1. Current CT recommendation for breast cancer patients in guidelines 2. The potential of PCD-CT for breast cancer workup 3. Case-based review of PCD-CT in breast cancer patients compared to EID-CT, other image modalities, and pathological results. 4. Discussion of the utilities of PCD-CT for breast cancer patients, including advantages, disadvantages, and pitfalls.

## **BREE-99 Breast Ultrasound Tomography: The Essentials for the Breast Radiologist**

Participants

Yu Zhao, MD, Rochester, NY (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

This educational exhibit will review the essentials of breast ultrasound tomography. 1. Understand basic concepts of breast ultrasound tomography including essential physics, the basic imaging sequences, and keys to imaging interpretation. 2. Describe the advantages of breast ultrasound tomography for evaluation of the breasts, especially in those with dense breasts. 3. Describe the specific imaging appearance on ultrasound tomography of various breast entities, benign and malignant. 4. Discuss the future practice considerations and limitations of ultrasound tomography.

### **TABLE OF CONTENTS/OUTLINE**

-This educational exhibit reviews the essentials of breast ultrasound tomography for the breast radiologist. This is a new imaging modality with enormous potential to add new value to breast imaging by improving diagnostic accuracy especially in patients with dense breasts. -We will describe in simple terms the physics of breast ultrasound tomography and the basic imaging sequences including Waveform Enhanced Reflection (Wafer), Reflection, Sound Speed, and Stiffness Fusion sequences in a breast ultrasound tomographic examination.-We will review with illustrative case examples of high-yield breast lesions including cysts, fibroadenomas, and cancers comparing the distinctive imaging appearance on ultrasound tomography versus other breast imaging modalities.-This will be followed by a discussion of the specific advantages of ultrasound tomography relative to other imaging modalities, such as improved lesion localization and lesion characterization. Finally, we will present the limitations of ultrasound tomography and general considerations for future practice.

### Pathologic Nipple Discharge: Is Breast MRI a Good Option?

#### Participants

Valeria Vidales, Buenos Aires, Argentina (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Pathologic nipple discharge (PND) is unilateral, spontaneous, involves a single duct, and is serous or bloody in appearance. MRI is able to detect the etiology of nipple discharge in 56-61% of cases when initial imaging with mammogram and ultrasound are negative. To describe differential diagnosis and its classification in BIRADS system.

#### TABLE OF CONTENTS/OUTLINE

Description of the anatomy of the nipple and retroareolar Description of different types of lesions that could be found in patients with nipple discharge US, mammographic and RM principal findings and its correlations. Sample cases

Printed on: 04/12/24

## Abstract Archives of the RSNA, 2023

BREE-10

### Single Duct Abnormalities: Multimodality Imaging and Assessment

#### Participants

Juliana Sitta, MD, Jackson, MS (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Ductal abnormalities entail a wide range of pathology that may present clinically or grow silently, ranging from benign to malignant processes. Solitary dilated duct is a rare mammographic finding with controversial clinical significance in the literature. Workup of the solitary dilated duct must include additional mammographic views and ultrasound to assess for additional findings that would raise suspicion for malignancy and provide a biopsy target. Ductal ectasia is the most common benign finding; however, atypical presentations such as peripheral location, wall thickening, and hypoechoic tissue should raise suspicion for secondary obstruction causes. Inspissated secretions can mimic intraductal masses and may be seen in association or secondary to acute and chronic mastitis, ductal ectasia, and intraductal papilloma. Patients with papillomatosis often have associated high-risk lesions and an increased lifetime risk of breast malignancy. MRI is a great adjunct to evaluate nipple discharge, particularly when the initial workup is negative, and to exclude underlying DCIS or invasive ductal carcinoma.

#### TABLE OF CONTENTS/OUTLINE

Review and illustrate ductal anatomy, physiology, and normal findings on multimodality imaging, including mammography, ultrasound, galactogram, and MRI. Illustrate and discuss problem-solving for single duct findings and presentations commonly associated with single duct abnormality with interesting cases from our institution. Analyze the added value of multiple imaging modalities in assessing ductal pathology, including galactogram and MRI.

BREE-100

### The Leading Role of Ultrasound in Breast Implant Evaluation in Developing Countries

#### Participants

Giannina Secco, MD, Buenos Aires, Argentina (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To illustrate ultrasound findings in breasts with implants and their comparison with those in magnetic resonance imaging. To discuss the advantages and limitations of ultrasound for breast implant evaluation and why it remains a valuable and irreplaceable tool in underdeveloped and developing countries.

#### TABLE OF CONTENTS/OUTLINE

Detecting a broken breast implant is essential due to the potential physical discomfort, cosmetic deformity, and health risks associated with a ruptured implant. Early detection and prompt treatment of a broken implant are crucial to prevent further complications and ensure optimal patient outcomes. Knowledge of a ruptured implant can help patients make informed decisions about implant replacement or removal. In order to acknowledge this, we believe breast implant ultrasound is a preferable choice to MRI for breast implant evaluation in underdeveloped and developing countries. Breast implant ultrasound is more cost-effective, with often portable machines, non-invasive procedure that does not require the use of contrast agents or ionizing radiation, provides real-time imaging, does not require anesthesia and is widely available in many healthcare facilities. Ultrasound imaging can be performed and interpreted quickly, allowing clinicians to make prompt treatment decisions. Furthermore, breast implant ultrasound is safe for patients with pacemakers or other implanted devices, while MRI may not be feasible for these patients. Although ultrasound has its limitations in some cases, it remains a valuable and irreplaceable tool for breast implant evaluation in underdeveloped and developing countries.

### Cystic Breast Lesions Assessment and Management: An Educational Approach for Radiology Residents

#### Participants

Karina Pesce, PhD, Capital Federal, Argentina (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To recognize the spectrum of cystic breast lesions. To learn tools and tips for the sonographic evaluation of cystic lesions. To understand the importance of distinguishing benign cystic lesions from potentially malignant cystic masses To learn skills in the assessment and management of cystic breast lesions

#### TABLE OF CONTENTS/OUTLINE

1-Introduction: Cystic breast lesions are a common finding in breast imaging studies. Accurate characterization and precise management of these lesions are essential to avoid unnecessary biopsies and tests, as well as to timely identify which of these lesions require further diagnostic evaluation. 2- Ultrasound parameters necessary for a correct evaluation of cystic lesions. 3- Tips and tricks in the ultrasound evaluation of cystic lesions. 4- Spectrum of cystic lesions. 5- Ultrasound appearance 6-Radiological appearance of cystic breast lesions on other imaging modalities such as mammography, MRI. 7- Management. 8- Interactive clinical cases for self-evaluation. 9- Conclusions

### Radiological Signs in Breast Imaging: What Should the Radiology Resident Know?

#### Participants

Karina Pesce, PhD, Capital Federal, Argentina (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1.To know recognize the different radiological signs in breast imaging.2.To learn the importance of accurate identification of the different radiological signs.

#### TABLE OF CONTENTS/OUTLINE

Introduction This educational poster reviews the importance of understanding breast radiological signs. Accurate identification of different radiological signs is critical for early diagnosis and effective treatment of various medical conditions, including breast cancer. Furthermore, knowledge of clinical and radiological signs in breast imaging can help prevent diagnostic errors and reduce the number of unnecessary medical tests. Description of the radiological signs in breast imaging. Tips and techniques for identifying these signs are also provided to assist residents in their interpretation of medical images. interactive clinical cases for self-evaluation. These cases offer residents the opportunity to apply their knowledge and receive immediate feedback, thereby strengthening their diagnostic skills and decision-making abilities. Conclusion: Radiologists residents must be familiar with different radiological signs to accurately interpret medical images and provide an accurate diagnosis.

### Peer Learning in Breast Imaging: Lessons Learned in Our Institution

#### Participants

Marcela Lauer, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

It is estimated that medical diagnostic mistakes contribute to approximately 10% of patients deaths and 17% of adverse events in hospitals. Consequently, optimal patient care is related to recognizing and preventing such errors. Strategies were developed to ensure performance standards in radiology departments, including score-based second-reader peer review systems. However, this type of strategy may be associated with subjectivity, sampling bias, underreporting of errors due to peer relationships and fear of punitive action. It may have emotional impact for radiologists and lead to feelings like anxiety, shame, and humiliation, contributing to a culture of defensiveness. On the other hand, peer learning is an strategy focused on learning and improvement that has gained momentum, as a respectful nonpunitive collaborative culture improves performance in modern radiology practice. The objective of this presentation is to show how we established peer learning in our breast imaging department, the bias that were related to the mistakes we made, how we concluded they could have been avoided and our experience with peer learning as a group. We aim that this presentation may help and encourage other services to implement peer learning in their clinical practice, and also learn from the multimodality imaging cases we provide.

#### TABLE OF CONTENTS/OUTLINE

Didactic case-based reviews of breast imaging exams (including mammography, ultrasound and magnetic resonance imaging performed in our service) that were discussed in our peer learning meetings in the last 5 years, with correlation of associated cognitive bias, how the cases could have been better managed and lessons learned that changed our daily practice.

### Multimodality Surveillance of Breast Implants in Asymptomatic Patients and the Potential Challenges for the Radiologist in Light of the 2022 United States Food and Drug Administration (FDA) Guidelines

#### Participants

Carisa Le-Petross, MD, FRCPC, Houston, TX (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Recently the United States Food and Drug Administration (FDA) implemented changes to breast implant surveillance that radiologists may not be aware of<sup>1,2</sup>. At the end of this exhibit, the participant will: • Be up-to-date on the 2022 FDA guidelines for breast implant screening. • Learn the common signs of implant rupture on ultrasound (US). • Learn the common signs of implant rupture on magnetic resonance imaging (MRI). • Be familiar with implant complications and new technology to minimize some complications<sup>3</sup>. • Be familiar with some key differences between updated FDA guidelines and the imaging recommendations from the American College of Radiology Appropriateness Criteria.

#### TABLE OF CONTENTS/OUTLINE

- Discuss the changes in the 2022 FDA guidelines for breast implant screening, especially the addition of US as an alternative to MRI for initial imaging surveillance for silicone implant rupture in asymptomatic patients<sup>1-4</sup>.
- Discuss the 2022 FDA guidelines recommendation for the first screening imaging test at 5 years after implantation instead of 2 years after implantation, the lack of compliance from patients, and background behind this change<sup>1-5</sup>.
- Discuss the potential controversies regarding the imaging modality of choice to evaluate for implant rupture via case-based presentation<sup>4</sup>.
- Review the imaging signs of implant rupture on different modalities, focusing mainly on US and MRI. Review benefits and/or challenges of new implants, technology such as acellular dermal matrix (ADM), and new generation tissue expanders.

BREE-105

### Abnormality of the Duct on Breast Ultrasound: Comparison with Multimodality, Correlation with Pathological Findings, and Assessment

#### TEACHING POINTS

The 6th edition of BI-RADS is expected to include nonmass lesions detected on breast ultrasound. In breast imaging, it is important to comprehend lesions such as ductal carcinoma in situ which do not form masses but appear as abnormalities of the ducts. Ultrasound is the best imaging tool for a detailed evaluation of the ducts. Although definitions and terminology for ductal abnormalities may vary in the literature, there is a growing interest among Asian countries regarding ultrasound findings of ductal abnormalities. In this review, we present a method for detecting and evaluating ductal abnormalities based on a detailed comparison with pathological findings. To understand and organize the terminology found in various literature and guidelines, as well as the corresponding findings. To become familiar with normal anatomy and identify findings accurately. To compare expected findings in other modalities with pathological findings. To discuss evidence-based assessment and management plan for each finding.

#### TABLE OF CONTENTS/OUTLINE

Normal anatomy Methods of detection Terminology Comparison with multimodality and correlation with pathological findings Assessment and management plan of each pathological finding Case studies The included cases are as follows: Ultrasound findings Ductal dilatation Duct dilatation with internal echoes Duct wall thickening Irregularity of the ductal caliber Pathological diagnoses Duct ectasia Fibrocystic change Intraductal papilloma (IDP) Atypical ductal hyperplasia Ductal carcinoma in situ (DCIS) Ductal carcinoma in situ with invasive component Invasive ductal carcinoma (IDC)

### **A Review of Contrast-Enhanced Mammography in the Evaluation of Suspicious Breast Micro-Calcifications and Our Experience**

#### **Participants**

Félix Maimir Quadrado, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

- To outline a potential indication of contrast-enhanced mammography (CEM).- To review the contribution to date of CEM in the evaluation of suspicious breast microcalcifications.- To share and discuss our initial experience using CEM in the evaluation of suspicious breast microcalcifications and their histopathologic results. The interpretation and description of breast microcalcifications have always posed a great challenge to breast radiologists. Due to the intrinsic relation of microcalcifications with different breast lesions, and in the case of suspicious ones with breast carcinomas, CEM has been proposed as a promising technique because of its capability to assess neoangiogenesis. We present an up-to-date revision of CEM in the evaluation of suspicious breast microcalcifications and our center's initial experience.

#### **TABLE OF CONTENTS/OUTLINE**

- Introduction- False-positive cases- False-negative cases- What the recent literature tells us- Our experience

BREE-107

### Diagnostic Approach and Assessment of Cystic Breast Lesion

#### TEACHING POINTS

1. Cystic masses are common findings on mammography, ultrasonography, and MR imaging and a thorough understanding of their imaging findings and management is important. 2. It is important to obtain US images with meticulous technique for accurate classification and assessment of cystic breast lesions. 3. Complex cystic and solid masses may have one or all of the following characteristics: a thick wall ( $\geq 0.5$  mm), thick internal septations, an intracystic mass, and both solid and cystic components. 4. Complex cystic and solid masses are usually assessed as suspicious (BI-RADS category 4) and accompanied by a recommendation for biopsy.

#### TABLE OF CONTENTS/OUTLINE

A. Definition of cystic breast lesions 1. Simple cyst 2. Complicated cyst 3. Clustered microcysts 4. Complex cystic and solid mass B. Meticulous technique in evaluating cystic breast lesions on US C. Multimodality imaging findings with important differential diagnosis 1. Simple or complicated cyst vs. Nearly anechoic solid mass on US 2. Inflamed or ruptured cyst vs. Rim enhancing mass on breast MRI D. Imaging-pathologic correlation of complex cystic and solid mass E. Diagnostic approach and BI-RADS assessment of cystic breast lesions F. Management of cystic breast lesions

BREE-108

### Breast Malignancy: Beyond Breast Carcinoma

#### Participants

Alex Gil Ordonez, MD, Barcelona, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- To provide the basis for recognizing morphological and functional imaging findings of non-epithelial and metastatic lesions of the breast (B5d, NBSBSP).- To review the most common B5d lesions through a pictorial review of our cases.- To describe the clinical management of B5d lesions and the role of the radiologist in these cases.

#### TABLE OF CONTENTS/OUTLINE

1.Introduction 1.1. NBSBSP classification. 2. B5d lesions through a pictorial review of our cases. 2.1. Metastatic disease. 2.2. Oncohematological disease. 2.3. Sarcomas 3. Imaging features 4. Management 5. ConclusionsThe vast majority of malignant breast neoplasms are breast carcinomas. Nevertheless, some malignant breast lesions present different histologies, which are commonly less suspicious than carcinomas on imaging techniques. Their recognition is essential to an early diagnosis and therapeutic approach.

BREE-109

### Vague and Nebulous: Non-Mass Ultrasound Lesions

#### TEACHING POINTS

(1.) To review descriptors of ultrasound (US) non-mass lesions. (2.) To illustrate US non-mass lesions identified as correlates for breast MRI non-mass enhancement. (3.) To demonstrate methods for locating US non-mass lesions as correlates for breast MRI non-mass enhancement.

#### TABLE OF CONTENTS/OUTLINE

**Introduction:** Ultrasound (US) correlates of MRI-detected non-mass enhancement (NME) may have no defined mass-like sonographic margin or shape, or may show subtle disruptions of the background tissue pattern. A new US lexicon term, non-mass lesion (NML), better describes these US findings. **Cases:** This educational exhibit will show 10 cases of US NML corresponding to MRI NME. We will highlight methods of predicting the US appearance and location of the NML on MRI-directed US by the use of breast architecture, surrounding cysts/masses, and use of the MRI appearance to predict the size and shape of the NML. **Histopathologies** include breast cancer, radial scar, sclerosing adenosis, fibrocystic change and fat necrosis. **Conclusion:** The exhibit illustrates subtle US NML correlates to MRI NME. Techniques for successful MRI-directed ultrasound detection of these findings are described. Once correlation is confirmed, US-guided biopsy, which is more expeditious than MRI-guided biopsy, can be performed.

BREE-11

### Male Breast Lesions: To Infinity and Beyond

#### Participants

Camila Guimaraes, PhD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Teaching Points: Male breast disease encompasses both benign and malignant conditions that are hormonally influenced. Gynecomastia and skin lesions are the most common conditions in symptomatic men, referred for a palpable mass, with imaging patterns that can correlate with different histopathological phases. Other benign tumors in male breasts include lipoma, pseudoangiomatous stromal hyperplasia, granular cell tumor, fibromatosis, myofibroblastoma, schwannoma, and hemangioma. The incidence of breast cancer in men is rare but has increased and accounts for 1% of all breast carcinomas, with invasive ductal carcinoma being the most common type in adult males. Other tumors that may occur include papillary carcinoma, invasive lobular carcinoma, adenoid cystic carcinoma, liposarcoma, dermatofibrosarcoma, pleomorphic hyalinizing angiectatic tumor, basal cell carcinoma of the nipple, hematopoietic malignancies, and secondary tumors. Understanding the clinical and imaging characteristics of these tumors is important for their accurate diagnosis and optimal treatment.

#### TABLE OF CONTENTS/OUTLINE

Table of Contents/Outline: This article examines the clinical, radiological, and pathological characteristics of both benign and malignant tumors of the male breast. Cases of male breast disease were selected from the file of the Breast Radiology group of our hospital showing some of these pathologies: 1. Complicated Cyst; 2. Dermoid Cyst; 3. Myxoid Liposarcoma; 4. Hybernoma.

### From Words to Images: Applying the Contrast Enhanced Mammography BI-RADS® Lexicon

#### Participants

Mitva J. Patel, MD, Columbus, OH (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The American College of Radiology Breast Imaging Reporting and Data System (ACR BI-RADS®) lexicon is widely used in clinical practice and is a standardized nomenclature used for mammographic reporting. Recently, an extension of the lexicon was developed for the interpretation and reporting of contrast-enhanced mammography (CEM) findings. Adopting the American College of Radiology (ACR) Contrast Enhanced Mammography (CEM) Lexicon is important as standardization reduces inter-observer variability and improves the accuracy and reliability of diagnostic reporting, which ultimately leads to better patient outcomes. Education on this new topic is essential as adoption of the lexicon is critical to assist standardize reporting, improve patient care, and facilitate communication between radiologists and clinicians.

#### TABLE OF CONTENTS/OUTLINE

I. CEM Lexicon classification for recombined images?A. Background parenchymal enhancement?1. Level?2. Symmetry?B. Lesion conspicuity?C. Masses?-Internal enhancement characteristics?D. Non-mass enhancement?-Distribution?E. Enhancing asymmetry?II. Interpretation?A. Findings on low energy images only?B. Areas of enhancement seen on recombined images only?C. Low energy images with associated enhancement on recombined images

Printed on: 04/12/24

BREE-111

### The Power of Contrast: Contrast Enhanced Mammography in the Diagnostic Clinic

#### Participants

Mitva J. Patel, MD, Columbus, OH (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

We hope that by highlighting the practical uses of CEM and its potential to enhance breast cancer detection in the diagnostic clinic, more practices will embrace this powerful technology. Contrast enhanced mammography (CEM) is an imaging technique that combines standard mammography with iodinated contrast to improve breast cancer detection. By highlighting areas of increased vascularity associated with malignancy, CEM has been shown to improve the sensitivity of mammography, particularly in women with dense breast tissue. Despite these well-known benefits, the adoption of CEM in clinical practice has been slow, owing primarily to the difficulties establishing a CEM program and reimbursement. Despite these challenges, we believe the benefits it brings to the diagnostic clinic outweigh the additional effort. CEM may be used to: -resolve equivocal findings on mammography, and to increase confidence prior to stereotactic biopsy for vague areas of architectural distortion. -as a more efficient, accessible alternative to MRI in pre-operative extent of disease and workup of highly suspicious findings identified on screening mammography. We hope that by highlighting the practical uses of CEM and its potential to enhance breast cancer detection in the diagnostic clinic, more practices will embrace this powerful technology.

#### TABLE OF CONTENTS/OUTLINE

Examples provided will demonstrate how CEM impacted these patients' management and supports the notion that CEM has a place in the diagnostic clinic as a cost-effective and time-efficient alternative to breast magnetic resonance imaging (MRI) for select patients.

BREE-112

### Common Enough to Care - Young Women with Breast Cancer: Multidisciplinary Approach and Special Considerations

#### TEACHING POINTS

Breast cancer in young women, widely accepted as women under 40 years of age, has a worse prognosis compared to older patients as young age is an independent predictor of adverse breast-cancer specific outcomes, including morbidity, local and systemic recurrence, and death. Historically, young women have been underrepresented in clinical trials and undergo more aggressive therapy solely based on their young age. As it is important to recognize how these women differ from older patients, the teaching points of this presentation are to: 1. Describe the epidemiology, clinical presentation, and tumor biology of young women with breast cancer. 2. Define imaging guidelines in high-risk populations and in young women after diagnosis of breast cancer. 3. Explain surgical management and surgical risk reducing strategies. 4. Highlight the special considerations unique to young women including the effects of oncology treatment on fertility and lactation and describe fertility preservation techniques.

#### TABLE OF CONTENTS/OUTLINE

1. Appearance of breast cancer in young women: Epidemiology and clinical presentation, Tumor biology; 2. Imaging guidelines: Risk factors and assessment, Genetics based or calculated lifetime risk, Diagnosis and staging; 3. Surgical management: Breast conserving vs. mastectomy, Cosmetic options, Risk reducing strategies; 4. Effects of oncology treatment on fertility: Chemotherapy, Hormone therapy; 5. Fertility Preservation Techniques

BREE-113

### Breast US: A Guide for Beginners

#### Participants

Erica E. Francolin Federicci, PhD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Ultrasonographic characterization of mammographic abnormalities and palpable lesions is indicated in the evaluation and management of breast diseases. Although in the United States breast ultrasounds (US) are performed by sonographers, in many countries it is performed by physicians. Considering that breast screening US as an adjunct to mammography will be more widely practiced in the United States, the Breast Imaging-Reporting and Data System (BI-RADS®) provides training and performance guidance as set forth in ACRIN 6666. Because the effective use of the US lexicon relies on excellent sonographic technique and understanding of breast anatomy, the objective of this presentation is to didactically illustrate how the BI-RADS® recommendations should be followed, including the most common findings, pitfalls and how to avoid them.

#### TABLE OF CONTENTS/OUTLINE

We used ultrasonographic images (in correlation to mammography and magnetic resonance imaging, when appropriate) from our institution's digital archive, in order to provide a case-based didactic review of the most common findings in breast ultrasounds, including a review of the adequate technical parameters, lexicon and reporting system and tips to avoid common pitfalls, based on the BI-RADS® recommendations.

BREE-114

### Pseudo-progression During Immunotherapy: A New Challenge for Breast Radiologists

#### TEACHING POINTS

Immunotherapy has emerged as a promising treatment strategy for advanced breast tumors. Immune checkpoint inhibitors (ICI) such as blockades that target programmed death-1 (PD-1), programmed death-ligand 1 (PD-L1) and cytotoxic T-lymphocyte associated antigen (CTLA-4), are one of the most powerful tools in the immunotherapy armamentarium and offer a beneficial immunotherapeutic regimen for patients with breast cancer. The pattern of treatment with immunotherapy is totally different from other therapeutic modalities, thus bringing major challenges to clinicians and radiologists who are not familiar with it. One of these challenges is pseudoprogression, that can be characterized as a transient increase of tumor burden followed by tumor regression. Although rare, it is fundamental for the radiologist to be aware of this condition and to carry out studies in the direction of finding diagnostic tools that are capable of more accurately identify this phenomenon contributing for better patient outcomes. In this didactic exhibit, we will discuss the basis of immunotherapy in breast cancer, demonstrate imaging findings of cases of breast cancer pseudoprogression and discuss the current tools available to identify the possibility of this condition such as biomarkers, imaging techniques and biopsy.

#### TABLE OF CONTENTS/OUTLINE

1) Basis of immunotherapy 2) Definition of pseudoprogression 3) Tools used to identify pseudoprogression 3.1) Biomarkers 3.2) Medical imaging 3.3) Biopsy 4) Cases of breast cancer pseudoprogression

### **Contrast-enhanced Mammography in Breast Cancers for Women with Dense Breasts: Accuracy, Value, Controversies and Solutions**

#### **Participants**

Bingmei Zhang, Ankang, China (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

The purpose of this exhibit is: 1. To familiarize the reader to what CESM implies as an emerging modality and its implementation for breast imaging. 2. To demonstrate diagnostic accuracy and correlation in lesion size estimation of CEM against DCE-MRI in dense breast patients. 3. To illustrate value of CEM in evaluating BI-RADS 4 microcalcifications including morphology, distribution and neovascularity of microcalcifications. 4. To discuss whether CEM can be an effective imaging tool in pre-surgical planning for women with dense breast parenchyma. 5. To highlight the benefits and deficits of CEM in women with dense breast who are at an increased risk of developing breast cancer.

#### **TABLE OF CONTENTS/OUTLINE**

1. Brief overview about the different approaches in CEM and their features in imaging interpretation (temporal subtraction and dual energy technique). 2. Cancer evaluation in the dense breast and review of cases, comparing CESM with MRI in the assessment of disease extent in breast carcinomas. 3. Practical application of CEM with illustrated clinical examples in evaluating BI-RADS 4 microcalcifications in dense breast. 4. Is CESM adequate and accurate in pre-surgical planning for women with dense breast. 5. Advantages vs. drawbacks of CEM and potential pitfalls elucidation for high risk screening for women in dense breast. 6. The future applications of CEM in breast evaluation.

### Preoperative Wire and Wireless Localizations Gone Wrong: How to Get Out of Trouble

#### Participants

Sheila Enamandram, MD, MBA, Stanford, CA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Accurate, thoughtful planning of preoperative image-guided wire or wireless localizations is critical for breast conservation surgery, especially in complex imaging scenarios. Target lesion visualization and localization may require more than one imaging modality and/or a non-routine approach for difficult marker/target localizations. Understanding the differences in size, appearance, and deployment techniques of localization devices is important in accurate placement and retrieval. Targeted markers may be found in unexpected places when not seen in the initial specimen radiograph. Clear communication with surgical colleagues is paramount.

#### TABLE OF CONTENTS/OUTLINE

This case-based exhibit will highlight anatomic, procedural, and technical troubleshooting steps in the following scenarios: Biopsy marker, wire, or wireless device migration; Biopsy marker non-visualization; Target not marked at time of initial biopsy; Target obscured or visible on only one imaging modality; Wireless radar reflector malfunction; Alternative imaging modalities needed for localization; Biopsy marker not seen in the specimen and ultimately found in unexpected places; Incomplete retrieval of distal hook wire in the specimen.

### Staying Vigilant: Imaging Surveillance and Risk Prediction After Breast Cancer

#### Participants

Beatriu Reig, MD, MPH, New York, NY (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Patients with a personal history of breast cancer have 5-20% recurrence rates and are at increased risk of second breast cancers. 2. Risk factors for recurrent or second breast cancer include dense breasts, young age at diagnosis of the first breast cancer, omission of radiation after breast conserving therapy, and hormone receptor negative first breast cancer. 3. Imaging biomarkers such as background parenchymal enhancement are under investigation and may permit personalized risk prediction and guide surveillance recommendations in the future.

#### TABLE OF CONTENTS/OUTLINE

1) Introduction (definition, statistics, localized vs metastatic recurrence, early vs late recurrence) 2) Risk factors for recurrence a) Association of molecular subtypes with risk for recurrence b) Effect of neoadjuvant chemotherapy c) Modifiable risk factors (aromatase inhibitor or tamoxifen after ER+ cancer, alcohol consumption, weight) 3) Screening methods for recurrence a) Mammography b) Ultrasound i) Inclusion of the axilla c) MRI i) Abbreviated vs full-protocol d) Contrast-enhanced mammography 4) What should be the imaging interval? 5) Post-mastectomy imaging 6) Risk models for individualized screening a) Clinicopathologic factors b) Imaging biomarkers c) Radiomics and artificial intelligence models

### Breast Cancer or Not? An Interactive Case-Based Review of FDG-PET/CT Positive Findings in the Breast

#### Participants

Emily Yoon, MD, Mineola, NY (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Background Interpretation of lesions with increased FDG uptake in the breast can be challenging due to nonspecific uptake in various benign and malignant processes involving the breasts. Knowledge of this wide spectrum is essential for accurate analysis of FDG-PET/CT in conjunction with a patient's symptomology. The purpose of this educational exhibit is to illustrate the multi-modality imaging appearance of various benign and malignant processes that demonstrate hypermetabolic activity within the breast on FDG-PET/CT. Teaching Points Differentiate various benign and malignant processes that can result in hypermetabolic lesions in the breast Understand sensitivity and specificity of FDG-PET/CT for breast cancer and metastatic breast lymphadenopathy Conclusion There is a wide range of benign and malignant conditions presenting as hypermetabolic breast lesions on FDG-PET/CT. Knowledge of the various imaging features is important for accurate diagnosis and patient management.

#### TABLE OF CONTENTS/OUTLINE

This presentation will be case-based with review of clinical history and imaging findings (mammogram, US, MRI, PET/CT) of patients with FDG-PET positive findings in the breast. Several benign and malignant pathologies will be reviewed, as outlined below. Teaching points with recent literature review will provide guidance when non-breast cancer pathology should be suspected in cases, while also highlighted when additional dedicated breast imaging is indicated. Breast implant capsule-associated squamous cell carcinoma Reactive lymphadenopathy Metastatic disease Granulomatous mastitis Fat necrosis Inflammatory breast cancer Gynecomastia Infectious/Inflammatory changes

### The Role of DBT-Guided Biopsy for MRI/CEM Detected Lesions

#### Participants

Cesar Urtasun Iriarte I, MD, Pamplona, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To emphasize the need to correlate MRI/Contrast Enhanced Mammography (CEM) findings with DBT (Digital breast tomosynthesis). To show the advantages of DBT-guided biopsy compared to MRI-guided biopsy. To consider DBT-guided biopsy as an alternative for CEM-detected lesions.

#### TABLE OF CONTENTS/OUTLINE

**INTRODUCTION:** Both MRI and CEM are morphofunctional imaging techniques based on neoangiogenesis. These techniques are more sensitive than pure morphological techniques, such as DM or DBT. **ASSESSMENT OF MASS ENHANCEMENTS:** Second look US is of choice to evaluate these lesions. **ASSESSMENT OF NON-MASS ENHANCEMENTS:** These lesions are challenging. Although US plays an important role, in many cases it is inconclusive. DBT correlation is very important, specifically using the craneocaudal (CC) view. This view is easy to compare anatomical structures with both MRI (axial) and CEM. **DBT GUIDED BIOPSY:** This technique offers several advantages over MRI or CEM guided biopsies: Less time consuming, widely spread technique. Not all the vendors have dedicated units to perform CEM guided biopsies. Once the lesion is located with DBT, the performance of the biopsy is easy. Usually 10G vacuum assisted biopsy devices are used. **CONCLUSION:** DBT guided biopsy can offer a good alternative for MRI/CEM detected lesions, specially for non-mass enhancements.

BREE-17

### Breast Ductal Disease: Multimodality Imaging Detection and Assessment

#### TEACHING POINTS

Review normal ductal anatomy and its imaging features. Review the broad differential of benign and malignant ductal diseases, particularly in the setting of a single dilated duct. Recognize imaging abnormalities of ductal diseases and features associated with malignancy on DBT, US, and MRI. Describe appropriate diagnostic workups and management of ductal diseases.

#### TABLE OF CONTENTS/OUTLINE

Breast ductal disease is an important aspect of breast imaging and often poses challenges in diagnosis and management, particularly in the setting of a single dilated duct. Thus, radiologists should be familiar with clinical presentations, diagnostic workup, imaging features, and differentials for ductal abnormalities. Patients may present with nipple discharge, palpable abnormalities, infectious symptoms, lactational issues, or be asymptomatic. Ductal pathologies range from ductal ectasia, periductal mastitis, intraductal papillomas, to ductal carcinoma in situ, invasive ductal carcinoma, and Paget's disease. Radiologists should recognize both normal and abnormal ductal imaging features on DBT (dilated ducts, masses, and/or calcifications), on US (cystic ductal dilation, ductal wall irregularities or arborization, intraductal masses or debris), and on MRI (clustered ring non-mass enhancement, abnormal linear or segmental NME). This educational exhibit will provide a comprehensive case-based review of benign and malignant ductal diseases, their multimodality imaging features, and associated management recommendations.

### Breast Surgery: Changes and Findings Multimodal Diagnosis

#### Participants

Maria Jose Chico, Buenos Aires, Argentina (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Identify the different post-surgical changes of breast surgery<sup>2</sup>. Learn to identify which findings are suspicious and which are not.<sup>3</sup>  
Understand and integrate the findings in the different imaging modalities.<sup>4</sup> Understand the differential diagnoses

#### TABLE OF CONTENTS/OUTLINE

The accurate interpretation of images of the postsurgical breast depends on the availability of high-quality imaging. These changes should be interpreted in conjunction with the clinical and surgical history. They may correspond to benign or suspected changes. It is useful to analyze them in the different imaging modalities to support or rule out a suspected diagnosis. They can appear in the post-surgical period due to both malignant and benign conditions

### Beyond the Lump: Navigating the Challenges of Cystic Breast Lesions

#### Participants

Maria Vitoria Ludwig, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Our educational exhibit is directed to review the assessment and management of cystic breast lesions through the following points: review the pathologies presented as cystic breast lesions; understand how to identify and categorize breast cysts at ultrasonography; comprehend the appropriate management according to the imaging finding, correlating with clinical history and other imaging modalities if available; enlighten biopsy modalities, indication and technique; recognize the importance of subsequent histological analysis.

#### TABLE OF CONTENTS/OUTLINE

The subject will be approached in the following sequence: pathologies presented as cystic breast lesions and their malignancy risk; diagnosis, initial evaluation and ultrasound classification of breast cysts, linked with drawing representations of each type of cyst; appropriate risk assessment and management according to the imaging finding considering correlation with clinical history and other imaging modalities, namely mammography and magnetic resonance imaging; how to choose the most suitable biopsy modality and possible pitfalls; correlation of radiological findings with histopathologic analysis, followed by revision of management if required; illustrative cases in the different imaging methods.

### Lipofilling: What Does Breast Radiology Need to Know?

#### Participants

Karen Caro, PhD, CABA, Argentina (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1.- Describe the imaging characteristics of the lesions in lipofilling  
2.- When should we consider that a lesion after a lipofilling procedure would need histological certification, in relation to the imaging findings?

#### TABLE OF CONTENTS/OUTLINE

Currently fat transfer (lipofilling) is used in breast reconstruction. In this paper we will describe its advantages and how it is seen in the different imaging studies (ultrasound, mammography and MRI). It is important to identify which are the usual benign findings in the different methods and what Bi-Rads to assign, in this way we can define those cases in which their histological evaluation should be considered. Describe the advantages and disadvantages of this method in breast remodeling. The importance of recognizing radiological manifestations and the difficulties involved in detecting suspicious lesions. Knowing how to recognize that fat necrosis is a frequent lesion after lipofilling, which should be suspected in order to avoid other more complex studies such as MRI and even biopsies

### Back to the Tumor: Navigating Breast Cancer Recurrence Like a Pro

#### Participants

Vitor Zanetta, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Review the risk and pattern of tumor recurrence according to molecular subtype. Provide visual and data-driven insights into expected imaging changes following treatment. Highlight the role that multimodality plays in differentiating expected imaging findings from treatment and imaging findings indicative of recurrence or new breast cancer. Review current follow-up protocols after breast cancer and screening for intermediate risk patients.

#### TABLE OF CONTENTS/OUTLINE

Review the influence of breast cancer subtype on the rate, timing and location of tumor recurrence. Expected imaging changes following treatment with visual and data-driven insights: Expected timeline of post-surgical changes. Details in the assessment of local recurrence in breast-conserving surgery and mastectomy. Possible changes in axillary and internal mammary lymph nodes. The role that multimodality imaging (mammogram, ultrasound, MRI and PET-CT) plays in differentiating recurrence or new breast cancer from post-treatment changes, including: Frequent dilemmas in clinical practice: evaluation of calcifications, distortions, fat necrosis and enhancements in the surgical bed. How to deal with conflicting findings between different imaging methods to avoid unnecessary biopsies without losing sensitivity for early recognition of recurrence. Subtle recurrence and the importance of serial follow-up Imaging. Examine the follow-up protocols after breast cancer and screening for intermediate-risk patients from the perspective of personalized medicine.

### From Flat to Fabulous - A Radiological Guide to Breast Aesthetic Fillers and Biostimulators

#### Participants

Heni Skaf, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To expose, through cases from our institution, manifestations of different breast filling and biostimulator materials in the most diverse imaging methods, such as: free silicone, acrylates (PMMA, PAAG), hyaluronic acid, vitamin D, calcium hydroxyapatite and fat grafting. To familiarize the breast radiologist with the radiological presentation of these materials, avoiding false positives and unnecessary investigations. To discuss the usual topography in which they are injected, as well as possible local and systemic complications of using such materials.

#### TABLE OF CONTENTS/OUTLINE

Introduction: The demand for percutaneous aesthetic procedures is rising in medicine, especially in the context of facial harmonization. This also applies to the breast, both for use in cancer patients, with the increase in the incidence and in diagnosis of breast cancer, as well as for purely aesthetic purposes in the breast itself or even due to migration from other injection sites. Imaging findings: on mammography, ultrasonography and magnetic resonance as well as possible complications and usual injection sites of free silicone, acrylates (PMMA, PAAG), hyaluronic acid, vitamin D, calcium hydroxyapatite and fat grafting. For the most part, non-resorbable synthetic biomaterials, fat grafting, as well as resorbable materials used recently, have radiologic representation. Conclusion: The use of aesthetic breast fillers, whether in the oncological context or not, is on the rise. Often, the patient does not have knowledge of what was used, which can limit the clinical decision of the physician. Additionally, recognition of the radiological appearance of different fillers can avoid false positives and unnecessary biopsies.

### Axillary Lymphadenopathy Induced by COVID-19 Vaccination: What Have We Learned?

#### Participants

Miguel Barrio Piqueras I, MD, Pamplona, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- US features of reactive lymph nodes after COVID-19 vaccination in patients with and without previous COVID-19 infection- Nodal reactivity in young and middle-age patients vaccinated with different COVID-19 vaccine protocols-Association between the cortical thickness measurement of reactive post-vaccine lymphadenopathy and an effective humoral response in COVID-19-naïve patients

#### TABLE OF CONTENTS/OUTLINE

The COVID-19 pandemic led to the approval of an emerging vaccination program to contain coronavirus dissemination. One of the most commonly reported local side effects of COVID-19 vaccination has been the development of axillary lymphadenopathy. In this poster, we will discuss about this phenomenon:1. Which ultrasound features should be evaluated?2. Does nodal response differ if there exists a prior history of COVID-19 infection?3. Do the ultrasound characteristics of reactive axillary nodes change depending on the administered COVID-19 vaccination?4. What is the nodal reactivity to the COVID vaccination according to age?5. How long does reactive lymphadenopathy last?6. Does cortical thickness of reactive post-vaccine lymph nodes reflect a humoral response?Conclusions- Reactive lymphadenopathy is a common side effect of COVID-19 vaccination- It is generally a harmless and temporary condition- Healthcare providers should be aware of this potential phenomenon to provide an appropriate guidance to patients

BREE-26

### Cystic Carcinomas: Preventing Misdiagnosis and Lessons Learned

#### Participants

Hemal Grover, MD, New York, NY (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Simple cysts: well circumscribed isodense masses on mammogram; well circumscribed anechoic masses on ultrasound with a thin, smooth, imperceptible wall and posterior acoustic enhancement. Complicated cysts meet all criteria for simple cysts except they contain debris/echogenic intracystic contents. Necrotic tumors (rapidly growing) can present as cystic masses. They can be anechoic, demonstrate posterior acoustic enhancement and therefore often misdiagnosed as simple or complicated cysts. However, careful evaluation of the margins is imperative as it can reveal subtle irregularity and raise suspicion for malignancy. Correlation with mammogram (particularly spot compression views) can be helpful to reveal obscured or irregular margins. Cystic carcinomas often present as palpable masses. These cases should be viewed with a higher index of suspicion before being labeled as BIRADS 2. Real time physician directed ultrasound is recommended along with a bilateral mammogram with spot compression views (including in women 30-35 years old). Family history, genetic mutations and ancestry (eg Ashkenazi Jewish descent) should be considered while evaluating these patients.

#### TABLE OF CONTENTS/OUTLINE

Imaging features of simple, complicated and complex cysts. Classification of complex cysts. Clinical history, diagnostic mammogram, ultrasound and MRI findings of authors' cases of cystic carcinomas. Errors of interpretation/misdiagnosis and lessons learnt. Differential Diagnoses.

### Granulomatous Mastitis: Imaging Insights into a Benign Mimicker of Breast Infection and Malignancy

#### Participants

Sravani Gampala, MD, Syracuse, NY (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Understand the etiology and clinical presentation of granulomatous mastitis. 2. Recognize the imaging findings of granulomatous mastitis across mammography, ultrasound, and MRI. 3. Appreciate the importance of correlating imaging findings with the clinical picture. 4. Acknowledge the consequences of misdiagnosing granulomatous mastitis. 5. Emphasize the role of radiologists in considering granulomatous mastitis as a differential diagnosis. 6. Discuss the importance of a multidisciplinary approach in the accurate diagnosis of granulomatous mastitis.

#### TABLE OF CONTENTS/OUTLINE

I. Introduction to Granulomatous Mastitis A. Etiology B. Clinical presentation II. Imaging Modalities A. Mammography 1. Findings 2. Differential diagnosis B. Ultrasound 1. Findings 2. Differential diagnosis C. MRI 1. Findings 2. Differential diagnosis III. Consequences of Misdiagnosis A. Unnecessary studies B. Patient anxiety C. Invasive procedures IV. Radiologist's Role in Diagnosis A. Considering granulomatous mastitis B. Biopsy and pathological challenges V. Multidisciplinary Approach A. Collaboration in diagnosis B. Improved diagnostic accuracy.

### More Than Just a Pretty Cyst - Assessment and Management of Cystic Breast Lesions

#### Participants

Vivian Ogata, MD, (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- To discuss the ultrasound imaging parameters, from B-mode adjustments, Doppler imaging, to post-processing techniques, to properly evaluate cystic breast lesions.- To present the imaging findings of the listed cystic lesions according to the BI-RADS® lexicon such as: simple cyst, complicated cyst, clustered microcysts and complex solid and cystic masses, illustrating with multimodality imaging.- To discuss each subcategory of cystic lesions, its management and follow-up, illustrating with some challenging radiologic cases.- To habituate general radiologists with these findings in order to improve the diagnostic rate of such mammary lesions, reducing unnecessary biopsies.

#### TABLE OF CONTENTS/OUTLINE

- Introduction and epidemiology: breast cystic lesions are a common diagnosis in women and include a wide spectrum of diseases, from a simple apocrine cyst to complex solid cystic carcinomas.- Scanning techniques, ultrasound adjustment, artifacts and post-processing imaging: adjustment of ultrasonographic basic parameters and adequate scanning techniques are essential for an accurate diagnosis. We can also employ Doppler, elastography, as well as use imaging artifacts to our advantage, patient's position changes more recent post-processing techniques (harmonic and spatial compounding imaging) to better characterize cystic lesions.- Cystic lesions subcategories, classification, histological representation and multimodality imaging depiction.- Management and follow-up: adequate ACR BI-RADS® categorization of each subtype of cystic lesion, illustrating with some challenging cases , exploring some related pitfalls and discussing benign and malignant differential diagnosis.

### Can Aesthetic Procedures Interfere With Breast Cancer Screening?

#### Participants

Leticia Oliveira, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The incidence of dermatological procedures to modify aesthetics in body contouring, including post-surgical reconstructions, has been increasing every year, especially minimally invasive ones with injectables. Recognizing the imaging findings provoked by these procedures will avoid possible diagnostic pitfalls and allow the radiologist to alert the dermatologist about the possible loss of breast cancer screening caused by some of these previously unregistered procedures. Further, patients should be educated about the hazards associated with improper use of injectables from non-licensed individuals. Patients must be encouraged to seek out licensed physicians who use FDA-approved products for any medical and cosmetic care.

#### TABLE OF CONTENTS/OUTLINE

To review literature data on aesthetic dermatological procedures in the breast and axillary region, with cases from our institution, and illustrate with imaging findings found, based on different imaging methods

Printed on: 04/12/24

### **It's Not the Same As It Was: Multimodal Review of Breast Cancer Recurrence and What the Radiologist Needs to Know**

#### **Participants**

Leticia Oliveira, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

- Breast cancer is the most common cancer in the female population worldwide and the number of patients underwent conservative surgery is growing; - The annual risk of recurrence disease varies between 2 to 5% in 5-20 years after diagnosis; - Locoregional recurrence is defined as the detection of lesions in the ipsilateral breast, chest wall or regional lymph node. If the other parts of the body are affected, it becomes a systemic recurrence; - Some factors related to breast cancer recurrence include failure in the first treatment and non-adherence to adjuvant therapy and surgical margins, but could be related to tumor size, aggressive biology of the primary tumor, young patient age at diagnosis and presence of familial or genetic risk factors; - Tumor recurrence may or may not be similar to the primary malignancy and can simulate benign conditions; - Imaging recurrence are variable and this knowledge becomes essential in radiological practice in order to improve the diagnosis and management of the patient.

#### **TABLE OF CONTENTS/OUTLINE**

- To review the factors associated to breast cancer recurrence and the epidemiology of these cases; - To show the most common findings in breast cancer recurrence using cases of our institution; - To teach how to evaluate the different methods of imaging (mammogram, ultrasound and MRI) in these cases and give tips that may help to differentiate sequelae of treatment from suspect lesion; - Easy-to-use take home messages to facilitate the handling of challenging cases.

### Demystifying Gynecomastia: A Pictorial Review

#### Participants

Rocio Cortes Quezada, MEd, Tlalpan, Mexico (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

\*Most male breast masses are benign and the most common reason is gynecomastia. \*Forms of breast imaging in male patients are used for diagnostic purposes. \*Pseudogynecomastia and cancer are the most common differential diagnoses. \*Mammography can show increased glandular tissue and ductal dilatation in cases of gynecomastia. Masses, calcifications or signs suggestive of malignancy can also be visualized. \*Ultrasound can help distinguish true gynecomastia from pseudogynecomastia (accumulation of fatty tissue in the breast region). \* Biopsy is the only method to determine if a breast mass in a man is benign or malignant. •  
\*Biopsy can be guided by ultrasound or mammography

#### TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Definition 3. Epidemiology 4. Clinical presentation 5. Etiology 6. Anatomy and embryology of the male breast 7. Types of gynecomastia 8. Imaging tests of the male breast 9. Imaging findings (mammography, ultrasound) 10. Differential diagnoses 11. Cases: a. Pseudogynecomastia. b. Lipoma. c. Epidermal inclusion cyst of the breast. d. Duct ectasia. e. Fat necrosis f. Invasive ductal carcinoma 12. Conclusions

### Breast Cancer Surveillance in Patients with Prior History of Breast Cancer: Updates and Controversies

#### Participants

Sona Chikarmane, MD, Newtonville, MA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Patients with a prior history of breast cancer (PHBC) are at increased risk of recurrent or second breast cancers. PHBC are also living longer due to improved screening and advances in treatment. Developing optimal screening regimens are critical in detecting breast cancers in these high-risk patients. Expected post-treatment changes include architectural distortion, edema, and skin thickening, which stabilize around two years post-treatment. Multimodality breast imaging surveillance is available, with screening mammography (full field digital mammography or digital breast tomosynthesis), whole breast ultrasound, contrast-enhanced mammography, and breast MRI. The purpose of this educational exhibit will be to review breast cancer surveillance in PHBC, highlighting updates and controversies in screening guidelines.

#### TABLE OF CONTENTS/OUTLINE

1. Review literature on risk of recurrent/second breast cancers in PHBC
2. Discuss optimal mammography screening regimens, including screening vs diagnostic mammography, cadence of screening, and batch vs immediate interpretation.
3. Review the current societal screening guidelines, including mammography and breast MRI.
4. Show multi-modality image-rich cases of recurrent breast cancer versus expected post-treatment changes.
5. Highlight controversies in breast cancer screening guidelines, including age when to stop screening, imaging the reconstructed breast, and compliance with screening.

### Tales from the Breast: When Breast Problems Have Surprising Origins

#### Participants

Natalia Lima, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Diseases that affect the breast, but do not originate from it, may include systemic, autoimmune, infectious or even tumoral conditions from other sites. They can cause inflammation in the breast tissue and manifest with pain, skin thickening, ulcerations and masses. It is essential to know each one of them to help the clinical practice of differentiating breast carcinoma from these pathologies.

#### TABLE OF CONTENTS/OUTLINE

Illustrated didactic cases from our Breast Radiology group showing some diseases and their presentation forms that can simulate breast carcinoma. They were classified into subgroups such as: 1. Related to the vasculonervous system (MAV and neurofibromatosis), 2. Systemic disorders (cutaneous lymphoma and congestive heart failure) , 3. Metastasis to the breast (melanoma and adrenal cortical carcinoma), 4. Soft Tissue tumors (granular cell tumor and synovial sarcoma), 5. Infectious (tuberculosis and dermatobiosis).

### A Guide to Cystic Breast Lesions

#### Participants

Christina Le, DO, Morristown, NJ (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Breast imaging is often complex and can appear difficult to understand. It is rarely explored in depth throughout medical school training and can be rather limited throughout residency, especially for those pursuing other specialties for fellowship. The purpose of this exhibit is to provide a demystified review of cystic breast lesions. This is meant to supplement a resident's knowledge of breast pathology and present the information in a concise yet comprehensive manner. Throughout the presentation, the pathophysiology and patient presentation of each entity will be discussed. This will be followed by the often variable imaging findings that can be encountered on ultrasound, mammography, and MRI. Annotated pictorial examples are provided to facilitate visualization of the specific lesion characteristics. To conclude, the exhibit will discuss treatment options and the appropriate BIRADS criteria to help standardize the severity of these lesions.

#### TABLE OF CONTENTS/OUTLINE

1. Overview/educational objectives 2. BIRADS categories 3. Simple Cyst 4. Galactocele 5. Fat necrosis/oil cyst 6. Hematoma 7. Abscess 8. Intracystic papilloma 9. Necrotic neoplasm 10. Conclusion 11. References

BREE-36

### Exploding Jelly of the Breast: The Mucocele-Like Lesion (MLL)

#### TEACHING POINTS

<Mucocele-Like Lesions are considered risk injuries (B3a). Mucin in the stroma calcifies over time, showing up as such on mammography. By mammography the type of calcifications is variable. By ultrasound it appears as microcysts, complex cysts or irregular nodules. The treatment depends on the diagnostic biopsy method.>

#### TABLE OF CONTENTS/OUTLINE

<Mucocele-Like Lesions were first described by Rosen in 1986 as a benign lesion "cysts containing mucin, lined by squamous or cuboid epithelium with or without extravasated mucin", currently considered a risk lesion. It is due to mucinous ducts that obstruct their contents, causing rupture with extravasation of the contents into the surrounding stroma, which over time can form calcifications, which are observed by mammography; less commonly, it presents as a mass. By ultrasound they are observed as a cyst with thick, mucin-like content or microcystic conglomerates. The more complex the cystic lesion, the more likely it is to be associated with Ductal Carcinoma In Situ (DCIS). With core needle biopsy, the percentage of diagnostic underestimation is less than 4% if they are lesions without atypia, but amounts to approximately 20% if they are lesions with atypia, so removal by vacuum-assisted biopsy or surgery is preferred.>

### Rare Tumors of the Breast

#### TEACHING POINTS

Rare tumors of the breast: Metaplastic carcinoma of the breast and Primary signet ring cell carcinoma of the breast. Epidemiology, image presentation of cases, clinical characteristics, imaging findings

#### TABLE OF CONTENTS/OUTLINE

Metaplastic breast carcinoma is a rare type of neoplasm that resembles a high-grade histological carcinoma, presents a high incidence of recurrences, poor prognosis, difficulties at the time of diagnosis, the establishment of therapeutic guidelines, and controversy regarding its nomenclature. The bibliography is very limited and the published descriptive studies have a low number of cases, making it difficult to obtain definitive and extrapolated conclusions, especially when making therapeutic decisions. Primary signet ring cell carcinoma of the breast is a rare tumor of controversial histogenesis, aggressive behavior and unusual metastatic pattern to the gastrointestinal tract and serous surfaces, posing differential diagnosis problems with metastasis of signet ring cell carcinoma of the breast. other origins, preferably gastrointestinal.

### AI Advancements in Breast Imaging: Transforming Radiology for Improved Patient Care

#### Participants

Matteo Mancino, MD, Roma, Italy (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To explore the basic concepts of deep learning and machine learning in breast imaging. To examine AI-based tools and their applications in detection, diagnosis, and treatment planning for breast cancer. To assess AI performance compared to human experts. To discuss ethical considerations. To investigate AI future trends and developments for breast imaging.

#### TABLE OF CONTENTS/OUTLINE

Introduction: presenting the fundamental principles of deep learning and machine learning in the context of breast imaging. 1. Workload to explore how AI algorithms can positively influence radiologists' workload, also triaging negative mammograms and potentially replacing second readers. 2. AI accuracy to discuss how AI-based solutions contribute to improve diagnostic accuracy in mammography and enable a more precise lesion classification. 3. Cancer-Prediction evaluating the ability of AI algorithms to identify cancer-predictive features in mammograms. 4. AI role in ultrasound and MRI to examine the development and performance of AI-based solutions for detecting and classifying breast lesions in ultrasound and MRI. 5. Ethical considerations Addressing the ethical concerns surrounding AI implementation, including data privacy, algorithm fairness, and potential biases in the development process. 6. Future trends to address the future trends of AI, contemplating the potential integration of AI with other imaging modalities, exploring the role of radiogenomics in breast imaging, and anticipating novel AI advancements.

### Multimodal Imaging of Breast Tissue Expanders, Including Associated Complications and MRI Contraindications

#### Participants

Almir Bitencourt, MD, PhD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

? To show the types of breast tissue expanders and MRI contraindications. ? To perform a multimodal review of the imaging aspects of breast tissue expanders. ? To illustrate complications associated to breast tissue expanders.

#### TABLE OF CONTENTS/OUTLINE

Breast tissue expanders are temporary devices commonly used in two-stage breast reconstruction surgery. Tissue expanders are gradually filled with saline to stretch the skin and chest tissues to make room for breast reconstruction with a permanent implant. There are different types of breast tissue expanders depending on the number of lumens (one or two), filling (saline and/or silicone) and injection dome (remote or internal). Some types have metallic components that are not suitable for MRI imaging due to the potential for image distortion or dislocation. It is important to recognize the imaging features of breast tissue expanders, to avoid misdiagnosis, since tissue expanders with small filling may mimic implant rupture on imaging. Complications associated with breast tissue expanders are rare and include infection, hematoma, rupture, and displacement.

### Code of Con-DUCT: An Algorithmic Approach to Multimodality Assessment and Management of Dilated Mammary Ducts

#### Participants

Rajshree Singh, MD, Lansdowne, PA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- The ACR BI-RADS® 5th Edition indicates that a SDD has a > 2% likelihood of malignancy, and therefore warrants a suspicious (BI-RADS 4A) assessment. Otherwise, there are few recommendations for evaluation and management of dilated ducts found at breast imaging.
- Further evaluation with MRI and/or tissue sampling may be warranted if ductal dilation (DD) is new or increasing, symptomatic, or associated with worrisome mammographic or ultrasound (US) features.
- We propose an algorithm-based approach to assessing dilated ducts, specifying worrisome features on mammogram and targeted US to guide further workup.
- This approach may potentially reduce radiologists' uncertainty, unnecessary biopsies, missed cancers, and healthcare expenditures.

#### TABLE OF CONTENTS/OUTLINE

1. Ductal anatomy
2. Definition of DD
3. Etiologies of DD
4. DD requiring further evaluation:
  - a. New or interval change
  - b. Patient symptoms and/or clinical findings
  - c. Suspicious mammographic findings
5. Worrisome US findings
6. Proposed algorithm for assessment and management
7. Identification of key findings that help guide diagnostic decisions.
8. Case-based application and examples
9. Role of ductography, US with elastography, and MR

Printed on: 04/12/24

### Breast Imaging Disparities in the U.S

#### Participants

Dami Olufosoye, BS, MPH, Mount Pleasant, MI (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

This educational exhibit is a call to action for radiologists to identify racial disparities in their own practice. We will review recent studies identifying disparities individuals of color face in breast imaging and discuss successful interventions. 1. Breast cancer is the second leading cause of cancer deaths in women in the US but the leading cause in black women. 2. Black women have less access to screening mammography 3. Black and Hispanic women have lower rates of receiving adequate breast cancer treatment and post-treatment surveillance 4. Black women have increased rates of breast cancer recurrence 5. Imaging disparities based on race and other factors can be identified by radiologists and mitigated with outreach programs

#### TABLE OF CONTENTS/OUTLINE

1 US Epidemiologic breast cancer data 2 Racial disparities in breast cancer screening • Decreased access to mammography centers, advanced imaging equipment, specialized physicians, genetic testing • Additional limitations: § Patient distrust § Provider-patient relationship 3 Racial disparities in diagnostic work-up • Increased time to diagnostic work-up and to biopsy • Later stage at diagnosis 4 Racial disparities after breast cancer diagnosis • Lower rates of receiving adequate breast cancer care and post-treatment surveillance • Lower rates of 5-year breast cancer survival • Higher rates of cancer recurrence 5 How radiologists can help • Identification and mitigation of imaging disparities is part of our professional responsibility to our patients • Examples of successful initiatives

### Breast Cysts: A Pictorial Exhibit of Benign and Malignant Twists

#### Participants

Flavia M. Starling, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Cystic breast lesions are the most common masses found in the female breast of any age group, mainly between 30 and 50 years of age. They are derived from the terminal lobular duct unit as a result of fibrocystic change and may contain isolated liquid or even associated solid component, thus comprising a wide spectrum of variable disease entities, including benign and malignant pathologies. Simple and complicated cysts are usually benign; but on the other hand, complex cystic masses containing mixed cystic and solid components are indeterminate. Therefore, knowing that cysts are common lesions and that up to approximately 31% of complex breast cysts are associated with malignancy, the radiologist must be familiar with the main pathologies and imaging characteristics that includes this category of lesions.

#### TABLE OF CONTENTS/OUTLINE

- Didactically review the main cystic lesions of the breast and their characteristics through different imaging methods and case-based revision obtained from the digital archive of our institution.
- Take home message
- References

### Molecular Classification of Breast Cancer: Guide for the Radiologist

#### Participants

Sandra Lara, CABA, Argentina (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Breast cancer is a disease that, despite having a histopathological classification, also includes molecular and genetic subtypes, being able to carry out a molecular classification that guides the clinical behavior, prognosis and different radiological characteristics based on the expression of biomarkers (HER2, ER, PR, Ki67), this classification complements the traditional classification and adds a very useful biological approach to disease management. That is why it is important for the radiologist to know and recognize the importance of classification, as well as to identify the most common imaging characteristics in the different diagnostic methods according to each molecular subtype.

#### TABLE OF CONTENTS/OUTLINE

Introduction· Breast molecular biomarkers· Revision of the classification of molecular subtypes of breast cancer· Imaging characteristics in the different methods according to each molecular subtype· Clinical cases· Conclusions

### Invasive Lobular Carcinoma (ILC): The Cancer With a Thousand Faces

#### Participants

Adriana Alvarez, MD, Santiago De Compostela, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The Invasive Lobular Carcinoma (ILC) is the second most common type of invasive breast cancer. The incidence is increasing due to replacement therapy in postmenopausal women and diagnosis advances. There are two histologic variants: classic and pleomorphic. ILC is usually estrogen receptor positive and her2 negative. The loss of desmoplastic cell reaction and the low density of cells in this tumors make the clinical and the mammographic detection difficult. This entity has multiple imaging manifestations, being a challenge for the radiologist. ILC can be bilateral, multifocal or multicentric, with a unique metastatic pattern. Diagnosis is based in clinical and radiological tests. The most common manifestation is an irregular or spiculated mass in mammography and an hypoechoic irregular mass with posterior shadowing in US. MRI is the gold standard and it is used in the presence of multifocal, multicentric or bilateral disease as well as in the presence of lymphadenopathies.

#### TABLE OF CONTENTS/OUTLINE

This educational exhibit presents epidemiological and main ILC features. Tumor presentation and behaviour are explained. A multi-modality review of clinical and radiologic features through clinical cases, as well as pitfalls, are presented and they can help the radiologist in the diagnosis.

### **MRI-Detected US: How to Improve the Detection Rate of Non Mass Lesions Using Breast Anatomical Landmarks**

#### **TEACHING POINTS**

Nonmass lesions on US are most often observed when US is used to target mammographic asymmetries, biopsy suspicious calcifications seen on screening mammography, and to biopsy abnormalities on MRI. In a meta-analysis of 2201 lesions, the success rate of targeted US after MRI was 58% (range, 23%-82%) and detection rates varied by lesion type. Nonmass enhancement lesions on MRI are less likely to be detected on targeted US than mass lesions (66% of all masses and 30% of nonmass enhancement lesions were seen). This review introduces a new viewpoint on breast ultrasound anatomy necessary to obtain a close correlation with MRI and describes a target US method with anatomical landmarks based on this viewpoint. 1. Some US images of MRI-detected lesions are more indistinct than surrounding benign lesions and need to be correlated with precision. 2. About effective anatomical landmarks for MRI correlation including surrounding tissues and vascular routes as a new anatomical landmark. 3. Pattern classification of mammary fat and mammary gland distribution for reading anatomic landmarks in MRI correlation. 4. The anatomical mechanism of deformity and how to decipher it on US. Breast deformity during ultrasound examination is not related to breast size, but varies from individual to individual.

#### **TABLE OF CONTENTS/OUTLINE**

1. the identification rate of in each literature and its relationship to landmarks used
2. identification rates by anatomical landmarks and MRI images using those landmarks
3. classification of patterns of fat and mammary gland distribution in the breast based on anatomical understanding
4. anatomic mechanisms of breast deformity in MRI and US
5. US techniques considering breast deformity
6. case presentation

### Imaging Review of Mammography and Ultrasound Findings in Uncommon Breast Lesions: A Trainee-Focused Guide

#### Participants

Thurl Hugh Cledera, MD, Taguig, Philippines (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Differentiating uncommon breast lesions from cancerous lesions in the breast is paramount to proper diagnosis, risk stratification, and treatment in patients presenting with a breast mass in imaging. Uncommon breast lesions may vary from those arising in the glandular parenchyma (phyllodes), inflammation (mastitis and abscess), autoimmune (granulomatous mastitis), and metabolic (diabetic mastopathy) etiologies. In centers where resources are limited, knowing the value of mammography and ultrasound findings may help guide biopsy, which in turn provides adequate treatment. At the end of this exhibit, the learner will be able to review the basic findings that are seen in breast lesions on imaging and understand the role of clinical and imaging correlation in the proper identification of these lesions.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction
2. Brief review of histology of uncommon breast lesions
3. Basic findings in mammography
4. Basic findings in ultrasound
5. Correlating findings in mammography and ultrasound
6. Cases of uncommon breast lesions

a. Lactating adenoma  
b. Intraductal papilloma  
c. Mastitis (bacterial)  
d. Granulomatous mastitis  
e. Diabetic mastopathy  
f. Mondor's disease  
g. Paget's disease  
h. Phyllodes tumor  
i. Dermatomyositis  
j. Foreign bodies

### Untangling the Mammary Ducts: Decoding the Complexity of Intraductal Pathology

#### Participants

Elsa Cecilia Molina Miranda, MD, Ciudad De Mexico, Mexico (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

**Mammography:** Mammography can show intraductal lesions as grouped calcifications in a linear or branching pattern. **Breast ultrasound:** Ultrasound can identify intraductal lesions as masses or areas of ductal dilation. **Core needle biopsy (CNB):** This procedure is used to obtain a tissue sample from the lesion. CNB is performed guided by ultrasound or mammography. **Vacuum-assisted biopsy (VAB):** This procedure uses a suction device to obtain a tissue sample from the lesion. VAB is performed guided by ultrasound or mammography. **Contrast-enhanced mammography:** This exam uses a contrast medium to evaluate the vascularity of lesions in the breast, which may suggest the presence of a malignant lesion. Management of intraductal lesions depends on the definitive diagnosis obtained by biopsy. If the lesion is found to be malignant, treatment may include surgery, radiation therapy, and/or chemotherapy. If the lesion is benign, treatment may include observation or surgical removal.

#### TABLE OF CONTENTS/OUTLINE

Table of contents:1. Objectives2. Anatomia y fisiopatologia 3. Cases 4. Metodos diagnosticos 5. Approach 6. Conclusions  
Outline:Intraductal breast lesions are those that originate in the breast ducts and can be benign or malignant. These lesions can be detected by diagnostic methods such as mammography, breast ultrasound, core needle biopsy (CNB), vacuum-assisted biopsy (VAB), and contrast-enhanced mammography. The management of intraductal lesions depends on the definitive diagnosis obtained by biopsy, and treatment may include surgery, radiotherapy, and/or chemotherapy for malignant lesions, while benign lesions may be observed or surgically removed.

### Coming Out of the Bubble: Assessment and Management of Cystic Breast Lesions

#### Participants

Bruna Nantes, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

An approach to the evaluation and diagnosis of cystic lesions in the breast, with the aim of helping radiologists in their daily practice. Detail the different types of cystic breast lesions and their differential diagnoses, as well as the appropriate management of these lesions.

#### TABLE OF CONTENTS/OUTLINE

Brief introduction: the prevalence of cystic breast lesions and the importance of adequate recognition and classification of these lesions. Definition and descriptors: detail the correct definition and description of the different types of cystic lesions. Flowchart on the management of cystic breast lesions. Multiple clinical cases of the different differential diagnoses of each type of cystic breast lesion, that contemplate: - Images from mammography, ultrasound and eventually MRI or CT scan; - Type of biopsy performed (if performed); - Recommendations on approaches to cystic lesions as per BI-RADS; - Recommendations on some special cases of cystic lesions; Conclusion.

### When Lightning Strikes the Same Place Twice: Detecting Ipsilateral Breast Cancer Recurrence in the Post Operative Breast

#### TEACHING POINTS

Illustrate the imaging features suspicious of ipsilateral breast cancer recurrence in patients with prior lumpectomy or mastectomy. Review current literature for recommendations on adjunct imaging surveillance in women with prior history of breast cancer given their increased risk of a second breast cancer. Review imaging mimickers of breast cancer recurrence and discuss management recommendations. Highlight teaching points for each case to increase confidence in making a timely diagnosis.

#### TABLE OF CONTENTS/OUTLINE

Case base review We will present an image rich exhibit depicting imaging findings in ipsilateral breast cancer recurrence in the post lumpectomy patients who present for annual surveillance mammography or breast MRI, and in patients who present with clinical concerns. Cases will illustrate imaging findings, histopathology and management at the initial diagnosis and at time of recurrence. Examples of imaging mimickers of breast cancer will familiarize the learner with benign conditions in the post-surgical breast. At the end of the exhibit, teaching points will be summarized. Summary: Women with a prior personal history of breast cancer are at an increased breast cancer risk. Cumulative incidence of ipsilateral breast tumor recurrence rate has been reported at 14.3%. The image appearance of the post operative breast can make the detection of breast cancer recurrence more challenging. As a result, radiologists should be familiar with common and uncommon imaging findings of ipsilateral breast cancer recurrence. This presentation will review the current screening recommendations in this setting, expected post operative changes, breast cancer mimics, and the imaging findings of recurrence.

### **New Blossoms on the Old Tree: Advancing Ductography with Digital Breast Tomosynthesis (DBT) or Contrast-enhanced Mammography (CEM)**

#### **Participants**

Juan Tao, Wuhan, China (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

1. Ductography is a useful tool for evaluating pathologic nipple discharge, allowing for identification and localization of intraductal lesions. 2. Ductography combined with DBT or CEM can eliminate masking of small filling defects caused by overlapping ductal branches and improve visualization of the entire ductal tree, enhancing the clarity of diagnosis. 3. Fine-tuning of the procedural steps and optimization of the contrast agent concentration are necessary for the successful implementation of ductography with DBT or CEM. 4. Potential additional risks of radiation exposure associated with combining DBT or CEM should be considered, and measures should be taken to minimize radiation dose to the patient in accordance with established protocols and guidelines for radiation safety in breast imaging.

#### **TABLE OF CONTENTS/OUTLINE**

I. The Old Tree: Overview of Ductography and Its Clinical Value in Evaluating PND. II. The New Bloom on the Tree: Clinical Cases Demonstrating the Utility of Ductography combined with DBT or CEM A. Sharper Sights Case: DBT-Ductography Increased Accuracy of Diagnosis. B. Wider Insights Case: CEM-Ductography Improved Visualization of the Entire Ductal Tree. III. Technical Aspects of Ductography combined with DBT or CEM. IV. Radiation Safety Considerations with Ductography and DBT or CEM A. Potential Additional Risks of Radiation Exposure B. Strategies to Minimize Radiation Dose to the Patient C. Importance of Adherence to Established Protocols and Guidelines for Radiation Safety in Breast Imaging. V. Conclusion A. Summary of the Key Points Regarding Ductography with DBT or CEM B. Future Directions and Potential Applications of Ductography with DBT or CEM. VI. References.

### Vascular Mammary Lesions: Key Features to Make an Accurate Diagnosis and Avoid Unnecessary Biopsies

#### Participants

Ladys Camargo, MD, Ciudad Autonoma de Buenos Aires, Argentina (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Review the normal vascular anatomy of the breast  
2. Know the most frequent vascular breast lesions  
3. Know and discuss the diagnostic modalities commonly used for the diagnosis of vascular lesions  
4. What is the imaging follow-up of vascular lesions?

#### TABLE OF CONTENTS/OUTLINE

There are various vascular mammary lesions, ranging from chronic systemic processes, congenital malformations, post-traumatic sequelae, benign masses, to malignant tumors. Accurate diagnosis of vascular lesions in breast images is very risky due to overlapping characteristics. This is why radiologists must be aware of the key features in the different diagnostic methods for interpreting images of vascular lesions in order to make an accurate diagnosis and avoid unnecessary biopsies and finally be able to discuss management recommendations and guidance.

Outline-Introduction-Vascular anatomy of the breast-Imaging characteristics of the most frequent vascular mammary lesions-Diagnostic methods for the diagnosis of vascular lesions-Discussion of management and monitoring-Clinical cases.-Conclusions.-Bibliography

### Everything We Need to Know About Papillary Breast Carcinoma

#### Participants

Lisett Cruzado-Quiroz, MD, Lima, Peru (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Papillary breast carcinoma is a rare subtype of invasive ductal carcinoma with infiltrative papillary growth representing about 0,5 - 0,7% of all invasive breast cancers. It is usually seen in postmenopausal in their sixth to eight decade of life. Association with carcinoma in situ is uncommon. Typically presents with bloody nipple discharge or/with slow growing palpable tumors, frequently found in the periareolar region. In general, they have better prognosis than ductal carcinoma with a 100% 10 year survival rate following treatment. Lymph node involvement and distant metastases are rare except in the invasive form. Mammography usually shows a solitary round or oval mass with circumscribed margins. Rarely they associate poorly defined margins or spiculation, given the low occurrence of desmoplastic reaction. Ultrasound generally shows a complex mass with solid and cystic components with good sound transmission. MRI may demonstrate heterogeneous lesions with septations, mural nodule and intracystic haemorrhage, the solid components typically show washout kinetics. Intracystic papillary carcinomas can occur in a pure form or may be associated with ductal carcinoma in-situ or invasive ductal carcinoma. The authors will review the clinical manifestation, imaging features and pathology correlation of this rare breast carcinoma.

#### TABLE OF CONTENTS/OUTLINE

Review of the pathophysiology of papillary breast cancers (histological and molecular aspect).Multimodal review of imaging features of papillary cancers (mammographic, ultrasonographic, and MR findings)To determine the Radiology-Pathology concordance/discordance by reviewing cases.Update on the treatment of papillary breast cancer.

### Decoding Ductal Pathology: Multimodality Approach to Nipple Discharge and Management of the Solitary Duct

#### TEACHING POINTS

1. Identify what differentiates physiologic nipple discharge from pathologic discharge 2. Describe an approach to the diagnostic workup of patients with nipple discharge 3. Discuss the clinical importance of a solitary dilated duct and describe an approach to management in these patients 4. Implement new strategies for biopsy of hard-to-sample intraductal masses under both ultrasound and MRI-guidance

#### TABLE OF CONTENTS/OUTLINE

Nipple discharge represents 2-5% of medical visits among women and is the third most common breast concern (pain > lump > nipple discharge). As radiologists our primary responsibility in assessment and management of these patients is to distinguish physiologic and pathologic causes of nipple discharge. This presentation will review the prevalence, epidemiology and pathologic subtypes of papillary lesions and other common pathologies resulting in pathologic nipple discharge and provide the reader with a diagnostic algorithm for management of these patients. Using a multimodality case-based approach, the reader will develop a differential diagnosis and management strategy for imaging findings in patients with nipple discharge, including management of the solitary dilated duct. We provide the reader with important tips and tricks for biopsy of intraductal lesions and solitary dilated ducts under ultrasound and MRI-guidance and address the potential challenges of radiology-pathology concordance in these cases.

### Ductal Carcinoma in Situ: Beyond First Impressions

#### Participants

Hannah L. Chung, MD, Salt Lake City, UT (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

DCIS often co-exist with invasive cancers and 19-36% of DCIS after percutaneous needle biopsy are upstaged to an invasive cancer at surgical excision. Up to 3% of DCIS demonstrate axillary nodal metastases. The morphology of the calcifications are useful in predicting the nuclear grade. DCIS may also manifest as a noncalcified mass, asymmetry or distortion. Sonography demonstrates these findings as a mass, nonmass area or ductal change. MRI demonstrates the extent of DCIS better than other imaging modalities and findings correlate with high grade DCIS. Observed recurrences and lymph node metastases pose challenges to current evaluation and treatments of DCIS.

#### TABLE OF CONTENTS/OUTLINE

Table of Contents 1. What is DCIS a. Significance of DCIS b. Biology and evolution of DCIS 2. Clinical Presentation of DCIS a. Asymptomatic b. Nipple discharge c. Paget's disease of the nipple d. Palpable lump 3. Imaging correlates with biology and pathology a. Mammographic i. Calcifications, mass, asymmetry, distortion b. Sonographic i. Nonmass findings 1. hypoechoic areas 2. echogenic foci 3. shadowing, 4. pseudomicrocyst ii. Ductal change c. MRI- MRI is useful to demonstrate extent of disease, exclude invasive disease, and correlates with high grade DCIS. i. nonmass enhancement ii. mass. 4. Special considerations a. Occult invasive cancers or misdiagnosis- Can imaging predict invasion? b. Axillary Staging- Is axillary ultrasound with biopsy and sentinel lymph node necessary? 5. Research: Past, now, and future endeavors a. NSABP, UKANZ, ECOG-ACRIN b. Active surveillance vs standard treatment - COMET, LORIS, LORD c. ### When Cysts Are Not So Simple: Tips for Complex Cystic Breast Masses Evaluation.

#### TEACHING POINTS

-To review the different entities causing the sonographic appearance of a complex cyst.-To illustrate a series of cases of complex cystic benign and malignant lesions of the breast providing correlation with imaging (US, contrast-enhanced mammography, MRI) and pathology. - To discuss the specific management of those lesions including imaging and interventional procedures. -To emphasize pitfalls, diagnostic difficulties, and differential diagnosis.

#### TABLE OF CONTENTS/OUTLINE

Cystic breast lesions are frequently detected on breast ultrasonography. Simple cysts, complicated cysts, and oil cysts do not require further invasive diagnostic procedures. However, malignant entities may present with complex cystic and solid masses. Through sample cases, a variety of imaging and pathology findings from complex cystic lesions with management discussion will be demonstrated. 1. Introduction. US findings and technical pitfalls. 2.Cystic lesions evaluation, useful findings that could be of significant diagnostic value to distinguish between confusing cysts. Classification of cysts and suspicious findings. 3.Work-up of suspicious lesions on US: mammography/contrast-enhanced mammography (CEM) and MRI. Interventional procedures. 4. Typical benign and malignant lesions with their important findings on ultrasonography, contrast-enhanced mammography, and MRI: Benign: complicated/inflammatory cyst, seroma, oil cyst, epidermal inclusion cyst, galactocele, mucocele-like tumor, hematoma, abscess, fat necrosis, fibroadenoma, papilloma, benign Phyllodes tumor. Malignant: malignant Phyllodes tumor, papillary, medullary, colloid, and squamous cell carcinoma, sarcoma.

### **Differentiating Simple Cysts From Complicated Cysts, Complex Cystic and Solid Masses, and Other Cystic Breast Lesions**

#### **Participants**

Tara Retson, MD, PhD, San Diego, CA (*Presenter*) Research Consultant, CureMetrix, Inc Stock options, CureMetrix, Inc

#### **TEACHING POINTS**

Cystic diseases of the breast are common, and confusion can occur regarding their appropriate classification and management. Distinguishing between benign cysts/cystic lesions and malignant cyst-like/fluid-containing cancers may be challenging. Specifically, triple negative breast cancers and intracystic papillary carcinomas should not be dismissed as benign/probably benign. Cystic lesions may be diagnosed accurately and managed appropriately using characteristic imaging findings. It is imperative to properly classify lesions as complex cystic and solid masses vs. complicated cysts since their management differs, and the differential of complex cystic and solid masses includes cancer. This educational exhibit will define simple cysts, teach radiologists about cystic lesions that may not be benign, review their imaging appearances, and recommend management options for complicated cysts, clustered microcysts, and complex cystic and solid breast masses.

#### **TABLE OF CONTENTS/OUTLINE**

Introduction; Definitions/illustrations of simple cysts, complicated cysts, clustered microcysts and complex cystic and solid masses; Multimodality examples of cystic breast lesions, systematic approach to the characterization of cystic lesions; How to appropriately apply BI-RADS classification and management recommendations of cystic breast lesions; Utilization of a quiz at the end of the exhibit to test yourself on the systematic approach presented.

### Get Your Ducts in a Row: Imaging and Management Considerations of Ductal Disease of the Breast

#### Participants

Firouzeh Arjmandi, MD, Dallas, TX (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

-In the imaging evaluation of spontaneous clear and/or bloody nipple discharge, negative diagnostic conventional imaging (mammogram and ultrasound) warrants further evaluation with breast MRI.-Nipple changes on physical exam even in the absence of imaging findings are suspicious. Clinical exam findings should guide next steps in management, and nipple tissue biopsy should be performed by the surgeon in the appropriate clinical setting.-In the setting of a small, subtle intraductal mass seen on diagnostic MRI and not well visualized at time of MR-guided biopsy, targeting the end of a blind-ending solitary duct can help to guide the biopsy.-The combination of findings of a palpable lump, nipple discharge, and nipple inversion, and the presence of associated coarse heterogeneous calcifications raises concern for malignancy, and biopsy should be recommended (despite the presence of more benign appearing rim calcifications).-Treatment of intraductal papillomas without atypia has become more conservative. Upgrade to DCIS or invasive carcinoma is more common in women >50 years, lesions >1 cm, palpable lesions and papillomas >5 cm from the nipple.

#### TABLE OF CONTENTS/OUTLINE

-Overlapping imaging features of benign and malignant calcifications, including high grade versus low grade DCIS-Utility of MRI in the evaluation of extent of disease in intermediate to high grade DCIS-Multimodality imaging and clinical evaluation of pathologic nipple discharge and nipple changes (erythema and scaling)-Imaging assessment and clinical management of a solitary dilated duct and intraductal lesions-Accurate assessment of response to neoadjuvant chemotherapy in the setting of increasing calcifications post therapy

### Test Your Knowledge: A Case Based Quiz of Contrast Enhanced Mammography BI-RADS Lexicon

#### Participants

Daniel Sandoval, MD, Ciudad De Mexico, Mexico (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

• To learn the descriptors published in the ACR 2022 BI-RADS supplement for contrast enhanced mammography by reviewing a series of daily case images. • As this supplement has only recently been published, this exhibit is intended to help radiologists become familiar with the terminology and its representation on images, through an interactive and entertaining activity.

#### TABLE OF CONTENTS/OUTLINE

• Background Contrast enhanced mammography lexicon overview (categories, terms, features and definitions) • Illustrated case based quizzeso Case #1: Background parenchymal enhancement - Level: Minimal, Mild, Moderate, Marked. - Symmetry: Symmetric, Asymmetric.o Case #2: Masses - Shape: Oval, Round, Irregular.- Margin: Circumscribed, Irregular, Spiculated. - Internal enhancement characteristics: Homogeneous, Heterogeneous, Rim enhancement. o Case #3: Non mass enhancement - Distribution; Diffuse, Multiple regions, Regional, Focal, Linear, Segmental- Internal enhancement characteristics: Homogeneous, Heterogeneous, Clumped. o Case #4: Enhancing asymmetry - Internal enhancement pattern: Homogeneous, Heterogeneous. o Case #5: Lesion conspicuity - Low - Moderate - High• References

### Complex Cystic Breast Masses: An MR Imaging Review

#### Participants

Jie Liu, Wuhan, China (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To define the concept of complex cystic breast masses. 2. To categorize complex cystic breast masses into three types based on the percentage and spatial distribution of cystic and solid components in the contrast-enhanced MRI. 3. In comparison with US, MRI affords superior visualisation of the proportion and distribution characteristics of solid and cystic components within complex cystic breast masses, which facilitates their differential diagnosis. Moreover, multi-parametric MRI such as T2WI, dynamic contrast-enhanced MRI (DCE-MRI) and diffusion-weighted imaging (DWI) enables the recognition of the presence and distribution characteristics of cystic and solid components, the combination of which can serve as a complementary imaging aid for accurate diagnosis.

#### TABLE OF CONTENTS/OUTLINE

I. Introduction A. Overview of complex cystic breast masses B. Importance of accurate diagnosis II. Complex cystic breast masses A. Definition of complex cystic breast masses B. Etiology of complex cystic breast masses C. Clinical manifestations of complex cystic breast masses III. Categorization of complex cystic breast masses based on MRI features Group A : thick outer wall and/or thick internal septa (> 0.5 mm). Group B: predominantly cystic component(>50%)or intracystic mural nodule. Group C:predominantly solid component and cystic component=50% IV. Comparison of MRI and ultrasound in complex cystic breast masses A. Advantages of MRI over ultrasound B. Limitations of ultrasound C. Diagnostic value of multiparametric MRI in identifying cystic components V. Conclusion A. Summary of key points B. diagnostic flow chart of complex cystic breast masses C. Future directions for research VI. References

### Trial by Priors: When to Call Back a Stable Mammographic Finding

#### TEACHING POINTS

1. Comparison with multiple prior studies can help identify slowly evolving malignancies. 2. Mammographic findings that warrant further evaluation include increasing number of calcifications or suspicious distributions, evolving asymmetries, architectural distortions, and slow growing or spiculated masses. 3. Early recognition of these suspicious findings allows for appropriate diagnostic workup and improved diagnosis of slow growing malignancies.

#### TABLE OF CONTENTS/OUTLINE

1. Introductory slide. This exhibit hopes to educate breast imagers about stable mammographic findings that require further evaluation. While stability of imaging findings over two years is often suggestive of benignity, comparison with multiple prior imaging studies can allow better evaluation of stability and identify features that are slowly evolving over time. There are also some imaging features that should be further evaluated and sampled regardless of apparent stability. This educational exhibit will discuss several cases of malignancy, highlighting the suspicious imaging features that prompted additional work up. 2. List of teaching points to guide the upcoming case discussion. 3. Anonymized cases demonstrating different examples of slow growing malignancies. Each case will include: Multiple prior studies to demonstrate evolution over time; Explanation of decision making that lead to diagnostic evaluation; Findings on diagnostic imaging; Pathology results after biopsy. 4. Summary slide that reviews the teaching points.

### Indications and Outcomes of Cryoablation in Breast Malignancies: A Single Institution Case Review

#### Participants

Sasha Kurumety, MD, Houston, TX (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The goal of this presentation is to educate radiology trainees on the use of cryoablation as a treatment option for breast malignancies, when cryoablation may be appropriate, and expected short and long term outcomes of the procedure. Using a series of cases from our institution, we will describe selection criteria to identify patients that may benefit from this minimally invasive cancer treatment option and demonstrate post treatment imaging findings. After this presentation, learners will be able to describe the utility of cryoablation in treating breast malignancies and mechanisms of action, as well as understand the complications, outcomes, and future directions/ongoing trials for cryoablation.

#### TABLE OF CONTENTS/OUTLINE

Background:- Current FDA approved indications for cryoablation and uses of cryoablation in breast cancer- Ongoing trials: discussion of ICE3, FROST, and home institution trials and preliminary outcomesDiscussion of mechanism of action:- Direct freezing and cell death, indirect immune response activation- Advantages, disadvantages, and risks/complications of cryoablationCryoablation at our institution:- Qualifying patient and tumor characteristics, preprocedural evaluation- Interdisciplinary decision-makingInstitutional cryoablation cases:- Preprocedural imaging, biopsy pathology results, imaging during procedure, and post cryoablation follow up imaging/pathologyFuture directions: pathway to FDA approval, Medicare coverage, and increasing accessibility.

### To Treat or Not to Treat: A Review of Papillary Lesions of the Breast

#### TEACHING POINTS

Papillary breast lesions are a heterogeneous group of proliferative changes that occur within the epithelial lining of breast ducts. These lesions have varying presentations, pathological characteristics, and treatment options, requiring careful radiological evaluation for an accurate diagnosis. The spectrum of the lesions includes intraductal papilloma with/without atypia, intraductal papillary carcinoma, encapsulated papillary carcinoma, solid papillary carcinoma, and invasive papillary carcinoma. Radiologists must be aware of these variations to accurately identify, diagnose, and provide appropriate management recommendations. The primary objective of the exhibit is to present a comprehensive pictorial review of papillary breast lesions with radiological pathological images. We will also discuss the steps in the diagnosis and current management recommendations of these lesions. By the end of this exhibit, the audience will have a better understanding of the various papillary lesions and their clinical and imaging presentations, enabling them to provide appropriate radiologic-pathologic correlation and treatment recommendation for patients.

#### TABLE OF CONTENTS/OUTLINE

1) Introduction. 2) Definition of papillary breast lesions. 3) Pictorial review of the spectrum of papillary lesions. 4) Case examples of the spectrum of papillary lesions with pathological correlation. 5) Symptoms presentation of various papillary lesions. 6) Imaging techniques recommendations for diagnosis of papillary lesions. 7) Review of current BI-RADS terms in the description of these abnormalities. 8) Latest management recommendation for papillary lesions within the spectrum. 9) Conclusion/Summary.

### Case Based Review of the Modern Reconstructed Breast: Benign Imaging Findings and Complications

#### Participants

Shelby Breit, MD, Durham, KS (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Understand imaging findings associated with modern reconstruction techniques  
2. Recognize uncommon and common benign findings  
3. Discuss complications

#### TABLE OF CONTENTS/OUTLINE

Reconstruction Methods  
Implants  
Autologous Flaps (AF)  
Imaging after implant reconstruction  
Type: silicone vs saline implant  
Acellular dermal matrix (ADM)  
Benign complications: Rupture  
Gel bleed  
Abscess/infection  
Hematoma  
Siliconoma  
Implant associated mesenchymal tumors (fibromatosis)  
Imaging after AF reconstruction  
Type: pedicled, free, perforator flaps  
Venous coupler device  
Benign complications: Fat necrosis/lipografting  
Epidermal inclusion cyst

### Breast MRI: What the Surgeon Wants to Know

#### TEACHING POINTS

As there is increasing need for a multidisciplinary approach to patient care, it is important for the radiologist to understand which MRI findings change clinical management. After this presentation, participants will understand: 1. Indications for breast MRI 2. Breast cancer staging 3. Indications for different types of breast cancer treatment, including surgery, radiation, and systemic 4. Breast MRI findings that change clinical/surgical management 5. MRI correlates on mammogram and ultrasound

#### TABLE OF CONTENTS/OUTLINE

A. Indications for MRI a. American College of Radiology Practice Parameter b. American Society of Breast Surgeons Consensus Guidelines B. Overview of breast cancer staging C. Surgical management a. Indications b. Mastectomy vs. lumpectomy c. Types of mastectomy D. Radiation a. Indications b. Whole vs. partial breast treatment E. Systemic a. Indications for neoadjuvant chemotherapy b. Types of systemic treatment (chemotherapy, hormone blockade, biologic therapies) F. MRI findings that impact staging and management with multimodality case examples a. Multicentric/multifocal disease b. Nodal involvement (rotter's node, level I, level II, level III, internal mammary chain node) c. Nipple enhancement d. Skin enhancement e. Chest wall involvement f. Cancer in contralateral breast g. Metastatic disease - bone/lung involvement

### The Not So Simple Cyst

#### TEACHING POINTS

Cystic breast lesions are frequently encountered on ultrasound, often incidentally with a broad differential diagnosis including both benign and malignant pathology. Accurate description and classification according to the BI-RADS Lexicon based on ultrasound characteristics are essential for appropriate estimation of risk for malignancy and in turn management guidance. Emphasis on optimal ultrasound techniques, BI-RADS classification based on imaging characteristics, and correlation with example cases will be given with the purpose of helping residents and radiologists feel confident on how to proceed when faced with a cystic breast lesion.

#### TABLE OF CONTENTS/OUTLINE

I. Introduction II. Optimal Ultrasound Technique III. BI-RADS classification of cystic lesions 1. Simple cyst 2. Complicated cyst 3. Complex cystic and solid mass (classification of complex masses) IV. Sampling techniques V. Take Away Points

Printed on: 04/12/24

### The Cures Act: Challenges and Benefits in Breast Imaging

#### TEACHING POINTS

The 21st Century Cures Act is a federal law signed in 2016, aiming to remove barriers to health information exchange. The legislation includes a Final Rule, federally enforced as of April 2021, mandating patient access to electronic health information to increase transparency. Part of the mandate prohibits "information blocking," defined as a healthcare practice that is "likely to interfere with access, exchange, or use of electronic health information." For radiology practices, this means that reports are released to patients immediately when finalized. Immediate release allows for increased patient autonomy but reports often include sensitive information, especially in breast imaging, in addition to terminology that might be confusing to patients. Screening and diagnostic reports, previously held for a period of time at many institutions to allow time for direct patient communication, are now immediately released to patients. This educational exhibit reviews the impact of the Cures Act on breast imaging practices, including benefits, challenges, and potential solutions to navigate the legislation.

#### TABLE OF CONTENTS/OUTLINE

I. Legislation II. Positive Implications and Challenges III. Evolution of Practice

### How to Start Using Optoacoustic Imaging in Your Breast Practice: A Primer

#### Participants

Berat Bersu Ozcan, MD, Dallas, TX (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Optoacoustic imaging (OAI) is a novel technique that uses non-ionizing lasers to detect endogenous tissue contrast. Gray scale ultrasound (GUS) is fused with parametric maps of relative light absorption for oxy/deoxyHgb in real-time, enabling simultaneous functional and anatomic imaging. The most frequently tested interpretation schema involves dividing mass into 3 internal and 2 external features. The 3 internal scores include the number of individually resolved vessels and their relative deoxygenation (vessel score), tumor blush, representing volume-averaged vessels too small to resolve individually (blush score), and Hgb amount (hemoglobin score). The 2 external scores reflect the amount and relative oxygenation of hemoglobin and vessel morphology within the boundary zone (bz, immediately surrounding the tumor, analogous to the thick echogenic rim surrounding tumors on GUS images) and the peripheral zone (pz, territory beyond the bz). Combined evaluation of GSUS and OAI features to classify benign and malignant masses have consistently shown to increase significantly (43.0% vs 28.1%,  $p < 0.001$ ) diagnostic specificity with high interreader (7 readers) agreement (mean kappa = 0.55;  $p < 0.001$ ). A study combining decision support tools with 15 fellowship-trained radiologists showed that interreader agreement [intraclass correlation coefficient (ICC) 0.80, 95%CI: 0.78, 9.82] and agreement between reader and decision support tool (95.3% of all reads) was high.

#### TABLE OF CONTENTS/OUTLINE

1. Optoacoustic Imaging Principles 2. Equipment Types and Current Status 3. Interpreting Optoacoustic Images: A Comprehensive Guide 4. Understanding system limitations 5. Case Demonstration 6. Test Your Knowledge

### **What You Need to Know About the Pediatric Breast: A Review of the Normal Breast and Diagnostic Approach of Pediatric Breast Disease.**

#### **TEACHING POINTS**

The purpose of this exhibit is to: Describe the physiologic breast development and its variants from birth to adolescence. Review the optimal imaging modalities for evaluation of breast lesions in children and adolescents. Recognize imaging appearances of benign and malignant lesions that can affect the pediatric breast. Learn the recommendations for follow-up and management of pediatric breast lesions to avoid a delayed diagnosis or unnecessary interventions.

#### **TABLE OF CONTENTS/OUTLINE**

We review: Utility of the different imaging modalities in the assessment of the pediatric breast. Breast physiologic development from birth to puberty and pathological conditions that can occur. Benign and malignant pediatric breast disease with illustrating cases. Non-mass findings: Asymmetrical breast development, accessory breast tissue, accessory nipple, pseudogynecomastia, gynecomastia, atypical ductal hyperplasia, surgical scar. Benign masses: Simple and complex cysts, retroareolar cyst, epidermal inclusion cyst, fibrocystic changes, mastitis and abscess, hematoma, intramammary lymph node, reactive lymph node to vaccines, fibroadenoma, pseudoangiomatous stromal hyperplasia, sclerosing adenosis, phyllodes tumor and tubular adenoma. Malignant masses: Metastasis and primary breast cancer. Diagnostic approach of pediatric breast disease with follow-up and management algorithm and indications for interventions such as biopsy or surgery.

### Localization for Nonpalpable Breast Lesions. A Pictorial Review of Different Imaging-guided Preoperative Localization Procedures in the Breast and Axilla.

#### Participants

Javier Azpeitia Arman, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

-To know the different devices employed for nonpalpable breast lesions localization. -To review the role of imaging techniques (mammogram, US, MR, CT, gamma detector) in the localization of breast lesions for breast conserving surgery. -To understand surgeon needs including technical factors of localization and communication of the relationship of the lesion and the marker. -To become familiar with the localization process, and different tips and tricks for each device.

#### TABLE OF CONTENTS/OUTLINE

Breast-conserving surgery requires multidisciplinary communication and planning between the surgeon and the radiologist. Removal of the lesion with adequate surgical margins and avoiding resection of healthy breast tissue is essential. 1. History of wire localization, radioactive seed, and other non-needle-wire localization techniques 2. Advantages and disadvantages of using seed localization versus needle-wire localization. 3. Wire localization. 4. Non-wire devices: radioactive I125, magnetic, radar, and radiofrequency seeds 5. Technique and pitfalls. Before the procedure: review of the patient's imaging and histopathologic findings. Wire or seed placement. Preoperative detection. Operating room. Recovery. 6. Case examples of potential difficulties and problems and how to overcome them.

### Is it Back? Multimodality Surveillance of Breast Cancer Recurrence: Literature Review and Case Presentation

#### Participants

Mohammed Sabawi, MBChB, Iowa City, IA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Screening patients with previously treated breast cancer is challenging, because benign post treatment changes can obscure or resemble an underlying recurrence and due to technical limitations in performing a mammography on a treated breast. There are postoperative mammographic findings in a conservatively treated breast which follow expected time course. Any new mammographic finding (new masses, asymmetries or microcalcifications) should raise suspicion for recurrence. Abnormal screening mammogram is the most common presentation of breast cancer recurrence. Margin involvement and lack of radiotherapy and/ or chemotherapy are important prognostic factors of local recurrence. There is no clear guidelines to dictate ipsilateral breast screening after mastectomy and reconstruction with or without implant. Breast MRI is highly sensitive imaging modality to detect local recurrence in certain patient groups. It can be also utilized as problem solving to assess equivocal clinical or mammographic findings.

#### TABLE OF CONTENTS/OUTLINE

Introduction Review of incidence, risk factors, diagnostic performance of multimodality surveillance and presentation of breast cancer recurrence. Review of post breast conserving treatment imaging findings and their time course of evolution. Review of available national guidelines for multimodality surveillance after curative treatment for locoregional breast cancer. Case based review of different and unusual presentations of breast cancer recurrence. Conclusion. References.

### **A Review of the Combined Score for Quantitative Shear Wave Elastography (SWE) and Superb Microvascular Image Vascular Index (SMIVI) to Evaluate Breast Masses**

#### **Participants**

NA YOUNG LEE, Seoul, Korea, Republic Of (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

1. To differentiate between benign and malignant breast masses, we propose using the combined score of quantitative parameters for shear wave elastography (SWE) and superb microvascular image (SMI) with BI-RADS. We suggest using the combined score for SWEmax, SWERatio, and SMIVI and demonstrate how it can be used to differentiate between benign and malignant breast masses. 2. We calculated the combined score by adding the BI-RADS score and each quantitative parameter (SWEmax, SWERatio, and SMIVI). The BI-RADS categories were scored on a scale of 1 to 5 (C3:1, C4a:2, C4b:3, C4c:4, and C5:5), and SWEmax, SWERatio, and SMIVI were scored as 0 or 1 based on applied cutoff values. The summed score ranged from 1 to 8. We used a cutoff value of 4 for the combined score to discriminate between benign and malignant cases based on the reported AUC values. 3. The combined score of B-mode US and quantitative parameters can improve diagnostic performance and reduce unnecessary breast biopsy. However, the combined scores should be applied with caution, considering that the quantitative parameters have limitations in assessing small-sized, pure DCIS, or low-grade invasive cancer.

#### **TABLE OF CONTENTS/OUTLINE**

1. Review the principles of quantitative parameters for SWE (SWEmax, SWERatio) and SMIVI. 2. Review the appropriate cut off value for quantitative parameters for SWEmax, SWERatio, and SMIVI and evaluate their diagnostic performance in differentiating between benign and malignant masses. 3. Showcase the various case of combined score and pathology reviews to demonstrate how combined scores are helpful for differential diagnosis of breast masses, and which cases will be carefully applied.

### Threading the Needle: The Role of Breast Radiologists in Managing Suspicious Internal Mammary Lymph Nodes

#### Participants

Megan Kalambo, MD, Missouri City, TX (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Examine Internal Mammary Lymph Nodes (IMLN) as an important component of breast lymphatic drainage. 2. Review the implications of metastatic IMLN adenopathy in the staging of breast cancer. 3. Provide an overview of IMLN basin anatomy, differential diagnosis of IM adenopathy, and the clinical indications for imaging and sampling. 4. Explain the tools and technical steps necessary for conducting a successful ultrasound biopsy of IMLNs. 5. Recognize ultrasound-guided Fine Needle Aspiration (FNA) biopsy as a feasible percutaneous sampling technique radiologists can use to provide treatment planning assistance to clinical teams.

#### TABLE OF CONTENTS/OUTLINE

Based on our experiences at a tertiary oncologic referral center, we will provide an overview of internal mammary lymph nodes (IMLN) with regard to the anatomical, clinical, imaging and procedural considerations for radiologists. • Overview of IM nodal basin anatomy • Management of indeterminate and suspicious IMLNs • Differential diagnosis of abnormal/indeterminate IMLNs • Incidence and implications of IMLN adenopathy on breast cancer staging • Indications for imaging of IMLN • Multimodality identification of IMLN on Ultrasound, MRI, PET/CT • Biopsy considerations • Indications • Tools • Technical steps • Case-based discussion of IMLNs • Tips for imaging and clinical management of patients with indeterminate/suspicious IMLN.

### The State of Breast Imaging in the Caribbean

#### Participants

Dami Olufosoye, BS, MPH, Mount Pleasant, MI (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Provide an overview of the current trends in incidence and mortality of breast cancer in the Caribbean 2. Discuss the state of breast services with respect to breast exams and screening 3. Discuss the challenges in breast services including infrastructure and health workforce availability 4. Recognize patient-related barriers 5. Review main points of the global breast cancer initiative and goals for breast imaging in the Caribbean

#### TABLE OF CONTENTS/OUTLINE

- Overview of breast cancer incidence, prevalence, mortality, and stage of diagnosis in the Caribbean compared globally and to the US
- State of breast services with respect to breast exams and testing
- National guidelines on breast exams and screening
- Self-breast exams
- Clinical breast exams
- Access to mammograms
- Discuss the state of breast services pertaining to the infrastructure and health workforce availability
- Number of equipment in the region
- Type of equipment available: digital mammography vs full film digital mammography vs tomosynthesis
- Maintenance/ Audit of equipment
- Health workforce: radiologists, oncologists, physicists
- Breast treatment services
- Barriers surrounding breast cancer
- Knowledge deficits
- Patient beliefs
- 2021 Global Breast Initiative
- Key messages
- Recommendations for implementing interventions

### Breast Lesions Detected on CT: When to Refer for Triple Breast Assessment

#### Participants

Sharmeen Jaffer, MD, London, United Kingdom (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Incidental breast lesions are a common finding on CT and unnecessary referrals can create a significant burden on the breast clinic.
- To evaluate imaging characteristics of incidental breast lesions identified on CT and suggest characteristics which warrant referral to the breast clinic.
- To identify imaging characteristics of breast lesion mimics or benign breast lesions; avoiding unnecessary referral to the breast clinic.
- To explore the limitations of CT with imaging breast lesions including post-contrast enhancement in benign and malignant lesions.

#### TABLE OF CONTENTS/OUTLINE

- Variability of normal breast glandular tissue on CT including asymmetry and differences in density.
- Breast lesions with benign characteristics such as coarse or popcorn calcification or well defined cysts with homogenous fluid attenuation.
- Indeterminate breast lesions including intramammary lymph nodes, leiomyomas, papilloma, fat necrosis or lobular fibroadenomas which demonstrate post-contrast enhancement.
- Suspicious breast lesions and indicators of malignancy including irregular or speculate margins and global or peripheral contrast enhancement; measured in Hounsfield units (HU).
- Mimics of breast malignancy including lymphoedema, post surgical changes or radiotherapy.
- Factors that negate an unnecessary referral to breast clinic include: long term stability, lesion previously assessed on mammography/ultrasound/biopsy proven benign lesion.

### Multimodality Imaging of Recurrent and Residual Breast Cancer

#### TEACHING POINTS

After this exhibit, the reader will be able to: 1. Describe the epidemiology and clinical implications of recurrent and residual breast cancer. 2. Demonstrate the importance of a multimodality approach to the detection, workup and diagnosis of recurrent and residual breast cancer. 3. Apply specific strategies to improve early detection to optimize patient outcomes.

#### TABLE OF CONTENTS/OUTLINE

Recurrent and residual breast cancer remains a diagnostic challenge with significant clinical implications. Early and accurate detection is critical for optimizing patient outcomes. Using a case-based multi-modality approach, this exhibit will: 1. Review the epidemiology and clinical implications of recurrent and residual breast cancer. 2. Discuss current surveillance recommendations and supporting literature, including the importance of patient anxiety. 3. Review expected post-treatment findings, discussing the advantages and disadvantages of each modality (mammography, ultrasound and MRI). 4. Provide an approach to surveillance imaging and residual disease, with emphasis on the surgical pathology report, surgical margins and the importance of breast biopsy marker clips. 5. Provide tips and tricks to ensure early identification of recurrent/residual disease and avoid post-treatment surveillance pitfalls.

### From Benign to Malignant: Understanding the Spectrum of Phyllodes Tumors

#### Participants

Abel Gonzalez Huete, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To provide an overview of Phyllodes tumors, including their pathology features, categories and clinical presentation. 2. To discuss the role of the different imaging in the diagnosis of Phyllodes tumors. 3. To review the differential diagnosis of Phyllodes tumors and how to differentiate them from other breast tumors. 4. To highlight the importance of accurate diagnosis in the management of Phyllodes tumors.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction: Breast anatomy, Fibroepithelial tumors, Epidemiology, Pathogenesis, Categories of Phyllodes Tumors (Benign, Borderline, and Malignant) 2. Clinical Presentation 3. Pathology 4. Imaging Findings: - Benign Phyllodes tumor (Mammography, Ultrasound and MRI), - Borderline Phyllodes tumor (Mammography, Ultrasound and MRI), - Malignant Phyllodes tumor (Mammography, Ultrasound and MRI). 5. Differential Diagnosis: Fibroadenoma, Primary Sarcoma of the Breast, Periductal Stromal Tumor of the Breast, Other. 6. Benign vs Malignant Phyllodes Tumors: Key Differences 7. Management, Treatment and Prognosis 8. Conclusion 9. References

### **A Sheep in Wolf's Clothing: The Multiple Appearances of Local Breast Cancer Recurrence After Breast Mastectomy**

#### **Participants**

Agostina Peralta I, Buenos Aires, Argentina (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

-Discuss the role of the different image modalities in the surveillance of breast cancer recurrence after breast mastectomy.- Recognizing the imaging and the normal anatomic changes depending on the type of breast mastectomy performed.-Illustrate the imagen findings corresponding to a breast cancer recurrence on different image modalities.-Differentiating post-surgical benign findings from a malignant relapse.

#### **TABLE OF CONTENTS/OUTLINE**

Studies have proven that the presence of local recurrence is an independent predictor for survival this is why radiologist should be familiarized to distinguish normal or benign findings after mastectomy form a recurrence. With the main objective of early detection and treatment. -Briefly review the different surveillance recommendations for these patients given by international societies. - Description of the different surgical breast reconstruction techniques used nowadays will be performed. These include the use of prosthetic implants, autologous tissue flaps, skin and fat flaps. -Illustrations will be shown of the expected anatomic changes after mastectomy on different image modalities depending on the surgical technique. -Images showing and differentiating benign findings from a post-surgical local breast cancer recurrence will be portrait.

Mary W. Yamashita, MD, South Pasadena, CA (*Presenter*) Research Grant, Delphinus Medical Technologies, Inc; Consultant, Delphinus Medical Technologies, Inc

#### TEACHING POINTS

- Ultrasound as adjunct to screening mammography for women with dense breasts increases cancer detection. - There are new ultrasound technologies available for same day supplemental dense breast screening. - Invenia ABUS from GE and SoftVue Automated Whole Breast Ultrasound Tomography (SV) from Delphinus Medical Technologies are both PMA-approved for screening and diagnostic purposes. - In clinical practice, ABUS is time-consuming and requires significant reading time. - SV offers benefits of same day supplemental screening with mammography and, unlike other ultrasound imaging, only adds 3-4 mins of reading time per case for the radiologist.

#### TABLE OF CONTENTS/OUTLINE

1. Why ultrasound is important in screening women with dense breasts 2. Overview of ultrasound technologies available for dense breast screening 3. Comparison of indications for use 4. Benefits and challenges with integrating ultrasound into practice for adjunct screening for women with dense breasts: Workflow 5. Reading time: what makes reading ABUS and HHUS challenging in clinical practice, what are the main drivers of the time it takes for radiologist to interpret images including technique and training, number of images, image quality, and artifacts 6. Overview of SV automated whole breast ultrasound 7. Image sequence and reading protocol for SV 8. Example clinical cases demonstrating SV hanging protocol 9. SV reading time study and results 10. Conclusion

### Do Not Miss Architectural Distortion!

#### Participants

Haydee Ojeda-Fournier, MD, San Diego, CA (*Presenter*) Research Consultant, View Point Medical, Inc; Stock options, CureMetrix, Inc

#### TEACHING POINTS

The BI-RADS 5th edition manual defines architectural distortion (AD) as “distortion of the breast parenchyma with no definite mass visible.” AD of the breast is an abnormality found in multimodality breast imaging and occurs with benign and malignant lesions. The most common cause of architectural distortion is a surgical scar. However, 4% of breast cancers present with AD. In addition to being a primary imaging finding, AD may also be an associated finding. In addition, AD is notorious for being a missed mammographic lesion. It is important for radiologists to “train their eyes” to identify AD and to know the differential considerations and pitfalls associated with AD evaluation to avoid potential missed breast cancer. The goals of this educational exhibit are to 1. recognize AD by 2D mammogram, digital breast tomosynthesis (DBT), ultrasound, and MRI, 2. review the differential considerations of AD, and 3. recommend management options and perform radiology-pathology concordance.

#### TABLE OF CONTENTS/OUTLINE

Introduction; Definition of AD; Multimodality imaging examples of AD of the breast including mammography, sonography, and MRI; Learn a systematic approach to the characterization of AD; AD and DBT; How to appropriately apply the BI-RADS classification and management recommendations of AD; Challenging cases of AD; Pitfalls in evaluating AD: fat-containing, one view only, not seen at biopsy; Discordance in AD rad-path correlation; Sample cases; Conclusion.

### Non-mass Lesion on Breast Ultrasound: Radiologic-Pathologic Correlation and a Guide to Approach

#### Participants

Haejung Kim, MD, Seoul, Korea, Republic Of (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Unlike mass, non-mass lesion does not show a three-dimensional structure, so it is more difficult than mass to detect and make an accurate diagnosis on breast ultrasound. For this reason, non-mass lesion evaluation on breast ultrasound often follows the detection of abnormality on other imaging modalities, such as mammography or MRI. This educational exhibit was prepared to increase understanding of non-mass lesions seen on breast ultrasound and to help accurately diagnose benign and malignant non-mass lesions. 1. Review the definition of non-mass lesion on breast ultrasound, 2. Correlate radiologic and pathological findings of benign and malignant non-mass lesions, and 3. Discuss a guide to approach for evaluating non-mass lesions on breast ultrasound.

#### TABLE OF CONTENTS/OUTLINE

1. Definition of non-mass lesion on breast ultrasound A. True non-mass lesion vs. Normal variants 2. Correlation between radiologic and pathologic findings of non-mass lesions on US A. Imaging features of non-mass lesions on US B. Pathologic features correlated with benign and malignant non-mass lesions 3. Approach for evaluating non-mass lesion on breast ultrasound

BREE-82

### The Cyst Bang Theory: When to Biopsy

#### TEACHING POINTS

1. Explain the epidemiology and pathogenesis of breast cyst. 2. Recognize the characteristics by image of breast cysts. The complex cyst is uncommon, but are suspicious of malignancy and merit biopsy. 3. Recognize criteria that will help identify a complex cyst. 4. Identify intraductal papillary nodule. Benign papillomas constitute 85% and 90%, intracystic papillary carcinomas 6% to 7%. 5. Points to help distinguish real from artifacts (echos) on ultrasonography images. 6. Recognize the most important differences in images between complicated and complex cyst. The true papillary nodules are anchored to the wall and do not move with the postural changes of the patient. 7. Analyze when to suspect malignancy in the breast cysts and categorize them based on the BIRADS.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Epidemiology and pathogenesis 3. What are complex cysts 4. What should birads assign to a complex cyst 5. Review the spectrum of findings (mammography, us and contrast-enhanced mammography) 6. When to decide biopsy, a complex cyst 7. Let's practice (illustrative cases) 8. Conclusions

### Solitary Dilated Duct in the Breast: A Multimodality Pictorial Review

#### TEACHING POINTS

Solitary dilated duct is associated with benign and malignant findings and the BI-RADS classification has varied over previous editions. Solitary dilated duct has characteristic imaging features on multiple modalities. Recognizing the imaging features, particularly if new, is important for management.

#### TABLE OF CONTENTS/OUTLINE

Background Review of solitary dilated duct and BIRADS classification. Pictorial Review: Cases illustrating benign and malignant lesions with multiple modalities. Case 1: History: Presenting with bloody nipple discharge. Imaging: Mammogram, ultrasound. Pathology: Papilloma without atypia. Case 2: History: Presenting with breast pain. Imaging: Mammogram, ultrasound. Pathology: Invasive ductal carcinoma. Case 3: History: 60-year-old female presenting for screening mammogram. Imaging: Mammogram, ultrasound. Pathology: Papilloma without atypia. Case 4: History: Presenting with bloody nipple discharge. Imaging: Mammogram, ultrasound, MRI. Pathology: Papilloma with high-risk features. Case 5: History: Presenting for screening mammogram. Imaging: Mammogram, ultrasound. Pathology: Intraductal papilloma. Case 6: History: Presenting with bloody nipple discharge. Imaging: Mammogram, ultrasound, ductogram. Pathology: DCIS. Case 7: History: Presenting with bloody nipple discharge. Imaging: Mammogram, ultrasound, ductogram, MRI. Pathology: Multifocal DCIS with intraductal papillomatosis. Conclusion Review pearls for solitary dilated duct findings and management.

### MRI Detected Lesion in Women with a Personal History of Breast Cancer, and Then?

#### Participants

Ga-Eun Park, MD, Seoul, Korea, Republic Of (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Screening is still important for women with a history of breast cancer, because of high risk for future breast cancer. Breast MRI shows impressive resolution with high sensitivity, but specificity is relatively low.
- Second look ultrasound is a well-established approach for MRI detected lesions, and lesions found on subsequent ultrasound have a high probability of malignancy. However, second look ultrasound has limitations, such as operator dependence and the possibility of false negatives. Follow-up is required, and re-biopsy should be considered in case of image-pathology discordant.
- Correlation with mammography can sometimes be helpful. In particular, new or increasing calcifications can be objective evidence for lesion detection and confirmation of biopsy results.
- MR-guided biopsy must be considered in lesions with suspicious MRI features but occult on US or mammography.

#### TABLE OF CONTENTS/OUTLINE

<Representative cases of new enhancing lesion on breast MRI>• According to surgical method: op site after BCS, ipsilateral and contralateral breast after BCS, after mastectomy• According to detection modality: second look ultrasound (successful and missed), mammography, MR-guided biopsy for occult lesion• According to biopsy results: recurrence, false positive (benign), false negative (missed)

Printed on: 04/12/24

BREE-85

### 5 Years of False Negative Review from the Mammography Audit: Observations and Lessons Learned

#### Participants

Heather Garrett, MD, Saint Louis, MO (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

-Review of false negative (FN) cases can refine your mammography practice.-Sensitivity of mammography is limited in dense breasts.-BCT changes can make mammography difficult to interpret. ACR recommends annual screening MRI in patients with a prior history of BCT and dense breasts.-Screening MRI is more sensitive than mammography in the detection of breast cancer. High-risk patients should obtain annual mammography and annual screening MRI alternating at 6 month intervals.-Clinical symptoms (palpable breast lump, nipple discharge, skin changes and focal breast pain) should be evaluated using a multi-modality imaging approach.-BIRADS 3 cases are included in the FN review of diagnostic mammography. 0-2% of these cases may be cancers.

#### TABLE OF CONTENTS/OUTLINE

Background: False negative (FN) case review is mandated part of the annual mammography radiologist audit (MQSA/ACR). We are a large academic practice with dedicated breast imagers. We analyzed 135 FN cases from 5 years (2016-2020).Observations: -FN cases tended to be in patients with dense breasts, personal history of breast cancer, prior BCT, elevated life-time risk for breast cancer.-FN cases were mostly detected by presenting clinical symptom or screening MRI.-Some FN cases were women who had been given the assessment of BIRADS 3 in the diagnostic setting.Cases: 5-10 cases to illustrate teaching points.Lessons Learned: Overall, we found that there are many reasons for FN studies, the minority of which involved "missed cancers." Review of FN cases can refine your mammography practice.

### Don't Forget About the Nipple: Overview of the Anatomy and Different Lesions Involving the Nipple-areolar Complex

#### Participants

Maria Guerra, MD, Monterrey, Mexico (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To describe the normal anatomy and some anatomic variants of the nipple-areolar complex (NAC). To review imaging anatomy of the NAC by different techniques. To present a pictorial review of commonly known benign and malignant NAC lesions.

#### TABLE OF CONTENTS/OUTLINE

Anatomy of the nipple-areolar complex  
Retraction  
Inversion  
Imaging anatomy: mammogram, ultrasound, magnetic resonance  
Different lesions:  
Dermal lesions: nipple calcifications, Epidermal inclusion cyst  
Inflammatory lesions: duct ectasia, retroareolar cyst, periductal mastitis, abscess, Zuska disease  
Benign Tumors: Nipple adenoma  
Malignant tumors: papilloma, carcinoma, Paget's disease

BREE-87

### The Many Faces of Invasive Lobular Carcinoma

#### Participants

Miral Patel, MD, (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Invasive lobular carcinoma accounts for 5-15% of all breast cancers. 2. ILC is characterized by the lack of E-cadherin function, which explains the discohesive growth pattern and the subtle findings in imaging. 3. A review of radiologic and pathologic correlation of invasive lobular carcinoma and its morphologic variants can aid radiologists in recognizing patterns in the imaging presentation of invasive lobular carcinoma to facilitate early detection.

#### TABLE OF CONTENTS/OUTLINE

This educational exhibit reviews: 1- Basic review of invasive lobular carcinoma 2- Case based discussion of the radiologic presentation and pathologic correlation of the variants of invasive lobular carcinoma including classic, solid, signet ring cell, and pleomorphic 3- Pattern recognition in the presentation of invasive lobular carcinoma

BREE-88

### Breast Cancer Recurrence: Incidence and Imaging Appearance

#### Participants

Haydee Ojeda-Fournier, MD, San Diego, CA (*Presenter*) Research Consultant, View Point Medical, Inc; Stock options, CureMetrix, Inc

#### TEACHING POINTS

Locoregional recurrence has been estimated to occur in 5-25% of breast cancer (BC) survivors, defined as the reappearance of the tumor at the surgical site or metastases in the regional lymph nodes. Even after mastectomy, there is a 2-10% reported lifetime risk of recurrence. Recurrence varies by molecular subtypes of BC, triple negative BC at 2-5 years after and other types at 5-15 years after treatment. Mammography remains the primary imaging modality for post-BCT surveillance. Breast MRI has the highest accuracy for differentiating post-surgical scar from recurrence. By the end of this educational exhibit, the learner will: 1. Learn the incidence, risk factors, and clinical presentation of breast cancer recurrence, 2. Review imaging recommendations for patients with a history of breast cancer and those with suspected breast cancer recurrence, 3. Recognize the common imaging appearance of recurrent breast cancer on multimodality imaging, 4. Distinguish the appearance of recurrent breast cancer from expected post-surgical changes and other differential diagnoses

#### TABLE OF CONTENTS/OUTLINE

Introduction; Incidence and definition of breast cancer recurrence; Expected recurrence rates based on molecular subtypes of BC; Clinical presentation of breast cancer recurrence; Review imaging recommendations for patients with a history of breast cancer; Review diagnostic workup for patients with suspected breast cancer recurrence; Differential considerations of in-breast recurrence and regional nodal recurrence; A pictorial review of multimodality imaging in BC recurrence; Clinical management of recurrent BC; Algorithm for imaging patients with suspected recurrence; Conclusion

### AI in Breast Imaging: Current Status and Future Directions

#### Participants

Berat Bersu Ozcan, MD, Dallas, TX (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Artificial intelligence (AI) in breast imaging is being used for lesion classification, breast density and cancer risk assessment. In screening mammography setting, stand-alone sensitivity of commercially available AI system range 75-85% at radiologists' specificity of 49-79%. This indicates comparable results with radiologist performance (AUC, 0.84 vs 0.81, respectively).
- Beyond screening ,a deep learning model trained on uses mammograms and traditional risk factors showed superior performance in predicting 5 year breast cancer risk compared to the Tyrer-Cuzick model. (AUC, 0.70 vs 0.62,  $p < 0.001$ ).
- Model drift is a concept that describes degradation of AI model performance as the data it is used on changes. This raises concerns regarding the performance and reliability of AI models in real-life clinical settings.
- The FDA requires manufacturers of Artificial Intelligence/Machine Learning (AI/ML)-Based Software as a Medical Device (SaMD) to be transparent and monitor the real-world performance of their products to ensure the algorithm meets the standards after deployment.
- In a recent Dutch patient survey most patients (77.8%) did not support stand-alone use of AI in screening interpretation. Furthermore, 41.7% opposed the idea of using AI to select cases for second reading and 17% objected to AI as a second reader.
- The reimbursement for breast imaging AI has not yet been established, and several proposed frameworks are currently under discussion.

### Navigating Mammary Ducts Pathologies and Anatomy: A Radiological Handbook

#### Participants

Giovanna Andreani, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The breast is an apocrine gland that contains different types of tissue: glandular, fibrous or connective, and fatty tissue. The glandular tissue is composed of mammary lobules and ducts, the latter being a tubular structure with the function of carrying the milk produced by the gland to the nipple. There are several pathologies and variations that can affect the mammary duct, ranging from benign alterations such as ductal ectasia or papilloma to even malignant ones (ductal carcinoma in situ or invasive ductal carcinoma, among others). Knowing that the majority of breast cancer arises from the ductal epithelium, it is crucial in the diagnosis and treatment of breast cancer by detecting intraductal lesions at an early stage. The objective of this study is to didactically review the anatomy and embryology of mammary ducts, as well as the main pathologies that affect this very important structure.

#### TABLE OF CONTENTS/OUTLINE

Review of the anatomy and discussion of the radiological findings in the mammary ducts, whether in their normal appearance or pathological changes through the different imaging methods obtained from the digital archive of our institution.

Printed on: 04/12/24

BREE-90

### Beyond the Norm: An Exploration of Extramammary Metastases to the Breast

#### Participants

Berat Bersu Ozcan, MD, Dallas, TX (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Metastases to the breast are rare, comprising 0.5-6.6% of all malignancies in the breast, and typically indicate widely disseminated disease and poor prognosis.
- Lymphoma (17-38.3%), melanoma (8.3-23.4%), lung (8-15%), gynecological carcinomas (8-12.8%), and sarcomas (2%-12%) are the most common primary tumors to metastasize to the breast.
- Imaging features can vary depending on the primary neoplasm and route of dissemination, hematogenous (more common) or lymphatic.
- Typically, metastases present as well-defined masses without calcifications or distortion on mammography and round hypoechoic masses on ultrasound. Hematogenous metastases present as solitary or multiple breast masses located in the skin, subcutaneous tissue, or the breast parenchyma.
- Breast findings should be characterized according to the BI-RADS lexicon and managed according to the most suspicious features. If metastatic disease to the breast is in the differential diagnosis based on patient history and/or clinical presentation, early confirmation of secondary involvement with pre-operative biopsy of breast lesions is crucial to direct appropriate management.
- Breast metastases can be highly vascular, and ultrasound technique should be optimized to not confuse with pseudoaneurysms or aneurysms, which could result in a delay of diagnosis.

#### TABLE OF CONTENTS/OUTLINE

1. Literature review 2. Diagnostic algorithm 3. Key clinical and imaging features 4. The diagnostic and prognostic role of imaging modalities 5. Case demonstration and pathologic correlation

### Optimizing DWI for Improved Imaging in Breast Cancer and Beyond

#### Participants

Sheida Ebrahimi, MD, La Jolla, CA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Diffusion weighted imaging (DWI) is an advanced MRI technique that reflects water diffusion in tissues of interest and has been shown predicting pathologic response to neoadjuvant chemotherapy. It assists radiologists in better detecting and characterizing breast lesions. DWI can be challenging due to the breast morphology and introduction of artifacts. This exhibit reviews current state of DWI in breast cancer imaging including the physics of DWI, protocols utilized, advanced DWI techniques, and current indications. Strategies for optimizing DWI to improve image quality, diagnostic accuracy, and clinical utility will also be reviewed. At the end of this educational exhibit, learners will: 1. Recall the fundamentals of DWI and ADC Values; 2. Describe the correlation between ADC values and breast cancer prognostic factors; 3. Understand DWI challenges and limitations, and strategies for enhancing standard DWI; 4. Classify advanced DWI.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction: Overview of DWI and its importance in breast cancer; 2. Fundamentals of DWI: Explanation of water diffusion in tissues; ADC values and their significance in DWI; 3. ADC Values and prognostic factors in breast cancer; 4. Benefits and applications of DWI in breast cancer; 5. Quality control and factors influencing repeatability and reproducibility of ADC measure: Techniques to improve the quality of ADC measurements; 6. Comparison of DWI protocols: QIBA recommendations vs. our institute's approach; 7. Technical challenges and limitations of DWI: Techniques to Improve standard DWI; 8. Classification of advanced DWI: Overview of subtypes of advanced DWI, their differences, and advantages; 9. Conclusion.

### Idiopathic Granulomatous Mastitis: A Case-Based Review

#### TEACHING POINTS

1. Idiopathic granulomatous mastitis (IGM) is estimated to affect 2.4/100,000 women, at median age of 36.5 years, and bilateral involvement in 8.8%. 2. Common symptoms are pain, erythema, palpable lump, and less frequently, fistulous drainage or nipple discharge. 3. The most common ultrasound findings are hypoechoic collection (75.9%) and skin involvement (53.5%). Mammography is often nonspecific, but common findings include focal asymmetry (51.6%), global asymmetry (18.3%), mass (17.2%), abnormal lymph nodes (8.6%). 4. IGM can mimic infectious mastitis or breast cancer on imaging and clinically. 5. Biopsy is usually required to confirm diagnosis and guide management. Often biopsy is necessary to exclude malignancy, especially inflammatory or triple-negative subtypes. Suspected IGM may be tentatively diagnosed by clinically assessing treatment response, but given overlap of imaging features and different treatment for IGM and infectious mastitis, biopsy is often needed. 6. Imaging findings often persist after resolution of clinical symptoms, thus clinical follow-up should be the mainstay for surveillance.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction  
2. Typical imaging findings on mammography and ultrasound  
3. Other entities that mimic IGM  
4. Case-based review of biopsy-proven cases using key images with descriptions, treatment and clinical outcome data  
5. Biopsy and management considerations

### **Don't Be Fooled: Not Every Late-Onset Peri-Implant Effusion is Seroma! A Case-Based Review of Breast Implant-Associated Anaplastic Large Cell Lymphoma (BIA-ALCL)**

#### **TEACHING POINTS**

We report the case of a female patient, with a history of mammoplasty six years ago, reporting sudden enlargement of the left breast. Imaging exams showed the presence of peri-implant fluid in the same breast, with the analysis of the fluid confirming the BIA-ALCL. Breast Implant-associated Anaplastic Large Cell Lymphoma (BIA-ALCL) is characterized by a late-onset peri-implant effusion, appearing on average 10 years after exposure to breast implants. The pathogenesis is not completely identified, but it is known that cases of BIA-ALCL are related to textured prostheses, with the surface of the prosthesis being the most important factor in inducing the disease. It may present only with the effusion (subtype of effusion) or associated with a peri-implant mass (mass-forming disease). The main associated symptoms are sudden edema secondary to the peri-implant effusion and, in case of mass-forming disease, the presence of a palpable nodule. Multiple imaging methods can be used in the evaluation of patients with suspected BIA-ALCL. However, diagnostic confirmation depends on the analysis of the fluid found. The diagnosis of BIA-ALCL is made with the characterization of morphologically atypical lymphocytes, with CD30 expression and negativity for ALK-1. The differential diagnosis of the effusion subtype is made with late seroma. Distant disease is rare, being a neoplasm with a high potential for cure, if identified in the early stages and when not associated with masses, with a surgical approach as a curative technique, in the case of the subtype of effusion.

### Cystic Breast Lesions- What to Do When It's Not Simple

#### Participants

Laura Harper, MD, Rochester, MN (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Imaging features of benign and malignant cystic lesions may overlap, causing misclassification with the potential to produce diagnostic delay and harm. The purpose of this exhibit is to review ultrasound features of benign and malignant cystic breast masses to guide appropriate characterization and management. The Breast Imaging Reporting and Data System (BIRADS) assessment categories will be reviewed as it pertains to cystic breast masses, including review of appropriate utilization of the BIRADS-3 (probably benign) assessment category. Emphasis will be placed on recognizing suspicious imaging features warranting further evaluation with percutaneous biopsy. Teaching Points: 1. Examine imaging features of various cystic breast masses (Simple cysts, complicated cysts, and complex cystic and solid mass). 2. Discuss overlap of benign and malignant complex cystic and solid masses (ex: hematoma, abscess, cancer). 3. Review appropriate BI-RADS category assessment and management for various cystic lesions

#### TABLE OF CONTENTS/OUTLINE

1. Introduction of the prevalence, clinical presentation and patient factors associated with cystic breast masses 2. Review distinguishing features and BI-RADS category assessments for various cystic masses 3. Multimodality (mammography, contrast-enhanced mammography, ultrasound, and magnetic resonance imaging) case-based review of benign and malignant cystic breast masses 4. Conclusion (summary of key educational points)

### **Patterns of Breast Cancer Recurrence in the Post-Mastectomy Breast with or without Reconstruction: A Case-Based Review**

#### **Participants**

Shannon Lanzo, MD, Stanford, CA (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

1. Women treated for breast cancer with mastectomy with or without reconstruction are at risk of developing loco-regional recurrence along the suture line or within residual tissue.2. Benign post-operative findings include edema, seroma, hematoma, fat necrosis, post-operative scarring and fibrosis, which evolve over time.3. Recurrence may be difficult to distinguish from these benign findings.4. Biopsy is warranted when imaging findings are equivocal.

#### **TABLE OF CONTENTS/OUTLINE**

1. This case-based exhibit will review the expected post-operative appearance post mastectomy without or with reconstruction using autologous tissue flaps (pedicled or free flap), and/or prosthetic implants.2. We will illustrate typical imaging features of benign post treatment changes (fat necrosis, fibrosis, edema, skin thickening, etc.) and malignant findings on mammogram, ultrasound, and MRI.3. We will review appropriate use of combined imaging and biopsy methods when imaging findings are equivocal.

### Diagnostic Potential of Photon-Counting Detector Computed Tomography to Evaluate Breast Cancer Patients

#### Participants

Misugi Urano, MD, PhD, Nagoya, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Photon-counting detector computed tomography (PCD-CT) has several advantages over energy-integrating computed tomography (EID-CT). It provides high spatial resolution and improves image contrast, resulting in precise visualization of soft tissue and microstructures while reducing radiation dose. In addition, a simultaneous multi-energy acquisition offers further qualitative and quantitative information in a single scan. These benefits make PCD-CT a valuable tool for systemic staging, preoperative planning, and post-treatment monitoring of breast cancer patients due to its ability to precisely depict the local extent of tumors and the presence of small lesions. This presentation will focus on PCD-CT in initial staging workup, treatment response assessment, or recurrences monitoring in breast cancer patients, comparing to EID-CT, other image modalities, and pathological results. We will also discuss the advantages and pitfalls of PCD-CT.

#### TABLE OF CONTENTS/OUTLINE

1. Current CT recommendation for breast cancer patients in guidelines
2. The potential of PCD-CT for breast cancer workup
3. Case-based review of PCD-CT in breast cancer patients compared to EID-CT, other image modalities, and pathological results.
4. Discussion of the utilities of PCD-CT for breast cancer patients, including advantages, disadvantages, and pitfalls.

### Breast Ultrasound Tomography: The Essentials for the Breast Radiologist

#### Participants

Yu Zhao, MD, Rochester, NY (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

This educational exhibit will review the essentials of breast ultrasound tomography. 1. Understand basic concepts of breast ultrasound tomography including essential physics, the basic imaging sequences, and keys to imaging interpretation. 2. Describe the advantages of breast ultrasound tomography for evaluation of the breasts, especially in those with dense breasts. 3. Describe the specific imaging appearance on ultrasound tomography of various breast entities, benign and malignant. 4. Discuss the future practice considerations and limitations of ultrasound tomography.

#### TABLE OF CONTENTS/OUTLINE

-This educational exhibit reviews the essentials of breast ultrasound tomography for the breast radiologist. This is a new imaging modality with enormous potential to add new value to breast imaging by improving diagnostic accuracy especially in patients with dense breasts. -We will describe in simple terms the physics of breast ultrasound tomography and the basic imaging sequences including Waveform Enhanced Reflection (Wafer), Reflection, Sound Speed, and Stiffness Fusion sequences in a breast ultrasound tomographic examination. -We will review with illustrative case examples of high-yield breast lesions including cysts, fibroadenomas, and cancers comparing the distinctive imaging appearance on ultrasound tomography versus other breast imaging modalities. -This will be followed by a discussion of the specific advantages of ultrasound tomography relative to other imaging modalities, such as improved lesion localization and lesion characterization. Finally, we will present the limitations of ultrasound tomography and general considerations for future practice.

CAEE

### Cardiac Imaging Education Exhibits

#### Sub-Events

**CAEE-1 Is It Possible to Assess Left Atrial Remodeling Using Deep Learning? An Attempt to Classify Atrial Fibrillation Types Using Contrast-Enhanced CT Images.**

#### TEACHING POINTS

Catheter ablation therapy is one of the curative treatments for atrial fibrillation (AF). It is generally known that the recurrence rate after treatment increases as attacks persist, and the factor is related to structural remodeling of the left atrium. However, standard evaluation is difficult, and the indication for catheter ablation therapy is currently determined by the surgeon's empirical judgment and the duration of disease obtained from the patient's self-report. Therefore, this study demonstrates the possibility of assessing remodeling of the left atrium from the results of the visualization of the classification basis of the two models. The major teaching points of this exhibit are 1. Evaluation of AF types using contrast-enhanced CT imaging is difficult only for experienced physicians 2. Deep learning enables evaluation of the left atrium using features such as the structure of the left atrium and pulmonary veins obtained from images. 3. Evaluation of structural remodeling of the left atrium may be useful for AF types

#### TABLE OF CONTENTS/OUTLINE

1. About Atrial Fibrillation -Classification of Atrial Fibrillation Types -Structural remodeling of the left atrium 2. Treatment options for Atrial Fibrillation -Relationship between seizure duration and treatment outcome 3. Results of experiments -How well did you recognize the shape of the left atrium?

**CAEE-10 Seeing Beyond the Surface: A Radiological Exploration of Pacemakers, CRT, and ICDs**

#### TEACHING POINTS

- Review the relevant cardiac anatomy, the different types of devices (pacemakers, CRT, and ICDs), and the positioning and integrity of the different elements of the devices.
- Understand the importance of X-ray imaging in the diagnosis and follow-up of patients with pacemakers, CRT, and ICDs.
- Identify the normal and abnormal X-ray findings for these devices, including lead placement, device positioning, and associated complications.
- Understand how X-ray imaging is used to evaluate the function of pacemakers, CRT, and ICDs, including pacing and electrical leads, and common X-ray findings associated with device malfunction.
- Recognize the potential limitations associated with X-ray imaging of these devices and the troubleshooting strategies for addressing those limitations.

1. Introduction 2. Overview of cardiac devices (pacemakers, CRT, and ICDs) 3. Anatomy and positioning of cardiac devices 4. Importance of X-ray imaging in diagnosis and follow-up 5. Differentiating between pacemakers, CRT, and ICDs on chest radiography 6. Normal and abnormal X-ray findings for pacemakers, CRT, and ICDs a. Device type and differences. b. Device positioning c. Internal elements d. Lead placement e. Lead integrity f. Associated complications 7. Troubleshooting strategies for technical limitations of X-ray 8. Take home points

**CAEE-11 AI-Assisted Autonomous Aortic Aneurysm Analysis - Status, Strengths, Slants, and Stresses: Ut Nos Ibi Nunc?**

Participants

Roshan Fahimi, MD, Cambridge, MA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The exhibit will help the audience understand the following aspects of multiple AI algorithms pertaining to triage, measurement, detection, and report creation for aortic aneurysm and dissection. 1. Aortic evaluation with CT: Intentional and incidental 2. Scientific evidence for aortic evaluation with AI 3. Multi-vendor AI for aortic evaluation 4. Status, strengths, slants, and stresses of AI models

#### TABLE OF CONTENTS/OUTLINE

We use our multi-vendor AI experience to organize and present the exhibit content into following brackets: 1. Aortic Diseases: Incidence, importance, and imaging 2. AI for aortic aneurysm and dissection: Evidence in literature 3. Approach of multiple AI algorithms in aortic aneurysm and dissection 4. Screening and AI-based new metrics for aorta 5. Status, weaknesses, and stresses of AI algorithms 6. Autonomy for AI-assisted analysis: Should we be there now?

**CAEE-12 Boost Your Imaging Skills and Help Your Interventional Cardiologists Before and After Left Atrial Appendage Occlusion**

Participants

Seyedali Nabipoorashrafi, MD, MD, Seattle, WA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Familiarize radiologists with available LAAO devices and their clinical applications. Review the required pre-procedural measurements for LAAO. Educate radiologists with post LAAO complications and ideal imaging techniques for their detection. Review spectrum of

normal post procedural findings that should be differentiated from complications.

#### TABLE OF CONTENTS/OUTLINE

1. Review the different LAAO devices (Watchman, Watchman FLX, Amulet, and Lariat), their unique features, and patient selection criteria. 2. Recognize the importance of preprocedural Image based planning in guiding device selection and placement. 3. Pictorial review of LAAO complications A) peri-device leak B) off-axis placement, and C) device-related thrombosis. 4. Review of the clinical importance of post procedural complications with focus on the role of imaging. 5. Review of the management of device-related complications with emphasis on the role of imaging. 6. Comparison between CT and other imaging modalities (Echocardiography and MRI) for LAAO planning and surveillance.

#### CAEE-13 Fibromuscular Dysplasia: a Multifaceted Vascular Disease

Participants

Frances Ferreira De Deus, MD, Niteroi, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Provide an overview of the pathophysiology and clinical manifestations of fibromuscular dysplasia (FMD). less prevalent, but more commonly underdiagnosed as related to this pathology. - To describe the role of imaging in the diagnosis and prevention of complications.

#### TABLE OF CONTENTS/OUTLINE

Fibromuscular dysplasia (FMD) is a non-inflammatory, non-atherosclerotic, idiopathic arterial disease that primarily affects Caucasian women and medium-sized vessels. The classic finding is the beaded appearance and tortuosity of the affected vessel. However, FMD also predisposes to aneurysm formation, dissection, and stenosis, which are not always suspected to be related to FMD by the imaging community. We describe and illustrate with schematic figures and cases the main sites of vessel involvement, the variable radiological findings and the complications related to the disease. The most affected sites are the renal and cerebrovascular arteries, although the aorta and other arteries may also be involved. FMD can predispose to important complications, such as stroke, myocardial or renal infarction, aneurysm rupture and progressive dissection. FMD is often a subclinical and underdiagnosed arteriopathy with catastrophic complications. The radiological community should be familiar with the different phenotypic appearances. Invasive angiography and non-invasive vascular imaging by CT and MRI play an important role in the diagnosis and prevention of complications.

#### CAEE-14 How to Distinguish Chronic Total Occlusion From Subtotal Occlusion by Distal Transluminal Attenuation Gradient in Coronary CT Angiography

#### TEACHING POINTS

Understand how to calculate distal transmural attenuation gradient (TAG<sub>distal</sub>) in coronary CT angiography (CCTA) and TAG<sub>distal</sub> can be used to distinguish chronic total occlusion (CTO) from subtotal occlusion (STO).

#### TABLE OF CONTENTS/OUTLINE

1. CTO and STO Chronic total occlusion (CTO) is a complete interruption of coronary arterial flow caused by plaque obstructing arterial lumen. Subtotal occlusion (STO) is a "functional" total occlusion and slow blood flow passes through the occluded segment. Percutaneous coronary intervention is attempted less frequently for CTO lesions and has a higher unsuccessful rate and late restenosis compared with STO lesions. 2. TAG<sub>distal</sub> TAG: linear regression coefficient between intraluminal radiological attenuations and vessel length. May be calculated manually or automatically by artificial intelligence post-processing technology TAG<sub>distal</sub>: calculated from distal to occlusion. 3. Distinguish CTO from STO by TAG<sub>distal</sub> Coronary arteries with CTO showed higher TAG<sub>distal</sub> compared with arteries with STO. TAG<sub>distal</sub> has higher accuracy in differentiating CTO from STO. 4. Improve the diagnostic efficiency of CCTA Radiologists routinely diagnose CTO and STO through CCTA, and TAG combined with CCTA can improve the diagnostic efficiency 5. Clinical Application AI-enabled TAG measurements may be used to assist radiologists to differentiate STO from CTO with moderate diagnostic accuracy, improving diagnostic workflow.

#### CAEE-15 How to Distinguish Chronic Total Occlusion from Subtotal Occlusion by Transluminal Attenuation Gradient in Coronary CT Angiography

#### TEACHING POINTS

Understand how to calculate transmural attenuation gradient (TAG) in coronary CT angiography (CCTA) and TAG can be used to distinguish chronic total occlusion (CTO) from subtotal occlusion (STO).

#### TABLE OF CONTENTS/OUTLINE

1. CTO and STO Chronic total occlusion (CTO) is a complete interruption of coronary arterial flow caused by plaque obstructing arterial lumen. Subtotal occlusion (STO) is a "functional" total occlusion and slow blood flow passes through the occluded segment. Percutaneous coronary intervention is attempted less frequently for CTO lesions and has a higher unsuccessful rate and late restenosis compared with STO lesions. 2. TAG TAG: linear regression coefficient between intraluminal radiological attenuations and vessel length. May be calculated manually or automatically by artificial intelligence post-processing technology TAG<sub>all</sub>: calculated from ostium to distal vessel TAG<sub>distal</sub>: calculated from distal to occlusion. 3. Distinguish CTO from STO by TAG<sub>all</sub> and TAG<sub>distal</sub> Coronary arteries with CTO showed lower TAG<sub>all</sub> and higher TAG<sub>distal</sub> compared with arteries with STO. TAG<sub>distal</sub> has higher accuracy in differentiating CTO from STO. 4. Improve the diagnostic efficiency of CCTA Radiologists routinely diagnose CTO and STO through CCTA, and TAG combined with CCTA can improve the diagnostic efficiency 5. Clinical Application AI-enabled TAG measurements may be used to assist radiologists to differentiate STO from CTO with moderate diagnostic accuracy, improving diagnostic workflow.

#### CAEE-16 Calcium in the Heart: A Guide to Interpret Like an Expert

Participants

Seyedali Nabipoorashrafi, MD, MD, Seattle, WA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1- Reviewing various calcified cardiac lesions, including calcification of the pericardium, vascular structures, myocardium, valves,

and valve annuli.2- Reviewing the morphology, location, and extent of calcification, which are often pathognomonic features that aid in identifying each type of calcified lesion as well as conditions associated with them.3- Exploring the clinical significance of various calcified lesions and outlining a structured clinical approach for their management.4- Discussing differential diagnosis of cardiac calcification and evaluation of their etiologies

#### TABLE OF CONTENTS/OUTLINE

1- Introduction to a systematic evaluation of calcified cardiac lesions2- Identifying:A) Pathognomonic features of pericardial calcifications and considering their underlying causesB) Pathognomonic features of valvular and annular calcifications based on underlying causesC) Myocardial calcifications associated with tumors (such as endothelioma and rhabdomyoma), trauma, or infarction.D) Papillary muscle calcification.E) Left atrial calcifications related to atrial fibrillation, congestive heart failure, and endocarditis.F) Intracavitary calcifications in the atria and ventricles.

#### CAEE-17 Medical Terminology in Cardiothoracic Radiology

##### TEACHING POINTS

Medical terminology includes words and phrases aiming to accurately describe anatomical structures, processes, conditions, medical procedures, and treatments. In cardiothoracic radiology, there is a plethora of words originating from Greek and they may be misused and misspelled in everyday practice. To aid colleagues in fluent and effective use of these terms, we have derived a radiologically illustrated glossary of the most frequent terms, their definitions and explanations of their origin and meaning. Typically, medical terms stemming from Greek adhere to a fixed structure of a prefix, a root, and a suffix. The prefix appears at the beginning of a medical term and usually indicates a location, direction, type, quality, or quantity. The root gives a term its essential meaning whereas the suffix appears at the end of a term and may indicate a specialty, test, procedure, function, disorder, or status.

#### TABLE OF CONTENTS/OUTLINE

In a comprehensive and schematic way, words are presented alphabetically divided in two sections: anatomy and pathology and illustrated with representative radiology images, relevant findings and key imaging references. For each word the correct orthography is demonstrated along with a brief review of its history and etymology.

#### CAEE-18 The One Ring to Rule Them Out: Deciphering Differential Diagnosis of Left Ventricular Ring-Like Late Gadolinium Enhancement

##### TEACHING POINTS

Despite being initially described as a diagnostic marker for arrhythmogenic cardiomyopathy (ACM), ring-like LGE has been increasingly reported in non-genetic heart diseaseRing-like LGE secondary to ACM may be accompanied by inverted T-waves in left precordial leads, ventricular arrhythmia with left bundle branch block morphology, and family history of premature sudden deathRing-like LGE secondary to Chagas disease may be accompanied by residency in south america, positive serology, right bundle branch block and left anterior fascicular block, and apical aneurysmRing-like LGE secondary to viral myocarditis may be accompanied by prodromal manifestations (e.g fever, flu-like symptoms and diarrhea), and myocardial edemaRing-like LGE secondary to Keshan disease may be accompanied by residency in China, disabsortive syndrome, and selenium deficiencyRing-like LGE secondary to sarcoidosis may be accompanied by extracardiac findings, right bundle branch block, 2nd- and 3rd-degree heart block, and right ventricular free wall LGE

#### TABLE OF CONTENTS/OUTLINE

Introduction: definition of left ventricular ring-like LGE, clinical significance, and objectivesDifferential diagnosis between genetic causes: left-dominant CMADifferential diagnosis between endemic causes: Chagas disease, and Keshan diseaseDifferential diagnosis between inflammatory causes: viral myocarditis, sarcoidosis, and heart transplant rejectionDifferential diagnosis between causes of non-ring-like circumferential LGE: myocardial infarction, amyloidosis, and dystrophin cardiomyopathiesDiscussion: table with distinctive features of ring-like LGE differential diagnosis

#### CAEE-19 Understanding Transesophageal Echocardiography: A Radiologist's Guide

##### TEACHING POINTS

TEACHING POINTS1. To understand the complimentary role of transesophageal echocardiography in multi-modality cardiac imaging including indications, contra-indications and potential complications.2. To have an understanding of the standard trans-esophageal examination3. Using cross modality reference be able to identify specific pathologies on TEE, CT and MRI.

#### TABLE OF CONTENTS/OUTLINE

TABLE OF CONTENTS/OUTLINE1. Introduction: Overview of the role of TEE in multimodality cardiac imaging including indications, contraindications, and complications.2. The standard transesophageal examination with cross modality reference with CT and MRI3. Specific roles of TEE in acute aortic syndromes, cardiac source of emboli, infective endocarditis and valvular assessment. Pathological appearances on TEE with cross modality reference.4. Summary.

#### CAEE-2 Role of Cardiac MRI in the Follow Up of Postoperative Congenital Heart Disease

Participants  
Harold Goerne, MD, Guadalajara, Mexico (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

To review congenital heart diseases that require imaging follow up after surgical or endovascular repair. To discuss the role of cardiac MRI in the evaluation of postoperative findings in CHD repair. To demonstrate the importance of follow up imaging for detection of postoperative complications.

#### TABLE OF CONTENTS/OUTLINE

1) Introduction 2) Congenital heart diseases - Clinical features; embryology; pathophysiology; treatment 3) Advantages and disadvantages of imaging modalities- Echo, CT, MRI. 4) MRI 5) Discussion, illustration with case examples of postoperative findings in repaired congenital heart diseases a) TOF: 1) Total repair (Pulmonary valve regurgitation, RV dilatation, RVOT wall fibrosis/aneurysms) b) TGA: 1) Jatene / Atrial switch (stenosis, thrombosis) 2) Banding (stenosis) c) DORV 1) Jatene (coronary

ostia stenosis, PA stenosis) 2) MBT 3) Rastelli (leaking, regurgitation) 6) Discussion, illustration with case examples of postoperative complications in the repair of congenital heart diseases. I. Pulmonary valve insufficiency II. Aneurysmal dilatation of patch III. Myocardial dysfunction (Structural alterations, hypertrophy and remodeling) IV. Right ventricular dysfunction

## **CAEE-20 Multimodality Imaging of the Pericardium**

Participants

Nilo Fernandes Leca Junior, MD, Niteroi, Brazil (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

To discuss the strengths and limitations of different imaging techniques in the exploration of the pericardium. To highlight the radiological aspects of the normal pericardium and the spectrum of pathological entities such as developmental anomalies, inflammation/infection, effusion, neoplasms, iatrogenic conditions and pericardial constriction.

### **TABLE OF CONTENTS/OUTLINE**

Pericardial diseases are conditions that involve the membrane that surrounds the heart. Imaging plays a pivotal role in the assessment, which is performed by multiple non-invasive methods such as x-ray, echocardiography, CT and MRI. Echo remains as the first modality in most clinical scenarios. The most common conditions involving the pericardium are inflammation, effusions and constriction. Pericarditis is classified by symptom duration and by etiology (infection, idiopathic, neoplastic, drug related, iatrogenic and autoimmune). Pericardial constriction is a rare complication. Pericardial effusion is related to varying degrees of abnormal fluid accumulation into the pericardial space, and can evolve to tamponade. Primary and secondary masses are commonly accessed by CT and MRI. Secondary involvement is far more common than primary pericardial tumors. Congenital anomalies are relatively uncommon entities and may range from pericardial cysts to partial or total agenesis. Cardiovascular imaging plays an important role on the management of pericardial pathologies, which should be promptly recognized to help guide timely treatment.

## **CAEE-21 Utility of CT Coronary Angiography in Septal Vascular Mapping Prior to Alcohol Ablation in Hypertrophic Obstructive Cardiomyopathy**

### **TEACHING POINTS**

1. Alcohol septal ablation (ASA), an established treatment in hypertrophic obstructive cardiomyopathy (HOCM), iatrogenically induces an infarct of the target basal septum- the site of contact of mitral valve leaflet on the septum during systolic anterior motion (SAM). 2. Invasive angiography provides information about the course and size of coronary arteries but not their territorial distribution. Inaccurate infarct localisation due to alcohol injection into right ventricular side of septum and inability to identify the target vessel on invasive angiography leads to failure of ASA. 3. Computed tomography (CT) angiography has the dual benefit of detailing vascular anatomy and providing information on myocardial distribution. Mapping the septal vascular anatomy with CT coronary angiography prior to ASA improves localisation of infarct with predictable outcome and procedural success at the first attempt compared to traditional methods. The authors describe a new 5-step method of creating a CT navigational map for planning selective sub-branch micro-catheterisation.

### **TABLE OF CONTENTS/OUTLINE**

1. Mechanism and principle of ASA. 2. CT angiography protocol and 5-step mapping technique of the target basal septal vasculature. 3. Checklist of CT reporting points including the distance and angulation of the septal arteries. 4. Illustration of variant CT septal vascular anatomy. 5. Causes and demonstration of failed procedures in pre-CT traditional ASA. 6. Clinical utility of CT-guided ASA in terms of symptomatic, functional and haemodynamic improvement.

## **CAEE-22 Gray Blood and Applications**

Participants

Paula Terra Amaral, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

The purpose of this exhibition is: Review the concept and indications of the gray blood myocardial delayed enhancement (MDE) technique? Highlight the ease of execution and applicability of the method? Understand the benefits of applying gray blood in the investigation of myocardial fibrosis? Identify the radiological findings that will help in the diagnosis as well as pitfalls of this technique

### **TABLE OF CONTENTS/OUTLINE**

Gray blood is a sequence in cardiac magnetic resonance imaging (CMR) obtained by partial blood signal suppression that increases the ability to identify and localize myocardial scarring near the cavity. A pictorial essay based on cases from our collection allows for a comprehensive assessment and understanding: ? Grayblood MDE technique with a tutorial video? Main indications of grayblood MDE images? Grayblood MDE radiological findings in cases of subendocardial enhancement and papillary muscles? Grayblood MDE radiological findings in cases of post-cardiac transplantation, cardiac tumor, myocarditis and hypertrophic cardiomyopathy? Cases in which grayblood MDE did not help in the diagnosis

## **CAEE-23 Imaging of the Ductus Arteriosus**

Participants

Kaustav Bera, MD, Cleveland, OH (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

1. 1. To know the embryology, physiology and modalities for evaluation of the ductus arteriosus 2. 2. To learn about the pathologies of the ductus going beyond patent ductus arteriosus 3. To review the clinical and imaging findings of the above-mentioned entities with case examples

### **TABLE OF CONTENTS/OUTLINE**

1. Embryologic development of ductus arteriosus 2. Physiological significance of ductus arteriosus 3. Modalities for evaluation of pathologies of ductus arteriosus : USG, CT, MR, Invasive angiogram 4. Pathologies of Ductus: - Normal variants - Congenital/developmental o PDA § Risk factors and pathophysiology § Classification § Causes § Maintaining patency post birth for

some Congenital Heart diseases § Closure of PDA o Aneurysm of DA o Congenital vascular ring o Significance in Coarctation of aorta ( Preductal versus post ductal) - Post traumatic o Mechanism of and incidence of ductal injury o Minimal aortic injury (MAI) o Ductal Pseudoaneurysm o Penetrating ulcer o Aortic dissection - Miscellaneous o Infective aortitis associated with the nonpatent remnant of a ductus arteriosus o Atherosclerotic penetrating ulcer/ pseudoaneurysm of aortic ductus. 5. Differential diagnosis/mimics: - Aortic spindle mimicking aortic ductus pseudoaneurysm/MAI - Type III ductal diverticulum mimicking Aortic ductus pseudoaneurysm - Infundibula of the aortic branch vessels mimicking Aortic ductus pseudoaneurysm - Technical mimics of MAI :Breathing, arterial pulsation and other motion artefacts, streaming/streaking of contrast mimic minimal aortic injuries) - Anatomical mimics of MAI : Noncalcified and partially calcified atheroma

#### **CAEE-24 The Space Between: A Roadmap to Cardiac Recesses Grooves**

Participants

Katherine Cheng, MD, Stamford, CT (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

The recesses, grooves, and potential spaces around the heart are defined by the vasculature and supporting fibrous structures; these areas can easily be overlooked by the radiologist. Changes in configuration and appearance of these spaces can occur with pathological processes and can be more readily identified using a standard search pattern. A structured search pattern using a vascular and fibro-skeletal based review can help the radiologist identify and differentiate pathology from normal spaces and structures.

##### **TABLE OF CONTENTS/OUTLINE**

1. Review the normal anatomy of the heart including the recesses and grooves as well as the supporting vascular and fibro-skeleton of the heart. 2. Illustrate the common pathology that can occur in these spaces including thrombus, tumor, abscesses, and pseudoaneurysm. 3. Highlight the importance of variant and abnormal processes in these spaces and the impact on medical and surgical management.

#### **CAEE-25 The Role of Imaging in Cardio-Oncology: Detecting, Preventing, and Managing Cardiovascular Disease in Cancer Patients and Survivors**

Participants

Osamu Manabe, MD, PhD, Saitama-Shi, Japan (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

Cardio-oncology is a new specialty that focuses on detecting, preventing, treating, and following up on cardiovascular disease (CVD) in cancer patients and survivors. Cancer and CVD share many risk factors, such as aging, smoking, diabetes mellitus, and genetic predisposition. Furthermore, some cancer treatments have negative effects on the cardiovascular system, leading to an increased burden of cardiac complications in survivors. Cardio-oncology aims to minimize cardiovascular complications in patients with cancer and requires close collaboration between oncologists, cardiologists, and radiologists. In this presentation, we will discuss the usefulness of various imaging modalities in the field of cardio-oncology, taking into account the latest technology available.

##### **TABLE OF CONTENTS/OUTLINE**

Cardio-oncology is a new multidisciplinary field to institute appropriate surveillance, treatment, and follow-up strategies for CVD in patients with cancer (Fig.1). Imaging modalities such as MRI (Fig.2), CT (Fig.3), and nuclear medicine including PET (Fig.4) play a crucial role in diagnosing and monitoring CVD in cancer patients. These non-invasive methods can be used to assess cardiac function, tissue characteristics, metabolic activity, and also tumor size and extent. Using novel imaging technologies is essential for early detection, treatment, risk stratification, and survivorship in cardio-oncology (Fig 5).

#### **CAEE-26 Whole-body Assessment of Vasculitis and Its Complications Using CT, FDG-PET, and MRI**

Participants

Noriko Oyama-Manabe, MD, PhD, Saitama City, Japan (*Presenter*) Grant, DAIICHI SANKYO Group; Grant, Bayer AG; Grant, Eisai Co, Ltd; Grant, Canon Medical Systems Corporation

##### **TEACHING POINTS**

1. Overview of the etiology, pathophysiology, clinical presentation, diagnostic criteria, and therapeutic approaches for primary and secondary vasculitis 2. To compare image characteristics of specific vasculitis and its complications with CT, MRI and FDG-PET/CT 3. To describe the role of multimodality imaging in the quantitative evaluation of inflammation for the initial diagnosis and during follow-up after treatment

##### **TABLE OF CONTENTS/OUTLINE**

Vasculitis manifests in various clinical presentations, morphologies, and prognoses, requiring a multimodal imaging approach. Radiologists can aid in the accurate diagnosis of vasculitis and its complications, treatment planning, and patient care with multimodality imaging. In this presentation, we will cover both primary and secondary vasculitis, which can be caused by various factors, including infections and drug-induced reactions. Knowledge of systemic clinical manifestations in affected patients may help establish a specific diagnosis. 1. To review the clinical features and imaging findings of the different types of vasculitis including those that primarily involve large, medium-sized, or small vessels. 2. Tips for scanning with adequate timing and reconstruction for various complications due to infectious vasculitis including secondary to TEVAR and EVAR. 3. To describe the role of these imaging modalities in the quantitative evaluation of inflammation for the initial diagnosis and during follow-up after treatment, with an emphasis on monitoring therapeutic response using quantitative parameters.

#### **CAEE-27 Unveiling Cardiac Intracavitary 4D flow MRI**

Participants

Jordi Broncano, MD, Cordoba, Spain (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

Reliable analysis of intracardiac flow provides important insight for the interpretation and management of cardiovascular diseases.

Recently, non-invasive evaluation of intracardiac hemodynamics by 4D flow CMR constitute a reliable, robust, and reproducible method for the analysis of flow patterns in valvular diseases, cardiomyopathies, or congenital heart diseases (CHD). Furthermore, in virtue of its multidimensional/multidirectional capabilities it allows to calculate common (flow, velocities, and volumes) and advanced (kinetic energy and turbulent kinetic energy, vortical flow imaging and particle tracing) intracardiac chamber flow hemodynamic parameters. Recently, some of them have been shown to have important prognostic implications. Teaching points 1. To describe the physical basis of 4D flow, the main acquisition process, optimization techniques and advanced post-processing methods 2. To analyze the current and potential clinical applications of intracavitary 4D flow in cardiac imaging.

#### TABLE OF CONTENTS/OUTLINE

1. 4D flow physical basis 2. 4D flow acquisition technique and protocol 3. Conventional intracavitary flow analysis 4. Advanced intracavitary 4D flow analysis - Kinetic Energy and Turbulent Kinetic Energy - Viscous energy loss - Vortical Flow Imaging - Particle tracing 5. Current and potential clinical applications intracavitary 4D flow - Dilated cardiomyopathy - Ischemic heart disease - Atrial fibrillation and heart failure - Valvular heart disease - Hypertrophic cardiomyopathy - Congenital heart diseases 6. Intracavitary 4D flow prognostic biomarkers: Ready to primetime? 7. Take home points

#### CAEE-28 CT Imaging in Ischemic Heart Disease and Complications

Participants

Takashi Norikane, MD, PhD, Kita-gun, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Cardiac imaging plays a pivotal role in the diagnosis of ischemic heart disease. Echocardiogram, coronary angiography, nuclear medicine imaging and magnetic resonance imaging are common imaging modalities. However, conventional CT can provide important information about ischemic heart disease and complications. This presentation introduces the basic approaches of CT in ischemic heart disease and complications and follows with an overview of normal heart and coronary anatomy and frequently encountered pathologic conditions.

#### TABLE OF CONTENTS/OUTLINE

Normal anatomy Coronary artery and territories Heart chambers Pericardium Myocardial infarction Atherosclerosis, Air embolism, Coronary artery anomaly, IgG4-related disease, Aortic dissection, thromboembolism due to essential thrombocythemia, Diaphragmatic hernia (post CABG), Post aortic valve replacement Complications Myocardial rupture, ventricular septal rupture, Dressler's syndrome, Ventricular aneurysm, Calcification Myocardial persistent enhancement after percutaneous coronary intervention Differential diagnosis Myocarditis, Takotsubo-myocardiopathy

#### CAEE-29 Unravelling the Mitral Valve on CT

Participants

Vidushi Gupta JR, MD, MBBS, Delhi, India (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Assessment of normal valvular morphology and basic physiology of mitral valve on MDCT 2. Discuss the pearls and pitfalls relevant to planning, acquisition and interpretation of cardiac CT images 3. Enumerate various structural and functional abnormalities 4. Describe the role of CT in pre and post-procedural imaging in patients with TMVR (Transcatheter mitral valve replacement).

#### TABLE OF CONTENTS/OUTLINE

1. Introduction 2. ECG placement with proper planning and acquisition protocol 3. Pearls and pitfalls 4. Post processing 5. Normal mitral valvular anatomy and function 6. Assessing Structural abnormalities 7. Assessing Functional abnormalities 8. Role of CT in pre and post procedural imaging in TMVR 9. Take home message

#### CAEE-3 Robotic and Minimally Invasive Mitral Valve Surgery: Radiological Assessment and Surgery Correlation

#### TEACHING POINTS

1. Robotic and minimally invasive mitral valve surgery is a safe and less traumatic surgical approach compared to the open cardiac surgery. Besides, it can be regarded as a widely accepted technique given the volume of publications from numerous institutions. 2. Multimodality imaging assessment conducted before to surgery are essential for selecting appropriate patients, anatomical evaluation, surgical planning, and optimal patient outcomes. 3. Radiologists can assist in patient treatment by being knowledgeable about the variety of anticipated postoperative findings and potential complications following robotic and minimally invasive mitral valve surgery.

#### TABLE OF CONTENTS/OUTLINE

A. Overview of surgical techniques: Ministernotomy, minithoracotomy, robotically assisted B. Indications and contraindications C. CT angiography for pre-operative assessment 1. Scan protocol and postprocessing technique 2. Preoperative checklist 1) Aorta and iliofemoral arteries 2) Evaluation of lung, pleural plaques 3) Chest wall, diaphragm 4) Pericardium, mediastinum 5) Aorta diameter, pulmonary artery diameter, ascending aortic calcification 6) Mitral valve geometry, calcification 7) Central veins (vena cavae, coronary sinus) 8) Coronary arteries D. Procedural considerations E. Case examples F. Postoperative assessment G. Conclusion

#### CAEE-30 Need for Speed: Fast MRI in Cardiac Imaging

Participants

Jordi Broncano, MD, Cordoba, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Cardiac MRI has become versatile technique for normal and diseased heart. However this results in complex and slow CMR examinations, raising the perception of CMR as a high-cost imaging method. Therefore, a more rationale and question-driven protocols are increasing acceptance in order to reduce the amount of acquisition time, increase patient acceptance and clinical value of this well-known game-changer imaging method. Teaching points 1. To describe the current technical advances, drawbacks, tips and tricks available for providing fast MRI protocols in clinical practice. 2. To detail the different proposals

described in the literature for optimizing CMR protocols (fast MRI) in a "question - driven" scenario and with a "building - blocks" strategy.

#### TABLE OF CONTENTS/OUTLINE

1. Fast MRI concept and rationale 2. Conventional CMR protocoling problems: Knowing what I need to fix. 3. Fast MRI strategies in cardiac imaging • 3.1. Cine SSFP o Free - breathing EKG gated cine SSFP o Post-contrast cine SSFP o Sparse acquisition cine SSFP o Deep Learning (DL) cine SSFP o 3D cine SSFP • 3.2 Tissue characterization/parametric mapping o Single-Shot black blood imaging o DL acquisition and reconstruction o 3D single parameter mapping o Accelerated T1 T2 mapping • 3.3. 4D flow imaging o 4D flow EPI o Accelerated 4D flow • 3.4. MR angiography o Compressed sensing o Other strategies o Non - contrast MRA • 3.5. Late Gadolinium Enhancement o Free breathing single-shot LGE o Breathold 3D LGE o 3D PSIR LGE o DL LGE 5. Fast CMR protocols in the clinical practice: The "building - blocks" strategy - Ischemic heart disease - Non-ischemic heart disease - Valvular heart disease - Arrhythmogenic cardiomyopathy - Congenital heart disease 6. Take home points

#### CAEE-31 Pulmonary Vein Anomalies Made Easy

Participants

Juliana Da Silveira, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To overview the embryology and normal anatomy of the pulmonary veins. To discuss the spectrum of anomalous pulmonary venous connections (APVCs). To describe and illustrate with schematic figures and cases the types of APVCs. To discuss the importance of the diagnosis to allow timely treatment and a better prognosis.

#### TABLE OF CONTENTS/OUTLINE

The normal PV anatomy consists of four PVs, which drain oxygenated blood from the lungs to the left atrium (LA). The LA and PVs initially develop separately, and get progressively connected during fetal development. If there is failure in any step of this embryonic process, APVCs will happen. Anomalous pulmonary venous connections are a group of abnormal drainage of one or more PVs outside of the LA and can be classified either as partial or total, depending on the number of the veins involved. We describe and illustrate with schematic figures and cases the types of anomalous pulmonary venous connections, whether partial or total, common or rare, depending on the site of pulmonary vein drainage, the number of veins involved, and the presence or absence of vein obstruction. Common and rare anatomical variations will also be demonstrated. The clinical syndromes related to abnormal pulmonary venous returns will be discussed, ranging from dramatic neonatal emergency to subclinical presentation and late development of pulmonary hypertension.

#### CAEE-32 The Changing Face of Myocarditis

Participants

Matthew McCann, MD, Jacksonville, FL (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

COVID-19 ushered in a dramatic rise in public awareness of myocarditis and related complications. Mirroring this, an unprecedented utilization of imaging for assessment of cardiac events followed. Utilization of imaging for vaccine-related cardiotoxicity has similarly risen. Synchronously, other previously unrecognized causes of myocarditis are now increasingly encountered, including drug-related cardiotoxicity, as seen with new oncologic agents. Clinical history, lab assessment, and imaging remain central to establishing a diagnosis of myocarditis. Cardiac MRI plays an integral role in diagnosis, stratification, and monitoring of recovery from this changing face of myocarditis. Recognition of the evolving etiologies, imaging techniques and revised diagnostic criteria are paramount for appropriate diagnosis.

#### TABLE OF CONTENTS/OUTLINE

This exhibit outlines the timeline of awareness, specific entities and imaging features which comprise the "changing face of myocarditis" including cardiotoxicity related to COVID-19, COVID-19 vaccination, drug reactions including immune checkpoint inhibitors, and cardiotoxicity related to environmental contaminants and other exposures. Cardiac MR plays a key role in diagnosis, stratification, and monitoring of cardiotoxicity in these entities. The specific imaging features and diagnostic considerations are outlined and described in order that the radiologist gains a better understanding of this evolving diagnosis, allowing for appropriate utilization of imaging and improved diagnostic accuracy of this complex disease.

#### CAEE-33 New CAD-RADS 2.0: What Has Changed from CAD-RADS 1.0

Participants

Janio De Paula Santos, MD, Niteroi, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To reinforce the importance of applying the CAD-RADS classification for a better communication with the healthcare providers. To describe the differences between CAD-RADS versions 1.0 and 2.0. To demonstrate with cases how to apply the CAD-RADS 2.0 classification.

#### TABLE OF CONTENTS/OUTLINE

The Coronary Artery Disease Reporting and Data System (CAD-RADS) is a standardized guide created to categorize coronary CT angiography findings and to facilitate communication between the radiological community and referring physicians. A new CAD-RADS classification was recently published with the objective of adding anatomical and functional data, which may offer stronger prognostic value other than just describing the presence or absence of anatomical lesions. What's the same? The main categories (0, 1, 2, 3, 4, 5) based on stenosis severity (0, 1-24%, 25-49%, 50-69%, 70-99%, occlusion) were maintained. Complementary modifiers "G", "S" and "N" standing for the presence of Grafts, Stents, or a Non-diagnostic study were maintained. What has changed? A grading scale for calcific plaque burden was added (P1, P2, P3 and P4). For plaques with features indicating high risk of rupture, the modifier "V" was replaced to "HRP" -> high-risk plaque. An "I" modifier was added if the investigation of ischemia was performed, either by perfusion or FFR-CT. The use of CAD-RADS to report findings provides a clinically useful categorization of CAD and standardizes the way of providing results across imaging sites, which is additionally useful for research purposes.

#### CAEE-34 Multimodality Review of Common Mitral Valve Pathology and the Current Surgical Interventions

## TEACHING POINTS

As the treatments for valvular disease have evolved over the years, the assessment of cardiac valves now often requires multiple imaging modalities, including cardiac CT, cardiac MRI, and echocardiography. The aim of this exhibit is to review the normal appearance as well as common pathologies involving the mitral valve on the various modalities discussed above. Lastly, the current available treatments for mitral valve disease will be reviewed including repairs (such as annuloplasty, valvuloplasty, and mitral valve clips) and replacements (such as surgical valve replacement and transcatheter mitral valve replacement).

## TABLE OF CONTENTS/OUTLINE

1. Review of the normal appearance of mitral valve on CT, MRI, and Echo. 2. Review of common mitral valve disease including mitral regurgitation, mitral stenosis, mitral prolapse, mitral annular disjunction, flail leaflet, parachute mitral valve, mitral cleft, mitral masses (fibroelastoma, vegetations, thrombus), and mitral annular calcification. 3. Review of the current treatments. Mitral valve repairs include annuloplasty, valvuloplasty, and mitral valve clips. Mitral valve replacements including surgical and more minimally invasive techniques, such as robot-assisted or transcatheter-based TMVR.

## CAEE-35 Visualizing the Mitral: An Imager Approach to Mitral Valve Disorders

Participants

Mohamed Ibrahim, MD, Birmingham, AL (*Presenter*) Nothing to Disclose

## TEACHING POINTS

- Overview on clinical burden of Mitral valve diseases (MVDs) and pertinent anatomy.
- Familiarity with the current imaging approach to MVDs.
- Understand the role of imaging in the management of MVDs.

## TABLE OF CONTENTS/OUTLINE

- Mitral valve diseases burden and pertinent anatomy
  - o Mitral valve anatomy
  - o Clinical burden of MVDs
- Current imaging approach to MVDs:
  - o Role of Echo as the main modality for early detection
  - o Complementary role of CT and MR
  - o Comprehensive evaluation of MVDs (Mechanism of abnormality, Quantification, Ventricular remodeling, Vascular changes, Risk stratification, Valve morphology)
- Where does imaging fit in MVDs management?
  - o Assessing etiology, mechanism, and grading
  - o Pre-procedural planning: § Surgery vs Transcatheter intervention § Repair vs replacement
- Surgical replacement: sternotomy vs Robotic, and the role of CTA and CMR
- Transcatheter replacement: transapical vs trans-septal approaches, and the role of Echo and CT § Favorable anatomical markers, predictors of challenging procedures and contraindications
  - o Intra-procedural guidance and monitoring
  - o Post-procedural Follow up; Devices (stability, leaflet motion, leaks, vegetations/thrombus), Hemodynamics, and chamber size and function)

## CAEE-36 Left Ventricular Hypertrophy: An Approach to Differential Diagnosis

Participants

Rafael Perez Milan, MD, Leon, Mexico (*Presenter*) Nothing to Disclose

## TEACHING POINTS

- Left ventricular hypertrophy (LVH) is a common finding in cardiac magnetic resonance (CMR) with multiple diagnostic considerations.
- LVH is an independent predictor of future cardiovascular events regardless of its etiology.
- LVH can be defined as follows.
- LV myocardial thickness more 12 mm.
- Increased LV mass: Body surface area - indexed LV mass (over 95th percentile - 91 g/m<sup>2</sup> in males; 77 g/m<sup>2</sup> in females)

## TABLE OF CONTENTS/OUTLINE

- To understand basic anatomy and embryology of the left ventricle.
- To define left ventricular hypertrophy (LVH) and clinical implications.
- To describe the differential diagnosis of LVH.
- Role of cardiac magnetic resonance (CMR) in narrowing the differential diagnosis.

## CAEE-37 Complications of Acute Myocardial Infarction: Infrequent but Lethal

## TEACHING POINTS

1. Acute Myocardial Infarction (AMI) is a frequent pathology and one of the leading causes of death in the world. Early revascularization has become a standard of care, thus reducing the high associated morbi-mortality. 2. Although infrequent, several secondary complications can occur, particularly when treatment is delayed or inadequate. 3. These are divided into mechanical, inflammatory, arrhythmic, thrombotic, and embolic. 4. CT, and especially MRI, help us to adequately assess cardiac function, ventricular volumes and structure, myocardial viability and possible associated complications.

## TABLE OF CONTENTS/OUTLINE

- Introduction- General characteristics of AMI and its complications.
- Complications are divided into categories, with cases to illustrate each
- Mechanical complications are most frequently evaluated through CT and MR. In the acute phase, the most frequent are left ventricular free wall rupture, septal ventricular defect, and papillary muscle rupture. In a chronic phase, pseudoaneurysms and ventricular aneurysms are found.
- Conclusions. Complications of AMI are infrequent, but they can be potentially lethal. An accurate and early diagnosis significantly improves the prognosis. CT and MRI are the main imaging modalities used after echocardiography.

## CAEE-38 Imaging Features and Mimics of Primary and Metastatic Pericardial Tumors

## TEACHING POINTS

1. Understand the role of imaging modalities in the diagnosis and management of primary and metastatic pericardial tumors and their mimics. 2. Review the imaging features of pericardial tumors and their mimics on echocardiography, CT, MRI, and PET/CT. 3. Discuss the limitations of imaging in the diagnosis and management of pericardial tumors and their mimics.

## TABLE OF CONTENTS/OUTLINE

I. Introduction A. Epidemiology and clinical presentation of pericardial tumors and their mimics II. Role of Imaging Modalities A.

Echocardiography B. Computed Tomography (CT) C. Magnetic Resonance Imaging (MRI) D. Positron Emission Tomography/Computed Tomography (PET/CT) III. Imaging Features of Pericardial Tumors and Their Mimics A. Primary pericardial tumors B. Metastatic pericardial tumors C. Pericardial cysts D. Lipomatous hypertrophy E. Pericardial fat pad F. Hemangioma G. Thymoma IV. Limitations of Imaging in the Diagnosis and Management of Pericardial Tumors and Their Mimics V. Conclusion

### CAEE-39 Mitral Valve Diseases 101: A Comprehensive Case-Based Review for Radiology Trainees

Participants

Mangun Randhawa, MBBS, Boston, MA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Describe the normal anatomy of the mitral valve and imaging modalities used for its evaluation  
2. Discuss various pathologies of native and prosthetic mitral valves, their implications, and their differential diagnoses  
3. Review role of imaging for mitral valve interventions

#### TABLE OF CONTENTS/OUTLINE

1. Morphologic anatomy of the mitral valve  
2. Congenital mitral valve abnormalities : parachute mitral valve, parachute-like mitral valve, Shone complex  
3. Mitral valve prolapse (various types) and mitral annular dysjunction  
4. Mitral annular calcifications, and complications  
5. Infective endocarditis  
6. Mass (different histopathologies)  
7. Pre-procedural and Post-procedural evaluation of mitral valve implantation including prediction of left ventricular outflow tract obstruction post trans-catheter implantation.

### CAEE-4 It's All About the Pericardium

Participants

Felipe Aluja, MD, MEd, (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Discuss the anatomy of the pericardium and the pericardial recesses with emphasis on CT and MRI. Identify selected entities affecting the pericardium, from benign to malignant, with a brief description of their clinical characteristics. Provide a deep review of the imaging findings from the conventional radiology to MRI, with emphasis in the ancillary findings that aid in the differential diagnosis approach. Describe the pitfalls and mimics of pericardial disease in conventional radiology, CT, MRI and PET/CT.

#### TABLE OF CONTENTS/OUTLINE

• Introduction • Anatomy of the pericardium and pericardial recesses: from the schemes to the imaging. • The pericardium in conventional radiology, CT, MRI and PET/CT. • Conditions of the pericardium: o Air, collections, hemorrhage, and pericardial tamponade o Acute and chronic inflammation (including constrictive pericarditis) o Benign neoplasms o Malignant primary and secondary neoplasms o Congenital lesions • Try your best? Take home points

### CAEE-40 Artificial Intelligence in Cardiac MRI- Applications, Pitfalls Challenges

Participants

Prabhakar Rajiah, MD, FRCR, Rochester, MN (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To review the principles of Artificial Intelligence (AI) techniques relevant to cardiac MRI (CMR); 2. To discuss how AI can be applied to the different steps of the CMR; 3. To illustrate common applications of AI in CMR

#### TABLE OF CONTENTS/OUTLINE

1. AI, MACHINE LEARNING, DEEP LEARNING; 2. CHALLENGES OF CMR- complex anatomy, pathology, planes, sequences 3. AI NETWORKS- Convolutional neuronal network (CNN), general adversarial network (GAN); 4. ILLUSTRATION OF CLINICAL APPLICATIONS OF AI IN CARDIAC MRI WITH CASE EXAMPLES AND TECHNIQUES USED A. Upstream- Protocolling, workflow management/prioritization B. Image acquisition- Plane prescription; Patient positioning; Automated cardiac MRI planes; Automated selection of inversion time; B. Image reconstruction- Decreased artifacts; Decreased noise; Decreased acquisition time; Improved resolution- Super resolution ; Virtual Native Enhancement without contrast (VNE); Synthetic strain; C. Segmentation of structures- Ventricular volumes, function, mass in SSFP, Vascular anatomy in MRA; D. Automated quantification- Volumes, mass, function, LGE, parametric mapping (T1, T2, ECV), flow, strain, aortic diameter; E. Automated post-processing- perfusion, 4D flow; F. Classification of disease- Scar from non-contrast cine, Cardiomyopathies, CAD, myocardial infarction, atherosclerotic plaque, valvular disease, heart failure G. Prognostic factors- Risk stratification- Predictive models; H. Radiomics /Textural analysis I. Automated reporting J. Automated CMR pipeline 5. CHALLENGES- Small, biased training datasets, black box, quality criteria for algorithm design; 6. PITFALLS - Inaccuracies; 7. FUTURE DIRECTIONS- Good Machine learning practices.

### CAEE-41 Emerging Applications of Non-Contrast Cardiac CT: Beyond Coronary Score

Participants

Masafumi Kidoh, MD, PhD, Kumamoto, Japan (*Presenter*) Endowed Chair, Koninklijke Philips NV

#### TEACHING POINTS

Teaching Points 1. Non-contrast cardiac CT is widely used to detect and quantify coronary and heart valve calcium. On the other hand, detection of fat, myocardial edema, thrombus/hematoma, and subtle myocardial calcification beyond coronary and heart valve calcification using non-contrast cardiac CT has not been widely performed, possibly due to poor image quality. 2. Recent advances in CT technology (such as model-based iterative reconstruction and dual-layer spectral/photon-counting CT) have drastically improved the low-contrast resolution of CT images, allowing the detection of small differences in CT values within soft tissue on non-contrast and delayed phase cardiac CT images. Side-by-side viewing of non-contrast cardiac CT images and delayed (or arterial) phase cardiac CT images may be useful in differentiating various pathologies. 3. In this exhibit, we report that non-contrast cardiac CT is useful for the detection and characterization of cardiac low-contrast lesions (soft tissue lesions) beyond coronary and heart valve calcification.

#### TABLE OF CONTENTS/OUTLINE

Table of Contents/Outline 1. Scan and reconstruction techniques for non-contrast cardiac CT. Single energy CT. Dual energy CT.

Table of Contents/Outline 1. Scan and reconstruction techniques for non-contrast cardiac CT - Single-energy CT - Dual-energy CT - Photon-counting CT 2. Principle of CT number in non-contrast cardiac CT 3. Clinical applications: beyond coronary score - Calcification - Thrombus/hematoma - Anemia - Water/myocardial edema - Fat 4. Future directions 5. Summary

### **CAEE-42 From Cyan to Cinnabar - The Radiologist's Role in Operative Management of Single Ventricle Congenital Heart Disease**

Participants

Shravan Sridhar, MD, MS, San Francisco, CA (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Single ventricle congenital heart diseases are rare and challenging to manage. While historically, outcomes have been poor, recent advancements in surgical management have improved post-operative outcomes and long-term prognosis. Imaging has also advanced from morphologic characterization to assessment of function and flow dynamics. Here, we present a framework for understanding the pathophysiology of the single ventricle state and 3-stage palliation repair, review important imaging-informed decision points along the course of operative management, and present metrics important to long-term outcome and management.

#### **TABLE OF CONTENTS/OUTLINE**

1. Title slide, disclosures 2. Abbreviations 3. Table of contents 4. Normal physiology 5. Single ventricle physiology 6. Norwood/DKS 7. mBTT and RV-PA conduit 8. Glenn procedure, mention of Kawashima 9. Fontan procedure 10. Operative management, main decisions 11. Single (SVR), biventricular (BiVR), or 1.5 ventricle (1.5VR) repair? 12. SVR Ex AV canal 13. CT/MRI evaluation 14. BiVR Ex DORV 15. CT/MRI evaluation 16. 1.5VR Ex Tricuspid atresia 17. CT/MRI evaluation 18. 1.5VR Ex Ebstein anomaly 19. CT/MRI evaluation 20. Safe for hybrid/bridge-to-Norwood? 21. Example 22. Hybrid procedure, relevance of HLHS, and risk factors for retrograde aortic arch obstruction 23. CT/MRI evaluation 24. Safe for Glenn? 25. Example 26. CT/MRI evaluation 27. What features may change Fontan approach? 28. Pre-Fontan operative planning example 29. CT/MRI evaluation prior to Fontan 30. Failing Fontan and BiVR or 1.5VR conversion surgery 31. Preop. Items (e.g. LVOT widening, valvuloplasty) 32. CT/MRI evaluation prior to conversion surgery 33. Summary 34. References

### **CAEE-43 Myocardial Strain Analysis Using Feature Tracking**

Participants

Masaya Kishohara, MD, PhD, Nagoya City, Japan (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

1. Myocardial strain refers to the deformation of the walls and chambers of the heart from a relaxed to a contracted state. 2. Feature tracking is a technique that enables the analysis of myocardial strain. 3. Strain analysis performed in the left ventricle and the left atrium is a better prognostic indicator for heart failure than left ventricular ejection fraction. 4. Strain analysis by feature tracking might apply to 4D-CT images.

#### **TABLE OF CONTENTS/OUTLINE**

1. The concept of myocardial strain and its types: Myocardial strain using feature tracking is an alteration of length in one dimension or spatial orientation. Left ventricular strain is classified as radial, circumferential, and longitudinal strain. Left atrial strain is obtained as global longitudinal strain. 2. The principle of features tracking: Template matching is a technique that follows similar templates during the process of myocardial contraction. 3. The importance of myocardial strain for patients with heart failure. 4. What is left atrial strain? The left atrial strain is an index that reflects the diastolic and contractile capacity of the left atrium. Similar to the left ventricular global longitudinal strain, it is helpful in predicting prognosis in heart failure with preserved left ventricular ejection fraction. 5. An experiment using 4D-CT for myocardial strain analysis

### **CAEE-44 The Role of Gadolinium Enhancement Patterns in Diagnosing Myocardial Diseases at Cardiac MR - Enhancing Residents' Knowledge**

Participants

Otávio Augusto Ferreira Dalla Pria, MD, Iowa City, IA (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

The abnormal myocardium can depict different patterns of gadolinium contrast enhancement depending on the cause of the injury. Therefore, assessing enhancement patterns in Cardiac MR plays a pivotal role in diagnosing diverse myocardium diseases. Ischemic cardiomyopathies produce delayed vascular-distributed gadolinium enhancement, and non-ischemic patterns are not limited to vascular territories. Patterns of enhancement distribution are crucial in differentiating between ischemic and non-ischemic heart pathologies and narrowing differential etiologic diagnostics in both. This exhibit aims: 1. To review myocardium gadolinium enhancement MR patterns. 2. To illustrate differential diagnostics based on the type of enhancement. 3. To discuss challenges and confounder factors.

#### **TABLE OF CONTENTS/OUTLINE**

1- Introduction/Objectives: Cardiac MRI can help diagnose a plethora of myocardial dysfunction. The gadolinium enhancement pattern is one of the characteristics that can help identify differential diagnostics. In this presentation, we summarize and illustrate the 5 types of cardiac MRI enhancement patterns and correlate findings with main differential diagnostics. 2- Case-based approach: Present 5 Patterns of Enhancement in Cardiac MRI (Subendocardial, subepicardial, transmural, patchy, mid-myocardial/mesocardial), correlating with primary differential diagnostics through didactical cases illustration in both ischemic and non-ischemic cardiomyopathies. 3- Limitations, Conclusion, and Take-home messages.

### **CAEE-45 Role of Multi-Modality Imaging in Cardio-Obstetrics**

Participants

Prabhakar Rajiah, MD, FRCR, Rochester, MN (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Cardio-obstetrics is an expanding subspecialty that focuses on prevention, early detection, and management of cardiovascular disease (CVD) in pregnancy. 1. To review the cardiovascular complications in pregnancy; 2. To understand disease processes

exacerbated by pregnancy; 3. To discuss the role of imaging in cardiovascular complications of pregnancy and pre-conception planning; 4. To understand the concept of pregnancy heart team and risk stratification

#### TABLE OF CONTENTS/OUTLINE

1. INTRODUCTION ;2.PHYSIOLOGICAL CARDIOVASCULAR CHANGES OF PREGNANCY;3. ROLE OF IMAGING IN PREGNANCY;4. IMAGING MODALITIES;5. COMPLICATIONS RELATED TO PREGNANCY (Discussion, clinical features, imaging findings and differential diagnosis with case examples)-Cardiac- Heart failure, arrhythmia, thromboembolism;Obstetrics- hypertension, Preeclampsia, hemorrhage;Perinatal-miscarriage, premature delivery, restricted growth;Venous thromboembolism including PE;Amniotic fluid embolism;Peri-partum cardiomyopathy;Spontaneous coronary artery dissection;Pulmonary hypertension;Hypertensive disorders (Eclampsia/Pre-eclampsia);Heart failure and arrhythmias;6.EXACERBATION OF PRE-EXISTING CVD DURING PREGNANCY (Illustration with case examples)-Inherited aortic diseases;Congenital heart disease;Hereditary hemorrhagic telangiectasia;Valvular disorders;7. PRECONCEPTION PLANNING- Risk stratification;8. CARDIOVASCULAR CHANGES IN ABDOMINAL DISEASES;9. ISSUES RELATED TO IMAGING IN PREGNANCY;- CT- Radiation, contrast agents- MRI- Gadolinium10. APPROPRIATENESS CRITERIA for imaging in pregnancy; 11. FLOW-CHART SHOWING systematic approach to imaging pregnant patients.

#### CAEE-46 Single Ventricle: A Radiology Primer for Pre-Procedural Evaluation

Participants  
Prabhakar Rajiah, MD, FRCR, Rochester, MN (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To review the spectrum of lesions that result in a single ventricle 2. To discuss the surgical options in the management of single ventricle 3. To illustrate the different types of single ventricle using case examples 4. To highlight critical imaging parameters necessary for pre-procedural planning

#### TABLE OF CONTENTS/OUTLINE

1. SINGLE VENTRICLE- Definition, types 2. ROLE OF MULTIMODALITY IMAGING- Echo, CT, MRI, Cardiac cath, nuclear medicine 3. CT AND MRI- Indications, protocols, tips and tricks 4. REVIEW AND ILLUSTRATION OF PHENOTYPES OF SINGLE VENTRICLE Right dominant- Hypoplastic left heart syndrome, mitral atresia, double inlet/outlet RV; Left dominant- Hypoplastic right heart syndrome, Tricuspid atresia, Double inlet LV ; Either- unbalanced AV canal (Right/left); Functional single ventricle- TOF with pulmonary atresia, truncus, TAPVR, Severe Ebsteins anomaly, Tricuspid atresia, Double inlet LV/RV, AV canal defect (balanced/unbalanced), heterotaxy 5. ANATOMICAL CHARACTERIZATION- Atrial situs, ventricular situs, great artery relationship, morphologic LV vs RV, functioning/rudimentary ventricles 6. CRITICAL PARAMETERS NECESSARY FOR SURGICAL/INTERVENTIONAL MANAGEMENT - Ventricular function- Poor prognosis if low - Atrial septal restriction - Bulboventricular foramen in DILV or tricuspid atresia with TGA - Atrioventricular valve- Obstruction or regurgitation - Outlet obstruction- Presence and nature - Vascular resistance- Pulmonary and systemic - Patency of ductus arteriosus - Patency of aortic arch - Pulmonary artery anatomy - Venous connections 7. MIMICS- Criss-cross heart; Superior/inferior ventricle

#### CAEE-47 Generating Cardiac Segmentation Datasets: Automated Segmentation and Tool-Based Manual Correction

Participants  
Hirohisa Oda, PhD, Shizuoka, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Easy label generation for custom AI: Manual correction tool for cardiac segmentation

#### TABLE OF CONTENTS/OUTLINE

- Application-specific custom AI for cardiac segmentation\* Our application: Modeling patient-specific therapeutic instrument- Outline\* Step 1: AI-based segmentation with a very limited number of cases for automated segmentation on other cases\* Step 2: Manual correction with our original tool- Step 1: AI-based segmentation\* Innovations from the "U-Net era"\* Trainable with limited training datasets as "seeds" of dataset generation\* Key technologies: Swin Transformer Self-supervised training [1]\* Examples of automatic segmentation- Step 2: Manual correction with our original tool\* HeartCorrect: Our original plugin for an image visualization tool MITK-Workbench\* Utilizing MITK's interpolation feature\* Automated correction for obeying the anatomical relationships of chambers- Comparison with MONAI Label[1] Hatamizadeh, Ali, et al. "Swin UNETR: Swin transformers for semantic segmentation of brain tumors in MRI images." BrainLes 2021, LNCS 12962, 2022.

#### CAEE-48 Myocardial Delayed Enhancement By Spectral CT: Our Experience

Participants  
Almudena Gil Boronat, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Role of Late enhancement in cardiac dual-CT2. Show the protocol we are using in our centre.3. Present CT-MRI correlation in several pathologies, mainly in myocarditis

#### TABLE OF CONTENTS/OUTLINE

1. Background Quick review of the pathophysiology and usefulness of late enhancement in cardiological studies.2. Spectral CT and acquisition protocol used in our center.3. Representative cases of different diagnoses with CT-MRI correlation.4. Conclusions.5. Bibliography.

#### CAEE-49 Mitral Valve Disjunction: The Great Unknown

Participants  
Almudena Gil Boronat, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To review mitral valve disjunction (MVD)2. Role of MRI in the evaluation of radiological features associated with and pitfalls.

## TABLE OF CONTENTS/OUTLINE

1. Background Revision of mitral valve disjunction • Definition • Pathology • Classification • Location 2. Representative cases of different disjunction types. 3. Representative cases of different radiological features associated with and pitfalls. 4. Conclusion. 5. Bibliography.

### CAEE-5 **All In Vein"? Anatomy, Variations and Abnormalities of Coronary Venous System with an Emphasis on CT Findings and Clinical Importance**

Participants

Firat Atak, MD, Ankara, Turkey (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Cardiac CT can provide substantial information regarding cardiac venous anatomy and anomalies although it is mainly used for the evaluation of coronary arterial system. 2. Radiologists can more readily identify cardiac venous anomalies on CT by having a basic knowledge of the normal venous anatomy, adding venous anomalies to the standard checklist, and being aware of the conditions in which these anomalies may be clinically significant. 3. Cardiac venous system anomalies may be vital in percutaneous interventions and surgical procedures as they may fundamentally influence the course of the procedure or change the operation plan.

## TABLE OF CONTENTS/OUTLINE

A. Overview of normal cardiac venous anatomy B. Scan protocol and postprocessing C. Coronary sinus (CS) variations and anomalies with case examples D. Other cardiac vein variations with case examples E. Clinical importance of the cardiac venous system -Cardiac shunts -Cardiac resynchronization therapy -Coronary sinus pacing -Retrograde cardioplegia -Percutaneous mitral anuloplasty -Percutaneous atriotomy (Levoatrial-to-coronary sinus shunting) for heart failure -Percutaneous in situ coronary venous arterialization (PICVA) -Enlargement of CS and clinical importance of PLSVC - Radiofrequency catheter ablation - Central venous interventions F. Conclusion

### CAEE-50 **State-of-the-Art Multimodality Imaging of Cardiac Transplant and Complications: A Practical Update**

Participants

Prabhakar Rajiah, MD, FRCR, Rochester, MN (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To discuss the normal appearances of cardiac transplant 2. To optimize the CT and MRI protocols for evaluation of patients with cardiac transplant 3. To illustrate the imaging appearances of various complications following cardiac transplant

## TABLE OF CONTENTS/OUTLINE

1.Introduction 2. Indications- Heart failure, intractable angina or arrhythmia, cardiomyopathies, congenital heart disease, cardiac tumor) 3. Cardiac transplant techniques- Orthotopic vs heterotopic, bicaval vs biatrial 4. Role of imaging in evaluation of cardiac transplant 5. Imaging techniques- Echo, CT, MRI, Cardiac catheterization, Intravascular ultrasound, Optical coherence tomography, nuclear medicine 6. Cardiac transplant follow up diagnostic pathway 7. Imaging protocols for follow up= CT-No premedications, Photon counting CT; MRI- Quantitative techniques, T2, T1 mapping; 8. Complications- Review of the following complications with illustrative case examples- Post procedural graft dysfunction; Post surgical- pericardial effusion, mediastinal hematoma; Cardiac Allograft Vasculopathy (CAV) - Diffuse, more aggressive, microvasculature- angiography vs CTA; Acute cellular rejection; Chronic rejection; Accelerated coronary atherosclerosis; Infections; Post-transplant lymphoproliferative disorder; Gout; Osteoporosis; Chronic kidney disease;

### CAEE-51 **The Heart of the Matter: Pearls and Pitfalls in Cardiac CT**

Participants

Katherine Chung, MD, Stony Brook, NY (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Cardiac CT imaging is a valuable diagnostic resource for physicians to evaluate cardiac anatomy and function. The indications for CT imaging include evaluation of the coronary vessels for anomalies, presence of coronary artery disease (CAD) and calcium score, pre-TAVR evaluation, pre-ablation study for atrial fibrillation, and observing the patency of grafts, amongst other reasons as well. Although radiologists regularly read these types of images, radiologists-in-training may have variable levels of exposure and can come across cases that lead to confusion. The goal of this presentation is to elucidate the essential pearls of acquiring and evaluating cardiac CT scans, so radiologists-in-training are comfortable and confident with evaluating CT scans and providing appropriate recommendations. Furthermore, we will highlight the common areas of confusion through case-based examples of common pitfalls that may occur.

## TABLE OF CONTENTS/OUTLINE

1) Introduction 2) Indications and contraindications (Efficacy in disease diagnosis) 3) Definitions and Anatomy 4) Protocols and Techniques for acquiring images 5) Pearls and Pitfalls (Pre-ablation study for atrial fibrillation, Pre-TAVR study, Calcium Score, Coronary Artery Disease, Thoracic aortic aneurysm) 6) Artifacts (Stair Step artifact, Streak artifact from CABG or TAVR patients, Motion) 7) Conclusion

### CAEE-52 **From Pumps to Waves: Understanding the Impact of Mechanical Circulatory Assist Devices on Spectral Doppler Ultrasound Analysis**

Participants

Mateus Soares, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Heart failure (HF) is a syndrome resulting from impaired ventricular filling or ejection. Many patients with HF progress to a refractory state, regardless of advanced therapies. Cardiac transplantation remains the definitive treatment for end-stage disease. Mechanical circulatory assist devices (CAD) help support patients with cardiogenic shock or end-stage HF. It may be used as a short-term

device to support hemodynamically unstable patients, including those with the possibility of heart function recovery, or as long-term device usually as a bridge to transplantation. CAD are mechanical pumps that help an impaired ventricle maintain hemodynamics and preserve satisfactory end-organ blood flow. There are commercially available devices to support both the left and right ventricle. In most cases, the spectral Doppler waveform is altered in the setting of a CAD, reflecting systemic hemodynamic changes. Despite the increasing use of these devices, there is not much information in the radiological literature about spectral Doppler changes in these patients. Accurate diagnosis requires a better understanding of CAD mechanisms and associated Doppler ultrasound findings, as well as possible vascular complications.

#### TABLE OF CONTENTS/OUTLINE

Review the normal arterial Doppler waveforms in patients with preserved cardiac function. Describe the mechanisms of various CAD and their hemodynamic impacts on arterial spectral Doppler waveforms. Discuss the main vascular-related complications and the use of ultrasound in diagnosis.

#### CAEE-53 **Blood-Flow Volume Quantification Using Phase-contrast MRI in Congenital Heart Disease: Pre- and Post-surgical Evaluation**

##### TEACHING POINTS

Phase-contrast (PC) MRI can be used to measure blood flow in patients with congenital heart disease (CHD). Although Doppler echocardiography can provide shunt flow velocities in patients with common CHD such as atrial or ventricular septal defects, it may be limited by natural or surgical variations. On the other hand, PC MRI can provide precise blood flow analysis non-invasively for patients with complex CHDs and post-surgical anatomy. We demonstrate the principles and potential pitfalls of blood flow volume quantification using PC MRI and present some cases such as a coronary fistula, anomalous origin of one pulmonary artery from the aorta, and a patient who underwent a Blalock-Taussig shunt operation.

#### TABLE OF CONTENTS/OUTLINE

1. Principles of PC flow volume measurement - A review of PC MRI technique, semi-automatically flow volume measurements 2. Pitfalls of PC flow volume measurement - Velocity encoding (VENC) selection considering aliasing and low phase shift value, spatial and temporal resolution, image plane setting, respiratory motion artifact, validation strategies 3. Blood flow volumes commonly measured in our hospital - Ascending aorta, main/right/left pulmonary artery, superior/inferior vena cava, the cross-section of mitral/tricuspid valve, right/left pulmonary vein 4. Representative cases - Right coronary artery to left ventricular fistula, right pulmonary artery from the descending aorta, post-surgical patients (modified Blalock-Taussig shunt, Glenn procedure, cardiac plug implantation, balloon angioplasty etc.)

#### CAEE-54 **A Novel Coronary CT Imaging Technique that Further Improves the Spatial Resolution of Super Resolution Deep Learning Reconstruction**

##### TEACHING POINTS

1. Review the current status in coronary CT image evaluation and summarize its limitations 2. Summarize the relationship between spatial resolution and image noise in the current various CT image reconstruction methods 3. Explain the features of the new super resolution deep learning reconstruction (SR-DLR) algorithm trained using the data acquired by the super resolution CT system 4. Proposal of a new imaging method that further improves the spatial resolution of the SR-DLR algorithm and improves the visualization capabilities of coronary arteries, stent lumens, and calcified lesions 5. Comparison of image quality and exposure dose between conventional and new imaging methods

#### TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Summarize the limitations of assessment of STENT lumens and calcified lesions using current CT imaging 3. Explains the features and usefulness of the new super resolution deep learning reconstruction (SR-DLR) algorithm trained using data acquired by a super-resolution CT system 4. Limitations of coronary CT imaging under normal scanning conditions using the SR-DLR algorithm 5. Proposal of a new imaging method that further improves the spatial resolution of the SR-DLR algorithm 6. Description of focal spot sizes used in coronary CT for super-resolution and conventional CT systems 7. Presenting the spatial resolution and image noise of small-focus imaging combined with the SR-DLR in conventional CT systems 8. Comparison of images with different focal spot size for stents and calcified lesions in the same cases, presenting the usefulness of small-focus imaging 9. Comparison of exposure dose in imaging at each focal spot size

#### CAEE-55 **Cardiac CT Pearls and Pitfalls: What You Should Know About Anatomy to Avoid Catastrophes**

Participants

Amalia Aranaz Murillo, MD, Zaragoza, Spain (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

1. Understanding the different visual axes in cardiac imaging is crucial for interpreting cardiac anatomy. 2. Familiarity with the characteristics and structures of the atriums and ventricles is essential for accurate diagnosis and assessment of cardiac function. 3. Knowledge of main coronary arteries and their pathways and bifurcations is vital for accurate assessment of coronary artery disease. 4. Understanding the anatomy and branches of the coronary and pulmonary veins is essential for evaluating cardiac function and assessing for potential blockages.

#### TABLE OF CONTENTS/OUTLINE

We sometimes read a poster or a review and feel quite deceived because what you expect to learn you already know. For that reason, this poster will have at the beginning a QA. If you know all the answers, please, do not waste time on it, if not, it might teach you some anatomy tricks. It will be divided into seven blocks that detail the anatomy and structures of the heart in CT. The first block describes the different visualization axes of the heart and evaluates structures such as the anterior and inferior wall of the myocardium, the left atrial appendage, and the coronary sinus. The second block focuses on the characteristics of the right atrium and its different structures. The third describes the components of the ventricles and their structure. The fourth focuses on the major arteries of the heart, including the aorta and pulmonary artery. The fifth block details the four main coronary arteries and their paths and bifurcations. In the sixth, the coronary veins and their tributaries are explained, and finally, the anatomy of the pulmonary veins and their variability in the number and arrangement of drainage orifices to the left atrium is described.

#### CAEE-56 **Complications After Cardiac and Ascending Aorta Surgery**

Participants

María Guerrero Martin, Madrid, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To understand and distinguish the different types of ascending aorta surgeries 2. To evaluate the pathological findings after cardiovascular surgery, in order to differentiate them from the usual ones 3. To discern the most typical complications in relation to their chronological onset and their follow-up 4. To show the possible options in the management of patients with these complications 5. To emphasize the role of CT in the diagnosis of these conditions

#### TABLE OF CONTENTS/OUTLINE

1. Background and methods 2. Findings 2.1. Techniques used to evaluate postoperative patients 2.2. Common findings after cardiovascular surgery 2.3. Complication following aortic surgery 2.3.1. Early complications: periprosthetic haematomas, pseudoaneurysm formation, distal malperfusion 2.3.2. Late complications: aortic valve regurgitation, infection, anastomotic stenosis 2.4. Complications following cardiac valve surgery: valvular/paravalvular regurgitation, endocarditis, hypoattenuating leaflet thickening, prosthesis-patient mismatch 2.5. Complications following coronary artery procedures: stenosis, thrombosis 3. Our experience 4. Conclusion

#### CAEE-57 Cardiac MRI in Adult Orthotopic Heart Transplant

Participants

Sandra Quinn, Chicago, IL (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Outline unique CMR tissue characteristics of the transplanted heart 2. Discuss tissue characteristics suggestive of acute cardiac allograft rejection in the transplanted heart 3. Outline the role of quantitative myocardial stress perfusion in detection of epicardial and microvascular cardiac allograft vasculopathy 4. Provide an overview of the published data with respect to CMR and adult heart transplant

#### TABLE OF CONTENTS/OUTLINE

1. Cardiac MRI in Orthotopic Heart Transplant· Overview of structural and functional CMR and its role in major complications of heart transplant, i.e., acute cardiac allograft rejection and cardiac allograft vasculopathy.2. CMR Tissue Characterization in Orthotopic Heart Transplant· Describes the general considerations and overview of published values regarding CMR myocardial tissue characterization of the transplant heart.3. Acute Cardiac Allograft Rejection (ACAR)· Outline the published CMR myocardial tissue characterization values for patients with active ACAR and ACAR previous history.4. Cardiac Allograft Vasculopathy (CAV)· Illustrate with a representative clinical case the role of CMR quantitative perfusion in the identification of CAV· Describe expected resting and stress myocardial blood flow and myocardial perfusion reserve in heart transplant recipients vs healthy volunteers· Identify the role of myocardial perfusion reserve for identification of CAV.· 5. The Key Evidence in Summary· Summary table outlining the published evidence for CMR in heart transplant and complications of heart transplant.

