M4-PL02

### Plenary Session: Leading Through Technology: Valuing Artificial and Human Intelligence

Monday, Nov. 27 11:00AM - 12:00PM Room: Arie Crown

#### COURSE DESCRIPTION

Radiology has successfully led many technological revolutions. Mindful of challenges inherent in major change, we embark on another paradigm shift as Artificial Intelligence (AI) inexorably permeates clinical radiology practice ushering in another pivotal phase in the history of our specialty. Values-based leadership emphasizing patient well-being, accuracy, efficiency, transparency, and fairness will be crucially important. We must intentionally preserve core manifestations of human intelligence, especially those at the heart of patient care -- including judgment, transparency, and communication. Fostering lifelong learning across the entire radiology workforce to identify and advance the opportunities and recognize and call out the pitfalls of generative AI is mission critical. Human values like altruism, truth, and trust (i.e., equity, accuracy, and realized positive impact of diagnostic imaging and intervention) must drive leadership decision-making to forcefully mitigate the unintended consequences of this new human + AI paradigm as it develops. This plenary talk will invoke leadership models like functional leadership, servant leadership, and transformational leadership to develop a framework designed to maintain a culture of stakeholder empowerment, collaboration, and continuous learning to reap the benefits of this fast-paced AI-informed phase for which our specialty is poised.

### Image Interpretation Session

Monday, Nov. 27 4:30PM - 5:30PM Room: Arie Crown

C. Douglas Phillips, MD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) View a few interesting cases and hear them discussed by experts. 2) Learn a bit about some fellow RSNA members. 3) Learn some differential diagnostic points.

#### COURSE DESCRIPTION

Teaching through reviewing problematic and interesting cases from the prior year.

#### Sub-Events

##### **M8-PL03B Abdominal Imaging**

Aya Kamaya, MD (*Presenter*) Royalties, RELX; Research Grant, Canon Medical Systems Corporation

##### **M8-PL03C Cardiothoracic Radiology**

Prachi P. Agarwal, MD (*Presenter*) Nothing to Disclose

### RSNA/AAPM Symposium: Together We Can Make A Difference

Thursday, Nov. 30 11:00AM - 12:00PM Room: E450A

Guang-Hong Chen, PhD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Explain how the technological developers can work with clinical radiologists to impact current and future clinical care.

#### COURSE DESCRIPTION

Radiologists employ innovative imaging technologies to conduct clinical diagnoses, while developers specializing in medical physics and biomedical imaging relentlessly introduce new concepts and techniques to optimize patient care. However, outstanding ideas and technological notions do not always translate into clinically viable products for real-world practice. Consequently, technological innovators and clinicians must collaborate synergistically to realize a shared goal: enhancing patient care. For the past three years, this objective has been the focal point of the RSNA/AAPM Plenary sessions. This year, we aim to showcase another successful collaboration that brought total-body PET imaging to clinical practices.

#### Sub-Events

##### R4-PL07B Total Body PET Imaging (Technical)

Simon R. Cherry, PhD (*Presenter*) Research Grant, Canon Medical Systems Corporation; Researcher, Shanghai United Imaging Healthcare Co, Ltd; Support, Shanghai United Imaging Healthcare Co, Ltd;

S6-PL01

### President's Address and Opening Session

Sunday, Nov. 26 4:00PM - 5:30PM Room: Arie Crown

#### Sub-Events

#### S6-PL01A Leading Through Change

Matthew A. Mauro, MD (*Presenter*) Board Member, Boston Scientific Corporation; Investor, Medtronic plc; Investor, Bayer AG

#### LEARNING OBJECTIVES

Radiology has revolutionized medicine, embracing change and fostering progress by pursuing innovation that improves our ability to diagnose and treat patients more effectively and efficiently. Now, as the pace of change rapidly accelerates in the modern medical landscape, radiology's leadership in driving health care innovation becomes increasingly important. We are experiencing transformations in all facets of patient care, from our clinical knowledge base and technological capacities to modes of health care delivery and practice management. These transformations are happening at every level, in every country in the world, in academia and in private practice. Change is not only inevitable, but also necessary as we commit to continuous improvement for our practices and our patients. That is why leading teams through change in an uncertain healthcare environment is an essential skill for today's radiologist. To lead through change, we must first be able to identify when change is necessary. After identifying a need for change, we can form a clear strategic vision for moving forward. By effectively communicating that vision, we inspire others to join us in removing barriers to change and empowering our teams to work as one to achieve our goal. RSNA President Matthew A. Mauro, MD, will explore how radiologists, regardless of setting, can embrace and influence change among their teams and throughout the radiology community; and—in so doing—spark a renewed commitment to ingenuity and innovation among practitioners across multiple disciplines of patient care. By strengthening our foundation as leaders to address the transformative challenges of our specialty, radiologists will be well positioned to secure our future and advance health care for the good of our patients.

#### S6-PL01B History Never Repeats Itself, But It Does Often Rhyme

Howard B. Chrisman, MD (*Presenter*) Nothing to Disclose

#### LEARNING OBJECTIVES

"History never repeats itself, but it does often rhyme", is often mistakenly credited to Mark Twain. Regardless of the origin, the notion that events, discoveries and circumstances are "unprecedented", when evaluated more thoughtfully, turn out to have precedent. While the nature of disruptive events and change can be uncomfortable, it must be embraced by leaders. Is today's world more complex than the past, perhaps? But do we leaders need to thoughtfully embrace advancements such as Artificial Intelligence, I think so. And as radiologist, while many may suggest AI might lead us to irrelevancy, I would argue, like past challenges, we should be excited to continue to do what we do best, which is be agile and innovative.

### Plenary Session: The Future of Healthcare Delivery: Considerations for Patients and Providers

Tuesday, Nov. 28 11:00AM - 12:00PM Room: Arie Crown

#### COURSE DESCRIPTION

Technology has accelerated the transformation of healthcare, resulting in innovative new treatments and previously unimagined capabilities for keeping on top of our health and wellness. Having spent close to two decades at the forefront of efforts to advance public health, Harvard-trained specialist and leading healthcare futurist Dr. Vin Gupta possesses unparalleled insights into current and future healthcare trends; how your organization might be impacted by new advancements, technologies, and policies; and what you need to know in order to adapt accordingly.

### Plenary Session Game Show: Oncology Imaging and Interventions: The Radiology Jeopardy

Wednesday, Nov. 29 11:00AM - 12:00PM Room: Arie Crown

Julius Chapiro, MD, PhD (*Moderator*) Research Grant, Guerbet SA;Consultant, Guerbet SA;Research Grant, Boston Scientific Corporation;Consultant, AstraZeneca PLC;Consultant, Bayer AG

Anna Shapiro, MD (*Moderator*) Nothing to Disclose

Nikitha Murali, MD (*Presenter*) Nothing to Disclose

Anne Sailer, MD (*Presenter*) Nothing to Disclose

Mansur A. Ghani, MD (*Presenter*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Explore the latest advancements in oncology imaging modalities: Understand the recent breakthroughs in imaging technologies and their application in the diagnosis and staging of various malignancies. 2) Stay updated on evidence-based practice in radiation oncology: Review recent clinical trials that have influenced the standard of care and the implications of these findings on treatment decision-making and patient outcomes. 3) Gain insights into functional and molecular imaging: Learn about novel imaging techniques, including diffusion-weighted imaging (DWI), perfusion imaging, spectroscopy, and radiomics, and understand their utility in evaluating tumor heterogeneity, angiogenesis, metabolic activity, and treatment response. 4) Identify emerging trends in image-guided interventions: Discover the evolving role of interventional oncology in minimally invasive tumor treatments and understand the current challenges and future prospects in this domain. 5) Discuss the multidisciplinary approach to oncology imaging and interventions: Recognize the importance of collaboration among radiologists, oncologists, surgeons, and pathologists to optimize patient care through integrated imaging protocols, clinical decision support systems, and standardized reporting.

#### COURSE DESCRIPTION

The plenary session is a comprehensive educational opportunity that focuses on the latest developments, cutting-edge technologies, and emerging trends in the field of oncology imaging and intervention. Attendees will be provided with a rich learning experience that explores innovative imaging techniques and their impact on cancer diagnosis, treatment planning, and therapies presented in a game-show format with participation of leading experts in the fields of Diagnostic Radiology, Interventional Radiology, Radiation Oncology and Nuclear Medicine.

### RSNA Deep Learning Lab: Basics of NLP in Radiology (Beginner Friendly)

Sunday, Nov. 26 10:00AM - 11:00AM Room: Learning Center, Deep Learning Lab

Jae Ho Sohn, MD, MS (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Understand common terminology and preprocessing techniques in NLP. 2) Identify several classic and modern approaches used to capture semantic meaning in text. 3) Learn how to implement a basic NLP pipeline from preprocessing to performance evaluation.

#### COURSE DESCRIPTION

In Person Session Only. Tickets must be purchased in advance for this course. This course can be added through the registration portal or by stopping by the Registration Desk. Space is limited. This session will feature a brief lecture introducing the basics of natural language processing (NLP) and highlight potential uses for it in radiology. The goal is to survey standard text preprocessing techniques and traditional NLP approaches as well as modern neural network based approaches. We will follow up the didactic portion with a hands-on Google Colab demo implementing discussed concepts for a text classification task. For best experience, we highly recommend attendees bring a laptop with a keyboard as well as have a Gmail account to access Google Colab.

### **RSNA Deep Learning Lab: NCI Imaging Data Commons - Curated Data and Reproducible AI Workflows (Beginner Friendly)**

Monday, Nov. 27 10:30AM - 11:30AM Room: Learning Center, Deep Learning Lab

Andriy Fedorov, PhD (*Moderator*) Nothing to Disclose

#### **LEARNING OBJECTIVES**

- 1) Learn about the functionality of NCI imaging data commons related to selection and preparation of data cohorts for developing AI workflows.
- 2) Introduce the basic capabilities of IDC in support of development of reproducible AI workflows.
- 3) Experiment with the application of open source AI tools to public imaging datasets.

#### **COURSE DESCRIPTION**

In Person Session Only. Tickets must be purchased in advance for this course. This course can be added through the registration portal or by stopping by the Registration Desk. Space is limited. NCI Imaging Data Commons (IDC), <https://imaging.datacommons.cancer.gov>, is a cloud-based repository of publicly available cancer imaging data co-located with the analysis and exploration tools and resources. IDC contains over 40TB of publicly available images and image annotations spanning a variety of cancer types and modalities. Attendees of this course will learn how to search, visualize and download IDC data, and how to build reproducible and shareable analysis workflows using Google Colab. The educational format will combine a lecture followed by a hands-on component and interactive discussions to gain familiarity with this resource.

### RSNA Deep Learning Lab: ChatGPT - DICOM de-identification using ChatGPT (Beginner Friendly)

Monday, Nov. 27 12:00PM - 1:00PM Room: Learning Center, Deep Learning Lab

George L. Shih, MD, MS (*Moderator*) Consultant, MD.ai, Inc;Shareholder, MD.ai, Inc

#### LEARNING OBJECTIVES

1) Introduction to DICOM tags and PHI stored in these tags. 2) Explain the issues around DICOM de-identification (DeID) and provide examples of DeID tools. 3) Leverage Large Language Model (eg, ChatGPT / GPT-4) to create a script to assist with DICOM DeID. 4) Hands-On DICOM DeID using GPT-4 generated scripts. 5) Other ways to leverage GPT-4 for DICOM DeID. 6) DICOM Pixel DeID

#### COURSE DESCRIPTION

In Person Session Only. Tickets must be purchased in advance for this course. This course can be added through the registration portal or by stopping by the Registration Desk. Space is limited.Hands-On learning lab that leverages conventional and AI tools (LLMs like ChatGPT / GPT-4) to help with DICOM de-identification (DeID). Will practice DeID using scripts generated by LLMs and leverage GPT-4 in other ways for the de-identification process.

### RSNA Deep Learning Lab: NLP - Text Classification with RNN's Transformer's (Beginner Friendly)

Monday, Nov. 27 1:30PM - 2:30PM Room: Learning Center, Deep Learning Lab

Walter F. Wiggins, MD, PhD (*Moderator*) Advisor, Qure.ai;

#### LEARNING OBJECTIVES

- 1) Develop a general understanding of how large language models (LLMs) for natural language processing (NLP) are trained.
- 2) Define the basic concepts of NLP preprocessing for text analysis (e.g. tokenization, embedding).
- 3) Use embeddings from an LLM to classify chest x-ray reports as positive or negative for specific findings.

#### COURSE DESCRIPTION

In Person Session Only. Tickets must be purchased in advance for this course. This course can be added through the registration portal or by stopping by the Registration Desk. Space is limited. This interactive course will provide participants with the opportunity to learn the basic principles of information extraction from radiology reports by working through a step-by-step example using radiology reports from a chest x-ray data set. Learners will use a large language model (LLM) to classify radiology reports as positive or negative for specific findings. This session will cover basic concepts in preparing data and training LLMs, as well as using a pre-trained LLM to classify radiology reports. No prior coding or machine learning experience is necessary.

### **RSNA Deep Learning Lab: Accessing Freely Available Public Datasets from The Cancer Imaging Archive (TCIA) (Beginner Friendly)**

Monday, Nov. 27 3:00PM - 4:00PM Room: Learning Center, Deep Learning Lab

Justin Kirby (*Moderator*) Nothing to Disclose

#### **LEARNING OBJECTIVES**

1) Learn how TCIA makes data sharing easier for researchers and hear a summary of existing datasets that are freely available for download. 2) Practice utilizing TCIA for data exploration, cohort definition, and downloading of data. 3) Learn how to access public and restricted access datasets using TCIA's REST APIs and other command line tools via Jupyter Notebooks.

#### **COURSE DESCRIPTION**

In Person Session Only. Tickets must be purchased in advance for this course. This course can be added through the registration portal or by stopping by the Registration Desk. Space is limited. Access to large, high quality data is essential for researchers to understand disease and precision medicine pathways, especially in cancer. However HIPAA constraints make sharing medical images outside an individual institution a complex process. The Cancer Imaging Archive (TCIA) is a public service funded by the National Cancer Institute which addresses this challenge by providing de-identification and data publication services to take major burdens of data sharing off researchers. TCIA has published over 200 unique data collections containing more than 70 million images. Recognizing that images alone are not enough to conduct meaningful research, most collections are linked to rich supporting data including patient outcomes, treatment information, genomic / proteomic analyses, and expert image analyses (segmentations, annotations, and radiomic / radiogenomic features). In this course we will address basic use cases for identifying TCIA datasets of interest and downloading them via Jupyter Notebooks.

### **RSNA Deep Learning Lab: Zero-code Implementation of Federated Learning for Radiology Tasks (Beginner Friendly)**

Tuesday, Nov. 28 9:00AM - 10:00AM Room: Learning Center, Deep Learning Lab

Spyridon Bakas, PhD (*Moderator*) Nothing to Disclose

#### **LEARNING OBJECTIVES**

1) Identify the processes and tools used to curate and process raw DICOM imaging data. 2) Learn how to train a robust AI model with zero/low code. 3) Recognize the practical applications of the model, deploy it in a clinical setting, and leverage federated learning to train from other institutions' data.

#### **COURSE DESCRIPTION**

In Person Session Only. Tickets must be purchased in advance for this course. This course can be added through the registration portal or by stopping by the Registration Desk. Space is limited. This course aims to enable participants to conduct federated learning studies without writing any code. The main use case will focus on training and deploying a fully automated image segmentation model. The course will cover the end-to-end workflow to develop an AI model, starting from curating and preprocessing DICOM data all the way to using supervised and human-in-the-loop learning to train robust models. Finally, participants will learn how to deploy their models in the clinic and as federated studies. All the tools and code used will be open-source and be made available to the participants prior to the course.

### RSNA Deep Learning Lab: MIDRC - Building and using AI-ready Datasets from a Massive Open Data Commons (Beginner Friendly)

Tuesday, Nov. 28 10:30AM - 11:30AM Room: Learning Center, Deep Learning Lab

Adam E. Flanders, MD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Understand the genesis and development of the Medical Imaging and Data Resource Center (MIDRC). 2) Appreciate how an imaging based data commons that links to clinical metadata can accelerate machine learning research. 3) Experience how to build your own data cohort for AI research using the MIDRC publication platform - Gen3.

#### COURSE DESCRIPTION

In Person Session Only. Tickets must be purchased in advance for this course. This course can be added through the registration portal or by stopping by the Registration Desk. Space is limited. The Medical Imaging Data and Resource Center (MIDRC) is a multi-institutional effort supported by the AAPM, ACR and RSNA that is funded by the National Institute of Biomedical Imaging and Bioengineering (NIBIB) to collect and publish imaging and related clinical data to accelerate research into uses of imaging based AI. MIDRC provides a model for collecting and publishing data to support research that can be applied across all areas of medical imaging. MIDRC initially began in 2020 by aggregating hundreds of thousands of imaging studies of COVID-19 patients. MIDRC has now transitioned into collecting patient data relevant to post-acute sequelae of COVID or "long COVID" and will be pivoting into other medical use cases in the future. This session, led by principal investigators of MIDRC will give an overview of the structure of the MIDRC data commons and a tour of the open access data portal published on the Gen3 platform. During this session, attendees will have the opportunity to experience how to build a selected data cohort direct from the MIDRC data commons for AI research.

### RSNA Deep Learning Lab: MedNIST Exam Classification with MONAI (Beginner Friendly)

Tuesday, Nov. 28 12:00PM - 1:00PM Room: Learning Center, Deep Learning Lab

Bradley J. Erickson, MD, PhD (*Moderator*) Board of Directors, VoiceIt Technologies, LLC; Stockholder, VoiceIt Technologies, LLC; Board of Directors, FLOWSIGMA Inc; Officer, FLOWSIGMA Inc; Stockholder, FLOWSIGMA Inc; Officer, Yunu Inc; Stockholder, Yunu Inc

#### LEARNING OBJECTIVES

1) Collect, format, and standardize medical image data. Use MONAI transforms to pre-process data. 2) Architect and train a convolutional neural network (CNN) in Pytorch for classification. 3) Evaluate the trained model on test dataset.

#### COURSE DESCRIPTION

In Person Session Only. Tickets must be purchased in advance for this course. This course can be added through the registration portal or by stopping by the Registration Desk. Space is limited. Medical image classification plays an essential role in aiding clinical diagnosis and treatment. With the rapid development of artificial intelligence (AI) and computer vision (CV), deep learning-based methods become more accurate and applicable to a variety of clinical tasks ---- potentially serving as a valuable ally for radiologists and pathologists. In this course, learners will get a hands-on practical introduction to deep learning for radiology and medical imaging. An end-to-end training and evaluation example based on the MedNIST dataset will be covered. We will introduce the "MONAI" deep learning platform, which is a Pytorch-based, open-source framework for deep learning in healthcare imaging.

### RSNA Deep Learning Lab: Object Detection in Medical Imaging

Wednesday, Nov. 29 10:00AM - 11:00AM Room: Learning Center, Deep Learning Lab

Bradley J. Erickson, MD, PhD (*Moderator*) Board of Directors, VoiceIt Technologies, LLC; Stockholder, VoiceIt Technologies, LLC; Board of Directors, FLOWSIGMA Inc; Officer, FLOWSIGMA Inc; Stockholder, FLOWSIGMA Inc; Officer, Yunu Inc; Stockholder, Yunu Inc

#### LEARNING OBJECTIVES

1) To become familiar with the use cases for generative models in radiology. 2) To understand the strengths and weaknesses of GANS and DDPMS, with particular emphasis on diffusion models.

#### COURSE DESCRIPTION

In Person Session Only. Tickets must be purchased in advance for this course. This course can be added through the registration portal or by stopping by the Registration Desk. Space is limited. This course will introduce you to generative models for radiology. There will be a brief description of some of the technologies being used. We will then develop a more in depth investigation of diffusion models, including hands-on coding of a diffusion model for radiology image generation.

### RSNA Deep Learning Lab: Medical Image Generation

Wednesday, Nov. 29 11:30AM - 12:30PM Room: Learning Center, Deep Learning Lab

Bradley J. Erickson, MD, PhD (*Moderator*) Board of Directors, VoiceIt Technologies, LLC; Stockholder, VoiceIt Technologies, LLC; Board of Directors, FLOWSIGMA Inc; Officer, FLOWSIGMA Inc; Stockholder, FLOWSIGMA Inc; Officer, Yunu Inc; Stockholder, Yunu Inc

#### LEARNING OBJECTIVES

1) Identify the applications of generative adversarial networks (GANs) in Radiology. 2) Explain the general intuition behind GAN training. 3) Train a GAN-based model to create synthetic lesions to augment the real data.

#### COURSE DESCRIPTION

In Person Session Only. Tickets must be purchased in advance for this course. This course can be added through the registration portal or by stopping by the Registration Desk. Space is limited. Generative adversarial networks (GANs) have evolved over the past several years and are being widely used for faster image acquisition, image quality improvement, and data augmentation, among many other applications. This hands-on workshop will cover the theoretical bases of GAN training and its applications in Radiology and introduce some of the well-known algorithms in this field. Finally, we will train a GAN to create synthetic lesions for data augmentation.

### RSNA Deep Learning Lab: MONAI Core on Amazon SageMaker Studio Lab

Wednesday, Nov. 29 1:00PM - 2:00PM Room: Learning Center, Deep Learning Lab

Alex Lemm (*Moderator*) Nothing to Disclose  
Andrew Crabb (*Moderator*) Nothing to Disclose

#### COURSE DESCRIPTION

In Person Session Only. Tickets must be purchased in advance for this course. This course can be added through the registration portal or by stopping by the Registration Desk. Space is limited. Amazon SageMaker Studio Lab provides no-cost access to a JupyterLab-based machine learning development environment for everyone with an email address. MONAI Core is a PyTorch-based, open-source library for training deep learning models in medical imaging. In this workshop, we will provide a brief introduction to MONAI and its various components, including MONAI Auto3Dseg—a low-code tool that empowers developers to address the complex task of 3D medical image segmentation. Notably, a team of NVIDIA researchers utilized Auto3Dseg to achieve success in several MICCAI 2023 challenges. Participants will engage in hands-on experience by running several MONAI labs within their own SageMaker Studio Lab environment, which will be provided as part of the course. Towards the end, we will also discuss leveraging another service—Amazon SageMaker—for training your cutting-edge image models at scale.

### **RSNA Deep Learning Lab: Deploy Your Own Model in Huggingface**

Thursday, Nov. 30 10:30AM - 11:30AM Room: Learning Center, Deep Learning Lab

Felipe C. Kitamura, MD, PhD (*Moderator*) Consultant, MD.ai, Inc Speaker, General Electric Company Speaker, SPCC (Sharing Progress in Cancer Care)

#### **LEARNING OBJECTIVES**

1) Learn the fundamentals of deep learning by training a model in PyTorch. 2) Build and deploy a custom pneumonia classification model in Hugging Face.

#### **COURSE DESCRIPTION**

In Person Session Only. Tickets must be purchased in advance for this course. This course can be added through the registration portal or by stopping by the Registration Desk. Space is limited. Dive into applied deep learning in this focused, hands-on course. You'll directly engage with the process of constructing a pneumonia classification model in PyTorch and deploying it using the Hugging Face platform. This session emphasizes learning through action. You won't be lost in theory but rather immersed in the practical application of deep learning technologies.

### **Cardiac CT Mentored Case Review: Imaging The Heart: Imaging Techniques, Anatomy, and Function**

Monday, Nov. 27 8:00AM - 9:00AM Room: E450B

Jacobo Kirsch, MD, MBA (*Moderator*) Medical Advisory Board, Zebra Medical Vision Ltd

#### **LEARNING OBJECTIVES**

1. To recognize normal anatomic structures of the heart on cross sectional CT images. 2. To identify normal and abnormal appearance of cardiac valves and cardiac function on cardiac CT. 3. To describe techniques for optimizations of the coronary CTA images. 4. To identify signs of non-obstructive coronary disease on CTA.

#### **COURSE DESCRIPTION**

This is a session with four didactic presentations that will primarily help radiologists that are new to cardiac CT recognize normal anatomic structures and normal valvular and myocardial function on cardiac CT. In addition, the audience will learn technical optimizations that can be applied to cardiac CT to improve visualization of the coronary arteries and cardiac structures. Finally, an introduction to coronary artery disease without obstructive coronary lesions will be presented. The session is heavily case based, so audience can get familiar with the appearance of normal and diseased hearts on cardiac CT.

### Lung Cancer Multidisciplinary Tumor Board Meeting

Monday, Nov. 27 8:00AM - 9:00AM Room: S406B

Michelle S. Ginsberg, MD (*Moderator*) Speaker, Ultimate Opinions In Medicine LLC

#### LEARNING OBJECTIVES

1) To discuss the diagnosis and staging of lung cancer. 2) Discuss the current multidisciplinary management of lung cancer. 3) Discuss the role of imaging in the post-treatment evaluation.

#### COURSE DESCRIPTION

This case-based discussion will expose the attendees to multidisciplinary discussion when treating lung cancer, The panel will demonstrate specific imaging findings that directly affect staging and treatment decisions and will provide the audience with specific information they should include in their reports regarding description of findings during the management of lung cancer patients.

### Fundamentals of Abdominopelvic Trauma

Monday, Nov. 27 8:00AM - 9:00AM Room: E451B

Christina A. LeBedis, MD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Explore the role of CT, including CT protocols, in the diagnosis of patients who have sustained abdominopelvic trauma specifically with respect to pancreatic trauma, splenic trauma, and bowel and mesenteric trauma. 2) Identify key CT imaging findings in these organ injury types through case examples. 3) Discuss the imaging findings crucial to patient triage and management.

#### COURSE DESCRIPTION

In this didactic course on Abdominopelvic trauma, learn state-of-the-art imaging of pancreatic trauma, splenic trauma and bowel and mesenteric trauma from expert emergency radiologists. Radiologists at all levels of training will benefit from the material presented as it can be readily incorporated into their core knowledge base to care for acutely injured patients.

### The MIDRC Experience with Curating DICOM Images for use in AI Research

Monday, Nov. 27 8:00AM - 9:00AM Room: S401

Paul E. Kinahan, PhD (*Moderator*) Co-founder, PET/X LLC

#### LEARNING OBJECTIVES

1) Develop artificial intelligence (AI) methods with improved repeatability and reproducibility, a recognized need is for large, publicly available, and curated imaging data sets. 2) Near-universal adoption of the Digital Imaging and Communications in Medicine (DICOM) standard enables this goal using a well-defined common data model. 3) As useful as DICOM is, improvements are needed in harmonization and standardization to better achieve FAIR (Findable, Accessible, Interoperable, Reusable) principles, which we will describe.

### Imaging in Sports: Common Patterns of Muscle Injury

Monday, Nov. 27 8:00AM - 9:00AM Room: E450A

Emma L. Rowbotham, FRCR (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Knowledge of normal anatomy and anatomical variants in the key regions for sports injury – hamstring, calf, proximal thigh chest wall, and abdominal wall. 2) To become familiar with the common injury patterns in these regions. 3) To be able to describe the injury patterns accurately with emphasis on clinically relevant factors. 4) To have an awareness of the relevant grading systems – understanding both the strengths and weaknesses of grading of injuries.

#### COURSE DESCRIPTION

This is a sports imaging session based around common and interesting areas of sports injury. Experts in sports imaging will cover: Pectoralis major injury, hamstring, calf, proximal thigh and chest wall injuries. The series of short lectures will cover the anatomy and typical injury patterns for these commonly injured areas of the body, appearances of the usual injury patterns and description of associated grading systems used in these regions. Knowledge of sports specific injury is important in providing a clear report to the team and will aid the reporter in producing a clear, concise and helpful report.

### Clinical Trials Methodology Workshop Spotlight (Sponsored by the RSNA Research Development Committee)

Monday, Nov. 27 8:00AM - 9:00AM Room: S502

Janie M. Lee, MD, MSc (*Moderator*) Research Grant, General Electric Company; Investigator, General Electric Company  
Susanna I. Lee, MD, PhD (*Moderator*) Royalties, Wolters Kluwer nv

#### LEARNING OBJECTIVES

1) Review how and why clinical trial protocols change through the development process. 2) Learn about potential facilitators and barriers to launching a clinical trial initially “workshopped” at the CTMW course. 3) Learn key biostatistical lessons regarding trial design and data analysis directly from CTMW biostatisticians using the trials presented by the Principal Investigators.

#### COURSE DESCRIPTION

RSNA's Clinical Trials Methodology Workshop (CTMW) has provided first-class education in clinical trials methodology and has greatly expanded interest and successful efforts in radiology and radiation oncology clinical research. While previously available exclusively to those accepted to the in-person CTMW, this course will make accessible to all RSNA annual meeting attendees the rigor and expertise of the CTMW in a lecture course format. This course highlights the development of clinical trial protocols and pragmatic real world lessons from implementing them, presented by two alumni of the successful RSNA Clinical Trials Methodology Workshop, with biostatistical commentary from a course faculty member. The session will conclude with Q&A with the audience.

#### Sub-Events

### Stroke and Cerebrovascular: Current Imaging Markers and Future Horizons

Monday, Nov. 27 8:00AM - 9:00AM Room: E353C

Achala S. Vagal, MD (*Moderator*) Departmental Research Grant, Johnson & Johnson  
Mahmud Mossa-Basha, MD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Understand correct nomenclature of imaging of small vessel disease. 2) Identify imaging makers of pulsatility and arterial stiffness. 3) Identify and learn about the conventional and advanced imaging biomarkers of secondary ischemic stroke.

#### COURSE DESCRIPTION

Imaging provides essential insights into small vessel disease and for secondary stroke prevention. Radiologists must be aware of the correct terminology for small vessel disease. Further, the course will help learners to understand the various conventional and advanced imaging biomarkers of cerebrovascular disease and secondary ischemic stroke.

#### Sub-Events

### Case based Review of Crazy OB/GYN Cases

Monday, Nov. 27 8:00AM - 9:00AM Room: E451A

Anne M. Kennedy, MBBCh (*Moderator*) Author with royalties, RELX

#### LEARNING OBJECTIVES

1) Develop a logical, systematic approach to complex OB and GYN cases. 2) Identify strategies to reduce a broad differential to a specific diagnosis or a short list of likely options.

#### COURSE DESCRIPTION

This will be a case-based interactive session. We will present cases with multiple choice questions for audience response using Poll Everywhere. We will review the correct diagnosis with tips for problem solving and narrowing a lengthy, generic list of differential diagnoses down to more focused list relevant to the case in hand. For OB cases we will provide postnatal or autopsy confirmation and for GYN cases operative results and pathology confirmation. Attendees will have a better visual database of unusual OBGYN pathology and learn a practical approach to complex cases.

#### Sub-Events

Monday, Nov. 27 9:00AM - 10:30AM Room: S504CD

Margarita V. Revzin, MD, MS (*Moderator*) Nothing to Disclose

#### **LEARNING OBJECTIVES**

1) Identify essential scanning techniques in ultrasound evaluation of the carotid system and abdominal vasculature that ensure accurate assessment and diagnosis. 2) Explain changes in the arterial waveforms encountered in various pathological processes affecting the carotid system and abdominal vasculature. 3) Describe most accepted diagnostic criteria for significant diseases in the carotid and abdominal vascular systems.

#### **COURSE DESCRIPTION**

In Person Session Only. Tickets must be purchased in advance for this course. This course can be added through the registration portal or by stopping by the Registration Desk. Space is limited. This is a hands-on course which will provide a brief didactic review followed by detailed hands-on instructions of basic scanning techniques utilized in the evaluation of the carotid system and abdominal vasculature, including, aorta, IVC, hepatic, mesenteric, and renal systems. Main accepted sonographic criteria for significant diseases of the aorta and its branches and the carotid system will be described. Tips and tricks in scanning will also be provided.

**Creating Experiential Designs that Add Value and Improve Performance (Sponsored by the RSNA Associated Sciences Consortium) (Supported in part by an Unrestricted Medical Education Grant from GE Healthcare, Inc.)**

Monday, Nov. 27 9:30AM - 10:30AM Room: N230B

Morris A. Stein, BArch (*Moderator*) Nothing to Disclose  
Catherine Gunn, MBA, RT (*Moderator*) Nothing to Disclose  
Susie M. Moseley, MS, RT (*Moderator*) Nothing to Disclose

### LEARNING OBJECTIVES

1) Create design expectations and measure outcomes. 2) Learn from prototyping solutions. 3) Deliver new models of spatial and functional organization.

### COURSE DESCRIPTION

It is not just about designing rooms or departments, or detailing technology, but designing experiences that impact our patients, staff, and families. Seize the opportunity to learn from current disruptive forces and cast a design vision for the future. Now more than ever, design solutions are process oriented and data driven, beyond product or technology installed.

### Multi-modality Challenging Breast Cases

Monday, Nov. 27 9:30AM - 10:30AM Room: S406A

Bonnie N. Joe, MD, PhD (*Moderator*) Institutional Research Grant, Kheiron Medical Technologies Ltd; Institutional research agreement, General Electric Company; Institutional research agreement, Siemens AG

#### LEARNING OBJECTIVES

1) Recognize challenging cases that occur in screening to avoid delayed diagnosis of breast cancer. 2) Learn strategies for incorporating multi-modality breast imaging in the diagnostic setting. 3) Apply a skillful approach to radiologic-pathologic correlation in breast imaging.

#### COURSE DESCRIPTION

This course will use an interactive case-based review format presented by an international group of breast imaging experts and will be followed by a live question and answer session.

#### Sub-Events

##### M3-CBR04B Multi-Modality Challenging Cases in Diagnostics

### **Cardiac CT Mentored Case Review: Coronary Atherosclerotic Disease - From Straightforward to Most Complicated**

Monday, Nov. 27 9:30AM - 10:30AM Room: E450B

Carole A. Ridge, FFR(RCSI) (*Moderator*) Nothing to Disclose

#### **LEARNING OBJECTIVES**

1) Learn about the diagnostic methods which detect coronary calcifications, their clinical implications and management strategies. 2) Develop an understanding of atherosclerotic plaque analysis techniques. 3) Understand the components and categories of the CAD-RAD system and how apply it in clinical practice. 4) Become familiar with the key concepts and application of CT fractional flow reserve and myocardial perfusion.

#### **COURSE DESCRIPTION**

This course is a comprehensive synopsis of the complexities of quantitative and qualitative assessment of coronary artery disease, beyond liminal narrowing.

#### **Sub-Events**

M3-CER06

### GI causes of Acute Abdominal Pain: Case-Based Approach

Monday, Nov. 27 9:30AM - 10:30AM Room: E451B

Robin B. Levenson, MD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Review GI causes of acute abdominal pain that may be seen on imaging in the acute setting. 2) Identify key imaging findings seen in acute GI related conditions causing acute abdominal pain, including tricky bowel obstruction, hepatobiliary-related, and lower abdominal pain related cases. 3) Discuss potential diagnostic pitfalls.

#### COURSE DESCRIPTION

Patients presenting with acute abdominal pain can represent a diagnostic challenge. The differential diagnosis may be vast, ranging from minor to life-threatening conditions, and the clinical symptoms may be nonspecific. Radiologist familiarity with the potential range of imaging findings for cases of acute abdominal pain is important for optimal imaging diagnosis. In this case-based session, cases of acute GI-related conditions will be presented with discussion of pertinent imaging features. This includes cases of hepatobiliary conditions, tricky bowel obstruction, GI causes of lower abdominal pain.

### Imaging Ovarian Cancer: Radiologists as Partners in Cancer Care

Monday, Nov. 27 9:30AM - 10:30AM Room: N228

Evis Sala, MD, PhD (*Moderator*) Co-founder, Lucida Medical Ltd

#### LEARNING OBJECTIVES

1) Learn the current treatment paradigms available to patients with ovarian cancer. 2) Review the role of multi-modality imaging in treatment selection and planning of patients with ovarian cancer. 3) Highlight the potential added value of radiogenomics and AI in prediction of treatment response and outcome in patients with ovarian cancer.

#### COURSE DESCRIPTION

This course will provide a comprehensive review of the current and state of the art treatments for patients with ovarian cancer. It will review the role of multimodality imaging in treatment selection and planning focusing on the added value of various imaging modalities for detection of peritoneal implants that change management. It will also provide a glimpse into the future of personalized care by highlighting the role of artificial intelligence and radiogenomics in improving prediction of response to neoadjuvant chemotherapy and early detection of treatment resistance which determines patient outcome.

### Imaging of Endocrine Disease in the Head and Neck

Monday, Nov. 27 9:30AM - 10:30AM Room: S401

Francis Deng, MD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Implement a standardized risk-stratification system for reporting thyroid nodules on ultrasound. 2) Describe the typical and atypical imaging characteristics of thyroid cancer, parathyroid adenomas, and paragangliomas in the head and neck. 3) Identify clinically consequential findings during the imaging workup of thyroid nodules, thyroid cancer, hyperparathyroidism, and paragangliomas in the head and neck.

#### COURSE DESCRIPTION

This session offers an exploration of head and neck endocrine imaging, blending lectures with case studies and audience response. Topics include risk stratification of thyroid nodules using ACR TI-RADS and K-TIRADS, imaging approaches for thyroid cancer, parathyroid adenoma preoperative localization, and head and neck paragangliomas. Typical and atypical imaging examples will be shared, emphasizing differentiation from common mimics, interpretation pitfalls, and clinical management considerations with which radiologists should be familiar. Get ready to hone your interpretation skills to razor sharpness under the guidance of world experts!

### Managing Complications in IR

Monday, Nov. 27 9:30AM - 10:30AM Room: N229

Robert A. Morgan, MBChB, FRCR (*Moderator*) Proctor, Medtronic plc

#### LEARNING OBJECTIVES

1) Key imaging findings of complications of interventional radiology procedures. 2) How to decide which complications of interventional radiology procedures require treatment and which complications can be managed conservatively. 3) How to treat complications of interventional radiology procedures.

#### COURSE DESCRIPTION

The aim of this course is to describe the key complications of the wide range interventional radiology procedures including vascular, non-vascular and ablation procedures. Important imaging findings will be discussed and methods will be described regarding how to manage complications. Many complications will be presented and discussed in a case-based format and discussion after each lecture will be encouraged.

### Imaging Differentials of Hip and Groin Pain

Monday, Nov. 27 9:30AM - 10:30AM Room: E450A

Christopher F. Beaulieu, MD, PhD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Improve understanding of pre- and postoperative imaging for femoroacetabular impingement. 2) Learn to recognize clinically important tendon derangements about the hip and groin. 3) Assess the value of advanced imaging methods in acute hip trauma.

#### COURSE DESCRIPTION

This five part lecture course focuses on common, clinically important disorders associated with hip and groin pain. Attendees will hear from experts on key issues in assessment of femoroacetabular impingement, including how to assess the painful postoperative hip. Acute hip trauma will be highlighted including how to assess for bone marrow changes on CT as well as MRI in fracture diagnosis. Tendon disorders about the hip and pubis will also be covered, with an aim to understand which abnormalities are more likely to be clinically relevant.

### Musculoskeletal Imaging: When Molecular Imaging Helps

Monday, Nov. 27 9:30AM - 10:30AM Room: S406B

Kevin P. Banks, MD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) To review cases with musculoskeletal pathology and correlative imaging. 2) To discuss where/ when to use molecular imaging with an emphasis on malignancy, trauma, and infection. 3) To illustrate incidental findings and review what to do with them.

#### COURSE DESCRIPTION

This course will provide a review of when molecular imaging (including PET/CT and SPECT/CT) is most helpful in the evaluation of musculoskeletal pathology.

#### Sub-Events

##### **M3- CNMMI03B** Musculoskeletal PET: The Good, the Bad, and the Indeterminant

### **Pediatric Neuroradiology: Difficult Concepts Simplified for all Practices**

Monday, Nov. 27 9:30AM - 10:30AM Room: E451A

Tina Y. Poussaint, MD (*Moderator*) Nothing to Disclose

#### **LEARNING OBJECTIVES**

1) Acquire knowledge of the etiologies and risk factors associated with stroke in children and understand how imaging can aid in their diagnosis and management. 2) Interpret neuroimaging findings and genetic profiles to establish a comprehensive understanding of congenital brain malformations. 3) Recognize the role of neuroimaging and molecular profiling in the diagnosis and management of pediatric brain tumors.

#### **COURSE DESCRIPTION**

This is an educational session designed to provide in-depth knowledge and practical insights into three critical areas of pediatric neuroradiology: neuroimaging of pediatric stroke, neuroimaging of brain tumors, and neuroimaging of congenital brain malformations. Through lecture format and detailed discussion, participants will gain the necessary tools to accurately diagnose these entities on imaging ultimately improving patient care and outcomes.

### **Instability in PE-Backed Radiology Groups (Sponsored by the RSNA Associated Sciences Consortium)**

Monday, Nov. 27 11:00AM - 12:00PM Room: N230B

Jennifer Kroken, MBA (*Moderator*) Nothing to Disclose

#### **LEARNING OBJECTIVES**

1. Discuss market instability and where it has led to some high-profile bankruptcies—was this avoidable and is your group at risk? 2) Examine the role of various market pressures contributing to instabilities in this model.

#### **COURSE DESCRIPTION**

No doubt the growing trend in the past decade or so has been for radiologists to run to the “stability” of a private equity-backed group but the breakdown of some of very large groups has begun. Is this the beginning of a trend or just poor luck and market pressures meeting bad timing? We’ll examine the current events and predict your future.

### **Informatics and Patient Centered Care- Creating the Tools For a Better Radiology Experience (Supported in part by an Unrestricted Medical Education Grant from Siemens Healthineers of Siemens Medical Solutions, USA, Inc.)**

Monday, Nov. 27 11:00AM - 12:00PM Room: N229

Nina S. Vincoff, MD (*Moderator*) Nothing to Disclose

#### **LEARNING OBJECTIVES**

1) Explain the challenges and opportunities to make price transparency tools useful for patients. 2) Describe how informatics tools can minimize missed care opportunities. 3) Understand how to partner with a patient and family advisory council to develop informatics tools that improve patient experience.

#### **COURSE DESCRIPTION**

In this educational session and panel discussion, informatics innovations that improve the patient experience and promote patient and family centered care will be presented. Hot topics including price transparency, follow up recommendations and missed care opportunities, and incorporation of patient feedback into practice operations will be discussed. This session will present practical informatics solutions that can be implemented in a variety of radiology practice settings.

### 21st Century Cures Act Information Blocking Provision: Friend or Foe? - A Debate

Monday, Nov. 27 11:00AM - 12:00PM Room: E351

Jennifer L. Kemp, MD (*Moderator*) Stockholder, Scanslated, Inc

#### LEARNING OBJECTIVES

1) Recognize the potential benefits of patient access to radiology reports, including improved patient education, increased transparency, and the ability to make more informed healthcare decisions. 2) Evaluate the potential harms associated with patient access to reports that patients may not fully understand, including increased patient anxiety, confusion, and potential misinterpretation of medical information. 3) Explore the perspective of referring physicians from a large academic center on patients having immediate access to radiology reports, including potential benefits, concerns, and impact on patient care and the physician-patient relationship.

#### COURSE DESCRIPTION

In this thought-provoking course, we delve into the complex and controversial topic of the Information Blocking Provision within the 21st Century Cures Act. The course features three engaging lectures, each presenting a different perspective on the impact and implications of this provision. Through a lively debate-style format, we aim to explore the benefits, challenges, and potential unintended consequences of this regulatory change.

### **Preventing Workplace Violence: Guidance from the FBI Behavioral Analysis Unit (Sponsored by the RSNA Associated Sciences Consortium)**

Monday, Nov. 27 1:30PM - 2:30PM Room: N230B

Susie M. Moseley, MS, RT (*Moderator*) Nothing to Disclose  
Jennifer Kroken, MBA (*Moderator*) Nothing to Disclose

#### **LEARNING OBJECTIVES**

1) Define workplace violence. 2) Prevention and intervention programs. 3) Response and incident management. 4) Safe separation practices.

#### **COURSE DESCRIPTION**

This session is an in-person only session and will not be live streamed or available for on demand. Presenters: Special Agent Cassie Carnright, FBI Threat Management Coordinator Special Agent Eileen McChrystal, FBI Behavioral Analysis Unit Coordinator Preventing Workplace Violence is a 60-minute Federal Bureau of Investigation (FBI) Behavioral Analysis Unit (BAU) presentation for private-sector and corporate security managers on preventing targeted violence in the workplace. This presentation identifies systems for identifying and reducing risks of workplace violence. It introduces the concept of threat assessment threat management (TATM) and how to apply TATM principles to threat assessment investigations within your organization.

### Cardiac CT Mentored Case Review: Imaging of Post Coronary and Valvular Surgical and Trans Vascular Interventions

Monday, Nov. 27 1:30PM - 2:30PM Room: E450B

Kate Hanneman, MD, MPH (*Moderator*) Speaker, Groupe Sanofi; Speaker, Amicus Therapeutics, Inc

#### LEARNING OBJECTIVES

- 1) Describe cardiac imaging for pre and post TAVR planning.
- 2) Discuss and identify imaging for pre and post TMVR planning.
- 3) Discuss the Approach to Assessment of Coronary Stents/CABG Patency.

#### COURSE DESCRIPTION

Cardiac CT Mentored Case Review: Imaging of Post Coronary and Valvular Surgical and Trans Vascular Interventions

#### Sub-Events

##### M6-CCA13B Pre- TAVR Imaging

Amar B. Shah, MD, MA (*Presenter*) Nothing to Disclose

##### M6-CCA13C Post- TAVR Imaging

Cristina Fuss, MD, PhD (*Presenter*) Nothing to Disclose

##### M6-CCA13D Pre- and Post TMVR Imaging

Eric E. Williamson, MD (*Presenter*) Nothing to Disclose

##### M6-CCA13E Approach to Assessment of Coronary Stents/CABG Patency

Harold I. Litt, MD, PhD (*Presenter*) Research Grant, Siemens AG; Research Grant, Koninklijke Philips NV

### Fundamentals of Diffuse Lung Disease

Monday, Nov. 27 1:30PM - 2:30PM Room: E450A

David M. Naeger, MD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Evaluate chest CT images for the presence of diffuse lung disease. 2) Define key imaging features used to characterize diffuse lung diseases. 3) Formulate a differential diagnosis based on the presence or absence of key chest CT imaging features.

#### COURSE DESCRIPTION

This course will review four important topics needed to evaluate diffuse lung disease. The course is intended for radiologists re-reviewing the fundamentals of this important aspect of chest radiology. We will use didactic and case-based material to review how to evaluate consolidations and ground-glass opacities, cystic lung disease, mosaic lung attenuation, and micronodular lung disease.

#### Sub-Events

##### M6-CCH04B Cystic Lung Disease

Joanna G. Escalon, MD (*Presenter*) Research Consultant, Vingroup

##### M6-CCH04C Airspace Opacity

David M. Naeger, MD (*Presenter*) Nothing to Disclose

### GU Causes of Acute Abdominal Pain: Case-Based Approach

Monday, Nov. 27 1:30PM - 2:30PM Room: E451B

Refky Nicola, DO, MSc (*Moderator*) Royalties, RELX

#### LEARNING OBJECTIVES

1) To point out the role of CT and MRI in the management of patients with acute gynecological diseases. 2) To be able to identify the specific findings that help correctly classify the etiology of obstructive urinary symptoms, that are not always due to urolithiasis. 3) To be aware of the possible differential diagnoses of renal colic in patients with flank pain. 4) To know the imaging findings of infectious processes of the genitourinary system and the particularities of some of them to make a more accurate diagnosis. 5) To remember that postoperative patients, both urologic and non-urologic, are at high risk for damage to the urinary tract. 6) Do not ignore findings suggestive of this and perform special imaging protocols to properly characterize Scrotal and penile emergencies are relatively uncommon but need to be diagnosed and treated urgently. The focus of this talk is on imaging techniques, interpretation and differential diagnosis as well as on clinical pictures of non-traumatic causes of scrotal and penile emergencies.

#### COURSE DESCRIPTION

Discuss the common and uncommon causes of gynecological, genitourinary and scrotal emergencies. The session will focus on imaging findings on US, CT, and MRI.

#### Sub-Events

M6-CGI03

### Dual- and Multi-energy CT of the Abdomen and Pelvis

Monday, Nov. 27 1:30PM - 2:30PM Room: S406B

Benjamin M. Yeh, MD (*Moderator*) Grant, Koninklijke Philips NV; Grant, General Electric Company; Consultant, Canon Medical Systems Corporation; Speaker, Canon Medical Systems Corporation; Royalties, Oxford University Press; Shareholder, Nextrast, Inc; Board Member, Nextrast, Inc

#### LEARNING OBJECTIVES

1) Identify ways that multi-energy CT can improve clinical image interpretation. 2) Explain how to introduce multi-energy CT imaging to everyday clinical practice. 3) Describe advantages of photon counting CT for reducing radiation dose and medical errors. 4) Identify strategies for use of contrast agents with multi-energy CT.

#### COURSE DESCRIPTION

Multi-energy CT is increasingly utilized and the scanners are rapidly evolving. In particular, abdominal imaging benefits from the ability of multi-energy CT to emphasize iodine signal, differentiate iodine from non-iodine radiodensities, reduce artifacts, and improve lesion detection. This course will explore ways to adopt multi-energy CT in every day clinical practice. The basics of photon counting as they pertain to clinical imaging will be reviewed, and the advantages of photon counting CT for body imaging applications will be explored. New considerations for contrast agent usage for body applications in the setting of multi energy CT will be explored.

#### Sub-Events

##### M6-CGI03B Interpretation of Abdominal Pelvic Dual Energy CT in Clinical Practice

Bari Dane, MD (*Presenter*) Nothing to Disclose

##### M6-CGI03C Practical Clinical Adoption of Dual Energy CT

### Best Practices for AI Model Creation

Monday, Nov. 27 1:30PM - 2:30PM Room: S401

Benjamin W. Strong, MD (*Moderator*) Officer, Virtual Radiologic Corporation

#### LEARNING OBJECTIVES

1) Understand the principles involved in selecting, developing, and deploying artificial intelligence algorithms in radiology.

#### COURSE DESCRIPTION

This course will be comprised of 5 short 10-minute presentations on selecting, developing, and deploying AI algorithms, including deployment in private practice, academics, and through third-party platforms.

#### Sub-Events

##### **M6-CIN14B Focused Selection of AI Algorithms**

Benjamin W. Strong, MD (*Presenter*) Officer, Virtual Radiologic Corporation

##### **M6-CIN14C Practical Application of Platform AI**

### Cutting Edge HCC Management

Monday, Nov. 27 1:30PM - 2:30PM Room: S404

Julius Chapiro, MD, PhD (*Moderator*) Research Grant, Guerbet SA;Consultant, Guerbet SA;Research Grant, Boston Scientific Corporation;Consultant, AstraZeneca PLC;Consultant, Bayer AG

#### LEARNING OBJECTIVES

1) Explore the latest advancements in data science of HCC and familiarize themselves with breakthroughs in image-analysis, machine learning, and novel forms of outcome prediction and clinical endpoints relevant to HCC diagnosis and therapy. 2) Understand the role of a multi-disciplinary tumor board in a rapidly evolving landscape of novel ablative modalities, image-guided navigational support, therapy guidelines, and staging systems pertinent to HCC. 3) Gain insights into current recommendations and ongoing trials combining loco-regional therapies with immunotherapy of HCC, with focus on novel concepts in adjuvant, and neoadjuvant therapy. 4) Identify emerging trends in combining radioembolization and chemoembolization with immunotherapy across stages. 5) Discuss the multidisciplinary approach to oncology imaging endpoints, including novel tumor response assessment techniques and standards pertinent to targeted HCC therapies.

#### COURSE DESCRIPTION

The educational course session is a comprehensive learning opportunity that focuses on the latest developments, cutting-edge technologies, and emerging trends in the field of primary liver cancer interventions. Attendees will be provided with a rich learning experience that explores innovative imaging techniques, novel guidelines and therapeutics and their impact on hepatocellular carcinoma (HCC) management, with lectures provided by global experts in the field of image-guided intervention in HCC.

### **RSNA Hands-On Lab: Musculoskeletal Ultrasound: Approach to Ultrasound Assessment of the Shoulder with Dynamic Maneuvers**

Monday, Nov. 27 2:00PM - 3:30PM Room: S504CD

Viviane Khoury, BSc, MD (*Moderator*) Nothing to Disclose  
Linda Probyn, MD (*Moderator*) Nothing to Disclose

#### **LEARNING OBJECTIVES**

1) Review anatomy and ultrasound imaging techniques for evaluation of the shoulder. 2) Describe useful dynamic imaging techniques to enhance assessment of the shoulder. 3) Discuss ultrasound imaging of common pathologic musculoskeletal conditions at the shoulder.

#### **COURSE DESCRIPTION**

In Person Session Only. Tickets must be purchased in advance for this course. This course can be added through the registration portal or by stopping by the Registration Desk. Space is limited. This session will review an approach to ultrasound of the shoulder including dynamic maneuvers. Part 1: There will be a hands-on demonstration by an instructor showing an approach to ultrasound examination of the shoulder. This will include assessment of the long head of biceps tendon, rotator cuff tendons, acromioclavicular joint, subacromial/subdeltoid bursa, posterior labrum, spinoglenoid notch and will include dynamic evaluation for biceps subluxation and subacromial impingement. This will be followed by a brief presentation highlighting common pathologic musculoskeletal conditions about the shoulder that are seen on ultrasound. Part 2: The participants will be divided into small groups and will practice an approach to ultrasound of the shoulder on a model with an instructor teaching the participants. Proper patient positioning will be shown. Tips on how to optimize ultrasound imaging to best evaluate the area of concern will be discussed.

### **Multidisciplinary (Adult) Brain Tumor Board**

Monday, Nov. 27 1:30PM - 2:30PM Room: E451A

Javier Villanueva-Meyer, MD (*Moderator*) Research Grant, General Electric Company  
Rajan Jain, MD (*Moderator*) Nothing to Disclose

#### **LEARNING OBJECTIVES**

1) Explain the current standard of care for diagnosis and treatment of adult diffuse gliomas. 2) Demonstrate the importance of role various sub-specialists play in multidisciplinary tumor board.

#### **COURSE DESCRIPTION**

We will present mullite cases of adult diffuse gliomas in a setting similar to multidisciplinary tumor board. Each case will be discussed by a neuro-radiologist, followed by a neuropathologist and a neurosurgeon to enhance various aspects of multidisciplinary contribution to patient care. Each specialist will discuss pertinent important aspects of adult diffuse glioma diagnosis, treatment and surveillance.

### Leiomyosarcoma: Clinical Perspective and MRI Update

Monday, Nov. 27 1:30PM - 2:30PM Room: N227B

Nicole M. Hindman, MD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Review current clinical challenges for Gynecologists in surgical resection of symptomatic fibroids- role of laparoscopic myomectomy and morcellation. 2) Identify role of MR imaging in risk-stratification of uterine masses that have features suspicious for leiomyosarcoma. 3) Learn to apply an imaging flow chart to uterine masses to differentiate subtypes of uterine fibroids. 4) Review a management flowchart that balances preserving fertility with optimal treatment of suspicious uterine masses.

#### COURSE DESCRIPTION

The prevalence of uterine leiomyosarcoma is greater than previously believed, with the American College of Obstetricians and Gynecologists reporting a prevalence of 1 in 770 (0.1%). The high profile deaths of previously healthy women after iatrogenic spread of an unsuspected uterine leiomyosarcoma had reverberating effects in the gynecologic community and affected subsequent FDA policies around surgical techniques from 2014 to the present. MR imaging can serve as an important role in pre-operative risk stratification for symptomatic uterine fibroids that are planned for surgery. This course will review the background of this clinical need, and apply an MR imaging evaluation of fibroids and a proposed management algorithm.

### **Dose Calculation Tools for Fluoroscopic Imaging: An Overview of Their Development, Accessibility, and What Role They Play in Communicating and Managing Patient Risk**

Monday, Nov. 27 1:30PM - 2:30PM Room: N228

Emily Marshall, PhD (*Moderator*) Scientific Advisory Board, Bayer AG;Consultant, Bayer AG;Scientific Advisory Board, Radimetrics Dosimetry Services;Consultant, Radimetrics Dosimetry Services  
David Borrego, PhD (*Moderator*) Nothing to Disclose

#### **LEARNING OBJECTIVES**

1) Explain the limitations and challenges in estimating radiation dose to the patient.2) Evaluate the various dose metrics available and how these may be useful within their clinical workflow in communicating with patients and managing their risk.3) Discuss the current state and future needs of radiation dosimetry in the context of low-dose research studies and what role attendees may play as stakeholders in the field.

#### **COURSE DESCRIPTION**

There are several tools and resources available to estimate the amount of radiation delivered to patients during fluoroscopic imaging procedures. This session, with a special emphasis on pediatric fluoroscopic imaging, will provide an overview of the current state of radiation dosimetry, the challenges in estimating patient dose, and what role these tools may play in improving communication and the management of patient risk. Attendees will leave the course with a developed understanding of appropriate applications and limitations of radiation dose estimates and tools available for their own educational use. This course, delivered lecture style, will provide practitioners the background needed to confidently produce, explain, and contextualize patient dose and risk following fluoroscopic imaging procedures.

#### **Sub-Events**

### Radiography Quality Assurance

Monday, Nov. 27 1:30PM - 2:30PM Room: N229

Matt Vanderhoek, PhD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Define and examine the roles of technologists, QA techs, physicists, radiologists, and engineers with respect to quality assurance. 2) Recognize and describe methods of quality assurance for application to routine clinical practice. 3) Understand the importance of regular quality control testing in radiographic imaging and its impact on clinical image quality and patient radiation exposure. 4) Understand the principles and application of the IAEA's remote, automated quality control solution.

#### COURSE DESCRIPTION

Enhance your understanding of routine quality assurance (QA) practices in radiography through this two-part lecture. Emphasizing teamwork, this course delves into the roles and relationships of technologists, physicists, engineers, and radiologists pertaining to QA. The course examines the QA significance of routine tasks performed by technologists such as reviewing images for proper exposure, positioning, and artifacts to maintain high standards in image quality. Course participants also gain valuable insights into annual QA procedures performed by physicists. In addition, the course dives into the use of remote and automated tools as part of a quality assurance program. Participants explore the IAEA's novel solution for cost-effective, automated quality control using simple test objects and free software. A practical guide is provided on use of the IAEA dedicated software & supplementary material to ensure consistent and superior image quality.

### Neoplasias del Pancreas/Pancreatic Neoplasms (CIR)

Monday, Nov. 27 1:30PM - 3:00PM Room: E353C

Pablo Soffia, MD (*Moderator*) Nothing to Disclose  
Fatima Matute Teresa, MD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Learn how to diagnose the most common malignant tumors of the pancreas using computed tomography and magnetic resonance imaging. 2) Learn how to image pancreatic tumors undergoing chemotherapy treatment and how to differentiate fibrosis from recurrence. 3) Learn the radiological features of neuroendocrine neoplasms of the pancreas and how to differentiate them from other types of tumors. 4) Learn to detect and characterize the most frequent cystic neoplasms of the pancreas and what are their signs of aggressiveness and malignancy.

#### COURSE DESCRIPTION

In this course, attendees will be able to refresh their knowledge about pancreatic neoplasms and their different forms of presentation. The most frequent malignant neoplasms, such as adenocarcinoma, will be reviewed, emphasizing the criteria of resectability and irresectability. It will also discuss how to follow up these tumors after starting chemotherapy treatment and how to detect fibrosis from recurrences. A review of the diagnostic criteria for neuroendocrine tumors of the pancreas and expert recommendations for their detection and follow-up will be presented. Finally, the spectrum of cystic neoplasms of the pancreas will be shown, highlighting when aggressiveness or malignancy should be suspected.

### Shift Work and Mental Health Among R.T.s (Sponsored by the RSNA Associated Sciences Consortium)

Monday, Nov. 27 3:00PM - 4:00PM Room: N230B

Susie M. Moseley, MS, RT (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Discuss the current state of mental health in the United States and assess anxiety and depression among a working sample of radiologic technologists. 2) Evaluate the relationship between mental health and working various shifts, including weekends, and taking call. 3) Identify coping strategies used to deal with anxiety and depression.

#### COURSE DESCRIPTION

Shift work is essential in health care where 24-hour access and service are expected. Engaging in shift work, however, is associated with mental health issues like depression and anxiety. Shift workers are also at a high risk for adverse health outcomes, such as stroke, obesity, gastrointestinal issues, and various types of cancer. This lecture (a) emphasizes the importance of assessing and managing mental health among health care professionals and (b) shares results from an original research study that explored shift work and mental health among a sample of working medical imaging and radiation therapy professionals.

### Contrast Enhanced Mammography

Monday, Nov. 27 3:00PM - 4:00PM Room: S406A

Janice S. Sung, MD (*Moderator*) Research Grant, General Electric Company

#### LEARNING OBJECTIVES

1) Review how to perform contrast enhanced mammography (CEM) and considerations when starting a CEM program. 2) Discuss the emerging roles of contrast enhanced mammography in both the screening and diagnostic settings.

#### COURSE DESCRIPTION

Contrast enhanced mammography (CEM) is an FDA approved technique that is emerging as an alternative vascular based technique to conventional breast imaging and MRI in both the screening and diagnostic settings. This session will review considerations in beginning a CEM program and review data supporting the use of CEM in both the screening and diagnostic settings.

### Hot Topics in Emergency Radiology

Monday, Nov. 27 3:00PM - 4:00PM Room: E451B

Douglas S. Katz, MD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) To understand how emergency radiology practices are being covered following the COVID pandemic and how the paradigm has changed in Canada, the US, and elsewhere. 2) To review the current practice of peer review and peer learning in emergency radiology and how quality assurance in radiology has changed, with examples from recent practice. 3) To overview the current role of point-of-care ultrasound and to understand how radiologists, emergency medicine practitioners, and other clinical providers are utilizing ultrasound at the patient's bedside, and the implications for other imaging and patient practice.

#### COURSE DESCRIPTION

The ER 'hot topics' session will include three relevant current topics in emergency radiology practice: staffing given the challenges of COVID and following the COVID pandemic, with changes in practice and remote coverage; peer learning and peer review, with evolution of how quality assurance is being performed in emergency radiology and in radiology in general; and the current use of point-of-care ultrasound and how it fits in with emergency radiology practice during the day time and after hours, and the implications for other imaging and for coverage.

### Pancreatic Tumor Imaging

Monday, Nov. 27 3:00PM - 4:00PM Room: E350

Avinash R. Kambadakone, MD, FRCR (*Moderator*) Advisory Board, Bayer AG Research Grant, General Electric Company Research Grant, Koninklijke Philips NV Research Grant, PanCAN Research Grant, Bayer

#### LEARNING OBJECTIVES

1) Describe the key updates in the imaging diagnosis of pancreatic cancer. 2) Explain the current role of imaging in assessment of therapeutic response in pancreatic cancer. 3) Discuss the importance of structured reporting in pancreatic cancer and implications for patient management. 4) Review the current and emerging applications of artificial intelligence in pancreatic cancer. 5) Explain recent advances in pancreatic neuroendocrine tumor imaging.

#### COURSE DESCRIPTION

This course will review the current state-of-the-art and recent advances in imaging of pancreatic cancer and pancreatic neuroendocrine tumors. The attendees will also learn the role of structured reporting and emerging applications of artificial intelligence in pancreatic cancer.

#### Sub-Events

##### **M7-CGI04B Diagnosis and Staging of Pancreatic Cancer: State of the Art**

Avinash R. Kambadakone, MD, FRCR (*Presenter*) Advisory Board, Bayer AG Research Grant, General Electric Company Research Grant, Koninklijke Philips NV Research Grant, PanCAN Research Grant, Bayer

##### **M7-CGI04C Pearls and Pitfalls in Pancreatic Cancer Response Assessment**

### Cutting Edge GU-Specific Diagnostic Classification Systems

Monday, Nov. 27 3:00PM - 4:00PM Room: N227B

Nicola Schieda, MD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Integrate standardized reporting of GU body systems into clinical practice. 2) Appreciate the importance of newer GU classification systems including Bosniak v2019, O-RADS and VI-RADS.

#### COURSE DESCRIPTION

In this 5 speaker course, attendees will be given an introduction to the importance of standardized reporting and emerging GU classification systems including Bosniak version 2019, O-RADS and VI-RADS. Standardized reporting in general and the implications of artificial intelligence and machine learning on reporting in GU will be discussed.

#### Sub-Events

##### **M7-CGU01B Adding Value through Disease-Specific Structured Reporting**

Atul B. Shinagare, MD (*Presenter*) Consultant, VirtualScopics, Inc; Consultant, Imaging Endpoints

### **Best Practices for AI Model Regulation and Human-AI Collaboration (Supported in part by an Unrestricted Medical Education Grant from Siemens Healthineers of Siemens Medical Solutions, USA, Inc.)**

Monday, Nov. 27 3:00PM - 4:00PM Room: S401

Krishna Juluru, MD (*Moderator*) Nothing to Disclose

#### **LEARNING OBJECTIVES**

1) Describe the FDA clearance and approval process for AI models including the necessary steps, timelines, and costs. Attendees will gain an understanding of the regulatory landscape and learn how to access up-to-date information about FDA regulated AI models. 2) Examine regulatory compliance when implementing AI models in the healthcare setting. 3) Illustrate practical strategies for enhancing human-AI interaction.

#### **COURSE DESCRIPTION**

This course is part of the "Best Practices in AI" series, designed to assist practicing radiologists and administrators in comprehending and enhancing process related to AI regulation and human-AI interaction. The course is comprised of three lectures by industry experts followed by an open Q and A session. The discussion will focus on two key topics. The first two lectures will provide an overview of the FDA process, covering important aspects such as timelines, costs associated with FDA clearance/approval, how to access an up-to-date list of FDA regulated AI models, understanding clearance documents, and ensuring compliant with regulatory guidelines when implementing an AI model. The second topic and final lecture will explore strategies to optimize human-machine interaction. It will delve into methods for integrating AI capabilities with clinical intelligence (medical knowledge) to improve the accuracy of AI systems, enhance explainability of AI-generated results, and expedite the development of clinician trust in AI technology.

### High Resolution Imaging of Common Pathology in the Wrist and Hand

Monday, Nov. 27 3:00PM - 4:00PM Room: E450A

Hillary W. Garner, MD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Demonstrate the imaging features of common pathologies of the wrist and hand. 2) Explain the advantages and limitations of radiographs, ultrasound, CT, and MRI in the evaluation of hand and wrist pathology.

#### COURSE DESCRIPTION

Common pathologies of the hand and wrist will be demonstrated in a case-based lecture format using radiographs and ultrasound as well as high-resolution CT and MRI. Tips and tricks on how to hone the differential diagnosis will be incorporated. At the end of the session, the audience will have a better understanding of optimal imaging techniques for various hand and wrist pathologies.

### Reimbursement Issues: Updates in 2023

Monday, Nov. 27 3:00PM - 4:00PM Room: E351

Richard E. Heller III, MD (*Moderator*) Consultant, Gerson Lehrman Group, Inc;

#### LEARNING OBJECTIVES

1) Identify key changes to Medicare reimbursement, including both the physician fee schedule and the Quality Payment Program, that are relevant to radiology reimbursement. 2) Identify key issues with implementation of the No Surprises Act that are relevant to radiology reimbursement. 3) List actions that medical practices and physicians can take to help protect patients' access to high quality medical imaging.

#### COURSE DESCRIPTION

The session will provide updates on three important aspects of radiology reimbursement policy: the Medicare physician fee schedule, the Quality Payment Program (created by MACRA) and the No Surprises Act.

#### Sub-Events

##### **M7- CNPM15B Medicare Fee Schedule Update**

### Protecting the Innocent: Recognizing Child Abuse on Imaging

Monday, Nov. 27 3:00PM - 4:00PM Room: N228

Yoshino Tamaki T. Sameshima, MD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Differentiating metabolic bone disease and child abuse. 2) Develop an understanding of pathophysiology of neuroimaging findings in non-accidental trauma and recognize suspicious imaging findings. 3) Differentiating accidental and non-accidental abdominal injuries in children.

#### COURSE DESCRIPTION

This comprehensive series of lectures focuses on various aspects of child abuse recognition and diagnosis through imaging techniques. Participants will learn how to protect innocent children by recognizing signs of abuse on imaging, including skeletal injuries, head trauma, and abdominal injuries. The lectures cover differentiating between metabolic bone diseases and child abuse, identifying abusive head trauma and describing it accurately, as well as determining whether abdominal injuries in children are accidental or non-accidental. By acquiring these skills and knowledge, attendees will be better equipped to safeguard vulnerable children and provide appropriate care and intervention when necessary.

### **Diving Deeper from Diagnostics - Theranostics and Radiotherapeutics (Sponsored by the RSNA Associated Sciences Consortium)**

Monday, Nov. 27 4:30PM - 5:30PM Room: N230B

Nancy McDonald, MS (*Moderator*) Nothing to Disclose  
Napapong Pongnapang, BSc, PhD (*Moderator*) Nothing to Disclose

#### **LEARNING OBJECTIVES**

1) Identify the use of theranostic agents in cancer diagnosis, staging and treatment. 2) Explain operational and logistical needs to build your own Theranostics Program. 3) Gain a comprehensive understanding of theranostics and radiotherapeutics to contribute to the development and implementation of Radioligand Therapy Program.

#### **COURSE DESCRIPTION**

This program is designed to provide an in-depth understanding of the principles, techniques and applications of Theranostics and Radiotherapeutics in medicine. This interdisciplinary course explores the triaging, ancillary medications needed, billing and design of Radioligand Program.

#### **Sub-Events**

##### **M8-CAS05C Evolution of Radiotherapeutics**

Dena Abdelhameed, PharmD (*Presenter*) Nothing to Disclose

##### **M8-CAS05D Basics of Establishing a Radioligand Therapy Program**

Lyndsi Hay, MS, BS (*Presenter*) Nothing to Disclose

### Best Practices for AI Model Selection

Monday, Nov. 27 4:30PM - 5:30PM Room: S401

Judy W. Gichoya, MBChB, MS (*Moderator*) Consultant, Softbrew Digital LTD

#### LEARNING OBJECTIVES

1) Learn how to evaluate an AI model effectively in practice (accuracy, ROI, scalability). 2) Learn how to prioritize use cases of AI that work the best for your practice. 3) Learn about the AI Vendor Market Landscape.

#### COURSE DESCRIPTION

Join a panel discussion of experts to learn about strategies for AI model selection, pilot evaluation, and the overall market landscape.

#### Sub-Events

##### **M8-CIN16B How to Evaluate an AI Model (Accuracy, Reliability, ROI)**

Ryan K. Lee, MD, MBA (*Presenter*) Bayer, Speaker's BureauPhilips, Speaker's BureauBracco, Advisor

### Chest Imaging: When Molecular Imaging Helps

Monday, Nov. 27 4:30PM - 5:30PM Room: N227B

Ryan J. Avery, MD (*Moderator*) Research Consultant, Konica Minolta, Inc

#### LEARNING OBJECTIVES

1) A case-based review discussing the emerging of Molecular Imaging techniques, which can improve detection of ischemic heart disease, infiltrative cardiomyopathies, and inflammatory cardiomyopathies, with a focus on sarcoidosis. 2) Provide a discussion of new Molecular Imaging techniques that are available for routine clinical diagnosis of pathologies related to coronary artery disease and infiltrative/inflammatory cardiomyopathies. Further, the rationale of the examinations will be provided by explaining the medical and imaging sciences that necessitate when and how to perform these examinations. 3) The case-based approach will discuss the key imaging findings that can be used to improve diagnosis of cardiothoracic diseases. Given the novelty of these exams, a review of important incidental findings and imaging pitfalls will also be provided to improve examination implementation and interpretation.

#### COURSE DESCRIPTION

Imaging of the heart and lungs has increasingly become a multi-modality approach. With numerous recent advances in Molecular Imaging, physicians increasingly need an approach as to when hybrid or targeted Molecular Imaging examinations can confirm pathophysiologic processes affecting the Cardiothoracic system.

#### Sub-Events

##### **M8-CNMMI04B** Multimodality Perspective of Cardiac Sarcoidosis - Hybridizing FDG-PET and Cardiac MR Imaging

### Spotlight on Safety Net Hospitals, Health Disparities, and Unique Barriers to Rural Care (Sponsored by the RSNA Health Equity Committee and the RSNA Committee on Diversity, Equity and Inclusion)

Monday, Nov. 27 4:30PM - 5:30PM Room: N229

Lucy B. Spalluto, MD, MPH (*Moderator*) Nothing to Disclose  
Gwendolyn M. Bryant-Smith, MD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Explain the history of safety net hospitals in the United States and the role of these hospitals in current day healthcare. 2) Identify unique barriers to radiologic care for rural populations. 3) Discuss developing breast and lung cancer screening programs for underserved populations.

#### COURSE DESCRIPTION

This course will spotlight safety net hospitals, health disparities, challenges to providing care for underserved and rural populations, and strategies to overcome these challenges. Many physicians and other members of the health care team are unaware of the history and purpose of the safety net hospital system in the United States. The safety net hospital system addresses unique barriers to care that marginalized and diverse populations endure, including rural populations. Many health care team members have limited understanding of how safety net hospitals meet these challenges. This course will provide an opportunity to gain an understanding of unique barriers to care for marginalized populations, immigrant, rural, urban, and gender diverse groups so that we might improve and become more helpful during our physician-patient interactions.

### Clinical Implementation and Standardization of Proton Magnetic Resonance Spectroscopy

Monday, Nov. 27 4:30PM - 5:30PM Room: E353B

Yuxiang Zhou, PHD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Review the physical principles of magnetic resonance spectroscopy (MRS) and MRS pulse sequences. 2) Describe strategies to effectively acquire, analyze, and quantify the quality of MRS data. 3) Discuss emerging applications of MRS in clinical practice. 4) Provide MRS reporting standards and discuss future perspectives in clinical reality.

#### COURSE DESCRIPTION

Magnetic resonance spectroscopy (MRS) permits the quantification of metabolites within a diverse range of tissues and pathologies. This metabolic information has been shown to enable better diagnoses, personalized treatments, and rapid assessment of treatment response. However, implementation of MRS remains challenging and consistent acquisition of high-quality data remains difficult due to the lack of technical standardization. This session will provide experts' advice, consensus recommendations, standardization of MRS acquisition, analysis and reporting to improve MRS quality in routine clinical practice. First, this educational course will introduce the physical principles of MRS and describe the latest clinically available MRS pulse sequences. Next, this course will present strategies to effectively and consistently acquire high-quality MRS data, robustly analyze this data, and perform MRS quality management in routine clinical practice. Finally, this session will discuss established and emerging applications of MRS, reporting standards and future perspectives in clinical reality.

### The Academy for Radiology and Biomedical Imaging Research 2023 Imaging Shark Bait Session

Monday, Nov. 27 4:00PM - 5:30PM Room: S406B

Scott A. Penner, JD (*Moderator*) Spouse, Research Grant, General Electric Company; Spouse, Consultant, Human Longevity, Inc; Spouse, Stockholder, CureMetrix, Inc; Spouse, Stock options, Cortechs.ai

#### LEARNING OBJECTIVES

1) Identifying strategies for bringing research to the competitive marketplace. 2) Presenting a proposal in a way that elicits interest from potential investors. 3) Taking steps to secure investor funding while developing and protecting their intellectual property. 4) Identifying ways to generate business value through licensing and collaborations.

#### COURSE DESCRIPTION

This year, the Academy for Radiology & Biomedical Imaging Research's traditional Shark Tank program will shift from our traditional competition style format to a more inclusive and broader-reaching Shark Bait Session. We will welcome an expert panel composed of venture capitalists, an intellectual property attorney, leaders of industry & academia, and a former pitcher/entrepreneur that has successfully obtained funding. In this session attendees will learn what experts look for and expect when deciding to invest in an innovative idea, providing tips, shared experiences, and an opportunity to ask questions. If you have ever wondered how to pitch your idea or if you wish to consider alternative funding resources, do not miss this fun, educational, and interactive session!

### **Solving the Retention Problem: Addressing Moral Injury in Radiology Practice (Sponsored by the RSNA Quality Improvement Committee)**

Monday, Nov. 27 4:30PM - 5:30PM Room: N226

Bettina Siewert, MD (*Moderator*) Editor, Wolters Kluwer nv;Reviewer, Wolters Kluwer nv

#### **LEARNING OBJECTIVES**

1) Describe the impact of moral distress on radiologists' well-being and staff retention. 2) Identify the most common contributors to moral distress in radiologists. 3) Identify countermeasures to moral distress in radiology practice.

#### **COURSE DESCRIPTION**

18% of radiologists have left a position because of moral distress and 28% have considered doing. This course will explore the impact of moral distress on radiologists' well-being and explore its connection to burn-out. Common causes of moral distress will be discussed as well as countermeasures mitigating its impact. The course consists of five 10-minutes lectures with time for discussion. Participants will be provided with practical action items for implementation in their work environment to decrease moral distress.

### **Pregnancy in the Emergency Room, Collaborative Session OB/GYN and Multisystem**

Thursday, Nov. 30 8:00AM - 9:00AM Room: S406B

Peter M. Doubilet, MD, PhD (*Moderator*) Nothing to Disclose

#### **LEARNING OBJECTIVES**

1) Diagnose normal and abnormal intrauterine and ectopic pregnancy. 2) Diagnose or exclude placental abruption based on sonographic findings. 3) Understand how best to use imaging modalities in pregnant women who present to the emergency room following trauma.

#### **COURSE DESCRIPTION**

This course will cover the use of diagnostic imaging in evaluating pregnant woman who present to the emergency room. One focus will be on women who present following trauma, where the course will address the appropriate use of imaging modalities, including ultrasound and computed tomography, and approaches to diagnosis (including the FAST ultrasound exam). A second focus will be on women who present with emergency symptoms, most commonly pain or vaginal bleeding, in the first trimester, where the course will address diagnosis of ectopic pregnancy, miscarriage of intrauterine pregnancy, and ovarian torsion. The third focus will be on women who present with emergency symptoms in the second and third trimesters, where the course will address diagnosis of placenta previa or abruption, cervical shortening, and assessment of fetal well-being.

### Coronary Artery Calcium Opportunistic Screening with Real-World Implementation Experience

Thursday, Nov. 30 8:00AM - 9:00AM Room: S401

Ross W. Filice, MD (*Moderator*) Advisor, BunkerHill Health, Inc;Shareholder, BunkerHill Health, Inc;Speaker, General Electric Company;Speaker, Koios Medical;Researcher, Koios Medical

#### LEARNING OBJECTIVES

1) Understand the utility and expanded screening population enabled by this technology. 2) Learn about real-world implementation challenges, opportunities, and considerations. 3) Consider how to establish care pathways with cardiology and other specialties.

#### COURSE DESCRIPTION

Coronary artery calcium (CAC) scoring is one of the cornerstones of cardiology risk assessment providing an opportunity to intervene on patients at risk and to save lives. Artificial intelligence now allows us to reliably obtain a CAC score on routine non-gated chest CTs and establish care pathways for referral and treatment. Learn about the underlying technology but also important regulatory and deployment considerations as well as how to establish a care pathway with an important perspective from a cardiologist.

#### Sub-Events

### Acute Pulmonary Embolism and Venous Interventions

Thursday, Nov. 30 8:00AM - 9:00AM Room: E350

Robert A. Lookstein, MD, MSc (*Moderator*) Consultant, Boston Scientific Corporation; Consultant, Medtronic plc; Consultant, Penumbra, Inc; Consultant, ShockWave Medical

#### LEARNING OBJECTIVES

1) Review the evidence base for endovascular management of venous thromboembolism. 2) Discuss the current status of prospective research related to the endovascular management of venous thromboembolism.

#### COURSE DESCRIPTION

Endovascular Therapy is increasingly being utilized to treat patients with symptomatic venous thromboembolism (Acute Pulmonary Embolism and Deep Vein Thrombosis). A number of prospective research trials are currently underway or are being planned to define the exact role of this growing practice. A diverse faculty will review the current evidence base and give insight for the data needed for the future.

### From Skin to Bone: Imaging of Infection

Thursday, Nov. 30 8:00AM - 9:00AM Room: N229

Erin F. Alaia, MD (*Moderator*) Biorez Inc, Consultant

#### LEARNING OBJECTIVES

1) To recognize the characteristic imaging findings of bone and soft tissue infection. 2) To review important pearls and common pitfalls in the diagnosis of musculoskeletal infection.

#### COURSE DESCRIPTION

This course will include lectures which review in detail the imaging of musculoskeletal infection. The attendee will gain understanding of the imaging of osteomyelitis, chronic bone infection, and spine infection, as well as joint, tendon sheath, bursa, and soft tissue infection.

#### Sub-Events

##### R1-CMK09B Imaging of Osteomyelitis

### **Mentorship, Sponsorship and Coaching: Not Just for Early Career (Sponsored by the RSNA Committee on Diversity, Equity and Inclusion)**

Thursday, Nov. 30 8:00AM - 9:00AM Room: E351

Judy Yee, MD (*Moderator*) Research Grant, General Electric Company  
Charlotte J. Yong-Hing, MD, FRCPC (*Moderator*) Nothing to Disclose

#### **LEARNING OBJECTIVES**

1) Understand the importance of using mentorship, sponsorship and coaching to help decrease the loss of mid career women and URiM in radiology.2) Identify the challenges of invisible minorities including LGBTQ radiologists and how we can provide support.3) Learn how to implement institution and department specific strategies to assure that all radiologists thrive after hire.

#### **COURSE DESCRIPTION**

The percentage of women and URiM faculty in radiology has remained stagnant despite an increase in medical school matriculants who have been traditionally underrepresented. There is a distinct need to increase the number of women and URiM entering radiology and to assure that they receive appropriate mentorship, sponsorship and coaching to succeed and to be promoted to higher ranks. This session will focus on the mid-career leaky pipeline that occurs for women and URiM and will provide potential solutions. The perspective of invisible minorities including LGBTQ faculty will be provided and how we can also provide support. Because institutions can be quite different, understanding the local culture is key to successfully implementing strategies to help with fixing the leaky pipeline.

### AI in Pediatric Radiology: What is a Reality Now and in the Near Future

Thursday, Nov. 30 8:00AM - 9:00AM Room: E450A

David B. Larson, MD, MBA (*Moderator*) Research Grant, Siemens AG ;Advisor, Bunkerhill Health;Shareholder, Bunkerhill Health

#### LEARNING OBJECTIVES

1) Learn about how both interpretive and non-interpretive AI tools can help improve efficiency and productivity in a pediatric radiology practice. 2) Understand why AI designed for adults may not be expected to perform similarly in pediatric patients and what may be done to mitigate this risk.

#### COURSE DESCRIPTION

We will explore the current state of understanding regarding benefits, challenges, and risks in implementing AI in a pediatric radiology practice, including risks associated with the use of AI models trained on adults applied to pediatric populations. The session will feature four expert presenters followed by a panel Q&A.

#### Sub-Events

### Deep Learning in MRI

Thursday, Nov. 30 8:00AM - 9:00AM Room: S402

Fang Liu, PhD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Explain the current clinical applications of deep learning in MRI. 2) Understand the basic methods applied in rapid MRI and MRI analysis.

#### COURSE DESCRIPTION

This course offers an overview of present deep learning (DL) techniques for MRI, including an introduction to DL principles in rapid image acquisition, reconstruction, post-processing, and analysis. Speakers will deliver a review of current DL utility and impact in clinical MRI, for example, musculoskeletal imaging, and an outlook on challenges and future directions of DL in MRI translational and clinical applications.

### Artificial Intelligence (AI) in Medical Imaging - The Pathway to Translation (Translational Research Educational Course (TREC) (Sponsored by the RSNA Research Development Committee)

Thursday, Nov. 30 8:00AM - 9:00AM Room: N228

J. Brian Fowlkes, PhD (*Moderator*) Research Grant, Koninklijke Philips NV; Equipment support, General Electric Company  
Shadi Abdar Esfahani, MD, MPH (*Moderator*) Scientific Advisory Board, RefleXion Medical Inc; Scientific Advisory Board, ImaginAb, Inc; Scientific Advisory Board, General Electric Company; Scientific Advisory Board, Trevarx Biomedical, Inc; Consultant, General Electric Company; Spouse, CEO, Trevarx Biomedical, Inc; Spouse, Owner, Trevarx Biomedical, Inc

#### LEARNING OBJECTIVES

1) Describe the current landscape for translating new AI tools to the clinic. 2) Understand aspects needed to move a new AI tool from an academic research lab to a commercial product. 3) Recognize essential needs of startup companies in this environment.

#### COURSE DESCRIPTION

This 1-hour session is designed to address the knowledge gap concerning guiding researchers to successfully translate research into clinical practice. This year it will provide a specific example on Artificial Intelligence (AI) as applied to robotics for image-guided intervention in the context of a startup company. This course will cover some of the steps needed such as developing the idea, assessing the clinical need, commercial demand, securing funding, making a team of collaborators to translate and commercialize the product. These topics will be addressed by speakers with expertise on different aspects of translational imaging research in the context of AI. The format will be presentations by 1) Translational clinician-investigator involved in the AI tool development and testing, 2) Computer/data scientist that helped develop the AI tools used and 3) the company CEO considering the commercialization, regulatory approval and marketing, with a Q&A panel session. The outcome of the course will be to provide the audience with a representative example of such translation efforts and the opportunity to discuss with the speakers their experiences.

### Localization and Biopsy Techniques for the Breast

Thursday, Nov. 30 9:30AM - 10:30AM Room: N229

Sarah M. Friedewald, MD (*Moderator*) Consultant, Hologic, Inc;Research Grant, Alphabet Inc

#### LEARNING OBJECTIVES

1) Identify different ways to optimize tomosynthesis, US and MRI guided biopsies. 2) Appreciate different methods of image guided localizations, and understand their strengths and limitations.

#### COURSE DESCRIPTION

In this course, the attendee will learn the basics of DBT, US and MRI guided biopsies as well as different localization techniques. The most recent literature supporting these techniques will be reviewed. Additionally, through imaging examples, different scenarios will be presented that the radiologist may encounter during these procedures. A practical guide on how to troubleshoot various issues that might arise will be presented.

### Lung Cancer Screening

Thursday, Nov. 30 9:30AM - 10:30AM Room: E450A

Caroline Chiles, MD (*Moderator*) Advisory Board, AstraZeneca PLC

#### LEARNING OBJECTIVES

1) Recognize important additions to Lung-RADS 2022. 2) Understand how radiologists can optimize the risk: benefit ratio in their lung cancer screening patients. 3) Compare human intelligence and artificial intelligence in the interpretation and reporting of lung screening CT. 4) Appreciate the need for lung nodule tracking tools in lung cancer screening and incidental pulmonary nodule programs.

#### COURSE DESCRIPTION

Lung-RADS 2022 contains significant revisions that, in part, move suspected infectious lesions to “Lung-RADS 0, incomplete” rather than Lung-RADS 4, suspicious, allow juxtapleural nodules the same assessment as perifissural nodules, and define a Stepped Management to the follow-up of nodules. CT screening for lung cancer can reduce lung-cancer specific mortality, but this benefit must be weighed in each patient against potential risks. We describe how radiologists can mitigate the risks associated with CT screening. As the number of lung screening CTs increases, radiologists may benefit from artificial intelligence that can not only identify nodules but also provide risk assessment. Appropriate follow-up of lung nodules is necessary for the early detection of lung cancer. Tools for tracking lung nodules are essential for successful lung nodule management in lung cancer screening and incidental pulmonary nodule programs.

Fiona M. Fennessy, MBBCh, PhD (*Moderator*) Consultant, Imaging Endpoints II LLC

#### LEARNING OBJECTIVES

1) Understand the current and future roles of targeted molecular imaging in improving GU cancer diagnosis, treatment planning, and surveillance. 2) Understand when and how to use a radiofrequency needle track cautery device to prevent bleeding or tumor track seeding during abdominal biopsies. 3) Identify the benefits and limitations of AI in improving workflow efficiency and patient outcomes in GU imaging.

#### COURSE DESCRIPTION

This course will provide participants information on how the future of GU imaging looks, outlining new MR, molecular, interventional and AI imaging pathways, and demonstrate how these will have the potential to improve accuracy and efficiency of complex GU imaging.

#### Sub-Events

##### R3-CGU06B Artificial Intelligence

Andrew D. Smith, MD, PhD (*Presenter*) Owner, AI Metrics LLC;Chairman, AI Metrics LLC;Officer, AI Metrics LLC;Patent agreement, AI Metrics LLC;Owner, Radiostics LLC;CEO, Radiostics LLC;Speaker, Canon Medical Systems Corporation;Patent holder, AI and Image Processing Algorithms

### Revolution in Alzheimer's Disease Therapy is Finally Here: What does the Radiologist Need to Know

Thursday, Nov. 30 9:30AM - 10:30AM Room: S403A

Katherine A. Zukotynski, MD, PhD (*Moderator*) Research Consultant, Konica Minolta, Inc; Research Consultant, General Electric Company; Speakers Bureau, Jubilant DraxImage Inc

#### LEARNING OBJECTIVES

1) Understand the roles of amyloid PET and MRI in the treatment protocol for anti-amyloid therapy. 2) Review appropriate use criteria of amyloid PET in the era of anti-amyloid therapy. 3) Discuss the neurologist's perspective on what the radiologist/ nuclear medicine physician needs to know.

#### COURSE DESCRIPTION

We are on the cusp of a revolution in dementia therapy. In particular, new anti-amyloid therapy may have a meaningful impact in slowing cognitive impairment. Neurologists, neuroradiologists and nuclear medicine specialists will play key role determining the impact of this therapy.

#### Sub-Events

##### **R3-CNMMI05B Introduction to PET Biomarkers for Alzheimer's Disease**

Katherine A. Zukotynski, MD, PhD (*Presenter*) Research Consultant, Konica Minolta, Inc; Research Consultant, General Electric Company; Speakers Bureau, Jubilant DraxImage Inc

### Reimagining Academia

Thursday, Nov. 30 9:30AM - 10:30AM Room: E351

Saurabh Jha, MBBS, MRCS (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Identify challenges faced with recruitment and retention in academia. 2) Explain how these challenges can be met through orthodox and novel operational approaches.

#### COURSE DESCRIPTION

With growing radiologist shortage, increasing hospital consolidation, and growth of teleradiology, the academic landscape looks very different today from twenty years ago. How does academia maintain its traditional mission and yet support high clinical output in a competitive market without the faculty suffering burnout?

#### Sub-Events

##### **R3- CNPM13B**      **Leveraging Teleradiology for Academic Medical Centers**

### Dysfunctional Uterine Bleeding

Thursday, Nov. 30 9:30AM - 10:30AM Room: S502

Liina Poder, MD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Define normal and abnormal uterine bleeding in premenopausal, pregnant and postmenopausal patients. 2) Outline etiologies of abnormal uterine bleeding in premenopausal, pregnant and postmenopausal patients. 3) Explain the role of appropriate imaging algorithms in different clinical scenarios.

#### COURSE DESCRIPTION

This course will enhance skills in formulating accurate and comprehensive radiology reports for patients with dysfunctional uterine bleeding throughout the life cycle. Structural and nonstructural causes of dysfunctional uterine bleeding in premenopausal: pregnant, non pregnant and in postmenopausal patients will be reviewed. A detailed explanation of appropriate imaging approach including US, CT, MRI, Hysterosalpingography will be provided for all entities involving the premenopausal, pregnant and postmenopausal patients who present with dysfunctional uterine bleeding. After completion of this course the attendees will have a comprehensive understanding and have developed an expertise in most common causes to rare etiologies of dysfunctional uterine bleeding.

### Musculoskeletal Case Based Multidisciplinary Review

Thursday, Nov. 30 9:30AM - 10:30AM Room: E450B

Edward Y. Kim, MD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Expose the attendees to multidisciplinary discussion when treating sarcomas and other musculoskeletal malignancies. 2) Demonstrate specific imaging findings that directly affect staging and treatment decisions. 3) Provide the audience with specific information they should include in their reports that directly affect prognosis and management.

#### COURSE DESCRIPTION

This multidisciplinary panel will discuss a series of challenging soft tissue and bone sarcoma cases. The session will highlight the importance of imaging in the diagnosis and treatment of these rare tumors. Panelists will represent radiology, orthopedic oncology, medical oncology, and radiation oncology.

#### Sub-Events

### Multimodality Thoracic Aortic Imaging: What the Radiologist and Surgeon Need to Know

Thursday, Nov. 30 9:30AM - 10:30AM Room: S403B

Kate Hanneman, MD, MPH (*Moderator*) Speaker, Groupe Sanofi; Speaker, Amicus Therapeutics, Inc  
James C. Carr, MD (*Moderator*) Institutional Research Grant, Siemens AG; Advisory Board, Siemens AG; Travel support, Siemens AG; Institutional Research Grant, Bayer AG; Advisory Board, Bayer AG; Travel support, Bayer AG; Speaker, Bayer AG; Institutional Research Grant, Guerbet SA; Advisory Board, Bracco Group

#### LEARNING OBJECTIVES

1) Describe key aortic imaging findings for the radiologist including measurements. 2) Discuss imaging findings and reporting from the surgeons perspective. 3) Identify aortic imaging findings for interventional planning and post-intervention evaluation.

#### COURSE DESCRIPTION

This educational course will discuss aortic imaging from the perspective of the surgeon, diagnostic radiologist, and intervention radiologist.

### **MR Safety: Case Based Approach to Scanning Patients with Active Implants (Sponsored by the RSNA Quality Improvement Committee)**

Thursday, Nov. 30 9:30AM - 10:30AM Room: N230B

William F. Sensakovic, PhD (*Moderator*) Nothing to Disclose  
Samuel J. Fahrenholtz, PhD (*Moderator*) Stockholder, Nano X Imaging

#### **LEARNING OBJECTIVES**

1) Identify safety issues related to active implants. 2) Describe strategies to meet implant scanning requirements. 3) Review considerations for scanning off-label. 4) Understand actions to take when a safety incident occurs.

#### **COURSE DESCRIPTION**

Description of Program: A unique challenge to MR safety is the logistics of managing patients with active implants due to the diversity of device safety labeling and large number of requested exams. In this session, there are four talks presenting case-based examples of managing patients with active implants. These talks progress from initial screening, to MR scanning protocol modifications, to off-label considerations, to managing safety events.

#### **Sub-Events**

### Breast Screening Update

Thursday, Nov. 30 11:00AM - 12:00PM Room: E450B

Thomas H. Helbich, MD, MBA (*Moderator*) Grant, Siemens AG; Grant, Bracco Group; Grant, Guerbet SA; Grant, Hologic, Inc; Grant, Novomed GmbH

#### LEARNING OBJECTIVES

1) To provide an update on breast screening strategies in the US, Canada, Europe and Australia. 2) To be aware how AI, supplement screening and screening with tomosynthesis has been introduced in these countries.

#### COURSE DESCRIPTION

Build your knowledge with top experts on different screening programs in US, Canada, Europe, and Australia. At the completion of the session, attendees should understand the current up to date thinking about screening programs and how their different approaches impact results and outcome.

#### Sub-Events

##### R4-CBR13B Status of Screening in USA

### Cardiac Transcatheter Intervention: The Whole Journey from Planning to Fixing it

Thursday, Nov. 30 11:00AM - 12:00PM Room: N226

Prabhakar Rajiah, MD, FRCR (*Moderator*) Nothing to Disclose  
Phillip M. Young, MD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) To become familiar with the more common structural heart interventions and the role of CT in pre-procedural planning. 2) To understand potential complications of these interventions and the role of imaging in post-procedural care.

#### COURSE DESCRIPTION

Several speakers will review current state-of-the-art imaging for procedural planning and followup. Radiologists should come out with a better understanding of how to support this rapidly growing field.

#### Sub-Events

### Scary Stories Told in the Dark: Nightmare on Night Float - Trauma Cases

Thursday, Nov. 30 11:00AM - 12:00PM Room: S406B

Laura L. Avery, MD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

- 1) Learners will improve time to recognition of traumatic diagnoses, helping to establish dominance over the trauma team.
- 2) Learners will gain confidence with tricky trauma diagnoses decreasing the learner's fight-or-flight response to trauma cases.
- 3) Learners will enjoy entertaining trauma cases, never let the truth get in the way of a good story.

#### COURSE DESCRIPTION

As your grandmother said, "Nothing good happens after midnight, the only thing open is the 7-11 and trouble". Unfortunately, you are on the receiving end of bad choices resulting in full-body CT scans. Spend an hour reviewing rapid-fire trauma cases with an emphasis on tricky traumatic injuries.

### Colorectal Imaging

Thursday, Nov. 30 11:00AM - 12:00PM Room: N227B

Judy Yee, MD (*Moderator*) Research Grant, General Electric Company

#### LEARNING OBJECTIVES

1) Explain the disparities in colorectal cancer screening and how CT Colonography can be used to improve health equity. 2) Provide best practices for state-of-the-art CTC technique. 3) Understand MRI staging and reporting of rectal cancer and evaluation following neoadjuvant treatment.

#### COURSE DESCRIPTION

The drivers of disparities in colorectal cancer screening and treatment are based in the social determinants of health. Current state-of-the-art CT Colonography technique will be provided and we will describe how CTC can positively impact health equity. Additionally, the use of MR for accurate rectal cancer staging and efficient reporting will be included as well as a review of MR findings following neoadjuvant therapy.

#### Sub-Events

##### **R4-CGI13B Colorectal Cancer Screening and Using CT Colonography to Improve Health Equity**

### Algorithms Without Borders

Thursday, Nov. 30 11:00AM - 12:00PM Room: S401

Saurabh Jha, MBBS, MRCS (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Understand the use cases for AI in LMICs. 2) Appreciate the opportunities and challenges of implementing an AI product. 3) Appreciate the importance of big data in Africa. 4) Appreciate the role of radiologists in facilitating the adoption of AI in LMICs.

#### COURSE DESCRIPTION

In LMICs, where there's a shortage of radiologists, AI algorithms improves access to imaging. Thus, AI is an equity promoting technology and its widespread use in LMICs is an example of reverse innovation. The state of AI in LMICs is discussed. The implications of reverse innovation for AI in the American market are analyzed.

### Advanced Pediatric Interventions

Thursday, Nov. 30 11:00AM - 12:00PM Room: E352

Joao G. Amaral, MD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Recognize pediatric pathologies that can be treated with Interventional Radiology. 2) Learn some pediatric techniques in Genitourinary, MSK, Oncologic, Gastrointestinal, Vascular Malformations, and Vascular Access interventions that differ from Adult Interventional Radiology. 3) Learn some tips and tricks on Pediatric Interventional Radiology.

#### COURSE DESCRIPTION

Advanced Pediatric Interventions is a course for the Adult Interventional Radiologist that is familiar with interventional techniques but has limited experience with pediatric patients, and for the General and/ or Pediatric Radiologist who performs some procedures in children but would like to expand their practice. This course will consist of a series of lectures given by experts on the field. It will showcase a broad spectrum of common pediatric procedures, including Genitourinary, MSK, Oncologic, Gastrointestinal, Vascular Malformations and Vascular Access interventions. Of particular importance is the fact that, although similar in many aspects, Pediatric Interventional Radiology techniques have several subtle differences in comparison to Adult Interventional Radiology. These include the type of disease, the longer life expectancy, the proper clinical management and the appropriate material/ device to be used in children. Lecturers will focus on pediatric indications and how these procedures may differ from adult interventions. There will be an opportunity for some questions and brief discussion at the end of each lecture. Attendees will be able to learn some tips and tricks and refine their knowledge in Pediatric Interventional Radiology.

### Nerve Imaging: Latest Perspectives and Advances

Thursday, Nov. 30 11:00AM - 12:00PM Room: N228

Darryl B. Sneag, MD (*Moderator*) Researcher, General Electric Company; Researcher, Siemens AG; Research support, AMAG Pharmaceuticals, Inc

#### LEARNING OBJECTIVES

1) Explain strategies to improve diagnostic image quality in qualitative and quantitative MR neurography. 2) Identify the role of whole-body MRI in peripheral nerve tumor assessment. 3) Appreciate the role of high-resolution ultrasound for diagnostic and therapeutic management of peripheral neuropathies.

