

## RSNA Statement on Appropriate Utilization of Medical Imaging

Reviewed: 5/9/2024

*The Radiological Society of North America (RSNA) is committed to excellence in patient care through education and research.*

- Medical imaging has improved the quality of health care and made it safer by providing less invasive methods for diagnosis and treatment. Appropriate use of medical imaging remains a cornerstone of high-quality medical care.
- Radiologists are the physician specialists with imaging-focused education, training, and experience to provide patients with the safest, most effective medical imaging and most accurate diagnostic interpretations. Radiologists have the expertise to determine the right imaging examination and to perform it the right way, using appropriateness criteria and accepted practice guidelines. Potential benefits should outweigh risks for each imaging procedure that is performed.
- Radiologists perform imaging examinations ordered by patients' physicians or other providers based on the clinical needs of the patient. Recent studies have shown that the most significant growth in utilization of imaging procedures is due to imaging performed by non-radiologists.
- To explore opportunities to improve patient safety through appropriate utilization, quality assurance and dose optimization, the RSNA has partnered with the American College of Radiology (ACR), the American Association of Physicists in Medicine (AAPM) and the American Society of Radiologic Technologists (ASRT) to conduct the Image Wisely campaign. Image Wisely is designed to raise awareness and promote education about radiation protection for patients undergoing medical imaging examinations.
- [ImageWisely.org](http://ImageWisely.org), [ImageGently.org](http://ImageGently.org), and [RadiologyInfo.org](http://RadiologyInfo.org) all have patient-directed content, which answers common patient questions about risks and benefits of medical imaging procedures, along with information on radiation exposure, contrast materials, anesthesia, radiation therapy procedures and other safety concerns.
- Radiologists and medical physicists have worked together to improve the safety of imaging examinations by minimizing dose without sacrificing diagnostic quality or therapeutic effectiveness. Working with radiology equipment manufacturers, radiologic scientists are directly involved in the development of technologies and protocols to ensure patient safety in medical imaging scenarios.
- RSNA supports a requirement that all personnel involved in medical imaging and radiation therapy procedures performed on patients meet well defined educational and credentialing criteria. In addition, the RSNA supports the establishment of accreditation requirements for medical imaging and radiation therapy facilities, a radiation dose index registry, consistent and mandatory reporting methods for medical radiation errors, and inclusion of appropriate utilization criteria into order entry systems.

*RSNA is a strong advocate for quality, safety, equity and adherence to appropriateness criteria in medical imaging and radiation oncology. Through its peer-reviewed journals, education programs and annual scientific assembly, RSNA continually informs radiologists, medical physicists, radiation oncologists and other radiology professionals of the latest technologies and research developments designed to improve radiologist performance and enhance patient safety.*

*Through research and education, RSNA has been at the forefront of efforts to improve diagnostic accuracy and therapeutic effectiveness of medical imaging exams and procedures while minimizing radiation dose.*