#### CAEE-58 Pre and Postoperative CT Evaluation for Robotic and Minimally Invasive Coronary Artery Bypass

#### TEACHING POINTS

Teaching points: 1. Robotic and minimally invasive coronary artery bypass is a safe and less traumatic surgical technique than open-heart surgery. It is considered the first-choice therapy for selected patients although the adoption has been slow in some institutions. 2. Imaging assessment prior to the surgery and providing relevant information to the surgeons is crucial for identifying suitable patients, anatomic assessment, surgical planning, and predicting outcomes. 3. Being familiar with the spectrum of expected postsurgical findings and complications following robotic and minimally invasive coronary artery bypass surgery is essential for radiologists to contribute to proper patient management.

#### TABLE OF CONTENTS/OUTLINE

Table of Contents/Outline: A. Overview of surgical techniques: TECAB, MIDCAB, robotic assisted B. Indications and contraindications C. CT angiography for preoperative evaluation 1. Scan protocol and postprocessing techniques 2. Preoperative checklists 1) Aorta and iliofemoral arteries 2) Evaluation of lung, pleural plaques 3) Chest wall, diaphragm 4) Heart, pericardium, mediastinum 5) Aorta diameter, pulmonary artery diameter, ascending aortic calcification 6) Internal mammary arteries 7) LAD and other coronary arteries D. Procedural considerations E. Postoperative CCTA assessment, complications F. Conclusion

#### CAEE-59 Navigating the Vortex: Advancements in Turbulent Flow Detection Using Cardiovascular 4D Flow MRI

#### TEACHING POINTS

4D flow MRI has revolutionized the assessment of in vivo flow dynamics, leading to a better understanding of physiological flow in healthy subjects and those with thoracic aortic aneurysms, chronic aortic dissection complications, and aortic prostheses. A key finding related to altered blood flow is turbulence, which can be visually detected through vortices in 4D flow MRI. However, visual assessment is subjective, prompting the need for quantitative evaluations. Recent advancements have facilitated the quantification of turbulent parameters such as vorticity, energy loss, and turbulent kinetic energy using 4D flow MRI. This presentation will explore clinical evaluation methods for these turbulence indices while discussing specific diseases as examples.

#### TABLE OF CONTENTS/OUTLINE

1. The background of flow analysis a. Clinical demands for flow analysis b. 4D Flow MRI technique for flow analysis c. Primary and secondary flow in a healthy aorta d. Quantification of turbulence - vorticity, energy loss, and turbulent kinetic energy2. Thoracic aneurysm a. Helical flows in patients with bicuspid aortic valve b. Association between aneurysmal development and wall shear stress3. Aortic dissection a. Blood flow volume quantification - forward and backward flow in the false lumen b. Vortices in the false lumen4. Post-prosthetic graft replacement a. Quantification of turbulent blood flow induced by artificial aorta b. Mechanical hemolytic anemia due to aortic arch graft stenosis5. Hypertrophic cardiomyopathy a. Vortex flow in the ascending aorta b. Association between turbulent kinetic energy elevation and left ventricular mass increase

#### CAEE-6 Beyond Coronary Artery Calcium: Cardiovascular Findings in Non-Gated Chest CT Scans

Participants

Miguel Barrio Piqueras I, MD, Pamplona, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To review the most common incidental cardiac findings on routine chest CT examinations. 2. To recognize which cardiac findings are relevant and can alter the clinical course and outcome of patients.

#### TABLE OF CONTENTS/OUTLINE

1. Coronary arteries: a). Anatomical variants (dominance) b). Coronary anomalies (origin)-Benign-Malignant c). Coronary artery calcium d). Coronary aneurysm e). Coronary artery fistula 2. Cardiac chambers: a). Intracavitary thrombus 3. Myocardium a). Myocardial infarction -Acute-Chronic b). Cardiomyopathy-Dilated-Hypertrophic c). Primary tumors-Fibroma-Myxoma d). Metastases-Chordoma-Lymphoma-Lung carcinoma-Melanoma e). Pseudotumors -Lipomatous hypertrophy of the interatrial septum 4. Valvular heart disease a). Anatomical variants -Bicuspid aortic valve b). Calcifications -Mitral annulus-Aortic valve 5. Congenital heart disease and thoracic vascular disorders: a). Atrial septal defects b). Patent ductus arteriosus c). Persistent left superior vena cava d). Aortic arch anomalies-Right sided -Double aortic arch e). Anomalous pulmonary venous drainage 6. Pericardial diseases: a). Pericarditis -Infectious-Iatrogenic-Autoimmune-Constrictive b). Pericardial effusion and hematoma c). Pericardial cysts d). Malignant pericardial involvement-Direct invasion-Metastases-Venous extension e). Pericardial fat necrosis

#### CAEE-60 Quantitative Stress Perfusion Cardiac Magnetic Resonance: Why, How and When?

#### TEACHING POINTS

1. Understand differences between qualitative, semi-quantitative and quantitative stress perfusion. 2. Understand how quantitative stress cardiac MRI (QuantCMR) is performed and calculated as well as how to interpret myocardial blood flow/ myocardial perfusion reserve. 3. Demonstrate clinical role of cardiac MRI quantitative stress perfusion. 4. Illustrate different pathologies and their appearances on cardiac MRI quantitative stress perfusion.

#### TABLE OF CONTENTS/OUTLINE

This exhibit will explain the recent interest and development of QuantCMR and how this differs from qualitative and semi-quantitative stress perfusion. Technical details of how QuantCMR is performed and quantified will be demonstrated along with tips/tricks of how to get high quality perfusion maps. The exhibit will explain differences between dual bolus and dual sequence techniques and issues to be aware of with different stress agents. The exhibit will discuss how QuantCMR is being increasingly recognized as being useful in patients with ischaemia and non-obstructive coronary arteries (INOCA) to diagnose coronary microvascular dysfunction (CMD) as well in standard assessment of obstructive coronary artery disease. Clinical examples of these pathologies will be illustrated. In addition, other cardiac diseases will also be demonstrated to illustrate how QuantCMR perfusion maps appear in different disease entities such as dilated cardiomyopathy and hypertrophic cardiomyopathy. Knowledge gaps and future directions will also be discussed.

#### CAEE-61 State of the Art on Acute Coronary Syndrome with Negative Coronary Angiography

Participants

Cesar Urtasun Iriarte I, MD, Pamplona, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To learn the definition of MINOCA and review the spectrum of causes that manifest as acute coronary syndrome with non-obstructive coronary arteries. To understand the role of cardiovascular imaging, learn about the management and, outline CT and MRI protocols.

#### TABLE OF CONTENTS/OUTLINE

A. Background, diagnosis, and management B. Assessment: CT and MRI protocols C. Acute coronary syndrome with negative coronary angiography a. MINOCA entities - Coronary plaque disruption- Coronary artery vasospasm- Coronary artery dissection- Coronary artery thrombosis/embolism- Coronary microvascular disorder- Myocardial oxygen demand-supply imbalance b. MINOCA-like entities Myocardial location (Tako-Tsubo, myocarditis, hypertrophic cardiomyopathy, dilated cardiomyopathy, infiltrative cardiomyopathy) Other non-cardiac mimickers (Vasculitis, pulmonary embolism, aortic dissection) D. Take-home messages

#### CAEE-62 Development in Free-Breathing Coronary CTA for Patients With High Heart Rate: Using Non-Device Respiratory Gating Method

#### TEACHING POINTS

Technological advances make Free-Breathing Coronary CTA (FB-CCTA) possible, but there are challenges for patients with higher heart rate (HR). We have developed a protocol of FB-CCTA at high HR using a non-device respiratory gating method.

#### TABLE OF CONTENTS/OUTLINE

We have developed a method to reduce motion artifacts even at high HR from free-breathing images. Since multi-segment reconstruction can improve image quality and diagnostic accuracy at higher HR, Scans and post-processing were performed to allow the segment reconstruction from free breathing images. After electrocardiogram gated Dynamic Volume Scan, to avoid motion artifacts due to breathing, the non-device respiratory gating was performed. The respiratory arrest phase was analyzed using Time-Density-Curve (TDC) plotted from the region of interest drawn on the chest wall of the dynamic image. Multi-segment reconstruction used data from multiple cardiac cycles during respiratory arrest time analyzed from the TDC was performed. In addition, the reconstruction type was applied with full-iterative model-based reconstruction algorithms for improved Signal-To-Noise ratio (SNR). The resulting image was reduced motion artifacts and improved SNR. This method is feasible to provide acceptable image quality and diagnostic performance in CCTA with free-breathing and high HR.

#### CAEE-63 Effectiveness of a Contrast Enhancement Boost Technique in Cardiac CT: Improved Detection of Late Iodine Enhancement (LIE) in Non-Ischemic Cardiomyopathy

#### TEACHING POINTS

• To learn about issues of myocardial evaluation with Single-Energy CT. • To learn about a subtraction technique with non-rigid

registration, that can be used to represent an image of the myocardium. • To learn the principles of the contrast enhancement boost technique (CE-boost) with non-rigid registration. • To learn about the contrast-improving effects of CE-boost and its diagnostic value in non-ischemic cardiomyopathy.

#### TABLE OF CONTENTS/OUTLINE

A. Comparison of CNR between Single-Energy CT and other imaging techniques for non-ischemic cardiomyopathy. B. Advantages of non-rigid registration compared to rigid registration in subtraction techniques. C. Usefulness of non-rigid registration subtraction technique with CE-boost in LIE-CT. D. Clinical case of LIE-CT using CE-boost for preoperative CT examination for TAVI. E. Advantages of CE-boost in non-ischemic cardiomyopathy and its application in clinical imaging.

#### CAEE-64 Cardiac MRI for the Beginner: A Step by Step Approach

##### TEACHING POINTS

Cardiac MRI is a non-invasive modality for anatomical, functional and myocardial tissue evaluation of the heart for a variety of cardiovascular diseases. It holds immense diagnostic potential and despite its relative high cost, it is becoming more increasingly mainstay in cardiac evaluation. Some conditions that cardiac MR renders benefits to include ischaemic heart disease, cardiomyopathy, valvular disease, congenital disease, pericardial disease and characterization of cardiac masses. It supplements the initial cardiac work-up by providing an unobstructed field of view, myocardial tissue assessment and remains the gold standard for RV and LV volumetric assessment. It is a complex study and includes an arsenal of MRI sequences including cine, myocardial perfusion, parametric mapping and flow sensitive sequences, all tailored to the specific clinical indication or question. Reading a Cardiac MR for the novice radiologist/cardiologist can be a daunting task. With the need for more Cardiac MR readers and to demystify this process, this poster will aim to provide a basic navigational chart for the novice reader which will provide a foundation for them to build upon. Teaching points: An overview of cardiac MRI sequences, basic principles and utility of each sequence An basic approach to interpreting a cardiac study An algorithm approach to common cardiac conditions with case based examples.

#### TABLE OF CONTENTS/OUTLINE

Basic cardiac MR sequences and their purpose How to approach a Cardiac MR Basic techniques on qualitative and quantitative assessment with tips and tricks Algorithm for common conditions Case based discussion

#### CAEE-65 Late Iodine Enhancement of Myocardium with Deep Learning Reconstruction Under Low Radiation Doses and Low Contrast Doses: How to Get the Best Image Quality

##### TEACHING POINTS

Late Iodine Enhancement (LIE) of myocardium in cardiac CT has been reported to reflect fibrotic lesions in myocardium similar to Late Gadolinium Enhancement (LGE) in cardiac MRI, but requires a higher contrast dose and radiation dose due to contrast enhancement and noise effects. To solve this problem, we propose three new points in using imaging, reconstruction and subtraction technology. 1. Imaging technology: Low-voltage imaging according to BMI. 2. Reconstruction technology: Deep Learning Reconstruction (Contrast enhancement parameters "AiCE"). 3. Subtraction technology: special contrast-enhancing subtraction technology "CE-Boost". Using the above three methods enables significant contrast enhancement and noise reduction, even with LIE at low radiation doses and low contrast doses. In addition, using DLR provides stability in the uniformity of CT values required for myocardial Extra Cellular Volume (ECV) quantification.

#### TABLE OF CONTENTS/OUTLINE

(1) Combination of three special technologies (2) Reconstruction and subtraction technologies (3) Deep learning reconstruction and special subtraction (4) Stable noise reduction with DLR (5) Combination of three special technologies

#### CAEE-66 Success Within Your Grasp: Planning for Mitral Valve Transcatheter Edge-to-Edge Repair

Participants

Hyun Jung Koo, MD, PhD, Seoul, Korea, Republic Of (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

To recap the evidence of mitral edge-to-edge repair in both primary and secondary mitral regurgitation To demonstrate preprocedural imaging modalities to help appropriate patient selection and interventional guide To understand intraprocedural imaging and post-procedural imaging findings

#### TABLE OF CONTENTS/OUTLINE

1. Evaluation of mitral regurgitation (MR) 1) Etiology of MR - Primary mitral regurgitation - Secondary (functional) mitral regurgitation 2) Quantification of MR 2. Types of percutaneous mitral valve repair 3. Patient selection for M-TEER - AHA/ACC Guidelines for M-TEER - Review of Trials: EVEREST II trial, COAPT trial, MITRA-FR trial - Anatomically suitable mitral valve morphology 4. Pre-procedural planning for M-TEER - Echocardiography and cardiac CT - Evaluation parameters 5. Intra-/Post- TEER imaging of M-TEER 6. Potential complications after M-TEER

#### CAEE-67 Multimodality Imaging in Sports Cardiology: New Kid on the Block

Participants

Prabhakar Rajiah, MD, FRCR, Rochester, MN (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

Although athletes' have low prevalence of coronary artery disease (CAD), they are prone for other cardiovascular disorders, which should be evaluated prior to suitability for athletic activity. 1. To review the role of Sports Cardiology, a relatively new subspecialty focused on athletes 2. To discuss the role of imaging, particularly MRI in the diagnosis of athlete's heart which is a structural adaptive change that overlaps with cardiomyopathies. 3. To illustrate with case examples the various entities that are encountered in athletes.

#### TABLE OF CONTENTS/OUTLINE

1. SPORTS CARDIOLOGY: INTRODUCTION a. Pre-athletic activity screening for diseases that may be worsened with sports activities

1. SPORTS CARDIOLOGY- INTRODUCTION a. Pre-athletic activity screening for diseases that may be worsened with sports activities b. Evaluation of diseases that cause adverse events in athletes 2. ROLE OF IMAGING- Echo, MRI, CT 3. MRI SEQUENCES AND PROTOCOL 4. ADAPTATIVE CHANGES IN ATHLETES= Endurance- Volume overload, increased wall stress, eccentric hypertrophy; Strength- Pressure overload, increased wall stress, concentric hypertrophy 5. MYOCARDIAL FIBROSIS IN ATHLETES- Prevalence and pattern 6. ATHLETE'S HEART (WITH CASE EXAMPLES)- Diagnostic criteria controversies; Distinguishing from mimics (Grey zone) a. Hypertrophic cardiomyopathy b. Dilated cardiomyopathy c. LV non compaction d. Arrhythmogenic cardiomyopathy 7. DISEASES CAUSING SUDDEN CARDIAC DEATH IN ATHLETES (with case examples) a. HCM b. ARVD C. Anomalous coronary arteries d. Commotio cordis e. Myocarditis 8. SCREENING STRATEGIES WITH IMAGING IN PROFESSIONAL ATHLETES 9. CTA IN RISK STRATIFICATION OF CORONARY ARTERY DISEASE 10. VETERAN ATHLETES AND MYOCARDIAL FIBROSIS- ARRHYTHMIA 11. ATHLETES AND COVID-19 12. MANAGEMENT OF INCIDENTAL FINDINGS IN ATHLETES

## **CAEE-68 The Minimal Essence of Machine Learning for Cardiovascular Diagnosis**

Participants

Ryo Ogawa, PhD, MD, Toon, Japan (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

Various information related to medical data can be obtained by machine learning. We explain how machine learning are used to cardiovascular diagnosis. 1. To review the role of machine learning.2. To explain the application of machine learning in cardiovascular diagnosis.3. To explain the principle of machine learning.

### **TABLE OF CONTENTS/OUTLINE**

1. Linear regression; overview, algorithm, example (heart failure)2. Logistic regression; overview, algorithm, example (history of heart disease)3. Support vector machine; overview, algorithm, example (Differentiation of cardiomyopathy)4. Random forest; overview, algorithm, example (Differentiation of cardiomyopathy)5. Neural network; overview, algorithm, example (Classification of myocardial infarction)6. Explainable AI; overview, algorithm, example (Gradient-weighted class activation mapping, Guided gradient-weighted class activation mapping)7. Generative AI; overview, algorithm, example (Deep convolutional generative adversarial network)

## **CAEE-69 Denoise to Visualize: The AI-Driven Post-Hoc Denoising for High-Fidelity Cardiac CT**

Participants

Tatsuya Nishii, MD, PhD, Suita, Japan (*Presenter*) Speakers Bureau, Guerbet SA;Speakers Bureau, General Electric Company;Speakers Bureau, Siemens AG;Research Grant, Canon Medical Systems Corporation

### **TEACHING POINTS**

In cardiac CT, maintenance the increased image noise from photon insufficiency is crucial while upholding high resolution. CT manufacturers have developed iterative and deep-learning reconstruction methods, but disparities exist. Advancements in AI enable image restoration, such as denoising through post-processing allowing radiologists to develop image-processing AI promoting the "democratization" of technology.This exhibit presents the development of a denoising method for high-fidelity cardiac CT using image-based deep learning and its clinical applications. Participants will learn about democratized image-processing AI and engage in its development and clinical application. In enhancement, we showcase cardiac CT images with the application of noise reduction technology, aiming to generate new ideas for diagnostic and prognostic imaging.

### **TABLE OF CONTENTS/OUTLINE**

1. Importance of noise reduction in cardiac CT 1.1 Cardiac CT imaging techniques 1.2 Noise's adverse effects2. AI denoising method differences 2.1 Deep-learning image reconstruction 2.2 Deep-learning post hoc denoising3. Denoising AI development Process 3.1 Optimal network selection 3.2 Data preparation essentials 3.3 Training, validation, and testing 3.4 Implementation highlights4. Clinical Showcases 4.1Exposure Reduction 4.1.1 1/4 dose coronary CT angiography 4.1.2 1/3 dose myocardial delayed enhancement CT 4.1.3 Low-dose pediatric cardiac CT 4.2 Image quality enhancements 4.2.1 Improved diagnostic performance of coronary CT angiography 4.2.2 Enhanced myocardial delayed enhancement CT 4.2.3 Enhanced 3D rendering images

## **CAEE-7 Atrial Septal Defects: A Multimodality Case-Based Approach**

### **TEACHING POINTS**

Outline the most common atrial septal defects and their associations.Demonstrate the role of cardiac MRI and CT in the diagnosis of atrial septal defects. Illustrate, through case reviews, the imaging findings of atrial septal defects.Discuss treatment options and morphological characteristics to treatment decisions.

### **TABLE OF CONTENTS/OUTLINE**

This review presents a multimodality case-based approach to the diagnosis of Atrial Septal Defects (ASDs).ASDs are the most common congenital cardiac anomaly.Ostium secundum is the most common ASD. Some congenital syndromes, including Holt Oram Syndrome and Lutembacher Syndrome, have ostium secundum type septal defects as part of their spectrum.Sinus venosus can present as a superior or inferior defect, each with different anatomical associations.Ostium primum is within the spectrum of atrioventricular septal defects and is associated with endocardial cushion defects and Trisomy 21.Coronary sinus atrial septal defect is a rare disease presenting as permeability of the coronary sinus. Raghiv syndrome is a type of coronary sinus ASD defined as a PLSVC draining to an unroofed coronary sinus.The roles of CT and MRI offer information on coronary and pulmonary diseases, as well as other anatomical variations that can impact the patient's treatment. MRI also enables functional assessment of the flow, cardiac function, and myocardial tissue characterization.Ostium primum/atrioventricular septal defects, coronary sinus defects, and sinus venosus defects are often treated surgically, while septum secundum type defects can be treated with transcatheter closure. The decision is based on the size, number, and shape of the defects.

## **CAEE-70 Quantitative Myocardial Perfusion MR: State-of-the-Art**

Participants

Roberta Catania, MD, Chicago, IL (*Presenter*) Institutional Research Grant, Siemens AG

### **TEACHING POINTS**

1. Quantitative perfusion MR is an objective and more reproducible tool to identify myocardial perfusion defects and differentiate

artifacts compared to only qualitative assessment. 2. Quantitative perfusion MR is a non-invasive tool that can add significant value in the work-up of patients with suspected coronary artery disease and surveillance of post heart transplant patients.

#### TABLE OF CONTENTS/OUTLINE

Introduction - Physiology of myocardial circulation at rest and stress and autoregulation - Overview of current noninvasive imaging techniques for coronary artery disease assessment and their accuracy - Clinical applications of myocardial perfusion imaging including assessment for epicardial and microvascular coronary artery disease and heart transplant surveillance Imaging techniques - Pharmaceutical stress agents: mechanism of action and contraindications - Cardiac perfusion MR: physical principles, imaging sequences and protocol - Quantitative analysis: Ø Current quantification techniques (automated pixel-wise and dual sequence approach) Ø Absolute quantification and myocardial perfusion reserve (MPR) Imaging interpretation and case study- How to interpret quantitative perfusion and key information to be provided in radiology report - Normal quantitative myocardial perfusion MR - Atlas of different radiologic findings - Troubleshooting interpretations of complicated quantitative perfusion MR findings

#### CAEE-71 Utility of Non-contrast MRI for Preprocedural Assessment in Patients Undergoing TAVI

Participants

Naoki Hosoda, Tokyo, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To learn about the pre-procedural assessment for transcatheter aortic valve implantation. To learn about the validity of non-contrast MRI assessment. To learn about non-contrast MRI imaging protocols. To learn about the benefit patient gain by alternative non-contrast MRI.

#### TABLE OF CONTENTS/OUTLINE

A. Non-contrast MRI can be used as an alternative to contrast CT for patients with CKD and contrast allergies. B. Usefulness of non-contrast MRI to measure in the same way as contrast CT. C. Short imaging protocol focused on pre-procedural assessment of TAVI. D. Non-contrast MRI not only allows assessment comparable to contrast CT, but also avoids risks for patients with CKD and contrast allergy and allows radiation free imaging.

#### CAEE-72 Pulmonary Artery: Showcase of Congenital and Acquired Pathologies You Should Know

#### TEACHING POINTS

1. To review the normal anatomy of the of the pulmonary artery and their branches. 2. To review the acquired and congenital causes. 3. To show the frequent findings in congenital pathologies. 4. To show the repercussion of the long-term affection of the pulmonary artery.

#### TABLE OF CONTENTS/OUTLINE

1. introduccion. 2. Normal anatomy of the pulmonary artery and their branches. 3. Acquired pathologies: Complications of chronic Pulmonary embolism, Dilated arteries secondary to pulmonary hypertension, Pulmonary Artery Stenosis and Pulmonary Venocclusive Disease. 4. Congenital pathologies: Pulmonary artery agenesis associated with aortopulmonary collateral arteries (MAPCAs), Pulmonary atresia with intact ventricular septum, Anomalous Aortic Origin of Pulmonary Arteries, Aneurysm, Absent pulmonary valve syndrome, Double-Outlet Right Ventricle, Dextro-Transposition of the Great Arteries, Anomalous left coronary artery from the pulmonary artery (ALCAPA), Pulmonary Artery Sling, pulmonary arteriovenous malformations. 5. Long term repercussion in the cardiac chambers and great vessels. 6. Review of the most commons surgical options and outcomes. 7. Discussion. 8. Conclusion

#### CAEE-73 Dual-energy Late Iodine Enhancement Cardiac CT: What is Necessary to Achieve with Dual-Layer Spectral CT?

#### TEACHING POINTS

A. To learn about late iodine enhancement (LIE): Imaging technique with dual-layer spectral CT. B. To learn how spectral imaging solves conventional imaging problems. C. To learn about the use of iodine density image for myocardial extracellular volume (ECV). D. To illustrate various clinical applications of these techniques by presenting clinical images.

#### TABLE OF CONTENTS/OUTLINE

A. Methods of scanning and contrasting late iodine enhancement (LIE) using dual-slice spectral CT. And their advantages and disadvantages. B. Advantage of spectral images over conventional CT for LIE. C. LIE image analysis. LIE by image subtraction and myocardial extracellular volume (ECV) by iodine concentration images. D. Evaluation of myocardial viability by LIE. Evaluation of OMI by subtraction-LIE. E. LIE myocardial viability evaluation. Evaluation of cardiomyopathies by ECV.

#### CAEE-74 The ABC's of ECG - Practical Tips and Tricks for Salvaging ECG-Gated Cardiac CT

Participants

Prabhakar Rajiah, MD, FRCR, Rochester, MN (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Distinguish the various artifacts commonly encountered in ECG-gated cardiac CT 2. Recognize whether the artifact can be repaired, reduced, or read around 3. Employ ECG sync point editing and composing to salvage cardiac CTs degraded by artifacts from heart rate rhythm, and ECG-gating error

#### TABLE OF CONTENTS/OUTLINE

1. Introduction Basics of ECG interpretation; ECG-gating techniques, trade-offs, applications; 2. Distinguishing respiratory/patient motion vs. gating artifact 3. ECG Gating Error: Missing Data (interpolation artifact)- Pitch too high on retro helical - data gaps; Missing Sync Points; 4. ECG Gating Error: Misplaced Data (duplication artifact)- Peaked T-waves; 5. Gating Artifact with correct ECG Gating: Tachycardia or Arrhythmia- PVCs; PACs; Long pause (PVC, PAC, dropped beat); Afib other beat-to-beat Irregularity; 6. ECG-editing options- Sync point editing-Missed a beat/tagged wrong thing/helical; Sync point composing: R wave tagged, manipulation of reconstructions to read-around; 7. A systematic approach for troubleshooting ECG-gating errors and artifacts

including case examples- Respiratory motion artifact- Normal ECG; Sinus tachycardia- Multisegment reconstruction; Heart rate change- Can sometimes be read-around; PVC without pause- Eliminate PVC sync; PVC with long pause- Eliminate PVC sync; Add evenly spaced sync points in pause; PAC- eliminate PAC sync or retain it extra, even sync points in best systolic phase; Atrial tachycardia- Sync in best systolic phase; Severe bradycardia- Two separate syncs in diastole; Atrial fibrillation- Artificially space sync points at each R-R interval so they line up each beat;

## **CAEE-75 Tumors of the Heart: From the Right Side to the Left Side**

Participants

Felipe Aluja, MD, MEd, (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

Discuss the most common cardiac masses, including their typical manifestations and associations, and a brief discussion of clinical scenarios. Describe the imaging signs of cardiac tumors in computed tomography, magnetic resonance imaging and PET/CT. Identify selected cardiac tumors commonly encountered in daily practice and integrate them with the clinical manifestations.

### **TABLE OF CONTENTS/OUTLINE**

• Introduction • Classification with brief but concise clinical presentation • Imaging signs of cardiac tumors in computed tomography, magnetic resonance imaging and PET/CT. • Selected cardiac tumors: o Primary: § Myxoma § Fibroelastoma § Atrial hemangioma § Lipoma § Rhabdomyoma § Fibroma § Angiosarcoma § Lymphoma § Paraganglioma o Secondary: § Metastasis • Pitfalls in cardiac tumors: o Vegetations o Intracavitary thrombus o Lipomatous hypertrophy • Take a guess? • Take home points

## **CAEE-76 Solving the Mystery: Cardiac Devices on Chest Radiographs**

### **TEACHING POINTS**

Heart disease is the leading cause of mortality in the United States. Advances in clinical care leading to new devices and treatments allow patients to live longer. Radiologists encounter chest radiographs daily, many with cardiac devices. On radiographs, devices will typically be visible, and it is essential for radiologists to recognize them, know appropriate positioning, and understand complications related to the devices to provide appropriate patient management. Inaccurate interpretation may lead to inappropriate management, delayed diagnosis, and delay of necessary or harmful interventions. The purpose of this exhibit is to walk through common and uncommon cardiac devices, their appropriate positioning, and complications related to mispositioned devices, as well as discuss pathophysiology of some devices. Cardiac rhythmic controlled devices, cardiovascular support devices, stroke prevention devices, cardiac valve support and prosthetic valves, and miscellaneous devices will be reviewed.

### **TABLE OF CONTENTS/OUTLINE**

1. Introduction to common cardiac devices 2. Classification of these devices 3. Expected positioning of cardiac devices 4. Visible and barely visible devices on CXR 5. Pathophysiological mechanisms of these devices 6. Examples of mispositioned devices 7. Complications related to incorrectly positioned devices 8. Less common/miscellaneous devices and their positioning 9. Flowchart of what to do with a mispositioned devices (urgent versus emergent) 10. What cardiologist expects from radiology report?

## **CAEE-77 Simplifying Semantic Segmentation in Cardiac MR: An Intuitive Guide for Radiologists using Transfer Learning**

### **TEACHING POINTS**

Understanding the importance of semantic segmentation in cardiac MR imaging  
Review of available solutions for segmentation and evaluation metrics  
Introduction to approaches for segmentation using Transfer learning  
Guided approach to a simplified segmentation process using high-level API for low-code development.  
Best practices for achieving accurate segmentation

### **TABLE OF CONTENTS/OUTLINE**

I. Introduction to Segmentation in Cardiac MRI Imaging  
Definition of image segmentation and its types.  
Need for segmentation in cardiac MRI imaging  
Available solutions for image segmentation and metrics for assessing accuracy  
II. Introduction to TorchIO, MONAI and FAST AI Libraries for Medical Image Analysis  
Overview of libraries.  
Understanding the Data to Model pipeline.  
Importance of Using Transfer Learning.  
Use of High-level APIs for low-code model development. III. Step-by-Step Demonstration of Segmentation using Google Colab and the Heart MRI Dataset  
Setting up the Google Colab environment  
Introduction to the Heart MRI dataset from the Medical Segmentation Decathlon challenge provided by King's College London  
Step-by-step demonstration of target segmentation of the left atrium with minimal lines of code  
IV. Best Practices for Achieving Accurate Segmentation  
Tips for optimising segmentation accuracy  
Strategies for addressing common segmentation challenges  
V. Conclusion  
Summary of key teaching points  
Future directions in semantic segmentation in cardiac MR imaging (like use of generative adversarial network (GAN))

## **CAEE-78 A Precarious Path - Complications of 3-stage Palliative Surgery for Single Ventricle Congenital Heart Disease**

Participants

Shravan Sridhar, MD, MS, San Francisco, CA (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

Single ventricle congenital heart diseases are most commonly managed with 3-stage palliation which culminates in the Fontan procedure. Post-operative imaging has been instrumental in assessing for complications both in the short term and long term and ensuring patient longevity. Here, we present some of the most commonly encountered complications associated with 3-stage palliation including early post-operative complications, features of physiologic decompensation, and late-stage downstream effects attributed to the unique physiology in these patients. Where appropriate, we review practical tips and pitfalls in imaging this unique set of patients.

### **TABLE OF CONTENTS/OUTLINE**

1. Title, disclosures  
2. Abbreviations  
3. Complications overview  
4. Clinical scenarios  
5. Potential workup  
6. Recent operationa. Mediastinal hematoma  
b. Pitfall: Surgical packing material  
c. Shunt/conduit occlusion  
d. Pitfall: Un/intentional occlusion  
7. Acute SOB/desaturation/chest paina. PE  
b. MIC  
c. CHF  
8. Chronic non-cyanotic SOB/desaturationa. Fontan thrombosis  
b. Pitfall:

Pseudothrombosis. Systemic AV valve dysfunction. Peri-anastomotic PA stenosis. Pitfall: Morphology/flow discrepancy RPA/LPA. Diaphragmatic paralysis. Post-Glenn SVC syndrome. Recurrent cyanosis. Pulmonary AVMs. Systemic-pulmonary venous collaterals. Practical tip: Quantifying collateral circulation. Patent fenestration. Baffle leak. Arrhythmias. Myocardial LGE. Weight gain. Liver failure. Weight loss. HCC. Protein-losing enteropathy. Chronic cough. Plastic bronchitis. Unexplained pleural effusion. Chylous pleural effusion. Potentially helpful clinical tests. References

## **CAEE-79 Left Atrial Appendage Assessment in Enhanced Cardiac CT**

Participants

Ronghui Ju, MD, PhD, Shenyang, China (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

In a recent study using cardiac computed tomography (CT) and magnetic resonance (MR), the shapes of the left atrial appendage (LAA) in patients with drug-refractory AF were classified into 4 morphological types, with "chicken wing" being the most common (48%), followed by "cactus" (30%), "windsock" (19%), and "cauliflower" (3%). Transcatheter left atrial appendage occlusion is an increasingly used alternative to oral anticoagulation in selected patients with atrial fibrillation. Pre-procedural imaging is a prerequisite to a successful intervention, with transesophageal echocardiography as the current gold standard. However, cardiac CT offers improved imaging with high-quality multiplanar and 3-dimensional reconstructed images. Nevertheless, the lack of a standardized imaging protocol has slowed the adoption of cardiac CT into clinical practice. This paper provides a protocol for the preparation, acquisition, and interpretation of cardiac CT imaging in pre-procedural planning of left atrial appendage occlusion. Orifice (OR) is defined as a line connecting the left upper pulmonary vein ridge and the circumflex coronary artery. Device landing zone (LZ) is defined as a line connecting the circumflex coronary artery and a point 1-2 mm inside the LAA, measured from the left upper pulmonary ridge tip. Length/depth of the appendage is measured as a line from the landing zone to the most distal tip of the appendage.

### **TABLE OF CONTENTS/OUTLINE**

Outline Page 1: What to assess about left atrial appendage (LAA) in an enhanced cardiac CT Page 23: 4 types of LAA morphologies (VR reconstruction) Page 4: LAA recognition and assessment of orifice and landing zone in multiplanar reconstruction images

## **CAEE-8 Coronary Artery Vasculitis, Encasement, and Mimics**

### **TEACHING POINTS**

1. Coronary artery vasculitis is an inflammatory process that is often distinguished from coronary artery encasement from benign and malignant neoplasms, although imaging appearances can overlap. 2. Coronary artery vasculitis is rare but represents an important diagnostic consideration, especially for acute coronary syndrome (ACS) patients with no traditional cardiovascular risk factors or systemic illness. 3. There are several mimics of coronary artery vasculitis, demanding careful attention to multi-organ findings and clinical presentation.

### **TABLE OF CONTENTS/OUTLINE**

1. Introduction. 2. Spectrum of coronary artery vasculitis and encasement. 3. Review and illustration of coronary artery vasculitis, including: polyarteritis nodosa, Kawasaki's disease, Takayasu's arteritis, giant cell arteritis, HIV. 4. Review and illustration of coronary artery encasement, including: malignant neoplasms (lymphoma, angiosarcoma), IgG4-related disease, Histiocytic disorders (Erdheim-Chester disease, Rosai Dorfman). 5. Complications of coronary artery vasculitis: aneurysms, stenosis, CHF. 5. Mimics of coronary artery vasculitis: spontaneous coronary artery dissection (SCAD), acute plaque rupture, vasospasm.

## **CAEE-80 Women's Heart: Role of Cardiac Imaging in Early Detection and Prognostication of Heart Diseases- A Primer for Cardiac Imagers**

Participants

Barun Bagga, MBBS, Mineola, NY (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

1. The diagnosis of heart disease in women poses unique challenges and remains underdiagnosed and undertreated. 2. Understanding the different etiologies of chest pain in women focusing on Acute myocardial infarction (AMI), MINOCA (myocardial ischemia with non-obstructed coronary arteries), myocarditis, Takotsubo, LV apical ballooning, and connective tissue disease-related cardiomyopathy. 3. AMI has a different presentation, underlying pathophysiology, and outcomes in women compared to men. 4. MINOCA is more common in women and in a younger population, with fewer traditional risk factors for coronary artery disease (CAD) and a higher prevalence of non-obstructive coronary plaques. 5. MINOCA has a higher all-cause mortality at 12 months compared to stable angina and has been found to have worse quality of life compared to AMI-CAD because they are less often treated with beta-blockers and less often referred to cardiac rehabilitation. 6. Cardiac MRI (CMRI) plays a crucial role in the diagnostic algorithm because of accurate myocardial characterization independent of the presence of obstructive coronary lesions. 7. CMRI has been shown to provide an etiologic diagnosis in as many as 77-87 % of cases of MINOCA and offers prognostic value with the extent of LGE involvement correlated with the risk of major cardiovascular events.

### **TABLE OF CONTENTS/OUTLINE**

1. Introduction. 2. Review the different causes of chest pain in women in a case-based approach: a) MINOCA; b) SCAD; c) Myocarditis; d) Takotsubo; e) LV apical ballooning; f) AMI; g) Connective tissue disease-related cardiomyopathy. 3. Review the role of cardiac imaging in diagnosis and prognostication.

## **CAEE-81 Improved Assessment of Coronary Artery Calcium in Photon-Counting Detector CT: A Phantom Study with Various Imaging Modalities**

Participants

Nobuo Kitera, RT, MSc, Nagoya, Japan (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

1. Accurate assessment of calcified lesions in coronary arteries can help establish better treatment strategies. 2. CT can obtain preoperative calcification information of coronary arteries, but it is difficult to completely complement intravascular imaging due to

limitations in spatial resolution and other factors. 3. Photon-counting detector (PCD) CT has higher spatial resolution than conventional energy-integrating detector CT and is expected to improve the ability to visualize microstructures. 4. PCD-CT has the potential to provide new diagnostic value as a preoperative diagnostic tool by acquiring highly accurate coronary artery calcification imaging.

#### TABLE OF CONTENTS/OUTLINE

1. Importance of coronary artery calcification assessment in percutaneous coronary intervention. 2. Characteristics of coronary artery calcification images in various imaging modalities. 3. Features of PCD-CT, including principles of high-resolution imaging, and selection of scan mode and reconstruction kernel. 4. Comparison of PCD-CT images with other imaging modalities using calcified phantom.

#### CAEE-82 Congenital Mitral Valve Disease: From Embryology to Pathology to Repair

Participants

Jonathan Liu, MD, San Francisco, CA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Congenital mitral valve disease can present in a myriad of ways, often differing in morphology, age of presentation, and symptoms. By understanding the development of the mitral valve apparatus, congenital mitral valve disease can be categorized based on which underlying apparatus structure is maldeveloped. The most common and clinically relevant mitral valve pathologies are discussed. Next, the general approach to evaluation of these congenital mitral valve pathologies is reviewed, highlighting the strengths and weakness of each imaging modality (CT, MRI, and echocardiography). Methods for quantification are also reviewed. Finally, the general approach to mitral repair and replacement in the context of congenital heart disease will be discussed.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Embryology and normal anatomy 3. Anomalies based on location a. Supravalvular Lesions b. Anomalies of leaflets c. Anomalies of chordae d. Anomalies of papillary muscles e. Associated congenital heart diseases 4. General approach to evaluation of congenital mitral valve disease a. Morphology i. Lesions best diagnosed by CT ii. Lesions best diagnosed by MRI iii. Lesions best diagnosed by echocardiography b. Flow i. Mitral regurgitation ii. Mitral stenosis iii. Mixed physiology 5. Correction of congenital mitral valve disease a. Mitral valve repair b. Mitral valve replacement 6. Conclusion

#### CAEE-83 Congenital Aortic Arch Anomalies: What the Clinician Wants to Know

Participants

Muhammad Naeem, MBBS, Saint Louis, MO (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Anomalies and congenital variants of the aortic arch are important entities to be familiar with, as they are known to be associated with congenital heart disease, vascular rings, genetic syndromes, and can have significant impact in clinical management. It is postulated to occur as a result of abnormal embryonal organogenesis of the primitive aortic arches. Advanced imaging, specifically computed tomography angiography (CTA) and magnetic resonance angiography (MRA) play a crucial role in the pre-operative planning, as these cases present an anatomic challenge for surgical intervention. Imaging is essential in the diagnosis, management, surgical planning and eventual outcome in patients with congenital arch anomalies. This exhibit will outline the imaging that may be required, and the information needed by the surgeon to attain the best possible surgical outcome.

#### TABLE OF CONTENTS/OUTLINE

1. Review anatomy of various congenital aortic arch anomalies, focusing on clinically significant anomalies that require surgical correction, through case-based examples. 2. Understand what are the most salient findings that should be reported to the surgeon in these case examples, so that pre-operative planning is optimized. We will review the clinically significant variants of congenital arch anomalies that require surgical correction, which may be unfamiliar due to their rarity in clinical practice. We will utilize case-based examples to demonstrate what the important imaging findings the radiologist should review and report to the surgeon. Our focus will cover the impact a radiologist can have in detecting these variants and to provide all the critical information to the surgeon, before an operation occurs.

#### CAEE-84 Imaging findings in Cardiac and Lung Transplant Emergencies and Urgencies

Participants

Thangalakshmi Sivathapandi, MD, Johns Creek, GA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Having comprehensive knowledge about hyperacute/acute complications of heart and lung transplants is crucial as imaging plays a vital role in the multidisciplinary management of these patients. 2. Despite many advances, a disproportionate portion of mortality still occurs in the early post-transplant period, hence prompt recognition of these complications is essentially needed to prevent allograft failure and death. 3. Accurate reporting by the radiologist could aid the clinician for timely intervention and appropriate patient care.

#### TABLE OF CONTENTS/OUTLINE

1. Overview: To review the salient radiological findings in hyperacute and acute complications of heart and lung transplant. 2. Heart transplant: primary graft dysfunction, post operative bleeding, pericardial tamponade, inferior and superior vena cava stenosis/injury, thromboembolism, sternal dehiscence, pseudoaneurysm, pulmonary edema, infection, and acute rejection. Highlighting the key findings of cross-sectional imaging studies including ultrasound, computed tomography, and magnetic resonance imaging with primary emphasis on CT findings. 3. Lung transplant: chest wall/pleural defects like wound dehiscence, acute and hyperacute rejection, primary graft dysfunction, bronchovascular anastomotic complications such as lobar torsion, bronchial dehiscence, and pulmonary arterial and venous stenosis/thrombosis, as well as bacterial, viral, and fungal infections among others.

#### CAEE-85 The Emerging Role of Cardiac CT in Clinical Practice of Cardiac Amyloidosis

Participants

Seitaro Oda, MD, Kumamoto, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Recent research has revealed a considerable number of hidden cardiac amyloidosis (CA) especially in patients with heart failure with left ventricular hypertrophy. CA is, however, frequently misdiagnosed as the other hypertrophic heart disease, and delayed diagnosis results in significant consequences for patients. 2. Current noninvasive diagnostic imaging strategies for CA include echocardiography, cardiac MRI, and bone scintigraphy. 3. Myocardial late iodine enhancement (LIE) and extracellular volume (ECV) quantification by cardiac CT has become clinically available and clinical evidence is accumulating. 4. Since CT is more practical than MRI and scintigraphy, it plays a clinically important role in the diagnosis and management of CA.

#### TABLE OF CONTENTS/OUTLINE

1. Basic knowledge of CA: - Classification of CA - Recent development on therapeutic agents 2. Current noninvasive diagnostic imaging strategies: - Echocardiography - Cardiac MRI - Bone scintigraphy 3. Myocardial tissue assessment using cardiac CT: - LIE imaging - ECV quantification - CT imaging protocols 4. The emerging role of cardiac CT for CA: - Efficient diagnostic flow and current evidence - Use in patients with mechanical devices - Application in patients with aortic stenosis - Application in patients with atrial fibrillation - Monitoring of therapeutic effect 5. Future directions

#### CAEE-86 **Genotype and Imaging Phenotype in Dilated and Arrhythmogenic Cardiomyopathy**

Participants

Seitaro Oda, MD, Kumamoto, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. With the rapid increase in the number of heart failure patients worldwide, research on personalized medicine for cardiomyopathy based on genomic information is being promoted. 2. In recent years, the relationship between genotype and phenotype in dilated cardiomyopathy (DCM) and arrhythmogenic cardiomyopathy (ACM) has been clarified. 3. Important pathogenic variants include titin (TTN), filamin C (FLNC), lamin A/C (LMNA), and desmoplakin (DSP), with characteristic genotypic-imaging phenotypes. 4. This presentation summarizes new findings on genotype-imaging phenotypes in DCM/ACM.

#### TABLE OF CONTENTS/OUTLINE

1. Evolving disease concept of DCM/ACM: - New diagnostic criteria for ACM (Padua criteria) - Arrhythmogenic right ventricular cardiomyopathy (ARVC) and arrhythmogenic left ventricular cardiomyopathy (ALVC) - Overlap of ACM and DCM 2. Genetic basis of DCM/ACM: - Genes encoding constituent proteins of cardiomyocytes - Genetic variants causing DCM/ACM 3. Genotype-imaging phenotypes in DCM/ACM: - Titin (TTN) - Filamin C (FLNC) - Lamin A/C (LMNA) - Desmoplakin (DSP) - Others 4. Important MRI, CT imaging findings: - Fibro-fatty replacement of myocardium - Ring-like delayed enhancement 5. Future directions

#### CAEE-87 **Diagnosis of Coronary Microvascular Disease, Principle, Challenges, and Emerging Technologies of CT and MRI**

Participants

Takanori Kokawa, MD, Tsu, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To review the definition, classification, and standard diagnostic steps of coronary microvascular disease (CMD). 2. To discuss the role of PET, MRI and CT in the diagnosis of CMD. 3. To illustrate emerging CT and MRI technologies for characterizing CMD.

#### TABLE OF CONTENTS/OUTLINE

A) Definition and epidemiology of CMD. B) Pathophysiology of CMD. C) Diagnostic criteria and standard approach for CMD. D) Role of non-invasive imaging modalities including PET, MRI and CT. E) Emerging technologies for assessment of CMD. a. Myocardial blood flow quantification by MR perfusion imaging and CT perfusion imaging. (Clinical example - normal CCTA, subendocardial perfusion defect, reduced CFR by MRI) b. Coronary sinus flow assessment by phase-contrast cine MRI c. Fractal analysis of dynamic myocardial CT perfusion. d. Potential of photon-counting CT for characterizing myocardium.

#### CAEE-88 **Demystifying the Mysteries of Heart Tumors and Tumor-like Conditions: A Succinct Approach for Radiologists**

Participants

Aniket Agarwal, MBBS, New Delhi, India (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Highlight the basic protocol of cardiac magnetic resonance imaging and simplifying the anatomy to help alleviate the cardiac-MR phobia. Devise an algorithmic approach to narrow down the differential for cardiac masses by using the clinical history, age, signal intensity, location and enhancement characteristics of the mass. Each sequence tells its own story. Double inversion recovery sequence, Triple inversion recovery has their own advantage. Early and late gadolinium enhancement characteristics of the mass is one of the most important features in differentiating a thrombus from a myxoma and a fibroma from a sarcoma. Rhabdomyomas are usually multi-focal non-enhancing or hypoenhancing lesions. Cine sequences provide assessment of mass mobility, its attachment points and hemodynamic impact on cardiac valves. Characterization for differentiation between benign and malignant features.

#### TABLE OF CONTENTS/OUTLINE

Cardiac MR protocol and basic cardiac MRI sequences. Important anatomical landmarks. Sequence wise diagnostic approach - What to look on which sequence? Algorithms- cardiac tumor classification based on benign/malignant, age, location, imaging characteristics. Differentiating cardiac masses on MRI. Mimics of cardiac tumors including anatomical tissues. Advantages and pitfalls of cardiac MRI.

#### CAEE-9 **Novel Approach for Comprehensive Preoperative Assessment of Valvular Heart Disease via Four Dimensional CT Datasets in the Era of Minimum Invasive Cardiac Surgery**

#### TEACHING POINTS

Recent years, surgical techniques of cardiac valvuloplasty, such as minimally invasive cardiac surgery (MICS) and robotic surgery, have developed dramatically. In exchange for less invasiveness, surgical procedures turned out highly technically demanding due to narrow operative field and deep working space. Comprehensive assessment of cardiac anatomy and preoperative simulation using various modalities would be more important than ever. We summarize the usefulness of cardiac CT, especially in preoperative physiological morphology assessment.

#### **TABLE OF CONTENTS/OUTLINE**

In valvuloplasty, to assess physiological morphology of valve complex under beating is one of the most important factors. Utilizing CT datasets, valve complex structures consisting of leaflets, chordae tendineae, papillary muscles, and prolapsing leaflet were faithfully reproduced, and allowed surgeon to observe and measure using 3D or 4D datasets. Furthermore, preoperative simulations via life size 3D models and virtual reality simulation systems constructed from high spatial resolution datasets have reached to the stage of practical use. The learning curve would be shortened by development of these simulation technologies, though construction treatment strategy and judging surgical procedures had been largely dependent on surgeon's experience in the past. We propose a novel approach for assessment the whole aspect of valvular heart disease using appropriate imaging modalities comprehensively.

CAEE-1

### **Is It Possible to Assess Left Atrial Remodeling Using Deep Learning? An Attempt to Classify Atrial Fibrillation Types Using Contrast-Enhanced CT Images.**

#### **TEACHING POINTS**

Catheter ablation therapy is one of the curative treatments for atrial fibrillation (AF). It is generally known that the recurrence rate after treatment increases as attacks persist, and the factor is related to structural remodeling of the left atrium. However, standard evaluation is difficult, and the indication for catheter ablation therapy is currently determined by the surgeon's empirical judgment and the duration of disease obtained from the patient's self-report. Therefore, this study demonstrates the possibility of assessing remodeling of the left atrium from the results of the visualization of the classification basis of the two models. The major teaching points of this exhibit are 1. Evaluation of AF types using contrast-enhanced CT imaging is difficult only for experienced physicians 2. Deep learning enables evaluation of the left atrium using features such as the structure of the left atrium and pulmonary veins obtained from images. 3. Evaluation of structural remodeling of the left atrium may be useful for AF types

#### **TABLE OF CONTENTS/OUTLINE**

1. About Atrial Fibrillation -Classification of Atrial Fibrillation Types -Structural remodeling of the left atrium 2. Treatment options for Atrial Fibrillation -Relationship between seizure duration and treatment outcome 3. Results of experiments -How well did you recognize the shape of the left atrium?

### Seeing Beyond the Surface: A Radiological Exploration of Pacemakers, CRT, and ICDs

#### TEACHING POINTS

- Review the relevant cardiac anatomy, the different types of devices (pacemakers, CRT, and ICDs), and the positioning and integrity of the different elements of the devices.
- Understand the importance of X-ray imaging in the diagnosis and follow-up of patients with pacemakers, CRT, and ICDs.
- Identify the normal and abnormal X-ray findings for these devices, including lead placement, device positioning, and associated complications.
- Understand how X-ray imaging is used to evaluate the function of pacemakers, CRT, and ICDs, including pacing and electrical leads, and common X-ray findings associated with device malfunction.
- Recognize the potential limitations associated with X-ray imaging of these devices and the troubleshooting strategies for addressing those limitations.

\*?aβ?e ?? ???te?ts/?t???e

1. Introduction
2. Overview of cardiac devices (pacemakers, CRT, and ICDs)
3. Anatomy and positioning of cardiac devices
4. Importance of X-ray imaging in diagnosis and follow-up
5. Differentiating between pacemakers, CRT, and ICDs on chest radiography
6. Normal and abnormal X-ray findings for pacemakers, CRT, and ICDsa. Device type and differences.b. Device positioningc. Internal elementsd. Lead placemente. Lead integrityf. Associated complications
7. Troubleshooting strategies for technical limitations of X-ray

### AI-Assisted Autonomous Aortic Aneurysm Analysis - Status, Strengths, Slants, and Stresses: Ut Nos Ibi Nunc?

#### Participants

Roshan Fahimi, MD, Cambridge, MA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The exhibit will help the audience understands the following aspects of multiple AI algorithms pertaining to triage, measurement, detection, and report creation for aortic aneurysm and dissection. 1. 1.Aortic evaluation with CT: Intentional and incidental 2. 2.Scientific evidence for aortic evaluation with AI 3. 3.Multi-vendor AI for aortic evaluation 4. 4. Status, strengths, slants, and stresses of AI models

#### TABLE OF CONTENTS/OUTLINE

We use our multi-vendor AI experience to organize and present the exhibit content into following brackets: 1. 1. Aortic Diseases: Incidence, importance, and imaging 2. 2. AI for aortic aneurysm and dissection: Evidence in literature 3. 3. Approach of multiple AI algorithms in aortic aneurysm and dissection 4. 4. Screening and AI-based new metrics for aorta 5. 5. Status, weaknesses, and stresses of AI algorithms 6. 6. Autonomy for AI-assisted analysis: Should we be there now?

### Boost Your Imaging Skills and Help Your Interventional Cardiologists Before and After Left Atrial Appendage Occlusion

#### Participants

Seyedali Nabipoorashrafi, MD, MD, Seattle, WA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Familiarize radiologists with available LAAO devices and their clinical applications. Review the required pre-procedural measurements for LAAO. Educate radiologists with post LAAO complications and ideal imaging techniques for their detection. Review spectrum of normal post procedural findings that should be differentiated from complications.

#### TABLE OF CONTENTS/OUTLINE

1. Review the different LAAO devices (Watchman, Watchman FLX, Amulet, and Lariat), their unique features, and patient selection criteria.
2. Recognize the importance of preprocedural Image based planning in guiding device selection and placement.
3. Pictorial review of LAAO complications A) peri-device leak B) off-axis placement, and C) device-related thrombosis.
4. Review of the clinical importance of post procedural complications with focus on the role of imaging.
5. Review of the management of device-related complications with emphasis on the role of imaging.
6. Comparison between CT and other imaging modalities (Echocardiography and MRI) for LAAO planning and surveillance.

CAEE-13

### Fibromuscular Dysplasia: a Multifaceted Vascular Disease

#### Participants

Frances Ferreira De Deus, MD, Niteroi, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Provide an overview of the pathophysiology and clinical manifestations of fibromuscular dysplasia (FMD). less prevalent, but more commonly underdiagnosed as related to this pathology.- To describe the role of imaging in the diagnosis and prevention of complications.

#### TABLE OF CONTENTS/OUTLINE

Fibromuscular dysplasia (FMD) is a non-inflammatory, non-atherosclerotic, idiopathic arterial disease that primarily affects Caucasian women and medium-sized vessels. The classic finding is the beaded appearance and tortuosity of the affected vessel. However, FMD also predisposes to aneurysm formation, dissection, and stenosis, which are not always suspected to be related to FMD by the imaging community. We describe and illustrate with schematic figures and cases the main sites of vessel involvement, the variable radiological findings and the complications related to the disease. The most affected sites are the renal and cerebrovascular arteries, although the aorta and other arteries may also be involved. FMD can predispose to important complications, such as stroke, myocardial or renal infarction, aneurysm rupture and progressive dissection. FMD is often a subclinical and underdiagnosed arteriopathy with catastrophic complications. The radiological community should be familiar with the different phenotypic appearances. Invasive angiography and non-invasive vascular imaging by CT and MRI play an important role in the diagnosis and prevention of complications.

CAEE-14

### How to Distinguish Chronic Total Occlusion From Subtotal Occlusion by Distal Transluminal Attenuation Gradient in Coronary CT Angiography

#### TEACHING POINTS

Understand how to calculate distal transluminal attenuation gradient (TAG<sub>distal</sub>) in coronary CT angiography (CCTA) and TAG<sub>distal</sub> can be used to distinguish chronic total occlusion (CTO) from subtotal occlusion (STO).

#### TABLE OF CONTENTS/OUTLINE

1. CTO and STO  
Chronic total occlusion (CTO) is a complete interruption of coronary arterial flow caused by plaque obstructing arterial lumen. Subtotal occlusion (STO) is a "functional" total occlusion and slow blood flow passes through the occluded segment. Percutaneous coronary intervention is attempted less frequently for CTO lesions and has a higher unsuccessful rate and late restenosis compared with STO lesions.  
2. TAG<sub>distal</sub>  
TAG: linear regression coefficient between intraluminal radiological attenuations and vessel length. May be calculated manually or automatically by artificial intelligence post-processing technology  
TAG<sub>distal</sub>: calculated from distal to occlusion.  
3. Distinguish CTO from STO by TAG<sub>distal</sub>  
Coronary arteries with CTO showed higher TAG<sub>distal</sub> compared with arteries with STO. TAG<sub>distal</sub> has higher accuracy in differentiating CTO from STO.  
4. Improve the diagnostic efficiency of CCTA  
Radiologists routinely diagnose CTO and STO through CCTA, and TAG combined with CCTA can improve the diagnostic efficiency  
5. Clinical Application  
AI-enabled TAG measurements may be used to assist radiologists to differentiate STO from CTO with moderate diagnostic accuracy, improving diagnostic workflow.

Printed on: 04/12/24

### Calcium in the Heart: A Guide to Interpret Like an Expert

#### Participants

Seyedali Nabipoorashrafi, MD, MD, Seattle, WA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1- Reviewing various calcified cardiac lesions, including calcification of the pericardium, vascular structures, myocardium, valves, and valve annuli. 2- Reviewing the morphology, location, and extent of calcification, which are often pathognomonic features that aid in identifying each type of calcified lesion as well as conditions associated with them. 3- Exploring the clinical significance of various calcified lesions and outlining a structured clinical approach for their management. 4- Discussing differential diagnosis of cardiac calcification and evaluation of their etiologies

#### TABLE OF CONTENTS/OUTLINE

1- Introduction to a systematic evaluation of calcified cardiac lesions  
2- Identifying:  
A) Pathognomonic features of pericardial calcifications and considering their underlying causes  
B) Pathognomonic features of valvular and annular calcifications based on underlying causes  
C) Myocardial calcifications associated with tumors (such as endothelioma and rhabdomyoma), trauma, or infarction.  
D) Papillary muscle calcification.  
E) Left atrial calcifications related to atrial fibrillation, congestive heart failure, and endocarditis.  
F) Intracavitary calcifications in the atria and ventricles.

CAEE-17

### Medical Terminology in Cardiothoracic Radiology

#### TEACHING POINTS

Medical terminology includes words and phrases aiming to accurately describe anatomical structures, processes, conditions, medical procedures, and treatments. In cardiothoracic radiology, there is a plethora of words originating from Greek and they may be misused and misspelled in everyday practice. To aid colleagues in fluent and effective use of these terms, we have derived a radiologically illustrated glossary of the most frequent terms, their definitions and explanations of their origin and meaning. Typically, medical terms stemming from Greek adhere to a fixed structure of a prefix, a root, and a suffix. The prefix appears at the beginning of a medical term and usually indicates a location, direction, type, quality, or quantity. The root gives a term its essential meaning whereas the suffix appears at the end of a term and may indicate a specialty, test, procedure, function, disorder, or status.

#### TABLE OF CONTENTS/OUTLINE

In a comprehensive and schematic way, words are presented alphabetically divided in two sections: anatomy and pathology and illustrated with representative radiology images, relevant findings and key imaging references. For each word the correct orthography is demonstrated along with a brief review of its history and etymology.

Printed on: 04/12/24

### The One Ring to Rule Them Out: Deciphering Differential Diagnosis of Left Ventricular Ring-Like Late Gadolinium Enhancement

#### TEACHING POINTS

Despite being initially described as a diagnostic marker for arrhythmogenic cardiomyopathy (ACM), ring-like LGE has been increasingly reported in non-genetic heart disease. Ring-like LGE secondary to ACM may be accompanied by inverted T-waves in left precordial leads, ventricular arrhythmia with left bundle branch block morphology, and family history of premature sudden death. Ring-like LGE secondary to Chagas disease may be accompanied by residency in south america, positive serology, right bundle branch block and left anterior fascicular block, and apical aneurysm. Ring-like LGE secondary to viral myocarditis may be accompanied by prodromal manifestations (e.g fever, flu-like symptoms and diarrhea), and myocardial edema. Ring-like LGE secondary to Keshan disease may be accompanied by residency in China, disabsortive syndrome, and selenium deficiency. Ring-like LGE secondary to sarcoidosis may be accompanied by extracardiac findings, right bundle branch block, 2nd- and 3rd-degree heart block, and right ventricular free wall LGE.

#### TABLE OF CONTENTS/OUTLINE

Introduction: definition of left ventricular ring-like LGE, clinical significance, and objectives  
Differential diagnosis between genetic causes: left-dominant CMAD  
Differential diagnosis between endemic causes: Chagas disease, and Keshan disease  
Differential diagnosis between inflammatory causes: viral myocarditis, sarcoidosis, and heart transplant rejection  
Differential diagnosis between causes of non-ring-like circumferential LGE: myocardial infarction, amyloidosis, and dystrophin cardiomyopathies  
Discussion: table with distinctive features of ring-like LGE differential diagnosis

### Understanding Transesophageal Echocardiography: A Radiologist's Guide

#### TEACHING POINTS

TEACHING POINTS1. To understand the complimentary role of transesophageal echocardiography in multi-modality cardiac imaging including indications, contra-indications and potential complications.2. To have an understanding of the standard trans-esophageal examination3. Using cross modality reference be able to identify specific pathologies on TEE, CT and MRI.

#### TABLE OF CONTENTS/OUTLINE

TABLE OF CONTENTS/OUTLINE1. Introduction: Overview of the role of TEE in multimodality cardiac imaging including indications, contraindications, and complications.2. The standard transesophageal examination with cross modality reference with CT and MRI3. Specific roles of TEE in acute aortic syndromes, cardiac source of emboli, infective endocarditis and valvular assessment. Pathological appearances on TEE with cross modality reference.4. Summary.

### Role of Cardiac MRI in the Follow Up of Postoperative Congenital Heart Disease

#### Participants

Harold Goerne, MD, Guadalajara, Mexico (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To review congenital heart diseases that require imaging follow up after surgical or endovascular repair. To discuss the role of cardiac MRI in the evaluation of postoperative findings in CHD repair. To demonstrate the importance of follow up imaging for detection of postoperative complications.

#### TABLE OF CONTENTS/OUTLINE

1) Introduction 2) Congenital heart diseases - Clinical features; embryology; pathophysiology; treatment 3) Advantages and disadvantages of imaging modalities- Echo, CT, MRI. 4) MRI 5) Discussion, illustration with case examples of postoperative findings in repaired congenital heart diseases a) TOF: 1) Total repair (Pulmonary valve regurgitation, RV dilatation, RVOT wall fibrosis/aneurysms) b) TGA: 1) Jatene / Atrial switch (stenosis, thrombosis) 2) Banding (stenosis) c) DORV 1) Jatene (coronary ostia stenosis, PA stenosis) 2) MBT 3) Rastelli (leaking, regurgitation) 6) Discussion, illustration with case examples of postoperative complications in the repair of congenital heart diseases. I. Pulmonary valve insufficiency II. Aneurysmal dilatation of patch III. Myocardial dysfunction (Structural alterations, hypertrophy and remodeling) IV. Right ventricular dysfunction

### Multimodality Imaging of the Pericardium

#### Participants

Nilo Fernandes Leca Junior, MD, Niteroi, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To discuss the strengths and limitations of different imaging techniques in the exploration of the pericardium. To highlight the radiological aspects of the normal pericardium and the spectrum of pathological entities such as developmental anomalies, inflammation/infection, effusion, neoplasms, iatrogenic conditions and pericardial constriction.

#### TABLE OF CONTENTS/OUTLINE

Pericardial diseases are conditions that involve the membrane that surrounds the heart. Imaging plays a pivotal role in the assessment, which is performed by multiple non-invasive methods such as x-ray, echocardiography, CT and MRI. Echo remains as the first modality in most clinical scenarios. The most common conditions involving the pericardium are inflammation, effusions and constriction. Pericarditis is classified by symptom duration and by etiology (infection, idiopathic, neoplastic, drug related, iatrogenic and autoimmune). Pericardial constriction is a rare complication. Pericardial effusion is related to varying degrees of abnormal fluid accumulation into the pericardial space, and can evolve to tamponade. Primary and secondary masses are commonly accessed by CT and MRI. Secondary involvement is far more common than primary pericardial tumors. Congenital anomalies are relatively uncommon entities and may range from pericardial cysts to partial or total agenesis. Cardiovascular imaging plays an important role on the management of pericardial pathologies, which should be promptly recognized to help guide timely treatment.

### Utility of CT Coronary Angiography in Septal Vascular Mapping Prior to Alcohol Ablation in Hypertrophic Obstructive Cardiomyopathy

#### TEACHING POINTS

1. Alcohol septal ablation (ASA), an established treatment in hypertrophic obstructive cardiomyopathy (HOCM), iatrogenically induces an infarct of the target basal septum- the site of contact of mitral valve leaflet on the septum during systolic anterior motion (SAM). 2. Invasive angiography provides information about the course and size of coronary arteries but not their territorial distribution. Inaccurate infarct localisation due to alcohol injection into right ventricular side of septum and inability to identify the target vessel on invasive angiography leads to failure of ASA. 3. Computed tomography (CT) angiography has the dual benefit of detailing vascular anatomy and providing information on myocardial distribution. Mapping the septal vascular anatomy with CT coronary angiography prior to ASA improves localisation of infarct with predictable outcome and procedural success at the first attempt compared to traditional methods. The authors describe a new 5-step method of creating a CT navigational map for planning selective sub-branch micro-catheterisation.

#### TABLE OF CONTENTS/OUTLINE

1. Mechanism and principle of ASA. 2. CT angiography protocol and 5-step mapping technique of the target basal septal vasculature. 3. Checklist of CT reporting points including the distance and angulation of the septal arteries. 4. Illustration of variant CT septal vascular anatomy. 5. Causes and demonstration of failed procedures in pre-CT traditional ASA. 6. Clinical utility of CT-guided ASA in terms of symptomatic, functional and haemodynamic improvement.

### Gray Blood and Applications

#### Participants

Paula Terra Amaral, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The purpose of this exhibition is: ? Review the concept and indications of the gray blood myocardial delayed enhancement (MDE) technique? Highlight the ease of execution and applicability of the method? Understand the benefits of applying gray blood in the investigation of myocardial fibrosis? Identify the radiological findings that will help in the diagnosis as well as pitfalls of this technique

#### TABLE OF CONTENTS/OUTLINE

Gray blood is a sequence in cardiac magnetic resonance imaging (CMR) obtained by partial blood signal suppression that increases the ability to identify and localize myocardial scarring near the cavity. A pictorial essay based on cases from our collection allows for a comprehensive assessment and understanding: ? Grayblood MDE technique with a tutorial video? Main indications of grayblood MDE images? Grayblood MDE radiological findings in cases of subendocardial enhancement and papillary muscles? Grayblood MDE radiological findings in cases of post-cardiac transplantation, cardiac tumor, myocarditis and hypertrophic cardiomyopathy? Cases in which grayblood MDE did not help in the diagnosis

### Imaging of the Ductus Arteriosus

#### Participants

Kaustav Bera, MD, Cleveland, OH (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To know the embryology, physiology and modalities for evaluation of the ductus arteriosus 2. To learn about the pathologies of the ductus going beyond patent ductus arteriosus 3. To review the clinical and imaging findings of the above-mentioned entities with case examples

#### TABLE OF CONTENTS/OUTLINE

1. Embryologic development of ductus arteriosus 2. Physiological significance of ductus arteriosus 3. Modalities for evaluation of pathologies of ductus arteriosus : USG, CT, MR, Invasive angiogram 4. Pathologies of Ductus: - Normal variants - Congenital/developmental o PDA § Risk factors and pathophysiology § Classification § Causes § Maintaining patency post birth for some Congenital Heart diseases § Closure of PDA o Aneurysm of DA o Congenital vascular ring o Significance in Coarctation of aorta ( Preductal versus post ductal) - Post traumatic o Mechanism of and incidence of ductal injury o Minimal aortic injury (MAI) o Ductal Pseudoaneurysm o Penetrating ulcer o Aortic dissection - Miscellaneous o Infective aortitis associated with the nonpatent remnant of a ductus arteriosus o Atherosclerotic penetrating ulcer/ pseudoaneurysm of aortic ductus. 5. Differential diagnosis/mimics: - Aortic spindle mimicking aortic ductus pseudoaneurysm/MAI - Type III ductal diverticulum mimicking Aortic ductus pseudoaneurysm - Infundibula of the aortic branch vessels mimicking Aortic ductus pseudoaneurysm - Technical mimics of MAI :Breathing, arterial pulsation and other motion artefacts, streaming/streaking of contrast mimic minimal aortic injuries) - Anatomical mimics of MAI : Noncalcified and partially calcified atheroma

CAEE-24

### The Space Between: A Roadmap to Cardiac Recesses Grooves

#### Participants

Katherine Cheng, MD, Stamford, CT (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The recesses, grooves, and potential spaces around the heart are defined by the vasculature and supporting fibrous structures; these areas can easily be overlooked by the radiologist. Changes in configuration and appearance of these spaces can occur with pathological processes and can be more readily identified using a standard search pattern. A structured search pattern using a vascular and fibro-skeletal based review can help the radiologist identify and differentiate pathology from normal spaces and structures.

#### TABLE OF CONTENTS/OUTLINE

1. Review the normal anatomy of the heart including the recesses and grooves as well as the supporting vascular and fibro-skeleton of the heart.
2. Illustrate the common pathology that can occur in these spaces including thrombus, tumor, abscesses, and pseudoaneurysm.
3. Highlight the importance of variant and abnormal processes in these spaces and the impact on medical and surgical management.

### **The Role of Imaging in Cardio-Oncology: Detecting, Preventing, and Managing Cardiovascular Disease in Cancer Patients and Survivors**

#### **Participants**

Osamu Manabe, MD, PhD, Saitama-Shi, Japan (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Cardio-oncology is a new specialty that focuses on detecting, preventing, treating, and following up on cardiovascular disease (CVD) in cancer patients and survivors. Cancer and CVD share many risk factors, such as aging, smoking, diabetes mellitus, and genetic predisposition. Furthermore, some cancer treatments have negative effects on the cardiovascular system, leading to an increased burden of cardiac complications in survivors. Cardio-oncology aims to minimize cardiovascular complications in patients with cancer and requires close collaboration between oncologists, cardiologists, and radiologists. In this presentation, we will discuss the usefulness of various imaging modalities in the field of cardio-oncology, taking into account the latest technology available.

#### **TABLE OF CONTENTS/OUTLINE**

Cardio-oncology is a new multidisciplinary field to institute appropriate surveillance, treatment, and follow-up strategies for CVD in patients with cancer (Fig.1). Imaging modalities such as MRI (Fig.2), CT (Fig.3), and nuclear medicine including PET (Fig.4) play a crucial role in diagnosing and monitoring CVD in cancer patients. These non-invasive methods can be used to assess cardiac function, tissue characteristics, metabolic activity, and also tumor size and extent. Using novel imaging technologies is essential for early detection, treatment, risk stratification, and survivorship in cardio-oncology (Fig 5).

CAEE-26

### Whole-body Assessment of Vasculitis and Its Complications Using CT, FDG-PET, and MRI

#### Participants

Noriko Oyama-Manabe, MD, PhD, Saitama City, Japan (*Presenter*) Grant, DAIICHI SANKYO Group; Grant, Bayer AG; Grant, Eisai Co, Ltd; Grant, Canon Medical Systems Corporation

#### TEACHING POINTS

1. Overview of the etiology, pathophysiology, clinical presentation, diagnostic criteria, and therapeutic approaches for primary and secondary vasculitis  
2. To compare image characteristics of specific vasculitis and its complications with CT, MRI and FDG-PET/CT  
3. To describe the role of multimodality imaging in the quantitative evaluation of inflammation for the initial diagnosis and during follow-up after treatment

#### TABLE OF CONTENTS/OUTLINE

Vasculitis manifests in various clinical presentations, morphologies, and prognoses, requiring a multimodal imaging approach. Radiologists can aid in the accurate diagnosis of vasculitis and its complications, treatment planning, and patient care with multimodality imaging. In this presentation, we will cover both primary and secondary vasculitis, which can be caused by various factors, including infections and drug-induced reactions. Knowledge of systemic clinical manifestations in affected patients may help establish a specific diagnosis. 1. To review the clinical features and imaging findings of the different types of vasculitis including those that primarily involve large, medium-sized, or small vessels. 2. Tips for scanning with adequate timing and reconstruction for various complications due to infectious vasculitis including secondary to TEVAR and EVAR. 3. To describe the role of these imaging modalities in the quantitative evaluation of inflammation for the initial diagnosis and during follow-up after treatment, with an emphasis on monitoring therapeutic response using quantitative parameters.

### Unveiling Cardiac Intracavitary 4D flow MRI

#### Participants

Jordi Broncano, MD, Cordoba, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Reliable analysis of intracardiac flow provides important insight for the interpretation and management of cardiovascular diseases. Recently, non-invasive evaluation of intracardiac hemodynamics by 4D flow CMR constitute a reliable, robust, and reproducible method for the analysis of flow patterns in valvular diseases, cardiomyopathies, or congenital heart diseases (CHD). Furthermore, in virtue of its multidimensional/multidirectional capabilities it allows to calculate common (flow, velocities, and volumes) and advanced (kinetic energy and turbulent kinetic energy, vortical flow imaging and particle tracing) intracardiac chamber flow hemodynamic parameters. Recently, some of them have been shown to have important prognostic implications. Teaching points 1. To describe the physical basis of 4D flow, the main acquisition process, optimization techniques and advanced post-processing methods 2. To analyze the current and potential clinical applications of intracavitary 4D flow in cardiac imaging.

#### TABLE OF CONTENTS/OUTLINE

1. 4D flow physical basis 2. 4D flow acquisition technique and protocol 3. Conventional intracavitary flow analysis 4. Advanced intracavitary 4D flow analysis - Kinetic Energy and Turbulent Kinetic Energy - Viscous energy loss - Vortical Flow Imaging - Particle tracing 5. Current and potential clinical applications intracavitary 4D flow - Dilated cardiomyopathy - Ischemic heart disease - Atrial fibrillation and heart failure - Valvular heart disease - Hypertrophic cardiomyopathy - Congenital heart diseases 6. Intracavitary 4D flow prognostic biomarkers: Ready to primetime? 7. Take home points

### CT Imaging in Ischemic Heart Disease and Complications

#### Participants

Takashi Norikane, MD, PhD, Kita-gun, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Cardiac imaging plays a pivotal role in the diagnosis of ischemic heart disease. Echocardiogram, coronary angiography, nuclear medicine imaging and magnetic resonance imaging are common imaging modalities. However, conventional CT can provide important information about ischemic heart disease and complications. This presentation introduces the basic approaches of CT in ischemic heart disease and complications and follows with an overview of normal heart and coronary anatomy and frequently encountered pathologic conditions.

#### TABLE OF CONTENTS/OUTLINE

Normal anatomy Coronary artery and territories Heart chambers Pericardium Myocardial infarction Atherosclerosis, Air embolism, Coronary artery anomaly, IgG4-related disease, Aortic dissection, thromboembolism due to essential thrombocythemia, Diaphragmatic hernia (post CABG), Post aortic valve replacement Complications Myocardial rupture, ventricular septal rupture, Dressler's syndrome, Ventricular aneurysm, Calcification Myocardial persistent enhancement after percutaneous coronary intervention Differential diagnosis Myocarditis, Takotsubo-myocardiopathy

### Unravelling the Mitral Valve on CT

#### Participants

Vidushi Gupta JR, MD, MBBS, Delhi, India (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Assessment of normal valvular morphology and basic physiology of mitral valve on MDCT  
2. Discuss the pearls and pitfalls relevant to planning, acquisition and interpretation of cardiac CT images  
3. Enumerate various structural and functional abnormalities  
4. Describe the role of CT in pre and post-procedural imaging in patients with TMVR (Transcatheter mitral valve replacement).

#### TABLE OF CONTENTS/OUTLINE

1. Introduction  
2. ECG placement with proper planning and acquisition protocol  
3. Pearls and pitfalls  
4. Post processing  
5. Normal mitral valvular anatomy and function  
6. Assessing Structural abnormalities  
7. Assessing Functional abnormalities  
8. Role of CT in pre and post procedural imaging in TMVR  
9. Take home message

### Robotic and Minimally Invasive Mitral Valve Surgery: Radiological Assessment and Surgery Correlation

#### TEACHING POINTS

1. Robotic and minimally invasive mitral valve surgery is a safe and less traumatic surgical approach compared to the open cardiac surgery. Besides, it can be regarded as a widely accepted technique given the volume of publications from numerous institutions. 2. Multimodality imaging assessment conducted before to surgery are essential for selecting appropriate patients, anatomical evaluation, surgical planning, and optimal patient outcomes. 3. Radiologists can assist in patient treatment by being knowledgeable about the variety of anticipated postoperative findings and potential complications following robotic and minimally invasive mitral valve surgery.

#### TABLE OF CONTENTS/OUTLINE

A. Overview of surgical techniques: Ministernotomy, minithoracotomy, robotically assisted B. Indications and contraindications C. CT angiography for pre-operative assessment 1. Scan protocol and postprocessing technique 2. Preoperative checklist 1) Aorta and iliofemoral arteries 2) Evaluation of lung, pleural plaques 3) Chest wall, diaphragm 4) Pericardium, mediastinum 5) Aorta diameter, pulmonary artery diameter, ascending aortic calcification 6) Mitral valve geometry, calcification 7) Central veins (vena cavae, coronary sinus) 8) Coronary arteries D. Procedural considerations E. Case examples F. Postoperative assessment G. Conclusion

CAEE-30

### Need for Speed: Fast MRI in Cardiac Imaging

#### Participants

Jordi Broncano, MD, Cordoba, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Cardiac MRI has become versatile technique for normal and diseased heart. However this results in complex and slow CMR examinations, raising the perception of CMR as a high-cost imaging method. Therefore, a more rationale and question-driven protocols are increasing acceptance in order to reduce the amount of acquisition time, increase patient acceptance and clinical value of this well-known game-changer imaging method. Teaching points 1. To describe the current technical advances, drawbacks, tips and tricks available for providing fast MRI protocols in clinical practice. 2. To detail the different proposals described in the literature for optimizing CMR protocols (fast MRI) in a "question - driven" scenario and with a "building - blocks" strategy.

#### TABLE OF CONTENTS/OUTLINE

1. Fast MRI concept and rationale 2. Conventional CMR protocoling problems: Knowing what I need to fix. 3. Fast MRI strategies in cardiac imaging • 3.1. Cine SSFP o Free - breathing EKG gated cine SSFP o Post-contrast cine SSFP o Sparse acquisition cine SSFP o Deep Learning (DL) cine SSFP o 3D cine SSFP • 3.2 Tissue characterization/parametric mapping o Single-Shot black blood imaging o DL acquisition and reconstruction o 3D single parameter mapping o Accelerated T1 T2 mapping • 3.3. 4D flow imaging o 4D flow EPI o Accelerated 4D flow • 3.4. MR angiography o Compressed sensing o Other strategies o Non - contrast MRA • 3.5. Late Gadolinium Enhancement o Free breathing single-shot LGE o Breathhold 3D LGE o 3D PSIR LGE o DL LGE 5. Fast CMR protocols in the clinical practice: The "building - blocks" strategy - Ischemic heart disease - Non-ischemic heart disease - Valvular heart disease - Arrhythmogenic cardiomyopathy - Congenital heart disease 6. Take home points

### Pulmonary Vein Anomalies Made Easy

#### Participants

Juliana Da Silveira, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To overview the embryology and normal anatomy of the pulmonary veins. To discuss the spectrum of anomalous pulmonary venous connections (APVCs). To describe and illustrate with schematic figures and cases the types of APVCs. To discuss the importance of the diagnosis to allow timely treatment and a better prognosis.

#### TABLE OF CONTENTS/OUTLINE

The normal PV anatomy consists of four PVs, which drain oxygenated blood from the lungs to the left atrium (LA). The LA and PVs initially develop separately, and get progressively connected during fetal development. If there is failure in any step of this embryonic process, APVCs will happen. Anomalous pulmonary venous connections are a group of abnormal drainage of one or more PVs outside of the LA and can be classified either as partial or total, depending on the number of the veins involved. We describe and illustrate with schematic figures and cases the types of anomalous pulmonary venous connections, whether partial or total, common or rare, depending on the site of pulmonary vein drainage, the number of veins involved, and the presence or absence of vein obstruction. Common and rare anatomical variations will also be demonstrated. The clinical syndromes related to abnormal pulmonary venous returns will be discussed, ranging from dramatic neonatal emergency to subclinical presentation and late development of pulmonary hypertension.

CAEE-32

### The Changing Face of Myocarditis

#### Participants

Matthew McCann, MD, Jacksonville, FL (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

COVID-19 ushered in a dramatic rise in public awareness of myocarditis and related complications. Mirroring this, an unprecedented utilization of imaging for assessment of cardiac events followed. Utilization of imaging for vaccine-related cardiotoxicity has similarly risen. Synchronously, other previously unrecognized causes of myocarditis are now increasingly encountered, including drug-related cardiotoxicity, as seen with new oncologic agents. Clinical history, lab assessment, and imaging remain central to establishing a diagnosis of myocarditis. Cardiac MRI plays an integral role in diagnosis, stratification, and monitoring of recovery from this changing face of myocarditis. Recognition of the evolving etiologies, imaging techniques and revised diagnostic criteria are paramount for appropriate diagnosis.

#### TABLE OF CONTENTS/OUTLINE

This exhibit outlines the timeline of awareness, specific entities and imaging features which comprise the “changing face of myocarditis” including cardiotoxicity related to COVID-19, COVID-19 vaccination, drug reactions including immune checkpoint inhibitors, and cardiotoxicity related to environmental contaminants and other exposures. Cardiac MR plays a key role in diagnosis, stratification, and monitoring of cardiotoxicity in these entities. The specific imaging features and diagnostic considerations are outlined and described in order that the radiologist gains a better understanding of this evolving diagnosis, allowing for appropriate utilization of imaging and improved diagnostic accuracy of this complex disease.

### New CAD-RADS 2.0: What Has Changed from CAD-RADS 1.0

#### Participants

Janio De Paula Santos, MD, Niteroi, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To reinforce the importance of applying the CAD-RADS classification for a better communication with the healthcare providers. To describe the differences between CAD-RADS versions 1.0 and 2.0. To demonstrate with cases how to apply the CAD-RADS 2.0 classification.

#### TABLE OF CONTENTS/OUTLINE

The Coronary Artery Disease Reporting and Data System (CAD-RADS) is a standardized guide created to categorize coronary CT angiography findings and to facilitate communication between the radiological community and referring physicians. A new CAD-RADS classification was recently published with the objective of adding anatomical and functional data, which may offer stronger prognostic value other than just describing the presence or absence of anatomical lesions. What's the same? The main categories (0, 1, 2, 3, 4, 5) based on stenosis severity (0, 1-24%, 25-49%, 50-69%, 70-99%, occlusion) were maintained. Complementary modifiers "G", "S" and "N" standing for the presence of Grafts, Stents, or a Non-diagnostic study were maintained. What has changed? A grading scale for calcific plaque burden was added (P1, P2, P3 and P4). For plaques with features indicating high risk of rupture, the modifier "V" was replaced to "HRP" -> high-risk plaque. An "I" modifier was added if the investigation of ischemia was performed, either by perfusion or FFR-CT. The use of CAD-RADS to report findings provides a clinically useful categorization of CAD and standardizes the way of providing results across imaging sites, which is additionally useful for research purposes.

CAEE-34

### Multimodality Review of Common Mitral Valve Pathology and the Current Surgical Interventions

#### TEACHING POINTS

As the treatments for valvular disease have evolved over the years, the assessment of cardiac valves now often requires multiple imaging modalities, including cardiac CT, cardiac MRI, and echocardiography. The aim of this exhibit is to review the normal appearance as well as common pathologies involving the mitral valve on the various modalities discussed above. Lastly, the current available treatments for mitral valve disease will be reviewed including repairs (such as annuloplasty, valvuloplasty, and mitral valve clips) and replacements (such as surgical valve replacement and transcatheter mitral valve replacement).

#### TABLE OF CONTENTS/OUTLINE

1. Review of the normal appearance of mitral valve on CT, MRI, and Echo. 2. Review of common mitral valve disease including mitral regurgitation, mitral stenosis, mitral prolapse, mitral annular disjunction, flail leaflet, parachute mitral valve, mitral cleft, mitral masses (fibroelastoma, vegetations, thrombus), and mitral annular calcification. 3. Review of the current treatments. Mitral valve repairs include annuloplasty, valvuloplasty, and mitral valve clips. Mitral valve replacements including surgical and more minimally invasive techniques, such as robot-assisted or transcatheter-based TMVR.

### Visualizing the Mitral: An Imager Approach to Mitral Valve Disorders

#### Participants

Mohamed Ibrahim, MD, Birmingham, AL (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Overview on clinical burden of Mitral valve diseases (MVDs) and pertinent anatomy.
- Familiarity with the current imaging approach to MVDs.
- Understand the role of imaging in the management of MVDs.

#### TABLE OF CONTENTS/OUTLINE

- Mitral valve diseases burden and pertinent anatomy
  - o Mitral valve anatomy
  - o Clinical burden of MVDs
  - Current imaging approach to MVDs:
    - o Role of Echo as the main modality for early detection
    - o Complementary role of CT and MR
    - o Comprehensive evaluation of MVDs (Mechanism of abnormality, Quantification, Ventricular remodeling, Vascular changes, Risk stratification, Valve morphology)
- Where does imaging fit in MVDs management?
  - o Assessing etiology, mechanism, and grading
  - o Pre-procedural planning: § Surgery vs Transcatheter intervention § Repair vs replacement
  - Surgical replacement: sternotomy vs Robotic, and the role of CTA and CMR
- Transcatheter replacement: transapical vs trans-septal approaches, and the role of Echo and CT § Favorable anatomical markers, predictors of challenging procedures and contraindications
  - o Intra-procedural guidance and monitoring
  - o Post-procedural Follow up; Devices (stability, leaflet motion, leaks, vegetations/thrombus), Hemodynamics, and chamber size and function)

### Left Ventricular Hypertrophy: An Approach to Differential Diagnosis

#### Participants

Rafael Perez Milan, MD, Leon, Mexico (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Left ventricular hypertrophy (LVH) is a common finding in cardiac magnetic resonance (CMR) with multiple diagnostic considerations.- LVH is an independent predictor of future cardiovascular events regardless of its etiology.- LVH can be defined as follows.- LV myocardial thickness more 12 mm.- Increased LV mass: Body surface area - indexed LV mass (over 95th percentile - 91 g/m<sup>2</sup> in males; 77 g/m<sup>2</sup> in females)

#### TABLE OF CONTENTS/OUTLINE

- To understand basic anatomy and embryology of the left ventricle.- To define left ventricular hypertrophy (LVH) and clinical implications.- To describe the differential diagnosis of LVH.- Role of cardiac magnetic resonance (CMR) in narrowing the differential diagnosis.

Printed on: 04/12/24

## Abstract Archives of the RSNA, 2023

CAEE-37

### Complications of Acute Myocardial Infarction: Infrequent but Lethal

#### TEACHING POINTS

1. Acute Myocardial Infarction (AMI) is a frequent pathology and one of the leading causes of death in the world. Early revascularization has become a standard of care, thus reducing the high associated morbi-mortality. 2. Although infrequent, several secondary complications can occur, particularly when treatment is delayed or inadequate. 3. These are divided into mechanical, inflammatory, arrhythmic, thrombotic, and embolic. 4. CT, and especially MRI, help us to adequately assess cardiac function, ventricular volumes and structure, myocardial viability and possible associated complications.

#### TABLE OF CONTENTS/OUTLINE

- Introduction- General characteristics of AMI and its complications.- Complications are divided into categories, with cases to illustrate each Mechanical complications are most frequently evaluated through CT and MR. In the acute phase, the most frequent are left ventricular free wall rupture, septal ventricular defect, and papillary muscle rupture. In a chronic phase, pseudoaneurysms and ventricular aneurysms are found.- Conclusions. Complications of AMI are infrequent, but they can be potentially lethal. An accurate and early diagnosis significantly improves the prognosis. CT and MRI are the main imaging modalities used after echocardiography.

### Mitral Valve Diseases 101: A Comprehensive Case-Based Review for Radiology Trainees

#### Participants

Mangun Randhawa, MBBS, Boston, MA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Describe the normal anatomy of the mitral valve and imaging modalities used for its evaluation  
2. Discuss various pathologies of native and prosthetic mitral valves, their implications, and their differential diagnoses  
3. Review role of imaging for mitral valve interventions

#### TABLE OF CONTENTS/OUTLINE

1. Morphologic anatomy of the mitral valve  
2. Congenital mitral valve abnormalities : parachute mitral valve, parachute-like mitral valve, Shone complex  
3. Mitral valve prolapse (various types) and mitral annular dysjunction  
4. Mitral annular calcifications, and complications  
5. Infective endocarditis  
6. Mass (different histopathologies)  
7. Pre-procedural and Post-procedural evaluation of mitral valve implantation including prediction of left ventricular outflow tract obstruction post trans-catheter implantation.

### It's All About the Pericardium

#### Participants

Felipe Aluja, MD, MEd, (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Discuss the anatomy of the pericardium and the pericardial recesses with emphasis on CT and MRI. Identify selected entities affecting the pericardium, from benign to malignant, with a brief description of their clinical characteristics. Provide a deep review of the imaging findings from the conventional radiology to MRI, with emphasis in the ancillary findings that aid in the differential diagnosis approach. Describe the pitfalls and mimics of pericardial disease in conventional radiology, CT, MRI and PET/CT.

#### TABLE OF CONTENTS/OUTLINE

- Introduction
- Anatomy of the pericardium and pericardial recesses: from the schemes to the imaging.
- The pericardium in conventional radiology, CT, MRI and PET/CT.
- Conditions of the pericardium:
  - o Air, collections, hemorrhage, and pericardial tamponade
  - o Acute and chronic inflammation (including constrictive pericarditis)
  - o Benign neoplasms
  - o Malignant primary and secondary neoplasms
  - o Congenital lesions
- Try your best? Take home points

### Artificial Intelligence in Cardiac MRI- Applications, Pitfalls Challenges

#### Participants

Prabhakar Rajiah, MD, FRCR, Rochester, MN (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To review the principles of Artificial Intelligence (AI) techniques relevant to cardiac MRI(CMR); 2. To discuss how AI can be applied to the different steps of the CMR; 3. To illustrate common applications of AI in CMR

#### TABLE OF CONTENTS/OUTLINE

1. AI, MACHINE LEARNING, DEEP LEARNING; 2. CHALLENGES OF CMR- complex anatomy, pathology, planes, sequences 3. AI NETWORKS- Convolutional neuronal network (CNN), general adversarial network (GAN); 4. ILLUSTRATION OF CLINICAL APPLICATIONS OF AI IN CARDIAC MRI WITH CASE EXAMPLES AND TECHNIQUES USED A. Upstream- Protocolling, workflow management/prioritization B. Image acquisition- Plane prescription; Patient positioning; Automated cardiac MRI planes; Automated selection of inversion time; B. Image reconstruction- Decreased artifacts; Decreased noise; Decreased acquisition time; Improved resolution- Super resolution ; Virtual Native Enhancement without contrast (VNE); Synthetic strain; C. Segmentation of structures- Ventricular volumes, function, mass in SSFP, Vascular anatomy in MRA; D. Automated quantification- Volumes, mass, function, LGE, parametric mapping (T1, T2, ECV), flow, strain, aortic diameter; E. Automated post-processing- perfusion, 4D flow; F. Classification of disease- Scar from non-contrast cine, Cardiomyopathies, CAD, myocardial infarction, atherosclerotic plaque, valvular disease, heart failure G. Prognostic factors- Risk stratification- Predictive models; H. Radiomics /Textural analysis I. Automated reporting J. Automated CMR pipeline 5. CHALLENGES- Small, biased training datasets, black box, quality criteria for algorithm design; 6. PITFALLS - Inaccuracies; 7. FUTURE DIRECTIONS- Good Machine learning practices.

### Emerging Applications of Non-Contrast Cardiac CT: Beyond Coronary Score

#### Participants

Masafumi Kidoh, MD, PhD, Kumamoto, Japan (*Presenter*) Endowed Chair, Koninklijke Philips NV

#### TEACHING POINTS

Teaching Points 1. Non-contrast cardiac CT is widely used to detect and quantify coronary and heart valve calcium. On the other hand, detection of fat, myocardial edema, thrombus/hematoma, and subtle myocardial calcification beyond coronary and heart valve calcification using non-contrast cardiac CT has not been widely performed, possibly due to poor image quality. 2. Recent advances in CT technology (such as model-based iterative reconstruction and dual-layer spectral/photon-counting CT) have drastically improved the low-contrast resolution of CT images, allowing the detection of small differences in CT values within soft tissue on non-contrast and delayed phase cardiac CT images. Side-by-side viewing of non-contrast cardiac CT images and delayed (or arterial) phase cardiac CT images may be useful in differentiating various pathologies. 3. In this exhibit, we report that non-contrast cardiac CT is useful for the detection and characterization of cardiac low-contrast lesions (soft tissue lesions) beyond coronary and heart valve calcification.

#### TABLE OF CONTENTS/OUTLINE

Table of Contents/Outline 1. Scan and reconstruction techniques for non-contrast cardiac CT - Single-energy CT - Dual-energy CT - Photon-counting CT 2. Principle of CT number in non-contrast cardiac CT 3. Clinical applications: beyond coronary score - Calcification - Thrombus/hematoma - Anemia - Water/myocardial edema - Fat 4. Future directions 5. Summary

### From Cyan to Cinnabar - The Radiologist's Role in Operative Management of Single Ventricle Congenital Heart Disease

#### Participants

Shravan Sridhar, MD, MS, San Francisco, CA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Single ventricle congenital heart diseases are rare and challenging to manage. While historically, outcomes have been poor, recent advancements in surgical management have improved post-operative outcomes and long-term prognosis. Imaging has also advanced from morphologic characterization to assessment of function and flow dynamics. Here, we present a framework for understanding the pathophysiology of the single ventricle state and 3-stage palliation repair, review important imaging-informed decision points along the course of operative management, and present metrics important to long-term outcome and management.

#### TABLE OF CONTENTS/OUTLINE

### Myocardial Strain Analysis Using Feature Tracking

#### Participants

Masaya Kisojara, MD, PhD, Nagoya City, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Myocardial strain refers to the deformation of the walls and chambers of the heart from a relaxed to a contracted state.2. Feature tracking is a technique that enables the analysis of myocardial strain.3. Strain analysis performed in the left ventricle and the left atrium is a better prognostic indicator for heart failure than left ventricular ejection fraction.4. Strain analysis by feature tracking might apply to 4D-CT images.

#### TABLE OF CONTENTS/OUTLINE

1. The concept of myocardial strain and its types: Myocardial strain using feature tracking is an alteration of length in one dimension or spatial orientation. Left ventricular strain is classified as radial, circumferential, and longitudinal strain. Left atrial strain is obtained as global longitudinal strain.2. The principle of features tracking: Template matching is a technique that follows similar templates during the process of myocardial contraction.3. The importance of myocardial strain for patients with heart failure.4. What is left atrial strain? The left atrial strain is an index that reflects the diastolic and contractile capacity of the left atrium. Similar to the left ventricular global longitudinal strain, it is helpful in predicting prognosis in heart failure with preserved left ventricular ejection fraction.5. An experiment using 4D-CT for myocardial strain analysis

### The Role of Gadolinium Enhancement Patterns in Diagnosing Myocardial Diseases at Cardiac MR - Enhancing Residents' Knowledge

#### Participants

Otavio Augusto Ferreira Dalla Pria, MD, Iowa City, IA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The abnormal myocardium can depict different patterns of gadolinium contrast enhancement depending on the cause of the injury. Therefore, assessing enhancement patterns in Cardiac MR plays a pivotal role in diagnosing diverse myocardium diseases. Ischemic cardiomyopathies produce delayed vascular-distributed gadolinium enhancement, and non-ischemic patterns are not limited to vascular territories. Patterns of enhancement distribution are crucial in differentiating between ischemic and non-ischemic heart pathologies and narrowing differential etiologic diagnostics in both. This exhibit aims: 1. To review myocardium gadolinium enhancement MR patterns. 2. To illustrate differential diagnostics based on the type of enhancement. 3. To discuss challenges and confounder factors.

#### TABLE OF CONTENTS/OUTLINE

1- Introduction/Objectives: Cardiac MRI can help diagnose a plethora of myocardial dysfunction. The gadolinium enhancement pattern is one of the characteristics that can help identify differential diagnostics. In this presentation, we summarize and illustrate the 5 types of cardiac MRI enhancement patterns and correlate findings with main differential diagnostics. 2- Case-based approach: Present 5 Patterns of Enhancement in Cardiac MRI (Subendocardial, subepicardial, transmural, patchy, mid-myocardial/mesocardial), correlating with primary differential diagnostics through didactical cases illustration in both ischemic and non-ischemic cardiomyopathies. 3- Limitations, Conclusion, and Take-home messages.

### Role of Multi-Modality Imaging in Cardio-Obstetrics

#### Participants

Prabhakar Rajiah, MD, FRCR, Rochester, MN (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Cardio-obstetrics is an expanding subspecialty that focuses on prevention, early detection, and management of cardiovascular disease (CVD) in pregnancy. 1. To review the cardiovascular complications in pregnancy; 2. To understand disease processes exacerbated by pregnancy; 3. To discuss the role of imaging in cardiovascular complications of pregnancy and pre-conception planning; 4. To understand the concept of pregnancy heart team and risk stratification

#### TABLE OF CONTENTS/OUTLINE

1. INTRODUCTION ;2.PHYSIOLOGICAL CARDIOVASCULAR CHANGES OF PREGNANCY;3. ROLE OF IMAGING IN PREGNANCY;4. IMAGING MODALITIES;5. COMPLICATIONS RELATED TO PREGNANCY (Discussion, clinical features, imaging findings and differential diagnosis with case examples)-Cardiac- Heart failure, arrhythmia, thromboembolism;Obstetrics- hypertension, Preeclampsia, hemorrhage;Perinatal-miscarriage, premature delivery, restricted growth;Venous thromboembolism including PE;Amniotic fluid embolism;Peri-partum cardiomyopathy;Spontaneous coronary artery dissection;Pulmonary hypertension;Hypertensive disorders (Eclampsia/Pre-eclampsia);Heart failure and arrhythmias;6.EXACERBATION OF PRE-EXISTING CVD DURING PREGNANCY (Illustration with case examples)-Inherited aortic diseases;Congenital heart disease;Hereditary hemorrhagic telangiectasia;Valvular disorders;7. PRECONCEPTION PLANNING- Risk stratification;8. CARDIOVASCULAR CHANGES IN ABDOMINAL DISEASES;9. ISSUES RELATED TO IMAGING IN PREGNANCY;- CT- Radiation, contrast agents- MRI- Gadolinium10. APPROPRIATENESS CRITERIA for imaging in pregnancy; 11. FLOW-CHART SHOWING systematic approach to imaging pregnant patients.

### Single Ventricle: A Radiology Primer for Pre-Procedural Evaluation

#### Participants

Prabhakar Rajiah, MD, FRCR, Rochester, MN (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To review the spectrum of lesions that result in a single ventricle 2. To discuss the surgical options in the management of single ventricle 3. To illustrate the different types of single ventricle using case examples 4. To highlight critical imaging parameters necessary for pre-procedural planning

#### TABLE OF CONTENTS/OUTLINE

1. SINGLE VENTRICLE- Definition, types 2. ROLE OF MULTIMODALITY IMAGING- Echo, CT, MRI, Cardiac cath, nuclear medicine 3. CT AND MRI- Indications, protocols, tips and tricks 4. REVIEW AND ILLUSTRATION OF PHENOTYPES OF SINGLE VENTRICLE Right dominant- Hypoplastic left heart syndrome, mitral atresia, double inlet/outlet RV; Left dominant- Hypoplastic right heart syndrome, Tricuspid atresia, Double inlet LV ; Either- unbalanced AV canal (Right/left); Functional single ventricle- TOF with pulmonary atresia, truncus, TAPVR, Severe Ebsteins anomaly, Tricuspid atresia, Double inlet LV/RV, AV canal defect (balanced/unbalanced), heterotaxy 5. ANATOMICAL CHARACTERIZATION- Atrial situs, ventricular situs, great artery relationship, morphologic LV vs RV, functioning/rudimentary ventricles 6. CRITICAL PARAMETERS NECESSARY FOR SURGICAL/INTERVENTIONAL MANAGEMENT - Ventricular function- Poor prognosis if low - Atrial septal restriction - Bulboventricular foramen in DILV or tricuspid atresia with TGA - Atrioventricular valve- Obstruction or regurgitation - Outlet obstruction- Presence and nature - Vascular resistance- Pulmonary and systemic - Patency of ductus arteriosus - Patency of aortic arch - Pulmonary artery anatomy - Venous connections 7. MIMICS- Criss-cross heart; Superoinferior ventricle

### All In Vein"? Anatomy, Variations and Abnormalities of Coronary Venous System with an Emphasis on CT Findings and Clinical Importance

#### Participants

Firat Atak, MD, Ankara, Turkey (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Cardiac CT can provide substantial information regarding cardiac venous anatomy and anomalies although it is mainly used for the evaluation of coronary arterial system. 2. Radiologists can more readily identify cardiac venous anomalies on CT by having a basic knowledge of the normal venous anatomy, adding venous anomalies to the standard checklist, and being aware of the conditions in which these anomalies may be clinically significant. 3. Cardiac venous system anomalies may be vital in percutaneous interventions and surgical procedures as they may fundamentally influence the course of the procedure or change the operation plan.

#### TABLE OF CONTENTS/OUTLINE

A. Overview of normal cardiac venous anatomy B. Scan protocol and postprocessing C. Coronary sinus (CS) variations and anomalies with case examples D. Other cardiac vein variations with case examples E. Clinical importance of the cardiac venous system -Cardiac shunts -Cardiac resynchronization therapy -Coronary sinus pacing -Retrograde cardioplegia -Percutaneous mitral anuloplasty -Percutaneous atriotomy (Levoatrial-to-coronary sinus shunting) for heart failure -Percutaneous in situ coronary venous arterialization (PICVA) -Enlargement of CS and clinical importance of PLSVC - Radiofrequency catheter ablation - Central venous interventions F. Conclusion

### State-of-the-Art Multimodality Imaging of Cardiac Transplant and Complications: A Practical Update

#### Participants

Prabhakar Rajiah, MD, FRCR, Rochester, MN (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To discuss the normal appearances of cardiac transplant 2. To optimize the CT and MRI protocols for evaluation of patients with cardiac transplant 3. To illustrate the imaging appearances of various complications following cardiac transplant

#### TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Indications- Heart failure, intractable angina or arrhythmia, cardiomyopathies, congenital heart disease, cardiac tumor) 3. Cardiac transplant techniques- Orthotopic vs heterotopic, bicaval vs biatrial 4. Role of imaging in evaluation of cardiac transplant 5. Imaging techniques- Echo, CT, MRI, Cardiac catheterization, Intravascular ultrasound, Optical coherence tomography, nuclear medicine 6. Cardiac transplant follow up diagnostic pathway 7. Imaging protocols for follow up= CT-No premedications, Photon counting CT; MRI- Quantitative techniques, T2, T1 mapping; 8. Complications- Review of the following complications with illustrative case examples- Post procedural graft dysfunction; Post surgical- pericardial effusion, mediastinal hematoma; Cardiac Allograft Vasculopathy (CAV) - Diffuse, more aggressive, microvasculature- angiography vs CTA; Acute cellular rejection; Chronic rejection; Accelerated coronary atherosclerosis; Infections; Post-transplant lymphoproliferative disorder; Gout; Osteoporosis; Chronic kidney disease;

### The Heart of the Matter: Pearls and Pitfalls in Cardiac CT

#### Participants

Katherine Chung, MD, Stony Brook, NY (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Cardiac CT imaging is a valuable diagnostic resource for physicians to evaluate cardiac anatomy and function. The indications for CT imaging include evaluation of the coronary vessels for anomalies, presence of coronary artery disease (CAD) and calcium score, pre-TAVR evaluation, pre-ablation study for atrial fibrillation, and observing the patency of grafts, amongst other reasons as well. Although radiologists regularly read these types of images, radiologists-in-training may have variable levels of exposure and can come across cases that lead to confusion. The goal of this presentation is to elucidate the essential pearls of acquiring and evaluating cardiac CT scans, so radiologists-in-training are comfortable and confident with evaluating CT scans and providing appropriate recommendations. Furthermore, we will highlight the common areas of confusion through case-based examples of common pitfalls that may occur.

#### TABLE OF CONTENTS/OUTLINE

1) Introduction 2) Indications and contraindications (Efficacy in disease diagnosis) 3) Definitions and Anatomy 4) Protocols and Techniques for acquiring images 5) Pearls and Pitfalls (Pre-ablation study for atrial fibrillation, Pre-TAVR study, Calcium Score, Coronary Artery Disease, Thoracic aortic aneurysm) 6) Artifacts (Stair Step artifact, Streak artifact from CABG or TAVR patients, Motion) 7) Conclusion

CAEE-52

### From Pumps to Waves: Understanding the Impact of Mechanical Circulatory Assist Devices on Spectral Doppler Ultrasound Analysis

#### Participants

Mateus Soares, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Heart failure (HF) is a syndrome resulting from impaired ventricular filling or ejection. Many patients with HF progress to a refractory state, regardless of advanced therapies. Cardiac transplantation remains the definitive treatment for end-stage disease. Mechanical circulatory assist devices (CAD) help support patients with cardiogenic shock or end-stage HF. It may be used as a short-term device to support hemodynamically unstable patients, including those with the possibility of heart function recovery, or as long-term device usually as a bridge to transplantation. CAD are mechanical pumps that help an impaired ventricle maintain hemodynamics and preserve satisfactory end-organ blood flow. There are commercially available devices to support both the left and right ventricle. In most cases, the spectral Doppler waveform is altered in the setting of a CAD, reflecting systemic hemodynamic changes. Despite the increasing use of these devices, there is not much information in the radiological literature about spectral Doppler changes in these patients. Accurate diagnosis requires a better understanding of CAD mechanisms and associated Doppler ultrasound findings, as well as possible vascular complications.

#### TABLE OF CONTENTS/OUTLINE

Review the normal arterial Doppler waveforms in patients with preserved cardiac function. Describe the mechanisms of various CAD and their hemodynamic impacts on arterial spectral Doppler waveforms. Discuss the main vascular-related complications and the use of ultrasound in diagnosis.

CAEE-53

### **Blood-Flow Volume Quantification Using Phase-contrast MRI in Congenital Heart Disease: Pre- and Post-surgical Evaluation**

#### **TEACHING POINTS**

Phase-contrast (PC) MRI can be used to measure blood flow in patients with congenital heart disease (CHD). Although Doppler echocardiography can provide shunt flow velocities in patients with common CHD such as atrial or ventricular septal defects, it may be limited by natural or surgical variations. On the other hand, PC MRI can provide precise blood flow analysis non-invasively for patients with complex CHDs and post-surgical anatomy. We demonstrate the principles and potential pitfalls of blood flow volume quantification using PC MRI and present some cases such as a coronary fistula, anomalous origin of one pulmonary artery from the aorta, and a patient who underwent a Blalock-Taussig shunt operation.

#### **TABLE OF CONTENTS/OUTLINE**

1. Principles of PC flow volume measurement - A review of PC MRI technique, semi-automatically flow volume measurements 2. Pitfalls of PC flow volume measurement - Velocity encoding (VENC) selection considering aliasing and low phase shift value, spatial and temporal resolution, image plane setting, respiratory motion artifact, validation strategies 3. Blood flow volumes commonly measured in our hospital - Ascending aorta, main/right/left pulmonary artery, superior/inferior vena cava, the cross-section of mitral/tricuspid valve, right/left pulmonary vein 4. Representative cases - Right coronary artery to left ventricular fistula, right pulmonary artery from the descending aorta, post-surgical patients (modified Blalock-Taussig shunt, Glenn procedure, cardiac plug implantation, balloon angioplasty etc.)

CAEE-54

### **A Novel Coronary CT Imaging Technique that Further Improves the Spatial Resolution of Super Resolution Deep Learning Reconstruction**

#### **TEACHING POINTS**

1. Review the current status in coronary CT image evaluation and summarize its limitations 2. Summarize the relationship between spatial resolution and image noise in the current various CT image reconstruction methods 3. Explain the features of the new super resolution deep learning reconstruction (SR-DLR) algorithm trained using the data acquired by the super resolution CT system 4. Proposal of a new imaging method that further improves the spatial resolution of the SR-DLR algorithm and improves the visualization capabilities of coronary arteries, stent lumens, and calcified lesions 5. Comparison of image quality and exposure dose between conventional and new imaging methods

#### **TABLE OF CONTENTS/OUTLINE**

1. Introduction 2. Summarize the limitations of assessment of STENT lumens and calcified lesions using current CT imaging 3. Explains the features and usefulness of the new super resolution deep learning reconstruction (SR-DLR) algorithm trained using data acquired by a super-resolution CT system 4. Limitations of coronary CT imaging under normal scanning conditions using the SR-DLR algorithm 5. Proposal of a new imaging method that further improves the spatial resolution of the SR-DLR algorithm 6. Description of focal spot sizes used in coronary CT for super-resolution and conventional CT systems 7. Presenting the spatial resolution and image noise of small-focus imaging combined with the SR-DLR in conventional CT systems 8. Comparison of images with different focal spot size for stents and calcified lesions in the same cases, presenting the usefulness of small-focus imaging 9. Comparison of exposure dose in imaging at each focal spot size

### Cardiac CT Pearls and Pitfalls: What You Should Know About Anatomy to Avoid Catastrophes

#### Participants

Amalia Aranaz Murillo, MD, Zaragoza, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Understanding the different visual axes in cardiac imaging is crucial for interpreting cardiac anatomy. 2. Familiarity with the characteristics and structures of the atriums and ventricles is essential for accurate diagnosis and assessment of cardiac function. 3. Knowledge of main coronary arteries and their pathways and bifurcations is vital for accurate assessment of coronary artery disease. 4. Understanding the anatomy and branches of the coronary and pulmonary veins is essential for evaluating cardiac function and assessing for potential blockages.

#### TABLE OF CONTENTS/OUTLINE

We sometimes read a poster or a review and feel quite deceived because what you expect to learn you already know. For that reason, this poster will have at the beginning a QA. If you know all the answers, please, do not waste time on it, if not, it might teach you some anatomy tricks. It will be divided into seven blocks that detail the anatomy and structures of the heart in CT. The first block describes the different visualization axes of the heart and evaluates structures such as the anterior and inferior wall of the myocardium, the left atrial appendage, and the coronary sinus. The second block focuses on the characteristics of the right atrium and its different structures. The third describes the components of the ventricles and their structure. The fourth focuses on the major arteries of the heart, including the aorta and pulmonary artery. The fifth block details the four main coronary arteries and their paths and bifurcations. In the sixth, the coronary veins and their tributaries are explained, and finally, the anatomy of the pulmonary veins and their variability in the number and arrangement of drainage orifices to the left atrium is described.

### Complications After Cardiac and Ascending Aorta Surgery

#### Participants

María Guerrero Martin, Madrid, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To understand and distinguish the different types of ascending aorta surgeries 2. To evaluate the pathological findings after cardiovascular surgery, in order to differentiate them from the usual ones 3. To discern the most typical complications in relation to their chronological onset and their follow-up 4. To show the possible options in the management of patients with these complications 5. To emphasize the role of CT in the diagnosis of these conditions

#### TABLE OF CONTENTS/OUTLINE

1. Background and methods 2. Findings 2.1. Techniques used to evaluate postoperative patients 2.2. Common findings after cardiovascular surgery 2.3. Complication following aortic surgery 2.3.1. Early complications: periprosthetic haematomas, pseudoaneurysm formation, distal malperfusion 2.3.2. Late complications: aortic valve regurgitation, infection, anastomotic stenosis 2.4. Complications following cardiac valve surgery: valvular/paravalvular regurgitation, endocarditis, hypoattenuating leaflet thickening, prosthesis-patient mismatch 2.5. Complications following coronary artery procedures: stenosis, thrombosis 3. Our experience 4. Conclusion

### Cardiac MRI in Adult Orthotopic Heart Transplant

#### Participants

Sandra Quinn, Chicago, IL (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Outline unique CMR tissue characteristics of the transplanted heart 2. Discuss tissue characteristics suggestive of acute cardiac allograft rejection in the transplanted heart 3. Outline the role of quantitative myocardial stress perfusion in detection of epicardial and microvascular cardiac allograft vasculopathy 4. Provide an overview of the published data with respect to CMR and adult heart transplant

#### TABLE OF CONTENTS/OUTLINE

1. Cardiac MRI in Orthotopic Heart Transplant· Overview of structural and functional CMR and its role in major complications of heart transplant, i.e., acute cardiac allograft rejection and cardiac allograft vasculopathy.2. CMR Tissue Characterization in Orthotopic Heart Transplant· Describes the general considerations and overview of published values regarding CMR myocardial tissue characterization of the transplant heart.3. Acute Cardiac Allograft Rejection (ACAR)· Outline the published CMR myocardial tissue characterization values for patients with active ACAR and ACAR previous history.4. Cardiac Allograft Vasculopathy (CAV)· Illustrate with a representative clinical case the role of CMR quantitative perfusion in the identification of CAV· Describe expected resting and stress myocardial blood flow and myocardial perfusion reserve in heart transplant recipients vs healthy volunteers· Identify the role of myocardial perfusion reserve for identification of CAV.· 5. The Key Evidence in Summary· Summary table outlining the published evidence for CMR in heart transplant and complications of heart transplant.

### Pre and Postoperative CT Evaluation for Robotic and Minimally Invasive Coronary Artery Bypass

#### TEACHING POINTS

Teaching points: 1. Robotic and minimally invasive coronary artery bypass is a safe and less traumatic surgical technique than open-heart surgery. It is considered the first-choice therapy for selected patients although the adoption has been slow in some institutions. 2. Imaging assessment prior to the surgery and providing relevant information to the surgeons is crucial for identifying suitable patients, anatomic assessment, surgical planning, and predicting outcomes. 3. Being familiar with the spectrum of expected postsurgical findings and complications following robotic and minimally invasive coronary artery bypass surgery is essential for radiologists to contribute to proper patient management.

#### TABLE OF CONTENTS/OUTLINE

Table of Contents/Outline: A. Overview of surgical techniques: TECAB, MIDCAB, robotic assisted B. Indications and contraindications C. CT angiography for preoperative evaluation 1. Scan protocol and postprocessing techniques 2. Preoperative checklists 1) Aorta and iliofemoral arteries 2) Evaluation of lung, pleural plaques 3) Chest wall, diaphragm 4) Heart, pericardium, mediastinum 5) Aorta diameter, pulmonary artery diameter, ascending aortic calcification 6) Internal mammary arteries 7) LAD and other coronary arteries D. Procedural considerations E. Postoperative CCTA assessment, complications F. Conclusion

### Navigating the Vortex: Advancements in Turbulent Flow Detection Using Cardiovascular 4D Flow MRI

#### TEACHING POINTS

4D flow MRI has revolutionized the assessment of in vivo flow dynamics, leading to a better understanding of physiological flow in healthy subjects and those with thoracic aortic aneurysms, chronic aortic dissection complications, and aortic prostheses. A key finding related to altered blood flow is turbulence, which can be visually detected through vortices in 4D flow MRI. However, visual assessment is subjective, prompting the need for quantitative evaluations. Recent advancements have facilitated the quantification of turbulent parameters such as vorticity, energy loss, and turbulent kinetic energy using 4D flow MRI. This presentation will explore clinical evaluation methods for these turbulence indices while discussing specific diseases as examples.

#### TABLE OF CONTENTS/OUTLINE

1. The background of flow analysis a. Clinical demands for flow analysis b. 4D Flow MRI technique for flow analysis c. Primary and secondary flow in a healthy aorta d. Quantification of turbulence - vorticity, energy loss, and turbulent kinetic energy  
2. Thoracic aneurysm a. Helical flows in patients with bicuspid aortic valve b. Association between aneurysmal development and wall shear stress  
3. Aortic dissection a. Blood flow volume quantification - forward and backward flow in the false lumen b. Vortices in the false lumen  
4. Post-prosthetic graft replacement a. Quantification of turbulent blood flow induced by artificial aorta b. Mechanical hemolytic anemia due to aortic arch graft stenosis  
5. Hypertrophic cardiomyopathy a. Vortex flow in the ascending aorta b. Association between turbulent kinetic energy elevation and left ventricular mass increase

### Beyond Coronary Artery Calcium: Cardiovascular Findings in Non-Gated Chest CT Scans

#### Participants

Miguel Barrio Piqueras I, MD, Pamplona, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To review the most common incidental cardiac findings on routine chest CT examinations. 2. To recognize which cardiac findings are relevant and can alter the clinical course and outcome of patients.

#### TABLE OF CONTENTS/OUTLINE

1. Coronary arteries: a). Anatomical variants (dominance) b). Coronary anomalies (origin)-Benign-Malignant c). Coronary artery calcium d). Coronary aneurysm e). Coronary artery fistula 2. Cardiac chambers: a). Intracavitary thrombus 3. Myocardium a). Myocardial infarction -Acute-Chronic b). Cardiomyopathy-Dilated-Hypertrophic c). Primary tumors-Fibroma-Myxoma d). Metastases-Chordoma-Lymphoma-Lung carcinoma-Melanoma e). Pseudotumors -Lipomatous hypertrophy of the interatrial septum 4. Valvular heart disease a). Anatomical variants -Bicuspid aortic valve b). Calcifications -Mitral annulus-Aortic valve 5. Congenital heart disease and thoracic vascular disorders: a). Atrial septal defects b). Patent ductus arteriosus c). Persistent left superior vena cava d). Aortic arch anomalies-Right sided -Double aortic arch e). Anomalous pulmonary venous drainage 6. Pericardial diseases: a). Pericarditis -Infectious-Iatrogenic-Autoimmune-Constrictive b). Pericardial effusion and hematoma c). Pericardial cysts d). Malignant pericardial involvement-Direct invasion-Metastases-Venous extension e). Pericardial fat necrosis

### Quantitative Stress Perfusion Cardiac Magnetic Resonance: Why, How and When?

#### TEACHING POINTS

1. Understand differences between qualitative, semi-quantitative and quantitative stress perfusion. 2. Understand how quantitative stress cardiac MRI (QuantCMR) is performed and calculated as well as how to interpret myocardial blood flow/ myocardial perfusion reserve. 3. Demonstrate clinical role of cardiac MRI quantitative stress perfusion. 4. Illustrate different pathologies and their appearances on cardiac MRI quantitative stress perfusion.

#### TABLE OF CONTENTS/OUTLINE

This exhibit will explain the recent interest and development of QuantCMR and how this differs from qualitative and semi-quantitative stress perfusion. Technical details of how QuantCMR is performed and quantified will be demonstrated along with tips/tricks of how to get high quality perfusion maps. The exhibit will explain differences between dual bolus and dual sequence techniques and issues to be aware of with different stress agents. The exhibit will discuss how QuantCMR is being increasingly recognised as being useful in patients with ischaemia and non-obstructive coronary arteries (INOCA) to diagnose coronary microvascular dysfunction (CMD) as well in standard assessment of obstructive coronary artery disease. Clinical examples of these pathologies will be illustrated. In addition, other cardiac diseases will also be demonstrated to illustrate how QuantCMR perfusion maps appear in different disease entities such as dilated cardiomyopathy and hypertrophic cardiomyopathy. Knowledge gaps and future directions will also be discussed.

### State of the Art on Acute Coronary Syndrome with Negative Coronary Angiography

#### Participants

Cesar Urtasun Iriarte I, MD, Pamplona, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To learn the definition of MINOCA and review the spectrum of causes that manifest as acute coronary syndrome with non-obstructive coronary arteries. To understand the role of cardiovascular imaging, learn about the management and, outline CT and MRI protocols.

#### TABLE OF CONTENTS/OUTLINE

A. Background, diagnosis, and management B. Assessment: CT and MRI protocols C. Acute coronary syndrome with negative coronary angiography a. MINOCA entities - Coronary plaque disruption- Coronary artery vasospasm- Coronary artery dissection- Coronary artery thrombosis/embolism- Coronary microvascular disorder- Myocardial oxygen demand-supply imbalance b. MINOCA-like entities Myocardial location (Tako-Tsubo, myocarditis, hypertrophic cardiomyopathy, dilated cardiomyopathy, infiltrative cardiomyopathy) Other non-cardiac mimickers (Vasculitis, pulmonary embolism, aortic dissection) D. Take-home messages

### Development in Free-Breathing Coronary CTA for Patients With High Heart Rate: Using Non-Device Respiratory Gating Method

#### TEACHING POINTS

Technological advances make Free-Breathing Coronary CTA (FB-CCTA) possible, but there are challenges for patients with higher heart rate (HR). We have developed a protocol of FB-CCTA at high HR using a non-device respiratory gating method.

#### TABLE OF CONTENTS/OUTLINE

We have developed a method to reduce motion artifacts even at high HR from free-breathing images. Since multi-segment reconstruction can improve image quality and diagnostic accuracy at higher HR, Scans and post-processing were performed to allow the segment reconstruction from free breathing images. After electrocardiogram gated Dynamic Volume Scan, to avoid motion artifacts due to breathing, the non-device respiratory gating was performed. The respiratory arrest phase was analyzed using Time-Density-Curve (TDC) plotted from the region of interest drawn on the chest wall of the dynamic image. Multi-segment reconstruction used data from multiple cardiac cycles during respiratory arrest time analyzed from the TDC was performed. In addition, the reconstruction type was applied with full-iterative model-based reconstruction algorithms for improved Signal-To-Noise ratio (SNR). The resulting image was reduced motion artifacts and improved SNR. This method is feasible to provide acceptable image quality and diagnostic performance in CCTA with free-breathing and high HR.

### **Effectiveness of a Contrast Enhancement Boost Technique in Cardiac CT: Improved Detection of Late Iodine Enhancement (LIE) in Non-Ischemic Cardiomyopathy**

#### **TEACHING POINTS**

- To learn about issues of myocardial evaluation with Single-Energy CT.
- To learn about a subtraction technique with non-rigid registration, that can be used to represent an image of the myocardium.
- To learn the principles of the contrast enhancement boost technique (CE-boost) with non-rigid registration.
- To learn about the contrast-improving effects of CE-boost and its diagnostic value in non-ischemic cardiomyopathy.

#### **TABLE OF CONTENTS/OUTLINE**

A. Comparison of CNR between Single-Energy CT and other imaging techniques for non-ischemic cardiomyopathy. B. Advantages of non-rigid registration compared to rigid registration in subtraction techniques. C. Usefulness of non-rigid registration subtraction technique with CE-boost in LIE-CT. D. Clinical case of LIE-CT using CE-boost for preoperative CT examination for TAVI. E. Advantages of CE-boost in non-ischemic cardiomyopathy and its application in clinical imaging.

CAEE-64

### Cardiac MRI for the Beginner: A Step by Step Approach

#### TEACHING POINTS

Cardiac MRI is a non-invasive modality for anatomical, functional and myocardial tissue evaluation of the heart for a variety of cardiovascular diseases. It holds immense diagnostic potential and despite its relative high cost, it is becoming more increasingly mainstay in cardiac evaluation. Some conditions that cardiac MR renders benefits to include ischaemic heart disease, cardiomyopathy, valvular disease, congenital disease, pericardial disease and characterization of cardiac masses. It supplements the initial cardiac work-up by providing an unobstructed field of view, myocardial tissue assessment and remains the gold standard for RV and LV volumetric assessment. It is a complex study and includes an arsenal of MRI sequences including cine, myocardial perfusion, parametric mapping and flow sensitive sequences, all tailored to the specific clinical indication or question. Reading a Cardiac MR for the novice radiologist/cardiologist can be a daunting task. With the need for more Cardiac MR readers and to demystify this process, this poster will aim to provide a basic navigational chart for the novice reader which will provide a foundation for them to build upon. Teaching points: An overview of cardiac MRI sequences, basic principles and utility of each sequence An basic approach to interpreting a cardiac study An algorithm approach to common cardiac conditions with case based examples.

#### TABLE OF CONTENTS/OUTLINE

Basic cardiac MR sequences and their purpose How to approach a Cardiac MR Basic techniques on qualitative and quantitative assessment with tips and tricks Algorithm for common conditions Case based discussion

### **Late Iodine Enhancement of Myocardial with Deep Learning Reconstruction Under Low Radiation Doses and Low Contrast Doses: How to Get the Best Image Quality**

#### **TEACHING POINTS**

Late Iodine Enhancement (LIE) of myocardium in cardiac CT has been reported to reflect fibrotic lesions in myocardium similar to Late Gadolinium Enhancement (LGE) in cardiac MRI, but requires a higher contrast dose and radiation dose due to contrast enhancement and noise effects. To solve this problem, we propose three new points in using imaging, reconstruction and subtraction technology. 1. Imaging technology: Low-voltage imaging according to BMI. 2. Reconstruction technology: Deep Learning Reconstruction (Contrast enhancement parameters "AiCE"). 3. Subtraction technology: special contrast-enhancing subtraction technology "CE-Boost". Using the above three methods enables significant contrast enhancement and noise reduction, even with LIE at low radiation doses and low contrast doses. In addition, using DLR provides stability in the uniformity of CT values required for myocardial Extra Cellular Volume (ECV) quantification.

#### **TABLE OF CONTENTS/OUTLINE**

(1) Combination of three special technologies (2) Reconstruction and subtraction technologies (3) Deep learning reconstruction and special subtraction (4) Stable noise reduction with DLR (5) Combination of three special technologies

### Success Within Your Grasp: Planning for Mitral Valve Transcatheter Edge-to-Edge Repair

#### Participants

Hyun Jung Koo, MD, PhD, Seoul, Korea, Republic Of (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To recap the evidence of mitral edge-to-edge repair in both primary and secondary mitral regurgitation To demonstrate preprocedural imaging modalities to help appropriate patient selection and interventional guide To understand intraprocedural imaging and post-procedural imaging findings

#### TABLE OF CONTENTS/OUTLINE

1. Evaluation of mitral regurgitation (MR) 1) Etiology of MR - Primary mitral regurgitation - Secondary (functional) mitral regurgitation 2) Quantification of MR 2. Types of percutaneous mitral valve repair 3. Patient selection for M-TEER - AHA/ACC Guidelines for M-TEER - Review of Trials: EVEREST II trial, COAPT trial, MITRA-FR trial - Anatomically suitable mitral valve morphology 4. Pre-procedural planning for M-TEER - Echocardiography and cardiac CT - Evaluation parameters 5. Intra-/Post- TEER imaging of M-TEER 6. Potential complications after M-TEER

### Multimodality Imaging in Sports Cardiology: New Kid on the Block

#### Participants

Prabhakar Rajiah, MD, FRCR, Rochester, MN (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Although athletes' have low prevalence of coronary artery disease (CAD), they are prone for other cardiovascular disorders, which should be evaluated prior to suitability for athletic activity. 1. To review the role of Sports Cardiology, a relatively new subspecialty focused on athletes 2. To discuss the role of imaging, particularly MRI in the diagnosis of athlete's heart which is a structural adaptive change that overlaps with cardiomyopathies. 3. To illustrate with case examples the various entities that are encountered in athletes.

#### TABLE OF CONTENTS/OUTLINE

1. SPORTS CARDIOLOGY- INTRODUCTION a. Pre-athletic activity screening for diseases that may be worsened with sports activities b. Evaluation of diseases that cause adverse events in athletes 2. ROLE OF IMAGING- Echo, MRI, CT 3. MRI SEQUENCES AND PROTOCOL 4. ADAPTATIVE CHANGES IN ATHLETES= Endurance- Volume overload, increased wall stress, eccentric hypertrophy; Strength- Pressure overload, increased wall stress, concentric hypertrophy 5. MYOCARDIAL FIBROSIS IN ATHLETES- Prevalence and pattern 6. ATHLETE'S HEART (WITH CASE EXAMPLES)- Diagnostic criteria controversies; Distinguishing from mimics (Grey zone) a. Hypertrophic cardiomyopathy b. Dilated cardiomyopathy c. LV non compaction d. Arrhythmogenic cardiomyopathy 7. DISEASES CAUSING SUDDEN CARDIAC DEATH IN ATHLETES (with case examples) a. HCM b. ARVD C. Anomalous coronary arteries d. Commotio cordis e. Myocarditis 8. SCREENING STRATEGIES WITH IMAGING IN PROFESSIONAL ATHLETES 9. CTA IN RISK STRATIFICATION OF CORONARY ARTERY DISEASE 10. VETERAN ATHLETES AND MYOCARDIAL FIBROSIS- ARRHYTHMIA 11. ATHLETES AND COVID-19 12. MANAGEMENT OF INCIDENTAL FINDINGS IN ATHLETES

### The Minimal Essence of Machine Learning for Cardiovascular Diagnosis

#### Participants

Ryo Ogawa, PhD, MD, Toon, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Various information related to medical data can be obtained by machine learning. We explain how machine learning are used to cardiovascular diagnosis. 1. To review the role of machine learning.2. To explain the application of machine learning in cardiovascular diagnosis.3. To explain the principle of machine learning.

#### TABLE OF CONTENTS/OUTLINE

1. Linear regression; overview, algorithm, example (heart failure)2. Logistic regression; overview, algorithm, example (history of heart disease)3. Support vector machine; overview, algorithm, example (Differentiation of cardiomyopathy)4. Random forest; overview, algorithm, example (Differentiation of cardiomyopathy)5. Neural network; overview, algorithm, example (Classification of myocardial infarction)6. Explainable AI; overview, algorithm, example (Gradient-weighted class activation mapping, Guided gradient-weighted class activation mapping)7. Generative AI; overview, algorithm, example (Deep convolutional generative adversarial network)

### Denoise to Visualize: The AI-Driven Post-Hoc Denoising for High-Fidelity Cardiac CT

#### Participants

Tatsuya Nishii, MD, PhD, Suita, Japan (*Presenter*) Speakers Bureau, Guerbet SA; Speakers Bureau, General Electric Company; Speakers Bureau, Siemens AG; Research Grant, Canon Medical Systems Corporation

#### TEACHING POINTS

In cardiac CT, maintenance of the increased image noise from photon insufficiency is crucial while upholding high resolution. CT manufacturers have developed iterative and deep-learning reconstruction methods, but disparities exist. Advancements in AI enable image restoration, such as denoising through post-processing allowing radiologists to develop image-processing AI promoting the "democratization" of technology. This exhibit presents the development of a denoising method for high-fidelity cardiac CT using image-based deep learning and its clinical applications. Participants will learn about democratized image-processing AI and engage in its development and clinical application. In enhancement, we showcase cardiac CT images with the application of noise reduction technology, aiming to generate new ideas for diagnostic and prognostic imaging.

#### TABLE OF CONTENTS/OUTLINE

1. Importance of noise reduction in cardiac CT 1.1 Cardiac CT imaging techniques 1.2 Noise's adverse effects 2. AI denoising method differences 2.1 Deep-learning image reconstruction 2.2 Deep-learning post hoc denoising 3. Denoising AI development Process 3.1 Optimal network selection 3.2 Data preparation essentials 3.3 Training, validation, and testing 3.4 Implementation highlights 4. Clinical Showcases 4.1 Exposure Reduction 4.1.1 1/4 dose coronary CT angiography 4.1.2 1/3 dose myocardial delayed enhancement CT 4.1.3 Low-dose pediatric cardiac CT 4.2 Image quality enhancements 4.2.1 Improved diagnostic performance of coronary CT angiography 4.2.2 Enhanced myocardial delayed enhancement CT 4.2.3 Enhanced 3D rendering images

### Atrial Septal Defects: A Multimodality Case-Based Approach

#### TEACHING POINTS

Outline the most common atrial septal defects and their associations. Demonstrate the role of cardiac MRI and CT in the diagnosis of atrial septal defects. Illustrate, through case reviews, the imaging findings of atrial septal defects. Discuss treatment options and morphological characteristics to treatment decisions.

#### TABLE OF CONTENTS/OUTLINE

This review presents a multimodality case-based approach to the diagnosis of Atrial Septal Defects (ASDs). ASDs are the most common congenital cardiac anomaly. Ostium secundum is the most common ASD. Some congenital syndromes, including Holt Oram Syndrome and Lutembacher Syndrome, have ostium secundum type septal defects as part of their spectrum. Sinus venosus can present as a superior or inferior defect, each with different anatomical associations. Ostium primum is within the spectrum of atrioventricular septal defects and is associated with endocardial cushion defects and Trisomy 21. Coronary sinus atrial septal defect is a rare disease presenting as permeability of the coronary sinus. Raghbir syndrome is a type of coronary sinus ASD defined as a PLSVC draining to an unroofed coronary sinus. The roles of CT and MRI offer information on coronary and pulmonary diseases, as well as other anatomical variations that can impact the patient's treatment. MRI also enables functional assessment of the flow, cardiac function, and myocardial tissue characterization. Ostium primum/atrioventricular septal defects, coronary sinus defects, and sinus venosus defects are often treated surgically, while septum secundum type defects can be treated with transcatheter closure. The decision is based on the size, number, and shape of the defects.

### Quantitative Myocardial Perfusion MR: State-of-the-Art

#### Participants

Roberta Catania, MD, Chicago, IL (*Presenter*) Institutional Research Grant, Siemens AG

#### TEACHING POINTS

1. Quantitative perfusion MR is an objective and more reproducible tool to identify myocardial perfusion defects and differentiate artifacts compared to only qualitative assessment. 2. Quantitative perfusion MR is a non-invasive tool that can add significant value in the work-up of patients with suspected coronary artery disease and surveillance of post heart transplant patients.

#### TABLE OF CONTENTS/OUTLINE

Introduction - Physiology of myocardial circulation at rest and stress and autoregulation - Overview of current noninvasive imaging techniques for coronary artery disease assessment and their accuracy - Clinical applications of myocardial perfusion imaging including assessment for epicardial and microvascular coronary artery disease and heart transplant surveillance Imaging techniques - Pharmaceutical stress agents: mechanism of action and contraindications - Cardiac perfusion MR: physical principles, imaging sequences and protocol - Quantitative analysis: Ø Current quantification techniques (automated pixel-wise and dual sequence approach) Ø Absolute quantification and myocardial perfusion reserve (MPR) Imaging interpretation and case study- How to interpret quantitative perfusion and key information to be provided in radiology report - Normal quantitative myocardial perfusion MR - Atlas of different radiologic findings - Troubleshooting interpretations of complicated quantitative perfusion MR findings

### Utility of Non-contrast MRI for Preprocedural Assessment in Patients Undergoing TAVI

#### Participants

Naoki Hosoda, Tokyo, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To learn about the pre-procedural assessment for transcatheter aortic valve implantation. To learn about the validity of non-contrast MRI assessment. To learn about non-contrast MRI imaging protocols. To learn about the benefit patient gain by alternative non-contrast MRI.

#### TABLE OF CONTENTS/OUTLINE

A. Non-contrast MRI can be used as an alternative to contrast CT for patients with CKD and contrast allergies. B. Usefulness of non-contrast MRI to measure in the same way as contrast CT. C. Short imaging protocol focused on pre-procedural assessment of TAVI. D. Non-contrast MRI not only allows assessment comparable to contrast CT, but also avoids risks for patients with CKD and contrast allergy and allows radiation free imaging.

### Dual-energy Late Iodine Enhancement Cardiac CT: What is Necessary to Achieve with Dual-Layer Spectral CT?

#### TEACHING POINTS

A. To learn about late iodine enhancement (LIE): Imaging technique with dual-layer spectral CT. B. To learn how spectral imaging solves conventional imaging problems. C. To learn about the use of iodine density image for myocardial extracellular volume (ECV). D. To illustrate various clinical applications of these techniques by presenting clinical images.

#### TABLE OF CONTENTS/OUTLINE

A. Methods of scanning and contrasting late iodine enhancement (LIE) using dual-slice spectral CT. And their advantages and disadvantages. B. Advantage of spectral images over conventional CT for LIE. C. LIE image analysis. LIE by image subtraction and myocardial extracellular volume (ECV) by iodine concentration images. D. Evaluation of myocardial viability by LIE. Evaluation of OMI by subtraction-LIE. E. LIE myocardial viability evaluation. Evaluation of cardiomyopathies by ECV.

### The ABC's of ECG - Practical Tips and Tricks for Salvaging ECG-Gated Cardiac CT

#### Participants

Prabhakar Rajiah, MD, FRCR, Rochester, MN (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Distinguish the various artifacts commonly encountered in ECG-gated cardiac CT 2. Recognize whether the artifact can be repaired, reduced, or read around 3. Employ ECG sync point editing and composing to salvage cardiac CTs degraded by artifacts from heart rate rhythm, and ECG-gating error

#### TABLE OF CONTENTS/OUTLINE

1. Introduction Basics of ECG interpretation; ECG-gating techniques, trade-offs, applications; 2. Distinguishing respiratory/patient motion vs. gating artifact 3. ECG Gating Error: Missing Data (interpolation artifact)- Pitch too high on retro helical - data gaps; Missing Sync Points; 4. ECG Gating Error: Misplaced Data (duplication artifact)- Peaked T-waves; 5. Gating Artifact with correct ECG Gating: Tachycardia or Arrhythmia- PVCs; PACs; Long pause (PVC, PAC, dropped beat); Afib other beat-to-beat Irregularity; 6. ECG-editing options- Sync point editing-Missed a beat/tagged wrong thing/helical; Sync point composing: R wave tagged, manipulation of reconstructions to read-around; 7. A systematic approach for troubleshooting ECG-gating errors and artifacts including case examples- Respiratory motion artifact- Normal ECG; Sinus tachycardia- Multisegment reconstruction; Heart rate change- Can sometimes be read-around; PVC without pause- Eliminate PVC sync; PVC with long pause- Eliminate PVC sync; Add evenly spaced sync points in pause; PAC- eliminate PAC sync or retain it extra, even sync points in best systolic phase; Atrial tachycardia- Sync in best systolic phase; Severe bradycardia- Two separate syncs in diastole; Atrial fibrillation- Artificially space sync points at each R-R interval so they line up each beat;

### Tumors of the Heart: From the Right Side to the Left Side

#### Participants

Felipe Aluja, MD, MEd, (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Discuss the most common cardiac masses, including their typical manifestations and associations, and a brief discussion of clinical scenarios. Describe the imaging signs of cardiac tumors in computed tomography, magnetic resonance imaging and PET/CT. Identify selected cardiac tumors commonly encountered in daily practice and integrate them with the clinical manifestations.

#### TABLE OF CONTENTS/OUTLINE

- Introduction
- Classification with brief but concise clinical presentation
- Imaging signs of cardiac tumors in computed tomography, magnetic resonance imaging and PET/CT.
- Selected cardiac tumors:
  - o Primary: § Myxoma § Fibroelastoma § Atrial hemangioma § Lipoma § Rhabdomyoma § Fibroma § Angiosarcoma § Lymphoma § Paraganglioma
  - o Secondary: § Metastasis
- Pitfalls in cardiac tumors:
  - o Vegetations
  - o Intracavitary thrombus
  - o Lipomatous hypertrophy
- Take a guess?
- Take home points

### Solving the Mystery: Cardiac Devices on Chest Radiographs

#### TEACHING POINTS

Heart disease is the leading cause of mortality in the United States. Advances in clinical care leading to new devices and treatments allow patients to live longer. Radiologists encounter chest radiographs daily, many with cardiac devices. On radiographs, devices will typically be visible, and it is essential for radiologists to recognize them, know appropriate positioning, and understand complications related to the devices to provide appropriate patient management. Inaccurate interpretation may lead to inappropriate management, delayed diagnosis, and delay of necessary or harmful interventions. The purpose of this exhibit is to walk through common and uncommon cardiac devices, their appropriate positioning, and complications related to mispositioned devices, as well as discuss pathophysiology of some devices. Cardiac rhythmic controlled devices, cardiovascular support devices, stroke prevention devices, cardiac valve support and prosthetic valves, and miscellaneous devices will be reviewed.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction to common cardiac devices 2. Classification of these devices 3. Expected positioning of cardiac devices 4. Visible and barely visible devices on CXR 5. Pathophysiological mechanisms of these devices 6. Examples of mispositioned devices 7. Complications related to incorrectly positioned devices 8. Less common/miscellaneous devices and their positioning 9. Flowchart of what to do with a mispositioned devices (urgent versus emergent) 10. What cardiologist expects from radiology report?

### Simplifying Semantic Segmentation in Cardiac MR: An Intuitive Guide for Radiologists using Transfer Learning

#### TEACHING POINTS

Understanding the importance of semantic segmentation in cardiac MR imaging  
Review of available solutions for segmentation and evaluation metrics  
Introduction to approaches for segmentation using Transfer learning  
Guided approach to a simplified segmentation process using high-level API for low-code development.  
Best practices for achieving accurate segmentation

#### TABLE OF CONTENTS/OUTLINE

I. Introduction to Segmentation in Cardiac MRI Imaging  
Definition of image segmentation and its types.  
Need for segmentation in cardiac MRI imaging  
Available solutions for image segmentation and metrics for assessing accuracy  
II. Introduction to TorchIO, MONAI and FAST AI Libraries for Medical Image Analysis  
Overview of libraries.  
Understanding the Data to Model pipeline.  
Importance of Using Transfer Learning.  
Use of High-level APIs for low-code model development. III. Step-by-Step Demonstration of Segmentation using Google Colab and the Heart MRI Dataset  
Setting up the Google Colab environment  
Introduction to the Heart MRI dataset from the Medical Segmentation Decathlon challenge provided by King's College London  
Step-by-step demonstration of target segmentation of the left atrium with minimal lines of code  
IV. Best Practices for Achieving Accurate Segmentation  
Tips for optimising segmentation accuracy  
Strategies for addressing common segmentation challenges  
V. Conclusion  
Summary of key teaching points  
Future directions in semantic segmentation in cardiac MR imaging (like use of generative adversarial network (GAN))

### A Precarious Path - Complications of 3-stage Palliative Surgery for Single Ventricle Congenital Heart Disease

#### Participants

Shravan Sridhar, MD, MS, San Francisco, CA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Single ventricle congenital heart diseases are most commonly managed with 3-stage palliation which culminates in the Fontan procedure. Post-operative imaging has been instrumental in assessing for complications both in the short term and long term and ensuring patient longevity. Here, we present some of the most commonly encountered complications associated with 3-stage palliation including early post-operative complications, features of physiologic decompensation, and late-stage downstream effects attributed to the unique physiology in these patients. Where appropriate, we review practical tips and pitfalls in imaging this unique set of patients.

### Left Atrial Appendage Assessment in Enhanced Cardiac CT

#### Participants

Ronghui Ju, MD, PhD, Shenyang, China (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

In a recent study using cardiac computed tomography (CT) and magnetic resonance (MR), the shapes of the left atrial appendage (LAA) in patients with drug-refractory AF were classified into 4 morphological types, with "chicken wing" being the most common (48%), followed by "cactus" (30%), "windsock" (19%), and "cauliflower" (3%). Transcatheter left atrial appendage occlusion is an increasingly used alternative to oral anticoagulation in selected patients with atrial fibrillation. Pre-procedural imaging is a prerequisite to a successful intervention, with transesophageal echocardiography as the current gold standard. However, cardiac CT offers improved imaging with high-quality multiplanar and 3-dimensional reconstructed images. Nevertheless, the lack of a standardized imaging protocol has slowed the adoption of cardiac CT into clinical practice. This paper provides a protocol for the preparation, acquisition, and interpretation of cardiac CT imaging in pre-procedural planning of left atrial appendage occlusion. Orifice (OR) is defined as a line connecting the left upper pulmonary vein ridge and the circumflex coronary artery. Device landing zone (LZ) is defined as a line connecting the circumflex coronary artery and a point 1-2 mm inside the LAA, measured from the left upper pulmonary ridge tip. Length/depth of the appendage is measured as a line from the landing zone to the most distal tip of the appendage.

#### TABLE OF CONTENTS/OUTLINE

OutlinePage 1: What to assess about left atrial appendage(LAA) in an enhanced cardiac CT Page 23: 4 types of LAA morphologies (VR reconstruction) Page 4: LAA recognition and assessment of orifice and landing zone in multiplanar reconstruction images

CAEE-8

### Coronary Artery Vasculitis, Encasement, and Mimics

#### TEACHING POINTS

1. Coronary artery vasculitis is an inflammatory process that is often distinguished from coronary artery encasement from benign and malignant neoplasms, although imaging appearances can overlap. 2. Coronary artery vasculitis is rare but represents an important diagnostic consideration, especially for acute coronary syndrome (ACS) patients with no traditional cardiovascular risk factors or systemic illness. 3. There are several mimics of coronary artery vasculitis, demanding careful attention to multi-organ findings and clinical presentation.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction. 2. Spectrum of coronary artery vasculitis and encasement. 3. Review and illustration of coronary artery vasculitis, including: polyarteritis nodosa, Kawasaki's disease, Takayasu's arteritis, giant cell arteritis, HIV. 4. Review and illustration of coronary artery encasement, including: malignant neoplasms (lymphoma, angiosarcoma), IgG4-related disease, Histiocytic disorders (Erdheim-Chester disease, Rosai Dorfman). 5. Complications of coronary artery vasculitis: aneurysms, stenosis, CHF. 5. Mimics of coronary artery vasculitis: spontaneous coronary artery dissection (SCAD), acute plaque rupture, vasospasm.

### Women's Heart: Role of Cardiac Imaging in Early Detection and Prognostication of Heart Diseases- A Primer for Cardiac Imagers

#### Participants

Barun Bagga, MBBS, Mineola, NY (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. The diagnosis of heart disease in women poses unique challenges and remains underdiagnosed and undertreated. 2. Understanding the different etiologies of chest pain in women focusing on Acute myocardial infarction (AMI), MINOCA (myocardial ischemia with non-obstructed coronary arteries), myocarditis, Takostubo, LV apical ballooning, and connective tissue disease-related cardiomyopathy.3. AMI has a different presentation, underlying pathophysiology, and outcomes in women compared to men.4. MINOCA is more common in women and in a younger population, with fewer traditional risk factors for coronary artery disease (CAD) and a higher prevalence of non-obstructive coronary plaques.5. MINOCA has a higher all-cause mortality at 12 months compared to stable angina and has been found to have worse quality of life compared to AMI-CAD because they are less often treated with beta-blockers and less often referred to cardiac rehabilitation.6. Cardiac MRI (CMRI) plays a crucial role in the diagnostic algorithm because of accurate myocardial characterization independent of the presence of obstructive coronary lesions.7. CMRI has been shown to provide an etiologic diagnosis in as many as 77-87 % of cases of MINOCA and offers prognostic value with the extent of LGE involvement correlated with the risk of major cardiovascular events.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction. 2. Review the different causes of chest pain in women in a case-based approach: a) MINOCA; b) SCAD; c) Myocarditis; d) Takostubo; e)LV apical ballooning; f)AMI; g)Connective tissue disease-related cardiomyopathy. 3. Review the role of cardiac imaging in diagnosis and prognostication.

### Improved Assessment of Coronary Artery Calcium in Photon-Counting Detector CT: A Phantom Study with Various Imaging Modalities

#### Participants

Nobuo Kitera, RT, MSc, Nagoya, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Accurate assessment of calcified lesions in coronary arteries can help establish better treatment strategies. 2. CT can obtain preoperative calcification. information of coronary arteries, but it is difficult to completely complement intravascular imaging due to limitations in spatial resolution and other factors. 3. Photon-counting detector (PCD) CT has higher spatial resolution than conventional energy-integrating detector CT and is expected to improve the ability to visualize microstructures. 4. PCD-CT has the potential to provide new diagnostic value as a preoperative diagnostic tool by acquiring highly accurate coronary artery calcification imaging.

#### TABLE OF CONTENTS/OUTLINE

1. Importance of coronary artery calcification assessment in percutaneous coronary intervention. 2. Characteristics of coronary artery calcification images in various imaging modalities. 3. Features of PCD-CT, including principles of high-resolution imaging, and selection of scan mode and reconstruction kernel. 4. Comparison of PCD-CT images with other imaging modalities using calcified phantom.

CAEE-82

### **Congenital Mitral Valve Disease: From Embryology to Pathology to Repair**

#### **Participants**

Jonathan Liu, MD, San Francisco, CA (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Congenital mitral valve disease can present in a myriad of ways, often differing in morphology, age of presentation, and symptoms. By understanding the development of the mitral valve apparatus, congenital mitral valve disease can be categorized based on which underlying apparatus structure is maldeveloped. The most common and clinically relevant mitral valve pathologies are discussed. Next, the general approach to evaluation of these congenital mitral valve pathologies is reviewed, highlighting the strengths and weakness of each imaging modality (CT, MRI, and echocardiography). Methods for quantification are also reviewed. Finally, the general approach to mitral repair and replacement in the context of congenital heart disease will be discussed.

#### **TABLE OF CONTENTS/OUTLINE**

1. Introduction  
2. Embryology and normal anatomy  
3. Anomalies based on location  
a. Supravalvular Lesions  
b. Anomalies of leaflets  
c. Anomalies of chordae  
d. Anomalies of papillary muscles  
e. Associated congenital heart diseases  
4. General approach to evaluation of congenital mitral valve disease  
a. Morphology  
i. Lesions best diagnosed by CT  
ii. Lesions best diagnosed by MRI  
iii. Lesions best diagnosed by echocardiography  
b. Flow  
i. Mitral regurgitation  
ii. Mitral stenosis  
iii. Mixed physiology  
5. Correction of congenital mitral valve disease  
a. Mitral valve repair  
b. Mitral valve replacement  
6. Conclusion

CAEE-83

### **Congenital Aortic Arch Anomalies: What the Clinician Wants to Know**

#### **Participants**

Muhammad Naeem, MBBS, Saint Louis, MO (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Anomalies and congenital variants of the aortic arch are important entities to be familiar with, as they are known to be associated with congenital heart disease, vascular rings, genetic syndromes, and can have significant impact in clinical management. It is postulated to occur as a result of abnormal embryonal organogenesis of the primitive aortic arches. Advanced imaging, specifically computed tomography angiography (CTA) and magnetic resonance angiography (MRA) play a crucial role in the pre-operative planning, as these cases present an anatomic challenge for surgical intervention. Imaging is essential in the diagnosis, management, surgical planning and eventual outcome in patients with congenital arch anomalies. This exhibit will outline the imaging that may be required, and the information needed by the surgeon to attain the best possible surgical outcome.

#### **TABLE OF CONTENTS/OUTLINE**

1. Review anatomy of various congenital aortic arch anomalies, focusing on clinically significant anomalies that require surgical correction, through case-based examples. 2. Understand what are the most salient findings that should be reported to the surgeon in these case examples, so that pre-operative planning is optimized. We will review the clinically significant variants of congenital arch anomalies that require surgical correction, which may be unfamiliar due to their rarity in clinical practice. We will utilize case-based examples to demonstrate what the important imaging findings the radiologist should review and report to the surgeon. Our focus will cover the impact a radiologist can have in detecting these variants and to provide all the critical information to the surgeon, before an operation occurs.

Printed on: 04/12/24

## Abstract Archives of the RSNA, 2023

CAEE-84

### Imaging findings in Cardiac and Lung Transplant Emergencies and Urgencies

#### Participants

Thangalakshmi Sivathapandi, MD, Johns Creek, GA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Having comprehensive knowledge about hyperacute/acute complications of heart and lung transplants is crucial as imaging plays a vital role in the multidisciplinary management of these patients. 2. Despite many advances, a disproportionate portion of mortality still occurs in the early post-transplant period, hence prompt recognition of these complications is essentially needed to prevent allograft failure and death. 3. Accurate reporting by the radiologist could aid the clinician for timely intervention and appropriate patient care.

#### TABLE OF CONTENTS/OUTLINE

1. Overview: To review the salient radiological findings in hyperacute and acute complications of heart and lung transplant. 2. Heart transplant: primary graft dysfunction, post operative bleeding, pericardial tamponade, inferior and superior vena cava stenosis/injury, thromboembolism, sternal dehiscence, pseudoaneurysm, pulmonary edema, infection, and acute rejection. Highlighting the key findings of cross-sectional imaging studies including ultrasound, computed tomography, and magnetic resonance imaging with primary emphasis on CT findings. 3. Lung transplant: chest wall/pleural defects like wound dehiscence, acute and hyperacute rejection, primary graft dysfunction, bronchovascular anastomotic complications such as lobar torsion, bronchial dehiscence, and pulmonary arterial and venous stenosis/thrombosis, as well as bacterial, viral, and fungal infections among others.

CAEE-85

### The Emerging Role of Cardiac CT in Clinical Practice of Cardiac Amyloidosis

#### Participants

Seitaro Oda, MD, Kumamoto, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Recent research has revealed a considerable number of hidden cardiac amyloidosis (CA) especially in patients with heart failure with left ventricular hypertrophy. CA is, however, frequently misdiagnosed as the other hypertrophic heart disease, and delayed diagnosis results in significant consequences for patients. 2. Current noninvasive diagnostic imaging strategies for CA include echocardiography, cardiac MRI, and bone scintigraphy. 3. Myocardial late iodine enhancement (LIE) and extracellular volume (ECV) quantification by cardiac CT has become clinically available and clinical evidence is accumulating. 4. Since CT is more practical than MRI and scintigraphy, it plays a clinically important role in the diagnosis and management of CA.

#### TABLE OF CONTENTS/OUTLINE

1. Basic knowledge of CA: - Classification of CA - Recent development on therapeutic agents 2. Current noninvasive diagnostic imaging strategies: - Echocardiography - Cardiac MRI - Bone scintigraphy 3. Myocardial tissue assessment using cardiac CT: - LIE imaging - ECV quantification - CT imaging protocols 4. The emerging role of cardiac CT for CA: - Efficient diagnostic flow and current evidence - Use in patients with mechanical devices - Application in patients with aortic stenosis - Application in patients with atrial fibrillation - Monitoring of therapeutic effect 5. Future directions

Printed on: 04/12/24

CAEE-86

### Genotype and Imaging Phenotype in Dilated and Arrhythmogenic Cardiomyopathy

#### Participants

Seitaro Oda, MD, Kumamoto, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. With the rapid increase in the number of heart failure patients worldwide, research on personalized medicine for cardiomyopathy based on genomic information is being promoted. 2. In recent years, the relationship between genotype and phenotype in dilated cardiomyopathy (DCM) and arrhythmogenic cardiomyopathy (ACM) has been clarified. 3. Important pathogenic variants include titin (TTN), filamin C (FLNC), lamin A/C (LMNA), and desmoplakin (DSP), with characteristic genotypic-imaging phenotypes. 4. This presentation summarizes new findings on genotype-imaging phenotypes in DCM/ACM.

#### TABLE OF CONTENTS/OUTLINE

1. Evolving disease concept of DCM/ACM: - New diagnostic criteria for ACM (Padua criteria) - Arrhythmogenic right ventricular cardiomyopathy (ARVC) and arrhythmogenic left ventricular cardiomyopathy (ALVC) - Overlap of ACM and DCM 2. Genetic basis of DCM/ACM: - Genes encoding constituent proteins of cardiomyocytes - Genetic variants causing DCM/ACM 3. Genotype-imaging phenotypes in DCM/ACM: - Titin (TTN) - Filamin C (FLNC) - Lamin A/C (LMNA) - Desmoplakin (DSP) - Others 4. Important MRI, CT imaging findings: - Fibro-fatty replacement of myocardium - Ring-like delayed enhancement 5. Future directions

### Diagnosis of Coronary Microvascular Disease, Principle, Challenges, and Emerging Technologies of CT and MRI

#### Participants

Takanori Kokawa, MD, Tsu, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To review the definition, classification, and standard diagnostic steps of coronary microvascular disease (CMD).2. To discuss the role of PET, MRI and CT in the diagnosis of CMD.3. To illustrate emerging CT and MRI technologies for characterizing CMD.

#### TABLE OF CONTENTS/OUTLINE

A) Definition and epidemiology of CMD.B) Pathophysiology of CMD.C) Diagnostic criteria and standard approach for CMD.D) Role of non-invasive imaging modalities including PET, MRI and CT.E) Emerging technologies for assessment of CMD. a. Myocardial blood flow quantification by MR perfusion imaging and CT perfusion imaging.(Clinical example - normal CCTA, subendocardial perfusion defect, reduced CFR by MRI) b. Coronary sinus flow assessment by phase-contrast cine MRI c. Fractal analysis of dynamic myocardial CT perfusion. d. Potential of photon-counting CT for characterizing myocardium.

CAEE-88

### Demystifying the Mysteries of Heart Tumors and Tumor-like Conditions: A Succinct Approach for Radiologists

#### Participants

Aniket Agarwal, MBBS, New Delhi, India (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Highlight the basic protocol of cardiac magnetic resonance imaging and simplifying the anatomy to help alleviate the cardiac-MR phobia. Devise an algorithmic approach to narrow down the differential for cardiac masses by using the clinical history, age, signal intensity, location and enhancement characteristics of the mass. Each sequence tells its own story. Double inversion recovery sequence, Triple inversion recovery has their own advantage. Early and late gadolinium enhancement characteristics of the mass is one of the most important features in differentiating a thrombus from a myxoma and a fibroma from a sarcoma. Rhabdomyomas are usually multi-focal non-enhancing or hypoenhancing lesions. Cine sequences provide assessment of mass mobility, its attachment points and hemodynamic impact on cardiac valves. Characterization for differentiation between benign and malignant features.

#### TABLE OF CONTENTS/OUTLINE

Cardiac MR protocol and basic cardiac MRI sequences. Important anatomical landmarks. Sequence wise diagnostic approach - What to look on which sequence? Algorithms- cardiac tumor classification based on benign/malignant, age, location, imaging characteristics. Differentiating cardiac masses on MRI. Mimics of cardiac tumors including anatomical tissues. Advantages and pitfalls of cardiac MRI.

CAEE-9

### **Novel Approach for Comprehensive Preoperative Assessment of Valvular Heart Disease via Four Dimensional CT Datasets in the Era of Minimum Invasive Cardiac Surgery**

#### **TEACHING POINTS**

Recent years, surgical techniques of cardiac valvuloplasty, such as minimally invasive cardiac surgery (MICS) and robotic surgery, have developed dramatically. In exchange for less invasiveness, surgical procedures turned out highly technically demanding due to narrow operative field and deep working space. Comprehensive assessment of cardiac anatomy and preoperative simulation using various modalities would be more important than ever. We summarize the usefulness of cardiac CT, especially in preoperative physiological morphology assessment.

#### **TABLE OF CONTENTS/OUTLINE**

In valvuloplasty, to assess physiological morphology of valve complex under beating is one of the most important factors. Utilizing CT datasets, valve complex structures consisting of leaflets, chordae tendineae, papillary muscles, and prolapsing leaflet were faithfully reproduced, and allowed surgeon to observe and measure using 3D or 4D datasets. Furthermore, preoperative simulations via life size 3D models and virtual reality simulation systems constructed from high spatial resolution datasets have reached to the stage of practical use. The learning curve would be shortened by development of these simulation technologies, though construction treatment strategy and judging surgical procedures had been largely dependent on surgeon's experience in the past. We propose a novel approach for assessment the whole aspect of valvular heart disease using appropriate imaging modalities comprehensively.

## Abstract Archives of the RSNA, 2023

CHEE

### Chest Imaging Education Exhibits

#### Sub-Events

#### CHEE-1 **The Phoenix Pulmonary Opacity**

##### TEACHING POINTS

The waxing and waning pulmonary opacity is a common finding often hiding in plain sight, akin to the mythical phoenix, which disappears only to reveal itself again later amongst the ashes. Crucial to narrowing the differential diagnosis is a broad-based knowledge of the natural course of these diseases, their laboratory and pathologic analyses, and utilization of the multi-disciplinary team. Overlapping characteristics demonstrates the importance of looking at secondary, non-parenchymal imaging characteristics, including radiographic findings outside of the thorax. Many of these are chronic and debilitating, if not fatal, which have often become treatable with the advent of chemotherapeutics and biologics. Therefore, having a systematic approach and a relationship with our clinical colleagues is critical in treating these successfully and timely to avoid associated morbidity and mortality.

##### TABLE OF CONTENTS/OUTLINE

1. Introduction. 2. Categorizing the waxing and waning pulmonary opacity 3. Demonstrate common primary imaging findings in the thorax (e.g., nodule/opacity characteristics) 4. Demonstrate common secondary imaging findings in the thorax (e.g., esophageal, lymphatic, cardiac) 5. Laboratory and pathologic correlatives 6. Role of the multi-disciplinary team in narrowing the differential diagnosis (Rheumatology, Pulmonology)

#### CHEE-10 **The 2021 WHO Classification of Lung Tumors: Takeaways for Radiologists Regarding Epithelial and Neuroendocrine Tumors**

##### Participants

Maria Clara Lorca, MD, Pittsford, NY (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

This educational exhibit will review the tumors of the lung. 1. New 2021 WHO Classification of tumors of the lung. 2. Depict radiological features of tumors of the lung. 3. Describe the importance of PET-CT in the diagnosis and follow up. 4. Describe the pearls and pitfalls that some entities demonstrate in imaging, including benign entities that can appear as a lung tumor. 5. Evaluate the sufficiency of small biopsy samples for diagnosis. 6. Discuss the spectrum of post-treatment changes of the lung.

##### TABLE OF CONTENTS/OUTLINE

This education exhibit reviews biopsy-proven cases of tumors of the lungs and their correlation with pathology. Review with illustrative case examples the different tumors of the lungs in a systematic fashion. Incorporate the new 2021 WHO classification of the tumors of the lung. Depict the imaging appearances of various types of the above tumors, with emphasis in epithelial, neuroendocrine, and hematomatous tumors. Mesenchymal tumors will not be emphasized, as they were recently described on Radiographics this year. Differentiate between the types of tumors for which small biopsy versus resection sampling are indicated for diagnosis. Depict post-treatment changes of the lung, with examples including lung toxicity, pseudo-progression, and to distinguish these changes from true tumor recurrence and their impact on future therapy.

#### CHEE-100 **Pulmonary Tuberculosis in Children and Adults: A Classic Disease with Updated Concepts. What the Clinician Needs to Know**

##### Participants

Marta Barrios Lopez, MD, Santander, Spain (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

1. To compare the typical appearance of pulmonary tuberculosis (TB) between adults and pediatric patients. Both the manifestations and the management differ in children and adults. 2. To review the latest evidence on pulmonary TB. Radiologists need to know what information is relevant to the clinician as well as the implications of certain imaging findings.

##### TABLE OF CONTENTS/OUTLINE

1. Introduction: Epidemiology and transmission mechanism in children vs adults. 2. Pathophysiology: Traditional vs new concept. The latest evidence has shown that the radiological appearance of the disease mainly depends on the host immune response and not on the time from infection. 3. Classification of Pulmonary TB according to Clinical and Radiological factors. 3.1. Active Disease: Primary Tuberculosis: 1. Lymphadenopathy in adults/children. 2. Parenchymal disease in adults/children. 3. Pleural effusion in adults/children. 4. Miliary TB in adults/children. 3.2. Active Disease: Postprimary Tuberculosis: 1. Postprimary TB in children. 2. Consolidation and cavitation. 3. Centrilobular nodules. 4. Summary of the main differences between children and adults. 5. Inactive Tuberculosis: Radiological findings and their risk of reactivation. The role of the radiology report. 6. Complications: Empyema necessitatis, Rasmussen aneurysm.

#### CHEE-101 **Uncommon Story of Common Entity: Tips and Tricks in Imaging of Non-Cardiogenic Pulmonary Edema**

## Participants

Janardhana Ponnathapura, MD, Winston Salem, NC (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Pulmonary edema is a most common clinical entity in both inpatient and out-patient setting. Identifying the underlying etiology of the edema is crucial to the timely implementation of appropriate therapy. Although cardiac dysfunction and volume overload are the most common etiologies routinely encountered, there are other different etiologies and presentations of pulmonary edema. Understanding the clinical context and underlying pathophysiology of these varied uncommon causes will help radiologists in narrowing differential diagnosis, therefore help clinicians to provide definitive treatment and better patient care. Furthermore, thorough knowledge about non-cardiogenic pulmonary edema reduces the rate of invasive procedures like Swan-Ganz catheterization and related complications.

### TABLE OF CONTENTS/OUTLINE

- Etiologies of non-cardiogenic pulmonary edema
- Mechanisms of non-cardiogenic edema
- Radiopathology correlation of pulmonary edema
- Pertinent role of chest x ray in initial diagnosis of cardiogenic vs non-cardiogenic pulmonary edema
- How subtle signs on chest x-ray helps to recognize uncommon etiologies of pulmonary edema
- How to differentiate different types of noncardiogenic edema on chest x ray.
- "Leave alone" type of pulmonary edema
- When should you use CT imaging
- Edema with and without diffuse alveolar damage- Does it matter on imaging?
- Short term and long -term complications of noncardiogenic pulmonary edema
- Algorithm and next step in the management of noncardiogenic pulmonary edema

### CHEE-102 An Update on the Role of Chest Imaging in Cystic Fibrosis

## Participants

Scott Bugenhagen, MD, PhD, Saint Louis, MO (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The purpose of this exhibit is: 1. To demonstrate the characteristic imaging findings of cystic fibrosis in the chest including a variety of commonly encountered complications through a series of clinical examples. 2. To review the latest guidelines and trends in the imaging of cystic fibrosis, with a focus on how clinical practice has changed with emerging therapies. 3. To describe the evolving role of chest radiography and cross-sectional imaging in this new clinical landscape, including a review of the most common scoring systems used in clinical practice.

### TABLE OF CONTENTS/OUTLINE

I. Review of current clinical landscape A. Summary of CF genotypes and patient specific therapy B. Advances in medical therapies C. Changes in clinical practice II. Role of chest radiography A. Characteristic findings B. Direct and follow treatment C. Radiographic scoring systems II. Role of computed tomography A. Indications a. HRCT b. Contrast enhanced CT and CTA B. Characteristic findings C. Direct and follow treatment D. CT scoring systems III. Imaging of complications A. Superinfection a. Colonization with *Pseudomonas aeruginosa* and *Staphylococcus aureus* b. Nontuberculous mycobacterial infection c. *Burkholderia cepacia* infection B. Aspergillus related lung disease a. Allergic bronchopulmonary aspergillosis b. Aspergilloma c. Semi-invasive aspergillosis C. Lobar collapse and idiopathic collapsed lung D. Pneumothorax E. Pulmonary hypertension and cor pulmonale F. Hemoptysis IV. Transplant evaluation

### CHEE-103 Upright Chest CT Imaging

## Participants

Yoshitake Yamada, MD, PhD, Tokyo, Japan (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The purposes of our exhibit are as follows: (1) To explain the development, background, and performance of upright CT. (2) To describe the anatomical changes in each structure of the chest due to differences in body position, that is, the direction of gravity. (3) To illustrate the clinical applications of upright CT for various chest diseases with clinical case presentations, and the potential applications in particle therapy.

### TABLE OF CONTENTS/OUTLINE

(1) Development of an upright CT and its background (2) Performance of upright CT: Physical characteristics, workflow improvement, safety, and remote operation during the infectious disease pandemic (3) Effect of gravity on the lungs, lobes, airways, heart, shoulder girdle, and chest vessels (4) Clinical applications of upright CT for various diseases such as chronic obstructive pulmonary disease, interstitial lung disease, scoliosis, diaphragmatic paralysis, and funnel chest (5) Upright 4D-CT of the chest (6) Potential applications of the upright CT in particle therapy (7) Limitation (8) Conclusion

### CHEE-104 Analysis of Fine Anatomical Structures Involved in Pulmonary Nodules by Ultra-High-Resolution CT

## Participants

Hiroshi Moriya, MD, PhD, Fukushima, Japan (*Presenter*) Advisor, California Capital Equity, LLC; Research Grant, Canon Medical Systems Corporation

### TEACHING POINTS

1. Spatial resolution of ultra-high-resolution CT (UHRCT) 2. Depiction of intralobular structure by UHRCT 3. MPR display of bronchus long-axis cross-section and short-axis cross-section (parallel pleural cross-section) 4. Typical cases: Analysis of fine anatomical structures involved in pulmonary nodules by UHRCT

### TABLE OF CONTENTS/OUTLINE

Ultra-high-resolution CT (UHRCT) is a CT that achieves high spatial resolution by reducing the detector size to 1/4. In the previous studies, the bronchial visualization ability of UHRCT was superior compared with conventional HRCT. In the depiction of lung field structure, bronchi with an inner diameter of 0.4 mm are delineated. Contrast enhancement and deep learning reconstruction method (DLR) enhances the contrast effect of peripheral blood vessels and improves visualization. By improving the resolution, it has become possible to display the intralobular structure. How to identify lobular structure: a. Bronchioles are centrally located in the

lobules. b. Identify the blood vessels that accompany the bronchi as pulmonary artery. c. Pulmonary veins are thicker than pulmonary arteries. d. Imaging of pulmonary arteries or veins in contrast-enhanced phase. e. Confirm continuity of the target vessel to the root of the pulmonary artery and vein. Lesions that spread with regularity to the lobular structure, lesions that extend independently of the lobular unit, lesions that extend beyond the lobule, and lesions confined within the lobule are presented.

### **CHEE-105 Thoracic IgG4-Related Disease: Revealing the Diverse and Heterogeneous Imaging Manifestations**

Participants

Kyubin Kim, MD, Yansan-Si, Korea, Republic Of (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

1. IgG4-related disease (IgG4-RD) is an immune-mediated fibroinflammatory condition characterized by dense lymphoplasmacytic infiltrations with predominant IgG4-positive plasma cells, usually accompanied by storiform fibrosis, obliterative phlebitis, and elevated serum IgG4 levels. 2. Thoracic manifestations of IgG4-RD are diverse and can mimic malignant lymphoma, infection, or other systemic autoimmune disease. The most common manifestations are mediastinal lymphadenopathy and peri-bronchovascular interstitial thickening. Other findings include pulmonary nodule or mass, interstitial lung abnormalities, pleural effusion or thickening, mediastinal or chest wall mass, and thoracic arteritis. 3. IgG4-RD can present with atypical radiologic findings such as migrating or cavitary nodules, lobar or segmental consolidation, and paravertebral mass making the diagnosis challenging. 4. Early diagnosis with clinical-radiologic-pathologic correlation is important to prevent irreversible damage due to fibrosis.

#### **TABLE OF CONTENTS/OUTLINE**

1. Definition, pathogenesis, and histopathology of IgG4-RD 2. Clinical manifestations and diagnostic criteria for thoracic IgG4-RD 3. Imaging findings of thoracic IgG4-RD: diverse and heterogeneous findings in the lungs, airway, mediastinum, pleura, chest wall, and thoracic vessels 4. Treatment and prognosis of thoracic IgG4-RD 5. Conclusion: The importance of recognizing the diverse imaging findings of thoracic IgG4-RD and reflecting them in diagnosis and treatment

### **CHEE-106 Beyond the Black Holes: A Multidisciplinary Approach to Cystic Lung Disease**

Participants

Lawrence Guan, MD, New Haven, CT (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Diffuse cystic lung diseases (DCLD) are characterized by thin-walled, air-filled spaces with normal intervening lung parenchyma. Certain entities can mimic or be mistaken for lung cysts such as emphysema, cavitary lesions, honeycombing, and cystic bronchiectasis. These are a diverse group of disorders with a variety of underlying causes including hereditary, neoplastic, infectious, inflammatory, lymphoproliferative, and smoking-related. High-resolution chest CT plays a central role in the evaluation of patients with DCLD's and it is not uncommon for these disorders to be discovered during imaging for other reasons. Therefore it is important for the radiologist to be aware of these conditions and their associations, as they may be the first to suggest the diagnosis. An approach to the characterization of cystic lung disease will be reviewed including imaging and clinical clues which can aid in suggesting one diagnosis over another.

#### **TABLE OF CONTENTS/OUTLINE**

1. Introduction. 2. Examples of cases: a. Mimics of lung cysts b. Smoking-related: Pulmonary Langerhans Cell Histiocytosis, Desquamative Interstitial Pneumonia c. Inflammatory: Amyloidosis, Hypersensitivity Pneumonitis d. Hereditary: Tuberos Sclerosis/Lymphangioleiomyomatosis, Birt-Hogg-Dube, Neurofibromatosis, Ehlers Danlos Syndrome, Sickle Cell Disease e. Lymphoproliferative: Lymphocytic Interstitial Pneumonia, Follicular bronchiolitis f. Neoplastic: Cystic metastases, Treated metastases g. Disorders with cystic component: Bronchopulmonary sequestration, Congenital pulmonary airway malformation, Bronchogenic cyst h. Miscellaneous: Infectious/Postinfectious, Posttraumatic 3. Conclusion.

### **CHEE-107 Mimics of Pulmonary Embolism (PE)**

Participants

Shaimaa Fadl, MD, Glen Allen, VA (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Learn technical, anatomical, and patient-related pitfalls in the diagnosis of pulmonary embolism. Illustrate common and uncommon pulmonary artery pathologies that can mimic pulmonary embolism. Discuss an imaging approach for the diagnosis and management of patients with different pulmonary artery pathologies.

#### **TABLE OF CONTENTS/OUTLINE**

Introduction Technical pitfalls. Anatomical pitfalls. Patient related pitfalls. Pulmonary artery malignancy (angiosarcoma, lymphoma). Pulmonary artery tumor embolism. Pulmonary artery in-situ thrombus (post-surgical, post radiotherapy). Pulmonary artery vasculitis. Atypical Infection. Granulomatous/Fibrosing mediastinitis. Role of different imaging modalities in evaluation of PE mimics. Diagnostic approach to PE mimics.

### **CHEE-108 Joining the Dots in Multiple Lung Nodules**

#### **TEACHING POINTS**

1. Varying etiologies cause multiple pulmonary nodules and can be mistaken for infection or metastatic disease. 2. Ancillary CT features such as air trapping with multiple pulmonary nodules are seen in DIPNECH, or chest wall vessel calcification with centrilobular nodules in renal failure suggests metastatic calcification. 3. Small calcified pulmonary nodules seen with reticulation in the lower lobes, usually in fibrotic ILD, represents dendriform ossification.

#### **TABLE OF CONTENTS/OUTLINE**

CT detected multiple lung nodules are most commonly due to infection, sarcoidosis, or metastasis. However, alternative etiologies causing lung nodules can be diagnosed on CT based on CT morphology or associated findings. These alternative causes of multiple lung nodules are often seen in patients with malignancies, and we must accurately diagnose these to prevent misinterpretation. Therefore, these lesser-known entities and their diagnostic CT findings are discussed. The etiologies are subclassified based on the

CT appearance of nodules such as non-solid, solid, cavitory, calcified, and nodules with central air bronchograms. A case-based approach will discuss meningoendotheliomatosis, DIPNECH, amyloidosis, LIP, LCH, Dendritic Ossification, metastatic calcification, Progressive massive fibrosis in silicosis, MMPH in Tuberous Sclerosis, MALT lymphoma amongst other similar disease processes. Ancillary CT features for, e.g., the air-trapping in DIPNECH, Cheerio sign in meningoendotheliomatosis, calcification in amyloidosis, vessel wall calcification in renal failure with metastatic calcification, etc., are highlighted. In addition, the next steps in the workup for diagnosis are also highlighted.

### **CHEE-109 0.55T MRI Thoracic Imaging**

Participants

Jonathan Liu, MD, San Francisco, CA (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Low field (< 1T) MRI is an emerging technology that possesses certain advantages over other imaging modalities and higher field MRI that make imaging of the lungs more attractive. The purpose of this exhibit is to highlight the considerations involved in implementing clinical use of low field MRI for thoracic imaging, with the hope of introducing the audience to this new imaging paradigm. A wide variety of cases (with a cohort of 22 patients at the time of abstract submission) are shown highlighting the benefits of low field MRI imaging with the Siemens FreeMax system (0.55T, MAGNETOM FreeMax; Siemens Healthcare, Erlangen, Germany) including ultra-short TE, diffusion weighted, and non-contrast MRI ventilation/perfusion imaging. We will also review the limitations and pitfalls of lung imaging at 0.55T MRI.

#### **TABLE OF CONTENTS/OUTLINE**

1. Introduction  
2. Rationale for low field MRI  
a. Advantages of low field MRI over other modalities  
i. MRI versus CT  
ii. Low field versus traditional 1.5T or 3T imaging  
b. Disadvantages of low field MRI over other modalities  
i. MRI vs CT  
ii. Low field MRI compared to 1.5/3T  
3. Imaging Protocol  
4. Clinical Indications  
a. Immediate  
b. Early  
c. Long-term  
5. Five to ten cases of 0.55 MRI images with CT correlation  
a. Normal anatomy  
b. Malignancy  
c. Inflammation  
d. Post-radiation  
e. Small airways/small vessel disease  
f. Large airways  
6. Key challenges, limitations, and pitfalls of lung imaging at 0.55T  
7. Future clinical and research directions  
8. Conclusion

### **CHEE-11 Light Up the Lungs: How Contrast Enhancement Can Help Diagnose Pulmonary Lesions**

#### **TEACHING POINTS**

Non-contrast CT of the chest is often requested by clinicians in settings where the addition of iodinated contrast is warranted. Radiologists must be familiar with how contrast positively impacts evaluation of pulmonary pathology. This exhibit will showcase the value of iodinated contrast improving assessment of pulmonary parenchymal entities. Iodinated contrast improves differentiation of pneumonia from atelectasis, with the former lacking enhancement, while atelectasis enhances homogeneously. Addition of contrast material allows detection of complications of pulmonary infections such as necrosis, pulmonary artery pseudoaneurysm and chest wall involvement. In the setting of congenital pulmonary lesions, CT evaluation should include iodinated contrast to evaluate arterial supply and venous drainage. Nodule characterization is improved with iodinated contrast. Lesion localization improves with iodinated contrast: including discerning lesions from vascular structures, delineation of hilar lesions, and appraisal of vascular and chest wall invasion in the setting of aggressive processes.

#### **TABLE OF CONTENTS/OUTLINE**

Contrast Enhanced CT protocols and indications  
Pulmonary arterial phase  
Systemic arterial phase  
Venous phase  
Infection  
Pneumonia vs Atelectasis  
Complications of pneumonia: necrosis, abscess, pseudoaneurysm, wall involvement  
Lesion localization and assessment of complications  
Hilar lesions  
Discernment from broncho-vascular bundle  
Vascular, mediastinal, and chest wall invasion  
Nodule characterization  
Hypervascular metastasis  
Carcinoid tumor  
AVM  
Congenital lesion evaluation  
Vascular supply (eg. Sequestration)  
Venous anomalies (eg. Hypoplastic lung evaluation)

### **CHEE-110 Don't Be Blue... Here's a Clue! Tips to Assess Adult Cardiac Pathology on a Chest Radiograph Like a Pro**

Participants

Janardhana Ponnatapura, MD, Winston Salem, NC (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

In the era where modalities such as 2-D echo, CT and MRI are being highly utilized for evaluation of cardiac pathology, a plain chest radiograph still plays a key role in contributing important information. However, the younger generation of radiologists do not seem to be optimally exposed or are unaware of the true value of a chest radiograph. Chest radiograph is convenient as it is an easily accessible, low-cost, and non-invasive diagnostic tool with minimal radiation dose. We aim to provide unique imaging clues to identify the classic signs, measurements, and differential diagnoses of various adult cardiac pathologies on a chest radiograph with confirmatory CT images. Since a chest radiograph is the first imaging modality for majority of patients with chest pain - it is very imperative for the radiologists to quickly recognize these subtle findings to provide an accurate diagnosis and proper patient management.

#### **TABLE OF CONTENTS/OUTLINE**

Introduction to normal cardiac anatomy  
CASE BASED LEARNING:  
• How to differentiate between:- Aortic Dissection vs Aortic Aneurysm- Pneumopericardium vs Pneumomediastinum- Pericardial Effusion vs Cardiomyopathy- Intramural esophageal lesion vs LA enlargement- Enlarged azygous arch vs Paratracheal lymph node- Stages of cardiogenic pulmonary edema  
• Identify:- Pulmonary embolism- Cardiac Valves- Focal pulmonary edema- Heterotaxy syndromes- Cardiac Size: Microcardia- Pectus Excavatum- Devices  
• Compare and contrast:- Cardiomyopathies: Dilated vs Hypertrophic- Individual chamber enlargements  
• Limitations

### **CHEE-111 Aerogenous Metastasis and Spread Through The Air Spaces (STAS) - Distinct Entities or Spectrum Of The Same Process?**

#### **TEACHING POINTS**

1. To present the proposed mechanisms and pathological findings described in aerogenous metastasis (AeM) and spread through the airways (STAS) as well as areas of uncertainty and their prognostic significance. 2. Discuss the concept of continuous and discontinuous cancer spread from the primary tumor.  
2. To review the pathological and imaging characteristics of primary lung

cancers with higher probability of spreading through the airspaces. 3. To describe CT features suggestive of aerogenous metastasis and their main differential diagnoses, including distinction from multiple synchronous primary adenocarcinomas.

#### TABLE OF CONTENTS/OUTLINE

1. Definition and pathophysiology of STAS and aerogenous metastasis (AeM).2. Risk factors and predisposing histological patterns.3. Imaging predictors, diagnosis, and prognostic significance of STAS and AeM.4. Differentiating aerogenous metastases from synchronous adenocarcinomas on CT.5. Clinical relevance and impact on patient management.6. Are STAS and aerogenous metastasis distinct entities or a spectrum of the same process?7. Future directions; areas of uncertainty and further research.

#### **CHEE-112 Navigating the Difficult ICU Chest Radiograph: Distinguishing Non-standard Cardiovascular Device Placements from Device Malposition**

Participants

Danielle Struck, BA, Las Vegas, NV (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Cardiovascular support devices are essential in the management of critically ill patients. While identifying malpositioned devices can often be straightforward, recognizing correctly positioned uncommon devices/non-standard placements and identifying malpositioned/incorrectly deployed devices can be difficult. Here, we present a case-based approach to distinguishing non-standard device placements from malposition and potential downstream complications, providing CT correlation where appropriate and specify lessons learned and practical tips in each case.

#### TABLE OF CONTENTS/OUTLINE

1. Title slide 2. Disclosures3. Abbreviations 4. Approach5. Scenarios6. Pulmonary critical care, MICUa. CVCs i. L SVC placement ii. Arterial placementb. PA catheter i. Inguinal approach ii. Peripheral placement, PA pseudoaneurysmc. ECMO i. Peripheral, situs inversus, central ii. Malposition7. Electrophysiology, CVICUa. Pacer/ICD i. Epicardial/subcutaneous leads, patient with atrial switch ii. Lead migration/fracture, ventricular perforationb. Transcatheter LAA closure i. Watchmann vs Amplatzer ii. Embolization8. Heart failure, CVICUa. Impella i. Impella RP (RV) ii. Access site hematoma, dissectionb. LVAD i. Different models ii. Infection, trauma, suck eventc. Intra-aortic balloon pump i. Upper extremity approach, adjustment ii. Malposition, visceral ischemia9. Structural cardiology, CVICUa. ASD closure device i. PDA closure device ii. Malposition, incomplete sealb. Prosthetic valves i. Transapical mitral valve prosthesis ii. Embolization10. CT surgery, SICUa. Pericardial drain i. Wraparound drain ii. Mediastinal placement11. Summary - Lessons12. Summary - Practical tips13. References

#### **CHEE-113 The Radiologist's Expedition into the Intricacies of Percutaneous Lung Biopsies and Ablations**

Participants

Megha Gupta, Glendale, AZ (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Lung cancer (CA) is the second most common cancer in the US and is the leading cause of cancer related mortality.Surgery is the mainstay of therapy for patients with stage I lung cancer, although many patients with lung cancer are poor surgical candidates.Stereotactic radiation body therapy (SBRT) is offered to inoperable patients with lung CA, however, carries significant side effects and risk of lung function deterioration.Image guided tumor ablation (IGTA) is an alternative treatment option with proven outcomes in Stage I lung CA without the risk of lung function deterioration. Also, IGTA is not limited by segmental anatomy.

#### TABLE OF CONTENTS/OUTLINE

Overview of lung cancer staging, identification of suitable patients for image guided lung ablation and discuss treatment outcomes.Understand the various modalities of lung ablation (Radio frequency, Microwave and Cryoablation).Approach to difficult biopsies and difficult needle placement including the use of hydro-dissection and artificial pneumothorax creation.Learn normal and abnormal imaging appearances post lung ablation and current follow up recommendations.

#### **CHEE-114 Getting Warmer... - Chest Radiological Findings in Patients with Fever of Unknown Origin**

Participants

Alla Khashper, MD, (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Fever of unknown origin (FUO) is defined as "fever = 101°F (38.3°C) for at least 3 weeks that remains undiagnosed after 3 inpatient days or at least 3 outpatient visits". FUO is a well-known clinical problem, has multiple thoracic etiologies, and commonly requires extensive workup. Imaging might identify the cause of FUO. However, no radiological recommendations have been established.

#### TABLE OF CONTENTS/OUTLINE

Historically, FUO has been divided into classic, nosocomial, immunodeficiency-related, and travel-associated categories. For imaging purposes the following classification appears more practical: infections, malignancies, inflammation and miscellaneous. The selected illustrative cases are listed in the attached presentation. The evaluation of FUO is always complex, including extended history taking, physical examination, and lab tests, followed by imaging. Chest radiography and CT are routinely performed and can usually provide putative or final diagnosis or suggest further imaging work-up, including but not limited to CT angiography, PET , MRI, and imaging-guided biopsy. This educational exhibit is a pictorial review of thoracic pathologies associated with FUO, targeting radiology trainees, general and subspecialized thoracic radiologists. It will highlight teaching points and provide clues to establish concise differential diagnosis of FUO causes.

#### **CHEE-115 Development of Color Dynamic Flow Image Using 4D-CTA for Post TEVAR Operative Case**

#### TEACHING POINTS

It is common to use 3D-CTA for postoperative evaluation of TEVAR. 3D-CTA can assess postoperative complications such as endoleak and the presence or absence of stent graft induced new entry (SINE). However, since 3D-CTA is a single time phase, it is difficult to evaluate the direction of blood flow to the aneurysm and the timing of outflow. This is where 4D-CTA comes in. 4D-CTA injects a contrast medium while continuously imaging a specific area. When 4D-CTA is displayed in Volume Rendering (VR), the

blood flow is easy to understand visually. Therefore, it is possible to observe end leakage and SINE around the stent graft. This time, we evaluated the blood flow when it was converted to VR using a color map. The color map was changed according to the CT value. In addition, the color map has been optimized to make 4D-CTA easier to observe. By displaying the blood flow as our original color map, it is possible to visually evaluate the direction of blood flow at the leak point and the timing of flow from the aorta into the aneurysm. This time, we take 4D-CTA scan and analyzed it with our original color map in the SINE case. By applying our method, it can be easy and visually to evaluate the entry point, blood flow direction, and outflow timing post TEVAR operation.

#### TABLE OF CONTENTS/OUTLINE

1. Problem analysis of conventional display method 2. Ingenuity in scanning / Exposure reduction technology 3. Ingenuity in image reconstruction 4. Evaluation by 4D-CTA 5. Creation of original color map 6. Evaluation of usefulness by clinical cases

#### CHEE-116 Cinematic Rendering of the Thoracic Aorta: A New Look at an Old Problem

##### Participants

Elliot Fishman, MD, Owings Mills, MD (*Presenter*) Co-founder, HipGraphics, Inc Stockholder, HipGraphics, Inc Institutional Grant support, Siemens AG Institutional Grant support, General Electric Company Consultant, Exact Sciences Corporation Consultant, Imaging Endpoints II LLC

##### TEACHING POINTS

1. 3D imaging with Cinematic rendering can play a major role in the detection of the thoracic aorta 2. Cinematic Rendering can be optimized with development of presets to improve workflow 3. Cinematic Rendering can be used in a range of applications including suspected dissection, coarctation of the aorta, vasculitis, post aorta repair and trauma 4. Cinematic Rendering will provide critical information to the referring physician for patient management 5. the radiologist needs to work closely with the referring physician and Cinematic Rendering help play a role in this interaction

#### TABLE OF CONTENTS/OUTLINE

a. Cinematic Rendering protocols b. CT acquisition protocols c. clinical applications with case studies-suspected dissection-post aortic aneurysm repair-coarctation of the aorta-trauma-vasculitis d. pearls and pitfall e. the literature f. future directions including AI g. bibliography

#### CHEE-117 Current and Novel Techniques for Artifact Reduction on Chest CT

##### Participants

Yoichiro Ota, RT, Yokohama, Japan (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

Various artifacts can be observed on chest CT. Motion artifacts are an important issue, especially in emergency cases in which patients are unable to hold their breath. Motion correction-deep learning reconstruction (MC-DLR) is a motion correction method developed using a deep learning framework to estimate patient motion in the lung region. This method comprises three major steps. First, a full-image reconstruction is decomposed into several partial-angle reconstructions. Second, a pre-trained deep convolutional neural network (DCNN) is applied to estimate the motion vector field between these partial angle reconstruction images. Finally, a motion-corrected image is reconstructed by incorporating the DCNN-predicted motion vector field (Fig. 1). An image with MC-DLR can reduce the motion artifacts in moving phantom experiments (Fig. 2) and clinical cases (Fig. 3). Radiologists should understand CT artifacts to distinguish between true lesions (Figs. 4,5). In this exhibit, we introduce the principles of CT artifacts and techniques to reduce them by presenting clinical cases.

#### TABLE OF CONTENTS/OUTLINE

Motion artifact, Streak artifact, Metal artifact, Dark band artifact, Partial volume effect

#### CHEE-118 Thoracic Manifestations of Autoimmune Diseases: From Suspicion to Diagnosis

##### Participants

Renato Fujiki, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

Interstitial lung disease (ILD) is the most common thoracic manifestation of autoimmune disease (AD). Each ILD pattern is more commonly associated with a specific AD, although there is an overlap between patterns. While connective tissue diseases (CTD) are commonly associated with thoracic manifestations, it is important to recognize that other AD can also affect the lungs. Besides ILD, AD can also present with airway, vascular, pleural, and mediastinal involvement. The purpose of this exhibit is - Review CT patterns of ILD more commonly associated to each specific AD and what is important to describe - Highlight the role of radiology in diagnosing and grading thoracic manifestations of AD - Discuss the new classification system known as "interstitial pneumonia with autoimmune features" (IPAF) and its relevance in patient management

#### TABLE OF CONTENTS/OUTLINE

1. Introduction a. Epidemiology, physiopathology and clinical aspects of the main autoimmune diseases (AD) b. Currently available treatment options 2. Role of different imaging methods in diagnosis and assessment of disease grading - advantages, limitations, usefulness a. X-ray b. Ultrasound c. CT - with protocol recommendation d. MRI 3. ILD patterns associated with AD - Case-by-case discussion review a. Non-specific interstitial pneumonia b. Organizing pneumonia c. Usual interstitial pneumonia d. Hypersensitivity pneumonitis-like pattern e. Others 4. Other thoracic manifestations of both CTD and non-CTD AD - including vascular, pleural, mediastinal and airway involvement 5. The new statement of interstitial pneumonia with autoimmune features (IPAF) - repercussions in clinical practice and recommendations 6. Conclusions "take-home messages"

#### CHEE-119 Bronchiectasis: Differential Diagnosis for Their Cause According to Their Spatial Distribution and Complications

##### Participants

Fernando Vasquez Puelles, MD, Barcelona, Spain (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

- Distribution of bronchiectasis, their association with different radiological findings, altogether with clinical context can aid in formulating a differential diagnosis for pathologies that cause bronchiectasis.- Bronchiectasis predisposes to complications which can be evaluated with imaging studies.

#### TABLE OF CONTENTS/OUTLINE

Bronchiectasis is irreversible bronchial dilatation, usually resulting from chronic infection, proximal airway obstruction, or congenital bronchial abnormality. Bronchiectasis can have a diffuse distribution with an upper/mid lung predominance (cystic fibrosis, sarcoidosis, tuberculosis), lower lung predominance (chronic aspiration, primary ciliary dyskinesia, Kartagener syndrome), or central predominance (Mounier-Kuhn syndrome, Williams-Campbell syndrome), or a focal distribution (endobronchial or peribronchial tumors, Swyer-James syndrome). It predisposes to chronic or recurrent infections, allergic bronchopulmonary aspergillosis, pneumothorax, hemoptysis, and pulmonary hypertension. Signs suggestive of infection include air-space disease, tree-in-bud pattern, ground-glass opacities, patchy opacification, and cavitation or abscess. Conclusion. Bronchiectasis is irreversible bronchial dilatation usually resulting from chronic infection, proximal airway obstruction, or congenital bronchial abnormality. There is a wide spectrum of causes of bronchiectasis, thus radiologists can use the morphologic features, particularly the spatial distribution, associated findings altogether with clinical information to provide a differential diagnosis for the cause of bronchiectasis and to help to find an adequate treatment.

#### CHEE-12 Cardiothoracic Imaging Findings in VEXAS Syndrome

Participants

Naim Qaqish, MD, Salt Lake City, UT (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

-VEXAS Syndrome is an adult-onset autoinflammatory disorder found almost exclusively in adult men (x-linked gene mutation) first described in 2020. The disease is severe with a poor prognosis.-Systemic hematologic and inflammatory disease affecting multiple organs, most commonly the skin, lungs, cardiovascular, and cartilage.-Diagnosis is made on bone marrow aspirate.-Pulmonary imaging findings: consolidative, ground glass and reticular opacities, pulmonary vasculitis, pleural effusions, bronchial inflammation/stenosis.-VS-associated interstitial lung disease usually follows an organizing pneumonia or NSIP pattern.- Cardiovascular imaging findings: Venous and/or arterial thrombosis, pulmonary emboli, pericarditis, myocarditis, and cardiac amyloidosis.

#### TABLE OF CONTENTS/OUTLINE

• Introduction to VEXAS Syndrome (VS) • Useful Laboratory Tests • Clinical Presentation with Common Manifestations • Pulmonary Imaging Features o Parenchymal disease (consolidation, GGO, reticulation) o Pleural effusions o VS-associated interstitial pneumonias § NSIP and organizing pneumonia patterns o Pulmonary vasculitis o Bronchial disease and stenosis o Less common pulmonary manifestations • Cardiovascular Imaging Features o Cardiac and pericardial involvement § Typical CMR findings o VS-associated vasculitis o Recurrent thromboembolic disease § DVT, pulmonary emboli, and arterial thrombosis • Differential Diagnosis • Treatment • Prognosis • Summary of Cardiothoracic Imaging Findings • References

#### CHEE-120 Heavy Stuff: The Burden of High-Attenuation Lung Lesions

Participants

Iuri Shen De Lacerda, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Propose a pattern-based approach to most common high-attenuating lung lesions- Review specific imaging features of each CT pattern of disease- Recognize the main differential diagnosis by section and understand the pathophysiology behind each hyperattenuating lesion through a case-based pictorial discussion- Highlight the importance of radiology in narrowing diagnostic possibilities and guiding next steps in patient management

#### TABLE OF CONTENTS/OUTLINE

I - INTRODUCTION- Definition of high-attenuation lung lesions- Pattern-based approach to narrow differential diagnosisII - PATTERNS AND ASSOCIATED DIAGNOSIS A - Calcified pulmonary nodules1. Dystrophic calcifications-a. Post-infectious-b. Pulmonary hemosiderosis: Idiopathic or Secondary (chronic alveolar hemorrhage)-c. Occupational disease: Silicosis, Coal workers pneumoconiosis2. Metastatic calcification: Benign or Malignant3. Pulmonary Alveolar microlithiasisB - Non-calcified hyperattenuating nodules1. Talcosis2. Mercury embolism and vapor inhalation3. Pulmonary cement embolization after vertebroplasty4. Cyanoacrylate embolizationC - Large calcified nodules or masses1. Calcified metastasis: Medullary thyroid carcinoma, Osteosarcoma, Chondrosarcoma2. Amyloidosis3. Granuloma4. Progressive massive fibrosisD - Hyperattenuating linear or reticular opacities1. Pulmonary dendriform ossification: Idiopathic or Secondary (idiopathic pulmonary fibrosis, chronic alveolar hemorrhage)2. Diffuse pulmonary amyloidosis: alveolar septal formE - High-attenuation consolidation1. Amiodarone lung2. Pulmonary Lipidol embolismIII - CONCLUSIONSSummary of key points"Take-home" messages

#### CHEE-121 Paraneoplastic Syndromes Related to Thoracic Neoplasms: Clinical and Imaging Clues

#### TEACHING POINTS

Paraneoplastic Syndromes are systemic manifestations of neoplasia not related to metastatic disease. These rare disorders are characterized by abnormal production of proteins (i.e. antibodies), protein derivatives, or steroids generated by the immune system. The diagnosis of thoracic neoplasms associated with these syndromes often presents diagnostic challenges for radiologists and clinicians alike. Radiologists play an essential role in the identification of the specific neoplasm associated with these syndromes. Therefore, knowledge of the neoplasm associated with each paraneoplastic syndrome is valuable for quality patient care. The goals of this exhibit are to help the learner: 1. List the clinical features of specific paraneoplastic syndromes related to thoracic neoplasms 2. Identify characteristic imaging features of thoracic neoplasms associated with specific paraneoplastic syndromes

#### TABLE OF CONTENTS/OUTLINE

1. Introduction - Definition of paraneoplastic syndromes 2. Overview of paraneoplastic syndromes associated with specific types of thoracic neoplasms 3. Discussion of clinical and imaging features of thoracic neoplasms that may manifest with a paraneoplastic syndrome at presentation 4. Conclusion

## **CHEE-122 Usual Interstitial Pneumonia and Variants, a Pictorial Review**

Participants

Moises Jose Lima, MD, Santiago de Compostela, Spain (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

- To define and illustrate the classic appearance of a UIP pattern.- To describe the HRCT diagnostic categories of Usual Interstitial Pneumonia (UIP).- To comment and review the CT findings of the main differential diagnosis of UIP. - To know the 2018 Fleischner diagnostic guidelines on the diagnosis of Idiopathic pulmonary fibrosis (IPF). - To enumerate and discuss specific and general variant patterns of fibrosis.

### **TABLE OF CONTENTS/OUTLINE**

1) Background: Interstitial lung disease concept and classification. Categorization of idiopathic interstitial pneumonias. UIP pathophysiology.2) HRCT technique in UIP3) Key features of a classic UIP pattern: honeycombing, reticular pattern, traction bronchiectasis, other findings of classic UIP pattern: GGO, mediastinal lymph node enlargement, pulmonary ossification, pleuroparenchymal elastosis.4) Diagnostic categories of UIP: UIP and uncommon presentations (asymmetric distribution, uniform craniocaudal distribution and others), probable UIP, possible UIP, a review of the main alternative diagnoses: non-specific interstitial pneumonia, fibrosing hypersensitivity pneumonitis, sarcoidosis, others.5) IPF Diagnosis: clinical history, UIP histopathology, IPF diagnostic criteria.6) Variant patterns of fibrosis: anterior upper lobe, exuberant honeycombing and straight edge signs.7) Specific variant patterns of fibrosis: scleroderma: four corners sign. Systemic lupus erythematosus: "Island-like" fibrosis and heterogeneous lung destruction.8) Summary

## **CHEE-123 NTM: What the Pulmonologist Wants to Know**

### **TEACHING POINTS**

Classic and non-classic NTM have characteristic distribution and morphology of bronchopulmonary disease with variability in part associated with the presence of underlying lung disease, as well as other factors. Radiologists may be the first to suggest pulmonary NTM in patients that are asymptomatic or with nonspecific constitutional symptoms leading to earlier diagnosis and management. Baseline CT description should include description of disease extent, fibrocavitary or nodular bronchiectatic type, presence of atelectasis, cavities, and fibrosis. Pulmonary NTM infections are usually indolent/slowly progressive with CT findings waxing and waning over time. Follow-up imaging is performed to assess interval improvement or progression of the airways disease, cavities, nodules and consolidation. The focal mass like/nodular NTM type can pose diagnostic challenges, and must be distinguished from other infections and malignancy. Development of high-attenuation mucous (HAM) in bronchiectatic airways is pathognomonic for superimposed ABPA. New or growing nodule should raise concern for neoplasm. NTM should be also be considered as an allergen to incite nonfibrotic hypersensitivity pneumonitis.

### **TABLE OF CONTENTS/OUTLINE**

Epidemiology. Diagnostic criteria for pulmonary NTM. CT Manifestations of pulmonary NTM. What the Radiologist needs to know. What the Pulmonologist wants to know.

## **CHEE-124 Thoracic Complications of Stanford Type A Aortic Dissection: A Review of CT Findings and Management**

### **TEACHING POINTS**

This presentation will serve as a review of aortic root anatomy and aortic dissection. It also includes an update to the Stanford classification system published jointly by the Society for Vascular Surgery and the Society of Thoracic Surgeons which provides a more detailed description of the dissection and is suited to sites offering endovascular repair (though likely to become more universally adopted in the future). The bulk of the exhibit is concerned with the complications of Type A dissection which occur within the thorax. A framework for classifying and subclassifying complications is described as well as a more detailed description of the pathophysiology, grading, and management of these complications. This information has previously been offered separately in review articles, case series, and case reports but will now presented as a single resource. Detailed diagrams and representative CT images will support the information presented and will aid the viewer's understanding of the concepts. CT is often utilized for investigation of suspected acute aortic syndrome. This presentation will be useful for radiologists and radiology residents working in the acute care setting, to assist their search pattern and tailor their reports to provide more useful information to the cardiothoracic surgeon.

### **TABLE OF CONTENTS/OUTLINE**

1. Introduction 2. Risk factors and epidemiology 3. Classification of aortic dissection 4. CT imaging protocol recommendations 5. Complications and management of aortic dissection 6. Thoracic complications of Type A dissection 6.1 Rupture complications 6.2 Malperfusion complications 6.3 Aortic valve distortion/disruption with regurgitation 7. Conclusion

## **CHEE-125 From Acute to Chronic: A Comprehensive Guide to Aortic Injuries and the New Classification System**

Participants

Amr Wardeh, MD, Syracuse, NY (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

(1.) Learn to differentiate among the different types of acute aortic syndrome and understand their clinical significance.(2.) Explore the signs of instability and potential complications in acute aortic syndrome.(3.) Examine the appearance of subacute and chronic aortic dissection.(4.) Discuss the limitations of the Stanford classification system in addressing the complexities of acute aortic syndrome.(5.) Introduce the new Society of Vascular Surgeons and the Society of Thoracic Surgeons classification system (SVS/STS) and how it differs from the Stanford classification system.(6.) Illustrate the use of the new SVS/STS classification system with example cases.

### **TABLE OF CONTENTS/OUTLINE**

(I.) Introduction to Acute Aortic Syndrome (A.) Definition and clinical importance (B.) Overview of the four types (1.) Aortic dissection (2.) Intramural hematoma (3.) Penetrating atherosclerotic ulcer (4.) Limited intimal tear (II.) Classification Systems (A.)

Stanford Classification System and its Limitations (B.) SVS/STS Classification System (C.) Comparison of the Classification Systems (D.) Example Cases: Applying the SVS/STS Classification System.

## **CHEE-126 Reporting Response Assessment in Clinical Trials in the Era of Personalized Medicine**

### **TEACHING POINTS**

Response Evaluation Criteria in Solid Tumors (RECIST) was published in 2000 and revised to RECIST 1.1 in 2009. RECIST defines lesions as measurable and non-measurable, based on whether they are quantifiable; measurable lesions consist of target, which are followed, and non-target. RECIST 1.1 includes newer technologies like FDG-PET and MRI and clarifies lymph node criteria. Target lesions must be: Easily and reproducibly measurable; Representative of the disease; Representative of distribution Progressive disease (PD) after initial response can be depicted using RECIST 1.1. Personalized therapies targeting specific receptors are in clinical trials and allow patients with slow progression to be followed long term. RECIST criteria are used to assess response to immunotherapy. Response may vary between unidimensional and volumetric assessment methods. Genomic profiling in a lung cancer patient revealed an EGFR mutation. The tumor was successfully targeted by Erlotinib, showing 61% decrease in size at 8 weeks.

### **TABLE OF CONTENTS/OUTLINE**

Illustrate response assessment in the era of personalized medicine clinical trials  
Depict optimal strategies for response assessment using a multimodality approach  
Explore novel response assessment criteria, such as volumetric and MRI based DCE and DWI, to assess response

## **CHEE-127 Congenital Lung Anomalies in the Adult**

Participants

Marcos Mestas Nunez SR, MD, Buenos Aires, Argentina (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

Although rare, congenital lung anomalies are incidentally discovered in adults and can pose a diagnostic dilemma. The radiologist must be familiar with the imaging findings and differential diagnosis. With this exhibit we will: 1) Review the typical imaging appearance of common and uncommon congenital lung anomalies as seen in the adult. 2) Review the concept of hybrid lesions. 3) Case based review of entities that can be mistaken for congenital lung anomalies, and the role of imaging in the differential diagnosis. 4) Describe complications and as well as discuss the risk of malignancy of some of these entities.

