of PCa, with a focus on PSMA ligands. 3) PSMA PET imaging for PCa: 3a) Application of PSMA PET for treatment guidance and management: implications and considerations. 3b) Pitfalls of PSMA PET imaging. 4) Radioligands and radiopharmaceuticals: advanced imaging and therapeutic applications: 4a) <sup>68</sup>Ga-PSMA-11. 4b) <sup>18</sup>F-DCFPyL (Piflufolastat F-18). 4c) <sup>177</sup>Lu-PSMA-617. 4c-i) Clinical applications and ongoing challenges. 4c-ii) Predictive biomarkers for assessing efficacy of <sup>177</sup>Lu-PSMA therapy. 4d) <sup>223</sup>Ra- Dichloride. 5) Conclusion and future directions.

### Multimodality Imaging of Epstein-Barr Virus-Associated Diseases with Emphasis on PET/CT

#### Participants

Kenneth Huynh, DO, Orange, CA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To review the spectrum of diseases associated with Epstein-Barr virus (EBV), including infectious mononucleosis, lymphoproliferative diseases, malignancies, and systemic autoimmune diseases. To present the multimodality imaging of the EBV-associated disease spectrum, with emphasis on F-18 FDG PET/CT in the initial staging and subsequent evaluation of therapeutic response.

#### TABLE OF CONTENTS/OUTLINE

Epstein-Barr virus (EBV) is an oncogenic herpesvirus that infects over 90% of the population worldwide. Although usually asymptomatic, EBV is associated with a wide spectrum of lymphoproliferative diseases and malignancies, especially in patients with immunologic suppression or compromise. EBV has been implicated in the pathogenesis of a variety of diseases, including but not limited to infectious mononucleosis, Burkitt's lymphoma, Hodgkin's and non-Hodgkin's lymphoma, nasopharyngeal carcinoma, gastric carcinoma, post-transplant lymphoproliferative disorders (PTLD), smooth muscle tumors, and autoimmune diseases. While chemotherapy and immunotherapy are therapeutic considerations for many of these diseases, modulation of immunosuppression is considered the first-line management, when applicable, with a regression rate of up to 50%. PET/CT imaging is a critical tool for initial disease staging, assessment of treatment response, and monitoring for disease recurrence. This educational exhibit will (1) review the multimodality imaging features of EBV-associated spectrum of diseases such as infectious mononucleosis, lymphoproliferative diseases, malignancies, and autoimmune diseases and (2) emphasize the role of PET/CT in the detection and surveillance of EBV-associated diseases.

### Revealing the Hidden Mysteries of the Brain: A Guide to Brain Perfusion Single Photon Emission Computed Tomography (SPECT)

#### Participants

Tomoki Imokawa, MD, Tokyo, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Single Photon Emission Computed Tomography (SPECT) is one of the nuclear medicine imaging modalities to evaluate cerebral hemodynamics. Cerebral perfusion studies are important in the diagnosis of a variety of diseases. Sometimes, cerebral perfusion studies are the only diagnostic clue. This presentation introduces the use of SPECT in the diagnosis of epilepsy and dementia. We also present cases in which SPECT played a decisive role in the diagnosis of inflammatory diseases and tumors, as well as cases in which SPECT served as an objective indicator of psychiatric symptoms and treatment efficacy. The results of SPECT research have important implications in clinical practice, and the application of its findings to MR perfusion imaging is also expected.

#### TABLE OF CONTENTS/OUTLINE

### Feasibility of Performing SPECT/CT Imaging on a CZT Scanner to Monitor Lutetium-177-PSMA-617 Therapy

#### TEACHING POINTS

Lutetium-177-PSMA-617 (Pluvicto) is a novel radioligand therapy for treatment of metastatic prostate cancer. Current time points for PSMA PET/CT include pre- and post- therapy imaging for patient selection and evaluation of treatment response, respectively. To date, there is no clinical imaging available to monitor the treatment progress during cycles of Pluvicto administration. Current Pluvicto treatment monitoring relies on non-imaging clinical tools, such as PSA levels. Sequential imaging (SPECT/CT) during treatment cycles provides imaging direction to monitor Pluvicto treatment targets and perform organ-based dosimetry. Technical challenges, image quality, and sensitivity of Lu SPECT/CT acquisition will be discussed with its implications in the future of image-guided personalized adaptive dosimetry and diagnosis.

#### TABLE OF CONTENTS/OUTLINE

F-18 PET/CT diagnostic scan for metastatic prostate cancer. Lutetium-177-PSMA-617 (Pluvicto) treatment of metastatic castration resistant prostate cancer. Use of Lu-177 SPECT/CT for sequential monitoring over Pluvicto treatment cycles. Acquisition of Lu SPECT/CT at 24 hours post cycle 1 of Pluvicto treatment. Evaluation of Pluvicto treatment target with SPECT/CT, avidity for metastatic and primary lesions, sparing of nonaffected essential organs. F-18 PET/CT and Lu SPECT/CT imaging qualitative concordance and discordance. Ongoing feasibility study to perform advanced quantification and dosimetry across treatment duration. Future possibility to tailor Pluvicto treatment and minimize patient risk across treatment cycles.

### Incremental Value of PET/CT in Identification of Infections Associated with Cardiac Devices

#### Participants

Matthew Koh, MD, Rochester, NY (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The diagnosis and anatomic localization of cardiac device-related infections is a presently challenging and clinically relevant topic. Historically, transthoracic and transesophageal echocardiography has been the gold standard of cardiac imaging, however, they are limited in the evaluation of implantable cardiac devices and prostheses, particularly left ventricular assist devices and prosthetic valves. 18F-fluoro-2-deoxyglucose positron emission tomography with CT (FDG PET/CT) has gained increased attention in recent years for the diagnosis of cardiac infections in these select populations. In this educational exhibit, we intend to provide relevant background information on this topic, review the essential components of left ventricular devices and prosthetic valves, outline the current standards regarding cardiac device-related infections, and finally provide cases that demonstrate the utility of FDG PET/CT in imaging cardiac device-related infection in both initial diagnosis and follow-up.

#### TABLE OF CONTENTS/OUTLINE

Introduction/Relevant background information. Review of essential components of left ventricular assist devices. Review of prosthetic cardiac valves. Current standards regarding imaging of cardiac device-related infections. Case collection of PET/CT in imaging cardiac device-related infections in initial diagnosis and follow-up. Conclusion/Final points.

### FDG PET/CT Imaging Pitfalls in Current Era of Immunotherapy: Watch Out for Sarcoid Like Reactions

#### TEACHING POINTS

Recognize the imaging features of sarcoidosis, sarcoid like reaction post immunotherapy on FDG PET/CT. Distinguish between tumor progression vs sarcoid like reaction on FDG PET/CT.

#### TABLE OF CONTENTS/OUTLINE

The imaging features of sarcoidosis are diverse and can be shown on a variety of imaging techniques. FDG avidity on PET/CT in patients with sarcoidosis is variable and can mimic malignancies (lymphoma, metastatic disease, post immunotherapy). Sarcoidosis typically demonstrates FDG avid supraclavicular, mediastinal, and bilateral hilar lymph nodes on PET/CT. Biopsy demonstrates non caseating granulomas. Immunologic toxicities in cancer patients are often referred to as immune-related adverse events (irAEs). Among various irAEs, sarcoid-like granulomatous lymphadenopathy occurs in 5% to 7% of patients, and typically presents as asymptomatic mediastinal/hilar lymphadenopathy, sometimes with accompanying multifocal pulmonary nodularity. Resolution or decrease in the original tumor burden on restaging PET/CT, and development of new FDG avid mediastinal/hilar lymphadenopathy in patients receiving immunotherapy indicates probable sarcoid like reaction. Recognition of this pattern of distribution is essential in interpreting the post treatment PET/CT. In equivocal cases, a biopsy or short interval PET scan may be necessary. Using a case based approach, we'll demonstrate PET/CT images of patients with sarcoidosis, evolution of sarcoid like reaction to various immunotherapeutic agents and sarcoid like distribution of metastatic disease.

### 18F-FDG PET/CT Focus on Inflammatory-infectious Diseases. Beyond Tumor-related Processes

#### Participants

Maria Baladron, MD, Santiago, Chile (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Review the applications and importance of non-oncologic 18F-FDG PET-CT in various infectious and inflammatory cases. Demonstrate the utility of 18F-FDG PET/CT in evaluating fever of unknown origin. Case-based review of common and uncommon inflammatory and infectious pathologies, including sarcoidosis, osteomyelitis, spondylodiscitis, and vasculitis, among others. Demonstrate the utility of 18F-FDG PET/CT in evaluating the extension of the disease and treatment response in some of these pathologies. Be aware that these pathologies sometimes are incidental findings in routine oncology follow up.

#### TABLE OF CONTENTS/OUTLINE

A brief theoretical basis of PET-CT imaging and mechanism of 18F-FDG interaction with cells. Fever of unknown origin as a clinical entity that benefits from the sensitivity of FDG uptake. Metabolic findings before morphologic variations challenge conventional imaging. Different potential uses of 18F-FDG PET/CT in infectious and inflammatory cases; assessing active inflammation, disease extent, occult disease, treatment response and sometimes determining the most suitable biopsy site. Display specific FDG18 uptake patterns in rare conditions like recurrent aseptic osteomyelitis. Illustrate cases of incidental inflammatory-infectious finding during oncologic patient evaluation.

### FDG PET/CT Imaging of Systemic Vasculitis: A Pictorial Review

#### Participants

Masatoshi Hotta, MD, PhD, Los Angeles, CA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Vasculitis can be classified into primary or secondary types based on its etiology or by the size of the affected blood vessels according to the Chapel Hill Consensus Conference criteria. As any size of vessel in any organ may be affected, the imaging findings vary widely. The heterogeneous nature of vasculitis poses a diagnostic challenge. The aims of this review are to: 1) present FDG-PET/CT images of primary and secondary systemic vasculitis affecting vessels of various sizes, including large, medium, small, and variable-sized vessels, 2) describe the FDG-PET/CT features of each systemic vasculitis type and discuss non-vascular findings that can aid in the differential diagnosis, and 3) review the role of FDG-PET/CT in the management of systemic vasculitis.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction | 2. Primary vasculitis: a) Large-vessel vasculitis (Takayasu arteritis, giant cell arteritis); b) Medium-vessel vasculitis (polyarteritis nodosa); c) ANCA-associated small-vessel vasculitis (microscopic polyangiitis, granulomatosis with polyangiitis, eosinophilic granulomatosis with polyangiitis); d) Variable-vessel vasculitis (Behçet's disease, Cogan's syndrome). | 3. Secondary vasculitis: a) Vasculitis associated with systemic disease (IgG4-related disease, sarcoidosis, relapsing polychondritis, Erdheim-Chester disease); b) Vasculitis associated with probable etiology (drugs, infection)

### **Transthyretin Cardiac Amyloidosis (ATTR-CM) and Alzheimer's Disease: Is There a Real Correlation or Age-related Specific to Certain Population**

#### **TEACHING POINTS**

-Review the relationship between cerebral amyloidosis (Alzheimer disease) and Transthyretin cardiac amyloidosis (ATTR-CM). - Review the imaging technique and radiotracer used for cerebral and cardiac amyloidosis. -Illustrate cases with cardiac and cerebral amyloidosis who presented to our institution

#### **TABLE OF CONTENTS/OUTLINE**

The term "cardiac dementia" (ATTR - CM) is referred to heart failure (HF) as a risk factor for Alzheimer disease (AD). It is thought that the correlation between these two entities is through perfusion defects, angiopathy, and inflammation. Some studies suggest that AD is a multiorgan, systemic disease that may contribute to diminished cardiovascular function. Moreover, recent studies have shown common molecular and pathological features in the brain and heart of the patients with AD, including intramyocardial deposits of A $\beta$ . Whether this amount of A $\beta$  deposit can play a role in compromised myocardial function in patients with AD is yet unknown. High A $\beta$  level in the brain is detected on PET imaging. Although the intramyocardial deposits of A $\beta$  are at a much lower concentration than those seen in the brain, cardiac PET imaging with C-PIB, 18F-florbetapir, and 18F-florbetaben can detect light chain and transthyretin amyloidosis and identify cardiac amyloidosis early in the course of the disease. In ATTR-CM, Tc PYP Cardiac SPECT CT improves the differentiation from blood pool and myocardial uptake and decreases false negatives. Alzheimer's disease and heart failure are two common age-related diseases that can coexist. However, whether there is a real correlation between the two is still a subject of debate and more large-scale population studies are being conducted to further investigate this.

### Preoperative and Postoperative 18F-Choline PET/CT Value in Patients with Primary Hyperparathyroidism

#### TEACHING POINTS

- To learn about 18F-Choline (FCH) molecule and recognize its physiologic biodistribution, pathological uptake and potential pitfalls.- To understand the acquisition protocol and recognize the importance of early phase PET scan combined with iodine contrast-enhanced CT.- To review current recommendations for the use of FCH PET/CT in patients with primary hyperparathyroidism (PHPT) and related clinical conditions (eg. tertiary hyperparathyroidism, MEN syndromes).

#### TABLE OF CONTENTS/OUTLINE

Choline is a chemical precursor for the synthesis of phospholipids that form the cell membrane. Parathyroid (PT) active tissue has a high uptake of FCH due to the upregulation of choline kinase. Hyperparathyroidism causes urinary, bone, neurologic, and gastrointestinal symptoms and complications. Most cases of PHPT are caused by a solitary PT adenoma. Surgery is the appropriate treatment, but the main reasons for surgical failure are ectopic glands and multiple active tissues. Precise preoperative location of PT tissue remains a difficult task with conventional imaging (99Tc-MIBI scan, CT, MRI) and it is more challenging in patients with previous neck surgery. FCH PET/CT has a high sensitivity for preoperative localization of PT adenomas and postoperative search of active PT tissue. FCH PET/CT is becoming a first-line imaging modality for preoperative and postoperative localization of active PT tissue in PHPT patients. Table of Contents- FCH physiologic uptake and normal biodistribution.- Imaging acquisition protocol. - Preoperative and postoperative localization of orthotopic and ectopic active PT tissue. - Recommendations for the use of FCH PET/CT in patients with PHPT. - Illustrative cases.

### Brain Death: Review of Neuroimaging criteria, Techniques and Pitfalls

#### TEACHING POINTS

1) Overview of brain death imaging with a focus on the role of radionuclide perfusion scintigraphy for early and accurate determination of brain death. 2) Review brain death physiology, medical standards, clinical and imaging criteria, confounding variables and inconsistencies in the concept of brain death documentation. 3) Highlight the imaging indications, patient preparation, techniques/protocols, instrumentation, imaging artifacts and pitfalls.

#### TABLE OF CONTENTS/OUTLINE

- Introduction: Review of brain death imaging to assist radiologists in performing, interpreting and appropriate reporting of the results for the confirmation of brain death. Outline
- Confirmatory examinations: Includes tests that show absence of brain electrical activity (EEG and somatosensory evoked potentials) and those that evaluate blood flow (radionuclide studies, multivessel angiography, CT/MR angiography).
- Methods of evaluating blood flow: Contrast enhanced angiography, Transcranial Doppler ultrasound, Radionuclide brain flow scintigraphy.
- Review of radionuclides-Tc-99m HMPAO-Tc-99m ECD-Tc-99 m DTPA-Tc-99 m Glucoheptonate-Tc-99 m TcO<sub>4</sub>
- Pitfalls of radionuclide scintigraphy -False positive tracer activity due to infection, tumors, scalp hyperemia due to head trauma, CSF shunts, intracranial pressure transducer.-False negative results due to disruptions in the skull and scalp, as well as pressure on the portion of the scalp resting on a hard surface causing photopenic area on the flow study.

### **The Utility of Brain Perfusion Single Photon Emission Computed Tomography (SPECT) in the Assessment of Neurodegenerative Diseases**

#### **Participants**

Tomoki Imokawa, MD, Tokyo, Japan (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

SPECT, or Single Photon Emission Computed Tomography, is one of the nuclear medicine imaging modalities to evaluate cerebral hemodynamics. Cerebral perfusion studies contain much information useful for the diagnosis of various diseases, especially neurodegenerative diseases. This presentation will highlight the use of SPECT in the diagnosis of neurodegenerative diseases and other conditions that cause dementia, such as cerebrovascular disease and idiopathic normal pressure hydrocephalus. The findings of SPECT have important clinical implications, and the application of the knowledge to MR perfusion imaging is also expected.

#### **TABLE OF CONTENTS/OUTLINE**

1. The Basics of SPECT 2. Alzheimer's Disease 3. Dementia with Lewy Bodies 4. Frontotemporal Dementia 5. Corticobasal Syndrome 6. Idiopathic Normal Pressure Hydrocephalus 7. Progressive Supranuclear Palsy 8. Multiple System Atrophy 9. Spinocerebellar Ataxia 10. Cerebrovascular Diseases 11. Creutzfeldt-Jakob Disease 12. Others

### Advanced Cancer Imaging with Hyperpolarized<sup>13</sup>C-MRI: Techniques and Applications

#### TEACHING POINTS

1. Hyperpolarized carbon-13 MRI (HP <sup>13</sup>C-MRI) is a promising metabolic imaging for oncology that employs dynamic nuclear polarization to enhance the polarization of solid-state compounds labeled with carbon-13, increasing signal by up to 50,000-fold, and allowing the detection of the probe and its downstream metabolites using a clinical MRI scanner. 2. HP <sup>13</sup>C-MRI using [1-<sup>13</sup>C]pyruvate enables non-invasive and rapid monitoring of the upregulated anaerobic glycolysis in cancer cells. MCT in the cellular membrane enables the uptake of [1-<sup>13</sup>C]pyruvate, which is then converted into [1-<sup>13</sup>C]lactate by LDH or into [1-<sup>13</sup>C]alanine by ALT or into <sup>13</sup>C-bicarbonate by PDH. 3. Hyperpolarization is transient and relaxes back to thermal equilibrium once leaving polarizer, providing an acquisition window of 2-3 minutes. MRI sequences are optimized to utilize the unrecoverable magnetization rapidly and efficiently. 4. Kinetic modeling involves developing a mathematical model that describes the rates at which probes are converted to products, while model-free metrics rely on metabolite ratios. 5. HP <sup>13</sup>C-MRI has been applied to prostate cancer, renal cell carcinoma, brain tumors, and breast cancer, showing its potential to distinguish between benign and malignant tumors, determine tumor aggressiveness, monitor response to therapy, and predict patient outcomes.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction of HP <sup>13</sup>C-MRI. 2. Technical aspects: (a) <sup>13</sup>C labeled probes; (b) Probe preparation and pharmacy kit assembly; (c) Hyperpolarization, dissolution, and quality control; (d) Patient injection, imaging acquisition, and data analysis. 3. Clinical applications. 4. Conclusions.

### Molecular Imaging of Dementia: A Case-Based Review

#### TEACHING POINTS

Introduction: Molecular imaging plays an increasingly important role in the early identification and monitoring of various forms of dementia, as well as in selecting appropriate patients for therapy in these disorders. In this educational exhibit, we aim to review the pathologic basis and salient imaging findings of the most common causes of dementia, drawing on case examples from our institution. Teaching points/ Learning objectives: 1. Understand the basic pathologic processes responsible for the most common neurodegenerative processes as well as their relative prevalence. 2. Learn the normal and abnormal uptake patterns in the brain on various nuclear medicine studies, including FDG PET, amyloid PET, and DaTScan. 3. Learn what further imaging workup would be recommended for indeterminate findings on FDG PET.

#### TABLE OF CONTENTS/OUTLINE

Outline: 1. Background of dementia a. Definition b. Review of different neurocognitive domains i. Perceptual-motor function ii. Language iii. Executive function iv. Learning and memory v. Complex attention vi. Social cognition c. Review of the most common causes of dementia and their pathologic basis d. Review of various proteinopathies 2. Review of findings of most common causes of dementia on FDG and amyloid PET as well as DaTScan with associated case examples i. Alzheimer's disease ii. Vascular dementia iii. Mixed dementia iv. Dementia with Lewy Bodies v. Frontotemporal dementia vi. Corticobasal degeneration vii. Creutzfeldt-Jakob disease 3. Imaging using F-18-DOPA in parkinsonism 4. Suggested further workup based on imaging findings 5. Review amyloid and Tau imaging tracers and briefly discuss other functional tracers useful in neurodegenerative diseases

### Radiation Safety in Theragnostics: Educational Simulated Real-life Scenarios

#### Participants

Kip Guja, MD, PhD, Stanford, CA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Theragnostics is a rapidly growing field in nuclear medicine in the era of personalized medicine. Knowledge of radiation safety issues in targeted radionuclide therapies (TRT) is vital for delivering safe and effective patient care, and for maintaining the safety of healthcare workers involved in patient care. The objective of this educational exhibit is to address fundamental issues in radiation safety related to TRT in an engaging way by presenting educational real-life scenarios which may be encountered in a theragnostics clinic.

#### TABLE OF CONTENTS/OUTLINE

Educational real-life scenarios to be discussed in this exhibit include: (1) Dose calibrator fails quality control testing, (2) Discrepancy >20% between assayed and prescribed dose, (3) Misadministration of the wrong therapeutic radiopharmaceutical, (4) Preparation of theragnostics treatment room and restroom, and (5) Patients with nephrostomy tubes referred for Lu-177 therapy, (6) Management of Lu-177 radionuclide spill, (7) Management of radioiodine spill (8) Precautions related to liquid I-131 therapy. The appropriate actions/response to each scenario will be summarized.

### Prostate Cancer Theragnostics: Review and Early Insights

#### TEACHING POINTS

1. Review the general characteristics of prostate cancer  
2. Explore current treatment options and algorithms for prostate cancer, focusing on the increasing role of PSMA theragnostics  
3. Establish a framework for the evaluation and selection of patients who would benefit from PSMA RLT  
4. Understand the factors behind successful PSMA RLT therapy; including protocols for treatment, side effects/contraindications and the role of imaging/laboratory monitoring during treatment  
5. Identify current ongoing research and unanswered questions in the role of PSMA RLT

#### TABLE OF CONTENTS/OUTLINE

I. Overview of prostate cancer  
a. Epidemiology, diagnosis, and progression  
b. Localized versus metastatic; Castration sensitive versus resistant  
II. Overview of current treatment  
a. Medical and surgical  
i. Surgery and radiotherapy  
ii. Androgen based  
iii. Chemotherapy  
b. Nuclear medicine  
i. Radium-223  
ii. <sup>177</sup>Lu-PSMA-617  
III. Overview of <sup>177</sup>Lu-PSMA-617  
a. Mechanism of action  
b. Overview of trial results and evidence  
IV. Treatment with <sup>177</sup>Lu-PSMA-617  
a. Patient selection  
i. Inclusion criteria and contraindications  
ii. Choosing between Ra-223 and PSMA RLT  
b. Treatment protocols  
V. Evaluation and monitoring of <sup>177</sup>Lu-PSMA-617 treatment response  
a. Adverse effects and management  
b. SPECT monitoring between cycles  
i. Range of responses  
ii. Imaging monitoring and adjusting therapy  
c. Criteria for cessation of therapy  
d. Case based review and examples  
VI. Future directions and unanswered questions  
a. Review of ongoing trials

### Beyond the Glowing Hues: A Comprehensive Review of False Positive Cases on FDG PET/CT

#### Participants

Kota Yokoyama, PhD, Tokyo, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

FDG PET is one of the most widely used nuclear medicine examination in clinical use today, with high detection capability for malignant tumors and inflammatory diseases. On the other hand, its specificity for tumors is not high, making it difficult to distinguish between inflammation and tumors. In addition, with the recent rise in the price of therapeutic drugs, there are more opportunities to use it for treatment response assessment, and it is important to understand the changes that may be encountered after various types of treatment. This section will provide an overview of the physiologic accumulation of FDG PET/CT and the frequently encountered and somewhat rare false-positive cases (non-neoplastic lesions), presenting a wide range of cases from initial presentation to post-treatment.

#### TABLE OF CONTENTS/OUTLINE

1. The basics of FDG PET/CT 2. Physiological uptake, Artifacts, reactive change, lipomatous hypertrophy, brown adipose3. Iatrogenic or post-treatment changes: radiation pneumonitis, radiation pulmonary fibrosis, radiation sialadenitis, radiation liver disease, postoperative PPFE, foreign body granuloma, thymic rebound, G-CSF reactive bone marrow, vaccine reactive accumulation, etc.4. Benign lesions: Pituitary adenoma, chronic thyroiditis, hypercellular bone marrow, desmoids, hypercellular bone marrow, etc.5. Inflammatory disease Sarcoidosis/sarcoid-like reaction, vasculitis, IgG4-related disease, Cattleman's disease, TAFRO syndrome, etc.6. Infectious diseases: Tuberculosis, mycosi fungoides, actinomycosis/nocardia, echinococcosis, etc.

### New Era of Imaging of Parkinson's Disease and Atypical Parkinsonian Syndrome

#### Participants

Yoshiaki Ota, MD, Ann Arbor, MI (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Early diagnosis and treatment of movement disorders including Parkinson's disease are highly important to reducing the risk of disease progression and improving the quality of life. 2. Brain MRI, FDG-PET, dopaminergic imaging, cholinergic imaging and 123I cardiac meta-iodobenzylguanidine (MIBG) have been clinically utilized not only for differential diagnosis but also for providing disease prognosis. 3. Novel molecular imaging and brain MRI can aid in deepening the pathophysiology of movement disorders and in treatment development.

#### TABLE OF CONTENTS/OUTLINE

1. Parkinson's disease and atypical Parkinsonian syndromes: (a) Parkinson's disease, (b) Progressive supranuclear palsy (PSP), (c) Multiple system atrophy (MSA), (d) Corticobasal degeneration (CBD), (e) Dementia with Lewy bodies (DLB) 2. Pathophysiology of Parkinson's disease: (a) Dual-hit hypothesis: a-synuclein pathology arises simultaneously in the olfactory bulb (OB) and dorsal motor nucleus of the vagus (DMV) and in the enteric nervous system (ENS) plexus. (b) Single-hit hypothesis: a-synuclein pathology arises in OB/DMV first or in ENS first. 3. Imaging modalities of Parkinson's disease and atypical Parkinsonian syndrome and common imaging features: (a) Brain MRI, (b) Advanced neuroimaging: Diffusion tensor imaging (DTI) and functional MRI (fMRI), neuromelanin-sensitive MRI (NM-MRI), (c) FDG-PET, (e) Dopaminergic imaging, (f) Cholinergic imaging, (g) Cardiac MIBG 4. Treatment options and imaging assessment of treatment response of Parkinson's disease and atypical Parkinsonian syndromes

### Nuclear Medicine Imaging in Epilepsy: What the Radiologist Needs to Know

#### TEACHING POINTS

1. Nuclear medicine imaging plays an essential role in the evaluation of medically refractory epilepsy patients. For these patients, surgery is effective provided there is a well-delineated epileptogenic focus. 2. Functional imaging methods—SPECT and PET—complement structural imaging, allowing accurate ictal focus localization even in the absence of a structural abnormality. 3. Comparison of ictal and interictal SPECT combined with MRI (SISCOM) increases the sensitivity for epileptogenic focus detection. 4. Interictal F-18 FDG PET helps to lateralize the epileptogenic focus, assess for other abnormalities, and guide further testing in pre-surgical planning. 5. Future endeavors include quantitative analysis improvements, neuroreceptor PET radiotracers, and multimodality imaging integration.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction of medically refractory epilepsy. 2. Overview of surgical options. 3. Description of the pre-surgical evaluation process, focusing on ictal and interictal SPECT and interictal FDG PET. 4. Presentation of radiopharmaceuticals and their characteristics. 5. Review of methodology, imaging protocols, and post-processing techniques. • Ictal and interictal SPECT • Interictal F-18 FDG PET 6. Illustration of SPECT and PET usage in ictal focus localization and pre-surgical guidance through a series of commonly encountered pathologies- temporal and extratemporal epilepsy, cortical dysplasia, arteriovenous malformations, encephalocele, tumors. 7. Review of emerging radiopharmaceutical imaging options.

### PSMA Radiotheranostics in Prostate Cancer: Principles, Practice, and Future Prospects

#### Participants

Laszlo Szidonya, MD, PhD, Portland, OR (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. <sup>177</sup>Lu-PSMA is a safe and effective therapy in metastatic castration-resistant prostate cancer. 2. Eligibility for treatment is based on the uptake of lesions on PSMA PET. 3. The degree of uptake on PSMA and FDG PET offers predictive and prognostic information. 4. Post-therapy imaging is important to confirm tumor uptake of the therapeutic agent, monitor response, and identify progressing lesions.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction: a. Clinical overview of prostate cancer and treatment options. b. Concept of radiotheranostics. c. Data from the VISION and TheraP trials. 2. Current practice: a. Eligibility for treatment. b. Therapy administration and dosing. c. Toxicity and side effects. 3. Added value of imaging: a. Prognostic/predictive PET biomarkers: i. Qualitative parameters: 1. Level of PSMA uptake relative to liver/spleen and salivary glands. ii. Quantitative parameters: 1. Absolute uptake values (e.g. SUV<sub>max</sub>). 2. Total tumor burden. iii. PSMA/FDG concordance/discordance. b. Post-therapy imaging: i. SPECT quantification to predict response. ii. Detection of disease progression. 4. Future directions: a. Timing, sequencing, and dose optimization. b. Potential role of personalized dosimetry. c. Alternative PSMA targeting molecules. d. PSMA therapy using alpha emitters. e. Combination therapy.

### Improving the Diagnostic Sensitivity of <sup>13</sup>N-Ammonia PET Imaging: Creating Age- and Gender-Matched Normal Databases for Myocardial Flow Reserve Measurements

#### Participants

Takuji Nanno, Suita, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

<sup>13</sup>N-Ammonia myocardial perfusion PET imaging (ammonia PET), is a non-invasive, quantitative imaging method that enables the evaluation of myocardial blood flow (MBF) for detecting myocardial ischemia and assessing disease severity. Myocardial flow reserve (MFR) measurements, obtained by comparing stress and rest MBF ratios, provide important diagnostic and prognostic information for ischemic heart disease. However, clinical interpretation of MFR values depends on the normal population values, and the normal database (NDB) for MFR has not been sufficiently evaluated. Since MFR measurements vary, it is desirable to create age- and gender-matched NDBs for individuals under 70 years old as well as NDB for individuals over 70 years old. By comparing MFR values with the appropriate reference NDB, it is possible to evaluate the severity of ischemia in a more detailed and objective manner. This presentation aims to introduce the methods for creating age- and gender-matched NDBs and their usefulness in clinical cases, thereby improving the diagnostic sensitivity in ammonia PET.

#### TABLE OF CONTENTS/OUTLINE

1. Age and Gender Differences in MFR in ammonia PET 2. Creation of age- and gender-matched NDBs for MFR using Syngo MBF software 3. Clinical case 1: Normal perfusion with normal coronary artery 4. Clinical case 2: Mild ischemia with significant stenosis in RCA and D1 5. Clinical case 3: Multi-vessel CAD

### Nuclear Medicine Lung Perfusion (Q) Imaging: SPECT/CT Indications and Interpretation Pearls and Pitfalls

#### TEACHING POINTS

1. Highlight the PISAPED interpretation criteria for perfusion-only lung scans  
2. Understand indications for and utility of SPECT/CT in lung perfusion scans  
3. Recognize common pearls and pitfalls in the interpretation of Q scans

#### TABLE OF CONTENTS/OUTLINE

1. Perfusion-only lung imaging  
a. Historic use of V/Q scans  
b. COVID pandemic and perfusion-only scans  
c. 2022 Global contrast shortage crisis  
2. Interpretation Criteria  
a. PISAPED perfusion-only criteria  
b. PIOPED perfusion-only criteria  
3. SPECT/CT Indications  
a. Non-wedge shaped perfusion defects  
b. Heterogeneous radiotracer uptake and distribution  
4. Case Examples  
a. COVID pneumonia with and without pulmonary embolism (PE)  
b. Emphysema as a mimic of PE  
c. Bronchopneumonia with and without PE  
d. CTEPH - missed on CTPA and better seen on Q scan  
e. PE with pulmonary infarct  
f. Pleural effusion masking PE on planar images  
g. Pulmonary masses as a mimic of PE  
h. Fibrosis as a mimic of PE  
5. Teaching Points  
a. Indications and utility of SPECT/CT  
b. Common pitfalls of interpretation

### COVID-19 Pandemic and Its Impact on Nuclear Medicine with Teaching Pearls

#### Participants

Nick Balanda, BSc, Chicago, IL (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

COVID-19 is a multi-systemic viral disease also known as SARS-CoV-2 or severe acute respiratory syndrome coronavirus 2. Worldwide rapid emergence of the COVID-19 pandemic altered the practice of medicine including nuclear medicine. It is considered to be one of the most massive and chaotic challenges confronting global public health of our times. This educational exhibit aims to: 1. Summarize economic impact of COVID 19 in a tertiary care university teaching hospital. 2. Describe the adaptation to the pandemic by modification of various imaging protocols (for example Myocardial perfusion, V/Q scan, scheduling of PET CT after COVID-19 vaccination), highlighting the importance of CT portion of SPECT CT and PET CT, especially for lung findings. 3. Offer Teaching Pearls and a case-based multi-modality correlation of interesting COVID-19-related findings in nuclear medicine and PET CT imaging with a focus on the impact on patient management.

#### TABLE OF CONTENTS/OUTLINE

We present 15 interesting COVID-19-related findings in nuclear medicine and PET CT imaging with a focus on the impact on patient management. These cases include incidental findings secondary to vaccination and COVID-19 infection as well as modified imaging protocols and highlight important considerations for radiologists interpreting images in the era of COVID-19.

### Role of 18F FDG PET CT in Patients with Lymphoma Treated with CAR-T Cell Therapy: Current Concepts

#### Participants

Vanessa Murad, MD, Bogota, Colombia (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1) Understand the principles and biological effects of CAR-T cell therapy. CAR-T cell therapy is a novel cancer treatment based on the genetic modification of the patient-derived T cells by adding synthetic functional chimeric antigen receptors (CARs), which permit the identification of specific tumor antigens. 18F -FDG PET/CT (=PET CT) is the imaging of choice for pre and post CAR-T cell therapy assessment, in patients with metabolically active lymphomas. 2) Recognize the role of PET CT in pre-therapy assessment. Highly metabolically active disease and high tumor burden at baseline PET CT, are predictors of unfavorable patients' outcomes and risk of therapy related toxicities. 3) Define the optimal timing of PET CT in therapy response assessment, as well as its impact on management (with demonstrative cases). PET CT 1-month after the infusion is the preferable timing for therapy response assessment, and may trigger a possible therapeutic intervention. A few cases of pseudo-progression after therapy have been described; however, all have been during the first few days after the infusion, with complete resolution at 1-month PET/CT. 4) Identify the main toxicities associated with CAR-T cell therapy and the role of PET CT in their evaluation.

#### TABLE OF CONTENTS/OUTLINE

1) Introduction to CAR-T cell therapy, brief history and indications. 2) Role of PET CT in CAR-T cell therapy: 2.1) Pre-therapy considerations. 2.2) Post-therapy response assessment: timing, impact and imaging interpretation including pseudo-progression evaluation. Demonstrative cases. 2.3) Evaluation of toxicities during CAR-T cell therapy: Cytokine release syndrome, immune effector cell-associated neurotoxicity syndrome and infection.

### Acute Adverse Events in Theragnostics: Educational Simulated Real-life Scenarios

#### Participants

Kip Guja, MD, PhD, Stanford, CA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Theragnostics is a rapidly growing field in nuclear medicine in the era of personalized medicine. Recognizing and appropriately managing acute adverse events associated with targeted radionuclide therapies (TRT) is vital for delivering safe and effective patient care. The objective of this educational exhibit is to highlight management of acute adverse associated with TRT in an engaging way by presenting simulated real-life scenarios which may be encountered in a theragnostics clinic.

#### TABLE OF CONTENTS/OUTLINE

Educational simulated real-life scenarios to be discussed in this exhibit include: (1) Extravasation of 177-Lu radionuclide, (2) Management of potential complications associated with amino acid infusion during Lu-177 DOTATATE therapy, (3) Management of carcinoid crisis after Lu-177 DOTATATE therapy, and (4) Mitigation of flare reaction to TRT (5) Management of acute sialadenitis with Lu-177 PSMA-617 therapy. The appropriate actions/response to each scenario will be summarized.

### Pediatric PET/MRI: The How and Why

#### Participants

Helen Nadel, MD, FRCPC, Menlo Park, CA (*Presenter*) Consultant, ICON plc;;

#### TEACHING POINTS

Since its introduction a decade ago, integrated PET/MRI has been established as a hybrid imaging modality that provides unique diagnostic information. A key application of PET/MRI is pediatric imaging for oncologic, neurologic, inflammatory, and metabolic conditions given its reduced radiation exposure and potential for reduction of administered radiotracer dose. Despite its successful clinical adoption, the availability of PET/MRI for pediatric patients is still limited to larger academic and clinical centers due to high complexity studies which require thorough patient preparation and exam planning, skilled image acquisition and careful image analysis and interpretation. These factors limit the accessibility of PET/MRI not only for imaging specialists in training, but also for experienced radiologists and nuclear medicine physicians. The purpose of this contribution is to provide guidance and the value of pediatric PET/MRI with clinical examples drawn from pediatric PET/MRI programs world-wide.

#### TABLE OF CONTENTS/OUTLINE

1. Common clinical indications for PET/MRI in pediatric patients 2. Commonly used PET tracers for these indications 3. PET/MRI instrumentation 4. Patient preparation (patient information, dietary aspects, sedation, anesthesia) 5. Examination planning and protocol definition 6. Examination execution 7. Aspects of image processing 8. Interpretation and reporting 9. Pitfalls and troubleshooting

### Role of FDG PET/CT in Therapeutic Decision Making in Lymphoma

#### TEACHING POINTS

1. Therapeutic options for lymphoma include chemotherapy, monoclonal antibody therapy, radiation therapy, stem cell transplant and chimeric antigen receptor therapy (CAR-T). FDG PET/CT plays an integral part in therapeutic decision making. 2. Interim FDG PET/CT allows response-adapted treatment with either reduction in the number of chemotherapy cycles or early use of more aggressive treatment. 3. In patients receiving CAR-T, response assessment on FDG PET/CT should be guided by LYRIC response criteria. 4. Interpretation of interim and post treatment FDG PET/CT can be confounded by thymic hyperplasia, infection/inflammation, immune related adverse events, marrow stimulation by granulocyte colony-stimulating factor (G-CSF). 5. FDG PET/CT plays a role in evaluating disease relapse or transformation and provides guide to biopsy.

#### TABLE OF CONTENTS/OUTLINE

1. NCCN treatment guidelines- illustrations of role of FDG PET/CT in therapeutic decision making. 2. Overview of CAR-T. 3. Illustrate staging by FDG PET/CT. 4. Illustrate Lugano and LYRIC treatment response criteria for interim and end of treatment FDG PET/CT. 5. Illustrate pitfalls in treatment response assessment- thymic hyperplasia, infection/inflammation, irAEs (immune related adverse events), marrow stimulation by G-CSF. 6. Illustrate role of PET/CT in identifying disease relapse or transformation

### Functional Imaging of Liver and Spleen Using Tc 99m Sulphur Colloid. A Case Based Multi-modality Pictorial Review with Teaching Pearls

#### Participants

Nick Balanda, BSc, Chicago, IL (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Nuclear Medicine Tc-99m Sulphur colloid liver-spleen scan has declined over recent years, however, it is still very useful in certain specific scenarios where it can be virtually diagnostic or confirmatory. Our case-based educational exhibit aims to: 1. Evaluate functional abnormalities of the liver and spleen based on the location and amount of radiotracer uptake. 2. Review specific scenarios for evaluating intra-pancreatic, left hemi abdominal, mediastinal, and left lung masses by liver spleen scan as questioned on conventional anatomic imaging with multi-modality correlation. 3. Evaluate a few specific space-occupying hepatic and splenic masses with multi-modality correlation. 4. Importance of SPECT CT over planar imaging.

#### TABLE OF CONTENTS/OUTLINE

Our case-based educational exhibit includes: Assessment for Hypersplenism in patients with thrombocytopenia, evaluating for cirrhosis, evaluating/confirming the presence of accessory/ectopic splenic tissue, evaluating specific intrapancreatic lesions, Hepatic cysts, hepatic hemangiomas, FNH, splenic infarcts, Budd-Chiari syndrome.

NMMIEE-63

### **Pictorial Review of MRI Fused with Somatostatin Receptor PET Tracers in Meningiomas: Does the Integration of Molecular and Anatomic Imaging Impact Clinical Management**

#### **TEACHING POINTS**

1. Physiologic avidity of somatostatin receptor PET tracers is minimal in the brain parenchyma, providing an excellent tumor background ratio (TBR), unlike FDG PET. 2. Somatostatin receptor PET assists in targeting meningiomas in complex anatomic regions such as the skull base and identifying additional sites. 3. MRI fused somatostatin receptor PET allows for distinguishing enhancing scar tissue from meningiomas. 4. Somatostatin receptor PET impacts clinical and radiation therapy (RT) management leading to changes in the clinical approach and/or modifications in radiation treatment volumes. 5. Somatostatin receptor PET has potential in neurotheranostics to provide diagnostic imaging to guide molecular therapeutic radionuclides, such as <sup>177</sup>Lutetium-DOTATATE.

#### **TABLE OF CONTENTS/OUTLINE**

1. General considerations: § Imaging evaluation of intracranial meningiomas in NM and anatomic modalities § Review the mechanism of Somatostatin Receptor Targeted PET Imaging 2. Integration of PET and imaging guided therapy: Radiotherapy fundamentals. 3. Case-based approach of impact on patient's treatment decisions. 4. Somatostatin receptor PET pitfalls: What you need to know? Summary: Our preliminary experience of MRI fused with somatostatin receptor PET has shown to enhance identification of disease extent compared to MRI only, especially in patients with prior treatments and extracranial components, impacting management decisions and providing information for potential radionuclide targeted therapy.

NMMIEE-64

### Radiotheranostics in Prostate Cancer: Current Practice and Future Outlook

#### Participants

Daniel Kwon, MD, PhD, Coquitlam, BC (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Next generation radiotheranostics are effective in patients with prostate cancer, with studies supporting imaging- and treatment-based on the molecular determinants of patient's disease  
2. Prostate-specific membrane antigen (PSMA)-targeted radiotheranostics represent the frontier of this paradigm, with PSMA-targeted imaging showing superiority compared to conventional imaging for staging and monitoring patients during therapy  
3. <sup>177</sup>Lu-based PSMA-targeted and <sup>223</sup>Ra radioligand therapy are effective in metastatic prostate cancer, and multiple clinical trials are exploring further indications  
4. Dosimetry will personalize doses per patient to maximize therapeutic benefit while minimizing toxicity  
5. Other radioisotopes (e.g. <sup>225</sup>Ac, <sup>161</sup>Tb) and molecular targets (e.g. gastrin-releasing peptide receptor (GRPR)) are being explored for radiotheranostic applications in prostate cancer

#### TABLE OF CONTENTS/OUTLINE

- Overview of prostate cancer: current diagnosis and treatment
- Introduction to radiotheranostics: common theranostic radioisotopes and their selection
- PSMA-targeted imaging and radioligand therapy: recent trial data, indications, clinical pearls, image-guided monitoring, and case examples
- Radium-223: indications, clinical pearls, and case examples in bone metastases in prostate cancer
- Dosimetry: principles and applications for personalized radioligand therapy
- The Future: Ongoing PSMA-targeting radiotheranostic clinical trials, emerging theranostic radioisotopes and radiotheranostic agents (e.g. GRPR)
- Conclusions and Summary

Printed on: 04/12/24

## Abstract Archives of the RSNA, 2023

NMMIEE-65

### 18F-FDG PET/CT: Least Useful to Most Important Imaging Modality for Evaluation of Prostate Cancer

#### TEACHING POINTS

1. Understand the roles and mechanism of PSMA and FDG PET/CT imaging in evaluating prostate cancer at different stages of the disease. 2. When reading PSMA PET/CT scans, interpreters should always correlate with clinical history such as PSA level, disease stage, and prior treatments. If PSMA positive lesions are not in proportion to high PSA level or if lesions are only seen on CT without PSMA avidity, think of transformation of prostatic adenocarcinoma (CRPC-Adeno) to treatment-induced neuroendocrine prostate cancer (t-NEPC). Consider 18F-FDG PET/CT for further evaluation. In some cases, 68Ga-DOTATATE PET/CT may be helpful.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Case examples 3. Educational objectives 4. Summary

Printed on: 04/12/24

## Abstract Archives of the RSNA, 2023

NMMIEE-7

### Perineural Tumoral Spread- A Search Pattern for PET Scan Readers

#### TEACHING POINTS

1. Perineural tumor spread is the macroscopic analogue of perineural tumor invasion. 2. F-18 FDG PET CT is often used in staging and response assessment in head and neck malignancies and has an important role in identification of perineural tumor spread.3. Familiarity with relevant cranial and peripheral nerve anatomy, pattern of perineural tumor spread and associated PET imaging appearance will lead to improved detection of this important prognosticating factor.4. FDG uptake resulting from postsurgical and postradiotherapy inflammation in addition to other infectious and inflammatory causes may lead to false positive cases mimicking perineural tumor spread.

#### TABLE OF CONTENTS/OUTLINE

1. Background- what's in a name- perineural tumor spread versus perineural tumor invasion.2. Overview of relevant cranial nerve and peripheral nerve anatomy.3. Pathophysiology of perineural tumor invasion and perineural tumor spread.4. Tumor types, sites, and clinical presentation of perineural tumor spread.5. Case based review of PET patterns of perineural tumor spread in the head and neck.6. Other usual and unusual locations for perineural tumor spread on PET imaging.7. Search pattern for peritumoral spread for PET scan readers.8. Imaging differentials for consideration and false positives. 9. Prognosis and treatment considerations in patients with perineural tumor spread.

NMMIEE-8

### Imaging Appearances of Large Vessel Vasculitis on 18F-FDG PET/CT: The Dark, the Bright, and the In-between

#### Participants

Rita Maria Lahoud, MD, Shelton, CT (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- 18F- FDG PET/CT can be used in the diagnostic evaluation of vasculitis, to determine the distribution of involvement, the activity status of the disease, and to assess treatment response.
- Where possible, CT angiography should be added to 18F-FDG PET/CT as it not only improves diagnostic accuracy but can identify frequent complications such as aneurysm formation or vascular dissection.
- PET vascular activity score (PETVAS) is a grading system that provides qualitative and quantitative assessment.
- Limitations include superficial cranial vessel involvement, extensive atherosclerosis, and persistent uptake in remission limiting the use of PET/CT for routine follow-up.
- Systemic rheumatologic conditions, including Erdheim Chester and IgG4 Related Disease can have secondary involvement of the large vessels, mimicking a large vessel vasculitis. It is important to recognize their distinguishing features and patterns of involvement on 18F- FDG PET/CT.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction to Large Vessel Vasculitis: a. GCA and PMR b. Takayasu's
2. Role of PET/CT in the Evaluation of LVV a. Disease activity b. Extent of involvement c. Biopsy Target d. Response Assessment
3. PET/CT protocol a. General patient preparation b. Impact of glucocorticoids c. Incubation time d. Contemporaneous CT angiogram
4. Common Imaging Appearances of LVV on PET/CT a. GCA pre and post therapy b. Takayasu's c. TIPIC variant of GCA
5. Differential Considerations a. Erdheim Chester b. IgG4 related disease
6. Diagnostic Accuracy of PET/CT

Printed on: 04/12/24

NMMIEE-9

### Epilepsy Beyond HARNESS-MRI Protocol through Hybrid PET-MRI and Advanced MRI Imaging

#### Participants

Piedad Acosta Mora, MD, Mexico City, Mexico (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- To learn the causes of drug-resistant epilepsy and structural alterations in neuroimaging.- To recognize the spectrum of MRI sequences optimized for epilepsy and to implement the use of HARNESS MRI protocol.- To review advanced neuroimaging techniques (functional, metabolic, post-processing.) and to explain the utility in the drug-resistant epilepsy - To evaluate the clinical impact of hybrid FDG -PETMRI in decision-making in drug-resistant epilepsy- To understand how hybrid imaging with PETMRI optimizes the subtle epileptogenic lesions detections and improves postsurgical seizure outcome.

#### TABLE OF CONTENTS/OUTLINE

1.Introduction2.Classification of seizure types3.Causes of drug-resistant epilepsy 4.MRI sequences optimized for epilepsy - HARNESS MRI protocol5.Advanced neuroimaging techniques - BOLD- MRI functional - Texture analysis - Spectroscopy - Diffusion tensor imaging (DTI) and fiber tractography 6.Role of hybrid FDG-PETMRI in epilepsy - Indications - Preparation - Technique and recommendations for acquisition - Normal patterns of brain FDG uptake - Cortical analysis 7.Case-based learning 8.Conclusions

Printed on: 04/12/24

NPMEE

### Noninterpretive Skills (Beyond Imaging) Education Exhibits

#### Sub-Events

#### **NPMEE-1 Every Little Bit Helps. How to Reduce Carbon Footprint with a Mobile MR. Experience from the Northwest of Spain.**

##### Participants

Mercedes Arias Gonzalez, MD, PhD, Vigo, Spain (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

Mobile MRs are able to fill the service void in small to medium-sized hospital without in-house magnets. Delivering care closer to home avoids travel kilometers, highly contributing to an improved carbon footprint. Carbon footprint per MR scan can be even further reduced due to a higher utilization rate, as MR scanners cannot be turned off. Being conscious of radiology contribution to carbon footprint and greenhouse gas emissions can contribute to reduce them, as much as possible.

##### TABLE OF CONTENTS/OUTLINE

Evolution of needs and mobile MR implementation in the public healthcare system in Galicia (a region in the Northwest of Spain) since 2006. Evaluation of kilometers avoided by patients since 2006 and its effect in carbon footprint. Study of utilization rates of each mobile MR scan through the years. Easy explanation of useful concepts concerning carbon footprint and greenhouse gas emissions.

#### **NPMEE-10 Financial Fitness for the Radiology Resident**

##### Participants

Kevin Wu, MD, Tampa, FL (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

Radiologists receive little formal instruction on basic concepts related to financial planning. Yet, certain financial decisions and strategies that are best employed during residency can yield as much as hundreds of thousands in savings over the course of a career. Therefore, early financial literacy is one of the most important aspects of career counseling that trainees can receive. Indeed, certain financial maneuvers are only possible during the training years. For those with an average loan burden, income driven repayment (IDR) can be worth >\$400,000 over the course of a career, and is a priority consideration. Other maneuvers, such as electing to contribute to a Roth 403b/401k (if available) rather than a pre-tax 403b/401k during residency, or performing a 403b/401k-to-IRA rollover followed Roth conversion after training, are expected to be worth \$84,000 by retirement. Even greater savings are likely with such maneuvers if marginal income tax rates increase in the future. These and other strategies require only hours to employ, and must not be missed for all who are eligible. In this light, we present an "order of priorities" regarding financial maneuvers that maximize yield with respect to ease of execution. Specifically, we discuss maneuvers such as student loan IDR, value-driven credit card rewards, 403b/401k to Roth IRA rollover, strategies around tax season, and early modifications of the retirement portfolio mix.

##### TABLE OF CONTENTS/OUTLINE

Philosophy/disclaimers, The financial waterfall, Student loan IDR, Credit card optimization, Expense ratios, Pretax purchasing, Roth vs. traditional and conversions, Income tax projections, Portfolio mix, Avoidance of taxation events, Tax season, Subtleties

#### **NPMEE-11 Radiology Dashboards: Applications in Addressing Healthcare Disparities in Image Utilization**

##### TEACHING POINTS

1. Review the role of dashboards in radiology  
2. Examine how healthcare disparities (HCD) in radiology can affect morbidity and mortality  
3. Highlight specific applications of radiology dashboards in addressing HCDs in imaging utilization  
4. Discuss the limitations of radiology dashboards

##### TABLE OF CONTENTS/OUTLINE

1. What is a Radiology Dashboard?  
a. Key Performance Indicators (KPIs)  
i. Patient tracking  
ii. Image utilization  
iii. Turnaround time  
iv. Resource allocation  
v. Quality assurance  
2. Overview of the literature on HCDs in image utilization (e.g. disparities in imaging utilization in the emergency department, disparities in utilization of low dose CT for lung cancer screening, etc.)  
3. Applications of radiology dashboards in addressing HCDs in image utilization  
a. Identifying risk factors for decreased imaging utilization stratified by type of study (e.g. screening mammogram, low dose CT for lung cancer screening) and patient setting (e.g. emergency department)  
i. Zip code of patient residence  
ii. Race and ethnicity  
iii. Age  
iv. Language preference  
b. Developing quality improvement initiatives  
i. Patient education  
ii. Language accessibility  
iii. Cultural competency training and diversification of work force  
iv. Community outreach (e.g. mammogram vans and patient education efforts)  
v. ACR Select  
c. Monitoring response  
i. Before and after studies  
ii. Non-Comparative studies  
iii. Time series  
4. Limitations of radiology dashboards  
5. Conclusions

#### **NPMEE-12 Out of the Darkness and into the Light: Redefining the Role of Radiology in Community Engagement**

Participants

Somiah Almeky, MD, Boston, MA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

•Provide a radiology-focused overview of foundational elements related to community engagement, community-based participatory research, reciprocal innovation, and community needs assessment and outreach •Discuss evidence-based examples of how radiology staff/trainees play a crucial role in delivering equitable care •Explore how community engagement can be leveraged as an effective method to restore purpose in our daily work and prevent burn-out •Review practical examples of community engagement across various settings (ie. rural, urban, global health) •Discuss steps to establish a centralized curriculum that defines the role of radiology in the community, and provides trainees with concrete examples of this work

#### TABLE OF CONTENTS/OUTLINE

1. Interface between Radiology and the Community •Definition of Community Engagement, Community-Based Participatory Research, Reciprocal Innovation •Leveraging institutional resources and community needs assessments to guide outreach efforts c. Evidence-based community engagement startup toolkit for radiology 2. Case-based review of ongoing outreach efforts in various settings •Cancer screening efforts •Resident-driven initiatives •Health equity efforts •Outreach interventions among veteran populations 3. Potential pitfalls and opportunities for growth •Allocation of effort and time in alignment with community needs and departmental workload. •Tips on identifying opportunities to engage diverse communities 4. Empowering the next generation •Establishing a "Community Engagement in Radiology" curriculum •Overview of required competency elements •Facilitators and barriers to dissemination of the curriculum

#### NPMEE-13 Breaking Bad News: What the Radiologist Needs to Know

Participants

Natalia Orthmann, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1.To emphasize the importance of breaking bad news in appropriate ways.2.To present the existing and consolidated bad news protocols.3.To elaborate on how the protocols can be applied in the day-to-day practice of radiologists, especially breast radiologists.4.To assist in the training of radiologists in this time of breaking bad news.5.To illustrate the differences between the most frequent protocols for breaking the bad news

#### TABLE OF CONTENTS/OUTLINE

1.Literature review focusing of consolidates bad news protocols.2.To illustrate and discuss how bad news protocols can make the moment less traumatic for physicians and patients.3.Discuss how to apply the protocols in the radiologist's routine.4.Examples cases of how bad news may occur in the radiologist's routine.5.Summary and conclusion.