#### COURSE DESCRIPTION

Imaging plays an increasingly important role in the diagnostic and therapeutic management of peripheral neuropathies. This educational program, in the form of lectures and question/answer sessions and geared towards both clinical radiologists and researchers, will focus on the latest ultrasound and MRI techniques for peripheral nerve evaluation. Emerging research topics, in particular use of quantitative diffusion MRI for evaluation of muscle denervation, will be presented. At the program's conclusion, attendees will gain a deeper appreciation of the role of both imaging modalities in clinical and research practice.

### **Pitfalls and Mimics in Oncologic Imaging**

Thursday, Nov. 30 11:00AM - 12:00PM Room: S404

Khaled M. Elsayes, MD, PhD (*Moderator*) Nothing to Disclose

#### **LEARNING OBJECTIVES**

1) Identify various pitfalls in Oncological imaging that can lead to erroneous diagnoses. 2) Describe relevant technical background, pathophysiology, and hemodynamics of these pitfalls. 3) Be familiar with various clues to reach a specific diagnosis.

#### **COURSE DESCRIPTION**

The purpose of this course is to illustrate the various pitfalls, mimics, and atypical features that can lead to inaccurate diagnosis in cancer patients. The content includes relevant pathogenesis and background as well as specific clues that can be used to reach an accurate diagnosis. It is important to avoid pitfalls and misdiagnoses that can alter the management plan. Helpful strategies for avoiding pitfalls include paying close attention to the clinical history of the patient, carefully evaluating all of the available imaging studies, and being aware of the various radiologic mimics.

### Health Equity in Radiology: Clinical Practice (Sponsored by the RSNA Research Development Committee and the RSNA Health Equity Committee)

Thursday, Nov. 30 11:00AM - 12:00PM Room: E351

Randy C. Miles, MD, MPH (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Understand how to improve operational efficiency through strategies and innovations in breast imaging centers located in resource limited settings. 2) Understand the importance of equity into and inclusion in lung cancer screening. 3) Learn how to leverage Community-Based Participatory Research and community outreach to inform the development of health equity programs focused on improving access to care among Latino/Hispanic communities. 4) Discuss practical methods to incorporate health equity principles radiology care.

#### COURSE DESCRIPTION

As a result of participation in this course, radiology practitioners will learn best practices of providing equitable care to diverse patient groups. The course will include practical, high yield, lectures focused on equipping radiology practices with discrete tools and resources to improve health equity and inclusivity in their practice.

### **Appropriate Use of Intravascular Contrast in Children: It Ain't Just Water! (Supported in part by an Unrestricted Medical Education Grant from GE Healthcare, Inc.)**

Thursday, Nov. 30 11:00AM - 12:00PM Room: N229

Judy H. Squires, MD (*Moderator*) Nothing to Disclose

#### **LEARNING OBJECTIVES**

1) Review different types of contrast media and safety considerations in ultrasound, CT, and MRI, as well as availability, considerations for use, and possible substitutions. 2) Review considerations for implementing contrast-enhanced ultrasound in pediatric practice. 4) Evaluate potential methods to improve sustainability in pediatric radiology practice, including decreasing contrast media utilization.

#### **COURSE DESCRIPTION**

Many diagnostic imaging studies require the use of IV and/or enteric contrast media, however, emerging technologies are decreasing the need in some circumstances. When contrast is necessary, there are different types of contrast, with some better suited for use in certain clinical scenarios. Additionally, there are many important short and long term safety considerations when using contrast media. Finally, contrast media have unique considerations for institutional, regulatory, and supply chain constraints. This course will review important considerations when using contrast media in children for imaging at ultrasound, CT, and MRI, including possible alternatives, safety considerations, and anticipated upcoming advancements.

Lubomir M. Hadjiiski, PhD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Understand the importance of data (in terms of sources, demographic distributions, and ethical uses) for training CAD-AI systems in a manner that promotes generalizability. 2) Describe the role of clinical acceptance testing from the perspectives of generalizability, efficiency in a clinical workflow, output explainability, and performance stability over time. 3) Identify practical considerations for the translation of CAD-AI tools to the clinic, including the human-machine interface, user training, and prospective surveillance.

#### COURSE DESCRIPTION

Rapid advances in artificial intelligence (AI) and machine learning (specifically, deep learning techniques) have enabled broad application of these methods in healthcare. The promise of deep-learning has promoted further interest in computer-aided diagnosis (CAD) development and applications using both “traditional” machine learning and newer deep-learning-based approaches; this expanded clinical decision support environment is referred to as “CAD-AI.” It is of paramount importance to ensure that a clinical decision support tool undergoes proper training and rigorous validation of its generalizability and robustness before adoption for patient care. A task group of the American Association of Physicists in Medicine (AAPM) developed recommendations on practices and standards for the development and performance assessment of decision support systems in a CAD-AI environment. With CAD applications expanding to new stages of the patient care process, this educational session will explore the broader issues common to the development of CAD-AI applications and their translation from the bench to the clinic. The goal of this lecture-based session (followed by discussion) is to bring attention to the proper training and validation of machine learning algorithms that may improve their generalizability and reliability, thus accelerating the adoption of CAD-AI systems for clinical decision support.

### Best Head and Neck Cases of 2023 From the Experts

Thursday, Nov. 30 1:30PM - 2:30PM Room: E450A

Tanya J. Rath, MD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Recognize typical and atypical entities that occur within the head and neck. 2) Differentiate between common head and neck pathologies from relevant mimics.

#### COURSE DESCRIPTION

In this case-based head and neck imaging session, attendees will be presented with classic, unusual and diagnostic dilemma cases within the head and neck as selected by the experts. Speakers will emphasize pearls for differentiating each entity from common mimics, pitfalls of interpretation to avoid, and relevant clinical management considerations with which radiologists should be familiar. This session offers attendees the opportunity to refine their interpretation of complex head and neck imaging studies by incorporating tips from world experts.

### Practice Issues and Reimbursement Improvement

Thursday, Nov. 30 3:00PM - 4:00PM Room: N230B

Cherie M. Kuzmiak, DO (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Identify & describe strategies to improve reimbursement & overall profitability of your practice in the fragmented US healthcare payer landscape. 2) Understand the sources of practice dissatisfaction/burnout & explain strategies for staff engagement/retention. 3) Discuss Post-Pandemic practice issues & how to implement changes to overcome a reduced workforce.

#### COURSE DESCRIPTION

This session will focus on the unique ways to improve practice issues and profitability, including methods to achieve staff retention, in the Post-Pandemic era. The course is applicable to radiologists and technologists of all career levels. The educational format of this course is lecture form with discussion.

### Cardiac Rapid Fire: 60 Cases in 60 minutes

Thursday, Nov. 30 3:00PM - 4:00PM Room: S402

Liisa L. Bergmann, MD, MBA (*Moderator*) Nothing to Disclose  
Jean Jeudy JR, MD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Interpret and recognize cardiac and pericardial masses through the review of clinical cases and enabling participants to feel more confident in their ability to identify such conditions in their patients. 2) Improve the management of valvular disease by understanding the different imaging techniques used and by gaining a thorough knowledge of the diagnosis and treatment of such diseases. 3) Implement a better understanding of congenital heart disease in clinical scenarios and explain the imaging methods used for the diagnosis, management, and treatment plans for patients with this condition.

#### COURSE DESCRIPTION

This advanced course is designed to provide attendees with an extensive review of cardiac imaging, with a particular focus on cardiac CT and cardiac MRI. Through the presentation of clinical cases, participants will be able to better identify and manage the diverse range of cardiovascular issues that they may encounter in their practice. The course is composed of primary topics that aim to explore the problems cardiovascular specialists typically encounter. Attendees will gain a greater understanding of cardiac and pericardial masses, valvular disease, and congenital heart disease. Radiology professionals at all levels of experience are encouraged to participate. This session will be delivered as a rapid-fire case presentation format with summary knowledge review. Attendees will be able to interact with the presenter and ask questions at the end of the session. After completing the course, attendees will be able to apply their enhanced knowledge of cardiac imaging in practical, real-world situations. Join us at #RSNA23 for an engaging and fast-paced educational experience that will enrich your practice and benefit your patients. #CV60in60

### **Pearls and Pitfalls in Chest Radiography**

Thursday, Nov. 30 3:00PM - 4:00PM Room: E450B

Gerald F. Abbott, MD (*Moderator*) Nothing to Disclose

#### **LEARNING OBJECTIVES**

- 1) To recognize the various chest radiographic features of diffuse interstitial lung diseases and their respective CT correlates.
- 2) To recognize the various chest radiographic features of pleural diseases and their respective CT correlates.
- 3) To learn the normal anatomy demonstrated on lateral chest radiography and recognize imaging abnormalities unique to the lateral view with their respective CT correlations.

#### **COURSE DESCRIPTION**

The chest radiograph is a foundational modality in thoracic imaging that remains one of the most frequently ordered diagnostic studies. It serves an important function in multiple healthcare settings – in emergency departments, intensive care units, outpatient clinics –and in the diagnosis and monitoring of oncologic disease. The effective interpretation of chest radiographs requires experience and a knowledge of radiographic anatomy, imaging signs of disease, and important pitfalls to avoid. This session will feature three case-based lectures presented by experienced thoracic radiologists whose teaching skills will be focused on giving attendees an expanded appreciation and skill in the interpretation of chest radiographs.

### Disaster Preparedness - Are you Ready for Chaos?

Thursday, Nov. 30 3:00PM - 4:00PM Room: S406B

Ferco H. Berger, MD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) To understand what changes when disaster strikes and (examples of) things to consider to be well prepared. 2) To explore the value provided by your residency and how to embed it in your disaster preparedness plan. 3) To explain the use of exercises for plan development and testing.

#### COURSE DESCRIPTION

Disaster can happen at any time and any place to anyone, so your hospital and department and you should be prepared to deal with the consequences of a variety of types of potential disasters in your region. This course will provide insight in how operations may have to change in this setting and how to best include and prepare your personnel for these rare occasions. Your residency is a valuable part and thinking about its role and preparedness is a unique feature that will be highlighted in this session.

### GI Transplant Imaging

Thursday, Nov. 30 3:00PM - 4:00PM Room: E351

Reena C. Jha, MD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Review the findings which should be reported in patients undergoing evaluation for potential living donor liver transplant. 2) Describe the findings that may be contraindications for living donor liver transplant. 3) Review the normal appearance of the liver post-transplant and early and late complications. 3) Illustrate the typical bowel and vascular anatomy of small bowel transplants and describe imaging techniques and postoperative complications. 4) Discuss the role of imaging in pancreatic transplantation focusing on post-surgical evaluation and review normal and abnormal appearances after pancreas transplantation.

#### COURSE DESCRIPTION

This lecture series will review the indications, imaging anatomy, surgical techniques and critical findings in patients undergoing evaluation for potential small bowel, pancreas and living liver transplant and review imaging post liver transplant.

### **Radiology Informatics Legislation Update**

Thursday, Nov. 30 3:00PM - 4:00PM Room: S401

Po-Hao Chen, MD, MBA (*Moderator*) Nothing to Disclose

#### **LEARNING OBJECTIVES**

1) Know when, in what context and under what names the most impactful recent legislation on informatics has presented. 2) Understand implications of current legislative product or debate on Informatics. 3) Perceive the political context in which Informatics-relevant legislation has occurred.

#### **COURSE DESCRIPTION**

This course is will help attendees stay updated and informed about the latest legislative developments relevant to radiology informatics. During this traditional lecture format, we will address crucial issues related to informatics such as the cybersecurity implications of new regulations, the political context in which informatics-relevant legislation occurs, and the history and updates of significant acts like the No Surprise Act. Additionally, we will discuss the new rules on data sharing introduced by the Office of the National Coordinator for Health Information Technology (ONC). Attending this session will give you a deep understanding of the legislative landscape and its impact on informatics.

### GI Interventions and Pain Management

Thursday, Nov. 30 3:00PM - 4:00PM Room: E352

David M. Mauro, MD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Understand clinical indications and procedures for palliative care, emergencies, and pain management. 2) Recognize appropriate anatomy as it relates to the interventional procedural techniques. 3) Explain clinical outcomes of different interventional procedures.

#### COURSE DESCRIPTION

In this course learners will be exposed to didactic lectures regarding different procedures in interventional radiology as it relates to gastrointestinal interventions, pain management and palliative care

#### Sub-Events

### Musculoskeletal Tumor Imaging: Current Trends and Recent Advances

Thursday, Nov. 30 3:00PM - 4:00PM Room: N228

Mark D. Murphey, MD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Recognize imaging differences between lipoma and well differentiated liposarcoma and current cytogenetic aberrations used in this distinction. 2) Understand recent advances in multidisciplinary management of spinal bone metastases and imaging of post-tumor resection reconstructions. 3) Identify updates to musculoskeletal tumor staging and use of T2 Dixon imaging of musculoskeletal tumors.

#### COURSE DESCRIPTION

This lecture format course includes a discussion of a range of topics concerning musculoskeletal tumor imaging and both current trends and recent advances. Topics range from a discussion of adipocytic neoplasms and use of cytogenetic aberrations that allow their distinction, imaging of post-resection reconstructions, the use of T2 Dixon imaging of neoplasms, recent advances in multidisciplinary management of spinal bone metastases and an update on musculoskeletal tumor staging. Attendees should expect a review and update on these important topics on imaging of musculoskeletal tumors.

### Acute Ultrasound Pearls and Pitfalls: Case Based Review

Thursday, Nov. 30 3:00PM - 4:00PM Room: E450A

Shweta Bhatt, MD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Identify the role of ultrasound in common and uncommon pediatric emergencies. 2) Understand some common and uncommon causes of acute pelvic pain in women. 3) Identify the ultrasound findings of musculoskeletal pathologies presenting in the acute setting.

#### COURSE DESCRIPTION

This course is designed to highlight the vital role ultrasound plays in imaging and diagnosis throughout the body with a focus on challenging emergent cases. A wide range of applications will be covered including vascular, pelvic, pediatric, and musculoskeletal. Attendees will have the opportunity to test their knowledge in real time as interesting unknown cases are presented in question/answer format with topic review by the speakers. Our goal is to provide a broad update in the field while addressing new opportunities and challenges for everyday practice

### Therapy Response Assessment: Read with the Experts

Thursday, Nov. 30 3:00PM - 4:00PM Room: S403A

David A. Mankoff, MD, PhD (*Moderator*) Speaker, Siemens AG Advisory Board, ImaginAb, Inc Advisory Board, RefleXion Medical Inc Consultant, Blue Earth Diagnostics Ltd Consultant, General Electric Company Research funded, Siemens AG Spouse, Owner, Trevarx Biomedical, Inc

#### LEARNING OBJECTIVES

1) Review current response assessment criteria applicable to PET/CT. 2) Illustrate the applications of these response assessment criteria in clinical practice. 3) Discuss advances in the field of PET/CT and response assessment.

#### COURSE DESCRIPTION

This course reviews the application of PET molecular imaging assessment of response to therapy and provides example of current disease-specific applications and response criteria. Presenters provide an overview on the approach to cancer response assessment and provide some cases examples to illustrate principles and practice of this methodology.

### Unprofessionalism in the Workplace

Thursday, Nov. 30 3:00PM - 4:00PM Room: S502

Vikas Gulani, MD, PhD (*Moderator*) Research support, Siemens AG;Consulting, Cook Group Incorporated

#### LEARNING OBJECTIVES

1) Recognize the manifestations of professional disruptions in the workplace. 2) Identify mitigation strategies for professional disruptions in the workplace.

#### COURSE DESCRIPTION

Unprofessional and disruptive behavior in the radiology workplace can be on the spectrum of overt to insidious. In this course, we will explore microaggressions, sexual harassment, and professionalism transgressions, and consider trainee professionalism and wellness. We will discuss how these behaviors may manifest themselves and provide examples of mitigation strategies.

### Emerging Neuroimaging Techniques: Stuck in the Research Realm or Ready for Prime-Time?

Thursday, Nov. 30 3:00PM - 4:00PM Room: N227B

Hediyeh Baradaran, MD, MS (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Review advances in 7T imaging as it pertains to specific clinical applications. 2) Identify potential benefits in clinical adoption of PET MR imaging. 3) Explain the difficulties with widespread use of 7T and PET MR imaging.

#### COURSE DESCRIPTION

Are 7T and PET MR imaging going to revolutionize neuroimaging or will they be relegated to the research realm? In this session, we will describe the current potential uses and limitations in using both 7T and PET/MR imaging. This lecture based session will provide evidence-based discussion of newer MR imaging technology to prepare neuroradiologists for potential changes in future practice.

#### Sub-Events

### Endometrial and Cervical Cancer Staging: How to Get it Right the First Time!

Thursday, Nov. 30 3:00PM - 4:00PM Room: S501

Andrea G. Rockall, FRCR, MRCP (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Understand the requirements to optimise imaging-based staging of endometrial and cervical cancer staging. 2) Be aware of key findings on imaging that will impact treatment planning.

#### COURSE DESCRIPTION

This lecture-based course will describe protocols and top tips to ensure accurate staging of endometrial and cervical cancer and will include ultrasound, MRI, and FDG-PET/CT. Pitfalls will be described. The key findings on imaging that will influence treatment planning will be discussed.

### **Pediatric Body MR Imaging: Whole Body Screening, Pitfalls, and Standardized Reports**

Thursday, Nov. 30 3:00PM - 4:00PM Room: N226

Govind B. Chavhan, MD (*Moderator*) Nothing to Disclose

#### **LEARNING OBJECTIVES**

1) Discuss the protocols and current clinical applications of whole body MRI and Rapid Abdominal MRI in children. 2) Identify pitfalls of MR Enterography in children and describe its applications beyond inflammatory bowel disease. 3) List the benefits and methods to use reporting template effectively in clinical practice.

#### **COURSE DESCRIPTION**

MR imaging is playing important role in body imaging in children with ever expanding clinical applications in various disease process. Update on new techniques and protocols as well as new emerging clinical applications of MR in pediatric body is essential. This educational session is designed to provide learners with updates on current techniques, protocols and pitfalls in pediatric body MR imaging via lectures. Clinical applications of whole-body MRI in screening of children with oncologic and non-oncologic disease processes, and applications of MR Enterography in evaluations of gastrointestinal diseases other than inflammatory bowel disease will be discussed. Strategies to use rapid abdominal MRI and its potential applications in children will be illustrated. Finally, importance and methods in communicating the imaging findings effectively through standardized reporting will be discussed.

### Data Curation for AI with Proper Medical Imaging Physics Context

Thursday, Nov. 30 3:00PM - 4:00PM Room: S405

Zhihua Qi, PhD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) To review the process and to demonstrate methods and tools to collect and prepare clinical data for AI model development and related research. 2) To learn how data quality and data size affect the performance and generalizability of deep neural network models. 3) To understand practical methods for series and study selection for clinically deployed AI models, common issues that arise in deployment, and several techniques for evaluating AI in an ongoing fashion.

#### COURSE DESCRIPTION

This course reviews the selection, procurement, quality and evaluation of data for AI development and deployment in radiology. With a focus on the technical and imaging physics aspects of AI in radiology, it is of high educational value to those interested in active involvement in such activities.

### **Breast Cancer Case Based Multidisciplinary Review**

Thursday, Nov. 30 3:00PM - 4:00PM Room: N229

Bethany L. Niell, MD, PhD (*Moderator*) Equipment support, Hologic, Inc

#### **LEARNING OBJECTIVES**

1) Describe the latest advances in breast cancer imaging before, during, and after treatment. 2) Facilitate a multidisciplinary approach to the diagnosis, management, and treatment of breast cancer.

#### **COURSE DESCRIPTION**

This course utilizes a case-based multi-disciplinary approach to discuss appropriate breast imaging examinations, radiologic-pathologic correlation, available radiotherapy options, as well as medical and surgical oncologic treatment planning in the setting of breast cancer.

#### **Sub-Events**

##### **R7-CR003B Breast Cancer Case Based Multidisciplinary Review**

### AI in Breast Imaging

Sunday, Nov. 26 9:00AM - 10:00AM Room: S406A

Constance D. Lehman, MD, PhD (*Moderator*) Institutional Grant, General Electric Company; Institutional Grant, Hologic, Inc; Co-founder, Clairity, Inc.

#### LEARNING OBJECTIVES

1) Develop critical thinking and understanding of the terminology in the development and evaluation of AI systems for breast cancer screening, diagnosis and treatment. 2) Gain insights from prospective interventional studies including diagnostic improvements, biases, and limitations. 3) Attain a realistic appreciation for the opportunities and challenges in the implementation of AI in clinical practice.

#### COURSE DESCRIPTION

Build your knowledge with top experts in evaluating, implementing, and understanding the wider impact of AI systems in breast cancer screening, diagnosis and intervention. There will be three lectures followed by an open panel discussion. We will cover the full cycle from development and evaluation of AI systems, including how the FDA evaluates AI algorithms, what developers might expect for post-market surveillance requirements, implications of results of large clinical trials, and future opportunities and challenges when implementing AI in routine clinical practice. In the final panel discussion, all presenters are available to discuss important topics brought forward by the panel and audience.

#### Sub-Events

##### S1-CBR02B AI in Breast Imaging: Development and Testing of Breast AI

Etta D. Pisano, MD (*Presenter*) Nothing to Disclose

##### S1-CBR02C AI in Breast Imaging: Pearls and Pitfalls of Implementation

Constance D. Lehman, MD, PhD (*Presenter*) Institutional Grant, General Electric Company; Institutional Grant, Hologic, Inc; Co-founder, Clairity, Inc.

### Mapping the Target & Pushing the Limits: Imaging Guidance for Electrophysiology Procedure Planning

Sunday, Nov. 26 9:00AM - 10:00AM Room: N230B

Jiayin Zhang, MD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

- 1) Identify the MR biomarkers in electrophysiology (EP) planning and learn how to guide procedure by the use of biomarkers.
- 2) Discover the latest advanced CT techniques for EP imaging.
- 3) Learn how to use interactive 3D modeling to plan EP procedure.

#### COURSE DESCRIPTION

Pre-procedural imaging is essential for guiding electrophysiology procedure planning. Learning the advanced EP imaging techniques is of educational importance for radiologists and cardiologists. This 1-hour course includes lectures from 3 distinguished professors, focusing on CMR, CT and 3D modelling respectively. In this session, you will be guided through the up-to-date MR and CT application in pre-procedural EP imaging and learn how to perform in clinical practice.

#### Sub-Events

##### S1-CCA05B Cardiac MRI Biomarkers in EP Planning

Harold I. Litt, MD, PhD (*Presenter*) Research Grant, Siemens AG; Research Grant, Koninklijke Philips NV

##### S1-CCA05C Beyond the Scar: Advanced CT Imaging

Jamie L. Schroeder, MD, DPhil (*Presenter*) Nothing to Disclose

S1-CER01

### Essential Head and Neck Trauma

Sunday, Nov. 26 9:00AM - 10:00AM Room: E451B

Koenraad H. Nieboer, MD (*Moderator*) Speakers Bureau, General Electric Company

#### LEARNING OBJECTIVES

1) Identify and describe correctly acute traumatic lesions on CT scan of the head, skull base, and lesions of the soft-tissues of the neck. 2) When to use advanced neuroimaging techniques in the setting of traumatic brain injury. 3) What is important to include in your report.

#### COURSE DESCRIPTION

This session offers 3 highly recommended lectures. From basic assessment of CT scan of the brain, skull base and soft-tissue lesions of the neck in the context of acute trauma to advanced imaging, for all experience levels. Clear identification and description of acute traumatic lesions are essential for rapid communication with referring physicians and trauma surgeons. And when do you recommend advanced imaging?

#### Sub-Events

##### S1-CER01B Essentials of Acute Brain Trauma

Koenraad H. Nieboer, MD (*Presenter*) Speakers Bureau, General Electric Company

##### S1-CER01C Skull Base Trauma (Including Mastoid)

Divya Gunda, MD (*Presenter*) Nothing to Disclose

### Pearls and Pitfalls of 3D Printing from Imaging Data

Sunday, Nov. 26 9:00AM - 10:00AM Room: E450B

Nicole Wake, PhD (*Moderator*) Employee, GE HealthCare

#### LEARNING OBJECTIVES

1) Understand how to evaluate and optimize the accuracy of clinical 3D printing. 2) Identify strategies to improve efficiency of 3D printing workflows. 3) Explain how to pitch the business case for 3D printing in healthcare facilities.

#### COURSE DESCRIPTION

Safety and quality in clinical 3D printing depend on many technical and operational factors. 3D printed anatomic models must reliably represent the patient's anatomy to be useful to the clinician, but the workflow required to create these models from medical imaging data is complex and time consuming. The inherent complexity of image-based 3D printing allows the possibility of errors at any stage of the process. These stages include imaging acquisition, fusion of multiple exam types, segmentation, computer aided design, 3D printing, and post processing of the final 3D printed product. In this educational course, the stages where variances in the 3D printing workflow can occur will be reviewed. Specific clinical scenarios and challenges will be used to illustrate strategies for successful 3D printing. Tips on how to assess quality as well as improve efficiency and address variances will be described. From an operational standpoint, strategies for making the business case for 3D printing capabilities in health care facilities will also be discussed. 3D printed models will be circulated as examples. Interactive polling questions will be used throughout the session to engage the audience and assess their knowledge base. This interactive didactic session addresses the needs outlined above and provides a framework to address potential pitfalls in performing clinical 3D printing. This topic is relevant to trainees and practicing radiologists engaged in the management of complex surgical conditions, as well as technologists and scientists involved in image optimization and processing for visualization and 3D modeling.

#### Sub-Events

### Emerging Imaging Techniques in MSK Imaging

Sunday, Nov. 26 9:00AM - 10:00AM Room: E450A

Iman Khodarahmi, MD, PhD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

- 1) Review the latest clinical advancements and translational techniques in MRI of metal-containing body parts and muscles.
- 2) Recognize the potential and challenges of photon counting CT in the diagnosis and management of musculoskeletal disease.
- 3) Describe the basic principles and novelties in artificial intelligence and their utility and impact on image reconstruction and analysis.

#### COURSE DESCRIPTION

Radiology and radiological sciences are the pioneers of technology development and implementation among all medical specialties. Knowledge of recent advancements is essential for the imaging community for timely incorporation of such developments in the clinical workflow. Through five lecture series, this educational course discusses the emerging techniques in MRI and CT imaging of the musculoskeletal system as well as the current state-of-the-art artificial intelligence methods applied to musculoskeletal imaging.

### **From Careerism to Professionalism: A Personal and Institutional Imperative (Sponsored by the RSNA Professionalism Committee)**

Sunday, Nov. 26 9:00AM - 10:00AM Room: E351

R. Paul Guillerman, MD (*Moderator*) Nothing to Disclose  
Sarah D. Bixby, MD, MBA (*Moderator*) Nothing to Disclose

#### **LEARNING OBJECTIVES**

1) Learn how to fit in and stand out by developing self-awareness of personal strengths/weaknesses and institutional culture and opportunities. 2) Learn how to avoid career self-sabotage by focusing on productive habits rather than goals, negotiating resources and authority commensurate with authority, engaging in supportive rather than exploitative relationships, and responding to challenges with resilience and antifragility. 3) Learn how to lead with or without titles to guide and inspire others to thrive and move beyond status-seeking careerism to professionalism based on a commitment to excellence and magnanimity.

#### **COURSE DESCRIPTION**

This course will be comprised of several presentations addressing how to best facilitate a successful transition from trainee to early and mid career radiologist and recognize the important distinction between "careerism" and professionalism. Advice will be provided on how to fit in and stand out by achieving the self-awareness to determine what practice setting and roles are best aligned to take advantage of personal strengths and promote professional growth. Tips for avoiding career self-sabotage will be offered, including focusing on productive habits rather than all-or-none goals, negotiating resources and authority commensurate with responsibility, engaging in supportive rather than exploitative relationships, developing resilience and antifragility in response to challenges, and adapting to cultural norms. While professional success can be measured in terms of metrics such as publications, citations, invited lectures, awards, grants, degrees, and titles, status-seeking "careerism" is ultimately much less fulfilling than building a strong sense of professionalism based on a passion for excellence and magnanimity that guides and inspires others to thrive.

### Essential Updates in Ischemic Stroke Imaging and Treatment

Sunday, Nov. 26 9:00AM - 10:00AM Room: E451A

Jeremy J. Heit, MD, PhD (*Moderator*) Consultant, Medtronic plc; Consultant, Terumo Corporation; Consultant, iSchemaView, Inc; Scientific Advisory Board, iSchemaView, Inc; Medical Advisory Board, iSchemaView, Inc; Committee Member, Vesalio

#### LEARNING OBJECTIVES

1) To describe new large artery occlusion targets for thrombectomy treatment in acute ischemic stroke patients. 2) To understand existing evidence for the treatment of medium and small artery occlusion targets by thrombectomy. 3) To understand new thrombectomy eligibility criteria based upon non-invasive imaging studies. 4) To describe new frontiers in endovascular thrombectomy and how they may impact ischemic stroke treatment in the near future.

#### COURSE DESCRIPTION

Acute ischemic stroke is the leading cause of disability in the United States and results in significant mortality worldwide. New randomized trials published in the past two years have substantially increased patient eligibility for endovascular thrombectomy. In this course, we will review new selection criteria for endovascular thrombectomy (such as patients with large ischemic cores and low ASPECTS) and the evidence for expanded treatment of vessel occlusions (such as basilar artery occlusions and small/medium vessel occlusions). In addition, we will describe existing and emerging changes in hospital systems to facilitate expeditious transfer and treatment of thrombectomy-eligible patients and discuss commonly encountered challenges in patient treatment through a case-based discussion.

#### Sub-Events

### Placenta Accreta Spectrum (PAS): Pearls, Pitfalls, and Perils

Sunday, Nov. 26 9:00AM - 10:00AM Room: S405

Diane M. Twickler, MD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Explain current clinical implications of placenta accreta spectrum (PAS) diagnosis. 2) Evaluate 1st trimester PAS with US, and PAS beyond 14 weeks gestation with US and MRI. 3) Understand the pathology of PAS and current FIGO classifications.

#### COURSE DESCRIPTION

Placenta Accreta Spectrum is a serious complication of pregnancy. This lecture will address how imaging with US and MRI can affect surgical planning that improves outcomes. Current US and MRI evaluation recommendations of PAS in pregnancy will be reviewed, including case presentations. The importance of correlation with pathologic outcomes and recommended FIGO classifications will be discussed.

### RSNA Hands-On Lab: Pediatric Musculoskeletal Ultrasound

Sunday, Nov. 26 10:00AM - 11:30AM Room: S504CD

Andrea S. Doria, MD, PhD (*Moderator*) Baxalta-Shire (Research Grant), Novo Nordisk (Research Grant), Terry Fox Foundation (Research Grant), PSI Foundation (Research Grant), Society of Pediatric Radiology (Research Grant), Garron Family Cancer Centre (Research Grant)

#### LEARNING OBJECTIVES

1) Review the anatomy and common pediatric pathologic musculoskeletal conditions in three pediatric joints: the elbow, hand and ankle. 2) Use dynamic scanning of the joints to better demonstrate the anatomy of soft tissue and osteochondral components of three pediatric joints and will point out the distinction of soft tissue structures by a compression technique. 3) Discuss pathologies in the aforementioned joints as an overview of common pediatric pathologic musculoskeletal conditions.

#### COURSE DESCRIPTION

In Person Session Only. Tickets must be purchased in advance for this course. This course can be added through the registration portal or by stopping by the Registration Desk. Space is limited. This 90-min pediatric musculoskeletal hands-on session is targeted to general radiologists who aim to get an overview of technical and clinical application perspectives on ultrasound scanning and interpreting pathology of elbows, hands and ankles of children and adolescents. The information provided in this session adds value to the diagnostic tools that can be used for assessment of musculoskeletal disorders that affect growing joints, particularly in young children who may require general anesthesia for MRI assessment of their joints. The session has two parts, a 60-min hands-on part where pre-assigned radiologists scan teenager models' joints in real time and a second 30-min knowledge application part where the audience has the opportunity to scan models' joints by themselves. In the first part of the session lecturers will demonstrate ultrasound protocols for scanning of pediatric elbows, hands and ankles in real-time and will discuss ultrasound findings of pathologies in these joints. In the second part of the session tutoring to scanning by the audience will be provided by assigned radiologists in a controlled educational environment where the audience will have the opportunity to apply the a priori discussed ultrasound protocols into scanning the models' joints.

### **Lung/Mediastinum Case Based Multidisciplinary Review**

Sunday, Nov. 26 9:00AM - 10:00AM Room: S402

Simon S. Lo, MBChB (*Moderator*) Committee member, Elekta AB

#### **LEARNING OBJECTIVES**

1) Identify imaging strategies in the diagnosis and staging of thoracic malignancies. 2) Explain the current multidisciplinary management of thoracic malignancies. 3) Identify imaging strategies for post-treatment evaluation.

#### **COURSE DESCRIPTION**

This case-based discussion will expose the attendees to multidisciplinary discussion when treating thoracic malignancies. The panel will demonstrate specific imaging findings that directly affect staging and treatment decisions and will provide the audience with specific information they should include in their reports that directly affect prognosis and management. The cases to be discussed will be stage III non-small cell lung cancer, superior vena cava obstruction from small cell lung carcinoma, and mesothelioma.

#### **Sub-Events**

### Aortic Dissection

Sunday, Nov. 26 9:00AM - 10:00AM Room: N226

Bradley D. Allen, MD, MS (*Moderator*) Consultant, Circle Cardiovascular Imaging Inc;Speaker, WebMD LLC  
Kate Hanneman, MD, MPH (*Moderator*) Speaker, Groupe Sanofi;Speaker, Amicus Therapeutics, Inc

#### LEARNING OBJECTIVES

1) Understand the subtypes and imaging appearance of aortic pathologies that are associated with acute aortic syndrome. 2) Explain the role of imaging for interventional planning in aortic dissection. 3) Describe the changes in imaging appearance of aortic dissection over time and the implications for patient risk.

#### COURSE DESCRIPTION

Aortic dissection and acute aortic syndromes are frequently encountered in clinical practice, but there is often confusion related to appropriate imaging and creating clinically impactful radiology reports. This session will review imaging approaches in acute aortic syndrome while providing learners with expert recommendation on reporting terminology and measurements, imaging for interventional planning in aortic dissection, and imaging in chronic aortic dissection.

#### Sub-Events

##### S1-CVA08C Imaging Acute Aortic Syndrome

Diana Litmanovich, MD (*Presenter*) Nothing to Disclose

##### S1-CVA08D Imaging for Surgical and Intervention Planning in Aortic Dissection

### HRCT Topics

Sunday, Nov. 26 10:30AM - 11:30AM Room: S406B

Brett M. Elicker, MD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Describe the typical findings of different patterns of injury within the lungs. 2) Understand the histologic, clinical, and radiologic aspects of organizing pneumonia. 3) Describe the role of HRCT in the setting of connective tissue disease and drug induced lung disease. 4) Explain the spectrum of findings and patterns seen in patients with hypersensitivity pneumonitis.

#### COURSE DESCRIPTION

The course will be a review of several topics in the field of diffuse lung disease. It will focus on a practical approach to reading high-resolution chest CTs, and identifying common findings and patterns of disease. A particular emphasis will be on patterns of injury seen in connective tissue disease and drug induced lung disease. It will also include a review of the multi-disciplinary approach to hypersensitivity pneumonitis and organizing pneumonia.

### Essentials of Spine Trauma

Sunday, Nov. 26 10:30AM - 11:30AM Room: E451B

Nicholas M. Beckmann, MD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Describe mechanisms and associated injury patterns of cervical and thoracolumbar spine trauma. 2) Demonstrate common classifications used for spine trauma and understand their clinical relevance. 3) Recognize significant traumatic spine soft tissue injuries on MRI.

#### COURSE DESCRIPTION

The anatomy of the spine is complex and traumatic spine injuries can be subtle, which can make it challenging to correctly diagnosis significant traumatic spine injuries. In this three-part didactic session, the typical injury patterns and classification systems used for diagnosing traumatic spine injuries on CT will be presented along with the role and interpretation of MRI in imaging spine trauma.

#### Sub-Events

##### S2-CER02B CT of Cervical Spine Trauma

### Best of Sessions in GU Oncology

Sunday, Nov. 26 10:30AM - 11:30AM Room: E352

Antonio C. Westphalen, MD, PhD (*Moderator*) Shareholder, ScanMed, LLC; Research funded, BotImage, Inc

#### LEARNING OBJECTIVES

1) Familiarize oneself with the most up-to-date data pertaining to genitourinary oncology, radiology, and associated fields.

#### COURSE DESCRIPTION

In this session we will summarize the newest and best GU oncology research published and presented at the most recent meetings in and outside radiology. Speakers will present research in their area of practice, but that are relevant for practicing radiologists.

### **The Symbiotic Relationship of AI and Patient Centered Radiology (Sponsored by the RSNA Public Information Committee)**

Sunday, Nov. 26 10:30AM - 11:30AM Room: E353B

Jennifer L. Kemp, MD (*Moderator*) Stockholder, Scanslated, Inc

#### **LEARNING OBJECTIVES**

1) How to include patients as our partner in AI implementation. 2) List 5 uses of AI to improve patient experience. 3) Learn how AI is seen by patients around the world.

#### **COURSE DESCRIPTION**

Both Artificial Intelligence and Patient Centered Care are hot topics in radiology, but the concepts at first glance may seem contradictory. This course will help its audience better understand how these two concepts can have a symbiotic relationship. Listeners will learn what patients want to know about AI and how to discuss how AI may affect their care. Specific AI tools to improve the patient experience in the radiologic care journey will be discussed. AI and patient-centric radiology may look different depending on practice demographics and geographic locations; how can we learn from each other?

#### **Sub-Events**

### Accelerating to the Future of AI in Radiology: A Demonstration of Imaging AI in Practice

Sunday, Nov. 26 10:30AM - 11:30AM Room: E450B

Katherine P. Andriole, PhD (*Moderator*) Nothing to Disclose  
Ali S. Tejani, MD (*Presenter*) Nothing to Disclose  
Madhavi V. Duvvuri, MD, MS (*Presenter*) Nothing to Disclose

#### LEARNING OBJECTIVES

- 1) Understand the future of AI applications throughout the entire radiology workflow.
- 2) Recognize practical implementation considerations, most importantly semantic and interoperability standards necessary to implement AI into the clinical arena.
- 3) Consider what the future of radiology AI implementation may hold.

Maxime Ronot, MD, PhD (*Moderator*) Speaker, General Electric Company; Speaker, Ipsen SA; Speaker, Canon Medical Systems Corporation; Speaker, Alexion Pharmaceuticals, Inc; Speaker, Guerbet SA; Speaker, Sirtex Medical Ltd

#### LEARNING OBJECTIVES

1) Understand the principles and techniques of interventions for trauma, including the use of imaging modalities, and vascular and non-vascular interventions. 2) Assess and prioritize traumatic injuries in the context of interventional radiology, recognizing indications and contraindications for different interventional procedures, and developing appropriate treatment plans. 3) Effectively communicate and collaborate with interdisciplinary teams involved in trauma care, contributing their knowledge and expertise in interventional radiology to facilitate comprehensive and coordinated management of trauma patients.

#### COURSE DESCRIPTION

The session is a comprehensive course that delves into the vital connection between interventional radiology and trauma. This session is designed to provide healthcare professionals with a deep understanding of the key topics in this field, including imaging workup, indications for trauma interventions, and management of various traumatic injuries. Through a combination of engaging lectures and interactive discussions, participants will gain the knowledge and skills necessary to effectively utilize interventional radiology techniques in trauma care. By the end of this session, participants will have a comprehensive understanding of the principles and techniques involved in interventional radiology for trauma intervention. They will be able to apply this knowledge to make informed decisions. Additionally, participants will develop the skills to effectively collaborate with multidisciplinary teams, facilitating improved outcomes for trauma patients through the integration of interventional radiology into trauma care protocols.

#### Sub-Events

##### S2-CIR01B Imaging Workup and Indications for Trauma Interventions

Maxime Ronot, MD, PhD (*Presenter*) Speaker, General Electric Company; Speaker, Ipsen SA; Speaker, Canon Medical Systems Corporation; Speaker, Alexion Pharmaceuticals, Inc; Speaker, Guerbet SA; Speaker, Sirtex Medical Ltd

### Current Controversies in MSK Imaging

Sunday, Nov. 26 10:30AM - 11:30AM Room: E450A

Robert D. Boutin, MD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Identify practical solutions to address common challenges and controversies experienced in musculoskeletal imaging.

#### COURSE DESCRIPTION

Speakers from diverse perspectives share highlights of their struggles and strategies for overcoming obstacles experienced in their clinical practices – with ample time for audience questions and discussion.

#### Sub-Events

##### **S2-CMK15B Controversies & Solutions at Stanford: From Knee MRI to Opportunistic Imaging**

Robert D. Boutin, MD (*Presenter*) Nothing to Disclose

### Multisystem Imaging Manifestations of COVID-19 and Related Complications

Sunday, Nov. 26 10:30AM - 11:30AM Room: S406A

Margarita V. Revzin, MD, MS (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Briefly explain pathophysiology of COVID-19. 2) Review diagnostic imaging hallmarks of COVID-19. 3) Describe multisystem immediate and long-term complications of COVID-19 including CNS, cardiovascular, pulmonary, and abdominal systems. 4) Discuss controversies of post COVID-19 vaccination.

#### COURSE DESCRIPTION

This session will provide a comprehensive review of the diagnostic imaging hallmarks, imaging features, multisystemic involvement, and evolution of imaging findings in patients with COVID-19. Neurologic, cardiac, abdominal, chest (early and chronic) complications will be discussed. Specific imaging considerations in COVID-19 related myocarditis and post vaccination complications will be also provided.

#### Sub-Events

##### S2-CMS05B Adominopelvic Imaging in COVID: Lessons Learned

Margarita V. Revzin, MD, MS (*Presenter*) Nothing to Disclose

##### S2-CMS05C Neuroimaging of the SARS-CoV-2 Infection and Post-vaccination Neurological Syndromes

Otto Rapalino, MD (*Presenter*) Nothing to Disclose

### **Radiology Workforce Shortage: Considerations for Rural and Sprawling Systems**

Sunday, Nov. 26 10:30AM - 11:30AM Room: E351

Saurabh Jha, MBBS, MRCS (*Moderator*) Nothing to Disclose

#### **LEARNING OBJECTIVES**

1) Identify the economic challenges in bringing radiology to rural areas. 2) Understand how policy and radiology financing can improve access to radiology in rural areas.

#### **COURSE DESCRIPTION**

Despite the public and private sector investment in imaging, access to imaging remains anemic in rural and underserved areas in the US. Increasingly responsibility for providing imaging to underserved populations falls on large hospitals. However, small practices have an important role, too. What can radiology leverage to improve access to imaging across the income gradient?

### Alzheimer's Disease Neuroimaging: State-Of-The-Art

Sunday, Nov. 26 10:30AM - 11:30AM Room: E451A

Gloria C. Chiang, MD (*Moderator*) Advisory Board, Biogen Idec Inc;Consultant, Life Molecular Imaging;Speaker, Horizon CME

#### LEARNING OBJECTIVES

1) Review the imaging biomarkers of common neurodegenerative diseases that are encountered in routine clinical practice, including the sequences that should be included in a dementia protocol. 2) Describe the role of neuroradiologists in diagnosing and monitoring amyloid-related imaging abnormalities (ARIA). 3) Identify new imaging biomarkers that could play a role in understanding Alzheimer's disease, including vascular, glymphatic, and inflammatory biomarkers.

#### COURSE DESCRIPTION

The diagnosis of Alzheimer's disease has shifted dramatically in the last 10 years from clinical/phenotypic criteria to a biological definition of the disease, for which imaging is crucial. Beyond assessing atrophy on MRI and hypometabolism on FDG-PET, radiologists play a key role in reviewing amyloid and tau PET scans, both clinically and in research, and performing lumbar punctures for CSF biomarkers. In the new era of anti-amyloid immunotherapies, imaging will also form the basis for diagnosing and monitoring amyloid-related imaging abnormalities (ARIA) in patients receiving aducanumab and lecanemab. This course will provide an update on state-of-the-art imaging of Alzheimer's disease, both in the context of differential diagnosis and therapy.

### Updates to MRI Safety Guidance for Varied MR Environments and Devices (Supported in part by an Unrestricted Medical Education Grant from GE Healthcare, Inc.)

Sunday, Nov. 26 10:30AM - 11:30AM Room: E353C

Michael N. Hoff, PhD (*Moderator*) Nothing to Disclose  
R. Jason Stafford, PhD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

- 1) Describe unique MRI safety considerations and corresponding guidance in radiation oncology environments.
- 2) Describe unique MRI safety considerations and corresponding guidance in low field, high field, and alternate layout MR environments.
- 3) Understand unique concerns of implants and devices within the context of new MR environments.

#### COURSE DESCRIPTION

MRI safety guidance is continually evolving to keep pace with the changing MRI landscape. Recent years have seen the introduction of novel clinical MR environments, including those with the MR/LINAC and ultra-high and low field systems, challenging the abilities of institutions, governing bodies, and regulators to stay abreast of the wave of change. It is not only essential that new safety standards for these diverse environments are established, but it is also necessary to clearly communicate new guidance to radiological personnel in a timely fashion. These lectures will outline key MRI safety considerations involving radiation oncology, variable magnetic fields, and patients with implants and devices, with special attention paid to the unique challenges in each environment, how radiologists, physicists, and technologists can address them.

### NIH Grantsmanship Workshop

Sunday, Nov. 26 12:00PM - 3:30PM Room: S102AB

Gayle E. Woloschak, BS, PhD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) To gain insights as to how to approach preparation of an R01 award. 2) To learn about other awards such as fellowships and clinical trials. 3) To hear from NIH on current perspectives on grant applications. 4) To witness a mock study section.

#### COURSE DESCRIPTION

The goal of this course is to help students gain insights into the NIH process from proposal preparation to review of applications. It will also review R, K, and clinical trials applications. The review process will be considered from the lens of a mock study section done for the entire class.

### Reducing Overtreatment in Early Stage Breast Cancer

Sunday, Nov. 26 1:00PM - 2:00PM Room: S406A

Lars J. Grimm, MD (*Moderator*) Advisor, Hologic, Inc; Consultant, Hologic, Inc; Editorial Advisory Board, WebMD Health Corp (WebMD, Inc)

#### LEARNING OBJECTIVES

1) Describe overtreatment and the implications for patient care. 2) Explain the limitations of current strategies to identify patients at risk for overtreatment. 3) Identify promising new approaches in development that can triage patients away from overtreatment.

#### COURSE DESCRIPTION

Overtreatment is one of the principal harms of breast cancer screening programs that primarily originates new diagnosed early stage breast cancers. Identifying which patients will be overtreated is a key challenge as the underlying natural history of breast cancer is poorly understood. Drs. Grimm, Niell, and Wallis will lecture on key elements of the overtreatment debate including radiology, radiomics, and population data. At the completion of the session, attendees should understand the current up to date thinking about overtreatment, identify which patients are at risk, and understand new and emerging strategies for triage currently in development.

#### Sub-Events

##### **S4-CBR03B Reducing Overtreatment in Early Stage Breast Cancer: Insights from Radiology**

### Efficient and Focused Cardiac MRI

Sunday, Nov. 26 1:00PM - 2:00PM Room: S406B

Karen G. Ordovas, MD, MS (*Moderator*) Nothing to Disclose  
Jens Bremerich, MD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Identify strategies to obtain a focused cardiac MRI and to enhance efficiency. 2) List technical tips to improve speed on imaging acquisition. 3) Describe the series of sequences needed for a focused stress CMR protocol.

#### COURSE DESCRIPTION

Cardiac MRI is a powerful tool to assess morphology, tissue and function. Unfocused imaging of "everything", however, results in frustration among patients, referring physicians, and hospital administrators. Thus Radiologists must establish strategies for concise and focused examinations.

#### Sub-Events

##### S4-CCA07C Fast & Focused: Cardiac MRI in 20 Minutes

### RSNA Hands-On Lab: Liver Elastography

Sunday, Nov. 26 2:00PM - 3:30PM Room: S504CD

Richard G. Barr, MD, PhD (*Moderator*) Consultant, Siemens AG;Speakers Bureau, Siemens AG;Research Grant, Siemens AG;Consultant, Koninklijke Philips NV;Speakers Bureau, Koninklijke Philips NV;Consultant, Canon Medical Systems Corporation;Advisor, Hologic, Inc;Research Grant, Hologic, Inc

#### LEARNING OBJECTIVES

1) Review the protocol required for accurate liver stiffness measurements. 2) Discuss the confounding factors needed to be considered when interpreting results. 3) Identify the various quantitative ultrasound methods for liver fat quantification.

#### COURSE DESCRIPTION

In Person Session Only. Tickets must be purchased in advance for this course. This course can be added through the registration portal or by stopping by the Registration Desk. Space is limited.Chronic Liver disease is a world-wide health problem. The use of multiparametric ultrasound can assess the presence of disease, severity of the disease, and monitor treatment. This course will review how to perform and interpret liver elastography. For accurate measurements a strict protocol is required. The protocol will be reviewed, and potential acquisition errors will be discussed. Confounding factors will be discussed as they can significantly affect the interpretation of the results. The course will also review the state-of-the-art for quantitative ultrasound assessment of liver fat content which is critical in making the diagnosis of non-alcoholic fatty liver disease. The combination of these techniques will be discussed on how to evaluate chronic liver disease.

### **Horse or Zebra: Case Based Review of Common Mimics in the Brain, Spine, Head and Neck (Joint Session)**

Sunday, Nov. 26 1:00PM - 2:00PM Room: E450A

Courtney M. Tomblinson, MD (*Moderator*) Nothing to Disclose

#### **LEARNING OBJECTIVES**

1) Recognize typical and atypical imaging features of stroke, degenerative disc disease, inflammatory sinus disease, and metastatic cervical lymph nodes. 2) Differentiate stroke, degenerative disc disease, inflammatory sinus disease, and metastatic cervical lymph nodes from relevant mimics.

#### **COURSE DESCRIPTION**

In this case-based combined Neuroradiology and Head and Neck session, attendees will be presented with frequent imaging diagnoses in the brain, spine, sinuses and neck. Speakers will emphasize imaging pearls that distinguish these diagnoses from common mimics. This session offers attendees the opportunity to refine their interpretation of complex neuroradiology and head and neck imaging studies by incorporating tips from world experts.

### Financial Planning: A Shield from Burnout

Sunday, Nov. 26 1:00PM - 2:00PM Room: E350

Sherwin S. Chan, MD, PhD (*Moderator*) Consultant, Jazz Pharmaceuticals plc; Research Grant, Jazz Pharmaceuticals plc; Research Grant, Hyperfine, Inc; Research Grant, General Electric Company

#### LEARNING OBJECTIVES

1) Understand the basics of budgeting, debt reduction, and planning for retirement. 2) Recognize the importance of wealth building and advantages of major asset classes for radiologists. 3) Gain insight into asset protection, insurance and loan forgiveness programs.

#### COURSE DESCRIPTION

Many radiologists are unable to translate their high income into a high net worth. This is due to high student debt, poor financial literacy and lifestyle creep. High debt drives choices in career path for trainees and practicing radiologists and contributes to physician burnout and mental health issues. Despite the importance of personal financial health, education on finances is absent from the majority of radiology training programs. Some highly successful and intelligent radiologists who contribute enormously to research, radiology education, and clinical care have not spent the necessary time learning about finances and preparing for retirement. The gap in financial literacy for women is even greater.

### **Pediatric Genitourinary Anomalies: The Prenatal-Postnatal Continuum**

Sunday, Nov. 26 1:00PM - 2:00PM Room: E451A

Amy R. Mehollin-Ray, MD (*Moderator*) Nothing to Disclose

#### **LEARNING OBJECTIVES**

1) Identify and discuss key imaging features in the prenatal ultrasound and MRI evaluation of fetal lower urinary tract obstruction. 2) Understand appropriate postnatal imaging evaluation of prenatally-detected renal and bladder disorders, with an emphasis on the use of ultrasound and nuclear scintigraphy. 3) Explore MR urography as an important adjunct anatomic and functional imaging study, with a focus on optimizing protocols and avoiding common pitfalls.

#### **COURSE DESCRIPTION**

Learners will explore the imaging evaluation of pediatric urinary tract obstruction using multiple imaging modalities (fetal ultrasound, fetal MRI, postnatal ultrasound, nuclear scintigraphy and MR urography), following a logical progression from fetal to postnatal life. Key fetal imaging findings will be emphasized, and the course will provide important, up-to-date information on which prenatal findings require postnatal work-up and when. The use of functional imaging data from scintigraphy and MR urography will be translated for everyday practice.

### Tutorial on Ultrasound Imaging

Sunday, Nov. 26 1:00PM - 2:00PM Room: N230B

Thaddeus A. Wilson, PhD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Explain the advantages and challenges of software beamforming, and its impact for the sonographer. 2) Describe ultrasound methods of tissue property quantification, including elastography, tomography, and backscatter methods. 3) Summarize advancements in transducer technology and their impact on image quality.

#### COURSE DESCRIPTION

This lecture will review the physics and principles underlying current diagnostic ultrasound imaging. Advances in computing power and transducer technology have driven significant changes in how ultrasound can be used to form images, map blood flow, measure tissue elasticity, and track contrast agents. Developments in both conventional and tomographic ultrasound are further enabling quantitative tissue characterization. This course will describe the fundamentals of these technologies and provide the student with an understanding of their capabilities and current challenges.

### Interstitial Lung Abnormality (ILA): What to do and Why

Sunday, Nov. 26 2:30PM - 3:30PM Room: N228

David A. Lynch, MBBCh (*Moderator*) Research Consultant, CALYX Inc; Research Consultant, Boehringer Ingelheim GmbH; Research Consultant, Veracyte, Inc; Research Consultant, DAIICHI SANKYO Group; Research Consultant, AstraZeneca PLC; Consultant, Polarean, Inc; Consultant, Bristol Myers Squibb Company  
Andrea Oh, MD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Define interstitial lung abnormalities (ILAs) and identify the different subtypes. 2) Differentiate between ILAs and early/subclinical interstitial lung disease (ILD). 3) Understand the clinical significance and management of ILAs.

#### COURSE DESCRIPTION

This session will provide the latest imaging and clinical updates on interstitial lung abnormalities (ILAs). Discussion topics will include defining ILAs and the different CT patterns, smoking related interstitial abnormalities, the clinical significance of ILAs from a pulmonologist's perspective, and identifying early ILD in connective tissue diseases.

### **Opportunistic CT Screening for Population Health: Radiology Scientific Expert Panel (Supported in part by an Unrestricted Medical Education Grant from Siemens Healthineers of Siemens Medical Solutions, USA, Inc.)**

Sunday, Nov. 26 2:30PM - 3:30PM Room: S401

Perry J. Pickhardt, MD (*Moderator*) Advisor, Bracco Group; Advisor, Zebra Medical Vision Ltd; Advisor, Nano X Imaging;

#### **LEARNING OBJECTIVES**

1) Explain the systematic opportunistic use of quantitative imaging findings on CT for population health purposes. 2) Explain how Artificial intelligence (AI) may facilitate the widespread implementation of opportunistic CT screening. 3) Identify barriers to acceptance of opportunistic screening, including managing regulatory clearance, demonstrating cost-effectiveness, and achieving reimbursement.

#### **COURSE DESCRIPTION**

This session will cover the promise and challenges related to the implementation of AI-based opportunistic CT screening for population health. All speakers are members of the recently convened Radiology Scientific Expert Panel on this topic, which recently published its findings in Radiology.

#### **Sub-Events**

##### **S5-CIN01B Rationale for Leveraging Opportunistic CT Data**

### Advanced Biliary Interventions

Sunday, Nov. 26 2:30PM - 3:30PM Room: E353B

Todd Schlachter, MD (*Moderator*) Research Grant, Guerbet SA

#### LEARNING OBJECTIVES

1) Gained the knowledge and expertise necessary to optimize patient outcomes through advanced diagnostic and therapeutic interventions in biliary disorders. 2) Identify what is cutting-edge right now and what may come next.

#### COURSE DESCRIPTION

The Advanced Biliary Interventions lecture series is a didactic program designed to provide IR physicians with knowledge and skills in biliary interventions. This course aims to equip participants with an advanced understanding of complex biliary disorders' diagnosis, management, and treatment through interactive lectures and case-based discussions. Throughout the course, participants will delve into the latest advancements, techniques, and evidence-based practices in biliary interventions, focusing on therapeutic and diagnostic procedures. The course will cover a wide range of topics, including but not limited to: Emerging Technologies and Innovations: Examining emerging technologies, minimally invasive approaches, and novel therapeutic options in biliary interventions, emphasizing what is cutting-edge right now and what may come next. Interventional Techniques: Detailed exploration of advanced interventional techniques, such as percutaneous transhepatic cholangiography and drainage (PTCD), endoscopic interventions, biliary stenting, and ablation. Biliary Anatomy and Physiology: A review of the anatomy and physiology of the biliary system, gallbladder, bile ducts, and connections. Benign Biliary Disorders: Discussion of the diagnosis and management of benign biliary conditions, including biliary strictures, stones, bile leaks, and other lesions. Malignant Biliary Disorders: Overview of the diagnostic and therapeutic approaches for malignant biliary disorders, including cholangiocarcinoma and metastatic disease. Complications and Management: Understanding the potential complications associated with biliary interventions and developing strategies for their prevention and management. The course will be delivered through a combination of didactic lectures, interactive case discussions, and multimedia presentations. Expert faculty, comprising experienced clinicians and researchers in the field, will guide participants through the course material, emphasizing evidence-based practice and clinical decision-making. Upon completion of the Advanced Biliary Interventions lecture series, participants will have gained the knowledge and expertise necessary to optimize patient outcomes through advanced diagnostic and therapeutic interventions in biliary disorders.

### Shoulder Imaging: Fundamentals

Sunday, Nov. 26 2:30PM - 3:30PM Room: E450A

Soterios Gyftopoulos, MD, MBA (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Recognize frequently encountered imaging findings of pathologic processes of the acromioclavicular joint on radiographic and cross section imaging. 2) To review the post-operative imaging appearance of common shoulder surgeries involving the labrum, rotator cuff tendons, and shoulder joints. 3) To review MRI and US findings of rotator cuff abnormalities.

#### COURSE DESCRIPTION

Shoulder Imaging: Fundamentals will provide an overview of the important clinical and imaging findings for common shoulder conditions. Expert musculoskeletal radiologists will present live lectures on topics including shoulder instability, acromioclavicular pathologies, rotator cuff tears, superior labral tears, and post-operative shoulder imaging. Individuals who attend this course will leave with crucial pearls and pitfalls of shoulder imaging, including MRI, CT, ultrasound, and x-ray, that can be easily applied to everyday practice. This is a can't miss session for all RSNA attendees, from medical students to attending physicians!

### Imaging Considerations in Challenging Population

Sunday, Nov. 26 2:30PM - 3:30PM Room: S406A

Marcia C. Javitt, MD (*Moderator*) Spouse, Consultant, NeuroRx, Inc

#### LEARNING OBJECTIVES

1) Gain increased awareness about caring for vulnerable or marginalized patients in the Radiology Department. 2) Understand the imaging modalities best suited to safe and appropriate personalized care of these populations. 3) Recognize and respond quickly and effectively to urgent and emergent conditions requiring imaging triage to essential treatment and intervention.

#### COURSE DESCRIPTION

This session will review imaging challenges and specific health related issues in obese, elderly, pediatric, and pregnant patients. Relevant problem-solving techniques, clinical information and multidisciplinary collaboration will be discussed. Imaging pearls and pitfalls will be provided. The format will be lectures and some discussion.

#### Sub-Events

### **Beyond Binary: Supporting Gender Diversity in Radiology (Sponsored by the RSNA Committee on Diversity, Equity and Inclusion)**

Sunday, Nov. 26 2:30PM - 3:30PM Room: E351

David S. Pryluck, MD, MBA (*Moderator*) Nothing to Disclose  
Courtney M. Tomblinson, MD (*Moderator*) Nothing to Disclose

#### **LEARNING OBJECTIVES**

1) Describe the foundational terms and concepts used within the transgender community and discuss the experiences of transgender patients in healthcare and radiologic subspecialties. 2) Understand the challenges faced by TGD people in the radiology workforce and learn how radiology practices can adapt facilities and practices to be more inclusive. 3) Present the importance of collecting robust Gender Data for radiology health care and for radiology research. Discuss how robust data leads to a better understanding of health outcomes and effectiveness of preventive interventions. 4) Discuss examples and tools to foster a supportive workplace environment and facilitate change, including: pronoun usage, being a vocal and visible ally, reviewing & updating local policies.

#### **COURSE DESCRIPTION**

The field of Radiology must adapt to support patients and workforce members whose identity extends beyond traditional binary gender models of male and female. In this session, participants will learn about experiences of transgender and/or gender diverse (TGD) persons as they navigate the current healthcare environment. Employees in the Radiology workforce will also discuss challenges faced by TGD persons and how Radiology practices can adapt facilities and practices to be more inclusive. We will discuss how to accurately collect more inclusive and comprehensive gender data to drive initiatives for recruitment and retention in Radiology. The session will close with a panel discussion offering tangible examples for supporting TGD peers and patients in our Radiology community.

### Reaching a Tipping Point: Balancing Workload and Staffing of Neuroradiologists

Sunday, Nov. 26 2:30PM - 3:30PM Room: E352

Melissa M. Chen, MD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Understand how work RVUs are derived and potential consequences of using these values as measurements of productivity. 2) Explore ways to objectively measure non-clinical work efforts. 3) Review academic work practice volumes and potential need for establishing limits.

#### COURSE DESCRIPTION

Demand for imaging continues to increase and will likely outpace the workforce supply. Academic and private radiology practice will face significant challenges. Sustaining the academic mission of radiology will also be a challenge. This session will review common metrics and benchmarks used to measure productivity of radiologists. Limitations of the systems will be discussed. Attendees will learn potential ways to measure non-clinical work efforts and productivity. Data from recent work survey of neuroradiology academic department productivity will be reviewed. Finally, the session will explore whether it is time for work limits for radiologists and what types of limits should be established.

### **STAT! Emergency Imaging of the Pediatric Patient**

Sunday, Nov. 26 2:30PM - 3:30PM Room: E451B

Kassa Darge, MD, PhD (*Moderator*) Nothing to Disclose

#### **LEARNING OBJECTIVES**

1) Demonstrate the utility of ultrasound and other modalities in the diagnosis of targeted pediatric abnormalities from the emergency room. 2) Identify tips and tricks to avoid pitfalls when diagnosing gonadal torsion, midgut volvulus and acute neck emergencies.

#### **COURSE DESCRIPTION**

This course focuses on the diagnostic aspects of specific pediatric emergencies which include gonadal torsion, midgut volvulus and acute neck abnormalities. The utility of different modalities will be covered.

#### **Sub-Events**

### Cone Beam Breast CT: Technology, Clinical Application, and Quality Image

Sunday, Nov. 26 2:30PM - 3:30PM Room: E353C

Mahadevappa Mahesh, PhD, MS (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) To learn the principles of CBCT and cone beam breast CT systems. 2) To understand image acquisition and dose measurement in cone beam breast CT. 3) To become familiar with clinical application of cone beam breast CT.

#### COURSE DESCRIPTION

Cone-beam CT (CBCT) is increasingly used in diagnostic imaging and image-guided procedures, ranging from interventional radiology to breast imaging, radiation therapy and surgery. The proliferation of CBCT systems that are used as standalone or as part of the fluoroscopy systems are used not only in radiology but in surgery, pain clinic, dental clinics, etc. Even though the fundamentals of cone beam breast CT are similar to CBCT, there are distinct differences between the two technologies, in terms of acquisition, image processing and radiation dose estimation. This course is aimed to cover the general principles of CBCT and Cone Beam Breast CT systems, along with the challenges of quality control evaluation, radiation dose measurements and clinical applications. The course has three presentations with first two aimed at describing the physics principles of CBCT and cone beam breast CT, while the final presentation will focus on clinical applications of breast CT.

#### Sub-Events

##### S5-CPH02B Overview of Cone Beam CT and the Challenges in Quality Control

### Tutorial on the Use of Ultrasound Contrast Agent and Parametric Imaging

Sunday, Nov. 26 2:30PM - 3:30PM Room: N230B

Zheng Feng Lu, PhD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) To understand the basics of contrast-enhanced ultrasound (CEUS) and ultrasound parametric imaging. 2) To gain knowledge of these emerging ultrasound technologies in various clinical applications. 3) To identify the technical considerations when implementing CEUS and parametric imaging in clinical applications.

#### COURSE DESCRIPTION

The first half of the course will provide a comprehensive understanding of contrast-enhanced ultrasound (CEUS) and its clinical applications by introducing the basics of contrast-enhanced ultrasound (CEUS), describing the technical considerations specific to CEUS, and explaining its clinical implementations as well as utilities. The second half of the course will showcase the emerging ultrasound parametric imaging. You will learn the basic physics principles underlying this technology. Various clinical applications of ultrasound parametric imaging will be explored.

### **Lymphoma: Imaging for Diagnosis and Prognosis**

Sunday, Nov. 26 2:30PM - 3:30PM Room: S402

Sarah A. Johnson, MD, FRCPC (*Moderator*) Nothing to Disclose

#### **LEARNING OBJECTIVES**

1) To enable participants to use standardized tools for response assessment in lymphoma.2) To identify strategies for diagnosis of lymphoma in the head and neck.3) To recognize current clinical challenges in lymphoma diagnosis and treatment.

#### **COURSE DESCRIPTION**

Imaging of lymphoma will be encountered by radiologists in all subspecialties and general practice. Accurate diagnosis and response assessment are of great clinical importance for lymphoma patients. This series of case-based lectures will enable participants to become comfortable with diagnosis and response assessment for imaging of lymphoma.

#### **Sub-Events**

### Supporting Patients with Neuro Diverse Needs Within Radiology (Sponsored by the RSNA Associated Sciences Consortium)

Tuesday, Nov. 28 8:00AM - 9:00AM Room: N230B

Charlotte Beardmore, MBA (*Moderator*) Nothing to Disclose  
Susie M. Moseley, MS, RT (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Explore the factors which influenced the experiences of autistic children and their parents in a diagnostic imaging department. 2) Discuss various types of dementia and how to identify patients who may have dementia. 3) Discuss lessons learned and recommend strategies to enhance patient and family centered care for neuro diverse individuals.

#### COURSE DESCRIPTION

Neurodiverse individuals have cognitive differences that affects how their brain works, resulting in unique strengths and challenges. These individuals may experience barriers in healthcare related to access, communication, sensory challenges, and provider knowledge, which can affect their experiences in medical imaging settings. This presentation will explore the experiences of autistic children and patients with dementia in medical imaging departments and discuss strategies to enhance patient-centered care for individuals with neuro diverse needs.

### Essentials of Breast Imaging

Tuesday, Nov. 28 8:00AM - 9:00AM Room: S406A

Katja Pinker-Domenig, MD, PhD (*Moderator*) Speakers Bureau, European Society of Breast Imaging;Speakers Bureau, Siemens AG;Speakers Bureau, IDKD;Speakers Bureau, Canon Medical Systems Corporation;Consultant, F. Hoffmann-La Roche Ltd;Consultant, Merantix Healthcare;Consultant, AURA Health

#### LEARNING OBJECTIVES

1) To have a basic knowledge of the advantages and limitations of x-ray-based breast imaging methods. 2) To understand when to do ultrasound in symptomatic breast practice and in what situations add-on US techniques are useful. 3) To have a basic understanding of breast MRI techniques, indications, reporting and consequent management recommendations.

#### COURSE DESCRIPTION

This educational course will explain the technique and indications of breast ultrasound, digital breast tomosynthesis and breast MRI and summarize its indications in clinical breast imaging. Upon completion of this course participants will understand the current clinical applications and limitations of the methods.

#### Sub-Events

### **The Heart of the Matter: MRI Case Based Review in Nonischemic Cardiomyopathies (Supported in part by an Independent Medical Education Grant from Pfizer, Inc.)**

Tuesday, Nov. 28 8:00AM - 9:00AM Room: S406B

Dominique C. DaBreo, MD, FRCPC (*Moderator*) Nothing to Disclose

Bradley D. Allen, MD, MS (*Moderator*) Consultant, Circle Cardiovascular Imaging Inc;Speaker, WebMD LLC

#### **LEARNING OBJECTIVES**

1) Review current best-practices for CMR evaluation of non-ischemic cardiomyopathy. 2) Demonstrate through cases the role of CMR in non-ischemic cardiomyopathy for diagnosis and risk-stratification. 3) Highlight areas of uncertainty in the current imaging approach and when other modalities can be used to aid in diagnosis.

#### **COURSE DESCRIPTION**

Cardiac MRI (CMR) is an important tool for providing accurate diagnosis and risk-stratification for non-ischemic cardiomyopathies. In this course, learners will be presented with a broad overview of the current state-of-the-art for CMR evaluation of multiple non-ischemic cardiomyopathies. Topics will be presented in a case-based lecture format highlighting relevant CMR acquisitions and interpretation approaches, with a data-driven focus on current best-practices.

### Prostate MRI and Molecular Imaging: Core and Advanced Applications

Tuesday, Nov. 28 8:00AM - 9:00AM Room: N228

Aytekin Oto, MD (*Moderator*) Research Grant, Koninklijke Philips NV; Medical Advisory Board, Profound Medical Inc; Consultant, IBM Corporation; Co-founder, Qmis LLC; Co-owner, Qmis LLC

#### LEARNING OBJECTIVES

- 1) Learn about the latest updates on prostate imaging with special emphasis on MRI and PET imaging.
- 2) Review the quality control efforts for prostate MR and explain the current and future applications of artificial intelligence on prostate imaging.
- 3) Understand the potential roles and added value of PSMA PET and PET MR in the management of patients with prostate cancer.
- 4) Identify how MRI could be optimized for and be used to mitigate the harm of prostate cancer screening.

#### COURSE DESCRIPTION

This session aims to provide a comprehensive update on the latest developments in prostate imaging with a special focus on MRI and PET imaging. The presentations are well-balanced and broad in scope, from practical updated tips for optimized prostate MR acquisition and interpretation to new techniques such as PET-MRI and PSMA-PET imaging. The role in the management of prostate cancer patients will be reviewed in addition to other hot topics including molecular imaging impacts, quality control, artificial intelligence applications, screening and disparities in prostate imaging.

#### Sub-Events

### Best Practices for AI Model Deployment

Tuesday, Nov. 28 8:00AM - 9:00AM Room: S401

Catherine M. Jones, MBBS (*Moderator*) Researcher, Annalise-AI Pty Ltd

#### LEARNING OBJECTIVES

1) To identify the key areas of consideration when deploying AI into clinical radiology practice. 2) To explore the approaches to change management and governance in AI. 3) Outline the key technological considerations in deploying AI into real world practice.

#### COURSE DESCRIPTION

This one hour session is an overview of the key areas essential to the safe, responsible and effective deployment of artificial intelligence (AI) into clinical radiological practice. The session is split into three lectures - change management strategies, AI governance considerations and an overview of the technological decision making process in AI deployment. This session is important for any radiologists, allied health professionals and medical imaging managers interested in incorporating AI into their practice.

### Head to Toe Tumor Challenging Cases: Lessons Learned

Tuesday, Nov. 28 8:00AM - 9:00AM Room: E450B

Rachna Madan, MBBS, MD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Understand key principles in radiologic-pathologic correlation as applicable to a variety of head & neck, thoracic, abdominal and musculoskeletal malignancies. 2) Formulate a focused differential diagnosis for head & neck, thoracic, abdominal, and musculoskeletal malignancies based on these principles. 3) The differential diagnoses would cover cases with infection, inflammation, and hemorrhage.

#### COURSE DESCRIPTION

This course will use a case-based format and highlight the role of imaging in the diagnosis of challenging oncology cases using a multimodality approach. The session will focus on a variety of head and neck, pediatric, chest, musculoskeletal, and abdominal malignancies. Clinical presentation and pathological correlations will be provided when possible. Differential diagnoses will include infection, inflammation, neoplasm, ischemia, hemorrhage. The session will provide a broad update in imaging advances that help to make the correct diagnosis.

### Case-based Review of PET/CT: Brain, Head, Neck

Tuesday, Nov. 28 8:00AM - 9:00AM Room: E353C

Phillip H. Kuo, MD, PhD (*Moderator*) Consultant, Konica Minolta, Inc; Consultant, Amgen Inc; Consultant, Blue Earth Diagnostics Ltd; Research Grant, Blue Earth Diagnostics Ltd; Consultant, Novartis AG; Speaker, Novartis AG; Consultant, Chimerix, Inc; Consultant, Fusion Pharmaceuticals Inc; Consultant, Bayer AG; Consultant, General Electric Company; Speaker, General Electric Company; Research Grant, General Electric Company; Speaker, Digital Science Press, Inc; Consultant, Radionetics; Former Employee, Konica Minolta, Inc

#### LEARNING OBJECTIVES

1) Understand best clinical practices for use and interpretation of dementia PET imaging. 2) Understand best clinical practices for use and interpretation of PET/CT in patients with head/neck cancer.

#### COURSE DESCRIPTION

The head/neck is an area of high anatomic and metabolic complexity. In this session, experts on dementia imaging and PET/CT for head/neck malignancy will use clinical cases to demonstrate fundamentals of interpretation, as well as pearls and pitfalls to help improve interpretation of these studies.

#### Sub-Events

### Demystifying Postoperative Spine Imaging: Imaging Techniques and Case Based Review

Tuesday, Nov. 28 8:00AM - 9:00AM Room: E451A

J. Levi Chazen, MD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Identify imaging optimization techniques for postoperative spine imaging with MRI and CT. 2) Understand common surgical approaches to the spine, expected postoperative changes, and surgical complications.

#### COURSE DESCRIPTION

Postoperative spine imaging is challenging with varied surgical approaches, instrumentation hardware, and related imaging artifact. This interactive case-based course will cover techniques to optimize postoperative spine imaging on both CT and MRI. Surgical techniques, hardware malplacement, postoperative collections, and neurovascular complications will be reviewed.

### **RSNA Hands-On Lab: Breast US Biopsy**

Tuesday, Nov. 28 9:00AM - 10:30AM Room: S504CD

Stamatia V. Destounis, MD (*Moderator*) Medical Advisory Board, iCad, Inc

#### **LEARNING OBJECTIVES**

1) Attendees will review various needle biopsy devices for ultrasound guided procedures along with opportunity to perform needle biopsy procedures under the supervision of breast radiologists. 2) Review of cyst aspiration and wire localization procedures will be performed along with clip placement.

#### **COURSE DESCRIPTION**

In Person Session Only. Tickets must be purchased in advance for this course. This course can be added through the registration portal or by stopping by the Registration Desk. Space is limited. Hands on opportunity for cyst aspiration, needle biopsy and wire localization procedures under ultrasound guidance and direct supervision by expert radiologists. Didactic lecture on the performance of the most common biopsy procedures in the breast followed by hands on opportunity to perform procedures.

### Diversity in Access to Breast Imaging (Sponsored by the RSNA Associated Sciences Consortium)

Tuesday, Nov. 28 9:30AM - 10:30AM Room: N230B

Brandy J. Reed, MBA, RT (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Understand the barriers to access in breast imaging that are related to diversity. 2) Describe data reflecting breast cancer screening center element disparities. 3) Describe potential solutions for addressing diversity-related barriers to breast imaging access.

#### COURSE DESCRIPTION

Asymmetries in health care access related to health care disparities have been amplified through and after the COVID pandemic. This course will include two interactive presentations (lectures) reviewing diversity-related barriers to access in breast imaging. Barriers reviewed include costs of care as a function of household income and insurance carriers, national screening guideline inconsistencies and variability, patient education and awareness, geocoding indicators of social determinants of health. Data on screening center element disparities will be described. Potential solutions and strategic plans to address this widening asymmetry in access to breast imaging care across vulnerable populations will be discussed.

#### Sub-Events

##### T3-CAS08B Diversity, Women, Minority Platform in the Imaging World

Wei T. Yang, MD, FRCR (*Presenter*) Royalties, Reed Elsevier; Advisory Board, Lux Capital

##### T3-CAS08C Diversity in Breast Imaging

### Acute Lung Injury

Tuesday, Nov. 28 9:30AM - 10:30AM Room: S406A

Ioannis Vlahos, MBBS, FRCR (*Moderator*) Director, Grayscale Ltd;Co-owner, Grayscale Ltd;

#### LEARNING OBJECTIVES

1) To evaluate appearances of acute lung injury and their clinical/pathological correlates. 2) To understand specific lung injuries in inhalation disorders and oncological patients. 3) Imaging assessment of patients with lung injury treated by ECMO.

#### COURSE DESCRIPTION

Lecture format with 4 lectures:1. Differentiating diffuse alveolar damage and acute fibrinous and organizing pneumonia, radiology and pathology. 2. E-cigarette or vaping use-associated lung injury (EVALI). 3. Oncological lung emergencies: common and uncommon imaging scenarios to be aware of.4. Assessing expected appearances and complications in ICU extracorporeal membrane oxygenation (ECMO) patients.

#### Sub-Events

### LIRADS

Tuesday, Nov. 28 9:30AM - 10:30AM Room: E450A

Jeong Min Lee, MD, PhD (*Moderator*) Grant, Bayer AG Grant, Canon Medical Systems Corporation Grant, Koninklijke Philips NV Grant, General Electric Healthcare Grant, Guerbet SA Grant, Samsung Electronics Co, Ltd Grant, Bracco Group Grant, Dongkuk Pharma Grant, Starmed Ltd Grant, RF medical Grant, Siemens AG Speakers, Bayer AG Speakers, Philips Healthcare Speakers, Samsung Medison Speakers, GE Healthcare

#### LEARNING OBJECTIVES

1) Apply the updated LI-RADS guidelines in the interpretation and reporting of liver imaging studies, ensuring accurate identification, and characterization of liver lesions. 2) Evaluate treatment response of liver lesions using CEUS techniques within the LI-RADS framework, enabling participants to assess therapeutic outcomes effectively. 3) Discuss challenging areas encountered in CT/MRI interpretation according to LI-RADS guidelines, enhancing participants' proficiency, and confidence in the assessment of liver lesions.

#### COURSE DESCRIPTION

This course is meticulously designed to keep radiologists informed and updated on the latest developments in LI-RADS (Liver Imaging Reporting and Data System) through focused educational sessions. Esteemed experts will deliver an all-encompassing overview of the latest advancements in LI-RADS assessment and reporting. This course is an opportunity to cultivate practical skills for accurately interpreting liver imaging studies by leveraging the latest guidelines, assessing treatment response with CEUS, and adeptly managing complex areas in CT/MRI interpretation. This training aims to elevate your proficiency and instill confidence in LI-RADS reporting, thereby promoting standardized and superior-quality reports. We invite you to join us, expand your understanding of LI-RADS, stay abreast of current developments, and polish your proficiency in liver imaging.

#### Sub-Events

##### T3-CGI08B LI-RADS Treatment Response Assessment with CEUS

### People, Process and Technology: 3 Pillars for Successful Rad IT Integration

Tuesday, Nov. 28 9:30AM - 10:30AM Room: S404

Namita S. Gandhi, MD, MSc (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Discuss challenges and considerations of integrating disparate radiology technology systems (EHR, RIS, PACS, Dictation systems) during merger and acquisitions. 2) Discuss radiology operational challenges and change management which go hand in hand when integrating technology from different organizations.

#### COURSE DESCRIPTION

Mergers and acquisitions (M & As) are becoming a common practice in healthcare. For M & As to be successful, the IT teams are usually asked to integrate the (often) disparate technologies across the different organizations. A successful integration is not only dependant on technological integration but also on change management and addressing operational considerations. In this course, we will discuss challenges and considerations for all three pillars of a successful IT integration - technology, people and processes, along with post go live optimization strategies.

#### Sub-Events

### Best Practices for AI Education

Tuesday, Nov. 28 9:30AM - 10:30AM Room: S401

Tessa S. Cook, MD, PhD (*Moderator*) Grant, Independence Blue Cross; Speaker, Sectra AB;

#### LEARNING OBJECTIVES

1) Introduce the concept of an educational framework, and how to educate radiologists and residents on AI. 2) Demonstrate how to concretely show radiologists the value of AI beyond the hype, and how it can integrate into the imaging workflow. 3) Discuss strategies for educating the entire care team (including our technologists and referring clinicians) as well as our patients about AI.

#### COURSE DESCRIPTION

AI isn't just coming; it's here. Do you know how you'll educate your fellow radiologists or our future colleagues about AI? What about our technologists, referring clinicians, and patients? In this didactic session, three experts will discuss best practices for AI education across the care continuum.

#### Sub-Events

##### **T3-CIN18B Educating the Care Team and Our Patients About AI**

### Case-based Review of PET/CT: Breast Cancer

Tuesday, Nov. 28 9:30AM - 10:30AM Room: E353C

Gary A. Ulaner, MD,PhD (*Moderator*) Speaker, Siemens AG;Speaker,Lantheus Holdings;Research support, General Electric Company;Research support, F. Hoffmann-La Roche Ltd;Research support, Lantheus Holdings;Research support, Novartis AG

#### LEARNING OBJECTIVES

1) Understand best clinical practices for use and interpretation of PET imaging in patient with lung cancer. 2) Understand best clinical practices for use and interpretation of FES PET/CT in patients with breast cancer.

#### COURSE DESCRIPTION

PET/CT has greatly impacted the imaging and therapy of chest malignancies, including longstanding value for staging of lung cancer, as well as novel Estrogen Receptor targeted imaging for breast cancer. In this session, experts on lung and breast cancers will use clinical cases to demonstrate fundamentals of interpretation, as well as pearls and pitfalls to help improve interpretation of FES (Cerianna) PET.

### **Errors in Radiology: The Human Factor is the X-Factor (Sponsored by the RSNA Professionalism Committee)**

Tuesday, Nov. 28 9:30AM - 10:30AM Room: E353B

Kate Hanneman, MD, MPH (*Moderator*) Speaker, Groupe Sanofi; Speaker, Amicus Therapeutics, Inc  
Michael K. Atalay, MD, PhD (*Moderator*) Nothing to Disclose

#### **LEARNING OBJECTIVES**

1) To identify and reduce or eliminate causes of human error. 2) To enhance productivity and system efficiency. 3) To improve safety, health, and well-being of both patients and care providers.

#### **COURSE DESCRIPTION**

The goals of this course will be to understand the salient features of human factors, why they occur, how they lead to errors in radiology, and strategies for managing them and reducing their adverse effects.

#### **Sub-Events**

### **Pediatric Thoracic Abnormalities: Congenital and Acquired**

Tuesday, Nov. 28 9:30AM - 10:30AM Room: E450B

Donald P. Frush, MD (*Moderator*) Nothing to Disclose

#### **LEARNING OBJECTIVES**

1) Develop the appropriate imaging approach in children to be able to characterize vascular rings and slings, lung lucencies as well as disorders of the diaphragm and chest wall.

#### **COURSE DESCRIPTION**

The types of thoracic disorders as well as the imaging approach to best characterize may be unique in the pediatric population. In this didactic session, four pediatric imaging experts will focus on four different regions of the chest: the lungs, vascular system, chest wall and diaphragm and discuss relevant, often commonly encountered disorders. Objectives include gaining an understanding of the benefits and challenges with imaging approaches for regional thoracic disorders and enhancing the ability to characterize abnormalities especially for guiding clinical management.

### Deep Learning in CT Image Formation

Tuesday, Nov. 28 9:30AM - 10:30AM Room: E451B

Lifeng Yu, PhD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

- 1) Describe deep learning applications in CT image formation process, including image reconstruction and artifact reduction.
- 2) Explain current clinical implementations of deep learning reconstruction methods on CT scanners and how to evaluate these methods.

#### COURSE DESCRIPTION

This course will provide an overview of deep learning applications in CT image formation, including image reconstruction and artifact correction. It will also summarize current clinical implementations of deep learning-based image reconstruction and noise reduction methods on CT scanners and describe how to appropriately evaluate these methods. Potential pitfalls of deep learning methods in CT image formation will be described. There are three lectures in this course:(1) Deep learning in CT reconstruction(2) Deep learning in CT artifact correction(3) Clinical implementation and evaluation

### Principles and Applications of 4D Flow MRI

Tuesday, Nov. 28 9:30AM - 10:30AM Room: N229

Jordi Broncano, MD (*Moderator*) Nothing to Disclose  
Christopher J. Francois, MD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Explain strategies for acquiring 4D Flow MRI and addressing challenges in its acquisition. 2) Describe methods for implementing 4D Flow MRI into routine clinical cardiovascular MRI studies. 3) Identify indications for including 4D Flow MRI in assessment of aorta, abdominal vascular, and congenital heart diseases.

#### COURSE DESCRIPTION

In this course, attendees will learn how to acquire and analyzed 4D Flow MRI. This will include a summary of approaches to acquiring 4D Flow MRI and addressing technical challenges in performing 4D Flow MRI. Recommendations for integrating 4D Flow MRI into routine clinical workflows will be provided. The use of 4D Flow MRI in evaluating aortic, abdominal vascular, and congenital heart diseases will be highlighted.

### Singapore Presents: Radiology in the Lion City - The Pursuit of Excellence Within 284 Square Miles

Tuesday, Nov. 28 9:30AM - 10:30AM Room: E350

Swee T. Quek, MBBS, FRCR (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Gain insight into the evolving Singapore healthcare structure and financing. 2) Understand the current and emerging trends in Singapore Radiology. 3) Appreciate how the future Singapore Radiology workforce may evolve. 4) Know key Radiology research interests and Interventional Radiology practices in the Singapore context.

#### COURSE DESCRIPTION

This course provides an overview of the Singapore healthcare system as a prelude to understanding how recent trends have impacted the practice of Radiology in our country, including the drive towards value-based imaging and shift towards population health in the face of an ageing population. The challenges placed on the Radiology workforce and how it may evolve in response to these demands are also discussed. Finally, we share highlights of Radiology research and future directions of Interventional Radiology practice in our country.

### How To's of Publishing Your Research: Ask the Trainee Editors

Tuesday, Nov. 28 9:30AM - 10:30AM Room: S403A

Gary D. Luker, MD (*Moderator*) Institutional Research Grant, Polyphor, Ltd

#### LEARNING OBJECTIVES

1) Describe the the editorial training opportunities for residents, fellows, graduate students, and postdocs offered by the Radiology suite of journals. 2) Understand the manuscript submission and peer review process. 3) Identify resources to assist with research and publishing in imaging.

#### COURSE DESCRIPTION

This interactive panel discussion is intended familiarize radiology residents, fellows, graduate students, and postdocs on the process of journal publishing. The panel will be comprised of members of the trainee editorial boards of the RSNA suite of journals (Radiology, Radiology Imaging Cancer, Radiology Artificial Intelligence, Radiology Cardiothoracic) and moderated by the journal editors. Each panel member will present a brief introduction of their journal's trainee activities and how it contributes to career development. This will be followed by a Q&A discussion where questions from the audience will be encouraged. Sample questions from past sessions include "How do you select the right journal?" "How do you handle peer reviewer comments?" "Should I publish first in a preprint server?" "How do I become a peer reviewer for a journal?" Resources and platforms available to authors for writing, statistical analysis, graphics design, and reporting criteria will be discussed.

### Best Practices for Continuous AI Model Evaluation

Tuesday, Nov. 28 11:00AM - 12:00PM Room: S401

Matthew P. Lungren, MD (*Moderator*) Advisor, Segmed, Inc;Shareholder, Segmed, Inc;Advisor, Bunkerhill Health;Shareholder, Bunkerhill Health;Employee, Microsoft Corporation

#### LEARNING OBJECTIVES

1) Understand the necessity and significance of continuous AI model evaluation in the field of radiology. 2) Identify key performance indicators for AI model monitoring, and learn strategies for their ongoing tracking and evaluation. 3) Gain insights into best practices for validation, recalibration, and adjustment of AI models to ensure their robustness and relevance over time. 4) Recognize ethical considerations and regulatory guidelines related to the application of AI in radiology, contributing to the responsible use of these technologies. 5) Apply practical techniques for continuous AI model evaluation in their own clinical or research context, enhancing the effectiveness of AI implementation in radiology.

#### COURSE DESCRIPTION

With the surge in the application of Artificial Intelligence (AI) in radiology, maintaining the performance of these models becomes paramount. This course will focus on the strategies and techniques required to continuously evaluate and improve AI models in order to maintain their reliability, safety, and efficacy in radiological practice. Drawing from a wealth of expertise and research, attendees will learn the key principles of AI model lifecycle management, performance monitoring, validation, recalibration techniques, and the ethics and regulations surrounding AI in radiology. Attendees will leave the session equipped with practical knowledge and resources that they can apply to their own AI models and radiological practices. This session is perfect for radiologists, AI researchers, clinicians, data scientists, and healthcare professionals who are leveraging or planning to leverage AI in their work and want to ensure the optimum performance of their AI models over time. With a blend of theory and practice, the session will provide essential knowledge and tools to help you navigate the rapidly evolving landscape of AI in radiology.

### **What Does Climate Change Have to do With Radiology? Impetus for Change and a Call to Action (Sponsored by the RSNA Professionalism Committee)**

Tuesday, Nov. 28 11:00AM - 12:00PM Room: S402

Kate Hanneman, MD, MPH (*Moderator*) Speaker, Groupe Sanofi; Speaker, Amicus Therapeutics, Inc

#### **LEARNING OBJECTIVES**

1) Discuss climate change and radiology. 2) Describe the impact of medical imaging on climate change and highlight opportunities for change. 3) Discuss research considerations with respect to studying the energy expenditure and other contributions to greenhouse gas emissions in radiology including the impact of interventions to mitigate emissions from our departments. 4) Evaluate actions that we can all take to address climate change outside of work in our personal lives including lighting, diet, and waste.

#### **COURSE DESCRIPTION**

The purpose of this course is to discuss the impact of radiology on climate change, impetus for change, and outline actionable steps we can take to address climate change in our personal and professional lives linked to the anticipated impact.

### **ASRT@RSNA: Strategies to Reduce Retraumatization in Medical Imaging and Radiation Therapy**

Tuesday, Nov. 28 11:00AM - 12:00PM Room: N230B

Susie M. Moseley, MS, RT (*Moderator*) Nothing to Disclose

#### **LEARNING OBJECTIVES**

1) Recognize challenges when caring for trauma patients in imaging and therapy departments. 2) Identify potential triggers for retraumatization in medical imaging and radiation therapy. 3) Apply trauma-informed interventions in a sexual assault case study.

#### **COURSE DESCRIPTION**

Delivery of health care often involves assessment and interventions in locations on the patient's body where trauma has previously occurred, increasing the probability of retraumatization and manifestation of signs and symptoms of trauma. Considering professionals providing imaging studies and radiation therapy treatment for patients who may have a high probability of a history of trauma, specific interventions should be employed to reduce retraumatizing a patient. This lecture offers strategies to provide quality care to a patient who has been unintentionally retraumatized in medical imaging and radiation therapy.

Tuesday, Nov. 28 11:00AM - 12:00PM Room: S405

Gudrun Zahlmann, PhD (*Moderator*) Nothing to Disclose

#### **LEARNING OBJECTIVES**

1) To understand what is needed to start an imaging research study. 2) To learn about imaging hypothesis generation. 3) To learn about basic statistical consideration for such a study. 4) To learn about imaging based measurements and its validation. 5) To understand how the above comes together with legal, ethical, clinical and other considerations to make an imaging study a reality.

#### **COURSE DESCRIPTION**

This course is intended to encourage you to start your own imaging research study. All necessary elements are discussed using a real life example. Experienced experts will share their insights. An interactive component is included in the workshop.

### What Cardiac Device is That? Interactive Session On Imaging Heart Failure Patients

Tuesday, Nov. 28 1:30PM - 2:30PM Room: S406B

Byoung Wook Choi, MD, PhD (*Moderator*) Nothing to Disclose  
Carole J. Dennie, MD, FRCPC (*Moderator*) Research Consultant, AstraZeneca PLC

#### LEARNING OBJECTIVES

1) Identify and describe the X-ray and CT appearances of different cardiac devices used in heart failure patients. 2) Recognize and overcome technical challenges in CT imaging of severe heart failure to optimize image quality and diagnostic accuracy. 3) Understand the imaging considerations, protocols, and potential complications associated with left ventricular assist devices (LVAD) and right ventricular assist devices (RVAD).

#### COURSE DESCRIPTION

This educational session is a comprehensive exploration of cardiac devices and their imaging appearances in heart failure patients. The session consists of three lectures that cover essential aspects of cardiac device imaging, including X-ray and CT appearances, technical challenges in CT imaging of severe heart failure, and imaging of left ventricular assist devices (LVAD) and right ventricular assist devices (RVAD). The session aims to enhance participants' knowledge and proficiency in imaging heart failure patients with various cardiac devices, ultimately improving patient care and diagnostic accuracy.

Hersh Chandarana, MD, MBA (*Moderator*) Institutional research agreement, Siemens AG; Equipment support, Siemens AG; Software support, Siemens AG

#### LEARNING OBJECTIVES

1) Explain developments in artificial intelligence that enable fast acquisitions and opportunities to maximize efficiency in the reporting of abbreviated MRI exams. 2) Understand opportunities and challenges of implementing abbreviated and fast MRI techniques in clinical practice. 3) Identify the clinical, financial, and medico-legal implications of abbreviated MRI exams.

#### COURSE DESCRIPTION

Indications for fast/focused MRI in abdomino-pelvic conditions continue to increase. We review challenges and opportunities to maximize the efficiency in the implementation of such protocols in a busy clinical practice.

#### Sub-Events

##### **T6-CGI05B Artificial Intelligence to Empower Focused/Fast Abdomino Pelvis MRI**

Hersh Chandarana, MD, MBA (*Presenter*) Institutional research agreement, Siemens AG; Equipment support, Siemens AG; Software support, Siemens AG

##### **T6-CGI05C Clinical Opportunities for Abbreviated MRI Low vs High Risk Patients**

Pari V. Pandharipande, MD, MPH (*Presenter*) I serve as a member of the Association of University Radiologists (AUR) General Electric (GE) Radiology Research Academic Fellowship (GERRAF) Board of Review (term: 7/1/22-2/28/23).

##### **T6-CGI05D From Image Acquisition to Report: How to Maximize Efficiency with Focused/Fast MRI Protocols**

Ivan Pedrosa, MD, PhD (*Presenter*) Scientific Advisor, Health Tech International; Scientific Advisor, Merck & Co, Inc

### State of the Art Analytics and Dashboarding: Quality, Finance, and AI

Tuesday, Nov. 28 1:30PM - 2:30PM Room: S401

Hanna M. Zafar, MD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Discuss the key metrics to follow on value-based care, quality, financial, and AI analytics and dashboards. 2) Learn how to integrate analytics and dashboards into retrospective process improvement and prospective daily and strategic planning.

#### COURSE DESCRIPTION

The session will include 30 minutes of traditional didactics and 30 minutes of Ask the Experts case-based discussion. Lectures will include best practices for creation, metrics to follow, and methods of dashboard utilization.

#### Sub-Events

##### **T6-CIN24B Intents and Technical Requirements of Dashboards**

### Management of Portal Hypertension

Tuesday, Nov. 28 1:30PM - 2:30PM Room: E451A

Juan C. Camacho, MD (*Moderator*) Research Grant, Elesta Echolaser

#### LEARNING OBJECTIVES

1) Review the medical management of portal hypertension. 2) Understand the physiopathology of portal hypertension. 3) Discuss recent advancement in imaging of portal hypertension. 4) Discuss the role of interventional radiology in portal hypertension, from TIPSS creation to portosystemic collaterals embolization with especial attention to complications that IRs can encounter during specific therapies.

#### COURSE DESCRIPTION

In the last few decades, there have been significant advancements in understanding the pathophysiology of portal hypertension. This knowledge has led to the development of safer and more effective minimally invasive approaches. The main objective is to provide alternatives to prevent life-threatening complications from clinically significant portal hypertension and to allow the continuation of treatments that would otherwise be stopped. Clinicians involved in portal hypertension care should be aware of risk factors, associated complications, and management of portal hypertension. Interventional radiology offers minimally invasive alternatives that play a central role in improving clinical outcomes and survival of these patients.

#### Sub-Events

### **Musculoskeletal Ultrasound: Normal Appearances, Pathologic Conditions and Hands-on Demo (Elbow, Ankle, Peripheral Nerves of the Upper Extremity)**

Tuesday, Nov. 28 1:30PM - 3:00PM Room: E450A

Robert S. Campbell, MBChB, FRCR (*Moderator*) Nothing to Disclose

#### **LEARNING OBJECTIVES**

1) Learn the relevant US anatomy for each of the 3 body areas. 2) Gain knowledge of techniques to optimally visualise the relevant anatomical structures. 3) Apply that knowledge to be able to perform US examination of clinical cases. 4) Understand the limitations of US and when to consider alternative image modalities.

#### **COURSE DESCRIPTION**

The 90-minute Ultrasound module will include the following topics: - The elbow- The ankle - Peripheral nerves of the upper limb Each 30-minute section will comprise a "live demonstration" of normal US anatomy followed by a case-based presentation of pathological cases discussing the utility of MSK Ultrasound in clinical practice. This session will provide a basis on which to develop your skills in MSK US.

### Case-based Review of PET/CT: Genitourinary Cancers

Tuesday, Nov. 28 1:30PM - 2:30PM Room: E353C

Gary A. Ulaner, MD,PhD (*Moderator*) Speaker, Siemens AG;Speaker,Lantheus Holdings;Research support, General Electric Company;Research support, F. Hoffmann-La Roche Ltd;Research support, Lantheus Holdings;Research support, Novartis AG

#### LEARNING OBJECTIVES

1) Understand the limitations urinary excretion of PET tracers can cause for interpretation of images around the kidneys, ureters, and bladder. 2) Understand best clinical practices for use of PSMA-targeted PET/CT for patients with prostate cancer.

#### COURSE DESCRIPTION

Novel PET/CT agents are revolutionizing the imaging and therapy of patients with prostate cancer. In this session, experts on 18F-fluciclovine (Axumin) and PSMA-targeted PET/CT will use clinical cases to demonstrate fundamentals of interpretation, as well as pearls and pitfalls to help improve interpretation of these studies.

#### Sub-Events

### Medicolegal Updates: What Radiologists Should Know About Error Disclosure

Tuesday, Nov. 28 1:30PM - 2:30PM Room: E353B

Stephen D. Brown, MD (*Moderator*) Stockholder, GSK plc ;Stockholder, Johnson & Johnson;Stockholder, AbbVie Inc;Stockholder, Merck & Co, Inc;Stockholder, CVS Health Corporation;Stockholder, Pfizer Inc

#### LEARNING OBJECTIVES

1) Identify systems processes that facilitate open communication with patients and families about medical errors. 2) Understand practical legal perspectives regarding open communication with patients and families about medical errors. 3) Describe executive level considerations regarding the implementation of coordinated enterprise-wide open communication practices around medical errors.

#### COURSE DESCRIPTION

This course will explore several timely issues relevant to communication with patients and families about adverse events and errors. 1) Process Considerations: Responsibly discussing medical errors with patients and families requires the implementation of principled, coordinated, enterprise-wide processes that support both patients and providers. This presentation, by a pediatric radiologist with extensive experience speaking on ethics, communication, professionalism, and error disclosure, will discuss systems processes that facilitate open communication with patients and families about medical errors. 3) Legal Perspective: Lofty ideals about “doing the right thing” in communicating honestly and transparently with patients and families about preventable adverse events feel unattainable to many physicians fearful of the legal consequences. This presentation, by an attorney with extensive malpractice expertise, will offer perspectives about the practical realities involved and consequences for physicians when considering whether and how to bring open communication about errors to patients and families. 3) Executive Perspective: Establishing institutional expectations regarding direct, transparent communication with patients and families about medical errors requires top-down leadership articulation of priorities, principles, and culture, coupled with integration of a complex web of stakeholders including insurers and risk managers, offices of legal counsel, quality and safety leaders, patient and personnel support systems, and front-line staff. The speaker, a senior academic radiologist and healthcare system executive, will present perspectives and experiences regarding management of disclosure processes at the broad enterprise level.