### **TABLE OF CONTENTS/OUTLINE**

1) Introduction and embryology  
2) Bronchopulmonary anomalies  
a) Bronchial atresia  
b) Lobar hyperinflation  
c) Bronchogenic cyst  
d) CPAM  
3) Combined pulmonary and vascular anomalies  
a) Pulmonary sequestration  
b) Hypogenetic lung syndrome  
c) Thoracic Isomerism  
4) "New concepts" hybrid lesions  
5) Miscellaneous  
a) Placental transmigration  
b) Proximal Interruption of the pulmonary artery  
6) Differential diagnoses: Case-based approach  
7) Complications  
a) Risk of malignancy: true or myth?  
b) Superimposed: a radiology challenge  
c) Hemoptysis and radiology in treatment

## **CHEE-128 The Family Plan: Multidisciplinary Approach to Familial Pulmonary Fibrosis (FPF)**

Participants

Katherine Cheng, MD, Stamford, CT (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

Familial pulmonary fibrosis (FPF), defined as pulmonary fibrosis affecting at least two first degree relatives, is a complex group of diseases caused by a variety of genetic mutations. Diagnosis of FPF is essential as these patients have a worse prognosis than their sporadic counterparts that affects management not only of the patient, but also of first-degree relatives. However, the diagnosis of FPF can be difficult for both the radiologist and clinician as imaging patterns of fibrosis are often unclassifiable; variable penetrance exists amongst family members; and new mutations are continuously being discovered. This exhibit aims to improve understanding of FPF through a multidisciplinary approach reviewing genetic, clinical, and imaging manifestations of FPF.

### **TABLE OF CONTENTS/OUTLINE**

1. Definition and Epidemiology of FPF.  
2. Overview of the Genetic Mutations Associated with FPF including telomere, surfactant, host defense  
3. Illustrate the spectrum of imaging patterns for FPF and the variability that can exist even amongst family members including unclassifiable, UIP, NSIP, PPFE  
4. Emphasize the importance of genetic testing

## **CHEE-129 Cardiovascular and Thoracic Imaging Manifestations of Lupus**

Participants

Muhammad Naeem, MBBS, Saint Louis, MO (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

- Systemic Lupus Erythematosus (SLE), also known as Lupus is a great masquerader and being a systemic illness it virtually affects every organ in the body. Cardiovascular and Thoracic manifestations are often prevalent. Over half of the patients with lupus develop pleuropulmonary involvement. Lupus patients often get delayed diagnosis and sometime radiologists can provide clue to underlying lupus by putting all the imaging findings together.  
- Thrombosis is quite prevalent in lupus given the high association with Antiphospholipid antibody (APLA). Other vascular manifestations can be coronary artery disease/aneurysms, pulmonary hypertension, venous thromboembolism, pulmonary emboli and rarely aortic dissections.  
- Heart involvement in lupus often present with myocarditis, although pericarditis is much more common due to the high prevalence of serositis in lupus.

### **TABLE OF CONTENTS/OUTLINE**

- Introduction- pathophysiological mechanisms in lupus- diagnostic criteria for lupus- Lung and Pleural involvement: Pleural disease, Lupus pneumonitis, Diffuse Alveolar Hemorrhage, Shrinking Lung Syndrome, Pulmonary fibrosis (along with classic patterns described in lupus)- Vascular involvement: Thrombosis/lupus anticoagulant/APLA antibodies, Venous thromboembolism, Pulmonary hypertension, Aortic dissections- Cardiac involvement: Pericardial involvement, Myocarditis and myocardial LGE pattern, Coronary artery disease and coronary vasculitis, Valvular disease (Libman-Sacks endocarditis)- Summary slide

## CHEE-13 Ground-Glass Opacities in Thoracic CT: Beyond the Acute Disease

Participants

Alicia Espinal Soria, MD, San Sebastian, Spain (*Presenter*) Nothing to Disclose

### TEACHING POINTS

To describe the spectrum of pathologic entities that manifest as ground-glass opacities in thoracic CT. To learn that ground glass opacities are not always related to acute diseases, being associated in some cases with fibrosis signs.

### TABLE OF CONTENTS/OUTLINE

Ground-glass opacities (GGO) are defined as a light increase in attenuation in pulmonary parenchyma that occur when alveolar space is compromised and/or when pulmonary capillary blood volume increases. This finding is often associated with acute pathology like pulmonary edema, alveolar hemorrhage, Pneumocystis jirovecii pneumonia, COVID-19, acute interstitial pneumonia, and acute respiratory distress syndrome. But some subacute and chronic pathologies may also manifest with GGO in CT such as cryptogenic organizing pneumonia, lepidic-predominant adenocarcinoma, chronic eosinophilic pneumonia, non-specific interstitial pneumonia, and nonfibrotic hypersensitivity pneumonitis. In addition, all of these entities can be classified according to the presence or lack of fibrosis signs, which is a determinant prognosis factor for the patients. The aim of this presentation is to review these pathologies with the most common imaging findings in order to facilitate the differential diagnosis in each case. However, in many cases the imaging findings are nonspecific therefore histologic and microbiologic studies will be necessary to make a definitive diagnosis.

## CHEE-130 ANCA-associated Vasculitis: The New 2022 ACR/EULAR Classification Criteria

Participants

Jonghyeon Kwon, MD, Seoul, Korea, Republic Of (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Introduction and classification of ANCA-associated small vessel vasculitis 2. Review of newly updated 2022 ACR/EULAR classification criteria and cases of ANCA-associated vasculitis 3. Role of radiologists for classification of ANCA-associated vasculitis

### TABLE OF CONTENTS/OUTLINE

1. Definition of ANCA-associated vasculitis 2. Classification criteria of ANCA-associated vasculitis A. 1990 American College of Rheumatology (ACR) classification criteria B. 2012 Revised Chapel Hill consensus conference (CHCC) nomenclature of systemic vasculitides C. 2022 American College of Rheumatology/European Alliance of Associations for Rheumatology (ACR/EULAR) Classification Criteria 3. Review of image findings and application of 2022 ACR/EULAR classification criteria A. Granulomatosis with polyangiitis (GPA) B. Eosinophilic granulomatosis with polyangiitis (EGPA) C. Microscopic polyangiitis (MPA) 4. Summary

## CHEE-131 Febrile Neutropenia: A Scenario and Pattern-based Approach to a Perplexing Problem

Participants

Adam Yen, MD, San Francisco, CA (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Febrile neutropenia presents a challenging clinical dilemma, and treatment success relies on early diagnosis and targeted antimicrobial therapy. Often, clinical teams look to radiologists to help narrow the differential diagnosis when a neutropenic patient's thoracic CT contains findings concerning for infection. Here, we examine the role of imaging and CT-guided biopsy in the management of febrile neutropenia, present an approach wherein clinical information is paired with a CT pattern to help the radiologist make an educated guess as to the underlying causative agent, and specify where either clinical information or imaging appearance can serve more useful.

### TABLE OF CONTENTS/OUTLINE

1. Clinical presentation 2. Imaging workup 3. Approach by imaging patterns a. Consolidation/nodules b. Cavitary consolidation c. GGO d. Halo e. Reverse halo f. Thoracic wall involvement 4. Helpful clinical information a. Time course b. Antimicrobial response c. Procalcitonin d. B-D-Glucan e. Galactomannan f. Serologies g. BAL aspirate microscopy h. Cultures 5. Less than 1 week from onset a. Consolidation/nodules - common bacteria i. Gram+ bacteria (MRSA, VRE) ii. Gram- bacteria (pseudomonas) b. GGO - mostly viral i. EBV, CMV, other viruses ii. PJP 6. Consolidation/nodules + non-response to broad spectrum antibiotics - fungi a. Candida b. Aspergillus c. Mucormycosis 7. Other organisms to consider - uncommon bacteria a. Nocardia b. Actinomyces 8. Utility of biopsy a. Fungal infection b. Malignancy c. Non-diagnostic biopsy d. Platelet management 9. Summary by imaging appearance 10. Summary by helpful clinical information

## CHEE-132 Deciphering Acute Diffuse Pulmonary Lesions: Unraveling the Diagnostic Enigma

Participants

Daisuke Yamada, MD, PhD, Tokyo, Japan (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Diffuse lung diseases include a wide variety of infectious, neoplastic, and allergic diseases in addition to idiopathic interstitial pneumonia. In this presentation, we will discuss what radiologists need to know about these diseases, especially those that present with diffuse lung lesions in an acute-onset.

### TABLE OF CONTENTS/OUTLINE

Presentation goals: To explain the pathophysiological mechanisms of hydrostatic and permeability pulmonary edema and describe the imaging findings. To discuss the spectrum of acute/subacute lung injury. To present information on acute diffuse pulmonary diseases classified by cause into idiopathic, infectious, allergic, drug-induced, neoplastic, and rare diseases and to describe their characteristic imaging findings. Cases include Infectious pneumonia: COVID-19 pneumonia, Cytomegalovirus pneumonia, Varicella zoster virus pneumonia, Influenza pneumonia, Pneumocystis pneumonia, Miliary tuberculosis, Legionella pneumonia, Diffuse aspergillosis after influenza viral infection Allergic lung diseases: Acute eosinophilic pneumonia, Acute hypersensitivity pneumonitis, E-cigarette, or vaping, product use associated lung injury (EVALI), Pulmonary injury associated with inhalation Drug-induced lung

injury: Caused by anti-cancer drugs and other medications  
Neoplastic diseases: Tumor embolism, Pulmonary tumor thrombotic microangiopathy, Carcinomatous lymphangiosis, Leukocytosis, Intravascular large B-cell lymphoma  
Rare diseases: Pulmonary hemorrhage, Fat embolism

### **CHEE-133 Detailed Radiologic-Pathologic Correlation in Fibrotic Hypersensitivity Pneumonitis (FHP): For Better Understanding of the HRCT Findings**

Participants

Daisuke Yamada, MD, PhD, Tokyo, Japan (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Understanding the histological backgrounds is an essential clue to making a better interpretation of HRCT images. The teaching points are 1) to review the anatomical/histological basic knowledges of the lungs for HRCT diagnosis of interstitial lung diseases, 2) to recognize the meaning of representative HRCT findings in fibrotic hypersensitivity pneumonitis by precise correlation to histological findings.

#### **TABLE OF CONTENTS/OUTLINE**

Definition and pathophysiology of fHP / Review the anatomical/histological basis of the lungs  
Anatomy of secondary lobule, location of the peribronchiolar region in secondary lobule  
Radiological and pathological findings  
Demonstration of typical radiological and pathological findings of fHP  
Essential HRCT findings to know?  
small airway lesion (e.g. three-density pattern, lobules with decreased attenuation), parenchymal fibrotic lesion showing random distribution or UIP/NSIP-like pattern  
Close correlation between radiological and pathological findings  
•Centrilobular ground-glass opacities on HRCT? bronchiolitis and peribronchiolar inflammation, airway-centered mild fibrosis/organization  
•Ground-glass opacities? diffuse parenchymal inflammation or mild alveolar septal thickening  
•NSIP-like pattern fibrosis showing peribronchovascular distribution on CT? can be formed by a fusion of airway-centered lesions  
•UIP-like pattern fibrosis showing periacinar/perilobular distribution on CT? is sometimes derived from organization along lymphatic routes result in periacinar/perilobular fibrosis  
Conclusion  
The HRCT findings of fHP are varied and complex, but can be better grasped by understanding the histological background.

### **CHEE-14 Oncologic Causes of Phrenic Nerve Palsy: Where and How to Look for**

Participants

Nivedita Chakrabarty, Mumbai, India (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

To illustrate normal anatomical course of phrenic nerve from skull base to diaphragm  
variant anatomy of phrenic nerve - pictorial review  
Imaging approach on when to suspect and how to report phrenic nerve compression/infiltration  
emphasis on oncologic case based approach to phrenic nerve palsy

#### **TABLE OF CONTENTS/OUTLINE**

Introduction  
Phrenic nerve; its anatomy, normal course and variants  
Various aetiologies of phrenic nerve palsy with emphasis on malignancy  
Pathophysiology of phrenic nerve palsy, infiltration vs compression  
CT and PET CT as a diagnostic modality for assessment of phrenic nerve palsy  
Pictorial illustration of cases  
Take home points

### **CHEE-15 Thoracic Involvement in Diseases Related to Dysregulated Humoral Immunity**

Participants

Jose Maluf, MD, (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

- Understand general concepts about immunity and humoral immunity
- Identify the main pathologies related to unfunctional humoral immunity
- Learn about the thoracic involvement in dysregulated humoral immunity states and how it can impact in patient's health
- Recognize the thoracic imaging findings related to a compromised humoral immunity

#### **TABLE OF CONTENTS/OUTLINE**

- Introduction - General concepts about immunity:
  - o Main concepts and differences between cellular and humoral immunity
  - o Relation of the chest and respiratory tract with humoral immunity and the potential impacts in patient's health
  - o Thoracic imaging role in patients with dysregulated humoral immunity states
- Different thoracic findings:
  - o Airway abnormalities
  - o Infections
  - o Chronic Inflammatory and interstitial lung diseases
  - o Benign lymphoproliferative disorders
  - o Neoplasms
- Case based review - Pathologies and thoracic manifestations:
  - o Common Variable Immunodeficiency (CVID)
  - o IgG4-Related Respiratory Disease (IgG4-RRD)
  - o Respiratory amyloidosis
  - o Hypogammaglobulinemia
  - o Pulmonary Light-Chain Deposition Disease
  - o Other conditions
- Future perspectives
- Conclusions and key takeaways

### **CHEE-16 Rare Vasculitides: An Institutional Case-Based Radiological Review of Hughes-Stovin Syndrome**

Participants

Taylor Loon, MD, Syracuse, NY (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

1) Describe the clinical presentation and identify the corresponding radiographic findings of Hughes-Stovin syndrome. 2) Compare and contrast the radiological and clinical findings with other vasculitides and other causes of pulmonary artery aneurysms. 3) Discuss the possible complications and highlight the medical and surgical management of Hughes-Stovin syndrome.

#### **TABLE OF CONTENTS/OUTLINE**

1) Introduce Hughes-Stovin Syndrome, its epidemiology, the three sequential phases of clinical presentation, and its diagnostic criteria. 2) Using cases from our institution, present the common radiologic features of Hughes-Stovin on chest radiograph and CT angiography of the thorax. 3) Using 3D-rendered images from our institution, further display the pulmonary arterial findings of Hughes-Stovin Syndrome. 4) Compare and contrast the diagnostic criteria, common radiologic findings and management of Hughes-Stovin to other pulmonary vasculitides including Behçet's disease and Granulomatosis with Polyangiitis. 5) Compare and contrast

Hughes-Stovin to other causes of pulmonary artery aneurysms including mycotic aneurysms. 6) Discuss unstable pulmonary aneurysms as a potential complication of Hughes-Stovin Syndrome and overview treatment algorithm based on CT pulmonary angiography findings. 7) Using digital subtraction angiography images from our institution, review embolization for unstable pulmonary artery aneurysms and potential complications of treatment.

### **CHEE-17 Childhood Interstitial Lung Disease: Stepwise Approach to Imaging Findings, Histopathologic Correlation, and Management**

Participants

Karen Ramirez Suarez, MD, Philadelphia, PA (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

- Childhood interstitial lung disease is rare with challenging differential diagnosis which requires a stepwise approach to diagnosis including clinical presentation, imaging, and histology leading to the correct diagnosis in most cases. - An age-based differential diagnosis is particularly helpful for infants and young children. - Imaging evaluation of lung parenchyma, primarily on CT, helps to correctly diagnose these disorders, aids in guiding biopsy when needed, and monitor treatment response or disease progression. - Radiologic pathologic correlation is an important final step in the evaluation of childhood interstitial lung disease.

#### **TABLE OF CONTENTS/OUTLINE**

- Role of imaging of childhood interstitial lung disease with delineation of technique and pediatric protocols. - Stepwise approach to diagnosing childhood interstitial lung disease from clinical presentation to diagnostic workup including imaging, genetics, and biopsy. - Correlation of imaging findings and histology in childhood interstitial lung disease - Differential diagnosis of childhood interstitial lung disease based on clinical findings, imaging, and histology.

### **CHEE-18 Lung Cancer Interventional Oncology: Fire and Ice in the Treatment of Lung Cancer**

#### **TEACHING POINTS**

-CT-guided ablation is a viable option for treatment of multifocal lung carcinoma and patients with inoperable tumors, recurrence, prior surgery or radiation. -Choice of ablation modality depends on consideration of technical factors, size and location of target lesion, and patient comorbidities. -Target lesions > 3 cm confer a higher local recurrence rate than lesions < 3 cm. -Postablation features of successful ablation include ground-glass margins, which is crucial for confirming treatment success. -Follow up of postablation patients is the responsibility of the interventional oncologist with a standardized regimen of office visits and imaging.

#### **TABLE OF CONTENTS/OUTLINE**

-Indications for ablation in lung cancer-Comparison of ablation modalities-Mechanisms of tissue injury in ablation-Indicators of successful ablation-Postablation zone imaging features-Follow up surveillance

### **CHEE-19 Breaking Through the Sternum: Expected Post-sternotomy Imaging's Findings and Complications**

Participants

Renan Arakaki, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Median sternotomy is the incision of choice for thoracic and cardiac surgical procedures. Its incidence of complications ranges approximately between 0,5-5%, with a mortality rate reaching up to 80%. Thus, it is essential for the radiologist to recognize expected poststernotomy imaging findings and differentiate them from complications. This educational exhibit aims to illustrate the different sternal closure techniques, expected postsurgical changes and the main sternotomy complications involving hardware (wire fracture, migration, and rotation), bone (fracture, sternal dehiscence, nonunion, and osteomyelitis), and soft tissues (hematoma, gossypiboma, and abscess).

#### **TABLE OF CONTENTS/OUTLINE**

- Sternal closure techniques- Expected postsurgical imaging findings- Acute sternotomy complications- Late sternotomy complications.

### **CHEE-2 Across the Diaphragm: Thoracic Complications of Abdominal Conditions and Percutaneous Procedures**

Participants

Elisa Antolinos Macho, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

-Recognize that many pathologic abdominal conditions and certain complications of percutaneous abdominal procedures may extend to the thoracic cavity -Learn the most common pathologic abdominal conditions and percutaneous procedures complications that may extend above the diaphragm -Describe the anatomical and acquired pathways through which infradiaphragmatic pathologic conditions and percutaneous procedures complications may reach the thorax -Review the appearance of these thoracic complications on different imaging modalities

#### **TABLE OF CONTENTS/OUTLINE**

1) Anatomy and physiology of the diaphragm 2) Common abdominal pathologic conditions and percutaneous procedures complications that may extend to the thorax o Liver and biliary system conditions o Pancreatic and splenic conditions o Kidneys and adrenal glands conditions o Pelvic conditions o Complications of percutaneous abdominal procedures § External biliary drainage § Percutaneous local ablative therapies of liver lesions § Embolization of portal and hepatic veins § Vertebroplasty 3) Pleural complications o Pleural effusion o Fistulas (biliopleural fistula, pancreaticopleural fistula) 4) Pulmonary complications o Infections § TB § Other mycobacteria o Inflammation § Sarcoid reaction § Pneumonitis § Mendelson syndrome o Fistulas 5) Thoracic vascular complications o Fat embolism syndrome o Foreign body embolism

## CHEE-20 Emerging Technology in Functional Lung Imaging: Hyperpolarized Xenon Gas MRI

### TEACHING POINTS

1. Hyperpolarized Xenon Gas (HXG) MRI is a new-to-market FDA approved imaging agent to evaluate lung ventilation, which offers advantages over other inhaled contrast agents. 2. Compared to traditional spirometry, HXG MRI is a promising surrogate with superior reproducibility and reliability. 3. Regulated by the FDA as a drug-device combination, HXG-MRI has some barriers and obstacles for adoption and implementation. 4. Various airway diseases, like asthma, COPD, and Cystic Fibrosis, have MR ventilation features that increase confidence in diagnosis and assessment of disease severity. 5. Ongoing investigation of HXG MRI is revealing new applications for medical imaging, which are not currently possible with existing modalities.

### TABLE OF CONTENTS/OUTLINE

1. Background/Objectives 2. Technique a. Drug Preparation --- i. Supplies, Consumables --- ii. Polarization --- iii. Dose Administration b. MR Scanner Configuration --- i. Coil --- ii. Software --- iii. Hardware c. Data Analysis --- i. Quantitative methods (Ventilation defect percent, VDP) --- ii. Qualitative methods 3. Clinical Implementation a. Regulatory b. Logistical c. Financial 4. Ventilation Characteristics a. Normal b. Pathology disease states --- i. COPD --- ii. Asthma --- iii. Cystic Fibrosis --- iv. COVID-19 (Acute and 'Long') 5. Future Frontiers a. Dissolved-Phase Imaging (Barrier Tissues and RBC) in healthy and diseased states. b. Dynamic HXG-MRI ('MR Spirometry') c. Physiological response to pharmaceutical agents

## CHEE-21 How Holey" Art Thou: Developing a Systematic Approach to Identifying and Reporting Cystic Lung Disease

Participants

Maria Clara Lorca, MD, Pittsford, NY (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Become familiarized with the different imaging appearance of cystic lung diseases and their differential diagnosis on chest CT. Differentiate true lung cysts versus their mimics: emphysema, cavities, and cystic bronchiectasis, cavitory lung metastasis. Recognize the distribution patterns of the different cystic lung diseases and formulate major differential diagnosis for solitary and multiple pulmonary cysts based on radiological appearance using a standardized approach.

### TABLE OF CONTENTS/OUTLINE

Recognize primary causes of cystic lung diseases, for example: Birt-Hogg-Dube (BHD) syndrome; spontaneous and tuberous sclerosis related lymphangioleiomyomatosis (LAM), Pulmonary Langerhans cell histiocytosis (PLCH), Lymphocytic interstitial pneumonia (LIP) Recognize acquired cystic lung diseases, for example: Light chain deposition disease, pulmonary laceration, Pneumocystis jirovecii infection, usual interstitial pneumonia, sarcoidosis, amyloidosis. Describe the role of the radiologist in the diagnosis and follow up of cystic lung diseases by CT, and when to recommend further biopsy. Our aim is to review the terminology, distribution and imaging patterns of the most common cystic lung diseases by CT and raise attention to the various mimics of cystic lung diseases, including cavitory lung metastases. The radiologist can then use this information to describe cystic lung disease utilizing a standardized reporting template to improve communication with referring providers.

## CHEE-22 Pulmonary Blood Volume Image with Dual-energy CT: Findings in Lung Cancer Patients

### TEACHING POINTS

1. To review how to obtain the pulmonary blood volume (PBV) images with dual-energy CT. 2. To describe the PBV imaging features and pathogenesis in lung cancer patients. 3. To discuss the importance of clinical implications and the pitfall.

### TABLE OF CONTENTS/OUTLINE

1. Introduction 2. technical overview of dual-energy CT 3. CTPA techniques 4. the PBV imaging features and pathogenesis in lung cancer patients: vascular abnormalities, bronchial abnormalities, parenchymal abnormalities, artifacts and pitfall, and others 5. Summary

## CHEE-23 Potential Applications of Photon-Counting Detector CT in Cardiothoracic Imaging

Participants

Mauricio Barbosa, MD, PhD, Dallas, TX (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Exemplify current and future applications of photon-counting detector CT (PCD-CT) in cardiothoracic imaging, including: 1. Improved image quality: PCD-CT provides higher spatial resolution and improved contrast-to-noise ratio, which enables more accurate and detailed imaging of the heart, vasculature and lungs. 2. Lower radiation dose: PCD-CT can allow for lower radiation doses than traditional CT. 3. Reduced artifacts: use of high keV imaging on PCD-CT can reduce metallic artifacts; combination of high-helical pitch imaging with PCD-CT can reduce motion artifacts. 4. Potential for new applications: PCD-CT technology offers new possibilities for functional imaging, including perfusion and multi-energy imaging, which may help in the diagnosis and management of cardiothoracic conditions.

### TABLE OF CONTENTS/OUTLINE

I. Introduction: ? • Explanation of physical principles? • Potential Advantages of PCD-CT over Energy-integrating detector CT (EID-CT)? • Improved image quality? • Reduction in radiation exposure? • Spectral imaging?; II. Clinical Applications of PCD-CT in Cardiothoracic Imaging?: • Coronary Artery Disease Imaging? • Lung Nodule and Mediastinal Mass Characterization? • Evaluation of Interstitial Lung Disease? • Thoracic Vascular Imaging/ Pulmonary embolism?; III. Future Possibilities: ? • Improvements in Quantitative Imaging? • Functional Imaging?; IV. Challenges and Limitations?: • Scientific and clinical validation? • Need for additional training and education?; V. Conclusion?: • Recap of current clinical applications? • Future directions for PCD-CT? • Final thoughts.

## CHEE-24 Disorders with Hand and Thoracic Involvement

Participants

Riddhi Borse, MBBS, MD, New Haven, CT (*Presenter*) Nothing to Disclose

## TEACHING POINTS

Numerous medical conditions have multiorgan imaging findings. Here, we review specifically the hand and cardiothoracic findings of selected infectious, inflammatory, connective tissue, neoplastic, and hereditary disorders. These correlations are meant to remind the astute clinician that certain hand findings should trigger a careful radiologic evaluation that includes imaging of the chest.

## TABLE OF CONTENTS/OUTLINE

1. Introduction.2. Examples of cases:A. Connective tissue disorders- Rheumatoid arthritis, Systemic Lupus Erythematosus, Raynaud's syndrome, Dermatomyositis. B. Hereditary Conditions: Marfan's Syndrome, Ehlers Danlos Syndrome, Sickle-cell disease.C. Metabolic conditions: Hyperparathyroidism, Renal Failure with osteodystrophy and metastatic calcification in the lungs.D. Infectious Diseases: Tuberculosis, Septic Embolism.E. Neoplastic Conditions: Lung Cancer, Melanoma.3. Conclusion.

## CHEE-25 Tracheobronchomalacia x Excessive Dynamic Airway Collapse: CT and Bronchoscopy Correlation

Participants

Helena Pereira, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

## TEACHING POINTS

- To discuss the differences between tracheobronchomalacia (TBM) and Excessive Dynamic Airway Collapse (EDAC), emphasizing their pathophysiology, anatomical aspects, clinical presentation and associated comorbidities. - To point out the challenges and controversies in its diagnosis. - To discuss the role of Flexible Dynamic Bronchoscopy and Computed Tomography in the assessment of central expiratory airway collapse (ECAC), highlighting the exam protocols and the main aspects to be evaluated. - To illustrate the imaging appearance of EDAC and TBM on bronchoscopy and CT.

## TABLE OF CONTENTS/OUTLINE

1 - Introduction2 - Pathophysiology, anatomical aspects and clinical presentation of TBM and EDAC. 3 - Flexible Dynamic Bronchoscopy and Computed Tomography: techniques, protocols and main findings. 4- Cases 5- Conclusion

## CHEE-26 What's That in the Bone?"- Non-Traumatic Musculoskeletal Pathology on Chest/ Breast Imaging

Participants

Tina Roa, MD, New York, NY (*Presenter*) Nothing to Disclose

## TEACHING POINTS

1. Understand the basic musculoskeletal anatomy seen in the chest including bones, joints, muscles, tendon insertions and major nerves (including the brachial plexus origin and long thoracic nerve). 2. Recognize MSK anatomic variants and common degenerative changes. 3. Recognize MSK manifestations of infectious, autoimmune, and other systemic pathologies on chest imaging (such as septic arthritis, sickle cell disease, rheumatoid arthritis, etc.) 4. Learn how to approach bone lesions within the chest. 5. Learn how to approach soft tissue lesions within the chest. 6. Review Bone-RADS criteria.

## TABLE OF CONTENTS/OUTLINE

1. Normal Anatomy: a. Osseous Structures of the Chest, b. Musculature of the Chest, c. Joints and Tendons, d. Major Nerves; 2. Orthopedic Findings: a. MSK Anatomic Variants in the Chest, b. Degenerative MSK Changes in the Chest; 3. MSK Infections/ Autoimmune/ Other Systemic Anomalies in the Chest: a. Septic Arthritis, b. Autoimmune MSK Manifestations in the Chest, c. Other Systemic Disorders; 4. MSK Tumors of the Chest: a. Benign Tumors (Osseous and Soft Tissue), b. Malignant Tumors (Osseous and Soft Tissue); 5. Algorithm to approach incidental bone lesion/ Review of Bone-RADS.

## CHEE-27 Spotting the Airway Snags: Computer Tomography Imaging Planning For Bronchoscopy Stent and Valve Placement

Participants

Miriana Mariussi, MD, Pilar, Argentina (*Presenter*) Nothing to Disclose

## TEACHING POINTS

The purpose of this exhibit is to: • Review the indications for bronchoscopy stent and valve placement. • Highlight the role of Computer Tomography in the treatment of airway stenosis, air leaks and chronic obstructive pulmonary disease (COPD). • Comprehend the application of CT planning prior to the bronchoscopy. • Correlate the radiological features with bronchoscopy findings. • Identify CT image findings during follow-up after the procedure.

## TABLE OF CONTENTS/OUTLINE

Bronchoscopy stent and valve placement have been established as a safe and effective treatment alternative for airway stenosis, air leaks and COPD. A case based pictorial essay allows for a comprehensive assessment and understanding of: • Clinical indications for bronchoscopy stent and valve placement. • Radiological features of airway stenosis, air leaks and COPD. • Pre-procedural CT planning for bronchoscopy airway stent placement. • Pre-procedural CT planning for the endobronchial unidirectional valve placement. • Imaging findings correlated with bronchoscopy. • Expected radiological findings during the follow up.

## CHEE-28 Trouble in the Air: Imaging Review of Early Complications Following Lung Transplantation and Our Institutional Experience

Participants

Bob Zhang, MBBS, BMedSc, Melbourne, Australia (*Presenter*) Nothing to Disclose

## TEACHING POINTS

Early complications following lung transplantation are a major cause of morbidity and mortality. Imaging plays a key role in their diagnosis, and it is important for radiologists to be able to recognise these complications, as well as understand the underlying cause. This exhibit aims to 1) discuss the spectrum of complications that occur within the first week following transplantation, 2) discuss preoperative factors that may predispose to complications, 3) review surgical techniques that reduce the risk of certain complications and how to recognise these on imaging, 4) discuss our institutional experience as a major transplant centre, and 5)

review the imaging findings of early complications using a case based format.

#### TABLE OF CONTENTS/OUTLINE

1. Overview of lung transplantation. 2. Overview of complications that occur in the first week following transplantation. 3. Preoperative factors that increase risk of complications following transplantation. 4. Surgical techniques to reduce the risk of postoperative complications and how to recognise these on imaging. 5. Review of our institutional experience as a major lung transplantation centre. 6. Case based review of imaging findings in early post-transplant complications.

#### CHEE-29 Bronchiectasis: Another Way to Approach Lung Disease

##### TEACHING POINTS

Bronchiectasis features in a wide range of pathological processes including infectious causes, bronchial aspiration, pneumoconiosis, congenital immunodeficiencies, and cartilage development disorders, among others. The spatial distribution; is considered a key point when it comes to establishing differential diagnoses in an easier and quicker way. The upper lung zones are usually compromised by cystic fibrosis, sarcoidosis, and allergic bronchopulmonary aspergillosis noticing a more central involvement while tuberculosis has an asymmetric distribution. The middle lobe and lingula frequently show bronchiectasis secondary to infection by atypical mycobacteria or adult respiratory distress syndrome. Associated findings allow radiologists and trainees to address the diagnoses. When tree-in-bud, centrilobular ground-glass nodules and bronchial wall thickening are seen in patients with lower lung zones bilateral bronchiectasis; bronchial aspiration should be suspected. Meanwhile, the presence of architectural distortion, honeycombing, and varicoid morphology bronchiectasis are commonly found in pulmonary fibrosis.

#### TABLE OF CONTENTS/OUTLINE

Location and distribution, Upper lung: Cystic fibrosis, Sarcoidosis, Allergic bronchopulmonary aspergillosis, Tuberculosis Middle/lingular: Atypical mycobacterial infection, Acute respiratory distress syndrome, Primary ciliary dyskinesia, Immunodeficiency Lower lung zone: Chronic aspiration, Pulmonary fibrosis,  $\alpha$ 1-Antitrypsin deficiency. Central: Tracheobronchomegaly, Williams Campbell syndrome Focal and diffuse: Endobronchial or peribronchial tumor, Swyer James syndrome, Bronchiolitis obliterans.

#### CHEE-3 Inside the Circuit: Radiology Insights into ECMO Placement

##### TEACHING POINTS

1. ECMO, or extracorporeal membrane oxygenation, is a life-support system that provides temporary respiratory or circulatory support to critically ill patients whose heart or lungs are failing. 2. Radiology plays an important role in ECMO, particularly in assessing the placement of the cannulas and monitoring for complications such as bleeding or clotting. 3. Sentinel events, such as malposition of the cannulation require rapid intervention and evaluation by the ECMO team and radiology. 4. There are different types of ECMO cannulation, including veno-arterial, veno-venous, veno-veno-arterial, and central cannulation. 5. Venous-arterial cannulation is used when the patient has both respiratory and circulatory failure, and it requires correct positioning to ensure optimal blood flow and oxygenation. Incorrect positioning can lead to complications such as limb ischemia or vessel injury. 6. Veno-venous ECMO is used when the patient has isolated respiratory failure, and it also requires correct positioning to avoid complications such as bleeding or pneumothorax.

#### TABLE OF CONTENTS/OUTLINE

Introduction 1. Indications for ECMO 2. Role of Radiology in ECMO 3. Sentinel Event Types of ECMO Cannulation 1. Veno-Arterial 2. Veno-Venous 3. Veno-Veno-Arterial 4. Central Cannulation Venous-Arterial Cannula 1. Indications 2. Correct Positioning 3. Incorrect Positioning 4. Complications of Incorrect Positioning VA ECMO: Femora Cannula 1. High Arterial Cannula 2. Low Arterial Cannula 3. Low Venous Cannula 4. High Venous Cannula Veno-Venous ECMO 1. Indications 2. Correct Positioning 3. Incorrect Positioning 4. Complications of Incorrect Positioning 5. Single lumen VV ECMO Conclusions

#### CHEE-30 Chill Out! Percutaneous CT- Guided Intrathoracic Cryoablation: Applications, Imaging Appearance, and Complications

Participants

Saumik Rahman, MD, New Haven, CT (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

Percutaneous cryotherapy uses liquified gases like nitrogen or argon through cryoprobes under CT guidance to create temperatures as low as - 40° C. Cytotoxic cell destruction occurs at this temperature which helps to destroy neoplastic cells. Cryotherapy allows real-time evaluation of the ablation site. It is a preferred ablation technique for central tumors close to airways, great vessels, pericardium.

#### TABLE OF CONTENTS/OUTLINE

Indications for cryotherapy: Primary lung cancer (early or advanced), metastatic lesions, mediastinal lesions, post-SBRT recurrent tumors, post-surgical recurrent tumors. Post treatment appearance - Immediately after the procedure, follow-up after 1 month, 3 months, 6 months and 12 months. Complications of cryotherapy Pneumothorax, hemoptysis, pleural effusion, parenchymal hemorrhage, pneumonia, esophageal injuries, tumor implantation, tumor recurrence, nerve injury, skin injury.

#### CHEE-31 Pleuroparenchymal Fibroelastosis: Update on Imaging with Pathological Correlation

Participants

Joel Gamble, MD, BSC, Toronto, ON (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

1. Pleuroparenchymal Fibroelastosis (PPFE) is a rare subtype of interstitial pneumonia that historically has been difficult to diagnose, particularly in its early stages, and often misdiagnosed by radiologists. 2. PPFE can be associated with other fibrotic interstitial lung diseases or triggered by previous infections, chemotherapy, hematopoietic stem cell transplant, and lung transplant. 3. Improving awareness of PPFE allows early recognition on CT and allows for close attention on clinical and imaging follow up, including implementation of supportive measures and potential treatment.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction to Pleuroparenchymal Fibroelastosis (PPFE): Definition and background; Historical context and understanding; Inclusion in American Thoracic Society/European Respiratory Society guidelines. 2. Diagnosis and Recognition of PPFE: Challenges in early-stage diagnosis; Importance of CT in the diagnosis; Pathological confirmation. 3. Causes and Associations of PPFE: Previously believed to be idiopathic; Association with other fibrotic interstitial lung diseases; triggers, including infections, chemotherapy, hematopoietic stem cell transplant, lung transplant. 4. Clinical Presentation and Prognosis: Slowly progressive or rapid clinical deterioration; Poor prognosis in most cases; Potential treatment.

### **CHEE-32 One-stop-Shop Pictorial Review of All Changes in Lung-RADS v2022**

Participants

Seyedali Nabipoorashrafi, MD, MD, Seattle, WA (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

1- Familiarize radiologists with the latest version of the Lung-RADS criteria (Lung-RADS v2022) for lung cancer screening (LCS). 2- Review the most recently added nomenclature and morphologic features that radiologists should consider determining the appropriate Lung-RADS categories. 3- Review important updates on assigning Lung-RADS categories on follow up studies (stepped management).

#### **TABLE OF CONTENTS/OUTLINE**

1- Introduction to the Lung-RADS tool and its various versions. 2- Comparison of important changes between the 2022 and 2019 versions of Lung-RADS in different domains, including A) Atypical pulmonary cysts B) Juxtapleural nodules C) Inflammatory or infectious findings D) Airway nodules. 3- Review of updated Lung-RADS terms and structural definitions, including the removal of the risk of malignancy table, changes in follow-up intervals, as well as reset of starting points for follow-up and different definitions for growth. 4- Brief review of the effect of changes in Lung-RADS classification criteria on clinical management.

### **CHEE-33 The Many Faces of Evil: A Pictorial Review and Algorithmic Approach to Autoimmune Diseases of the Thorax**

Participants

Seyedarash Mahdavi Anari, MD, Seattle, WA (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

- Different autoimmune diseases can involve different parts of the thorax, including but not limited to lung parenchyma, heart, esophagus, pleural and pericardial space, great vasculature, thymus gland, and thoracic chest wall.
- Patterns of lung disease could precede the development of the clinical diagnosis of autoimmune disease.
- As autoimmune disorders overlap clinically, the possibility of mixed thoracic radiological manifestations should be considered.
- Thoracic involvement in autoimmune disorders could happen due to the disease process itself, drug toxicity, or opportunistic infections from resultant immunodeficiency, which their differentiation needs meticulous clinical-radiological evaluation.
- Provide an algorithmic approach for diagnosis of autoimmune diseases with focus on intrathoracic findings.
- The European Respiratory Society/American Thoracic Society task force proposes using "Interstitial pneumonia with autoimmune features (IPAF)" for patients with idiopathic interstitial pneumonia and features suggestive of, but not definitive for a collagen vascular disease.

#### **TABLE OF CONTENTS/OUTLINE**

- Review of the thoracic findings in autoimmune disorders of the thorax based on the involved organs.
- Evaluation of lung parenchyma findings based on the pattern and prevalence.
- Assessment of autoimmune diseases of the thorax, beyond the lung parenchyma involvement.
- Review the post-treatment changes and treatment complications in the autoimmune disorders of the thorax.
- Evaluation of the natural progression of thoracic autoimmune disorders.
- An algorithmic approach for diagnosis of autoimmune diseases.

### **CHEE-34 Classical Signs on Chest Radiograph: A Primer for Residents**

Participants

Furkan Ufuk, MD, Denizli, Turkey (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

? Recognize the classic signs on chest radiographs. ? Describe each sign's anatomic and pathologic features and discuss their clinical importance.

#### **TABLE OF CONTENTS/OUTLINE**

This educational exhibit provides an overview of classic signs on chest radiographs and their clinical significance. The exhibition includes a table of contents and teaching points, such as recognizing the appearance of chest radiograph signs on Chest CT and describing the anatomic and pathologic features represented by each sign. Several imaging signs on chest radiographs are described, including Air bronchogram, Bat's wing or butterfly shadow, black pleura sign, and others, with the pathophysiologic origin of each sign and the characteristic imaging features described in detail. Radiologists must recognize these signs and understand their causes to provide accurate diagnoses of abnormalities affecting the lungs, heart, mediastinum, diaphragm, and pleura. The exhibit aims to enhance radiologists' knowledge of classic signs on chest radiographs, ultimately leading to improved diagnostic accuracy and better patient care.

### **CHEE-35 A Challenge in Diagnosing Benign Thymic Lesions as Benign**

#### **TEACHING POINTS**

1. To understand the normal/hyperplastic spectrum of the thymus and related clinical conditions 2. To understand the typical and atypical appearance of benign thymic lesions 3. To understand mimickers of thymic lesions

#### **TABLE OF CONTENTS/OUTLINE**

1. Importance of benign diagnosis of thymus a. Avoid unnecessary thymectomy or follow-up study b. Image modality selection and appropriate recommendation 2. Normal/hyperplastic spectrum of the thymus a. Various morphology of the thymus b. Demographic and clinical features related to thymic involution/hyperplasia c. Thymic hyperplasia related to COVID-19 infection or vaccination d.

2D and 3D analysis: Shape and measurement in size and volume 3. Typical appearance of common benign thymic lesions a. Thymic hyperplasia: True vs lymphoid hyperplasia b. Thymic cyst: Unilocular vs multilocular c. Thymolipoma d. Differentiation from thymic neoplasm (Thymic epithelial tumor, lymphoma) 4. Atypical appearance of benign thymic lesions a. Nodular component within the thymus b. Atypical morphologies of thymic hyperplasia (TH) • Non-suppressive TH out-of-phase T1WI MRI • Multinodular/multicystic TH (Sjogren's syndrome, HIV infection) c. Atypical features of thymic cyst • Complicated hyperattenuating cyst • Thymic/pericardial cyst within TH 5. Mimicker of thymic lesions a. Morgagni hernia b. Focal fat necrosis c. Ectopic thyroid lesion d. Tortuous internal mammary vein e. Lymph nodes 6. Summary

### **CHEE-36 A Comprehensive Pictorial Review: Vascular Anomaly and Malformation of Thorax**

Participants

Ryosuke Taiji, MD, Kashihara, Japan (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

The purpose of this exhibit is To depict anomalies and malformations of thorax To discuss the clinical feature, significance, and management for those entities.

#### **TABLE OF CONTENTS/OUTLINE**

The mediastinum contains two distinct circulatory systems, namely the systemic and pulmonary circulations. Anomalies and malformations have been reported within the thorax. In the pediatric population, some malformations are identified promptly after birth and necessitate surgical intervention. Radiologist should be familiar with these entities. Contents 1. Pulmonary artery Absence of the right pulmonary artery, proximal interruption of the pulmonary artery, pulmonary arterial aneurysm, pulmonary sling, and Taussig-Bing syndrome, 2. Aorta Aberrant right subclavian artery, right aortic arch and Kommerell diverticulum, arterial duct (Botallo's duct), and anomalous systemic arterial supply to the basal lung 3. Pulmonary vein Partial anomalous pulmonary venous return (PAPVR); right upper and lower pulmonary vein, Scimitar syndrome, total anomalous pulmonary venous return (TAPVR); supra-cardiac, cardiac, infracardiac type, anomalous unilateral single pulmonary vein (AUSPV), and pulmonary venous aneurysm 4. Vena cava Persistent left superior vena cava, azygos continuation of inferior vena cava 5. Summary

### **CHEE-37 Granulomatosis with Polyangiitis (GPA): Thoracic Manifestations with Emphasis on Differential Diagnosis**

Participants

Roddie Moraes Neto, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Review the pathophysiology and histologic features of granulomatosis with polyangiitis (GPA); review the main clinical manifestations of GPA; recognize the most common and uncommon chest imaging findings of GPA; highlight the main differential diagnosis of thoracic manifestations of GPA in a pattern-based approach, with clinical-radiological correlation.

#### **TABLE OF CONTENTS/OUTLINE**

Introduction: definition, pathophysiology, clinical features, diagnostic criteria; case based review - pattern-based thoracic manifestations of GPA with differential diagnoses: lung nodules and masses, airspace consolidation and ground glass opacities, airway thickening, pleural involvement, rare mediastinal manifestations (lymphadenopathy, cardiac involvement, great arteries vasculitis); conclusions and key takeaways

### **CHEE-38 Clearing the Fog - What You Must Know About Smoking-related Diffuse Lung Diseases**

Participants

Gabriel Neumann Kuhn, MD, Morro Redondo, Brazil (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Review the smoking-related diffuse lung diseases (SDLD) and its pathophysiological mechanism; Discuss the relationship between smoking and interstitial lung abnormalities (ILA) and the relevance of the imaging approach; Case-based demonstration of the main imaging findings associated in each one of the SDLD; Review the findings and implications of the combined emphysema-fibrosis syndrome.

#### **TABLE OF CONTENTS/OUTLINE**

General facts about tobacco use; Case based examples of the main SDLD (respiratory bronchiolitis / desquamative interstitial pneumonia, smoking related interstitial fibrosis / airway enlargement with fibrosis, Langerhans cell histiocytosis); Brief up-to-date approach of combined emphysema-fibrosis syndrome; Take home messages.

### **CHEE-39 Three Steps for the Success of a Lung Segmentectomy Surgery: The Role of the Radiologist**

Participants

Maria Celia Franco Issa, MD, Uberlandia, Brazil (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

? Review the concepts, indications and techniques of lung anatomical segmentectomy ? Describe the most relevant imaging features of the pulmonary nodule to the surgery planning ? Discuss the role of preoperative Chest Computed Tomography (CT) in the recognition of the drainage pattern of the intersegmental vein and determination of the intersegmental plane ? Recognize the anatomical features and variations of the pulmonary venous drainage with potential impact in lung segmentectomy ? Discuss the role of 3DCT in the lung segmentectomy planning

#### **TABLE OF CONTENTS/OUTLINE**

• Introduction • The rationale of Lung Segmentectomy o Indications o Advantages and disadvantages o Minimally Invasive Techniques - Video-assisted thoracic surgery (VATS) - Robotic-assisted thoracic surgery (RATS) - Potential complications • The role of the Radiologist in three steps 1. Describe the most relevant features for anatomical segmentectomy recommendation: - Nodule size and location - Resection margin - Previous lung resection - Absence of visible regional lymph node disease 2. Identify

the intersegmental vein - Delineate the intersegmental plane - Verify if the intersegmental vein is a drainage vein from the tumor 3. Look for variations of the pulmonary venous drainage that might impact in the lung segmentectomy - Case-based review - Atypical venous outflow to the left atrium - Atypical topography of the pulmonary vein - Atypical venous vascularization of pulmonary segments • Future Directions the role of CT with 3D reconstructions and 3D printing in lung segmentectomy planning

#### **CHEE-4 Primer for Radiology Residents: Cardiothoracic Emergencies in Oncology**

Participants

Jitesh Ahuja, MD, MBBS, Houston, TX (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

Familiarize radiologists with spectrum of acute cardiothoracic complications that can occur in oncology patients.

##### **TABLE OF CONTENTS/OUTLINE**

Cancer is the second most common cause of mortality in United States. Several acute cardiothoracic complications can occur in oncology patients that can be life-threatening. These complications can occur due to tumor itself, including the extent of local invasion and metastasis. In oncology patients undergoing treatment, emergencies can be the result of complications of chemo/immunotherapy, surgery and radiation therapy. Finally, patients with cancer are at increased risk of emergencies due to systemic disease from hypercoagulable state and immunosuppression. 1. Complications due to cancer itself a. Airway obstruction b. SVC syndrome c. Esophagorespiratory fistula d. Esophagoaortic fistula e. Large pleural effusion, hemothorax or pneumothorax f. Cardiac tamponade g. Lymphangitic carcinomatosis h. Spinal cord compression 2. Complications due to cancer treatment a. Pneumothorax, hemothorax b. Mediastinal hematoma, mediastinitis c. Lobar torsion d. Cardiac herniation e. Esophageal leak f. Drug or radiation pneumonitis g. Immunotherapy associated myocarditis 3. Systemic complication a. Pulmonary embolism b. Opportunistic infections c. Stress cardiomyopathy (Takotsubo)

#### **CHEE-40 Utilization of Virtual Bronchoscopy and 3D-Multiplanar Volume Reconstruction (MPVR) Correlation to Illustrate Tracheobronchial Tree Abnormalities - An Imaging Review**

##### **TEACHING POINTS**

Tracheobronchial tree abnormalities can be subtle on imaging and are not always accessible via fiberoptic bronchoscopy (FB). As healthcare shifts towards value-based care, technological innovations such as virtual bronchoscopy (VB) may not only reduce overspending but also improve clinical and patient satisfaction outcomes by providing radiologists with a visually intuitive medium to show rather than only tell complex 3D radiographic findings to non-radiologist audiences. VB is rendered by processing multi-detector row CT (MDCT) volumetric data via specialized software that assumes an artificial perspective from a lumen and then assigns opacity values and full spectrum color values based off attenuation values of different tissues and abrupt changes in attenuation between adjacent voxels. VB is underutilized, and it is better than conventional FB in specific cases where higher order subsegmental bronchial branches or regions distal to an obstruction/stenosis or are inaccessible via FB. VB enables a quick, highly accurate, and, most importantly, non-invasive visual medium to evaluate the tracheobronchial tree. It can play an invaluable role in personalized pre-procedural planning and simulations as well as in educating trainees in thoracic anatomy.

##### **TABLE OF CONTENTS/OUTLINE**

1. Briefly describe how 3D-MPVR post-processing is used in creating VB. 2. Using our institutional database, present CT imaging cases with their respective 3D-MPVR and VB images, including, but not limited to, the following tracheobronchial tree abnormalities: tracheal anomalies, tracheal stenosis, tracheal enlargement, excessive central airway collapse, endobronchial lesions, and trauma.

#### **CHEE-41 A Pictorial Review: Lymphoma and Lymphoproliferative Disease of Thorax**

Participants

Ryota Nakano, Kashihara, Japan (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

To depict lymphoma and lymphoproliferative disease of thorax To discuss the clinical and radiological findings and management

##### **TABLE OF CONTENTS/OUTLINE**

Lymphoma and lymphoproliferative diseases of the thorax occur primarily in the lungs, bronchus, mediastinum, and chest wall. Radiologists need to know more about each disease, as some require differentiation from lung cancer or other malignant mediastinal tumors. Contents. 1. Pulmonary lymphoproliferative disease (LPD): follicular bronchiolitis, lymphocytic interstitial pneumonia, and nodular lymphoid hyperplasia. 2. Primary pulmonary lymphoma: MALT lymphoma, diffuse large B-cell lymphoma, and Intravascular large B-cell lymphoma. 3. Primary mediastinal lymphoma: diffuse large B-cell lymphoma, classical Hodgkin lymphoma, and T-cell lymphoblastic lymphoma. 4. Primary pleural lymphoma: pyothorax associated lymphoma, and follicular lymphoma. 5. Miscellaneous: IgG4-related disease, Uni-/Multicentric Castleman disease, and methotrexate-associated LPD.

#### **CHEE-42 The Invisible Culprit: Demystifying Autoimmune Disorders of the Lungs**

##### **TEACHING POINTS**

Autoimmune disorders affecting the lungs are a group of medical conditions characterized by the presence of autoantibodies that can cause damage to organs throughout the body. They include connective tissue diseases. CTD-ILD is defined as evidence of ILD demonstrated by CT (i.e., some combination of reticulation, ground-glass opacities, traction bronchiectasis, honeycombing, and/or cysts) in the setting of an established CTD. It includes RA, systemic sclerosis, SLE, primary Sjogren's syndrome, idiopathic inflammatory myositis, and mixed connective tissue disease. Diagnosis typically involves imaging studies such as high-resolution CT scans, lung biopsies and immunological investigations. Treatment options include corticosteroids, immunosuppressants, oxygen therapy and pulmonary rehabilitation. In severe cases, lung transplantation is considered as a last resort.

##### **TABLE OF CONTENTS/OUTLINE**

1. Antisynthetase syndrome- inflammatory myositis, polyarthritis associated with ILD and anti-synthetase autoantibodies. 2. Microscopic polyangiitis- diffuse pulmonary alveolar hemorrhage is common feature. 3. RA-ILD is commonly associated with UIP. 4. SSc-ILD is commonly associated with NSIP. Risk factors- anti-topoisomerase Ab and higher skin score. 5. Sjogren's syndrome

typically presents with NSIP, other patterns like UIP, LIP, focal lymphoid hyperplasia of the lung, small airways disease, and pulmonary vasculitis. 6. IIM-ILD is restricted to subsets of DM and PM. Usually manifests as NSIP with OP. Risk factors - anti-Jo1, anti-PL-7, anti-PL-12, and Black race. 7. Sarcoidosis - commonly affects the lungs and mediastinum with variable radiographic features depending on the stage of the disease.

#### **CHEE-43 Pinpoint It - A Pictorial Essay on Causes of Acute Chest Pain on CT**

Participants

Murilo Peixoto, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

Acute localized chest pain is an important and frequent complaint in patients who seek the emergency medical care and can originate from many different compartments / tissues, namely the mediastinum (including cardiovascular structures), the lungs, the pleura, the chest wall, the spine or even the upper abdomen. Placing a skin marker at the topography of pain referred by the patient is an important step in facilitating the identification of a potential cause.

##### **TABLE OF CONTENTS/OUTLINE**

Numerous diseases may present as acute localized chest pain and chest computed tomography (CT) can be an important tool to detect the cause, including pulmonary infarction caused by acute thromboembolism, lobar pneumonia, pneumothorax, bone / cartilaginous fractures, acute cardiovascular pathologies, acute pericarditis, mediastinal fat necrosis, some upper abdominal pathologies, among other diseases. The placement of a skin marker in the vicinity of the potential finding, in the location pointed by the patient as painful, plays an important role in allowing for a more accurate search pattern by the radiologist. This exhibit aims to provide a pictorial essay on several findings that are consistent with the clinical presentation of acute localized chest pain as they appear on chest CT, with a special focus on cases in which the placement of a skin marker was particularly helpful.

#### **CHEE-44 Showcasing Signs Silhouettes: Assessment of Congenital Pediatric Cardiac Pathology on a Chest Radiograph**

Participants

Janardhana Ponnatapura, MD, Winston Salem, NC (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

Even with the availability of modalities such as echo, CT, and MRI; a plain chest radiograph remains as the first and most basic modality to investigate suspected congenital cardiac conditions in the pediatric population. A chest radiograph is convenient as it is an easily accessible, low-cost, and non-invasive diagnostic tool with minimal radiation dose, giving us an opportunity to move one step closer to a "green radiology." While evaluating the chest radiograph, it is vital to recognize that classic cardiac signs and silhouettes. Additional emphasis should be given to the pulmonary blood flow, ribs, and spine. Since a chest radiograph is the starting point for majority of patients with suspected congenital heart conditions - it is very imperative for the radiologists to quickly recognize these classic findings to provide an accurate diagnosis for proper patient management.

##### **TABLE OF CONTENTS/OUTLINE**

Introduction to normal pediatric cardiac silhouette  
Cyanotic Cardiac Heart disease:- Tetralogy of Fallot- Total Anomalous Pulmonary Venous Return (TAPVR)- Truncus Arteriosus- Transposition of Great Arteries- Tricuspid Atresia- Hypoplastic Left Heart Syndrome (HLHS)- Ebstein's Anomaly  
Acyanotic Cardiac Heart disease:- Atrial Septal Defect (ASD)- Ventricular Septal Defect (VSD)- Patent Ductus Arteriosus (PDA)- Coarctation of the Aorta- Aortic Stenosis- Pulmonic Stenosis  
• Technical factors  
• Limitations of Chest x-ray. Tricks and tips to radiologist for interpreting CXR.

#### **CHEE-45 Caution! Lung "Fields" Ahead: Thoracic Imaging in the Agricultural Setting**

##### **TEACHING POINTS**

The agricultural sector employs 884 million workers, over a quarter of the global labor force, yet it remains one of the three most hazardous industries in the world. High morbidity and fatality rates are largely attributable to respiratory illnesses arising from unique exposures inherent in agricultural processes. Since the last comprehensive overview of radiological manifestations of agricultural-related diseases was published in 1991 by Gurney et. al, imaging technologies have modernized, allowing for more exquisite characterization of these lung disorders. Modern agricultural practices have brought about new illnesses and mechanisms of trauma, with unique radiological manifestations that have not been sufficiently characterized in the literature. In this exhibit, we provide an updated overview of the radiological manifestations of agriculture-related lung diseases and chest traumas to help with timely diagnosis and treatment for this vulnerable population.

##### **TABLE OF CONTENTS/OUTLINE**

Outline: I. Agricultural workers as a vulnerable population II. Radiological manifestations from exposures to microorganisms in agriculture a. *Coxiella burnetii* (Q Fever) b. *Nocardia nova* c. Blastomycosis d. Acute histoplasmosis e. Pulmonary echinococcosis (hydatid disease) III. Radiological findings from exposures to organic compounds a. Organic dust toxic syndrome b. Nonfibrotic hypersensitivity pneumonitis c. Fibrotic hypersensitivity pneumonitis d. Silo filler's disease IV. Agricultural related trauma a. Blunt chest trauma b. Foreign body aspiration c. Deep vascular injury V. The final harvest: take home learning points

#### **CHEE-46 Cardiovascular Imaging in Thoracic Neoplasms**

Participants

Jordi Broncano, MD, Cordoba, Spain (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

Recent advances in chest MRI have expanded its use in the evaluation of chest tumors, not only for tissue characterization but also for precise depiction of invasion of adjacent structures, tumor staging and treatment monitoring. Moreover, depiction of cardiac involvement, either directly or indirectly, has been associated to worse prognosis in oncologic patients. Teaching points: 1. To detail the basic and advanced CMR techniques that may be incorporated to conventional chest MR protocols, as well as its indications and potential pitfalls. 2. To review the direct and indirect mechanisms of cardiovascular involvement in patients with thoracic malignancies. 3. To identify how combined hybrid cardiothoracic imaging may be useful for treatment surveillance and

monitoring.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction 2. CMR in cardio-oncology: The imaging protocol 2.1. Basic chest MR protocol (starting point) 2.2. Cardiac sequences for thoracic neoplasms evaluation - T1 black blood imaging (fat invasion) - DWI with EKG triggering - First pass perfusion - Cine SSFP - Parametric mapping (tumoral/tissue characterization) - MR angiography - 4D flow CMR (great vessels and cavitory hemodynamics) - PET/MR imaging 3. Cardiac involvement in Cardio-Oncology: Direct Mechanisms - Hematogeneous metastasis - Lymphoid metastasis - Direct involvement - Intravascular growth 4. Improving tumor staging with cardiac sequences - Cardiac/vascular/mediastinal invasion - Pleural invasion - Chest wall invasion 5. Indirect involvement of the heart in oncologic patients - Thoracic irradiation - Chemotherapeutic agents - Plasma cell dyscrasia (amyloid) 6. Use of CMR in treatment monitoring: Prognostic biomarkers 7. Take home points

#### CHEE-47 Chest Computed Tomography Angiotomography with 3D Reconstructions for Preoperative Planning

Participants

Paula Terra Amaral, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The purpose of this exhibit is to:- Review the evolution of surgical technique for pulmonary resections - Highlight the benefits of Computed Angiotomography with 3D reconstructions in surgical planning - Understand the application of CTA planning prior to segmentectomy to evaluate bronchovascular relations, anatomical variations and lung volumetry- Correlate the radiological findings with intraoperative findings - Identify the role of 3D images in facilitating communication between radiologists and surgeons

#### TABLE OF CONTENTS/OUTLINE

Surgical planning using imaging methods has become increasingly relevant with the advancement of robotic thoracic surgery and sublobar resections for the treatment of lung neoplasms, which has driven the growth of 3D reconstructions. A pictorial essay based on cases from our collection allows for a comprehensive assessment and understanding of:- Historical evolution of pulmonary lobectomy and current main indications for sublobar resections.- Benefits of 3D surgical planning. - How we do our 3D reconstructions with explaining videos.- Application of 3D reconstructions in robotic surgery consoles.- Radiological findings of 3D reconstructions with surgically relevant anatomical variations and bronchovascular relationships- 3D reconstruction findings with nodule volumetric and density analysis, lung segments volumetry and intersegmental resection planes

#### CHEE-48 The Role of Imaging in Bronchoscopic Lung Volume Reduction Using Endobronchial Valves

Participants

Yogesh Gupta, DO, (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Provide a background on the various lung volume reduction techniques and their efficacy in the treatment of COPD with a focus on bronchoscopic lung volume reduction (BLVR) using endobronchial valves (EBV) 2. Discuss important imaging parameters in preprocedural assessment with attention to target lobe selection as well as exclusion criteria 3. Present expected postprocedural imaging findings as well as various postprocedural complications with imaging correlates

#### TABLE OF CONTENTS/OUTLINE

Of the various BLVR techniques, EBVs have the largest body of scientific data to support their safety and efficacy. Imaging plays a central role both prior to the procedure - in determining the presence of contraindications and selecting the target lobe using CT -- as well as after the procedure - in determining whether the procedure was effective and characterizing potential complications using radiography and/or CT. Outline• Overview of indications and types of lung volume reduction• Background on mechanism of action of valves, valve types, and location of valve deployment• Preprocedural role of CT in characterizing emphysema, determining exclusion criteria, and target lobe selection and role of perfusion scintigraphy in further selection• CXR and CT imaging of expected postprocedural findings (i.e. lobar collapse) and potential complications (ex: pneumothorax, infection, valve migration)• Discussion of future directions

#### CHEE-5 Atypical Pulmonary Metastases: Patterns and Clinical Significance

Participants

Ioannis Vlahos, MBBS, FRCR, Houston, TX (*Presenter*) Director, Grayscale Ltd;Co-owner, Grayscale Ltd;

#### TEACHING POINTS

Based on cases from an international cancer referral center, explain:Atypical metastases (morphology, evolution, sources)Clinical implications of atypical patternsAssociated risks of mimics, misdiagnosis, delayed diagnosis

#### TABLE OF CONTENTS/OUTLINE

Atypical morphology and clinical implications:Cannonball, miliary, cavitating, pneumothorax-associated, calcified, ossified, hypervascular, hemorrhagic, airspace, endobronchial, central embolized, peripheral arterial microvascular (including pulmonary tumor thrombotic microangiopathy), endovenular, perilymphatic.Atypical growth rates:Rapid: implications for incorrect pathology (e.g. rhabdoid/sarcomatoid/small cell differentiation), re-biopsy (e.g. small cell transformation), metastatectomy recurrence ratesSlow: e.g. Adenoid Cystic CarcinomaBenign metastases (leiomyoma, meningioma, giant cell tumor, HPV)

#### CHEE-50 Differential Diagnosis of Multiple Subsolid Pulmonary Nodules

Participants

Murilo Peixoto, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- There are numerous etiologies to be considered in the differential diagnoses when faced with multiple subsolid nodules at high resolution computed tomography (HRCT).- Surveillance of these nodules should follow the recommendations of the Fleischner Society.- They can represent the initial manifestation of diseases that typically present with a different imaging pattern.- When

discerning upon a possible infectious etiology, the status of the patient as immunocompetent or immunosuppressed is a key to the diagnosis.- There are specific imaging signs and/or association with other conditions that may help narrow the differentials.

#### TABLE OF CONTENTS/OUTLINE

A pattern of multiple subsolid nodules is a diagnostic challenge. There are a plethora of conditions that can present with such characteristics on imaging, even more so when one considers that other imaging patterns may present as multiple subsolid nodules in the initial stages. It is important to understand the possible diagnoses that can present with such a pattern, as well as the recommendations for surveillance and the association with other conditions that may help narrow down the differentials, even to a single entity. In this exhibit, in the format of a pictorial essay, the HRCT pattern of multiple subsolid nodules is revised, as well as the multiple etiologies, manifestations and associations pertinent to the matter.

#### CHEE-51 **Keep an Eye on Diseased Lung: What to Look for in Native Lung After Unilateral Transplantation**

##### TEACHING POINTS

\* One-lung transplantation is a practice aimed at improving the survival of patients with advanced stages of pulmonary disease; its most common indications include COPD, pulmonary fibrosis, and sarcoidosis (in North America). Its practice is becoming more frequent, which has led to knowing with greater certainty both the benefits and complications associated with it. However, complications that preferentially involve the native lung have received less attention.\* Radiologists should be familiar with the most frequent complications in the native lung as well as their chronology and the most frequent form of presentation in the different imaging methods (CT and X-ray).\* Make a quick review of the management and treatment of each of them.

##### TABLE OF CONTENTS/OUTLINE

Introduction, classification, and chronology  
Infections  
Incidence  
Pathophysiology  
RX and CT findings  
Treatment  
Pulmonary thromboembolism  
Incidence  
Pathophysiology  
RX and CT findings

#### CHEE-52 **Collateral Venous Pathways In Superior Vena Cava Obstruction**

Participants

Marta Bueno, MD, Seville, Spain (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

1. To describe the different venous collateral routes in superior vena cava obstruction. 2. To relate the level of obstruction with the pattern of collateral vessels. 3. To illustrate some unusual image findings that can occur in superior vena cava syndrome

##### TABLE OF CONTENTS/OUTLINE

1. Anatomy and embryology of superior vena cava  
2. Causes of superior vena cava obstruction  
3. Different patterns of venous collateral pathways depending on the level of blockage  
4. Major collateral pathways  
4.1. Azygos-Hemiazygos system  
4.2. Lateral thoracic route  
4.3. Internal mammary route  
4.4. Anterior cervical route  
4.5. Pericardiophrenic route  
4.6. Vertebral route  
5. Unusual collateral pathways  
5.1. Systemic to pulmonary shunt.  
5.1.1. Anatomic  
5.1.2. Congenital  
5.1.3. Acquired  
5.2. Cavoportal pathways  
5.2.1. Downhill varices  
5.2.2. Caval-superficial-umbilical-portal  
5.2.3. Caval-mammary-phrenic-hepatic capsule-portal  
6. Unusual imaging findings:  
6.1. Reopening of left superior vena cava.  
6.2. Pseudopathologic vertebral body enhancement

#### CHEE-53 **Big Fat Truth: A Pictorial Review of Fat Containing Cardiothoracic Lesions - Practical Guide for Radiologists (Case-based)**

Participants

Iandra Pacheco, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

Demonstrate a practical guideline with cases to help radiologists with the differential diagnosis of fat containing lesions of the heart and the thorax. Illustrate with didactic cases and review the typical appearance and the main radiological characteristics of cardiothoracic lesions that contain fat.

##### TABLE OF CONTENTS/OUTLINE

INTRODUCTION  
IMAGING GUIDELINE  
Didactic scheme of the main sites of cardiothoracic involvement by fat containing lesions  
DEMONSTRATE DIDACTIC CASES WITH A RADIOLOGICAL REVIEW  
Thoracic duct lipoma  
Pleural lipoma  
Liposarcoma  
Lipoid pneumonia  
Pulmonary hamartoma  
Extramedullary hematopoiesis  
Lipomatous hypertrophy of the interatrial septum  
Arrhythmogenic right ventricular cardiomyopathy  
Cardiac lipoma  
Cardiac rhabdomyoma  
Mediastinal teratoma  
Mediastinal lipomatosis  
Diaphragmatic hernia  
Thymolipoma  
Epicardial fat necrosis

#### CHEE-54 **Unmasking the Silent Killer: Challenges in Lung Cancer Detection due to Underlying Disease, A Case Based Presentation**

##### TEACHING POINTS

1. Lung cancer detection can be challenging when the patient has an underlying disease. This may lead to delays in diagnosing lung cancer, which can be associated with poorer outcomes. 2. Location, shape, border, and size of abnormalities, as well as any associated features should be carefully evaluated. Continuous follow-up and comparison of serial imaging are important. 3. We present lung cancer developed in a variety of underlying diseases/conditions, emphasizing teaching points to help to differentiate lung cancer from underlying lung findings. 4. A multidisciplinary approach involving radiologists, pulmonologists, thoracic surgeons, and oncologists is necessary to ensure an accurate diagnosis and appropriate management plan.

##### TABLE OF CONTENTS/OUTLINE

1. Post-treatment. A) Postsurgical. B) Post-radiation. 2. Infection/inflammation. A) Tree in bud nodularity. B) Pneumonia/consolidation. 3. Aspiration. 4. Atelectasis. A) Post obstructive. B) Dependent. C) Rounded. 5. Systemic Disease. A) Pre-existing cystic lesions. B) Underlying scarring/fibrosis. 6. Normal anatomic variants. A) Lung cancer developing within/near

normal variant.

### **CHEE-55 Chest X-ray and Mediastinal Abnormalities**

Participants

Antonio Nunez Soto, MD, A Coruna, Spain (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Plain radiography is still today the most common image technique in our hospitals. It is accessible, inexpensive, painless and non-invasive, providing much information with a great cost-effectiveness ratio. With chest X-ray we can detect and analyze mediastinal pathologies, either suspected or incidental. Recognizing normal mediastinal anatomy and anatomic variants is essential for finding out pathology.

#### **TABLE OF CONTENTS/OUTLINE**

The aim of this poster is to describe the radiological analysis of chest radiography for detecting and diagnosing mediastinal abnormalities. For this purpose, we will show normal mediastinal anatomy and mediastinal lines in chest radiographs, as well as normal changes that we can see in supine X-rays with antero-posterior view instead of postero-anterior. We will explain the radiological signs and features that can help us identify mediastinal abnormalities, with the support of several cases of different pathologies (pneumomediastinum, mediastinal masses, vascular pathologies, diaphragmatic hernia...) from a third-level-hospital. For every case, we will provide the clinical information, the X-ray image, in which we will highlight the radiological signs implicated, and a correlation with other imaging techniques. In all cases, the chest X-rays were essential in the initial management of these patients. This presentation will be of interest for radiologists, resident doctors, medical students and other healthcare professionals. The combination of the theoretical semiology with our collection of cases will provide an easy and approachable way to review the most important mediastinal pathology.

### **CHEE-56 The Sternum: The Forgotten Bone of the Thoracic Cage**

Participants

Lucas Farias, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

The purpose of this exhibit is: 1) To review the normal anatomy of the sternum. 2) To review usual and unusual cases with sternal involvement. 3) To understand the sternum (anatomy and pathologies) by associating schematic drawings with MPR and three-dimensional reconstructions (including animated gif). 4) To correlate important findings with the anatomy, embryology, and pathophysiology. 5) To discuss image findings in order to enhance radiologists' skills. 6) To review CT protocols in the evaluation of patients with suspected coronary artery anomalies. 7) To highlight their characteristics in order to familiarize radiologists with these conditions, preventing unfavorable patient outcome.

#### **TABLE OF CONTENTS/OUTLINE**

1) Imaging protocols in the evaluation of patients with suspected sternal involvement. 2) Applied embryology and anatomy of the sternum. 3) Normal sternal development. 3.1. Anatomical variations. 3.2. Metabolic. 3.3. Vascular. 3.4. Inflammation and infection. 3.5. Trauma. 3.6. Postoperative changes. 3.7. Neoplasm. 4) Sample cases of pearls, pitfalls, diagnostic difficulties, and mimics. 5) Summary and take-home messages.

### **CHEE-57 Pulmonary Edema: You Better Not Drown in the Basics**

Participants

Gabriel Neumann Kuhn, MD, Morro Redondo, Brazil (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

The purposes of this exhibit are: 1. To elucidate the classification of pulmonary edema according to its pathophysiological mechanisms: - Hydrostatic edema; - Permeability edema without diffuse alveolar damage; - Permeability edema with diffuse alveolar damage; - Mixed edema. 2. Review the use and peculiarities in the main imaging methods for the evaluation of pulmonary edema: - Chest X-ray; - Computed tomography (CT). 3. Highlight the current epidemiological trends and radiological findings associated with the main causes of pulmonary edema.

#### **TABLE OF CONTENTS/OUTLINE**

• Review of thoraco-pulmonary anatomy: - Cardiac silhouette; - Pulmonary interstitium; - Pulmonary vascular markings; - Costophrenic angles. • Demonstration of the main radiological findings of pulmonary edema: - Alveolar edema; - Kerley B lines; - Opacities; - Consolidations; - Ground-glass opacities. • Demonstration of common and uncommon conditions that cause pulmonary edema from our clinical case collection, such as: - Cardiogenic pulmonary edema (left heart failure, mitral regurgitation, etc.); - Postobstructive pulmonary edema; - Pulmonary edema in pulmonary thromboembolism; - Pulmonary edema in drug abuse; - Post-lung transplant pulmonary edema; - Re-expansion pulmonary edema; - Neurogenic pulmonary edema.

### **CHEE-58 Multifocal Cystic and Cavitory Lung Disease: From Thin to Thick**

Participants

Paula Terra Amaral, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

The purpose of this exhibit is to: - Review cystic and cavitory lung disease and a general approach to focal and multifocal/diffuse forms. - Highlight the evaluation of the wall of focal aerated lung lesions and comprehend the imaging findings in thin-walled, thick-walled cysts and cavitory lung lesions. - Correlate the radiological characteristics with the main differential diagnoses and signs of malignancy. - Identify the important imaging findings addressed in cystic lesions of the new Lung-RADS v.2022

#### **TABLE OF CONTENTS/OUTLINE**

Cysts and cavities are commonly encountered abnormalities on chest CT. Occasionally, the underlying nature of the lesions can be readily apparent as in bullae associated with emphysema. Other times, cystic and cavitory lung lesions can be a diagnostic

challenge. A pictorial essay based on cases from our collection allows a comprehensive evaluation and understanding of:- General approach to focal and diffuse cystic and cavitory lung diseases. - Propose an algorithm to facilitate the evaluation of focal cystic lesions and cavities. - Evaluation and differential diagnosis of focal thin-walled cystic lesions. - Evaluation and differential diagnosis of focal pulmonary thick-walled cysts and cavitations. - Imaging findings of focal cystic lesions correlated with Lung-RADS v.2022

### **CHEE-59 Imaging of the Diaphragm: Anatomy and Disorders**

Participants

Miriam Gallego Casals, MD, Sabadell, Spain (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

The diaphragm is the physical barrier that separates the thorax from the abdomen and is the main muscle involved in ventilation. Its dysfunction can be a cause of dyspnea, and despite its importance, it is often underrated and incompletely evaluated by clinicians as well as by radiologists. We will briefly describe the anatomy of the diaphragm, and discuss its abnormalities through cases, classified as:- Dysfunction: paralysis, weakness or eventration and consequences of diaphragmatic inversion.- Hernias: congenital (Morgagni, Bochdalek) and acquired.- Rupture: traumatic and post-surgery.- Secondary: neoplastic and infectious involvement by contiguity from the abdominal cavity.- Miscellanea: Median arcuate ligament syndrome and increased uptake on PET/CT (respiratory effort, hiipo). Finally, we explain the main imaging techniques we have for both the functional and morphological study of the diaphragm, including chest radiographs, fluoroscopic tests, ultrasounds and CT.

#### **TABLE OF CONTENTS/OUTLINE**

- To describe the anatomy and physiology of the diaphragm.- To review the primary diaphragm disorders.- Learn the image techniques available for its study.

### **CHEE-6 Imaging Findings of Autoimmune Disorders: A Primer for Residents**

Participants

Furkan Ufuk, MD, Denizli, Turkey (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

- To provide an overview of autoimmune disorders, focusing on the most common conditions encountered in clinical practice. - To provide a primer on the imaging features of autoimmune disorders.

#### **TABLE OF CONTENTS/OUTLINE**

Autoimmune disorders are a diverse group of conditions in which the body's immune system attacks its own tissues, resulting in inflammation and damage. The spectrum of autoimmune disorders is broad, ranging from systemic diseases such as systemic lupus erythematosus and rheumatoid arthritis to organ-specific diseases such as autoimmune pancreatitis. Imaging plays a crucial role in the diagnosis and management of autoimmune disorders. This exhibit will provide a comprehensive overview of the imaging findings of autoimmune disorders and will highlight the importance of recognizing these findings in the diagnosis and management of these conditions. By the end of the exhibit, residents will have a better understanding of the role of radiologic imaging in the diagnosis and management of autoimmune disorders.

### **CHEE-60 Unmasking Septal Thickening: An Accessible Diagnostic Guide**

Participants

Fernando Rodado Aranguren, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

To differentiate the various patterns of septal thickening and their association with several interstitial lung diseases. To understand the pathophysiological basis of this finding. To provide a systematic and understandable guide to address the diagnostic dilemma.

#### **TABLE OF CONTENTS/OUTLINE**

Septal thickening of the lung can be the common radiological expression for many processes of different etiologies and variable severity, including pulmonary edema, lymphangitic tumor, sarcoidosis, asbestosis, amyloidosis or Erdheim-Chester disease among others. Due to the wide differential diagnosis that it poses, its presence is often perceived as confusing and challenging. To face this crossroads we must tackle it from its origin, so both the understanding of the underlying pathophysiological fundamentals and the recognition of ancillary imaging signs must be the objective of our study and the pillar for an adequate diagnostic approach. The goal of this work is to provide a tool that may help unmask the enigma: a systematic and understandable review of the different manifestations of septal thickening, focused on the underlying physiological background and exemplified with illustrative cases from our hospital.

### **CHEE-61 Take My Breath Away: MR Lungs from Maverick towards Mainstream, and Maybe Top Gun?**

Participants

Nicholas Bontrager, (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

MRI for evaluation of the pulmonary parenchyma and vessels is a viable alternative to CT that eliminates patient exposure to ionizing radiation, and that can be performed using the magnet you have, sequences you already use, and table times under 20 minutes per complete exam. Pulmonary MRI and MRA have been shown to be effective for evaluation of cystic fibrosis, lung cancer screening, pulmonary nodule and mass evaluation, pulmonary embolism, and more. For lung cancer screening, pulmonary MRI has been found to have equivalent life expectancy with favorable cost-effectiveness and fewer false-positives when compared to low-dose CT. Restricted diffusion is likely more specific to lung cancer than FDG avidity on PET CT. MRA for PE has similar sensitivity, specificity and patient outcomes at 6 months, when compared to CTA.

#### **TABLE OF CONTENTS/OUTLINE**

- MR Sequence Protocol for Evaluation of Lung Parenchyma. - Cases: Primary Lung Cancer, Pulmonary Nodules, Metastases. - MRA Sequence Protocols for Pulmonary Embolism, with gadolinium-based contrast agent and with ferumoxytol (off-label). - More Cases:

PE with GBCA MRA, PE in Pregnant Patient with ferumoxytol MRA, Incidental Findings. - Limitations of MR evaluation of the lungs and pulmonary vessels. - The future of MR evaluation of the lungs.

## **CHEE-62 A Case Based Review of Chest Wall Masses: Multimodality Imaging and Differential Diagnosis**

Participants

Sehar Salman, MD, San Antonio, TX (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

The goal of this presentation is to review clinical manifestations and radiologic findings of chest wall lesions. Many of these masses are discovered incidentally on routine chest imaging, and it is important for the interpreting radiologist to be able to recognize benign, indeterminate, and malignant features in order to guide management. In a series of cases, we will present different diagnoses of chest wall masses including both common and uncommon pathologies, to illustrate the spectrum of findings. After this presentation, learners should be familiar with chest wall anatomy, be able to describe imaging characteristics of lesions on multiple modalities, provide differential diagnoses, recognize indications for biopsy, and ultimately have a framework for approaching these masses.

### **TABLE OF CONTENTS/OUTLINE**

Background - Chest wall anatomy on ultrasound, CT, and MRI - The spectrum of chest wall pathologies (benign, malignant)- fat, fluid, soft tissue, bone  
Cases: lipoma, hematoma, elastofibroma dorsi, neurofibroma, fibrous dysplasia, desmoid fibromatosis, myxofibrosarcoma, metastatic disease - For each case: Clinical scenarios, multimodality imaging findings, differential - Indeterminate and malignant cases: biopsy indications, biopsy results, pathologic correlation (when available)  
Summarize key features and classic differential diagnoses  
Radiologic and clinical management of chest wall masses

## **CHEE-63 A CT Imaging Roadmap for Hemoptysis: from Etiology to Treatment Complications**

Participants

Niels Vinicius Padua Carvalho, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

The purpose of this exhibition is:  
• To review the most common causes of hemoptysis in clinical practice;  
• To illustrate the role of CT imaging for the evaluation of patients with hemoptysis;  
• To provide a systematic approach on hemoptysis imaging evaluation, highlighting key findings for an accurate diagnosis;  
• To explain the main therapeutic modalities employed in the treatment of hemoptysis.

### **TABLE OF CONTENTS/OUTLINE**

1. INTRODUCTION  
a. Epidemiology  
b. Vascular anatomy  
c. Physiopathology  
2. CT IMAGING: AN ETIOLOGY BASED REVIEW  
a. Infectious  
b. Inflammatory  
c. Vasculitis  
d. Congenital  
e. Neoplastic  
f. Other causes  
3. THERAPEUTIC MODALITIES  
a. Indications  
b. Techniques  
c. Complications  
4. SYSTEMATIC APPROACH: A ROADMAP  
5. SUMMARY AND TAKE-HOME MESSAGES

## **CHEE-64 Respiratory Complications from Burns Injury: A Pictorial Review**

### **TEACHING POINTS**

• Acute complications are almost always associated with smoke inhalation injury.  
• When acute lobar collapse cannot be explained by a malpositioned ETT, prompt bronchoscopy is required to assess for bronchial eschars or inspissated secretions from bronchorrhea.  
• In the subacute phase, short interval changes in heart size, parenchymal opacities and pleural effusions favors cardiogenic edema.  
• Expiratory CT is useful in assessing burns-induced chronic airways disease including tracheomalacia, bronchial webs and obliterative bronchiolitis.

### **TABLE OF CONTENTS/OUTLINE**

As many as 91% of deaths in burn patients are a result of respiratory complications. Understanding the spectrum of respiratory complications, their onset and evolution of changes over time is important in early and accurate imaging interpretation. This pictorial review aims to educate and familiarize readers with common and uncommon burns-related complications that may be detected on chest imaging. As multiple disease processes have overlapping imaging appearances, we have classified complications temporally into acute, subacute and delayed phases, and spatially classified complications according to the anatomical structures affected. This structured approach to imaging interpretation serves to facilitate understanding and provide readers with a practical approach to imaging interpretation in burns patients.

## **CHEE-65 Consolidation of Post-Lung Transplant Complications, Throughout Post-operative Course**

### **TEACHING POINTS**

Lung transplantation is a life-saving procedure for end-stage lung diseases and has been shown to improve quality of life. Currently, the median post-lung transplant survival is roughly 6 years. However, it is associated with various complications that can significantly impact post-transplant outcomes. The purposes of this exhibit are to: (1) Recall the many pathologic complications that arise with Lung Transplantation, (2) Evaluate and identify the radiological features associated with Lung Transplant complications, (3) Review the role of imaging in the diagnosis and management of these complications.

### **TABLE OF CONTENTS/OUTLINE**

Immediate and Early Postoperative Period (First 24 hours to First Week)  
Primary Graft Dysfunction  
Rejection  
Acute Rejection  
Hyperacute Rejection  
Pleural Complications  
Pleural Effusion  
Pleural Fistula  
Hemothorax  
Pneumothorax  
Intermediate Period (1 week to 4 months)  
Anastomotic (Airway) Dehiscence  
Stenosis  
Airway Stenosis  
Pulmonary Artery Stenosis  
Pulmonary Infections  
Candida  
CMV  
Aspergillus  
Late Periods (After 4 months)  
Pulmonary Infections  
Mycobacterial  
IRSV  
Chronic Lung Allograft Dysfunction (CLAD)  
Post-Transplant Lymphoproliferative Disorder (PTLD)

## **CHEE-66 Assessment of Both Fibrosis and Vascular Disease in Systemic Sclerosis: The Pivotal Role of the Radiologist and Future Perspectives**

Participants

Carlotta Zilioli, MD, Parma, Italy (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- To be informed of the fundamental pathogenic pathways of systemic sclerosis (SSc).- To be aware that, among the autoimmune rheumatic disease, SSc has the highest mortality due to lung complications, which mainly are fibrosis and pulmonary hypertension (PH).- To illustrate the radiological spectrum of thoracic manifestations in SSc.- To be informed about the recent advances in the imaging techniques, with specific attention to quantitative analysis, to early diagnose and monitor disease activity.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction:- Overview of underlying pathophysiology of SSc: endothelial and fibroblast dysfunction, leading to fibrosis.- Description of pulmonary manifestations of SSc, focusing on the leading cause of death: interstitial lung disease (ILD) and pulmonary hypertension (PH). 2. The use of high-resolution CT in the diagnosis of progressive SSc, particularly to early stages of ILD:- NSIP as the main histologic pattern: key finding - Other HRCT findings: pleural and pericardial, esophageal dilatation. 3. Description of the hallmark of PH:- Key findings on HRCT - Role of dual-energy CT angiography. 4. The emerging use of automated software to perform quantitative analyses on in SSc, correlating quantitative vessel parameters with ILD features.

#### CHEE-67 A Step-by-Step Approach to Pulmonary Fibrosis: What the General Radiologist Should Know

Participants

Ana Berasategui Criado, MD, Santander, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Expose the imaging modalities used in interstitial lung disease assessment. Provide a stepwise approach to identify the features of fibrotic lung disease and categorize the pattern of fibrosis. Review the radiological features of idiopathic pulmonary fibrosis (IPF) and the principal differential diagnoses, focusing on their distinctive features based on high-resolution computed tomography (HRCT).

#### TABLE OF CONTENTS/OUTLINE

Diffuse interstitial lung disease encompasses a heterogeneous group of processes characterized by a concrete pulmonary response to damage affecting the pulmonary interstitium and the secondary pulmonary lobule. IPF is a progressive chronic interstitial fibrotic lung disease of unknown etiology characterized by nonspecific clinical manifestations, a restrictive pattern in pulmonary function tests, and a poor prognosis. The morphologic hallmark in imaging and histopathology of IPF is the UIP pattern, characterized by subpleural reticulation, traction bronchiectasis, and honeycombing with an apex-to-basal gradient. However, it may also be present in several conditions, including asbestosis, chronic hypersensitivity pneumonitis, or connective tissue diseases. Definitive diagnosis requires clinical-radiological-pathological consistency, with imaging playing a pivotal role. An accurate classification based on the CT pattern enables early detection of fibrosis, distinguishing the UIP pattern from those that suggest an alternative diagnosis, determining the need for biopsy, and guiding subsequent treatment. We collected representative cases of pulmonary fibrosis from our institution to highlight the hallmark imaging findings that leads to accurate diagnosis.

#### CHEE-68 Through the Eye of the Needle: An Evidence-based Approach to the Benefits, Risks, and Controversies of CT-Guided Lung Biopsy

Participants

Shravan Sridhar, MD, MS, San Francisco, CA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

CT-guided lung biopsy is a vital tool in the diagnostic armamentarium of physicians involved in the workup of pulmonary lesions in a variety of clinical settings. Having a clear understanding of the benefits, yield, and risks of CT-guided lung biopsy is important in optimizing utility of this diagnostic test and minimizing adverse outcomes. We present current evidence in the literature as it relates to benefits/yield, risks and risk reduction, and controversies in lung biopsy.

#### TABLE OF CONTENTS/OUTLINE

1. Title and disclosures 2. Abbreviations 3. Table of contents 4. Overview 5. Indications a. List of indications b. Pre-test probability c. Negative predictive value d. Diagnostic accuracy 6. Risk/reduction a. Pneumothorax b. Hemorrhage c. Air embolism 7. Controversies a. Role of CT vs bronchoscopic biopsy b. Appropriate needle size c. FNA vs core needle biopsy d. Biopsy of subsolid nodule e. Biopsy of suspected infection f. Biopsy of cavitory nodule g. Repeat biopsy after non-diagnostic result h. Biopsy in setting of pulmonary hypertension i. Biopsy in setting of fibrotic ILD j. Tumor seeding k. Techniques to avoid complications i. Utility of blood patch/plug ii. Rapid rollover iii. Intrapulmonary length 8. Summary 9. References

#### CHEE-69 To Protect and to Serve: Imaging Review of the Sternum for the Thoracic Radiologist

Participants

Michelle Bondero, MD, MSc, Los Angeles, CA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The sternum "protects" the vital cardiovascular organs, "serves" as a mirror to reflect diffuse bone disorders, and may uncommonly be affected by isolated lesions. These conditions may present as non-specific chest pain, which is a common patient presentation in clinical practice. Furthermore, given its central location, the sternum is included on nearly all thoracic imaging, be that a radiograph, CT, or MR. Due to thoracic radiologists' predominant reliance on axial images and focus on the inner organs, it may be neglected in a speedy review and important diagnostic information may be missed. The goal is to (1) explain the anatomy and development of the sternum; (2) describe dedicated imaging approaches; as well as (3) define and depict the major disease processes that can be diagnosed on radiological imaging, as outlined below. In addition to the rich imaging illustration, multiple less common but important diseases will be included with corresponding clinical and surgico-pathologic correlation, when available. Board-exam questions will also be provided to emphasize key principles.

#### TABLE OF CONTENTS/OUTLINE

1. Anatomy (bony components, articulations). 2. Imaging (XR, CT, MR, US and NM). 3. Cases: a. Congenital: variants and anomalies; b. Traumatic (fractures); c. Infectious (osteomyelitis); d. Neoplastic (primary and mets); e. Metabolic (Paget's disease, renal osteodystrophy, sickle cell disease, osteopetrosis). 4. Peri-sternal joint disease (osteoarthritis, septic arthritis, inflammatory

arthritides, SAPHO). 5. Pre- and post-surgical (sternotomy, expected findings, complications, sternal measurements prior to cardiac surgery). 6. Post-radiation. 7. Artifacts.

## **CHEE-7 Dual Energy Chest Radiography in Oncological Practice**

Participants

Ioannis Vlahos, MBBS, FRCR, Houston, TX (*Presenter*) Director, Grayscale Ltd;Co-owner, Grayscale Ltd;

### **TEACHING POINTS**

Based on CXR implementation in a tertiary cancer center:CXR dual energy principles and techniquesPractical implementation for improved detection and accuracy, characterization, increased confidence, problem solving on chest radiographsAdvantages, disadvantages and limitations

### **TABLE OF CONTENTS/OUTLINE**

CXR Dual Energy Techniques (single exposure (SE), dual exposure (DE), weighted subtraction), new AI single exposure techniquesSoft tissue and bone-selective imagesAdvantages and disadvantages of SE DE (associated artifact recognition), dosimetryImproved lesion detection, confidence, additional lesions, growth determinationLesion characterization (soft tissue, calcification)Calcified lesions (mediastinum, lung, pleura)Bone metastases and other osseous conditions (pathological fractures, periosteal reactions, lytic lesions)Specific areas: Evaluation of the apices, cardiomeastinum, drug induced lung disease, postoperative pneumothoraxComplex evaluation: impact on accuracy, distracting pathology, missed findings, interpretation time

## **CHEE-70 Targeting the Unknown: A Stepwise Approach to CT-Guided Biopsy of Cavitory Lung Nodules**

Participants

Abhay Dhaliwal, MD, Bloomfield Hills, MI (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

-To review categories of inciting conditions that can lead to cavitory pulmonary nodules. -To discuss the role and technique of CT guided percutaneous trans-thoracic needle biopsy (PTNB) of cavitory nodules in the aid of diagnosis, ranging from pre-biopsy workup to post biopsy care. -To review the risks and complications associated with CT guided PTNB of cavitory nodules, and methods to minimize risk and manage complications. -To illustrate and discuss the key imaging features of pathology proven cases of processes that can present with cavitory pulmonary nodules, including infections (such as actinomyces and tuberculosis), inflammatory conditions (such as granulomatosis with polyangiitis and rheumatoid arthritis), and malignancies (such as primary and metastatic processes).

### **TABLE OF CONTENTS/OUTLINE**

Definition of cavity, biopsy materials, pre-biopsy work up, patient counseling, biopsy set up/technique, post-biopsy care, biopsy outcomes, biopsy risks/complications, management of complications, rad path correlation

## **CHEE-71 Avoiding Tunnel Vision: Looking Beyond Anatomic Specialization Boundaries**

Participants

Elizabeth Lee, MD, Ann Arbor, MI (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

1. While radiological sub specialization is advantageous and has firmly integrated radiologists in multidisciplinary teams, there is a potential for missed diagnoses when various anatomic regions of a cross-sectional study are interpreted separately by specialists. This is particularly relevant for junctional regions (such as diaphragm when chest and abdomen imaging are interpreted by chest and body radiologists).2. Variations in scan factors and contrast timing (for instance chest and abdominal imaging may be obtained at different phases of enhancement) can facilitate diagnosis.3. Even if studies are separately interpreted and dictated, it is important for specialists to avoid tunnel vision and check pertinent information.

### **TABLE OF CONTENTS/OUTLINE**

1. No man's zone: Junctional zones between two anatomical regions can be a cause of missed opportunities. For instance, lower ribs may only be partly included in chest CT and may be overlooked on an abdominal scan.2. Integration of imaging findings from various anatomic regions can provide a unifying diagnosis: Several diseases are multisystem pathologies, and the diagnostic process is facilitated by knowledge of involvement of other anatomic regions. Examples include neurofibromatosis, Birt-Hogg-Dube syndrome, embolized fragment of a device, etc.3. Differences in phase of enhancement: This can help in localizing as well as accurately characterizing an abnormality that is better seen on a specific phase of enhancement.4. Differences in patient positioning Arms up and arms down position for two different scans can uncover an unsuspected thoracic outlet syndrome.5. Correlating with all available imaging modalities

## **CHEE-72 Noninfectious Pulmonary Complications Following Hematopoietic Stem Cell Transplant**

Participants

Elizabeth Lee, MD, Ann Arbor, MI (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

1. There is an increase in the indications for, the potential recipient age and sources from which hematopoietic stem cell transplantation (HSCT) can be performed, with increasing numbers of the procedure performed yearly across the globe. 2. Up to one third of patients undergoing HSCT develop pulmonary complications with the rates of infectious pulmonary complications decreasing due to improvements in prophylaxis and treatment. 3. The rate of noninfectious complications has risen and now is a more common cause of death than those from infection. 4. There are a variety of noninfectious pulmonary complications which can be seen after HSCT including idiopathic pneumonia syndrome, bronchiolitis obliterans syndrome, thoracic air leak syndrome, venous thromboembolism, and pulmonary hypertension. 5. Idiopathic pneumonia syndrome has a varied presentations depending on the site of primary tissue injury which results in a varied imaging appearance such as diffuse alveolar hemorrhage or peri-engraftment respiratory distress syndrome.

### **TABLE OF CONTENTS/OUTLINE**

1. General review of hematopoietic stem cell transplantation 2. Idiopathic Pneumonia Syndrome (Acute interstitial pneumonitis, Acute respiratory distress syndrome, Delayed pulmonary toxicity syndrome, Peri-engraftment respiratory distress syndrome, Diffuse alveolar hemorrhage) 3. Bronchiolitis obliterans syndrome 4. Interstitial lung disease 5. Pleural effusions 6. Thoracic air leak syndrome 7. Venous thromboembolism 8. Pulmonary hypertension 9. Post-transplant lymphoproliferative disorder

### **CHEE-73 Bad to the Bone: Differentiating Pulmonary Ossification from Calcification on CT**

Participants

Kendrah Osei, MD, Baltimore, MD (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

1. The pathogenesis of pulmonary ossification and calcification is incompletely understood. 2. Pulmonary calcification and ossification can occur in both pulmonary and non-pulmonary conditions, including benign, malignant, inflammatory, infectious, and metabolic etiologies. 3. High-resolution CT imaging is important to differentiate conditions that cause dendriform pulmonary ossification and those that do not. 4. Multi-society consensus guidelines now include pulmonary ossification among high-confidence CT features of usual interstitial pneumonitis (UIP) pattern of idiopathic pulmonary fibrosis.

#### **TABLE OF CONTENTS/OUTLINE**

1. Definitions of pulmonary calcification, pulmonary ossification, and dendriform pulmonary ossification. 2. Pathogenesis of pulmonary calcification and ossification. 3. Causes of pulmonary calcification and ossification. 4. Imaging patterns of pulmonary calcification and ossification. 5. Dendriform pulmonary ossification as a diagnostic imaging feature of idiopathic pulmonary fibrosis. 6. Clinical impact of recognizing dendriform pulmonary ossification. 7. References.

### **CHEE-74 Thoracic Complications of Sickle Cell Disease**

Participants

Malcolm Davidson, Mississauga, ON (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

1 Acute chest syndrome is a leading cause of morbidity and mortality, and is characterized by the development of a new lung opacity along with fever and/or respiratory symptoms. The most common causes include infection, fat embolism, and infarction. 2 Sickle cell patients are functionally asplenic and immune compromised, making them vulnerable to pneumonia and other infections from encapsulated and atypical bacteria - a leading cause of mortality in this population. 3 Repeated pulmonary insults in sickle cell patients can lead to chronic pulmonary findings, such as pulmonary fibrosis. 4 Pulmonary embolism is more common in patients with sickle cell disease and can contribute to pulmonary hypertension (PH). PH is present in approximately 10% of sickle cell patients, and is often multifactorial in etiology (WHO group 5). Pulmonary artery dilation is associated with worse outcomes in those presenting with acute chest syndrome. 5 Bone complications in sickle cell disease can present similarly to acute chest syndrome. Patients in this population are at higher risk for osteomyelitis, and osteomyelitis should be considered if bone pain is atypical or if there are other supporting signs, symptoms, or imaging features.

#### **TABLE OF CONTENTS/OUTLINE**

1. Sickle Cell Pathophysiology 2. Acute Complications - Vaso-occlusive events, acute chest syndrome, infection 3. Chronic Complications - Lung fibrosis, cardiomyopathy, pulmonary hypertension, bone infarction

### **CHEE-75 Embracing Automation: Designing and Implementing a Robust Continuous Monitoring System for AI-Powered Radiology Applications**

Participants

Vasanth Venugopal, MD, New Delhi, India (*Presenter*) Officer, CARPL.AI Inc

#### **TEACHING POINTS**

1. Continuous monitoring is vital for AI-driven radiology platform performance and reliability. 2. Identify KPIs and benchmarks to measure AI application metrics, such as accuracy, sensitivity, and specificity in radiology. 3. Implement automated QA/QC mechanisms, like image quality checks and data validation, ensuring consistent, complete input data following standard protocols. 4. Use advanced monitoring techniques, like measuring model divergence, to detect and address model drift caused by input data changes or other factors.

#### **TABLE OF CONTENTS/OUTLINE**

I. Key Performance Indicators (KPIs) and Benchmarks A. Identifying relevant clinical and non-clinical KPIs B. Establishing performance benchmarks for AI applications II. Automated Quality Assurance and Quality Control A. Automated QA/QC mechanisms for image quality and artifacts B. Data validation techniques for ensuring input data integrity III. Performance Monitoring and Anomaly Detection A. Real-time monitoring of KPIs and other relevant metrics B. Anomaly detection algorithms for identifying unusual patterns or behaviors IV. Advanced Monitoring Techniques A. Measuring divergence between multiple models B. Benefits and challenges of using advanced monitoring techniques V. Continuous Improvement A. Iterative model development, performance evaluation, and updating B. Real-world performance data Collection VI. Regulatory Compliance and Periodic Reviews A. Ensuring monitoring system adherence to regulatory requirements B. Conducting periodic audits and reviews

### **CHEE-76 Imaging Findings in Bronchiectasis-Associated Diseases: A Comparison with Pathophysiology.**

#### **TEACHING POINTS**

Teaching Points (1) Bronchiectasis is a condition characterized by irreversible dilation of the bronchi. CT imaging categorizes it into three types: cylindrical, varicose, and cystic. (2) Bronchiectasis can occur in various disease groups, making its diagnosis challenging due to its diversity. (3) Understanding the relationship between the underlying pathophysiology and imaging findings is crucial.

#### **TABLE OF CONTENTS/OUTLINE**

Table of Contents/Outline (1) About bronchiectasis (2) Congenital bronchial anomalies (3) Mucociliary transport disorder (4) Immune

hypersensitivity (5) Immune deficiency (6) Connective tissue disorder (7) Infectious disease (8) Others (9) Summary

## **CHEE-77 Manifestations of Sickle Cell Disease on Thoracic Imaging**

### **TEACHING POINTS**

- Sickle cell disease (SCD) is a systemic disease that has a wide spectrum of pulmonary, soft tissue, skeletal, and upper abdominal findings that can be seen on thoracic imaging.- There is commonly an overlap between findings of the milder pneumonia and the more clinically severe acute chest syndrome. However, knowledge of some findings can favor one diagnosis over the other.- Over time, SCD can result in chronic changes to the lung parenchyma.

### **TABLE OF CONTENTS/OUTLINE**

1. Introductiona. Backgroundb. Epidemiology, genetics, and pathogenesis of sickle cell disease2. Acute manifestationsa. Spectrum of acute chest syndrome and pneumonia• Findings on chest radiograph and CT that could aid in the diagnosis• Etiologies of pneumonia (e.g, streptococcus pneumoniae, Hemophilus influenzae, etc.)b. Pulmonary edemac. Pulmonary thromboembolism3. Chronic manifestationsa. Cardiomegalyb. Pulmonary hypertensionc. Pulmonary fibrosis, cysts, and mosaic attenuation4. Other manifestations seen on thoracic imaginga. Skeletal and soft tissue manifestations (avascular necrosis of humeral heads, extramedullary hematopoiesis, "H-shape" vertebrae, osteomyelitis)b. Upper abdominal manifestations (Splenic auto-infarction, cirrhosis, iron deposition)5. Prognosis and treatment6. Conclusion

## **CHEE-78 Post-treatment Thoracic Changes in Breast Cancer Patients**

Participants

Eloy Naranjo Moreno, MD, Mataro, Spain (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

The goal of this exhibit is to provide an interactive and visual review of thoracic changes (surgical and after hormonal/chemotherapeutic treatments) that we can find in breast cancer patients who have undergone treatment or who are currently doing it. Nowadays, thanks to screening programs, breast cancer is a common pathology detected and treated precociously in many cases. This exhibit aims to present an illustrative compilation of thoracic and pulmonary changes in breast cancer treated patients; providing an algorithmic approach of these radiologic changes based on progression time and location in the lung; reviewing the most meaningful findings to allow radiologists to differentiate them from the general thoracic pathology. Post-treatment radiologic computed tomography (CT) changes in breast cancer include post-surgical changes (like removal and reconstruction of the affected breast), changes after and during hormonal/chemotherapy (appearance of interstitial pathology and other common signs in the lung) and post-radiotherapy changes (identifying irradiation regions and their findings correlation over time) that can be effectively identified through chest CT.

### **TABLE OF CONTENTS/OUTLINE**

Introduction and purpose / Background / Image findings: Post-surgical changes, changes after and during hormonal/chemotherapy and post-radiotherapy changes / Conclusion.

## **CHEE-79 Don't Forget to Check the Sternum After Thoracic Surgery: Expected Postsurgical Changes and Complications of Sternotomy and Sternal Wound Repair**

Participants

Zehavit Kirshenboim, MD, Ramat Gan, Israel (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

1. Various chest wall surgical methods are being used for the sternotomy for thoracic surgery.2. Identification of complications can be difficult due to a nonspecific clinical presentation which frequently overlaps with normal postsurgical changes. 3. Knowledge of expected postsurgical sternotomy imaging appearance is crucial to avoid misinterpretation and detect complications in a timely manner.

### **TABLE OF CONTENTS/OUTLINE**

1. Various sternotomy techniques, surgical methods for sternotomy wound repair and complications will be illustrated. A. Surgical techniques 1. Longitudinal vs. transverse 2. Sternal wiring vs. rigid sternal fixation 3. Debridement and sternal flap closure B. Complications 1. Pre-sternal complication - cellulitis, sinus tract 2. Sternal complication - nonunion, dehiscence, osteomyelitis, wire fracture and migration 3. Post sternal complication - mediastinitis, retrosternal abscess, empyema, retrosternal hematoma, sternal adhesion 4. Flap complication - bowel herniation, flap failure C. How to differentiate expected postsurgical appearances vs. complications 2. Strategies to detect complications, differential diagnosis - sternal metastasis, infected epicardial lead 3. Clinical implications and treatment of complications

## **CHEE-8 Into the Airway: Focal Tumors and Non-neoplastic Disorders (Detected by CT) Arising from the Bronchi**

Participants

Uxue Martinez Urabayen, MD, Bilbao, Spain (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

To review the multiple focal lesions that can originate in the airway, including the non-neoplastic lesions and the benign and malignant tumours. To describe and illustrate the main characteristics signs and imagine findings that may improve detection of the lesions, improving the management of this patients.

### **TABLE OF CONTENTS/OUTLINE**

**METHODS OR BACKGROUND** Neoplastic and non-neoplastic lesions of the airway track are rare. The majority are malignant. The diagnosis tends to be delayed due to the few and nonspecific symptoms. Chest radiographs are rarely diagnostic. **RESULTS OR FINDINGS** At CT benign and malignant tumours may have nonspecific characteristics, presenting as polypoid lesions or focal sessile lesions that narrow the airway lumen. Even non-neoplastic disorders may be identical. Mucus plugs have internal gas. Blood is indistinguishable from other endobronchial material. Broncholiths present calcification. Foreign bodies depend on the component of

which they are made of. Lipomas have internal fat and hamartomas are characterized by "popcorn" calcifications. Leiomyomas and papillomas look very much alike. Squamous cell carcinoma is the most common subtype of lung cancer that affects the central airway system. Carcinoid tumours tend to have intense enhancement at contrast material-enhanced CT and may present calcifications. Metastasis due to hematogenous invasion are usually multifocal. CONCLUSION The airway must be carefully evaluated on CT examinations to appreciate the slight differences in morphology of the lesions occupying the lumen. Knowing the Morphological characteristic and location of these lesions can help reduce the broad spectrum of differential diagnosis.

### **CHEE-80 Functional Lung MRI: How to Obtain Ventilation-Weighted Images from UTE MRI.**

Participants

Julius Heidenreich, MD, Wurzburg, Germany (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

1. The reader should learn about the prerequisites that are necessary for functional lung imaging (technical requirements, sequences, data types).2. The reader should understand that the basic post processing steps comprise (1: labelling of lung parenchyma; 2: image co-registration; 3: voxel-wise calculation of fractional ventilation.3. The reader should learn to interpret ventilation imaging and be able to distinguish ventilation maps from healthy subjects and patients with cystic fibrosis.4. The reader should know about pitfalls and limitations of UTE ventilation imaging and know about the alternative techniques.5. The exhibit should highlight the potential benefit of ventilation imaging. The reader should be able to understand its significance and the recent areas of application.

#### **TABLE OF CONTENTS/OUTLINE**

A. Introduction, Background and Purpose: Why is ventilation imaging relevant? B. Technical requirements: What images have to be acquired? C. Post-processing: What are the basic steps of data processing? D. Data analysis and calculation of fractional ventilation and lung function parameters. E. Image analysis: Healthy subjects vs. patients. What is the difference? F. Pitfalls and limitations. What are the alternatives?

### **CHEE-81 No Small Matter: Thoracic Manifestations of Small Vessel Vasculitis**

Participants

Sofia Gambetta I, MD, MD, Buenos Aires, Argentina (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

We will review epidemiology, clinical features and imaging manifestations of ANCA associated small vessel vasculitis in the thorax.Teaching points:1. Granulomatosis with polyangiitis presents with diverse pulmonary and airway involvement: tracheobronchial wall thickening/stenosis, lung nodules and masses that cavitate or present with ground glass halo, bronchovascular thickening or alveolar hemorrhage.2. Microscopic polyangiitis can be divided into two groups: alveolar hemorrhage and interstitial lung disease. a. 4 to 36% of patients with interstitial pneumonia at presentation have MPO-ANCA antibodies. b. Up to 10% of patients with IPF seroconvert to MPO-ANCA. c. UIP and probable UIP are the most common patterns of MPO-ANCA ILD.3. EGPA patients can be ANCA negative (eosinophilic manifestations) or ANCA positive (vasculitis features). a. Cardiac manifestations are more common than in other ANCA vasculitis and indicator of poor prognosis. b. Pulmonary manifestations include migratory/peripheral consolidations, GGOs and centrilobular nodules.

#### **TABLE OF CONTENTS/OUTLINE**

1. Overview of small vessel vasculitis. a. Etiology and Pathogenesis. b. Epidemiology. c. Serological findings2. GPA a. Clinical manifestations. b. Airway involvement. c. Pulmonary manifestations. d. Cardiac involvement3. MPA. a.Clinical manifestations. b. Pulmonary manifestations. i. MPO-ANCA associated ILD ii. Alveolar hemorrhage and hemosiderosis4. EGPA. a. Clinical manifestations. i. ANCA positive EGPA ii. ANCA negative EGPA. b. Pulmonary manifestations c. Cardiac manifestations. i. Myocarditis ii. Endocardial fibrosis iii. Pericarditis 5. Differential diagnosis

### **CHEE-82 Hypersensitivity Pneumonitis: Correlation of Radiologic and Pathologic Findings, Diagnostic Criteria and Recommendations According to the Latest Guidelines**

#### **TEACHING POINTS**

- To illustrate the key radiological and histological findings for the diagnosis of hypersensitivity pneumonitis and understand their correlation.- To review the hypersensitivity pneumonitis diagnostic criteria according to the latest guidelines and summarize recommendations.

#### **TABLE OF CONTENTS/OUTLINE**

1. Definition and epidemiology2. Inciting agents. Exposure to inhaled agents.3. Immunopathogenesis:3.1. Immunologic mechanisms involved in the development of the disease and how they relate with the clinical and laboratory features.3.2. Risk factors: Genetic and external factors.3.3. The smoking paradox in HP.4. Clinical features.5. Non fibrotic HP:5.1. Radiologic Features: Typical and Compatible findings.5.2. Histologic Features.5.3 Radio-pathological Correlation6. Fibrotic HP6.1 Radiologic Features: Typical, Compatible and Indeterminate findings.6.2. Histologic Features6.3. Radio-pathological Correlation.7. Diagnostic criteria in the multidisciplinary team.8. Current controversies and future directions.

### **CHEE-83 Recognizing Local Recurrence After Stereotactic Body Radiotherapy in the Lung: Imaging Appearances and Pitfalls. A Picture Essay with Diagnostic Algorithm.**

#### **TEACHING POINTS**

This exhibit focuses on the imaging features and differentiation of local recurrence from normal inflammatory process after stereotactic body radiotherapy (SBRT) in the lung, and provides a diagnostic algorithm to aid in accurate diagnosis.

#### **TABLE OF CONTENTS/OUTLINE**

1. Overview of SBRT as a treatment modality for primary lung cancer and lung metastases, including risk factors of local recurrence.2. Practical tips for interpreting post-SBRT studies, including the need to evaluate all examinations in three dimensions and to understand the dynamics of the entire process from early inflammation to residual scar tissue.3. Factors contributing to a

large inflammatory reaction post-SBRT, including the target size, radiation dose, absence of emphysema or presence of interstitial lung disease, target location near large bronchi, and use of immunotherapy.<sup>4</sup> Factors contributing to a small inflammatory reaction, such as small target size, peripheral tumor location, or the presence of emphysema.<sup>5</sup> Key steps and features of the normal post-SBRT inflammatory-fibrotic process, including discrete diffuse signs of inflammation, formation of a fibrotic circle, gradual consolidation, and the formation of a flat scar.<sup>6</sup> Features suggestive of local progression, including new nodular or lobular lesions with local increase in size (especially in cranio-caudal dimension), and a typical malignant contrast-enhancing pattern.<sup>7</sup> Algorithm for investigating suspected local recurrence post-SBRT, including consideration of a PET/CT, and biopsy.

#### **CHEE-84 Dis-Discombobulating" the Current State of Interstitial Lung Disease Imaging**

Participants

Jonathan Chung, MD, Chicago, IL (*Presenter*) Speaker, Veracyte, Inc; Consultant, Veracyte, Inc; Consultant, Boehringer Ingelheim GmbH; Speaker, Boehringer Ingelheim GmbH; Consultant, F. Hoffmann-La Roche Ltd; Speaker, F. Hoffmann-La Roche Ltd

##### **TEACHING POINTS**

- A systemic approach is paramount when diagnostic ILD on chest CT.
- To aid diagnosis, radiologists should familiarize themselves with current imaging guidelines and new and emerging concepts.
- Progressive pulmonary fibrosis (PPF) refers to ILDs other than idiopathic pulmonary fibrosis (IPF) with evidence of clinical, functional and/or radiologic progression over a one-year period.
- In patients with interstitial lung abnormality (ILA), clinical correlation and imaging follow-up should be considered, particularly when high-risk features for progression are present.
- Quantitative tools are valuable in the assessment of the extent and longitudinal progression of ILD.

##### **TABLE OF CONTENTS/OUTLINE**

- Practical approach to ILD on chest CT
- Updated approach to Hypersensitivity Pneumonitis (HP)
- Definition and current concepts of Progressive Pulmonary Fibrosis
- Definition and current concepts of Interstitial Lung Abnormality
- Current state of quantitative analysis and AI in ILD

#### **CHEE-85 Unusual Radiological Manifestation of Adenocarcinoma of the Lung**

##### **TEACHING POINTS**

Primary adenocarcinoma of the lung is a heterogeneous disease, varying in molecular, pathological and clinical features. Radiological features can vary from the 'typical' appearances - usually ground-glass (GGN), part-solid (PSNs) or solid nodules, or with consolidation. Awareness of atypical appearances of adenocarcinoma may result in earlier investigation and timely management.

##### **TABLE OF CONTENTS/OUTLINE**

Lung cancer remains the most common cause of cancer deaths worldwide and adenocarcinoma is the most common histologic subtype, responsible for just under half of all cases. The majority of tumours manifest radiologically with GGNs, PSNs, solid nodules or consolidation. In this review, we document our experience of atypical radiological presentations of adenocarcinoma spectrum disease, subsequently confirmed on histopathological analysis, at two tertiary centres. We include cases of adenocarcinoma presenting as a single, solid, calcified mass, as multiple micro- and macro-nodules and as widespread cystic airspaces. We describe cases presenting with unusual patterns of metastatic disease. We describe cases of atypical volume doubling times.

#### **CHEE-86 Pulmonary Hypertension: CT Signs That Point the Way**

Participants

Camilo Mieres, MD, Barcelona, Spain (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

CT signs suggestive of pulmonary hypertension (PH) What to include in CT reports in the workup for PH Findings in entities associated with PH

##### **TABLE OF CONTENTS/OUTLINE**

I. Background: -Pulmonary artery diameter can suggest PH, but the threshold differs with the clinical context. -CT findings can provide clues about the underlying cause of PH. II. Content: 1. Different pulmonary diameters should be considered in patients with low, intermediate, or high risk of PH. 2. Findings to analyze in the study of PH: Cardiac vascular anomalies (can be missed on echocardiography): -Intracardiac shunts (atrial septal defect (ASD), especially sinus venosus ASD) -Anomalous pulmonary venous return (often with ASD) -Patent ductus arteriosus Signs of obstruction of the pulmonary arteries (filling defects/vascular tree-in-bud, hypertrophied systemic arteries) -Chronic pulmonary embolism -Pulmonary tumor thrombotic microangiopathy -Excipient lung disease Signs of right ventricular repercussion. Lung anomalies (fibrosis, cysts, centrilobular nodules) -Interstitial lung disease (combined pulmonary fibrosis/emphysema, Langerhans cell histiocytosis, connective tissue disease) -Pulmonary veno-occlusive disease III. Conclusions: -CT can alert to the possibility of PH and can provide valuable clues about its etiology.

#### **CHEE-87 Developmental Disorders of Lung: A Pictorial Review**

Participants

Shambo Guha Roy, MBBS, MD, Darby, PA (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

1. Mounier Kuhn syndrome affects trachea and up to 4th order bronchial tree, whereas William Campbell syndrome causes dilatation distal to 4th order bronchi.
2. Congenital pulmonary airway malformation (CPAM) has 5 subtypes: Type 1 being commonest with one or more dominant large cysts. Cyst size gets smaller in type 2 and 3. Type 4 is indistinguishable from type 1 radiologically.
3. Sequestration happens in two forms: intra lobar and extra lobar depending upon its venous drainage. Extra lobar sequestration is often associated with CPAM, called the 'hybrid lesions'.
4. Pulmonary veno-lobar syndrome or Scimitar syndrome accounts for minority of partial anomalous pulmonary venous return (PAPVR). Treatment depends upon the left to right shunt, which can be quantified using phase contrast MRI.

##### **TABLE OF CONTENTS/OUTLINE**

1. Normal development of the lungs.
2. Classification of developmental disorders.
3. Airway disorders: Tracheal and bronchial

agenesis, Tracheobronchial branching anomaly, tracheobronchomegaly (Mounier Kuhn syndrome), bronchogenic cyst, congenital pulmonary airway malformation, bronchopulmonary sequestration.4. Parenchymal disorders: Congenital lobar emphysema, Pulmonary hypoplasia, Pulmonary cystic mesenchymal hamartoma.5. Vascular disorders: Pulmonary sling, absence of unilateral pulmonary artery, pulmonary veno-lobar syndrome.

### **CHEE-88 Diffuse Pulmonary Hemorrhage: A Diagnostic Challenge**

Participants

Camilo Mieres, MD, Barcelona, Spain (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

-Review the causes, pathophysiology, and radiological signs of diffuse pulmonary hemorrhage (DPH).-Underline the importance of correlating the imaging findings with clinical and laboratory findings.

#### **TABLE OF CONTENTS/OUTLINE**

I.- BackgroundDPH is rare. It can occur in many diseases with histologic findings ranging from normal vessels (bland hemorrhage) to capillaritis.Clinical and radiological findings are nonspecific, determining the etiology is challenging. II.- ContentThrough a series of cases, we show how the causes of DPH relate with the histologic patterns.Pulmonary capillaritis: neutrophilic infiltration of the alveolar septa, loss of capillary integrity -Small-vessel vasculitis/Anti-GBM (Goodpasture)-Rheumatic diseases (Lupus)-DrugsBland pulmonary hemorrhage: alveolar hemorrhage without destruction or inflammation of alveolar spaces-Anticoagulants, bleeding disorders-Heart failure (HF), mitral stenosis-Idiopathic pulmonary hemosiderosisDiffuse alveolar damage: alveolar edema and hyaline membranes-Infection-Drugs-Rheumatic diseases (Lupus)III.-ConclusionsRadiologic findings of DPH are nonspecific and must be interpreted together with clinical and laboratory data.

### **CHEE-89 Chest CT Imaging in the Era of Lung-sparing Thoracic Resection**

Participants

Farah Tamizuddin, MD, New York, NY (*Presenter*) Nothing to Disclose

Jane P. Ko, MD, New York, NY (*Presenter*) Research collaboration, Siemens AG

#### **TEACHING POINTS**

Chest computed tomography (CT) has a major role in planning and follow up after lung resection. Segmentectomy and sleeve resection techniques entailing anatomical lung segmental dissection are now a major method for curative surgery of early-stage lung cancer while preserving lung function. Accurate localization of pathology is essential, with clear definition of bronchial and vascular anatomy. More recently, minimally invasive approaches such as the robotic-assisted thoracoscopic surgery (RATs) and video assisted thoracoscopic surgery (VATS) techniques are options. Therefore, the objectives are: a) To review thoracic lung-resection approaches including RATs and VATs for sublobar resection and sleeve resection, b) bronchial anatomy and imaging for lesion localization, b) to discuss essential imaging findings to communicate that impact operative approach, including variant anatomy and c) to review expected postoperative imaging findings and complications.

#### **TABLE OF CONTENTS/OUTLINE**

1. Review of lung resection approaches: a) Sublobar, sleeve, and lobe resectionsb) RATs, VATS, open techniques, and advanced nodule localization methods 2. CT performance and essential preoperative anatomy evaluation: intersegmental plane identification: segmental bronchial anatomy, pulmonary arteries, pulmonary veins3. Essential imaging findings: airway variants and challenges, 3D techniques4. Post-operative imaging challenges: granulomas, airway distortion

### **CHEE-9 Snaking the Clogged Pipes: Imaging Findings of Central Venous Occlusions and Review of Therapeutic Options**

Participants

Saumik Rahman, MD, New Haven, CT (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Central venous obstruction can occur due to extrinsic compression or intrinsic stenosis. Clinical presentation and collateral drainage pathway development depends upon the site of obstruction and speed at which the obstruction occurs. IR based measures and surgical techniques are useful to relieve the obstruction to central vessels. We describe these techniques and their complications in this paper.

#### **TABLE OF CONTENTS/OUTLINE**

Introduction Causes of central venous obstruction • Extrinsic compression from lung cancer, lymphadenopathy, fibrosing mediastinitis • Intrinsic occlusion from catheter induced thrombosis. Imaging features of central venous obstruction- SVC narrowing, clot in the SVC, numerous chest wall collaterals, azygos vein dilatation. Collateral pathways based on the level of obstruction • pre azygos • azygos • post azygos. IR based approach for SVC recanalization- Angioplasty, stent placement. Surgical reconstruction methods for SVC- PTFE (polytetrafluoroethylene) graft, pericardial graft. Complications of reconstruction- Graft stenosis.

### **CHEE-90 Toward a New Era of CT Imaging: Current Status and Expectations of Photon Counting CT in the Thoracic Region**

Participants

Masahiro Yanagawa, MD, PhD, Suita, Japan (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Photon counting CT (PCCT) has appeared as a new generation of CT systems in clinical setting. PCCT can measure the energy levels of photons as they pass through an object being imaged, which differs from traditional CT scanners with energy-integrating detectors. PCCT has several advantages over traditional CT, including improved spatial resolution and contrast sensitivity, reduced radiation dose to the patient, and the ability to measure the energy spectrum of the incident radiation. PCCT is expected to bring significant improvements in various clinical applications for areas including the thorax. This education exhibit focuses on PCCT imaging in the thorax including technical perspectives, image quality, and clinical imaging. It is much appreciated if our information

would be useful in your clinical and research setting.

#### TABLE OF CONTENTS/OUTLINE

1. Comparison of PCCT equipment specifications with the traditional CT scanner with energy-integrating detector (EID-CT). 2. Improved spatial resolution: image quality according to reconstruction kernels and radiation dose. 3. Imaging by turbo flash spiral scan: high-definition images without motion artifacts even with electrocardiogram asynchrony and spectral imaging at the same time. 4. Iodine density imaging for pulmonary embolism and thoracic tumors: improved quantification due to the absence of electrical noise 5. Virtual non-contrast CT imaging created from each dynamic phase: comparison with true non-contrast CT in cases of thymic cyst, thymoma, and lung cancer. 6. Future expectations: effects on quantitative values including radiomics analysis.

#### CHEE-91 **Analysis of Solitary Lung Nodules Using Summation Images Created from Ultra-High-Resolution CT Data**

Participants

Hiroshi Moriya, MD, PhD, Fukushima, Japan (*Presenter*) Advisor, California Capital Equity, LLC; Research Grant, Canon Medical Systems Corporation

#### TEACHING POINTS

1. Advantages of ultrahigh-resolution CT: Ultra-high resolution CT has excellent spatial resolution in lung field analysis. 2. 3D image analysis method using ultra-high resolution CT data: Coronal MPR and VR image are useful for chest image analysis. Summation image (SUM) can observe a X-ray projection image of the chest from any viewpoint. 3. There are two factors that make lung lesions difficult to detect: (1) lesions with little density difference from the surrounding lung, and (2) presence in areas where other structures are projected in the anterior-posterior direction. 4. Points to note when interpreting chest radiographs in routine clinical practice.

#### TABLE OF CONTENTS/OUTLINE

1. Ultra-high-resolution CT (UHRCT) is a CT that achieves high spatial resolution by reducing the detector size to 1/4 of the conventional size. The resolution can be improved by increasing the number of pixels, and the reproducibility of density can be improved by reducing the partial volume effect. 2. Summation images using UHRCT data provide images similar to chest photographs. Ability to create X-ray-like images of removed lungs, enabling analysis of clinical chest radiograph findings. 3. Small pulmonary nodules are not readily detectable on plain chest radiographs. The difficulty in detecting the target lesion is due to the averaging of the density due to the thickness of the lung and the overlapping projection of other structures (cardiovasculature and bone). Ground-glass density lesions are obscured, but solid components and pleural indentation findings can be pointed out.

#### CHEE-92 **When Lungs Turn to Stone: A Differential Diagnosis of Pulmonary Calcifications**

Participants

Nahia Lizarraga Oroz, MD, Donostia, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Review the main pathologies that can cause intrapulmonary calcifications. - Highlight the key radiological features that will allow us to establish a correct differential diagnosis.

#### TABLE OF CONTENTS/OUTLINE

Pulmonary calcifications are a common imaging finding, usually seen on routine chest radiographs. Although they are usually harmless sequelae of remote processes, they provide important information for establishing a good diagnostic approach. They can be attributed to a variety of etiologies, including granulomatous disease, infection, malignancy, environmental exposure, or chronic disease. Consequently, it is necessary to correlate radiologic findings with clinical history and laboratory results. Specific radiologic features have been described, of which the appearance of pulmonary calcifications also provides valuable information regarding the underlying etiology. Therefore, a thorough differential diagnosis is necessary to identify the underlying cause and guide appropriate management. This work provides a comprehensive review of the radiologic features of pulmonary calcifications, including their distribution, size, shape, and associated findings, through cases studied at our center.

#### CHEE-93 **Proposals for the 9th edition TNM Staging for Lung Cancer - A Guide to Radiologists**

Participants

Maximiliano Klug, MD, Ramat Gan, Israel (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1- Unresolved issues of the 8th edition TNM staging for lung cancer are: exclusion of post neoadjuvant patients (yp) from staging analysis, absence of nodal metastatic burden quantification, lack of granularity within the M1C category. 2- Proposed T Category - remains unchanged. 3- Proposed N Category- N2 is divided into N2a as single-station N2 disease and N2b as multiple-station N2 disease - relevant to imaging interpretation; N1 and N3 remain unchanged. 4- Proposed M Category- M1C cases that are metastatic to a single organ site have a better prognosis than M1C to multiple sites- to be determined this month whether multiple single organ will be moved to M1B. The rest of M categories are unchanged. 5- The outcomes of matched ypN v pN categories differ significantly with worse survival for ypN (e.g., ypN0 vs. pN0)- caution for imaging interpretation and patient management decisions.

#### TABLE OF CONTENTS/OUTLINE

1- To describe the proposals for the 9th edition TNM Staging for Lung Cancer. 2- To discuss the differences from the previous edition, remaining challenges, as they pertain to imaging evaluation and interpretation, and potential future directions.

#### CHEE-94 **Early and Late CT Patterns After SBRT for Lung Nodule**

Participants

Ignacio Alba, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- To familiarize with the different radiological patterns observed on chest CT scans after stereotactic body radiotherapy (SBRT) for lung nodules, including early changes (within the first 6 months) and late changes (after 6 months)-To recognize cases of local and/or locoregional recurrence based on findings in our sample-To recognize evolutionary differences in chest CT findings based on the histological subtype of the treated lesion-To evaluate the ultimate success of SBRT as a therapeutic technique

#### TABLE OF CONTENTS/OUTLINE

We evaluated the different radiological patterns observed after SBRT for lung nodules using chest CT scans in 108 patients. Of the cases studied, 64 were primary tumors in early stages, 32 cases were lung metastases or metastases from other locations, and in 12 cases histology could not be identified. Among the primary lung tumors, 57% were adenocarcinomas, followed by 26% of squamous cell carcinomas. All chest CT scans were performed every 3 months during the first 2 years and every 6 months during the next 2 years after the completion of SBRT. The patterns observed in the first six months typically evolve progressively to a final stabilization pattern. The most frequently observed final radiological patterns were nodule-like and mass-like, followed scar-like and diffuse consolidation pattern. Thoracic recurrence was diagnosed by lack of parenchymal stabilization in 20% of cases, and locoregional lymph node involvement in the remaining cases. There were no significant differences in lung involvement based on the histology of the treated tumor

#### CHEE-95 CT Imaging of Lung Cancer: Exploring the Clinical Potential of CZT-based Photon Counting Detector CT

Participants

Tomoaki Sasaki, MD, (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Lung cancer is the leading cause of death worldwide. CT is a powerful tool for evaluating the primary site and staging of lung cancer. On CT imaging, lung cancer appears as a subsolid nodule or solid nodule. Measuring the total tumor size and the size of the solid portion if the tumor is a subsolid nodule is the first step in both early and advanced lung cancer. Assessment of invasion to critical organs is also important in locally advanced cancer. Accurate evaluation of ipsilateral mediastinal nodal and extrathoracic metastases is required to determine treatment strategy. Photon counting detector CT (PCD-CT) has recently emerged for clinical use. Cadmium zinc telluride (CZT)-based PCD-CT, a newly developed technology, allows for more precise observation of lung cancer with lower radiation exposure, which may have a significant impact on clinical practice. This presentation aims to 1) review the clinical significance and challenges of CT evaluation in lung cancer and 2) discuss the benefits provided by CZT-based PCD-CT for lung cancer patients.

#### TABLE OF CONTENTS/OUTLINE

Key features of lung cancer evaluation: primary site and staging 1. T: size (T1-T4), chest wall invasion (T3), mediastinal invasion (T4) 2. N: ipsilateral mediastinal node metastasis (N2) 3. M: pleural dissemination (M1a), extra thoracic metastasis (M1b-c) Basic principle of CZT-based PCD-CT Clinical potential of lung cancer assessment using PCD-CT: super high resolution (SHR) image, multienergy spectral image, reduction of radiation exposure

#### CHEE-96 Pictorial Review of Tracheal Diseases: A Case-Based Approach for Radiologists

Participants

Camila Gadens Zamboni, MD, Iowa City, IA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The evaluation of the trachea by imaging is essential to diagnose various tracheal diseases and help with surgical plans, assessment of treatment responses, and understanding surrounding structural abnormalities. In this scenario, the radiologist's role rises as an unreplacable analysis of this cartilaginous tube. This exhibit aims to summarize pertinent anatomy and review diverse tracheal diseases, congenital and acquired, through a didactic classification and presentation of the cases, including differential diagnosis, challenges, and limitations.

#### TABLE OF CONTENTS/OUTLINE

This is a case-based review of pathologies of the trachea focusing on 1- Pertinent anatomy review. 2- Best imaging methods for tracheal evaluation. 3- Classification of tracheal diseases with illustrative cases by focal vs. diffuse diseases, and the last by increased vs. decreased diameters. 4- Discussion of differential diagnoses. 5- Challenges and limitations on tracheal evaluation by imaging. 6- Take-home messages.

#### CHEE-97 Proposals for the 9th edition TNM Staging for Thymic Epithelial Tumor - A Guide to Radiologists

Participants

Maximiliano Klug, MD, Ramat Gan, Israel (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1- Unresolved issues of the 8th edition TNM staging for thymic epithelial tumor (TET) are: T category refinement - focus on tumor size; granularity between N categories; better differentiation between intra and extrathoracic metastatic disease. 2- Proposed T Category- T1a ( $\leq 5$ cm) and T1b ( $> 5$ cm) regardless of involvement of mediastinal pleura; T2: invasion of the pericardium, lung, or phrenic nerve; T3: invasion of the brachiocephalic vein, superior vena cava, chest wall, or extrapericardial pulmonary arteries and veins; T4: unchanged, direct invasion of the aorta and arch vessels, intrapericardial pulmonary artery, myocardium, trachea, or esophagus. 3- Proposed N Category- The ITMIG/IASLC lymph node stations are clarified, unchanged two nodal regions: anterior (N1) and deep (N2). N1 includes the thymic bed compartment in the anterior lower neck and prevascular mediastinum. N2 includes tracheobronchial, aortopulmonary window, subcarinal, hilar, internal mammary, and the deep cervical (jugular and supraclavicular) lymph nodes. 4- Proposed M Category- Unchanged. M1a: pleural or pericardial nodules separate from the primary tumor; M1b: pulmonary intraparenchymal nodules, extrathoracic metastases, or any non-regional lymph nodes (e.g. high neck, retro-cranial, axillary or extrathoracic lymph nodes).

#### TABLE OF CONTENTS/OUTLINE

1- To describe the proposals for the 9th edition TNM Staging for TET. 2- To discuss the differences from the previous edition, remaining challenges as they pertain to imaging evaluation, and potential future directions.

## **CHEE-98 Halo and Reversed Halo Signs in Chest CT: Are They Useful?**

Participants

Adria Roset Altadill, MD, Girona, Spain (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

The halo and reversed halo signs in chest CT may be caused by infections, inflammatory and vascular disorders and neoplastic diseases. These signs combined with ancillary imaging findings, additional information from PET-CT and spectral CT and proper clinical history may help the radiologist reach the final diagnosis.

### **TABLE OF CONTENTS/OUTLINE**

The halo and reversed halo signs were initially described and thought to be specific for invasive pulmonary aspergillosis and cryptogenic organizing pneumonia, respectively. However, there is a broad spectrum of causes for these chest CT findings, including infections, inflammatory and vascular disorders and neoplastic diseases. The most common causes of the halo sign in the lung are adenocarcinoma, invasive aspergillosis and septic emboly. Less common causes include bacterial and viral infections, hemorrhagic metastases, vasculitis and other inflammatory disorders. The reversed halo sign is more frequently seen in organizing pneumonia, followed by pulmonary infarcts, invasive mucormycosis and other granulomatous diseases. Despite having lost their specificity, the halo and reversed halo sign combined with ancillary chest CT findings and an adequate clinical background can be useful to narrow the differential diagnosis. Special attention has to be paid to the nodule size, number and morphology in the halo sign. The thickness and distribution of the ring of consolidation and the presence of internal reticulation within the reversed halo sign also need to be evaluated. Moreover, metabolic information from PET-CT and perfusion data from spectral CT may help differentiate pulmonary infarcts from other inflammatory or infectious causes of the reversed halo sign.

## **CHEE-99 Cystic Lung Disease: The Common, the Rare and the Unusual**

Participants

Daniel Vargas, MD, (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

While most radiologists are aware of the most common cystic lung diseases, a group of rare and unusual diseases including genetic syndromes, lymphoproliferative disorders, environmental exposures and congenital anomalies can also result in cyst formation in the lungs. This exhibit will: 1. Review the clinical and imaging features of common and rare cystic lung diseases. 2. Discuss the underlying histopathology in each of these entities and how it translates to imaging findings. 3. Offer the radiologist an approach to help narrow the differential and guide clinical management in the multidisciplinary care of these patients. 4. Review ancillary findings and complications in patients with cystic lung disease. 5. Current concepts in amyloidosis and light chain deposition disease and their role in cyst development in lymphoid interstitial pneumonia

### **TABLE OF CONTENTS/OUTLINE**

1. Lung cyst and cystic lung disease definition  
2. Common Cystic Lung Diseases

### The Phoenix Pulmonary Opacity

#### TEACHING POINTS

The waxing and waning pulmonary opacity is a common finding often hiding in plain sight, akin to the mythical phoenix, which disappears only to reveal itself again later amongst the ashes. Crucial to narrowing the differential diagnosis is a broad-based knowledge of the natural course of these diseases, their laboratory and pathologic analyses, and utilization of the multi-disciplinary team. Overlapping characteristics demonstrates the importance of looking at secondary, non-parenchymal imaging characteristics, including radiographic findings outside of the thorax. Many of these are chronic and debilitating, if not fatal, which have often become treatable with the advent of chemotherapeutics and biologics. Therefore, having a systematic approach and a relationship with our clinical colleagues is critical in treating these successfully and timely to avoid associated morbidity and mortality.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction. 2. Categorizing the waxing and waning pulmonary opacity 3. Demonstrate common primary imaging findings in the thorax (e.g., nodule/opacity characteristics) 4. Demonstrate common secondary imaging findings in the thorax (e.g., esophageal, lymphatic, cardiac)5. Laboratory and pathologic correlatives6. Role of the multi-disciplinary team in narrowing the differential diagnosis (Rheumatology, Pulmonology)

### The 2021 WHO Classification of Lung Tumors: Takeaways for Radiologists Regarding Epithelial and Neuroendocrine Tumors

#### Participants

Maria Clara Lorca, MD, Pittsford, NY (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

This educational exhibit will review the tumors of the lung. 1. New 2021 WHO Classification of tumors of the lung. 2. Depict radiological features of tumors of the lung. 3. Describe the importance of PET-CT in the diagnosis and follow up. 4. Describe the pearls and pitfalls that some entities demonstrate in imaging, including benign entities that can appear as a lung tumor. 5. Evaluate the sufficiency of small biopsy samples for diagnosis. 6. Discuss the spectrum of post-treatment changes of the lung.

#### TABLE OF CONTENTS/OUTLINE

This education exhibit reviews biopsy-proven cases of tumors of the lungs and their correlation with pathology. Review with illustrative case examples the different tumors of the lungs in a systematic fashion. Incorporate the new 2021 WHO classification of the tumors of the lung. Depict the imaging appearances of various types of the above tumors, with emphasis in epithelial, neuroendocrine, and hematolymphoid tumors. Mesenchymal tumors will not be emphasized, as they were recently described on Radiographics this year. Differentiate between the types of tumors for which small biopsy versus resection sampling are indicated for diagnosis. Depict post-treatment changes of the lung, with examples including lung toxicity, pseudo-progression, and to distinguish these changes from true tumor recurrence and their impact on future therapy.

### **Pulmonary Tuberculosis in Children and Adults: A Classic Disease with Updated Concepts. What the Clinician Needs to Know**

#### **Participants**

Marta Barrios Lopez, MD, Santander, Spain (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

1. To compare the typical appearance of pulmonary tuberculosis (TB) between adults and pediatric patients. Both the manifestations and the management differ in children and adults. 2. To review the latest evidence on pulmonary TB. Radiologists need to know what information is relevant to the clinician as well as the implications of certain imaging findings.

#### **TABLE OF CONTENTS/OUTLINE**

1. Introduction: Epidemiology and transmission mechanism in children vs adults. 2. Pathophysiology: Traditional vs new concept. The latest evidence has shown that the radiological appearance of the disease mainly depends on the host immune response and not on the time from infection. 3. Classification of Pulmonary TB according to Clinical and Radiological factors. 3.1. Active Disease: Primary Tuberculosis: 1. Lymphadenopathy in adults/children. 2. Parenchymal disease in adults/children. 3. Pleural effusion in adults/children. 4. Miliary TB in adults/children. 3.2. Active Disease: Postprimary Tuberculosis: 1. Postprimary TB in children. 2. Consolidation and cavitation. 3. Centrilobular nodules. 4. Summary of the main differences between children and adults. 5. Inactive Tuberculosis: Radiological findings and their risk of reactivation. The role of the radiology report. 6. Complications: Empyema necessitatis, Rasmussen aneurysm.

### Uncommon Story of Common Entity: Tips and Tricks in Imaging of Non-Cardiogenic Pulmonary Edema

#### Participants

Janardhana Ponnatapura, MD, Winston Salem, NC (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Pulmonary edema is a most common clinical entity in both inpatient and out-patient setting. Identifying the underlying etiology of the edema is crucial to the timely implementation of appropriate therapy. Although cardiac dysfunction and volume overload are the most common etiologies routinely encountered, there are other different etiologies and presentations of pulmonary edema. Understanding the clinical context and underlying pathophysiology of these varied uncommon causes will help radiologists in narrowing differential diagnosis, therefore help clinicians to provide definitive treatment and better patient care. Furthermore, thorough knowledge about non-cardiogenic pulmonary edema reduces the rate of invasive procedures like Swan-Ganz catheterization and related complications.

#### TABLE OF CONTENTS/OUTLINE

- Etiologies of non-cardiogenic pulmonary edema
- Mechanisms of non-cardiogenic edema
- Radiopathology correlation of pulmonary edema
- Pertinent role of chest x ray in initial diagnosis of cardiogenic vs non-cardiogenic pulmonary edema
- How subtle signs on chest x-ray helps to recognize uncommon etiologies of pulmonary edema
- How to differentiate different types of noncardiogenic edema on chest x ray.
- "Leave alone" type of pulmonary edema
- When should you use CT imaging
- Edema with and without diffuse alveolar damage- Does it matter on imaging?
- Short term and long -term complications of noncardiogenic pulmonary edema
- Algorithm and next step in the management of noncardiogenic pulmonary edema

### An Update on the Role of Chest Imaging in Cystic Fibrosis

#### Participants

Scott Bugenhagen, MD, PhD, Saint Louis, MO (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The purpose of this exhibit is: 1. To demonstrate the characteristic imaging findings of cystic fibrosis in the chest including a variety of commonly encountered complications through a series of clinical examples. 2. To review the latest guidelines and trends in the imaging of cystic fibrosis, with a focus on how clinical practice has changed with emerging therapies. 3. To describe the evolving role of chest radiography and cross-sectional imaging in this new clinical landscape, including a review of the most common scoring systems used in clinical practice.

#### TABLE OF CONTENTS/OUTLINE

I. Review of current clinical landscape A. Summary of CF genotypes and patient specific therapy B. Advances in medical therapies C. Changes in clinical practice II. Role of chest radiography A. Characteristic findings B. Direct and follow treatment C. Radiographic scoring systems II. Role of computed tomography A. Indications a. HRCT b. Contrast enhanced CT and CTA B. Characteristic findings C. Direct and follow treatment D. CT scoring systems III. Imaging of complications A. Superinfection a. Colonization with *Pseudomonas aeruginosa* and *Staphylococcus aureus* b. Nontuberculous mycobacterial infection c. *Burkholderia cepacia* infection B. *Aspergillus* related lung disease a. Allergic bronchopulmonary aspergillosis b. Aspergilloma c. Semi-invasive aspergillosis C. Lobar collapse and idiopathic collapsed lung D. Pneumothorax E. Pulmonary hypertension and cor pulmonale F. Hemoptysis IV. Transplant evaluation

### Upright Chest CT Imaging

#### Participants

Yoshitake Yamada, MD, PhD, Tokyo, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The purposes of our exhibit are as follows: (1) To explain the development, background, and performance of upright CT. (2) To describe the anatomical changes in each structure of the chest due to differences in body position, that is, the direction of gravity. (3) To illustrate the clinical applications of upright CT for various chest diseases with clinical case presentations, and the potential applications in particle therapy.

#### TABLE OF CONTENTS/OUTLINE

(1) Development of an upright CT and its background (2) Performance of upright CT: Physical characteristics, workflow improvement, safety, and remote operation during the infectious disease pandemic (3) Effect of gravity on the lungs, lobes, airways, heart, shoulder girdle, and chest vessels (4) Clinical applications of upright CT for various diseases such as chronic obstructive pulmonary disease, interstitial lung disease, scoliosis, diaphragmatic paralysis, and funnel chest (5) Upright 4D-CT of the chest (6) Potential applications of the upright CT in particle therapy (7) Limitation (8) Conclusion

CHEE-104

### Analysis of Fine Anatomical Structures Involved in Pulmonary Nodules by Ultra-High-Resolution CT

#### Participants

Hiroshi Moriya, MD, PhD, Fukushima, Japan (*Presenter*) Advisor, California Capital Equity, LLC; Research Grant, Canon Medical Systems Corporation

#### TEACHING POINTS

1. Spatial resolution of ultra-high-resolution CT (UHRCT) 2. Depiction of intralobular structure by UHRCT 3. MPR display of bronchus long-axis cross-section and short-axis cross-section (parallel pleural cross-section) 4. Typical cases: Analysis of fine anatomical structures involved in pulmonary nodules by UHRCT

#### TABLE OF CONTENTS/OUTLINE

Ultra-high-resolution CT (UHRCT) is a CT that achieves high spatial resolution by reducing the detector size to 1/4. In the previous studies, the bronchial visualization ability of UHRCT was superior compared with conventional HRCT. In the depiction of lung field structure, bronchi with an inner diameter of 0.4 mm are delineated. Contrast enhancement and deep learning reconstruction method (DLR) enhances the contrast effect of peripheral blood vessels and improves visualization. By improving the resolution, it has become possible to display the intralobular structure. How to identify lobular structure: a. Bronchioles are centrally located in the lobules. b. Identify the blood vessels that accompany the bronchi as pulmonary artery. c. Pulmonary veins are thicker than pulmonary arteries. d. Imaging of pulmonary arteries or veins in contrast-enhanced phase. e. Confirm continuity of the target vessel to the root of the pulmonary artery and vein. Lesions that spread with regularity to the lobular structure, lesions that extend independently of the lobular unit, lesions that extend beyond the lobule, and lesions confined within the lobule are presented.

### Thoracic IgG4-Related Disease: Revealing the Diverse and Heterogeneous Imaging Manifestations

#### Participants

Kyubin Kim, MD, Yansan-Si, Korea, Republic Of (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. IgG4-related disease (IgG4-RD) is an immune-mediated fibroinflammatory condition characterized by dense lymphoplasmacytic infiltrations with predominant IgG4-positive plasma cells, usually accompanied by storiform fibrosis, obliterative phlebitis, and elevated serum IgG4 levels. 2. Thoracic manifestations of IgG4-RD are diverse and can mimic malignant lymphoma, infection, or other systemic autoimmune disease. The most common manifestations are mediastinal lymphadenopathy and peri-bronchovascular interstitial thickening. Other findings include pulmonary nodule or mass, interstitial lung abnormalities, pleural effusion or thickening, mediastinal or chest wall mass, and thoracic arteritis. 4. IgG4-RD can present with atypical radiologic findings such as migrating or cavitory nodules, lobar or segmental consolidation, and paravertebral mass making the diagnosis challenging. 5. Early diagnosis with clinical-radiologic-pathologic correlation is important to prevent irreversible damage due to fibrosis.

#### TABLE OF CONTENTS/OUTLINE

1. Definition, pathogenesis, and histopathology of IgG4-RD 2. Clinical manifestations and diagnostic criteria for thoracic IgG4-RD 3. Imaging findings of thoracic IgG4-RD: diverse and heterogeneous findings in the lungs, airway, mediastinum, pleura, chest wall, and thoracic vessels 4. Treatment and prognosis of thoracic IgG4-RD 5. Conclusion: The importance of recognizing the diverse imaging findings of thoracic IgG4-RD and reflecting them in diagnosis and treatment

CHEE-106

### Beyond the Black Holes: A Multidisciplinary Approach to Cystic Lung Disease

#### Participants

Lawrence Guan, MD, New Haven, CT (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Diffuse cystic lung diseases (DCLD) are characterized by thin-walled, air-filled spaces with normal intervening lung parenchyma. Certain entities can mimic or be mistaken for lung cysts such as emphysema, cavitory lesions, honeycombing, and cystic bronchiectasis. These are a diverse group of disorders with a variety of underlying causes including hereditary, neoplastic, infectious, inflammatory, lymphoproliferative, and smoking-related. High-resolution chest CT plays a central role in the evaluation of patients with DCLD's and it is not uncommon for these disorders to be discovered during imaging for other reasons. Therefore it is important for the radiologist to be aware of these conditions and their associations, as they may be the first to suggest the diagnosis. An approach to the characterization of cystic lung disease will be reviewed including imaging and clinical clues which can aid in suggesting one diagnosis over another.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction. 2. Examples of cases: a. Mimics of lung cysts b. Smoking-related: Pulmonary Langerhans Cell Histiocytosis, Desquamative Interstitial Pneumonia c. Inflammatory: Amyloidosis, Hypersensitivity Pneumonitis d. Hereditary: Tuberos Sclerosis/Lymphangiomyomatosis, Birt-Hogg-Dube, Neurofibromatosis, Ehlers Danlos Syndrome, Sickle Cell Disease e. Lymphoproliferative: Lymphocytic Interstitial Pneumonia, Follicular bronchiolitis f. Neoplastic: Cystic metastases, Treated metastases g. Disorders with cystic component: Bronchopulmonary sequestration, Congenital pulmonary airway malformation, Bronchogenic cyst h. Miscellaneous: Infectious/Postinfectious, Posttraumatic 3. Conclusion.

## Abstract Archives of the RSNA, 2023

CHEE-108

### Joining the Dots in Multiple Lung Nodules

#### TEACHING POINTS

1. Varying etiologies cause multiple pulmonary nodules and can be mistaken for infection or metastatic disease. 2. Ancillary CT features such as air trapping with multiple pulmonary nodules are seen in DIPNECH, or chest wall vessel calcification with centrilobular nodules in renal failure suggests metastatic calcification. 3. Small calcified pulmonary nodules seen with reticulation in the lower lobes, usually in fibrotic ILD, represents dendriform ossification.

#### TABLE OF CONTENTS/OUTLINE

CT detected multiple lung nodules are most commonly due to infection, sarcoidosis, or metastasis. However, alternative etiologies causing lung nodules can be diagnosed on CT based on CT morphology or associated findings. These alternative causes of multiple lung nodules are often seen in patients with malignancies, and we must accurately diagnose these to prevent misinterpretation. Therefore, these lesser-known entities and their diagnostic CT findings are discussed. The etiologies are subclassified based on the CT appearance of nodules such as non-solid, solid, cavitary, calcified, and nodules with central air bronchograms. A case-based approach will discuss meningoendotheliomatosis, DIPNECH, amyloidosis, LIP, LCH, Dendritic Ossification, metastatic calcification, Progressive massive fibrosis in silicosis, MMPH in Tuberous Sclerosis, MALT lymphoma amongst other similar disease processes. Ancillary CT features for, e.g., the air-trapping in DIPNECH, Cheerio sign in meningoendotheliomatosis, calcification in amyloidosis, vessel wall calcification in renal failure with metastatic calcification, etc., are highlighted. In addition, the next steps in the workup for diagnosis are also highlighted.

### 0.55T MRI Thoracic Imaging

#### Participants

Jonathan Liu, MD, San Francisco, CA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Low field (< 1T) MRI is an emerging technology that possesses certain advantages over other imaging modalities and higher field MRI that make imaging of the lungs more attractive. The purpose of this exhibit is to highlight the considerations involved in implementing clinical use of low field MRI for thoracic imaging, with the hope of introducing the audience to this new imaging paradigm. A wide variety of cases (with a cohort of 22 patients at the time of abstract submission) are shown highlighting the benefits of low field MRI imaging with the Siemens Freemax system (0.55T, MAGNETOM Freemax; Siemens Healthcare, Erlangen, Germany) including ultra-short TE, diffusion weighted, and non-contrast MRI ventilation/perfusion imaging. We will also review the limitations and pitfalls of lung imaging at 0.55T MRI.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction  
2. Rationale for low field MRI  
a. Advantages of low field MRI over other modalities  
i. MRI versus CT  
ii. Low field versus traditional 1.5T or 3T imaging  
b. Disadvantages of low field MRI over other modalities  
i. MRI vs CT  
ii. Low field MRI compared to 1.5/3T  
3. Imaging Protocol  
4. Clinical Indications  
a. Immediate  
b. Early  
c. Long-term  
5. Five to ten cases of 0.55 MRI images with CT correlation  
a. Normal anatomy  
b. Malignancy  
c. Inflammation  
d. Post-radiation  
e. Small airways/small vessel disease  
f. Large airways  
6. Key challenges, limitations, and pitfalls of lung imaging at 0.55T  
7. Future clinical and research directions  
8. Conclusion

Printed on: 04/12/24

CHEE-11

### Light Up the Lungs: How Contrast Enhancement Can Help Diagnose Pulmonary Lesions

#### TEACHING POINTS

Non-contrast CT of the chest is often requested by clinicians in settings where the addition of iodinated contrast is warranted. Radiologists must be familiar with how contrast positively impacts evaluation of pulmonary pathology. This exhibit will showcase the value of iodinated contrast improving assessment of pulmonary parenchymal entities. Iodinated contrast improves differentiation of pneumonia from atelectasis, with the former lacking enhancement, while atelectasis enhances homogeneously. Addition of contrast material allows detection of complications of pulmonary infections such as necrosis, pulmonary artery pseudoaneurysm and chest wall involvement. In the setting of congenital pulmonary lesions, CT evaluation should include iodinated contrast to evaluate arterial supply and venous drainage. Nodule characterization is improved with iodinated contrast. Lesion localization improves with iodinated contrast: including discerning lesions from vascular structures, delineation of hilar lesions, and appraisal of vascular and chest wall invasion in the setting of aggressive processes.

#### TABLE OF CONTENTS/OUTLINE

Contrast Enhanced CT protocols and indications  
Pulmonary arterial phase  
Systemic arterial phase  
Venous phase  
Infection  
Pneumonia vs Atelectasis  
Complications of pneumonia: necrosis, abscess, pseudoaneurysm, wall involvement  
Lesion localization and assessment of complications  
Hilar lesions  
Discernment from broncho-vascular bundle  
Vascular, mediastinal, and chest wall invasion  
Nodule characterization  
Hypervascular metastasis  
Carcinoid tumor  
AVM  
Congenital lesion evaluation  
Vascular supply (eg. Sequestration)  
Venous anomalies (eg. Hypoplastic lung evaluation)

**Don't Be Blue... Here's a Clue! Tips to Assess Adult Cardiac Pathology on a Chest Radiograph Like a Pro**

### Participants

Janardhana Ponnatapura, MD, Winston Salem, NC (*Presenter*) Nothing to Disclose

### TEACHING POINTS

In the era where modalities such as 2-D echo, CT and MRI are being highly utilized for evaluation of cardiac pathology, a plain chest radiograph still plays a key role in contributing important information. However, the younger generation of radiologists do not seem to be optimally exposed or are unaware of the true value of a chest radiograph. Chest radiograph is convenient as it is an easily accessible, low-cost, and non-invasive diagnostic tool with minimal radiation dose. We aim to provide unique imaging clues to identify the classic signs, measurements, and differential diagnoses of various adult cardiac pathologies on a chest radiograph with confirmatory CT images. Since a chest radiograph is the first imaging modality for majority of patients with chest pain - it is very imperative for the radiologists to quickly recognize these subtle findings to provide an accurate diagnosis and proper patient management.

### TABLE OF CONTENTS/OUTLINE

Introduction to normal cardiac anatomy  
CASE BASED LEARNING:• How to differentiate between:- Aortic Dissection vs Aortic Aneurysm- Pneumopericardium vs Pneumomediastinum- Pericardial Effusion vs Cardiomyopathy- Intramural esophageal lesion vs LA enlargement- Enlarged azygous arch vs Paratracheal lymph node- Stages of cardiogenic pulmonary edema• Identify:- Pulmonary embolism- Cardiac Valves- Focal pulmonary edema- Heterotaxy syndromes- Cardiac Size: Microcardia- Pectus Excavatum- Devices• Compare and contrast:- Cardiomyopathies: Dilated vs Hypertrophic- Individual chamber enlargements• Limitations

### The Radiologist's Expedition into the Intricacies of Percutaneous Lung Biopsies and Ablations

#### Participants

Megha Gupta, Glendale, AZ (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Lung cancer (CA) is the second most common cancer in the US and is the leading cause of cancer related mortality. Surgery is the mainstay of therapy for patients with stage I lung cancer, although many patients with lung cancer are poor surgical candidates. Stereotactic radiation body therapy (SBRT) is offered to inoperable patients with lung CA, however, carries significant side effects and risk of lung function deterioration. Image guided tumor ablation (IGTA) is an alternative treatment option with proven outcomes in Stage I lung CA without the risk of lung function deterioration. Also, IGTA is not limited by segmental anatomy.

#### TABLE OF CONTENTS/OUTLINE

Overview of lung cancer staging, identification of suitable patients for image guided lung ablation and discuss treatment outcomes. Understand the various modalities of lung ablation (Radio frequency, Microwave and Cryoablation). Approach to difficult biopsies and difficult needle placement including the use of hydro-dissection and artificial pneumothorax creation. Learn normal and abnormal imaging appearances post lung ablation and current follow up recommendations.

CHEE-114

### Getting Warmer...” - Chest Radiological Findings in Patients with Fever of Unknown Origin

#### Participants

Alla Khashper, MD, (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Fever of unknown origin (FUO) is defined as "fever = 101°F (38.3°C) for at least 3 weeks that remains undiagnosed after 3 inpatient days or at least 3 outpatient visits". FUO is a well-known clinical problem, has multiple thoracic etiologies, and commonly requires extensive workup. Imaging might identify the cause of FUO. However, no radiological recommendations have been established.

#### TABLE OF CONTENTS/OUTLINE

Historically, FUO has been divided into classic, nosocomial, immunodeficiency-related, and travel-associated categories. For imaging purposes the following classification appears more practical: infections, malignancies, inflammation and miscellaneous. The selected illustrative cases are listed in the attached presentation. The evaluation of FUO is always complex, including extended history taking, physical examination, and lab tests, followed by imaging. Chest radiography and CT are routinely performed and can usually provide putative or final diagnosis or suggest further imaging work-up, including but not limited to CT angiography, PET , MRI, and imaging-guided biopsy. This educational exhibit is a pictorial review of thoracic pathologies associated with FUO, targeting radiology trainees, general and subspecialized thoracic radiologists. It will highlight teaching points and provide clues to establish concise differential diagnosis of FUO causes.

CHEE-115

### Development of Color Dynamic Flow Image Using 4D-CTA for Post TEVAR Operative Case

#### TEACHING POINTS

It is common to use 3D-CTA for postoperative evaluation of TEVAR. 3D-CTA can assess postoperative complications such as endoleak and the presence or absence of stent graft induced new entry (SINE). However, since 3D-CTA is a single time phase, it is difficult to evaluate the direction of blood flow to the aneurysm and the timing of outflow. This is where 4D-CTA comes in. 4D-CTA injects a contrast medium while continuously imaging a specific area. When 4D-CTA is displayed in Volume Rendering (VR), the blood flow is easy to understand visually. Therefore, it is possible to observe end leakage and SINE around the stent graft. This time, we evaluated the blood flow when it was converted to VR using a color map. The color map was changed according to the CT value. In addition, the color map has been optimized to make 4D-CTA easier to observe. By displaying the blood flow as our original color map, it is possible to visually evaluate the direction of blood flow at the leak point and the timing of flow from the aorta into the aneurysm. This time, we take 4D-CTA scan and analyzed it with our original color map in the SINE case. By applying our method, it can be easy and visually to evaluate the entry point, blood flow direction, and outflow timing post TEVAR operation.

#### TABLE OF CONTENTS/OUTLINE

1. Problem analysis of conventional display method 2. Ingenuity in scanning / Exposure reduction technology 3. Ingenuity in image reconstruction 4. Evaluation by 4D-CTA 5. Creation of original color map 6. Evaluation of usefulness by clinical cases

### Current and Novel Techniques for Artifact Reduction on Chest CT

#### Participants

Yoichiro Ota, RT, Yokohama, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Various artifacts can be observed on chest CT. Motion artifacts are an important issue, especially in emergency cases in which patients are unable to hold their breath. Motion correction-deep learning reconstruction (MC-DLR) is a motion correction method developed using a deep learning framework to estimate patient motion in the lung region. This method comprises three major steps. First, a full-image reconstruction is decomposed into several partial-angle reconstructions. Second, a pre-trained deep convolutional neural network (DCNN) is applied to estimate the motion vector field between these partial angle reconstruction images. Finally, a motion-corrected image is reconstructed by incorporating the DCNN-predicted motion vector field (Fig. 1). An image with MC-DLR can reduce the motion artifacts in moving phantom experiments (Fig. 2) and clinical cases (Fig. 3). Radiologists should understand CT artifacts to distinguish between true lesions (Figs. 4,5). In this exhibit, we introduce the principles of CT artifacts and techniques to reduce them by presenting clinical cases.

#### TABLE OF CONTENTS/OUTLINE

Motion artifact, Streak artifact, Metal artifact, Dark band artifact, Partial volume effect

### Thoracic Manifestations of Autoimmune Diseases: From Suspicion to Diagnosis

#### Participants

Renato Fujiki, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Interstitial lung disease (ILD) is the most common thoracic manifestation of autoimmune disease (AD). Each ILD pattern is more commonly associated with a specific AD, although there is an overlap between patterns. While connective tissue diseases (CTD) are commonly associated with thoracic manifestations, it is important to recognize that other AD can also affect the lungs. Besides ILD, AD can also present with airway, vascular, pleural, and mediastinal involvement. The purpose of this exhibit is - Review CT patterns of ILD more commonly associated to each specific AD and what is important to describe - Highlight the role of radiology in diagnosing and grading thoracic manifestations of AD - Discuss the new classification system known as "interstitial pneumonia with autoimmune features" (IPAF) and its relevance in patient management

#### TABLE OF CONTENTS/OUTLINE

1. Introduction
  - a. Epidemiology, pathophysiology and clinical aspects of the main autoimmune diseases (AD)
  - b. Currently available treatment options
2. Role of different imaging methods in diagnosis and assessment of disease grading - advantages, limitations, usefulness
  - a. X-ray
  - b. Ultrasound
  - c. CT - with protocol recommendation
  - d. MRI
3. ILD patterns associated with AD - Case-by-case discussion review
  - a. Non-specific interstitial pneumonia
  - b. Organizing pneumonia
  - c. Usual interstitial pneumonia
  - d. Hypersensitivity pneumonitis-like pattern
  - e. Others
4. Other thoracic manifestations of both CTD and non-CTD AD - including vascular, pleural, mediastinal and airway involvement.
5. The new statement of interstitial pneumonia with autoimmune features (IPAF) - repercussions in clinical practice and recommendations
6. Conclusions "take-home messages"

CHEE-119

### **Bronchiectasis: Differential Diagnosis for Their Cause According to Their Spatial Distribution and Complications**

#### **Participants**

Fernando Vasquez Puelles, MD, Barcelona, Spain (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

- Distribution of bronchiectasis, their association with different radiological findings, altogether with clinical context can aid in formulating a differential diagnosis for pathologies that cause bronchiectasis.- Bronchiectasis predisposes to complications which can be evaluated with imaging studies.

#### **TABLE OF CONTENTS/OUTLINE**

Bronchiectasis is irreversible bronchial dilatation, usually resulting from chronic infection, proximal airway obstruction, or congenital bronchial abnormality. Bronchiectasis can have a diffuse distribution with an upper/mid lung predominance (cystic fibrosis, sarcoidosis, tuberculosis), lower lung predominance (chronic aspiration, primary ciliary dyskinesia, Kartagener syndrome), or central predominance (Mounier-Kuhn syndrome, Williams-Campbell syndrome), or a focal distribution (endobronchial or peribronchial tumors, Swyer-James syndrome). It predisposes to chronic or recurrent infections, allergic bronchopulmonary aspergillosis, pneumothorax, hemoptysis, and pulmonary hypertension. Signs suggestive of infection include air-space disease, tree-in-bud pattern, ground-glass opacities, patchy opacification, and cavitation or abscess. Conclusion. Bronchiectasis is irreversible bronchial dilatation usually resulting from chronic infection, proximal airway obstruction, or congenital bronchial abnormality. There is a wide spectrum of causes of bronchiectasis, thus radiologists can use the morphologic features, particularly the spatial distribution, associated findings altogether with clinical information to provide a differential diagnosis for the cause of bronchiectasis and to help to find an adequate treatment.

### Cardiothoracic Imaging Findings in VEXAS Syndrome

#### Participants

Naim Qaqish, MD, Salt Lake City, UT (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

-VEXAS Syndrome is an adult-onset autoinflammatory disorder found almost exclusively in adult men (x-linked gene mutation) first described in 2020. The disease is severe with a poor prognosis.-Systemic hematologic and inflammatory disease affecting multiple organs, most commonly the skin, lungs, cardiovascular, and cartilage.-Diagnosis is made on bone marrow aspirate.-Pulmonary imaging findings: consolidative, ground glass and reticular opacities, pulmonary vasculitis, pleural effusions, bronchial inflammation/stenosis.-VS-associated interstitial lung disease usually follows an organizing pneumonia or NSIP pattern.-Cardiovascular imaging findings: Venous and/or arterial thrombosis, pulmonary emboli, pericarditis, myocarditis, and cardiac amyloidosis.

#### TABLE OF CONTENTS/OUTLINE

- Introduction to VEXAS Syndrome (VS) • Useful Laboratory Tests • Clinical Presentation with Common Manifestations • Pulmonary Imaging Features o Parenchymal disease (consolidation, GGO, reticulation) o Pleural effusions o VS-associated interstitial pneumonias § NSIP and organizing pneumonia patterns o Pulmonary vasculitis o Bronchial disease and stenosis o Less common pulmonary manifestations • Cardiovascular Imaging Features o Cardiac and pericardial involvement § Typical CMR findings o VS-associated vasculitis o Recurrent thromboembolic disease § DVT, pulmonary emboli, and arterial thrombosis • Differential Diagnosis • Treatment • Prognosis • Summary of Cardiothoracic Imaging Findings • References

CHEE-121

### Paraneoplastic Syndromes Related to Thoracic Neoplasms: Clinical and Imaging Clues

#### TEACHING POINTS

Paraneoplastic Syndromes are systemic manifestations of neoplasia not related to metastatic disease. These rare disorders are characterized by abnormal production of proteins (i.e. antibodies), protein derivatives, or steroids generated by the immune system. The diagnosis of thoracic neoplasms associated with these syndromes often presents diagnostic challenges for radiologists and clinicians alike. Radiologists play an essential role in the identification of the specific neoplasm associated with these syndromes. Therefore, knowledge of the neoplasm associated with each paraneoplastic syndrome is valuable for quality patient care. The goals of this exhibit are to help the learner: 1. List the clinical features of specific paraneoplastic syndromes related to thoracic neoplasms 2. Identify characteristic imaging features of thoracic neoplasms associated with specific paraneoplastic syndromes

#### TABLE OF CONTENTS/OUTLINE

1. Introduction - Definition of paraneoplastic syndromes 2. Overview of paraneoplastic syndromes associated with specific types of thoracic neoplasms 3. Discussion of clinical and imaging features of thoracic neoplasms that may manifest with a paraneoplastic syndrome at presentation 4. Conclusion

Printed on: 04/12/24

## Abstract Archives of the RSNA, 2023

CHEE-122

### Usual Interstitial Pneumonia and Variants, a Pictorial Review

#### Participants

Moises Jose Lima, MD, Santiago de Compostela, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- To define and illustrate the classic appearance of a UIP pattern.- To describe the HRCT diagnostic categories of Usual Interstitial Pneumonia (UIP).- To comment and review the CT findings of the main differential diagnosis of UIP. - To know the 2018 Fleischner diagnostic guidelines on the diagnosis of Idiopathic pulmonary fibrosis (IPF). - To enumerate and discuss specific and general variant patterns of fibrosis.

#### TABLE OF CONTENTS/OUTLINE

1) Background: Interstitial lung disease concept and classification. Categorization of idiopathic interstitial pneumonias. UIP pathophysiology.2) HRCT technique in UIP3) Key features of a classic UIP pattern: honeycombing, reticular pattern, traction bronchiectasis, other findings of classic UIP pattern: GGO, mediastinal lymph node enlargement, pulmonary ossification, pleuroparenchymal elastosis.4) Diagnostic categories of UIP: UIP and uncommon presentations (asymmetric distribution, uniform craniocaudal distribution and others), probable UIP, possible UIP, a review of the main alternative diagnoses: non-specific interstitial pneumonia, fibrosing hypersensitivity pneumonitis, sarcoidosis, others.5) IPF Diagnosis: clinical history, UIP histopathology, IPF diagnostic criteria.6) Variant patterns of fibrosis: anterior upper lobe, exuberant honeycombing and straight edge signs.7) Specific variant patterns of fibrosis: scleroderma: four corners sign. Systemic lupus erythematosus: "Island-like" fibrosis and heterogeneous lung destruction.8) Summary

Printed on: 04/12/24

## Abstract Archives of the RSNA, 2023

CHEE-123

### NTM: What the Pulmonologist Wants to Know

#### TEACHING POINTS

Classic and non-classic NTM have characteristic distribution and morphology of bronchopulmonary disease with variability in part associated with the presence of underlying lung disease, as well as other factors. Radiologists may be the first to suggest pulmonary NTM in patients that are asymptomatic or with nonspecific constitutional symptoms leading to earlier diagnosis and management. Baseline CT description should include description of disease extent, fibrocavitary or nodular bronchiectatic type, presence of atelectasis, cavities, and fibrosis. Pulmonary NTM infections are usually indolent/slowly progressive with CT findings waxing and waning over time. Follow-up imaging is performed to assess interval improvement or progression of the airways disease, cavities, nodules and consolidation. The focal mass like/nodular NTM type can pose diagnostic challenges, and must be distinguished from other infections and malignancy. Development of high-attenuation mucous (HAM) in bronchiectatic airways is pathognomonic for superimposed ABPA. New or growing nodule should raise concern for neoplasm. NTM should be also be considered as an allergen to incite nonfibrotic hypersensitivity pneumonitis.

#### TABLE OF CONTENTS/OUTLINE

Epidemiology. Diagnostic criteria for pulmonary NTM. CT Manifestations of pulmonary NTM. What the Radiologist needs to know. What the Pulmonologist wants to know.

CHEE-124

### Thoracic Complications of Stanford Type A Aortic Dissection: A Review of CT Findings and Management

#### TEACHING POINTS

This presentation will serve as a review of aortic root anatomy and aortic dissection. It also includes an update to the Stanford classification system published jointly by the Society for Vascular Surgery and the Society of Thoracic Surgeons which provides a more detailed description of the dissection and is suited to sites offering endovascular repair (though likely to become more universally adopted in the future). The bulk of the exhibit is concerned with the complications of Type A dissection which occur within the thorax. A framework for classifying and subclassifying complications is described as well as a more detailed description of the pathophysiology, grading, and management of these complications. This information has previously been offered separately in review articles, case series, and case reports but will now be presented as a single resource. Detailed diagrams and representative CT images will support the information presented and will aid the viewer's understanding of the concepts. CT is often utilized for investigation of suspected acute aortic syndrome. This presentation will be useful for radiologists and radiology residents working in the acute care setting, to assist their search pattern and tailor their reports to provide more useful information to the cardiothoracic surgeon.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Risk factors and epidemiology 3. Classification of aortic dissection 4. CT imaging protocol recommendations 5. Complications and management of aortic dissection 6. Thoracic complications of Type A dissection 6.1 Rupture complications 6.2 Malperfusion complications 6.3 Aortic valve distortion/disruption with regurgitation 7. Conclusion

### From Acute to Chronic: A Comprehensive Guide to Aortic Injuries and the New Classification System

#### Participants

Amr Wardeh, MD, Syracuse, NY (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

(1.) Learn to differentiate among the different types of acute aortic syndrome and understand their clinical significance.(2.) Explore the signs of instability and potential complications in acute aortic syndrome.(3.) Examine the appearance of subacute and chronic aortic dissection.(4.) Discuss the limitations of the Stanford classification system in addressing the complexities of acute aortic syndrome.(5.) Introduce the new Society of Vascular Surgeons and the Society of Thoracic Surgeons classification system (SVS/STS) and how it differs from the Stanford classification system.(6.) Illustrate the use of the new SVS/STS classification system with example cases.

#### TABLE OF CONTENTS/OUTLINE

(I.) Introduction to Acute Aortic Syndrome (A.) Definition and clinical importance (B.) Overview of the four types (1.) Aortic dissection (2.) Intramural hematoma (3.) Penetrating atherosclerotic ulcer (4.) Limited intimal tear (II.) Classification Systems (A.) Stanford Classification System and its Limitations (B.) SVS/STS Classification System (C.) Comparison of the Classification Systems (D.) Example Cases: Applying the SVS/STS Classification System.

### Reporting Response Assessment in Clinical Trials in the Era of Personalized Medicine

#### TEACHING POINTS

Response Evaluation Criteria in Solid Tumors (RECIST) was published in 2000 and revised to RECIST 1.1 in 2009. RECIST defines lesions as measurable and non-measurable, based on whether they are quantifiable; measurable lesions consist of target, which are followed, and non-target. RECIST 1.1 includes newer technologies like FDG-PET and MRI and clarifies lymph node criteria. Target lesions must be: Easily and reproducibly measurable; Representative of the disease; Representative of distribution Progressive disease (PD) after initial response can be depicted using RECIST 1.1. Personalized therapies targeting specific receptors are in clinical trials and allow patients with slow progression to be followed long term. iRECIST criteria are used to assess response to immunotherapy. Response may vary between unidimensional and volumetric assessment methods. Genomic profiling in a lung cancer patient revealed an EGFR mutation. The tumor was successfully targeted by Erlotinib, showing 61% decrease in size at 8 weeks.

#### TABLE OF CONTENTS/OUTLINE

Illustrate response assessment in the era of personalized medicine clinical trials  
Depict optimal strategies for response assessment using a multimodality approach  
Explore novel response assessment criteria, such as volumetric and MRI based DCE and DWI, to assess response

### Congenital Lung Anomalies in the Adult

#### Participants

Marcos Mestas Nunez SR, MD, Buenos Aires, Argentina (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Although rare, congenital lung anomalies are incidentally discovered in adults and can pose a diagnostic dilemma. The radiologist must be familiar with the imaging findings and differential diagnosis. With this exhibit we will: 1) Review the typical imaging appearance of common and uncommon congenital lung anomalies as seen in the adult. 2) Review the concept of hybrid lesions. 3) Case based review of entities that can be mistaken for congenital lung anomalies, and the role of imaging in the differential diagnosis. 4) Describe complications and as well as discuss the risk of malignancy of some of these entities.

#### TABLE OF CONTENTS/OUTLINE

1) Introduction and embryology 2) Bronchopulmonary anomalies a) Bronchial atresia b) Lobar hyperinflation c) Bronchogenic cyst d) CPAM 3) Combined pulmonary and vascular anomalies a) Pulmonary sequestration b) Hypogenetic lung syndrome c) Thoracic Isomerism 4) "New concepts" hybrid lesions 5) Miscellaneous a) Placental transmogrification b) Proximal Interruption of the pulmonary artery 6) Differential diagnoses: Case-based approach 7) Complications a) Risk of malignancy: true or myth? b) Superimposed: a radiology challenge c) Hemoptysis and radiology in treatment

### The Family Plan: Multidisciplinary Approach to Familial Pulmonary Fibrosis (FPF)

#### Participants

Katherine Cheng, MD, Stamford, CT (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Familial pulmonary fibrosis (FPF), defined as pulmonary fibrosis affecting at least two first degree relatives, is a complex group of diseases caused by a variety of genetic mutations. Diagnosis of FPF is essential as these patients have a worse prognosis than their sporadic counterparts that affects management not only of the patient, but also of first-degree relatives. However, the diagnosis of FPF can be difficult for both the radiologist and clinician as imaging patterns of fibrosis are often unclassifiable; variable penetrance exists amongst family members; and new mutations are continuously being discovered. This exhibit aims to improve understanding of FPF through a multidisciplinary approach reviewing genetic, clinical, and imaging manifestations of FPF.

#### TABLE OF CONTENTS/OUTLINE

1. Definition and Epidemiology of FPF.2. Overview of the Genetic Mutations Associated with FPF including telomere, surfactant, host defense3. Illustrate the spectrum of imaging patterns for FPF and the variability that can exist even amongst family members including unclassifiable, UIP, NSIP, PPFE4. Emphasize the importance of genetic testing

CHEE-129

### Cardiovascular and Thoracic Imaging Manifestations of Lupus

#### Participants

Muhammad Naeem, MBBS, Saint Louis, MO (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Systemic Lupus Erythematosus (SLE), also known as Lupus is a great masquerader and being a systemic illness it virtually affects every organ in the body. Cardiovascular and Thoracic manifestations are often prevalent. Over half of the patients with lupus develop pleuropulmonary involvement. Lupus patients often get delayed diagnosis and sometime radiologists can provide clue to underlying lupus by putting all the imaging findings together.- Thrombosis is quite prevalent in lupus given the high association with Antiphospholipid antibody (APLA). Other vascular manifestations can be coronary artery disease/aneurysms, pulmonary hypertension, venous thromboembolism, pulmonary emboli and rarely aortic dissections.- Heart involvement in lupus often present with myocarditis, although pericarditis is much more common due to the high prevalence of serositis in lupus.

#### TABLE OF CONTENTS/OUTLINE

- Introduction- pathophysiological mechanisms in lupus- diagnostic criteria for lupus- Lung and Pleural involvement: Pleural disease, Lupus pneumonitis, Diffuse Alveolar Hemorrhage, Shrinking Lung Syndrome, Pulmonary fibrosis (along with classic patterns described in lupus)- Vascular involvement: Thrombosis/lupus anticoagulant/APLA antibodies, Venous thromboembolism, Pulmonary hypertension, Aortic dissections- Cardiac involvement: Pericardial involvement, Myocarditis and myocardial LGE pattern, Coronary artery disease and coronary vasculitis, Valvular disease (Libman-Sacks endocarditis)- Summary slide

### Ground-Glass Opacities in Thoracic CT: Beyond the Acute Disease

#### Participants

Alicia Espinal Soria, MD, San Sebastian, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To describe the spectrum of pathologic entities that manifest as ground-glass opacities in thoracic CT. To learn that ground glass opacities are not always related to acute diseases, being associated in some cases with fibrosis signs.

#### TABLE OF CONTENTS/OUTLINE

Ground-glass opacities (GGO) are defined as a light increase in attenuation in pulmonary parenchyma that occur when alveolar space is compromised and/or when pulmonary capillary blood volume increases. This finding is often associated with acute pathology like pulmonary edema, alveolar hemorrhage, *Pneumocystis jirovecii* pneumonia, COVID-19, acute interstitial pneumonia, and acute respiratory distress syndrome. But some subacute and chronic pathologies may also manifest with GGO in CT such as cryptogenic organizing pneumonia, lepidic-predominant adenocarcinoma, chronic eosinophilic pneumonia, non-specific interstitial pneumonia, and nonfibrotic hypersensitivity pneumonitis. In addition, all of these entities can be classified according to the presence or lack of fibrosis signs, which is a determinant prognosis factor for the patients. The aim of this presentation is to review these pathologies with the most common imaging findings in order to facilitate the differential diagnosis in each case. However, in many cases the imaging findings are nonspecific therefore histologic and microbiologic studies will be necessary to make a definitive diagnosis.

### Febrile Neutropenia: A Scenario and Pattern-based Approach to a Perplexing Problem

#### Participants

Adam Yen, MD, San Francisco, CA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Febrile neutropenia presents a challenging clinical dilemma, and treatment success relies on early diagnosis and targeted antimicrobial therapy. Often, clinical teams look to radiologists to help narrow the differential diagnosis when a neutropenic patient's thoracic CT contains findings concerning for infection. Here, we examine the role of imaging and CT-guided biopsy in the management of febrile neutropenia, present an approach wherein clinical information is paired with a CT pattern to help the radiologist make an educated guess as to the underlying causative agent, and specify where either clinical information or imaging appearance can serve more useful.

#### TABLE OF CONTENTS/OUTLINE

1. Clinical presentation 2. Imaging workup 3. Approach by imaging patterns a. Consolidation/nodules b. Cavitory consolidation c. GGO d. Halo e. Reverse halo f. Thoracic wall involvement 4. Helpful clinical information a. Time course b. Antimicrobial response c. Procalcitonin d. B-D-Glucan e. Galactomannan f. Serologies g. BAL aspirate microscopy h. Cultures 5. Less than 1 week from onset a. Consolidation/nodules - common bacteria i. Gram+ bacteria (MRSA, VRE) ii. Gram- bacteria (pseudomonas) b. GGO - mostly viral i. EBV, CMV, other viruses ii. PJP 6. Consolidation/nodules + non-response to broad spectrum antibiotics - fungi a. Candida b. Aspergillus c. Mucormycosis 7. Other organisms to consider - uncommon bacteria a. Nocardia b. Actinomyces 8. Utility of biopsy a. Fungal infection b. Malignancy c. Non-diagnostic biopsy d. Platelet management 9. Summary by imaging appearance 10. Summary by helpful clinical information

### Deciphering Acute Diffuse Pulmonary Lesions: Unraveling the Diagnostic Enigma

#### Participants

Daisuke Yamada, MD, PhD, Tokyo, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Diffuse lung diseases include a wide variety of infectious, neoplastic, and allergic diseases in addition to idiopathic interstitial pneumonia. In this presentation, we will discuss what radiologists need to know about these diseases, especially those that present with diffuse lung lesions in an acute-onset.

#### TABLE OF CONTENTS/OUTLINE

Presentation goals: To explain the pathophysiological mechanisms of hydrostatic and permeability pulmonary edema and describe the imaging findings. To discuss the spectrum of acute/subacute lung injury. To present information on acute diffuse pulmonary diseases classified by cause into idiopathic, infectious, allergic, drug-induced, neoplastic, and rare diseases and to describe their characteristic imaging findings. Cases include Infectious pneumonia: COVID-19 pneumonia, Cytomegalovirus pneumonia, Varicella zoster virus pneumonia, Influenza pneumonia, Pneumocystis pneumonia, Miliary tuberculosis, Legionella pneumonia, Diffuse aspergillosis after influenza viral infection Allergic lung diseases: Acute eosinophilic pneumonia, Acute hypersensitivity pneumonitis, E-cigarette, or vaping, product use associated lung injury (EVALI), Pulmonary injury associated with inhalation Drug-induced lung injury: Caused by anti-cancer drugs and other medications Neoplastic diseases: Tumor embolism, Pulmonary tumor thrombotic microangiopathy, Carcinomatous lymphangiosis, Leukocytosis, Intravascular large B-cell lymphoma Rare diseases: Pulmonary hemorrhage, Fat embolism

### Thoracic Involvement in Diseases Related to Dysregulated Humoral Immunity

#### Participants

Jose Maluf, MD, (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Understand general concepts about immunity and humoral immunity
- Identify the main pathologies related to unfunctional humoral immunity
- Learn about the thoracic involvement in dysregulated humoral immunity states and how it can impact in patient's health
- Recognize the thoracic imaging findings related to a compromised humoral immunity

#### TABLE OF CONTENTS/OUTLINE

- Introduction - General concepts about immunity:
  - o Main concepts and differences between cellular and humoral immunity
  - o Relation of the chest and respiratory tract with humoral immunity and the potential impacts in patient's health
  - o Thoracic imaging role in patients with dysregulated humoral immunity states
- Different thoracic findings:
  - o Airway abnormalities
  - o Infection
  - o Chronic Inflammatory and interstitial lung diseases
  - o Benign lymphoproliferative disorders
  - o Neoplasms
- Case based review - Pathologies and thoracic manifestations:
  - o Common Variable Immunodeficiency (CVID)
  - o IgG4-Related Respiratory Disease (IgG4-RRD)
  - o Respiratory amyloidosis
  - o Hypogammaglobulinemia
  - o Pulmonary Light-Chain Deposition Disease
  - o Other conditions
- Future perspectives
- Conclusions and key takeaways

#### Participants

Karen Ramirez Suarez, MD, Philadelphia, PA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Childhood interstitial lung disease is rare with challenging differential diagnosis which requires a stepwise approach to diagnosis including clinical presentation, imaging, and histology leading to the correct diagnosis in most cases. - An age-based differential diagnosis is particularly helpful for infants and young children. - Imaging evaluation of lung parenchyma, primarily on CT, helps to correctly diagnose these disorders, aids in guiding biopsy when needed, and monitor treatment response or disease progression. - Radiologic pathologic correlation is an important final step in the evaluation of childhood interstitial lung disease.

#### TABLE OF CONTENTS/OUTLINE

- Role of imaging of childhood interstitial lung disease with delineation of technique and pediatric protocols. - Stepwise approach to diagnosing childhood interstitial lung disease from clinical presentation to diagnostic workup including imaging, genetics, and biopsy. - Correlation of imaging findings and histology in childhood interstitial lung disease - Differential diagnosis of childhood interstitial lung disease based on clinical findings, imaging, and histology.

CHEE-18

### Lung Cancer Interventional Oncology: Fire and Ice in the Treatment of Lung Cancer

#### TEACHING POINTS

-CT-guided ablation is a viable option for treatment of multifocal lung carcinoma and patients with inoperable tumors, recurrence, prior surgery or radiation.-Choice of ablation modality depends on consideration of technical factors, size and location of target lesion, and patient comorbidities.-Target lesions > 3 cm confer a higher local recurrence rate than lesions < 3 cm.-Postablation features of successful ablation include ground-glass margins, which is crucial for confirming treatment success.-Follow up of postablation patients is the responsibility of the interventional oncologist with a standardized regimen of office visits and imaging.

#### TABLE OF CONTENTS/OUTLINE

-Indications for ablation in lung cancer-Comparison of ablation modalities-Mechanisms of tissue injury in ablation-Indicators of successful ablation-Postablation zone imaging features-Follow up surveillance

Printed on: 04/12/24

### Breaking Through the Sternum: Expected Post-sternotomy Imaging's Findings and Complications

#### Participants

Renan Arakaki, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Median sternotomy is the incision of choice for thoracic and cardiac surgical procedures. Its incidence of complications ranges approximately between 0,5-5%, with a mortality rate reaching up to 80%. Thus, it is essential for the radiologist to recognize expected poststernotomy imaging findings and differentiate them from complications. This educational exhibit aims to illustrate the different sternal closure techniques, expected postsurgical changes and the main sternotomy complications involving hardware (wire fracture, migration, and rotation), bone (fracture, sternal dehiscence, nonunion, and osteomyelitis), and soft tissues (hematoma, gossypiboma, and abscess).

#### TABLE OF CONTENTS/OUTLINE

- Sternal closure techniques- Expected postsurgical imaging findings- Acute sternotomy complications- Late sternotomy complications.

### Across the Diaphragm: Thoracic Complications of Abdominal Conditions and Percutaneous Procedures

#### Participants

Elisa Antolinos Macho, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

-Recognize that many pathologic abdominal conditions and certain complications of percutaneous abdominal procedures may extend to the thoracic cavity -Learn the most common pathologic abdominal conditions and percutaneous procedures complications that may extend above the diaphragm -Describe the anatomical and acquired pathways through which infradiaphragmatic pathologic conditions and percutaneous procedures complications may reach the thorax -Review the appearance of these thoracic complications on different imaging modalities

#### TABLE OF CONTENTS/OUTLINE

1) Anatomy and physiology of the diaphragm 2) Common abdominal pathologic conditions and percutaneous procedures complications that may extend to the thorax o Liver and biliary system conditions o Pancreatic and splenic conditions o Kidneys and adrenal glands conditions o Pelvic conditions o Complications of percutaneous abdominal procedures § External biliary drainage § Percutaneous local ablative therapies of liver lesions § Embolization of portal and hepatic veins § Vertebroplasty 3) Pleural complications o Pleural effusion o Fistulas (biliopleural fistula, pancreaticopleural fistula) 4) Pulmonary complications o Infections § TB § Other mycobacteria o Inflammation § Sarcoid reaction § Pneumonitis § Mendelson syndrome o Fistulas 5) Thoracic vascular complications o Fat embolism syndrome o Foreign body embolism

### Emerging Technology in Functional Lung Imaging: Hyperpolarized Xenon Gas MRI

#### TEACHING POINTS

1. Hyperpolarized Xenon Gas (HXG) MRI is a new-to-market FDA approved imaging agent to evaluate lung ventilation, which offers advantages over other inhaled contrast agents. 2. Compared to traditional spirometry, HXG MRI is a promising surrogate with superior reproducibility and reliability. 3. Regulated by the FDA as a drug-device combination, HXG-MRI has some barriers and obstacles for adoption and implementation. 4. Various airway diseases, like asthma, COPD, and Cystic Fibrosis, have MR ventilation features that increase confidence in diagnosis and assessment of disease severity. 5. Ongoing investigation of HXG MRI is revealing new applications for medical imaging, which are not currently possible with existing modalities.

#### TABLE OF CONTENTS/OUTLINE

1. Background/Objectives  
2. Technique  
a. Drug Preparation---i. Supplies, Consumables---ii. Polarization---iii. Dose Administration  
b. MR Scanner Configuration---i. Coil---ii. Software---iii. Hardware  
c. Data Analysis---i. Quantitative methods (Ventilation defect percent, VDP)---ii. Qualitative methods  
3. Clinical Implementation  
a. Regulatory  
b. Logistical  
c. Financial  
4. Ventilation Characteristics  
a. Normal  
b. Pathology disease states---i. COPD---ii. Asthma---iii. Cystic Fibrosis---iv. COVID-19 (Acute and 'Long')  
5. Future Frontiers  
a. Dissolved-Phase Imaging (Barrier Tissues and RBC) in healthy and diseased states.  
b. Dynamic HXG-MRI ('MR Spirometry')  
c. Physiological response to pharmaceutical agents

### How Holey” Art Thou: Developing a Systematic Approach to Identifying and Reporting Cystic Lung Disease

#### Participants

Maria Clara Lorca, MD, Pittsford, NY (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Become familiarized with the different imaging appearance of cystic lung diseases and their differential diagnosis on chest CT. Differentiate true lung cysts versus their mimics: emphysema, cavities, and cystic bronchiectasis, cavitory lung metastasis. Recognize the distribution patterns of the different cystic lung diseases and formulate major differential diagnosis for solitary and multiple pulmonary cysts based on radiological appearance using a standardized approach.

#### TABLE OF CONTENTS/OUTLINE

Recognize primary causes of cystic lung diseases, for example: Birt-Hogg-Dube (BHD) syndrome; spontaneous and tuberous sclerosis related lymphangioleiomyomatosis (LAM), Pulmonary Langerhans cell histiocytosis (PLCH), Lymphocytic interstitial pneumonia (LIP) Recognize acquired cystic lung diseases, for example: Light chain deposition disease, pulmonary laceration, Pneumocystis jirovecii infection, usual interstitial pneumonia, sarcoidosis, amyloidosis. Describe the role of the radiologist in the diagnosis and follow up of cystic lung diseases by CT, and when to recommend further biopsy. Our aim is to review the terminology, distribution and imaging patterns of the most common cystic lung diseases by CT and raise attention to the various mimics of cystic lung diseases, including cavitory lung metastases. The radiologist can then use this information to describe cystic lung disease utilizing a standardized reporting template to improve communication with referring providers.

### Potential Applications of Photon-Counting Detector CT in Cardiothoracic Imaging

#### Participants

Mauricio Barbosa, MD, PhD, Dallas, TX (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Exemplify current and future applications of photon-counting detector CT (PCD-CT) in cardiothoracic imaging, including: 1. Improved image quality: PCD-CT provides higher spatial resolution and improved contrast-to-noise ratio, which enables more accurate and detailed imaging of the heart, vasculature and lungs. 2. Lower radiation dose: PCD-CT can allow for lower radiation doses than traditional CT. 3. Reduced artifacts: use of high keV imaging on PCD-CT can reduce metallic artifacts; combination of high-helical pitch imaging with PCD-CT can reduce motion artifacts. 4. Potential for new applications: PCD-CT technology offers new possibilities for functional imaging, including perfusion and multi-energy imaging, which may help in the diagnosis and management of cardiothoracic conditions.

#### TABLE OF CONTENTS/OUTLINE

I. Introduction: ? • Explanation of physical principles? • Potential Advantages of PCD-CT over Energy-integrating detector CT (EID-CT)? • Improved image quality? • Reduction in radiation exposure? • Spectral imaging?; II. Clinical Applications of PCD-CT in Cardiothoracic Imaging?: • Coronary Artery Disease Imaging? • Lung Nodule and Mediastinal Mass Characterization? • Evaluation of Interstitial Lung Disease? • Thoracic Vascular Imaging/ Pulmonary embolism?; III. Future Possibilities: ? • Improvements in Quantitative Imaging? • Functional Imaging?; IV. Challenges and Limitations?: • Scientific and clinical validation? • Need for additional training and education?; V. Conclusion?: • Recap of current clinical applications? • Future directions for PCD-CT? • Final thoughts.

### Disorders with Hand and Thoracic Involvement

#### Participants

Riddhi Borse, MBBS, MD, New Haven, CT (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Numerous medical conditions have multiorgan imaging findings. Here, we review specifically the hand and cardiothoracic findings of selected infectious, inflammatory, connective tissue, neoplastic, and hereditary disorders. These correlations are meant to remind the astute clinician that certain hand findings should trigger a careful radiologic evaluation that includes imaging of the chest.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction.2. Examples of cases:A. Connective tissue disorders- Rheumatoid arthritis, Systemic Lupus Erythematosus, Raynaud's syndrome, Dermatomyositis. B. Hereditary Conditions: Marfan's Syndrome, Ehlers Danlos Syndrome, Sickle-cell disease.C. Metabolic conditions: Hyperparathyroidism, Renal Failure with osteodystrophy and metastatic calcification in the lungs.D. Infectious Diseases: Tuberculosis, Septic Embolism.E. Neoplastic Conditions: Lung Cancer, Melanoma.3. Conclusion.

### What's That in the Bone?"- Non-Traumatic Musculoskeletal Pathology on Chest/ Breast Imaging

#### Participants

Tina Roa, MD, New York, NY (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Understand the basic musculoskeletal anatomy seen in the chest including bones, joints, muscles, tendon insertions and major nerves (including the brachial plexus origin and long thoracic nerve). 2. Recognize MSK anatomic variants and common degenerative changes. 3. Recognize MSK manifestations of infectious, autoimmune, and other systemic pathologies on chest imaging (such as septic arthritis, sickle cell disease, rheumatoid arthritis, etc.) 4. Learn how to approach bone lesions within the chest. 5. Learn how to approach soft tissue lesions within the chest. 6. Review Bone-RADS criteria.

#### TABLE OF CONTENTS/OUTLINE

1. Normal Anatomy: a. Osseous Structures of the Chest, b. Musculature of the Chest, c. Joints and Tendons, d. Major Nerves; 2. Orthopedic Findings: a. MSK Anatomic Variants in the Chest, b. Degenerative MSK Changes in the Chest; 3. MSK Infections/ Autoimmune/ Other Systemic Anomalies in the Chest: a. Septic Arthritis, b. Autoimmune MSK Manifestations in the Chest, c. Other Systemic Disorders; 4. MSK Tumors of the Chest: a. Benign Tumors (Osseous and Soft Tissue), b. Malignant Tumors (Osseous and Soft Tissue); 5. Algorithm to approach incidental bone lesion/ Review of Bone-RADS.

### Spotting the Airway Snags: Computer Tomography Imaging Planning For Bronchoscopy Stent and Valve Placement

#### Participants

Miriana Mariussi, MD, Pilar, Argentina (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The purpose of this exhibit is to:

- Review the indications for bronchoscopy stent and valve placement.
- Highlight the role of Computer Tomography in the treatment of airway stenosis, air leaks and chronic obstructive pulmonary disease (COPD).
- Comprehend the application of CT planning prior to the bronchoscopy.
- Correlate the radiological features with bronchoscopy findings.
- Identify CT image findings during follow-up after the procedure.

#### TABLE OF CONTENTS/OUTLINE

Bronchoscopy stent and valve placement have been established as a safe and effective treatment alternative for airway stenosis, air leaks and COPD. A case based pictorial essay allows for a comprehensive assessment and understanding of:

- Clinical indications for bronchoscopy stent and valve placement.
- Radiological features of airway stenosis, air leaks and COPD.
- Pre-procedural CT planning for bronchoscopy airway stent placement.
- Pre-procedural CT planning for the endobronchial unidirectional valve placement.
- Imaging findings correlated with bronchoscopy.
- Expected radiological findings during the follow up.

### **Trouble in the Air: Imaging Review of Early Complications Following Lung Transplantation and Our Institutional Experience**

#### **Participants**

Bob Zhang, MBBS, BMedSc, Melbourne, Australia (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Early complications following lung transplantation are a major cause of morbidity and mortality. Imaging plays a key role in their diagnosis, and it is important for radiologists to be able to recognise these complications, as well as understand the underlying cause. This exhibit aims to 1) discuss the spectrum of complications that occur within the first week following transplantation, 2) discuss preoperative factors that may predispose to complications, 3) review surgical techniques that reduce the risk of certain complications and how to recognise these on imaging, 4) discuss our institutional experience as a major transplant centre, and 5) review the imaging findings of early complications using a case based format.

#### **TABLE OF CONTENTS/OUTLINE**

1. Overview of lung transplantation. 2. Overview of complications that occur in the first week following transplantation. 3. Preoperative factors that increase risk of complications following transplantation. 4. Surgical techniques to reduce the risk of postoperative complications and how to recognise these on imaging. 5. Review of our institutional experience as a major lung transplantation centre. 6. Case based review of imaging findings in early post-transplant complications.

CHEE-29

### Bronchiectasis: Another Way to Approach Lung Disease

#### TEACHING POINTS

Bronchiectasis features in a wide range of pathological processes including infectious causes, bronchial aspiration, pneumoconiosis, congenital immunodeficiencies, and cartilage development disorders, among others. The spatial distribution; is considered a key point when it comes to establishing differential diagnoses in an easier and quicker way. The upper lung zones are usually compromised by cystic fibrosis, sarcoidosis, and allergic bronchopulmonary aspergillosis noticing a more central involvement while tuberculosis has an asymmetric distribution. The middle lobe and lingula frequently show bronchiectasis secondary to infection by atypical mycobacteria or adult respiratory distress syndrome. Associated findings allow radiologists and trainees to address the diagnoses. When tree-in-bud, centrilobular ground-glass nodules and bronchial wall thickening are seen in patients with lower lung zones bilateral bronchiectasis; bronchial aspiration should be suspected. Meanwhile, the presence of architectural distortion, honeycombing, and varicoid morphology bronchiectasis are commonly found in pulmonary fibrosis.

#### TABLE OF CONTENTS/OUTLINE

Location and distribution, Upper lung: Cystic fibrosis, Sarcoidosis, Allergic bronchopulmonary aspergillosis, Tuberculosis Middle/lingular: Atypical mycobacterial infection, Acute respiratory distress syndrome, Primary ciliary dyskinesia, Immunodeficiency Lower lung zone: Chronic aspiration, Pulmonary fibrosis,  $\alpha$ 1-Antitrypsin deficiency. Central: Tracheobronchomegaly, Williams Campbell syndrome Focal and diffuse: Endobronchial or peribronchial tumor, Swyer James syndrome, Bronchiolitis obliterans.

CHEE-3

### Inside the Circuit: Radiology Insights into ECMO Placement

#### TEACHING POINTS

1. ECMO, or extracorporeal membrane oxygenation, is a life-support system that provides temporary respiratory or circulatory support to critically ill patients whose heart or lungs are failing. 2. Radiology plays an important role in ECMO, particularly in assessing the placement of the cannulas and monitoring for complications such as bleeding or clotting. 3. Sentinel events, such as malposition of the cannulation require rapid intervention and evaluation by the ECMO team and radiology. 4. There are different types of ECMO cannulation, including veno-arterial, veno-venous, veno-veno-arterial, and central cannulation. 5. Venous-arterial cannulation is used when the patient has both respiratory and circulatory failure, and it requires correct positioning to ensure optimal blood flow and oxygenation. Incorrect positioning can lead to complications such as limb ischemia or vessel injury. 6. Venovenous ECMO is used when the patient has isolated respiratory failure, and it also requires correct positioning to avoid complications such as bleeding or pneumothorax.

#### TABLE OF CONTENTS/OUTLINE

Introduction 1. Indications for ECMO 2. Role of Radiology in ECMO 3. Sentinel Event Types of ECMO Cannulation 1. Veno-Arterial 2. Veno-Venous 3. Veno-Veno-Arterial 4. Central Cannulation Venous-Arterial Cannula 1. Indications 2. Correct Positioning 3. Incorrect Positioning 4. Complications of Incorrect Positioning VA ECMO: Femora Cannula 1. High Arterial Cannula 2. Low Arterial Cannula 3. Low Venous Cannula 4. High Venous Cannula Venovenous ECMO 1. Indications 2. Correct Positioning 3. Incorrect Positioning 4. Complications of Incorrect Positioning 5. Single lumen VV ECMO Conclusions

### **Chill Out! Percutaneous CT- Guided Intrathoracic Cryoablation: Applications, Imaging Appearance, and Complications**

#### **Participants**

Saumik Rahman, MD, New Haven, CT (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Percutaneous cryotherapy uses liquified gases like nitrogen or argon through cryoprobes under CT guidance to create temperatures as low as - 40° C. Cytotoxic cell destruction occurs at this temperature which helps to destroy neoplastic cells. Cryotherapy allows real-time evaluation of the ablation site. It is a preferred ablation technique for central tumors close to airways, great vessels, pericardium.

#### **TABLE OF CONTENTS/OUTLINE**

Indications for cryotherapy: Primary lung cancer (early or advanced), metastatic lesions, mediastinal lesions, post-SBRT recurrent tumors, post-surgical recurrent tumors. Post treatment appearance - Immediately after the procedure, follow-up after 1 month, 3 months, 6 months and 12 months. Complications of cryotherapy Pneumothorax, hemoptysis, pleural effusion, parenchymal hemorrhage, pneumonia, esophageal injuries, tumor implantation, tumor recurrence, nerve injury, skin injury.

### Pleuroparenchymal Fibroelastosis: Update on Imaging with Pathological Correlation

#### Participants

Joel Gamble, MD,BSC, Toronto, ON (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Pleuroparenchymal Fibroelastosis (PPFE) is a rare subtype of interstitial pneumonia that historically has been difficult to diagnose, particularly in its early stages, and often misdiagnosed by radiologists. 2. PPFE can be associated with other fibrotic interstitial lung diseases or triggered by previous infections, chemotherapy, hematopoietic stem cell transplant, and lung transplant. 3. Improving awareness of PPFE allows early recognition on CT and allows for close attention on clinical and imaging follow up, including implementation of supportive measures and potential treatment.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction to Pleuroparenchymal Fibroelastosis (PPFE): Definition and background; Historical context and understanding; Inclusion in American Thoracic Society/European Respiratory Society guidelines. 2. Diagnosis and Recognition of PPFE: Challenges in early-stage diagnosis; Importance of CT in the diagnosis; Pathological confirmation. 3. Causes and Associations of PPFE: Previously believed to be idiopathic; Association with other fibrotic interstitial lung diseases; triggers, including infections, chemotherapy, hematopoietic stem cell transplant, lung transplant. 4. Clinical Presentation and Prognosis: Slowly progressive or rapid clinical deterioration; Poor prognosis in most cases; Potential treatment.

### The Many Faces of Evil: A Pictorial Review and Algorithmic Approach to Autoimmune Diseases of the Thorax

#### Participants

Seyedarash Mahdavi Anari, MD, Seattle, WA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Different autoimmune diseases can involve different parts of the thorax, including but not limited to lung parenchyma, heart, esophagus, pleural and pericardial space, great vasculature, thymus gland, and thoracic chest wall.
- Patterns of lung disease could precede the development of the clinical diagnosis of autoimmune disease.
- As autoimmune disorders overlap clinically, the possibility of mixed thoracic radiological manifestations should be considered.
- Thoracic involvement in autoimmune disorders could happen due to the disease process itself, drug toxicity, or opportunistic infections from resultant immunodeficiency, which their differentiation needs meticulous clinical-radiological evaluation.
- Provide an algorithmic approach for diagnosis of autoimmune diseases with focus on intrathoracic findings.
- The European Respiratory Society/American Thoracic Society task force proposes using "Interstitial pneumonia with autoimmune features (IPAF)" for patients with idiopathic interstitial pneumonia and features suggestive of, but not definitive for a collagen vascular disease.

#### TABLE OF CONTENTS/OUTLINE

- Review of the thoracic findings in autoimmune disorders of the thorax based on the involved organs.
- Evaluation of lung parenchyma findings based on the pattern and prevalence.
- Assessment of autoimmune diseases of the thorax, beyond the lung parenchyma involvement.
- Review the post-treatment changes and treatment complications in the autoimmune disorders of the thorax.
- Evaluation of the natural progression of thoracic autoimmune disorders.
- An algorithmic approach for diagnosis of autoimmune diseases.

### Classical Signs on Chest Radiograph: A Primer for Residents

#### Participants

Furkan Ufuk, MD, Denizli, Turkey (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

? Recognize the classic signs on chest radiographs. ? Describe each sign's anatomic and pathologic features and discuss their clinical importance.

#### TABLE OF CONTENTS/OUTLINE

This educational exhibit provides an overview of classic signs on chest radiographs and their clinical significance. The exhibition includes a table of contents and teaching points, such as recognizing the appearance of chest radiograph signs on Chest CT and describing the anatomic and pathologic features represented by each sign. Several imaging signs on chest radiographs are described, including Air bronchogram, Bat's wing or butterfly shadow, black pleura sign, and others, with the pathophysiologic origin of each sign and the characteristic imaging features described in detail. Radiologists must recognize these signs and understand their causes to provide accurate diagnoses of abnormalities affecting the lungs, heart, mediastinum, diaphragm, and pleura. The exhibit aims to enhance radiologists' knowledge of classic signs on chest radiographs, ultimately leading to improved diagnostic accuracy and better patient care.