#### NPMEE-14 Green Teams - an AI Gore-ithm for Addressing Sustainability in Radiology

Participants

Katherine Frederick-Dyer, MD, Nashville, TN (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

We explain the process of forming a sustainability committee in the Department of Radiology to identify and address the environmental footprint in our academic department.

#### TABLE OF CONTENTS/OUTLINE

I. Introduction A. What is sustainability and how does addressing it reduce costs and improve human health B. What is design thinking and how do we use it to solve non-linear problems II. Baseline Survey A. Identify attitudes and interest in climate change B. Identify opportunities to reduce carbon footprint and build allies III. First meeting A. Forming the committee - approaches to inclusivity B. Guidance with local climate experts to guide discussion 1. Assess - What is the carbon footprint of the department? 2. Inspire - To what extent do concerns about climate change and support for climate mitigation affect employee morale and patient satisfaction? 3. Model - How do we share our successes to decarbonize our department to guide other departments? C. Design thinking session 1. Actively engage participants to brainstorm ideas using colorful sticky notes 2. Visually organize ideas into the Categories (IIIb) 3. Establish culture of inclusivity, collaboration, transparency, fun, and accountability D. Organize team into subgroups to address each CategoriesIV. Subsequent meetings A. Encourage teams to produce achievable deliverables each meeting B. Assess what expertise and resources are needed C. Delineate team member roles and responsibilities D. Define timeline and metrics for success V. Highlighting early wins and how this contributes to the bigger picture

#### NPMEE-15 Forward Together: Collaboratively Integrating Radiology throughout a Medical School Curriculum

Participants

Matthew Lee, MD, Phoenix, AZ (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Integrating radiology throughout a medical school curriculum mirrors the breadth, depth, and impact of radiology in the real world2. Sustainable implementation of radiology throughout a curriculum is a product of thoughtful and strategic partnerships with medical school leadership across disciplines and central governance committees3. Collaboratively working with colleagues across disciplines can expand the footprint and impact of radiology in medical school4. Early consistent exposure to quality radiology education promotes recruitment into radiology and positively impacts learners pursuing other specialties5. Effective student education transcends passive modes of learning through activities that promote increased learner engagement

#### TABLE OF CONTENTS/OUTLINE

1. ForWard - 3-phase model integrating basic, clinical, and public health sciences, 10 integrated "threads"2. Phase 1 - thematic blocks incorporating basic and clinical science and early clinical medicine - incorporating radiology into anatomy, patient-centered education cases3. Phase 2 - clinical rotations integrating clinical care, basic sciences, and thread areas - case-based learning4. Phase 3 - career exploration, intern preparation, "selectives" - novel radiology course development5. Leadership - medical student

directors, block leaders6. Innovative educational content creation and delivery - embracing remote techniques, case-based learning, website development7. Novel course development - Screening in Radiology, Financial Wellness8. Faculty Recruitment - range of faculty, educational RVUs9. Resident Recruitment - radiology interest group10. Lessons learned - staff support for sustainable implementation

## **NPMEE-16 #FOAMrad: A Personal Productivity Curriculum for Radiologists**

Participants

Alice Shieh, MD, Seattle, WA (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

- Simplify and adopt the "Getting Things Done" methodology for busy radiologists- Understand and incorporate the fundamentals of "Deep Work" for peak performance- Learn how to apply the science of habits based on best-selling book "Atomic Habits"- Demonstrate tried and tested productivity software applications to streamline repetitive tasks (for Mac users)- Review time-saving settings and approaches to combat e-mail overwhelm

### **TABLE OF CONTENTS/OUTLINE**

Getting Things Done framework ?- Delete it, Do it, Delegate it, Deposit it, Defer it ?Deep Work ?- 4 deep work philosophies: monastic, bimodal, rhythmic, journalistic?- 3 steps to rewire your brain: embrace boredom, quit social media, drain the shallows ? Atomic Habits ?- 4 laws of behavior change: cue, craving, response, rewards ?- Creating a new identity to develop new habits ?- Building better systems to achieve goals?Tried and tested productivity software applications to streamline repetitive tasks on a Mac?- Alfred, SetApp, 1Password, Evernote, Notion, Ecamm, Endnote, Backblaze ?E-mail management ?- Understanding e-mail communication principles ?- Time-saving settings for Outlook and Gmail ?Multitasking and prioritization techniques ?- MoSCoW (Must, Should, Could, Would)

## **NPMEE-17 Radiology Management at Your Fingertips: Incorporating Macropads Into the Radiology Workflow**

Participants

Elliot Breshears, MD, Seattle, WA (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

-Review the utility of macropads in automating and simplifying repetitive nature of the radiologist's workflow-Learn how to easily assemble, program, and implement macropads into your own radiology practice-Discuss the time-saving features of macropads

### **TABLE OF CONTENTS/OUTLINE**

Macropad device utility- Assign complex repetitive tasks to a single button click, improving efficiency- Ability to bypass IT restrictions and firewalls; eliminates need to install additional software on PACS workstationsResource selection process- Consolidating resources into 15 programmable keys- Implementing input from abdominal imaging faculty ?Assembly- Physical components: front and back plates, keycaps, switches, USB cables- Assembly process- Creating custom key stickers to promote intuitive access of selected resources ?Programming- Utilizing duckyScript and the duckyPad Configurator software- Navigating computing system compatibility issues ?Implementation and impact on radiology workflow- Reduction in mouse clicks needed to access resources- Plug and play with ability to use at different workstations ?Limitations- Cost- Time and effort associated with self-assembly, selecting and organizing incidentaloma guidelines- Minimal scripting required ?Future directions- Implementing Elgato stream deck into PACS stations with software installed after security clearance

## **NPMEE-18 Large Language Models and Natural Language Processing: Overview and Metrics for Radiology Report Simplification**

Participants

Rushabh Doshi, MPH,MSc, Cerritos, CA (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

1) Review the gap in health literacy for radiological reports. 2) Review existing efforts for radiology simplification. 3) Review the role of Natural Language Processing (NLP) and Large Language Models (LLM) models in report simplification. 4) Review the evaluation metrics of NLP and LLM models for report simplification.

### **TABLE OF CONTENTS/OUTLINE**

1) Radiology Report Transparency 2) Patient Interest in Report Simplification 3) Ongoing Simplification Efforts 4) Model Terminology 5) Application of Natural Language Processing and Large Learning Models for Report Simplification 6) Demystifying NLP and LLM models 7) How Models Learn - Training NLP and LLM models 8) Existing LLM Interfaces 9) Prompt Optimization of LLM Interfaces 10) Evaluation Metrics (Readability, Accuracy, Simplicity, etc.) 11) Implementing LLM models 12) Potential reimbursement model for report simplification 13) Future directions of LLM models in report simplification

## **NPMEE-19 Journey to Parenthood in Radiology: Progress, Challenges, and Opportunities**

### **TEACHING POINTS**

1. Delayed childbearing impacts the reproductive outcomes among physicians.2. A better understanding of the options to achieve parenthood allows for comprehensive family planning, flexible practice management, and inclusive dialogues.3. Accurate knowledge of occupational radiation exposure to women physicians may help assuage unrealistic fear and build a stronger pipeline of future radiologists.

### **TABLE OF CONTENTS/OUTLINE**

- To highlight the importance of and obstacles to family planning and childbearing for physicians and physicians-in-training
- To review occupational radiation risks and safety precautions in the radiology work environments and specifically within each radiology subspecialties
- To raise awareness of the various options and processes involved in egg preservation, fertility treatment, surrogacy, adoption, and fostering
- To provide an overview of existing policies and guidelines for family and medical leave in the United States, including the American Board of Radiology updated policies and state and federal laws
- To discuss potential mechanisms to support medical students, radiology trainees, and radiologists on their journey to parenthood and those who are

parents

## **NPMEE-2 Small Nodule, Big Impact: Incidental Findings Module**

### **TEACHING POINTS**

1) Studies have found that as radiographic imaging numbers continue to increase, so has the number of incidental findings. 2) Based on literature and guidelines including the ACR white papers and Fleischner Society recommendations, a new incidental/follow up tab was built into our electronic health record (EHR) to provide simple, fast and streamlined recommendations by radiologists for clinicians. 3) Additional measures are also built in to help achieve the proper patient follow up, such as dedicated nurse navigators to help track down incidental findings and assure proper follow up as well as inbox EHR messages to patients PCP upon discharge. 4) Future directions include expanding the followed-up incidental, education to both ordering providers and patients as well as research for continued evolution of incidental finding guidelines.

### **TABLE OF CONTENTS/OUTLINE**

1) Define the impact of incidental pulmonary findings by radiologists on patient care. 2) Discuss the implemented incidental findings tab within our health network and how it has changed patient care/outcomes. 3) Identify methods to expand this model to include more incidental findings and increase patient follow up. 4) Data collection and interruption for future incidental finding recommendations and guidelines.

## **NPMEE-20 Artificial Intelligence for Pediatric Radiologists: A Gentle Introduction for the Non-enthusiast**

Participants

Marcelo Takahashi, MD, PhD, (*Presenter*) Speaker, Vertex Pharmaceuticals Incorporated

### **TEACHING POINTS**

This presentation is intended for pediatric radiologists with no/little AI experience. We will explain the basic concepts of AI applied to radiology and discuss practical example of usage of AI in pediatric radiology. Main points: 1) Core AI concepts and lexicon 2) Brief history of AI in radiology 3) Basic algorithm creation and operation 4) Applications of AI in radiology 5) Limitations of AI in radiology

### **TABLE OF CONTENTS/OUTLINE**

1 - Disclaimer: • created for pediatric radiologists with no/very little experience in AI. • Essential concepts will be explained in straightforward manner and accessible language. 2 - Introduction: • Core concepts: • What is artificial intelligence, narrow AI and broad AI • Machine Learning and Deep Learning. • Big Data, Data Science, Domain Knowledge 3 - Brief history of AI in radiology: • The early years. • The CAD era • The Machine Learning and Deep Learning era. 5 - Basic Lexicon: • Dataset, model, algorithm, training, testing, generalization, features, classification, segmentation, regression, clustering, prediction, label, supervised learning, unsupervised learning 4 - "Classic Machine Learning" and Deep Learning: • How is a "classic ML" algorithm created? • DL algorithm creation • Main differences, advantages and disadvantages ("classic ML" vs DL). 5 - Where is/can AI be applied in the pediatric radiologist's workflow (with practical examples) • Imaging criteria, scheduling, acquisition (MR acceleration, CT/XR dose reduction), image analysis (segmentation, classification, detection), reporting (NLP), precision medicine. 6 - "Must know" AI limitations: • Algorithm creation vs algorithm implementation • Interpretation errors • Generalization errors 7 - Take home message

## **NPMEE-21 The Potential Applications of ChatGPT in the Field of Medical Imaging**

### **TEACHING POINTS**

This exhibit combines recent literature reviews to explore the application prospects of ChatGPT in the field of medical imaging, including its potential applications in medical service, teaching, and scientific research settings, possible ways to apply ChatGPT, and the attitudes of the academic community towards the application of ChatGPT in the field of medical imaging.

### **TABLE OF CONTENTS/OUTLINE**

1. ChatGPT can be used in the processing of medical document texts such as medical records in the medical imaging workflow, to achieve the structuring and standardization of texts, promoting effective interaction between staff and patients. 2. ChatGPT can also be used to train medical students and resident physicians in image diagnosis by improving teaching efficiency through interactive learning and teaching methods. 3. ChatGPT can assist in the literature retrieval, data collection, statistical analysis, and article writing processes in scientific research. However, researchers should be aware of the risk of ChatGPT taking over as the main tool and control the research process to ensure the authenticity of the research.

## **NPMEE-22 Ways to Improve Patient Satisfaction Analytics in the Modern Era of Radiology: Tips and Tricks from the Patient Satisfaction Officer**

### **TEACHING POINTS**

1. Third party analytics evaluate care directly from patients in a simple, fast, and easy-to-use fashion. 2. The information obtained from analytics offers radiologists and their practices an opportunity to identify patient needs and priorities while recognizing weaknesses and opportunity for improvement. 3. Modifications and implementation of new practices are often minor, requiring little to no infrastructure, cost, or time while having a positive impact on retention, referral, and most importantly patient satisfaction.

### **TABLE OF CONTENTS/OUTLINE**

1. Define the patient experience as it relates to most commonly observed factors. 2. Discuss the role that current-day technology has played in the implementation and innovation of healthcare analytics regarding both acquisition and interpretation. 3. Recognize that personnel, speed, and ease of care are common subjects of both positive and negative patient experiences. 4. Identify methods to respond to feedback that increase patient satisfaction.

## **NPMEE-23 Utilizing 3D Printing and Phantoms to Teach the Basic Principles and Pitfalls of Ultrasound**

Participants

Patricia Garcia, Cork, Ireland (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

Ultrasound (US) is an essential diagnostic tool for the radiologist. This teaching module will be a practical, interactive, and

Ultrasound (US) is an operator-dependent imaging technique; thus, teaching this skill is critical to radiology education. Ensuring adequate training is essential to patient safety and quality assurance in clinical practice. Those trained in US are keenly aware of the many pitfalls of US imaging. US physics and related artefacts are covered comprehensively in the Diagnostic Radiology curriculum; however, modern education emphasises alternate approaches to teaching, including hands-on practical sessions. US phantoms are used to teach biopsy techniques, but little literature exists on the use of phantoms to teach US basic principles. To simulate commonly encountered US limitations and artefacts, we created gelatin-based US phantoms with embedded objects made from 3D-printed moulds, allowing trainees to experience them in real-time. The embedded objects demonstrated concepts such as relative echogenicity, the importance of imaging an object in multiple planes, mirror image artefact, increased acoustic through-transmission and shadowing. Representative scans of these phantoms will be presented to confirm their utility in demonstrating these concepts.

#### TABLE OF CONTENTS/OUTLINE

1. Challenges of teaching hands-on ultrasound skills
2. Technical aspects of phantom creation
3. Demonstration of basic principles
4. Demonstration of artefacts

#### NPMEE-24 **Scire Quod Sciendum: Knowledge at the Intersection of Suboptimal Photography and Radiography**

Participants

Emiliano Garza Frias, MD, Monterrey, NL (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Learning Objectives Using the author-shot photographs and curated suboptimal radiographs, this exhibit will help the audience: 1. Understand the causes and types of suboptimal chest radiographs. 2. Learn about the global frequency of suboptimality in the most frequent radiological procedure - chest radiographs. 3. Understand what errors in photography can teach about suboptimal radiography. 4. Understand how suboptimality in radiography influences the interpretation using photo-radio-graphic examples.

#### TABLE OF CONTENTS/OUTLINE

Content organization 1. What makes a chest radiograph suboptimal? 2. What are the parallels between suboptimal radiography and photography? 3. Use of common causes and examples of suboptimal photographs to educate about suboptimal chest radiographs. 4. Parallel examples of how suboptimal photography and radiography hide or distort key findings

#### NPMEE-25 **RadioGraphics Trainee Editorial Advisory Members Board (RG TEAM)**

Participants

Melina Hosseiny, MD, La Jolla, CA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

-The RadioGraphics Trainee Editorial Advisory Members Board (RG TEAM) was established in December 2020 to involve trainees in shaping the journal's content and direction. -The RG TEAM is a group of radiology trainees from around the world who play a crucial role in developing high-quality educational resources that are specifically tailored to trainees. RG TEAM initiatives include content curation, innovation of creative trainee resources, organization of trainee Top 10 reading lists, creation of trainee-focused editorials, Cases from the Cookie Jar (in-print and social media), and the new official Spanish version on social media (Casos Cookie). -Joining the RG TEAM offers multiple benefits to its members, such as mentorship, networking, career development, experience in academic writing and publishing, and exposure to global radiology education. -Trainees can obtain mentorship through the RG TEAM by collaborating directly with RadioGraphics editorial board members and radiology experts, and gain valuable skills including communication, writing, and critical thinking skills. This relationship extends beyond the one-year term and can last a lifetime. -RG TEAM has an annual call for new applications available in SPRING. Interested trainees can submit their curriculum vitae, statement of interest, and an idea for a trainee-focused RG TEAM initiative. Residents and fellows in diagnostic or interventional radiology, radiation oncology, and nuclear medicine, as well as medical students, are encouraged to join.

#### TABLE OF CONTENTS/OUTLINE

- 1) Introduction to RadioGraphics and RG TEAM
- 2) RG TEAM Initiatives
- 3) Benefits of Joining the RG TEAM and How to Get Involved
- 4) Conclusion

#### NPMEE-26 **Blueprint for Medical Student Exposure to Radiology through Research: GSW and MVC Projects**

#### TEACHING POINTS

Medical students can be given early exposure to radiology through research. Research projects can be initiated using pre-existing data sets like the Trauma Registry maintained at Level I trauma centers. Projects can give residents and medical students leadership opportunities. Projects can give medical students opportunities to present their work at local, regional, and national conferences.

#### TABLE OF CONTENTS/OUTLINE

Purpose: Few opportunities exist for medical students to gain exposure to radiology outside of seeking out electives during clinical years. Methods: IRB approval was obtained to access 10 years of GSW injury data. See Figures 1 and 2. Under trainee guidance, medical students reviewed radiology images and worked to grade injuries by the American Association for the Surgery of Trauma injury grading scales. Once injuries were scored, clinical questions were examined. As part of the expansion to MVC injuries, we are recruiting new students at M1 Orientation and collaborating with other specialties. Results: In year 1, 13 posters were presented at a local conference, Research!Louisville, and 6 at state, regional, and national conferences. See Figures 3 and 4. Data presented at RSNA will include the number and listing of the projects presented at Research!Louisville in September 2023 (planning for 45 posters) and will also include 2 years of survey responses from medical student participants and leaders. Conclusion: Trauma registries provide a robust dataset that can be utilized to increase early exposure to radiology in medical school and facilitates collaborative projects between residents and medical students, that students can further expand on as their research experience grows. .

#### NPMEE-27 **Radiology at the Crossroads: Navigating Patient Safety, Risk Management, and Clinical Ethics in Modern Imaging Practice**

#### TEACHING POINTS

1. Comprehensive overview of medical ethics, patient safety, and risk management in radiology 2. Empowering radiologists and trainees to actively engage in quality improvement 3. Transcending specialties to create a positive impact on patient care

#### TABLE OF CONTENTS/OUTLINE

1) Intro: Radiology, Patient Safety, Ethics2) Radiation Safety, Dose Reduction3) Informed Consent in Procedures4) Communicating Critical/Incidental Findings5) Radiology Research Ethics6) AI, Machine Learning: Safety, Ethics7) Justification/Appropriateness of Imaging8) Optimizing Imaging Protocols9) Pediatric Radiology Safety10) Radiology Workflow, Patient Safety11) Contrast Media Safety, Reactions12) Radiation Exposure in Pregnancy13) Safety/Quality Improvement Initiatives14) Reducing Reporting Errors15) Incident Reporting, Learning from Errors16) Patient-centered Care17) Confidentiality, Data Protection18) Teleradiology Ethics19) Credentialing, Privileging20) Sports Injuries Imaging Ethics21) Cultural Competence, Diversity22) Managing Incidental Findings23) Peer Review, Feedback24) Radiology Education Ethics25) Financial Considerations, Conflicts26) Interprofessional Collaboration27) End-of-Life Care Ethics28) Cognitive/Mental Health Issues29) Radiology in Global Health, Disaster30) Palliative Care Imaging Ethics31) Addressing Healthcare Disparities32) Shared Decision-making33) Public Health Emergencies Ethics34) Access to Radiology Services35) Conclusion, Future Directions

#### **NPMEE-28 Myth Busters: Questioning Standard Radiology Practices for Value-added Care**

##### TEACHING POINTS

This exhibit aims to debunk common myths in radiology practices that are believed to provide value-added care but, in reality, lack sufficient scientific evidence to support their efficacy. By analyzing scientific data and exploring recent research, the article challenges widely accepted practices to promote a more evidence-based approach to radiology.

#### TABLE OF CONTENTS/OUTLINE

I. Introduction, a. Value-added care definition, b. Importance of evidence-based practicesII. Radiology Myths, a. Myths 1-5, b. Myths 6-10III. AUC Reality, a. AUC role in debunking myths, b. AUC examplesIV. Barriers to AUC, a. Resistance to change, b. Financial incentives, c. Technology and trainingV. Overcoming Barriers, a. Education, b. Incentives for evidence-based practices, c. Technology upgradesVI. Measuring Radiology Value, a. Patient outcomes, b. Costs, c. EfficiencyVII. Strategies for Value-Added Care, a. Staying current on evidence-based practices, b. AUC for dispelling myths, c. CommunicationVIII. Conclusion, a. Summary of exhibitIX. References

#### **NPMEE-29 From Detection to Action: A Journey Through Incidental Findings in Radiology**

##### TEACHING POINTS

This educational exhibit aims to provide a comprehensive understanding of incidental findings in radiology, addressing their various aspects including identification, communication, management, legal implications, and patient autonomy. The presentation highlights the importance of awareness and proper handling of incidental findings, balancing patient autonomy with ethical considerations and potential harms. It emphasizes the need for evidence-based management, structured reporting, and effective communication. The evolving role of technology, particularly AI, in detecting and managing incidental findings is also discussed.

#### TABLE OF CONTENTS/OUTLINE

Introduction: Definition and variability among radiologists || Settings where incidental findings may ariseEducation: ACGME and ABR guidelinesPatient autonomy Access to images, understanding reports, imaging preferences, and referralsCommunication of incidental findings: Timing, disclosure, responsibilities, and documentationLegal implications: Civil and criminal lawsuits, protection for radiologistsManagement of incidental findings Evidence-based practices, second opinions, structured reporting, national/international variations, conflicts of interest, guidelines, and low-resource settingsHarms of incidental findings Costs, psychological impact, overcalling and undercalling incidentalsCommon incidental findings: ACR white papers, unclear clinical significance, small focus of ischemiaConclusion Importance of awareness, research, guidelines, and technology in managing incidental findings.

#### **NPMEE-3 International Observerships in Pediatric Radiology: Optimization and Potential Benefits**

Participants  
Hermon Derbew, MD, Philadelphia, PA (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

International clinical observership programs can facilitate highly effective academic collaboration, international brand building, information dissemination and recruitment. However, this type of program typically adds bureaucracy, logistics and faculty workload for the hosting institution—as well as many regulatory and financial barriers for interested individuals. Our institution's proactive approach to welcoming observers from diverse backgrounds minimizes the financial burden to applicants and allows collaboration to advance our academic mission. This exhibit explains the process and impact of the program with emphasis on specific steps taken towards improved workflow and increased throughput of observers.

#### TABLE OF CONTENTS/OUTLINE

1. Process, 2. Institutional benefits, 3. Impact

#### **NPMEE-30 A Step-By-Step Approach to Establish and Enhance MRI Site Safety: A Primer for Radiologists**

Participants  
Pradnya Y. Mhatre, MD, (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

MRI Site Safety is important for protection of patients, staff and public. Proactively thinking about MR Safety features while designing an MR suite is key in establishing robust MR safe environment. American College of Radiology has created MR Safety Manual which includes general principles of MR Safety. We describe various components of MR Site Safety that need to be implemented in a systematic manner to create a robust and sustainable program.

#### TABLE OF CONTENTS/OUTLINE

Initial step in establishing site safety is to identify MR Medical Director, MR Safety Officer and MR Safety Committee. We describe

initial step in establishing site safety is to identify MR Medical Director, MR Safety Officer and MR Safety Committee. We describe how to structure MRI zones, including placement of ferrous quarantine, safe storage, patient transfer, mechanical room, and control room. We also discuss marking of equipment with appropriate signage, use of ferromagnetic detection devices, operation of MR conditional devices in Zone IV and infection control. Specific considerations for cryogen safety, cryogen vent pathway and quench scenario are discussed. Important design details during construction and installation are included. Development of key site safety policies and procedures needed and will be discussed including quarterly and yearly site safety checklist and QC program. Lastly, we will discuss emergency plans for various emergencies like fire, water damage, quench, structural damage, establishment of code area, and preparation for emergency resuscitation, which are a key component of site safety.

### **NPMEE-31 Stay Calm and Don't Attract the Magnet: A Comprehensive Review of MRI Safety Precautions**

Participants

Siddhant Dogra, MD, New York, NY (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Following completion of this presentation, the reader will be able to: (1) Identify the four zones of MRI facilities (2) Describe the direct effects of MRI on patients (e.g., noise, heat, neurostimulation) (3) Describe the indirect effects of MRI on patients (e.g., interactions with existing devices and equipment) (4) Define specific absorption rate (SAR) and specific energy dose (SED) and their applications to MRI examinations (5) Discuss specific MRI safety considerations for special patient populations (6) Discuss safety profiles of gadolinium-based contrast media

#### **TABLE OF CONTENTS/OUTLINE**

(1) Background: Physical setup and zones, Hardware and parts of MR apparatus (2) Auditory concerns (3) Heating effects (including burns) (4) Peripheral neural stimulation (5) Portable metallic objects and equipment (6) Medical device and hardware compatibility and interactions (7) Contrast agents (8) Personnel and staffing (9) Special populations: pediatric patients, pregnant patients, patients with altered states of consciousness, obese patients, prisoners and detainees

### **NPMEE-32 Common Errors in Neuroradiology**

Participants

Luke Wojdyla, DO, San Diego, CA (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Diagnostic errors in neuroradiology are alarmingly common, with estimates ranging from 1-16% in clinical practice. It is well established that most diagnostic misses, including those which result in malpractice litigation, are due to errors in perception. Despite this, the miss rates of specific neuroradiologic diseases have historically been undefined. Recently, a growing number of studies have quantified and categorized neuroradiologic errors across training levels and in a variety of practice schema, measuring the influence of radiologist experience, specific pathology, and other individual and systematic factors. In this exhibit, the most common diagnostic errors described in emerging neuroradiologic literature will be presented. Briefly, these include errors of cerebrovascular pathology, blind spots on CT head imaging, errors of cerebrovascular pathology, misses of head and neck pathology, and errors of skull-base pathology. Systemic factors affecting performance such as practice volumes, reading speeds, and fatigue will also be presented. Knowledge of these findings can provide insight into understanding why errors occur, and in turn, help develop robust strategies to prevent them. Radiologists should be aware of the common blind spots and missed pathologies in the variety of settings described in this exhibit.

#### **TABLE OF CONTENTS/OUTLINE**

Explore the impact of diagnostic error in neuroradiology. Summarize recent literature quantifying common neuroradiologic errors amongst residents, generalists, and neuroradiologists. Appreciate the risk factors and biases associated with error. Provide case examples of real errors encountered in one department. Discuss strategies to minimize error.

### **NPMEE-33 Microaggression or Cross-Cultural Competence?**

#### **TEACHING POINTS**

The pursuit of cultural competence among an increasingly diverse and interconnected workforce is vital. It requires empathy and perspective taking. It behooves us to successfully distinguish the subtleties that exist between the negative connotation of microaggressions from the positive influence of cultural competence. Microaggressions are subtle indignities, slights or insults whose derogatory nature communicates prejudice, dismissal, denigration, hostility or negativity to a member of a marginalized group. They may appear indirect, casual, innocuous, and insignificant. They are often unconscious and unintentional, arising from underlying: prejudice, discrimination, oppression, or bias. Are microaggressions sometimes confused with a genuine desire to improve one's cross-cultural competence?

#### **TABLE OF CONTENTS/OUTLINE**

1) Introduction 2) Cross-Cultural Competence and Communication 3) Microaggressions 4) "Microaggressions are a real problem" 5) "Microaggressions are much ado about nothing" 6) Conclusions

### **NPMEE-34 RadLinks: Creating an Efficient Reference Webpage for Incidentaloma Management Guidelines and Template Generation**

Participants

Alice Shieh, MD, Seattle, WA (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

- Conceptualize and design a webpage (RadLinks) to efficiently reference incidentaloma management guidelines- Discuss webpage design features that streamline incidentaloma management- Provide a seamless workflow so radiologists can provide incidentaloma management recommendations quickly with ease

#### **TABLE OF CONTENTS/OUTLINE**

Barriers to efficiency when managing incidentalomas?- Time consuming and repetitive efforts to look up information?- Lack of

resource consolidation? Benefits of using the RadLinks page? - Minimalist, user-friendly design? - Thoughtfully consolidated resources? - Pre-generated templates and text macros? - Hosted on public domain, with lack of institutional barriers RadLinks user interface features? - Expandable/collapsible navigation menu, ability to enlarge figures/charts in-screen, copy text to clipboard with one-click, mobile device compatibility? Website hosting and building options and tools? - Squarespace, Wix, WordPress? - Flaticon? - HTML/CSS tutorials Copyright issues? - Obtaining permissions to display figures and graphs from published articles Future directions? - Keeping content and guidelines up to date? - Expanding resources beyond incidentaloma management? - Reducing scrolling distance? - Implementing user suggestions and feedback?

### **NPMEE-35 Beauty Beyond a Few Slides Deep: How to Increase Radiology Lecture Engagement**

Participants

Julia Tran, MD, Westminster, CA (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

(1) Engaging lectures can hold the audience's attention, convey information more effectively, and make lessons more memorable. (2) Use graphic design resources (eg. AI art sites, design software, typography sites) to visually enhance your presentation. (3) Include activities that require active participation such as games, polls, and PACS simulators to increase engagement.

#### **TABLE OF CONTENTS/OUTLINE**

Didactics are an integral part of radiology education but creating engaging learning experiences can be challenging. Effective and interactive lectures improve learning outcomes by helping learners retain and apply new information. This educational exhibit will (1) introduce the concepts of graphic design and its role in creating impactful presentations. We will share various graphic design software, AI tools, and web resources useful for creating visually appealing designs. We provide examples of how to format lecture slides to emphasize key learning points and findings. This exhibit also aims to (2) showcase various interactive tools and activities that increase audience engagement. PACS simulators, such as PACSBIN, combine imaging software with educational tools to create case-based quizzes and lesson plans. Gamifying cases into competitions, such as Taboo™ or Pictionary™, motivates learners to strive for mastery. By implementing these strategies, educators can create more effective and engaging learning experiences.

### **NPMEE-36 Sustainability, Climate Change and Radiology: Why We Should Care and What We Can Do**

Participants

Hayley McKee, MSc, Toronto, ON (*Presenter*) Nothing to Disclose

Kate Hanneman, MD, MPH, (*Presenter*) Speaker, Groupe Sanofi; Speaker, Amicus Therapeutics, Inc

#### **TEACHING POINTS**

Producing, using, and powering medical imaging equipment to provide radiology services are estimated to contribute to 1% of total global greenhouse gas emissions. Achieving sustainability in radiology requires immediate and strategic action. Strategies should focus not only on mitigating radiology's impacts, but also building resiliency to the risks of climate change through adaptation, with action taken at individual, department, and industry levels. Opportunities to reduce radiology's carbon footprint include reducing emissions due to non-productive scanner time and minimizing the use of single-use products and overall waste. Reducing overall emissions in health care and radiology will also require partnerships with both industrial and clinical stakeholders.

#### **TABLE OF CONTENTS/OUTLINE**

The overarching goal of this exhibit is to review the intersection of sustainability, climate change and radiology with a focus on why we should care and steps we can take to reduce waste and greenhouse gas emissions. This will be achieved by: 1. Describing the human health impacts of climate change, with health equity considerations. 2. Discussing diagnostic and interventional radiology's contributions to greenhouse gas emissions and waste. 3. Reviewing sources and classification of emissions related to radiology. 4. Differentiating mitigation (reducing impacts) and adaptation (building resiliency) strategies related to radiology. 5. Exploring strategies to promote sustainable practices at individual, institutional, and industry levels.

### **NPMEE-37 Decolonizing Radiology: Addressing Historical Influences and Promoting Global Equity**

#### **TEACHING POINTS**

It is well established there are worldwide disparities in access to radiology services as well as image guided procedures. While differences in access to care persist in the United States, there are profound disparities in access to care between high income countries (HIC) and low/middle -income countries (LMIC). Socioeconomic differences in patient populations, lack of equipment, career opportunities, and until recently lack of formal training programs have all contributed to differences in global access to radiology services. An additional well known contributing factor in differences to access to care are the historical effects of colonialism. While there have been increasing world-wide efforts to decrease the gaps in access to care and addressing the training gap in radiology, there has been little effort to address the history of colonialism in global health work in the context of radiology. This educational exhibit aims to provide context to the history of colonialism in global health and how this perspective is crucial to provide sustainable solutions for long term global radiology equity and culturally competent global health work.

#### **TABLE OF CONTENTS/OUTLINE**

1. History of Colonial Influence on Radiology 2. Consequences of Colonialism in Radiology 3. Current State of Global Radiology Outreach 4. Strategies for Decolonizing Radiology

### **NPMEE-38 Global Radiology: Building Equitable and Sustainable Partnerships with Low- and Middle-Income Countries (LMICs)**

Participants

Lydia Kwarteng, BS, MPH, San Francisco, CA (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Global radiology partnerships can be leveraged to help address the shortage of radiology professionals in LMICs. Simultaneously, there are efforts to address the legacy of colonization on global health initiatives by highlighting the power asymmetry between High-Income Country (HIC) and LMIC partners. This exhibit reviews the critical need to help establish and scale-up radiology training programs in LMICs, highlights opportunities for reform in global health, and provides examples of best practices to foster

equitable and sustainable global radiology partnerships with LMICs.

#### TABLE OF CONTENTS/OUTLINE

Background- Shortage of radiology professionals in LMICs- Global radiology engagement in LMICs The Decolonize Global Health movement- Origins in global health- Goals and controversies Building equitable global radiology partnerships- Leadership and decision-making- Understanding sociocultural context- Equity in research, education, and capacity-building- Funding practices- Transparency and accountability Examples of successful partnerships in Africa- HIC-LMIC institutional collaborations in global cancer research, subspecialty training, and capacity-building (e.g. in neuroradiology, breast imaging, and interventional radiology).

#### **NPMEE-39 Usefulness of Deep Learning for Improved Image Quality and Noise Reduction in Diffusion Weighted Imaging (DWI)**

##### TEACHING POINTS

Deep learning (DL) has recently experienced explosive growth including many areas of medical research. Recent advances in DL-based image reconstruction in MRI have been reported to achieve improved image quality through noise reduction and super-resolution (SR), but there have been very few reports of its application to diffusion-weighted imaging (DWI). We have scanned various body regions with a DL-based DWI research application for clinical evaluation. These images are presented with clinical findings. In addition, underlying technical details and imaging parameter optimizations are presented. Although the visual impression varies depending on imaging regions or scan parameters, the following advantages in DL-based reconstruction are observed: noise reduction due to DL, reduced distortion due to higher acceleration factor, sharpness improvement due to SR and higher spatial resolution, and better visibility of background normal tissues due to shorter echo time.

#### TABLE OF CONTENTS/OUTLINE

1. To present DWI images with deep learning-based image reconstruction and its findings in various body regions. 2. To understand the mechanism of deep learning-based image reconstruction. 3. To understand scan parameter optimization in DL DWI. 4. To know the clinical feasibility of DL DWI in patients with various diseases.

#### **NPMEE-4 Waste Reduction in Radiology: Educational Case Series**

##### TEACHING POINTS

In the U.S. the healthcare sector is estimated to contribute almost 10% of our nation's carbon emissions. As healthcare professionals, we are committed to improving the well-being of our patients, so we also must focus on decreasing our contribution to climate change. Radiology departments can target both direct and indirect emissions by decreasing energy usage within the workspace, reducing unnecessary imaging, and transitioning to green suppliers for the procurement and disposal of medical equipment. Studies have shown that there is a high rate of imaging overuse. Understanding the environmental impact associated with these practices can help to encourage appropriate usage. There are both external and internal factors that can drive a physician to order unnecessary or inappropriate imaging, including but not limited to defensive medicine, patient expectations, obliviousness to cost and risks, breaks in patient-provider communication, and inadequate knowledge.

#### TABLE OF CONTENTS/OUTLINE

Introduction a. Health care impact on environment b. Radiology energy use c. Avenues for reduction Case examples a. Emissions by scan b. Contrast use Inappropriate imaging examples a. Contributions to inappropriate imaging b. Inpatient cases c. Outpatient cases Advocacy strategies

#### **NPMEE-40 The Second Mountain - Climbing the Challenges of Mid-career Radiology**

Participants

Miltiadis Tembelis, MD, Mineola, NY (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

The mid-career phase for a radiologist, and many other professions, is a time burdened by career stagnation and high rates of burnout. To spite it being a particularly difficult time in the radiologist career, there is little dedicated mid-career support to help radiologists overcome their woes. The goal of this presentation is to highlight the difficulties faced by the mid-career radiologists as well as provide potential solutions to these problems. A focus on the mid-career female radiologist and their unique challenges will also be presented.

#### TABLE OF CONTENTS/OUTLINE

This review will define the mid-career radiologist and provide an overview of the current radiology workforce. Problems such as burnout, career stagnation, alternative career pursuits, lack of mentorship, sponsorship and career development programs, and gender specific challenges of women will be discussed. Potential solutions to these problems will also be presented.

#### **NPMEE-41 Subspecialty Breast Imaging Education in Tanzania: Clinical, Infrastructure and Logistical Paradigms for Best Practices in the Low- and- Middle Income (LMIC) Setting**

Participants

Toma Omfofoye, MD, Houston, TX (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

- Given the global rise in breast cancer, radiology workforce shortages in sub-Saharan Africa are critical.
- The RSNA-led Global Learning Center (GLC) initiative in Tanzania for sub-specialty breast radiology training is presented as a paradigm for remote/in-person education.
- It is imperative to tailor interventions for the resource-limited LMIC environment.
- Presenting a scalable education program for best practices in the LMIC setting, with goals of improving interdisciplinary breast care through training, infrastructure, and optimization of local resources.
- An example of an transnational alliance to care for underserved populations.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction a. Radiology workforce in Africa b. Breast Cancer in Tanzania 2. Educational Paradigm a. Background/need i. Tanzania medical education, radiology and subspecialty education b. Trainees c. Curriculum i. Goals/objectives ii. Content iii.

Learners iv. Faculty v. Resources and Methods ? Synchronous teaching ? Asynchronous teaching ? Observerships vi. Assessment vii. Governance viii. Continuous improvement 3. Breast Imaging Service a. LMIC modality specific goals b. Reporting c. Interprofessional collaborations 4. Infrastructure a. improving technology and support staff 5. Future directions

#### **NPMEE-42 Radiologists for a Sustainable Future (R4SF): Bridging the Gap Between Radiology Practice and Environmental Responsibility**

Participants

Melina Hosseiny, MD, La Jolla, CA (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

-Radiologists for a sustainable future(R4SF) is an international community of radiologists and trainees, dedicated to promoting environmentally sustainable radiology practice and healthcare delivery.-R4SF advocates for policies that promote environmental sustainability in healthcare.At R4SF, radiologists/radiologists-in-training and leaders in the field unite to promote sustainable practices in radiology through education and awareness initiatives, the promotion of sustainable projects, and the establishment of a supportive network.-The R4SF has teams working together to advocate for sustainable radiology through education, policy, social media, and research. -Education team focuses on expanding the participation of medical students and residents in sustainable practices.-R4SF collaborated with members' ACR chapters to propose and pass a resolution on climate change and sustainability at the 2022 National ACR meeting. -R4SF team is a subgroup of the larger multispecialty Healthcare without Harm physician network and has support, mentorship, and sponsorship from great leaders in the radiology society.-Members of R4SF have delivered talks and shared our aims to the radiology community at various societies, including RSNA, ARRS, SABI, AUR, and others.

##### **TABLE OF CONTENTS/OUTLINE**

1)Introduction to Radiologists for a Sustainable Future (R4SF)2)R4SF Initiatives 3)R4SF Goals and Collaborations4)Benefits of Joining the R4SF and How to Get Involved5)Future Direction

#### **NPMEE-43 Let it Go, Let it Go: An Approach to Assessment and Reporting of Benign or Low-Risk Incidental Findings in the Chest**

Participants

Erin Gomez, MD, Columbia, MD (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

Radiologists are expected to provide management recommendations for incidentally detected pulmonary nodules and thyroid nodules. While some are clinically impactful, a majority are benign and inconsequential. Fleischner, Thyroid White Paper and TIRADS consensus recommendations were developed to decrease inappropriate recommendations for further evaluation. In our quest to do no harm, radiologists can help decrease patient anxiety, time spent, medical expenses and potential risks associated with further characterization by using best practices for characterizing and reporting nodules which do not require further evaluation through clear, concise language. We will present examples of nodules inappropriately recommended for follow up and a step by step approach to assessment and reporting. ?

##### **TABLE OF CONTENTS/OUTLINE**

Introduction?Commonly Mischaracterized Incidental Findings on Chest CT:?- Pulmonary nodules?- Mucous plugging?Granulomas?- AVMs?- Thyroid Nodules?Risk statistics for nodules by size?Reporting considerations:?- Morphologic descriptors (shape, density, distribution)?- Measurements - 3 plane review?- Concise, specific language; avoiding vague terms?- Comparison with prior imaging? Patient history?Letting it go: supporting data?Role of Structured Reporting?Pre-Populated Macros: Pros and Cons?Society Recommendations and Indications for Incorporation into Reports?Closed Loop Communication?Conclusion

#### **NPMEE-44 Best Practices for Medical Student Engagement in the Radiology Reading Room**

Participants

Devyn Rigsby, Philadelphia, PA (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

1. There is no standardized approach to engaging medical students in the radiology reading room during radiology electives (1).2. Without intentional incorporation of medical students into the reading room team, students may feel disinterested, excluded, or insufficiently challenged to learn. Negative experiences on radiology electives may dissuade students from pursuing radiology as a career.3. This presentation shares best practices for radiology preceptors to foster a healthy learning environment, maximize educational opportunities, and increase medical student interest in radiology.4. Best practices for engaging medical students in radiology courses can be divided into three parts: preparing for student arrival, starting a learning session, and facilitating case-based instruction.5. These best practices are transferrable to any institution's in-person radiology curriculum for medical students.Reference 1. Darras KE, Spouge R, Kang H, et al. The challenge with clinical radiology electives. *Can Assoc Radiol J*. 2019;70(4):337-343.

##### **TABLE OF CONTENTS/OUTLINE**

1. Problem statement2. Common concerns about the reading room experience raised by students at our institution3. Preparing for student arrival in the reading room a. Introductory information b. Identify near-peer mentor (resident or fellow) c. Student workspace4. Starting a learning session a. Learning objectives b. Transfer of foundational knowledge c. Select cases for student to attempt independently5. Facilitating learning through cases a. Student inclusion in all trainee readouts b. 1:1 student readouts on assigned cases c. Session wrap-up

#### **NPMEE-45 Reducing Inappropriate Screening of Endometrial Cancer in Transgendered Men: Discussion of Best Practices**

##### **TEACHING POINTS**

1. To review the testosterone-induced changes in patients who are assigned female at birth (AFAB)2. To discuss the existing literature on the appropriateness of transvaginal US in evaluating abnormal vaginal bleeding in transgender men on hormone-replacement therapy3. To discuss the costs, financial and psychological, of inappropriate screening4. To recommend new guidelines

for screening endometrial cancer in transgender men

#### TABLE OF CONTENTS/OUTLINE

- Hormone replacement therapy treatment goals for transgender men- Current guidelines for endometrial cancer screening - Guidelines for endometrial cancer screening in transgender men - Recommendations for endometrial cancer screening in transgender men- Costs of inappropriate transvaginal US screening- Patient-centered care principles in treatment and care of transgender men

#### **NPMEE-46 It Takes a Village: Multidisciplinary Breast Subspecialty Telementoring for Low- to- Middle-Income-Countries (LMICs)**

Participants

Toma Omofoye, MD, Houston, TX (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Funded by an RSNA International education grant, a method for telementoring is described for breast radiologists, pathologists, oncologists, and surgeons where domestic/foreign, low/high resource, and within/outside subspecialty input is used to adapt best practices to available resources. Breast subspecialist shortages in African Low-Middle-Income Countries (LMICs) call for creative solutions. Many LMICs lack multidisciplinary communication (radiology-pathology or tumor board). While LMIC practitioners have varying levels of breast subspecialty training and resources, they have tailored creative solutions for optimizing resources to address advanced disease. The transnational collaboration (with 200 participants from 3 continents- Africa, North and South America) assists capacity building.

#### TABLE OF CONTENTS/OUTLINE

We describe a model for multidisciplinary telementoring to provide paired subspecialty support for breast health practitioners in LMICs. 1. Introduction: LMIC breast cancer burden and subspecialty workforce gaps 2. Project Extension for Community Healthcare Outcomes (ECHO) ABCD model: a. Amplification of medical knowledge b. Best practices to improve outcomes c. Case based (clinically-relevant) learningd. Database: outcome monitoring 3. Program Formata. Case presentation b. Interprofessional and multidisciplinary inputc. Complementary didactics 4. Case-based examples including: Rad-path concordance, quality, symptom, interesting or difficult cases, and rare disease management

#### **NPMEE-47 Supporting Women in Radiology: Implementing a Multi-institutional Coalition**

#### TEACHING POINTS

Women are underrepresented in radiology. Even though men and women are about equality represented among medical school graduates, only 27% of applicants in radiology are women.<sup>1,2</sup> Furthermore, female radiology leaders make up an even smaller minority, consisting of only 13% of radiology leaders.<sup>3,4</sup> The purpose of this exhibit is to showcase how a women in radiology (WIR) group in a teaching institution can provide role models, mentorship, and promote a culture of diversity and inclusion. Furthermore, the introduction of WIR collaborations with other institutions can promote an institution's inter-institutional alliances and provide career advancement opportunities for its trainees. Training institutes are in a unique position to bring about this change. Trainees who have cultivated gender equality values can have a positive impact on their future practices. Though it takes time and effort to foster a culture of diversity and inclusion, it is necessary to do so in order to create a gender inclusive workplace which will benefit not only radiology departments but also patients.

#### TABLE OF CONTENTS/OUTLINE

A) Mentorship: Implementation of "mentoring up" and "mentoring down". B) Promote career advancement opportunities and promotions: Organize discussion panels with panelists from both private practice and academics with a mix of early, mid, and advanced career radiologists. C) Collaborate with other institutions' WIR committees to create inter-institutional alliances focused on promoting the above. D) Overcome or mitigate bias by organizing upstander workshops as part of the training curriculum.E) Understand the unique needs of women in the field, including pregnancy, parental leave, and lactation.

#### **NPMEE-48 Benefits and Applications of ChatGPT for Radiology Trainees**

#### TEACHING POINTS

1. To provide an overview of ChatGPT from a trainee perspective2. To highlight best practices for using ChatGPT 3. To illustrate how ChatGPT can be used to create relevant radiology review content including practice questions 4. To demonstrate the radiology virtual-advisor capability of ChatGPT 5. To describe how medical students can use ChatGPT to develop a preparation plan for radiology rotations6. To provide an overview of the future of ChatGPT in radiology undergraduate medical education

#### TABLE OF CONTENTS/OUTLINE

- What is ChatGPT? - How are trainees using ChatGPT? - Applications of ChatGPT for radiology learning and best practices- Using ChatGPT to generate radiology practice questions - Using ChatGPT to prepare for radiology rotations- Using ChatGPT as a virtual radiology advisor- Using ChatGPT to assist during core clinical rotations - Using ChatGPT to assist with professional communication - Future of ChatGPT in radiology undergraduate medical education

#### **NPMEE-49 Promoting Health Equity Through Radiology: Practical Tips for Empowering the Next Generation of Trainees**

Participants

Pooja Agrawal, MD, Houston, TX (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Medical students and residents in radiology represent the next generation of trainees and have a vital role in fostering sustainable health equity efforts focused on eliminating health disparities in radiology. Three ways trainees can promote health equity in radiology are through research, community outreach, and education.

#### TABLE OF CONTENTS/OUTLINE

Introduction: Review existing health disparities in radiology using findings from a published systematic review; discuss the

importance of trainee involvement in eliminating disparities; describe practical ways how research, community outreach, and education can promote health equityHealth equity research: Introduce tips to identify a mentor; discuss how to select a research topic by identifying gaps in existing research; review opportunities at national meetings to build research networkCommunity outreach: Discuss how to leverage existing community needs assessment to identify emerging opportunities; develop initiatives to educate patients about the importance of screening as a trainee; provide examples of radiology-focused community efforts (mobile mammography/lung cancer screening, RAD-AID)Education in health equity: Participate in the creation of radiology health equity-focused learning materials; collaborate in establishing mentorship programs to promote diverse applicants in radiology; explore how current radiology pillars in quality safety, innovation, and AI can be used as catalysts to bridge existing disparitiesConclusion: Discuss how long-lasting health equity necessitates an understanding of systemic obstacles and a commitment to staying informed on fields such as molecular imaging, social genomics, and AI algorithms

#### **NPMEE-5    Medicolegal Readout: A Malpractice Primer for Radiologists**

Participants

Luke Wojdyla, DO, San Diego, CA (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

The majority of radiologists will face litigation in their careers. In a 2021 survey, 71% of radiologists said they were sued which is similar to estimates in prior reports. Despite this, dedicated teaching of medicolegal issues is often lacking or incomplete in radiology training programs. Residents are seldom exposed to legal issues that can arise when caring for patients, and attendings themselves may feel unqualified in leading medicolegal discussions. Concerningly, residents may transition to independent practice with an incomplete understanding of the legal environment applicable to their practice. This exhibit will provide background for the legal frameworks relevant to modern radiology practice. A brief historical summary of key court decisions will be presented alongside a discussion of malpractice and radiologic errors. Challenging case scenarios will address nonroutine communication, reporting missed findings on comparison imaging, addressing technical limitations, and admitting mistakes, among others. At the end of the presentation, the reader should understand the legal basis for common radiologic practices, identify challenging situations with increased medicolegal risk, and implement practical strategies to mitigate risk of litigation.

##### **TABLE OF CONTENTS/OUTLINE**

Recognize the magnitude of malpractice within radiology. Understand how fundamental radiology practices have arisen directly from court rulings. Describe the most common causes for malpractice. Identify examples of frequently encountered medicolegal hazards and controversies. Case-based imaging examples will be used to discuss challenging medicolegal issues encountered in radiology.

#### **NPMEE-50    Integration of Clinical Context into Medical School Gross Anatomy Based on CT Imaging of the Students' Dissection Cadavers**

Participants

Peter J. Haar, MD, PhD, (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

Incorporating imaging in medical school gross anatomy courses can provide medical students with early, positive learning experiences with radiology. The teaching points of this exhibit include the following: first, to describe methods to incorporate CT imaging of the students' dissection cadavers into a novel exercise in which dissection cadavers are regarded as medical students' "first patients;" second, to outline roles for radiology attendings and residents in interactive cadaver CT workshops; and third, to explore the potential benefits of the experience in medical education and radiology residency training.

##### **TABLE OF CONTENTS/OUTLINE**

1.) Anatomy Rounds: an exercise for medical students to synthesize clinically relevant cadaver observations. 2.) Methods and resources to acquire and distribute cadaver CT images to medical students. 3.) Involving radiology residents in generating radiology findings on full-body cadaver CT image sets. 4.) Strategies to enhance the learning experience of interactive workshops based on the dissection cadaver CT images. 5.) Potential benefits of interactive radiology experiences early in medical school education. 6.) Feedback from medical students and radiology residents on the value of the learning experience.

#### **NPMEE-51    Designing Interactive Team-Based Learning Experiences with Cadaver CT Images in Medical School Gross Anatomy**

Participants

Peter J. Haar, MD, PhD, (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

Curricula involving CT images of medical school gross anatomy cadavers can provide students with a rewarding educational experience early in medical school. Teaching points of this exhibit include the following: first, to describe the challenges and benefits of teaching simple CT image analysis to enhance and complement gross anatomy instruction; second, to outline a strategy for developing interactive team-based learning modules and assessments; and third, to examine potential pitfalls and solutions in teaching the curriculum.

##### **TABLE OF CONTENTS/OUTLINE**

1.) Teaching gross anatomy and cross-sectional anatomy in parallel. 2.) User-friendly image interaction and teaching foundational concepts of CT imaging. 3.) Designing learning experiences with the intellectual rewards of correctly making real imaging diagnoses. 4.) Interactive group-learning assignments, and assessment of learning. 5.) Advantages and disadvantages of the interactive cadaver CT-based curriculum. 6.) Feedback and student response to the curriculum.

#### **NPMEE-6    A National Plan for the Renewal of Imaging in the EU: A Regional Perspective**

##### **TEACHING POINTS**

With this publication it is intended to disseminate a National Investment Plan and how it was managed and developed from a regional point of view. The main objective of this Plan is to increase overall survival and the quality of life of people through the diagnosis of diseases in early stages, which allow rapid therapeutic intervention. The plan pays special attention to the pathologies

with the greatest impact on the present and future of a National Public Health Service (SNS), such as chronic diseases, oncological diseases, rare diseases and neurological diseases. All this, consolidating equity in access to high technology and improving the quality of care and the safety of patients and professionals. This poster describes the objectives, method and results of a national plan that involves the acquisition of 847 state-of-the-art equipment for the SNS in order to: Reduce the obsolescence of high-tech equipment, guaranteeing the renewal of 100% of equipment that is 12 years old or older in accordance with scientific recommendations. Raise the average density rate of high-tech equipment per 100,000 inhabitants by at least 15%, in order to improve equity in access throughout the national territory, bring the service closer to patients and position the SNS, progressively, in the European average. As a consequence of the application of the Plan in our region, 76 new pieces of equipment are being installed (63 renewals and 13 extensions) and the total amount of the investment is € 67,204,159.

#### TABLE OF CONTENTS/OUTLINE

TABLE OF CONTENTS Context and introduction Objectives of the Plan Methodology Results Discussion and conclusions

#### **NPMEE-7 Guide for Radiologists Leading Multidisciplinary Conference**

Participants

Jody Shen, MD, Palo Alto, CA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Radiologists play a key role in multidisciplinary conference. This educational exhibit is meant to be a guide for trainees or junior attending radiologists for planning and leading a multidisciplinary conference. Special considerations will be given to leading the conference virtually (e.g. over Zoom) as this has become more commonplace. This guide can help radiologists early in their career add value to patient care and build relationships with referring clinicians.

#### TABLE OF CONTENTS/OUTLINE

A. How to prepare for multidisciplinary conference. B. How to lead multidisciplinary conference and key principles with examples of before revision, better strategy, and rationale: 1) Move it along. 2) Maximize screen real estate. 3) Keep it simple. 4) Keep it clinically relevant. 5) Get feedback. C. Common questions and challenging cases.