### AI - Applications of Neuroradiology

Tuesday, Nov. 28 1:30PM - 2:30PM Room: E450B

Yvonne W. Lui, MD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1. Understand the breadth of neuroimaging applications being addressed by machine learning approaches including less-talked about applications in spine imaging and pediatric neuroradiology. 2. Know the current state-of-the-art in terms of machine learning in MR image reconstruction. 3. Have a basic, working knowledge of the use of machine learning in radiomics for brain tumors.

#### COURSE DESCRIPTION

What's the buzz? Get yourself up-to-date on deep learning and Neuroradiology! This course will cover cutting-edge advances in neuroimaging applications of machine learning from image reconstruction to radiogenomics to practical clinical advances including in pediatric populations. The course will cover state-of-the-art techniques and approaches in an accessible way and give you an easily digestible update overview on the topic. This course will equip you with relevant information to engage with colleagues, referring physicians, scientists, and vendors on this topic.

### Small Parts Ultrasound in Children: A Roadmap to Appropriate Biopsy

Tuesday, Nov. 28 1:30PM - 2:30PM Room: N228

Claudia M. Martinez Rios Arellano, MD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Discuss how to recognize the sonographic features of solid pediatric breast masses and how to apply an appropriate lexicon. 2) Learn how to appreciate features of the normal breast to avoid iatrogenic injury to the developing breast and how to differentiate benign from concerning breast masses in children to guide an appropriate management. 3) Discuss sonographic appearances of pediatric thyroid nodules, using a practical approach for characterization and management. 4) Provide detailed explanations of various lumps and bumps encountered in children, describing the sonographic technique, highlighting the role of ultrasound and the clinical information when assessing these lesions, that can help to differentiate those that are best to watch versus those that should be removed.

#### COURSE DESCRIPTION

This lecture course will address the sonographic features of lesions of the breast, thyroid and various lumps and bumps in children. Lesions of these small parts in children can be benign or malignant, and reaching a final diagnosis based on imaging alone can be challenging. Awareness of the distinct imaging features of these lesions, can help in guiding a management approach, deciding when it is best to biopsy or to watch.

Tuesday, Nov. 28 1:30PM - 2:30PM Room: N230B

Susie M. Moseley, MS, RT (*Moderator*) Nothing to Disclose

#### **LEARNING OBJECTIVES**

1) Recognize the subtle and covert ways that exclusionary behaviors are conveyed through speech and behavior. 2) Understand the impact that exclusionary behaviors have in the workplace. 3) Implement strategies to pro-actively address exclusionary behaviors.

#### **COURSE DESCRIPTION**

Inclusive workplaces are associated with improved job satisfaction, reduced turnover, and increased organizational commitment. Creating an inclusive workplace requires leaders, teams, and individuals to pay attention to the subtle ways in which they may exclude team members. This course includes a practical lecture focused on equipping radiology professionals with discrete tools and resources to identify and pro-actively address exclusionary behaviors.

### **Framing Health Equity Through the Lens of Organizational Readiness and Accountability (Sponsored by the RSNA Health Equity Committee)**

Tuesday, Nov. 28 1:30PM - 2:30PM Room: E352

Efren J. Flores, MD (*Moderator*) Speaker, WebMD LLC; Speaker, Consulting Medical Associates, Inc  
Lucy B. Spalluto, MD, MPH (*Moderator*) Nothing to Disclose

#### **LEARNING OBJECTIVES**

1) Participants will be competent to describe the concept of health equity from a radiology perspective and its importance of addressing disparities seen in healthcare organizations. 2) Participants will gain insight about key policies set by the Joint Commission and the CMS, learning about their requirements and the evolving national frameworks used to advance health equity. 3) Participants will learn how to employ existing quality tools and metrics to identify healthcare gaps measure progress in programs aimed to improve health equity within radiology. 4) Participants will gain an understanding of the application of cultural dexterity in radiology to promote an organizations' accountability towards improving health equity. 5) Participants will be equipped to understand the implications of health equity-based payment models within radiology departments. They will be confident to align existing efforts made in the radiology departments with these new models to ensure readiness for change.

#### **COURSE DESCRIPTION**

Health equity is a vehicle for organizational change and a catalyst for personalized care. This growing role has resulted in an increase attention by national quality and safety organizations, private and public payors, and government and industry collaborators. Radiology continues to play a central role in patient care and are poised to lead health equity efforts at their respective institutions. Therefore, it is paramount that radiologists are equipped with a knowledge toolkit that will enable them to lead institutional readiness efforts to successfully comply with the evolving accountability requirements to reduce health disparities and future equity-based payment models. Beyond the increasing focus on health equity by healthcare and academic institutions and industry collaborators, addressing health care disparities has become a quality and safety priority in radiology. New and revised requirements to reduce health care disparities will apply to radiology practices and health organizations as part of the Joint Commission's accreditation requirements. Additionally, the Centers for Medicare and Medicaid Services (CMS) have updated their framework to further advance health equity, and the President's Cancer Panel and the Cancer Moonshot have made health equity in cancer screening a key pillar of these efforts. These frameworks set the foundation and priorities to eliminate health disparities and drive structural change with evolving payment models that will impact all health care systems and radiology practices. Therefore, it is vital that radiologists are equipped with a knowledge toolkit to lead healthcare institutional readiness efforts to ensure radiology practices and healthcare systems are compliant with these evolving requirements. Leveraging the CMS framework for health equity and the Department of Health and Human Services Health People 2030, the purpose of this session is to discuss high-yield topics that will provide practical examples and on how to lead data-driven institutional efforts and system-wide outcomes measures that will support organizational readiness to advance health equity. The topics covered will be discussed with national radiology leaders and will include the following: 1. Effective standardization of sociodemographic data collection and root cause analyses to identify care gaps in radiology. 2. Building capacity by enhancing diversity efforts in radiology. 3. Understanding and successfully navigating the health equity Joint Commission requirements 4. Developing and implementing system-wide outcomes metrics to measure progress in disparities. 5. Aligning radiology efforts to ensure readiness for evolving payment models.

### **Pulmonary Vascular Imaging: CTEPH/Pulmonary Hypertension**

Tuesday, Nov. 28 3:00PM - 4:00PM Room: E451B

Ann N. Leung, MD (*Moderator*) Nothing to Disclose

#### **LEARNING OBJECTIVES**

1) Recognize and diagnose CTEPH on imaging studies. 2) Distinguish CTEPH from other conditions that affect the pulmonary vasculature.

#### **COURSE DESCRIPTION**

Chronic thromboembolic pulmonary hypertension (CTEPH) is a potentially curable form of pulmonary hypertension that develops in approximately 3% of patients with pulmonary embolism. CTEPH is a dual vascular disorder characterized by obstruction of the pulmonary vasculature by organized thromboembolic material and a secondary arteriopathic process affecting small resistance vessels. Untreated, CTEPH can lead to right heart failure and death. Diagnosis of CTEPH is made on the basis of imaging. This course presented in lecture-style format will discuss the relative strengths and weaknesses of the different diagnostic modality options as well as the characteristic imaging features of CTEPH on each. The session will include a case-based review to reinforce the imaging appearance of CTEPH and allow its differentiation from mimics.

### GU Essentials! A Case-Based Audience Participation Session

Tuesday, Nov. 28 3:00PM - 4:00PM Room: S406A

Tharakeswara K. Bathala, MD, MS (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Develop a systematic approach to assess genitourinary imaging studies, accurately identifying anatomical structures, abnormalities, and pathology. 2) Apply advanced imaging techniques and protocols for the evaluation of various genitourinary disorders. 3) Differentiate between benign and malignant genitourinary lesions based on imaging characteristics and implement appropriate management strategies. 4) Incorporate evidence-based guidelines and best practices into clinical practice, ensuring accurate diagnoses, appropriate patient selection, and timely interventions in genitourinary imaging. 5) Evaluate the limitations and potential pitfalls of genitourinary imaging techniques, enabling participants to make informed decisions and prevent diagnostic errors.

#### COURSE DESCRIPTION

"GU Essentials! A Case-Based Audience Participation Session" is an engaging and interactive lecture series designed to provide a comprehensive understanding of genitourinary imaging for radiologists, trainees, and healthcare professionals involved in diagnosing and managing genitourinary conditions. Through dynamic case-based discussions and active audience participation, this series aims to enhance participants' interpretation skills and provide valuable insights into genitourinary imaging studies.

### Case-based Review of PET/CT: Neuroendocrine Cancers

Tuesday, Nov. 28 3:00PM - 4:00PM Room: E353C

Lisa Bodei, MD, PhD (*Moderator*) Consultant, Novartis AG ;Speaker, Novartis AG;Research Grant, Novartis AG;Consultant, Ipsen SA;Consultant, ITM Isotopen Technologien Muenchen AG;Speaker, ITM Isotopen Technologien Muenchen AG;Consultant, Clovis Oncology, Inc;Consultant, Ion Beam Applications, SA

#### LEARNING OBJECTIVES

1) Understand best clinical practices for use and interpretation of PET/CT in patients with neuroendocrine tumors. 2) Compared and contrast Ga68-Dotatate with 64Cu-Dotatate.

#### COURSE DESCRIPTION

PET/CT has greatly impacted the imaging and therapy of neuroendocrine malignancies, including continuing improvements in somatostatin receptor-targeted PET. In this session, experts on neuroendocrine tumors will use clinical cases to demonstrate fundamentals of interpretation, as well as pearls and pitfalls to help improve interpretation of PET studies.

### Spine Imaging - Core Concepts & Cutting Edge

Tuesday, Nov. 28 3:00PM - 4:00PM Room: E450B

Peter G. Kranz, MD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Review core concepts essential for all radiologists interpreting spine imaging: adjacent-segment degeneration and imaging of painful facet joints. 2) Explain cutting-edge techniques that will shape spine imaging in the future: AI and CSF-venous fistula imaging.

#### COURSE DESCRIPTION

This session will consist of 4 lectures targeted to both general practice radiologists and spine imaging specialists. Content will include two lectures addressing core concepts of that are commonly encountered in practice, and are crucial to understand how spine imaging interfaces with clinical decision-making. In addition, two lectures will address cutting-edge topics expected to influence spine imaging and shape changes in practice in the near future.

#### Sub-Events

### Endometriosis: US, MR, and Surgical Correlations

Tuesday, Nov. 28 3:00PM - 4:00PM Room: E451A

Scott W. Young, MD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Understand the MR appearance of endometriosis phenotypes: superficial endometriosis, endometrioma, and deep endometriosis. 2) Learn the sonographic appearance of common sites of deep endometriosis, how to acquire high-yield ultrasound images of DE in the posterior compartment, and how to report DE on augmented routine pelvic ultrasound in compliance with Society of Radiologists in Ultrasound (SRU) Consensus Statement on ultrasound of endometriosis. 3) Understand the utility of preoperative imaging in the management and resection of advanced-stage endometriosis.

#### COURSE DESCRIPTION

Endometriosis is a prevalent condition affecting approximately 10% of individuals, especially during reproductive age. Currently, affected persons undergo significant diagnostic delay and suboptimal medical and surgical treatment due to a lack of awareness. Imaging plays an increasingly vital role in diagnosis and management. Lecturers will provide critical information on how to decrease diagnostic delay, improve communication of important imaging observations, and the impact of imaging information on surgical treatment and medical management.

**ASRT@RSNA: AI for Good: How Collaboration Should Inform Responsible Future Practice (Supported in part by an Unrestricted Medical Education Grant from Siemens Healthineers of Siemens Medical Solutions, USA, Inc.)**

Tuesday, Nov. 28 3:00PM - 4:00PM Room: N230B

Susie M. Moseley, MS, RT (*Moderator*) Nothing to Disclose

### LEARNING OBJECTIVES

1) Appreciate the ways in which AI is poised to impact medical imaging and radiation therapy practice from a clinical, technical, professional, and ethical lens. 2) Champion the value of equipping medical radiation technologists (MRTs) to be literate in relevant technologies, data, and system level considerations. 3) Leverage the unique perspective and expertise of MRTs to inform an AI-enabled future through advocacy and collaboration.

### COURSE DESCRIPTION

Artificial intelligence (AI) is emerging as an important tool in medical imaging and radiation therapy – but it should only ever be considered exactly that – a tool, leveraged to inform responsible and high quality care. To realize a desired future state that makes most appropriate use of technology and most effective use of diverse skill sets within the interprofessional team, it is important that medical radiation technologists (MRTs) equip themselves to be part of relevant conversations and decisions. Education, advocacy, and collaboration are all necessary as we build towards AI-enabled medical imaging and radiation therapy practice. This presentation will highlight the diverse applications of AI, and the considerations for responsible implementation from the perspective of MRTs as members of the interprofessional team, at both the practice and system level.

### Visceral Vascular Imaging

Tuesday, Nov. 28 3:00PM - 4:00PM Room: N226

Jody Shen, MD (*Moderator*) Nothing to Disclose  
Iain D. Kirkpatrick, MD, FRCPC (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Describe how to optimize CT protocols for the diagnosis of acute mesenteric ischemia or the localization of gastrointestinal hemorrhage, and the imaging findings most helpful in making a diagnosis. 2) Identify which imaging modalities are most appropriate for the investigation of pelvic congestion syndrome or renal arterial pathology in 2023, and associated radiologic findings.

#### COURSE DESCRIPTION

Abdominal vascular pathology crosses subspecialties and can be challenging for general radiologists, the abdominal radiologist who rarely interprets CT/MR angiography or the cardiovascular radiologist/interventionalist who is less familiar with visceral abdominal imaging. This Refresher Course consists of four lectures covering the vascular and visceral findings seen in acute mesenteric ischemia, gastrointestinal hemorrhage, renal arterial disease and pelvic congestion syndrome, as well as the appropriate selection of imaging modalities and protocols for these constantly evolving diagnoses. At the end of the course, attendees should feel comfortable prescribing and interpreting studies for all of these indications.

### Italy Presents: Radiology in the NextGenerationEU Plan

Tuesday, Nov. 28 3:00PM - 4:00PM Room: E350

Andrea Giovagnoni, MD (*Moderator*) Nothing to Disclose  
Emanuele Neri, MD (*Moderator*) Speakers Bureau, General Electric Company

#### LEARNING OBJECTIVES

1) Vision and transformation of an historical scientific society born in 1913 and now representing more than 12,000 members in Italy. 2) Italy best practices for success stories such as its main journal, La Radiologia Medica, which hit an IF of 6.313 in 2021. 3) Italian radiologists' contributions to the National Recovery and Resilience Plan, a Similar Marshall plan post-pandemic. 4) Evolution of society reflecting in the scientific and professional area: How to embrace diversity and inclusion to express radiologists' full potential. The Italian initiatives to strengthen connections and synergies among regions. 5) Insight into the Italian College of Interventional radiology: SIRM's role in guiding and training young IR residents. 6) An innovative partnership between radiology and the Italian Winter Olympic games 2026: Among the branches of sports medicines radiology can excel to become an ally of winter sport athletes.

#### COURSE DESCRIPTION

Cav. Mico Delianova Licastro – US Delegate for CONI- Italian National Olympic Committee This course is structured to provide an overview of the Italian Society of Medical and Interventional Radiology, one of the largest Italian and European scientific societies which experienced an accelerated growth in recent years (up to 12K members, 46% are women and 49% of members belong to the young age groups, 25-44y, that is progressively increasing). The pandemic experience brought a new perspective on the structure of educational activities, opening to a multidisciplinary approach and involving younger radiologist to take an active part in the society. The National Recovery and Resilience Plan (PNRR) is part of an extraordinary post-pandemic European funding program involving the Italian university system in the field of Precision Medicine. The contributions of the Italian radiologists involved in the project in the development of pre clinical studies and clinical trials for new therapeutic approaches will be presented. The project includes 12 universities, the Italian National Institute of Health, 5 scientific research and treatment institutes (IRCCS), 6 companies and a research foundation, and represents the first national network of scientists, technologists and young researchers who, with holistic and multidisciplinary approach, they share and develop knowledge, research and innovative technologies in order to bring the National Health System into the contemporary era of Precision Medicine. SIRM has a long-standing commitment to supporting IR education and making resources available to interventional radiologists. SIRM have played an important role in this framework by establishing high-quality standards in the training and practice of IRs throughout country. Several activities will be described to support IR residents throughout their careers and are regularly revised by IR experts to ensure that they reflect the most up-to-date techniques and technologies. A recent partnership with the National Olympic Committee at last 2022 SIRM Annual Meeting opened to a new form of collaboration between Italian radiology and the sports universe, showing the importance of diagnostic imaging not just in health but also in sports medicine.

### Planning for Your Future: How to Minimize Taxes and Create Your Legacy

Tuesday, Nov. 28 3:00PM - 4:00PM Room: S405

#### LEARNING OBJECTIVES

1) What you need for a solid estate plan. 2) How to save on taxes and be charitable at the same time. 3) Popular ways to leave a legacy at R&E Foundation.

#### COURSE DESCRIPTION

In today's uncertain economic environment, creating a solid estate plan can be a challenge. It can be difficult to determine how to manage your assets to save on taxes, protect your loved ones, and support the future of organizations important to you such as the R&E Foundation. Many RSNA members are motivated to "give back" to our field by making a legacy gift to R&E Foundation to help us support the next generation of radiologists. In addition to the comprehensive discussion outlined above, the session will include ample opportunity for Q&A at the end of the session.

### Case-based Review of Breast Modalities

Tuesday, Nov. 28 4:30PM - 5:30PM Room: S406A

Maxine S. Jochelson, MD (*Moderator*) Speaker, General Electric Company

#### LEARNING OBJECTIVES

1) Identify the differences in accuracy when using pure anatomic imaging compared to anatomic imaging plus vascular imaging. 2) Demonstrate the best approach to interpreting DBT, US, CEM and breast MRI

#### COURSE DESCRIPTION

During this session, the three presenters Drs. Jochelson, Lewin and Bitencourt will lecture on various breast imaging modalities and show clinical examples of cases imaged by Digital Breast Tomosynthesis (DBT), Breast Ultrasound, Contrast Enhanced Mammography (CEM) and MRI to demonstrate interpretive pearls of wisdom, utility of these modalities and limitations of these modalities. This course is important as it will address the pros and cons of breast imaging using anatomic imaging technology vs vascular imaging as well as the best approaches to imaging in various clinical situations.

### The Future is Here: Artificial Intelligence in Cardiovascular Imaging

Tuesday, Nov. 28 4:30PM - 5:30PM Room: E451A

Marly Van Assen, MSc, PhD (*Moderator*) Nothing to Disclose

Albert Hsiao, MD, PhD (*Moderator*) Co-founder, Arterys Inc;Shareholder, Arterys Inc;Co-founder, Vektor.AI;Shareholder, Vektor.AI;Research Grant, Bayer AG;Research Grant, General Electric Company;Research Grant, KA Imaging

#### LEARNING OBJECTIVES

1) Identify current opportunities for artificial intelligence (AI) to improve clinical workflows and diagnostic capabilities in cardiac imaging. 2) Apply foundational concepts necessary for evaluation of new AI technologies. 3) Recognize fields of interest for future AI development to improve diagnosis and management of cardiovascular disease.

#### COURSE DESCRIPTION

This course will provide practical examples of the daily application of artificial intelligence (AI) technologies to clinical practice of cardiac imaging, including cardiac MRI and CT. We will review the rapid advancement of new technologies that have become necessary components of every day practice and clinical workflows at several institutions, current data supporting their effectiveness, and opportunities ahead for AI and related technologies to improve the diagnosis and management of cardiovascular disease.

### Practical Multi-Energy CT in the ER

Tuesday, Nov. 28 4:30PM - 5:30PM Room: E451B

Savvas Nicolaou, MD, FRCPC (*Moderator*) Institutional research agreement, Siemens AG; Stockholder, Canada Diagnostic Centres

#### LEARNING OBJECTIVES

1) Demonstrate proficient understanding of multi-energy CT principles and technical aspects, enabling participants to effectively utilize this advanced imaging technique in emergency medicine. 2) Apply knowledge of multi-energy CT image interpretation and analysis to accurately diagnose and triage emergency conditions, resulting in improved patient care and optimized treatment planning. 3) Collaborate with radiologists and other healthcare professionals in a multidisciplinary approach, leveraging multi-energy CT findings to enhance decision-making, and facilitate seamless communication in emergency scenarios.

#### COURSE DESCRIPTION

**Course Description:** Join us for an engaging educational session on Practical Multi-Energy CT in the ER, where we delve into the powerful applications of this cutting-edge imaging technology in emergency medicine. This course is designed to equip healthcare professionals with the knowledge and skills to harness the full potential of multi-energy CT, enabling them to deliver enhanced patient care and expedite critical decision-making in emergency scenarios. Through a combination of dynamic lectures, interactive discussions, hands-on training, and case-based workshops, participants will gain a comprehensive understanding of multi-energy CT principles, technical aspects, and clinical applications. This course addresses the crucial need for accurate and efficient diagnostic imaging in the emergency room, providing valuable insights into the optimized use of multi-energy CT for prompt and precise diagnosis, treatment planning, and triage.

**Educational Format:**

- Engaging lectures led by renowned experts in the field of emergency radiology
- Interactive discussions and case-based workshops for collaborative learning
- Hands-on training sessions on multi-energy CT scanner operation and image acquisition optimization
- Utilization of advanced post-processing techniques and software tools through practical demonstrations
- Integration of real-life emergency scenarios for enhanced learning and skill application

**Expected Outcome:** By the end of this educational session, participants will have acquired a solid foundation in multi-energy CT imaging, enabling them to:

- o Understand the principles and technical aspects of multi-energy CT
- o Identify and differentiate energy levels for specific emergency conditions
- o Optimize image acquisition parameters for accurate diagnostic imaging
- o Interpret multi-energy CT images to facilitate prompt and precise diagnosis
- o Apply advanced post-processing techniques to enhance image analysis
- o Collaborate effectively with radiologists and other healthcare professionals in emergency management
- o Overcome challenges and limitations associated with multi-energy CT
- o Stay updated with the latest advancements in the field

**Course Structure and Subspecialties:**

- Module 1: Introduction to Multi-Energy CT in the Emergency Room
  - o Understanding the principles and physics of multi-energy CT
  - o Clinical advantages and applications of multi-energy CT in emergency medicine
  - o Role of multi-energy CT in trauma assessment and triage
- Module 2: Technical Aspects and Image Acquisition
  - o Multi-energy CT scanner technology and workflow
  - o Selection of appropriate energy levels and protocols for different emergency scenarios
  - o Optimization of image acquisition parameters
- Module 3: Image Interpretation and Diagnosis
  - o Evaluation and interpretation of multi-energy CT images in emergency cases
  - o Identification of acute pathologies and critical findings
  - o Case-based discussions and interactive sessions
- Module 4: Advanced Post-Processing Techniques
  - o Utilizing advanced post-processing tools for accurate image analysis
  - o Virtual monoenergetic imaging and material decomposition techniques
  - o 3D visualization and volume rendering in emergency medicine
- Module 5: Clinical Applications in Specific Emergency Subspecialties
  - o Multi-energy CT in neurologic emergencies
  - o Multi-energy CT in cardiovascular emergencies
  - o Multi-energy CT in abdominal and pelvic emergencies
  - o Multi-energy CT in musculoskeletal emergencies
  - o Multi-energy CT in pediatric emergencies
- Module 6: Hands-on Training and Workshop
  - o Practical training sessions on operating multi-energy CT scanners
  - o Hands-on experience with post-processing techniques and software tools
  - o Case simulations and interactive workshops to reinforce learning
- Module 7: Multidisciplinary Approach and Collaboration
  - o Effective communication and collaboration with radiologists and other healthcare professionals in emergency settings

### GI Post-Operative Imaging

Tuesday, Nov. 28 4:30PM - 5:30PM Room: E450B

Lauren M. Burke, MD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Understand the common GI surgical interventions. 2) Be able to identify typical post-surgical imaging findings and complications.

#### COURSE DESCRIPTION

This course is designed to be an “all you need to know” course that covers the typical post-surgical findings following common hepatic, pancreatic, bariatric and gastrointestinal surgeries. Topics will be discussed through a multimodality approach with CT, MR, US, and fluoroscopy findings highlighted throughout the session. With continued advances in surgical interventions and institutional variations in surgical technique, radiologists are expected to have a broad understanding of the post-surgical abdomen. Throughout the four didactic lectures, participants should be familiar with common gastrointestinal surgical interventions and the typical post-surgical findings and complications.

### Head and Neck Cancer: Read Like the Experts and Tumor Board Discussion

Tuesday, Nov. 28 4:30PM - 5:30PM Room: S406B

Kristen L. Baugnon, MD (*Moderator*) Nothing to Disclose

Ashley H. Aiken, MD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Review the key imaging findings in evaluation of head and neck cancer patients, including at staging, treatment response and surveillance time points. 2) Recognize the important imaging findings that impact clinical management of patients with head and neck cancer.

#### COURSE DESCRIPTION

In this "Best of" head and neck imaging session, attendees will hear short talks from experts focusing on the key information the multidisciplinary tumor board (surgeons, radiation oncologists and oncologists) needs to know from the imaging at diagnosis and follow-up of tumors in the head and neck. Speakers will emphasize imaging pearls and important clinical management considerations with which radiologists should be familiar. These talks will be followed by a case-based discussion by a panel of experts in a simulated tumor board session. Sample cases will be presented and discussed by radiologists, a head and neck cancer surgeon and a radiation oncologist. This session offers attendees a real world glimpse into how imaging interpretation impacts decision-making in the clinical management of head and neck cancer patients.

#### **LEARNING OBJECTIVES**

1) Become familiar with MIDRC, including how to contribute and how to use its open medical imaging data. 2) Understand the need for appropriate data curation processes and annotation in order to train and test AI algorithms. 3) Realize the potential for biases in AI systems and means with which to mitigate them. 4) Understand the benefit of a sequestered imaging data commons in effectively and efficiently enabling translation of AI algorithms through regulatory for public health.

#### **COURSE DESCRIPTION**

This course will describe the Medical Imaging and Data Resource Center (<https://www.midrc.org/>), the first and only national COVID-19 image repository in the United States, which has collected over 300,000 studies from dozens of sites around the country. MIDRC is a collaborative project between the Radiological Society of North America (RSNA), the American College of Radiology (ACR), and the American Association of Physicists in Medicine (AAPM), funded by the National Institute of Biomedical Imaging and Bioengineering (NIBIB). Its underlying technology can support repositories for other diseases. We will describe how you can use its open medical data, and how to contribute new data. We will discuss the challenges and opportunities presented by such a national imaging research repository and review its role in supporting machine learning research.

### Interventional Radiology Residency

Tuesday, Nov. 28 4:30PM - 5:30PM Room: E353B

Anne M. Covey, MD (*Moderator*) Stockholder, Amgen Inc

#### LEARNING OBJECTIVES

1) Review the current options to obtain IR/DR certification. 2) Understand controversies in the ESIR pathway, the potential merits of additional post-residency training options, and the T32 pathway for research during residency.

#### COURSE DESCRIPTION

IR/DR became a primary specialty in 2012 and there are several options for candidates to achieve ABR certification. The purpose of this course is to provide an update on the status of the IR/DR training pathways and highlight current challenges and opportunities.

### **Ankle: The Common, Uncommon and Easily Overlooked**

Tuesday, Nov. 28 4:30PM - 5:30PM Room: E450A

Reto Sutter, MD (*Moderator*) Nothing to Disclose

#### **LEARNING OBJECTIVES**

1) Identify common abnormalities and normal variants of ankle imaging. 2) Describe easily overlooked features of ankle pathologies and how to recognize them on imaging.

#### **COURSE DESCRIPTION**

Imaging the ankle can be easy and difficult at the same time. Some pathologies are very common and are easily recognized, while others are uncommon or easily overlooked. This course will shine spotlights on various aspects of ankle imaging, including common abnormalities and normal variants as well as less common and easily overlooked pathologies that are important to keep in mind and should not be missed.

### **Nuts and Bolts: Essentials of Building a Radiology Learning Healthcare System (Sponsored by the RSNA Research Development Committee)**

Tuesday, Nov. 28 4:30PM - 5:30PM Room: E350

Jeffrey G. Jarvik, MD, MPH (*Moderator*) Royalties, Mannheim Media;Co-editor, Mannheim Media;Travel support, General Electric Company;Author with royalties, Wolters Kluwer nv  
Marta E. Heilbrun, MD, MS (*Moderator*) Nothing to Disclose

#### **LEARNING OBJECTIVES**

1) Review fundamentals of learning healthcare systems and special considerations for radiology. 2) Discuss the strengths and limitations of leveraging your organizational electronic medical record for clinical operational quality improvement initiatives and clinical research studies. 3) Introduce the concept of culture as learning healthcare system infrastructure and why buy-in from teams and key stakeholders is critical for successful implementation.

#### **COURSE DESCRIPTION**

Radiologists have little exposure to the ideas that are fundamental to learning healthcare systems (LHS). This course will introduce radiologists to key concepts underlying LHS, and explain why LHS are important to radiologists and their health systems, clinicians, patients, and researchers. We will focus on special considerations for radiology LHS. We will focus on leveraging the electronic medical record and why addressing the culture of the system, by getting a commitment from teams and individuals to integrate the LHS framework into routine care processes, is important.

### Is It A Tumor? Pediatric Body and Skeletal Neoplasms Made Easy

Tuesday, Nov. 28 4:30PM - 5:30PM Room: N228

Lisa J. States, MD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) List the common and uncommon solid and cystic focal liver lesions that occur in children. 2) Recognize the key imaging features that enable differentiation of pediatric gynecological tumors. 3) Identify imaging features of pediatric bone lesions requiring biopsy.

#### COURSE DESCRIPTION

This lecture-based session will provide learners with an in depth understanding of the differential diagnosis of tumors that occur in children with a focus on lesions found in the liver, pediatric female pelvis, and bones. Updates in diagnostic tools, protocols and techniques will be provided for each topic. After this session, the participant will be able to formulate a focused differential and recommend an approach to diagnosis, as well as be able to update current protocols to create a state-of-the-art practice for pediatric patients.

### Virtual Clinical Trial

Tuesday, Nov. 28 4:30PM - 5:30PM Room: S404

Ehsan Samei, PHD (*Moderator*) Research Grant, General Electric Company; Advisory Board, General Electric Company; Research Grant, Siemens AG; Advisory Board, Siemens AG; Advisory Board, medInt Holdings, LLC; Advisory Board, Metis Health Analytics; Research Consultant, Nanox Imaging Ltd; Royalties, General Electric Company; Royalties, medInt Holdings, LLC; Royalties, 12 Sigma Technologies; Royalties, Mirion Technologies, Inc; Royalties, Cambridge University Press; Royalties, John Wiley & Sons, Inc

#### LEARNING OBJECTIVES

- 1) Understand the role of virtual trials in medicine and in radiology.
- 2) Understand the components of virtual imaging trials.
- 3) Understand the research, clinical, and regulatory potentials of virtual trials.

#### COURSE DESCRIPTION

The complexity and diversity of medical imaging technologies have continued to accelerate, outpacing our ability to optimize their use. This has become a significant challenge across the spectra of scientific inquiries, product designs, and clinical applications. New imaging technology has been traditionally evaluated through clinical trials. However, such trials are often not feasible or even definitive due to ethical limitations, expense, time requirements, difficulty in accruing enough subjects - especially with low prevalence conditions, or the fundamental lack of ground truth. Virtual Clinical Trials (VCT) provide a new paradigm to assess the impact of medical imaging innovations on patient care. VCTs offer a new disease-known approach to conduct medical trials that can be clinically relevant, timely, and accurate while reflecting the variabilities of human subjects and disease, as well as the complexities of technologies, providing answers that would otherwise be impractical to obtain or simply unattainable. A VCT consists of 1) realistic populations of computational patients spanning ages and a range of phenotypical characteristics including sex and race with realistic models of disease, 2) detailed models of clinical imaging systems, and 3) computational models of the image interpretation processes. This session offers a summary of VCT methods and processes in the field of radiology and highlights applications in clinical practice and in the regulatory assessment of imaging products.

### **Pancreatic Cancer Case Based Multidisciplinary Review**

Tuesday, Nov. 28 4:30PM - 5:30PM Room: S402

Ann Raldow, MD, MPH (*Moderator*) Consultant, ViewRay, Inc

#### **LEARNING OBJECTIVES**

1) Expose the attendees to multidisciplinary discussion when treating pancreatic cancer. 2) Demonstrate specific imaging findings that directly affect staging and treatment decisions. 3) Provide the audience with specific information they should include in their reports that directly affect prognosis and management.

#### **COURSE DESCRIPTION**

This comprehensive course aims to provide attendees with a multidisciplinary understanding of pancreatic cancer diagnosis and management. Through interactive discussions, expert opinions, and case studies, participants will gain valuable insights into the integration of various disciplines in the treatment of this challenging disease. The course will focus on the critical role of imaging findings, their impact on staging and treatment decisions, and the specific information that should be included in reports to guide management.

### Management of Elevated Risk Breast Lesions

Wednesday, Nov. 29 8:00AM - 9:00AM Room: S406A

Sarah J. Vinnicombe, FRCR, MRCP (*Moderator*) Consultant, Bayer AG

#### LEARNING OBJECTIVES

1) Gain an understanding of the nature of high risk breast lesions. 2) Appreciate the differing strategies to manage these lesions from an international perspective.

#### COURSE DESCRIPTION

This course will review the management of high risk breast lesions, which are diagnosed through breast core needle biopsy. High risk lesions are a heterogeneous group of pathologies which, while not malignant, are associated with malignancy, either synchronous or metachronous. This series of three lectures will discuss the challenges in diagnosing these lesions and the differing management approaches in the USA and Europe.

### Cardiac Imaging in Private Practice: Maximizing Efficiency with Quality

Wednesday, Nov. 29 8:00AM - 9:00AM Room: E353C

Amar B. Shah, MD, MA (*Moderator*) Nothing to Disclose  
Michael F. Morris, MD (*Moderator*) Educator, Medtronic plc

#### LEARNING OBJECTIVES

1) Understand how CT protocols can drive output. 2) Explore how blending imaging modalities in cardiovascular imaging can provide customized and optimized care to the patient. 3) Discuss the role of a 3D Lab can solve imaging problems.

#### COURSE DESCRIPTION

As the utilization of Cardiac CTA increase, imagers are challenged to expand services while maintaining a high standard of image quality, accuracy and identify the ideal use of the technology to optimize patient care. The speakers in the session will review imaging protocol tips, the role of complementary imaging modalities and how technology processing teams and labs can support a program and drive quality care.

### Understanding Thoracic AI/Radiomics: Where Are We and Where We Are Going?

Wednesday, Nov. 29 8:00AM - 9:00AM Room: S404

Carol C. Wu, MD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Compare and contrast artificial intelligence (AI) and machine learning strategies used in thoracic imaging. 2) Interpret radiomics research trial outcomes. 3) Explain the benefits and pitfalls of applications of AI in thoracic imaging.

#### COURSE DESCRIPTION

Artificial intelligence (AI) and radiomics are increasingly used in thoracic imaging research and clinical practice. This session aims to provide attendees a basic understanding of these tools and their applications in thoracic imaging. The knowledge should facilitate appropriate interpretation and utilization of the results generated by these techniques.

### Essentials of GI Imaging

Wednesday, Nov. 29 8:00AM - 9:00AM Room: N228

Courtney C. Moreno, MD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Identify common and uncommon imaging findings in patients with biliary disease, diverticulitis, and small bowel obstruction. 2) Review the imaging appearance of liver lesions in non-cirrhotic patients. 3) Describe fluoroscopic imaging techniques.

#### COURSE DESCRIPTION

This session will include lectures describing imaging findings in patients with biliary disease, diverticulitis, and small bowel obstruction. The imaging appearances of liver lesions in non-cirrhotic patients will be reviewed. Gastrointestinal fluoroscopic techniques will also be discussed.

#### Sub-Events

##### W1-CGI10B Biliary Imaging

### Case-Based Audience Participation Peer-Learning

Wednesday, Nov. 29 8:00AM - 9:00AM Room: E353B

Priyanka Jha, MBBS (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Learn hard-to-diagnose or interesting misdiagnosed GU-related disease from emergency to oncology.

#### COURSE DESCRIPTION

This course is a case-based learning session focusing on GU-cases that are difficult to diagnose or easily missed. There will be cases of renal masses, prostate, bladder and upper urinary tract, adrenal glands, and GU emergencies. All presentations will encourage audience participation, and pearls will be presented after each case. This course is designed for all levels, including trainees and attendings.

### Structured Reporting - Why, How, and Future Directions

Wednesday, Nov. 29 8:00AM - 9:00AM Room: S401

Patricia Balthazar, MD (*Moderator*) Dr. Balthazar received research support from the Association of University Radiologists GE Radiology Research Academic Fellowship.

#### LEARNING OBJECTIVES

1) Understand the importance and benefits of using structured reporting templates. 2) Acquire practical knowledge on how to create and use structured reporting to maximize efficiency, quality and compliance with real-life examples. 3) Discuss future applications of structured reporting.

#### COURSE DESCRIPTION

This course explores the importance, creation, and future implementation of structured reporting in radiology. Speakers will delve into key topics including the use of structured report templates and macros, the influence of radiology report elements on patient care, and the evolving future of radiology reports in the context of Common Data Elements and FHIR observations. Participants can anticipate an engaging format combining lectures and interactive panel discussion. The vital role structured reporting plays in enhancing clinical decision-making, improving communication, promoting standardization, and improving quality of care will be discussed with real-life examples. The expected outcome is for attendees to gain an enriched understanding of structured reporting and the capability to implement learned strategies into their practices for enhanced patient outcomes.

### Advanced MSK, Head & Neck Interventions

Wednesday, Nov. 29 8:00AM - 9:00AM Room: E352

Kazim Narsinh, MD (*Moderator*) Nothing to Disclose  
Gina Landinez, MD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Identify scenarios where Interventional Radiology modalities (embolization, ablation) can enable and complement surgical and medical treatment plans for benign and malignant head and neck conditions. 2) Understand vertebroplasty, including devices that are yet to become available in the United States. 3) Understand novel musculoskeletal interventional image guidance platforms. 4) Understand the approach to Desmoid tumors including NCCN guideline updates.

#### COURSE DESCRIPTION

With major updates to the NCCN Guidelines completed (MSK) and to the ATA guidelines imminent in 2023-2024 (Thyroid) this session aims to provide advanced pearls for Interventional Radiologists entering the MSKIR and ThyroidIR domains.

### Arthritis and Body Composition: How Imaging Influences Clinical Decision Making

Wednesday, Nov. 29 8:00AM - 9:00AM Room: E450A

David A. Rubin, MD (*Moderator*) Scientific Advisory Board, ImageBiopsy Lab

#### LEARNING OBJECTIVES

1) Describe how imaging findings can influence the choice of drugs and assess their effectiveness in patients with rheumatoid arthritis and seronegative spondyloarthropathies. 2) Explain the impact of imaging for predicting natural history and prognosticating disease course in patients with arthritis and disorders of body composition. 3) Discuss the role of imaging in disease surveillance for arthritis and disorders of body composition.

#### COURSE DESCRIPTION

This lecture-based educational course will review how imaging findings influence clinical decision-making for patients with osteoarthritis, rheumatoid arthritis, seronegative spondyloarthritis, and disorders of body composition. Presenters will use case-examples and data from the literature to emphasize the ways in which advanced imaging informs management decisions, disease surveillance, prognostication, and assessment of drug responses, remission, and progression.

### Neuroradiologists Under Pressure - Global Perspectives

Wednesday, Nov. 29 8:00AM - 9:00AM Room: N227B

C. C. Tchoyoson Lim, MMedSc, MBBS (*Moderator*) Research Consultant, Hanalytics Pte Ltd; Research Consultant, Iota MedTech Pte Ltd; Royalties from intellectual property; Research Grant, PI

#### LEARNING OBJECTIVES

1) To review the diversity or similarity of burden of health delivery workload on practicing neuroradiologists in different parts of the world: including emerging trends/challenges in clinical/academic/reimbursement issues. 2) To understand what steps neuroradiologists are taking to relieve the pressure, and if this is working, if this is generalizable. 3) To discuss how to balance clinical workload and academic mission for neuroradiologists.

#### COURSE DESCRIPTION

Post-pandemic, clinical workload for neuroradiologists has increased, exacerbating pre-existing difficult working conditions; but is this increased pressure on us the same around the world? There's a sense that the altruistic, ethical and academic missions are under threat, to the detriment of our patients. This session will explore problems and possible solutions in diverse parts of the world.

### Integrating US and MR O-RADS in your Practice

Wednesday, Nov. 29 8:00AM - 9:00AM Room: S405

Elizabeth A. Sadowski, MD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Learn how the O-RADS US and MRI risk stratification system can be incorporated into clinical practice. 2) Understand which lesions may be adequately characterized with US. 3) Identify lesions that would benefit from further assessment on MRI before definitive management.

#### COURSE DESCRIPTION

This series of lectures will review how the O-RADS US and MRI risk stratification system can be incorporated into your practice, with a focus on when US is enough and when MRI adds value.

#### Sub-Events

### Photon Counting CT

Wednesday, Nov. 29 8:00AM - 9:00AM Room: E451A

Shuai Leng, PhD (*Moderator*) License agreement, Siemens AG

#### LEARNING OBJECTIVES

1) Understand principles of photon counting detector (PCD) and PCD-CT. 2) Explore benefits of PCD-CT in comparison with energy integrating detector CT. 3) Identify potential applications of PCD-CT in various clinical areas.

#### COURSE DESCRIPTION

Photon counting detector (PCD) has been an active research area in recent years. Commercial PCD-CT has been available for routine clinical use since the FDA cleared the first PCD-CT in late 2021, representing a major imaging device advancement for CT. In this lecture, we will discuss the fundamental principles of PCD and explain major benefits of this technology relative to energy integrating detectors which are used on most commercial CT scanners. History and current status of PCD-CT will also be discussed. Potential applications in various clinical areas will be demonstrated using sample phantom and patient images. Challenges and opportunities will also be discussed.

### **ASRT@RSNA: Shaping the Future of Imaging: Quality Initiatives for Enhanced Effectiveness and Efficiency**

Wednesday, Nov. 29 8:00AM - 9:00AM Room: N230B

Susie M. Moseley, MS, RT (*Moderator*) Nothing to Disclose

#### **LEARNING OBJECTIVES**

1) Understand the evolution of imaging services to pinpoint areas for quality enhancement. 2) Identify core quality dimensions, emphasizing safety and patient-centered approaches. 3) Explain CQI principles using the PDCA cycle in imaging settings. 4) Discuss the impact of AI and machine learning on imaging service efficiency. 5) Create a strategic plan integrating quality initiatives and technological advancements for innovative imaging services.

#### **COURSE DESCRIPTION**

This presentation explores the pivotal quality initiatives steering modern health care imaging services. Attendees will gain a nuanced understanding of the comprehensive approach to quality, encompassing vital facets such as safety, timeliness and patient-centeredness. The speaker will discuss the transformation of imaging services and unravel the pivotal role of continuous quality improvement through the plan-do-check-act cycle for enhancing efficiency and effectiveness. Attendees will delve into the exciting realm of technological innovations like artificial intelligence and machine learning that are revolutionizing workflow dynamics and understand the necessity of continuous education in upholding the highest standards of patient care. Designed for health care professionals, radiologists and decision-makers, this presentation aims to provide tools to navigate the evolving landscape of imaging services, ensuring a patient-centric approach grounded in innovation and efficiency. Join us to forge the path to a future where quality is not just a benchmark but a sustained promise.

### RSNA/ESR Symposium: Imaging of Neurodegenerative Disorders - Basics of Neuroimaging in Neurodegeneration

Wednesday, Nov. 29 8:00AM - 9:00AM Room: E450B

Meike W. Vernooij, MD, PhD (*Moderator*) Nothing to Disclose  
Alexander Drzezga, MD (*Moderator*) Research support, Siemens AG ;Research support, Life Molecular Imaging;Research support, General Electric Company;Research support, Eli Lilly and Company;Research support, Eisai Co, Ltd;Consultant, Siemens AG ;Consultant, General Electric Company

#### LEARNING OBJECTIVES

1) To understand the standard MR Imaging protocol, normal aging findings, as well as Alzheimer disease mimic on structural brain MR imaging. 2) To become familiar with existing and new molecular imaging tracers for dementia and parkinsonian disorders. 3) To comprehend the evolving role of imaging biomarkers in standard clinical practice as well as trials (including imaging of side effects such as ARIA).

#### COURSE DESCRIPTION

Structural MRI and molecular imaging techniques are key modalities in the diagnosis (and increasingly also in early detection) of neurodegenerative disorders. This session is part of an educational ESR-RSNA transatlantic course (of 4 sessions in total) that discusses imaging in neurodegeneration, from basics to advanced applications. This first educational session will discuss the basics of MRI and PET imaging, choices of imaging protocols, PET tracers and MR sequences, changes that occur with normal aging and other mimics, and what the role is of imaging biomarkers in general in clinical practice versus trials. At the end of the course, the participants will better understand the basics of molecular and structural imaging in neurodegenerative disorders.

#### Sub-Events

### Overcoming Staff Shortages in Radiology: How to Ensure Patient Safety during the 'Great Resignation'?

Wednesday, Nov. 29 8:00AM - 9:00AM Room: N229

Zi Zhang, MD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Ensuring patient safety and workflow efficiency in radiology. This lecture will discuss strategies to optimize and standardize radiology workflow to improve patient safety, eases pressure on radiologists and supporting staff. 2) Investing in education to mobilize and develop our imaging workforce. This lecture will discuss learning and development initiatives to engage and upskill the radiology staff to improve work quality and patient safety. 3) Improving recruitment and retention in radiology. This lecture will address reasons behind the "Great Resignation" and discuss strategies to create an enjoyable workplace in radiology practice to improve recruitment and retention of clinical staff. 4) Implementing artificial intelligence in different aspects of radiology practice. This lecture will discuss appropriate clinical implications of artificial intelligence in different aspects of radiology practice, such as patient scheduling, image acquisition and reporting, to increase work efficiency and improve patient safety.

#### COURSE DESCRIPTION

The shortage of healthcare staff is becoming the nation's top patient safety concern. The prompt and accurate results of imaging studies can be the difference between life and death. Yet shortage of practicing radiologists in the United States is projected to worsen while demands for radiology services continue to grow. Radiology practices have been experiencing staff shortages across various positions, struggling to both maintain staffing and bring in new talent. Thus, many patients have been forced to endure long wait when seeking care in radiology. The goal of our course is to discuss strategies to ensure patient safety and address workforce challenges facing radiology.

### Who is Paying for Radiology Education? (Sponsored by the American Association for Women in Radiology)

Wednesday, Nov. 29 8:00AM - 9:00AM Room: S402

Kristin K. Porter, MD, PhD (*Moderator*) Stockholder, Pfizer Inc; Medical Advisory Board, Bracco Group

#### LEARNING OBJECTIVES

1) Discuss who is and who should pay for radiology education. 2) Consider whether our current compensation models are disincentivizing radiologists from pursuing careers in academics. 3) Examine the potential impact of under-funding radiology education on the gender pay-gap in radiology.

#### COURSE DESCRIPTION

The demand for medical imaging is outstripping the supply of radiologists. From 2010 to 2020, the number of DR trainees entering the workforce increased just 2.5% (1), compared to a 180% increase in the number of CT and US examinations in the same decade. (2) On March 29, 2023, the Resident Physician Shortage Reduction Act of 2023 was proposed; if passed, it would expand the number of Medicare-supported medical residency positions by 14,000 over seven years. A similar bill was proposed in 2021 but did not pass. As lawmakers struggle to provide additional funding for medical workforce education, medical trainees in the United States continue to take on debt for medical education and training. As of 2018, early-career radiologists owed an average of \$190,000 after graduate programs. (3) Once trained, early-career radiologists encounter a decision regarding whether to choose academics or to enter private practice. If they choose academics, they will earn an average of \$141,628 less per year than their private practice counterparts. (4) Radiology education does not end with employment. All radiologists must participate in continuing medical education (CME). The average CME allowance of a physician was \$3,691 in 2022 (5), which is typically considered part of a physician's overall compensation package. Providing and paying for CME is big business. The worldwide sales of academic publishing will exceed 19 billion dollars in 2023 and Elsevier, a leader in academic publishing, has a profit margin approaching 40%, which is higher than that of Microsoft, Google and Coca Cola. (6) Academic radiologists are expected to author, review, and edit articles for these academic journals for nominal, if any, compensation. Similarly, many radiologists earn CME at radiology conferences, typically organized, and staffed by academic radiologists for nominal, if any, compensation. Please join us as we discuss these observations and the question of who is and who should pay for radiology education. This question particularly impacts women in radiology, since, while the percentage of women in radiology has hovered around 25% since 2007 (7), there is a greater percentage of women in academic radiology (34.7%). (8) Please join us as we consider whether our current compensation models are disincentivizing radiologists from pursuing careers in academics; examine what impact, if any, the under-funding of radiology education has on the gender pay-gap in radiology; and contemplate how we as a field can overcome these challenges.

### RSNA Hands-On Lab: Contrast Reaction Management

Wednesday, Nov. 29 9:00AM - 10:30AM Room: E265

Carolyn L. Wang, MD (*Moderator*) Research Grant, General Electric Company

#### LEARNING OBJECTIVES

1) Recognize various types of contrast reactions and the proper management of various types of contrast reactions through simulation-based training. 2) Learn with hands-on practice the proper administration of various routes of epinephrine as well as other medications to treat the more common allergic-like contrast reactions. 3) Recognize and manage a contrast reaction in a sedated patient. 4) Recognize and manage a contrast reaction in a pediatric patient 5) Recognize and practice team communication skills necessary for high stress infrequent scenarios using simulation-based training.

#### COURSE DESCRIPTION

In Person Session Only. Tickets must be purchased in advance for this course. This course can be added through the registration portal or by stopping by the Registration Desk. Space is limited. Through hands-on high-fidelity simulation scenario training, learners will practice recognizing and managing various types of contrast reactions. Following a brief lecture, learners will rotate through multiple stations during the course to gain individual hands-on experience. To enhance the learner's experience and allow for more time in the hands-on stations, we ask all learners for the course to watch this short 15 min. video on contrast reaction management prior to the course [https://youtu.be/9r-\\_E8dmJ0A](https://youtu.be/9r-_E8dmJ0A).

### The Eyes Have It: Essentials in Orbital Imaging

Wednesday, Nov. 29 9:30AM - 10:30AM Room: S405

Elizabeth George, MD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Understand the imaging algorithm and search patterns for patients presenting with eye pain, diplopia, and vision loss. 2) Understand the imaging algorithm and search patterns in the pediatric orbit.

#### COURSE DESCRIPTION

In this Head and Neck session devoted to the orbit, attendees will review the imaging approach and will be presented with clinical case examples of patients with eye pain, diplopia, and vision loss. Attendees will also review the imaging approaches and pathologies in the pediatric orbit. Speakers will emphasize pearls for imaging evaluation and differentiating each entity from common mimics, pitfalls of interpretation to avoid, and relevant clinical management considerations with which radiologists should be familiar. This session offers attendees the opportunity to refine their interpretation of complex head and neck imaging studies by incorporating tips from world experts.

### **Radiology Dashboarding 2.0 (Sponsored by the RSNA Quality Improvement Committee)**

Wednesday, Nov. 29 9:30AM - 10:30AM Room: E351

Matthew E. Zygmunt, MD (*Moderator*) Nothing to Disclose  
Melissa A. Davis, MD, MBA (*Moderator*) Nothing to Disclose

#### **LEARNING OBJECTIVES**

1) To describe sensible radiologist performance metrics. 2) To weigh the role of metrics use in achieving health equity. 3) To implement dashboarding in your practice.

#### **COURSE DESCRIPTION**

Dashboards help us understand how our departments function. It is important for radiologists to know how to leverage these tools to make decisions within their practices. In this session we will discuss how to leverage dashboards in our operations, educational initiatives, and in regard to equitable decision making.

### **Pediatric Musculoskeletal Imaging: Cutting-edge Updates for Common Conditions**

Wednesday, Nov. 29 9:30AM - 10:30AM Room: E451A

Kirsten Ecklund, MD (*Moderator*) Nothing to Disclose

#### **LEARNING OBJECTIVES**

1) Understand perfusion imaging and current applications of artificial intelligence (AI) in evaluation of hip dysplasia. 2) Construct an imaging algorithm for the work up of the limping child and recognize common and uncommon etiologies of acute limp. 3) Define updated imaging protocols for evaluation of pediatric musculoskeletal infections with an emphasis on high resolution US, vascular imaging, and MR DWI.

#### **COURSE DESCRIPTION**

This 3-lecture session will review state-of-the-art, updated multimodality techniques for imaging common pediatric musculoskeletal conditions at diagnosis and during follow-up.

#### **Sub-Events**

#### **W3-CPD06B Developmental Dysplasia of the Hip: Updates in Imaging Protocols**

### AI in Ultrasound Imaging

Wednesday, Nov. 29 9:30AM - 10:30AM Room: S406B

Karen Drukker, PHD (*Moderator*) Royalties, Hologic, Inc

#### LEARNING OBJECTIVES

1) Ultrasonic imaging modalities and devices, methods for ultrasonic beamforming, image reconstruction, speckle reduction, and image artifact removal. 2) Robotics and ultrasound-guided interventions. 3) Ultrasound image analysis for detection, diagnosis, and prognosis of disease.

#### COURSE DESCRIPTION

This updated course will consist of 3 lectures that will inform the audience on new developments in all aspects of AI for medical ultrasound from high-quality image generation, including beam formation, image reconstruction, and microbubbles, to robotics, to ultrasound image analysis intended as a decision aid to radiologists in clinical practice.

#### Sub-Events

##### **W3-CPH07B Incorporating Ultrasound Imaging Physics into Artificial Intelligence**

### Pediatric MDC Review

Wednesday, Nov. 29 9:30AM - 10:30AM Room: S501

Hesham Elhalawani, MD, MSc (*Moderator*) Nothing to Disclose  
Camilo Jaimes Cobos, MD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Engage in a multidisciplinary discussion concerning three complex pediatric oncology cases, focusing on their clinical and imaging characteristics. 2) Present recommendations from the COG/SPR consensus papers pertaining to image acquisition and interpretation. 3) Examine the role of radiation therapy in these cases, emphasizing strategic planning, and delivery considerations.

#### COURSE DESCRIPTION

This interactive panel discussion will delve into three complex pediatric oncology cases. The panel, composed of two pediatric radiologists, a radiation oncologist, and a medical oncologist, will guide the conversation. Each case will be introduced through its clinical presentation and initial imaging. The medical oncologist will provide insights into the biology of the tumor, its staging, and the standard medical management. Following this, the radiation oncologist will discuss treatment alternatives, intricacies of radiation planning, and crucial aspects of delivery. The discussion will emphasize key aspects of medical imaging for each case, drawing on the recent recommendations from the Children's Oncology Group (COG)/Society for Pediatric Radiology (SPR) guidelines.

### **ASRT@RSNA: Cybersecurity Primer for Radiology Professionals**

Wednesday, Nov. 29 9:30AM - 10:30AM Room: N230B

Susie M. Moseley, MS, RT (*Moderator*) Nothing to Disclose

#### **LEARNING OBJECTIVES**

1) Recognize the sources of cyber threats and how our equipment and people make us vulnerable. 2) Prepare in advance of cyberattacks. 3) Describe the business continuity and recovery processes in the hours and days after an attack.

#### **COURSE DESCRIPTION**

Cybersecurity is relevant to all modern industries – especially radiology, as imaging is leading the way as the first truly digital specialty, fully dependent on networked computer systems. We all need to take a thoughtful and systematic approach to preventing cyberattack, including all radiology infrastructure and staff. This effort must include investment in technology, deployment, and management. We must practice good "cyber hygiene" to protect infrastructure and ensure that staff are educated and aware of the threats. The human element is one of the most common points of failure against cyberattacks. This lecture will cover the most likely sources of cyber threats, how to prepare for these attacks in advance, and how to maintain business continuity in the event of an attack.

### RSNA/ESR Symposium: Imaging of Neurodegenerative Disorders - Dementia: Towards an Aetiologic Diagnosis

Wednesday, Nov. 29 9:30AM - 10:30AM Room: E450B

Meike W. Vernooij, MD, PhD (*Moderator*) Nothing to Disclose

Alexander Drzezga, MD (*Moderator*) Research support, Siemens AG ;Research support, Life Molecular Imaging;Research support, General Electric Company;Research support, Eli Lilly and Company;Research support, Eisai Co, Ltd;Consultant, Siemens AG ;Consultant, General Electric Company

#### LEARNING OBJECTIVES

1) Explain the current use of MRI for etiologic dementia diagnosis. 2) Explain the current use of molecular imaging for etiologic dementia diagnosis. 3) Demonstrate structured selection and assessment of imaging exams through cases.

#### COURSE DESCRIPTION

Structural MRI and molecular imaging techniques are key modalities in the diagnosis (and increasingly also in early detection) of neurodegenerative disorders. This session is part of an educational ESR-RSNA transatlantic course (of 4 sessions in total) that discusses imaging in neurodegeneration, from basics to advanced applications. This second educational session will discuss how in current clinical practice imaging modalities such as MRI and molecular imaging techniques can be used to support an etiologic diagnosis of dementia. This session will give general radiologists and those interested in neuroradiology and nuclear medicine/molecular imaging the knowledge needed for appropriate selection and structured assessment of imaging exams in diagnostic work-up of dementia. The session format consist of in part lectures, followed by an interactive case-based discussion.

### **Through the Looking Glass (Informatics Lens); Enhancing Patient Journey Through Imaging (Supported in part by an Unrestricted Medical Education Grant from Siemens Healthineers of Siemens Medical Solutions, USA, Inc.)**

Wednesday, Nov. 29 11:00AM - 12:00PM Room: S401

Namita S. Gandhi, MD, MSc (*Moderator*) Nothing to Disclose

#### **LEARNING OBJECTIVES**

1) Informatics strategy and initiatives to enhance the pre imaging exam journey. 2) Informatics strategy and challenges with patient friendly report. 3) Informatics strategies for patient friendly image exchange. 4) Informatics considerations for patient reported outcomes.

#### **COURSE DESCRIPTION**

Patient journey refers to patient's experience throughout an episode of care; for radiology this begins at the time when an imaging order is placed and carries through till the patients receive their imaging reports. The reports impact further patient care and outcomes. Traditionally, strategies to improve patient experience and care in radiology are focused on enhancing only the radiology encounter. This course will focus on the entire episode of care (pre and post radiology encounter) in a patient's imaging journey and discuss informatics strategies and considerations to enhance the entire journey. The session will be organized as short presentations by the speakers followed by a panel discussion at the end. The panel will be available for audience questions.

### US Radiology Reimbursement in Context: What Comes Next?

Wednesday, Nov. 29 11:00AM - 12:00PM Room: E351

Richard E. Heller III, MD (*Moderator*) Consultant, Gerson Lehrman Group, Inc;

#### LEARNING OBJECTIVES

1) Identify the macroeconomic forces that are influencing reimbursement for radiology services. 2) Identify actions that private, commercial health insurance companies are taking that influence reimbursement for radiology services. 3) Explain the challenges facing radiology under the Medicare Physician Fee Schedule. 4) List actions that medical practices and physicians can take to help protect patients' access to high quality medical imaging.

#### COURSE DESCRIPTION

The session will focus on the future of radiology reimbursement within the broader context of health care reform and macroeconomic forces in the United States. This includes value-based payment, Medicare and the physician fee schedule, private payor issues, digital medicine and others. This will be a hybrid session, pairing presentations with moderated dialogue and Q/A.

### Chest MRI, PET-CT and Photon Counting CT Updates

Wednesday, Nov. 29 1:30PM - 2:30PM Room: N229

Lea Azour, MD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Describe updates in Chest MRI for Acute PE and Mediastinal Mass Evaluation. 2) Review recent innovations in thoracic PET/CT. 3) Illustrate applications of photon counting CT in the chest.

#### COURSE DESCRIPTION

This course will highlight practical, and clinically applied advances in thoracic cross-sectional imaging spanning MRI for pulmonary artery and mediastinal evaluation, PET/CT, and photon-counting CT.

#### Sub-Events

##### W6-CCH08B Update on MRI for Acute PE

Christopher J. Francois, MD (*Presenter*) Nothing to Disclose

##### W6-CCH08C Update on Mediastinal Mass Imaging

### **Pediatric Trauma: A Case-Based Approach**

Wednesday, Nov. 29 1:30PM - 2:30PM Room: E451B

Arnold C. Merrow JR, MD (*Moderator*) Consultant, RELX; Author with royalties, RELX

#### **LEARNING OBJECTIVES**

- 1) Explain common mechanisms of injury in the child.
- 2) Become familiar with normal developmental anatomic changes in the child and understand how these can mimic pathology and will result in different patterns of injury compared to an adult.
- 3) Review optimized imaging strategies for the pediatric patient.

#### **COURSE DESCRIPTION**

A sampling of common and/or critical injuries will be covered in a case-based format with attention to the pediatric spine, extremities, and thoraco-abdominal regions. This will include brief reviews of key developmental features that can mimic pathology by imaging and alter the results of trauma applied to these levels as compared to adults. Both accidental and nonaccidental traumatic mechanisms will be discussed, and imaging strategies appropriate to the pediatric patient will be shared.

### Liver Diffuse Disease

Wednesday, Nov. 29 1:30PM - 2:30PM Room: N227B

Sudhakar K. Venkatesh, MD, FRCR (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Understand the principles and clinical applications of MR elastography and US elastography in evaluating liver fibrosis and diffuse liver diseases. 2) Recognize new fat quantification techniques in liver imaging to accurately assess and monitor hepatic steatosis. 3) Utilize iron quantification methods in liver imaging to evaluate and monitor iron overload disorders. 4) Integrate these advanced imaging techniques into clinical practice to improve the diagnosis and management of patients with diffuse liver diseases.

#### COURSE DESCRIPTION

This educational session aims to provide participants with a comprehensive understanding of advanced imaging techniques for evaluating diffuse liver diseases, with a focus on MR elastography, US elastography, fat quantification, and iron quantification. The session will delve into the principles, clinical applications, advantages, and limitations of each technique, enabling radiologists (participants) to make informed decisions about their use in clinical practice.

### **GU Tumor Boards: How to Bring Value and Become Indispensable**

Wednesday, Nov. 29 1:30PM - 2:30PM Room: E350

Atul B. Shinagare, MD (*Moderator*) Consultant, VirtualScopics, Inc; Consultant, Imaging Endpoints

#### **LEARNING OBJECTIVES**

1) Use case-based format to identify key imaging features that significantly impact management. 2) Understand the common pitfalls in imaging assessment of GU tumors. 3) Improve communication with referring providers to help improve outcomes.

#### **COURSE DESCRIPTION**

With advances in oncology, the role of radiologist in management of GU cancers is rapidly evolving. At GU tumor boards, the radiologist plays a key role in diagnosis, staging, and clinical decision-making. This course guides the attendees through the various challenges and pitfalls faced by the radiologist at the GU tumor boards to successfully guide patient management.

### Ransomware: Principles, Detection, and Recovery

Wednesday, Nov. 29 1:30PM - 2:30PM Room: S401

Benoit Desjardins, MD, PhD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Evaluate the growing impact of ransomware. 2) Describe how to detect early signs of compromise from a cyberattack. 3) Describe the lessons learned from recovery after a ransomware attack.

#### COURSE DESCRIPTION

Cybercrime against healthcare institutions has exploded in recent years. Seven years ago, the Hollywood Presbyterian Medical Center paid a \$17,000 ransom to regain access to its medical records blocked by ransomware. In 2021, more than 1 in 3 organizations, and in 2022, more than 2 in 3 organizations reported being hit by ransomware. The Russia-tied Ryuk group hit over 235 healthcare facilities, raking in more than \$100 million in ransoms. Although paying ever-increasing ransoms can be costly for medical centers, refusing to pay them often leads to even bigger losses. The University of Vermont Health system lost \$50 million and Universal Health System lost \$67 million for refusing to pay ransoms in 2020. The Scripps Institute was recently victim of a ransomware attack and lost \$100 million in revenue in the recovery process. The situation has been considerably worsened by the pandemic, which produced a triple threat for healthcare systems: (1) a rapid expansion of internet-connected technologies and services causing an expanded attack surface, (2) an increase in many types of cyberattacks, and (3) fewer available resources to defend against cyberattacks. Recently, the zero-day vulnerability Log4j in Apache software has been leading to hundreds of cyber-attacks around the world since December 2021. Cybersecurity has become an important part of healthcare, and we must address this topic at RSNA since every radiology practice can become a victim of a cyber-attack. This explosion in cyber-attacks against medical centers is the result of (1) the increased connectivity of hospitals through medical devices and networks, (2) the commoditization of cyber-attack tools, and (3) the US Justice System penalizing cyber-attack victims, rather than going after the perpetrators. In this refresher course, we will provide an update on ransomware on hospitals, how to recover from it and the increased interconnectivity of medical devices which worsens the consequences of these attacks. In more details: The status of ransomware in 2023. This will be discussed by Dr Desjardins, an academic radiologist and ex-hacker and specialist in cybersecurity in healthcare. He will not only describe the evolution of ransomware over the past several years, but also explain the basic operating principles of ransomware and how ransomware attacks against hospitals are getting more prevalent and costly. He will also provide an overview of national initiatives to defend against ransomware. Detecting compromise and attacks against medical devices. This will be discussed by Prof Fu, a well-known leader in the cybersecurity of medical devices, who just finished his term as Acting Director of Medical Device Cybersecurity at the FDA. He will not only describe the common, easily avoided, cybersecurity design problems in medical devices, but how to detect early signs of compromise from a pending cyberattack, and how to improve the security of medical devices. Lessons learned from hospital ransomware recovery and planning considerations. This will be discussed by Dr Chen from the Cleveland Clinic. One of the facilities in Cleveland Clinic's network was recently victim of a huge ransomware attack, and Dr Chen published a great overview of lessons learned from this attack and developed a four-phase plan for the recovery from such a cyberattack (J Digit Imaging. 2021 Jun). He will provide a practical overview of these lessons and plan. This refresher course will bring the radiology community up to date on the exponentially growing threat of ransomware affecting healthcare, including recent attacks, and techniques of defense. The course will be presented by radiologists and top cybersecurity experts. The information technology issues will be addressed at a technical level appropriate for the radiology community at large, to make the community aware of this growing era of digital warfare and its implications for radiology practices. Our refresher course will have

### Challenges in Imaging the Knee

Wednesday, Nov. 29 1:30PM - 2:30PM Room: S406B

Andrew J. Grainger, MD (*Moderator*) Speakers Bureau, General Electric Company

#### LEARNING OBJECTIVES

1) Understand areas of knee imaging and intervention that offer particular challenges to the radiologist. 2) Develop strategies to review and report knee MRI that avoid these challenging pitfalls. 3) Understand techniques and their rationale for the imaging guided intervention of patellar tendon disease.

#### COURSE DESCRIPTION

The knee is one of the most commonly imaged peripheral joints. However, advances in surgical techniques and our understanding of the functional anatomy of the knee mean that new challenges to the radiologist exist. This course aims to highlight particularly challenging areas in the interpretation of knee imaging studies. It will primarily focus on MRI, but an additional presentation will discuss the role that radiology has in the management of patellar tendon disease.

Wednesday, Nov. 29 1:30PM - 2:30PM Room: E351

Anand K. Narayan, MD, PhD (*Moderator*) Nothing to Disclose  
Marissa B. Lawson, MD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Implement best practices in the use and reporting of race and ethnicity in radiology research studies. 2) Incorporate social determinants of health data in health services research. 3) Reduce biases and improve fairness in the design and use of artificial intelligence methods in medical imaging. 4) Develop a research proposal or action plan that addresses health equity issues.

#### COURSE DESCRIPTION

As a result of participation in this course, radiology researchers will be able to incorporate best practices in health equity and inclusive writing into their own clinical research studies. The course will include practical, high yield, lectures focused on equipping radiology researchers with discrete tools and resources for their own research studies.

### Emergency Neuroimaging: Pearls and Pitfalls from Coccyx to Vertex

Wednesday, Nov. 29 1:30PM - 2:30PM Room: E451A

Jason F. Talbott, MD, PhD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Gain familiarity with key CT and MRI findings and up-to-date classification systems in the setting of spine, head and neck, and intracranial emergencies. 2) Review appropriate indications for obtaining MRI and key MRI imaging findings in patients with acute spine emergency. 3) Review an algorithmic approach for evaluating spinal, head and neck, and intracranial imaging findings in the setting of suspected neurological emergencies.

#### COURSE DESCRIPTION

The radiologist plays a critical role in the evaluation, triage, and management planning for patients with neurological emergencies. Often, subtle imaging findings on CT and MRI are important for accurate diagnosis, timely triage, and appropriate management of patients with neurological emergencies. The primary focus of this session is to familiarize the radiologist with the spectrum of imaging findings that must be included in the search pattern for CT and MRI exams of the head, neck, and spine in the setting of non-traumatic neurologic emergency. A case-based approach will be utilized implementing up-to-date classification systems for a variety of neurological emergencies. Evidenced-based indications for obtaining follow-up and/or advanced imaging such as MRI for subtle CT findings will also be emphasized.

### Prostate Cancer Case Based Multidisciplinary Review

Wednesday, Nov. 29 1:30PM - 2:30PM Room: S402

Tristan Barrett, MBBS, MD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) To understand the typical imaging findings of prostate cancer on mpMRI. 2) To assess the impact of MRI on staging prostate cancer in a multidisciplinary setting. 3) To assess the role of imaging in the diagnosis of prostate cancer through case examples.

#### COURSE DESCRIPTION

This course uses a case-based approach to diagnostic and management decision making in the work-up of patients presenting with prostate cancer. The panel includes radiologists, urologists and radiation oncologists.

#### Sub-Events

**ASRT@RSNA: Reflection in Practice: An Approach for Reducing Patients Radiation Dose (Supported in part by an Independent Medical Education Grant from Bayer HealthCare Pharmaceuticals Inc.)**

Wednesday, Nov. 29 1:30PM - 2:30PM Room: N230B

Susie M. Moseley, MS, RT (*Moderator*) Nothing to Disclose

### LEARNING OBJECTIVES

1) Explain reflective practice, its purpose, and the reflective cycle. 2) Discuss the three components of reflective practice and four levels of individual reflection. 3) Apply reflection before, during, and after practice.

### COURSE DESCRIPTION

Reflective practice is a term coined by Donald Schon in the 1980s, which is based in the idea that practitioners should think about what they are doing while they are doing it. Reflective practice is based on identifying a problem and devising ways to address the problem, thereby formulating best practice. It results in the development of profession practice into professional artistry. The reflective cycle, along with the application of the reflection before, during, and after practice, lends the ability to evaluate one's practice critically, thereby reducing errors. This approach can be used to reduce patients' radiation dose. This lecture will address practical applications of reflective practice.

### Peripheral Vascular Imaging

Wednesday, Nov. 29 1:30PM - 2:30PM Room: N226

Dominik Fleischmann, MD (*Moderator*) Research Grant, Siemens AG; Stockholder, iSchemaView, Inc; Stockholder, Segmed, Inc  
Dominika Sucha, MD, PhD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Understand the principles, techniques, and roles of peripheral vascular CTA and MRA. 2) Characterize vascular pathologies in thoracic outlet syndrome (TOS) and peripheral arterial disease (PAD). 3) Understand clinical implications and applications of peripheral vascular imaging in endovascular treatment planning.

#### COURSE DESCRIPTION

This educational course emphasizes the importance of peripheral vascular imaging in diagnosing and characterizing vascular conditions affecting the upper and lower extremities and highlights how vascular imaging contributes to endovascular treatment planning. Global peripheral vascular disease burden is high and substantially contributes to major cardiovascular event rate. With increasing endovascular treatment options, anatomic assessment is important. Imaging peripheral vessels, however, presents significant challenges, requiring a comprehensive understanding of acquisition techniques for optimal patient assessment. Participate and gain insights to support clinical decisions effectively.

### RSNA/ESR Symposium: Imaging of Neurodegenerative Disorders - Movement Disorders

Wednesday, Nov. 29 1:30PM - 2:30PM Room: E450B

Meike W. Vernooij, MD, PhD (*Moderator*) Nothing to Disclose  
Kejal Kantarci, MD (*Moderator*) Research support, Eli Lilly and Company;Consultant, Biogen Idec Inc

#### LEARNING OBJECTIVES

1) Explain the current use of MRI in Lewy body disease and movement disorders. 2) Explain the current use of molecular imaging in Lewy body disease and movement disorders. 3) Demonstrate structured selection and assessment of imaging exams through cases.

#### COURSE DESCRIPTION

Structural MRI and molecular imaging techniques are key modalities in the diagnosis (and increasingly also in early detection) of neurodegenerative disorders. This session is part of an educational ESR-RSNA transatlantic course (of 4 sessions in total) that discusses imaging in neurodegeneration, from basics to advanced applications. This third educational session will discuss how MRI and molecular imaging techniques can be used to understand the underlying pathology in patients with Parkinson's Disease, atypical parkinsonism and other movement disorders. This session will give general radiologists and those interested in neuroradiology and nuclear medicine/molecular imaging the knowledge needed for appropriate selection and structured assessment of imaging exams in diagnostic work-up of movement disorders. The session format consists of in part lectures, followed by an interactive case-based discussion.

### Cranial Nerve Deficits - A Symptom Based Session

Wednesday, Nov. 29 3:00PM - 4:00PM Room: E450A

Remy R. Lobo, MD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Identify various causes of cranial nerve deficits based on clinical features and imaging findings.

#### COURSE DESCRIPTION

This lecture series will explore various clinical imaging scenarios with special focus on cranial neuropathies. Several classic entities as well as more rare pathologies will be shared on this whirlwind through the skull base! Come join us to deepen your understanding (and enjoyment) of Head & Neck imaging!

### Writing AI Abstracts: Tips for Success

Wednesday, Nov. 29 3:00PM - 4:00PM Room: S401

Ali S. Tejani, MD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Understand key elements of an abstract on artificial intelligence (AI) in imaging. 2) Learn to structure an abstract using pertinent components of the Checklist for Artificial Intelligence in Medical Imaging (CLAIM). 3) Identify and correct errors in example imaging AI abstracts. 4) Evaluate example abstracts to augment one's skills as a reviewer.

#### COURSE DESCRIPTION

It can be daunting to write a concise, yet sufficiently detailed abstract about a radiology artificial intelligence (AI) application. Abstracts often lack key information that allows readers to determine the quality and reproducibility of the submitted work. This session will help participants improve the quality of abstracts they submit to journals and conferences. Presenters will introduce the Checklist for Artificial Intelligence in Medical Imaging (CLAIM), share their experiences as AI abstract reviewers, describe best practices, and identify frequently seen errors. Participants will be equipped to build upon this course's lessons to write high-quality abstracts and to serve as abstract reviewers. This session will feature both a discussion with an expert panel and an interactive session to allow participants to evaluate and edit intentionally flawed AI abstracts.

### Cholangiocarcinoma and Oligometastatic Disease

Wednesday, Nov. 29 3:00PM - 4:00PM Room: S501

Muneeb Ahmed, MD (*Moderator*) Stockholder, Agile Devices, Inc;Scientific Advisory Board, Agile Devices, Inc;Consultant, Canon Medical Systems Corporation;Consultant, RevOps Health, Inc;

#### LEARNING OBJECTIVES

1) Explain current criteria used to determine whether patients with liver metastases can undergo surgical resection. 2) Explain how hepatic venous deprivation is performed and when it should be used to induce pre-operative liver hypertrophy. 3) Be familiar with current clinical outcome data for thermal ablation, TACE, and Y90-TARE used to treat intrahepatic cholangiocarcinoma and colorectal liver metastases. 4) Explain how Interventional Radiology treatments are used in locally-advanced and metastatic pancreatic cancer.

#### COURSE DESCRIPTION

Interventional and surgical treatments for cholangiocarcinoma, hepatic colorectal metastases, and pancreatic cancer can lead to good clinical outcomes in well-selected patients. This lecture-based course will review how Interventional Oncology, Surgery, and Combined approaches are applied in these cancers, and the current clinical data in each of these diseases. Attendees of this course will learn how interventional radiology and surgery can be used and combined to achieve optimal patient outcomes, and will be familiar with the most recent literature on these approaches.

### Neuroendocrine Theranostics

Wednesday, Nov. 29 3:00PM - 4:00PM Room: E352

Terence Z. Wong, MD, PhD (*Moderator*) Consultant, General Electric Company

#### LEARNING OBJECTIVES

1) Learn applications, pitfalls, and recommendations for imaging neuroendocrine neoplasms with DOTATATE and MIBG radiotracers. 2) Understand clinical applications, patient selection, and the different practical aspects of treating patients with <sup>177</sup>Lu-DOTATATE and <sup>131</sup>I-MIBG radiopharmaceuticals.

#### COURSE DESCRIPTION

This course will include two lectures followed by a panel discussion. Theranostic approaches have been used to treat neuroendocrine tumors for decades, first using MIBG for imaging and therapy, and more recently somatostatin receptor based imaging and therapy with DOTATATE. This course will provide an update on the imaging and patient selection as well as practical aspects of providing these treatments.

### Evaluating Economic Favorability and Outcomes of Imaging: Cost Effectiveness and Beyond

Wednesday, Nov. 29 3:00PM - 4:00PM Room: E351

Stella Kang, MD, MSc (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Describe principles of cost effectiveness analysis, one of the major forms of economic evaluation. 2) Identify economic tools and methods to convey programmatic costs and projected impact on desired clinical goals. 3) Understand the role of economic evaluation in shaping policies and clinical practice internationally.

#### COURSE DESCRIPTION

How do we allocate resources towards programs and strategies that will make the biggest impact on gains in health? In this course, participants will understand principles underlying economic evaluation for healthcare. We will describe cost effectiveness analysis and its roots in outcomes as well as costs (both as an input and as an output reflecting downstream effects). We will also explore the forms of economic analyses that influence health policy and practices, both by government and locally by decision-makers of health systems. Practical tools and applications for imagers will be a major emphasis of the session.

#### Sub-Events

##### **W7-CNPM17B** A Brief Introduction to Economic Evaluation for Imaging

Stella Kang, MD, MSc (*Presenter*) Nothing to Disclose

##### **W7-CNPM17C** Cost-Effectiveness Analysis: How it Works in Imaging

Pari V. Pandharipande, MD, MPH (*Presenter*) I serve as a member of the Association of University Radiologists (AUR) General Electric (GE) Radiology Research Academic Fellowship (GERRAF) Board of Review (term: 7/1/22-2/28/23).

##### **W7-CNPM17D** How Do Health Systems and Payers Use Cost Effectiveness to Inform Health Care Decisions about Imaging?

### **ASRT@RSNA: Leading and Developing Remote Imaging in a Radiology Department**

Wednesday, Nov. 29 3:00PM - 4:00PM Room: N230B

Susie M. Moseley, MS, RT (*Moderator*) Nothing to Disclose

#### **LEARNING OBJECTIVES**

1) Understand the general challenges and benefits of remote imaging. 2) Identify safety and regulatory aspects of remote imaging. 3) Develop and implement a plan to incorporate remote technology in your radiology department or imaging center.

#### **COURSE DESCRIPTION**

Remote Scanning or Remote Imaging has been an increasingly important topic of radiology meetings and discussion boards, especially regarding CT and MRI. With the technical improvements over the years, it has become feasible to image a patient from a remote location. This session will discuss the overall challenges and benefits of remote scanning in the radiology department, as well as the various leadership perceptions of remote scanning, from vendor solutions to the technologists' implementation of the technology. Our discussion will also include the important safety aspects of remote scanning in general terms for radiology and more specific details of safety regulations with CT and MRI. Other topics will include how remote imaging currently and, in the future, can serve as an adjunct in supporting leaders' ability to increase staff coverage, competence, retention, and improved department safety profiles.

### RSNA/ESR Symposium: Imaging of Neurodegenerative Disorder - The Next Frontier in Imaging in Neurodegeneration

Wednesday, Nov. 29 3:00PM - 4:00PM Room: E450B

Alexander Drzezga, MD (*Moderator*) Research support, Siemens AG ;Research support, Life Molecular Imaging;Research support, General Electric Company;Research support, Eli Lilly and Company;Research support, Eisai Co, Ltd;Consultant, Siemens AG ;Consultant, General Electric Company  
Yoshimi Anzai, MD, MPH (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) To describe the changing role of anatomical and molecular imaging for patients with neurodegenerative disorders, and the shift from nosological diagnosis to a biomarker-defined diagnosis. 2) To identify newest developments in PET tracers for specific neurodegenerative diseases. 3) To explain the role of advances in AI and imaging hardware in the diagnosis of neurodegenerative disease.

#### COURSE DESCRIPTION

Structural MRI and molecular imaging techniques are key modalities in the diagnosis (and increasingly also in early detection) of neurodegenerative disorders. This session is part of an educational ESR-RSNA transatlantic course (of 4 sessions in total) that discusses imaging in neurodegeneration, from basics to advanced applications. This final educational session will give a broader perspective of in which direction the field of imaging in neurodegeneration is moving, including biomarker-based diagnoses, advanced hardware and software applications for novel imaging and AI-based diagnoses.

### Achieving Health Equity and Care Delivery Through Sustainable Community Partnerships in Radiology (Sponsored by the RSNA Health Equity Committee)

Wednesday, Nov. 29 3:00PM - 4:00PM Room: N228

Efren J. Flores, MD (*Moderator*) Speaker, WebMD LLC; Speaker, Consulting Medical Associates, Inc  
Somiah Almecky, MD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Participants will learn the best practices to foster trust and longitudinal relationships to establish meaningful partnerships between key community members and enhance effectiveness of collaborations. 2) Participants will be able to identify how to effectively engage with patients and community members to identify the social determinants of health that influence access to radiology care in their practice. 3) Participants will learn to bring in a cultural lens to community engagement to foster bi-directional learning, learn to acknowledge and respect the distinctive values of individuals coming from diverse communities. 4) Participants will be able to describe the importance of Community-Based Participatory Research in health equity efforts and other community-based grass roots efforts and outreach that can be employed in the advancement of program development to advance health equity.

#### COURSE DESCRIPTION

In many instances, radiologists are seeking opportunities to learn practical ways to engage in community outreach in their practices. This session will provide participants with an opportunity to participate in an interactive session with radiologists and community organizations that have successfully established meaningful partnerships that foster trust and longitudinal partnerships to advance health equity and care delivery transformation in radiology. Radiology practices and the communities of the patients they serve are directly impacted by the social determinants of health that influence their radiology care. Radiology is a leader in healthcare innovation and care delivery transformation, but often the communities served are not included in the creative process or implementation of novel care models and technologies aimed to benefit them. Therefore, the implementation of new technologies in radiology without the input of the community creates a disconnect that ultimately results in the health disparities we see in our radiology practices. Meaningful community engagement requires working transdisciplinary collaborations that breaks silos between healthcare, public health, and community health sectors. This type of engagement is one that foster trusts and sustainable relationships that result in community partnerships and coalitions across healthcare organizations to serve as catalysts for transformational change in radiology. Thus, the purpose of this session is to engage in an interactive session with the audience and members of the panel in a discussion on how to successfully form community partnerships between radiologists and community organizations. The Chicago Southwest Organizing Project (SWOP) is a local transdisciplinary community organization that is collaborating with the RSNA Health Equity Committee representative members will be invited to participate in this session as well as radiologists that have successfully established community relationships in their practices and improve access to care. Leveraging the National Academy of Medicine framework for Health Equity and Community Engagement, topics to be covered will include: 1. Strengthening Community Partnerships Through Diversity, Inclusion and Trust 2. Designing and Implementing community-aligned programs to increase access to care. 3. Culturally-centered, sustainable partnerships to foster bi-directional learning 4. The role of community-based participatory research in guiding health equity efforts. 5. Transforming the radiology education experience and fostering well-being through community outreach experiences.

### Multimodality Challenging Breast Cases

Wednesday, Nov. 29 4:30PM - 5:30PM Room: S406A

Steven P. Poplack, MD (*Moderator*) Faculty, Ultimate Opinions in Medicine LLC; Speaker, Efficiency Learning Systems Inc

#### LEARNING OBJECTIVES

1) Recognize digital tomosynthesis artifacts that mimic breast cancer. 2) Define the role of breast ultrasound in personalized breast cancer screening. 3) Understand when and how MRI can help manage patients presenting with breast symptoms.

#### COURSE DESCRIPTION

This is a case-based interactive educational session focused on challenging breast imaging cases. Each presentation will highlight diagnostic challenges and / or potential pitfalls inherent to each modality (DBT, US, MRI). This is relevant to clinical practice, wherein recognition of interpretive challenges is critical to establishing appropriate differential diagnosis and management. Whenever possible speakers will relate discussion and learning points to accepted peer reviewed standards. We look forward to a thought provoking session with active audience participation.

#### Sub-Events

### **The Cardiac Debate: Where on The Map is Parametric Mapping**

Wednesday, Nov. 29 4:30PM - 5:30PM Room: N226

Jacobo Kirsch, MD, MBA (*Moderator*) Medical Advisory Board, Zebra Medical Vision Ltd

#### **LEARNING OBJECTIVES**

1. To list advantages and disadvantages of T1 mapping for diagnosis of cardiomyopathies. 2. To describe the most clinically useful applications of T1 mapping. 3. To recognize when T1 map does not add significant value to standard CMR study.

#### **COURSE DESCRIPTION**

This session is a debate on the topic of T1 mapping in CMR. Two experts in the field will present their opinion in favor or against the routine utilization of this CMR technique in clinical practice. A moderated discussion will then happen with participation from speakers and audience.

#### **Sub-Events**

### Emergency Radiology Practice Management in 2023: Health Equity, Sustainability, and Cost in the US and Europe

Wednesday, Nov. 29 4:30PM - 5:30PM Room: E451B

Suzanne T. Chong, MD, MS (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Describe health equity as a Joint Commission national patient safety goal. 2) Explore ways in which radiology practices can contribute to achieving health equity. 3) Understand state of the EU for ER and discuss challenges to its growth and success. 4) Discuss sustainability and explore the business case for growing a thriving ER practice. 5) Realize the shared goals, values, and mission of ER in the US and Europe.

#### COURSE DESCRIPTION

As Emergency Radiology continues its growth and expansion in the US and around the world, its singular vantage point at the intersection of healthcare for all and 24/7 service provision highlights unique challenges in the domains of quality and sustainability, and sparks debate on the costs of doing business. In this session, we focus on health equity as a national patient safety goal, discuss the challenges facing our European colleagues as the global mandate for emergency radiology marches onward, and explore the business case for sustainability in successful ER practices.

### Case-Based Review of GI

Wednesday, Nov. 29 4:30PM - 5:30PM Room: S406B

Douglas S. Katz, MD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Review a series of cases using interactive technology with the audience of various challenging patients. 2) Review a variety of disorders of the biliary tract, of COVID in the abdomen, or fluoroscopy applications and demonstration of disorders in the abdomen, and of the spleen and pancreas. 3) Understand the differential diagnosis of these conditions, if there is one, and the implications for patient management.

#### COURSE DESCRIPTION

Case-based interactive review of patients at various levels of difficult on various imaging modalities of the abdomen will be reviewed by experienced faculty for several organs/organ systems in the abdomen, with review of the current relevant literature. The expected outcome is that the learner/attendee will understand the differential diagnosis - if there is one (some of the cases may have just one diagnosis), and the implications for patient management.

### Small Joints-Big Problems: Imaging of the Hands and Feet

Wednesday, Nov. 29 4:30PM - 5:30PM Room: E450A

Tetyana A. Gorbachova, MD (*Moderator*) Nothing to Disclose

#### LEARNING OBJECTIVES

1) Review imaging features and technical and interpretational pitfalls in the diagnosis of the abnormalities of the small joints of the hand, wrist, and foot. 2) Analyze the biomechanics and clinical significance of injuries to the small joints of the upper and lower extremity.

#### COURSE DESCRIPTION

This course is composed of a series of lectures focused on imaging of the joints of the hand, wrist and foot, in a format of short didactic lectures and Q&A. Individual lectures will highlight the tips and pitfalls of imaging diagnosis of common conditions that occur in clinical practice.

### **CRASH COURSE! Traumatic Injuries of the Brain, Cerebrovasculature, Orbits, and Skull Base**

Wednesday, Nov. 29 4:30PM - 5:30PM Room: E353B

Nancy Pham, MD (*Moderator*) Nothing to Disclose

#### **LEARNING OBJECTIVES**

1) Review the primary injury patterns of traumatic brain injuries and secondary injuries that can occur as complications of mass effect and herniation. When to use advanced neuroimaging as well as Identify and describe the mechanism associated with traumatic cerebrovascular injuries. 2) Review the imaging manifestations of various traumatic injuries of the orbits, potential complications, and the current imaging approach for evaluation. 3) Review the imaging manifestations of various traumatic injuries of the temporal bones, potential complications, and the current imaging approach for evaluation.

#### **COURSE DESCRIPTION**

This session is comprised of 4 high-yield lectures focused on the spectrum of traumatic imaging findings related to the brain, cerebrovasculature, orbits, and temporal bones. Discussion will address the relevant anatomy, interesting cases, potential complications, and current imaging strategies for evaluating these injuries.

### Practical Aspects of MRI

Wednesday, Nov. 29 4:30PM - 5:30PM Room: N229

Nicole Seiberlich, PhD (*Moderator*) Royalties, Siemens AG; Research support, Siemens AG

#### LEARNING OBJECTIVES

1) Describe how differences in contrast can be induced by the selection of particular pulse sequence settings to differentiate tissues using MRI. 2) Explain how data collection in MRI is related to image resolution and scan time, and make practical tradeoffs between these factors. 3) Describe several common artifacts encountered in MRI, what causes them, and how to mitigate them.

#### COURSE DESCRIPTION

In this course, comprised of three 20-minute lectures, practical aspects of deploying Magnetic Resonance Imaging will be discussed. The aim of this course is to help radiologists to better understand the basics of MRI, and why clinical MRI exams are structured the way that they are. A detailed understanding of MRI physics is not required. MRI is complex due to the large number of parameters that can be adjusted and the unexpected artifacts that can arise, especially in the presence of motion. Determining an appropriate protocol for a clinical question balances the need for contrast between healthy and diseased tissue, the speed of the individual sequences, exam length, and the incremental diagnostic utility provided by adding to the protocol. This course will tackle these questions by focusing on three topics: 1) image contrast, and how it is generated and used to discriminate different tissues; 2) image resolution and how it relates to data collection, and 3) common artifacts, their causes, and how to mitigate them.

### Cardiothoracic Imaging What Drives the Field - Editor's Perspectives

Wednesday, Nov. 29 4:30PM - 5:30PM Room: S402

Fernando U. Kay, MD, PhD (*Moderator*) Research Grant, Edwards Lifesciences Corporation  
Suhny Abbara, MD (*Moderator*) Royalties, RELX

#### LEARNING OBJECTIVES

1) To identify latest scientific trends and current and future developments in cardiothoracic Imaging. 2) Identify key topics of interest and educational and research opportunities in the fields of chest imaging, cardiovascular CT and cardiac MRI. 3) To give the editor's perspective on scholarly publishing trends and future needs in the field of cardiovascular and thoracic imaging.

#### COURSE DESCRIPTION

This program has Editors from several cardiovascular imaging journals share the latest and most impactful published science and educational articles in their respective journals and discuss current priorities and future directions and initiatives in their respective fields. The represented journals include Radiology CTI (RSNA), JCCT (SCCT Cardiac CT), JCMR (SCMR cardiovascular MRI) and JTI (STR Thoracic Imaging)

Nisha Sharma, MBChB, FRCR (*Moderator*) Nothing to Disclose

#### Sub-Events

#### **M1-SSBR03-2 The Dual Role of Breast Density in Masking Cancers and Predicting Future Risk of Breast Cancer: What is the Impact?**

Elizabeth A. Morris, MD (*Presenter*) Scientific Advisory Board, Bracco Group; Speaker, Bayer AG; Scientific Advisory Board, Bayer AG; Speaker, Guerbet SA; Researcher, Guerbet SA; Stockholder, Revel Transit Inc; Stockholder, Kheiron Medical Technologies Ltd

#### PURPOSE

To assess the impact of mammographic breast density on masking cancers and predicting future risk of breast cancer in a large multi-facility screening mammography center.

#### METHODS AND MATERIALS

This retrospective study included 201,864 consecutive bilateral 2D full field digital screening mammograms from a multi-facility U.S.-based screening program from January 2011 through December 2016. Patient age, radiologist reported BI-RADS assessment (0-5), and breast density (dense (c+d) vs not dense (a+b)) were extracted from electronic medical records. Cancer outcomes and cancer type (pure DCIS vs any invasive breast cancer) were obtained from local tumor registries. Interval cancers were defined as exams with BI-RADS assessment of 1 or 2 followed by cancer diagnosis within one year. Age-adjusted cancer rates (observed cancers/exams) were compared by breast density category using odds ratios and 95% confidence intervals, using "not dense" as the reference group.

#### RESULTS

Patients with dense breast tissue had significantly higher odds than patients without dense breast tissue of an interval cancer (adjusted OR, 2.83; 95% CI, 2.05-3.96;  $p < .001$ ) and higher odds of a cancer diagnosis overall (adjusted OR, 1.38; 95% CI, 1.31-1.45;  $p < .001$ ). This trend was similar for both DCIS (adjusted OR, 1.53; 95% CI, 1.40-1.67;  $p < .001$ ) and for invasive cancers (adjusted OR, 1.33; 95% CI, 1.24-1.43;  $p < .001$ ).

#### CONCLUSION

Breast density impacts both interval cancer rates and overall cancer rates. The impact of breast density as a cancer masking agent appears stronger than as a breast cancer risk factor for DCIS and invasive cancer.

#### CLINICAL RELEVANCE/APPLICATION

Our findings support current language mandated by U.S. federal legislation for dual impact of breast density on cancer masking and risk prediction, and suggest the impact on masking is greater than the impact on future risk of cancer.

#### **M1-SSBR03-3 Molecular Breast Imaging for Women with Dense Breasts: Results Update from the Density MATTERS Trial**

Carrie B. Hruska, PhD (*Presenter*) Institutional license agreement, CMR Naviscan Corporation; Researcher, Siemens AG

#### PURPOSE

To assess the performance of molecular breast imaging (MBI) relative to digital breast tomosynthesis (DBT) screening among asymptomatic women with dense breasts in the Density MATTERS trial (ClinicalTrials.gov NCT03220893).

## METHODS AND MATERIALS

Across five participating centers, women age 40-75 presenting for screening DBT, with dense breasts (ACR BI-RADS C or D) on last mammogram and no prior supplemental screening, were prospectively enrolled to undergo MBI over two annual screening rounds. MBI was performed with a dedicated dual-head CZT gamma camera and 300 MBq Tc-99m sestamibi (effective dose of 2 mSv). MQSA-certified radiologists independently interpreted DBT and MBI; positive findings on either led to integrated interpretation and possible workup. Performance of screening with DBT alone, MBI alone, and the combination of DBT with supplemental MBI was evaluated.

## RESULTS

Median age of participants at enrollment was 57 years. Among 2978 women completing initial screening, the rate of recall for diagnostic workup was 8.5% for DBT, 11.4% for MBI, and 17.9% for DBT plus MBI. Of 35 breast cancers diagnosed within 1 year of follow-up, DBT detected 13 (37%), MBI detected 25 (71%), and DBT plus MBI detected 33 (94%). The cancer detection rate (CDR) per 1000 screened was 4.4 for DBT alone, 8.4 for MBI alone, and 11.1 for DBT plus MBI. The rate of interval cancers per 1000 screened was 0.7 (2 of 2978). Twenty-three of 35 cancers were invasive: DBT detected 8 (35%), MBI detected 18 (78%), and DBT plus MBI detected 22 (96%). Cancers detected only by supplemental MBI were mostly invasive (14/20) with median size of 0.9 cm (range 0.2-2.6 cm). The proportion of biopsies resulting in cancer, PPV3, was 19.7% (13/66) for DBT, 22.3% (25/112) for MBI, and 22.1% (33/149) for DBT+MBI. At the second screening round, completed in 2456 women thus far, the rate of recall was 8.7% for DBT, 5.8% for MBI, and 13.3% for DBT plus MBI. Of 16 patients with cancers detected at second screening, DBT detected 10 (63%) and MBI detected 11 (69%). Seven of 16 cancers at second screen were invasive; DBT detected 3 of 7 invasive (44%) and MBI detected 6 of 7 invasive (85%).

## CONCLUSION

In women with dense breasts, MBI as a supplement to DBT provided an incremental CDR of 6.7 for all cancers and 4.7 for invasive cancers in the first screening round and continued to detect invasive cancers undetected on DBT in a second screening round. Recall rate of MBI was reduced by half from first to second screening round.

## CLINICAL RELEVANCE/APPLICATION

The 2.5-fold increase in invasive cancer detection and modest increase in recall rate provided by MBI in this multicenter trial supports use of MBI as a supplemental screening test for women with dense breasts.

## M1-SSBR03-4 Real World Use of Artificial Intelligence Risk Scores to Identify Women at High Risk for Breast Cancer with Subanalyses Based on Histopathology and Time of Detection

Axel Graewingholt, MD (*Presenter*) Research Consultant, iCad, Inc

## PURPOSE

To assess an Artificial Intelligence (AI) risk tool for identifying women as high risk on prior full field digital mammography (FFDM) exams who are detected with different breast cancer histopathologies within the next two years in biennial screening.

## METHODS AND MATERIALS

A retrospective case-control study was conducted at a single German institution with a double reading scenario between 2013 and 2016 (n= 53,453 screening exams) evaluating the 2-year risk scores of prior FFDM exams for screen-detected (n=205) and interval cancers (n=94). An imaging only AI risk model (iCAD ProFound AI® Risk) utilizes mammographic features, density and age at exam to provide a risk score enabling identification of women more likely to be diagnosed with breast cancer prior to or at next biennial screening exam. Women were considered high risk with a score of more than 1.2% absolute risk. Risk scores were evaluated on prior screens for all cancers subanalyzed by histopathology and for 355 non-cancer exams in same time period, with 4 years of cancer-free follow-up. Two-sample independent ANOVA was used for statistical analyses with 95% Confidence Intervals (CI).

## RESULTS

The algorithm identified 128 of 299 (42.8%) women who were high risk on the mammogram read as normal prior to cancer detection. The sample of 355 cancer-free women had 26 (7.3%) with high risk. Risk scores relative to screen-detected cancer (SDC) histopathology were analyzed for high risk on prior: 59 of 145 (40.7%) were invasive ductal (IDC), 15 of 23 (65.2%) were invasive lobular (ILC) and 13 of 37 (35.1%) were ductal carcinoma in situ (DCIS). For 94 interval cancers (IC): 3 of 4 (75%) DCIS and 38 of 90 (42.2%) invasive were high risk. Average risk for priors of 299 cancers was 1.29% (95%CI:1.21%-1.37%) and of 355 non-cancers 0.54% (95%CI:0.47%-0.61%), difference 0.75%, p<0.0001. Average risk on priors for 205 SDC was 1.23% (95%CI:1.10%-1.36%) vs average risk on priors of 94 IC was 1.42% (95%CI:1.23%-1.61%), difference 0.19%, p=0.1016. The average risk for priors of SDC was 1.21% (95%CI:1.07%-1.35%) for 145 IDC, 1.7% (95%CI:1.32%-2.08%) for 23 ILC and 0.98% (95%CL:0.69%-1.27%) for 37 DCIS, p=0.0085.

## CONCLUSION

An image-derived AI risk model can identify women who will have breast cancer detected within the next 2 years who have a 2.4 times (1.29%/0.54%) higher average risk score compared to women who remain cancer free. Average risk for invasive

cancers and particularly lobular cancers was higher than that of DCIS.