### A Challenge in Diagnosing Benign Thymic Lesions as Benign

#### TEACHING POINTS

1. To understand the normal/hyperplastic spectrum of the thymus and related clinical conditions 2. To understand the typical and atypical appearance of benign thymic lesions 3. To understand mimickers of thymic lesions

#### TABLE OF CONTENTS/OUTLINE

1. Importance of benign diagnosis of thymus a. Avoid unnecessary thymectomy or follow-up study b. Image modality selection and appropriate recommendation 2. Normal/hyperplastic spectrum of the thymus a. Various morphology of the thymus b. Demographic and clinical features related to thymic involution/hyperplasia c. Thymic hyperplasia related to COVID-19 infection or vaccination d. 2D and 3D analysis: Shape and measurement in size and volume 3. Typical appearance of common benign thymic lesions a. Thymic hyperplasia: True vs lymphoid hyperplasia b. Thymic cyst: Unilocular vs multilocular c. Thymolipoma d. Differentiation from thymic neoplasm (Thymic epithelial tumor, lymphoma) 4. Atypical appearance of benign thymic lesions a. Nodular component within the thymus b. Atypical morphologies of thymic hyperplasia (TH) • Non-suppressive TH out-of-phase T1WI MRI • Multinodular/multicystic TH (Sjogren's syndrome, HIV infection) c. Atypical features of thymic cyst • Complicated hyperattenuating cyst • Thymic/pericardial cyst within TH 5. Mimicker of thymic lesions a. Morgagni hernia b. Focal fat necrosis c. Ectopic thyroid lesion d. Tortuous internal mammary vein e. Lymph nodes 6. Summary

### A Comprehensive Pictorial Review: Vascular Anomaly and Malformation of Thorax

#### Participants

Ryosuke Taiji, MD, Kashihara, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The purpose of this exhibit is To depict anomalies and malformations of thorax To discuss the clinical feature, significance, and management for those entities.

#### TABLE OF CONTENTS/OUTLINE

The mediastinum contains two distinct circulatory systems, namely the systemic and pulmonary circulations. Anomalies and malformations have been reported within the thorax. In the pediatric population, some malformations are identified promptly after birth and necessitate surgical intervention. Radiologist should be familiar with these entities. Contents 1. Pulmonary artery Absence of the right pulmonary artery, proximal interruption of the pulmonary artery, pulmonary arterial aneurysm, pulmonary sling, and Taussig-Bing syndrome, 2. Aorta Aberrant right subclavian artery, right aortic arch and Kommerell diverticulum, arterial duct (Botallo's duct), and anomalous systemic arterial supply to the basal lung 3. Pulmonary vein Partial anomalous pulmonary venous return (PAPVR); right upper and lower pulmonary vein, Scimitar syndrome, total anomalous pulmonary venous return (TAPVR); supra-cardiac, cardiac, infracardiac type, anomalous unilateral single pulmonary vein (AUSPV), and pulmonary venous aneurysm 4. Vena cava Persistent left superior vena cava, azygos continuation of inferior vena cava 5. Summary

### Three Steps for the Success of a Lung Segmentectomy Surgery: The Role of the Radiologist

#### Participants

Maria Celia Franco Issa, MD, Uberlandia, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

? Review the concepts, indications and techniques of lung anatomical segmentectomy ? Describe the most relevant imaging features of the pulmonary nodule to the surgery planning ? Discuss the role of preoperative Chest Computed Tomography (CT) in the recognition of the drainage pattern of the intersegmental vein and determination of the intersegmental plane ? Recognize the anatomical features and variations of the pulmonary venous drainage with potential impact in lung segmentectomy ? Discuss the role of 3DCT in the lung segmentectomy planning

#### TABLE OF CONTENTS/OUTLINE

- Introduction
- The rationale of Lung Segmentectomy
  - o Indications
  - o Advantages and disadvantages
  - o Minimally Invasive Techniques - Video-assisted thoracic surgery (VATS) - Robotic-assisted thoracic surgery (RATS) - Potential complications
- The role of the Radiologist in three steps
  - 1. Describe the most relevant features for anatomical segmentectomy recommendation:
    - Nodule size and location
    - Resection margin
    - Previous lung resection
    - Absence of visible regional lymph node disease
  - 2. Identify the intersegmental vein - Delineate the intersegmental plane - Verify if the intersegmental vein is a drainage vein from the tumor
  - 3. Look for variations of the pulmonary venous drainage that might impact in the lung segmentectomy - Case-based review - Atypical venous outflow to the left atrium - Atypical topography of the pulmonary vein - Atypical venous vascularization of pulmonary segments
- Future Directions the role of CT with 3D reconstructions and 3D printing in lung segmentectomy planning

### Primer for Radiology Residents: Cardiothoracic Emergencies in Oncology

#### Participants

Jitesh Ahuja, MD, MBBS, Houston, TX (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Familiarize radiologists with spectrum of acute cardiothoracic complications that can occur in oncology patients.

#### TABLE OF CONTENTS/OUTLINE

Cancer is the second most common cause of mortality in United States. Several acute cardiothoracic complications can occur in oncology patients that can be life-threatening. These complications can occur due to tumor itself, including the extent of local invasion and metastasis. In oncology patients undergoing treatment, emergencies can be the result of complications of chemo/immunotherapy, surgery and radiation therapy. Finally, patients with cancer are at increased risk of emergencies due to systemic disease from hypercoagulable state and immunosuppression. 1. Complications due to cancer itself a. Airway obstruction b. SVC syndrome c. Esophagorespiratory fistula d. Esophagoaortic fistula e. Large pleural effusion, hemothorax or pneumothorax f. Cardiac tamponade g. Lymphangitic carcinomatosis h. Spinal cord compression 2. Complications due to cancer treatment a. Pneumothorax, hemothorax b. Mediastinal hematoma, mediastinitis c. Lobar torsion d. Cardiac herniation e. Esophageal leak f. Drug or radiation pneumonitis g. Immunotherapy associated myocarditis 3. Systemic complication a. Pulmonary embolism b. Opportunistic infections c. Stress cardiomyopathy (Takotsubo)

### Utilization of Virtual Bronchoscopy and 3D-Multiplanar Volume Reconstruction (MPVR) Correlation to Illustrate Tracheobronchial Tree Abnormalities - An Imaging Review

#### TEACHING POINTS

Tracheobronchial tree abnormalities can be subtle on imaging and are not always accessible via fiberoptic bronchoscopy (FB). As healthcare shifts towards value-based care, technological innovations such as virtual bronchoscopy (VB) may not only reduce overspending but also improve clinical and patient satisfaction outcomes by providing radiologists with a visually intuitive medium to show rather than only tell complex 3D radiographic findings to non-radiologist audiences. VB is rendered by processing multi-detector row CT (MDCT) volumetric data via specialized software that assumes an artificial perspective from a lumen and then assigns opacity values and full spectrum color values based off attenuation values of different tissues and abrupt changes in attenuation between adjacent voxels. VB is underutilized, and it is better than conventional FB in specific cases where higher order subsegmental bronchial branches or regions distal to an obstruction/stenosis or are inaccessible via FB. VB enables a quick, highly accurate, and, most importantly, non-invasive visual medium to evaluate the tracheobronchial tree. It can play an invaluable role in personalized pre-procedural planning and simulations as well as in educating trainees in thoracic anatomy.

#### TABLE OF CONTENTS/OUTLINE

1. Briefly describe how 3D-MPVR post-processing is used in creating VB. 2. Using our institutional database, present CT imaging cases with their respective 3D-MPVR and VB images, including, but not limited to, the following tracheobronchial tree abnormalities: tracheal anomalies, tracheal stenosis, tracheal enlargement, excessive central airway collapse, endobronchial lesions, and trauma.

CHEE-41

### A Pictorial Review: Lymphoma and Lymphoproliferative Disease of Thorax

#### Participants

Ryota Nakano, Kashihara, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To depict lymphoma and lymphoproliferative disease of thorax To discuss the clinical and radiological findings and management

#### TABLE OF CONTENTS/OUTLINE

Lymphoma and lymphoproliferative diseases of the thorax occur primarily in the lungs, bronchus, mediastinum, and chest wall. Radiologists need to know more about each disease, as some require differentiation from lung cancer or other malignant mediastinal tumors. Contents. 1. Pulmonary lymphoproliferative disease (LPD): follicular bronchiolitis, lymphocytic interstitial pneumonia, and nodular lymphoid hyperplasia. 2. Primary pulmonary lymphoma: MALT lymphoma, diffuse large B-cell lymphoma, and Intravascular large B-cell lymphoma. 3. Primary mediastinal lymphoma: diffuse large B-cell lymphoma, classical Hodgkin lymphoma, and T-cell lymphoblastic lymphoma. 4. Primary pleural lymphoma: pyothorax associated lymphoma, and follicular lymphoma. 5. Miscellaneous: IgG4-related disease, Uni-/Multicentric Castleman disease, and methotrexate-associated LPD.

### The Invisible Culprit: Demystifying Autoimmune Disorders of the Lungs

#### TEACHING POINTS

Autoimmune disorders affecting the lungs are a group of medical conditions characterized by the presence of autoantibodies that can cause damage to organs throughout the body. They include connective tissue diseases. CTD-ILD is defined as evidence of ILD demonstrated by CT (i.e., some combination of reticulation, ground-glass opacities, traction bronchiectasis, honeycombing, and/or cysts) in the setting of an established CTD. It includes RA, systemic sclerosis, SLE, primary Sjogren's syndrome, idiopathic inflammatory myositis, and mixed connective tissue disease. Diagnosis typically involves imaging studies such as high-resolution CT scans, lung biopsies and immunological investigations. Treatment options include corticosteroids, immunosuppressants, oxygen therapy and pulmonary rehabilitation. In severe cases, lung transplantation is considered as a last resort.

#### TABLE OF CONTENTS/OUTLINE

1. Antisynthase syndrome- inflammatory myositis, polyarthritis associated with ILD and anti-synthetase autoantibodies. 2. Microscopic polyangiitis- diffuse pulmonary alveolar hemorrhage is common feature. 3. RA-ILD is commonly associated with UIP. 4. SSc-ILD is commonly associated with NSIP. Risk factors- anti-topoisomerase Ab and higher skin score. 5. Sjogren's syndrome typically presents with NSIP, other patterns like UIP, LIP, focal lymphoid hyperplasia of the lung, small airways disease, and pulmonary vasculitis. 6. IIM-ILD is restricted to subsets of DM and PM. Usually manifests as NSIP with OP. Risk factors - anti-Jo1, anti-PL-7, anti-PL-12, and Black race. 7. Sarcoidosis -commonly affects the lungs and mediastinum with variable radiographic features depending on the stage of the disease.

### Pinpoint It - A Pictorial Essay on Causes of Acute Chest Pain on CT

#### Participants

Murilo Peixoto, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Acute localized chest pain is an important and frequent complaint in patients who seek the emergency medical care and can originate from many different compartments / tissues, namely the mediastinum (including cardiovascular structures), the lungs, the pleura, the chest wall, the spine or even the upper abdomen. Placing a skin marker at the topography of pain referred by the patient is an important step in facilitating the identification of a potential cause.

#### TABLE OF CONTENTS/OUTLINE

Numerous diseases may present as acute localized chest pain and chest computed tomography (CT) can be an important tool to detect the cause, including pulmonary infarction caused by acute thromboembolism, lobar pneumonia, pneumothorax, bone / cartilaginous fractures, acute cardiovascular pathologies, acute pericarditis, mediastinal fat necrosis, some upper abdominal pathologies, among other diseases. The placement of a skin marker in the vicinity of the potential finding, in the location pointed by the patient as painful, plays an important role in allowing for a more accurate search pattern by the radiologist. This exhibit aims to provide a pictorial essay on several findings that are consistent with the clinical presentation of acute localized chest pain as they appear on chest CT, with a special focus on cases in which the placement of a skin marker was particularly helpful.

CHEE-44

### Showcasing Signs Silhouettes: Assessment of Congenital Pediatric Cardiac Pathology on a Chest Radiograph

#### Participants

Janardhana Ponnatapura, MD, Winston Salem, NC (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Even with the availability of modalities such as echo, CT, and MRI; a plain chest radiograph remains as the first and most basic modality to investigate suspected congenital cardiac conditions in the pediatric population. A chest radiograph is convenient as it is an easily accessible, low-cost, and non-invasive diagnostic tool with minimal radiation dose, giving us an opportunity to move one step closer to a "green radiology." While evaluating the chest radiograph, it is vital to recognize that classic cardiac signs and silhouettes. Additional emphasis should be given to the pulmonary blood flow, ribs, and spine. Since a chest radiograph is the starting point for majority of patients with suspected congenital heart conditions - it is very imperative for the radiologists to quickly recognize these classic findings to provide an accurate diagnosis for proper patient management.

#### TABLE OF CONTENTS/OUTLINE

Introduction to normal pediatric cardiac silhouette  
Cyanotic Cardiac Heart disease:- Tetralogy of Fallot- Total Anomalous Pulmonary Venous Return (TAPVR)- Truncus Arteriosus- Transposition of Great Arteries- Tricuspid Atresia- Hypoplastic Left Heart Syndrome (HLHS)- Ebstein's Anomaly  
• Acyanotic Cardiac Heart disease:- Atrial Septal Defect (ASD)- Ventricular Septal Defect (VSD)- Patent Ductus Arteriosus (PDA)- Coarctation of the Aorta- Aortic Stenosis- Pulmonic Stenosis  
• Technical factors  
• Limitations of Chest x-ray. Tricks and tips to radiologist for interpreting CXR.

### Caution! Lung "Fields" Ahead: Thoracic Imaging in the Agricultural Setting

#### TEACHING POINTS

The agricultural sector employs 884 million workers, over a quarter of the global labor force, yet it remains one of the three most hazardous industries in the world. High morbidity and fatality rates are largely attributable to respiratory illnesses arising from unique exposures inherent in agricultural processes. Since the last comprehensive overview of radiological manifestations of agriculture-related diseases was published in 1991 by Gurney et. al, imaging technologies have modernized, allowing for more exquisite characterization of these lung disorders. Modern agricultural practices have brought about new illnesses and mechanisms of trauma, with unique radiological manifestations that have not been sufficiently characterized in the literature. In this exhibit, we provide an updated overview of the radiological manifestations of agriculture-related lung diseases and chest traumas to help with timely diagnosis and treatment for this vulnerable population.

#### TABLE OF CONTENTS/OUTLINE

Outline: I. Agricultural workers as a vulnerable population II. Radiological manifestations from exposures to microorganisms in agriculture a. *Coxiella burnetii* (Q Fever) b. *Nocardia nova* c. Blastomycosis d. Acute histoplasmosis e. Pulmonary echinococcosis (hydatid disease) III. Radiological findings from exposures to organic compounds a. Organic dust toxic syndrome b. Nonfibrotic hypersensitivity pneumonitis c. Fibrotic hypersensitivity pneumonitis d. Silo filler's disease IV. Agricultural related trauma a. Blunt chest trauma b. Foreign body aspiration c. Deep vascular injury V. The final harvest: take home learning points

Printed on: 04/12/24

CHEE-46

### Cardiovascular Imaging in Thoracic Neoplasms

#### Participants

Jordi Broncano, MD, Cordoba, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Recent advances in chest MRI have expanded its use in the evaluation of chest tumors, not only for tissue characterization but also for precise depiction of invasion of adjacent structures, tumor staging and treatment monitoring. Moreover, depiction of cardiac involvement, either directly or indirectly, has been associated to worse prognosis in oncologic patients. Teaching points: 1. To detail the basic and advanced CMR techniques that may be incorporated to conventional chest MR protocols, as well as its indications and potential pitfalls. 2. To review the direct and indirect mechanisms of cardiovascular involvement in patients with thoracic malignancies. 3. To identify how combined hybrid cardiothoracic imaging may be useful for treatment surveillance and monitoring.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction 2. CMR in cardio-oncology: The imaging protocol 2.1. Basic chest MR protocol (starting point) 2.2. Cardiac sequences for thoracic neoplasms evaluation - T1 black blood imaging (fat invasion) - DWI with EKG triggering - First pass perfusion - Cine SSFP - Parametric mapping (tumoral/tissue characterization) - MR angiography - 4D flow CMR (great vessels and cavitory hemodynamics) - PET/MR imaging 3. Cardiac involvement in Cardio-Oncology: Direct Mechanisms - Hematogeneous metastasis - Lymphoid metastasis - Direct involvement - Intravascular growth 4. Improving tumor staging with cardiac sequences - Cardiac/vascular/mediastinal invasion - Pleural invasion - Chest wall invasion 5. Indirect involvement of the heart in oncologic patients - Thoracic irradiation - Chemotherapeutic agents - Plasma cell dyscrasia (amyloid) 6. Use of CMR in treatment monitoring: Prognostic biomarkers 7. Take home points

CHEE-47

### Chest Computed Tomography Angiotomography with 3D Reconstructions for Preoperative Planning

#### Participants

Paula Terra Amaral, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The purpose of this exhibit is to:- Review the evolution of surgical technique for pulmonary resections - Highlight the benefits of Computed Angiotomography with 3D reconstructions in surgical planning - Understand the application of CTA planning prior to segmentectomy to evaluate bronchovascular relations, anatomical variations and lung volumetry- Correlate the radiological findings with intraoperative findings - Identify the role of 3D images in facilitating communication between radiologists and surgeons

#### TABLE OF CONTENTS/OUTLINE

Surgical planning using imaging methods has become increasingly relevant with the advancement of robotic thoracic surgery and sublobar resections for the treatment of lung neoplasms, which has driven the growth of 3D reconstructions. A pictorial essay based on cases from our collection allows for a comprehensive assessment and understanding of:- Historical evolution of pulmonary lobectomy and current main indications for sublobar resections.- Benefits of 3D surgical planning. - How we do our 3D reconstructions with explaining videos.- Application of 3D reconstructions in robotic surgery consoles.- Radiological findings of 3D reconstructions with surgically relevant anatomical variations and bronchovascular relationships- 3D reconstruction findings with nodule volumetric and density analysis, lung segments volumetry and intersegmental resection planes

### The Role of Imaging in Bronchoscopic Lung Volume Reduction Using Endobronchial Valves

#### Participants

Yogesh Gupta, DO, (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Provide a background on the various lung volume reduction techniques and their efficacy in the treatment of COPD with a focus on bronchoscopic lung volume reduction (BLVR) using endobronchial valves (EBV) 2. Discuss important imaging parameters in preprocedural assessment with attention to target lobe selection as well as exclusion criteria 3. Present expected postprocedural imaging findings as well as various postprocedural complications with imaging correlates

#### TABLE OF CONTENTS/OUTLINE

Of the various BLVR techniques, EBVs have the largest body of scientific data to support their safety and efficacy. Imaging plays a central role both prior to the procedure - in determining the presence of contraindications and selecting the target lobe using CT -- as well as after the procedure - in determining whether the procedure was effective and characterizing potential complications using radiography and/or CT. Outline• Overview of indications and types of lung volume reduction• Background on mechanism of action of valves, valve types, and location of valve deployment• Preprocedural role of CT in characterizing emphysema, determining exclusion criteria, and target lobe selection and role of perfusion scintigraphy in further selection• CXR and CT imaging of expected postprocedural findings (i.e. lobar collapse) and potential complications (ex: pneumothorax, infection, valve migration)• Discussion of future directions

### Differential Diagnosis of Multiple Subsolid Pulmonary Nodules

#### Participants

Murilo Peixoto, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- There are numerous etiologies to be considered in the differential diagnoses when faced with multiple subsolid nodules at high resolution computed tomography (HRCT).- Surveillance of these nodules should follow the recommendations of the Fleischner Society.- They can represent the initial manifestation of diseases that typically present with a different imaging pattern.- When discerning upon a possible infectious etiology, the status of the patient as immunocompetent or immunosuppressed is a key to the diagnosis.- There are specific imaging signs and/or association with other conditions that may help narrow the differentials.

#### TABLE OF CONTENTS/OUTLINE

A pattern of multiple subsolid nodules is a diagnostic challenge. There are a plethora of conditions that can present with such characteristics on imaging, even more so when one considers that other imaging patterns may present as multiple subsolid nodules in the initial stages. It is important to understand the possible diagnoses that can present with such a pattern, as well as the recommendations for surveillance and the association with other conditions that may help narrow down the differentials, even to a single entity. In this exhibit, in the format of a pictorial essay, the HRCT pattern of multiple subsolid nodules is revised, as well as the multiple etiologies, manifestations and associations pertinent to the matter.

### Keep an Eye on Diseased Lung: What to Look for in Native Lung After Unilateral Transplantation

#### TEACHING POINTS

\* One-lung transplantation is a practice aimed at improving the survival of patients with advanced stages of pulmonary disease; its most common indications include COPD, pulmonary fibrosis, and sarcoidosis (in North America). Its practice is becoming more frequent, which has led to knowing with greater certainty both the benefits and complications associated with it. However, complications that preferentially involve the native lung have received less attention.\* Radiologists should be familiar with the most frequent complications in the native lung as well as their chronology and the most frequent form of presentation in the different imaging methods (CT and X-ray).\* Make a quick review of the management and treatment of each of them.

#### TABLE OF CONTENTS/OUTLINE

Introduction, classification, and chronology  
Infections Incidence Pathophysiology RX and CT findings Treatment  
Pulmonary thromboembolism Incidence Pathophysiology RX and CT findings Treatment  
Tumor Incidence Pathophysiology RX and CT findings Treatment  
Hyperinflation Incidence Pathophysiology RX and CT findings Treatment  
Pneumothorax Incidence Pathophysiology RX and CT findings Treatment

### Unmasking the Silent Killer: Challenges in Lung Cancer Detection due to Underlying Disease, A Case Based Presentation

#### TEACHING POINTS

1. Lung cancer detection can be challenging when the patient has an underlying disease. This may lead to delays in diagnosing lung cancer, which can be associated with poorer outcomes. 2. Location, shape, border, and size of abnormalities, as well as any associated features should be carefully evaluated. Continuous follow-up and comparison of serial imaging are important. 3. We present lung cancer developed in a variety of underlying diseases/conditions, emphasizing teaching points to help to differentiate lung cancer from underlying lung findings. 4. A multidisciplinary approach involving radiologists, pulmonologists, thoracic surgeons, and oncologists is necessary to ensure an accurate diagnosis and appropriate management plan.

#### TABLE OF CONTENTS/OUTLINE

1. Post-treatment. A) Postsurgical. B) Post-radiation. 2. Infection/inflammation. A) Tree in bud nodularity. B) Pneumonia/consolidation. 3. Aspiration. 4. Atelectasis. A) Post obstructive. B) Dependent. C) Rounded. 5. Systemic Disease. A) Pre-existing cystic lesions. B) Underlying scarring/fibrosis. 6. Normal anatomic variants. A) Lung cancer developing within/near normal variant.

CHEE-55

### Chest X-ray and Mediastinal Abnormalities

#### Participants

Antonio Nunez Soto, MD, A Coruna, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Plain radiography is still today the most common image technique in our hospitals. It is accessible, inexpensive, painless and non-invasive, providing much information with a great cost-effectiveness ratio. With chest X-ray we can detect and analyze mediastinal pathologies, either suspected or incidental. Recognizing normal mediastinal anatomy and anatomic variants is essential for finding out pathology.

#### TABLE OF CONTENTS/OUTLINE

The aim of this poster is to describe the radiological analysis of chest radiography for detecting and diagnosing mediastinal abnormalities. For this purpose, we will show normal mediastinal anatomy and mediastinal lines in chest radiographs, as well as normal changes that we can see in supine X-rays with antero-posterior view instead of postero-anterior. We will explain the radiological signs and features that can help us identify mediastinal abnormalities, with the support of several cases of different pathologies (pneumomediastinum, mediastinal masses, vascular pathologies, diaphragmatic hernia...) from a third-level-hospital. For every case, we will provide the clinical information, the X-ray image, in which we will highlight the radiological signs implicated, and a correlation with other imaging techniques. In all cases, the chest X-rays were essential in the initial management of these patients. This presentation will be of interest for radiologists, resident doctors, medical students and other healthcare professionals. The combination of the theoretical semiology with our collection of cases will provide an easy and approachable way to review the most important mediastinal pathology.

### Pulmonary Edema: You Better Not Drown in the Basics

#### Participants

Gabriel Neumann Kuhn, MD, Morro Redondo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The purposes of this exhibit are: 1. To elucidate the classification of pulmonary edema according to its pathophysiological mechanisms: - Hydrostatic edema; - Permeability edema without diffuse alveolar damage; - Permeability edema with diffuse alveolar damage; - Mixed edema. 2. Review the use and peculiarities in the main imaging methods for the evaluation of pulmonary edema: - Chest X-ray; - Computed tomography (CT). 3. Highlight the current epidemiological trends and radiological findings associated with the main causes of pulmonary edema.

#### TABLE OF CONTENTS/OUTLINE

- Review of thoraco-pulmonary anatomy: - Cardiac silhouette; - Pulmonary interstitium; - Pulmonary vascular markings; - Costophrenic angles.
- Demonstration of the main radiological findings of pulmonary edema: - Alveolar edema; - Kerley B lines; - Opacities; - Consolidations; - Ground-glass opacities.
- Demonstration of common and uncommon conditions that cause pulmonary edema from our clinical case collection, such as: - Cardiogenic pulmonary edema (left heart failure, mitral regurgitation, etc.); - Postobstructive pulmonary edema; - Pulmonary edema in pulmonary thromboembolism; - Pulmonary edema in drug abuse; - Post-lung transplant pulmonary edema; - Re-expansion pulmonary edema; - Neurogenic pulmonary edema.

### Multifocal Cystic and Cavitory Lung Disease: From Thin to Thick

#### Participants

Paula Terra Amaral, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The purpose of this exhibit is to:- Review cystic and cavitory lung disease and a general approach to focal and multifocal/diffuse forms. - Highlight the evaluation of the wall of focal aerated lung lesions and comprehend the imaging findings in thin-walled, thick-walled cysts and cavitory lung lesions. - Correlate the radiological characteristics with the main differential diagnoses and signs of malignancy. - Identify the important imaging findings addressed in cystic lesions of the new Lung-RADS v.2022

#### TABLE OF CONTENTS/OUTLINE

Cysts and cavities are commonly encountered abnormalities on chest CT. Occasionally, the underlying nature of the lesions can be readily apparent as in bullae associated with emphysema. Other times, cystic and cavitory lung lesions can be a diagnostic challenge. A pictorial essay based on cases from our collection allows a comprehensive evaluation and understanding of:- General approach to focal and diffuse cystic and cavitory lung diseases. - Propose an algorithm to facilitate the evaluation of focal cystic lesions and cavities. - Evaluation and differential diagnosis of focal thin-walled cystic lesions. - Evaluation and differential diagnosis of focal pulmonary thick-walled cysts and cavitations. - Imaging findings of focal cystic lesions correlated with Lung-RADS v.2022

### Imaging of the Diaphragm: Anatomy and Disorders

#### Participants

Miriam Gallego Casals, MD, Sabadell, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The diaphragm is the physical barrier that separates the thorax from the abdomen and is the main muscle involved in ventilation. Its dysfunction can be a cause of dyspnea, and despite its importance, it is often underrated and incompletely evaluated by clinicians as well as by radiologists. We will briefly describe the anatomy of the diaphragm, and discuss its abnormalities through cases, classified as: - Dysfunction: paralysis, weakness or eventration and consequences of diaphragmatic inversion. - Hernias: congenital (Morgagni, Bochdalek) and acquired. - Rupture: traumatic and post-surgery. - Secondary: neoplastic and infectious involvement by contiguity from the abdominal cavity. - Miscellanea: Median arcuate ligament syndrome and increased uptake on PET/CT (respiratory effort, hiipo). Finally, we explain the main imaging techniques we have for both the functional and morphological study of the diaphragm, including chest radiographs, fluoroscopic tests, ultrasounds and CT.

#### TABLE OF CONTENTS/OUTLINE

- To describe the anatomy and physiology of the diaphragm. - To review the primary diaphragm disorders. - Learn the image techniques available for its study.

### Imaging Findings of Autoimmune Disorders: A Primer for Residents

#### Participants

Furkan Ufuk, MD, Denizli, Turkey (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- To provide an overview of autoimmune disorders, focusing on the most common conditions encountered in clinical practice. - To provide a primer on the imaging features of autoimmune disorders.

#### TABLE OF CONTENTS/OUTLINE

Autoimmune disorders are a diverse group of conditions in which the body's immune system attacks its own tissues, resulting in inflammation and damage. The spectrum of autoimmune disorders is broad, ranging from systemic diseases such as systemic lupus erythematosus and rheumatoid arthritis to organ-specific diseases such as autoimmune pancreatitis. Imaging plays a crucial role in the diagnosis and management of autoimmune disorders. This exhibit will provide a comprehensive overview of the imaging findings of autoimmune disorders and will highlight the importance of recognizing these findings in the diagnosis and management of these conditions. By the end of the exhibit, residents will have a better understanding of the role of radiologic imaging in the diagnosis and management of autoimmune disorders.

### Unmasking Septal Thickening: An Accessible Diagnostic Guide

#### Participants

Fernando Rodado Aranguren, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To differentiate the various patterns of septal thickening and their association with several interstitial lung diseases. To understand the pathophysiological basis of this finding. To provide a systematic and understandable guide to address the diagnostic dilemma.

#### TABLE OF CONTENTS/OUTLINE

Septal thickening of the lung can be the common radiological expression for many processes of different etiologies and variable severity, including pulmonary edema, lymphangitic tumor, sarcoidosis, asbestosis, amyloidosis or Erdheim-Chester disease among others. Due to the wide differential diagnosis that it poses, its presence is often perceived as confusing and challenging. To face this crossroads we must tackle it from its origin, so both the understanding of the underlying pathophysiological fundamentals and the recognition of ancillary imaging signs must be the objective of our study and the pillar for an adequate diagnostic approach. The goal of this work is to provide a tool that may help unmask the enigma: a systematic and understandable review of the different manifestations of septal thickening, focused on the underlying physiological background and exemplified with illustrative cases from our hospital.

### Take My Breath Away: MR Lungs from Maverick towards Mainstream, and Maybe Top Gun?

#### Participants

Nicholas Bontrager, (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

MRI for evaluation of the pulmonary parenchyma and vessels is a viable alternative to CT that eliminates patient exposure to ionizing radiation, and that can be performed using the magnet you have, sequences you already use, and table times under 20 minutes per complete exam. Pulmonary MRI and MRA have been shown to be effective for evaluation of cystic fibrosis, lung cancer screening, pulmonary nodule and mass evaluation, pulmonary embolism, and more. For lung cancer screening, pulmonary MRI has been found to have equivalent life expectancy with favorable cost-effectiveness and fewer false-positives when compared to low-dose CT. Restricted diffusion is likely more specific to lung cancer than FDG avidity on PET CT. MRA for PE has similar sensitivity, specificity and patient outcomes at 6 months, when compared to CTA.

#### TABLE OF CONTENTS/OUTLINE

- MR Sequence Protocol for Evaluation of Lung Parenchyma. - Cases: Primary Lung Cancer, Pulmonary Nodules, Metastases. - MRA Sequence Protocols for Pulmonary Embolism, with gadolinium-based contrast agent and with ferumoxytol (off-label). - More Cases: PE with GBCA MRA, PE in Pregnant Patient with ferumoxytol MRA, Incidental Findings. - Limitations of MR evaluation of the lungs and pulmonary vessels. - The future of MR evaluation of the lungs.

### A Case Based Review of Chest Wall Masses: Multimodality Imaging and Differential Diagnosis

#### Participants

Sehar Salman, MD, San Antonio, TX (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The goal of this presentation is to review clinical manifestations and radiologic findings of chest wall lesions. Many of these masses are discovered incidentally on routine chest imaging, and it is important for the interpreting radiologist to be able to recognize benign, indeterminate, and malignant features in order to guide management. In a series of cases, we will present different diagnoses of chest wall masses including both common and uncommon pathologies, to illustrate the spectrum of findings. After this presentation, learners should be familiar with chest wall anatomy, be able to describe imaging characteristics of lesions on multiple modalities, provide differential diagnoses, recognize indications for biopsy, and ultimately have a framework for approaching these masses.

#### TABLE OF CONTENTS/OUTLINE

Background - Chest wall anatomy on ultrasound, CT, and MRI - The spectrum of chest wall pathologies (benign, malignant)- fat, fluid, soft tissue, bone  
Cases: lipoma, hematoma, elastofibroma dorsi, neurofibroma, fibrous dysplasia, desmoid fibromatosis, myxofibrosarcoma, metastatic disease - For each case: Clinical scenarios, multimodality imaging findings, differential - Indeterminate and malignant cases: biopsy indications, biopsy results, pathologic correlation (when available)  
Summarize key features and classic differential diagnoses  
Radiologic and clinical management of chest wall masses

CHEE-64

### Respiratory Complications from Burns Injury: A Pictorial Review

#### TEACHING POINTS

- Acute complications are almost always associated with smoke inhalation injury.
- When acute lobar collapse cannot be explained by a malpositioned ETT, prompt bronchoscopy is required to assess for bronchial eschars or inspissated secretions from bronchorrhea.
- In the subacute phase, short interval changes in heart size, parenchymal opacities and pleural effusions favors cardiogenic edema.
- Expiratory CT is useful in assessing burns-induced chronic airways disease including tracheomalacia, bronchial webs and obliterative bronchiolitis.

#### TABLE OF CONTENTS/OUTLINE

As many as 91% of deaths in burn patients are a result of respiratory complications. Understanding the spectrum of respiratory complications, their onset and evolution of changes over time is important in early and accurate imaging interpretation. This pictorial review aims to educate and familiarize readers with common and uncommon burns-related complications that may be detected on chest imaging. As multiple disease processes have overlapping imaging appearances, we have classified complications temporally into acute, subacute and delayed phases, and spatially classified complications according to the anatomical structures affected. This structured approach to imaging interpretation serves to facilitate understanding and provide readers with a practical approach to imaging interpretation in burns patients.

### Consolidation of Post-Lung Transplant Complications, Throughout Post-operative Course

#### TEACHING POINTS

Lung transplantation is a life-saving procedure for end-stage lung diseases and has been shown to improve quality of life. Currently, the median post-lung transplant survival is roughly 6 years. However, it is associated with various complications that can significantly impact post-transplant outcomes. The purposes of this exhibit are to: (1) Recall the many pathologic complications that arise with Lung Transplantation, (2) Evaluate and identify the radiological features associated with Lung Transplant complications, (3) Review the role of imaging in the diagnosis and management of these complications.

#### TABLE OF CONTENTS/OUTLINE

Immediate and Early Postoperative Period (First 24 hours to First Week) Primary Graft Dysfunction Rejection Acute Rejection Hyperacute Rejection Pleural Complications Pleural Effusion Pleural Fistula Hemothorax Pneumothorax Intermediate Period (1 week to 4 months) Anastomotic (Airway) Dehiscence Stenosis Airway Stenosis Pulmonary Artery Stenosis Pulmonary Infections Candida CMV Aspergillus Late Periods (After 4 months) Pulmonary Infections Mycobacterial RSV Chronic Lung Allograft Dysfunction (CLAD) Post-Transplant Lymphoproliferative Disorder (PTLD)

CHEE-66

### Assessment of Both Fibrosis and Vascular Disease in Systemic Sclerosis: The Pivotal Role of the Radiologist and Future Perspectives

#### Participants

Carlotta Zilioli, MD, Parma, Italy (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- To be informed of the fundamental pathogenic pathways of systemic sclerosis (SSc).- To be aware that, among the autoimmune rheumatic disease, SSc has the highest mortality due to lung complications, which mainly are fibrosis and pulmonary hypertension (PH).- To illustrate the radiological spectrum of thoracic manifestations in SSc.- To be informed about the recent advances in the imaging techniques, with specific attention to quantitative analysis, to early diagnose and monitor disease activity.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction:- Overview of underlying pathophysiology of SSc: endothelial and fibroblast dysfunction, leading to fibrosis.- Description of pulmonary manifestations of SSc, focusing on the leading cause of death: interstitial lung disease (ILD) and pulmonary hypertension (PH). 2. The use of high-resolution CT in the diagnosis of progressive SSc, particularly to early stages of ILD:- NSIP as the main histologic pattern: key finding - Other HRCT findings: pleural and pericardial, esophageal dilatation. 3. Description of the hallmark of PH:- Key findings on HRCT - Role of dual-energy CT angiography. 4. The emerging use of automated software to perform quantitative analyses on in SSc, correlating quantitative vessel parameters with ILD features.

### A Step-by-Step Approach to Pulmonary Fibrosis: What the General Radiologist Should Know

#### Participants

Ana Berasategui Criado, MD, Santander, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Expose the imaging modalities used in interstitial lung disease assessment. Provide a stepwise approach to identify the features of fibrotic lung disease and categorize the pattern of fibrosis. Review the radiological features of idiopathic pulmonary fibrosis (IPF) and the principal differential diagnoses, focusing on their distinctive features based on high-resolution computed tomography (HRCT).

#### TABLE OF CONTENTS/OUTLINE

Diffuse interstitial lung disease encompasses a heterogeneous group of processes characterized by a concrete pulmonary response to damage affecting the pulmonary interstitium and the secondary pulmonary lobule. IPF is a progressive chronic interstitial fibrotic lung disease of unknown etiology characterized by nonspecific clinical manifestations, a restrictive pattern in pulmonary function tests, and a poor prognosis. The morphologic hallmark in imaging and histopathology of IPF is the UIP pattern, characterized by subpleural reticulation, traction bronchiectasis, and honeycombing with an apex-to-basal gradient. However, it may also be present in several conditions, including asbestosis, chronic hypersensitivity pneumonitis, or connective tissue diseases. Definitive diagnosis requires clinical-radiological-pathological consistency, with imaging playing a pivotal role. An accurate classification based on the CT pattern enables early detection of fibrosis, distinguishing the UIP pattern from those that suggest an alternative diagnosis, determining the need for biopsy, and guiding subsequent treatment. We collected representative cases of pulmonary fibrosis from our institution to highlight the hallmark imaging findings that leads to accurate diagnosis.

### Through the Eye of the Needle: An Evidence-based Approach to the Benefits, Risks, and Controversies of CT-Guided Lung Biopsy

#### Participants

Shravan Sridhar, MD, MS, San Francisco, CA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

CT-guided lung biopsy is a vital tool in the diagnostic armamentarium of physicians involved in the workup of pulmonary lesions in a variety of clinical settings. Having a clear understanding of the benefits, yield, and risks of CT-guided lung biopsy is important in optimizing utility of this diagnostic test and minimizing adverse outcomes. We present current evidence in the literature as it relates to benefits/yield, risks and risk reduction, and controversies in lung biopsy.

#### TABLE OF CONTENTS/OUTLINE

1. Title and disclosures  
2. Abbreviations  
3. Table of contents  
4. Overview  
5. Indications  
a. List of indications  
b. Pre-test probability  
c. Negative predictive value  
d. Diagnostic accuracy  
6. Risk/reduction  
a. Pneumothorax  
b. Hemorrhage  
c. Air embolism  
7. Controversies  
a. Role of CT vs bronchoscopic biopsy  
b. Appropriate needle size  
c. FNA vs core needle biopsy  
d. Biopsy of subsolid nodule  
e. Biopsy of suspected infection  
f. Biopsy of cavitary nodule  
g. Repeat biopsy after non-diagnostic result  
h. Biopsy in setting of pulmonary hypertension  
i. Biopsy in setting of fibrotic ILD  
j. Tumor seeding  
k. Techniques to avoid complications  
i. Utility of blood patch/plug  
ii. Rapid rollover  
iii. Intrapulmonary length

### To Protect and to Serve: Imaging Review of the Sternum for the Thoracic Radiologist

#### Participants

Michelle Bondero, MD, MSc, Los Angeles, CA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The sternum "protects" the vital cardiovascular organs, "serves" as a mirror to reflect diffuse bone disorders, and may uncommonly be affected by isolated lesions. These conditions may present as non-specific chest pain, which is a common patient presentation in clinical practice. Furthermore, given its central location, the sternum is included on nearly all thoracic imaging, be that a radiograph, CT, or MR. Due to thoracic radiologists' predominant reliance on axial images and focus on the inner organs, it may be neglected in a speedy review and important diagnostic information may be missed. The goal is to (1) explain the anatomy and development of the sternum; (2) describe dedicated imaging approaches; as well as (3) define and depict the major disease processes that can be diagnosed on radiological imaging, as outlined below. In addition to the rich imaging illustration, multiple less common but important diseases will be included with corresponding clinical and surgico-pathologic correlation, when available. Board-exam questions will also be provided to emphasize key principles.

#### TABLE OF CONTENTS/OUTLINE

1. Anatomy (bony components, articulations). 2. Imaging (XR, CT, MR, US and NM). 3. Cases: a. Congenital: variants and anomalies; b. Traumatic (fractures); c. Infectious (osteomyelitis); d. Neoplastic (primary and mets); e. Metabolic (Paget's disease, renal osteodystrophy, sickle cell disease, osteopetrosis). 4. Peri-sternal joint disease (osteoarthritis, septic arthritis, inflammatory arthritides, SAPHO). 5. Pre- and post-surgical (sternotomy, expected findings, complications, sternal measurements prior to cardiac surgery). 6. Post-radiation. 7. Artifacts.

### Dual Energy Chest Radiography in Oncological Practice

#### Participants

Ioannis Vlahos, MBBS, FRCR, Houston, TX (*Presenter*) Director, Grayscale Ltd; Co-owner, Grayscale Ltd;

#### TEACHING POINTS

Based on CXR implementation in a tertiary cancer center: CXR dual energy principles and techniques  
Practical implementation for improved detection and accuracy, characterization, increased confidence, problem solving on chest radiographs  
Advantages, disadvantages and limitations

#### TABLE OF CONTENTS/OUTLINE

CXR Dual Energy Techniques (single exposure (SE), dual exposure (DE), weighted subtraction), new AI single exposure techniques  
Soft tissue and bone-selective images  
Advantages and disadvantages of SE DE (associated artifact recognition), dosimetry  
Improved lesion detection, confidence, additional lesions, growth determination  
Lesion characterization (soft tissue, calcification)  
Calcified lesions (mediastinum, lung, pleura)  
Bone metastases and other osseous conditions (pathological fractures, periosteal reactions, lytic lesions)  
Specific areas: Evaluation of the apices, cardiomeastinum, drug induced lung disease, postoperative pneumothorax  
Complex evaluation: impact on accuracy, distracting pathology, missed findings, interpretation time

CHEE-71

### Avoiding Tunnel Vision: Looking Beyond Anatomic Specialization Boundaries

#### Participants

Elizabeth Lee, MD, Ann Arbor, MI (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. While radiological sub specialization is advantageous and has firmly integrated radiologists in multidisciplinary teams, there is a potential for missed diagnoses when various anatomic regions of a cross-sectional study are interpreted separately by specialists. This is particularly relevant for junctional regions (such as diaphragm when chest and abdomen imaging are interpreted by chest and body radiologists).2. Variations in scan factors and contrast timing (for instance chest and abdominal imaging may be obtained at different phases of enhancement) can facilitate diagnosis.3. Even if studies are separately interpreted and dictated, it is important for specialists to avoid tunnel vision and check pertinent information.

#### TABLE OF CONTENTS/OUTLINE

1. No man's zone: Junctional zones between two anatomical regions can be a cause of missed opportunities. For instance, lower ribs may only be partly included in chest CT and may be overlooked on an abdominal scan.2. Integration of imaging findings from various anatomic regions can provide a unifying diagnosis: Several diseases are multisystem pathologies, and the diagnostic process is facilitated by knowledge of involvement of other anatomic regions. Examples include neurofibromatosis, Birt-Hogg-Dube syndrome, embolized fragment of a device, etc.3. Differences in phase of enhancement: This can help in localizing as well as accurately characterizing an abnormality that is better seen on a specific phase of enhancement.4. Differences in patient positioning Arms up and arms down position for two different scans can uncover an unsuspected thoracic outlet syndrome.5. Correlating with all available imaging modalities

### Noninfectious Pulmonary Complications Following Hematopoietic Stem Cell Transplant

#### Participants

Elizabeth Lee, MD, Ann Arbor, MI (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. There is an increase in the indications for, the potential recipient age and sources from which hematopoietic stem cell transplantation (HSCT) can be performed, with increasing numbers of the procedure performed yearly across the globe. 2. Up to one third of patients undergoing HSCT develop pulmonary complications with the rates of infectious pulmonary complications decreasing due to improvements in prophylaxis and treatment. 3. The rate of noninfectious complications has risen and now is a more common cause of death than those from infection. 4. There are a variety of noninfectious pulmonary complications which can be seen after HSCT including idiopathic pneumonia syndrome, bronchiolitis obliterans syndrome, thoracic air leak syndrome, venous thromboembolism, and pulmonary hypertension. 5. Idiopathic pneumonia syndrome has a varied presentations depending on the site of primary tissue injury which results in a varied imaging appearance such as diffuse alveolar hemorrhage or peri-engraftment respiratory distress syndrome.

#### TABLE OF CONTENTS/OUTLINE

1. General review of hematopoietic stem cell transplantation 2. Idiopathic Pneumonia Syndrome (Acute interstitial pneumonitis, Acute respiratory distress syndrome, Delayed pulmonary toxicity syndrome, Peri-engraftment respiratory distress syndrome, Diffuse alveolar hemorrhage) 3. Bronchiolitis obliterans syndrome 4. Interstitial lung disease 5. Pleural effusions 6. Thoracic air leak syndrome 7. Venous thromboembolism 8. Pulmonary hypertension 9. Post-transplant lymphoproliferative disorder

### Bad to the Bone: Differentiating Pulmonary Ossification from Calcification on CT

#### Participants

Kendrah Osei, MD, Baltimore, MD (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. The pathogenesis of pulmonary ossification and calcification is incompletely understood. 2. Pulmonary calcification and ossification can occur in both pulmonary and non-pulmonary conditions, including benign, malignant, inflammatory, infectious, and metabolic etiologies. 3. High-resolution CT imaging is important to differentiate conditions that cause dendriform pulmonary ossification and those that do not. 4. Multi-society consensus guidelines now include pulmonary ossification among high-confidence CT features of usual interstitial pneumonitis (UIP) pattern of idiopathic pulmonary fibrosis.

#### TABLE OF CONTENTS/OUTLINE

1. Definitions of pulmonary calcification, pulmonary ossification, and dendriform pulmonary ossification. 2. Pathogenesis of pulmonary calcification and ossification. 3. Causes of pulmonary calcification and ossification. 4. Imaging patterns of pulmonary calcification and ossification. 5. Dendriform pulmonary ossification as a diagnostic imaging feature of idiopathic pulmonary fibrosis. 6. Clinical impact of recognizing dendriform pulmonary ossification. 7. References.

CHEE-74

### Thoracic Complications of Sickle Cell Disease

#### Participants

Malcolm Davidson, Mississauga, ON (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1 Acute chest syndrome is a leading cause of morbidity and mortality, and is characterized by the development of a new lung opacity along with fever and/or respiratory symptoms. The most common causes include infection, fat embolism, and infarction.<sup>2</sup> Sickle cell patients are functionally asplenic and immune compromised, making them vulnerable to pneumonia and other infections from encapsulated and atypical bacteria - a leading cause of mortality in this population.<sup>3</sup> Repeated pulmonary insults in sickle cell patients can lead to chronic pulmonary findings, such as pulmonary fibrosis.<sup>4</sup> Pulmonary embolism is more common in patients with sickle cell disease and can contribute to pulmonary hypertension (PH). PH is present in approximately 10% of sickle cell patients, and is often multifactorial in etiology (WHO group 5). Pulmonary artery dilation is associated with worse outcomes in those presenting with acute chest syndrome.<sup>5</sup> Bone complications in sickle cell disease can present similarly to acute chest syndrome. Patients in this population are at higher risk for osteomyelitis, and osteomyelitis should be considered if bone pain is atypical or if there are other supporting signs, symptoms, or imaging features.

#### TABLE OF CONTENTS/OUTLINE

1. Sickle Cell Pathophysiology  
2. Acute Complications - Vaso-occlusive events, acute chest syndrome, infection  
3. Chronic Complications - Lung fibrosis, cardiomyopathy, pulmonary hypertension, bone infarction

### Embracing Automation: Designing and Implementing a Robust Continuous Monitoring System for AI-Powered Radiology Applications

#### Participants

Vasanth Venugopal, MD, New Delhi, India (*Presenter*) Officer, CARPL.AI Inc

#### TEACHING POINTS

1. Continuous monitoring is vital for AI-driven radiology platform performance and reliability. 2. Identify KPIs and benchmarks to measure AI application metrics, such as accuracy, sensitivity, and specificity in radiology. 3. Implement automated QA/QC mechanisms, like image quality checks and data validation, ensuring consistent, complete input data following standard protocols. 4. Use advanced monitoring techniques, like measuring model divergence, to detect and address model drift caused by input data changes or other factors.

#### TABLE OF CONTENTS/OUTLINE

I. Key Performance Indicators (KPIs) and Benchmarks A. Identifying relevant clinical and non-clinical KPIs B. Establishing performance benchmarks for AI applications  
II. Automated Quality Assurance and Quality Control A. Automated QA/QC mechanisms for image quality and artifacts B. Data validation techniques for ensuring input data integrity  
III. Performance Monitoring and Anomaly Detection A. Real-time monitoring of KPIs and other relevant metrics B. Anomaly detection algorithms for identifying unusual patterns or behaviors  
IV. Advanced Monitoring Techniques A. Measuring divergence between multiple models B. Benefits and challenges of using advanced monitoring techniques  
V. Continuous Improvement A. Iterative model development, performance evaluation, and updating B. Real-world performance data Collection  
VI. Regulatory Compliance and Periodic Reviews A. Ensuring monitoring system adherence to regulatory requirements B. Conducting periodic audits and reviews

### Manifestations of Sickle Cell Disease on Thoracic Imaging

#### TEACHING POINTS

- Sickle cell disease (SCD) is a systemic disease that has a wide spectrum of pulmonary, soft tissue, skeletal, and upper abdominal findings that can be seen on thoracic imaging.- There is commonly an overlap between findings of the milder pneumonia and the more clinically severe acute chest syndrome. However, knowledge of some findings can favor one diagnosis over the other.- Over time, SCD can result in chronic changes to the lung parenchyma.

#### TABLE OF CONTENTS/OUTLINE

1. Introductiona. Backgroundb. Epidemiology, genetics, and pathogenesis of sickle cell disease2. Acute manifestationsa. Spectrum of acute chest syndrome and pneumonia• Findings on chest radiograph and CT that could aid in the diagnosis• Etiologies of pneumonia (e.g, streptococcus pneumoniae, Hemophilus influenzae, etc.)b. Pulmonary edemac. Pulmonary thromboembolism3. Chronic manifestationsa. Cardiomegalyb. Pulmonary hypertensionc. Pulmonary fibrosis, cysts, and mosaic attenuation4. Other manifestations seen on thoracic imaginga. Skeletal and soft tissue manifestations (avascular necrosis of humeral heads, extramedullary hematopoiesis, "H-shape" vertebrae, osteomyelitis)b. Upper abdominal manifestations (Splenic auto-infarction, cirrhosis, iron deposition)5. Prognosis and treatment6. Conclusion

### Post-treatment Thoracic Changes in Breast Cancer Patients

#### Participants

Eloy Naranjo Moreno, MD, Mataro, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The goal of this exhibit is to provide an interactive and visual review of thoracic changes (surgical and after hormonal/chemotherapeutic treatments) that we can find in breast cancer patients who have undergone treatment or who are currently doing it. Nowadays, thanks to screening programs, breast cancer is a common pathology detected and treated precociously in many cases. This exhibit aims to present an illustrative compilation of thoracic and pulmonary changes in breast cancer treated patients; providing an algorithmic approach of these radiologic changes based on progression time and location in the lung; reviewing the most meaningful findings to allow radiologists to differentiate them from the general thoracic pathology. Post-treatment radiologic computed tomography (CT) changes in breast cancer include post-surgical changes (like removal and reconstruction of the affected breast), changes after and during hormonal/chemotherapy (appearance of interstitial pathology and other common signs in the lung) and post-radiotherapy changes (identifying irradiation regions and their findings correlation over time) that can be effectively identified through chest CT.

#### TABLE OF CONTENTS/OUTLINE

Introduction and purpose / Background / Image findings: Post-surgical changes, changes after and during hormonal/chemotherapy and post-radiotherapy changes / Conclusion.

### Don't Forget to Check the Sternum After Thoracic Surgery: Expected Postsurgical Changes and Complications of Sternotomy and Sternal Wound Repair

#### Participants

Zehavit Kirshenboim, MD, Ramat Gan, Israel (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Various chest wall surgical methods are being used for the sternotomy for thoracic surgery. 2. Identification of complications can be difficult due to a nonspecific clinical presentation which frequently overlaps with normal postsurgical changes. 3. Knowledge of expected postsurgical sternotomy imaging appearance is crucial to avoid misinterpretation and detect complications in a timely manner.

#### TABLE OF CONTENTS/OUTLINE

1. Various sternotomy techniques, surgical methods for sternotomy wound repair and complications will be illustrated. A. Surgical techniques 1. Longitudinal vs. transverse 2. Sternal wiring vs. rigid sternal fixation 3. Debridement and sternal flap closure B. Complications 1. Pre-sternal complication - cellulitis, sinus tract 2. Sternal complication - nonunion, dehiscence, osteomyelitis, wire fracture and migration 3. Post sternal complication - mediastinitis, retrosternal abscess, empyema, retrosternal hematoma, sternal adhesion 4. Flap complication - bowel herniation, flap failure C. How to differentiate expected postsurgical appearances vs. complications 2. Strategies to detect complications, differential diagnosis - sternal metastasis, infected epicardial lead 3. Clinical implications and treatment of complications

### Into the Airway: Focal Tumors and Non-neoplastic Disorders (Detected by CT) Arising from the Bronchi

#### Participants

Uxue Martinez Urabayen, MD, Bilbao, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To review the multiple focal lesions that can originate in the airway, including the non-neoplastic lesions and the benign and malignant tumours. To describe and illustrate the main characteristics signs and imagine findings that may improve detection of the lesions, improving the management of this patients.

#### TABLE OF CONTENTS/OUTLINE

**METHODS OR BACKGROUND** Neoplastic and non-neoplastic lesions of the airway track are rare. The majority are malignant. The diagnosis tends to be delayed due to the few and nonspecific symptoms. Chest radiographs are rarely diagnostic. **RESULTS OR FINDINGS** At CT benign and malignant tumours may have nonspecific characteristics, presenting as polypoid lesions or focal sessile lesions that narrow the airway lumen. Even non-neoplastic disorders may be identical. Mucus plugs have internal gas. Blood is indistinguishable from other endobronchial material. Broncholiths present calcification. Foreign bodies depend on the component of which they are made of. Lipomas have internal fat and hamartomas are characterized by "popcorn" calcifications. Leiomyomas and papillomas look very much alike. Squamous cell carcinoma is the most common subtype of lung cancer that affects the central airway system. Carcinoid tumours tend to have intense enhancement at contrast material-enhanced CT and may present calcifications. Metastasis due to hematogenous invasion are usually multifocal. **CONCLUSION** The airway must be carefully evaluated on CT examinations to appreciate the slight differences in morphology of the lesions occupying the lumen. Knowing the Morphological characteristic and location of these lesions can help reduce the broad spectrum of differential diagnosis.

### Functional Lung MRI: How to Obtain Ventilation-Weighted Images from UTE MRI.

#### Participants

Julius Heidenreich, MD, Wurzburg, Germany (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. The reader should learn about the prerequisites that are necessary for functional lung imaging (technical requirements, sequences, data types).2. The reader should understand that the basic post processing steps comprise (1: labelling of lung parenchyma; 2: image co-registration; 3: voxel-wise calculation of fractional ventilation.3. The reader should learn to interpret ventilation imaging and be able to distinguish ventilation maps from healthy subjects and patients with cystic fibrosis.4. The reader should know about pitfalls and limitations of UTE ventilation imaging and know about the alternative techniques.5. The exhibit should highlight the potential benefit of ventilation imaging. The reader should be able to understand its significance and the recent areas of application.

#### TABLE OF CONTENTS/OUTLINE

A. Introduction, Background and Purpose: Why is ventilation imaging relevant? B. Technical requirements: What images have to be acquired? C. Post-processing: What are the basic steps of data processing? D. Data analysis and calculation of fractional ventilation and lung function parameters. E. Image analysis: Healthy subjects vs. patients. What is the difference? F. Pitfalls and limitations. What are the alternatives?

### No Small Matter: Thoracic Manifestations of Small Vessel Vasculitis

#### Participants

Sofia Gambetta I, MD, MD, Buenos Aires, Argentina (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

We will review epidemiology, clinical features and imaging manifestations of ANCA associated small vessel vasculitis in the thorax. Teaching points: 1. Granulomatosis with polyangiitis presents with diverse pulmonary and airway involvement: tracheobronchial wall thickening/stenosis, lung nodules and masses that cavitate or present with ground glass halo, bronchovascular thickening or alveolar hemorrhage. 2. Microscopic polyangiitis can be divided into two groups: alveolar hemorrhage and interstitial lung disease. a. 4 to 36% of patients with interstitial pneumonia at presentation have MPO-ANCA antibodies. b. Up to 10% of patients with IPF seroconvert to MPO-ANCA. c. UIP and probable UIP are the most common patterns of MPO-ANCA ILD. 3. EGPA patients can be ANCA negative (eosinophilic manifestations) or ANCA positive (vasculitis features). a. Cardiac manifestations are more common than in other ANCA vasculitis and indicator of poor prognosis. b. Pulmonary manifestations include migratory/peripheral consolidations, GGOs and centrilobular nodules.

#### TABLE OF CONTENTS/OUTLINE

1. Overview of small vessel vasculitis. a. Etiology and Pathogenesis. b. Epidemiology. c. Serological findings 2. GPA a. Clinical manifestations. b. Airway involvement. c. Pulmonary manifestations. d. Cardiac involvement 3. MPA. a. Clinical manifestations. b. Pulmonary manifestations. i. MPO-ANCA associated ILD ii. Alveolar hemorrhage and hemosiderosis 4. EGPA. a. Clinical manifestations. i. ANCA positive EGPA ii. ANCA negative EGPA. b. Pulmonary manifestations c. Cardiac manifestations. i. Myocarditis ii. Endocardial fibrosis iii. Pericarditis 5. Differential diagnosis

### **Recognizing Local Recurrence After Stereotactic Body Radiotherapy in the Lung: Imaging Appearances and Pitfalls. A Picture Essay with Diagnostic Algorithm.**

#### **TEACHING POINTS**

This exhibit focuses on the imaging features and differentiation of local recurrence from normal inflammatory process after stereotactic body radiotherapy (SBRT) in the lung, and provides a diagnostic algorithm to aid in accurate diagnosis.

#### **TABLE OF CONTENTS/OUTLINE**

1. Overview of SBRT as a treatment modality for primary lung cancer and lung metastases, including risk factors of local recurrence.
2. Practical tips for interpreting post-SBRT studies, including the need to evaluate all examinations in three dimensions and to understand the dynamics of the entire process from early inflammation to residual scar tissue.
3. Factors contributing to a large inflammatory reaction post-SBRT, including the target size, radiation dose, absence of emphysema or presence of interstitial lung disease, target location near large bronchi, and use of immunotherapy.
4. Factors contributing to a small inflammatory reaction, such as small target size, peripheral tumor location, or the presence of emphysema.
5. Key steps and features of the normal post-SBRT inflammatory-fibrotic process, including discrete diffuse signs of inflammation, formation of a fibrotic circle, gradual consolidation, and the formation of a flat scar.
6. Features suggestive of local progression, including new nodular or lobular lesions with local increase in size (especially in cranio-caudal dimension), and a typical malignant contrast-enhancing pattern.
7. Algorithm for investigating suspected local recurrence post-SBRT, including consideration of a PET/CT, and biopsy.

### Dis-Discombobulating" the Current State of Interstitial Lung Disease Imaging

#### Participants

Jonathan Chung, MD, Chicago, IL (*Presenter*) Speaker, Veracyte, Inc;Consultant, Veracyte, Inc;Consultant, Boehringer Ingelheim GmbH;Speaker, Boehringer Ingelheim GmbH;Consultant, F. Hoffmann-La Roche Ltd;Speaker, F. Hoffmann-La Roche Ltd

#### TEACHING POINTS

- A systemic approach is paramount when diagnostic ILD on chest CT.
- To aid diagnosis, radiologists should familiarize themselves with current imaging guidelines and new and emerging concepts.
- Progressive pulmonary fibrosis (PPF) refers to ILDs other than idiopathic pulmonary fibrosis (IPF) with evidence of clinical, functional and/or radiologic progression over a one-year period.
- In patients with interstitial lung abnormality (ILA), clinical correlation and imaging follow-up should be considered, particularly when high-risk features for progression are present.
- Quantitative tools are valuable in the assessment of the extent and longitudinal progression of ILD.

#### TABLE OF CONTENTS/OUTLINE

- Practical approach to ILD on chest CT
- Updated approach to Hypersensitivity Pneumonitis (HP)
- Definition and current concepts of Progressive Pulmonary Fibrosis
- Definition and current concepts of Interstitial Lung Abnormality
- Current state of quantitative analysis and AI in ILD

CHEE-85

### Unusual Radiological Manifestation of Adenocarcinoma of the Lung

#### TEACHING POINTS

Primary adenocarcinoma of the lung is a heterogeneous disease, varying in molecular, pathological and clinical features. Radiological features can vary from the 'typical' appearances - usually ground-glass (GGN), part-solid (PSNs) or solid nodules, or with consolidation. Awareness of atypical appearances of adenocarcinoma may result in earlier investigation and timely management.

#### TABLE OF CONTENTS/OUTLINE

Lung cancer remains the most common cause of cancer deaths worldwide and adenocarcinoma is the most common histologic subtype, responsible for just under half of all cases.. The majority of tumours manifest radiologically with GGNs, PSNs, solid nodules or consolidation. In this review, we document our experience of atypical radiological presentations of adenocarcinoma spectrum disease, subsequently confirmed on histopathological analysis, at two tertiary centres. We include cases of adenocarcinoma presenting as a single, solid, calcified mass, as multiple micro- and macro-nodules and as widespread cystic airspaces. We describe cases presenting with unusual patterns of metastatic disease. We describe cases of atypical volume doubling times.

### Pulmonary Hypertension: CT Signs That Point the Way

#### Participants

Camilo Mieres, MD, Barcelona, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

CT signs suggestive of pulmonary hypertension (PH) What to include in CT reports in the workup for PH Findings in entities associated with PH

#### TABLE OF CONTENTS/OUTLINE

I. Background: -Pulmonary artery diameter can suggest PH, but the threshold differs with the clinical context. -CT findings can provide clues about the underlying cause of PH. II. Content: 1. Different pulmonary diameters should be considered in patients with low, intermediate, or high risk of PH. 2. Findings to analyze in the study of PH: Cardiac vascular anomalies (can be missed on echocardiography): -Intracardiac shunts (atrial septal defect (ASD), especially sinus venosus ASD) -Anomalous pulmonary venous return (often with ASD) -Patent ductus arteriosus Signs of obstruction of the pulmonary arteries (filling defects/vascular tree-in-bud, hypertrophied systemic arteries) -Chronic pulmonary embolism -Pulmonary tumor thrombotic microangiopathy -Exipient lung disease Signs of right ventricular repercussion. Lung anomalies (fibrosis, cysts, centrilobular nodules) -Interstitial lung disease (combined pulmonary fibrosis/emphysema, Langerhans cell histiocytosis, connective tissue disease) -Pulmonary veno-occlusive disease III. Conclusions: -CT can alert to the possibility of PH and can provide valuable clues about its etiology.

### Developmental Disorders of Lung: A Pictorial Review

#### Participants

Shambo Guha Roy, MBBS, MD, Darby, PA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Mounier Kuhn syndrome affects trachea and up to 4th order bronchial tree, whereas William Campbell syndrome causes dilatation distal to 4th order bronchi. 2. Congenital pulmonary airway malformation (CPAM) has 5 subtypes: Type 1 being commonest with one or more dominant large cysts. Cyst size gets smaller in type 2 and 3. Type 4 is indistinguishable from type 1 radiologically. 3. Sequestration happens in two forms: intra lobar and extra lobar depending upon its venous drainage. Extra lobar sequestration is often associated with CPAM, called the 'hybrid lesions'. 4. Pulmonary veno-lobar syndrome or Scimitar syndrome accounts for minority of partial anomalous pulmonary venous return (PAPVR). Treatment depends upon the left to right shunt, which can be quantified using phase contrast MRI.

#### TABLE OF CONTENTS/OUTLINE

1. Normal development of the lungs. 2. Classification of developmental disorders. 3. Airway disorders: Tracheal and bronchial agenesis, Tracheobronchial branching anomaly, tracheobronchomegaly (Mounier Kuhn syndrome), bronchogenic cyst, congenital pulmonary airway malformation, bronchopulmonary sequestration. 4. Parenchymal disorders: Congenital lobar emphysema, Pulmonary hypoplasia, Pulmonary cystic mesenchymal hamartoma. 5. Vascular disorders: Pulmonary sling, absence of unilateral pulmonary artery, pulmonary veno-lobar syndrome.

### Diffuse Pulmonary Hemorrhage: A Diagnostic Challenge

#### Participants

Camilo Mieres, MD, Barcelona, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

-Review the causes, pathophysiology, and radiological signs of diffuse pulmonary hemorrhage (DPH).-Underline the importance of correlating the imaging findings with clinical and laboratory findings.

#### TABLE OF CONTENTS/OUTLINE

I.- BackgroundDPH is rare. It can occur in many diseases with histologic findings ranging from normal vessels (bland hemorrhage) to capillaritis.Clinical and radiological findings are nonspecific, determining the etiology is challenging. II.- ContentThrough a series of cases, we show how the causes of DPH relate with the histologic patterns.Pulmonary capillaritis: neutrophilic infiltration of the alveolar septa, loss of capillary integrity -Small-vessel vasculitis/Anti-GBM (Goodpasture)-Rheumatic diseases (Lupus)-DrugsBland pulmonary hemorrhage: alveolar hemorrhage without destruction or inflammation of alveolar spaces-Anticoagulants, bleeding disorders-Heart failure (HF), mitral stenosis-Idiopathic pulmonary hemosiderosisDiffuse alveolar damage: alveolar edema and hyaline membranes-Infection-Drugs-Rheumatic diseases (Lupus)III.-ConclusionsRadiologic findings of DPH are nonspecific and must be interpreted together with clinical and laboratory data.

### Chest CT Imaging in the Era of Lung-sparing Thoracic Resection

#### Participants

Farah Tamizuddin, MD, New York, NY (*Presenter*) Nothing to Disclose

Jane P. Ko, MD, New York, NY (*Presenter*) Research collaboration, Siemens AG

#### TEACHING POINTS

Chest computed tomography (CT) has a major role in planning and follow up after lung resection. Segmentectomy and sleeve resection techniques entailing anatomical lung segmental dissection are now a major method for curative surgery of early-stage lung cancer while preserving lung function. Accurate localization of pathology is essential, with clear definition of bronchial and vascular anatomy. More recently, minimally invasive approaches such as the robotic-assisted thoracoscopic surgery (RATs) and video assisted thoracoscopic surgery (VATS) techniques are options. Therefore, the objectives are: a) To review thoracic lung-resection approaches including RATs and VATs for sublobar resection and sleeve resection, b) bronchial anatomy and imaging for lesion localization, b) to discuss essential imaging findings to communicate that impact operative approach, including variant anatomy and c) to review expected postoperative imaging findings and complications.

#### TABLE OF CONTENTS/OUTLINE

1. Review of lung resection approaches: a) Sublobar, sleeve, and lobe resections b) RATs, VATS, open techniques, and advanced nodule localization methods 2. CT performance and essential preoperative anatomy evaluation: intersegmental plane identification: segmental bronchial anatomy, pulmonary arteries, pulmonary veins 3. Essential imaging findings: airway variants and challenges, 3D techniques 4. Post-operative imaging challenges: granulomas, airway distortion

Printed on: 04/12/24

### Snaking the Clogged Pipes: Imaging Findings of Central Venous Occlusions and Review of Therapeutic Options

#### Participants

Saumik Rahman, MD, New Haven, CT (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Central venous obstruction can occur due to extrinsic compression or intrinsic stenosis. Clinical presentation and collateral drainage pathway development depends upon the site of obstruction and speed at which the obstruction occurs. IR based measures and surgical techniques are useful to relieve the obstruction to central vessels. We describe these techniques and their complications in this paper.

#### TABLE OF CONTENTS/OUTLINE

Introduction Causes of central venous obstruction • Extrinsic compression from lung cancer, lymphadenopathy, fibrosing mediastinitis • Intrinsic occlusion from catheter induced thrombosis. Imaging features of central venous obstruction- SVC narrowing, clot in the SVC, numerous chest wall collaterals, azygos vein dilatation. Collateral pathways based on the level of obstruction • pre azygos • azygos • post azygos. IR based approach for SVC recanalization- Angioplasty, stent placement. Surgical reconstruction methods for SVC- PFTE (polytetrafluoroethylene) graft, pericardial graft. Complications of reconstruction- Graft stenosis.

### Toward a New Era of CT Imaging: Current Status and Expectations of Photon Counting CT in the Thoracic Region

#### Participants

Masahiro Yanagawa, MD, PhD, Suita, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Photon counting CT (PCCT) has appeared as a new generation of CT systems in clinical setting. PCCT can measure the energy levels of photons as they pass through an object being imaged, which differs from traditional CT scanners with energy-integrating detectors. PCCT has several advantages over traditional CT, including improved spatial resolution and contrast sensitivity, reduced radiation dose to the patient, and the ability to measure the energy spectrum of the incident radiation. PCCT is expected to bring significant improvements in various clinical applications for areas including the thorax. This education exhibit focuses on PCCT imaging in the thorax including technical perspectives, image quality, and clinical imaging. It is much appreciated if our information would be useful in your clinical and research setting.

#### TABLE OF CONTENTS/OUTLINE

1. Comparison of PCCT equipment specifications with the traditional CT scanner with energy-integrating detector (EID-CT). 2. Improved spatial resolution: image quality according to reconstruction kernels and radiation dose. 3. Imaging by turbo flash spiral scan: high-definition images without motion artifacts even with electrocardiogram asynchrony and spectral imaging at the same time. 4. Iodine density imaging for pulmonary embolism and thoracic tumors: improved quantification due to the absence of electrical noise 5. Virtual non-contrast CT imaging created from each dynamic phase: comparison with true non-contrast CT in cases of thymic cyst, thymoma, and lung cancer. 6. Future expectations: effects on quantitative values including radiomics analysis.

CHEE-91

### Analysis of Solitary Lung Nodules Using Summation Images Created from Ultra-High-Resolution CT Data

#### Participants

Hiroshi Moriya, MD, PhD, Fukushima, Japan (*Presenter*) Advisor, California Capital Equity, LLC; Research Grant, Canon Medical Systems Corporation

#### TEACHING POINTS

1. Advantages of ultrahigh-resolution CT: Ultra-high resolution CT has excellent spatial resolution in lung field analysis. 2. 3D image analysis method using ultra-high resolution CT data: Coronal MPR and VR image are useful for chest image analysis. Summation image (SUM) can observe a X-ray projection image of the chest from any viewpoint. 3. There are two factors that make lung lesions difficult to detect: (1) lesions with little density difference from the surrounding lung, and (2) presence in areas where other structures are projected in the anterior-posterior direction. 4. Points to note when interpreting chest radiographs in routine clinical practice.

#### TABLE OF CONTENTS/OUTLINE

1. Ultra-high-resolution CT (UHRCT) is a CT that achieves high spatial resolution by reducing the detector size to 1/4 of the conventional size. The resolution can be improved by increasing the number of pixels, and the reproducibility of density can be improved by reducing the partial volume effect. 2. Summation images using UHRCT data provide images similar to chest photographs. Ability to create X-ray-like images of removed lungs, enabling analysis of clinical chest radiograph findings. 3. Small pulmonary nodules are not readily detectable on plain chest radiographs. The difficulty in detecting the target lesion is due to the averaging of the density due to the thickness of the lung and the overlapping projection of other structures (cardiovasculature and bone). Ground-glass density lesions are obscured, but solid components and pleural indentation findings can be pointed out.

CHEE-92

### When Lungs Turn to Stone: A Differential Diagnosis of Pulmonary Calcifications

#### Participants

Nahia Lizarraga Oroz, MD, Donostia, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Review the main pathologies that can cause intrapulmonary calcifications. - Highlight the key radiological features that will allow us to establish a correct differential diagnosis.

#### TABLE OF CONTENTS/OUTLINE

Pulmonary calcifications are a common imaging finding, usually seen on routine chest radiographs. Although they are usually harmless sequelae of remote processes, they provide important information for establishing a good diagnostic approach. They can be attributed to a variety of etiologies, including granulomatous disease, infection, malignancy, environmental exposure, or chronic disease. Consequently, it is necessary to correlate radiologic findings with clinical history and laboratory results. Specific radiologic features have been described, of which the appearance of pulmonary calcifications also provides valuable information regarding the underlying etiology. Therefore, a thorough differential diagnosis is necessary to identify the underlying cause and guide appropriate management. This work provides a comprehensive review of the radiologic features of pulmonary calcifications, including their distribution, size, shape, and associated findings, through cases studied at our center.

### Proposals for the 9th edition TNM Staging for Lung Cancer - A Guide to Radiologists

#### Participants

Maximiliano Klug, MD, Ramat Gan, Israel (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1- Unresolved issues of the 8th edition TNM staging for lung cancer are: exclusion of post neoadjuvant patients (yp) from staging analysis, absence of nodal metastatic burden quantification, lack of granularity within the M1C category. 2- Proposed T Category - remains unchanged. 3- Proposed N Category- N2 is divided into N2a as single-station N2 disease and N2b as multiple-station N2 disease - relevant to imaging interpretation; N1 and N3 remain unchanged. 4- Proposed M Category- M1C cases that are metastatic to a single organ site have a better prognosis than M1C to multiple sites- to be determined this month whether multiple single organ will be moved to M1B. The rest of M categories are unchanged. 5- The outcomes of matched ypN v pN categories differ significantly with worse survival for ypN (e.g., ypN0 vs. pN0)- caution for imaging interpretation and patient management decisions.

#### TABLE OF CONTENTS/OUTLINE

1- To describe the proposals for the 9th edition TNM Staging for Lung Cancer. 2- To discuss the differences from the previous edition, remaining challenges, as they pertain to imaging evaluation and interpretation, and potential future directions.

CHEE-94

### Early and Late CT Patterns After SBRT for Lung Nodule

#### Participants

Ignacio Alba, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- To familiarize with the different radiological patterns observed on chest CT scans after stereotactic body radiotherapy (SBRT) for lung nodules, including early changes (within the first 6 months) and late changes (after 6 months)-To recognize cases of local and/or locoregional recurrence based on findings in our sample-To recognize evolutionary differences in chest CT findings based on the histological subtype of the treated lesion-To evaluate the ultimate success of SBRT as a therapeutic technique

#### TABLE OF CONTENTS/OUTLINE

We evaluated the different radiological patterns observed after SBRT for lung nodules using chest CT scans in 108 patients. Of the cases studied, 64 were primary tumors in early stages, 32 cases were lung metastases or metastases from other locations, and in 12 cases histology could not be identified. Among the primary lung tumors, 57% were adenocarcinomas, followed by 26% of squamous cell carcinomas. All chest CT scans were performed every 3 months during the first 2 years and every 6 months during the next 2 years after the completion of SBRT. The patterns observed in the first six months typically evolve progressively to a final stabilization pattern. The most frequently observed final radiological patterns were nodule-like and mass-like, followed scar-like and diffuse consolidation pattern. Thoracic recurrence was diagnosed by lack of parenchymal stabilization in 20% of cases, and locoregional lymph node involvement in the remaining cases. There were no significant differences in lung involvement based on the histology of the treated tumor

CHEE-95

### CT Imaging of Lung Cancer: Exploring the Clinical Potential of CZT-based Photon Counting Detector CT

#### Participants

Tomoaki Sasaki, MD, (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Lung cancer is the leading cause of death worldwide. CT is a powerful tool for evaluating the primary site and staging of lung cancer. On CT imaging, lung cancer appears as a subsolid nodule or solid nodule. Measuring the total tumor size and the size of the solid portion if the tumor is a subsolid nodule is the first step in both early and advanced lung cancer. Assessment of invasion to critical organs is also important in locally advanced cancer. Accurate evaluation of ipsilateral mediastinal nodal and extrathoracic metastases is required to determine treatment strategy. Photon counting detector CT (PCD-CT) has recently emerged for clinical use. Cadmium zinc telluride (CZT)-based PCD-CT, a newly developed technology, allows for more precise observation of lung cancer with lower radiation exposure, which may have a significant impact on clinical practice. This presentation aims to 1) review the clinical significance and challenges of CT evaluation in lung cancer and 2) discuss the benefits provided by CZT-based PCD-CT for lung cancer patients.

#### TABLE OF CONTENTS/OUTLINE

Key features of lung cancer evaluation: primary site and staging<sup>1</sup>. T: size (T1-T4), chest wall invasion (T3), mediastinal invasion (T4)<sup>2</sup>. N: ipsilateral mediastinal node metastasis (N2)<sup>3</sup>. M: pleural dissemination (M1a), extra thoracic metastasis (M1b-c)  
Basic principle of CZT-based PCD-CT  
Clinical potential of lung cancer assessment using PCD-CT: super high resolution (SHR) image, multienergy spectral image, reduction of radiation exposure

### Pictorial Review of Tracheal Diseases: A Case-Based Approach for Radiologists

#### Participants

Camila Gadens Zamboni, MD, Iowa City, IA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The evaluation of the trachea by imaging is essential to diagnose various tracheal diseases and help with surgical plans, assessment of treatment responses, and understanding surrounding structural abnormalities. In this scenario, the radiologist's role rises as an unreplaceable analysis of this cartilaginous tube. This exhibit aims to summarize pertinent anatomy and review diverse tracheal diseases, congenital and acquired, through a didactic classification and presentation of the cases, including differential diagnosis, challenges, and limitations.

#### TABLE OF CONTENTS/OUTLINE

This is a case-based review of pathologies of the trachea focusing on 1- Pertinent anatomy review. 2- Best imaging methods for tracheal evaluation. 3- Classification of tracheal diseases with illustrative cases by focal vs. diffuse diseases, and the last by increased vs. decreased diameters. 4- Discussion of differential diagnoses. 5- Challenges and limitations on tracheal evaluation by imaging. 6- Take-home messages.

### Proposals for the 9th edition TNM Staging for Thymic Epithelial Tumor - A Guide to Radiologists

#### Participants

Maximiliano Klug, MD, Ramat Gan, Israel (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1- Unresolved issues of the 8th edition TNM staging for thymic epithelial tumor (TET) are: T category refinement - focus on tumor size; granularity between N categories; better differentiation between intra and extrathoracic metastatic disease. 2- Proposed T Category- T1a ( $\leq 5$ cm) and T1b ( $> 5$ cm) regardless of involvement of mediastinal pleura; T2: invasion of the pericardium, lung, or phrenic nerve; T3: invasion of the brachiocephalic vein, superior vena cava, chest wall, or extrapericardial pulmonary arteries and veins; T4: unchanged, direct invasion of the aorta and arch vessels, intrapericardial pulmonary artery, myocardium, trachea, or esophagus. 3- Proposed N Category- The ITMIG/IASLC lymph node stations are clarified, unchanged two nodal regions: anterior (N1) and deep (N2). N1 includes the thymic bed compartment in the anterior lower neck and prevascular mediastinum. N2 includes tracheobronchial, aortopulmonary window, subcarinal, hilar, internal mammary, and the deep cervical (jugular and supraclavicular) lymph nodes. 4- Proposed M Category- Unchanged. M1a: pleural or pericardial nodules separate from the primary tumor; M1b: pulmonary intraparenchymal nodules, extrathoracic metastases, or any non-regional lymph nodes (e.g. high neck, retro-crural, axillary or extrathoracic lymph nodes).

#### TABLE OF CONTENTS/OUTLINE

1- To describe the proposals for the 9th edition TNM Staging for TET. 2- To discuss the differences from the previous edition, remaining challenges as they pertain to imaging evaluation, and potential future directions.

## Abstract Archives of the RSNA, 2023

CHEE-98

### Halo and Reversed Halo Signs in Chest CT: Are They Useful?

#### Participants

Adria Roset Altadill, MD, Girona, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The halo and reversed halo signs in chest CT may be caused by infections, inflammatory and vascular disorders and neoplastic diseases. These signs combined with ancillary imaging findings, additional information from PET-CT and spectral CT and proper clinical history may help the radiologist reach the final diagnosis.

#### TABLE OF CONTENTS/OUTLINE

The halo and reversed halo signs were initially described and thought to be specific for invasive pulmonary aspergillosis and cryptogenic organizing pneumonia, respectively. However, there is a broad spectrum of causes for these chest CT findings, including infections, inflammatory and vascular disorders and neoplastic diseases. The most common causes of the halo sign in the lung are adenocarcinoma, invasive aspergillosis and septic emboly. Less common causes include bacterial and viral infections, hemorrhagic metastases, vasculitis and other inflammatory disorders. The reversed halo sign is more frequently seen in organizing pneumonia, followed by pulmonary infarcts, invasive mucormycosis and other granulomatous diseases. Despite having lost their specificity, the halo and reversed halo sign combined with ancillary chest CT findings and an adequate clinical background can be useful to narrow the differential diagnosis. Special attention has to be paid to the nodule size, number and morphology in the halo sign. The thickness and distribution of the ring of consolidation and the presence of internal reticulation within the reversed halo sign also need to be evaluated. Moreover, metabolic information from PET-CT and perfusion data from spectral CT may help differentiate pulmonary infarcts from other inflammatory or infectious causes of the reversed halo sign.

### Cystic Lung Disease: The Common, the Rare and the Unusual

#### Participants

Daniel Vargas, MD, (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

While most radiologists are aware of the most common cystic lung diseases, a group of rare and unusual diseases including genetic syndromes, lymphoproliferative disorders, environmental exposures and congenital anomalies can also result in cyst formation in the lungs. This exhibit will:

1. Review the clinical and imaging features of common and rare cystic lung diseases.
2. Discuss the underlying histopathology in each of these entities and how it translates to imaging findings.
3. Offer the radiologist an approach to help narrow the differential and guide clinical management in the multidisciplinary care of these patients.
4. Review ancillary findings and complications in patients with cystic lung disease.
5. Current concepts in amyloidosis and light chain deposition disease and their role in cyst development in lymphoid interstitial pneumonia.

#### TABLE OF CONTENTS/OUTLINE

1. Lung cyst and cystic lung disease definition
2. Common Cystic Lung Diseases
  - a. Lymphangioleiomyomatosis.
  - b. Birt-Hogg-Dube syndrome.
  - c. Pulmonary Langerhans Cell Histiocytosis.
  - d. Lymphoid Interstitial Pneumonia and Current Understanding of the role of Amyloidosis and Light Chain Deposition Disease.
  - e. Desquamative Interstitial Pneumonia.
2. Rare Cystic Lung Diseases.
  - a. Neurofibromatosis type 1.
  - b. Nieman-Pick Disease.
  - c. Trisomy 21.
  - d. Vascular Ehlers-Danlos Syndrome.
  - e. Proteus Syndrome.
  - f. Lymphomatoid Granulomatosis.
  - g. Follicular Bronchiolitis.
  - h. Atypical Infections (eg. P Jiroveci).
  - i. Hydrocarbon Pneumonitis.
  - j. Proximal Interruption of the Pulmonary Artery

EREE

### Emergency Radiology Education Exhibits

#### Sub-Events

#### EREE-1 **Ankle and Foot Injuries in ER: A Checklist-Based Approach to Radiographs**

##### TEACHING POINTS

1. To recognize various anatomic bony landmarks on ankle and foot radiographs with CT correlation.2. To understand the pathophysiology and biomechanics of injuries in ankle and foot trauma.3. To be aware of the most commonly used ankle and foot trauma classification schemes.4. To understand the need for accurate diagnosis and characterization of ankle and foot injuries to guide management decisions to ensure optimal clinical outcomes.5. To understand the role of CT in foot and ankle trauma. 6. To review the management of ankle and foot traumatic injuries.

##### TABLE OF CONTENTS/OUTLINE

1. Review the anatomy of the ankle and foot using illustrations, radiographs, and CT.2. Various radiographic projection series and protocols to diagnose and characterize ankle and foot injury patterns.3. The spectrum of foot and ankle injuries with key concepts in accurate characterization on radiographs with CT correlation.4. Illustrated classifications of ankle and foot traumatic injury. 5. An algorithmic approach to accurately predict and identify subtle injuries.6. Clues to avoid common pitfalls will be included.7. Troubleshooting role of CT to be elucidated.8. Focused review of the management of foot and ankle injuries.

#### EREE-10 **A Guide to Evaluating the Post-robotic and Post-laparoscopic Abdomen**

##### Participants

Jay Pancholi, MBChB, BSc, Wilmslow, United Kingdom (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

1) To illustrate new surgical techniques with robotic surgery including recent advances in anastomoses.2) To identify common post-operative complications in relation to timing since surgery.3) To highlight review areas for post operative scans.4) To review pearls and pitfalls in distinguishing expected appearances compared to complications.5) To explain considerations when protocolling imaging requests.

##### TABLE OF CONTENTS/OUTLINE

Minimally invasive surgical techniques continue to advance with robotic surgery representing one of the most recent innovations. These techniques allow previously difficult anastomoses to be more readily performed. Post operative imaging is a common challenge faced by radiologists. Knowledge of surgical technique and possible complications is important for all radiologists interpreting these scans to ensure appropriate protocolling and accurate diagnosis. The poster will show illustrations of surgical techniques, normal post operative appearances and a variety of complications presented as scrollable cases. The poster will be outlined as: -Surgical advances--Robotic surgical incision sites--New anastomotic techniques---Minimally invasive colonic anastomosis---Kono-S anastomosis-Expected appearances--Normal free gas relative to day post op--Normal free fluid relative to day post op-Complications--Anastomotic leak--Bowel ischaemia--Vascular injury---Pseudoaneurysm--AV fistula--Ureteric injury--Lymphatic injury--Incisional hernia

#### EREE-11 **Twisting Around: A Review of the Potential Locations of Torsions**

##### Participants

Laura Cavero Barreras, MD, Ordizia, Spain (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

- To review the pathophysiology of a torsion. - To understand which imaging modality should be ordered depending on the location of the torsion. - To know the possible sites of torsion and review the major imaging findings at each site on the different imaging techniques. - To review the radiological signs of ischemia that may appear as a consequence of torsion and may influence surgical management of the condition.

##### TABLE OF CONTENTS/OUTLINE

Torsion is a broad term that describes a twisting of an organ around its mesentery or its vascular pedicle resulting in an impairment of its blood supply. The vein is usually the first vessel affected resulting in venous stasis or ischemia. If left untreated, arterial compromise can occur leading to arterial infarction. For this reason, they are usually surgical emergencies and a prompt diagnosis is essential to avoid organ necrosis or hollow organ perforation. Imaging techniques are necessary to establish the diagnosis. Although intestinal volvulus and gonadal torsion are broadly known, there are other organs that can rarely result in torsion such as the lung, the spleen, the gallbladder, and the Fallopian tube. This presentation aims to review the imaging findings of torsion in all potential locations and identify the signs of ischemia that may occur in this setting.

#### EREE-12 **Above the Rest: A Review of Upper Cervical Spine Injuries**

##### Participants

Jerry Cruz-Rodriguez, BA, San Juan, PR (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

-Radiologists play a crucial role in characterizing acute cervical spine injuries in the emergent trauma setting using an imaging-based morphology approach.- Jefferson fractures involve the anterior and/or posterior arch of C1, lateral mass, or transverse anterior arch, and require CT for detection.- Hangman fractures involve disruption of C2's posterior elements at the pars interarticularis and can be devastating injuries.-OCFs require CT for detection and indicate serious trauma has occurred, potentially causing instability of the atlanto-occipital joint and neurological injuries.-Dens fractures are classified into 3 types, and CT is used to determine the type and guide management decisions.-AOD involves complete separation of the upper cervical spine from the skull base and requires CT for accurate diagnosis.-Traumatic atlantoaxial instability is a potentially devastating unstable injury that can be missed without careful assessment on initial CT scan.-TRS/TRF requires CT to diagnose the degree of subluxation and assess accompanying injuries, with clinical and dynamic imaging assessments needed for rotatory fixation.

#### TABLE OF CONTENTS/OUTLINE

A. IntroductionI OverviewII AO Spine Upper Cervical Injury ClassificationB. Upper Cervical Spine InjuriesI Common and uncommon important injuries of the upper cervical spineII CT characterization and discussion of typical mechanismsIII Image review and correlation with AO Spine ClassificationOccipital condyle fractures (OCF) Atlanto-Occipital Dissociation (AOD)Atlantoaxial instabilityTraumatic Rotatory Subluxation/Fixation (TRS)Atlas (Jefferson) fracturesHangman fracturesOdontoid fracturesC. ConclusionD. Self assessment

#### EREE-13 **Ultrasonographic Diagnosis of Pneumothorax: Legend or Reality?**

Participants

Guilherme del Guerra, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

This study aims to report the importance of chest ultrasound in the evaluation of critically ill patients with pneumothorax, highlighting the need for systematization in chest ultrasound assessment and technical recognition of pneumothorax ultrasound signs. The main echographic signs used in the detection of pneumothorax are: Absence of sliding of the two pleural leaflets, accentuated reverberation (A Lines), absence of comet tail artifacts and B lines and determination of the Pulmonary Point.In the presence of pneumothorax, trapped gas obscures visualization of the underlying pleural line, so that no pulmonary slippage is identified.The systematized technique used in chest ultrasound is based on: use of a high-frequency linear probe (5-12MHz); patient positioning in dorsal decubitus; division of each hemithorax into six quadrants. Each quadrant should be analyzed to ensure identification of the pneumothorax. The use of technically systematized chest ultrasound for the diagnosis of pneumothorax has high sensitivity, bringing a great benefit to critically ill patients, and can be used for diagnosis and decision-making quick conduct.

#### TABLE OF CONTENTS/OUTLINE

- Systematization of chest ultrasound evaluation-Normal findings on chest ultrasound - Ultrasonographic findings of pneumothorax - Cases of patients with pneumothorax diagnosed by ultrasound

#### EREE-14 **Don't Lose Your Head -- Imaging of Atlantooccipital Dissociation and Central Skull Base Fractures**

Participants

Desmin Milner, MD, Birmingham, AL (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Understand normal anatomy of the central/posterior skull base and craniocervical junction.2. Understand various traumatic injuries at the central/posterior skull base and craniocervical junction.3. Understand some mimics of craniocervical junction injury.

#### TABLE OF CONTENTS/OUTLINE

1. Review normal anatomy of the central/posterior skull base and craniocervical junction.2. Briefly review CT and MRI imaging protocols in the setting of trauma.3. Review traumatic injuries of the central/posterior skull base and craniocervical junction including: atlantooccipital dissociation, occipital condyle fractures, clival fractures, and transsphenoidal fractures.4. Review of other ligamentous injuries at the craniocervical junction.5. Review mimics of craniocervical junction injury.

#### EREE-15 **Blunt Cerebrovascular Injuries (BCVI): Diagnosis, Evolution, and Complications**

Participants

Elham Beheshtian, MD, Baltimore, MD (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Advances in multidetector CT angiography in the context of multitrauma have led to increased diagnosis of blunt cerebrovascular injuries (BCVI).2. Early BCVI detection and treatment can decrease the risk of complications, such as ischemic strokes, carotid cavernous fistula, and arteriovenous fistulas.3. BCVI is graded from 1-5 on the Biffi Scale, based on imaging appearance. The grading system is used to guide patient management and can predict the natural evolution of an injury.

#### TABLE OF CONTENTS/OUTLINE

I. Introduction - epidemiology, morbidity and mortality, mechanism, imaging modalitiesII. Biffi ScaleA.Pathophysiology and imaging examples of grades1-5 injuryB.Management implications by grade C.Natural history of an injury, including complicationsIII. Diagnostic considerations 1.Imaging modalities 2.Universal vs. selective screening 3.Imaging follow-upIV. BCVI mimics - fibromuscular dysplasia, atherosclerosis, carotid web, vasospasm, true aneurysmV. Venous injuryVI. Summary

#### EREE-16 **Peer Learning Pearls: The Most Commonly Missed MSK Diagnosis on the Overnight Shift - Diagnostic Errors and Great Calls**

Participants

Thais Kuwazuru, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

## TEACHING POINTS

The aim of this exhibition is to:- Highlight the most commonly missed musculoskeletal diagnosis identified after Peer Review analysis and the great calls of difficult cases;- Demonstrate practical tips to avoid missing diagnosis;- Review the current concepts about these pathologies;- Show illustrative and didactic cases from our service, specially from emergency and urgent care units.

## TABLE OF CONTENTS/OUTLINE

INTRODUCTION- The greatest difficulties during the night shift and emergency room for the radiologist;- Impact of early accurate diagnosis of these diseases.IMAGING INTERPRETATION- The most commonly missed musculoskeletal diagnosis identified after Peer Review analysis, including:- Fractures: vertebral acute fracture, transdiscal fracture, scaphoid fracture, avulsion fracture of Chopart joint;- Infection: discitis and spondylodiscitis, abscess;- Hematoma and active bleeding;- Other causes of musculoskeletal pain such as longus colli tendinitis, disc herniation;- Great calls - difficult cases.INTERACTIVE CASE-BASED DIDACTICS- Sample cases to illustrate and solidify the concepts;- The main tips that every radiologist working the night shift should know;- Correlation with current literature data.CONCLUSION AND TAKE HOME MESSAGES- Patient assessment in emergency and urgent care scenario very often include imaging investigation;- In order to improve patient outcomes and prevent iatrogenic treatments (or lack of treatment), it is essential to know the imaging patterns of each pathology and the tips to avoid missing diagnosis.

## EREE-17 **Murphy's Law: What Can Go Wrong in Robotic and Laparoscopic Surgeries**

Participants

Daniel Cardoso, MD, Fortaleza, Brazil (*Presenter*) Nothing to Disclose

## TEACHING POINTS

Understand the main differences between open surgery, and minimally invasive surgery (MIS). Recognize the anatomy of the abdominal wall. Understand how the abdominal access is performed in MIS. Comprehend expected imaging patterns after MIS. Recognize the complications associated to MIS and its related imaging findings.

## TABLE OF CONTENTS/OUTLINE

INTRODUCTION: Open versus MIS. Modalities of MIS. Anatomy of the abdominal wall, and its relation to the abdominal access in MIS. Expected imaging findings after MIS COMPLICATIONS AFTER MIS: a case-based review - Laparoscopy-related: Epidemiology. Imaging findings. How to proceed? Robotic-related: Epidemiology. Imaging findings. How to proceed? SUMMARY AND SYSTEMATIC APPROACH: what to look for? Preoperative imaging / Postoperative imaging TAKE HOME MESSAGES

## EREE-18 **Don't Look Just for the Bowels: A Comprehensive Review of Noninvasive Vascular Imaging in Abdominal Solid Organ Ischemia**

Participants

Hermes Vinicius Pedrini Pereira, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

## TEACHING POINTS

- Review the anatomy of intra-abdominal solid organs vascularization.- Expose frequent and infrequent cases of intra-visceral vasculopathies in the context of acute abdomen.- Remember the main parenchymal changes resulting from vascular events and their differential diagnoses.- Tips on how to identify critical findings and report them.

## TABLE OF CONTENTS/OUTLINE

- Concepts of arterial and venous circulatory anatomy and solid organs vascularization.- Circulatory physiology and how it affects the different imaging modalities.- CT and MR protocols and reconstruction techniques, systematically mentioned in the interpretation of our cases.- Imaging aspects of acute vascular events, from the organ's pedicle to its parenchyma.- Intra-abdominal occlusive ischemic events (thromboembolism, torsions, dissections).- Non-occlusive ischemic events (hemodynamic shock, substance abuse).- Other vascular abnormalities that may have clinical repercussions (shunts and malformations).- Correlation between imaging and clinical signs.- Risk factors and pre-existing conditions that can help us think about solid organ ischemia.- Practical information for effective reporting and necessary information for intervention planning, including the critical imaging findings that needs immediate intervention.

## EREE-19 **Friendly Fire: A Rapid Review of Iatrogenic Intrathoracic Injuries Related to Support Devices**

Participants

Saumik Rahman, MD, New Haven, CT (*Presenter*) Nothing to Disclose

## TEACHING POINTS

Many common interventions performed by health care providers while placing supporting devices may lead to injuries to the lungs, pleura, heart, or mediastinal structures. These injuries may range from asymptomatic findings managed conservatively to life-threatening injuries requiring emergent surgical or percutaneous intervention. The radiographic and cross-sectional imaging appearance of malpositioned intrathoracic medical devices and complications related to iatrogenic thoracic trauma secondary to medical devices or procedures will be reviewed, and recommendations for clinical teams based upon imaging findings will be discussed.

## TABLE OF CONTENTS/OUTLINE

1. Introduction.2. Examples of cases:a. Chest tube placement- Pulmonary contusion, laceration, hemothorax, pneumothorax.b. Pacemaker placement- Hemopericardium, pneumomediastinum, pneumothorax, hemothorax, chest wall hematoma.c. Swan-Ganz catheter- Pulmonary artery pseudoaneurysm.d. Enteric tubes- Endobronchial course causing lung injuries, esophageal perforation.e. Central venous catheters- Vascular dissection, vascular perforation, pneumothorax, mediastinal hematoma.3. Conclusion.

## EREE-2 **MR Imaging of Pelvic Emergencies**

Participants

Gayatri Joshi, MD, Atlanta, GA (*Presenter*) Royalties from Elsevier.

## TEACHING POINTS

Pelvic pain is a commonly presenting symptom in the Emergency Department (ED) and while ultrasound (US) or computed tomography (CT) are often the initial imaging exam, magnetic resonance (MR) imaging plays a vital role for specific populations (such as the pregnant patient) and in clinical scenarios in which diagnosis relies on the greater sensitivity provided by MR imaging. After reviewing this exhibit, learners should be able to: 1. Understand the role of MR imaging in the emergent setting 2. Proficiently recognize emergent pelvic disorders by MR imaging 3. Utilize best practices for diagnosing pelvic emergencies in the ED, including those of infectious, inflammatory, ischemic, obstructive, traumatic, neoplastic etiologies

#### TABLE OF CONTENTS/OUTLINE

This exhibit will: 1. Systematically illustrate the clinical and imaging features of pelvic emergencies that may present in the ED, particularly those of the MSK, vascular, GI GU body systems. The spectrum of pelvic emergencies discussed in this exhibit will include those of infectious, inflammatory, ischemic, obstructive, traumatic, neoplastic etiologies 2. Discuss best imaging practices of the acute pelvis in the ED, with pearls/pitfalls for optimizing efficient accurate diagnosis 3. Briefly address relevant management as applicable to the Radiologist to aid in expedient, appropriate management

#### EREE-20 **Imaging Features and the Role of Interventional Radiology and Radiation Therapy in Oncologic Emergency**

Participants

Akihiro Nakamata, MD, Shimotsuke, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Due to the rapidly increasing elderly population and to the advancements in oncology, there has been an increase in the diagnosis of cancer, and also a rise in oncological emergencies. In oncologic emergencies, radiologists play a major role not only in diagnosis but also in the subsequent treatment of interventional radiology and radiation therapy. Therefore, radiologists should know imaging features and the treatment of oncologic emergencies in the whole body.

#### TABLE OF CONTENTS/OUTLINE

The purpose of this exhibit is: 1. To classify oncologic emergencies according to their pathology and location 2. To review oncologic emergencies in the whole body 3. To discuss the clinical and imaging features of the oncologic emergencies 4. To discuss the role of interventional radiology and radiation therapy  
Table of contents: 1) Subtypes based on imaging findings reflecting the background pathology. 2) Oncologic emergencies of various organs in this presentation. A) Central nervous system: Cerebral herniation Spinal cord compression B) Thoracic: Superior vena cava syndrome Airway obstruction Pericardial effusion with cardiac tamponade Pleural effusion Pulmonary thromboembolism, pulmonary tumor thrombotic microangiopathy (PTTM) Esophagorespiratory fistula Massive hemoptysis C) Abdomen: Abdominal compartment syndrome Biliary obstruction Biliary bleeding Intestinal obstruction Intestinal bleeding Bowel perforation Urinary tract obstruction Abdominal bleeding

#### EREE-21 **Understanding Cerebral Edema and Brain Herniation: A Simple Guide For Residents**

Participants

Gustavo Alonzo Correa I, MD, Mexico City, Mexico (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To recognize the basic intracranial anatomy necessary for understanding the radiological features of brain herniation. To explain the appearances, pathogenesis and classification of cerebral edema. To discuss use of a systematic approach of cerebral herniation. To identify the imaging findings, clinical manifestations and potential complications associated in cerebral herniation.

#### TABLE OF CONTENTS/OUTLINE

Introduction Normal brain anatomy Brain edema (Vasogenic, Citotoxic and Transependymal) Concept of brain herniation Physiopathology of brain herniation Key level approach to brain herniation Classification Subfalcine hernia Transtentorial descending hernia Transtentorial ascending hernia Tonsillar Extracranial hernia To take home points

#### EREE-22 **Dental Trauma: A CT Perspective for Tooth-Saving Precautions**

Participants

Erhan Akpinar, MD, Sihhiye, Turkey (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To provide a basic anatomical overview of dental trauma with illustration of regions susceptible to trauma. To inform which dental fractures are important to save the tooth, and what to report for clinicians to get information about treatment options with basic points. To review the common terminology and classification of dental trauma/fractures with emphasizing the conditions that create or increase the risk of tooth loss. To present basic structural report templates for dental trauma reporting To discuss the CT imaging findings related to treatment of dental trauma and complications with illustrative cases.

#### TABLE OF CONTENTS/OUTLINE

1. Dental Anatomy, Weak Points and Crucial Structures to Keep The Tooth Alive / Functional 2. Terminology and Current Classification of Types of Dental Trauma 3. Fractures that require treatment within a few hours • Crown-Root Fractures • Root Fractures • Alveolar Fractures • Extrusive and Lateral Luxation • Avulsion 4. Fractures that require treatment within the first 24 hours • Complex Crown Fractures (Involving Pulp Structures) • Concussion and Subluxation • Intrusive Luxation 5. Treatment Options and Complications 6. A Structural Report Template for Dental Trauma

#### EREE-23 **Ultrasound in Acute Care: Point-Of-Care**

Participants

Roddie Moraes Neto, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Recognize the practical applications of point of care ultrasound in emergency care; highlight patient positioning and how to acquire images in some exams performed with POCUS; learn the well-established ultrasound imaging standards in the literature.

## TABLE OF CONTENTS/OUTLINE

Introduction: thorax, heart, abdomen, vessels; case-based review: thorax (pleural effusion, consolidation, pulmonary edema, pneumothorax), heart (pericardial effusion, pericarditis, vena cava, cardiogenic shock), abdomen (cholelithiasis, appendicitis, FAST, urolithiasis, testicular torsion / epididymo-orchitis, intussusception), vessels deep vein thrombosis, jugular thrombosis, ultrasound-guided peripheral venous catheter, aorta abdominal aneurysm); conclusions and key takeaways.

### EREE-24 Genitourinary Oncologic Emergencies: A Radiologists' Guide

Participants

Mamie Gao, MD, Houston, TX (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Describe the best imaging approach for evaluating oncologic emergencies affecting the genitourinary tract. 2. Identify imaging manifestations of genitourinary oncologic emergencies. 3. Identify potential pitfalls in imaging genitourinary oncologic emergencies. 4. Recognize the important role of radiologists in the multi-disciplinary setting to communicate and collaborate findings in emergent cases.

## TABLE OF CONTENTS/OUTLINE

1. Genitourinary oncologic emergencies and imaging approach. 2. Multimodality imaging features of genitourinary oncologic emergencies. a) Hematuria: hemorrhagic cystitis. b) Obstructive uropathy: tumor burden and post-treatment (nephrostomy tube malfunction, ileal conduit). c) Infectious: pyelonephritis, renal abscess, prostatic abscess, cystitis related to prior treatment (BCG, ileal conduit). d) Miscellaneous Post-Treatment (radiotherapy, chemotherapy, surgery, urinary diversion): hemorrhage, fistulas. 3. Role of radiology in management. 4. Potential mimics and pitfalls (underdistended urinary bladder, residual malignancy, emergencies unrelated to malignancy, trauma).

### EREE-25 Stercoral Colitis- Diagnosis, Complications and Management

Participants

John J. Hines JR, MD, Huntington, NY (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Background Information/Purpose Stercoral colitis is an inflammatory process typically involving the sigmoid colon and rectum, due to chronic constipation and rectal distention, causing increased intraluminal pressure, and eventually leading to ischemia, ulceration, perforation, peritonitis and death from feculent peritonitis and sepsis if not treated. The purpose of this exhibit is to familiarize radiologists with the spectrum of CT imaging features of uncomplicated and complicated stercoral colitis and its mimics. Key Anatomic or Pathophysiologic Issues, Imaging Findings or Imaging Technique: Common CT findings of stercoral colitis include: 1.) Stool filled and distended colon with focal colonic wall thickening 2.) Pericolonic/presacral fat stranding. 3.) Presence of localized extraluminal gas, discontinuity of the colonic or rectal wall, and extraluminal gas in cases of perforation.

## TABLE OF CONTENTS/OUTLINE

Educational Goals/Teaching Points 1. Review the risk factors, pathophysiology and clinical presentation of stercoral colitis. 2. Discuss the importance of early recognition of uncomplicated stercoral colitis, and the role of the radiologist in bring this diagnosis to the attention of the clinical team. 3. Illustrate the imaging findings of complicated and uncomplicated stercoral colitis on CT, including typical and atypical imaging findings, and unusual complications. 4. Review imaging mimics of stercoral colitis such as diverticulitis, infectious colitis, inflammatory bowel disease and ischemic colitis. 5. Discuss the management of complicated and uncomplicated stercoral colitis.

### EREE-26 Typical Findings Under Atypical Lenses: When to Suspect Endometriosis on Emergency CT

Participants

Joao Stern, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Illustrate the different appearances of endometriosis on CT Share tips, pearls and pitfalls to suspect and diagnose endometriosis on pelvic computed tomography. Correlate relevant findings from computed tomography and magnetic resonance imaging of the pelvis to consolidate learning.

## TABLE OF CONTENTS/OUTLINE

- introduction- common sites of involvement- image translation to CT of classic sign with MR correlation- discussion of the main findings of endometriosis on CT scan of the pelvis.

### EREE-27 Pain in the Bump: Acute Abdomen in Pregnancy - MRI Clues for On-Call Residents

Participants

Mili Rohilla, MD, Worcester, MA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To acquaint on-call residents with MR imaging signs in the acute abdomen To make residents comfortable with MR abdomen in pregnant patients

## TABLE OF CONTENTS/OUTLINE

Acute abdomen is a common ER presentation in pregnant patients, and can pose a diagnostic challenge due to the physiological changes during pregnancy. Magnetic resonance imaging (MRI) is a useful diagnostic tool due to its high contrast resolution and absence of ionizing radiation. Radiology residents need to be cognizant of the MR imaging findings of acute abdomen in pregnancy and differential diagnoses to interpret them accurately and promptly. We will discuss the common system-wise presentations and MR findings: Gastrointestinal System: Appendicitis, acute pancreatitis, inflammatory bowel disease, intestinal obstruction. Hepatobiliary system: Acute cholecystitis, choledocholithiasis, HELLP syndrome. Reproductive System: Ectopic pregnancy, ovarian torsion,

placental abruption, uterine rupture. Urinary System: Urolithiasis, acute pyelonephritis, renal abscess. Cardiovascular System: Ovarian vein thrombosis, Budd-Chiari syndrome, acute aortic syndrome. It is important to promptly diagnose and manage the underlying cause of acute abdomen in pregnancy to prevent adverse maternal and fetal outcomes.

### **EREE-28 Ocular Trauma: What Should We Keep In Mind?**

Participants

Omar Andres Pantoja Burbano I, MD, Bogota, Colombia (*Presenter*) Nothing to Disclose

Omar Andres Pantoja Burbano I, MD, Bogota, Colombia (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

- To perform a systematic approach to the most important aspects of the ocular trauma. - Recognize the principal anatomic structures of the orbit and understand the compromise of such in the different traumatic injuries. - Identify the most relevant signs of ocular and orbit trauma in diagnostic imaging, with specific emphasis in orbit tomography. - Learn how to classify the ocular trauma according to the involvement of the anterior or posterior segments and the presence of ocular globe rupture or burst. - To consider and exclude the most relevant differential diagnoses.

#### **TABLE OF CONTENTS/OUTLINE**

1. Introduction. 2. Anatomy of the ocular globe. 3. Anterior segment lesions. 4. Posterior segment lesions. 5. Ocular globe rupture and foreign bodies. 6. Pitfalls and differential diagnoses. 7. Take away points. 8. References.

### **EREE-29 A Quick Guide to Pelvic Pain in the Emergency Room: MR Imaging of the Acute Female Pelvis**

Participants

Elissandra Lima, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

- Review the anatomy of the female pelvis on MRI- Understand the role of MR imaging in the evaluation of gynecologic emergencies- Illustrate the imaging findings non-obstetric and obstetric causes- Discuss their differential diagnosis, imaging pitfalls, and complications

#### **TABLE OF CONTENTS/OUTLINE**

1. Normal MRI anatomy of uterus and adnexa with cyclical variation 2. Advantages and disadvantages of MR Imaging 3. Non-obstetric and obstetric causes 4. Imaging assessment of critical and prevalent gynecological diseases in the emergency room 5. Pelvic inflammatory disease, including endometritis, cervicitis, salpingo-oophoritis, pyosalpinx, and tubo-ovarian abscess 6. Leiomyoma torsion and fibroid degeneration 7. Endometriosis 8. Obstetric causes, including ectopic pregnancy, molar pregnancy, retained products of conception, placenta accreta spectrum 9. Other pelvic abnormalities 10. Potential imaging pitfalls and how to avoid them 11. Complications

### **EREE-3 Shattered Chests: Lessons from Thoracic Trauma Cases**

Participants

Manuel Sebastian Paez Alvarez SR, MD, Toledo, Spain (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

To present a comprehensive overview of thoracic trauma cases, highlighting the most common and not-so-common pathologies. To familiarize radiologists and radiology residents with diagnostic clues of thoracic imaging in trauma patients. To analyze key features and provide tips to identify pitfalls of traumatic chest CT.

#### **TABLE OF CONTENTS/OUTLINE**

Introduction: Importance of thoracic trauma imaging and its implications in emergency settings. Pulmonary parenchymal injury: a. Pulmonary contusions b. Pulmonary lacerations c. Pulmonary hematomas d. Traumatic pulmonary hemias Pleural space injury: a. Pneumothorax b. Hemothorax Chest wall injury: a. Rib fractures b. Sternal fractures c. Chondrocostal, chondrosternal, and cartilage injuries d. Sternoclavicular dislocations Tracheobronchial injury: a. Laceration of the trachea and bronchi Other injuries: a. Boerhaave Syndrome b. Aortic injury c. Iatrogenic cardiac perforation d. Traumatic diaphragmatic hernias This educational exhibit aims to provide a comprehensive understanding of thoracic trauma cases, emphasizing the importance of recognizing imaging findings for accurate diagnosis. Radiologists and radiology residents will benefit from the illustrative cases and diagnostic tips presented, improving their skills in traumatic chest CT interpretation.

### **EREE-30 The Contrast-Enhanced FAST Exam (cFAST) In Blunt Thoracoabdominal Trauma**

Participants

Melanie P. Caserta, MD, Jacksonville, FL (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

The Focused Assessment with Sonography in Trauma (FAST) is one of the most frequently performed ultrasound examinations in adults and children in the acute care setting. However, it has significant limitations since intraabdominal fluid is used as a surrogate marker for intraabdominal injury (IAI). Adding an ultrasound contrast agent to the exam can substantially improve the diagnostic accuracy of identifying solid organ injuries and rapidly identify significant organ lacerations and active intraperitoneal hemorrhage. The cFAST exam is a rapid, standardized, and systematic ultrasound examination that balances a comprehensive organ survey with the time constraints of highly structured and algorithmic trauma patient care. After reviewing this case-based exhibit, the learner will: - Understand the limitations of the traditional FAST exam and advantages of adding an ultrasound contrast agent (UCA) - Describe the cFAST exam protocol and set-up as part of the trauma resuscitation team - Recognize the limitations of the cFAST exam and next steps in imaging.

#### **TABLE OF CONTENTS/OUTLINE**

1. Objectives 2. Background a. The evolution of the FAST exam b. Contrast-enhanced ultrasound in trauma 3. Imaging a. Equipment, technical requirements, and supplies. IV access ii. Selection of the UCA iii. Ultrasound equipment b. Integration into the

trauma team c. The contrast-enhanced FAST exam protocol i. Patient population ii. Exclusion criteria iii. Special populations iv. Safety Considerations v. UCA preparation Contrast Administration vi. Imaging Protocol vii. Limitations 4. Pediatric and adult case presentations

### **EREE-31 Searching for Causes of Preventable Death - Role of Early Postmortem CT in Trauma Patients**

Participants

Lain Ibanez, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

- To show an accurate protocol to perform a post-mortem CT in patients who died after severe trauma in a first-level trauma center
- To describe the main radiological features of different early deceased trauma patients and their potential relationship with the cause of death
- To identify the misplacement of medical devices in patients who died from trauma
- To determine if there was preventable death based on clinical and radiological findings

#### **TABLE OF CONTENTS/OUTLINE**

- Performing an early post-mortem CT protocol and CT technique
- Analysis of radiological and clinical features, injuries, and medical device misplacement
- Determining causes of death and their avoidability
- Conclusions

Outline: Despite the improvement in the management of trauma patients there is still a percentage who die during or immediately before receiving hospital care and before having an imaging test. This reason jointly with an increasingly low rate of autopsies, prevents to understand the causes of death and whether or not it had been avoidable. Since June 2022 the trauma and radiology teams at our level 1 trauma center decided to carry out a program to study preventable mortality in trauma patients who died before or during initial care. In this presentation we will show the design of our project, how we accomplish post-mortem CT studies and also present our preliminary results. We will show a clinical-radiological correlation of our cases, analyze the main injuries, misplacement of medical devices, causes of death and whether its avoidability. Finally the main concerns we faced and major limitations are exposed.

### **EREE-32 Beyond the Diagnosis of Appendicitis: CHAR(13) + CHAR(10) The Role of Computed Tomography in the Nonoperative Management of Acute Appendicitis in Adults**

Participants

Eliko Tanaka, MD, (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Diagnosis of acute appendicitis using computed tomography (CT) is highly accurate and established. The treatment of appendicitis includes surgery and conservative treatment, and the role of conservative treatment is expanding. However, conservative treatment has challenges, such as treatment failure and malignant tumors. CT diagnosis plays a significant role in determining the treatment plan. This presentation describes CT findings related to the indications for conservative treatment of appendicitis, as well as CT findings related to the course of conservative treatment. Additionally, it discusses challenges in CT diagnosis associated with conservative treatment, such as recurrent appendicitis or tumor complications, and presents a case series.

Teaching points include:

1. Understand the indications and contraindications for conservative management of appendicitis and its CT findings
2. Familiarize CT findings related to the course of conservative treatment for appendicitis
3. Recognize the potential complications of conservative management, such as treatment failure, malignancy, recurrent appendicitis, and identify the corresponding CT findings

#### **TABLE OF CONTENTS/OUTLINE**

1. Indications and contraindications of conservative treatment in the World Society of Emergency Surgery (WSES) guidelines
2. CT findings that suggest a high risk of failure in conservative treatment and a need for extended surgery
3. Imaging findings during the course of conservative treatment
4. Recurrent appendicitis and its CT findings
5. Differential diagnosis between tumor and non-tumor cases

### **EREE-33 Role of MR in the Diagnosis of Suspect Metastatic Spinal Cord Compression: A Pictorial Imaging Review With Medical and Radiological Scales**

Participants

Blanca Lumbreras-Fernandez, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

The learning objectives of this exhibit are:

- 1- To illustrate the spectrum of metastatic spinal cord compression (MSCC) and the scales and scores that should be included in the radiological report.
- 2- To discuss the image findings of MSCC with emphasis in epidural lesions.

#### **TABLE OF CONTENTS/OUTLINE**

- 1- Pathophysiology of MSCC, including demographics.
- 2- Review of common imaging findings in the management guidelines for MSCC. Relevance of the inclusion in the radiological report of the Epidural Spinal Cord Compression (ESCC) Scale and Spinal Instability Neoplastic Score.
- 3- Evaluation of the most representative cases of MSCC collected and their differential diagnosis with other causes of cord compression, specially epidural lesions in a non-traumatic setting through imaging cases from our center.
- 4- Conclusions: Acute compressive myelopathy is a medical emergency. Early diagnosis and treatment improve the neurological prognosis. MR is the technique of choice to confirm the diagnosis or establish an alternative one as well as to determine the level, extension, degree of compression, stability of the spine and presence of myelopathy. The incorporation of the ESCC scale and SINS to the radiological report improves multidisciplinary communication and the adequacy of urgent treatment of MSCC.

### **EREE-34 Cognitive Biases and Diagnostic Errors in Emergency Neuroradiology, A Case-Based Approach**

#### **TEACHING POINTS**

1. Introduce the dual process theory of reasoning, with a focus on the "Type 1" system, heuristics, cognitive biases, and diagnostic errors. Discuss how the emergency radiology setting may predispose toward Type 1 thinking.
2. Review different types of cognitive biases and diagnostic errors via case-based emergency neuroradiology examples.
3. Describe different strategies to combat cognitive biases and reduce diagnostic errors.

## TABLE OF CONTENTS/OUTLINE

Decision making literature theorizes there is a dual process of reasoning which is comprised of a fast, intuitive "Type 1" system and a slower, more deliberative "Type 2" system. The high volume and acuity of the emergency setting may predispose toward Type 1 thinking. In Type 1 thinking, we use a number of heuristics, or shortcuts, to improve efficiency though this comes at the cost of an increased predilection toward cognitive biases and diagnostic errors. Recognition of common cognitive biases and strategies to manage them may reduce diagnostic errors. In this education exhibit, we will review common cognitive biases using an emergency neuroradiology case-based approach to illustrate these biases in action to help recognize and counter them. Some examples of cognitive biases that will be reviewed include bandwagon effect, alliterative error, framing bias, triage cueing, satisfaction of search, confirmation bias, attribution bias, availability bias, anchoring bias, and productivity bias. We will also discuss metacognition strategies to help counter these biases.

### EREE-35 **Never Fear! Peer Learning in Emergency Pelvic and First Trimester Ultrasound**

#### TEACHING POINTS

Women presenting with acute pelvic pain and/or bleeding can pose a diagnostic challenge in the emergency setting. The differential diagnosis may be broad, and these symptoms are often indications for pelvic ultrasound (US). Interpretation of pelvic US may be tricky and a source of confusion and misinterpretation. Furthermore, cognitive biases in imaging interpretation can lead to diagnostic errors. Familiarity with common and uncommon pelvic US imaging findings is imperative to assist with prompt and accurate diagnosis. Awareness of potential biases when interpreting pelvic US further helps hone interpretation. This exhibit will illustrate the imaging findings of multiple causes of pelvic pain/bleeding in non-pregnant and first trimester pregnant patients. Diagnostic errors and biases in interpretation related to these cases will also be highlighted.

#### TABLE OF CONTENTS/OUTLINE

This exhibit will review pelvic US peer learning cases and highlight teaching pearls and potential pitfalls in diagnosis. 1. Review common and uncommon causes of acute pelvic pain/bleeding in non-pregnant patients, including ovarian/fallopian tube torsion, cysts, hydrosalpinx, fibroids, benign and malignant adnexal lesions, tuboovarian abscess. 2. Review causes of pelvic pain/bleeding in first trimester pregnant patients, including ectopic pregnancy in different locations, ruptured heterotopic pregnancy, retained products of conception, uterine AVM. 3. Review non-OB/GYN causes of pelvic/abdominal pain for which pelvic US was the initial imaging modality, including appendicitis, appendiceal mucocele, diverticulitis. 4. Review potential biases in pelvic US imaging interpretation with examples from our cases.

### EREE-36 **Plain Abdominal Radiography in the Emergency Room**

Participants

Carla Suarez Silva, MD, A Coruna, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Plain abdominal radiographs continue to be a fundamental tool in emergency rooms.- We present abdominal X-rays performed in a third-level hospital over the last few years. In all cases, the radiographs helped guide the patient's management.- The semiology of abdominal simple radiography is presented in a didactic and interactive way to achieve an adequate interpretation.- Knowing the radiological analysis of the abdominal radiograph continues to be useful for the comprehensive management of the patient.

#### TABLE OF CONTENTS/OUTLINE

This education exhibit presents a collection of 25 cases of abdominal X-rays. All cases will be presented in a structured and interactive format, beginning with an overview of the patient's clinical data, followed by the X-ray image(s), the detail of the radiological findings using visual aids, pearls and pitfalls, and the final diagnosis providing correlation with other imaging methods. Furthermore, taking advantage of the fact that all the X-rays were performed urgently, a green, yellow, or red circle will appear in the top right corner of all radiographs indicating the severity of the pathology presented by the patient. To facilitate the reading of this presentation, the name of the radiological density that will help us make an adequate interpretation of the abdominal radiograph will be displayed at the bottom of each image. The table of contents is: • Introduction • Teaching points • Table of Contents • How to approach an abdominal X-Ray? • Check all the clinical data • Technical aspects • Radiological densities • Cases • Case 1: Patient 1 • ? • Case 25: Patient 25

### EREE-37 **DECT in the Acute Setting - Bowel Trauma**

#### TEACHING POINTS

Highlight the value of Dual Energy CT (DECT) in traumatic bowel injury Understand the principles of DECT and iodine overlay map Illustrate the use of DECT and iodine overlay maps to improve diagnostic confidence and sensitivity in detecting bowel injury, contrast extravasation, free fluid, and reducing metal artifacts.

#### TABLE OF CONTENTS/OUTLINE

1. Background 2. DECT and Bowel Injury a. DECT Increases Conspicuity of Hyperattenuating Free Fluid b. Lack of Iodine Uptake in Injured Bowel c. Metal Artifact Reduction d. Contrast Extravasation 3. Conclusion

### EREE-38 **Beyond Aortoenteric and Aortocaval Fistulas - Intraabdominal Fistulas: Imaging Findings and Importance of Early Identification**

Participants

Amalia Aranaz Murillo, MD, Zaragoza, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Intraabdominal fistulas are uncommon but can be catastrophic if not identified and treated promptly. Multiphasic multidetector CT angiography (angio-MDCT) is the initial imaging choice for diagnosis. 2. The imaging signs of intraabdominal fistulas can be divided into direct and indirect signs and emergency radiologists should be familiar with them and be aware of potential mimics and maskers to avoid misdiagnosis.

#### TABLE OF CONTENTS/OUTLINE

This poster aims to provide an overview of intraabdominal fistulas, their imaging findings, and the importance of early identification and familiarize the radiologist with the mimics and maskers of intraabdominal fistulas. Intraabdominal fistulas are a rare but life-threatening condition if they are not identified and treated promptly. Imaging plays a crucial role, and angio-MDCT is often the initial imaging technique. The imaging signs of intraabdominal fistulas can be divided into direct and indirect signs. Direct signs include visualization of the fistula tract, extravasation of contrast medium, and aortic graft migration, but these signs are rarely observed. Indirect signs are often the only available evidence and include abnormalities of the aortic wall, irregularities of the interface between the aorta and the fistulizing entity, and the presence of gas or fluid collections. Although the most frequent intraabdominal fistulas are aortoenteric and aortocaval fistula, other types of fistulas and potential mimics can occur, and one should know and be aware of them. Familiarity with the different imaging modalities and the various mimics and maskers of fistulas can help in accurate diagnosis, ultimately leading to improved patient outcomes.

#### **EREE-39 Kicking, Biting, and Screaming: Common Radiological Patterns and Mechanisms of Equine-Related Injuries Presenting to the Emergency Department**

Participants

Trae Brooks, MD, BS, Lexington, KY (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

Thoracic injuries may occur in over half of horse-related trauma cases, including clavicle and rib fractures as well as hemothoraces and pneumothoraces. Clinical and imaging evaluation is crucial to rule-out underlying thoracic trauma (Chad Ball, 2007). Children who receive an injury while unmounted are likely to have more severe injuries than those who were mounted, with most trauma localized to the abdomen (Grace Wolyncewicz, 2018). Fractures are one of the most common injuries in mounted equestrians and should be suspected in patients presenting after a fall from a horse. The initial height of the rider, velocity of travel, and vulnerable position of landing are all key factors contributing to the severity and location of the fracture and need for prompt imaging and evaluation.

##### **TABLE OF CONTENTS/OUTLINE**

We will begin with an overview of horse-related trauma from a historical and epidemiologic perspective. Using a simplified algorithm, we will then discuss the classic patterns of various trauma such as fall from or with a horse while mounted and injuries sustained from direct injury from a horse while unmounted such as bite, kick, or stomp/trample injuries. Finally, we will use case-based examples with multimodality imaging to show the broad extent of injury concerning various systems - organized into Torso, Musculoskeletal/Extremity and Central Nervous System/Spine.

#### **EREE-4 CT of Appendicitis in Adults: Problematic Scans and Scenarios**

Participants

Douglas Katz, MD, Mineola, NY (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

-A non-trivial minority of CT examinations performed for suspected appendicitis - regardless of the protocol utilized - end up being challenging to interpret for a variety of reasons, in adults -This exhibit will review problematic scenarios and situations involving CT performed for right lower quadrant pain in non-pregnant adults -Review uncommon/atypical/unusual presentations of appendicitis and its potential mimics and potential pitfalls, as well as some of the more common problematic scenarios -Demonstrate examples of these CT scenarios from our practices -Briefly overview QA and medical-legal issues in suspected appendicitis in adults with an emphasis on CT

##### **TABLE OF CONTENTS/OUTLINE**

Outline: -Oral contrast - to use or not to use on CT? -Subtle/early findings -Perforated appendicitis- review of the literature -The right lower quadrant 'phlegmon' -Potential pitfalls and confounders - right colonic diverticulitis, 'secondary' appendicitis, distal/tip appendicitis, the non-visualized appendix, chronic/relapsing appendicitis, and resolving appendicitis -Appendicitis and rotation anomalies -Stump appendicitis -Appendicitis in hernias -Appendicitis and underlying neoplasms -Additional potential errors, quality assurance issues, and medical-legal issues

#### **EREE-40 Abdominal Hemorrhage on MRI: Findings and Pitfalls**

Participants

Bertin Mathai, MD, Bronx, NY (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

Non-traumatic intra-abdominal hemorrhage can be due to multiple etiologies and can be a source of acute abdominal pain and life threatening blood loss. Prompt radiologic identification and localization of hemorrhage is crucial for appropriate decision-making and management. Acute intra abdominal hemorrhage is usually diagnosed by computed tomography (CT). Magnetic resonance imaging (MRI), is less frequently used in the acute setting, and radiologists may be less familiar with the appearance of blood and potential etiologies of hemorrhage, such as ruptured aneurysms and hemorrhagic masses. The signal characteristics of hemorrhage can vary depending on both the age of the hemorrhage as well as its background location. The superior soft tissue resolution of MRI can help characterize intra-abdominal blood products in cases where CT is indeterminate, and can help diagnose an underlying mass in cases where it is obscured by blood on CT. This educational exhibit will discuss the timeline of hemorrhage with respect to MRI signal, show multiple causes of spontaneous intra abdominal bleeding, and highlight scenarios where MRI can provide added value in diagnosing the source of hemorrhage.

##### **TABLE OF CONTENTS/OUTLINE**

1) Background 2) Molecular and Magnetic Timeline of Blood 3) Optimizing MRI Protocol to Visualize Blood 4) Differential Diagnosis / Cases 5) Literature Review 6) Conclusion 7) References

#### **EREE-41 Pre-Hospital Emergency Medicine: A Spectrum of Imaging Findings**

##### **TEACHING POINTS**

This educational exhibit aims to: 1) Increase awareness and understanding among radiologists of the principles of Pre-Hospital

Emergency Medicine 2) Review imaging which illustrates techniques used by Emergency Medical Services (EMS) providers 3) Highlight pertinent radiologic findings which call attention to potential complications arising from pre-hospital care.

#### **TABLE OF CONTENTS/OUTLINE**

Topics covered within this presentation include: 1) Introduction to Pre-Hospital Emergency Medicine--Including Purpose of Emergency Medical Services (EMS) and Scope of practice of EMS providers; 2) Airway Management--Including Endotracheal intubation and Surgical airways; 3) Cardiopulmonary Resuscitation--Including Use and effects of mechanically-assisted chest compressions, Radiologic findings of decompressive needle thoracostomy (DNT), and Efficacy of intraosseous vascular access for resuscitation and IV contrast administration; 4) Techniques of Patient Immobilization--Including Imaging appearance and appropriate positioning of cervical spine collars, Imaging appearance and clinical benefit of hemostatic tourniquets, and Imaging appearance and appropriate positioning of pelvic binders

#### **EREE-42 Immediate-CT with Hybrid Emergency Room System for Severe Trauma Patients**

##### **TEACHING POINTS**

•Several studies have shown that trauma whole-body CT has facilitated the early identification of major injuries and a reduction in mortality and morbidity. •HERS (Hybrid-Emergency Room System) is an all-in-one concept of emergency room with the functions of CT scanner, interventional radiology and surgery, and useful in critical trauma treatment strategies. •HERS in trauma treatment can be performed from diagnosis to treatment without transporting the patient, so it is possible to significantly reduce the time.

##### **TABLE OF CONTENTS/OUTLINE**

•We devised a new trauma treatment strategy using HERS. This is "immediate CT protocol" in which CT scan is performed immediately after arrival at the hospital. •The immediate-CT(i-CT)protocol is optimized for CT scans immediately after arrival at the hospital. •This protocol enabled rapid diagnostic imaging for critical traumatized patients. And, can provide more information than ultrasound, X-ray used in "primary survey". It is also possible to find major damage earlier. •By detecting brain injury, aortic injury, retroperitoneal hematoma, lung injury, and spine injury, early activation of injuries that require referral to other departments is now possible. And we call it "BARLS". •We demonstrated that the i-CT protocol leads to reduction of the time from arrival to CT scans without adverse events. As a result, we have contributed to the planning of treatment strategies and early activation of specialized treatment. •This novel trauma treatment strategy can contribute to improving the life-saving rate

#### **EREE-43 Multiphase CT Angiography Using a Time-Variant Color Map: How Can It Contribute to the Improvement of the Diagnosis and Management of the Acute Stroke?**

##### **TEACHING POINTS**

- Multiphase CT Angiography (mCTA) offers several advantages over single-phase CTA (sCTA) and contributes to improving the diagnosis and management of the acute ischemic stroke (AIS). - mCTA increases interrater agreement for both proximal and distal vessel occlusions compared with sCTA and reduces time needed to detect the occlusion. - mCTA helps to characterize the thrombus length and thrombus permeability, which may influence the treatment. - mCTA improves characterization of collateral status, that may be a useful fact in the management of some patients with AIS. - mCTA has potential value in delineating the core ischemic area and detecting tissue at risk. - mCTA can also be useful in hemorrhagic stroke. It improves prediction of intracerebral hemorrhage expansion and improves the evaluation of venous vessels and the diagnosis of vascular malformation. - mCTA may be useful in the characterization of stroke mimics.

##### **TABLE OF CONTENTS/OUTLINE**

Multiphase CTA (mCTA) provides time-resolved images of the cerebral vasculature that are useful in patients with acute stroke. An arterial (red color) and 2 venous phases are acquired ( peak venous phase in green, and late venous phase in blue) are acquired. We review the role and potential of CTA in patients with ischemic and hemorrhagic stroke, its advantages over sCTA, its limitations and its usefulness in the evaluation of stroke mimics.

#### **EREE-44 Visceral Ischemia: What Should the Emergency Radiologist Know?**

Participants

Silvia Cayon Somacarrera, MD, Torrelavega, Spain (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

To describe the key radiological features of visceral ischemia, including cases of liver, gallbladder, pancreas, spleen, renal, stomach and intestine ischemia. To understand the pathophysiology behind those radiological findings

##### **TABLE OF CONTENTS/OUTLINE**

The infarct's shape depends on the distribution of the vascular tree. The organs with hilum show wedge-shaped infarcts (eg. liver, kidney, spleen) while the organs without hilum show infarctions that extend through the different wall layers (eg. intestine). We collected the most illustrative cases of visceral ischemia of the last years in our institution to show the key characteristics to make a quick and accurate diagnosis. Mesenteric ischemia has a very high mortality rate if not properly treated. The key findings to evaluate are: mesenteric vessels, intestinal walls and the existence of gas (pneumatosis/pneumoperitoneum). Hepatic ischemia is uncommon due to its double vascular supply. The most typical finding is wedge-shaped hypodense areas but we can also find rounded or tubular areas parallel to the bile ducts. Renal ischemia is most often caused by renal artery embolism. Focal infarcts are depicted as hypodense triangular areas. Complete infarcts present as generalized hypoattenuation of the renal parenchyma. Splenic ischemia is relatively common. Acute infarcts are shown as triangular hypodensities, subacute infarcts as cystic images while in chronic infarcts calcifications or atrophy can be seen. Cortex preservation may be observed in complete renal/splenic infarcts due to collateral circulation.

#### **EREE-45 Evaluating Primary and Secondary Endpoints in Intracranial Hemorrhage AI Algorithms - A Review of Current Market Algorithms and a Proposed Retraining Model for Improving Patient Triage**

Participants

Raviteja Suryadevara, MD, Louisville, KY (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

The implementation of AI algorithms for intracranial hemorrhage (ICH) in the ED setting can expedite detection, triaging, and timely intervention. Most AI algorithms, in addition to their binary primary endpoint of -ICH or +ICH, also collect secondary outcome endpoint data (processing time, bleed location, bleed volume calculation). Based on trauma volume and workflow of ED practice, these algorithms should be employed accordingly. Retrospectively retraining AI algorithms to collect data on secondary outcome endpoints should be a flexible option. Retraining AI for additional primary endpoints allows for improved triaging. Specifically, in patients with intracranial hemorrhages, additional triaging of the ED reading list based on bleed volume and subtype would allow for communication and subsequent timely treatment of patients with the highest potential morbidity or mortality first. Any proposed AI retraining model, though technically sound, has challenges with acquisition of new patient data for retraining.

#### TABLE OF CONTENTS/OUTLINE

Workflow in the ED for suspected traumatic/spontaneous ICH. Where AI algorithms can help in the ED setting. Currently approved 510(k) premarket cleared algorithms for ICH detection. Quantitative evaluation of ICH AI algorithms based on primary and secondary outcomes. Retraining AI algorithms for secondary endpoints: technical logistical challenges. Conclusion. References

#### EREE-46 Life-Threatening Acute Aortic Lesions Beyond Acute Aortic Syndrome

##### TEACHING POINTS

TEACHING POINTS: - Many potentially severe acute aortic lesions exist beyond the classical spectrum of acute aortic syndrome (AAS). - Life-threatening acute aortic conditions may result from traumatic injuries, iatrogenic lesions, infectious complications or aneurismatic rupture.

#### TABLE OF CONTENTS/OUTLINE

TABLE OF CONTENTS: Aortic lesions can be life-threatening and require immediate medical attention. Imaging techniques play a critical role in the diagnosis because the clinical presentation is variable and nonspecific. Moreover, CT and MRI provide fundamental information for surgical planning. AAS is a well-known medical emergency with high mortality when left untreated. However, it may show an atypical appearance and many other potentially severe acute aortic lesions beyond the classical AAS also demand immediate diagnosis. These include traumatic injuries, iatrogenic lesions, infectious complications and aneurismatic rupture. Significant traumatic injuries are classified as intramural hematomas, pseudoaneurysms and aortic ruptures. Iatrogenic lesions are usually the result of invasive coronary interventions or aortic stent placement. Mycotic pseudoaneurysms are included in the spectrum of infectious aortitis. Ruptured thoracic aneurysms are rarely imaged due to their lethality. Finally, we review atypical presentations of AAS that also need to be considered, such as intimal intussusception or dissection extension into the pulmonary arteries.

#### EREE-47 Non-Obstetric- Emergencies in Pregnancy: Imaging Pathway, Findings, and Special Considerations

##### TEACHING POINTS

1. Imaging pregnant patients require special considerations and non-ionizing radiation imaging is preferred (US/MRI). However, CT in trauma and acute settings should not be delayed due to concern for radiation. 2. Knowledge of specific non-obstetric pathologies affecting pregnant patients and their imaging appearance is crucial for timely and accurate diagnoses of acute and traumatic conditions. 3. Shared decision making? with the patient is important to weight risks and benefits of imaging tests if time permits.

#### TABLE OF CONTENTS/OUTLINE

1. Review risks and safety of different imaging modalities in pregnancy (dose of fetal radiation and associated risks, iodinated and gadolinium contrast agents). 2. Special considerations when imaging pregnant patients (positioning in scanner, contrast reaction and management, recommendations regarding lead shielding). 3. Trauma imaging in pregnancy: Review imaging pathway and traumatic pathologies at higher risk in pregnant patients (retroperitoneal hemorrhage?, liver, spleen, renal and bladder injuries?). 4. Acute non-traumatic pathologies: incidence and pathophysiology in pregnancy, imaging pathway and findings, for example: (a), Abdomen: Acute cholecystitis, choledocholithiasis, appendicitis, renal stone/urosepsis, bowel obstruction, colitis, (b) Chest: Pulmonary embolism, pneumonia, (c) Neuro: Cerebral venous thrombosis, seizures, stroke, (d) Vascular: Complicated AVM, deep venous thrombosis, arterial occlusion.

#### EREE-48 Pictorial Review of Orbital Emergencies

Participants  
Wen Wang, MD, Orlando, FL (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

Teaching Points: 1. A simplified anatomic checklist-based approach can enable an emergency radiologist to accurately and efficiently identify acute temporal bone pathology, and this approach will be reviewed in this exhibit. 2. The radiologist plays an important role by identifying key imaging findings and providing diagnoses that can direct treatment by prompting an emergency physician to admit a patient for inpatient management, order a surgical consult, or order further imaging to check for related complications. The absence of these findings are also pertinent negatives that enable clinicians to proceed with treatment in the ED or discharge a patient with outpatient follow-up. 3. This exhibit will review traumatic and acute non-traumatic pathology in a case-based format, with emphasis on key imaging findings that affect management and prognosis.

#### TABLE OF CONTENTS/OUTLINE

I. Relevant anatomic review of the orbit II. Checklist for traumatic and non-traumatic pathology III. Non-traumatic Pathologies: i. Infection Preseptal cellulitis Postseptal cellulitis Dacryocystitis Subperiosteal abscess ii. Non-infectious inflammatory pathology Sarcoidosis Optic neuritis iii. Detachment Retinal detachment Choroidal detachment IV. Traumatic pathologies: i. Fractures Blowout fractures/wall fractures Lefort II and III fractures Naso-orbito-ethmoid fractures Optic canal fracture ii. Penetrating trauma Paint gun injury Gunshot injury

#### EREE-49 We've Got Your Back: How Radiologists Can Aid Surgical Decision Making By Using the AO Spine Classification System

Participants  
Andrew Simmerman, MD, Baltimore, MD (*Presenter*) Nothing to Disclose

## TEACHING POINTS

AO Spine Injury Classification systems offer reliable and clinically relevant morphology descriptions for spinal trauma imaging. Subaxial cervical and thoracolumbar injuries are classified as A: compression, B: tension band/distraction, C: displacement/translational. A B have subtypes. The motion segment is the spine's functional unit, by which tension band and displacement injuries are labeled. Fracture morphology, neurologic signs, and patient factors influence conservative or surgical management. MRI and dynamic radiography help assess for ligamentous injuries. Rigid spines and osteoporosis affect treatment. Cervical spine specifics include facet injury, disc herniation, cerebrovascular injury, and unique ligamentous injuries at the occiput-C1-C2 levels.

## TABLE OF CONTENTS/OUTLINE

Overview Goals of classification and radiological reporting Spinal bone and ligamentous anatomy Motion segment and tension band concepts Subaxial cervical and thoracolumbar injuries Type A: Compression Type B: Distraction Type C: Translation Type F: Facets (subaxial) Modifiers Indeterminate/incomplete tension band injuries Stiffening and metabolic bone diseases Critical disc herniation Cerebrovascular injury Upper cervical injuries A: Bone-only B: Ligamentous without complete separation C: Translation

## EREE-5 Broken Beauty: How Can I Make a Good Interpretation of a Facial Trauma on CT?

Participants

Elena Julian Gomez, MD, Santander, Spain (*Presenter*) Nothing to Disclose

## TEACHING POINTS

- To review the facial radiological anatomy and to remember the different systems that organize it.- To propose a systematic approach for the evaluation of the facial bone mass, depending on the functional relationships between the structures.- To know the typical radiological patterns of facial fractures, taking into account some "key ideas" that we must remember, because they sometimes modify the therapeutic management.- To recognize the complications that can be associated with facial fractures depending on their location.- To emphasize the importance of making an useful radiological report for the requesting physician, with an organized description of the fractures.

## TABLE OF CONTENTS/OUTLINE

1. Radiological facial anatomy: 1.1. Three thirds system: upper (frontal), middle (from upper orbital rim to upper maxilla) and lower (mandible). 1.2. Facial buttress system: there are 4 vertical and 4 horizontal buttresses that emphasize the functional relationships between the different facial bones.2. Systematic assessment of the facial mass: 2.1. Fractures of the upper third (frontal). 2.2. Fractures of the middle third: isolated (e.g. nasoseptal fractures) or complex (le Fort fractures, fractures of the nasal-orbital-ethmoidal complex and fractures of the zygomatic-maxillary complex). 2.3. Fractures of the lower third (mandibular). Within each section, we will discuss typical radiological fracture patterns and "key ideas" to remember.3. Complications that may be associated depending on the affected buttress.4. How to make an adequate radiological report useful for the requesting physician, without falling into the error of making a "shopping list" with the affected bones.

## EREE-50 The Role of CT in Non-occlusive Mesenteric Occlusion for Diagnosis, Therapeutic Strategy, and Patient Management

Participants

Akitoshi Inoue, MD, PhD, Otsu, Japan (*Presenter*) Nothing to Disclose

## TEACHING POINTS

Non-occlusive mesenteric ischemia (NOMI) is characterized by segmental and skipped bowel ischemia caused by vasospasm without mechanical stenosis in the superior mesenteric artery (SMA). NOMI is a life-threatening condition, and the mortality is high. Even in survival cases, nutrient malabsorption called short bowel syndrome resulting from bowel resection for necrotized small bowel may require lifetime intravenous nutrition. CT depicts spastic SMA and branches and is considered a diagnostic tool instead of invasive angiography. Regarding the bowel, heterogeneous imaging findings, including absent enhancement, hemorrhagic necrosis, pneumatosis, and paper-thin wall appearance, can be observed, which reflects skip-segmental bowel necrosis on macroscopic findings. Additionally, CT plays an essential role in predicting the severity of bowel ischemia and reperfusion as the imaging findings reflect dynamic pathophysiology caused by vasospasms in the superior mesenteric region.

## TABLE OF CONTENTS/OUTLINE

1. To illustrate the etiology and pathophysiology of NOMI2. CT image findings in the superior mesenteric artery and branches, and small bowel 3. Challenge to predict the viability of ischemic bowel on CT 4. Case presentation with tips and pitfalls for NOMI 5. Differential diagnosis (mesenteric artery occlusion, mesenteric venous occlusion, strangulated bowel obstruction, and pneumatosis intestinalis) 6. Summary

## EREE-51 Where Is the Catheter Tip? Chest Radiograph Findings of Incorrect Placement Comparison With CT and Normal Radiographs

Participants

Masafumi Sakai, MD, Tsukuba, Japan (*Presenter*) Nothing to Disclose

## TEACHING POINTS

In the intensive care unit, catheters and tubes are inserted into patients. Incorrect catheter placement can lead to various complications; detecting incorrect placement on chest radiographs is essential for early intervention and improved patient outcomes. However, incorrect catheter placement is easily overlooked if there is no comprehensive understanding of the three-dimensional anatomy of the chest and correct placement of the catheter on chest radiographs. Furthermore, new devices have also been introduced recently, which radiologists need to be familiar with. The purpose of this exhibit is: 1. To explain chest radiographic findings of incorrect catheter placement correlating with CT and comparison with the normal position. To explain the complications and pitfalls associated with incorrect catheter placement

## TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Case presentation I Central venous catheter Arterial misplacement Misplacement in small veins (azygos veins,

etc.) Catheter fragmentation Pitfalls (vascular anomaly, etc.) | Swan-Ganz catheter Misplacement of the peripheral pulmonary artery (PA). Complications (pseudoaneurysm of the PA) | Subcutaneous implantable cardioverter defibrillator Misplacement in anterior mediastinum | Endotracheal tube One-lung ventilation Pitfalls (tube tip shifts in accordance with neck flexion and extension) | Chest tube Misplacement in the interlobar fissure Misplacement in the lung | Epidural catheter Misplacement outside the epidural space | Etc. 3. Summary 4. Conclusion

#### **EREE-52 Dual Energy CT in Acute Inflammatory and Infectious Processes of the Head and Neck. The 4 P: Protocols, Post-processing, Pearls and Pitfalls**

Participants  
Paloma Puyalto, PhD, MD, Barcelona, Spain (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

Dual energy CT (DECT) images combine data from a wide range of energy acquisitions without impacting patient dose. In contrast to single energy CT (SECT), which uses only energy around 70 keV, virtual monochromatic images (VMI) can be reconstructed at any level of energy within a 40-150 keV range. Lower energies allow better delimitation of inflammatory tissue enhancement although this increases image noise ratio. Higher energies enable the virtual subtraction of iodine contrast, which improves calcium identification and reduces metallic artifacts. Material decomposition maps allow better identification of neck abscesses. The main purposes of this exhibit are: 1- To describe the DECT image acquisition protocols and post-processing methods. 2- To illustrate DECT findings and main tips in head and neck inflammatory and infectious diseases within different locations and its SECT correspondence. 3- To outline the differential diagnosis, potential pitfalls in DECT, and how to avoid them.

##### **TABLE OF CONTENTS/OUTLINE**

1-DECT protocol. 2-Post-processing techniques (VMI and material decomposition maps). 3-Case-based image examples of DECT and SECT correspondence for ears, orbits, paranasal sinuses, salivary glands, dental, pharyngeal, and para-pharyngeal mucosal inflammatory and infectious processes. 4- Pearls, pitfalls, and differential diagnosis in DECT images.

#### **EREE-53 At Arm's Length: Upper Extremity CT Angiography and Neurovascular Pathology**

Participants  
Andrew Sinensky, MD, Baltimore, MD (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

1) Upper extremity (UE) vascular pathology can be conceptualized anatomically: the shoulder, arm, elbow, forearm, and hand. 2) CT angiography (CTA) and digital subtraction angiography (DSA) play a vital role in diagnosis and management of acute neurovascular pathology. 3) The thoracic outlet is the neurovascular outflow of the UE; thoracic outlet syndrome (TOS) results as the consequence of disruption of this outflow. 4) Non-traumatic vascular pathology of the UE is less common than lower extremity pathology and is often thromboembolic or anatomic in etiology. 5) Trauma of the UE has classic artery/nerve injury pair associations, such as at Guyon's canal (ulnar artery + nerve) and the mid-humerus (deep brachial artery + radial nerve).

##### **TABLE OF CONTENTS/OUTLINE**

1) UE Anatomy A) Arterial B) Venous C) Brachial plexus D) Thoracic outlet 2) CTA and DSAA) Technical considerations B) Pitfalls 3) Other Modalities A) Ultrasound B) MR4) Atraumatic A) Central (thromboembolic, aortic dissection) B) Peripheral (atherosclerosis, aneurysm/pseudoaneurysm, vasospasm) C) External compression (TOS, quadrilateral space syndrome) D) Systemic (vasculitis, connective tissue disorders) E) Dialysis grafts and fistulas 5) Blunt and Penetrating Trauma A) Vascular injury (pseudoaneurysm, arteriovenous fistula, laceration) B) Neurologic injury (transection, compression) C) Neurovascular injuries by region (shoulder, arm, forearm, elbow, wrist, hand) 6) Management A) Surgical B) Endovascular C) Post-operative imaging considerations D) Complications

#### **EREE-54 Imaging Spectrum of Extremity Vascular Emergencies: CTA-Angiographic Correlation**

##### **TEACHING POINTS**

1) To discuss the common mechanisms for traumatic and non-traumatic peripheral vascular emergencies as well as their management 2) Differentiate pertinent imaging features of traumatic and non-traumatic peripheral vascular emergencies 3) To juxtapose CT angiography and conventional angiographic findings for each etiology

##### **TABLE OF CONTENTS/OUTLINE**

1) Basic mechanisms of vascular injury 2) The advantages and drawback of CTA compared to conventional angiography in the setting of traumatic vascular injury 3) Common imaging features and clinical signs that suggest vascular emergency 4) CT angiographic and conventional angiographic correlation for several traumatic peripheral vascular emergencies - Laceration - Transection - Intramural Hematoma - Arteriovenous Fistula - Vasospasm - Intimal Dissection - Pseudoaneurysm - Thrombosis 5) CT angiographic and conventional angiographic correlation for several non-traumatic peripheral vascular emergencies - Embolism - Vasculitis - Acute DVT - May Thurner's Syndrome - Vessel Entrapment 6) Discussion of each etiology's pertinent imaging, clinical features, as well as their management

#### **EREE-55 Ischemic Bowel: A Challenging Imaging Diagnosis**

##### **TEACHING POINTS**

- Briefly examine the epidemiology and common causes of ischemic bowel (IB) disease. - Master anatomic and morphologic imaging findings of IB on CT. - Understand recommendations for additional imaging to increase diagnostic certainty, including the utility of arterial phase or multiphase CT imaging. - Learn indications for surgical vs. nonsurgical management of IB and the role of the radiologist in guiding management.

##### **TABLE OF CONTENTS/OUTLINE**

CT is the preferred imaging technique for diagnosing ischemic bowel, as it outperforms laboratory and physical exam findings in reliability and accuracy. However, CT may only detect nonspecific signs of mesenteric ischemia, bowel dilatation, bowel wall thickening, bowel obstruction, mesenteric edema, mesenteric stranding, mesenteric vascular engorgement, and ascites. In this exhibit, we review the causes of IB including vascular (thrombosis, embolism, vasculitis), anatomic (volvulus, neoplastic), and

systemic (hypoperfusion). Each diagnosis is accompanied by multiple CT cases highlighting specific and subtle imaging findings with a focus on imaging findings which alter management. Follow-up via imaging (CT angiography, MRI, MR angiography) or intervention (colonoscopy, surgical, catheter based) are reviewed with multimodality cases. Timely and accurate diagnosis of IB is crucial for guiding management, preserving bowel viability, and reducing morbidity/mortality and the radiologist is central in this clinical cascade.

### **EREE-56 The Diagnostic Ability of Postmortem Imaging for the Cause of Death**

Participants

Yu Nakaki, Hiroshima, Japan (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Postmortem imaging is widely used to identify the cause of death. Although postmortem imaging can help to determine the cause of death, its diagnostic ability depends on the subject and the methodology applied. In >65% of cases, postmortem CT (PMCT) is useful for identifying the cause of unnatural deaths because traumatic changes can be detected. On the other hand, since cardiac disease, e.g. myocardial infarction, lethal arrhythmia, and pulmonary thromboembolism cannot be diagnosed by PMCT, it is useful in only 40-50% of natural deaths. Therefore, contrast-enhanced PMCT and postmortem MRI (PMMRI) have been introduced. We describe the diagnostic ability of postmortem imaging, demonstrate the causes of deaths that can be diagnosed by postmortem imaging, and alert to interpretation pitfalls.

#### **TABLE OF CONTENTS/OUTLINE**

1. Diagnostic ability of PMCT for •Unnatural deaths •Natural deaths 2. Diagnostic ability of contrast-enhanced PMCT 3. Diagnostic ability of PMMRI 4. Causes of death that can be diagnosed by postmortem imaging •Aortic dissection •Aortic aneurysm rupture •Sub-arachnoid hemorrhage •Cerebral hemorrhage •Gastrointestinal bleeding/occlusion/perforation •Pulmonary thromboembolism 5. Pitfalls of postmortem imaging

### **EREE-57 Obstetric Ultrasound: What Not to Miss for the ER Radiologist**

#### **TEACHING POINTS**

1. Obstetric ultrasound is an excellent tool to assess maternal, fetal, and placental parameters in all trimesters due to its noninvasive nature, ease of availability, portability, and lack of ionizing radiation. It is the first-line method used in the evaluation of pregnant patients. 2. Transvaginal ultrasound is an excellent modality in the first trimester for adequate characterization of fetal abnormalities. 3. The focus of second and third trimesters should be on the evaluation of fetal viability and potentially life-threatening abnormalities.

#### **TABLE OF CONTENTS/OUTLINE**

1. Normal pregnancy parameters to look for in emergent obstetric ultrasounds. 2. Classification of obstetric emergencies by maternal, fetal, and placental anomalies. 3. Maternal abnormalities. First trimester. Ectopic pregnancy. 1. Adnexal. 2. Abdominal. Interstitial and cervical implantation. 3. Molar pregnancy. b. Second and third trimesters. i. Uterine dehiscence/rupture. ii. Cervical and adnexal abnormalities. 4. Fetal abnormalities. a. First trimester. Major fetal structural abnormalities. ii. Nonviable pregnancy. b. Second and third trimesters. i. Fetal hemorrhage. ii. Amniotic fluid abnormalities. iii. Doppler abnormalities. 5. Placental abnormalities. a. Placenta Previa. b. Placental abruption. c. Vasa Previa. d. Placenta accreta spectrum. 6. Pitfalls in the diagnosis of common obstetric emergencies. a. Corpus luteal cyst vs Ectopic pregnancy. b. Post C-section changes vs uterine dehiscence. c. Placenta previa vs contraction

### **EREE-58 An Approach to Lateral Shoulder Impact Injuries: What the Radiologists Need to Know**

Participants

Michael Lee, Vancouver, BC (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

1. Review the normal anatomy of the shoulder using radiographs. 2. Varying injuries can be sustained from lateral shoulder impacts (LSIs), including soft-tissue and osseous injuries. 3. Systematic approach for LSIs is essential to avoid missing injuries. 4. Dual-energy computed tomography (DECT) can be used to support the radiological evaluation of LSI injuries. The shoulder girdle is often injured and requires imaging in lateral impacts (e.g. in sports or pedestrian impacts), and can account for up to 4% of emergency department visits. Injuries may involve the clavicle, humerus, scapula, rotator cuff muscles, and the acromioclavicular and glenohumeral joints. To increase diagnostic accuracy, systematic search patterns are often utilized by radiologists. A systematic approach to common injuries encountered in LSIs may be useful for radiologists and trainees who evaluate acutely presenting patients.

#### **TABLE OF CONTENTS/OUTLINE**

1. Disclosures 2. Learning Objectives 3. Shoulder Anatomy and Stability 4. Clavicular Fractures 5. Acromioclavicular Fractures 6. Scapular Fractures 7. Proximal Humeral Fractures 8. Anterior Shoulder Dislocations 9. Dual-Energy CT in LSI 10. References

### **EREE-59 A Technical Perspective on CT Perfusion Pitfalls and Roadmap for Troubleshooting**

Participants

Ahmed Moawad, MD, Darby, PA (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

- Illustrate the acquisition protocols for CTP in stroke patients- Introduce the perfusion parameters and thresholds for identifying core infarction and penumbra- Highlight different image processing algorithms- Demonstrate workflow for post processing software- Case based review of technical pitfalls of CT perfusion processing and acquisition

#### **TABLE OF CONTENTS/OUTLINE**

\* Introduction about acquisition of CTP and its parameters\* Diagnostic criteria for stroke/penumbra and threshold for each parameter \* Different types of image processing: Maximum slope technique and Deconvolution. \* General workflow for automated post-processing software.\* Technical pitfalls during acquisition:# Patient motion- Effect of patient interscan motion on image

registration.- Streak artifact as a result of intrascan motion- Motion correction algorithms. # Head position- Perfusion asymmetry due to head tilt\* Types of technical pitfalls in CTP processing:# Different CT perfusion thresholds for infarction.# Image alignment and registration pitfalls- Skull stripping and brain segmentation algorithm # Arterial inflow (AIF) selection pitfalls.- Arteries to use an input Criteria of correctly selected AIF- Troubleshooting AIF selection # Region of interest (ROI) selection pitfalls- Optimum position of the venous ROI- Troubleshooting ROI selection.# Time attenuation curves (TAC) pitfalls- Normal characteristics of the TAC- Bolus arrival time and first moment time- Curve Truncation

## **EREE-6 Black Belts, Bruises, and Breaks: A Radiological Journey Through the Brutal World of Martial Arts Injuries**

### **TEACHING POINTS**

1. As the popularity of martial arts rises, injuries increase. Radiologists must recognize common and uncommon injuries associated with specific fighting disciplines. 2. Martial arts can be categorized as striking versus grappling. Understanding differences in movements and mechanisms can predict injury patterns.3. Head and limb injuries commonly occur during striking, while joint and spine injuries are often seen with grappling.4. Experience, age, and setting are important considerations.

### **TABLE OF CONTENTS/OUTLINE**

Striking:Muay Thai/ Taekwondo/ Boxing Head Skull (strikes score points)Mandible/orbit fractures and dislocations Spine Cervical sprains/strains (clinch technique)Torso Rib fractures, solid organ injury (SOI)Upper ExtremitiesFractures/dislocations/ligament injuries/bursitis (blocking kicks/punching hard surfaces/overuse)Lower ExtremitiesFractures/soft tissue/ligament injuries (repeated high kicking/kicking hard surface/rotation+jumping)Grappling:Judo/ Brazilian Jiu Jitsu/ WrestlingHeadAuricular hematomas (friction)SpineFractures/subluxations/disc herniations (hyperextension/throw injuries)Torso Pectoralis major rupture (hyperextension)Upper ExtremityDislocation/fractures/ligament tears (Kimura/fingers blocked in the swell of the Kimono)Lower ExtremityMeniscus/ligament tears/bursitis (Osotogari/footlock)

## **EREE-60 Beyond Bones on the Trauma Spine CT: Critical Injuries in the Nonfractured Spine; a Case-based Review of Subtle But Important Nonosseous Findings the Neurosurgeon Needs to Know**

Participants

Brad Wright, PhD,MD, Salt Lake City, UT (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

\* A trauma spine CT that is negative for fracture may have subtle but important traumatic findings that should prompt an MRI for further workup, because they may require surgical intervention. These findings include signs of unstable ligamentous injury and signs of potential cord compression. \* Widening of an anterior disc space suggests an unstable hyperextension injury, with rupture of the anterior longitudinal ligament. \* Widening of an interspinous distance suggests an unstable hyperflexion injury, with rupture of the posterior ligamentous complex. \* Widening of one or both atlantooccipital joints and widening of one or both C1-C2 facet joints suggests atlantooccipital subluxation and atlantoaxial subluxation, respectively, with capsular injury and potential injury to other ligaments. \* Although spinal epidural hematomas and disc herniations are better evaluated on MRI, they can often be identified on CT, especially if they are large and more likely to require surgery.

### **TABLE OF CONTENTS/OUTLINE**

\* Introduction\* Hyperextension injuries\* Hyperflexion injuries\* Atlantooccipital and atlantoaxial subluxation\* More obvious malalignment (with fractures): distraction injuries and dislocations\* Spinal epidural hematoma and disc herniation

## **EREE-61 Mesenteric Pathologies in Emergency Imaging**

Participants

Christian Gomez, MD, Atlanta, GA (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

-Describe the anatomy of the peritoneum, mesentery and omentum.-Review mesenteric pathologies in a systemic approach with multi-modality imaging.-Differentiate commonly encountered mesenteric pathologies according to imaging and clinical characteristics.-Understand which mesenteric pathologies require follow-up or acute intervention.

### **TABLE OF CONTENTS/OUTLINE**

Mesenteric abnormalities are often encountered during emergency imaging. The imaging findings are often nonspecific and encompass a wide range of pathologies. In this exhibit, we review a spectrum of diseases with key imaging and clinical findings. We also highlight patient symptomology, key diagnostic features, potential acute complications, and follow up recommendations. This exhibit will review the anatomy of the peritoneal cavity, mesentery, omentum, and the peritoneal fluid circulation. Pathologies discussed include:-blunt and penetrating trauma?-secondary infiltration of the mesentery from edema or bowel inflammation?-varying stages of sclerosing mesenteritis?-sclerosing encapsulating peritonitis?-tuberculosis; omental infarct ?-primary and secondary mesenteric malignancies - carcinoid, dermoid, lymphoma, metastases, carcinomatosis, primary mesenteric mesothelioma, desmoplastic round cell, GIST, and mesenteric paraganglioma ?-cystic lesions - pseudomyxoma peritonei, inclusion cyst, duplication cyst, lymphangioma, and pseudocyst.

## **EREE-62 10 Points That Force You to Think About Intraabdominal Compartment Syndrome**

Participants

Almudena Gil Boronat, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

1. To review intra-abdominal hypertension (IAH) and abdominal compartment syndrome (ACS) 2. Role of body CT in evaluation abdominal compartment syndrome

### **TABLE OF CONTENTS/OUTLINE**

Background: Revision of intra-abdominal hypertension and intra-abdominal compartment syndrome. • Definition • Risk factors • Recognition of suspicious clinical situation and analytical findings Identification of characteristic CT features associated with IAH and

ACS. • Determining the etiology • To describe the standardized measurements used in CT to radiologically suggest the diagnosis • To propose 10 key points to not miss the diagnosis • Limitations of CT Algorithm for diagnosis of this entity and management of the patients. Conclusion Bibliography.

### **EREE-63 Computed Tomographic Angiogram (CTA) of the Upper Extremities**

Participants

Richard Tsai, MD, St. Louis, MO (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Teaching Points: With the advancement of cross-sectional imaging and sub-mm isotropic data acquisition, computed tomographic angiography (CTA) has become an excellent non-invasive diagnostic tool for the evaluation of the upper extremity vasculature. CTA is able to evaluate for vessel patency, irregularity, and achieve the anatomic detail needed in pre-operative planning. It is generally performed in the setting of trauma, but can also be used to evaluate other causes and sources of acute limb ischemia, and vasculitides. In this review, the normal vasculature and common anatomic variations will be presented, with a focus on trauma, acute limb ischemia, and vasculitis.

#### **TABLE OF CONTENTS/OUTLINE**

This exhibit is on the RadioGraphics Needs List under Emergency Radiology: Upper extremity CT angiography. This exhibit will: 1) Discuss the imaging technique and rationale for upper extremity CTA 2) Illustrate normal anatomy and commonly encountered anatomic variants 3) Illustrate the utility of upper extremity CTA for the evaluation of trauma, vasculitis, acute limb ischemia, and pre-operative planning 4) Describe pitfalls in interpretation of upper extremity CTA Outline: Normal anatomy and common anatomic variants Imaging protocols and interpretation Pitfalls: -Streak (instrumentation, contrast bolus on ipsilateral side) -Motion -Outrunning the bolus Trauma: -Occlusion -Vasospasm -Active extravasation -Pseudoaneurysm -Arteriovenous fistula Acute limb ischemia: -Thromboembolism -Stents and complications Vasculitis: -Takayasu's -Buerger's -Scleroderma/CREST syndrome

### **EREE-64 CT of Knee Fractures and Dislocations in Adults: Diagnosis, Grading, and Management Implications**

Participants

David Dreizin, MD, Baltimore, MD (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

1. CT is indicated for any distal femur fracture with possible articular involvement, due to easily missed coronal plane (Hoffa) fractures which displace further if unrecognized. 2. Patellar comminution associated with transverse fracture is often missed without CT, leading to potential loss of fixation with tension band wiring. Low profile 3D matrix/basket plates are increasingly used for patellar fractures shown to be comminuted at CT. 3. Patella baja is common with early severe osteoarthritis in patients with partial patellectomy for severely comminuted inferior pole fractures. 4. Medial tibial plateau fractures are complex injuries often reflecting fracture dislocation with associated ACL and lateral collateral ligament damage and dislocation of the rest of the plateau from the femur. 5. The PTA (posterior tibial slope) and mTPA (medial tibial plateau) angles can be used to determine side of compression for primary plating.

#### **TABLE OF CONTENTS/OUTLINE**

1. Contemporary CT imaging utilization for high-energy fractures- includes comparison with x-ray and MRI 2. Distal femur. i. classification- AO/OTA system ii. Patterns of injury/biomechanics iii. CT for surgical approach and hardware selection iv. Complications 3. Patella. i. classification- AO/OTA and its limitations ii. Patterns of injury/biomechanics iii. CT for surgical approach and hardware selection iv. Complications 4. Tibia. i. classification- Schatzker and 3 column concept (Luo) ii. Patterns of injury/biomechanics iii. CT for surgical approach and hardware selection iv. Complications 5. Conclusion/summary

### **EREE-65 What You Should Know to Improve the Quality of Contrast-enhanced CT Under ECMO?**

Participants

Fuyuki Washizuka, Tokyo, Japan (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

To learn about hemodynamics when using extracorporeal membrane oxygenation (ECMO). To understand the relationship between the degree of residual native ejection fraction and the flow rate in the ECMO system when using veno-arterial ECMO (VA-ECMO). To learn about contrast-enhanced CT precautions and contrast methods under the use of ECMO. To learn the pitfalls of contrast-enhanced CT when using veno-venous ECMO (VV-ECMO). To learn how to ensure contrast-enhanced CT under more complex assisted circulation.

#### **TABLE OF CONTENTS/OUTLINE**

A. Changes in blood flow over time during VA-ECMO use. B. ECMO is divided into two categories, with VA-ECMO subdivided into three according to left ventricular ejection fraction (LVEF) and ECMO flow rate. C. Tips for successful contrast-enhanced CT in special hemodynamic situations when using VA-ECMO. D. Secrets to ensure successful contrast-enhanced CT when using VV-ECMO.

### **EREE-66 A Hidden Killer: Abdominal Pseudoaneurysms and Their Diagnostic Challenge**

Participants

Fernando Rodado Aranguren, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

To understand the pathophysiology and etiological spectrum of visceral pseudoaneurysms, as well as their potential complications that can lead to urgent abdominal pathology. To define the radiological findings that guide the diagnosis of a pseudoaneurysm and its complications in the different imaging tests.

#### **TABLE OF CONTENTS/OUTLINE**

Pseudoaneurysms are abnormal focal dilations of the arterial vessels, generally produced by a disruption of the arterial wall that

conditions the passage of blood through it, but remaining contained by the tunica adventitia or the perivascular soft tissues (unlike true aneurysms consisting of focal arterial dilations formed by all layers of the arterial wall). Among the possible causes of arterial wall damage that originates pseudoaneurysms are inflammatory processes, trauma, and iatrogenesis due to invasive procedures. Abdominal visceral pseudoaneurysms can develop a series of complications that entail high morbidity and mortality, generally divided into two large groups: those derived from compression phenomena of adjacent structures due to mass effect, and those derived from aneurysm rupture with bleeding into different spaces and structures. Through this work we will carry out an orientation to the radiological management of pseudoaneurysms and their complications, reviewing the typical findings described in the literature and illustrating them with several cases from our hospital.

#### **EREE-67 Body MRI in Acute Abdomen: Primer for the On-call Radiologist and Case Based Review**

Participants

Ashlesha Udare, MBBS, MD, Philadelphia, PA (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

-To evaluate the appropriateness of Body MRI in acute abdomen. -To understand the importance of abbreviated protocols in an emergency setting. -To know the typical and atypical imaging features of various acute abdominal emergencies and the appearance of incidental emergent findings via a case-based review.

##### **TABLE OF CONTENTS/OUTLINE**

Acute Abdomen: When to do MRI?: Iodinated contrast contraindication-Renal insufficiency. History of serious contrast allergy. Failed contrast-enhanced study. Pregnancy-SAR, localiser planning. Problem-solving tool-Clinical Vs CT/US mismatch-Get a "better look!". ACR appropriateness guidelines. Technical Pearls for Body MRI in acute conditions: Micro-protocolling, monitoring scans, fast sequences, safety concerns. Case-based review of various acute abdomen Body MRIs: Gastro-intestinal emergencies (appendicitis, cholecystitis, cholangitis, diverticulitis, hepatic pyogenic abscess). Acute gynaecological conditions (ovarian torsion, massive ovarian edema, tube-ovarian abscess, fibroid degeneration, hemorrhagic cyst, ruptured ovarian cystic lesion) Acute pregnancy related cases (Ectopic pregnancies, placental abnormalities). Acute genito-urinary cases (Pyelonephritis/renal abscess, peniletrauma, scrotal trauma, epididymis-orchitis, priapism) Musculoskeletal injuries presenting as acute abdomen (core muscle injuries, abdominal wall hernias/hematomas, avulsion injuries). Cardiovascular cases (acute aortic syndromes, PE). Miscellaneous: Post-intervention, Post-transplant (renal vein thrombosis, GVHD), Oncological emergencies (ruptured HCC, SVC syndrome). Incidental emergent findings (pneumoperitoneum, hemoperitoneum)

#### **EREE-7 Uncoupling the Forefoot From the Midfoot: Experience and Review of Lisfranc Injuries**

Participants

Victor Rodriguez-Laval, MD, PhD, Madrid, Spain (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

To understand the anatomy of the Lisfranc ligament complex and its importance. To review the most prevalent injury mechanisms, classifications, and treatment options. To present the X-ray and CT findings in the emergency room, surgical procedures and post-treatment imaging.

##### **TABLE OF CONTENTS/OUTLINE**

We reviewed the Lisfranc injuries over the previous ten years in our institution and chose the most representative cases. The normal and pathologic anatomy will be highlighted using a multimodality approach that includes plain radiographs, CT with 3D reconstructions. A case-based methodology will be used to cover the whole spectrum of injuries, from Lisfranc ligament sprains to homolateral and divergent fracture-dislocation type injuries, and this will be followed by additional discussion. Also, a brief overview of typical classification schemes, operation approaches, gradation of injury, and postoperative imaging will be presented. It is important to understand the anatomy and injury pattern to be able to diagnose Lisfranc injuries because a delay on the diagnosis increases the risk for midfoot instability, deformity and debilitating osteoarthritis. Given the often subtle initial radiographic findings, maintaining a high index of suspicion with a low threshold to obtain supplemental imaging is key in reducing miss rates. As Lisfranc injuries comprise only a small fraction of overall foot injuries, a periodic review of the salient imaging findings is essential.

#### **EREE-8 Acute Large Bowel Diverticulitis: A Pictorial Review**

##### **TEACHING POINTS**

Acute large bowel diverticulitis is a common reason of emergency department visits and when complicated it may end up in urgent gastrointestinal surgery. Computer tomography (CT) remains as the primary diagnostic tool in the diagnosis and staging of acute diverticulitis and its complications. Our radiologic report is essential for the surgeon to establish a treatment and to determine an outcome as well as for the exclusion of alternate causes of pathology. We recommend using international diverticulitis staging classifications (as WSES Clasification or modified Hinchey classification) to improve our communication with surgeons. In this educational communication, we aimed to illustrate the key CT imaging features of diverticulitis and its complications including perforation, phlegmon, abscess, ascending septic thrombophlebitis (phylephlebitis), bleeding, intestinal obstruction, and fistula.

##### **TABLE OF CONTENTS/OUTLINE**

Introduction, Reporting CT findings, Anatomy check, Complications, To take home notes

#### **EREE-9 Imaging the Acute Complications of Gender-Affirming Surgeries: A Primer in the Emergency Radiology Setting**

Participants

Siddhi Hegde, MBBS, Boston, MA (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

Gender-affirming surgeries (GAS) and their complications are critical for radiologists to understand. GAS is often tailored to the patient; there is a diverse spectrum of post-operative appearances and complications. Typical postoperative anatomy may imitate pathology if not identified correctly. Radiologists' diagnostic expertise, knowledge of institutional GAS and common complications, and their ability to collaborate with multidisciplinary clinical team, enables them to offer valuable insights on institutional practices

and guide appropriate next steps for complications. We will highlight the diagnostic features of the acute complications that may arise following gender-affirming surgeries and provide an overview of the ideal workup in the acute setting.

#### **TABLE OF CONTENTS/OUTLINE**

Describe expected imaging appearance of post-GAS neoanatomy, including common terminology Review multi-modality emergent imaging [ultrasound, plain film, retrograde urethrogram (RUG), Computed Tomography (CT)] review of common and "can't miss" complications Neourethral- anastomotic leaks, diverticula, fistulae, stenoses/strictures Transmasculine prostheses/device/implant - abscess, hematoma, malpositioning Bladder or rectal injury after vaginectomy (leading to fistulae) Postoperative bleedingSilicone emboli Providing gender-affirming care during imaging and reporting Understand ideal workup and unique imaging protocol considerationsDiscuss pitfalls of imaging in the acute setting, pearls for long-term follow-up

EREE-1

### Ankle and Foot Injuries in ER: A Checklist-Based Approach to Radiographs

#### TEACHING POINTS

1. To recognize various anatomic bony landmarks on ankle and foot radiographs with CT correlation. 2. To understand the pathophysiology and biomechanics of injuries in ankle and foot trauma. 3. To be aware of the most commonly used ankle and foot trauma classification schemes. 4. To understand the need for accurate diagnosis and characterization of ankle and foot injuries to guide management decisions to ensure optimal clinical outcomes. 5. To understand the role of CT in foot and ankle trauma. 6. To review the management of ankle and foot traumatic injuries.

#### TABLE OF CONTENTS/OUTLINE

1. Review the anatomy of the ankle and foot using illustrations, radiographs, and CT. 2. Various radiographic projection series and protocols to diagnose and characterize ankle and foot injury patterns. 3. The spectrum of foot and ankle injuries with key concepts in accurate characterization on radiographs with CT correlation. 4. Illustrated classifications of ankle and foot traumatic injury. 5. An algorithmic approach to accurately predict and identify subtle injuries. 6. Clues to avoid common pitfalls will be included. 7. Troubleshooting role of CT to be elucidated. 8. Focused review of the management of foot and ankle injuries.

Printed on: 04/12/24

EREE-10

### A Guide to Evaluating the Post-robotic and Post-laparoscopic Abdomen

#### Participants

Jay Pancholi, MBChB, BSc, Wilmslow, United Kingdom (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1) To illustrate new surgical techniques with robotic surgery including recent advances in anastomoses. 2) To identify common post-operative complications in relation to timing since surgery. 3) To highlight review areas for post operative scans. 4) To review pearls and pitfalls in distinguishing expected appearances compared to complications. 5) To explain considerations when protocolling imaging requests.

#### TABLE OF CONTENTS/OUTLINE

Minimally invasive surgical techniques continue to advance with robotic surgery representing one of the most recent innovations. These techniques allow previously difficult anastomoses to be more readily performed. Post operative imaging is a common challenge faced by radiologists. Knowledge of surgical technique and possible complications is important for all radiologists interpreting these scans to ensure appropriate protocolling and accurate diagnosis. The poster will show illustrations of surgical techniques, normal post operative appearances and a variety of complications presented as scrollable cases. The poster will be outlined as: -Surgical advances--Robotic surgical incision sites--New anastomotic techniques---Minimally invasive colonial anastomosis---Kono-S anastomosis-Expected appearances--Normal free gas relative to day post op--Normal free fluid relative to day post op-Complications--Anastomotic leak--Bowel ischaemia--Vascular injury---Pseudoaneurysm--AV fistula--Ureteric injury--Lymphatic injury--Incisional hernia

EREE-11

### Twisting Around: A Review of the Potential Locations of Torsions

#### Participants

Laura Cavero Barreras, MD, Ordizia, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- To review the pathophysiology of a torsion. - To understand which imaging modality should be ordered depending on the location of the torsion. - To know the possible sites of torsion and review the major imaging findings at each site on the different imaging techniques. - To review the radiological signs of ischemia that may appear as a consequence of torsion and may influence surgical management of the condition.

#### TABLE OF CONTENTS/OUTLINE

Torsion is a broad term that describes a twisting of an organ around its mesentery or its vascular pedicle resulting in an impairment of its blood supply. The vein is usually the first vessel affected resulting in venous stasis or ischemia. If left untreated, arterial compromise can occur leading to arterial infarction. For this reason, they are usually surgical emergencies and a prompt diagnosis is essential to avoid organ necrosis or hollow organ perforation. Imaging techniques are necessary to establish the diagnosis. Although intestinal volvulus and gonadal torsion are broadly known, there are other organs that can rarely result in torsion such as the lung, the spleen, the gallbladder, and the Fallopian tube. This presentation aims to review the imaging findings of torsion in all potential locations and identify the signs of ischemia that may occur in this setting.

EREE-12

### Above the Rest: A Review of Upper Cervical Spine Injuries

#### Participants

Jerry Cruz-Rodriguez, BA, San Juan, PR (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

-Radiologists play a crucial role in characterizing acute cervical spine injuries in the emergent trauma setting using an imaging-based morphology approach.- Jefferson fractures involve the anterior and/or posterior arch of C1, lateral mass, or transverse anterior arch, and require CT for detection.- Hangman fractures involve disruption of C2's posterior elements at the pars interarticularis and can be devastating injuries.-OCFs require CT for detection and indicate serious trauma has occurred, potentially causing instability of the atlanto-occipital joint and neurological injuries.-Dens fractures are classified into 3 types, and CT is used to determine the type and guide management decisions.-AOD involves complete separation of the upper cervical spine from the skull base and requires CT for accurate diagnosis.-Traumatic atlantoaxial instability is a potentially devastating unstable injury that can be missed without careful assessment on initial CT scan.-TRS/TRF requires CT to diagnose the degree of subluxation and assess accompanying injuries, with clinical and dynamic imaging assessments needed for rotatory fixation.

#### TABLE OF CONTENTS/OUTLINE

A. Introduction  
I Overview  
II AO Spine Upper Cervical Injury Classification  
B. Upper Cervical Spine Injuries  
I Common and uncommon important injuries of the upper cervical spine  
II CT characterization and discussion of typical mechanisms  
III Image review and correlation with AO Spine Classification  
Occipital condyle fractures (OCF) Atlanto-Occipital Dissociation (AOD) Atlantoaxial instability  
Traumatic Rotatory Subluxation/Fixation (TRS) Atlas (Jefferson) fractures Hangman fractures Odontoid fractures  
C. Conclusion  
D. Self assessment

EREE-13

### Ultrasonographic Diagnosis of Pneumothorax: Legend or Reality?

#### Participants

Guilherme del Guerra, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

This study aims to report the importance of chest ultrasound in the evaluation of critically ill patients with pneumothorax, highlighting the need for systematization in chest ultrasound assessment and technical recognition of pneumothorax ultrasound signs. The main echographic signs used in the detection of pneumothorax are: Absence of sliding of the two pleural leaflets, accentuated reverberation (A Lines), absence of comet tail artifacts and B lines and determination of the Pulmonary Point. In the presence of pneumothorax, trapped gas obscures visualization of the underlying pleural line, so that no pulmonary slippage is identified. The systematized technique used in chest ultrasound is based on: use of a high-frequency linear probe (5-12MHz); patient positioning in dorsal decubitus; division of each hemithorax into six quadrants. Each quadrant should be analyzed to ensure identification of the pneumothorax. The use of technically systematized chest ultrasound for the diagnosis of pneumothorax has high sensitivity, bringing a great benefit to critically ill patients, and can be used for diagnosis and decision-making quick conduct.

#### TABLE OF CONTENTS/OUTLINE

- Systematization of chest ultrasound evaluation - Normal findings on chest ultrasound - Ultrasonographic findings of pneumothorax - Cases of patients with pneumothorax diagnosed by ultrasound

Printed on: 04/12/24

### Don't Lose Your Head -- Imaging of Atlantooccipital Dissociation and Central Skull Base Fractures

#### Participants

Desmin Milner, MD, Birmingham, AL (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Understand normal anatomy of the central/posterior skull base and craniocervical junction.2. Understand various traumatic injuries at the central/posterior skull base and craniocervical junction.3. Understand some mimics of craniocervical junction injury.

#### TABLE OF CONTENTS/OUTLINE

1. Review normal anatomy of the central/posterior skull base and craniocervical junction.2. Briefly review CT and MRI imaging protocols in the setting of trauma.3. Review traumatic injuries of the central/posterior skull base and craniocervical junction including: atlantooccipital dissociation, occipital condyle fractures, clival fractures, and transsphenoidal fractures.4. Review of other ligamentous injuries at the craniocervical junction.5. Review mimics of craniocervical junction injury.

### Blunt Cerebrovascular Injuries (BCVI): Diagnosis, Evolution, and Complications

#### Participants

Elham Beheshtian, MD, Baltimore, MD (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Advances in multidetector CT angiography in the context of multitrauma have led to increased diagnosis of blunt cerebrovascular injuries (BCVI). 2. Early BCVI detection and treatment can decrease the risk of complications, such as ischemic strokes, carotid cavernous fistula, and arteriovenous fistulas. 3. BCVI is graded from 1-5 on the Biffi Scale, based on imaging appearance. The grading system is used to guide patient management and can predict the natural evolution of an injury.

#### TABLE OF CONTENTS/OUTLINE

I. Introduction - epidemiology, morbidity and mortality, mechanism, imaging modalities  
II. Biffi Scale  
A. Pathophysiology and imaging examples of grades 1-5 injury  
B. Management implications by grade  
C. Natural history of an injury, including complications  
III. Diagnostic considerations  
1. Imaging modalities  
2. Universal vs. selective screening  
3. Imaging follow-up  
IV. BCVI mimics - fibromuscular dysplasia, atherosclerosis, carotid web, vasospasm, true aneurysm  
V. Venous injury  
VI. Summary

### Peer Learning Pearls: The Most Commonly Missed MSK Diagnosis on the Overnight Shift - Diagnostic Errors and Great Calls

#### Participants

Thais Kuwazuru, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The aim of this exhibition is to:- Highlight the most commonly missed musculoskeletal diagnosis identified after Peer Review analysis and the great calls of difficult cases;- Demonstrate practical tips to avoid missing diagnosis;- Review the current concepts about these pathologies;- Show illustrative and didactic cases from our service, specially from emergency and urgent care units.

#### TABLE OF CONTENTS/OUTLINE

INTRODUCTION- The greatest difficulties during the night shift and emergency room for the radiologist;- Impact of early accurate diagnosis of these diseases.IMAGING INTERPRETATION- The most commonly missed musculoskeletal diagnosis identified after Peer Review analysis, including:- Fractures: vertebral acute fracture, transdiscal fracture, scaphoid fracture, avulsion fracture of Chopart joint;- Infection: discitis and spondylodiscitis, abscess;- Hematoma and active bleeding;- Other causes of musculoskeletal pain such as longus colli tendinitis, disc herniation;- Great calls - difficult cases.INTERACTIVE CASE-BASED DIDACTICS- Sample cases to illustrate and solidify the concepts;- The main tips that every radiologist working the night shift should know;- Correlation with current literature data.CONCLUSION AND TAKE HOME MESSAGES- Patient assessment in emergency and urgent care scenario very often include imaging investigation;- In order to improve patient outcomes and prevent iatrogenic treatments (or lack of treatment), it is essential to know the imaging patterns of each pathology and the tips to avoid missing diagnosis.

### Don't Look Just for the Bowels: A Comprehensive Review of Noninvasive Vascular Imaging in Abdominal Solid Organ Ischemia

#### Participants

Hermes Vinicius Pedrini Pereira, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Review the anatomy of intra-abdominal solid organs vascularization.- Expose frequent and infrequent cases of intra-visceral vasculopathies in the context of acute abdomen.- Remember the main parenchymal changes resulting from vascular events and their differential diagnoses.- Tips on how to identify critical findings and report them.

#### TABLE OF CONTENTS/OUTLINE

- Concepts of arterial and venous circulatory anatomy and solid organs vascularization.- Circulatory physiology and how it affects the different imaging modalities.- CT and MR protocols and reconstruction techniques, systematically mentioned in the interpretation of our cases.- Imaging aspects of acute vascular events, from the organ's pedicle to its parenchyma.- Intra-abdominal occlusive ischemic events (thromboembolism, torsions, dissections).- Non-occlusive ischemic events (hemodynamic shock, substance abuse).- Other vascular abnormalities that may have clinical repercussions (shunts and malformations).- Correlation between imaging and clinical signs.- Risk factors and pre-existing conditions that can help us think about solid organ ischemia.- Practical information for effective reporting and necessary information for intervention planning, including the critical imaging findings that needs immediate intervention.

### Friendly Fire: A Rapid Review of Iatrogenic Intrathoracic Injuries Related to Support Devices

#### Participants

Saumik Rahman, MD, New Haven, CT (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Many common interventions performed by health care providers while placing supporting devices may lead to injuries to the lungs, pleura, heart, or mediastinal structures. These injuries may range from asymptomatic findings managed conservatively to life-threatening injuries requiring emergent surgical or percutaneous intervention. The radiographic and cross-sectional imaging appearance of malpositioned intrathoracic medical devices and complications related to iatrogenic thoracic trauma secondary to medical devices or procedures will be reviewed, and recommendations for clinical teams based upon imaging findings will be discussed.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction.2. Examples of cases:a. Chest tube placement- Pulmonary contusion, laceration, hemothorax, pneumothorax.b. Pacemaker placement- Hemopericardium, pneumomediastinum, pneumothorax, hemothorax, chest wall hematoma.c. Swan-Ganz catheter- Pulmonary artery pseudoaneurysm.d. Enteric tubes- Endobronchial course causing lung injuries, esophageal perforation.e. Central venous catheters- Vascular dissection, vascular perforation, pneumothorax, mediastinal hematoma.3. Conclusion.

### MR Imaging of Pelvic Emergencies

#### Participants

Gayatri Joshi, MD, Atlanta, GA (*Presenter*) Royalties from Elsevier.

#### TEACHING POINTS

Pelvic pain is a commonly presenting symptom in the Emergency Department (ED) and while ultrasound (US) or computed tomography (CT) are often the initial imaging exam, magnetic resonance (MR) imaging plays a vital role for specific populations (such as the pregnant patient) and in clinical scenarios in which diagnosis relies on the greater sensitivity provided by MR imaging. After reviewing this exhibit, learners should be able to: 1. Understand the role of MR imaging in the emergent setting 2. Proficiently recognize emergent pelvic disorders by MR imaging 3. Utilize best practices for diagnosing pelvic emergencies in the ED, including those of infectious, inflammatory, ischemic, obstructive, traumatic, neoplastic etiologies

#### TABLE OF CONTENTS/OUTLINE

This exhibit will: 1. Systematically illustrate the clinical and imaging features of pelvic emergencies that may present in the ED, particularly those of the MSK, vascular, GI GU body systems. The spectrum of pelvic emergencies discussed in this exhibit will include those of infectious, inflammatory, ischemic, obstructive, traumatic, neoplastic etiologies 2. Discuss best imaging practices of the acute pelvis in the ED, with pearls/pitfalls for optimizing efficient/accurate diagnosis 3. Briefly address relevant management as applicable to the Radiologist to aid in expedient, appropriate management

### Imaging Features and the Role of Interventional Radiology and Radiation Therapy in Oncologic Emergency

#### Participants

Akihiro Nakamata, MD, Shimotsuke, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Due to the rapidly increasing elderly population and to the advancements in oncology, there has been an increase in the diagnosis of cancer, and also a rise in oncological emergencies. In oncologic emergencies, radiologists play a major role not only in diagnosis but also in the subsequent treatment of interventional radiology and radiation therapy. Therefore, radiologists should know imaging features and the treatment of oncologic emergencies in the whole body.

#### TABLE OF CONTENTS/OUTLINE

The purpose of this exhibit is: 1. To classify oncologic emergencies according to their pathology and location 2. To review oncologic emergencies in the whole body 3. To discuss the clinical and imaging features of the oncologic emergencies 4. To discuss the role of interventional radiology and radiation therapy Table of contents: 1) Subtypes based on imaging findings reflecting the background pathology. 2) Oncologic emergencies of various organs in this presentation. A) Central nervous system: Cerebral herniation Spinal cord compression B) Thoracic: Superior vena cava syndrome Airway obstruction Pericardial effusion with cardiac tamponade Pleural effusion Pulmonary thromboembolism, pulmonary tumor thrombotic microangiopathy (PTTM) Esophagorespiratory fistula Massive hemoptysis C) Abdomen: Abdominal compartment syndrome Biliary obstruction Biliary bleeding Intestinal obstruction Intestinal bleeding Bowel perforation Urinary tract obstruction Abdominal bleeding

### Understanding Cerebral Edema and Brain Herniation: A Simple Guide For Residents

#### Participants

Gustavo Alonzo Correa I, MD, Mexico City, Mexico (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To recognize the basic intracranial anatomy necessary for understanding the radiological features of brain herniation. To explain the appearances, pathogenesis and classification of cerebral edema. To discuss use of a systematic approach of cerebral herniation. To identify the imaging findings, clinical manifestations and potential complications associated in cerebral herniation.

#### TABLE OF CONTENTS/OUTLINE

Introduction  
Normal brain anatomy  
Brain edema (Vasogenic, Citotoxic and Transependymal)  
Concept of brain herniation  
Physiopathology of brain herniation  
Key level approach to brain herniation  
Classification  
Subfalcine hernia  
Transtentorial descending hernia  
Transtentorial ascending hernia  
Tonsillar  
Extracranial hernia

### Dental Trauma: A CT Perspective for Tooth-Saving Precautions

#### Participants

Erhan Akpınar, MD, Sihhiye, Turkey (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To provide a basic anatomical overview of dental trauma with illustration of regions susceptible to trauma. To inform which dental fractures are important to save the tooth, and what to report for clinicians to get information about treatment options with basic points. To review the common terminology and classification of dental trauma/fractures with emphasizing the conditions that create or increase the risk of tooth loss. To present basic structural report templates for dental trauma reporting To discuss the CT imaging findings related to treatment of dental trauma and complications with illustrative cases.

#### TABLE OF CONTENTS/OUTLINE

1. Dental Anatomy, Weak Points and Crucial Structures to Keep The Tooth Alive / Functional 2. Terminology and Current Classification of Types of Dental Trauma 3. Fractures that require treatment within a few hours • Crown-Root Fractures • Root Fractures • Alveolar Fractures • Extrusive and Lateral Luxation • Avulsion 4. Fractures that require treatment within the first 24 hours • Complex Crown Fractures (Involving Pulp Structures) • Concussion and Subluxation • Intrusive Luxation 5. Treatment Options and Complications 6. A Structural Report Template for Dental Trauma

### Genitourinary Oncologic Emergencies: A Radiologists' Guide

#### Participants

Mamie Gao, MD, Houston, TX (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Describe the best imaging approach for evaluating oncologic emergencies affecting the genitourinary tract. 2. Identify imaging manifestations of genitourinary oncologic emergencies. 3. Identify potential pitfalls in imaging genitourinary oncologic emergencies. 4. Recognize the important role of radiologists in the multi-disciplinary setting to communicate and collaborate findings in emergent cases.

#### TABLE OF CONTENTS/OUTLINE

1. Genitourinary oncologic emergencies and imaging approach. 2. Multimodality imaging features of genitourinary oncologic emergencies. a) Hematuria: hemorrhagic cystitis. b) Obstructive uropathy: tumor burden and post-treatment (nephrostomy tube malfunction, ileal conduit). c) Infectious: pyelonephritis, renal abscess, prostatic abscess, cystitis related to prior treatment (BCG, ileal conduit). d) Miscellaneous Post-Treatment (radiotherapy, chemotherapy, surgery, urinary diversion): hemorrhage, fistulas. 3. Role of radiology in management. 4. Potential mimics and pitfalls (underdistended urinary bladder, residual malignancy, emergencies unrelated to malignancy, trauma).

### Stercoral Colitis- Diagnosis, Complications and Management

#### Participants

John J. Hines JR, MD, Huntington, NY (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Background Information/Purpose Stercoral colitis is an inflammatory process typically involving the sigmoid colon and rectum, due to chronic constipation and rectal distention, causing increased intraluminal pressure, and eventually leading to ischemia, ulceration, perforation, peritonitis and death from feculent peritonitis and sepsis if not treated. The purpose of this exhibit is to familiarize radiologists with the spectrum of CT imaging features of uncomplicated and complicated stercoral colitis and its mimics. Key Anatomic or Pathophysiologic Issues, Imaging Findings or Imaging Technique: Common CT findings of stercoral colitis include: 1.) Stool filled and distended colon with focal colonic wall thickening 2.) Pericolonic/presacral fat stranding. 3.) Presence of localized extraluminal gas, discontinuity of the colonic or rectal wall, and extraluminal gas in cases of perforation.

#### TABLE OF CONTENTS/OUTLINE

Educational Goals/Teaching Points 1. Review the risk factors, pathophysiology and clinical presentation of stercoral colitis.2. Discuss the importance of early recognition of uncomplicated stercoral colitis, and the role of the radiologist in bring this diagnosis to the attention of the clinical team.3. Illustrate the imaging findings of complicated and uncomplicated stercoral colitis on CT, including typical and atypical imaging findings, and unusual complications. 4.Review imaging mimics of stercoral colitis such as diverticulitis, infectious colitis, inflammatory bowel disease and ischemic colitis.5. Discuss the management of complicated and uncomplicated stercoral colitis.

### Pain in the Bump: Acute Abdomen in Pregnancy - MRI Clues for On-Call Residents

#### Participants

Mili Rohilla, MD, Worcester, MA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To acquaint on-call residents with MR imaging signs in the acute abdomen To make residents comfortable with MR abdomen in pregnant patients

#### TABLE OF CONTENTS/OUTLINE

Acute abdomen is a common ER presentation in pregnant patients, and can pose a diagnostic challenge due to the physiological changes during pregnancy. Magnetic resonance imaging (MRI) is a useful diagnostic tool due to its high contrast resolution and absence of ionizing radiation. Radiology residents need to be cognizant of the MR imaging findings of acute abdomen in pregnancy and differential diagnoses to interpret them accurately and promptly. We will discuss the common system-wise presentations and MR findings: Gastrointestinal System: Appendicitis, acute pancreatitis, inflammatory bowel disease, intestinal obstruction. Hepatobiliary system: Acute cholecystitis, choledocholithiasis, HELLP syndrome. Reproductive System: Ectopic pregnancy, ovarian torsion, placental abruption, uterine rupture. Urinary System: Urolithiasis, acute pyelonephritis, renal abscess. Cardiovascular System: Ovarian vein thrombosis, Budd-Chiari syndrome, acute aortic syndrome. It is important to promptly diagnose and manage the underlying cause of acute abdomen in pregnancy to prevent adverse maternal and fetal outcomes.

### A Quick Guide to Pelvic Pain in the Emergency Room: MR Imaging of the Acute Female Pelvis

#### Participants

Elissandra Lima, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Review the anatomy of the female pelvis on MRI- Understand the role of MR imaging in the evaluation of gynecologic emergencies- Illustrate the imaging findings non-obstetric and obstetric causes- Discuss their differential diagnosis, imaging pitfalls, and complications

#### TABLE OF CONTENTS/OUTLINE

1. Normal MRI anatomy of uterus and adnexa with cyclical variation 2. Advantages and disadvantages of MR Imaging 3. Non-obstetric and obstetric causes 4. Imaging assessment of critical and prevalent gynecological diseases in the emergency room 5. Pelvic inflammatory disease, including endometritis, cervicitis, salpingo-oophoritis, pyosalpinx, and tubo-ovarian abscess 6. Leiomyoma torsion and fibroid degeneration 7. Endometriosis 8. Obstetric causes, including ectopic pregnancy, molar pregnancy, retained products of conception, placenta accreta spectrum 9. Other pelvic abnormalities 10. Potential imaging pitfalls and how to avoid them 11. Complications

### Shattered Chests: Lessons from Thoracic Trauma Cases

#### Participants

Manuel Sebastian Paez Alvarez SR, MD, Toledo, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To present a comprehensive overview of thoracic trauma cases, highlighting the most common and not-so-common pathologies. To familiarize radiologists and radiology residents with diagnostic clues of thoracic imaging in trauma patients. To analyze key features and provide tips to identify pitfalls of traumatic chest CT.

#### TABLE OF CONTENTS/OUTLINE

Introduction: Importance of thoracic trauma imaging and its implications in emergency settings. Pulmonary parenchymal injury: a. Pulmonary contusions b. Pulmonary lacerations c. Pulmonary hematomas d. Traumatic pulmonary hemias Pleural space injury: a. Pneumothorax b. Hemothorax Chest wall injury: a. Rib fractures b. Sternal fractures c. Chondrocostal, chondrosternal, and cartilage injuries d. Sternoclavicular dislocations Tracheobronchial injury: a. Laceration of the trachea and bronchi Other injuries: a. Boerhaave Syndrome b. Aortic injury c. Iatrogenic cardiac perforation d. Traumatic diaphragmatic hernias This educational exhibit aims to provide a comprehensive understanding of thoracic trauma cases, emphasizing the importance of recognizing imaging findings for accurate diagnosis. Radiologists and radiology residents will benefit from the illustrative cases and diagnostic tips presented, improving their skills in traumatic chest CT interpretation.

### The Contrast-Enhanced FAST Exam (cFAST) In Blunt Thoracoabdominal Trauma

#### Participants

Melanie P. Caserta, MD, Jacksonville, FL (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The Focused Assessment with Sonography in Trauma (FAST) is one of the most frequently performed ultrasound examinations in adults and children in the acute care setting. However, it has significant limitations since intraabdominal fluid is used as a surrogate marker for intraabdominal injury (IAI). Adding an ultrasound contrast agent to the exam can substantially improve the diagnostic accuracy of identifying solid organ injuries and rapidly identify significant organ lacerations and active intraperitoneal hemorrhage. The cFAST exam is a rapid, standardized, and systematic ultrasound examination that balances a comprehensive organ survey with the time constraints of highly structured and algorithmic trauma patient care. After reviewing this case-based exhibit, the learner will:- Understand the limitations of the traditional FAST exam and advantages of adding an ultrasound contrast agent (UCA)- Describe the cFAST exam protocol and set-up as part of the trauma resuscitation team- Recognize the limitations of the cFAST exam and next steps in imaging.

#### TABLE OF CONTENTS/OUTLINE

1. Objectives 2. Background a. The evolution of the FAST exam b. Contrast-enhanced ultrasound in trauma 3. Imaging a. Equipment, technical requirements, and supplies i. IV access ii. Selection of the UCA iii. Ultrasound equipment b. Integration into the trauma team c. The contrast-enhanced FAST exam protocol i. Patient population ii. Exclusion criteria iii. Special populations iv. Safety Considerations v. UCA preparation Contrast Administration vi. Imaging Protocol vii. Limitations 4. Pediatric and adult case presentations

EREE-31

### Searching for Causes of Preventable Death - Role of Early Postmortem CT in Trauma Patients

#### Participants

Lain Ibanez, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- To show an accurate protocol to perform a post-mortem CT in patients who died after severe trauma in a first-level trauma center
- To describe the main radiological features of different early deceased trauma patients and their potential relationship with the cause of death
- To identify the misplacement of medical devices in patients who died from trauma
- To determine if there was preventable death based on clinical and radiological findings

#### TABLE OF CONTENTS/OUTLINE

- Performing an early post-mortem CT protocol and CT technique
  - Analysis of radiological and clinical features, injuries, and medical device misplacement
  - Determining causes of death and their avoidability
  - Conclusions
- Outline: Despite the improvement in the management of trauma patients there is still a percentage who die during or immediately before receiving hospital care and before having an imaging test. This reason jointly with an increasingly low rate of autopsies, prevents to understand the causes of death and whether or not it had been avoidable. Since June 2022 the trauma and radiology teams at our level 1 trauma center decided to carry out a program to study preventable mortality in trauma patients who died before or during initial care. In this presentation we will show the design of our project, how we accomplish post-mortem CT studies and also present our preliminary results. We will show a clinical-radiological correlation of our cases, analyze the main injuries, misplacement of medical devices, causes of death and whether its avoidability. Finally the main concerns we faced and major limitations are exposed.

## Abstract Archives of the RSNA, 2023

EREE-32

### **Beyond the Diagnosis of Appendicitis:CHAR(13) + CHAR(10)The Role of Computed Tomography in the Nonoperative Management of Acute Appendicitis in Adults**

#### **Participants**

Eliko Tanaka, MD, (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Diagnosis of acute appendicitis using computed tomography (CT) is highly accurate and established. The treatment of appendicitis includes surgery and conservative treatment, and the role of conservative treatment is expanding. However, conservative treatment has challenges, such as treatment failure and malignant tumors. CT diagnosis plays a significant role in determining the treatment plan. This presentation describes CT findings related to the indications for conservative treatment of appendicitis, as well as CT findings related to the course of conservative treatment. Additionally, it discusses challenges in CT diagnosis associated with conservative treatment, such as recurrent appendicitis or tumor complications, and presents a case series. Teaching points include: 1. Understand the indications and contraindications for conservative management of appendicitis and its CT findings 2. Familiarize CT findings related to the course of conservative treatment for appendicitis 3. Recognize the potential complications of conservative management, such as treatment failure, malignancy, recurrent appendicitis, and identify the corresponding CT findings

#### **TABLE OF CONTENTS/OUTLINE**

1. Indications and contraindications of conservative treatment in the World Society of Emergency Surgery (WSES) guidelines 2. CT findings that suggest a high risk of failure in conservative treatment and a need for extended surgery 3. Imaging findings during the course of conservative treatment 4. Recurrent appendicitis and its CT findings 5. Differential diagnosis between tumor and non-tumor cases

### Role of MR in the Diagnosis of Suspect Metastatic Spinal Cord Compression: A Pictorial Imaging Review With Medical and Radiological Scales

#### Participants

Blanca Lumbreras-Fernandez, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The learning objectives of this exhibit are: 1-To illustrate the spectrum of metastatic spinal cord compression (MSCC) and the scales and scores that should be included in the radiological report. 2- To discuss the image findings of MSCC with emphasis in epidural lesions.

#### TABLE OF CONTENTS/OUTLINE

1-Pathophysiology of MSCC, including demographics. 2-Review of common imaging findings in the management guidelines for MSCC. Relevance of the inclusion in the radiological report of the Epidural Spinal Cord Compression (ESCC) Scale and Spinal Instability Neoplastic Score. 3- Evaluation of the most representative cases of MSCC collected and their differential diagnosis with other causes of cord compression, specially epidural lesions in a non-traumatic setting through imaging cases from our center. 4- Conclusions: Acute compressive myelopathy is a medical emergency. Early diagnosis and treatment improve the neurological prognosis. MR is the technique of choice to confirm the diagnosis or establish an alternative one as well as to determine the level, extension, degree of compression, stability of the spine and presence of myelopathy. The incorporation of the ESCC scale and SINS to the radiological report improves multidisciplinary communication and the adequacy of urgent treatment of MSCC.

EREE-34

### Cognitive Biases and Diagnostic Errors in Emergency Neuroradiology, A Case-Based Approach

#### TEACHING POINTS

1. Introduce the dual process theory of reasoning, with a focus on the "Type 1" system, heuristics, cognitive biases, and diagnostic errors. Discuss how the emergency radiology setting may predispose toward Type 1 thinking. 2. Review different types of cognitive biases and diagnostic errors via case-based emergency neuroradiology examples. 3. Describe different strategies to combat cognitive biases and reduce diagnostic errors.

#### TABLE OF CONTENTS/OUTLINE

Decision making literature theorizes there is a dual process of reasoning which is comprised of a fast, intuitive "Type 1" system and a slower, more deliberative "Type 2" system. The high volume and acuity of the emergency setting may predispose toward Type 1 thinking. In Type 1 thinking, we use a number of heuristics, or shortcuts, to improve efficiency though this comes at the cost of an increased predilection toward cognitive biases and diagnostic errors. Recognition of common cognitive biases and strategies to manage them may reduce diagnostic errors. In this education exhibit, we will review common cognitive biases using an emergency neuroradiology case-based approach to illustrate these biases in action to help recognize and counter them. Some examples of cognitive biases that will be reviewed include bandwagon effect, alliterative error, framing bias, triage cueing, satisfaction of search, confirmation bias, attribution bias, availability bias, anchoring bias, and productivity bias. We will also discuss metacognition strategies to help counter these biases.