#### **NPMEE-8 Being a Radiologist in the Earthquake: Are You Prepared Enough**

Participants

Duygu Ekizalioglu, MD, Izmir, Turkey (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Raising awareness of earthquakes and other potential disasters The critical role of Radiologists in disaster prevention To overview radiology's role in disaster management Global outreach and education for radiology department disaster preparedness

#### TABLE OF CONTENTS/OUTLINE

What is an earthquake and when does it become a disaster? A recent experience: The impact of the earthquake in Turkiye The critical role of Radiologists in disaster prevention and preparedness Where does Radiology stand in disaster management on hyperacute/acute/subacute/chronic stages: Providing necessary imaging services based on the availability and utility of imaging methods, alternative reporting systems for communication, and teleradiology services The challenges that radiologists faced in the Turkiye earthquake management system; and what is next? A comparison of past experiences in different countries; lessons learned?

#### **NPMEE-9 Using Process Mapping to Identify Targeted Interventions to Reduce Imaging Disparities**

#### TEACHING POINTS

- Process mapping is a quality improvement tool used to depict flow of healthcare processes.
- Components of the imaging process are addressed in order to reduce imaging disparities.
- Pre-imaging interventions include reviewing imaging guidelines, providing culturally dexterous patient educational materials, community outreach, and improving imaging access.
- Imaging interventions include high quality interpretation services, patient-centered communication strategies, and maximizing patient comfort.
- Post-imaging interventions include structured collection of patient feedback and culturally-responsive patient navigation services to ensure adequate follow-up.

#### TABLE OF CONTENTS/OUTLINE

1) Process Mapping Definition a) Published Process Maps b) Apply Health Equity Lens to Published Imaging Process Maps 2) Pre-Imaging a) Review Imaging Guidelines Using Health Equity Lens i) Cancer Screening (breast, lung, colorectal) b) Clinical Decision Support to Reduce Variability in Decision-Making c) Patient and Provider Education d) Maximizing Patient Access i) Evidence-Based Strategies 3) Imaging a) Culturally Dexterous Communication Strategies i) Definition ii) Standardized Communication Strategies to Improve Patient Communication for Diverse Patient Populations (1) Review Evidence-Based Strategies iii) Stigmatizing Language in Medicine (1) Definition (2) Application of Stigmatizing Language in Radiology 1. Physician-patient encounter 2. Radiology Reports 3. Electronic health records (3) Vulnerable groups 1. Patients of color 2. Obese population 3. LGBTQ community 4) Post-Imaging a) Collection of Patient Feedback b) Patient-Navigation Services i) Review Evidence-Based Strategies

NPMEE-1

### Every Little Bit Helps. How to Reduce Carbon Footprint with a Mobile MR. Experience from the Northwest of Spain.

#### Participants

Mercedes Arias Gonzalez, MD, PhD, Vigo, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Mobile MRs are able to fill the service void in small to medium-sized hospital without in-house magnets. Delivering care closer to home avoids travel kilometers, highly contributing to an improved carbon footprint. Carbon footprint per MR scan can be even further reduced due to a higher utilization rate, as MR scanners cannot be turned off. Being conscious of radiology contribution to carbon footprint and greenhouse gas emissions can contribute to reduce them, as much as possible.

#### TABLE OF CONTENTS/OUTLINE

Evolution of needs and mobile MR implementation in the public healthcare system in Galicia (a region in the Northwest of Spain) since 2006. Evaluation of kilometers avoided by patients since 2006 and its effect in carbon footprint. Study of utilization rates of each mobile MR scan through the years. Easy explanation of useful concepts concerning carbon footprint and greenhouse gas emissions.

Printed on: 04/12/24

## Abstract Archives of the RSNA, 2023

NPMEE-10

### Financial Fitness for the Radiology Resident

#### Participants

Kevin Wu, MD, Tampa, FL (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Radiologists receive little formal instruction on basic concepts related to financial planning. Yet, certain financial decisions and strategies that are best employed during residency can yield as much as hundreds of thousands in savings over the course of a career. Therefore, early financial literacy is one of the most important aspects of career counseling that trainees can receive. Indeed, certain financial maneuvers are only possible during the training years. For those with an average loan burden, income driven repayment (IDR) can be worth >\$400,000 over the course of a career, and is a priority consideration. Other maneuvers, such as electing to contribute to a Roth 403b/401k (if available) rather than a pre-tax 403b/401k during residency, or performing a 403b/401k-to-IRA rollover followed Roth conversion after training, are expected to be worth \$84,000 by retirement. Even greater savings are likely with such maneuvers if marginal income tax rates increase in the future. These and other strategies require only hours to employ, and must not be missed for all who are eligible. In this light, we present an "order of priorities" regarding financial maneuvers that maximize yield with respect to ease of execution. Specifically, we discuss maneuvers such as student loan IDR, value-driven credit card rewards, 403b/401k to Roth IRA rollover, strategies around tax season, and early modifications of the retirement portfolio mix.

#### TABLE OF CONTENTS/OUTLINE

Philosophy/disclaimers, The financial waterfall, Student loan IDR, Credit card optimization, Expense ratios, Pretax purchasing, Roth vs. traditional and conversions, Income tax projections, Portfolio mix, Avoidance of taxation events, Tax season, Subtleties

NPMEE-11

### Radiology Dashboards: Applications in Addressing Healthcare Disparities in Image Utilization

#### TEACHING POINTS

1. Review the role of dashboards in radiology  
2. Examine how healthcare disparities (HCD) in radiology can affect morbidity and mortality  
3. Highlight specific applications of radiology dashboards in addressing HCDs in imaging utilization  
4. Discuss the limitations of radiology dashboards

#### TABLE OF CONTENTS/OUTLINE

1. What is a Radiology Dashboard?  
a. Key Performance Indicators (KPIs)  
i. Patient tracking  
ii. Image utilization  
iii. Turnaround time  
iv. Resource allocation  
v. Quality assurance  
2. Overview of the literature on HCDs in image utilization (e.g. disparities in imaging utilization in the emergency department, disparities in utilization of low dose CT for lung cancer screening, etc.)  
3. Applications of radiology dashboards in addressing HCDs in image utilization  
a. Identifying risk factors for decreased imaging utilization stratified by type of study (e.g. screening mammogram, low dose CT for lung cancer screening) and patient setting (e.g. emergency department)  
i. Zip code of patient residence  
ii. Race and ethnicity  
iii. Age  
iv. Language preference  
b. Developing quality improvement initiatives  
i. Patient education  
ii. Language accessibility  
iii. Cultural competency training and diversification of work force  
iv. Community outreach (e.g. mammogram vans and patient education efforts)  
v. ACR Select  
c. Monitoring response  
i. Before and after studies  
ii. Non-Comparative studies  
iii. Time series  
4. Limitations of radiology dashboards  
5. Conclusions

Printed on: 04/12/24

## Abstract Archives of the RSNA, 2023

NPMEE-12

### Out of the Darkness and into the Light: Redefining the Role of Radiology in Community Engagement

#### Participants

Somiah Almeky, MD, Boston, MA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Provide a radiology-focused overview of foundational elements related to community engagement, community-based participatory research, reciprocal innovation, and community needs assessment and outreach
- Discuss evidence-based examples of how radiology staff/trainees play a crucial role in delivering equitable care
- Explore how community engagement can be leveraged as an effective method to restore purpose in our daily work and prevent burn-out
- Review practical examples of community engagement across various settings (ie. rural, urban, global health)
- Discuss steps to establish a centralized curriculum that defines the role of radiology in the community, and provides trainees with concrete examples of this work

#### TABLE OF CONTENTS/OUTLINE

1. Interface between Radiology and the Community
  - Definition of Community Engagement, Community-Based Participatory Research, Reciprocal Innovation
  - Leveraging institutional resources and community needs assessments to guide outreach efforts
  - Evidence-based community engagement startup toolkit for radiology
2. Case-based review of ongoing outreach efforts in various settings
  - Cancer screening efforts
  - Resident-driven initiatives
  - Health equity efforts
  - Outreach interventions among veteran populations
3. Potential pitfalls and opportunities for growth
  - Allocation of effort and time in alignment with community needs and departmental workload.
  - Tips on identifying opportunities to engage diverse communities
4. Empowering the next generation
  - Establishing a "Community Engagement in Radiology" curriculum
  - Overview of required competency elements
  - Facilitators and barriers to dissemination of the curriculum

Printed on: 04/12/24

NPMEE-13

### Breaking Bad News: What the Radiologist Needs to Know

#### Participants

Natalia Orthmann, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1.To emphasize the importance of breaking bad news in appropriate ways.2.To present the existing and consolidated bad news protocols.3.To elaborate on how the protocols can be applied in the day-to-day practice of radiologists, especially breast radiologists.4.To assist in the training of radiologists in this time of breaking bad news.5.To illustrate the differences between the most frequent protocols for breaking the bad news

#### TABLE OF CONTENTS/OUTLINE

1.Literature review focusing of consolidates bad news protocols.2.To illustrate and discuss how bad news protocols can make the moment less traumatic for physicians and patients.3.Discuss how to apply the protocols in the radiologist's routine.4.Examples cases of how bad news may occur in the radiologist's routine.5.Summary and conclusion.

NPMEE-14

### Green Teams - an AI Gore-ithm for Addressing Sustainability in Radiology

#### Participants

Katherine Frederick-Dyer, MD, Nashville, TN (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

We explain the process of forming a sustainability committee in the Department of Radiology to identify and address the environmental footprint in our academic department.

#### TABLE OF CONTENTS/OUTLINE

I. Introduction A. What is sustainability and how does addressing it reduce costs and improve human health B. What is design thinking and how do we use it to solve non-linear problems II. Baseline Survey A. Identify attitudes and interest in climate change B. Identify opportunities to reduce carbon footprint and build allies III. First meeting A. Forming the committee - approaches to inclusivity B. Guidance with local climate experts to guide discussion 1. Assess - What is the carbon footprint of the department? 2. Inspire - To what extent do concerns about climate change and support for climate mitigation affect employee morale and patient satisfaction? 3. Model - How do we share our successes to decarbonize our department to guide other departments? C. Design thinking session 1. Actively engage participants to brainstorm ideas using colorful sticky notes 2. Visually organize ideas into the Categories (IIIb) 3. Establish culture of inclusivity, collaboration, transparency, fun, and accountability D. Organize team into subgroups to address each CategoriesIV. Subsequent meetings A. Encourage teams to produce achievable deliverables each meeting B. Assess what expertise and resources are needed C. Delineate team member roles and responsibilities D. Define timeline and metrics for success V. Highlighting early wins and how this contributes to the bigger picture

NPMEE-15

### Forward Together: Collaboratively Integrating Radiology throughout a Medical School Curriculum

#### Participants

Matthew Lee, MD, Phoenix, AZ (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Integrating radiology throughout a medical school curriculum mirrors the breadth, depth, and impact of radiology in the real world  
2. Sustainable implementation of radiology throughout a curriculum is a product of thoughtful and strategic partnerships with medical school leadership across disciplines and central governance committees  
3. Collaboratively working with colleagues across disciplines can expand the footprint and impact of radiology in medical school  
4. Early consistent exposure to quality radiology education promotes recruitment into radiology and positively impacts learners pursuing other specialties  
5. Effective student education transcends passive modes of learning through activities that promote increased learner engagement

#### TABLE OF CONTENTS/OUTLINE

1. ForWard - 3-phase model integrating basic, clinical, and public health sciences, 10 integrated "threads"  
2. Phase 1 - thematic blocks incorporating basic and clinical science and early clinical medicine - incorporating radiology into anatomy, patient-centered education cases  
3. Phase 2 - clinical rotations integrating clinical care, basic sciences, and thread areas - case-based learning  
4. Phase 3 - career exploration, intern preparation, "selectives" - novel radiology course development  
5. Leadership - medical student directors, block leaders  
6. Innovative educational content creation and delivery - embracing remote techniques, case-based learning, website development  
7. Novel course development - Screening in Radiology, Financial Wellness  
8. Faculty Recruitment - range of faculty, educational RVUs  
9. Resident Recruitment - radiology interest group  
10. Lessons learned - staff support for sustainable implementation

Printed on: 04/12/24

## Abstract Archives of the RSNA, 2023

NPMEE-16

### #FOAMrad: A Personal Productivity Curriculum for Radiologists

#### Participants

Alice Shieh, MD, Seattle, WA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Simplify and adopt the "Getting Things Done" methodology for busy radiologists- Understand and incorporate the fundamentals of "Deep Work" for peak performance- Learn how to apply the science of habits based on best-selling book "Atomic Habits"- Demonstrate tried and tested productivity software applications to streamline repetitive tasks (for Mac users)- Review time-saving settings and approaches to combat e-mail overwhelm

#### TABLE OF CONTENTS/OUTLINE

Getting Things Done framework ?- Delete it, Do it, Delegate it, Deposit it, Defer it ?Deep Work ?- 4 deep work philosophies: monastic, bimodal, rhythmic, journalistic?- 3 steps to rewire your brain: embrace boredom, quit social media, drain the shallows ? Atomic Habits ?- 4 laws of behavior change: cue, craving, response, rewards ?- Creating a new identity to develop new habits ?- Building better systems to achieve goals?Tried and tested productivity software applications to streamline repetitive tasks on a Mac?- Alfred, SetApp, 1Password, Evernote, Notion, Ecamm, Endnote, Backblaze ?E-mail management ?- Understanding e-mail communication principles ?- Time-saving settings for Outlook and Gmail ?Multitasking and prioritization techniques ?- MoSCoW (Must, Should, Could, Would)

Printed on: 04/12/24

NPMEE-17

### Radiology Management at Your Fingertips: Incorporating Macropads Into the Radiology Workflow

#### Participants

Elliot Breshears, MD, Seattle, WA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

-Review the utility of macropads in automating and simplifying repetitive nature of the radiologist's workflow-Learn how to easily assemble, program, and implement macropads into your own radiology practice-Discuss the time-saving features of macropads

#### TABLE OF CONTENTS/OUTLINE

Macropad device utility- Assign complex repetitive tasks to a single button click, improving efficiency- Ability to bypass IT restrictions and firewalls; eliminates need to install additional software on PACS workstationsResource selection process- Consolidating resources into 15 programmable keys- Implementing input from abdominal imaging faculty ?Assembly- Physical components: front and back plates, keycaps, switches, USB cables- Assembly process- Creating custom key stickers to promote intuitive access of selected resources ?Programming- Utilizing duckyScript and the duckyPad Configurator software- Navigating computing system compatibility issues ?Implementation and impact on radiology workflow- Reduction in mouse clicks needed to access resources- Plug and play with ability to use at different workstations ?Limitations- Cost- Time and effort associated with self-assembly, selecting and organizing incidentaloma guidelines- Minimal scripting required ?Future directions- Implementing Elgato stream deck into PACS stations with software installed after security clearance

Printed on: 04/12/24

### Large Language Models and Natural Language Processing: Overview and Metrics for Radiology Report Simplification

#### Participants

Rushabh Doshi, MPH, MSc, Cerritos, CA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1) Review the gap in health literacy for radiological reports. 2) Review existing efforts for radiology simplification. 3) Review the role of Natural Language Processing (NLP) and Large Language Models (LLM) models in report simplification. 4) Review the evaluation metrics of NLP and LLM models for report simplification.

#### TABLE OF CONTENTS/OUTLINE

1) Radiology Report Transparency 2) Patient Interest in Report Simplification 3) Ongoing Simplification Efforts 4) Model Terminology 5) Application of Natural Language Processing and Large Learning Models for Report Simplification 6) Demystifying NLP and LLM models 7) How Models Learn - Training NLP and LLM models 8) Existing LLM Interfaces 9) Prompt Optimization of LLM Interfaces 10) Evaluation Metrics (Readability, Accuracy, Simplicity, etc.) 11) Implementing LLM models 12) Potential reimbursement model for report simplification 13) Future directions of LLM models in report simplification

Printed on: 04/12/24

## Abstract Archives of the RSNA, 2023

NPMEE-19

### Journey to Parenthood in Radiology: Progress, Challenges, and Opportunities

#### TEACHING POINTS

1. Delayed childbearing impacts the reproductive outcomes among physicians. 2. A better understanding of the options to achieve parenthood allows for comprehensive family planning, flexible practice management, and inclusive dialogues. 3. Accurate knowledge of occupational radiation exposure to women physicians may help assuage unrealistic fear and build a stronger pipeline of future radiologists.

#### TABLE OF CONTENTS/OUTLINE

- To highlight the importance of and obstacles to family planning and childbearing for physicians and physicians-in-training
- To review occupational radiation risks and safety precautions in the radiology work environments and specifically within each radiology subspecialties
- To raise awareness of the various options and processes involved in egg preservation, fertility treatment, surrogacy, adoption, and fostering
- To provide an overview of existing policies and guidelines for family and medical leave in the United States, including the American Board of Radiology updated policies and state and federal laws
- To discuss potential mechanisms to support medical students, radiology trainees, and radiologists on their journey to parenthood and those who are parents

Printed on: 04/12/24

## Abstract Archives of the RSNA, 2023

NPMEE-2

### Small Nodule, Big Impact: Incidental Findings Module

#### TEACHING POINTS

1) Studies have found that as radiographic imaging numbers continue to increase, so has the number of incidental findings. 2) Based on literature and guidelines including the ACR white papers and Fleischner Society recommendations, a new incidental/follow up tab was built into our electronic health record (EHR) to provide simple, fast and streamlined recommendations by radiologists for clinicians. 3) Additional measures are also built in to help achieve the proper patient follow up, such as dedicated nurse navigators to help track down incidental findings and assure proper follow up as well as inbox EHR messages to patients PCP upon discharge. 4) Future directions include expanding the followed-up incidental, education to both ordering providers and patients as well as research for continued evolution of incidental finding guidelines.

#### TABLE OF CONTENTS/OUTLINE

1) Define the impact of incidental pulmonary findings by radiologists on patient care. 2) Discuss the implemented incidental findings tab within our health network and how it has changed patient care/outcomes. 3) Identify methods to expand this model to include more incidental findings and increase patient follow up. 4) Data collection and interruption for future incidental finding recommendations and guidelines.

NPMEE-20

### Artificial Intelligence for Pediatric Radiologists: A Gentle Introduction for the Non-enthusiast

#### Participants

Marcelo Takahashi, MD, PhD, (*Presenter*) Speaker, Vertex Pharmaceuticals Incorporated

#### TEACHING POINTS

This presentation is intended for pediatric radiologists with no/little AI experience. We will explain the basic concepts of AI applied to radiology and discuss practical example of usage of AI in pediatric radiology. Main points: 1)Core AI concepts and lexicon 2)Brief history of AI in radiology 3)Basic algorithm creation and operation 4)Applications of AI in radiology 5)Limitations of AI in radiology

#### TABLE OF CONTENTS/OUTLINE

1 - Disclaimer: • created for pediatric radiologists with no/very little experience in AI. • Essential concepts will be explained in straightforward manner and accessible language.2 - Introduction: • Core concepts: • What is artificial intelligence, narrow AI and broad AI • Machine Learning and Deep Learning. • Big Data, Data Science, Domain Knowledge3 - Brief history of AI in radiology: • The early years. • The CAD era • The Machine Learning and Deep Learning era.5 - Basic Lexicon: • Dataset, model, algorithm, training, testing, generalization, features, classification, segmentation, regression, clustering, prediction, label, supervised learning, unsupervised learning4 - "Classic Machine Learning" and Deep Learning: • How is a "classic ML" algorithm created? • DL algorithm creation • Main differences, advantages and disadvantages ("classic ML" vs DL).5 - Where is/can AI be applied in the pediatric radiologist's workflow (with practical examples) • Imaging criteria, scheduling, acquisition (MR acceleration, CT/XR dose reduction), image analysis (segmentation, classification, detection), reporting (NLP), precision medicine.6 - "Must know" AI limitations : • Algorithm creation vs algorithm implementation • Interpretation errors • Generalization errors7 - Take home message

### The Potential Applications of ChatGPT in the Field of Medical Imaging

#### TEACHING POINTS

This exhibit combines recent literature reviews to explore the application prospects of ChatGPT in the field of medical imaging, including its potential applications in medical service, teaching, and scientific research settings, possible ways to apply ChatGPT, and the attitudes of the academic community towards the application of ChatGPT in the field of medical imaging.

#### TABLE OF CONTENTS/OUTLINE

1. ChatGPT can be used in the processing of medical document texts such as medical records in the medical imaging workflow, to achieve the structuring and standardization of texts, promoting effective interaction between staff and patients. 2. ChatGPT can also be used to train medical students and resident physicians in image diagnosis by improving teaching efficiency through interactive learning and teaching methods. 3. ChatGPT can assist in the literature retrieval, data collection, statistical analysis, and article writing processes in scientific research. However, researchers should be aware of the risk of ChatGPT taking over as the main tool and control the research process to ensure the authenticity of the research.

NPMEE-22

### Ways to Improve Patient Satisfaction Analytics in the Modern Era of Radiology: Tips and Tricks from the Patient Satisfaction Officer

#### TEACHING POINTS

1. Third party analytics evaluate care directly from patients in a simple, fast, and easy-to-use fashion. 2. The information obtained from analytics offers radiologists and their practices an opportunity to identify patient needs and priorities while recognizing weaknesses and opportunity for improvement. 3. Modifications and implementation of new practices are often minor, requiring little to no infrastructure, cost, or time while having a positive impact on retention, referral, and most importantly patient satisfaction.

#### TABLE OF CONTENTS/OUTLINE

1. Define the patient experience as it relates to most commonly observed factors. 2. Discuss the role that current-day technology has played in the implementation and innovation of healthcare analytics regarding both acquisition and interpretation. 3. Recognize that personnel, speed, and ease of care are common subjects of both positive and negative patient experiences. 4. Identify methods to respond to feedback that increase patient satisfaction.

### Utilizing 3D Printing and Phantoms to Teach the Basic Principles and Pitfalls of Ultrasound

#### Participants

Patricia Garcia, Cork, Ireland (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Ultrasound (US) is an operator-dependent imaging technique; thus, teaching this skill is critical to radiology education. Ensuring adequate training is essential to patient safety and quality assurance in clinical practice. Those trained in US are keenly aware of the many pitfalls of US imaging. US physics and related artefacts are covered comprehensively in the Diagnostic Radiology curriculum; however, modern education emphasises alternate approaches to teaching, including hands-on practical sessions. US phantoms are used to teach biopsy techniques, but little literature exists on the use of phantoms to teach US basic principles. To simulate commonly encountered US limitations and artefacts, we created gelatin-based US phantoms with embedded objects made from 3D-printed moulds, allowing trainees to experience them in real-time. The embedded objects demonstrated concepts such as relative echogenicity, the importance of imaging an object in multiple planes, mirror image artefact, increased acoustic through-transmission and shadowing. Representative scans of these phantoms will be presented to confirm their utility in demonstrating these concepts.

#### TABLE OF CONTENTS/OUTLINE

1. Challenges of teaching hands-on ultrasound skills
2. Technical aspects of phantom creation
3. Demonstration of basic principles
4. Demonstration of artefacts

Printed on: 04/12/24

### Scire Quod Sciendum: Knowledge at the Intersection of Suboptimal Photography and Radiography

#### Participants

Emiliano Garza Frias, MD, Monterrey, NL (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Learning Objectives Using the author-shot photographs and curated suboptimal radiographs, this exhibit will help the audience: 1. Understand the causes and types of suboptimal chest radiographs. 2. Learn about the global frequency of suboptimality in the most frequent radiological procedure - chest radiographs. 3. Understand what errors in photography can teach about suboptimal radiography. 4. Understand how suboptimality in radiography influences the interpretation using photo-radio-graphic examples.

#### TABLE OF CONTENTS/OUTLINE

Content organization 1. What makes a chest radiograph suboptimal? 2. What are the parallels between suboptimal radiography and photography? 3. Use of common causes and examples of suboptimal photographs to educate about suboptimal chest radiographs. 4. Parallel examples of how suboptimal photography and radiography hide or distort key findings

### RadioGraphics Trainee Editorial Advisory Members Board (RG TEAM)

#### Participants

Melina Hosseiny, MD, La Jolla, CA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

-The RadioGraphics Trainee Editorial Advisory Members Board (RG TEAM) was established in December 2020 to involve trainees in shaping the journal's content and direction. -The RG TEAM is a group of radiology trainees from around the world who play a crucial role in developing high-quality educational resources that are specifically tailored to trainees. RG TEAM initiatives include content curation, innovation of creative trainee resources, organization of trainee Top 10 reading lists, creation of trainee-focused editorials, Cases from the Cooky Jar (in-print and social media), and the new official Spanish version on social media (Casos Cooky). -Joining the RG TEAM offers multiple benefits to its members, such as mentorship, networking, career development, experience in academic writing and publishing, and exposure to global radiology education. -Trainees can obtain mentorship through the RG TEAM by collaborating directly with RadioGraphics editorial board members and radiology experts, and gain valuable skills including communication, writing, and critical thinking skills. This relationship extends beyond the one-year term and can last a lifetime. -RG TEAM has an annual call for new applications available in SPRING. Interested trainees can submit their curriculum vitae, statement of interest, and an idea for a trainee-focused RG TEAM initiative. Residents and fellows in diagnostic or interventional radiology, radiation oncology, and nuclear medicine, as well as medical students, are encouraged to join.

#### TABLE OF CONTENTS/OUTLINE

1)Introduction to RadioGraphics and RG TEAM2)RG TEAM Initiatives3)Benefits of Joining the RG TEAM and How to Get Involved4)Conclusion

### Blueprint for Medical Student Exposure to Radiology through Research: GSW and MVC Projects

#### TEACHING POINTS

Medical students can be given early exposure to radiology through research. Research projects can be initiated using pre-existing data sets like the Trauma Registry maintained at Level I trauma centers. Projects can give residents and medical students leadership opportunities. Projects can give medical students opportunities to present their work at local, regional, and national conferences.

#### TABLE OF CONTENTS/OUTLINE

Purpose: Few opportunities exist for medical students to gain exposure to radiology outside of seeking out electives during clinical years. Methods: IRB approval was obtained to access 10 years of GSW injury data. See Figures 1 and 2. Under trainee guidance, medical students reviewed radiology images and worked to grade injuries by the American Association for the Surgery of Trauma injury grading scales. Once injuries were scored, clinical questions were examined. As part of the expansion to MVC injuries, we are recruiting new students at M1 Orientation and collaborating with other specialties. Results: In year 1, 13 posters were presented at a local conference, Research!Louisville, and 6 at state, regional, and national conferences. See Figures 3 and 4. Data presented at RSNA will include the number and listing of the projects presented at Research!Louisville in September 2023 (planning for 45 posters) and will also include 2 years of survey responses from medical student participants and leaders. Conclusion: Trauma registries provide a robust dataset that can be utilized to increase early exposure to radiology in medical school and facilitates collaborative projects between residents and medical students, that students can further expand on as their research experience grows. .

NPMEE-28

### Myth Busters: Questioning Standard Radiology Practices for Value-added Care

#### TEACHING POINTS

This exhibit aims to debunk common myths in radiology practices that are believed to provide value-added care but, in reality, lack sufficient scientific evidence to support their efficacy. By analyzing scientific data and exploring recent research, the article challenges widely accepted practices to promote a more evidence-based approach to radiology.

#### TABLE OF CONTENTS/OUTLINE

I. Introduction, a. Value-added care definition, b. Importance of evidence-based practices  
II. Radiology Myths, a. Myths 1-5, b. Myths 6-10  
III. AUC Reality, a. AUC role in debunking myths, b. AUC examples  
IV. Barriers to AUC, a. Resistance to change, b. Financial incentives, c. Technology and training  
V. Overcoming Barriers, a. Education, b. Incentives for evidence-based practices, c. Technology upgrades  
VI. Measuring Radiology Value, a. Patient outcomes, b. Costs, c. Efficiency  
VII. Strategies for Value-Added Care, a. Staying current on evidence-based practices, b. AUC for dispelling myths, c. Communication  
VIII. Conclusion, a. Summary of exhibit  
IX. References

Printed on: 04/12/24

### From Detection to Action: A Journey Through Incidental Findings in Radiology

#### TEACHING POINTS

This educational exhibit aims to provide a comprehensive understanding of incidental findings in radiology, addressing their various aspects including identification, communication, management, legal implications, and patient autonomy. The presentation highlights the importance of awareness and proper handling of incidental findings, balancing patient autonomy with ethical considerations and potential harms. It emphasizes the need for evidence-based management, structured reporting, and effective communication. The evolving role of technology, particularly AI, in detecting and managing incidental findings is also discussed.

#### TABLE OF CONTENTS/OUTLINE

Introduction: Definition and variability among radiologists || Settings where incidental findings may arise  
Education: ACGME and ABR guidelines  
Patient autonomy: Access to images, understanding reports, imaging preferences, and referrals  
Communication of incidental findings: Timing, disclosure, responsibilities, and documentation  
Legal implications: Civil and criminal lawsuits, protection for radiologists  
Management of incidental findings: Evidence-based practices, second opinions, structured reporting, national/international variations, conflicts of interest, guidelines, and low-resource settings  
Harms of incidental findings: Costs, psychological impact, overcalling and undercalling incidentals  
Common incidental findings: ACR white papers, unclear clinical significance, small focus of ischemia  
Conclusion: Importance of awareness, research, guidelines, and technology in managing incidental findings.

### International Observerships in Pediatric Radiology: Optimization and Potential Benefits

#### Participants

Hermon Derbew, MD, Philadelphia, PA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

International clinical observership programs can facilitate highly effective academic collaboration, international brand building, information dissemination and recruitment. However, this type of program typically adds bureaucracy, logistics and faculty workload for the hosting institution—as well as many regulatory and financial barriers for interested individuals. Our institution's proactive approach to welcoming observers from diverse backgrounds minimizes the financial burden to applicants and allows collaboration to advance our academic mission. This exhibit explains the process and impact of the program with emphasis on specific steps taken towards improved workflow and increased throughput of observers.

#### TABLE OF CONTENTS/OUTLINE

1. Process, 2. Institutional benefits, 3. Impact

Printed on: 04/12/24

### A Step-By-Step Approach to Establish and Enhance MRI Site Safety: A Primer for Radiologists

#### Participants

Pradnya Y. Mhatre, MD, (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

MRI Site Safety is important for protection of patients, staff and public. Proactively thinking about MR Safety features while designing an MR suite is key in establishing robust MR safe environment. American College of Radiology has created MR Safety Manual which includes general principles of MR Safety. We describe various components of MR Site Safety that need to be implemented in a systematic manner to create a robust and sustainable program.

#### TABLE OF CONTENTS/OUTLINE

Initial step in establishing site safety is to identify MR Medical Director , MR Safety Officer and MR Safety Committee. We describe how to structure MRI zones, including placement of ferrous quarantine, safe storage, patient transfer, mechanical room, and control room. We also discuss marking of equipment with appropriate signage, use of ferromagnetic detection devices, operation of MR conditional devices in Zone IV and infection control. Specific considerations for cryogen safety, cryogen vent pathway and quench scenario are discussed. Important design details during construction and installation are included. Development of key site safety policies and procedures needed and will be discussed including quarterly and yearly site safety checklist and QC program. Lastly, we will discuss emergency plans for various emergencies like fire, water damage, quench, structural damage, establishment of code area, and preparation for emergency resuscitation, which are a key component of site safety.

Printed on: 04/12/24

NPMEE-31

### Stay Calm and Don't Attract the Magnet: A Comprehensive Review of MRI Safety Precautions

#### Participants

Siddhant Dogra, MD, New York, NY (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Following completion of this presentation, the reader will be able to: (1) Identify the four zones of MRI facilities (2) Describe the direct effects of MRI on patients (e.g., noise, heat, neurostimulation) (3) Describe the indirect effects of MRI on patients (e.g., interactions with existing devices and equipment) (4) Define specific absorption rate (SAR) and specific energy dose (SED) and their applications to MRI examinations (5) Discuss specific MRI safety considerations for special patient populations (6) Discuss safety profiles of gadolinium-based contrast media

#### TABLE OF CONTENTS/OUTLINE

(1) Background: Physical setup and zones, Hardware and parts of MR apparatus (2) Auditory concerns (3) Heating effects (including burns) (4) Peripheral neural stimulation (5) Portable metallic objects and equipment (6) Medical device and hardware compatibility and interactions (7) Contrast agents (8) Personnel and staffing (9) Special populations: pediatric patients, pregnant patients, patients with altered states of consciousness, obese patients, prisoners and detainees

Printed on: 04/12/24

NPMEE-32

### Common Errors in Neuroradiology

#### Participants

Luke Wojdyla, DO, San Diego, CA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Diagnostic errors in neuroradiology are alarmingly common, with estimates ranging from 1-16% in clinical practice. It is well established that most diagnostic misses, including those which result in malpractice litigation, are due to errors in perception. Despite this, the miss rates of specific neuroradiologic diseases have historically been undefined. Recently, a growing number of studies have quantified and categorized neuroradiologic errors across training levels and in a variety of practice schema, measuring the influence of radiologist experience, specific pathology, and other individual and systematic factors. In this exhibit, the most common diagnostic errors described in emerging neuroradiologic literature will be presented. Briefly, these include errors of cerebrovascular pathology, blind spots on CT head imaging, errors of cerebrovascular pathology, misses of head and neck pathology, and errors of skull-base pathology. Systemic factors affecting performance such as practice volumes, reading speeds, and fatigue will also be presented. Knowledge of these findings can provide insight into understanding why errors occur, and in turn, help develop robust strategies to prevent them. Radiologists should be aware of the common blind spots and missed pathologies in the variety of settings described in this exhibit.

#### TABLE OF CONTENTS/OUTLINE

Explore the impact of diagnostic error in neuroradiology. Summarize recent literature quantifying common neuroradiologic errors amongst residents, generalists, and neuroradiologists. Appreciate the risk factors and biases associated with error. Provide case examples of real errors encountered in one department. Discuss strategies to minimize error.

NPMEE-33

### Microaggression or Cross-Cultural Competence?

#### TEACHING POINTS

The pursuit of cultural competence among an increasingly diverse and interconnected workforce is vital. It requires empathy and perspective taking. It behooves us to successfully distinguish the subtleties that exist between the negative connotation of microaggressions from the positive influence of cultural competence. Microaggressions are subtle indignities, slights or insults whose derogatory nature communicates prejudice, dismissal, denigration, hostility or negativity to a member of a marginalized group. They may appear indirect, casual, innocuous, and insignificant. They are often unconscious and unintentional, arising from underlying: prejudice, discrimination, oppression, or bias. Are microaggressions sometimes confused with a genuine desire to improve one's cross-cultural competence?

#### TABLE OF CONTENTS/OUTLINE

1) Introduction 2) Cross-Cultural Competence and Communication 3) Microaggressions 4) "Microaggressions are a real problem" 5) "Microaggressions are much ado about nothing" 6) Conclusions

Printed on: 04/12/24

NPMEE-34

### **RadLinks: Creating an Efficient Reference Webpage for Incidentaloma Management Guidelines and Template Generation**

#### **Participants**

Alice Shieh, MD, Seattle, WA (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

- Conceptualize and design a webpage (RadLinks) to efficiently reference incidentaloma management guidelines- Discuss webpage design features that streamline incidentaloma management- Provide a seamless workflow so radiologists can provide incidentaloma management recommendations quickly with ease

#### **TABLE OF CONTENTS/OUTLINE**

Barriers to efficiency when managing incidentalomas?- Time consuming and repetitive efforts to look up information?- Lack of resource consolidation?Benefits of using the RadLinks page?- Minimalist, user-friendly design?- Thoughtfully consolidated resources ?- Pre-generated templates and text macros ?- Hosted on public domain, with lack of institutional barriersRadLinks user interface features ?- Expandable/collapsible navigation menu, ability to enlarge figures/charts in-screen, copy text to clipboard with one-click, mobile device compatibility ?Website hosting and building options and tools ?- Squarespace, Wix, WordPress ?- Flaticon ?- HTML/CSS tutorialsCopyright issues ?- Obtaining permissions to display figures and graphs from published articlesFuture directions ?- Keeping content and guidelines up to date?- Expanding resources beyond incidentaloma management?- Reducing scrolling distance ?- Implementing user suggestions and feedback ?

### Beauty Beyond a Few Slides Deep: How to Increase Radiology Lecture Engagement

#### Participants

Julia Tran, MD, Westminster, CA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

(1) Engaging lectures can hold the audience's attention, convey information more effectively, and make lessons more memorable. (2) Use graphic design resources (eg. AI art sites, design software, typography sites) to visually enhance your presentation. (3) Include activities that require active participation such as games, polls, and PACS simulators to increase engagement.

#### TABLE OF CONTENTS/OUTLINE

Didactics are an integral part of radiology education but creating engaging learning experiences can be challenging. Effective and interactive lectures improve learning outcomes by helping learners retain and apply new information. This educational exhibit will (1) introduce the concepts of graphic design and its role in creating impactful presentations. We will share various graphic design software, AI tools, and web resources useful for creating visually appealing designs. We provide examples of how to format lecture slides to emphasize key learning points and findings. This exhibit also aims to (2) showcase various interactive tools and activities that increase audience engagement. PACS simulators, such as PACSBIN, combine imaging software with educational tools to create case-based quizzes and lesson plans. Gamifying cases into competitions, such as Taboo™ or Pictionary™, motivates learners to strive for mastery. By implementing these strategies, educators can create more effective and engaging learning experiences.

NPMEE-36

### Sustainability, Climate Change and Radiology: Why We Should Care and What We Can Do

#### Participants

Hayley McKee, MSc, Toronto, ON (*Presenter*) Nothing to Disclose

Kate Hanneman, MD, MPH, (*Presenter*) Speaker, Groupe Sanofi; Speaker, Amicus Therapeutics, Inc

#### TEACHING POINTS

Producing, using, and powering medical imaging equipment to provide radiology services are estimated to contribute to 1% of total global greenhouse gas emissions. Achieving sustainability in radiology requires immediate and strategic action. Strategies should focus not only on mitigating radiology's impacts, but also building resiliency to the risks of climate change through adaptation, with action taken at individual, department, and industry levels. Opportunities to reduce radiology's carbon footprint include reducing emissions due to non-productive scanner time and minimizing the use of single-use products and overall waste. Reducing overall emissions in health care and radiology will also require partnerships with both industrial and clinical stakeholders.

#### TABLE OF CONTENTS/OUTLINE

The overarching goal of this exhibit is to review the intersection of sustainability, climate change and radiology with a focus on why we should care and steps we can take to reduce waste and greenhouse gas emissions. This will be achieved by: 1. Describing the human health impacts of climate change, with health equity considerations. 2. Discussing diagnostic and interventional radiology's contributions to greenhouse gas emissions and waste. 3. Reviewing sources and classification of emissions related to radiology. 4. Differentiating mitigation (reducing impacts) and adaptation (building resiliency) strategies related to radiology. 5. Exploring strategies to promote sustainable practices at individual, institutional, and industry levels.

NPMEE-37

### Decolonizing Radiology: Addressing Historical Influences and Promoting Global Equity

#### TEACHING POINTS

It is well established there are worldwide disparities in access to radiology services as well as image guided procedures. While differences in access to care persist in the United States, there are profound disparities in access to care between high income countries (HIC) and low/middle -income countries (LMIC). Socioeconomic differences in patient populations, lack of equipment, career opportunities, and until recently lack of formal training programs have all contributed to differences in global access to radiology services. An additional well known contributing factor in differences to access to care are the historical effects of colonialism. While there have been increasing world-wide efforts to decrease the gaps in access to care and addressing the training gap in radiology, there has been little effort to address the history of colonialism in global health work in the context of radiology. This educational exhibit aims to provide context to the history of colonialism in global health and how this perspective is crucial to provide sustainable solutions for long term global radiology equity and culturally competent global health work.

#### TABLE OF CONTENTS/OUTLINE

1. History of Colonial Influence on Radiology  
2. Consequences of Colonialism in Radiology  
3. Current State of Global Radiology Outreach  
4. Strategies for Decolonizing Radiology

Printed on: 04/12/24

NPMEE-38

### **Global Radiology: Building Equitable and Sustainable Partnerships with Low- and Middle-Income Countries (LMICs)**

#### **Participants**

Lydia Kwarteng, BS, MPH, San Francisco, CA (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Global radiology partnerships can be leveraged to help address the shortage of radiology professionals in LMICs. Simultaneously, there are efforts to address the legacy of colonization on global health initiatives by highlighting the power asymmetry between High-Income Country (HIC) and LMIC partners. This exhibit reviews the critical need to help establish and scale-up radiology training programs in LMICs, highlights opportunities for reform in global health, and provides examples of best practices to foster equitable and sustainable global radiology partnerships with LMICs.

#### **TABLE OF CONTENTS/OUTLINE**

Background- Shortage of radiology professionals in LMICs- Global radiology engagement in LMICs The Decolonize Global Health movement- Origins in global health- Goals and controversies Building equitable global radiology partnerships- Leadership and decision-making- Understanding sociocultural context- Equity in research, education, and capacity-building- Funding practices- Transparency and accountability Examples of successful partnerships in Africa- HIC-LMIC institutional collaborations in global cancer research, subspecialty training, and capacity-building (e.g. in neuroradiology, breast imaging, and interventional radiology).

NPMEE-39

### Usefulness of Deep Learning for Improved Image Quality and Noise Reduction in Diffusion Weighted Imaging (DWI)

#### TEACHING POINTS

Deep learning (DL) has recently experienced explosive growth including many areas of medical research. Recent advances in DL-based image reconstruction in MRI have been reported to achieve improved image quality through noise reduction and super-resolution (SR), but there have been very few reports of its application to diffusion-weighted imaging (DWI). We have scanned various body regions with a DL-based DWI research application for clinical evaluation. These images are presented with clinical findings. In addition, underlying technical details and imaging parameter optimizations are presented. Although the visual impression varies depending on imaging regions or scan parameters, the following advantages in DL-based reconstruction are observed: noise reduction due to DL, reduced distortion due to higher acceleration factor, sharpness improvement due to SR and higher spatial resolution, and better visibility of background normal tissues due to shorter echo time.

#### TABLE OF CONTENTS/OUTLINE

1. To present DWI images with deep learning-based image reconstruction and its findings in various body regions. 2. To understand the mechanism of deep learning-based image reconstruction. 3. To understand scan parameter optimization in DL DWI. 4. To know the clinical feasibility of DL DWI in patients with various diseases.

NPMEE-4

### Waste Reduction in Radiology: Educational Case Series

#### TEACHING POINTS

In the U.S. the healthcare sector is estimated to contribute almost 10% of our nation's carbon emissions. As healthcare professionals, we are committed to improving the well-being of our patients, so we also must focus on decreasing our contribution to climate change. Radiology departments can target both direct and indirect emissions by decreasing energy usage within the workspace, reducing unnecessary imaging, and transitioning to green suppliers for the procurement and disposal of medical equipment. Studies have shown that there is a high rate of imaging overuse. Understanding the environmental impact associated with these practices can help to encourage appropriate usage. There are both external and internal factors that can drive a physician to order unnecessary or inappropriate imaging, including but not limited to defensive medicine, patient expectations, obliviousness to cost and risks, breaks in patient-provider communication, and inadequate knowledge.

#### TABLE OF CONTENTS/OUTLINE

Introduction a. Health care impact on environment b. Radiology energy use c. Avenues for reduction  
Case examples a. Emissions by scan b. Contrast use  
Inappropriate imaging examples a. Contributions to inappropriate imaging b. Inpatient cases c. Outpatient cases  
Advocacy strategies

### The Second Mountain - Climbing the Challenges of Mid-career Radiology

#### Participants

Miltiadis Tembelis, MD, Mineola, NY (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The mid-career phase for a radiologist, and many other professions, is a time burdened by career stagnation and high rates of burnout. To spite it being a particularly difficult time in the radiologist career, there is little dedicated mid-career support to help radiologists overcome their woes. The goal of this presentation is to highlight the difficulties faced by the mid-career radiologists as well as provide potential solutions to these problems. A focus on the mid-career female radiologist and their unique challenges will also be presented.

#### TABLE OF CONTENTS/OUTLINE

This review will define the mid-career radiologist and provide an overview of the current radiology workforce. Problems such as burnout, career stagnation, alternative career pursuits, lack of mentorship, sponsorship and career development programs, and gender specific challenges of women will be discussed. Potential solutions to these problems will also be presented.

### Subspecialty Breast Imaging Education in Tanzania: Clinical, Infrastructure and Logistical Paradigms for Best Practices in the Low- and- Middle Income (LMIC) Setting

#### Participants

Toma Omofoye, MD, Houston, TX (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Given the global rise in breast cancer, radiology workforce shortages in sub-Saharan Africa are critical.
- The RSNA-led Global Learning Center (GLC) initiative in Tanzania for sub-specialty breast radiology training is presented as a paradigm for remote/in-person education.
- It is imperative to tailor interventions for the resource-limited LMIC environment.
- Presenting a scalable education program for best practices in the LMIC setting, with goals of improving interdisciplinary breast care through training, infrastructure, and optimization of local resources.
- An example of an transnational alliance to care for underserved populations.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction a. Radiology workforce in Africa b. Breast Cancer in Tanzania 2. Educational Paradigm a. Background/need i. Tanzania medical education, radiology and subspecialty education b. Trainees c. Curriculum i. Goals/objectives ii. Content iii. Learners iv. Faculty v. Resources and Methods ? Synchronous teaching ? Asynchronous teaching ? Observerships vi. Assessment vii. Governance viii. Continuous improvement 3. Breast Imaging Service a. LMIC modality specific goals b. Reporting c. Interprofessional collaborations 4. Infrastructure a. improving technology and support staff 5. Future directions

### Let it Go, Let it Go: An Approach to Assessment and Reporting of Benign or Low-Risk Incidental Findings in the Chest

#### Participants

Erin Gomez, MD, Columbia, MD (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Radiologists are expected to provide management recommendations for incidentally detected pulmonary nodules and thyroid nodules. While some are clinically impactful, a majority are benign and inconsequential. Fleischner, Thyroid White Paper and TIRADS consensus recommendations were developed to decrease inappropriate recommendations for further evaluation. In our quest to do no harm, radiologists can help decrease patient anxiety, time spent, medical expenses and potential risks associated with further characterization by using best practices for characterizing and reporting nodules which do not require further evaluation through clear, concise language. We will present examples of nodules inappropriately recommended for follow up and a step by step approach to assessment and reporting.

#### TABLE OF CONTENTS/OUTLINE

Introduction  
Commonly Mischaracterized Incidental Findings on Chest CT:  
- Pulmonary nodules  
- Mucous plugging  
- Granulomas  
- AVMs  
- Thyroid Nodules  
Risk statistics for nodules by size  
Reporting considerations:  
- Morphologic descriptors (shape, density, distribution)  
- Measurements - 3 plane review  
- Concise, specific language; avoiding vague terms  
- Comparison with prior imaging  
Patient history  
Letting it go: supporting data  
Role of Structured Reporting  
Pre-Populated Macros: Pros and Cons  
Society Recommendations and Indications for Incorporation into Reports  
Closed Loop Communication  
Conclusion

### Best Practices for Medical Student Engagement in the Radiology Reading Room

#### Participants

Devyn Rigsby, Philadelphia, PA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. There is no standardized approach to engaging medical students in the radiology reading room during radiology electives (1).2. Without intentional incorporation of medical students into the reading room team, students may feel disinterested, excluded, or insufficiently challenged to learn. Negative experiences on radiology electives may dissuade students from pursuing radiology as a career.3. This presentation shares best practices for radiology preceptors to foster a healthy learning environment, maximize educational opportunities, and increase medical student interest in radiology.4. Best practices for engaging medical students in radiology courses can be divided into three parts: preparing for student arrival, starting a learning session, and facilitating case-based instruction.5. These best practices are transferrable to any institution's in-person radiology curriculum for medical students.Reference 1. Darras KE, Spouge R, Kang H, et al. The challenge with clinical radiology electives. *Can Assoc Radiol J*. 2019;70(4):337-343.

#### TABLE OF CONTENTS/OUTLINE

1. Problem statement2. Common concerns about the reading room experience raised by students at our institution3. Preparing for student arrival in the reading room a. Introductory information b. Identify near-peer mentor (resident or fellow) c. Student workspace4. Starting a learning session a. Learning objectives b. Transfer of foundational knowledge c. Select cases for student to attempt independently5. Facilitating learning through cases a. Student inclusion in all trainee readouts b. 1:1 student readouts on assigned cases c. Session wrap-up

Printed on: 04/12/24

### **It Takes a Village: Multidisciplinary Breast Subspecialty Telementoring for Low- to- Middle-Income- Countries (LMICs)**

#### **Participants**

Toma Omofoye, MD, Houston, TX (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Funded by an RSNA International education grant, a method for telementoring is described for breast radiologists, pathologists, oncologists, and surgeons where domestic/foreign, low/high resource, and within/outside subspecialty input is used to adapt best practices to available resources. Breast subspecialist shortages in African Low-Middle-Income Countries (LMICs) call for creative solutions. Many LMICs lack multidisciplinary communication (radiology-pathology or tumor board). While LMIC practitioners have varying levels of breast subspecialty training and resources, they have tailored creative solutions for optimizing resources to address advanced disease. The transnational collaboration (with 200 participants from 3 continents- Africa, North and South America) assists capacity building.

#### **TABLE OF CONTENTS/OUTLINE**

We describe a model for multidisciplinary telementoring to provide paired subspecialty support for breast health practitioners in LMICs. 1. Introduction: LMIC breast cancer burden and subspecialty workforce gaps 2. Project Extension for Community Healthcare Outcomes (ECHO) ABCD model: a. Amplification of medical knowledge b. Best practices to improve outcomes c. Case based (clinically-relevant) learning d. Database: outcome monitoring 3. Program Formata. Case presentation b. Interprofessional and multidisciplinary input c. Complementary didactics 4. Case-based examples including: Rad-path concordance, quality, symptom, interesting or difficult cases, and rare disease management

### Supporting Women in Radiology: Implementing a Multi-institutional Coalition

#### TEACHING POINTS

Women are underrepresented in radiology. Even though men and women are about equally represented among medical school graduates, only 27% of applicants in radiology are women.<sup>1,2</sup> Furthermore, female radiology leaders make up an even smaller minority, consisting of only 13% of radiology leaders.<sup>3,4</sup> The purpose of this exhibit is to showcase how a women in radiology (WIR) group in a teaching institution can provide role models, mentorship, and promote a culture of diversity and inclusion. Furthermore, the introduction of WIR collaborations with other institutions can promote an institution's inter-institutional alliances and provide career advancement opportunities for its trainees. Training institutes are in a unique position to bring about this change. Trainees who have cultivated gender equality values can have a positive impact on their future practices. Though it takes time and effort to foster a culture of diversity and inclusion, it is necessary to do so in order to create a gender inclusive workplace which will benefit not only radiology departments but also patients.

#### TABLE OF CONTENTS/OUTLINE

A) Mentorship: Implementation of "mentoring up" and "mentoring down". B) Promote career advancement opportunities and promotions: Organize discussion panels with panelists from both private practice and academics with a mix of early, mid, and advanced career radiologists. C) Collaborate with other institutions' WIR committees to create inter-institutional alliances focused on promoting the above. D) Overcome or mitigate bias by organizing upstander workshops as part of the training curriculum. E) Understand the unique needs of women in the field, including pregnancy, parental leave, and lactation.

### Benefits and Applications of ChatGPT for Radiology Trainees

#### TEACHING POINTS

1. To provide an overview of ChatGPT from a trainee perspective  
2. To highlight best practices for using ChatGPT  
3. To illustrate how ChatGPT can be used to create relevant radiology review content including practice questions  
4. To demonstrate the radiology virtual-advisor capability of ChatGPT  
5. To describe how medical students can use ChatGPT to develop a preparation plan for radiology rotations  
6. To provide an overview of the future of ChatGPT in radiology undergraduate medical education

#### TABLE OF CONTENTS/OUTLINE

- What is ChatGPT?  
- How are trainees using ChatGPT?  
- Applications of ChatGPT for radiology learning and best practices  
- Using ChatGPT to generate radiology practice questions  
- Using ChatGPT to prepare for radiology rotations  
- Using ChatGPT as a virtual radiology advisor  
- Using ChatGPT to assist during core clinical rotations  
- Using ChatGPT to assist with professional communication  
- Future of ChatGPT in radiology undergraduate medical education

### Promoting Health Equity Through Radiology: Practical Tips for Empowering the Next Generation of Trainees

#### Participants

Pooja Agrawal, MD, Houston, TX (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Medical students and residents in radiology represent the next generation of trainees and have a vital role in fostering sustainable health equity efforts focused on eliminating health disparities in radiology. Three ways trainees can promote health equity in radiology are through research, community outreach, and education.

#### TABLE OF CONTENTS/OUTLINE

Introduction: Review existing health disparities in radiology using findings from a published systematic review; discuss the importance of trainee involvement in eliminating disparities; describe practical ways how research, community outreach, and education can promote health equity  
Health equity research: Introduce tips to identify a mentor; discuss how to select a research topic by identifying gaps in existing research; review opportunities at national meetings to build research network  
Community outreach: Discuss how to leverage existing community needs assessment to identify emerging opportunities; develop initiatives to educate patients about the importance of screening as a trainee; provide examples of radiology-focused community efforts (mobile mammography/lung cancer screening, RAD-AID)  
Education in health equity: Participate in the creation of radiology health equity-focused learning materials; collaborate in establishing mentorship programs to promote diverse applicants in radiology; explore how current radiology pillars in quality safety, innovation, and AI can be used as catalysts to bridge existing disparities  
Conclusion: Discuss how long-lasting health equity necessitates an understanding of systemic obstacles and a commitment to staying informed on fields such as molecular imaging, social genomics, and AI algorithms

### Medicolegal Readout: A Malpractice Primer for Radiologists

#### Participants

Luke Wojdyla, DO, San Diego, CA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The majority of radiologists will face litigation in their careers. In a 2021 survey, 71% of radiologists said they were sued which is similar to estimates in prior reports. Despite this, dedicated teaching of medicolegal issues is often lacking or incomplete in radiology training programs. Residents are seldom exposed to legal issues that can arise when caring for patients, and attendings themselves may feel unqualified in leading medicolegal discussions. Concerningly, residents may transition to independent practice with an incomplete understanding of the legal environment applicable to their practice. This exhibit will provide background for the legal frameworks relevant to modern radiology practice. A brief historical summary of key court decisions will be presented alongside a discussion of malpractice and radiologic errors. Challenging case scenarios will address nonroutine communication, reporting missed findings on comparison imaging, addressing technical limitations, and admitting mistakes, among others. At the end of the presentation, the reader should understand the legal basis for common radiologic practices, identify challenging situations with increased medicolegal risk, and implement practical strategies to mitigate risk of litigation.

#### TABLE OF CONTENTS/OUTLINE

Recognize the magnitude of malpractice within radiology. Understand how fundamental radiology practices have arisen directly from court rulings. Describe the most common causes for malpractice. Identify examples of frequently encountered medicolegal hazards and controversies. Case-based imaging examples will be used to discuss challenging medicolegal issues encountered in radiology.

### Integration of Clinical Context into Medical School Gross Anatomy Based on CT Imaging of the Students' Dissection Cadavers

#### Participants

Peter J. Haar, MD, PhD, (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Incorporating imaging in medical school gross anatomy courses can provide medical students with early, positive learning experiences with radiology. The teaching points of this exhibit include the following: first, to describe methods to incorporate CT imaging of the students' dissection cadavers into a novel exercise in which dissection cadavers are regarded as medical students' "first patients;" second, to outline roles for radiology attendings and residents in interactive cadaver CT workshops; and third, to explore the potential benefits of the experience in medical education and radiology residency training.