#### **CLINICAL RELEVANCE/APPLICATION**

Risk assessment with an AI risk tool in screening may be useful to stratify women with higher risk for supplemental screening or shortening intervals to detect cancers earlier without increasing overdiagnosis by overestimating DCIS.

#### **M1-SSBR03-5 Radiomics and Genomics: Image-Only Deep Learning Risk Model Performance Improves with Polygenic Risk Scores**

Leslie Lamb, MD, MSc (*Presenter*) Nothing to Disclose

#### **PURPOSE**

Mammograms contain highly predictive biomarkers of future breast cancer risk, which can be identified by deep learning (DL) risk stratification models. Traditional risk assessment models have demonstrated improved performance with the inclusion of genetic risk variants. The purpose of this study is to assess the performance of an image-only DL model risk score with the addition of polygenic risk scores (PRS).

#### **METHODS AND MATERIALS**

This nested case-control study included participants undergoing routine bilateral 2D full field digital screening mammography across the US between 01/2001-01/2017, as part of the prospective Nurses' Health Study (NHSII). NHSII was established in 1989 and followed 116,429 female registered nurses aged 25-42 years over time with biennial questionnaires about diseases and health-related topics. DL and Gail five-year models were used to assess risk. PRS were calculated using 67 single nucleotide polymorphisms. Participants with a diagnosis of cancer within one month of mammogram were excluded. Patient demographics, mammograms, PRS, and cancer outcomes were collected as part of NHSII. DL and Gail model performance with and without PRS were compared using areas under the receiver operating characteristic curve (AUCs) unconditional logistic regression models with Delong test ( $p < 0.05$ ).

#### **RESULTS**

926 participants (350 cases of breast cancer, 576 controls) underwent screening mammography. 68 were had a diagnosis of breast cancer within one month of mammogram. 491, 67, and 54 were missing a PRS, Gail score, and DL score, respectively. 804 (268 cases, 536 controls) had DL score, 313 (110 cases, 203 controls) DL+PRS, 684 (220 cases, 464 controls) Gail score and 263 (94 cases, 169 controls) Gail+PRS. This resulted in a study population of 858 participants (282 cases, 576 controls). Mean age was 55.3y (SD 5.4y). All participants were White. 310 (36.1%) were pre-menopausal and 548 (63.8%) post-menopausal. 398 (46.3%) had non-dense and 457 (53.2%) had dense breasts. The AUC of DL model was 0.65 (95% CI: 0.61-0.70) vs 0.72 (95% CI 0.66-0.78) in DL+PRS ( $p < 0.05$ ). The AUC of Gail model was 0.50 (95% CI: 0.45-0.54) vs 0.68 (95% CI: 0.61-0.74) in Gail+PRS ( $p < 0.001$ ). The AUC of DL model was significantly higher than Gail model ( $p < 0.001$ ) however there was no evidence of a significant difference in DL+PRS vs Gail+PRS ( $p = 0.34$ ).

#### **CONCLUSION**

A screening mammography DL breast cancer risk assessment model has high risk discriminatory accuracy which can be improved with the addition of PRS.

#### **CLINICAL RELEVANCE/APPLICATION**

A DL image-only risk model derived automatically at the time of screening mammography, can be improved with genetic information. Identification of high-risk patients by DL model could assist in triaging women for genetic testing.

#### **M1-SSBR03-6 Performance of a Deep Learning Image Based 5-year Breast Cancer Risk Model Developed Across Global Imaging Centers that Provides a Percent Probability Output for Use in Existing Clinical Workflows and Decision Making**

Christiane K. Kuhl, MD, PhD (*Presenter*) Advisory Board, Guerbet SA; Speaker, Bracco Group; Speaker, Bayer AG

#### **PURPOSE**

To train, validate, test, and calibrate a deep learning, image-based five-year breast cancer risk prediction model in a multi-center international data consortium.

#### **METHODS AND MATERIALS**

This retrospective, multi-center international study included 318,101 consecutive bilateral 2D full field digital screening mammograms obtained from 129,498 patients between January 2007 and December 2016, after excluding exams that lacked five-year follow up. Test datasets, held out of model development, included 46,104 exams from Europe and the U.S., along with all 5,888 exams from South America. Patient demographics including age and race/ethnicity were retrieved from electronic medical records and cancer outcomes were obtained from local tumor registries. We leveraged a deep convolutional neural network using federated learning to create the DL model, which was trained to predict the development of breast cancer within five years of the mammogram, based only on the four standard mammography views (RCC, LCC, RMLO and

LMLO). A calibration algorithm was used to create percent probabilities of future cancer from the DL score. Model performance on each center's held-out test data sets was estimated using areas under the receiver operating characteristic curve (AUCs) with 95% CIs. To assess calibration, held-out test sets were combined and segmented into five equally sized bins based on increasing predicted risk, and used to generate observed-to-expected ratios (O/E ratios) with 95% CIs.

## RESULTS

We found point estimate AUCs consistently at or above 0.75 across centers. AUC by center: United States 0.75 [95% CI 0.74, 0.77] (n = 30,335); Europe 0.80 [95% CI 0.78, 0.82] (n = 15,769); and South America 0.80 [95% CI 0.77, 0.82] (n = 5,888). Observed-to-expected ratios overall and for spectrum of predicted low- to high-risk bins demonstrated strong calibration of the model with future cancer occurrence: overall 1.00 [95% CI 0.95, 1.06] (n = 52,981); first bin 1.01 [95% CI 0.76, 1.29] (n = 10,597), second bin 0.80 [95% CI 0.64, 0.98] (n = 10,596), third bin 1.04 [95% CI 0.90, 1.20] (n = 10,595), fourth bin 0.99 [95% CI 0.88, 1.11] (n = 10,596), fifth bin 1.03 [95% CI 0.96, 1.10] (n = 10,597).

## CONCLUSION

A deep learning model trained and calibrated on an international mammography screening consortium data resource, based on the screening mammogram alone, provides strong predictive accuracy (AUC of 0.75-0.80) and is well calibrated for use in current standard of care clinical workflows that rely on five-year breast cancer risk predictions.

## CLINICAL RELEVANCE/APPLICATION

A deep learning breast cancer risk model can be calibrated to provide five-year risk estimates to support more personalized screening and risk reduction interventions as recommended by clinical practice guidelines.

### **M1-SSBR03-7 Using Density-Specific Calibration of AI Thresholds in a Double-Reader Setting to Achieve Equal Sensitivity for Women With High Mammographic Density**

Haiko Schurz, BSc, PhD (*Presenter*) Nothing to Disclose

## PURPOSE

Higher mammographic density, BIRADS category C and D, is associated with lower radiologist sensitivity and increased risk of breast cancer. Artificial Intelligence Computer-Aided Detection (AI CAD) generates a continuous score translated to a normal/abnormal decision by thresholding. In this study, we explore whether the lower radiologist sensitivity could be counteracted by lowering the AI threshold for high density mammograms.

## METHODS AND MATERIALS

The Swedish platform for Validation of AI in Breast imaging (VAI-B) with mammograms from 2008-2021 was used. A three-year follow-up period with biopsy-verification defined the reference standard of breast cancer or healthy. Mammograms were processed by AI CAD (Lunit, South Korea) to produce a continuous abnormality score and a density class. We determined the sensitivity of the radiologist double reading for each density category. We then combined single radiologist assessment and AI calibrated to maintain sensitivity, first, overall, for the entire dataset and, second, re-calibrated to enforce the same sensitivity for density C and D as for density B. Finally, we compare the performance between the radiologist double-reading with single reader plus AI calibrated on overall-sensitivity, and with single reader plus AI calibrated to maintain sensitivity for density C and D.

## RESULTS

Overall, 38529 (upscaled to 972522) screening mammograms from 28580 healthy and 5773 women diagnosed with cancer were included in this study. The radiologist's double reading sensitivity was 52.8% overall and 63.4%, 56.4%, 48.6% 43.8% for density A, B, C and D respectively. Radiologist double-reading had 16.3 false positives per detected cancer (FP/C). Simulating double-reading by AI and one radiologist, calibrated to maintain overall sensitivity without taking density into account, reduced FP/C by 24.4% to 11.5. After re-calibrating to enforce that density B sensitivity (56.4%) was maintained for density C and D, the cancers detected increased by 7.5%, while the FP/C of 14.7 showed a decrease of 9.7% compared to radiologist double-reading and an increase of 19.5% compared to the density-ignorant AI workflow.

## CONCLUSION

Calibrating the AI threshold separately for each density category to ensure having the same sensitivity for women with density C and D as for with density B is feasible. Density-specific calibration would equalize sensitivity between density B, C and D, through a 7.5% increase in cancer detection at the cost of around 20% increase in false positives per cancer.

## CLINICAL RELEVANCE/APPLICATION

Implementing AI CAD systems with density-specific calibration could improve fairness of the screening system giving women with higher mammographic density an equal chance of screen-detection.

### **The Dual Role of Breast Density in Masking Cancers and Predicting Future Risk of Breast Cancer: What is the Impact?**

Monday, Nov. 27 8:00AM - 9:00AM Room: E352

Elizabeth A. Morris, MD (*Presenter*) Scientific Advisory Board, Bracco Group; Speaker, Bayer AG; Scientific Advisory Board, Bayer AG; Speaker, Guerbet SA; Researcher, Guerbet SA; Stockholder, Revel Transit Inc; Stockholder, Kheiron Medical Technologies Ltd

#### **PURPOSE**

To assess the impact of mammographic breast density on masking cancers and predicting future risk of breast cancer in a large multi-facility screening mammography center.

#### **METHODS AND MATERIALS**

This retrospective study included 201,864 consecutive bilateral 2D full field digital screening mammograms from a multi-facility U.S.-based screening program from January 2011 through December 2016. Patient age, radiologist reported BI-RADS assessment (0-5), and breast density (dense (c+d) vs not dense (a+b)) were extracted from electronic medical records. Cancer outcomes and cancer type (pure DCIS vs any invasive breast cancer) were obtained from local tumor registries. Interval cancers were defined as exams with BI-RADS assessment of 1 or 2 followed by cancer diagnosis within one year. Age-adjusted cancer rates (observed cancers/exams) were compared by breast density category using odds ratios and 95% confidence intervals, using "not dense" as the reference group.

#### **RESULTS**

Patients with dense breast tissue had significantly higher odds than patients without dense breast tissue of an interval cancer (adjusted OR, 2.83; 95% CI, 2.05-3.96;  $p < .001$ ) and higher odds of a cancer diagnosis overall (adjusted OR, 1.38; 95% CI, 1.31-1.45;  $p < .001$ ). This trend was similar for both DCIS (adjusted OR, 1.53; 95% CI, 1.40-1.67;  $p < .001$ ) and for invasive cancers (adjusted OR, 1.33; 95% CI, 1.24-1.43;  $p < .001$ ).

#### **CONCLUSION**

Breast density impacts both interval cancer rates and overall cancer rates. The impact of breast density as a cancer masking agent appears stronger than as a breast cancer risk factor for DCIS and invasive cancer.

#### **CLINICAL RELEVANCE/APPLICATION**

Our findings support current language mandated by U.S. federal legislation for dual impact of breast density on cancer masking and risk prediction, and suggest the impact on masking is greater than the impact on future risk of cancer.

### **Molecular Breast Imaging for Women with Dense Breasts: Results Update from the Density MATTERS Trial**

Monday, Nov. 27 8:00AM - 9:00AM Room: E352

Carrie B. Hruska, PhD (*Presenter*) Institutional license agreement, CMR Naviscan Corporation; Researcher, Siemens AG

#### **PURPOSE**

To assess the performance of molecular breast imaging (MBI) relative to digital breast tomosynthesis (DBT) screening among asymptomatic women with dense breasts in the Density MATTERS trial (ClinicalTrials.gov NCT03220893).

#### **METHODS AND MATERIALS**

Across five participating centers, women age 40-75 presenting for screening DBT, with dense breasts (ACR BI-RADS C or D) on last mammogram and no prior supplemental screening, were prospectively enrolled to undergo MBI over two annual screening rounds. MBI was performed with a dedicated dual-head CZT gamma camera and 300 MBq Tc-99m sestamibi (effective dose of 2 mSv). MQSA-certified radiologists independently interpreted DBT and MBI; positive findings on either led to integrated interpretation and possible workup. Performance of screening with DBT alone, MBI alone, and the combination of DBT with supplemental MBI was evaluated.

#### **RESULTS**

Median age of participants at enrollment was 57 years. Among 2978 women completing initial screening, the rate of recall for diagnostic workup was 8.5% for DBT, 11.4% for MBI, and 17.9% for DBT plus MBI. Of 35 breast cancers diagnosed within 1 year of follow-up, DBT detected 13 (37%), MBI detected 25 (71%), and DBT plus MBI detected 33 (94%). The cancer detection rate (CDR) per 1000 screened was 4.4 for DBT alone, 8.4 for MBI alone, and 11.1 for DBT plus MBI. The rate of interval cancers per 1000 screened was 0.7 (2 of 2978). Twenty-three of 35 cancers were invasive: DBT detected 8 (35%), MBI detected 18 (78%), and DBT plus MBI detected 22 (96%). Cancers detected only by supplemental MBI were mostly invasive (14/20) with median size of 0.9 cm (range 0.2-2.6 cm). The proportion of biopsies resulting in cancer, PPV3, was 19.7% (13/66) for DBT, 22.3% (25/112) for MBI, and 22.1% (33/149) for DBT+MBI. At the second screening round, completed in 2456 women thus far, the rate of recall was 8.7% for DBT, 5.8% for MBI, and 13.3% for DBT plus MBI. Of 16 patients with cancers detected at second screening, DBT detected 10 (63%) and MBI detected 11 (69%). Seven of 16 cancers at second screen were invasive; DBT detected 3 of 7 invasive (44%) and MBI detected 6 of 7 invasive (85%).

#### **CONCLUSION**

In women with dense breasts, MBI as a supplement to DBT provided an incremental CDR of 6.7 for all cancers and 4.7 for invasive cancers in the first screening round and continued to detect invasive cancers undetected on DBT in a second screening round. Recall rate of MBI was reduced by half from first to second screening round.

#### **CLINICAL RELEVANCE/APPLICATION**

The 2.5-fold increase in invasive cancer detection and modest increase in recall rate provided by MBI in this multicenter trial supports use of MBI as a supplemental screening test for women with dense breasts.

### Real World Use of Artificial Intelligence Risk Scores to Identify Women at High Risk for Breast Cancer with Subanalyses Based on Histopathology and Time of Detection

Monday, Nov. 27 8:00AM - 9:00AM Room: E352

Axel Graewingholt, MD (*Presenter*) Research Consultant, iCad, Inc

#### PURPOSE

To assess an Artificial Intelligence (AI) risk tool for identifying women as high risk on prior full field digital mammography (FFDM) exams who are detected with different breast cancer histopathologies within the next two years in biennial screening.

#### METHODS AND MATERIALS

A retrospective case-control study was conducted at a single German institution with a double reading scenario between 2013 and 2016 (n= 53,453 screening exams) evaluating the 2-year risk scores of prior FFDM exams for screen-detected (n=205) and interval cancers (n=94). An imaging only AI risk model (iCAD ProFound AI® Risk) utilizes mammographic features, density and age at exam to provide a risk score enabling identification of women more likely to be diagnosed with breast cancer prior to or at next biennial screening exam. Women were considered high risk with a score of more than 1.2% absolute risk. Risk scores were evaluated on prior screens for all cancers subanalyzed by histopathology and for 355 non-cancer exams in same time period, with 4 years of cancer-free follow-up. Two-sample independent ANOVA was used for statistical analyses with 95% Confidence Intervals (CI).

#### RESULTS

The algorithm identified 128 of 299 (42.8%) women who were high risk on the mammogram read as normal prior to cancer detection. The sample of 355 cancer-free women had 26 (7.3%) with high risk. Risk scores relative to screen-detected cancer (SDC) histopathology were analyzed for high risk on prior: 59 of 145 (40.7%) were invasive ductal (IDC), 15 of 23 (65.2%) were invasive lobular (ILC) and 13 of 37 (35.1%) were ductal carcinoma in situ (DCIS). For 94 interval cancers (IC): 3 of 4 (75%) DCIS and 38 of 90 (42.2%) invasive were high risk. Average risk for priors of 299 cancers was 1.29% (95%CI:1.21%-1.37%) and of 355 non-cancers 0.54% (95%CI:0.47%-0.61%), difference 0.75%, p<0.0001. Average risk on priors for 205 SDC was 1.23% (95%CI:1.10%-1.36%) vs average risk on priors of 94 IC was 1.42% (95%CI:1.23%-1.61%), difference 0.19%, p=0.1016. The average risk for priors of SDC was 1.21% (95%CI:1.07%-1.35%) for 145 IDC, 1.7% (95%CI:1.32%-2.08%) for 23 ILC and 0.98% (95%CL:0.69%-1.27%) for 37 DCIS, p=0.0085.

#### CONCLUSION

An image-derived AI risk model can identify women who will have breast cancer detected within the next 2 years who have a 2.4 times (1.29%/0.54%) higher average risk score compared to women who remain cancer free. Average risk for invasive cancers and particularly lobular cancers was higher than that of DCIS.

#### CLINICAL RELEVANCE/APPLICATION

Risk assessment with an AI risk tool in screening may be useful to stratify women with higher risk for supplemental screening or shortening intervals to detect cancers earlier without increasing overdiagnosis by overestimating DCIS.

### Radiomics and Genomics: Image-Only Deep Learning Risk Model Performance Improves with Polygenic Risk Scores

Monday, Nov. 27 8:00AM - 9:00AM Room: E352

Leslie Lamb, MD, MSc (*Presenter*) Nothing to Disclose

#### PURPOSE

Mammograms contain highly predictive biomarkers of future breast cancer risk, which can be identified by deep learning (DL) risk stratification models. Traditional risk assessment models have demonstrated improved performance with the inclusion of genetic risk variants. The purpose of this study is to assess the performance of an image-only DL model risk score with the addition of polygenic risk scores (PRS).

#### METHODS AND MATERIALS

This nested case-control study included participants undergoing routine bilateral 2D full field digital screening mammography across the US between 01/2001-01/2017, as part of the prospective Nurses' Health Study (NHSII). NHSII was established in 1989 and followed 116,429 female registered nurses aged 25-42 years over time with biennial questionnaires about diseases and health-related topics. DL and Gail five-year models were used to assess risk. PRS were calculated using 67 single nucleotide polymorphisms. Participants with a diagnosis of cancer within one month of mammogram were excluded. Patient demographics, mammograms, PRS, and cancer outcomes were collected as part of NHSII. DL and Gail model performance with and without PRS were compared using areas under the receiver operating characteristic curve (AUCs) unconditional logistic regression models with DeLong test ( $p < 0.05$ ).

#### RESULTS

926 participants (350 cases of breast cancer, 576 controls) underwent screening mammography. 68 were had a diagnosis of breast cancer within one month of mammogram. 491, 67, and 54 were missing a PRS, Gail score, and DL score, respectively. 804 (268 cases, 536 controls) had DL score, 313 (110 cases, 203 controls) DL+PRS, 684 (220 cases, 464 controls) Gail score and 263 (94 cases, 169 controls) Gail+PRS. This resulted in a study population of 858 participants (282 cases, 576 controls). Mean age was 55.3y (SD 5.4y). All participants were White. 310 (36.1%) were pre-menopausal and 548 (63.8%) post-menopausal. 398 (46.3%) had non-dense and 457 (53.2%) had dense breasts. The AUC of DL model was 0.65 (95% CI: 0.61-0.70) vs 0.72 (95% CI 0.66-0.78) in DL+PRS ( $p < 0.05$ ). The AUC of Gail model was 0.50 (95% CI: 0.45-0.54) vs 0.68 (95% CI: 0.61-0.74) in Gail+PRS ( $p < 0.001$ ). The AUC of DL model was significantly higher than Gail model ( $p < 0.001$ ) however there was no evidence of a significant difference in DL+PRS vs Gail+PRS ( $p = 0.34$ ).

#### CONCLUSION

A screening mammography DL breast cancer risk assessment model has high risk discriminatory accuracy which can be improved with the addition of PRS.

#### CLINICAL RELEVANCE/APPLICATION

A DL image-only risk model derived automatically at the time of screening mammography, can be improved with genetic information. Identification of high-risk patients by DL model could assist in triaging women for genetic testing.

### Performance of a Deep Learning Image Based 5-year Breast Cancer Risk Model Developed Across Global Imaging Centers that Provides a Percent Probability Output for Use in Existing Clinical Workflows and Decision Making

Monday, Nov. 27 8:00AM - 9:00AM Room: E352

Christiane K. Kuhl, MD, PhD (*Presenter*) Advisory Board, Guerbet SA; Speaker, Bracco Group; Speaker, Bayer AG

#### PURPOSE

To train, validate, test, and calibrate a deep learning, image-based five-year breast cancer risk prediction model in a multi-center international data consortium.

#### METHODS AND MATERIALS

This retrospective, multi-center international study included 318,101 consecutive bilateral 2D full field digital screening mammograms obtained from 129,498 patients between January 2007 and December 2016, after excluding exams that lacked five-year follow up. Test datasets, held out of model development, included 46,104 exams from Europe and the U.S., along with all 5,888 exams from South America. Patient demographics including age and race/ethnicity were retrieved from electronic medical records and cancer outcomes were obtained from local tumor registries. We leveraged a deep convolutional neural network using federated learning to create the DL model, which was trained to predict the development of breast cancer within five years of the mammogram, based only on the four standard mammography views (RCC, LCC, RMLO and LMLO). A calibration algorithm was used to create percent probabilities of future cancer from the DL score. Model performance on each center's held-out test data sets was estimated using areas under the receiver operating characteristic curve (AUCs) with 95% CIs. To assess calibration, held-out test sets were combined and segmented into five equally sized bins based on increasing predicted risk, and used to generate observed-to-expected ratios (O/E ratios) with 95% CIs.

#### RESULTS

We found point estimate AUCs consistently at or above 0.75 across centers. AUC by center: United States 0.75 [95% CI 0.74, 0.77] (n = 30,335); Europe 0.80 [95% CI 0.78, 0.82] (n = 15,769); and South America 0.80 [95% CI 0.77, 0.82] (n = 5,888). Observed-to-expected ratios overall and for spectrum of predicted low- to high-risk bins demonstrated strong calibration of the model with future cancer occurrence: overall 1.00 [95% CI 0.95, 1.06] (n = 52,981); first bin 1.01 [95% CI 0.76, 1.29] (n = 10,597), second bin 0.80 [95% CI 0.64, 0.98] (n = 10,596), third bin 1.04 [95% CI 0.90, 1.20] (n = 10,595), fourth bin 0.99 [95% CI 0.88, 1.11] (n = 10,596), fifth bin 1.03 [95% CI 0.96, 1.10] (n = 10,597).

#### CONCLUSION

A deep learning model trained and calibrated on an international mammography screening consortium data resource, based on the screening mammogram alone, provides strong predictive accuracy (AUC of 0.75-0.80) and is well calibrated for use in current standard of care clinical workflows that rely on five-year breast cancer risk predictions.

#### CLINICAL RELEVANCE/APPLICATION

A deep learning breast cancer risk model can be calibrated to provide five-year risk estimates to support more personalized screening and risk reduction interventions as recommended by clinical practice guidelines.

M1-SSBR03-7

### Using Density-Specific Calibration of AI Thresholds in a Double-Reader Setting to Achieve Equal Sensitivity for Women With High Mammographic Density

Monday, Nov. 27 8:00AM - 9:00AM Room: E352

Haiko Schurz, BSc, PhD (*Presenter*) Nothing to Disclose

#### PURPOSE

Higher mammographic density, BIRADS category C and D, is associated with lower radiologist sensitivity and increased risk of breast cancer. Artificial Intelligence Computer-Aided Detection (AI CAD) generates a continuous score translated to a normal/abnormal decision by thresholding. In this study, we explore whether the lower radiologist sensitivity could be counteracted by lowering the AI threshold for high density mammograms.

#### METHODS AND MATERIALS

The Swedish platform for Validation of AI in Breast imaging (VAI-B) with mammograms from 2008-2021 was used. A three-year follow-up period with biopsy-verification defined the reference standard of breast cancer or healthy. Mammograms were processed by AI CAD (Lunit, South Korea) to produce a continuous abnormality score and a density class. We determined the sensitivity of the radiologist double reading for each density category. We then combined single radiologist assessment and AI calibrated to maintain sensitivity, first, overall, for the entire dataset and, second, re-calibrated to enforce the same sensitivity for density C and D as for density B. Finally, we compare the performance between the radiologist double-reading with single reader plus AI calibrated on overall-sensitivity, and with single reader plus AI calibrated to maintain sensitivity for density C and D.

#### RESULTS

Overall, 38529 (upscaled to 972522) screening mammograms from 28580 healthy and 5773 women diagnosed with cancer were included in this study. The radiologist's double reading sensitivity was 52.8% overall and 63.4%, 56.4%, 48.6% 43.8% for density A, B, C and D respectively. Radiologist double-reading had 16.3 false positives per detected cancer (FP/C). Simulating double-reading by AI and one radiologist, calibrated to maintain overall sensitivity without taking density into account, reduced FP/C by 24.4% to 11.5. After re-calibrating to enforce that density B sensitivity (56.4%) was maintained for density C and D, the cancers detected increased by 7.5%, while the FP/C of 14.7 showed a decrease of 9.7% compared to radiologist double-reading and an increase of 19.5% compared to the density-ignorant AI workflow.

#### CONCLUSION

Calibrating the AI threshold separately for each density category to ensure having the same sensitivity for women with density C and D as for with density B is feasible. Density-specific calibration would equalize sensitivity between density B, C and D, through a 7.5% increase in cancer detection at the cost of around 20% increase in false positives per cancer.

#### CLINICAL RELEVANCE/APPLICATION

Implementing AI CAD systems with density-specific calibration could improve fairness of the screening system giving women with higher mammographic density an equal chance of screen-detection.

### Breast Imaging (CEM in Screening and Diagnosis)

Monday, Nov. 27 8:00AM - 9:00AM Room: E351

Maxine S. Jochelson, MD (*Moderator*) Speaker, General Electric Company  
Jordana Phillips, MD (*Moderator*) Research Grant, General Electric Company; Consultant, General Electric Company; Consultant, Hologic, Inc  
Paola Clauser, MD, PhD (*Moderator*) Speaker, Siemens AG

#### Sub-Events

#### **M1-SSBR04-1 Contrast Enhanced Mammography Screening for Women with Extremely Dense Breasts**

Noam Nissan, MD, PhD (*Presenter*) Nothing to Disclose

#### **PURPOSE**

To evaluate the diagnostic performance of contrast-enhanced mammography (CEM) for breast cancer screening in women with extremely dense breasts.

#### **METHODS AND MATERIALS**

This IRB-approved retrospective single center study included screening CEMs reporting extremely dense breast composition, performed between December 2012 and March 2022. Electronic medical records were reviewed for demographic, radiological and clinical characteristics. Sensitivity, specificity, negative and positive predictive value (NPV and PPV, respectively) were calculated, including PPV1 for positive screening mammograms (BI-RADS 0,4 and 5) and PPV3 for biopsies performed.

#### **RESULTS**

1300 screening CEMs were performed among 609 women with extremely dense breasts. Mean age was 49.9 years  $\pm$  9.4 (standard deviation). 114 (18.7%) had a family history of breast cancer in a first-degree relative younger than 50 years, and 235 (38.6%) had a personal history of breast cancer. The final BI-RADS score was 1 or 2 in 1137 (87.5%) women, BI-RADS 3 in 98 (7.5%) women, and BI-RADS 4 or 5 in 65 (5.0%) patients. Overall, 15 cancers were diagnosed (cancer detection-rate, 11.5 per 1000). At least 1-year follow up was available for 1265 exams. There were two interval cancers. Sensitivity was 29.4% (5/17) on the low-energy images compared with 88.2% (15/17) for the entire study (low-energy and contrast images) ( $p < 0.001$ ). PPV1 was 6.6% (15/227), and PPV3 was 23.4% (15/64). Specificity was 87.7% (1108/1263) and NPV was 99.8% (1108/1110). Contrast-reaction was observed in 0.5% of examinations (7/1300) experienced, all mild.

#### **CONCLUSION**

CEM detects mammographically-occult cancers in women with extremely dense breast tissue while maintaining high diagnostic accuracy.

#### **CLINICAL RELEVANCE/APPLICATION**

CEM has the potential to serve as a supplementary screening modality for women with extremely dense breasts at increased risk for developing breast cancer.

#### **M1-SSBR04-2 A Large-Scale Single Center Evaluation of Contrast Enhanced Mammography (CEM) In the Pre-operative Staging of Breast Cancer**

Chiara Bellini, MD (*Presenter*) Nothing to Disclose

#### **PURPOSE**

To assess the efficacy of CEM in the pre-operative staging in patients with biopsy-proven Breast Cancer.

## METHODS AND MATERIALS

Four radiologists reviewed 524 Contrast Enhanced Mammography (CEM) exams conducted at our center between 2017 and 2020. All CEMs were pre-operative staging exams of 525 malignant lesions. Our gold standard was the final histology after surgery. Based on CEMs results, the surgical plan made on conventional imaging (CI) was either confirmed or changed and each exam has been catalogued as either True Negative (TN), True Positive (TP), False Negative (FN) or False Positive (FP). Patients were subdivided according to breast density, lesion's palpability, enhancing behavior in CEM. Sensitivity, specificity, positive (PPV) and negative (NPV) predictive values of CEM in each different group were calculated.

## RESULTS

In 226/525 cases, CEM showed at least one additional lesion: 50 resulted as B5 after biopsy and 45 as malignant at the final histology (TP). 124 were negative either at second-look, biopsy or final histology (TN). 6 CEMs were FP, because CEM overestimated the extension of the disease and one FN, when CEM underestimated it. On 299/525 CEMs, no additional lesions were detected: in 280/299, final histology confirmed the absence of other lesions (TN); in 10/299, the enhancement area matched the extension of the IL at the final histology (TP); in 9/299 there was a mismatch between what CEM and final histology showed due to an underestimation (5 FN) or overestimation (4 FP) of CEM disease extension. In the whole population, 394 TN, 108 TP, 6 FN, 17 FP were recorded. CEM changed the surgical plan in 22.5% of the cases (118/525). Subsequently, final histology confirmed the absence of other lesions (TN) or the presence of additional ones emerged in CEM (TP) and the real extension of the IL leading us to categorize CEMs as FP, when it overestimated the extension of the IL and FN when CEM underestimated it. Overall CEM sensitivity was 94.8%, specificity 95.9%, PPV 86.4% and NPV 98.5%; the accuracy was 95.6% and AUC of ROC curve was 0.953. The statistical analysis showed a higher diagnostic performance in patients with palpable lesions ( $p: 0.0022$ ).

## CONCLUSION

CEM changed the surgical plan in 22.5% of our series, proving to be an accurate exam in the presurgical staging of breast cancer (95.6 %), especially for palpable lesions ( $p: 0.0022$ ). It had high sensitivity, specificity, NPV and PPV (respectively 94.8%, 95.9%, 98.5% and 86.4%). Since its diagnostic performances, CEM stands as an efficient asset, essential in the surgical planning.

## CLINICAL RELEVANCE/APPLICATION

CEM diagnostic performances support its reliability in the presurgical staging setting, for a lesion-tailored management, leading to the best surgical plan, avoiding over- or undertreatment.

## **M1- SSBRO4-3 A Prospective Study of Supplemental Screening with Contrast Enhanced Mammography in Women with Elevated Risk of Breast Cancer: Results of the Prevalence Round**

Bhavika N. Patel, MD (*Presenter*) Research support, GRAIL, Inc; Research Grant, Hologic, Inc

## PURPOSE

To prospectively investigate the role of supplemental screening CEM to detect cancer in high-risk patients.

## METHODS AND MATERIALS

This prospective, single institution, IRB approved observational study was conducted in asymptomatic patients 35 years of age or older who were deemed at elevated risk of breast cancer, defined as IBIS v.8.0 lifetime risk of breast cancer score >15% or a prior personal history of breast cancer. Enrollment was from January 2019 to April 2020. Patients with negative (BI-RADS 1 or 2) conventional 2D/3D screening mammography (MG) within 6 months were invited to undergo supplemental CEM screening. Patients with prior screening molecular breast imaging, ultrasound or MR within 12 months were excluded from study participation. Outcome measures were the incremental cancer detection rate, sensitivity, specificity, positive predictive value, and negative predictive value of CEM. Secondary outcomes included biological profiles of MG-occult, CEM detected cancers.

## RESULTS

A total of 461 patients were enrolled in this prospective study over a 16-month period. Average age of the participants was 56.4 years  $\pm$  9.5 (standard deviation); 409 (89%) were dense and 52 (11%) non-dense. Forty-four lesions were identified on CEM in 36 patients. Biopsy revealed benign changes in 22 patients (22/36, 61%), 4 patients with high-risk lesions (4/36, 11%), and 11 patients with breast cancer (11/36, 31%). Fourteen cancers were diagnosed during CEM screening study in 11 patients; for an overall supplemental cancer detection rate of 21.7 per 1000 patients, 95% CI (10.4, 39.5). CEM imaging screening offered high specificity (0.922, 95% CI: 0.897, 0.947), high NPV (0.998, 95% CI: 0.993, 1.000), moderate PPV1 (0.239, 95% CI: 0.116, 0.362), moderate PPV3 (0.297, 95% CI: 0.150, 0.445), and high sensitivity (0.917, 95% CI: 0.760, 1.000). At least 1 year follow up was available on all patients: 1 developed an interval cancer, 430 cases with negative follow-up MG, 31 with clinical history of no interval breast cancer.

## CONCLUSION

This pilot trial demonstrates a supplemental cancer detection rate of 21.7 per 1000 during prevalence round of CEM screening in patients at an elevated risk for breast cancer, comparable to results reported for high-risk surveillance MR imaging. Larger, multi institutional, multi-year high-risk CEM trials are needed for those patients who are not otherwise undergoing regular supplemental surveillance MR imaging.

## CLINICAL RELEVANCE/APPLICATION

CEM had a supplemental cancer detection rate of 21.7 per 1000 patients and had high specificity (0.922) and high sensitivity (0.917). These findings are comparable to results reported for high-risk surveillance MR imaging.

### M1-SSBR04-4 **Screening Contrast-Enhanced Mammography as an Alternative to MRI (SCEMAM)**

Wendie A. Berg, MD, PhD (*Presenter*) Institutional Research Grant, Koios Medical, Inc

## PURPOSE

To evaluate the impact of contrast-enhanced mammography (CEM) on cancer detection, false-positive recalls (FPR), and positive predictive value of biopsies (PPV3) when added to tomosynthesis (DBT) in women eligible for screening MRI without a personal history of breast cancer (PHBC).

## METHODS AND MATERIALS

From 3/15/2021 - 12/2/2022, 615 eligible women consented to an IRB-approved, HIPAA-compliant protocol to have a single screening CEM examination with clinical DBT. Nine of 615 (1.5%) lacked IV access. There were two equipment failures and one each vasovagal reaction, low initial blood pressure, and contrast reaction (rash) prior to obtaining CEM images. A total of 4/606 (0.7%) women receiving contrast developed rash or hives within 24 hours of the examination. Two radiologists interpreted each study: R1 reviewed DBT first and R2, CEM. We assessed incremental cancer detection rate (ICDR), cancer type/nodal status, FPR rates, PPV3 of biopsies performed, and interval cancer rate. At least one-year follow-up or cancer diagnosis is available for 373 participants to date.

## RESULTS

601 women age 30-75 years, median 56, completed CEM. Twelve women (2.0%) were diagnosed with 16 sites of breast cancer. Of the 12 women with cancer, 5 (42%) were detected by R1 on DBT (and one was seen on DBT by R2, also seen on CEM by both observers). Another 6 women (ICDR 10.0/1000, 95%CI 3.3, 18.3) were identified only on CEM (one seen only by R2). Of the six women with cancer seen only on CEM, five had invasive disease, all node negative, median size 0.7 cm (range 0.4-1.1 cm); three were ILC. Two women with calcifications due to DCIS were identified only on low-energy images and DBT (one intermediate grade, ER/PR+, and one high grade DCIS, ER/PR-); no cancers were seen only on DBT. FPR of combined DBT+CEM was 127/589 (21.6%) for R1, an increase of 13.3% over DBT alone at 49/589 (8.3%, P<.001). Of the 601 women, 54 (9.0%) were recommended for biopsy based only on CEM by R1, and 6/54 (11.1%) women were diagnosed with cancer. At the lesion level, PPV3 was 7/61 (11.5%) for biopsies prompted only by CEM. There have been no interval cancers to date.

## CONCLUSION

We observed significantly increased detection of early-stage breast cancer using CEM after DBT. In this elevated risk population without PHBC, CEM produced a large number of false-positive recalls and showed relatively low PPV3 of biopsies performed.

## CLINICAL RELEVANCE/APPLICATION

In women eligible for MRI screening, CEM is a reasonable alternative, but women need to be informed of the substantial risk of false-positive recalls for additional testing and often biopsy.

### M1-SSBR04-5 **Shedding Light on Shadows: Initial Experience of First Implementation of Contrast-Enhanced Mammography in a Lower Income Country**

Zohaib M. Mallick, MBBS (*Presenter*) Nothing to Disclose

## PURPOSE

To report our initial experience and challenges with contrast-enhanced mammograms (CEM) in a low-income country and to describe the enhancement patterns of breast lesions on CEM.

## METHODS AND MATERIALS

A retrospective review of 23 CEM examinations performed at our institution between January 1, 2022 and March 31, 2023. The demographic information, clinical indications, previous mammogram findings, previous ultrasound findings, and enhancement patterns and morphology of the lesions and the histopathologic diagnosis were obtained from the patient's electronic health record.

## RESULTS

CEM reduced cost by more than 70% when compared to MRI. However, the major challenges faced in the beginning of launch of the service were lack of skilled professionals and lack of awareness among clinicians. This study included 23 patients (mean age of 49 years) who underwent CEM. Nineteen patients showed contrast enhancement and underwent biopsy, and all were found to be malignant. Rest of the four cases appeared to be benign on ultrasound. Conventional mammography missed the majority of these malignant cases (13 out of 19). Fifteen cases had mass-like enhancement, with the majority of them having ill-defined or spiculated morphology. Invasive ductal carcinoma (n=14) was the most common type of cancer with the majority of cases being grade II. The most common indication was preoperative staging (n=10), followed by treatment response evaluation (n=4).

## CONCLUSION

CEM is feasible in lower income countries, and a valuable diagnostic tool for detecting and characterising breast lesions, particularly in high-risk cases.

## CLINICAL RELEVANCE/APPLICATION

"Shedding Light on Shadows" presents the initial experiences and challenges faced during the first implementation of contrast-enhanced mammography (CEM) in a lower-income country. The study underscores the potential benefits of CEM in enhancing breast cancer detection rates and overall patient care, while also addressing the specific barriers and limitations that may be unique to resource-limited settings. By sharing these insights, the study aims to provide valuable information for other lower-income countries considering the adoption of this advanced diagnostic tool, ultimately contributing to improved global healthcare outcomes in the fight against breast cancer.

## M1-SSBR04-6 CEM in Evaluation of Suspicious Microcalcifications to Reduce Unnecessary Biopsies

Davide Pupo, MD (*Presenter*) Nothing to Disclose

## PURPOSE

Contrast-enhanced mammography (CEM) combines conventional mammography with iodinated contrast to improve cancer detection. The aim of the study was to evaluate CEM diagnostic performance in predicting the malignancy of suspicious microcalcification, so that the number of biopsies for benign lesions could be reduced.

## METHODS AND MATERIALS

The enrollment period for this study was from January 2021 to January 2022. 251 patients (average age 54.76) with suspicious microcalcification in conventional mammography were reviewed and analyzed by two radiologists in this preliminary retrospective study. We excluded 149 cases of patients who had undergone biopsy procedures before CEM and patients whose histological examinations were not available. All the lesions were evaluated using BIRADS criteria, with 4-categories qualitative scale based on enhancement intensity. Histological results were considered the gold standard.

## RESULTS

On 102 suspicious microcalcifications, 64 showed contrast enhancement (CE) and underwent biopsy: 28/64 were malignant lesions (43.75%) and 36/64 were benign ones (56.25%). Instead, 38/102 suspicious microcalcifications didn't show any CE in CEM, 18/38 underwent biopsy because of their high-suspect morphology. On the other hand, 27/38, underwent a radiological follow-up, performed at 12, 18, 24 and 32 months (av. 18 months). None of them upgraded to malignancies. Between all suspicious microcalcifications that didn't show CE, just one of them was a malignant lesion (DCIS), the only one false negative in our study. We considered lesions resulting B2 or B3 after biopsy as true negative if they didn't have any CE and as false positive if they showed enhancement. Instead, we considered lesions resulting B5 after biopsy as true positive if they showed enhancement and false negative if they didn't. The sensitivity, specificity, positive and negative predictive values (PPV and NPV), and accuracy of CEM were 96.5%, 50.7%, 43.75%, 97.4% and 63.7%, respectively.

## CONCLUSION

These preliminary results, if confirmed on a large scale, suggest that the enhancement of suspicious microcalcifications in CEM has high sensitivity in predicting malignancy (96.5%); on the other hand, due to its high NPV (97.4%), if suspicious microcalcifications don't show enhancement, they could be candidate to radiological follow-up, reducing number of biopsies for benign lesions and patients' distress.

## CLINICAL RELEVANCE/APPLICATION

If suspicious microcalcifications don't show enhancement in CEM, they have a low risk of malignancy (NPV 97.4%), so they could be candidate to radiological follow-up, reducing biopsies for benign lesions and patients' distress.

M1-SSBR04-1

### Contrast Enhanced Mammography Screening for Women with Extremely Dense Breasts

Monday, Nov. 27 8:00AM - 9:00AM Room: E351

Noam Nissan, MD, PhD (*Presenter*) Nothing to Disclose

#### PURPOSE

To evaluate the diagnostic performance of contrast-enhanced mammography (CEM) for breast cancer screening in women with extremely dense breasts.

#### METHODS AND MATERIALS

This IRB-approved retrospective single center study included screening CEMs reporting extremely dense breast composition, performed between December 2012 and March 2022. Electronic medical records were reviewed for demographic, radiological and clinical characteristics. Sensitivity, specificity, negative and positive predictive value (NPV and PPV, respectively) were calculated, including PPV1 for positive screening mammograms (BI-RADS 0,4 and 5) and PPV3 for biopsies performed.

#### RESULTS

1300 screening CEMs were performed among 609 women with extremely dense breasts. Mean age was 49.9 years  $\pm$  9.4 (standard deviation). 114 (18.7%) had a family history of breast cancer in a first-degree relative younger than 50 years, and 235 (38.6%) had a personal history of breast cancer. The final BI-RADS score was 1 or 2 in 1137 (87.5%) women, BI-RADS 3 in 98 (7.5%) women, and BI-RADS 4 or 5 in 65 (5.0%) patients. Overall, 15 cancers were diagnosed (cancer detection-rate, 11.5 per 1000). At least 1-year follow up was available for 1265 exams. There were two interval cancers. Sensitivity was 29.4% (5/17) on the low-energy images compared with 88.2% (15/17) for the entire study (low-energy and contrast images) ( $p < 0.001$ ). PPV1 was 6.6% (15/227), and PPV3 was 23.4% (15/64). Specificity was 87.7% (1108/1263) and NPV was 99.8% (1108/1110). Contrast-reaction was observed in 0.5% of examinations (7/1300) experienced, all mild.

#### CONCLUSION

CEM detects mammographically-occult cancers in women with extremely dense breast tissue while maintaining high diagnostic accuracy.

#### CLINICAL RELEVANCE/APPLICATION

CEM has the potential to serve as a supplementary screening modality for women with extremely dense breasts at increased risk for developing breast cancer.

M1-SSBR04-2

### A Large-Scale Single Center Evaluation of Contrast Enhanced Mammography (CEM) In the Pre-operative Staging of Breast Cancer

Monday, Nov. 27 8:00AM - 9:00AM Room: E351

Chiara Bellini, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

To assess the efficacy of CEM in the pre-operative staging in patients with biopsy-proven Breast Cancer.

#### METHODS AND MATERIALS

Four radiologists reviewed 524 Contrast Enhanced Mammography (CEM) exams conducted at our center between 2017 and 2020. All CEMs were pre-operative staging exams of 525 malignant lesions. Our gold standard was the final histology after surgery. Based on CEMs results, the surgical plan made on conventional imaging (CI) was either confirmed or changed and each exam has been catalogued as either True Negative (TN), True Positive (TP), False Negative (FN) or False Positive (FP). Patients were subdivided according to breast density, lesion's palpability, enhancing behavior in CEM. Sensitivity, specificity, positive (PPV) and negative (NPV) predictive values of CEM in each different group were calculated.

#### RESULTS

In 226/525 cases, CEM showed at least one additional lesion: 50 resulted as B5 after biopsy and 45 as malignant at the final histology (TP). 124 were negative either at second-look, biopsy or final histology (TN). 6 CEMs were FP, because CEM overestimated the extension of the disease and one FN, when CEM underestimated it. On 299/525 CEMs, no additional lesions were detected: in 280/299, final histology confirmed the absence of other lesions (TN); in 10/299, the enhancement area matched the extension of the IL at the final histology (TP); in 9/299 there was a mismatch between what CEM and final histology showed due to an underestimation (5 FN) or overestimation (4 FP) of CEM disease extension. In the whole population, 394 TN, 108 TP, 6 FN, 17 FP were recorded. CEM changed the surgical plan in 22.5% of the cases (118/525). Subsequently, final histology confirmed the absence of other lesions (TN) or the presence of additional ones emerged in CEM (TP) and the real extension of the IL leading us to categorize CEMs as FP, when it overestimated the extension of the IL and FN when CEM underestimated it. Overall CEM sensitivity was 94.8%, specificity 95.9%, PPV 86.4% and NPV 98.5%; the accuracy was 95.6% and AUC of ROC curve was 0.953. The statistical analysis showed a higher diagnostic performance in patients with palpable lesions ( $p: 0.0022$ ).

#### CONCLUSION

CEM changed the surgical plan in 22.5% of our series, proving to be an accurate exam in the presurgical staging of breast cancer (95.6 %), especially for palpable lesions ( $p: 0.0022$ ). It had high sensitivity, specificity, NPV and PPV (respectively 94.8%, 95.9%, 98.5% and 86.4%). Since its diagnostic performances, CEM stands as an efficient asset, essential in the surgical planning.

#### CLINICAL RELEVANCE/APPLICATION

CEM diagnostic performances support its reliability in the presurgical staging setting, for a lesion-tailored management, leading to the best surgical plan, avoiding over- or undertreatment.

M1-SSBR04-3

### **A Prospective Study of Supplemental Screening with Contrast Enhanced Mammography in Women with Elevated Risk of Breast Cancer: Results of the Prevalence Round**

Monday, Nov. 27 8:00AM - 9:00AM Room: E351

Bhavika N. Patel, MD (*Presenter*) Research support, GRAIL, Inc; Research Grant, Hologic, Inc

#### **PURPOSE**

To prospectively investigate the role of supplemental screening CEM to detect cancer in high-risk patients.

#### **METHODS AND MATERIALS**

This prospective, single institution, IRB approved observational study was conducted in asymptomatic patients 35 years of age or older who were deemed at elevated risk of breast cancer, defined as IBIS v.8.0 lifetime risk of breast cancer score >15% or a prior personal history of breast cancer. Enrollment was from January 2019 to April 2020. Patients with negative (BI-RADS 1 or 2) conventional 2D/3D screening mammography (MG) within 6 months were invited to undergo supplemental CEM screening. Patients with prior screening molecular breast imaging, ultrasound or MR within 12 months were excluded from study participation. Outcome measures were the incremental cancer detection rate, sensitivity, specificity, positive predictive value, and negative predictive value of CEM. Secondary outcomes included biological profiles of MG-occult, CEM detected cancers.

#### **RESULTS**

A total of 461 patients were enrolled in this prospective study over a 16-month period. Average age of the participants was 56.4 years  $\pm$  9.5 (standard deviation); 409 (89%) were dense and 52 (11%) non-dense. Forty-four lesions were identified on CEM in 36 patients. Biopsy revealed benign changes in 22 patients (22/36, 61%), 4 patients with high-risk lesions (4/36, 11%), and 11 patients with breast cancer (11/36, 31%). Fourteen cancers were diagnosed during CEM screening study in 11 patients; for an overall supplemental cancer detection rate of 21.7 per 1000 patients, 95% CI (10.4, 39.5). CEM imaging screening offered high specificity (0.922, 95% CI: 0.897, 0.947), high NPV (0.998, 95% CI: 0.993, 1.000), moderate PPV1 (0.239, 95% CI: 0.116, 0.362), moderate PPV3 (0.297, 95% CI: 0.150, 0.445), and high sensitivity (0.917, 95% CI: 0.760, 1.000). At least 1 year follow up was available on all patients: 1 developed an interval cancer, 430 cases with negative follow-up MG, 31 with clinical history of no interval breast cancer.

#### **CONCLUSION**

This pilot trial demonstrates a supplemental cancer detection rate of 21.7 per 1000 during prevalence round of CEM screening in patients at an elevated risk for breast cancer, comparable to results reported for high-risk surveillance MR imaging. Larger, multi institutional, multi-year high-risk CEM trials are needed for those patients who are not otherwise undergoing regular supplemental surveillance MR imaging.

#### **CLINICAL RELEVANCE/APPLICATION**

CEM had a supplemental cancer detection rate of 21.7 per 1000 patients and had high specificity (0.922) and high sensitivity (0.917). These findings are comparable to results reported for high-risk surveillance MR imaging.

### Screening Contrast-Enhanced Mammography as an Alternative to MRI (SCEMAM)

Monday, Nov. 27 8:00AM - 9:00AM Room: E351

Wendie A. Berg, MD, PhD (*Presenter*) Institutional Research Grant, Koios Medical, Inc

#### PURPOSE

To evaluate the impact of contrast-enhanced mammography (CEM) on cancer detection, false-positive recalls (FPR), and positive predictive value of biopsies (PPV3) when added to tomosynthesis (DBT) in women eligible for screening MRI without a personal history of breast cancer (PHBC).

#### METHODS AND MATERIALS

From 3/15/2021 - 12/2/2022, 615 eligible women consented to an IRB-approved, HIPAA-compliant protocol to have a single screening CEM examination with clinical DBT. Nine of 615 (1.5%) lacked IV access. There were two equipment failures and one each vasovagal reaction, low initial blood pressure, and contrast reaction (rash) prior to obtaining CEM images. A total of 4/606 (0.7%) women receiving contrast developed rash or hives within 24 hours of the examination. Two radiologists interpreted each study: R1 reviewed DBT first and R2, CEM. We assessed incremental cancer detection rate (ICDR), cancer type/nodal status, FPR rates, PPV3 of biopsies performed, and interval cancer rate. At least one-year follow-up or cancer diagnosis is available for 373 participants to date.

#### RESULTS

601 women age 30-75 years, median 56, completed CEM. Twelve women (2.0%) were diagnosed with 16 sites of breast cancer. Of the 12 women with cancer, 5 (42%) were detected by R1 on DBT (and one was seen on DBT by R2, also seen on CEM by both observers). Another 6 women (ICDR 10.0/1000, 95%CI 3.3, 18.3) were identified only on CEM (one seen only by R2). Of the six women with cancer seen only on CEM, five had invasive disease, all node negative, median size 0.7 cm (range 0.4-1.1 cm); three were ILC. Two women with calcifications due to DCIS were identified only on low-energy images and DBT (one intermediate grade, ER/PR+, and one high grade DCIS, ER/PR-); no cancers were seen only on DBT. FPR of combined DBT+CEM was 127/589 (21.6%) for R1, an increase of 13.3% over DBT alone at 49/589 (8.3%,  $P < .001$ ). Of the 601 women, 54 (9.0%) were recommended for biopsy based only on CEM by R1, and 6/54 (11.1%) women were diagnosed with cancer. At the lesion level, PPV3 was 7/61 (11.5%) for biopsies prompted only by CEM. There have been no interval cancers to date.

#### CONCLUSION

We observed significantly increased detection of early-stage breast cancer using CEM after DBT. In this elevated risk population without PHBC, CEM produced a large number of false-positive recalls and showed relatively low PPV3 of biopsies performed.

#### CLINICAL RELEVANCE/APPLICATION

In women eligible for MRI screening, CEM is a reasonable alternative, but women need to be informed of the substantial risk of false-positive recalls for additional testing and often biopsy.

### Shedding Light on Shadows: Initial Experience of First Implementation of Contrast-Enhanced Mammography in a Lower Income Country

Monday, Nov. 27 8:00AM - 9:00AM Room: E351

Zohaib M. Mallick, MBBS (*Presenter*) Nothing to Disclose

#### PURPOSE

To report our initial experience and challenges with contrast-enhanced mammograms (CEM) in a low-income country and to describe the enhancement patterns of breast lesions on CEM.

#### METHODS AND MATERIALS

A retrospective review of 23 CEM examinations performed at our institution between January 1, 2022 and March 31, 2023. The demographic information, clinical indications, previous mammogram findings, previous ultrasound findings, and enhancement patterns and morphology of the lesions and the histopathologic diagnosis were obtained from the patient's electronic health record.

#### RESULTS

CEM reduced cost by more than 70% when compared to MRI. However, the major challenges faced in the beginning of launch of the service were lack of skilled professionals and lack of awareness among clinicians. This study included 23 patients (mean age of 49 years) who underwent CEM. Nineteen patients showed contrast enhancement and underwent biopsy, and all were found to be malignant. Rest of the four cases appeared to be benign on ultrasound. Conventional mammography missed the majority of these malignant cases (13 out of 19). Fifteen cases had mass-like enhancement, with the majority of them having ill-defined or spiculated morphology. Invasive ductal carcinoma (n=14) was the most common type of cancer with the majority of cases being grade II. The most common indication was preoperative staging (n=10), followed by treatment response evaluation (n=4).

#### CONCLUSION

CEM is feasible in lower income countries, and a valuable diagnostic tool for detecting and characterising breast lesions, particularly in high-risk cases.

#### CLINICAL RELEVANCE/APPLICATION

"Shedding Light on Shadows" presents the initial experiences and challenges faced during the first implementation of contrast-enhanced mammography (CEM) in a lower-income country. The study underscores the potential benefits of CEM in enhancing breast cancer detection rates and overall patient care, while also addressing the specific barriers and limitations that may be unique to resource-limited settings. By sharing these insights, the study aims to provide valuable information for other lower-income countries considering the adoption of this advanced diagnostic tool, ultimately contributing to improved global healthcare outcomes in the fight against breast cancer.

### CEM in Evaluation of Suspicious Microcalcifications to Reduce Unnecessary Biopsies

Monday, Nov. 27 8:00AM - 9:00AM Room: E351

Davide Pupo, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

Contrast-enhanced mammography (CEM) combines conventional mammography with iodinated contrast to improve cancer detection. The aim of the study was to evaluate CEM diagnostic performance in predicting the malignancy of suspicious microcalcification, so that the number of biopsies for benign lesions could be reduced.

#### METHODS AND MATERIALS

The enrollment period for this study was from January 2021 to January 2022. 251 patients (average age 54.76) with suspicious microcalcification in conventional mammography were reviewed and analyzed by two radiologists in this preliminary retrospective study. We excluded 149 cases of patients who had undergone biopsy procedures before CEM and patients whose histological examinations were not available. All the lesions were evaluated using BIRADS criteria, with 4-categories qualitative scale based on enhancement intensity. Histological results were considered the gold standard.

#### RESULTS

On 102 suspicious microcalcifications, 64 showed contrast enhancement (CE) and underwent biopsy: 28/64 were malignant lesions (43.75%) and 36/64 were benign ones (56.25%). Instead, 38/102 suspicious microcalcifications didn't show any CE in CEM, 18/38 underwent biopsy because of their high-suspect morphology. On the other hand, 27/38, underwent a radiological follow-up, performed at 12, 18, 24 and 32 months (av. 18 months). None of them upgraded to malignancies. Between all suspicious microcalcifications that didn't show CE, just one of them was a malignant lesion (DCIS), the only one false negative in our study. We considered lesions resulting B2 or B3 after biopsy as true negative if they didn't have any CE and as false positive if they showed enhancement. Instead, we considered lesions resulting B5 after biopsy as true positive if they showed enhancement and false negative if they didn't. The sensitivity, specificity, positive and negative predictive values (PPV and NPV), and accuracy of CEM were 96.5%, 50.7%, 43.75%, 97.4% and 63.7%, respectively.

#### CONCLUSION

These preliminary results, if confirmed on a large scale, suggest that the enhancement of suspicious microcalcifications in CEM has high sensitivity in predicting malignancy (96.5%); on the other hand, due to its high NPV (97.4%), if suspicious microcalcifications don't show enhancement, they could be candidate to radiological follow-up, reducing number of biopsies for benign lesions and patients' distress.

#### CLINICAL RELEVANCE/APPLICATION

If suspicious microcalcifications don't show enhancement in CEM, they have a low risk of malignancy (NPV 97.4%), so they could be candidate to radiological follow-up, reducing biopsies for benign lesions and patients' distress.

#### Sub-Events

#### **M1-SSCA03-1 Improved Detection of Small and Low-density Plaques in Virtual Non-iodine-based Coronary Artery Calcium Scoring on Photon-Counting Detector CT**

Nicola Fink, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

With improved multi-material separation, photon-counting detector (PCD)-CT allows to create virtual non-iodine (VNI) reconstructions for coronary artery calcium scoring (CACS) based on contrast-enhanced scans. VNI-CACS has been shown to outperform previous virtual non-contrast (VNC) images. However, previous studies focused on total scores. This study aimed to assess the impact of plaque size and density on the algorithm's performance and to provide recommendations regarding "safety net" reconstructions for an improved detection of subtle plaques.

#### METHODS AND MATERIALS

CACS was evaluated in phantoms simulating three chest diameters and containing nine calcifications with different sizes (5, 3, 1mm) and densities (800, 400, 200 mg/cm<sup>3</sup>), and in patients (n=63; 57.8±15.5 years; 58.7% male) who underwent true non-contrast (TNC) and contrast-enhanced cardiac PCD-CT. VNI images were reconstructed at different VMI (55-80keV) and quantum iterative reconstructions (QIR; strength 1-4). TNC scans at 70keV, QIR off served as reference. In vitro CACS was analyzed with standard CACS settings (3.0mm slices, kernel Qr36, threshold 130HU). In addition, the number of detected calcifications and CACS of small and low-density plaques were investigated using adjusted reconstructions (1.0mm, kernel Qr44, thresholds 120/110HU). Based on background Agatston scores of best performing settings, "safety net" reconstructions were defined and assessed in in vivo TNC plaques initially not detected by standard VNI reconstructions.

#### RESULTS

Correlation and agreement between standard CACSVNI and CACSTNC was higher in large/medium-sized and high/medium-density plaques than in low-density plaques (ICC=0.90, r>0.9 vs. ICC=0.20-0.48, r =0.47-0.56). Small plaques were not detectable using standard VNI. The highest detectability of calcifications was achieved using slice thickness 1.0mm, kernel Qr44, CACS thresholds 120/110HU, and QIR=2. Compared to standard VNI settings, using our proposed "safety net" reconstructions (55keV, QIR2; threshold 110HU) for in vivo CACS increased detectability of subtle plaques by 89.3% and improved correlation and agreement of CACSVNI with CACSTNC (ICC=0.51, r=0.60; with standard settings not detectable).

#### CONCLUSION

Compared to TNC-CACS, the performance of the VNI algorithm is limited for small and low-density plaques, which can be improved using "safety net" reconstructions. These should additionally be performed in patients with a standard CACS<sub>VNI</sub> of zero to identify missed plaques.

#### CLINICAL RELEVANCE/APPLICATION

The proposed "safety net" improves accurate cardiovascular risk assessment using VNI-based CACS, especially in patients who would otherwise be classified as false-negative due to missed subtle plaques.

#### **M1-SSCA03-2 Ultra High Resolution Photon Counting CT Results in Improved Spatial Accuracy during Simulated Coronary Motion**

Audrey Rich, MD (*Presenter*) Nothing to Disclose

## PURPOSE

Ultra high resolution photon counting CT (PCCT) has the potential for improved visualization of minute anatomic structures. Yet, increases in spatial resolution are susceptible to motion related image degradation. A major challenge in cardiac imaging is the intrinsic motion of the heart. Motion artifacts compromise image quality and the visualization of coronary anatomy and disease. The purpose of the study is to determine if the increased spatial accuracy of PCCT is preserved in moving structures, such as coronary arteries.

## METHODS AND MATERIALS

A dynamic cardiac phantom device simulated cardiac coronary motion by mechanically transferring device movement to a tungsten wire. Wire motion corresponded to different device rates, which equated to different cardiac rates. The tungsten wire was imaged while stationary and moving, using a coronary CT angiography protocol with sequential ECG triggered axial acquisition settings on a PCCT using a conventional reconstruction mode at 120kV with 0.6mm slice thickness and the Bv36u kernel. The moving wire was reimaged on the same PCCT system with the same protocol but using a prospectively triggered method on the ultra high resolution mode at 140kV with 0.2mm slice thickness using the Bv56u kernel. In each setting, images were acquired using a top gantry speed of 264m/s, 66ms temporal resolution, and 120x0.2mm collimation. Image reconstruction was performed using a 512 x 512 matrix and processed using ImageJ software. Images were compared using the full width at half maximum (FWHM) area of the point spread function as a numerical estimate of spatial accuracy.

## RESULTS

Using the standard acquisition mode, at a device rate of 70bpm, the point object images were degraded in shape and attenuation to different degrees during the motion cycle. The FWHM area corresponded to our visual assessment and ranged from 5.1mm<sup>2</sup> to 23.8mm<sup>2</sup>, depending on the time of image reconstruction. Conversely, using the UHR reconstructions, the best image reconstruction yielded a smaller point image with better definition than the best reconstruction from the standard stationary and dynamic resolution series. The FWHM area ranged from 0.8mm<sup>2</sup> to 5.9mm<sup>2</sup>.

## CONCLUSION

Object motion degraded image quality to variable degrees over the motion cycle. The UHR mode improves overall spatial accuracy at rest and during moving conditions when comparing the two settings that exist within photon counting.

## CLINICAL RELEVANCE/APPLICATION

High resolution photon counting CT improves spatial accuracy under dynamic conditions.

## M1-SSCA03-3 Coronary Stent Imaging in Photon Counting Computed Tomography: Assessability of In-Stent Stenoses

Jan Robert Kroger, MD (*Presenter*) Travel Support, Otsuka Holdings Co, Ltd;

## PURPOSE

To evaluate the assessment of in-stent stenosis in coronary artery stents in a phantom using photon counting computed tomography (PCCT) with standard resolution mode (SRM) and ultra-high-resolution mode (UHR) as well as different reconstruction kernels.

## METHODS AND MATERIALS

6 coronary artery stents (diameter 3 mm) were implanted in plastic tubes. Hypodense stenoses were implanted. Tubes were filled with contrast medium and examined using rotational angiography to define the ground-truth. For CT examinations tubes were filled with a solution of saline and contrast medium adjusted to measure 600 HU and were scanned at a PCCT (Naeotom Alpha, Siemens Healthineers) in SRM and UHR. Images were reconstructed using a standard vascular kernel (BV72c, e.g. UHRc) and an experimental kernel optimized for stent imaging (BV72o, e.g. SRMo). Analysis was performed by 5 readers, measuring lumen diameter inside the stent and residual lumen inside the stenosis and rating the assessability of the stenosis on a five-point Likert scale. One-way ANOVA or Friedman test were used for the comparison of multiple means as appropriate. Post-hoc testing with Bonferroni corrected p-values was performed in case of significant differences.

## RESULTS

The visible in-stent lumen averaged 0.27±0.49 mm in SRM, 1.37±0.55 mm in UHR (p<0.001). In UHRc, the visible lumen averaged 1.32±0.57 mm, and in UHRo it was 1.43±0.54 mm (p=0.033). The residual lumen was measured significantly more accurately in UHR than in SRM (mean SRM 0.11±0.19 mm vs. UHR 0.41±0.22 mm). The difference between UHRc and UHRo is also significant in favor of UHRo (UHRc 0.35±0.23 mm vs. UHRo 0.47±0.19 mm, corrected p=0.021). Compared to angiography, UHRo achieved the best classification of in-stent stenosis grade but still overestimated the stenosis grade. UHRo received the highest rating regarding the assessability of the stenosis (3.31±1.20). The difference between SRM and UHR and between UHRc and UHRo was significant (for both comparisons p<0.001).

## CONCLUSION

PCCT in UHR mode enables the evaluation of in-stent stenosis in small-diameter coronary artery stents in a phantom. The assessability of the stenosis can be further enhanced by optimizing image reconstruction kernels for stent imaging.

## CLINICAL RELEVANCE/APPLICATION

Coronary artery computed tomography plays a major role in the evaluation of coronary artery disease and PCCT with UHR might overcome limitations of standard CTA when examining patients with coronary stents.

### **M1-SSCA03-4 Pure Calcium Virtual Unenhanced Images from Photon-counting Coronary Angiography Provide Accurate Coronary Artery Calcium Scoring**

Nina Pauline Haag, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

Coronary artery calcium scoring (CACS) is an important predictor of morbidity in chronic coronary artery disease (CAD). CACS requires an unenhanced CT scan in addition to contrast-enhanced coronary CT angiography (cCTA). Photon counting CT (PCCT) provides a customized algorithm for the reconstruction of virtual unenhanced images from cCTA specifically for calcium scoring (PureCalcium, Siemens Healthineers). This study aimed to evaluate the accuracy of PureCalcium images derived from contrast-enhanced photon counting cCTA in comparison to unenhanced CACS images (uCACS).

#### METHODS AND MATERIALS

In this retrospective study, 128 patients receiving PCCT (Naeotom Alpha, syngo.CT VB50, Siemens Healthineers) with uCACS and cCTA for CAD between August 2022 and April 2023 were included. PureCalcium images were reconstructed from cCTA data. UCASC and PureCalcium data sets were evaluated using a semiautomatic workflow (Calciumscoring, Syngo.Via VB60, Siemens Healthineers). Agatston scores were generated for both data sets. DLP values for the entire examination and the uCACS scan were analyzed. Data are presented as mean  $\pm$  standard deviation. Differences in the Agatston score between uCACS and PureCalcium were evaluated using the paired sample t-test and Pearson's correlation coefficient as well as the intra-class correlation coefficient between both scores were calculated. Bland Altman analysis was performed, and bias and limits of agreement (LoA) are presented. The intra-class correlation coefficient was calculated for Agatston scores from both measurements. P-values of  $< 0.05$  were considered statistically significant.

#### RESULTS

84 patients had an Agatston score of  $> 0$ . The mean Agatston score was equivalent between uCACS and PureCalcium ( $115.5 \pm 270.7$  vs.  $112.4 \pm 275.5$ ,  $p=0.519$ ); the correlation between both scores was excellent ( $r=0.98$ ,  $p < 0.001$ ). ICC between both measurements was excellent with 0.981. Bland Altman analysis showed a bias of  $3.1 \pm 54.0$  (LoA:  $-102.7/108.9$ ). The mean DLP for the entire examination was  $236.9 \pm 213.2$  mGy\*cm, while DLP for uCACS was  $32.2 \pm 11.7$  mGy\*cm. Thus, the uCACS share of the radiation dose of the entire examination was  $19 \pm 9$  %.

## CONCLUSION

Agatston scores derived from PureCalcium images of PCCT scanners and standard uCACS correlate to a high degree and do not differ significantly. Omitting a dedicated unenhanced scan in PCCT cCTA could reduce radiation dose by  $19 \pm 9$  %.

## CLINICAL RELEVANCE/APPLICATION

Coronary artery calcium scoring is an important predictor of morbidity in chronic coronary artery disease. Deriving Agatston scores directly from contrast-enhanced CTA could reduce the radiation dose of a typical CT examination of the coronary arteries substantively.

### **M1-SSCA03-5 Ultra-High-Resolution K-Edge Imaging for Characterization of Coronary Arteries with Deep-Silicon Photon-Counting CT: Comparison with Conventional Dual-Energy CT**

Amir Pourmorteza, PhD (*Presenter*) Nothing to Disclose

#### PURPOSE

Photon-counting detectors (PCD) may improve image quality and diagnostic value of CT compared to the energy-integrating detectors (EID). Reduced radiation dose, spectral information, and improved spatial resolution are three advantages of PCD. Edge-irradiated deep-Si PCD promises better spectral and spatial resolution compared to CdTe and CdZnTe PCDs. Here we investigate the utility of deep-Si PCD for characterizing coronary artery plaques and stents.

#### METHODS AND MATERIALS

We fabricate custom coronary artery phantoms with diameter ( $d$ ) = 2-3.5 mm. Calcified and soft plaques, and 7 coronary stents are added to the arteries and filled with iodine- or gadolinium-based contrast agents (IBCA, GBCA). The inserts are placed inside water cylinders ( $d=12$ cm). 15 mL-diameter vials with calibrated dilutions and mixtures of IBCA and GBCA, water, and fat are also included. We scan the phantoms using a prototype deep-Si PCD-CT scanner at 120 kVp, 400 mAs, 1-s

rotation, with 8 energy bins. Dual-energy fast kV-switching EID-CT is used for comparison. Iodine density maps, water maps, and virtual monoenergetic images (VMIs) are reconstructed using a filtered-backprojection algorithm with "Detail" kernel for EID, vs a prototype high-resolution kernel for PCD (MTF 10% at 7.8 lp/cm vs 21.2 lp/cm). Reconstruction field-of-view is 128 mm for both scanners. Image voxel size was  $250 \times 250 \times 625 \mu\text{m}^3$  vs  $125 \times 125 \times 417 \mu\text{m}^3$  for EID vs PCD, respectively. We measure iodine density in ROIs with  $d > 8 \text{ mm}$  ( $N = 8$ ). Lumen diameter ( $N = 24$ ) was used as a metric for effective spatial resolution (blooming) in 70 keV VMIs. The Wilcoxon signed rank test is used to compare the two scanners with  $p < 0.05$  considered statistically significant.

## RESULTS

Errors in iodine density measured in IBCA dilutions with water are significantly different and in the  $[-0.3 \ 3.2]$  vs  $[-2.2 \ -0.02]$  mg I/mL range for EID and PCD, respectively. PCD material decomposition separates IBCA and GBCA into iodine density and water maps with good accuracy in iodine quantification in both mixtures (error range  $[-0.3 \ 0.3]$  mg I/mL) whereas the EID erroneously decomposes GBCA into both iodine and water (error range  $[0.0 \ 11.0]$  mg I/mL). Lumen diameter measurements are more accurate for PCD vs EID (error 173 vs 352  $\mu\text{m}$ ).

## CONCLUSION

Deep-Si PCD demonstrates good accuracy in iodine quantification and can accurately decompose mixtures of two contrast agents. Its improved spatial resolution results in sharper images with blooming artifacts reduced by 50% compared to a state-of-the-art dual-energy EID scanner.

## CLINICAL RELEVANCE/APPLICATION

UHR spectral evaluation of coronary arteries with deep-Si photon-counting CT can help improve visualization of plaques and stents by providing spectral information at 150  $\mu\text{m}$  resolution.

## M1-SSCA03-6 In-human Evaluation of Coronary Stent Patency using Ultra-High-Resolution Photon-Counting Detector CT: A Comparison to Invasive Angiography

Muhammad Taha Hagar, MD (*Presenter*) Nothing to Disclose

## PURPOSE

To evaluate the diagnostic accuracy of ultra-high-resolution photon-counting detector CT angiography (UHR PCD-CTA) in assessing coronary stent patency, using invasive coronary angiography (ICA) as a reference.

## METHODS AND MATERIALS

Consecutive patients with previous coronary stent placement were prospectively enrolled between August 2022 and March 2023 and underwent UHR PCD-CTA (collimation:  $120 \times 0.2 \text{ mm}$ ). Two blinded and independent readers assessed the image quality of the in-stent lumen by applying a 5-point Likert scale (1="excellent" to 5="non-diagnostic") and evaluated stents for relevant in-stent stenosis of 50% or greater. UHR PCD-CTA's diagnostic accuracy was determined using ICA as the reference standard.

## RESULTS

The study involved 44 coronary stents in 18 participants (mean age: 83 years  $\pm$  6 [SD], 12 women). In 3 out of 44 stents, both readers rated image quality as non-diagnostic, while reader 2 considered another stent's image quality insufficient. Compared to ICA, UHR PCD-CTA showed sensitivity, specificity, and accuracy of 100% (95% CI: 47.8, 100), 92.3% (95% CI: 79.1, 98.4), and 93.2% (95% CI: 81.3, 98.6) for reader one and 100% (95% CI: 47.8, 100), 87.2% (95% CI: 72.6, 95.7), and 88.6% (95% CI: 75.4, 96.2) for reader two. Both readers reported a 100% negative predictive value (36 out of 36 stents and 34 out of 34 stents). Inter-reader agreement for stent patency was 90.1%, yielding a substantial Cohen's kappa value of 0.72.

## CONCLUSION

UHR PCD-CTA offers non-invasive coronary stent patency evaluation with elevated image quality and diagnostic accuracy.

## CLINICAL RELEVANCE/APPLICATION

UHR PCD-CTA is a reliable technique for assessing coronary stent patency. Its high negative predictive value makes it a promising non-invasive approach for excluding in-stent stenosis in patients with prior stent implantation.

### Improved Detection of Small and Low-density Plaques in Virtual Non-iodine-based Coronary Artery Calcium Scoring on Photon-Counting Detector CT

Monday, Nov. 27 8:00AM - 9:00AM Room: E353B

Nicola Fink, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

With improved multi-material separation, photon-counting detector (PCD)-CT allows to create virtual non-iodine (VNI) reconstructions for coronary artery calcium scoring (CACS) based on contrast-enhanced scans. VNI-CACS has been shown to outperform previous virtual non-contrast (VNC) images. However, previous studies focused on total scores. This study aimed to assess the impact of plaque size and density on the algorithm's performance and to provide recommendations regarding "safety net" reconstructions for an improved detection of subtle plaques.

#### METHODS AND MATERIALS

CACS was evaluated in phantoms simulating three chest diameters and containing nine calcifications with different sizes (5, 3, 1mm) and densities (800, 400, 200 mg/cm<sup>3</sup>), and in patients (n=63; 57.8±15.5 years; 58.7% male) who underwent true non-contrast (TNC) and contrast-enhanced cardiac PCD-CT. VNI images were reconstructed at different VMI (55-80keV) and quantum iterative reconstructions (QIR; strength 1-4). TNC scans at 70keV, QIR off served as reference. In vitro CACS was analyzed with standard CACS settings (3.0mm slices, kernel Qr36, threshold 130HU). In addition, the number of detected calcifications and CACS of small and low-density plaques were investigated using adjusted reconstructions (1.0mm, kernel Qr44, thresholds 120/110HU). Based on background Agatston scores of best performing settings, "safety net" reconstructions were defined and assessed in in vivo TNC plaques initially not detected by standard VNI reconstructions.

#### RESULTS

Correlation and agreement between standard CACSVNI and CACSTNC was higher in large/medium-sized and high/medium-density plaques than in low-density plaques (ICC=0.90, r>0.9 vs. ICC=0.20-0.48, r =0.47-0.56). Small plaques were not detectable using standard VNI. The highest detectability of calcifications was achieved using slice thickness 1.0mm, kernel Qr44, CACS thresholds 120/110HU, and QIR=2. Compared to standard VNI settings, using our proposed "safety net" reconstructions (55keV, QIR2; threshold 110HU) for in vivo CACS increased detectability of subtle plaques by 89.3% and improved correlation and agreement of CACSVNI with CACSTNC (ICC=0.51, r=0.60; with standard settings not detectable).

#### CONCLUSION

Compared to TNC-CACS, the performance of the VNI algorithm is limited for small and low-density plaques, which can be improved using "safety net" reconstructions. These should additionally be performed in patients with a standard CACS<sub>VNI</sub> of zero to identify missed plaques.

#### CLINICAL RELEVANCE/APPLICATION

The proposed "safety net" improves accurate cardiovascular risk assessment using VNI-based CACS, especially in patients who would otherwise be classified as false-negative due to missed subtle plaques.

### Ultra High Resolution Photon Counting CT Results in Improved Spatial Accuracy during Simulated Coronary Motion

Monday, Nov. 27 8:00AM - 9:00AM Room: E353B

Audrey Rich, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

Ultra high resolution photon counting CT (PCCT) has the potential for improved visualization of minute anatomic structures. Yet, increases in spatial resolution are susceptible to motion related image degradation. A major challenge in cardiac imaging is the intrinsic motion of the heart. Motion artifacts compromise image quality and the visualization of coronary anatomy and disease. The purpose of the study is to determine if the increased spatial accuracy of PCCT is preserved in moving structures, such as coronary arteries.

#### METHODS AND MATERIALS

A dynamic cardiac phantom device simulated cardiac coronary motion by mechanically transferring device movement to a tungsten wire. Wire motion corresponded to different device rates, which equated to different cardiac rates. The tungsten wire was imaged while stationary and moving, using a coronary CT angiography protocol with sequential ECG triggered axial acquisition settings on a PCCT using a conventional reconstruction mode at 120kV with 0.6mm slice thickness and the Bv36u kernel. The moving wire was reimaged on the same PCCT system with the same protocol but using a prospectively triggered method on the ultra high resolution mode at 140kV with 0.2mm slice thickness using the Bv56u kernel. In each setting, images were acquired using a top gantry speed of 264m/s, 66ms temporal resolution, and 120x0.2mm collimation. Image reconstruction was performed using a 512 x 512 matrix and processed using ImageJ software. Images were compared using the full width at half maximum (FWHM) area of the point spread function as a numerical estimate of spatial accuracy.

#### RESULTS

Using the standard acquisition mode, at a device rate of 70bpm, the point object images were degraded in shape and attenuation to different degrees during the motion cycle. The FWHM area corresponded to our visual assessment and ranged from 5.1mm<sup>2</sup> to 23.8mm<sup>2</sup>, depending on the time of image reconstruction. Conversely, using the UHR reconstructions, the best image reconstruction yielded a smaller point image with better definition than the best reconstruction from the standard stationary and dynamic resolution series. The FWHM area ranged from 0.8mm<sup>2</sup> to 5.9mm<sup>2</sup>.

#### CONCLUSION

Object motion degraded image quality to variable degrees over the motion cycle. The UHR mode improves overall spatial accuracy at rest and during moving conditions when comparing the two settings that exist within photon counting.

#### CLINICAL RELEVANCE/APPLICATION

High resolution photon counting CT improves spatial accuracy under dynamic conditions.

### Coronary Stent Imaging in Photon Counting Computed Tomography: Assessability of In-Stent Stenoses

Monday, Nov. 27 8:00AM - 9:00AM Room: E353B

Jan Robert Kroger, MD (*Presenter*) Travel Support, Otsuka Holdings Co, Ltd;

#### PURPOSE

To evaluate the assessment of in-stent stenosis in coronary artery stents in a phantom using photon counting computed tomography (PCCT) with standard resolution mode (SRM) and ultra-high-resolution mode (UHR) as well as different reconstruction kernels.

#### METHODS AND MATERIALS

6 coronary artery stents (diameter 3 mm) were implanted in plastic tubes. Hypodense stenoses were implanted. Tubes were filled with contrast medium and examined using rotational angiography to define the ground-truth. For CT examinations tubes were filled with a solution of saline and contrast medium adjusted to measure 600 HU and were scanned at a PCCT (Naeotom Alpha, Siemens Healthineers) in SRM and UHR. Images were reconstructed using a standard vascular kernel (BV72c, e.g. UHRc) and an experimental kernel optimized for stent imaging (BV72o, e.g. SRMo). Analysis was performed by 5 readers, measuring lumen diameter inside the stent and residual lumen inside the stenosis and rating the assessability of the stenosis on a five-point Likert scale. One-way ANOVA or Friedman test were used for the comparison of multiple means as appropriate. Post-hoc testing with Bonferroni corrected p-values was performed in case of significant differences.

#### RESULTS

The visible in-stent lumen averaged  $0.27 \pm 0.49$  mm in SRM,  $1.37 \pm 0.55$  mm in UHR ( $p < 0.001$ ). In UHRc, the visible lumen averaged  $1.32 \pm 0.57$  mm, and in UHRo it was  $1.43 \pm 0.54$  mm ( $p = 0.033$ ). The residual lumen was measured significantly more accurately in UHR than in SRM (mean SRM  $0.11 \pm 0.19$  mm vs. UHR  $0.41 \pm 0.22$  mm). The difference between UHRc and UHRo is also significant in favor of UHRo (UHRc  $0.35 \pm 0.23$  mm vs. UHRo  $0.47 \pm 0.19$  mm, corrected  $p = 0.021$ ). Compared to angiography, UHRo achieved the best classification of in-stent stenosis grade but still overestimated the stenosis grade. UHRo received the highest rating regarding the assessability of the stenosis ( $3.31 \pm 1.20$ ). The difference between SRM and UHR and between UHRc and UHRo was significant (for both comparisons  $p < 0.001$ ).

#### CONCLUSION

PCCT in UHR mode enables the evaluation of in-stent stenosis in small-diameter coronary artery stents in a phantom. The assessability of the stenosis can be further enhanced by optimizing image reconstruction kernels for stent imaging.

#### CLINICAL RELEVANCE/APPLICATION

Coronary artery computed tomography plays a major role in the evaluation of coronary artery disease and PCCT with UHR might overcome limitations of standard CTA when examining patients with coronary stents.

### Pure Calcium Virtual Unenhanced Images from Photon-counting Coronary Angiography Provide Accurate Coronary Artery Calcium Scoring

Monday, Nov. 27 8:00AM - 9:00AM Room: E353B

Nina Pauline Haag, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

Coronary artery calcium scoring (CACS) is an important predictor of morbidity in chronic coronary artery disease (CAD). CACS requires an unenhanced CT scan in addition to contrast-enhanced coronary CT angiography (cCTA). Photon counting CT (PCCT) provides a customized algorithm for the reconstruction of virtual unenhanced images from cCTA specifically for calcium scoring (PureCalcium, Siemens Healthineers). This study aimed to evaluate the accuracy of PureCalcium images derived from contrast-enhanced photon counting cCTA in comparison to unenhanced CACS images (uCACS).

#### METHODS AND MATERIALS

In this retrospective study, 128 patients receiving PCCT (Naeotom Alpha, syngo.CT VB50, Siemens Healthineers) with uCACS and cCTA for CAD between August 2022 and April 2023 were included. PureCalcium images were reconstructed from cCTA data. UCASC and PureCalcium data sets were evaluated using a semiautomatic workflow (Calciumscoring, Syngo.Via VB60, Siemens Healthineers). Agatston scores were generated for both data sets. DLP values for the entire examination and the uCACS scan were analyzed. Data are presented as mean  $\pm$  standard deviation. Differences in the Agatston score between uCACS and PureCalcium were evaluated using the paired sample t-test and Pearson's correlation coefficient as well as the intra-class correlation coefficient between both scores were calculated. Bland Altman analysis was performed, and bias and limits of agreement (LoA) are presented. The intra-class correlation coefficient was calculated for Agatston scores from both measurements. P-values of  $< 0.05$  were considered statistically significant.

#### RESULTS

84 patients had an Agatston score of  $> 0$ . The mean Agatston score was equivalent between uCACS and PureCalcium ( $115.5 \pm 270.7$  vs.  $112.4 \pm 275.5$ ,  $p=0.519$ ); the correlation between both scores was excellent ( $r=0.98$ ,  $p < 0.001$ ). ICC between both measurements was excellent with 0.981. Bland Altman analysis showed a bias of  $3.1 \pm 54.0$  (LoA:  $-102.7/108.9$ ). The mean DLP for the entire examination was  $236.9 \pm 213.2$  mGy\*cm, while DLP for uCACS was  $32.2 \pm 11.7$  mGy\*cm. Thus, the uCACS share of the radiation dose of the entire examination was  $19 \pm 9$  %.

#### CONCLUSION

Agatston scores derived from PureCalcium images of PCCT scanners and standard uCACS correlate to a high degree and do not differ significantly. Omitting a dedicated unenhanced scan in PCCT cCTA could reduce radiation dose by  $19 \pm 9$  %.

#### CLINICAL RELEVANCE/APPLICATION

Coronary artery calcium scoring is an important predictor of morbidity in chronic coronary artery disease. Deriving Agatston scores directly from contrast-enhanced CTA could reduce the radiation dose of a typical CT examination of the coronary arteries substantively.

### Ultra-High-Resolution K-Edge Imaging for Characterization of Coronary Arteries with Deep-Silicon Photon-Counting CT: Comparison with Conventional Dual-Energy CT

Monday, Nov. 27 8:00AM - 9:00AM Room: E353B

Amir Pourmorteza, PhD (*Presenter*) Nothing to Disclose

#### PURPOSE

Photon-counting detectors (PCD) may improve image quality and diagnostic value of CT compared to the energy-integrating detectors (EID). Reduced radiation dose, spectral information, and improved spatial resolution are three advantages of PCD. Edge-irradiated deep-Si PCD promises better spectral and spatial resolution compared to CdTe and CdZnTe PCDs. Here we investigate the utility of deep-Si PCD for characterizing coronary artery plaques and stents.

#### METHODS AND MATERIALS

We fabricate custom coronary artery phantoms with diameter ( $d$ ) = 2-3.5 mm. Calcified and soft plaques, and 7 coronary stents are added to the arteries and filled with iodine- or gadolinium-based contrast agents (IBCA, GBCA). The inserts are placed inside water cylinders ( $d=12$ cm). 15 mL-diameter vials with calibrated dilutions and mixtures of IBCA and GBCA, water, and fat are also included. We scan the phantoms using a prototype deep-Si PCD-CT scanner at 120 kVp, 400 mAs, 1-s rotation, with 8 energy bins. Dual-energy fast kV-switching EID-CT is used for comparison. Iodine density maps, water maps, and virtual monoenergetic images (VMIs) are reconstructed using a filtered-backprojection algorithm with "Detail" kernel for EID, vs a prototype high-resolution kernel for PCD (MTF 10% at 7.8 lp/cm vs 21.2 lp/cm). Reconstruction field-of-view is 128 mm for both scanners. Image voxel size was  $250 \times 250 \times 625 \mu\text{m}^3$  vs  $125 \times 125 \times 417 \mu\text{m}^3$  for EID vs PCD, respectively. We measure iodine density in ROIs with  $d > 8$  mm ( $N = 8$ ). Lumen diameter ( $N = 24$ ) was used as a metric for effective spatial resolution (blooming) in 70 keV VMIs. The Wilcoxon signed rank test is used to compare the two scanners with  $p < 0.05$  considered statistically significant.

#### RESULTS

Errors in iodine density measured in IBCA dilutions with water are significantly different and in the  $[-0.3 \ 3.2]$  vs  $[-2.2 \ -0.02]$  mg I/mL range for EID and PCD, respectively. PCD material decomposition separates IBCA and GBCA into iodine density and water maps with good accuracy in iodine quantification in both mixtures (error range  $[-0.3 \ 0.3]$  mg I/mL) whereas the EID erroneously decomposes GBCA into both iodine and water (error range  $[0.0 \ 11.0]$  mg I/mL). Lumen diameter measurements are more accurate for PCD vs EID (error 173 vs 352  $\mu\text{m}$ ).

#### CONCLUSION

Deep-Si PCD demonstrates good accuracy in iodine quantification and can accurately decompose mixtures of two contrast agents. Its improved spatial resolution results in sharper images with blooming artifacts reduced by 50% compared to a state-of-the-art dual-energy EID scanner.

#### CLINICAL RELEVANCE/APPLICATION

UHR spectral evaluation of coronary arteries with deep-Si photon-counting CT can help improve visualization of plaques and stents by providing spectral information at 150  $\mu\text{m}$  resolution.

### **In-human Evaluation of Coronary Stent Patency using Ultra-High-Resolution Photon-Counting Detector CT: A Comparison to Invasive Angiography**

Monday, Nov. 27 8:00AM - 9:00AM Room: E353B

Muhammad Taha Hagar, MD (*Presenter*) Nothing to Disclose

#### **PURPOSE**

To evaluate the diagnostic accuracy of ultra-high-resolution photon-counting detector CT angiography (UHR PCD-CTA) in assessing coronary stent patency, using invasive coronary angiography (ICA) as a reference.

#### **METHODS AND MATERIALS**

Consecutive patients with previous coronary stent placement were prospectively enrolled between August 2022 and March 2023 and underwent UHR PCD-CTA (collimation: 120 x 0.2 mm). Two blinded and independent readers assessed the image quality of the in-stent lumen by applying a 5-point Likert scale (1="excellent" to 5="non-diagnostic") and evaluated stents for relevant in-stent stenosis of 50% or greater. UHR PCD-CTA's diagnostic accuracy was determined using ICA as the reference standard.

#### **RESULTS**

The study involved 44 coronary stents in 18 participants (mean age: 83 years  $\pm$  6 [SD], 12 women). In 3 out of 44 stents, both readers rated image quality as non-diagnostic, while reader 2 considered another stent's image quality insufficient. Compared to ICA, UHR PCD-CTA showed sensitivity, specificity, and accuracy of 100% (95% CI: 47.8, 100), 92.3% (95% CI: 79.1, 98.4), and 93.2% (95% CI: 81.3, 98.6) for reader one and 100% (95% CI: 47.8, 100), 87.2% (95% CI: 72.6, 95.7), and 88.6% (95% CI: 75.4, 96.2) for reader two. Both readers reported a 100% negative predictive value (36 out of 36 stents and 34 out of 34 stents). Inter-reader agreement for stent patency was 90.1%, yielding a substantial Cohen's kappa value of 0.72.

#### **CONCLUSION**

UHR PCD-CTA offers non-invasive coronary stent patency evaluation with elevated image quality and diagnostic accuracy.

#### **CLINICAL RELEVANCE/APPLICATION**

UHR PCD-CTA is a reliable technique for assessing coronary stent patency. Its high negative predictive value makes it a promising non-invasive approach for excluding in-stent stenosis in patients with prior stent implantation.

Alice Schuch, MD (*Moderator*) Nothing to Disclose

#### Sub-Events

#### **M1-SSGU03-1 The Diagnostic Value of Dynamic Contrast Enhanced MRI for Clinically Significant Prostate Cancer: An International Multi-Reader Study with 61 Radiologists (The PI-CAI Reader Study)**

Jasper J. Twilt, MSc (*Presenter*) Nothing to Disclose

#### PURPOSE

The PI-CAI Reader Study evaluated the added value of dynamic contrast enhanced (DCE) MRI to diagnose clinically significant prostate cancer (csPCa) within a large international multi-reader multi-case (MRMC) observer study (61 radiologists, 45 centers from 20 countries).

#### METHODS AND MATERIALS

Readers assessed 400 retrospective prostate MRI exams without prior prostate treatment or csPCa presence, acquired between 2012-2021 from four Dutch and one Norwegian tertiary center. Presence of csPCa (Gleason Grade Group = 2) was defined as a positive biopsy or radical prostatectomy within 3 years. Readers were divided into four blocks, reading 100 cases each. Readers provided a patient-level suspicion score (0-100) of harboring csPCa on bpMRI and annotated each suspected csPCa lesion with a PI-RADS 3-5 score. Next, readers were unblinded to DCE and could update the case and lesion assessments, if deemed necessary. The difference in diagnostic performance between bpMRI and mpMRI was assessed using MRMC analysis based on Area under the Receiver Operating Characteristic Curve (AUROC), and index PI-RADS = 3 and PI-RADS = 4 operating points. Subgroup analysis was performed for expert (>1000 cases read in total, >200 cases/year) and non-expert (<1000 cases read in total, <200 cases/year) readers.

#### RESULTS

Reader experience varied between 1-23 years (median: 7). 133 patients (34%) harbored csPCa. The AUROC performance at bpMRI and mpMRI was  $0.855 \pm 0.02$  and  $0.862 \pm 0.02$ . Subgroup analysis showed AUROC at bpMRI and mpMRI of  $0.863 \pm 0.02$  and  $0.869 \pm 0.02$  for experts and  $0.830 \pm 0.02$  and  $0.839 \pm 0.02$  for non-experts, respectively. Considering performance using index PI-RADS scores, 91% of readings did not change upon mpMRI assessment. At an operating point of PI-RADS = 3, sensitivity for bpMRI and mpMRI was  $0.89 \pm 0.02$  and  $0.90 \pm 0.02$  with specificity of  $0.59 \pm 0.03$  and  $0.58 \pm 0.03$ . At PI-RADS = 4, DCE improved sensitivity ( $0.81 \pm 0.03$  at bpMRI and  $0.85 \pm 0.03$  at mpMRI) at the cost of specificity ( $0.76 \pm 0.02$  at bpMRI and  $0.72 \pm 0.02$  at mpMRI).

#### CONCLUSION

bpMRI showed a similar ability to diagnose csPCa compared to mpMRI, indicating limited added value of DCE. Compared to expert readers, non-experts had overall lower accuracy for diagnosing csPCa. No difference between bpMRI and mpMRI after stratification to level of experience was observed. At PI-RADS  $\geq 4$  DCE might improve csPCa diagnosis at the cost of increased false positives.

#### CLINICAL RELEVANCE/APPLICATION

Within a large international multi-reader multi-case study, results showed that the ability to diagnose csPCa remains similar when DCE MRI is omitted potentially saving costs and patient burden from the injection of contrast agent.

#### **M1-SSGU03-2 Comparison of a Diagnostic Performance of ADC Maps Generated Based on Intermediate and High B-Values in Detection and Grading of Prostate Cancer: An Intra-patient Study**

Roberta Catania, MD (*Presenter*) Institutional Research Grant, Siemens AG

## **PURPOSE**

To compare the diagnostic performance of apparent diffusion coefficient (ADC) values calculated based on intermediate (1000 s/mm<sup>2</sup>) and high (1600 s/mm<sup>2</sup>) b-values for detection and assessment of prostate cancer.

## **METHODS AND MATERIALS**

This retrospective study was approved by the institutional review board and informed consent was waived. One hundred and one lesions in 57 adult men who underwent magnetic resonance imaging (MRI) of the prostate between December 2020 and November 2021 and had subsequent fused MRI/ultrasound (US) targeted biopsy were included. Two separate diffusion weighted images (DWI) sequences were obtained using b-values of 50, 500, 1000 s/mm<sup>2</sup> and b-value of 50, 1600 s/mm<sup>2</sup> and 2 separate ADC maps were generated based on b-values of 1000 or 1600 (herein referred to as ADC1000 and ADC1600, respectively). Regions of interests were drawn inside the lesions on the corresponding ADC maps by two fellowship-trained radiologists. Qualitative assessment was also evaluated based on conspicuity of the lesions on the two different ADC maps according to a three-points Likert scale (1: high, 2: intermediate, 3: low). ADC values and lesion conspicuity scores were compared using univariate paired tests. Receiver operating characteristic (ROC) curves were constructed to compare the performance of ADC1000 and ADC1600 for diagnosis, and grading, of prostate cancer.

## **RESULTS**

One hundred and one lesions were included, 39 of them were malignant. ADC values were significantly lower at ADC1600 ( $p < 0.001$ ) for both readers with a mean difference of  $1.294 \times 10^{-3}$  mm<sup>2</sup>/s ( $\pm 148.8$ ) and  $1.595 \times 10^{-3}$  mm<sup>2</sup>/s ( $\pm 1.255$ ), respectively. Conspicuity of the lesions was superior at ADC1600 ( $p < 0.001$ ). Performance of ADC1600 for detection of prostate cancer was slightly higher (area under curve of 0.81 versus 0.77;  $p < 0.001$ ). An ADC1600 value lower than  $0.780 \times 10^{-3}$  mm<sup>2</sup>/s had a sensitivity and specificity of 82% and 66%, respectively, for detection of prostate cancer. The correlation between ADC values and different Gleason scores was strong and slightly better at ADC1600 ( $r = 0.53$  vs.  $0.47$ ;  $p < 0.05$ ).

## **CONCLUSION**

Quantitative and qualitative assessment demonstrated superior performance of ADC<sub>1600</sub> for lesion detection and for discrimination of benign from malignant lesions.

## **CLINICAL RELEVANCE/APPLICATION**

PI-RADS v2.1 recommends using ADC map calculated from intermediate b-value (800-1000 sec/mm<sup>2</sup>) to avoid diffusion kurtosis effect. Results of this cohort shows superior performance of ADC1600 for visualization and characterization of prostate lesions.

## **M1-SSGU03-3 The Power of PI-QUAL Metrics and Multidisciplinary Collaboration: Building a Robust and Comfortable Non-endorectal Prostate MRI Protocol**

Scott H. Robertson, PhD (*Presenter*) Nothing to Disclose

## **PURPOSE**

To utilize PI-QUAL scoring to assess the efficacy of protocol optimizations in enhancing the image quality of non-endorectal multiparametric prostate MRI. Furthermore, we aim to quantify the inter-reader agreement of PI-QUAL scores between radiologists, technologists, and physicists to determine whether future PI-QUAL investigations should incorporate a broader scope of team-members.

## **METHODS AND MATERIALS**

This retrospective IRB-approved study considered 1114 multiparametric prostate MRI exams that were obtained according to the PI-RADS v2/2.1 guidelines during a national quality improvement project. Each exam was scored according to the PI-QUAL standard, which provided both ratings of overall exam-level image quality as well as descriptors of image quality at the pulse sequence level. A set of 4 radiologists, 2 technologists, and 1 medical physicist audited an additional 150 exams that spanned both pre- and post-improvement phases to assess overall improvement. The two-tailed Wilcoxon rank sum test was used to assess differences in image quality between the exams. Inter-reader variability was assessed in 100 exams using the percent majority agreement and the average standard deviation of PI-QUAL scores between evaluators.

## **RESULTS**

Average PI-QUAL scores improved from  $3.67 \pm 0.75$  to  $4.16 \pm 0.59$  ( $p < 0.01$ ) after implementing a series of protocol changes to address common image quality issues. Distortion in DWI was reduced from 21.6% (41/190) to 11.5% (30/261) by adopting R/L rather than A/P phase encoding ( $p < 0.01$ ). Similarly, T2WI breathing motion artifacts were reduced from 34.6% (94/272) to 12.8% (23/179) with R/L phase encoding ( $p < 0.01$ ). DWI wraparound artifact was mitigated by employing a full-pelvis shim and enabling the abdomen shim option. The occurrence of low-SNR was reduced from 19.4% (19/98) to 6.3% (10/160) by instituting a 200-lb weight-limit for using an ERC ( $p < 0.01$ ). The percent majority agreement was similar between radiologists, technologists and physicists, and all evaluators combined (72%, 77%, and 67%, respectively).

## CONCLUSION

PI-QUAL is a highly useful tool for assessing image quality at the exam-level and for assessing the effects of MR protocol changes at the individual sequence level. PI-QUAL can be used by radiologists as well as other members of the MRI team, including physicists and technologists. Increasing multidisciplinary participation could substantially impact the performance of future QI studies.

## CLINICAL RELEVANCE/APPLICATION

PI-QUAL scores offer valuable insights at the exam- and series-level for optimizing protocols. Broadening the scope of PI-QUAL reviewers could provide more holistic and effective quality improvement initiatives.

### **M1-SSGU03-4 Inter-rater Reproducibility of the Prostate Imaging Quality (PI-QUAL) Score: A Multi-reader from Multicenter Study with Large Sample Size Data**

Liang Wang (*Presenter*) Nothing to Disclose

## PURPOSE

To investigate the inter-rater reproducibility of the Prostate imaging quality (PI-QUAL) for multiparametric magnetic resonance imaging (mpMRI) in a multireader from multicenter study.