EREE-35

### Never Fear! Peer Learning in Emergency Pelvic and First Trimester Ultrasound

#### TEACHING POINTS

Women presenting with acute pelvic pain and/or bleeding can pose a diagnostic challenge in the emergency setting. The differential diagnosis may be broad, and these symptoms are often indications for pelvic ultrasound (US). Interpretation of pelvic US may be tricky and a source of confusion and misinterpretation. Furthermore, cognitive biases in imaging interpretation can lead to diagnostic errors. Familiarity with common and uncommon pelvic US imaging findings is imperative to assist with prompt and accurate diagnosis. Awareness of potential biases when interpreting pelvic US further helps hone interpretation. This exhibit will illustrate the imaging findings of multiple causes of pelvic pain/ bleeding in non-pregnant and first trimester pregnant patients. Diagnostic errors and biases in interpretation related to these cases will also be highlighted.

#### TABLE OF CONTENTS/OUTLINE

This exhibit will review pelvic US peer learning cases and highlight teaching pearls and potential pitfalls in diagnosis. 1. Review common and uncommon causes of acute pelvic pain/bleeding in non-pregnant patients, including ovarian/ fallopian tube torsion, cysts, hydrosalpinx, fibroids, benign and malignant adnexal lesions, tuboovarian abscess. 2. Review causes of pelvic pain/bleeding in first trimester pregnant patients, including ectopic pregnancy in different locations, ruptured heterotopic pregnancy, retained products of conception, uterine AVM. 3. Review non-OB/GYN causes of pelvic/abdominal pain for which pelvic US was the initial imaging modality, including appendicitis, appendiceal mucocele, diverticulitis. 4. Review potential biases in pelvic US imaging interpretation with examples from our cases.

### Plain Abdominal Radiography in the Emergency Room

#### Participants

Carla Suarez Silva, MD, A Coruna, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Plain abdominal radiographs continue to be a fundamental tool in emergency rooms.- We present abdominal X-rays performed in a third-level hospital over the last few years. In all cases, the radiographs helped guide the patient's management.- The semiology of abdominal simple radiography is presented in a didactic and interactive way to achieve an adequate interpretation.- Knowing the radiological analysis of the abdominal radiograph continues to be useful for the comprehensive management of the patient.

#### TABLE OF CONTENTS/OUTLINE

This education exhibit presents a collection of 25 cases of abdominal X-rays. All cases will be presented in a structured and interactive format, beginning with an overview of the patient's clinical data, followed by the X-ray image(s), the detail of the radiological findings using visual aids, pearls and pitfalls, and the final diagnosis providing correlation with other imaging methods. Furthermore, taking advantage of the fact that all the X-rays were performed urgently, a green, yellow, or red circle will appear in the top right corner of all radiographs indicating the severity of the pathology presented by the patient. To facilitate the reading of this presentation, the name of the radiological density that will help us make an adequate interpretation of the abdominal radiograph will be displayed at the bottom of each image. The table of contents is: • Introduction • Teaching points • Table of Contents • How to approach an abdominal X-Ray? • Check all the clinical data • Technical aspects • Radiological densities • Cases • Case 1: Patient 1 • ? • Case 25: Patient 25

### Beyond Aortoenteric and Aortocaval Fistulas - Intraabdominal Fistulas: Imaging Findings and Importance of Early Identification

#### Participants

Amalia Aranaz Murillo, MD, Zaragoza, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Intraabdominal fistulas are uncommon but can be catastrophic if not identified and treated promptly. Multiphasic multidetector CT angiography (angio-MDCT) is the initial imaging choice for diagnosis. 2. The imaging signs of intraabdominal fistulas can be divided into direct and indirect signs and emergency radiologists should be familiar with them and be aware of potential mimics and maskers to avoid misdiagnosis.

#### TABLE OF CONTENTS/OUTLINE

This poster aims to provide an overview of intraabdominal fistulas, their imaging findings, and the importance of early identification and familiarize the radiologist with the mimics and maskers of intraabdominal fistulas. Intraabdominal fistulas are a rare but life-threatening condition if they are not identified and treated promptly. Imaging plays a crucial role, and angio-MDCT is often the initial imaging technique. The imaging signs of intraabdominal fistulas can be divided into direct and indirect signs. Direct signs include visualization of the fistula tract, extravasation of contrast medium, and aortic graft migration, but these signs are rarely observed. Indirect signs are often the only available evidence and include abnormalities of the aortic wall, irregularities of the interface between the aorta and the fistulizing entity, and the presence of gas or fluid collections. Although the most frequent intraabdominal fistulas are aortoenteric and aortocaval fistula, other types of fistulas and potential mimics can occur, and one should know and be aware of them. Familiarity with the different imaging modalities and the various mimics and maskers of fistulas can help in accurate diagnosis, ultimately leading to improved patient outcomes.

### **Kicking, Biting, and Screaming: Common Radiological Patterns and Mechanisms of Equine-Related Injuries Presenting to the Emergency Department**

#### **Participants**

Trae Brooks, MD, BS, Lexington, KY (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Thoracic injuries may occur in over half of horse-related trauma cases, including clavicle and rib fractures as well as hemothoraces and pneumothoraces. Clinical and imaging evaluation is crucial to rule-out underlying thoracic trauma (Chad Ball, 2007). Children who receive an injury while unmounted are likely to have more severe injuries than those who were mounted, with most trauma localized to the abdomen (Grace Wolyncewicz, 2018). Fractures are one of the most common injuries in mounted equestrians and should be suspected in patients presenting after a fall from a horse. The initial height of the rider, velocity of travel, and vulnerable position of landing are all key factors contributing to the severity and location of the fracture and need for prompt imaging and evaluation.

#### **TABLE OF CONTENTS/OUTLINE**

We will begin with an overview of horse-related trauma from a historical and epidemiologic perspective. Using a simplified algorithm, we will then discuss the classic patterns of various trauma such as fall from or with a horse while mounted and injuries sustained from direct injury from a horse while unmounted such as bite, kick, or stomp/trample injuries. Finally, we will use case-based examples with multimodality imaging to show the broad extent of injury concerning various systems - organized into Torso, Musculoskeletal/Extremity and Central Nervous System/Spine.

### CT of Appendicitis in Adults: Problematic Scans and Scenarios

#### Participants

Douglas Katz, MD, Mineola, NY (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

-A non-trivial minority of CT examinations performed for suspected appendicitis - regardless of the protocol utilized - end up being challenging to interpret for a variety of reasons, in adults -This exhibit will review problematic scenarios and situations involving CT performed for right lower quadrant pain in non-pregnant adults -Review uncommon/atypical/unusual presentations of appendicitis and its potential mimics and potential pitfalls, as well as some of the more common problematic scenarios -Demonstrate examples of these CT scenarios from our practices -Briefly overview QA and medical-legal issues in suspected appendicitis in adults with an emphasis on CT

#### TABLE OF CONTENTS/OUTLINE

Outline: -Oral contrast - to use or not to use on CT? -Subtle/early findings -Perforated appendicitis- review of the literature -The right lower quadrant 'phlegmon' -Potential pitfalls and confounders - right colonic diverticulitis, 'secondary' appendicitis, distal/tip appendicitis, the non-visualized appendix, chronic/relapsing appendicitis, and resolving appendicitis -Appendicitis and rotation anomalies -Stump appendicitis -Appendicitis in hernias -Appendicitis and underlying neoplasms -Additional potential errors, quality assurance issues, and medical-legal issues

### Abdominal Hemorrhage on MRI: Findings and Pitfalls

#### Participants

Bertin Mathai, MD, Bronx, NY (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Non-traumatic intra-abdominal hemorrhage can be due to multiple etiologies and can be a source of acute abdominal pain and life threatening blood loss. Prompt radiologic identification and localization of hemorrhage is crucial for appropriate decision-making and management. Acute intra abdominal hemorrhage is usually diagnosed by computed tomography (CT). Magnetic resonance imaging (MRI), is less frequently used in the acute setting, and radiologists may be less familiar with the appearance of blood and potential etiologies of hemorrhage, such as ruptured aneurysms and hemorrhagic masses. The signal characteristics of hemorrhage can vary depending on both the age of the hemorrhage as well as its background location. The superior soft tissue resolution of MRI can help characterize intra-abdominal blood products in cases where CT is indeterminate, and can help diagnose an underlying mass in cases where it is obscured by blood on CT. This educational exhibit will discuss the timeline of hemorrhage with respect to MRI signal, show multiple causes of spontaneous intra abdominal bleeding, and highlight scenarios where MRI can provide added value in diagnosing the source of hemorrhage.

#### TABLE OF CONTENTS/OUTLINE

1) Background 2) Molecular and Magnetic Timeline of Blood 3) Optimizing MRI Protocol to Visualize Blood 4) Differential Diagnosis / Cases 5) Literature Review 6) Conclusion 7) References

### Pre-Hospital Emergency Medicine: A Spectrum of Imaging Findings

#### TEACHING POINTS

This educational exhibit aims to: 1) Increase awareness and understanding among radiologists of the principles of Pre-Hospital Emergency Medicine 2) Review imaging which illustrates techniques used by Emergency Medical Services (EMS) providers 3) Highlight pertinent radiologic findings which call attention to potential complications arising from pre-hospital care.

#### TABLE OF CONTENTS/OUTLINE

Topics covered within this presentation include: 1) Introduction to Pre-Hospital Emergency Medicine--Including Purpose of Emergency Medical Services (EMS) and Scope of practice of EMS providers; 2) Airway Management--Including Endotracheal intubation and Surgical airways; 3) Cardiopulmonary Resuscitation--Including Use and effects of mechanically-assisted chest compressions, Radiologic findings of decompressive needle thoracostomy (DNT), and Efficacy of intraosseous vascular access for resuscitation and IV contrast administration; 4) Techniques of Patient Immobilization--Including Imaging appearance and appropriate positioning of cervical spine collars, Imaging appearance and clinical benefit of hemostatic tourniquets, and Imaging appearance and appropriate positioning of pelvic binders

### Immediate-CT with Hybrid Emergency Room System for Severe Trauma Patients

#### TEACHING POINTS

- Several studies have shown that trauma whole-body CT has facilitated the early identification of major injuries and a reduction in mortality and morbidity.
- HERS (Hybrid-Emergency Room System) is an all-in-one concept of emergency room with the functions of CT scanner, interventional radiology and surgery, and useful in critical trauma treatment strategies.
- HERS in trauma treatment can be performed from diagnosis to treatment without transporting the patient, so it is possible to significantly reduce the time.

#### TABLE OF CONTENTS/OUTLINE

- We devised a new trauma treatment strategy using HERS. This is "immediate CT protocol" in which CT scan is performed immediately after arrival at the hospital.
- The immediate-CT(i-CT)protocol is optimized for CT scans immediately after arrival at the hospital.
- This protocol enabled rapid diagnostic imaging for critical traumatized patients. And, can provide more information than ultrasound, X-ray used in "primary survey". It is also possible to find major damage earlier.
- By detecting brain injury, aortic injury, retroperitoneal hematoma, lung injury, and spine injury, early activation of injuries that require referral to other departments is now possible. And we call it "BARLS".
- We demonstrated that the i-CT protocol leads to reduction of the time from arrival to CT scans without adverse events. As a result, we have contributed to the planning of treatment strategies and early activation of specialized treatment.
- This novel trauma treatment strategy can contribute to improving the life-saving rate

### **Multiphase CT Angiography Using a Time-Variant Color Map: How Can It Contribute to the Improvement of the Diagnosis and Management of the Acute Stroke?**

#### **TEACHING POINTS**

- Multiphase CT Angiography (mCTA) offers several advantages over single-phase CTA (sCTA) and contributes to improving the diagnosis and management of the acute ischemic stroke (AIS). - mCTA increases interrater agreement for both proximal and distal vessel occlusions compared with sCTA and reduces time needed to detect the occlusion. - mCTA helps to characterize the thrombus length and thrombus permeability, which may influence the treatment. - mCTA improves characterization of collateral status, that may be a useful fact in the management of some patients with AIS. - mCTA has potential value in delineating the core ischemic area and detecting tissue at risk. - mCTA can also be useful in hemorrhagic stroke. It improves prediction of intracerebral hemorrhage expansion and improves the evaluation of venous vessels and the diagnosis of vascular malformation. - mCTA may be useful in the characterization of stroke mimics.

#### **TABLE OF CONTENTS/OUTLINE**

Multiphase CTA (mCTA) provides time-resolved images of the cerebral vasculature that are useful in patients with acute stroke. An arterial (red color) and 2 venous phases are acquired ( peak venous phase in green, and late venous phase in blue) are acquired. We review the role and potential of CTA in patients with ischemic and hemorrhagic stroke, its advantages over sCTA, its limitations and its usefulness in the evaluation of stroke mimics.

### Visceral Ischemia: What Should the Emergency Radiologist Know?

#### Participants

Silvia Cayon Somacarrera, MD, Torrelavega, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To describe the key radiological features of visceral ischemia, including cases of liver, gallbladder, pancreas, spleen, renal, stomach and intestine ischemia. To understand the pathophysiology behind those radiological findings

#### TABLE OF CONTENTS/OUTLINE

The infarct's shape depends on the distribution of the vascular tree. The organs with hilum show wedge-shaped infarcts (eg. liver, kidney, spleen) while the organs without hilum show infarctions that extend through the different wall layers (eg. intestine). We collected the most illustrative cases of visceral ischemia of the last years in our institution to show the key characteristics to make a quick and accurate diagnosis. Mesenteric ischemia has a very high mortality rate if not properly treated. The key findings to evaluate are: mesenteric vessels, intestinal walls and the existence of gas (pneumatosis/pneumoperitoneum). Hepatic ischemia is uncommon due to its double vascular supply. The most typical finding is wedge-shaped hypodense areas but we can also find rounded or tubular areas parallel to the bile ducts. Renal ischemia is most often caused by renal artery embolism. Focal infarcts are depicted as hypodense triangular areas. Complete infarcts present as generalized hypoattenuation of the renal parenchyma. Splenic ischemia is relatively common. Acute infarcts are shown as triangular hypodensities, subacute infarcts as cystic images while in chronic infarcts calcifications or atrophy can be seen. Cortex preservation may be observed in complete renal/splenic infarcts due to collateral circulation.

### Evaluating Primary and Secondary Endpoints in Intracranial Hemorrhage AI Algorithms - A Review of Current Market Algorithms and a Proposed Retraining Model for Improving Patient Triage

#### Participants

Raviteja Suryadevara, MD, Louisville, KY (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The implementation of AI algorithms for intracranial hemorrhage (ICH) in the ED setting can expedite detection, triaging, and timely intervention. Most AI algorithms, in addition to their binary primary endpoint of -ICH or +ICH, also collect secondary outcome endpoint data (processing time, bleed location, bleed volume calculation). Based on trauma volume and workflow of ED practice, these algorithms should be employed accordingly. Retrospectively retraining AI algorithms to collect data on secondary outcome endpoints should be a flexible option. Retraining AI for additional primary endpoints allows for improved triaging. Specifically, in patients with intracranial hemorrhages, additional triaging of the ED reading list based on bleed volume and subtype would allow for communication and subsequent timely treatment of patients with the highest potential morbidity or mortality first. Any proposed AI retraining model, though technically sound, has challenges with acquisition of new patient data for retraining.

#### TABLE OF CONTENTS/OUTLINE

Workflow in the ED for suspected traumatic/spontaneous ICH. Where AI algorithms can help in the ED setting. Currently approved 510(k) premarket cleared algorithms for ICH detection. Quantitative evaluation of ICH AI algorithms based on primary and secondary outcomes. Retraining AI algorithms for secondary endpoints: technical logistical challenges. Conclusion. References

EREE-46

### Life-Threatening Acute Aortic Lesions Beyond Acute Aortic Syndrome

#### TEACHING POINTS

TEACHING POINTS: - Many potentially severe acute aortic lesions exist beyond the classical spectrum of acute aortic syndrome (AAS).- Life-threatening acute aortic conditions may result from traumatic injuries, iatrogenic lesions, infectious complications or aneurismatic rupture.

#### TABLE OF CONTENTS/OUTLINE

TABLE OF CONTENTS: Aortic lesions can be life-threatening and require immediate medical attention. Imaging techniques play a critical role in the diagnosis because the clinical presentation is variable and nonspecific. Moreover, CT and MRI provide fundamental information for surgical planning. AAS is a well-known medical emergency with high mortality when left untreated. However, it may show an atypical appearance and many other potentially severe acute aortic lesions beyond the classical AAS also demand immediate diagnosis. These include traumatic injuries, iatrogenic lesions, infectious complications and aneurismatic rupture. Significant traumatic injuries are classified as intramural hematomas, pseudoaneurysms and aortic ruptures. Iatrogenic lesions are usually the result of invasive coronary interventions or aortic stent placement. Mycotic pseudoaneurysms are included in the spectrum of infectious aortitis. Ruptured thoracic aneurysms are rarely imaged due to their lethality. Finally, we review atypical presentations of AAS that also need to be considered, such as intimal intussusception or dissection extension into the pulmonary arteries.

EREE-47

### Non-Obstetric- Emergencies in Pregnancy: Imaging Pathway, Findings, and Special Considerations

#### TEACHING POINTS

1. Imaging pregnant patients require special considerations and non-ionizing radiation imaging is preferred (US/MRI). However, CT in trauma and acute settings should not be delayed due to concern for radiation. 2. Knowledge of specific non-obstetric pathologies affecting pregnant patients and their imaging appearance is crucial for timely and accurate diagnoses of acute and traumatic conditions. 3. Shared decision making? with the patient is important to weight risks and benefits of imaging tests if time permits.

#### TABLE OF CONTENTS/OUTLINE

1. Review risks and safety of different imaging modalities in pregnancy (dose of fetal radiation and associated risks, iodinated and gadolinium contrast agents). 2. Special considerations when imaging pregnant patients (positioning in scanner, contrast reaction and management, recommendations regarding lead shielding). 3. Trauma imaging in pregnancy: Review imaging pathway and traumatic pathologies at higher risk in pregnant patients (retroperitoneal hemorrhage?, liver, spleen, renal and bladder injuries?). 4. Acute non-traumatic pathologies: incidence and pathophysiology in pregnancy, imaging pathway and findings, for example: (a), Abdomen: Acute cholecystitis, choledocholithiasis, appendicitis, renal stone/urosepsis, bowel obstruction, colitis, (b) Chest: Pulmonary embolism, pneumonia, (c) Neuro: Cerebral venous thrombosis, seizures, stroke, (d) Vascular: Complicated AVM, deep venous thrombosis, arterial occlusion.

### Pictorial Review of Orbital Emergencies

#### Participants

Wen Wang, MD, Orlando, FL (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Teaching Points: 1. A simplified anatomic checklist-based approach can enable an emergency radiologist to accurately and efficiently identify acute temporal bone pathology, and this approach will be reviewed in this exhibit. 2. The radiologist plays an important role by identifying key imaging findings and providing diagnoses that can direct treatment by prompting an emergency physician to admit a patient for inpatient management, order a surgical consult, or order further imaging to check for related complications. The absence of these findings are also pertinent negatives that enable clinicians to proceed with treatment in the ED or discharge a patient with outpatient follow-up. 3. This exhibit will review traumatic and acute non-traumatic pathology in a case-based format, with emphasis on key imaging findings that affect management and prognosis.

#### TABLE OF CONTENTS/OUTLINE

I. Relevant anatomic review of the orbit II. Checklist for traumatic and non-traumatic pathology III. Non-traumatic Pathologies: i. Infection Preseptal cellulitis Postseptal cellulitis Dacryocystitis Subperiosteal abscess ii. Non-infectious inflammatory pathology Sarcoidosis Optic neuritis iii. Detachment Retinal detachment Choroidal detachment IV. Traumatic pathologies: i. Fractures Blowout fractures/wall fractures Lefort II and III fractures Naso-orbito-ethmoid fractures Optic canal fracture ii. Penetrating trauma Paint gun injury Gunshot injury

### We've Got Your Back: How Radiologists Can Aid Surgical Decision Making By Using the AO Spine Classification System

#### Participants

Andrew Simmerman, MD, Baltimore, MD (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

AO Spine Injury Classification systems offer reliable and clinically relevant morphology descriptions for spinal trauma imaging. Subaxial cervical and thoracolumbar injuries are classified as A: compression, B: tension band/distraction, C: displacement/translational. A B have subtypes. The motion segment is the spine's functional unit, by which tension band and displacement injuries are labeled. Fracture morphology, neurologic signs, and patient factors influence conservative or surgical management. MRI and dynamic radiography help assess for ligamentous injuries. Rigid spines and osteoporosis affect treatment. Cervical spine specifics include facet injury, disc herniation, cerebrovascular injury, and unique ligamentous injuries at the occiput-C1-C2 levels.

#### TABLE OF CONTENTS/OUTLINE

Overview Goals of classification and radiological reporting Spinal bone and ligamentous anatomy Motion segment and tension band concepts Subaxial cervical and thoracolumbar injuries Type A: Compression Type B: Distraction Type C: Translation Type F: Facets (subaxial) Modifiers Indeterminate/incomplete tension band injuries Stiffening and metabolic bone diseases Critical disc herniation Cerebrovascular injury Upper cervical injuries A: Bone-only B: Ligamentous without complete separation C: Translation

### Broken Beauty: How Can I Make a Good Interpretation of a Facial Trauma on CT?

#### Participants

Elena Julian Gomez, MD, Santander, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- To review the facial radiological anatomy and to remember the different systems that organize it.- To propose a systematic approach for the evaluation of the facial bone mass, depending on the functional relationships between the structures.- To know the typical radiological patterns of facial fractures, taking into account some "key ideas" that we must remember, because they sometimes modify the therapeutic management.- To recognize the complications that can be associated with facial fractures depending on their location.- To emphasize the importance of making an useful radiological report for the requesting physician, with an organized description of the fractures.

#### TABLE OF CONTENTS/OUTLINE

1. Radiological facial anatomy: 1.1. Three thirds system: upper (frontal), middle (from upper orbital rim to upper maxilla) and lower (mandible). 1.2. Facial buttress system: there are 4 vertical and 4 horizontal buttresses that emphasize the functional relationships between the different facial bones.2. Systematic assessment of the facial mass: 2.1. Fractures of the upper third (frontal). 2.2. Fractures of the middle third: isolated (e.g, nasoseptal fractures) or complex (le Fort fractures, fractures of the nasal-orbital-ethmoidal complex and fractures of the zygomatic-maxillary complex). 2.3. Fractures of the lower third (mandibular). Within each section, we will discuss typical radiological fracture patterns and "key ideas" to remember.3. Complications that may be associated depending on the affected buttress.4. How to make an adequate radiological report useful for the requesting physician, without falling into the error of making a "shopping list" with the affected bones.

### The Role of CT in Non-occlusive Mesenteric Occlusion for Diagnosis, Therapeutic Strategy, and Patient Management

#### Participants

Akitoshi Inoue, MD, PhD, Otsu, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Non-occlusive mesenteric ischemia (NOMI) is characterized by segmental and skipped bowel ischemia caused by vasospasm without mechanical stenosis in the superior mesenteric artery (SMA). NOMI is a life-threatening condition, and the mortality is high. Even in survival cases, nutrient malabsorption called short bowel syndrome resulting from bowel resection for necrotized small bowel may require lifetime intravenous nutrition. CT depicts spastic SMA and branches and is considered a diagnostic tool instead of invasive angiography. Regarding the bowel, heterogeneous imaging findings, including absent enhancement, hemorrhagic necrosis, pneumatosis, and paper-thin wall appearance, can be observed, which reflects skip-segmental bowel necrosis on macroscopic findings. Additionally, CT plays an essential role in predicting the severity of bowel ischemia and reperfusion as the imaging findings reflect dynamic pathophysiology caused by vasospasms in the superior mesenteric region.

#### TABLE OF CONTENTS/OUTLINE

1. To illustrate the etiology and pathophysiology of NOMI 2. CT image findings in the superior mesenteric artery and branches, and small bowel 3. Challenge to predict the viability of ischemic bowel on CT 4. Case presentation with tips and pitfalls for NOMI 5. Differential diagnosis (mesenteric artery occlusion, mesenteric venous occlusion, strangulated bowel obstruction, and pneumatosis intestinalis) 6. Summary

### Where Is the Catheter Tip? Chest Radiograph Findings of Incorrect Placement Comparison With CT and Normal Radiographs

#### Participants

Masafumi Sakai, MD, Tsukuba, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

In the intensive care unit, catheters and tubes are inserted into patients. Incorrect catheter placement can lead to various complications; detecting incorrect placement on chest radiographs is essential for early intervention and improved patient outcomes. However, incorrect catheter placement is easily overlooked if there is no comprehensive understanding of the three-dimensional anatomy of the chest and correct placement of the catheter on chest radiographs. Furthermore, new devices have also been introduced recently, which radiologists need to be familiar with. The purpose of this exhibit is: 1. To explain chest radiographic findings of incorrect catheter placement correlating with CT and comparison with the normal position. To explain the complications and pitfalls associated with incorrect catheter placement

#### TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Case presentation | Central venous catheter Arterial misplacement Misplacement in small veins (azygos veins, etc.) Catheter fragmentation Pitfalls (vascular anomaly, etc.) | Swan-Ganz catheter Misplacement of the peripheral pulmonary artery (PA). Complications (pseudoaneurysm of the PA) | Subcutaneous implantable cardioverter defibrillator Misplacement in anterior mediastinum | Endotracheal tube One-lung ventilation Pitfalls (tube tip shifts in accordance with neck flexion and extension) | Chest tube Misplacement in the interlobar fissure Misplacement in the lung | Epidural catheter Misplacement outside the epidural space | Etc. 3. Summary 4. Conclusion

### Dual Energy CT in Acute Inflammatory and Infectious Processes of the Head and Neck. The 4 P: Protocols, Post-processing, Pearls and Pitfalls

#### Participants

Paloma Puyalto, PhD, MD, Barcelona, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Dual energy CT (DECT) images combine data from a wide range of energy acquisitions without impacting patient dose. In contrast to single energy CT (SECT), which uses only energy around 70 keV, virtual monochromatic images (VMI) can be reconstructed at any level of energy within a 40-150 keV range. Lower energies allow better delimitation of inflammatory tissue enhancement although this increases image noise ratio. Higher energies enable the virtual subtraction of iodine contrast, which improves calcium identification and reduces metallic artifacts. Material decomposition maps allow better identification of neck abscesses. The main purposes of this exhibit are: 1- To describe the DECT image acquisition protocols and post-processing methods. 2- To illustrate DECT findings and main tips in head and neck inflammatory and infectious diseases within different locations and its SECT correspondence. 3- To outline the differential diagnosis, potential pitfalls in DECT, and how to avoid them.

#### TABLE OF CONTENTS/OUTLINE

1-DECT protocol. 2-Post-processing techniques (VMI and material decomposition maps). 3-Case-based image examples of DECT and SECT correspondence for ears, orbits, paranasal sinuses, salivary glands, dental, pharyngeal, and para-pharyngeal mucosal inflammatory and infectious processes. 4- Pearls, pitfalls, and differential diagnosis in DECT images.

### At Arm's Length: Upper Extremity CT Angiography and Neurovascular Pathology

#### Participants

Andrew Sinensky, MD, Baltimore, MD (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1) Upper extremity (UE) vascular pathology can be conceptualized anatomically: the shoulder, arm, elbow, forearm, and hand. 2) CT angiography (CTA) and digital subtraction angiography (DSA) play a vital role in diagnosis and management of acute neurovascular pathology. 3) The thoracic outlet is the neurovascular outflow of the UE; thoracic outlet syndrome (TOS) results as the consequence of disruption of this outflow. 4) Non-traumatic vascular pathology of the UE is less common than lower extremity pathology and is often thromboembolic or anatomic in etiology. 5) Trauma of the UE has classic artery/nerve injury pair associations, such as at Guyon's canal (ulnar artery + nerve) and the mid-humerus (deep brachial artery + radial nerve).

#### TABLE OF CONTENTS/OUTLINE

1) UE Anatomy A) Arterial B) Venous C) Brachial plexus D) Thoracic outlet 2) CTA and DSAA) Technical considerations B) Pitfalls 3) Other Modalities A) Ultrasound B) MR 4) Atraumatic A) Central (thromboembolic, aortic dissection) B) Peripheral (atherosclerosis, aneurysm/pseudoaneurysm, vasospasm) C) External compression (TOS, quadrilateral space syndrome) D) Systemic (vasculitis, connective tissue disorders) E) Dialysis grafts and fistulas 5) Blunt and Penetrating Trauma A) Vascular injury (pseudoaneurysm, arteriovenous fistula, laceration) B) Neurologic injury (transection, compression) C) Neurovascular injuries by region (shoulder, arm, forearm, elbow, wrist, hand) 6) Management A) Surgical B) Endovascular C) Post-operative imaging considerations D) Complications

EREE-55

### Ischemic Bowel: A Challenging Imaging Diagnosis

#### TEACHING POINTS

-Briefly examine the epidemiology and common causes of ischemic bowel (IB) disease.-Master anatomic and morphologic imaging findings of IB on CT.-Understand recommendations for additional imaging to increase diagnostic certainty, including the utility of arterial phase or multiphase CT imaging.-Learn indications for surgical vs. nonsurgical management of IB and the role of the radiologist in guiding management.

#### TABLE OF CONTENTS/OUTLINE

CT is the preferred imaging technique for diagnosing ischemic bowel, as it outperforms laboratory and physical exam findings in reliability and accuracy. However, CT may only detect nonspecific signs of mesenteric ischemia, bowel dilatation, bowel wall thickening, bowel obstruction, mesenteric edema, mesenteric stranding, mesenteric vascular engorgement, and ascites. In this exhibit, we review the causes of IB including vascular (thrombosis, embolism, vasculitis), anatomic (volvulus, neoplastic), and systemic (hypoperfusion). Each diagnosis is accompanied by multiple CT cases highlighting specific and subtle imaging findings with a focus on imaging findings which alter management. Follow-up via imaging (CT angiography, MRI, MR angiography) or intervention (colonoscopy, surgical, catheter based) are reviewed with multimodality cases. Timely and accurate diagnosis of IB is crucial for guiding management, preserving bowel viability, and reducing morbidity/mortality and the radiologist is central in this clinical cascade.

EREE-56

### The Diagnostic Ability of Postmortem Imaging for the Cause of Death

#### Participants

Yu Nakaki, Hiroshima, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Postmortem imaging is widely used to identify the cause of death. Although postmortem imaging can help to determine the cause of death, its diagnostic ability depends on the subject and the methodology applied. In >65% of cases, postmortem CT (PMCT) is useful for identifying the cause of unnatural deaths because traumatic changes can be detected. On the other hand, since cardiac disease, e.g. myocardial infarction, lethal arrhythmia, and pulmonary thromboembolism cannot be diagnosed by PMCT, it is useful in only 40-50% of natural deaths. Therefore, contrast-enhanced PMCT and postmortem MRI (PMMRI) have been introduced. We describe the diagnostic ability of postmortem imaging, demonstrate the causes of deaths that can be diagnosed by postmortem imaging, and alert to interpretation pitfalls.

#### TABLE OF CONTENTS/OUTLINE

1. Diagnostic ability of PMCT for •Unnatural deaths •Natural deaths 2. Diagnostic ability of contrast-enhanced PMCT 3. Diagnostic ability of PMMRI 4. Causes of death that can be diagnosed by postmortem imaging •Aortic dissection •Aortic aneurysm rupture •Sub-arachnoid hemorrhage •Cerebral hemorrhage •Gastrointestinal bleeding/occlusion/perforation •Pulmonary thromboembolism 5. Pitfalls of postmortem imaging

EREE-57

### Obstetric Ultrasound: What Not to Miss for the ER Radiologist

#### TEACHING POINTS

1. Obstetric ultrasound is an excellent tool to assess maternal, fetal, and placental parameters in all trimesters due to its noninvasive nature, ease of availability, portability, and lack of ionizing radiation. It is the first-line method used in the evaluation of pregnant patients. 2. Transvaginal ultrasound is an excellent modality in the first trimester for adequate characterization of fetal abnormalities. 3. The focus of second and third trimesters should be on the evaluation of fetal viability and potentially life-threatening abnormalities.

#### TABLE OF CONTENTS/OUTLINE

1. Normal pregnancy parameters to look for in emergent obstetric ultrasounds. 2. Classification of obstetric emergencies by maternal, fetal, and placental anomalies. 3. Maternal abnormalities. a. First trimester. Ectopic pregnancy. 1. Adnexal. 2. Abdominal. Interstitial and cervical implantation. iii. Molar pregnancy. b. Second and third trimesters. i. Uterine dehiscence/rupture. ii. Cervical and adnexal abnormalities. 4. Fetal abnormalities. a. First trimester. Major fetal structural abnormalities. ii. Nonviable pregnancy. b. Second and third trimesters. i. Fetal hemorrhage. ii. Amniotic fluid abnormalities. iii. Doppler abnormalities. 5. Placental abnormalities. a. Placenta Previa. b. Placental abruption. c. Vasa Previa. d. Placenta accreta spectrum. 6. Pitfalls in the diagnosis of common obstetric emergencies. a. Corpus luteal cyst vs Ectopic pregnancy. b. Post C-section changes vs uterine dehiscence. c. Placenta previa vs contraction.

### An Approach to Lateral Shoulder Impact Injuries: What the Radiologists Need to Know

#### Participants

Michael Lee, Vancouver, BC (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Review the normal anatomy of the shoulder using radiographs. 2. Varying injuries can be sustained from lateral shoulder impacts (LSIs), including soft-tissue and osseous injuries. 3. Systematic approach for LSIs is essential to avoid missing injuries. 4. Dual-energy computed tomography (DECT) can be used to support the radiological evaluation of LSI injuries. The shoulder girdle is often injured and requires imaging in lateral impacts (e.g. in sports or pedestrian impacts), and can account for up to 4% of emergency department visits. Injuries may involve the clavicle, humerus, scapula, rotator cuff muscles, and the acromioclavicular and glenohumeral joints. To increase diagnostic accuracy, systematic search patterns are often utilized by radiologists. A systematic approach to common injuries encountered in LSIs may be useful for radiologists and trainees who evaluate acutely presenting patients.

#### TABLE OF CONTENTS/OUTLINE

1. Disclosures 2. Learning Objectives 3. Shoulder Anatomy and Stability 4. Clavicular Fractures 5. Acromioclavicular Fractures 6. Scapular Fractures 7. Proximal Humeral Fractures 8. Anterior Shoulder Dislocations 9. Dual-Energy CT in LSI 10. References

### Black Belts, Bruises, and Breaks: A Radiological Journey Through the Brutal World of Martial Arts Injuries

#### TEACHING POINTS

1. As the popularity of martial arts rises, injuries increase. Radiologists must recognize common and uncommon injuries associated with specific fighting disciplines. 2. Martial arts can be categorized as striking versus grappling. Understanding differences in movements and mechanisms can predict injury patterns. 3. Head and limb injuries commonly occur during striking, while joint and spine injuries are often seen with grappling. 4. Experience, age, and setting are important considerations.

#### TABLE OF CONTENTS/OUTLINE

Striking: Muay Thai/ Taekwondo/ Boxing Head Skull (strikes score points) Mandible/orbit fractures and dislocations Spine Cervical sprains/strains (clinch technique) Torso Rib fractures, solid organ injury (SOI) Upper Extremities Fractures/dislocations/ligament injuries/bursitis (blocking kicks/punching hard surfaces/overuse) Lower Extremities Fractures/soft tissue/ligament injuries (repeated high kicking/kicking hard surface/rotation+jumping) Grappling: Judo/ Brazilian Jiu Jitsu/ Wrestling Head Auricular hematomas (friction) Spine Fractures/subluxations/disc herniations (hyperextension/throw injuries) Torso Pectoralis major rupture (hyperextension) Upper Extremity Dislocation/fractures/ligament tears (Kimura/fingers blocked in the swell of the Kimono) Lower Extremity Meniscus/ligament tears/bursitis (Osotogari/footlock)

### **Beyond Bones on the Trauma Spine CT: Critical Injuries in the Nonfractured Spine; a Case-based Review of Subtle But Important Nonosseous Findings the Neurosurgeon Needs to Know**

#### **Participants**

Brad Wright, PhD,MD, Salt Lake City, UT (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

\* A trauma spine CT that is negative for fracture may have subtle but important traumatic findings that should prompt an MRI for further workup, because they may require surgical intervention. These findings include signs of unstable ligamentous injury and signs of potential cord compression. \* Widening of an anterior disc space suggests an unstable hyperextension injury, with rupture of the anterior longitudinal ligament.\* Widening of an interspinous distance suggests an unstable hyperflexion injury, with rupture of the posterior ligamentous complex.\* Widening of one or both atlantooccipital joints and widening of one or both C1-C2 facet joints suggests atlantooccipital subluxation and atlantoaxial subluxation, respectively, with capsular injury and potential injury to other ligaments.\* Although spinal epidural hematomas and disc herniations are better evaluated on MRI, they can often be identified on CT, especially if they are large and more likely to require surgery.

#### **TABLE OF CONTENTS/OUTLINE**

\* Introduction\* Hyperextension injuries\* Hyperflexion injuries\* Atlantooccipital and atlantoaxial subluxation\* More obvious malalignment (with fractures): distraction injuries and dislocations\* Spinal epidural hematoma and disc herniation

### Mesenteric Pathologies in Emergency Imaging

#### Participants

Christian Gomez, MD, Atlanta, GA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

-Describe the anatomy of the peritoneum, mesentery and omentum.-Review mesenteric pathologies in a systemic approach with multi-modality imaging.-Differentiate commonly encountered mesenteric pathologies according to imaging and clinical characteristics.-Understand which mesenteric pathologies require follow-up or acute intervention.

#### TABLE OF CONTENTS/OUTLINE

Mesenteric abnormalities are often encountered during emergency imaging. The imaging findings are often nonspecific and encompass a wide range of pathologies. In this exhibit, we review a spectrum of diseases with key imaging and clinical findings. We also highlight patient symptomology, key diagnostic features, potential acute complications, and follow up recommendations. This exhibit will review the anatomy of the peritoneal cavity, mesentery, omentum, and the peritoneal fluid circulation. Pathologies discussed include:-blunt and penetrating trauma?-secondary infiltration of the mesentery from edema or bowel inflammation?-varying stages of sclerosing mesenteritis?-sclerosing encapsulating peritonitis?-tuberculosis; omental infarct ?-primary and secondary mesenteric malignancies - carcinoid, dermoid, lymphoma, metastases, carcinomatosis, primary mesenteric mesothelioma, desmoplastic round cell, GIST, and mesenteric paraganglioma ?-cystic lesions - pseudomyxoma peritonei, inclusion cyst, duplication cyst, lymphangioma, and pseudocyst.

EREE-63

### Computed Tomographic Angiogram (CTA) of the Upper Extremities

#### Participants

Richard Tsai, MD, St. Louis, MO (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Teaching Points: With the advancement of cross-sectional imaging and sub-mm isotropic data acquisition, computed tomographic angiography (CTA) has become an excellent non-invasive diagnostic tool for the evaluation of the upper extremity vasculature. CTA is able to evaluate for vessel patency, irregularity, and achieve the anatomic detail needed in pre-operative planning. It is generally performed in the setting of trauma, but can also be used to evaluate other causes and sources of acute limb ischemia, and vasculitides. In this review, the normal vasculature and common anatomic variations will be presented, with a focus on trauma, acute limb ischemia, and vasculitis.

#### TABLE OF CONTENTS/OUTLINE

This exhibit is on the RadioGraphics Needs List under Emergency Radiology: Upper extremity CT angiography. This exhibit will: 1) Discuss the imaging technique and rationale for upper extremity CTA 2) Illustrate normal anatomy and commonly encountered anatomic variants 3) Illustrate the utility of upper extremity CTA for the evaluation of trauma, vasculitis, acute limb ischemia, and pre-operative planning 4) Describe pitfalls in interpretation of upper extremity CTA  
Outline: Normal anatomy and common anatomic variants  
Imaging protocols and interpretation  
Pitfalls: -Streak (instrumentation, contrast bolus on ipsilateral side)-Motion-Outrunning the bolus  
Trauma: -Occlusion-Vasospasm-Active extravasation-Pseudoaneurysm-Arteriovenous fistula  
Acute limb ischemia: -Thromboembolism-Stents and complications  
Vasculitis: -Takayasu's-Buerger's-Scleroderma/CREST syndrome

### CT of Knee Fractures and Dislocations in Adults: Diagnosis, Grading, and Management Implications

#### Participants

David Dreizin, MD, Baltimore, MD (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. CT is indicated for any distal femur fracture with possible articular involvement, due to easily missed coronal plane (Hoffa) fractures which displace further if unrecognized. 2. Patellar comminution associated with transverse fracture is often missed without CT, leading to potential loss of fixation with tension band wiring. Low profile 3D matrix/basket plates are increasingly used for patellar fractures shown to be comminuted at CT. 3. Patella baja is common with early severe osteoarthritis in patients with partial patellectomy for severely comminuted inferior pole fractures. 4. Medial tibial plateau fractures are complex injuries often reflecting fracture dislocation with associated ACL and lateral collateral ligament damage and dislocation of the rest of the plateau from the femur. 5. The PTA (posterior tibial slope) and mTPA (medial tibial plateau) angles can be used to determine side of compression for primary plating.

#### TABLE OF CONTENTS/OUTLINE

1. Contemporary CT imaging utilization for high-energy fractures- includes comparison with x-ray and MRI  
2. Distal femur.  
i. classification- AO/OTA system  
ii. Patterns of injury/biomechanics  
iii. CT for surgical approach and hardware selection  
iv. Complications  
3. Patella.  
i. classification- AO/OTA and its limitations  
ii. Patterns of injury/biomechanics  
iii. CT for surgical approach and hardware selection  
iv. Complications  
4. Tibia.  
i. classification- Schatzker and 3 column concept (Luo)  
ii. Patterns of injury/biomechanics  
iii. CT for surgical approach and hardware selection

### What You Should Know to Improve the Quality of Contrast-enhanced CT Under ECMO?

#### Participants

Fuyuki Washizuka, Tokyo, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To learn about hemodynamics when using extracorporeal membrane oxygenation (ECMO). To understand the relationship between the degree of residual native ejection fraction and the flow rate in the ECMO system when using veno-arterial ECMO (VA-ECMO). To learn about contrast-enhanced CT precautions and contrast methods under the use of ECMO. To learn the pitfalls of contrast-enhanced CT when using veno-venous ECMO (VV-ECMO). To learn how to ensure contrast-enhanced CT under more complex assisted circulation.

#### TABLE OF CONTENTS/OUTLINE

A. Changes in blood flow over time during VA-ECMO use. B. ECMO is divided into two categories, with VA-ECMO subdivided into three according to left ventricular ejection fraction (LVEF) and ECMO flow rate. C. Tips for successful contrast-enhanced CT in special hemodynamic situations when using VA-ECMO. D. Secrets to ensure successful contrast-enhanced CT when using VV-ECMO.

EREE-66

### A Hidden Killer: Abdominal Pseudoaneurysms and Their Diagnostic Challenge

#### Participants

Fernando Rodado Aranguren, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To understand the pathophysiology and etiological spectrum of visceral pseudoaneurysms, as well as their potential complications that can lead to urgent abdominal pathology. To define the radiological findings that guide the diagnosis of a pseudoaneurysm and its complications in the different imaging tests.

#### TABLE OF CONTENTS/OUTLINE

Pseudoaneurysms are abnormal focal dilations of the arterial vessels, generally produced by a disruption of the arterial wall that conditions the passage of blood through it, but remaining contained by the tunica adventitia or the perivascular soft tissues (unlike true aneurysms consisting of focal arterial dilations formed by all layers of the arterial wall). Among the possible causes of arterial wall damage that originates pseudoaneurysms are inflammatory processes, trauma, and iatrogenesis due to invasive procedures. Abdominal visceral pseudoaneurysms can develop a series of complications that entail high morbidity and mortality, generally divided into two large groups: those derived from compression phenomena of adjacent structures due to mass effect, and those derived from aneurysm rupture with bleeding into different spaces and structures. Through this work we will carry out an orientation to the radiological management of pseudoaneurysms and their complications, reviewing the typical findings described in the literature and illustrating them with several cases from our hospital.

### Body MRI in Acute Abdomen: Primer for the On-call Radiologist and Case Based Review

#### Participants

Ashlesha Udare, MBBS, MD, Philadelphia, PA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

-To evaluate the appropriateness of Body MRI in acute abdomen.-To understand the importance of abbreviated protocols in an emergency setting.-To know the typical and atypical imaging features of various acute abdominal emergencies and the appearance of incidental emergent findings via a case-based review.

#### TABLE OF CONTENTS/OUTLINE

Acute Abdomen: When to do MRI?: Iodinated contrast contraindication-Renal insufficiency. History of serious contrast allergy.Failed contrast-enhanced study.Pregnancy-SAR, localiser planning.Problem-solving tool-Clinical Vs CT/US mismatch-Get a "better look!". ACR appropriateness guidelines.Technical Pearls for Body MRI in acute conditions: Micro-protocolling, monitoring scans, fast sequences, safety concerns.Case-based review of various acute abdomen Body MRIs: Gastro-intestinal emergencies (appendicitis, cholecystitis, cholangitis, diverticulitis, hepatic pyogenic abscess). Acute gynaecological conditions (ovarian torsion, massive ovarian edema, tube-ovarian abscess, fibroid degeneration, hemorrhagic cyst, ruptured ovarian cystic lesion) Acute pregnancy related cases (Ectopic pregnancies, placental abnormalities). Acute genito-urinary cases (Pyelonephritis/renal abscess, peniletrauma, scrotal trauma, epididymis-orchitis, priapism) Musculoskeletal injuries presenting as acute abdomen (core muscle injuries, abdominal wall hernias/hematomas, avulsion injuries). Cardiovascular cases (acute aortic syndromes, PE). Miscellaneous: Post-intervention, Post-transplant (renal vein thrombosis, GVHD), Oncological emergencies (ruptured HCC, SVC syndrome). Incidental emergent findings (pneumoperitoneum, hemoperitoneum)

### Uncoupling the Forefoot From the Midfoot: Experience and Review of Lisfranc Injuries

#### Participants

Victor Rodriguez-Laval, MD, PhD, Madrid, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To understand the anatomy of the Lisfranc ligament complex and its importance. To review the most prevalent injury mechanisms, classifications, and treatment options. To present the X-ray and CT findings in the emergency room, surgical procedures and post-treatment imaging.

#### TABLE OF CONTENTS/OUTLINE

We reviewed the Lisfranc injuries over the previous ten years in our institution and chose the most representative cases. The normal and pathologic anatomy will be highlighted using a multimodality approach that includes plain radiographs, CT with 3D reconstructions. A case-based methodology will be used to cover the whole spectrum of injuries, from Lisfranc ligament sprains to homolateral and divergent fracture-dislocation type injuries, and this will be followed by additional discussion. Also, a brief overview of typical classification schemes, operation approaches, gradation of injury, and postoperative imaging will be presented. It is important to understand the anatomy and injury pattern to be able to diagnose Lisfranc injuries because a delay on the diagnosis increases the risk for midfoot instability, deformity and debilitating osteoarthritis. Given the often subtle initial radiographic findings, maintaining a high index of suspicion with a low threshold to obtain supplemental imaging is key in reducing miss rates. As Lisfranc injuries comprise only a small fraction of overall foot injuries, a periodic review of the salient imaging findings is essential.

## Abstract Archives of the RSNA, 2023

EREE-8

### Acute Large Bowel Diverticulitis: A Pictorial Review

#### TEACHING POINTS

Acute large bowel diverticulitis is a common reason of emergency department visits and when complicated it may end up in urgent gastrointestinal surgery. Computer tomography (CT) remains as the primary diagnostic tool in the diagnosis and staging of acute diverticulitis and its complications. Our radiologic report is essential for the surgeon to establish a treatment and to determine an outcome as well as for the exclusion of alternate causes of pathology. We recommend using international diverticulitis staging classifications (as WSES Classification or modified Hinchey classification) to improve our communication with surgeons. In this educational communication, we aimed to illustrate the key CT imaging features of diverticulitis and its complications including perforation, phlegmon, abscess, ascending septic thrombophlebitis (phylephlebitis), bleeding, intestinal obstruction, and fistula.

#### TABLE OF CONTENTS/OUTLINE

### Imaging the Acute Complications of Gender-Affirming Surgeries: A Primer in the Emergency Radiology Setting

#### Participants

Siddhi Hegde, MBBS, Boston, MA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Gender-affirming surgeries (GAS) and their complications are critical for radiologists to understand. GAS is often tailored to the patient; there is a diverse spectrum of post-operative appearances and complications. Typical postoperative anatomy may imitate pathology if not identified correctly. Radiologists' diagnostic expertise, knowledge of institutional GAS and common complications, and their ability to collaborate with multidisciplinary clinical team, enables them to offer valuable insights on institutional practices and guide appropriate next steps for complications. We will highlight the diagnostic features of the acute complications that may arise following gender-affirming surgeries and provide an overview of the ideal workup in the acute setting.

#### TABLE OF CONTENTS/OUTLINE

Describe expected imaging appearance of post-GAS neoanatomy, including common terminology Review multi-modality emergent imaging [ultrasound, plain film, retrograde urethrogram (RUG), Computed Tomography (CT)] review of common and "can't miss" complications Neourethral- anastomotic leaks, diverticula, fistulae, stenoses/strictures Transmasculine prostheses/device/implant - abscess, hematoma, malpositioning Bladder or rectal injury after vaginectomy (leading to fistulae) Postoperative bleeding Silicone emboli Providing gender-affirming care during imaging and reporting Understand ideal workup and unique imaging protocol considerations Discuss pitfalls of imaging in the acute setting, pearls for long-term follow-up

GIEE

### Gastrointestinal Imaging Education Exhibits

#### Sub-Events

**GIEE-1 A Deep Dive into Essential Predictive Imaging Features of Abdominal Neoplasms in the Era of Personalized Therapy: Insight into the Correlation with Pathological, Molecular, and Genetic Background**

#### TEACHING POINTS

Recognizing imaging findings regarding the tumor microenvironment and molecular function of abdominal neoplasms is not only the key to appropriate diagnosis, but also to early prediction of treatment options and response to various therapies. This exhibit aims to provide a better understanding of the essential predictive imaging findings of abdominal neoplasms in correlation with their pathological, molecular, and genetic background, which has the potential to lead to personalized treatment strategies in the coming era.

#### TABLE OF CONTENTS/OUTLINE

The treatment options for abdominal malignancies have become more diverse with advances in surgery, chemo and immunotherapy, making pre-treatment risk stratification even more important. Radiologists are now required not only to diagnose but also to predict the prognosis and efficacy of treatment based on images, and to contribute to the selection of appropriate treatment. Understanding of predictive imaging findings can also help us to speculate upon the tumor microenvironment, which might be required in the future. We summarize these imaging findings for the following neoplasms; (i)HCC, (ii) Liver metastases from colorectal cancer, (iii) Pancreatic cancer, (vi) Intrahepatic cholangiocarcinoma. We also focused on the application of these findings to treatment strategies for each abdominal malignancy to explore the usefulness of these predictive findings in the era of personalized treatment.

#### GIEE-10 Fibropolycystic Liver Disease: An MRI Review with Pearls and Pitfalls

Participants

Jordan LeGout, MD, Ponte Vedra Beach, FL (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Fibropolycystic liver disease comprises a spectrum of interrelated conditions that range from congenital hepatic fibrosis to choledochal cysts. In this exhibit we will: -Review the MRI appearance of the various fibropolycystic liver diseases and associated conditions-Highlight imaging pitfalls using real errors encountered in clinical practice-Introduce imaging pearls for the various conditions that can help arrive at the correct diagnosis-Differentiate between those conditions that are benign and incidental and those that pose risk for development of malignancy

#### TABLE OF CONTENTS/OUTLINE

I. IntroductionII. Congenital hepatic fibrosis a. Pearl: Liver morphology, segment IV hypertrophy b. Pitfall: FNH-like lesionsIII. Biliary hamartomas a. Pearl: Use high b-value diffusion to uncover lesions b. Pitfall: Polycystic liver disease, infiltrative malignancyIV: Peribiliary cysts a. Pearl: Anatomic sequences over MRCP b. Pitfall: PSCV. Polycystic liver disease a. Pearl: Use subtraction imaging b. Pitfall: Mucinous cystic neoplasmVI. Caroli Disease/Syndrome a. Pearl: Different degrees of involvement (diffuse vs. segmental) b. Pitfall: Recurrent pyogenic cholangitis VII. Choledochal cysts a. Review appearance of subtypes b. Pearl: Field defect and risk for cholangiocarcinoma c. Pitfall: Age related and cholecystectomy related ductal dilation

#### GIEE-100 Post-neoadjuvant MRI Changes and Challenges in Rectal Adenocarcinoma: What to Look for

Participants

Mayra V. Soares, MD, Brasilia, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To understand the pivotal role of MRI in the post-neoadjuvant restaging of rectal cancer.To highlight the main imaging changes in post-neoadjuvant MRI, which reflect histopathologic changes that may occur after chemoradiation treatment.To recognize how fibrosis or increased mucin production, addressed by high-resolution MRI, impacts risk stratification post-neoadjuvant therapy.To learn about some challenges in MRI morphological and DWI evaluation regarding new treatment optionsUnderstand the role of radiologists as part of patient care, helping to enroll patients eligible to "watch-and-wait" programs.

#### TABLE OF CONTENTS/OUTLINE

Introduction:Primary tumor and nodal assessment with MRI.Rectal cancer treatment guidelines overview.When neoadjuvant treatment is the best approach.Neoadjuvant treatment options: CRT x TNT.Recognizing tumoral changes after CRT Posttreatment changes in the primary tumor - a systematic approachTumor Restaging: a response classification based on histopathologic and DWI changesPatterns of tumor responseMRI tumor regression grades - a risk stratification incomplete/poor x "near-complete"/complete responders"Watch-and-wait": patient selection and current controversies.Immunotherapy - the new kid on the blockFuture considerations: potential biomarkers in rectal cancer and game-changer?Conclusion.

## **GIEE-101 Getting Started in Bariatric Surgery Imaging: Postoperative Anatomy and Complications**

### **TEACHING POINTS**

Review postoperative anatomy changes in bariatric procedures. Discuss the approach to postoperative evaluation. Identify imaging findings of common bariatric surgery complications.

### **TABLE OF CONTENTS/OUTLINE**

Background. Eligibility criteria. Types of bariatric surgery and techniques. Postoperative evaluation. Cased based review of common postoperative complications. Imaging findings in weight regain and insufficient weight loss after bariatric surgery.

## **GIEE-102 Principles and Clinical Applications of Dual-layer Spectral CT in Gastrointestinal Imaging**

Participants

Chiara Spasiano, Vedano Al Lambro, Italy (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

To summarize the fields of application of Spectral-CT technology and define the actual advantages and benefits in clinical imaging, derived from recent literature review.

### **TABLE OF CONTENTS/OUTLINE**

Dual-energy computed tomography (DECT) or spectral-CT is an advanced CT that acquires data at different energy levels to enhance material differentiation and tissue characterization. Conventional CT utilizes a polychromatic beam, but energy levels are not separated in image generation while in a dual-layer detector, the thinner top layer measures low-energy photons, and the thicker bottom layer measures high-energy photons. Complex material decomposition algorithms are used to generate images for routine clinical interpretation or for more advantage material characterization, including virtual non-contrast (VNC), iodine maps, and effective atomic number, as well as virtual monochromatic image sets, from 40 to 200keV. The most common use has been characterizing urinary calculi (different composition), gallstones (isoattenuating to bile on conventional CT), detection and correct definitions of incidental cystic lesions. While added value of multi-energy CT in body imaging include: characterization of incidental lesions (very common event in body imaging), iodine detection and subtraction (possibility to reconstruct several Iodine-Map, at monoenergetic images, both with Low and High energy levels), assessment of tissue perfusion (using organ iodine distribution as surrogate of perfusion, especially in pulmonary embolism), contrast dose reduction, tissue characterization, and finally the possibility to decrease the number of scan.

## **GIEE-103 Beyond TNM Staging System: Evaluation of Colon Cancer Prognostic Factors by CT and MRI**

### **TEACHING POINTS**

To review the diagnostic accuracy of CT and MRI for staging colon cancer. To define locally advanced colon tumors. To enumerate colon cancer prognostic factors and critical information that should be present in radiological reports in this context.

### **TABLE OF CONTENTS/OUTLINE**

1 - Anatomic considerations of colon and retroperitoneal surgical margin 2 - TNM Staging of colon cancer 3 - Colon cancer prognostic factors (primary tumor extramural extension, retroperitoneal surgical margin involvement, extramural vessel invasion, and lymph node metastases) 4 - Locally advanced colon tumors 5 - Current treatment of colon tumors 6 - Promising treatment (neoadjuvant systemic therapy) 7 - Role of imaging in stratification of patients with colon cancer according to their risk group, contributing to better patient selection and optimization of colon cancer treatment

## **GIEE-104 Gastrointestinal Neuroendocrine Neoplasms, Imaging, Pathology, Classification and Management: 2023 Update**

Participants

Kedar Sharbidre, MD, Birmingham, AL (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

1. Gastrointestinal (GI) neuroendocrine neoplasms (NENs) are rare heterogeneous epithelial tumors with characteristic histological, and biological behavior. 2. The most recent WHO 2019 classifies NENs into well-differentiated (G1-G3) and poorly differentiated neuroendocrine carcinomas (NECs). Numerous studies have been published since then describing the effectiveness of this classification, diagnostic implications, and management. 3. Most often clinical, imaging and molecular features have to be integrated in order to appropriately correlate with pathologic classification, particularly to differentiate between G3-NET and NECs. As the tumor grade progresses the FDG-PET is more likely to be useful rather than DOTATE-PET which correlates with a poorly differentiated grade (NEC). The NETPET scoring system based on dual-tracer imaging can help better characterize well-differentiated metastatic NET lesions. 4. Surgery remains the mainstay of treatment for locoregional GI-NENs. Treatment of G3-NENs includes peptide receptor radionuclide therapy (PRRT), Somatostatin analogs, Everolimus, or sunitinib. Everolimus is an mTOR inhibitor while Sunitinib malate inhibits multiple receptor kinases such as VEGFR and PDGFR. Platinum-based chemotherapy with cisplatin/carboplatin and etoposide/irinotecan is recommended for patients with poorly-differentiated NECs

### **TABLE OF CONTENTS/OUTLINE**

1) Background, 2) WHO 2019 classification of the NENs, 3) 2023 Imaging update with emphasis on molecular techniques and NETPET Scoring, 4) Update on the management of NENs with emphasis on medical treatment, 5) Conclusion.

## **GIEE-105 Tricks and Pitfalls of Multi-parametric MRI Restaging of Rectal Cancer After Preoperative Chemoradiotherapy**

Participants

Giovanni Sussan, MD, Padova, Italy (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

1. To describe the MRI protocol for rectal cancer evaluation after preoperative chemo-radiotherapy (pCRT), dealing also with the

debated practices<sup>2</sup>. To describe the correct evaluation and the most common pitfalls of T staging after chemoradiation, using both DWI and contrast-enhanced sequences<sup>3</sup>. To describe the correct evaluation and the most common pitfalls of N staging after pCRT, including the MRI evaluation of the lateral pelvic lymph nodes<sup>4</sup>. To describe the other fundamental features that should be reported while evaluating an MRI for rectal cancer restaging (such as Mesorectal Fascia/peritoneal reflection involvement, Extramural Vascular Invasion [EMVI], etc.)

#### TABLE OF CONTENTS/OUTLINE

1. Protocol of study<sup>2</sup>. Localization and Reported Template tips<sup>3</sup>. ycT staging MRI evaluation<sup>4</sup>. mrTRG evaluation of the primary lesion<sup>5</sup>. ycN staging MRI evaluation<sup>6</sup>. Mesorectal fascia (MRF) involvement<sup>7</sup>. Peritoneal Reflection involvement<sup>8</sup>. EMVI<sup>9</sup>. Tumor deposits

#### GIEE-106 The Watch-and-Wait Program in Rectal Cancer. A Primer for Radiologists

Participants

Lautaro Florentin, MD, Buenos Aires, Argentina (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

HING POINTS  
The watch-and-wait (WW) program is an organ-preserving approach for those patients with locally advanced rectal cancer who have no evidence of residual tumor after neoadjuvant therapy. The aim of WW is to improve the quality of life of these patients avoiding unnecessary resective surgeries in disease-free rectum. MRI plays a pivotal role in the selection process of patients who are suitable for this approach. The combination of high-resolution T2-weighted sequences (T2HR) and diffusion weighted images (DWI) are essential for detecting early regrowth during the monitoring of these patients.

#### TABLE OF CONTENTS/OUTLINE

Introduction  
History  
Why WW strategy?  
Initial assessment  
To whom?  
How to?  
i) Defining locally advanced rectal cancer (LARC). The role of MRI  
Candidates selection. Response after neoadjuvant chemoradiotherapy (nCRT)  
Tumor regression grading system  
The concept of clinical complete response (cCR). Clinical, endoscopic and radiologic aspects.  
i) Primary tumor- Complete, near complete and incomplete responders  
Radiological features  
Endoscopic findings  
ii) Lymph nodes - Complete, near complete and incomplete responders  
Radiological features  
Surveillance  
What does regrowth mean? Outcome implications  
Detecting regrowth. The advantage of MRI  
Regrowth types: intraluminal, mesorectal and lateral internal iliac/obturator nodes  
Regrowth patterns

#### GIEE-107 Primary Hepatic Neuroendocrine Neoplasm (PHNEN) and Neuroendocrine Liver Metastasis (NELM): Imaging Update and Management

Participants

Kedar Sharbidre, MD, Birmingham, AL (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Teaching Points  
Primary hepatic neuroendocrine neoplasms (PHNENs) are rare heterogeneous neoplasms arising from the intrahepatic neuroendocrine cells, ectopic pancreatic or adrenal tissue in the liver. Imaging appearances of these tumors are rarely been reported. Neuroendocrine liver metastases (NELM) are more common arising from gastro-enteropancreatic primary and are heterogeneous in clinical presentation and prognosis. After reviewing this exhibit, the learner will be able to: 1. Understand the basic pathophysiology of PHNENs and NELMs. 2. Understand the imaging diagnosis of these tumors and common differentials. 3. Get a basic understanding of principles of management of these tumors. 4. Imaging of Post-operative complications of liver directed therapy

#### TABLE OF CONTENTS/OUTLINE

A. Pathophysiology of PHNENs and NELMs  
B. Clinical and biochemical assessment.  
C. Imaging protocol for liver disease.  
D. Common and uncommon imaging appearance with CT, MRI and PET-CTs  
E. Updated management guidelines  
F. Assessment of post treatment complications

#### GIEE-108 CT Imaging of Peritoneal Carcinomatosis and Its Mimics: Pictorial Review

#### TEACHING POINTS

Multidetector computed tomography (MDCT) is the most commonly used technique for the detection of peritoneal carcinomatosis and for the evaluation of the extend of the disease. The objectives of this study are: 1) Review the pathophysiologic mechanism of the tumor spread and the most common sites and forms of peritoneal involvement 2) Assessment of the peritoneal cancer index (PCI) that provides important information for the surgical planning 3) Illustrate a wide variety of tumorous and inflammatory conditions that can occur in the peritoneal surface and mimic peritoneal carcinomatosis

#### TABLE OF CONTENTS/OUTLINE

Representative cases of peritoneal carcinomatosis and its mimics are illustrated in this exhibit, grouped according the following headings: 1) Anatomy of the peritoneum and the physiology of circulation and resorption of peritoneal fluid 2) CT imaging findings and patterns of peritoneal carcinomatosis 3) Peritoneal cancer index 4) Mimics of peritoneal carcinomatosis including tuberculous peritonitis, peritoneal lymphomatosis, pseudomyxoma peritonei, primary peritoneal mesothelioma, sclerosing peritonitis, fat saponification, leiomyomatosis 5) Take home points.

#### GIEE-109 Facing the 'Celiac Iceberg': What Role can Cross-sectional Imaging Play

Participants

Xinyue Wang, Guangzhou, China (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

As a condition described as 'celiac iceberg', celiac disease (CD) remains underdiagnosed and undertreated. Radiological evaluation of CD deserves more attention because cross-sectional imaging is helpful in clinical management of CD, including disease diagnosis, complications identification, treatment response evaluation, and prognostic prediction, which should be considered the examination of choice in patients suspected of having CD. The purpose of this exhibit is: 1. To introduce the challenges of diagnosis and treatment in CD; 2. To introduce what role of cross-sectional imaging can play in CD; 3. To introduce the imaging features of CD and

its complications;

#### TABLE OF CONTENTS/OUTLINE

-The profile of CD and the challenges facing  
Role of cross-sectional imaging in CD- Disease diagnosis- Complications identification- Disease activity and severity evaluation- Treatment response evaluation- Prognostic prediction  
Imaging features of CD- Jejunoileal fold pattern reversal- Mesenteric vascular engorgement - Enlarged mesenteric lymph nodes- A decreased size of spleen- Small bowel wall thickening- Diffusely dilated bowels with excess fluid or gas- Intramural fat deposition  
A complication of CD: Mesenteric lymph node cavitation syndrome- Imaging features of mesenteric lymph node cavitation syndrome - Enlarged mesenteric lymph nodes that contain fat-fluid levels

#### GIEE-111 Unveiling the Mysteries of Pancreas Transplantation through Imaging

##### TEACHING POINTS

Understand the clinical relevance, indications, and surgical techniques of pancreas transplantation. Learn about the role of multimodality imaging (US, CT, MRI and CEUS) in the assessment and management of pancreas transplantation.

#### TABLE OF CONTENTS/OUTLINE

Introduction: an overview  
Clinical importance of pancreas transplantation  
Epidemiology: United States and Global context  
Pancreas transplantation: surgical aspects  
Types of pancreas transplant: indications and outcomes  
Surgical techniques: arterial anastomosis, enteric drainage of exocrine secretions and venous anastomosis  
Multimodality imaging assessment of pancreas graft recipients  
US, CR and MRI: advantages and limitations  
Graft's normal appearance  
Complications: a case-based review  
Early versus late complications  
Rejection: radiological-pathological correlations  
Perspectives  
Artificial intelligence and novel imaging techniques  
Contrast enhanced ultrasound (CEUS): focus on graft's perfusion and rejection  
Take home messages

#### GIEE-110 Abdominopelvic Actinomycosis

Participants

Yong-Soo Kim, MD, PhD, (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

To review microbiological and clinical features of actinomycosis this may involve the abdominopelvic organs. To illustrate various CT features of actinomycosis involving abdominopelvic organs.

#### TABLE OF CONTENTS/OUTLINE

Actinomycosis is a chronic inflammatory disease which can involve a variety of human organs. This disease commonly occurs in three distinct forms; a cervicofacial form, an abdominopelvic form and a thoracopulmonic form. After penetrating through the mucosal barrier, the route of propagation is direct spread to adjacent tissue. The aggressive nature of infiltration of actinomycosis may be confused with neoplasm and other inflammatory diseases, especially tuberculosis or fungal infection. Various abdominal organs may be infected by actinomycosis. Abdominal infection has been associated with abdominal surgery, such as appendectomy, or a perforation of the intestinal mucosa; a rupture of appendix, diverticulitis, foreign body perforation of the transverse or sigmoid colon, peptic ulcer. Pelvic actinomycosis may be associated with any type of intrauterine contraceptive device or with an intra-abdominal portal entry. Abdominal actinomycosis can present as an abscess or as a mass that is often fixed to the underlying tissue, as a sinus tract with drainage, perirectal or perianal disease.

#### GIEE-111 Comprehensive Image-based Overview Of Percutaneous Enteral Access

##### TEACHING POINTS

Image-guided percutaneous enteral catheters offer a minimally invasive alternative to endoscopic or surgical techniques to provide patients access for important nutrition and medication administration. This exhibit discusses the indications, contraindications, techniques, and peri-procedural management of image-guided percutaneous gastrostomy, gastrojejunostomy (including AbbVie PEG-J pull-type technique for Duopa infusion), jejunostomy, and transesophageal gastrostomy.

#### TABLE OF CONTENTS/OUTLINE

- Pre-Procedural Considerations
- Indications/Contraindications for percutaneous enteral catheter placement
- Image-guided technique for percutaneous gastrostomy/gastrojejunostomy
- Image-guided technique for percutaneous jejunostomy
- Image-guided technique for percutaneous transesophageal gastrostomy
- Image-guided technique for percutaneous pull-type AbbVie PEG-J
- Post-procedural evaluation and complication management

#### GIEE-112 Duodenal Diseases: Illustrated Cases for Radiologists

Participants

Manuel Sebastian Paez Alvarez SR, MD, Toledo, Spain (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

To provide a comprehensive, illustrative guide for diagnosing duodenal diseases in radiology practice. To review and emphasize the imaging characteristics of various duodenal pathologies on CT studies. To highlight the importance of recognizing subtle findings and common anatomical anomalies for accurate diagnosis.

#### TABLE OF CONTENTS/OUTLINE

Duodenal diseases encompass a broad spectrum of conditions that can originate in the duodenum or result from processes involving neighboring organs. This exhibit aims to educate radiologists on various duodenal pathologies, emphasizing illustrative cases through CT studies. Introduction: Overview of duodenal diseases and their significance in gastrointestinal imaging. Congenital anomalies. Inflammatory diseases. Neoplastic diseases. Vascular pathologies. Iatrogenic complications involving the duodenum. Other duodenal entities and pathologies. Conclusion. In this educational exhibit, we will provide a thorough understanding of the duodenum's anatomy and various diseases, emphasizing the importance of recognizing subtle imaging findings in the context of duodenal pathology. This resource will serve as a valuable guide for radiology residents and radiologists seeking to improve their diagnostic skills in abdominal CT imaging.

## **GIEE-113 Usual and Unusual GI Tract Diverticula, Clinical Presentation, Imaging Characteristics and Management**

### **TEACHING POINTS**

Review the pathophysiology of diverticula formation throughout the gastrointestinal tract. Describe the presentation and demonstrate the imaging characteristics of typical and atypical diverticula throughout the entire gastrointestinal tract. Discuss potential complications of diverticula, as well as their management.

### **TABLE OF CONTENTS/OUTLINE**

-Overview of the pathophysiology of diverticular disease-Overview of radiological findings, complications, and management of diverticular disease--For each type, examples from our database will be provided Foregut----Zenker's diverticulum----Traction and pulsion diverticulum----Pseudodiverticulum----Epiphrenic diverticulum----Gastric diverticulum----Duodenal diverticulum-----Duodenal diverticulitis-----Lemmel syndrome-----Duodenal diverticular lithiasis-----Intraluminal duodenal diverticulum Midgut---- Jejunum diverticulum-----Jejunum diverticulitis---- Meckel's diverticulum-----Bleeding Meckel's diverticulum-----Meckel's diverticulitiso Hindgut----Colonic diverticulum-----Right Colon-----Acute diverticulitis-----Appendiceal diverticulum-----Diverticular abscess-----Left Colon-----Acute diverticulitis-----Diverticular abscess secondary to ruptured diverticula-----Fistula-----Colo-vesical fistula-----Colo-iliopsoas fistula-----Fecal peritonitis and purulent peritonitis secondary to ruptured diverticula-----Septic Thrombophlebitis-----Bleeding colonic diverticulum-----Giant colonic diverticulum

## **GIEE-114 Infiltrative Hepatocellular Carcinoma: Challenging Cases and Its Benign Mimics**

Participants

Elhamy Heba, MD, MD, Lexington, KY (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

Various histopathologic and morphologic subtypes of hepatocellular carcinoma (HCC) are described throughout the literature. Among all these subtypes, the infiltrative appearance of HCC presents unique challenges in detection, both clinically and radiographically. Infiltrative appearance of HCC is characterized by diffuse permeative spread throughout the liver parenchyma, without forming a mass-like lesion, in a manner that sometimes it is difficult to detect on a background abnormal liver parenchyma. Radiologist must distinguish the infiltrative pattern of HCC from processes that may mimic such as: confluent fibrosis, diffuse fat or iron deposition, diffuse metastatic disease, cholangiocarcinoma, and hepatic microabscesses.

### **TABLE OF CONTENTS/OUTLINE**

1. Incidence and prevalence of infiltrative HCC  
2. Review imaging features of infiltrative HCC, including multimodality case-based review of typical and challenging cases of infiltrative HCC with pathological correlation  
3. Discussion of Tumor in vein as a common imaging feature of infiltrative appearance of HCC  
4. Mimics of infiltrative appearance of HCC including confluent fibrosis, diffuse fat/iron deposition, diffuse metastatic disease, cholangiocarcinoma, and hepatic micro abscesses  
5. Review of prognosis, management and post treatment imaging of infiltrative appearance of HCC

## **GIEE-115 Autoimmune Diseases of the Liver and Biliary Tract**

### **TEACHING POINTS**

Understand mechanisms behind self-tolerance and autoimmunity  
Review spectrum of autoimmune disorders of the liver and biliary tract  
Review the typical and atypical imaging appearance of autoimmune liver and biliary disorders on CT And MRI.

### **TABLE OF CONTENTS/OUTLINE**

Autoimmune disorders involving liver and biliary tract can be broadly classified into Autoimmune hepatitis (AIH)- Type 1 and Type 2  
Primarily biliary cholangitis (PBC)  
Large duct and small duct primary sclerosing cholangitis (PSC)  
Overlap syndromes: AIH+PBC; PBC+PSC; AIH+PSC  
IgG4 sclerosing cholangitis  
Drug-induced autoimmune injury  
Liver involvement in systemic autoimmune disorder (SAD)  
Diagnostic approach  
Role of MRCP in the diagnosis of autoimmune biliary disorders  
Illustration of imaging findings of AIH  
Heterogeneous enhancement of parenchyma  
Periportal edema  
Normal MRCP  
Responsive to steroids  
PBC  
Lace-like fibrosis  
"Periportal halo" sign  
Portal lymphadenopathy  
Normal MRCP in the early stage  
gt pruned tree appearance in later stage  
PSC  
Predilection for peripheral intrahepatic ducts  
Beaded appearance of ducts on MRCP  
High risk of perihilar cholangiocarcinoma  
Small duct PSC  
Normal MRCP  
Typical PSC histology  
IgG4 disease  
Circumferential thickening  
Predilection for extrahepatic and hilar ducts  
Drug-induced (biologic agents)  
Appropriate clinical context  
Rapid progression  
Systemic autoimmune disorder  
Immune-mediated hepatitis may be seen in systemic lupus erythematosus and rheumatoid arthritis

## **GIEE-116 Gastrointestinal Pharmacoradiology: Updated Review of the Indications, Pharmacodynamics, and Adverse Effects of Bowel Preparation Agents, Gastrointestinal Contrasts and Motility-Modifying Medications**

### **TEACHING POINTS**

The purpose of the exhibit is: • To review the liquid diet and different cathartics used for bowel preparation including their pharmacodynamics, mechanisms of action, dosage, contraindications, precautions and adverse reactions. • To address patients' frequent questions about bowel preparation before radiologic examinations. • To explain the chemical characteristics and non-active component of the enteric contrast agents used for fluoroscopic, CT and MRI examinations. • To discuss the indications, pros and cons, concentrations, contraindications of enteric contrast, and strategies to prevent adverse reactions and mitigate legal consequences. • To review motility-modifying agents used to optimize GI tract imaging, including their common indications, mechanisms of action, administration route, dosage, peak action, risks, and contraindications. • To describe sedative agents used for intubation.

### **TABLE OF CONTENTS/OUTLINE**

AGENTS USED FOR: Bowel preparation • Liquid diet • Action mechanisms of cathartics • Saline osmotic cathartics: magnesium citrate • Stimulant cathartics: bisacodyl GI tract endoluminal contrasts for • Fluoroscopic exams: barium sulfate, iodinated water-soluble contrasts, gas. • CT studies • MRI examinations Motility modifiers of GI tract • Antiperistalsis/hypotonia: glucagon, Buscopan • Prokinetics: metoclopramide Mild sedation • Benzodiazepines Topical anesthesia • Lidocaine Lubricants for intubation

## **GIEE-117 Oh No, I Thought It Was a Hemangioma!!!**

Participants

Matteo Bonatti, MD, Bolzano, Italy (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

- Liver hemangiomas are frequently encountered during imaging studies and have peculiar features on US, CEUS, CT and MRI.- Various benign and malignant liver lesions may show imaging features resembling hemangiomas.- At US, echogenic liver lesions are not always hemangiomas, particularly in cirrhotic patients and in patients with known malignancies: CEUS might be helpful as a quick problem-solving technique in these cases.- Contrast enhancement pattern must be accurately evaluated: centripetal enhancement alone might be misleading if not associated with globular pattern. - On MRI, hemangiomas must show "fluid-like" T2-hyperintensity; moderately T2-hyperintense lesions are almost never hemangiomas.- Always have a look to ADC values.- Hemangiomas do not have perilesional nodules.- Hemangiomas may slowly grow over time

### **TABLE OF CONTENTS/OUTLINE**

To briefly review the typical imaging features that hemangiomas must show on US, CEUS, CT and MRI in order to confidently diagnose them. To show a series of liver hemangioma mimickers (e.g. mass forming intrahepatic cholangiocarcinoma, angiosarcoma, neuroendocrine tumor metastases, colorectal tumor metastases, mucinous tumor metastases,?) on various imaging modalities. For every case the misleading feature(s) will be highlighted.

## **GIEE-118 Constipation, Hirschsprung's Disease, and Stercoral Colitis: Detection, Classification and Treatment**

Participants

Rohan Kulkarni, Southgate, KY (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

1. Differentiate and classify different forms of colonic dysfunction to distinguish neurogenic, drug-induced, metabolic, functional, and mechanical causes of constipation  
2. Identify and describe radiological features of constipation and its complications Explain the role of abdominal radiographs, CT, fluoroscopic defecography, and MR defecography in detection and classification of constipation.  
3. Recommend the next appropriate step in management and describe potential image-guided intervention that can contribute to treatment of constipation

### **TABLE OF CONTENTS/OUTLINE**

Defining Constipation - Defecatory straining, hard lumpy stools, sensation of incomplete evacuation, sensation of anorectal obstruction or blockage, need for manual maneuvers such as digital evacuation, and or fewer than 3 stools per week. Etiologies of Constipation  
1. Neurogenic: Diabetes mellitus, Hirschsprung's Disease, Intestinal Pseudo obstruction  
2. Drug-Induced Anticholinergics, Neutrally active agents  
3. Metabolic Hypokalemia, hypothyroidism  
4. Functional Pelvic floor dysfunction  
5. Mechanical Neoplasm, stricture, volvulus  
Radiologic features of constipation and its complications on Radiographs, CT, Fluoroscopy and MR-Colonic dilation- Large stool burden- Fecaloma or fecal impaction- Wall thickening- Pericolonic stranding- Perforation- Abscess  
Treatment of Constipation- Laxative/enemas- Manual dis-impaction- Water soluble fluoroscopic enema- Biofeedback- Surgery

## **GIEE-119 Imaging in Pancreas Transplantation: Conventional and Novel Approaches**

### **TEACHING POINTS**

- Pancreas graft location and vascular anatomy are unique and must be understood for radiologic evaluation- Ultrasound, CT, MRI all play roles in graft evaluation- Contrast enhanced ultrasound (CEUS), novel MRI techniques, graft biopsy, and alternative transplant approaches all may be part of comprehensive patient care

### **TABLE OF CONTENTS/OUTLINE**

- Indications for pancreas transplant- Review of expected surgical technique / post surgical anatomy  
Correlation with intra-operative pictures can assist- Rationale for pancreas graft imaging ; how does radiology make a difference  
Graft parenchymal and vascular evaluation  
Graft environment+ Fluid collections, bowel obstruction, enteric anastomosis evaluation- Advances in Ultrasound  
Grayscale, Doppler, CEUS  
CEUS novel techniques identify vascular insufficiency in grafts and change surgical management  
CEUS used to follow rejection over time- CT  
Multiphase CT evaluation for graft and vessel  
Examples of common pathology (vascular, pancreatitis, bowel complications)- Standard and investigational MRI  
Evaluation for fluid around graft, may assess vessels with or without angiography  
Evaluation with gadolinium-based as well as iron-based contrast agents- Biopsy  
Image guided percutaneous approach- Alternate transplant approaches  
Islet cell transplant  
Composite transplant

## **GIEE-12 A Primer for Pancreatic Head Pathologies- What the Surgeons Want to Know at the Multidisciplinary Conference**

Participants

Kazi Irfan, MD, FRCR, Columbia, MO (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

1. Review the malignant and benign solid lesions in relation to the pancreatic head and their imaging appearance  
2. Differentiation of the cystic pancreatic lesions and approach to their differential diagnosis  
3. Discuss the NCCN guidelines for the assessment of vascular involvement to ascertain resectability  
4. Illustrate the surgical technique of Whipple's procedure  
5. Enumerate the important anatomical variants in the celiac and superior mesenteric arteries which would alter the surgical technique  
6. Provide a roadmap to distinguish normal post operative changes from tumor recurrence

### **TABLE OF CONTENTS/OUTLINE**

- Imaging appearance of mass forming lesions involving the pancreatic head  
\* Primary malignancies  
\* Metastases  
\* Neuroendocrine tumors  
\* Benign lesions  
\* Mass forming chronic pancreatitis- Multidisciplinary approach in the diagnosis and management of the solid lesions- Role of imaging in staging and assessment for surgical resectability- Different cystic lesions involving the pancreatic head  
\* IPMN  
\* Serous cystadenoma  
\* Mucinous cystadenoma  
\* Pseudocyst- Imaging evaluation to differentiate between the cystic pancreatic lesions- Multidisciplinary approach in the diagnosis and management the cystic pancreatic lesions- Indications of

Whipple's surgery and the surgical technique-Review the anatomical variants of significance involving the celiac and superior mesenteric vasculature-Multidisciplinary approach in assessment of local tumor recurrence and distant metastases

## **GIEE-120 Deep Learning Reconstructions in the Abdomen: An Update**

Participants

Corey Jensen, MD, Houston, TX (*Presenter*) Research Grant, General Electric Company

### **TEACHING POINTS**

- DLR markedly reduces image noise and preserves image texture
- Increasing evidence suggests significant capacity for radiation dose reduction of 46-61% compared to hybrid IR
- o Including for low contrast > 5mm liver lesion detection task
- o Limited evidence suggests less aggressive dose reduction for lesions < 5mm
- No free lunch
- o Next gen DLR algorithms will address mild loss of high spatial frequency information in clinical images

### **TABLE OF CONTENTS/OUTLINE**

- Reconstruction Background - how did we get here?
- o Reconstruction history
- o Iterative recon (IR) limitations
- o Unique QA issues for IR
- o Case examples
- What is DLR?
- Phantom Evidence Update
- Clinical Evidence Update from Literature Review
- DLR Implementation
- o Assessing your practice baseline
- o Determining intended clinical tasks
- DLR pitfalls
- Conclusion

## **GIEE-121 Rectum, Set, Go: A Radiologist's Perspective of a New NAPRC Accredited Multidisciplinary Rectal Cancer Tumor Board at a Large Cancer Center**

### **TEACHING POINTS**

1. NAPRC offers standardized, risk-adapted management of rectal cancer, while Rectal Cancer Multidisciplinary Teams (RC-MDT) provide structure and resources for accreditation and compliance.
2. Radiologists will learn NAPRC standards which involve utilizing synoptic reporting formats for 95% of all staging MRI exams, having 90% of pre-treatment MRI exams read by RC-MDT member radiologists, and fulfilling minimum attendance requirements.
3. Radiologists are key members of RC-MDT, meeting at least bimonthly with surgeons, pathologists, radiation oncologists, and medical oncologists. Uniform MRI image acquisition and interpretation, along with standardized reporting, are crucial for effective staging.

### **TABLE OF CONTENTS/OUTLINE**

A) Requirements for NAPRC-accredited RC-MDT

1. Multispecialty services and program management
2. RC-MDT meeting structure
- a. Radiologist's requirements
- i. American College of Radiology (ACR) education module
- ii. Radiologist's mandatory presence for all meetings with individual attendance requirements
- iii. Internal record review to audit MR exams
- iv. Measures of compliance for synoptic reports

B) RC-MDT member radiologist's contributions

1. Radiologists read 90% of pre-treatment staging MRI exams.
2. Post-treatment restaging and tumor regression grading (TRG)
3. Surgical planning
4. Surveillance

C) MR Rectal cancer exams

1. Technical uniqueness of acquisition
2. Imaging features of local disease
3. Standard synoptic report used in 95% of staging MR exams
4. Prediction of local recurrence and metastasis

D) Secondary initiatives

1. Rectal cancer education program and goals of care
2. Data management
3. Quality improvement

## **GIEE-122 CRS (Cytoreductive surgery) + HIPEC or PIPAC: The Radiologist Verdict**

Participants

Raquel Acosta Hernandez, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

The therapeutic management of peritoneal carcinomatosis (PC) and pseudomixoma peritonei (PMP) requires an assessment in multidisciplinary committees. The radiologist must report where each tumor burden is addressed using the a) PCI (peritoneal carcinomatosis index), b) presence of distant secondary disease (extraperitoneal) and c) tumor implants location in "danger zones" that would condition an incomplete CRS (Cytoreductive surgery). Not only the extent of the disease must be taken into account, but also other patients' individual factors and comorbidities as well as the resources available in each center. Multidisciplinary interaction constitutes the main pillar for a correct selection of patients who are candidates for CRS and subsequent intraperitoneal chemotherapy or, given the risk of incomplete CRS, consideration of other possibilities innovative palliative therapies, such as PIPAC.

### **TABLE OF CONTENTS/OUTLINE**

Review the first peritoneal carcinomatosis (CP) evaluation approach: a) PCI (Peritoneal cancer index) b) Implant zones due to peritoneal fluid stasis. c) Implant zones: "Key locations" and d) Ascites and e) Extraperitoneal disease. Illustrate the "danger zones" and unfavourable tumor implants location: beyond the first CP check-points. Update of pseudomyxoma peritonei (PMP): a misunderstanding and controversial disease. Analyze the different types of treatment (surgery, HIPEC and PIPAC): assessment in multidisciplinary committees and focus on the role of radiologist in multidisciplinary committees.

## **GIEE-123 Pre-operative Evaluation in Living Donor Liver Transplantation: A Roadmap for Radiologist**

Participants

Hande Ozen Atalay, MD, Istanbul, Turkey (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

Liver transplantation is the most effective treatment for liver failure. Because the number of cadaveric donors is not enough considering the high demand, the number of living donor liver transplantations (LDLT) has been on the rise, and right lobe transplantation accounts for 70 % of all LDLT. In pre-transplant imaging, there are many important issues that should be evaluated and noted in the report. Radiologists play a pivotal role in a transplantation unit and surgical planning. In the pre-operative evaluation of LDLT, choosing the appropriate liver segment for the recipient (right lobe, left lateral segment, etc.) and evaluating the liver in the donor candidate in terms of parenchymal lesions and diseases constitute the initial steps. The liver segmentation should next be done; the total liver volume and the volume of the liver segment to be transplanted are calculated. This step is essential for avoiding small-for-size syndrome in the recipient as well as liver insufficiency in the donor candidate. Recognition of vascular and biliary anatomical variations is critical because certain anatomical variations are accepted as contraindications to LDLT and may cause post-operative ischemia in the donor and recipient. To conclude, radiologists must be aware of their crucial role in

the pre-operative imaging of LDLT.

#### TABLE OF CONTENTS/OUTLINE

-Living donor liver transplantation (LDLT) definition, types, and indications-Liver parenchymal evaluation, segmentation, and volume rendering-Important vascular and biliary variations in the LDLT-Contraindications of the right lobe and left lateral segment LDLT-Important issues to be noted in the pre-transplant radiological report -Conclusion

#### GIEE-124 Gelatinous Jigsaw: A Pictorial Review of Mucinous Cystic Pancreatic Neoplasms

Participants

Milini Rana, MD, Shreveport, TX (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The goal is to educate the audience in recognizing the multi-modal imaging features of mucinous cystic pancreatic neoplasms (MCPN), with an emphasis on their clinical and pathological correlation. We will also characterize morphological features of different pancreatic cystic lesions and elucidate the imaging and histopathologic features of MCPN subtypes including mucinous cystadenoma, mucinous cystadenocarcinoma and intraductal papillary mucinous neoplasm (IPMN).

#### TABLE OF CONTENTS/OUTLINE

Mucinous cystic pancreatic neoplasm (MCPN) clinical overview Epidemiology Pathophysiology Classifying non-neoplastic and neoplastic MCPN subtypes Review MCPN multi-modal imaging features on Ultrasound (US), Computed Tomography (CT), and Magnetic Resonance Imaging (MRI) Imaging and histologic features of Mucinous Cystadenoma Imaging and histologic features of Mucinous Cystadenocarcinoma Key features of differentiating Intraductal Papillary Mucinous Neoplasm (IPMN) and its subtypes Treatment and Prognosis

#### GIEE-125 CT Guided Gastrostomy Placement: An Alternative Approach without Placement of Nasogastric Tube

Participants

Mohanad Kurdi, MD, Brooklyn, NY (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Computed Tomographic (CT) guided gastrostomy tube (G-tube) placement is an alternative to fluoroscopic techniques. CT guided G-tubes forego the placement of a nasogastric (NG) tube as insufflation of the stomach is performed via anterior abdominal wall percutaneous access. NG tubes cause a variety of problems, including patient discomfort, challenging placement, premature removal and malplacement. Cross sectional imaging allows for a global view of intra-abdominal structures, with more accurate localization of soft tissue structures. Compare and contrast CT and fluoroscopic guided techniques with pitfalls of both.

#### TABLE OF CONTENTS/OUTLINE

Background Indications and Contraindications Gastrostomy Tube Placement Techniques Disadvantages of Nasogastric Tubes CT Guided G-Tube Overview Technical Considerations CT versus Fluoroscopy Our Experience Discussion References

#### GIEE-126 Worry or Go with the Flow: Perfusion Anomalies and Vascular Disorders of the Liver - A Primer for the Radiologist

#### TEACHING POINTS

1. Understanding the imaging appearances and physiology of transient hepatic attenuation differences (THADs) on CT and transient hepatic intensity differences (THIDs) on MRI is crucial to aid the radiologist in diagnosing hepatic disease processes. 2. Recognizing perfusion anomalies in the liver is essential to avoid misinterpretation of "pseudolesions", a common pitfall for the training radiologist. 3. Familiarity with the pathogenesis and imaging features of hepatic vascular disorders helps guide correct diagnosis and patient management.

#### TABLE OF CONTENTS/OUTLINE

1. Physiology of hepatic perfusion a. Nutrient rich mesenteric venous inflow b. Compensatory nature of hepatic arterial and portal venous blood flow 2. Concept of THADs/THIDs a. Pathophysiology b. Case-based review of common etiologies: "Cs" of THAD/THID c. Strategies to avoid misinterpretation 3. Concept of streamline phenomenon a. Implications with case-based review 4. Concept of third inflow a. Implications with case-based review 5. Case-based review of miscellaneous vascular diseases a. Sinusoidal occlusion syndrome b. Budd Chiari c. Cavernous transformation and portal biliopathy d. Hepatic peliosis e. Hepatic ischemia secondary to TIPS

#### GIEE-127 Borderline Pancreatic Cancer: Role of Cross Sectional Imaging in Therapeutic Decision Making

#### TEACHING POINTS

Borderline pancreatic ductal adenocarcinoma (BR-PDAC) is defined as a tumor potentially resectable but with anatomical (vascular involvement), biological (serum biomarkers) or clinical (performance status) conditions that may impact in free margin resections or postoperative outcomes. Anatomical BR-PDAC is at high risk for margin positive when surgery is upfront, so neoadjuvant chemotherapy and/or radiotherapy is considered to increase the chance of a R0 resections. Radiology is a significant tool concerning anatomical dimension, evaluating tumor - vessel relationships, being a pillar in decision making to choose the best therapeutic option for each patient. The images are also fundamental evaluating post-neoadjuvant response, contributing to evaluate tumor biology and responding patients. The objective of this exhibit is: 1) To review the role of imaging determining resectability status of tumors with detailed analysis in tumor - vessel contact of BR-PDAC. 2) To evaluate anatomical conditions that influences in surgical technique, particularly when vascular reconstructions are needed. 3) To review imaging response criteria post neoadjuvant therapy.

#### TABLE OF CONTENTS/OUTLINE

a) Tumor - venous contact analysis using Computed Tomography (CT) and Magnetic Resonance Imaging (MRI). b) Tumor - artery contact evaluation and its differences when comparing to vein analysis. c) How proper radiological identification of the characteristics of venous and/or artery involvement influence on surgical approach and vascular reconstruction techniques required for a successful surgery.

## **GIEE-128 Make it Simple-Imaging of the Postoperative Whipple**

Participants

Ali Agely, MD, Jacksonville, FL (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

The Whipple procedure (pancreaticoduodenectomy) is performed to resect pancreatic head or periampullary neoplasms. CT and (increasingly) MRI are performed in the acute and delayed postoperative settings, notably in patients with a complicated course. This presentation provides a comprehensive overview of various postoperative imaging findings after a Whipple procedure with emphasis on MRI. Familiarity with expected findings and postoperative complications gives the radiologist the knowledge to render a prompt and accurate diagnosis.

### **TABLE OF CONTENTS/OUTLINE**

1) Surgical review 2) Normal, expected findings in the acute and delayed postoperative settings 3) Complications: Pancreatic fistula, Leak (gastrojejunostomy and biliary-enteric), anastomotic strictures, pancreatitis (acute and acute on chronic), hemorrhage, abscess, portomesenteric venous thrombus, tumor recurrence, delayed gastric emptying, and stent migration

## **GIEE-129 GI and GU Fluoroscopy In Common Post-op Oncologic Surgeries: What You Need to Know About This Leaky Business**

### **TEACHING POINTS**

1. Describe common gastrointestinal and genitourinary fluoroscopic procedures in oncology 2. Illustrate the different techniques and indications for post op fluoroscopic examinations with key teaching points 3. Demonstrate normal and abnormal fluoroscopic examinations including complications with emphasis on leaks

### **TABLE OF CONTENTS/OUTLINE**

1. Introduction. 2. Endoscopic evaluation versus double contrast studies. 3. Surgical techniques of Ivor Lewis esophagectomy and its complications. 4. Indications, techniques and imaging findings of single-contrast esophagram. 5. Colonic and jejunal interposition. 6. Surgical techniques for rectal surgeries and their complications. 7. Indications, technique and imaging findings on single contrast enema. 8. Indications, techniques and imaging findings of bladder surgeries and urinary diversions on cystogram, loopogram and pouchogram. 11. Take-home messages. 12. References.

## **GIEE-13 Late Postoperative GI Tract Evaluation: Identifying Complications Based on Surgical Technique**

Participants

Daniel Montel, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

To recognize and understand the surgical techniques performed at gastrointestinal tract surgeries. To enumerate the main late postoperative complications of the gastrointestinal tract surgeries and their imaging features. To correlate imaging findings in the evaluation of late postoperative period with the particularities of each gastrointestinal tract surgery. This enables the characterization of complications that may be related to postoperative anatomical changes, anastomosis, stomas, surgical incision on abdominal wall, or intra-abdominal adhesions.

### **TABLE OF CONTENTS/OUTLINE**

• Introduction. • Overview of late complications in gastrointestinal tract surgery. • Review of surgical techniques in gastrointestinal tract surgery. • Complications related to anastomosis. • Complications related to postoperative anatomical changes. • Complications related to adhesions. • Complications related to intestinal stomas. • Complications related to surgical incisions in the abdominal wall. • Teaching points.

## **GIEE-130 Constipation, Stercoral Colitis, Hirschsprung Disease and Complications in Adults**

Participants

Joel Gamble, MD, BSC, Toronto, ON (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

Imaging is unreliable in establishing the diagnosis of constipation and directing routine management. Severe or chronic constipation can lead to serious complications, for which imaging is essential. Stercoral colitis is a potentially fatal complication of fecal impaction. High attenuation mucosa and perfusion defect are the most accurate features for fatal cases. The natural history of Hirschsprung disease epitomizes the complications of constipation. Despite surgical resection, many adults have chronic constipation, and a subset have serious constipation-related complications.

### **TABLE OF CONTENTS/OUTLINE**

Constipation: Clinical diagnosis; recent literature that imaging does not correlate with bowel habit, predict symptoms of constipation, or reliably direct management decisions; imaging for complications of constipation. Stercoral colitis: Mucosal ulceration due to pressure ischemia, possible perforation; spectrum of findings severity. Hirschsprung disease: Absent ganglion cells in the submucosal and myenteric plexuses; symptoms into adulthood include constipation, straining, incomplete evacuation. various mechanisms of chronic constipation; late presentation of Hirschsprung in adulthood; complications include adhesional obstruction; fistula formation; obstipation; perforation

## **GIEE-131 The Pinch and the Squeeze: A Review of Vascular Compression Syndromes**

Participants

Hannah Lamberg, MD, Ann Arbor, MI (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

1. Diagnosis of almost all vascular compression syndromes is largely clinically based. However, certain imaging findings can be

suggestive of these syndromes, aiding in diagnosis and treatment.2. Findings suggestive of a vascular compression syndrome include pre-stenotic vessel dilation, formation of varices, and compression of other structures (e.g. ureter, duodenum).

#### **TABLE OF CONTENTS/OUTLINE**

1. Brief introduction of vascular compression syndromes2. Radiologic findings with accompanying CT examples including:- Nutcracker Syndrome- May-Thurner Syndrome- Pelvic Venous Congestion Syndrome (non-vascular compression syndrome)- Median Arcuate Ligament Syndrome- Superior Mesenteric Artery Syndrome- Chronic Ureteropelvic Junction Obstruction by crossing vessels- Ovarian vein syndrome.3. Summary/Conclusions: Review of high-yield teaching points

#### **GIEE-132 Imaging of Gallstones and Complications**

Participants

Maria Zulfiqar, MD, MBBS, Scottsdale, AZ (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

The purpose of this exhibit is to:1. Identify various types of gallstones and discuss imaging techniques2. Multimodality imaging review of the features of gallstones and their complications3. Discuss pitfalls and mimics of gallstones.

#### **TABLE OF CONTENTS/OUTLINE**

There are three main types of gallstones: Cholesterol (10%), Pigmented (10%) and mixed (80%).Ultrasound is the superior imaging modality for detection of gallstones as up to 20% stones are not calcified and CT occult. CT is better to detect gallstone complications. Dual Energy CT utilizes low KV, calcium-based and lipid-based imaging and more sensitive than single energy CT to detect gallstones.Gallstone complications: Acute cholecystitis; Acute cholangitis; Mirrizi Syndrome; Biliary-enteric fistulae; infected fallen gallstones; post-cholecystectomy syndrome.Pitfalls and Mimics: Assessment of stone impaction; gallbladder polyps; cystic artery pseudoaneurysm, enteroliths.Summary: Gallstones are common seen on imaging and can serve as a nidus for infection/inflammation; cause biliary outflow obstruction or fistulize to adjacent structures necessitating prompt diagnosis sometimes utilizing multimodality imaging, treatment and intervention.

#### **GIEE-133 Don't Judge a Gallbladder by Its Wall**

Participants

Sara Siguenza-Gonzalez, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Radiologists are very used to cholecystitis in daily clinical practice, but there are other entities that affect the gallbladder (GB):Classification and description of those entities according to a pathological point of view.Principal radiographic features of each disorder in ultrasound (without and with contrast), CT (including spectral CT) and MRI.Key points to guide the differential diagnosis of the main pathology of the GB.

#### **TABLE OF CONTENTS/OUTLINE**

1. An approach to the anatomy and physiology of the GB. Description of normal anatomy, anatomic variants and congenital features.2. Describe benign entities, idiopathic diseases (cholesterolosis and adenomyomatosis) and bile stasis diseases. 3. An update of premalignant gallbladder polyps.4. Analyze malignant pathology, including primary tumours (gallbladder carcinoma and cholangiocarcinoma) and secondary tumours (metastasis and lymphoma).5. A portrayal of others disorders in the GB: traumatic pathology, secondary causes of diffuse gallbladder wall thickening and inflammatory diseases beyond acute cholecystitis.

#### **GIEE-134 Hepatobiliary and Pancreatic Manifestations of Immunochemotherapy: A Practical Guide**

Participants

Soumyadeep Ghosh, MBBS, MD, Cambridge, MA (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

1. An update on the commonly used cancer immunotherapy and chemotherapy agents that affect the liver, biliary system and pancreas. 2. Delve into the pathogenesis of these therapy-related hepatobiliary and pancreatic manifestations. 3. Illustrate the role of imaging in diagnosis of these therapy-related manifestations in the context of cancer.

#### **TABLE OF CONTENTS/OUTLINE**

1. Background 2. Cancer immunotherapy and chemotherapy agents that can affect the liver, biliary system and pancreas a) CTLA-4 inhibitor - Ipilimumab b) PD-1 inhibitor- Nivolumab, Pembrolizumab c) PD-L1 inhibitor - Durvalumab, Atezolizumab d) Alkylating agents - Oxaliplatin e) Anti-metabolites - Pyrimidine analogues (5-fluorouracil, Gemcitabine), 6-mercaptopurine, methotrexate f) Vinca alkaloids - Vincristine, Vinblastine g) Topoisomerase I inhibitors - Irinotecan 3.) Therapy related adverse effects - Hepatic - Biliary - Pancreatic 4. Steatosis 5. Diffuse hepatitis 6. Fibrosis 7. Pseudocirrhosis 8. Sinusoidal obstruction syndrome 9. Focal nodular hyperplasia - like lesions 10. Nodular regenerative hyperplasia

#### **GIEE-135 Primary Peritoneal Malignant Mesothelioma: Everything a Resident Needs to Know**

Participants

Soumyadeep Ghosh, MBBS, MD, Cambridge, MA (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Distinguish the various subtypes of mesothelioma based on clinical and radiological features. Illustrate the spectrum of imaging features of primary peritoneal mesothelioma. Be cognizant of the mimics of primary peritoneal malignant mesothelioma in our daily reporting.

#### **TABLE OF CONTENTS/OUTLINE**

1. Background on mesothelioma 2. Subtypes of peritoneal mesothelioma a) Cystic mesothelioma b) Primary peritoneal malignant mesothelioma (PPMM) c) Well-differentiated papillary mesothelioma 3. Spectrum of imaging features of primary peritoneal malignant mesothelioma 4. Cases - a) Peritoneal thickening b) Peritoneal masses c) Omental fat stranding and nodularity d) Extensive disease

5. Mimics a) Peritoneal carcinomatosis b) Lymphoma c) Tuberculous peritonitis

### **GIEE-136 All About the Gallbladder: From Normal to Rare**

#### **TEACHING POINTS**

Review of normal anatomy and common conditions of the gallbladder, demonstrating the role of the available imaging methods. Illustrate unusual cases of the gallbladder, highlighting the main imaging findings for the correct approach and diagnosis.

#### **TABLE OF CONTENTS/OUTLINE**

Brief demonstration of the gallbladder anatomy as well the imaging findings related to its most frequent conditions. Case-based illustration of multiple uncommon gallbladder pathologies according to their nature: - Anatomical variants and malformations; - Inflammation; - Neoplasms; - Others (trauma, torsion etc.).

### **GIEE-137 Imaging Characteristics of Pancreatic Serous Cystadenoma and Common Imitators**

Participants

Nikolas Brozovich, MD, Augusta, GA (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

1) Pathophysiology of Pancreatic serous cystadenoma.2) MR characteristics of Pancreatic serous cystadenoma and its subtypes.3) Cystic pancreatic lesions mimicking serous cystadenoma.4) Aggressive features of atypical serous cystadenomas.5) Utility of endoscopic ultrasound and fluid aspiration for definitive diagnosis.

#### **TABLE OF CONTENTS/OUTLINE**

Pancreatic cystic neoplasms are commonly encountered in practice and reported on 20-40% of abdominal MRI scans compared to only 3% of CT scans. Serous cystadenoma of the pancreas can have similar characteristics to other benign and malignant pancreatic lesions. The microcystic form of Pancreatic serous cystadenoma has classic features with a pathognomonic enhancing scar and stellate calcifications seen in 30% of cases.1) MR features of microcystic, macrocystic, oligocystic, and solid pancreatic serous cystadenoma subtypes.2) Atypical aggressive features including parenchymal atrophy, ductal dilatation, and vascular/local invasion.3) Common mimics including Mucinous cystic pancreatic neoplasm(MCPN), Solid pseudopapillary epithelial neoplasm(SPEN), Intraductal papillary mucinous neoplasm(IPMN), pseudocyst, lymphoepithelial cyst, cystic neuroendocrine tumor(NET), and adenocarcinoma.4) Von Hippel-Lindau syndrome- Increased incidence of developing Pancreatic serous cystadenoma and other benign and malignant tumors of various organs.

### **GIEE-138 Barriers to Adopting LI-RADS and Steps to Overcome**

Participants

James Lee, MD, (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

1) The Liver Imaging Reporting and Data System (LI-RADS) is a reporting system for the classification of hepatocellular carcinoma (HCC) that continues to grow in adoption throughout North America including important steps of alignment with both the American Association for the Study of Liver Disease (AASLD 2018) and the Organ Procurement Transplant Network (OPTN 2022) 2) Despite growing adoption, radiologist still encounter barriers to implementation within their own clinical academic departments, from referring physicians and surround community practices.3) An understanding of different barriers that may face radiologists and referrers towards the adoption of LI-RADS is an important step to overcoming these obstacles.

#### **TABLE OF CONTENTS/OUTLINE**

I. Review LI-RADS purpose to standardize reporting and data collection for patients at risk for developing HCCII. Illustrate the growth of LI-RADS adoption over the past decadeIII. Describe the barriers to adoption of LI-RADS from both the radiologist and referring providers point of viewIV. Explain how to overcome barriers from the experiences encountered from our multiple (12) institution collaborative.

### **GIEE-139 Crohn's Disease: Step by Step in MRI**

Participants

Natalia Zuniga, MD, Cali, Colombia (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Active disease is characterized by wall thickening and edema and or ulceration. Wall thickening alone, without the supporting features of oedema or ulceration, often indicates inactive disease, particularly if the wall is dark on fat-suppressed T2WI. Functional techniques such as DWI and motility imaging provide ways to quantify disease activity, monitor, and even predict therapeutic response. Complications can be divided into stricturing, penetrating, related to short bowel and development of malignancy. Characterization of strictures requires a fixed luminal narrowing with upstream dilatation greater than 3 cm. The strictures should be differentiated between inflammatory luminal narrowing or fixed fibrosis, and should be measured the length of the stricture. Contrast enhancement may be useful, but active and fibrotic disease both enhance. Early enhancement is more typical for active CD whereas delayed enhancement may indicate established fibrosis. It is useful to distinguish between response to treatment and imaging remission. Response implies a significant reduction of the inflammatory burden, and imaging remission implies the abolition of all activity. Scores are not routinely applied in clinical practice, however their knowledge is necessary for the description of mild, moderate and severe disease, which is sufficient.

#### **TABLE OF CONTENTS/OUTLINE**

Definition and initial diagnosis. Disease Activity. Disease phenotype. Non-stricturing, non-penetrating (inflammatory). Stricturing Disease. Penetrating Disease. Depict and quantify the degree of inflammatory activity. Severity. Therapeutic monitoring and response to treatment. Preoperative mapping. Postoperative recurrence

### **GIEE-14 What Goes Up Must Come Down: Multimodality Imaging Evaluation of Reflux Disease, Related Surgeries and Complications**

Participants

Moataz Ahmed Sayed Mohammed Soliman, MSc, CHICAGO, IL (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Explain the causes and mechanisms of reflux disease and its effects on the esophagus and stomach Review imaging modalities and findings for diagnosis and assessment of reflux severity Describe the surgical procedures utilized for treatment of reflux disease, their advantages and disadvantages Recognize the post-operative imaging findings and potential complications of reflux surgery with possible management options

#### TABLE OF CONTENTS/OUTLINE

Introduction: Define reflux disease Epidemiology Complications Pathophysiology: Role of the lower esophageal sphincter, hiatal hernia, gastric acid, and other factors in reflux disease Diagnostic tests: Upper endoscopy, pH monitoring, manometry Review the indications, techniques, and findings of different imaging modalities for reflux disease Imaging possible disease complications Treatment Medical therapy (prescription and non-prescription medications) Surgery: Compare types, outcomes, and risks of different surgical options for reflux disease, such as Fundoplication LINX Device Transoral incisionless fundoplication (TIF) Stretta procedure Post-operative imaging: Expected post-operative imaging findings Complications: Identify the common and rare complications of reflux surgery and their imaging features and management strategies Dysphagia and difficult Infection Bleeding Esophagogastric perforation, leakage Fistula Unwrapping of fundoplication LINX device migration Conclusion: An algorithmic approach to imaging evaluation

#### GIEE-140 Abdominal Tuberculosis: Think About It

Participants

Nerea Torena, Madrid, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Review abdominal tuberculosis, findings, and possible differential diagnoses. 2. To present cases of abdominal tuberculosis diagnosed at our centre in the last 5 years.

#### TABLE OF CONTENTS/OUTLINE

In Europe Tuberculosis has an average incidence of 26 cases per 100000 inhabitants. Pulmonary disease is the most frequent, abdominal involvement occurs in 11-12% of patients with extrapulmonary tuberculosis. Most frequently it affects the genitourinary tract, lymph nodes, peritoneum, and solid viscera, mainly the liver, spleen, and pancreas. Symptoms can be nonspecific; most commonly fever, abdominal pain, and weight loss. The radiological findings are not pathognomonic, but may be suggestive if considered with clinical, immunological status, and demographic origin. Abdominal disease can simulate multiple conditions: lymphoma, Crohn's disease, adenocarcinoma, carcinomatosis, etc. Tuberculosis cases diagnosed at our hospital in the last 5 years have been reviewed, 262 cases. 18 patients (6.8%) with abdominal involvement detected by imaging techniques. Radiological findings of each location will be discussed and depicted. Genitourinary, hepato-splenic, peritoneal, intestinal, lymph node and pancreatic tuberculosis will be shown. Differential diagnoses of each location will be reviewed. Abdominal tuberculosis diagnosis is complicated. Imaging findings are usually nonspecific and present in a very diverse way mimicking different diseases. It is important to suspect this pathology and establish its diagnosis to start the most appropriate treatment as soon as possible.

#### GIEE-141 Post-operative Complications of Cholecystectomy: What the Radiologist Needs to Know

Participants

Kazi Irfan, MD, FRCR, Columbia, MO (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Surgical anatomy of the gall bladder fossa. 2. Variants in the vasculature and biliary anatomy predisposing to injuries. 3. Types of cholecystectomy surgical approaches. 4. Imaging overview of indications of cholecystectomy. 5. Algorithm for imaging approach to diagnose acute cholecystitis. 6. Appropriate use of multimodality imaging in the diagnosis of post-operative complications. 7. Expected post-surgical changes. 8. Spectrum of post-surgical complications

#### TABLE OF CONTENTS/OUTLINE

Introduction: -Cholecystectomy is among the most commonly performed abdominal surgeries -Can be performed by either laparoscopic or open approaches Common indications for cholecystectomy: Acute/chronic cholecystitis, symptomatic cholelithiasis, gallstone pancreatitis, gall bladder masses/ polyps Multimodality imaging in diagnosis and management of post-surgical complications: -Computed Tomography (CT): primary imaging modality -Magnetic resonance Imaging (MRI): Ideal for biliary anatomy. Hepatobiliary excreted contrast (Eovist) can confirm bile leak -Ultrasound -Hepatobiliary scintigraphy -Fluoroscopy: Transhepatic and T-tube cholangiograms -Angiography Postsurgical complications of cholecystectomy: -Collections? \*Expected postsurgical seroma/hematoma? \*Bile leak or biloma (can be secondarily infected)? \*Hematoma? \*Abscess? -Bile duct injuries (can be associated with bile leak or biloma)? \*Stricture? \*Ligation or transection? -Gallstone related? \*Retained or new gallstones in CBD or remnant cystic duct? \*Dropped gallstones? -Vascular? \*Active bleed? \*Pseudoaneurysms? \*Vascular occlusions? -Other? \*Cholecystitis in residual gall bladder? \*Bowel injury? \*Clip migration?

#### GIEE-142 Navigating the Labyrinth of Peritoneal and Retroperitoneal Anatomy: Abdominal Disease Spread Made Easy

Participants

Janardhana Ponnathapura, MD, Winston Salem, NC (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Essential to understanding disease spread in abdomen is to separate the peritoneum from the retroperitoneum. These areas have distinct anatomy with well-defined separate pathways. The peritoneum is comprised of connected recesses that are potential spaces, normally not imaged except when containing excess fluid or air. Peritoneal recesses are formed by the opposing peritoneal surfaces and subdivided by the attachments of the ligaments and mesenteries to the parietal peritoneum. Disease flows within the recesses by changes in abdominal pressure. This forms a distinct spread pattern. The retroperitoneum is stratified by the renal

fascia into the anterior and posterior pararenal spaces and the perirenal space. The fascia contains and directs spread from the contained organs with the compartments. Each space has a unique spread pattern defined by the containing fascia. The anterior pararenal space is connected to the mesenteries and ligaments forming the subperitoneal space. This space interconnects the retroperitoneum with the mesenteries allowing for the normal continuum of blood vessels, lymphatics, and nerves but also forms the pathways for bidirectional spread of disease.

#### TABLE OF CONTENTS/OUTLINE

• Anatomy • Clinical embryology • Fundamental concept of the subperitoneal space • Distinguishing intraperitoneal spread from subperitoneal spread • New planes of retroperitoneum • Patterns of spread of disease from the; -Liver-Distal esophagus and stomach- Pancreas-Small intestine-Large intestine-Renal and adrenal • Mechanisms of spread of disease (fluid, gas and soft tissue)- Subperitoneal-Intraperitoneal-Contiguous invasion • Clinical and radiological applications

#### GIEE-143 Hepatic Transplantation Assessment: What Radiologists Should Know

Participants

Carmen Gonzalez-Carrero Sixto, MD, Santander, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Review the surgical techniques used in liver transplantation for vascular anastomosis. Describe the normal findings immediately after the procedure. Expose the most frequent acute postoperative vascular complications.

#### TABLE OF CONTENTS/OUTLINE

1. BACKGROUND: Liver transplant is the treatment of choice for end stage liver disease. Morbidity and mortality have significantly been reduced thanks to advances in surgical techniques, immunosuppressive therapy and multidisciplinary team approach. We radiologists play a key role in the diagnose and follow-up of possible complications.2. SURGICAL TECHNIQUE 3. NORMAL FINDINGS: in the first 24 to 48 hours after a liver transplant, US must be performed. 4. VASCULAR COMPLICATIONS: - Hepatic artery: thrombosis, stenosis, pseudoaneurisma. - Portal vein: thrombosis, stenosis. - Suprahepatic veins: thrombosis, stenosis.5. CONCLUSION: After a liver transplant imaging techniques are important to rule out and follow up possible complications. There are some normal findings in the immediate postoperative period but radiologists need to know how to identify abnormal features suspicious of complications.

#### GIEE-144 Head with Two Tales: Early Spread of Disease from the Pancreas

Participants

Janardhana Ponnatapura, MD, Winston Salem, NC (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The head of the pancreas can be considered as two separate entity with distinct embryological variations. During embryology the ventral pancreatic bud becomes the caudal portion and the uncinat process of the head of the pancreas, while the dorsal bud becomes the cranial portion of the head. This embryology results in anterior and posterior components of the head of the pancreas each having their distinct vascular supply, nerve supply and lymphatic drainage. It is essential for the radiologist to appreciate that this results in two distinct spread patterns from the head of the pancreas. This knowledge about the early disease spread from the head of the pancreas becomes important particularly in the case of tumor as the radiologist can confidently predict, and diagnose the metastatic spread knowing the origin of the tumor.

#### TABLE OF CONTENTS/OUTLINE

• Anatomy of the pancreas • Clinical embryology of the head of the pancreas • Fundamental concept of the two heads of the pancreas • Distinct vascular supply • Distinct nerve supply • Distinct lymphatic supply • Distinguishing the different disease spread from the anterior head and posterior head • How imaging helps in successfully identifying the early spread • Important anatomical landmarks to help recognizing the spread of the disease • Patterns and mechanisms of early spread of the tumor • Clinical and radiological applications • Algorithm to predict the spread of metastatic disease from the head of the pancreas

#### GIEE-145 The 'New' 2023 American Association for the Study of the Liver Disease (AASLD) Practice Guidance on the Diagnosis and Management of Nonalcoholic Fatty Liver Disease (NAFLD): Radiologists' Perspective

Participants

Eri Osta, BS, San Antonio, TX (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

• Familiarize audience with 2023 AASLD practice guidance statement for diagnosis management of Nonalcoholic fatty liver disease (NAFLD) with special emphasis on imaging-related statements. • Discuss imaging biomarkers other non-invasive tests in risk assessment of NAFLD patients. • Review complementary roles of liver function tests, Fibroscan, shear wave Elastography MRI PDFF in assessing hepatic steatosis, fibrosis "at-risk" nonalcoholic steatohepatitis (NASH). • Discuss ongoing research advances role of AI-based tests in NAFLD

#### TABLE OF CONTENTS/OUTLINE

• Introduction • Epidemiology: Prevalence and demographics of NAFLD. • Spectrum of NAFLD: Pathophysiology, stages, and progression - Nonalcoholic fatty liver (NAFL), Nonalcoholic steatohepatitis (NASH), at-risk NASH, advanced fibrosis cirrhosis • Predictors of clinical outcomes in NAFLD: Identifying high-risk patients: fibrosis-4 (FIB-4) scoring system • Diagnosis and Assessment of NAFLD • Hepatic steatosis: Ultrasound, Fibroscan/Controlled attenuation parameters (CAP) MRI-PDFF techniques • "At-risk" NASH Evaluating FAST (Fibroscan + AST levels), MAST (MRE + AST levels), MEFIB (MRE + FIB-4) scoring systems. • Advanced fibrosis: Assessing extent of fibrosis with Fibroscan/VCTE MRE • Cirrhosis Rule in/out irreversible fibrosis • Future directions Ongoing research • Conclusion Recent developments in NAFLD have led to substantial advancements in biomarkers therapeutics, with significant implications for radiologists collaborating with multidisciplinary care teams. Emerging imaging non-imaging biomarkers can exclude advanced liver disease or identify patients at an increased risk for cirrhosis.

#### GIEE-146 Pancreatic Duct Anomalies: A Primer for Trainees

Participants

Hatem Al Kashroom, MD, Syracuse, NY (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Pancreatic duct anomalies are rare but can cause significant health problems if not detected early. 2. The two main types of congenital pancreatic duct anomalies are pancreas divisum and annular pancreas. 3. Symptoms of pancreatic duct anomalies may include abdominal pain, nausea, vomiting, and weight loss. 4. Diagnosis usually involves imaging tests such as MRI (MRCP) and/or CT scan. 5. Overview of the acquired pancreatic duct anomalies 6. Patients with a family history of pancreatic duct anomalies or pancreatitis may be at higher risk and should discuss screening options with their healthcare provider.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction to normal pancreatic anatomy and embryology 2. Pancreatic divisum and divisum types 3. Annular pancreas 4. Acquired pancreatic duct anomalies 5. Diagnostic tests and preferred imaging modalities

#### GIEE-147 What The Radiologist Needs To Know About Pseudomyxoma Peritonei And HIPEC

Participants

Natalia Zuniga, MD, Cali, Colombia (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The mucinous deposits tend to follow routes of normal peritoneal fluid flow, there are watershed regions in the peritoneal cavity where cells can be deposited to form implants. Signs of peritoneal metastases include the presence of peritoneal nodules, thickening, or fat stranding. A peritoneal cancer index greater than 20 is considered a poor prognostic factor. CT provides anatomic imaging. MRI provides a combination of anatomic imaging and tumor functional imaging. PET imaging provides functional imaging based upon an assessment of the tumor's metabolism of glucose. T1WI and T2WI sequences provide anatomic details to precisely localize the larger peritoneal tumors and nodules, but are relatively insensitive for depicting small peritoneal tumors and subtle fat stranding. DWI are particularly useful for depicting mucinous lesions due to the conspicuity of high signal intensity mucin and fluid within these tumors. Peritoneal tumors enhance with intravenous gadolinium increasing their conspicuity. The combination of hyperthermia and high concentration chemotherapy used in HIPEC can also alter physiological healing, which may increase the incidence of vascular, lymphatic, gastrointestinal, urological and diaphragmatic complications.

#### TABLE OF CONTENTS/OUTLINE

Terminology. Pseudomyxoma peritonei. Hyperthermic Intraperitoneal Chemotherapy (HIPEC). Peritoneal anatomy and physiology. Preoperative imaging. Establish the presence or absence of peritoneal metastases. Quantitation of the radiologic Peritoneal Cancer Index. Description of extraperitoneal metastases. Postoperative imaging. Normal findings. Features indicative of complications.

#### GIEE-148 Off the Wall: Incidental Muscle Pathology on Abdominopelvic Imaging

Participants

Benjamin Northrup, MD, Chesterfield, MO (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The use of cross-sectional imaging has increased exponentially, and incidental musculoskeletal findings have become commonplace. These are frequently referred to as "the radiologist's blind spot." Recent publications offer detailed review of abdominal wall pathology. However, the differential diagnosis for abnormalities of the paraspinal and pelvic musculature is often distinct. This review will familiarize radiologists with these unique and often overlooked pathologies and with management recommendations.

#### TABLE OF CONTENTS/OUTLINE

1. Abdominopelvic muscle anatomy 2. Congenital and structural abnormalities 3. Metabolic abnormalities (diabetic myonecrosis, rhabdomyolysis, hyperparathyroidism) 4. Vascular (arteriovenous malformations, ischemic myonecrosis) 5. Inflammatory myopathy (inflammatory myositis, sarcoidosis, drug-related, HIV, radiation, crystalline) 6. Infectious (poliomyelitis, cysticercosis, infectious myositis) 7. Sequelae of injury and trauma (DOMS, tears, hematoma, bursitis, heterotopic ossification, myositis ossificans) 8. Neoplasia (primary and metastatic malignant neoplasms, benign neoplasms) 9. Atrophy (denervation myopathy, end-stage inflammation, sarcopenia) 10. Normal variants and pitfalls (accessory and anomalous muscles, injection granulomata, lipohypertrophy) 11. An algorithmic approach to incidental musculoskeletal abdominal findings

#### GIEE-149 Peritoneal Carcinomatosis and HIPEC

Participants

Victoria John, MBChB, Stockport, United Kingdom (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Peritoneal carcinomatosis occurs from spread of a primary cancer to the peritoneum, most commonly from the gastrointestinal tract and ovary. Pseudomyxoma peritonei is a rare type of peritoneal carcinomatosis characterised by accumulation of mucinous ascites and mucinous peritoneal deposits secondary to intraperitoneal spread of a mucin-producing primary tumour. Cytoreductive surgery (CRS) and hyperthermic intraperitoneal chemotherapy (HIPEC) in suitable patients offers a chance for cure and is the mainstay of treatment in lower grades tumours, for which current chemotherapy regimes are of limited effect. Pre-operative imaging is key in determining patients' suitability for CRS/HIPEC with regards to tumour burden. Factors include the Sugarbaker Peritoneal Cancer Index (PCI), ascites and abdominal wall involvement, unfavourable sites of disease, presence of small bowel and mesenteric disease, as well as extra-peritoneal metastases. The most commonly used imaging modalities are CT and dedicated abdominal MRI. It is recognised that CT may underestimate the degree of disease, whilst MRI with peritoneal protocol has a higher sensitivity and may provide more accurate description of disease extent for the operating surgeon.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction. 2. Peritoneal Anatomy. 3. Imaging techniques in peritoneal carcinomatosis including recommended protocols in CT and MRI. 4. Types of peritoneal carcinomatosis including pseudomyxoma peritonei. 5. Treatment of peritoneal carcinomatosis with cytoreductive surgery and HIPEC. 6. Adverse sites of disease on imaging. 7. Summary.

## **GIEE-15 Contrast-enhanced Ultrasound (CEUS), More Than Just Bubbles: Diagnostic and Interventional Applications in Daily Clinical Practice**

Participants

Paul Lopez, MBBS, Donostia-San Sebastian, Spain (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

-To learn the potential applications of CEUS throughout the body. -To understand the value of CEUS both in diagnostic and interventional procedures.

### **TABLE OF CONTENTS/OUTLINE**

Since its introduction into clinical practice in the late 1990s, CEUS has gained popularity among radiologists as a diagnostic tool in multiple organ systems, and more recently in radiological interventionism. This is due to its great advantages, which include real-time imaging, high contrast resolution and absence of nephrotoxicity among others. This work will review the potential applications of CEUS in daily clinical practice based on cases of our center. -Liver: characterization of benign and malignant focal lesions, role in hepatocellular carcinoma, interventional procedures. -Gallbladder: tumor versus inflammatory process and biliary mold. -Kidney: complex cystic lesions and tumors, interventional procedures. -Urinary tract and bladder: tumor versus clot, grading vesicoureteral reflux in children. -Thyroid: ablation procedures. -Inflammatory bowel disease: evaluation of inflammatory activity, treatment monitoring, fibrous versus inflammatory strictures? -Interventional radiology: guide for percutaneous biopsies, tumor ablations and drain placement, post-ablation surveillance? -Vascular applications: thrombus detection and evaluation, hemorrhage detection?

## **GIEE-150 Metastatic Lobular Breast Cancer: What the Abdominal Radiologist Needs to Know**

Participants

David Fidler, MBBS, London, United Kingdom (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

-Invasive lobular breast carcinoma (ILC) has a predilection for abdominal and pelvic metastases, with a distinctive distribution and distinctive imaging features. -Three important patterns of abdominal metastasis: Infiltrative submucosal and subserosal metastasis to abdominal and pelvic viscera, mimicking primary abdominal and pelvic malignancy, for example stomach carcinoma (linitis plastica type), colonic carcinoma, uterine and bladder carcinoma; Diffuse peritoneal metastasis, mimicking metastatic ovarian cancer/primary peritoneal neoplasm; Retroperitoneal metastasis, mimicking lymphoma or retroperitoneal fibrosis. -Appears on imaging as smooth, infiltrative lesions, without extramural extension and without desmoplastic reaction. Long segment and multi-organ involvement is typical. MRI signal partially reflects the target organ. -Metastases can occur many years after primary malignancy, and therefore may not be clinically suspected. The radiologist at the MDT may be the first to suggest the diagnosis. -The lesions may not be evident at endoscopy and may be missed on superficial biopsy, therefore radiological suspicion is key

### **TABLE OF CONTENTS/OUTLINE**

-Patterns of abdominal metastasis: GI and GU tract; Peritoneum; Retroperitoneum. -Imaging features. -Why is this important to me?

## **GIEE-151 Transplantation for Type 1 Diabetes: Radiologist's Primer on Pancreatic, Pancreatic-kidney and Islet Cell Transplantation Imaging**

### **TEACHING POINTS**

1) Overview of transplantation procedures for type 1 diabetes with imaging of pancreatic, pancreatic-kidney and novel strategy of islet cell transplantation. 2) Highlight the clinical indications, surgical anatomy, procedure techniques, pre and post-transplantation imaging. 3) Review expected imaging acquisition parameters for US, CT and MRI. 4) Describe immediate, early and delayed complications of pancreatic, pancreatic kidney and islet cell transplantation.

### **TABLE OF CONTENTS/OUTLINE**

• Introduction: Multimodality imaging of pancreatic, pancreatic-kidney and islet cell transplantation with emphasis on transplantation-related complications. Outline • Pancreatic and pancreatic-kidney transplant-Assessment of donor pancreas and graft implantation.-Imaging modalities: US, CT, MRI, angiography.-Complications: Vascular (Thrombosis, Pseudoaneurysm), transplant pancreatitis, intestinal complications (Leak, Bowel obstruction, Fistula). • Islet cell transplantation-Pretransplant imaging: Chest x ray, abdominal US-Technique: Portal venogram, islet cell infusion, tract embolization.-Post-transplant imaging: Ultrasound, PET, SPIO MR imaging-Complications: Early (Hemorrhage, Portal vein thrombosis, Arteriportal fistula) and delayed (Heterogenous hepatic steatosis, Immunosuppression related effects).

## **GIEE-152 Mucking Up the Abdomen: Common and Uncommon Presentations of Pseudomyxoma Peritonei**

Participants

Ethan Zaccagnino, MD, Los Angeles, CA (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

Pseudomyxoma Peritonei (PMP) is an entity characterized by mucinous ascites due to the spread of mucin producing neoplasms. It commonly presents as acute appendicitis or RLQ pain with imaging revealing a mucocele of the appendix. Mucocele rupture may cause spread of tumor into the abdomen resulting in peritoneal implantation. Less common sites of origin include gallbladder, small intestine, pancreas, breast and ovary/fallopian tubes. Imaging findings include mucinous or soft-tissue peritoneal implantations and mass effect or scalloping of the abdominal viscera. Ultrasound may detect mucinous ascites or discrete tumors, however cross-sectional imaging with CT or MR is preferred to characterize PMP. Treatment options include surgical debulking and Hyperthermic Intraperitoneal Chemotherapy (HIPEC). Serial imaging is often warranted, as recurrence is common.

### **TABLE OF CONTENTS/OUTLINE**

1. Intro to pseudomyxoma peritonei (PMP). 2. Mucinous tumors (low and high grade appendiceal mucinous neoplasms, as well as mucinous adenocarcinoma) and sites of origin. 3. Epidemiology of mucinous tumors and PMP. 4. Multimodality imaging features of mucinous tumors and PMP. 5. Treatment (HIPEC and surgical debulking) and complications (mucinous ascites and recurrence) of

PMP. 6. Mimics of PMP as well as situations in which mucinous tumors and PMP can mimic non-neoplastic entities. 7. Common and uncommon presentations. 8. Summary and conclusion.

### **GIEE-153 Diagnosis of Biliary Atresia: Featured Images for the Radiologist**

#### **TEACHING POINTS**

- -Identify the normal liver and bile duct findings in different imaging modalities and the main characteristics and classification of biliary atresia.
- -Illustrate the featured signs and imaging data in the diagnosis of biliary atresia and their post-operative complications.

#### **TABLE OF CONTENTS/OUTLINE**

- Normal pediatric liver ultrasound.
- Some facts about biliary atresia.
- Ultrasound findings.
- Normal and pathological hepatobiliary scintigraphy.
- Findings in percutaneous procedures.
- Imaging in post-operative complications.

### **GIEE-154 Integrating Intestinal Ultrasound (IUS) into an Inflammatory Bowel Disease (IBD) Imaging Service**

#### **TEACHING POINTS**

- Successful control of Crohn's Disease (CD) relies on effectively suppressing inflammation which requires ongoing monitoring.
- A number of trials have validated intestinal ultrasound (IUS) as having excellent diagnostic accuracy in patients with CD, performing comparably to established modalities such as MRI. International guidelines recommend that newly diagnosed CD patients undergo small bowel assessment with IUS or MR enterography.
- Additionally, ultrasound is cost-effective, widely available and better tolerated by patients which is crucial when regular monitoring is required.
- A one-stop clinic where patients undergo IUS with subsequent assessment by a gastroenterologist enables timely implementation of a targeted management plan for better disease control.
- Operators must have appropriate training and experience with IUS as well as a methodical and reproducible technique for accurate disease assessment.
- With sufficient operators trained in IUS, it may also be offered as a point-of-care test in the emergency department.
- Oral and intravenous contrast may be used in IUS selectively to provide additional information.
- A reporting template can serve as a useful aid to performing a comprehensive study. Successful implementation requires multidisciplinary input involving radiology, gastroenterology, and surgery.

#### **TABLE OF CONTENTS/OUTLINE**

1. Introduction 2. One-stop clinic 3. Resources 4. Technique 5. Sonographic appearances of IBD: Case Studies 6. Summary

### **GIEE-155 The Hepatic Angiomyolipoma: A Guide to Avoiding a Big Fat Mistake**

Participants

Ana Paula Fraga Cintra Gonzaga, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Provide an overview of hepatic angiomyolipoma (HAML). Discuss typical and atypical cases of HAML with an emphasis on imaging features. Review the main differential diagnoses of HAML with a didactic approach. Offer useful tips for challenging cases to enhance accurate diagnosis and patient outcomes. Develop a radiological survival guide for interpreting fat hepatic nodules.

#### **TABLE OF CONTENTS/OUTLINE**

HAML is a rare tumor with a combination of blood vessels, smooth muscle, and varying degrees of mature fat. Despite limited research on HAML, this presentation aims to offer a comprehensive overview of the key features of this lesion, including epidemiology, associations (such as tuberous sclerosis), pathology, radiographic features, prognosis, and treatment. Using case-based presentations, we will explore both classical and uncommon imaging manifestations of HAML, including potential malignant behavior. Additionally, the presentation will discuss the differential diagnosis of HAML, ranging from benign lesions (lipoma, nodular hepatic steatosis, steatotic adenoma, and focal nodular hyperplasia) to malignant neoplasms (HCC and metastasis). Tips for differentiating these diagnoses based on imaging and other clinical factors will be provided. Provide tips for challenging cases where the diagnosis may not be apparent from imaging alone, and radiologists can still play a critical role in contributing to better patient outcomes. Propose a radiological survival guide. This guide will summarize key radiographic and non-radiographic features of HAML, along with differential diagnoses and important clinical considerations, to assist radiologists in accurate diagnosis and appropriate patient management.

### **GIEE-156 Bariatric Surgery: A Pictorial Review. From Post-Surgical Anatomy to Complications**

Participants

Maria Galante I, MD, (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

- To describe the normal postsurgical anatomy of the most common bariatric surgery techniques.
- To analyze the most frequent complications of each of them, with CT and fluoroscopic imaging.
- To present CT images of interesting cases of patients that have undergone bariatric surgery procedures. In this exhibit we will review the most frequent bariatric techniques and their complications, that are divided in late and early depending on the postoperative period in which that may appear (more or less than one month). Older procedures such as vertical-banded gastroplasty and jejuno-ileal bypass will not be assessed.

#### **TABLE OF CONTENTS/OUTLINE**

1. Generalities and indications of bariatric surgery 2. Classification 3. Post-surgical imaging control protocol 4. Restrictive Surgeries: Anatomical imaging features and main complications 4.1 Adjustable Gastric Banding 4.2 Sleeve Gastrectomy 5. Restrictive and Malabsorptive Procedures: Anatomical imaging features and main complications 5.1 Roux-en-Y- Gastric Bypass 5.2 Anastomosis duodenoileal bypass (SADI-s), minigastric bypass, duodenal switch 6. Conclusions

### **GIEE-157 Tricky abdominal cases: Practical approach using Spectral CT**

Participants

Ana Villanueva, MD, Toronto, Spain (*Presenter*) Nothing to Disclose

## TEACHING POINTS

1. To learn the benefits of spectral CT applications in challenging abdominal imaging cases  
2. Role of spectral CT in patient's care, how we can change management decisions

## TABLE OF CONTENTS/OUTLINE

1. Background: Revision of basic concepts of spectral CT.  
• Definition  
• Types of Spectral CT available in the market  
• Review of different material decomposition applications  
2. Review of challenging abdominal and pelvic cases.  
• Case-based and interactive format- The reader will be able to click on different stories to go through broad spectrum of cases covering most of abdominal and pelvic organs- We will display daily situations where the radiologist could feel stuck while reporting the CT- Companion quiz questions and teaching points/tips will be shown- Updated literature will be provided for each case. By clicking on each reference, the reader will be redirected straight to the actual paper  
• To propose an algorithm to guide the radiologist to accurately reach the diagnosis  
• To demonstrate how spectral CT is useful for problem solving and the radiologist could aid in successful decision-making and avoid additional imaging or procedures  
3. Limitations of spectral CT  
4. Conclusion

## GIEE-158 Don't Be Thrown for a Loop! A Review of Internal Hernias for the Abdominal Imager

### TEACHING POINTS

Internal hernias are herniations of abdominal viscera, usually small bowel, through congenital or acquired openings of the peritoneum or mesentery. Internal hernias can obstruct and are considered surgical emergencies due to the high risk of bowel strangulation. If complications such as bowel obstruction or ischemia are not present, then imaging findings of internal hernia will consist primarily of displacement of normal abdominal structures. After reviewing this exhibit, the viewer will be familiar with the various kinds of congenital and acquired hernias, as well as the epidemiology, surgical risk factors, imaging appearance, and complications associated with internal hernias.

### TABLE OF CONTENTS/OUTLINE

1. Introduction  
2. Congenital Hernias  
2a. Brief review of embryology and general anatomy  
Types of Hernias with accompanying cases.  
2b. Lesser Sac (Foramen of Winslow).  
2c. Left paraduodenal (Fossa of Landzert).  
2d. Right paraduodenal (Fossa of Waldeyer)  
2e. Pericecal  
2f. Transomental: Greater Omentum and Lesser Omentum  
2g. Sigmoid  
2h. Broad Ligament  
3. Acquired/Iatrogenic  
3a. Introduction to Acquired Hernias and commonly associated surgeries  
3b. Roux en Y/ Gastric Bypass: Description of Procedure and Associated Hernias  
3c and d. Epidemiology, Anatomy, and Imaging appearance of: transmesenteric and jejuno-jejunostomy hernias  
3e. Left colectomy and low anterior resection  
3f. Epidemiology, Anatomy, and Imaging appearance of the following: herniation of the small bowel inferior to the neorectum.  
4. Complications  
4a. Bowel obstruction, including closed loop  
4b. Strangulation and Ischemia  
5. Summary

## GIEE-159 Periportal Lesions - Tiny Space, Huge Possibilities

Participants

Cynthia Borborema, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

### TEACHING POINTS

• To review the anatomy of the periportal space and its pathophysiology;  
• To present the most relevant anatomical variants.  
• To compartmentalize the periportal lesions through a series of cases.  
• To introduce the disorders that may affect that space with a brief review of the clinical context and imaging findings.

### TABLE OF CONTENTS/OUTLINE

• The periportal region is the anatomic space around the portal vein and its intrahepatic branches composed of hepatic artery branches, bile duct branches, lymphatics, and nerves that can be affected by a variety of pathological conditions. Due to its complex anatomical architecture and the wide possibility of lesion natures, involvement of the periportal space can be a diagnostic challenge for radiologists.  
• Review of periportal anatomy with didactic illustrations of the main anatomical variants.  
• In this presentation periportal lesions will be divided into the following categories: vascular (pathologies of the portal vein and hepatic artery), lymphatic (pathologies of periportal lymphatics), neural (pathologies of periportal nerves), periportal space as a pathway for diseases to spread and miscellaneous.  
• A complete case-based review of common (periportal edema, portal biliopathy, peribiliary cysts, infectious diseases) and unusual disorders involving the periportal space, such as segmental arterial mediolysis, metastatic calcifications, plexiform neurofibroma, extramedullary hematopoiesis, amyloidosis, lymphangioma, hepatic artery giant pseudoaneurysm, ganglioneuroma, schwannoma.

## GIEE-16 Imaging of Pancreas Transplants: A Comprehensive, Multimodality Review

Participants

Rachel Perez, MD, Phoenix, AZ (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Anatomy and surgical technique  
2. Key imaging features and techniques  
3. Pancreas transplant complications

### TABLE OF CONTENTS/OUTLINE

1. Introduction  
2. Review of normal/donor pancreatic anatomy  
2a. Donor arterial supply, venous drainage, and exocrine drainage  
3. Surgical technique/transplant anatomy  
3a. Systemic-venous drainage  
3b. Portal-venous drainage  
3c. Exocrine Bowel drainage  
3d. Exocrine Bladder drainage  
3e. Stepwise approach to identifying anatomy  
4. Imaging  
4a. Ultrasound and Contrast-Enhanced Ultrasound  
4b. CT/CTA  
4c. MRI/MRA (including ferumoxytol)  
5. Biopsy technique  
6. Complications  
6a. Parenchymal  
6a1. Rejection  
6a2. Pancreatitis  
6b. Vascular  
6b1. Thrombosis  
6b2. Stenosis  
6b3. Hemorrhage  
6b4. Pseudoaneurysm  
6b5. Arteriovenous Fistula  
6c. Bowel  
6c1. Small Bowel Obstruction  
6c2. Exocrine leak  
7. Summary of key learning points

## GIEE-160 The Anatomy of Normal and Abnormal Swallowing

Participants

Nancy J. McNulty, MD, (*Presenter*) Book contract, Oxford University Press

### TEACHING POINTS

The oral cavity, pharynx, larynx, and surrounding muscles, bones and cartilaginous structures work together in a sophisticated and coordinated way to achieve normal swallowing. Accurate diagnosis of swallowing dysfunction requires a comprehensive understanding of what is normal, and how normal structures work in a coordinated fashion to achieve deglutition. This exhibit will review the components of swallowing that are voluntary, such as chewing, forming a bolus of food on the tongue, and initiating deglutition, and the involuntary reflexes that are initiated by stimulation of the palate or touch receptors in the pharynx. The pertinent anatomy, including muscles and their innervation, will be highlighted and reinforced. Clinically, swallowing dysfunction can be assessed with a video fluoroscopic barium swallow study. Normal swallowing exams will be used to demonstrate normal function, and highlight the components of a normal swallow.

#### TABLE OF CONTENTS/OUTLINE

Outline the sequence of events that occur during normal swallowing. Explain the muscles involved in the voluntary and involuntary tasks of swallowing and their innervation. Identify the anatomy and the role of structures of the head and neck during normal swallowing, and how they work to prevent nasopharyngeal regurgitation and aspiration. Review components of normal swallowing function on video swallowing examinations with audio narration. Observe video swallowing examinations with audio narration highlighting commonly encountered types of swallowing dysfunction.

#### **GIEE-161 The Invaluable Role of CEUS in HCC imaging: Planning and Guidance of Ablative Therapy and Secondary Surveillance Following Treatment**

Participants

Shayan Hemmati, BSc, Calgary, AB (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

(1) The unique benefits of hepatocellular carcinoma (HCC) diagnosis with contrast enhanced ultrasound (CEUS) include dynamic real time imaging and bubble tracking techniques, along with exquisite sensitivity for detection of arterial phase hyperenhancement (APHE) and washout (WO). (2) The advantages of performing CEUS prior to ultrasound guided ablative therapy for HCC include accurate identification of the nodule and grayscale occult lesions, determination of the best ultrasound technique (probe selection, patient positioning/breath hold), and identification of any unexpected findings that would alter or preclude ablative therapy (ex. additional lesions or tumour in vein). (3) Performance of CEUS at the time of ablation is essential to guide probe placement for grayscale occult or difficult to visualize nodules allowing the interventionalist to target either foci of APHE or areas of WO. (4) Performance of immediate post ablation CEUS to assess for completeness of ablation increases the number of successful ablations by allowing immediate identification and re-treatment of residual tumour or non-target ablations. (5) Inclusion of CEUS in secondary surveillance optimally resolves indeterminate or equivocal MRI results. Recognition of non-linear artifact on CEUS, arising from the microwave ablation probe tract, is essential to avoid misdiagnosis.

#### TABLE OF CONTENTS/OUTLINE

- Background - Diagnosis of HCC with CEUS - Ablation Planning with CEUS - Ablation Targeting with CEUS - Immediate Post-ablation Assessment with CEUS - Secondary Surveillance with CEUS - Conclusion - References

#### **GIEE-162 Role of Imaging in Systemic Therapy for HCC**

Participants

Kevin Zand, MD, Washington, DC (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Multiple combined and single systemic therapies are currently FDA approved for intermediate and advanced stage HCC. 2. Systemic therapy for HCC improves overall survival in patients who are not candidates for curative or locoregional therapies or who have failed locoregional therapy. 3. Imaging has a key role in the post treatment evaluation, response assessment, and diagnosis of potential complications. 4. LI-RADS treatment response algorithm is not applicable to the systemically treated HCC. 5. HCC response to immunotherapy is different compared to chemotherapy, and should be considered in tumor response assessment by imaging.

#### TABLE OF CONTENTS/OUTLINE

1. The current role and survival benefit of immunotherapy for HCC. 2. Review of response assessment criteria in the systemically treated HCC (RECIST, mRECIST, and other criteria) and their use in clinical trials that lead to FDA approval of the new agents. 3. Post treatment imaging assessment. Representative cases will illustrate the imaging before and after systemic therapy (at multiple time points when relevant) with correlation with the clinical course and overall outcomes. (a) Representative cases from patients with favorable/stable outcomes. (b) Representative cases from patients with poor outcome. (c) Representative cases showing treatment related complications. 4. Review of emerging literature on combined immunotherapy with locoregional therapy. 5. Limitations of treatment response assessment after systemic therapy for HCC and future directions

#### **GIEE-163 Hypointense Hepatic Findings on Hepatobiliary Phase Imaging**

Participants

Kelly Harper, FRCPC, Ottawa, ON (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Review the mechanism of hepatocellular contrast agent uptake and factors affecting it - Liver parenchyma hypointensities in hepatobiliary phase (HBP) can be diffuse, regional, and focal - Parenchymal hypointensities can be due to technical, parenchymal, vascular, and biliary causes - Both hepatocellular and non-hepatocellular lesions can show hypointensity - Hypointensity of a lesion is useful for its characterization - Hypointensity around a neoplasm may be associated with aggressive nature with management implications

#### TABLE OF CONTENTS/OUTLINE

- Parenchymal hypointensity
  - o Diffuse
    - o Technical- timing; opposed phase imaging; no fat suppression, low flip angle.
    - o Parenchymal § Poor hepatocyte function-chronic liver disease § Diffuse hepatic steatosis. § Iron overload § Infiltrative disorders- fibrosis, amyloidosis, malignancy etc § Drug injury § Genetic polymorphism of OATPB1
    - o Vascular § Acute portal vein-narrowing or occlusion § Portal hypertension Sinusoidal obstruction syndrome
    - o Distal biliary obstruction- common bile duct
    - o Regional (lobar/segmental/geographical)
    - o Parenchymal § Radiation- SBRT
    - o Vascular § Acute portal vein branch occlusion § Portal vein

embolization § Hepatic vein occlusion o Bile duct branch occlusion o Focal o Focal fat deposits o Focal confluent fibrosis o Arterioportal shunts o Infective/inflammatory- cholangitis • Hypointense lesions • Hepatocellular lesions o Hepatocellular carcinoma o Hepatic adenoma • Non hepatocellular lesions o Cysts o Metastases o Hemangioma o Cholangiocarcinoma

## **GIEE-164 Inclusion of Liver CEUS in Current Practice Guidelines**

Participants

Stephanie Wilson, MD, Calgary, AB (*Presenter*) Equipment support, Koninklijke Philips NV; Equipment support, Siemens AG; Equipment support, Samsung Electronics Co, Ltd; Research support, Samsung Electronics Co, Ltd;

### **TEACHING POINTS**

(1) Current North American guidelines of relevance for liver imaging with CEUS include those from AASLD, American Association for the Study of Liver Disease; NCCN, National Comprehensive Cancer Network; and LI-RADS, Liver Imaging Reporting and Data Systems, a classification for those at risk for HCC including an algorithm for categorization of nodules shown on imaging. (2) CEUS was originally not favored for liver imaging because of misconceptions about its ability to differentiate hepatocellular carcinoma from cholangiocarcinoma. (3) Current data shows CEUS performs equivalent and often superior to CT/MR for characterization of liver nodules. (4) CEUS techniques for metastasis detection and diagnosis include sweeping the liver in the portal venous phase to show washout zones and on top injections to show the arterial enhancement of washout lesions. (5) CEUS STRENGTHS include: - Resolution of indeterminate nodules from CT/MRI, with reduction of biopsy - High specificity for HCC within LI-RADS allowing treatment of HCC following CEUS without biopsy. - Accurate characterization of nodules found on surveillance US for HCC. - Better correlation of nodules from surveillance US than shown with MRI, making CEUS the modality of choice as the first test following positive surveillance US. - Optimal diagnosis of small metastases

### **TABLE OF CONTENTS/OUTLINE**

-Introduction of Guidelines for Liver Imaging -AASLD emphasizing imaging for suspect or confirmed HCC. -NCCN emphasizing long-term surveillance of patients at risk for development of metastases. -LI-RADS and its algorithm for categorization of liver nodules, with integration of CEUS LI-RADS with LI-RADS for CT/MRI. -Our perspective on Liver Imaging with CEUS.

## **GIEE-165 Recognizing Benign Lesions in Cirrhotic Liver: Moving Beyond Odds and Enhancing Interpretation**

### **TEACHING POINTS**

1 - This review aims to enhance the recognition and interpretation of benign lesions in patients with cirrhotic liver that may arise due to underlying cirrhosis or occur incidentally. 2 - Illustrate with cases the typical and atypical features of these lesions using computed tomography (CT) and magnetic resonance imaging (MRI). 3 - Provide practical considerations and diagnostic clues to minimize misunderstandings in interpretation and ensure accurate assignment of the Liver Imaging Reporting and Data System (LI-RADS®) category.

### **TABLE OF CONTENTS/OUTLINE**

1 - Definition of cirrhosis and its impact on the appearance of benign lesions. 2 - Describing the imaging presentations of various benign entities in cirrhotic liver on CT and MRI, distinguishing between their typical and atypical features. 3 - Practical considerations and diagnostic clues to differentiate from malignancy and how to assign the correct LI-RADS® category.

## **GIEE-166 What's New in Classification, Pathology, Imaging Findings, and Management of Cystic Liver Diseases: 2023 Update**

Participants

Sriram Jaganathan, MBBS, Little Rock, AR (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

• Discuss 2023 updates on the classification, nomenclature, and pathology of developmental, non-neoplastic neoplastic cystic liver disease • Review spectrum of imaging findings role of different imaging modalities in diagnosis management • Discuss current updates in management strategies with special emphasis on the 2022 European Association for the Study of the Liver (EASL) clinical practice guidelines

### **TABLE OF CONTENTS/OUTLINE**

Introduction Classification Nomenclature of hepatic cystic diseases Molecular pathogenesis hepatic cystogenesis updates Imaging Techniques: US/CT/MRI PET/CT Polycystic liver disease (PLD) Role of imaging in assessing cyst volumes, total liver volumes treatment follow-up; Gigot Schnellendorfer classifications; Complications Management Non-neoplastic Cysts Simple hepatic cysts (malformation of the ductal plate): cystic bile duct hamartoma; Infections: Abscess, Echinococcal cyst; Congenital: choledochal cyst Caroli disease, foregut cyst, von Meyenberg complex; Miscellaneous: peribiliary cysts, organizing hematoma, fibrous cyst pseudocyst Cystic Neoplasms Mucinous cystic neoplasms, Intraductal papillary neoplasm, tubulopapillary oncocytic papillary neoplasms, cystic metastases, HCC, cholangiocarcinoma rare tumors. Imaging spectrum of cystic liver diseases Management: EASL 2022 clinical practice guidelines with the central role of imaging Conclusion Imaging is pivotal in diagnosing, guiding appropriate treatment, and assessing complications for cystic liver diseases. By emphasizing up-to-date imaging findings and recommendations, radiologists are better equipped to provide effective patient care.

## **GIEE-167 Liver Transplant Complications; Case Review from Our Hospital**

Participants

Iskander Artech Amaid, MD, Barakaldo, Spain (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

Get to know the normal findings of the immediate postoperative period of liver transplantation. Mention the most frequent complications classified into arterial, venous and biliary based on cases seen in our Hospital.

### **TABLE OF CONTENTS/OUTLINE**

OLT (orthotopic liver transplantation) is the definitive treatment for patients with end-stage liver disease, acute fulminant liver failure, some neoplasms (HCC, metastases...increasingly broad indications). The surgical technique consists of extracting the donor

(dissection of the hepatic hilum on a bench +- arterial reconstruction if variants) and subsequent implantation. The first step to take when evaluating a liver graft will be to read the surgical report to later understand the images. An ultrasound is mainly performed 24 hours after the transplant, in which we assess the parenchyma, the bile duct, and the flow of the arterial and venous vessels. It will be important to know the normal ultrasound findings. Complications are divided into arterial, venous and biliary. Regarding arterial complications, we have occlusion of the hepatic artery due to dissection/thrombosis of the latter (the most serious complication), hepatic artery stenosis, and pseudoaneurysms. Regarding biliary complications, we have, on the one hand, biliary strictures, most of them anastomotic (they may be non-anastomotic in the intrahepatic bile duct but are related to other causes such as ischemia) and on the other hand the bile leakage. Venous complications are the least frequent, and can affect both the suprahepatic veins and the portal vein, and consist mainly of thrombosis and stenosis.

### **GIEE-168 Uncommon Pancreas Solid Lesions: Spectrum of Imaging Appearance and Radiologic-Pathologic Correlation**

Participants

Yoshihiko Fukukura, MD, PhD, Kurashiki, Japan (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

TEACHING POINTS Pancreatic solid lesions display a wide spectrum of histology, including exocrine and endocrine tumors. The most common tumors of exocrine and endocrine tumors of the pancreas are ductal adenocarcinoma and neuroendocrine tumor, respectively. Uncommon tumors that need to be differentiated from the common pancreas solid tumors include adenosquamous carcinoma, colloid carcinoma, undifferentiated carcinoma, acinar cell carcinoma, solid-pseudopapillary neoplasm, etc. Familiarity of imaging findings of the uncommon tumors is important to arrive at the correct diagnosis of pancreas solid lesions because a precise diagnosis determines the treatment and surgical approach. The purpose of this exhibit is: 1. To describe the imaging and histopathologic features of uncommon pancreas solid tumors 2. To recognize and describe the imaging appearance of some mimics of pancreas solid tumors 3. To discuss the imaging differential diagnosis of pancreas solid tumors

#### **TABLE OF CONTENTS/OUTLINE**

1. Review of CT and MR imaging findings of uncommon pancreas solid tumors, with histopathological correlation. 2. Highlight key differential diagnostic points of pancreas solid tumors. 3. Summary: Awareness of radiological findings of uncommon pancreas solid tumor is important to arrive at the correct diagnosis of pancreas tumors.

### **GIEE-169 Non-contrast Vascular Reconstruction in Patients with a History of Contrast Agent Allergy**

#### **TEACHING POINTS**

Depiction of vascular information by contrast-enhanced CT is required for preoperative examination of surgery. However, there are often cases where it is difficult to use a contrast medium due to allergies to the contrast medium. We have developed a virtual abdominal contrast CT image as a preoperative vascular image by non-contrast CT image for such cases. We performed CT without contrast medium infusion in the abdomen. High-definition scanning conditions were set for image reconstruction. Vascular extraction was performed on the obtained CT volume data using workstation automatic tracking. After that, the multi-planar reconstruction display (MPR) was created from the CT image. By combining the blood vessel information and the MPR display, it was possible to create a virtual abdominal contrast CT image similar to the conventional contrast CT without injecting a contrast medium. The images we developed were evaluated to have important information for the surgeon.

#### **TABLE OF CONTENTS/OUTLINE**

1. Necessity of vascular information and problems of contrast agent allergy 2. Scan technique for blood vessel extraction 3. Extraction of abdominal blood vessels using automatic tracking 4. Creating an MPR display 5. Composite display of blood vessel image MPR display 6. Clinical significance of virtual abdominal contrast CT images

### **GIEE-17 Misdiagnosis of Pancreatic Intraductal Papillary Mucinous Neoplasms and the Challenge of Mimicking Lesions: Imaging Diagnosis and Differentiation Strategies**

#### **TEACHING POINTS**

1. Accurate diagnosis of lesions that mimic IPMNs is crucial to determine appropriate surveillance or resection. 2. There is a risk of overdiagnosis and overtreatment of potentially neoplastic lesions with up to half of cystic lesions mischaracterized on imaging. 3. Using dedicated pancreatic protocol CT and noting unique features such as a bulging ampulla for IPMNs or the extracapsular cystic sign of SCAs can aid in distinguishing subtle differences. Additionally, a "cysts-within-a-cyst" appearance is often present in MCN, giving them a multilocular appearance, as opposed to the "cyst-by-cyst" presentation of IPMNs. 4. Cystic pancreatic neuroendocrine tumors have peripheral hypervascular rim on arterial phase CT. 5. Lymphoepithelial cysts have a cheerios-like appearance with signal drop out on out of phase images. 6. Pancreatic schwannoma has progressive homogeneous enhancement with areas of necrosis. 7. Chronic pancreatitis has a chain of lake appearance with strictures, intraductal calculi, and parenchymal calcifications. 8. EUS, FNA, fluid analysis, cytology, radiomics, and artificial intelligence are all useful tools for definitive diagnosis when CT and MRI are not specific enough.

#### **TABLE OF CONTENTS/OUTLINE**

1. IPMN diagnosis and misdiagnosis 2. Misdiagnosis of mimicking lesions and strategies to accurate diagnosis-Macrocytic Serous Cystadenoma-Cystic Pancreatic Neuroendocrine Tumor-Mucinous Cystic Neoplasm-Lymphoepithelial Cyst-Duodenal Diverticulum-Pancreatic Schwannoma-Chronic Pancreatitis-Retention Cyst and Cystic Fibrosis-Intrapancreatic Accessory Spleen and Epidermoid Cyst-Pancreatic Lipoma or Interdigitating Fat-Choledochal Cyst 3. Conclusion

### **GIEE-170 Advanced Ultrasound Techniques for Liver Transplantation Evaluation**

Participants

Gonzalo Martin Ordonez, MD, Majadahonda, Spain (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

To describe the usual Doppler technique for liver graft follow-up and for evaluation of complications. To describe the use of contrast enhanced ultrasound (CEUS) in the evaluation of vascular complications and graft ischaemia. To describe the use of shear wave elastography in the evaluation of medical complications.

## TABLE OF CONTENTS/OUTLINE

Liver transplantation is the treatment of multiple end-stage liver diseases. Medical and surgical complications are an important source of morbidity and mortality, and radiological examinations are essential for their early detection. Doppler ultrasound is the preferred imaging technique in the initial evaluation of the liver graft and during follow-up due to its portability and the unique hemodynamic information it provides. The use of CEUS allows to confirm vascular complications to define the location and the extension of ischemic areas, and to ascertain biliary tract ischemic involvement, what that is key for deciding the optimal treatment. Shear-wave elastography provides a non-specific but interesting quantitative information that allows for a sequential evaluation of the liver parenchyma. It is useful in the diagnosis and follow-up of medical complications including rejection and the rarer obstructive sinusoidal syndrome. The liver rigidity also aids to decide in which patients a biopsy should be done. We show a pictorial review of cases from our institution to illustrate the vascular, biliary and medical complications that can be evaluated with these techniques.

### GIEE-171 Advanced Abdominal MRI Techniques and Problem-solving Strategies

Participants

Yoonhee Lee, MD, Incheon, Korea, Republic Of (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Magnetic resonance imaging (MRI) plays an important role in abdominal imaging owing to its ability of detection and characterization of focal lesions. Nowadays, techniques for reducing scan time with an acceptable image quality such as parallel imaging, compressed sensing (CS) technique, and nowadays cutting edge deep learning (DL) techniques have arisen for problem solving strategies. Also free breathing techniques using dynamic phase involving extra-dimensional (XD)-volumetric interpolated breath-hold examination (VIBE), and golden-angle radial sparse parallel (GRASP) can help patients with severe dyspnea or under sedation perform abdomen MRI. Therefore, this pictorial review aims to show various advanced abdomen MRI techniques for reducing scan time with maintaining image quality and free breathing techniques during dynamic phase, and representative cases with aforementioned techniques.

## TABLE OF CONTENTS/OUTLINE

•I. Reducing scan time and improving image quality 1.Parallel imaging : Dynamic phase (Controlled Aliasing in Parallel Imaging Results in Higher Acceleration), Half-Fourier-acquisition single-shot turbo spin-echo (HASTE) 2.Compressed sensing technique : Dynamic phase, Magnetic resonance cholangiopancreatography 3.Deep learning (DL) : T2 weighted image, Diffusion weighted image •Strength and pitfalls of DL while radiologists interpreting lesions 4.Motion corrected diffusion weighted image • •II. Free breathing technique during dynamic phase 1.Stack of Stars volumetric interpolated breath-hold examination (StarVIBE) 2.Extra-dimensional (XD)-VIBE 3.Golden-angle radial sparse parallel (GRASP)

### GIEE-172 Imaging of Pancreatic Cystic Lesions: What Radiologists Should Know

Participants

Akihiko Kanki, MD, Kurashiki, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The purpose of this presentation is:1) To demonstrate the common and uncommon computed tomography and magnetic resonance imaging findings of neoplastic pancreatic cystic lesions, including the radiologic-pathologic correlation.2) To learn about the non-neoplastic and cyst-like lesions of the pancreas that can mimic pancreatic cystic neoplasms.

## TABLE OF CONTENTS/OUTLINE

Classification of Pancreatic Cystic LesionsImaging findings of common pancreatic cystic lesionsNeoplastic pancreatic cystic lesions•Mucinous cystic neoplasm•Serous neoplasm•Intraductal papillary mucinous neoplasm•Intraductal tubulopapillary neoplasm•Intraductal oncocytic papillary neoplasmImaging findings of uncommon pancreatic cystic lesions•Intraductal papillary mucinous neoplasm complicated with intraductal hemorrhage, perforation and fistula formation•Mucinous cystic neoplasm occurring with side branch-type intraductal papillary mucinous neoplasmNon-neoplastic and cyst-like lesions of the pancreas that can mimic pancreatic cystic neoplasmsNon-neoplastic pancreatic cystic lesions•Squamous lined cyst•Acinar cystic transformationVarious pancreatic tumors with cystic degeneration•Solid pseudopapillary neoplasm•Others

### GIEE-173 Pseudomyxoma Peritonei: Imaging Features and Current Therapies

Participants

Laura Jorgenson, Rochester, MN (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Define pseudomyxoma peritonei. Understand and describe the histopathology, pathophysiology, and etiologies of PMP, with a focus on appendiceal and ovarian neoplasms. Describe the multimodality imaging features of pseudomyxoma peritonei. Recognize complications related to PMP, mucinous tumor burden, and cytoreductive surgery. Discuss specific imaging findings which are essential to the surgical oncologist in determining resectability and cytoreductive surgery planning. Review current therapies available to patients with PMP.

## TABLE OF CONTENTS/OUTLINE

TABLE OF CONTENTS/OUTLINE 1. Definition of PMP and imaging featuresDefineOptimizing US, CT, MR, and PET image acquisitionImaging features on different modalitiesNatural History 2. Tumor OriginAppendicealOvarianNon-malignant causesDifferentiation from multicystic mesotheliomaBrief review of pathologies of peritoneal surface malignancies 3. Potential Complications and related imaging features4. Example reporting template5. What the surgeon needs to know and current therapiesPeritoneal Carcinomatosis Index (PCI)Cytoreductive SurgeryHIPECSystemic chemotherapy - understanding response to therapy vs. progression

### GIEE-174 Dual Energy CT Angiography in Acute Mesenteric Ischemia - A Review

Participants

Aachi Kaushik Chary, MBBS, New Delhi, India (*Presenter*) Nothing to Disclose

## TEACHING POINTS

- To define the clinical presentation of acute mesenteric ischemia and dual energy CT angiography protocol for its diagnosis-To illustrate the types and various imaging features of acute mesenteric ischemia on dual energy CT- To discuss the benefits of dual energy CT in acute mesenteric ischemia

## TABLE OF CONTENTS/OUTLINE

Acute mesenteric ischemia (AMI) is a common potentially fatal condition requiring accurate and prompt image-based diagnosis to ensure quick treatment to save the bowel. The exhibit includes the following contents-Depiction of the clinical presentation of AMI along with the details of dual energy CT angiography protocol-Enumeration of the various causes and types of AMI-Detailed illustration of the vascular, bowel and associated findings on dual energy CT angiography in patients presenting with different types of AMI, with emphasis on the ominous signs-Elaborate discussion with illustrations on the benefits of dual energy CT including generation of virtual non-contrast images which reduce radiation dose, iodine maps representing tissue perfusion, and mono-energetic images which improve image contrast and thus diagnostic ability-Brief depiction of the role of interventional radiology in AMI

## GIEE-175 Ancillary Features Are Coming to LI-RADS Treatment Response Algorithm: Let's Get You Ready

### TEACHING POINTS

- The LI-RADS Treatment Response Algorithm (LR-TRA) is a standardized system for assessing and reporting treatment response after locoregional therapy (LRT) for hepatocellular carcinoma (HCC).- Emerging radiology-pathology and inter-reader studies have highlight the potential for ancillary features to improve detection of incomplete necrosis with greater radiology-pathology concordance.- This exhibit highlights the updates in the LR-TRA v2023 (compared to v2018), especially pertaining to the role of newly incorporated ancillary features. The overall objective of the changes is to improve diagnostic accuracy of post-treatment imaging assessment.

### TABLE OF CONTENTS/OUTLINE

- Summarize the role of the TRA in the context of the currently used treatments for HCC.- Provide an evidence-based review of current literature highlighting the value of incorporating ancillary features in treatment response assessment after locoregional therapy in HCC.- Highlight key updates of the LI-RADS v2023 TRA pertaining to use of ancillary features after various forms of LRT for response assessment, using a case-based and illustrative approach.

## GIEE-176 Ischemic Cholangiopathy: Imaging Patterns and Other Biliary Complications Following DCD Liver Transplant

Participants

Maria Zulfiqar, MD, MBBS, Scottsdale, AZ (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The purpose of this exhibit is to:1. Describe various imaging patterns of ischemic cholangiopathy post DCD liver transplant on MRI/MRCP2. Elaborate prognostic significance of these imaging patterns.3. Discuss additional biliary complications post liver transplant.

### TABLE OF CONTENTS/OUTLINE

Four different patterns of IC: have been identified, each correlating with DCD allograft prognosis. • Diffuse necrosis: Most severe form with nearly 100% need for retransplant, characterized by multifocal biliary strictures, wall necrosis and bile lakes. Usually, hepatic artery is severely stenosed or occluded. • Multifocal progressive: Starts as mild to moderate multifocal stricturing cholangiopathy that progresses in a few months to more severe form with worsening strictures or even biliary necrosis. >50% need for retransplant. • Confluence dominant: Mild to moderate cholangiopathy that involves the biliary confluence. Most cases can be managed without need for retransplant. • Minor Form: Mild areas of multifocal stricturing that remain stable or resolve. Other liver transplant biliary complications: • Anastomotic stricture • Bile leak/anastomotic dehiscence • Vanishing bile duct syndrome (ductopenia) • Biliary stones; Biliary cast syndrome; hemobilia • Cystic duct remnant mucocele • Roux limb bleeding, Roux limb stasis or obstruction. Summary IC post DCD liver transplant is a major source of allograft complications. Identifying different patterns of IC can help stratify need for stenting and predict allograft prognosis.

## GIEE-177 Multimodality Imaging Biomarkers for Crohn's Disease Strictures

Participants

Safa Hoodshenas, MD, Rochester, MN (*Presenter*) Nothing to Disclose

### TEACHING POINTS

• To understand the role and characteristics of existing and future biomarkers in Crohn's disease strictures • To review existing diagnostic and prognostic Crohn's imaging biomarkers and potential surrogate clinical endpoints • To describe potential imaging biomarkers that reflect stricture histopathology or pathophysiology • To describe the strengths and weaknesses of existing and future biomarkers for Crohn's disease strictures.

### TABLE OF CONTENTS/OUTLINE

• Existing diagnostic and prognostic biomarkers of Crohn's disease strictures • Using CT or MR enterography to measure response biomarkers and/or efficacy endpoints for Crohn's strictures • Stiffness, fibrosis, and smooth muscle hypertrophy are histopathologic and physiologic targets for an emerging array of MR, ultrasound, and PET biomarkers • MRI-based biomarkers include delayed gadolinium enhancement, normalized magnetization transfer, DWI and intravoxel incoherent motion, T1 mapping, intramural T2 signal, and quantified small bowel motility • Ultrasound-based biomarkers include wall thickness, elastography to measure shear stiffness, contrast-enhanced ultrasound, and ultrasensitive microvessel imaging • Molecular imaging targets at PET-MRE include inflammation and fibrosis

## GIEE-178 Kidney Pancreatic Transplantation: Anatomy and Surgical Technique Guide for Residents

Participants

#### TEACHING POINTS

Pancreas transplant is a complex procedure which represents a surgical alternative for the treatment of diabetic patients with the goal of avoiding the systemic complications associated with the disease. The most frequent approach is the SPK transplant in which both grafts of a single donor are inserted in one surgical act, on the right and the left fossa respectively. Transplanted kidney is implanted extraperitoneally in an iliac fossa. The most widely used technique is end-to-side anastomosis of the donor's renal artery to the recipient's external iliac artery. Transplantation of the pancreatic graft is performed together with a duodenal segment. Enteric exocrine drainage will be through anastomosis of the donor duodenal segment to a small bowel loop of the recipient whereas systemic endocrine drainage will be through the portal vein of the graft which is anastomosed directly to the primitive iliac vein. To learn surgical technique and post-operative anatomy. To know normal postoperative imaging assessment. To recognize all the complications.

#### TABLE OF CONTENTS/OUTLINE

Introduction and normal anatomy Surgical techniques Normal post-operative imaging appearance Complications Take-home messages

#### GIEE-179 Hepatic Sinusoidal Disorders

Participants

Sudhakar K. Venkatesh, MD, FRCR, Rochester, MN (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Understand pathophysiology behind hepatic sinusoidal disorders
- Review the typical imaging appearances sinusoidal obstruction caused by different etiologies and characteristic findings for differentiation of etiologies.
- Review conditions that cause sinusoidal and perisinusoidal infiltration and may mimic sinusoidal obstruction.

#### TABLE OF CONTENTS/OUTLINE

- Normal hepatic sinusoid structure and physiology
- Mechanisms causing sinusoidal dilatation and/or obstruction.
- Histopathological correlation of imaging findings
- Sinusoidal dilatation
  - o Outflow obstruction
  - § Post sinusoidal causes.
- Congestive hepatopathy
  - Heart failure
  - Pericarditis
  - Congenital heart diseases
- Budd-Chiari syndrome
- Sinusoidal obstruction syndrome
  - o Myeloablative conditioning for stem cell transplantation.
  - § Utility of ultrasound in diagnosis of SOS in children
  - o Chemotherapy-oxaliplatin based therapies, immunotherapy.
  - o Radiotherapy
- Sinusoidal dilatation without obstruction
  - o Vascular disorders
  - § Arterioportal shunts
  - § Decreased portal flow.
  - § Porto-sinusoidal vascular disorder
  - o Extrahepatic acute inflammatory/infective conditions
  - o Use of oral contraceptives or hormones
  - o Hepatic peliosis
  - o Extrahepatic malignancy without liver infiltration
- Sinusoidal and/or perisinusoidal infiltration with or without dilatation
  - o Perisinusoidal fibrosis
  - o Amyloidosis
  - o Myeloproliferative disorders
  - o Malignancy

#### GIEE-18 The Dark Side of the Bowel Disease: Algorithmic Approach Step by Step

#### TEACHING POINTS

Review through different imaging modalities the evaluation of the intestinal wall. To revise the general features of the normal bowel wall. Create an algorithm that allows quick < easy evaluation to guide the diagnosis. To discuss the different imaging findings we may see in different pathologies. To study different pathologic entities that present with bowel wall thickening.

#### TABLE OF CONTENTS/OUTLINE

Introduction Anatomy basic bowel wall. Step by step > interpretation of < analyzed by categorizing attenuation changes in the intestinal wall. Diagnostic Algorithm description. Descriptions of the commonest causes Key points. Conclusions References

#### GIEE-180 CT Approach to Acute Mesenteric Ischemia

#### TEACHING POINTS

-Acute mesenteric ischemia it's an infrequent pathology, but the mortality rate is high because of the nonspecific symptoms and the delayed diagnosis, so the role of the imaging and the radiologist are fundamental to reduce the mortality rates.-Appropriate protocols of CT imaging should be used to optimize the radiation and contrast medium use, because there is a disbalance in the homeostasis of the patient and every minute counts to make de diagnosis.-If there is a kidney failure, there are protocols for a safety use of the iodinated contrast medium.-To establish an adequate diagnosis, the histopathology and anatomy of the arteries and the bowel should be evaluated.-There are three main structures that we must evaluate to have an adequate approach to mesenteric ischemia: bowel lumen, bowel walls and abdominal localization.-When there is an acute mesenteric ischemia, other abdominal organs like adrenal glands, inferior cava vein, aorta, liver, spleen, and kidneys have changes and findings that can predict complications and mortality.

#### TABLE OF CONTENTS/OUTLINE

Gross anatomy Abdominal artery anatomy. Relevant anastomoses. Abdominal vein anatomy. Histology of the bowel. Pathophysiology of acute mesenteric ischemia. CT imaging protocols. Indications, Simple, artery and portal phases with timing and technique (kVp, mA, rotation, PITCH). What to do if there is an acute kidney failure Classification of the acute mesenteric ischemia. Systematic approach to acute mesenteric ischemia. Bowel Wall thickness. Diameter. Wall enhancement. Mesentery Fat. Liquid. Localization. Vessels. Artery. Vein. Other abdominal organs Liver. Kidneys. Adrenal glands. Pulmonary embolism. Conclusions. Bibliography.

#### GIEE-181 Gastric Cancer CT Staging: Radiologic Patterns with Radiologic-Pathologic Correlation

#### TEACHING POINTS

State of the art treatment of locally advanced gastric cancer is multimodal and involves combined surgical and medical therapy. CT has a central role in the staging of gastric cancer, being the method of choice for this purpose; a local and distant staging as accurate as possible is crucial for a correct treatment planning, avoiding under- or over-treatment of the Patient. To obtain a correct staging, a thorough knowledge of normal and pathologic gastric radiological anatomy and the pathways of tumor spread is crucial. Through the analysis of illustrative cases: To know the normal and pathologic gastric radiologic anatomy and the lymphatic and hematogenous pathways of spread of gastric cancer. To know the TNM classification (8th edition) for gastric cancer and

correctly use the CT criteria necessary for its application. To correlate radiologic patterns of gastric cancer with macroscopic and microscopic pathologic patterns. To correlate clinical CT staging and pathologic staging with regard to T and N parameters. To understand the limitations and pitfalls of imaging and the causes of radiological overstaging and understaging.

#### TABLE OF CONTENTS/OUTLINE

1. Concepts of normal and pathologic gastric radiologic anatomy and lymphatic and hematogenous tumor spread pathways are explained. 2. Some illustrative cases of early-stage, locally advanced and oligometastatic gastric cancer are presented, with clinical staging obtained by CT imaging applying the TNM 8th edition classification. Correlation of CT images with macroscopic and microscopic pathologic findings is shown by detailed explanation of the findings. 3. Some examples of CT understaging and overstaging and their possible explanations are presented.

#### GIEE-182 Abdominal Inflammatory Lesions Unmasked: A Radiological Hunt for Tumor Impostors!

Participants

Abrahamo Elias Neto, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To review the abdominal inflammatory diseases which mimic tumor-like lesions. To present diagnostic challenging cases of inflammatory diseases that can mimic tumoral lesions. To be aware of non-malignant conditions as differential diagnoses at the initial presentation of lesions suspicious for neoplasms, and which imaging features may help in the differentiation. To highlight clinical and laboratory data that can help the radiologist not fall into pitfalls.

#### TABLE OF CONTENTS/OUTLINE

Abdominopelvic inflammatory lesions can present a diagnostic challenge for radiologists, particularly when distinguishing between tumor and non-tumor involvement. This can have a significant impact on patient outcomes, as the management and prognosis of these conditions can vary dramatically. Overview of the main inflammatory diseases that mimic neoplasms. Key radiological findings in cross-section abdominal images that aid in distinguishing between tumor and non-tumor lesions. The role of clinical and laboratory information in the differential diagnosis of inflammatory lesions. Didactic exposition of illustrative cases in which inflammatory diseases mimic neoplasms, such as rectal syphilis, peritoneal tuberculosis, focal pyelonephritis, glandular cystitis, hepatic inflammatory pseudotumor, xanthogranulomatous cholecystitis, complicated appendicitis, focal pancreatitis, vaginal vault abscess, and lobular endocervical glandular hyperplasia. Recap of the importance of accurately differentiating between tumor and non-tumor involvement in abdominopelvic inflammatory lesions, with the key takeaways from this educational exhibition.

#### GIEE-183 Expanding the Role for Biopsy in HCC: It's Not Just About Diagnosis

Participants

Mansur Ghani, MD, San Diego, CA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Traditionally, clinical indications for biopsy of hepatocellular carcinoma (HCC) have included circumstances when imaging diagnosis is uncertain or for HCC that does not respond as expected to therapy. 2. More recently, developments in the understanding of pathological and molecular alterations in HCC at the cellular level have created additional opportunities for biopsy for the purposes of prognosis, treatment selection and treatment monitoring.

#### TABLE OF CONTENTS/OUTLINE

Review of traditional indications for biopsy in HCC (Fig. 1)- Diagnosis in the case of LR-4 (Fig. 2), LR-M (Fig. 3) and LR-TIV- Lesions that do not respond as expected to therapy Additional potential roles for biopsy in HCC- Diagnosis- Lesions in non-cirrhotic livers or scenarios where LI-RADS currently cannot be applied (e.g. cardiac cirrhosis and Fontan related liver disease)- LR-3 lesions (Fig. 4)- Prognosis- There are several histological HCC sub-classes, each with distinct molecular patterns and prognostic implications (Fig. 5)- Microscopic vascular invasion (MVI) can be incidentally detected on biopsy, and surrogate molecular markers can be used to predict MVI- Stemness-related biomarkers are associated with more aggressive clinical behavior- Treatment selection- Potentially targetable genetic alterations are found in approximately 24% of HCC.- Treatment monitoring- Genetic sequencing of biopsy tissue can be performed to design specific liquid biopsy panels to monitor efficacy of treatment.- Biopsy Techniques- Biopsy types: fine-needle aspiration, needle-core biopsy, micro-histology, liquid biopsy- Types of image guidance- Ultrasound with an emphasis on the emerging role of contrast-enhanced ultrasound- CT-guided

#### GIEE-184 Getting to the Bottom of the Pelvic Floor: A Primer on MR Defecography Technique, Reporting and Implications for Surgical Management

Participants

Nitin Venugopal, MD, Seattle, WA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Indications for MR defecography (MRD); advantages over fluoroscopic defecography and correlation of both techniques
- Anatomic considerations: compartments, measurements, pathophysiology of the pelvic floor
- Technique and phases of examination for functional assessment
- Standardized terminology and reporting
- Imaging findings of common and rare diagnoses
- Surgical management of pelvic organ prolapse: choice of procedure, techniques and post-op imaging findings

#### TABLE OF CONTENTS/OUTLINE

Review pelvic compartmental anatomy, important lines and measurements:- Pubococcygeal line- H-line- M-line- Urethral axis- Vaginal axis Variations of technique and equipment:- Phases: rest, contraction, defecation- Sequences- Open vs. closed MRI technique- Coil design Standardized terminology and reporting, consensus guidelines by SAR and AJR. Step by step interpretation of a case with sample reporting template. Entities discussed:- Peritoneocele, Enterocoele, Sigmoidocoele- Cystocoele- Urethral Hypermobility- Uterine/Vaginal prolapse- Descending perineal syndrome- Structural Outlet Obstruction: Rectocoele, Rectal prolapse, Intussusception, Rectal mass- Functional Outlet Obstruction: Puborectalis dyskinesia, Anismus anorectal incontinence- Spastic pelvic floor syndrome Surgical management of pelvic descent- Pre-op considerations Obliterative vs. reconstructive techniques Abdominal vs. vaginal approach Concomitant urinary or fecal incontinence repair, colporrhaphy Hysterectomy vs. uterine-sparing Risk calculator for prophylactic urinary incontinence prevention Indications for mesh augmentation- Post-op imaging findings and

complications

### **GIEE-185 MRI-Based Body Composition Analysis: We Can See the Fat That Hides Inside You**

Participants

Luciana Belem, MD, MSc, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

- Review how MRI of the abdomen may help identify high-risk adiposity phenotypes in the obesity context.- Review the literature on obesity, addressing the impact of visceral and ectopic fat in health.- Discuss which measurements can be made on MRI of the abdomen to assess visceral and ectopic fat.- Teach how to measure visceral and ectopic fat on MRI of the abdomen.

#### **TABLE OF CONTENTS/OUTLINE**

- Definition: what is visceral and ectopic fat.- Review the pathophysiology of obesity and discuss how to differentiate the adiposity phenotypes on MRI.- Body composition measures on MRI: Visceral adipose tissue, subcutaneous adipose tissue and skeletal muscle. Area or volume? If area, which level? Which muscle groups to include in skeletal muscle quantity assessment.- Protocol: which sequences use to assess body composition parameters and quantify ectopic fat.- Chemical shift-encoded (CSE) MRI with estimation of proton density fat fraction (PDFF): potential biomarker in obesity.- Ectopic fat measures on MRI: Muscle fat: which abdominal muscle group to measure? Pancreas fat: where and how to measure? Liver fat: where and how to measure?

### **GIEE-186 Mind The gap! The Tubes and Pipes in Crohn's Disease: Technical Aspects and Diagnostic Findings of CT and MRI-Enterography**

Participants

Mayra V. Soares, MD, Brasilia, Brazil (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

To review relevant points in the anatomy of the small intestine, in the context of Crohn's Disease, highlighting the main sites of involvement. To review the indications, protocol, and technical aspects of CT and RM-enterography (CT-e and MR-e). To point out differences and similarities, advantages and disadvantages between CT-e and RM-e. To show typical and atypical imaging findings of Crohn's disease and main complications. To distinguish phenotypic patterns of presentation of Crohn's disease in CT-e and RM-e.

#### **TABLE OF CONTENTS/OUTLINE**

Introduction Review of the anatomy of the small intestine Review of the typical and atypical imaging findings of Crohn's disease and its phenotypes CT-e and MR-e protocols Main diagnostic findings in Crohn's disease: Segmental mural enhancement mural thickening stenosis ulcerations vasa recta ingurgitation lymph node enlargement Complications related to Crohn's Disease: fistulas inflammatory mass Abscess

### **GIEE-187 The Mystery of Internal Hernias: What Should the Radiologists Know?**

Participants

Basem Jaber, MD, Darby, PA (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

- Reviewing the different types of the internal hernias- Discussing the imaging features of various types of internal hernias- Identifying possible complications of internal hernias- Providing case-based review of common and uncommon pathologies

#### **TABLE OF CONTENTS/OUTLINE**

Internal hernias are defined as protrusion of small bowel loops through normal apertures and/or defects in the peritoneum or mesentery into a compartment within the abdominal cavity, commonly presenting as an acute intestinal obstruction. The incidence of internal hernias is increasing with the new surgical procedures now being performed. It is crucial for radiologists to be familiar with and understand the different types of internal hernias and the possible complications since they have high mortality rate and they are often challenging to recognize. Key points:- Introduction to peritoneum anatomy- Internal hernia different types- The diagnostic approach for internal hernias- Pearls and pitfalls for recognizing internal hernias complications imaging features

### **GIEE-188 Just Not GIST: Non-GIST Mesenchymal Neoplasms of the Alimentary Tract**

Participants

Rashmi Balasubramanya, MD, Philadelphia,, PA (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

There is a heterogeneous group of non-GIST, mesenchymal neoplasms of the gastrointestinal tract that are characterized by distinctive histopathology tumor genetics as well as variable clinico-biological profiles and imaging findings. Characteristic disease distribution: While glomus tumors and plexiform fibromyxomas display distinct predilection for the gastric antrum, smooth muscle tumors of the gut preferentially occur in the esophagus and colorectum. Distinctive genetic markers: Based on MDM2 gene amplifications, esophageal giant fibrovascular polyps are now considered well-differentiated liposarcomas. Other tumors with distinctive cytogenetics include lipomas (HMGA2 gene rearrangements), granular cell tumors (inactivating AP6AP gene mutations), gastroblastomas (MALAT1-GLI1 fusions), plexiform fibromyxomas (GLI activating mutations), malignant neuroectodermal tumors (EWSR1-ATF1 gene fusions), IMTs (ALK gene rearrangements) and SFTs (STAT6 NAB2 gene fusions).

#### **TABLE OF CONTENTS/OUTLINE**

Introduction, taxonomy, demographics, clinical manifestations, pathological features, Multimodality cross sectional imaging findings on CT, MRI, PET-CT, management, prognosis, conclusion. Entities discussed: Esophageal granular tumor and well- differentiated liposarcoma; distinctive gastric tumors such as synovial sarcoma, IMT, plexiform fibromyxoma, and glomus tumor; smooth muscle tumors, lipomatous/neurogenic tumors, malignant neuroectodermal tumor, Kaposi sarcoma, sclerosing epithelioid fibrosarcoma.

## **GIEE-189 Not Always What It Seems: Exploring Mimickers of Liver Malignancy**

Participants

Kumi Ozaki, MD, PhD, Hamamatsu, Japan (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

· Review of several mimickers of liver malignancy based on characteristic imaging findings. · Comprehension of key clinical and imaging findings that may help distinguishing mimickers from malignant liver lesions.

### **TABLE OF CONTENTS/OUTLINE**

1. Overview of characteristic imaging and clinical features of typical liver malignancy. 2. Overview of mimickers of liver malignancy based on each characteristic imaging findings; patterns of enhancement (early staining and prolonged enhancement, early staining and wash-out, gradual enhancement, peripheral enhancement), fat component, lower ADC values, growth rate, cystic lesion with mural nodule, periportal lesion and so on. 3. Overview of mimickers of liver malignancy in the patients with chronic liver disease or cirrhosis. 4. Overview of mimickers of liver malignancy in the patients with a known malignancy. 5. Undistinguishable mimickers from liver malignancy. 6. Take home points

## **GIEE-19 Precision Medicine and Early Detection of Pancreatic Cancer**

Participants

Linda C. Chu, MD, Lutherville, MD (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

Patients with pancreatic cancer often present with non-specific clinical symptoms and are diagnosed at advanced disease stage. Recent advances in imaging techniques, molecular analysis, and artificial intelligence can lead to earlier detection of pancreatic cancer, which can significantly improve patient outcomes. The purposes of this exhibit are to review the current guidelines in high-risk screening of pancreatic cancer, review the role of liquid biopsy and pancreatic cyst fluid molecular markers in earlier detection, and the potential role of artificial intelligence in automated detection of pancreatic cancer.

### **TABLE OF CONTENTS/OUTLINE**

Current guidelines in high-risk screening of pancreatic cancer. Role of liquid biopsy and pancreatic cyst fluid molecular markers in early detection. Artificial intelligence assisted automated detection of pancreatic cancer.

## **GIEE-190 CT Imaging for Assessment of Hepatic Steatosis**

### **TEACHING POINTS**

1. To illustrate a pictorial review of focal and diffuse steatosis in the liver. 2. To explain the principles of quantitative assessment of liver fat using CT. 3. To review the accuracy of fat quantification by using single-energy CT (including quantitative CT) and dual/multienergy CT. 4. To demonstrate application to visual display of quantitative results.

### **TABLE OF CONTENTS/OUTLINE**

1. Clinical significance 2. Etiology of diffuse fatty liver diseases 3. Beware of localized fat: neoplastic and non-neoplastic lesions 4. CT techniques for quantification. 4-1. Conventional single-energy CT and quantitative CT 4-2. Dual-energy CT a) CT attenuation value b) Fat fraction c) Electron density d) Virtual non-contrast imaging 4-3. Photon-counting CT 5. Visual tools for pre- and post-therapy assessment 5-1. Fat quantification of each liver lobe/segment 5-2. Fat distribution and its statistics

## **GIEE-191 Computer-Aided Diagnosis for Hepatic MRI: What is Needed and Expected**

Participants

Shogo Maeda, Hiroshima, Japan (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

a. As gadoteric acid-enhanced MRI has combined perfusion and hepatocyte-selective properties, it is widely used to detect and diagnose focal hepatic lesions. b. Gadoteric acid-enhanced hepatobiliary phase (HBP) images are highly sensitive for the detection of hepatic lesions. However, small lesions, especially those near hepatic vessels, may be missed because they and the vessels are low signal-intense on HBP images. Computer-Aided Diagnosis (CAD) may be effective, especially for detecting small lesions on HBP images. c. Because many hepatic lesions, benign or malignant, are low signal-intense on HBP images, a differential diagnosis requires comprehensive evaluation with other sequences. CAD can differentiate between benign and malignant lesions by integrating information from EOB-MRI and sequences such as T2- and diffusion-weighted scans. Therefore, CAD is particularly useful for differential diagnosis in a single case of mixed benign and malignant lesions. d. A diagnosis of hepatic lesions is reached by integrating findings from various modalities and clinical information. A CAD that integrates all information is required.

### **TABLE OF CONTENTS/OUTLINE**

a. History and classification of CAD in radiology b. Possibility of CAD for detecting hepatic lesions on MR images c. Possibility of CAD for diagnosis of hepatic lesions on MR images d. Future prospects of CAD for diagnosing hepatic lesions

## **GIEE-192 Update on Histology, Staging, and Treatment of Intrahepatic Cholangiocarcinoma: The Role of the Radiologist**

Participants

Wyanne Law, MD, Unionville, ON (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

1. Describe the morphologic and histopathologic classification of intrahepatic cholangiocarcinoma (ICC) 2. Discuss differential diagnosis of ICC, including hepatocellular carcinoma (HCC), metastasis and benign entities 3. Describe American Joint Committee on Cancer (AJCC) 8TH edition staging for ICC and resection criteria 4. Discuss non-surgical options and recognize response/progression disease and complications

## TABLE OF CONTENTS/OUTLINE

Classification Location: intrahepatic 10% vs perihilar 50- 60% vs distal 20-30% Morphologic: periductal infiltrating, mass forming, intraductal growing-Histopathologic: large duct vs small duct Imaging characteristics of ICC Peripherally enhancing, hypervascular, delayed enhancement Update on staging AJCC 8th edition for ICC TNM Surgical Resection Adequate future liver remnant (FLR) with intact hepatic arterial, portal venous, hepatic venous, and biliary drainage, excluding distant metastases, bilobar tumor and nonregional nodes Chemotherapy Gemcitabine + cisplatin Response: RECIST Immunotherapy TOPAZ-1 trial - Durvalumab -New inhibitors targeting genetic alterations in small duct, Pemigatinib, infigratinib Response: iRECIST-Complications: colitis, hepatitis, pneumonitis, renal failure, myocarditis Hepatic arterial infusion pump Floxuridine-Complications: gastroduodenal artery aneurysm, extravasation from catheter Ablative radiotherapy Complications: Radiation-based liver parenchymal changes (RILD), delayed onset of radiation necrosis Transarterial radioembolization (TARE) Yttrium 90 Complications: Post-radioembolization syndrome, gastroduodenal ulcer, cholecystitis

## GIEE-193 Gastrointestinal Ectopic Pancreas: Cross-sectional Imaging Spectrum and Differential Diagnosis

### TEACHING POINTS

1. Describe the clinical manifestations and the spectrum of cross-sectional imaging findings of the ectopic pancreas (EP) in the gastrointestinal tract. 2. Discuss the diagnosis of the gastrointestinal EP with emphasis to formulate a differential diagnosis for gastrointestinal submucosal tumors.

### TABLE OF CONTENTS/OUTLINE

1. The definition and overview of clinical manifestations of gastrointestinal ectopic pancreas (EP). 2. The pathologic gross manifestation and histological classification of EP. 3. A list of the common morphological manifestations of EP on cross-sectional images including sites and incidences, location, size, shape, contour, margin, attenuation/intensity signals, growth pattern, enhancement pattern, picking out those specific signs which are essential clues to indicate the diagnosis, such as duct-like structure in the lesion, hyperenhancement of the overlying mucosa, central umbilication, perilesional fat or low attenuation. 4. Describe the uncommon findings of EP with a comprehensive case series, including rare histological types and with secondary complications, including pancreatitis, pseudocyst formation, malignant degeneration, gastrointestinal bleeding, bowel obstruction. 5. Differential diagnosis between EP and other gastrointestinal submucosal tumors, such as gastrointestinal stromal tumors (GISTs), gastroduodenal glomus tumors, neuroendocrine tumor, leiomyomas and schwannomas. 6. Summary 7. Suggesting reading

## GIEE-2 Squamoid Cyst of Pancreatic Ducts: Rare Cystic Lesion of Pancreas

Participants

Duygu Cengiz, MD, Istanbul, Turkey (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Develop an awareness of squamoid cyst of pancreatic ducts (SCOP) Learn imaging features of SCOP Compare SCOP to other similar cystic lesions to make differential diagnosis. Discuss relation of SCOP and PDAC

### TABLE OF CONTENTS/OUTLINE

Cystic lesions of pancreas Rare pancreatic cystic lesion: Squamoid cyst of Pancreatic Ducts (SCOP) Pathologic definition of SCOP Misnomer or not: Is SCOP really related to pancreatic ducts? Imaging features of SCOP Differential diagnosis of SCOP Simple Mucinous Cyst (SMC): Is it possible to differentiate SMC from SCOP? SCOP and PDAC: Is there a relation?

## GIEE-20 Distinguishing Inflammatory Conditions from Cancer of the Gastrointestinal Tract: What Radiologists Should Know

Participants

Camila Vendrami, MD, Chicago, IL (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- Review imaging technique to assess gastrointestinal (GI) inflammatory conditions and cancer
- Review and illustrate the typical imaging appearances that allow differentiation of these inflammatory conditions and cancer
- Review and illustrate potential complications from these entities

### TABLE OF CONTENTS/OUTLINE

- Introduction: overview of GI inflammatory conditions and tumors
- Imaging techniques: US, CT, MR including enterography
- Gastric inflammation and gastric tumors
  - o Clinical findings, detection and imaging features to differentiate the entities
- Small bowel enteritis and other small bowel pathology and SB cancers (adenocarcinoma, carcinoid, lymphoma, GIST, metastases etc.)
  - o Clinical findings, detection and imaging features to differentiate the entities
- Diverticulitis and colon cancer
  - o Clinical findings, detection and imaging features to differentiate the entities
- Appendicitis and appendiceal cancers [adenocarcinoma, neuroendocrine (carcinoid), lymphoma and colon cancer associated with appendicitis], endometriosis of appendix
  - o Clinical findings, detection and imaging features to differentiate the entities
- Potential complications such as perforation and fistulas
- Conclusion

## GIEE-21 It's Not Just a Question of Size: Unveiling the Secret World of Abdominopelvic Lymph Nodes for a Proper Radiological Assessment

Participants

Ana Lopes Potente, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Review individual lymph node anatomy, names, and abdominal and pelvic lymph node group locations. Demonstrate through illustrative cases which clues the lymph nodes can reveal to us about diagnostic possibilities.

### TABLE OF CONTENTS/OUTLINE

- Importance of lymph node evaluation. Limitations of size-based evaluation.
- Didactic drawings to review anatomy and pathophysiology.
- Review of updated literature on normal dimensions of lymph nodes.
- Video map to point out nomenclature and

location of abdominal and pelvic lymph node chains, such as (but not limited to) retrocrural, retroperitoneal, gastrohepatic ligament, porta hepatis, celiac and superior mesenteric artery, pancreaticoduodenal, perisplenic, mesenteric, and pelvic nodes. - Demonstration of the main imaging techniques for lymph node evaluation. Importance of adequate protocols. Discussion of benefits and limitations of each method. - Case studies to highlight pitfalls and findings that may simulate lymphadenopathy, such as splenosis, accessory spleen, papillary process of the caudate lobe, vascular anomalies, prominent vascular structures like gonadal veins, and scalloped diaphragmatic crus. Tips to avoid misdiagnosis. - Special cases in which lymph node morphology can point to specific diagnoses. - Importance of lymph node features beyond size in diagnosis. - Exposition of rare cases where lymph node enlargement causes vascular and nervous complications. Discussion of diagnosis and management. - Summary of teaching points.

## **GIEE-22 Spectrum of Heterotopic Ectopic Splenic Conditions**

Participants

Perry J. Pickhardt, MD, Madison, WI (*Presenter*) Advisor, Bracco Group; Advisor, Zebra Medical Vision Ltd; Advisor, Nano X Imaging;

### **TEACHING POINTS**

1. To describe the spectrum of heterotopic and ectopic splenic conditions, including the underlying embryologic basis. 2. To demonstrate the role of cross-sectional and imaging and scintigraphy in asymptomatic detection and symptomatic diagnosis of these splenic-related conditions, through a series of clinical examples.

### **TABLE OF CONTENTS/OUTLINE**

- Introduction- Embryologic development of the spleen o Normal splenic development o Spectrum of abnormal development - Splenic-specific imaging techniques o Nuclear medicine (heat-treated RBC > sulfur colloid scans) o MRI (ferumoxytol) - Heterotopic splenic conditions o Splenules § Pancreatic tail splenules o Splenogonadal fusion § Discontinuous form § Continuous form - Ectopic splenic conditions o Splenosis o Wandering spleen § Incidental asymptomatic detection § Symptomatic torsion o Polysplenia (heterotaxy) § Associated findings- Concluding remarks

## **GIEE-23 Peritoneal Carcinomatosis: The Role of the Radiologist in Selecting Patients for Curative Treatment**

Participants

Alicia Espinal Soria, MD, San Sebastian, Spain (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

To know the different presentations of the peritoneal carcinomatosis in CT. To get familiar with the term Peritoneal Cancer Index and the website used to calculate it "e-Promise". To make a differential diagnosis with the pathologies that may mimic peritoneal implants.

### **TABLE OF CONTENTS/OUTLINE**

Intraabdominal malignancies often spread to peritoneal cavity causing peritoneal carcinomatosis. The most common primary neoplasms are colorectal, small bowel, stomach, ovaries and pancreas. Peritoneal carcinomatosis (PC) may present in CT like ascites, peritoneal thickening, peritoneal nodules or masses, "omental cake" pattern or pseudomyxoma peritonei. This presentation forms in CT are also seen in other pathologies such as peritoneal tuberculosis, acute peritonitis, splenosis, peritoneal lymphomatosis, and peritoneal mesothelioma. Histologic analysis must be made to obtain a definitive diagnosis in doubtful cases. Until recently, PC was considered an end-stage disease where supportive care was the only possible treatment. The cytoreductive surgery (CRS) followed by Hyperthermic intraperitoneal chemotherapy (HIPEC) is a combined treatment that has given a curative option to properly selected patients. It is important to know the most frequent shapes and locations of peritoneal implants to calculate the Peritoneal Cancer Index (PCI) using CT imaging, which is part of the selection criteria. The website "e-Promise.org" is useful to calculate this Index and help the clinician deciding the most suitable treatment for each patient.

## **GIEE-24 Comprehensive Review of Imaging in Pancreatic Transplantation: A Panorama of Good and Bad!**

Participants

Shravya Srinivas Rao, MD, Boston, MA (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

- To learn pancreas transplant- indications, types, surgical procedure- To discuss post-transplant imaging surveillance of pancreas - To review the spectrum of post-transplant complications- visceral, vascular, intestinal\*?aB?e ?? ???te?ts/?t???e 1. Pancreas transplantation procedure- Indications- Types of transplantation (whole organ vs islet cell)- Surgical procedures2. Role of imaging in pancreas transplantation- Preoperative imaging- Imaging modalities- Technique and protocol- Post-operative surveillance3. Imaging manifestations after pancreas transplantation- Normal appearance- Post-operative complications- Differential diagnosis- Radio-pathologic correlation- Pitfalls and challenges

## **GIEE-25 Rectum MRI: Beyond the basics**

Participants

Thiago Jose Pinheiro Lopes, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

- High-resolution MRI is a cornerstone in the evaluation of the rectum, notably for cancer. In the past years, its use has been expanded far beyond TNM staging, enabling post-neoadjuvant therapy follow-up, patient selection for the "Watch and Wait" approach, predicting response to Total Neoadjuvant Treatment (TNT), and much more. - MRI imaging has enabled less invasive treatment approaches, with improved quality of life for patients and similar outcomes, and radiologists should be aware of these developments. - Our purpose is to review emerging applications of rectal resonance in the radiological routine and bring tips for deepening the anatomy of the rectum.

### **TABLE OF CONTENTS/OUTLINE**

1. Introduction. 2. Delving into the anatomy of the rectum. 3. Recognizing post-CRT changes in rectum cancer. 4. Selecting patients for the "Watch and Wait" approach. 5. Using MRI to predict response to Total Neoadjuvant Treatment (TNT). 6. Identifying mucinous tumors. 7. Recognizing mesorectal fascia involvement. 8. Evaluating sphincter invasion in low rectal cancer. 9. Future directions. 10. Take home messages.

## **GIEE-26 Quantitative CT for Diffuse Liver Diseases: Steatosis, Iron, and Fibrosis**

Participants

Perry J. Pickhardt, MD, Madison, WI (*Presenter*) Advisor, Bracco Group; Advisor, Zebra Medical Vision Ltd; Advisor, Nano X Imaging;

### **TEACHING POINTS**

1. To demonstrate the ability of CT to quantify fat, iron, and fibrosis content within the liver, analogous to MRI approaches. 2. Explain the rationale for opportunistic screening at abdominal CT for detecting unsuspected diffuse liver disease, including steatosis, hemochromatosis, and compensated cirrhosis. 3. Describe a battery of CT-based liver biomarkers that can now be obtained in a fully-automated fashion using AI-based methodology.

### **TABLE OF CONTENTS/OUTLINE**

- Overview of diffuse liver diseases o Hepatic steatosis and NAFLD o Hepatic iron overload and hemochromatosis o Hepatic fibrosis and cirrhosis - Quantification methods for hepatic fat, iron, and fibrosis content: o Liver biopsy o Advanced MRI methods o CT-based biomarkers - Opportunistic CT-based screening for diffuse liver disease o Rationale o Manual and automated techniques o Brief review of evidence to date o Pitfalls o Prospects for the (near) future - Concluding remarks

## **GIEE-27 Imaging in HIPEC- All You Need To Know!**

Participants

Shravva Srinivas Rao, MD, Boston, MA (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

Peritoneal malignancies like pseudomyxoma peritonei, metastatic carcinomatosis from colon adenocarcinoma, mucinous carcinomas of ovary, stomach, pancreas etc., can be treated with cytoreduction surgery and hyperthermic intraperitoneal chemotherapy (HIPEC) or early postoperative intraperitoneal chemotherapy (EPIC). Objectives of this exhibit are:- To discuss imaging manifestations of peritoneal malignancies - To review the technique, principles, and complications of HIPEC therapy- To learn the role of imaging in the assessment of HIPEC patients before and after therapy

### **TABLE OF CONTENTS/OUTLINE**

1. HIPEC- technique and principles 2. Peritoneal tumors- classification and imaging features 3. Radiological, surgical and pathological correlation 4. Criteria for CRS and HIPEC- selection of patients for HIPEC 5. Calculation of Peritoneal Cancer Index: principles and method of estimation 6. Imaging in response assessment

## **GIEE-28 Peritoneal Carcinomatosis Versus Primary and Secondary Peritoneal Tumors and Other Traps**

Participants

Ghina Jardali, MD, Villejuif, France (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

• Review of the imaging features of common and uncommon peritoneal diseases, neoplastic (such as pseudomyxoma peritonei) and non-neoplastic, that mimic peritoneal carcinomatosis. • Emphasis on the CT/MRI findings and the additional imaging clues that may allow the radiologist to appropriately narrow the differential diagnosis and, in some cases, make an imaging-specific diagnosis.

### **TABLE OF CONTENTS/OUTLINE**

I. Imaging appearance of peritoneal carcinomatosis II. Imaging clues to the diagnosis of differential diagnosis: a. Secondary peritoneal-based neoplasms i. Pseudomyxoma peritonei b. Primary peritoneal neoplasms i. Malignant peritoneal mesothelioma c. Primary peritoneal mesenchymal tumors i. Gastrointestinal stromal tumor (GIST) with peritoneal sarcomatosis ii. Fibromatosis (Desmoid tumor) d. Non-neoplastic mimics of peritoneal carcinomatosis: i. Mesothelial cysts ii. Cystic lymphangioma iii. Lymphangiomyomatosis iv. Mesenteric fat necrosis / lipophagic granuloma v. Atypical infections: Tuberculosis, Actinomycosis

## **GIEE-29 Gastro-Intestinal Devices: from Esophagus to Anus. Imaging Appearance Review of Common and Less Common GI Foreign Bodies**

Participants

Emre Aslan, MD, Ville Mont-Royal, QC (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

1) Review of imaging appearance of common and less common gastrointestinal (GI) devices. 2) Summarize common device-specific complications. 3) Review of MRI safety profiles for each GI device.

### **TABLE OF CONTENTS/OUTLINE**

1) Introduction: As minimally invasive procedures become more ubiquitous and technology keeps advancing, new GI devices are being used by interventional radiologists and interventional gastroenterologists. 2) Clinical use Radiologists and radiology trainees must stay up to date with new GI devices to recognize and prevent complications whenever possible. Each device's indications, normal imaging appearances, potential complications and MRI safety profiles will be discussed. 3) Endoscopically placed devices esophageal, duodenal, rectal stents, AXIOS stent, and Ovesco device. 4) Surgically placed devices LINX reflux management system, gastric pacemaker, gastric band, Ray-Tec X-rayable sponge and laparotomy sponge. 5) Tubes and balloons Blakemore tube, cecostomy tube, intragastric balloon, and Minnesota tube. 6) Other Amplatzer plug and capsule endoscopy device. 7) Conclusion Summary of key teaching points.