#### TABLE OF CONTENTS/OUTLINE

1.) Anatomy Rounds: an exercise for medical students to synthesize clinically relevant cadaver observations. 2.) Methods and resources to acquire and distribute cadaver CT images to medical students. 3.) Involving radiology residents in generating radiology findings on full-body cadaver CT image sets. 4.) Strategies to enhance the learning experience of interactive workshops based on the dissection cadaver CT images. 5.) Potential benefits of interactive radiology experiences early in medical school education. 6.) Feedback from medical students and radiology residents on the value of the learning experience.

### Designing Interactive Team-Based Learning Experiences with Cadaver CT Images in Medical School Gross Anatomy

#### Participants

Peter J. Haar, MD, PhD, (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Curricula involving CT images of medical school gross anatomy cadavers can provide students with a rewarding educational experience early in medical school. Teaching points of this exhibit include the following: first, to describe the challenges and benefits of teaching simple CT image analysis to enhance and complement gross anatomy instruction; second, to outline a strategy for developing interactive team-based learning modules and assessments; and third, to examine potential pitfalls and solutions in teaching the curriculum.

#### TABLE OF CONTENTS/OUTLINE

1.) Teaching gross anatomy and cross-sectional anatomy in parallel. 2.) User-friendly image interaction and teaching foundational concepts of CT imaging. 3.) Designing learning experiences with the intellectual rewards of correctly making real imaging diagnoses. 4.) Interactive group-learning assignments, and assessment of learning. 5.) Advantages and disadvantages of the interactive cadaver CT-based curriculum. 6.) Feedback and student response to the curriculum.

### A National Plan for the Renewal of Imaging in the EU: A Regional Perspective

#### TEACHING POINTS

With this publication it is intended to disseminate a National Investment Plan and how it was managed and developed from a regional point of view. The main objective of this Plan is to increase overall survival and the quality of life of people through the diagnosis of diseases in early stages, which allow rapid therapeutic intervention. The plan pays special attention to the pathologies with the greatest impact on the present and future of a National Public Health Service (SNS), such as chronic diseases, oncological diseases, rare diseases and neurological diseases. All this, consolidating equity in access to high technology and improving the quality of care and the safety of patients and professionals. This poster describes the objectives, method and results of a national plan that involves the acquisition of 847 state-of-the-art equipment for the SNS in order to: Reduce the obsolescence of high-tech equipment, guaranteeing the renewal of 100% of equipment that is 12 years old or older in accordance with scientific recommendations. Raise the average density rate of high-tech equipment per 100,000 inhabitants by at least 15%, in order to improve equity in access throughout the national territory, bring the service closer to patients and position the SNS, progressively, in the European average. As a consequence of the application of the Plan in our region, 76 new pieces of equipment are being installed (63 renewals and 13 extensions) and the total amount of the investment is € 67,204,159.

### Guide for Radiologists Leading Multidisciplinary Conference

#### Participants

Jody Shen, MD, Palo Alto, CA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Radiologists play a key role in multidisciplinary conference. This educational exhibit is meant to be a guide for trainees or junior attending radiologists for planning and leading a multidisciplinary conference. Special considerations will be given to leading the conference virtually (e.g. over Zoom) as this has become more commonplace. This guide can help radiologists early in their career add value to patient care and build relationships with referring clinicians.

#### TABLE OF CONTENTS/OUTLINE

A. How to prepare for multidisciplinary conference. B. How to lead multidisciplinary conference and key principles with examples of before revision, better strategy, and rationale: 1) Move it along. 2) Maximize screen real estate. 3) Keep it simple. 4) Keep it clinically relevant. 5) Get feedback. C. Common questions and challenging cases.

### Being a Radiologist in the Earthquake: Are You Prepared Enough

#### Participants

Duygu Ekizalioglu, MD, Izmir, Turkey (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Raising awareness of earthquakes and other potential disasters The critical role of Radiologists in disaster prevention To overview radiology's role in disaster management Global outreach and education for radiology department disaster preparedness

#### TABLE OF CONTENTS/OUTLINE

What is an earthquake and when does it become a disaster? A recent experience: The impact of the earthquake in Turkiye The critical role of Radiologists in disaster prevention and preparedness Where does Radiology stand in disaster management on hyperacute/acute/subacute/chronic stages: Providing necessary imaging services based on the availability and utility of imaging methods, alternative reporting systems for communication, and teleradiology services The challenges that radiologists faced in the Turkiye earthquake management system; and what is next? A comparison of past experiences in different countries; lessons learned?

### Using Process Mapping to Identify Targeted Interventions to Reduce Imaging Disparities

#### TEACHING POINTS

- Process mapping is a quality improvement tool used to depict flow of healthcare processes.
- Components of the imaging process are addressed in order to reduce imaging disparities.
- Pre-imaging interventions include reviewing imaging guidelines, providing culturally dexterous patient educational materials, community outreach, and improving imaging access.
- Imaging interventions include high quality interpretation services, patient-centered communication strategies, and maximizing patient comfort.
- Post-imaging interventions include structured collection of patient feedback and culturally-responsive patient navigation services to ensure adequate follow-up.

#### TABLE OF CONTENTS/OUTLINE

1) Process Mapping Definition  
a) Published Process Maps  
b) Apply Health Equity Lens to Published Imaging Process Maps  
2) Pre-Imaging  
a) Review Imaging Guidelines Using Health Equity Lens  
i) Cancer Screening (breast, lung, colorectal)  
b) Clinical Decision Support to Reduce Variability in Decision-Making  
c) Patient and Provider Education  
d) Maximizing Patient Access  
i) Evidence-Based Strategies  
3) Imaging  
a) Culturally Dexterous Communication Strategies  
i) Definition  
ii) Standardized Communication Strategies to Improve Patient Communication for Diverse Patient Populations  
(1) Review Evidence-Based Strategies  
iii) Stigmatizing Language in Medicine  
(1) Definition  
(2) Application of Stigmatizing Language in Radiology  
1. Physician-patient encounter  
2. Radiology Reports  
3. Electronic health records  
(3) Vulnerable groups  
1. Patients of color  
2. Obese population  
3. LGBTQ community  
4) Post-Imaging  
a) Collection of Patient Feedback  
b) Patient-Navigation Services  
i) Review Evidence-Based Strategies

NREE

### Neuroradiology Education Exhibits

#### Sub-Events

#### **NREE-1 Variants and Anomalies of Intracranial Cerebral Arteries and Considerations for Neuroendovascular Procedures**

##### TEACHING POINTS

- To describe the embryology of the intracranial cerebral arteries in order to explain the origin of its anatomical variants and anomalies.  
- To review all the variants and anomalies of intracranial cerebral arteries giving examples from cases from our institution.  
- To revise the associated pathology and the implications for endovascular procedures.

##### TABLE OF CONTENTS/OUTLINE

1. Introduction  
2. Embryology  
3. Intracranial Internal Carotid Artery  
3.1. Variants. Tortuosity.  
3.2. Anomalies  
3.2.1. Aberrant carotid artery  
3.2.2. Persistent estapedial artery  
3.3. Ophthalmic artery  
4. Persistent carotid-basilar communications  
4.1. Trigeminal artery  
4.2. Hypoglossal artery  
4.3. Proatlantal intersegmental artery  
5. Anterior cerebral artery (ACA)  
5.1. Variants  
5.1.1. The anterior communicating artery  
5.2. Anomalies  
5.2.1. Infraoptic origin and persistent olfactory primitive artery  
5.2.2. Accessory, multiple and aberrant ACA  
5.2.3. Bihemispheric and azygos ACA  
6. Middle cerebral artery (MCA)  
6.1. Variants  
6.2. Anomalies  
6.2.1. Accessory, fenestrated and duplicated MCA  
7. The posterior arterial circulation  
7.1. Variants  
7.1.1. Fetal origin  
7.1.2. AICA-PICA  
7.2. Anomalies  
7.2.1. Basilar fenestration

#### **NREE-10 'Incidental' Intracranial Arterial Anatomical Variants: Implications for Diagnosis, Pathology and Treatment**

Participants  
Charlotte Chung, MD, PhD, New York, NY (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

Variability in intracranial arterial anatomy is well recognized to be the rule, not the exception. For example, the Circle of Willis is incomplete in 75-80% of brain CT/MR angiography. While anatomic variations may be clinically inconsequential in the normal patient, accurate delineation of the involved anatomy may be critical in the setting of pathology. This exhibit employs a systematic vessel-based approach to illustrate common intracranial arterial variants and their potential clinical implications through case-based discussions. Educational objectives of this exhibit are:  
- Outline intracranial arterial development and resultant spectrum of anatomic variations  
- Illustrate common 'incidental' variant configurations of the intracranial arteries on multimodal (CTA, MRA, and DSA) neuroimaging.  
- Highlight implications of anatomical variants in diagnosis, pathology, and treatment of cerebrovascular diseases

##### TABLE OF CONTENTS/OUTLINE

I. Case-based review of anatomical variants in the distal ICA  
II. Case-based review of anatomical variants in the Circle of Willis  
III. Case-based illustration of the continuum of variant MCA and ACA cortical branching pattern  
IV. Case-based review of anatomical variants in the vertebrobasilar circulation  
V. Variants in vessel morphology and caliber mimicking pathology

#### **NREE-100 Frontier Technology in Non-Invasive Vascular Imaging; Arterial Spin Labeling-Based Non-Contrast MR Digital Subtraction Angiography on Cerebral Diseases**

Participants  
Miho Gomyo, Mitaka, Japan (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

1. To learn the basic principles of arterial spin labeling-based non-contrast MR digital subtraction angiography (ASL-MRDSA) that can obtain dynamic information of cerebral arteries without using a Gd-based contrast agent.  
2. To learn various scanning methods of ASL-MRDSA.  
3. To learn clinical applications of ASL-MRDSA to evaluate cerebral lesions.  
4. To know some novel techniques of ASL-MRDSA.  
5. To review pitfalls and limitations of ASL-MRDSA.

##### TABLE OF CONTENTS/OUTLINE

1. Basic principles of ASL-MRDSA  
2. Various scanning methods of ASL-MRDSA and their characteristics; 2D-methods, 3D-methods, and ultra-short TE methods  
3. Novel techniques of ASL-MRDSA  
4. Clinical applications of ASL-MRDSA to evaluate the following diseases:  
• intracranial arterial stenosis/occlusion  
• moyamoya disease  
• arteriovenous malformation (AVM)  
• carotid-cavernous fistula (CCF)  
• dural arteriovenous fistula (dAVF)  
• extracranial to intracranial (EC-IC) bypass  
• hypervascular tumors (skull tumor, hemangioblastoma, paraganglioma, and so on)  
• post-operative study of cerebral aneurysms (clipping, coil embolization)  
5. Pitfalls and limitations

#### **NREE-101 Patterns of Abnormal Magnetic Susceptibility in the Brain**

##### TEACHING POINTS

1. Susceptibility-weighted imaging (SWI) is an MRI sequence that uses phase and magnitude information to show subtle

1) Susceptibility weighted imaging (SWI) is an MRI sequence that uses phase and magnitude information to characterize substances that distort the local magnetic field, allowing for identification of hemosiderin, calcification, and iron deposition. 2) Depending on the pathology, abnormal magnetic susceptibility may appear as a single or multiple lesions and can present with varying morphology. 3) SWI lesion locations correlate with the disease mechanism. Understanding physiologic and pathologic reasons for localization is key to formulating the differential diagnosis and diagnosis 4) SWI is instrumental in characterization of vascular abnormalities, masses, and causes of microhemorrhage. 5) SWI is often able to detect changes earlier in a disease process than other sequences.

#### TABLE OF CONTENTS/OUTLINE

Pathology organized by susceptibility patterns: -Single lesion: - Location specific - Basal ganglia: neurodegenerative diseases, hypertensive hemorrhages, toxic/metabolic entities - Midline: desmoid - Sulcal: siderosis - Single vascular: thrombosis of cerebral vein or DVA, calcified embolus in Circle of Willis artery - Linear susceptibility along margins of cerebral mass: pyogenic abscess - Multiple lesions: - Location specific - Grey-white matter junction: hemorrhagic metastases, grade 1 DAI - Lobar: CAA - Diffuse vascular: ferumoxytol - Corpus callosum: grade 2 DAI - Brainstem: grade 3 DAI, kernohan phenomenon -Non-location specific - Diffuse axonal injury - Fat emboli - Microhemorrhage of acute illness, post-cardiac surgery

#### NREE-102 Head On: Facing Central Nervous System Lymphoma

Participants

MARCELO DOS SANTOS BANDEIRA FILHO, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The purpose of this exhibit is- To explore the proper terminology and classification of lymphomas based on updates of the fifth edition of the WHO Classification of Tumors of the Central Nervous System (CNS).- List the main clinical and epidemiological characteristics and risk factors associated with the appearance of CNS lymphomas.- To show through a pictorial review the classic imaging findings of various lymphomas of the CNS.- Show atypical cases of lymphomas and develop adequate reasoning for the radiologist to face unusual findings.

#### TABLE OF CONTENTS/OUTLINE

Powerpoint Layout Introduction: 1. Overview of clinical, epidemiological and risk factors. 2. Neuroradiology: 2.1 Terminology of SNC lymphomas. 5th edition of the WHO 2.2 Classification of Tumors: SNC lymphomas. CNS Lymphomas: Primary diffuse large B-cell lymphoma of the CNS. Immunodeficiency-associated CNS lymphoma. Lymphomatoid granulomatosis. Intravascular large B-cell lymphoma. Miscellaneous rare lymphomas in the CNS: MALT lymphoma of the dura. Other low-grade B-cell lymphomas of the CNS. Anaplastic large cell lymphoma (ALK+/ALK-) T-cell and NK/T-cell lymphomas

#### NREE-103 Photon Counting Detector Lateral Decubitus CT Myelography: A Developing Technique for Detection of Cerebrospinal Fluid - Venous Fistulas

Participants

Nikkole Weber, ARRT, RT, Rochester, MN (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Discuss protocol development and optimization of Photon Counting Detector (PCD) CT Myelography (CTM) 2. Describe features of PCD technology that improve detection of cerebrospinal fluid- venous fistulas (CVFs): spectral, spatial and fast 4D serial acquisitions 3. Demonstrate examples of CVFs found on PCD CTM

#### TABLE OF CONTENTS/OUTLINE

1. Review current imaging modalities for myelography 2. PCD CTM protocol development a. Performed in right and left lateral decubitus Trendelenburg positions b. Lumbar spine localizers c. Spinal needle placement intrathecally d. Bolus tracking to monitor contrast flow within the thecal sac e. Serial paired acquisitions, with multi-energy (ME) and high-resolution (HR)/ME scan modes 3. Unique technologic advantages of PCD that aid in detection of subtle CVF a. Higher spatial resolution i. Spinal anatomy of interest very small ii. HRME (0.2mm), ME (0.4mm) scan mode reconstructions b. Improved radiation dose efficiency compared to energy integrating detector CT scanners—reduced electronic noise, optimal photon weighting, smaller detector pixel size, and removal of septae. Resultant images with thinner slices and sharper kernels can be generated without increasing noise c. Spectral reconstructions to improve contrast enhancement and iodine contrast to noise ratio (CNR) i. Increased iodine CNR due to more optimal energy weighting of PCDs (more weight towards low-energy photons) ii. Subtle CVFs can be very faint. Virtual monoenergetic images (VMI) at low keV (40) increases the conspicuity of iodine d. Fast 4D acquisition: 3D volume + a series of acquisitions at different time points. e. Metal artifact reduction vs high keV VMI reconstructions tested 4. CVF example patient images

#### NREE-104 MR Bone Imaging: Value of Application to Cervical and Intracranial Vessel Wall Imaging

Participants

Kazuhiro Tsuchiya, PhD, Tokyo, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To learn basic concepts and technical aspects of bone imaging like CT by MR imaging. 2. To know basic concepts of vessel wall imaging (VWI) by MR bone imaging with improved visualization between vessel walls and vessel lumen. 3. To know what benefits MR bone imaging offers over conventional cervical and intracranial VWI techniques and some pitfalls.

#### TABLE OF CONTENTS/OUTLINE

1. Basic issues of MR bone imaging including currently employed scanning sequences and postprocessing methods. 2. MR bone imaging-based VWI: how to improve image quality. 3. MR bone imaging-based VWI: how does it work in the diagnosis of vessel wall abnormalities? 4. Presentation of clinical cases with discussion of implications. Cases will cover carotid calcified plaques, intracranial main trunk plaques, aneurysms, vasculitis, moyamoya disease, and so on. 5. Additional discussion including current limitations and future directions of this technique.

#### NREE-105 Posterior Fossa Ependymomas: Newly Defined Molecular and Genetic Subtypes with Characteristic Imaging Features

Participants

Shan McBurney-Lin, MD, MBA, San Francisco, CA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Posterior fossa (PF) ependymomas have been newly classified into two distinct subtypes, PFA and PFB, based on molecular and genetic features by the World Health Organization in 2021.2. Each subtype has unique epidemiologic, biologic, prognostic, clinical, and imaging features.3. Imaging plays an important role in differentiating the two subtypes of PF ependymomas and in distinguishing PFA and PFB subtypes from other PF tumors, which benefits surgical planning and tumor recurrence surveillance.4. Upon completion of review of this exhibit, readers will be able to recognize the distinct molecular, genetic, and clinical features of PF ependymomas and become familiar with the characteristic imaging features of each subtype for improved early imaging diagnostic capability.

#### TABLE OF CONTENTS/OUTLINE

1. Overview of PFA and PFB ependymal tumor subtypes, including epidemiology, prognosis and molecular/epigenetic alteration2. Characteristic imaging features of PFA and PFB tumor subtypes3. Radiologic differences between PFA/PFB subtypes and similar entities within the radiologic differential diagnosisa. Medulloblastoma. Atypical teratoid rhabdoid tumorc. Pilocytic astrocytoma4. Summary and quiza. Summary of key radiologic findings of PFA/PFB subtypesb. Quiz to review new knowledge via example cases

#### NREE-106 SWI Brush Sign of Cerebral Parenchymal Veins in CNS Diseases and Conditions

Participants

Seiya Kishi, Tsu, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

SWI brush sign (BS) represents prominent intracerebral veins in various diseases including ischemic stroke, moyamoya disease, cerebral venous thrombosis (CVT) and Sturge-Weber syndrome (SWS). We aimed to1) learn anatomy of intracerebral veins 2) understand mechanisms of SWI BS in each disease 3) learn clinical significance related to this sign.

#### TABLE OF CONTENTS/OUTLINE

1. What is SWI BS; SWI allows visualization of intracerebral veins (in white matter and occasionally in cortex). BS represents findings of prominent intracerebral veins in some diseases and conditions.2. Diseases that cause the SWI BS; SWI BS is caused by ischemic stroke, moyamoya disease, CVT, and SWS. It may disappear over time with or without treatments.3. Mechanisms of brush sign; Increased deoxyhemoglobin in venous blood (BOLD effect) in ischemic stroke and moyamoya disease Congestion, and partially BOLD effect in CVT and SWS.4. Clinical significance related to SWI BS; indicates severe hemodynamic impairment in ischemic stroke correlates with severity in moyamoya disease and with increased intracranial venous pressure in CVT suggests the diagnosis of cortical vein thrombosis when found in affected cortex may contribute to better clinical outcomes in SWS.

#### NREE-107 How to Improve in Intraoperative Image Quality in Transcranial MR-guided Focused Ultrasound Surgery

#### TEACHING POINTS

The objective of this exhibition is to provide a method for enhancing of intraoperative image quality in transcranial MR-guided focused ultrasound surgery (TcMRgFUS). TcMRgFUS possesses the distinct advantage of allowing expeditious assessment of therapeutic efficacy post each sonication and intraoperative magnetic resonance (MR) imaging for visualization of the lesion. In circumstances which denotes a lack of desired therapeutic effects and the lesion misses the planned target, subsequent ablation targets can be delicately re-aligned based on the intraoperative image. Thus, the acquisition of high-quality intraoperative images, which can accurately confirm the lesion, is imperative. The accuracy of this re-alignment is contingent upon the quality of the intraoperative image. Unfortunately, the current intraoperative image quality obtained from a 3.0T MRI system, is deficient in precisely identifying the lesion. In view of this limitation, we have been developed and substantiated a method for ameliorating the quality of intraoperative images.

#### TABLE OF CONTENTS/OUTLINE

1. TcMRgFUS procedure a. Overview of TcMRgFUS b. Intraoperative T2-weighted image using 3.0T MRI2. Method for improving intraoperative image quality a. Calculating manual transmitter gainb. Acquiring high-quality intraoperative T2-weighted image3. Effectiveness of enhancing intraoperative image quality a. Clinical images resultsb. Contrast between the lesion and thalamus

#### NREE-108 Primary Angiitis of the Central Nervous System (PACNS): Imaging Features and Differential Diagnosis

#### TEACHING POINTS

-To provide a detailed review of the literature of PACNS.-To review the different imaging features of PANCS.-To know the most frequent mimickers of PACNS.

#### TABLE OF CONTENTS/OUTLINE

PACNS is a rare inflammatory vasculopathy (affecting the medium and small vessels) in brain and spinal cord that is frequently difficult to diagnose. The neurological manifestations vary, but they typically include chronic headache, encephalopathy, focal weakness, or stroke. Brain biopsy is the gold standard and only definitive test for PACNS, but has limited sensitivity, is invasive, and is associated with high rates of morbidity. Lumbar puncture is also performed, but has limited specificity for diagnosis. Catheter angiography is the imaging reference standard and is frequently employed, even though it has limited sensitivity and specificity. Neuroimaging is critical in the diagnosis of PACNS. PACNS may present with diffuse or multi-focal white matter abnormalities, hemorrhagic stroke, single or multi-territorial ischemic infarcts, micro-hemorrhages, and pseudotumoral lesions. Vessel wall MRI increases diagnostic accuracy by showing concentric mural thickening and contrast enhancement in brain arteries affected by vasculitis. Reversible cerebral vasoconstriction syndrome, atherosclerosis, Moyamoya disease, CLIPPERS, primary CNS diffuse lymphoma, and secondary cerebral vasculitis are the most common differential diagnoses. In this review, we will illustrate and describe the radiological appearance and differential diagnosis of primary angiitis of the central nervous system (PACNS), and imaging's role in diagnosis.

#### NREE-109 The T2-FLAIR Mismatch Sign in Oncologic Neuroradiology: Imaging Criteria, Current Uses, and Histo-

## Molecular Correlates

Participants

Samir Dagher, MD, BS, Houston, TX (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Detecting the "classic" T2-FLAIR Mismatch sign (T2FMM) requires a strict application of the T2 and FLAIR criteria in adult patients with suspected CNS gliomas. The "classic" T2FMM exhibits near-perfect specificity yet variably low sensitivity for the diagnosis of astrocytoma, IDH-mutant in adults. 2. A less stringent application of the strict criteria allows for the detection of the "partial" T2FMM. Studies suggest it may reliably exclude the diagnosis of glioblastoma, IDH-wildtype while compromising the near-perfect specificity of the "classic" sign. 3. Differences in MRI acquisition parameters may affect the visibility of the T2FMM. 4. The T2FMM has also been reported in pediatric-type CNS tumors, namely dysembryoplastic neuroepithelial tumors and H3K27-altered diffuse midline gliomas. 5. Although limited data suggests significantly larger intercellular spaces, including microcysts, and upregulation of the mTOR pathway in mismatched compared to non-mismatched tumors, this has not yet translated into prognostic implications. 6. Mismatched tumors have significantly higher apparent diffusion coefficient, and lower relative cerebral blood volume on diffusion- and perfusion-weighted imaging, respectively, compared to non-mismatched tumors.

### TABLE OF CONTENTS/OUTLINE

1. Adult-type diffuse gliomas in the 2021 WHO classification of CNS tumors 2. The "classic" T2FMM: imaging criteria, clinical uses and pitfalls 3. The "partial" T2FMM: imaging criteria and clinical uses 4. The T2FMM in pediatric-type tumors 5. Clinical and histomolecular correlates 6. Diffusion- and perfusion-weighted imaging correlates

## NREE-11 Cerebral Small Vessel Disease: Small Size, Big Problems

Participants

Eduardo Freire, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Review the imaging patterns of cerebral small vessel disease (SVD). Review the classification and subgroups of SVD. Correlate clinical findings and complaints with imaging patterns. Review the subtypes of SVD and their own diagnostic criteria. Review the Boston criteria 2.0 for cerebral amyloid angiopathy (CAA). Review the new markers of Boston criteria 2.0. Discuss the role of the radiologist in the diagnosis of SVD.

### TABLE OF CONTENTS/OUTLINE

Cerebral Small Vessel Disease (SVD) is a high prevalence disease, and a common cause of stroke and dementia. Although SVD can be asymptomatic at the beginning, some imaging findings may suggest its diagnosis. The study "Standards for Reporting Vascular change on neuroimaging (STRIVE)" shows SVD imaging patterns on brain magnetic resonance (MR) that allows considering it as a differential diagnosis. SVD comprises a group of diseases that affect capillaries, arterioles, small veins and venules, and small perforating arteries. Didactically, we can classify SVD according to its pathological and genetic characteristics into sporadic and hereditary (genetically determined). Sporadic subtypes are the most common and represent the two main etiologies of SVD: hypertensive and related to cerebral amyloid angiopathy. Brain MR imaging findings are usually similar for all etiologies. To assist the radiologist, STRIVE compiled imaging findings that represent SVD's indirect signs.

## NREE-110 It's Not All About the Shine: Spotting MS MRI Biomarkers

Participants

Nicole Lambrakos, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Briefly describe the multiple sclerosis biomarkers and which techniques have the highest sensitivity and specificity. 2. Discuss the importance of spotting imaging multiple sclerosis biomarkers and their pathology correlation. 3. Expose the role of MR in identifying the main multiple sclerosis biomarkers. 4. Looking for multiple sclerosis biomarkers in doubtful lesions to favor demyelinating etiology.

### TABLE OF CONTENTS/OUTLINE

1. Main multiple sclerosis biomarkers identifiable via MR. 2. Pathophysiology: correlation of imaging and pathology of multiple sclerosis biomarkers. 3. Differential diagnosis: using MR biomarkers to help favor demyelinating etiology.

## NREE-111 Pituitary Insufficiency in Children: Spectrum of MR Imaging Findings

### TEACHING POINTS

1. Hypo-functioning pituitary tissue may appear normal on MRI. 2. Congenital anomalies of hypothalamic-pituitary axis (HPA) often present with pituitary insufficiency in children and are frequently associated with additional CNS anomalies. 3. Normally developed but hypo-functioning pituitary tissue may demonstrate subtle imaging abnormalities such as small size or decreased enhancement. 4. Common infiltrative lesions resulting in pituitary insufficiency in children include germ cell tumors and histiocytosis. 5. Pituitary insufficiency can be seen as a long-term side effect of radiation treatment for pediatric posterior fossa tumors.

### TABLE OF CONTENTS/OUTLINE

1. Background a. Normal embryologic development of the HPA b. Characteristics of normal HPA on MR imaging, including quantitative assessment of pituitary gland enhancement c. Brief clinical overview of hypopituitarism in children 2. Case-based review highlighting the spectrum of abnormalities seen in 85 children with pituitary insufficiency seen at a tertiary care children's hospital over a 5-year period. a. Normal pituitary gland b. Subtle imaging abnormalities in otherwise well-formed HPA c. Congenital abnormalities affecting HPA i. Associated CNS anomalies d. Mass Lesions involving HPA i. Neoplasms ii. Non-neoplastic e. Post-radiation pituitary insufficiency

## NREE-112 Highways to the Danger Zone: Craniofacial to Cerebrovascular Anastomoses

### TEACHING POINTS

1) The etiology of vascular collateralization includes congenital and pathologic connections. 2) Cerebral angiography is the gold

1) The etiology of vascular collateralization includes congenital and pathologic connections. 2) Cerebral angiography is the gold standard for identifying extra- to intra-cranial collateralization. 3) Familiarity with the functional vascular territory schema for extra- to intra-cranial collaterals can help dictate appropriate and safe treatment.

#### TABLE OF CONTENTS/OUTLINE

1) Background a) Review of extra- to intra- cranial anastomosis. i) Developed in the setting of large artery occlusion, vascular agenesis, or high flow shunting due to "sump effect". ii) Small non-visualized collaterals can open in response to acutely increased intra-arterial pressure (e.g., embolization, superselective injection). iii) Anastomotic channels often follow cranial nerves. b) Review of normal cerebrovascular anatomy c) Extra- to intra- cranial anastomotic classification scheme i) Orbital ii) Petrocavernous-Clival iii) Cervical iv) Dural-Pial 2) Interactive case-based review of anastomotic channels organized by functional vascular territories a) Non-invasive imaging b) Cerebral angiography c) Interactive 3D-reconstruction 3) Implications for endovascular therapy a) Complications (e.g., stroke, cranial nerve palsy) b) Common angiographic markers to avoid injury (e.g., choroidal blush) c) Methods to avoid non-target embolization (e.g., balloon occlusion) 4) Summary

#### **NREE-113 Newly Recognized Neurodegenerative Conditions and Adult-onset Leukodystrophies: An Updated Guide in the Genomic Era**

Participants

Amit K. Agarwal, MD, MBBS, Jacksonville, FL (*Presenter*) Stockholder, Gilead Sciences, Inc

#### TEACHING POINTS

Teaching points 1. To discuss the recent updates in molecular markers and genetics for neurodegenerative conditions 2. To discuss radiological pattern recognition of the newly recognized neurodegenerative conditions and adult-onset leukodystrophies

#### TABLE OF CONTENTS/OUTLINE

1. Molecular markers and genetics a. Next generation sequencing b. Neurodegenerative genome panel c. Leukodystrophy genome panel 2. Classification of neurodegenerative conditions [NDD](focus on TDP-43) 3. Recently recognized NDD a. TDP-43 proteinopathies -Limbic-predominant age-related TDP-43 encephalopathy (LATE) - Facial onset sensory and motor neuronopathy (FOSMN) - Cerebral age-related TDP-43 with sclerosis (CARTS)- Multisystem proteinopathy (MSP) - Perry disease (DCTN1 mutations)b. Amyloidoses - Transthyretine-associated cerebral amyloidosis - Neuronal intranuclear hyaline inclusion disease (NIHID)c. Other (miscellaneous) -New brain iron accumulation NDD (BPAN, FAHN)- Chronic traumatic encephalopathy (tauopathy) - EPM1- Unverricht-Lundborg disease -4. Recently recognized adult-onset leukoencephalopathies a. CSF1R-leukoencephalopathy (hereditary diffuse leukoencephalopathy with spheroids) b. AARS2-leukoencephalopathy c. CARASIL (cerebral autosomal recessive arteriopathy) d. CARASAL (cathepsin A-related arteriopathy with strokes) e. COL4A1 and TREX1 associated leukoencephalopathiesf. Leukoencephalopathy with brainstem and cord involvement with elevated lactate (LBSL) g. Late-presenting hypomyelinating disorders (PLP1, GJC2, TUBB4A, POLR3A, POLR3B, CLCN2, NKX6-2)5. Simplified MRI approach for NDD6. Summary/conclusion

#### **NREE-114 Posterior Cranial Fossa Tumors: Tips and Tricks for Diagnosis**

Participants

Nahia Lizarraga Oroz, MD, Donostia, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Review the anatomy of the posterior cranial fossa (PCF). - Establish a proper differential diagnosis based on patient age and imaging findings. - Highlight the specific radiological features of the most common posterior cranial fossa tumors (PCFT).

#### TABLE OF CONTENTS/OUTLINE

The PCF is the infratentorial compartment of the cranial vault that houses the cerebellum, brainstem and fourth ventricle. Tumors that settle in this location have serious implications not only because of their potential malignancy but also because they can cause brainstem compression, herniation and hydrocephalus, among other complications. Tumor location and patient demographics, as well as imaging findings on CT or MR must be considered in order to establish a proper differential diagnosis. While cerebellar metastases are the most common PCFT in adults, medulloblastoma is the most common in children. Specific radiologic features have been described to differentiate PCFT, allowing the radiologist to make an accurate diagnosis. In addition, neuroimaging is also useful in surgical planning for these tumors. In this work we review the most common PCFT in patients of all ages, through cases studied in our center highlighting the key radiologic findings that enable us to make a correct diagnosis.

#### **NREE-115 Autoimmune Encephalitis: When Your Immune System Attacks Your Brain and MRI is Your Detective**

Participants

Fernando Diego Choque Chavez, MD, Barcelona, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Review the pathophysiology and classification of autoimmune encephalitis. 2. Describe and illustrate characteristic MRI findings related to autoimmune encephalitis 3. Discuss the role of neuroradiology in the diagnostic work-up.

#### TABLE OF CONTENTS/OUTLINE

1. Teaching points 2. Introduction 3. Pathophysiology and classification 4. Clinical presentation and radiological findings 4.1 Autoimmune encephalitis with intracellular antigens (group I) 4.2. Autoimmune encephalitis with cell-surface directed antigens (group II) 5. Differential diagnosis 6. Summary and conclusions 7. Bibliography

#### **NREE-116 Insights into Neural Connections: Neuroimaging and Neuromodulation in Parkinson's Disease and Essential Tremor**

Participants

Sonoko Oshima, MD, PhD, Los Angeles, CA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Knowledge on neural connections in movement disorders is crucial to understand mechanisms of clinical manifestations, diagnose

the diseases, and maximize benefits and minimize side effects of therapies. The aim of this presentation is to improve radiologists' role in diagnosing and treating Parkinson's disease (PD) and essential tremor (ET) by 1) overviewing neural connections between cortex and deep gray matter and 2) discussing neuromodulation therapies for movement disorders including deep brain stimulation (DBS) and MR-guided focused ultrasound (MRgFUS) from the perspective of neural connections and neuroimaging.

#### TABLE OF CONTENTS/OUTLINE

1) Neural connections related to Parkinson's disease and essential tremor - Histological findings - Imaging findings 2) Neuromodulation therapies: deep brain stimulation (DBS) and MR-guided focused ultrasound (MRgFUS) - Neurophysiological mechanisms - Treatment targets: subthalamic nucleus (STN), globus pallidus interna (Gpi), ventral intermediate nucleus (Vim) of the thalamus - Localization of targets by imaging technique: indirect and direct targeting - Post-operative imaging

#### **NREE-117 Unraveling Dementia Imaging: Challenging Common Misconceptions and Exploring Emerging Conditions**

Participants  
Siddhant Dogra, MD, New York, NY (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

(1) Radiologists are generally unfamiliar with clinical and imaging features of common neurodegenerative diseases and wary of suggesting it in their reports. (2) AD, FTLD, PPA and DLB often present with classic, unambiguous appearances on CT, MRI and FDG PET. (3) PCA and CBDS have typical clinical and imaging presentations but are syndromes with multiple potential underlying causes. (4) As the US population ages and lifespans increase, mixed dementia and recently described, more indolent forms of neurodegenerative disease become more prevalent. (5) Newly recognized neurodegenerative diseases (CARTS, LATE and PART) share clinical and imaging features, and may mimic Alzheimer's disease.

#### TABLE OF CONTENTS/OUTLINE

(1) Neurodegenerative disease in everyday radiology (2) Classic clinical, MRI and FDG PET presentations of neurodegenerative diseases: Alzheimer's Disease, Frontotemporal Lobar Degeneration, Primary Progressive Aphasia, Dementia with Lewy Bodies, Vascular cognitive impairment (3) Challenges to neurodegenerative imaging workup: "Normal aging?", Specificity limits of MRI, FDG or Amyloid PET, Mixed dementia is common, Dementia with Lewy bodies (Mimic of both PD and AD, Current imaging limitations, Frequent comorbidity with AD), Confusion in radiology re: clinical-radiology syndromes (Specific diagnosis vs differential for underlying pathology, CBDS [corticobasal degeneration syndrome], PCA [posterior cortical atrophy], PPA [primary progressive aphasia], (4) Newly recognized indolent forms of neurodegeneration: Mimics of AD in patients > 75 years (CARTS, PART, LATE), Are there specific MRI and PET findings?

#### **NREE-118 Quick Diagnosis and Treatment - A Novel AIS Treatment Strategy using Hybrid Emergency Room System**

#### TEACHING POINTS

•A quick diagnosis is important to determine treatment indications for patients who have AIS. •HERS (Hybrid-Emergency Room System) is an all-in-one concept for an Emergency Room. HERS is useful in critical trauma treatment strategies as computed tomography, interventional radiology and surgery are available in one environment. •It is reported that using HERS for AIS, shortened the time to reperfusion. •With my study, we have setup an AIS protocol that allows a Time Based Strategy and Tissue Based Strategy using HERS.

#### TABLE OF CONTENTS/OUTLINE

•We established an AIS treatment strategy (one stop management) using HERS (Angio-CT suite). •HERS can go from diagnostic imaging to treatment without transferring the patient from department to department. •A one-stop stroke protocol with simultaneous CT perfusion and whole body CTA can determine treatment indications, optimize treatment planning, and ensure safety. •This novel protocol is useful for identifying occluded vessels, assessing brain function, and confirming access routes. •Using our approach, a quick diagnosis and quick treatment were possible in cases of acute aortic dissection, aortic aneurysm rupture, carotid artery stenosis, carotid artery dissection in patients suspected with AIS. •A one-stop stroke protocol using HERS can be confirmed to shorten the door-to-image and treatment time and increase the re-canalization rate.

#### **NREE-119 Don't Hold Your Breath: Reproducible Hypercapnic Stimuli for Cerebrovascular Reactivity Mapping with RespirAct**

Participants  
Diana Vera, MD, Rochester, MN (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Review the fundamental physiology of hypercapnia and its association with cerebrovascular reactivity (CVR). 2. Explain the mechanisms and advantages of hypercapnic stimuli as generated by the RespirAct instrument as compared to conventional breath-hold techniques for BOLD fMRI-based CVR mapping. 3. Showcase representative examples of patients with cerebrovascular disease and CVR maps produced by RespirAct and BOLD fMRI.

#### TABLE OF CONTENTS/OUTLINE

I. Hypercapnia and its association with cerebrovascular reactivity (CVR) a. Fundamentals of CVR b. Importance of measuring CVR II. Design of the RespirAct device for the production of controlled hypercapnia a. Current established practice b. The RespirAct device description III. Comparison of RespirAct and conventional breath-hold methods of CVR mapping with BOLD fMRI a. A brief review of the origin of the BOLD signal b. RespirAct advantages over conventional breath-hold technique IV. Representative examples of CVR measurements with RespirAct in the context of a. Cerebrovascular steno-occlusive diseases b. Arteriovenous malformations c. Brain tumors V. Summary/Conclusion

#### **NREE-12 Spinal Vascular Malformations: A Systematic Angioarchitecture and Pathophysiology-Based Approach to Classification and Diagnosis**

Participants

Charlotte Chung, MD, PhD, New York, NY (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Spinal vascular malformation refers to a spectrum of lesions with abnormal connection between (or morphology of) spinal arteries and veins, all of which differ in angioarchitecture, pathophysiology, and clinical sequelae. Advances in angiographic and non-invasive imaging techniques have improved spinal vasculature visualization, enabling identification of distinctive morphologic and hemodynamic features. This exhibit introduces a comprehensive classification system based on these imaging features to aid diagnosis of well recognized as well as rare/recently identified spinal vascular lesions. The educational objectives of this exhibit are:- Review normal spinal vascular anatomy.- Discuss multimodal imaging techniques for evaluating spinal vascular malformations.- Differentiate spinal vascular malformations based on location, angioarchitecture, pathophysiology, and symptomology.- Illustrate radiographic appearance of spinal vascular malformations including arteriovenous fistulas and malformations, and non-shunting lesions such as aneurysms.

#### TABLE OF CONTENTS/OUTLINE

I. Annotated diagrams of normal spinal arterial and venous anatomy  
II. Imaging techniques for spinal vascular malformation evaluation  
III. Systematic classification of spinal vascular malformations  
IV. Radiographic features of various spinal vascular malformations  
V. Radiographic mimics

#### **NREE-120 Uncovering the Hidden Dangers: Addressing Diagnostic Errors in Brain Emergency Neuroradiology**

Participants

Maria Lucia Brun, MD, OTTAWA, ON (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- To explain the importance of accurate and timely diagnosis in brain emergency neuroradiology. - To describe the different types of diagnostic errors in brain emergency neuroradiology. - To identify the potential causes of diagnostic errors and to develop effective strategies for error prevention and mitigation in emergency neuroradiology. - Case-based series examples to highlight different error types and the factors that led to the errors.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction  
2. Background  
3. Types of errors:- Cognitive errors: biases or heuristics that influence the radiologist's thinking or decision-making (Framing, Anchoring, Alliterative, Satisfaction of search, Availability, Attribution).- Communication errors: Breakdown in communication.- Perception/perceptual errors: Misinterpretation or misperception.- Technical errors: Limitations in the imaging equipment or technique used. - Organizational errors: Factors outside of the radiologist's control (workload, staffing issues, etc)  
4. Consequences of errors- Delayed/missed diagnoses- Incorrect/unnecessary treatments - Patient harm- Legal and financial consequences  
5. Strategies for error prevention and mitigation in emergency neuroradiology- Valuable tools to reduce errors in the imaging evaluation of brain emergencies- Showcase the particular strategies used at our departments.  
6. Case series examples- Provide case examples to further illustrate and explain the statements mentioned above.- Highlight the factors that led to the errors and how they could have been prevented or mitigated in that particular case.  
7. Conclusion

#### **NREE-121 A Game-Changing Approach to Non-Invasive Vascular Imaging: Ultra High-Resolution CT with Novel Deep Learning Reconstruction**

#### TEACHING POINTS

1. To learn the basic principles of ultra high-resolution CT (UHRCT).  
2. To learn the basic principles of the novel reconstruction technology "deep learning reconstruction (DLR)".  
3. To know the differences in image quality between DLR and conventional reconstruction methods on brain CTA using UHRCT.  
4. Clinical applications of brain CTA with DLR using UHRCT and comparison with digital subtraction angiography (DSA).  
5. To know the pitfalls of CTA with DLR and DSA on cerebral diseases.  
6. To present the outlook of brain CTA with DLR using UHRCT in the near future.

#### TABLE OF CONTENTS/OUTLINE

1. Basic principles of UHRCT  
2. Basic principles of the novel imaging reconstruction method "DLR"  
3. The image quality of DLR and conventional reconstruction methods on brain CTA using UHRCT  
4. Clinical applications of brain CTA with DLR using UHRCT and DSA to evaluate the following diseases  
intracranial aneurysms  
moyamoya disease  
arteriovenous malformations (AVMs)  
dural arteriovenous fistulas (dAVFs)  
giant cell arteritis  
tumors (skull tumor, meningioma, schwannoma, glioma, and so on)  
5. Pitfalls of CTA and DSA  
6. The future outlook of brain CTA with DLR using UHRCT

#### **NREE-122 Erdheim-Chester Disease Beyond MSK: Do You Know What to Look for in Brain MRI?**

Participants

Marta Barrios Lopez, MD, Santander, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To explain and illustrate the main neuroradiological findings in Erdheim-Chester Disease (ECD), an uncommon type of systemic histiocytosis with almost constant bone involvement. 2. To learn the prognostic implications of certain neuroradiological findings. 3. Much of the literature on this subject focuses on its musculoskeletal findings. However, neuroradiological manifestations are an important source of morbidity and mortality in these patients.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction: 1.1. Main systemic manifestations of ECD: establishing a context. 1.2. The BRAF mutation and its (neuro)imaging implications. 2. Neuroradiological findings: 2.1. Introduction: Classification and frequency of neurological manifestations. MRI protocol. 2.2. Intra-axial involvement. Typically infratentorial. 2.3. Hypothalamic-pituitary manifestations. Several patterns. 2.4. Meningeal involvement: Different patterns. Masses often present a diagnostic challenge. 2.5. Orbital involvement. Do not forget the orbits in your systematic search. 3. Conclusions 4. References

#### **NREE-123 Neurocysticercosis: Findings from a Challenge Disease in the Third World**

#### TEACHING POINTS

The purposes of this exhibit are: review and illustrate the imaging findings of neurocysticercosis, the differential diagnoses, and their correlation with pathological images. Describe through illustrative presentations the benefits of the multimodality imaging approach to the diagnosis of neurocysticercosis. Present challenging cases, such as pseudotumoral lesions. Establish the imaging red flags and how they can help the radiologist reach the correct diagnosis.

#### **TABLE OF CONTENTS/OUTLINE**

Neurocysticercosis stages and parasite life cycle. Imaging patterns on MR and CT. Susceptibility weighted imaging (SWI) role on calcified lesions. Diffusion-weighted imaging (DWI) showing the scolex. Spectroscopy as a valuable tool for differential diagnosis. 3D CISS sequence applicability for subarachnoid lesions. Vessel wall imaging sequence showing vasculitis with or without infarction. Pseudotumoral lesions. Differential diagnoses based on a pictorial review using representative cases from a Tertiary University Hospital database. A practical approach for better diagnostic accuracy and avoiding pitfalls. Final remarks.

#### **NREE-124 Evaluation of Head and Spinal CT Angiography with Photon-counting Detector CT: How Close to the Angiographic and Operative Findings**

##### **TEACHING POINTS**

The purpose of this exhibit is: 1) To review imaging of head and spinal CT angiography with photon-counting detector CT 2) To correlate with angiography and intraoperative findings.

#### **TABLE OF CONTENTS/OUTLINE**

Recently, Photon-counting detector (PCD-CT) has been developed and enabling high-resolution imaging at a lower radiation dose. PCD-CT employs a photon-counting detector that can measure the number of incident X-ray photons and their energy. The newly released PCD-CT (NAEOTOM Alpha, Siemens Healthineers, Forchheim, Germany) has been in clinical use at our institution since December 2022. The PCD-CT offers several advantages over current state-of-the-art energy-integrating detector CT (EID-CT). The PCD-CT does not require septa to create a detector channel but does EID-CT. Therefore, it can be seen that downsizing the anode to achieve higher resolution does not affect the dose efficiency of the PCD-CT. The purpose of our exhibit is to present head and spinal cord CT angiographic images acquired with PCD-CT and corresponding images acquired angiographically and intraoperatively to clarify the delineation potential of PCD-CT. In spinal arterio-venous fistula (AVF), feeder, shunted pouch, and drainer are depicted in CTA. In spinal tumor of hemangioblastoma, tumor drainer is recognized in CTA. We would like to provide insight into how close the PCD-CTA findings are to the angiographic and intraoperative findings.

#### **NREE-125 MRI Analysis of Causes and Consequences of Acute Epileptic Seizures from Temporal Lobe Origin**

Participants

Silvana Sarria Estrada I, MD, PhD, Barcelona, Spain (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

MRI is useful to diagnose the cause and functional changes associated with acute seizures or status epilepticus (SE) from temporal lobe origin. Several MRI abnormalities on diffusion/perfusion-weighted, T2-weighted and contrast-enhanced T1-weighted sequences, observed after acute seizures in chronic conditions, even distant from the temporal lobe, are relevant to detect changes in the evolution. The identification of inflammatory component on MRI after a new onset temporal lobe seizure impacts the prognosis of infectious or autoimmune encephalitis, stroke or malignant tumours. Acute MRI findings in new onset seizures or SE are often subtle or unspecific. Timing of serial follow-up MRIs must be protocolized. Increase of amygdalar enlargements, hippocampal atrophy or autoimmune epilepsies can be detected using time defined follow-up MRI studies. In conclusion, a standardized MRI protocol for acute seizures and SE that analyses structure and function of the temporal lobe can lead to an early diagnosis of severe and chronic disorders. The time intervals between serial follow-up MRIs are relevant to avoid further consequences.

#### **TABLE OF CONTENTS/OUTLINE**

1 Temporal lobe seizures are often associate with ictal MRI abnormalities. 2 Acute MRI can diagnose acute seizures or status epilepticus. 3 Some MRI features, even distant from chronic lesions, may suggest change in evolution. 4 Early MTI features in new onset seizures can lead to the diagnostic of chronic conditions. 5 Time-defined serial MR scans are needed in cases of subtle or unspecific MRI features.

#### **NREE-126 The Haunted Core in Acute Ischemic Stroke**

##### **TEACHING POINTS**

Perfusion-based imaging used in the evaluation of tissue viability is crucial in the management of patients with acute ischemic stroke (AIS), especially in extended time windows. Currently used imaging techniques in AIS cannot accurately differentiate between salvageable and non-salvageable tissue. There is no widespread gold standard definition of ischemic core. Different findings highlighting current challenges and solutions in AIS imaging will be presented through clinical cases.

#### **TABLE OF CONTENTS/OUTLINE**

Perfusion-based CT and MR imaging techniques are used for detection of AIS and evaluation of tissue viability. At present, common available imaging techniques fail to accurately differentiate between salvageable and non-salvageable ischemic tissue. Additionally, a widespread gold standard definition of the ischemic core is lacking. Through clinical cases, image findings highlighting challenges and solutions in the evaluation of tissue viability will be discussed, like limited sensitivity to detect early ischemic changes on non-contrast enhanced CT (NCCT), variation in outcome after successful recanalization, potential reversibility of DWI-lesions, false negative initial DWI, overestimation of ischemic core on perfusion computed tomography and variation in penumbra and core volume calculations. Considering the important role of imaging in the management of patients with AIS, it is crucial with profound knowledge about advantages and limitations of penumbra and core evaluation. The teaching points will be extensively illustrated through clinical imaging examples.

#### **NREE-127 Cavernous Sinus Dural Arteriovenous Fistulas: Relevant Vascular Anatomy, Angioarchitecture and Endovascular Treatments**

Participants

Hiro Kiyosue, MD, (*Presenter*) Research Grant, Koninklijke Philips NV

## TEACHING POINTS

Dural arteriovenous fistulas (DAVFs) frequently involve the cavernous sinus (CS). Although CSDAVFs are usually associated with benign ocular symptoms, they can cause aggressive symptoms such as cerebral hemorrhage. Those symptoms are strongly related to the pattern of venous drainage. Recent advances of imaging and therapeutic technologies allow us to evaluate their angioarchitecture precisely and to treat them effectively by endovascular techniques. However, serious complications such as fetal hemorrhage and infarction can occur during and after embolization mainly due to overlooking of tiny but important vessels relevant to CSDAVFs. This presentation demonstrates imaging anatomy of important vessels relevant to the CS, angioarchitecture of CSDAVF, and tips and tricks for successful endovascular treatments. CS is derived from three different venous systems of prootic sinus, duro-osseous venous plexus, and primitive tentorial sinus. Anatomical variations occur during development of CS. The CSDAVFs are fed by multiple feeders from the internal and external carotid arteries, which converge to form shunted pouches adjacent to the CS. The CSDAVFs are effectively occluded by selective embolization of those shunted pouches. Inadequate embolization of the venous outflow may lead serious complication.

## TABLE OF CONTENTS/OUTLINE

1. Relevant vascular anatomy:1-1. Arterial branches to the CS and their potential anastomoses.1-2. Venous tributary and their variations.2. Angioarchitecture of CSDAVF: common feeders, shunted pouches, and dangerous drainage routes3. Endovascular techniques: various access routes, selective transvenous embolization, and sinus packing

## NREE-128 Understanding Perisylvian Cortical Anatomy: Tips and Tricks

Participants

Sally Choi, MD, BS, San Antonio, TX (*Presenter*) Nothing to Disclose

## TEACHING POINTS

- Perisylvian area serves as a crossroad for important cortical structures with principal functions for example Broca's area is located along the anterior and ascending rami of the sylvian fissure (M sign) o Wernicke area is classically located along the inferior aspect of the posterior ramus of the Sylvian fissure
- Important structures form this area areo Frontal operculum Parietal operculum Temporal operculum Insula
- Knowing these structures is beneficial for a radiologist in describing the anatomical component of a lesion to better understand the physiologic symptoms corresponding to the lesion location with surgical and prognostic importance.

## TABLE OF CONTENTS/OUTLINE

- Briefly discuss the sylvian fissure anatomy
- Discuss the different cortical structures form the perisylvian area such as frontal, parietal and temporal operculum and insula.
- Discuss the MRI anatomy of these structures utilizing some tips and tricks to understand the anatomy such as- M shaped appearance of the inferior frontal gyrus along the anterior and ascending rami of the sylvian fissure
- Discuss the role of these cortical structures in the principal functions of the body.
- Discuss the role of relevance of Functional MRI in these areas

## NREE-129 The Cortico-Limbo-Thalamo-Cortical Circuits: An Update to the Papez Circuit of the Limbic System

Participants

Parnian Shobeiri, MD, MPH, Tehran, (*Presenter*) Nothing to Disclose

## TEACHING POINTS

? The Papez circuit is a circuit believed to control memory and emotion, composed of the cingulate cortex, entorhinal cortex, parahippocampal gyrus, hippocampus, hypothalamus, and thalamus. ? In recent years, multiple additional limbic fiber connectivity has been revealed using diffusion-weighted imaging (DWI) techniques. Some of these fiber tracts include the amygdalofugal tract (AFT), amygdalothalamic tract (ATT), stria terminalis (ST), dorsal thalamo-hypothalamic tract (DTH), cerebello-hypothalamic tracts, and the parieto-occipito-hypothalamic tract (POHT) ? This presentation aims to summarize the anatomy of the limbic system, outline previous updates to the circuit, and elaborate on the anatomical connectivity of the limbic circuits based on recent DWI as an update to the original Papez circuit.

## TABLE OF CONTENTS/OUTLINE

? The original Papez circuit and updates over time ? The Yakovlev model/circuit ? The MacLean's model ? Overview of high spatial resolution diffusion weighted imaging ? Review of previously established Papez circuit (See Figures 1 5 for specific tracts) ? Detailed fiber tract anatomy ? Updates to previously known limbic circuits: the role of additional fibers in creating multiple neuronal loops and circuits

## NREE-13 Mapping the Way: A Road Map for Diagnosing, Treatment and Follow Up of Brain Metastases

Participants

Julia Brunelli, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

## TEACHING POINTS

This educational exhibition aims to provide a comprehensive overview of the imaging evaluation of patients with suspected brain metastases, emphasizing the prevalence and potential diagnostic challenges associated with these neoplasms. It will highlight specific imaging patterns, differential diagnoses, and potential pitfalls in imaging interpretation. The exhibition will also discuss the clinical and imaging features that suggest the etiology of primary tumors, including a pictorial essay of specific patterns. Additionally, it will review radiological criteria for diagnosing radionecrosis, pseudoprogression, and disease progression in brain metastases patients and emphasize the importance of advanced imaging techniques. Case studies will be used to illustrate radiological challenges and diagnostic considerations in the treatment and follow-up of these patients.