## METHODS AND MATERIALS

Patients who underwent mpMRI and 24-core coaxial needle saturation biopsy of the prostate by the transperineal approach between January 2019 and February 2020 were retrospectively included. The mpMRI included multiplanar T2-weighted imaging (T2WI), Diffusion-weighted imaging (DWI), and dynamic contrast-enhanced imaging (DCE). Three readers from different general medical centers with at least 6 years of experience in diagnostic imaging independently assessed the PI-QUAL score of each mpMRI sequence. Training was conducted before scoring. Inter-rater agreement was assessed using Kendall's w-coefficient. Pairwise agreement was assessed using Cohen's kappa coefficient.

## RESULTS

Of 813 patients, 595 patients were enrolled. The three readers had strong agreement in PI-QUAL scores, Kendall's w coefficient was 0.678. Moderate to strong agreement was observed when comparing the three sequences individually, for the T2WI sequence, Kendall's w coefficient was 0.579; for the DWI sequence, Kendall's w coefficient was 0.763; for DCE sequences, Kendall's w coefficient was 0.666. Furthermore, the kappa value between R1 and R2 was 0.71 (95% CI: 0.65-0.76), the kappa value between R1 and R3 was 0.75 (95% CI: 0.70-0.80), the kappa value between R2 and R3 was 0.75 (95% CI: 0.70-0.80).

## CONCLUSION

PI-QUAL not only has good inter-reader consistency, but also has high reproducibility among physicians from different centers.

## CLINICAL RELEVANCE/APPLICATION

Our study observed that simplification is likely inevitable for future iterations of the PI-QUAL based on a 5-point scale or simplified into a 3-point scale.

### **M1-SSGU03-5 AI-based Reconstruction Improves Image Quality and Shortens Acquisition Time in DWI for Multiparametric Prostate MRI**

Elene Iordanishvili, MD (*Presenter*) Nothing to Disclose

## PURPOSE

Multiparametric prostate MRI (mpMRI) and its standardization using the prostate imaging reporting and data system (PIRADS) have increased the detection rate of clinically significant prostate cancers. Yet, MRI availability is limited, and the exam is time consuming. Diffusion weighted imaging (DWI) is an essential sequence to diagnose prostate cancer. However, it suffers from low signal-to-noise (SNR) and contrast-to-noise ratios (CNR). Recently, reconstruction techniques using artificial intelligence (AI) have shown to improve T2w image quality and shorten acquisition time (TA). To evaluate image quality and diagnostic capability of an AI-reconstructed DWI sequence for mpMRI.

## METHODS AND MATERIALS

Ongoing study, so far including 45 consecutive patients undergoing standardized mpMRI (including T2wTSE, T1w dynamic CE GRE and DWI with ADC map) on a 3T system. Patients received a standard (std) and AI-DWI sequence with ADC maps (b 50, 400, 1000 s/mm<sup>2</sup>) plus a separate b1400 s/mm<sup>2</sup>). AI-DWI used less averages than std-DWI. Std-DWI image reconstruction employed Compressed SENSE (CS). AI-DWI image reconstruction was based on the Adaptive-CS-Net, i.e., including a convolutional neural network. 2 blinded radiologists assessed the PIRADS category for each patient based on the standard protocol first with AI-and then with std-DWI. Image quality (noise, delineation of lesion, artefacts) was ranked on a 10-point

Likert scale. ROI-based apparent SNR and CNR were calculated for semiquantitative analysis. Significance was tested using a generalised linear model.

## RESULTS

All patients were assigned the same PIRADS category based on std-, as well as AI-DWI. Regarding image quality, AI-DWI was ranked significantly less noisy than the std-DWI (median noise 5 vs 7;  $p < 0.001$ ). Delineation of lesions and presence of artefacts did not differ significantly between both sequences. CNR and SNR of the AI-ADC were significantly higher compared to the std-ADC (mean-CNR-AI-ADC = 9; mean-CNR-ADC = 8;  $P = 0.005$ ; mean-aSNR-AI-ADC = 10.5; mean-aSNR-ADC = 7;  $P = 0.001$ ). AI-b1400 showed higher aSNR and aCNR than the std-DWI, without statistical significance. TA was 3:12 minutes shorter for the AI-DWI compared to the std-DWI. (7:30 min vs. 4:18 min).

## CONCLUSION

AI-reconstruction significantly improves DWI quality, while maintaining diagnostic certainty and reducing TA by 57 %.

## CLINICAL RELEVANCE/APPLICATION

AI-DWI outperforms the standard DWI with regards to image quality and TA in patients, undergoing screening prostate MRI.

## M1-SSGU03-6 Deep Learning-Based Interpretable AI for Prostate T2W MRI Quality Evaluation

Mason Belue, MD (*Presenter*) Nothing to Disclose

## PURPOSE

To develop an image quality evaluation artificial intelligence (AI) model for T2 weighted (T2W) prostate MRI and to generate interpretable 3D quality heatmaps.

## METHODS AND MATERIALS

This retrospective study included 994 patients scanned between January 2011 and December 2021 for clinical suspicion or follow-up of prostate cancer from an in-house institutional database ( $n=699$ ) and public PROSTATEx dataset ( $n=294$ ). T2W MRIs were given a quality score (class 0 = non-diagnostic, class 1 = equivocal, class 2 = diagnostic) based on evaluation of both general distortions (e.g., motion, distortion, noise, aliasing) and perceptual distortions (e.g., obscured delineation of prostatic capsule, prostatic zones, and excess rectal gas) by an expert genitourinary radiologist with 20 years of experience. A train-validation-test split of 70:15:15 was applied. All quality classification models were based on 3D DenseNet121 architecture using the MONAI framework. In addition to multi-classification, binary classification was utilized (Class 0/1 versus class 2). Partial occlusion sensitivity maps were generated for anatomical correlation. Reproducibility of quality scores was assessed within a subset of the testing dataset (60 cases, with quality score distribution of 1:1:1) in a blinded reader study with two experienced body radiologists, evaluated using weighted Cohen Kappa.

## RESULTS

Best validation multi-class accuracy of 77% was achieved during training. In the test dataset (149 cases, 101 class 2, 31 class 1, and 17 class 0), the multi-classification accuracy was 72.5% (108/149) whereas the binary accuracy was 83.9% (125/149). The sub-class sensitivity for binary quality distortion classification for class 0 was 100% (17/17) and the sub-class specificity for T2W classification of the absence of any quality distortions for class 2 was 89.1% (90/101). Within the multi-reader study for 3-class quality, both readers showed moderate to substantial agreement with ground truth ( $\kappa = 0.59$ ,  $\kappa = 0.65$  respectively), substantial agreement with each other ( $\kappa = 0.60$ ), and moderate agreement with AI ( $\kappa = 0.42$ ,  $\kappa = 0.43$  respectively). 3D quality heatmap evaluation revealed that the most important non-diagnostic quality imaging features from the AI perspective were interslice motion, rectal gas, and obscured capsule/prostatic zones.

## CONCLUSION

The 3D AI model can assess prostate T2W image quality with moderate accuracies and can translate whole sequence-level classification labels into 3D voxel-level quality heatmaps.

## CLINICAL RELEVANCE/APPLICATION

Image quality has a significant downstream impact on ruling out clinically significant cancers. AI may be able to help with reproducible identification of MRI sequences requiring re-acquisition with explainability.

Printed on: 08/22/24

### **The Diagnostic Value of Dynamic Contrast Enhanced MRI for Clinically Significant Prostate Cancer: An International Multi-Reader Study with 61 Radiologists (The PI-CAI Reader Study)**

Monday, Nov. 27 8:00AM - 9:00AM Room: S405

Jasper J. Twilt, MSc (*Presenter*) Nothing to Disclose

#### **PURPOSE**

The PI-CAI Reader Study evaluated the added value of dynamic contrast enhanced (DCE) MRI to diagnose clinically significant prostate cancer (csPCa) within a large international multi-reader multi-case (MRMC) observer study (61 radiologists, 45 centers from 20 countries).

#### **METHODS AND MATERIALS**

Readers assessed 400 retrospective prostate MRI exams without prior prostate treatment or csPCa presence, acquired between 2012-2021 from four Dutch and one Norwegian tertiary center. Presence of csPCa (Gleason Grade Group = 2) was defined as a positive biopsy or radical prostatectomy within 3 years. Readers were divided into four blocks, reading 100 cases each. Readers provided a patient-level suspicion score (0-100) of harboring csPCa on bpMRI and annotated each suspected csPCa lesion with a PI-RADS 3-5 score. Next, readers were unblinded to DCE and could update the case and lesion assessments, if deemed necessary. The difference in diagnostic performance between bpMRI and mpMRI was assessed using MRMC analysis based on Area under the Receiver Operating Characteristic Curve (AUROC), and index PI-RADS = 3 and PI-RADS = 4 operating points. Subgroup analysis was performed for expert (>1000 cases read in total, >200 cases/year) and non-expert (<1000 cases read in total, <200 cases/year) readers.

#### **RESULTS**

Reader experience varied between 1-23 years (median: 7). 133 patients (34%) harbored csPCa. The AUROC performance at bpMRI and mpMRI was  $0.855 \pm 0.02$  and  $0.862 \pm 0.02$ . Subgroup analysis showed AUROC at bpMRI and mpMRI of  $0.863 \pm 0.02$  and  $0.869 \pm 0.02$  for experts and  $0.830 \pm 0.02$  and  $0.839 \pm 0.02$  for non-experts, respectively. Considering performance using index PI-RADS scores, 91% of readings did not change upon mpMRI assessment. At an operating point of PI-RADS = 3, sensitivity for bpMRI and mpMRI was  $0.89 \pm 0.02$  and  $0.90 \pm 0.02$  with specificity of  $0.59 \pm 0.03$  and  $0.58 \pm 0.03$ . At PI-RADS = 4, DCE improved sensitivity ( $0.81 \pm 0.03$  at bpMRI and  $0.85 \pm 0.03$  at mpMRI) at the cost of specificity ( $0.76 \pm 0.02$  at bpMRI and  $0.72 \pm 0.02$  at mpMRI).

#### **CONCLUSION**

bpMRI showed a similar ability to diagnose csPCa compared to mpMRI, indicating limited added value of DCE. Compared to expert readers, non-experts had overall lower accuracy for diagnosing csPCa. No difference between bpMRI and mpMRI after stratification to level of experience was observed. At PI-RADS  $\geq 4$  DCE might improve csPCa diagnosis at the cost of increased false positives.

#### **CLINICAL RELEVANCE/APPLICATION**

Within a large international multi-reader multi-case study, results showed that the ability to diagnose csPCa remains similar when DCE MRI is omitted potentially saving costs and patient burden from the injection of contrast agent.

### Comparison of a Diagnostic Performance of ADC Maps Generated Based on Intermediate and High B-Values in Detection and Grading of Prostate Cancer: An Intra-patient Study

Monday, Nov. 27 8:00AM - 9:00AM Room: S405

Roberta Catania, MD (*Presenter*) Institutional Research Grant, Siemens AG

#### PURPOSE

To compare the diagnostic performance of apparent diffusion coefficient (ADC) values calculated based on intermediate (1000 s/mm<sup>2</sup>) and high (1600 s/mm<sup>2</sup>) b-values for detection and assessment of prostate cancer.

#### METHODS AND MATERIALS

This retrospective study was approved by the institutional review board and informed consent was waived. One hundred and one lesions in 57 adult men who underwent magnetic resonance imaging (MRI) of the prostate between December 2020 and November 2021 and had subsequent fused MRI/ultrasound (US) targeted biopsy were included. Two separate diffusion weighted images (DWI) sequences were obtained using b-values of 50, 500, 1000 s/mm<sup>2</sup> and b-value of 50, 1600 s/mm<sup>2</sup> and 2 separate ADC maps were generated based on b-values of 1000 or 1600 (herein referred to as ADC1000 and ADC1600, respectively). Regions of interests were drawn inside the lesions on the corresponding ADC maps by two fellowship-trained radiologists. Qualitative assessment was also evaluated based on conspicuity of the lesions on the two different ADC maps according to a three-points Likert scale (1: high, 2: intermediate, 3: low). ADC values and lesion conspicuity scores were compared using univariate paired tests. Receiver operating characteristic (ROC) curves were constructed to compare the performance of ADC1000 and ADC1600 for diagnosis, and grading, of prostate cancer.

#### RESULTS

One hundred and one lesions were included, 39 of them were malignant. ADC values were significantly lower at ADC1600 ( $p < 0.001$ ) for both readers with a mean difference of  $1.294 \times 10^{-3}$  mm<sup>2</sup>/s ( $\pm 148.8$ ) and  $1.595 \times 10^{-3}$  mm<sup>2</sup>/s ( $\pm 1.255$ ), respectively. Conspicuity of the lesions was superior at ADC1600 ( $p < 0.001$ ). Performance of ADC1600 for detection of prostate cancer was slightly higher (area under curve of 0.81 versus 0.77;  $p < 0.001$ ). An ADC1600 value lower than  $0.780 \times 10^{-3}$  mm<sup>2</sup>/s had a sensitivity and specificity of 82% and 66%, respectively, for detection of prostate cancer. The correlation between ADC values and different Gleason scores was strong and slightly better at ADC1600 ( $r = 0.53$  vs.  $0.47$ ;  $p < 0.05$ ).

#### CONCLUSION

Quantitative and qualitative assessment demonstrated superior performance of ADC<sub>1600</sub> for lesion detection and for discrimination of benign from malignant lesions.

#### CLINICAL RELEVANCE/APPLICATION

PI-RADS v2.1 recommends using ADC map calculated from intermediate b-value (800-1000 sec/mm<sup>2</sup>) to avoid diffusion kurtosis effect. Results of this cohort shows superior performance of ADC1600 for visualization and characterization of prostate lesions.

### The Power of PI-QUAL Metrics and Multidisciplinary Collaboration: Building a Robust and Comfortable Non-endorectal Prostate MRI Protocol

Monday, Nov. 27 8:00AM - 9:00AM Room: S405

Scott H. Robertson, PhD (*Presenter*) Nothing to Disclose

#### PURPOSE

To utilize PI-QUAL scoring to assess the efficacy of protocol optimizations in enhancing the image quality of non-endorectal multiparametric prostate MRI. Furthermore, we aim to quantify the inter-reader agreement of PI-QUAL scores between radiologists, technologists, and physicists to determine whether future PI-QUAL investigations should incorporate a broader scope of team-members.

#### METHODS AND MATERIALS

This retrospective IRB-approved study considered 1114 multiparametric prostate MRI exams that were obtained according to the PI-RADS v2/2.1 guidelines during a national quality improvement project. Each exam was scored according to the PI-QUAL standard, which provided both ratings of overall exam-level image quality as well as descriptors of image quality at the pulse sequence level. A set of 4 radiologists, 2 technologists, and 1 medical physicist audited an additional 150 exams that spanned both pre- and post-improvement phases to assess overall improvement. The two-tailed Wilcoxon rank sum test was used to assess differences in image quality between the exams. Inter-reader variability was assessed in 100 exams using the percent majority agreement and the average standard deviation of PI-QUAL scores between evaluators.

#### RESULTS

Average PI-QUAL scores improved from  $3.67 \pm 0.75$  to  $4.16 \pm 0.59$  ( $p < 0.01$ ) after implementing a series of protocol changes to address common image quality issues. Distortion in DWI was reduced from 21.6% (41/190) to 11.5% (30/261) by adopting R/L rather than A/P phase encoding ( $p < 0.01$ ). Similarly, T2WI breathing motion artifacts were reduced from 34.6% (94/272) to 12.8% (23/179) with R/L phase encoding ( $p < 0.01$ ). DWI wraparound artifact was mitigated by employing a full-pelvis shim and enabling the abdomen shim option. The occurrence of low-SNR was reduced from 19.4% (19/98) to 6.3% (10/160) by instituting a 200-lb weight-limit for using an ERC ( $p < 0.01$ ). The percent majority agreement was similar between radiologists, technologists and physicists, and all evaluators combined (72%, 77%, and 67%, respectively).

#### CONCLUSION

PI-QUAL is a highly useful tool for assessing image quality at the exam-level and for assessing the effects of MR protocol changes at the individual sequence level. PI-QUAL can be used by radiologists as well as other members of the MRI team, including physicists and technologists. Increasing multidisciplinary participation could substantially impact the performance of future QI studies.

#### CLINICAL RELEVANCE/APPLICATION

PI-QUAL scores offer valuable insights at the exam- and series-level for optimizing protocols. Broadening the scope of PI-QUAL reviewers could provide more holistic and effective quality improvement initiatives.

### Inter-rater Reproducibility of the Prostate Imaging Quality (PI-QUAL) Score: A Multi-reader from Multicenter Study with Large Sample Size Data

Monday, Nov. 27 8:00AM - 9:00AM Room: S405

Liang Wang (*Presenter*) Nothing to Disclose

#### PURPOSE

To investigate the inter-rater reproducibility of the Prostate imaging quality (PI-QUAL) for multiparametric magnetic resonance imaging (mpMRI) in a multireader from multicenter study.

#### METHODS AND MATERIALS

Patients who underwent mpMRI and 24-core coaxial needle saturation biopsy of the prostate by the transperineal approach between January 2019 and February 2020 were retrospectively included. The mpMRI included multiplanar T2-weighted imaging (T2WI), Diffusion-weighted imaging (DWI), and dynamic contrast-enhanced imaging (DCE). Three readers from different general medical centers with at least 6 years of experience in diagnostic imaging independently assessed the PI-QUAL score of each mpMRI sequence. Training was conducted before scoring. Inter-rater agreement was assessed using Kendall's w-coefficient. Pairwise agreement was assessed using Cohen's kappa coefficient.

#### RESULTS

Of 813 patients, 595 patients were enrolled. The three readers had strong agreement in PI-QUAL scores, Kendall's w coefficient was 0.678. Moderate to strong agreement was observed when comparing the three sequences individually, for the T2WI sequence, Kendall's w coefficient was 0.579; for the DWI sequence, Kendall's w coefficient was 0.763; for DCE sequences, Kendall's w coefficient was 0.666. Furthermore, the kappa value between R1 and R2 was 0.71 (95% CI: 0.65-0.76), the kappa value between R1 and R3 was 0.75 (95% CI: 0.70-0.80), the kappa value between R2 and R3 was 0.75 (95% CI: 0.70-0.80).

#### CONCLUSION

PI-QUAL not only has good inter-reader consistency, but also has high reproducibility among physicians from different centers.

#### CLINICAL RELEVANCE/APPLICATION

Our study observed that simplification is likely inevitable for future iterations of the PI-QUAL based on a 5-point scale or simplified into a 3-point scale.

### AI-based Reconstruction Improves Image Quality and Shortens Acquisition Time in DWI for Multiparametric Prostate MRI

Monday, Nov. 27 8:00AM - 9:00AM Room: S405

Elene Iordanishvili, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

Multiparametric prostate MRI (mpMRI) and its standardization using the prostate imaging reporting and data system (PIRADS) have increased the detection rate of clinically significant prostate cancers. Yet, MRI availability is limited, and the exam is time consuming. Diffusion weighted imaging (DWI) is an essential sequence to diagnose prostate cancer. However, it suffers from low signal-to-noise (SNR) and contrast-to-noise ratios (CNR). Recently, reconstruction techniques using artificial intelligence (AI) have shown to improve T2w image quality and shorten acquisition time (TA). To evaluate image quality and diagnostic capability of an AI-reconstructed DWI sequence for mpMRI.

#### METHODS AND MATERIALS

Ongoing study, so far including 45 consecutive patients undergoing standardized mpMRI (including T2wTSE, T1w dynamic CE GRE and DWI with ADC map) on a 3T system. Patients received a standard (std) and AI-DWI sequence with ADC maps (b 50, 400, 1000 s/mm<sup>2</sup>) plus a separate b1400 s/mm<sup>2</sup>). AI-DWI used less averages than std-DWI. Std-DWI image reconstruction employed Compressed SENSE (CS). AI-DWI image reconstruction was based on the Adaptive-CS-Net, i.e., including a convolutional neural network. 2 blinded radiologists assessed the PIRADS category for each patient based on the standard protocol first with AI-and then with std-DWI. Image quality (noise, delineation of lesion, artefacts) was ranked on a 10-point Likert scale. ROI-based apparent SNR and CNR were calculated for semiquantitative analysis. Significance was tested using a generalised linear model.

#### RESULTS

All patients were assigned the same PIRADS category based on std-, as well as AI-DWI. Regarding image quality, AI-DWI was ranked significantly less noisy than the std-DWI (median noise 5 vs 7;  $p < 0.001$ ). Delineation of lesions and presence of artefacts did not differ significantly between both sequences. CNR and SNR of the AI-ADC were significantly higher compared to the std-ADC (mean-CNR-AI-ADC = 9; mean-CNR-ADC = 8;  $P = 0.005$ ; mean-aSNR-AI-ADC = 10.5; mean-aSNR-ADC = 7;  $P = 0.001$ ). AI-b1400 showed higher aSNR and aCNR than the std-DWI, without statistical significance. TA was 3:12 minutes shorter for the AI-DWI compared to the std-DWI. (7:30 min vs. 4:18 min).

#### CONCLUSION

AI-reconstruction significantly improves DWI quality, while maintaining diagnostic certainty and reducing TA by 57 %.

#### CLINICAL RELEVANCE/APPLICATION

AI-DWI outperforms the standard DWI with regards to image quality and TA in patients, undergoing screening prostate MRI.

### Deep Learning-Based Interpretable AI for Prostate T2W MRI Quality Evaluation

Monday, Nov. 27 8:00AM - 9:00AM Room: S405

Mason Belue, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

To develop an image quality evaluation artificial intelligence (AI) model for T2 weighted (T2W) prostate MRI and to generate interpretable 3D quality heatmaps.

#### METHODS AND MATERIALS

This retrospective study included 994 patients scanned between January 2011 and December 2021 for clinical suspicion or follow-up of prostate cancer from an in-house institutional database (n=699) and public PROSTATEx dataset (n=294). T2W MRIs were given a quality score (class 0 = non-diagnostic, class 1 = equivocal, class 2 = diagnostic) based on evaluation of both general distortions (e.g., motion, distortion, noise, aliasing) and perceptual distortions (e.g., obscured delineation of prostatic capsule, prostatic zones, and excess rectal gas) by an expert genitourinary radiologist with 20 years of experience. A train-validation-test split of 70:15:15 was applied. All quality classification models were based on 3D DenseNet121 architecture using the MONAI framework. In addition to multi-classification, binary classification was utilized (Class 0/1 versus class 2). Partial occlusion sensitivity maps were generated for anatomical correlation. Reproducibility of quality scores was assessed within a subset of the testing dataset (60 cases, with quality score distribution of 1:1:1) in a blinded reader study with two experienced body radiologists, evaluated using weighted Cohen Kappa.

#### RESULTS

Best validation multi-class accuracy of 77% was achieved during training. In the test dataset (149 cases, 101 class 2, 31 class 1, and 17 class 0), the multi-classification accuracy was 72.5% (108/149) whereas the binary accuracy was 83.9% (125/149). The sub-class sensitivity for binary quality distortion classification for class 0 was 100% (17/17) and the sub-class specificity for T2W classification of the absence of any quality distortions for class 2 was 89.1% (90/101). Within the multi-reader study for 3-class quality, both readers showed moderate to substantial agreement with ground truth ( $\kappa = 0.59$ ,  $\kappa = 0.65$  respectively), substantial agreement with each other ( $\kappa = 0.60$ ), and moderate agreement with AI ( $\kappa = 0.42$ ,  $\kappa = 0.43$  respectively). 3D quality heatmap evaluation revealed that the most important non-diagnostic quality imaging features from the AI perspective were interslice motion, rectal gas, and obscured capsule/prostatic zones.

#### CONCLUSION

The 3D AI model can assess prostate T2W image quality with moderate accuracies and can translate whole sequence-level classification labels into 3D voxel-level quality heatmaps.

#### CLINICAL RELEVANCE/APPLICATION

Image quality has a significant downstream impact on ruling out clinically significant cancers. AI may be able to help with reproducible identification of MRI sequences requiring re-acquisition with explainability.

#### Sub-Events

### **M1-SSIR01-New Therapeutic Strategy in Biliary Stenosis in Liver Transplant Pediatric Patients: Biodegradable Stent as One-step Treatment**

Manuel Perez Toran (*Presenter*) Nothing to Disclose

#### **PURPOSE**

To present the effectiveness of one-step treatment of biliary strictures in liver-transplant pediatric patients.

#### **METHODS AND MATERIALS**

Post-transplant biliary strictures treated with biodegradable biliary stents in one time (2013- 2022) were reviewed. The following data were collected: epidemiological data of patients and transplantation, type of stricture (choledochocholedochal / bilioenteric), degree of bile duct dilatation, pre-dilatation of stricture (balloon size), number and dimensions of the stents, subsequent dilatation (balloon size), technical and clinical success (primary patency at 12 months), intravenous antibiotic regimen peri- and post-procedure, and analytical data before and up to 12 months post-procedure.

#### **RESULTS**

17 procedures in 16 patients (mean 7.4 years [8m-18y]). Anastomotic stenosis in 68.8% (68.8% bilioenteric, 31.32% choledochocholedochal), 20% multiple stenosis and 12.5% stenosis associated with biliary leak. Two patients (12.5%) had a previous arterial complication (stenosis and thrombosis). The 87.5% had dilatation proximal to the stenosis. Predilatation of the stenosis was performed in 88.2% (balloons 53.4% 6 mm; 26.6% 7 mm; 20% 8 mm) and post-stent dilatation in 73.3% (balloons 16.67% 6 mm; 50% 7 mm; 33.3% 8 mm). 100% of intrahepatic tract embolization performed and 100% technical and clinical success were obtained at 12 months.

#### **CONCLUSION**

One-step treatment of biliary strictures in liver transplant pediatric patients is safe and effective, reducing the number of general anesthesia, days of hospitalization, morbidity (due to the absence of drainage catheter) and improving the quality of life of the child and family.

#### **CLINICAL RELEVANCE/APPLICATION**

It may be considered in the future as the treatment of choice in pediatric transplant patients.

### **M1-SSIR01-Pulmonary Arteriovenous Malformation Embolization with 0.018 coils: Long-Term Safety, Efficacy and Persistence Rate Comparison with Amplatzer Vascular Plugs**

Alexander Botsford, MD, FRCPC (*Presenter*) Nothing to Disclose

#### **PURPOSE**

Micro-coils are increasingly popular for pulmonary arteriovenous malformations (PAVMs) embolization due to their small atraumatic delivery system and their detachability but their safety and efficacy to embolize PAVMs is not well documented. The purpose of this study is to compare the safety and efficacy of 0.018 coils to Amplatzer Vascular Plugs (AVP) for PAVM embolization.

## METHODS AND MATERIALS

All 157 patients who underwent 633 PAVM embolizations between November 2002 and August 2020 were evaluated retrospectively. PAVMs with multiple feeders, those with no follow up or with missing data and those not embolized with 0.018 coils or AVP were excluded. Remaining PAVMs embolizations were split into 4 groups according to the embolization material: 1- non-fibered 0.018 coils (NFC), 2- fibered 0.018 coils (FC), 3- combination of NFC and FC, 4- AVP. PAVM persistence was defined as persistent flow through coils or from adjacent pulmonary arteries on DSA or as <30% diameter reduction of the aneurysmal sac on CT. Kaplan-Meier analysis and cox regression were used to assess PAVM persistence free survival.

## RESULTS

A total of 109 patients (30 men and 79 women; mean age, 49 years; age range, 33-65 years) who underwent embolization of 312 PAVMs with NFC (43 PAVMs), FC (127 PAVMs), combination of NFC and FC (12 PAVMs) or AVP (130 PAVMs) were included. PAVM feeding artery diameter and distance between embolization devices and PAVM aneurysmal sac were larger in the AVP than in the 0.018 coil group ( $p < 0.0001$  and  $p = 0.10$ ; respectively). Technical success was 100% (312/312), with no major complication. Re-embolizations rates were 44.2% (19/43); 22.9% (29/127) and 6.2% (8/130) for PAVMs treated with NFC, FC and AVP respectively. There were 0.44 (80/182) and 0.07 (9/130) re-embolization procedures per PAVM in the 0.018 coils and AVP groups, respectively. PAVM persistence free survival rates at 10 years follow-up were 40.8% and 44.7% in the NFC and FC groups ( $p = 0.22$ ) and 47.3% and 81% in the 0.018 coil (NFC+FC) and AVP groups ( $p < 0.0001$ ). In multivariate analysis, the distance between embolization devices and PAVM aneurysmal sac was associated to PAVM persistence ( $p = 0.017$ ) but the PAVM feeding artery diameter was not ( $p = 0.934$ ).

## CONCLUSION

PAVM embolization with 0.018 coils was associated with a significantly higher PAVM persistence and re-embolization rates in comparison with AVP. PAVMs persistence rate was not significantly improved with 0.018 FC than with 0.018 NFC.

## CLINICAL RELEVANCE/APPLICATION

Although 0.018 coils are safe and effective for PAVM embolization, they are associated with high reperfusion and re-embolization rates and, hence, other embolization material should be preferred whenever possible.

## M1-SSIR01-Factors Associated with Initial Incomplete Ablation for Benign Thyroid Nodules after Radiofrequency Ablation: First Results of CEUS Evaluation

Chong-Ke Zhao, PhD (*Presenter*) Nothing to Disclose

## PURPOSE

To assess the factors associated with initial incomplete ablation (ICA) after radiofrequency ablation for benign thyroid nodules (BTNs).

## METHODS AND MATERIALS

A total of 69 BTNs (mean volume  $6.35 \pm 5.66$  ml, range 1.00-25.04 ml) confirmed by fine-needle aspiration cytology (FNAC) in fifty-four patients were treated with ultrasound-guided percutaneous radiofrequency ablation (RFA) and the local treatment efficacy was immediately assessed by intra-procedural contrast-enhanced ultrasound (CEUS). The RFA was performed with a bipolar electrode (CelonProSurge 150-T20, output power: 20 W). CEUS was performed with a second-generation contrast agent under low acoustic power (i.e. coded phase inversion, CPI). Characteristics of clinical factors, findings on conventional gray-scale ultrasound, color-Doppler ultrasound, and CEUS were evaluated preoperatively. Factors associated with initial ICA and initial ICA patterns on CEUS were assessed. Volume reduction ratios (VRRs) of ICA nodules were compared with those with complete ablation (CA).

## RESULTS

The RFA procedures were accomplished with a mean ablation time and mean total energy deposition of  $11.13 \pm 3.39$  min (range, 5.38-22.13 min) and  $12612 \pm 4466$  J (range, 6310-26130 J) respectively. CEUS detected initial ICA in 21 of 69 (30.8%) BTNs and 16 (76.2%) of the 21 BTNs with initial ICA achieved CA after additional RFA, leading to a final CA rate of 92.8% (64/69). The factors associated with initial ICA were predominantly solid nodule, nodule close to danger triangle area, nodule close to carotid artery, and peripheral blood flow on color-Doppler ultrasound (all  $P < 0.05$ ). The mean VRRs of all BTNs were 23.4%, 54.4% and 81.9% at the 1-, 3- and 6-month follow-up, respectively. All BTNs achieved therapeutic success in this series in that all had VRRs of >50% at the 6-month follow-up, among which 7 nodules (10.1%) had VRRs of >90%. There were significant differences in VRRs between ICA nodules and CA nodules at the 3- and 6-month follow-up (all  $P < 0.05$ ).

## CONCLUSION

The factors associated with initial ICA after RFA for BTNs were predominantly solid nodules, nodule close to danger triangle area, nodule close to carotid artery, and peripheral blood flow on color-Doppler ultrasound.

## CLINICAL RELEVANCE/APPLICATION

The factors associated with initial ICA after RFA for BTNs were predominantly solid nodules, nodule close to danger triangle area, nodule close to carotid artery, and peripheral blood flow on color-Doppler ultrasound. CEUS assists quick treatment response evaluation and facilitates subsequent additional RFA and final CA of the nodules. Nodules with CA achieve a better outcome in terms of VRR in comparison with those with ICA.

### **M1-SSIR01-Prospective Margin Estimates Predict Local Tumor Progression Following Microwave Ablation of Small Renal Masses**

Franklin Iheanacho, BA (*Presenter*) Nothing to Disclose

#### **PURPOSE**

To evaluate the relationship between prospectively generated ablative margin estimates and local tumor progression (LTP) among patients undergoing microwave ablation (MWA) of small renal masses (SRM).

#### **METHODS AND MATERIALS**

This HIPAA-compliant study was performed with a waiver for informed consent following institutional review board approval. Between 2017 and 2020, all patients who underwent MWA for SRM at one institution were retrospectively identified. Prior to MWA, manual segmentation of tumor and kidney shapes was performed in 3DSlicer using contrast-enhanced CT or MR imaging. During the MWA procedure, these shapes were coregistered with helical non-contrast CT images obtained after MWA antenna placement. Predicted ablation zone shape and size (based on manufacturer estimates) were then overlaid onto the resultant model based on antenna-tumor geometry. A model-to-model distance algorithm was employed to calculate multiple ablative margin estimates including mean, median, first and third quartiles (Q1, Q3), minimum, maximum, standard deviation, range, and variance. All patients were followed with CT imaging to assess for LTP. LTP was modeled as a function of each margin estimate by hazard regression, and models were evaluated using hazard ratios and Akaike information criterion (AIC). Receiver operating characteristic curve area under the curve (ROC-AUC) was estimated using Harrell's and Uno's C indices. Significance was set at  $p=0.05$ .

#### **RESULTS**

128 consecutive patients were evaluated (median age, 72.1 years; 55.5% male). Mean tumor diameter was  $2.4 \pm 0.9$  cm. Median follow-up duration was 1.2 years. LTP was observed in nine (7%) patients. Analysis showed Q1, minimum, and average estimated ablative margins were significantly associated with LTP. For every one-unit increase of Q1 margin, the hazard of recurrence increased 67% (HR: 1.67 [1.25-2.20],  $p= 0.002$ ) with an ROC-AUC of .93 (Uno) and .77 (Harrell). Likewise, for every one-unit increase of minimum ablative margin, the hazard of recurrence increased 32% (HR: 1.32 [1.09-1.60],  $p= 0.007$ ) with an ROC-AUC of .93 (Uno) and .76 (Harrell). Finally, for every one-unit increase of mean margin, the hazard of recurrence increased 48% (HR: 1.48 [1.18-1.85],  $p= 0.013$ ) with an ROC-AUC of .83 (Uno) and .75 (Harrell). Other margin estimates were not associated with significant LTP risk.

#### **CONCLUSION**

Prospectively generated ablative margin estimates can be used to predict local tumor progression risk following microwave ablation of small renal masses.

## CLINICAL RELEVANCE/APPLICATION

Prognostic margin estimates obtained during microwave ablation procedures may allow interventional radiologists to modify treatment approach in real-time to optimize outcomes for patients with small renal masses.

### **Pulmonary Arteriovenous Malformation Embolization with 0.018 coils: Long-Term Safety, Efficacy and Persistence Rate Comparison with Amplatzer Vascular Plugs**

Monday, Nov. 27 8:00AM - 9:00AM Room: N229

Alexander Botsford, MD, FRCPC (*Presenter*) Nothing to Disclose

#### **PURPOSE**

Micro-coils are increasingly popular for pulmonary arteriovenous malformations (PAVMs) embolization due to their small atraumatic delivery system and their detachability but their safety and efficacy to embolize PAVMs is not well documented. The purpose of this study is to compare the safety and efficacy of 0.018 coils to Amplatzer Vascular Plugs (AVP) for PAVM embolization.

#### **METHODS AND MATERIALS**

All 157 patients who underwent 633 PAVM embolizations between November 2002 and August 2020 were evaluated retrospectively. PAVMs with multiple feeders, those with no follow up or with missing data and those not embolized with 0.018 coils or AVP were excluded. Remaining PAVMs embolizations were split into 4 groups according to the embolization material: 1- non-fibered 0.018 coils (NFC), 2- fibered 0.018 coils (FC), 3- combination of NFC and FC, 4- AVP. PAVM persistence was defined as persistent flow through coils or from adjacent pulmonary arteries on DSA or as <30% diameter reduction of the aneurysmal sac on CT. Kaplan-Meier analysis and cox regression were used to assess PAVM persistence free survival.

#### **RESULTS**

A total of 109 patients (30 men and 79 women; mean age, 49 years; age range, 33-65 years) who underwent embolization of 312 PAVMs with NFC (43 PAVMs), FC (127 PAVMs), combination of NFC and FC (12 PAVMs) or AVP (130 PAVMs) were included. PAVM feeding artery diameter and distance between embolization devices and PAVM aneurysmal sac were larger in the AVP than in the 0.018 coil group ( $p < 0.0001$  and  $p = 0.10$ ; respectively). Technical success was 100% (312/312), with no major complication. Re-embolizations rates were 44.2% (19/43); 22.9% (29/127) and 6.2% (8/130) for PAVMs treated with NFC, FC and AVP respectively. There were 0.44 (80/182) and 0.07 (9/130) re-embolization procedures per PAVM in the 0.018 coils and AVP groups, respectively. PAVM persistence free survival rates at 10 years follow-up were 40.8% and 44.7% in the NFC and FC groups ( $p = 0.22$ ) and 47.3% and 81% in the 0.018 coil (NFC+FC) and AVP groups ( $p < 0.0001$ ). In multivariate analysis, the distance between embolization devices and PAVM aneurysmal sac was associated to PAVM persistence ( $p = 0.017$ ) but the PAVM feeding artery diameter was not ( $p = 0.934$ ).

#### **CONCLUSION**

PAVM embolization with 0.018 coils was associated with a significantly higher PAVM persistence and re-embolization rates in comparison with AVP. PAVMs persistence rate was not significantly improved with 0.018 FC than with 0.018 NFC.

#### **CLINICAL RELEVANCE/APPLICATION**

Although 0.018 coils are safe and effective for PAVM embolization, they are associated with high reperfusion and re-embolization rates and, hence, other embolization material should be preferred whenever possible.

### Factors Associated with Initial Incomplete Ablation for Benign Thyroid Nodules after Radiofrequency Ablation: First Results of CEUS Evaluation

Monday, Nov. 27 8:00AM - 9:00AM Room: N229

Chong-Ke Zhao, PhD (*Presenter*) Nothing to Disclose

#### PURPOSE

To assess the factors associated with initial incomplete ablation (ICA) after radiofrequency ablation for benign thyroid nodules (BTNs).

#### METHODS AND MATERIALS

A total of 69 BTNs (mean volume  $6.35 \pm 5.66$  ml, range 1.00-25.04 ml) confirmed by fine-needle aspiration cytology (FNAC) in fifty-four patients were treated with ultrasound-guided percutaneous radiofrequency ablation (RFA) and the local treatment efficacy was immediately assessed by intra-procedural contrast-enhanced ultrasound (CEUS). The RFA was performed with a bipolar electrode (CelonProSurge 150-T20, output power: 20 W). CEUS was performed with a second-generation contrast agent under low acoustic power (i.e. coded phase inversion, CPI). Characteristics of clinical factors, findings on conventional gray-scale ultrasound, color-Doppler ultrasound, and CEUS were evaluated preoperatively. Factors associated with initial ICA and initial ICA patterns on CEUS were assessed. Volume reduction ratios (VRRs) of ICA nodules were compared with those with complete ablation (CA).

#### RESULTS

The RFA procedures were accomplished with a mean ablation time and mean total energy deposition of  $11.13 \pm 3.39$  min (range, 5.38-22.13 min) and  $12612 \pm 4466$  J (range, 6310-26130 J) respectively. CEUS detected initial ICA in 21 of 69 (30.8%) BTNs and 16 (76.2%) of the 21 BTNs with initial ICA achieved CA after additional RFA, leading to a final CA rate of 92.8% (64/69). The factors associated with initial ICA were predominantly solid nodule, nodule close to danger triangle area, nodule close to carotid artery, and peripheral blood flow on color-Doppler ultrasound (all  $P < 0.05$ ). The mean VRRs of all BTNs were 23.4%, 54.4% and 81.9% at the 1-, 3- and 6-month follow-up, respectively. All BTNs achieved therapeutic success in this series in that all had VRRs of  $>50\%$  at the 6-month follow-up, among which 7 nodules (10.1%) had VRRs of  $>90\%$ . There were significant differences in VRRs between ICA nodules and CA nodules at the 3- and 6-month follow-up (all  $P < 0.05$ ).

#### CONCLUSION

The factors associated with initial ICA after RFA for BTNs were predominantly solid nodules, nodule close to danger triangle area, nodule close to carotid artery, and peripheral blood flow on color-Doppler ultrasound.

#### CLINICAL RELEVANCE/APPLICATION

The factors associated with initial ICA after RFA for BTNs were predominantly solid nodules, nodule close to danger triangle area, nodule close to carotid artery, and peripheral blood flow on color-Doppler ultrasound. CEUS assists quick treatment response evaluation and facilitates subsequent additional RFA and final CA of the nodules. Nodules with CA achieve a better outcome in terms of VRR in comparison with those with ICA.

### Prospective Margin Estimates Predict Local Tumor Progression Following Microwave Ablation of Small Renal Masses

Monday, Nov. 27 8:00AM - 9:00AM Room: N229

Franklin Iheanacho, BA (*Presenter*) Nothing to Disclose

#### PURPOSE

To evaluate the relationship between prospectively generated ablative margin estimates and local tumor progression (LTP) among patients undergoing microwave ablation (MWA) of small renal masses (SRM).

#### METHODS AND MATERIALS

This HIPAA-compliant study was performed with a waiver for informed consent following institutional review board approval. Between 2017 and 2020, all patients who underwent MWA for SRM at one institution were retrospectively identified. Prior to MWA, manual segmentation of tumor and kidney shapes was performed in 3DSlicer using contrast-enhanced CT or MR imaging. During the MWA procedure, these shapes were coregistered with helical non-contrast CT images obtained after MWA antenna placement. Predicted ablation zone shape and size (based on manufacturer estimates) were then overlaid onto the resultant model based on antenna-tumor geometry. A model-to-model distance algorithm was employed to calculate multiple ablative margin estimates including mean, median, first and third quartiles (Q1, Q3), minimum, maximum, standard deviation, range, and variance. All patients were followed with CT imaging to assess for LTP. LTP was modeled as a function of each margin estimate by hazard regression, and models were evaluated using hazard ratios and Akaike information criterion (AIC). Receiver operating characteristic curve area under the curve (ROC-AUC) was estimated using Harrell's and Uno's C indices. Significance was set at  $p=0.05$ .

#### RESULTS

128 consecutive patients were evaluated (median age, 72.1 years; 55.5% male). Mean tumor diameter was  $2.4 \pm 0.9$  cm. Median follow-up duration was 1.2 years. LTP was observed in nine (7%) patients. Analysis showed Q1, minimum, and average estimated ablative margins were significantly associated with LTP. For every one-unit increase of Q1 margin, the hazard of recurrence increased 67% (HR: 1.67 [1.25-2.20],  $p= 0.002$ ) with an ROC-AUC of .93 (Uno) and .77 (Harrell). Likewise, for every one-unit increase of minimum ablative margin, the hazard of recurrence increased 32% (HR: 1.32 [1.09-1.60],  $p= 0.007$ ) with an ROC-AUC of .93 (Uno) and .76 (Harrell). Finally, for every one-unit increase of mean margin, the hazard of recurrence increased 48% (HR: 1.48 [1.18-1.85],  $p= 0.013$ ) with an ROC-AUC of .83 (Uno) and .75 (Harrell). Other margin estimates were not associated with significant LTP risk.

#### CONCLUSION

Prospectively generated ablative margin estimates can be used to predict local tumor progression risk following microwave ablation of small renal masses.

#### CLINICAL RELEVANCE/APPLICATION

Prognostic margin estimates obtained during microwave ablation procedures may allow interventional radiologists to modify treatment approach in real-time to optimize outcomes for patients with small renal masses.

##### M1-SSNMMI02-2 **<sup>18</sup>F-Fluorothantrate Pharmacokinetics and Metabolism in Breast Cancer: Implications for PARP Inhibitor Binding and Translational Imaging**

Anthony J. Young, BS (*Presenter*) Nothing to Disclose

#### PURPOSE

PARP-1 is a DNA repair enzyme targeted for cancer therapy via PARP inhibitors (PARPi). PARPi have variable efficacy in breast and other cancers, and a biomarker to predict response is an unmet clinical need. PARPi binding is poorly understood, but one hypothesized mechanism is trapping activated PARP-1 on DNA, preventing repair and triggering cell death. <sup>18</sup>F-Fluorothantrate (<sup>18</sup>F-FTT) is a PARPi-based radioligand that has shown promise as a non-invasive predictor of PARPi engagement and clinical efficacy. To aid ongoing clinical trials of <sup>18</sup>F-FTT and development of PARP-1 theranostics, we sought to investigate the kinetics and metabolism of <sup>18</sup>F-FTT, relate them to PARP-1 expression, and provide imaging recommendations.

#### METHODS AND MATERIALS

30 women with breast cancer underwent dynamic <sup>18</sup>F-FTT PET/CT. Tumor activity was measured and modeled with normal breast and muscle reference tissues to calculate distribution volume ratios (DVR) in PMOD. A two-tissue compartmental model was used to calculate total volumes of distribution (VT). DVR, VT, static standardized uptake values (SUV), and SUV to normal tissue ratios (SUVR) were tested for correlations with PARP-1 expression in surgical resections. In mouse xenograft models, uptake and radiometabolite concentrations in tumor, blood, and muscle were compared with histology and microPET imaging.

#### RESULTS

Pharmacokinetics were well fit by reference region models of reversible binding, however, blood input models assuming negligible metabolite uptake were unstable. In vivo DVR of <sup>18</sup>F-FTT in breast cancer correlated with ex vivo PARP-1 expression,  $r = 0.72$ ,  $p = 0.02$ ,  $n = 10$ . SUVR at 40-60 minutes highly correlated with DVR estimates,  $r^2 = 0.88$ ,  $p < 1 \times 10^{-13}$ ,  $n = 30$ . <sup>18</sup>F-FTT metabolism was faster in mice than humans, and tumor and muscle showed similarly significant metabolites uptake.

#### CONCLUSION

<sup>18</sup>F-FTT uptake in breast cancer is associated with PARP-1 expression, and imaging 40-60 minutes post-injection reasonably estimates kinetics, corroborating findings in ovarian cancer. <sup>18</sup>F-FTT quantitation is likely influenced by metabolites, which can be partially controlled for via reference tissue modeling to estimate specific binding. Rapid metabolism in mice suggests earlier imaging may reduce noise. Similar metabolite uptake in tumor and muscle supports normalization to muscle reference tissue. The significant tumor concentration of <sup>18</sup>F-FTT metabolites suggests PARPi studies may benefit from characterization of metabolites for insight into binding pathways.

## CLINICAL RELEVANCE/APPLICATION

18F-FTT can serve as a biomarker for PARPi in breast cancer. Ongoing clinical trials could benefit from standardized PET imaging protocols and theranostics may be informed by additional study of radiometabolites.

### **M1-SSNMMI02-3 18F-FDG PET-CT Versus Conventional Staging in Patients with Locally Advanced Breast Cancer: A Randomised Trial (PETABC)**

Ur Metser, MD, FRCPC (*Presenter*) Consultant, POINT Biopharma Inc

#### PURPOSE

Staging tests are performed when a patient presents with locally advanced breast cancer (LABC). Treatment is combined modality therapy of curative intent (neoadjuvant chemotherapy, surgery, and regional radiation) if no metastases are found. Positive emission tomography-computed tomography (PET-CT) can detect more asymptomatic distant metastases than conventional staging, but the evidence is based on uncontrolled studies. We hypothesized that PET-CT would identify more patients with metastatic breast cancer than staging with usual imaging tests, and that upstaging to Stage IV breast cancer would change treatment away from multimodality therapy of curative intent.

#### METHODS AND MATERIALS

For inclusion, patients had histological evidence of invasive ductal carcinoma of the breast; TNM Stage III or Stage IIb (T3N0, but not T2N1). Consenting patients from six regional cancer centres in Ontario were randomized to 18F-Fluorodeoxyglucose PET-CT or conventional staging (bone scan, CT chest/abdomen and pelvis). The primary endpoint was upstaging to Stage IV. A key secondary outcome was receiving curative intent combined modality therapy. Trial registration number NCT02751710.

#### RESULTS

Between December 2016 and April 2022, 184 patients were randomized to whole body PET-CT and 185 patients to conventional staging. Forty-three (23%) PET-CT patients were upstaged to Stage 4 compared to 21 (11%) conventional staged patients, absolute difference, 12.3%; 95% CI, 3.9 to 19.9; P = 0.002. Consequently, treatment was changed in 35 (81.3%) of 43 upstaged PET-CT patients and 20 (95.2%) of the 21 upstaged conventional patients. Subsequently, 149 (81%) in the PET-CT group received combined modality treatment versus 165 (89.2%) in the conventional staging group, absolute difference, 8.2%; 95% CI, 0.1 to 15.4; P = 0.03.

#### CONCLUSION

In patients with LABC, PET-CT detected more distant metastases than conventional staging and fewer PET-CT patients received curative intent combined modality therapy. Our randomized trial demonstrates the utility of the PET-CT staging strategy.

## CLINICAL RELEVANCE/APPLICATION

\* PET-CT upstages to stage IV more often than conventional imaging (CT chest, abdomen and pelvis bone scintigraphy).\* This impacts patient management with fewer patients receiving combined modality therapy after PET than after conventional workup.\* The results have had policy implications in our jurisdiction with PET-CT now being funded for this indication in Ontario.

### **M1-SSNMMI02-4 Prospective Evaluation of N- and M-staging in Conventional Imaging, MRI and 18F-FDG PET/MRI in Newly Diagnosed Breast Cancer**

Janna Morawitz, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

To compare the diagnostic potential of whole-body MRI, whole-body 18F-FDG PET/MRI and conventional staging (CT, axillary sonography and bone scintigraphy) for N and M staging in newly diagnosed breast cancer

#### METHODS AND MATERIALS

208 patients (age 53.5±12.0 years) with newly diagnosed breast cancer were prospectively included in this study. All patients underwent whole-body 18F-FDG PET/MRI, thoracoabdominal CT, whole-body scintigraphy and axillary sonography. Images were evaluated separately regarding lesion count, lesion localization, and lesion characterization. Histopathology and follow-up imaging served as reference standard. A McNemar test was used to compare diagnostic performance of 18F-FDG PET/MRI, MRI and conventional staging

#### RESULTS

In N-staging conventional imaging (axillary sonography and CT combined) showed a sensitivity of 80.9%, a specificity of 99.2%, a positive predictive value of 98.6%, a negative predictive value of 87.4%, and an accuracy of 91.4%. The corresponding values for MRI were 79.6%, 100.0%, 100.0%, 87.0%, and 91.4%, and for 18F-FDG PET/MRI 86.5%, 94.1%, 91.7%, 90.3%, and 90.9%. The differences between conventional imaging and PET/MRI (p<0.001) and MRI and PET/MRI

( $p=0.005$ ) were statistically significant. 18FDG PET/MRI classified 94.8% of the nodal positive patients into the correct cN stage (cN1-cN3c). The results for MRI and conventional imaging were 82.9% and 75.0%, respectively. For M staging, conventional imaging (CT and bone scintigraphy combined) showed a sensitivity of 83.3%, a specificity of 98.5%, a positive predictive value of 76.9%, a negative predictive value of 98.9%, and an accuracy of 97.6%. The corresponding values for MRI and 18F-FDG PET/MRI were 100.0%, 98.5%, 80.0%, 100.0% and 98.6% respectively. There were no significant differences in the detection of distant metastases in 18F-FDG PET/MRI and MRI compared to conventional imaging ( $p=0.705$  and  $p=0.157$ ).

#### CONCLUSION

In nodal staging of primary breast cancer patients  $^{18}\text{F}$ -FDG PET/MRI showed a significantly better diagnostic performance than MRI alone and conventional staging. No significant differences were seen in the detection of distant metastases.

#### CLINICAL RELEVANCE/APPLICATION

$^{18}\text{F}$ -FDG PET/MRI can be reliably used for staging purpose in patients with newly diagnosed breast cancer.

### M1-SSNMMI02-5 **Is $^{18}\text{F}$ -fluciclovine or $^{68}\text{Ga}$ -PSMA PET Superior to Conventional Imaging in the Detection of Metastatic Breast Lobular Carcinoma?**

Aliza Mushtaq, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

To determine if  $^{18}\text{F}$ -fluciclovine or  $^{68}\text{Ga}$ -PSMA PET has superior detection of metastatic disease from invasive lobular carcinoma (ILC) of the breast compared with conventional imaging (CI) with either CT and bone scan, or  $^{18}\text{F}$ -FDG PET.

#### METHODS AND MATERIALS

20 women with de-novo or suspected recurrent ILC underwent two PET-CT scans after IV administration of mean  $9.7\pm 1.04$  (range: 7.14-10.9) mCi  $^{18}\text{F}$ -fluciclovine and mean  $4.9\pm 0.7$  (range: 2.9-5.5) mCi  $^{68}\text{Ga}$ -PSMA on separate days to allow for radiotracer decay. Uptake per patient as well as in 3 regions per patient: ipsilateral axillary lymph node (LN), extra-axillary LN (ipsilateral supraclavicular, internal mammary), or distant disease was interpreted by 3 readers in consensus and was compared to clinician choice of CI (CT/bone scan in 13 patients and  $^{18}\text{F}$ -FDG PET in 7 patients). True positive detection rate was calculated after comparison to a composite standard of truth (confirmatory imaging or biopsy), excluding false positive activity. SUVmax and tumor: background (blood pool) of the hottest lesion for each positive region was recorded for  $^{18}\text{F}$ -fluciclovine and  $^{68}\text{Ga}$ -PSMA to calculate mean uptake, and differences evaluated by T-test.

#### RESULTS

Conventional imaging detected metastasis in 5/20 patients in 7/60 regions (2 axillary, 2 extra-axillary and 3 distant).  $^{68}\text{Ga}$ -PSMA PET-CT detected metastasis in 7/20 patients in 7/60 regions (4 axillary and 3 distant).  $^{18}\text{F}$ -fluciclovine detected metastasis in 9/20 patients in 13/60 regions (5 axillary, 3 extra-axillary and 5 distant).  $^{18}\text{F}$ -fluciclovine was positive in all regions positive on PSMA. However, in 6 regions positive on  $^{18}\text{F}$ -fluciclovine,  $^{68}\text{Ga}$ -PSMA was negative. Mean SUVmax and T:B for  $^{18}\text{F}$ -fluciclovine ( $n=13$ ) was  $5.25(\pm 3.3)$  and  $3.7(\pm 2.3)$  respectively. Mean SUVmax and T:B for  $^{68}\text{Ga}$ -PSMA ( $n=9$ ) was  $3.84(\pm 3.42)$  and  $3.29(\pm 2.65)$ , respectively.  $p$ -value for the difference in SUVmax for  $^{18}\text{F}$ -fluciclovine and  $^{68}\text{Ga}$ -PSMA is 0.34 (ns) and  $p$ -value for the difference in T:B is 0.70 (ns).

#### CONCLUSION

$^{68}\text{Ga}$ -PSMA PET-CT has higher detection for metastases compared to CI on a patient, but not region level (ipsilateral axillary, extra-axillary, distant).  $^{18}\text{F}$ -fluciclovine PET-CT has higher detection for metastases compared to CI and  $^{68}\text{Ga}$ -PSMA on a patient and region level. Though  $^{18}\text{F}$ -fluciclovine seems to have higher SUVmax and T:B of lesions compared with  $^{68}\text{Ga}$ -PSMA, the differences are not statistically significant. One limitation of this study may be the small sample size and therefore larger trials are recommended.

#### CLINICAL RELEVANCE/APPLICATION

In the management of patients with ILC, novel molecular imaging, especially with  $^{18}\text{F}$ -fluciclovine PET-CT seems to result in greater metastases detection and deserves further study.

### **<sup>18</sup>F-Fluorothantrace Pharmacokinetics and Metabolism in Breast Cancer: Implications for PARP Inhibitor Binding and Translational Imaging**

Monday, Nov. 27 8:00AM - 9:00AM Room: E350

Anthony J. Young, BS (*Presenter*) Nothing to Disclose

#### **PURPOSE**

PARP-1 is a DNA repair enzyme targeted for cancer therapy via PARP inhibitors (PARPi). PARPi have variable efficacy in breast and other cancers, and a biomarker to predict response is an unmet clinical need. PARPi binding is poorly understood, but one hypothesized mechanism is trapping activated PARP-1 on DNA, preventing repair and triggering cell death. <sup>18</sup>F-Fluorothantrace (<sup>18</sup>F-FTT) is a PARPi-based radioligand that has shown promise as a non-invasive predictor of PARPi engagement and clinical efficacy. To aid ongoing clinical trials of <sup>18</sup>F-FTT and development of PARP-1 theranostics, we sought to investigate the kinetics and metabolism of <sup>18</sup>F-FTT, relate them to PARP-1 expression, and provide imaging recommendations.

#### **METHODS AND MATERIALS**

30 women with breast cancer underwent dynamic <sup>18</sup>F-FTT PET/CT. Tumor activity was measured and modeled with normal breast and muscle reference tissues to calculate distribution volume ratios (DVR) in PMOD. A two-tissue compartmental model was used to calculate total volumes of distribution (VT). DVR, VT, static standardized uptake values (SUV), and SUV to normal tissue ratios (SUVR) were tested for correlations with PARP-1 expression in surgical resections. In mouse xenograft models, uptake and radiometabolite concentrations in tumor, blood, and muscle were compared with histology and microPET imaging.

#### **RESULTS**

Pharmacokinetics were well fit by reference region models of reversible binding, however, blood input models assuming negligible metabolite uptake were unstable. In vivo DVR of <sup>18</sup>F-FTT in breast cancer correlated with ex vivo PARP-1 expression,  $r = 0.72$ ,  $p = 0.02$ ,  $n = 10$ . SUVR at 40-60 minutes highly correlated with DVR estimates,  $r^2 = 0.88$ ,  $p < 1 \times 10^{-13}$ ,  $n = 30$ . <sup>18</sup>F-FTT metabolism was faster in mice than humans, and tumor and muscle showed similarly significant metabolites uptake.

#### **CONCLUSION**

<sup>18</sup>F-FTT uptake in breast cancer is associated with PARP-1 expression, and imaging 40-60 minutes post-injection reasonably estimates kinetics, corroborating findings in ovarian cancer. <sup>18</sup>F-FTT quantitation is likely influenced by metabolites, which can be partially controlled for via reference tissue modeling to estimate specific binding. Rapid metabolism in mice suggests earlier imaging may reduce noise. Similar metabolite uptake in tumor and muscle supports normalization to muscle reference tissue. The significant tumor concentration of <sup>18</sup>F-FTT metabolites suggests PARPi studies may benefit from characterization of metabolites for insight into binding pathways.

#### **CLINICAL RELEVANCE/APPLICATION**

<sup>18</sup>F-FTT can serve as a biomarker for PARPi in breast cancer. Ongoing clinical trials could benefit from standardized PET imaging protocols and theranostics may be informed by additional study of radiometabolites.

### Is $^{18}\text{F}$ -fluciclovine or $^{68}\text{Ga}$ -PSMA PET Superior to Conventional Imaging in the Detection of Metastatic Breast Lobular Carcinoma?

Monday, Nov. 27 8:00AM - 9:00AM Room: E350

Aliza Mushtaq, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

To determine if  $^{18}\text{F}$ -fluciclovine or  $^{68}\text{Ga}$ -PSMA PET has superior detection of metastatic disease from invasive lobular carcinoma (ILC) of the breast compared with conventional imaging (CI) with either CT and bone scan, or  $^{18}\text{F}$ -FDG PET.

#### METHODS AND MATERIALS

20 women with de-novo or suspected recurrent ILC underwent two PET-CT scans after IV administration of mean  $9.7 \pm 1.04$  (range: 7.14-10.9) mCi  $^{18}\text{F}$ -fluciclovine and mean  $4.9 \pm 0.7$  (range: 2.9-5.5) mCi  $^{68}\text{Ga}$ -PSMA on separate days to allow for radiotracer decay. Uptake per patient as well as in 3 regions per patient: ipsilateral axillary lymph node (LN), extra-axillary LN (ipsilateral supraclavicular, internal mammary), or distant disease was interpreted by 3 readers in consensus and was compared to clinician choice of CI (CT/bone scan in 13 patients and  $^{18}\text{F}$ -FDG PET in 7 patients). True positive detection rate was calculated after comparison to a composite standard of truth (confirmatory imaging or biopsy), excluding false positive activity. SUVmax and tumor: background (blood pool) of the hottest lesion for each positive region was recorded for  $^{18}\text{F}$ -fluciclovine and  $^{68}\text{Ga}$ -PSMA to calculate mean uptake, and differences evaluated by T-test.

#### RESULTS

Conventional imaging detected metastasis in 5/20 patients in 7/60 regions (2 axillary, 2 extra-axillary and 3 distant).  $^{68}\text{Ga}$ -PSMA PET-CT detected metastasis in 7/20 patients in 7/60 regions (4 axillary and 3 distant).  $^{18}\text{F}$ -fluciclovine detected metastasis in 9/20 patients in 13/60 regions (5 axillary, 3 extra-axillary and 5 distant).  $^{18}\text{F}$ -fluciclovine was positive in all regions positive on PSMA. However, in 6 regions positive on  $^{18}\text{F}$ -fluciclovine,  $^{68}\text{Ga}$ -PSMA was negative. Mean SUVmax and T:B for  $^{18}\text{F}$ -fluciclovine (n=13) was  $5.25 (\pm 3.3)$  and  $3.7 (\pm 2.3)$  respectively. Mean SUVmax and T:B for  $^{68}\text{Ga}$ -PSMA (n=9) was  $3.84 (\pm 3.42)$  and  $3.29 (\pm 2.65)$ , respectively. p-value for the difference in SUVmax for  $^{18}\text{F}$ -fluciclovine and  $^{68}\text{Ga}$ -PSMA is 0.34 (ns) and p-value for the difference in T:B is 0.70 (ns).

#### CONCLUSION

$^{68}\text{Ga}$ -PSMA PET-CT has higher detection for metastases compared to CI on a patient, but not region level (ipsilateral axillary, extra-axillary, distant).  $^{18}\text{F}$ -fluciclovine PET-CT has higher detection for metastases compared to CI and  $^{68}\text{Ga}$ -PSMA on a patient and region level. Though  $^{18}\text{F}$ -fluciclovine seems to have higher SUVmax and T:B of lesions compared with  $^{68}\text{Ga}$ -PSMA, the differences are not statistically significant. One limitation of this study may be the small sample size and therefore larger trials are recommended.

#### CLINICAL RELEVANCE/APPLICATION

In the management of patients with ILC, novel molecular imaging, especially with  $^{18}\text{F}$ -fluciclovine PET-CT seems to result in greater metastases detection and deserves further study.

#### **M1-SSPD02-1 CT-based Segmentation Model for Pediatric Hepatoblastoma Trained on Data From COG AHEP0731 Liver Tumor Trial: Performance and Comparison to Adult-based Model**

Vidya Sankar Viswanathan, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

Hepatoblastoma is a rare malignant liver tumor affecting children. To date, no automated segmentation models exist for this tumor. Adult hepatocellular carcinoma (HCC)-based segmentation models may not perform optimally due to differences in tumor characteristics. Therefore, we aimed to train a segmentation model on pediatric hepatoblastoma CT data and compare its performance with an adult HCC-based liver tumor segmentation model in a clinical trial dataset.

#### METHODS AND MATERIALS

We derived the dataset from the Children's Oncology Group AHEP0731 trial. Our data included 227 CT scans from hepatoblastoma patients obtained at diagnosis, after 2 cycles of chemotherapy, or prior to resection. Two pediatric radiologists manually annotated 56 randomly selected CTs for liver tumor segmentation. These were used to train an nnU-Net-based segmentation model, denoted as MP. An additional validation set of 50 CTs was annotated for segmentation by three radiologists (50 scans, divided into two groups of 25 with each group manually annotated by 2 of 3 radiologists). We optimized training by using a 5-fold cross-validation strategy with 5000 epochs and evaluated the model's performance on the validation set using the Dice similarity coefficient (DSC). DSC was also calculated between human annotations within the validation set. We compared the performance of a publicly available segmentation model trained on adult HCC CT scans using DSC, denoted as MA.

#### RESULTS

MP was tested on 50 CT scans and achieved an average Dice similarity coefficient (DSC) of  $0.83 \pm 0.03$  for the segmentation of pediatric hepatoblastoma from CT scans. In contrast, MA performed poorly on hepatoblastoma cases, with an average DSC of  $0.53 \pm 0.04$  (Figure 1). Inter-rater agreement between the reviewers on the validation set was  $0.88 \pm 0.01$  and  $0.89 \pm 0.02$  (Table 1) for MP.

#### CONCLUSION

An adult HCC-based liver tumor segmentation model performed poorly when segmenting hepatoblastoma. In contrast, our nnU-Net-based segmentation model was accurate and displayed a comparable degree of dissimilarity to that observed between radiologists.

#### CLINICAL RELEVANCE/APPLICATION

Our findings suggest that AI algorithms for liver tumor segmentation should be specifically trained on pediatric data to achieve the best results in children with hepatoblastoma.

#### **M1-SSPD02-2 Fractal Analysis of Perfusion MRI in Neuroblastoma Correlates with Tumor Microvasculature and Predicts Chemotherapy Response**

Florian Michallek, MD (*Presenter*) Nothing to Disclose

## PURPOSE

To establish perfusion fractal analysis of magnetic resonance imaging (MRI) in neuroblastoma primary tumors for assessing vascularity and predicting response to induction chemotherapy. We hypothesized that perfusion heterogeneity is inversely correlated with volumetric response potential due to the effect on vascular supply for therapeutic agents.

## METHODS AND MATERIALS

We retrospectively included patients with high-risk neuroblastoma. Contrast-enhanced MRI was performed at diagnosis (timepoint, TP1) and prior to surgery (TP2). Patients received 4-7 cycles of N5 and N6 chemotherapy. Imaging was performed at 1.5 or 3T with clinical routine protocols including a contrast-enhanced, fat-saturated T1-weighted sequence. Tumor volume was defined as paravertebral or adrenal tumor formation including connected local lymph node metastases. Segmentation was performed at TP1 and TP2 in consensus by two readers. Fractal analysis was performed as previously established in prostate cancer, pancreatic cancer, and hepatic adenoma and carcinoma. Spatially resolved fractal dimension (FD) maps were calculated. Histological fractal analysis of CD34-stained microvessels was available in a small subgroup of five patients at TP1 and TP2. Agreement of predicted volume response with measured volume response was evaluated in the validation cohort by Bland-Altman statistics.

## RESULTS

We included 73 patients, n=36 as discovery cohort (one center) and n=37 as separate validation cohort (29 centers), with an average tumor volume of 239.4 ml (standard deviation, SD: 237.3 ml) and 235.3 ml (SD: 204.9 ml) at TP1, which reduced to 35.8 ml (SD: 45.1 ml) and 32.6 ml (SD: 49.2 ml) at TP2. Fractal analysis demonstrated that regional tumor response depended on local perfusion heterogeneity as quantified on FD maps: Tumor regions with low FD at TP1 showed markedly better volumetric response than regions with high FD. In the validation cohort, histogram-based evaluation of FD predicted relative volumetric response with high accuracy (mean bias: -5%, limits of agreement: -35 - 25%). On CD34-staining, microvascular FD was low at TP1 (mean FD=1.23, SD=0.09) and increased at TP2 (mean FD=1.44, SD=0.07;  $p<0.001$ ), hinting at increasing microvascular heterogeneity after chemotherapy, which was reflected in MRI (TP1: mean FD=3.40, SD=0.04; TP2: mean FD=3.53, SD=0.07;  $p<0.001$ ).

## CONCLUSION

Fractal analysis of neuroblastoma perfusion predicted primary tumor response to induction chemotherapy and allowed to regionally resolve tumor response potential, based on heterogeneity of tumor vascularity.

## CLINICAL RELEVANCE/APPLICATION

Fractal analysis allows spatially resolved prediction of local tumor tissue response to chemotherapy based on perfusion heterogeneity.

## M1-SSPD02-3 Whole-body MRI Quantitative Parameters as Biomarkers for Predicting the Efficacy of CAR-T Therapy in Pediatric Patients with Mature Aggressive B-Cell Non-Hodgkin Lymphoma

Bingjie Zheng, MD (*Presenter*) Nothing to Disclose

## PURPOSE

To explore the role of whole-body MRI quantitative parameters, such as T2 signal intensity, ADCmin, ADCmax, and ADCmean, as potential biomarkers for predicting the efficacy of CAR-T therapy in the treatment of pediatric patients with mature aggressive B-cell non-Hodgkin lymphoma.

## METHODS AND MATERIALS

This was a prospective multicenter study that included patients with aggressive mature B-cell NHL who received CAR-T therapy. Whole-body MRI was performed before and within 2 weeks after CAR-T infusion to evaluate the extent of tumor involvement throughout the body. The patients were divided into two groups, complete response (CR) and non-CR, by a multidisciplinary team using all available imaging and clinical investigations based on international pediatric NHL criteria. Quantitative parameters of MRI, including T2 signal intensity, ADCmin, ADCmax, and ADCmean, were measured by trained radiologists. The relationship between these parameters and the achievement of CR was analyzed using statistical methods. Models were established to predict CR using single-factor analysis, and the best threshold, specificity, sensitivity, and area under the curve (AUC) were determined and compared to identify the most accurate predictive model.

## RESULTS

A total of 45 patients were included in the study, with 19 patients achieving CR after CAR-T therapy. The T2 signal intensity before CAR-T infusion was significantly higher in the non-CR group than in the CR group ( $266\pm 152$  vs.  $363\pm 156$ ,  $P<0.05$ ). There was a significant difference in ADCmin, ADCmax, and ADCmean measured within 2 weeks after CAR-T infusion between the CR and non-CR groups ( $0.94\pm 0.38$  vs.  $0.52\pm 0.37$ ,  $P<0.05$ ;  $1.73\pm 0.69$  vs.  $0.83\pm 0.42$ ,  $P<0.05$ ;  $1.28\pm 0.48$  vs.  $0.65\pm 0.32$ ,  $P<0.05$ ; respectively). The AUC values for the prediction of CR using ADCmax, T2 signal intensity, and ADCmean were 0.96, 0.872, and 0.802, respectively.

## CONCLUSION

Our findings suggest that MRI quantitative parameters, particularly T2 signal intensity and ADC values, can serve as useful tools in predicting the response to CAR-T therapy in pediatric and adolescent patients with aggressive mature B-cell NHL. Our results show that early follow-up MRI can be used as a non-invasive biomarker to predict complete response.

## CLINICAL RELEVANCE/APPLICATION

The results of this study highlight the importance of using MRI quantitative parameters in predicting response to CAR-T therapy in pediatric patients with mature aggressive B-cell NHL. Clinicians may use these non-invasive biomarkers to detect treatment response at an early stage, which could guide personalized treatment strategies and ultimately improve patient outcomes.

## M1-SSPD02-4 Brain Lesions Following Selective Intra-arterial Chemotherapy Treatment for Retinoblastoma

Daniel Vossough (*Presenter*) Nothing to Disclose

## PURPOSE

Selective intra-arterial chemotherapy (IAC) has become a widespread treatment method for children with retinoblastoma (RB). There is a paucity of literature on potential complications of this form of treatment. In this study, we investigate the presence and development of focal brain lesions above baseline rates on MRI after systemic chemotherapy (SC), IAC, or both.

## METHODS AND MATERIALS

In this retrospective IRB-approved study, clinical and brain MRI examinations of RB patients undergoing SC, IAC, or both were collected at a large pediatric retinoblastoma referral center. IAC was performed by interventional staff from two different institutions. Pre-treatment, post-treatment, and last available MRI exams were reviewed, blinded to treatment regimen. Associations between type of treatment, presence and distribution of lesions were explored.

## RESULTS

A total of 194 patients treated in a 10-year period were included. Median age at diagnosis was 10.4 months (IQR: 4-21). There was unilateral RB in 92 (47.4%) and bilateral RB in 102 (52.6%) patients. 95 patients (48.9%) had SC only, 36 (18.6%) had IAC only, and 63 (32.5%) had both. In those with IAC treatment, 37 (37.3%) were for the right, 49 (49.4%) for the left, and 13 (13.1%) for bilateral treatment. The median IAC cycles was 3 (IQR: 2-4) and the median systemic chemotherapy cycles was 6 (IQR: 6-6). The presence of excess focal brain lesions in the brain was associated with use of IAC compared to SC alone (50.5% vs 14.7%,  $p < 0.001$ , OR=5.9). The rate was higher in those with both SC and IAC compared to SC alone (OR=7.7,  $p < 0.001$ ). There was no significant difference in brain lesions between the IAC group and those not receiving IAC at baseline ( $p = 0.227$ ). There was an association between the side of IAC (left, right, bilateral) and the side of brain lesions after IAC ( $p = 0.001$ ). No significant association was found between the cumulative IAC agent dose and number of brain lesions ( $p = 0.384$ ). The common distribution of the lesions was in the white matter of the frontal lobes (79%), parietal lobes (51%), temporal lobes (5%), and the thalami (8%).

## CONCLUSION

Selective intra-arterial chemotherapy for RB is associated with the incidence and development of post-treatment focal brain lesions. The incidence of these lesions is much higher than historical catheter angiography cerebral complications in children. The causes and potential long-term effects of these changes should be explored.

## CLINICAL RELEVANCE/APPLICATION

Focal brain lesions develop after IAC for retinoblastoma. The exact mechanism and long-term clinical and developmental implications of these lesions, if any, is unknown and deserves further evaluation.

## M1-SSPD02-5 Chemoablation of Salivary Glands: A Definitive Solution for Sialorrhea

Mabel Garcia-Hidalgo Alonso, PhD, MD (*Presenter*) Nothing to Disclose

## PURPOSE

Chemical ablation of salivary glands is a safe and effective treatment with stable long-term results in pediatric patients. The primary objective is to assess the effectiveness of chemical ablation in reducing sialorrhea in pediatric patients with neurological disorders. The secondary objectives are to evaluate the permanence of the benefits in the long term, to analyze post-treatment complications, to assess the subjective satisfaction of the families of the treated patients and, finally, to evaluate the impact of the changes in the lives of the patients and their families.

## METHODS AND MATERIALS

A retrospective longitudinal and analytical cohort, multicenter, retrospective study is designed, including all patients with sialorrhoea treated by chemical ablation of the salivary glands at our institution during the period 2011-2019. After establishing the inclusion and exclusion criteria, a final sample size of 29 patients was obtained. The treatment includes the chemical ablation of two glands (parotid and ipsilateral submandibular glands) in the same procedure. The procedure starts by cannulating the Stenon's duct and Wharton's duct using a dilator and introducing a sialography needle (22G). Sialography is carried out by scopic control to check and then, under ultrasound control, ethoxysclerol 3% is injected. After 5 minutes of waiting, ethanol is injected, which will be seen as intraductal echogenic material. It is important to inject the sclerosing substances at a slow and steady rhythm to avoid perforation of the ducts and extraparenchymal outflow of the pharmacological agents into the subcutaneous cellular tissue. The cannulation of both ducts, thus avoiding percutaneous injections, allows a better diffusion of the drug and a lower risk of vascular or nerve damage.

## RESULTS

The pre-treatment Quantitative Score in our study population obtained a mean of 8.68, which decreased drastically to 5.48 after treatment. In ALL items of the Sialorrhoea Impact Scale, statistically significant differences were obtained pre-treatment and post-treatment ( $p < 0.001$ ). Treatment efficacy was maintained in the medium term (12 months) in more than 80% of patients, as well as in more than 75% in the long term (18 months). More than 75% of patients were satisfied or very satisfied with the treatment.

## CONCLUSION

Chemical ablation of the salivary glands is a minimally invasive, safe and effective treatment of sialorrhoea in paediatric age with long-term results in patients with cerebral palsy and other neurological disorders.

## CLINICAL RELEVANCE/APPLICATION

Sialorrhoea is especially prevalent in children with cerebral palsy and has a great impact on the patient's quality of life and their families leading to psychological and social disturbances in their daily lives.

## M1- SSPD02-6 Mid-Term Outcomes of Biliary Drainage with New Biodegradable Stents in Pediatric Liver Transplantation

Paolo Marra, MD (*Presenter*) Nothing to Disclose

## PURPOSE

To report the mid-term outcomes of percutaneous biliary drainage with double biodegradable stent placement for the treatment of benign anastomotic biliary strictures in pediatric liver transplants (PLT).

## METHODS AND MATERIALS

From March 2022 all consecutive patients with PLT who underwent percutaneous transhepatic cholangiography (PTC), bilioplasty and placement of two side-by-side 10F helical-shaped (non-expandable) biodegradable (slow degradation profile of 11 weeks) biliary stents were prospectively enrolled. The primary endpoint was freedom from biliary stricture recurrence considered as absence of bile duct dilation at imaging (US/MRI) and absence of cholestasis at laboratory tests. The secondary endpoint was the assessment of procedure-related complications.

## RESULTS

Percutaneous transhepatic stent placement was performed in 15 patients (10 females; median age 7 years, range 3-11 years) for the treatment of perianastomotic strictures (14 hepatico-jejunostomy; 1 duct-to-duct anastomosis). Stenting was performed after the maintenance of an internal-external biliary drainage for a median time of 28 days (range 11.5-53 days). Median follow-up was 233.5 days (range 182.5-263 days). In 6/15 patients the external drainage was exchanged with the biodegradable stents within 2 weeks from PTC. Bile duct dilation was present at imaging in 15 patients before PTC and in 7 patients at the last imaging follow-up. Median values of direct bilirubin, alkaline phosphatase and gamma-glutamyl-transferase levels measured before the procedure and at last follow-up decreased from 0.3 to 0.25 mg/dL, from 440 to 343.5 U/L, and from 98 to 31 U/L, respectively. One case (1/15; 7%) of cholangitis after stent placement required rehospitalization and was managed conservatively; no other complications occurred during the follow-up. One patient (1/15; 7%) developed clinical cholestasis with imaging-confirmed restenosis.

## CONCLUSION

Preliminary data suggests that placement of biodegradable biliary stents for the treatment of benign biliary strictures in PLT patients may provide good outcomes. Biodegradable stents can be considered to replace poorly tolerated external biliary drainage.

## CLINICAL RELEVANCE/APPLICATION

New biodegradable stents may represent a valid treatment option to mitigate concerns related to the maintenance of external biliary drainage in pediatric patients affected by benign biliary strictures after liver transplantation.

### CT-based Segmentation Model for Pediatric Hepatoblastoma Trained on Data From COG AHEP0731 Liver Tumor Trial: Performance and Comparison to Adult-based Model

Monday, Nov. 27 8:00AM - 9:00AM Room: N227B

Vidya Sankar Viswanathan, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

Hepatoblastoma is a rare malignant liver tumor affecting children. To date, no automated segmentation models exist for this tumor. Adult hepatocellular carcinoma (HCC)-based segmentation models may not perform optimally due to differences in tumor characteristics. Therefore, we aimed to train a segmentation model on pediatric hepatoblastoma CT data and compare its performance with an adult HCC-based liver tumor segmentation model in a clinical trial dataset.

#### METHODS AND MATERIALS

We derived the dataset from the Children's Oncology Group AHEP0731 trial. Our data included 227 CT scans from hepatoblastoma patients obtained at diagnosis, after 2 cycles of chemotherapy, or prior to resection. Two pediatric radiologists manually annotated 56 randomly selected CTs for liver tumor segmentation. These were used to train an nnU-Net-based segmentation model, denoted as MP. An additional validation set of 50 CTs was annotated for segmentation by three radiologists (50 scans, divided into two groups of 25 with each group manually annotated by 2 of 3 radiologists). We optimized training by using a 5-fold cross-validation strategy with 5000 epochs and evaluated the model's performance on the validation set using the Dice similarity coefficient (DSC). DSC was also calculated between human annotations within the validation set. We compared the performance of a publicly available segmentation model trained on adult HCC CT scans using DSC, denoted as MA.

#### RESULTS

Mp was tested on 50 CT scans and achieved an average Dice similarity coefficient (DSC) of  $0.83 \pm 0.03$  for the segmentation of pediatric hepatoblastoma from CT scans. In contrast, MA performed poorly on hepatoblastoma cases, with an average DSC of  $0.53 \pm 0.04$  (Figure 1). Inter-rater agreement between the reviewers on the validation set was  $0.88 \pm 0.01$  and  $0.89 \pm 0.02$  (Table 1) for Mp.

#### CONCLUSION

An adult HCC-based liver tumor segmentation model performed poorly when segmenting hepatoblastoma. In contrast, our nnU-Net-based segmentation model was accurate and displayed a comparable degree of dissimilarity to that observed between radiologists.

#### CLINICAL RELEVANCE/APPLICATION

Our findings suggest that AI algorithms for liver tumor segmentation should be specifically trained on pediatric data to achieve the best results in children with hepatoblastoma.

### Fractal Analysis of Perfusion MRI in Neuroblastoma Correlates with Tumor Microvasculature and Predicts Chemotherapy Response

Monday, Nov. 27 8:00AM - 9:00AM Room: N227B

Florian Michallek, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

To establish perfusion fractal analysis of magnetic resonance imaging (MRI) in neuroblastoma primary tumors for assessing vascularity and predicting response to induction chemotherapy. We hypothesized that perfusion heterogeneity is inversely correlated with volumetric response potential due to the effect on vascular supply for therapeutic agents.

#### METHODS AND MATERIALS

We retrospectively included patients with high-risk neuroblastoma. Contrast-enhanced MRI was performed at diagnosis (timepoint, TP1) and prior to surgery (TP2). Patients received 4-7 cycles of N5 and N6 chemotherapy. Imaging was performed at 1.5 or 3T with clinical routine protocols including a contrast-enhanced, fat-saturated T1-weighted sequence. Tumor volume was defined as paravertebral or adrenal tumor formation including connected local lymph node metastases. Segmentation was performed at TP1 and TP2 in consensus by two readers. Fractal analysis was performed as previously established in prostate cancer, pancreatic cancer, and hepatic adenoma and carcinoma. Spatially resolved fractal dimension (FD) maps were calculated. Histological fractal analysis of CD34-stained microvessels was available in a small subgroup of five patients at TP1 and TP2. Agreement of predicted volume response with measured volume response was evaluated in the validation cohort by Bland-Altman statistics.

#### RESULTS

We included 73 patients, n=36 as discovery cohort (one center) and n=37 as separate validation cohort (29 centers), with an average tumor volume of 239.4 ml (standard deviation, SD: 237.3 ml) and 235.3 ml (SD: 204.9 ml) at TP1, which reduced to 35.8 ml (SD: 45.1 ml) and 32.6 ml (SD: 49.2 ml) at TP2. Fractal analysis demonstrated that regional tumor response depended on local perfusion heterogeneity as quantified on FD maps: Tumor regions with low FD at TP1 showed markedly better volumetric response than regions with high FD. In the validation cohort, histogram-based evaluation of FD predicted relative volumetric response with high accuracy (mean bias: -5%, limits of agreement: -35 - 25%). On CD34-staining, microvascular FD was low at TP1 (mean FD=1.23, SD=0.09) and increased at TP2 (mean FD=1.44, SD=0.07;  $p<0.001$ ), hinting at increasing microvascular heterogeneity after chemotherapy, which was reflected in MRI (TP1: mean FD=3.40, SD=0.04; TP2: mean FD=3.53, SD=0.07;  $p<0.001$ ).

#### CONCLUSION

Fractal analysis of neuroblastoma perfusion predicted primary tumor response to induction chemotherapy and allowed to regionally resolve tumor response potential, based on heterogeneity of tumor vascularity.

#### CLINICAL RELEVANCE/APPLICATION

Fractal analysis allows spatially resolved prediction of local tumor tissue response to chemotherapy based on perfusion heterogeneity.

### Whole-body MRI Quantitative Parameters as Biomarkers for Predicting the Efficacy of CAR-T Therapy in Pediatric Patients with Mature Aggressive B-Cell Non-Hodgkin Lymphoma

Monday, Nov. 27 8:00AM - 9:00AM Room: N227B

Bingjie Zheng, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

To explore the role of whole-body MRI quantitative parameters, such as T2 signal intensity, ADC<sub>min</sub>, ADC<sub>max</sub>, and ADC<sub>mean</sub>, as potential biomarkers for predicting the efficacy of CAR-T therapy in the treatment of pediatric patients with mature aggressive B-cell non-Hodgkin lymphoma.

#### METHODS AND MATERIALS

This was a prospective multicenter study that included patients with aggressive mature B-cell NHL who received CAR-T therapy. Whole-body MRI was performed before and within 2 weeks after CAR-T infusion to evaluate the extent of tumor involvement throughout the body. The patients were divided into two groups, complete response (CR) and non-CR, by a multidisciplinary team using all available imaging and clinical investigations based on international pediatric NHL criteria. Quantitative parameters of MRI, including T2 signal intensity, ADC<sub>min</sub>, ADC<sub>max</sub>, and ADC<sub>mean</sub>, were measured by trained radiologists. The relationship between these parameters and the achievement of CR was analyzed using statistical methods. Models were established to predict CR using single-factor analysis, and the best threshold, specificity, sensitivity, and area under the curve (AUC) were determined and compared to identify the most accurate predictive model.

#### RESULTS

A total of 45 patients were included in the study, with 19 patients achieving CR after CAR-T therapy. The T2 signal intensity before CAR-T infusion was significantly higher in the non-CR group than in the CR group (266±152 vs. 363±156, P<0.05). There was a significant difference in ADC<sub>min</sub>, ADC<sub>max</sub>, and ADC<sub>mean</sub> measured within 2 weeks after CAR-T infusion between the CR and non-CR groups (0.94±0.38 vs. 0.52±0.37, P<0.05; 1.73±0.69 vs. 0.83±0.42, P<0.05; 1.28±0.48 vs. 0.65±0.32, P<0.05; respectively). The AUC values for the prediction of CR using ADC<sub>max</sub>, T2 signal intensity, and ADC<sub>mean</sub> were 0.96, 0.872, and 0.802, respectively.

#### CONCLUSION

Our findings suggest that MRI quantitative parameters, particularly T2 signal intensity and ADC values, can serve as useful tools in predicting the response to CAR-T therapy in pediatric and adolescent patients with aggressive mature B-cell NHL. Our results show that early follow-up MRI can be used as a non-invasive biomarker to predict complete response.

#### CLINICAL RELEVANCE/APPLICATION

The results of this study highlight the importance of using MRI quantitative parameters in predicting response to CAR-T therapy in pediatric patients with mature aggressive B-cell NHL. Clinicians may use these non-invasive biomarkers to detect treatment response at an early stage, which could guide personalized treatment strategies and ultimately improve patient outcomes.

### Brain Lesions Following Selective Intra-arterial Chemotherapy Treatment for Retinoblastoma

Monday, Nov. 27 8:00AM - 9:00AM Room: N227B

Daniel Vossough (*Presenter*) Nothing to Disclose

#### PURPOSE

Selective intra-arterial chemotherapy (IAC) has become a widespread treatment method for children with retinoblastoma (RB). There is a paucity of literature on potential complications of this form of treatment. In this study, we investigate the presence and development of focal brain lesions above baseline rates on MRI after systemic chemotherapy (SC), IAC, or both.

#### METHODS AND MATERIALS

In this retrospective IRB-approved study, clinical and brain MRI examinations of RB patients undergoing SC, IAC, or both were collected at a large pediatric retinoblastoma referral center. IAC was performed by interventional staff from two different institutions. Pre-treatment, post-treatment, and last available MRI exams were reviewed, blinded to treatment regimen. Associations between type of treatment, presence and distribution of lesions were explored.

#### RESULTS

A total of 194 patients treated in a 10-year period were included. Median age at diagnosis was 10.4 months (IQR: 4-21). There was unilateral RB in 92 (47.4%) and bilateral RB in 102 (52.6%) patients. 95 patients (48.9%) had SC only, 36 (18.6%) had IAC only, and 63 (32.5%) had both. In those with IAC treatment, 37 (37.3%) were for the right, 49 (49.4%) for the left, and 13 (13.1%) for bilateral treatment. The median IAC cycles was 3 (IQR: 2-4) and the median systemic chemotherapy cycles was 6 (IQR: 6-6). The presence of excess focal brain lesions in the brain was associated with use of IAC compared to SC alone (50.5% vs 14.7%,  $p < 0.001$ , OR=5.9). The rate was higher in those with both SC and IAC compared to SC alone (OR=7.7,  $p < 0.001$ ). There was no significant difference in brain lesions between the IAC group and those not receiving IAC at baseline ( $p = 0.227$ ). There was an association between the side of IAC (left, right, bilateral) and the side of brain lesions after IAC ( $p = 0.001$ ). No significant association was found between the cumulative IAC agent dose and number of brain lesions ( $p = 0.384$ ). The common distribution of the lesions was in the white matter of the frontal lobes (79%), parietal lobes (51%), temporal lobes (5%), and the thalami (8%).

#### CONCLUSION

Selective intra-arterial chemotherapy for RB is associated with the incidence and development of post-treatment focal brain lesions. The incidence of these lesions is much higher than historical catheter angiography cerebral complications in children. The causes and potential long-term effects of these changes should be explored.

#### CLINICAL RELEVANCE/APPLICATION

Focal brain lesions develop after IAC for retinoblastoma. The exact mechanism and long-term clinical and developmental implications of these lesions, if any, is unknown and deserves further evaluation.

### Chemoablation of Salivary Glands: A Definitive Solution for Sialorrhea

Monday, Nov. 27 8:00AM - 9:00AM Room: N227B

Mabel Garcia-Hidalgo Alonso, PhD, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

Chemical ablation of salivary glands is a safe and effective treatment with stable long-term results in pediatric patients. The primary objective is to assess the effectiveness of chemical ablation in reducing sialorrhea in pediatric patients with neurological disorders. The secondary objectives are to evaluate the permanence of the benefits in the long term, to analyze post-treatment complications, to assess the subjective satisfaction of the families of the treated patients and, finally, to evaluate the impact of the changes in the lives of the patients and their families.

#### METHODS AND MATERIALS

A retrospective longitudinal and analytical cohort, multicenter, retrospective study is designed, including all patients with sialorrhoea treated by chemical ablation of the salivary glands at our institution during the period 2011-2019. After establishing the inclusion and exclusion criteria, a final sample size of 29 patients was obtained. The treatment includes the chemical ablation of two glands (parotid and ipsilateral submandibular glands) in the same procedure. The procedure starts by cannulating the Stenon's duct and Wharton's duct using a dilator and introducing a sialography needle (22G). Sialography is carried out by scopic control to check and then, under ultrasound control, ethoxysclerol 3% is injected. After 5 minutes of waiting, ethanol is injected, which will be seen as intraductal echogenic material. It is important to inject the sclerosing substances at a slow and steady rhythm to avoid perforation of the ducts and extraparenchymal outflow of the pharmacological agents into the subcutaneous cellular tissue. The cannulation of both ducts, thus avoiding percutaneous injections, allows a better diffusion of the drug and a lower risk of vascular or nerve damage.

#### RESULTS

The pre-treatment Quantitative Score in our study population obtained a mean of 8.68, which decreased drastically to 5.48 after treatment. In ALL items of the Sialorrhoea Impact Scale, statistically significant differences were obtained pre-treatment and post-treatment ( $p < 0.001$ ). Treatment efficacy was maintained in the medium term (12 months) in more than 80% of patients, as well as in more than 75% in the long term (18 months). More than 75% of patients were satisfied or very satisfied with the treatment.

#### CONCLUSION

Chemical ablation of the salivary glands is a minimally invasive, safe and effective treatment of sialorrhoea in paediatric age with long-term results in patients with cerebral palsy and other neurological disorders.

#### CLINICAL RELEVANCE/APPLICATION

Sialorrhea is especially prevalent in children with cerebral palsy and has a great impact of on the patient's quality of life and their families leading to psychological and social disturbances in their daily lives.

### Mid-Term Outcomes of Biliary Drainage with New Biodegradable Stents in Pediatric Liver Transplantation

Monday, Nov. 27 8:00AM - 9:00AM Room: N227B

Paolo Marra, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

To report the mid-term outcomes of percutaneous biliary drainage with double biodegradable stent placement for the treatment of benign anastomotic biliary strictures in pediatric liver transplants (PLT).

#### METHODS AND MATERIALS

From March 2022 all consecutive patients with PLT who underwent percutaneous transhepatic cholangiography (PTC), bilioplasty and placement of two side-by-side 10F helical-shaped (non-expandable) biodegradable (slow degradation profile of 11 weeks) biliary stents were prospectively enrolled. The primary endpoint was freedom from biliary stricture recurrence considered as absence of bile duct dilation at imaging (US/MRI) and absence of cholestasis at laboratory tests. The secondary endpoint was the assessment of procedure-related complications.

#### RESULTS

Percutaneous transhepatic stent placement was performed in 15 patients (10 females; median age 7 years, range 3-11 years) for the treatment of perianastomotic strictures (14 hepatico-jejunostomy; 1 duct-to-duct anastomosis). Stenting was performed after the maintenance of an internal-external biliary drainage for a median time of 28 days (range 11.5-53 days). Median follow-up was 233.5 days (range 182.5-263 days). In 6/15 patients the external drainage was exchanged with the biodegradable stents within 2 weeks from PTC. Bile duct dilation was present at imaging in 15 patients before PTC and in 7 patients at the last imaging follow-up. Median values of direct bilirubin, alkaline phosphatase and gamma-glutamyl-transferase levels measured before the procedure and at last follow-up decreased from 0.3 to 0.25 mg/dL, from 440 to 343.5 U/L, and from 98 to 31 U/L, respectively. One case (1/15; 7%) of cholangitis after stent placement required rehospitalization and was managed conservatively; no other complications occurred during the follow-up. One patient (1/15; 7%) developed clinical cholestasis with imaging-confirmed restenosis.

#### CONCLUSION

Preliminary data suggests that placement of biodegradable biliary stents for the treatment of benign biliary strictures in PLT patients may provide good outcomes. Biodegradable stents can be considered to replace poorly tolerated external biliary drainage.

#### CLINICAL RELEVANCE/APPLICATION

New biodegradable stents may represent a valid treatment option to mitigate concerns related to the maintenance of external biliary drainage in pediatric patients affected by benign biliary strictures after liver transplantation.

### Stand-alone Performance of Artificial Intelligence-based Computer-assisted Diagnosis in Screening Automated Breast Ultrasound

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Haejung Kim, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

To evaluate the stand-alone performance of artificial intelligence-based computer-assisted diagnosis (AI-CAD) in screening automated breast ultrasound (ABUS) interpretation and find the factors associated with false-negative and false-positive results.

#### METHODS AND MATERIALS

The ABUS source data of 435 women in a single institution were retrospectively analyzed using AI-CAD system (LUCAS). Three volume data of antero-posterior, medial, and lateral scanning were obtained for each breast. Of total 435 women, 97 were breast cancer patients with screening detected single malignant lesion between October 2019 and June 2020, and 338 were women who underwent screening ABUS between May 2019 and June 2019 and showed negative final diagnosis. We reviewed the results of AI-CAD system in detecting malignant lesion on ABUS and analyzed the sensitivity, specificity, positive predictive value (PPV), and negative predictive value (NPV). Also the associated factors with false-negative and false-positive results were analyzed.

#### RESULTS

The sensitivity, specificity, PPV, and NPV of AI-CAD in ABUS interpretation were 0.75 (73 of 97; 95% confidence interval, 0.65 to 0.83), 0.58 (195 of 338; 95% CI, 0.52 to 0.63), 0.34 (73 of 216; 95% CI, 0.30 to 0.37), and 0.89 (195 of 219; 95% CI, 0.85 to 0.92), respectively. The average number of CAD-detected lesion was 1.2 per study (1.8 in patients with cancer, and 1.0 in patients without cancer). True positive lesions were detected in 1.81 of 3 volumes of breast, while false positive lesions were detected in 1.30 of 3 volumes (1.5 in benign lesions and 1.1 in pseudo-lesions). False-negative results in breast cancer were more frequent for isoechoic mass ( $p < 0.001$ ) and mass without echogenic rind ( $p = 0.043$ ). Among 143 patients with false-positive results, 49 (34.3%) had pseudo-lesions. False-positive results were more frequent for dense breasts on mammography ( $p < 0.001$ ), however, the background echotexture of ABUS was not associated with false positive results or pseudo-lesions.

#### CONCLUSION

AI system showed NPV of 89% for negative interpretation of ABUS. However, radiologists should carefully recheck the results of AI-CAD system to reduce false-positive results and recall rate.

#### CLINICAL RELEVANCE/APPLICATION

By providing information on the stand-alone performance of AI-CAD in screening ABUS interpretation, it helps to correctly understand the advantages and disadvantages of AI-CAD system and apply them to clinical practice.

### **A Novel Triage Model for Screening Mammograms Based on a Density AI and a Cancer Detection AI**

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Serena Pacile, PhD (*Presenter*) Employee, Therapixel SA

#### **PURPOSE**

To estimate the effectiveness of a triage model for breast cancer screening examinations based on two AI systems: one for breast density assessment and one for cancer detection.

#### **METHODS AND MATERIALS**

For this retrospective simulation study, a dataset of 2,981 tomosynthesis screening examinations was collected. The dataset included 696 biopsy-proven cancer cases and 2,285 negative screens (verified by a negative follow-up). For each collected screen, the interpretation made by the primary reader was also collected. A two-steps triage model was set up based on two AI systems: one estimating the breast composition, and one detecting and characterizing regions suspicious for malignancy (hereafter referred to as AI-density and AI-detection). The first step was based on density: examinations whose density was assessed as C or D by AI-density were considered as requiring human interpretation. Examinations whose density was assessed as A or B were further processed by AI-detection: those with an AI-detection score lower than a given threshold were considered negative and not worth of reader interpretation, otherwise they were considered as requiring human interpretation. The proposed triage model is based on the French breast screening context where patients with high density breasts systematically undergo both mammography and ultrasound, and autonomous offloading of examinations by AI is mainly applicable to low density breasts. We examined the effect on recall rate and workload reduction keeping constant the cancer detection rate. We used inverse probability weighting to compensate for distribution differences between the used dataset and a typical screening population.

#### **RESULTS**

AI-density assessed 611 exams (20.5%) as density A, 1,024 (34.35%) exams as density B, 967 exams (32.44%) as density C and 379 exams (12.71%) as density D. Based on AI-detection scores of examinations assigned with densities A and B, 26.43% of women were considered negative without significantly affecting the cancer detection rate (which remained constant around 5/1000 - 95% CI 4.6/1000 to 5.7/1000). The recall rate decreased from 10.02% (8.74% - 11.29%) to 8.2% (7.07% - 9.32%).

#### **CONCLUSION**

Results have shown that the proposed two-step triage strategy could safely select patients to be removed from radiologists' workload without affecting the cancer detection rate. A prospective study that applies this model has been set up in France and is supposed to start including patients on January 2024.

#### **CLINICAL RELEVANCE/APPLICATION**

Using two AI systems (one for density and one for cancer detection) to triage mammograms could potentially reduce radiologist workload at constant cancer detection rate, and decrease the rate of women recalled back for further examinations.

### **Automated Assessment of Breast Positioning and Image Quality Using Artificial Intelligence for Digital Breast Tomosynthesis (DBT) with Two-Dimensional Synthetic Mammography and Full-Field Digital Mammography (FFDM)**

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Ying Guo (*Presenter*) Nothing to Disclose

#### **PURPOSE**

This study aimed to evaluate the accuracy of an artificial intelligence based tool for automated assessment of breast positioning and image quality in DBT, using synthetically reconstructed projection images.

#### **METHODS AND MATERIALS**

A total of 150 mammography examinations were enrolled in this study. Subjects underwent screening mammography including DBT with 2D-SM and FFDM. The AI-assisted automated assessment tool evaluated the quality of breast positioning in each image set. Nine image quality criteria evaluating the appearance of the nipple, breast rotation, pectoral muscle, inframammary fold, pectoral nipple line, shoulder overlap shadow, abdominal skin, contralateral breast and foreign body were used for craniocaudal and mediolateral-oblique views. Image quality of cases were also evaluated with the standards of Mammography Quality Standards Act (MQSA) as grade "adequate" or "inadequate". The performance of the AI system was evaluated using accuracy, sensitivity, and specificity. The inter-rater agreement and comparison of their findings with those reported by the AI system was calculated using Cohen's kappa coefficient.