## **GIEE-3 The Washout of Hepatocellular Carcinoma at Portal Venous Phase versus Equilibrium Phase: Radiological and Clinicopathological Implication**

Participants

Kengo Yoshimitsu, MD, PhD, Fukuoka, Japan (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

•To learn that there are two distinct types of hepatocellular carcinoma (HCC) washout to be recognized: one at the portal venous phase (PVP) and the other at the equilibrium phase (EqP). •To learn that these two represents two different phenomena; a dynamic, and a static one, respectively. •To learn that PVP washout is a consequence of rapid hemodynamic change of HCC and background liver (BGL). •To learn that EqP washout represents static condition of contrast medium distribution in the extracellular space of HCC and BGL. •To learn that PVP washout is significantly related to histological grades of HCC, or its status of microvascular invasion. •To learn that EqP washout might be related to immunohistochemical subgroup of HCC.

#### TABLE OF CONTENTS/OUTLINE

1. Basic concept of two types of "WASHOUT" of HCC 2. Washout at PVP: radiological consideration 3. Washout at PVP: clinicopathological implication 4. Washout at EqP: radiological consideration 5. Washout at EqP: clinicopathological implication 6. Washout on dynamic MRI using extracellular contrast medium or gadoxetate 7. Summary

#### GIEE-30 Focal Liver Lesions: A Case-based Quiz

Participants

Laura Cavero Barreras, MD, Ordizia, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- To highlight the importance of the clinical context of patients with focal liver lesions. - To review the typical and atypical imaging findings of focal liver lesions in multimodality imaging techniques through cases studied in our center. - To know the current guidelines and define a practical approach to the radiologic management of liver lesions. - To identify potential pitfalls and key imaging findings to make the correct diagnosis.

#### TABLE OF CONTENTS/OUTLINE

Focal liver lesions represent a widespread, heterogeneous group of disorders that can be benign or malignant, solitary or multiple. Diagnosis is usually challenging as many lesions may mimic each other. Radiologists must consider the appearance and the enhancement pattern of the nodule on different imaging techniques, such as US, CT, and MRI. Moreover, contrast-enhanced US (CEUS) can help to resolve doubts and establish the diagnosis in cases where other imaging techniques do not provide a definite diagnosis. On the other hand, it is necessary to consider the clinical context of the patient, as this will determine the further management of the lesion. This presentation will take the form of a quiz to discuss the typical and atypical imaging findings and the management of focal liver lesions based on current guidelines.

#### GIEE-31 Laxative-free Photon-counting CT Colonography for Colorectal Cancer Screening

Participants

Yasuji Ryu, MD, Kanazawa, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The teaching points of this exhibit are to (1) explain the emerging role of laxative-free CT colonography in colorectal cancer (CRC) screening, (2) explain the role of photon-counting CT in addressing the challenges of conventional CT colonography, and (3) explain the role of artificial intelligence (AI) in unlocking the potential of laxative-free photon-counting CT colonography as a CRC screening test.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction: the importance of CRC screening; the emerging role and challenges of laxative-free CT colonography. 2. Photon-counting CT: benefits over conventional CT; how photon-counting CT addresses the challenges of laxative-free CT colonography. 3. AI enables an effective laxative-free photon-counting CT colonography examination: computer-aided detection; virtual bowel cleansing; risk assessment; putting it all together. 4. What we know and don't know: outcomes from clinical laxative-free CT colonography trials; initial observations from photon-counting CT colonography studies. 5. Summary.

#### GIEE-33 Pancreas Transplantation: What Should the Radiologist Know?

Participants

Ana Berasategui Criado, MD, Santander, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To expose the existing surgical techniques in pancreatic transplantation. To highlight the role of the different imaging tests in graft evaluation. To make a pictorial review of the postoperative complications according to the time after transplantation.

#### TABLE OF CONTENTS/OUTLINE

Pancreatic transplantation is a valid therapeutic option for poorly controlled diabetes mellitus and advanced diabetic nephropathy. Knowledge of the surgical techniques, location of the anastomoses and related complications will assist the radiologist in performing an accurate assessment that leads to adequate management and long-term survival of pancreatic grafts. There are three types of pancreas transplantations regarding the drainage method: systemic venous and bladder exocrine drainage, systemic venous and enteric exocrine drainage, and portal venous and enteric exocrine drainage. Radiological assessment of the pancreas graft is usually multimodal. Ultrasound is the first-line imaging modality for the initial post-surgical evaluation performed within the first 24 hours. CT is preferred if complications are presumed. Postoperative complications include parenchymal, infectious, enteric or vascular disorders, which can be classified according to the time lapse after transplantation in which they occur: immediate (< 24 hours), early (24-72 hours), intermediate (72 hours-weeks) and late (months). We gathered the most illustrative cases of postoperative complications from recent years at our institution to show the key features of imaging that enable rapid and accurate management.

#### GIEE-34 Retrospectively Defined Missed Early Signs of Pancreatic Cancer on CT

Participants

Satomi Kawamoto, MD, Baltimore, MD (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To review cases of missed early pancreatic ductal adenocarcinoma (PDAC) and early changes of PDAC on CT. 2. Small,

isoattenuating PDAC without contour deformity can be easily missed.<sup>3</sup> CT findings to suggest early PDAC include pancreatic duct dilatation with or without abrupt duct cutoff, vascular invasion, focal parenchymal atrophy, and focal enhancement.

#### TABLE OF CONTENTS/OUTLINE

1. Background: Delay in diagnosis can contribute to poor outcomes in PDAC, and imaging plays a crucial role in the diagnosis of early PDAC. 2. Review of cases of missed early PDAC and early changes of PDAC before clinical diagnosis on CT. (1) Small, isoattenuating PDAC without contour deformity. (2) Pancreatic duct dilatation is most common secondary finding (3) Abrupt pancreatic duct cut-off (4) Vascular invasion is not a common finding but high likelihood of missing (5) Parenchymal atrophy (6) Focal enhancement. 3. Cognitive errors (1) Underlying pancreatitis (2) Unexpected finding. 4. Discussion of future direction

#### **GIEE-35 Plan to Scan the Pancreas Transplant: A Sweet Review of Anatomy, Imaging Technique, and Complications**

Participants

Maham Siddique, MD, New York, NY (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Teaching Points: • Pancreas transplant aims to restore normal glycemic control, often in young patients with diabetes and manifesting end-stage renal disease. • Ultrasound is performed to evaluate the pancreas and transplant vessels in the perioperative period. • Ultrasound, CT, and MRI can diagnose transplant-related complications. Common vascular complications include arterial and venous thrombosis and arterial pseudoaneurysm. Transplant pancreatitis has similar complications to inflammation of the native pancreas and can impact the renal transplant. • Radiologists should be familiar with normal pancreas transplant anatomy, vascular and non-vascular complications of pancreas transplants, as early recognition of these entities may improve outcomes.

#### TABLE OF CONTENTS/OUTLINE

Outline: Pancreas transplant background and demographics, Normal pancreas transplant anatomy and surgical technique, Normal transplant evaluation on ultrasound and reporting template, Acute and necrotizing graft pancreatitis, Vascular complications: arterial and venous stenosis and thrombosis, pseudoaneurysm, acute arterial bleeding, Non-vascular complications: Peripancreatic collections, hematoma, post-transplant lymphoproliferative disease.

#### **GIEE-36 Why Oh Y-Grafts: Understanding the Anatomy, Imaging, and Complications of Pancreas Transplantation**

Participants

Melanie P. Caserta, MD, Jacksonville, FL (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Pancreas transplant is the treatment for severe Type I diabetes mellitus complicated by end stage renal disease, poorly controlled Type I or II diabetes, and cystic fibrosis. Pancreas transplantation is most commonly performed simultaneously with kidney transplantation (80%) or following kidney transplantation (16%), and least commonly performed alone. Ultrasound is the first line modality for evaluating the allograft and vasculature and to look for complications. Contrast enhanced ultrasound, CT and MRI can be used as problem solving tools to further evaluate complications. After reviewing this case-based exhibit, the learner will: - Understand indications for pancreas transplantation - Describe the surgical anatomy of pancreas transplants - Describe ultrasound technique for evaluating the transplant pancreas - Recognize complications of pancreas transplant - Determine when additional imaging of the pancreas transplant is needed

#### TABLE OF CONTENTS/OUTLINE

Outline: 1. Objectives 2. Background - Pancreas Transplant a. Benefits of pancreas transplantation b. Review of surgical technique 3. Imaging a. Ultrasound - First line imaging i. Ultrasound protocol ii. Normal appearance iii. Complications 1. Vascular 2. Parenchymal 3. Perigraft 4. Bowel b. Problem solving i. Contrast enhanced ultrasound to assess allograft perfusion and vascular complications ii. CT - peripancreatic fluid collections, suspected intestinal obstruction, multiphase evaluation to assess graft and vasculature iii. MRI - Ferumoxytol MRI to assess transplant vasculature 4. Treatment and Intervention a. Medical b. Ultrasound guided c. Endovascular d. Surgical

#### **GIEE-37 Navigating Through the Esophageal Disorders in Chest CT Scans: What Radiologists Should Know**

Participants

Miguel Barrio Piqueras I, MD, Pamplona, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To know basic anatomy and histology of the esophagus To learn the role of CT imaging in the detection and characterization of esophageal pathology. To recognize the most important imaging findings of non-malignant and malignant esophageal diseases.

#### TABLE OF CONTENTS/OUTLINE

1. Esophageal anatomy and histology 2. Benign esophageal disorders a). Benign esophageal tumors - Leiomyoma - Fibrovascular polyps - Esophageal schwannomas b). Congenital lesions: - Duplication cysts c). Esophageal diverticula - Pharyngo-esophageal junction: Zenker diverticula - Middle esophagus diverticulum - Epiphrenic diverticulum d). Infectious diseases - Candida - HIV - CMV - Herpes simplex virus - Chagas e). Inflammatory disorders - Reflux esophagitis and Barrett's esophagus - Eosinophilic esophagitis (EoE) - Radiotherapy-induced esophagitis - Scleroderma - CREST f). Traumatic and fistulas - Esophageal impaction - Hematoma - Perforation - Actinic - Esophageal-airway fistula - Esophageal mediastinal fistula g). Others - Achalasia - Acute esophageal necrosis (AEN) - Hiatal hernia - Esophageal and para-esophageal varices 3. Primary malignant esophageal tumors a). Squamous carcinoma (SCC) b). Adenocarcinoma c). Lymphoma d). Primary malignant melanoma

#### **GIEE-38 Diffuse and Focal Liver Fat: Pearls and Pitfalls**

#### TEACHING POINTS

To review the imaging features of liver fat in different methods. To discuss and illustrate the main causes and consequences of fatty liver disease, as well as its associated conditions To demonstrate common and uncommon patterns of liver fat distribution and

discuss the underlying pathophysiology. To recognize that classic liver lesions can have different patterns of imaging presentation in the setting of steatosis. To present challenging cases and mimic lesions, highlighting the clues that can be helpful for the correct diagnosis.

#### **TABLE OF CONTENTS/OUTLINE**

Liver fat in different imaging methods (US, CT and MRI). Main findings of several causes of fatty liver disease (alcoholism, metabolic syndrome, chemotherapy, drug toxicity, infection, PCOS). Patterns of liver fat distribution (diffuse, focal, geographic, multinodular, perivascular), including uncommon oncologic and cirrhotic cases. Patterns of presentation of the classic liver lesions in the setting of steatosis (FNH, hemangioma etc). Differential diagnosis between true lesions and pseudolesions.

#### **GIEE-39      Ultrasound Of the Gastrointestinal Tract: Contributions of Ancillary Ultrasound Techniques**

Participants

Nameerah Wajahat, Calgary, AB (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

(1.) Greyscale ultrasound evaluation comprises the fundamental basis of diagnostic evaluation of the bowel in inflammatory bowel disease (IBD) (2.) Wall thickness, inflammatory fat and signal on color doppler imaging (CDI) are the markers which increase in proportion to active inflammation. (3.) Ancillary Ultrasound techniques including: endovaginal sonography (EVS), contrast enhanced ultrasound (CEUS) and shear wave elastography (SWE) contribute greatly to final diagnosis and patient outcome. (4.) EVS provides information about anatomy and pathology in the deep pelvis with high resolution. (5.) CEUS allows for subjective and objective information about blood flow at the capillary level, allowing characterization of inflammatory masses as representative of active inflammation (phlegmon) or abscess formation (liquid pus) (6.) SWE measures bowel wall stiffness aiding with characterization of strictures. Soft inflammatory strictures- medical management. Stiff chronic strictures - surgical management

#### **TABLE OF CONTENTS/OUTLINE**

- Introduction to ultrasound of the bowel with emphasis on greyscale imaging - Ancillary features what are they and what do they do? - Endovaginal Sonography and its role in deep bowel evaluation - CEUS (Contrast Enhanced Ultrasound) and its contribution to activity assessment - SWE (Shear wave elastography) and its contribution to stricture assessment - Change of management with ancillary techniques

#### **GIEE-4      Comprehensive Review of Abdominal Manifestations of Melanoma with Emphasis on Liver Metastasis**

#### **TEACHING POINTS**

The purpose of this exhibit is 1. To review imaging findings of primary and secondary melanoma in the abdomen and pelvis 2. To discuss multimodality imaging of liver metastasis from melanoma 3. To present an imaging atlas of gadoteric acid-enhanced MRI for liver metastasis and to discuss its potential value 4. To discuss surveillance protocols for intraabdominal metastasis of melanoma

#### **TABLE OF CONTENTS/OUTLINE**

1. Clinical aspects of melanoma (1) Epidemiology (2) Staging (3) Treatment and prognosis 2. Primary melanoma in the abdomen 3. Metastatic melanoma in the abdomen (1) Liver (2) Pancreaticobiliary system (3) Gastrointestinal tract (4) Other involvement 4. Multimodality imaging of liver metastasis (1) Ultrasound (2) CT (3) MRI i. Lesion detection and characterization ii. Special considerations for gadoteric acid-enhanced MRI for melanoma iii. MR findings of liver metastasis according to the primary origin of melanoma 5. Surveillance and prognosis (1) Surveillance protocol for metastatic melanoma in the abdomen (2) Prognostic implications of imaging features

#### **GIEE-40      Step-by-step Assessment in Colon Cancer Risk Stratification. Assessment by Virtual Colonography and Dual Energy Support**

Participants

Omar Gamboa Abundis, MD, Ciudad de Mexico, Mexico (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Colorectal cancer represents the third most diagnosed cancer and corresponds to the second cause of death in the world. The recognized precursor lesion is the adenoma, and the risk of malignant transformation is significantly increased. Virtual colonography is a noninvasive screening method for colon cancer and avoids the unnecessary risk of bleeding or perforation present in colonoscopy. Learn to describe and categorize the findings and pitfalls in lesions found during image processing and viewing.

#### **TABLE OF CONTENTS/OUTLINE**

Table of Contents: Teaching points. Introduction. What is CRADS. Virtual colonography acquisition protocol. Image processing and anatomical considerations. Description of the results. CRADS categories. CRADS 1 to 4. Extracolonic findings. E0 to E4. Main pitfalls to consider. Conclusions. References. Outline: Colorectal cancer is the third most common cancer and is the second leading cause of cancer death in the world. It is important to carry out a screening test in patients over 45 years of age and even more so in those who present a high risk of suffering from this disease. Virtual colonography provides an excellent alternative with rapid acquisition protocols and high sensitivity and specificity. Useful in highrisk patients during the colonoscopy intervention, also avoiding the possible risk of perforation and bleeding.

#### **GIEE-41      Deep Learning for Electronic Cleansing in Fecal-tagging CT Colonography**

#### **TEACHING POINTS**

This exhibit reviews the historical perspectives of Electronic Cleansing (EC), the major cleansing artifacts and pitfalls in the conventional deterministic EC methods, the recent technical advances of deep-learning based EC (Deep-EC) methods, comparison between Deep-EC and conventional deterministic EC, and the future trend of Deep-EC development fecal-tagging CT Colonography (CTC). The teaching points of this exhibit are: 1. EC requires accurate classification or segmentation of tagging fecal residuals and their mixtures. Conventional deterministic EC methods exhibit various artifacts and pitfalls. 2. State-of-the-art deep-learning models and training techniques provide an effective solution to reduction of EC artifacts and pitfalls. 3. Intracolonic lumen segmentation (ILS), which combines EC and colon segmentation into a single procedure in the CTC workflow, is a promising Deep-EC method in

CTC.

#### TABLE OF CONTENTS/OUTLINE

1. Review of deterministic EC methods with discussion of the limitations and clinical challenges.2. Describe the challenges of building a large-scale CTC dataset for EC.3. Present recent technical advances of Deep-EC by applying deeper and larger Convolutional Neural Network (CNN) and various model training techniques to reduce EC artifacts.4. Present a cutting-edge Deep-EC procedure, Intracolonic lumen segmentation, built on the two-stream U-Net (BiS-UNet) model.5. Compare the image quality of EC and Deep-EC in 3D visualization of cleansed colon in non-cathartic fecal-tagging CTC.6. Discuss the technique trend and future developments of Deep-EC.

#### GIEE-43 Peribiliary Cystic Lesions: Uncommon Mimickers of Hepatic and Biliary Cystic Lesions

##### TEACHING POINTS

To describe and demonstrate with radiological cases the common and uncommon peri-biliary entities.To identify the imaging features indicative of pathologies of the peri-biliary space and emphasize the radiological differences with hepatic and biliary lesions.To propose a practical systematization in the evaluation of intrahepatic peri-biliary cystic lesions.To suggest a step-by-step guide for clinical-radiological reasoning.

##### TABLE OF CONTENTS/OUTLINE

Intrahepatic peribiliary cystic lesions are usually benign and result from cystic dilatation of tubule-alveolar glands with acini of serous and mucinous cholangio-ctyes with various stages of maturation. The term intrahepatic refers to cystic changes located above the hepatic hilum that have the portal vein, hepatic artery, and portal neurovascular bundle as anatomical landmarks. They are usually multiple, small, thin-walled, serous content, and by definition do not exhibit communication with adjacent bile ducts. They may take on a confluent appearance resembling multiloculated malignancies or even mimic intraductal biliary pathologies. This intrahepatic peri-biliary region is susceptible to several pathologies that include inflammatory, infectious, neoplastic, congenital and acquired nature. The objective of this review is to systematize the evaluation of peribiliary cystic lesions taking into consideration their intrahepatic location and their radiological aspects that may have some peculiar characteristics.

#### GIEE-44 More Than Atlanta... The Entire Acute Pancreatitis Map. A Comprehensive Review Of Acute Pancreatitis Complications

Participants

Lucia Chagas, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

To review the concepts of the Atlanta criteria, both related to the initial diagnosis (edematous interstitial pancreatitis / necrotizing pancreatitis) and their complications (pancreatic pseudocyst / walled-off necrosis). To provide context for other complications of acute pancreatitis, such as thrombosis, pseudoaneurysm, hemorrhage, infection and ductal disconnected syndrome, regarding the associated risk for their development and diagnosis on imaging exams.

##### TABLE OF CONTENTS/OUTLINE

Schematic drawings and computed tomography and magnetic resonance images aimed at understanding imaging findings that precede certain complications, as well as aspects related to their diagnosis. Differential diagnosis approach between edematous interstitial and necrotizing pancreatitis, as well as the complications that may arise from each of them.

#### GIEE-45 LI-RADS Treatment Response Algorithm v2023: Roadmap for Post Radiation Treatment Response

Participants

Aadithya Nalla, Okemos, MI (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

1. The LI-RADS Treatment Response Algorithm (LR-TRA) is a standardized system for assessing and reporting treatment response after locoregional therapy (LRT) for hepatocellular carcinoma (HCC).2. When compared to other LRTs, radiation-based therapies (transarterial radioembolization (TARE) and stereotactic beam radiation therapy (SBRT)) have distinct post-treatment imaging appearances, including persistence of arterial phase hyperenhancement (APHE), which makes response assessment challenging using the current TRAs which use APHE as a surrogate imaging biomarker for viability. Changes in the LR-TRA v2023 are intended to address this challenge.3. This exhibit highlights the updates in the LR-TRA v2023, including the correct application of the new algorithm after radiation therapy to HCC, with the overall objective of improving diagnostic accuracy of post-treatment imaging assessment.

##### TABLE OF CONTENTS/OUTLINE

1. Summarize the role of the TRA in the context of radiation therapy for HCC.2. Case-based and illustrative review of expected imaging features after radiation-based treatments to HCC and identify pitfalls in response assessment.3. Introduce and highlight key updates of the new component of the LR-TRA v2023 pertaining to its application after radiation-based treatments for response assessment using a case-based review.

#### GIEE-46 From Guidelines to Radiology Practice: Navigating the 2023 ASCO Guidelines for Advanced Gastroesophageal Cancer

Participants

Charit Tippareddy, MD, Cleveland, OH (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

1. Discuss new 2023 ASCO guidelines for advanced gastroesophageal cancer therapies2. Radiologic imaging findings related to treatment sequelae3. Differentiate treatment related response versus disease progression on radiologic imaging

##### TABLE OF CONTENTS/OUTLINE

1 Pathophysiology, demographics, risk factors of gastroesophageal cancer2 New 2023 ASCO Guidelines and their implications for

1. Pathophysiology, demographics, risk factors of gastroesophageal cancer2. New 2023 ASCO Guidelines and their implications for treatment3. Imaging modalities used in diagnosis and staging of advanced gastroesophageal cancer4. Role of imaging in staging and management of advanced gastroesophageal cancer5. Demonstrate patient imaging cases that relate to the following:5a. Treatment related effects of immune checkpoint inhibitors5b. Treatment related effects of platinum-based chemotherapy5c. Treatment related effects of fluoropyrimidines5d. Treatment related effects of tyrosine kinase inhibitors5e. Post-radiation effects5f. Post-esophagectomy complications6. Conclusions

#### **GIEE-47 Internalize It!: An Insider's Case-Based Guide to Internal Hernias**

Participants

Collin Edwards, MD, New York, NY (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

- Internal hernias occur due to herniation of viscera, most often small bowel, through the mesentery or peritoneum, and considered in the differential for intestinal obstruction. - Internal hernias are classified by different systems based on distribution of bowel loops in the abdomen and pelvis. - Post-operative internal hernias occur after roux-en-Y anastomosis for gastric bypass and liver transplant. - CT with IV and PO contrast is the imaging modality of choice for evaluating internal hernias. - "Sac-like" appearance of dilated small bowel loops on imaging should raise concern for internal hernia. - Radiologists should have a clear understanding of normal peritoneal anatomy, surgical history, and the characteristic location of common and uncommon internal hernias on imaging.

##### **TABLE OF CONTENTS/OUTLINE**

- Introduction and background - Normal peritoneal anatomy and boundaries - Case-based review, management, and surgical outcome - Paraduodenal hernia - Lesser Sac/Foramen of Winslow hernia - Pericecal hernia - Intersigmoid hernia - Transmesenteric hernia - Pelvic and broad ligament hernia - Post Roux-en-Y hernias: Petersen's, Roux limb mesentery, enteroenterostomy

#### **GIEE-48 Islet Insurgents: A Radio-Pathologic Review of Pancreatic Neuroendocrine Tumors**

Participants

David Mata, MD, Shreveport, LA (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

Purpose/Aim:The goal is to educate the audience in recognizing the multi-modal imaging features of pancreatic neuroendocrine tumors (pNET), with an emphasis on clinical and pathological correlation. We will also elucidate the histopathologic features of pancreatic neuroendocrine neoplasm subtypes.

##### **TABLE OF CONTENTS/OUTLINE**

Content organization:1. Pancreatic Neuroendocrine neoplasm clinical overview. 2. Differentiating syndromic vs nonsyndromic subtypes. 3. Multi-modal radiographic features on Computed Tomography (CT) and Magnetic Resonance Imaging (MRI). 4. Histopathological and gross pathologic characteristics of pNET. 5. Treatment and Prognosis. 6. Summary.

#### **GIEE-49 Have you Ever Seen the Rain? Cross-sectional Imaging of Pancreatic Leak**

Participants

Daniel Cardoso, MD, Fortaleza, Brazil (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

Recognize the pancreatic anatomy and its relation to other structures. Understand what can cause a pancreatic fistula (PF) and its mechanisms . Comprehend the imaging patterns of PF. Recognize the potential pitfalls of PF.

##### **TABLE OF CONTENTS/OUTLINE**

INTRODUCTION: Pancreatic anatomy and relationship with other abdominal structures. Pancreas imaging patterns on Computed Tomography (CT), and Magnetic Resonance Imaging (MRI). Pancreas patterns after surgery (gastroduodenopancreatectomy, and distal pancreatectomy). Epidemiology of PF, and its causes. DIAGNOSIS AND IMAGING FINDINGS: PF - How to identify on CT? How to identify on MRI? How to proceed? Potential pitfalls of PF, don't get caught! SUMMARY AND SYSTEMATIC APPROACH. TAKE HOME MESSAGES.

#### **GIEE-5 Selected Portal Venous Anomalies: An Institutional Multimodality Case-based Review of Portal Varices and Intrahepatic Congenital Shunts**

Participants

Abtin Jafroodifar, MD, Syracuse, NY (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

Review portal venous (PV) varices and aneurysms, including congenital, acquired, true and pseudoaneurysms, with review of extrahepatic and intrahepatic classifications. Learn to properly communicate and report PV varices and aneurysms and their complications such as thrombosis, portal hypertension, or compressive syndromes. Discuss congenital intrahepatic portosystemic shunts subtypes. Review PV embryological development as it relates to a radiologist's practice. Explore the diagnostic clues to recognize PV varices, aneurysms, and intrahepatic shunts using multimodality imaging including ultrasound, CT, MR, and cinematic 3D rendering.

##### **TABLE OF CONTENTS/OUTLINE**

(1)Review normal and variant portal vein anatomy using CT, MR, angiography, and original diagrams. Briefly review portal vein embryological development from the vitelline and umbilical venous systems.(2)Discuss the diagnostic criteria, relevant presentation, and epidemiology of PV varices and aneurysms. Optimal imaging protocols will be outlined.(3)A case-based review of different types of PV varices, including congenital, acquired, and isolated subtypes. Case-based review of intrahepatic portal vein aneurysms and eventual thrombosis.(4)A case-based review of five types of congenital intrahepatic portosystemic shunts classified by Park et al. (AJR, 1990). Present pre- and post closure of a congenital intrahepatic shunt case in a patient with bilateral Wilm's tumors. (5)Present a rare case of splenic vein aneurysm with eventual thrombosis and recanalization using cross-sectional imaging; of note, splenic vein aneurysms are so rare that a true prevalence has not been reported. Discuss mesenteric and splenic vein aneurysms.

## **GIEE-50 Ensuring High-Reliability Anatomic Evaluation for Living Liver Donors Using Multi-Contrast-Agent MRCP**

### Participants

Valerie Khaykin, Ann Arbor, MI (*Presenter*) Nothing to Disclose  
Reve Chahine, MD, Beirut, MI (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Living donor liver transplantation (LDLT) expands access to transplantation but has the challenges of substantial technical complexity and simultaneous risk for both donor and recipient. 2. Precise understanding of the anatomy of the central liver (biliary drainage, hepatic venous drainage, arterial and venous anomalies) and segment 4 is critical to living donor success. 3. Contrast-enhanced MRCP is used to assess anatomy but suffers from suboptimal reliability due to motion artifacts (eg, respiratory motion at MRCP, arterial phase tachypnea with gadoxetate disodium) and technical factors. 4. We implemented a multi-contrast agent MRCP imaging protocol using gadoxetate disodium and gadobenate dimeglumine to enable high-reliability imaging in the arterial phase (gadobenate) and of the bile ducts (non-contrast MRCP + gadoxetate hepatobiliary phase) and prevent the need for repeat or adjunctive imaging (eg, CTA).

### TABLE OF CONTENTS/OUTLINE

1. Background on LDLT 2. Highlight key anatomic considerations for assessing eligibility for donation 3. Targeted review of conventional single-contrast agent MRCP imaging protocols for living liver donor evaluation a. MRCP with extracellular gadolinium-based contrast material b. MRCP with gadoxetate disodium c. Single contrast agent MRCP followed by CTA 4. Demonstration of successful multi-contrast agent MRCP for assessing living liver donor eligibility a. Protocol b. Technical considerations c. Advantages d. Pictorial review e. Limitations

## **GIEE-51 MR Imaging Biomarkers: Can Aggressive Imaging Features of Hepatocellular Carcinoma Predict Early Post-Treatment Recurrence?**

### TEACHING POINTS

1. Hepatocellular carcinoma (HCC) diagnosis and management is almost exclusively imaging based without the need for pathologic confirmation. 2. Certain MR imaging features have shown to be predictive of more aggressive biologic subtypes of HCC, resulting in increased likelihood of early post-treatment recurrence and worse overall survival. 3. In order to optimally treat HCC, it is important to recognize the multifactorial etiology for tumor recurrence and/or progression including a basic understanding of the complex immunologic tumor microenvironment.

### TABLE OF CONTENTS/OUTLINE

1. Review the histopathology of HCC, including the histologic variants using a pictorial representation of the heterogeneity in the histology and biology of HCC. 2. Pictorial review of MR imaging biomarkers predictive of aggressive tumor biology. 3. Review of the hepatic and tumor microenvironment and its role in treatment response after locoregional therapy. 4. Review clinical outcomes after locoregional therapy to HCC by various locoregional modalities with an emphasis on HCC with aggressive pre-treatment imaging features by using a case-based approach. 5. Demonstrate a proposed mechanism to use various MR imaging biomarkers to risk stratify patients with aggressive versus less-aggressive HCC to reduce the chance of early post-treatment progression and improve overall management.

## **GIEE-52 Solid Pseudopapillary Tumors of the Pancreas: Old Friend, New Meme**

### Participants

David Mata, MD, Shreveport, LA (*Presenter*) Nothing to Disclose

### TEACHING POINTS

This educational exhibit will depict typical image findings of solid pseudopapillary tumors (SPT) of the pancreas, with an emphasis of epidemiological, clinical, and pathological correlation. Illustrated as well are common mimics of SPT, including neuroendocrine and malignant tumors of the pancreas. A review of epidemiology and clinical features of SPT. Identify relevant Ultrasound (US), Computed Tomography (CT), and Magnetic Resonance Imaging (MRI) appearances of typical SPT. Correlate morphologic findings with Positron Emission Tomography (PET), pathologic microscopy, and gross surgical specimens. Provide key features to differentiate SPT from other retroperitoneal tumors.

### TABLE OF CONTENTS/OUTLINE

SPT are rare epithelial tumors of exocrine pancreas with low malignant potential and overall good prognosis. Mostly found in young adults and Caucasian women, these tumors are often asymptomatic but can present with abdominal pain and a palpable mass. Since there are SPT mimics, it is important to obtain clinical history and know the epidemiology of SPT. Upon diagnosis, SPT are normally large, circumscribed masses comprised of both solid, hemorrhagic, and necrotic components with no associated ductal dilation. It is important to note, smaller presenting SPT (< 3cm) often have image findings of a solid, homogenous appearance. The intralosomal appearance depends on the degree of hemorrhage, calcification, tumor necrosis, or cystic degeneration. These tumors are commonly found in the body and tail of the pancreas. To avoid erroneous interpretation or delay in diagnosis, appropriate knowledge of SPT imaging patterns and presentations is required.

## **GIEE-53 Mimics of Inflammatory Bowel Disease: Not everything is Crohn's or Ulcerative Colitis**

### TEACHING POINTS

1. Inflammatory bowel disease (IBD; Crohn's disease and Ulcerative colitis) represents a group of diseases characterized by chronic inflammation of the gastrointestinal tract. 2. Patients frequently present with nonspecific symptoms such as abdominal pain, weight loss, diarrhea, nausea, vomiting and obstruction. 3. Various infectious and non-infectious diseases can mimic IBD including malabsorption syndromes, autoimmune diseases, drug-induced conditions, diverticulitis, appendicitis, vascular etiologies and malignancy. 4. Imaging is a crucial tool in identifying IBD mimics as it helps clinicians in making accurate diagnoses and implementing appropriate treatment strategies.

### TABLE OF CONTENTS/OUTLINE

1. Typical imaging characteristics of IBD (Crohn's disease and Ulcerative colitis) 2. Differential diagnoses of infectious causes with

1. Typical imaging characteristics of IBD (Crohn's disease and ulcerative colitis); 2. Differential diagnoses of infectious causes with common imaging features and corresponding cases. 3. Differential diagnoses of non-infectious causes with common imaging features and corresponding cases.

#### **GIEE-54 Unveiling Internal Hernias A Comprehensive Review of CT Imaging Patterns**

Participants

Patricia Dantas I, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

The purpose of this exhibit is: Review peritoneal cavity anatomy with emphasis on the most common internal hernia sites. Discuss the role of computed tomography (CT) in the diagnosis and management of patients. Illustrate imaging patterns of the main types of internal hernia, highlighting the specific characteristics of congenital, oncologic and bariatric surgery cases. Identify key CT features that help differentiate open-loop from closed-loop obstruction and those that may predict ischemic injury of the small bowel loops. Recognize the main differential diagnoses and pitfalls of internal hernias, addressing diagnostic challenges. Propose an algorithm to aid in the interpretation of CT images in cases of intestinal obstruction.

##### **TABLE OF CONTENTS/OUTLINE**

1) Introduction: epidemiology, clinical and pathophysiological aspects of bowel obstruction 2) Role of CT in the evaluation of obstructive acute abdomen, including CT protocol recommendations. 3) Review of peritoneal cavity anatomy: - Main peritoneal spaces; - Ligaments; - Normal recesses and foramina. 4) To demonstrate, through a case-based review, the imaging patterns of the following types of internal hernias: - Paraduodenal Through foramen of Winslow - Intersigmoid - Falciform ligament - Pericecal - Supravesical - Transmesenteric / Transomental - Acquired (postoperative/trauma). 5) To discuss and illustrate major complications of internal hernias: - Ischaemia - Perforation - Illustrative key points. 6) Differential diagnosis and pitfalls. 7) Relevant imaging findings that aid surgical decisions. 8) Algorithm for the diagnosis of internal hernias. 9) Conclusions and "take-home messages".

#### **GIEE-55 Preoperative Assessment in Pancreatic Ductal Adenocarcinoma: Understanding the Impact of Staging and Anatomical Variants on Surgical Planning**

Participants

Davi Romao, MD, (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

It is critical to understand the radiologic features of pancreatic ductal adenocarcinoma and how they affect surgical planning. In this pictorial review, we will focus on the assessment of vascular invasion and its impact on surgical planning. We will also review the major anatomic variants associated with the vascular anatomy of the celiac trunk, superior mesenteric artery and its branches.

##### **TABLE OF CONTENTS/OUTLINE**

1. Review of pancreatic adenocarcinoma staging 2. Assessment of vascular invasion in pancreatic adenocarcinoma 2a. Venous involvement 2b. Artery involvement 3. Anatomical variants 3a. Celiac trunk variants 3b. Superior mesenteric artery variants 3c. Venous variants 4. Surgical Technique 4a. Cephalic pancreaticoduodenectomy 4b. Distal pancreatectomy 4c. Types of venous reconstruction 4d. Celiac axis resection - when is this feasible?

#### **GIEE-56 Learning From Failure: Non-Target Embolization with Yttrium-90 in the Treatment of Hepatic Tumors**

##### **TEACHING POINTS**

1. The role of hepatic trans-arterial radioembolization (TARE) loco-regional therapy is expanding with new applications particularly in earlier stages of disease 2. Optimized TARE workflow involves careful pre-procedural selection, peri-procedural monitoring, and post-procedural evaluation 3. Peri-procedural imaging and dosimetry allows identification of non-target intra- and extra-hepatic dose delivery as well as target dose estimation 4. Identifying potential causes of discordance between Y-90 microsphere delivery and intended target with multi-modality imaging can impact patient outcomes and may be a valuable area of future research

##### **TABLE OF CONTENTS/OUTLINE**

1. Introduction to transarterial radioembolization (TARE) 2. Indications and approaches to Y90 radioembolization in hepatic tumors 3. Workflow and evaluation of Y90 Treatment (Pre-, peri- and post-procedural) 4. Examples of non-target delivery, complications, and clinical outcome based on peri-therapy scans 5. Potential causes of non-target delivery 6. Future directions of research

#### **GIEE-57 Update on Multi Energy CT Applications for Pancreatic Diseases**

Participants

Yasunori Nagayama, MD, (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

Multi-energy CT provides spectral-based imaging such as virtual non-contrast imaging (VNC), virtual monochromatic imaging (VMI), and material density maps, potentially facilitating the optimal lesion assessment and management for patients with pancreatic diseases. The aim of this presentation is to provide the state-of-the-art clinical applications of multi-energy CT technologies for pancreatic imaging by presenting the numerous representative examples.

##### **TABLE OF CONTENTS/OUTLINE**

I. Principle of multi-energy CT technology II. Multi-energy CT systems III. Post-processed spectral CT imaging IV. Clinical applications of spectral imaging in pancreatic diseases A) Improved lesion delineation 1. Iso-attenuating pancreatic ductal adenocarcinoma (PDAC) 2. Incidental PDAC on routine abdominal CT 3. Staging of PDAC on routine portal-venous phase CT 4. Neuroendocrine tumor (NET) 5. Acute pancreatitis B) Spectral-based lesion characterization 1. Chronic mass forming pancreatitis vs. PDAC 2. NET vs. intrapancreatic accessory spleen 3. Local recurrence of PDAC vs. post-operative perivascular fibrosis 4. Pancreatic cyst C) Prediction of clinical outcome 1. Chemotherapy response for PDAC 2. Risk stratification for post-operative pancreatic fistula (POPF) 3. Prediction of future PDAC development D) Improve patient safety by reducing radiation dose and iodine doses

#### **GIEE-58 Gastrointestinal Oncologic Emergencies: A Radiologists' Guide**

Participants  
Mindy Wang, MD, Houston, TX (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Describe the imaging approach for evaluating oncologic emergencies affecting gastrointestinal tract.
- Identify imaging manifestations of gastrointestinal oncologic emergencies.
- Identify potential pitfalls in imaging of gastrointestinal oncologic emergencies.

#### TABLE OF CONTENTS/OUTLINE

- Gastrointestinal oncologic emergencies and imaging approach
- Multimodality imaging features of gastrointestinal oncologic emergencies
  - o Intestinal obstruction
  - o Intestinal ischemia
  - o Intestinal perforation
  - o Intussusception
  - o Inflammatory/infectious changes (including superinfection of tumor necrosis/abscess formation)
  - o Graft versus host disease
  - o Tumor torsion/volvulus
  - o Peritonitis
  - o Lymphatic obstruction
  - o Vascular complications
    - § Hemorrhage (including active extravasation and intramural hematoma)
    - § Thrombosis (microangiopathy, venous and arterial thrombosis or thrombophlebitis)
    - § Arteritis
    - § Aneurysm/pseudoaneurysm
  - o Emergencies related to paraneoplastic syndrome
- Management
- Mimics and potential pitfalls

#### GIEE-59 Hepatic Artery Infusion Pump: A Multi-institutional Comprehensive Case-based Review

Participants  
Harit Kapoor, MD, MBBS, Poughkeepsie, NY (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1) HAIP is a novel surgically placed intraarterial pharmacotherapeutic option with three salient indications: unresectable burden of colorectal liver metastases (CRLM), adjuvant therapy post CRLM resection and in unresectable intrahepatic cholangiocarcinoma (ICC).2) Post-procedure Tc-MAA SPECT are vital to ensure isolated and maximal bilobar hepatic perfusion for safe and efficacious drug delivery.3) Patient selection is multi-factorial including presence of intra- and extrahepatic disease, anatomy and patency of vasculature, hepatic function, extent of prior chemotherapy treatment, and performance status.4) All HAI devices are MRI conditional however the Medtronic Synchronised II device is set to automatically stall while in the scanner and must be interrogated post-scan to assure the motor has restarted.5) HAIP therapy is associated with unique complications, many of which are delayed and unsuspected. Meticulous interrogation of the catheter tip position and a low threshold for further investigations on follow-up imaging can help decrease complication rates.

#### TABLE OF CONTENTS/OUTLINE

1) Role of HAIP therapy for different clinical indications.2) Technical aspects of HAIP placement and trouble shooting in extrahepatic perfusion3) Expected imaging appearances of HAIP devices in both normal and variant anatomic situations4) Role, interpretation and management implications of Tc-MAA SPECT pump perfusion imaging5) Tabulated overview and Case-based examples of HAIP complications (Pump pocket-related, Catheter-related and Hepatobiliary).6) Summary

#### GIEE-6 Improving the Gall Stone Detectability by Using the Monochromatic Images with a Fast kVp-Switching Single-Source Spectral Computed Tomography: A Phantom Experiment with Gall Stone Specimen

#### TEACHING POINTS

1. In the conventional polychromatic (kVp) scan mode, gall stones detectability such as the cholesterol, pigment, and rare were lower because the small difference of computed tomography (CT) value (hounsfield unit: HU).2. Nowadays, with the application of fast kVp switching single source dual energy scan, its spectral mode enables the ability to reconstruct monochromatic images at different energy level. The purpose of this study is to compare the gall stones detectability between the dual energy scan mode and conventional polychromatic scan mode during a phantom study. 3.The monochromatic display method (cine display mode and spectral HU curve) with dual energy scan mode was possible for improving the detection of various gallstones compare with the conventional polychromatic scan mode (kVp).

#### TABLE OF CONTENTS/OUTLINE

CONTENT ORGANIZATION 1: Clinical case (Cholelithiasis) :MRI and CT images 2: Gall stone specimens :dual energy CT scan mode images(keV) and conventional scan mode images (kVp). 3: Spectral HU curve 4: Gall stone specimens (cholesterol): cine display mode 5: Clinical case (Cholelithiasis): performed dual energy CT

#### GIEE-60 A "Cyst"ematic Approach to Cystic Pancreatic Lesions

#### TEACHING POINTS

The target audience of this educational activity is for all radiologists who read CT or MR imaging of the abdomen.1. Demonstrate multimodality imaging features and patterns of common cystic pancreatic lesions2. Illustrate a systematic approach to distinguishing between pancreatic cystic lesions3. Review case-based clinical management including histopathologic correlation

#### TABLE OF CONTENTS/OUTLINE

Content: A systematic multi-modality imaging review of pancreatic cystic lesions will be included including an explanation for key diagnostic features, differentiation between lesions, histopathologic correlation, and review of management.The case selection includes:1. Mucinous cystic neoplasms2. Serous cystadenomas3. Solid pseudopapillary epithelial neoplasms4. Intraductal papillary mucinous neoplasms5. Cystic neuroendocrine tumors6. Sequela of pancreatitis (pseudocysts and walled off necrosis)

#### GIEE-61 Exploring the Uncommon: Lesser-Known Abdominal Syndromes and Their Presentation

Participants  
Priyanka Prajapati, MBBS, Cleveland, OH (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Teaching Points1. Illustrate rare abdominal syndromes with clinical and radiological features.Highlight the constellation of associated findings and complications.3. Emphasize the importance of a multimodality approach when diagnosing rare abdominal syndromes.

## TABLE OF CONTENTS/OUTLINE

Table of contents  
1. Background  
2. Normal anatomy relevant to the syndromes  
3. Importance of Pathology, Molecular tests, Imaging, Laboratory tests  
4. Case based illustrations of:  
a) TEMPI Syndrome  
b) Abernethy Syndrome  
c) DRESS Syndrome  
d) Li-Fraumeni Syndrome  
5. Classical clinical presentation and laboratory findings  
6. Pertinent Imaging findings of the syndromes  
7. Associated pathologies found  
8. Other Rare Abdominal Syndromes

### GIEE-62 Imaging Overview of Peritoneal Mesothelioma

Participants

Suren Reddy Satti, Preston, United Kingdom (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

A comprehensive overview of peritoneal mesothelioma with a focus on the histological subtypes, key distinguishing imaging features and understanding the common pitfalls involved in diagnosis.

## TABLE OF CONTENTS/OUTLINE

The aim is to improve understanding of peritoneal mesothelioma and the subtypes to aid with diagnosis and subsequent management. We present a radiological case-based review of the subtypes of peritoneal mesothelioma with accompanying histological and intra operative findings. Clinical features along with specific imaging findings for each subtype will be shown along with some pitfalls in interpretation. Subtypes of peritoneal mesothelioma: 1. Multicystic mesothelioma 2. Well differentiated papillary mesothelioma 3. Epithelioid mesothelioma 4. Sarcomatoid mesothelioma 5. Biphasic mesothelioma  
Mimics of mesothelioma - Lymphangioma - IgG4 peritoneal disease - Tuberculosis

### GIEE-63 Burn the Cake: The Role of HIPEC in Pseudomyxoma Peritonei

Participants

Vitor Bichuette, MD, Uberaba, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

? To review concepts involving epidemiology, imaging findings and surgical techniques used in the treatment of pseudomyxoma peritonei (PP). ? To illustrate the use of peritoneal cancer index (PCI) to assess the peritoneal cavity. ? To review how hyperthermic Intraperitoneal chemotherapy (HIPEC) is performed, the techniques involved, indications and contraindications, and related complications. ? To discuss how radiologists can help surgeons in the management of PP.

## TABLE OF CONTENTS/OUTLINE

- Introduction - General concepts
  - o The use of CT to assess the PCI
  - Pseudomyxoma peritonei:
    - o Definition, clinical presentation, imaging features and treatment.
    - o Imaging aspects of peritoneal pseudomyxoma and peritoneal carcinomatosis: how to differentiate
    - o Surgical treatment
  - HIPEC:
    - o A step-by-step explanation of how HIPEC is performed.
    - o Advantages, indications and contraindications.
    - o Most common outcomes and complications.
  - Case-Based Review:
    - o Sample cases explaining and demonstrating image findings of PP and how CT can be used before and after the surgery
    - o Assessment of PCI
    - o HIPEC: normal and abnormal findings
  - Future Directions: new perspectives in the use of HIPEC to treat peritoneal tumors.
  - Conclusion and key takeaways.

### GIEE-64 Sonazoid-Enhanced Ultrasonography: What Can We Do in Abdominal Radiology and Intervention?

Participants

Jae Woong Choi, MD, PhD, Seoul, Korea, Republic Of (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Sonazoid-enhanced ultrasonography (SEUS) is recently introduced contrast-enhanced ultrasonography using Sonazoid (GE Healthcare) offering the vascular phase and the unique post-vascular Kupffer phase for helping diagnose focal liver lesions (FLL). Its role has been primarily focused on differentiating benign and malignant FLLs. However SEUS can be used in diverse clinical settings such as evaluating the hepatic vasculature, and a guiding tool for interventional procedures of the liver. In conclusion, we believe that CEUS can be applied to diverse clinical settings, not only for the diagnostic purposes but also for the interventional procedures as an excellent guiding tool.

## TABLE OF CONTENTS/OUTLINE

1) Physics of SEUS, 2) Diagnostic roles of SEUS, 3) Application of SEUS in evaluation of hepatic vasculature, 4) Introduction of SEUS during liver biopsy, 5) SEUS as a guidance tool for radiofrequency ablation, 6) Tips and limitations of SEUS.

### GIEE-65 Fundamental of Pancreatic Adenocarcinoma Imaging on CT: What a Resident Should Know

Participants

Carlos M. Campana SR, MD, CDMX, Mexico (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Review the anatomy of the pancreas, its vasculature and lymphatic drainage.  
- Illustrate the CT features of pancreatic adenocarcinoma.  
- Understand the staging of the pancreatic adenocarcinoma and the surgical criteria.

## TABLE OF CONTENTS/OUTLINE

- Introduction.  
- Anatomic considerations.  
- Teaching points.  
- CT features of pancreatic adenocarcinoma.  
- Case based approach.  
- Staging and surgical criteria.  
- Conclusions.

### GIEE-66 Fake Liver Lesions: Can You Help Me? An Illustrative Guide to Liver Pseudo-lesions and Tumor Mimickers

Participants

Roberta Sasso, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Review importance of epidemiology for diagnosis of liver lesions. Illustrate clinical and imaging findings that might help distinguishing benign and malignant liver lesions. Practical tips and imaging features that could help achieve an accurate diagnosis and avoid unnecessary procedures. Highlight potential pitfalls related to different treatments that may mimic liver lesions.

#### TABLE OF CONTENTS/OUTLINE

Introduction - General concepts: epidemiology of liver lesions, including risk factors, incidence, and mortality. Imaging findings on CT and MRI of several liver lesions. Liver lesions: illustrative cases of different benign hepatic lesions and pseudolesions that mimic malignant hepatic lesions. Pitfalls: expected post-treatment changes that might be confused with true lesions. Normal findings after surgery, transplant, ablation, embolization, radiation and immunotherapy are reviewed. Case-Based Review: series of cases demonstrating imaging findings of liver lesions and how different modalities can be used. Conclusion and key takeaways.

#### GIEE-67 Imaging Review of Pseudomyxoma Peritonei

#### TEACHING POINTS

Comprehensive radiological overview of pseudomyxoma peritonei (PMP), and its patterns of disease spread. Common appearances of appendix mucinous tumours and frequently encountered interpretation pitfalls leading to misdiagnosis.

#### TABLE OF CONTENTS/OUTLINE

Diagnosis of PMP is often delayed in the non-specialist setting due to minimal exposure to appendix tumours and a lack of awareness. The aim is to improve the knowledge of pseudomyxoma peritonei and aid in the radiological diagnosis through understanding of its various aetiologies and the common pitfalls in imaging diagnosis. We present a case-based exhibit of PMP with reference to histology and intra-operative findings. To include: • Common radiologic findings at presentation, predominant patterns of disease spread and complications of PMP with key review areas when reporting. • Examples of delayed diagnosis from misinterpretation with tips and tricks to aid with accurate diagnosis. The cases include: o Primary appendix tumours, misdiagnosed as an abnormal ovary or fallopian tube. o Krukenberg tumours reported as a primary ovarian tumour. o Diffuse peritoneal disease with a primary appendix tumour (initially not identified). o Complicated appendicitis with an underlying tumour. • Other origins of pseudomyxoma other than the appendix, such as urachus and mature teratoma of the ovary. • How to optimize imaging to aid with diagnosis, utilizing positive oral contrast in computed tomography (CT) imaging of pseudomyxoma peritonei, use of MRP re-formats and MRI protocols.

#### GIEE-68 Role of Radiological Imaging in the Diagnosis and Management of ERCP Complications

#### TEACHING POINTS

- What is Endoscopic Retrograde Cholangiopancreatography (ERCP), and in which situations is it performed?
- What are the complications of ERCP and how often do we encounter them?
- Diagnosis of ERCP complications with the help of imaging methods. Tips for radiologists
- The importance of imaging methods in the early diagnosis of complications
- The role of imaging in management of complications

#### TABLE OF CONTENTS/OUTLINE

Table of Contents • Terminology and anatomy of the bile ducts and pancreatic duct • Post-ERCP expected imaging findings • Complications of ERCP • Demonstration of pathologies in imaging methods for the diagnosis of complications • The importance of early diagnosis in case of complications and correlation of imaging finding with clinical symptoms and signs • Demonstration of possible complications with sample cases • Follow up imaging findings during the treatment process of patients with complications

Outline • Endoscopic retrograde cholangiopancreatography (ERCP) is an application that is increasingly used to treat biliopancreatic disorders. This situation leads to a rise in the number of cases with complications. • It is important to distinguish between expected findings and pathological findings in post ERCP images. • It is important to evaluate the history and physical examination together with imaging methods for early diagnosis of complications and to decrease morbidity. • Imaging methods play a guiding role in the classification of complications.

#### GIEE-69 Multimodality Imaging in the Detection and Characterization of Anatomic Variants, Benign, and Malignant Conditions of the Peri-Ampullary Region

Participants

Kelvin Cortis, FRCR, Msida, Malta (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To illustrate the conventional and variant anatomy of the ampullary and periampullary region. To provide a structured differential of the various conditions that may present at the ampullary and peri-ampullary regions. To describe the imaging features of pathologies at these regions.

#### TABLE OF CONTENTS/OUTLINE

The periampullary region is an anatomically and pathologically complex region. It encompasses the pancreatic head, second part of the duodenum, pancreatico-biliary junction, and associated neurovascular structures. All these structures are within a 2cm radius from the major duodenal papilla. Familiarity with this area and its variants will increase diagnostic accuracy and recognition of associated complications, thereby guiding proper management. This pictorial exhibit will display the multimodality imaging findings of developmental, benign, and neoplastic entities that may arise at the ampullary and peri-ampullary regions. Developmental entities include duodenal webs, pancreas divisum, pancreaticobiliary malunion, and annular pancreas. Para-duodenal pancreatitis, papillitis, Lemmel's syndrome, choledocholithiasis, and vascular abnormalities, are benign conditions that might involve the ampullary region. Neoplastic conditions that can involve the periampullary region include ampullary carcinoma, periampullary duodenal carcinoma, pancreatic tumours, distal common bile duct tumours, gastrointestinal stromal tumours, and neuroendocrine tumours. Abdominal radiologists should have a thorough anatomical understanding of the ampullary region in order to formulate a structured differential diagnosis that will lead to timely and precise diagnosis and management.

#### GIEE-7 Anorectal Fistula - Detection, Classification, and Post Treatment Follow-up

Participants

Joseph Owen, MD, Lexington, KY (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Identify and describe anorectal fistula based on the Parks classification system on MR2. Explain the options for treatment of anorectal fistula and associated complications based on their classification3. Recognize and describe the post treatment appearance of anorectal fistula and abscesses on CT and MR

#### TABLE OF CONTENTS/OUTLINE

The predisposing factors for development of anorectal fistula: Crohn's Disease; Prior pelvic radiation; Obstetric injuries; Infection; Foreign body insertio; MalignancyDiagnoses and characterization: MR; Exam under anesthesiaClassification of anorectal fistula with the Parks classification Inter-sphincteric; Trans-sphincteric; Supra-sphincteric; Extra-sphinctericClassification of Anorectal Abscess: Ischiorectal; Inter-sphincteric; Supra-levator; HorseshoeTreatment Abscess- Incision and drainage; Simple fistula - Primary fistulotomy; Complex fistula - Sphincter-sparing staged treatmentPost-treatment imaging appearance and characterization Seton; Endoanal advancement flap; Residual scar tissue; and inflammation; Recurrent fistula; Recurrent abscess

#### GIEE-70 **Advanced Pancreatic Imaging: 10 Tips and Tricks**

Participants

Mariana Peleja, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Pancreatic ductal adenocarcinoma (PDAC) and other pancreatic conditions can be very difficult to diagnose and be a real challenge even to an experienced radiologist.The purpose of this exhibit is to present, through a serie of challenging cases, the direct and indirect signs of focal and diffuse pancreatic disease, and how can the radiologist help to establish the correct diagnosis using different imaging methods, such as Ultrasound (US), Computed Tomography (CT), Magnetic Resonance Imaging (MRI) and Positron Emission Tomography (PET) CT. Some of the presented tips include:- Careful evaluation of main pancreatic duct or biliary tree dilation;- Importance of the T1-weighted images to evaluate the pancreatic parenchyma;- Look for asymmetrical parenchyma atrophy;- Pay attention to abnormalities involving the surrounding vessels;- Search for secondary lesions if uncertain about malignancy (such as liver and lymph nodes).

#### TABLE OF CONTENTS/OUTLINE

- Cases of pancreatic neoplasms and inflammatory conditions, with subtle findings that should raise a suspicion for a pancreatic disease;- Brief Review of pancreatic anatomy with multimodality imaging;- Image assessment of PDAC, with its features spectrum and tricky findings;- Importance of imaging for staging and resectability evaluation;- Other challenging cases in pancreatic cancer imaging, which the radiologist expertise is crucial to the correct management of disease.

#### GIEE-71 **Peritoneal carcinomatosis: A Comprehensive Review of Peritoneal MRI. Primer for Residents**

#### TEACHING POINTS

Peritoneal carcinomatosis is a common metastatic manifestation in several malignancies, with a higher incidence in gastrointestinal and gynecological tumors. Imaging techniques are essential in assessing the extent of the disease and guiding treatment decisionsPeritoneal MRI is a noninvasive technique that provides high-quality imaging of the peritoneum with excellent soft tissue contrast and high spatial resolution, with no exposure to ionizing radiation. Specific imaging protocols with DCE and DWI sequences allow a better assessment of peritoneal disease, especially unfavorable sites such as mesenteric and intestinal involvement, with enhanced sensitivity for detecting small lesionsClinical applications of peritoneal MRI include diagnosis, staging, and monitoring of peritoneal metastases, with a crucial role in guiding therapeutic strategies and prognostic utility in patients undergoing cytoreductive surgery or HIPECThe "PAUSE" method offers a structured approach to reporting peritoneal involvement, providing a precise description of the location and extent of the disease, serving as a road map for the surgeon and facilitating surgical planning.

#### TABLE OF CONTENTS/OUTLINE

Introduction: Peritoneal metastases and diagnostic challenges. Advantages over CT and PET/CT. Peritoneal MRI: Dedicated protocol. Clinical applications: Diagnosis, staging, and monitoring of peritoneal metastases. Advantages and limitations. The "PAUSE" method: A structured reporting tool. Case examples. Conclusions. References

#### GIEE-72 **Photon-counting CT: Technical Features and Clinical Impact on Abdominal Imaging**

Participants

Hirimitsu Onishi, MD, PhD, Suita, Japan (*Presenter*) Research Grant, General Electric Company;Speakers Bureau, General Electric Company

#### TEACHING POINTS

The photon-counting CT system is equipped with a photon-counting detector that can measure the number of photons and the energy of each photon, allowing the acquisition of images with high spatial resolution and virtual monochromatic contrast. One of the major advantages of photon-counting CT in abdominal examinations is that it provides virtual monochromatic images with high image quality and high spatial resolution. The purpose of this presentation is: 1. To illustrate the technical features of photon-counting CT system compared with conventional CT system with energy integrating detector, 2. To introduce the effective use of photon-counting CT for the evaluation of abdominal diseases, and 3. To discuss the clinical impact of photon-counting CT on the diagnosis of abdominal diseases.

#### TABLE OF CONTENTS/OUTLINE

1. Technical overview of photon-counting CT; 2. Scan modes; ultra-high resolution mode, multi-energy mode, and dual source mode; 3. A variety of image reconstruction kernels; 4. Quantum iterative reconstruction algorithm; 5. High spatial resolution; 6. Valuable virtual monochromatic imaging; 7. Possibility of radiation dose reduction; 8. Scanning protocols optimized for the abdominal diseases; 9. Clinical implications for the diagnosis of abdominal diseases; 10. Summary

## **GIEE-73 Pearls and Pitfalls of Rectal MRI: The Only Stool You Need**

Participants

Hala Khasawneh, MBBS, Rochester, MN (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

Highlight essential imaging findings in staging. Illustrate essential key points and common pitfalls to serve as a guiding tool for radiologists through an interactive approach. Overview of current treatment options including surgical and nonsurgical approaches, such as "watch and wait" will be discussed.

### **TABLE OF CONTENTS/OUTLINE**

Over the past few decades, rectal MRI has created a paradigm shift in the management options of rectal cancer by providing accurate TNM staging and restaging as well as post-treatment assessment. However, a few controversies remain in reporting TNM staging for rectal cancer which radiologists need to be aware of to provide more reproducible and standardized reporting. The benefit of rectal MRI in guiding disease management relies on obtaining high-quality scan for accurate TNM staging, assessment of Circumferential Resection Margin, Extramural Vascular Invasion, anal canal involvement and tumor relation with surrounding pelvic structures. Using an evidence-based approach, we aim to clarify controversial key points in reporting rectal MRI, including staging of T4b tumor, utilizing diffusion weighted imaging in restaging, evaluation of mucinous lesions, differentiating lymph nodes from tumor deposits, and morphological assessment and localization of lateral pelvic lymph nodes in staging and restaging. Rectal MRI is essential for tailoring treatment plans in rectal cancer. Therefore, it is paramount to have standardized and reproducible interpretation of scans to enhance consistency in disease staging.

## **GIEE-74 The Magic Eye: Advantages of Spectral CT Imaging over Conventional CT in Liver and Pancreatic Pathology**

Participants

Antonio Michael-Fernandez, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

- To review the most important spectral CT reconstructions for abdominal imaging and the improvement in material differentiation with this technique. - To show Spectral CT imaging advantages over conventional CT through some cases of liver and pancreatic pathologies.

### **TABLE OF CONTENTS/OUTLINE**

Background: Spectral CT is gaining increasing clinical importance with multiple potential applications including abdominal and oncology imaging. We present different cases with liver and pancreatic pathologies where spectral CT images offer multiple advantages over conventional CT, as low-energy virtual monoenergetic images and iodine maps for the detection of hyper- and hypovascularized liver lesions. The purpose of this review is to provide an overview of potential useful abdominal applications of spectral CT focused on liver and pancreatic pathology. Details of content: We present different types of cases (such as characterization of liver and pancreatic lesions, improving vascular contrast for surgical planning or evaluation the response of tumour therapy) and review and analyze the most important spectral CT reconstructions for each case (virtual unenhanced, iodine maps and virtual monochromatic reconstructions). These reconstructions allow better detection and characterizations of findings and reduce the need for correlative or follow-up imaging. Conclusion: Spectral CT imaging offers multiple advantages in the abdominal area. The combination of different types of spectral reconstructions improves better detection and characterization of liver and pancreatic lesions. It also allows precise treatment planning and could be a potential therapy monitoring parameter.

## **GIEE-75 Going, Going, Gone: Case-Based Review of Sclerosing Hemangiomas**

Participants

Bryson Jones, BS, Georgetown, KY (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

1) Hepatic hemangiomas are the most common benign neoplasm encounter in the liver and most are discovered incidentally. 2) The appearance of hemangiomas may change over time and may be influenced by senescent changes of the liver or diffuse disease of the surrounding hepatic parenchyma. 3) Hemangiomas undergoing degeneration has been described as sclerosing/sclerosed, hyalinized, or thrombosed and present a diagnostic dilemma for radiologist 4) Understanding the imaging appearance and crucial importance of prior comparative imaging is key to making the diagnosis and avoiding unnecessary additional imaging and invasive procedures.

### **TABLE OF CONTENTS/OUTLINE**

I. Briefly review the classic appearance of hepatic hemangiomas, incidence and natural history, as well as illustrative pathological changes that are proposed to occur as hemangiomas sclerosed. II. Propose a diagnostic algorithmic approach to a suspected sclerosing/sclerosed hemangioma. III. Provide case-based imaging examples of hemangiomas as they evolve over time, including US, CT, MRI and CEUS. IV. Provide case-based imaging example of pitfalls in attempting to prospectively diagnose sclerosing hemangiomas.

## **GIEE-76 Pitfalls of Contrast-enhanced Ultrasound (CEUS) in Liver Lesions: Early Arterial Enhancement Patterns and Washout**

Participants

Elhamy Heba, MD, MD, Lexington, KY (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

1. Understand the utility of CEUS in a patient population in which CT and MRI contrast agents are contraindicated. 2. Discuss different enhancement patterns of benign and malignant liver lesions. 3. Explain pitfalls in interpreting washout (most associated with malignancy) including understanding true intravascular nature of microbubbles contrast agent and that additional factors related to technique can lead to early bubble rupture and appearance of false washout in benign lesions. 4. Discuss possible pathophysiology of earlier rupture of the microbubbles in benign subcapsular liver lesions compared to lesions located deeper in the

liver.5. Discuss potential false positive washout scenarios in benign liver lesions on a background of hepatic steatosis due to echogenic liver parenchyma resulting in lesion appearing relatively hypoechoic compared to adjacent liver parenchyma.

#### **TABLE OF CONTENTS/OUTLINE**

1. Overview: review of the utility of CEUS and mention the advantages, disadvantages and indications in liver imaging.2. Understanding the mechanism of CEUS agent (microbubbles), explaining how that might contribute to false washout in different circumstances.3. Different enhancement pattern of benign and malignant liver lesion with emphasis on washout as an important feature to suggest malignancy of liver lesion.4. False washout in benign liver lesions as a pitfall of CEUS, case-based approach.5. True washout in cases of hepatocellular carcinoma, metastases, and cholangiocarcinoma for comparison.

#### **GIEE-77 Imaging Evaluation in Living Liver and Kidney Donors: What to Report**

Participants

Thamy Carvalho, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

1- Illustrate the main imaging standards in the pre-transplant evaluation of live liver and kidney donors through conventional radiology images, such as computed tomography (CT) and magnetic resonance imaging (MRI), from the digital archive of our institution.2- Improve the understanding of vascular variants (arterial and venous) and their implications in the pre-renal and liver transplant evaluation of potential living donors using a didactic approach, through illustrations.3- Evaluation of donors' pre-transplant images, understanding the procedure and identification of anatomical variants that may interfere with the surgical technique, in addition to possible pathologies that may prevent a possible transplant.4- Describe and prepare a structured report of the main findings that may contraindicate the candidate for transplants, in addition to assisting in the surgical technique to be performed.

#### **TABLE OF CONTENTS/OUTLINE**

1 - Review of vascular variants, pathologies and anatomical reconstructions of candidates for pre-transplantation of live liver and kidney donors through illustrative images.2 - Illustration of vascular variants and pathologies supported by the use of illustrative images that may imply or prevent transplantation.3 - Preoperative knowledge of hepatic and renal vascular anatomical variants is mandatory for surgical planning and to help reduce postoperative complications. This information must pertain to the structured report.4 - Summary and messages to take home.

#### **GIEE-78 The Many Faces of FNH: MRI Findings**

Participants

Enzo Casali SR, MD, Buenos Aires, Argentina (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Describe the typical presentation of FNH. Analyze uncommon MRI findings in FNH. Evaluate the importance of liver-specific contrast agents in achieving correct diagnosis.

#### **TABLE OF CONTENTS/OUTLINE**

Focal nodular hyperplasia (FNH) is the second most common benign liver tumor after hemangioma. Magnetic Resonance (MRI) is an extremely useful tool for the diagnosis of FNH due to its high sensitivity and specificity. The correct diagnosis of FNH and its distinction from other differential diagnoses is essential because asymptomatic patients with FNH do not require treatment. FNH is classified as classic or nonclassic and MRI findings vary according to this. Lesions typically shows iso or hypointense signal on T1-weighted images, slightly hyper or isointense signal on T2-weighted images, an hyperintense central scar on T2-weighted images, an intense homogeneous enhancement during the arterial phase of gadolinium-enhanced imaging and enhancement of the central scar during later phases. Other more infrequent findings are: increase in size, T1 hyperintensity, the presence of a pseudocapsule, the appearance of multiple HNF all at once and the association with other benign liver lesions. Using liver-specific contrast agents may facilitate the diagnosis in these cases. Recognizing these different MRI patterns allows us to establish a correct diagnosis of FNH, preventing treatment in asymptomatic patients.

#### **GIEE-79 Abbreviated MRI Techniques for HCC Screening**

Participants

Diana Kadi, MD, Durham, NC (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

1. US has low sensitivity for HCC, especially in early-stage tumors, cirrhosis and obesity. 2. To improve sensitivity over US for early detection of HCC, while remaining cost-effective, Abbreviated MRI (AMRI) protocols have been developed. 3. This exhibit will review emerging concepts in AMRI-based HCC surveillance, including technical aspects, diagnostic performance, current gaps in knowledge, and future directions.

#### **TABLE OF CONTENTS/OUTLINE**

1. Current guidelines for HCC surveillance 2. Limitations of US 3. CT and MRI a. Superior reported diagnostic sensitivity, especially for small and early HCC b. Limitations 4. Three general AMRI approaches a. Non-contrast AMRI i. Technique o T1 weighted imaging a. Low sensitivity for early-stage HCC o T2 weighted imaging a. Help differentiate suspicious/benign lesions b. Low sensitivity for small HCC o Diffusion weighted imaging a. Restricted diffusion favors malignancy b. Higher lesion conspicuity ii. Reporting iii. Advantages iv. Disadvantages b. Dynamic AMRI i. Technique o Pre-contrast o Arterial phase a. Assess APHE o Portal venous and delayed phases a. Washout b. Capsule ii. Reporting iii. Advantages iv. Disadvantages 5. Hepatobiliary Phase AMRI a. Technique i. Hepatobiliary phase imaging o High liver to lesion contrast ii. T2 weighted imaging o Excludes some benign lesions iii. DWI o Mixed data regarding benefit of DWI b. Reporting c. Advantages d. Disadvantages 6. Gaps and current needs a. Prospective studies are needed to implement AMRI in guidelines b. Current utilization should be in patients whose US-based HCC surveillance is compromised SUMMARY AMRI is a high-sensitivity alternative to US for surveillance of early-stage HCC in patients at risk for HCC.

#### **GIEE-8 Intrahepatic Cholangiocarcinoma: A Review of Current and Emerging Imaging Techniques and Treatment Options**

Participants

Julia Saltalamacchia, MD, Portland, OR (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Intrahepatic cholangiocarcinoma makes up a small percentage of total CCA cases, but treatment and surgical options differ from extrahepatic cholangiocarcinoma. 2. Improvements in MRCP imaging and PET/MRI serve as complimentary modalities to standard MR and CT imaging for staging, problem solving, and follow up. 3. Recent developments in systemic and locoregional therapies have expanded treatment options and therapy considerations including radiation therapy, interventional oncology, expanded neoadjuvant therapies, and expanded surgical resectability (including transplantation)

#### TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Intrahepatic cholangiocarcinoma work-up a. NCCN guidelines 3. Imaging considerations a. Characteristic findings b. Mimics and pitfalls c. The emerging role of FDG PET MRI 4. Treatment options a. General principles - locoregional and systemic options b. Chemotherapy 1. Systemic therapy 2. Targeted a. Transarterial chemoembolization b. Hepatic arterial infusion pump 3. Downstaging after neoadjuvant therapy c. Radiation 1. External beam radiation therapy 2. Y-90 radioembolization (lobar and radiation segmentectomy) d. Surgical 1. Preoperative considerations 2. Patient selection 3. Surgical options a. Wedge resection b. Segmentectomy +/- hepaticojejunostomy (HJ) c. Hepatectomy +/- HJ d. Transplantation

#### GIEE-80 Role of Radiology in a Multidisciplinary Approach of Hepatocellular Carcinoma

Participants

Elissandra Lima, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- To review international diagnostic HCC guidelines and LI-RADS with examples- To review the classical imaging appearance and patterns of HCC- To understand imaging features that correlate with favorable versus poor outcome and those associated with post-treatment response and recurrence

#### TABLE OF CONTENTS/OUTLINE

1. Background 2. When to use each imaging modality? 3. Optimal study protocol of the liver 4. What contrast agent to use? Hepatobiliary versus extracellular contrast agent 5. Characterization of hepatocarcinoma nodules 6. How to use LI-RADS? 7. International diagnostic HCC guidelines 8. Mimickers and Overdiagnosis of HCC: Flash-filling hemangioma, focal confluent fibrosis, intrahepatic cholangiocarcinoma, hepatic lymphoma 9. Staging, treatment decision-making, and follow-up of HCC 10. Evaluating beyond the liver: Common sites of extrahepatic metastasis 11. How to select patients with HCC for liver transplantation, resection or locoregional treatment? 12. Advanced disease: Locoregional therapies or systemic therapies

#### GIEE-81 Pseudomyxoma Peritonei: Concepts, Classification, Imaging Spectrum and HIPEC

#### TEACHING POINTS

To describe and demonstrate the imaging features of pseudomyxoma peritonei in the various diagnostic modalities. To propose a systematization of the evaluation of pseudomyxoma peritonei. Contextualize the role of imaging to predict the extent and quantification of disease that may result in a more aggressive surgical approach combined with or without HIPEC.

#### TABLE OF CONTENTS/OUTLINE

Peritoneal pseudomyxoma (PPM) is a clinical syndrome characterized by the accumulation of mucinous ascites in the peritoneal cavity. The most common cause of peritoneal pseudomyxoma is mucinous neoplasms in the appendix and according to the new consensus statement, PPM is classified based on the histology of the peritoneal disease and not based on the primary neoplasm. Peritoneal pseudomyxoma is classified into: acellular mucin, low-grade mucinous carcinoma peritonei (G1), high-grade mucinous carcinoma peritonei (G2) and high-grade mucinous carcinoma peritonei with signet ring cells (G3). The imaging spectrum of PPM is variable and suggestive findings include mucinous ascites, peritoneal nodules and omental. It is essential to be familiar with this pathology since accurate staging, with details of the sites affected, is essential to define therapy which may include cytoreductive surgery and hyperthermic intraperitoneal chemotherapy (HIPEC). The role of imaging is well documented and each diagnostic modality has its indications and limitations in the staging and follow-up of PPM. This review provides an updated and comprehensive summary of the histologic classification of PPM, imaging findings, and describes the role of the radiologist in the multidisciplinary setting to predict the extent and quantification of disease.

#### GIEE-82 Peeking Inside the Pancreas: A Radiological Journey through Imaging of Unusual and Rare Pancreatic Tumors

Participants

Mostafa Shehata, MD, Houston, TX (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Describe the imaging approach for evaluating unusual and rare pancreatic tumors. 2. Identify imaging manifestations of unusual and rare pancreatic tumors. 3. Identify potential pitfalls in imaging of unusual and rare pancreatic tumors.

#### TABLE OF CONTENTS/OUTLINE

1. Unusual and rare pancreatic tumors and imaging approach 2. Multimodality imaging features of unusual and rare pancreatic tumors a. Primary malignant tumors: i. Acinar cell adenocarcinoma ii. Pancreatic small cell carcinoma iii. Pancreatic adenosquamous carcinoma iv. Pancreatic lymphoma v. Hepatoid pancreatic adenocarcinoma vi. Pancreatic mucinous carcinoma vii. Pancreatic primary lymphoma viii. Clear cell acinar cell carcinoma ix. Pancreatic carcinosarcoma x. Pancreatic hemangiopericytoma xi. Pancreatic rhabdomyosarcoma b. Primary tumors with malignant potential: i. Solid pseudopapillary tumor ii. Intraductal tubulopapillary neoplasm iii. Teratoma iv. Solid serous cystadenoma c. Secondary Malignant Tumors i. Unusual metastases to pancreas d. Benign Tumors i. Pancreatic lipoma ii. Intraductal papillary neoplasm (IPMN) iii. Lymphoepithelial cysts iv. Focal pancreatitis 3. Mimics and Pitfalls (tumor like conditions; IgG4-RD; biliary tract tumors; duodenal tumors (duodenal dystrophy, gastrointestinal stromal tumor (von Recklinghausen), Brunner's duodenal hamartoma)

**GIEE-83 Adding Insult to Injury: Unexpected Gastric Cancer Presentations That Can Make Radiologist's Life Difficult**

Participants

Dequiter Machado, DC, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. To demonstrate the variability in presentations of gastric carcinoma and the dissemination patterns. 2. To understand and learn how to differentiate fibrosis from disease progression and primary tumor involvement. 3. To identify recurrence in the esophagus-gastric junction 4. To illustrate the role of radiology in the differential diagnosis, staging, and surveillance of patients with gastric carcinoma.

**TABLE OF CONTENTS/OUTLINE**

- Gastric normal anatomy and possible secondary implant pathways . Epidemiology of gastric cancer . Variability in presentations in gastric adenocarcinoma.- Rare patterns of tumor recurrence, that we should not miss.

**GIEE-84 The Solution is Right at Your Fingertips: Linear Probe and Improvement of US Gallbladder Evaluation**

Participants

Pilar Navarro Azurmendi, MD, Pilar, Argentina (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1 To analyze the benefits and limitations of linear and curved transducers used in US evaluation of the gallbladder with cine and imaging findings throughout different cases. 2 To review the most advantageous sonographic technique and knobology optimization. 3 To identify potential pitfalls in US evaluation and the technics to prevent them. 4 To assess the available tools to minimize the risk of misinterpretation in biliary pathology imaging.

**TABLE OF CONTENTS/OUTLINE**

1 Types of transducers used for gallbladder evaluation. Characteristics, benefits and limitations. 2 Sonographic technique and knobology optimization through cine videos and images. 3 Anatomy, useful landmarks and choice of sonographic window. 4 Ultrasound artifacts: making use of imaging artifacts to aid in diagnosis. 5 Identify potential pitfalls in gallbladder ultrasound evaluation and how to avoid them. 6 Diagnostic criteria for gallbladder wall pathologies. 7 Test your knowledge: interactive review for integration of clinical cases with imaging findings. 8 Take-home messages.

**GIEE-85 Lymphoma: What to Expect from the Unexpected**

Participants

Fabio Yoshimura, Santana De Parnaiba, Brazil (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Lymphoma is a disease that can manifest itself in multiple ways. It is important to know the sites of involvement in its most varied forms and the possible imaging characteristics. This work aims to improve the literature with illustrated teaching cases from our department about suspicious lesions, allowing for early diagnosis and adequate follow-up.

**TABLE OF CONTENTS/OUTLINE**

This work aims to review with illustrated cases and their characteristic images from main abdominal organs affected by Lymphoma:- Liver;- Spleen;- Gastrointestinal tract;- Pancreas;- Kidney;- Peritoneal cavity.

**GIEE-86 Uses, Finding, Pitfalls, and Advanced Applications in Gadoteric Acid-Enhanced MR Imaging of the Liver**

Participants

Elissandra Lima, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- To understand the Pharmacokinetics of gadoteric acid- To review clinical applications, pitfalls and of gadoteric acid-enhanced MRI- To discuss advanced and future applications such as multiparametric liver MRI, magnetic resonance cholangiography, and liver function assessment

**TABLE OF CONTENTS/OUTLINE**

1. Background 2. Pharmacokinetics of gadoteric acid 3. Magnetic resonance protocol and technique: abbreviated and multiparametric protocols 4. Optimizing the workflow 5. Clinical applications of gadoteric acid-enhanced MRI: Focal nodular hyperplasia, hepatocellular adenomas, hepatocellular carcinoma, cholangiocellular carcinoma, liver metastases, hepatic fibrosis, biliary imaging 6. Evaluation of treatment response of liver metastases 7. Gadoteric acid-enhanced MRI for staging treatment decision-making, and follow-up of HCC 8. Incidental discovery of focal liver lesions 9. Pitfalls and solutions: arterial phase limitations, hepatobiliary phase limitations, focal nodular hyperplasia, "pseudowashout", uptake in lesions other than FNH. 10. Advanced and future applications

**GIEE-87 Bad Connections: Review of Intestinal Fistulae**

Participants

Allison Forrest, MD, Burlington, VT (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Intestinal fistulae in the abdomen and pelvis are common and result in significant morbidity. Fistulae occur between hollow viscous organs and can occur in the setting of surgery, trauma, inflammation, and malignancy. Multiple imaging modalities are used for both initial evaluation and follow up, with selection of technique depending on the anatomy involved. Fluoroscopic evaluation is often helpful in the evaluation as it provides real-time, dynamic evaluation of fistulae and can further delineate complex anatomy in

conjunction with cross-sectional imaging. Selection of route of contrast administration and catheter selection for evaluation of enterocutaneous fistulae are particularly important for successful fluoroscopic evaluation. An understanding of the spectrum of fistulae and the tools available to radiologists are critical for accurate characterization of fistulae.

#### TABLE OF CONTENTS/OUTLINE

1. Review the pathophysiology of intestinal fistulae. 2. Provide an overview of indications and protocols for imaging evaluation of fistulae, with emphasis on fluoroscopic evaluation with cross-sectional correlation. Specific tips for evaluation of enterocutaneous, esophageal, small bowel, and colonic fistulae will be discussed. 3. Display case examples of common and uncommon intestinal fistulae, including those due to surgery, malignancy, inflammation, and trauma. 4. Review factors that are commonly implicated in delayed fistulae healing. 5. Brief overview of treatment principles and available therapies.

#### GIEE-88 Fibro-polycystic Liver Disease: What Radiologists Need to Know

Participants

Lautaro Florentin, MD, Buenos Aires, Argentina (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Fibropolycystic liver disease refers to a group of different liver and biliary anomalies caused by abnormal embryologic development of ductal plates. Congenital hepatic fibrosis, biliary hamartomas, autosomal dominant polycystic disease, Caroli disease, and choledochal cysts are included in this group. Fibropolycystic liver diseases usually do not exist as single entities and can be found in combined forms. Each entity shows characteristic imaging findings, specially at computed tomography (CT) and magnetic resonance (MR). Radiologists should be familiar with this spectrum of lesions to properly guide the management of these patients.

#### TABLE OF CONTENTS/OUTLINE

Introduction  
What is fibropolycystic liver disease?  
Embryologic development  
Congenital hepatic fibrosis  
What is?  
Imaging findings  
Biliary hamartomas (Von Meyenburg complex)  
What is?  
Imaging findings  
Autosomal dominant polycystic disease  
What is?  
Imaging findings  
Complications  
Caroli Disease  
What is?  
Caroli disease vs. Caroli Syndrome  
Imaging findings  
Choledochal cysts  
Pathogenesis  
controversy. Bilio-pancreatic maljunction association. Todani's Classification  
Imaging findings

#### GIEE-89 New Concepts in Staging and Treatment of Colon Cancer: What the Radiologist Needs to Know

Participants

Amit Choudhari, MBBS, FRCR, Mumbai, India (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Understand types of colon cancer surgeries, including multivisceral resection
- Comprehend the elements which need to be covered while reporting a clinically relevant colon cancer staging CT report
- Review the questions asked in multidisciplinary tumor boards
- Updates on the recent advances in colon cancer management
- Discuss the advantages of neoadjuvant chemotherapy prior to surgery as per recent literature

#### TABLE OF CONTENTS/OUTLINE

- Pathophysiology of colon cancer
- Types of colon cancer surgeries and nodal resections
- Discuss common and uncommon presentations in colon cancer (extramural vascular invasion, aneurysmal dilatation, vascular involvement, tumor bowel fistula, uncommon pathologies)
- What the surgeon wants to know from the radiologist for planning surgery; e.g., a patient with ascending colon cancer with duodenal involvement can undergo colo-pancreaticoduodenectomy
- dMMR/MSI-H, ctDNA, FoxTROT, Niche-2: What they mean and why do we need to know about them

#### GIEE-9 Internal Hernia after Roux-en-Y Gastric Bypass: Clues to a Challenging Diagnosis

#### TEACHING POINTS

- Internal hernias are a complication in up to 10% of patients after Roux-en-Y gastric bypass (RYGB).
- Risk factors for internal hernia after RYGB include retrocolic technique, non-closure of mesenteric defects and amount of weight loss after surgery.
- Untreated internal hernias place the patient at risk for bowel ischemia.
- Several signs of varying sensitivity and specificity have been described for internal hernias after RYGB.
- A structured approach should be taken to assess for internal hernias in all patients who have undergone RYGB—especially those who are presenting with abdominal pain.

#### TABLE OF CONTENTS/OUTLINE

- Description of RYGB procedure.
- Three types of internal hernia after RYGB: Transmesocolic, Petersen and jejuno-jejunostomy hernias.
- Incidence of internal hernia after RYGB.
- Risk factors for internal hernia after RYGB.
- Clinical presentation of internal hernias after RYGB.
- Prognosis of untreated internal hernia after RYGB.
- Treatment of internal hernia after RYGB.
- Accuracy of CT in diagnosing internal hernia after RYGB.
- CT findings of internal hernia after RYGB and their sensitivity and specificity in detecting internal hernias. All signs will be accompanied by example images and/or image stacks.
- Vascular Signs: SMV beaking sign, vascular swirl sign and hooking intestine sign.
- Mesenteric Signs: Mesenteric edema, mesenteric lymph nodes and eye of the hurricane sign.
- Bowel signs: Small bowel obstruction, right sided jejunojejunal anastomosis, mushroom sign, small bowel behind SMA, small bowel between transverse colon and stomach and clustered loops of small bowel.
- Structured approach to assessing the presence of internal hernia in patients with RYGB.

#### GIEE-90 Tips for Differentiation Between Pancreatic Ductal Adenocarcinoma with Bile duct Invasion and Cholangiocarcinoma with Pancreas Invasion

Participants

Shintaro Ichikawa, MD, PhD, Hamamatsu, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Both pancreatic ductal adenocarcinoma (PDAC) and cholangiocarcinoma are mostly adenocarcinomas and share common pathological features. Therefore, their imaging findings are similar, and when a mass stretching from the head of the pancreas to the distal common bile duct is found, it may be difficult to distinguish whether it is bile duct invasion from PDAC or pancreatic invasion from cholangiocarcinoma. To differentiate between the two, it may be useful to focus on whether the pancreatic or bile

duct lesion is the predominant finding and whether the main pancreatic duct is dilated.

#### TABLE OF CONTENTS/OUTLINE

The following tips for differentiating between PDAC with bile duct invasion and cholangiocarcinoma with pancreatic invasion are discussed along with their key imaging findings:1. Predominant lesion Pancreatic lesions of PDAC are larger than those of cholangiocarcinoma. The range of common bile duct lesions in cholangiocarcinomas is greater than that of lesions in PDAC.2. Double-duct sign Both the main pancreatic and common bile ducts are often dilated in PDAC, whereas the main pancreatic duct is rarely dilated in cholangiocarcinoma. The following differential diagnoses are discussed along with their key imaging findings:1. Ampullary masses (adenoma, adenocarcinoma, and neuroendocrine neoplasms)2. Pancreatic groove cancer3. Groove pancreatitis4. Mass-forming pancreatitis5. Sclerosing cholangitis

#### GIEE-91 Complications of Colorectal Cancer Treatment

Participants

Kelly Cox, DO, Jacksonville, FL (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Teaching Points: Colorectal cancer remains the third most common cancer and is the second leading cause for cancer related deaths in the United States. Colorectal cancer is highly treatable and often curable with early detection. After a quick review of colorectal cancer and its most current treatment algorithms, we will take an in depth look at the complications of treatment including those related to surgery, liver directed therapy, chemotherapy and immune checkpoint inhibitors. As colorectal cancer treatment has rapidly changed in recent years, new and unexpected imaging complications of treatment must be recognized in our daily practice to direct immediate patient care and future colorectal cancer treatment.

#### TABLE OF CONTENTS/OUTLINE

1. Review of colorectal cancer and its most current treatment algorithms 2. Surgical Complications a. Perforation/Anastomotic Leak b. Abscess c. Fistula d. Local recurrence with and without obstruction 3. Liver Directed Therapies a. Intrahepatic artery infusion chemotherapy - biliary strictures b. Radiofrequency ablation i. Thermal injury ii. Injury to adjacent organs c. Radioembolization 4. Chemotherapy Induced Injuries a. Steatohepatitis b. FNH-like lesions 5. Checkpoint Inhibitor complications a. Pseudoprogression b. Pneumonitis c. Diarrhea, enteritis and colitis d. Bowel perforation e. Pancreatitis

#### GIEE-92 Deep-learning CT Reconstruction in the Abdomen: Principles, Techniques, Current Practice and Future Perspective

Participants

Mostafa Shehata, MD, Houston, TX (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Understanding the background and important principles of image reconstruction methods in CT with the advantages and disadvantages of each modality 2. Comprehensive review on the deep learning imaging reconstruction and why it outperforms other modalities 3. To discuss clinical impact of deep-learning CT reconstruction in abdominal imaging 4. Future perspective and implementation

#### TABLE OF CONTENTS/OUTLINE

1. CT image reconstruction and deep learning a. Definition principles of CT image reconstruction b. History and advances of CT image reconstruction until now c. Common quantitative and qualitative parameters for image quality d. Explain the advantages and disadvantages of each reconstruction technique (filtered back projection, iterative reconstruction, full model-based iterative reconstruction, hybrid iterative reconstruction)2. Deep-learning image reconstruction (DLIR) in the abdomen CT a. Understanding the basics of convolutional neural networks (CNNs) b. The role of DLIR in CT image quality improvement and noise reduction c. Factors influencing the performance of deep-learning CT reconstruction3. Where DLIR in CT abdomen now a. DLIR algorithms available b. Current evidence and practice of deep-learning CT reconstruction in the abdomen c. Clinical impact on the diagnosis of abdominal organs diseases4. DLIR limitations and potential future developments

#### GIEE-93 Radiologic Features of Abdominal Multimodality Imaging Related to Cardiovascular Disorders

Participants

Yeju Kang, MD, Seoul, Korea, Republic Of (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To classify various cardiovascular disorders causing changes on abdominal multimodality imaging. 2. To comprehensively review the pathophysiology of intra-abdominal changes caused by cardiovascular disorders. 3. To present various radiologic features of abdominal multimodality imaging in patients with cardiovascular disorders.

#### TABLE OF CONTENTS/OUTLINE

1. Cardiac disorders-related changes: Congestive heart failure: hepatic congestion, cardiac cirrhosis/Infective endocarditis: infection due to septic embolism, infarction, mesenteric ischemia/Atrial fibrillation: infarction, mesenteric ischemia/Valvular heart disease: hemosiderin deposition due to mechanical cardiac valve/Cardiac arrest: cardiopulmonary resuscitation-related change 2. Vascular disorders-related changes: Obstruction of the vena cava: liver cirrhosis due to membranous obstruction of inferior vena cava, hepatic neoplasm, third flow due to superior vena cava obstruction/Vasculitis: systemic lupus erythematosus, IgA vasculitis, Behcet disease, etc. 3. Cardiovascular drug-related changes: anticoagulants-related changes, anti-arrhythmic agents-related changes

#### GIEE-94 Signet Ring Cell Adenocarcinomas of the GI Tract: Clinical, Radiological, and Pathological Correlation

Participants

Perry J. Pickhardt, MD, Madison, WI (*Presenter*) Advisor, Bracco Group; Advisor, Zebra Medical Vision Ltd; Advisor, Nano X Imaging;

#### TEACHING POINTS

1. T1. To describe the key epidemiological, clinical, radiological, and pathological features of signet ring cell adenocarcinoma of the

1. To describe the key epidemiological, clinical, radiological, and pathological features of signet ring cell adenocarcinomas of the GI tract. 2. To review the specific features of gastric, colorectal, esophageal, appendiceal, and pancreaticobiliary signet ring cancers, with radiologic-pathologic correlation. 3. To illustrate linitis plastica, scirrhous tumors, and the "malignant target sign" associated with these aggressive cancers.

#### TABLE OF CONTENTS/OUTLINE

- Introduction - Signet ring cell adenocarcinomas of the GI tract o Histopathological definition o Epidemiology and prognosis o The malignant target sign - Clinical-Pathological-Radiological correlation o Gastric signet ring cell adenocarcinoma (linitis plastica) o Colorectal signet ring cell adenocarcinoma o Esophageal signet ring cell adenocarcinoma o Appendiceal signet ring cell adenocarcinoma o Pancreaticobiliary signet ring cell adenocarcinoma o Metastatic signet ring cell adenocarcinoma - Concluding remarks

#### GIEE-95 The Many Forms of Acute Pancreatitis

##### TEACHING POINTS

The morphological expression of acute pancreatitis (AP) is highly variable and in its more complex forms it can be a difficult challenge for the radiologist in training to decipher. Therefore, the main objective of this paper is to present a guide for understanding the morphological classification of AP, related complications and differential diagnoses using the standardized terminology established in the revised Atlanta classification system. Other objectives are: To recognize the general clinical features of AP and the bases of the Atlanta classification system. To understand the current role of the radiologist in the diagnosis and treatment of acute pancreatitis. To emphasize the importance of the implementation of standardized reporting schemas and a well-defined lexicon into the radiology practice to facilitate accurate communication among members of a multidisciplinary team.

#### TABLE OF CONTENTS/OUTLINE

Introduction. Clinical overview: diagnostic criteria, pathogenesis and etiology, disease severity and risk stratification, clinical classification according to the revised Atlanta classification (RAC): phases of evolution and severity. Imaging guidelines: how, when and why to image. General overview of the RAC system. Morphologic classification interstitial edematous pancreatitis (IEP) vs necrotizing pancreatitis (NP). Pancreatic and peripancreatic collections APFC, pseudocyst, ANC and WON. Local complications: Infection, inflammation and mass effect on adjacent organs, biliary obstruction, pancreatic duct stricture, disconnected pancreatic duct, vascular complications (hemorrhage, venous thrombosis, pseudoaneurysm). Other complications. Imaging mimics of AP.

#### GIEE-96 Pseudomyxoma Peritonei and HIPEC: What Am I Missing?

Participants  
Matheus Gomes SR, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

Pseudomyxoma peritonei (PMP) is a rare and complex clinical syndrome characterized by the intraperitoneal accumulation of mucinous material, which arises from a variety of neoplasms, mainly from appendiceal mucinous neoplasm. The purpose of this exhibit is • Review the main CT and MRI imaging findings of PMP. • Recognize the most common tumor sites which may cause pseudomyxoma peritonei • Illustrate through a diagram the pathways of disease spread into peritoneal spaces • Discuss HIPEC therapy and surgery indications, different outcomes and complications • Highlight the radiologist role in decision-making in a multidisciplinary team

#### TABLE OF CONTENTS/OUTLINE

1. Introduction- Epidemiology, clinical and pathophysiological aspects of pseudomyxoma peritonei- CT and MRI protocol recommendation 2. Current treatment options- To discuss for each of the following treatment modalities indications, contraindications, advantages and limitations (HIPEC, Surgical treatment and Systemic treatment)- To review through illustrative clinical cases the main CT and MRI findings of: Initial assessment of disease • Most common sites of disease • Hints at first evaluation of images • Difficult sites of resection • Potential "blind spots" Evaluation of treatment response • Disease progression • Stable disease / No evidence of disease • Response to treatment 3. "Take-home messages": To improve radiology communication with the multidisciplinary team and ensure prompt diagnosis and proper treatment of PMP, it is essential to understand the major clinical and imaging aspects of the disease and its treatment options.

#### GIEE-97 Non-cirrhotic Portal Hypertension: Etiologies and Workup

Participants  
Alba Pugliesi, MD, Ludwigsburg, Germany (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

1. Noncirrhotic portal hypertension (NCPH), defined as elevated portal pressures in absence of advanced hepatic fibrosis, can be seen in association with multiple pre-sinusoidal, sinusoidal, and post-sinusoidal pathologic conditions. 2. Many of the aforementioned etiologies can result in liver dysmorphism (despite the absence of advanced hepatic fibrosis), resulting in incorrect diagnosis of cirrhosis.

#### TABLE OF CONTENTS/OUTLINE

Introduction • Definition and review of mechanisms of portal hypertension Pre-hepatic etiologies of NCPH • Case-based review of pre-hepatic etiologies of NCPH with emphasis on chronic inflow obstruction Intrahepatic etiologies of NCPH • Case-based review of pre-sinusoidal, sinusoidal, and post-sinusoidal etiologies of NCPH. Post-hepatic etiologies of NCPH • Case-based review of post-hepatic etiologies of NCPH with emphasis on outflow obstruction and cardiac etiologies (including Fontan-associated liver disease). Architectural and morphological changes of liver • Review of non-fibrotic pathways of response to injury by hepatocytes, with focus on regenerative nodular hyperplasia Diagnostic Workup, Challenges and Pitfalls • Discussing role of biopsy, hepatic venous wedge pressure, and elastography Conclusion

#### GIEE-98 Tips and Tricks for CT Optimization of the Abdomen

Participants  
Mostafa Shehata, MD, Houston, TX (*Presenter*) Nothing to Disclose

## TEACHING POINTS

The educational exhibit discusses CT dose optimization in abdominal imaging, and how it is important to reduce radiation exposure while maintaining diagnostic accuracy. Strategies for reducing radiation dose and optimizing contrast media administration, managing image artifacts and noise, and incorporating AI-based deep learning image reconstruction (DLIR) can also contribute to dose optimization. Tailoring the imaging protocol based on the clinical indication, patient age, medical history, and comorbidities is crucial for achieving the best diagnostic outcome. Advice from the experts and emphasizing the importance of staff education and collaboration in CT optimization.

## TABLE OF CONTENTS/OUTLINE

Review the background and understand the basic principles of the CT optimization in abdominal imaging  
Strategies for reducing radiation dose in abdominal CT  
Methods used to optimize the dose in abdominal CT  
Future directions of embedding AI into abdominal imaging  
CT optimization  
Tailoring the imaging protocol to the clinical question and patient presentation  
Factors to be considered when tailoring imaging protocol (the clinical indication, patient age, medical history, and comorbidities)  
Electing the appropriate imaging protocol for achieving the best diagnostic outcome  
Unlocking the Secrets of the CT optimization of the Abdomen: Tips and Tricks from the Pros  
a. Port injections - "How to inject like the pros"  
b. Helical pitch- "Low pitch isn't what it used to be"

## GIEE-99 Clinical Application of Artificial Intelligence (AI) in Chronic Liver Diseases Management

Participants

Mohamed Eltaher, MD, Houston, TX (*Presenter*) Nothing to Disclose

## TEACHING POINTS

1. Understand the function of artificial intelligence (AI) in tumor segmentation. 2. Review the existing medical uses of liver segmentation. 3. Grasp the advantages and disadvantages of different methods for segmenting liver tissues. 4. Understand the imaging criteria that must be met for a liver segmentation project to be successful. 5. Explore possible future developments in liver segmentation.

## TABLE OF CONTENTS/OUTLINE

1. Brief introduction to artificial intelligence (AI). 2. Overview of different architectures used in deep learning methods. 3. Application of AI in the medical field. a new era of healthcare services. 4. Available Liver segmentation methods and techniques. 5. Advantages and disadvantages of different segmentation methods. 6. Challenges facing manual and automated liver segmentation. 7. Current uses of liver volumetry: a) assessment of response to intervention or surgery in liver malignancy. b) prediction of clinical outcomes including disease behavior, overall survival. C) virtual surgical planning. d) prediction of future liver remnant volume after hepatectomy surgery. 8. Future directions: a) Vascular sub-segmentation. b) Radiogenomics. c) Fully automated segmental volumetry. d) Automated volumetric RECIST measurements.

### **A Deep Dive into Essential Predictive Imaging Features of Abdominal Neoplasms in the Era of Personalized Therapy: Insight into the Correlation with Pathological, Molecular, and Genetic Background**

#### **TEACHING POINTS**

Recognizing imaging findings regarding the tumor microenvironment and molecular function of abdominal neoplasms is not only the key to appropriate diagnosis, but also to early prediction of treatment options and response to various therapies. This exhibit aims to provide a better understanding of the essential predictive imaging findings of abdominal neoplasms in correlation with their pathological, molecular, and genetic background, which has the potential to lead to personalized treatment strategies in the coming era.

#### **TABLE OF CONTENTS/OUTLINE**

The treatment options for abdominal malignancies have become more diverse with advances in surgery, chemo and immunotherapy, making pre-treatment risk stratification even more important. Radiologists are now required not only to diagnose but also to predict the prognosis and efficacy of treatment based on images, and to contribute to the selection of appropriate treatment. Understanding of predictive imaging findings can also help us to speculate upon the tumor microenvironment, which might be required in the future. We summarize these imaging findings for the following neoplasms; (i)HCC, (ii) Liver metastases from colorectal cancer, (iii) Pancreatic cancer, (vi) Intrahepatic cholangiocarcinoma. We also focused on the application of these findings to treatment strategies for each abdominal malignancy to explore the usefulness of these predictive findings in the era of personalized treatment.

### Fibropolycystic Liver Disease: An MRI Review with Pearls and Pitfalls

#### Participants

Jordan LeGout, MD, Ponte Vedra Beach, FL (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Fibropolycystic liver disease comprises a spectrum of interrelated conditions that range from congenital hepatic fibrosis to choledochal cysts. In this exhibit we will: -Review the MRI appearance of the various fibropolycystic liver diseases and associated conditions-Highlight imaging pitfalls using real errors encountered in clinical practice-Introduce imaging pearls for the various conditions that can help arrive at the correct diagnosis-Differentiate between those conditions that are benign and incidental and those that pose risk for development of malignancy

#### TABLE OF CONTENTS/OUTLINE

I. IntroductionII. Congenital hepatic fibrosis a. Pearl: Liver morphology, segment IV hypertrophy b. Pitfall: FNH-like lesionsIII. Biliary hamartomas a. Pearl: Use high b-value diffusion to uncover lesions b. Pitfall: Polycystic liver disease, infiltrative malignancyIV: Peribiliary cysts a. Pearl: Anatomic sequences over MRCP b. Pitfall: PSCV. Polycystic liver disease a. Pearl: Use subtraction imaging b. Pitfall: Mucinous cystic neoplasmVI. Caroli Disease/Syndrome a. Pearl: Different degrees of involvement (diffuse vs. segmental) b. Pitfall: Recurrent pyogenic cholangitis VII. Choledochal cysts a. Review appearance of subtypes b. Pearl: Field defect and risk for cholangiocarcinoma c. Pitfall: Age related and cholecystectomy related ductal dilation

### Post-neoadjuvant MRI Changes and Challenges in Rectal Adenocarcinoma: What to Look for

#### Participants

Mayra V. Soares, MD, Brasilia, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To understand the pivotal role of MRI in the post-neoadjuvant restaging of rectal cancer. To highlight the main imaging changes in post-neoadjuvant MRI, which reflect histopathologic changes that may occur after chemoradiation treatment. To recognize how fibrosis or increased mucin production, addressed by high-resolution MRI, impacts risk stratification post-neoadjuvant therapy. To learn about some challenges in MRI morphological and DWI evaluation regarding new treatment options. Understand the role of radiologists as part of patient care, helping to enroll patients eligible to "watch-and-wait" programs.

#### TABLE OF CONTENTS/OUTLINE

Introduction: Primary tumor and nodal assessment with MRI. Rectal cancer treatment guidelines overview. When neoadjuvant treatment is the best approach. Neoadjuvant treatment options: CRT x TNT. Recognizing tumoral changes after CRT. Posttreatment changes in the primary tumor - a systematic approach. Tumor Restaging: a response classification based on histopathologic and DWI changes. Patterns of tumor response. MRI tumor regression grades - a risk stratification incomplete/poor x "near-complete"/complete responders. "Watch-and-wait": patient selection and current controversies. Immunotherapy - the new kid on the block. Future considerations: potential biomarkers in rectal cancer and game-changer? Conclusion.

### Principles and Clinical Applications of Dual-layer Spectral CT in Gastrointestinal Imaging

#### Participants

Chiara Spasiano, Vedano Al Lambro, Italy (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To summarize the fields of application of Spectral-CT technology and define the actual advantages and benefits in clinical imaging, derived from recent literature review.

#### TABLE OF CONTENTS/OUTLINE

Dual-energy computed tomography (DECT) or spectral-CT is an advanced CT that acquires data at different energy levels to enhance material differentiation and tissue characterization. Conventional CT utilizes a polychromatic beam, but energy levels are not separated in image generation while in a dual-layer detector, the thinner top layer measures low-energy photons, and the thicker bottom layer measures high-energy photons. Complex material decomposition algorithms are used to generate images for routine clinical interpretation or for more advantage material characterization, including virtual non-contrast (VNC), iodine maps, and effective atomic number, as well as virtual monochromatic image sets, from 40 to 200keV. The most common use has been characterizing urinary calculi (different composition), gallstones (isoattenuating to bile on conventional CT), detection and correct definitions of incidental cystic lesions. While added value of multi-energy CT in body imaging include: characterization of incidental lesions (very common event in body imaging), iodine detection and subtraction (possibility to reconstruct several Iodine-Map, at monoenergetic images, both with Low and High energy levels), assessment of tissue perfusion (using organ iodine distribution as surrogate of perfusion, especially in pulmonary embolism), contrast dose reduction, tissue characterization, and finally the possibility to decrease the number of scan.

### Beyond TNM Staging System: Evaluation of Colon Cancer Prognostic Factors by CT and MRI

#### TEACHING POINTS

To review the diagnostic accuracy of CT and MRI for staging colon cancer. To define locally advanced colon tumors. To enumerate colon cancer prognostic factors and critical information that should be present in radiological reports in this context.

#### TABLE OF CONTENTS/OUTLINE

1 - Anatomic considerations of colon and retroperitoneal surgical margin 2 - TNM Staging of colon cancer 3 - Colon cancer prognostic factors (primary tumor extramural extension, retroperitoneal surgical margin involvement, extramural vessel invasion, and lymph node metastases) 4 - Locally advanced colon tumors 5 - Current treatment of colon tumors 6 - Promising treatment (neoadjuvant systemic therapy) 7 - Role of imaging in stratification of patients with colon cancer according to their risk group, contributing to better patient selection and optimization of colon cancer treatment

### Gastrointestinal Neuroendocrine Neoplasms, Imaging, Pathology, Classification and Management: 2023 Update

#### Participants

Kedar Sharbidre, MD, Birmingham, AL (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Gastrointestinal (GI) neuroendocrine neoplasms (NENs) are rare heterogeneous epithelial tumors with characteristic histological, and biological behavior. 2. The most recent WHO 2019 classifies NENs into well-differentiated (G1-G3) and poorly differentiated neuroendocrine carcinomas (NECs). Numerous studies have been published since then describing the effectiveness of this classification, diagnostic implications, and management. 3. Most often clinical, imaging and molecular features have to be integrated in order to appropriately correlate with pathologic classification, particularly to differentiate between G3-NET and NECs. As the tumor grade progresses the FDG-PET is more likely to be useful rather than DOTATE-PET which correlates with a poorly differentiated grade (NEC). The NETPET scoring system based on dual-tracer imaging can help better characterize well-differentiated metastatic NET lesions. 4. Surgery remains the mainstay of treatment for locoregional GI-NENs. Treatment of G3-NENs includes peptide receptor radionuclide therapy (PRRT), Somatostatin analogs, Everolimus, or sunitinib. Everolimus is an mTOR inhibitor while Sunitinib malate inhibits multiple receptor kinases such as VEGFR and PDGFR. Platinum-based chemotherapy with cisplatin/carboplatin and etoposide/irinotecan is recommended for patients with poorly-differentiated NECs

#### TABLE OF CONTENTS/OUTLINE

1) Background, 2) WHO 2019 classification of the NENs, 3) 2023 Imaging update with emphasis on molecular techniques and NETPET Scoring, 4) Update on the management of NENs with emphasis on medical treatment, 5) Conclusion.

### Tricks and Pitfalls of Multi-parametric MRI Restaging of Rectal Cancer After Preoperative Chemoradiotherapy

#### Participants

Giovanni Sussan, MD, Padova, Italy (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To describe the MRI protocol for rectal cancer evaluation after preoperative chemo-radiotherapy (pCRT), dealing also with the debated practices  
2. To describe the correct evaluation and the most common pitfalls of T staging after chemoradiation, using both DWI and contrast-enhanced sequences  
3. To describe the correct evaluation and the most common pitfalls of N staging after pCRT, including the MRI evaluation of the lateral pelvic lymph nodes  
4. To describe the other fundamental features that should be reported while evaluating an MRI for rectal cancer restaging (such as Mesorectal Fascia/peritoneal reflection involvement, Extramural Vascular Invasion [EMVI], etc.)

#### TABLE OF CONTENTS/OUTLINE

1. Protocol of study  
2. Localization and Reported Template tips  
3. ycT staging MRI evaluation  
4. mrTRG evaluation of the primary lesion  
5. ycN staging MRI evaluation  
6. Mesorectal fascia (MRF) involvement  
7. Peritoneal Reflection involvement  
8. EMVI  
9. Tumor deposits

### The Watch-and-Wait Program in Rectal Cancer. A Primer for Radiologists

#### Participants

Lautaro Florentin, MD, Buenos Aires, Argentina (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

**TEACHING POINTS** The watch-and-wait (WW) program is an organ-preserving approach for those patients with locally advanced rectal cancer who have no evidence of residual tumor after neoadjuvant therapy. The aim of WW is to improve the quality of life of these patients avoiding unnecessary resective surgeries in disease-free rectum. MRI plays a pivotal role in the selection process of patients who are suitable for this approach. The combination of high-resolution T2-weighted sequences (T2HR) and diffusion weighted images (DWI) are essential for detecting early regrowth during the monitoring of these patients.

#### TABLE OF CONTENTS/OUTLINE

Introduction  
History  
Why WW strategy?  
Initial assessment  
To whom?  
How to?  
i) Defining locally advanced rectal cancer (LARC). The role of MRI  
Candidates selection. Response after neoadjuvant chemoradiotherapy (nCRT)  
Tumor regression grading system  
The concept of clinical complete response (cCR). Clinical, endoscopic and radiologic aspects.  
i) Primary tumor- Complete, near complete and incomplete responders  
Radiological features  
Endoscopic findings  
ii) Lymph nodes - Complete, near complete and incomplete responders  
Radiological features  
Surveillance  
What does regrowth mean? Outcome implications  
Detecting regrowth. The advantage of MRI  
Regrowth types: intraluminal, mesorectal and lateral internal iliac/obturator nodes  
Regrowth patterns

### Primary Hepatic Neuroendocrine Neoplasm (PHNEN) and Neuroendocrine Liver Metastasis (NELM): Imaging Update and Management

#### Participants

Kedar Sharbidre, MD, Birmingham, AL (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Teaching Points Primary hepatic neuroendocrine neoplasms (PHNENs) are rare heterogeneous neoplasms arising from the intrahepatic neuroendocrine cells, ectopic pancreatic or adrenal tissue in the liver. Imaging appearances of these tumors are rarely been reported. Neuroendocrine liver metastases (NELM) are more common arising from gastro-enteropancreatic primary and are heterogeneous in clinical presentation and prognosis. After reviewing this exhibit, the learner will be able to: 1. Understand the basic pathophysiology of PHNENs and NELMs. 2. Understand the imaging diagnosis of these tumors and common differentials. 3. Get a basic understanding of principles of management of these tumors. 4. Imaging of Post-operative complications of liver directed therapy

#### TABLE OF CONTENTS/OUTLINE

A. Pathophysiology of PHNENs and NELMs B. Clinical and biochemical assessment. C. Imaging protocol for liver disease. D. Common and uncommon imaging appearance with CT, MRI and PET-CTs E. Updated management guidelines F. Assessment of post treatment complications

Printed on: 04/12/24

### CT Imaging of Peritoneal Carcinomatosis and Its Mimics: Pictorial Review

#### TEACHING POINTS

Multidetector computed tomography (MDCT) is the most commonly used technique for the detection of peritoneal carcinomatosis and for the evaluation of the extent of the disease. The objectives of this study are: 1) Review the pathophysiologic mechanism of the tumor spread and the most common sites and forms of peritoneal involvement 2) Assessment of the peritoneal cancer index (PCI) that provides important information for the surgical planning 3) Illustrate a wide variety of tumorous and inflammatory conditions that can occur in the peritoneal surface and mimic peritoneal carcinomatosis

#### TABLE OF CONTENTS/OUTLINE

Representative cases of peritoneal carcinomatosis and its mimics are illustrated in this exhibit, grouped according to the following headings: 1) Anatomy of the peritoneum and the physiology of circulation and resorption of peritoneal fluid 2) CT imaging findings and patterns of peritoneal carcinomatosis 3) Peritoneal cancer index 4) Mimics of peritoneal carcinomatosis including tuberculous peritonitis, peritoneal lymphomatosis, pseudomyxoma peritonei, primary peritoneal mesothelioma, sclerosing peritonitis, fat saponification, leiomyomatosis 5) Take home points.

### Facing the 'Celiac Iceberg': What Role can Cross-sectional Imaging Play

#### Participants

Xinyue Wang, Guangzhou, China (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

As a condition described as 'celiac iceberg', celiac disease (CD) remains underdiagnosed and undertreated. Radiological evaluation of CD deserves more attention because cross-sectional imaging is helpful in clinical management of CD, including disease diagnosis, complications identification, treatment response evaluation, and prognostic prediction, which should be considered the examination of choice in patients suspected of having CD. The purpose of this exhibit is: 1. To introduce the challenges of diagnosis and treatment in CD; 2. To introduce what role of cross-sectional imaging can play in CD; 3. To introduce the imaging features of CD and its complications;

#### TABLE OF CONTENTS/OUTLINE

-The profile of CD and the challenges facing  
Role of cross-sectional imaging in CD- Disease diagnosis- Complications identification- Disease activity and severity evaluation- Treatment response evaluation- Prognostic prediction  
Imaging features of CD- Jejunoileal fold pattern reversal- Mesenteric vascular engorgement - Enlarged mesenteric lymph nodes- A decreased size of spleen- Small bowel wall thickening- Diffusely dilated bowels with excess fluid or gas- Intramural fat deposition  
A complication of CD: Mesenteric lymph node cavitation syndrome- Imaging features of mesenteric lymph node cavitation syndrome - Enlarged mesenteric lymph nodes that contain fat-fluid levels

### Unveiling the Mysteries of Pancreas Transplantation through Imaging

#### TEACHING POINTS

Understand the clinical relevance, indications, and surgical techniques of pancreas transplantation. Learn about the role of multimodality imaging (US, CT, MRI and CEUS) in the assessment and management of pancreas transplantation.

#### TABLE OF CONTENTS/OUTLINE

Introduction: an overview  
Clinical importance of pancreas transplantation  
Epidemiology: United States and Global context  
Pancreas transplantation: surgical aspects  
Types of pancreas transplant: indications and outcomes  
Surgical techniques: arterial anastomosis, enteric drainage of exocrine secretions and venous anastomosis  
Multimodality imaging assessment of pancreas graft recipients  
US, CR and MRI: advantages and limitations  
Graft's normal appearance  
Complications: a case-based review  
Early versus late complications  
Rejection: radiological-pathological correlations  
Perspectives  
Artificial intelligence and novel imaging techniques  
Contrast enhanced ultrasound (CEUS): focus on graft's perfusion and rejection  
Take home messages

### Abdominopelvic Actinomycosis

#### Participants

Yong-Soo Kim, MD, PhD, (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To review microbiological and clinical features of actinomycosis this may involve the abdominopelvic organs. To illustrate various CT features of actinomycosis involving abdominopelvic organs.

#### TABLE OF CONTENTS/OUTLINE

Actinomycosis is a chronic inflammatory disease which can involve a variety of human organs. This disease commonly occurs in three distinct forms; a cervicofacial form, an abdominopelvic form and a thoracopulmonic form. After penetrating through the mucosal barrier, the route of propagation is direct spread to adjacent tissue. The aggressive nature of infiltration of actinomycosis may be confused with neoplasm and other inflammatory diseases, especially tuberculosis or fungal infection. Various abdominal organs may be infected by actinomycosis. Abdominal infection has been associated with abdominal surgery, such as appendectomy, or a perforation of the intestinal mucosa; a rupture of appendix, diverticulitis, foreign body perforation of the transverse or sigmoid colon, peptic ulcer. Pelvic actinomycosis may be associated with any type of intrauterine contraceptive device or with an intra-abdominal portal entry. Abdominal actinomycosis can present as an abscess or as a mass that is often fixed to the underlying tissue, as a sinus tract with drainage, perirectal or perianal disease.

### Comprehensive Image-based Overview Of Percutaneous Enteral Access

#### TEACHING POINTS

Image-guided percutaneous enteral catheters offer a minimally invasive alternative to endoscopic or surgical techniques to provide patients access for important nutrition and medication administration. This exhibit discusses the indications, contraindications, techniques, and peri-procedural management of image-guided percutaneous gastrostomy, gastrojejunostomy (including AbbVie PEG-J pull-type technique for Duopa infusion), jejunostomy, and transesophageal gastrostomy.

#### TABLE OF CONTENTS/OUTLINE

- Pre-Procedural Considerations
- Indications/Contraindications for percutaneous enteral catheter placement
- Image-guided technique for percutaneous gastrostomy/gastrojejunostomy
- Image-guided technique for percutaneous jejunostomy
- Image-guided technique for percutaneous transesophageal gastrostomy
- Image-guided technique for percutaneous pull-type AbbVie PEG-J
- Post-procedural evaluation and complication management

### Duodenal Diseases: Illustrated Cases for Radiologists

#### Participants

Manuel Sebastian Paez Alvarez SR, MD, Toledo, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To provide a comprehensive, illustrative guide for diagnosing duodenal diseases in radiology practice. To review and emphasize the imaging characteristics of various duodenal pathologies on CT studies. To highlight the importance of recognizing subtle findings and common anatomical anomalies for accurate diagnosis.

#### TABLE OF CONTENTS/OUTLINE

Duodenal diseases encompass a broad spectrum of conditions that can originate in the duodenum or result from processes involving neighboring organs. This exhibit aims to educate radiologists on various duodenal pathologies, emphasizing illustrative cases through CT studies. Introduction: Overview of duodenal diseases and their significance in gastrointestinal imaging. Congenital anomalies. Inflammatory diseases. Neoplastic diseases. Vascular pathologies. Iatrogenic complications involving the duodenum. Other duodenal entities and pathologies. Conclusion. In this educational exhibit, we will provide a thorough understanding of the duodenum's anatomy and various diseases, emphasizing the importance of recognizing subtle imaging findings in the context of duodenal pathology. This resource will serve as a valuable guide for radiology residents and radiologists seeking to improve their diagnostic skills in abdominal CT imaging.

### Infiltrative Hepatocellular Carcinoma: Challenging Cases and Its Benign Mimics

#### Participants

Elhamy Heba, MD, MD, Lexington, KY (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Various histopathologic and morphologic subtypes of hepatocellular carcinoma (HCC) are described throughout the literature. Among all these subtypes, the infiltrative appearance of HCC presents unique challenges in detection, both clinically and radiographically. Infiltrative appearance of HCC is characterized by diffuse permeative spread throughout the liver parenchyma, without forming a mass-like lesion, in a manner that sometimes it is difficult to detect on a background abnormal liver parenchyma. Radiologist must distinguish the infiltrative pattern of HCC from processes that may mimic such as: confluent fibrosis, diffuse fat or iron deposition, diffuse metastatic disease, cholangiocarcinoma, and hepatic microabscesses.

#### TABLE OF CONTENTS/OUTLINE

1. Incidence and prevalence of infiltrative HCC
2. Review imaging features of infiltrative HCC, including multimodality case-based review of typical and challenging cases of infiltrative HCC with pathological correlation
3. Discussion of Tumor in vein as a common imaging feature of infiltrative appearance of HCC
4. Mimics of infiltrative appearance of HCC including confluent fibrosis, diffuse fat/iron deposition, diffuse metastatic disease, cholangiocarcinoma, and hepatic micro abscesses
5. Review of prognosis, management and post treatment imaging of infiltrative appearance of HCC

Printed on: 04/12/24

### Autoimmune Diseases of the Liver and Biliary Tract

#### TEACHING POINTS

Understand mechanisms behind self-tolerance and autoimmunity  
Review spectrum of autoimmune disorders of the liver and biliary tract  
Review the typical and atypical imaging appearance of autoimmune liver and biliary disorders on CT And MRI.

#### TABLE OF CONTENTS/OUTLINE

Autoimmune disorders involving liver and biliary tract can be broadly classified into  
Autoimmune hepatitis (AIH)- Type 1 and Type 2  
Primarily biliary cholangitis (PBC)  
Large duct and small duct primary sclerosing cholangitis (PSC)  
Overlap syndromes: AIH+PBC; PBC+PSC; AIH+PSC  
IgG4 sclerosing cholangitis  
Drug-induced autoimmune injury  
Liver involvement in systemic autoimmune disorder (SAD)  
Diagnostic approach  
Role of MRCP in the diagnosis of autoimmune biliary disorders  
Illustration of imaging findings of AIH  
Heterogeneous enhancement of parenchyma  
Periportal edema  
Normal MRCP  
Responsive to steroids  
PBCLace-like fibrosis  
"Periportal halo" sign  
Portal lymphadenopathy  
Normal MRCP in the early stage  
gt pruned tree appearance in later stage  
PSCPredilection for peripheral intrahepatic ducts  
Beaded appearance of ducts on MRCP  
High risk of perihilar cholangiocarcinoma  
Small duct PSC  
Normal MRCP  
Typical PSC histology  
IgG4 disease  
Circumferential thickening  
Predilection for extrahepatic and hilar ducts  
Drug-induced (biologic agents)  
Appropriate clinical context  
Rapid progression  
Systemic autoimmune disorder  
Immune-mediated hepatitis may be seen in systemic lupus erythematosus and rheumatoid arthritis

GIEE-117

### Oh No, I Thought It Was a Hemangioma!!!

#### Participants

Matteo Bonatti, MD, Bolzano, Italy (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Liver hemangiomas are frequently encountered during imaging studies and have peculiar features on US, CEUS, CT and MRI.- Various benign and malignant liver lesions may show imaging features resembling hemangiomas.- At US, echogenic liver lesions are not always hemangiomas, particularly in cirrhotic patients and in patients with known malignancies: CEUS might be helpful as a quick problem-solving technique in these cases.- Contrast enhancement pattern must be accurately evaluated: centripetal enhancement alone might be misleading if not associated with globular pattern. - On MRI, hemangiomas must show "fluid-like" T2-hyperintensity; moderately T2-hyperintense lesions are almost never hemangiomas.- Always have a look to ADC values.- Hemangiomas do not have perilesional nodules.- Hemangiomas may slowly grow over time

#### TABLE OF CONTENTS/OUTLINE

To briefly review the typical imaging features that hemangiomas must show on US, CEUS, CT and MRI in order to confidently diagnose them.To show a series of liver hemangioma mimickers (e.g. mass forming intrahepatic cholangiocarcinoma, angiosarcoma, neuroendocrine tumor metastases, colorectal tumor metastases, mucinous tumor metastases,?) on various imaging modalities. For every case the misleading feature(s) will be highlighted.

### Constipation, Hirschsprung's Disease, and Stercoral Colitis: Detection, Classification and Treatment

#### Participants

Rohan Kulkarni, Southgate, KY (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Differentiate and classify different forms of colonic dysfunction to distinguish neurogenic, drug-induced, metabolic, functional, and mechanical causes of constipation  
2. Identify and describe radiological features of constipation and its complications Explain the role of abdominal radiographs, CT, fluoroscopic defecography, and MR defecography in detection and classification of constipation.  
3. Recommend the next appropriate step in management and describe potential image-guided intervention that can contribute to treatment of constipation

#### TABLE OF CONTENTS/OUTLINE

Defining Constipation - Defecatory straining, hard lumpy stools, sensation of incomplete evacuation, sensation of anorectal obstruction or blockage, need for manual maneuvers such as digital evacuation, and or fewer than 3 stools per week. Etiologies of Constipation  
1. Neurogenic: Diabetes mellitus, Hirschsprung's Disease, Intestinal Pseudo obstruction  
2. Drug-Induced Anticholinergics, Neutrally active agents  
3. Metabolic Hypokalemia, hypothyroidism  
4. Functional Pelvic floor dysfunction  
5. Mechanical Neoplasm, stricture, volvulus  
Radiologic features of constipation and its complications on Radiographs, CT, Fluoroscopy and MR- Colonic dilation- Large stool burden- Fecaloma or fecal impaction- Wall thickening- Pericolonic stranding- Perforation- Abscess  
Treatment of Constipation- Laxative/enemas- Manual dis-impaction- Water soluble fluoroscopic enema- Biofeedback- Surgery

### Imaging in Pancreas Transplantation: Conventional and Novel Approaches

#### TEACHING POINTS

- Pancreas graft location and vascular anatomy are unique and must be understood for radiologic evaluation- Ultrasound, CT, MRI all play roles in graft evaluation- Contrast enhanced ultrasound (CEUS), novel MRI techniques, graft biopsy, and alternative transplant approaches all may be part of comprehensive patient care

#### TABLE OF CONTENTS/OUTLINE

- Indications for pancreas transplant- Review of expected surgical technique / post surgical anatomyo Correlation with intra-operative pictures can assist- Rationale for pancreas graft imaging ; how does radiology make a differenceo Graft parenchymal and vascular evaluationo Graft environment+ Fluid collections, bowel obstruction, enteric anastomosis evaluation- Advances in Ultrasoundo Grayscale, Doppler, CEUSo CEUS novel techniques identify vascular insufficiency in grafts and change surgical managemento CEUS used to follow rejection over time- CT o Multiphase CT evaluation for graft and vesselso Examples of common pathology (vascular, pancreatitis, bowel complications)- Standard and investigational MRIo Evaluation for fluid around graft, may assess vessels with or without angiographyo Evaluation with gadolinium-based as well as iron-based contrast agents- Biopsyo Image guided percutaneous approach- Alternate transplant approacheso Islet cell transplanto Composite transplant

### A Primer for Pancreatic Head Pathologies- What the Surgeons Want to Know at the Multidisciplinary Conference

#### Participants

Kazi Irfan, MD, FRCR, Columbia, MO (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Review the malignant and benign solid lesions in relation to the pancreatic head and their imaging appearance  
2. Differentiation of the cystic pancreatic lesions and approach to their differential diagnosis  
3. Discuss the NCCN guidelines for the assessment of vascular involvement to ascertain resectability  
4. Illustrate the surgical technique of Whipple's procedure  
5. Enumerate the important anatomical variants in the celiac and superior mesenteric arteries which would alter the surgical technique  
6. Provide a roadmap to distinguish normal post operative changes from tumor recurrence

#### TABLE OF CONTENTS/OUTLINE

-Imaging appearance of mass forming lesions involving the pancreatic head\*Primary malignancies\*Metastases\*Neuroendocrine tumors\*Benign lesions\*Mass forming chronic pancreatitis-Multidisciplinary approach in the diagnosis and management of the solid lesions-Role of imaging in staging and assessment for surgical resectability-Different cystic lesions involving the pancreatic head\*IPMN\*Serous cystadenoma\*Mucinous cystadenoma\*Pseudocyst-Imaging evaluation to differentiate between the cystic pancreatic lesions-Multidisciplinary approach in the diagnosis and management the cystic pancreatic lesions- Indications of Whipple's surgery and the surgical technique-Review the anatomical variants of significance involving the celiac and superior mesenteric vasculature-Multidisciplinary approach in assessment of local tumor recurrence and distant metastases

### **Rectum, Set, Go: A Radiologist's Perspective of a New NAPRC Accredited Multidisciplinary Rectal Cancer Tumor Board at a Large Cancer Center**

#### **TEACHING POINTS**

1. NAPRC offers standardized, risk-adapted management of rectal cancer, while Rectal Cancer Multidisciplinary Teams (RC-MDT) provide structure and resources for accreditation and compliance. 2. Radiologists will learn NAPRC standards which involve utilizing synoptic reporting formats for 95% of all staging MRI exams, having 90% of pre-treatment MRI exams read by RC-MDT member radiologists, and fulfilling minimum attendance requirements. 3. Radiologists are key members of RC-MDT, meeting at least bimonthly with surgeons, pathologists, radiation oncologists, and medical oncologists. Uniform MRI image acquisition and interpretation, along with standardized reporting, are crucial for effective staging.

#### **TABLE OF CONTENTS/OUTLINE**

A) Requirements for NAPRC-accredited RC-MDT 1. Multispecialty services and program management 2. RC-MDT meeting structure a. Radiologist's requirements i. American College of Radiology (ACR) education module ii. Radiologist's mandatory presence for all meetings with individual attendance requirements iii. Internal record review to audit MR exams iv. Measures of compliance for synoptic reports B) RC-MDT member radiologist's contributions 1. Radiologists read 90% of pre-treatment staging MRI exams. 2. Post-treatment restaging and tumor regression grading (TRG) 3. Surgical planning 4. Surveillance C) MR Rectal cancer exams 1. Technical uniqueness of acquisition 2. Imaging features of local disease 3. Standard synoptic report used in 95% of staging MR exams 4. Prediction of local recurrence and metastasis D) Secondary initiatives 1. Rectal cancer education program and goals of care 2. Data management 3. Quality improvement

### CRS (Cytoreductive surgery) + HIPEC or PIPAC: The Radiologist Verdict

#### Participants

Raquel Acosta Hernandez, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The therapeutic management of peritoneal carcinomatosis (PC) and pseudomyxoma peritonei (PMP) requires an assessment in multidisciplinary committees. The radiologist must report where each tumor burden is addressed using the a) PCI (peritoneal carcinomatosis index), b) presence of distant secondary disease (extraperitoneal) and c) tumor implants location in "danger zones" that would condition an incomplete CRS (Cytoreductive surgery). Not only the extent of the disease must be taken into account, but also other patients' individual factors and comorbidities as well as the resources available in each center. Multidisciplinary interaction constitutes the main pillar for a correct selection of patients who are candidates for CRS and subsequent intraperitoneal chemotherapy or, given the risk of incomplete CRS, consideration of other possibilities innovative palliative therapies, such as PIPAC.

#### TABLE OF CONTENTS/OUTLINE

Review the first peritoneal carcinomatosis (CP) evaluation approach: a) PCI (Peritoneal cancer index) b) Implant zones due to peritoneal fluid stasis. c) Implant zones: "Key locations" and d) Ascites and e) Extraperitoneal disease. Illustrate the "danger zones" and unfavourable tumor implants location: beyond the first CP check-points. Update of pseudomyxoma peritonei (PMP): a misunderstanding and controversial disease. Analyze the different types of treatment (surgery, HIPEC and PIPAC): assessment in multidisciplinary committees and focus on the role of radiologist in multidisciplinary committees.

GIEE-123

### Pre-operative Evaluation in Living Donor Liver Transplantation: A Roadmap for Radiologist

#### Participants

Hande Ozen Atalay, MD, Istanbul, Turkey (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Liver transplantation is the most effective treatment for liver failure. Because the number of cadaveric donors is not enough considering the high demand, the number of living donor liver transplantations (LDLT) has been on the rise, and right lobe transplantation accounts for 70 % of all LDLT. In pre-transplant imaging, there are many important issues that should be evaluated and noted in the report. Radiologists play a pivotal role in a transplantation unit and surgical planning. In the pre-operative evaluation of LDLT, choosing the appropriate liver segment for the recipient (right lobe, left lateral segment, etc.) and evaluating the liver in the donor candidate in terms of parenchymal lesions and diseases constitute the initial steps. The liver segmentation should next be done; the total liver volume and the volume of the liver segment to be transplanted are calculated. This step is essential for avoiding small-for-size syndrome in the recipient as well as liver insufficiency in the donor candidate. Recognition of vascular and biliary anatomical variations is critical because certain anatomical variations are accepted as contraindications to LDLT and may cause post-operative ischemia in the donor and recipient. To conclude, radiologists must be aware of their crucial role in the pre-operative imaging of LDLT.

#### TABLE OF CONTENTS/OUTLINE

-Living donor liver transplantation (LDLT) definition, types, and indications-Liver parenchymal evaluation, segmentation, and volume rendering-Important vascular and biliary variations in the LDLT-Contraindications of the right lobe and left lateral segment LDLT-Important issues to be noted in the pre-transplant radiological report -Conclusion

### **Gelatinous Jigsaw: A Pictorial Review of Mucinous Cystic Pancreatic Neoplasms**

#### **Participants**

Milind Rana, MD, Shreveport, TX (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

The goal is to educate the audience in recognizing the multi-modal imaging features of mucinous cystic pancreatic neoplasms (MCPN), with an emphasis on their clinical and pathological correlation. We will also characterize morphological features of different pancreatic cystic lesions and elucidate the imaging and histopathologic features of MCPN subtypes including mucinous cystadenoma, mucinous cystadenocarcinoma and intraductal papillary mucinous neoplasm (IPMN).

#### **TABLE OF CONTENTS/OUTLINE**

Mucinous cystic pancreatic neoplasm (MCPN) clinical overview Epidemiology Pathophysiology Classifying non-neoplastic and neoplastic MCPN subtypes Review MCPN multi-modal imaging features on Ultrasound (US), Computed Tomography (CT), and Magnetic Resonance Imaging (MRI) Imaging and histologic features of Mucinous Cystadenoma Imaging and histologic features of Mucinous Cystadenocarcinoma Key features of differentiating Intraductal Papillary Mucinous Neoplasm (IPMN) and its subtypes Treatment and Prognosis

### CT Guided Gastrostomy Placement: An Alternative Approach without Placement of Nasogastric Tube

#### Participants

Mohanad Kurdi, MD, Brooklyn, NY (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Computed Tomographic (CT) guided gastrostomy tube (G-tube) placement is an alternative to fluoroscopic techniques. CT guided G-tubes forego the placement of a nasogastric (NG) tube as insufflation of the stomach is performed via anterior abdominal wall percutaneous access. NG tubes cause a variety of problems, including patient discomfort, challenging placement, premature removal and malplacement. Cross sectional imaging allows for a global view of intra-abdominal structures, with more accurate localization of soft tissue structures. Compare and contrast CT and fluoroscopic guided techniques with pitfalls of both.

#### TABLE OF CONTENTS/OUTLINE

Background Indications and Contraindications Gastrostomy Tube Placement Techniques Disadvantages of Nasogastric Tubes CT Guided G-Tube Overview Technical Considerations CT versus Fluoroscopy Our Experience Discussion References

### **Worry or Go with the Flow: Perfusion Anomalies and Vascular Disorders of the Liver - A Primer for the Radiologist**

#### **TEACHING POINTS**

1. Understanding the imaging appearances and physiology of transient hepatic attenuation differences (THADs) on CT and transient hepatic intensity differences (THIDs) on MRI is crucial to aid the radiologist in diagnosing hepatic disease processes. 2. Recognizing perfusion anomalies in the liver is essential to avoid misinterpretation of "pseudolesions", a common pitfall for the training radiologist. 3. Familiarity with the pathogenesis and imaging features of hepatic vascular disorders helps guide correct diagnosis and patient management.

#### **TABLE OF CONTENTS/OUTLINE**

1. Physiology of hepatic perfusion a. Nutrient rich mesenteric venous inflow b. Compensatory nature of hepatic arterial and portal venous blood flow 2. Concept of THADs/THIDs a. Pathophysiology b. Case-based review of common etiologies: "Cs" of THAD/THID c. Strategies to avoid misinterpretation 3. Concept of streamline phenomenon a. Implications with case-based review 4. Concept of third inflow a. Implications with case-based review 5. Case-based review of miscellaneous vascular diseases a. Sinusoidal occlusion syndrome b. Budd Chiari c. Cavernous transformation and portal biliopathy d. Hepatic peliosis e. Hepatic ischemia secondary to TIPS

GIEE-127

### Borderline Pancreatic Cancer: Role of Cross Sectional Imaging in Therapeutic Decision Making

#### TEACHING POINTS

Borderline pancreatic ductal adenocarcinoma (BR-PDAC) is defined as a tumor potentially resectable but with anatomical (vascular involvement), biological (serum biomarkers) or clinical (performance status) conditions that may impact in free margin resections or postoperative outcomes. Anatomical BR-PDAC is at high risk for margin positive when surgery is upfront, so neoadjuvant chemotherapy and/or radiotherapy is considered to increase the chance of a R0 resections. Radiology is a significant tool concerning anatomical dimension, evaluating tumor - vessel relationships, being a pillar in decision making to choose the best therapeutic option for each patient. The images are also fundamental evaluating post-neoadjuvant response, contributing to evaluate tumor biology and responding patients. The objective of this exhibit is: 1) To review the role of imaging determining resectability status of tumors with detailed analysis in tumor - vessel contact of BR-PDAC. 2) To evaluate anatomical conditions that influences in surgical technique, particularly when vascular reconstructions are needed. 3) To review imaging response criteria post neoadjuvant therapy.

#### TABLE OF CONTENTS/OUTLINE

a) Tumor - venous contact analysis using Computed Tomography (CT) and Magnetic Resonance Imaging (MRI). b) Tumor - artery contact evaluation and its differences when comparing to vein analysis. c) How proper radiological identification of the characteristics of venous and/or artery involvement influence on surgical approach and vascular reconstruction techniques required for a successful surgery.

### Make it Simple-Imaging of the Postoperative Whipple

#### Participants

Ali Agely, MD, Jacksonville, FL (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The Whipple procedure (pancreaticoduodenectomy) is performed to resect pancreatic head or periampullary neoplasms. CT and (increasingly) MRI are performed in the acute and delayed postoperative settings, notably in patients with a complicated course. This presentation provides a comprehensive overview of various postoperative imaging findings after a Whipple procedure with emphasis on MRI. Familiarity with expected findings and postoperative complications gives the radiologist the knowledge to render a prompt and accurate diagnosis.

#### TABLE OF CONTENTS/OUTLINE

1) Surgical review 2) Normal, expected findings in the acute and delayed postoperative settings 3) Complications: Pancreatic fistula, Leak (gastrojejunostomy and biliary-enteric), anastomotic strictures, pancreatitis (acute and acute on chronic), hemorrhage, abscess, portomesenteric venous thrombus, tumor recurrence, delayed gastric emptying, and stent migration

### **GI and GU Fluoroscopy In Common Post-op Oncologic Surgeries: What You Need to Know About This Leaky Business**

#### **TEACHING POINTS**

1. Describe common gastrointestinal and genitourinary fluoroscopic procedures in oncology  
2. Illustrate the different techniques and indications for post op fluoroscopic examinations with key teaching points  
3. Demonstrate normal and abnormal fluoroscopic examinations including complications with emphasis on leaks

#### **TABLE OF CONTENTS/OUTLINE**

1. Introduction.  
2. Endoscopic evaluation versus double contrast studies.  
3. Surgical techniques of Ivor Lewis esophagectomy and its complications.  
4. Indications, techniques and imaging findings of single-contrast esophagram.  
5. Colonic and jejunal interposition.  
6. Surgical techniques for rectal surgeries and their complications.  
7. Indications, technique and imaging findings on single contrast enema.  
8. Indications, techniques and imaging findings of bladder surgeries and urinary diversions on cystogram, loopogram and pouchogram.  
11. Take-home messages.  
12. References.

### Late Postoperative GI Tract Evaluation: Identifying Complications Based on Surgical Technique

#### Participants

Daniel Montel, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To recognize and understand the surgical techniques performed at gastrointestinal tract surgeries. To enumerate the main late postoperative complications of the gastrointestinal tract surgeries and their imaging features. To correlate imaging findings in the evaluation of late postoperative period with the particularities of each gastrointestinal tract surgery. This enables the characterization of complications that may be related to postoperative anatomical changes, anastomosis, stomas, surgical incision on abdominal wall, or intra-abdominal adhesions.

#### TABLE OF CONTENTS/OUTLINE

- Introduction.
- Overview of late complications in gastrointestinal tract surgery.
- Review of surgical techniques in gastrointestinal tract surgery.
- Complications related to anastomosis.
- Complications related to postoperative anatomical changes.
- Complications related to adhesions.
- Complications related to intestinal stomas.
- Complications related to surgical incisions in the abdominal wall.
- Teaching points.

### Constipation, Stercoral Colitis, Hirschsprung Disease and Complications in Adults

#### Participants

Joel Gamble, MD,BSC, Toronto, ON (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Imaging is unreliable in establishing the diagnosis of constipation and directing routine management. Severe or chronic constipation can lead to serious complications, for which imaging is essential. Stercoral colitis is a potentially fatal complication of fecal impaction. High attenuation mucosa and perfusion defect are the most accurate features for fatal cases. The natural history of Hirschsprung disease epitomizes the complications of constipation. Despite surgical resection, many adults have chronic constipation, and a subset have serious constipation-related complications.

#### TABLE OF CONTENTS/OUTLINE

Constipation: Clinical diagnosis; recent literature that imaging does not correlate with bowel habit, predict symptoms of constipation, or reliably direct management decisions; imaging for complications of constipation. Stercoral colitis: Mucosal ulceration due to pressure ischemia, possible perforation; spectrum of findings severity. Hirschsprung disease: Absent ganglion cells in the submucosal and myenteric plexuses; symptoms into adulthood include constipation, straining, incomplete evacuation. various mechanisms of chronic constipation; late presentation of Hirschsprung in adulthood; complications include adhesional obstruction; fistula formation; obstipation; perforation

GIEE-131

### The Pinch and the Squeeze: A Review of Vascular Compression Syndromes

#### Participants

Hannah Lamberg, MD, Ann Arbor, MI (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Diagnosis of almost all vascular compression syndromes is largely clinically based. However, certain imaging findings can be suggestive of these syndromes, aiding in diagnosis and treatment. 2. Findings suggestive of a vascular compression syndrome include pre-stenotic vessel dilation, formation of varices, and compression of other structures (e.g. ureter, duodenum).

#### TABLE OF CONTENTS/OUTLINE

1. Brief introduction of vascular compression syndromes 2. Radiologic findings with accompanying CT examples including:- Nutcracker Syndrome- May-Thurner Syndrome- Pelvic Venous Congestion Syndrome (non-vascular compression syndrome)- Median Arcuate Ligament Syndrome- Superior Mesenteric Artery Syndrome- Chronic Ureteropelvic Junction Obstruction by crossing vessels- Ovarian vein syndrome. 3. Summary/Conclusions: Review of high-yield teaching points

### Imaging of Gallstones and Complications

#### Participants

Maria Zulfiqar, MD, MBBS, Scottsdale, AZ (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The purpose of this exhibit is to: 1. Identify various types of gallstones and discuss imaging techniques 2. Multimodality imaging review of the features of gallstones and their complications 3. Discuss pitfalls and mimics of gallstones.

#### TABLE OF CONTENTS/OUTLINE

There are three main types of gallstones: Cholesterol (10%), Pigmented (10%) and mixed (80%). Ultrasound is the superior imaging modality for detection of gallstones as up to 20% stones are not calcified and CT occult. CT is better to detect gallstone complications. Dual Energy CT utilizes low KV, calcium-based and lipid-based imaging and more sensitive than single energy CT to detect gallstones. Gallstone complications: Acute cholecystitis; Acute cholangitis; Mirizzi Syndrome; Biliary-enteric fistulae; infected fallen gallstones; post-cholecystectomy syndrome. Pitfalls and Mimics: Assessment of stone impaction; gallbladder polyps; cystic artery pseudoaneurysm, enteroliths. Summary: Gallstones are common seen on imaging and can serve as a nidus for infection/inflammation; cause biliary outflow obstruction or fistulize to adjacent structures necessitating prompt diagnosis sometimes utilizing multimodality imaging, treatment and intervention.

### Don't Judge a Gallbladder by Its Wall

#### Participants

Sara Siguenza-Gonzalez, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Radiologists are very used to cholecystitis in daily clinical practice, but there are other entities that affect the gallbladder (GB): Classification and description of those entities according to a pathological point of view. Principal radiographic features of each disorder in ultrasound (without and with contrast), CT (including spectral CT) and MRI. Key points to guide the differential diagnosis of the main pathology of the GB.

#### TABLE OF CONTENTS/OUTLINE

1. An approach to the anatomy and physiology of the GB. Description of normal anatomy, anatomic variants and congenital features. 2. Describe benign entities, idiopathic diseases (cholesterolosis and adenomyomatosis) and bile stasis diseases. 3. An update of premalignant gallbladder polyps. 4. Analyze malignant pathology, including primary tumours (gallbladder carcinoma and cholangiocarcinoma) and secondary tumours (metastasis and lymphoma). 5. A portrayal of others disorders in the GB: traumatic pathology, secondary causes of diffuse gallbladder wall thickening and inflammatory diseases beyond acute cholecystitis.

### Imaging Characteristics of Pancreatic Serous Cystadenoma and Common Imitators

#### Participants

Nikolas Brozovich, MD, Augusta, GA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1) Pathophysiology of Pancreatic serous cystadenoma.2) MR characteristics of Pancreatic serous cystadenoma and its subtypes.3) Cystic pancreatic lesions mimicking serous cystadenoma.4) Aggressive features of atypical serous cystadenomas.5) Utility of endoscopic ultrasound and fluid aspiration for definitive diagnosis.

#### TABLE OF CONTENTS/OUTLINE

Pancreatic cystic neoplasms are commonly encountered in practice and reported on 20-40% of abdominal MRI scans compared to only 3% of CT scans. Serous cystadenoma of the pancreas can have similar characteristics to other benign and malignant pancreatic lesions. The microcystic form of Pancreatic serous cystadenoma has classic features with a pathognomonic enhancing scar and stellate calcifications seen in 30% of cases.1) MR features of microcystic, macrocystic, oligocystic, and solid pancreatic serous cystadenoma subtypes.2) Atypical aggressive features including parenchymal atrophy, ductal dilatation, and vascular/local invasion.3) Common mimics including Mucinous cystic pancreatic neoplasm(MCPN), Solid pseudopapillary epithelial neoplasm(SPEN), Intraductal papillary mucinous neoplasm(IPMN), pseudocyst, lymphoepithelial cyst, cystic neuroendocrine tumor(NET), and adenocarcinoma.4) Von Hippel-Lindau syndrome- Increased incidence of developing Pancreatic serous cystadenoma and other benign and malignant tumors of various organs.

### Barriers to Adopting LI-RADS and Steps to Overcome

#### Participants

James Lee, MD, (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1) The Liver Imaging Reporting and Data System (LI-RADS) is a reporting system for the classification of hepatocellular carcinoma (HCC) that continues to grow in adoption throughout North America including important steps of alignment with both the American Association for the Study of Liver Disease (AASLD 2018) and the Organ Procurement Transplant Network (OPTN 2022) 2) Despite growing adoption, radiologist still encounter barriers to implementation within their own clinical academic departments, from referring physicians and surround community practices.3) An understanding of different barriers that may face radiologists and referrers towards the adoption of LI-RADS is an important step to overcoming these obstacles.

#### TABLE OF CONTENTS/OUTLINE

I. Review LI-RADS purpose to standardize reporting and data collection for patients at risk for developing HCCII. Illustrate the growth of LI-RADS adoption over the past decadeIII. Describe the barriers to adoption of LI-RADS from both the radiologist and referring providers point of viewIV. Explain how to overcome barriers from the experiences encountered from our multiple (12) institution collaborative.

GIEE-139

### Crohn's Disease: Step by Step in MRI

#### Participants

Natalia Zuniga, MD, Cali, Colombia (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Active disease is characterized by wall thickening and edema and or ulceration. Wall thickening alone, without the supporting features of oedema or ulceration, often indicates inactive disease, particularly if the wall is dark on fat-suppressed T2WI. Functional techniques such as DWI and motility imaging provide ways to quantify disease activity, monitor, and even predict therapeutic response. Complications can be divided into stricturing, penetrating, related to short bowel and development of malignancy. Characterization of strictures requires a fixed luminal narrowing with upstream dilatation greater than 3 cm. The strictures should be differentiated between inflammatory luminal narrowing or fixed fibrosis, and should be measured the length of the stricture. Contrast enhancement may be useful, but active and fibrotic disease both enhance. Early enhancement is more typical for active CD whereas delayed enhancement may indicate established fibrosis. It is useful to distinguish between response to treatment and imaging remission. Response implies a significant reduction of the inflammatory burden, and imaging remission implies the abolition of all activity. Scores are not routinely applied in clinical practice, however their knowledge is necessary for the description of mild, moderate and severe disease, which is sufficient.

#### TABLE OF CONTENTS/OUTLINE

Definition and initial diagnosis. Disease Activity. Disease phenotype. Non-stricturing, non-penetrating (inflammatory). Stricturing Disease. Penetrating Disease. Depict and quantify the degree of inflammatory activity. Severity. Therapeutic monitoring and response to treatment. Preoperative mapping. Postoperative recurrence

### Abdominal Tuberculosis: Think About It

#### Participants

Nerea Torena, Madrid, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Review abdominal tuberculosis, findings, and possible differential diagnoses. 2. To present cases of abdominal tuberculosis diagnosed at our centre in the last 5 years.

#### TABLE OF CONTENTS/OUTLINE

In Europe Tuberculosis has an average incidence of 26 cases per 100000 inhabitants. Pulmonary disease is the most frequent, abdominal involvement occurs in 11-12% of patients with extrapulmonary tuberculosis. Most frequently it affects the genitourinary tract, lymph nodes, peritoneum, and solid viscera, mainly the liver, spleen, and pancreas. Symptoms can be nonspecific; most commonly fever, abdominal pain, and weight loss. The radiological findings are not pathognomonic, but may be suggestive if considered with clinical, immunological status, and demographic origin. Abdominal disease can simulate multiple conditions: lymphoma, Crohn's disease, adenocarcinoma, carcinomatosis, etc. Tuberculosis cases diagnosed at our hospital in the last 5 years have been reviewed, 262 cases. 18 patients (6.8%) with abdominal involvement detected by imaging techniques. Radiological findings of each location will be discussed and depicted. Genitourinary, hepato-splenic, peritoneal, intestinal, lymph node and pancreatic tuberculosis will be shown. Differential diagnoses of each location will be reviewed. Abdominal tuberculosis diagnosis is complicated. Imaging findings are usually nonspecific and present in a very diverse way mimicking different diseases. It is important to suspect this pathology and establish its diagnosis to start the most appropriate treatment as soon as possible.

### Post-operative Complications of Cholecystectomy: What the Radiologist Needs to Know

#### Participants

Kazi Irfan, MD, FRCR, Columbia, MO (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Surgical anatomy of the gall bladder fossa. 2. Variants in the vasculature and biliary anatomy predisposing to injuries. 3. Types of cholecystectomy surgical approaches. 4. Imaging overview of indications of cholecystectomy. 5. Algorithm for imaging approach to diagnose acute cholecystitis. 6. Appropriate use of multimodality imaging in the diagnosis of post-operative complications. 7. Expected post-surgical changes. 8. Spectrum of post-surgical complications

#### TABLE OF CONTENTS/OUTLINE

Introduction:-Cholecystectomy is among the most commonly performed abdominal surgeries-Can be performed by either laparoscopic or open approaches  
Common indications for cholecystectomy: Acute/chronic cholecystitis, symptomatic cholelithiasis, gallstone pancreatitis, gall bladder masses/ polyps  
Multimodality imaging in diagnosis and management of post-surgical complications:-Computed Tomography (CT): primary imaging modality-Magnetic resonance Imaging (MRI): Ideal for biliary anatomy. Hepatobiliary excreted contrast (Eovist) can confirm bile leak-Ultrasound-Hepatobiliary scintigraphy-Fluoroscopy: Transhepatic and T-tube cholangiograms-Angiography  
Postsurgical complications of cholecystectomy:-Collections? \*Expected postsurgical seroma/hematoma? \*Bile leak or biloma (can be secondarily infected)? \*Hematoma? \*Abscess?-Bile duct injuries (can be associated with bile leak or biloma)? \*Stricture? \*Ligation or transection?-Gallstone related? \*Retained or new gallstones in CBD or remnant cystic duct? \*Dropped gallstones?-Vascular? \*Active bleed? \*Pseudoaneurysms? \*Vascular occlusions?-Other? \*Cholecystitis in residual gall bladder? \*Bowel injury? \*Clip migration?

### Navigating the Labyrinth of Peritoneal and Retroperitoneal Anatomy: Abdominal Disease Spread Made Easy

#### Participants

Janardhana Ponnatapura, MD, Winston Salem, NC (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Essential to understanding disease spread in abdomen is to separate the peritoneum from the retroperitoneum. These areas have distinct anatomy with well-define separate pathways. The peritoneum is comprised of connected recesses that are potential spaces, normally not imaged except when containing excess fluid or air. Peritoneal recesses are formed by the opposing peritoneal surfaces and subdivided by the attachments of the ligaments and mesenteries to the parietal peritoneum. Disease flows within the recesses by changes in abdominal pressure. This forms a distinct spread pattern. The retroperitoneum is stratified by the renal fascia into the anterior and posterior pararenal spaces and the perirenal space. The fascia contains and directs spread from the contained organs with the compartments. Each space has a unique spread pattern defined by the containing fascia. The anterior pararenal space is connected to the mesenteries and ligaments forming the subperitoneal space. This space interconnects the retroperitoneum with the mesenteries allowing for the normal continuum of blood vessels, lymphatics, and nerves but also forms the pathways for bidirectional spread of disease.

#### TABLE OF CONTENTS/OUTLINE

- Anatomy
- Clinical embryology
- Fundamental concept of the subperitoneal space
- Distinguishing intraperitoneal spread from subperitoneal spread
- New planes of retroperitoneum
- Patterns of spread of disease from the;- Liver-Distal esophagus and stomach- Pancreas-Small intestine-Large intestine-Renal and adrenal
- Mechanisms of spread of disease (fluid, gas and soft tissue)- Subperitoneal-Intraperitoneal-Contiguous invasion
- Clinical and radiological applications

GIEE-143

### Hepatic Transplantation Assessment: What Radiologists Should Know

#### Participants

Carmen Gonzalez-Carrero Sixto, MD, Santander, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Review the surgical techniques used in liver transplantation for vascular anastomosis. Describe the normal findings immediately after the procedure. Expose the most frequent acute postoperative vascular complications.

#### TABLE OF CONTENTS/OUTLINE

1. BACKGROUND: Liver transplant is the treatment of choice for end stage liver disease. Morbidity and mortality have significantly been reduced thanks to advances in surgical techniques, immunosuppressive therapy and multidisciplinary team approach. We radiologists play a key role in the diagnose and follow-up of possible complications. 2. SURGICAL TECHNIQUE 3. NORMAL FINDINGS: in the first 24 to 48 hours after a liver transplant, US must be performed. 4. VASCULAR COMPLICATIONS: - Hepatic artery: thrombosis, stenosis, pseudoaneurisma. - Portal vein: thrombosis, stenosis. - Suprahepatic veins: thrombosis, stenosis. 5. CONCLUSION: After a liver transplant imaging techniques are important to rule out and follow up possible complications. There are some normal findings in the immediate postoperative period but radiologists need to know how to identificate abnormal features suspicious of complications.

GIEE-144

### Head with Two Tales: Early Spread of Disease from the Pancreas

#### Participants

Janardhana Ponnatapura, MD, Winston Salem, NC (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The head of the pancreas can be considered as two separate entity with distinct embryological variations. During embryology the ventral pancreatic bud becomes the caudal portion and the uncinata process of the head of the pancreas, while the dorsal bud becomes the cranial portion of the head. This embryology results in anterior and posterior components of the head of the pancreas each having their distinct vascular supply, nerve supply and lymphatic drainage. It is essential for the radiologist to appreciate that this results in two distinct spread patterns from the head of the pancreas. This knowledge about the early disease spread from the head of the pancreas becomes important particularly in the case of tumor as the radiologist can confidently predict, and diagnose the metastatic spread knowing the origin of the tumor.

#### TABLE OF CONTENTS/OUTLINE

- Anatomy of the pancreas
- Clinical embryology of the head of the pancreas
- Fundamental concept of the two heads of the pancreas
- Distinct vascular supply
- Distinct nerve supply
- Distinct lymphatic supply
- Distinguishing the different disease spread from the anterior head and posterior head
- How imaging helps in successfully identifying the early spread
- Important anatomical landmarks to help recognizing the spread of the disease
- Patterns and mechanisms of early spread of the tumor
- Clinical and radiological applications
- Algorithm to predict the spread of metastatic disease from the head of the pancreas

Printed on: 04/12/24

GIEE-145

### The 'New' 2023 American Association for the Study of the Liver Disease (AASLD) Practice Guidance on the Diagnosis and Management of Nonalcoholic Fatty Liver Disease (NAFLD): Radiologists' Perspective

#### Participants

Eri Osta, BS, San Antonio, TX (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Familiarize audience with 2023 AASLD practice guidance statement for diagnosis management of Nonalcoholic fatty liver disease (NAFLD) with special emphasis on imaging-related statements.
- Discuss imaging biomarkers other non-invasive tests in risk assessment of NAFLD patients.
- Review complementary roles of liver function tests, Fibroscan, shear wave Elastography MRI PDFF in assessing hepatic steatosis, fibrosis "at-risk" nonalcoholic steatohepatitis (NASH).
- Discuss ongoing research advances role of AI-based tests in NAFLD

#### TABLE OF CONTENTS/OUTLINE

- Introduction
- Epidemiology: Prevalence and demographics of NAFLD.
- Spectrum of NAFLD: Pathophysiology, stages, and progression - Nonalcoholic fatty liver (NAFL), Nonalcoholic steatohepatitis (NASH), at-risk NASH, advanced fibrosis cirrhosis
- Predictors of clinical outcomes in NAFLD: Identifying high-risk patients: fibrosis-4 (FIB-4) scoring system
- Diagnosis and Assessment of NAFLD
- Hepatic steatosis: Ultrasound, Fibroscan/Controlled attenuation parameters (CAP) MRI-PDFF techniques
- "At-risk" NASH Evaluating FAST (Fibroscan + AST levels), MAST (MRE + AST levels), MEFIB (MRE + FIB-4) scoring systems.
- Advanced fibrosis: Assessing extent of fibrosis with Fibroscan/VCTE MRE
- Cirrhosis Rule in/out irreversible fibrosis
- Future directions Ongoing research
- Conclusion Recent developments in NAFLD have led to substantial advancements in biomarkers therapeutics, with significant implications for radiologists collaborating with multidisciplinary care teams. Emerging imaging non-imaging biomarkers can exclude advanced liver disease or identify patients at an increased risk for cirrhosis.

### Pancreatic Duct Anomalies: A Primer for Trainees

#### Participants

Hatem Al Kashroom, MD, Syracuse, NY (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Pancreatic duct anomalies are rare but can cause significant health problems if not detected early. 2. The two main types of congenital pancreatic duct anomalies are pancreas divisum and annular pancreas. 3. Symptoms of pancreatic duct anomalies may include abdominal pain, nausea, vomiting, and weight loss. 4. Diagnosis usually involves imaging tests such as MRI (MRCP) and/or CT scan. 5. Overview of the acquired pancreatic duct anomalies 6. Patients with a family history of pancreatic duct anomalies or pancreatitis may be at higher risk and should discuss screening options with their healthcare provider.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction to normal pancreatic anatomy and embryology 2. Pancreatic divisum and divisum types 3. Annular pancreas 4. Acquired pancreatic duct anomalies 5. Diagnostic tests and preferred imaging modalities

Printed on: 04/12/24

## Abstract Archives of the RSNA, 2023

GIEE-147

### What The Radiologist Needs To Know About Pseudomyxoma Peritonei And HIPEC

#### Participants

Natalia Zuniga, MD, Cali, Colombia (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The mucinous deposits tend to follow routes of normal peritoneal fluid flow, there are watershed regions in the peritoneal cavity where cells can be deposited to form implants. Signs of peritoneal metastases include the presence of peritoneal nodules, thickening, or fat stranding. A peritoneal cancer index greater than 20 is considered a poor prognostic factor. CT provides anatomic imaging. MRI provides a combination of anatomic imaging and tumor functional imaging. PET imaging provides functional imaging based upon an assessment of the tumor's metabolism of glucose. T1WI and T2WI sequences provide anatomic details to precisely localize the larger peritoneal tumors and nodules, but are relatively insensitive for depicting small peritoneal tumors and subtle fat stranding. DWI are particularly useful for depicting mucinous lesions due to the conspicuity of high signal intensity mucin and fluid within these tumors. Peritoneal tumors enhance with intravenous gadolinium increasing their conspicuity. The combination of hyperthermia and high concentration chemotherapy used in HIPEC can also alter physiological healing, which may increase the incidence of vascular, lymphatic, gastrointestinal, urological and diaphragmatic complications.

#### TABLE OF CONTENTS/OUTLINE

Terminology. Pseudomyxoma peritonei. Hyperthermic Intraperitoneal Chemotherapy (HIPEC). Peritoneal anatomy and physiology. Preoperative imaging. Establish the presence or absence of peritoneal metastases. Quantitation of the radiologic Peritoneal Cancer Index. Description of extraperitoneal metastases. Postoperative imaging. Normal findings. Features indicative of complications.

Printed on: 04/12/24

## Abstract Archives of the RSNA, 2023

GIEE-148

### Off the Wall: Incidental Muscle Pathology on Abdominopelvic Imaging

#### Participants

Benjamin Northrup, MD, Chesterfield, MO (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The use of cross-sectional imaging has increased exponentially, and incidental musculoskeletal findings have become commonplace. These are frequently referred to as “the radiologist’s blind spot.” Recent publications offer detailed review of abdominal wall pathology. However, the differential diagnosis for abnormalities of the paraspinal and pelvic musculature is often distinct. This review will familiarize radiologists with these unique and often overlooked pathologies and with management recommendations.

#### TABLE OF CONTENTS/OUTLINE

1. Abdominopelvic muscle anatomy
2. Congenital and structural abnormalities
3. Metabolic abnormalities (diabetic myonecrosis, rhabdomyolysis, hyperparathyroidism)
4. Vascular (arteriovenous malformations, ischemic myonecrosis)
5. Inflammatory myopathy (inflammatory myositis, sarcoidosis, drug-related, HIV, radiation, crystalline)
6. Infectious (poliomyelitis, cysticercosis, infectious myositis)
7. Sequelae of injury and trauma (DOMS, tears, hematoma, bursitis, heterotopic ossification, myositis ossificans)
8. Neoplasia (primary and metastatic malignant neoplasms, benign neoplasms)
9. Atrophy (denervation myopathy, end-stage inflammation, sarcopenia)
10. Normal variants and pitfalls (accessory and anomalous muscles, injection granulomata, lipohypertrophy)
11. An algorithmic approach to incidental musculoskeletal abdominal findings

Printed on: 04/12/24

## Abstract Archives of the RSNA, 2023

GIEE-149

### Peritoneal Carcinomatosis and HIPEC

#### Participants

Victoria John, MBChB, Stockport, United Kingdom (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Peritoneal carcinomatosis occurs from spread of a primary cancer to the peritoneum, most commonly from the gastrointestinal tract and ovary. Pseudomyxoma peritonei is a rare type of peritoneal carcinomatosis characterised by accumulation of mucinous ascites and mucinous peritoneal deposits secondary to intraperitoneal spread of a mucin-producing primary tumour. Cytoreductive surgery (CRS) and hyperthermic intraperitoneal chemotherapy (HIPEC) in suitable patients offers a chance for cure and is the mainstay of treatment in lower grades tumours, for which current chemotherapy regimes are of limited effect. Pre-operative imaging is key in determining patients' suitability for CRS/HIPEC with regards to tumour burden. Factors include the Sugarbaker Peritoneal Cancer Index (PCI), ascites and abdominal wall involvement, unfavourable sites of disease, presence of small bowel and mesenteric disease, as well as extra-peritoneal metastases. The most commonly used imaging modalities are CT and dedicated abdominal MRI. It is recognised that CT may underestimate the degree of disease, whilst MRI with peritoneal protocol has a higher sensitivity and may provide more accurate description of disease extent for the operating surgeon.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction. 2. Peritoneal Anatomy. 3. Imaging techniques in peritoneal carcinomatosis including recommended protocols in CT and MRI. 4. Types of peritoneal carcinomatosis including pseudomyxoma peritonei. 5. Treatment of peritoneal carcinomatosis with cytoreductive surgery and HIPEC. 6. Adverse sites of disease on imaging. 7. Summary.

### Contrast-enhanced Ultrasound (CEUS), More Than Just Bubbles: Diagnostic and Interventional Applications in Daily Clinical Practice

#### Participants

Paul Lopez, MBBS, Donostia-San Sebastian, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

-To learn the potential applications of CEUS throughout the body. -To understand the value of CEUS both in diagnostic and interventional procedures.

#### TABLE OF CONTENTS/OUTLINE

Since its introduction into clinical practice in the late 1990s, CEUS has gained popularity among radiologists as a diagnostic tool in multiple organ systems, and more recently in radiological interventionism. This is due to its great advantages, which include real-time imaging, high contrast resolution and absence of nephrotoxicity among others. This work will review the potential applications of CEUS in daily clinical practice based on cases of our center. -Liver: characterization of benign and malignant focal lesions, role in hepatocellular carcinoma, interventional procedures. -Gallbladder: tumor versus inflammatory process and biliary mold. -Kidney: complex cystic lesions and tumors, interventional procedures. -Urinary tract and bladder: tumor versus clot, grading vesicoureteral reflux in children. -Thyroid: ablation procedures. -Inflammatory bowel disease: evaluation of inflammatory activity, treatment monitoring, fibrous versus inflammatory strictures? -Interventional radiology: guide for percutaneous biopsies, tumor ablations and drain placement, post-ablation surveillance? -Vascular applications: thrombus detection and evaluation, hemorrhage detection?

### Metastatic Lobular Breast Cancer: What the Abdominal Radiologist Needs to Know

#### Participants

David Fidler, MBBS, London, United Kingdom (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

-Invasive lobular breast carcinoma (ILC) has a predilection for abdominal and pelvic metastases, with a distinctive distribution and distinctive imaging features. -Three important patterns of abdominal metastasis: Infiltrative submucosal and subserosal metastasis to abdominal and pelvic viscera, mimicking primary abdominal and pelvic malignancy, for example stomach carcinoma (linitis plastica type), colonic carcinoma, uterine and bladder carcinoma; Diffuse peritoneal metastasis, mimicking metastatic ovarian cancer/primary peritoneal neoplasm; Retroperitoneal metastasis, mimicking lymphoma or retroperitoneal fibrosis. -Appears on imaging as smooth, infiltrative lesions, without extramural extension and without desmoplastic reaction. Long segment and multi-organ involvement is typical. MRI signal partially reflects the target organ. -Metastases can occur many years after primary malignancy, and therefore may not be clinically suspected. The radiologist at the MDT may be the first to suggest the diagnosis. -The lesions may not be evident at endoscopy and may be missed on superficial biopsy, therefore radiological suspicion is key

#### TABLE OF CONTENTS/OUTLINE

-Patterns of abdominal metastasis: GI and GU tract; Peritoneum; Retroperitoneum. -Imaging features. -Why is this important to me?

Printed on: 04/12/24

### Transplantation for Type 1 Diabetes: Radiologist's Primer on Pancreatic, Pancreatic-kidney and Islet Cell Transplantation Imaging

#### TEACHING POINTS

1) Overview of transplantation procedures for type 1 diabetes with imaging of pancreatic, pancreatic-kidney and novel strategy of islet cell transplantation. 2) Highlight the clinical indications, surgical anatomy, procedure techniques, pre and post-transplantation imaging. 3) Review expected imaging acquisition parameters for US, CT and MRI. 4) Describe immediate, early and delayed complications of pancreatic, pancreatic kidney and islet cell transplantation.

#### TABLE OF CONTENTS/OUTLINE

- Introduction: Multimodality imaging of pancreatic, pancreatic-kidney and islet cell transplantation with emphasis on transplantation-related complications. Outline
- Pancreatic and pancreatic-kidney transplant-Assessment of donor pancreas and graft implantation.-Imaging modalities: US, CT, MRI, angiography.-Complications: Vascular (Thrombosis, Pseudoaneurysm), transplant pancreatitis, intestinal complications (Leak, Bowel obstruction, Fistula).
- Islet cell transplantation-Pretransplant imaging: Chest x ray, abdominal US-Technique: Portal venogram, islet cell infusion, tract embolization.-Post-transplant imaging: Ultrasound, PET, SPIO MR imaging-Complications: Early (Hemorrhage, Portal vein thrombosis, Arteriportal fistula) and delayed (Heterogenous hepatic steatosis, Immunosuppression related effects).

GIEE-152

### Mucking Up the Abdomen: Common and Uncommon Presentations of Pseudomyxoma Peritonei

#### Participants

Ethan Zaccagnino, MD, Los Angeles, CA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Pseudomyxoma Peritonei (PMP) is an entity characterized by mucinous ascites due to the spread of mucin producing neoplasms. It commonly presents as acute appendicitis or RLQ pain with imaging revealing a mucocele of the appendix. Mucocele rupture may cause spread of tumor into the abdomen resulting in peritoneal implantation. Less common sites of origin include gallbladder, small intestine, pancreas, breast and ovary/fallopian tubes. Imaging findings include mucinous or soft-tissue peritoneal implantations and mass effect or scalloping of the abdominal viscera. Ultrasound may detect mucinous ascites or discrete tumors, however cross-sectional imaging with CT or MR is preferred to characterize PMP. Treatment options include surgical debulking and Hyperthermic Intraperitoneal Chemotherapy (HIPEC). Serial imaging is often warranted, as recurrence is common.

#### TABLE OF CONTENTS/OUTLINE

1. Intro to pseudomyxoma peritonei (PMP). 2. Mucinous tumors (low and high grade appendiceal mucinous neoplasms, as well as mucinous adenocarcinoma) and sites of origin. 3. Epidemiology of mucinous tumors and PMP. 4. Multimodality imaging features of mucinous tumors and PMP. 5. Treatment (HIPEC and surgical debulking) and complications (mucinous ascites and recurrence) of PMP. 6. Mimics of PMP as well as situations in which mucinous tumors and PMP can mimic non-neoplastic entities. 7. Common and uncommon presentations. 8. Summary and conclusion.

### Integrating Intestinal Ultrasound (IUS) into an Inflammatory Bowel Disease (IBD) Imaging Service

#### TEACHING POINTS

- Successful control of Crohn's Disease (CD) relies on effectively suppressing inflammation which requires ongoing monitoring. - A number of trials have validated intestinal ultrasound (IUS) as having excellent diagnostic accuracy in patients with CD, performing comparably to established modalities such as MRI. International guidelines recommend that newly diagnosed CD patients undergo small bowel assessment with IUS or MR enterography. - Additionally, ultrasound is cost-effective, widely available and better tolerated by patients which is crucial when regular monitoring is required. - A one-stop clinic where patients undergo IUS with subsequent assessment by a gastroenterologist enables timely implementation of a targeted management plan for better disease control. - Operators must have appropriate training and experience with IUS as well as a methodical and reproducible technique for accurate disease assessment. - With sufficient operators trained in IUS, it may also be offered as a point-of-care test in the emergency department. - Oral and intravenous contrast may be used in IUS selectively to provide additional information. - A reporting template can serve as a useful aid to performing a comprehensive study. Successful implementation requires multidisciplinary input involving radiology, gastroenterology, and surgery.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction 2. One-stop clinic 3. Resources 4. Technique 5. Sonographic appearances of IBD: Case Studies 6. Summary

### The Hepatic Angiomyolipoma: A Guide to Avoiding a Big Fat Mistake

#### Participants

Ana Paula Fraga Cintra Gonzaga, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Provide an overview of hepatic angiomyolipoma (HAML). Discuss typical and atypical cases of HAML with an emphasis on imaging features. Review the main differential diagnoses of HAML with a didactic approach. Offer useful tips for challenging cases to enhance accurate diagnosis and patient outcomes. Develop a radiological survival guide for interpreting fat hepatic nodules.

#### TABLE OF CONTENTS/OUTLINE

HAML is a rare tumor with a combination of blood vessels, smooth muscle, and varying degrees of mature fat. Despite limited research on HAML, this presentation aims to offer a comprehensive overview of the key features of this lesion, including epidemiology, associations (such as tuberous sclerosis), pathology, radiographic features, prognosis, and treatment. Using case-based presentations, we will explore both classical and uncommon imaging manifestations of HAML, including potential malignant behavior. Additionally, the presentation will discuss the differential diagnosis of HAML, ranging from benign lesions (lipoma, nodular hepatic steatosis, steatotic adenoma, and focal nodular hyperplasia) to malignant neoplasms (HCC and metastasis). Tips for differentiating these diagnoses based on imaging and other clinical factors will be provided. Provide tips for challenging cases where the diagnosis may not be apparent from imaging alone, and radiologists can still play a critical role in contributing to better patient outcomes. Propose a radiological survival guide. This guide will summarize key radiographic and non-radiographic features of HAML, along with differential diagnoses and important clinical considerations, to assist radiologists in accurate diagnosis and appropriate patient management.

### Bariatric Surgery: A Pictorial Review. From Post-Surgical Anatomy to Complications

#### Participants

Maria Galante I, MD, (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- To describe the normal postsurgical anatomy of the most common bariatric surgery techniques.- To analyze the most frequent complications of each of them, with CT and fluoroscopic imaging.- To present CT images of interesting cases of patients that have undergone bariatric surgery procedures.In this exhibit we will review the most frequent bariatric techniques and their complications, that are divided in late and early depending on the postoperative period in which that may appear (more or less than one month). Older procedures such as vertical-banded gastroplasty and jejuno-ileal bypass will not be assessed.

#### TABLE OF CONTENTS/OUTLINE

1. Generalities and indications of bariatric surgery  
2. Classification  
3. Post- surgical imaging control protocol  
4. Restrictive Surgeries: Anatomical imaging features and main complications  
4.1 Adjustable Gastric Banding  
4.2 Sleeve Gastrectomy  
5. Restrictive and Malabsorptive Procedures: Anatomical imaging features and main complications  
5.1 Roux-en-Y- Gastric Bypass  
5.2 Anastomosis duodenoileal bypass (SADI-s), minigastric bypass, duodenal switch  
6. Conclusions

### Tricky abdominal cases: Practical approach using Spectral CT

#### Participants

Ana Villanueva, MD, Toronto, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To learn the benefits of spectral CT applications in challenging abdominal imaging cases  
2. Role of spectral CT in patient's care, how we can change management decisions

#### TABLE OF CONTENTS/OUTLINE

1. Background: Revision of basic concepts of spectral CT.  
• Definition  
• Types of Spectral CT available in the market  
• Review of different material decomposition applications  
2. Review of challenging abdominal and pelvic cases.  
• Case-based and interactive format- The reader will be able to click on different stories to go through broad spectrum of cases covering most of abdominal and pelvic organs- We will display daily situations where the radiologist could feel stuck while reporting the CT- Companion quiz questions and teaching points/tips will be shown- Updated literature will be provided for each case. By clicking on each reference, the reader will be redirected straight to the actual paper  
• To propose an algorithm to guide the radiologist to accurately reach the diagnosis  
• To demonstrate how spectral CT is useful for problem solving and the radiologist could aid in successful decision-making and avoid additional imaging or procedures  
3. Limitations of spectral CT  
4. Conclusion

### Don't Be Thrown for a Loop! A Review of Internal Hernias for the Abdominal Imager

#### TEACHING POINTS

Internal hernias are herniations of abdominal viscera, usually small bowel, through congenital or acquired openings of the peritoneum or mesentery. Internal hernias can obstruct and are considered surgical emergencies due to the high risk of bowel strangulation. If complications such as bowel obstruction or ischemia are not present, then imaging findings of internal hernia will consist primarily of displacement of normal abdominal structures. After reviewing this exhibit, the viewer will be familiar with the various kinds of congenital and acquired hernias, as well as the epidemiology, surgical risk factors, imaging appearance, and complications associated with internal hernias.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Congenital Hernias 2a. Brief review of embryology and general anatomy Types of Hernias with accompanying cases. 2b. Lesser Sac (Foramen of Winslow). 2c. Left paraduodenal (Fossa of Landzert). 2d. Right paraduodenal (Fossa of Waldeyer) 2e. Pericecal 2f. Transomental: Greater Omentum and Lesser Omentum 2g. Sigmoid 2h. Broad Ligament 3. Acquired/Iatrogenic 3a. Introduction to Acquired Hernias and commonly associated surgeries 3b. Roux en Y/ Gastric Bypass: Description of Procedure and Associated Hernias 3c and d. Epidemiology, Anatomy, and Imaging appearance of: transmesenteric and jejuno-jejunostomy hernias 3e. Left colectomy and low anterior resection 3f. Epidemiology, Anatomy, and Imaging appearance of the following: herniation of the small bowel inferior to the neorectum. 4. Complications 4a. Bowel obstruction, including closed loop 4b. ### Periportal Lesions - Tiny Space, Huge Possibilities

#### Participants

Cynthia Borborema, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- To review the anatomy of the periportal space and its pathophysiology;
- To present the most relevant anatomical variants.
- To compartmentalize the periportal lesions through a series of cases.
- To introduce the disorders that may affect that space with a brief review of the clinical context and imaging findings.

#### TABLE OF CONTENTS/OUTLINE

- The periportal region is the anatomic space around the portal vein and its intrahepatic branches composed of hepatic artery branches, bile duct branches, lymphatics, and nerves that can be affected by a variety of pathological conditions. Due to its complex anatomical architecture and the wide possibility of lesion natures, involvement of the periportal space can be a diagnostic challenge for radiologists.
- Review of periportal anatomy with didactic illustrations of the main anatomical variants.
- In this presentation periportal lesions will be divided into the following categories: vascular (pathologies of the portal vein and hepatic artery), lymphatic (pathologies of periportal lymphatics), neural (pathologies of periportal nerves), periportal space as a pathway for diseases to spread and miscellanea.
- A complete case-based review of common (periportal edema, portal biliopathy, peribiliary cysts, infectious diseases) and unusual disorders involving the periportal space, such as segmental arterial mediolysis, metastatic calcifications, plexiform neurofibroma, extramedullary hematopoiesis, amyloidosis, lymphangioma, hepatic artery giant pseudoaneurysm, ganglioneuroma, schwannoma.

### The Anatomy of Normal and Abnormal Swallowing

#### Participants

Nancy J. McNulty, MD, (*Presenter*) Book contract, Oxford University Press

#### TEACHING POINTS

The oral cavity, pharynx, larynx, and surrounding muscles, bones and cartilaginous structures work together in a sophisticated and coordinated way to achieve normal swallowing. Accurate diagnosis of swallowing dysfunction requires a comprehensive understanding of what is normal, and how normal structures work in a coordinated fashion to achieve deglutition. This exhibit will review the components of swallowing that are voluntary, such as chewing, forming a bolus of food on the tongue, and initiating deglutition, and the involuntary reflexes that are initiated by stimulation of the palate or touch receptors in the pharynx. The pertinent anatomy, including muscles and their innervation, will be highlighted and reinforced. Clinically, swallowing dysfunction can be assessed with a video fluoroscopic barium swallow study. Normal swallowing exams will be used to demonstrate normal function, and highlight the components of a normal swallow.

#### TABLE OF CONTENTS/OUTLINE

Outline the sequence of events that occur during normal swallowing. Explain the muscles involved in the voluntary and involuntary tasks of swallowing and their innervation. Identify the anatomy and the role of structures of the head and neck during normal swallowing, and how they work to prevent nasopharyngeal regurgitation and aspiration. Review components of normal swallowing function on video swallowing examinations with audio narration. Observe video swallowing examinations with audio narration highlighting commonly encountered types of swallowing dysfunction.

### The Invaluable Role of CEUS in HCC imaging: Planning and Guidance of Ablative Therapy and Secondary Surveillance Following Treatment

#### Participants

Shayan Hemmati, BSc, Calgary, AB (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

(1) The unique benefits of hepatocellular carcinoma (HCC) diagnosis with contrast enhanced ultrasound (CEUS) include dynamic real time imaging and bubble tracking techniques, along with exquisite sensitivity for detection of arterial phase hyperenhancement (APHE) and washout (WO).(2) The advantages of performing CEUS prior to ultrasound guided ablative therapy for HCC include accurate identification of the nodule and grayscale occult lesions, determination of the best ultrasound technique (probe selection, patient positioning/beat hold), and identification of any unexpected findings that would alter or preclude ablative therapy (ex. additional lesions or tumour in vein).(3) Performance of CEUS at the time of ablation is essential to guide probe placement for grayscale occult or difficult to visualize nodules allowing the interventionalist to target either foci of APHE or areas of WO.(4) Performance of immediate post ablation CEUS to assess for completeness of ablation increases the number of successful ablations by allowing immediate identification and re-treatment of residual tumour or non-target ablations.(5) Inclusion of CEUS in secondary surveillance optimally resolves indeterminate or equivocal MRI results. Recognition of non-linear artifact on CEUS, arising from the microwave ablation probe tract, is essential to avoid misdiagnosis.

#### TABLE OF CONTENTS/OUTLINE

- Background - Diagnosis of HCC with CEUS - Ablation Planning with CEUS - Ablation Targeting with CEUS - Immediate Post-ablation Assessment with CEUS - Secondary Surveillance with CEUS - Conclusion - References

### Role of Imaging in Systemic Therapy for HCC

#### Participants

Kevin Zand, MD, Washington, DC (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Multiple combined and single systemic therapies are currently FDA approved for intermediate and advanced stage HCC.2. Systemic therapy for HCC improves overall survival in patients who are not candidates for curative or locoregional therapies or who have failed locoregional therapy.3. Imaging has a key role in the post treatment evaluation, response assessment, and diagnosis of potential complications.4. LI-RADS treatment response algorithm is not applicable to the systemically treated HCC.5. HCC response to immunotherapy is different compared to chemotherapy, and should be considered in tumor response assessment by imaging.

#### TABLE OF CONTENTS/OUTLINE

1. The current role and survival benefit of immunotherapy for HCC2. Review of response assessment criteria in the systemically treated HCC (RECIST, mRECIST, and other criteria) and their use in clinical trials that lead to FDA approval of the new agents3. Post treatment imaging assessment. Representative cases will illustrate the imaging before and after systemic therapy (at multiple time points when relevant) with correlation with the clinical course and overall outcomes.(a) Representative cases from patients with favorable/stable outcomes.(b) Representative cases from patients with poor outcome.(c) Representative cases showing treatment related complications4. Review of emerging literature on combined immunotherapy with locoregional therapy 5. Limitations of treatment response assessment after systemic therapy for HCC and future directions

### Hypointense Hepatic Findings on Hepatobiliary Phase Imaging

#### Participants

Kelly Harper, FRCPC, Ottawa, ON (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Review the mechanism of hepatocellular contrast agent uptake and factors affecting it - Liver parenchyma hypointensities in hepatobiliary phase (HBP) can be diffuse, regional, and focal - Parenchymal hypointensities can be due to technical, parenchymal, vascular, and biliary causes - Both hepatocellular and non-hepatocellular lesions can show hypointensity - Hypointensity of a lesion is useful for its characterization - Hypointensity around a neoplasm may be associated with aggressive nature with management implications

#### TABLE OF CONTENTS/OUTLINE

- Parenchymal hypointensity
  - o Diffuse
    - o Technical- timing; opposed phase imaging; no fat suppression, low flip angle.
    - o Parenchymal
      - § Poor hepatocyte function-chronic liver disease
      - § Diffuse hepatic steatosis.
      - § Iron overload
      - § Infiltrative disorders- fibrosis, amyloidosis, malignancy etc
      - § Drug injury
      - § Genetic polymorphism of OATPB1
    - o Vascular
      - § Acute portal vein-narrowing or occlusion
      - § Portal hypertension Sinusoidal obstruction syndrome
    - o Distal biliary obstruction- common bile duct
    - o Regional (lobar/segmental/geographical)
      - o Parenchymal
        - § Radiation- SBRT
      - o Vascular
        - § Acute portal vein branch occlusion
        - § Portal vein embolization
        - § Hepatic vein occlusion
      - o Bile duct branch occlusion
    - o Focal
      - o Focal fat deposits
      - o Focal confluent fibrosis
      - o Arterioportal shunts
      - o Infective/inflammatory- cholangitis
  - Hypointense lesions
    - Hepatocellular lesions
      - o Hepatocellular carcinoma
      - o Hepatic adenoma
    - Non hepatocellular lesions
      - o Cysts
      - o Metastases
      - o Hemangioma
      - o Cholangiocarcinoma

### Inclusion of Liver CEUS in Current Practice Guidelines

#### Participants

Stephanie Wilson, MD, Calgary, AB (*Presenter*) Equipment support, Koninklijke Philips NV; Equipment support, Siemens AG; Equipment support, Samsung Electronics Co, Ltd; Research support, Samsung Electronics Co, Ltd;

#### TEACHING POINTS

(1) Current North American guidelines of relevance for liver imaging with CEUS include those from AASLD, American Association for the Study of Liver Disease; NCCN, National Comprehensive Cancer Network; and LI-RADS, Liver Imaging Reporting and Data Systems, a classification for those at risk for HCC including an algorithm for categorization of nodules shown on imaging. (2) CEUS was originally not favored for liver imaging because of misconceptions about its ability to differentiate hepatocellular carcinoma from cholangiocarcinoma. (3) Current data shows CEUS performs equivalent and often superior to CT/MR for characterization of liver nodules. (4) CEUS techniques for metastasis detection and diagnosis include sweeping the liver in the portal venous phase to show washout zones and on top injections to show the arterial enhancement of washout lesions. (5) CEUS STRENGTHS include: - Resolution of indeterminate nodules from CT/MRI, with reduction of biopsy - High specificity for HCC within LI-RADS allowing treatment of HCC following CEUS without biopsy. - Accurate characterization of nodules found on surveillance US for HCC. - Better correlation of nodules from surveillance US than shown with MRI, making CEUS the modality of choice as the first test following positive surveillance US. - Optimal diagnosis of small metastases

#### TABLE OF CONTENTS/OUTLINE

-Introduction of Guidelines for Liver Imaging -AASLD emphasizing imaging for suspect or confirmed HCC. -NCCN emphasizing long-term surveillance of patients at risk for development of metastases. -LI-RADS and its algorithm for categorization of liver nodules, with integration of CEUS LI-RADS with LI-RADS for CT/MRI. -Our perspective on Liver Imaging with CEUS.

### Recognizing Benign Lesions in Cirrhotic Liver: Moving Beyond Odds and Enhancing Interpretation

#### TEACHING POINTS

1 - This review aims to enhance the recognition and interpretation of benign lesions in patients with cirrhotic liver that may arise due to underlying cirrhosis or occur incidentally. 2 - Illustrate with cases the typical and atypical features of these lesions using computed tomography (CT) and magnetic resonance imaging (MRI). 3 - Provide practical considerations and diagnostic clues to minimize misunderstandings in interpretation and ensure accurate assignment of the Liver Imaging Reporting and Data System (LI-RADS®) category.

#### TABLE OF CONTENTS/OUTLINE

1 - Definition of cirrhosis and its impact on the appearance of benign lesions. 2 - Describing the imaging presentations of various benign entities in cirrhotic liver on CT and MRI, distinguishing between their typical and atypical features. 3 - Practical considerations and diagnostic clues to differentiate from malignancy and how to assign the correct LI-RADS® category.

### What's New in Classification, Pathology, Imaging Findings, and Management of Cystic Liver Diseases: 2023 Update

#### Participants

Sriram Jaganathan, MBBS, Littlerock, AR (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Discuss 2023 updates on the classification, nomenclature, and pathology of developmental, non-neoplastic neoplastic cystic liver disease
- Review spectrum of imaging findings role of different imaging modalities in diagnosis management
- Discuss current updates in management strategies with special emphasis on the 2022 European Association for the Study of the Liver (EASL) clinical practice guidelines

#### TABLE OF CONTENTS/OUTLINE

Introduction Classification Nomenclature of hepatic cystic diseases Molecular pathogenesis hepatic cystogenesis updates Imaging Techniques: US/CT/MRI PET/CT Polycystic liver disease (PLD) Role of imaging in assessing cyst volumes, total liver volumes treatment follow-up; Gigot Schnelldorfer classifications; Complications Management Non-neoplastic Cysts Simple hepatic cysts (malformation of the ductal plate): cystic bile duct hamartoma; Infections: Abscess, Echinococcal cyst; Congenital: choledochal cyst Caroli disease, foregut cyst, von Meyenberg complex; Miscellaneous: peribiliary cysts, organizing hematoma, fibrous cyst pseudocyst Cystic Neoplasms Mucinous cystic neoplasms, Intraductal papillary neoplasm, tubulopapillary oncocytic papillary neoplasms, cystic metastases, HCC, cholangiocarcinoma rare tumors. Imaging spectrum of cystic liver diseases Management: EASL 2022 clinical practice guidelines with the central role of imaging Conclusion Imaging is pivotal in diagnosing, guiding appropriate treatment, and assessing complications for cystic liver diseases. By emphasizing up-to-date imaging findings and recommendations, radiologists are better equipped to provide effective patient care.

### Liver Transplant Complications; Case Review from Our Hospital

#### Participants

Iskander Arteche Arnaiz, MD, Barakaldo, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Get to know the normal findings of the immediate postoperative period of liver transplantation. Mention the most frequent complications classified into arterial, venous and biliary based on cases seen in our Hospital.

#### TABLE OF CONTENTS/OUTLINE

OLT (orthotopic liver transplantation) is the definitive treatment for patients with end-stage liver disease, acute fulminant liver failure, some neoplasms (HCC, metastases...increasingly broad indications). The surgical technique consists of extracting the donor (dissection of the hepatic hilum on a bench + arterial reconstruction if variants) and subsequent implantation. The first step to take when evaluating a liver graft will be to read the surgical report to later understand the images. An ultrasound is mainly performed 24 hours after the transplant, in which we assess the parenchyma, the bile duct, and the flow of the arterial and venous vessels. It will be important to know the normal ultrasound findings. Complications are divided into arterial, venous and biliary. Regarding arterial complications, we have occlusion of the hepatic artery due to dissection/thrombosis of the latter (the most serious complication), hepatic artery stenosis, and pseudoaneurysms. Regarding biliary complications, we have, on the one hand, biliary strictures, most of them anastomotic (they may be non-anastomotic in the intrahepatic bile duct but are related to other causes such as ischemia) and on the other hand the bile leakage. Venous complications are the least frequent, and can affect both the suprahepatic veins and the portal vein, and consist mainly of thrombosis and stenosis.

GIEE-168

### Uncommon Pancreas Solid Lesions: Spectrum of Imaging Appearance and Radiologic-Pathologic Correlation

#### Participants

Yoshihiko Fukukura, MD, PhD, Kurashiki, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

TEACHING POINTS Pancreatic solid lesions display a wide spectrum of histology, including exocrine and endocrine tumors. The most common tumors of exocrine and endocrine tumors of the pancreas are ductal adenocarcinoma and neuroendocrine tumor, respectively. Uncommon tumors that need to be differentiated from the common pancreas solid tumors include adenosquamous carcinoma, colloid carcinoma, undifferentiated carcinoma, acinar cell carcinoma, solid-pseudopapillary neoplasm, etc. Familiarity of imaging findings of the uncommon tumors is important to arrive at the correct diagnosis of pancreas solid lesions because a precise diagnosis determines the treatment and surgical approach. The purpose of this exhibit is: 1. To describe the imaging and histopathologic features of uncommon pancreas solid tumors 2. To recognize and describe the imaging appearance of some mimics of pancreas solid tumors 3. To discuss the imaging differential diagnosis of pancreas solid tumors

#### TABLE OF CONTENTS/OUTLINE

1. Review of CT and MR imaging findings of uncommon pancreas solid tumors, with histopathological correlation. 2. Highlight key differential diagnostic points of pancreas solid tumors. 3. Summary: Awareness of radiological findings of uncommon pancreas solid tumor is important to arrive at the correct diagnosis of pancreas tumors.

GIEE-169

### Non-contrast Vascular Reconstruction in Patients with a History of Contrast Agent Allergy

#### TEACHING POINTS

Depiction of vascular information by contrast-enhanced CT is required for preoperative examination of surgery. However, there are often cases where it is difficult to use a contrast medium due to allergies to the contrast medium. We have developed a virtual abdominal contrast CT image as a preoperative vascular image by non-contrast CT image for such cases. We performed CT without contrast medium infusion in the abdomen. High-definition scanning conditions were set for image reconstruction. Vascular extraction was performed on the obtained CT volume data using workstation automatic tracking. After that, the multi-planar reconstruction display (MPR) was created from the CT image. By combining the blood vessel information and the MPR display, it was possible to create a virtual abdominal contrast CT image similar to the conventional contrast CT without injecting a contrast medium. The images we developed were evaluated to have important information for the surgeon.

#### TABLE OF CONTENTS/OUTLINE

1. Necessity of vascular information and problems of contrast agent allergy 2. Scan technique for blood vessel extraction 3. Extraction of abdominal blood vessels using automatic tracking 4. Creating an MPR display 5. Composite display of blood vessel image MPR display 6. Clinical significance of virtual abdominal contrast CT images

### **Misdiagnosis of Pancreatic Intraductal Papillary Mucinous Neoplasms and the Challenge of Mimicking Lesions: Imaging Diagnosis and Differentiation Strategies**

#### **TEACHING POINTS**

1. Accurate diagnosis of lesions that mimic IPMNs is crucial to determine appropriate surveillance or resection. 2. There is a risk of overdiagnosis and overtreatment of potentially neoplastic lesions with up to half of cystic lesions mischaracterized on imaging. 3. Using dedicated pancreatic protocol CT and noting unique features such as a bulging ampulla for IPMNs or the extracapsular cystic sign of SCAs can aid in distinguishing subtle differences. Additionally, a "cysts-within-a-cyst" appearance is often present in MCN, giving them a multilocular appearance, as opposed to the "cyst-by-cyst" presentation of IPMNs. 4. Cystic pancreatic neuroendocrine tumors have peripheral hypervascular rim on arterial phase CT. 5. Lymphoepithelial cysts have a cheerios-like appearance with signal drop out on out of phase images. 6. Pancreatic schwannoma has progressive homogeneous enhancement with areas of necrosis. 7. Chronic pancreatitis has a chain of lake appearance with strictures, intraductal calculi, and parenchymal calcifications. 8. EUS, FNA, fluid analysis, cytology, radiomics, and artificial intelligence are all useful tools for definitive diagnosis when CT and MRI are not specific enough.

#### **TABLE OF CONTENTS/OUTLINE**

1. IPMN diagnosis and misdiagnosis 2. Misdiagnosis of mimicking lesions and strategies to accurate diagnosis-Macrocytic Serous Cystadenoma-Cystic Pancreatic Neuroendocrine Tumor-Mucinous Cystic Neoplasm-Lymphoepithelial Cyst-Duodenal Diverticulum-Pancreatic Schwannoma-Chronic Pancreatitis-Retention Cyst and Cystic Fibrosis-Intrapancreatic Accessory Spleen and Epidermoid Cyst-Pancreatic Lipoma or Interdigitating Fat-Choledochal Cyst 3. ### Advanced Ultrasound Techniques for Liver Transplantation Evaluation

#### Participants

Gonzalo Martin Ordonez, MD, Majadahonda, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To describe the usual Doppler technique for liver graft follow-up and for evaluation of complications. To describe the use of contrast enhanced ultrasound (CEUS) in the evaluation of vascular complications and graft ischaemia. To describe the use of shear wave elastography in the evaluation of medical complications.

#### TABLE OF CONTENTS/OUTLINE

Liver transplantation is the treatment of multiple end-stage liver diseases. Medical and surgical complications are an important source of morbidity and mortality, and radiological examinations are essential for their early detection. Doppler ultrasound is the preferred imaging technique in the initial evaluation of the liver graft and during follow-up due to its portability and the unique hemodynamic information it provides. The use of CEUS allows to confirm vascular complications to define the location and the extension of ischemic areas, and to ascertain biliary tract ischemic involvement, what that is key for deciding the optimal treatment. Shear-wave elastography provides a non-specific but interesting quantitative information that allows for a sequential evaluation of the liver parenchyma. It is useful in the diagnosis and follow-up of medical complications including rejection and the rarer obstructive sinusoidal syndrome. The liver rigidity also aids to decide in which patients a biopsy should be done. We show a pictorial review of cases from our institution to illustrate the vascular, biliary and medical complications that can be evaluated with these techniques.

### Advanced Abdominal MRI Techniques and Problem-solving Strategies

#### Participants

Yoonhee Lee, MD, Incheon, Korea, Republic Of (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Magnetic resonance imaging (MRI) plays an important role in abdominal imaging owing to its ability of detection and characterization of focal lesions. Nowadays, techniques for reducing scan time with an acceptable image quality such as parallel imaging, compressed sensing (CS) technique, and nowadays cutting edge deep learning (DL) techniques have arisen for problem solving strategies. Also free breathing techniques using dynamic phase involving extra-dimensional (XD)-volumetric interpolated breath-hold examination (VIBE), and golden-angle radial sparse parallel (GRASP) can help patients with severe dyspnea or under sedation perform abdomen MRI. Therefore, this pictorial review aims to show various advanced abdomen MRI techniques for reducing scan time with maintaining image quality and free breathing techniques during dynamic phase, and representative cases with aforementioned techniques.

#### TABLE OF CONTENTS/OUTLINE

•I. Reducing scan time and improving image quality 1.Parallel imaging : Dynamic phase (Controlled Aliasing in Parallel Imaging Results in Higher Acceleration), Half-Fourier-acquisition single-shot turbo spin-echo (HASTE) 2.Compressed sensing technique : Dynamic phase, Magnetic resonance cholangiopancreatography 3.Deep learning (DL) : T2 weighted image, Diffusion weighted image  
•Strength and pitfalls of DL while radiologists interpreting lesions 4.Motion corrected diffusion weighted image • •II. Free breathing technique during dynamic phase 1.Stack of Stars volumetric interpolated breath-hold examination (StarVIBE) 2.Extra-dimensional (XD)-VIBE 3.Golden-angle radial sparse parallel (GRASP)

### Imaging of Pancreatic Cystic Lesions: What Radiologists Should Know

#### Participants

Akihiko Kanki, MD, Kurashiki, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The purpose of this presentation is: 1) To demonstrate the common and uncommon computed tomography and magnetic resonance imaging findings of neoplastic pancreatic cystic lesions, including the radiologic-pathologic correlation. 2) To learn about the non-neoplastic and cyst-like lesions of the pancreas that can mimic pancreatic cystic neoplasms.

#### TABLE OF CONTENTS/OUTLINE

Classification of Pancreatic Cystic Lesions  
Imaging findings of common pancreatic cystic lesions  
Neoplastic pancreatic cystic lesions  
• Mucinous cystic neoplasm  
• Serous neoplasm  
• Intraductal papillary mucinous neoplasm  
• Intraductal tubulopapillary neoplasm  
• Intraductal oncocytic papillary neoplasm  
Imaging findings of uncommon pancreatic cystic lesions  
• Intraductal papillary mucinous neoplasm complicated with intraductal hemorrhage, perforation and fistula formation  
• Mucinous cystic neoplasm occurring with side branch-type intraductal papillary mucinous neoplasm  
Non-neoplastic and cyst-like lesions of the pancreas that can mimic pancreatic cystic neoplasms  
Non-neoplastic pancreatic cystic lesions  
• Squamous lined cyst  
• Acinar cystic transformation  
Various pancreatic tumors with cystic degeneration  
• Solid pseudopapillary neoplasm

### Pseudomyxoma Peritonei: Imaging Features and Current Therapies

#### Participants

Laura Jorgenson, Rochester, MN (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Define pseudomyxoma peritonei. Understand and describe the histopathology, pathophysiology, and etiologies of PMP, with a focus on appendiceal and ovarian neoplasms. Describe the multimodality imaging features of pseudomyxoma peritonei. Recognize complications related to PMP, mucinous tumor burden, and cytoreductive surgery. Discuss specific imaging findings which are essential to the surgical oncologist in determining resectability and cytoreductive surgery planning. Review current therapies available to patients with PMP.

#### TABLE OF CONTENTS/OUTLINE

TABLE OF CONTENTS/OUTLINE 1. Definition of PMP and imaging features  
Define  
Optimizing US, CT, MR, and PET image acquisition  
Imaging features on different modalities  
Natural History 2. Tumor Origin  
Appendiceal  
Ovarian  
Non-malignant causes  
Differentiation from multicystic mesothelioma  
Brief review of pathologies of peritoneal surface malignancies 3. Potential Complications and related imaging features 4. Example reporting template 5. What the surgeon needs to know and current therapies  
Peritoneal Carcinomatosis Index (PCI)  
Cytoreductive Surgery  
HIPEC  
Systemic chemotherapy - understanding response to therapy vs. progression

### Ancillary Features Are Coming to LI-RADS Treatment Response Algorithm: Let's Get You Ready

#### TEACHING POINTS

- The LI-RADS Treatment Response Algorithm (LR-TRA) is a standardized system for assessing and reporting treatment response after locoregional therapy (LRT) for hepatocellular carcinoma (HCC).- Emerging radiology-pathology and inter-reader studies have highlight the potential for ancillary features to improve detection of incomplete necrosis with greater radiology-pathology concordance.- This exhibit highlights the updates in the LR-TRA v2023 (compared to v2018), especially pertaining to the role of newly incorporated ancillary features. The overall objective of the changes is to improve diagnostic accuracy of post-treatment imaging assessment.

#### TABLE OF CONTENTS/OUTLINE

- Summarize the role of the TRA in the context of the currently used treatments for HCC.- Provide an evidence-based review of current literature highlighting the value of incorporating ancillary features in treatment response assessment after locoregional therapy in HCC.- Highlight key updates of the LI-RADS v2023 TRA pertaining to use of ancillary features after various forms of LRT for response assessment, using a case-based and illustrative approach.

### Ischemic Cholangiopathy: Imaging Patterns and Other Biliary Complications Following DCD Liver Transplant

#### Participants

Maria Zulfiqar, MD, MBBS, Scottsdale, AZ (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The purpose of this exhibit is to: 1. Describe various imaging patterns of ischemic cholangiopathy post DCD liver transplant on MRI/MRCP. 2. Elaborate prognostic significance of these imaging patterns. 3. Discuss additional biliary complications post liver transplant.

#### TABLE OF CONTENTS/OUTLINE

Four different patterns of IC: have been identified, each correlating with DCD allograft prognosis.

- Diffuse necrosis: Most severe form with nearly 100% need for retransplant, characterized by multifocal biliary strictures, wall necrosis and bile lakes. Usually, hepatic artery is severely stenosed or occluded.
- Multifocal progressive: Starts as mild to moderate multifocal stricturing cholangiopathy that progresses in a few months to more severe form with worsening strictures or even biliary necrosis. >50% need for retransplant.
- Confluence dominant: Mild to moderate cholangiopathy that involves the biliary confluence. Most cases can be managed without need for retransplant.
- Minor Form: Mild areas of multifocal stricturing that remain stable or resolve.

Other liver transplant biliary complications:

- Anastomotic stricture
- Bile leak/anastomotic dehiscence
- Vanishing bile duct syndrome (ductopenia)
- Biliary stones; Biliary cast syndrome; hemobilia
- Cystic duct remnant mucocele
- Roux limb bleeding, Roux limb stasis or obstruction.

Summary IC post DCD liver transplant is a major source of allograft complications. Identifying different patterns of IC can help stratify need for stenting and predict allograft prognosis.

### Multimodality Imaging Biomarkers for Crohn's Disease Strictures

#### Participants

Safa Hoodeshenas, MD, Rochester, MN (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- To understand the role and characteristics of existing and future biomarkers in Crohn's disease strictures
- To review existing diagnostic and prognostic Crohn's imaging biomarkers and potential surrogate clinical endpoints
- To describe potential imaging biomarkers that reflect stricture histopathology or pathophysiology
- To describe the strengths and weaknesses of existing and future biomarkers for Crohn's disease strictures.

#### TABLE OF CONTENTS/OUTLINE

- Existing diagnostic and prognostic biomarkers of Crohn's disease strictures
- Using CT or MR enterography to measure response biomarkers and/or efficacy endpoints for Crohn's strictures
- Stiffness, fibrosis, and smooth muscle hypertrophy are histopathologic and physiologic targets for an emerging array of MR, ultrasound, and PET biomarkers
- MRI-based biomarkers include delayed gadolinium enhancement, normalized magnetization transfer, DWI and intravoxel incoherent motion, T1 mapping, intramural T2 signal, and quantified small bowel motility
- Ultrasound-based biomarkers include wall thickness, elastography to measure shear stiffness, contrast-enhanced ultrasound, and ultrasensitive microvessel imaging
- Molecular imaging targets at PET-MRE include inflammation and fibrosis

### Kidney Pancreatic Transplantation: Anatomy and Surgical Technique Guide for Residents

#### Participants

Juan Bautista Rolla, MD, Ciudad Autonoma De Buenos Aires, Argentina (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Pancreas transplant is a complex procedure which represents a surgical alternative for the treatment of diabetic patients with the goal of avoiding the systemic complications associated with the disease. The most frequent approach is the SPK transplant in which both grafts of a single donor are inserted in one surgical act, on the right and the left fossa respectively. Transplanted kidney is implanted extraperitoneally in an iliac fossa. The most widely used technique is end-to-side anastomosis of the donor's renal artery to the recipient's external iliac artery. Transplantation of the pancreatic graft is performed together with a duodenal segment. Enteric exocrine drainage will be through anastomosis of the donor duodenal segment to a small bowel loop of the recipient whereas systemic endocrine drainage will be through the portal vein of the graft which is anastomosed directly to the primitive iliac vein. To learn surgical technique and post-operative anatomy. To know normal postoperative imaging assessment. To recognize all the complications.

### Hepatic Sinusoidal Disorders

#### Participants

Sudhakar K. Venkatesh, MD, FRCR, Rochester, MN (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Understand pathophysiology behind hepatic sinusoidal disorders
- Review the typical imaging appearances sinusoidal obstruction caused by different etiologies and characteristic findings for differentiation of etiologies.
- Review conditions that cause sinusoidal and perisinusoidal infiltration and may mimic sinusoidal obstruction.