## TABLE OF CONTENTS/OUTLINE

1. Imaging Evaluation of Patients with Suspected Brain Metastases

- Overview of intracranial metastases as the most common adult intracranial neoplasms and their imaging evaluation
- Imaging patterns and differential diagnoses
- Mimickers and pitfalls in imaging interpretation

2. Etiology of the Primary Tumor

- Clinical and imaging features suggestive of the primary tumor
- Pictorial essay of brain metastases with specific patterns

3. Treatment and Follow-up

- Radiological criteria for diagnosing radionecrosis, pseudoprogression, and disease progression
- Case studies illustrating radiological challenges in distinguishing these conditions

## **NREE-130 CNS Imaging of the Immunocompromised - An Opportunistic Review for the Radiologist**

Participants

Luis Colon Flores, MD, Oceanside, NY (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

1) Review the main imaging findings of the different opportunistic infections. 2) Review and recognize the different HIV/AIDS associated CNS conditions. 3) Discuss the imaging findings of immunodeficiency-associated primary CNS lymphomas.

### **TABLE OF CONTENTS/OUTLINE**

1) Introduction 2) Opportunistic infections (Bacterial, viral, fungal and parasitic) 3) HIV/AIDS CNS associated conditions 4) Immunodeficiency-associated primary CNS lymphoma 5) Conclusion

## **NREE-131 The Ultimate Imaging Companion to Vascular Complications in Cancer Patients: A Comprehensive Review for Radiologists**

Participants

Jessica De Oliveira, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

Vascular complications are a significant cause of morbidity and mortality in cancer patients, with increasing incidence due to improved survival and evolving treatments. Oncologic patients are more prone to vascular complication such as hypercoagulability state, reduction in mobility and aggressive treatments as brain radiation. These complications may occur at disease presentation or be secondary to treatment. Our aim is to review the main imaging findings of vascular complications in a didactic way. We believe this approach may facilitate diagnostic suspicion.

### **TABLE OF CONTENTS/OUTLINE**

Introduction: Review main intracranial vascular complications in oncology patients, with an emphasis on the pathophysiological mechanisms involved. To display a flowchart dividing these complications according to treatment status and treatments applied. To discuss for each vascular complication the risk factors, clinical presentation, main imaging findings and relevant treatments. The discussion will be enriched with illustrative cases, including: Complications before treatment: Hypercoagulability (Trousseau syndrome, cerebral venous thrombosis). Vascular compression/ obstruction by the tumor or Vascular compression/ obstruction due to brain herniation. Intravascular tumor dissemination (oncotic aneurysm and intravascular lymphoma). Complications during treatment: Post-operative ischemia Late complications after treatment: Aneurysm after radiotherapy, SMART, Radiation induced cavernous malformations. To highlight the most relevant clinical and imaging aspects of these vascular complications, essential for prompt diagnosis and treatment.

## **NREE-132 Skull Drip: Algorithmic Multimodality Imaging Approach**

Participants

Pokhraj Suthar, MD, Chicago, IL (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

Briefly discuss various causes and sites of skull base CSF leak. To learn the diagnostic imaging findings of various modalities including high resolution NECT, CT cisternogram, MRI and radiotracer studies, in identifying the cause and localizing the exact site of skull base CSF leaks. To learn the algorithmic imaging approach and how it is helpful for surgical planning in cases of skull base CSF leak. To diagnose recurrent leaks in post-surgical repair of primary CSF leak

### **TABLE OF CONTENTS/OUTLINE**

Cerebrospinal fluid (CSF) leaks are extracranial leaks of CSF via an osteodural defect in the skull base into the tympanomastoid cavity, paranasal sinus, or rarely in the skull base neck space. There are various etiologies for the same, including accidental trauma, congenital malformation, spontaneous leaks in idiopathic intracranial hypertension and iatrogenic. Accurate localization of the site of the leak and identification of the underlying cause is necessary for surgical planning to avoid associated complications and prevent recurrence. In this educational exhibit, we outline the various interesting cases of skull base defects, their multimodality algorithmic imaging diagnosis approach (CT, MRI, CT/MR/Nuclear medicine radionuclide cisternography), correlation of imaging diagnosed skull base defect with surgical outcome, and imaging diagnosis of recurrent CSF leaks.

## **NREE-133 The Ternary Plot Analysis of Time-sensitive Diffusion Imaging in CNS Pathologies**

Participants

Toshiaki Taoka, MD, PhD, , Japan (*Presenter*) Research Grant, Canon Medical Systems Corporation

### **TEACHING POINTS**

Time-sensitive diffusion imaging provides potentially valuable information on tissue characteristics, with the oscillating gradient spin-echo (OGSE) method enabling short diffusion times compared to the conventional pulsed-field gradient spin-echo (PGSE) method. Comparing the signal on OGSE and PGSE can provide information on tissue compartmentalization. However, comparing different images can make interpretation challenging, and organizing pixel information is necessary. The ternary plot method presents the relationship between diffusivity, compartmentalization, and water content for a single pixel, simplifying the presentation of tissue characteristics obtained from OGSE, PGSE, and  $b=0$  images. This educational exhibit demonstrates the tissue characteristics of various central nervous system pathologies provided by time-sensitive diffusion imaging using the triangulation method of the ternary plot. The ternary plot method has further applications, including the color coding of the pixels according to the tissue characteristics.

### **TABLE OF CONTENTS/OUTLINE**

1. Overview of time dependence of diffusion MRI 2. Methods for displaying time-dependent diffusion-related coefficients. 3. Distribution of the time-dependent diffusion-related coefficients on ternary plot 4. Further application of ternary plot method

## **NREE-134 A Review of Imaging Findings in Neurogenic Ptosis**

## TEACHING POINTS

To understand the anatomy of the neural pathways that innervate the upper eyelid retractor muscles (e.g. oculosympathetic pathway and oculomotor nerve pathway). To describe the normal cross-sectional anatomy of the neural pathways causing neurogenic ptosis. To illustrate the imaging findings of various lesions causing neurogenic ptosis according to a course-based approach.

## TABLE OF CONTENTS/OUTLINE

Introduction and general overview of ptosis / Anatomic review and imaging-based normal cross-sectional anatomy of the neural pathways innervating the upper eyelid retractor muscles (oculosympathetic and oculomotor pathway) / A variety of pathologic conditions causing neurogenic ptosis according to a course-based approach 1. Oculomotor nerve palsy (oculomotor nerve pathway) - Intra-axial segment - Cisternal segment - Cavernous segment - Orbital segment 2. Horner's syndrome (oculosympathetic pathway) - Central neuron - Preganglionic neuron - Postganglionic neuron 3. Neuromuscular junction disorders / Summary and conclusion

## NREE-135 Epilepsy Surgery: Nuts and Bolts for Radiologists

Participants

Jack Yang, Lexington, MA (*Presenter*) Nothing to Disclose

## TEACHING POINTS

A broad range of surgical procedures are available for medically refractory epilepsy from open parenchymal resections to more recent minimally-invasive ablative therapies. In this exhibit, we outline the scope and techniques of these surgical procedures, role of neuroimaging, expected post surgical imaging findings and associated complications. We describe neuroimaging role in subdural or depth electrode placement, an invasive diagnostic surgical procedure for more precise localization of epileptogenic focus. We briefly outline the MRI safety issues in imaging patients with neuromodulation devices.

## TABLE OF CONTENTS/OUTLINE

Table of Contents: I. Epilepsy surgery: Evolution II. Types of surgical procedures: Scope and Techniques A. Surgery for localization of epileptogenic focus: a. Invasive procedure - Subdural grid and strip placement. b. Minimally-invasive procedure - Stereo-EEG B. Surgery for refractory epilepsy a. Invasive procedures: Resection - 1. Hemispherectomy 2. Lobar resection 3. Lesionectomy. Disconnection - 1. Conventional corpus callosotomy 2. Multiple subpial resections. b. Minimally- or less-invasive procedures: Ablative therapies - 1. Laser Interstitial thermal therapy (LITT) 2. MR guided focused US 3. Gamma knife. Neuromodulation procedures - 1. Vagal nerve stimulation (VNS) 2. Deep brain stimulation (DBS) 3. Responsive neurostimulation (RNS) III. MRI safety issues in imaging epilepsy patients with implants and electrodes

## NREE-136 Exploring the FDA Pharmacovigilance Database to Assess the Importance of Symptoms Associated with Gadolinium Exposure (SAGE)

Participants

Eric Lancelot, PhD, Roissy CDG CEDEX, France (*Presenter*) Nothing to Disclose

## TEACHING POINTS

Analysis of FDA pharmacovigilance database to determine safety of gadolinium based contrast media.

## TABLE OF CONTENTS/OUTLINE

**Objective** The aim of this study was to assess the tendency of adverse events representing "symptoms associated with gadolinium exposure" (SAGE) among the bulk of safety experiences reported to health authorities. **Materials and Methods** SAGE symptoms were searched by preferred terms (PTs) in different system organ class (SOC) categories in the FDA Adverse Event Reporting System (FAERS) database over a 5-year period ranging from 2014 to 2019. The numbers of SAGE symptoms per PT, and cumulatively per SOC, were recorded and their weights in the overall spectrum of AEs were determined for 3 linear and 3 macrocyclic GBCAs. **Results:** The analysis of FAERS data revealed a significantly higher SAGE weight for linear GBCAs, namely gadodiamide (23.27%), gadopentetate dimeglumine (22.12%) and gadobenate dimeglumine (19.27%), than for the macrocyclic GBCAs, namely gadoteridol (8.45%), gadobutrol (4.53%) and gadoterate meglumine (3.82%). The SOCs "musculoskeletal and connective tissue disorders", "nervous system disorders", "general disorders and administration site conditions" and "psychiatric disorders" were consistent with this ranking. Moreover, SAGE weights displayed a steady growth of about 5% per year for the linear GBCAs and 1% per year for the macrocyclic agents. **Conclusion** This study showed that SAGE symptoms may be more prevalent with linear than macrocyclic GBCAs, and that SAGE reporting tends to rise significantly more in patients exposed to linear agents. These differences might be explained by the differences in kinetic stability between the GBCAs.

## NREE-137 2022 Updated Diagnostic Criteria of Neurofibromatosis Type 2 and CNS Tumor Manifestations: Imaging Findings, Histological Features, and Assessment of Treatment Effect

Participants

Yoshiaki Ota, MD, Ann Arbor, MI (*Presenter*) Nothing to Disclose

## TEACHING POINTS

1. The diagnostic criteria of NF2 has been revised in 2022 as well as that of schwannomatosis and radiologists should be familiar with the revision. 2. Vestibular schwannomas, meningiomas, other cranial nerve schwannomas, ependymomas, and astrocytomas can be related to NF2. 3. DWI, DSC-MRI, and DCE-MRI can allow for more detailed characterization, tumor differentiation, treatment response assessment, and gene mutation in NF2 patients.

## TABLE OF CONTENTS/OUTLINE

1. 2022 revised diagnostic criteria of NF2A diagnosis of NF2 can be made when an individual has one of the following: a) Bilateral vestibular schwannomas (VS) b) An identical NF2 pathogenic variant in at least 2 anatomically distinct NF2-related tumors (schwannoma, meningioma, and/or ependymoma). c) Either 2 major or 1 major and 2 minor criteria as described in the following: Major criteria: 1) Unilateral VS, 2) First-degree relative other than sibling with NF2-related schwannomatosis, 3) Two or more

meningiomas (Note: single meningioma qualifies as minor criteria). Minor criteria: Can count >1 of a type: Ependymoma, meningioma, schwannoma<sup>2</sup>. Common imaging features and clinical/pathological characteristics of NF2-related CNS tumors: (a) Vestibular schwannoma (b) Trigeminal schwannoma (c) Meningioma (d) Spinal Ependymoma (e) Spinal astrocytoma<sup>3</sup>. Treatment options and imaging assessment of treatment response: (a) Conventional imaging (CT, MRI) (b) Advanced imaging (DWI, DSC-MRI, and DCE-MRI)<sup>4</sup>. Other familial schwannomatosis (SMARCB1 and LZTR1) and meningiomatosis (SMARCB1, SMARCE1, SUFU, and PDGFB)

## **NREE-138 The Radiologist's Guide to Lumbar Spine Pain Procedures: Indications, Techniques and Complications**

### **TEACHING POINTS**

Less than 3 percent of the 4 million annual pain procedures are performed by radiologists, despite having the unique ability to correlate imaging findings with clinical features for targeted pain interventions. This exhibit is aimed at educating the radiologists regarding indications, planning, techniques and challenges of common lumbar pain procedures, with emphasis on 'how to' perform transforaminal and interlaminar epidural spinal injections (ESI). Other technically demanding pain procedures including dorsal transforaminal S1 ESI, synovial cyst rupture and blood patches will be discussed, along with tips and tricks for performing challenging interventions in postoperative, scoliotic and degenerative spine.

### **TABLE OF CONTENTS/OUTLINE**

1. Relevant Lumbar Spine anatomy and fluoroscopic positioning 2. Clinico-radiologic correlation- Clinical examination, patient counselling, selecting the right procedure. 3. Procedure and tray setup 4. Transforaminal ESI- 'how to' approach the target, pre and post contrast injection views. • Supra-neural TFESI • Infra-neural TFESI 5. Interlaminar ESI- • Optimal needle positioning in multiplanar imaging • Recognizing suboptimal needle location 6. Dorsal S1 ESI- recognizing landmarks and optimal views for needle positioning. 7. Other pain relief procedures • Synovial cyst rupture- Direct (IL/TF) and Indirect Techniques • Epidural blood patch 8. Challenging cases and difficult myelograms • Scoliotic and degenerative spine • Postoperative spine 9. Pearls and pitfalls- complications and how to prevent them.

## **NREE-139 From Genes to Emergencies: An Innovative Approach to Imaging Assessment, Genetic Aspects, and Emergency Room Evaluation in CADASIL**

Participants

Ana Luiza Basilio Franca, Rio De Janeiro, Brazil (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

This educational exhibit aims to provide a comprehensive understanding of cerebral autosomal dominant arteriopathy with subcortical infarcts and leukoencephalopathy (CADASIL) disease, including: To illustrate the imaging highlights of the cerebral autosomal dominant arteriopathy with subcortical infarcts and leukoencephalopathy (CADASIL). To exhibit the genetic cascade involved in the disease. To explain the imaging approach to the disease within the context of acute stroke in the emergency. To illustrate the differential diagnosis, including cerebral autosomal recessive arteriopathy with subcortical infarcts and leukoencephalopathy (CARASIL) and white matter diseases.

### **TABLE OF CONTENTS/OUTLINE**

1. Introduction and revision of CADASIL's epidemiology, clinical presentation, and etiology. 2. MRI highlights in CADASIL. 3. Genetic considerations associated with CADASIL. 4. Differential diagnosis, including CARASIL and other white matter diseases. 5. Imaging assessment in the emergency room. 6. Take-home messages.

## **NREE-14 An Imaging Review of Autoimmune Encephalitis: An Often-Overlooked Diagnosis**

Participants

Miriam Fernandez-Gomez, MD, Almeria, Spain (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

- To understand the many signs, symptoms, and types of autoimmune encephalitis. - To Review the main antibodies that have been identified, their patterns of CNS involvement, and their typical anatomical distributions due to the relative concentration of target proteins. - To Highlight the characteristic MRI findings associated with autoimmune encephalitis, with specific emphasis on the role of neuroimaging in the diagnostic work-up. - Finally, to describe a case report of anti-LGI1 autoimmune encephalitis associated with SARS-CoV-2 (COVID-19).

### **TABLE OF CONTENTS/OUTLINE**

TABLE OF CONTENTS  
I. Introduction  
Introduce the topic of autoimmune encephalitis  
II. Understanding Autoimmune Encephalitis  
Define autoimmune encephalitis  
Discuss the symptoms of autoimmune encephalitis  
Explain the pathophysiology of autoimmune encephalitis  
Describe the different types of autoimmune encephalitis  
III. MR Imaging Findings Associated with Autoimmune Encephalitis  
Discuss the characteristic MRI findings associated with autoimmune encephalitis  
Emphasize the role of neuroimaging in the diagnostic work-up  
IV. Autoimmune Encephalitis in SARS-CoV-2 Infection (COVID-19): Illustrative Case  
Describe a case report of anti-LGI1 autoimmune encephalitis associated with SARS-CoV-2 (COVID-19)  
V. Conclusion  
Summarize the key points of the paper  
Discuss the importance of recognizing and diagnosing autoimmune encephalitis

## **NREE-140 Predictors of Intracerebral Hemorrhage Expansion on CT**

### **TEACHING POINTS**

1. Review classification of intracranial hemorrhages and define hemorrhage expansion  
2. Importance of identifying intracranial hemorrhage expansion  
3. Describe findings on imaging that can predict hemorrhage expansion  
Intracerebral hemorrhage (ICH) results in 10-20% of all strokes and leaves 60-80% of survivors functionally dependent. Identifying early hematoma expansion (HE), defined as growth >12.5 mL or volume >33%, is crucial for modifying its potential impact. Three accepted HE indicators in non-contrast computed tomography include baseline hematoma volume as measured by the ABC/2 method. Secondly, irregularly hemorrhage shape indicating multiple leaking blood vessels. Radiologically, the satellite sign and island sign are imaging correlates that indicate irregular hemorrhage shape. Lastly, the imaging density heterogeneity of the hematoma can represent active bleeding. Three signs that represent heterogeneity of the hematoma include the swirl, black hole, and blend sign.

### **TABLE OF CONTENTS/OUTLINE**

1. Classification of intracranial hemorrhage. Intra-axial hemorrhage. Extra-axial hemorrhage. 2. Defining hematoma expansion (HE). 3. Importance of identifying intracerebral hemorrhage expansion. a. Relative incidence. b. Prognostic indicator. 4. Clinical aspects that increase risk of hematoma expansion. a. Systolic BP and onset to CT time. b. Prior anticoagulant therapy. c. hyperglycemia. 5. Radiological signs of hemorrhage expansion. a. Hematoma shape/volume/location. b. Perihematomal edema. c. Hematocrit levels. d. Spot sign. e. Satellite sign, Island sign, Swirl sign, Blend sign and Black hole sign

#### **NREE-141 Beyond the Blind Spots: A Comprehensive Approach to Reducing Diagnostic Errors in Neuroradiology in the Emergency Room for Enhanced Patient Safety**

Participants

Heber Colares Costa, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

Pedro Castro, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

To exhibit a timely and accurate diagnosis of neurological conditions like stroke, brain tumors, and traumatic brain injury, providing effective treatment. To show misdiagnosis or diagnosis delays due to errors in imaging evaluation that can seriously harm the patient, including permanent neurological deficits or death. To prevent unnecessary interventions or treatments, inhibiting inaccurate interpretation of imaging studies and unnecessary surgeries, medications, or other medicines that can harm the patient physically and financially. To avoid significant medicolegal consequences.

##### **TABLE OF CONTENTS/OUTLINE**

1. Revision of epidemiology, pathology, and demographics of neuroradiologic emergencies. 2. Imaging evaluation of the emergency room's crucial and prevalent neuroradiologic diseases. 3. Potential imaging pitfalls in neuroradiologic emergencies and how to avoid them. 4. Potential causes of imaging medical errors, including night periods, fatigue and exhaustion of radiologists, a large volume of examinations, and short evaluation times. 5. The consequences of errors in neuroradiological imaging evaluation in the emergency room, including delays in stroke recanalization therapy, misdiagnoses of intracranial hemorrhages, dural venous sinus thrombosis, and inadequate treatment for these conditions. 6. Highlights on medicolegal issues and reputational damage for healthcare providers and hospitals. 7. How to ensure that hospitals and healthcare providers can reduce the risk of misdiagnosis, unnecessary interventions, and legal consequences, ultimately leading to better patient outcomes. 8. Take-home messages.

#### **NREE-142 The Uncharted Territory of Neurodegeneration: Keeping Pace with the Latest Advances in Imaging Diagnosis and Novel Therapies for Degenerative Diseases**

Participants

Ana Luiza Basilio Franca, Rio De Janeiro, Brazil (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

Brain neurodegenerative diseases are a group of disorders characterized by progressive damage and loss of neurons in the brain. These diseases include Alzheimer's disease, Parkinson's disease, Huntington's disease, and amyotrophic lateral sclerosis (ALS), among others. Recent advances in imaging diagnosis and novel therapies have shown promising results in improving the diagnosis and treatment of these conditions. The study aims to: To explain the imaging features, genetic cascade, and physiopathology involved in neurodegenerative diseases. To exhibit that advanced imaging techniques have significantly improved the diagnosis of brain neurodegenerative diseases. To explain the imaging approach to the diseases, differential diagnosis, and current therapeutics.

##### **TABLE OF CONTENTS/OUTLINE**

1. Revision of epidemiology, clinical presentation, and etiology of neurodegenerative diseases. 2. Genetical considerations. 3. The role of magnetic resonance imaging (MRI) and functional MRI (fMRI) in identifying structural changes in the brain associated with neurodegeneration. 4. Positron emission tomography (PET) in assessing amyloid plaques and tau protein in the brain, characteristic features of Alzheimer's disease. 5. Novel therapies for neurodegenerative brain diseases, including immunotherapy, gene therapy, stem cell therapy, neuroprotection with drugs, and deep brain stimulation. 6. Differential diagnosis. 7. Take-home messages.

#### **NREE-143 Exploring the Depths of Pediatric Posterior Fossa Tumors: Integrating Molecular Analysis and Magnetic Resonance Imaging for Unprecedented Diagnosis and Prognosis**

Participants

Laura Magalhaes, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

Pedro Castro, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

To illustrate the imaging diversity of these tumors, including a range of histological subtypes, including medulloblastoma, ependymoma, and pilocytic astrocytoma, among others. To demonstrate the importance of pediatric posterior fossa CNS tumors molecular analysis, providing an accurate diagnosis, risk stratification, and personalized treatment. To identify the specific genetic alterations and biomarkers for managing these tumors.

##### **TABLE OF CONTENTS/OUTLINE**

1. Revision of epidemiology, pathology, and pediatric posterior fossa CNS tumor demographics. 2. Imaging features in pediatric posterior fossa CNS tumors, including pilocytic astrocytoma, ependymoma, medulloblastoma, other embryonal tumors, Rosette-forming glioneuronal tumor, diffuse midline gliomas, tectal gliomas including diffuse low-grade MAPK pathway-altered. 3. Most recent updates on pediatric posterior fossa CNS tumors molecular alterations, including WNT, SHH, and non-WNT/non-SHH medulloblastomas, BRAF mutations in pilocytic astrocytoma, EZHIP in group A ependymomas, MAPK pathway-altered in diffuse low-grade tectal gliomas. 4. Imaging strategies to depict the correct diagnosis based on the genetic profile. 5. Flowchart of the changes and last updates based on the neoplastic molecular profile. 6. Take-home messages.

#### **NREE-144 From Conception to Cancer: Exploring the Molecular Signatures of Embryonal Tumors for Precision Medicine**

Participants

Laura Magalhaes, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

Pedro Castro, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Recent advances in molecular biology have led to a better understanding of the types and subtypes of these tumors based on the 2021 World Health Organization of central nervous system tumors. The study aims to: To illustrate that the molecular analysis of Central Nervous System (CNS) embryonal tumors is critical for accurate diagnosis, risk stratification, and targeted therapy. To show that molecular analysis can help identify specific genetic alterations and biomarkers that can provide valuable information for managing these tumors.

#### TABLE OF CONTENTS/OUTLINE

1. Revision of epidemiology, pathology, and demographics of CNS embryonal tumors. 2. Imaging features in CNS embryonal tumors. 3. Most recent updates on CNS embryonal tumors molecular alterations, including WNT-activated medulloblastoma, sonic hedgehog (SHH) activated, and non-WNT/non-SHH medulloblastomas. 4. Recent advances in molecular biology have led to identifying specific genetic alterations and biomarkers in non-medulloblastoma embryonal tumors, including teratoid/rhabdoid tumors (AT/RTs), embryonal tumors with multilayered rosettes (ETMRs), CNS Neuroblastoma, FOXR2-Activated, CNS Tumor with BCOR Internal Tandem Duplication, Cribriform Neuroepithelial Tumor. 5. Specific genetic mutations, amplifications, or deletions associated with tumor progression, recurrence, and response to therapy, including C19MC, DCER1, FOXR2, BCOR-ITD, SMARCB1, SMARCB4, AT/RT (TYR), AT/RT (SHH), AT/RT (MYC). 6. Imaging strategies to depict the correct diagnosis based on the genetic profile. 7. Flowchart of the changes and last updates based on the neoplastic molecular profile. 8. Take-home messages.

#### NREE-145 Neurogenetics and Imaging of Motor Neuron Disease

Participants

Maxwell Wright, BS, Mechanicsburg, PA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1.To discuss the classification and pathogenesis of motor neuron disease (MND). 2.To highlight the neurogenetics, imaging findings, and diagnostic pearls for the specific diagnosis of various upper and lower MNDs.

#### TABLE OF CONTENTS/OUTLINE

We retrospectively reviewed 113 patients from our PACS system with clinical and imaging findings correlating with motor neuron disease (MND). All the patients underwent routine MRIs of the brain and spine. Almost 100% of these patients had CSF examinations, while genetic studies were available in 49% of the patients. All studies were read by two neuroradiologists. Imaging findings were correlated with the clinical examination, CSF, and biochemical results, which were further correlated with the genetic studies when available. For easy understanding, this exhibit is classified under the following categories: 1. Upper MND: Primary lateral sclerosis (PLS), Hereditary Spastic Paraparesis (HSP), Pseudobulbar Palsy 2. Lower MND: a) Chronic onset: Inherited- Spinal Muscular Atrophy (SMA), Progressive Muscular Atrophy (PMA), Distal hereditary motor neuropathy; Acquired- Upper limb dominance (Flail Arm, Hirayama, Segmental MND) Lower limb dominance (PMA, Monomelic Amyotrophy) b) Acute onset: Guillain Barre Syndrome, Polio; and 3. Combination of UMN and LMN: Amyotrophic lateral sclerosis (ALS). Conclusion: 1. Neurogenetics and neuroimaging complement each other in clinching the specific diagnosis of MND. 2. We discuss the neurogenetics, pathogenesis, and imaging appearance of the MND in this exhibit.

#### NREE-146 Imaging Spectrum of Cystic Spinal Lesions

#### TEACHING POINTS

• To illustrate the compartmental spinal anatomy. • To discuss the key imaging findings of cystic spinal lesions and their mimics. • To demonstrate the utility of multimodality imaging in the differential diagnosis of cystic spinal lesions.

#### TABLE OF CONTENTS/OUTLINE

A wide variety of benign and malignant cystic lesions can involve the different compartments of the spine. Although an exact diagnosis may be challenging, different imaging characteristics are used in order to narrow the differential diagnosis and/or establish the exact diagnosis. In addition, spinal cysts can be divided into: intramedullary, intradural extramedullary, or extradural, depending on their location, which is only useful in planning treatment. Magnetic resonance imaging (MRI) is the imaging method of choice to identify and characterize spinal cysts, and ultrasound (US) is often used as the initial imaging modality in pediatric patients. Instead, CT is helpful for evaluating cystic lesions of the vertebral column. In this exhibit, we will review the multimodal imaging features of the most common cystic spinal lesions based on their etiology, including neoplastic, congenital, degenerative, infectious, post-traumatic, and postsurgical disorders. We will also review the main differential diagnoses that should be considered.

#### NREE-147 Pediatric Neurometabolic Diseases: A Pictorial Review of How the Radiologist can Approach Hypomyelinating and Dysmyelinating Disorders

#### TEACHING POINTS

1: Pediatric Neurological metabolic diseases are a group of disorders affecting the brain, mostly related with a specific enzyme deficiency. 2: These disorders traditionally affect the white matter but can also affect the gray matter (both cortex and basal ganglia). 3: Pattern of white matter disease is one of the most helpful clues in the characterizing these conditions on imaging. 4: Pathologically, these disorders can be classified as hypomyelinating (with mild signal changes, with T2 hyperintensity and T1 hypo to isointensity) or other white matter diseases (pronounced T2 hyperintensity and T1 hypointensity) 5: Hypomyelinating disorders can be differentiated based on peripheral neural compromise or not. 5: Other white matter diseases (dysmyelinating) can be characterized based on the pattern of white matter disease (confluent vs multifocal). 6: Confluent white matter disease has an extensive differential, and it is critical to depict where changes are visualized (diffuse, frontal, parieto-occipital, posterior fossa, periventricular or subcortical).

#### TABLE OF CONTENTS/OUTLINE

1: Hypomyelinating disorders (T1 hypointensity and T2 hyperintensity). 1.1: Without typical PNS involvement: Pelizaeus Merzbacher Disease- 1.2: With typical PNS involvement: Cockayne disease 2: Other white matter diseases (mild T1 hypo or isointensity and T2 mild hyperintensity). 2.1: Confluent. 2.1.1: Frontal: Infantile Neuroaxonal Dystrophy. 2.1.2: Parieto-occipital: X-Linked adrenoleukodystrophy. 2.1.3: Posterior Fossa: Leigh syndrome. 2.1.4: Periventricular: Krabbe Disease. 2.1.5: Subcortical: Kearns

Sayre Syndrome. 2.2: Multifocal: Hydroxy glutaric Aciduria.

## **NREE-148 Imaging Approach and Review of Arteriovenous Orbital Fistulae**

### **TEACHING POINTS**

Reinforce the knowledge and correct identification of the vascular structures involved in the orbital-venous arterial fistula. List the imaging findings through contrasted tomography and contrasted MRI, to identify the main aspects to highlight in the diagnosis of orbital arteriovenous fistula. Complications of orbital arteriovenous fistula. Management and prognosis of patients with orbital arteriovenous fistula

### **TABLE OF CONTENTS/OUTLINE**

Definition, Diagnosis and image findings, Clinical findings, Treatment Arteriovenous orbital fistulae is a rare condition that occurs when an abnormal connection forms between an artery and a vein within the orbit; This causes blood to flow directly from the arterial system to the venous system, bypassing the capillary network. As a result, there is a high-pressure gradient in the venous system, leading to congestion and dilation of the veins. Arteriovenous orbital fistulae can be congenital or acquired. The most common cause of acquired arteriovenous orbital fistulae is trauma, such as a blunt or penetrating injury. Symptoms of arteriovenous orbital fistulae include bulging of the eye, proptosis, diplopia), visual disturbance, and in severe cases, loss of vision or even blindness. Diagnosis of arteriovenous orbital fistulae involves a thorough medical history and physical examination, including imaging studies such as ANGIO CT or enhanced MRI. Treatment options depend on the severity of the condition and may include observation, embolization or surgical removal of the abnormal vessels.

## **NREE-149 Intradural Spinal Lesions: A Review of Common and Rare Pathologies**

Participants

Sultan Yahya, MD, Hamilton, ON (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

- Review normal spinal anatomy and compartments- Approach to intradural spinal pathologies, and distinguishing intra and extramedullary pathologies- Review common and rare intra-medullary neoplasms, including ependymomas, subependymomas, astrocytomas, metastasis, hemangioblastomas and spinal involvement in diffuse leptomeningeal glioneuronal tumors. - Discuss medullary neoplastic mimics, including demyelinating/inflammatory abnormalities, infarctions, and arteriovenous malformations. - Review common and rare extramedullary neoplasms including meningiomas, schwannomas, metastasis, angioliopomas, mature cystic teratomas, paragangliomas, dermoids/epidermoid/lipomas and neuroenteric cysts.

### **TABLE OF CONTENTS/OUTLINE**

- Spinal compartmental anatomy- Approach to intradural pathologies- Intramedullary abnormalities: tumors, differentials of medullary signal abnormalities and neoplastic mimics- Extramedullary lesions: common / rare tumoral entities and cystic lesions

## **NREE-15 Cortically-Based Brain Tumors: Who is Who**

Participants

Irene Diaz, MD, Bilbao, Spain (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

Cortically-based brain tumors have some features in common. They usually clinically manifest as epilepsy refractory to anti-epileptic drugs and most frequently affect children and young adults. We can also talk about long-term epilepsy-associated tumors (LEAT), and they are usually low-grade tumors. Radiologically, they may be difficult to differentiate, but there are some imaging diagnostic clues that will help us find the correct diagnosis.

### **TABLE OF CONTENTS/OUTLINE**

An image-based quiz will lead the review of different cases of cortically-based brain tumors, with its differential diagnostic clues at imaging. Most of our patients were young adults and clinically presented with focal epilepsy. We are mainly showing low-grade tumors, such as dysembryoplastic neuroepithelial tumor (DNET), ganglioglioma, pleomorphic xanthoastrocytoma, oligodendroglioma, multinodular and vacuolating neuronal tumor (MVNT) or polymorphous low-grade neuroepithelial tumor of the young (PLNTY).

## **NREE-150 Cerebellar Ataxia: Differential Diagnosis Based on Common Imaging Patterns**

### **TEACHING POINTS**

- Ataxia is a physical finding characterized by impaired coordination of voluntary muscle movement, resulting in disequilibrium, vertigo and gait ataxia. - Ataxia can be caused by either impaired vestibular input to the cerebellum or by cerebellum dysfunction itself. - Brain MRI, the imaging modality of choice, has a key role in differentiating the many causes of ataxia. - Ataxia may present with different cerebellum findings: normal, hypoplastic and atrophic morphology. - Regarding clinical findings, ataxia may be further classified as acute / subacute or chronic; traumatic; autoimmune; paraneoplastic or genetic. - Combining imaging and clinical features, differential diagnosis is made.

### **TABLE OF CONTENTS/OUTLINE**

- Defining ataxia. - Clinical findings that are relevant for the diagnosis based on MRI. - Differentiating normal vs hypoplastic vs atrophic cerebellum.- Further exemplifying findings in atrophic cerebellum that lead towards specific diagnosis (e.g.: superficial siderosis, basal ganglia abnormalities, white matter abnormalities). - Further exemplifying findings in hypoplastic cerebellum that lead towards specific diagnosis (e.g.: unilateral hypoplasia, posterior fossa malformations, hemorrhage). - Flowchart to the approach of cerebellar ataxia.

## **NREE-151 Interstitial Fluidopathy: A Concept for Understanding CNS Diseases with Impaired Interstitial Fluid Dynamics**

Participants

Toshiaki Taoka, MD, PhD, , Japan (*Presenter*) Research Grant, Canon Medical Systems Corporation

## TEACHING POINTS

This educational presentation proposes a new concept called "Central Nervous System (CNS) Interstitial Fluidopathy," which encompasses diseases whose pathologies are associated with abnormal interstitial fluid dynamics. The glymphatic system hypothesis proposes that cerebrospinal fluid and interstitial fluid in the brain constitute a mass transport system, including waste clearance. Impairment of these functions results in protein leakage into the interstitium and impaired efflux of waste products, leading to the accumulation of waste products, tissue dysfunction, and conditions such as neuroinflammation. The term "CNS interstitial fluidopathy" describes diseases or conditions in which abnormalities in interstitial fluid dynamics are one of the significant factors in the pathological process. Various diseases, including Alzheimer's disease, Parkinson's disease, traumatic brain injury, multiple sclerosis, and small vessel diseases, develop due to abnormalities in the interstitial fluid dynamics. By categorizing these diseases as CNS interstitial fluidopathies, we can improve our understanding of their disease mechanisms, develop potential imaging methods, clinical methods, and common treatment methods or drugs. The dynamics of interstitial fluid are critical for understanding CNS diseases or disorders, and the proposed concept may promote advancements in disease treatment or prevention.

## TABLE OF CONTENTS/OUTLINE

1. An overview of the dynamics of cerebrospinal fluid and interstitial fluid in the CNS2. The waste clearance system in the CNS.3. Pathologies associated with abnormal interstitial fluid dynamics.4. A summary of the concept of interstitial fluidopathy.

## NREE-152 A Night in the ER: Diagnostic Errors in Emergency Neuroradiology

Participants

George Vilanilam, MBBS, Little Rock, AR (*Presenter*) Nothing to Disclose

## TEACHING POINTS

Introduction: Diagnostic errors in emergency neuroradiology are a major contributor to unnecessary healthcare costs and have been implicated in preventable deaths in the US. Errors are broadly categorized into perceptive and interpretive errors. The most common erroneous studies are CT head (32%), CT cervical spine (18%), and CTA head and neck (24%). Specific teaching points1) Defining and understanding common sources of diagnostic errors in emergency neuroradiology.2) Providing examples of common cognitive biases and perceptual errors.3) Discussing methods to mitigate diagnostic errors in emergency neuroradiology.

## TABLE OF CONTENTS/OUTLINE

Common cognitive biases/interpretive errors1) Truncation of the search and analytical thought processes (premature closure, satisfaction of search, and satisfaction of report).2) Affirming initial diagnosis (anchoring bias and attribution bias).3) Recency (availability and non-availability bias).4) Outcome-related bias (regret bias/defensive reporting, outcome bias).5) Biases stemming from clinical parameters (framing bias, attribution bias).6) Retrospective biases (hindsight bias, self-serving bias). Perceptual errors1) Related to viewing technique (inappropriate windowing and fogging phenomenon). 2) Related to the finding itself (edge of film, first or last slice, bilateral or diffuse findings, subtle or poorly conspicuous). Recommendations to reduce diagnostic and reporting errors

## NREE-16 Nervous System MR Elastography: Current Update

Participants

Safa Hoodeshenas, MD, Rochester, MN (*Presenter*) Nothing to Disclose

## TEACHING POINTS

1) How MR elastography of the nervous system is performed; From the generation of the shear waves to obtain qualitative and quantitative parameters2) What MRE can tell us about neural tissue biomechanical properties in physiologic and pathologic conditions

## TABLE OF CONTENTS/OUTLINE

1) Principles of MR elastography technique in the nervous system2) Qualitative and quantitative obtained parameters 3) Role of artificial intelligence in MRE4) Slip interface imaging5) MRE in neurodegenerative disease (Alzheimer's disease, Frontotemporal dementia, Lewy body dementia, Normal pressure hydrocephalus)6) MRE in characterizing and treatment planning of intracranial tumors (tumor subtype and grade, consistency, adhesion to surrounding tissue)7) MRE in traumatic brain injury8) MRE in neuroinflammatory disorders9) Functional MRE10) Pediatric nervous system MRE

## NREE-17 I Only See White Spots: Understanding the Clinical and Radiological Features of CNS Demyelination

Participants

Miguel Barrio Piqueras I, MD, Pamplona, Spain (*Presenter*) Nothing to Disclose

## TEACHING POINTS

To describe the most typical imaging characteristics of secondary demyelinating processes. To know the basic notions in relation with epidemiology, clinical presentation, pathology, possibility of spinal cord involvement and differential diagnosis. To be able to assist the diagnosis of each etiological group in order to provide better and faster management, taking into account the severity of the findings and prediction of outcome.

## TABLE OF CONTENTS/OUTLINE

1. Autoimmune a. Multiple sclerosisb. Baló (example of tumefactive autoimmune lesions)c. Devic (optic neuromyelitis)2. Infectiousa. HIV encephalopathyb. PML (progressive multifocal leukoencephalopathy)c. Subacute sclerosing encephalomyelitis3. Vasculara. Binswanger (subcortical arteriolesclerotic encephalopathy)b. CADASIL (Cerebral autosomal dominant arteriopathy with subcortical infarcts and leukoencephalopathy)c. Post-anoxicd. PRES (posterior reversible encephalopathy)4. Toxic-metabolica. Osmotic demyelinationb. Toxic leukoencephalopathyc. CLOCC (cytotoxic lesions of the corpus callosum)5. Traumatica. Diffuse axonal injury

## NREE-18 Facets of a "Heavy Brain": Exploring Patterns of Iron Metabolism Disturbances

## TEACHING POINTS

Iron accumulation in the brain is common in several neurodegenerative disorders and normal aging. It likely contributes to the

pathophysiology of neurodegenerative changes in these conditions by inducing oxidative stress, inflammation, and cell death. The patterns of iron deposits in the central nervous system vary between different conditions, both at the macroscopic and microscopic level. The role of iron in the pathogenesis and response to iron chelation therapy varies between individual disorders.

#### **TABLE OF CONTENTS/OUTLINE**

This review summarizes the whole brain, cellular, and subcellular patterns of iron accumulation in neurodegenerative diseases of genetic and sporadic origin, and also other associations as neuroinfections. We also provide an update on mechanisms, biomarkers, and effects of brain iron accumulation in these disorders, focusing on recent publications. This pictorial review will also show how we can systematize the role of iron in brain and provide a practical guide to identify the main pathologies.

#### **NREE-19 Don't Take the Long Way: A Diagnostic Shortcut to Longitudinally Extensive Myelopathies**

Participants

Nicole Lambrakos, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

1. Outline and describe the types of myelopathies (mechanical and non-mechanical). 2. Explain the pathology and imaging findings of myelopathies. 3. Build a decision making diagnostic flowchart, pointing out the imaging characteristics of myelopathies.

#### **TABLE OF CONTENTS/OUTLINE**

1. Brief review of spinal cord anatomy, tracts and function. 2. Definition of myelopathy and longitudinally extensive spinal cord lesions and their subtypes (mechanical and non-mechanical). 3. Pathology of spondylotic myelopathy. 4. Clinical and imaging findings. 6. Most specific imaging findings. 5. Decision making diagnostic flowchart of myelopathies based on their imaging characteristics.

#### **NREE-2 Variants and Anomalies of Extracranial Cerebral Arteries and Considerations for Neuroendovascular Procedures**

#### **TEACHING POINTS**

- To describe the embryology of the aortic arch in order to explain the origin of its anatomical variants and anomalies. - To review the variants and anomalies of extracranial cerebral arteries giving examples from cases from our institution. - To revise some of the pathology associated with extracranial vascular variants and anomalies and the implications for endovascular procedures.

#### **TABLE OF CONTENTS/OUTLINE**

1. Introduction. 2. Embryology. 3. Aortic arch 3.1. Variants 3.1.1. Bovine arch 3.1.2. Elongation and tortuosity 3.2. Anomalies 3.2.1. Right-sided aortic arch 3.2.2. Right aberrant subclavian artery and bicarotid trunk 3.2.3. Double aortic arch 4. Cervical Internal carotid artery 4.1. Variants 4.1.1. Elongation and tortuosity 4.2. Anomalies 4.2.1. Internal carotid artery agenesis 4.2.2. Main branches anomalous origins 5. Cervical vertebral artery 5.1. Variants 5.2. Anomalies 5.2.1. Anomalous origin of the vertebral artery

#### **NREE-20 Beyond the Basic: Advanced MRI Techniques in Neuroimaging**

Participants

Marina Da Cruz, Fernandopolis, Brazil (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Advanced magnetic resonance imaging (MRI) techniques allow expanding the range of diagnostic tools with the potential to assess functional parameters in neuroimaging, complementary to traditional sequences, that can and should be used by radiologists to aid in the differential diagnosis. The purposes of this submission are: - To review advanced MRI techniques in neuroimaging, such as spectroscopy, perfusion weighted imaging, tractography, nigrosome and neuromelanine evaluation and vessel wall study; - To expose the main indications of each method; - To discuss possible imaging features in some groups of pathologies;

#### **TABLE OF CONTENTS/OUTLINE**

1. Review technique and indications of spectroscopy; 2. Technique and indications of perfusion weighted imaging; 3. Discuss technique, indications and basic interpretation of tractography; 4. Assessment of nigrosome and neuromelanine; 5. Discuss technique, indications and basic interpretation of vessel wall study;

#### **NREE-21 Progressive Multifocal Leukoencephalopathy (PML): A Thorough Overview from Traditional to Contemporary Findings, Including Inflammatory Subtype, IRIS, Drug-associated, and Asymptomatic Cases**

#### **TEACHING POINTS**

1: Discuss PML imaging findings from classical observations to the latest insights. Explain the progression of lesions, taking into account the pathological findings. 2: Contrast-enhanced PML lesions are extremely important in clinical management, and discussing their significance in imaging findings is essential. 3: Address the key points of imaging findings for recently discussed drug-related PML and asymptomatic PML.

#### **TABLE OF CONTENTS/OUTLINE**

1: About progressive multifocal leukoencephalopathy (PML) 1-1: Classification of JCV diseases of the Brain 2: PML progresses through the following 3 steps, reflecting pathological findings 2-1: First step: "Initiation" as a small demyelinating lesion 2-2: Second step: "Expansion" and "Extension" of demyelinating lesions 2-3: Third step: "Fusion" of demyelinating lesions, resulting in axonal destruction! 3: Interpretation of contrast enhancement in PML lesions! 4: New MRI findings related to PML 4-1: low signal intensity on T2\*WI and SWI in U-fibers and deep gray matter adjacent to the lesions 4-2: hyperintense cortical sign (HCS) on T1WI 5: Drug-associated PML 5-1: natalizumab-associated PML 5-2: punctate lesions

## **NREE-22    Neurological Emergencies in Oncologic Patients: Understanding the Importance of Early Imaging Evaluation**

Participants

THARYN Goncalves FRANCO DE GODOY, Sao PAULO, Brazil (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

Neurological emergencies are common and life-threatening conditions, particularly in oncologic patients who are at higher risk due to factors, including immunosuppression, coagulopathy, and treatments such as chemotherapy and radiation therapy. Due to their compromised status, early diagnosis can be challenging, and imaging exams are often required for proper evaluation. Radiologists, especially those working in cancer centers, must be familiar with these emergencies to ensure prompt treatment and reduce morbidity and mortality. Our aim is to review the neurologic emergencies to oncologic patients dividing them into pre and post-treatment, including early and late complications. To increment the discussion, risk factors, clinical presentation, imaging findings and treatment will be in illustrative cases.

### **TABLE OF CONTENTS/OUTLINE**

Introduction: review neurologic emergencies to oncologic patients. To divide the emergencies in two groups: related to cancer itself or its treatment (early and late complications), through a visual flowchart. To discuss, for each condition risk factors, clinical presentation, imaging findings and treatment. Following conditions: Pre-treatment: intracranial hypertension, vasogenic edema, herniations, spinal cord compression, paraneoplastic syndromes, ischemic and hemorrhagic stroke, venous sinus thrombosis. Post-treatment: radiation-induced vasogenic edema and leukoencephalopathy, infections, hemorrhages, radiation necrosis, SMART syndrome, radiation vasculopathy, encephalopathy, PRES, opportunistic infections. To highlight the particular aspects to oncologic patients, discussing the clinical and imaging for early diagnosis and treatment.

## **NREE-23    Beyond the Lumen: Unraveling the Vessel Wall Technique**

Participants

Maria Laura Piassa, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

- A method that is here to stay, the vessel wall study, aims to evaluate the vascular wall and characterize the pathologies that compromise it, whether inflammatory, dissection, or atheromatous plaques.- It is a study that requires a high spatial resolution, with homogeneous signal suppression of the intravascular lumen, 2D or 3D multiplanar acquisitions, allowing several acquisitions.- In the evaluation of atherosclerotic diseases, VW-MRI demonstrates parietal thickening that eccentrically involves the circumference of the arterial wall, showing different characteristics on T1 and T2 sequences, depending on its internal content. Active/unstable plaques present a thin fibrous cap, large lipid core, presence of hemorrhage, contrast uptake and vascular remodeling.- Other differential diagnoses of intracranial luminal stenosis would be dissection, vasculitis (primary or secondary), reversible vasoconstriction and Moya-moya. VW-MRI is also used in the evaluation of aneurysms.- Pitfalls are points that deserve full attention, highlighting low flow, in which incomplete suppression can mimic wall thickening and vasa vasorum, mimicking vasculitis.

### **TABLE OF CONTENTS/OUTLINE**

- Raise the importance of the VW-RM, including its techniques and applications.- Assess atherosclerotic disease and its differential diagnoses more precisely, stratifying individual risks, with potential influence on treatment decisions.

## **NREE-24    Help When You're Feeling Low: Intracranial Hypotension and Algorithms for Diagnosis**

Participants

Rahim Ismail, MD, Rochester, NY (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

1. Familiarize radiologists with the pathology and pathophysiology of spinal CSF leaks resulting in spontaneous intracranial hypotension (SIH).
2. Localization of the culprit spinal CSF leak in SIH patients can be difficult. At our institution we use a combination of brain and spinal MRI to guide the type of myelographic imaging and patient positioning for the myelogram to help localize the CSF leak.
3. Role of dynamic CT myelogram (DCM) and digital subtraction myelogram (DSM) in patients demonstrating a spinal longitudinally extensive collection (SLEC) on spinal MRI.
4. Role of lateral decubitus DSM in patients with SLEC negative MRI in evaluating for a CSF venous fistula (CVF) or distal tears of the nerve root sleeve.
5. Role of DSM for precise localization in patients with suspected fast flow CSF leaks, such as dural tears from sharp osteophytes.
6. Role of DCM in patients with suspected CSF leaks from proximal nerve root sleeve tears/perineural cysts.
7. Describe our institutional protocols for performing DCM and DSM including tips for optimizing timing and provocative assessments.

### **TABLE OF CONTENTS/OUTLINE**

The following illustrative examples will be shown: 1. Pathology: Different etiologies of spinal CSF leaks will be shown including: a. Microspurs b. perineural cysts c. CSF venous fistula (CVF) d. distal dural tears. 2. We will describe our institutional algorithm for the work up of these complex subsets of patients.

## **NREE-25    Connecting the Dots: A Step-by-Step Guide of Brain Myelination**

Participants

Afonso Santos, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

The purposes of this exhibit are: To review the normal appearance of myelination on imaging studies To define a step-by-step analysis algorithm to facilitate the assessment of myelination To display a compendium of cases involving myelination disorders

### **TABLE OF CONTENTS/OUTLINE**

Myelin is a vital component of the nervous system, serving as an insulator for neurons and found in both the central and peripheral nervous systems. It not only insulates but also speeds up action potentials by 10-100 times that of an unmyelinated axon. Moreover, it regulates ion composition and fluid volume around the axon, which is crucial for maintaining its health and integrity. MRI

is the best noninvasive way to assess myelin and myelination in the pediatric brain. Mature myelin usually appears hyperintense to the gray matter cortex on T1 and hypointense to the gray matter cortex on T2. The process of myelination starts during fetal development with the cranial nerves, which are essential for our survival, and continues throughout life. As myelination progresses, it generally follows a pattern of development from bottom to top (caudocranial), back to front (posterior to anterior), and central to peripheral (deep to superficial). In conclusion, myelin is a vital component of the nervous system and plays a critical role in proper functioning. Understanding the process of myelination and the appearance of mature myelin on imaging is essential for the evaluation of many neurological conditions.

## **NREE-26 Nigrosome 1: Anatomy, Variants and Pathologies**

Participants

Danielly Santos SR, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

The purpose of this exhibit is to help the readers to determine the presence or absence of an abnormality in the N1 and establish diagnostic reasoning in cases of parkinsonism. The objectives of this electronic exhibit are:- to revisit the anatomical definition of the N1 region using schematic illustrations and imaging MRI;- to illustrate the anatomical variants of the N1;- to exhibit parkinsonism diagnostic algorithm;- provide imaging findings of various patients who presented with parkinsonism.

### **TABLE OF CONTENTS/OUTLINE**

Parkinson's disease is a clinically heterogeneous chronic progressive neurodegenerative disease with loss of dopaminergic neurons in Nigrosome 1 (N1). Nigrosomes are small clusters of dopaminergic cells within the substantia nigra. Five nigrosomes have been described with the largest labeled as N1, located in the posterior third of the substantia nigra. The N1 is the key structure in the midbrain that is very important in movement disorders, particularly those associated with parkinsonism. Interpreting the N1 sign can be difficult because it can take many forms but the high-resolution data and clear characterization of the N1 appearance help to make that decision easier.

## **NREE-27 Stroke of Luck: Imaging of Hyperacute Stroke and Selecting Patients Effectively**

### **TEACHING POINTS**

? Stroke management was revolutionized recently by the proven benefit of intervention with a larger time window on selected patients ? Time is brain: CT perfusion helps identifying salvageable brain tissue ? Radiologists play a crucial role on helping the multidisciplinary team select patients who will benefit from intervention based on imaging criteria ? Perfusion studies should be routinely assessed to avoid misinterpretation and excluding patients from therapy

### **TABLE OF CONTENTS/OUTLINE**

Introduction Over the past few years, after publication of the results of the DEFUSE 3, EXTEND and DAWN trials, stroke management has been revolutionized. These studies proved the benefit from intervention with a larger time window based on certain perfusion imaging criteria. This educational exhibit's goal is to review the role of conventional and advanced imaging on hyperacute stroke, ending with a proposed interpretation algorithm for selecting patients effectively. Current treatment options and inclusion criteria Imaging of hyperacute stroke ? Acquisition protocols ? CT ? MR ? Perfusion CT/MR ? ASPECTS ? AI (Rapid, Brainomix) ? Assessing study's quality ? Pitfalls ? Proposed interpretation algorithm

## **NREE-28 Headache, Dizziness, and Leaks. May the Balance be with You. A Pictorial Review of Intracranial Hypo and Hypertension**

Participants

Fernanda Avalos, MD, Quito, Ecuador (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

Cerebrospinal fluid (CSF) homeostasis is essential to maintain normal intracranial pressure. Even a small imbalance in CSF production, absorption, or flow can lead to altered intracranial pressure. Imaging in increased intracranial pressure (ICP): Although there are no specific imaging findings of idiopathic intracranial hypertension, enlarged arachnoid outpouchings such as an empty sella, enlarged Meckel's cave, or signs in the optic nerve such as vertical tortuosity or flattening of the posterior sclera should raise suspicion, as these signs have been identified in 23-80% of patients. ICP may be due to secondary causes such as disturbances in CSF production and absorption or obstructive hydrocephalus that can result from lesions such as intracranial masses. Imaging in intracranial hypotension: the major radiological features can be summarized with the acronym SPACE (Sagging of the brain, Pituitary enlargement, Angles, Collections, and Enhancement of the pachymeninges). Dural membrane leaks contribute to the majority of causes of intracranial hypotension. Therefore, understanding the imaging methods and findings can guide definitive treatment and improve patient outcomes.

### **TABLE OF CONTENTS/OUTLINE**

1. Understand the physiological mechanism of CSF in the central nervous system. 2. Describe the common symptoms of intracranial hypo- and hypertension, and recall clinical findings during neurological examination. 3. Radiological findings of intracranial hypertension with differential diagnosis. 4. Radiological and clinical evolution of a patient with intracranial hypotension, from the first study with unspecified headache, through spinal leak diagnosis, to control after treatment

## **NREE-29 Meningiomas - Do You Know Their Presentations: Brief Pictorial Review of Intracranial Meningiomas Presentations and Their Radiological Findings. Our Image Experience**

### **TEACHING POINTS**

Remember the definition of meningiomas and its most relevant epidemiological data. Review the current classification of intracranial meningiomas according to the World Health Organization (WHO) and their different imaging characteristics. Overhaul a brief pictorial review with exemplified cases of typical and atypical meningiomas from our institute.

### **TABLE OF CONTENTS/OUTLINE**

Meningiomas are the most common nonglial primary tumors of the Central Nervous System and the most common extraaxial

neoplasms. They may originate in unexpected locations such as the orbit, paranasal sinus, or ventricles or be entirely intraosseous (within the calvaria). The radiologist must be aware of their less frequent and uncharacteristic the imaging features in order to suggest the right diagnoses in cases that are atypical. The present educational exhibit intends to make a brief pictorial review of the main presentations of intracranial meningiomas, their current classification and imaging characteristics, and exemplify them with cases of patients from our institute.