#### **RESULTS**

The AI algorithm demonstrated high accuracy in distinguishing between adequate and inadequate images, with an overall accuracy of 93%, sensitivity of 94% and specificity of 92% for FFDM and an accuracy of 92%, sensitivity of 95 and specificity of 91% for DBT with 2D-SM. In terms of breast positioning, the AUC of poor imaging quality prediction by AI system according to incomplete gland, incomplete pectoralis muscle, over or insufficient exposure was (0.903 vs 0.937 vs 0.982). Overall accuracy of AI system were 0.958 for FFDM and 0.932 for DBT with 2D-SM. Inter-observer agreement for image quality assessment was found to be 0.82 (95% confidence interval [CI]: 0.77-0.87), indicating substantial agreement between radiologists and AI system using 2D-SM images. The kappa coefficients for breast positioning assessment were also calculated and found to be moderate to substantial, with values ranging from 0.57 to 0.83 (95% CI: 0.48-0.67 and 0.78-0.88, respectively).

#### **CONCLUSION**

The results showed a high degree of agreement between the automated and manual assessments, also indicating the performance of the AI tool in assessing breast positioning and image quality in DBT using 2D-SM images was comparable with that in FFDM.

#### **CLINICAL RELEVANCE/APPLICATION**

The study demonstrated the potential of this AI assisted system to improve the efficiency, accuracy, and reliability in DBT screening.

### TopoTxR: A Topology-based Framework for Breast Parenchyma Characterization on DCE-MRI

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Prateek Prasanna, PhD (*Presenter*) Nothing to Disclose

#### PURPOSE

In order to comprehensively analyze the biology of breast cancer, it is necessary to examine the surrounding breast parenchyma. Automated characterization of breast parenchyma using DCE-MRI is challenging due to the intricacy of the parenchymal tissue structures. Existing quantitative techniques, when combined with deep learning, are unable to accurately represent the complex structures, such as fibroglandular tissue. The fibroglandular tissue may undergo malignant transformation. To better evaluate the subtle structures of the breast, we propose a novel approach, TopoTxR, that incorporates topological features extracted from persistence diagrams as auxiliary information. This enables the convolutional neural network (CNN) to directly focus on the biologically-relevant topological structures.

#### METHODS AND MATERIALS

We train and validate TopoTxR to predict pathological complete response (pCR) using ISPY-1 post-contrast DCE-MRI data. Our study involves 161 patients, with 47 achieving pCR and 114 not. To enhance the performance of the 3D CNN, we integrated a mask-guided attention module that leverages a prepared topology-related mask. This mask approximates the curvilinear tissue-like structures enclosed by tissues and glands in their proximity. While inputting the raw DCE-MRI as the input of the CNN backbone, we applied the topological structure mask to guide the generation of the attention map in the latent space. TopoTxR takes advantage of the noise-free topological structures while retaining other biologically relevant information of the original data. Finally, we employed a classifier to the attention-filtered features for pCR prediction, followed by a custom loss function combined mask guided loss and refined the classification loss to address the sample imbalance problem.

#### RESULTS

TopoTxR utilizes the topological mask as supplementary input combined with the original image and incorporating Focal Loss. It improves pCR prediction significantly compared to previous methods and it also surpasses the state-of-the-art, Densenet-KD, by 3% in accuracy. Our ablation studies show the effectiveness of mask-guided attention modules and Focal Loss, respectively.

#### CONCLUSION

Our novel method leverages pre-computed topological biomarkers to enhance the performance of 3D CNN in pCR prediction. This model reasonably integrates both topology and full image information to obtain and evaluate high biological related features.

#### CLINICAL RELEVANCE/APPLICATION

Predicting treatment response enables physicians to plan and determine the most effective treatment strategy for their patients prior to disease progression (i.e. immediate surgical intervention in cases where neoadjuvant chemotherapy is predicted to fail).

### Cloud-Based Machine Learning Platform for the Detection and Localization of Breast Cancer on DCE-MR Scans

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Gavin Jones (*Presenter*) Nothing to Disclose

#### PURPOSE

Breast cancer is the most common cancer diagnosed in US women and is second to lung cancer as a cause of death in women. Machine learning (ML) can play a role in aiding breast radiologists with the detection and localization of tumors on MRI. The aim of this project was to create an ML algorithm using cloud-based software capable of accurately identifying breast cancer on DCE-MRI. The trained algorithm may be used as a radiologist adjunct in the early identification of lesions.

#### METHODS AND MATERIALS

Breast cancer MR images were obtained from a publicly available dataset of 922 radiologist-annotated and biopsy-confirmed breast cancer. The provided annotations denoted a 3D bounding box of each tumor. Using these coordinates, multiple 2D slices of the tumor were selected to augment the total number of tumor-containing images to 1267 training and 396 test images. Tumor images were further processed to exploit contrast enhancement data by compiling pre-contrast tumor slices with their corresponding early and late post-contrast slices into a single RGB image. Cloud-based ML software was then used to train the algorithm on the processed 1267 pre-annotated MR images. Following training, the algorithm's accuracy and precision were assessed using the remaining 396 test images. Tumor subgroup analyses were also performed to assess detection performance on classifiers such as ductal and lobular histology and molecular features such as luminal A/B, HER2+/-, ER +/-, PR+/-, and triple-negative carcinomas.

#### RESULTS

The trained ML model had 94.3% recall and 89.8% precision when the probability and overlap thresholds were set to 95% and 30% respectively. When tested on the 396 non-annotated validation images, the model localized breast cancer tumors with a recall of 88.6% and an average precision of 86.5% with a confidence interval of 0.95 and an F1 score of 0.89. For the subgroup analyses, HER2 enriched molecular subtype (n=20) had the highest overall average precision (95.5%), recall (95.5%), and F1 (0.95). The lowest-performing subgroup was lobular carcinoma (n=31) with average precision (88.8%), recall (84.4%), and F1 (0.90).

#### CONCLUSION

Our study has shown that ML techniques trained on a large set of annotated MR images can produce a highly accurate breast cancer detection and identification tool. The performance of tumor classifiers varies depending on tumor type, receptor status, and molecular subtype.

#### CLINICAL RELEVANCE/APPLICATION

An ML tool that can accurately detect and localize breast cancer tumors can improve care by providing women with diagnoses and thus treatment options more quickly. In the future, this ML model can be made accessible within an online tool that will quickly review breast MR slices and determine if there is breast cancer and localize tumors.

### Artificial Intelligence-Supported Additional Review of Screening Mammography Improves Radiologist Cancer Detection Rate

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Matthew McCabe, PhD (*Presenter*) Nothing to Disclose

#### PURPOSE

Studies estimate that for every 5 cancers detected by screening mammography, there is 1 false negative. A common method of reducing the false negative rate is "double-reading," where two readers interpret mammograms. However, double-reading is costly, and single-reading is standard practice in the USA. The purpose of this study was to explore the utility of an Artificial Intelligence (AI) supported additional review process (AIAR) where AI identifies the most suspicious exams for selective additional review. The goal is to realize the benefit of decreased false negatives through double-reading while minimizing additional workload.

#### METHODS AND MATERIALS

A total of 522,078 digital breast tomosynthesis screening mammograms from March 2021 to August 2022 underwent AIAR at 5 practices in the US. The dataset contained 2,739 screen-caught cancers. In the AIAR process, screening mammograms were assessed using a custom AI algorithm. Exams considered suspicious by the AI algorithm that were not recalled by the interpreting radiologist (i.e. given a BIRADS 1 or 2) were flagged for review by an experienced radiologist. The reviewer could consult with the interpreting radiologist if they thought a recall was warranted, who could decide whether to revise to a BIRADS 0 and recall the patient. Performance metrics, including recall rate (RR), cancer detection rate (CDR), and positive predictive value 1 (PPV1) were computed for 98 individual interpreting radiologists.

#### RESULTS

A total of 19,560 exams were flagged by AIAR, and 201 additional cancers were detected. Thus, with AIAR only 4% of exams required an additional review, while yielding an 8% increase in cancer detection. AIAR increased CDR across practices (range 5-21%), while minimally impacting RR (range 1-3%). PPV1 also increased at every practice (range 3-16%), indicating AIAR finds more cancers for each recall. Radiologists with lower pre-AIAR CDRs improved more compared to those with high pre-AIAR CDR (e.g., CDR increase of 0.55 vs 0.35 for radiologists with pre-AIAR CDR of 2-4 vs 4-6). Finally, AIAR could be further improved to identify up to 243 more cancers by standardizing the consult rate to ~5 consults per 100 reviews which would maximize the positive predictive value of consults at ~35 cancers per 100 consults.

#### CONCLUSION

AIAR increases cancers detected, while minimizing the additional workload required to identify and recall at-risk patients in a large real-world dataset.

#### CLINICAL RELEVANCE/APPLICATION

AIAR is a practical means to improve cancer detection in the real-world, and therefore reduce false negatives without incurring substantial additional costs.

### Sonographic Prediction of Breast Cancer Patients Non-Responding to Neoadjuvant Chemotherapy at Baseline: Comparison of Standard B-mode and a Deep-Learning Model

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Panagiotis Kapetas, MD,PhD (*Presenter*) Nothing to Disclose

#### PURPOSE

To evaluate whether pre-therapeutic breast ultrasound (US) can serve in the prediction of breast cancer (BC) patients non-responding to neoadjuvant chemotherapy (NAC) and to compare two different models.

#### METHODS AND MATERIALS

This retrospective, IRB-approved study included 245 patients with histologically confirmed invasive BC who underwent NAC. The dataset was divided into a training (165 cases) and a validation set (80 cases). A representative B-mode US image of each tumor from the pre-treatment examination was selected. 2 experienced breast fellows independently evaluated the lesions using standard BI-RADS descriptors. Logistic regression was used to identify independent predictors of response to NAC in the training set and create a model. Additionally, a Resnet18-based neural network with Dropout layers to decrease the amount of overfitting was trained to predict the treatment outcome. The performance of both models was evaluated on the validation set using descriptive statistics. Postoperative histology was the standard of reference for treatment response: absence (pathological complete response- pCR) or presence of residual invasive tumor in the breast or axillary lymph nodes.

#### RESULTS

145 patients (59.2%) did not achieve a pCR. From the BI-RADS descriptors, oval or round shape, microlobulated or spiculated margin and the presence of calcifications or edema proved to be independent predictors of pCR. A model using these showed an accuracy, sensitivity, specificity, positive and negative predictive value of respectively 65%, 82%, 41%, 67% and 61% for the prediction of non-responders to NAC. Compared to that, the DL-based model achieved an accuracy, sensitivity, specificity, positive and negative predictive value of 72%, 83%, 55%, 74% and 69%.

#### CONCLUSION

Breast US can accurately predict lack of response to NAC for BC patients prior to its initiation. A DL model using images from the baseline US examination demonstrates an increased diagnostic performance as compared to standard B-mode BI-RADS descriptors.

#### CLINICAL RELEVANCE/APPLICATION

Pre-therapeutic breast ultrasound offers accurate information, which may aid in the management of breast cancer patients, planned to undergo neoadjuvant chemotherapy.

Printed on: 08/22/24

## Abstract Archives of the RSNA, 2023

M2-SPBR-8

### **Prediction of Pathologic Response to Neoadjuvant Chemotherapy in Patients with Breast Cancer Based on Artificial Intelligence Techniques**

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Ahmed Sharafeldeen, MSc, BSc (*Presenter*) Nothing to Disclose

#### **PURPOSE**

The aim is to develop a computer aided diagnosis (CAD) system to accurately predict the response of neoadjuvant chemotherapy on breast cancer patients based on magnetic resonance imaging (MRI). The system aims to predict three possible responses, which are complete response (indicating the complete disappearance of the lesion), partial response (in which the tumor partially disappeared), or no response (suggesting that the tumor did not respond to chemotherapy).

#### **METHODS AND MATERIALS**

The proposed system is composed of four distinct stages. The first stage involves manual delineation of the breast tumor by an experienced radiologist. Secondly, four distinct features are extracted from the manually segmented tumor, namely functional imaging markers, apparent diffusion coefficient (ADC), computed from diffusion-weighted imaging (DWI) using baseline scans and b-500, b-1000, and b-1500 scans, along with texture features, grey level co-occurrence matrix (GLCM) and grey level run length matrix (GLRLM), extracted from T1-weighted, T2-weighted, and STIR models. Thirdly, these features are statistically represented using percentiles, which helps to capture the salient aspects of the data distribution while minimizing the impact of outliers. Finally, the features are combined together and then fed into a gradient boosting classifier.

#### **RESULTS**

To evaluate the effectiveness of the proposed system, a dataset of 110 breast cancer patients was used, with 28 patients showing complete response, 53 with partial response, and 29 with no response. The system's performance is assessed using k=15 cross-validation approach. The findings demonstrated that the proposed system outperforms the accuracy of classifying each feature individually as well as other statistical machine learning classifiers, achieving an impressive accuracy of 85.5 a specificity of 73.5 a sensitivity of 98.5. The results clearly indicate that integrating functional imaging markers and texture markers using majority voting approach significantly enhances the diagnostic system's performance.

#### **CONCLUSION**

The proposed CAD system accurately predicts the response of neoadjuvant chemotherapy on breast cancer patients by utilizing various markers related to the pathology. The system's performance is further improved by integrating functional imaging markers and texture markers in a non-invasive manner.

#### **CLINICAL RELEVANCE/APPLICATION**

The motivation behind this objective is to reduce the risk of exposure to neoadjuvant chemotherapy, which can be painful and dangerous. By assessing the response of the impact of chemotherapy exposure, physicians can determine whether chemotherapy is necessary or if the patient should undergo surgery directly.

### Analyzing the Collinearity of Race and Breast Tissue Density in Misclassification of Abnormality in Screening Mammograms

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Linglin Zhang (*Presenter*) Nothing to Disclose

#### PURPOSE

Deep learning techniques have been developed to assist the assessment of potential breast cancer in screening mammograms. Research has shown gaps in model performance within subgroups of some demographic and imaging features in classifying abnormality in mammograms presenting region of interests (ROIs); However, the collinearity between such features is unknown. The purpose of this study was to investigate the collinearity of those demographic and imaging characteristics in association with the performance of deep learning model in classifying abnormality in screening mammograms.

#### METHODS AND MATERIALS

We applied a modified ResNet152V2 convolutional neural network structure trained on 39,054 and tested on 13,390 mammogram patches from (REDACTED) dataset. Positive patches are the ROIs annotated by the original interpreting radiologists on BI-RADS 0 images; Negative patches were randomly selected from regions in BI-RADS 0 images avoiding ROIs, and regions in BI-RADS 1 and BI-RADS 2 images. The classification result of test set patches was aggregated to their source images, while only images containing all correctly classified patches were considered as successful prediction. Image-level classification results on 5,723 test images containing ROIs were analyzed by logistic regression models for the association with race and tissue densities, separately and together. Variance inflation factor (VIF) was calculated for race and tissue density.

#### RESULTS

VIF between race and density is 1.000005, showing features are moderately, nearly not correlated. Experiment 1 combined three race groups and four densities into 12 subgroups, no significant correlation with image misclassification was found. Experiment 2 had three models built in White, Black and Other races populations separately, we found that only in Black population, BI-RADS densities C ( $p=0.026$ ) and D ( $p=0.012$ ) have significantly higher chance to be misclassified.

#### CONCLUSION

The study reveals there is no collinearity issue with race and tissue density in the dataset and deep learning structure that were used.

#### CLINICAL RELEVANCE/APPLICATION

This can be used as a guide for future model development.

### Preliminary Investigation of the Right Ventricular Scalloping Index as a Novel CMR-derived Marker for Diagnosing Arrhythmogenic Right Ventricular Cardiomyopathy

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Ko Ying Huang, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

The cardiac magnetic resonance (CMR) evaluation of right ventricular (RV) morphologic abnormalities in patients with arrhythmogenic right ventricular cardiomyopathy (ARVC) is subjective. Here we aimed to develop a novel index, the right ventricular scalloping index (RVSI), to standardize the measurement of RV free wall scalloping and aid in the imaging diagnosis.

#### METHODS AND MATERIALS

We retrospectively included 15 patients with definite ARVC and 45 age- and sex-matched patients with idiopathic right ventricular outflow tract ventricular arrhythmia (RVOT-VA) as controls. The RVSI was measured from cine images on four-chamber view to evaluate its ability to distinguish between ARVC and RVOT-VA patients.

#### RESULTS

The RVSI was significantly higher in the ARVC than RVOT-VA group ( $1.57 \pm 0.22$  vs.  $1.27 \pm 0.07$ ,  $p < 0.001$ ). The RVSI demonstrated high intra- and interobserver reliability (intraclass correlation coefficient, 0.94 and 0.93, respectively). A cut-off value of  $RVSI = 1.38$  provided high sensitivity of 86.7% and high specificity of 95.6%. Moderate linear correlations were found between RVSI and RVEF ( $r = -0.42$ ,  $p < 0.001$ ) as well as between RVSI and RVEDVI ( $r = 0.5$ ,  $p < 0.001$ ). The subgroup analysis revealed a moderate linear correlation between RVSI and RVEDVI ( $r = 0.67$ ,  $p = 0.006$ ) in the ARVC subgroup. In a multivariable analysis, a family history of ARVC or sudden cardiac death (odds ratio, 98.14; 95% confidence interval, 2.34-4116.35;  $p = 0.016$ ) and an  $RVSI = 1.38$  (odds ratio, 145.24; 95% confidence interval, 9.90-2131.10;  $p < 0.001$ ) remained predictive of definite ARVC.

#### CONCLUSION

RVSI is a quantitative method with good performance for distinguishing ARVC and RVOT-VA patients.

#### CLINICAL RELEVANCE/APPLICATION

ARVC is among the major differential diagnoses to be considered in patients with an initial impression of RVOT-VA, image survey with CMR before ablation is recommended to provide a comprehensive assessment of RV morphology, and RVSI is easy and intuitive to measure.

### Regional Variation of Left Ventricular Myocardial T2 Mapping Values and Diagnostic Performance for Active Cardiac Sarcoidosis

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Jordan H. Chamberlin, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

Myocardial tissue characterization with T2 mapping has been shown to aid in diagnosis of cardiac sarcoidosis, but the regional variation and diagnostic performance has not been well evaluated.

#### METHODS AND MATERIALS

2503 patients undergoing 1.5T cardiac MRI from 2017-2022 were queried. 326 patients with biopsy proven extracardiac sarcoidosis were enrolled in this retrospective cohort analysis, of which 110 were found to have complete T2 mapping series. The left ventricle was manually delineated into the 16 corresponding anatomic segments and 7 regions (Basal, mid, apical, anterior, inferior, septal, and lateral) according to the American Heart Association segmentation guidelines. Active cardiac sarcoidosis (aCS) was defined using the 2017 Japanese Circulation Society criteria within 30 days of imaging. Optimal thresholds were calculated using a balanced resampling bootstrapping technique. The optimal thresholds were rounded to the nearest integer for ease of clinical use. Mann-Whitney U Tests were used for comparing continuous distributions.

#### RESULTS

37 (33.6%) patients (mean age 57 years, 65.9% males, 63.4% Black) were found to meet aCS criteria. T2 values across all myocardial regions were found to be significantly higher for patients meeting criteria for aCS ( $P < 0.05$ ). Median regional T2 values in patients with aCS ranged from 48.6 ms (septal) to 50.8 ms (apical) and median regional T2 values in patients without aCS ranged from 47.0 ms (lateral) to 49.5 ms (apical). Utilizing optimized thresholds ( $>50$ ms), the septal myocardium was most specific for active disease (specificity = 0.923). The single region most sensitive for active disease involvement was the inferior segments (sensitivity = 0.630). Using a 50 ms positive threshold for each region, the positive predictive value (PPV) increased proportionally with the addition of each positive region (PPV 1 region  $> 50$ ms, = 0.42, PPV 5 regions = 0.65, PPV 6 regions = 0.88, PPV 7 regions = 1.00). Correspondingly, using a  $< 47$  ms negative threshold, the negative predictive value for ruling out aCS was highest for three segments  $< 47$  ms (NPV = 0.82).

#### CONCLUSION

T2 mapping values vary significantly across the left ventricular myocardium. The best threshold for active disease was found to be  $> 50$  ms, and the best threshold for ruling out active disease was  $< 47$  ms. Elevated regional T2 mapping (especially in the septal and inferior segments) is highly specific for active disease and shows a proportional relationship of myocardial involvement with diagnostic performance.

#### CLINICAL RELEVANCE/APPLICATION

T2 mapping, with attention to regional variation, can help identify patients with active cardiac sarcoidosis.

### Cardiac Magnetic Resonance Feature-tracking Assessment of Whole-heart Myocardial Mechanics: Prognostic Value for Early Outcomes in Non-ischemic Dilated Cardiomyopathy

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Gryte Galnaitiene, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

To evaluate the prognostic value of whole-heart myocardial strain parameters derived from feature tracking (FT) on cardiac magnetic resonance imaging (CMRI) for early outcomes in patients with nonischemic dilated cardiomyopathy (NIDCM).

#### METHODS AND MATERIALS

This was a single-center prospective study involving 97 patients (mean age  $49.5 \pm 10.1$  years; 69.1% males) with NIDCM. We identified the baseline CMRI-derived whole-heart myocardial mechanical parameters: global longitudinal and circumferential strains of the left ventricle (LVGLS and LVGCS, respectively), global longitudinal strain of the right ventricle (RVGLS), peak longitudinal strain of the left atrium (LA strain) and right atrium (RA strain). The volumes of both ventricles and areas of both atria were also assessed. We evaluated the prognostic impact of the mechanical parameters for early outcomes that were: cardiac death, heart transplantation and hospitalization for worsening heart failure (HF) at 1 year after diagnosis of NIDCM. Logistic regression analysis was used to assess the potential predictors of these early outcomes.

#### RESULTS

The patients were divided into two groups according to the presence of early outcomes. The groups did not differ in mean age and males ( $p > 0.05$ ). The early outcomes were established in 32 patients (3 heart transplantations, 9 cardiac death, and 30 hospitalizations for HF worsening). All patients' left ventricular ejection fraction (LVEF) was severely reduced (mean LVEF  $28.9 \pm 8.9\%$ ) and more decreased in the group with early adverse outcomes ( $23.7 \pm 10.1\%$  vs  $32.9 \pm 10.6\%$ ,  $p < 0.001$ ). Both ventricles and atria were more dilated in the group with early adverse outcomes ( $p < 0.05$ ). Patients without early outcomes had higher LVGLS and RVGLS values ( $-8.2 \pm 4.1$  vs  $-11.7 \pm 4.6$  and  $-12.7 \pm 5.3$  vs  $-16.8 \pm 6.5$ , respectively,  $p < 0.05$ ). The similar tendency was noticed in LA strain and RA strain parameters ( $8.4 \pm 5.0$  vs  $14.6 \pm 4.3$  and  $11.5 \pm 6.9$  vs  $17.1 \pm 8.0$ , respectively,  $p < 0.05$ ). Logistic regression analysis showed that LVGLS was an independent predictor of early adverse outcomes in patients with NIDCM after 1 year ( $p = 0.001$ ).

#### CONCLUSION

LVGLS derived from FT on CMRI can be a significant independent predictor of early adverse outcomes in patients with NIDCM.

#### CLINICAL RELEVANCE/APPLICATION

The mechanics of all parts of the heart in patients with NIDCM were evaluated. It was revealed that LVGLS has an additive prognostic value to predict early adverse outcomes in patients with severely reduced LVEF and NIDCM.

### Evaluation of Myocardial Histological Properties by Pharmacokinetic Analysis Using Golden-angle Radial Sparse Parallel Imaging-volumetric Interpolated Breath-hold Examination (GRASP-VIBE)

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Masaru Shiotani, RT (*Presenter*) Nothing to Disclose

#### PURPOSE

Golden-angle radial sparse parallel imaging-volumetric interpolated breath-hold examination (GRASP-VIBE) is a sequence used for dynamic contrast-enhance (DCE) MRI that is robust to motion and enables to evaluate of tissue dynamic contrast analysis. This study examined the feasibility of myocardial perfusion imaging under free-breathing conditions using the GRASP-VIBE method and the possibility of assessing myocardial properties using pharmacokinetic analysis.

#### METHODS AND MATERIALS

Prior to cardiac contrast-enhanced MRI, written informed consent was obtained from all 60 subjects enrolled in the study. Perfusion imaging was performed using GRASP-VIBE for 100 seconds following bolus injection of contrast agent. 3D-image reconstruction was performed with a temporal resolution of 3.0 seconds with liver gate, a breath correction technique using liver tracking. The reconstructed images were visually evaluated for streak and cardiac motion artifacts using a 5-point scale, and the image set with the best visual quality was chosen for pharmacokinetic analysis. The analysis was conducted using a workstation (Syngo Tissue 4D) and involved placing a region of interest (ROI) in the septum of the left ventricular myocardium and calculating the volume transfer constant (K<sub>trans</sub>) using curve fitting with the Tofts model. The myocardial properties were evaluated by pharmacokinetic analysis for the three groups of hypertrophic cardiomyopathy (HCM), dilated cardiomyopathy (DCM), and normal subjects, as diagnosed from clinical information. ROC analysis determined cutoff values for differentiation of these diseases using K<sub>trans</sub>, and sensitivity and specificity were calculated.

#### RESULTS

Among the participants, 7 were diagnosed as normal, 14 as HCM, and 8 as DCM. The K<sub>trans</sub> was significantly lower in the HCM (0.606,  $p=0.0104$ ) and DCM (0.694,  $p=0.0188$ ) groups compared to the normal group (1.299). The area under the curve (AUC) for differentiating HCM from normal myocardium was 0.964, and the sensitivity and specificity were 0.857 and 1.00, respectively, when a cutoff value of 0.816 was used. The AUC for differentiating DCM from normal myocardium was 0.939, and the sensitivity and specificity were 0.875 and 1.00, respectively, when a cutoff value of 0.834 was used.

#### CONCLUSION

GRASP-VIBE is a promising tool for evaluating myocardial perfusion and has the potential to become a new myocardial histological characterization index using pharmacokinetic analysis.

#### CLINICAL RELEVANCE/APPLICATION

GRASP-VIBE can acquire myocardial perfusion images without motion artifacts under free breathing without ECG synchronization. K<sub>trans</sub> might be a new biomarker for assessing myocardial properties.

### Low-field MRI to Visualize Interstitial Lung Disease Yields High Conformity with CT in Assessing Fibrosis Extent

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Nadine Bayerl (*Presenter*) Nothing to Disclose

#### PURPOSE

The purpose of this study was to assess the feasibility of lung imaging using a 0.55 T MRI for visualization of interstitial lung disease (ILD) compared to high-resolution CT (HRCT) as the current standard of reference.

#### METHODS AND MATERIALS

This ongoing prospective clinical trial complied with the Declaration of Helsinki and enrolled 25 consecutive patients so far (mean age  $63 \pm 13$  years; male  $n=15$ ; female  $n=10$ ). Inclusion criteria were confirmed ILD on HRCT and the absence of MRI contraindications. Underlying primary diseases were systemic sclerosis ( $n=16$ ), anti-synthetase syndrome ( $n=3$ ), rheumatoid arthritis ( $n=2$ ), mixed collagenases ( $n=1$ ), systemic lupus erythematosus ( $n=1$ ) and idiopathic pulmonary fibrosis ( $n=2$ ). All patients gave informed written consent. Within the maximum of 30 days, patients underwent conventional HRCT and lung MRI on a 0.55 T scanner. In the latter, two-dimensional turbo-spin-echo (TSE) proton density-weighted sequences (TE/TR=35/2000 milliseconds) with BLADE (periodically rotated overlapping parallel lines with enhanced reconstruction) readout,  $1.25 \times 1.25$  mm<sup>2</sup> in plane-resolution,  $304 \times 304$  matrix and 6 mm slice thickness were acquired in transversal plane for visualization of pulmonary findings. Evaluating the visualization of ILD was performed at five defined levels of the lung by assessing the overall extent of ILD, ground-glass opacity (GGO) and reticulation. Wilcoxon signed-rank tests were performed to evaluate the differences between the paired groups. Significance was assumed for  $p < 0.05$ . Statistical analysis was carried out using GraphPad Prism 9 for macOS, Version 9.4.1 (458).

#### RESULTS

Low-field MRI of the lung allowed an assessment of the overall extent of pulmonary fibrosis comparable to CT (MRI, median=10 %, interquartile range IQR=5-40%; CT, median=15%, IQR=5-40%) with no significant differences between the two modalities. In MRI the extent of reticulation was slightly underestimated compared to CT (MRI, median=5%, IQR=5-18%; CT, median=10%, IQR=5-20%), and the extent of GGO was overestimated (MRI, median=5%, IQR=0-20%; CT, median=5%, IQR=0-10%), both reaching significance ( $p < 0.01$ ). The main limitation of this still ongoing study is the small sample size. Our observations will be substantiated in further studies.

#### CONCLUSION

Our study indicates that low-field MRI of the lung provides a reliable visualization of overall extent of ILD and could be useful for monitoring in follow-up examinations as a radiation-free alternative to HRCT.

#### CLINICAL RELEVANCE/APPLICATION

Patients undergo CT scans up to once a year to monitor the extent of ILD, resulting in repeated radiation exposure. Low-field MRI has the potential to be a promising radiation-free alternative to CT for follow-up.

### **Idiopathic and Infection-triggered Acute Exacerbation of Idiopathic Inflammatory Myopathies-associated Interstitial Lung Disease: Clinical, Radiological Features and Prognosis**

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Jingping Zhang (*Presenter*) Nothing to Disclose

#### **PURPOSE**

Acute exacerbation (AE) of idiopathic inflammatory myopathies-associated interstitial lung disease (IIM-ILD) is a life-threatening event. According to the newly proposed diagnostic criteria for the AE of rheumatic disease-associated interstitial lung disease (RD-ILD), infection is regarded as one of the triggers of AE, and AE could be categorised as idiopathic (I-AE) or infection-triggered (iT-AE). In the present study, we aimed to investigate the differences in the clinical, radiological features and prognosis between I-AE and iT-AE of IIM-ILD patients.

#### **METHODS AND MATERIALS**

We retrospectively analysed 69 patients with AE-IIM-ILD (I-AE (34), iT-AE (35)) in our hospital consecutively between January 2014 and December 2020. Infection was identified as confirmation of bacteria, virus, or fungus in samples obtained from the respiratory tract. The outcome was 1-year all-cause mortality.

#### **RESULTS**

I-AE patients showed higher haemoglobin and PaO<sub>2</sub>/FiO<sub>2</sub> ratio than iT-AE patients ( $P < 0.05$ ), and lower pulse, body temperature, white blood cell (WBC) count, neutrophil percentage (NEU), lower C-reactive protein, erythrocyte sedimentation rate, lactate dehydrogenase, hydroxybutyrate dehydrogenase levels, and lower extent of ground-glass opacities (GGO) on HRCT than iT-AE patients ( $P < 0.05$ ). Multiple logistic regression analysis showed that the combination of NEU and the extent of GGO could help discriminate I-AE from iT-AE patients; the area under the receiver operating characteristic (ROC) curves (AUC) was 0.812 (95%CI 0.711-0.913, Sensitivity 0.714, Specificity 0.735, Accuracy 0.725). There is a significant difference in 1-year all-cause mortality between I-AE and iT-AE patients (mortality: I-AE 17.9%, iT-AE 54.3%; log-rank test,  $P = 0.0023$ ).

#### **CONCLUSION**

Infection-triggered AE-IIM-ILD suffered a poorer prognosis than the idiopathic AE-IIM-ILD. The combination of NEU and the extent of GGO on HRCT could help differentiate between the two groups.

#### **CLINICAL RELEVANCE/APPLICATION**

Distinguishing infection-triggered AE from idiopathic AE of IIM-ILD is essential in clinical practice for providing appropriate treatment. NEU combined with GGO extent on HRCT could help differentiate idiopathic AE from infection-triggered AE of IIM-ILD. Infection-triggered AE-IIM-ILD suffered a poorer prognosis than the idiopathic AE-IIM-ILD.

### Role and Accuracy of MRI in Connective Tissue Disease Related Interstitial Lung Disease

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Surabhi Vyas, MD, MBBS (*Presenter*) Nothing to Disclose

#### PURPOSE

To determine diagnostic accuracy of MRI with respect to HRCT in connective tissue disease related interstitial lung disease CTD-ILD.

#### METHODS AND MATERIALS

Prospective single-center diagnostic study with sample size of 31 patients of CTD-ILD. Patients underwent HRCT chest and MRI chest on a 1.5 T scanner. PFT and 6-minute-walk-test were done. Warrick-scores and extent-scores were calculated for HRCT and MRI. Warrick score is sum of morphology-score extent-score. Morphology score is sum of scores given for presence/absence of various CT findings with maximum score of 5 for subpleural cyst and minimum score of 1 for ground-glass-opacity, 0 for absence. Extent-score is calculated for each morphology based on number of bronchopulmonary-segments involved, 1 for less than 3, 2 for 4 to 6 and 3 for more than 6 segments. Each MRI sequence was scored independently and combined-MRI-score was also calculated.

#### RESULTS

MRI showed agreement with HRCT for extent of subpleural-line (50%;  $p=0.0015$ ), honeycombing (46.67%;  $p=0.0004$ ), subpleural-cysts (60%;  $p<0.0001$ ) and ground-glass-opacities (50%;  $p=0.003$ ). Best sequences to look for subpleural-line, honeycombing, subpleural-cyst and ground-glass-opacities were STIR (46.67%;  $p=0.0194$ ), 4-minute postcontrast sequence (61.11%;  $p=0.0290$ ), BTFE (50%;  $p=0.0003$ ). Among combined-scores calculated excluding postcontrast sequences, only 1/31 cases had different score than combined-score derived from all 10 sequences (including postcontrast sequences). Ground-glass-opacities were overestimated by MRI (higher scores in 13; lower scores in 2). Combined-MRI-score showed significant correlation with FEV1( $r=0.3484$ ;  $p=0.05$ ), FEV1/FVC( $r=0.4086$ ;  $p=0.02$ ), MEF50( $r=0.4203$ ;  $p=0.03$ ) post-walk test fatigue score(0.4639;  $p=0.01$ ).

#### CONCLUSION

MRI shows moderate, statistically significant, agreement with HRCT and clinical-parameters in morphological and global assessment of ILD extent in CTD patients. Abbreviated MRI protocol for ILD assessment would be T2, STIR, BTFE in axial planes as these sequences show closest correlation with the CT-scores. Post-contrast sequences didn't contribute significantly to global-score. With evolving MRI technology, shorter scan times and longer lifespan of patients, MRI becomes an attractive radiation-free option for serial follow-up of such patients.

#### CLINICAL RELEVANCE/APPLICATION

MRI has the potential to provide a radiation free imaging alternative to CT in follow up of ILD.

### An Explainable Artificial Intelligence to Detect Histopathological UIP Pattern from HRCT Images and Validation of its Ability

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Ryoko Egashira, MD, PhD (*Presenter*) Speakers Bureau, Boehringer Ingelheim GmbH;Speakers Bureau, AstraZeneca PLC;Speakers Bureau, Shionogi & Co, Ltd;Speakers Bureau, KYORIN Holdings, Inc;Speakers Bureau, DAIICHI SANKYO Group;Speakers Bureau, Bayer AG;Speakers Bureau, Otsuka Holdings Co, Ltd;

#### PURPOSE

To create an explainable artificial intelligence that can predict histopathological UIP pattern from HRCT images by machine learning and to validate its ability

#### METHODS AND MATERIALS

233 cases of interstitial lung diseases (ILDs) of mixed etiologies with volumetric CT images were retrospectively identified for this study from an archive with pathologically proven ILDs. The cases were divided into CT-training set for CT-imaging features (n=74), pathology-training set for UIP/non-UIP labels (n=61, UIP: non-UIP=34:27), and a test set (n=98, UIP: non-UIP=60:38). CT-training set cases were selected to include a variety of morphologic patterns and etiologic backgrounds. A custom machine learning model was trained to CT-imaging features. CT-feature extractors for 2D patches from volumetric CT images were created using self-supervised learning. The CT patches with similar features were clustered based on the output features and then pulmonologists/radiologist integrated the radiologically synonymous clusters. Using the integrated clusters as labeled data, deep-learning models to classify the CT findings were created by transfer-learning. A UIP/non-UIP classifier model to classify the cases into UIP or non-UIP by distribution of CT findings in each lung zone using Random Forest. The model was validated using leave-one-out cross validation. Unaware of the labels, two board-certified radiologists classified the test-set cases into UIP/non-UIP pattern according to modified Fleischner's UIP criteria. The validation and test set results were presented as an average of UIP/non-UIP classifier output. The performance of the model was compared with the radiologists' performance.

#### RESULTS

The accuracy and area under curve (AUC) of the model in validation were 71.47%, 0.785, respectively. In the test set, the accuracy, AUC, sensitivity, specificity and F1 score of the model were 78.67%, 0.843, 84.16%, 70%, and 82.88%. The radiologists' accuracy, sensitivity and specificity were 74.49%, 58.3% and 92% in reader A, 68.37%, 48.3% and 92.1% in reader B, respectively.

#### CONCLUSION

The model's performance in predicting pathological UIP pattern in various ILDs was 78.67% in accuracy and 82.88% in F1 score, which was better than the radiologists' performance using modified UIP criteria. While radiologists' performance was excellent in specificity.

#### CLINICAL RELEVANCE/APPLICATION

The detection of histopathological UIP pattern is a key to the prediction of progressive pulmonary fibrosis. There are currently no diagnostic HRCT criteria for UIP pattern other than IPF, this predictive model may be useful.

### Effect of Contrast Enhancement on Diagnosis of Interstitial Lung Abnormalities in Automatic Quantitative CT Measurement

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Jaeyeon Choi (*Presenter*) Nothing to Disclose

#### PURPOSE

To evaluate the effect of contrast enhancement on the diagnosis of interstitial lung abnormalities (ILA) in automatic quantitative CT measurement

#### METHODS AND MATERIALS

Patients who underwent preoperative chest CT for lung cancer between April 2017 and December 2020 were retrospectively included. Each examination consisted of a pair of nonenhanced and contrast-enhanced CT scans, and images were analyzed using a commercially available deep learning-based automated quantification software for ILA. According to quantified results based on the definition by the Fleischner Society, patients were divided into normal and ILA groups. The agreement for the diagnosis of ILA was estimated with kappa values. Reproducibility and measurement variability were also estimated using the intra-class correlation coefficient (ICC) and Bland-Altman method.

#### RESULTS

Of the 1199 included patients (mean age, 62.2 years  $\pm$  10.9 [SD]; 595 females), ILA was identified in 46 (3.8%) and 76 (6.3%) on pre- and post-contrast images, respectively. Pre-contrast and post-contrast CT scans showed substantial agreement (weighted Kappa: 0.67) in the diagnosis of ILA. Of the 46 patients diagnosed with ILA on pre-contrast scans, 42 were also diagnosed with ILA on post-contrast scans. Post-contrast images showed a greater extent of total ILA than pre-contrast images (mean percentage, 0.99%  $\pm$  2.2 vs 0.63%  $\pm$  1.6,  $p < 0.0001$ ). Pre- and post-contrast images showed excellent reproducibility for fibrotic ILA (ICC = 0.96), but only fair reproducibility for non-fibrotic ILA (ICC = 0.74). Measurement variability was wider in nonfibrotic ILA than in fibrotic ILA (95% limits of agreement, nonfibrotic: [-2.3, 3.0] vs. fibrotic: [-0.1, 0.1]).

#### CONCLUSION

Contrast enhancement influenced the quantification of ILA with a tendency to overestimate, especially for nonfibrotic ILA.

#### CLINICAL RELEVANCE/APPLICATION

Automatic quantitative assessment for ILA on contrast-enhanced CT images may lead to overdiagnosis of ILA; thus care should be taken in the diagnosis of ILA and subsequent visual assessment may be needed.

### Quantitative CT-based Regional Lung Function and PFT at Baseline Predict One-Year Change of DLCO in Idiopathic Pulmonary Fibrosis

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Wonchul Chung (*Presenter*) Nothing to Disclose

#### PURPOSE

While carbon monoxide lung diffusing capacity (DLCO) test is an important functional measure for idiopathic pulmonary fibrosis (IPF), it is also difficult for patients to conduct. We aimed to predict future DLCO using regional lung function variables computed from quantitative CT (QCT) and baseline pulmonary function test (PFT) variables, via machine learning.

#### METHODS AND MATERIALS

Full inspiratory and full expiratory CTs, demographics, and PFT measurements (spirometry and DLCO) at baseline and DLCO at 1-year follow-up visits were prospectively collected of 45 IPF patients (age=71±5, M:F=39:6) at 5 institutions in South Korea (under IRB approval and with subject consent, using a common dose-reduced QCT protocol). 113 multiscale lung structural and functional features were derived from QCT analysis, using VIDA Vision (Coralville, IA) and in-house software. QCT, demographics, and PFT features significantly correlated with percent predicted DLCO (DLCO%pred) after one year ( $p < 0.05$ , Pearson's correlation) were then used to predict DLCO%pred after one year using XGBoost machine learning algorithm. Model performance was evaluated by  $R^2$  and mean absolute error (MAE).

#### RESULTS

QCT variables had significant correlations with DLCO. Baseline percent predicted DLCO ( $r=0.76$ ;  $p < 0.001$ ), percent predicted forced expiratory volume in the first second (FEV1%pred) ( $r=0.65$ ;  $p < 0.001$ ) and forced vital capacity (FVC%pred) ( $r=0.64$ ;  $p < 0.001$ ), Among QCT variables, regional ventilation index (RRAVC) at whole lobe and Right lower lobe (RLL) ( $r=-0.35$ ,  $-0.13$ ;  $p=0.03$ ,  $0.04$ ), high attenuation area percent (HAA%) at whole lung, left upper lobe (LUL) and left lower lobe (LLL) ( $r=-0.45$ ,  $-0.40$ ,  $-0.39$ ;  $p=0.04$ ,  $0.02$ ,  $0.03$ ) also contributed in predicting future DLCO score. Normalized tracheal wall thickness (WT\*trachea) was also negatively associated with future DLCO ( $r=-0.3$ ;  $p < 0.03$ ). XGBoost model's performance in  $R$ -squared ( $R^2$ ) and mean absolute error (MAE) were 0.73 and 9.01, implying 73% of the total variation and predictions off by 9.01 units from the actual values. Results suggest association of left lung RRAVC, HAA% and tracheal wall thickening with smaller future DLCO in IPF.

#### CONCLUSION

QCT based regional lung structure-function and PFT features can predict DLCO after 1 year via machine learning.

#### CLINICAL RELEVANCE/APPLICATION

Predicting DLCO after 1 year via machine learning provide pathophysiological interpretation of regional changes in lung structure and function in IPF.

### Severe Asthma Patient Treatment Response Evaluation Using Visual and Quantitative Analysis of Chest CT

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Miji Lee, MD (*Presenter*) Nothing to Disclose

#### **PURPOSE**

Visual and quantitative analysis on chest CT for bronchiectasis(BE) score and mucus impaction(MI) extent in patients with severe asthma investigate the correlation with the patient's treatment response.

#### **METHODS AND MATERIALS**

The 34 asthma patients (mean age; 55.1±12.8 years, male;female=40%;60%) who had undergone initial and 1 year follow up inspiration/expiration CT after treatment. Experienced thoracic radiologists independently determined the change of BE score and MI extent. Using Aview software (Coreline Soft), quantitative air-trapping and airway were analyzed at the initial and 10months follow up CT scan. Clinical parameters considered in patient have FEV1 and FEV1/FVC, sputum and blood eosinophils. For statistical analysis, intraclass correlation coefficient and correlation analysis were used.

#### **RESULTS**

In the intraclass correlation coefficient between the two readers, the bronchiectasis(BE) score showed a reliability of 78% and the mucus impaction showed a reliability of 89%. Table 1 shows the greater the BE score and MI extent, the closer the pattern of obstructive lung disease is derived from both readers. MI extent was positive correlated with eosinophils. In the quantitative analysis, FEV1 and FEV1/FVC showed a positive correlation in the normal lung area, but a negative correlation in the case of functional air-trapping with and without emphysema. Quantitatively, when the counted branch segment increases, the PFT result shows a positive correlation, and the Pi10 and wall area measurements show a negative correlation. According to table 2, changes in BE score and MI extent showed a relatively significant correlation with changes in clinical parameters. Only Pi10 showed a negative correlation with PFT, and quantitative normal lung and functional air-trapping changes did not show any correlation.

#### **CONCLUSION**

In patient with asthma, changes in MI extent with treatment have clinical significance rather than the severity of BE score itself. Visual changes in MI extent after treatment of asthma on CT and quantitatively decreased Pi10 correlated with changes in PFT and eosinophilia.

#### **CLINICAL RELEVANCE/APPLICATION**

Through quantitative analysis of airway and visual analysis of mucoid impaction extent, post-treatment response can be evaluated in patients with severe asthma.

### Classification of Acute Superior Mesenteric Artery Occlusion on CT using a 3D Machine Learning Model

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Robert J. Harris, PhD (*Presenter*) Scientist, Virtual Radiologic Corporation

#### PURPOSE

Acute superior mesenteric artery (SMA) occlusion is a life-threatening condition that requires immediate diagnosis and treatment. Although our group has previously developed a machine learning 2D model to identify SMA occlusion by analyzing each CT slice individually, it is sometimes not possible to identify an occlusion on a single CT slice. We hypothesized that we could train a machine learning 3D model to identify SMA occlusion on CT with full volumetric context.

#### METHODS AND MATERIALS

Natural language processing (NLP) of radiology CT reports was used retrospectively to identify studies containing SMA occlusion. An axial image series from each of these studies was annotated by a Board Certified radiologist by segmenting the region of occlusion using an in-house brush tool. These segmentations were converted into 3D bounding boxes; 615 annotated volumes were used as positives, and 618 CT volumes with no SMA occlusion were used as negatives in the training dataset. A RetinaNet 3D model using the Medical Open Network for AI (MONAI) framework was implemented for training. The model was applied to a test dataset consisting of 20 negative studies and 59 studies positive for SMA occlusion. The positive studies were cases where the pathology had been missed by the initial reading radiologist (quality assurance cases). Prior to running the RetinaNet 3D model, a separate CT anatomy classification model was run on each series and only slices with abdominal anatomy were kept, to reduce the total image volume inferred by the RetinaNet 3D model. The highest probability from bounding boxes generated by the RetinaNet 3D model was taken as the overall model result for a study.

#### RESULTS

The highest validation accuracy during training was 0.678, at which point the final model was saved. The model achieved an AUC of 0.837 on the test dataset. At a threshold of 0.88, sensitivity was 63.6% with a specificity of 100%, suggesting that over half of missed SMA occlusion cases at our practice would have been caught had this model been in place.

#### CONCLUSION

An artificial intelligence model was trained to identify SMA occlusion on CT imaging. To our knowledge, this is the first use of a machine learning 3D model to identify SMA occlusion on CT images. This model is currently undergoing iterative retraining with false positives and false negatives from prospective data and will be continually updated in preparation for live clinical deployment.

#### CLINICAL RELEVANCE/APPLICATION

SMA occlusions on CT must be timely diagnosed to improve patient outcome and are sometimes missed by radiologists. A 3D model to identify these cases for both worklist prioritization and quality assurance would be highly relevant to improving patient care.

### **A Preliminary Study on the Value of Multi-frequency MR Elastography in Auxiliary Evaluating the Efficacy of Neoadjuvant Chemoradiotherapy for Locally Advanced Rectal Cancer**

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Xiao Wang (*Presenter*) Nothing to Disclose

#### **PURPOSE**

To investigate the value of multi-frequency magnetic resonance elastography (m-MRE) in auxiliary evaluating the efficacy of neoadjuvant chemoradiotherapy (nCRT) for patients with locally advanced rectal cancer (LARC).

#### **METHODS AND MATERIALS**

From Nov. 2021 to Dec. 2022, 81 patients with rectal cancer were prospectively recruited and after screening by exclusion criteria, 64 patients who underwent radical resection after nCRT were finally enrolled. All patients underwent MRI and rectal elastography examination within 1 week before surgery. Maps of shear-wave speed  $c$  ( $c$ -map) and phase angle of the shear modulus  $f$  ( $f$ -map) were generated and then measured  $c$  and  $f$  values for tumor or rectum wall. According to the collected pathologic ypTN stages and tumor regression grades (TRG), patients were divided into Group1: ypT0-1 (Good response, GR) and ypT2-4 (Poor response, PR) groups, Group2: ypN0 and ypN1-2 groups and Group3: pCR (TRG0) and Non-pCR (TRG1-3) groups. To analyze whether the differences of m-MRE parameters ( $c$ ,  $f$ ,  $c+f$ ) among different groups were statistically significant, and drew ROC curve to analyze the diagnostic efficiency. Compared with T2WI+DWI, to explore whether m-MRE ( $c+f$ ) can show better diagnostic efficacy in distinguishing different groups and to further analyze whether the combination of T2WI+DWI and m-MRE ( $c+f$ ) can achieve higher diagnostic efficacy. To explore whether the combination of T2WI+DWI and m-MRE ( $c+f$ ) could improve the diagnostic accuracy and consistency than that of T2WI+DWI, with pathological results as gold standard.

#### **RESULTS**

Significant differences of  $c$  and  $f$  values were observed in Group 1 and Group 3 ( $P < 0.05$ ), but not in Group 2. m-MRE ( $c$ ,  $f$  and  $c+f$ ) showed good diagnostic efficacy both in Group 1 with AUC values 0.810, 0.736 and 0.853, and Group 3 with AUC values 0.810, 0.736 and 0.853 (all  $P < 0.05$ ). m-MRE ( $c+f$ ) had significantly higher AUC values ( $P < 0.05$ ) than T2WI+DWI in Group 1 and Group 3. Furthermore, the combination of T2WI+DWI and m-MRE ( $c+f$ ) can get higher AUC values ( $P < 0.05$ ) than T2WI+DWI in Group 1 and Group 3 as well. Besides, it could also improve the diagnostic accuracy and consistency than that of T2WI+DWI, with pathological results as gold standard.

#### **CONCLUSION**

m-MRE has a potential auxiliary value in evaluating the efficacy of nCRT for LARC patients.

#### **CLINICAL RELEVANCE/APPLICATION**

Reliable preoperative methods to accurately evaluate tumor regression and identify patients with pCR are significant to LARC patients, which can promote making personalized clinical treatment plans.

### Predicting the Risk of Postoperative Distant Metastasis in Patients with Locally Advanced Rectal Cancer: Using MRI-based Delta-imaging Methods

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Yu Zhu (*Presenter*) Nothing to Disclose

#### PURPOSE

To predict the risk of postoperative distant metastases in patients with locally advanced rectal cancer by using delta-imaging features extracted from MRI before and after nCRT.

#### METHODS AND MATERIALS

A total of 213 patients with locally advanced rectal cancer were retrospectively enrolled in Yunnan Cancer Hospital from January 2016 to June 2019. All patients underwent surgical treatment after nCRT and underwent MRI examination before and after nCRT. All patients were followed up for at least 3 years after surgery, except those with postoperative endpoint events. They were randomly divided into training group and verification group (training group n=149, verification group n=64) in a ratio of 7:3, which were used for feature selection and verification respectively. Tumor lesions were delineated layer by layer on T2-weighted imaging (T2-weighted imaging) before and after nCRT, and 3D-slicer software was used for feature extraction. Delta-image omics features are defined as the difference in image omics features before and after nCRT. Using The least absolute shrinkage and selection operator algorithm (LASSO) for feature reduction and extraction, three delta-image omics models were constructed. It includes the Delta-Imagomics model and the combined Delta-imagomics model based on the absolute and relative variation of imagomics features before and after nCRT. Receiver operating characteristic curve (ROC) was used to evaluate the predictive value of the model for DM.

#### RESULTS

A total of 213 patients with LARC were included in this study (42% female and 58% male), with an average age of  $58.50 \pm 12.37$  years and a median follow-up time of 39.8 months. A total of 36 patients (16.9%) developed DM after surgery. 1382 features were extracted from each lesion before and after nCRT. After feature reduction and screening, 7 key features were included in the delta-imaging model based on absolute and relative changes of imaging features before and after nCRT in the training set. In the training set, the area under ROC curve of the absolute and relative variation Delta-Imaging model and the combined Delta-imaging model were 0.77, 0.74 and 0.82, respectively, and the AUC of the corresponding test set were 0.73, 0.70 and 0.84, respectively.

#### CONCLUSION

The combined prediction model based on delta-imaging features of MRI is helpful to predict the risk of distant metastasis after local advanced rectal cancer surgery, and is better than the pure delta-imaging model of absolute and relative changes.

#### CLINICAL RELEVANCE/APPLICATION

To predict the risk of postoperative distant metastases in patients with locally advanced rectal cancer .

### Machine Learning-based Response Assessment in Patients with Rectal Cancer After Neoadjuvant CCRT: Radiomics Analysis for the Assessment of Tumor Regression Grade Using T2-weighted MR Exam

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Yongdae Lee, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

We investigated the machine learning model-based radiomics analysis for the assessment of tumor regression grade using T2-weighted MR images in patients with rectal cancer after neoadjuvant chemotherapy-radiation therapy (CRT).

#### METHODS AND MATERIALS

A total of 100 patients with rectal cancer who underwent magnetic resonance (MR) imaging at baseline and after CRT between January 2010 to May 2021 were included. The median age was 64 (31-89) and male was 66% (66/100). All MR scans were acquired with two different 3T scanners (Achieva 3.0T MR system, Philips Healthcare; MAGNETOM Vida, Siemens Healthineers) and included the oblique axial T2-weighted images acquired perpendicular to the long axis of the tumor. Region of interest (ROI) for each cancer lesion was drawn and extracted by a radiologist and 116 radiomics-feature was analyzed using MEDIP software (MEDICAL IP, Seoul, Republic of Korea, [medicalip.com/Medip](http://medicalip.com/Medip)). Treatment responses were evaluated by the radiologist using MR tumor regression grade (mrTRG). Responses were classified into two groups ('good' versus 'poor'); mrTRG 1, 2, and 3 were categorized as 'good', and mrTRG 4 and 5 were categorized as 'poor'. We implemented the 3-principle component analysis (PCA)-ensemble model to predict the response group. Model performance was evaluated by calculating the area under a receiver operating curve (AUROC) for each feature-set, and selected combination of the feature sets.

#### RESULTS

Texture-feature based sets and selected combinations were compared with qualitative mrTRG assessment to identify the significant feature sets in predicting the treatment responses. With the volume feature set (3D), the mean volume change was calculated, and overall 38.55% of volume has decreased. In comparison between the two groups, good response group showed lower baseline tumor volume and larger volume loss at post-CRT MR (50.32%) while poor response group showed larger baseline tumor volume and lesser volume loss at post-CRT MR (29.54%). Of all texture-feature sets and selected combinations of the feature sets, volume feature set (3D) combined with histogram-based contrast feature set (1st order) achieved the largest AUC of 0.79 for differentiating good and poor response.

#### CONCLUSION

Machine learning based radiomics analysis using T2-weighted MR imaging demonstrated feasible diagnostic ability for the response assessment in patients with post CRT rectal cancer. This radiomics analysis enables quantification of tumor volume and texture change.

#### CLINICAL RELEVANCE/APPLICATION

Machine learning based radiomics analysis represents quantitative assessment of treatment response in post-CRT rectal cancer, and can be a useful assistant for treatment response assessment.

### Personalized Weight-Based Dosing of Iodinated Contrast Material: Dose Savings and Effect on Image Quality in Abdominal Computed Tomography (CT)

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Christina Shehata, BA (*Presenter*) Nothing to Disclose

#### PURPOSE

Fixed dosing of iodinated contrast material (CM) (i.e., using the same amount of contrast for all patients or based on weight buckets) is a standard practice among many institutions for abdominal CT. This study aims to investigate effects of personalized weight-based dosing (1.14 mL/kg) of CM on saving of contrast and on image quality of abdominal CT.

#### METHODS AND MATERIALS

376 patients who underwent abdominal CT at a large urban academic medical center were included in this study. Each patient had at least two CT of abdomen performed within a one-year interval, with one study using a fixed dose of iodine contrast and the other implementing weight-based dosing. Studies were matched by imaging protocol, peak kilovoltage (kVp), and phase of enhancement. The amount of administered contrast for each study was collected. Attenuation of various organs and structures including portal vein, aorta, inferior vena cava, hepatic veins, liver, and spleen was measured. In addition, noise, contrast-to-noise ratio, and subjective image quality were calculated. Values were compared using paired and unpaired t-test. Sub-analysis based on patients' BMI was also performed.

#### RESULTS

In the fixed-dose protocol, the mean iodine dose was 35 g, compared to 26.2 g and 32.6 g in the weight-based protocol in patients with normal/low weight (BMI = 25) and those with high weight (BMI > 25), respectively. The weight-based protocol also resulted in an average cost reduction of 16.3% with average savings of \$72.58. There were no differences in noise between the two protocols. In patients with high weight, except for the aorta, there were no significant differences in enhancement at the selected ROI between the two contrast protocols. Patients with a normal or low weight with weight-based contrast dosing had lower enhancement ( $p < 0.001$ ), with mean difference in degree of enhancement ranging 7.4-28.1 HU depending on the organ/structure, compared to the studies with a fixed dosing.

#### CONCLUSION

The results of this study demonstrate that a personalized weight-based CM dosing strategy can result in significant saving of contrast. The saving is more pronounced in patients with lower BMI. In patients with higher BMI, the enhancement of abdominal organs was non-inferior to fixed-dosing CTs. Despite the lower degree of enhancement of structure in low-BMI group, as expected with the lower amount of administered iodine, the difference in degree of enhancement was small with no significant effect on subjective perceived image quality.

#### CLINICAL RELEVANCE/APPLICATION

These data support that a weight-based contrast protocol can maintain image quality (especially in larger patients) while improving patient safety and reducing healthcare costs.

### Effect of the Body Water and the Body Composition, Calculated by Bioelectrical Impedance Analysis on Contrast-enhanced Dynamic Computed Tomography Images of the Liver

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Takanori Masuda, PhD (*Presenter*) Nothing to Disclose

#### PURPOSE

To improve its diagnosis on contrast-enhanced dynamic CT (CE-DCT) scans, contrast injection protocol must yield stable arterial contrast enhancement. To investigate how the body-water distribution and the body composition, calculated by bioelectrical impedance analysis (BIA), affect aortic and hepatic enhancement on CE-DCT scans.

#### METHODS AND MATERIALS

This retrospective study was approved by our institutional review board; informed patient consent was waived. Between January 2019 and May 2020, 236 patients with liver cirrhosis underwent CE-DCT before BIA. The CT number (in Hounsfield units, HU) of the abdominal aorta at the celiac artery level on unenhanced scans and during the hepatic arterial phase (HAP) scans was recorded. And, the mean CT number of the hepatic parenchyma of both hepatic lobes at the celiac artery level on unenhanced and portal venous phase (PVP) scans was recorded. We calculated changes in the iodine dose per contrast enhancement (mgI/HU) (IDCE) to evaluate the effect of the patient age and of various constituents of the body composition by performing BIA.

#### RESULTS

The IDCE of the abdominal aorta during HAP was  $121.5 \pm 32.1$  mgI/HU; it was  $698.7 \pm 211.1$  mgI/HU in the hepatic parenchyma during the PVP. Among the parameters used in our BIA, the total body weight (TBW) was the most important factor affecting the IDCE of the liver abdominal aorta on CE-DCT scans acquired during the HAP ( $r = 0.83$ ). The TBW and the skeletal muscle index most strongly affected the IDCE of the hepatic parenchyma on CE-DCT scans obtained during the PVP ( $r = 0.69$ ).

#### CONCLUSION

The TBW had the strongest effect on contrast enhancement. The skeletal muscle index exhibited the strongest correlation with hepatic parenchymal contrast enhancement during the PVP.

#### CLINICAL RELEVANCE/APPLICATION

We found that many body parameters included in BIA affect IDCE on CE-DCT images. Most exhibited a more than moderate correlation with IDCE of vessels and the hepatic parenchyma. It may be a useful index for machine learning to obtain a stable contrast enhancement on CE-DCT.

### Effect of the CT Values for Abdominal Aorta and Liver Parenchyma During Contrast Enhancement Dynamic CT with or without the Splenomegaly

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Hiroyuki Ikenaga, BS (*Presenter*) Nothing to Disclose

#### PURPOSE

To compare CT (computed tomography) values for abdominal aorta and liver parenchyma during dynamic contrast-enhanced (CE) CT in cirrhotic patients with and without splenomegaly.

#### METHODS AND MATERIALS

We considered 258 patients (83 males and 46 females for the splenomegaly group, and 83 males and 46 females for the control group) for this study. We measured CT values in the abdominal aorta and hepatic parenchyma during the hepatic arterial (HAP) and portal venous (PVP) phases. The aortic CE at HAP and the hepatic parenchymal CE at PVP were compared between the two groups. For depiction ability, we also calculated the optimal CE rates (>280 HU in the abdominal aorta and >50 HU in the hepatic parenchyma) for each group.

#### RESULTS

The median and range of the CE for all patients with abdominal aorta and liver parenchyma were 273.0 HU (110.9-477.3 HU) and 54.0 HU (19.9-78.6 HU), respectively, in the Splenomegaly (SM) group and 298.9 HU (158.6-494.0 HU) and 54.0 HU (16.5-78.5 HU), respectively, in the non-SM group. In the SM group, the CE for abdominal aorta decreased during the aortic phase for a dynamic CE CT ( $p < 0.05$ ). For the depiction ability, there were significant differences in the rates of optimal CE between both the groups ( $p < 0.05$ ).

#### CONCLUSION

The diagnostic ability and CE for abdominal aorta during the aortic phase exhibited a significant decrease during dynamic CE CT in SM patients.

#### CLINICAL RELEVANCE/APPLICATION

It is necessary to change the injection rates and contrast materials volume during CE CT depending on the presence or absence of SM.

### **Fidelity of Iodine and HU Values in a Renal Phantom using a Novel edge-on-irradiated Si-based Photon-Counting Detector CT**

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Fides R. Schwartz, MD (*Presenter*) Nothing to Disclose

#### **PURPOSE**

To evaluate the accuracy of a new edge-on-irradiate silicon-based photon-counting detector CT (Deep Si-PCCT) prototype for quantification of iodine concentration and stability of HU values in moderately and strongly enhancing kidney parenchyma.

#### **METHODS AND MATERIALS**

A phantom that simulates moderately and strongly enhancing kidney parenchyma (at 180 and 240 HU) inside a small patient (23 cm diameter) was scanned using a novel, Deep Si-PCCT prototype. The simulated kidney parenchyma contains an internal dense water-equivalent rod at 60 HU and a rod of 2.2 mg/mL iodine concentration to simulate a proteinaceous, non-enhancing and a mildly enhancing cystic renal lesion. The rods were positioned in the kidney parenchyma in two separate setups, so each rod was imaged within both levels of kidney enhancement. The accuracy and stability of the iodine quantification and HU values were evaluated with repeated ROI measurements of the same size across consecutive slices along the length of the simulated kidney parenchyma and the internal rods. Images were reconstructed with prototype soft tissue kernel at 2.5mm slice thickness without additional denoising.

#### **RESULTS**

The Deep Si-PCCT accurately quantified the iodine concentration in the small rod at  $2.1 \pm 0.02$  and  $2.1 \pm 0.04$  mg/mL (Setup 1 and 2, respectively), and the quantification was stable across the length of the internal rod, with both setups. The water equivalent rod was also quantified correctly, showing iodine concentrations within the standard deviation and HU values of  $58 \pm 0.5$  HU and  $60 \pm 0.9$ . The HU values of moderately and strongly enhancing renal parenchyma were stable across the length of the rod and correlated with the know ground-truth values. The figure also shows images of the first patient with cystic renal lesions scanned on the new Deep Si-PCCT at 120 kVp with 400 mAs and 1 second rotation (axial scan), reconstructed with a standard soft tissue kernel.

#### **CONCLUSION**

The Deep Si-based PCCT is a promising tool for accurate and stable quantification of iodine concentration and measurement of HU values in cystic lesions within moderately and strongly enhancing kidney parenchyma. It has the potential to improve the diagnosis and management of cystic renal lesions.

#### **CLINICAL RELEVANCE/APPLICATION**

The novel Deep Si-based photon-counting detector CT provides, accurate iodine quantification and HU values in kidney parenchyma and cystic lesions, which is crucial for the classification and management of cystic renal lesions.

### Renal Cyst Pseudoenhancement: Impact of Virtual Monochromatic and Ultra-high-resolution Imaging with Photon-counting Detector CT

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Atsushi Nakamoto, MD, PhD (*Presenter*) Nothing to Disclose

#### PURPOSE

To investigate whether virtual monochromatic and ultra-high-resolution imaging with photon-counting detector CT (PCD-CD) can overcome renal cyst pseudoenhancement.

#### METHODS AND MATERIALS

This retrospective study included 104 renal cysts in 31 patients (20 men and 11 women, age range, 42 to 91 years; mean age, 71.6 years) who underwent abdominal dynamic contrast-enhanced CT with PCD-CT. Cysts less than 3 mm in diameter and greater than 20 mm in diameter were excluded. Unenhanced and portal venous phase images were reconstructed with 512 and 1024 matrices with slice thicknesses of 0.2, 0.4, 1, and 2 mm, respectively. The 0.2-mm-thick images were reconstructed using polychromatic imaging (T3D) because virtual monochromatic imaging is not applicable to the 0.2-mm-thick images. For the other slice thicknesses, 70 keV virtual monochromatic images were reconstructed. In addition, 512-matrix, 1-mm-thick virtual monochromatic images were reconstructed at 50, 60, 80, and 90 keV. CT values were measured by placing regions of interest on the renal cysts and the attenuation increase from unenhanced to portal venous phase was calculated. The attenuation increases in each image were compared and the frequency of pseudoenhancement (an increase of 10 HU or more) was evaluated.

#### RESULTS

There was no significant difference in attenuation increase between the 512 and 1024 matrix images at any slice thickness ( $P > .05$ ). The attenuation increases were significantly higher for the 0.2-mm-thick T3D images and the 2-mm-thick 70 keV images compared to the 0.4-mm and 1-mm-thick 70 keV images ( $P < .001$ ). The attenuation increase was lower at higher keVs, with significant differences among all keVs ( $P < .001$ ). The frequency of pseudoenhancement was lowest for 90 keV images (13/104, 12.5%), followed by 80 keV images and 0.4-mm-thick 70 keV images (18/104, 17.3%). When only cysts with 10 mm or larger in diameter were included, virtual monochromatic images at 70 keV or higher showed no pseudoenhancement.

#### CONCLUSION

Virtual monochromatic images with PCD-CT can overcome renal cyst enhancement. Thinner slice thicknesses were useful in reducing pseudoenhancement, although 0.2-mm-thick images had a higher frequency of pseudoenhancement due to their polychromatic nature.

#### CLINICAL RELEVANCE/APPLICATION

Virtual monochromatic imaging at 70 keV or higher using photon-counting detector CT shows no pseudoenhancement in renal cysts of 10 mm or larger in diameter and is expected to improve the diagnostic performance of renal masses.

### The Prevalence of Malleus-tympanum Synostosis on Ultra-high-resolution CT: A Preliminary Study

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Ning Xu, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

To determine the prevalence of malleus-tympanum synostosis (MTS) in different individuals via 0.1 mm ultra -high-resolution CT (U-HRCT).

#### METHODS AND MATERIALS

This retrospective study evaluated U-HRCT scans with 0.1 mm thickness of 1587 ears from 1122 subjects from October 2020 to March 2022. MTS presented as a bony connection between the malleus and tympanic wall. MTS was detected in subjects with normal ears, subjects with different types of hearing loss (HL), and subjects with various causes of conductive HL. The prevalence of MTS was calculated and statistically compared between subjects with normal ears and with different types of HL, as well as between subjects with various causes of conductive HL. The correlation between MTS and age or gender was calculated using the Mann-Whitney U test.

#### RESULTS

The prevalence of MTS was 2.8% (16/577), 3.4% (12/352), 7.2% (27/374), and 13.7% (39/284) in subjects with normal, mixed HL, sensorineural HL, and conductive HL ears, respectively. MTS was more common in subjects with HL than in subjects with normal ears ( $p < 0.001$ ), and significant differences were shown between mixed and sensorineural HL groups ( $p_{m-s} = 0.023$ ), between mixed and conductive HL groups ( $p_{m-c} < 0.001$ ), and between sensorineural and conductive HL groups ( $p_{s-c} = 0.006$ ). The prevalence of MTS was 83.9% (52/62), 34.8% (23/66), 12.6% (61/483), 7.5% (8/107), and 6.9% (7/102) in subjects with conductive HL with tympanosclerosis, definite middle ear malformations, otitis media, otosclerosis, and middle ear cholesteatoma, respectively. Besides, MTS was found in 18.8% (6/32) of subjects with unexplained conductive HL, 3 of whom were confirmed as having malleus fixation by surgery. No correlation was shown between MTS and age ( $p = 0.41$ ) or gender ( $p = 0.70$ ) in subjects with normal ears.

#### CONCLUSION

MTS is a new sign that can be clearly visualized on an ultra-high-resolution CT with 0.1 mm thickness. The prevalence of MTS was 2.8% and 7.7% in subjects with normal ears and with HL, respectively. It may be asymptomatic, or may be associated with conductive HL.

#### CLINICAL RELEVANCE/APPLICATION

Malleus-tympanum synostosis (MTS) is a new sign that can be clearly visualized on an ultra-high-resolution CT with 0.1 mm thickness. It is not uncommon and may be asymptomatic or may be associated with conductive HL by resulting in malleus fixation. Moreover, MTS may be the cause of some "idiopathic" conductive HL. Otolologists can use their understanding of MTS to develop new treatment strategies and improve hearing outcomes.

### Comparative Study of the Sensitivity of Ultra-high-resolution CT and High-resolution CT in the Diagnosis of Isolated Fenestral Otosclerosis

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Ning Xu, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

To compare the sensitivity of ultra-high-resolution computed tomography (U-HRCT) and high-resolution computed tomography (HRCT) in the diagnosis of isolated fenestral otosclerosis (IFO).

#### METHODS AND MATERIALS

Eighty-five patients (85 ears) with both clinical and intraoperative diagnosis of IFO were prospectively included between October 2020 and November 2022. Only U-HRCT (0.1mm thickness) was performed for 20 ears, only HRCT (0.67mm thickness) was performed for 45 ears, and both U-HRCT and HRCT were performed for 20 ears. General radiologists and neuroradiologists who were blinded to the clinical and surgical conditions evaluated the images. The sensitivity of U-HRCT and HRCT to detect IFO by the two groups of radiologists were compared.

#### RESULTS

The diagnostic sensitivity of U-HRCT was 100% (40/40 ears) for neuroradiologists and 87.5% (35/40 ears) for general radiologists, which was significantly higher than that of HRCT (89.2% [58/65 ears] for neuroradiologists; 41.5% [27/65 ears] for general radiologists) ( $P=0.042$  and  $P=0.000$ , respectively). When evaluated with HRCT, the sensitivity of general radiologists was significantly lower compared to neuroradiologists ( $P=0.000$ ), while no difference was shown when general radiologists switched to U-HRCT ( $P=0.152$ ). Among the 20 ears that underwent both examinations, 5 ears with  $<1$  mm lesion involving the fissula ante fenestram were shown on U-HRCT, while the sensitivity of HRCT was 40% (2/5 ears) for neuroradiologists, which was significantly lower than that for neuroradiologists to diagnose lesions  $>1$  mm (93.3%, 14/15 ears,  $P=0.032$ ).

#### CONCLUSION

U-HRCT is more sensitive than HRCT in the diagnosis of IFO, and has a significant advantage in the detection of  $< 1$ mm lesions.

#### CLINICAL RELEVANCE/APPLICATION

U-HRCT has a high spatial resolution scale, which can significantly improve the delineation of IFO lesions and improve the ability of general radiologists to detect this disease. It has the potential to be used for screening of patients with suspected otosclerosis.

### Feasibility of the mDIXON Method for Estimation the Parotid Gland Fat Fraction in Sjögren's Syndrome

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Changwei Ding (*Presenter*) Nothing to Disclose

#### **PURPOSE**

SS characterized by irreversible varying degrees of fat deposition, the objective of this study is to explore the feasibility of estimating fat fraction (FF) in parotid glands with Sjogren's syndrome using the mDIXON method.

#### **METHODS AND MATERIALS**

Conventional MRI and mDIXON-Quant were performed on 62 parotid glands (case group) in 31 SS patients and 62 parotid glands (control group) in 31 healthy volunteers with age and mean body mass index matching. The FF values of the two groups were compared, and the changes of FF values with different degrees of fat deposition were analyzed.

#### **RESULTS**

The FF value of parotid gland in the case group was significantly higher than that in the control group ( $35.7 \pm 15.7$ ,  $28.3 \pm 16.1$ , respectively,  $P=0.008$ ). The FF value in the case group increased gradually from no significant fat deposition in the early stage ( $32.1 \pm 4.8$ ) to significant fat substitution ( $73.0 \pm 4.9$ ).

#### **CONCLUSION**

The FF values obtained by the mDIXON method are a new method that can quantitatively assess the extent of SS parotid gland lesions.

#### **CLINICAL RELEVANCE/APPLICATION**

mDIXON provides a simple and easy clinical method for quantitative assessment of the extent of SS parotid gland lesions.

### Characterization of Intratumoral Heterogeneity by using Diffusion-relaxation Correlation Spectrum Imaging (DR-CSI) in HNSCC

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Yingwei Wu, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

To determine the feasibility of diffusion-relaxation correlation spectrum imaging (DR-CSI) in the characterization of microstructural tissue compartments in HNSCC.

#### METHODS AND MATERIALS

Patients suspected with HNSCC who underwent 3-T MRI and surgical resection were prospectively studied. DR-CSI was applied and imaged for primary HNSCC and metastatic lymph nodes in vivo and were co-registered pathological slides. The DR-CSI spectral signal components volume ( $V_A$ ,  $V_B$ ,  $V_C$ ) was identified in accordance with the pathological findings and compared between benign and malignant primary tumors or lymph nodes. A linear model assessed the correlations between ( $V_A$ ,  $V_B$ ,  $V_C$ ) and each component observed in pathological findings. Strength of correlations was evaluated by using Spearman correlation coefficients.

#### RESULTS

Totally 32 subjects (mean age, 45 years  $\pm$  5.6) were evaluated in this study; Basically, three pathological components including epithelial, stroma and vascular areas were accordantly matched with DR-CSI spectral signal components (spectral peaks). Different DR-CSI pattern was observed between HNSCC and benign lesions or metastatic and benign lymph nodes. HNSCC exhibited increased  $V_A$  (HNSCC vs benign,  $0.41 \pm 0.06$  vs  $0.29 \pm 0.06$ ;  $P < 0.01$ ), decreased  $V_C$  ( $0.13 \pm 0.08$  vs  $0.27 \pm 0.09$ ,  $P < 0.01$ ). High malignancy suggested higher  $V_A$  (low- vs high malignancy  $0.36 \pm 0.11$  vs  $0.57 \pm 0.13$ ;  $P < 0.05$ ). In addition, metastatic lymph nodes presented decreased  $V_C$  (metastatic vs benign,  $0.14 \pm 0.08$  vs  $0.19 \pm 0.18$ ;  $P = 0.04$ ).and increased  $V_B$  (metastatic vs benign,  $0.21 \pm 0.08$  vs  $0.14 \pm 0.18$ ;  $P = 0.051$ ).

#### CONCLUSION

Diffusion-relaxation correlation spectrum imaging is feasible to determine the intra-tumoral heterogeneity of HNSCC. The signal components correlate with pathological compartments. Quantitative  $V_A$ ,  $V_B$  and  $V_C$  can be applied to determine malignancy and cervical metastasis.

#### CLINICAL RELEVANCE/APPLICATION

Microstructural MRI has the potential to improve diagnosis and characterization intra-tumoral heterogeneity. DR-CSI has been approved to quantitatively determine various components within the tumor, which is a promising approach for identify intra-tumoral heterogeneity.

### Improving Metal Artifact Reduction Methods in Dual-Energy CT for Head and Neck CT Examinations: A Clinical Assessment

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Liu Xing (*Presenter*) Nothing to Disclose

#### PURPOSE

To evaluate the effectiveness of iterative metal artifact reduction (iMAR) technique in reducing dental metallic artifacts during head and neck CT examinations.

#### METHODS AND MATERIALS

Thirty patients with dental prosthesis implants were prospectively collected. Siemens single-source dual-energy CT (SOMATOM Definition Edge CT) was used for examination and the original data were reconstructed respectively in iMAR group (Group A) and conventional iterative reconstruction group (Group B). The CT and SD values of the high density artifacts, low density artifacts, the surrounding soft tissue areas and the same layer of contralateral artifact-free affected areas in the two groups of images were measured respectively. The difference between the two groups was compared by paired t-test. Two senior radiologists used the 5-component table (1~5 points, non-assessable ~ excellent) method to score the metal artifacts removal ability of the two groups. Mann-Whitney U test was used to compare the subjective scores and the consistency of the scores was analyzed by Kappa test.

#### RESULTS

There was no significant difference in CT values at the opposite side of the same layer without artifacts ( $P > 0.05$ ). The CT values in Group A were significantly reduced in the high density artifact area ( $p < 0.05$ ), while significantly increased in the low density artifact area ( $p < 0.05$ ), and were closer to the CT values in the corresponding anatomical areas at the opposite side of the same layer. In terms of image noise, the SD values in each measurement area of Group A's images were lower than those of Group B and were significantly lower in high density areas and low density areas ( $p < 0.05$ ). In terms of subjective score, the results of the two groups of image evaluation were excellent and consistent (Kappa=0.945,  $p < 0.05$ ). The subjective score of Group A was significantly higher than that of the control group, and the subjective score was increased by 2.1 (Group A:  $4.23 \pm 0.32$ , Group B:  $2.11 \pm 0.51$ ;  $P < 0.05$ ).

#### CONCLUSION

The iMAR technique can significantly reduce metal artifacts around dental implants, correct CT values of surrounding tissues, help to accurately observe tissue structures around implants, improve image quality, and has great clinical application value.

#### CLINICAL RELEVANCE/APPLICATION

Compared with conventional iterative reconstruction, it is preferable to use the iMAR technique in head and neck CT examinations as it allows better image quality and helps to accurately observe tissue structures around implants.

### Image Perturbation Analysis to Study the Effect of Motion on CT Radiomic Metrics

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Hesam Setayesh (*Presenter*) Nothing to Disclose

#### PURPOSE

To investigate the robustness of radiomic metrics in simulated clinically observed ranges of organ motion using an anthropomorphic liver CT phantom with 3D-printed texture inserts.

#### METHODS AND MATERIALS

18 Volumetric CT images of the anthropomorphic liver radiomics phantom with 7 texture inserts were obtained under different imaging conditions varying slice thickness (0.625mm, 1.25mm and 2.5mm), dose (13,86 mGy standard, 40 % dose reduction, and 60 % dose reduction), tube voltage (100 kVp and 120 kVp) and reconstruction algorithms (deep learning image reconstruction algorithm and a hybrid iterative reconstruction algorithm ASiR-V50% one at a time). A circular region of interest (ROI) was manually contoured within a centrally placed texture insert of the phantom. 91 radiomic metrics belonging to 6 different texture families were extracted from the ROI using opensource Pyradiomics software. Subsequently, the same 91 radiomics metrics were extracted using the same ROI co-registered on motion perturbed versions of the original CT images. Specifically, 6 motion conditions: rotation by 5 degrees, rotation by 15 degrees, translation by 2 pixels to the right, translation by 3 pixels to the right, rotation 15 degrees plus translation 2 pixels, and rotation 15 degrees plus translation by 3 pixels were considered. Intraclass correlation (ICC) 2-way-mixed with absolute agreement was used to evaluate radiomics robustness under different imaging and motion conditions.

#### RESULTS

In all imaging conditions, translation by 2 or 3 pixels led to the highest number of radiomic metrics with ICC > 0.8 (indicating high robustness). As opposed to translations, rotation of 15 degrees compared to rotation by 5 degrees showed a significant reduction in robust radiomic metrics, under all imaging conditions ( $p < 0.0001$ ). Rotation followed by translation showed an increase in the number of robust metrics compared to rotation alone, possibly due to the overlap between the modified and the original ROI owing to small movements. Also, despite changes in imaging conditions, the trends in robustness were comparable across the different motion conditions.

#### CONCLUSION

Translation motion amplitudes  $\leq 3$  times the spatial resolution of the image retained the robustness of radiomic metrics on the CT images of anthropomorphic liver phantom. Different radiomic families showed different associations to the simulated motions. However, across different imaging conditions, the trends in robustness were comparable across the different motion conditions.

#### CLINICAL RELEVANCE/APPLICATION

In a clinical situation, understanding the effect of motion and suppressing its effects may support the development of a robust quantitative approach such as radiomics.

### Deep Learning is a Promising Tool for Fully Automatic Malignant Lesions Identification and Segmentation in Whole-body [<sup>68</sup>Ga]Ga-PSMA PET/CT Scans

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Joana Castanheira, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

This work aims to assess the feasibility and robustness of deep learning-based fully automatic malignant lesion detection and segmentation on whole-body [<sup>68</sup>Ga]Ga-PSMA PET/CT scans.

#### METHODS AND MATERIALS

A dataset of 122 whole-body [<sup>68</sup>Ga]Ga-PSMA-11 PET/CT scans from patients with prostate cancer was used as the training set. These scans were acquired on a Philips Gemini TF16 PET/CT scanner. Two nuclear medicine physicians labeled all lesions suspected of malignancy. Then, a self-adaptive Bayesian classifier was used for semiautomatic lesion segmentation [1]. All segmentations were reviewed and manually rectified if necessary. This set (scans and segmentations) was used to train a fully automatic lesion detection and segmentation 3D U-Net, using the nnU-Net framework [2]. The CT scans were used as a second channel to feed the network. For testing, an independent set containing 39 whole-body [<sup>68</sup>Ga]Ga-PSMA-11 PET/CT scans from prostate cancer patients was randomly selected from our archives. All these scans were performed on a Philips Vereos Digital PET/CT scanner. The gold standard malignant lesions identification and segmentation of the test set were generated as indicated for the training set. The Dice similarity coefficient was used to measure the voxelwise agreement/overlap between the gold standard segmentations and the ones obtained with the trained network.

#### RESULTS

From the 39 test scans included, 32 scans were identified by the physicians as having malignant lesions, and 7 without. The trained network correctly identified all 32 scans with malignant lesions (sensitivity of 100%). From the 7 scans without malignant lesions, the trained network correctly identified 6 (specificity of 86%). Regarding the quality of the segmentation on the 32 scans, the median Dice coefficient was 0.73 (interquartile range [IQR] 0.53-0.82), the sensitivity was 72% (IQR 0.41-0.86), and the predictive positive value was 90% (IQR 0.72-0.99).

#### CONCLUSION

The solution herein described and implemented using deep learning achieved very good results, despite the additional difficulty of segmenting scans acquired on a scanner significantly different from the one used to obtain the train scans. Therefore, fully automatic lesion detection and segmentation on [<sup>68</sup>Ga]Ga-PSMA-11 PET/CT scans using deep learning may be used to help routine clinical work, especially during disease staging and to assess response to therapy. References [1] Constantino et al. J Digit Imaging 2023; [2] Isensee et al. Nature Methods 2021.

#### CLINICAL RELEVANCE/APPLICATION

Deep learning-based fully automatic malignant lesions detection and segmentation on [<sup>68</sup>Ga]Ga-PSMA PET/CT scans is feasible and appears sufficiently robust to be used as an auxiliary tool in the clinics.

### **The CadAIver: Reproducibility Assessment and Novel Normalization Algorithm of Radiomics Features of Vertebral Bone from Different CT Scanners and Protocols**

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Riccardo Levi (*Presenter*) Nothing to Disclose

#### **PURPOSE**

1. To quantify the effects of different dose protocols, reconstruction algorithms, fields of view and CT scanners on Radiomics features of the lumbar vertebrae in a cadaveric trunk. 2. To develop a novel normalization algorithm to harmonize Radiomics analyses.

#### **METHODS AND MATERIALS**

We performed a total of 96 CT acquisitions of a cadaveric trunk (80-year old male) on 3 different CT scanners from 2 different vendors, using different kV (80 to 140, with 20 kV steps) and mA (250 to 400, with 50 mA steps). Each acquisition was performed using 2 fields of view (500 and 320 mm) and 2 reconstruction kernels (standard and bone). We also performed a Test-Retest protocol on a single scanner to assess repeatability of features. The lumbar vertebrae were segmented using a convolutional neural network (CNN) with nnU-Net structure and Radiomics features were extracted using pyradiomics library. Intra- and Inter-scanner analyses were assessed using either Analysis of Variance Repeated Measurements (parametric test) or Friedman's Test (non-parametric test) and each radiomics feature was tested using a generalized linear model (GLM) to assess the effects of all the above-mentioned CT acquisition parameters. Moreover, the proposed GLM model was successively employed to standardize radiomics features across different acquisitions, and was compared to the Combat algorithm, using a 10-folds cross-validation (CV) evaluating the R2.

#### **RESULTS**

Variation of KV showed the highest feature modification in intra- and inter-scanner analyses, with the First Order features showing the highest variability (up to 94.4% on Scanner 1). Little or no effect was evident upon mA variation. 100% of shape features on all scanners were found significantly dependent on FOV, and 83% of GLSZM were statistically different between reconstruction kernels. The proposed GLM normalization algorithm obtained a mean R2 across CV higher than 0.90 in 21 Radiomics features (19.6%), whereas Combat normalization algorithm obtained an high R2 value in 1 Radiomics feature (0.90%). Moreover, GLM algorithm was statistically superior in 39 Radiomics features in respect to Combat (which was superior in 16 Radiomics features) in terms of R2.

#### **CONCLUSION**

To our knowledge, this study is the first attempt in describing the effects of CT acquisition parameters on Radiomics features in lumbar vertebrae from cadaveric donor. Current and Voltage affect the Radiomics features in different ways. The developed GLM model was superior to Combat in normalizing radiomics features across all the different CT acquisitions.

#### **CLINICAL RELEVANCE/APPLICATION**

CT radiomics features are to be normalized before multi-scanner studies. The complete dataset and GLM normalization model will be publicly available to foster research in Radiomics.

### Independent Evaluation of the Winning Kits19 Model for Kidney Tumor Segmentation on a Large External Patient Cohort

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Alex G. Raman, MS (*Presenter*) Nothing to Disclose

#### PURPOSE

The fully automatic segmentation of kidney tumors on Computed Tomography (CT) can enable significant advantages in clinical practice including increased accuracy of diagnosis and prognostication of patient outcomes. The Kits19 challenge in 2019 set a baseline for kidney tumor segmentation, with the highest scoring model, nnUNet, receiving a Dice score of 0.85. Herein we seek to evaluate this model on an independent dataset of 694 segmented kidney tumors.

#### METHODS AND MATERIALS

The nnUNet model trained on 210 Kits19 cases was evaluated on a separate institution-specific dataset of 694 total segmented kidney tumor cases, acquired from a diverse range of partner sites. A separate nnUNet model was trained on 555 of the institutional cases and evaluated on both 139 held out cases from the same institution as well as the 210 Kits19 cases. Unfortunately, the KiTS19 90 test cases were not available to evaluate the model trained on institutional data.

#### RESULTS

The nnUNet model trained on the 210 KiTS19 cases received a Dice score of 0.64 when evaluated on the institution specific dataset of 555 cases. The nnUNet trained on the 210 KiTS19 cases also received a Dice score of 0.66 on a held-out test set of 139 institutional cases. In addition, an nnUNet model was trained on these 555 institutional cases and received a Dice score of 0.72 when evaluated on the held-out test set of 139 cases from the same institution. The nnUNet model trained on 555 institutional cases received a Dice score of 0.55 when evaluated on the 210 KiTS19 training cases.

#### CONCLUSION

That the KiTS19 nnUNet model performed significantly worse (0.21 and 0.19 Dice score drops) on the institutional dataset was unexpected, but bears significant implications. Likewise, that the institutional nnUNet model performed significantly worse on the KiTS19 dataset (0.17 Dice score drop) despite being trained on a larger pool of data, reinforces a similar concept. Both models tended to do better on independent data derived from their own respective datasets. This highlights the importance of creating large medical machine learning datasets that incorporate data from a broad range of sources that can capture the data heterogeneity present in distinct patient populations and allow for the creation of generalizable machine learning models.

#### CLINICAL RELEVANCE/APPLICATION

These results also highlight the value of federated learning in a healthcare setting, which can allow for the incorporation of diverse datasets into model training, while maintaining the privacy of patient and institutional health data. Furthermore, these results raise the question of what the true state-of-the-art Dice score is for kidney tumor segmentation and demonstrate the importance of independent model evaluation prior to potential clinical deployment.

### Evaluating the Segment Anything Model for MRI Organ Segmentation Using a Simulated Interactive Setup

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Yan Zhuang, PhD, MS (*Presenter*) Nothing to Disclose

#### PURPOSE

To evaluate the multi-organ segmentation capabilities of the recently released Segment Anything Model (SAM) as an interactive semi-automated annotation tool for organ segmentation in magnetic resonance (MR) images.

#### METHODS AND MATERIALS

This retrospective study used the publicly available multi-organ MRI dataset, AMOS22, which contains 60 MRI volumes from multiple institutions. The 15 target organs are: liver, spleen, right kidney, left kidney, gallbladder, esophagus, stomach, aorta, inferior vena cava, pancreas, right adrenal gland, left adrenal gland, duodenum, bladder, and prostate/uterus. We extracted 2D slices from each 3D MRI volume and resized images to 512 by 512 pixels, resulting in a total number of 3609 2D images. We evaluated the SAM in a simulated interactive annotation setup. The initial prompt given to SAM was the ground truth bounding box (bbox) with added random jitter. SAM then outputs an initial segmentation mask. In subsequent iterations, SAM takes point-based prompts, as well as all previous prompts and the current segmentation mask, to generate the next refined segmentation mask. This procedure was repeated for 10 iterations to produce the final segmentation. The magnitude of random jitter for the initial bbox is a scaling factor that's uniformly drawn between [0.5,2] for our experiment. The magnitude of random jitter for subsequent point prompts is a translation  $0.2 \cdot R_{\max}$  pixels, where  $R_{\max}$  is the shortest distance between the center and the boundary of a false positive/negative region. The segmentation results of target 15 organs were evaluated against the ground truth masks using the Dice similarity coefficient (DSC) on 2D slices.

#### RESULTS

The mean $\pm$ std DSC for 15 organs after the initial bounding box prompt was  $0.777 \pm 0.049$ . The final mean $\pm$ std DSC after 10 iterative steps was  $0.901 \pm 0.056$ . The best three organs were the right kidney ( $0.954 \pm 0.034$ ), left kidney ( $0.951 \pm 0.028$ ), and spleen ( $0.949 \pm 0.051$ ). The worst three organs were right adrenal gland ( $0.807 \pm 0.113$ ), prostate/uterus ( $0.819 \pm 0.246$ ), and duodenum ( $0.825 \pm 0.156$ ). The mean DSCs increased monotonically with the number of prompts, implying better segmentation results.

#### CONCLUSION

Experimental results demonstrated that after 10 iterations, the SAM model was able to provide reasonable segmentation results for most of the organs in the MR images.

#### CLINICAL RELEVANCE/APPLICATION

The SAM model can potentially reduce radiologists' annotation burden for segmenting MR images to just a few mouse clicks.

### An Automated Quantification Algorithm for Evaluating Total Metabolic Tumor Volume in Patients with FDG-avid Lymphoma using a Deep-learning Model

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Lale Kostakoglu, MD, MPH (*Presenter*) Research Consultant, F. Hoffmann-La Roche Ltd

#### PURPOSE

Total metabolic tumor volume (TMTV) holds promise as a method for quantifying tumor burden in patients with 18F-fluorodeoxyglucose (FDG)-avid lymphoma, but methodological limitations mean that it is rarely used in clinical practice. We developed a deep-learning (DL) model for automatic lesion segmentation and TMTV quantification from FDG-positron emission tomography/computed tomography (FDG-PET/CT) scans. We aimed to evaluate the model and identify factors influencing its performance in patients with diffuse large B-cell lymphoma (DLBCL) or follicular lymphoma (FL).

#### METHODS AND MATERIALS

The DL algorithm (aTMTV) was trained using retrospective trial data from 836 adults with DLBCL. Model testing was performed using an independent retrospective data set including baseline and post-treatment scans from 166 adults with DLBCL and 201 adults with advanced FL collected from two large phase 3 multicenter trials. FDG-PET/CT scans were assessed by expert readers using semiautomated software (mTMTV) and by aTMTV. Pearson's correlation coefficient ( $r$ ) was used to evaluate aTMTV performance versus mTMTV. Bias was assessed using the slope and intercept from a weighted Deming regression. Lesion detection performance was assessed by sensitivity (the proportion of mTMTV-detected lesions identified by aTMTV) and positive predictive value (PPV; the proportion of aTMTV-detected lesions identified by mTMTV).

#### RESULTS

aTMTV quantification highly correlated with mTMTV in the test set ( $n = 367$ ;  $r$ , 0.96 [95% confidence interval (CI): 0.95, 0.96]) for DLBCL and FL. Only moderate bias was detected between aTMTV and mTMTV (slope, 1.06 [95% CI: 1.02, 1.09]; intercept, -0.27 [95% CI: -0.52, -0.03]; mean difference between methods, 0.10 [standard deviation: 1.15]). Agreement between aTMTV and mTMTV was consistent among patients with different demographics and clinical characteristics, and across scans from different PET/CT scanner manufacturers. Overall mean sensitivity and PPV for lesion detection were both  $> 0.8$ . Performance was lower for lesions  $\leq 10$  mL (mean sensitivity, 0.67; mean PPV, 0.72) than for lesions  $> 10$  mL (mean sensitivity and PPV  $> 0.95$ ).

#### CONCLUSION

The model demonstrated good performance and acceptable bias for TMTV measurement in patients with DLBCL or FL. Good generalizability was observed across patient subpopulations and PET/CT scanner manufacturers. Reduced algorithm performance for small lesions ( $\leq 10$  mL) may be the result of higher variability among readers in the determination of small lesions.

#### CLINICAL RELEVANCE/APPLICATION

With further optimization and validation, this model may provide a novel automated approach for lesion segmentation and TMTV quantification to inform the management of patients with FDG-avid lymphoma.

### Unilateral Lung Disease Model Developed using Interventional Radiology Technique

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Hiroshi Kodama, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

Standard mouse model of pulmonary fibrosis model has been made by administration of Bleomycin intratracheally or intraperitoneally. The problem of this traditional methods is high mortality rate of more than 50% after Bleomycin administration. Our hypothesis was that unilateral lung disease model established using interventional radiology technique can overcome this limitation, and the feasibility and usefulness of unilateral lung disease was assessed.

#### METHODS AND MATERIALS

After 6-week-old C57BL/6 mice were anesthetized, a 1.7Fr. microcatheter was advanced into trachea using otoscope. Then, 1.0mg/kg of Bleomycin was injected into bilateral lung at trachea (n=13) or unilateral lung (n=14) after advancing the microcatheter to left main bronchus under fluoroscopy. Technical success, %decrease of body weight and survival at day 28 were evaluated. Body weight change and survival were compared between bilateral and unilateral lung disease groups using Mann-Whitney test and log-rank test. Lungs were extracted and evaluated on HE or Masson Trichrome stained specimens.

#### RESULTS

In all mice, bleomycin was successfully injected in bilateral or unilateral lung: Technical success rate was 100%. Body weights decreased 75.7%±14.0% in bilateral lung disease group, and it was significantly improved to 94.1%±11.4% in unilateral lung disease group (p=0.03). Overall survival rate at day 28 was 30.8% and 85.7% in bilateral and unilateral lung disease model, respectively. Survival was significantly better in unilateral lung disease model(p=0.01). On histological evaluation, it is confirmed that collagen deposition was only seen in bleomycin injected lung in unilateral lung disease model.

#### CONCLUSION

Establishing both healthy lung and disease lung in the same individual model using interventional radiology technique was feasible and make it possible to achieve less body weight loss and more favorable survival.

#### CLINICAL RELEVANCE/APPLICATION

Interventional radiology technique helps developing new animal model. Unilateral lung disease mouse model may be useful to analyze the treatment effect to both diseased and normal lung in the same individual.

### Fully Automated Dynamic Frame Rate Adjustment in Digital Subtraction Angiography

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Brendan Crabb, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

Digital subtraction angiography (DSA) is a commonly used method for visualizing vasculature throughout the human body. Unfortunately, patient motion can generate artifacts, limiting the diagnostic quality of the images. When motion artifacts are present, image quality can be effectively improved by utilizing higher acquisition frame rates. However, this approach increases radiation dose to both the patient and provider. Moreover, frame rate adjustments are currently performed manually and frequently overlooked. There is a critical need to automatically optimize acquisition frame rates to maximize image quality and limit unnecessary radiation. We aim to develop a fully automated method to adjust frame rates on a series-to-series basis in response to motion artifacts.

#### METHODS AND MATERIALS

DSAs of the cerebral, hepatic, and splenic vasculature were retrospectively collected (n=88 patients, 217 series; frame rate range 1-7 frames per second). The degree of motion artifacts in each DSA was visually scored using a five-grade Likert scale. In addition, image histograms were calculated for each DSA, and the relationship between the standard deviation of pixel intensities and the artifact rating was investigated. A Pearson correlation coefficient with a two-sided p-value was used to quantify the relationship, and the processing time required to analyze each DSA image was recorded.

#### RESULTS

The degree of motion artifacts was strongly associated with the standard deviation of pixel intensities in the image histogram ( $r = 0.78$ ,  $p < 1 \times 10^{-5}$ ). The average processing time required to calculate this metric for a DSA image was 0.008 seconds on a middle-entry PC (Intel Core i5 processor, 8GB RAM).

#### CONCLUSION

The standard deviation of pixel intensities in DSA is significantly associated with the degree of motion artifacts and can be calculated in less than 0.01 seconds. This relationship can be utilized to adjust acquisition frame rates for DSA in a quantifiable, automated, real-time approach.

#### CLINICAL RELEVANCE/APPLICATION

Increasing DSA acquisition frame rates is an effective method to improve image quality when motion artifacts are present, but it also increases the radiation dose. In this study, we present a concept to perform fully automated, real-time frame rate optimizations on a series-to-series basis. This approach will improve image quality when patient motion is present while limiting radiation exposure when high frame rates are unnecessary.

### Impact of a Selective Lens Dose Reduction Protocol in 3D Rotational Angiography on Eye Lens Radiation Exposure in Cerebral Angiography: A Randomized Controlled Trial

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Jong-Tae Yoon, BS (*Presenter*) Nothing to Disclose

#### PURPOSE

There is limited research on the radiation exposure to the eye lens during cerebral angiography. A recent study has reported that a simple adjustment of table height during three-dimensional rotational angiography (3D-RA) can significantly reduce the radiation dose to the lens. This study aims to investigate the radiation dose to the eye lens during cerebral angiography and evaluate the effectiveness of a lens dose reduction protocol for 3D-RA in reducing overall lens dose exposure.

#### METHODS AND MATERIALS

A randomized, controlled clinical trial was conducted at a tertiary hospital, with patients undergoing diagnostic cerebral angiography for unruptured intracranial aneurysms. The lens dose reduction protocol in 3D-RA involved raising the table to position the patient's eye lens away from the rotation axis. The radiation dose at the eye lens was estimated by measuring the entrance surface air kerma with photoluminescent glass dosimeter (PLD). The lens doses of 3D-RA and overall examination were analyzed and compared between the two groups. Image quality of the 3D-RA was assessed using quantitative and qualitative methods.