#### TABLE OF CONTENTS/OUTLINE

- Normal hepatic sinusoid structure and physiology
- Mechanisms causing sinusoidal dilatation and/or obstruction.
- Histopathological correlation of imaging findings
- Sinusoidal dilatation
  - o Outflow obstruction
  - § Post sinusoidal causes.
- Congestive hepatopathy
  - Heart failure
  - Pericarditis
  - Congenital heart diseases
- Budd-Chiari syndrome
- Sinusoidal obstruction syndrome
  - o Myeloablative conditioning for stem cell transplantation.
  - § Utility of ultrasound in diagnosis of SOS in children
  - o Chemotherapy-oxaliplatin based therapies, immunotherapy.
  - o Radiotherapy
- Sinusoidal dilatation without obstruction
  - o Vascular disorders
  - § Arteriportal shunts
  - § Decreased portal flow.
  - § Porto-sinusoidal vascular disorder
  - o Extrahepatic acute inflammatory/infective conditions
  - o Use of oral contraceptives or hormones
  - o Hepatic peliosis
  - o Extrahepatic malignancy without liver infiltration
- Sinusoidal and/or perisinusoidal infiltration with or without dilatation
  - o Perisinusoidal fibrosis
  - o Amyloidosis
  - o Myeloproliferative disorders
  - o Malignancy

### The Dark Side of the Bowel Disease: Algorithmic Approach Step by Step

#### TEACHING POINTS

Review through different imaging modalities the evaluation of the intestinal wall. To revise the general features of the normal bowel wall. Create an algorithm that allows quick & easy evaluation to guide the diagnosis. To discuss the different imaging findings we may see in different pathologies. To study different pathologic entities that present with bowel wall thickening.

#### TABLE OF CONTENTS/OUTLINE

Introduction Anatomy basic bowel wall. Step by step > interpretation of < analyzed by categorizing attenuation changes in the intestinal wall. Diagnostic Algorithm description. Descriptions of the commonest causes Key points. Conclusions References

### CT Approach to Acute Mesenteric Ischemia

#### TEACHING POINTS

-Acute mesenteric ischemia it's an infrequent pathology, but the mortality rate is high because of the nonspecific symptoms and the delayed diagnosis, so the role of the imaging and the radiologist are fundamental to reduce the mortality rates.-Appropriate protocols of CT imaging should be used to optimize the radiation and contrast medium use, because there is a disbalance in the homeostasis of the patient and every minute counts to make de diagnosis.-If there is a kidney failure, there are protocols for a safety use of the iodinated contrast medium.-To establish an adequate diagnosis, the histopathology and anatomy of the arteries and the bowel should be evaluated.-There are three main structures that we must evaluate to have an adequate approach to mesenteric ischemia: bowel lumen, bowel walls and abdominal localization.-When there is an acute mesenteric ischemia, other abdominal organs like adrenal glands, inferior cava vein, aorta, liver, spleen, and kidneys have changes and findings that can predict complications and mortality.

#### TABLE OF CONTENTS/OUTLINE

Gross anatomy Abdominal artery anatomy. Relevant anastomoses. Abdominal vein anatomy. Histology of the bowel.Pathophysiology of acute mesenteric ischemia. CT imaging protocols. Indications, Simple, artery and portal phases with timing and technique (kVp, mA, rotation, PITCH). What to do if there is an acute kidney failureClassification of the acute mesenteric ischemia.Systematic approach to acute mesenteric ischemia. Bowel Wall thickness. Diameter. Wall enhancement. Mesentery Fat. Liquid. Localization. Vessels. Artery. Vein. Other abdominal organs Liver. Kidneys. Adrenal glands. Pulmonary embolism.Conclusions. Bibliography.

### Gastric Cancer CT Staging: Radiologic Patterns with Radiologic-Pathologic Correlation

#### TEACHING POINTS

State of the art treatment of locally advanced gastric cancer is multimodal and involves combined surgical and medical therapy. CT has a central role in the staging of gastric cancer, being the method of choice for this purpose; a local and distant staging as accurate as possible is crucial for a correct treatment planning, avoiding under- or over-treatment of the Patient. To obtain a correct staging, a thorough knowledge of normal and pathologic gastric radiological anatomy and the pathways of tumor spread is crucial. Through the analysis of illustrative cases: To know the normal and pathologic gastric radiologic anatomy and the lymphatic and hematogenous pathways of spread of gastric cancer. To know the TNM classification (8th edition) for gastric cancer and correctly use the CT criteria necessary for its application. To correlate radiologic patterns of gastric cancer with macroscopic and microscopic pathologic patterns. To correlate clinical CT staging and pathologic staging with regard to T and N parameters. To understand the limitations and pitfalls of imaging and the causes of radiological overstaging and understaging.

#### TABLE OF CONTENTS/OUTLINE

1. Concepts of normal and pathologic gastric radiologic anatomy and lymphatic and hematogenous tumor spread pathways are explained. 2. Some illustrative cases of early-stage, locally advanced and oligometastatic gastric cancer are presented, with clinical staging obtained by CT imaging applying the TNM 8th edition classification. Correlation of CT images with macroscopic and microscopic pathologic findings is shown by detailed explanation of the findings. 3. Some examples of CT understaging and overstaging and their possible explanations are presented.

### Abdominal Inflammatory Lesions Unmasked: A Radiological Hunt for Tumor Impostors!

#### Participants

Abrahao Elias Neto, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To review the abdominal inflammatory diseases which mimic tumor-like lesions. To present diagnostic challenging cases of inflammatory diseases that can mimic tumoral lesions. To be aware of non-malignant conditions as differential diagnoses at the initial presentation of lesions suspicious for neoplasms, and which imaging features may help in the differentiation. To highlight clinical and laboratory data that can help the radiologist not fall into pitfalls.

#### TABLE OF CONTENTS/OUTLINE

Abdominopelvic inflammatory lesions can present a diagnostic challenge for radiologists, particularly when distinguishing between tumor and non-tumor involvement. This can have a significant impact on patient outcomes, as the management and prognosis of these conditions can vary dramatically. Overview of the main inflammatory diseases that mimic neoplasms. Key radiological findings in cross-section abdominal images that aid in distinguishing between tumor and non-tumor lesions. The role of clinical and laboratory information in the differential diagnosis of inflammatory lesions. Didactic exposition of illustrative cases in which inflammatory diseases mimic neoplasms, such as rectal syphilis, peritoneal tuberculosis, focal pyelonephritis, glandular cystitis, hepatic inflammatory pseudotumor, xanthogranulomatous cholecystitis, complicated appendicitis, focal pancreatitis, vaginal vault abscess, and lobular endocervical glandular hyperplasia. Recap of the importance of accurately differentiating between tumor and non-tumor involvement in abdominopelvic inflammatory lesions, with the key takeaways from this educational exhibition.

GIEE-183

### Expanding the Role for Biopsy in HCC: It's Not Just About Diagnosis

#### Participants

Mansur Ghani, MD, San Diego, CA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Traditionally, clinical indications for biopsy of hepatocellular carcinoma (HCC) have included circumstances when imaging diagnosis is uncertain or for HCC that does not respond as expected to therapy. 2. More recently, developments in the understanding of pathological and molecular alterations in HCC at the cellular level have created additional opportunities for biopsy for the purposes of prognosis, treatment selection and treatment monitoring.

#### TABLE OF CONTENTS/OUTLINE

Review of traditional indications for biopsy in HCC (Fig. 1)- Diagnosis in the case of LR-4 (Fig. 2), LR-M (Fig. 3) and LR-TIV- Lesions that do not respond as expected to therapy Additional potential roles for biopsy in HCC- Diagnosis- Lesions in non-cirrhotic livers or scenarios where LI-RADS currently cannot be applied (e.g. cardiac cirrhosis and Fontan related liver disease)- LR-3 lesions (Fig. 4)- Prognosis- There are several histological HCC sub-classes, each with distinct molecular patterns and prognostic implications (Fig. 5)- Microscopic vascular invasion (MVI) can be incidentally detected on biopsy, and surrogate molecular markers can be used to predict MVI- Stemness-related biomarkers are associated with more aggressive clinical behavior- Treatment selection- Potentially targetable genetic alterations are found in approximately 24% of HCC.- Treatment monitoring- Genetic sequencing of biopsy tissue can be performed to design specific liquid biopsy panels to monitor efficacy of treatment.- Biopsy Techniques- Biopsy types: fine-needle aspiration, needle-core biopsy, micro-histology, liquid biopsy- Types of image guidance- Ultrasound with an emphasis on the emerging role of contrast-enhanced ultrasound- CT-guided

### Getting to the Bottom of the Pelvic Floor: A Primer on MR Defecography Technique, Reporting and Implications for Surgical Management

#### Participants

Nitin Venugopal, MD, Seattle, WA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Indications for MR defecography (MRD); advantages over fluoroscopic defecography and correlation of both techniques
- Anatomic considerations: compartments, measurements, pathophysiology of the pelvic floor
- Technique and phases of examination for functional assessment
- Standardized terminology and reporting
- Imaging findings of common and rare diagnoses
- Surgical management of pelvic organ prolapse: choice of procedure, techniques and post-op imaging findings

#### TABLE OF CONTENTS/OUTLINE

Review pelvic compartmental anatomy, important lines and measurements:- Pubococcygeal line- H-line- M-line- Urethral axis- Vaginal axis  
Variations of technique and equipment:- Phases: rest, contraction, defecation- Sequences- Open vs. closed MRI technique- Coil design  
Standardized terminology and reporting, consensus guidelines by SAR and AJR. Step by step interpretation of a case with sample reporting template.  
Entities discussed:- Peritoneocele, Enterocele, Sigmoidocele- Cystocele- Urethral Hypermobility- Uterine/Vaginal prolapse- Descending perineal syndrome- Structural Outlet Obstruction: Rectocele, Rectal prolapse, Intussusception, Rectal mass- Functional Outlet Obstruction: Puborectalis dyskinesia, Anismus anorectal incontinence- Spastic pelvic floor syndrome  
Surgical management of pelvic descent- Pre-op considerations  
Obliterative vs. reconstructive techniques  
Abdominal vs. vaginal approach  
Concomitant urinary or fecal incontinence repair, colporrhaphy  
Hysterectomy vs. uterine-sparing  
Risk calculator for prophylactic urinary incontinence prevention  
Indications for mesh augmentation- Post-op imaging findings and complications

### **MRI-Based Body Composition Analysis: We Can See the Fat That Hides Inside You**

#### **Participants**

Luciana Belem, MD, MSc, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

- Review how MRI of the abdomen may help identify high-risk adiposity phenotypes in the obesity context.- Review the literature on obesity, addressing the impact of visceral and ectopic fat in health.- Discuss which measurements can be made on MRI of the abdomen to assess visceral and ectopic fat.- Teach how to measure visceral and ectopic fat on MRI of the abdomen.

#### **TABLE OF CONTENTS/OUTLINE**

- Definition: what is visceral and ectopic fat.- Review the pathophysiology of obesity and discuss how to differentiate the adiposity phenotypes on MRI.- Body composition measures on MRI: Visceral adipose tissue, subcutaneous adipose tissue and skeletal muscle. Area or volume? If area, which level? Which muscle groups to include in skeletal muscle quantity assessment.- Protocol: which sequences use to assess body composition parameters and quantify ectopic fat.- Chemical shift-encoded (CSE) MRI with estimation of proton density fat fraction (PDFF): potential biomarker in obesity.- Ectopic fat measures on MRI: Muscle fat: which abdominal muscle group to measure? Pancreas fat: where and how to measure? Liver fat: where and how to measure?

### **Mind The gap! The Tubes and Pipes in Crohn's Disease: Technical Aspects and Diagnostic Findings of CT and MRI-Enterography**

#### **Participants**

Mayra V. Soares, MD, Brasilia, Brazil (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

To review relevant points in the anatomy of the small intestine, in the context of Crohn's Disease, highlighting the main sites of involvement. To review the indications, protocol, and technical aspects of CT and RM-enterography (CT-e and MR-e). To point out differences and similarities, advantages and disadvantages between CT-e and RM-e. To show typical and atypical imaging findings of Crohn's disease and main complications. To distinguish phenotypic patterns of presentation of Crohn's disease in CT-e and RM-e.

#### **TABLE OF CONTENTS/OUTLINE**

Introduction Review of the anatomy of the small intestine Review of the typical and atypical imaging findings of Crohn's disease and its phenotypes CT-e and MR-e protocols Main diagnostic findings in Crohn's disease: Segmental mural enhancement mural thickening stenosis ulcerations vasa recta ingurgitation lymph node enlargement Complications related to Crohn's Disease: fistulas inflammatory mass Abscess

GIEE-187

### The Mystery of Internal Hernias: What Should the Radiologists Know?

#### Participants

Basem Jaber, MD, Darby, PA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Reviewing the different types of the internal hernias- Discussing the imaging features of various types of internal hernias- Identifying possible complications of internal hernias- Providing case-based review of common and uncommon pathologies

#### TABLE OF CONTENTS/OUTLINE

Internal hernias are defined as protrusion of small bowel loops through normal apertures and/or defects in the peritoneum or mesentery into a compartment within the abdominal cavity, commonly presenting as an acute intestinal obstruction. The incidence of internal hernias is increasing with the new surgical procedures now being performed. It is crucial for radiologists to be familiar with and understand the different types of internal hernias and the possible complications since they have high mortality rate and they are often challenging to recognize. Key points:- Introduction to peritoneum anatomy- Internal hernia different types- The diagnostic approach for internal hernias- Pearls and pitfalls for recognizing internal hernias complications imaging features

GIEE-188

### Just Not GIST: Non-GIST Mesenchymal Neoplasms of the Alimentary Tract

#### Participants

Rashmi Balasubramanya, MD, Philadelphia,, PA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

There is a heterogeneous group of non-GIST, mesenchymal neoplasms of the gastrointestinal tract that are characterized by distinctive histopathology tumor genetics as well as variable clinico-biological profiles and imaging findings. Characteristic disease distribution: While glomus tumors and plexiform fibromyxomas display distinct predilection for the gastric antrum, smooth muscle tumors of the gut preferentially occur in the esophagus and colorectum. Distinctive genetic markers: Based on MDM2 gene amplifications, esophageal giant fibrovascular polyps are now considered well-differentiated liposarcomas. Other tumors with distinctive cytogenetics include lipomas (HMGA2 gene rearrangements), granular cell tumors (inactivating AP6AP gene mutations), gastroblastomas (MALAT1-GLI1 fusions), plexiform fibromyxomas (GLI activating mutations), malignant neuroectodermal tumors (EWSR1-ATF1 gene fusions), IMTs (ALK gene rearrangements) and SFTs (STAT6 NAB2 gene fusions).

#### TABLE OF CONTENTS/OUTLINE

Introduction, taxonomy, demographics, clinical manifestations, pathological features, Multimodality cross sectional imaging findings on CT, MRI, PET-CT, management, prognosis, conclusion. Entities discussed: Esophageal granular tumor and well- differentiated liposarcoma; distinctive gastric tumors such as synovial sarcoma, IMT, plexiform fibromyxoma, and glomus tumor; smooth muscle tumors, lipomatous/neurogenic tumors, malignant neuroectodermal tumor, Kaposi sarcoma, sclerosing epithelioid fibrosarcoma.

### Not Always What It Seems: Exploring Mimickers of Liver Malignancy

#### Participants

Kumi Ozaki, MD, PhD, Hamamatsu, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

· Review of several mimickers of liver malignancy based on characteristic imaging findings. · Comprehension of key clinical and imaging findings that may help distinguishing mimickers from malignant liver lesions.

#### TABLE OF CONTENTS/OUTLINE

1. Overview of characteristic imaging and clinical features of typical liver malignancy.2. Overview of mimickers of liver malignancy based on each characteristic imaging findings; patterns of enhancement (early staining and prolonged enhancement, early staining and wash-out, gradual enhancement, peripheral enhancement), fat component, lower ADC values, growth rate, cystic lesion with mural nodule, periportal lesion and so on.3. Overview of mimickers of liver malignancy in the patients with chronic liver disease or cirrhosis.4. Overview of mimickers of liver malignancy in the patients with a known malignancy.5. Undistinguishable mimickers from liver malignancy6. Take home points

### Precision Medicine and Early Detection of Pancreatic Cancer

#### Participants

Linda C. Chu, MD, Lutherville, MD (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Patients with pancreatic cancer often present with non-specific clinical symptoms and are diagnosed at advanced disease stage. Recent advances in imaging techniques, molecular analysis, and artificial intelligence can lead to earlier detection of pancreatic cancer, which can significantly improve patient outcomes. The purposes of this exhibits are to review the current guidelines in high-risk screening of pancreatic cancer, review the role of liquid biopsy and pancreatic cyst fluid molecular markers in earlier detection, and the potential role of artificial intelligence in automated detection of pancreatic cancer.

#### TABLE OF CONTENTS/OUTLINE

Current guidelines in high-risk screening of pancreatic cancer. Role of liquid biopsy and pancreatic cyst fluid molecular markers in early detection. Artificial intelligence assisted automated detection of pancreatic cancer.

### Computer-Aided Diagnosis for Hepatic MRI: What is Needed and Expected

#### Participants

Shogo Maeda, Hiroshima, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

a. As gadoteric acid-enhanced MRI has combined perfusion and hepatocyte-selective properties, it is widely used to detect and diagnose focal hepatic lesions. b. Gadoteric acid-enhanced hepatobiliary phase (HBP) images are highly sensitive for the detection of hepatic lesions. However, small lesions, especially those near hepatic vessels, may be missed because they and the vessels are low signal-intense on HBP images. Computer-Aided Diagnosis (CAD) may be effective, especially for detecting small lesions on HBP images. c. Because many hepatic lesions, benign or malignant, are low signal-intense on HBP images, a differential diagnosis requires comprehensive evaluation with other sequences. CAD can differentiate between benign and malignant lesions by integrating information from EOB-MRI and sequences such as T2- and diffusion-weighted scans. Therefore, CAD is particularly useful for differential diagnosis in a single case of mixed benign and malignant lesions. d. A diagnosis of hepatic lesions is reached by integrating findings from various modalities and clinical information. A CAD that integrates all information is required.

#### TABLE OF CONTENTS/OUTLINE

a. History and classification of CAD in radiology b. Possibility of CAD for detecting hepatic lesions on MR images c. Possibility of CAD for diagnosis of hepatic lesions on MR images d. Future prospects of CAD for diagnosing hepatic lesions

### Gastrointestinal Ectopic Pancreas: Cross-sectional Imaging Spectrum and Differential Diagnosis

#### TEACHING POINTS

1. Describe the clinical manifestations and the spectrum of cross-sectional imaging findings of the ectopic pancreas (EP) in the gastrointestinal tract. 2. Discuss the diagnosis of the gastrointestinal EP with emphasis to formulate a differential diagnosis for gastrointestinal submucosal tumors.

#### TABLE OF CONTENTS/OUTLINE

1. The definition and overview of clinical manifestations of gastrointestinal ectopic pancreas (EP). 2. The pathologic gross manifestation and histological classification of EP. 3. A list of the common morphological manifestations of EP on cross-sectional images including sites and incidences, location, size, shape, contour, margin, attenuation/intensity signals, growth pattern, enhancement pattern, picking out those specific signs which are essential clues to indicate the diagnosis, such as duct-like structure in the lesion, hyperenhancement of the overlying mucosa, central umbilication, perilesional fat or low attenuation. 4. Describe the uncommon findings of EP with a comprehensive case series, including rare histological types and with secondary complications, including pancreatitis, pseudocyst formation, malignant degeneration, gastrointestinal bleeding, bowel obstruction. 5. Differential diagnosis between EP and other gastrointestinal submucosal tumors, such as gastrointestinal stromal tumors (GISTs), gastroduodenal glomus tumors, neuroendocrine tumor, leiomyomas and schwannomas. 6. Summary 7. Suggesting reading

### Distinguishing Inflammatory Conditions from Cancer of the Gastrointestinal Tract: What Radiologists Should Know

#### Participants

Camila Vendrami, MD, Chicago, IL (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Review imaging technique to assess gastrointestinal (GI) inflammatory conditions and cancer
- Review and illustrate the typical imaging appearances that allow differentiation of these inflammatory conditions and cancer
- Review and illustrate potential complications from these entities

#### TABLE OF CONTENTS/OUTLINE

- Introduction: overview of GI inflammatory conditions and tumors
- Imaging techniques: US, CT, MR including enterography
- Gastric inflammation and gastric tumors
  - o Clinical findings, detection and imaging features to differentiate the entities
- Small bowel enteritis and other small bowel pathology and SB cancers (adenocarcinoma, carcinoid, lymphoma, GIST, metastases etc.)
  - o Clinical findings, detection and imaging features to differentiate the entities
- Diverticulitis and colon cancer
  - o Clinical findings, detection and imaging features to differentiate the entities
- Appendicitis and appendiceal cancers [adenocarcinoma, neuroendocrine (carcinoid), lymphoma and colon cancer associated with appendicitis], endometriosis of appendix
  - o Clinical findings, detection and imaging features to differentiate the entities
- Potential complications such as perforation and fistulas
- Conclusion

### **It's Not Just a Question of Size: Unveiling the Secret World of Abdominopelvic Lymph Nodes for a Proper Radiological Assessment**

#### **Participants**

Ana Lopes Potente, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Review individual lymph node anatomy, names, and abdominal and pelvic lymph node group locations. Demonstrate through illustrative cases which clues the lymph nodes can reveal to us about diagnostic possibilities.

#### **TABLE OF CONTENTS/OUTLINE**

- Importance of lymph node evaluation. Limitations of size-based evaluation. - Didactic drawings to review anatomy and pathophysiology. - Review of updated literature on normal dimensions of lymph nodes. - Video map to point out nomenclature and location of abdominal and pelvic lymph node chains, such as (but not limited to) retrocrural, retroperitoneal, gastrohepatic ligament, porta hepatis, celiac and superior mesenteric artery, pancreaticoduodenal, perisplenic, mesenteric, and pelvic nodes. - Demonstration of the main imaging techniques for lymph node evaluation. Importance of adequate protocols. Discussion of benefits and limitations of each method. - Case studies to highlight pitfalls and findings that may simulate lymphadenopathy, such as splenosis, accessory spleen, papillary process of the caudate lobe, vascular anomalies, prominent vascular structures like gonadal veins, and scalloped diaphragmatic crus. Tips to avoid misdiagnosis. - Special cases in which lymph node morphology can point to specific diagnoses. - Importance of lymph node features beyond size in diagnosis. - Exposition of rare cases where lymph node enlargement causes vascular and nervous complications. Discussion of diagnosis and management. - Summary of teaching points.

### Peritoneal Carcinomatosis: The Role of the Radiologist in Selecting Patients for Curative Treatment

#### Participants

Alicia Espinal Soria, MD, San Sebastian, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To know the different presentations of the peritoneal carcinomatosis in CT. To get familiar with the term Peritoneal Cancer Index and the website used to calculate it "e-Promise". To make a differential diagnosis with the pathologies that may mimic peritoneal implants.

#### TABLE OF CONTENTS/OUTLINE

Intraabdominal malignancies often spread to peritoneal cavity causing peritoneal carcinomatosis. The most common primary neoplasms are colorectal, small bowel, stomach, ovaries and pancreas. Peritoneal carcinomatosis (PC) may present in CT like ascites, peritoneal thickening, peritoneal nodules or masses, "omental cake" pattern or pseudomyxoma peritonei. This presentation forms in CT are also seen in other pathologies such as peritoneal tuberculosis, acute peritonitis, splenosis, peritoneal lymphomatosis, and peritoneal mesothelioma. Histologic analysis must be made to obtain a definitive diagnosis in doubtful cases. Until recently, PC was considered an end-stage disease where supportive care was the only possible treatment. The cytoreductive surgery (CRS) followed by Hypertermic intraperitoneal chemotherapy (HIPEC) is a combined treatment that has given a curative option to properly selected patients. It is important to know the most frequent shapes and locations of peritoneal implants to calculate the Peritoneal Cancer Index (PCI) using CT imaging, which is part of the selection criteria. The website "e-Promise.org" is useful to calculate this Index and help the clinician deciding the most suitable treatment for each patient.

### Rectum MRI: Beyond the basics

#### Participants

Thiago Jose Pinheiro Lopes, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- High-resolution MRI is a cornerstone in the evaluation of the rectum, notably for cancer. In the past years, its use has been expanded far beyond TNM staging, enabling post-neoadjuvant therapy follow-up, patient selection for the "Watch and Wait" approach, predicting response to Total Neoadjuvant Treatment (TNT), and much more. - MRI imaging has enabled less invasive treatment approaches, with improved quality of life for patients and similar outcomes, and radiologists should be aware of these developments. - Our purpose is to review emerging applications of rectal resonance in the radiological routine and bring tips for deepening the anatomy of the rectum.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction. 2. Delving into the anatomy of the rectum. 3. Recognizing post-CRT changes in rectum cancer. 4. Selecting patients for the "Watch and Wait" approach. 5. Using MRI to predict response to Total Neoadjuvant Treatment (TNT). 6. Identifying mucinous tumors. 7. Recognizing mesorectal fascia involvement. 8. Evaluating sphincter invasion in low rectal cancer. 9. Future directions. 10. Take home messages.

### Quantitative CT for Diffuse Liver Diseases: Steatosis, Iron, and Fibrosis

#### Participants

Perry J. Pickhardt, MD, Madison, WI (*Presenter*) Advisor, Bracco Group; Advisor, Zebra Medical Vision Ltd; Advisor, Nano X Imaging;

#### TEACHING POINTS

1. To demonstrate the ability of CT to quantify fat, iron, and fibrosis content within the liver, analogous to MRI approaches. 2. Explain the rationale for opportunistic screening at abdominal CT for detecting unsuspected diffuse liver disease, including steatosis, hemochromatosis, and compensated cirrhosis. 3. Describe a battery of CT-based liver biomarkers that can now be obtained in a fully-automated fashion using AI-based methodology.

#### TABLE OF CONTENTS/OUTLINE

- Overview of diffuse liver diseases  
o Hepatic steatosis and NAFLD  
o Hepatic iron overload and hemochromatosis  
o Hepatic fibrosis and cirrhosis  
- Quantification methods for hepatic fat, iron, and fibrosis content:  
o Liver biopsy  
o Advanced MRI methods  
o CT-based biomarkers  
- Opportunistic CT-based screening for diffuse liver disease  
o Rationale  
o Manual and automated techniques  
o Brief review of evidence to date  
o Pitfalls  
o Prospects for the (near) future  
- Concluding remarks

Shravya Srinivas Rao, MD, Boston, MA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Peritoneal malignancies like pseudomyxoma peritonei, metastatic carcinomatosis from colon adenocarcinoma, mucinous carcinomas of ovary, stomach, pancreas etc., can be treated with cytoreduction surgery and hyperthermic intraperitoneal chemotherapy (HIPEC) or early postoperative intraperitoneal chemotherapy (EPIC). Objectives of this exhibit are:- To discuss imaging manifestations of peritoneal malignancies - To review the technique, principles, and complications of HIPEC therapy- To learn the role of imaging in the assessment of HIPEC patients before and after therapy

#### TABLE OF CONTENTS/OUTLINE

1. HIPEC- technique and principles  
2. Peritoneal tumors- classification and imaging features  
3. Radiological, surgical and pathological correlation  
4. Criteria for CRS and HIPEC- selection of patients for HIPEC  
5. Calculation of Peritoneal Cancer Index: principles and method of estimation  
6. Imaging in response assessment

GIEE-28

### Peritoneal Carcinomatosis Versus Primary and Secondary Peritoneal Tumors and Other Traps

#### Participants

Ghina Jardali, MD, Villejuif, France (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Review of the imaging features of common and uncommon peritoneal diseases, neoplastic (such as pseudomyxoma peritonei) and non-neoplastic, that mimic peritoneal carcinomatosis. • Emphasis on the CT/MRI findings and the additional imaging clues that may allow the radiologist to appropriately narrow the differential diagnosis and, in some cases, make an imaging-specific diagnosis.

#### TABLE OF CONTENTS/OUTLINE

I. Imaging appearance of peritoneal carcinomatosis II. Imaging clues to the diagnosis of differential diagnosis: a. Secondary peritoneal-based neoplasms i. Pseudomyxoma peritonei b. Primary peritoneal neoplasms i. Malignant peritoneal mesothelioma c. Primary peritoneal mesenchymal tumors i. Gastrointestinal stromal tumor (GIST) with peritoneal sarcomatosis ii. Fibromatosis (Desmoid tumor) d. Non-neoplastic mimics of peritoneal carcinomatosis: i. Mesothelial cysts ii. Cystic lymphangioma iii. Lymphangiomyomatosis iv. Mesenteric fat necrosis / lipophagic granuloma v. Atypical infections: Tuberculosis, Actinomycosis

### **Gastro-Intestinal Devices: from Esophagus to Anus. Imaging Appearance Review of Common and Less Common GI Foreign Bodies**

#### **Participants**

Emre Aslan, MD, Ville Mont-Royal, QC (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

1) Review of imaging appearance of common and less common gastrointestinal (GI) devices.2) Summarize common device-specific complications.3) Review of MRI safety profiles for each GI device.

#### **TABLE OF CONTENTS/OUTLINE**

1) Introduction: As minimally invasive procedures become more ubiquitous and technology keeps advancing, new GI devices are being used by interventional radiologists and interventional gastroenterologists.2) Clinical use Radiologists and radiology trainees must stay up to date with new GI devices to recognize and prevent complications whenever possible. Each device's indications, normal imaging appearances, potential complications and MRI safety profiles will be discussed.3) Endoscopically placed devices esophageal, duodenal, rectal stents, AXIOS stent, and Ovesco device.4) Surgically placed devices LINX reflux management system, gastric pacemaker, gastric band, Ray-Tec X-rayable sponge and laparotomy sponge.5) Tubes and balloons Blakemore tube, cecostomy tube, intragastric balloon, and Minnesota tube.6) Other Amplatzer plug and capsule endoscopy device.7) Conclusion Summary of key teaching points.

### The Washout of Hepatocellular Carcinoma at Portal Venous Phase versus Equilibrium Phase: Radiological and Clinicopathological Implication

#### Participants

Kengo Yoshimitsu, MD, PhD, Fukuoka, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

•To learn that there are two distinct types of hepatocellular carcinoma (HCC) washout to be recognized: one at the portal venous phase (PVP) and the other at the equilibrium phase (EqP). •To learn that these two represents two different phenomena; a dynamic, and a static one, respectively. •To learn that PVP washout is a consequence of rapid hemodynamic change of HCC and background liver (BGL). •To learn that EqP washout represents static condition of contrast medium distribution in the extracellular space of HCC and BGL. •To learn that PVP washout is significantly related to histological grades of HCC, or its status of microvascular invasion. •To learn that EqP washout might be related to immunohistochemical subgroup of HCC.

#### TABLE OF CONTENTS/OUTLINE

1. Basic concept of two types of "WASHOUT" of HCC 2. Washout at PVP: radiological consideration 3. Washout at PVP: clinicopathological implication 4. Washout at EqP: radiological consideration 5. Washout at EqP: clinicopathological implication 6. Washout on dynamic MRI using extracellular contrast medium or gadoxetate 7. Summary

### Focal Liver Lesions: A Case-based Quiz

#### Participants

Laura Cavero Barreras, MD, Ordizia, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- To highlight the importance of the clinical context of patients with focal liver lesions. - To review the typical and atypical imaging findings of focal liver lesions in multimodality imaging techniques through cases studied in our center. - To know the current guidelines and define a practical approach to the radiologic management of liver lesions. - To identify potential pitfalls and key imaging findings to make the correct diagnosis.

#### TABLE OF CONTENTS/OUTLINE

Focal liver lesions represent a widespread, heterogeneous group of disorders that can be benign or malignant, solitary or multiple. Diagnosis is usually challenging as many lesions may mimic each other. Radiologists must consider the appearance and the enhancement pattern of the nodule on different imaging techniques, such as US, CT, and MRI. Moreover, contrast-enhanced US (CEUS) can help to resolve doubts and establish the diagnosis in cases where other imaging techniques do not provide a definite diagnosis. On the other hand, it is necessary to consider the clinical context of the patient, as this will determine the further management of the lesion. This presentation will take the form of a quiz to discuss the typical and atypical imaging findings and the management of focal liver lesions based on current guidelines.

### Laxative-free Photon-counting CT Colonography for Colorectal Cancer Screening

#### Participants

Yasuji Ryu, MD, Kanazawa, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The teaching points of this exhibit are to (1) explain the emerging role of laxative-free CT colonography in colorectal cancer (CRC) screening, (2) explain the role of photon-counting CT in addressing the challenges of conventional CT colonography, and (3) explain the role of artificial intelligence (AI) in unlocking the potential of laxative-free photon-counting CT colonography as a CRC screening test.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction: the importance of CRC screening; the emerging role and challenges of laxative-free CT colonography. 2. Photon-counting CT: benefits over conventional CT; how photon-counting CT addresses the challenges of laxative-free CT colonography. 3. AI enables an effective laxative-free photon-counting CT colonography examination: computer-aided detection; virtual bowel cleansing; risk assessment; putting it all together. 4. What we know and don't know: outcomes from clinical laxative-free CT colonography trials; initial observations from photon-counting CT colonography studies. 5. Summary.

### Pancreas Transplantation: What Should the Radiologist Know?

#### Participants

Ana Berasategui Criado, MD, Santander, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To expose the existing surgical techniques in pancreatic transplantation. To highlight the role of the different imaging tests in graft evaluation. To make a pictorial review of the postoperative complications according to the time after transplantation.

#### TABLE OF CONTENTS/OUTLINE

Pancreatic transplantation is a valid therapeutic option for poorly controlled diabetes mellitus and advanced diabetic nephropathy. Knowledge of the surgical techniques, location of the anastomoses and related complications will assist the radiologist in performing an accurate assessment that leads to adequate management and long-term survival of pancreatic grafts. There are three types of pancreas transplantations regarding the drainage method: systemic venous and bladder exocrine drainage, systemic venous and enteric exocrine drainage, and portal venous and enteric exocrine drainage. Radiological assessment of the pancreas graft is usually multimodal. Ultrasound is the first-line imaging modality for the initial post-surgical evaluation performed within the first 24 hours. CT is preferred if complications are presumed. Postoperative complications include parenchymal, infectious, enteric or vascular disorders, which can be classified according to the time lapse after transplantation in which they occur: immediate (< 24 hours), early (24- 72 hours), intermediate (72 hours-weeks) and late (months). We gathered the most illustrative cases of postoperative complications from recent years at our institution to show the key features of imaging that enable rapid and accurate management.

GIEE-34

### Retrospectively Defined Missed Early Signs of Pancreatic Cancer on CT

#### Participants

Satomi Kawamoto, MD, Baltimore, MD (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To review cases of missed early pancreatic ductal adenocarcinoma (PDAC) and early changes of PDAC on CT. 2. Small, isoattenuating PDAC without contour deformity can be easily missed. 3. CT findings to suggest early PDAC include pancreatic duct dilatation with or without abrupt duct cutoff, vascular invasion, focal parenchymal atrophy, and focal enhancement.

#### TABLE OF CONTENTS/OUTLINE

1. Background: Delay in diagnosis can contribute to poor outcomes in PDAC, and imaging plays a crucial role in the diagnosis of early PDAC. 2. Review of cases of missed early PDAC and early changes of PDAC before clinical diagnosis on CT. (1) Small, isoattenuating PDAC without contour deformity. (2) Pancreatic duct dilatation is most common secondary finding (3) Abrupt pancreatic duct cut-off (4) Vascular invasion is not a common finding but high likelihood of missing (5) Parenchymal atrophy (6) Focal enhancement. 3. Cognitive errors (1) Underlying pancreatitis (2) Unexpected finding. 4. Discussion of future direction

### Plan to Scan the Pancreas Transplant: A Sweet Review of Anatomy, Imaging Technique, and Complications

#### Participants

Maham Siddique, MD, New York, NY (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Teaching Points: • Pancreas transplant aims to restore normal glycemic control, often in young patients with diabetes and manifesting end-stage renal disease. • Ultrasound is performed to evaluate the pancreas and transplant vessels in the perioperative period. • Ultrasound, CT, and MRI can diagnose transplant-related complications. Common vascular complications include arterial and venous thrombosis and arterial pseudoaneurysm. Transplant pancreatitis has similar complications to inflammation of the native pancreas and can impact the renal transplant. • Radiologists should be familiar with normal pancreas transplant anatomy, vascular and non-vascular complications of pancreas transplants, as early recognition of these entities may improve outcomes.

#### TABLE OF CONTENTS/OUTLINE

Outline: Pancreas transplant background and demographics, Normal pancreas transplant anatomy and surgical technique, Normal transplant evaluation on ultrasound and reporting template, Acute and necrotizing graft pancreatitis, Vascular complications: arterial and venous stenosis and thrombosis, pseudoaneurysm, acute arterial bleeding, Non-vascular complications: Peripancreatic collections, hematoma, post-transplant lymphoproliferative disease.

### Why Oh Y-Grafts: Understanding the Anatomy, Imaging, and Complications of Pancreas Transplantation

#### Participants

Melanie P. Caserta, MD, Jacksonville, FL (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Pancreas transplant is the treatment for severe Type I diabetes mellitus complicated by end stage renal disease, poorly controlled Type I or II diabetes, and cystic fibrosis. Pancreas transplantation is most commonly performed simultaneously with kidney transplantation (80%) or following kidney transplantation (16%), and least commonly performed alone. Ultrasound is the first line modality for evaluating the allograft and vasculature and to look for complications. Contrast enhanced ultrasound, CT and MRI can be used as problem solving tools to further evaluate complications. After reviewing this case-based exhibit, the learner will: - Understand indications for pancreas transplantation - Describe the surgical anatomy of pancreas transplants - Describe ultrasound technique for evaluating the transplant pancreas - Recognize complications of pancreas transplant - Determine when additional imaging of the pancreas transplant is needed

#### TABLE OF CONTENTS/OUTLINE

Outline: 1. Objectives 2. Background - Pancreas Transplant a. Benefits of pancreas transplantation b. Review of surgical technique 3. Imaging a. Ultrasound - First line imaging i. Ultrasound protocol ii. Normal appearance iii. Complications 1. Vascular 2. Parenchymal 3. Perigraft 4. Bowel b. Problem solving i. Contrast enhanced ultrasound to assess allograft perfusion and vascular complications ii. CT - peripancreatic fluid collections, suspected intestinal obstruction, multiphase evaluation to assess graft and vasculature iii. MRI - Ferumoxytol MRI to assess transplant vasculature 4. Treatment and Intervention a. Medical b. Ultrasound guided c. Endovascular d. Surgical

### Navigating Through the Esophageal Disorders in Chest CT Scans: What Radiologists Should Know

#### Participants

Miguel Barrio Piqueras I, MD, Pamplona, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To know basic anatomy and histology of the esophagus  
To learn the role of CT imaging in the detection and characterization of esophageal pathology.  
To recognize the most important imaging findings of non-malignant and malignant esophageal diseases.

#### TABLE OF CONTENTS/OUTLINE

1. Esophageal anatomy and histology  
2. Benign esophageal disorders  
a). Benign esophageal tumors - Leiomyoma - Fibrovascular polyps - Esophageal schwannomas  
b). Congenital lesions: - Duplication cysts  
c). Esophageal diverticula - Pharyngoesophageal junction: Zenker diverticula - Middle esophagus diverticulum - Epiphrenic diverticulum  
d). Infectious diseases - Candida - HIV - CMV - Herpes simplex virus - Chagas  
e). Inflammatory disorders - Reflux esophagitis and Barrett's esophagus - Eosinophilic esophagitis (EoE) - Radiotherapy-induced esophagitis - Scleroderma - CREST  
f). Traumatic and fistulas - Esophageal impactation - Hematoma - Perforation - Actinic - Esophageal-airway fistula - Esophageal mediastinal fistula  
g). Others - Achalasia - Acute esophageal necrosis (AEN) - Hiatal hernia - Esophageal and para-esophageal varices  
3. Primary malignant esophageal tumors  
a). Squamous carcinoma (SCC)  
b). Adenocarcinoma  
c). Lymphoma  
d). Primary malignant melanoma

### Diffuse and Focal Liver Fat: Pearls and Pitfalls

#### TEACHING POINTS

To review the imaging features of liver fat in different methods. To discuss and illustrate the main causes and consequences of fatty liver disease, as well as its associated conditions. To demonstrate common and uncommon patterns of liver fat distribution and discuss the underlying pathophysiology. To recognize that classic liver lesions can have different patterns of imaging presentation in the setting of steatosis. To present challenging cases and mimic lesions, highlighting the clues that can be helpful for the correct diagnosis.

#### TABLE OF CONTENTS/OUTLINE

Liver fat in different imaging methods (US, CT and MRI). Main findings of several causes of fatty liver disease (alcoholism, metabolic syndrome, chemotherapy, drug toxicity, infection, PCOS). Patterns of liver fat distribution (diffuse, focal, geographic, multinodular, perivascular), including uncommon oncologic and cirrhotic cases. Patterns of presentation of the classic liver lesions in the setting of steatosis (FNH, hemangioma etc). Differential diagnosis between true lesions and pseudolesions.

### Ultrasound Of the Gastrointestinal Tract: Contributions of Ancillary Ultrasound Techniques

#### Participants

Nameerah Wajahat, Calgary, AB (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

(1.) Greyscale ultrasound evaluation comprises the fundamental basis of diagnostic evaluation of the bowel in inflammatory bowel disease (IBD) (2.) Wall thickness, inflammatory fat and signal on color doppler imaging (CDI) are the markers which increase in proportion to active inflammation. (3.) Ancillary Ultrasound techniques including: endovaginal sonography (EVS), contrast enhanced ultrasound (CEUS) and shear wave elastography (SWE) contribute greatly to final diagnosis and patient outcome. (4.) EVS provides information about anatomy and pathology in the deep pelvis with high resolution. (5.) CEUS allows for subjective and objective information about blood flow at the capillary level, allowing characterization of inflammatory masses as representative of active inflammation (phlegmon) or abscess formation (liquid pus) (6.) SWE measures bowel wall stiffness aiding with characterization of strictures. Soft inflammatory strictures- medical management. Stiff chronic strictures - surgical management

#### TABLE OF CONTENTS/OUTLINE

- Introduction to ultrasound of the bowel with emphasis on greyscale imaging - Ancillary features what are they and what do they do? - Endovaginal Sonography and its role in deep bowel evaluation - CEUS (Contrast Enhanced Ultrasound) and its contribution to activity assessment - SWE (Shear wave elastography) and its contribution to stricture assessment - Change of management with ancillary techniques

### Comprehensive Review of Abdominal Manifestations of Melanoma with Emphasis on Liver Metastasis

#### TEACHING POINTS

The purpose of this exhibit is 1. To review imaging findings of primary and secondary melanoma in the abdomen and pelvis 2. To discuss multimodality imaging of liver metastasis from melanoma 3. To present an imaging atlas of gadoxetic acid-enhanced MRI for liver metastasis and to discuss its potential value 4. To discuss surveillance protocols for intraabdominal metastasis of melanoma

#### TABLE OF CONTENTS/OUTLINE

1. Clinical aspects of melanoma (1) Epidemiology (2) Staging (3) Treatment and prognosis 2. Primary melanoma in the abdomen 3. Metastatic melanoma in the abdomen (1) Liver (2) Pancreaticobiliary system (3) Gastrointestinal tract (4) Other involvement 4. Multimodality imaging of liver metastasis (1) Ultrasound (2) CT (3) MRI i. Lesion detection and characterization ii. Special considerations for gadoxetic acid-enhanced MRI for melanoma iii. MR findings of liver metastasis according to the primary origin of melanoma 5. Surveillance and prognosis (1) Surveillance protocol for metastatic melanoma in the abdomen (2) Prognostic implications of imaging features

### Step-by-step Assessment in Colon Cancer Risk Stratification. Assessment by Virtual Colonography and Dual Energy Support

#### Participants

Omar Gamboa Abundis, MD, Ciudad de Mexico, Mexico (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Colorectal cancer represents the third most diagnosed cancer and corresponds to the second cause of death in the world. The recognized precursor lesion is the adenoma, and the risk of malignant transformation is significantly increased. Virtual colonography is a noninvasive screening method for colon cancer and avoids the unnecessary risk of bleeding or perforation present in colonoscopy. Learn to describe and categorize the findings and pitfalls in lesions found during image processing and viewing.

#### TABLE OF CONTENTS/OUTLINE

Table of Contents: Teaching points. Introduction. What is CRADS. Virtual colonography acquisition protocol. Image processing and anatomical considerations. Description of the results. CRADS categories. CRADS 1 to 4. Extracolonic findings. E0 to E4. Main pitfalls to consider. Conclusions. References. Outline: Colorectal cancer is the third most common cancer and is the second leading cause of cancer death in the world. It is important to carry out a screening test in patients over 45 years of age and even more so in those who present a high risk of suffering from this disease. Virtual colonography provides an excellent alternative with rapid acquisition protocols and high sensitivity and specificity. Useful in highrisk patients during the colonoscopy intervention, also avoiding the possible risk of perforation and bleeding.

### Deep Learning for Electronic Cleansing in Fecal-tagging CT Colonography

#### TEACHING POINTS

This exhibit reviews the historical perspectives of Electronic Cleansing (EC), the major cleansing artifacts and pitfalls in the conventional deterministic EC methods, the recent technical advances of deep-learning based EC (Deep-EC) methods, comparison between Deep-EC and conventional deterministic EC, and the future trend of Deep-EC development fecal-tagging CT Colonography (CTC). The teaching points of this exhibit are: 1. EC requires accurate classification or segmentation of tagging fecal residuals and their mixtures. Conventional deterministic EC methods exhibit various artifacts and pitfalls. 2. State-of-the-art deep-learning models and training techniques provide an effective solution to reduction of EC artifacts and pitfalls. 3. Intracolonic lumen segmentation (ILS), which combines EC and colon segmentation into a single procedure in the CTC workflow, is a promising Deep-EC method in CTC.

#### TABLE OF CONTENTS/OUTLINE

1. Review of deterministic EC methods with discussion of the limitations and clinical challenges. 2. Describe the challenges of building a large-scale CTC dataset for EC. 3. Present recent technical advances of Deep-EC by applying deeper and larger Convolutional Neural Network (CNN) and various model training techniques to reduce EC artifacts. 4. Present a cutting-edge Deep-EC procedure, Intracolonic lumen segmentation, built on the two-stream U-Net (BiS-UNet) model. 5. Compare the image quality of EC and Deep-EC in 3D visualization of cleansed colon in non-cathartic fecal-tagging CTC. 6. Discuss the technique trend and future developments of Deep-EC.

GIEE-43

### Peribiliary Cystic Lesions: Uncommon Mimickers of Hepatic and Biliary Cystic Lesions

#### TEACHING POINTS

To describe and demonstrate with radiological cases the common and uncommon peri-biliary entities. To identify the imaging features indicative of pathologies of the peri-biliary space and emphasize the radiological differences with hepatic and biliary lesions. To propose a practical systematization in the evaluation of intrahepatic peri-biliary cystic lesions. To suggest a step-by-step guide for clinical-radiological reasoning.

#### TABLE OF CONTENTS/OUTLINE

Intrahepatic peribiliary cystic lesions are usually benign and result from cystic dilatation of tubule-alveolar glands with acini of serous and mucinous cholangio-cytes with various stages of maturation. The term intrahepatic refers to cystic changes located above the hepatic hilum that have the portal vein, hepatic artery, and portal neurovascular bundle as anatomical landmarks. They are usually multiple, small, thin-walled, serous content, and by definition do not exhibit communication with adjacent bile ducts. They may take on a confluent appearance resembling multiloculated malignancies or even mimic intraductal biliary pathologies. This intrahepatic peri-biliary region is susceptible to several pathologies that include inflammatory, infectious, neoplastic, congenital and acquired nature. The objective of this review is to systematize the evaluation of peribiliary cystic lesions taking into consideration their intrahepatic location and their radiological aspects that may have some peculiar characteristics.

### LI-RADS Treatment Response Algorithm v2023: Roadmap for Post Radiation Treatment Response

#### Participants

Aadithya Nalla, Okemos, MI (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. The LI-RADS Treatment Response Algorithm (LR-TRA) is a standardized system for assessing and reporting treatment response after locoregional therapy (LRT) for hepatocellular carcinoma (HCC).2. When compared to other LRTs, radiation-based therapies (transarterial radioembolization (TARE) and stereotactic beam radiation therapy (SBRT)) have distinct post-treatment imaging appearances, including persistence of arterial phase hyperenhancement (APHE), which makes response assessment challenging using the current TRAs which use APHE as a surrogate imaging biomarker for viability. Changes in the LR-TRA v2023 are intended to address this challenge.3. This exhibit highlights the updates in the LR-TRA v2023, including the correct application of the new algorithm after radiation therapy to HCC, with the overall objective of improving diagnostic accuracy of post-treatment imaging assessment.

#### TABLE OF CONTENTS/OUTLINE

1. Summarize the role of the TRA in the context of radiation therapy for HCC.2. Case-based and illustrative review of expected imaging features after radiation-based treatments to HCC and identify pitfalls in response assessment.3. Introduce and highlight key updates of the new component of the LR-TRA v2023 pertaining to its application after radiation-based treatments for response assessment using a case-based review.

### From Guidelines to Radiology Practice: Navigating the 2023 ASCO Guidelines for Advanced Gastroesophageal Cancer

#### Participants

Charit Tippareddy, MD, Cleveland, OH (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Discuss new 2023 ASCO guidelines for advanced gastroesophageal cancer therapies  
2. Radiologic imaging findings related to treatment sequelae  
3. Differentiate treatment related response versus disease progression on radiologic imaging

#### TABLE OF CONTENTS/OUTLINE

1. Pathophysiology, demographics, risk factors of gastroesophageal cancer  
2. New 2023 ASCO Guidelines and their implications for treatment  
3. Imaging modalities used in diagnosis and staging of advanced gastroesophageal cancer  
4. Role of imaging in staging and management of advanced gastroesophageal cancer  
5. Demonstrate patient imaging cases that relate to the following:  
5a. Treatment related effects of immune checkpoint inhibitors  
5b. Treatment related effects of platinum-based chemotherapy  
5c. Treatment related effects of fluoropyrimidines  
5d. Treatment related effects of tyrosine kinase inhibitors  
5e. Post-radiation effects  
5f. Post-esophagectomy complications

### Internalize It!: An Insider's Case-Based Guide to Internal Hernias

#### Participants

Collin Edwards, MD, New York, NY (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Internal hernias occur due to herniation of viscera, most often small bowel, through the mesentery or peritoneum, and considered in the differential for intestinal obstruction. - Internal hernias are classified by different systems based on distribution of bowel loops in the abdomen and pelvis. - Post-operative internal hernias occur after roux-en-Y anastomosis for gastric bypass and liver transplant. - CT with IV and PO contrast is the imaging modality of choice for evaluating internal hernias. - "Sac-like" appearance of dilated small bowel loops on imaging should raise concern for internal hernia. - Radiologists should have a clear understanding of normal peritoneal anatomy, surgical history, and the characteristic location of common and uncommon internal hernias on imaging.

#### TABLE OF CONTENTS/OUTLINE

- Introduction and background - Normal peritoneal anatomy and boundaries - Case-based review, management, and surgical outcome - Paraduodenal hernia - Lesser Sac/Foramen of Winslow hernia - Pericecal hernia - Intersigmoid hernia - Transmesenteric hernia - Pelvic and broad ligament hernia - Post Roux-en-Y hernias: Petersen's, Roux limb mesentery, enteroenterostomy

### Selected Portal Venous Anomalies: An Institutional Multimodality Case-based Review of Portal Varices and Intrahepatic Congenital Shunts

#### Participants

Abtin Jafroodifar, MD, Syracuse, NY (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Review portal venous (PV) varices and aneurysms, including congenital, acquired, true and pseudoaneurysms, with review of extrahepatic and intrahepatic classifications. Learn to properly communicate and report PV varices and aneurysms and their complications such as thrombosis, portal hypertension, or compressive syndromes. Discuss congenital intrahepatic portosystemic shunts subtypes. Review PV embryological development as it relates to a radiologist's practice. Explore the diagnostic clues to recognize PV varices, aneurysms, and intrahepatic shunts using multimodality imaging including ultrasound, CT, MR, and cinematic 3D rendering.

#### TABLE OF CONTENTS/OUTLINE

(1) Review normal and variant portal vein anatomy using CT, MR, angiography, and original diagrams. Briefly review portal vein embryological development from the vitelline and umbilical venous systems. (2) Discuss the diagnostic criteria, relevant presentation, and epidemiology of PV varices and aneurysms. Optimal imaging protocols will be outlined. (3) A case-based review of different types of PV varices, including congenital, acquired, and isolated subtypes. Case-based review of intrahepatic portal vein aneurysms and eventual thrombosis. (4) A case-based review of five types of congenital intrahepatic portosystemic shunts classified by Park et al. (*AJR*, 1990). Present pre- and post closure of a congenital intrahepatic shunt case in a patient with bilateral Wilm's tumors. (5) Present a rare case of splenic vein aneurysm with eventual thrombosis and recanalization using cross-sectional imaging; of note, splenic vein aneurysms are so rare that a true prevalence has not been reported. Discuss mesenteric and splenic vein aneurysms.

Reve Chahine, MD, Beirut, MI (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Living donor liver transplantation (LDLT) expands access to transplantation but has the challenges of substantial technical complexity and simultaneous risk for both donor and recipient. 2. Precise understanding of the anatomy of the central liver (biliary drainage, hepatic venous drainage, arterial and venous anomalies) and segment 4 is critical to living donor success. 3. Contrast-enhanced MRCP is used to assess anatomy but suffers from suboptimal reliability due to motion artifacts (eg, respiratory motion at MRCP, arterial phase tachypnea with gadoxetate disodium) and technical factors. 4. We implemented a multi-contrast agent MRCP imaging protocol using gadoxetate disodium and gadobenate dimeglumine to enable high-reliability imaging in the arterial phase (gadobenate) and of the bile ducts (non-contrast MRCP + gadoxetate hepatobiliary phase) and prevent the need for repeat or adjunctive imaging (eg, CTA).

#### TABLE OF CONTENTS/OUTLINE

1. Background on LDLT. Highlight key anatomic considerations for assessing eligibility for donation. 3. Targeted review of conventional single-contrast agent MRCP imaging protocols for living liver donor evaluation. a. MRCP with extracellular gadolinium-based contrast material. b. MRCP with gadoxetate disodium. c. Single contrast agent MRCP followed by CTA. 4. Demonstration of successful multi-contrast agent MRCP for assessing living liver donor eligibility. a. Protocol. b. Technical considerations. c. Advantages. d. Pictorial review. e. Limitations.

### **MR Imaging Biomarkers: Can Aggressive Imaging Features of Hepatocellular Carcinoma Predict Early Post-Treatment Recurrence?**

#### **TEACHING POINTS**

1. Hepatocellular carcinoma (HCC) diagnosis and management is almost exclusively imaging based without the need for pathologic confirmation. 2. Certain MR imaging features have shown to be predictive of more aggressive biologic subtypes of HCC, resulting in increased likelihood of early post-treatment recurrence and worse overall survival. 3. In order to optimally treat HCC, it is important to recognize the multifactorial etiology for tumor recurrence and/or progression including a basic understanding of the complex immunologic tumor microenvironment.

#### **TABLE OF CONTENTS/OUTLINE**

1. Review the histopathology of HCC, including the histologic variants using a pictorial representation of the heterogeneity in the histology and biology of HCC. 2. Pictorial review of MR imaging biomarkers predictive of aggressive tumor biology. 3. Review of the hepatic and tumor microenvironment and its role in treatment response after locoregional therapy. 4. Review clinical outcomes after locoregional therapy to HCC by various locoregional modalities with an emphasis on HCC with aggressive pre-treatment imaging features by using a case-based approach. 5. Demonstrate a proposed mechanism to use various MR imaging biomarkers to risk stratify patients with aggressive versus less-aggressive HCC to reduce the chance of early post-treatment progression and improve overall management.

### Solid Pseudopapillary Tumors of the Pancreas: Old Friend, New Meme

#### Participants

David Mata, MD, Shreveport, LA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

This educational exhibit will depict typical image findings of solid pseudopapillary tumors (SPT) of the pancreas, with an emphasis of epidemiological, clinical, and pathological correlation. Illustrated as well are common mimics of SPT, including neuroendocrine and malignant tumors of the pancreas. A review of epidemiology and clinical features of SPT. Identify relevant Ultrasound (US), Computed Tomography (CT), and Magnetic Resonance Imaging (MRI) appearances of typical SPT. Correlate morphologic findings with Positron Emission Tomography (PET), pathologic microscopy, and gross surgical specimens. Provide key features to differentiate SPT from other retroperitoneal tumors.

#### TABLE OF CONTENTS/OUTLINE

SPT are rare epithelial tumors of exocrine pancreas with low malignant potential and overall good prognosis. Mostly found in young adults and Caucasian women, these tumors are often asymptomatic but can present with abdominal pain and a palpable mass. Since there are SPT mimics, it is important to obtain clinical history and know the epidemiology of SPT. Upon diagnosis, SPT are normally large, circumscribed masses comprised of both solid, hemorrhagic, and necrotic components with no associated ductal dilation. It is important to note, smaller presenting SPT (< 3cm) often have image findings of a solid, homogenous appearance. The intralésional appearance depends on the degree of hemorrhage, calcification, tumor necrosis, or cystic degeneration. These tumors are commonly found in the body and tail of the pancreas. To avoid erroneous interpretation or delay in diagnosis, appropriate knowledge of SPT imaging patterns and presentations is required.

### Mimics of Inflammatory Bowel Disease: Not everything is Crohn's or Ulcerative Colitis

#### TEACHING POINTS

1. Inflammatory bowel disease (IBD; Crohn's disease and Ulcerative colitis) represents a group of diseases characterized by chronic inflammation of the gastrointestinal tract. 2. Patients frequently present with nonspecific symptoms such as abdominal pain, weight loss, diarrhea, nausea, vomiting and obstruction. 3. Various infectious and non-infectious diseases can mimic IBD including malabsorption syndromes, autoimmune diseases, drug-induced conditions, diverticulitis, appendicitis, vascular etiologies and malignancy. 4. Imaging is a crucial tool in identifying IBD mimics as it helps clinicians in making accurate diagnoses and implementing appropriate treatment strategies.

#### TABLE OF CONTENTS/OUTLINE

1. Typical imaging characteristics of IBD (Crohn's disease and Ulcerative colitis). 2. Differential diagnoses of infectious causes with common imaging features and corresponding cases. 3. Differential diagnoses of non-infectious causes with common imaging features and corresponding cases.

### Unveiling Internal Hernias A Comprehensive Review of CT Imaging Patterns

#### Participants

Patricia Dantas I, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The purpose of this exhibit is: Review peritoneal cavity anatomy with emphasis on the most common internal hernia sites. Discuss the role of computed tomography (CT) in the diagnosis and management of patients. Illustrate imaging patterns of the main types of internal hernia, highlighting the specific characteristics of congenital, oncologic and bariatric surgery cases. Identify key CT features that help differentiate open-loop from closed-loop obstruction and those that may predict ischemic injury of the small bowel loops. Recognize the main differential diagnoses and pitfalls of internal hernias, addressing diagnostic challenges. Propose an algorithm to aid in the interpretation of CT images in cases of intestinal obstruction.

#### TABLE OF CONTENTS/OUTLINE

1) Introduction: epidemiology, clinical and pathophysiological aspects of bowel obstruction 2) Role of CT in the evaluation of obstructive acute abdomen, including CT protocol recommendations. 3) Review of peritoneal cavity anatomy:- Main peritoneal spaces;- Ligaments;- Normal recesses and foramina. 4) To demonstrate, through a case-based review, the imaging patterns of the following types of internal hernias:- Paraduodenal Through foramen of Winslow- Intersigmoid- Falciform ligament- Pericecal- Supravesical- Transmesenteric / Transomental- Acquired (postoperative/trauma). 5) To discuss and illustrate major complications of internal hernias:- Ischaemia- Perforation- Illustrative key points. 6) Differential diagnosis and pitfalls. 7) Relevant imaging findings that aid surgical decisions. 8) Algorithm for the diagnosis of internal hernias. 9) Conclusions and "take-home messages".

### Preoperative Assessment in Pancreatic Ductal Adenocarcinoma: Understanding the Impact of Staging and Anatomical Variants on Surgical Planning

#### Participants

Davi Romao, MD, (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

It is critical to understand the radiologic features of pancreatic ductal adenocarcinoma and how they affect surgical planning. In this pictorial review, we will focus on the assessment of vascular invasion and its impact on surgical planning. We will also review the major anatomic variants associated with the vascular anatomy of the celiac trunk, superior mesenteric artery and its branches.

#### TABLE OF CONTENTS/OUTLINE

1. Review of pancreatic adenocarcinoma staging  
2. Assessment of vascular invasion in pancreatic adenocarcinoma  
2a. Venous involvement  
2b. Artery involvement  
3. Anatomical variants  
3a. Celiac trunk variants  
3b. Superior mesenteric artery variants  
3c. Venous variants  
4. Surgical Technique  
4a. Cephalic pancreaticoduodenectomy  
4b. Distal pancreatectomy  
4c. Types of venous reconstruction  
4d. Celiac axis resection - when is this feasible?

### Learning From Failure: Non-Target Embolization with Yttrium-90 in the Treatment of Hepatic Tumors

#### TEACHING POINTS

1. The role of hepatic trans-arterial radioembolization (TARE) loco-regional therapy is expanding with new applications particularly in earlier stages of disease 2. Optimized TARE workflow involves careful pre-procedural selection, peri-procedural monitoring, and post-procedural evaluation 3. Peri-procedural imaging and dosimetry allows identification of non-target intra- and extra-hepatic dose delivery as well as target dose estimation 4. Identifying potential causes of discordance between Y-90 microsphere delivery and intended target with multi-modality imaging can impact patient outcomes and may be a valuable area of future research

#### TABLE OF CONTENTS/OUTLINE

1. Introduction to transarterial radioembolization (TARE) 2. Indications and approaches to Y90 radioembolization in hepatic tumors 3. Workflow and evaluation of Y90 Treatment (Pre-, peri- and post-procedural) 4. Examples of non-target delivery, complications, and clinical outcome based on peri-therapy scans 5. Potential causes of non-target delivery 6. Future directions of research

### Update on Multi Energy CT Applications for Pancreatic Diseases

#### Participants

Yasunori Nagayama, MD, (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Multi-energy CT provides spectral-based imaging such as virtual non-contrast imaging (VNC), virtual monochromatic imaging (VMI), and material density maps, potentially facilitating the optimal lesion assessment and management for patients with pancreatic diseases. The aim of this presentation is to provide the state-of-the-art clinical applications of multi-energy CT technologies for pancreatic imaging by presenting the numerous representative examples.

#### TABLE OF CONTENTS/OUTLINE

I. Principle of multi-energy CT technology II. Multi-energy CT systems III. Post-processed spectral CT imaging IV. Clinical applications of spectral imaging in pancreatic diseases A) Improved lesion delineation 1. Iso-attenuating pancreatic ductal adenocarcinoma (PDAC) 2. Incidental PDAC on routine abdominal CT 3. Staging of PDAC on routine portal-venous phase CT 4. Neuroendocrine tumor (NET) 5. Acute pancreatitis B) Spectral-based lesion characterization 1. Chronic mass forming pancreatitis vs. PDAC 2. NET vs. intrapancreatic accessory spleen 3. Local recurrence of PDAC vs. post-operative perivascular fibrosis 4. Pancreatic cyst C) Prediction of clinical outcome 1. Chemotherapy response for PDAC 2. Risk stratification for post-operative pancreatic fistula (POPF) 3. Prediction of future PDAC development D) Improve patient safety by reducing radiation dose and iodine doses

### Gastrointestinal Oncologic Emergencies: A Radiologists' Guide

#### Participants

Mindy Wang, MD, Houston, TX (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Describe the imaging approach for evaluating oncologic emergencies affecting gastrointestinal tract.
- Identify imaging manifestations of gastrointestinal oncologic emergencies.
- Identify potential pitfalls in imaging of gastrointestinal oncologic emergencies.

#### TABLE OF CONTENTS/OUTLINE

- Gastrointestinal oncologic emergencies and imaging approach
- Multimodality imaging features of gastrointestinal oncologic emergencies
  - o Intestinal obstruction
  - o Intestinal ischemia
  - o Intestinal perforation
  - o Intussusception
  - o Inflammatory/infectious changes (including superinfection of tumor necrosis/abscess formation)
  - o Graft versus host disease
  - o Tumor torsion/volvulus
  - o Peritonitis
  - o Lymphatic obstruction
  - o Vascular complications
    - § Hemorrhage (including active extravasation and intramural hematoma)
    - § Thrombosis (microangiopathy, venous and arterial thrombosis or thrombophlebitis)
    - § Arteritis
    - § Aneurysm/pseudoaneurysm
  - o Emergencies related to paraneoplastic syndrome
- Management
- Mimics and potential pitfalls

### Hepatic Artery Infusion Pump: A Multi-institutional Comprehensive Case-based Review

#### Participants

Harit Kapoor, MD, MBBS, Poughkeepsie, NY (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1) HAIP is a novel surgically placed intraarterial pharmacotherapeutic option with three salient indications: unresectable burden of colorectal liver metastases (CRLM), adjuvant therapy post CRLM resection and in unresectable intrahepatic cholangiocarcinoma (ICC).2) Post-procedure Tc-MAA SPECT are vital to ensure isolated and maximal bilobar hepatic perfusion for safe and efficacious drug delivery.3) Patient selection is multi-factorial including presence of intra- and extrahepatic disease, anatomy and patency of vasculature, hepatic function, extent of prior chemotherapy treatment, and performance status.4) All HAI devices are MRI conditional however the Medtronic Synchroned II device is set to automatically stall while in the scanner and must be interrogated post-scan to assure the motor has restarted.5) HAIP therapy is associated with unique complications, many of which are delayed and unsuspected. Meticulous interrogation of the catheter tip position and a low threshold for further investigations on follow-up imaging can help decrease complication rates.

#### TABLE OF CONTENTS/OUTLINE

1) Role of HAIP therapy for different clinical indications.2) Technical aspects of HAIP placement and trouble shooting in extrahepatic perfusion3) Expected imaging appearances of HAIP devices in both normal and variant anatomic situations4) Role, interpretation and management implications of Tc-MAA SPECT pump perfusion imaging5) Tabulated overview and Case-based examples of HAIP complications (Pump pocket-related, Catheter-related and Hepatobiliary).6) Summary

### Improving the Gall Stone Detectability by Using the Monochromatic Images with a Fast kVp-Switching Single-Source Spectral Computed Tomography: A Phantom Experiment with Gall Stone Specimen

#### TEACHING POINTS

1. In the conventional polychromatic (kVp) scan mode, gall stones detectability such as the cholesterol, pigment, and rare were lower because the small difference of computed tomography (CT) value (hounsfield unit: HU). 2. Nowadays, with the application of fast kVp switching single source dual energy scan, its spectral mode enables the ability to reconstruct monochromatic images at different energy level. The purpose of this study is to compare the gall stones detectability between the dual energy scan mode and conventional polychromatic scan mode during a phantom study. 3. The monochromatic display method (cine display mode and spectral HU curve) with dual energy scan mode was possible for improving the detection of various gallstones compare with the conventional polychromatic scan mode (kVp).

#### TABLE OF CONTENTS/OUTLINE

CONTENT ORGANIZATION 1: Clinical case (Cholelithiasis) :MRI and CT images 2: Gall stone specimens :dual energy CT scan mode images(keV) and conventional scan mode images (kVp). 3: Spectral HU curve 4: Gall stone specimens (cholesterol): cine display mode 5: Clinical case (Cholelithiasis): performed dual energy CT

### A "Cyst"ematic Approach to Cystic Pancreatic Lesions

#### TEACHING POINTS

The target audience of this educational activity is for all radiologists who read CT or MR imaging of the abdomen.1. Demonstrate multimodality imaging features and patterns of common cystic pancreatic lesions2. Illustrate a systematic approach to distinguishing between pancreatic cystic lesions3. Review case-based clinical management including histopathologic correlation

#### TABLE OF CONTENTS/OUTLINE

Content: A systematic multi-modality imaging review of pancreatic cystic lesions will be included including an explanation for key diagnostic features, differentiation between lesions, histopathologic correlation, and review of management. The case selection includes:1. Mucinous cystic neoplasms2. Serous cystadenomas3. Solid pseudopapillary epithelial neoplasms4. Intraductal papillary mucinous neoplasms5. Cystic neuroendocrine tumors6. Sequela of pancreatitis (pseudocysts and walled off necrosis)

### Imaging Overview of Peritoneal Mesothelioma

#### Participants

Suren Reddy Satti, Preston, United Kingdom (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

A comprehensive overview of peritoneal mesothelioma with a focus on the histological subtypes, key distinguishing imaging features and understanding the common pitfalls involved in diagnosis.

#### TABLE OF CONTENTS/OUTLINE

The aim is to improve understanding of peritoneal mesothelioma and the subtypes to aid with diagnosis and subsequent management. We present a radiological case-based review of the subtypes of peritoneal mesothelioma with accompanying histological and intra operative findings. Clinical features along with specific imaging findings for each subtype will be shown along with some pitfalls in interpretation. Subtypes of peritoneal mesothelioma: 1. Multicystic mesothelioma 2. Well differentiated papillary mesothelioma 3. Epithelioid mesothelioma 4. Sarcomatoid mesothelioma 5. Biphasic mesothelioma Mimics of mesothelioma - Lymphangioma - IgG4 peritoneal disease - Tuberculosis

### Burn the Cake: The Role of HIPEC in Pseudomyxoma Peritonei

#### Participants

Vitor Bichuette, MD, Uberaba, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

? To review concepts involving epidemiology, imaging findings and surgical techniques used in the treatment of pseudomyxoma peritonei (PP). ? To illustrate the use of peritoneal cancer index (PCI) to assess the peritoneal cavity. ? To review how hyperthermic Intraperitoneal chemotherapy (HIPEC) is performed, the techniques involved, indications and contraindications, and related complications. ? To discuss how radiologists can help surgeons in the management of PP.

#### TABLE OF CONTENTS/OUTLINE

- Introduction - General concepts
  - o The use of CT to assess the PCI
- Pseudomyxoma peritonei:
  - o Definition, clinical presentation, imaging features and treatment.
  - o Imaging aspects of peritoneal pseudomyxoma and peritoneal carcinomatosis: how to differentiate
  - o Surgical treatment
- HIPEC:
  - o A step-by-step explanation of how HIPEC is performed.
  - o Advantages, indications and contraindications.
  - o Most common outcomes and complications.
- Case-Based Review:
  - o Sample cases explaining and demonstrating image findings of PP and how CT can be used before and after the surgery
  - o Assessment of PCI
  - o HIPEC: normal and abnormal findings
- Future Directions: new perspectives in the use of HIPEC to treat peritoneal tumors.
- Conclusion and key takeaways.

### Sonazoid-Enhanced Ultrasonography: What Can We Do in Abdominal Radiology and Intervention?

#### Participants

Jae Woong Choi, MD, PhD, Seoul, Korea, Republic Of (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Sonazoid-enhanced ultrasonography (SEUS) is recently introduced contrast-enhanced ultrasonography using Sonazoid (GE Healthcare) offering the vascular phase and the unique post-vascular Kupffer phase for helping diagnose focal liver lesions (FLL). Its role has been primarily focused on differentiating benign and malignant FLLs. However SEUS can be used in diverse clinical settings such as evaluating the hepatic vasculature, and a guiding tool for interventional procedures of the liver. In conclusion, we believe that CEUS can be applied to diverse clinical settings, not only for the diagnostic purposes but also for the interventional procedures as an excellent guiding tool.

#### TABLE OF CONTENTS/OUTLINE

1) Physics of SEUS, 2) Diagnostic roles of SEUS, 3) Application of SEUS in evaluation of hepatic vasculature, 4) Introduction of SEUS during liver biopsy, 5) SEUS as a guidance tool for radiofrequency ablation, 6) Tips and limitations of SEUS.

### Fake Liver Lesions: Can You Help Me? An Illustrative Guide to Liver Pseudo-lesions and Tumor Mimickers

#### Participants

Roberta Sasso, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Review importance of epidemiology for diagnosis of liver lesions. Illustrate clinical and imaging findings that might help distinguishing benign and malignant liver lesions. Practical tips and imaging features that could help achieve an accurate diagnosis and avoid unnecessary procedures. Highlight potential pitfalls related to different treatments that may mimic liver lesions.

#### TABLE OF CONTENTS/OUTLINE

Introduction - General concepts: epidemiology of liver lesions, including risk factors, incidence, and mortality. Imaging findings on CT and MRI of several liver lesions. Liver lesions: illustrative cases of different benign hepatic lesions and pseudolesions that mimic malignant hepatic lesions. Pitfalls: expected post-treatment changes that might be confused with true lesions. Normal findings after surgery, transplant, ablation, embolization, radiation and immunotherapy are reviewed. Case-Based Review: series of cases demonstrating imaging findings of liver lesions and how different modalities can be used. Conclusion and key takeaways.

### Imaging Review of Pseudomyxoma Peritonei

#### TEACHING POINTS

Comprehensive radiological overview of pseudomyxoma peritonei (PMP), and its patterns of disease spread. Common appearances of appendix mucinous tumours and frequently encountered interpretation pitfalls leading to misdiagnosis.

#### TABLE OF CONTENTS/OUTLINE

Diagnosis of PMP is often delayed in the non-specialist setting due to minimal exposure to appendix tumours and a lack of awareness. The aim is to improve the knowledge of pseudomyxoma peritonei and aid in the radiological diagnosis through understanding of its various aetiologies and the common pitfalls in imaging diagnosis. We present a case-based exhibit of PMP with reference to histology and intra-operative findings. To include:

- Common radiologic findings at presentation, predominant patterns of disease spread and complications of PMP with key review areas when reporting.
- Examples of delayed diagnosis from misinterpretation with tips and tricks to aid with accurate diagnosis. The cases include:
  - o Primary appendix tumours, misdiagnosed as an abnormal ovary or fallopian tube.
  - o Krukenberg tumours reported as a primary ovarian tumour.
  - o Diffuse peritoneal disease with a primary appendix tumour (initially not identified).
  - o Complicated appendicitis with an underlying tumour.
- Other origins of pseudomyxoma other than the appendix, such as urachus and mature teratoma of the ovary.
- How to optimize imaging to aid with diagnosis, utilizing positive oral contrast in computed tomography (CT) imaging of pseudomyxoma peritonei, use of MRP re-formats and MRI protocols.

### Role of Radiological Imaging in the Diagnosis and Management of ERCP Complications

#### TEACHING POINTS

- What is Endoscopic Retrograde Cholangiopancreatography (ERCP), and in which situations is it performed?
- What are the complications of ERCP and how often do we encounter them?
- Diagnosis of ERCP complications with the help of imaging methods. Tips for radiologists
- The importance of imaging methods in the early diagnosis of complications
- The role of imaging in management of complications

#### TABLE OF CONTENTS/OUTLINE

Table of Contents

- Terminology and anatomy of the bile ducts and pancreatic duct
- Post-ERCP expected imaging findings
- Complications of ERCP
- Demonstration of pathologies in imaging methods for the diagnosis of complications
- The importance of early diagnosis in case of complications and correlation of imaging finding with clinical symptoms and signs
- Demonstration of possible complications with sample cases
- Follow up imaging findings during the treatment process of patients with complications

Outline

- Endoscopic retrograde cholangiopancreatography (ERCP) is an application that is increasingly used to treat biliopancreatic disorders. This situation leads to a rise in the number of cases with complications.
- It is important to distinguish between expected findings and pathological findings in post ERCP images.
- It is important to evaluate the history and physical examination together with imaging methods for early diagnosis of complications and to decrease morbidity.
- Imaging methods play a guiding role in the classification of complications.

### Multimodality Imaging in the Detection and Characterization of Anatomic Variants, Benign, and Malignant Conditions of the Peri-Ampullary Region

#### Participants

Kelvin Cortis, FRCR, Msida, Malta (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To illustrate the conventional and variant anatomy of the ampullary and periampullary region. To provide a structured differential of the various conditions that may present at the ampullary and peri-ampullary regions. To describe the imaging features of pathologies at these regions.

#### TABLE OF CONTENTS/OUTLINE

The periampullary region is an anatomically and pathologically complex region. It encompasses the pancreatic head, second part of the duodenum, pancreato-biliary junction, and associated neurovascular structures. All these structures are within a 2cm radius from the major duodenal papilla. Familiarity with this area and its variants will increase diagnostic accuracy and recognition of associated complications, thereby guiding proper management. This pictorial exhibit will display the multimodality imaging findings of developmental, benign, and neoplastic entities that may arise at the ampullary and peri-ampullary regions. Developmental entities include duodenal webs, pancreas divisum, pancreaticobiliary malunion, and annular pancreas. Para-duodenal pancreatitis, papillitis, Lemmel's syndrome, choledocholithiasis, and vascular abnormalities, are benign conditions that might involve the ampullary region. Neoplastic conditions that can involve the periampullary region include ampullary carcinoma, periampullary duodenal carcinoma, pancreatic tumours, distal common bile duct tumours, gastrointestinal stromal tumours, and neuroendocrine tumours. Abdominal radiologists should have a thorough anatomical understanding of the ampullary region in order to formulate a structured differential diagnosis that will lead to timely and precise diagnosis and management.

### Advanced Pancreatic Imaging: 10 Tips and Tricks

#### Participants

Mariana Peleja, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Pancreatic ductal adenocarcinoma (PDAC) and other pancreatic conditions can be very difficult to diagnose and be a real challenge even to an experienced radiologist. The purpose of this exhibit is to present, through a series of challenging cases, the direct and indirect signs of focal and diffuse pancreatic disease, and how can the radiologist help to establish the correct diagnosis using different imaging methods, such as Ultrasound (US), Computed Tomography (CT), Magnetic Resonance Imaging (MRI) and Positron Emission Tomography (PET) CT. Some of the presented tips include:- Careful evaluation of main pancreatic duct or biliary tree dilation;- Importance of the T1-weighted images to evaluate the pancreatic parenchyma;- Look for asymmetrical parenchyma atrophy;- Pay attention to abnormalities involving the surrounding vessels;- Search for secondary lesions if uncertain about malignancy (such as liver and lymph nodes).

#### TABLE OF CONTENTS/OUTLINE

- Cases of pancreatic neoplasms and inflammatory conditions, with subtle findings that should raise a suspicion for a pancreatic disease;- Brief Review of pancreatic anatomy with multimodality imaging;- Image assessment of PDAC, with its features spectrum and tricky findings;- Importance of imaging for staging and resectability evaluation;- Other challenging cases in pancreatic cancer imaging, which the radiologist expertise is crucial to the correct management of disease.

### Peritoneal carcinomatosis: A Comprehensive Review of Peritoneal MRI. Primer for Residents

#### TEACHING POINTS

Peritoneal carcinomatosis is a common metastatic manifestation in several malignancies, with a higher incidence in gastrointestinal and gynecological tumors. Imaging techniques are essential in assessing the extent of the disease and guiding treatment decisions. Peritoneal MRI is a noninvasive technique that provides high-quality imaging of the peritoneum with excellent soft tissue contrast and high spatial resolution, with no exposure to ionizing radiation. Specific imaging protocols with DCE and DWI sequences allow a better assessment of peritoneal disease, especially unfavorable sites such as mesenteric and intestinal involvement, with enhanced sensitivity for detecting small lesions. Clinical applications of peritoneal MRI include diagnosis, staging, and monitoring of peritoneal metastases, with a crucial role in guiding therapeutic strategies and prognostic utility in patients undergoing cytoreductive surgery or HIPEC. The "PAUSE" method offers a structured approach to reporting peritoneal involvement, providing a precise description of the location and extent of the disease, serving as a road map for the surgeon and facilitating surgical planning.

#### TABLE OF CONTENTS/OUTLINE

Introduction: Peritoneal metastases and diagnostic challenges. Advantages over CT and PET/CT. Peritoneal MRI: Dedicated protocol. Clinical applications: Diagnosis, staging, and monitoring of peritoneal metastases. Advantages and limitations. The "PAUSE" method: A structured reporting tool. Case examples. Conclusions. References

### Photon-counting CT: Technical Features and Clinical Impact on Abdominal Imaging

#### Participants

Hiroimitsu Onishi, MD, PhD, Suita, Japan (*Presenter*) Research Grant, General Electric Company; Speakers Bureau, General Electric Company

#### TEACHING POINTS

The photon-counting CT system is equipped with a photon-counting detector that can measure the number of photons and the energy of each photon, allowing the acquisition of images with high spatial resolution and virtual monochromatic contrast. One of the major advantages of photon-counting CT in abdominal examinations is that it provides virtual monochromatic images with high image quality and high spatial resolution. The purpose of this presentation is: 1. To illustrate the technical features of photon-counting CT system compared with conventional CT system with energy integrating detector, 2. To introduce the effective use of photon-counting CT for the evaluation of abdominal diseases, and 3. To discuss the clinical impact of photon-counting CT on the diagnosis of abdominal diseases.

#### TABLE OF CONTENTS/OUTLINE

1. Technical overview of photon-counting CT; 2. Scan modes; ultra-high resolution mode, multi-energy mode, and dual source mode; 3. A variety of image reconstruction kernels; 4. Quantum iterative reconstruction algorithm; 5. High spatial resolution; 6. Valuable virtual monochromatic imaging; 7. Possibility of radiation dose reduction; 8. Scanning protocols optimized for the abdominal diseases; 9. Clinical implications for the diagnosis of abdominal diseases; 10. Summary

### Pearls and Pitfalls of Rectal MRI: The Only Stool You Need

#### Participants

Hala Khasawneh, MBBS, Rochester, MN (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Highlight essential imaging findings in staging. Illustrate essential key points and common pitfalls to serve as a guiding tool for radiologists through an interactive approach. Overview of current treatment options including surgical and nonsurgical approaches, such as "watch and wait" will be discussed.

#### TABLE OF CONTENTS/OUTLINE

Over the past few decades, rectal MRI has created a paradigm shift in the management options of rectal cancer by providing accurate TNM staging and restaging as well as post-treatment assessment. However, a few controversies remain in reporting TNM staging for rectal cancer which radiologists need to be aware of to provide more reproducible and standardized reporting. The benefit of rectal MRI in guiding disease management relies on obtaining high-quality scan for accurate TNM staging, assessment of Circumferential Resection Margin, Extramural Vascular Invasion, anal canal involvement and tumor relation with surrounding pelvic structures. Using an evidence-based approach, we aim to clarify controversial key points in reporting rectal MRI, including staging of T4b tumor, utilizing diffusion weighted imaging in restaging, evaluation of mucinous lesions, differentiating lymph nodes from tumor deposits, and morphological assessment and localization of lateral pelvic lymph nodes in staging and restaging. Rectal MRI is essential for tailoring treatment plans in rectal cancer. Therefore, it is paramount to have standardized and reproducible interpretation of scans to enhance consistency in disease staging.

### The Magic Eye: Advantages of Spectral CT Imaging over Conventional CT in Liver and Pancreatic Pathology

#### Participants

Antonio Michael-Fernandez, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- To review the most important spectral CT reconstructions for abdominal imaging and the improvement in material differentiation with this technique. - To show Spectral CT imaging advantages over conventional CT through some cases of liver and pancreatic pathologies.

#### TABLE OF CONTENTS/OUTLINE

Background:Spectral CT is gaining increasing clinical importance with multiple potential applications including abdominal and oncology imaging.We present different cases with liver and pancreatic pathologies where spectral CT images offer multiple advantages over conventional CT, as low-energy virtual monoenergetic images and iodine maps for the detection of hyper- and hypovascularized liver lesions. The purpose of this review is to provide an overview of potential useful abdominal applications of spectral CT focused on liver and pancreatic pathology.Details of content:We present different types of cases (such as characterization of liver and pancreatic lesions, improving vascular contrast for surgical planning or evaluation the response of tumour therapy) and review and analyze the most important spectral CT reconstructions for each case (virtual unenhanced, iodine maps and virtual monochromatic reconstructions).These reconstructions allow better detection and characterizations of findings and reduce the need for correlative or follow-up imaging.Conclusion:Spectral TC imaging offers multiple advantages in the abdominal area. The combination of different types of spectral reconstructions improves better detection and characterization of liver and pancreatic lesions. It also allows precise treatment planning and could be a potential therapy monitoring parameter.

### Going, Going, Gone: Case-Based Review of Sclerosing Hemangiomas

#### Participants

Bryson Jones, BS, Georgetown, KY (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1) Hepatic hemangiomas are the most common benign neoplasm encounter in the liver and most are discovered incidentally. 2) The appearance of hemangiomas may change over time and may be influenced by senescent changes of the liver or diffuse disease of the surrounding hepatic parenchyma. 3) Hemangiomas undergoing degeneration has been described as sclerosing/sclerosed, hyalinized, or thrombosed and present a diagnostic dilemma for radiologist 4) Understanding the imaging appearance and crucial importance of prior comparative imaging is key to making the diagnosis and avoiding unnecessary additional imaging and invasive procedures.

#### TABLE OF CONTENTS/OUTLINE

I. Briefly review the classic appearance of hepatic hemangiomas, incidence and natural history, as well as illustrative pathological changes that are proposed to occur as hemangiomas sclerose. II. Propose a diagnostic algorithmic approach to a suspected sclerosing/sclerosed hemangioma. III. Provide case-based imaging examples of hemangiomas as they evolve over time, including US, CT, MRI and CEUS. IV. Provide case-based imaging example of pitfalls in attempting to prospectively diagnose sclerosing hemangiomas.

### **Pitfalls of Contrast-enhanced Ultrasound (CEUS) in Liver Lesions: Early Arterial Enhancement Patterns and Washout**

#### **Participants**

Elhamy Heba, MD, MD, Lexington, KY (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

1. Understand the utility of CEUS in a patient population in which CT and MRI contrast agents are contraindicated. 2. Discuss different enhancement patterns of benign and malignant liver lesions. 3. Explain pitfalls in interpreting washout (most associated with malignancy) including understanding true intravascular nature of microbubbles contrast agent and that additional factors related to technique can lead to early bubble rupture and appearance of false washout in benign lesions. 4. Discuss possible pathophysiology of earlier rupture of the microbubbles in benign subcapsular liver lesions compared to lesions located deeper in the liver. 5. Discuss potential false positive washout scenarios in benign liver lesions on a background of hepatic steatosis due to echogenic liver parenchyma resulting in lesion appearing relatively hypoechoic compared to adjacent liver parenchyma.

#### **TABLE OF CONTENTS/OUTLINE**

1. Overview: review of the utility of CEUS and mention the advantages, disadvantages and indications in liver imaging. 2. Understanding the mechanism of CEUS agent (microbubbles), explaining how that might contribute to false washout in different circumstances. 3. Different enhancement pattern of benign and malignant liver lesion with emphasis on washout as an important feature to suggest malignancy of liver lesion. 4. False washout in benign liver lesions as a pitfall of CEUS, case-based approach. 5. True washout in cases of hepatocellular carcinoma, metastases, and cholangiocarcinoma for comparison.

### Imaging Evaluation in Living Liver and Kidney Donors: What to Report

#### Participants

Thamy Carvalho, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1- Illustrate the main imaging standards in the pre-transplant evaluation of live liver and kidney donors through conventional radiology images, such as computed tomography (CT) and magnetic resonance imaging (MRI), from the digital archive of our institution.2- Improve the understanding of vascular variants (arterial and venous) and their implications in the pre-renal and liver transplant evaluation of potential living donors using a didactic approach, through illustrations.3- Evaluation of donors' pre-transplant images, understanding the procedure and identification of anatomical variants that may interfere with the surgical technique, in addition to possible pathologies that may prevent a possible transplant.4- Describe and prepare a structured report of the main findings that may contraindicate the candidate for transplants, in addition to assisting in the surgical technique to be performed.

#### TABLE OF CONTENTS/OUTLINE

1 - Review of vascular variants, pathologies and anatomical reconstructions of candidates for pre-transplantation of live liver and kidney donors through illustrative images.2 - Illustration of vascular variants and pathologies supported by the use of illustrative images that may imply or prevent transplantation.3 - Preoperative knowledge of hepatic and renal vascular anatomical variants is mandatory for surgical planning and to help reduce postoperative complications. This information must pertain to the structured report.4 - Summary and messages to take home.

### The Many Faces of FNH: MRI Findings

#### Participants

Enzo Casali SR, MD, Buenos Aires, Argentina (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Describe the typical presentation of FNH. Analyze uncommon MRI findings in FNH. Evaluate the importance of liver-specific contrast agents in achieving correct diagnosis.

#### TABLE OF CONTENTS/OUTLINE

Focal nodular hyperplasia (FNH) is the second most common benign liver tumor after hemangioma. Magnetic Resonance (MRI) is an extremely useful tool for the diagnosis of FNH due to its high sensitivity and specificity. The correct diagnosis of FNH and its distinction from other differential diagnoses is essential because asymptomatic patients with FNH do not require treatment. FNH is classified as classic or nonclassic and MRI findings vary according to this. Lesions typically shows iso or hypointense signal on T1-weighted images, slightly hyper or isointense signal on T2-weighted images, an hyperintense central scar on T2-weighted images, an intense homogeneous enhancement during the arterial phase of gadolinium-enhanced imaging and enhancement of the central scar during later phases. Other more infrequent findings are: increase in size, T1 hyperintensity, the presence of a pseudocapsule, the appearance of multiple FNH all at once and the association with other benign liver lesions. Using liver-specific contrast agents may facilitate the diagnosis in these cases. Recognizing these different MRI patterns allows us to establish a correct diagnosis of FNH, preventing treatment in asymptomatic patients.

### Abbreviated MRI Techniques for HCC Screening

#### Participants

Diana Kadi, MD, Durham, NC (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. US has low sensitivity for HCC, especially in early-stage tumors, cirrhosis and obesity. 2. To improve sensitivity over US for early detection of HCC, while remaining cost-effective, Abbreviated MRI (AMRI) protocols have been developed. 3. This exhibit will review emerging concepts in AMRI-based HCC surveillance, including technical aspects, diagnostic performance, current gaps in knowledge, and future directions.

#### TABLE OF CONTENTS/OUTLINE

1. Current guidelines for HCC surveillance 2. Limitations of US 3. CT and MRI a. Superior reported diagnostic sensitivity, especially for small and early HCC b. Limitations 4. Three general AMRI approaches a. Non-contrast AMRI i. Technique o T1 weighted imaging a. Low sensitivity for early-stage HCC o T2 weighted imaging a. Help differentiate suspicious/benign lesions b. Low sensitivity for small HCC o Diffusion weighted imaging a. Restricted diffusion favors malignancy b. Higher lesion conspicuity ii. Reporting iii. Advantages iv. Disadvantages b. Dynamic AMRI i. Technique o Pre-contrast o Arterial phase a. Assess APHE o Portal venous and delayed phases a. Washout b. Capsule ii. Reporting iii. Advantages iv. Disadvantages 5. Hepatobiliary Phase AMRI a. Technique i. Hepatobiliary phase imaging o High liver to lesion contrast ii. T2 weighted imaging o Excludes some benign lesions iii. DWI o Mixed data regarding benefit of DWI b. Reporting c. Advantages d. Disadvantages 6. Gaps and current needs a. Prospective studies are needed to implement AMRI in guidelines b. Current utilization should be in patients whose US-based HCC surveillance is compromised

**SUMMARY** AMRI is a high-sensitivity alternative to US for surveillance of early-stage HCC in patients at risk for HCC.

### Intrahepatic Cholangiocarcinoma: A Review of Current and Emerging Imaging Techniques and Treatment Options

#### Participants

Julia Saltalamacchia, MD, Portland, OR (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Intrahepatic cholangiocarcinoma makes up a small percentage of total CCA cases, but treatment and surgical options differ from extrahepatic cholangiocarcinoma  
2. Improvements in MRCP imaging and PET/MRI serve as complimentary modalities to standard MR and CT imaging for staging, problem solving, and follow up.  
3. Recent developments in systemic and locoregional therapies have expanded treatment options and therapy considerations including radiation therapy, interventional oncology, expanded neoadjuvant therapies, and expanded surgical resectability (including transplantation)

#### TABLE OF CONTENTS/OUTLINE

1. Introduction  
2. Intrahepatic cholangiocarcinoma work-up  
a. NCCN guidelines  
3. Imaging considerations  
a. Characteristic findings  
b. Mimics and pitfalls  
c. The emerging role of FDG PET MRI  
4. Treatment options  
a. General principles - locoregional and systemic options  
b. Chemotherapy  
1. Systemic therapy  
2. Targeted  
a. Transarterial chemoembolization  
b. Hepatic arterial infusion pump  
3. Downstaging after neoadjuvant therapy  
c. Radiation  
1. External beam radiation therapy  
2. Y-90 radioembolization (lobar and radiation segmentectomy)  
d. Surgical  
1. Preoperative considerations  
2. Patient selection  
3. Surgical options  
a. Wedge resection  
b. Segmentectomy +/- hepaticojejunostomy (HJ)  
c. Hepatectomy +/- HJ  
d. Transplantation

### Role of Radiology in a Multidisciplinary Approach of Hepatocellular Carcinoma

#### Participants

Elissandra Lima, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- To review international diagnostic HCC guidelines and LI-RADS with examples- To review the classical imaging appearance and patterns of HCC- To understand imaging features that correlate with favorable versus poor outcome and those associated with post-treatment response and recurrence

#### TABLE OF CONTENTS/OUTLINE

1. Background 2. When to use each imaging modality? 3. Optimal study protocol of the liver 4. What contrast agent to use? Hepatobiliary versus extracellular contrast agent 5. Characterization of hepatocarcinoma nodules 6. How to use LI-RADS? 7. International diagnostic HCC guidelines 8. Mimickers and Overdiagnosis of HCC: Flash-filling hemangioma, focal confluent fibrosis, intrahepatic cholangiocarcinoma, hepatic lymphoma 9. Staging, treatment decision-making, and follow-up of HCC 10. Evaluating beyond the liver: Common sites of extrahepatic metastasis 11. How to select patients with HCC for liver transplantation, resection or locoregional treatment? 12. Advanced disease: Locoregional therapies or systemic therapies

### Pseudomyxoma Peritonei: Concepts, Classification, Imaging Spectrum and HIPEC

#### TEACHING POINTS

To describe and demonstrate the imaging features of pseudomyxoma peritonei in the various diagnostic modalities. To propose a systematization of the evaluation of pseudomyxoma peritonei. Contextualize the role of imaging to predict the extent and quantification of disease that may result in a more aggressive surgical approach combined with or without HIPEC.

#### TABLE OF CONTENTS/OUTLINE

Peritoneal pseudomyxoma (PPM) is a clinical syndrome characterized by the accumulation of mucinous ascites in the peritoneal cavity. The most common cause of peritoneal pseudomyxoma is mucinous neoplasms in the appendix and according to the new consensus statement, PPM is classified based on the histology of the peritoneal disease and not based on the primary neoplasm. Peritoneal pseudomyxoma is classified into: acellular mucin, low-grade mucinous carcinoma peritonei (G1), high-grade mucinous carcinoma peritonei (G2) and high-grade mucinous carcinoma peritonei with signet ring cells (G3). The imaging spectrum of PPM is variable and suggestive findings include mucinous ascites, peritoneal nodules and omental. It is essential to be familiar with this pathology since accurate staging, with details of the sites affected, is essential to define therapy which may include cytoreductive surgery and hyperthermic intraperitoneal chemotherapy (HIPEC). The role of imaging is well documented and each diagnostic modality has its indications and limitations in the staging and follow-up of PPM. This review provides an updated and comprehensive summary of the histologic classification of PPM, imaging findings, and describes the role of the radiologist in the multidisciplinary setting to predict the extent and quantification of disease.

### Peeking Inside the Pancreas: A Radiological Journey through Imaging of Unusual and Rare Pancreatic Tumors

#### Participants

Mostafa Shehata, MD, Houston, TX (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Describe the imaging approach for evaluating unusual and rare pancreatic tumors. 2. Identify imaging manifestations of unusual and rare pancreatic tumors. 3. Identify potential pitfalls in imaging of unusual and rare pancreatic tumors.

#### TABLE OF CONTENTS/OUTLINE

1. Unusual and rare pancreatic tumors and imaging approach 2. Multimodality imaging features of unusual and rare pancreatic tumors a. Primary malignant tumors: i. Acinar cell adenocarcinoma ii. Pancreatic small cell carcinoma iii. Pancreatic adenosquamous carcinoma iv. Pancreatic lymphoma v. Hepatoid pancreatic adenocarcinoma vi. Pancreatic mucinous carcinoma vii. Pancreatic primary lymphoma viii. Clear cell acinar cell carcinoma ix. Pancreatic carcinosarcoma x. Pancreatic hemangiopericytoma xi. Pancreatic rhabdomyosarcoma b. Primary tumors with malignant potential: i. Solid pseudopapillary tumor ii. Intraductal tubulopapillary neoplasm iii. Teratoma iv. Solid serous cystadenoma c. Secondary Malignant Tumors i. Unusual metastases to pancreas d. Benign Tumors i. Pancreatic lipoma ii. Intraductal papillary neoplasm (IPMN) iii. Lymphoepithelial cysts iv. Focal pancreatitis 3. Mimics and Pitfalls (tumor like conditions; IgG4-RD; biliary tract tumors; duodenal tumors (duodenal dystrophy, gastrointestinal stromal tumor (von Recklinghausen), Brunner's duodenal hamartoma)

### Adding Insult to Injury: Unexpected Gastric Cancer Presentations That Can Make Radiologist's Life Difficult

#### Participants

Dequitier Machado, DC, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To demonstrate the variability in presentations of gastric carcinoma and the dissemination patterns. 2. To understand and learn how to differentiate fibrosis from disease progression and primary tumor involvement. 3. To identify recurrence in the esophagus-gastric junction 4. To illustrate the role of radiology in the differential diagnosis, staging, and surveillance of patients with gastric carcinoma.

#### TABLE OF CONTENTS/OUTLINE

- Gastric normal anatomy and possible secondary implant pathways . Epidemiology of gastric cancer . Variability in presentations in gastric adenocarcinoma.- Rare patterns of tumor recurrence, that we should not miss.

### The Solution is Right at Your Fingertips: Linear Probe and Improvement of US Gallbladder Evaluation

#### Participants

Pilar Navarro Azurmendi, MD, Pilar, Argentina (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1 To analyze the benefits and limitations of linear and curved transducers used in US evaluation of the gallbladder with cine and imaging findings throughout different cases. 2 To review the most advantageous sonographic technique and knobology optimization. 3 To identify potential pitfalls in US evaluation and the technics to prevent them. 4 To assess the available tools to minimize the risk of misinterpretation in biliary pathology imaging.

#### TABLE OF CONTENTS/OUTLINE

1 Types of transducers used for gallbladder evaluation. Characteristics, benefits and limitations. 2 Sonographic technique and knobology optimization through cine videos and images. 3 Anatomy, useful landmarks and choice of sonographic window. 4 Ultrasound artifacts: making use of imaging artifacts to aid in diagnosis. 5 Identify potential pitfalls in gallbladder ultrasound evaluation and how to avoid them. 6 Diagnostic criteria for gallbladder wall pathologies. 7 Test your knowledge: interactive review for integration of clinical cases with imaging findings. 8 Take-home messages.

### Uses, Finding, Pitfalls, and Advanced Applications in Gadoteric Acid-Enhanced MR Imaging of the Liver

#### Participants

Elissandra Lima, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- To understand the Pharmacokinetics of gadoteric acid- To review clinical applications, pitfalls and of gadoteric acid-enhanced MRI- To discuss advanced and future applications such as multiparametric liver MRI, magnetic resonance cholangiography, and liver function assessment

#### TABLE OF CONTENTS/OUTLINE

1. Background 2. Pharmacokinetics of gadoteric acid 3. Magnetic resonance protocol and technique: abbreviated and multiparametric protocols 4. Optimizing the workflow 5. Clinical applications of gadoteric acid-enhanced MRI: Focal nodular hyperplasia, hepatocellular adenomas, hepatocellular carcinoma, cholangiocellular carcinoma, liver metastases, hepatic fibrosis, biliary imaging 6. Evaluation of treatment response of liver metastases 7. Gadoteric acid-enhanced MRI for staging treatment decision-making, and follow-up of HCC 8. Incidental discovery of focal liver lesions 9. Pitfalls and solutions: arterial phase limitations, hepatobiliary phase limitations, focal nodular hyperplasia, "pseudowashout", uptake in lesions other than FNH. 10. Advanced and future applications

### Bad Connections: Review of Intestinal Fistulae

#### Participants

Allison Forrest, MD, Burlington, VT (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Intestinal fistulae in the abdomen and pelvis are common and result in significant morbidity. Fistulae occur between hollow viscous organs and can occur in the setting of surgery, trauma, inflammation, and malignancy. Multiple imaging modalities are used for both initial evaluation and follow up, with selection of technique depending on the anatomy involved. Fluoroscopic evaluation is often helpful in the evaluation as it provides real-time, dynamic evaluation of fistulae and can further delineate complex anatomy in conjunction with cross-sectional imaging. Selection of route of contrast administration and catheter selection for evaluation of enterocutaneous fistulae are particularly important for successful fluoroscopic evaluation. An understanding of the spectrum of fistulae and the tools available to radiologists are critical for accurate characterization of fistulae.

#### TABLE OF CONTENTS/OUTLINE

1. Review the pathophysiology of intestinal fistulae.
2. Provide an overview of indications and protocols for imaging evaluation of fistulae, with emphasis on fluoroscopic evaluation with cross-sectional correlation. Specific tips for evaluation of enterocutaneous, esophageal, small bowel, and colonic fistulae will be discussed.
3. Display case examples of common and uncommon intestinal fistulae, including those due to surgery, malignancy, inflammation, and trauma.
4. Review factors that are commonly implicated in delayed fistulae healing.
5. Brief overview of treatment principles and available therapies.

### Fibro-polycystic Liver Disease: What Radiologists Need to Know

#### Participants

Lautaro Florentin, MD, Buenos Aires, Argentina (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Fibropolycystic liver disease refers to a group of different liver and biliary anomalies caused by abnormal embryologic development of ductal plates. Congenital hepatic fibrosis, biliary hamartomas, autosomal dominant polycystic disease, Caroli disease, and choledochal cysts are included in this group. Fibropolycystic liver diseases usually do not exist as single entities and can be found in combined forms. Each entity shows characteristic imaging findings, specially at computed tomography (CT) and magnetic resonance (MR). Radiologists should be familiar with this spectrum of lesions to proper guide the management of these patients.

#### TABLE OF CONTENTS/OUTLINE

Introduction  
What is fibropolycystic liver disease?  
Embryologic development  
Congenital hepatic fibrosis  
What is?  
Imaging findings  
Biliary hamartomas (Von Meyenburg complex)  
What is?

### New Concepts in Staging and Treatment of Colon Cancer: What the Radiologist Needs to Know

#### Participants

Amit Choudhari, MBBS, FRCR, Mumbai, India (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Understand types of colon cancer surgeries, including multivisceral resection
- Comprehend the elements which need to be covered while reporting a clinically relevant colon cancer staging CT report
- Review the questions asked in multidisciplinary tumor boards
- Updates on the recent advances in colon cancer management
- Discuss the advantages of neoadjuvant chemotherapy prior to surgery as per recent literature

#### TABLE OF CONTENTS/OUTLINE

- Pathophysiology of colon cancer
- Types of colon cancer surgeries and nodal resections
- Discuss common and uncommon presentations in colon cancer (extramural vascular invasion, aneurysmal dilatation, vascular involvement, tumor bowel fistula, uncommon pathologies)
- What the surgeon wants to know from the radiologist for planning surgery; e.g., a patient with ascending colon cancer with duodenal involvement can undergo colo-pancreaticoduodenectomy
- dMMR/MSI-H, ctDNA, FoxTROT, Niche-2: What they mean and why do we need to know about them

Printed on: 04/12/24

### Internal Hernia after Roux-en-Y Gastric Bypass: Clues to a Challenging Diagnosis

#### TEACHING POINTS

- Internal hernias are a complication in up to 10% of patients after Roux-en-Y gastric bypass (RYGB).
- Risk factors for internal hernia after RYGB include retrocolic technique, non-closure of mesenteric defects and amount of weight loss after surgery.
- Untreated internal hernias place the patient at risk for bowel ischemia.
- Several signs of varying sensitivity and specificity have been described for internal hernias after RYGB.
- A structured approach should be taken to assess for internal hernias in all patients who have undergone RYGB—especially those who are presenting with abdominal pain.

#### TABLE OF CONTENTS/OUTLINE

- Description of RYGB procedure.
- Three types of internal hernia after RYGB: Transmesocolic, Petersen and jejuno-jejunostomy hernias.
- Incidence of internal hernia after RYGB.
- Risk factors for internal hernia after RYGB.
- Clinical presentation of internal hernias after RYGB.
- Prognosis of untreated internal hernia after RYGB.
- Treatment of internal hernia after RYGB.
- Accuracy of CT in diagnosing internal hernia after RYGB.
- CT findings of internal hernia after RYGB and their sensitivity and specificity in detecting internal hernias. All signs will be accompanied by example images and/or image stacks.
- Vascular Signs: SMV beaking sign, vascular swirl sign and hooking intestine sign.
- Mesenteric Signs: Mesenteric edema, mesenteric lymph nodes and eye of the hurricane sign.
- Bowel signs: Small bowel obstruction, right sided jejunojejunal anastomosis, mushroom sign, small bowel behind SMA, small bowel between transverse colon and stomach and clustered loops of small bowel.
- Structured approach to assessing the presence of internal hernia in patients with RYGB.

GIEE-90

### Tips for Differentiation Between Pancreatic Ductal Adenocarcinoma with Bile duct Invasion and Cholangiocarcinoma with Pancreas Invasion

#### Participants

Shintaro Ichikawa, MD, PhD, Hamamatsu, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Both pancreatic ductal adenocarcinoma (PDAC) and cholangiocarcinoma are mostly adenocarcinomas and share common pathological features. Therefore, their imaging findings are similar, and when a mass stretching from the head of the pancreas to the distal common bile duct is found, it may be difficult to distinguish whether it is bile duct invasion from PDAC or pancreatic invasion from cholangiocarcinoma. To differentiate between the two, it may be useful to focus on whether the pancreatic or bile duct lesion is the predominant finding and whether the main pancreatic duct is dilated.

#### TABLE OF CONTENTS/OUTLINE

The following tips for differentiating between PDAC with bile duct invasion and cholangiocarcinoma with pancreatic invasion are discussed along with their key imaging findings:

1. Predominant lesion: Pancreatic lesions of PDAC are larger than those of cholangiocarcinoma. The range of common bile duct lesions in cholangiocarcinomas is greater than that of lesions in PDAC.
2. Double-duct sign: Both the main pancreatic and common bile ducts are often dilated in PDAC, whereas the main pancreatic duct is rarely dilated in cholangiocarcinoma.

The following differential diagnoses are discussed along with their key imaging findings:

1. Ampullary masses (adenoma, adenocarcinoma, and neuroendocrine neoplasms)
2. Pancreatic groove cancer
3. Groove pancreatitis
4. Mass-forming pancreatitis
5. Sclerosing cholangitis

### Complications of Colorectal Cancer Treatment

#### Participants

Kelly Cox, DO, Jacksonville, FL (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Teaching Points: Colorectal cancer remains the third most common cancer and is the second leading cause for cancer related deaths in the United States. Colorectal cancer is highly treatable and often curable with early detection. After a quick review of colorectal cancer and its most current treatment algorithms, we will take an in depth look at the complications of treatment including those related to surgery, liver directed therapy, chemotherapy and immune checkpoint inhibitors. As colorectal cancer treatment has rapidly changed in recent years, new and unexpected imaging complications of treatment must be recognized in our daily practice to direct immediate patient care and future colorectal cancer treatment.

#### TABLE OF CONTENTS/OUTLINE

1. Review of colorectal cancer and its most current treatment algorithms 2. Surgical Complications a. Perforation/Anastomotic Leak b. Abscess c. Fistula d. Local recurrence with and without obstruction 3. Liver Directed Therapies a. Intrahepatic artery infusion chemotherapy - biliary strictures b. Radiofrequency ablation i. Thermal injury ii. Injury to adjacent organs c. Radioembolization 4. Chemotherapy Induced Injuries a. Steatohepatitis b. FNH-like lesions 5. Checkpoint Inhibitor complications a. Pseudoprogression b. Pneumonitis c. Diarrhea, enteritis and colitis d. Bowel perforation e. Pancreatitis

### Deep-learning CT Reconstruction in the Abdomen: Principles, Techniques, Current Practice and Future Perspective

#### Participants

Mostafa Shehata, MD, Houston, TX (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Understanding the background and important principles of image reconstruction methods in CT with the advantages and disadvantages of each modality 2. Comprehensive review on the deep learning imaging reconstruction and why it outperforms other modalities 3. To discuss clinical impact of deep-learning CT reconstruction in abdominal imaging 4. Future perspective and implementation

#### TABLE OF CONTENTS/OUTLINE

1. CT image reconstruction and deep learning a. Definition principles of CT image reconstruction b. History and advances of CT image reconstruction until now c. Common quantitative and qualitative parameters for image quality d. Explain the advantages and disadvantages of each reconstruction technique (filtered back projection, iterative reconstruction, full model-based iterative reconstruction, hybrid iterative reconstruction)2. Deep-learning image reconstruction (DLIR) in the abdomen CT a. Understanding the basics of convolutional neural networks (CNNs) b. The role of DLIR in CT image quality improvement and noise reduction c. Factors influencing the performance of deep-learning CT reconstruction3. Where DLIR in CT abdomen now a. DLIR algorithms available b. Current evidence and practice of deep-learning CT reconstruction in the abdomen c. Clinical impact on the diagnosis of abdominal organs diseases4. DLIR limitations and potential future developments

### Radiologic Features of Abdominal Multimodality Imaging Related to Cardiovascular Disorders

#### Participants

Yeju Kang, MD, Seoul, Korea, Republic Of (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To classify various cardiovascular disorders causing changes on abdominal multimodality imaging. 2. To comprehensively review the pathophysiology of intra-abdominal changes caused by cardiovascular disorders. 3. To present various radiologic features of abdominal multimodality imaging in patients with cardiovascular disorders.

#### TABLE OF CONTENTS/OUTLINE

1. Cardiac disorders-related changes: Congestive heart failure: hepatic congestion, cardiac cirrhosis/Infective endocarditis: infection due to septic embolism, infarction, mesenteric ischemia/Atrial fibrillation: infarction, mesenteric ischemia/Valvular heart disease: hemosiderin deposition due to mechanical cardiac valve/Cardiac arrest: cardiopulmonary resuscitation-related change 2. Vascular disorders-related changes: Obstruction of the vena cava: liver cirrhosis due to membranous obstruction of inferior vena cava, hepatic neoplasm, third flow due to superior vena cava obstruction/Vasculitis: systemic lupus erythematosus, IgA vasculitis, Behcet disease, etc. 3. Cardiovascular drug-related changes: anticoagulants-related changes, anti-arrhythmic agents-related changes

### Signet Ring Cell Adenocarcinomas of the GI Tract: Clinical, Radiological, and Pathological Correlation

#### Participants

Perry J. Pickhardt, MD, Madison, WI (*Presenter*) Advisor, Bracco Group; Advisor, Zebra Medical Vision Ltd; Advisor, Nano X Imaging;

#### TEACHING POINTS

1 T1. To describe the key epidemiological, clinical, radiological, and pathological features of signet ring cell adenocarcinomas of the GI tract. 2. To review the specific features of gastric, colorectal, esophageal, appendiceal, and pancreaticobiliary signet ring cancers, with radiologic-pathologic correlation. 3. To illustrate linitis plastica, scirrhous tumors, and the "malignant target sign" associated with these aggressive cancers.

#### TABLE OF CONTENTS/OUTLINE

- Introduction - Signet ring cell adenocarcinomas of the GI tract o Histopathological definition o Epidemiology and prognosis o The malignant target sign - Clinical-Pathological-Radiological correlation o Gastric signet ring cell adenocarcinoma (linitis plastica) o Colorectal signet ring cell adenocarcinoma o Esophageal signet ring cell adenocarcinoma o Appendiceal signet ring cell adenocarcinoma o Pancreaticobiliary signet ring cell adenocarcinoma o Metastatic signet ring cell adenocarcinoma - Concluding remarks

GIEE-95

### The Many Forms of Acute Pancreatitis

#### TEACHING POINTS

The morphological expression of acute pancreatitis (AP) is highly variable and in its more complex forms it can be a difficult challenge for the radiologist in training to decipher. Therefore, the main objective of this paper is to present a guide for understanding the morphological classification of AP, related complications and differential diagnoses using the standardized terminology established in the revised Atlanta classification system. Other objectives are: To recognize the general clinical features of AP and the bases of the Atlanta classification system. To understand the current role of the radiologist in the diagnosis and treatment of acute pancreatitis. To emphasize the importance of the implementation of standardized reporting schemas and a well-defined lexicon into the radiology practice to facilitate accurate communication among members of a multidisciplinary team.

#### TABLE OF CONTENTS/OUTLINE

Introduction. Clinical overview: diagnostic criteria, pathogenesis and etiology, disease severity and risk stratification, clinical classification according to the revised Atlanta classification (RAC): phases of evolution and severity. Imaging guidelines: how, when and why to image. General overview of the RAC system. Morphologic classification interstitial edematous pancreatitis (IEP) vs necrotizing pancreatitis (NP). Pancreatic and peripancreatic collections APFC, pseudocyst, ANC and WON. Local complications: Infection, inflammation and mass effect on adjacent organs, biliary obstruction, pancreatic duct stricture, disconnected pancreatic duct, vascular complications (hemorrhage, venous thrombosis, pseudoaneurysm). Other complications. Imaging mimics of AP.

GIEE-96

### Pseudomyxoma Peritonei and HIPEC: What Am I Missing?

#### Participants

Matheus Gomes SR, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Pseudomyxoma peritonei (PMP) is a rare and complex clinical syndrome characterized by the intraperitoneal accumulation of mucinous material, which arises from a variety of neoplasms, mainly from appendiceal mucinous neoplasm. The purpose of this exhibit is • Review the main CT and MRI imaging findings of PMP. • Recognize the most common tumor sites which may cause pseudomyxoma peritonei. • Illustrate through a diagram the pathways of disease spread into peritoneal spaces. • Discuss HIPEC therapy and surgery indications, different outcomes and complications. • Highlight the radiologist role in decision-making in a multidisciplinary team

#### TABLE OF CONTENTS/OUTLINE

1. Introduction- Epidemiology, clinical and pathophysiological aspects of pseudomyxoma peritonei- CT and MRI protocol recommendation 2. Current treatment options- To discuss for each of the following treatment modalities indications, contraindications, advantages and limitations (HIPEC, Surgical treatment and Systemic treatment)- To review through illustrative clinical cases the main CT and MRI findings of: Initial assessment of disease • Most common sites of disease • Hints at first evaluation of images • Difficult sites of resection • Potential "blind spots" Evaluation of treatment response • Disease progression • Stable disease / No evidence of disease • Response to treatment 3. "Take-home messages": To improve radiology communication with the multidisciplinary team and ensure prompt diagnosis and proper treatment of PMP, it is essential to understand the major clinical and imaging aspects of the disease and its treatment options.

Printed on: 04/12/24

GIEE-97

### Non-cirrhotic Portal Hypertension: Etiologies and Workup

#### Participants

Alba Pugliesi, MD, Ludwigsburg, Germany (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Noncirrhotic portal hypertension (NCPH), defined as elevated portal pressures in absence of advanced hepatic fibrosis, can be seen in association with multiple pre-sinusoidal, sinusoidal, and post-sinusoidal pathologic conditions. 2. Many of the aforementioned etiologies can result in liver dysmorphism (despite the absence of advanced hepatic fibrosis), resulting in incorrect diagnosis of cirrhosis.

#### TABLE OF CONTENTS/OUTLINE

Introduction • Definition and review of mechanisms of portal hypertension Pre-hepatic etiologies of NCPH • Case-based review of pre-hepatic etiologies of NCPH with emphasis on chronic inflow obstruction Intrahepatic etiologies of NCPH • Case-based review of pre-sinusoidal, sinusoidal, and post-sinusoidal etiologies of NCPH. Post-hepatic etiologies of NCPH • Case-based review of post-hepatic etiologies of NCPH with emphasis on outflow obstruction and cardiac etiologies (including Fontan-associated liver disease). Architectural and morphological changes of liver • Review of non-fibrotic pathways of response to injury by hepatocytes, with focus on regenerative nodular hyperplasia Diagnostic Workup, Challenges and Pitfalls • Discussing role of biopsy, hepatic venous wedge pressure, and elastography Conclusion

Printed on: 04/12/24

GIEE-98

### Tips and Tricks for CT Optimization of the Abdomen

#### Participants

Mostafa Shehata, MD, Houston, TX (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The educational exhibit discusses CT dose optimization in abdominal imaging, and how it is important to reduce radiation exposure while maintaining diagnostic accuracy. Strategies for reducing radiation dose and optimizing contrast media administration, managing image artifacts and noise, and incorporating AI-based deep learning image reconstruction (DLIR) can also contribute to dose optimization. Tailoring the imaging protocol based on the clinical indication, patient age, medical history, and comorbidities is crucial for achieving the best diagnostic outcome. Advice from the experts and emphasizing the importance of staff education and collaboration in CT optimization.

#### TABLE OF CONTENTS/OUTLINE

Review the background and understand the basic principles of the CT optimization in abdominal imaging  
Strategies for reducing radiation dose in abdominal CT  
Methods used to optimize the dose in abdominal CT  
Future directions of embedding AI into abdominal imaging  
CT optimization  
Tailoring the imaging protocol to the clinical question and patient presentation  
Factors to be considered when tailoring imaging protocol (the clinical indication, patient age, medical history, and comorbidities)  
Electing the appropriate imaging protocol for achieving the best diagnostic outcome  
Unlocking the Secrets of the CT optimization of the Abdomen: Tips and Tricks from the Pros  
a. Port injections - "How to inject like the pros"  
b. Helical pitch- "Low pitch isn't what it used to be"

Printed on: 04/12/24

## Abstract Archives of the RSNA, 2023

GIEE-99

### Clinical Application of Artificial Intelligence (AI) in Chronic Liver Diseases Management

#### Participants

Mohamed Eltaher, MD, Houston, TX (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Understand the function of artificial intelligence (AI) in tumor segmentation. 2. Review the existing medical uses of liver segmentation. 3. Grasp the advantages and disadvantages of different methods for segmenting liver tissues. 4. Understand the imaging criteria that must be met for a liver segmentation project to be successful. 5. Explore possible future developments in liver segmentation.

#### TABLE OF CONTENTS/OUTLINE

1. Brief introduction to artificial intelligence (AI). 2. Overview of different architectures used in deep learning methods. 3. Application of AI in the medical field. a new era of healthcare services. 4. Available Liver segmentation methods and techniques. 5. Advantages and disadvantages of different segmentation methods. 6. Challenges facing manual and automated liver segmentation. 7. Current uses of liver volumetry: a) assessment of response to intervention or surgery in liver malignancy. b) prediction of clinical outcomes in including disease behavior, overall survival. C) virtual surgical planning. d) prediction of future liver remnant volume after hepatectomy surgery. 8. Future directions: a) Vascular sub-segmentation. b) Radiogenomics. c) Fully automated segmental volumetry. d) Automated volumetric RECIST measurements.

Printed on: 04/12/24

## Abstract Archives of the RSNA, 2023

GUEE

### Genitourinary Imaging Education Exhibits

#### Sub-Events

#### **GUEE-1 Zinner Syndrome: A Radiological Journey Through a Little Known Condition**

##### Participants

Elena Julian Gomez, MD, Santander, Spain (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

1. To review the embryology and anatomy of the male urogenital system. 2. To describe the radiological findings of typical Zinner syndrome and its variants, through a series of 10 patients from our institution whose images are representative. 3. To perform a differential diagnosis with other pelvis cystic lesions, providing an algorithm that helps us to distinguish them depending on their location and their relationship with adjacent structures, including radiological images belonging to our institution.

##### TABLE OF CONTENTS/OUTLINE

1. Embryology and anatomy of the male urogenital system the role of the mesonephric (Wolffian) duct and the ureteral bud in the formation of the different male urogenital structures. 2. Zinner syndrome: a rare congenital urogenital entity due to an alteration in embryogenesis between 4th and 13th weeks of gestation, characterized by unilateral renal agenesis, cystic dilatation of the ipsilateral seminal vesicle and obstruction of the ejaculatory duct. - Definition. - Pathophysiology. - Clinical manifestations. - Diagnosis: the role of different imaging tests in its diagnosis, specifically pelvic MRI, which is considered the Gold Standard technique due to its excellent soft-tissue resolution. - Treatment. 3. Differential diagnosis with other pelvic cystic lesions (intra- and extraprostatic) according to their location and relationship with neighboring structures. This work is illustrated with representative radiological images of cases belonging to our institution.

#### **GUEE-10 Thingamajigs, Thingamabobs, and Doohickeys: A Comprehensive Imaging Review of Pelvic Medical Devices**

##### Participants

Amanda Gibson, DO, Lexington, KY (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

1. Given the ever-increasing number of imaging examinations performed and the continuous development and refinement of medical devices, radiologists commonly encounter such devices in clinical practice. 2. Pelvic medical devices may be detected incidentally on imaging examinations or imaging may be performed specifically to evaluate for device complication. 3. Knowledge of device indication and function may provide important clues to patient history that might not otherwise be available at the time of image interpretation. 4. Medical device complications are typically related to infection, malposition, and/or suboptimal device function. 5. A comprehensive knowledge of device indication, function, structure, imaging appearance, and associated complications is necessary to provide accurate and timely assessment of pelvic medical devices.

##### TABLE OF CONTENTS/OUTLINE

1. Succinct description of pelvic medical device structure, function, and indications for use in both women and men 2. Illustration of imaging features of pelvic medical devices, including normal findings, imaging artifacts, and device-related complications, across both planar and cross-sectional studies, with emphasis on key findings to report 3. Discussion of MRI safety issues related to pelvic medical devices

#### **GUEE-100 Feel the Burn: Imaging Infections of the Male and Female Reproductive Tract**

##### Participants

Alexander Kuehne, MD, Clear Lake, MN (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

- Familiarize the radiologist with the spectrum of reproductive tract infections, focusing on some of their more unusual etiologies and presentations.
- Review imaging of male and female reproductive tract infections in case-based format.
- Highlight key imaging features of specific infections, atypical presentations, and common mimics.
- Review imaging characteristics that would help to narrow the differential diagnosis.
- Provide an overview of management and treatment of reproductive tract infections, their sequelae, and complications.

##### TABLE OF CONTENTS/OUTLINE

- Classification of reproductive tract infections: sexually transmitted diseases; endogenous infections; iatrogenic infections.
- Review of infections by anatomic region, particularly unusual infections/presentations: uterus and adnexa; vagina and vulva; prostate and penis; spermatic cord and scrotum; perineum.
- Management of infections, their sequelae, and their complications.

#### **GUEE-101 Imaging of Benign and Malignant Renal Neoplasms Based on the WHO 2022 Classifications: What**

## Radiologists Should Know

Participants

Nikolas Brozovich, MD, Augusta, GA (*Presenter*) Nothing to Disclose

### TEACHING POINTS

· Describe important reporting elements of renal tumors· Describe classification and approach to renal tumors on the basis of WHO 2022 Classifications· Describe multimodality imaging characteristics of renal tumors· Role of imaging to evaluate renal tumors after local renal therapy and complications

### TABLE OF CONTENTS/OUTLINE

Content: • WHO 2022 renal tumor classification • Reporting elements of renal tumors • Clear cell tumors • Papillary tumors • Oncocytoma • Chromophobe cell renal carcinoma • Mucinous tubular and spindle cell carcinoma • Adult cystic nephroma • Metanephric tumors • Mixed epithelial and stromal renal tumors • Angiomyolipoma • Renomedullary interstitial cell tumor • Mesoblastic nephroma • Collecting duct carcinoma • Eosinophilic solid and cystic renal cell carcinoma • Inflammatory myofibroblastic tumor of the kidney • Renal perivascular epithelioid cell tumor (PEcoma) • Syndromes with renal tumors • Other tumors of the upper tract • Lymphoma • Transitional cell carcinoma • Metastasis • Abscess • Xanthogranulomatous pyelonephritis

### GUEE-102 Imaging of Inferior Vena Cava Wall Invasion in Renal Cell Carcinoma with Tumor Thrombus

Participants

Haiyi Wang, MD, Beijing, China (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Locally advanced renal cell carcinoma with inferior vena cava (IVC) tumor thrombus is one of the most challenging diseases in urology. T3c disease is diagnosed when a tumor thrombus invades the IVC wall. The presence or absence of IVC wall invasion has a significant impact on the selection of surgical protocols, which include IVC incision thrombectomy, IVC segmental resection, and IVC resection. Higher morbidity and mortality rates occur when a tumor thrombus invades the IVC wall. Tumor thrombus invading the IVC wall is associated with poor postoperative survival. The purposes of this exhibit are: 1) Discuss the role of IVC wall invasion in the surgical treatment of renal cell carcinoma and tumor thrombus. 2) Clarify significant image findings of IVC wall invasion. 3) Illustrate meaningful information and pitfalls of diagnosing IVC wall invasion in radiology reports.

### TABLE OF CONTENTS/OUTLINE

1) Overview of anatomy and physiology of the inferior vena cava system. 2) Introduction of the mechanism of IVC tumor thrombosis formation in renal cell carcinoma. 3) Describe surgical management of different types of tumor thrombectomy: a. IVC incision thrombectomy; b. IVC segmental resection; c. IVC resection. 4) Imaging methods selection: a. contrast-enhanced ultrasound (CEUS); b. CT; c. MRI. 5) Imaging findings of IVC wall invasion in cases-based imaging. 6) Illustrate key signs and pitfalls in diagnosing IVC wall invasion. 7). Build a scoring system: inferior vena cava wall invasion likelihood scores (IVC WALLS). 8) Consolidate the acquired knowledge: Review preoperative imaging findings of IVC invasion that aid in surgical decisions. 9) Conclusions.

### GUEE-103 Spectrum of Male and Female Urethral and Periurethral Pathologies at Imaging

Participants

Nikolas Brozovich, MD, Augusta, GA (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1) Role of imaging in the evaluation of the urethra.2) Review of relevant male and female urethral anatomy.3) Recognize a variety of urological conditions in males and females at imaging.

### TABLE OF CONTENTS/OUTLINE

Conventional imaging studies such as retrograde urethrography(RUG), voiding cystourethrography(VCUG), and Ultrasonography(US) are limited in the evaluation of the periurethral tissues. MR imaging serves as an important noninvasive imaging modality that can provide anatomic detail of the urethra and periurethral tissue due to excellent tissue contrast and multiplanar capability. 1) Detailed male and female urethral and periurethral anatomy.2) MR technique for urethral evaluation.3) Female urethral pathology including urethral diverticulum and associated pathology, urethral leiomyoma, periurethral/paravaginal cysts, bulking agents, urethral prolapse, periurethral hemangioma, and neoplasms.4) Male urethral pathology including urethral calculi, Peyronie's disease, artificial sphincter, infection, and neoplasms.

### GUEE-104 Radiologic Feature of Complications after Artificial Urinary Sphincter Implantation Following Total Prostatectomy

Participants

Shioto Oda, MD, Kashiwa, Japan (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Artificial urinary sphincter (AUS) is an implanted device used for the treatment of urinary incontinence, commonly following prostatectomy. Despite increasing reports of device failure and postoperative complications, comprehensive reports on imaging have yet to be compiled. When complications occur after AUS surgery, entire device replacement may be necessary, which can be burdensome for the patient. However, with precise identification of the malfunctioning part, partial replacement has been possible in some cases. This presentation will exhibit imaging findings of malfunction and postoperative complications after AUS implantation at our hospital, together with anatomical findings, to contribute towards appropriate device management. The purpose of this exhibit is: 1) To provide a comprehensive review of the normal appearance of AUS, along with an analysis of the parts that are commonly associated with complications 2) To exhibit the various complications related to device failure and surgery on a case-by-case basis.

### TABLE OF CONTENTS/OUTLINE

1) Normal Appearance of AUS 2) Malfunction of AUS 2.1) Circuit Leakage 2.2) Pump Malfunction 3) Complications Directly Related to the Procedure 3.1) Urinary Injury During Replacement of AUS 3.2) Hematomas and Infections Occuring in the Subacute Period

## **GUEE-11 Imaging of upper urinary tract neoplasms**

Participants

Kyungmin Kim, BMBS, Manchester, United Kingdom (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

Neoplasms of the upper urinary tract can be investigated with different imaging modalities such as CT, MRI and ultrasound. In certain cases, nuclear medicine studies, such as PET-CT or DMSA can aid with detection of occult bone metastasis or determining the best treatment option. The traditional CT protocol for visualizing renal parenchymal abnormalities is a triple phase study. Alternatively, a split bolus urography protocol also provides good visualization of the renal parenchyma and the collecting systems with a reduced radiation dose. Renal cell carcinoma (RCC) is the most common type of upper urinary tract neoplasm with a wide range of phenotypes from homogeneous solid mass to heterogeneous multi-cystic or necrotic lesions. Differentiating between benign and malignant renal neoplasms can be challenging and histopathological evaluation may be required to confirm the diagnosis. A wide range of conditions ranging from developmental, infectious, granulomatous and vascular causes can mimic upper urinary tract neoplasms.

### **TABLE OF CONTENTS/OUTLINE**

1. Introduction  
2. Imaging modalities for investigation of upper tract neoplasms  
2.1 CT  
2.2 MRI  
2.3 Ultrasound  
2.3.1 Contrast enhanced ultrasound  
2.4 Nuclear medicine  
3. Imaging features of upper tract neoplasms  
3.1 Malignant  
3.1.1 RCC  
3.1.2 TCC  
3.1.3 Lymphoma  
3.1.4 Wilm's tumor  
3.1.5 Miscellaneous  
3.2 Benign  
3.2.1 Oncocytoma  
3.2.2 Angiomyolipoma  
4. Upper urinary tract pseudotumors  
4.1 Developmental  
4.2 Infectious  
4.3 Granulomatous  
4.4 Vascular  
4.5 Miscellaneous  
5. Summary

## **GUEE-12 Not Only Prostate Adenocarcinoma is Present in the Interpretation of Multiparametric Prostate MRI**

### **TEACHING POINTS**

Knowledge of normal anatomic structures and physiological changes that may simulate prostate adenocarcinoma in prostate multiparametric magnetic resonance imaging (mpMRI) Clinical presentation MRI characteristics with pathological correlation can help us to accurately characterize benign and malignant diseases, that can mimic prostate adenocarcinoma in mpMRI resulting in appropriate patient management.

### **TABLE OF CONTENTS/OUTLINE**

Review and identify normal prostatic anatomic structures that can affect mpMRI interpretation because may simulate prostate adenocarcinoma: hypertrophic anterior fibromuscular stroma, asymmetrical and focal thickening of the surgical capsule, congested appearance of periprostatic vascular plexus normal Review the clinical manifestations and mpMRI characteristics with pathological correlation of prostatic and periprostatic benign process: congenital anomalies (Zinner's syndrome), prostatic abscess, infective or inflammatory prostatitis (bacterial, granulomatous, IgG4-related disease), prostatic hemorrhage, ectopic stromal benign prostatic hyperplasia nodule, periprostatic lymph nodes, osteochondroma of the pubic symphysis, neoplasms with unpredictable clinical course (stromal neoplasm of uncertain malignant potential), direct neoplastic invasion of malignant tumors in adjacent organs (diffuse large B-cell lymphoma of the rectum), that can mimic prostate adenocarcinoma in mpMRI

## **GUEE-13 MRI-Based VI-RADS for Bladder Cancer: Enhancing Accuracy and Consistency in Reporting**

Participants

Sina Houshmand, MD, San Francisco, CA (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

1. Review imaging findings of bladder cancer with emphasis on the importance of differentiation between muscle-invasive and non-muscle invasive disease and impact of imaging on clinical management.  
2. Review technical aspects of multiparametric MRI for bladder cancer.  
3. A pictorial review and step-by-step tutorial on Vesical Imaging-Reporting and Data System (VI-RADS).

### **TABLE OF CONTENTS/OUTLINE**

1. Introduction to bladder cancer  
a. Types and relevant pathology  
b. Diagnosis, staging, treatment  
c. Role of imaging in clinical management  
d. Imaging of bladder cancer  
2. VIRADS  
a. Definitions and categories  
b. MRI scoring  
c. Examples  
3. Technical aspects  
a. Patient preparation  
b. MR protocol  
4. Pitfalls and mimics  
5. Case review

## **GUEE-14 Male Pelvic Floor: Anatomical Particularities and Dysfunctions**

### **TEACHING POINTS**

To review some aspects of normal anatomy that are relevant in the context of male pelvic floor dysfunction. To demonstrate the differences between the male and female pelvic floor by comparing the reference values provided. To identify changes in male pelvic floor structures during micturition and defecation. To review the examination protocols for functional assessment. To systematize the evaluation of male pelvic floor dysfunctions with clinical cases and flowcharts.

### **TABLE OF CONTENTS/OUTLINE**

The male pelvic floor has specific anatomical differences and pathophysiological peculiarities. The most important risk factors for its dysfunction include surgical procedures and radiotherapy. Pelvic floor dysfunctions can be grouped into three major categories (gastrointestinal, urinary, and sexual dysfunctions) and the best modality for this evaluation is dedicated magnetic resonance imaging (MRI). There is a paucity of literature related to imaging evaluation of the male pelvic floor. Typical markers used refer to the pubococcygeal line (PCL), the H line, the M line, and anorectal angle. Specific markers include the puboprostatic angle and the prostatic-urethral angle. Radiologists should recognize these particularities, the potential risk factors leading to these dysfunctions, and which landmarks are used in functional assessment.

## **GUEE-15 No Need to Go Nuts: Simplified Testicular Neoplasms Sonographic Analysis**

Participants

Fabio Yoshimura, Santana De Parnaiba, Brazil (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

The purposes of this exhibit are: To review the scrotum and adjacent structures anatomy in ultrasound; To emphasize the importance of adequate sonographic technique evaluation; To review most common testicular neoplasms; To present a metastasis case, a rare entity; To show ultrasound features of these neoplasms.

#### TABLE OF CONTENTS/OUTLINE

1. To review the scrotum anatomy in ultrasound: Testicles; Ductus deferens; Pampiniform plexus; Epididymis; Tunica vaginalis; Tunica albuginea. 2. Examination technique in ultrasound; 3. Illustrated teaching cases from our department showing the main testicular neoplasms: - Seminoma- Non-seminomatous germ cell tumors- Testicular lymphoma- Metastases to testis

#### GUEE-16 Don't Forget the Female Urethra: An Approach for Radiologists

##### TEACHING POINTS

The female urethra can be adequately studied by static or/otr dynamic imaging methods. The spectrum of pathologies is wide, from the complexity of finding direct signs in a urethral diverticulum to the challenge of providing the necessary information for an adequate treatment of solid masses of undetermined origin. In recent years, the use of minimally invasive surgical techniques for the urinary incontinence/pelvic prolapse approach has raised the need to be familiar with the radiological features pre and post treatment for proper patient counseling.

##### TABLE OF CONTENTS/OUTLINE

-Review of the anatomy of the female urethra-Imaging methods-acquisition protocols  
Ultrasound (focused on static technique)  
Magnetic Resonance  
Voiding Cystourethrography  
Retrograde double-balloon positive-pressure urethrography-Pathology of the female urethra  
Malformaciones  
Cystic pathology: diverticulum versus urethral cyst  
Solid pathology  
Benign: abscess; myoma  
Malignant: Primary: urothelial carcinoma, squamous cell carcinoma, adenocarcinoma, Aggressive angiofibroma  
Secondary: contiguous invasion versus metastatic lesions  
Pre-posttreatment imaging in minimally invasive surgical techniques for stress-mixed urinary incontinence (synthetic midurethral slings and bulking agents)-Differential diagnosis of urethral cystic from periurethral cystic pathologies-Conclusions

#### GUEE-17 Predominantly Non-Cystic Multiple Focal Renal Lesions: An Imaging Approach

Participants

Mario G. Santamarina, MD, Vina del Mar, Chile (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

1. To review causes of predominantly non-cystic multiple focal renal lesions. 2. To discuss imaging findings of the different entities. 3. To provide imaging-based clues useful to focus and to guide to the correct diagnosis.

##### TABLE OF CONTENTS/OUTLINE

The presence of multiple focal renal lesions may be an isolated or dominant imaging finding as well as an additional abnormality in the setting of multiorgan involvement. An imaging-based approach may be crucial in the differential diagnosis process as well as in patient management. Knowledge of the imaging appearance of the various causes and integration with other findings may result in a correct diagnosis in most cases as well as in assisting in proper patient work-up and management. Table of Contents: I- Overview; II- Main causes of multiple focal renal lesions 1. Infectious, 2. Inflammatory, 3. Vascular, 4. Related to neoplasm (main hereditary renal cancer syndromes, renal metastases, lymphoproliferative disorders, renal oncocytosis).; III- Summary.

#### GUEE-18 Medical Devices in the Pelvis: The Good, the Bad, and the Ugly

##### TEACHING POINTS

1. Understand that a variety of devices may reside in the pelvis. 2. Recognize the multimodality imaging features of different devices to include expected location and malposition/migration and their potential associated complications. 3. Emphasize the importance of detecting malpositioned/migrated devices to facilitate treatment.

##### TABLE OF CONTENTS/OUTLINE

Medical Devices divided by biological sex where applicable. o Biological Female: § Intrauterine Device • Hormonal (e.g., Mirena) • Non-hormonal (e.g., Copper, Lippes Loop) • Sterilization Device (e.g., Essure) o Biological Male: § Penile Prosthesis o Devices found in both sexes: § Artificial Urinary Sphincter § Suprapubic Catheter and Foley Catheter § Ureteral Stents § Pessary § Peritoneal Dialysis Catheter  
1. The following will be discussed for the devices where applicable: a. Indication b. Types c. Multimodality imaging features of the device in its expected position. d. Multimodality imaging features of the device in an abnormal position. e. Complications from malposition or migration of the device f. Treatment  
2. Highlight the importance of familiarity with the multimodality imaging features of the wide variety of medical devices in the pelvis so that a malpositioned or migrated device can be easily recognized and brought to the attention of the referring physician to facilitate the patient receiving treatment.

#### GUEE-19 Revisiting Voiding Cystourethrography (VCUG) and Retrograde Urethrogram (RUG).

Participants

Gabriela Lauar, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

Voiding cystourethrography (VCUG) and retrograde urethrogram (RUG) are fluoroscopic classic examinations performed by radiologist even in the present days, despite becoming increasingly scarce, still has its diagnostic value. Iodine contrast and x-ray equipment are required to perform the exam. Indications may vary according to venter, age, and clinical history. The findings can be divided between congenital and acquired at bladder and urethral lesions. VCUG and RUG are complementary tests to urethroscopy, as they can detect pathologies that were not previously visible. Other exams can offer adjunct informations, such as sonography and MRI, but this can provide unique diagnoses or inspire the development of new professionals or new techniques such as urethral resonance.

##### TABLE OF CONTENTS/OUTLINE

This pictorial study aims to review, describe and illustrate the examination and findings of RUG and VCUG in male and female

patients that cannot go unnoticed in our reports. We have selected images of cases from our service that may raise suspicion or confirm the disease. We separate the cases according to anatomy and gender. The pathologies we will explore are divided into bladder, urethra findings, as well as prostate-related.. Quick and correct diagnosis can be crucial for the treatment of our patients.

## **GUEE-2 Dose Reduction Strategies in CTKUB for Urolithiasis**

### **TEACHING POINTS**

1. It is critical for radiologists to understand CTKUB dose reduction strategies and successfully optimize protocols that produce high image quality with minimal dosage. 2. Familiarity with the practical approach in CTKUB will both decrease radiation dose and optimize imaging quality for the specific clinical indication.

### **TABLE OF CONTENTS/OUTLINE**

The purpose of this exhibit is: 1. To discuss the relationship between radiation dose and image quality 2. To assess radiation dose reduction strategy with preserving image quality in CTKUB. Introduction- Radiation exposure and CT- Urolithiasis and CTKUB: Low dose and ultralow dose CT- ALARA principle "As Low As Reasonably Achievable" Optimization for Scans Reconstruction Parameters - CT radiation dose Estimate- CT radiation dose affecting factors- Control Z-Axis: Scan Range - Lower mAs- Lowering kVp- kVp mAs Settings- Automatic Tube Current Modulation (ATCM)- Noise Reduction Technique including deep learning-based image reconstruction Practical Approach: Decreased radiation dose and improved image quality- Dose justification: Risk vs. Benefit - ALARA (As Low As Reasonably Achievable) principle- Optimization for Scans Reconstruction Parameters - Dose Management: Monitoring, Radiation tracking- Educating requesting physicians and CT technicians

## **GUEE-20 Decoding the cCLS Score: A Game-Changer in the Diagnosis and Management of Renal Masses**

Participants

Daniella Braz Parente, MD, PhD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

Daniella B. Parente, MD, PhD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

Review the classification and epidemiology of the most common upper urinary tract neoplasms. Understand the importance of cCLS score in the management of incidental renal lesions. Explore nephrometry as a tool for assessing the surgical complexity of renal masses.

### **TABLE OF CONTENTS/OUTLINE**

I. INTRODUCTION - Overview of upper urinary tract neoplasms and their epidemiology II. IMAGING TECHNIQUE - Overview of imaging modalities for renal mass detection and characterization - Best practices for imaging protocol III. IMAGING INTERPRETATION - Typical imaging features of common renal tumors - Explanation of cCLS score and its significance in the diagnosis of renal masses - Overview of nephrometry score and its role in assessing surgical complexity - Importance of CT and MRI in staging renal masses - Utilization of structured reports IV. QUICK REVIEW OF TREATMENT OPTIONS Overview of different treatment modalities for renal masses Pros and cons of each treatment option V. INTERACTIVE CASE-BASED DIDACTICS - Presentation of illustrative cases demonstrating the utility of cCLS score in diagnosis and management of renal masses

## **GUEE-21 Imaging of Upper Tract Urothelial Neoplasms: Pearls and Pitfalls**

### **TEACHING POINTS**

Review the staging of upper urinary tract urothelial carcinoma (UTUC) which is critical for treatment decisions and surgical planning. Discuss the role of different imaging exams in the diagnosis of UTUC with a focus on CT and MR urogram protocols. Provide an evidence-based approach to critical T-staging. Highlight nuances in staging unique to UTUCs. Identify important pitfalls in the diagnosis of UTUC including benign neoplastic, infectious, and inflammatory etiologies.

### **TABLE OF CONTENTS/OUTLINE**

Introduction: Epidemiology, prevalence, risk factors, Clinical presentation, TNM Staging. Exam protocols Value of multi-phasic exams, CT urogram dose reduction techniques including split bolus and virtual non-contrast, MR urogram. Staging: Tumor location: renal calyx or pelvis, ureter. Multifocality, Evidence based approach to critical T-staging T2 vs T3: ureteral border analysis, Hydronephrosis severity, Evaluation of contralateral urinary tract and bladder, Role of renal function evaluation, Nodal disease and distant metastases, Critical findings for treatment decision making and surgical planning. Pitfalls: Endometriosis, Infection, Malakoplakia. Post-treatment Surveillance imaging: Post-surgical appearance, Local recurrence, Risk of metachronous UTUC in contralateral urinary tract or bladder. Conclusion.

## **GUEE-22 Go with the Flow: Imaging of Urinary Tract Augments, Reconstructions, and Non-Cystectomy Diversions in Adult Patients**

### **TEACHING POINTS**

- A variety of surgical techniques are utilized to augment, reconstruct or reroute the urine stream and these procedures often utilize other segments of the GU or GI tract
- Findings from these procedures may be found on imaging studies during routine practice. Surgical records may not be available for many adult patients, especially for those with remote procedures performed in childhood
- Postsurgical anatomy must be appropriately recognized for accurate diagnoses
- Radiologists should be aware of surgical techniques and potential alterations made to the GU and GI tracts to help recognize expected postoperative anatomy, to facilitate greater diagnostic accuracy of postoperative complications, and avoid potential pitfalls

### **TABLE OF CONTENTS/OUTLINE**

- Review indications for bladder augments, reconstructions and non-cystectomy urinary diversions
- Describe common surgical procedures performed for bladder augmentation, ureteral reconstructions and non-cystectomy diversions, including continent and non-continent diversions- Bladder augments: gastrocystoplasty, ileocystoplasty, sigmoid cystoplasty- Reconstructions: psoas hitch, Boari flap, ileal interposition, uretero-ureterostomy, ureteroneocystectomy- Diversions: ileovesicostomy, appendicovesicostomy, Monti procedure
- Discuss appropriate imaging techniques and radiologic evaluation, including how to recognize the postoperative anatomy and expected findings
- Describe the imaging findings of postoperative complications including leak, fistula, abscess, mucus formation, stones, GU and GI obstruction

## **GUEE-23 Periprostatic Anatomy: An Illustrated Review and Implications for Treatment Planning**

### **TEACHING POINTS**

1. Identify clinically relevant normal anatomy of periprostatic structures with imaging (MRI, CT, and angiography) correlation 2. Recognize periprostatic anatomic variations and implications to treatment planning

### **TABLE OF CONTENTS/OUTLINE**

Table of Contents/Outline 1. Introduction 2. Prostatic pseudocapsule -Discussion of periprostatic fascial anatomy and composition - Implications for prostate cancer (PCa) staging and treatment -Preoperative MRI criteria for the diagnosis of extraprostatic PCa extension 3. Neurovascular Bundle -Normal anatomy with surgical correlation -Imaging identification and implications on prostate biopsy, PCa surgical and image-guided focal treatment planning. 4. Rectoprostatic space and Denonvilliers' Fascia -Discussion of rectoprostatic space and fascial anatomy with surgical correlation -Implication on PCa local dissemination in the pelvis -Hydrogel spacer placement for rectal wall protection during radiation therapy - normal and abnormal gel distribution 5. Membranous Urethra and External Urethral Sphincter -Normal membranous urethra and external urethral sphincter anatomy -Relationship to incontinence prediction post prostatectomy? -Imaging identification of external sphincter and relevance for eligibility and planning of image-guided focal treatment 6. Vascular anatomy -Normal anatomy and common variants -Importance for prostatic embolization procedures in the treatment of benign prostatic hyperplasia

## **GUEE-24 Renal and Upper Urinary Tract Tumors: How to Effectively Report and Impact Surgical Management**

Participants

Monick Nakayama, MD, Ribeirao Preto, Brazil (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

Upper urinary tract masses (UTMs) have been increasingly detected by imaging cross-sectional techniques, either as an incidental finding or in the context of a specific investigation, leading to the discovery of renal tumors of smaller dimensions, for whom adequate characterization is mandatory. Correct assignments of malignant and potential benign UTMs are imperative to avoid unnecessary surgical procedures and even biopsies. Nonetheless, the number of benign masses that are surgically approached is still high and prediction of the risk of malignancy is challenging. For UTMs, the lack of well-established scores or specific signs makes imaging evaluation even more difficult but essential for therapeutical definition, and reporting key imaging findings with aggressive lesions is crucial.

### **TABLE OF CONTENTS/OUTLINE**

Introduction Illustrative summary of the anatomy and histology of the kidney and upper urinary tract and histological origin of UTMs Summary of the main image findings in malignant tumors with pathological correlation, including: Tumors of the renal parenchyma Tumors of the collecting system and ureters Lymphoproliferative disorders Metastases Overview of main benign tumors and their essential imaging findings Tricks in upper urinary tract imaging including pseudotumoral lesions How to report the imaging findings for helping in surgical planning Conclusion

## **GUEE-25 Above and Beyond the Imaging Features of Urolithiasis: What the Radiologist Needs to Know**

Participants

Juan Francisco Santoscoy Gutierrez JR, MD, Miami Beach, FL (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

a) Review the pathophysiology of kidney stone formation, types of calculi and clinical presentation. b) Discuss the general evaluation of urolithiasis with emphasis on the characteristic imaging features of different urinary calculi and specific imaging findings focusing on the clinically relevant information that can affect management by the urologist. c) Describe the standard of care of nephrolithiasis focusing on the current non-invasive options, minimally invasive options and invasive options performed by the urology surgeon. d) List the anticipated post-treatment follow-up, complications and prognosis of urolithiasis.

### **TABLE OF CONTENTS/OUTLINE**

I. General overview: epidemiology, pathophysiology, clinical presentation II. Evaluation and management: a) General laboratory work and urinary tests b) Imaging and clinically relevant reporting: non-contrast CT, CT urography, dual energy CT, ultrasonography, radiography, MRI III. Treatment: a) Non-invasive options: observation, medical expulsion therapy, oral medication for dissolution b) Minimally invasive options: extracorporeal shockwave lithotripsy, ureteroscopy, percutaneous nephrolithotomy c) Invasive options: laparoscopy and open surgery IV. Post-treatment follow-up, complications and prognosis

## **GUEE-26 Hematuria Beyond Infection, Stones and Cancer: An Imaging and Evaluation Guide of Unusual Cases**

Participants

Eduardo Zukovski, MD, Umuarama, Brazil (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

- It is essential that radiologists know how to investigate hematuria, indications and limitations of each imaging option and recommendations for follow-up;
- All the examination protocols should be adapted to the patient while optimizing radiation dose;
- CT urography performs better than conventional radiography, ultrasound and intravenous urography in the detection of renal parenchymal masses and urinary tract calculi;
- Patients are now categorized into risk categories according to their clinical presentation and risk factors, and the workup is adapted to that category;

### **TABLE OF CONTENTS/OUTLINE**

Hematuria is one of the most common urologic diagnoses, estimate to account for over 20% of urology evaluations; It is defined as the presence of three or more red blood cells per high-powered field in two of three properly collected urinalysis specimens; It can be classified as gross hematuria or microhematuria; The differential diagnosis encompasses a wide range of conditions and the risk of detecting an underlying cancer has been found to be highly dependent on which risk factors are present; More common causes of hematuria include urinary tract infection, urolithiasis, trauma, renal parenchymal disease, and malignancy;

## **GUEE-27 Insights into Renal Cell Carcinoma with Novel Imaging Approaches**

Participants  
Khoschy Schawkat, MD, PhD, Boston, MA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

· The updated Bosniak Classification, version 2019, predicts the likelihood of malignancy in cystic renal masses, with improved specificity of the higher risk categories, thereby expanding the number of masses that can be monitored.· In the clear cell likelihood score (ccLS), version 2.0, multiparametric MRI features of small renal masses without macroscopic fat are sequentially analyzed to determine the likelihood of clear cell renal cell carcinoma.· Contrast-enhanced ultrasound and dual energy CT are useful in identification and characterization of solid and cystic renal masses.· Several radiopharmaceuticals may contribute to the characterization of renal masses, such as 99m-technetium sestamibi, radiolabeled girentuximab and 68Ga-prostate-specific membrane antigen.· In the future, RCC may be diagnosed, managed, and treated more effectively using radiomics and artificial intelligence (AI).

#### TABLE OF CONTENTS/OUTLINE

1) New Imaging Algorithms Using Established Imaging Techniques (Bosniak classification, version 2019, and clear cell likelihood score version 2.0). 2) Novel Modalities (Contrast-enhanced ultrasound, dual energy CT, and molecular imaging including Sestamibi, Girentuximab, and PSMA). 3) Radiomic and artificial intelligence.

#### GUEE-28 **Penile MRI: A Multi-institutional Case-based Review of Anatomy, Spectrum of Pathologies and Prosthetic Complications**

Participants  
Harit Kapoor, MD, MBBS, Poughkeepsie, NY (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1) Penile MRI provides invaluable clinical information in a wide array of pathologies. However, given the infrequent use, contemporary radiology residency and fellowship training provides insufficient exposure to penile MRI.2) After reviewing this presentation, the learner will be able to:a. Understand normal penile anatomy including prosthetic anatomy;b. Describe indications for penile MRI and key aspects for image acquisition;c. Diagnose various penile pathologies based on characteristic imaging findings;d. Understand the basis for differences in management and tenets of surgical planning for various disease entities;e. Describe indications for penile prosthesis implantation and diagnose common implant complications.

#### TABLE OF CONTENTS/OUTLINE

1) Overview of penile MRI technique, indications, and normal anatomy.2) Tabulated summary of various penile diseases with classic MRI appearances.3) Case examples (with differentials, pearls and pitfalls) including but not limited to: (i) Penile trauma (contusion, fractures); (ii) Corrected anomalous genitalia; (iii) Cowper's gland pathology (retention cysts and syringocele); (iv) Penile malignancy (primary staging, post-penectomy recurrence, metastases); (v) Penile implant complications (malpositioning, infection and erosion/extrusion); (vi) Priapism (types, post-treatment imaging); (viii) Periurethral and perineal sepsis.

#### GUEE-29 **Upper Tract Urothelial Neoplasms and Mimics**

Participants  
Satheesh Krishna, MD, Toronto, ON (*Presenter*) Nothing to Disclose  
Murray Di Loreto, MD, Toronto, ON (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

• Review the methods and techniques for the optimal evaluation of the urothelium. • Identify role of imaging in diagnosis and staging of upper tract urothelial cancer. • Identify imaging features with radiology-pathology correlation of lesions involving the urothelium in a quiz-based format.

#### TABLE OF CONTENTS/OUTLINE

• Is there still a role of conventional urography? Which is better - retrograde urography? antegrade urography? intravenous pyelourography? • CT urography - what is the ideal urothelial phase? should arterial phase be included? split-bolus technique vs dedicated delayed phase? • When is MR urography preferred over CT urography- improvements in MR sequences (including compressed sensing, k-space undersampling, parallel imaging and AI). Is Lasix injection needed? Prone vs supine patient positioning? Wide vs narrow FOV how to optimize? Are cine-T2 images useful? T2 based or gadolinium based? Pitfalls, artifacts simulating urothelial disease will be discussed (especially pertaining to MR urography) and solutions will be presented (flow voids on T2? T1\* effects due to concentrated gadolinium). • What is multiparametric MR Urography - what are the various components of multiparametric MR urography, and how does it improve diagnosis? What is the literature evidence for multiparametric MR urography? • How does imaging help in diagnosis and staging of upper tract urothelial neoplasms? What are the key findings impacting management of upper tract urothelial neoplasms? • Approach towards differential diagnosis of these lesions (including common, uncommon and rare mimics) with tips and tricks and imaging pearls as to when to suspect a diagnosis other than UCC, and optimal follow-up/referral strategy.

#### GUEE-3 **Lost Without Bosniak: Overcoming the Challenges of Non-Classifiable Renal Cystic Masses**

Participants  
Jhonata Soares Da Silva, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

A comprehensive review of situations where the Bosniak classification for renal cystic masses is not applicable, emphasizing the importance of being aware of these contexts and how to manage cases where the classification is not useful. Challenging Cases: The exhibition will showcase various challenging cases of renal cystic masses where the Bosniak classification may not be applied. These cases will test participants' knowledge and critical thinking.

#### TABLE OF CONTENTS/OUTLINE

Overview of cystic renal lesions in daily practice and the importance of differential diagnoses. Brief mention of the Bosniak

classification system and its limitations. Situations where the Bosniak Classification is not applicable, such as inflammatory/infectious conditions, vascular diseases, calyceal diverticula, polycystic kidney disease, Birt-Hogg-Dubé, Von Hippel-Lindau, Tuberous Sclerosis, pelvic cysts, and cystic metastasis are all conditions that can mimic renal cystic masses and are not included in the Bosniak classification system. In this section, we will review each of these conditions, their presentation, and management. Case-based review of concepts and tips: Practical tips and case-based reviews of concepts to help manage renal cystic masses that cannot be classified by the Bosniak system. Helping assistant doctors for better outcomes: discussion of how to assist and guide assistant doctors in managing challenging cases of renal cystic masses. Key take-home messages: summary of the important points discussed during the presentation, with practical advice on how to incorporate the acquired knowledge into clinical practice.

### **GUEE-30 Imaging and Interventional Management in Different Conditions Underlying Renovascular Hypertension**

Participants

Eric Castane, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

1. Review the imaging study of the arterial renal system both in normal and in renal artery stenosis. 2. Describe the vascular radiology management of the renovascular hypertension.

#### **TABLE OF CONTENTS/OUTLINE**

1. Material and methods / Background. 2. Arterial hypertension and renovascular hypertension: definitions and clinical features. 3. Imaging study of the renal arteries: normal, anatomic variants and pathological findings. 3.1. US assessment (evaluation points, technique, signs). 3.2. CT. 3.3. MRI. 3.4. Angiography. 3.5. Algorithmic approach to renal artery stenosis. 4. Interventional radiology management: therapeutic options and post procedure imaging criteria. 5. RAS: etiologies pictorial review (atherosclerosis, fibromuscular dysplasia, vasculitis, others). 6. RAS after renal transplantation (diagnosis and interventions). 7. Conclusions.

### **GUEE-31 Imaging of the Urachus**

Participants

Maria Zulfiqar, MD, MBBS, Scottsdale, AZ (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

The purpose of this exhibit is to: 1. Illustrate normal urachal anatomy on imaging and discuss urachal embryogenesis. 2. Provide case-based review of the imaging features of various urachal non-neoplastic and neoplastic entities.

#### **TABLE OF CONTENTS/OUTLINE**

Embryogenesis: Urachus is an embryonic ductal remnant of the allantois and cloaca extending from the bladder dome to the umbilicus. Imaging modalities: US is usually the imaging modality of choice, especially in the pediatric population. CT and MR carry higher temporal and spatial resolution with added benefit of staging malignancy when present. • Congenital: Patent urachus (urachal fistula); Umbilical-urachal sinus tract; Vesicourachal diverticulum; Urachal cyst • Infections/inflammation: Urachal stone/calcification; abscess. • Urachal neoplasms: Benign Adenoma; Cystadenoma, fibroma. Malignant Mucinous adenocarcinoma; Nonmucinous adenocarcinoma; Urothelial; Squamous; Sarcomatoid; Metastatic. • Non-neoplastic masses: Endometriosis; Hemorrhage. Summary Urachal pathology is often discovered incidentally on imaging and presents with nonspecific urinary symptoms. Early detection of urachal pathology and identification of complications such as infection and malignancy are imperative to prevent significant patient morbidity.

### **GUEE-32 Testicular Cancer: What the Radiologist Needs to Know**

Participants

Ingrid Alonso Ramon, MD, Mexico City, Mexico (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

To review the general characteristics of testicular cancer including the different types and their incidence. To describe the different features of multimodality imaging (ultrasound, CT, PET/CT) including the expected findings depending on histologic type and their utility of each in TNMS. Recognize the importance of diagnosis, treatment and follow-up.

#### **TABLE OF CONTENTS/OUTLINE**

Description of the general characteristics of testicular cancers including (a) embryology (b) incidence (c) detailed pathologic features. d) Clinical presentation To review of multimodality imaging findings including expected findings. To establish the usefulness of the different imaging methods for diagnosis, follow-up, complications and stratification of each one. To Discuss clinical scenarios to establish the best course of action.

### **GUEE-33 Penile Ultrasound: An Updated Pictorial Review for Residents**

Participants

Hugo Velazquez, MD, Mexico City, Mexico (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

-To illustrate the anatomical structures of the penis by sonography. -To determine the protocol used at our center. -To show the main indications for penile Doppler ultrasound with and without vasoactive drug. -To list the normal parameters in the Doppler evaluation and their pathological correlation. -To review the main sonographic findings in different conditions.

#### **TABLE OF CONTENTS/OUTLINE**

1. A pictorial review of the anatomy of the penis structures by ultrasound. 2. Penis ultrasound protocol and technical parameters. 3. Indications and use of vasoactive drug. 4. Examples of different conditions with sonographic findings.

### **GUEE-34 Contrast-Enhanced Ultrasound (CEUS): Vascular Applications from the Kidneys to the Bladder**

## TEACHING POINTS

1. CEUS is a very useful imaging modality in patients with poor renal function due to the non-nephrotoxic nature of the ultrasound contrast agents. 2. In the kidneys, CEUS is accurate in characterizing indeterminate lesions, characterizing complex cysts according to the Bosniak criteria, differentiating solid renal tumors from pseudotumors, identifying renal infarction, abscesses, and for the follow-up of non-surgical renal lesions. 3. CEUS is also used in renal transplant patients to look for masses, cysts, and other vascular problems. 4. In the bladder, CEUS is excellent in differentiating bladder cancer from benign pathologies such as a hematoma in patients with hematuria. It also aids in differentiating non-muscle invasive bladder cancers (NMIBC) from muscle-invasive bladder cancers (MIBCs), thereby guiding appropriate management. 5. CEUS can also detect primary tumors of the ureter or tumors extending from the bladder into the ureter by means of enhancement patterns.

## TABLE OF CONTENTS/OUTLINE

1. Overview of vascular applications of CEUS in the urinary system. 2. The technique of performing CEUS. 3. Microbubbles as non-nephrotoxic blood pool contrast agents. 4. Renal applications of CEUS. i. Renal infarction ii. Renal abscess iii. Characterization of cystic renal masses iv. Solid renal tumors vs pseudotumors v. Angiomyolipoma vs renal cell carcinoma 5. Renal transplant applications 6. Bladder application of CEUS. i. Bladder cancer vs Hematoma ii. Staging of bladder cancer iii. NMIBC vs MIBC iv. Ureteral tumor

## GUEE-35 Imaging Findings of Upper Tract Urothelial Carcinoma (UTUC) and Its Mimickers

Participants

Marina Farani, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

## TEACHING POINTS

To review the characteristic imaging findings of upper tract urothelial carcinoma. To outline the role of imaging in diagnosis and staging of carcinoma of the renal pelvis and the ureter. To discuss different diagnostic imaging modalities in the context of upper tract urothelial carcinomas. To make differential diagnosis of upper urinary tract neoplasms from other lesions, including benign lesions.

## TABLE OF CONTENTS/OUTLINE

Introduction: Epidemiology, risk factors, signal and symptoms and pathogenesis about carcinoma of upper urinary tract. Diagnosis: A step-by-step explanation of how to characterize and diagnostic a upper tract urothelial neoplasm. The use of computed tomography and the magnetic resonance to describe the different imaging patterns of tumors (papillary and infiltrating) and to staging urothelial carcinoma of upper urinary tract. Case-Based Review: Sample cases explaining and demonstrating different imaging patterns about upper tract urothelial carcinoma in different imaging modalities. This section will present illustrative cases of carcinoma urothelial infiltrating renal parenchyma, limited at renal pelvis and calyceal infundibulum and distal ureter. This section will present illustrative cases of diagnostic differential/mimickers of urothelial neoplasm, like inflammation, blood clots, endometriosis and renal lymphoma. Conclusion and key takeaways.

## GUEE-36 Bladder Neoplasm: A Practical Guide for Residents

Participants

Vitor Romano, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

## TEACHING POINTS

The purposes of this exhibit are: Provide a practical guide for residents on how to perform a bladder cancer screening. Systematize the evaluation of bladder cancer. Introduce and exemplify the VI-RADS classification. Demonstrate how muscle layer invasion should be evaluated according to the VI-RADS classification.

## TABLE OF CONTENTS/OUTLINE

We will discuss the following topics and focus on the VI-RADS classification. Introduction: Epidemiology; Pathophysiology. Subtypes of bladder cancer. Urothelial carcinoma; Urachal adenocarcinoma. Imaging methods. TNM grading. VI-RADS classification. Imaging acquisition; Analysis; Examples. Evaluation of the metastatic disease. Management and followup.

## GUEE-37 Evaluation of Trauma-Related Kidney Injuries

Participants

Vitor Romano, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

## TEACHING POINTS

The purposes of this exhibit are: Provide a guide on how to assess kidney injuries related to blunt trauma. Indications for radiological evaluation of renal injury. Role of various imaging modalities (computed tomography, excretory urography, angiography, retrograde pyelography, ultrasonography and magnetic resonance imaging). Give a context of the conduct according to the kidney injury.

## TABLE OF CONTENTS/OUTLINE

Introduction: Epidemiology; Pathophysiology. Imaging methods. Computed tomography images acquisition protocol. AAST classification for renal trauma. Examples. Overview.

## GUEE-38 Atypical Prostatic Cancer Metastases Recurrence: A Pictorial Review

Participants

Murilo Peixoto, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

## TEACHING POINTS

Prostate cancer is one of the most common malignancies in men worldwide. It has a recognizable pattern of metastatic spread, most frequently to regional lymph nodes and bone, as well as a typical recurrence pattern to pelvic lymph nodes, vesicourethral anastomosis, and bed of seminal vesicles and vas deferens. However, there are different patterns of metastases and recurrence

that must be recognized.

#### **TABLE OF CONTENTS/OUTLINE**

Atypical metastatic disease occurs in less than 5% of patients. Atypical lymph node involvement includes the supradiaphragmatic chains, most commonly the retrocaval, hilar, and supraclavicular ones. Extranodal involvement can occur in the lung and pleura, abdominal viscera, breast, orbit, brain/meninges and soft tissues. Interestingly, atypical distant metastases rarely occur in isolation and PET-PSMA usually demonstrates multiple simultaneous lesions. A higher Gleason score has also been reported to be associated with a greater likelihood of atypical metastases. When evaluating for recurrence, the atypical sites that need to be part of the routine imaging evaluation include anterior portions of the urethra, ureteral meatus (associated with poor prognosis), urinary bladder (distant from the anastomotic area), rectum, mesorectum and compromised retroperitoneal lymph nodes with preservation of the pelvic chains. This exhibit aims to review the locations and atypical patterns of manifestation of this neoplasm according to the different diagnostic modalities, focusing on multiparametric magnetic resonance imaging (MRI) and PET-PSMA.

#### **GUEE-39 Clinical Utility of the Vesical Imaging-Reporting and Data System for Histological Variants and Non-Urothelial Bladder Cancer**

##### **TEACHING POINTS**

Histological variants (VUC) and non-urothelial bladder cancer (NUC) are relatively rare bladder cancer subtypes. These subtypes have a high malignant potential, aggressive advanced tumor features, and an increased risk of disease recurrence compared to pure urothelial bladder cancer (PUC). Accurate preoperative muscle invasion assessment and subsequent immediate surgical intervention are warranted in these patients. The usefulness of the Vesical Imaging-Reporting and Data System (VI-RADS) has been established for PUC by several previous studies. However, the validity of VI-RADS for VUC and NUC still has to be established. This exhibit aims to clarify MRI features of VUC and NUC with histological correlation, demonstrate VI-RADS scoring of VUC and NUC, and discuss the feasibility of biparametric MRI for VUC and NUC compared to PUC.

#### **TABLE OF CONTENTS/OUTLINE**

1, VI-RADS and histological classification of bladder cancer, 2, VUC with VI-RADS scoring (squamous differentiation, glandular differentiation, sarcomatoid variant, plasmacytoid variant, micropapillary variant, and nested variant), 3, NUC and other bladder malignant tumors with VI-RADS scoring (squamous cell carcinoma, adenocarcinoma, small cell carcinoma, lymphoma, urachal adenocarcinoma, and bladder metastasis), 4, Risk of underestimation of muscle invasion in VUC and NUC at biparametric MRI and its clinical implications, 5, Summary.

#### **GUEE-4 Use of 3D Printed Models to Guide Surgical Resection of Renal Masses**

Participants

Mujtaba Hameed, BS, BA, Canton, MI (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

1. 3D modeling and printing has been increasingly utilized in recent years to guide improvements and new applications for medical diagnosis and treatment planning. 2. 3D models provide a unique degree of tactile and visual information, especially anatomopathological information that would be particularly relevant in surgical planning of tumor resection (e.g., renal masses). 3. 3D modeling can improve the characterization and treatment of renal masses at multiple stages, including segmentation, modeling, printing, preoperative planning, patient consent and education, intraoperative reference, and ultimately surgical removal.

#### **TABLE OF CONTENTS/OUTLINE**

1. Introduction characterizing the background of 3D modeling and printing in medical diagnosis and treatment, as well as review of relevant examples in the literature and within our institutional experience. 2. Description of initial case presentation and pertinent clinical workup. 3. Review of CT images, process of segmentation, and creation of 3D printed models utilizing clinical 3D visualization software. 4. Description of technique used in editing of 3D models via 3D printing software, including model video. 5. Creation of 3D model of the patient's left kidney (with mass demarcated), description of the utility of the modeling process both preoperative and intraoperatively.

#### **GUEE-40 A Practical Guide for Evaluating Renal Masses: Didactic Case-Based Review**

Participants

Fernanda Limonge, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

Discuss and illustrate the cystic lesions of the kidney, emphasizing Bosniak v2019 classification. Describe the features of solid renal masses. Review the TNM system for renal cell carcinoma (RCC). Discuss the active surveillance of renal masses as an alternative to immediate treatment. Review the imaging findings in the context of post-treatment.

#### **TABLE OF CONTENTS/OUTLINE**

Cystic lesions- Illustrate the Bosniak classification- Tips on how to interpret a cystic renal mass Didactic approach for evaluating solid renal masses- Ball versus bean patterns- Clear cell likelihood score (ccLS) Describe and review renal masses and histological subtypes- Angiomyolipoma- Oncocytoma- Clear cell RCC- Papillary RCC- Chromophobe RCC- Collecting duct carcinoma- Medullary carcinoma- Urothelial carcinoma- Lymphoma- Metastasis Locoregional risk stratification- Tumor size- Axial location (anterior/posterior; endophytic/exophytic)- Longitudinal location (relationship with the polar lines)- Hilar proximity (vessels/collecting system) Distant disease assessment- Metastatic disease (bone, liver, lung, lymph nodes)- Synchronic urothelial carcinoma Active surveillance Post-treatment complications- Relapse- Hematoma- Urinoma- Arteriovenous complications

#### **GUEE-41 Male Urethral Anatomy Revealed: Navigating Anatomical Variations and Complications**

Participants

Helen Ribeiro De Oliveira, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

The purposes of this exhibit is: Illustrate the main anatomical landmarks of the male urethra according to imaging methods Review

the imaging modalities useful to evaluate the male urethra. Propose a differential diagnosis of lesions according to localization and congenital or acquired, traumatic, infectious, and neoplastic etiologies and highlight the imaging features of each one. To evaluate the postoperative findings and complications.

#### **TABLE OF CONTENTS/OUTLINE**

- Introduction- Main anatomical landmarks- Imaging methods- Differential diagnosis and clues to diagnosis- Practical tips and Pitfalls- Normal postoperative findings and complications- Conclusion/Take home message

#### **GUEE-42 Imaging and Management of Renovascular Hypertension: An In-Depth Review**

Participants

Igor Oliveira, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Understand the pathophysiology of renovascular hypertension (RVH) and its clinical implications. Review the diseases that can lead to RVH, differential diagnosis, and treatment complications. Assess the role of various imaging modalities in diagnosing and assessing the severity of RVH. Discuss the importance of imaging in guiding interventional and surgical management of RVH. Evaluate the current evidence-based guidelines for the management of RVH.

#### **TABLE OF CONTENTS/OUTLINE**

I. Introduction to Renovascular Hypertension A. Pathophysiology of RVH B. Clinical presentation and implications II. Imaging Modalities for RVH A. Duplex ultrasonography B. Computed tomographic angiography (CTA) C. Magnetic resonance angiography (MRA) 1. Protocol and techniques 2. Contrast enhanced vs unenhanced MRA D. Digital subtraction angiography (DSA) E. Selecting of the appropriate imaging modality III. Etiology and Differential Diagnosis of RVH A. Diseases leading to RVH 1. Atherosclerosis 2. Fibromuscular dysplasia 3. Vasculitis 4. Other causes 5. particularities in the pediatric population B. Differential diagnosis and clinical challenges C. Algorithm approach on etiology definition on CTA and MRA IV. Interventional and Surgical Management A. Indications for intervention B. Percutaneous transluminal angioplasty (PTA) with or without stenting C. Surgical revascularization D. Nephrectomy in non-functioning kidneys E. Treatment complications V. Evidence-based Guidelines for RVH Management A. Role of imaging in treatment planning B. Recommendations for follow-up imaging VI. Conclusion A. Importance of imaging in the diagnosis and management of RVH B. Future directions in RVH imaging and management

#### **GUEE-43 Practical Guideline for Adrenal Incidentalomas: A Case-Based Review**

Participants

Iandra Pacheco, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Demonstrate a practical guideline with cases to help radiologists with the differential diagnosis of adrenal incidentalomas. Illustrate with didactic cases the European Society of Endocrinology Clinical Practice Guideline in collaboration with the European Network for the Study of Adrenal Tumors and the White Paper of the ACR Incidental Findings Committee. Review the typical image appearance of adrenal incidentalomas.

#### **TABLE OF CONTENTS/OUTLINE**

INTRODUCTION IMAGING PROTOCOL CT and MRI REVIEW INCIDENTALOMAS GUIDELINES White paper of ACR European Society of Endocrinology Clinical Practice DEMONSTRATE DIDACTIC CASES- Adenoma - Myelolipoma - Cyst or hemorrhage - Prior granulomatous infection or hematoma- Indeterminate adrenal incidentalomas (= 1 - < 4 cm with prior imaging) . With cancer history: new or enlarging mass. No cancer history: enlarging indeterminate adrenal masses- Indeterminate adrenal incidentalomas (= 1 - < 4 cm without prior imaging) . No cancer history: 1 - 2 cm 2 - 4 cm. Cancer history- With history of cancer (= 1 - < 4 cm). Without known metastatic disease or prior exam. Central necrosis

#### **GUEE-44 How to Improve Surgical Management in Penile Cancer: An MRI and Pathology Correlation**

Participants

Thiago Caetano, MD, Porto Alegre, Brazil (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Describe the protocol and main sequences used in magnetic resonance imaging for optimal imaging of the penis. Comment on the main penile cancer subtypes based on MR imaging features and correlate with the pathological diagnosis. Discuss the importance of MR imaging in the staging of penile cancer, as well as its potential to aid in surgical management.

#### **TABLE OF CONTENTS/OUTLINE**

Introduction: Relevant anatomy of the penis Definition and main types of penile cancer Epidemiology and risk factors MR technique and discussion: Describe the main protocol and sequences used in penile cancer MR imaging Staging, imaging features and pathology correlation: Discuss the major changes in the 8th AJCC Cancer Staging Manual Demonstrate imaging features of the main types of penile cancer and correlate with pathology Conclusion: Discuss its usefulness in local staging and locoregional lymph nodal metastasis and comment on future directions

#### **GUEE-45 Space OAR in Prostate Cancer - the What, the How, and Beyond: A Primer for Radiologists**

Participants

Nabih Nakrou, MD, Watertown, MA (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

The purpose of this presentation is to: • Review the role of SpaceOAR hydrogel spacer in prostate cancer treatment and placement techniques. • Discuss imaging findings and mimics on different modalities via variable cases. • Recognize radiologic findings of SpaceOAR complications and malfunction.

#### **TABLE OF CONTENTS/OUTLINE**

We will address the following: • SpaceOAR composition • SpaceOAR placement and anatomy • Indications and roles of SpaceOAR in prostate cancer radiotherapy, including companion cases for treatment and follow-up • Common pitfalls and mimics of hydrogel spacers • Rare SpaceOAR-related complications

#### **GUEE-46 The Female Urethra: A Practical Guide**

Participants

Louise Cavalcanti, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

1. Describe embryology and anatomy of the female urethra highlighting the anatomical landmarks for diagnoses and surgical planning. 2. The intention of this pictorial review is to describe the most important imaging methods and their contribution to the diagnosis of the main pathologies. 3. Discuss the main pathologies of the female urethra, through richly illustrated clinical cases, correlating with the symptoms and emphasizing the learning points.

##### **TABLE OF CONTENTS/OUTLINE**

a. Introduction. b. Embryology: Brief description of embryology. c. Anatomy: Important landmarks. d. Imaging methods: Sonography, MRI, Urethrography. e. Pathology: Discuss the most significant pathologies with key points and possible differential diagnoses. f. Cases: Illustrate the most frequent pathologies with clinical cases. g. Take home messages.

#### **GUEE-47 Renal Vascular Hypertension: A Primer for the Radiologist**

##### **TEACHING POINTS**

1. Review the etiology, pathophysiology, classification and diagnosis of renal vascular hypertension 2. Review contemporary ultrasound, CT and MR angiography techniques and findings of renal vascular hypertension 3. Summarize modern treatment recommendations

##### **TABLE OF CONTENTS/OUTLINE**

1. Introduction 2. Etiology and pathophysiology of renal vascular hypertension 3. Modality selection and protocol optimization 4. Imaging features of renal artery narrowing including a) etiology b) flow dynamics c) renal perfusion d) post-intervention appearance e) complications 5. Summary of treatment recommendations with emphasis on the impact of specific imaging findings on therapy

#### **GUEE-48 Penile Pathology Prep: A Quiz-based Review of Penile Ultrasound for Trainees**

##### **TEACHING POINTS**

By the end of the presentation, the learner will be able to 1. Interpret the imaging and relevant anatomy for penile ultrasound. 2. Understand the role of ultrasound in diagnosis and management of penile pathologies and discern when to use ultrasound as an adjunct or in lieu of other modalities. 3. Describe the ultrasound findings for penile pathologies focusing on emergent and commonly encountered cases. 4. Identify normal and abnormal ultrasound Doppler flow parameters in various conditions that may aid in diagnosis. 5. Raise awareness of the clinical utility of penile ultrasound in certain penile pathologies given the safety profile and wide accessibility of this modality. Target Audience: Trainees.

##### **TABLE OF CONTENTS/OUTLINE**

We present a case-based quiz of various penile pathologies as seen on ultrasound. Each case will be associated with pertinent symptoms and unlabeled ultrasound images. The diagnosis will be revealed, along with description of the imaging findings followed by relevant educational content for each diagnosis such as: defining relevant pathophysiology, explaining key findings/associations, the clinical significance, and the uses/limitations of ultrasound related to that diagnosis. An introductory overview of normal anatomy and Doppler parameters will also be provided. Diagnoses include: 1. Erectile dysfunction - Arteriogenic 2. Erectile dysfunction - Venogenic 3. Priapism - High-flow 4. Priapism - Low-flow 5. Peyronie's disease 6. Mondor's disease 7. Penile fracture 8. Penis infection/abscess 9. Penile mass - Squamous cell carcinoma 10. Penile foreign body

#### **GUEE-49 Now Streaming: Review of Male Urethral Imaging with Focus on MRI**

Participants

Milana Flusberg, MD, New York, NY (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

Proper technique and understanding of normal male urethral anatomy on retrograde urethrography aids in interpretation of scans for trauma and strictures. Differential diagnosis of periurethral cysts in men includes utricle, Mullerian duct cyst, Cowper's duct/gland cyst, diverticulum, and collections (urinoma/abscess). MRI is used for local staging of male urethral cancer. Radiologists should be familiar with the appearance of urethral procedures including artificial sphincter and Urolift.

##### **TABLE OF CONTENTS/OUTLINE**

Performance of retrograde urethrography; Normal male urethral anatomy and normal variants; Urethral strictures: inflammatory, post-traumatic, neoplastic; Urethral trauma: mechanisms, grading, associated findings; Peri-urethral cysts and collections: utricle, Mullerian duct cyst, Cowper's duct/gland cyst, diverticulum, urinoma, abscess; Urethral cancer: background, imaging appearance, staging; Post-procedural urethra

#### **GUEE-5 Overview of Tumor Thrombus in Renal Cell Carcinoma**

##### **TEACHING POINTS**

Renal cell carcinoma (RCC) invades into the vasculature in approximately 10% of patients. Tumor thrombus is most commonly associated with clear cell RCC but it can also occur due to other entities, such as papillary RCC. This educational exhibit will: (1) Review the incidence, prognosis, and classification system of tumor thrombus in RCC. (2) Review the imaging features of tumor thrombus. (3) Discuss the role of imaging in guiding surgical treatment of tumor thrombus.

## TABLE OF CONTENTS/OUTLINE

(1) Incidence, clinical presentation, and prognosis of tumor thrombus in RCC. (2) Review the T staging of RCC with tumor thrombus according to the 2010 AJCC clinical staging and Mayo Clinic RCC tumor thrombus level classification system. (3) CT and MRI imaging features of tumor thrombus with case-based pictorial review. (4) Treatment of RCC with tumor thrombus. (5) Potential surgical approach for varying levels of tumor thrombus and post-operative imaging. (6) Summary of teaching points.

### **GUEE-50 Genitourinary Tract Infections and Inflammatory Conditions: Spectrum of Imaging Features, Pitfalls and Mimics**

Participants

Ayman H. Gaballah, MD, FRCR, Columbia, MO (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Illustrate the etiology, pathogenesis, and clinical presentation of genitourinary (GU) tract infections 2. Review the appropriate imaging workup and imaging features of GU infections 3. Discuss mimics and pitfalls of GU infections Highlight management options

#### TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Anatomic illustrations 3. Classification of genitourinary tract infections • Urinary tract infections: i. Upper urinary tract (kidney and ureter): 1. Focal/diffuse pyelonephritis 2. Emphysematous pyelitis/pyelonephritis 3. Renal/perinephric abscesses 4. Hydronephrosis and pyonephrosis 5. Xanthogranulomatous pyelonephritis 6. Parasitic infection (hydatid infection) 7. Other infections such as T.B 8. Ureteritis cystica ii. Lower urinary tract (urinary bladder and urethra): 1. Cystitis 2. Emphysematous cystitis 3. Diverticulitis of urinary bladder/urethra 4. Parasitic infection (Schistosomiasis) 5. Fungal infections (actinomycosis, candidiasis) 6. Cystitis cystica 7. Radiation and chemotherapy cystitis 8. iii. Urachal Inflammatory and Infectious Conditions • Genital infections: i. Female genital system: 1. Pelvic inflammatory disease (e.g., cervicitis, endometritis, pyosalpinx, etc.) 2. Tubo-ovarian abscess 3. Pelvic actinomycosis 4. Necrotizing fasciitis 5. Other rare infections ii. Male genital system: 1. Infectious and granulomatous prostatitis 2. Prostatic abscess 3. Epididymo-orchitis and abscess 4. Scrotal wall cellulitis, abscess 5. Fournier gangrene iii. Sexually transmitted infections 4. Predisposing factors and complications of GU infection 5. Imaging features and case presentation 6. Mimics and pitfalls 7. Updates on management options 8. Conclusion

### **GUEE-51 Urologic Prosthetics: An Imaging Review of Short-term and Long-term Complications**

Participants

Mary Woodruff, DO, (*Presenter*) Nothing to Disclose

Mary Woodruff, DO, (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Urologic prosthetics are commonly encountered in everyday practice. As with any surgical procedure and implantable device, there are complications, both short-term and longer term. With contribution from the urology team, we have selected a case collection to highlight these complications with both imaging findings and gross anatomic photos. The addition of gross anatomic and surgical photos complement the imaging findings and provide a better understanding of the clinical perspective. In reviewing these cases, the radiologist may better recognize and accurately diagnose complications related to urologic prosthetics.

#### TABLE OF CONTENTS/OUTLINE

A review of the urologic prosthetics and implant components. Normal orthotopic positioning of urologic prosthetics anatomically and in imaging. Selection of cases with imaging and pictorial findings Selected cases include: Urethral cuff erosion of artificial urinary sphincter. Postoperative pelvic/scrotal hematoma. Scrotal abscess. Penile prosthesis scrotal pump erosion. Herniation of prosthesis reservoir into the inguinal canal. Reservoir leak. Fracture of malleable penile prosthesis.

### **GUEE-52 How We Do It: A Diagnostic Approach to Avoid Overtreatment in Management of Centrally Located Renal Masses**

Participants

Layra Leao, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Review imaging features of the differential diagnosis of centrally located renal masses.- Illustrate diagnostic clues related to common and uncommon mimickers of upper tract urothelial carcinoma.- Highlight the importance of the tumor board approach in managing challenging cases as a platform for care coordination and a tool to optimize decision-making.

#### TABLE OF CONTENTS/OUTLINE

Imaging diagnostic differentiation of upper tract urothelial carcinomas (UTUC) and other centrally located renal tumors can be challenging; management patterns vary considerably due to the different oncologic behavior of these lesions. Misinterpretation in imaging studies could lead to unnecessary aggressive approaches. Some radiological features can help to predict the histology or pathologic aggressiveness of renal tumors, providing optimal and safe management. The presence of an infiltrative or nodular expansile pattern of growth is the first step in the differentiation of conditions that may simulate UTUC. Benign and malignant mimickers include renal cell carcinomas, metastasis, lymphoma, pseudotumors, and infection. Standardization of imaging protocols and reporting can help to differentiate these entities. The multidisciplinary discussion of challenging cases in the tumor board meetings should be included in the medical practice to identify interpretation mistakes and avoid unnecessary patient damage.

### **GUEE-53 MRI Clear Cell Likelihood Score (cCL): A Great Mechanism to Managing the Indeterminate Renal Masses**

Participants

RODRIGO OKAMURA, GUARULHOS, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1 - To understand the different aspects of renal lesions and the importance of classifying those with a higher risk of clear cell carcinoma. 2 - Through practical cases and interactive quizzes, demonstrate how to use the clear cell likelihood score (cCLs). 3 -

Present some cases with limitations of cCLs applicability. 4- Expose some pitfalls and challenging cases.

#### TABLE OF CONTENTS/OUTLINE

1 - Introduction on renal carcinomas subtypes and cCLs score creation.. 2 - Demonstate how to use the cCLs. 3 - Quiz case studies with practical use of cCLs. 4 - Answer each case with the corresponding pathological resulrs. 5 - Challenging cases with limitations of the cCLs algorithm. 6 - Pitfalls that can lead to erroneous diagnosis. 7 - Summary and take home notes.

#### **GUEE-54 Female Lower Genitourinary Tract: Imaging Evaluation of the Most Common Alterations of Interest in Female Urology**

Participants

Alice Schuch, MD, Porto Alegre, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

? Identify the anatomical landmarks of the female pelvic floor and perineum which can guide the radiologist to the correct diagnosis.? Point out the best imaging method for the diagnosis.? Review imaging features of the most common abnormalities of the female lower genitourinary tract.? List complicating features that may be seen by imaging and some rarer lesions that may be included in the differential diagnosis.

#### TABLE OF CONTENTS/OUTLINE

Imaging methods Retrograde urethrocytography and computed tomography are limited imaging methods for the evaluation of female lower genitourinary changes. Ultrasound plays a role in more specific indications. However, magnetic resonance imaging is usually the method of choice and provides the best identification of the anatomical structures for the diagnosis. Imaging evaluation common alterations will be characterized especially on MRI, as cystic lesions, including Bartholin's gland cyst and urethral diverticulum, as well as prolapses, such as urethral caruncle. Some complications of the common lesions will be included, in addition to tumors or tumor-like lesions, to provide the radiologist ability to perform differential diagnosis. Conclusion MRI is an ideal imaging method to evaluate female lower genitourinary changes, and it is essential that radiologists know how to detect and characterize these lesions, since, even when benign, they can be quite symptomatic.

#### **GUEE-55 Pitfalls of Renal Transplant Imaging**

Participants

Reece Goiffon, MD, PhD, Boston, MA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

TEACHING POINTS1. Discuss the relevant anatomic/imaging considerations, criteria, and imaging techniques for pre-renal donor work-up.2. Become familiar with the normal anatomic features, including location, surgical technique, and relevant hilar anastomoses following renal transplantation as well as the normal grayscale and color/power Doppler imaging features of a renal allograft.3. Review common pitfalls encountered both during pre-renal transplantation work-up and during evaluation of the renal allograft post-transplantation with particular attention to accurate diagnosis of post-transplant complications.4. Highlight the important roles of both computed tomography (CT) and ultrasound (US) in pre- and post-renal transplant evaluation.

#### TABLE OF CONTENTS/OUTLINE

TABLE OF CONTENTS/OUTLINEWe present a comprehensive review of normal pre- and post-renal transplant imaging as well as a review of potential pitfalls in both the pre-transplant imaging work-up and post-transplant allograft evaluation.Pre-renal transplant pitfalls may include:• Incidental arteriopathies (e.g. fibromuscular dysplasia)• Aberrant vascular anatomy• Incidental primary renal neoplasms• Other incidental malignancyPost-renal transplant pitfalls may include:• Postoperative edema at the arterial anastomosis• Renal vein thrombosis with diastolic flow reversal in the transplant renal artery• Postoperative fluid collections (seroma vs hematoma vs urinoma vs lymphocele)• Allograft malignancy

#### **GUEE-56 Imaging of Upper Urinary Tract Neoplasms**

Participants

Miriam Gallego Casals, MD, Sabadell, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Upper urinary tract urothelial carcinoma (UTUC) stands for only 5-10% of all urinary tract tumors and is mainly represented by transitional cell carcinoma (TCC, >95%).TCC usually develops in males around 65 and is related with many chemical compounds and urinary stasis (that is why it is more common in the bladder rather than on the ureter). Haematuria is the most frequent symptom, although non-specific, and urine cytology is usually negative. Commonly multifocal, with a high incidence of early recurrence, requires rigorous urothelial surveillance.CT urography has largely replaced any other imaging techniques, using contrast media to outline the collecting system. As UTUC can be challenging to identify on routine imaging, we use a series of cases to illustrate the most common patterns and signs that help us identify these tumors: a soft tissue density filling defect that enhances lightly is the most typical finding. Other types such as the non-papillary is infiltrative and harder to detect, often invading beyond the mucosa at the time of diagnosis. In the renal pelvis, these tumors do not change renal contours even when large. Instead, small ureteral tumors are more likely to obstruct the kidney and cause renal malfunction.We explain through several cases how to distinguish UTUC from other neoplasms or benign processes, dividing these UTUC mimickers in two groups: - Filling defects pitfalls: clots, calculi, mycetomas, etc- Urothelial thickenings: lymphoma, tuberculosis, schistosomiasis, etc

#### TABLE OF CONTENTS/OUTLINE

Brief description of epidemiologic and pathologic characteristics of the tumors of the upper urinary tract. Discussion of patterns and signs that indicate their presence, and some pitfalls.

#### **GUEE-57 Imaging Assessment for Penile Prosthesis Complications: What the Radiologists Should Know**

Participants

Sofia Bretos Azcona, MD, Santander, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To review the types of penile prostheses and their components and findings on imaging techniques. To review the possible complications associated with penile prostheses and the role of imaging in their assessment and surgical planning.

#### TABLE OF CONTENTS/OUTLINE

1. Types of penile prostheses 1.1. Semi-rigid/maleable prostheses. 1.2. Hydraulic prostheses. 1.2.1. Two pieces hydraulic prosthesis 1.2.2. Three pieces hydraulic prosthesis 1.2.3. Low-profile reservoir three pieces hydraulic prosthesis. 2. Radiological evaluation of penile prostheses. 2.1. Radiography 2.2. Ultrasound 2.3. CT scan 2.4. MRI 3. Expected imaging findings on complications related to penile prostheses and the role of imaging in their assessment. 3.1. Immediate surgical complications 3.2. Related to mechanical failure 3.2.1. Autoinflation of cylinders 3.2.2. Leakage 3.2.3. Fractures 3.2.4. Aneurysm of cylinders 3.2.5. Reservoir complications 3.3. Related to malposition of the prostheses components. 3.3.1. Erosion 3.3.2. Migration 3.3.3. Crossover 3.3.4. Buckling 3.3.5. Floppy glans syndrome 3.4. Imaging findings on infected prostheses 3.4.1. Early infection 3.4.2. Late infection 4. Conclusion

#### **GUEE-58 Urothelial-phase CT Urography for Diagnosing Urothelial Tumors: A Paradigm Shift for Investigating Hematuria**

Participants

Nigel Cowan, PhD, FRCR, Cosham, United Kingdom (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Urothelial-phase CT urography (25-50 s post contrast administration) is considered a paradigm shift in the development of CT urography for diagnosing urothelial tumors and investigating hematuria. Urothelial tumours are hypervascular and display early hyperenhancement following contrast administration. Familiarity with the signs of urothelial tumours on urothelial-phase CT enables radiologists to make the diagnosis on both GU and non-GU studies. Urothelial-phase compared with excretory-phase CT urography has many advantages. These include shorter examination time, increased patient throughput, no need for complicated patient related manoeuvres to promote full opacification, improved tumour visualisation in cases of hydronephrosis, hydroureter and contrast layering and reduced false positive diagnoses. The diagnostic accuracy of urothelial-phase imaging for urothelial tumors is high. Diagnosis of urothelial tumors using urothelial-phase CT urography makes the excretory-phase redundant.

#### TABLE OF CONTENTS/OUTLINE

A brief 25 year history of CT urography for investigating hematuria. The evolution of CT urography techniques. A comparison of urothelial-phase with excretory-phase CT urography for diagnosing urothelial tumors. Definition description of the techniques. Advantages and disadvantages. An atlas of urothelial tumors showing the signs of urothelial tumours on the urothelial-phase and examples of true positive, false negative and false positive results. Development of a confidence scoring system based on urothelial-phase imaging findings to improve report clarification and direct management: straight to surgery, ureteroscopy +/- biopsy or follow-up. Conclusion References

#### **GUEE-59 New Method for Differentiating Stents from Adjacent Urinary Stone Using Dual Energy Spectral CT with Advanced Post-processing**

#### TEACHING POINTS

1) To illustrate the limitations of conventional CT imaging in differentiating urinary stones and stents. 2) To illustrate novel techniques and approaches using dual energy spectral CT (DEsCT) to differentiate urinary stones from stents. 3) To demonstrate strategies of selecting appropriate image types with advanced post-processing.

#### TABLE OF CONTENTS/OUTLINE

1) Conventional CT and its limitations • Fixed tube voltage of 120kVp with mA modulation and helical scanning mode. • CT value alone lacks the power to differentiate stones and stents. 2) Advanced CT imaging technologies • Dual-energy CT (80/140kVp) with preset dose levels and Adaptive Statistical Iterative Reconstruction-V (ASiR-V). • Different energy levels, material decomposition (MD) images and effective atomic number (Zeff). 3) Optimal strategies using these technologies • Select appropriate MD basis material pairs such as Calcium/Iodine, Fat/ Calcium, Fat/ Iodine, or Iodine/HAP. • Apply Zeff, Calcium/Iodine and CT value at 70 keV to better differentiate urinary stones and stents.

#### **GUEE-6 The Spectrum of Renal Angiomyolipoma with Radiologic Pathologic Correlation**

Participants

Jamie Marko, MD, Bethesda, MD (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Renal angiomyolipoma (AML) is a benign mesenchymal neoplasm composed of an admixture of thick-walled dysmorphic blood vessels, smooth muscle cells and adipose tissue. Angiomyolipomas belong to the perivascular epithelioid cell (PEComa) tumor family. 2. Variants of angiomyolipoma include the classic AML, fat-poor AML, epithelioid AML, and AML with epithelial cysts. Angiomyolipoma may occur sporadically or with tuberous sclerosis. 3. The classic variant, which accounts for more than 90% of cases, is confidently diagnosed at imaging by detecting macroscopic fat. Fat is hyperechoic at ultrasound. It has an attenuation < -20 Hounsfield Units at CT and matches the appearance of subcutaneous fat. Fat is T1 hyperintense with loss of signal with fat suppression at MRI. Small areas of fat are detected with chemical shift imaging. 4. Most angiomyolipomas have a benign clinical course. The most frequent complication is retroperitoneal hemorrhage, most common with tumors > 4 cm. Less commonly, angiomyolipoma may invade the renal vein and inferior vena cava. Epithelioid angiomyolipoma has malignant potential and may recur and metastasize.

#### TABLE OF CONTENTS/OUTLINE

1. Review the gross, histologic, and immunohistochemical pathologic features of renal AML, including the uncommon variants. 2. Describe the multimodality imaging features of renal AML, including the uncommon variants. 3. Describe the pathologic basis of the imaging findings associated with each variant. 4. Illustrate the spectrum of renal AML including its variants. Will include important complications including retroperitoneal hemorrhage and vascular involvement.

#### **GUEE-60 Prostate Imaging for Recurrent Reporting (PI-RR): A User Guide**

Participants

Anup Shetty, MD, Saint Louis, MO (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The Prostate imaging for Recurrence Reporting (PI-RR) system was introduced in 2021 to create standards for reporting pelvic MRI after radical prostatectomy or radiation for treatment of prostate cancer. Using a similar nomenclature as PI-RADS v2.1, PI-RR uses established knowledge of MRI features of recurrent prostate cancer and codifies it systematically to be accessible to prostate MR readers of all experience levels. This exhibit is on the RadioGraphics Needs List under Genitourinary Imaging: Pictorial on Guidelines and Reporting Systems. This exhibit will: 1) Discuss the rationale for PI-RR 2) Describe technical standards and reporting guidelines 3) Illustrate the use of PI-RR to assess for recurrent prostate cancer after radical prostatectomy and radiation therapy through a series of instructive cases 4) Describe pitfalls of the current version, including non-applicability for focal therapies 5) Detail areas for future development of PI-RR

#### TABLE OF CONTENTS/OUTLINE

\* Background: Why PI-RR, including the benefits of standardizing post-treatment prostate MRI\* Technical Standards: Requirements, extras (subtraction imaging, 3D volumetric T2 for MPR)\* Reporting: Component scores in the PI-RR system shown in a pictorial format\* Case Examples: Prostatectomy, external beam radiation, brachytherapy\* Pitfalls: Definitions of PI-RR 4/5 for post-prostatectomy based on laterality; susceptibility artifact from brachytherapy seeds and surgical clips; residual prostate tissue after prostatectomy\* Future Development: Focal therapy (cryoablation, HIFU, etc.); Integrating PSMA-PET/CT

#### GUEE-61 Don't Stress, Just Study With Care, Renovascular Hypertension Will Be Conquered, in Your Test

#### TEACHING POINTS

1. Renovascular hypertension (RH) is the most common and potentially reversible cause of secondary hypertension. However, renal artery stenosis is often found as an incidental finding on routine examinations. Thus, knowledge of the clinical aspects of this pathology is necessary to increase the pre-test probability and the different diagnostic imaging modalities provide subsidies for better therapeutic decisions. 2. Revisit the multiple imaging methods used in the diagnosis of RH (Duplex Doppler Ultrasonography, CT Angiography, MRI Angiography and Renography): protocols, advantages, limitations and the main causes of RH as well as its imaging aspects. 3. Knowledge of invasive treatment options (Percutaneous transluminal renal angioplasty and surgery) and their respective technical aspects, indications and procedural complications.

#### TABLE OF CONTENTS/OUTLINE

1. Overview of Renovascular Hypertension (RH) A. Epidemiology B. Physiopathology C. Causes 2. Indications for Testing a Patient for RH: A. Clinical Clues to Enhance the Pre-Test Probability B. Renal Artery Stenosis as an Incidental finding 3. Non Invasive Diagnostic Testing for RH and Expected Findings: A. Duplex Doppler Ultrasonography B. CT Angiography C. MRI Angiography D. Renography E. Contrast-Related Kidney Injury 4. Determining the appropriate time to combine different diagnostic methods 5. Reporting of RH Patient Examination: A. Anatomical Variants B. Most Common Lesion Aspects C. Atherosclerosis D. Fibromuscular Dysplasia E. Complex Lesions 6. Overview of RH Management: A. Percutaneous Transluminal Renal Angioplasty B. Surgery C. Procedural Complications

#### GUEE-62 Prostate MRI Pitfalls and Confounders: A Case-based Approach

Participants

Eduardo Thadeu De Oliveira Correia, MD, PhD, Cleveland, OH (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Prostate MRI is widely used for the detection and characterization of prostate cancer. Nonetheless, many conditions can mimic prostate cancer lesions, leading to false positive MRI results. This educational exhibit employs a case-based approach to explore the pitfalls and confounders that arise during the assessment of prostate MRI and guide readers on how to distinguish these benign mimickers from malignant lesions.

#### TABLE OF CONTENTS/OUTLINE

1. A prostate MRI with too many findings a. Case 1: prostate cancer in a MRI done within 4 weeks of prostate biopsy b. Teaching points 2. A must-known confounder a. Case 2: extruded benign prostatic hyperplasia b. Teaching points 3. The importance of clinical history a. Case 3: granulomatous prostatitis b. Teaching points 4. The role of Delayed Contrast Enhancement a. Case 4: prostate abscess b. Teaching points 5. An extremely rare case: know the boundaries! a. Case 5: malakoplakia b. Teaching points 6. Prostate MRI is more than just PI-RADS: check the surroundings! a. Case 6: PI-RADS 5 lesion, ureteral stone and ileo-ileal intussusception b. Teaching points

#### GUEE-63 Factors that Influence Prostate Cancer Visibility on Multiparametric MRI

Participants

Eduardo Thadeu De Oliveira Correia, MD, PhD, Cleveland, OH (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Multiparametric MRI (mpMRI) is endorsed by guidelines worldwide as a fundamental tool for the detection and characterization of prostate cancer. Nonetheless, still, 10-20% of patients with clinically significant prostate cancer have a false negative result in mpMRI. In this exhibit, we will review factors that can decrease lesion conspicuity and reduce the detectability of malignant lesions.

#### TABLE OF CONTENTS/OUTLINE

1. What factors can influence Prostate Cancer visibility on mpMRI? a. Histology b. Background Signal Changes c. Image quality 2. Histological determinants of lesion visibility on mpMRI a. Tumor volume b. Gleason/ISUP score c. Epithelium, stroma, and lumen fraction 3. The effect of background signal changes of the peripheral zone on lesion visibility a. Diffusely hypointense peripheral zone on T2WI b. Heterogenous hypointensity in the peripheral zone on T2WI c. Background signal changes in DWI and DCE d. Associated clinical factors and conditions 4. Benign mimickers of prostate cancer on mpMRI a. Prostatitis b. BPH c. Adenosis d. Necrosis e. Focal atrophy 5. Image quality: patient and scanner factors that can decrease lesion conspicuity

## **GUEE-64 Update on Hereditary Renal Mass Syndromes: Genetics, Renal, and Extrarenal Imaging Findings**

Participants

Acacia Yoon, Stanford, CA (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

1. Review hereditary renal mass syndromes in the context of the 2022 World Health Organization update, which has a stronger emphasis on genetic alterations. 2. Review extrarenal findings associated with each syndromes. A diagnostic approach will be proposed. 3. Understand the role of the radiologist in diagnosis and management. Genetic testing may not be necessary or even specific for certain syndromes; thus, radiologists may be the first to suggest the diagnosis.

### **TABLE OF CONTENTS/OUTLINE**

1. Hereditary renal mass syndromes with multimodality imaging correlates: genetic mutation, inheritance pattern, diagnostic criteria, renal mass subtype(s), extrarenal findings, and management: Birt-Hogg-Dubé, von Hippel-Lindau, tuberous sclerosis complex, succinate dehydrogenase deficiency, fumarate hydratase deficiency, hereditary papillary renal cell carcinoma, PTEN hamartoma syndrome, BAP1 tumor predisposition syndrome, chromosome 3 translocation. 2. Role of the radiologist in diagnosis and management. 3. Diagnostic approach for the radiologist.

## **GUEE-65 Abnormal Testicular Waveforms: What Do They Mean**

Participants

Yashant Aswani, MD, Iowa City, IA (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

1. To identify typical and atypical waveforms of testicular torsion 2. To understand and describe the difference between partial and complete testicular torsion 3. To describe the features of torsion-detorsion syndrome 4. To understand the mimics of testicular torsion

### **TABLE OF CONTENTS/OUTLINE**

1. Normal testicular blood supply with normal spectral Doppler explained with image and line diagram 2. To illustrate testicular torsion with various examples for clear understanding and interpretation 3. To illustrate examples of partial torsion with various spectral Doppler variations including amplitude of the waveforms, parvus tardus pattern, monophasic waveform and reversal of diastolic flow 4. To illustrate torsion-detorsion with multiple examples. Spermatic knot sign will also be illustrated in detail with images and cine clips 5. To illustrate mimics of testicular torsion such as patients with vasculitis and drug-induced spectral Doppler abnormalities with histopathology correlation

## **GUEE-66 Magnetic Resonance Imaging for Non-Oncologic Penile Pathology: It's Not that Hard**

Participants

Daniel Corominas, MD, Barcelona, Spain (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

The use of Magnetic Resonance Imaging is widespread for oncological pathology of the penis, but its use is of much importance in non-oncological pathology such as Peyronie's disease, penile fracture, and priapism. Intracavernosal drug injection is an option for the treatment of erectile dysfunction, but it is also important for conducting erection imaging studies, so the radiologist must be aware of its method of administration, possible complications, and how to prevent and treat them. Treatment of non-oncological diseases of the penis using penile prostheses has expanded recently. MRI MRIs the method of choice for evaluating their proper functioning, as it provides high-resolution spatial images and it is key to helping urologists determine the need for replacements and repairs.