### **NREE-3 Don't be Afraid of Neuroimaging Epilepsy: A Case-based Review of a Myriad of Etiologies and Findings**

#### **TEACHING POINTS**

Epilepsy is seen as a clinical manifestation due to excessive or synchronous abnormal neuronal activity in the brain, defined as recurrent, unprovoked seizures. The prevalence is high, and patients have an increased risk of premature death, injuries, psychosocial dysfunction, and reduced quality of life. The etiologies encompass multiple causes. Neuroimaging studies (particularly magnetic resonance imaging) are essential in evaluating epilepsy, mainly in cases refractory to pharmacotherapy, once the location of the epileptogenic focus is a turning point in a successful neurosurgery approach. The purpose of this exhibit is to present, through illustrative cases, a practical approach to imaging findings within multiple epilepsy etiologies.

#### **TABLE OF CONTENTS/OUTLINE**

Education Exhibit Presentation ? Introduction. ? Clinical and epidemiological aspects. ? A case-based review of original cases from the neuroradiology department of a tertiary hospital showing imaging features of a range of etiological substrates of epilepsy (from the common ones to the rarest), always through the perspective and purpose of a practical approach. Key and ancillary imaging features will be highlighted in each case. ? Take-home messages ? References.

### **NREE-30 Maxillo-mandibular Lesions: Gnawing Through the Differentials**

Participants  
Gilleen Cortes, DO, Orange, CA (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

1. To provide an overview and differential diagnosis for maxillo-mandibular lesions encountered during imaging of the head and neck.
2. To present the multimodal radiologic features with case-based review of maxillo-mandibular lesions.
3. To highlight the approach of maxillo-mandibular lesions including diagnosis and management.

#### **TABLE OF CONTENTS/OUTLINE**

Maxillo-mandibular lesions are commonly encountered and usually incidental during head and neck imaging. There is a broad spectrum of lesions, which may be of odontogenic and non-odontogenic origin and can be further classified by cystic, solid, infectious/inflammatory, benign, and malignant processes. Patient characteristics and location of the lesion may be helpful; however, without pathognomonic imaging features, tissue sampling is frequently required. Several key cases presented at our institution will be reviewed such as: periapical cyst, dentigerous cyst, odontogenic keratocyst, non-odontogenic developmental cystic lesions, aneurysmal bone cyst, ameloblastoma, fibrous dysplasia, osteosclerosis, condensing osteitis, cementoblastoma, ossifying fibroma, osteomyelitis, odontogenic carcinoma, invasive squamous cell carcinoma, and osteoradionecrosis. Accurate diagnosis is essential to prevent further complications, as otherwise treatable lesions with destructive potential may be missed.

### **NREE-31 Looking Back: Everything You Need to Know on Infratentorial Malformations**

Participants  
Taisa Guarilha, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

The purpose of this exhibit is:- To review normal anatomy of the posterior fossa- To explain in a simplified way normal embryology and the modifications that result in these malformations- To demonstrate how infratentorial malformations can present themselves- Exemplify with cases- Present a flow chart

#### **TABLE OF CONTENTS/OUTLINE**

1. Normal anatomy
2. Embryology: - Normal- Malformations
3. Cases:
  - 3.a. Cystic malformations: Dandy-Walker continuum, Blake Pouch, Cyst, Mega Cisterna Magna, Arachnoid cyst
  - 3.b. Non-cystic malformations:
    - Predominant cerebellar involvement: Rhombencephalosynapsis- Macrocerbellum- Microcerbellum- Cerebellar Hypoplasia - bilateral, unilateral - Cortical cerebellar malformation- Cobblestone-- Predominant brainstem involvement:- Pontine tegmental cap dysplasia- Horizontal gaze palsy with progressive scoliosis- Möbius Syndrome-- Predominant cerebellar and brainstem involvement:- Molar tooth malformations - including Joubert Syndrome- Pontocerebellar hypoplasia- Walker-Walburg- Lhermitte-Duclos syndrome - Craniocervical junction: Chiari spectrum
    - 3.c. Others- Masiner-Santino Syndrome- Quadrigeminal cistern lipoma
4. Flowchart
5. Take home messages

### **NREE-32 No More Conflict: Imaging of Neurovascular Compression Syndromes, Related Anatomy and Surgical Approach**

#### **TEACHING POINTS**

Neurovascular compression (or conflict) is one of the causes that must be considered in patients presenting with cranial nerve related symptoms. MR imaging is key to rule out differential diagnosis. Knowing the involved anatomy is fundamental to identify possible sites of compression. Communication with the surgeon plays a major role and the reports must include necessary information to surgical planning.

#### **TABLE OF CONTENTS/OUTLINE**

Neurovascular conflict syndromes (NVCS) consist of symptoms related to compression of the V, VII, VIII or XII cranial nerves by vascular structures, usually at the transition zone near the nerve root entry zone. When indicated microsurgical decompression can be done. Trigeminal Nerve NVCS of the V CN usually presents as trigeminal neuralgia and is caused by compression at its REZ of the level of the pons by an elongated superior cerebellar or anterior inferior cerebellar arteries. Facial and Vestibulocochlear Nerves Facial hemispasm (VII CN) / vertigo and tinnitus (VIII CN) may come from compression at the inferior pons level by the AICA.

Glossopharyngeal Nerve IX CN compression at its REZ on the upper medulla by the PICA may cause glossopharyngeal neuralgia.

### **NREE-33 Emergency Neuroradiology Misses: Case Examples and Lessons Learned**

#### **TEACHING POINTS**

Diagnostic errors are the 3rd leading cause of death in the United States. In diagnostic radiology, the rate of errors increases significantly in the emergency setting, this is particularly critical in neuroradiology, where misinterpretation or misidentification may significantly delay treatment and adversely impact patient outcome. In this educational exhibit, readers will be able to: Recognize the two types of thought processing in human decision making, Recognize common diagnostic errors and underlying cognitive biases in image interpretation, See examples of real life missed/misinterpreted cases in emergency neuroradiology and Understand different approaches to reduce diagnostic errors.

#### **TABLE OF CONTENTS/OUTLINE**

1. Background of diagnostic errors in radiology (statistics and common misses in emergency neuroradiology). 2. Type 1 and Type 2 Processing in Clinical Decision Making (heuristic vs analytical approaches). 3. Different Types of Errors During Image Interpretation (cognitive/interpretive biases, perceptual errors). 4. Sample cases to illustrate different types of misses in emergency neuroradiology (perceptual errors - blind spot; cognitive error/lack of knowledge; perceptive error - satisfaction of search; inadequate history). 5. How do we reduce diagnostic errors (strategies from the literature and our institution will be provided such as non-random peer review, double reading, interdisciplinary rounds and tumor boards, reducing interruptions, computer-aided decision making support system)

### **NREE-34 Infarcts, Malformations, and Tumors.. Oh My! A Review of Vascular Pathology In and Around the Spinal Cord**

#### **TEACHING POINTS**

1. To review spinal vascular anatomy with original diagrams. 2. To review International Society for the Study of Vascular Anomalies (ISSVA) and other classification systems. 3. To discuss the clinical presentation and etiologies. 4. To demonstrate common imaging findings.

#### **TABLE OF CONTENTS/OUTLINE**

1. Introduction 2. Infarcts 3. Malformations 4. Tumors 5. Conclusion

### **NREE-35 Teratomas of the Brain, Head and Neck, and Spine: Imaging Appearances**

#### **TEACHING POINTS**

- Illustrate the different imaging appearances of teratomas in the brain, head and neck, and spine.
- Discuss their locations and associated complications.
- Understand the usefulness of CT and MRI in the diagnosis and characterization of teratomas.

#### **TABLE OF CONTENTS/OUTLINE**

Intracranial and spine teratomas, as well as those in the head and neck, are rare tumors that originate from all three embryonic germ layers (ectoderm, mesoderm, endoderm). They can be classified depending on their differentiation as mature, immature, and teratoma with malignant transformation. Clinical manifestations vary according to location and size. Intracranial teratomas are usually located in the midline, generally in the pineal and suprasellar regions, and represent more than two-thirds of brain tumors diagnosed before birth. In the spine, teratomas can occur at any level and compartment (extradural, intradural, or intramedullary). Characteristically, all show distinct components with fat, calcification, and soft-tissue attenuation on CT. Predominantly cystic teratomas also occur. MRI offers better characterization of these tumors and detection of their complications. In this exhibit, we will discuss typical and unusual appearances of teratomas on CT and MRI approaching them by location: • Intracranial: congenital, midline, and off-midline location • Head and Neck • Spine: intramedullary, intradural extramedullary, and extradural/sacroccygeal

### **NREE-36 Radiographic Findings in Hypoxic-Ischemic Brain Injury and the Role of Imaging in Brain Death Determination**

Participants

Min Tae Kim, MD, BSC, Torrance, CA (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

The purpose of this exhibit is to 1. Discuss patterns of hypoxic-ischemic brain injury in pediatric and adult patients 2. Review the utility of imaging in prognostication 3. Review brain death determination using clinical criteria and imaging support 4. Present select cases from our institution

#### **TABLE OF CONTENTS/OUTLINE**

1. Introduction 2. Patterns of hypoxic-ischemic brain injury in neonates- Normal MRI appearance of the neonatal brain- Patterns of mild, moderate, and severe injury 3. Patterns of hypoxic-ischemic brain injury in infants, young children, and adults- Commonly involved regions of the brain - cortex, deep gray matter, perirolandic cortex, watershed distribution, white matter, cerebellum- Review of radiographic findings on CT- Review of radiographic findings on MR 4. How imaging can assist in determining prognosis 5. Radiographic imaging in the brain death examination- CT angiography- Digital subtraction angiography (DSA) - gold standard- Nuclear medicine 6. Select cases from our institution

### **NREE-37 Don't Get Trapped: Diagnostic Errors in Emergency Neuroradiology**

Participants

Julia Brunelli, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Diagnostic errors in neuroradiology in the emergency department can have serious consequences for patients. The prevalence of errors in diagnostic radiology is around 3-5%. Factors such as less time to prepare the report and discuss the case with peers, the patient's clinical condition evolving rapidly, and dependence on the radiological report to take immediate actions according to the

imaging findings can all contribute to errors. In this educational presentation, we will review a series of cases to address a series of etiologies that are present in a neurological emergency room and provide tips to improve accuracy and patient outcomes.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction• Overview of diagnostic errors• Renfrew Classification (revised by Kim and Mansfield in 2014)2. Case based review• Etiologies that are present in the emergency• Learning with the case: tips about that etiology3. Do it yourself• Cases as a diagnostic challenge for the audience

#### NREE-38 A to Z of Motor Neuron Diseases

Participants

Amit Desai, MD, Jacksonville, FL (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Review neuroanatomy of the motor system2. Discuss common upper and lower motor neuron diseases3. Provide a multi-disciplinary and radiologic pattern based approach to diagnosis of motor neuron diseases

#### TABLE OF CONTENTS/OUTLINE

1. Introduction2. Neuroanatomy Review3. Classification of Upper and Lower Motor Neuron Diseases. Imaging features, pathophysiology, genetics, clinical symptoms, and management will be reviewed.A. Upper Motor Neuron Involvement Only: i. Primary Lateral Sclerosisii. Hereditary Spastic Paraplegiaiii. Spinal AVM/AVFiv. Radiation MyelitisB. Lower Motor Neuron Involvement Only: i. Progressive Muscular Atrophyii. Flail Arm/Leg Syndromeiii. Post-Polio Syndromeiv. AIDPv. CIDPvi. Motor Neuron Lymphoproliferative DisordersC. Upper and Lower Motor Neuron Involvement: i. Amyotrophic Lateral Sclerosis (ALS)ii. ALS Plus Syndrome, Progressive Bulbar Atrophyiii. Bulbar-onset ALSD. Diseases affecting the Muscle/Neuromuscular Junction: i. Myasthenia Gravisii. Lambert Eatoniii. Inclusion Body Myositis4. Simplified Diagnostic Approach Based Upon Clinical Symptomatology and Radiologic Imaging Pattern5. Conclusion

#### NREE-39 Novel WHO Intra-axial Tumoral Entities: Beyond Gliomas

Participants

Sultan Yahya, MD, Hamilton, ON (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Review the evolution of CNS tumor classification- Concepts in the WHO 2021 classification of tumors - What's new?- Pertinent Radiomics and Molecular Classification of tumors- Recognize imaging features of relatively Novel CNS tumoral entities- Diffuse Pediatric high grade glioma- High Grade astrocytoma with piloid features (HGAP)- Astroblastoma- Multinodular and Vacuolating neuronal tumor (MVNT)- Multiloculated and Vacuolating Posterior Fossa lesions of Unknown Significance (MV-PLUS)- Diffuse Leptomeningeal Glioneuronal Tumor (DLMGT) - Calcifying Pseudoneoplasm of the Neuroaxis (CAPNON)- Polymorphous Low Grade Neuroepithelial tumor of the Young (PLNTY).

#### TABLE OF CONTENTS/OUTLINE

Review of CNS tumor classification and Novel concepts in the WHO 2021 classificationCased- based review of new CNS tumoral entities: - Diffuse Pediatric high grade glioma- High Grade astrocytoma with piloid features (HGAP)- Astroblastoma- Multinodular and Vacuolating neuronal tumor (MVNT)- Multiloculated and Vacuolating Posterior Fossa lesions of Unknown Significance (MV-PLUS)- Diffuse Leptomeningeal Glioneuronal Tumor (DLMGT) - Calcifying Pseudoneoplasm of the Neuroaxis (CAPNON)- Polymorphous Low Grade Neuroepithelial tumor of the Young (PLNTY).

#### NREE-4 Radiological Approach to Toxic-metabolic Encephalopathies

Participants

Valeria Andrea G. Schonstedt, MD, Santiago, Chile (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To propose a systematic radiologic approach in the evaluation of toxic-metabolic diseases.

#### TABLE OF CONTENTS/OUTLINE

1) When to suspect toxic-metabolic disease in a patient with acute encephalopathy 2) Important differential diagnosis that should be ruled out 3) To establish a topographic approach to suggest an etiologic diagnosis 4) To be aware of rare asymmetric presentations

#### NREE-40 Radiopharmaceutical Therapy for Fibromyalgia: A Promising Treatment Option

Participants

Sriram Paravastu, BA, Lee's Summit, MO (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Despite the availability of several pharmacological and non-pharmacological therapies, the management of fibromyalgia remains challenging.2. Preliminary studies have shown promising results in PET imaging of fibromyalgia.3. Radiopharmaceutical therapy involves the administration of radiopharmaceutical agents that selectively accumulate in specific tissues or organs and may be the next step in treatment of fibromyalgia.

#### TABLE OF CONTENTS/OUTLINE

1. Current challenges in the management of fibromyalgia2. Radiopharmaceutical therapy for fibromyalgiaa. Current radiotracers under investigation3. Preliminary studies on molecular imaging of for fibromyalgiaa. Radiolabeled Substance-P monoclonal antibodyb. Radiolabeled small molecules4. Future directions and challengesa. Theranostics in fibromyalgia and other chronic pain syndromesb. Establishment of objective clinical markers of fibromyalgia

#### NREE-41 Neurovascular Devices and Related Complications: A Case-based Approach

Participants

Victor De Carvalho, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The purpose of this exhibit is to: 1. Showcase the mainly used neurovascular devices, highlighting the preferred imaging modalities and what to avoid in the postoperative evaluation of each device. 2. Review the most relevant complications assessed by imaging related to each neurovascular device : what to look for?

#### TABLE OF CONTENTS/OUTLINE

- Introduction with a brief and illustrative review of the main neurovascular devices used in clinical practice and the modalities of choice for assessment of each device.
- Provide a guide on what to look for when assessing neurovascular devices with the most commonly associated complications.
- Provide didactic cases to illustrate the most important complications related to each neurovascular device and consolidate the acquired knowledge.
- Conclusions.
- Bibliographical references.

#### **NREE-42 Impact of Deep Learning-Based Reconstruction on Neuro MR Imaging: Image Noise Reduction and Super Spatial Resolution**

Participants

Hiroyuki Uetani, Kumamoto, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To understand the principle of deep learning-based reconstruction (DLR) for reducing image noise and enhancing spatial resolution of neuro MRI. 2. To illustrate the applications of DLR with/without compressed sensing (CS) and parallel imaging and super spatial resolution-DLR (SR-DLR) for neuro MRI, and discuss the strengths of this techniques. 3. To discuss the pitfalls and limitations of DLR with/without CS and parallel imaging and SR-DLR techniques.

#### TABLE OF CONTENTS/OUTLINE

Introduction: 1) What is DLR with/without CS and parallel imaging, and SR-DLR techniques? 2) The advantages and disadvantages of DLR with/without CS and parallel imaging, and SR-DLR techniques. Clinical application of DLR with/without CS and parallel imaging and SR-DLR in neuro MR imaging: 1) DLR: High signal-to-noise ratio (SNR) images without long acquisition times A) High-resolution 3D T2 weighted imaging (HR-3D T2WI) B) MR angiography 1) Combination of DLR and CS/parallel imaging: High SNR images in a short acquisition time without sacrificing spatial resolution A) 2D-T2WI on the sellar region or spine B) MR angiography C) High-resolution 3D-T2WI 2) SR-DLR: High SNR images with super spatial resolution without long acquisition times A) 2D-T2WI on the hippocampus B) MR angiography C) Double inversion recovery (DIR) imaging D) Contrast-enhanced 3D T1WI E) Bone imaging Pitfalls and limitations of DLR with/without CS and parallel imaging, and SR-DLR in neuro MR imaging.

#### **NREE-43 NODDI vs Traditional dMRI Metrics: Revealing Microstructure Without a Microscope**

#### TEACHING POINTS

Importance of dMRI as a non-invasive medical imaging modality for investigating the white matter integrity in the brain. Different traditional scalar metrics currently used for characterising the diffusion of water molecules - FA, MD, RD and AD and discussing their pitfalls. Introduction to new advanced metrics like NODDI (neurite orientation dispersion and density imaging) for neuroscience clinical research. Clinical relevance of scalar metrics

#### TABLE OF CONTENTS/OUTLINE

Introduction to dMRI Traditional dMRI metrics to reveal microscopic details of tissue architecture (FA, AD, RD, MD) Pitfalls of traditional metrics NODDI- introduction and applications in clinical research (TBI and Epilepsy)

#### **NREE-44 Practical Guide for Young Radiologists: Basic Sequences in Neuroradiology**

Participants

Taisa Santos, MD, Salvador, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Describe the aspects and physical parameters of basic magnetic resonance imaging sequences of the brain. Identify the main evaluation structures and tissue signal patterns in each sequence. Correlate brain diseases with signal changes.

#### TABLE OF CONTENTS/OUTLINE

Different Magnetic Resonance (MRI) imaging sequences are used together for brain evaluation. Knowledge of the physical aspects and signal patterns of basic MR sequences are essential for elucidation of neurological pathologies. Variables such as the number of radiofrequency (RF) pulses, angle, period between excitations (repetition time - TR) and period between excitation to echo (echo time - TE) determine the different signals between tissues on T1, T2 and image density proton weights. Some tissues and contents show different signals in each sequence. In the T1 sequence, fat, lesions with high protein content, some stages of hemoglobin degradation and melanin have high signal. In this sequence, it is important to analyze bone structures, brain parenchyma, flow-void, pineal and pituitary glands. In the T2/FLAIR sequence, most lesions have high signal, is a good sequence to see white lesions. In T2\*/SWI, blood, calcium, air have low signal. Some neoplastic, infectious, and ischemic changes show diffusion restriction on the DWI sequence and characteristic postcontrast enhancement. The correlation of signal patterns from different tissues in the evaluation of basic sequences helps in the recognition of patterns of normality and pathological alterations, being an important knowledge for young radiologists to begin to understand the findings of magnetic resonance imaging of the brain.

#### **NREE-45 The Art of Arteritis: Imaging Primary CNS Vasculitis**

Participants

Eleanor Taylor, MSc, MBBS, London, United Kingdom (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. A practical approach to the investigation of PCNSV covering the diagnostic criteria, presentation, and laboratory tests, but with

1. A practical approach to the investigation of PCNSV, covering the diagnostic criteria, presentation, and laboratory tests, but with a primary focus on imaging. 2. A structured discussion of the radiological manifestations of PCNSV. 3. An awareness of the common mimics and their differentiating clinical and radiological features. 4. Insight into the role of imaging in the process of diagnosis and treatment from a multidisciplinary perspective.

#### TABLE OF CONTENTS/OUTLINE

Primary central nervous system (CNS) vasculitis (PCNSV) is an extremely rare diagnosis but a common clinical concern. The presentation is non-specific; it typically manifests in middle-aged patients with subacute headache, altered cognition, and variable additional neurological features. Cerebrospinal fluid analysis can be normal in up to one third of cases. The radiological phenotype is protean, with no pathognomonic findings and innumerable mimics. Luminal vascular imaging has variable sensitivity and poor specificity. Assessment can be augmented by the use of vessel wall imaging, but this is not a panacea. Definitive diagnosis requires biopsy, not always an attractive prospect, but the risks need to be weighed against those of the disease and its treatment, both of which are considerable. To meet this formidable challenge, we will outline a practical approach to the investigation of suspected PCNSV, review the imaging findings, and explore the common mimics and their differentiating features. This will be illustrated with a series of cases compiled from a neurosciences centre in London.

#### **NREE-46 The Hidden Dangers of Hypothalamic and Hypophysal Lesions: Not Everything is Neoplastic**

Participants  
Taisa Santos, MD, Salvador, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Review the normal anatomy and embryology of hypothalamic-pituitary axis using schematic illustrations and imaging MRI. Identify the main imaging features to guide differential diagnosis in non-neoplastic hypothalamic-pituitary involvement. To display a compendium of cases of non-neoplastic hypothalamic-pituitary axis.

#### TABLE OF CONTENTS/OUTLINE

The hypothalamic-pituitary axis is responsible to regulate many other endocrine glands through its hormone, and the pituitary being known as the master gland, is divided into two distinct parts: the anterior pituitary (adenohypophysis) and the posterior pituitary (neurohypophysis), differ in embryologic origin and function. There are several diseases that can affect the function and morphology of the hypothalamic-pituitary axis. It is susceptible to involvement by a variety of processes, including congenital, infectious or inflammatory, neoplastic or toxic-metabolic diseases. Imaging plays a key role in determining the most probable diagnosis and the Magnetic resonance (MR) imaging is the modality of choice for evaluating the anatomy and pathologic conditions of the hypothalamic-pituitary axis, helping to distinguish neoplastic and non-neoplastic lesions. The MRI differential diagnosis depends on anatomic recognition and characterization of associated imaging findings such as volumetric changes, stalk thickening, cystic appearance, intensity of signal in T1 and T2-weighted imaging. Therefore, we propose a systematic approach to address non-neoplastic pituitary changes based on the most important imaging patterns.

#### **NREE-47 Uncovering Coverage: Best Cases on Meningeal Pathology**

Participants  
Raissa Marjory Zonta Moreti, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To review normal meningeal embryology and anatomy. To understand normal behavior of brain meninges. To discuss best MR imaging protocol to evaluate meningeal diseases. To create systematic approach to evaluation of imaging patterns of most relevant meningeal pathology.

#### TABLE OF CONTENTS/OUTLINE

Introduction  
Normal embryology  
Anatomy  
Physiological behavior of meninges  
Imaging protocol  
MR imaging patterns  
Anatomic - leptomenigeal, pachymenigeal.  
Morphologic - mass-like, nodular, smooth.  
Meningeal pathology  
Infection  
Pyogenic  
Viral  
Fungal  
Parasite  
Tumors  
Benign  
Malignant - primary and secondary  
Granulomatosis  
Sarcoidosis  
Tuberculosis  
Wegener disease  
Langerhans Cell Disease  
Non Langerhans Cell Disease  
Inflammatory Diseases  
IgG4 related Pseudotumor  
Miscellaneous  
Iatrogenic  
Traumatic

#### **NREE-48 Everything About CNS Infections: A Pictorial Review. Tips and Tricks for General Radiologists**

Participants  
David Castaneda SR, MD, Santander, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- To highlight the diagnostic pearls to recognize properly CNS infections. - To showcase the differential diagnosis of the main CNS infections. - To point out the importance of the state of the immune system when analyzing these studies. - To provide an extensive pictorial review with the most typical findings of both common and uncommon infections, from bacteria, to viruses, and also fungi and parasites.

#### TABLE OF CONTENTS/OUTLINE

1. Bacterial meningitis. 1.1. Typical imaging features. 1.2. Complications: acute hydrocephalus, extra-axial collections, cranial nerve involvement, arterial and venous strokes, ventriculitis. 2. Brain abscesses and cerebritis. 2.1. Ring enhancing lesions differential diagnosis. 3. Herpes encephalitis. 4. Rhombencephalitis. 5. Acute cerebellitis. 6. Encephalitis with bithalamic lesions. 7. Neurosyphilis. 8. Neurocysticercosis. 9. Hydatidosis. 10. Toxoplasmosis. 11. Cryptococcal meningitis. 12. Progressive multifocal leukoencephalopathy. 13. HIV encephalopathy. 14. Nocardia. 15. Aspergillosis. 16. Mucormycosis. 17. Neuroborreliosis. 18. Rickettsial infections. 19. COVID-19. 20. Creutzfeldt-Jakob.

#### **NREE-49 Cranial Surgical Approaches: What the Radiologist Needs to Know**

Participants  
Taisa Santos, MD, Salvador, Brazil (*Presenter*) Nothing to Disclose

## TEACHING POINTS

To correlate the topography of brain lesions with surgical approaches through illustrations and imaging tests. Assist in the identification of surgical accesses through imaging exams. Establish anatomical relationships and correlate with the surgical approaches crania.

## TABLE OF CONTENTS/OUTLINE

In addition to the pre-surgical evaluation for neurosurgeries, the imaging study is extremely important in identifying postoperative findings. Post-surgical changes include repercussions on the brain parenchyma, soft tissues and recognition of the cranial approaches used. The evolution of the location of the pathology helps in the interpretation of the surgical approach. Some topographies favor the use of specific accesses to allow manipulation of certain structures. Access to the skull base, brainstem, supratentorial and intraventricular are well established in the literature and the correct description in the medical report is part of the post-surgical evaluation. Therefore, we proposed to correlate surgical procedures with the location of encephalic pathologies. The demonstration of these aspects is facilitated through schematic illustrations that make it possible to associate these findings with the topography of the lesion in the surgical approach.

## NREE-5 Old but Gold: A Primer of Spine Radiography

Participants

Bianca Bianco, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

## TEACHING POINTS

The spine is made up of a complex anatomy and its evaluation could be challenging sometimes. It is a curved structure composed of bony vertebrae that are connected through cartilaginous intervertebral discs. It ensures proper posture, spinal cord protection, communication with the brain, body mobility and sensation through the complex interplay between the bones, ligaments and muscle structures. The radiography is the first method for its evaluation. Although this a simple imaging method, the correct analysis is very important for the clinical management of the patient. A well-performed radiography, with an appropriate position and adequate beam increases the accuracy of the diagnosis, besides the low-cost exam and high availability in the health care system. The purpose of this presentation is to review the normal anatomy of the cervical, thoracic and lumbar spine, to provide a didactic approach about the main characteristics of the evaluation, and to guide young physicians through the analysis of spine radiography.

## TABLE OF CONTENTS/OUTLINE

Didactic review of how to evaluate the spine radiography, including the aspects of the technique, anatomy of the cervical, thoracic and lumbar spine as well as the most common pathologies, based on our service's digital archive.

## NREE-50 Encephalitis and Encephalopathy: Differential Diagnosis of Infectious and Autoimmune Diseases Based on Imaging Patterns and Topography

Participants

Beatriz Prado, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

## TEACHING POINTS

The purpose of this exhibit is: To review and discuss the differential diagnosis and brain MRI imaging patterns of infectious and autoimmune diseases by brain topography. Discuss and illustrate through illustrative cases different imaging patterns and emphasize the key findings that may lead to a specific diagnoses.

## TABLE OF CONTENTS/OUTLINE

Introduction Describe the most common brain MRI imaging features of encephalitis and encephalopathy, including images that illustrate each feature, such as swelling, inflammation, bleeding, among others. Discuss the differential diagnosis of encephalitis and encephalopathy on brain MRI, divided by topography: -Cortical: Anti-NMDAR encephalitis, Herpes simplex encephalitis, Progressive Multifocal Leukoencephalopathy -White matter: Multiple Sclerosis, Susac Syndrome, FLAMES -Basal ganglia and/or thalamus: Auto-immune striatal encephalitis, FLAMES, acute necrotizing encephalitis, Neurocysticercosis -Cerebellum: Paraneoplastic cerebellar degeneration with anti-TR, Paraneoplastic cerebellar degeneration with anti-GAD, Aseptic meningitis with systemic lupus erythematosus, Acute disseminated encephalomyelitis -Brainstem: Progressive Multifocal Leukoencephalopathy, enterovirus rhomboencephalitis, Listeria rhomboencephalitis, NMSOD Key findings and diagnostic tips Diagnostic Approach Final remarks

## NREE-51 Motor Neuron Diseases: Diagnostic Approach, Imaging Findings, and Mimics

Participants

Tatiana Iutaka, BDS, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

## TEACHING POINTS

This panel aims to: Study the diagnostic approach and clinical indications of imaging in motor neuron disease (MND); Review the MRI acquisition protocols, including advanced MRI techniques; Explain and demonstrate through illustrative cases different imaging patterns of MND; Discuss the main MND mimics and their imaging findings

## TABLE OF CONTENTS/OUTLINE

Review of the definition and clinical syndrome of MND Review the clinical indications of imaging in MND Review the main imaging techniques used for the evaluation of MND Standard MRI acquisition protocol MRI signs that might support the diagnosis directly: T2WI, FLAIR, and magnetization transfer hyperintensities in the corticospinal tract (CST) in the brain or sometimes in the spinal cord Atrophy of the precentral gyrus The 'motor dark line' in T2WI and susceptibility sequences The bright tongue sign Illustrative cases of motor neuron diseases: Amyotrophic lateral sclerosis (ALS) Bulbar ALS Primary lateral sclerosis Mills syndrome Imaging findings of the main MND mimics, divided by clinical feature (e.g.: upper motor neuron (UMN) onset, purely UMN, bulbar onset): Ischemia (e.g., stroke) Mass (e.g., tumor, vascular malformation) Radiculopathies (cervical, lumbosacral) Demyelinating disease (e.g., multiple sclerosis) Advanced imaging and respective findings: DWI: Lower mean fractional anisotropy in the CST Volumetric or morphometric analyses of T1WI 3D MRI: Volume changes mainly in classical motor areas Proton (1H) magnetic resonance spectroscopy (MRS): NAA decline over time in the motor cortex Functional MRI: Altered cortical activity in patients with ALS PET and SPECT: Hypometabolism and hypoperfusion are most prominent in the motor cortex

## **NREE-52 The Fascinating Limbic System: Anatomy, Pathology and Involvement Patterns**

Participants

Lucas Souza, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

The purposes of this exhibit are:- Review and illustrate the imaging anatomy of the limbic system, correlating with the main imaging methods, emphasizing the potential of each in identifying the structures.- To describe the main imaging patterns of lesions involving the limbic system, including dementia and psychiatric disorders, inflammatory and infectious diseases, temporal lobe epilepsy, neoplasms, Wernicke's encephalopathy, ischemic events, among others, highlighting key points for approaching the diagnosis differential.- Determine an algorithm for the systematic evaluation of differential diagnosis, emphasizing the main clinical features and imaging red flags.

### **TABLE OF CONTENTS/OUTLINE**

- Anatomy of the limbic system, emphasizing the functional aspects.- Imaging patterns of diseases that affect the limbic system.- Differential diagnosis based on a pictorial review using representative cases from our institutional database: - Neoplasms - Infection and inflammation- Dementia and neuropsychiatric disorders- Ischemia and Infarction - Metabolic diseases - Developmental malformations- Diagnostic Algorithm- Final remarks

## **NREE-53 Imaging the Sick Neonate: Neurosonogram in Hypoxic Ischemic Injury**

### **TEACHING POINTS**

1. Hypoxic-ischemic injury (HII) of the neonatal brain and resulting encephalopathy sequel remains a significant cause of morbidity and mortality in the neonatal population. 2. Ultrasound of skull (neurosonogram) is a powerful and effective screening tool in the evaluation of sick neonates with clinical hypoxia as it determines the pattern, timing, and extent of injury in HII and differentiates it from other conditions with similar clinical picture. 3. The pattern of injury on brain imaging has crucial implications in therapies and predicted neurodevelopmental outcomes. 4. Major role of neurosonogram is identifying the diagnosis, directing appropriate therapy, monitoring evolution of disease, predicting outcomes and detecting complications of therapy. 5. Addition of Doppler and shear wave elastography (SWE) in determining the difference in brain stiffness in neonates with birth asphyxia can increase the specificity of grey-scale ultrasound.

### **TABLE OF CONTENTS/OUTLINE**

1. Normal neurosonogram appearance and technique in neonates. 2. Pathogenesis, grading and evolution of HII in term and preterm neonates with less profound and severe injury. 3. Patterns of HII in term and preterm neonates with illustration. 4. Role of ultrasound Doppler and SWE in evaluation of HII. 5. Ultrasound illustration of few clinical mimics of HII. 6. Uses and limitations of neurosonography.

## **NREE-54 Errors in the Neuroradiological Emergency: An Escape Room Experience**

Participants

Nathalia Santos, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

TEACHING POINTS The purposes of this exhibit are:- Discuss and illustrate clinical cases of the neuroradiological emergency in a quiz and gamification format, simulating an Escape Room experience.- Highlight the imaging points and red flags to make right diagnoses in the context of emergency. - Describe the most common possible errors in neuroradiological emergency, highlighting tips and challenges in the cases presented.

### **TABLE OF CONTENTS/OUTLINE**

TABLE OF CONTENTS: - Neuroradiological emergency cases in an escape room dynamic:- The most emblematic cases in the context of neuroradiological emergency- Types of errors that can occur while the radiologist is analyzing a case- Series of cases that leads to escape and to finish the call and escape the room- Clinical cases - Quiz format- Ischemic stroke - Early and late signs of stroke- Main trials and treatment windows- Hemorrhagic lesions- Trauma - Fracture and anatomic pitfalls - Pseudofractures in a child skull - Hematic collections- Brain herniations- Headache- Arterial dissection- Metabolic disorders in the emergency- Most common intoxications- Key tips and challenges from the cases demonstrated- Escaping the room: conclusions and lessons learned

## **NREE-55 Temporal Lobe Tumors: A Pattern-based Imaging Approach**

Participants

Afonso Santos, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

1. Review the anatomy of the temporal lobe;2. Group the main primary central nervous system (CNS) tumors that affect the temporal lobe according to imaging characteristics;3. Synthesize the main imaging features of each tumor that help in the differential diagnosis on flashcards for quick reference;4. Show some differential diagnoses that can be confused with temporal lobe tumors

### **TABLE OF CONTENTS/OUTLINE**

Temporal lobe disorders are associated with several conditions, including seizures, dementia, and memory impairment, followed by a spectrum of behavioral disorders. It is noteworthy that about 10% of temporal lobe epilepsies are caused by focal temporal lesions. In this context, this work has as main objectives: In this sense, most primary CNS tumors can potentially occur in the temporal lobe, but entities with a predilection for being diagnosed in this location include: ganglioglioma (40%), DNET (20%), diffuse low-grade astrocytoma (20%) and others (20%). Some of these lesions may present specific imaging characteristics, which allow narrowing the differential diagnosis. Didactically, these lesions can be grouped based on imaging features into solid-cystic, bullous, or solid. Besides any primary CNS tumor can arise from temporal lobe, this location has specific clinical symptoms, and some tumors has a particular predilection for the temporal lobe. The radiologist has a special rule to recognize and narrow the differential diagnosis that will guide the treatment or follow up on each case.

## **NREE-56 Embryonal Tumors - Correlations Between Imaging Findings and Molecular Subtypes**

Participants

Larissa Freitas, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

The purposes of this exhibit are: • To present the essential embryonal malignancies of the Central Nervous System. • To review the WHO CNS5 classification, considering the new modifications in nomenclature and distribution of embryonal tumors. • To make a parallel between radiophenotypic imaging and genomic features. • To present the essential imaging features correlated to tumor's genetic pattern. • To highlight the importance of recognizing the imaging pattern of embryonal tumors to therapeutics and prognosis.

### **TABLE OF CONTENTS/OUTLINE**

• Introduction - Essential embryonal malignancies of the Central Nervous System. - Review the WHO CNS5 classification making a parallel between radiophenotypic imaging and genomic features. • Medulloblastoma - Medulloblastoma WNT-activated - Medulloblastoma SHH-activated - Medulloblastoma, non-WNT / non-SHH - Group 3 - Group 4 - Other embryonal tumors - Atypical teratoid rhabdoid tumor - Embryonal tumor with multilayered rosettes - CNS Neuroblastoma, FOXR2-activated

## **NREE-57 A Pocket Guide of the Main Side Effects, from Common to Rare, of Radiation Therapy in the Brain**

Participants

Marta Calvo-Imrizaldu, MD, Pamplona, Spain (*Presenter*) Research Grant, Siemens AG

### **TEACHING POINTS**

- To review the different techniques of brain radiation therapy available for primary or metastatic tumors, that radiologists need to know. Basic pathophysiology. Novel approaches and indications.- To recognize the main radiation-related findings on brain studies, from common to unexpected, and its differential diagnosis. Focus on radiation necrosis, radiation induced tumors, and mimics of vascular diseases (SMART syndrome, vasculitis, PRES).

### **TABLE OF CONTENTS/OUTLINE**

1. Background and basics pathophysiology of radiation therapy.i. Clinical relevance statement ii. Basic pathophysiology iii. Risk factors. Benefits and risks iv. Radiation therapy techniques: conventional radiation therapy (external beam radiation therapy), stereotactic radiosurgery, proton therapy. v. Dosimetry2. MRI features and pictorial review of the main radiation-related findings on brain imaging, with differential diagnosis:- Common: a. Atrophy b. Leukoencephalopathy c. Microhemorrhages/cavernomas d. Hypoperfusion e. Mastoiditis- Less common: a. Pseudoprogression b. Radionecrosis c. Intratumoral bleeding d. Radiation-induced vasculitis- Rare: a. Radiation-induced tumors (most commonly meningioma) b. SMART syndrome: stroke-like migraine attack after radiation therapy c. PRES3. Reporting tips4. Conclusion

## **NREE-58 Radiological Evaluation of the Spectrum of Pathologies Involving Medullary Veins in Neonates and Young Children**

Participants

Esther Martin Ramirez, MD, MADRID, Spain (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

To describe the anatomy and the venous drainage pathways of the intracranial venous system, with emphasis on medullary veins.To review the main pathologies that can cause medullary veins injury in newborns and young children.To explain the pathophysiology of diseases associated with medullary veins injury and their characteristic radiological findings, especially based on magnetic resonance imaging (MRI).To review the guideline-recommended MRI technique for medullary veins evaluation.

### **TABLE OF CONTENTS/OUTLINE**

There are two types of medullary veins: superficial veins (SMV) and deep veins (DMV). SMV drain the subcortical white matter centrifugally into pial veins, whereas DMV drain the deep white and grey matter centripetally into subependymal veins, with a characteristic distribution consisting of a radial pattern with four convergence zones in frontal horns and trigons, and a parallel pattern in bodies and inferior horns of lateral ventricles. The unique disposition of medullary veins allows us to detect their involvement in different pathologies through different imaging techniques, especially on MRI with susceptibility-weighted imaging sequences.The aim of this educational exhibit is to review the most frequent pathologies related to medullary veins seen in neonates and young children, including vascular anomalies, thrombosis, hemorrhage and infectious encephalitis, among others.

## **NREE-59 Fungus on the Mind: There's Much Room for Improvement**

Participants

Karthik Rajendran, MBChB, London, United Kingdom (*Presenter*) Nothing to Disclose

Girija Agarwal, MBBS, Harrow, United Kingdom (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

1. An overview of the epidemiology, pathophysiology and clinical features of fungal CNS infections.2. A structured review of the imaging features of various fungal CNS infections and their complications.3. An approach to the differentiation of fungal CNS infections from other common infectious and non-infectious mimics, with a focus on clinico-radiologic correlation.

### **TABLE OF CONTENTS/OUTLINE**

Fungal infections of the central nervous system (CNS) typically occur in immunocompromised patients and can be caused by yeasts (e.g. Cryptococcus), molds (e.g. Aspergillus), and dimorphic fungi (e.g. Coccidioides). The prognosis is influenced by the specific organism and patient factors but is frequently poor with mortality generally exceeding >50%.The imaging features, whilst often non-specific with a broad differential in a majority of cases, can also be distinctive and sometimes organism specific. Pathophysiological knowledge of varying fungal infections aids understanding the pathognomonic features to aid in narrowing the differential. Querying fungal etiology, even if the findings are less specific, at an early-stage aids directed laboratory testing and empirical treatment.Prolonged iatrogenic immunosuppression is on the rise, with increasing organ transplantation and cancer

incidence. Old foes like HIV remain common. Radiologists are therefore increasingly likely to encounter fungal CNS infections sporadically and must be familiar with the imaging manifestations to aid early diagnosis and improve clinical outcomes.

## **NREE-6      **Neuroradiologic Complications of Immunotherapy in the Treatment of Cancer****

Participants

John A. Arrington, MD, Tampa, FL (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

• As immune modulation in the treatment of cancer is becoming more common, its complications become more prevalent and the radiologist should be aware of these to aid rapid diagnosis and appropriate therapy. Unlike conventional chemotherapy which typically will cause immune suppression, immune modulation therapy generates an increase in systemic immune response and therefore a different spectrum of complications. This exhibit will explain the nomenclature, mechanism of action, and imaging features of more common complications of immunotherapy in the treatment of neoplasm.

### **TABLE OF CONTENTS/OUTLINE**

• Mechanism of action of Immune Checkpoint Inhibitor (ICI) therapy • Mechanism of action of Chimeric Antigen Receptor T Cell (CAR-T) therapy • Recognizing ICI nomenclature (\*mab) is helpful to know to determine if a patient's therapeutic regimen includes ICI • Neuroimaging examples • Hypophysitis • Pseudoprogression • Myositis • Acute Idiopathic Demyelinating Polyneuropathy (AIDP). • Acute myelitis (CAR-T) • Thyroiditis • CAR-T related infarction

## **NREE-60      **Diffuse High-Grade Gliomas - New Concepts****

Participants

Bruna Carvalho, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

The purposes of this exhibit are: • To present the current classification of central nervous system tumors and genetic biomarker roles. • To define pediatric-type and adult-type diffuse high-grade gliomas and their molecular pathways. • To present the essential imaging features correlated to the tumor's genetic pattern. • To correlate radiophenotypic imaging and genomic features with prognosis and determination of treatment approaches.

### **TABLE OF CONTENTS/OUTLINE**

• Adult-type diffuse high-grade gliomas - Glioblastoma, IDH wildtype - Astrocytoma, IDH-mutant, grade 4 - Astrocytoma, IDHm, CDKN2A/B homozygous deletion, grade 4 • Pediatric-type diffuse high-grade gliomas - Diffuse midline glioma, H3 K27-altered - Diffuse hemispheric glioma, H3 G34-mutant

## **NREE-61      **Anoxic Brain Injury Patterns. What Can't I miss? Reviewing Patterns and Differential Diagnosis of Anoxic Brain Injury in Newborns, Children and Adults****

Participants

Bernardo Pillar Quadros, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

The purposes of this exhibit are: - Review and illustrate the imaging findings of the main anoxic brain injuries patterns, classified according to age: newborns, children and adults. - Describe the main imaging patterns of the anoxic brain injuries, including brainstem lesion, thalamic lesion, periventricular leukomalacia, ventrolateral thalamic lesion, posterior putamen lesion, periorlandic cortex lesion, cortical laminar necrosis, delayed post-hypoxic leukoencephalopathy, HACE, diffuse edema, some intoxication hypoxia patterns and some differential diagnosis, highlighting key points to differential diagnosis approach. - Determine an algorithm for the systematic evaluation of differential diagnosis, emphasizing the main clinical features and imaging red flags.

### **TABLE OF CONTENTS/OUTLINE**

- Imaging patterns of main anoxic brain injuries in newborns, children and adults. - Preterm newborn patterns lesions - Term newborn patterns lesions - Children/ adults patterns lesions - Intoxication hypoxia patterns lesions - Differential diagnosis based on a pictorial review using representative cases from our institutional database - Hypoglycemia - Creutzfeldt-Jakob disease - Uremic Encephalopathy - Metabolic disorders - Diagnostic Algorithm- Final Remarks

## **NREE-62      **Cerebrovascular Reserve Imaging Evaluation: How Much of a Challenge Can it Be****

### **TEACHING POINTS**

Cerebrovascular reserve imaging with arterial spin labeling (ASL) and acetazolamide challenge is a non-invasive MRI-based technique that evaluates cerebrovascular reactivity. ASL measures cerebral blood flow by magnetically labeling arterial blood water protons, allowing for quantification of regional cerebral blood flow (CBF) without exogenous contrast agents. Acetazolamide (a vasodilator) challenge can be used to estimate cerebrovascular reserve (CVR). ASL with acetazolamide challenge is useful for assessing CVR in neurological conditions such as cerebrovascular disease and neurodegenerative disease.

### **TABLE OF CONTENTS/OUTLINE**

I. Introduction II. Arterial Spin Labeling III. Acetazolamide Challenge IV. Cerebrovascular Reserve Imaging with ASL and Acetazolamide Challenge Protocol, applications and analysis. V. Clinical Utility in Various Neurological Disorders VI. Conclusion

## **NREE-63      **Brainstorming the Brainstem: A Pictorial Review of Challenging Diagnosis****

Participants

Rafael Oliveira, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

The goals of this paper are: - Brief anatomy review of the brainstem - Summarize uncommon diseases of the brainstem - Review

imaging presentations of brainstem diseases - Differentiate common and uncommon patterns of known diseases affecting the brainstem

#### TABLE OF CONTENTS/OUTLINE

Powerpoint layout  
1 Midbrain: 1.1 Parkinson 1.2 Wernicke-Korsakoff Syndrome 1.3 Wilson's Disease  
2 Pons: 2.1 Chronic lymphocytic inflammation with pontine perivascular enhancement responsive to steroids (CLIPPERS) 2.2 Osmotic Myelinolysis 2.3 Autosomal recessive spastic ataxia of Charlevoix-Saguenay (ARSACS)  
3 Medulla: 3.1 Friedreich Ataxia 3.2 Neuromyelitis optica spectrum disorder (NMOSD) 3.3 Dural Arteriovenous Fistula 3.4 Adult Onset Alexander Disease (AOAD) 3.5 Leukoencephalopathy with brainstem and spinal cord involvement and lactate elevation (LBSL)  
4 Miscellany: 4.1 Neuro-Behçet 4.2 Enterovirus Rombencephalitis 4.3 Myelin oligodendrocyte glycoprotein antibody-associated disease (MOGAD) 4.4 Adrenoleukodystrophy

#### NREE-64 Glioneuronal and Neuronal Tumors: What Can Molecular Pathways Teach Us

Participants

Giovanna Calfi, MD, Sao PAULO, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- List the essential information on various glioneuronal and neuronal tumors according to the 5th Edition of the WHO Classification of Tumors of the Central Nervous System. - Identify the main imaging features and molecular pathway involved in these brain tumors. - Highlight the importance of recognizing those patterns to help neuroradiologists narrow their diagnostic hypotheses, thus saving time and resources.

#### TABLE OF CONTENTS/OUTLINE

- Introduction: Brief review of the inclusion of glioneuronal and neuronal tumors in the 5th edition of the 2021 WHO Classification of Tumors of the Central Nervous System; Presentation of the main common characteristics of glioneuronal and neuronal tumors; Illustration of the MAPK pathway - The radiological, epidemiological and clinical characteristics correlated based on the most known genetic mutations of each tumor, namely: Dysembryoplastic neuroepithelial tumor (DNET); Multinodular and vacuolating neuronal tumor (MVNT); Central neurocytoma; Extraventricular neurocytoma; Ganglioglioma; Rosette-forming glioneuronal tumor; Dysplastic cerebellar gangliocytoma (Lhermitte-Duclos disease); Diffuse leptomeningeal glioneuronal tumor; Desmoplastic infantile astrocytoma; Papillary glioneuronal tumor; Gangliocytoma; Myxoid glioneuronal tumor

#### NREE-65 Practical Guide to Fetal Craniospinal MRI: Essentials for General Neuroradiologists and Trainees

#### TEACHING POINTS

After review of this exhibit, the radiologist should: Be able to recognize the normal fetal anatomy of the craniospinal axis. Be familiar with common indications for fetal MRI and protocol for fetal Neuroimaging Recognize and diagnose a broad range of pathologies that can be assessed with fetal MRI.

#### TABLE OF CONTENTS/OUTLINE

Fetal ultrasound is the primary diagnostic tool used for fetal imaging, but there are limitations to imaging the fetal brain, face and neck, and spinal canal. Fetal MRI is often performed to characterize ultrasound findings and provide better prognostic information for obstetric patients. Common indications for fetal craniospinal MRI include ventriculomegaly, midline anomalies, posterior fossa malformations, fetal intracranial mass, encephaloceles, cleft lip and palate, spinal malformations, and in utero disruptive events. With increased demand for these exams for pre- and post-natal health, more general neuroradiologists will be needed for interpretation. This comprehensive review has the potential to improve patient access to fetal craniospinal MRI by increasing general neuroradiologist's and trainee's comfort with interpretation of these exams. We will review imaging protocols, normal fetal anatomy, common indications, case examples, and postnatal MRI correlates. Case examples will include the Pierre Robin sequence, congenital epulis, Dandy Walker variants, open and closed dysraphism, intrauterine fetal demise with intracranial hemorrhage, orofacial-digital syndrome, and multiple midline abnormalities including alobar holoprosencephaly with synophthalmia.

#### NREE-66 The Hidden Face of Gliomas: Decoding the Pathophysiology and Infiltrative Patterns of Gliomas

Participants

Marta Calvo-Imrizaldu, MD, Pamplona, Spain (*Presenter*) Research Grant, Siemens AG

#### TEACHING POINTS

- To review the current knowledge of the pathophysiology of gliomas and the challenges of their study and management. - To outline different imaging presentations of gliomas and the role of MRI in the presurgical workup of these tumors. Pearls on imaging biomarkers available and potential diagnostic pitfalls.

#### TABLE OF CONTENTS/OUTLINE

1. Background. Pathophysiological aspects of glioma  
2. Imaging protocol recommended for brain tumors  
3. Pictorial review of the main different infiltrative patterns of gliomas, from isolated hyperintense signal on T2-FLAIR to ring-enhancing necrotic gliomas:  
a. Non-contrast enhancing gliomas  
b. Gliomatosis pattern of gliomas  
c. Non-enhancing with contrast enhancing components gliomas  
d. Homogeneous enhancing gliomas  
e. "Ring enhancing" with necrosis gliomas  
f. Cystic gliomas  
g. Butterfly gliomas  
h. Multifocal gliomas  
With the following information applying for each: clinical issues and pearls on the updated 2021 World Health Organization classification, imaging biomarkers available and potential diagnostic pitfalls.  
4. Reporting tips  
5. Conclusion

#### NREE-67 Myelination and Inborn Errors of Metabolism: Learning That Goes Hand in Hand

Participants

Lucas Souza, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The purposes of this exhibit are: - Review and illustrate the classic patterns of myelination, emphasizing the main findings for age delimitation, as well as signs of developmental delay. - To describe the main imaging patterns of Inborn Errors of Metabolism, including hypomyelination and demyelination, exemplifying cases of Pelizaeus disease, Alexander disease, Canavan disease, Krabbe disease, Metachromatic leukodystrophy, among others, highlighting key points for approaching the differential diagnosis. - Determine

an algorithm for the systematic evaluation of differential diagnosis, emphasizing the main clinical features and imaging red flags.

#### TABLE OF CONTENTS/OUTLINE

- Imaging patterns of white matter myelination, emphasizing the key findings.- Neuroimaging of Inborn Errors of Metabolism.- Differential diagnosis based on a pictorial review using representative cases from our institutional database:- Organelle-based approach- Imaging pattern approach: white matter predominance versus gray matter predominance; diffuse white matter involvement (vanishing white matter disease), involvement of the basal ganglia (PKAN, MELAS), periventricular predominance (metachromatic leukodystrophy and Krabbe disease), subcortical predominance (L2-hydroxyglutaric aciduria), among other patterns.- Diagnostic Algorithm- Final remarks

#### NREE-68 **Neurovascular Potpourri: Disentangling the Differentials**

Participants

Eugene Shin, MD, Orange, CA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Vascular pathology may be the primary reason for, or an incidental finding on contrast enhanced exams. The goal of this presentation is to provide a broad overview of the range of neurovascular findings one may encounter, from benign congenital variations to neoplasms.

#### TABLE OF CONTENTS/OUTLINE

Neurovascular topics covered include the following:1. Congenital/anatomic variants, including aortic arch and major branches, Circle of Willis and persistent carotid-vertebrobasilar anastomoses, arterial fenestration, and junctional dilatation of the basilar artery tip.2. Review International Society for the Study of Vascular Anomalies characterization of vascular anomalies, primarily discerning vascular malformations from tumors with case examples. Tips will be provided to help discern vascular lesions from similar appearing processes in the head and neck region.3. Examine other vascular disorders including moyamoya disease, fibromuscular dysplasia (including carotid intimal variant), reversible cerebral vasoconstriction syndrome, and amyloid angiopathy.

#### NREE-69 **'To Bleed or Not to Bleed'- The DVA Conundrum**

#### TEACHING POINTS

- Delineate the angioanatomy of developmental venous anomalies. •Classify the various mechanisms that render DVAs symptomatic.
- The following are illustrated with sample cases: •"Flow related" pathomechanisms. •decreased outflow; collector vein thrombosis and DVA thrombosis. •Increased inflow in the form of arterialisation of DVA . •DVAs associated with cavernomas •DVAs with no overt neuroparenchymal signal changes but with resistant epilepsy with metabolic abnormality on PET. •DVAs associated with grey matter abnormalities. •DVAs in tandem with high grade gliomas.

#### TABLE OF CONTENTS/OUTLINE

- Angioanatomy of developmental venous anomalies •Classification of the various pathomechanisms of symptomatic DVAs •The following are illustrated with sample cases: •"Flow related" pathomechanisms (as would be illustrated in our case series) -decreased outflow; collector vein thrombosis and DVA thrombosis. •Collector vein stenosis culminating in outflow restricted DVAs. •Increased inflow in the form of arterialisation of DVA . •DVAs associated with cavernomas •DVAs with no overt neuroparenchymal signal changes but with resistant epilepsy with metabolic abnormality on PET. •DVAs associated with grey matter abnormalities. •DVAs in tandem with high grade gliomas. •Overview of the treatment strategies both endovascular and conservative in the management of these vascular lesions.