#### RESULTS

A total of 20 participants (mean age, 58 years  $\pm$  9.4 [SD]; 12 men [60%]) were enrolled and randomly assigned to either the conventional group or the lens dose group. The lens dose in 3D-RA was significantly lower in the lens dose group compared to the conventional group (median of 1.1 mGy vs 4.5 mGy,  $P < .001$ ). The total dose was significantly lower in the lens dose reduction group (median of 7.5 mGy vs 10.2 mGy,  $P = .003$ ). In the conventional group, 3D-RA accounted for 46% of the total lens dose, while in the lens dose group, its proportion decreased to 16%. No significant differences were observed in the image quality between the groups.

#### CONCLUSION

The study demonstrated that the lens dose reduction protocol showed significant reduction in the lens dose of the 3D-RA as well as entire cerebral angiography, without compromising image quality.

#### CLINICAL RELEVANCE/APPLICATION

Radiation exposure during neurointerventional procedures is one of the significant issues to consider clinically as lenses have a high radiation sensitivity, and frequent radiation exposure can increase the risk of developing cataracts. Therefore, managing radiation exposure is crucial, and the use of techniques to reduce radiation doses in lenses, as presented in this study, can potentially decrease the likelihood of cataract formation in patients.

### Immunologic Stem Markers of Poorly-differentiated Hepatocellular Carcinoma: Potential Targets for Locoregional NK-cell Based Immunotherapy

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Jason Chiang, MD, PhD (*Presenter*) Consultant, Intuitive Surgical, Inc; Equipment support, Johnson & Johnson

#### PURPOSE

Poorly differentiated hepatocellular carcinoma (HCC) is hypothesized to contain immunologic markers of cancer stem cells that elevate the risk for recurrence or progression after locoregional therapy. Natural killer (NK) cells are uniquely able to target cancer stem cells via the innate immune pathway. The goal of this study was to identify cancer stem cell immunologic markers of poorly- vs well-differentiated hepatocellular carcinomas that would make them susceptible to NK-cell based therapy. HCC cell lines of poor- and well-differentiated HCCs were then incubated with naïve and activated NK cells to validate their cytotoxicity profile.

#### METHODS AND MATERIALS

Two HCC tumor cell lines of different grades of differentiation (SNU-423: poorly differentiated; HepG2: well-differentiated) were used to determine immunologic stem cell phenotype and susceptibility to NK cell-mediated cytotoxicity. Flow cytometry was used to evaluate for surface receptor expression of MHC-I, CD-54, CD-44, and PDL-1 after staining with PE-conjugated antibodies. Isotype control antibodies were used to determine non-specific bindings. Freshly isolated NK cells and IL-2 activated NK cells prior to using 4-hr <sup>51</sup>Cr release assay.

#### RESULTS

The poorly differentiated HCC (SNU-423) had significantly higher expression percentage of CD44 ( $P < 0.0001$ ) and much lower expression percentage of MHC-I ( $p = 0.028$ ) and CD-54 ( $P = 0.01$ ), compared to the well-differentiated HCC (HepG2). There was no difference in PDL-1 levels ( $p = 0.70$ ) between the two cell lines. Naïve NK cells and activated NK cells both demonstrated significantly higher targeted killing of the poorly differentiated HCC when compared to the well-differentiated HCC (untreated NK in Snu-423 vs HepG2,  $p = 0.013$ , IL2-treated NK in Snu-423 vs HepG2,  $p < 0.001$ ,). Morphologically, poorly differentiated HCCs exhibited smaller size and proliferated faster when compared to well differentiated HCCs.

#### CONCLUSION

Poorly-differentiated HCCs demonstrated significantly decreased expression of stem cell markers MHC-I, CD-54, and higher expression of CD-44 when compared to well-differentiated HCC. Poorly-differentiated HCCs were subsequently validated to be more susceptible to NK cell therapy. Additional studies in in-vivo HCC models are required to confirm stem profile of poorly differentiated HCCs and their utility as a biomarker for successful NK cell targeting.

#### CLINICAL RELEVANCE/APPLICATION

NK-cell based therapy can potentially be used to augment conventional locoregional therapy options for early- to intermediate-stage HCC. Advances in NK cell activation and expansion will lend itself well to transarterial directed delivery of immunotherapy.

### Evaluating the Potential of ChatGPT's Competency in Interventional Radiology

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Hossam A. Zaki, BS (*Presenter*) Nothing to Disclose

#### PURPOSE

This project investigates ChatGPT's proficiency in Interventional Radiology by evaluating its clinical decision making and performance on a standardized exam.

#### METHODS AND MATERIALS

We utilized ChatGPT, an LLM by Open AI trained on general data, as well as GlassAI, an LLM by Glass Health trained on medical text. Using the American College of Radiology (ACR) Appropriateness Criteria's patient presentations and criteria, we prompted ChatGPT to rank the 3 best interventional procedures, devices, or venous access areas. GlassAI was prompted to provide the best interventional procedures only. Each output was scored out of 3, where 3 is "usually appropriate", 2 is "may be appropriate", 1 is "usually not appropriate", and 0 is not listed. Partial scores were given for non-specific answers. We also used a Self-Assessment Module for Vascular and Interventional Radiology from the ACR published in 2011 to feed non-image based multiple choice questions into ChatGPT. A 1 was given for a correct answer, while a 0 was given for an incorrect answer. Clinical scenarios and exam questions were passed into each LLM twice, to account for stochasticity. The score for the board exam questions were averaged across both runs. Statistical significance was determined using a two-sided student's T-test.

#### RESULTS

ChatGPT achieved a score of 2.38, 2.32, and 3.00 in selecting interventional procedures, devices, and venous access sites, respectively. GlassAI achieved a score of 3.00 in selecting interventional procedures. The difference between the two scores was found to be statistically significant ( $p < 0.05$ ). The average score for the exam was 74.2%.

#### CONCLUSION

This study has demonstrated the potential of LLMs as a valuable tool for IR contexts. Compared to the ACR Appropriateness Criteria, LLMs perform well selecting an interventional procedure when prompted with a specific clinical scenario. GlassAI, a medical-specific model, performed better than ChatGPT, a general model. ChatGPT performed well in predicting interventional devices and venous access sites. ChatGPT performed well on the simulated IR exam.

#### CLINICAL RELEVANCE/APPLICATION

Throughout the study, LLMs consistently exhibited a strong ability to comprehend complex medical scenarios and provide accurate, relevant predictions in interventional radiology areas. Moreover, the use of ChatGPT in a test setting demonstrated its proficiency in answering a wide range of questions. By integrating the model into the decision-making process, we can enhance the efficacy of diagnostic and therapeutic interventions while reducing the cognitive burden on clinicians.

### Thumb Distal Phalangeal Pseudolesion: Imaging Findings and Associations of an Underappreciated Normal Variant that May Mimic Osteolytic Pathology

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Andrew G. Helming, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

In daily practice, we often observe a thumb distal phalangeal lucency on routine radiographs which may prompt cross-sectional imaging for further work-up. We hypothesize this represents a "pseudolesion" similar to those at the proximal humerus, radial tuberosity and femoral neck. To our knowledge, this finding has not been described in peer-reviewed literature. We aim to: 1) Describe imaging features of the thumb distal phalangeal pseudolesion (DPPL), 2) record incidence and frequency across age groups, and 3) evaluate associations with underlying diseases.

#### METHODS AND MATERIALS

IRB approved, retrospective review of 450 radiographic exams from 7/1/2021-7/1/2022. Patients divided into 3 age groups: 0-17, mean 12; 18-65, mean 42; 66+, mean 74.5. Each group of 150 cases had 50 hand, wrist, digit exams. Demographics obtained from electronic medical records and cases reviewed on PACS for: DPPL (Likert scale- 0, not present; 1, possible; 2, definite), view-specific conspicuity, location (distal/proximal, radial/ulnar, palmar/dorsal), size, laterality, osteopenia, osteoarthritis (OA) (modified Kellgren-Lawrence), inflammatory arthropathy, periarticular mineralization, and indication.

#### RESULTS

450 patients, 51% female and 49% male, 51% left and 49% right, DPPL present in 23%. Frequency of DPPL varied with age as follows: 68 (45%) seen in >65, 34 (23%) in 18-65, and 3 (2%) in those <18. DPPL located at proximal palmar aspect of thumb distal phalanx in 100%, 97% at ulnar aspect, 3% radial. 2% of patients had inflammatory arthropathy, 21% osteopenia, and 2% peri-articular mineralization. Positive correlations between DPPL presence and patient age, osteopenia, and presence of osteoarthritis, ( $p < 0.001$ ); severity of OA was not correlated. DPPL was not associated with gender or inflammatory arthropathy, and dubiously associated with periarticular mineralization. DPPL frequently seen on frontal and oblique views, infrequently on lateral views. Average size 6.4 x 4.5 mm (CC x TV). DPPL more common on hand and digit radiographs.

#### CONCLUSION

DPPL is common in patients older than 65 and consistently identified at the proximal, palmar-ulnar aspect of the thumb distal phalanx at wrist, hand, and finger/thumb radiography. DPPL is significantly associated with aging, increasing osteopenia, and osteoarthritis, and is unusual in the pediatric population. Anatomically, DPPL may be attributed to radial and ulnar sided basal tubercles bordering a palmar fossa/concavity which is less discrete prior to skeletal maturation.

#### CLINICAL RELEVANCE/APPLICATION

Increasing radiologist awareness of DPPL as a normal variant at the thumb distal phalanx may decrease overcalls of osteolytic bone disease, eliminating unnecessary work-up and alleviating patient anxiety.

### Peripheral Tear of the TFCC: Diagnostic Accuracy of MR Imaging of the Wrist and Diagnostic Performance of the Primary and Secondary Signs

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Youngjun Hur, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

The aim of the study was to assess the diagnostic performance value of MRI findings in patients with type 1b triangular fibrocartilage complex (TFCC) tear of the wrist.

#### METHODS AND MATERIALS

In this study, a retrospective enrollment of 78 patients was conducted to examine the diagnostic performance of preoperative MRI examinations in patients with type 1b TFCC tear. Of the enrolled patients, 39 were confirmed to have type 1b TFCC tear through arthroscopy and underwent MRI examination within 180 days before surgery. As the control group, 39 patients were randomly selected from 1157 patients who underwent MRI examination for wrist pain during the same period. Both groups underwent a review of 19 MRI findings by two independent observers, and the correlation between each diagnostic finding and type 1b TFCC tear was assessed using a Chi-square test. The 19 MRI findings comprise 8 primary signs of abnormalities in the distal or proximal lamina, alongside 11 secondary signs suggestive of abnormalities in the surrounding structures.

#### RESULTS

The type 1b TFCC tear group exhibited a significantly greater incidence of 7 primary MRI signs, comprising fiber discontinuity, signal alteration, and retraction of both proximal and distal lamina, as well as scarring of the distal lamina, compared to the control group (all  $p < 0.05$ ). Remarkably, the presence of fiber discontinuity and signal alteration of the distal lamina were higher in the type 1b TFCC tear group (74.3% vs. 38.5%,  $p = 0.003$ , and 87.2% vs. 43.6%,  $p < 0.001$ , respectively), as detected by both observers. In contrast, none of the 11 secondary MRI signs were statistically significant.

#### CONCLUSION

MRI assessment of fiber discontinuity and signal alteration in the distal lamina through MRI examination may provide predictive markers for type 1b TFCC tear. These findings highlight the potential value of MRI as a diagnostic tool for this particular condition.

#### CLINICAL RELEVANCE/APPLICATION

This study holds the potential to identify the diagnostic accuracy of wrist MR imaging, as well as the diagnostic performance of both primary and secondary signs related to type 1b TFCC tear.

### Wrist Instability after Sectioning the Different Components of the Scafolunate Ligament and DCSS using a Cadaveric Model and Evaluated by 4DCT

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Badr Sellami, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

To study the effect of sectioning the different components of the SL (scafolunate) ligament-DCSS (dorsal scafolunate septum) in a cadaveric model and assessing dynamic effects with 4DCT.

#### METHODS AND MATERIALS

Five fresh frozen cadaveric specimens were imaged with 4DCT while placed in a custom-made wooden frame before and after introduction of different SL-DCSS lesions. The lesions were created arthroscopically and consisted of VSL (ventral), DSL (dorsal), VSL+DSL, VSL+DSL+partial DCSS, and VSL+DSL+complete DCSS. With CT, dynamic acquisitions were obtained in flexion, extension (F-E), and radial and ulnar (R-U) deviation. Relevant bony structures were semi-automatically segmented. Based on this X; Y; Z graphs were created to analyze the movement of the bones.

#### RESULTS

With VSL sectioning, no SL diastasis occurred. Dorsal tilt increased with VSL sectioning. With DSL sectioning SL diastasis was seen but only in flexion-extension, and not in ulnar-radial deviation. With sectioning of multiple components SL diastasis was observed in all motions. With VSL, DSL, VSL+ DSL tilting in F-E was not concordant with tilting in R-U deviation. When the DCSS was completely sectioned tilting increased significantly in all motions and SL diastasis was most pronounced.

#### CONCLUSION

1. SL diastasis does not occur with VSL lesions, however with DSL lesions it can also not be shown on R-U deviation 2. Except for the most severe injury of all structures (SL+ DCSS) the motion in R-U deviation is not concordant with F-E as would be expected. We believe that the extrinsic ligaments restrain the expected motion. 3. The more components are injured the more SL diastasis and tilting increases. 4. The DCSS plays a very important stabilizing role, and SL instability is most severe when it is injured.

#### CLINICAL RELEVANCE/APPLICATION

Patterns of abnormal scafolunate motion after section of different components can be analyzed on 4D CT, and could predict the underlying injuries. The DCSS (dorsal scafolunate septum) plays an important stabilizing role.

## Abstract Archives of the RSNA, 2023

M2-SPMK-4

### **Clinical Importance of the Retinacula, Subsheat, Ligament Attachments and Dynamics of the ECU. An US-MRI Study with Anatomical and Histologic Correlation**

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Michel O. De Maeseneer, MD, PhD (*Presenter*) Nothing to Disclose

#### **PURPOSE**

To perform an US-MR\_anatomical-histological correlation of the extensor carpi ulnaris retinaculae, subsheat, and their attachments to the TFC and carpal ligaments. To review MR and US imaging in 7 patients with abnormal subsheat and ulnar sided TFC tears.

#### **METHODS AND MATERIALS**

Five cadaver specimens (fresh frozen, Thiel, embalmed) were dissected and sectioned at the level of the ECU. US was performed prior to dissection at 4 levels (cubital groove, styloid process, subsheat, carpal insertion). In the 2 dissected specimens (one nl TFC, one major TFC tear) dynamic clips during pro-supination were obtained. US imaging was obtained in consensus by 2 experienced MSK radiologists with a 24 Mhz ultrasound probe. Seven cases of abnormal ECU subsheat on MRI and US from 3 institutions were retrospectively reviewed.

#### **RESULTS**

At the cubital level the ECU is only covered by a thin superficial retinaculum, there is no tight bony or ligament attachment and mobility in pro-supination is very significant. The subsheat starts at the styloid process level, where it connects to the styloid insertion of the TFC. The subsheat is actually a sling of ligamentous bands in continuity with other tendons and extrinsic carpal ligaments (band of Barfred, radiolunotriquetral, intercarpal ligament) Dynamic studies showed a sudden click in pro-supination in the specimens with a major TFC tear, in contrast to the specimens with a normal TFC. All studied cases with abnormal subsheat showed ulnar sided TFC tears.

#### **CONCLUSION**

The ECU retinacula and subsheat are complex, and have not been correctly described in previous anatomical and imaging work. This area is best evaluated on 24 Mhz US as are dynamics of the ECU tendon in pro-supination. There is no subsheat nor tight attachment of the ECU at the cubital level, but tight connections to the extrinsic carpal ligaments distally. In the clinical patients, major abnormality of the subsheat on MR or snapping dislocation of the ECU on US, was associated with ulnar sided TFC tears.

#### **CLINICAL RELEVANCE/APPLICATION**

Understanding the anatomy of the subsheat as described in this work is a requisite to correctly interpret US and MR imaging of this area. Our findings also shed light on the clinical concept of 'ECU dislocation-abnormal ECU motion' Although only limited clinical cases were studied, our findings suggest that subsheat abnormalities and 'abnormal ECU motion' are associated with ulnar sided TFC tears.

### Open Access AI Tools in Clinical Support Roles - An Example of Shoulder Implant Recognition

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Wolfram A. Bosbach, MD, PhD (*Presenter*) Nothing to Disclose

#### **PURPOSE**

Uptake of novel artificial intelligence methods into clinical tools is slowed down by multiple factors. One is the lack of access to computing facilities. In this study, we test today's open access resources for performing a musculoskeletal 4-class labeling task.

#### **METHODS AND MATERIALS**

The tools we chose are Google-Chrome as browser, Google-Drive as online repository, Google-Colab as running environment. The model was implemented in Python, specifically Google-TensorFlow. The code was run on a deliberately unbalanced dataset with X-ray images containing implants from four different shoulder implant manufacturers. We applied a fine tuning on the Google-EfficientNet, the dataset was enlarged for training by data augmentation.

#### **RESULTS**

We show that today's available open access resources are suitable for the intended task. Google-EfficientNet can be trained to perform the class labeling. Accuracy and avoidance of overfitting are improved by the data augmentation.

#### **CONCLUSION**

We will make the designed tool available as open access tool on github. Remaining issues today are the data safety and data privacy. Future tools will need to address those if sensitive data is supposed to be processed.

#### **CLINICAL RELEVANCE/APPLICATION**

Identification of unknown implants is only one of the many clinical applications. The relevance of our work is to demonstrate a pilot that uses remotely open access tools for AI work. In the future, support tools could be designed to assist a radiologist in his daily clinical routine.

### Wavelet Decomposition Synthetic Imaging in Metal Artifact Reduction MRI (Magnetic Resonance Imaging) in Patients With Long Bone Tumor Prosthesis

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Jiwoo Park, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

To identify the optimal metal artifact reduction sequences (MARS) and to explore solutions to overcome the limitation of existing MARS by using wavelet decomposition.

#### METHODS AND MATERIALS

We assessed a total of 1348 cases of thigh MRI from patients aged  $\geq 18$  years who underwent 3.0T MRI (Philips Healthcare, Best, the Netherlands) at our institution from January 2016 to April 2022. The inclusion criteria were as follows: (1) Bone resection and tumor prosthesis insertion for tumor involvement of the femur (2) MARS were applied to post-operative follow-up MRI; STIR Metal Artifact Reduction for Orthopedic Implants (O-MAR), mDixon O-MAR, STIR O-MAR XD (3) MARS included the coronal T2FS sequence, which allows for viewing the major axis of a long bone tumor prosthesis in a single image and is deemed the most useful for lesion detection (4) Sufficient image quality for assessment. A total of 61 cases (STIR O-MAR: 15 cases, mDixon O-MAR 17cases, STIR O-MAR XD 29 cases) with MR images were included in the final analysis. To assess the metal related signal changes that can affect the diagnostic performance, MR images were assessed by the following parameters: the distinction of anatomic structures and image quality. (1) For the distinction of anatomic structures, (1.1) bony cortex on the outer layer of the long bone with the tumor prosthesis could be well observed (1.2) the range of the muscles showing artifacts in the anterior compartment of thigh muscles surrounding the femur, (2) Regarding image quality, (2.1) center signal void area and (2.2) total artifact area including geometric image distortion, spatial blurring and image noise. The scores for the four parameters assessed for each MARS were summed up (4-20 points). The scores of three sequences were evaluated using the one-way ANOVA and post hoc Tukey Honestly Significant Difference (HSD) test. Wavelet decomposition was applied to O-MAR XD images: a total of 101 conventional sequence-MARS pairs.

#### RESULTS

There were no significant difference in OMAR sequence and mDixon O-MAR sequence ( $P=0.378$ ). However, in subsequent images, wavelet decomposition reduced artifacts caused by blurring, a drawback of OMAR-XD, and there were significantly improved image quality and decreased metal artifact reductions in area ( $P<0.001$ ).

#### CONCLUSION

OMAR or mDIXON OMAR appeared to be more useful than OMAR-XD for assessing 3.0T MRI images of long bone tumor prostheses. Application of the Wavelet decomposition synthetic imaging would aid diagnosis than OMAR-XD in patients with long bone tumor prosthesis.

#### CLINICAL RELEVANCE/APPLICATION

Efforts to reduce metal artifacts in MRI have been ongoing, but assessing postoperative magnetic resonance imaging (MRI) of patients with a long bone tumor prosthesis is still challenging.

Printed on: 08/22/24

## Abstract Archives of the RSNA, 2023

M2-SPMK-7

### Development of a Fitted Ultrasound Standoff Pad Device

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Mario Russo, MEng (*Presenter*) Nothing to Disclose

#### PURPOSE

Ultrasound (US) examinations are ubiquitous diagnostic assessments, reaching nearly 350 scans per 1,000 person-years in the United States. However, US examinations of superficial structures near curved bony prominences, such as the ankle or wrist, can be challenging, often requiring the use of a standoff pad. Unfortunately, a standard standoff pad can be challenging to use due to its bulky size and instability. This is further exacerbated when dynamic maneuvers or procedures are necessary. To address this issue, we have developed initial prototypes of a custom standoff pad adaptor, the FreePad. This exploratory study aims to compare the FreePad to the standard standoff pad and no pad in selected patients undergoing musculoskeletal ultrasound.

#### METHODS AND MATERIALS

We used an operator-centered iterative design approach to create the FreePad. The Form 3 3D-printer was utilized throughout this process to create and test consecutive prototypes. This study was granted IRB approval and utilized patient informed consent. Included were 12 patients who presented to the outpatient radiology clinic for musculoskeletal ultrasound with a focus on superficial structures near anatomic areas of bony eminences (elbow, wrist, hand, ankle and foot). Each patient was examined under three conditions: 1) using US gel with no standoff pad, 2) with a standard standoff pad, and 3) with the FreePad. Each condition was evaluated for: a) duration of examination in seconds and, on a scale of 1 to 5, b) ease of use, c) quality of images, d) patient comfort, and e) diagnostic confidence. Three staff radiologists assessed the diagnostic confidence independently. The criteria results were evaluated using paired sample t-tests.

#### RESULTS

The FreePad was easier to use than both US gel and the standoff pad ( $p=0.03$ ,  $p=0.002$ ). While statistically better than US gel across all other conditions, the FreePad compared to a standoff pad trended towards requiring shorter duration (138 vs 169 sec,  $p=0.09$ ), producing higher quality images (4.5 vs 3.9,  $p=0.08$ ), greater diagnostic confidence (4.4 vs 3.8,  $p=0.08$ ), and increased patient comfort (4.8 vs 4.3,  $p=0.06$ ).

#### CONCLUSION

Use of the FreePad allows for easier scanning of superficial anatomic regions associated with bony eminences. Utilizing a fitted standoff pad device can improve the diagnostic confidence and quality of US images, while significantly enhancing the ease of clinician imaging.

#### CLINICAL RELEVANCE/APPLICATION

The significantly improved ease of imaging using the FreePad is of everyday benefit to MSK radiologists' diagnostic practice and holds even greater promise for improving US-guided procedures in challenging anatomy.

Printed on: 08/22/24

M2-SPMK-8

### The Laundry Dilemma: Long or Short Programme to Get Off Calcium Spots

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

David Macia-Suarez, PhD, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

Long-term comparison of two follow up approaches in performing Ultrasound-guided Percutaneous Irrigation of Calcific Tendinopathy (US-PICT) in the shoulder.

#### METHODS AND MATERIALS

A Cross-sectional study of the evolution of patients undergoing an US-PICT was performed in 2 hospitals, through a Shoulder Pain and Disability Index (SPADI) questionnaire and a clinical survey 5 years after the intervention. The two approaches to assess were: Hospital 1: follow-up by the radiology service a month and a half after the intervention, assessing the need to perform a new US-PICT in case both symptoms and calcification persisted. Hospital 2: the patient was discharged after the intervention, being able to return to the consultation at his own request. In both cases, the same US-PICT (single needle lavage) technique was performed. All patients were informed of their participation in the study and gave their approval through an informed consent document. Authorization was requested and obtained from the regional bioethics committee. At 5 years of the intervention the two approaches were compared using the SPADI questionnaire, a clinical survey and a physical and an US exploration. The SPADI questionnaire consisted of 5 items that assessed pain and 8 items for mobility. The survey consisted of 11 questions that assessed: pain, overall state, mobility and medications compared to before US-PICT. A total of 93 patients were analyzed. 34 from Hospital 1 and 58 from Hospital 2. Statistical analyses were performed using R Statistical Software (v.4.12; Rcore Team 2021), which include a descriptive analysis of the data. Welch test was used in SPADI score means. The Chi-Squared or Fisher test were performed in survey questions.

#### RESULTS

SPADI Score was statistically significant different in the two centers (Hospital 1:  $2.26 \pm 2.18$ ; Hospital 2:  $4.41 \pm 3.01$ ;  $p$ -value  $< 0.001$ ). However, the number of US-PICT was not associated with SPADI Score. Statistically significant differences were found between hospitals in the following aspects of the clinical survey: pain ( $p$ -value = 0.007); mobility compared to healthy ( $p$ -value = 0.001); overall state ( $p$ -value = 0.008). No statistically significant differences were found between the two centers about sex, age, mobility assessment and US features.

#### CONCLUSION

It seems that closer follow-up of patients (Hospital 1 approach) has better objective (SPADI Score) and subjective (clinical survey) long-term outcomes.

#### CLINICAL RELEVANCE/APPLICATION

Performing a close and long follow up of patients after US-PICT allows a better outcome and, therefore, a better clinical state.

### **MRI-guided Retrograde Drilling for Osteochondritis Dissecans of the Talus in Pediatric Patients**

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Jyri E. Jarvinen (*Presenter*) Nothing to Disclose

#### **PURPOSE**

This study aimed to evaluate the feasibility, effectivity, and safety of MRI-guided percutaneous retrograde drilling in the treatment of osteochondritis dissecans of the talus (OCDT) in pediatric population.

#### **METHODS AND MATERIALS**

The retrospective study (2010 - 2019) had 27 consecutive pediatric patients (mean age 13 years) with 30 stable, symptomatic OCDT which were unresponsive to conservative treatment. The OCDT were treated using MRI-guided retrograde drilling. They were graded pre- and post-operatively on a validated 5-grade scale (I - V) based on MRI. The procedure's effectivity was assessed by radiological improvement of the OCDT, and by postprocedural questionnaire that was aimed to evaluate pain (Visual Analogue Scale (VAS) 0 - 10) and performance (scale 0 - 10). Also, an evaluation of procedure-associated symptom alleviation was elicited.

#### **RESULTS**

The mean follow-up time was 6.1 (2.4 - 11.4) years. MRI-guided drilling was technically successful in all the cases. No major complications occurred. All the patients were discharged from hospital on the day as the procedure was performed. Mean time interval for follow-up imaging was 4.8 (1 - 12) months. All the OCDT represented grade II - III in pre-operative assessment, and they all remained stable during follow-up. The OCDT grade improved after drilling ( $p = 0.039$ ). Three of grade III OCDT improved to grade I, five of grade III OCDT improved to grade II, and one of grade II OCDT progressed to grade III. The rest of the OCDT remained unchanged. Increased ossification was observed in 39% of the OCDT. The symptoms were significantly alleviated or completely disappeared in 63% of the cases. Preoperative mean VAS and performance was 6.3 (SD 2.0) and 5.2 (SD 2.4), respectively. Both pain (mean change in VAS -3.8, SD 2.6) and performance (mean change 2.6, SD 3.1) were improved significantly ( $p < 0.001$  and  $P = 0.001$ , respectively). Orally administered anti-inflammatory drugs and paracetamol provided satisfactory postprocedural pain relief for 96.7% of the patients.

#### **CONCLUSION**

MRI-guided retrograde drilling of stable OCDT is a feasible, effective, and safe treatment method for pediatric patients.

#### **CLINICAL RELEVANCE/APPLICATION**

MRI-guided retrograde drilling of OCDT provides minimally invasive treatment option for patients who are unresponsive to conservative treatment. It is less invasive compared to surgery and is suitable for outpatient care. Additionally, lack of ionizing radiation makes it considerable treatment choice for pediatric patients.

### STIR Features of Primary Lower Extremity Lymphedema: A Retrospective Analysis of 228 Patients

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

MENGKE LIU (*Presenter*) Nothing to Disclose

#### PURPOSE

The staging of primary lower extremity lymphedema (LEL) is difficult and vital in clinical work. So we investigated the STIR manifestations of primary lower extremity lymphedema (LEL) in different clinical stages.

#### METHODS AND MATERIALS

A retrospective analysis of 228 patients of primary LEL was conducted, all of which underwent MRI examination using a short-time inversion recovery (STIR) sequence. The affected limb MRI manifestation was observed, and patients were divided into stages I, II, and III based on the 2020 International Society of Lymphology (ISL) clinical staging standards. Two radiologists assessed the following characteristics on STIR: the extent of edema, the frequency of MRI manifestations, including dermal thickening (dermal thickness > 2mm), and the morphology of edema in subcutaneous (grid, honeycomb, parallel-lines, banded, crescent, and lymphatic lake). Parallel-lines were thin, 1-2 mm wide, and parallel to the superficial fascia, not forming a network. Grid signs were multiple intertwined lines, up to 3mm wide, with the largest meridian parallel to the superficial fascia and a width-to-length ratio of less than 2/3. Honeycomb signs represented a further thickening of the grid in more than two directions, with a wall thickness greater than 3mm and a width-to-length ratio greater than 2/3. Band sign is an accumulation of fluid on the fascial surface with a strip-like structure observed at the axial level. Crescent sign is a subfascial accumulation observed at the axial level. Lymphatic lake is a large, structureless area of edema located in the subcutaneous soft tissue.

#### RESULTS

The extent of edema was positively correlated with clinical stage, both longitudinally and transversely. When comparing stages, the incidence of dermal thickening in stages II and III were significantly higher than that in stage I. The incidence of parallel-lines in stage I was significantly higher than that in stages II and III. The incidence of grid in stages I and II was significantly higher than that in stage III. The incidence of honeycomb in stages II and III was significantly higher than that in stage I. The incidence of banded sign in stages I and II was significantly higher than that in stage III. The incidence of lymphatic lake and crescent in stage III was significantly higher than that in stages I and II ( $P < 0.05$ ).

#### CONCLUSION

STIR manifestations of primary LEL in different stages have certain characteristics, Parallel line sign is a characteristic sign of stage I, and crescentic sign and lymphatic lake are characteristic signs of stage III. MRI can be an effective auxiliary tool for evaluating the severity of primary LEL.

#### CLINICAL RELEVANCE/APPLICATION

STIR can sensitively diagnose lymphedema and assist in clinical staging.

### Virtual Myocardial PET Generated from SPECT-to-PET Translation Model Corrects False High Resting Score in SPECT Due to Photon Attenuation

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Masateru Kawakubo, PhD (*Presenter*) Nothing to Disclose

#### PURPOSE

Myocardial single photon emission computed tomography (SPECT) is used worldwide for the diagnosis of myocardial ischemia. However, myocardial SPECT with an Anger-type gamma camera has specific artifacts, such as the effect of deep attenuation in the left ventricular inferior wall, that hinder accurate diagnosis. On the other hand, ammonia positron emission tomography (PET) has excellent detector sensitivity and its high-resolution images are considered the gold standard for ischemia diagnosis. We developed an algorithm to generate the virtual PET (vPET) from myocardial SPECT by deep learning network of SPECT-to-PET dataset of the same patient. This research investigates improvement in visual ischemia scoring accuracy of virtual myocardial PET generated by SPECT-to-PET translation (SPT) model.

#### METHODS AND MATERIALS

Fifty-four datasets of N-13 ammonia PET and Tc-99m-methoxyisobutylisonitrile SPECT at stress and resting state were retrospectively analyzed. These myocardial base to apical short-axis image dataset from same patient-to-patient were randomly divided into 34 cases of training datasets (2525 images) and 20 cases of test datasets (1762 images). Summed rest scores (SRS) and summed stress score (SSS) derived from vPET with the SPT model, SPECT, and PET in 20 test cases were blindly and independently assessed and compared among them.

#### RESULTS

SRS of vPET was not differ from those of PET ( $P > 0.999$ ), but those of SPECT was significantly over-estimated than PET ( $P = 0.002$ ) (vPET vs. SPECT vs. PET =  $0.8 \pm 2.0$  vs.  $1.8 \pm 1.5$  vs.  $0.5 \pm 0.4$ ). There were no differences of SSS among vPET, SPECT, and PET (vPET vs. SPECT vs. PET =  $1.5 \pm 2.2$  vs.  $3.4 \pm 3.0$  vs.  $4.1 \pm 5.6$ ).

#### CONCLUSION

Our proposed virtual PET imaging with SPT deep learning model potentially improves visual score based myocardial ischemia diagnosis in SPECT imaging without additional radioisotope injection and the high-cost novel imaging modality. This is the reasonable approach utilizing deep learning because myocardial ischemia diagnosis with standalone SPECT is used worldwide.

#### CLINICAL RELEVANCE/APPLICATION

Virtual PET for correcting attenuation artifact in SPECT is applicable as a low-cost and practical clinical tool which provides powerful auxiliary information for myocardial ischemia diagnosis.

### Coronary Artery Bypass Grafting Transiently Improves Myocardial Strain and Myocardial Flow Reserve: An Ammonia PET Study

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Atsushi Yamamoto, MD, PhD (*Presenter*) Nothing to Disclose

#### PURPOSE

Coronary artery bypass grafting (CABG) is associated with better survival and lower rates of major cardiovascular events in the short and long terms. The patency of bypass grafts has been confirmed using coronary CT angiography; however, the effects of CABG on myocardial strain and microcirculatory functions have not been elucidated. We have made it possible to evaluate left ventricular myocardial strain (LVMS), adapting a feature-tracking technique to electrocardiography-gated high-resolution  $^{13}\text{N}$ -ammonia positron emission tomography (NH<sub>3</sub>-PET). The aim of this study was to evaluate the change of LVMS and myocardial flow reserve (MFR) measured by NH<sub>3</sub>-PET before and after CABG.

#### METHODS AND MATERIALS

Between March 2015 and December 2022, 946 consecutive patients were performed resting and stressed NH<sub>3</sub>-PET because of known or suspected IHD. Patients who underwent NH<sub>3</sub>-PET before and after CABG (mean interval, 6 months) were enrolled. Patients with a transplanted heart, congenital heart disease, adenosine ineffectiveness, or poor imaging were excluded. LVMS was assessed by a feature-tracking technique on the NH<sub>3</sub>-PET cine images of horizontal long-axis slices, and the LVMS ratio (LVMSR) was defined as LVMS at stress divided by that at rest. MFR was calculated using a two-compartment model of the time concentration curve for the first two minutes after ammonia injection. LVMSR and MFR before and after CABG were compared by paired t-test. 11 patients who underwent NH<sub>3</sub>-PET before and after percutaneous coronary intervention (PCI) were analyzed as a comparison group.

#### RESULTS

16 patients who underwent CABG were retrospectively analyzed. LVMSR in the CABG group showed significant improvement with invasive treatment ( $0.99 \pm 0.13$  vs.  $1.15 \pm 0.21$ ,  $p=0.0013$ ). Global MFR increased significantly from baseline to post CABG ( $1.49 \pm 0.42$  vs.  $1.91 \pm 0.51$ ,  $p<0.0001$ ). On the other hand, there was no significant difference in LVMSR before and after PCI ( $1.01 \pm 0.14$  vs.  $1.00 \pm 0.11$ ,  $p=0.87$ ). No significant improvements in global MFR ( $1.83 \pm 0.65$  vs.  $2.12 \pm 0.77$ ,  $p=0.16$ ) were observed in the PCI group.

#### CONCLUSION

CABG transiently improves myocardial strain and MFR significantly. The effect is more pronounced than PCI.

#### CLINICAL RELEVANCE/APPLICATION

This method can reproducibly assess local function before and after revascularization. Furthermore, it has the advantage of detecting ischemia-related wall motion abnormalities, whereas previously only ischemia was evaluated.

### Radiology Practice Size Distribution Pre- and Post-COVID-19 Pandemic

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Kyle Tegtmeyer, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

Prior investigations by Rosenkrantz et. al in 2019 have demonstrated a trend of consolidation of radiology groups in the mid-2010s. However, little is known about changes in radiology practice group size and numbers spanning the COVID-19 pandemic. This study seeks to investigate consolidation trends within radiology practice groups before and after the COVID-19 pandemic.

#### METHODS AND MATERIALS

Data on radiologists and their associated practice affiliations were obtained for 2017 and early 2023 from the Physician Compare national database provided by the Centers for Medicare and Medicaid Services. Calculations of unique radiology practice groups and number of unique associated national provider identifier (NPI) numbers associated with each radiology group were performed using R 4.2.2.

#### RESULTS

The number of unique radiologists nationally increased between 2017 and 2023 from 32060 to 34080. Between 2017 and 2023, the number of radiology practices decreased from 3909 to 3455 unique practice entities. The median number of radiologists per practice remained 6 between 2017 and 2023, but the mean practice size increased from 13.9 to 19.0 unique radiologists, indicating a growing skew towards larger groups. The top 10 groups by size increased from including 2411 unique radiologists in 2017 to 3554 unique radiologists in 2023. The top 10 groups by size in 2023 include 3 groups not previously within the top 100 groups by size; the top ranked group by size in 2023 ranked 39th in size in 2017. The number of unique NPI-Practice group pairs has increased from 54,274 in 2017 to 65,664 in 2023; the average radiologist increased billing from under an average of 1.69 to 1.93 distinct practice entities from 2017 to 2023. Analysis by group size demonstrates relative growth in number of radiology practices with >25 radiologists, with a 119% relative increase in number of groups with 100+ radiologists. Geographic analysis demonstrates a relative increase of proportion of groups located within the western census region of approximately 10%, with relative decreases in the remaining regions.

#### CONCLUSION

Consolidation of radiology practice groups has continued through the COVID-19 pandemic from 2017 to 2023, with fewer unique practices and higher average number of radiologists per practice. The greatest growth is seen among practices with 100+ radiologists, highlighting the high degree of consolidation in recent years among the largest groups in the US. At least some of this consolidation appears to be due to greater number of distinct practice entities under which radiologists are billing.

#### CLINICAL RELEVANCE/APPLICATION

Increasing consolidation of radiology practices was seen between 2017 and early 2023, with the largest growth seen in practices with 100 or more radiologists.

### Reducing Energy Consumption in MRI using Shorter Scan Protocols, Optimized Magnet Cooling Patterns and Deep Learning Sequences: How Low Can We Go

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Saif Afat, MD (*Presenter*) Nothing to Disclose

#### **PURPOSE**

This study aimed to investigate energy consumption in MRI scanners and identify strategies for improving energy efficiency in radiology departments and practices. We focused on musculoskeletal MRI and assessed the potential savings achievable through optimizing protocols, incorporating deep learning (DL) accelerated acquisitions, and optimizing the cooling system.

#### **METHODS AND MATERIALS**

Energy consumption measurements were performed on three MRI scanners (1.5T Aera, 1.5T Sola, 3T Skyra) in practices in Munich, Germany, between December 2022 and March 2023. Two levels of energy reduction measures, eco protocols and DL accelerated sequences, were implemented and compared to baseline. Analysis was conducted in R and Python to evaluate the average, median, and standard deviations of sequence scan times and energy consumption.

#### **RESULTS**

Our findings showed significant energy savings by optimizing protocol settings alone, with knee imaging achieving a 21% energy consumption reduction and 22% time reduction. Implementing DL technologies led to a 37% energy consumption reduction and a 46% time reduction compared to baseline. Optimizing the magnet cooling strategy resulted in a 23.2% reduction during off-cycles.

#### **CONCLUSION**

Implementing energy-saving strategies, including eco protocols, DL accelerated sequences, and optimized magnet cooling, can significantly reduce energy consumption in MRI scanners without compromising image quality or operational efficiency. Radiology departments and practices should consider adopting these strategies to improve energy efficiency and reduce costs.

#### **CLINICAL RELEVANCE/APPLICATION**

Reducing energy consumption in MRI scanners has environmental, financial, and operational implications for radiology departments and practices. Implementing energy-saving strategies can help address the growing demand for medical devices while reducing energy costs and greenhouse gas emissions.

### Multiscale Principal Gradient Alterations in Subcortical-Cortical Connectome as Potential Biomarkers for Memory Impairments in Major Depressive Disorder

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Qian Zhang (*Presenter*) Nothing to Disclose

#### PURPOSE

Major depressive disorder (MDD) is associated with functional abnormalities in subcortical networks, which contribute to clinical symptoms and cognitive impairments. This study introduces a new approach, functional gradient mapping, to identify hierarchical organization in subcortical connectivity patterns and evaluate their relationship with cognitive features.

#### METHODS AND MATERIALS

Resting-state fMRI studies were conducted on 145 never-treated first-episode MDD patients and 145 healthy controls (HCs). The voxel-wise gradient distributions of the subcortical-cortical connectome were mapped, and group-averaged gradient values were compared across all subcortical voxels, three main systems (limbic, thalamic, and basal ganglia), structural subregions, and functional subregions related to specific cortical functional networks. The study also assessed the association between significant gradient alterations and neuropsychological functioning.

#### RESULTS

The principal gradient values were organized along a gradual anterior-posterior axis across subcortical structures in MDD patients, which varied across different subcortical systems and subregions relative to HCs. At the system level, principal gradient values were lower in the thalamic and limbic systems but higher in the basal ganglia (BG) striatal system in the MDD group. Within subcortical functional subfields, MDD patients had lower gradient values in all limbic subregions and higher gradient values in thalamic subregions projecting to the frontoparietal network but lower values in other thalamic-subregions. Higher gradient values were observed in BG subregions projecting to FPN and visual networks, but lower gradient values were observed in BG regions projecting to sensorimotor, default mode (DMN), and ventral attention network (VAN). Notably, altered principal gradient values of the thalamic system and the subregion projecting to DMN were positively associated with episodic memory test performance in MDD patients, while the BG region projecting to VAN was negatively linked.

#### CONCLUSION

Multiscale principal gradient alterations of the subcortical-cortical connectome reflected hierarchical disorganization underlying functional segregation in MDD. The interactive associations of thalamic and BG gradient alterations were implicated in subcortical functional connectivity disturbance and episodic memory impairments in MDD patients, revealing an internally differentiated and clinically relevant pattern of subcortical gradient dysfunction in MDD.

#### CLINICAL RELEVANCE/APPLICATION

These findings enhanced our understanding of MDD-related hierarchical pathology and presented potential intervention biomarkers for memory improvements in MDD.

### Volume Reduction in Hippocampal Subregions is Associated with Cognitive Impairment in Patients with Cerebral Small Vessel Disease

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Na Wang (*Presenter*) Nothing to Disclose

#### PURPOSE

Cerebral small vessel disease (CSVD) is a chronic disease that can lead to mental and psychiatric impairment. As a key brain region for memory and learning, the volume change in the hippocampus may play an important role in cognitive impairment in patients with CSVD, but the specific mechanism is still unknown. The purpose of this article is to compare the volume changes in hippocampal subregions in patients with severe CSVD (CSVD-S), patients with mild CSVD (CSVD-M) and healthy controls (HCs) to investigate the influencing factors of cognitive differences in patients with CSVD.

#### METHODS AND MATERIALS

Sixty-seven CSVD-S patients, 150 CSVD-M patients and 98 healthy controls underwent magnetic resonance imaging (MRI) and cognitive tests. FreeSurfer was used to automatically segment the hippocampus from high-resolution MRI and extract the volume data of 19 subregions. One-way analysis of variance was used to compare the volume differences in hippocampal subregions among the three groups, and the correlation between regions of interest (ROIs) and cognitive test results in the CSVD groups was analyzed. In addition, stepwise regression analysis was performed to correlate the ROIs with multiple risk factors in the CSVD groups.

#### RESULTS

We found significant differences in the volumes of the presubiculum-body, head of granule cell and molecular layer of the dentate gyrus (GC-ML-DG-head), fimbria and hippocampus amygdala transition area (HATA) among the three groups ( $p < 0.003$ , Bonferroni correction), and the volumes of the CSVD-S group were significantly smaller than those of the HC group ( $p < 0.003$ ). Bivariate correlation analysis showed that these four subregions were correlated with the Stroop color-word test (SCWT), and the GC-ML-DG-head and fimbria were also correlated with the Montreal cognitive assessment (MoCA) ( $p < 0.013$ ) in the CSVD groups. Influencing factors of the four subregions included age, gender, smoking, hyperlipidemia and hypertension. Mediation analysis showed that the average volume of the 4 ROIs partially mediated the relationship between drinking and SCWT scores.

#### CONCLUSION

The volume reduction of some hippocampal subregions can aggravate cognitive impairment in patients with CSVD, and the decreased volume of hippocampal subregions was associated with age, gender, smoking, hyperlipidemia and hypertension. The volume of 4 ROIs mediates cognitive function in CSVD patients with drinking.

#### CLINICAL RELEVANCE/APPLICATION

Maintaining good living habits and paying more attention to blood pressure and blood lipids can help to reduce the cognitive impairment caused by CSVD.

### Regional High Iron Deposition on Brain Quantitative Susceptibility Mapping Correlates with Decreased Cognitive Function in End Stage Renal Disease

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Yuan Li (*Presenter*) Nothing to Disclose

#### PURPOSE

The end-stage renal disease (ESRD) patients usually have increased brain iron depositions. This study aimed to quantitatively evaluate the brain iron deposition in patients with ESRD by threshold method of quantitative susceptibility mapping (QSM), and to analyze the correlation between the iron deposition and cognitive function.

#### METHODS AND MATERIALS

Thirty-four ESRD patients and 45 healthy controls (HCs) were prospectively recruited. All subjects were scanned using a 3T MRI to acquire strategically acquired gradient echo (STAGE) sequence. The mean magnetic sensitivity values (MSV) and volume (MSVM, VM) and high iron region (MSVH, VH) of bilateral caudate nucleus (CN), putamen (PUT), globus pallidus (GP), substantia nigra (SN), red nucleus (RN) and dentate nucleus (DN) in both groups were measured manually (Figure 1). All QSM data was compared between groups using analysis of covariance. Neuropsychological examination results were compared between the two groups by two-sample t tests or Mann-Whitney U tests. Partial correlation analysis was used to assess correlations between the MSVH, VH/VM data and cognitive test scores in the ESRD group, with gender, age and education level as covariates. Multiple comparisons of all statistical values were corrected by false discovery rate (FDR). A statistically significant P-value was set at 0.05.

#### RESULTS

Compared with HCs, the MSVM of bilateral PUT, DN and right RN were decreased (Table 1), the VM of all gray matter nuclei were decreased, and the MSVH and VH/VM of bilateral CN, PUT, DN and right SN were increased in ESRD patients ( $P < 0.05$ , FDR corrected)(Figure 2). Patients with ESRD had lower MoCA and DSST scores but higher TMT-A, TMT-B, HAMA, HAMD and BDI-II scores (Table 2). The partial correlation analysis showed that the MSVH of the bilateral RN was negatively correlated with orientation scores (left:  $P = 0.002$ ,  $r = -0.568$ ; right:  $P < 0.001$ ,  $r = -0.651$ )(Figure 3).

#### CONCLUSION

The iron deposition of gray matter nuclei increased as well as volume decreased in ESRD patients. The MSV in high iron areas can better assess the distribution of iron and is related to the cognitive dysfunction.

#### CLINICAL RELEVANCE/APPLICATION

Previous studies were based on the mean MSV of gray matter nuclei in ESRD patients, but since the distribution of iron is uneven, we further divided the gray matter nuclei into high iron area according to the threshold, which can sensitively reflect the abnormal distribution of brain iron and cognitive impairment.

### Cerebral Blood Flow Changes in Patients with End Stage Renal Disease: A Study Based on Pseudo-continuous Arterial Spin Labeling

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Yuan Li (*Presenter*) Nothing to Disclose

#### PURPOSE

Patients with end-stage renal disease (ESRD) lead to cerebral hemodynamic instability. This study aimed to quantitatively evaluate the cerebral blood flow (CBF) alteration in patients with ESRD and to analyze the correlation between the CBF with cognitive and clinical indicators.

#### METHODS AND MATERIALS

Thirty-five ESRD patients and 46 healthy controls (HCs) were prospectively recruited. All subjects were scanned using a 3T MRI to acquire pseudo-continuous arterial spin labeling (pCASL) sequence. The relative values of cerebral blood flow (rCBF) of the whole brain was measured using SPM8. All CBF data was compared between groups using analysis of covariance. Neuropsychological examination scores and laboratory indexes were compared between the two groups by two-sample t tests or Mann-Whitney U tests. Partial correlation analysis was used to assess correlations between the CBF data, cognitive test scores and blood biochemical test in the ESRD group, with gender, age and education level as covariates. A statistically significant P-value was set at 0.05.

#### RESULTS

Compared with the HCs, the ESRD group exhibited lower rCBF in the bilateral thalamus and putamen (Figure 1, Table 1)( $P < 0.05$ , FDR corrected). There were significant differences in the levels of RBC, HB, Cre, eGFR, UA and HCY between the two groups (all  $P < 0.05$ ). Patients with ESRD had lower MoCA and DSST scores but higher TMT-A, HAMA, HAMD and BDI-II scores (Table 3). The partial correlation analysis showed that the rCBF of the bilateral thalamus were positively correlated with HCY (left:  $P = 0.010$ ,  $r = 0.449$ ; right:  $P = 0.005$ ,  $r = 0.486$ ), the rCBF of the left putamen was negatively correlated with the MoCA scores ( $P = 0.010$ ,  $r = -0.447$ ), the rCBF of the right thalamus was negatively correlated with the orientation scores ( $P = 0.016$ ,  $r = -0.421$ ), the rCBF of the left putamen was negatively correlated with the delayed recall scores ( $P = 0.002$ ,  $r = -0.528$ ), and the right putamen was negatively correlated with the attention scores ( $P = 0.047$ ,  $r = -0.353$ )(Figure 2).

#### CONCLUSION

The cerebral blood flow in bilateral putamen and thalamus decreased in patients with ESRD, which correlated with HCY level and neurocognitive scores.

#### CLINICAL RELEVANCE/APPLICATION

Patients with ESRD have cerebral hemodynamic imbalances and may suffer from a range of complications. So we used arterial-spin labeling MR imaging to non-invasively and quantitatively evaluate cerebral blood flow changes in patients with ESRD, and analysis the correlation between these changes and cognitive impairment.

### Visceral Abdominal Adipose Tissue and Insulin Resistance Respectively Influence Alzheimer's Disease Amyloid Pathology and Neurodegeneration in Midlife

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Mahsa Dolatshahi, MD, MPH (*Presenter*) Nothing to Disclose

#### PURPOSE

Obesity and adiposity at midlife, evidenced by high body mass index (BMI), are increasingly understood as risk factors for Alzheimer's disease (AD). Importantly, visceral fat is known to be associated with insulin resistance and a proinflammatory state, the mechanisms involved in AD pathology. Herein, we aimed to assess the association between brain MRI volumes as well as amyloid and tau uptake with obesity, insulin resistance, and abdominal adipose tissue in the cognitively normal midlife population.

#### METHODS AND MATERIALS

A total of 34 middle-aged (age:  $51.27 \pm 6.12$  years, BMI:  $32.28 \pm 6.39$  kg/m<sup>2</sup>), cognitively normal participants, underwent bloodwork, brain, and abdominal MRI, as well as amyloid and tau PET scan. Homeostatic Model Assessment for Insulin Resistance (HOMAIR)  $> 1.9$  was used as a measure of insulin resistance. Visceral and subcutaneous adipose tissue (VAT, SAT) were semi-automatically segmented using VOXel Analysis Suite (Voxa). FreeSurfer 7.1.1 was used for the automatic segmentation of cortical and subcortical brain regions using a probabilistic atlas. Dynamic amyloid imaging was performed with a bolus injection of  $\sim 15$  mCi of [<sup>11</sup>C]PiB, followed by a 60-min scan. A single intravenous bolus of between 7.2-10.8 mCi of AV-1451 was administered. Data from the 30-60 minute, and 80-100 minute post-injection window for PiB and AV-1451 were used for the analysis, respectively. The association of brain volumes and PiB and AV-1451 standardized uptake value ratios (SUVRs) within the default mode network areas with BMI and VAT/SAT ratio were assessed using linear regression models.

#### RESULTS

We observed lower right entorhinal white matter volumes in obese participants with insulin resistance compared to metabolically normal non-obese group ( $p=0.004$ ), without any significant difference in PiB or AV-1451 SUVRs. Regression models with sex, age and education as covariates showed a significant positive association between VAT/SAT ratio and left precuneus white matter PiB SUVRs ( $R^2=0.31$ ,  $p=0.005$ ), but no significant associations with AV-1451 SUVRs.

#### CONCLUSION

In our midlife obese sample with insulin resistance, there was lower right entorhinal white matter volume, which is involved in relaying information to the hippocampus. We also demonstrated higher early amyloid pathology in AD-signature areas such as the precuneus in mid-life persons with high VAT/SAT ratio, a marker of visceral obesity.

#### CLINICAL RELEVANCE/APPLICATION

These findings prompt designing interventions targeted at reducing abdominal visceral fat, obesity, and insulin resistance in midlife to prevent against Alzheimer disease pathology and neurodegeneration.

### Utility of Quantifying the Glymphatic System Activity using Diffusion Tensor Image Analysis Along the Perivascular Space (DTI-ALPS) in Mild Cognitive Impairment (MCI), Compared to the Cerebrospinal Fluid (CSF) Biomarker

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Hiroto Takahashi, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

Identifying early Alzheimer's disease (AD) would offer better disease management. The cerebrospinal fluid (CSF) biomarker is sensitive to neurodegeneration in dementia. Dysfunction of the glymphatic system has been revealed to be associated with various diseases including AD. We evaluated the activity of the glymphatic system in mild cognitive impairment (MCI) with a diffusion-based technique called diffusion tensor image analysis along the perivascular space (DTI-ALPS) to explore the imaging biomarker for assessing early dementia, while comparing the CSF biomarker level.

#### METHODS AND MATERIALS

Sixty-two patients with MCI underwent both CSF measurement and diffusion magnetic resonance imaging at 3T. No hyperintensities in the periventricular white matter were observed in all subjects on T2-weighted images. Based on the CSF p-tau/A $\beta$ 42 ratio value, 33 patients with AD pathology (AD group) were discriminated from 29 patients with non-AD pathology (non-AD group). Diffusivities in the X, Y and Z axes were obtained in the lateral ventricle body plane of all subjects. We assessed the diffusivity along the perivascular spaces, as well as projection fibers and association fibers, respectively in order to acquire the DTI-ALPS index of each hemisphere. The significance of intergroup difference in the DTI-ALPS index was tested using Mann-Whitney's U test. The performance of the DTI-ALPS index to discriminate the groups was assessed using receiver operating characteristic (ROC) analysis. Correlations between the DTI-ALPS index and each CSF amyloid  $\beta$  (A $\beta$ ) 42, phosphorylated tau (p-tau) and total tau (t-tau) value were assessed in all subjects using Pearson's correlation analysis.

#### RESULTS

The DTI-ALPS indices of both hemispheres were higher in the AD group than those of the non-AD group (Right: 1.72/1.59 for AD group/non-AD group; P value was 0.056; Left: 1.61/1.44 for AD group/non-AD group; P value was 0.002, indicating significant intergroup difference). The respective areas under the ROC curve of the DTI-ALPS index of the right/left hemispheres were 0.64/0.73. The DTI-ALPS indices of both hemispheres showed significant correlation with each p-tau value (r: 0.26/0.28 for right/left) and t-tau value (r: 0.28/0.31 for right/left), whereas no significant correlation with the CSFA $\beta$  42 value was identified, in all subjects.

#### CONCLUSION

Impairment of the glymphatic system was more observed in non-AD pathology than in AD pathology in MCI. The DTI-ALPS index might be useful for discriminating early AD from other dementias as well as for measuring neurodegeneration in MCI.

#### CLINICAL RELEVANCE/APPLICATION

Quantifying the activity of the glymphatic system may be a useful biomarker for diagnosing early AD as well as for measuring neurodegeneration in early dementia.

### Evaluate Depression in Parkinson's Disease with a Multi-Flip-Angle and Multi-Echo Gradient Echo Sequence (Multiplex) MRI

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

He Sui, MD,MD (*Presenter*) Nothing to Disclose

#### PURPOSE

Previous multimodal MRI has proven to be a useful imaging approach for both clinical diagnosis and research investigating, however, studies of Parkinson's disease (PD) have focused primarily on motor-related basal ganglia structures and little research has been done on clinical scale indicators. In this experiment, we used multiparametric MRI to detect changes related to non-motor symptoms (NMS) in patients with PD.

#### METHODS AND MATERIALS

We included 37 patients with PD diagnosed by two neurologists from August to December 2021 in our hospital in this retrospective study. Hamilton Depression Scale (HAMD) were used to assess the PD patients. 3D TIWI and Multi-Flip-Angle and Multi-Echo Gradient Echo Sequence (Multiplex) MRI techniques such as T2<sup>\*</sup>-, T1-, PD-mapping and quantitative susceptibility mapping (QSM) were performed using a 3T MR scanner. The regions of interest of the whole brain were depicted according to automatic brain segmentation based on deep learning. The Spearman's rank correlation coefficient was used to analyze the relationship between volume, relaxation value of each brain subregion and NMS related assessment scales

#### RESULTS

Among parkinsonian subjects, we found that left paracentral, precuneus on both sides, and right superior temporal gyrus in MTP-QSM, right frontal pole and left lateral occipital gyrus on MTP-T2<sup>\*</sup> mapping showed correlations with HAMD. Volume of the left superior frontal gyrus, middle frontal gyrus on both sides, left frontalpole, insula on both sides, right middle cingulate gyrus, right entorhinal cortex, right superior temporal gyrus, right middle temporal gyrus and optic chiasm showed negative correlations with HAMD on 3D TIWI images. The indicators in MTP-T1 mapping and PD mapping do not have a clear correlation with HAMD.

#### CONCLUSION

There is a certain degree of correlation between Multiplex MRI and some clinical evaluation indicators related to depression of PD, we suggest the fusion of quantitative multiparametric neuroimaging measures as an effective strategy that could generally cope with early diagnosis of PD.

#### CLINICAL RELEVANCE/APPLICATION

Quantitative multiparametric neuroimaging measures may serve as an effective strategy for non-invasively characterizing the Parkinson's disease.

### The Impact of Amyloid & Cerebral Small Vascular Disease on Glymphatic Function: A Study Based on Alzheimer's Disease Continuum Participants

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Hui Hong, PhD (*Presenter*) Nothing to Disclose

#### PURPOSE

Glymphatic dysfunction is a crucial pathway for dementia. Alzheimer's Disease (AD) pathologies co-existing with cerebral small vessel disease (CSVD) is the most common pathogenesis for dementia. We hypothesize that AD pathologies and CSVD could be associated with glymphatic dysfunction, contributing to cognitive impairment.

#### METHODS AND MATERIALS

Participants completed with amyloid PET, diffusion tensor imaging (DTI) and T2FLAIR sequences were included from the Alzheimer's Disease Neuroimaging Initiative (ADNI). White matter hyperintensities (WMH) as the most common CSVD marker was evaluated from T2FLAIR images and represented the burden of CSVD, amyloid PET was used to assess A $\beta$  aggregation in the brain, and DTI-ALPS calculated from DTI reflected glymphatic function. We used correlation analysis to investigate the relationship between WMH burden/A $\beta$  aggregation and DTI-ALPS and the correlations of DTI-ALPS with cognitive domains. Next, mediation analysis was carried out to explore the mediating effects of DTI-ALPS between WMH burden/ A $\beta$  aggregation and cognitive domains.

#### RESULTS

One hundred and thirty-three participants along the AD continuum were included, consisting of 40 CN-, 48 CN+, 26 MCI+, and 19 AD + participants. We found both WMH burden ( $r = -0.432$ ,  $p < 0.001$ ) and whole brain A $\beta$  aggregation ( $r = -0.268$ ,  $p = 0.003$ ) were independently negatively associated with DTI-ALPS. There were no interaction effects of A $\beta$  aggregation and WMH burden on DTI-ALPS ( $\beta = 0.109$ ,  $p = 0.260$ ). DTI-ALPS was positively associated with memory ( $r = 0.470$ ,  $p < 0.001$ ), executive function ( $r = 0.356$ ,  $p < 0.001$ ), visual-spatial function ( $r = 0.241$ ,  $p < 0.040$ ), and language performance ( $r = 0.391$ ,  $p = 0.007$ ). In the mediation analysis, we found that DTI-ALPS mediated the relationship of WMH burden/A $\beta$  with memory, executive and language performance.

#### CONCLUSION

Our study provided evidence that both AD pathology (A $\beta$ ) and CSVD were associated with glymphatic dysfunction, which is further related to cognitive impairment.

#### CLINICAL RELEVANCE/APPLICATION

Our results may provide a theoretical basis for glymphatic function intervention for treating AD.

### **Discordant Hippocampal Atrophy and Cerebral Hypometabolism in Alzheimer's Disease Subjects with Confirmed $\beta$ -amyloid Positivity**

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Gavin Yuan, BA (*Presenter*) Nothing to Disclose

#### **PURPOSE**

Hippocampal atrophy on MRI and cerebral hypometabolism on FDG-PET are both widely used biomarkers of Alzheimer's disease (AD). Clinically, hippocampal volumes and FDG-avidity are assessed in comparison to age-matched reference groups, but accuracy of such methods have largely been tested in cohorts without biomarker-confirmed AD. Here, we examined the accuracy of MRI and FDG-PET in amyloid-positive AD, at the single-subject level, and factors that could be associated with structural-metabolic discordance.

#### **METHODS AND MATERIALS**

We included 108 subjects with AD (age 74.5 $\pm$  8.2 years, 59:49 males: females) from the Alzheimer's Disease Neuroimaging Initiative (ADNI), with a positive 18F-florbetapir amyloid PET scan, who underwent FDG-PET and volumetric MRI. 179 amyloid-negative, normal controls (age 75.1 $\pm$  6.9 years, 97:82 males:females) served as the age-matched reference group. Bilateral hippocampal volumes were segmented using  $\beta$ Freerfer v7.1.1, averaged, and normalized by intracranial volume. The same  $\beta$ Freerfer regions were applied to the coregistered FDG-PET and normalized by the pons. A threshold of 1.5 standard deviations below the reference group defined biomarker abnormality (e.g. presence of hippocampal atrophy or cerebral hypometabolism). Two-by-two contingency tables were used to assess concordance/discordance between hippocampal atrophy and hypometabolism. Statistical analyses were performed in STATA 16, and group differences were assessed using the Kruskal-Wallis or Fisher's Exact Tests.

#### **RESULTS**

Hippocampal atrophy correctly classified 40/108 (37%) subjects as AD, whereas precuneus cerebral hypometabolism correctly classified 51/108 (47%) subjects. Structural-metabolic discordance was seen in 47/108 (44%) subjects. Individuals with higher Fazekas scores were less likely to have hippocampal atrophy (OR 0.56,  $p=0.015$ ) or cerebral hypometabolism (OR 0.62,  $p=0.04$ ). Older individuals were less likely to have cerebral hypometabolism (OR 0.93,  $p=0.007$ ). Some subjects without a typical pattern of temporoparietal hypometabolism had significantly decreased FDG avidity in the caudate (5/108) and thalamus (3/108).

#### **CONCLUSION**

Cerebral hypometabolism on FDG-PET and hippocampal atrophy on MRI each detected less than half of the amyloid-confirmed AD subjects. Discordance was high, suggesting that other factors, including age and microvascular disease, could affect the sensitivity of these biomarkers. Notably, the caudate and thalamus were atypical areas of hypometabolism that warrant further investigation.

#### **CLINICAL RELEVANCE/APPLICATION**

Knowing the limitations of clinically used quantitative AD biomarkers is important for appropriate management.

### Defining the Relationship Between Mesial Temporal Atrophy and CSF Biomarkers in Amnesic Mild Cognitive Impairment

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Allison K. Sullivan, MD, MPH (*Presenter*) Nothing to Disclose

#### PURPOSE

The NIA-AA research framework introduced a classification scheme to define and stage the pathologic processes leading to Alzheimer's disease (AD) using three groups of biomarkers: biomarkers of  $\beta$ -amyloid deposition, neurofibrillary tangles deposition, and neurodegeneration. Our aim was to evaluate the differences in mesial temporal atrophy rate among amnesic mild cognitive impairment (MCI) patients with normal CSF biomarkers, CSF biomarkers indicating abnormal  $\beta$ -amyloid deposition (A+), and abnormal CSF biomarkers without  $\beta$ -amyloid deposition.

#### METHODS AND MATERIALS

We retrospectively identified 401 elderly patients from the Alzheimer's Disease Neuroimaging Initiative cohort, 243 with a diagnosis of amnesic MCI and 158 cognitively unimpaired (CU). MCI patients were classified into three groups: normal biomarkers ( $n = 46$ ), Alzheimer's continuum (A+,  $n = 144$ ), and non-AD pathologic change (all other biomarker profiles,  $n = 53$ ). Hippocampal (HV) and entorhinal cortex (ERCV) volumes were calculated from brain MRI obtained during the first and second year of study participation. We then evaluated group differences over time using mixed model Analysis of Covariance procedures. Results were considered statistically significant when  $p < 0.05$ .

#### RESULTS

HV and ERCV atrophy rates differed among groups of subjects when controlling for age (HV:  $F = 20.45$ ,  $p < 0.001$ ; ERCV:  $F = 11.86$ ,  $p < 0.001$ ). HV atrophy rate was greatest in the MCI A+ group than all other groups. Worse ERCV atrophy rates were observed in the MCI A+ group than CU elderly individuals and MCI subjects with non-AD pathologic change.

#### CONCLUSION

Mesial temporal atrophy rate is worse in MCI subjects with abnormal  $\beta$ -amyloid deposition (A+) than other MCI individuals.

#### CLINICAL RELEVANCE/APPLICATION

Understanding structural brain differences among patients with different biomarker profiles will enhance the design of clinical trials targeting MCI subjects, especially when MRI markers of neurodegeneration are employed as endpoint.

### PET-based A $\beta$ Quantification and Volumetric Comparisons in A $\beta$ -classified Patients

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Priya Santhanam, PhD (*Presenter*) Nothing to Disclose

#### PURPOSE

This study aims to identify associations between PET-based quantification of amyloid- $\beta$  (A $\beta$ ) and MR brain volumetrics in patients with or without radiological presence of A $\beta$  plaques.

#### METHODS AND MATERIALS

Patients (n=164; mean age=75.1 years) who were clinically identified as having mild cognitive impairment (MCI) and/or Alzheimer's dementia underwent 3T MRI anatomical imaging and PET CT imaging using A $\beta$  binding tracers Amyvid or Vizamy. Neuroradiologist interpretation of PET-imaging allowed patients to be classified as positive (n=89; A $\beta$ +) or negative (n=75; A $\beta$ -) for A $\beta$  presence. NeuroQuant (v3.0) was used to obtain normalized percentile volumes in regions of interest for this patient population (based on previous findings), which were then compared between A $\beta$ + and A $\beta$ - groups. Quantified A $\beta$  tracer in these same regions acquired through newly-available PETQuant (3.0.2) software was also compared between groups. Finally, the statistical association between volumetrics and PET A $\beta$  quantities within regions was assessed via regression modeling.

#### RESULTS

PET-based A $\beta$  quantities were significantly higher in A $\beta$ + patients for bilateral amygdala (p<0.001), entorhinal cortex (p<0.001), hippocampus (left: p=0.001, right: p=0.002), and parahippocampal regions (p<0.001) as compared to A $\beta$ - patients. Additionally, normalized percentile volumes were significantly lower in the A $\beta$ + group for bilateral amygdala (left: p=0.001, right: p=0.005), left hippocampus (p=0.009), and bilateral parahippocampus (left: p=0.003, right: p=0.033). A regression model further identified significant associations between A $\beta$  quantity and volumetric percentile in the left entorhinal cortex (p=0.005), bilateral hippocampus (left: p=0.009, right: p=0.038), and right parahippocampus (p=0.046).

#### CONCLUSION

Decreased volumes and increased A $\beta$  quantities in limbic regions were observed in patients with clinical A $\beta$  positivity. In combination, NeuroQuant and PETQuant metrics provide a useful supplement to radiological examination in patients with MCI or Alzheimer's dementia. Further analysis is needed to determine any predictive value for patient classification and outcomes.

#### CLINICAL RELEVANCE/APPLICATION

A $\beta$  classification in patients with MCI or Alzheimer's dementia can be further informed by quantified metrics of volume and A $\beta$  tracer quantities in limbic regions.

### The Study of Total Load of Imaging Combined with Cognition on Cerebral Small Vessel Disease in High Altitude Areas

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Hai Hua Bao (*Presenter*) Nothing to Disclose

#### PURPOSE

Cerebral small vessel disease (CSVD) is the most common cerebrovascular disease that can result in disability and cognitive decline in older adults. Owing to the unique environmental conditions, research on cerebral small vessel disease in high altitude areas is limited. The purpose of this study was to investigate whether altitude can affect cognitive function in patients with CSVD, and to evaluate the correlation between total imaging load and cognitive scores.

#### METHODS AND MATERIALS

A total of 56 patients with CSVD who were admitted to the Department of Neurology of the Affiliated Hospital of Qinghai University were included in the study, according to the altitude, it is divided into middle altitude group (1500-2500 meters, n=30) and high altitude group (2500-4500 meters, n=26). Use Prisma 3.0 T magnetic resonance to perform head T1WI, T2WI, T2Flair, DWI, SWI and MRA scans, evaluate CSVD imaging markers and calculate the total load (0-4 points, the severity of the disease is proportional to the score). After the scan, the Cambridge Automated Neuropsychological Test Battery (CANTAB) was used to evaluate the cognitive abilities of all patients, including motor screening task (MOT), reaction time (RTI), rapid visual information processing (RVP), paired association learning (PAL), delayed matching to sample (DMS), spatial working memory (SWM), psychomotor speed, sustained attention, memory ability, and executive function were assessed separately. Data analysis was performed using SPSS 25.0 software.

#### RESULTS

When the total load score was 0 or 1, The high altitude group performed poorly in the DMS test( $P=0.019$ ) and the RIT test( $P=0.024$ ); When the score was 2, there was statistically significant difference between the two groups in DMS ( $P=0.004$ ); when the score was 3 or 4, there was no statistical difference in the test results between the two groups ( $P>0.05$ ). The CSVD total load score was positively correlated with DMSMLAD, DMSMLS, and MOTML ( $r=0.614, 0.727, 0.448$ , all  $P<0.05$ )

#### CONCLUSION

With the increase in altitude, the memory ability and psychomotor speed of CSVD patients decreased more significantly. In addition, with the aggravation of CSVD, memory ability and psychomotor speed will also decrease.

#### CLINICAL RELEVANCE/APPLICATION

Cognitive function decline is more serious in patients with cerebral small vessel disease at high altitude, and it is very important to strengthen early diagnosis and clinical intervention for patients in high altitude areas.

### Brain Cortical Complexity and Subcortical Morphometrics in T2D with Microvascular Complication

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Linqing Fu (*Presenter*) Nothing to Disclose

#### PURPOSE

To explore the relationship between the change of cerebral gray matter volume and cognitive function in type 2 diabetes patients with microvascular complication (T2D-C), and to analyze how the change of cerebral gray matter volume and cognitive function are causal links through mediators.

#### METHODS AND MATERIALS

39 normal controls, 39 type 2 diabetes patients without microvascular complication (T2D), and 39 T2D-C patients were recruited for 3D T1weighted imaging (3D T1WI) scanning and neuropsychological scale testing. Voxel-based morphology (VBM) was used to analyze and compare the differences in gray matter volume and neuropsychological scale among the three groups, then the mean gray matter volume of different brain regions between groups was used for partial correlation analysis with the scores of cognitive assessment scales such as Montreal cognitive assessment (MoCA) and biochemical indicators such as HbA1c.

#### RESULTS

With  $p < 0.05$  as the test level of statistical difference, the brain regions with the statistical difference in gray matter volume among the three groups were located in the calcarine, thalamus, left putamen, and left precentral gyrus. Compared with T2D group, the volume of gray matter in the thalamus and left putamen in T2D-C group decreased. Partial correlation analysis showed that the thalamic gray matter volume and left putamen in T2D-C patients were negatively correlated with fasting blood glucose, positively correlated with HOMA2-%B, and negatively correlated with TMT-A score. Mediation analysis found that the direct effect of fasting blood glucose on TMT-A was not significant, but the indirect effect was significant, that is, the gray matter volume of the left putamen played a complete intermediary role in the relationship between fasting blood glucose and TMT-A.

#### CONCLUSION

In T2D-C patients, there are extensive areas of reduced gray matter, and the change in gray matter volume is related to cognitive decline.

#### CLINICAL RELEVANCE/APPLICATION

Early detection of cognitive impairment in T2D patients and targeted intervention can delay the progression of cognitive decline.

### Diffusion and Perfusion Properties of Fetal Brain and Placenta in Fetuses Affected by Intrauterine Growth Restriction (IUGR): A Preliminary IVIM MRI Study

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Roberta Ninkova, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

To investigate the potential use of Intravoxel Incoherent Motion (IVIM) imaging in the study of microperfusion and microstructural characteristics of fetal brain and placenta in Intrauterine Growth Restriction (IUGR) fetuses, comparing IVIM parameters with those of a healthy control group.

#### METHODS AND MATERIALS

112 pregnancies (30 IUGR; 82 normal) were enrolled. MR examinations were performed at 1.5 T, using a DWI sequence with 10 different b-values (0,10,30,50,75,100,200,400,700,1000 s/mm<sup>2</sup>). For each fetus, specific ROIs were manually placed on fetal and maternal sides of each placenta, and for fetal brain on the following areas: centrum semi-ovale (CSO), frontal and occipital white matter (FWM, OWM), basal ganglia (BG), thalamus (TH), cerebellar hemisphere (CH) and pons. Differences of mean values of perfusion fraction (f), diffusion coefficient (D), and pseudo-diffusion coefficient (D\*) and their correlation with Gestational Age (GA) and Birth Weight (BW) were investigated in both IUGR and control group.

#### RESULTS

We found that in the fetal side of placenta, f allowed to discriminate SGA (Small for Gestational Age) from real FGR (Fetal Growth Restriction) ( $p=0.03$ ), with FGR showing lower values. SGA showed intermediate perfusion pattern in terms of f compared to FGR and healthy controls. A significant positive correlation was found between f and BW in fetal side of IUGR group. Concerning the fetal brain, we found higher D values in supratentorial WM areas compared with the other regions (TH, BG, pons, CH), in both normal and IUGR groups. In particular, higher D values in OWM and pons in IUGR fetuses compared to healthy group. A significant negative correlation between D and GA was found for almost all brain areas in the healthy group and conversely not in the IUGR group.

#### CONCLUSION

Complex interactions between placental and fetal environments ensure normal fetal growth. Impairment of the fetoplacental unit may lead to Intrauterine Growth Restriction (IUGR), which is associated with perinatal morbidity and mortality, and long-term complications, like neurodevelopmental delay. In order to this, the development of new non-invasive examinations, such as fetal MRI, may be helpful in detecting fetal abnormalities and understanding their pathogenesis. Specifically, the IVIM model, may be a novel technique to detect microstructural and microperfusion abnormalities of the placenta and fetal brain that occur in IUGR fetuses.

#### CLINICAL RELEVANCE/APPLICATION

Preliminary results show that IVIM parameters may be potential in vivo biomarkers of IUGR severity, improving prenatal and postnatal diagnosis and management of IUGR fetuses.

### Reliability of CT Numbers on Energy Integrating and Deep Silicon Photon Counting Detector CT with Patient Mispositioning

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Aria M. Salyapongse, BS (*Presenter*) Nothing to Disclose

#### PURPOSE

In this study we compared the CT number of six clinically relevant materials on an energy-integrating detector (EID) and deep silicon photon-counting (PCD) CT as an effect of mispositioning for different patient sizes.

#### METHODS AND MATERIALS

We performed three sets of dose-matched scans on a patient size-mimicking phantom with five different water-equivalent diameters (WED) (Mercury Phantom, Gammex). The acquisition modes were: (1) 120 kV single-energy (SE) EID CT, (2) 80/140 kV rapid kV-switching dual-energy (DE) EID CT, and (3) 120 kV deep silicon PCD CT at four positions in the bore: (1) isocenter (0 cm), (2) up 4 cm, (3) up 8 cm, (4) and up 12 cm. Average CT number was calculated for air, water, polystyrene, iodine 10 mg/mL, bone, and polyethylene in (1) 120 kV polychromatic EID, (2) 70 keV monochromatic EID, and (3) 70 keV monochromatic deep silicon PCD images. Trends in CT number with WED for each position were assessed by plotting CT numbers against WED. Slopes were compared using t-tests with multiple comparison adjustment to assess whether trends in CT number with WED were decreased for deep silicon PCD CT relative to EID CT. CT number accuracy was assessed by calculating ideal material CT numbers using the U.S. National Institute of Standards and Technology (NIST) XCOM database toolkit.

#### RESULTS

For air, water, iodine, and bone materials, deep silicon PCD CT had the smallest magnitude slope of CT number over WED for all tested positions. Deep silicon PCD CT slopes are flatter compared with SE EID CT and reached statistical significance for iodine ( $p < .001$ ), and bone ( $p < .001$ ) for all positions, and for air ( $p = .008$ ) and water ( $p = .01$ ) at three positions. Deep silicon PCD CT slopes were flatter compared with DE EID CT and reached statistical significance for air ( $p = .005$ ), water ( $p = .04$ ), and bone ( $p < .001$ ) for all positions, and for iodine ( $p = .04$ ) at three positions. The accuracy of deep silicon PCD CT was higher than either SE or DE EID CT for all materials at all positions except for polystyrene at 12 cm, based on relative root mean square error.

#### CONCLUSION

WED contributes more to CT number change than mispositioning. The change in CT number over WED was smallest for deep silicon PCD CT for air, water, and bone at all tested positions. The CT number accuracy was also closest to the ideal CT number on deep silicon PCD CT for all materials at all positions except polystyrene at 12 cm, compared with SE and DE EID CT.

#### CLINICAL RELEVANCE/APPLICATION

Accurate and stable CT numbers are important for clinical diagnoses, and use of deep silicon PCD CT provides more stable and accurate CT number over patient size and mispositioning compared with SE and DE EID CT.

### **Dual-Energy CT-based Low Energy Virtual Monoenergetic Imaging of the Lower Extremity Runoff in Patients with Diabetes Mellitus: Impact on Image Quality, Vascular Contrast and Diagnostic Accessibility**

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Christian Booz, MD (*Presenter*) Speaker, Siemens AG

#### **PURPOSE**

To evaluate the impact of low energy virtual monoenergetic imaging (VMI)+ dual-energy CT reconstructions on quantitative and qualitative image quality, vascular contrast and diagnostic assessability of lower extremity arteries in patients with diabetes mellitus.

#### **METHODS AND MATERIALS**

Dual-energy CT angiography scans of lower extremities in patients suffering from diabetes who had undergone clinically indicated dual-energy CT examinations between January 2018 and January 2023 were retrospectively analyzed. Images were reconstructed with standard linear blending (F<sub>0.5</sub>) and low keV VMI+ series were generated from 40 to 100 keV, in an interval of 15 keV. Quantitative analyses included evaluation of vascular CT numbers, signal-to-noise ratio (SNR) and contrast-to-noise ratio (CNR). A total of five CT number measurements per vessel were performed in the superficial and deep femoral artery, the popliteal artery, proximal anterior and posterior tibial artery as well as the fibular artery. Qualitative analyses were performed by three board-certified radiologists independently using five-point scales to evaluate image quality, vascular contrast and diagnostic assessability of lower extremity arteries.

#### **RESULTS**

Our final study cohort consisted of 154 patients (82 males). Mean attenuation, CNR and SNR values were highest in 40 keV VMI+ reconstructions (HU, 1180.41 ± 45.09; SNR, 29.91 ± 0.99; CNR, 28.60 ± 1.03) followed by 55 keV VMI+ reconstructions; all three mean values at these keV levels were significantly higher compared with the remaining VMI+ series and standard F<sub>0.5</sub> images (HU, 251.32 ± 7.13; SNR: 13.22 ± 0.44; CNR: 10.57 ± 0.39) (p<.0001). The qualitative analysis showed highest rating scores for 55 keV VMI+ reconstructions followed by 40 and 70 keV VMI+ series with a significant difference compared to standard F<sub>0.5</sub> images regarding image quality, vascular contrast and diagnostic assessability of lower extremity arteries (p<.0001).

#### **CONCLUSION**

Low keV VMI+reconstructions at a level of40-55 keV significantly improve image quality, vascular contrast and the diagnostic assessability of lower extremity arteries in patients with diabetes mellitus compared with standard CT series.

#### **CLINICAL RELEVANCE/APPLICATION**

In patients with diabetes mellitus undergoing dual-energy CT scans of lower extremity arteries, low keV VMI+ CT reconstructions at a level of 40-55 keV should be routinely reconstructed in clinical routine to improve image quality and the diagnostic assessability and to potentially reduce radiation dose and the needed amount of intravenous contrast material in scan protocols in order to protect kidney function.

### Combining K-edge Filtration and Dual-layer CT for Improved Spectral Performance in Pediatric Diagnostics

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Olivia F. Sandvold, BS (*Presenter*) Nothing to Disclose

#### PURPOSE

In pediatric spectral CT, accurate quantitative performance with low radiation doses is imperative. Our study demonstrates the effectiveness of using a combination of a K-edge filter and dual-layer spectral detector to increase the quantification sensitivity of iodine and calcium in pediatric patients.

#### METHODS AND MATERIALS

A polychromatic simulation based on a clinical dual-layer spectral CT (Spectral CT 7500, Philips Healthcare) was used to generate incident spectra at tube voltages of 100 and 120 kVp with radiation exposure of 33 mAs. An optimal K-edge filter material and thickness (holmium 0.15 mm) was selected from other potential filters using the Cramer-Rao lower bound of noise in the iodine domain for a single pencil-beam x-ray projection at the central detector. To model the combination of the K-edge filter and dual-layer CT, the input spectra were filtered and linearly scaled to match the patient dose of the non-filtered cases. The spectra were then applied to noiseless photoelectric and Compton scatter basis projections of three pediatric phantoms containing tissue equivalent inserts (iodine 0.5 mg/mL, iodine 2.0 mg/mL, blood, calcium 50 mg/mL). The phantoms ranged in diameter from 10 to 20 cm. Using fan beam geometry, Poisson noise was added, a material decomposition look-up table approach was used, and filtered back projection reconstruction was performed to generate photo/scatter basis images with realistic noise. To estimate spectral sensitivity, noise was measured for each insert in the photoelectric image, and a corresponding noise ratio relative to K-edge filtered simulations was calculated to compare filtered and non-filtered simulations.

#### RESULTS

At 100 kVp and across all three phantom sizes, the holmium filter and dual-layer CT combination compared to the non-filtered simulation averaged 11% and 10% improvement in photoelectric noise in iodine 0.5 mg/mL and iodine 2.0 mg/mL inserts, respectively. Average filtered noise improvement at 120 kVp was 3% and 5% for the same rods. For the calcium insert, the maximum relative noise improvement was 17% in the 20 cm phantom at 100 kVp. To match non-filtered patient dose, tube exposure was 93 and 85 mAs for 100 and 120 kVp scans.

#### CONCLUSION

Combined holmium K-edge filtration with dual-layer CT increased iodine and calcium sensitivity in pediatric scans at 100 and 120 kVp with radiation exposures within tube capability. This could lead to increased iodine and calcium quantification accuracy and reduced additional non-contrast scans for pediatric patients.

#### CLINICAL RELEVANCE/APPLICATION

The combination of K-edge filtration with dual-layer CT may enhance iodine and calcium quantification accuracy and reduce need for additional non-contrast scans in pediatric diagnostic imaging.

### A Comparative Study of Extracellular Volume Fraction Measured by Spectral CT Between Liver and Pancreas in Patients with Hypertension

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Xiaoming Huang (*Presenter*) Nothing to Disclose

#### PURPOSE

To investigate the correlation between extracellular volume fraction of liver and pancreas measured by spectral CT iodine maps and hypertension-related indicators and to compare their diagnostic value.

#### METHODS AND MATERIALS

166 patients who underwent abdominal spectral CT enhancement scanning were included. They were divided into a normal blood pressure group and a hypertension group according to whether they had hypertension. Then, the hypertension group was further divided into three subgroups according to the systolic and diastolic blood pressure levels. The fECV was calculated by measuring the iodine density (ID) of the liver and abdominal aorta from the iodine maps in equilibrium phase as follows:  $fECV = ID_{\text{hepatic or pancreatic}} \times (100 - Hct) / ID_{\text{abdominal aorta}}$ . One-Way ANOVA analysis was used to compare fECV values among groups. Spearman correlation analysis was used to analyze the correlation between fECV and blood pressure-related indicators, i.e., systolic blood pressure, diastolic blood pressure, pulse pressure. Multiple linear stepwise regression equations were established to obtain the quantitative relationship between fECV and blood pressure-related indicators. ROC curves were used to evaluate the diagnostic performance of hepatic and pancreatic fECV for hypertension.

#### RESULTS

The hepatic fECV ( $36.42 \pm 5.20$ ) and pancreatic fECV ( $36.64 \pm 5.46$ ) of patients with hypertension were significantly higher than those patients with normal blood pressure ( $30.17 \pm 4.12$ ,  $33.45 \pm 3.41$ ) and increased with the enhancement of hypertension level. The fECV of liver and pancreas were positively correlated with SBP ( $r=0.57$ ,  $0.42$ ) and DBP ( $r=0.33$ ,  $0.32$ ). Multiple linear regression analysis showed that SBP entered the equation finally ( $\beta=0.105$ , constant= $18.520$ ;  $\beta=0.119$ , constant= $17.528$ ). The AUC for diagnosing hypertension through hepatic fECV was  $0.830$  (SEN  $61.50\%$ , SPE  $88.00\%$ , cut-off value  $34.16\%$ ) and the AUC for diagnosing hypertension through pancreatic fECV was  $0.663$  (SEN  $53.00\%$ , SPE  $94.70\%$ , cut-off value  $37.93\%$ ). Comparing the two AUCs, the accuracy of hepatic fECV was higher than that of pancreatic fECV and the difference was statistically significant ( $P < 0.05$ ).

#### CONCLUSION

The fECV of liver and pancreas measured by spectral CT iodine maps was related to hypertension-related indicators. SBP was an independent risk factor for elevating both hepatic and pancreatic fECV. The hepatic fECV was more helpful for diagnosing hypertension.

#### CLINICAL RELEVANCE/APPLICATION

The fECV obtained by dual energy spectral examination is a convenient biomarker to assess the liver and pancreas chronic injury. The fECV derived from spectral CT iodine maps had clinical application values for studying the chronic damage of abdominal organs caused by hypertension.

### Imaging Parameters Affecting Stone Detection using Virtual Unenhanced Images at Excretory Phase in Contrast-enhanced Dual-energy CT Urography

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Jianying Li, PhD (*Presenter*) Employee, General Electric Company

#### PURPOSE

To investigate the imaging parameters influencing urinary stone detection rate with virtual unenhanced (VUE) images obtained at the excretory phase (EP) in contrast-enhanced dual-energy CT urography (DECTU).

#### METHODS AND MATERIALS

150 urinary stone patients (mean age:  $47.51 \pm 14.42$  years; males vs females: 101 vs 49) who required triphasic DECTU were analyzed. The true unenhanced (TUE) and VUE images at EP (VUE(EP)) were obtained. Per stone detection rates on the above images were recorded. Stone location, size and CT number on the TUE images were recorded and used in univariate and multivariate logistic regression analyses to investigate imaging factors influencing urinary stone detection rate on VUE(EP) images. In addition, five contrast agents were included in the regression analyses. Thresholds for detecting urinary stone on VUE(EP) images were determined using receiver operating characteristics (ROC) analysis.

#### RESULTS

Three hundred and four stones were detected on TUE images; 217 stones were identified on VUE(EP) images (detection rate, 71.4%). Size (Univariate Multivariate:  $p < 0.001$ ) and CT number (Univariate Multivariate:  $p < 0.001$ ) of the stones were both important factors affecting the detection of stone on the VUE(EP) images (Tab.1). The stone detection rate in the urinary tract was significantly higher than that in the kidney (Univariate Multivariate:  $p < 0.01$ ) (Tab.1 and Fig. 1). However, different contrast agents did not affect the detection rate ( $p = 0.547$ ). The area under ROC curve (AUC) of using size and CT number for detecting stone on the VUE(EP) images was only 0.80 and 0.80, respectively with thresholds for stones with size larger than 3.3 mm and CT number greater than 615 HU being detected. After adding the stone location, the AUC of the three parameters can reach up to 0.88 (Tab.2 and Fig. 2).

#### CONCLUSION

VUE images at EP in DECTU has a relatively low detection rate for urinary stones. Stone location, size and CT number have significant impact on the stone detection rate using VUE(EP) images.

#### CLINICAL RELEVANCE/APPLICATION

VUE images at EP in DECTU are not suitable for detection of urinary stones. Stone location, size and CT number may have an impact on the stone detection rate.

### Mobile Photon-counting Detector CT with MD Plus for Neuroimaging of Patients in Intensive Care Unit

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Junyoung Park (*Presenter*) Nothing to Disclose

#### PURPOSE

The purpose of this study is to evaluate our developed multi-material decomposition method (MD Plus) with mobile PCD-CT for neuroimaging of patients at ICU, and prove the characterization and differentiation of materials between contrast agent and hemorrhage in high-density lesions.

#### METHODS AND MATERIALS

For neuroimaging of patients at ICU, the MD Plus was developed and optimized. All CT scans were performed with the FDA 510(k) cleared mobile PCD-CT (OmniTom Elite). For verification of the accuracy of our MD plus algorithm with the mobile PCD-CT, the experiments were conducted using a multi-energy phantom with various exposure conditions and locations of contrast agent. To prove the material characterization of neuroimaging of patients at ICU, our MD plus algorithm was applied to the patients who underwent mobile PCD-CT. The ability of differentiation between iodine and hemorrhage was evaluated.

#### RESULTS

The results of multi-energy phantom with different exposure showed that there is no critical artifacts on material decomposition maps with various exposure settings. The measured iodine concentrations of each exposure setting were compared to the ground truth. The linear relationships were observed the measured and true iodine concentrations and the coefficient of determinations ( $R^2$ ) for 5, 10, 15, 20 mA were 0.994, 0.995, 0.996, 0.998 respectively. The results of different contrast demonstrated that the material maps were comparable and the difference ratio was 3.644%. The results of neuro-images of patients at ICU demonstrate the key benefits of our MD plus algorithm with mobile PCD-CT: the regions of intracerebral hemorrhage are clearly visible in material decomposition map. Also, the consistent and repeatable ability to show iodine concentration in material map regardless of different patients was proved.

#### CONCLUSION

Our quantitative results of multi-energy phantom verified the accuracy of our MD plus algorithm. In addition, the qualitative results regarding clinical cases of patient at ICU demonstrate that our MD plus algorithm with mobile PCD-CT can separate the contrast agent from the blood accurately. The differentiation of iodine and hemorrhage or acute ischemic stroke can be used in high density lesions after intra-arterial recanalization.

#### CLINICAL RELEVANCE/APPLICATION

The accurate results of MD plus algorithm with mobile PCD-CT can lead to simplified clinical imaging protocols and improved workflow for neuroimaging of critical patients with the risks associated with transportation and life-threatening illness.

### Self-Supervised Deep Learning Methods for Photon Counting CT (PCCT) Denoising without Clean References

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Sen Wang, PhD (*Presenter*) Research support, General Electric Company

#### PURPOSE

To evaluate the performance of self-supervised methods for PCCT image denoising from routine scans, without repeat scans or clean images. These methods include: Noise2Noise (N2N), Noisier2Noise (Nr2N), and Noise2Void (N2V).

#### METHODS AND MATERIALS

For clinical images, clean references are difficult to obtain, as noise is always present. Typically, synthetic low-dose images and full-dose images are used as training input and reference, namely Noise2Full-dose (N2Fd), where the inherent noise correlation degrades the result. Alternatively, several self-supervised learning methods have been proposed. N2N is supposed to be equivalent to Noise2Clean (N2C; trained with clean references). For PCCT scans, binomial selection can be used to create the noise independent pairs required in N2N; Nr2N leverages N2Fd which contains residual noise proportional to the synthetic low-dose noise. Thus, it is possible to cancel the residual noise with careful post-processing. To evaluate their performances, we converted clinical images from the KiTS21 Challenge to water and Ca density maps and simulated PCCT scans using a 120 kVp spectrum and a realistic energy response. For simplicity, the total counts were used to create a grayscale image. The dataset was split into train (211) / validation (30) / test (59) cases (5 slices from each case). A basic U-Net was trained for 90 epochs, minimizing L2 loss. Dose was split evenly using binomial selection for N2N. N2V was also included in our comparison.

#### RESULTS

All methods reduced the original RMSE of the test set from 27.70 HU. Average RMSE in the test set was 12.37 HU for N2N, which was equivalent to that of N2C (12.38 HU). N2Fd, which violates the independence criterion, had suboptimal results (17.82 HU). Nr2N improved the performance of N2Fd to 13.30 HU. N2V (24.37 HU) had the worst performance since CT images violate its requirement of spatially uncorrelated noise. While Nr2N performed well, we found that the performance relies heavily on the convergence of N2Fd. With a limited amount of training data, the convergence of N2Fd might be incomplete, leading to suboptimal results for Nr2N.

#### CONCLUSION

Among the representative self-supervised learning methods, N2N yields the best performance, approaching that of N2C while only requiring routine scans. Nr2N can effectively improve the performance of N2Fd with proper training and post-processing, but is slightly inferior to N2N. Future work will investigate the applicability of N2N to real data, as well as more sophisticated networks and loss functions.

#### CLINICAL RELEVANCE/APPLICATION

We evaluated representative self-supervised learning methods for PCCT image denoising that can use routine scans to train a denoising network without a clean (noiseless) reference.

M2-SPPH-5

### Feasibility and Accuracy in Calcium Quantification of the Turbo Flash Mode on a Clinical Photon Counting Detector CT System: A Phantom Study

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Shan Shui Zhou (*Presenter*) Nothing to Disclose

#### PURPOSE

The high-pitch scan mode on a first-generation clinical dual-source photon counting detector (PCD) CT system can be used for energy analysis, which is helpful for calcium quantification. However, its performance has not been validated because the high-pitch scan could not obtain the energy spectrum information by the energy-integrating detector dual-source CT. The purpose of this study is to evaluate the feasibility and accuracy of calcium quantification in the high-pitch scan on PCD-CT.

#### METHODS AND MATERIALS

A Gammex<sup>TM</sup> multi-energy CT phantom with three calcium inserts (50, 100, and 300 mg/ml), with and without the elliptical outer layer, was evaluated using a high-pitch (3.2) and regular (0.8) spiral modes on a PCD-CT. Each scan setting was repeated three times with two tube voltages (120 and 140 kVp) and 4 radiation doses (1, 3, 5, and 10 mGy). Calcium maps were generated by adjusting the specific calcium ratio in post-processing and the mean calcium attenuation (CaCT) across three consecutive slices were recorded. Linear regression and Pearson correlation coefficient was implemented for accessing the correlation between CaCT in all scan settings and calcium concentration. The root-mean-squared-error (RSME) was calculated and compared between the high-pitch and regular spiral scans.

#### RESULTS

For all scan settings, the extremely strong correlations between CaCT and calcium concentration were proven by the statistically significant linear regressions (all R-square  $>$ ; 0.99,  $p$   $<$ ; 0.05) and Pearson correlation coefficients (all  $r$   $>$ ; 0.99). The conversion slope ranged from 0.310 to 0.354 mg/mL/HU for the high-pitch scans and from 0.315 to 0.361 mg/mL/HU for the regular spiral scans. The largest RMSE was witnessed in the high-pitch scans of the large phantom at 140 kVp and 1 mGy. The median [interquartile range] RMSE demonstrated similar calcium quantification abilities between the high-pitch and the regular spiral scans (1.25 [0.81; 2.75] versus 0.90 [0.68; 1.50] mg/mL,  $p = 0.152$ ).

#### CONCLUSION

The high-pitch scan mode with full spectral information offers feasible and accurate calcium quantification using the dual-source PCD-CT.

#### CLINICAL RELEVANCE/APPLICATION

Accurate calcium quantification by high-pitch scans on PCD-CT even under ultra-low doses could be promising for bone density screening.

### Decomposition of CT Contrast Agents: Single or Multiple Photon Counting CT Scans? Single or Dual Source PCCT?

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Marc Kachelriess, PhD (*Presenter*) Nothing to Disclose

#### PURPOSE

With the beginning of the photon counting CT (PCCT) era, claims are being made that scanning two contrast agents simultaneously is beneficial in terms of dose. Our aim is to quantify the supposed benefit or the possible harm.

#### METHODS AND MATERIALS

PCCT inherently records spectral information. Moreover, the only clinically approved PCCT system, the Naeotom Alpha, is a dual source CT (DSCT): both x-ray tubes can operate at different kV and can utilize different patient-specific prefilters (PSPs), e.g. tin. With PCCT it becomes possible to distinguish more than two materials. Potential applications focus on using two contrast agents, e.g. X=iodine and Y=hafnium. The simultaneous application of two such agents is claimed to be advantageous, e.g. in a way such that the arterial phase of an abdominal acquisition shows X and the venous phase is enhanced by Y. Is this strategy, WXY, with W being the soft tissue, better than two scans W+WX or WX+WY, assuming no patient motion in-between? Or would even three scans, e.g. W+WX+WXY be optimal? To find out, we conducted a study simulating various patient sizes, tube voltages from 70 to 150 kV, four different PSP thicknesses, and all possible bin settings of a photon counting detector to assess the dose-normalized signal-to-noise-ratio (SNRD) of the resulting virtual non-contrast images, and the contrast agent maps of X and Y. No additional noise reduction strategies were applied in order to obtain a fair comparison. Dose penalty (DP) factors are given by the squared ratio of the SNRD values.

#### RESULTS

With just one agent, X=Iodine, doing WX (single source PCCT) instead of W+WX (two scans) yields DP=2.6. Doing WX+WX (DSCT) instead of W+WX yields DP=1.6. With two agents, X=Iodine, Y=Gadolinium, WXY comes with DP=1.5 when compared to WX+WY and with DP=2.0 when compared to W+WX. Surprisingly, WXY+WXY, which can be realized by a DSCT scan, is only slightly (DP=1.25) outperformed by W+WX, which requires two separate scans. By far the best performance is obtained by W+WX+WY and by W+WY+WXY (DP=3.2 if doing WXY instead), which, however, require three scans.

#### CONCLUSION

For the task of providing contrast agent maps, simultaneous contrast agents always come with a penalty in the order of 1.5 to 3.2 which means that the 1.5- to 3.2-fold patient dose is necessary. If motion between two non-simultaneous scans could be perfectly corrected for, patient dose and thus patient risk could be drastically reduced. In particular, if an unenhanced scan (W) is performed in addition to the enhanced scan(s).

#### CLINICAL RELEVANCE/APPLICATION

As long as no motion-compensation between scans can be performed, the currently proposed scan strategies are unavoidable. Once motion can be compensated for, scans should be separated into different contrast enhancement schemes.