### **TABLE OF CONTENTS/OUTLINE**

1) MRI protocol for non-oncological pathology of the penis. 2) Intracavernosal drug injection: a basic guide for radiologists. 3) Penile anatomy on MRI. 4) Non-oncological pathology of the penis. 4.1) Erectile dysfunction 4.2) Peyronie's disease 4.3) Priapism 4.4) Penile fracture 5) Penile prosthesis. 5.1) Indications and types of surgery 5.2) Types of penile prostheses and their components 5.3) Imaging evaluation of the penile prosthesis: importance of MRI 5.4) Evaluation of the penile prosthesis complications. 5.4.1) Cylinders and shafts complications 5.4.2) Glans mobility alterations 5.4.3) Reservoir malposition 5.4.4) Circuit rupture and prosthesis malfunction 6) Conclusions and future directions.

## **GUEE-67 Urethral Pathologies in Male Patients: Evaluation with Magnetic Resonance Urethrography - A Pictorial Essay**

Participants

Kamila Schiavini, MD, SAO LUIS, Brazil (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

TP1 Magnetic resonance imaging (MRI) is a promising imaging modality for the comprehensive evaluation of urethral pathologies, providing high resolution and multiplanar imaging capabilities without the need for radiation or invasive procedures. TP2 MRI can accurately identify and assess the extent of anterior and posterior urethral strictures, as well as fistulous tracts with adjacent organs, and can aid in the evaluation of postoperative complications. TP3 Urethral strictures can result from traumatic or inflammatory causes and can lead to obstructive uropathy. Posterior urethral injuries commonly result from pelvic trauma, while anterior urethral strictures can result from instrumentation or inflammation. TP4 MRI provides a non-invasive and radiation-free alternative to traditional imaging techniques, such as urethrocytography, which can be limited by poor visualization of urethral strictures and invasiveness. TP5 MRI can also be used to evaluate other pathologies of the male genitourinary tract, including prostate cancer and penile cancer.

### **TABLE OF CONTENTS/OUTLINE**

I. Introduction A. Overview of traditional urethral imaging techniques B. Advantages of MRI for comprehensive evaluation of urethral pathologies II. Methodology A. Patient selection and imaging protocol B. MRI findings in anterior and posterior urethral strictures and

fistulas III. Discussion A. Traumatic and inflammatory causes of urethral strictures B. MRI evaluation of postoperative complications C. Comparison of MRI with traditional urethral imaging techniques IV. Conclusion A. Summary of the advantages of MRI in the evaluation of urethral pathologies B. Potential implications for clinical practice and patient outcomes

#### **GUEE-68 Unveiling the Masked Masqueraders: Navigating Anatomical Variations and Adenocarcinoma Mimickers in Prostate Multiparametric MRI**

Participants

Enis Yilmaz, MD, Bethesda, MD (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

Multiparametric MRI (mpMRI) is the imaging modality of choice in assessment of prostate adenocarcinoma (PCa). However, various conditions involving the prostate might resemble PCa due to their imaging characteristics and these patients might undergo unnecessary biopsy procedures. Our aim is to review some of the entities that could be a pitfall for readers and outline their key imaging findings to differentiate them from PCa.

##### **TABLE OF CONTENTS/OUTLINE**

(1) Overview of prostate anatomy and typical imaging characteristics of PCa. (a) Central Zone (b) Anterior fibromuscular stroma (c) Bulbourethral glands (Cowper's glands) (2) Conditions that may mimic PCa and their appearance at mpMRI: (a) Acute and chronic bacterial prostatitis (b) Tuberculous prostatitis (c) Granulomatous prostatitis (d) Prostate abscess (e) Intraprostatic calcification (f) Mucinous neoplasm of prostate (g) Stromal Tumor of Uncertain Malignant Potential of the Prostate (STUMP) (h) Biopsy related hemorrhage (i) Post-focal treatment prostate (j) Exophytic BPH nodule (k) Small cell carcinoma of the prostate (3) Hints that could be helpful in differentiation of PCa and PCa mimickers (4) Summary of findings

#### **GUEE-69 Practical Approach to Primary Retroperitoneal Tumors: Tips for An Imaging Diagnosis**

Participants

Shota Kondo, Hiroshima, Japan (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

a. For a differential imaging diagnosis of primary retroperitoneal tumors, a focus on the principal tumor features, e.g. fat, cystic components, a mucinous matrix, and necrosis is important. b. On images of well-differentiated liposarcomas the fat component predominates. In other histological types of liposarcomas it is not large and it may not be identifiable. c. High signal intensity on T2-weighted MRI scans with delayed contrast enhancement indicates a myxoid stroma that may be, for example, myxoid liposarcoma, schwannoma, or myxofibrosarcoma. d. Retroperitoneal tumors with a predominantly cystic component commonly include benign lesions such as lymphatic malformations, tail gut cysts, and ancient schwannomas. e. Common primary retroperitoneal malignancies such as leiomyosarcoma, undifferentiated pleomorphic sarcoma, and liposarcoma often have a necrotic appearance, suggesting a poor prognosis.

##### **TABLE OF CONTENTS/OUTLINE**

1. Retroperitoneal anatomy 2. Diagnostic algorithm and clinical management of primary retroperitoneal tumors 3. Imaging findings of various primary retroperitoneal tumors 4. Utility of 18F-FDG-PET/CT for diagnosing primary retroperitoneal tumors 5. Tips for avoiding diagnostic pitfalls and for clinical management

#### **GUEE-7 Multiparametric MR Urethrography (MRU): Dynamic Comprehensive Evaluation of the Male Urethra**

Participants

Alice Schuch, MD, Porto Alegre, Brazil (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

Describe the optimal technique for a comprehensive MRU protocol including the instillation of sterile urethral jelly, multiparametric sequences, and dynamic maneuvers. Identification of normal urethral anatomy on MRU including evaluation of periurethral compartments in both static and dynamic images. Describe how each component of MRU is crucial for the evaluation of common, uncommon, and rare urethral pathology.

##### **TABLE OF CONTENTS/OUTLINE**

MRU has revolutionized the imaging of the male urethra. Patient preparation: in the supine position and the penis in the anatomic position with an injection of lidocaine gel for urethral distension. Imaging protocol and interpretation high-spatial resolution, small FOV, multiplanar T2WI, to provide the best anatomic overview. T1WI is useful for assessing hemorrhage and vascular thrombosis, while the DCE is useful in evaluating masses and differentiation between fibrosis and inflammation. DWI assists in the depiction of a urethral mass and skips lesions. Dynamic maneuvers, with Valsalva and urination, are also performed to assess the sphincters and pelvic floor. Clinical applications: value of MRU in multiple specific clinical indications will be discussed, including urethral strictures, diverticula, fistulas, trauma, cancer staging, infections/inflammation. Conclusion MRU is an ideal one-stop replacement for traditional fluoroscopic urethrography, with growing data in the literature in recent years.

#### **GUEE-70 Prostate Cancer Strikes Back! A Pictorial Review of Local Recurrence and the PI-RR Score**

Participants

Bernardo Oliveira, MD, MBA, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

##### **TEACHING POINTS**

To understand the main finding of prostate local recurrence on magnetic resonance imaging. To review the new PI-RR score and learn how to apply it. To gain experience in prostate recurrence MR evaluation through clinical cases.

##### **TABLE OF CONTENTS/OUTLINE**

Introduction - First Things First Basic clinical concepts you should know before reading the MR imaging (PSAd, PSA doubling time, and more). Getting familiarized with the normal male pelvis after radical prostatectomy and radiotherapy. A brief review about the new PI-RR score system. Discussion - Prostate Cancer Strikes Back! prostate cancer local recurrence case collection, focusing on

MR imaging.Summary - It's your turn to strike back!Learn tips and tricks to enhance your skills.

## **GUEE-71 The 'New' 2022 World Health Organization (WHO) Classification of Adrenal Cortical Tumors: A Primer for Radiologists**

Participants

Nuray Bakal, MD, San Antonio, TX (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

Familiarize audience with 'new' 2022 World Health Organization (WHO) classification of adrenal cortical tumors (ACTs) Describe the pathology, genetics, molecular biology natural history of ACTs. Review imaging spectrum of benign malignant ACTs discuss the role of imaging in the screening, diagnosis, staging, and surveillance Discuss the potential diagnostic management implications of the current classification

### **TABLE OF CONTENTS/OUTLINE**

Introduction The spectrum of adrenal cortical lesions Updates in WHO classification Pathology, Genetics Molecular Biology Genetic Syndromes: Li-Fraumeni, Lynch, MEN1. Imaging Techniques: US, CT, MRI PET-CT Congenital adrenal hyperplasia Adrenocortical nodular disease: Sporadic nodular, Bilateral micronodular, Bilateral macronodular Cortical adenomas: typical/atypical imaging findings Primary aldosteronism: HISTALDO classification imaging findings Cortisol-producing adenomas Cortical carcinoma: imaging spectrum Adrenal Myelolipoma Adrenal rests, adrenal Cysts. Rare tumors: melanoma, adenomatoid tumors sex cord-stromal tumors Role of imaging in screening surveillance of ACTs other lesions Diagnostic Management Implications of 2022 WHO Classification Imaging biomarkers. Conclusion The new 2022 WHO classification of ACTs highlights the importance of molecular genetic features in characterizing classifying ACTs and updated terminology for select pathologies. The pivotal role of CT/MRI/PET-CT imaging features in the diagnosis, treatment surveillance of cortical tumors is discussed. Familiarity of radiologists with new ACTs subtypes associated imaging findings helps to accurately identify and characterize ACTs.

## **GUEE-72 Pictorial Review of the Diagnosis of Muscle-Invasive Bladder Cancer Using Vesical Imaging-Reporting and Data System (VI-RADS)**

Participants

Mitsuru Takeuchi, MD, PhD, Nagoya, Japan (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

The Vesical Imaging-Reporting and Data System (VI-RADS) is a standard MRI imaging and diagnostic method for muscle-invasive bladder cancer that was published in 2018. As a member of the VI-RADS committee, I was involved in the development of the diagnostic criteria. Several studies have demonstrated that VI-RADS has excellent sensitivity and specificity for muscle-invasive bladder cancer. However, reading VI-RADS requires some expertise, and there are various pitfalls. Therefore, this exhibition will first explain the basic MRI reading procedure for bladder cancer. Then, based on my experience of reviewing MRI images of approximately 300 cases of bladder cancer with trainees, we will discuss the causes of misdiagnosis and precautions to prevent misdiagnosis by presenting case images. Furthermore, limitations of the current VI-RADS diagnostic criteria will also be addressed.

### **TABLE OF CONTENTS/OUTLINE**

1) Basic procedure for reading bladder MRI 1-a) Role of multiparametric MRI 1-b) Imaging findings of tumor stalk and thickened submucosa 1-c) Categorizing bladder cancer according to VI-RADS diagnostic criteria 2) Teaching file, misdiagnosed cases by trainee, consideration of the cause and suggestions for improvement 2-a) Problems with the patient's condition or imaging 2-b) Misdiagnosis due to insufficient reading skill 2-c) Misdiagnosed cases caused by the limitation of current VI-RADS diagnostic criteria 2-d) Difficult to diagnose bladder cancer with atypical histology and imaging findings

## **GUEE-73 Visualizing Dynamic Mechanisms of Lower Urinary Tract Symptoms (LUTS): Usefulness of Urodynamic 4D-CT**

### **TEACHING POINTS**

- Providing required items for LUTS surgery
- CT Scanning technique for LUTS
- Benefits of 4D-CT scanning for urination evaluation
- Morphological Evaluation before after surgery

### **TABLE OF CONTENTS/OUTLINE**

A. Morphological and functional evaluations are important. B. Morphological evaluation is required for bladder, urethra, prostate. Scanning is performed in a semi-seated position to reproduce a physiological urination state. 4D-CT uses intermittent scanning to reduce radiation exposure from the beginning to the end of urination. C. "Using 4D-CT can evaluate morphological changes in the bladder, prostate, and urethra and the location and timing of bladder outlet obstruction that occurs at the start of urinary flow, and urodynamic information." D. Analysis of the volume data enables pre and post operative comparisons. Evaluation using CT can show the effectiveness of quantitative evaluation. Outline "4D-CT is particularly effective in judging the applicability of operation and evaluating kinetic and morphological data in cases of prostate problems without morphological changes and dysuria due to a small decrease in uroflow intensity due to insufficient strength of the urethral sphincter muscle." There are cases in which surgery was indicated for patients whose anatomical structure deviated from the ideal. 4D-CT can evaluate morphology and function. So, it is useful for surgical indication and surgical planning.

## **GUEE-74 The Role of Imaging Techniques in Penile Lesions: When and How to Use Them**

Participants

Sandra Baleato Gonzalez, PhD, Santiago de Compostela, Spain (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

1. To illustrate normal US and MR penile anatomy. 2. To review the spectrum of traumatic and atraumatic lesions involving the penis highlighting the typical and atypical sonographic and MR appearances of pathologic disorders, with special emphasis on distinctive and subtle findings that may clarify the diagnosis. 3. To discuss the value of other imaging techniques (CT, PET-CT, arteriography, urethrography) in penile pathology.

## TABLE OF CONTENTS/OUTLINE

1. Introduction. General features and basic concepts. 2. Anatomy. US and MR anatomy and imaging protocol. 3. Vascular disorders (Mondor disease, partial thrombosis of the corpus cavernosum, high flow and low-flow priapism). 4. Trauma. (Penile fracture, urethral injury, post-traumatic arterial penile fistula, extratunical hematoma and intracavernosal hematoma). 5. Inflammation (Cellulitis, abscess, fistula and gangrenous cavernositis). 6. Benign lesions (Peyronie disease, cavernous hemangioma, median raphe cyst, epidermoid cyst and so on). 7. Malignant lesions (Primary penile cancer and penile metastasis). 8. Summary.

### **GUEE-75 The Perils of Prostate MRI: How to Best Avoid Common Imaging Pitfalls**

Participants

Amanda Gibson, DO, Lexington, KY (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

1. Prostate MR is a robust imaging modality with emerging utilization in screening, tumor characterization, surveillance, risk stratification, and local staging of prostate cancer. 2. The inherent complex anatomy of the prostate gland, coupled with advancements in MRI technology and varied pathologies affecting the prostate, result in several potential pitfalls in MR image interpretation. 3. To ensure accurate interpretation, the radiologist must be familiar with the appearance of normal prostate anatomy, as normal variations can mimic clinically significant cancer, as well as benign entities which could simulate or mask cancer.

#### **TABLE OF CONTENTS/OUTLINE**

1. Review normal anatomy of the prostate on MR with focus on central zone and anterior fibromuscular stroma 2. Illustrate benign prostatic pathologies and ways in which their imaging may mimic prostate cancer - Normal anatomic structures and expected postprocedural sequela that mimic cancer - Noncancerous abnormalities that may mimic cancer - Artifacts which may mimic or mask cancer 3. Describe locoregional invasion of prostate cancer beyond neurovascular bundles and capsular disruption 4. Highlight case-based teaching points with normal and abnormal prostate MRI 5. Provide flowchart guide on different interpretation pathways when reading prostate MRI for both junior and seasoned radiologists

### **GUEE-76 Imaging and Management of Renovascular Hypertension: State-of-the-Art**

Participants

Prabhakar Rajiah, MD, FRCR, Rochester, MN (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

1. To review the pathophysiology of renovascular hypertension (RHT) 2. To discuss the role of multimodality imaging in the diagnostic pathway of RHT 3. To illustrate the imaging appearances of various causes of RHT 4. To review the role of interventional management of RHT.

#### **TABLE OF CONTENTS/OUTLINE**

1. RENOVASCULAR HYPERTENSION- DEFINITION 2. IMAGING MODALITIES- Ultrasound, doppler; CTA, Photon counting CT; MRA- Contrast and non contrast techniques (3D SSFP, Phase contrast), 4D flow; Catheter angiography; Nuclear medicine; 3. DISCUSSION OF ETIOLOGIES OF RENAL HYPERTENSION WITH MULTIPLE CASE EXAMPLES - Non-stenotic lesions (via renal artery compression and/or changes in renal perfusion) o Renal artery aneurysm o Renal arteriovenous fistula - Stenotic lesions (via renal artery compression/occlusion) o Atherosclerotic disease o Fibromuscular dysplasia o Neurofibromatosis type 1 o Midaortic syndrome o Dissection o Vasculitis (Polyarteritis nodosa ,Takayasu arteritis) o Trauma o Retroperitoneal fibrosis/radiation o Thromboembolism 4. ROLE OF IMAGING IN EXCLUDING OTHER CAUSES OF REFRACTORY HYPERTENSION- Endocrine- pheochromocytoma, hyperaldosteronism, Cushing's, thyroid dysfunction, hyperparathyroidism; Renal parenchymal disease; Mid aortic syndrome, coarctation; 5. IMAGING APPROACH FOR RHT 6. END-ORGAN ASSESSMENT- Kidneys, Heart, brain 7. TREATMENT- Optimal management is individualized to patient clinical context and dependent on etiology of renovascular hypertension; Medical - antihypertensives (i.e. ACE inhibitors/ARBs); Interventional- Angioplasty, stenting; Surgical

### **GUEE-77 Bosniak IV Cystic Masses: A Tough Nut to Crack**

Participants

Ignacio De Garcillan, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

- To revise Bosniak IV cystic mass v 2019 CT and MRI features.- To review possible pitfalls: interpretative, technical, and mass related.- To illustrate several Bosniak IV cases from our hospital.

#### **TABLE OF CONTENTS/OUTLINE**

In 2019 a new Bosniak classification version was published providing a detailed description of Bosniak IV category features. Its main objective was to increase specificity. Nevertheless, interpretation and classification of septa and nodule in each category remains challenging. In this exhibition we will focus on Bosniak IV cystic masses. Each feature will be revised and discussed to avoid misinterpretation. Potential pitfalls will be reviewed: interpretative quantitative and qualitative features, technical concerns, and mass related issues. Examples of these pitfalls will be exhibited with several recommendations to avoid them: zooming, multiplanar reconstruction, exclusive enhancing septa measuring, subtraction imaging, best quality sequence and examination selection, temporal evolution, employing Bosniak classification when applicable etc. Bosniak IV cystic masses diagnosed at our centre will be illustrated with different imaging techniques. Several clear cell renal carcinomas with cystic transformation, papillary carcinoma, clear cell papillary renal cell tumour, multilocular cystic neoplasm, fumarate hydratase- deficient renal carcinoma and unclassifiable renal carcinoma will be shown.

### **GUEE-78 What Can Go Wrong When Doing Right? Iatrogenic Genitourinary Complications**

#### **TEACHING POINTS**

1. A growing number of systemic, minimally invasive, and surgical treatment modalities for various genitourinary (GU) pathologies may lead to various unique iatrogenic complications. Diagnostic imaging plays an essential role in detection and subsequent management. 2. A multimodality approach to identifying iatrogenic GU complications is key for prompt diagnosis to prevent morbidity.

For example, both multiphase CT urogram and fluoroscopic antegrade nephrostogram can be utilized to confirm ureteral injury.<sup>3</sup> Knowledge of key imaging findings and mimics of complications are important to prevent misdiagnosis and mistreatment as well as to distinguish expected post treatment appearance from complication.

#### TABLE OF CONTENTS/OUTLINE

A. Introduction<sup>1</sup>. Review of treatment modality types for various GU pathologies (both benign and malignant)<sup>2</sup>. Pictorial review of genitourinary anatomy and areas prone for iatrogenic injury• Essential GU anatomical structures• Common postsurgical anatomy• Discussion on the radiosensitivity of the GU systemB. Multimodality approach to identifying GU complications<sup>1</sup>. Decision tree on selecting the most optimal imaging type for common complicationsC. Case-based imaging review of iatrogenic GU complications<sup>1</sup>. Systemic treatment<sup>2</sup>. Minimally invasive interventions<sup>3</sup>. Surgical intervention

#### GUEE-79 Magnetic Resonance Imaging Review and Virtual Biopsy of Common Solid Renal Masses

Participants

Luis Calimano-Ramirez, Jacksonville, PR (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Relevant anatomic review of the renal system. 2. Review multiple cases with magnetic resonance imaging features of neoplastic pathology. 3. Review correlation with pathology result to examine the function of magnetic resonance imaging as means of virtual biopsy toward identifying renal mass characteristics in selected cases.

#### TABLE OF CONTENTS/OUTLINE

1. Neoplastic pathologies: I. Benign etiology: a. Renal leiomyoma b. Renal Angiomyolipoma c. Renal Oncocytoma d. Renal plasmacytoma e. Solitary fibrous tumor. II. Malignant etiology: a. Clear Cell Renal cell Carcinoma b. Papillary Cell Carcinoma c. Medullary Renal Cell Carcinoma d. Collecting Duct Carcinoma e. Urothelial Cell Carcinoma f. Renal Lymphoma.2. Inflammatory etiology: a. Xanthogranulomatous Pyelonephritis.

#### GUEE-8 Imaging of Renal Cancer: The Past, The Present, and The Future

Participants

Alex Chung, MD, Los Angeles, CA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

-Many benign cystic and solid renal lesions can be reliably distinguished on multiple imaging modalities such as US, contrast-enhanced US (CEUS), CT and MRI, including Bosniak I/II cysts and fat-rich angiomyolipoma (F-AML).-Among indeterminate renal lesions such as clear cell renal cell carcinoma (ccRCC), papillary renal cell carcinoma (pRCC), chromophobe renal cell carcinoma (chrRCC), oncocytoma (Onc) and fat-poor angiomyolipoma (FP-AML), the enhancement characteristics and other parameters can further characterize the renal lesions.-Likert-based CT and MR likelihood scores for renal masses can help stratify the risk of indeterminate renal lesion for active surveillance or surgical management.-Novel imaging parameters and artificial intelligence will further assist in imaging characterization of indeterminate renal lesions.

#### TABLE OF CONTENTS/OUTLINE

-Introduction.-Normal Anatomy and Conventional Imaging Technique.-Imaging Findings/Pathology.-Enhancement characteristics including Mean Enhancement, Absolute Enhancement, Relative Enhancement, Absolute De-enhancement and Relative Washout.-Likelihood scores to aid risk stratification.-Novel imaging parameters and artificial intelligence, including <sup>99m</sup>Tc-sestamibi SPECT, Perfusion, Radiogenomics and Machine/Deep learning.-Biopsy of Renal Masses

#### GUEE-80 Urine the Wrong Place - When Urine Leaves the Urinary Tract. A Review of Urine Leaks and Urinary Tract Fistulas

#### TEACHING POINTS

The presentation of urine leaks and fistulas can be variable; however, a good patient history will usually raise suspicion for these entities. It is important to understand the pathology of urinary leaks and fistulas as well as the expected anatomy, including normal and post-operative, to understand the imaging findings. Familiarity with the principles of CT urogram is crucial in distinguishing blood from urine in trauma and post-operative patients to accurately make a diagnosis. The radiologist plays a vital role in these cases in recommending and troubleshooting follow up imaging as well as in guiding clinicians in their management. Management usually involves urinary diversion, which interventional radiology plays a large role in.

#### TABLE OF CONTENTS/OUTLINE

1) Review of normal male and female urinary tract anatomy and expected post-operative findings 2) Review of urinary tract imaging protocols - CT urogram, cystograms 3) Renal leaks - traumatic, spontaneous 4) Ureteral leaks - traumatic, iatrogenic 5) Bladder leaks - traumatic, iatrogenic, spontaneous 6) Urinary tract fistulas 7) Treatment/management options - IR interventions for urinary diversion

#### GUEE-81 MRI after Focal Therapy for Prostate Cancer: What Radiologists Must Know

#### TEACHING POINTS

-Overview of the currently available focal treatments for prostate cancer: indications, contraindications, and techniques.-Review of potential complications of each procedure: frequency, diagnosis, and management.-Discussion of expected postoperative MRI findings of each procedure: early and late.-Review of imaging findings of recurrent prostate cancer post focal treatment: diagnosis, mimics, and management.-Discussion of potential pitfalls.

#### TABLE OF CONTENTS/OUTLINE

Introduction-Rationale for focal therapy.-Potential benefits.-Criticisms to focal therapy.-Importance for radiologists and urologists.Treatment options-Electroporation (NanoKnife): Technique, Post-op appearance (Early and Late), Complications, Recurrence.-HIFU (FocalOne and TULSA): Technique, Post-op appearance (Early and Late), Complications, Recurrence.-Cryoablation: Technique, Post-op appearance (Early and Late), Complications, Recurrence.-Laser Ablation: Technique, Post-op

appearance (Early and Late), Complications, Recurrence.

## **GUEE-82 Advances in MRI Techniques for Evaluation of Upper Urinary Tract Neoplasms: A Comprehensive Review**

Participants

Mohamed A. El-Ghar, MD, Mansoura, Egypt (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

1. Familiarizing with the different advanced MRI techniques used in the evaluation of renal neoplasms, including diffusion-weighted imaging (DWI), intravoxel incoherent motion (IVIM) MRI, Diffusion Tensor Imaging (DTI), Blood oxygen level dependent (BOLD) MRI and Arterial spin labeling (ASL). 2. Identifying the advantages and limitations of conventional and advanced MRI techniques in the evaluation of renal neoplasms, how they can improve diagnostic accuracy, characterization of the masses and treatment planning. 3. Understanding the role of MRI in the staging renal neoplasms, and if their role for the new techniques. 4. Familiarizing with the current guidelines and recommendations for the use of MRI in the evaluation of renal neoplasms. 5. Identifying potential areas for future research and development in the field of MRI for the evaluation of renal neoplasms, including the use of artificial intelligence and machine learning algorithms to improve diagnostic accuracy and reduce interpretation variability.

### **TABLE OF CONTENTS/OUTLINE**

I. Introduction - Definition and incidence of upper urinary tract neoplasms - Importance of accurate diagnosis and staging - Overview of MRI techniques for evaluation II. Conventional MRI Techniques - T1- and T2-weighted imaging - Contrast-enhanced imaging - Limitations and challenges III. Advanced MRI; DWI MRI, IVIM-MRI, DTI-MRI, BOLD-MRI, ASL, Comparative advantages of advanced techniques • IV. Applications in Upper Urinary Tract Neoplasms • Diagnosis and characterization of renal masses • Differentiation between benign and malignant tumors • Staging of malignant masses • V. Clinical Implications and Future Directions • VI. Conclusion

## **GUEE-83 How to Do a Urethrogram... in Less than 15 Minutes and with No Special Equipment**

### **TEACHING POINTS**

• Urethrograms are nothing to be afraid of; • We have developed a technique that is well-tolerated, can be performed in less than 15 minutes, and requires no specialist equipment; • This exhibit explains how to perform our technique for both males and females; • We also illustrate the important anatomical structures, pitfalls, and complications of this technique.

### **TABLE OF CONTENTS/OUTLINE**

The ideal urethrogram should be quick, well-tolerated, provide high-quality diagnostic images and, if possible, not require any special equipment. At our institution, we have stopped using Knutson's clamps and balloon-occlusion catheters, and now perform approximately 15 studies per week with just 6Fr and 10Fr catheters. The technique we have developed is quick, well-tolerated and provides diagnostic images of the whole (a) anterior and (b) posterior urethra: a) A 10Fr catheter is inserted into anterior urethra. The patient compresses the distal penile shaft while the anterior urethra is imaged in two oblique planes. A release view (with hand suddenly removed) allows the urethra to decompress and distends the submeatal urethra, visualised on fluoroscopy at 3-4 frames/sec; b) The bladder is filled via a catheter or via retrograde instillation (we discuss both methods). The patient voids for a descending study in the oblique plane. We also discuss a rapid '5min urethrogram' in patients without tight strictures, which only requires inserting a catheter once. Adaptions are covered for the following scenarios: i) Tight strictures; ii) Occlusive segments; iii) The female urethra; iv) Percatheter studies. The relevant common pitfalls and uncommon complications of this technique are also discussed.

## **GUEE-84 Evolving Role of Conventional Imaging for Prostate Cancer in the Era of PSMA PET**

Participants

Hiroaki Takahashi, MD, PhD, Rochester, MN (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

Prostate-Specific Membrane Antigen (PSMA)-targeted positron emission tomography (PET) imaging is increasingly utilized for evaluating patients with high-risk prostate cancer (PCa) or recurrent PCa. The current National Comprehensive Cancer Network (NCCN) guidelines describe that conventional imaging is not a prerequisite to PSMA-PET for PCa staging. However, we have witnessed growing demand for conventional imaging as a confirmatory test for indeterminate findings on PSMA PET. PSMA-avid lesions other than PCa metastasis may cause false-positive observations, whereas PCa metastases to PSMA avid organs result in false-negative observations. Further, in conjugation with PSMA PET, prostate MRI has better performance in assessing the primary PCa, as well as local recurrence. In this context, PSMA PET does not replace conventional imaging, but does change the way in which conventional imaging is used. This exhibit will discuss the strategic approach of conventional PCa imaging in the era of PSMA PET. The purposes of this exhibit are: 1. To review the evolving role of conventional PCa imaging in the era of PSMA PET. 2. To discuss strategies to address recently recognized PSMA PET imaging pitfalls.

### **TABLE OF CONTENTS/OUTLINE**

1. Fundamental mechanism and imaging interpretation of PSMA PET. 2. Role of conventional PCa imaging: focusing on imaging pitfalls of indeterminate findings on PSMA PET.- Assessment of primary PCa.- Assessment of local recurrence.- Assessment of metastases involving lymph nodes, bones, and solid organs. 3. Summary.

## **GUEE-85 Urinary Bladder Diverticula: Imaging Features and Complications**

Participants

Grace Zhu, MD, Saint Louis, MO (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

1. Describe different categories of urinary bladder diverticula with comparison to normal urinary bladder. 2. Discuss urinary bladder diverticula multimodal imaging features. 3. Provide a case-based review of urinary bladder diverticula complications.

### **TABLE OF CONTENTS/OUTLINE**

1. Description of the different types of urinary diverticulaA. Describe histology of normal urinary bladder and diverticulaB. Highlight features of true and false urinary bladder diverticula2. Imaging of urinary bladder diverticulaA. Describe features of uncomplicated urinary bladder diverticulaB. Identify pitfalls that prevent optimal imaging 3C. Provide examples of diverticula mimics3. Case based review of urinary bladder diverticula complicationsA. Urine stasis and urinary bladder diverticula pathologyB. Diverticular stonesC. Diverticula and urinary tract infectionD. Cancer and staging consideration in diverticulaE. Incomplete voiding and obstruction

### **GUEE-86 The Crucial Role of Ultrasound in the Detection of Renal Transplantation Complications**

Participants

Elena Julian Gomez, MD, Santander, Spain (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

- To know the essential role of ultrasound in the detection of renal transplant complications. - To describe the systematic to follow when performing an ultrasound of renal transplantation. - To learn the typical ultrasound findings of renal transplant complications. - To be able to recognize those cases in which it will be necessary to complete the study with another tests in order to confirm the suspected diagnosis.

#### **TABLE OF CONTENTS/OUTLINE**

Doppler ultrasound is one of the control tests routinely performed on all patients 24-48 hours after renal transplantation, as well as subsequently according to their evolution.Thanks to ultrasound, we can assess the state of the renal graft and rule out the existence of associated complications, which may be divided into:1. Vascular complications: - Renal artery stenosis. - Renal artery thrombosis. - Renal vein thrombosis. - Pseudoaneurysm.- Arterio-venous fistula. 2. Urological complications: - Ureteral obstruction. 3. Perirenal collections: - Hematoma. - Urinoma. - Abscess.- Lymphocele. 4. Parenchymal complications: - Acute tubular necrosis. - Acute rejection. - Immunosuppressant toxicity. 5. Other complications: - Lithiasis. - Renal graft infections (early and late). - Chronic rejection.In this paper we will detail the ultrasound findings that characterize these complications, through representative images of cases belonging to our institution. We will also explain those patients in which it was necessary to perform additional studies to confirm the suspected diagnosis.

### **GUEE-87 Penile Ultrasound: A Pictorial Review of the Anatomy and the Most Relevant Pathologies**

Participants

Elena Julian Gomez, MD, Santander, Spain (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

- To become familiar with the normal sonographic appearance of the penile structures, as well as to know its arterial and venous vascularization.- To understand the technique of intracavernous injection of vasoactive substances, along with the normal response of vascular structures.- To review the main pathologies affecting the penis and their sonographic findings.

#### **TABLE OF CONTENTS/OUTLINE**

1. Penile anatomy by ultrasound: to recognize the anatomical structures in conjunction with the arterial and venous vascularization.2. Main penile pathologies: - Peyronie disease: its diagnosis is clinical, but ultrasound can confirm its presence, determine the extent of plaques and rule out a possible associated erectile dysfunction. - Erectile dysfunction: through intracavernous injection of vasoactive agents (PGE1) it is assessed whether there is a vascular (arterial or veno-occlusive) cause of erectile dysfunction. - Priapism: to evaluate ischemic, non-ischemic or metastatic causes. - Penile inflammation (e.g. cellulitis, balanitis, cavernositis,...): the main usefulness of ultrasound is to estimate the extension of inflammation and rule out abscess formation. - Trauma: in case of suspected penile rupture, ultrasound is especially helpful in doubtful cases or to locate the fracture line, as well as to assess long-term complications. - Benign entities: including cystic lesions (raphe cysts, epidermoid, dermoid,...), sclerosing lymphangitis, segmental thrombosis of the corpus cavernosum, calciphylaxis,...- Tumors: ultrasound is appropriate to determine the depth of the tumor and its spread to the corpus cavernosum.

### **GUEE-88 Unmuddling the Middle: a Guide to Central Renal Abnormalities**

Participants

Wendy Tu, MD, FRCPC, (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Central renal pathologies can originate from all of the complex constituent structures of the kidney: the renal parenchyma, predominantly the medulla; collecting structures; sinus including fat and neural structures; vessels; lymphatics; and extension of retroperitoneal processes. Parenchymal and medullary pathologies can include benign or malignant tumors, from the common renal cell carcinoma to rare primary sarcomas. Both tumorous and nontumorous pathologies can occur in the renal pelvis, such as papillary necrosis or blood clot. Vascular lesions include renal arteriovenous fistula or renal artery aneurysms, which can mimic other pathologies. Retroperitoneal lymphoma, fibrosis, histiocytosis, or lymphangiomatosis can involve the renal sinus. Multimodality imaging with ultrasound, CT, MRI, and angiography is important for differentiation of pathologies. Imaging is crucial to predict partial nephrectomy complexity with use of nephrometry scores.

#### **TABLE OF CONTENTS/OUTLINE**

1) Parenchymal tumors invading the renal sinus such as renal cell carcinoma and mixed epithelial and stromal tumor family tumors 2) Benign and malignant medullary tumors such as hemangioma, primary sarcoma, and medullary carcinoma 3) Sinus and medullary pathologies such as mesenchymal tumors, retroperitoneal fibrosis, and histiocytosis 4) Collecting system processes including urothelial carcinoma, papillary necrosis, calcifications, and clots 5) Vascular anomalies such as arteriovenous malformations, renal artery aneurysm, and renal vein varix

### **GUEE-89 The Body Meets the Adrenal: Adrenal Manifestations of Systemic Disorders**

Participants

Wendy Tu, MD, FRCPC, (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

To describe imaging manifestations of adrenal gland involvement by common and uncommon systemic disorders. Paired organs of the endocrine system, the adrenal glands have important roles in production of cortical and medullary hormones and catecholamines. The glands can be affected by a variety of neoplastic and non-neoplastic systemic disorders, some with life-threatening consequences such as in cases of adrenal hemorrhage and shock. Radiologists should be familiar with imaging manifestations along with potential associated laboratory abnormalities to ensure correct characterization and diagnosis for guidance on management. It is essential to distinguish adrenal manifestations of systemic disorders from other primary benign and malignant adrenal lesions.

#### TABLE OF CONTENTS/OUTLINE

Entities discussed will include: 1) Hemorrhagic conditions such as stress-related hemorrhage. 2) Hematologic diseases such as lymphoma. 3) Autoimmune conditions leading to adrenalitis such as Ipilimumab-induced adrenalitis. 4) Conditions leading to adrenal hyperplasia such as paraneoplastic syndromes. 5) Hereditary syndromes such as Von Hippel-Lindau disease and Neurofibromatosis. 6) Granulomatous diseases such as tuberculosis. 7) Infiltrative disorders such as amyloidosis. 8) Adrenal hyperenhancement in the setting of systemic hypoperfusion.

#### GUEE-9 Urine Trouble! An Interactive Review of Multiparametric MR Urography It's Pitfalls

##### TEACHING POINTS

1. Review the MR techniques for optimizing multi-parametric MR urography with attention to pitfalls  
2. Identify advantages over CT Urography  
3. Identify imaging features of lesions involving the urothelium in a quiz-based format with radiology-pathology correlation

#### TABLE OF CONTENTS/OUTLINE

1. What is multi-parametric MR Urography and how does it improve diagnosis?  
2. Why would MR Urography be preferred over CT Urography? What are the benefits and limitations?  
3. Improvements in MR sequences (including compressed sensing, k-space under-sampling, parallel imaging, and AI), which allow unprecedented improvement in image quality.  
4. Dilemmas in technique - is Lasix injection needed? Prone versus supine patient positioning? Wide vs narrow FOV? Are cine-T2 images useful?  
5. How to identify and avoid pitfalls and artifacts - flow voids on T2? T1\* effects due to concentrated gadolinium?  
6. How does MR urography help in identification and staging of urothelial neoplasms?  
7. How can MR urography help identify common, uncommon, and rare mimics of urothelial lesions using a rad-path quiz-based format?

#### GUEE-90 2022 WHO Classification of Adrenal Tumors Revisited: Atlas of Diseases with Pathological Insights

Participants

Adriano Basso Dias, MSc, Toronto, ON (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

Review the update 2022 WHO Classification of Adrenal Cortical Tumors  
Review the update 2022 WHO Classification of Pheochromocytoma and Paragangliomas  
Identify imaging features with radiologic-pathologic correlation of common and uncommon adrenal lesions

#### TABLE OF CONTENTS/OUTLINE

Are There Any Nomenclature Changes or Any New Diagnostic Categories in the New WHO Classification of Adrenal Cortical Proliferations?  
What are the Radiological and Pathological Correlates of Adrenal Cysts?  
What Should a Radiologist Know about Adrenal Cortical Carcinoma?  
Why Do Radiologists and Pathologists Need to Know Ectopic or Heterotopic Locations for Adrenal Cortical Tissue?  
What are the Highlights in the New WHO 2022 Classification of Pheochromocytoma and Paragangliomas  
Miscellaneous (Including Mesenchymal and Stromal Tumors)

#### GUEE-91 Focal Therapy of Prostate Cancer: A Primer for Radiologists

Participants

Adriano Basso Dias, MSc, Toronto, ON (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

Understand the current concepts of prostate focal therapy  
Recognize the most important MRI features to report pre and post focal therapy  
Known the role and limitations of prostate MRI for patient selection for focal therapy  
Be familiar with future directions of imaging techniques in focal therapy

#### TABLE OF CONTENTS/OUTLINE

Introduction - Indications, energy sources and templates available for focal therapy (FT)  
Role of imaging in the pre treatment assessment- MRI for diagnosis, staging and patient selection for FT  
Role of imaging in the post treatment assessment- MRI findings post FT- Types of recurrence- Pitfalls  
Future Perspectives- What imaging modalities are on the horizon for patient selection for focal therapy and treatment guidance

#### GUEE-92 The Extraperitoneal Cavity: Gaining Understanding through Surgical Procedures

Participants

Kiyoko Mukai, Tokyo, Japan (*Presenter*) Nothing to Disclose

##### TEACHING POINTS

The extraperitoneal cavity has a complex anatomy, and furthermore, there is limited opportunity to understand this invisible anatomy on imaging. In this presentation, we will discuss the anatomy of the extraperitoneal cavity and the importance of preoperative imaging in surgical planning, using the surgical technique for prostatectomy as a guide.

#### TABLE OF CONTENTS/OUTLINE

Learn basic techniques and anatomy in standard surgical procedures  
1. Intra-abdominal observation  
2. Dissection of the retropubic space/Retzius cavity  
3. Lymph node dissection  
4. Incision of the endopelvic fascia  
5. Dissection of the bladder neck  
6. Dissection of the seminal vesicles  
7. Management of the prostate pedicles  
8. Dissection of the posterior aspect of the prostate  
9. Management of the lateral aspect of the prostate  
10. Division of the urethra  
11. Reconstruction (including urethral anastomosis)  
A collection of

casesCase1: Benign prostatic hyperplasiaCase2: Enlargement of the middle lobeCase3: Previous transurethral resection of the prostate (TURP)Case4: T3 prostate cancerCase5: ProstatitisCase6: Vascular anomaly

## **GUEE-93 Insights into Urethra: A Diagnostic Approach and Comprehensive Guide to Multimodal Imaging in Urethral Lesions**

### **TEACHING POINTS**

Urethral lesions can range from common to rarely encountered in clinical practice. Imaging modality plays a key role in evaluating the variety of urethral conditions because of its high objectivity and utility. This exhibit aims to introduce the multimodal imaging spectrum of urethral lesions, from traumatic change to neoplasms, and demonstrate the diagnostic approach to becoming familiar with urethral lesions.

### **TABLE OF CONTENTS/OUTLINE**

Presentation goals:1. To demonstrate the normal anatomy of the male and female urethra.2. To demonstrate the step-by-step diagnostic approach to the urethral lesions3. To demonstrate multimodality imaging findings of various urethral lesionsIllustrative imaging/cases include: (i) Traumatic and post-treatment changes &1;Urethral injury, &1;Urethral foreign body, &1;Iatrogenic changes (&1;Radiation therapy induced urethritis, &1;Changes after transurethral injection therapy, &1;Operative complications)(ii) Intra- or peri-urethral lesions - Intra-urethra &1;Urethral stones, &1;Urethral caruncle, &1;Fibroepithelial polyp, &1;Primary urethral carcinoma, &1;Malignant melanoma, &1;Lymphoma, &1;Sarcoma- Peri-urethra &1;Urethral diverticulum, &1;Periurethral cyst, &1;Peyronie's disease, &1;Leiomyoma, &1;Tumors arising from urethral diverticulum- Both intra- and peri-urethra &1;Urethral cellulitis, &1;Urethral abscess(iii) Non-urethral origin neoplastic lesions &1;Direct invasion from pelvic and genital tumors, &1;Metastatic tumors

## **GUEE-94 Standardized, Vesical Imaging Reporting and Data System (VI-RADS) - Compliant, Acquisition and Interpretation of Multiparametric Magnetic Resonance of the Bladder: A Practical Guide**

Participants

Martina Pecoraro, MD, Roma, Italy (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

1. Bladder multiparametric MRI is the most accurate imaging test for local staging of bladder cancer. 2. The Vesical Imaging Reporting and Data System (VI-RADS) has standardized the acquisition protocol of bladder MRI and created a 5-point scoring system to differentiate muscle invasive from non-muscle invasive bladder cancer.3. The use of VI-RADS for bladder cancer local staging has shown excellent diagnostic performance and inter-reader reproducibility in multiple studies.4. High diagnostic accuracy of bladder MRI and VI-RADS is dependent on proper patient preparation and implementation of the imaging protocol.5. Pitfalls in evaluating bladder MRI can occur and needs to be acknowledged

### **TABLE OF CONTENTS/OUTLINE**

MRI of the bladder with the use of VI-RADS is a powerful diagnostic tool for the local assessment of bladder cancer, but it requires the radiologist to implement a specific acquisition protocol and image interpretation standards to achieve optimal diagnostic accuracy and reproducibility. In this educational exhibit we discuss with a practical approach the technical aspects to follow for the correct acquisition of VI-RADS compliant bladder MRI studies. Furthermore, we provide a practical approach to the assessment, scoring, and reporting of bladder lesions according to the VI-RADS scoring system. Also, we provide details on what is beyond VI-RADS 1.0 concerning Pitfalls and Tips and Tricks: details will cover bladder distension and how to handle with it, pitfalls in staging cancers located at ureteral orifices, at folded bladder walls (e.g anterior bladder wall), at diverticula, and after previous tumor resection. To conclude we will provide insights on training and VI-RADS learning curve.

## **GUEE-95 Everything a Radiologist Needs to Know About the Diagnosis and Treatment of Renal Angiomyolipomas**

Participants

Brendan Ryu, BS, Westbury, NY (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

(1) To review the epidemiology, pathophysiology, and genetic associations of renal AMLs. (2) To highlight the clinical presentation and imaging characteristics of renal AMLs. (3) To discuss the utility and efficacy of the various treatment options for renal AMLs.

### **TABLE OF CONTENTS/OUTLINE**

Introduction and Associations - Overview- Normal Renal Anatomy and Vasculature - Epidemiology and Pathophysiology of Renal AMLs- Association with Tuberous Sclerosis Complex (TSC)Diagnosis- Clinical Presentation- Incidental Secondary to Complications (bleeding, etc.)- Imaging Modalities- Ultrasound/Doppler- Computed Tomography/Angiography- Magnetic Resonance Imaging/Angiography- Direct AngiographyTreatment and Management - Active Surveillance- Criteria for Intervention- Medical Management- mTOR inhibitors- Embolization- Glue- Particles- Coils- Other materials- Ablation- Surgery- Potential Treatment Complications- Bleeding- Non-target embolization- Post-operative collectionPost-Treatment Imaging Appearance

## **GUEE-96 Pre- and Post-treatment Imaging of Upper Urinary Tract Urothelial Cancer (UTUC): National Comprehensive Cancer Network and European Association of Urology UTUC Guidelines in 2023**

Participants

Hirotsugu Nakai, MD, Rochester, MN (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

Upper tract urothelial cancer (UTUC) accounts for 5-10% of UCs. However, 60% of UTUC are invasive at the diagnosis, and multiplicity of disease is common. Therefore, lifelong surveillance is required. Imaging and image-guided biopsy and intervention play an important role in the diagnosis and management of patients with UTUC. CT urography (CTU), MR urography (MRU), and retrograde ureteropyelography with CT or US are used for detection, localization, staging and follow-up of patients with UTUC. FDG PET/CT and chest imaging are useful for staging and re-staging when metastasis is suspected. This is a comprehensive review of the spectrum of clinical and imaging findings of pre- and post-treatment UTUC with illustration of key multimodality imaging findings

in representative cases.

#### TABLE OF CONTENTS/OUTLINE

1) Background of UTUC; epidemiology, risk factors, manifestations, pathology, and staging.2) Review of National Comprehensive Cancer Network (NCCN) and European Association of Urology (EAU) UTUC guidelines, version 2023.3) Technique and utility of imaging modality including CTU, MRU, retrograde ureteropyelography with CT or US, FDG PET/CT, chest CT and radiography, and image guided biopsy and intervention.4) Imaging findings of urothelial cancer of the pelvicaliceal systems and ureters before and after treatment.5) Conditions mimicking UTUC including lymphoma, primary renal neoplasms, metastasis, sarcoma, fibroepithelial polyp, inverted papilloma, ureteritis, amyloidosis, and suburothelial hemorrhage.6) Summary

#### GUEE-97 A Spectrum of LUT Pathologies in Males: A Pictorial Review

Participants

María Salazar Osorio, MD, Ciudad de Mexico, Mexico (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- To explain a general review of the male lower urinary tract (LUT) anatomy through diagrams and multimodal images.- To review the most common pathologies and their diagnosis by multiple imaging techniques.- To discuss through real cases common and not-so-common presentations of the pathologies of male LUT.

#### TABLE OF CONTENTS/OUTLINE

- Introduction- Anatomy- Imaging techniques- Main indications- Clinical findings and characteristic features of each presentation (congenital anomalies, benign and malignant pathologies of the urethra, bladder, and prostate)- Conclusions

#### GUEE-98 Are We Talking About the Same Thing? How EPE is Scored

Participants

Andre De Freitas Secaf, MD, Ribeirao Preto, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Prostate cancer is the second most common cause of cancer-related deaths in men. The first option for treating intermediate and high-risk disease is radiotherapy or radical prostatectomy, however, this choice heavily relies on the presence of extraprostatic extension (EPE). EPE is associated with a higher risk of positive surgical margins, biochemical recurrence, metastatic disease and shorter overall survival. For better surgical planning, the evaluation of EPE using multiparametric magnetic resonance imaging (mpMRI) is essential. There are two major criteria for assessing EPE, through mpMRI, one from National Cancer Institute (NCI) and one from the European Society of Urogenital Radiology (ESUR). The NCI score can be classified as 0- no suspected pathological EPE; 1- curvilinear contact length or capsular irregularity and bulge; 2- curvilinear contact length and capsular irregularity and protuberance; 3- EPE visible on MRI or invasion of adjacent anatomical structures. The ESUR score uses a five-point scale (1 = capsular abutment; 2 = not specified; 3 = capsular irregularity; 4 = neurovascular bundle thickening, bulge, or loss of capsule; 5 = measurable extracapsular disease). We aim to discuss the imaging findings of EPE and how to score them according to the NCI and ESUR criteria, emphasizing their strengths and limitations. These scores should be familiar for any radiologist working in the prostate field, as a more accurate diagnosis of EPE can significantly impact the patient's management and outcomes.

#### TABLE OF CONTENTS/OUTLINE

Introduction; NCI and ESUR scores; Cases of EPE using both scores; Discussion.

#### GUEE-99 Spectrum of Fat Containing Lesions in the Adrenal Gland: Tips, Tricks and Mimics

Participants

Jorge Abreu Gomez, MD, Pickering, ON (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Identify the role of CT and MRI in identification of macroscopic and microscopic fat - including pitfalls, and newer entities including radiomics, histogram analysis, dual-energy decomposition and AI techniques.2. Describe the common, and uncommon adrenal nodules which present with fat, with an algorithmic approach as to how the type (macroscopic vs microscopic), amount (small vs large), distribution (homogeneous vs heterogeneous), helps arrive at the right diagnosis.

#### TABLE OF CONTENTS/OUTLINE

- Adrenal nodules can have microscopic (intravoxel) fat or macroscopic (bulk fat), or both. However, they often mimic each other.- What is the role of CT in detection of microscopic fat? Does an attenuation of <10HU always mean microscopic fat? What are the pitfalls of detecting macroscopic fat with CT - increased noise, small ROI? Can histogram analysis improve CT performance? How can dual energy CT improve fat-detection and fat quantification?- What is the role of MRI in detecting microscopic fat? Is MRI only useful when non-contrast CT attenuation is between 10-30HU? Which is better to depict fat - 2D sequences or 3D sequences? How can flip-angles be optimized to improve detection of fat? How are MRI fat quantification methods applicable to focal adrenal lesions?- Amount of bulk fat in adrenal lesions matters - Masses with >50% of bulk fat are myelolipomas; < 50% - can represent myelolipomas or myelolipomatous degeneration which could occur in either an adrenal adenoma or adrenocortical carcinoma.- How to approach diagnosis of lipid poor adenoma with cross sectional imaging.- What are the different patterns of signal loss on out of phase T1w in the diagnosis of adrenal adenoma, when to suspect malignancy?

## Abstract Archives of the RSNA, 2023

GUEE-1

### Zinner Syndrome: A Radiological Journey Through a Little Known Condition

#### Participants

Elena Julian Gomez, MD, Santander, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To review the embryology and anatomy of the male urogenital system. 2. To describe the radiological findings of typical Zinner syndrome and its variants, through a series of 10 patients from our institution whose images are representative. 3. To perform a differential diagnosis with other pelvis cystic lesions, providing an algorithm that helps us to distinguish them depending on their location and their relationship with adjacent structures, including radiological images belonging to our institution.

#### TABLE OF CONTENTS/OUTLINE

1. Embryology and anatomy of the male urogenital system the role of the mesonephric (Wolffian) duct and the ureteral bud in the formation of the different male urogenital structures. 2. Zinner syndrome: a rare congenital urogenital entity due to an alteration in embryogenesis between 4th and 13th weeks of gestation, characterized by unilateral renal agenesis, cystic dilatation of the ipsilateral seminal vesicle and obstruction of the ejaculatory duct. - Definition. - Pathophysiology. - Clinical manifestations. - Diagnosis: the role of different imaging tests in its diagnosis, specifically pelvic MRI, which is considered the Gold Standard technique due to its excellent soft-tissue resolution. - Treatment. 3. Differential diagnosis with other pelvic cystic lesions (intra- and extraprostatic) according to their location and relationship with neighboring structures. This work is illustrated with representative radiological images of cases belonging to our institution.

GUEE-10

### Thingamajigs, Thingamabobs, and Doohickeys: A Comprehensive Imaging Review of Pelvic Medical Devices

#### Participants

Amanda Gibson, DO, Lexington, KY (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Given the ever-increasing number of imaging examinations performed and the continuous development and refinement of medical devices, radiologists commonly encounter such devices in clinical practice. 2. Pelvic medical devices may be detected incidentally on imaging examinations or imaging may be performed specifically to evaluate for device complication. 3. Knowledge of device indication and function may provide important clues to patient history that might not otherwise be available at the time of image interpretation. 4. Medical device complications are typically related to infection, malposition, and/or suboptimal device function. 5. A comprehensive knowledge of device indication, function, structure, imaging appearance, and associated complications is necessary to provide accurate and timely assessment of pelvic medical devices.

#### TABLE OF CONTENTS/OUTLINE

1. Succinct description of pelvic medical device structure, function, and indications for use in both women and men 2. Illustration of imaging features of pelvic medical devices, including normal findings, imaging artifacts, and device-related complications, across both planar and cross-sectional studies, with emphasis on key findings to report 3. Discussion of MRI safety issues related to pelvic medical devices

Printed on: 04/12/24

GUEE-100

### Feel the Burn: Imaging Infections of the Male and Female Reproductive Tract

#### Participants

Alexander Kuehne, MD, Clear Lake, MN (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Familiarize the radiologist with the spectrum of reproductive tract infections, focusing on some of their more unusual etiologies and presentations.
- Review imaging of male and female reproductive tract infections in case-based format.
- Highlight key imaging features of specific infections, atypical presentations, and common mimics.
- Review imaging characteristics that would help to narrow the differential diagnosis.
- Provide an overview of management and treatment of reproductive tract infections, their sequelae, and complications.

#### TABLE OF CONTENTS/OUTLINE

- Classification of reproductive tract infections: sexually transmitted diseases; endogenous infections; iatrogenic infections.
- Review of infections by anatomic region, particularly unusual infections/presentations: uterus and adnexa; vagina and vulva; prostate and penis; spermatic cord and scrotum; perineum.
- Management of infections, their sequelae, and their complications.

GUEE-101

### Imaging of Benign and Malignant Renal Neoplasms Based on the WHO 2022 Classifications: What Radiologists Should Know

#### Participants

Nikolas Brozovich, MD, Augusta, GA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

· Describe important reporting elements of renal tumors· Describe classification and approach to renal tumors on the basis of WHO 2022 Classifications· Describe multimodality imaging characteristics of renal tumors· Role of imaging to evaluate renal tumors after local renal therapy and complications

#### TABLE OF CONTENTS/OUTLINE

Content: • WHO 2022 renal tumor classification • Reporting elements of renal tumors • Clear cell tumors • Papillary tumors • Oncocytoma • Chromophobe cell renal carcinoma • Mucinous tubular and spindle cell carcinoma • Adult cystic nephroma • Metanephric tumors • Mixed epithelial and stromal renal tumors • Angiomyolipoma • Renomedullary interstitial cell tumor • Mesoblastic nephroma • Collecting duct carcinoma • Eosinophilic solid and cystic renal cell carcinoma • Inflammatory myofibroblastic tumor of the kidney • Renal perivascular epitheloid cell tumor (PEcoma) • Syndromes with renal tumors • Other tumors of the upper tract • Lymphoma • Transitional cell carcinoma • Metastasis • Abscess • Xanthogranulomatous pyelonephritis

Printed on: 04/12/24

GUEE-102

### Imaging of Inferior Vena Cava Wall Invasion in Renal Cell Carcinoma with Tumor Thrombus

#### Participants

Haiyi Wang, MD, Beijing, China (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Locally advanced renal cell carcinoma with inferior vena cava (IVC) tumor thrombus is one of the most challenging diseases in urology. T3c disease is diagnosed when a tumor thrombus invades the IVC wall. The presence or absence of IVC wall invasion has a significant impact on the selection of surgical protocols, which include IVC incision thrombectomy, IVC segmental resection, and IVC resection. Higher morbidity and mortality rates occur when a tumor thrombus invades the IVC wall. Tumor thrombus invading the IVC wall is associated with poor postoperative survival. The purposes of this exhibit are: 1) Discuss the role of IVC wall invasion in the surgical treatment of renal cell carcinoma and tumor thrombus. 2) Clarify significant image findings of IVC wall invasion. 3) Illustrate meaningful information and pitfalls of diagnosing IVC wall invasion in radiology reports.

#### TABLE OF CONTENTS/OUTLINE

1) Overview of anatomy and physiology of the inferior vena cava system. 2) Introduction of the mechanism of IVC tumor thrombosis formation in renal cell carcinoma. 3) Describe surgical management of different types of tumor thrombectomy: a. IVC incision thrombectomy; b. IVC segmental resection; c. IVC resection. 4) Imaging methods selection: a. contrast-enhanced ultrasound (CEUS); b. CT; c. MRI. 5) Imaging findings of IVC wall invasion in case-based imaging. 6) Illustrate key signs and pitfalls in diagnosing IVC wall invasion. 7). Build a scoring system: inferior vena cava wall invasion likelihood scores (IVC WAILS). 8) Consolidate the acquired knowledge: Review preoperative imaging findings of IVC invasion that aid in surgical decisions. 9) Conclusions.

GUEE-103

### Spectrum of Male and Female Urethral and Periurethral Pathologies at Imaging

#### Participants

Nikolas Brozovich, MD, Augusta, GA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1) Role of imaging in the evaluation of the urethra.2) Review of relevant male and female urethral anatomy.3) Recognize a variety of urological conditions in males and females at imaging.

#### TABLE OF CONTENTS/OUTLINE

Conventional imaging studies such as retrograde urethrography(RUG), voiding cystourethrography(VCUG), and Ultrasonography(US) are limited in the evaluation of the periurethral tissues. MR imaging serves as an important noninvasive imaging modality that can provide anatomic detail of the urethra and periurethral tissue due to excellent tissue contrast and multiplanar capability. 1) Detailed male and female urethral and periurethral anatomy.2) MR technique for urethral evaluation.3) Female urethral pathology including urethral diverticulum and associated pathology, urethral leiomyoma, periurethral/paravaginal cysts, bulking agents, urethral prolapse, periurethral hemangioma, and neoplasms.4) Male urethral pathology including urethral calculi, Peyronie's disease, artificial sphincter, infection, and neoplasms.

GUEE-104

### **Radiologic Feature of Complications after Artificial Urinary Sphincter Implantation Following Total Prostatectomy**

#### **Participants**

Shioto Oda, MD, Kashiwa, Japan (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Artificial urinary sphincter (AUS) is an implanted device used for the treatment of urinary incontinence, commonly following prostatectomy. Despite increasing reports of device failure and postoperative complications, comprehensive reports on imaging have yet to be compiled. When complications occur after AUS surgery, entire device replacement may be necessary, which can be burdensome for the patient. However, with precise identification of the malfunctioning part, partial replacement has been possible in some cases. This presentation will exhibit imaging findings of malfunction and postoperative complications after AUS implantation at our hospital, together with anatomical findings, to contribute towards appropriate device management. The purpose of this exhibit is: 1) To provide a comprehensive review of the normal appearance of AUS, along with an analysis of the parts that are commonly associated with complications 2) To exhibit the various complications related to device failure and surgery on a case-by-case basis.

#### **TABLE OF CONTENTS/OUTLINE**

1) Normal Appearance of AUS 2) Malfunction of AUS 2.1) Circuit Leakage 2.2) Pump Malfunction 3) Complications Directly Related to the Procedure 3.1) Urinary Injury During Replacement of AUS 3.2) Hematomas and Infections Occurring in the Subacute Period

Printed on: 04/12/24

GUEE-11

### Imaging of upper urinary tract neoplasms

#### Participants

Kyungmin Kim, BMBS, Manchester, United Kingdom (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Neoplasms of the upper urinary tract can be investigated with different imaging modalities such as CT, MRI and ultrasound. In certain cases, nuclear medicine studies, such as PET-CT or DMSA can aid with detection of occult bone metastasis or determining the best treatment option. The traditional CT protocol for visualizing renal parenchymal abnormalities is a triple phase study. Alternatively, a split bolus urography protocol also provides good visualization of the renal parenchyma and the collecting systems with a reduced radiation dose. Renal cell carcinoma (RCC) is the most common type of upper urinary tract neoplasm with a wide range of phenotypes from homogeneous solid mass to heterogeneous multi-cystic or necrotic lesions. Differentiating between benign and malignant renal neoplasms can be challenging and histopathological evaluation may be required to confirm the diagnosis. A wide range of conditions ranging from developmental, infectious, granulomatous and vascular causes can mimic upper urinary tract neoplasms.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction  
2. Imaging modalities for investigation of upper tract neoplasms  
2.1 CT  
2.2 MRI  
2.3 Ultrasound  
2.3.1 Contrast enhanced ultrasound  
2.4 Nuclear medicine  
3. Imaging features of upper tract neoplasms  
3.1 Malignant  
3.1.1 RCC  
3.1.2 TCC  
3.1.3 Lymphoma  
3.1.4 Wilm's tumor  
3.1.5 Miscellaneous  
3.2 Benign  
3.2.1 Oncocytoma  
3.2.2 Angiomyolipoma  
4. Upper urinary tract pseudotumors  
4.1 Developmental  
4.2 Infectious

### Not Only Prostate Adenocarcinoma is Present in the Interpretation of Multiparametric Prostate MRI

#### TEACHING POINTS

Knowledge of normal anatomic structures and physiological changes that may simulate prostate adenocarcinoma in prostate multiparametric magnetic resonance imaging (mpMRI) Clinical presentation MRI characteristics with pathological correlation can help us to accurately characterize benign and malignant diseases, that can mimic prostate adenocarcinoma in mpMRI resulting in appropriate patient management.

#### TABLE OF CONTENTS/OUTLINE

Review and identify normal prostatic anatomic structures that can affect mpMRI interpretation because may simulate prostate adenocarcinoma: hypertrophic anterior fibromuscular stroma, asymmetrical and focal thickening of the surgical capsule, congested appearance of periprostatic vascular plexus normal Review the clinical manifestations and mpMRI characteristics with pathological correlation of prostatic and periprostatic benign process: congenital anomalies (Zinner's syndrome), prostatic abscess, infective or inflammatory prostatitis (bacterial, granulomatous, IgG4-related disease), prostatic hemorrhage, ectopic stromal benign prostatic hyperplasia nodule, periprostatic lymph nodes, osteochondroma of the pubic symphysis, neoplasms with unpredictable clinical course (stromal neoplasm of uncertain malignant potential), direct neoplastic invasion of malignant tumors in adjacent organs (diffuse large B-cell lymphoma of the rectum), that can mimic prostate adenocarcinoma in mpMRI

### MRI-Based VI-RADS for Bladder Cancer: Enhancing Accuracy and Consistency in Reporting

#### Participants

Sina Houshmand, MD, San Francisco, CA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Review imaging findings of bladder cancer with emphasis on the importance of differentiation between muscle-invasive and non-muscle invasive disease and impact of imaging on clinical management. 2. Review technical aspects of multiparametric MRI for bladder cancer. 3. A pictorial review and step-by-step tutorial on Vesical Imaging-Reporting and Data System (VI-RADS).

#### TABLE OF CONTENTS/OUTLINE

1. Introduction to bladder cancer  
a. Types and relevant pathology  
b. Diagnosis, staging, treatment  
c. Role of imaging in clinical management  
d. Imaging of bladder cancer  
2. VIRADS  
a. Definitions and categories  
b. MRI scoring  
c. Examples  
3. Technical aspects  
a. Patient preparation  
b. MR protocol  
4. Pitfalls and mimics  
5. Case review

## Abstract Archives of the RSNA, 2023

GUEE-14

### Male Pelvic Floor: Anatomical Particularities and Dysfunctions

#### TEACHING POINTS

To review some aspects of normal anatomy that are relevant in the context of male pelvic floor dysfunction. To demonstrate the differences between the male and female pelvic floor by comparing the reference values provided. To identify changes in male pelvic floor structures during micturition and defecation. To review the examination protocols for functional assessment. To systematize the evaluation of male pelvic floor dysfunctions with clinical cases and flowcharts.

#### TABLE OF CONTENTS/OUTLINE

The male pelvic floor has specific anatomical differences and pathophysiological peculiarities. The most important risk factors for its dysfunction include surgical procedures and radiotherapy. Pelvic floor dysfunctions can be grouped into three major categories (gastrointestinal, urinary, and sexual dysfunctions) and the best modality for this evaluation is dedicated magnetic resonance imaging (MRI). There is a paucity of literature related to imaging evaluation of the male pelvic floor. Typical markers used refer to the pubococcygeal line (PCL), the H line, the M line, and anorectal angle. Specific markers include the puboprostatic angle and the prostatic-urethral angle. Radiologists should recognize these particularities, the potential risk factors leading to these dysfunctions, and which landmarks are used in functional assessment.

GUEE-16

### Don't Forget the Female Urethra: An Approach for Radiologists

#### TEACHING POINTS

The female urethra can be adequately studied by static or/otr dynamic imaging methods. The spectrum of pathologies is wide, from the complexity of finding direct signs in a urethral diverticulum to the challenge of providing the necessary information for an adequate treatment of solid masses of undetermined origin. In recent years, the use of minimally invasive surgical techniques for the urinary incontinence/pelvic prolapse approach has raised the need to be familiar with the radiological features pre and post treatment for proper patient counseling.

#### TABLE OF CONTENTS/OUTLINE

-Review of the anatomy of the female urethra-Imaging methods-acquisition protocolsUltrasound (focused on static technique)Magnetic ResonanceVoiding CystourethrographyRetrograde double-balloon positive-pressure urethrography-Pathology of the female urethraMalformacionesCystic pathology: diverticulum versus urethral cystSolid pathologyBenign: abscess; myoma Malignant:Primary: urothelial carcinoma, squamous cell carcinoma, adenocarcinoma, Aggressive angiomyxoma Secondary: contiguous invasion versus metastatic lesions Pre-posttreatment imaging in minimally invasive surgical techniques for stress-mixed urinary incontinence (synthetic midurethral slings and bulking agents)-Differential diagnosis of urethral cystic from periurethral cystic pathologies-Conclusions

GUEE-17

### Predominantly Non-Cystic Multiple Focal Renal Lesions: An Imaging Approach

#### Participants

Mario G. Santamarina, MD, Vina del Mar, Chile (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To review causes of predominantly non-cystic multiple focal renal lesions.
2. To discuss imaging findings of the different entities.
3. To provide imaging-based clues useful to focus and to guide to the correct diagnosis.

#### TABLE OF CONTENTS/OUTLINE

The presence of multiple focal renal lesions may be an isolated or dominant imaging finding as well as an additional abnormality in the setting of multiorgan involvement. An imaging-based approach may be crucial in the differential diagnosis process as well as in patient management. Knowledge of the imaging appearance of the various causes and integration with other findings may result in a correct diagnosis in most cases as well as in assisting in proper patient work-up and management. Table of Contents: I- Overview; II- Main causes of multiple focal renal lesions 1. Infectious, 2. Inflammatory, 3. Vascular, 4. Related to neoplasm (main hereditary renal cancer syndromes, renal metastases, lymphoproliferative disorders, renal oncocytosis).; III- Summary.

Printed on: 04/12/24

## Abstract Archives of the RSNA, 2023

GUEE-18

### Medical Devices in the Pelvis: The Good, the Bad, and the Ugly

#### TEACHING POINTS

1. Understand that a variety of devices may reside in the pelvis. 2. Recognize the multimodality imaging features of different devices to include expected location and malposition/migration and their potential associated complications. 3. Emphasize the importance of detecting malpositioned/migrated devices to facilitate treatment.

#### TABLE OF CONTENTS/OUTLINE

Medical Devices divided by biological sex where applicable. o Biological Female: § Intrauterine Device • Hormonal (e.g., Mirena) • Non-hormonal (e.g., Copper, Lippes Loop) • Sterilization Device (e.g., Essure) o Biological Male: § Penile Prosthesis o Devices found in both sexes: § Artificial Urinary Sphincter § Suprapubic Catheter and Foley Catheter § Ureteral Stents § Pessary § Peritoneal Dialysis Catheter 1. The following will be discussed for the devices where applicable: a. Indication b. Types c. Multimodality imaging features of the device in its expected position. d. Multimodality imaging features of the device in an abnormal position. e. Complications from malposition or migration of the device f. Treatment 2. Highlight the importance of familiarity with the multimodality imaging features of the wide variety of medical devices in the pelvis so that a malpositioned or migrated device can be easily recognized and brought to the attention of the referring physician to facilitate the patient receiving treatment.

GUEE-19

### Revisiting Voiding Cystourethrography (VCUG) and Retrograde Urethrogram (RUG).

#### Participants

Gabriela Lauar, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Voiding cystourethrography (VCUG) and retrograde urethrogram (RUG) are fluoroscopic classic examinations performed by radiologist even in the present days, despite becoming increasingly scarce, still has its diagnostic value. Iodine contrast and x-ray equipment are required to perform the exam. Indications may vary according to venter, age, and clinical history. The findings can be divided between congenital and acquired at bladder and urethral lesions. VCUG and RUG are complementary tests to urethroscopy, as they can detect pathologies that were not previously visible. Other exams can offer adjunct informations, such as sonography and MRI, but this can provide unique diagnoses or inspire the development of new professionals or new techniques such as urethral resonance.

#### TABLE OF CONTENTS/OUTLINE

This pictorial study aims to review, describe and illustrate the examination and findings of RUG and VCUG in male and female patients that cannot go unnoticed in our reports. We have selected images of cases from our service that may raise suspicion or confirm the disease. We separate the cases according to anatomy and gender. The pathologies we will explore are divided into bladder, urethra findings, as well as prostate-related.. Quick and correct diagnosis can be crucial for the treatment of our patients.

GUEE-2

### Dose Reduction Strategies in CTKUB for Urolithiasis

#### TEACHING POINTS

1. It is critical for radiologists to understand CTKUB dose reduction strategies and successfully optimize protocols that produce high image quality with minimal dosage. 2. Familiarity with the practical approach in CTKUB will both decrease radiation dose and optimize imaging quality for the specific clinical indication.

#### TABLE OF CONTENTS/OUTLINE

The purpose of this exhibit is: 1. To discuss the relationship between radiation dose and image quality 2. To assess radiation dose reduction strategy with preserving image quality in CTKUB. Introduction- Radiation exposure and CT- Urolithiasis and CTKUB: Low dose and ultralow dose CT- ALARA principle "As Low As Reasonably Achievable" Optimization for Scans Reconstruction Parameters - CT radiation dose Estimate- CT radiation dose affecting factors- Control Z-Axis: Scan Range - Lower mAs- Lowering kVp- kVp mAs Settings- Automatic Tube Current Modulation (ATCM)- Noise Reduction Technique including deep learning-based image reconstruction Practical Approach: Decreased radiation dose and improved image quality- Dose justification: Risk vs. Benefit - ALARA (As Low As Reasonably Achievable) principle- Optimization for Scans Reconstruction Parameters - Dose Management: Monitoring, Radiation tracking- Educating requesting physicians and CT technicians

GUEE-20

### Decoding the cCLS Score: A Game-Changer in the Diagnosis and Management of Renal Masses

#### Participants

Daniella Braz Parente, MD, PhD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

Daniella B. Parente, MD, PhD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Review the classification and epidemiology of the most common upper urinary tract neoplasms. Understand the importance of cCLS score in the management of incidental renal lesions. Explore nephrometry as a tool for assessing the surgical complexity of renal masses.

#### TABLE OF CONTENTS/OUTLINE

I. INTRODUCTION - Overview of upper urinary tract neoplasms and their epidemiology II. IMAGING TECHNIQUE - Overview of imaging modalities for renal mass detection and characterization - Best practices for imaging protocol III. IMAGING INTERPRETATION - Typical imaging features of common renal tumors - Explanation of cCLS score and its significance in the diagnosis of renal masses - Overview of nephrometry score and its role in assessing surgical complexity - Importance of CT and MRI in staging renal masses - Utilization of structured reports IV. QUICK REVIEW OF TREATMENT OPTIONS Overview of different treatment modalities for renal masses Pros and cons of each treatment option V. INTERACTIVE CASE-BASED DIDACTICS - Presentation of illustrative cases demonstrating the utility of cCLS score in diagnosis and management of renal masses

Printed on: 04/12/24

## Abstract Archives of the RSNA, 2023

GUEE-21

### Imaging of Upper Tract Urothelial Neoplasms: Pearls and Pitfalls

#### TEACHING POINTS

Review the staging of upper urinary tract urothelial carcinoma (UTUC) which is critical for treatment decisions and surgical planning. Discuss the role of different imaging exams in the diagnosis of UTUC with a focus on CT and MR urogram protocols. Provide an evidence-based approach to critical T-staging. Highlight nuances in staging unique to UTUCs. Identify important pitfalls in the diagnosis of UTUC including benign neoplastic, infectious, and inflammatory etiologies.

#### TABLE OF CONTENTS/OUTLINE

Introduction: Epidemiology, prevalence, risk factors, Clinical presentation, TNM Staging. Exam protocols Value of multi-phasic exams, CT urogram dose reduction techniques including split bolus and virtual non-contrast, MR urogram. Staging: Tumor location: renal calyx or pelvis, ureter. Multifocality, Evidence based approach to critical T-staging T2 vs T3: ureteral border analysis, Hydronephrosis severity, Evaluation of contralateral urinary tract and bladder, Role of renal function evaluation, Nodal disease and distant metastases, Critical findings for treatment decision making and surgical planning. Pitfalls: Endometriosis, Infection, Malakoplakia. Post-treatment Surveillance imaging: Post-surgical appearance, Local recurrence, Risk of metachronous UTUC in contralateral urinary tract or bladder. Conclusion.

GUEE-22

### Go with the Flow: Imaging of Urinary Tract Augments, Reconstructions, and Non-Cystectomy Diversions in Adult Patients

#### TEACHING POINTS

- A variety of surgical techniques are utilized to augment, reconstruct or reroute the urine stream and these procedures often utilize other segments of the GU or GI tract• Findings from these procedures may be found on imaging studies during routine practice. Surgical records may not be available for many adult patients, especially for those with remote procedures performed in childhood• Postsurgical anatomy must be appropriately recognized for accurate diagnoses• Radiologists should be aware of surgical techniques and potential alterations made to the GU and GI tracts to help recognize expected postoperative anatomy, to facilitate greater diagnostic accuracy of postoperative complications, and avoid potential pitfalls

#### TABLE OF CONTENTS/OUTLINE

- Review indications for bladder augments, reconstructions and non-cystectomy urinary diversions• Describe common surgical procedures performed for bladder augmentation, ureteral reconstructions and non-cystectomy diversions, including continent and non-continent diversions- Bladder augments: gastrocystoplasty, ileocystoplasty, sigmoid cystoplasty- Reconstructions: psoas hitch, Boari flap, ileal interposition, uretero-ureterostomy, ureteroneocystectomy- Diversions: ileovesicostomy, appendicovesicostomy, Monti procedure• Discuss appropriate imaging techniques and radiologic evaluation, including how to recognize the postoperative anatomy and expected findings• Describe the imaging findings of postoperative complications including leak, fistula, abscess, mucus formation, stones, GU and GI obstruction

Printed on: 04/12/24

GUEE-23

### Periprostatic Anatomy: An Illustrated Review and Implications for Treatment Planning

#### TEACHING POINTS

1. Identify clinically relevant normal anatomy of periprostatic structures with imaging (MRI, CT, and angiography) correlation
2. Recognize periprostatic anatomic variations and implications to treatment planning

#### TABLE OF CONTENTS/OUTLINE

Table of Contents/Outline 1. Introduction 2. Prostatic pseudocapsule -Discussion of periprostatic fascial anatomy and composition - Implications for prostate cancer (PCa) staging and treatment -Preoperative MRI criteria for the diagnosis of extraprostatic PCa extension 3. Neurovascular Bundle -Normal anatomy with surgical correlation -Imaging identification and implications on prostate biopsy, PCa surgical and image-guided focal treatment planning. 4. Rectoprostatic space and Denonvilliers' Fascia -Discussion of rectoprostatic space and fascial anatomy with surgical correlation -Implication on PCa local dissemination in the pelvis -Hydrogel spacer placement for rectal wall protection during radiation therapy - normal and abnormal gel distribution 5. Membranous Urethra and External Urethral Sphincter -Normal membranous urethra and external urethral sphincter anatomy -Relationship to incontinence prediction post prostatectomy? -Imaging identification of external sphincter and relevance for eligibility and planning of image-guided focal treatment 6. Vascular anatomy -Normal anatomy and common variants -Importance for prostatic embolization procedures in the treatment of benign prostatic hyperplasia

Printed on: 04/12/24

GUEE-24

### Renal and Upper Urinary Tract Tumors: How to Effectively Report and Impact Surgical Management

#### Participants

Monick Nakayama, MD, Ribeirao Preto, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Upper urinary tract masses (UTMs) have been increasingly detected by imaging cross-sectional techniques, either as an incidental finding or in the context of a specific investigation, leading to the discovery of renal tumors of smaller dimensions, for whom adequate characterization is mandatory. Correct assignments of malignant and potential benign UTMs are imperative to avoid unnecessary surgical procedures and even biopsies. Nonetheless, the number of benign masses that are surgically approached is still high and prediction of the risk of malignancy is challenging. For UTMs, the lack of well-established scores or specific signs makes imaging evaluation even more difficult but essential for therapeutical definition, and reporting key imaging findings with aggressive lesions is crucial.

#### TABLE OF CONTENTS/OUTLINE

Introduction  
Illustrative summary of the anatomy and histology of the kidney and upper urinary tract and histological origin of UTMs  
Summary of the main image findings in malignant tumors with pathological correlation, including:  
Tumors of the renal parenchyma  
Tumors of the collecting system and ureters  
Lymphoproliferative disorders  
Metastases  
Overview of main benign tumors and their essential imaging findings  
Tricks in upper urinary tract imaging including pseudotumoral lesions  
How to report the imaging findings for helping in surgical planning  
Conclusion

Printed on: 04/12/24

GUEE-25

### Above and Beyond the Imaging Features of Urolithiasis: What the Radiologist Needs to Know

#### Participants

Juan Francisco Santoscoy Gutierrez JR, MD, Miami Beach, FL (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

a) Review the pathophysiology of kidney stone formation, types of calculi and clinical presentation. b) Discuss the general evaluation of urolithiasis with emphasis on the characteristic imaging features of different urinary calculi and specific imaging findings focusing on the clinically relevant information that can affect management by the urologist. c) Describe the standard of care of nephrolithiasis focusing on the current non-invasive options, minimally invasive options and invasive options performed by the urology surgeon. d) List the anticipated post-treatment follow-up, complications and prognosis of urolithiasis.

#### TABLE OF CONTENTS/OUTLINE

I. General overview: epidemiology, pathophysiology, clinical presentation  
II. Evaluation and management: a) General laboratory work and urinary tests  
b) Imaging and clinically relevant reporting: non-contrast CT, CT urography, dual energy CT, ultrasonography, radiography, MRI  
III. Treatment: a) Non-invasive options: observation, medical expulsion therapy, oral medication for dissolution  
b) Minimally invasive options: extracorporeal shockwave lithotripsy, ureteroscopy, percutaneous nephrolithotomy  
c) Invasive options: laparoscopy and open surgery  
IV. Post-treatment follow-up, complications and prognosis

GUEE-26

### Hematuria Beyond Infection, Stones and Cancer: An Imaging and Evaluation Guide of Unusual Cases

#### Participants

Eduardo Zukovski, MD, Umuarama, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- It is essential that radiologists know how to investigate hematuria, indications and limitations of each imaging option and recommendations for follow-up;
- All the examination protocols should be adapted to the patient while optimizing radiation dose;
- CT urography performs better than conventional radiography, ultrasound and intravenous urography in the detection of renal parenchymal masses and urinary tract calculi;
- Patients are now categorized into risk categories according to their clinical presentation and risk factors, and the workup is adapted to that category;

#### TABLE OF CONTENTS/OUTLINE

Hematuria is one of the most common urologic diagnoses, estimate to account for over 20% of urology evaluations; It is defined as the presence of three or more red blood cells per high-powered field in two of three properly collected urinalysis specimens; It can be classified as gross hematuria or microhematuria; The differential diagnosis encompasses a wide range of conditions and the risk of detecting an underlying cancer has been found to be highly dependent on which risk factors are present; More common causes of hematuria include urinary tract infection, urolithiasis, trauma, renal parenchymal disease, and malignancy;

GUEE-27

### Insights into Renal Cell Carcinoma with Novel Imaging Approaches

#### Participants

Khoschy Schawkat, MD, PhD, Boston, MA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

· The updated Bosniak Classification, version 2019, predicts the likelihood of malignancy in cystic renal masses, with improved specificity of the higher risk categories, thereby expanding the number of masses that can be monitored.· In the clear cell likelihood score (ccLS), version 2.0, multiparametric MRI features of small renal masses without macroscopic fat are sequentially analyzed to determine the likelihood of clear cell renal cell carcinoma.· Contrast-enhanced ultrasound and dual energy CT are useful in identification and characterization of solid and cystic renal masses.· Several radiopharmaceuticals may contribute to the characterization of renal masses, such as 99m-technetium sestamibi, radiolabeled girentuximab and 68Ga-prostate-specific membrane antigen.· In the future, RCC may be diagnosed, managed, and treated more effectively using radiomics and artificial intelligence (AI).

#### TABLE OF CONTENTS/OUTLINE

1) New Imaging Algorithms Using Established Imaging Techniques (Bosniak classification, version 2019, and clear cell likelihood score version 2.0). 2) Novel Modalities (Contrast-enhanced ultrasound, dual energy CT, and molecular imaging including Sestamibi, Girentuximab, and PSMA). 3) Radiomic and artificial intelligence.

### Penile MRI: A Multi-institutional Case-based Review of Anatomy, Spectrum of Pathologies and Prosthetic Complications

#### Participants

Harit Kapoor, MD, MBBS, Poughkeepsie, NY (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1) Penile MRI provides invaluable clinical information in a wide array of pathologies. However, given the infrequent use, contemporary radiology residency and fellowship training provides insufficient exposure to penile MRI. 2) After reviewing this presentation, the learner will be able to: a. Understand normal penile anatomy including prosthetic anatomy; b. Describe indications for penile MRI and key aspects for image acquisition; c. Diagnose various penile pathologies based on characteristic imaging findings; d. Understand the basis for differences in management and tenets of surgical planning for various disease entities; e. Describe indications for penile prosthesis implantation and diagnose common implant complications.

#### TABLE OF CONTENTS/OUTLINE

1) Overview of penile MRI technique, indications, and normal anatomy. 2) Tabulated summary of various penile diseases with classic MRI appearances. 3) Case examples (with differentials, pearls and pitfalls) including but not limited to: (i) Penile trauma (contusion, fractures); (ii) Corrected anomalous genitalia; (iii) Cowper's gland pathology (retention cysts and syringocele); (iv) Penile malignancy (primary staging, post-penectomy recurrence, metastases); (v) Penile implant complications (malpositioning, infection and erosion/extrusion); (vi) Priapism (types, post-treatment imaging); (viii) Periurethral and perineal sepsis.

GUEE-29

### Upper Tract Urothelial Neoplasms and Mimics

#### Participants

Satheesh Krishna, MD, Toronto, ON (*Presenter*) Nothing to Disclose

Murray Di Loreto, MD, Toronto, ON (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Review the methods and techniques for the optimal evaluation of the urothelium.
- Identify role of imaging in diagnosis and staging of upper tract urothelial cancer.
- Identify imaging features with radiology-pathology correlation of lesions involving the urothelium in a quiz-based format.

#### TABLE OF CONTENTS/OUTLINE

- Is there still a role of conventional urography? Which is better - retrograde urography? antegrade urography? intravenous pyelourography?
- CT urography - what is the ideal urothelial phase? should arterial phase be included ? split-bolus technique vs dedicated delayed phase?
- When is MR urography preferred over CT urography- improvements in MR sequences (including compressed sensing, k-space undersampling, parallel imaging and AI). Is Lasix injection needed? Prone vs supine patient positioning? Wide vs narrow FOV how to optimize? Are cine-T2 images useful? T2 based or gadolinium based ? Pitfalls, artifacts simulating urothelial disease will be discussed (especially pertaining to MR urography) and solutions will be presented (flow voids on T2? T1\* effects due to concentrated gadolinium).
- What is multiparametric MR Urography - what are the various components of multiparametric MR urography, and how does it improve diagnosis? What is the literature evidence for multiparametric MR urography?
- How does imaging help in diagnosis and staging of upper tract urothelial neoplasms? What are the key findings impacting management of upper tract urothelial neoplasms?
- Approach towards differential diagnosis of these lesions (including common, uncommon and rare mimics) with tips and tricks and imaging pearls as to when to suspect a diagnosis other than UCC, and optimal follow-up/referral strategy.

### Lost Without Bosniak: Overcoming the Challenges of Non-Classifiable Renal Cystic Masses

#### Participants

Jhonata Soares Da Silva, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

A comprehensive review of situations where the Bosniak classification for renal cystic masses is not applicable, emphasizing the importance of being aware of these contexts and how to manage cases where the classification is not useful. Challenging Cases: The exhibition will showcase various challenging cases of renal cystic masses where the Bosniak classification may not be applied. These cases will test participants' knowledge and critical thinking.

#### TABLE OF CONTENTS/OUTLINE

Overview of cystic renal lesions in daily practice and the importance of differential diagnoses. Brief mention of the Bosniak classification system and its limitations. Situations where the Bosniak Classification is not applicable, such as inflammatory/infectious conditions, vascular diseases, calyceal diverticula, polycystic kidney disease, Birt-Hogg-Dubé, Von Hippel-Lindau, Tuberous Sclerosis, pelvic cysts, and cystic metastasis are all conditions that can mimic renal cystic masses and are not included in the Bosniak classification system. In this section, we will review each of these conditions, their presentation, and management. Case-based review of concepts and tips: Practical tips and case-based reviews of concepts to help manage renal cystic masses that cannot be classified by the Bosniak system. Helping assistant doctors for better outcomes: discussion of how to assist and guide assistant doctors in managing challenging cases of renal cystic masses. Key take-home messages: summary of the important points discussed during the presentation, with practical advice on how to incorporate the acquired knowledge into clinical practice.

### Imaging and Interventional Management in Different Conditions Underlying Renovascular Hypertension

#### Participants

Eric Castane, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Review the imaging study of the arterial renal system both in normal and in renal artery stenosis. 2. Describe the vascular radiology management of the renovascular hypertension.

#### TABLE OF CONTENTS/OUTLINE

1. Material and methods / Background. 2. Arterial hypertension and renovascular hypertension: definitions and clinical features. 3. Imaging study of the renal arteries: normal, anatomic variants and pathological findings. 3.1. US assessment (evaluation points, technique, signs). 3.2. CT. 3.3. MRI. 3.4. Angiography. 3.5. Algorithmic approach to renal artery stenosis. 4. Interventional radiology management: therapeutic options and post procedure imaging criteria. 5. RAS: etiologies pictorial review (atherosclerosis, fibromuscular dysplasia, vasculitis, others). 6. RAS after renal transplantation (diagnosis and interventions). 7. Conclusions.

### Imaging of the Urachus

#### Participants

Maria Zulfiqar, MD, MBBS, Scottsdale, AZ (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The purpose of this exhibit is to: 1. Illustrate normal urachal anatomy on imaging and discuss urachal embryogenesis. 2. Provide case-based review of the imaging features of various urachal non-neoplastic and neoplastic entities.

#### TABLE OF CONTENTS/OUTLINE

Embryogenesis: Urachus is an embryonic ductal remnant of the allantois and cloaca extending from the bladder dome to the umbilicus. Imaging modalities: US is usually the imaging modality of choice, especially in the pediatric population. CT and MR carry higher temporal and spatial resolution with added benefit of staging malignancy when present. • Congenital: Patent urachus (urachal fistula); Umbilical-urachal sinus tract; Vesicourachal diverticulum; Urachal cyst • Infections/inflammation: Urachal stone/calcification; abscess. • Urachal neoplasms: Benign Adenoma; Cystadenoma, fibroma. Malignant Mucinous adenocarcinoma; Nonmucinous adenocarcinoma; Urothelial; Squamous; Sarcomatoid; Metastatic. • Non-neoplastic masses: Endometriosis; Hemorrhage. Summary Urachal pathology is often discovered incidentally on imaging and presents with nonspecific urinary symptoms. Early detection of urachal pathology and identification of complications such as infection and malignancy are imperative to prevent significant patient morbidity.

### Testicular Cancer: What the Radiologist Needs to Know

#### Participants

Ingrid Alonso Ramon, MD, Mexico City, Mexico (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To review the general characteristics of testicular cancer including the different types and their incidence. To describe the different features of multimodality imaging (ultrasound, CT, PET/CT) including the expected findings depending on histologic type and their utility of each in TNMS. Recognize the importance of diagnosis, treatment and follow-up.

#### TABLE OF CONTENTS/OUTLINE

Description of the general characteristics of testicular cancers including (a) embryology (b) incidence (c) detailed pathologic features. d) Clinical presentation To review of multimodality imaging findings including expected findings. To establish the usefulness of the different imaging methods for diagnosis, follow-up, complications and stratification of each one. To Discuss clinical scenarios to establish the best course of action.

GUEE-34

### Contrast-Enhanced Ultrasound (CEUS): Vascular Applications from the Kidneys to the Bladder

#### TEACHING POINTS

1. CEUS is a very useful imaging modality in patients with poor renal function due to the non-nephrotoxic nature of the ultrasound contrast agents. 2. In the kidneys, CEUS is accurate in characterizing indeterminate lesions, characterizing complex cysts according to the Bosniak criteria, differentiating solid renal tumors from pseudotumors, identifying renal infarction, abscesses, and for the follow-up of non-surgical renal lesions. 3. CEUS is also used in renal transplant patients to look for masses, cysts, and other vascular problems. 4. In the bladder, CEUS is excellent in differentiating bladder cancer from benign pathologies such as a hematoma in patients with hematuria. It also aids in differentiating non-muscle invasive bladder cancers (NMIBC) from muscle-invasive bladder cancers (MIBCs), thereby guiding appropriate management. 5. CEUS can also detect primary tumors of the ureter or tumors extending from the bladder into the ureter by means of enhancement patterns.

#### TABLE OF CONTENTS/OUTLINE

1. Overview of vascular applications of CEUS in the urinary system. 2. The technique of performing CEUS. 3. Microbubbles as non-nephrotoxic blood pool contrast agents. 4. Renal applications of CEUS. i. Renal infarction ii. Renal abscess iii. Characterization of cystic renal masses iv. Solid renal tumors vs pseudotumors v. Angiomyolipoma vs renal cell carcinoma 5. Renal transplant applications 6. Bladder application of CEUS. i. Bladder cancer vs Hematoma ii. Staging of bladder cancer iii. NMIBC vs MIBC iv. Ureteral tumor

### Imaging Findings of Upper Tract Urothelial Carcinoma (UTUC) and Its Mimickers

#### Participants

Marina Farani, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To review the characteristic imaging findings of upper tract urothelial carcinoma. To outline the role of imaging in diagnosis and staging of carcinoma of the renal pelvis and the ureter. To discuss different diagnostic imaging modalities in the context of upper tract urothelial carcinomas. To make differential diagnosis of upper urinary tract neoplasms from other lesions, including benign lesions.

#### TABLE OF CONTENTS/OUTLINE

Introduction: Epidemiology, risk factors, signal and symptoms and pathogenesis about carcinoma of upper urinary tract. Diagnosis: A step-by-step explanation of how to characterize and diagnostic a upper tract urothelial neoplasm. The use of computed tomography and the magnetic resonance to describe the different imaging patterns of tumors (papillary and infiltrating) and to staging urothelial carcinoma of upper urinary tract. Case-Based Review: Sample cases explaining and demonstrating different imaging patterns about upper tract urothelial carcinoma in different imaging modalities. This section will present illustrative cases of carcinoma urothelial infiltrating renal parenchyma, limited at renal pelvis and calyceal infundibulum and distal ureter. This section will present illustrative cases of diagnostic differential/mimickers of urothelial neoplasm, like inflammation, blood clots, endometriosis and renal lymphoma. Conclusion and key takeaways.

### Atypical Prostatic Cancer Metastases Recurrence: A Pictorial Review

#### Participants

Murilo Peixoto, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Prostate cancer is one of the most common malignancies in men worldwide. It has a recognizable pattern of metastatic spread, most frequently to regional lymph nodes and bone, as well as a typical recurrence pattern to pelvic lymph nodes, vesicourethral anastomosis, and bed of seminal vesicles and vas deferens. However, there are different patterns of metastases and recurrence that must be recognized.

#### TABLE OF CONTENTS/OUTLINE

Atypical metastatic disease occurs in less than 5% of patients. Atypical lymph node involvement includes the supradiaphragmatic chains, most commonly the retrocaval, hilar, and supraclavicular ones. Extranodal involvement can occur in the lung and pleura, abdominal viscera, breast, orbit, brain/meninges and soft tissues. Interestingly, atypical distant metastases rarely occur in isolation and PET-PSMA usually demonstrates multiple simultaneous lesions. A higher Gleason score has also been reported to be associated with a greater likelihood of atypical metastases. When evaluating for recurrence, the atypical sites that need to be part of the routine imaging evaluation include anterior portions of the urethra, ureteral meatus (associated with poor prognosis), urinary bladder (distant from the anastomotic area), rectum, mesorectum and compromised retroperitoneal lymph nodes with preservation of the pelvic chains. This exhibit aims to review the locations and atypical patterns of manifestation of this neoplasm according to the different diagnostic modalities, focusing on multiparametric magnetic resonance imaging (MRI) and PET-PSMA.

GUEE-39

### **Clinical Utility of the Vesical Imaging-Reporting and Data System for Histological Variants and Non-Urothelial Bladder Cancer**

#### **TEACHING POINTS**

Histological variants (VUC) and non-urothelial bladder cancer (NUC) are relatively rare bladder cancer subtypes. These subtypes have a high malignant potential, aggressive advanced tumor features, and an increased risk of disease recurrence compared to pure urothelial bladder cancer (PUC). Accurate preoperative muscle invasion assessment and subsequent immediate surgical intervention are warranted in these patients. The usefulness of the Vesical Imaging-Reporting and Data System (VI-RADS) has been established for PUC by several previous studies. However, the validity of VI-RADS for VUC and NUC still has to be established. This exhibit aims to clarify MRI features of VUC and NUC with histological correlation, demonstrate VI-RADS scoring of VUC and NUC, and discuss the feasibility of biparametric MRI for VUC and NUC compared to PUC.

#### **TABLE OF CONTENTS/OUTLINE**

1, VI-RADS and histological classification of bladder cancer, 2, VUC with VI-RADS scoring (squamous differentiation, glandular differentiation, sarcomatoid variant, plasmacytoid variant, micropapillary variant, and nested variant), 3, NUC and other bladder malignant tumors with VI-RADS scoring (squamous cell carcinoma, adenocarcinoma, small cell carcinoma, lymphoma, urachal adenocarcinoma, and bladder metastasis), 4, Risk of underestimation of muscle invasion in VUC and NUC at biparametric MRI and its clinical implications, 5, Summary.

### Use of 3D Printed Models to Guide Surgical Resection of Renal Masses

#### Participants

Mujtaba Hameed, BS, BA, Canton, MI (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. 3D modeling and printing has been increasingly utilized in recent years to guide improvements and new applications for medical diagnosis and treatment planning. 2. 3D models provide a unique degree of tactile and visual information, especially anatomopathological information that would be particularly relevant in surgical planning of tumor resection (e.g., renal masses). 3. 3D modeling can improve the characterization and treatment of renal masses at multiple stages, including segmentation, modeling, printing, preoperative planning, patient consent and education, intraoperative reference, and ultimately surgical removal.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction characterizing the background of 3D modeling and printing in medical diagnosis and treatment, as well as review of relevant examples in the literature and within our institutional experience. 2. Description of initial case presentation and pertinent clinical workup. 3. Review of CT images, process of segmentation, and creation of 3D printed models utilizing clinical 3D visualization software. 4. Description of technique used in editing of 3D models via 3D printing software, including model video. 5. Creation of 3D model of the patient's left kidney (with mass demarcated), description of the utility of the modeling process both preoperative and intraoperatively.

### A Practical Guide for Evaluating Renal Masses: Didactic Case-Based Review

#### Participants

Fernanda Limonge, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Discuss and illustrate the cystic lesions of the kidney, emphasizing Bosniak v2019 classification. Describe the features of solid renal masses. Review the TNM system for renal cell carcinoma (RCC). Discuss the active surveillance of renal masses as an alternative to immediate treatment. Review the imaging findings in the context of post-treatment.

#### TABLE OF CONTENTS/OUTLINE

Cystic lesions- Illustrate the Bosniak classification- Tips on how to interpret a cystic renal mass  
Didactic approach for evaluating solid renal masses- Ball versus bean patterns- Clear cell likelihood score (ccLS)  
Describe and review renal masses and histological subtypes- Angiomyolipoma- Oncocytoma- Clear cell RCC- Papillary RCC- Chromophobe RCC- Collecting duct carcinoma- Medullary carcinoma- Urothelial carcinoma- Lymphoma- Metastasis  
Locoregional risk stratification- Tumor size- Axial location (anterior/posterior; endophytic/exophytic)- Longitudinal location (relationship with the polar lines)- Hilar proximity (vessels/collecting system)  
Distant disease assessment- Metastatic disease (bone, liver, lung, lymph nodes)- Synchronous urothelial carcinoma  
Active surveillance  
Post-treatment complications- Relapse- Hematoma- Urinoma- Arteriovenous complications

### Male Urethral Anatomy Revealed: Navigating Anatomical Variations and Complications

#### Participants

Helen Ribeiro De Oliveira, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The purposes of this exhibit is: Illustrate the main anatomical landmarks of the male urethra according to imaging methods  
Review the imaging modalities useful to evaluate the male urethra  
Propose a differential diagnosis of lesions according to localization and congenital or acquired, traumatic, infectious, and neoplastic etiologies and highlight the imaging features of each one  
To evaluate the postoperative findings and complications

#### TABLE OF CONTENTS/OUTLINE

- Introduction- Main anatomical landmarks- Imaging methods- Differential diagnosis and clues to diagnosis- Practical tips and Pitfalls- Normal postoperative findings and complications- Conclusion/Take home message

Printed on: 04/12/24

### Imaging and Management of Renovascular Hypertension: An In-Depth Review

#### Participants

Igor Oliveira, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Understand the pathophysiology of renovascular hypertension (RVH) and its clinical implications. Review the diseases that can lead to RVH, differential diagnosis, and treatment complications. Assess the role of various imaging modalities in diagnosing and assessing the severity of RVH. Discuss the importance of imaging in guiding interventional and surgical management of RVH. Evaluate the current evidence-based guidelines for the management of RVH.

#### TABLE OF CONTENTS/OUTLINE

I. Introduction to Renovascular Hypertension A. Pathophysiology of RVH B. Clinical presentation and implications II. Imaging Modalities for RVH A. Duplex ultrasonography B. Computed tomographic angiography (CTA) C. Magnetic resonance angiography (MRA) 1. Protocol and techniques 2. Contrast enhanced vs unenhanced MRA D. Digital subtraction angiography (DSA) E. Selecting of the appropriate imaging modality III. Etiology and Differential Diagnosis of RVH A. Diseases leading to RVH 1. Atherosclerosis 2. Fibromuscular dysplasia 3. Vasculitis 4. Other causes 5. particularities in the pediatric population B. Differential diagnosis and clinical challenges C. Algorithm approach on etiology definition on CTA and MRA IV. Interventional and Surgical Management A. Indications for intervention B. Percutaneous transluminal angioplasty (PTA) with or without stenting C. Surgical revascularization D. Nephrectomy in non-functioning kidneys E. Treatment complications V. Evidence-based Guidelines for RVH Management A. Role of imaging in treatment planning B. Recommendations for follow-up imaging VI. Conclusion A. Importance of imaging in the diagnosis and management of RVH B. Future directions in RVH imaging and management

### Practical Guideline for Adrenal Incidentalomas: A Case-Based Review

#### Participants

Iandra Pacheco, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Demonstrate a practical guideline with cases to help radiologists with the differential diagnosis of adrenal incidentalomas. Illustrate with didactic cases the European Society of Endocrinology Clinical Practice Guideline in collaboration with the European Network for the Study of Adrenal Tumors and the White Paper of the ACR Incidental Findings Committee. Review the typical image appearance of adrenal incidentalomas.

#### TABLE OF CONTENTS/OUTLINE

INTRODUCTION IMAGING PROTOCOL CT and MRI REVIEW INCIDENTALOMAS GUIDELINES White paper of ACR European Society of Endocrinology Clinical Practice DEMONSTRATE DIDACTIC CASES- Adenoma - Myelolipoma - Cyst or hemorrhage - Prior granulomatous infection or hematoma- Indeterminate adrenal incidentalomas (= 1 - < 4 cm with prior imaging) . With cancer history: new or enlarging mass. No cancer history: enlarging indeterminate adrenal masses- Indeterminate adrenal incidentalomas (= 1 - < 4 cm without prior imaging) . No cancer history: 1 - 2 cm 2 - 4 cm. Cancer history- With history of cancer (= 1 - < 4 cm). Without known metastatic disease or prior exam. Central necrosis

### How to Improve Surgical Management in Penile Cancer: An MRI and Pathology Correlation

#### Participants

Thiago Caetano, MD, Porto Alegre, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Describe the protocol and main sequences used in magnetic resonance imaging for optimal imaging of the penis. Comment on the main penile cancer subtypes based on MR imaging features and correlate with the pathological diagnosis. Discuss the importance of MR imaging in the staging of penile cancer, as well as its potential to aid in surgical management.

#### TABLE OF CONTENTS/OUTLINE

Introduction: Relevant anatomy of the penis  
Definition and main types of penile cancer  
Epidemiology and risk factors  
MR technique and discussion: Describe the main protocol and sequences used in penile cancer MR imaging  
Staging, imaging features and pathology correlation: Discuss the major changes in the 8th AJCC Cancer Staging Manual  
Demonstrate imaging features of the main types of penile cancer and correlate with pathology  
Conclusion: Discuss its usefulness in local staging and locoregional lymph nodal metastasis and comment on future directions

### The Female Urethra: A Practical Guide

#### Participants

Louise Cavalcanti, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Describe embryology and anatomy of the female urethra highlighting the anatomical landmarks for diagnoses and surgical planning. 2. The intention of this pictorial review is to describe the most important imaging methods and their contribution to the diagnosis of the main pathologies. 3. Discuss the main pathologies of the female urethra, through richly illustrated clinical cases, correlating with the symptoms and emphasizing the learning points.

#### TABLE OF CONTENTS/OUTLINE

a. Introduction. b. Embryology: Brief description of embryology. c. Anatomy: Important landmarks. d. Imaging methods: Sonography, MRI, Urethrography. e. Pathology: Discuss the most significant pathologies with key points and possible differential diagnoses. f. Cases: Illustrate the most frequent pathologies with clinical cases. g. Take home messages.

GUEE-48

### Penile Pathology Prep: A Quiz-based Review of Penile Ultrasound for Trainees

#### TEACHING POINTS

By the end of the presentation, the learner will be able to

1. Interpret the imaging and relevant anatomy for penile ultrasound.
2. Understand the role of ultrasound in diagnosis and management of penile pathologies and discern when to use ultrasound as an adjunct or in lieu of other modalities.
3. Describe the ultrasound findings for penile pathologies focusing on emergent and commonly encountered cases.
4. Identify normal and abnormal ultrasound Doppler flow parameters in various conditions that may aid in diagnosis.
5. Raise awareness of the clinical utility of penile ultrasound in certain penile pathologies given the safety profile and wide accessibility of this modality.

Target Audience: Trainees.

#### TABLE OF CONTENTS/OUTLINE

We present a case-based quiz of various penile pathologies as seen on ultrasound. Each case will be associated with pertinent symptoms and unlabeled ultrasound images. The diagnosis will be revealed, along with description of the imaging findings followed by relevant educational content for each diagnosis such as: defining relevant pathophysiology, explaining key findings/associations, the clinical significance, and the uses/limitations of ultrasound related to that diagnosis. An introductory overview of normal anatomy and Doppler parameters will also be provided. Diagnoses include:

1. Erectile dysfunction - Arteriogenic
2. Erectile dysfunction - Venogenic
3. Priapism - High-flow
4. Priapism - Low-flow
5. Peyronie's disease
6. Mondor's disease
7. Penile fracture
8. Penis infection/abscess
9. Penile mass - Squamous cell carcinoma
10. Penile foreign body

**Now Streaming: Review of Male Urethral Imaging with Focus on MRI**

### Participants

Milana Flusberg, MD, New York, NY (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Proper technique and understanding of normal male urethral anatomy on retrograde urethrography aids in interpretation of scans for trauma and strictures. Differential diagnosis of periurethral cysts in men includes utricle, Mullerian duct cyst, Cowper's duct/gland cyst, diverticulum, and collections (urinoma/abscess). MRI is used for local staging of male urethral cancer. Radiologists should be familiar with the appearance of urethral procedures including artificial sphincter and Urolift.

### TABLE OF CONTENTS/OUTLINE

Performance of retrograde urethrography; Normal male urethral anatomy and normal variants; Urethral strictures: inflammatory, post-traumatic, neoplastic; Urethral trauma: mechanisms, grading, associated findings; Peri-urethral cysts and collections: utricle, Mullerian duct cyst, Cowper's duct/gland cyst, diverticulum, urinoma, abscess; Urethral cancer: background, imaging appearance, staging; Post-procedural urethra

GUEE-5

### Overview of Tumor Thrombus in Renal Cell Carcinoma

#### TEACHING POINTS

Renal cell carcinoma (RCC) invades into the vasculature in approximately 10% of patients. Tumor thrombus is most commonly associated with clear cell RCC but it can also occur due to other entities, such as papillary RCC. This educational exhibit will: (1) Review the incidence, prognosis, and classification system of tumor thrombus in RCC. (2) Review the imaging features of tumor thrombus. (3) Discuss the role of imaging in guiding surgical treatment of tumor thrombus.

#### TABLE OF CONTENTS/OUTLINE

(1) Incidence, clinical presentation, and prognosis of tumor thrombus in RCC. (2) Review the T staging of RCC with tumor thrombus according to the 2010 AJCC clinical staging and Mayo Clinic RCC tumor thrombus level classification system. (3) CT and MRI imaging features of tumor thrombus with case-based pictorial review. (4) Treatment of RCC with tumor thrombus. (5) Potential surgical approach for varying levels of tumor thrombus and post-operative imaging. (6) Summary of teaching points.

### Genitourinary Tract Infections and Inflammatory Conditions: Spectrum of Imaging Features, Pitfalls and Mimics

#### Participants

Ayman H. Gaballah, MD, FRCR, Columbia, MO (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Illustrate the etiology, pathogenesis, and clinical presentation of genitourinary (GU) tract infections 2. Review the appropriate imaging workup and imaging features of GU infections 3. Discuss mimics and pitfalls of GU infections Highlight management options

#### TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Anatomic illustrations 3. Classification of genitourinary tract infections • Urinary tract infections: i. Upper urinary tract (kidney and ureter): 1. Focal/diffuse pyelonephritis 2. Emphysematous pyelitis/pyelonephritis 3. Renal/perinephric abscesses 4. Hydronephrosis and pyonephrosis 5. Xanthogranulomatous pyelonephritis 6. Parasitic infection (hydatid infection) 7. Other infections such as T.B 8. Ureteritis cystica ii. Lower urinary tract (urinary bladder and urethra): 1. Cystitis 2. Emphysematous cystitis 3. Diverticulitis of urinary bladder/urethra 4. Parasitic infection (Schistosomiasis) 5. Fungal infections (actinomycosis, candidiasis) 6. Cystitis cystica 7. Radiation and chemotherapy cystitis 8. iii. Urachal Inflammatory and Infectious Conditions • Genital infections: i. Female genital system: 1. Pelvic inflammatory disease (e.g., cervicitis, endometritis, pyosalpinx, etc.) 2. Tubo-ovarian abscess 3. Pelvic actinomycosis 4. Necrotizing fasciitis 5. Other rare infections ii. Male genital system: 1. Infectious and granulomatous prostatitis 2. Prostatic abscess 3. Epididymo-orchitis and abscess 4. Scrotal wall cellulitis, abscess 5. Fournier gangrene iii. Sexually transmitted infections 4. Predisposing factors and complications of GU infection 5. Imaging features and case presentation 6. Mimics and pitfalls 7. Updates on management options 8. Conclusion

GUEE-51

### Urologic Prosthetics: An Imaging Review of Short-term and Long-term Complications

#### Participants

Mary Woodruff, DO, (*Presenter*) Nothing to Disclose

Mary Woodruff, DO, (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Urologic prosthetics are commonly encountered in everyday practice. As with any surgical procedure and implantable device, there are complications, both short-term and longer term. With contribution from the urology team, we have selected a case collection to highlight these complications with both imaging findings and gross anatomic photos. The addition of gross anatomic and surgical photos complement the imaging findings and provide a better understanding of the clinical perspective. In reviewing these cases, the radiologist may better recognize and accurately diagnose complications related to urologic prosthetics.

#### TABLE OF CONTENTS/OUTLINE

A review of the urologic prosthetics and implant components. Normal orthotopic positioning of urologic prosthetics anatomically and in imaging. Selection of cases with imaging and pictorial findings Selected cases include: Urethral cuff erosion of artificial urinary sphincter. Postoperative pelvic/scrotal hematoma. Scrotal abscess. Penile prosthesis scrotal pump erosion. Herniation of prosthesis reservoir into the inguinal canal. Reservoir leak. Fracture of malleable penile prosthesis.

Printed on: 04/12/24

GUEE-52

### How We Do It: A Diagnostic Approach to Avoid Overtreatment in Management of Centrally Located Renal Masses

#### Participants

Layra Leao, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- Review imaging features of the differential diagnosis of centrally located renal masses.- Illustrate diagnostic clues related to common and uncommon mimickers of upper tract urothelial carcinoma.- Highlight the importance of the tumor board approach in managing challenging cases as a platform for care coordination and a tool to optimize decision-making.

#### TABLE OF CONTENTS/OUTLINE

Imaging diagnostic differentiation of upper tract urothelial carcinomas (UTUC) and other centrally located renal tumors can be challenging; management patterns vary considerably due to the different oncologic behavior of these lesions. Misinterpretation in imaging studies could lead to unnecessary aggressive approaches. Some radiological features can help to predict the histology or pathologic aggressiveness of renal tumors, providing optimal and safe management. The presence of an infiltrative or nodular expansile pattern of growth is the first step in the differentiation of conditions that may simulate UTUC. Benign and malignant mimickers include renal cell carcinomas, metastasis, lymphoma, pseudotumors, and infection. Standardization of imaging protocols and reporting can help to differentiate these entities. The multidisciplinary discussion of challenging cases in the tumor board meetings should be included in the medical practice to identify interpretation mistakes and avoid unnecessary patient damage.

GUEE-54

### Female Lower Genitourinary Tract: Imaging Evaluation of the Most Common Alterations of Interest in Female Urology

#### Participants

Alice Schuch, MD, Porto Alegre, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

? Identify the anatomical landmarks of the female pelvic floor and perineum which can guide the radiologist to the correct diagnosis.? Point out the best imaging method for the diagnosis.? Review imaging features of the most common abnormalities of the female lower genitourinary tract.? List complicating features that may be seen by imaging and some rarer lesions that may be included in the differential diagnosis.

#### TABLE OF CONTENTS/OUTLINE

Imaging methods Retrograde urethrocytography and computed tomography are limited imaging methods for the evaluation of female lower genitourinary changes. Ultrasound plays a role in more specific indications. However, magnetic resonance imaging is usually the method of choice and provides the best identification of the anatomical structures for the diagnosis. Imaging evaluation common alterations will be characterized especially on MRI, as cystic lesions, including Bartholin's gland cyst and urethral diverticulum, as well as prolapses, such as urethral caruncle. Some complications of the common lesions will be included, in addition to tumors or tumor-like lesions, to provide the radiologist ability to perform differential diagnosis. Conclusion MRI is an ideal imaging method to evaluate female lower genitourinary changes, and it is essential that radiologists know how to detect and characterize these lesions, since, even when benign, they can be quite symptomatic.

GUEE-55

### Pitfalls of Renal Transplant Imaging

#### Participants

Reece Goiffon, MD, PhD, Boston, MA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

TEACHING POINTS1. Discuss the relevant anatomic/imaging considerations, criteria, and imaging techniques for pre-renal donor work-up.2. Become familiar with the normal anatomic features, including location, surgical technique, and relevant hilar anastomoses following renal transplantation as well as the normal grayscale and color/power Doppler imaging features of a renal allograft.3. Review common pitfalls encountered both during pre-renal transplantation work-up and during evaluation of the renal allograft post-transplantation with particular attention to accurate diagnosis of post-transplant complications.4. Highlight the important roles of both computed tomography (CT) and ultrasound (US) in pre- and post-renal transplant evaluation.

#### TABLE OF CONTENTS/OUTLINE

TABLE OF CONTENTS/OUTLINEWe present a comprehensive review of normal pre- and post-renal transplant imaging as well as a review of potential pitfalls in both the pre-transplant imaging work-up and post-transplant allograft evaluation.Pre-renal transplant pitfalls may include:• Incidental arteriopathies (e.g. fibromuscular dysplasia)• Aberrant vascular anatomy• Incidental primary renal neoplasms• Other incidental malignancyPost-renal transplant pitfalls may include:• Postoperative edema at the arterial anastomosis• Renal vein thrombosis with diastolic flow reversal in the transplant renal artery• Postoperative fluid collections (seroma vs hematoma vs urinoma vs lymphocele)• Allograft malignancy

## Abstract Archives of the RSNA, 2023

GUEE-56

### Imaging of Upper Urinary Tract Neoplasms

#### Participants

Miriam Gallego Casals, MD, Sabadell, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Upper urinary tract urothelial carcinoma (UTUC) stands for only 5-10% of all urinary tract tumors and is mainly represented by transitional cell carcinoma (TCC, >95%). TCC usually develops in males around 65 and is related with many chemical compounds and urinary stasis (that is why it is more common in the bladder rather than on the ureter). Haematuria is the most frequent symptom, although non-specific, and urine cytology is usually negative. Commonly multifocal, with a high incidence of early recurrence, requires rigorous urothelial surveillance. CT urography has largely replaced any other imaging techniques, using contrast media to outline the collecting system. As UTUC can be challenging to identify on routine imaging, we use a series of cases to illustrate the most common patterns and signs that help us identify these tumors: a soft tissue density filling defect that enhances lightly is the most typical finding. Other types such as the non-papillary is infiltrative and harder to detect, often invading beyond the mucosa at the time of diagnosis. In the renal pelvis, these tumors do not change renal contours even when large. Instead, small ureteral tumors are more likely to obstruct the kidney and cause renal malfunction. We explain through several cases how to distinguish UTUC from other neoplasms or benign processes, dividing these UTUC mimickers in two groups: - Filling defects pitfalls: clots, calculi, mycetomas, etc- Urothelial thickenings: lymphoma, tuberculosis, schistosomiasis, etc

#### TABLE OF CONTENTS/OUTLINE

Brief description of epidemiologic and pathologic characteristics of the tumors of the upper urinary tract. Discussion of patterns and signs that indicate their presence, and some pitfalls.

Printed on: 04/12/24

GUEE-58

### **Urothelial-phase CT Urography for Diagnosing Urothelial Tumors: A Paradigm Shift for Investigating Hematuria**

#### **Participants**

Nigel Cowan, PhD, FRCR, Cosham, United Kingdom (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

Urothelial-phase CT urography (25-50 s post contrast administration) is considered a paradigm shift in the development of CT urography for diagnosing urothelial tumors and investigating hematuria. Urothelial tumours are hypervascular and display early hyperenhancement following contrast administration. Familiarity with the signs of urothelial tumours on urothelial-phase CT enables radiologists to make the diagnosis on both GU and non-GU studies. Urothelial-phase compared with excretory-phase CT urography has many advantages. These include shorter examination time, increased patient throughput, no need for complicated patient related manoeuvres to promote full opacification, improved tumour visualisation in cases of hydronephrosis, hydroureter and contrast layering and reduced false positive diagnoses. The diagnostic accuracy of urothelial-phase imaging for urothelial tumors is high. Diagnosis of urothelial tumors using urothelial-phase CT urography makes the excretory-phase redundant.

#### **TABLE OF CONTENTS/OUTLINE**

A brief 25 year history of CT urography for investigating hematuria. The evolution of CT urography techniques. A comparison of urothelial-phase with excretory-phase CT urography for diagnosing urothelial tumors. Definition description of the techniques. Advantages and disadvantages. An atlas of urothelial tumors showing the signs of urothelial tumours on the urothelial-phase and examples of true positive, false negative and false positive results. Development of a confidence scoring system based on urothelial-phase imaging findings to improve report clarification and direct management: straight to surgery, ureteroscopy +/- biopsy or follow-up. Conclusion References

### New Method for Differentiating Stents from Adjacent Urinary Stone Using Dual Energy Spectral CT with Advanced Post-processing

#### TEACHING POINTS

1) To illustrate the limitations of conventional CT imaging in differentiating urinary stones and stents. 2) To illustrate novel techniques and approaches using dual energy spectral CT (DEsCT) to differentiate urinary stones from stents. 3) To demonstrate strategies of selecting appropriate image types with advanced post-processing.

#### TABLE OF CONTENTS/OUTLINE

1) Conventional CT and its limitations • Fixed tube voltage of 120kVp with mA modulation and helical scanning mode. • CT value alone lacks the power to differentiate stones and stents. 2) Advanced CT imaging technologies • Dual-energy CT (80/140kVp) with preset dose levels and Adaptive Statistical Iterative Reconstruction-V (ASiR-V). • Different energy levels, material decomposition (MD) images and effective atomic number (Zeff). 3) Optimal strategies using these technologies • Select appropriate MD basis material pairs such as Calcium/Iodine, Fat/ Calcium, Fat/ Iodine, or Iodine/HAP. • Apply Zeff, Calcium/Iodine and CT value at 70 keV to better differentiate urinary stones and stents.

GUEE-6

### The Spectrum of Renal Angiomyolipoma with Radiologic Pathologic Correlation

#### Participants

Jamie Marko, MD, Bethesda, MD (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Renal angiomyolipoma (AML) is a benign mesenchymal neoplasm composed of an admixture of thick-walled dysmorphic blood vessels, smooth muscle cells and adipose tissue. Angiomyolipomas belong to the perivascular epithelioid cell (PEComa) tumor family. 2. Variants of angiomyolipoma include the classic AML, fat-poor AML, epithelioid AML, and AML with epithelial cysts. Angiomyolipoma may occur sporadically or with tuberous sclerosis. 3. The classic variant, which accounts for more than 90% of cases, is confidently diagnosed at imaging by detecting macroscopic fat. Fat is hyperechoic at ultrasound. It has an attenuation  $< -20$  Hounsfield Units at CT and matches the appearance of subcutaneous fat. Fat is T1 hyperintense with loss of signal with fat suppression at MRI. Small areas of fat are detected with chemical shift imaging. 4. Most angiomyolipomas have a benign clinical course. The most frequent complication is retroperitoneal hemorrhage, most common with tumors  $> 4$  cm. Less commonly, angiomyolipoma may invade the renal vein and inferior vena cava. Epithelioid angiomyolipoma has malignant potential and may recur and metastasize.

#### TABLE OF CONTENTS/OUTLINE

1. Review the gross, histologic, and immunohistochemical pathologic features of renal AML, including the uncommon variants. 2. Describe the multimodality imaging features of renal AML, including the uncommon variants. 3. Describe the pathologic basis of the imaging findings associated with each variant. 4. Illustrate the spectrum of renal AML including its variants. Will include important complications including retroperitoneal hemorrhage and vascular involvement.

GUEE-60

### Prostate Imaging for Recurrent Reporting (PI-RR): A User Guide

#### Participants

Anup Shetty, MD, Saint Louis, MO (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The Prostate imaging for Recurrence Reporting (PI-RR) system was introduced in 2021 to create standards for reporting pelvic MRI after radical prostatectomy or radiation for treatment of prostate cancer. Using a similar nomenclature as PI-RADS v2.1, PI-RR uses established knowledge of MRI features of recurrent prostate cancer and codifies it systematically to be accessible to prostate MR readers of all experience levels. This exhibit is on the RadioGraphics Needs List under Genitourinary Imaging: Pictorial on Guidelines and Reporting Systems. This exhibit will: 1) Discuss the rationale for PI-RR 2) Describe technical standards and reporting guidelines 3) Illustrate the use of PI-RR to assess for recurrent prostate cancer after radical prostatectomy and radiation therapy through a series of instructive cases 4) Describe pitfalls of the current version, including non-applicability for focal therapies 5) Detail areas for future development of PI-RR

#### TABLE OF CONTENTS/OUTLINE

\* Background: Why PI-RR, including the benefits of standardizing post-treatment prostate MRI\* Technical Standards: Requirements, extras (subtraction imaging, 3D volumetric T2 for MPR)\* Reporting: Component scores in the PI-RR system shown in a pictorial format\* Case Examples: Prostatectomy, external beam radiation, brachytherapy\* Pitfalls: Definitions of PI-RR 4/5 for post-prostatectomy based on laterality; susceptibility artifact from brachytherapy seeds and surgical clips; residual prostate tissue after prostatectomy\* Future Development: Focal therapy (cryoablation, HIFU, etc.); Integrating PSMA-PET/CT

GUEE-61

**Don't Stress, Just Study With Care, Renovascular Hypertension Will Be Conquered, in Your Test**

### TEACHING POINTS

1. Renovascular hypertension (RH) is the most common and potentially reversible cause of secondary hypertension. However, renal artery stenosis is often found as an incidental finding on routine examinations. Thus, knowledge of the clinical aspects of this pathology is necessary to increase the pre-test probability and the different diagnostic imaging modalities provide subsidies for better therapeutic decisions. 2. Revisit the multiple imaging methods used in the diagnosis of RH (Duplex Doppler Ultrasonography, CT Angiography, MRI Angiography and Renography): protocols, advantages, limitations and the main causes of RH as well as its imaging aspects. 3. Knowledge of invasive treatment options (Percutaneous transluminal renal angioplasty and surgery) and their respective technical aspects, indications and procedural complications.

### TABLE OF CONTENTS/OUTLINE

1. Overview of Renovascular Hypertension (RH) A. Epidemiology B. Physiopathology C. Causes 2. Indications for Testing a Patient for RH: A. Clinical Clues to Enhance the Pre-Test Probability B. Renal Artery Stenosis as an Incidental finding 3. Non Invasive Diagnostic Testing for RH and Expected Findings: A. Duplex Doppler Ultrasonography B. CT Angiography C. MRI Angiography D. Renography E. Contrast-Related Kidney Injury 4. Determining the appropriate time to combine different diagnostic methods 5. Reporting of RH Patient Examination: A. Anatomical Variants B. Most Common Lesion Aspects C. Atherosclerosis D. Fibromuscular Dysplasia E. Complex Lesions 6. Overview of RH Management: A. Percutaneous Transluminal Renal Angioplasty B. Surgery C. Procedural Complications

### Prostate MRI Pitfalls and Confounders: A Case-based Approach

#### Participants

Eduardo Thadeu De Oliveira Correia, MD, PhD, Cleveland, OH (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Prostate MRI is widely used for the detection and characterization of prostate cancer. Nonetheless, many conditions can mimic prostate cancer lesions, leading to false positive MRI results. This educational exhibit employs a case-based approach to explore the pitfalls and confounders that arise during the assessment of prostate MRI and guide readers on how to distinguish these benign mimickers from malignant lesions.

#### TABLE OF CONTENTS/OUTLINE

1. A prostate MRI with too many findings a. Case 1: prostate cancer in a MRI done within 4 weeks of prostate biopsy b. Teaching points 2. A must-known confounder a. Case 2: extruded benign prostatic hyperplasia b. Teaching points 3. The importance of clinical history a. Case 3: granulomatous prostatitis b. Teaching points 4. The role of Delayed Contrast Enhancement a. Case 4: prostate abscess b. Teaching points 5. An extremely rare case: know the boundaries! a. Case 5: malakoplakia b. Teaching points 6. Prostate MRI is more than just PI-RADS: check the surroundings! a. Case 6: PI-RADS 5 lesion, ureteral stone and ileo-ileal intussusception b. Teaching points

GUEE-63

### Factors that Influence Prostate Cancer Visibility on Multiparametric MRI

#### Participants

Eduardo Thadeu De Oliveira Correia, MD, PhD, Cleveland, OH (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Multiparametric MRI (mpMRI) is endorsed by guidelines worldwide as a fundamental tool for the detection and characterization of prostate cancer. Nonetheless, still, 10-20% of patients with clinically significant prostate cancer have a false negative result in mpMRI. In this exhibit, we will review factors that can decrease lesion conspicuity and reduce the detectability of malignant lesions.

#### TABLE OF CONTENTS/OUTLINE

1. What factors can influence Prostate Cancer visibility on mpMRI? a. Histology b. Background Signal Changes c. Image quality 2. Histological determinants of lesion visibility on mpMRI a. Tumor volume b. Gleason/ISUP score c. Epithelium, stroma, and lumen fraction 3. The effect of background signal changes of the peripheral zone on lesion visibility a. Diffusely hypointense peripheral zone on T2WI b. Heterogenous hypointensity in the peripheral zone on T2WI c. Background signal changes in DWI and DCE d. Associated clinical factors and conditions 4. Benign mimickers of prostate cancer on mpMRI a. Prostatitis b. BPH c. Adenosis d. Necrosis e. Focal atrophy 5. Image quality: patient and scanner factors that can decrease lesion conspicuity

GUEE-64

### Update on Hereditary Renal Mass Syndromes: Genetics, Renal, and Extrarenal Imaging Findings

#### Participants

Acacia Yoon, Stanford, CA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Review hereditary renal mass syndromes in the context of the 2022 World Health Organization update, which has a stronger emphasis on genetic alterations. 2. Review extrarenal findings associated with each syndromes. A diagnostic approach will be proposed. 3. Understand the role of the radiologist in diagnosis and management. Genetic testing may not be necessary or even specific for certain syndromes; thus, radiologists may be the first to suggest the diagnosis.

#### TABLE OF CONTENTS/OUTLINE

1. Hereditary renal mass syndromes with multimodality imaging correlates: genetic mutation, inheritance pattern, diagnostic criteria, renal mass subtype(s), extrarenal findings, and management: Birt-Hogg-Dubé, von Hippel-Lindau, tuberous sclerosis complex, succinate dehydrogenase deficiency, fumarate hydratase deficiency, hereditary papillary renal cell carcinoma, PTEN hamartoma syndrome, BAP1 tumor predisposition syndrome, chromosome 3 translocation. 2. Role of the radiologist in diagnosis and management. 3. Diagnostic approach for the radiologist.

GUEE-65

### Abnormal Testicular Waveforms: What Do They Mean

#### Participants

Yashant Aswani, MD, Iowa City, IA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To identify typical and atypical waveforms of testicular torsion 2. To understand and describe the difference between partial and complete testicular torsion 3. To describe the features of torsion-detorsion syndrome 4. To understand the mimics of testicular torsion

#### TABLE OF CONTENTS/OUTLINE

1. Normal testicular blood supply with normal spectral Doppler explained with image and line diagram 2. To illustrate testicular torsion with various examples for clear understanding and interpretation 3. To illustrate examples of partial torsion with various spectral Doppler variations including amplitude of the waveforms, parvus tardus pattern, monophasic waveform and reversal of diastolic flow 4. To illustrate torsion-detorsion with multiple examples. Spermatic knot sign will also be illustrated in detail with images and cine clips 5. To illustrate mimics of testicular torsion such as patients with vasculitis and drug-induced spectral Doppler abnormalities with histopathology correlation

GUEE-66

### Magnetic Resonance Imaging for Non-Oncologic Penile Pathology: It's Not that Hard

#### Participants

Daniel Corominas, MD, Barcelona, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The use of Magnetic Resonance Imaging is widespread for oncological pathology of the penis, but its use is of much importance in non-oncological pathology such as Peyronie's disease, penile fracture, and priapism. Intracavernosal drug injection is an option for the treatment of erectile dysfunction, but it is also important for conducting erection imaging studies, so the radiologist must be aware of its method of administration, possible complications, and how to prevent and treat them. Treatment of non-oncological diseases of the penis using penile prostheses has expanded recently. MRI is the method of choice for evaluating their proper functioning, as it provides high-resolution spatial images and it is key to helping urologists determine the need for replacements and repairs.

#### TABLE OF CONTENTS/OUTLINE

1) MRI protocol for non-oncological pathology of the penis. 2) Intracavernosal drug injection: a basic guide for radiologists. 3) Penile anatomy on MRI. 4) Non-oncological pathology of the penis. 4.1) Erectile dysfunction. 4.2) Peyronie's disease. 4.3) Priapism. 4.4) Penile fracture. 5) Penile prosthesis. 5.1) Indications and types of surgery. 5.2) Types of penile prostheses and their components. 5.3) Imaging evaluation of the penile prosthesis: importance of MRI. 5.4) Evaluation of the penile prosthesis complications. 5.4.1) Cylinders and shafts complications. 5.4.2) Glans mobility alterations. 5.4.3) Reservoir malposition. 5.4.4) Circuit rupture and prosthesis malfunction. 6) Conclusions and future directions.

GUEE-67

### Urethral Pathologies in Male Patients: Evaluation with Magnetic Resonance Urethrography - A Pictorial Essay

#### Participants

Kamila Schiavini, MD, SAO LUIS, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

TP1 Magnetic resonance imaging (MRI) is a promising imaging modality for the comprehensive evaluation of urethral pathologies, providing high resolution and multiplanar imaging capabilities without the need for radiation or invasive procedures. TP2 MRI can accurately identify and assess the extent of anterior and posterior urethral strictures, as well as fistulous tracts with adjacent organs, and can aid in the evaluation of postoperative complications. TP3 Urethral strictures can result from traumatic or inflammatory causes and can lead to obstructive uropathy. Posterior urethral injuries commonly result from pelvic trauma, while anterior urethral strictures can result from instrumentation or inflammation. TP4 MRI provides a non-invasive and radiation-free alternative to traditional imaging techniques, such as urethrocytography, which can be limited by poor visualization of urethral strictures and invasiveness. TP5 MRI can also be used to evaluate other pathologies of the male genitourinary tract, including prostate cancer and penile cancer.

#### TABLE OF CONTENTS/OUTLINE

I. Introduction A. Overview of traditional urethral imaging techniques B. Advantages of MRI for comprehensive evaluation of urethral pathologies II. Methodology A. Patient selection and imaging protocol B. MRI findings in anterior and posterior urethral strictures and fistulas III. Discussion A. Traumatic and inflammatory causes of urethral strictures B. MRI evaluation of postoperative complications C. Comparison of MRI with traditional urethral imaging techniques IV. Conclusion A. Summary of the advantages of MRI in the evaluation of urethral pathologies B. Potential implications for clinical practice and patient outcomes

### Unveiling the Masked Masqueraders: Navigating Anatomical Variations and Adenocarcinoma Mimickers in Prostate Multiparametric MRI

#### Participants

Enis Yilmaz, MD, Bethesda, MD (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Multiparametric MRI (mpMRI) is the imaging modality of choice in assessment of prostate adenocarcinoma (PCa). However, various conditions involving the prostate might resemble PCa due to their imaging characteristics and these patients might undergo unnecessary biopsy procedures. Our aim is to review some of the entities that could be a pitfall for readers and outline their key imaging findings to differentiate them from PCa.

#### TABLE OF CONTENTS/OUTLINE

(1) Overview of prostate anatomy and typical imaging characteristics of PCa. (a) Central Zone (b) Anterior fibromuscular stroma (c) Bulbourethral glands (Cowper's glands) (2) Conditions that may mimic PCa and their appearance at mpMRI: (a) Acute and chronic bacterial prostatitis (b) Tuberculous prostatitis (c) Granulomatous prostatitis (d) Prostate abscess (e) Intraprostatic calcification (f) Mucinous neoplasm of prostate (g) Stromal Tumor of Uncertain Malignant Potential of the Prostate (STUMP) (h) Biopsy related hemorrhage (i) Post-focal treatment prostate (j) Exophytic BPH nodule (k) Small cell carcinoma of the prostate (3) Hints that could be helpful in differentiation of PCa and PCa mimickers (4) Summary of findings

GUEE-69

### Practical Approach to Primary Retroperitoneal Tumors: Tips for An Imaging Diagnosis

#### Participants

Shota Kondo, Hiroshima, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

a. For a differential imaging diagnosis of primary retroperitoneal tumors, a focus on the principal tumor features, e.g. fat, cystic components, a mucinous matrix, and necrosis is important. b. On images of well-differentiated liposarcomas the fat component predominates. In other histological types of liposarcomas it is not large and it may not be identifiable. c. High signal intensity on T2-weighted MRI scans with delayed contrast enhancement indicates a myxoid stroma that may be, for example, myxoid liposarcoma, schwannoma, or myxofibrosarcoma. d. Retroperitoneal tumors with a predominantly cystic component commonly include benign lesions such as lymphatic malformations, tail gut cysts, and ancient schwannomas. e. Common primary retroperitoneal malignancies such as leiomyosarcoma, undifferentiated pleomorphic sarcoma, and liposarcoma often have a necrotic appearance, suggesting a poor prognosis.

#### TABLE OF CONTENTS/OUTLINE

1. Retroperitoneal anatomy 2. Diagnostic algorithm and clinical management of primary retroperitoneal tumors 3. Imaging findings of various primary retroperitoneal tumors 4. Utility of 18F-FDG-PET/CT for diagnosing primary retroperitoneal tumors 5. Tips for avoiding diagnostic pitfalls and for clinical management

GUEE-7

### Multiparametric MR Urethrography (MRU): Dynamic Comprehensive Evaluation of the Male Urethra

#### Participants

Alice Schuch, MD, Porto Alegre, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Describe the optimal technique for a comprehensive MRU protocol including the instillation of sterile urethral jelly, multiparametric sequences, and dynamic maneuvers. Identification of normal urethral anatomy on MRU including evaluation of periurethral compartments in both static and dynamic images. Describe how each component of MRU is crucial for the evaluation of common, uncommon, and rare urethral pathology.

#### TABLE OF CONTENTS/OUTLINE

MRU has revolutionized the imaging of the male urethra. Patient preparation: in the supine position and the penis in the anatomic position with an injection of lidocaine gel for urethral distension. Imaging protocol and interpretation high-spatial resolution, small FOV, multiplanar T2WI, to provide the best anatomic overview. T1WI is useful for assessing hemorrhage and vascular thrombosis, while the DCE is useful in evaluating masses and differentiation between fibrosis and inflammation. DWI assists in the depiction of a urethral mass and skips lesions. Dynamic maneuvers, with Valsalva and urination, are also performed to assess the sphincters and pelvic floor. Clinical applications: value of MRU in multiple specific clinical indications will be discussed, including urethral strictures, diverticula, fistulas, trauma, cancer staging, infections/inflammation. Conclusion MRU is an ideal one-stop replacement for traditional fluoroscopic urethrography, with growing data in the literature in recent years.

### The 'New' 2022 World Health Organization (WHO) Classification of Adrenal Cortical Tumors: A Primer for Radiologists

#### Participants

Nuray Bakal, MD, San Antonio, TX (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Familiarize audience with 'new' 2022 World Health Organization (WHO) classification of adrenal cortical tumors (ACTs) Describe the pathology, genetics, molecular biology natural history of ACTs. Review imaging spectrum of benign malignant ACTs discuss the role of imaging in the screening, diagnosis, staging, and surveillance Discuss the potential diagnostic management implications of the current classification

#### TABLE OF CONTENTS/OUTLINE

Introduction The spectrum of adrenal cortical lesions Updates in WHO classification Pathology, Genetics Molecular Biology Genetic Syndromes: Li-Fraumeni, Lynch, MEN1. Imaging Techniques: US, CT, MRI PET-CT Congenital adrenal hyperplasia Adrenocortical nodular disease: Sporadic nodular, Bilateral micronodular, Bilateral macronodular Cortical adenomas: typical/atypical imaging findings Primary aldosteronism: HISTALDO classification imaging findings Cortisol-producing adenomas Cortical carcinoma: imaging spectrum Adrenal Myelolipoma Adrenal rests, adrenal Cysts. Rare tumors: melanoma, adenomatoid tumors sex cord-stromal tumors Role of imaging in screening surveillance of ACTs other lesions Diagnostic Management Implications of 2022 WHO Classification Imaging biomarkers. Conclusion The new 2022 WHO classification of ACTs highlights the importance of molecular genetic features in characterizing classifying ACTs and updated terminology for select pathologies. The pivotal role of CT/MRI/PET-CT imaging features in the diagnosis, treatment surveillance of cortical tumors is discussed. Familiarity of radiologists with new ACTs subtypes associated imaging findings helps to accurately identify and characterize ACTs.

### **Pictorial Review of the Diagnosis of Muscle-Invasive Bladder Cancer Using Vesical Imaging-Reporting and Data System (VI-RADS)**

#### **Participants**

Mitsuru Takeuchi, MD, PhD, Nagoya, Japan (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

The Vesical Imaging-Reporting and Data System (VI-RADS) is a standard MRI imaging and diagnostic method for muscle-invasive bladder cancer that was published in 2018. As a member of the VI-RADS committee, I was involved in the development of the diagnostic criteria. Several studies have demonstrated that VI-RADS has excellent sensitivity and specificity for muscle-invasive bladder cancer. However, reading VI-RADS requires some expertise, and there are various pitfalls. Therefore, this exhibition will first explain the basic MRI reading procedure for bladder cancer. Then, based on my experience of reviewing MRI images of approximately 300 cases of bladder cancer with trainees, we will discuss the causes of misdiagnosis and precautions to prevent misdiagnosis by presenting case images. Furthermore, limitations of the current VI-RADS diagnostic criteria will also be addressed.

#### **TABLE OF CONTENTS/OUTLINE**

1) Basic procedure for reading bladder MRI 1-a) Role of multiparametric MRI 1-b) Imaging findings of tumor stalk and thickened submucosa 1-c) Categorizing bladder cancer according to VI-RADS diagnostic criteria 2) Teaching file, misdiagnosed cases by trainee, consideration of the cause and suggestions for improvement 2-a) Problems with the patient's condition or imaging 2-b) Misdiagnosis due to insufficient reading skill 2-c) Misdiagnosed cases caused by the limitation of current VI-RADS diagnostic criteria 2-d) Difficult to diagnose bladder cancer with atypical histology and imaging findings

### Visualizing Dynamic Mechanisms of Lower Urinary Tract Symptoms (LUTS): Usefulness of Urodynamic 4D-CT

#### TEACHING POINTS

- Providing required items for LUTS surgery • CT Scanning technique for LUTS • Benefits of 4D-CT scanning for urination evaluation
- Morphological Evaluation before after surgery

#### TABLE OF CONTENTS/OUTLINE

A. Morphological and functional evaluations are important. B. Morphological evaluation is required for bladder, urethra, prostate. Scanning is performed in a semi-seated position to reproduce a physiological urination state. 4D-CT uses intermittent scanning to reduce radiation exposure from the beginning to the end of urination. C. "Using 4D-CT can evaluate morphological changes in the bladder, prostate, and urethra and the location and timing of bladder outlet obstruction that occurs at the start of urinary flow, and urodynamic information." D. Analysis of the volume data enables pre and post operative comparisons. Evaluation using CT can show the effectiveness of quantitative evaluation. Outline "4D-CT is particularly effective in judging the applicability of operation and evaluating kinetic and morphological data in cases of prostate problems without morphological changes and dysuria due to a small decrease in uroflow intensity due to insufficient strength of the urethral sphincter muscle." There are cases in which surgery was indicated for patients whose anatomical structure deviated from the ideal. 4D-CT can evaluate morphology and function. So, it is useful for surgical indication and surgical planning.

### The Role of Imaging Techniques in Penile Lesions: When and How to Use Them

#### Participants

Sandra Baleato Gonzalez, PhD, Santiago de Compostela, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To illustrate normal US and MR penile anatomy. 2. To review the spectrum of traumatic and atraumatic lesions involving the penis highlighting the typical and atypical sonographic and MR appearances of pathologic disorders, with special emphasis on distinctive and subtle findings that may clarify the diagnosis. 3. To discuss the value of other imaging techniques (CT, PET-CT, arteriography, urethrography) in penile pathology.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction. General features and basic concepts. 2. Anatomy. US and MR anatomy and imaging protocol. 3. Vascular disorders (Mondor disease, partial thrombosis of the corpus cavernosum, high flow and low-flow priapism). 4. Trauma. (Penile fracture, urethral injury, post-traumatic arterial penile fistula, extratunical hematoma and intracavernosal hematoma). 5. Inflammation (Cellulitis, abscess, fistula and gangrenous cavernositis). 6. Benign lesions (Peyronie disease, cavernous hemangioma, median raphe cyst, epidermoid cyst and so on). 7. Malignant lesions (Primary penile cancer and penile metastasis). 8. Summary.

### The Perils of Prostate MRI: How to Best Avoid Common Imaging Pitfalls

#### Participants

Amanda Gibson, DO, Lexington, KY (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Prostate MR is a robust imaging modality with emerging utilization in screening, tumor characterization, surveillance, risk stratification, and local staging of prostate cancer. 2. The inherent complex anatomy of the prostate gland, coupled with advancements in MRI technology and varied pathologies affecting the prostate, result in several potential pitfalls in MR image interpretation. 3. To ensure accurate interpretation, the radiologist must be familiar with the appearance of normal prostate anatomy, as normal variations can mimic clinically significant cancer, as well as benign entities which could simulate or mask cancer.

#### TABLE OF CONTENTS/OUTLINE

1. Review normal anatomy of the prostate on MR with focus on central zone and anterior fibromuscular stroma 2. Illustrate benign prostatic pathologies and ways in which their imaging may mimic prostate cancer - Normal anatomic structures and expected postprocedural sequela that mimic cancer - Noncancerous abnormalities that may mimic cancer - Artifacts which may mimic or mask cancer 3. Describe locoregional invasion of prostate cancer beyond neurovascular bundles and capsular disruption 4. Highlight case-based teaching points with normal and abnormal prostate MRI 5. Provide flowchart guide on different interpretation pathways when reading prostate MRI for both junior and seasoned radiologists

### Imaging and Management of Renovascular Hypertension: State-of-the-Art

#### Participants

Prabhakar Rajiah, MD, FRCR, Rochester, MN (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To review the pathophysiology of renovascular hypertension (RHT) 2. To discuss the role of multimodality imaging in the diagnostic pathway of RHT 3. To illustrate the imaging appearances of various causes of RHT 4. To review the role of interventional management of RHT.

#### TABLE OF CONTENTS/OUTLINE

1. RENOVASCULAR HYPERTENSION- DEFINITION 2 .IMAGING MODALITIES- Ultrasound, doppler; CTA, Photon counting CT; MRA- Contrast and non contrast techniques (3D SSFP, Phase contrast), 4D flow; Catheter angiography; Nuclear medicine; 3. DISCUSSION OF ETIOLOGIES OF RENAL HYPERTENSION WITH MULTIPLE CASE EXAMPLES - Non-stenotic lesions (via renal artery compression and/or changes in renal perfusion) o Renal artery aneurysm o Renal arteriovenous fistula - Stenotic lesions (via renal artery compression/occlusion) o Atherosclerotic disease o Fibromuscular dysplasia o Neurofibromatosis type 1 o Midaortic syndrome o Dissection o Vasculitis (Polyarteritis nodosa ,Takayasu arteritis) o Trauma o Retroperitoneal fibrosis/radiation o Thromboembolism 4. ROLE OF IMAGING IN EXCLUDING OTHER CAUSES OF REFRACTORY HYPERTENSION- Endocrine- pheochromocytoma, hyperaldosteronism, Cushing's, thyroid dysfunction, hyperparathyroidism; Renal parenchymal disease; Mid aortic syndrome, coarctation; 5. IMAGING APPROACH FOR RHT 6. END-ORGAN ASSESSMENT- Kidneys, Heart, brain 7. TREATMENT- Optimal management is individualized to patient clinical context and dependent on etiology of renovascular hypertension; Medical - antihypertensives (i.e. ACE inhibitors/ARBs); Interventional- Angioplasty, stenting; Surgical

### Bosniak IV Cystic Masses: A Tough Nut to Crack

#### Participants

Ignacio De Garcillan, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- To revise Bosniak IV cystic mass v 2019 CT and MRI features.- To review possible pitfalls: interpretative, technical, and mass related.- To illustrate several Bosniak IV cases from our hospital.

#### TABLE OF CONTENTS/OUTLINE

In 2019 a new Bosniak classification version was published providing a detailed description of Bosniak IV category features. Its main objective was to increase specificity. Nevertheless, interpretation and classification of septa and nodule in each category remains challenging. In this exhibition we will focus on Bosniak IV cystic masses. Each feature will be revised and discussed to avoid misinterpretation. Potential pitfalls will be reviewed: interpretative quantitative and qualitative features, technical concerns, and mass related issues. Examples of these pitfalls will be exhibited with several recommendations to avoid them: zooming, multiplanar reconstruction, exclusive enhancing septa measuring, subtraction imaging, best quality sequence and examination selection, temporal evolution, employing Bosniak classification when applicable etc. Bosniak IV cystic masses diagnosed at our centre will be illustrated with different imaging techniques. Several clear cell renal carcinomas with cystic transformation, papillary carcinoma, clear cell papillary renal cell tumour, multilocular cystic neoplasm, fumarate hydratase- deficient renal carcinoma and unclassifiable renal carcinoma will be shown.

Printed on: 04/12/24

GUEE-78

### What Can Go Wrong When Doing Right? Iatrogenic Genitourinary Complications

#### TEACHING POINTS

1. A growing number of systemic, minimally invasive, and surgical treatment modalities for various genitourinary (GU) pathologies may lead to various unique iatrogenic complications. Diagnostic imaging plays an essential role in detection and subsequent management. 2. A multimodality approach to identifying iatrogenic GU complications is key for prompt diagnosis to prevent morbidity. For example, both multiphasic CT urogram and fluoroscopic antegrade nephrostogram can be utilized to confirm ureteral injury. 3. Knowledge of key imaging findings and mimics of complications are important to prevent misdiagnosis and mistreatment as well as to distinguish expected post treatment appearance from complication.

#### TABLE OF CONTENTS/OUTLINE

A. Introduction  
1. Review of treatment modality types for various GU pathologies (both benign and malignant)  
2. Pictorial review of genitourinary anatomy and areas prone for iatrogenic injury  
• Essential GU anatomical structures  
• Common postsurgical anatomy  
• Discussion on the radiosensitivity of the GU system  
B. Multimodality approach to identifying GU complications  
1. Decision tree on selecting the most optimal imaging type for common complications  
C. Case-based imaging review of iatrogenic GU complications

### Magnetic Resonance Imaging Review and Virtual Biopsy of Common Solid Renal Masses

#### Participants

Luis Calimano-Ramirez, Jacksonville, PR (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Relevant anatomic review of the renal system. 2. Review multiple cases with magnetic resonance imaging features of neoplastic pathology. 3. Review correlation with pathology result to examine the function of magnetic resonance imaging as means of virtual biopsy toward identifying renal mass characteristics in selected cases.

#### TABLE OF CONTENTS/OUTLINE

1. Neoplastic pathologies: I. Benign etiology: a. Renal leiomyoma b. Renal Angiomyolipoma c. Renal Oncocytoma d. Renal plamacytoma e. Solitary fibrous tumor. II. Malignant etiology: a. Clear Cell Renal cell Carcinoma b. Papillary Cell Carcinoma c. Medullary Renal Cell Carcinoma d. Collecting Duct Carcinoma e. Urothelial Cell Carcinoma f. Renal Lymphoma.2. Inflammatory etiology: a. Xanthogranulomatous Pyelonephritis.

GUEE-8

### Imaging of Renal Cancer: The Past, The Present, and The Future

#### Participants

Alex Chung, MD, Los Angeles, CA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

-Many benign cystic and solid renal lesions can be reliably distinguished on multiple imaging modalities such as US, contrast-enhanced US (CEUS), CT and MRI, including Bosniak I/II cysts and fat-rich angiomyolipoma (F-AML).-Among indeterminate renal lesions such as clear cell renal cell carcinoma (ccRCC), papillary renal cell carcinoma (pRCC), chromophobe renal cell carcinoma (chrRCC), oncocytoma (Onc) and fat-poor angiomyolipoma (FP-AML), the enhancement characteristics and other parameters can further characterize the renal lesions.-Likert-based CT and MR likelihood scores for renal masses can help stratify the risk of indeterminate renal lesion for active surveillance or surgical management.-Novel imaging parameters and artificial intelligence will further assist in imaging characterization of indeterminate renal lesions.

#### TABLE OF CONTENTS/OUTLINE

-Introduction.-Normal Anatomy and Conventional Imaging Technique.-Imaging Findings/Pathology.-Enhancement characteristics including Mean Enhancement, Absolute Enhancement, Relative Enhancement, Absolute De-enhancement and Relative Washout.-Likelihood scores to aid risk stratification.-Novel imaging parameters and artificial intelligence, including 99mTc-sestamibi SPECT, Perfusion, Radiogenomics and Machine/Deep learning.-Biopsy of Renal Masses

GUEE-80

### Urine the Wrong Place - When Urine Leaves the Urinary Tract. A Review of Urine Leaks and Urinary Tract Fistulas

#### TEACHING POINTS

The presentation of urine leaks and fistulas can be variable; however, a good patient history will usually raise suspicion for these entities. It is important to understand the pathology of urinary leaks and fistulas as well as the expected anatomy, including normal and post-operative, to understand the imaging findings. Familiarity with the principles of CT urogram is crucial in distinguishing blood from urine in trauma and post-operative patients to accurately make a diagnosis. The radiologist plays a vital role in these cases in recommending and troubleshooting follow up imaging as well as in guiding clinicians in their management. Management usually involves urinary diversion, which interventional radiology plays a large role in.

#### TABLE OF CONTENTS/OUTLINE

1) Review of normal male and female urinary tract anatomy and expected post-operative findings 2) Review of urinary tract imaging protocols - CT urogram, cystograms 3) Renal leaks - traumatic, spontaneous 4) Ureteral leaks - traumatic, iatrogenic 5) Bladder leaks - traumatic, iatrogenic, spontaneous 6) Urinary tract fistulas 7) Treatment/management options - IR interventions for urinary diversion

### MRI after Focal Therapy for Prostate Cancer: What Radiologists Must Know

#### TEACHING POINTS

-Overview of the currently available focal treatments for prostate cancer: indications, contraindications, and techniques.-Review of potential complications of each procedure: frequency, diagnosis, and management.-Discussion of expected postoperative MRI findings of each procedure: early and late.-Review of imaging findings of recurrent prostate cancer post focal treatment: diagnosis, mimics, and management.-Discussion of potential pitfalls.

#### TABLE OF CONTENTS/OUTLINE

Introduction-Rationale for focal therapy.-Potential benefits.-Criticisms to focal therapy.-Importance for radiologists and urologists.Treatment options-Electroporation (NanoKnife): Technique, Post-op appearance (Early and Late), Complications, Recurrence.-HIFU (FocalOne and TULSA): Technique, Post-op appearance (Early and Late), Complications, Recurrence.-Cryoablation: Technique, Post-op appearance (Early and Late), Complications, Recurrence.-Laser Ablation: Technique, Post-op appearance (Early and Late), Complications, Recurrence.

### Advances in MRI Techniques for Evaluation of Upper Urinary Tract Neoplasms: A Comprehensive Review

#### Participants

Mohamed A. El-Ghar, MD, Mansoura, Egypt (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Familiarizing with the different advanced MRI techniques used in the evaluation of renal neoplasms, including diffusion-weighted imaging (DWI), intravoxel incoherent motion (IVIM) MRI, Diffusion Tensor Imaging (DTI), Blood oxygen level dependent (BOLD) MRI and Arterial spin labeling (ASL). 2. Identifying the advantages and limitations of conventional and advanced MRI techniques in the evaluation of renal neoplasms, how they can improve diagnostic accuracy, characterization of the masses and treatment planning. 3. Understanding the role of MRI in the staging renal neoplasms, and if their role for the new techniques. 4. Familiarizing with the current guidelines and recommendations for the use of MRI in the evaluation of renal neoplasms. 5. Identifying potential areas for future research and development in the field of MRI for the evaluation of renal neoplasms, including the use of artificial intelligence and machine learning algorithms to improve diagnostic accuracy and reduce interpretation variability.

#### TABLE OF CONTENTS/OUTLINE

I. Introduction - Definition and incidence of upper urinary tract neoplasms - Importance of accurate diagnosis and staging - Overview of MRI techniques for evaluation II. Conventional MRI Techniques -T1- and T2-weighted imaging -Contrast-enhanced imaging -Limitations and challenges III. Advanced MRI; DWI MRI, IVIM-MRI,DTI-MRI, BOLD-MRI, ASL, Comparative advantages of advanced techniques • IV. Applications in Upper Urinary Tract Neoplasms • Diagnosis and characterization of renal masses • Differentiation between benign and malignant tumors • Staging of malignant masses • V. Clinical Implications and Future Directions • VI. Conclusion

GUEE-83

### How to Do a Urethrogram... in Less than 15 Minutes and with No Special Equipment

#### TEACHING POINTS

- Urethrograms are nothing to be afraid of;
- We have developed a technique that is well-tolerated, can be performed in less than 15 minutes, and requires no specialist equipment;
- This exhibit explains how to perform our technique for both males and females;
- We also illustrate the important anatomical structures, pitfalls, and complications of this technique.

#### TABLE OF CONTENTS/OUTLINE

The ideal urethrogram should be quick, well-tolerated, provide high-quality diagnostic images and, if possible, not require any special equipment. At our institution, we have stopped using Knutson's clamps and balloon-occlusion catheters, and now perform approximately 15 studies per week with just 6Fr and 10Fr catheters. The technique we have developed is quick, well-tolerated and provides diagnostic images of the whole (a) anterior and (b) posterior urethra: a) A 10Fr catheter is inserted into anterior urethra. The patient compresses the distal penile shaft while the anterior urethra is imaged in two oblique planes. A release view (with hand suddenly removed) allows the urethra to decompress and distends the submeatal urethra, visualised on fluoroscopy at 3-4 frames/sec; b) The bladder is filled via a catheter or via retrograde instillation (we discuss both methods). The patient voids for a descending study in the oblique plane. We also discuss a rapid '5min urethrogram' in patients without tight strictures, which only requires inserting a catheter once. Adaptions are covered for the following scenarios: i) Tight strictures; ii) Occlusive segments; iii) The female urethra; iv) Pericatheter studies. The relevant common pitfalls and uncommon complications of this technique are also discussed.

GUEE-84

### Evolving Role of Conventional Imaging for Prostate Cancer in the Era of PSMA PET

#### Participants

Hiroaki Takahashi, MD, PhD, Rochester, MN (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Prostate-Specific Membrane Antigen (PSMA)-targeted positron emission tomography (PET) imaging is increasingly utilized for evaluating patients with high-risk prostate cancer (PCa) or recurrent PCa. The current National Comprehensive Cancer Network (NCCN) guidelines describe that conventional imaging is not a prerequisite to PSMA-PET for PCa staging. However, we have witnessed growing demand for conventional imaging as a confirmatory test for indeterminate findings on PSMA PET. PSMA-avid lesions other than PCa metastasis may cause false-positive observations, whereas PCa metastases to PSMA avid organs result in false-negative observations. Further, in conjugation with PSMA PET, prostate MRI has better performance in assessing the primary PCa, as well as local recurrence. In this context, PSMA PET does not replace conventional imaging, but does change the way in which conventional imaging is used. This exhibit will discuss the strategic approach of conventional PCa imaging in the era of PSMA PET. The purposes of this exhibit are: 1. To review the evolving role of conventional PCa imaging in the era of PSMA PET. 2. To discuss strategies to address recently recognized PSMA PET imaging pitfalls.

#### TABLE OF CONTENTS/OUTLINE

1. Fundamental mechanism and imaging interpretation of PSMA PET. 2. Role of conventional PCa imaging: focusing on imaging pitfalls of indeterminate findings on PSMA PET.- Assessment of primary PCa.- Assessment of local recurrence.- Assessment of metastases involving lymph nodes, bones, and solid organs. 3. Summary.

### Urinary Bladder Diverticula: Imaging Features and Complications

#### Participants

Grace Zhu, MD, Saint Louis, MO (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Describe different categories of urinary bladder diverticula with comparison to normal urinary bladder.  
2. Discuss urinary bladder diverticula multimodal imaging features  
3. Provide a case-based review of urinary bladder diverticula complications

#### TABLE OF CONTENTS/OUTLINE

1. Description of the different types of urinary diverticula  
A. Describe histology of normal urinary bladder and diverticula  
B. Highlight features of true and false urinary bladder diverticula  
2. Imaging of urinary bladder diverticula  
A. Describe features of uncomplicated urinary bladder diverticula  
B. Identify pitfalls that prevent optimal imaging  
3. Provide examples of diverticula mimics  
3. Case based review of urinary bladder diverticula complications  
A. Urine stasis and urinary bladder diverticula pathology  
B. Diverticular stones  
C. Diverticula and urinary tract infection  
D. Cancer and staging consideration in diverticula  
E. Incomplete voiding and obstruction

GUEE-86

### The Crucial Role of Ultrasound in the Detection of Renal Transplantation Complications

#### Participants

Elena Julian Gomez, MD, Santander, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- To know the essential role of ultrasound in the detection of renal transplant complications.
- To describe the systematic to follow when performing an ultrasound of renal transplantation.
- To learn the typical ultrasound findings of renal transplant complications.
- To be able to recognize those cases in which it will be necessary to complete the study with another tests in order to confirm the suspected diagnosis.

#### TABLE OF CONTENTS/OUTLINE

Doppler ultrasound is one of the control tests routinely performed on all patients 24-48 hours after renal transplantation, as well as subsequently according to their evolution. Thanks to ultrasound, we can assess the state of the renal graft and rule out the existence of associated complications, which may be divided into: 1. Vascular complications: - Renal artery stenosis. - Renal artery thrombosis. - Renal vein thrombosis. - Pseudoaneurysm. - Arterio-venous fistula. 2. Urological complications: - Ureteral obstruction. 3. Perirenal collections: - Hematoma. - Urinoma. - Abscess. - Lymphocele. 4. Parenchymal complications: - Acute tubular necrosis. - Acute rejection. - Immunosuppressant toxicity. 5. Other complications: - Lithiasis. - Renal graft infections (early and late). - Chronic rejection. In this paper we will detail the ultrasound findings that characterize these complications, through representative images of cases belonging to our institution. We will also explain those patients in which it was necessary to perform additional studies to confirm the suspected diagnosis.

Printed on: 04/12/24

GUEE-87

### Penile Ultrasound: A Pictorial Review of the Anatomy and the Most Relevant Pathologies

#### Participants

Elena Julian Gomez, MD, Santander, Spain (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- To become familiar with the normal sonographic appearance of the penile structures, as well as to know its arterial and venous vascularization.- To understand the technique of intracavernous injection of vasoactive substances, along with the normal response of vascular structures.- To review the main pathologies affecting the penis and their sonographic findings.

#### TABLE OF CONTENTS/OUTLINE

1. Penile anatomy by ultrasound: to recognize the anatomical structures in conjunction with the arterial and venous vascularization.2. Main penile pathologies: - Peyronie disease: its diagnosis is clinical, but ultrasound can confirm its presence, determine the extent of plaques and rule out a possible associated erectile dysfunction. - Erectile dysfunction: through intracavernous injection of vasoactive agents (PGE1) it is assessed whether there is a vascular (arterial or veno-occlusive) cause of erectile dysfunction. - Priapism: to evaluate ischemic, non-ischemic or metastatic causes. - Penile inflammation (e.g. cellulitis, balanitis, cavernositis,...): the main usefulness of ultrasound is to estimate the extension of inflammation and rule out abscess formation. - Trauma: in case of suspected penile rupture, ultrasound is especially helpful in doubtful cases or to locate the fracture line, as well as to assess long-term complications. - Benign entities: including cystic lesions (raphe cysts, epidermoid, dermoid,...), sclerosing lymphangitis, segmental thrombosis of the corpus cavernosum, calciphylaxis,...- Tumors: ultrasound is appropriate to determine the depth of the tumor and its spread to the corpus cavernosum.

GUEE-88

### Unmuddling the Middle: a Guide to Central Renal Abnormalities

#### Participants

Wendy Tu, MD, FRCPC, (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Central renal pathologies can originate from all of the complex constituent structures of the kidney: the renal parenchyma, predominantly the medulla; collecting structures; sinus including fat and neural structures; vessels; lymphatics; and extension of retroperitoneal processes. Parenchymal and medullary pathologies can include benign or malignant tumors, from the common renal cell carcinoma to rare primary sarcomas. Both tumorous and nontumorous pathologies can occur in the renal pelvis, such as papillary necrosis or blood clot. Vascular lesions include renal arteriovenous fistula or renal artery aneurysms, which can mimic other pathologies. Retroperitoneal lymphoma, fibrosis, histiocytosis, or lymphangiomatosis can involve the renal sinus. Multimodality imaging with ultrasound, CT, MRI, and angiography is important for differentiation of pathologies. Imaging is crucial to predict partial nephrectomy complexity with use of nephrometry scores.

#### TABLE OF CONTENTS/OUTLINE

1) Parenchymal tumors invading the renal sinus such as renal cell carcinoma and mixed epithelial and stromal tumor family tumors 2) Benign and malignant medullary tumors such as hemangioma, primary sarcoma, and medullary carcinoma 3) Sinus and medullary pathologies such as mesenchymal tumors, retroperitoneal fibrosis, and histiocytosis 4) Collecting system processes including urothelial carcinoma, papillary necrosis, calcifications, and clots 5) Vascular anomalies such as arteriovenous malformations, renal artery aneurysm, and renal vein varix

GUEE-89

### The Body Meets the Adrenal: Adrenal Manifestations of Systemic Disorders

#### Participants

Wendy Tu, MD, FRCPC, (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

To describe imaging manifestations of adrenal gland involvement by common and uncommon systemic disorders. Paired organs of the endocrine system, the adrenal glands have important roles in production of cortical and medullary hormones and catecholamines. The glands can be affected by a variety of neoplastic and non-neoplastic systemic disorders, some with life-threatening consequences such as in cases of adrenal hemorrhage and shock. Radiologists should be familiar with imaging manifestations along with potential associated laboratory abnormalities to ensure correct characterization and diagnosis for guidance on management. It is essential to distinguish adrenal manifestations of systemic disorders from other primary benign and malignant adrenal lesions.

#### TABLE OF CONTENTS/OUTLINE

Entities discussed will include: 1) Hemorrhagic conditions such as stress-related hemorrhage. 2) Hematologic diseases such as lymphoma. 3) Autoimmune conditions leading to adrenalitis such as Ipilimumab-induced adrenalitis. 4) Conditions leading to adrenal hyperplasia such as paraneoplastic syndromes. 5) Hereditary syndromes such as Von Hippel-Lindau disease and Neurofibromatosis. 6) Granulomatous diseases such as tuberculosis. 7) Infiltrative disorders such as amyloidosis. 8) Adrenal hyperenhancement in the setting of systemic hypoperfusion.

### Urine Trouble! An Interactive Review of Multiparametric MR Urography It's Pitfalls

#### TEACHING POINTS

1. Review the MR techniques for optimizing multi-parametric MR urography with attention to pitfalls  
2. Identify advantages over CT Urography  
3. Identify imaging features of lesions involving the urothelium in a quiz-based format with radiology-pathology correlation

#### TABLE OF CONTENTS/OUTLINE

1. What is multi-parametric MR Urography and how does it improve diagnosis?  
2. Why would MR Urography be preferred over CT Urography? What are the benefits and limitations?  
3. Improvements in MR sequences (including compressed sensing, k-space under-sampling, parallel imaging, and AI), which allow unprecedented improvement in image quality.  
4. Dilemmas in technique - is Lasix injection needed? Prone versus supine patient positioning? Wide vs narrow FOV? Are cine-T2 images useful?  
5. How to identify and avoid pitfalls and artifacts - flow voids on T2? T1\* effects due to concentrated gadolinium?  
6. How does MR urography help in identification and staging of urothelial neoplasms?  
7. How can MR urography help identify common, uncommon, and rare mimics of urothelial lesions using a rad-path quiz-based format?

### 2022 WHO Classification of Adrenal Tumors Revisited: Atlas of Diseases with Pathological Insights

#### Participants

Adriano Basso Dias, MSc, Toronto, ON (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Review the update 2022 WHO Classification of Adrenal Cortical Tumors  
Review the update 2022 WHO Classification of Pheochromocytoma and Paragangliomas  
Identify imaging features with radiologic-pathologic correlation of common and uncommon adrenal lesions

#### TABLE OF CONTENTS/OUTLINE

Are There Any Nomenclature Changes or Any New Diagnostic Categories in the New WHO Classification of Adrenal Cortical Proliferations?  
What are the Radiological and Pathological Correlates of Adrenal Cysts?  
What Should a Radiologist Know about Adrenal Cortical Carcinoma?  
Why Do Radiologists and Pathologists Need to Know Ectopic or Heterotopic Locations for Adrenal Cortical Tissue?  
What are the Highlights in the New WHO 2022 Classification of Pheochromocytoma and Paragangliomas  
Miscellaneous (Including Mesenchymal and Stromal Tumors)

### Focal Therapy of Prostate Cancer: A Primer for Radiologists

#### Participants

Adriano Basso Dias, MSc, Toronto, ON (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Understand the current concepts of prostate focal therapy  
Recognize the most important MRI features to report pre and post focal therapy  
Know the role and limitations of prostate MRI for patient selection for focal therapy  
Be familiar with future directions of imaging techniques in focal therapy

#### TABLE OF CONTENTS/OUTLINE

Introduction - Indications, energy sources and templates available for focal therapy (FT)  
Role of imaging in the pre treatment assessment- MRI for diagnosis, staging and patient selection for FT  
Role of imaging in the post treatment assessment- MRI findings post FT- Types of recurrence- Pitfalls  
Future Perspectives- What imaging modalities are on the horizon for patient selection for focal therapy and treatment guidance

### The Extraperitoneal Cavity: Gaining Understanding through Surgical Procedures

#### Participants

Kiyoko Mukai, Tokyo, Japan (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The extraperitoneal cavity has a complex anatomy, and furthermore, there is limited opportunity to understand this invisible anatomy on imaging. In this presentation, we will discuss the anatomy of the extraperitoneal cavity and the importance of preoperative imaging in surgical planning, using the surgical technique for prostatectomy as a guide.

#### TABLE OF CONTENTS/OUTLINE

Learn basic techniques and anatomy in standard surgical procedures

1. Intra-abdominal observation
2. Dissection of the retroperitoneal space/Retzius cavity
3. Lymph node dissection
4. Incision of the endopelvic fascia
5. Dissection of the bladder neck
6. Dissection of the seminal vesicles
7. Management of the prostate pedicles
8. Dissection of the posterior aspect of the prostate
9. Management of the lateral aspect of the prostate
10. Division of the urethra
11. Reconstruction (including urethral anastomosis)

A collection of cases

- Case1: Benign prostatic hyperplasia
- Case2: Enlargement of the middle lobe
- Case3: Previous transurethral resection of the prostate (TURP)
- Case4: T3 prostate cancer
- Case5: Prostatitis
- Case6: Vascular anomaly

GUEE-93

### Insights into Urethra: A Diagnostic Approach and Comprehensive Guide to Multimodal Imaging in Urethral Lesions

#### TEACHING POINTS

Urethral lesions can range from common to rarely encountered in clinical practice. Imaging modality plays a key role in evaluating the variety of urethral conditions because of its high objectivity and utility. This exhibit aims to introduce the multimodal imaging spectrum of urethral lesions, from traumatic change to neoplasms, and demonstrate the diagnostic approach to becoming familiar with urethral lesions.

#### TABLE OF CONTENTS/OUTLINE

Presentation goals: 1. To demonstrate the normal anatomy of the male and female urethra. 2. To demonstrate the step-by-step diagnostic approach to the urethral lesions. 3. To demonstrate multimodality imaging findings of various urethral lesions. Illustrative imaging/cases include: (i) Traumatic and post-treatment changes & Urethral injury, & Urethral foreign body, & Iatrogenic changes (& Radiation therapy induced urethritis, & Changes after transurethral injection therapy, & Operative complications) (ii) Intra- or peri-urethral lesions - Intra-urethra & Urethral stones, & Urethral caruncle, & Fibroepithelial polyp, & Primary urethral carcinoma, & Malignant melanoma, & Lymphoma, & Sarcoma- Peri-urethra & Urethral diverticulum, & Periurethral cyst, & Peyronie's disease, & Leiomyoma, & Tumors arising from urethral diverticulum- Both intra- and peri-urethra & Urethral cellulitis, & Urethral abscess (iii) Non-urethral origin neoplastic lesions & Direct invasion from pelvic and genital tumors, & Metastatic tumors

Printed on: 04/12/24

GUEE-94

### **Standardized, Vesical Imaging Reporting and Data System (VI-RADS) - Compliant, Acquisition and Interpretation of Multiparametric Magnetic Resonance of the Bladder: A Practical Guide**

#### **Participants**

Martina Pecoraro, MD, Roma, Italy (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

1. Bladder multiparametric MRI is the most accurate imaging test for local staging of bladder cancer. 2. The Vesical Imaging Reporting and Data System (VI-RADS) has standardized the acquisition protocol of bladder MRI and created a 5-point scoring system to differentiate muscle invasive from non-muscle invasive bladder cancer. 3. The use of VI-RADS for bladder cancer local staging has shown excellent diagnostic performance and inter-reader reproducibility in multiple studies. 4. High diagnostic accuracy of bladder MRI and VI-RADS is dependent on proper patient preparation and implementation of the imaging protocol. 5. Pitfalls in evaluating bladder MRI can occur and needs to be acknowledged

#### **TABLE OF CONTENTS/OUTLINE**

MRI of the bladder with the use of VI-RADS is a powerful diagnostic tool for the local assessment of bladder cancer, but it requires the radiologist to implement a specific acquisition protocol and image interpretation standards to achieve optimal diagnostic accuracy and reproducibility. In this educational exhibit we discuss with a practical approach the technical aspects to follow for the correct acquisition of VI-RADS compliant bladder MRI studies. Furthermore, we provide a practical approach to the assessment, scoring, and reporting of bladder lesions according to the VI-RADS scoring system. Also, we provide details on what is beyond VI-RADS 1.0 concerning Pitfalls and Tips and Tricks: details will cover bladder distension and how to handle with it, pitfalls in staging cancers located at ureteral orifices, at folded bladder walls (e.g anterior bladder wall), at diverticula, and after previous tumor resection. To conclude we will provide insights on training and VI-RADS learning curve.

### Pre- and Post-treatment Imaging of Upper Urinary Tract Urothelial Cancer (UTUC): National Comprehensive Cancer Network and European Association of Urology UTUC Guidelines in 2023

#### Participants

Hirotsugu Nakai, MD, Rochester, MN (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Upper tract urothelial cancer (UTUC) accounts for 5-10% of UCs. However, 60% of UTUC are invasive at the diagnosis, and multiplicity of disease is common. Therefore, lifelong surveillance is required. Imaging and image-guided biopsy and intervention play an important role in the diagnosis and management of patients with UTUC. CT urography (CTU), MR urography (MRU), and retrograde ureteropyelography with CT or US are used for detection, localization, staging and follow-up of patients with UTUC. FDG PET/CT and chest imaging are useful for staging and re-staging when metastasis is suspected. This is a comprehensive review of the spectrum of clinical and imaging findings of pre- and post-treatment UTUC with illustration of key multimodality imaging findings in representative cases.

#### TABLE OF CONTENTS/OUTLINE

1) Background of UTUC; epidemiology, risk factors, manifestations, pathology, and staging.2) Review of National Comprehensive Cancer Network (NCCN) and European Association of Urology (EAU) UTUC guidelines, version 2023.3) Technique and utility of imaging modality including CTU, MRU, retrograde ureteropyelography with CT or US, FDG PET/CT, chest CT and radiography, and image guided biopsy and intervention.4) Imaging findings of urothelial cancer of the pelvicaliceal systems and ureters before and after treatment.5) Conditions mimicking UTUC including lymphoma, primary renal neoplasms, metastasis, sarcoma, fibroepithelial polyp, inverted papilloma, ureteritis, amyloidosis, and suburothelial hemorrhage.6) Summary

GUEE-98

### Are We Talking About the Same Thing? How EPE is Scored

#### Participants

Andre De Freitas Secaf, MD, Ribeirao Preto, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Prostate cancer is the second most common cause of cancer-related deaths in men. The first option for treating intermediate and high-risk disease is radiotherapy or radical prostatectomy, however, this choice heavily relies on the presence of extraprostatic extension (EPE). EPE is associated with a higher risk of positive surgical margins, biochemical recurrence, metastatic disease and shorter overall survival. For better surgical planning, the evaluation of EPE using multiparametric magnetic resonance imaging (mpMRI) is essential. There are two major criteria for assessing EPE, through mpMRI, one from National Cancer Institute (NCI) and one from the European Society of Urogenital Radiology (ESUR). The NCI score can be classified as 0- no suspected pathological EPE; 1- curvilinear contact length or capsular irregularity and bulge; 2- curvilinear contact length and capsular irregularity and protuberance; 3- EPE visible on MRI or invasion of adjacent anatomical structures. The ESUR score uses a five-point scale (1 = capsular abutment; 2 = not specified; 3 = capsular irregularity; 4 = neurovascular bundle thickening, bulge, or loss of capsule; 5 = measurable extracapsular disease). We aim to discuss the imaging findings of EPE and how to score them according to the NCI and ESUR criteria, emphasizing their strengths and limitations. These scores should be familiar for any radiologist working in the prostate field, as a more accurate diagnosis of EPE can significantly impact the patient's management and outcomes.

#### TABLE OF CONTENTS/OUTLINE

Introduction; NCI and ESUR scores; Cases of EPE using both scores; Discussion.

### Spectrum of Fat Containing Lesions in the Adrenal Gland: Tips, Tricks and Mimics

#### Participants

Jorge Abreu Gomez, MD, Pickering, ON (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Identify the role of CT and MRI in identification of macroscopic and microscopic fat - including pitfalls, and newer entities including radiomics, histogram analysis, dual-energy decomposition and AI techniques. 2. Describe the common, and uncommon adrenal nodules which present with fat, with an algorithmic approach as to how the type (macroscopic vs microscopic), amount (small vs large), distribution (homogeneous vs heterogeneous), helps arrive at the right diagnosis.

#### TABLE OF CONTENTS/OUTLINE

- Adrenal nodules can have microscopic (intravoxel) fat or macroscopic (bulk fat), or both. However, they often mimic each other.- What is the role of CT in detection of microscopic fat? Does an attenuation of <10HU always mean microscopic fat? What are the pitfalls of detecting macroscopic fat with CT - increased noise, small ROI? Can histogram analysis improve CT performance? How can dual energy CT improve fat-detection and fat quantification?- What is the role of MRI in detecting microscopic fat? Is MRI only useful when non-contrast CT attenuation is between 10-30HU? Which is better to depict fat - 2D sequences or 3D sequences? How can flip-angles be optimized to improve detection of fat? How are MRI fat quantification methods applicable to focal adrenal lesions?- Amount of bulk fat in adrenal lesions matters - Masses with >50% of bulk fat are myelolipomas; < 50% - can represent myelolipomas or myelolipomatous degeneration which could occur in either an adrenal adenoma or adrenocortical carcinoma.- How to approach diagnosis of lipid poor adenoma with cross sectional imaging.- What are the different patterns of signal loss on out of phase T1w in the diagnosis of adrenal adenoma, when to suspect malignancy?

Printed on: 04/12/24

HNEE

### Head & Neck Imaging Education Exhibits

#### Sub-Events

#### **HNEE-1 Don't Lose Your Nerve: Pictorial Review of Cranial Nerve Denervation in the Head and Neck**

Participants

Rachel Saks, MD, Rego Park, NY (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Review the pathophysiology of denervation and the subsequent imaging changes that occur within the muscle over time.2. Review the anatomy of the cranial nerves with motor function, particularly focussing on the muscles innervated by each nerve and their appearances with acute and chronic denervation.3. Review potential imaging pitfalls due to denervation changes, such as misinterpretation of contralateral FDG uptake in the setting of vocal cord palsy.

#### TABLE OF CONTENTS/OUTLINE

1. Pathophysiology of denervation2. Imaging findings in acute, subacute and late denervation3. Cranial nerve anatomy and appearances of denervation of the muscles innervated by the specific nerve- Oculomotor nerve- Trochlear nerve- Abducens nerve- Trigeminal nerve- Facial nerve- Glossopharyngeal nerve- Vagus nerve- Spinal Accessory nerve- Hypoglossal nerve4. Imaging pitfalls

#### **HNEE-10 Don't Get Trapped: Diagnostic Errors in Emergency Head and Neck Radiology**

Participants

Thiago Jose Pinheiro Lopes, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- An incidence of 3-4% of errors in the radiological routine is estimated. In the emergency room, the accuracy of the diagnosis becomes even more relevant, considering the need to take more immediate measures depending on the imaging findings. - Errors in diagnostic radiology can occur for a variety of reasons. Recognizing the cognitive views that favor their occurrence is important to prevent them. - Our objective is to present a series of head and neck radiological cases, unraveling the causes of errors and then providing strategies to be followed to minimize them during radiological interpretation.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction. 2. Types of errors in diagnostic radiology (Renfrew Classification). 3. Series of misdiagnosis real cases in emergency room head and neck radiology, including: a) Case discussion: anatomy review, possible complications related to an error in image interpretation. b) Identification of the error causes. c) Tips on how to avoid them. 4. Challenges, pearls and pitfalls when interpreting a head and neck radiological exam. 5. Take home messages.

#### **HNEE-11 Basic Principles of Nasal Imaging**

Participants

Mina Al-Ani, MBBCh, Elmsford, NY (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Nasal masses can originate in the nasal cavity or adjacent structures. Utilizing a systematic approach for evaluating nasal imaging plays a crucial role in establishing a differential diagnosis, treatment, and surgical planning. After a review of nasal anatomy using illustrations and cross-sectional images, we discuss the fundamental principles of nasal imaging and their application in the analysis of a broad spectrum of nasal abnormalities. Imaging features and clinical findings of these lesions are discussed.

#### TABLE OF CONTENTS/OUTLINE

1. Brief introduction emphasizing the role of imaging in diagnosing nasal lesions.2. Illustration of nasal anatomy.3. Principles of nasal imaging used in the evaluation of a wide range of nasal lesions, including but not limited to:a. Congenital lesions (e.g., encephalocele, supernumerary tooth, and nasolabial cyst)b. Benign masses (e.g., schwannoma, paraganglioma, and inverted papilloma)c. Malignant masses (e.g., squamous cell carcinoma, esthesioneuroblastoma, and nasal metastasis)d. Infectious and inflammatory lesions (e.g., fungal sinusitis, granulomatosis with polyangiitis, and rhinoscleroma)e. Pseudomasses (e.g., pneumosinus dilatans, septal hematoma, and rhinolith).4. Conclusion.

#### **HNEE-12 Orthognathic Imaging: Pre- and Post-Surgical Considerations for Craniofacial Reconstruction**

Participants

Jeffers Nguyen, MD, New Haven, CT (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The interpretation of orthognathic imaging studies is a growing part of both general and subspecialty neuroradiology practice.

These studies are performed to evaluate a wide range of conditions, including congenital anomalies, traumatic injuries, neoplastic growth, and iatrogenic complications. They are necessary for successful craniofacial reconstruction. Surgical planning and post-surgical follow-up studies are used to evaluate for appropriate jaw alignment and bite and to assess for complications. These topics may not be covered in depth by educational materials at the residency and fellowship levels. We hope to provide an accessible, illustrative review at graded levels of orthognathic imaging for the trainee, general radiologist, and neuroradiologist. Finally, we will also briefly touch on principles related to imaging for an increasingly prevalent procedure, facial feminization surgery, and we will share cases related to our institution experience.

#### **TABLE OF CONTENTS/OUTLINE**

1) Etiologies of Maxillofacial Deformities; 2) Important Orthognathic Terms and Concepts; 3) Orthognathic Surgical Procedures and their Indications; 4) Pre- and Post-Surgical Orthognathic Imaging Considerations; 5) Overview of Facial Feminization Surgery (FFS); 6) Utility of Orthognathic and FFS Presurgical Planning Macros and Reporting Checklists

#### **HNEE-13 Hypervascular Neck Lesions: From the Most Common to Uncommon Pathology**

Participants

Hugo Velazquez, MD, Mexico City, Mexico (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

-To describe the anatomy of the neck spaces and its contents. -To determine the protocols used in suspected neck lesions by CTA and MRA. -To list the most common and uncommon neck lesions with a hypervascular pattern enhancement. -To illustrate clinical scenarios of these lesions.

#### **TABLE OF CONTENTS/OUTLINE**

1. A pictorial review of the anatomy of the neck spaces and its contents. 2. CTA and MRA protocols for the approach of neck lesions. 3. Key points of the most common vascular neck lesions. 4. Examples of uncommon vascular lesions of the neck to keep in mind.

#### **HNEE-14 Breaking the Ultrasound Barrier: Review of Sonographic Imaging of the Neck**

Participants

Anu Kamalasanan, FRCR, MBBS, East Renfrewshire, United Kingdom (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

1) Tongue pathology can be assessed, characterized and staged with USS. 2) Thyroglossal duct pathology are better assessed with USS as avascular cystic structure in infrahyoid midline anterior to the pre epiglottic space and cranially extending deep to the hyoid towards the midline posterior tongue which move dynamically with deglutition and protrusion of tongue. 3) Tonsils are seen as predominantly hypoechoic regions of alternating hyper and hypoechoic striations in the oropharynx, at the level of and deep to submandibular gland. 4) Pre epiglottic and paraglottic fat spaces are visualized as homogeneously hyperechoic avascular fat filled spaces with pathology presenting as hypoechoic mass. 5) Thyroid cartilage involvement presents with dehiscence of the hyperechoic cortex and infiltration of medulla and extra laryngeal tissues.

#### **TABLE OF CONTENTS/OUTLINE**

1) Illustrate with examples the normal sonographic appearance and contents of surgical triangles of the neck. 2) Illustrate with examples the sonographic cervical lymph nodal stations, normal and pathological sonographic appearance of lymph nodes. 3) Illustrate with example the normal sonographic appearance of the soft tissues of the neck, including sonographic appearance of tongue, oropharynx, supraglottis and larynx. 4) Illustrate with examples the pathological sonographic appearance of the soft tissues of the neck, including pathology of tongue, oropharynx, supraglottis and larynx.

#### **HNEE-15 Imaging of Nasal, Paranasal, and Skull Base Lesions: A Comprehensive Review**

Participants

Kota Yokoyama, PhD, Tokyo, Japan (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

The World Health Organization's (WHO) Classification of Head and Neck Tumors, Fifth Edition, is now available in 2022. This book is essential for radiologists to consider differential diagnosis and to obtain clinical information. On the other hand, the classification is based on the origin of the lesion and the genes, which makes it inconvenient as a guide for specific anatomical sites. For example, bone and soft tissue tumors, hematologic tumors, melanotic tumors, minor salivary gland tumors, germ cell tumors, and neuroendocrine tumors which can occur anywhere in the head and neck region, are classified in their own category, creating unexpected pitfalls when considering the differential diagnosis of nasal, paranasal, and skull base lesions. In addition, since the book is not intended for radiologists only, it does not cover a wide range of useful diagnostic imaging findings. Focusing on the radiologist, this exhibition will provide a comprehensive review of CT, MRI, and nuclear medicine imaging findings of lesions that can occur in the nasal, paranasal, and skull base.

#### **TABLE OF CONTENTS/OUTLINE**

1. Anatomy of nasal, paranasal, skull base 2. Sinonasal tract (nasal, paranasal, skull base) origin tumors 3. Other origin tumors involving the sinonasal tract 4. Inflammation involving the sinonasal tract 5. Infections involving the sinonasal tract

#### **HNEE-16 Clinical-radiologic Correlation of Acute Disorders of the Afferent Visual Pathway**

Participants

Kyle Robey, MD, Brookline, MA (*Presenter*) Nothing to Disclose

#### **TEACHING POINTS**

The afferent visual pathway includes structures that perceive and process visual information, as well as the intervening nerves and white matter tracts. Acute processes affecting the globes, optic nerves, optic tracts, optic radiations, and occipital cortices may result in sudden onset of vision loss. Given the relatively large anatomical area over which the afferent visual pathway is

distributed, the insults which can occur are diverse in etiology. A broad differential should initially be considered, which can be focused by relevant history. Moreover, though the entire afferent visual pathway should be scrutinized in the setting of an acute visual deficit, an ocular examination and visual field campimetry may further localize the affected anatomical structure. Therefore, familiarity with the clinical presentation and neuro-ophthalmological exam can guide the radiologist in evaluating and interpreting CT and MR images.

#### TABLE OF CONTENTS/OUTLINE

1) Review of the anatomy of the afferent visual pathway 2) Analyze and understand the main elements of a basic eye exam and correlate the findings with the affected anatomical area 3) Review common and uncommon conditions of acute vision loss which span the afferent visual pathway

#### HNEE-17 **Open Your Eyes! What Every Radiologist Should Know About Orbit Vascular Lesions**

Participants

Marcella N. Brandao, MD, MEd, Salvador, Brazil (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Understand well the anatomy of the orbit and dominate the normal in the image; Distinguish the pathologies that affect the extraconal, intraconal and both compartments; Recognize and review the particularities of the main diseases in the illustrative cases, both in Computed Tomography and Magnetic Resonance;

#### TABLE OF CONTENTS/OUTLINE

Every radiologist needs to be attentive to the details involving vascular lesions of the orbit. These diseases are infrequent, some extremely rare, but they cannot go unnoticed in differential imaging diagnoses. In addition, the natural history, growth pattern and histological composition of each lesion must be taken into account for the correct diagnosis. It is essential to recognize and keep in mind the diagnosis of: capillary hemangioma; venous lymphatic malformation; arteriovenous fistula; venous cavernous malformation; cavernous carotid fistula; ophthalmic artery aneurysm. Each image finding in the different modalities will be exemplified in detail through figures, descriptions and tables. Furthermore, the present study will make you a more complete radiologist, as it will explain the anatomy of the orbit relating it to each lesion in a direct, simple and intuitive way, making your diagnosis accurate and fast. In addition to serving as a guide for quick reference on the topic.

#### HNEE-18 **Multimodality Imaging of Salivary Glands**

#### TEACHING POINTS

1. To discuss the anatomy of major salivary glands 2. To review salivary gland pathology categories and associated epidemiology 3. To describe ultrasound, CT/MRI features of common pathologies with pathologic correlation 4. To introduce newly described entities in salivary gland pathology 5. To highlight the utility of percutaneous biopsy, with technical considerations

#### TABLE OF CONTENTS/OUTLINE

1. Normal anatomy a. Parotid b. Submandibular c. Sublingual 2. Common salivary gland pathologies a. Sialolithiasis b. Sjogren syndrome c. Infectious/Inflammatory conditions d. Cysts e. Neoplasms (with hints based on patient demographics and risk factors) i. Benign 1. Pleomorphic adenoma 2. Warthin's Tumor 3. Cystadenolymphoma 4. Other- Hemangioma, Oncocytoma, Basal Cell Adenoma ii. Malignant 1. Mucoepidermoid carcinoma 2. Adenocystic carcinoma 3. Squamous cell carcinoma 4. Adenocarcinoma 5. Acinic cell carcinoma 6. Lymphoma iii. Metastases 3. Newly described salivary gland pathology a. Sclerosing polycystic adenoma b. Mucinous/secretory variant of myoepithelioma c. Mammary analog secretory carcinoma d. Cribriform adenocarcinoma e. IgG4-related disease 4. Pitfalls 5. Percutaneous biopsy a. Approach and anatomical considerations b. FNA versus Core c. US vs CT guidance d. Complications 6. Summary/conclusion

#### HNEE-19 **Pediatric Head and Neck: On Call Resource**

Participants

Alexandra Foust, DO, North Royalton, OH (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. The spectrum of acute non-traumatic disease in the pediatric head and neck differs from that in adults. 2. Consider foreign body ingestion or aspiration in young child with sudden-onset respiratory distress or paroxysmal cough. 3. Meningitis, empyema, and venous sinus thrombosis are important complications of pediatric sinusitis or otomastoiditis cases.

#### TABLE OF CONTENTS/OUTLINE

The vast array of acute non-traumatic pathologies encountered in the pediatric head and neck can be an intimidating subject for residents on busy call rotations with limited time to look up information. Although there is some overlap with adult diseases, many entities are more common in the pediatric population and, thus, it is important for radiologists caring for children to be well-versed in this topic. This multi-institutional, multimodality exhibit will be structured as an on-call resource for trainees, organized by anatomic location and highlighting key points, pearls, pitfalls, and mimics of many acute non-traumatic pathologies in the pediatric head and neck: Selected Examples: 1. Orbit: peri-orbital and orbital cellulitis, dacryocystitis, optic neuritis, proptosis 2. Sinonasal: complicated sinusitis 3. Ear: labyrinthitis, otomastoiditis, petrous apicitis 4. Oral/airway: epiglottitis, laryngotracheobronchitis, tonsillitis and peritonsillar abscess, Ludwig angina 5. Neck/spine: Grisel syndrome, retropharyngeal abscess, lymphadenitis, sialadenitis, torticollis, infection of congenital cysts, osteomyelitis 6. Variable: foreign body insertion (oral/nasal), angioedema 7. Vascular: Lemierre syndrome, vasculitis, nontraumatic dissection, and complicated vascular malformations

#### HNEE-2 **Proton Beam Therapy for Skull Base Chordoma and Chondrosarcoma: A Guide for the Radiologist**

#### TEACHING POINTS

- High-quality CT and MRI are critical for optimising surgical and radiotherapy decision-making and treatment in skull base chordoma and chondrosarcoma
- A detailed radiology report at the time of proton planning is essential for assessment of baseline and postoperative tumor sites, including distance to critical structures, with a required gap of =3mm from brainstem and =5mm from the optic apparatus
- Radiologists should be aware of surgical approaches to skull base tumors
- Radiologists should understand imaging appearances following multilayer endoscopic skull base repair and be aware of their evolution over time

## TABLE OF CONTENTS/OUTLINE

Skull base chordoma and chondrosarcoma are rare, locally aggressive tumors. Treatment consists of maximal surgical resection and postoperative adjuvant therapy. Proton beam therapy enables dose escalation to tumor while limiting exposure dose to critical neurologic structures (brainstem, optic apparatus). High-quality pre-operative CT and MRI are critical for proton planning. MRI should include T2, T2 fat saturation, T1, volume FLAIR, FIESTA and postcontrast T1 fat saturation, with at least one volume sequence. Preoperative CTA BrainLab with bone reconstructions enables assessment of bone erosion, vascular relations and anatomical assessment for endoscopic-approach surgery. Intraoperative MRI should be considered to confirm clearance from dose-limiting structures. Post-operative MRI is optimally performed at <48 hours to enable optimal distinction between post-operative changes relating to multilayer skull base repair and tumor residuum.

### HNEE-20 Congenital and Infantile Masses of the Head and Neck

Participants

Alexandra Foust, DO, North Royalton, OH (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. A rapidly growing mass lacking high vessel density (Doppler US), internal flow-voids (MRI), and arterial-phase enhancement (MRI) should raise concern for lesions other than hemangioma. 2. It is important to describe the relationship of fetal head and neck masses to the airway so that appropriate delivery plans (EXIT procedure) can be made.

#### TABLE OF CONTENTS/OUTLINE

The spectrum of congenital and infantile head and neck soft tissue masses is broad, including developmental structural deformities/deficiencies, ectopic tissues, and benign and malignant neoplasms. It is important for radiologists to be aware of the imaging features of these lesions so that timely and appropriate management can be pursued. This multi-institutional, multimodality exhibit highlights pearls and pitfalls from fetal and post-natal cases encountered during clinical practice to illustrate the imaging appearance of numerous common and rare infantile masses in the head and neck using an anatomic approach. Selected Examples: 1. Skull/scalp: Cephalohematoma and other collections 2. Nasal: nasal glial heterotopia, cephalocele 3. Orbital: dacryocystocele, orbital varix 4. Oral/airway: epulis, epignathus, nasopalatine duct cyst, vallecular cyst, hairy polyp, sialoblastoma 5. Ear: cholesteatoma 6. Neck: thyroglossal duct cyst, ectopic thyroid or thymus, fibromatosis coli 7. Variable: dermoid/epidermoid, branchial apparatus anomaly, vascular anomalies, neuroblastoma, rhabdomyosarcoma, infantile fibrosarcoma, melanotic ectodermal tumor of infancy.

### HNEE-21 Post-operative Imaging in Oncologic Skull Base Surgery Reconstructions

#### TEACHING POINTS

? There is a broad spectrum of surgical techniques in resection of skull base tumors. ? Recognizing normal aspects of post-surgical grafts is important to differentiate from recurrent disease in skull base surgery. ? Radiologist plays an important role in preoperative and post-surgical management of this lesions.

#### TABLE OF CONTENTS/OUTLINE

Anatomy and normal variants Skull base surgery is a complex procedure that involves accessing and operating on the delicate structures and the anatomical complex area at the base of the skull. It is challenging even for experienced surgeons and radiologists. It forms the floor of the cranial cavity and separates the brain from other facial and neck structures. It is divided into three regions: the anterior skull base, the middle skull base, and the posterior skull base. Each of these regions has its own unique anatomy and challenges when it comes to surgery. For a successful surgery, knowledge of the normal variants of the anatomy is crucial to avoid iatrogenic lesions during surgery. Some important normal variants include the pneumatization of the anterior clinoid process, sphenothmoidal (Onodi) cells, and postsellar pneumatization from the sphenoid sinus. These variants are associated with a greater risk for carotid and optic nerve injuries as well as cerebrospinal fluid (CSF) rhinorrhea. Neurosurgical options in accessing the skull base ? Frontotemporal ? Subfrontal ? Transpetrosal ? Lateral ? Endoscopic endonasal Common Neoplasms ? Pituitary adenoma ? Schwannoma ? Meningioma ? Olfactory neuroblastoma ? Skull base invasion from head and neck tumor Normal imaging characteristics of post-surgical grafts When to suspect a recurrent tumor?

### HNEE-22 Complications of Paranasal Sinus Mucoceles: A Pictorial Review

Participants

Joseph Carbone, MD, Orange, CA (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Teaching Points: 1. Review mucocele CT and MR imaging characteristics and their variance, as well as potential locations to be aware of with a highlight on important adjacent structures. 2. Describe complications of mucoceles with CT and MR correlates with a focus on findings requiring urgent management. 3. Provide radiologists with a framework for reporting when discussing mucoceles, adjacent structures, and their pertinent negatives as it relates to mucocele complications.

#### TABLE OF CONTENTS/OUTLINE

Mucoceles are slow-growing lesions that result from obstruction of the facial paranasal sinuses. While they are most often benign, they can sometimes lead to urgent or severe pathology in nearby structures. The severity of clinical presentation varies depending on the sinus involved, ranging from asymptomatic to intracranial extension resulting in blindness. Further, radiologists should be aware for their potential for aggressive behavior and have an understanding for relevant reportable findings when describing mucoceles pertaining to mass effect and the location of adjacent structures, superimposed infection, and intracranial extension. This educational exhibit aims to review varying imaging characteristics of mucoceles and their potential locations using CT and MRI correlates. A pictorial review of mucoceles and their severe complications will be used to highlight key reportable imaging findings for radiologists when describing mucoceles and their involvement with adjacent structures.

### HNEE-23 Imaging of the Skull and Facial Bones for Pediatric and Adult Patients

Participants

Minako Azuma, MD, PhD, Miyazaki, Japan (*Presenter*) Nothing to Disclose

## TEACHING POINTS

1. In pediatric and adult patients, a wide variety of abnormalities are found in the skull and facial bones, including tumors, inflammations, congenital disease, and so on. Additionally, there are also secondary changes in bone associated with some diseases. 2. It is necessary for radiologists to know radiological findings of the skull and facial bone disorders. 3. Radiologists also have to know normal variations that have no pathological significance.

## TABLE OF CONTENTS/OUTLINE

1. Anatomy and normal development of the skull and facial bones 2. Techniques for the imaging of the skull and facial bones (1) CT (2) MRI (3) CT like bone imaging in MRI 3. Normal variants of the skull and facial bones (1) Shape and thickness (2) Bone marrow (3) Pneumatization 4. Disorders of the skull and facial bones (1) Abnormality associated with suture (craniosynostosis) (2) Tumors and allied diseases a) Benign: Chordoma, osteoma, meningioma, and so on b) Malignant: chondrosarcoma, rhabdomyosarcoma, metastasis c) Allied diseases: Epidermoid cyst, hemangioma, Langerhans Cell Histiocytosis, and so on (3) Systematic disease a) Hematologic disorders: leukemia, multiple myeloma, anemias b) Metabolic and endocrine disorders (4) Metabolic and endocrine disorders: primary hyperparathyroidism (5) Inflammation and infection: osteomyelitis (5) Secondary changes in bone: Hyperostosis, blistering 3. Take home points 4. References

## HNEE-24 Sonographic Evaluation of Major Salivary Glands: A Pictorial Review

Participants

Rachita Khot, MD, Charlottesville, VA (*Presenter*) Nothing to Disclose

## TEACHING POINTS

High-resolution ultrasound imaging plays a key role in evaluating focal versus diffuse salivary gland diseases and differentiating benign versus malignant lesions. This exhibit will discuss approaches to diagnosis and 1. Review the typical and uncommon sonographic appearances of pathologies involving the salivary glands 2. Discuss the OMERACT Ultrasound Scoring System in primary Sjögren's Syndrome 3. Discuss the next step in the management of the pathologies

## TABLE OF CONTENTS/OUTLINE

1. Illustration of major salivary gland and surrounding structures 2. Ultrasound imaging techniques, sonographic landmarks, and normal anatomy 3. Approach to diagnosis 4. OMERACT Ultrasound Scoring System in Sjögren's Syndrome • Background • Grey-scale scoring with imaging examples: Grade 0, normal parenchyma; Grade 1, mild inhomogeneity without anechoic or hypoechoic areas and hyperechogenic bands; Grade 2, moderate inhomogeneity with focal anechoic or hypoechoic areas; Grade 3, severe inhomogeneity with diffuse anechoic or hypoechoic areas occupying the entire gland 5. Pathologies of the major salivary glands • Congenital: Lymphoepithelial cysts, Epidermoid cyst • Sialadenitis: Acute and chronic; Abscess • Sialolithiasis: Obstructing and non-obstructing stones in the duct • Sialectasis • Neoplasms: Hemangioma, Lymphangioma, Lipoma, Adenomas (Pleomorphic, Basal cell, Warthin's), Carcinoma (Adenoid cystic carcinoma (Ca), Mucoepidermoid Ca, Acinar cell Ca, Squamous cell Ca), Lymphoma, Metastasis • Others: Intraglandular lymph nodes, Trauma, AV fistula 6. Management and follow-up • Role of CT and MRI in the further workup • Role of biopsy 7. Conclusion

## HNEE-25 Decoding Cystic and Cyst-Like Lesions in the Head and Neck: A Comprehensive Imaging Guide

Participants

Maria Lucia Brun, MD, OTTAWA, ON (*Presenter*) Nothing to Disclose

## TEACHING POINTS

- To identify the relevant imaging features of cystic and cyst-like lesions of the head and neck. - To describe the differential diagnosis of cystic and cyst-like lesions of the head and neck, based on imaging and anatomical location. - To learn the importance of incorporating relevant/pertinent clinical information in narrowing the differential diagnoses. - To recognize the course and potential complications associated with cystic and cyst-like lesions. - To suggest appropriate follow-up and recommend effective diagnostic workup.

## TABLE OF CONTENTS/OUTLINE

1. Introduction/Background 2. Role of Diagnostic Imaging- Ultrasound- CT - MRI 3. Approach based on location Once the cystic nature is confirmed? evaluate differential diagnosis according to location: - Anterior neck - Midline lesions: Parapharyngeal/pharyngeal cysts, Ranula, Thyroid cysts, Parathyroid cysts, thyroglossal duct cyst, thymic cyst, dermoid/epidermoid cyst. - Lateral - Paramedian lesions: Branchial cleft cysts, Lymphatic malformations, suppurative/caseating adenopathy (infectious/inflammatory), cystic adenopathy (thyroid cancer and HPV-related SCC). - Specific spaces: Salivary glands; entities which may present as a cyst in the salivary glands: Lymphoepithelial cysts, Epidermal inclusion cysts, Warthin tumor, Mucocele, etc. 4. Others- Not location-dependent: Lymphocele, Seroma, Abscesses. 5. Conclusion

## HNEE-26 Chew It All Up! Everything You Need to Know About Teeth

Participants

Bruna Gherardi, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

## TEACHING POINTS

The high prevalence of craniofacial trauma, sinus infection disease, and maxillo-mandibular procedures, among other conditions, frequently requires the interpretation of dental images in daily practice. Teeth can be the source or the extension of a pathologic process and therefore must not be overlooked by radiologists. Radiologists can use their knowledge of the main dental imaging findings in emergency radiology to add great value to image interpretation. In this study we will describe the anatomy of the structures surrounding the teeth. Identify the main dental alterations in the emergency or outpatient setting. Train the radiologist to look accurately at lesions, mainly inflammatory ones related to dental disorders.

## TABLE OF CONTENTS/OUTLINE

General and dental anatomy. Inflammatory conditions related to teeth as pericoronitis, periodontal disease, periapical abscess, dental sinusitis, facial cellulitis and abscess, orbital cellulitis, Ludwig's angina, dental trauma, complications of dental procedures like dental implants and extraction. Most common tumor and tumor-like lesions related to teeth. Take home messages.

## **HNEE-27 The Jugular Foramen: Approach to Tumoral and Non-tumoral Pathologies**

Participants

Yasovineeth Bhogadi, MD, Hamilton, ON (*Presenter*) Nothing to Disclose

### **TEACHING POINTS**

- Review the anatomy of the Jugular foramen- Understand the clinical presentations of various pathologies- Differential diagnosis to tumoral disease and approach- Non-tumoral disease entities

### **TABLE OF CONTENTS/OUTLINE**

- Review the anatomy of the Jugular foramen- Differential diagnosis of masses- Approach to tumoral masses- Non-tumoral disease entities

## **HNEE-28 Use Homemade Rice Bags to Improve the Image Quality of 3.0TMR Cervical Spine Enhancement Scans**

### **TEACHING POINTS**

1. Magnetic resonance cervical spine enhancement scan fat suppression current problems 2. To propose a method to improve image quality using rice bags

### **TABLE OF CONTENTS/OUTLINE**

1. Magnetic resonance cervical spine enhancement scan fat suppression current problems • Contrast-enhanced scans of the cervical spine are mainly performed using the T1WI adipose inhibition sequence to better visualize the lesions • But in the actual examination, due to the irregular geometry of the neck, the local magnetic field is uneven, and the fat suppression is often uneven, which affects the image quality and the display of lesions 2. A method to improve image quality using rice bags is proposed. • Rice bags are simple to make and low cost • Place a rice bag under the patient's neck and a rice bag above the neck without causing discomfort • Comparing conventional MRI scans with neck-filled rice bag scans, we found that the use of rice bags can eliminate artifacts, improve lipid uniformity, and improve image quality

## **HNEE-29 Parry-Romberg Syndrome and En Coup De Sabre: A Pictorial Review**

### **TEACHING POINTS**

(1) Parry-Romberg Syndrome [PRS] and En Coup De Sabre [ECDS] are defined by acquired progressive hemifacial atrophy. (2) Patients may present with headache, facial pain/paresthesia, or epilepsy. (3) Atrophy can affect unilateral periorbital, midface bones and soft tissues. (4) Atrophic tissue does not demonstrate signal change or enhancement as might be seen with denervation. (5) Intracranial manifestations may also be present, although facial involvement does not predict intracranial lesion severity.

### **TABLE OF CONTENTS/OUTLINE**