#### NREE-7 **Structural and Metabolic Biomarkers in Autism Spectrum Disorder**

Participants

Robert Subtirelu, Ronkonkoma, NY (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Evaluate the utility of structural and metabolic biomarkers in the assessment and diagnosis of patients with autism spectrum disorder (ASD) 2. Discuss possible directions for future studies to expand the application of positron emission tomography (PET) and magnetic resonance imaging (MRI) in ASD

#### TABLE OF CONTENTS/OUTLINE

1) INTRODUCTION 1.1) Methodology 1.2) Results of literature review 1.3) Summary of results 2) MRI IDENTIFIED VOLUMETRIC AND STRUCTURAL DIFFERENCES 2.1) Significance of differences in the context of ASD 2.2) Diagnostic applications 3) FDG PET/CT SHOWS DIFFUSE HYPOMETABOLISM 3.1) Hypometabolism and cognitive changes 3.2) Generalized decrease in metabolism of bilateral temporal lobes 4) ASD RESTING STATE fMRI DATA 4.1) Role of paracentral lobule in ASD symptoms 4.2) Underconnectivity and cognition 5) THE EFFECT OF AGE ON SURFACE BRAIN MEASURES IN AUTISM SPECTRUM DISORDER 5.1) Cortical thickness and cognition 5.2) Effect of surface area increase of right occipital gyrus on ASD symptoms

#### NREE-70 **Easy Come, Easy Go - Transient Brain Findings**

Participants

Samya Alves, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Despite the notability of sequelae left by neurological diseases, many conditions may present as transient abnormalities. Toxic-metabolic encephalopathies comprise one of the groups which classically presents in such manner and is part of the radiologists' daily practice - most of them having a pattern of symmetrical restricted diffusion. Other entities, like some vasculopathies and genetic determined diseases - although instinctively associated with permanent brain damage - might also portray themselves as temporary imaging alterations. In these cases, the follow-up would be critical in determining the diagnosis as it is in differentiating a post-ictal change (typically reversible) from an autoimmune encephalitis (more enduring).- Present a didactic manner for sorting of transient findings and reversible conditions by pathophysiology.- Illustrate transient imaging features in a case-based review.

## TABLE OF CONTENTS/OUTLINE

Suggestion for sorting of reversible imaging findings and conditions  
Toxic-metabolic: exogenous intoxications (medication, recreational drugs), endogenous intoxications, cytotoxic lesions of corpus callosum (CLOC)  
Vascular: PRESS, vasoconstriction syndromes, hemiplegic migraine, transient global amnesia, focal cerebral arteriopathy of childhood  
Genetic determined: phenylketonuria, urea cycle disorders, mitochondrial encephalopathy with lactic acidosis (MELAS).  
Neoplastic: some brain tumors may exhibit temporary post contrast enhancement or cystic changes without meaning tumor progression (e.g., pilocytic astrocytoma).  
Miscellaneous: stroke-like migraine attacks after radiation therapy, benign external hydrocephalus, torcular pseudomass

## NREE-71 Post-operative Spine Imaging: Evolution of Percutaneous and Surgical Devices

### TEACHING POINTS

? Percutaneous devices, such as pedicle screws and vertebral augmentation, are often used in minimally invasive procedures and have lower complication rates. ? Post-operative imaging is essential to assess the success of spine surgery, detect complications, and guide further treatment. ? Radiologists should be familiar with the different surgical approaches and devices used in spinal surgery to accurately describe the post-operative imaging findings and identify any complications that may arise.

## TABLE OF CONTENTS/OUTLINE

Arthrosis Degenerative changes in the lumbar spine are a common source of back pain and disability, affecting millions of people around the world. A great part is discogenic. Degenerative disc changes can take several forms, including disc herniation, spinal stenosis, and osteoarthritis, all of which can cause nerve compression and pain. Surgical approaches ? Anterior lumbar interbody fusion (ALIF) ? Lateral lumbar interbody fusion (LLIF) ? Transforaminal lumbar interbody fusion (TLIF) ? Posterior lumbar interbody fusion (PLIF) Common devices used for arthrodesis How do surgeons decide which approach option? Some challenging cases

## NREE-72 From A to V: Arterial and Venous Intracranial Anatomy, Variants and Malformations

Participants  
Eduardo Valadares, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Describe the anatomy of arterial and venous intracranial systems  
Exhibit the normal appearance and common variations of the arterial and venous intracranial systems  
Summarize the most common and some rare congenital and acquired intracranial vascular malformations

## TABLE OF CONTENTS/OUTLINE

Anatomy of Intracranial Arteries and Veins  
Normal CT and MRI Appearance  
Common Arterial Variations  
Fenestrations and Duplications  
Internal Carotid Arteries Variants  
Anterior Cerebral Artery Variants  
Middle Cerebral Artery Variants  
Posterior cerebral Artery Variants  
Persistent Carotid-Basilar Artery Anastomoses  
Common Venous Variations  
Hypoplastic Venous Sinus  
Absent Venous Sinus  
Arachnoid Granulations  
Pure Arterial Malformations  
Anterior Cerebral Artery Dolichoectasia  
Associated with Cortical Dysplasia  
CVM with Arteriovenous Shunting  
Arteriovenous Malformation  
Cerebral Proliferative Angiopathy  
Dural AV Fistula  
Carotid-Cavernous Fistula  
Vein of Galen Aneurysmal Malformation  
Fistula without Arteriovenous Shunting  
Developmental Venous Anomaly  
Sinus Pericranii  
Cerebral Cavernous Malformation  
Capillary Telangiectasia  
Vascular Neurocutaneous Syndromes  
Sturge-Weber Syndrome  
PHACE Syndrome  
Wyburn-Mason Syndrome

## NREE-73 A Radiologist Guide to Evaluating White Matter Lesions in Pediatric Patients

Participants  
Roberto Bastos, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The purposes of this exhibit are:- Review and illustrate the classic imaging patterns of white matter lesions in pediatric patients, with a step-by-step approach.- To describe the main imaging patterns of white matter lesions, including hypomyelination and demyelination diseases, highlighting key points for approaching the differential diagnosis.- Determine an algorithm for the systematic evaluation of differential diagnosis, emphasizing the main clinical features and imaging red flags.

## TABLE OF CONTENTS/OUTLINE

Imaging patterns of white matter lesions in pediatric patients  
Differential diagnosis of pediatric conditions that may course with white matter lesions, discussing the main recognizable image patterns:- Terminal myelination- Periventricular leukomalacia- Hypoxic ischemic encephalopathy- Posterior reversible encephalopathy syndrome (PRES)- Hypoglycemic encephalopathy- Adrenoleukodystrophy- Kearns Sayre syndrome- L-2-hydroxyglutaric aciduria- Methotrexate-related leukoencephalopathy- Focal cortical dysplasia- Multiple sclerosis- Acute disseminated encephalomyelitis (ADEM)- Vascular malformation- Ischemic stroke- Hemorrhagic stroke- Perivascular spaces- Other conditions including aggressive and non-aggressive neoplasms, infection of CNS, phacomatosis, autoimmune and neurodegenerative disorders  
Limitations and tips for the correct diagnosis  
Practical Diagnostic Algorithm  
Final remarks

## NREE-74 CNS Tumor on Drugs - Nuts and Bolts of Neuro-oncology Agents for the Radiologist in the Age of Personalized Medicine

### TEACHING POINTS

To introduce both common and newly emerging targeted neuro-oncology agents, typical imaging response patterns, and the imaging manifestation of associated toxicities.  
To highlight targeted agents with actionable molecular markers in primary brain tumors and brain metastasis, focusing on their mechanism of action in oncogenesis.  
To recognize atypical imaging response patterns and describe the crucial role of radiologists in providing crucial input for the management of CNS neoplasms in the age of personalized medicine.

## TABLE OF CONTENTS/OUTLINE

1. Introduce commonly used traditional chemotherapy agents as well as emerging targeted chemotherapy with their mechanism of

actions• Traditional alkylating agents, including Wafer• Anti-metabolites• Targeted chemotherapy i. ALK ii. HER2 iii. EGFR iv. VEGF v. PD-1 vi. CTLA-4 vii. mTOR viii. BRAF ix. MEK x. HIF xi. CAR T-cell therapy xii. IDH inhibitor• Combination therapy• Experimental drugs2. Usual imaging findings of favorable treatment response and/or disease progression.3. Unique atypical response patterns of different neuro-oncology agents and their clinical implications in cancer management.4. Important chemotherapy-related adverse events and corresponding imaging presentation.5. Illustration of imaging manifestations of newly emerging therapies in the era of personalized medicine.

## **NREE-75 A Rose by Any Other Name? Non-Alzheimer Neurodegenerative Conditions**

Participants

Samya Alves, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

Alzheimer Disease (AD) is the most common cause of dementia worldwide. However, recent studies continue to demonstrate an overlapping of clinical syndromes among neurodegenerative disorders other than DA, as well as have been presenting new biomarkers for differentiating them. As imaging and nuclear techniques advance, the role of the neuroradiologist becomes more essential to provide at least a narrowing of the differential diagnosis in order to offer the best treatment options as early as possible. - Review neurodegenerative conditions besides DA and their pathophysiology. - Mention newly recognized biomarkers, entities, and classifications. - Summarize imaging and nuclear medicine aspects for the differential diagnosis of the neurodegenerative diseases.

### **TABLE OF CONTENTS/OUTLINE**

- Introduction- Neurodegenerative conditionso Clinical phenotypes and molecular subdivisionso Imaging and nuclear medicine featureso Differential diagnosis - Case-based review

## **NREE-76 ECASS Radiological Classification of Hemorrhagic Transformation of Infarcted Brain Tissue: Don't Miss the Blood**

### **TEACHING POINTS**

Define the characteristics of hemorrhagic transformation of infarcted brain tissue, recognize the pitfalls and mimics of this entity and reproduce the new classification system: ECCAS II. Recall the different possible etiologies and clinical factors for developing this hemorrhagic complication.

### **TABLE OF CONTENTS/OUTLINE**

Introduction The hemorrhagic transformation of the infarcted brain tissue is a frequent complication of acute stroke, because of the extravasation of blood across a disrupted blood brain barrier. There are many risk factors and contributors for this disruption. By the ECASS classification system, the types of hemorrhage can be divided in two: hemorrhagic infarction (HI) and parenchymal hematoma (PH). The recognition and classification of this entity is important because the PH2 is found to be a significant predictor of neurological deterioration with higher mortality rates. Teaching points Illustrate the characteristics of an intracranial hemorrhage, specifically the hemorrhagic transformation of infarcted brain tissue. Employ the ECASS classification for hemorrhagic transformation of infarcted brain tissue. Recognize the patterns and learn how to report the different types of hemorrhagic transformation. Distinguish the pitfalls that can mimic a hemorrhagic transformation of infarcted brain tissue. Describe the possible etiologies and clinical factors for developing an intracranial hemorrhagic transformation of infarcted brain tissue.

## **NREE-77 Vein of Galen Aneurysmal Malformations: A Resident's Approach**

Participants

Sameer Chandra, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

- What is a Vein of Galen aneurysmal malformations (VGAM), and how does it appear in a CT and MRI scan. - Highlight the differences between Mural and choroidal Vein of Galen aneurysmal malformations (VGAM). - Exemplify the natural evolution of VGAMs, when treated vs left untreated.

### **TABLE OF CONTENTS/OUTLINE**

Vein of Galen aneurysmal malformations (VGAM) are characterized by an embryonic choroidal arteriovenous malformation supplied by the choroidal arteries (ACA, AChoA, PChoA). The venous drainage in VGAMs is towards the median prosencephalic vein. VGAMs are formed between 6th and 11th weeks of embryological development, and corresponds to 30-50% of all vascular malformations in infants. VGAMs can be subdivided into two types Choroidal and Mural. Choroidal VGAMs are characterized by multiple feeders including thalamoperforating, choroidal and pericallosal arteries are located in the subarachnoid space in the choroidal fissure. Choroidal VGAMs converge on a fistula at the anterior aspect of the median prosencephalic vein (MPV); Tend to present earlier (neonates) with more severe shunts. Choroidal VGAMs result in high output cardiac failure because of multiple high flow fistulas with less outflow restriction. Mural VGAMs are characterized by fistulae in the subarachnoid space in the wall of the median prosencephalic vein; supply may be unilateral or bilateral. They are associated with absence or stenosis of Dural sinuses and stenosis at the level of the jugular foramen. Present later (infants) and with hydrocephalus. Mural VGAMs presents with fewer fistulas with high outflow restriction.

## **NREE-78 Review of a HIV-associated Pathology in the Central Nervous System (CNS) Head and Neck**

Participants

Ahmed Abdelhalim, Los Angeles, CA (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

1. To review clinical presentation and imaging manifestations of HIV-associated CNS and head neck pathology, including infectious, inflammatory and neoplastic etiologies2. To discuss differential diagnoses and management considerations3. To present select cases from our institution that highlight these imaging features

### **TABLE OF CONTENTS/OUTLINE**

1. Introduction  
2. Infectious etiologies: presentation, imaging features, differential diagnosis  
a. Virali. HIV encephalopathy  
ii. Progressive multifocal leukoencephalopathy  
iii. Cytomegalovirus  
iv. AIDS encephalopathy and atrophy  
b. Fungali. Cryptococcus  
c. Bacteriali. Tuberculosis  
ii. Neurosyphilis  
d. Parasitici. Toxoplasmosis  
3. Immune reconstitution inflammatory syndrome (IRIS)  
4. CNS Lymphoma  
5. Select head and neck case review: HIV myelopathy, Kaposi sarcoma, lymphadenopathy, lymphoepithelial parotid cysts

## **NREE-79 Anatomy and Congenital Variations of the Sella Turcica, Suprasellar Cistern and Hypothalamus**

Participants

Alex Dias, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

Review the normal embryology and anatomy of the pituitary gland, the suprasellar cistern and the hypothalamus. Summarize the imaging characteristics of the sellar region on CT and MRI. Provide tools to identify anomalies in the sellar region; discuss differential diagnosis and common pitfalls.

### **TABLE OF CONTENTS/OUTLINE**

1. Introduction  
2. Anatomy and embryology review- sella turcica and hypophysis- parasellar region, suprasellar region and hypothalamus  
3. Clinical-radiological correlation of congenital sellar variations  
4. Case-based review of congenital variations and pathology: - osseous - intrasellar - suprasellar - parasellar  
5. Take-home points

## **NREE-8 Beyond Myelopathy: Imaging Findings Associated with Under-recognized Neurologic Manifestations of HTLV-1**

Participants

Jedrej Krawczyk, MD, London, United Kingdom (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

Human T-cell lymphotropic virus type-1 (HTLV-1) was first described in the early 1980s. Presently, where testing occurs, HTLV-1 has a prevalence of approximately 10 million (which is likely an underestimate) and is endemic in areas such as southwestern Japan and South America. Whilst in most, the infection is asymptomatic, the infection is lifelong, and there are several, likely under-recognized and potentially devastating neurological complications. The best described is HTLV-1-associated myelopathy (HAM), which typically presents with chronic progressive spastic paraparesis and bladder disturbance, but there are rarer conditions, such as acute myelopathy, encephalopathy, and inflammatory myositis. Raising awareness of these less common presentations is crucial to facilitate prompt diagnosis and treatment, especially as prompt medical intervention may limit and even potentially reverse damage. Here we describe the range of neurological and neuromuscular presentations of HTLV-1, focusing on their imaging findings illustrated by a selection of cases from our tertiary care center.

### **TABLE OF CONTENTS/OUTLINE**

1) To briefly outline clinical and imaging manifestations of HTLV-1-associated myelopathy.  
2) To provide an illustrative review of rarer presentations of HTLV-1-related neurological disorders  
3) To describe the differential diagnoses and their main discriminating imaging features.

## **NREE-80 Detangling the Knots of Pediatric Neurometabolic Disorders, One at a Time**

### **TEACHING POINTS**

- Discuss the pathophysiology of neurometabolic disorders in the pediatric age group.
- Review the imaging findings of common and rare neurometabolic conditions.
- Review the overlap in imaging manifestations and discern subtleties in differentiating various neurometabolic conditions.
- Recognise neurometabolic disorders amenable to treatment with emphasis on current and developing treatment options

### **TABLE OF CONTENTS/OUTLINE**

- Introduction to the pathophysiology with glimpses of the pattern of CNS involvement in pediatric neurometabolic disorders.
- Extensive in depth review of the imaging of various subtypes including : 1. Disorders of amino acid metabolism 2. Organic acidemias 3. Peroxisomal disorders 4. Lysosomal storage disorders 5. Neurodegenerative diseases of childhood 6. Channelopathies
- Imaging overview along with clinical correlation.
- Emphasis on treatment amenable cases.

## **NREE-81 Beware of the Railway Crossing, Neuralgia Awaits You. A Resident's Guide to Neurovascular Conflict**

Participants

Andres Haro Laverde, MD, Quito, Ecuador (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

1. Not all vascular conflicts may lead to a clinical condition; therefore, the topographical finding must correlate with the symptoms.  
2. Peripheral nerves have critical segments, where they run without a myelin sheath; this is called the transition zone.  
3. The correct imaging protocol can lead to the diagnosis; nevertheless, the best pulse sequences are prone to artifacts, and it is important to identify them.  
4. Infectious, neoplastic, or inflammatory causes may overlap; therefore, be aware of differentials.

### **TABLE OF CONTENTS/OUTLINE**

1. Anatomical review of the cranial nerves with a hub in the most common trapped roots  
2. Physiopathology of vascular palsy and the common clinical findings.  
3. Types of cranial nerve vascular conflicts and pitfalls.

## **NREE-82 A Comprehensive Guide of Neurovascular Imaging: Discovering Pearls and Overcoming Pitfalls**

Participants

Niels Vinicius Padua Carvalho, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

The aim of this exhibition is to: • Thoroughly review the technical aspects of neurovascular imaging (arterial and venous angiotomography and magnetic resonance angiography) and vessel wall imaging. • Illustrate the role of these imaging methods, overall CT and MRI, highlighting advantages and disadvantages of each modality. • Unify the most important methods in a single article/presentation. • Summarize the pearls of these methods for diagnosis purpose and how to overcome the main pitfalls.

#### TABLE OF CONTENTS/OUTLINE

• INTRODUCTION Importance of neurovascular imaging through the time and where we stand today • IMAGING TECHNIQUE Neurovascular imaging techniques, including: § Protocol: when to choose each method § Sequences: which sequences are preferred for each modality § Imaging acquisition: the physical aspects and time of acquisition. • INTERACTIVE CASE-BASED DIDACTICS Sample cases to illustrate and consolidate the main pearls and pitfalls of neurovascular imaging, separated by imaging method and type of errors • FUTURE DIRECTIONS AND TAKE HOME MESSAGES Where do we need improvement? What is on the horizon for neurovascular imaging?

#### **NREE-83 INTRA-ARTERIAL CHEMOTHERAPY FOR RETINOBLASTOMA: ANATOMICAL HEMODYNAMIC CHALLENGES**

Participants  
Matteo Zanoni, Siena, Italy (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- In the hope of salvaging eyes with retinoblastoma (RB) from enucleation, intra-arterial chemotherapy (IAC) has been proposed in 2008. - The main goal of IAC is to deliver a high dose of drugs directly to the tumor while avoiding the side effects and risks of systemic chemotherapy. - In the ideal scenario, an adequate blush is visualized from the internal carotid artery, ophthalmic artery origin is favorable for catheterization and no prominent cutaneous branches from the ophthalmic artery are seen. - IAC is not always as straightforward as expected and some challenges may be seen. - The first scenario is a difficult and unstable catheterization of the OA, in spite of its visualization by selective angiography, usually due to a too angulated origin of the OA. - The second scenario occurs when OA is not visible from ICA injection or the blush is not visible and contrast medium flows back into the ICA when catheterization of the OA is properly achieved. One anastomosis with the external carotid artery could be in place providing alternative pathways for the orbital supply and drug administration. - Distribution volume of the drug, which correlates to effectiveness of the IAC, could increase because of cutaneous branches originating from OA, thus increasing local side effects.

#### TABLE OF CONTENTS/OUTLINE

- Intra-arterial chemotherapy for retinoblastoma- IAC technique and ideal scenario- Anatomical challenges and solutions- Hemodynamic challenges and solutions- Distribution volume understanding

#### **NREE-84 Pictorial Review of the Applications of Dynamic Susceptibility Contrast (DSC) MRI Perfusion in the Characterization of Meningiomas**

Participants  
Theodore Wang, South Pasadena, CA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Background review on the key characteristics of meningiomas and basics of dynamic susceptibility contrast (DSC) MRI perfusion. 2. Literature and pictorial review of the applications of DSC perfusion in the evaluation of meningioma characteristics, including grade, histologic subtypes, consistency, and vascularity. 3. Future applications of DSC in the evaluation of meningiomas.

#### TABLE OF CONTENTS/OUTLINE

1. Background on meningiomas and DSC MRI perfusion: (a) Brief background on meningiomas, including differences in grade, histologic subtype, consistency, and vascularity. (b) Background on the clinical importance of these different characteristics and current imaging evaluation. (c) Review of the current literature on the application of DSC for meningioma evaluation. 2. Applications of DSC perfusion in meningioma evaluation: (a) Pictorial review of applications of DSC perfusion in meningioma evaluation. (i) Review the differences in perfusion between histologic subtypes of meningiomas, including the correlation of higher perfusion values with higher grade tumors and surrounding brain parenchyma. (ii) Discuss the role of DSC in predicting vascularity and consistency of meningiomas. 3. Discussion of future directions of DSC for meningioma evaluation.

#### **NREE-85 Neuroinfectious Disorders in the Emergency: From Usual to Bizarre**

#### TEACHING POINTS

To depict the pattern of CNS infections in different compartments of the brain. To illustrate characteristic imaging findings attributable to specific pathogens. To be familiar with atypical infectious etiologies in the neuroparenchyma.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction to CNS infections 2. CT and MRI imaging protocol of CNS infections: Impact of delayed CT images and Post Gadolinium FLAIR sequences. 3. Infectious involvement of different compartments of brain. 4. Meningitis: Bacterial, Cryptococcal, Viral, Rickettsial/Scrub typhus. 5. Brain Parenchymal involvement in CNS infections Restricted to white matter Both grey and white matter involvement Involvement of basal ganglia/thalami or brainstem. 6. Infectious Mass lesions Fungal abscess Pyogenic abscess Tuberculoma Parasitic infections Fungal granulomatous lesions. 7. Atypical neuroparenchymal infections Neuromyelitis Leptospirosis Scrub typhus Nocardiosis

#### **NREE-86 Arteriovenous Malformations: Practical Application of Spetzler Martin Classification**

#### TEACHING POINTS

Brain arteriovenous malformations are a type of intracranial high flow vascular malformation composed of enlarged feeding arteries, a nidus of vessels closely associated with the brain parenchyma through which arteriovenous shunting occurs, and draining veins. These malformations are characterized by a nidus forming the transition between the feeding artery and draining vein. If this transition is made directly, then it is considered an arteriovenous fistula, which is a separate type of cerebral vascular anomaly.

## TABLE OF CONTENTS/OUTLINE

Definition Clinical findings Location Incidence Associated anomalies Classification Cases

### **NREE-87 Advances in NOWinBRAIN 3D Neuroimage Large Repository: Cortical and Cranial Openings and Neurologic Disorders**

#### TEACHING POINTS

The exhibit: 1) Demonstrates a novel image display and exploration method using sequences of cortical and cranial openings; 2) Enables skull-brain correlation via cranial openings exposing the underlying parcellated and labeled brain (divided into lobes, gyri, and sulci) and intracranial arteries and venous system; 3) Facilitates brain-intracranial arteries correlation by opening 64 gyri and 6 lobules exposing the white matter and the arteries usually hidden deep in the sulci; 4) Provides a correspondence between brain damage (lesion) and the resulting disorder for vascular, cranial nerve and regional anatomy-related synthesized lesions, each lesion labeled with a disorder, signs, symptoms, and/or syndromes; 5) Presents a wide spectrum of over 8,600 3D neuroimages systematically organized, named and grouped into over 630 folders; 6) Is a valuable resource for medical students and residents as well as educators to prepare presentations.

#### TABLE OF CONTENTS/OUTLINE

The NOWinBRAIN repository contains 12 galleries (G1-G12) with 3D neuroimages derived from 3D brain atlases constructed from multiple 3/7 T MR and CT scans of a living brain. Galleries G1-G6 with 5000+ images were earlier presented at RSNA. For RSNA 2023 this repository is extended, enhanced, and two new galleries are created with cortical and cranial openings (G8) and 3D simulated neurologic disorders with outcomes (G11). The NOWinBRAIN repository is web-based and publically available at [www.nowinbrain.org](http://www.nowinbrain.org)

### **NREE-88 Brain Bubbles: Updates on Intracranial Cystic Lesions**

Participants

Azza Reda, MD, Ottawa, ON (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- To describe the intra- and extra-axial cystic lesions based on the anatomical location.
- To highlight the recently described and updated cystic lesions.
- To provide an algorithmic approach describing incidental lesions elucidating the differential diagnosis with an aim to recognize do not touch lesions, aid in appropriate management, and prevent inadvertent surgical intervention.

#### TABLE OF CONTENTS/OUTLINE

Updated approach to diagnose neoplastic and neoplastic intracranial cystic lesions A. Intra-axial: supra and infratentorial parenchymal lesions. B. Extra-axial: supra and infratentorial; and each divided, into midline, off midline, and intraventricular lesions. Intra-axial cystic lesions • Non neoplastic lesions: Enlarged perivascular spaces (Glymphatic system and tumefactive type), Neuroglial cyst, porencephalic cyst, and ependymal cyst. • Infectious cysts: Cryptococcosis, Neurocysticercosis, and abscess. • Neoplastic lesions: MVNT and MVNT plus, DNET, ganglioglioma, metastasis, glioblastoma and oligodendroglioma, pilocytic astrocytoma, haemangioblastoma, medulloblastoma, pleomorphic xanthoastrocytoma, and rarely ependymoma. Extra-axial cystic lesions • Non neoplastic lesions: Pineal cyst, Rathke's cleft cyst, normal, arachnoid cyst, dermoid, epidermoid cyst, choroid plexus cyst and fissure, colloid cyst, Neurocysticercosis and neuroenteric cyst. • Neoplastic lesions: craniopharyngioma, schwannoma, ependymoma and pituitary apoplexy. Significant emphasis would be on the atypical cystic brain metastatic lesions and don't touch lesions.

### **NREE-89 MR Case-based Review of Cavernous Sinus Lesions**

Participants

Eva Romo, Madrid, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To review the anatomy of the cavernous sinuses and normal appearance on MR To make a case-based illustration of the MR imaging features on the main cavernous sinus lesions

#### TABLE OF CONTENTS/OUTLINE

Anatomy of the cavernous sinus MR protocol for suspected cavernous sinus pathology Case-based MR imaging findings of main cavernous sinus lesions Neoplastic Case 1: Pituitary adenoma Case 2: Meningioma Case 3: Giant hemangioma Case 4: Lymphoma Case 5: Chordoma Case 6: Metastatic lesion of skin carcinoma Inflammatory Case 7: Tolosa-Hunt syndrome Vascular Case 8: Cavernous ICAs aneurysms Case 9: ICA occlusion

### **NREE-9 Caught in the Web: Imaging Techniques in Identifying Ischemic Stroke Due to Carotid Web**

Participants

Ana Luiza Basilio Franca, Rio De Janeiro, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The carotid web is a rare vascular anomaly that can lead to ischemic stroke. Its diagnosis and management can be challenging due to its limited pathophysiology and presentation understanding. However, advanced diagnostic imaging techniques have greatly enhanced the identification and management of the carotid web. This educational exhibit highlights the importance of early detection, accurate diagnosis, and interdisciplinary approach to carotid web management: To illustrate carotid web radiologic highlights. To explain the complications involved with the finding. To explain the imaging assessment.

#### TABLE OF CONTENTS/OUTLINE

1. Definition of carotid web and revision of epidemiology, clinical presentation, and etiology, including prevalence and incidence of the carotid web, common clinical presentations, and etiological factors contributing to carotid web.
2. CT angiography highlights.
3. Underlying factors contributing to carotid web development, including early detection and management importance.
4. Differential diagnosis of carotid web and the importance of accurate diagnosis for appropriate management.
5. Potential complications associated with carotid web and the importance of identifying and managing complications promptly.
6. Clinical perspective: current

management strategies for carotid web and the importance of an interdisciplinary approach to the patient. 7. Take-home messages.

## **NREE-90 Big Vents: Causes of Hydrocephalus**

### **TEACHING POINTS**

Classification and terminology of hydrocephalus continue to be sources of confusion and debate in the literature. This exhibit provides an overview of the ventricular system and hydrocephalus classification scheme, covering typical pathologies and their imaging findings to enable the reader to approach hydrocephalus confidently. Normal ventricular anatomy consists of four interconnected choroid plexus-lined cavities and two canals. Anatomic variants can mimic hydrocephalus. Hydrocephalus is a disorder of flow, formation, or resorption of cerebrospinal fluid (CSF). Hydrocephalus classification is based on obstruction site and includes high pressure, normal pressure (NPH), and low-pressure subtypes. Intraventricular obstructive hydrocephalus (IVOH) inhibits CSF outflow due to obstruction at or before the 4th ventricle. Extraventricular obstructive hydrocephalus (EVOH) is due to obstruction anywhere from the 4th ventricular outlet foramina to the arachnoid granulations. Overproduction hydrocephalus is frequently caused by choroid plexus papilloma. NPH is diagnosed via a combination of history, neurological examination, and specific imaging findings. Syndrome of Inappropriately Low-Pressure Acute Hydrocephalus (SILPAH) is a rare and unrecognized condition with imaging findings mirroring severe obstructive hydrocephalus.

### **TABLE OF CONTENTS/OUTLINE**

Ventricular Anatomy CSF Production and Circulation Models Normal Variants Hydrocephalus Classification High Pressure subtypes IVOH EVOH Overproduction NPH SILPAH Summary

## **NREE-91 CNS Imaging Correlates of an FDA Cleared Diagnostic Meningitis/Encephalitis Panel**

Participants

Norbert Campeau, MD, (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

1. Diagnosis of CNS infections from cerebrospinal fluid collected by lumbar puncture is increasingly performed using comprehensive diagnostic panels. 2. This exhibit serves as a useful imaging reference atlas for the 14 microbial entities of meningitis/encephalitis included on an FDA cleared diagnostic panel which includes 6 bacteria, 7 viruses, and 1 yeast. 3. Knowledge of the imaging findings for these entities is clinically useful to monitor the extent of CSF involvement in known positive cases, or to suggest CSF testing in suspected cases undergoing CNS imaging. 4. The relative merits of CT, MRI and cranial ultrasound imaging modalities and contrast use will be discussed.

### **TABLE OF CONTENTS/OUTLINE**

A. The 14 microbial entities included on the diagnostic panel are: - 6 bacteria (*Haemophilus Influenza*, *Streptococcus pneumoniae*, *Neisseria meningitidis*, *Escherichia coli* K1, *Streptococcus agalactiae*, *Listeria monocytogenes*) - 7 viruses (*Enterovirus*, *Cytomegalovirus*, *Herpes Simplex 1*, *Herpes Simplex 2*, *Human Herpesvirus 6*, *Human parechovirus*, and *Varicella zoster*) - 1 yeast (*Cryptococcus neoformans/C. gattii*) B. The CNS imaging findings for each of the above microbial entities will be presented, including a brief synopsis of the epidemiology and clinical presentation. C. Summary Table of Imaging Findings.

## **NREE-92 Portable Ultralow Field (0.064 Tesla) MRI for Neuroimaging**

Participants

Saurabh Jindal, MD, MBBS, (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

1. Bedside magnetic resonance imaging (MRI) performed by an MRI or non-MRI-trained technologist in the presence of clinical staff/family. 2. Clinical utility in neurointensive care units and unstable patients who cannot be transferred to the MRI suite. 3. Standard sequences to diagnose common neurological emergencies, such as stroke, hypoxic-ischemic injury, and empyema. 4. Infarct or Artifact?: When in doubt on the low signal-to-noise ratio (SNR) diffusion-weighted images (DWI), evidence of edema on T2W/FLAIR images can aid in the diagnosis.

### **TABLE OF CONTENTS/OUTLINE**

1. Introduction to portable MRI scanner 2. Clinical cases 3. Teaching points 4. References 5. Acknowledgments

## **NREE-93 Radiologist's Guide to Image-guided Spinal Steroid Injections: Anatomy, Procedural Technique, and Potential Pitfalls**

Participants

Jeffrey Ling, MD, Joint Base Lewis-McChord, WA (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

Review pertinent spinal anatomy with emphasis on key radiographic landmarks for epidural needle access. Discuss the utility and indications for spinal steroid injections in the setting of neck or back pain. Provide a brief overview of image guided approaches that can be utilized for spinal steroid injections. Understand potential procedural pitfalls and complications.

### **TABLE OF CONTENTS/OUTLINE**

Introduction Epidemiology of painful spine conditions and associated imaging findings. Relevant anatomy of the lumbar and cervical spine. Indications and contraindications of image-guided steroid injections. Choice of corticosteroid and/or local anesthetics. Potential procedural risks and complications. Procedure approach and technique Preprocedural planning: evaluate degenerative disease at the target level, assess epidural target and adjacent structures, anticipate distance to target and optimal needle length; CT versus fluoroscopy technique. Interlaminar epidural steroid injections. Transforaminal epidural steroid injections: supraneural approach, infraneural approach. Complications Common: temporary local discomfort during needle placement; inadvertent dural puncture (CSF leak). Rare, serious: contrast reaction; hemorrhage, epidural hematoma; spinal cord infarct (intravascular injection). Discussion Evaluation of post-procedural improvement in pain. CT versus fluoroscopy. Review of tips and tricks for technical procedural success. Alternative options for pain relief.

## **NREE-94 The Big Picture: A Radiologist's Guide to Unlocking the Intricacies of Pediatric Neurometabolic Diseases**

### **TEACHING POINTS**

1. Brain MRI is the primary imaging modality for assessing neurometabolic disease in children. 2. MR spectroscopy should be considered as a supplemental imaging tool when neurometabolic disease is suspected. 3. Symmetric signal abnormalities involving white matter, basal ganglia, thalami, brainstem, and cerebellum can be major clues on imaging for neurometabolic disease. 4. Narrowing down the differential diagnosis requires further assessment of anatomic distribution, temporal progression, and additional imaging findings such as cysts and calcifications. 5. Age at presentation, particularly neonatal onset, is an important factor to consider when diagnosing devastating metabolic diseases in newborns.

### **TABLE OF CONTENTS/OUTLINE**

Introduction Brief overview of the importance of radiological assessment in pediatric neurometabolic disease Imaging Modalities for Neurometabolic Disease Highlighting brain MRI as the primary imaging modality Discussing the added value of MR spectroscopy Clues on Imaging for Neurometabolic Disease Describing specific patterns and findings on imaging, such as symmetric signal abnormalities involving white matter, basal ganglia, thalami, brainstem, and cerebellum Emphasizing the importance of pattern recognition in identifying potential neurometabolic disease Narrowing Down the Differential Diagnosis Discussing the role of further assessment, including anatomic distribution, temporal progression, and additional imaging findings such as cysts and calcifications Highlighting the significance of age at presentation, particularly neonatal onset Conclusion Summarizing the key take-home messages for radiologists in imaging pediatric neurometabolic disease

## **NREE-95 Multimodality Imaging of Cerebral Vasospasm**

Participants

Mikel Elgezabal, MD, Barrika, Spain (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

1. To highlight key concepts such as symptomatic vasospasm, radiographic vasospasm and delayed cerebral ischemia, that will help the reader understand cerebral vasospasm and its consequences. 2. To describe different diagnostic methods for detection of cerebral vasospasm, each with their advantages and disadvantages, providing illustrative examples. 3. To propose a practical diagnostic-therapeutic approach of severe SAH and vasospasm.

### **TABLE OF CONTENTS/OUTLINE**

1. Cerebral vasospasm: key concepts 1.1. Definitions: SAH, radiographic vasospasm, symptomatic vasospasm, delayed cerebral ischemia (DCI). 1.2. Etiology: SAH. Risk factors, diagnostic protocol, prognosis. 2. Diagnosis of cerebral vasospasm 2.1. Clinical signs and symptoms and other monitoring tools. 2.2. Transcranial Doppler ultrasound. 2.3. CT (NECT, CT perfusion, CTA) 2.4. DSA 2.5. Diagnostic management - proposed algorithm 3. Treatment: the fight against DCI 3.1. Medical treatment. 3.2. Angiographic/Interventional treatment and its complications. 4. Take home points

## **NREE-96 A Trip Through Gyrfiform Enhancement**

Participants

Adria Roset Altadill, MD, Girona, Spain (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

- Gyrfiform enhancement is mainly secondary to vascular and infectious causes. - Gyrfiform enhancement should be discerned at imaging from leptomeningeal enhancement. - Distinction between the different etiologies of gyrfiform enhancement has to be made based on clinical history, brain distribution and ancillary radiologic findings.

### **TABLE OF CONTENTS/OUTLINE**

Gyrfiform enhancement, also called gyral or cortical enhancement, is an uncommon brain pattern that refers to contrast deposition on the superficial grey matter of the cerebral cortex. The main causes of this enhancement pattern are vascular and infectious. Vascular causes can be related to arterial or venous infarctions, seizures, migraine syndromes, posterior reversible encephalopathy syndrome (PRES) and subarachnoid hemorrhage. Infectious processes include mainly herpes encephalitis, cerebritis and meningitis. Finally, gyral enhancement may also rarely occur in neoplastic diseases or cases of neurotoxicity. Cortical enhancement can be detected by contrast-enhanced head CT or brain MRI, although the latter is much more sensitive due to its higher contrast resolution. It is important to differentiate cortical enhancement from leptomeningeal enhancement, which can demonstrate a similar "serpentine" morphology but affects the subarachnoid space and the pia matter instead. In order to narrow the differential diagnosis between the spectrum of causes of cortical enhancement, a focus should be placed on clinical history, distribution of the gyral enhancement and ancillary radiologic findings.

## **NREE-97 Cerebrovascular Disease in Young Adults: A Case-Based Review**

Participants

Huijuan Wang, MD, Pontiac, MI (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

Cerebrovascular disease (CVD) can result from blood vessel narrowing, rupture, or a hypercoagulable state, which may present on imaging as vascular stenosis, hemorrhage, or occlusion, respectively. As an emerging public health issue with debilitating effects on young adults, recognizing the similarities and differences between young adults and elderly patients for the etiologies and prevalence of various types of CVD is imperative for optimal patient outcomes.

### **TABLE OF CONTENTS/OUTLINE**

1. Review the common etiologies and prevalence of cerebrovascular disease (CVD) in young adults and how this compares to elderly patients. 2. Categorize the differential diagnosis based on the general imaging appearance of vascular stenosis, hemorrhage, and occlusion in conjunction with the location of the abnormality. 3. Practice the diagnostic approach previously reviewed with multiple vignette-style young adult CVD cases with questions accompanying each case focused on differential diagnosis, prognosis, and

management.4. Discuss clinical presentation, key imaging findings, differential diagnosis, and management of each presented case.

### **NREE-98 Imaging of Deep Brain Stimulation Systems**

Participants

Alexandre Boutet, MD,MSc, Toronto, ON (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

(1) Deep brain stimulation (DBS) surgery, which is the most common functional neurosurgery treatment, is increasingly being performed worldwide. (2) Its therapeutic effect hinges upon accurate and precise targeting of the intended brain structure—maximizing therapeutic benefits while minimizing spillover onto neighbouring structures that may produce adverse effects. (3) Knowledge of the anatomical relationships of the most common targets including the subthalamic nucleus and pallidum is essential for accurate reporting. (4) Postoperative imaging of DBS patients is subject to strict MRI safety guidelines to prevent heating at the electrode tips, which is the main risk. Knowledge of the factors influencing safety such as specific absorption rate (SAR) is crucial to provide these patients with optimal MRI when it is required. (5) Interpretation of DBS postoperative imaging requires knowledge of the expected appearances and the complications. (6) Functional neurosurgery is a rapidly evolving field with considerable scope for the role of radiologists to grow beyond their current contributions.

#### **TABLE OF CONTENTS/OUTLINE**

(1) Brief background of functional neurosurgery focusing on DBS. (2) Anatomical relationships of the most common targets. (3) Framework on how to safely acquire MRI in postoperative DBS patients. (4) Expected and complicated postoperative imaging appearances of DBS. (5) Future directions and opportunities for radiologists.

### **NREE-99 MRI Characteristics of Chemotherapy Related Central Neurotoxicity: A Pictorial Review**

Participants

Rugaiyah Alkhatib, MBBS, FRCR, Singapore, Singapore (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Due to the increasing incidence of cancer and advancements in cancer treatment, the prevalence of chemotherapy-related neurotoxicity has also seen an increasing trend. Chemotherapy-related neurotoxicity is a well-recognized complication in oncologic patients, with a wide range of patients, from 19% to more than 85% receiving chemotherapeutic agents experiencing symptoms of neurotoxicity. This may present with a wide range of neurological manifestations, which can pose diagnostic challenges, particularly, in distinguishing it from tumor progression and paraneoplastic syndrome. Therefore, imaging plays a crucial role in the management of these patients. MRI can reveal various imaging patterns of chemotherapy-induced neurotoxicity, including acute-subacute leukoencephalopathy with reversible DWI pattern, commonly observed with methotrexate use, as well as acute cerebellar syndrome and reversible acute cerebellar toxicity patterns, which is most often induced by high-dose cytarabine. Other imaging patterns include posterior reversible encephalopathy syndrome, neurovascular complications pattern, progressive multifocal leukoencephalopathy pattern and spinal cord toxicity. In this pictorial review, we will highlight the MRI characteristics and patterns related to chemotherapy-induced neurotoxicity, as well as provide case-based examples to better illustrate these features.

#### **TABLE OF CONTENTS/OUTLINE**

1. Introduction  
2. Types of chemotherapeutic agents and mechanism of action  
3. Characteristics MRI features of chemotherapy-induced central neurotoxicity  
4. Conclusion

### Variants and Anomalies of Intracranial Cerebral Arteries and Considerations for Neuroendovascular Procedures

#### TEACHING POINTS

- To describe the embryology of the intracranial cerebral arteries in order to explain the origin of its anatomical variants and anomalies.- To review all the variants and anomalies of intracranial cerebral arteries giving examples from cases from our institution.- To revise the associated pathology and the implications for endovascular procedures.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction2. Embryology3. Intracranial Internal Carotid Artery 3.1. Variants. Tortuosity. 3.2. Anomalies 3.2.1. Aberrant carotid artery 3.2.2. Persistent estapedial artery 3.3. Ophthalmic artery4. Persistent carotid-basilar communications4.1. Trigeminal artery 4.2. Hypoglossal artery 4.3. Proatlantal intersegmental artery5. Anterior cerebral artery (ACA) 5.1. Variants 5.1.1. The anterior communicating artery 5.2. Anomalies 5.2.1. Infraoptic origin and persistent olfactory primitive artery 5.2.2. Accessory, multiple and aberrant ACA 5.2.3. Bihemispheric and azygos ACA6. Middle cerebral artery (MCA) 6.1. Variants 6.2. Anomalies 6.2.1. Accessory, fenestrated and duplicated MCA7. The posterior arterial circulation 7.1. Variants 7.1.1. Fetal origin 7.1.2. AICA-PICA 7.2. Anomalies 7.2.1. Basilar fenestration

### 'Incidental' Intracranial Arterial Anatomical Variants: Implications for Diagnosis, Pathology and Treatment

#### Participants

Charlotte Chung, MD, PhD, New York, NY (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Variability in intracranial arterial anatomy is well recognized to be the rule, not the exception. For example, the Circle of Willis is incomplete in 75-80% of brain CT/MR angiography. While anatomic variations may be clinically inconsequential in the normal patient, accurate delineation of the involved anatomy may be critical in the setting of pathology. This exhibit employs a systematic vessel-based approach to illustrate common intracranial arterial variants and their potential clinical implications through case-based discussions. Educational objectives of this exhibit are:- Outline intracranial arterial development and resultant spectrum of anatomic variations- Illustrate common 'incidental' variant configurations of the intracranial arteries on multimodal (CTA, MRA, and DSA) neuroimaging.- Highlight implications of anatomical variants in diagnosis, pathology, and treatment of cerebrovascular diseases

#### TABLE OF CONTENTS/OUTLINE

I. Case-based review of anatomical variants in the distal ICAII. Case-based review of anatomical variants in the Circle of WillisIII. Case-based illustration of the continuum of variant MCA and ACA cortical branching patternIV. Case-based review of anatomical variants in the vertebrobasilar circulationV. Variants in vessel morphology and caliber mimicking pathology

Printed on: 04/12/24

### Frontier Technology in Non-Invasive Vascular Imaging; Arterial Spin Labeling-Based Non-Contrast MR Digital Subtraction Angiography on Cerebral Diseases

#### Participants

Miho Gomyo, Mitaka, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To learn the basic principles of arterial spin labeling-based non-contrast MR digital subtraction angiography (ASL-MRDSA) that can obtain dynamic information of cerebral arteries without using a Gd-based contrast agent. 2. To learn various scanning methods of ASL-MRDSA. 3. To learn clinical applications of ASL-MRDSA to evaluate cerebral lesions. 4. To know some novel techniques of ASL-MRDSA. 5. To review pitfalls and limitations of ASL-MRDSA.

#### TABLE OF CONTENTS/OUTLINE

1. Basic principles of ASL-MRDSA 2. Various scanning methods of ASL-MRDSA and their characteristics; 2D-methods, 3D-methods, and ultra-short TE methods 3. Novel techniques of ASL-MRDSA 4. Clinical applications of ASL-MRDSA to evaluate the following diseases; • intracranial arterial stenosis/occlusion • moyamoya disease • arteriovenous malformation (AVM) • carotid-cavernous fistula (CCF) • dural arteriovenous fistula (dAVF) • extracranial to intracranial (EC-IC) bypass • hypervascular tumors (skull tumor, hemangioblastoma, paraganglioma, and so on) • post-operative study of cerebral aneurysms (clipping, coil embolization) 5. Pitfalls and limitations

NREE-101

### Patterns of Abnormal Magnetic Susceptibility in the Brain

#### TEACHING POINTS

1) Susceptibility weighted imaging (SWI) is an MRI sequence that uses phase and magnitude information to characterize substances that distort the local magnetic field, allowing for identification of hemosiderin, calcification, and iron deposition. 2) Depending on the pathology, abnormal magnetic susceptibility may appear as a single or multiple lesions and can present with varying morphology. 3) SWI lesion locations correlate with the disease mechanism. Understanding physiologic and pathologic reasons for localization is key to formulating the differential diagnosis and diagnosis 4) SWI is instrumental in characterization of vascular abnormalities, masses, and causes of microhemorrhage. 5) SWI is often able to detect changes earlier in a disease process than other sequences.

#### TABLE OF CONTENTS/OUTLINE

Pathology organized by susceptibility patterns: -Single lesion: - Location specific - Basal ganglia: neurodegenerative diseases, hypertensive hemorrhages, toxic/metabolic entities - Midline: desmoid - Sulcal: siderosis - Single vascular: thrombosis of cerebral vein or DVA, calcified embolus in Circle of Willis artery - Linear susceptibility along margins of cerebral mass: pyogenic abscess - Multiple lesions: - Location specific - Grey-white matter junction: hemorrhagic metastases, grade 1 DAI - Lobar: CAA - Diffuse vascular: ferumoxytol - Corpus callosum: grade 2 DAI - Brainstem: grade 3 DAI, kernohan phenomenon -Non-location specific - Diffuse axonal injury - Fat emboli - Microhemorrhage of acute illness, post-cardiac surgery

### Head On: Facing Central Nervous System Lymphoma

#### Participants

MARCELO DOS SANTOS BANDEIRA FILHO, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The purpose of this exhibit is- To explore the proper terminology and classification of lymphomas based on updates of the fifth edition of the WHO Classification of Tumors of the Central Nervous System (CNS).- List the main clinical and epidemiological characteristics and risk factors associated with the appearance of CNS lymphomas.- To show through a pictorial review the classic imaging findings of various lymphomas of the CNS.- Show atypical cases of lymphomas and develop adequate reasoning for the radiologist to face unusual findings.

#### TABLE OF CONTENTS/OUTLINE

Powerpoint Layout  
Introduction:1. Overview of clinical, epidemiological and risk factors.2. Neuroradiology:2.1 Terminology of SNC lymphomas.5th edition of the WHO 2.2 Classification of Tumors: SNC lymphomas.CNS Lymphomas:Primary diffuse large B-cell lymphoma of the CNS.Immunodeficiency-associated CNS lymphomaLymphomatoid granulomatosisIntravascular large B-cell lymphomaMiscellaneous rare lymphomas in the CNS:MALT lymphoma of the duraOther low-grade B-cell lymphomas of the CNSAnaplastic large cell lymphoma (ALK+/ALK-)T-cell and NK/T-cell lymphomas

### Photon Counting Detector Lateral Decubitus CT Myelography: A Developing Technique for Detection of Cerebrospinal Fluid - Venous Fistulas

#### Participants

Nikkole Weber, ARRT, RT, Rochester, MN (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Discuss protocol development and optimization of Photon Counting Detector (PCD) CT Myelography (CTM) 2. Describe features of PCD technology that improve detection of cerebrospinal fluid- venous fistulas (CVFs): spectral, spatial and fast 4D serial acquisitions 3. Demonstrate examples of CVFs found on PCD CTM

#### TABLE OF CONTENTS/OUTLINE

1. Review current imaging modalities for myelography 2. PCD CTM protocol development a. Performed in right and left lateral decubitus Trendelenburg positions b. Lumbar spine localizers c. Spinal needle placement intrathecally d. Bolus tracking to monitor contrast flow within the thecal sac e. Serial paired acquisitions, with multi-energy (ME) and high-resolution (HR)/ME scan modes 3. Unique technologic advantages of PCD that aide in detection of subtle CVF a. Higher spatial resolution i. Spinal anatomy of interest very small ii. HRME (0.2mm), ME (0.4mm) scan mode reconstructions b. Improved radiation dose efficiency compared to energy integrating detector CT scanners—reduced electronic noise, optimal photon weighting, smaller detector pixel size, and removal of septae. Resultant images with thinner slices and sharper kernels can be generated without increasing noise c. Spectral reconstructions to improve contrast enhancement and iodine contrast to noise ratio (CNR) i. Increased iodine CNR due to more optimal energy weighting of PCDs (more weight towards low-energy photons) ii. Subtle CVFs can be very faint. Virtual monoenergetic images (VMI) at low keV (40) increases the conspicuity of iodine d. Fast 4D acquisition: 3D volume + a series of acquisitions at different time points. e. Metal artifact reduction vs high keV VMI reconstructions tested 4. CVF example patient images

Printed on: 04/12/24

### MR Bone Imaging: Value of Application to Cervical and Intracranial Vessel Wall Imaging

#### Participants

Kazuhiro Tsuchiya, PhD, Tokyo, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To learn basic concepts and technical aspects of bone imaging like CT by MR imaging.2. To know basic concepts of vessel wall imaging (VWI) by MR bone imaging with improved visualization between vessel walls and vessel lumen.3. To know what benefits MR bone imaging offers over conventional cervical and intracranial VWI techniques and some pitfalls.

#### TABLE OF CONTENTS/OUTLINE

1. Basic issues of MR bone imaging including currently employed scanning sequences and postprocessing methods.2. MR bone imaging-based VWI: how to improve image quality.3. MR bone imaging-based VWI: how does it work in the diagnosis of vessel wall abnormalities?4. Presentation of clinical cases with discussion of implications. Cases will cover carotid calcified plaques, intracranial main trunk plaques, aneurysms, vasculitis, moyamoya disease, and so on.5. Additional discussion including current limitations and future directions of this technique.

Printed on: 04/12/24

### Posterior Fossa Ependymomas: Newly Defined Molecular and Genetic Subtypes with Characteristic Imaging Features

#### Participants

Shan McBurney-Lin, MD, MBA, San Francisco, CA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Posterior fossa (PF) ependymomas have been newly classified into two distinct subtypes, PFA and PFB, based on molecular and genetic features by the World Health Organization in 2021.<sup>2</sup> Each subtype has unique epidemiologic, biologic, prognostic, clinical, and imaging features.<sup>3</sup> Imaging plays an important role in differentiating the two subtypes of PF ependymomas and in distinguishing PFA and PFB subtypes from other PF tumors, which benefits surgical planning and tumor recurrence surveillance.<sup>4</sup> Upon completion of review of this exhibit, readers will be able to recognize the distinct molecular, genetic, and clinical features of PF ependymomas and become familiar with the characteristic imaging features of each subtype for improved early imaging diagnostic capability.

#### TABLE OF CONTENTS/OUTLINE

1. Overview of PFA and PFB ependymal tumor subtypes, including epidemiology, prognosis and molecular/epigenetic alteration<sup>2</sup>. Characteristic imaging features of PFA and PFB tumor subtypes<sup>3</sup>. Radiologic differences between PFA/PFB subtypes and similar entities within the radiologic differential diagnosis. Medulloblastoma. Atypical teratoid rhabdoid tumor. Pilocytic astrocytoma<sup>4</sup>. Summary and quiz. Summary of key radiologic findings of PFA/PFB subtypes. Quiz to review new knowledge via example cases

NREE-106

### SWI Brush Sign of Cerebral Parenchymal Veins in CNS Diseases and Conditions

#### Participants

Seiya Kishi, Tsu, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

SWI brush sign (BS) represents prominent intracerebral veins in various diseases including ischemic stroke, moyamoya disease, cerebral venous thrombosis (CVT) and Sturge-Weber syndrome (SWS). We aimed to 1) learn anatomy of intracerebral veins 2) understand mechanisms of SWI BS in each disease 3) learn clinical significance related to this sign.

#### TABLE OF CONTENTS/OUTLINE

1. What is SWI BS; SWI allows visualization of intracerebral veins (in white matter and occasionally in cortex). BS represents findings of prominent intracerebral veins in some diseases and conditions. 2. Diseases that cause the SWI BS; SWI BS is caused by ischemic stroke, moyamoya disease, CVT, and SWS. It may disappear over time with or without treatments. 3. Mechanisms of brush sign; Increased deoxyhemoglobin in venous blood (BOLD effect) in ischemic stroke and moyamoya disease Congestion, and partially BOLD effect in CVT and SWS. 4. Clinical significance related to SWI BS; indicates severe hemodynamic impairment in ischemic stroke correlates with severity in moyamoya disease and with increased intracranial venous pressure in CVT suggests the diagnosis of cortical vein thrombosis when found in affected cortex may contribute to better clinical outcomes in SWS.

### How to Improve in Intraoperative Image Quality in Transcranial MR-guided Focused Ultrasound Surgery

#### TEACHING POINTS

The objective of this exhibition is to provide a method for enhancing of intraoperative image quality in transcranial MR-guided focused ultrasound surgery (TcMRgFUS). TcMRgFUS possesses the distinct advantage of allowing expeditious assessment of therapeutic efficacy post each sonication and intraoperative magnetic resonance (MR) imaging for visualization of the lesion. In circumstances which denotes a lack of desired therapeutic effects and the lesion misses the planned target, subsequent ablation targets can be delicately re-aligned based on the intraoperative image. Thus, the acquisition of high-quality intraoperative images, which can accurately confirm the lesion, is imperative. The accuracy of this re-alignment is contingent upon the quality of the intraoperative image. Unfortunately, the current intraoperative image quality obtained from a 3.0T MRI system, is deficient in precisely identifying the lesion. In view of this limitation, we have been developed and substantiated a method for ameliorating the quality of intraoperative images.

#### TABLE OF CONTENTS/OUTLINE

1. TcMRgFUS procedure a. Overview of TcMRgFUS b. Intraoperative T2-weighted image using 3.0T MRI2. Method for improving intraoperative image quality a. Calculating manual transmitter gainb. Acquiring high-quality intraoperative T2-weighted image3. Effectiveness of enhancing intraoperative image quality a. Clinical images resultsb. Contrast between the lesion and thalamus

NREE-108

### Primary Angiitis of the Central Nervous System (PACNS): Imaging Features and Differential Diagnosis

#### TEACHING POINTS

-To provide a detailed review of the literature of PACNS.-To review the different imaging features of PANCS.-To know the most frequent mimickers of PACNS.

#### TABLE OF CONTENTS/OUTLINE

PACNS is a rare inflammatory vasculopathy (affecting the medium and small vessels) in brain and spinal cord that is frequently difficult to diagnose. The neurological manifestations vary, but they typically include chronic headache, encephalopathy, focal weakness, or stroke. Brain biopsy is the gold standard and only definitive test for PACNS, but has limited sensitivity, is invasive, and is associated with high rates of morbidity. Lumbar puncture is also performed, but has limited specificity for diagnosis. Catheter angiography is the imaging reference standard and is frequently employed, even though it has limited sensitivity and specificity. Neuroimaging is critical in the diagnosis of PACNS. PACNS may present with diffuse or multi-focal white matter abnormalities, hemorrhagic stroke, single or multi-territorial ischemic infarcts, micro-hemorrhages, and pseudotumoral lesions. Vessel wall MRI increases diagnostic accuracy by showing concentric mural thickening and contrast enhancement in brain arteries affected by vasculitis. Reversible cerebral vasoconstriction syndrome, atherosclerosis, Moyamoya disease, CLIPPERS, primary CNS diffuse lymphoma, and secondary cerebral vasculitis are the most common differential diagnoses. In this review, we will illustrate and describe the radiological appearance and differential diagnosis of primary angiitis of the central nervous system (PACNS), and imaging's role in diagnosis.

### The T2-FLAIR Mismatch Sign in Oncologic Neuroradiology: Imaging Criteria, Current Uses, and Histo-Molecular Correlates

#### Participants

Samir Dagher, MD, BS, Houston, TX (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Detecting the "classic" T2-FLAIR Mismatch sign (T2FMM) requires a strict application of the T2 and FLAIR criteria in adult patients with suspected CNS gliomas. The "classic" T2FMM exhibits near-perfect specificity yet variably low sensitivity for the diagnosis of astrocytoma, IDH-mutant in adults. 2. A less stringent application of the strict criteria allows for the detection of the "partial" T2FMM. Studies suggest it may reliably exclude the diagnosis of glioblastoma, IDH-wildtype while compromising the near-perfect specificity of the "classic" sign. 3. Differences in MRI acquisition parameters may affect the visibility of the T2FMM. 4. The T2FMM has also been reported in pediatric-type CNS tumors, namely dysembryoplastic neuroepithelial tumors and H3K27-altered diffuse midline gliomas. 5. Although limited data suggests significantly larger intercellular spaces, including microcysts, and upregulation of the mTOR pathway in mismatched compared to non-mismatched tumors, this has not yet translated into prognostic implications. 6. Mismatched tumors have significantly higher apparent diffusion coefficient, and lower relative cerebral blood volume on diffusion- and perfusion-weighted imaging, respectively, compared to non-mismatched tumors.

#### TABLE OF CONTENTS/OUTLINE

1. Adult-type diffuse gliomas in the 2021 WHO classification of CNS tumors. 2. The "classic" T2FMM: imaging criteria, clinical uses and pitfalls. 3. The "partial" T2FMM: imaging criteria and clinical uses. 4. The T2FMM in pediatric-type tumors. 5. Clinical and histo-molecular correlates. 6. Diffusion- and perfusion-weighted imaging correlates.

### Cerebral Small Vessel Disease: Small Size, Big Problems

#### Participants

Eduardo Freire, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Review the imaging patterns of cerebral small vessel disease (SVD). Review the classification and subgroups of SVD. Correlate clinical findings and complaints with imaging patterns. Review the subtypes of SVD and their own diagnostic criteria. Review the Boston criteria 2.0 for cerebral amyloid angiopathy (CAA). Review the new markers of Boston criteria 2.0. Discuss the role of the radiologist in the diagnosis of SVD.

#### TABLE OF CONTENTS/OUTLINE

Cerebral Small Vessel Disease (SVD) is a high prevalence disease, and a common cause of stroke and dementia. Although SVD can be asymptomatic at the beginning, some imaging findings may suggest its diagnosis. The study "Standards for Reporting Vascular change on neuroimaging (STRIVE)" shows SVD imaging patterns on brain magnetic resonance (MR) that allows considering it as a differential diagnosis. SVD comprises a group of diseases that affect capillaries, arterioles, small veins and venules, and small perforating arteries. Didactically, we can classify SVD according to its pathological and genetic characteristics into sporadic and hereditary (genetically determined). Sporadic subtypes are the most common and represent the two main etiologies of SVD: hypertensive and related to cerebral amyloid angiopathy. Brain MR imaging findings are usually similar for all etiologies. To assist the radiologist, STRIVE compiled imaging findings that represent SVD's indirect signs.

### It's Not All About the Shine: Spotting MS MRI Biomarkers

#### Participants

Nicole Lambrakos, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Briefly describe the multiple sclerosis biomarkers and which techniques have the highest sensitivity and specificity.2. Discuss the importance of spotting imaging multiple sclerosis biomarkers and their pathology correlation.3. Expose the role of MR in identifying the main multiple sclerosis biomarkers.4. Looking for multiple sclerosis biomarkers in doubtful lesions to favor demyelinating etiology.

#### TABLE OF CONTENTS/OUTLINE

1. Main multiple sclerosis biomarkers identifiable via MR.2. Pathophysiology: correlation of imaging and pathology of multiple sclerosis biomarkers.3. Differential diagnosis: using MR biomarkes to help favor demyelinating etiology.

Printed on: 04/12/24

### Pituitary Insufficiency in Children: Spectrum of MR Imaging Findings

#### TEACHING POINTS

1. Hypo-functioning pituitary tissue may appear normal on MRI. 2. Congenital anomalies of hypothalamic-pituitary axis (HPA) often present with pituitary insufficiency in children and are frequently associated with additional CNS anomalies. 3. Normally developed but hypo-functioning pituitary tissue may demonstrate subtle imaging abnormalities such as small size or decreased enhancement. 4. Common infiltrative lesions resulting in pituitary insufficiency in children include germ cell tumors and histiocytosis. 5. Pituitary insufficiency can be seen as a long-term side effect of radiation treatment for pediatric posterior fossa tumors.

#### TABLE OF CONTENTS/OUTLINE

1. Background a. Normal embryologic development of the HPA b. Characteristics of normal HPA on MR imaging, including quantitative assessment of pituitary gland enhancement c. Brief clinical overview of hypopituitarism in children 2. Case-based review highlighting the spectrum of abnormalities seen in 85 children with pituitary insufficiency seen at a tertiary care children's hospital over a 5-year period. a. Normal pituitary gland b. Subtle imaging abnormalities in otherwise well-formed HPA c. Congenital abnormalities affecting HPA i. Associated CNS anomalies d. Mass Lesions involving HPA i. Neoplasms ii. Non-neoplastic e. Post-radiation pituitary insufficiency

### Highways to the Danger Zone: Craniofacial to Cerebrovascular Anastomoses

#### TEACHING POINTS

1) The etiology of vascular collateralization includes congenital and pathologic connections. 2) Cerebral angiography is the gold standard for identifying extra- to intra-cranial collateralization. 3) Familiarity with the functional vascular territory schema for extra- to intra-cranial collaterals can help dictate appropriate and safe treatment.

#### TABLE OF CONTENTS/OUTLINE

1) Background a) Review of extra- to intra- cranial anastomosis. i) Developed in the setting of large artery occlusion, vascular agenesis, or high flow shunting due to "sump effect". ii) Small non-visualized collaterals can open in response to acutely increased intra-arterial pressure (e.g., embolization, superselective injection). iii) Anastomotic channels often follow cranial nerves. b) Review of normal cerebrovascular anatomy c) Extra- to intra- cranial anastomotic classification scheme i) Orbital ii) Petrocavernous-Clival iii) Cervical iv) Dural-Pial 2) Interactive case-based review of anastomotic channels organized by functional vascular territories a) Non-invasive imaging b) Cerebral angiography c) Interactive 3D-reconstruction 3) Implications for endovascular therapy a) Complications (e.g., stroke, cranial nerve palsy) b) Common angiographic markers to avoid injury (e.g., choroidal blush) c) Methods to avoid non-target embolization (e.g., balloon occlusion) 4) Summary

### Newly Recognized Neurodegenerative Conditions and Adult-onset Leukodystrophies: An Updated Guide in the Genomic Era

#### Participants

Amit K. Agarwal, MD, MBBS, Jacksonville, FL (*Presenter*) Stockholder, Gilead Sciences, Inc

#### TEACHING POINTS

Teaching points 1. To discuss the recent updates in molecular markers and genetics for neurodegenerative conditions 2. To discuss radiological pattern recognition of the newly recognized neurodegenerative conditions and adult-onset leukodystrophies

#### TABLE OF CONTENTS/OUTLINE

1. Molecular markers and genetics a. Next generation sequencing b. Neurodegenerative genome panel c. Leukodystrophy genome panel 2. Classification of neurodegenerative conditions [NDD](focus on TDP-43) 3. Recently recognized NDD a. TDP-43 proteinopathies -Limbic-predominant age-related TDP-43 encephalopathy (LATE) - Facial onset sensory and motor neuropathy (FOSMN) - Cerebral age-related TDP-43 with sclerosis (CARTS)- Multisystem proteinopathy (MSP) - Perry disease (DCTN1 mutations)b. Amyloidoses - Transthyretine-associated cerebral amyloidosis - Neuronal intranuclear hyaline inclusion disease (NIHID)c. Other (miscellaneous) -New brain iron accumulation NDD (BPAN, FAHN)- Chronic traumatic encephalopathy (tauopathy) - EPM1- Unverricht-Lundborg disease -4. Recently recognized adult-onset leukoencephalopathies a. CSF1R-leukoencephalopathy (hereditary diffuse leukoencephalopathy with spheroids) b. AARS2-leukoencephalopathy c. CARASIL (cerebral autosomal recessive arteriopathy) d. CARASAL (cathepsin A-related arteriopathy with strokes) e. COL4A1 and TREX1 associated leukoencephalopathiesf. Leukoencephalopathy with brainstem and cord involvement with elevated lactate (LBSL) g. Late-presenting hypomyelinating disorders (PLP1, GJC2, TUBB4A, POLR3A, POLR3B, CLCN2, NKX6-2)5. Simplified MRI approach for NDD6. Summary/conclusion

### Posterior Cranial Fossa Tumors: Tips and Tricks for Diagnosis

#### Participants

Nahia Lizarraga Oroz, MD, Donostia, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Review the anatomy of the posterior cranial fossa (PCF). - Establish a proper differential diagnosis based on patient age and imaging findings. - Highlight the specific radiological features of the most common posterior cranial fossa tumors (PCFT).

#### TABLE OF CONTENTS/OUTLINE

The PCF is the infratentorial compartment of the cranial vault that houses the cerebellum, brainstem and fourth ventricle. Tumors that settle in this location have serious implications not only because of their potential malignancy but also because they can cause brainstem compression, herniation and hydrocephalus, among other complications. Tumor location and patient demographics, as well as imaging findings on CT or MR must be considered in order to establish a proper differential diagnosis. While cerebellar metastases are the most common PCFT in adults, medulloblastoma is the most common in children. Specific radiologic features have been described to differentiate PCFT, allowing the radiologist to make an accurate diagnosis. In addition, neuroimaging is also useful in surgical planning for these tumors. In this work we review the most common PCFT in patients of all ages, through cases studied in our center highlighting the key radiologic findings that enable us to make a correct diagnosis.

### Insights into Neural Connections: Neuroimaging and Neuromodulation in Parkinson's Disease and Essential Tremor

#### Participants

Sonoko Oshima, MD, PhD, Los Angeles, CA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Knowledge on neural connections in movement disorders is crucial to understand mechanisms of clinical manifestations, diagnose the diseases, and maximize benefits and minimize side effects of therapies. The aim of this presentation is to improve radiologists' role in diagnosing and treating Parkinson's disease (PD) and essential tremor (ET) by 1) overviewing neural connections between cortex and deep gray matter and 2) discussing neuromodulation therapies for movement disorders including deep brain stimulation (DBS) and MR-guided focused ultrasound (MRgFUS) from the perspective of neural connections and neuroimaging.

#### TABLE OF CONTENTS/OUTLINE

1) Neural connections related to Parkinson's disease and essential tremor - Histological findings - Imaging findings 2) Neuromodulation therapies: deep brain stimulation (DBS) and MR-guided focused ultrasound (MRgFUS) - Neurophysiological mechanisms - Treatment targets: subthalamic nucleus (STN), globus pallidus interna (GPi), ventral intermediate nucleus (Vim) of the thalamus - Localization of targets by imaging technique: indirect and direct targeting - Post-operative imaging

### Unraveling Dementia Imaging: Challenging Common Misconceptions and Exploring Emerging Conditions

#### Participants

Siddhant Dogra, MD, New York, NY (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

(1) Radiologists are generally unfamiliar with clinical and imaging features of common neurodegenerative diseases and wary of suggesting it in their reports. (2) AD, FTLD, PPA and DLB often present with classic, unambiguous appearances on CT, MRI and FDG PET. (3) PCA and CBDS have typical clinical and imaging presentations but are syndromes with multiple potential underlying causes. (4) As the US population ages and lifespans increase, mixed dementia and recently described, more indolent forms of neurodegenerative disease become more prevalent. (5) Newly recognized neurodegenerative diseases (CARTS, LATE and PART) share clinical and imaging features, and may mimic Alzheimer's disease.

#### TABLE OF CONTENTS/OUTLINE

(1) Neurodegenerative disease in everyday radiology (2) Classic clinical, MRI and FDG PET presentations of neurodegenerative diseases: Alzheimer's Disease, Frontotemporal Lobar Degeneration, Primary Progressive Aphasia, Dementia with Lewy Bodies, Vascular cognitive impairment (3) Challenges to neurodegenerative imaging workup: "Normal aging?", Specificity limits of MRI, FDG or Amyloid PET, Mixed dementia is common, Dementia with Lewy bodies (Mimic of both PD and AD, Current imaging limitations, Frequent comorbidity with AD), Confusion in radiology re: clinical-radiology syndromes (Specific diagnosis vs differential for underlying pathology, CBDS [corticobasal degeneration syndrome], PCA [posterior cortical atrophy], PPA [primary progressive aphasia], (4) Newly recognized indolent forms of neurodegeneration: Mimics of AD in patients > 75 years (CARTS, PART, LATE), Are there specific MRI and PET findings?

### Quick Diagnosis and Treatment - A Novel AIS Treatment Strategy using Hybrid Emergency Room System

#### TEACHING POINTS

•A quick diagnosis is important to determine treatment indications for patients who have AIS. •HERS (Hybrid-Emergency Room System) is an all-in-one concept for an Emergency Room. HERS is useful in critical trauma treatment strategies as computed tomography, interventional radiology and surgery are available in one environment. •It is reported that using HERS for AIS, shortened the time to reperfusion. •With my study, we have setup an AIS protocol that allows a Time Based Strategy and Tissue Based Strategy using HERS.

#### TABLE OF CONTENTS/OUTLINE

•We established an AIS treatment strategy (one stop management) using HERS (Angio-CT suite). •HERS can go from diagnostic imaging to treatment without transferring the patient from department to department. •A one-stop stroke protocol with simultaneous CT perfusion and whole body CTA can determine treatment indications, optimize treatment planning, and ensure safety. •This novel protocol is useful for identifying occluded vessels, assessing brain function, and confirming access routes. • Using our approach, a quick diagnosis and quick treatment were possible in cases of acute aortic dissection, aortic aneurysm rupture, carotid artery stenosis, carotid artery dissection in patients suspected with AIS. •A one-stop stroke protocol using HERS can be confirmed to shorten the door-to-image and treatment time and increase the re-canalization rate.

### Don't Hold Your Breath: Reproducible Hypercapnic Stimuli for Cerebrovascular Reactivity Mapping with RespirAct

#### Participants

Diana Vera, MD, Rochester, MN (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Review the fundamental physiology of hypercapnia and its association with cerebrovascular reactivity (CVR).2. Explain the mechanisms and advantages of hypercapnic stimuli as generated by the RespirAct instrument as compared to conventional breath-hold techniques for BOLD fMRI-based CVR mapping.3. Showcase representative examples of patients with cerebrovascular disease and CVR maps produced by RespirAct and BOLD fMRI.

#### TABLE OF CONTENTS/OUTLINE

I. Hypercapnia and its association with cerebrovascular reactivity (CVR)a. Fundamentals of CVRb. Importance of measuring CVRII. Design of the RespirAct device for the production of controlled hypercapniaa. Current established practiceb. The RespirAct device descriptionIII. Comparison of RespirAct and conventional breath-hold methods of CVR mapping with BOLD fMRIa. A brief review of the origin of the BOLD signalb. RespirAct advantages over conventional breath-hold techniqueIV. Representative examples of CVR measurements with RespirAct in the context of a. Cerebrovascular steno-occlusive diseasesb. Arteriovenous malformationsc. Brain tumorsV. Summary/Conclusion

### Spinal Vascular Malformations: A Systematic Angioarchitecture and Pathophysiology-Based Approach to Classification and Diagnosis

#### Participants

Charlotte Chung, MD, PhD, New York, NY (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Spinal vascular malformation refers to a spectrum of lesions with abnormal connection between (or morphology of) spinal arteries and veins, all of which differ in angioarchitecture, pathophysiology, and clinical sequelae. Advances in angiographic and non-invasive imaging techniques have improved spinal vasculature visualization, enabling identification of distinctive morphologic and hemodynamic features. This exhibit introduces a comprehensive classification system based on these imaging features to aid diagnosis of well recognized as well as rare/recently identified spinal vascular lesions. The educational objectives of this exhibit are:- Review normal spinal vascular anatomy.- Discuss multimodal imaging techniques for evaluating spinal vascular malformations.- Differentiate spinal vascular malformations based on location, angioarchitecture, pathophysiology, and symptomology.- Illustrate radiographic appearance of spinal vascular malformations including arteriovenous fistulas and malformations, and non-shunting lesions such as aneurysms.

#### TABLE OF CONTENTS/OUTLINE

I. Annotated diagrams of normal spinal arterial and venous anatomy  
II. Imaging techniques for spinal vascular malformation evaluation  
III. Systematic classification of spinal vascular malformations  
IV. Radiographic features of various spinal vascular malformations  
V. Radiographic mimics

### Uncovering the Hidden Dangers: Addressing Diagnostic Errors in Brain Emergency Neuroradiology

#### Participants

Maria Lucia Brun, MD, OTTAWA, ON (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- To explain the importance of accurate and timely diagnosis in brain emergency neuroradiology. - To describe the different types of diagnostic errors in brain emergency neuroradiology. - To identify the potential causes of diagnostic errors and to develop effective strategies for error prevention and mitigation in emergency neuroradiology. - Case-based series examples to highlight different error types and the factors that led to the errors.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction  
2. Background  
3. Types of errors:- Cognitive errors: biases or heuristics that influence the radiologist's thinking or decision-making (Framing, Anchoring, Alliterative, Satisfaction of search, Availability, Attribution).- Communication errors: Breakdown in communication.- Perception/perceptual errors: Misinterpretation or misperception.- Technical errors: Limitations in the imaging equipment or technique used. - Organizational errors: Factors outside of the radiologist's control (workload, staffing issues, etc)  
4. Consequences of errors- Delayed/missed diagnoses- Incorrect/unnecessary treatments - Patient harm- Legal and financial consequences  
5. Strategies for error prevention and mitigation in emergency neuroradiology- Valuable tools to reduce errors in the imaging evaluation of brain emergencies- Showcase the particular strategies used at our departments.  
6. Case series examples- Provide case examples to further illustrate and explain the statements mentioned above.- Highlight the factors that led to the errors and how they could have been prevented or mitigated in that particular case.  
7. Conclusion

Printed on: 04/12/24

### **A Game-Changing Approach to Non-Invasive Vascular Imaging: Ultra High-Resolution CT with Novel Deep Learning Reconstruction**

#### **TEACHING POINTS**

1. To learn the basic principles of ultra high-resolution CT (UHRCT). 2. To learn the basic principles of the novel reconstruction technology "deep learning reconstruction (DLR)". 3. To know the differences in image quality between DLR and conventional reconstruction methods on brain CTA using UHRCT. 4. Clinical applications of brain CTA with DLR using UHRCT and comparison with digital subtraction angiography (DSA). 5. To know the pitfalls of CTA with DLR and DSA on cerebral diseases. 6. To present the outlook of brain CTA with DLR using UHRCT in the near future.

#### **TABLE OF CONTENTS/OUTLINE**

1. Basic principles of UHRCT 2. Basic principles of the novel imaging reconstruction method "DLR" 3. The image quality of DLR and conventional reconstruction methods on brain CTA using UHRCT 4. Clinical applications of brain CTA with DLR using UHRCT and DSA to evaluate the following diseases: intracranial aneurysms, moyamoya disease, arteriovenous malformations (AVMs), dural arteriovenous fistulas (dAVFs), giant cell arteritis, tumors (skull tumor, meningioma, schwannoma, glioma, and so on) 5. Pitfalls of CTA and DSA 6. The future outlook of brain CTA with DLR using UHRCT

### Erdheim-Chester Disease Beyond MSK: Do You Know What to Look for in Brain MRI?

#### Participants

Marta Barrios Lopez, MD, Santander, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To explain and illustrate the main neuroradiological findings in Erdheim-Chester Disease (ECD), an uncommon type of systemic histiocytosis with almost constant bone involvement. 2. To learn the prognostic implications of certain neuroradiological findings. 3. Much of the literature on this subject focuses on its musculoskeletal findings. However, neuroradiological manifestations are an important source of morbidity and mortality in these patients.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction: 1.1. Main systemic manifestations of ECD: establishing a context. 1.2. The BRAF mutation and its (neuro)imaging implications. 2. Neuroradiological findings: 2.1. Introduction: Classification and frequency of neurological manifestations. MRI protocol. 2.2. Intra-axial involvement. Typically infratentorial. 2.3. Hypothalamic-pituitary manifestations. Several patterns. 2.4. Meningeal involvement: Different patterns. Masses often present a diagnostic challenge. 2.5. Orbital involvement. Do not forget the orbits in your systematic search. 3. Conclusions 4. References

### Neurocysticercosis: Findings from a Challenge Disease in the Third World

#### TEACHING POINTS

The purposes of this exhibit are: review and illustrate the imaging findings of neurocysticercosis, the differential diagnoses, and their correlation with pathological images. Describe through illustrative presentations the benefits of the multimodality imaging approach to the diagnosis of neurocysticercosis. Present challenging cases, such as pseudotumoral lesions. Establish the imaging red flags and how they can help the radiologist reach the correct diagnosis.

#### TABLE OF CONTENTS/OUTLINE

Neurocysticercosis stages and parasite life cycle. Imaging patterns on MR and CT. Susceptibility weighted imaging (SWI) role on calcified lesions. Diffusion-weighted imaging (DWI) showing the scolex. Spectroscopy as a valuable tool for differential diagnosis. 3D CISS sequence applicability for subarachnoid lesions. Vessel wall imaging sequence showing vasculitis with or without infarction. Pseudotumoral lesions. Differential diagnoses based on a pictorial review using representative cases from a Tertiary University Hospital database. A practical approach for better diagnostic accuracy and avoiding pitfalls. Final remarks.

### Evaluation of Head and Spinal CT Angiography with Photon-counting Detector CT: How Close to the Angiographic and Operative Findings

#### TEACHING POINTS

The purpose of this exhibit is: 1) To review imaging of head and spinal CT angiography with photon-counting detector CT 2) To correlate with angiography and intraoperative findings.

#### TABLE OF CONTENTS/OUTLINE

Recently, Photon-counting detector (PCD-CT) has been developed and enabling high-resolution imaging at a lower radiation dose. PCD-CT employs a photon-counting detector that can measure the number of incident X-ray photons and their energy. The newly released PCD-CT (NAEOTOM Alpha, Siemens Healthineers, Forchheim, Germany) has been in clinical use at our institution since December 2022. The PCD-CT offers several advantages over current state-of-the-art energy-integrating detector CT (EID-CT). The PCD-CT does not require septa to create a detector channel but does EID-CT. Therefore, it can be seen that downsizing the anode to achieve higher resolution does not affect the dose efficiency of the PCD-CT. The purpose of our exhibit is to present head and spinal cord CT angiographic images acquired with PCD-CT and corresponding images acquired angiographically and intraoperatively to clarify the delineation potential of PCD-CT. In spinal arterio-venous fistula (AVF), feeder, shunted pouch, and drainer are depicted in CTA. In spinal tumor of hemangioblastoma, tumor drainer is recognized in CTA. We would like to provide insight into how close the PCD-CTA findings are to the angiographic and intraoperative findings.

### MRI Analysis of Causes and Consequences of Acute Epileptic Seizures from Temporal Lobe Origin

#### Participants

Silvana Sarria Estrada I, MD, PhD, Barcelona, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

MRI is useful to diagnose the cause and functional changes associated with acute seizures or status epilepticus (SE) from temporal lobe origin. Several MRI abnormalities on diffusion/perfusion-weighted, T2-weighted and contrast-enhanced T1-weighted sequences, observed after acute seizures in chronic conditions, even distant from the temporal lobe, are relevant to detect changes in the evolution. The identification of inflammatory component on MRI after a new onset temporal lobe seizure impacts the prognosis of infectious or autoimmune encephalitis, stroke or malignant tumours. Acute MRI findings in new onset seizures or SE are often subtle or unspecific. Timing of serial follow-up MRIs must be protocolized. Increase of amygdalar enlargements, hippocampal atrophy or autoimmune epilepsies can be detected using time defined follow-up MRI studies. In conclusion, a standardized MRI protocol for acute seizures and SE that analyses structure and function of the temporal lobe can lead to an early diagnosis of severe and chronic disorders. The time intervals between serial follow-up MRIs are relevant to avoid further consequences.

#### TABLE OF CONTENTS/OUTLINE

1 Temporal lobe seizures are often associate with ictal MRI abnormalities. 2 Acute MRI can diagnose acute seizures or status epilepticus. 3 Some MRI features, even distant from chronic lesions, may suggest change in evolution. 4 Early MTI features in new onset seizures can lead to the diagnostic of chronic conditions. 5 Time-defined serial MR scans are needed in cases of subtle or unspecific MRI features.

NREE-126

### The Haunted Core in Acute Ischemic Stroke

#### TEACHING POINTS

Perfusion-based imaging used in the evaluation of tissue viability is crucial in the management of patients with acute ischemic stroke (AIS), especially in extended time windows. Currently used imaging techniques in AIS cannot accurately differentiate between salvageable and non-salvageable tissue. There is no widespread gold standard definition of ischemic core. Different findings highlighting current challenges and solutions in AIS imaging will be presented through clinical cases.

#### TABLE OF CONTENTS/OUTLINE

Perfusion-based CT and MR imaging techniques are used for detection of AIS and evaluation of tissue viability. At present, common available imaging techniques fail to accurately differentiate between salvageable and non-salvageable ischemic tissue. Additionally, a widespread gold standard definition of the ischemic core is lacking. Through clinical cases, image findings highlighting challenges and solutions in the evaluation of tissue viability will be discussed, like limited sensitivity to detect early ischemic changes on non-contrast enhanced CT (NCCT), variation in outcome after successful recanalization, potential reversibility of DWI-lesions, false negative initial DWI, overestimation of ischemic core on perfusion computed tomography and variation in penumbra and core volume calculations. Considering the important role of imaging in the management of patients with AIS, it is crucial with profound knowledge about advantages and limitations of penumbra and core evaluation. The teaching points will be extensively illustrated through clinical imaging examples.

### **Cavernous Sinus Dural Arteriovenous Fistulas: Relevant Vascular Anatomy, Angioarchitecture and Endovascular Treatments**

#### **Participants**

Hiro Kiyosue, MD, (*Presenter*) Research Grant, Koninklijke Philips NV

#### **TEACHING POINTS**

Dural arteriovenous fistulas (DAVFs) frequently involve the cavernous sinus (CS). Although CSDAVFs are usually associated with benign ocular symptoms, they can cause aggressive symptoms such as cerebral hemorrhage. Those symptoms are strongly related to the pattern of venous drainage. Recent advances of imaging and therapeutic technologies allow us to evaluate their angioarchitecture precisely and to treat them effectively by endovascular techniques. However, serious complications such as fetal hemorrhage and infarction can occur during and after embolization mainly due to overlooking of tiny but important vessels relevant to CSDAVFs. This presentation demonstrates imaging anatomy of important vessels relevant to the CS, angioarchitecture of CSDAVF, and tips and tricks for successful endovascular treatments. CS is derived from three different venous systems of prootic sinus, duro-osseous venous plexus, and primitive tentorial sinus. Anatomical variations occur during development of CS. The CSDAVFs are fed by multiple feeders from the internal and external carotid arteries, which converge to form shunted pouches adjacent to the CS. The CSDAVFs are effectively occluded by selective embolization of those shunted pouches. Inadequate embolization of the venous outflow may lead serious complication.

#### **TABLE OF CONTENTS/OUTLINE**

1. Relevant vascular anatomy:1-1. Arterial branches to the CS and their potential anastomoses.1-2. Venous tributary and their variations.2. Angioarchitecture of CSDAVF: common feeders, shunted pouches, and dangerous drainage routes3. Endovascular techniques: various access routes, selective transvenous embolization, and sinus packing

### Understanding Perisylvian Cortical Anatomy: Tips and Tricks

#### Participants

Sally Choi, MD, BS, San Antonio, TX (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Perisylvian area serves as a crossroad for important cortical structures with principal functions for example Broca's area is located along the anterior and ascending rami of the Sylvian fissure (M sign) o Wernicke area is classically located along the inferior aspect of the posterior ramus of the Sylvian fissure
- Important structures form this area areo Frontal operculum o Parietal operculum o Temporal operculum o Insula
- Knowing these structures is beneficial for a radiologist in describing the anatomical component of a lesion to better understand the physiologic symptoms corresponding to the lesion location with surgical and prognostic importance.

#### TABLE OF CONTENTS/OUTLINE

- Briefly discuss the Sylvian fissure anatomy
- Discuss the different cortical structures form the perisylvian area such as frontal, parietal and temporal operculum and insula.
- Discuss the MRI anatomy of these structures utilizing some tips and tricks to understand the anatomy such as- M shaped appearance of the inferior frontal gyrus along the anterior and ascending rami of the Sylvian fissure
- Discuss the role of these cortical structures in the principal functions of the body.
- Discuss the role of relevance of Functional MRI in these areas

### The Cortico-Limbo-Thalamo-Cortical Circuits: An Update to the Papez Circuit of the Limbic System

#### Participants

Parnian Shobeiri, MD, MPH, Tehran, (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

? The Papez circuit is a circuit believed to control memory and emotion, composed of the cingulate cortex, entorhinal cortex, parahippocampal gyrus, hippocampus, hypothalamus, and thalamus. ? In recent years, multiple additional limbic fiber connectivity has been revealed using diffusion-weighted imaging (DWI) techniques. Some of these fiber tracts include the amygdalofugal tract (AFT), amygdalothalamic tract (ATT), stria terminalis (ST), dorsal thalamo-hypothalamic tract (DTH), cerebello-hypothalamic tracts, and the parieto-occipito-hypothalamic tract (POHT) ? This presentation aims to summarize the anatomy of the limbic system, outline previous updates to the circuit, and elaborate on the anatomical connectivity of the limbic circuits based on recent DWI as an update to the original Papez circuit.

#### TABLE OF CONTENTS/OUTLINE

? The original Papez circuit and updates over time ? The Yakovlev model/circuit ? The MacLean's model ? Overview of high spatial resolution diffusion weighted imaging ? Review of previously established Papez circuit (See Figures 1-5 for specific tracts) ? Detailed fiber tract anatomy ? Updates to previously known limbic circuits: the role of additional fibers in creating multiple neuronal loops and circuits

### Mapping the Way: A Road Map for Diagnosing, Treatment and Follow Up of Brain Metastases

#### Participants

Julia Brunelli, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

This educational exhibition aims to provide a comprehensive overview of the imaging evaluation of patients with suspected brain metastases, emphasizing the prevalence and potential diagnostic challenges associated with these neoplasms. It will highlight specific imaging patterns, differential diagnoses, and potential pitfalls in imaging interpretation. The exhibition will also discuss the clinical and imaging features that suggest the etiology of primary tumors, including a pictorial essay of specific patterns. Additionally, it will review radiological criteria for diagnosing radionecrosis, pseudoprogression, and disease progression in brain metastases patients and emphasize the importance of advanced imaging techniques. Case studies will be used to illustrate radiological challenges and diagnostic considerations in the treatment and follow-up of these patients.

#### TABLE OF CONTENTS/OUTLINE

1. Imaging Evaluation of Patients with Suspected Brain Metastases • Overview of intracranial metastases as the most common adult intracranial neoplasms and their imaging evaluation • Imaging patterns and differential diagnoses • Mimickers and pitfalls in imaging interpretation  
2. Etiology of the Primary Tumor • Clinical and imaging features suggestive of the primary tumor • Pictorial essay of brain metastases with specific patterns  
3. Treatment and Follow-up • Radiological criteria for diagnosing radionecrosis, pseudoprogression, and disease progression • Case studies illustrating radiological challenges in distinguishing these conditions

### The Ultimate Imaging Companion to Vascular Complications in Cancer Patients: A Comprehensive Review for Radiologists

#### Participants

Jessica De Oliveira, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Vascular complications are a significant cause of morbidity and mortality in cancer patients, with increasing incidence due to improved survival and evolving treatments. Oncologic patients are more prone to vascular complication such as hypercoagulability state, reduction in mobility and aggressive treatments as brain radiation. These complications may occur at disease presentation or be secondary to treatment. Our aim is to review the main imaging findings of vascular complications in a didactic way. We believe this approach may facilitate diagnostic suspicion.

#### TABLE OF CONTENTS/OUTLINE

Introduction: Review main intracranial vascular complications in oncology patients, with an emphasis on the pathophysiological mechanisms involved. To display a flowchart dividing these complications according to treatment status and treatments applied. To discuss for each vascular complication the risk factors, clinical presentation, main imaging findings and relevant treatments. The discussion will be enriched with illustrative cases, including: Complications before treatment: Hypercoagulability (Trousseau syndrome, cerebral venous thrombosis). Vascular compression/ obstruction by the tumor or Vascular compression/ obstruction due to brain herniation. Intravascular tumor dissemination (oncotic aneurysm and intravascular lymphoma). Complications during treatment: Post-operative ischemia Late complications after treatment: Aneurysm after radiotherapy, SMART, Radiation induced cavernous malformations. To highlight the most relevant clinical and imaging aspects of these vascular complications, essential for prompt diagnosis and treatment.

### Skull Drip: Algorithmic Multimodality Imaging Approach

#### Participants

Pokhraj Suthar, MD, Chicago, IL (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Briefly discuss various causes and sites of skull base CSF leak. To learn the diagnostic imaging findings of various modalities including high resolution NECT, CT cisternogram, MRI and radiotracer studies, in identifying the cause and localizing the exact site of skull base CSF leaks. To learn the algorithmic imaging approach and how it is helpful for surgical planning in cases of skull base CSF leak. To diagnose recurrent leaks in post-surgical repair of primary CSF leak

#### TABLE OF CONTENTS/OUTLINE

Cerebrospinal fluid (CSF) leaks are extracranial leaks of CSF via an osteodural defect in the skull base into the tympanomastoid cavity, paranasal sinus, or rarely in the skull base neck space. There are various etiologies for the same, including accidental trauma, congenital malformation, spontaneous leaks in idiopathic intracranial hypertension and iatrogenic. Accurate localization of the site of the leak and identification of the underlying cause is necessary for surgical planning to avoid associated complications and prevent recurrence. In this educational exhibit, we outline the various interesting cases of skull base defects, their multimodality algorithmic imaging diagnosis approach (CT, MRI, CT/MR/Nuclear medicine radionuclide cisternography), correlation of imaging diagnosed skull base defect with surgical outcome, and imaging diagnosis of recurrent CSF leaks.

NREE-133

### The Ternary Plot Analysis of Time-sensitive Diffusion Imaging in CNS Pathologies

#### Participants

Toshiaki Taoka, MD, PhD, , Japan (*Presenter*) Research Grant, Canon Medical Systems Corporation

#### TEACHING POINTS

Time-sensitive diffusion imaging provides potentially valuable information on tissue characteristics, with the oscillating gradient spin-echo (OGSE) method enabling short diffusion times compared to the conventional pulsed-field gradient spin-echo (PGSE) method. Comparing the signal on OGSE and PGSE can provide information on tissue compartmentalization. However, comparing different images can make interpretation challenging, and organizing pixel information is necessary. The ternary plot method presents the relationship between diffusivity, compartmentalization, and water content for a single pixel, simplifying the presentation of tissue characteristics obtained from OGSE, PGSE, and  $b=0$  images. This educational exhibit demonstrates the tissue characteristics of various central nervous system pathologies provided by time-sensitive diffusion imaging using the triangulation method of the ternary plot. The ternary plot method has further applications, including the color coding of the pixels according to the tissue characteristics.

#### TABLE OF CONTENTS/OUTLINE

1. Overview of time dependence of diffusion MRI2. Methods for displaying time-dependent diffusion-related coefficients.3. Distribution of the time-dependent diffusion-related coefficients on ternary plot4. Further application of ternary plot method

### A Review of Imaging Findings in Neurogenic Ptosis

#### TEACHING POINTS

To understand the anatomy of the neural pathways that innervate the upper eyelid retractor muscles (e.g. oculosympathetic pathway and oculomotor nerve pathway). To describe the normal cross-sectional anatomy of the neural pathways causing neurogenic ptosis. To illustrate the imaging findings of various lesions causing neurogenic ptosis according to a course-based approach.

#### TABLE OF CONTENTS/OUTLINE

Introduction and general overview of ptosis / Anatomic review and imaging-based normal cross-sectional anatomy of the neural pathways innervating the upper eyelid retractor muscles (oculosympathetic and oculomotor pathway) / A variety of pathologic conditions causing neurogenic ptosis according to a course-based approach 1. Oculomotor nerve palsy (oculomotor nerve pathway) - Intra-axial segment - Cisternal segment - Cavernous segment - Orbital segment 2. Horner's syndrome (oculosympathetic pathway) - Central neuron - Preganglionic neuron - Postganglionic neuron 3. Neuromuscular junction disorders / Summary and conclusion

### Epilepsy Surgery: Nuts and Bolts for Radiologists

#### Participants

Jack Yang, Lexington, MA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

A broad range of surgical procedures are available for medically refractory epilepsy from open parenchymal resections to more recent minimally-invasive ablative therapies. In this exhibit, we outline the scope and techniques of these surgical procedures, role of neuroimaging, expected post surgical imaging findings and associated complications. We describe neuroimaging role in subdural or depth electrode placement, an invasive diagnostic surgical procedure for more precise localization of epileptogenic focus. We briefly outline the MRI safety issues in imaging patients with neuromodulation devices.

#### TABLE OF CONTENTS/OUTLINE

Table of Contents: I. Epilepsy surgery: Evolution II. Types of surgical procedures: Scope and Techniques A. Surgery for localization of epileptogenic focus: a. Invasive procedure - Subdural grid and strip placement. b. Minimally-invasive procedure - Stereo-EEG B. Surgery for refractory epilepsy a. Invasive procedures: Resection - 1. Hemispherectomy 2. Lobar resection 3. Lesionectomy. Disconnection - 1. Conventional corpus callosotomy 2. Multiple subpial resections. b. Minimally- or less-invasive procedures: Ablative therapies - 1. Laser Interstitial thermal therapy (LITT) 2. MR guided focused US 3. Gamma knife. Neuromodulation procedures - 1. Vagal nerve stimulation (VNS) 2. Deep brain stimulation (DBS) 3. Responsive neurostimulation (RNS) III. MRI safety issues in imaging epilepsy patients with implants and electrodes

### Exploring the FDA Pharmacovigilance Database to Assess the Importance of Symptoms Associated with Gadolinium Exposure (SAGE)

#### Participants

Eric Lancelot, PhD, Roissy CDG CEDEX, France (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Analysis of FDA pharmacovigilance database to determine safety of gadolinium based contrast media.

#### TABLE OF CONTENTS/OUTLINE

**Objective** The aim of this study was to assess the tendency of adverse events representing "symptoms associated with gadolinium exposure" (SAGE) among the bulk of safety experiences reported to health authorities. **Materials and Methods** SAGE symptoms were searched by preferred terms (PTs) in different system organ class (SOC) categories in the FDA Adverse Event Reporting System (FAERS) database over a 5-year period ranging from 2014 to 2019. The numbers of SAGE symptoms per PT, and cumulatively per SOC, were recorded and their weights in the overall spectrum of AEs were determined for 3 linear and 3 macrocyclic GBCAs. **Results:** The analysis of FAERS data revealed a significantly higher SAGE weight for linear GBCAs, namely gadodiamide (23.27%), gadopentetate dimeglumine (22.12%) and gadobenate dimeglumine (19.27%), than for the macrocyclic GBCAs, namely gadoteridol (8.45%), gadobutrol (4.53%) and gadoterate meglumine (3.82%). The SOCs "musculoskeletal and connective tissue disorders", "nervous system disorders", "general disorders and administration site conditions" and "psychiatric disorders" were consistent with this ranking. Moreover, SAGE weights displayed a steady growth of about 5% per year for the linear GBCAs and 1% per year for the macrocyclic agents. **Conclusion** This study showed that SAGE symptoms may be more prevalent with linear than macrocyclic GBCAs, and that SAGE reporting tends to rise significantly more in patients exposed to linear agents. These differences might be explained by the differences in kinetic stability between the GBCAs.

### 2022 Updated Diagnostic Criteria of Neurofibromatosis Type 2 and CNS Tumor Manifestations: Imaging Findings, Histological Features, and Assessment of Treatment Effect

#### Participants

Yoshiaki Ota, MD, Ann Arbor, MI (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. The diagnostic criteria of NF2 has been revised in 2022 as well as that of schwannomatosis and radiologists should be familiar with the revision. 2. Vestibular schwannomas, meningiomas, other cranial nerve schwannomas, ependymomas, and astrocytomas can be related to NF2. 3. DWI, DSC-MRI, and DCE-MRI can allow for more detailed characterization, tumor differentiation, treatment response assessment, and gene mutation in NF2 patients.

#### TABLE OF CONTENTS/OUTLINE

1. 2022 revised diagnostic criteria of NF2A diagnosis of NF2 can be made when an individual has one of the following: a) Bilateral vestibular schwannomas (VS) b) An identical NF2 pathogenic variant in at least 2 anatomically distinct NF2-related tumors (schwannoma, meningioma, and/or ependymoma). c) Either 2 major or 1 major and 2 minor criteria as described in the following: Major criteria: 1) Unilateral VS, 2) First-degree relative other than sibling with NF2-related schwannomatosis, 3) Two or more meningiomas (Note: single meningioma qualifies as minor criteria). Minor criteria: Can count >1 of a type: Ependymoma, meningioma, schwannoma. 2. Common imaging features and clinical/pathological characteristics of NF2-related CNS tumors: (a) Vestibular schwannoma (b) Trigeminal schwannoma (c) Meningioma (d) Spinal Ependymoma (e) Spinal astrocytoma. 3. Treatment options and imaging assessment of treatment response: (a) Conventional imaging (CT, MRI) (b) Advanced imaging (DWI, DSC-MRI, and DCE-MRI). 4. Other familial schwannomatosis (SMARCB1 and LZTR1) and meningiomatosis (SMARCB1, SMARCE1, SUFU, and PDGFB)

### The Radiologist's Guide to Lumbar Spine Pain Procedures: Indications, Techniques and Complications

#### TEACHING POINTS

Less than 3 percent of the 4 million annual pain procedures are performed by radiologists, despite having the unique ability to correlate imaging findings with clinical features for targeted pain interventions. This exhibit is aimed at educating the radiologists regarding indications, planning, techniques and challenges of common lumbar pain procedures, with emphasis on 'how to' perform transforaminal and interlaminar epidural spinal injections (ESI). Other technically demanding pain procedures including dorsal transforaminal S1 ESI, synovial cyst rupture and blood patches will be discussed, along with tips and tricks for performing challenging interventions in postoperative, scoliotic and degenerative spine.

#### TABLE OF CONTENTS/OUTLINE

1. Relevant Lumbar Spine anatomy and fluoroscopic positioning 2. Clinico-radiologic correlation- Clinical examination, patient counselling, selecting the right procedure. 3. Procedure and tray setup 4. Transforaminal ESI- 'how to' approach the target, pre and post contrast injection views. • Supra-neural TFESI • Infra-neural TFESI 5. Interlaminar ESI- • Optimal needle positioning in multiplanar imaging • Recognizing suboptimal needle location 6. Dorsal S1 ESI- recognizing landmarks and optimal views for needle positioning. 7. Other pain relief procedures • Synovial cyst rupture- Direct (IL/TF) and Indirect Techniques • Epidural blood patch 8. Challenging cases and difficult myelograms • Scoliotic and degenerative spine • Postoperative spine 9. Pearls and pitfalls- complications and how to prevent them.

### **From Genes to Emergencies: An Innovative Approach to Imaging Assessment, Genetic Aspects, and Emergency Room Evaluation in CADASIL**

#### **Participants**

Ana Luiza Basilio Franca, Rio De Janeiro, Brazil (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

This educational exhibit aims to provide a comprehensive understanding of cerebral autosomal dominant arteriopathy with subcortical infarcts and leukoencephalopathy (CADASIL) disease, including: To illustrate the imaging highlights of the cerebral autosomal dominant arteriopathy with subcortical infarcts and leukoencephalopathy (CADASIL). To exhibit the genetic cascade involved in the disease. To explain the imaging approach to the disease within the context of acute stroke in the emergency. To illustrate the differential diagnosis, including cerebral autosomal recessive arteriopathy with subcortical infarcts and leukoencephalopathy (CARASIL) and white matter diseases.

#### **TABLE OF CONTENTS/OUTLINE**

1. Introduction and revision of CADASIL's epidemiology, clinical presentation, and etiology. 2. MRI highlights in CADASIL. 3. Genetic considerations associated with CADASIL. 4. Differential diagnosis, including CARASIL and other white matter diseases. 5. Imaging assessment in the emergency room. 6. Take-home messages.

### An Imaging Review of Autoimmune Encephalitis: An Often-Overlooked Diagnosis

#### Participants

Miriam Fernandez-Gomez, MD, Almeria, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- To understand the many signs, symptoms, and types of autoimmune encephalitis. - To Review the main antibodies that have been identified, their patterns of CNS involvement, and their typical anatomical distributions due to the relative concentration of target proteins. - To Highlight the characteristic MRI findings associated with autoimmune encephalitis, with specific emphasis on the role of neuroimaging in the diagnostic work-up. - Finally, to describe a case report of anti-LGI1 autoimmune encephalitis associated with SARS-CoV-2 (COVID-19).

#### TABLE OF CONTENTS/OUTLINE

TABLE OF CONTENTS  
I. Introduction Introduce the topic of autoimmune encephalitis  
II. Understanding Autoimmune Encephalitis Define autoimmune encephalitis Discuss the symptoms of autoimmune encephalitis Explain the pathophysiology of autoimmune encephalitis Describe the different types of autoimmune encephalitis  
III. MR Imaging Findings Associated with Autoimmune Encephalitis Discuss the characteristic MRI findings associated with autoimmune encephalitis Emphasize the role of neuroimaging in the diagnostic work-up  
IV. Autoimmune Encephalitis in SARS-CoV-2 Infection (COVID-19): Illustrative Case Describe a case report of anti-LGI1 autoimmune encephalitis associated with SARS-CoV-2 (COVID-19)  
V. Conclusion Summarize the key points of the paper Discuss the importance of recognizing and diagnosing autoimmune encephalitis

### Predictors of Intracerebral Hemorrhage Expansion on CT

#### TEACHING POINTS

1. Review classification of intracranial hemorrhages and define hemorrhage expansion  
2. Importance of identifying intracranial hemorrhage expansion  
3. Describe findings on imaging that can predict hemorrhage expansion  
Intracerebral hemorrhage (ICH) results in 10-20% of all strokes and leaves 60-80% of survivors functionally dependent. Identifying early hematoma expansion (HE), defined as growth >12.5 mL or volume >33%, is crucial for modifying its potential impact. Three accepted HE indicators in non-contrast computed tomography include baseline hematoma volume as measured by the ABC/2 method. Secondly, irregularly hemorrhage shape indicating multiple leaking blood vessels. Radiologically, the satellite sign and island sign are imaging correlates that indicate irregular hemorrhage shape. Lastly, the imaging density heterogeneity of the hematoma can represent active bleeding. Three signs that represent heterogeneity of the hematoma include the swirl, black hole, and blend sign.

#### TABLE OF CONTENTS/OUTLINE

1. Classification of intracranial hemorrhagea. Intra-axial hemorrhageb. Extra-axial hemorrhage  
2. Defining hematoma expansion (HE)  
3. Importance of identifying intracerebral hemorrhage expansion.a. Relative incidenceb. Prognostic indicator  
4. Clinical aspects that increase risk of hematoma expansiona. Systolic BP and onset to CT timeb. Prior anticoagulant therapyc. hyperglycemia  
5. Radiological signs of hemorrhage expansiona. Hematoma shape/volume/locationb. Perihematomal edemac. Hematocrit levelsd. Spot signe. Satellite sign, Island sign, Swirl sign, Blend sign and Black hole sign

Printed on: 04/12/24

### **Beyond the Blind Spots: A Comprehensive Approach to Reducing Diagnostic Errors in Neuroradiology in the Emergency Room for Enhanced Patient Safety**

#### **Participants**

Heber Colares Costa, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

Pedro Castro, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

To exhibit a timely and accurate diagnosis of neurological conditions like stroke, brain tumors, and traumatic brain injury, providing effective treatment. To show misdiagnosis or diagnosis delays due to errors in imaging evaluation that can seriously harm the patient, including permanent neurological deficits or death. To prevent unnecessary interventions or treatments, inhibiting inaccurate interpretation of imaging studies and unnecessary surgeries, medications, or other medicines that can harm the patient physically and financially. To avoid significant medicolegal consequences.

#### **TABLE OF CONTENTS/OUTLINE**

1. Revision of epidemiology, pathology, and demographics of neuroradiologic emergencies. 2. Imaging evaluation of the emergency room's crucial and prevalent neuroradiologic diseases. 3. Potential imaging pitfalls in neuroradiologic emergencies and how to avoid them. 4. Potential causes of imaging medical errors, including night periods, fatigue and exhaustion of radiologists, a large volume of examinations, and short evaluation times. 5. The consequences of errors in neuroradiological imaging evaluation in the emergency room, including delays in stroke recanalization therapy, misdiagnoses of intracranial hemorrhages, dural venous sinus thrombosis, and inadequate treatment for these conditions. 6. Highlights on medicolegal issues and reputational damage for healthcare providers and hospitals. 7. How to ensure that hospitals and healthcare providers can reduce the risk of misdiagnosis, unnecessary interventions, and legal consequences, ultimately leading to better patient outcomes. 8. Take-home messages.

### **The Uncharted Territory of Neurodegeneration: Keeping Pace with the Latest Advances in Imaging Diagnosis and Novel Therapies for Degenerative Diseases**

#### **Participants**

Ana Luiza Basilio Franca, Rio De Janeiro, Brazil (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Brain neurodegenerative diseases are a group of disorders characterized by progressive damage and loss of neurons in the brain. These diseases include Alzheimer's disease, Parkinson's disease, Huntington's disease, and amyotrophic lateral sclerosis (ALS), among others. Recent advances in imaging diagnosis and novel therapies have shown promising results in improving the diagnosis and treatment of these conditions. The study aims to: To explain the imaging features, genetic cascade, and physiopathology involved in neurodegenerative diseases. To exhibit that advanced imaging techniques have significantly improved the diagnosis of brain neurodegenerative diseases. To explain the imaging approach to the diseases, differential diagnosis, and current therapeutics.

#### **TABLE OF CONTENTS/OUTLINE**

1. Revision of epidemiology, clinical presentation, and etiology of neurodegenerative diseases. 2. Genetical considerations. 3. The role of magnetic resonance imaging (MRI) and functional MRI (fMRI) in identifying structural changes in the brain associated with neurodegeneration. 4. Positron emission tomography (PET) in assessing amyloid plaques and tau protein in the brain, characteristic features of Alzheimer's disease. 5. Novel therapies for neurodegenerative brain diseases, including immunotherapy, gene therapy, stem cell therapy, neuroprotection with drugs, and deep brain stimulation. 6. Differential diagnosis. 7. Take-home messages.

### Exploring the Depths of Pediatric Posterior Fossa Tumors: Integrating Molecular Analysis and Magnetic Resonance Imaging for Unprecedented Diagnosis and Prognosis

#### Participants

Laura Magalhaes, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

Pedro Castro, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To illustrate the imaging diversity of these tumors, including a range of histological subtypes, including medulloblastoma, ependymoma, and pilocytic astrocytoma, among others. To demonstrate the importance of pediatric posterior fossa CNS tumors molecular analysis, providing an accurate diagnosis, risk stratification, and personalized treatment. To identify the specific genetic alterations and biomarkers for managing these tumors.

#### TABLE OF CONTENTS/OUTLINE

1. Revision of epidemiology, pathology, and pediatric posterior fossa CNS tumor demographics. 2. Imaging features in pediatric posterior fossa CNS tumors, including pilocytic astrocytoma, ependymoma, medulloblastoma, other embryonal tumors, Rosette-forming glioneuronal tumor, diffuse midline gliomas, tectal gliomas including diffuse low-grade MAPK pathway-altered. 3. Most recent updates on pediatric posterior fossa CNS tumors molecular alterations, including WNT, SHH, and non-WNT/non-SHH medulloblastomas, BRAF mutations in pilocytic astrocytoma, EZHIP in group A ependymomas, MAPK pathway-altered in diffuse low-grade tectal gliomas. 4. Imaging strategies to depict the correct diagnosis based on the genetic profile. 5. Flowchart of the changes and last updates based on the neoplastic molecular profile. 6. Take-home messages.