M2-SPPH-8

### The Accuracy of Monoenergetic Attenuation at High-pitch Scans using A Dual-source Photon-counting Detector CT: A Phantom Study

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Le Qin (*Presenter*) Nothing to Disclose

#### PURPOSE

High-pitch scans performed on a dual-source photon-counting detector CT (PCD-CT) enable reconstructions of virtual monoenergetic imaging at different keV levels. However, the accuracy of monoenergetic attenuation at high-pitch acquisition remains unknown. Thus, the purpose of this study is to evaluate the monoenergetic accuracy of iodine inserts between the regular spiral scan and the high-pitch scan on a first-generation clinical dual-source PCD-CT.

#### METHODS AND MATERIALS

The Gammex<sup>TM</sup> multi-energy CT phantom containing iodine inserts of 2, 5, 10 and 15 mg/mL was scanned on a dual-source PCD-CT, with and without the elliptical outer layer. Two pitch levels (3.2 and 0.8), two tube voltages (120 and 140 kVp) and 4 radiation doses (1, 3, 5 and 10 mGy) were alternated, and each scan setting was repeated three times. The image noise in the background and monoenergetic accuracy of the iodine inserts were evaluated at 40, 70, 100 and 140 keV. The median attenuation errors and absolute attenuation bias were further assessed with linear regression to explore the impact of phantom setup and scan parameters.

#### RESULTS

The background noise increased with lower keV level and radiation doses. The noise levels between high-pitch and regular spiral scans were evidently different for the large phantom at 40 and 70 keV, especially when radiation dose decreased. In the small phantom, the median attenuation errors at 1, 3, 5 and 10 mGy were 5.5 (1.8; 10.5) [median, (25th percentile; 75th percentile)], 5.9 (1.3; 10.6), 6.0 (2.1; 10.1) and 5.7 (2.6; 13.6) HU, respectively. Similarly, the errors were 3.3 (-2.5; 13.9), 4.1 (-1.6; 11.7), 4.1 (-1.0; 11.2) and 4.6 (-1.0; 12.9) HU in the large phantom. At the worst-case scenario, the attenuation bias exceeded 10 HU in 14.6% (7 of 48 measurements for 4 inserts, 4 keV levels and 3 scan repeats) and 29.2% (14 of 48) for the small and large phantom setups, respectively. The linear regression revealed comparable monoenergetic accuracy between high-pitch and regular spiral scans ( $p = 0.332$ ). Compared to the 70 keV, images at 40 keV and 140 keV were associated with statistically significant (6.6 HU and 1.6 HU, both  $p < 0.001$ ) higher attenuation bias.

#### CONCLUSION

The high-pitch scans exhibited similar monoenergetic accuracy with the regular spiral scans, although the attenuations at 40 keV and 140 keV still required careful interpretation.

#### CLINICAL RELEVANCE/APPLICATION

The monoenergetic images with high-pitch scans enabled by the dual-source PCD-CT provide accurate attenuation and could be quantitative used in conditions requiring fast acquisition such as pulmonary embolism, chest pain triad and ruptured cerebral aneurysm.

M2-SPPH-9

### Comparison of Iodine Quantification between High-pitch and Regular Spiral Scans using a Dual-source Photon-counting Detector CT: A Phantom Study

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Peng Liu (*Presenter*) Nothing to Disclose

#### PURPOSE

With the advent of the dual source photon-counting detector CT (PCD-CT), material decomposition at high pitch could become a clinical reality and potentially exhibit unprecedented diagnostic value. However, its accuracy has not been validated so far. Thus, the purpose of this study is to investigate the accuracy of iodine quantification in a phantom setup and compare the performance between high-pitch and regular spiral scans based on the first-generation clinical PCD-CT.

#### METHODS AND MATERIALS

Four inserts with known iodine concentrations (2, 5, 10 and 15 mg/mL) were placed in the removable head section of a Gammex<sup>TM</sup> multi-energy CT phantom. The phantom, with and without the elliptical outer layer, was scanned using high-pitch (3.2) and regular (0.8) spiral modes on a dual-source PCD-CT. Two tube voltages (120 and 140 kVp) and 4 radiation doses (1, 3, 5 and 10 mGy) were also alternated, and each scan setting was repeated three times. The mean iodine measurements across three consecutive slices were recorded, and the association between the percentage absolute bias (PAB, normalized to the actual reference) and all scan factors was explored using a linear regression analysis.

#### RESULTS

A total of 96 acquisitions were performed with both phantom setups and all variations of scan parameters. In the small phantom, the PAB ranged from 1.8% to 5.9% and 1.5% to 3.2% for high-pitch and regular spiral acquisitions, respectively, across different radiation doses and tube voltages. The bias appeared more pronounced in the large phantom (4.4% to 8.5% for high-pitch and 2.5% to 6.8% for regular spiral). The linear regression analysis revealed that scan modes, tube voltages and radiation doses were all statistically irrelevant ( $P > 0.05$ ) to the iodine measurement bias. Compared to the phantom with the outer layer, the small phantom was significantly associated ( $p < 0.001$ ) with 7.2% fewer PAB.

#### CONCLUSION

Iodine density can be accurately and reliably quantified with the high-pitch scan mode, whose ability of material decomposition was only recently brought by the advent of the dual-source PCD-CT.

#### CLINICAL RELEVANCE/APPLICATION

High-pitch scans on PCD-CT ensures accurate iodine quantification even in low radiation doses, thus enabling clinical applications which require fast acquisition such as in pediatrics, pulmonary embolism and acute ischemic stroke.

### Assessment of Diagnostic Efficacy of Photon Counting CT Virtual Mono-Energetic Imaging for Abdominal Aortic and Pelvic Vascular Imaging in Patients Prior to Transcatheter Aortic Valve Replacement (TAVR)

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center

Leona Alizadeh, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

Our study aim was to evaluate the diagnostic efficacy of photon counting CT (PCCT) virtual mono-energetic (VMI)+ imaging for low-keV abdominal and pelvic vascular imaging and TAVR planning.

#### METHODS AND MATERIALS

A total of 125 patients (69 male/ 56 female) underwent PCCT imaging pre-TAVR for assessment of the abdominal aorta and pelvic vessels for transfemoral access planning. Virtual mono-energetic images (40 - 120 keV) were generated in 15 keV steps from the spectral post-processing datasets (SPP). For assessment of quantitative image quality, SNR and CNR were calculated from measurements in the infrarenal aorta, common iliac artery, internal iliac artery, external iliac artery, and common femoral artery. Qualitative IQ, diagnostic significance, and vascular contrast were evaluated in a blinded manner by four experienced radiologists, using a 5-point Likert scale with clinically relevant criteria.

#### RESULTS

The highest mean SNR and CNR values of the VMI+ series were found in 40 keV reconstructions (SNR  $32.5 \pm 9.5$  CNR  $33.3 \pm 9.8$ ), followed by the measurements in the 55 keV VMI+ (SNR  $25.0 \pm 8.0$  CNR  $26.3 \pm 7.8$ )( $p < 0.001$ ). SNR and CNR of 40 keV and 55 keV were significantly higher than all other keV levels including standard 120 kV (SNR  $10.7 \pm 3.0$ ; CNR  $26.2 \pm 9.5$ ) ( $p < 0.001$ ). Accordingly, mean HU-values of 40 keV VMI+ reconstructions were significantly higher at  $1401 \pm 18$ , followed by  $748 \pm 14$  for 55 keV reconstructions ( $p < 0.001$ ). The IQ rating using the Likert scale was higher for the virtual mono-energetic images at 55 keV compared to 40 keV ( $4.6 \pm 1.6$  vs.  $3.9 \pm 1.8$ )( $p < 0.001$ ). The qualitative analysis showed highest rating scores for 55 keV VMI+ reconstructions followed by 40 keV and 70 keV VMI+ series with a significant difference compared to standard 120 kV CT images series regarding image quality, vascular contrast and diagnostic assessability for the femoral access planning( $p < .0001$ ).

#### CONCLUSION

Our findings suggest that PCCT virtual mono-energetic imaging provides higher SNR and CNR values and better IQ than conventional CT imaging for the abdominal aorta and pelvic vessels at 40 keV. However, for qualitative image quality, 55 keV may be preferred.

#### CLINICAL RELEVANCE/APPLICATION

Choice of the right VMI+ reconstruction, allows for use of the diagnostic quality reserve for potential reduction in contrast agent and radiation dose. Further, low-keV VMI+ PCCT reconstructions with enhanced diagnostic quality for TAVR procedure planning may improve patient safety.

#### **M2-STCE1- Language guided age-translated generation model to predict incident vertebral fracture 2 using lateral spine X-ray image**

Sang Wouk Cho, MS (*Presenter*) Nothing to Disclose

##### **PURPOSE**

Spine X-ray images contain valuable clinically relevant information, offering insights into the structural integrity of the vertebrae and the presence of fracture. This study aims to generate age-translated X-ray image from language-based diffusion model to predict the incident vertebral fracture (VF) risk.

##### **METHODS AND MATERIALS**

Clinical data and lateral spine X-ray images of patients aged 50 or older who presented to our institution between January 2007 to December 2018 were collected. Incident VF was defined using follow-up X-ray radiographs. A language guided latent diffusion model (LDM) was trained to extract feature maps of morphological structure depending on ages which were used to train another LDM. Two LDMs generated age-translated X-ray images based on the age prompts of incident VF with clinical data. Fracture risk of generated images was calculated using a prevalent VF model and the performance was compared with the Fracture Risk Assessment Tool (FRAX).

##### **RESULTS**

A total of 29,307 lateral spine plain X-ray images from 9,276 patients (mean age 65.7, 66% women) were used to train the language-guided diffusion model. A stratified random sample of 6% (n=555) was selected to predict fracture risk. Over a mean follow-up period of 34.8 months, vertebral fractures occurred in 7.6% of patients (705 out of 9,276 in the whole dataset; 43 out of 512 in the prediction set). In image generation, our model exhibited significantly better image quality and stability with a Peak Signal-to-Noise Ratio (PSNR) of 20.737, compared to a single LDM with PSNR of 15.856 (p<0.001). As generating spine X-ray images, the intermediate feature maps of the LDM model highlighted to spine structure. In the prediction set, generative image-based fracture risk showed higher performance than major osteoporotic fracture risk score

(MOF) and hip fracture risk score (HF) of FRAX in term of c-index (Our 0.703, 95% confidence interval (CI) 0.641 to 0.763; MOF 0.644,95%CI 0.571 to 0.715; HF 0.662, 95%CI 0.587 to 0.735).

## **CONCLUSION**

Our model shows great potential to generate the data-driven morphological changing by age. In addition, generative image-based fracture risk outperformed the FRAX in incident VF prediction in a longitudinal cohort.

## **CLINICAL RELEVANCE/APPLICATION**

We believe that morphological changes in age-translated X-ray images may have better guidance for clinicians to distinguish high risk group of fracture.

## **M2-STCE1-3 Investigation of Implicit Gender Bias in Radiology Fellowship Letters of Recommendation Using Large Language Models**

Batuhan Gundogdu, PhD (*Presenter*) Nothing to Disclose

## **PURPOSE**

To assess and prevent incidents of implicit bias on letters of recommendation (LORs) written for radiology fellowship applicants and analyze such occurrences with respect to the genders of the applicants.

## **METHODS AND MATERIALS**

Perplexity (PPL) conveys a score of a language model's ability to produce a given text. We used the PPL metric as a measure of uniqueness/personalness of a letter of recommendation. In this setting, a more generic and commonly witnessed LOR would yield a low PPL score even if it includes many strong and standout words. In contrast, a personalized letter, possibly describing the specific relationship between the applicant and the writer, would have a high PPL score regardless of the sentiment score. We analyzed 1,036 letters of recommendation from 336 radiology fellowship applications submitted to the University of Chicago. Texts were anonymized, names and other personal entities were replaced with placeholders. We then used a pre-trained Llama 2 large language model (LLM) to calculate average sentence PPL scores for each letter. We compared the distribution of PPL scores with respect to applicant gender with Mann-Whitney U test.

## **RESULTS**

Although there was no significant difference in semantic score (positivity) ( $p>0.5$ ) and letter length ( $p>0.5$ ) between the letters of recommendations of male and female applicants, the PPL scores of LORs written to male applicants were significantly higher than LORs of female applicants ( $p<0.05$ ), indicating more personalized letters for male applicants and more generic letters were written for female applicants.

## **CONCLUSION**

A pattern of more generic and descriptive letters for females, but more personalized and unique letters for males can be an innocent-looking and a subtle implicit bias towards male applicants in radiology careers.

## **CLINICAL RELEVANCE/APPLICATION**

Understanding the differences in the language and content of letters of recommendation for radiology fellowship applicants can help identify areas for improvement in the evaluation process, promoting fair and equitable consideration of all applicants based on their qualifications and potential contributions to the field.

### Language guided age-translated generation model to predict incident vertebral fracture using lateral spine X-ray image

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center Theater 1

Sang Wouk Cho, MS (*Presenter*) Nothing to Disclose

#### PURPOSE

Spine X-ray images contain valuable clinically relevant information, offering insights into the structural integrity of the vertebrae and the presence of fracture. This study aims to generate age-translated X-ray image from language-based diffusion model to predict the incident vertebral fracture (VF) risk.

#### METHODS AND MATERIALS

Clinical data and lateral spine X-ray images of patients aged 50 or older who presented to our institution between January 2007 to December 2018 were collected. Incident VF was defined using follow-up X-ray radiographs. A language guided latent diffusion model (LDM) was trained to extract feature maps of morphological structure depending on ages which were used to train another LDM. Two LDMs generated age-translated X-ray images based on the age prompts of incident VF with clinical data. Fracture risk of generated images was calculated using a prevalent VF model and the performance was compared with the Fracture Risk Assessment Tool (FRAX).

#### RESULTS

A total of 29,307 lateral spine plain X-ray images from 9,276 patients (mean age 65.7, 66% women) were used to train the language-guided diffusion model. A stratified random sample of 6% (n=555) was selected to predict fracture risk. Over a mean follow-up period of 34.8 months, vertebral fractures occurred in 7.6% of patients (705 out of 9,276 in the whole dataset; 43 out of 512 in the prediction set). In image generation, our model exhibited significantly better image quality and stability with a Peak Signal-to-Noise Ratio (PSNR) of 20.737, compared to a single LDM with PSNR of 15.856 ( $p < 0.001$ ). As generating spine X-ray images, the intermediate feature maps of the LDM model highlighted to spine structure. In the prediction set, generative image-based fracture risk showed higher performance than major osteoporotic fracture risk score (MOF) and hip fracture risk score (HF) of FRAX in term of c-index (Our 0.703, 95% confidence interval (CI) 0.641 to 0.763; MOF 0.644, 95%CI 0.571 to 0.715; HF 0.662, 95%CI 0.587 to 0.735).

#### CONCLUSION

Our model shows great potential to generate the data-driven morphological changing by age. In addition, generative image-based fracture risk outperformed the FRAX in incident VF prediction in a longitudinal cohort.

#### CLINICAL RELEVANCE/APPLICATION

We believe that morphological changes in age-translated X-ray images may have better guidance for clinicians to distinguish high risk group of fracture.

### Investigation of Implicit Gender Bias in Radiology Fellowship Letters of Recommendation Using Large Language Models

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center Theater 1

Batuhan Gundogdu, PhD (*Presenter*) Nothing to Disclose

#### **PURPOSE**

To assess and prevent incidents of implicit bias on letters of recommendation (LORs) written for radiology fellowship applicants and analyze such occurrences with respect to the genders of the applicants.

#### **METHODS AND MATERIALS**

Perplexity (PPL) conveys a score of a language model's ability to produce a given text. We used the PPL metric as a measure of uniqueness/personalness of a letter of recommendation. In this setting, a more generic and commonly witnessed LOR would yield a low PPL score even if it includes many strong and standout words. In contrast, a personalized letter, possibly describing the specific relationship between the applicant and the writer, would have a high PPL score regardless of the sentiment score. We analyzed 1,036 letters of recommendation from 336 radiology fellowship applications submitted to the University of Chicago. Texts were anonymized, names and other personal entities were replaced with placeholders. We then used a pre-trained Llama 2 large language model (LLM) to calculate average sentence PPL scores for each letter. We compared the distribution of PPL scores with respect to applicant gender with Mann-Whitney U test.

#### **RESULTS**

Although there was no significant difference in semantic score (positivity) ( $p > 0.5$ ) and letter length ( $p > 0.5$ ) between the letters of recommendations of male and female applicants, the PPL scores of LORs written to male applicants were significantly higher than LORs of female applicants ( $p < 0.05$ ), indicating more personalized letters for male applicants and more generic letters were written for female applicants.

#### **CONCLUSION**

A pattern of more generic and descriptive letters for females, but more personalized and unique letters for males can be an innocent-looking and a subtle implicit bias towards male applicants in radiology careers.

#### **CLINICAL RELEVANCE/APPLICATION**

Understanding the differences in the language and content of letters of recommendation for radiology fellowship applicants can help identify areas for improvement in the evaluation process, promoting fair and equitable consideration of all applicants based on their qualifications and potential contributions to the field.

M2-STCE2

### Science Session (Theranostics)

Monday, Nov. 27 9:00AM - 9:30AM Room: Learning Center Theater 2

#### Sub-Events

#### **M2-STCE2- Hsp90 as a target for novel radiopharmaceuticals in metastatic breast cancer**

1

Marybeth A. Nedrud, MD, PhD (*Presenter*) Nothing to Disclose

#### **PURPOSE**

The field of theranostics represents a promising area of research, with most recent advancements seen in prostate cancer with PSMA-based radiopharmaceuticals. The protein Hsp90 is a ubiquitously expressed chaperone protein that functions in cell growth and survival. This protein is upregulated in cancer and associated with poor overall survival, particularly in breast cancer. This work examines if Hsp90-based radiopharmaceuticals maybe useful for the detection and ultimate treatment of metastatic breast cancer.

#### **METHODS AND MATERIALS**

Human normal breast epithelial and breast cancer cell lines were maintained in appropriate growth media per ATCC recommendations. Protein levels were assessed with western blotting and primary antibodies against Hsp90 and GAPDH. Previously developed Hsp90 inhibitors with a tethered Cy5 fluorophore were used in combination with fluorescence microscopy to examine cell labeling. Cell aggressiveness was assessed with a wound healing assay.

#### **RESULTS**

Hsp90 is upregulated in breast cancer cell lines relative to normal epithelium. Furthermore, the protein is translocated to the cell surface in cancer, a phenotype not observed in normal tissue and advantageous for diagnostic and therapeutic targeting. Indeed, small molecule inhibitors of Hsp90 selectively label breast cancer cells *in vitro*. This labeling is dependent upon active Hsp90 binding. The intensity correlates with cell line aggressiveness, as HER2+ and triple negative cell lines with high metastatic potential show the highest degree of labeling by our inhibitor.

#### **CONCLUSION**

Tethered Hsp90-inhibitors selectively label human breast cancer cells *in vitro*. The degree of labeling correlates with metastatic potential, suggesting a role for Hsp90-inhibitor based radiopharmaceuticals for the detection of metastatic breast cancer.

#### **CLINICAL RELEVANCE/APPLICATION**

The field of theranostics shows much promise by using tumor specific protein expression to detect and treat of metastatic disease. Our studies outline a role for the use of Hsp90-inhibitor based radiopharmaceuticals in breast cancer, with future efforts focused on pre-clinical testing of these agents.

#### **M2-STCE2- Detection of senescent cells in pig specimen using a $\beta$ -gal MR imaging agent**

2

Kerem Nernekli, MD (*Presenter*) Nothing to Disclose

#### **PURPOSE**

During the development of osteoarthritis (OA), joint deterioration gradually occurs due to the secretion of mediators by senescent mesenchymal stromal cells. The purpose of our study was to evaluate if  $\beta$ -gal-responsive gadolinium chelate can detect senescent cells on magnetic resonance imaging (MRI).

#### **METHODS AND MATERIALS**

Senescence was induced in 100 million porcine mesenchymal stem cells (pMSC) with 250 nM doxorubicin and confirmed by a  $\beta$ -galactosidase assay. The cells were co-stained with DAPI and CellEvent<sup>TM</sup> Senescence Green. The relative number of

green-positive senescent cells compared to the total number of DAPI-positive cells was determined for doxorubicin-treated pMSC and untreated control pMSC. The (T1)-relaxation times of increasing concentrations of  $\beta$ -gal-responsive Gd-chelate and  $\beta$ -gal-responsive Gd-chelate plus  $\beta$ -gal enzyme were compared to determine optimal concentration to observe Gd-chelate activation. Next, ten samples of 10 million control cells (n=5) and senescent cells (n=5) were incubated with (0.25 mM)  $\beta$ -gal-responsive Gd-chelate, followed by implantation into 10 cartilage defects of 5 pig knee joints. Cell samples and specimen underwent MRI at 3 Tesla, using a (T1)-weighted fast spin-echo sequence (TR = 700, TE = 12 ms, (80 mm x 40 mm) field of view (FOV)) and a RARE Variable TR (VTR) saturation recovery sequence (TE = 10 ms, TR = 40, 75, 150, 300, 500, 700, 1000, 1500, and 2000 ms, RARE factor = 2, FOV 80 mm x 40 mm). Quantitative measures of senescent and viable cells were compared with a student's t-test.

## RESULTS

Following incubation with doxorubicin, cell samples contained a significantly higher number of  $\beta$ -gal positive pMSC (89%) compared to untreated control samples (11%). Senescent pMSC incubated with 0.625 mM, 0.5 mM, 0.25 mM, and 0.1 mM of  $\beta$ -gal-responsive Gd demonstrated T1-relaxation times of 0.335 ms, 0.605 ms, 0.940 ms, and 1.159 ms without the addition of  $\beta$ -gal as well as 0.290 ms, 0.458 ms, 0.774 ms and 1.037 ms with the addition of beta-gal. The largest difference between T1-relaxation times of samples with and without  $\beta$ -gal activation was noted for a concentration of 0.25 mM Gd. In joint specimens, senescent pMSC implants demonstrated a stronger hyperintense signal on T1-weighted MR images than viable pMSC implants. The T1-relaxation time was  $0.788 \pm 0.22$  ms for senescent cell implants and  $1.03 \pm 0.14$  ms for viable cell implants (p=0.0015).

## CONCLUSION

We demonstrate the feasibility of a  $\beta$ -gal MR imaging agent for MRI detection of senescent cells in joint specimens.

## CLINICAL RELEVANCE/APPLICATION

The  $\beta$ -gal MR imaging agent can enable the detection of senescent cells in arthritic joints and serve as a new imaging biomarker for monitoring the efficacy of senolytic therapies.

## M2-STCE2-3 Detection of senescent cells in a porcine model of osteoarthritis: A pilot study using 18F-PyGal Radiotracer

Kerem Nerekli, MD (*Presenter*) Nothing to Disclose

## PURPOSE

Aging mesenchymal stromal cells release biomolecules that lead to progressive joint damage and osteoarthritis (OA). Our study aimed to evaluate whether 18F-PyGal radiotracer yields senescence-specific positron emission tomography and magnetic resonance imaging (PET-MRI).

## METHODS AND MATERIALS

Senescence was induced in 125 million porcine mesenchymal stem cells (pMSC) with 250Nm doxorubicin and confirmed by a  $\beta$ -galactosidase assay. The cells were co-stained with DAPI and CellEvent<sup>TM</sup> Senescence Green. The relative number of green-positive senescent cells compared to the total number of DAPI-positive cells was determined for doxorubicin-treated pMSC and untreated control pMSC. Triplicate samples of 0.5 million senescent and viable pMSC were incubated with 0.20 uCi of 18F-PyGal tracer for 1 hour, followed by PET imaging. Next, 10 million senescent pMSC (n=12) or viable pMSC (n=12) were implanted into 24 cartilage defects of 12 knee joints of 6 three-month-old Yucatan minipigs (3 males/3 females). 24 hours later, 0.20 uCi of 18F-PyGal was injected intraarticularly. After an uptake time of 60 minutes, all knee joints underwent integrated positron emission tomography (PET, 20-minute acquisition time) and fat-saturated proton density-weighted MRI (fast spin-echo sequence, TR=2500, TE=22 ms) on a clinical PET/MR scanner. The maximum standardized uptake values (SUV<sub>max</sub>) of senescent and viable pMSC were compared with a student's t-test.

## RESULTS

Doxorubicin-induced senescent pMSC demonstrated significantly higher  $\beta$ -gal expression (83%) compared to control viable cells (17 %). Senescent pMSC demonstrated a strong radiotracer signal on PET imaging studies, while viable cells demonstrated little or no radiotracer retention, both in vitro and in vivo. In vitro, the SUV<sub>max</sub> of senescent pMSCs (3074.4 $\pm$ 374.4) was significantly higher compared to the SUV<sub>max</sub> of control pMSCs (1350.23  $\pm$ 191.35; p=0.037). In vivo, the SUV<sub>max</sub> of senescent MSCs (males: 7.55  $\pm$  3.25, females 6.25 $\pm$  1.98) was significantly higher compared to the SUV<sub>max</sub> of viable controls (males: 3.25 $\pm$ 0.90, p=0.031 and females: 1.23 $\pm$  0.58, p=0.0027). Within respective groups of senescent or viable implants, there was no significant difference between the results of male or female pigs. Histology confirmed significantly stronger  $\beta$ -gal staining in senescent cell implants compared to viable cell implants.

## CONCLUSION

18F-PyGal radiotracer accumulates in senescent cells and yields senescence-specific signal on positron PET-MRI scans.

## **CLINICAL RELEVANCE/APPLICATION**

<sup>18</sup>F-PyGal can be used to detect senescent cells on PET/MR images. This can be helpful in studying the role of senescence in the development of OA and provide a quantitative biomarker for monitoring the efficacy of novel therapies.

### M3-SSCH03-1 **Diagnosis of Acute PE with Photon-Counting-Detector CT: Comparison with Energy-Integrating-Detector CT in Daily Routine**

Martine J. Remy-Jardin, MD, PhD (*Presenter*) Research Grant, Siemens AG; Speaker, Siemens AG

#### PURPOSE

To compare the conditions of acute PE detection when energy-integrating-detector CT (EID-CT) is replaced by photon-counting-detector CT (PCD-CT).

#### METHODS AND MATERIALS

The study population included two cohorts of consecutive patients referred for suspicion of acute pulmonary embolism who underwent a chest CT angiographic examination with EID-CT (Somatom Force ; Siemens Healthineers) in Group 1 (n=158) and PCD-CT (Naeotom Alpha ; Siemens Healthineers) in Group 2 (n=172). In Group 1, there were two scanning options depending on the patient respiratory status : (a) a dual-energy protocol when a 6-second apnea was possible (Group 1a ; n=105); (b) a high-pitch, single-energy protocol when the patient was short of breath (Group 1b ; n=53). In Group 2, all patients were scanned with multienergy (collimation:144 x 0.4mm; 120 kVp; pitch: 1.5; IQ level: 80). Standard morphologic imaging consisted of 1-mm thick images (Group 1a : averaged images from both tubes; Group 1b : standard polychromatic images; Group 2 : 70 keV images).

#### RESULTS

In Group 1b : (a) the mean duration of data acquisition was  $0.5 \pm 0.1$  s with a mean CTDIvol of  $6.7 \pm 5.0$  mGy and a median DLP of 168.2 mGy.cm ; (b) all examinations were interpretable down to the subsegmental (n=51 ; 96.2%) or segmental (n=2 ; 3.8%) level. Compared to Group 1a, Group 2 examinations had a significantly (a) shorter mean acquisition time ( $0.9 \pm 0.1$ s vs  $4.0 \pm 0.3$  s ;  $p < 0.001$ ) ; (b) lower mean CTDIvol ( $5.1 \pm 1.9$  mGy vs  $9.5 \pm 2.6$  mGy) and median DLP (169.0 mGy.cm [Q1: 136.0 ; Q3: 215.0] vs 323.4 mGy.cm [Q1: 282.8 ; Q3 : 411.1]) ( $p < 0.001$ ), respectively reduced by 46.3% and 47.7% ; (c) higher proportion of examinations devoid of cardiogenic motion artifacts (n=153 ; 89.0% vs n=30 ; 28.6%) ;  $p < 0.001$ ) with a comparable high rate of examinations interpretable down to the subsegmental level (n=164 ; 95.3% vs n=98 ; 93.3%) ; (d) higher mean level of objective image noise ( $20.3 \pm 6.9$  vs  $17.3 \pm 6.6$  ;  $p < 0.001$ ) with no difference in subjective image noise. Suboptimal arterial enhancement was observed in 5 patients in Group 1a and 6 patients in Group 2, restored on low-energy images in both groups (tube A images in Group 1a ; 50 keV images in Group 2). Acute PE was diagnosed in 16 patients (15%) in Group 1a, 14 patients (26%) in Group 1b and 21 patients (12%) in Group 2. Perfusion images in Group 2 had significantly higher qualitative scores ( $p = 0.047$ ), rated as good to excellent in 158 patients (91.9%) vs 88 patients (83.8%) in Group 1a.

#### CONCLUSION

Compared to EID-CT, high-quality morphologic and perfusion imaging was available in all patients scanned with PCD-CT with a dose reduced by 47.7%.

#### CLINICAL RELEVANCE/APPLICATION

PCD-CT ensures confident depiction of acute PE with spectral imaging available at low radiation dose in all patient categories.

### M3-SSCH03-2 **External Validation of a Deep Learning-Based Model to Detect Pulmonary Embolism on CTPA**

Eline Langius, MD (*Presenter*) Nothing to Disclose

## PURPOSE

To evaluate the implementation and generalisability of the winning deep learning (DL) model developed by Guanshuo Xu for the RSNA 2020 pulmonary embolism (PE) detection challenge using CT pulmonary angiography (CTPA) scan data of two hospitals.

## METHODS AND MATERIALS

Consecutive CTPA scan data from patients referred to two hospitals for suspected PE was retrospectively analysed by the DL model after successful implementation of the solution code according to the guidelines provided. The first set from hospital A included multidetector CTPA images of 238 patients. The second set from hospital B consisted of 114 patients scanned on a spectral detector CT (SDCT) scanner, which provided paired virtual monochromatic images (VMI). The output of the DL model was compared with a reference standard, which included a consensus reading between at least two experienced cardiothoracic radiologists. Areas under the receiver operating characteristic curve (AUCs) of the algorithm were calculated. Diagnostic measures were obtained by choosing an optimal cut-off value. In the second set, performance of the algorithm on conventional images and VMI was compared.

## RESULTS

According to the reference standard, PE was present in 71 patients (29.8%) in the first dataset and 40 patients (35.1%) in the second dataset. The AUC was 0.96 (95% CI 0.93-0.99) for external validation on the data of hospital A. The AUCs were 0.89 (95% CI 0.82-0.96) and 0.86 (95% CI 0.78-0.95) for external validation on respectively conventional and VMI data from hospital B.

## CONCLUSION

The winning DL model developed for the RSNA 2020 PE detection challenge could be successfully implemented. It showed high diagnostic accuracy on scan data from two hospitals. The lower performance on novel SDCT data suggests that additional training of the DL model on advanced technology may improve generalisability for widespread use in any clinical setting.

## CLINICAL RELEVANCE/APPLICATION

The winning DL model developed for the RSNA 2020 PE detection challenge could be implemented in our hospital, while sustaining high diagnostic performance on conventional CTPA data.

## M3-SSCH03-3 Sex-Specific Differences in Lesion Type and Distribution in Chronic Thromboembolic Pulmonary Hypertension

Marie L. Bambrick, MBBCh (*Presenter*) Nothing to Disclose

## PURPOSE

Registry data suggests females are less likely than males to undergo surgery for chronic thromboembolic pulmonary hypertension (CTEPH) despite a similar proportion of proximal vs distal disease. We hypothesized that sex-specific differences in CTEPH could be elicited with a more detailed analysis of the pulmonary vasculature incorporating lesion location and type.

## METHODS AND MATERIALS

For this single center retrospective review, preoperative computed tomography pulmonary angiography of patients who underwent pulmonary endarterectomy (January 2017 - September 2021) for surgically proven CTEPH were analyzed by a fellowship trained thoracic radiologist. The pulmonary vascular tree was divided into 32 distinct named vessels (3 main, 1 interlobar, 5 lobar, 1 lingular, 2 basal trunks and 20 segmental) and each vessel scored for the presence or absence of chronic thromboembolism. Lesions were classified as either a web, eccentric thickening or occlusion with only the single most obstructive lesion counted per vessel. Subsegmental disease was noted if present when no other lesion was identified in the segmental vessel. Clinical data for each patient was obtained from review of their medical records.

## RESULTS

144 patients were included with 78 (54%) females. Baseline characteristics were similar in females vs males with no significant difference in age (mean 44 vs 41 years,  $p=0.59$ ) or mean pulmonary artery pressure (44 vs 41 mmHg,  $p=0.27$ ). There were 2,679 chronic pulmonary emboli identified in the 4,562 vessels analyzed. Females had fewer vessels involved per case (mean 17 vs 20 vessels,  $p=0.004$ ) and, though diffuse disease was common to both sexes, females had more disease-free pulmonary segments (mean 5.8 vs 3.4 segments,  $p=0.001$ ). Males had an overall greater number of webs, eccentric thickening, and occlusions ( $p=0.006$ , 0.04 and 0.05 respectively). The distribution of lesion type did not significantly vary between sexes at the main ( $p=0.74$ ) or lobar level ( $p=0.14$ ), but significant differences were observed in the segmental ( $p<0.001$ ) and subsegmental vasculature. When no segmental lesion was seen, females had a higher number of subsegmental lesions in those segments ( $p=0.02$ ).

## CONCLUSION

Sex-specific differences exist in chronic pulmonary embolism type and distribution at the segmental and subsegmental level. A higher prevalence of subsegmental disease and a lower burden of chronic PE in females, despite similar hemodynamics, may explain the reported disparity in surgical management.

## CLINICAL RELEVANCE/APPLICATION

Sex-specific differences in CTEPH of lesions at the segmental and subsegmental level may explain reported disparities in the management of chronic thromboembolic pulmonary hypertension.

### M3-SSCH03-4 **Detectability for Peripheral Pulmonary Artery Lesions in Patients with CTEPH: Comparison between Ultra-High-Resolution vs. Conventional CT**

Satoshi Higuchi, MD, PhD (*Presenter*) Nothing to Disclose

## PURPOSE

Conventional multidetector CT pulmonary angiography (CTPA), due to its spatial resolution, has been limited to the detection of peripheral steno-occlusive lesions in chronic thromboembolic pulmonary hypertension (CTEPH). This study aims to evaluate the detectability of lesions in segmental and subsegmental pulmonary arteries with CTPA, as identified by invasive selective angiography, between ultra-high-resolution (UHRCT) and conventional CT (cCT) in patients with CTEPH.

## METHODS AND MATERIALS

A total of 24 consecutive patients (age, 70±11 years; 8 men) diagnosed with CTEPH and treated with balloon pulmonary angioplasty (BPA) from 2019 to 2020 were included. Twelve patients underwent CTPA before BPA with cCT (SOMATOM Definition Flash, Siemens Healthineers), and others with UHRCT (Aquilion Precision, Canon Medical Systems). The morphology and location of lesions were evaluated in selective angiography by a cardiologist and in CTPA images by a radiologist. The morphology was classified into 4 types: ringlike stenosis; web; subtotal occlusion; and total occlusion. The definition of segmental and subsegmental branches was determined based on the anatomical feature of the bronchus. Each branch was classified on the CT volume rendering images to avoid differences in perception of the evaluated vessel by each modality. The detection rate of lesions identified by angiography was evaluated between two groups using the chi-square test.  $P < 0.05$  indicated statistical significance.

## RESULTS

For the lesions identified by selective angiography, 80% (44/55) of segmental lesions and 48% (123/256) of subsegmental lesions were detected by cCT, while 98% (42/43) of lesions in segmental arteries and 93% (270/289) of lesions in subsegmental arteries were detected by UHRCT. The detectability of lesions by UHRCT was significantly higher than that by cCT in both of segmental and subsegmental branch (segmental: 98% vs. 80%,  $p = 0.011$  and subsegmental: 93% vs. 48%,  $p < 0.001$ ). There was no interaction by segmental and subsegmental branches ( $p$  for interaction = 0.73). In undetected lesions by CTPA, web lesions accounted for 67% (97/144) in the cCT and 70% (14/20) in the UHRCT, indicating it is the most challenging lesion to detect with CT.

## CONCLUSION

UHRCT demonstrated significantly higher detectability of lesions in segmental and subsegmental pulmonary arteries than conventional CT in patients with CTEPH who were eligible for BPA. By type of lesions, web lesion was the most challenging to detect by CTPA.

## CLINICAL RELEVANCE/APPLICATION

Ultra-high-resolution CT allows to detect lesions in peripheral pulmonary arteries which are the target of BPA more accurately than the conventional CT, helping establishment of the safe and effective BPA for patients with CTEPH.

### M3-SSCH03-5 **Lung Microvasculopathy in CTEPH: Ultra-High-Resolution (UHR) Findings with Photon-Counting CT in 29 Patients**

Martine J. Remy-Jardin, MD, PhD (*Presenter*) Research Grant, Siemens AG; Speaker, Siemens AG

## PURPOSE

To evaluate the morphological characteristics of the most distal divisions of the pulmonary circulation in CTEPH patients with mosaic perfusion.

## METHODS AND MATERIALS

Over a 18-month period, 206 patients with a high-probability of pulmonary hypertension (PH) at echocardiography were referred for chest CT angiography with photon-counting-detector CT. After PH confirmation by right-heart-catheterization in 168 patients, Group 4 PH was diagnosed in 42 patients; 13 patients were excluded (non-CTEPH-pulmonary artery obstruction:  $n = 2$ ; CTEPH without mosaic perfusion ( $n = 9$ ) or lung infection ( $n = 2$ ), leading to a study population of 29 patients scanned

with a collimation of 144 x 0.4mm (n=18) and 120 x 0.2 mm (n=11). Distal lung circulation was assessed in the outer third of the lung parenchyma at the level of the hyper- (zone A) and hypo- (zone B) attenuating areas of mosaic perfusion, after selection of 2 to 3 pairs in different lobes per patient. Two experienced chest radiologists analyzed the size of vascular sections, the presence of PAH-like lesions (i.e., ill-defined micronodules, lobular ground-glass attenuation), capillary and venous lesions seen in PVOD/PCH (septal lines, ground-glass nodules) and systemic-to-pulmonary anastomoses.

## RESULTS

The study population included 15 females and 14 males (mean age : 68.7 ± 12.7 yr ; mean PAPm : 44.4 ± 10.1 mm Hg ; mean PVR : 7.9 ± 3.2 Wood unit) with 3 pairs selected in all but one patient (2 pairs), leading to the analysis of 86 pairs. Significant differences were observed between zones A and B regarding the presence of : (a) dilated distal pulmonary arteries (zone A : n=79 ; 91.9% ; zone B ; n=26 ; 30.23% ; p<0.0001) ; (b) ill-defined micronodules (zone A : n=29 ; 22.09% ; zone B : n=35 ; 40.70% ; p=0.0025) ; (c) lobular ground-glass opacities (zone A : n=2 ; 2.33% ; zone B : n=13 ; 15.12% ; p=0.0045) ; (d) diameter of pulmonary veins (p<0.0001). When dividing the population into two subgroups of patients with a PAPm below (Group A) or above (Group B) the median PAPm value (i.e., 42.5 mm Hg) : (a) the 42 pairs of Group A showed similar differences as those described in the overall study group and a significantly higher frequency of subpleural systemic-to-pulmonary anastomoses (n=21 ; 50% vs 11 ; 26.19% ; p=0.0075) ; (b) in the 41 pairs of Group B, the only significant difference concerned the diameter of distal pulmonary arteries (p<0.0001).

## CONCLUSION

The morphological characteristics of distal pulmonary circulation significantly differed between hyper-and hypo-attenuating areas with a trend toward homogenization of findings in patients with severe PH.

## CLINICAL RELEVANCE/APPLICATION

This study suggests that the high-spatial resolution of PCD-CT has the capability of approaching the complex pathophysiology of small-vessel disease in CTEPH.

## M3- SSCH03-6 Hidden in Plain Sight: Characteristics and Prognostic Value of the Spiral Flap Trajectory in Aortic Dissection

Pablo Francis Schell, MD (*Presenter*) Nothing to Disclose

## PURPOSE

To describe the radiological features of the spiral trajectory (ST) of the flap along the descending thoracic aorta (DTA), a characteristic trait of aortic dissection (AD) on CT angiography (CTA) which has not been thoroughly researched. To find out the association of ST with long-term aortic adverse events (AAE) and create a simple risk evaluation model.

## METHODS AND MATERIALS

A CTA was performed in the subacute phase of AD (<3 months) in all patients discharged after 2008 with a patent false lumen (FL) and no comorbidities (n=105, mean age 58 years, 76 men, 44 type B). The change in the position of the flap on transverse aortic images from the aortic isthmus to the distal abdominal segment was scored in a semiquantitative ordinal scale: ST0 (<45° of rotation), ST1 (45-90°), ST2 (90-180°), ST3 (180-270°), ST4 (270-360°) and ST5 (>360°). Additional scores/measurements performed were maximum aortic diameter, proximal and distal entry tear areas, DTA elongation and tortuosity indices, circumferential FL extent, partial FL thrombosis and arch morphology. Long-term AAE were defined as: DTA aneurysm, elective or emergent aortic surgery and AD-related clinical complications or death. Binomial logistic regression analyses for clinical and radiological parameters related to ST>1 were performed. Sex- and age-adjusted multivariable Cox regression models were compared according to model metrics.

## RESULTS

A spiral flap trajectory (ST>1) was present in 72 participants (69%). The most frequent level after ST0 was ST2 (n=27). There were no differences in proportions between subgroups regarding AD type or the presence of genetic aortic disease (p=0.44 and p=0.08, respectively). Dyslipidemia, gothic arch morphology, DTA diameter and elongation were related to ST>1. Fifty-four participants (51%) had an AAE during follow-up (median 6.02 years, IQR 2.72-9.39). Participants with ST=1 showed a shorter estimated survival time than those with ST0 (6.69 versus 11.6; p=0.01). A sex- and age-adjusted model composed of genetic aortic disease, type B AD and ST=1 allowed for the creation of low- (n=32), intermediate- (n=59) and high-risk (n=14) groups with median survival times of 13.1, 8 and 2.7 years, respectively (Log-rank p<0.0001).

## CONCLUSION

A spiral flap trajectory in aortic dissection, defined as a rotation of the flap >45° along the descending thoracic aorta, is a common and conspicuous finding associated with an increase in the risk of long-term aortic adverse events.

## CLINICAL RELEVANCE/APPLICATION

The spiral flap trajectory is an easily available early marker of risk in AD that does not require complex measurements. Survivors at high risk of aortic adverse events might benefit from earlier surgical treatment.

M3-SSCH03-1

### Diagnosis of Acute PE with Photon-Counting-Detector CT: Comparison with Energy-Integrating-Detector CT in Daily Routine

Monday, Nov. 27 9:30AM - 10:30AM Room: N227B

Martine J. Remy-Jardin, MD, PhD (*Presenter*) Research Grant, Siemens AG; Speaker, Siemens AG

#### PURPOSE

To compare the conditions of acute PE detection when energy-integrating-detector CT (EID-CT) is replaced by photon-counting-detector CT (PCD-CT).

#### METHODS AND MATERIALS

The study population included two cohorts of consecutive patients referred for suspicion of acute pulmonary embolism who underwent a chest CT angiographic examination with EID-CT (Somatom Force ; Siemens Healthineers) in Group 1 (n=158) and PCD-CT (Naeotom Alpha ; Siemens Healthineers) in Group 2 (n=172). In Group 1, there were two scanning options depending on the patient respiratory status : (a) a dual-energy protocol when a 6-second apnea was possible (Group 1a ; n=105); (b) a high-pitch, single-energy protocol when the patient was short of breath (Group 1b ; n=53). In Group 2, all patients were scanned with multienergy (collimation:144 x 0.4mm; 120 kVp; pitch: 1.5; IQ level: 80). Standard morphologic imaging consisted of 1-mm thick images (Group 1a : averaged images from both tubes; Group 1b : standard polychromatic images; Group 2 : 70 keV images).

#### RESULTS

In Group 1b : (a) the mean duration of data acquisition was  $0.5 \pm 0.1$  s with a mean CTDIvol of  $6.7 \pm 5.0$  mGy and a median DLP of 168.2 mGy.cm ; (b) all examinations were interpretable down to the subsegmental (n=51 ; 96.2%) or segmental (n=2 ; 3.8%) level. Compared to Group 1a, Group 2 examinations had a significantly (a) shorter mean acquisition time ( $0.9 \pm 0.1$ s vs  $4.0 \pm 0.3$  s ;  $p < 0.001$ ) ; (b) lower mean CTDIvol ( $5.1 \pm 1.9$  mGy vs  $9.5 \pm 2.6$  mGy) and median DLP (169.0 mGy.cm [Q1: 136.0 ; Q3: 215.0] vs 323.4 mGy.cm [Q1: 282.8 ; Q3 : 411.1]) ( $p < 0.001$ ), respectively reduced by 46.3% and 47.7% ; (c) higher proportion of examinations devoid of cardiogenic motion artifacts (n=153 ; 89.0% vs n=30 ; 28.6%) ;  $p < 0.001$ ) with a comparable high rate of examinations interpretable down to the subsegmental level (n=164 ; 95.3% vs n=98 ; 93.3%) ; (d) higher mean level of objective image noise ( $20.3 \pm 6.9$  vs  $17.3 \pm 6.6$  ;  $p < 0.001$ ) with no difference in subjective image noise. Suboptimal arterial enhancement was observed in 5 patients in Group 1a and 6 patients in Group 2, restored on low-energy images in both groups (tube A images in Group 1a ; 50 keV images in Group 2). Acute PE was diagnosed in 16 patients (15%) in Group 1a, 14 patients (26%) in Group 1b and 21 patients (12%) in Group 2. Perfusion images in Group 2 had significantly higher qualitative scores ( $p = 0.047$ ), rated as good to excellent in 158 patients (91.9%) vs 88 patients (83.8%) in Group 1a.

#### CONCLUSION

Compared to EID-CT, high-quality morphologic and perfusion imaging was available in all patients scanned with PCD-CT with a dose reduced by 47.7%.

#### CLINICAL RELEVANCE/APPLICATION

PCD-CT ensures confident depiction of acute PE with spectral imaging available at low radiation dose in all patient categories.

### External Validation of a Deep Learning-Based Model to Detect Pulmonary Embolism on CTPA

Monday, Nov. 27 9:30AM - 10:30AM Room: N227B

Eline Langius, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

To evaluate the implementation and generalisability of the winning deep learning (DL) model developed by Guanshuo Xu for the RSNA 2020 pulmonary embolism (PE) detection challenge using CT pulmonary angiography (CTPA) scan data of two hospitals.

#### METHODS AND MATERIALS

Consecutive CTPA scan data from patients referred to two hospitals for suspected PE was retrospectively analysed by the DL model after successful implementation of the solution code according to the guidelines provided. The first set from hospital A included multidetector CTPA images of 238 patients. The second set from hospital B consisted of 114 patients scanned on a spectral detector CT (SDCT) scanner, which provided paired virtual monochromatic images (VMI). The output of the DL model was compared with a reference standard, which included a consensus reading between at least two experienced cardiothoracic radiologists. Areas under the receiver operating characteristic curve (AUCs) of the algorithm were calculated. Diagnostic measures were obtained by choosing an optimal cut-off value. In the second set, performance of the algorithm on conventional images and VMI was compared.

#### RESULTS

According to the reference standard, PE was present in 71 patients (29.8%) in the first dataset and 40 patients (35.1%) in the second dataset. The AUC was 0.96 (95% CI 0.93-0.99) for external validation on the data of hospital A. The AUCs were 0.89 (95% CI 0.82-0.96) and 0.86 (95% CI 0.78-0.95) for external validation on respectively conventional and VMI data from hospital B.

#### CONCLUSION

The winning DL model developed for the RSNA 2020 PE detection challenge could be successfully implemented. It showed high diagnostic accuracy on scan data from two hospitals. The lower performance on novel SDCT data suggests that additional training of the DL model on advanced technology may improve generalisability for widespread use in any clinical setting.

#### CLINICAL RELEVANCE/APPLICATION

The winning DL model developed for the RSNA 2020 PE detection challenge could be implemented in our hospital, while sustaining high diagnostic performance on conventional CTPA data.

### Sex-Specific Differences in Lesion Type and Distribution in Chronic Thromboembolic Pulmonary Hypertension

Monday, Nov. 27 9:30AM - 10:30AM Room: N227B

Marie L. Bambrick, MBBCh (*Presenter*) Nothing to Disclose

#### PURPOSE

Registry data suggests females are less likely than males to undergo surgery for chronic thromboembolic pulmonary hypertension (CTEPH) despite a similar proportion of proximal vs distal disease. We hypothesized that sex-specific differences in CTEPH could be elicited with a more detailed analysis of the pulmonary vasculature incorporating lesion location and type.

#### METHODS AND MATERIALS

For this single center retrospective review, preoperative computed tomography pulmonary angiography of patients who underwent pulmonary endarterectomy (January 2017 - September 2021) for surgically proven CTEPH were analyzed by a fellowship trained thoracic radiologist. The pulmonary vascular tree was divided into 32 distinct named vessels (3 main, 1 interlobar, 5 lobar, 1 lingular, 2 basal trunks and 20 segmental) and each vessel scored for the presence or absence of chronic thromboembolism. Lesions were classified as either a web, eccentric thickening or occlusion with only the single most obstructive lesion counted per vessel. Subsegmental disease was noted if present when no other lesion was identified in the segmental vessel. Clinical data for each patient was obtained from review of their medical records.

#### RESULTS

144 patients were included with 78 (54%) females. Baseline characteristics were similar in females vs males with no significant difference in age (mean 44 vs 41 years,  $p=0.59$ ) or mean pulmonary artery pressure (44 vs 41 mmHg,  $p=0.27$ ). There were 2,679 chronic pulmonary emboli identified in the 4,562 vessels analyzed. Females had fewer vessels involved per case (mean 17 vs 20 vessels,  $p=0.004$ ) and, though diffuse disease was common to both sexes, females had more disease-free pulmonary segments (mean 5.8 vs 3.4 segments,  $p=0.001$ ). Males had an overall greater number of webs, eccentric thickening, and occlusions ( $p=0.006$ , 0.04 and 0.05 respectively). The distribution of lesion type did not significantly vary between sexes at the main ( $p=0.74$ ) or lobar level ( $p=0.14$ ), but significant differences were observed in the segmental ( $p<0.001$ ) and subsegmental vasculature. When no segmental lesion was seen, females had a higher number of subsegmental lesions in those segments ( $p=0.02$ ).

#### CONCLUSION

Sex-specific differences exist in chronic pulmonary embolism type and distribution at the segmental and subsegmental level. A higher prevalence of subsegmental disease and a lower burden of chronic PE in females, despite similar hemodynamics, may explain the reported disparity in surgical management.

#### CLINICAL RELEVANCE/APPLICATION

Sex-specific differences in CTEPH of lesions at the segmental and subsegmental level may explain reported disparities in the management of chronic thromboembolic pulmonary hypertension.

### **Detectability for Peripheral Pulmonary Artery Lesions in Patients with CTEPH: Comparison between Ultra-High-Resolution vs. Conventional CT**

Monday, Nov. 27 9:30AM - 10:30AM Room: N227B

Satoshi Higuchi, MD, PhD (*Presenter*) Nothing to Disclose

#### **PURPOSE**

Conventional multidetector CT pulmonary angiography (CTPA), due to its spatial resolution, has been limited to the detection of peripheral steno-occlusive lesions in chronic thromboembolic pulmonary hypertension (CTEPH). This study aims to evaluate the detectability of lesions in segmental and subsegmental pulmonary arteries with CTPA, as identified by invasive selective angiography, between ultra-high-resolution (UHRCT) and conventional CT (cCT) in patients with CTEPH.

#### **METHODS AND MATERIALS**

A total of 24 consecutive patients (age,  $70 \pm 11$  years; 8 men) diagnosed with CTEPH and treated with balloon pulmonary angioplasty (BPA) from 2019 to 2020 were included. Twelve patients underwent CTPA before BPA with cCT (SOMATOM Definition Flash, Siemens Healthineers), and others with UHRCT (Aquilion Precision, Canon Medical Systems). The morphology and location of lesions were evaluated in selective angiography by a cardiologist and in CTPA images by a radiologist. The morphology was classified into 4 types: ringlike stenosis; web; subtotal occlusion; and total occlusion. The definition of segmental and subsegmental branches was determined based on the anatomical feature of the bronchus. Each branch was classified on the CT volume rendering images to avoid differences in perception of the evaluated vessel by each modality. The detection rate of lesions identified by angiography was evaluated between two groups using the chi-square test.  $P < 0.05$  indicated statistical significance.

#### **RESULTS**

For the lesions identified by selective angiography, 80% (44/55) of segmental lesions and 48% (123/256) of subsegmental lesions were detected by cCT, while 98% (42/43) of lesions in segmental arteries and 93% (270/289) of lesions in subsegmental arteries were detected by UHRCT. The detectability of lesions by UHRCT was significantly higher than that by cCT in both of segmental and subsegmental branch (segmental: 98% vs. 80%,  $p = 0.011$  and subsegmental: 93% vs. 48%,  $p < 0.001$ ). There was no interaction by segmental and subsegmental branches ( $p$  for interaction = 0.73). In undetected lesions by CTPA, web lesions accounted for 67% (97/144) in the cCT and 70% (14/20) in the UHRCT, indicating it is the most challenging lesion to detect with CT.

#### **CONCLUSION**

UHRCT demonstrated significantly higher detectability of lesions in segmental and subsegmental pulmonary arteries than conventional CT in patients with CTEPH who were eligible for BPA. By type of lesions, web lesion was the most challenging to detect by CTPA.

#### **CLINICAL RELEVANCE/APPLICATION**

Ultra-high-resolution CT allows to detect lesions in peripheral pulmonary arteries which are the target of BPA more accurately than the conventional CT, helping establishment of the safe and effective BPA for patients with CTEPH.

### Lung Microvasculopathy in CTEPH: Ultra-High-Resolution (UHR) Findings with Photon-Counting CT in 29 Patients

Monday, Nov. 27 9:30AM - 10:30AM Room: N227B

Martine J. Remy-Jardin, MD, PhD (*Presenter*) Research Grant, Siemens AG; Speaker, Siemens AG

#### PURPOSE

To evaluate the morphological characteristics of the most distal divisions of the pulmonary circulation in CTEPH patients with mosaic perfusion.

#### METHODS AND MATERIALS

Over a 18-month period, 206 patients with a high-probability of pulmonary hypertension (PH) at echocardiography were referred for chest CT angiography with photon-counting-detector CT. After PH confirmation by right-heart-catheterization in 168 patients, Group 4 PH was diagnosed in 42 patients ;13 patients were excluded (non-CTEPH-pulmonary artery obstruction : n=2 ; CTEPH without mosaic perfusion (n=9) or lung infection (n=2), leading to a study population of 29 patients scanned with a collimation of 144 x 0.4mm (n=18) and 120 x 0.2 mm (n=11). Distal lung circulation was assessed in the outer third of the lung parenchyma at the level of the hyper- (zone A) and hypo- (zone B) attenuating areas of mosaic perfusion, after selection of 2 to 3 pairs in different lobes per patient. Two experienced chest radiologists analyzed the size of vascular sections, the presence of PAH-like lesions (i.e., ill-defined micronodules, lobular ground-glass attenuation), capillary and venous lesions seen in PVOD/PCH (septal lines, ground-glass nodules) and systemic-to-pulmonary anastomoses.

#### RESULTS

The study population included 15 females and 14 males (mean age :  $68.7 \pm 12.7$  yr ; mean PAPm :  $44.4 \pm 10.1$  mm Hg ; mean PVR :  $7.9 \pm 3.2$  Wood unit) with 3 pairs selected in all but one patient (2 pairs), leading to the analysis of 86 pairs. Significant differences were observed between zones A and B regarding the presence of : (a) dilated distal pulmonary arteries (zone A : n=79 ; 91.9% ; zone B ; n=26 ; 30.23% ;  $p < 0.0001$ ) ; (b) ill-defined micronodules (zone A : n=29 ; 22.09% ; zone B : n=35 ; 40.70% ;  $p = 0.0025$ ) ; (c) lobular ground-glass opacities (zone A : n=2 ; 2.33% ; zone B : n=13 ; 15.12% ;  $p = 0.0045$ ) ; (d) diameter of pulmonary veins ( $p < 0.0001$ ). When dividing the population into two subgroups of patients with a PAPm below (Group A) or above (Group B) the median PAPm value (i.e., 42.5 mm Hg) : (a) the 42 pairs of Group A showed similar differences as those described in the overall study group and a significantly higher frequency of subpleural systemic-to-pulmonary anastomoses (n=21 ; 50% vs 11 ; 26.19% ;  $p = 0.0075$ ) ; (b) in the 41 pairs of Group B, the only significant difference concerned the diameter of distal pulmonary arteries ( $p < 0.0001$ ).

#### CONCLUSION

The morphological characteristics of distal pulmonary circulation significantly differed between hyper-and hypo-attenuating areas with a trend toward homogenization of findings in patients with severe PH.

#### CLINICAL RELEVANCE/APPLICATION

This study suggests that the high-spatial resolution of PCD-CT has the capability of approaching the complex pathophysiology of small-vessel disease in CTEPH.

### Hidden in Plain Sight: Characteristics and Prognostic Value of the Spiral Flap Trajectory in Aortic Dissection

Monday, Nov. 27 9:30AM - 10:30AM Room: N227B

Pablo Francis Schell, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

To describe the radiological features of the spiral trajectory (ST) of the flap along the descending thoracic aorta (DTA), a characteristic trait of aortic dissection (AD) on CT angiography (CTA) which has not been thoroughly researched. To find out the association of ST with long-term aortic adverse events (AAE) and create a simple risk evaluation model.

#### METHODS AND MATERIALS

A CTA was performed in the subacute phase of AD (<3 months) in all patients discharged after 2008 with a patent false lumen (FL) and no comorbidities (n=105, mean age 58 years, 76 men, 44 type B). The change in the position of the flap on transverse aortic images from the aortic isthmus to the distal abdominal segment was scored in a semiquantitative ordinal scale: ST0 (<45° of rotation), ST1 (45-90°), ST2 (90-180°), ST3 (180-270°), ST4 (270-360°) and ST5 (>360°). Additional scores/measurements performed were maximum aortic diameter, proximal and distal entry tear areas, DTA elongation and tortuosity indices, circumferential FL extent, partial FL thrombosis and arch morphology. Long-term AAE were defined as: DTA aneurysm, elective or emergent aortic surgery and AD-related clinical complications or death. Binomial logistic regression analyses for clinical and radiological parameters related to ST>1 were performed. Sex- and age-adjusted multivariable Cox regression models were compared according to model metrics.

#### RESULTS

A spiral flap trajectory (ST>1) was present in 72 participants (69%). The most frequent level after ST0 was ST2 (n=27). There were no differences in proportions between subgroups regarding AD type or the presence of genetic aortic disease (p=0.44 and p=0.08, respectively). Dyslipidemia, gothic arch morphology, DTA diameter and elongation were related to ST>1. Fifty-four participants (51%) had an AAE during follow-up (median 6.02 years, IQR 2.72-9.39). Participants with ST=1 showed a shorter estimated survival time than those with ST0 (6.69 versus 11.6; p=0.01). A sex- and age-adjusted model composed of genetic aortic disease, type B AD and ST=1 allowed for the creation of low- (n=32), intermediate- (n=59) and high-risk (n=14) groups with median survival times of 13.1, 8 and 2.7 years, respectively (Log-rank p<0.0001).

#### CONCLUSION

A spiral flap trajectory in aortic dissection, defined as a rotation of the flap >45° along the descending thoracic aorta, is a common and conspicuous finding associated with an increase in the risk of long-term aortic adverse events.

#### CLINICAL RELEVANCE/APPLICATION

The spiral flap trajectory is an easily available early marker of risk in AD that does not require complex measurements. Survivors at high risk of aortic adverse events might benefit from earlier surgical treatment.

#### Sub-Events

#### **M3-SSGI05-1 Low keV Virtual Monochromatic Images in Abdominal CT Angiography with Photon-counting CT Improve Abdominal Arteries Delineation**

Takashi Ota, MD, PhD (*Presenter*) Nothing to Disclose

#### PURPOSE

To evaluate the ability of low keV (50 keV) virtual monochromatic images (VMI) to depict abdominal arteries in abdominal CT angiography (CTA) compared to the 70 keV VMI with photon-counting CT (PCCT).

#### METHODS AND MATERIALS

This retrospective study included 50 consecutive patients who underwent abdominal CTA with a PCCT scanner. After intravenous injection of 600 mgI/kg contrast agent in 25 seconds, CTA was scanned 8 seconds after the abdominal aortic attenuation reached 40 HU. Signal-to-noise ratio (SNR) and contrast-to-noise ratio (CNR) in the abdominal aorta (AA), celiac (CeA), superior mesenteric (SMA), renal (RA), and right hepatic artery (RHA) were quantitatively evaluated by region-of-interest analysis on 0.4 mm thickness CT images and compared between 70 keV and 50 keV VMI by paired t-test. Image noise (SD<sub>fat</sub>) was defined as the standard deviation (SD) of CT density for anterior subcutaneous fat. The mean attenuation value of muscles (HU<sub>muscle</sub>) was defined as the CT value of the erector spinae muscles at the same slice and level as that of the CeA. The SNR and the CNR were calculated as follows:  $SNR = HU_{vessel}/SD_{vessel}$ ;  $CNR = (HU_{vessel} - HU_{muscle})/SD_{fat}$ . We created a volume rendering 3D images from the CTA data. We measured the distance from the origin of the CeA to the end of the A8 branch of the RHA to assess how far arterial branches are visualized distally. The software analyzed the vessel route and automatically measured the vessel's length. We compared the length from CeA to A8 at 70 keV VMI with that at 50 keV VMI by using paired t-test.

#### RESULTS

SNR values of 50 keV VMI were significantly higher than those of 70 keV VMI in each artery;  $35.69 \pm 7.52$  vs.  $25.54 \pm 4.34$  for AA,  $21.60 \pm 8.14$  vs.  $18.59 \pm 5.14$  for CeA,  $22.31 \pm 8.18$  vs.  $18.93 \pm 5.58$  for SMA,  $21.38 \pm 8.30$  vs.  $19.11 \pm 5.37$  for RA, and  $13.84 \pm 7.39$  vs.  $12.54 \pm 6.99$  for RHA (all  $p < .05$ ). CNR values of 50 keV VMI were also significantly higher than those of 70 keV VMI in each artery;  $49.29 \pm 15.14$  vs.  $28.42 \pm 7.69$  for AA,  $49.26 \pm 14.44$  vs.  $28.94 \pm 7.71$  for CeA,  $50.45 \pm 15.65$  vs.  $29.70 \pm 8.20$  for SMA,  $50.08 \pm 15.49$  vs.  $29.51 \pm 8.00$  for RA,  $44.73 \pm 14.15$  vs.  $26.62 \pm 7.47$  for RHA (all  $p < .05$ ). The distance between the CeA origin and the A8 end was significantly longer with 50 keV VMI than that with 70 keV VMI:  $192.6 \pm 33.3$  mm with 50 keV VMI and  $180.3 \pm 30.9$  mm with 70 keV VMI ( $p < .001$ ).

#### CONCLUSION

In abdominal CTA with PCCT, the quantitative image quality of 50 keV VMI was better than that of 70 keV VMI. In addition, 3D CTA with 50 keV VMI could depict branches of the RHA more peripherally than that with 70 keV VMI.

#### CLINICAL RELEVANCE/APPLICATION

Low keV virtual monochromatic images have the advantage of delineating arterial branches more peripherally on abdominal CT angiography with photon-counting CT, allowing for a more detailed understanding of the vascular anatomy.

### **M3-SSGI05-2 Ultra-high-resolution Abdominal CT Angiography using Photon-counting CT: A Comparison with Spectral CT Angiography**

Hiromitsu Onishi, MD, PhD (*Presenter*) Research Grant, General Electric Company; Speakers Bureau, General Electric Company

#### **PURPOSE**

A clinical photon-counting (PC) CT scanner can produce images with a minimum slice thickness of 0.2 mm, but for virtual monochromatic images (VMIs), the minimum thickness is limited to 0.4 mm. The purpose of our study was to compare ultra-high-resolution (UHR) abdominal CT angiography (CTA) using 0.2 mm images with spectral CTA using 0.4 mm images in the visualization of arteries at PC CT.

#### **METHODS AND MATERIALS**

This retrospective study included 61 consecutive patients with suspected hepatopancreatobiliary cancer who underwent abdominal CT using a PC CT scanner. For UHR CTA, early arterial phase images after 600 mgI/kg contrast administration were reconstructed with a matrix of 1024×1024, a field of view (FOV) of 205 mm x 205 mm, and a thickness of 0.2 mm (0.2 mm isotropic voxel) using all counted events (termed T3D for PC CT) at 120 kVp. Using the same raw data, 120 kVp T3D and 50 keV VMIs with a 1024 x 1024 matrix, 410 mm x 410 mm FOV, and 0.4 mm thickness (0.4 mm isotropic voxel) were also reconstructed for high-resolution (HR) CTA and 50 keV spectral HR CTA, respectively. Image noise, contrast, and contrast-to-noise ratio (CNR) between hepatic artery and liver parenchyma were measured on maximum intensity projection CTA images and compared using ANOVA. Image quality and visualization of the arteries were also evaluated and compared using the Friedman's test.

#### **RESULTS**

Image noise was significantly higher for UHR CTA ( $16.3 \pm 2.8$  HU) than for HR CTA ( $14.2 \pm 3.5$  HU,  $P < .001$ ) or 50 keV HR CTA ( $13.4 \pm 2.6$  HU,  $P < .001$ ). Contrast and CNR were significantly lower for UHR CTA ( $355 \pm 79$  and  $22.4 \pm 6.9$ , respectively) and HR CTA ( $362 \pm 78$ ,  $26.9 \pm 8.8$ ) than for 50 keV HR CTA ( $770 \pm 164$ ,  $59.6 \pm 18.1$ ,  $P < .001$  for all). In visual assessment, image noise and artifacts were more severe for HR CTA and UHR CTA than for 50 keV HR CTA ( $P < .001$  and  $P < .05$ , respectively). Image sharpness for UHR CTA was significantly superior to HR CTA and 50 keV HR CTA ( $P < .01$  for both). Overall image quality for 50 keV HR CTA was significantly better than for HR CTA and UHR CTA ( $P < .001$  for both). UHR CTA and 50 keV HR CTA showed better delineation of hepatic artery branches than HR CTA ( $P < .001$  for both), and there were no significant differences between UHR CTA and 50 keV HR CTA ( $P = .998$ ).

#### **CONCLUSION**

Although UHR CTA with PC CT has higher spatial resolution, its overall image quality in the abdominal region was inferior to that of 50keV HR CTA with PC CT due to severe image noise and artifacts, and its ability to depict hepatic arteries was almost equal to that of 50keV HR CTA with PC CT.

#### **CLINICAL RELEVANCE/APPLICATION**

When using photon-counting CT, ultra-high-resolution abdominal CT angiography and spectral CT angiography were equally excellent at visualizing small arterial branches, allowing evaluation of detailed vascular anatomy.

### **M3-SSGI05-4 Consistency and Stability of Monoenergetic Attenuation of Photon-counting Detector CT with Various Scanning Settings: A Phantom Study**

Yanzhao Yang (*Presenter*) Nothing to Disclose

#### **PURPOSE**

The inconsistency in traditional CT attenuation values acquired from different scanning modes greatly affects the promotion of CT quantitative applications. This study aims to determine the consistency of attenuation value (Hounsfield Unit, HU) acquired on a clinical first-generation dual-source Photon Counting Detector (PCD)-CT system using a phantom system across varies tube voltages and radiation doses.

#### **METHODS AND MATERIALS**

A multi-energy CT phantom containing ten different tissue-simulating inserts with a large elliptical ring was imaged on a dual-source PCD-CT scanner. Each scan setting was repeated three times across three tube voltage (90, 120 and 140kV) with three image quality (IQ) level (80, 145 and 180) respectively. Various tissue inserts were used to characterize the consistency and stability of HUs on monoenergetic images between 50 to 80 keV by intraclass correlation coefficient (ICC) and Bland-Altman plots. Mixed-effected linear regression analysis was implemented for exploring the association between the absolute bias and all scan factors.

## RESULTS

A total of 27 acquisitions were performed with all variations of scan parameters. Image noise increase with the decrease of the monoenergetic level and the increase of the image quality level ( $p < 0.001$ ). Taking the attenuation of inserts in a default abdominal scanning mode (120 kVp with IQ level 145) as a reference, high consistency and stability of HU measurements were observed with different tube voltages and radiation exposure levels with PCD-CT (all ICC  $> 0.99$ ). The mean bias across various tissue insert were all less than 5HU among different acquisition modes and monoenergetic levels. No significant influence on the absolute bias of attenuation was observed across all scanning settings except 90kV with IQ level at 80.

## CONCLUSION

PCD-CT provides stable, repeatable and standardized HUs without influence from different scanning modes for a wide range of radiation doses.

## CLINICAL RELEVANCE/APPLICATION

PCD-CT has potential application value for quantification in different scanning modes, especially at an ultra-low dose level, which could drive the standardization of CT quantification applications.

### M3-SSGI05-6 A Technique to Identify Isoattenuating Gallstones with Dual-Energy CT: an in Vivo Study

Todd C. Soesbe, PhD (*Presenter*) Nothing to Disclose

## PURPOSE

To develop a dual-energy CT method for differentiating isoattenuating gallstones from bile and compare it with previously reported dual-energy CT methods by using a retrospective in vivo reader study.

## METHODS AND MATERIALS

CT scans for 20 isoattenuating gallstone positive and 20 gallstone negative patients were retrospectively collected at two separate institutions. All patients (21 men; mean age, 62; age range, 30-88 years) were scanned with dual-energy CT (IQon, Philips Healthcare) from July 2015 and Oct 2019. Positive and negative stone diagnoses were confirmed with MRCP, ERCP, or US performed within 90 days of CT. Conventional, 40 keV monoenergetic, and effective-Z series were created for each patient. Comparing 2D histograms from all gallstone positive to all gallstone negative patients revealed that isoattenuating stones appear in a separate and unique 2D location. A global ROI around this unique 2D location permitted material differentiation and visual segmentation of isoattenuating stones within the conventional CT series. Thus, two custom series were created for each patient using either Compton and photoelectric attenuation data (segmented-1), or denoised 200 and 40 keV monoenergetic data (segmented-2). Four readers evaluated the presence of isoattenuating stones in each of the five series. Inter-reader agreement was measured by interclass correlation coefficient (ICC), diagnostic performance was evaluated by the mean area under the ROC curve (AUC) estimates, and multi-reader multi-case analysis of variance was used to compare series types.

## RESULTS

For the gallstone positive patients, 20 had gallbladder stones, 1 had cystic duct stones, 3 had common bile duct stones, and 4 had contrast scans. For the gallstone negative patients, 15 had contrast scans. For all patients, the segmented-1 and segmented-2 series provided the highest agreements (ICC = 0.86 and 0.94, respectively) and the highest overall AUC (0.95; 95% confidence interval [CI]: 0.91, 1.00, and 0.94; 95% confidence interval [CI]: 0.89, 1.00, respectively).

## CONCLUSION

Both 2D histogram methods accurately differentiated and segmented isoattenuating gallstones from bile in a single colorized CT series. Our in vivo study results agree with those from a recent ex vivo isoattenuating gallstone study that used a similar 2D histogram method and reader study. Furthermore, the vendor-neutral aspects of our improved in vivo method have the potential to make dual-energy CT the reference standard to evaluate gallstone disease.

## CLINICAL RELEVANCE/APPLICATION

This technique can potentially reduce the need for further gastrointestinal imaging with US or MRI, leading to a reduction in imaging cost, time-to-diagnosis, and risk for patients with cholelithiasis or choledocholithiasis.

### Low keV Virtual Monochromatic Images in Abdominal CT Angiography with Photon-counting CT Improve Abdominal Arteries Delineation

Monday, Nov. 27 9:30AM - 10:30AM Room: E350

Takashi Ota, MD, PhD (*Presenter*) Nothing to Disclose

#### PURPOSE

To evaluate the ability of low keV (50 keV) virtual monochromatic images (VMI) to depict abdominal arteries in abdominal CT angiography (CTA) compared to the 70 keV VMI with photon-counting CT (PCCT).

#### METHODS AND MATERIALS

This retrospective study included 50 consecutive patients who underwent abdominal CTA with a PCCT scanner. After intravenous injection of 600 mgI/kg contrast agent in 25 seconds, CTA was scanned 8 seconds after the abdominal aortic attenuation reached 40 HU. Signal-to-noise ratio (SNR) and contrast-to-noise ratio (CNR) in the abdominal aorta (AA), celiac (CeA), superior mesenteric (SMA), renal (RA), and right hepatic artery (RHA) were quantitatively evaluated by region-of-interest analysis on 0.4 mm thickness CT images and compared between 70 keV and 50 keV VMI by paired t-test. Image noise (SD<sub>fat</sub>) was defined as the standard deviation (SD) of CT density for anterior subcutaneous fat. The mean attenuation value of muscles (HU<sub>muscle</sub>) was defined as the CT value of the erector spinae muscles at the same slice and level as that of the CeA. The SNR and the CNR were calculated as follows:  $SNR = HU_{vessel}/SD_{vessel}$ ;  $CNR = (HU_{vessel} - HU_{muscle})/SD_{fat}$ . We created a volume rendering 3D images from the CTA data. We measured the distance from the origin of the CeA to the end of the A8 branch of the RHA to assess how far arterial branches are visualized distally. The software analyzed the vessel route and automatically measured the vessel's length. We compared the length from CeA to A8 at 70 keV VMI with that at 50 keV VMI by using paired t-test.

#### RESULTS

SNR values of 50 keV VMI were significantly higher than those of 70 keV VMI in each artery;  $35.69 \pm 7.52$  vs.  $25.54 \pm 4.34$  for AA,  $21.60 \pm 8.14$  vs.  $18.59 \pm 5.14$  for CeA,  $22.31 \pm 8.18$  vs.  $18.93 \pm 5.58$  for SMA,  $21.38 \pm 8.30$  vs.  $19.11 \pm 5.37$  for RA, and  $13.84 \pm 7.39$  vs.  $12.54 \pm 6.99$  for RHA (all  $p < .05$ ). CNR values of 50 keV VMI were also significantly higher than those of 70 keV VMI in each artery;  $49.29 \pm 15.14$  vs.  $28.42 \pm 7.69$  for AA,  $49.26 \pm 14.44$  vs.  $28.94 \pm 7.71$  for CeA,  $50.45 \pm 15.65$  vs.  $29.70 \pm 8.20$  for SMA,  $50.08 \pm 15.49$  vs.  $29.51 \pm 8.00$  for RA,  $44.73 \pm 14.15$  vs.  $26.62 \pm 7.47$  for RHA (all  $p < .05$ ). The distance between the CeA origin and the A8 end was significantly longer with 50 keV VMI than that with 70 keV VMI:  $192.6 \pm 33.3$  mm with 50 keV VMI and  $180.3 \pm 30.9$  mm with 70 keV VMI ( $p < .001$ ).

#### CONCLUSION

In abdominal CTA with PCCT, the quantitative image quality of 50 keV VMI was better than that of 70 keV VMI. In addition, 3D CTA with 50 keV VMI could depict branches of the RHA more peripherally than that with 70 keV VMI.

#### CLINICAL RELEVANCE/APPLICATION

Low keV virtual monochromatic images have the advantage of delineating arterial branches more peripherally on abdominal CT angiography with photon-counting CT, allowing for a more detailed understanding of the vascular anatomy.

### Ultra-high-resolution Abdominal CT Angiography using Photon-counting CT: A Comparison with Spectral CT Angiography

Monday, Nov. 27 9:30AM - 10:30AM Room: E350

Hiromitsu Onishi, MD, PhD (*Presenter*) Research Grant, General Electric Company; Speakers Bureau, General Electric Company

#### PURPOSE

A clinical photon-counting (PC) CT scanner can produce images with a minimum slice thickness of 0.2 mm, but for virtual monochromatic images (VMIs), the minimum thickness is limited to 0.4 mm. The purpose of our study was to compare ultra-high-resolution (UHR) abdominal CT angiography (CTA) using 0.2 mm images with spectral CTA using 0.4 mm images in the visualization of arteries at PC CT.

#### METHODS AND MATERIALS

This retrospective study included 61 consecutive patients with suspected hepatopancreatobiliary cancer who underwent abdominal CT using a PC CT scanner. For UHR CTA, early arterial phase images after 600 mgI/kg contrast administration were reconstructed with a matrix of 1024×1024, a field of view (FOV) of 205 mm x 205 mm, and a thickness of 0.2 mm (0.2 mm isotropic voxel) using all counted events (termed T3D for PC CT) at 120 kVp. Using the same raw data, 120 kVp T3D and 50 keV VMIs with a 1024 x 1024 matrix, 410 mm x 410 mm FOV, and 0.4 mm thickness (0.4 mm isotropic voxel) were also reconstructed for high-resolution (HR) CTA and 50 keV spectral HR CTA, respectively. Image noise, contrast, and contrast-to-noise ratio (CNR) between hepatic artery and liver parenchyma were measured on maximum intensity projection CTA images and compared using ANOVA. Image quality and visualization of the arteries were also evaluated and compared using the Friedman's test.

#### RESULTS

Image noise was significantly higher for UHR CTA ( $16.3 \pm 2.8$  HU) than for HR CTA ( $14.2 \pm 3.5$  HU,  $P < .001$ ) or 50 keV HR CTA ( $13.4 \pm 2.6$  HU,  $P < .001$ ). Contrast and CNR were significantly lower for UHR CTA ( $355 \pm 79$  and  $22.4 \pm 6.9$ , respectively) and HR CTA ( $362 \pm 78$ ,  $26.9 \pm 8.8$ ) than for 50 keV HR CTA ( $770 \pm 164$ ,  $59.6 \pm 18.1$ ,  $P < .001$  for all). In visual assessment, image noise and artifacts were more severe for HR CTA and UHR CTA than for 50 keV HR CTA ( $P < .001$  and  $P < .05$ , respectively). Image sharpness for UHR CTA was significantly superior to HR CTA and 50 keV HR CTA ( $P < .01$  for both). Overall image quality for 50 keV HR CTA was significantly better than for HR CTA and UHR CTA ( $P < .001$  for both). UHR CTA and 50 keV HR CTA showed better delineation of hepatic artery branches than HR CTA ( $P < .001$  for both), and there were no significant differences between UHR CTA and 50 keV HR CTA ( $P = .998$ ).

#### CONCLUSION

Although UHR CTA with PC CT has higher spatial resolution, its overall image quality in the abdominal region was inferior to that of 50keV HR CTA with PC CT due to severe image noise and artifacts, and its ability to depict hepatic arteries was almost equal to that of 50keV HR CTA with PC CT.

#### CLINICAL RELEVANCE/APPLICATION

When using photon-counting CT, ultra-high-resolution abdominal CT angiography and spectral CT angiography were equally excellent at visualizing small arterial branches, allowing evaluation of detailed vascular anatomy.

### **Consistency and Stability of Monoenergetic Attenuation of Photon-counting Detector CT with Various Scanning Settings: A Phantom Study**

Monday, Nov. 27 9:30AM - 10:30AM Room: E350

Yanzhao Yang (*Presenter*) Nothing to Disclose

#### **PURPOSE**

The inconsistency in traditional CT attenuation values acquired from different scanning modes greatly affects the promotion of CT quantitative applications. This study aims to determine the consistency of attenuation value (Hounsfield Unit, HU) acquired on a clinical first-generation dual-source Photon Counting Detector (PCD)-CT system using a phantom system across various tube voltages and radiation doses.

#### **METHODS AND MATERIALS**

A multi-energy CT phantom containing ten different tissue-simulating inserts with a large elliptical ring was imaged on a dual-source PCD-CT scanner. Each scan setting was repeated three times across three tube voltage (90, 120 and 140kV) with three image quality (IQ) level (80, 145 and 180) respectively. Various tissue inserts were used to characterize the consistency and stability of HUs on monoenergetic images between 50 to 80 keV by intraclass correlation coefficient (ICC) and Bland-Altman plots. Mixed-effected linear regression analysis was implemented for exploring the association between the absolute bias and all scan factors.

#### **RESULTS**

A total of 27 acquisitions were performed with all variations of scan parameters. Image noise increase with the decrease of the monoenergetic level and the increase of the image quality level ( $p < 0.001$ ). Taking the attenuation of inserts in a default abdominal scanning mode (120 kVp with IQ level 145) as a reference, high consistency and stability of HU measurements were observed with different tube voltages and radiation exposure levels with PCD-CT (all ICC > 0.99). The mean bias across various tissue insert were all less than 5HU among different acquisition modes and monoenergetic levels. No signification influence on the absolute bias of attenuation was observed across all scanning settings except 90kV with IQ level at 80.

#### **CONCLUSION**

PCD-CT provides stable, repeatable and standardized HUs without influence from different scanning modes for a wide range of radiation doses.

#### **CLINICAL RELEVANCE/APPLICATION**

PCD-CT has potential application value for quantification in different scanning modes, especially at an ultra-low dose level, which could drive the standardization of CT quantification applications.

#### **M3-SSGI06-1 Inter-Exam Reproducibility of Contrast-Enhanced Liver MRI Radiomics Features: Optimization by Tissue-Based Image Normalization and Bias Field Correction**

Bryan A. Blakeney, MD, PhD (*Presenter*) Nothing to Disclose

#### **PURPOSE**

Contrast-enhanced MRI is an important imaging modality for evaluating liver pathology. Lack of standardized intensity units and nonuniform signal intensities (bias field) are challenges specific for radiomic analysis of MRI. Reproducibility is an important performance metric of imaging biomarker development. This study evaluates image pre-processing methods for contrast-enhanced liver MRI.

#### **METHODS AND MATERIALS**

This is a single center retrospective study including 19 patients with two multiphase gadoteric acid-enhanced liver MRIs for evaluation of Focal Nodular Hyperplasia (FNH) on Siemens and Philips, 1.5T (n=23) and 3T (15), systems. From 54 patients, exclusion criteria were cancer (24), missing phases (4), and alternative diagnosis (7). The largest FNH was manually segmented, and spherical regions of interests were placed on reference tissues (right and left liver lobes, spleen, subcutaneous fat, vertebral body, paraspinal muscle, and aorta) using 3D Slicer 5.0.3. First and second order radiomics features were calculated with or without N4ITK bias field correction (BFC), on signal intensity normalized to whole image and each reference tissue, using PyRadiomics (custom version based on version 3.0.1) on original pre-contrast, arterial, and hepatobiliary phases and their Laplacian of Gauss and Wavelet transformations. Concordance Correlation Coefficient (CCC) was calculated to measure reproducibility across the two imaging studies. The effect of normalization methods, BFC, and imaging phase on CCC was assessed by multivariable linear regression.

#### **RESULTS**

For each pre-processed exam, 3354 radiomics features were calculated. Normalization of image intensity to right or ipsilateral (to FNH) liver lobe improved mean CCC (0.59 and 0.60 respectively vs 0.43 for no normalization) and was statistically significantly higher ( $p < 0.0001$ ) than any other normalization. BFC independently improved mean CCC overall ( $p < 0.0001$ ) and in pairwise comparison for right or ipsilateral liver vs. non-BFC when averaged over all phases. Right and ipsilateral liver normalization after BFC produced the most radiomic features (1180 and 1172, respectively) meeting lower 95% confidence interval bound for CCC  $> 0.5$ .

#### **CONCLUSION**

Reproducibility of radiomics features in liver is improved by pre-processing with normalization to right or ipsilateral liver lobe and with bias field correction. This study suggests the benefit of standardized MR image processing for radiomic analysis for radiomics-based biomarker development.

#### **CLINICAL RELEVANCE/APPLICATION**

Image pre-processing impacts the reproducibility of radiomics features on contrast-enhanced liver MRI. Standardizing image processing is important for biomarker development using liver MRI radiomics.

#### **M3-SSGI06-2 Liver MRI-Derived Proton Density Fat Fraction: An Image-Derived Phenotype Causally Affects Pan-liver Disease Risk**

MD (*Presenter*) Nothing to Disclose

## PURPOSE

Liver MRI-derived proton density fat fraction (MRI-PDFF) plays an important role in clinical trials. A better understanding of MRI-PDFF associated with pan-liver diseases might support its promotion. To quantify the genetically predicted causal effect of liver MRI-PDFF across the pan-liver disease. To quantify the genetically predicted causal effect of liver MRI-PDFF across the pan-liver disease.

## METHODS AND MATERIALS

This population-based study was mainly derived from summary-level data and 378,436 individual data from UK Biobank and FinnGen. The primary analysis of Mendelian randomization (MR) analysis was conducted using the inverse-variance-weighted method to explore the causal association between genetically determined liver MRI-PDFF and pan-liver disease risk under Bonferroni correction. Logistic regression was performed to validate the association between liver MRI-PDFF PRS and pan-liver disease risk at individual-level data. Mediation analyses were performed using the multivariable MR framework.

## RESULTS

Genetically predicted high liver MRI-PDFF was associated with increased risks of malignant liver neoplasm (odds ratio [OR], 4.52;  $P = 3.28 \times 10^{-9}$ ), alcoholic liver disease (OR, 1.91;  $P = 1.07 \times 10^{-4}$ ), fibrosis and cirrhosis of liver (OR, 3.03;  $P = 1.75 \times 10^{-14}$ ), fibrosis of liver (OR, 3.61;  $P = .002$ ), cirrhosis of liver (OR, 3.77;  $P = 7.37 \times 10^{-9}$ ), nonalcoholic steatohepatitis (OR, 7.66;  $P = 2.86 \times 10^{-8}$ ), and NAFLD (OR, 4.39;  $P = 6.10 \times 10^{-8}$ ), respectively. Additionally, individual-level evidence similarly supported the association described mentioned above based on the liver MRI-PDFF PRS (all  $P < .004$ ). The mediation analysis indicated genetically predicted high-density lipoprotein cholesterol, type 2 diabetes mellitus, and waist-to-hip ratio (25.1%-46.3% mediation effects) were related to the occurrence of fibrosis and cirrhosis of liver, cirrhosis of liver, and NAFLD via liver MRI-PDFF (all  $P < .005$ ).

## CONCLUSION

The study provided evidence that the associations of genetically predicted liver MRI-PDFF with liver health, promoting MRI-PDFF in routine clinical practice.

## CLINICAL RELEVANCE/APPLICATION

The liver MRI-PDFF has a causal association with pan-liver disease risk and is a mediator of metabolic phenotypes, to provide evidence for liver health monitoring.

## M3-SSGI06-3 Results of the Non-invasive Biomarkers of Metabolic Liver Disease NIMBLE study 1.1 on the Reproducibility and Repeatability of US Fat Quantification Techniques in Non-alcoholic Fatty Liver Disease

Arinc Ozturk, MD (*Presenter*) Nothing to Disclose

## PURPOSE

Non-alcoholic fatty liver disease (NAFLD) is the most common cause of liver disease worldwide. Non-invasive liver fat quantification is important for diagnosis and treatment response assessment. Ultrasound-based fat quantification methods include attenuation coefficient (AC), speed of sound (SoS), shear wave dispersion (SWD), controlled attenuation parameter (CAP), Ultrasound derived fat fraction (UDFF), viscosity, and hepatorenal index (HRI). Defining the reproducibility and repeatability of these quantitative biomarkers is relevant for clinical biomarker interpretation and for use as endpoints in clinical trials. The aim of this study was to quantify the inter-vendor reproducibility and operator repeatability and reproducibility of these measures.

## METHODS AND MATERIALS

Prospective two-center study of adults with suspected or established NAFLD stratified by Fibrosis-4 Index (FIB-4). Participants underwent 6 examinations on different ultrasound systems and CAP on two days, each day by a different operator, less than a week apart. Operators and clinical investigators were blinded and a pre-specified scanning order was maintained. Different day/different operator reproducibility coefficient (RDCDDO), same-day/same-operator repeatability coefficient (RCSOSO), and different-scanner reproducibility coefficient (RDCDS) were calculated for each biomarker. RDC reflects the smallest difference between two measurements due to change in underlying steatosis rather than measurement variability; lower is better.

## RESULTS

40 participants (mean age 60 years, 60% female) with low (17), intermediate (15), and high (8) FIB-4 scores were recruited. Mean BMI was 30.9 kg/m<sup>2</sup>. Precision point estimates (RDCDDO, RCSOSO) pooled across manufacturers were: HRI (82.4%, 73.6%), SWD (69.1%, 23.5%), CAP (26%, 21%), UDFF (57.8%, 37.3%), SoS (5%, 5%), AC (26%, 18%) and viscosity (43.2%, 34.1%). RDCDS was 80.8% and 51% for HRI and AC respectively [Table1].

## CONCLUSION

SoS, AC, and CAP were the most reproducible and repeatable fat quantification biomarkers while HRI was the least. Variability across vendors was high. A  $\geq 26\%$  difference in different-day AC or CAP measurements constitutes a true patient change rather than measurement variability. UDF and viscosity demonstrated intermediate performance. SWD was repeatable by the same operator, but less reproducible by different operators. The high variability between vendors means that the results are vendor dependent and not interchangeable.

## CLINICAL RELEVANCE/APPLICATION

Non-invasive US-based steatosis assessment biomarkers are available on many US systems. Understanding expected quantitative biomarker variability guides clinical interpretation and clinical trial utilization.

### M3-SSGI06-4 Development and Validation of Quantitative Clinical Ultrasound Shear Wave Elastography Exam Quality Metrics

Siddhi Hegde, MBBS (*Presenter*) Nothing to Disclose

## PURPOSE

Interquartile range (IQR) to median (IQR/M) ratio is the quality metric for vibration controlled transient elastography which has been extrapolated to shear wave elastography (SWE) despite limited evidence. We 1) assess the performance of the existing IQR/M 30% threshold 2) characterize SWE discrimination as a function of IQR/M, and 3) propose body mass index (BMI) and skin to liver capsule distance (SCD) quality indices to predict low-quality (LQ) SWE exams.

## METHODS AND MATERIALS

A single-center retrospective cross-sectional study of adult patients with suspected nonalcoholic fatty liver disease (NAFLD) with non-focal liver biopsy results and US 2D-SWE exams within 1 year was performed. Histopathological fibrosis stage =2 (NASH CRN or Brunt) was considered clinically significant fibrosis (CSF). All pathology slides were reviewed twice by an experienced pathologist to obtain fibrosis decision. A median value of  $< 50$  kilopascals (kPa) from at least 3 SWE measurements constituted a valid case. IQR was calculated using the MS Excel quartile.inc function. IQR/M was reported as a percentage. Receiver operator characteristic (ROC) curves to assess SWE prediction of CSF were plotted for high-quality (HQ) and LQ exams and area under the curve (AUC) was compared by DeLong's test. AUC vs number of included cases under the threshold was assessed across IQR/M thresholds. SCD was manually calculated by trained physicians on the first SWE image. AUCs assessed BMI and SCD prediction of LQ exams.

## RESULTS

546 cases were included (49.4%, n=269 female) with mean (standard deviation) age of 52.1 (12.8) years. 162 (29.7%) cases had CSF. Median SWE predicted CSF with AUC of 0.69 (Odds ratio (OR) 1.06 (95% confidence intervals (CI) 1.04-1.09,  $p < 0.001$ ). At the standard IQR/M threshold of 30%, HQ AUC was 0.80 (OR 1.19, 95% CI 1.12-1.27) with inclusion of 58.6% cases. LQ SWE performed significantly worse (AUC 0.59, DeLong's test  $p < 0.001$ ). At an IQR/M threshold of 20%, HQ AUC was 0.82 (OR 1.42, 95% CI 1.28-1.59) with inclusion of 42.5% cases. At an IQR/M threshold of 60%, HQ AUC was 0.77 (OR 1.16, 95% CI 1.12-1.22) with inclusion of 80.4% cases. BMI and SCD were significant predictors of LQ exams (AUC= 0.6273, 0.7238 respectively, both  $p < 0.001$ ); SCD performance was superior (OR 3.12, 95% CI 2.31-4.29).

## CONCLUSION

Low IQR/M predicts better SWE performance. IQR/M thresholds from 20% - 60% can prioritize accuracy or minimize non-diagnostic exams. The current standard threshold is an acceptable compromise. SCD better predicts LQ exams than BMI. SCD may predict LQ exams without requiring 10 SWE measurements.

## CLINICAL RELEVANCE/APPLICATION

Optimal selection of a quantitative SWE quality threshold will maximize clinical diagnostic performance while minimizing non-diagnostic exams.

### M3-SSGI06-5 AI-SCD: A Deep Learning Approach for Skin-to-Liver Capsule Distance Measurement to Optimize Shear Wave Elastography Performance

Abder-Rahman Ali, MSc, PhD (*Presenter*) Nothing to Disclose

## PURPOSE

Increased skin-to-liver capsule distance (SCD) degrades ultrasound shear wave elastography (SWE) measurements due to beam aberration and attenuation. We propose an SCD threshold to predict unreliable SWE exams and develop an artificial intelligence (AI)-measured SCD (AI-SCD) to automate the process.

## METHODS AND MATERIALS

AI-SCD was trained using self-supervised learning (SimCLR) on 17,441 unannotated liver B-mode images, distinct from the cohort below, followed by fine-tuning on 495 radiologist-annotated images using ENet, a supervised learning approach for liver segmentation. The algorithm calculates AI-SCD along the image central axis using a pixel spacing and physical distance conversion factor. We then performed a single-center retrospective cross-sectional study of adult patients with suspected chronic liver disease with non-focal liver biopsy and SWE exams within 1 year. Clinically significant fibrosis (CSF) was considered stage = 2 (or = 3 for Ishak). Cases with SWE median stiffness (MS) <50 kilopascals (kPa) from at least 3 SWE measurements were included. Manual annotated-SCD and AI-SCD were estimated for each case using B-mode images. AUC was calculated for MS predicting CSF before and after stratifying by high and low Manual-SCD and AI-SCD using a threshold of 2.5 cm. AUCs were compared using the DeLong test considering  $p < 0.05$  to be statistically significant.

## RESULTS

1,300 cases (621 women, 48%) with mean age  $50.8 \pm 14.1$  years were analysed. Fatty liver disease (600), viral hepatitis (114), nonspecific (263) and other causes (147) were the causes of liver disease in our dataset. 385 (29.6%) had CSF. Manual SCD (0.6 - 9.2 cm, median 2.0 cm) and AI-SCD (0.89 - 8.6 cm, median 2.03 cm) demonstrated moderate correlation (Pearson's  $r=0.68$ ,  $p < 0.001$ ), minimal bias (0.02 cm) and 95% limits of agreement of -1.05 to 1.09cm. MS was a significant predictor of CSF (AUC = 0.72, odds ratio = 1.085,  $p < 0.001$ ). AUC was higher for low Manual-SCD (988 cases, 76%) than high Manual-SCD (0.77 vs 0.58,  $p < 0.001$ ). AUC was higher for low AI-SCD (989 cases, 76.1%) than high AI-SCD (0.77 vs 0.6,  $p < 0.001$ ).

## CONCLUSION

High SCD reduces SWE exam performance for predicting CSF. AI-SCD can reliably, precisely, and automatically estimate SCD to predict exams that are more likely to be nondiagnostic. This may be useful to select patients who will most benefit from SWE and guide remaining patients to alternate diagnostic strategies like biopsy or magnetic resonance imaging. AI-SCD may also provide a future pathway to automatically optimize SWE acquisition settings to maximize measurement quality.

## CLINICAL RELEVANCE/APPLICATION

Automated SCD calculation may provide a future pathway to automatically optimize SWE acquisition settings to maximize measurement quality.

## M3-SSGI06-6 Co-registration Techniques of MRI Rectum and ex vivo Rectal Whole-Mount Histology: A Feasibility Study

Joao Manoel M. Santos, MD (*Presenter*) Nothing to Disclose

## PURPOSE

Accurate assessment of treatment response requires robust spatial anatomical correlation between histopathology and MRI to create reliable ground-truth labels for training radiomics algorithms. To achieve this, a multimodal radiology-pathology image registration workflow is necessary. This study aims to develop a radiology-pathology co-registration method that enables 1:1 automated spatial mapping between preoperative rectal MRI and ex vivo rectal whole-mount histology (WMH).

## METHODS AND MATERIALS

The study population included 13 patients with rectal adenocarcinoma who underwent neoadjuvant therapy followed by TME from 2018 to 2022, with available WMH and both baseline and post neoadjuvant MRI. A multimodal radiology-pathology image registration workflow was developed. For each patient, 3 axial levels were identified: the center of the tumor bed, one superior and one inferior slice. Using 3 axial levels, the following steps were performed 1) Tumor bed, contours of the internal and external borders of the rectum and 8 corresponding landmarks were manually delineated on T2WI images and corresponding WMH images by a radiologist and a pathologist; 2) Rigid point-based registration of images with automated rescaling was computed via the delineated landmarks, and biomechanically constrained elastic deformable registration was computed from the initial rigid alignment between the annotated internal and external rectal contours to account for differences in MR and WMH rectal distension; 3) Outputs from the multimodal image fusion system were rendered in 3D Slicer to obtain accurate and precise visualization. Dice overlap and modified Hausdorff distance (MHD) of the segmented external, internal, and tumor bed contours were obtained.

## RESULTS

When comparing the rigid point-based registration with deformable image registration, Dice overlap varied from 0.85 to 0.95 mm in the external rectal contour ( $p = 0.0028$ ), and 0.47 to 0.55 mm in the internal contour ( $p = 0.033$ ). MHD, which exhibits the distance to agreement of the delineated MR rectum and histological images, varied from 1.76 to 0.59 mm in the external rectal contour ( $p = 0.008$ ), and 1.67 to 1.23 mm in the internal contour ( $p = 0.01$ ).

## CONCLUSION

This study showed promising results in terms of multimodal image fusion and precise anatomical correlation. Deformable registration significantly improves the internal and external contour agreement over rigid point-based registration.

## **CLINICAL RELEVANCE/APPLICATION**

The clinical impact is related to increasing the accuracy of MRI in assessing treatment response of patients with rectal cancer after neoadjuvant therapy, allowing rectal preservation and thereby improving patients' outcomes and quality of life.

### Inter-Exam Reproducibility of Contrast-Enhanced Liver MRI Radiomics Features: Optimization by Tissue-Based Image Normalization and Bias Field Correction

Monday, Nov. 27 9:30AM - 10:30AM Room: E352

Bryan A. Blakeney, MD, PhD (*Presenter*) Nothing to Disclose

#### PURPOSE

Contrast-enhanced MRI is an important imaging modality for evaluating liver pathology. Lack of standardized intensity units and nonuniform signal intensities (bias field) are challenges specific for radiomic analysis of MRI. Reproducibility is an important performance metric of imaging biomarker development. This study evaluates image pre-processing methods for contrast-enhanced liver MRI.

#### METHODS AND MATERIALS

This is a single center retrospective study including 19 patients with two multiphase gadoteric acid-enhanced liver MRIs for evaluation of Focal Nodular Hyperplasia (FNH) on Siemens and Philips, 1.5T (n=23) and 3T (15), systems. From 54 patients, exclusion criteria were cancer (24), missing phases (4), and alternative diagnosis (7). The largest FNH was manually segmented, and spherical regions of interests were placed on reference tissues (right and left liver lobes, spleen, subcutaneous fat, vertebral body, paraspinal muscle, and aorta) using 3D Slicer 5.0.3. First and second order radiomics features were calculated with or without N4ITK bias field correction (BFC), on signal intensity normalized to whole image and each reference tissue, using PyRadiomics (custom version based on version 3.0.1) on original pre-contrast, arterial, and hepatobiliary phases and their Laplacian of Gauss and Wavelet transformations. Concordance Correlation Coefficient (CCC) was calculated to measure reproducibility across the two imaging studies. The effect of normalization methods, BFC, and imaging phase on CCC was assessed by multivariable linear regression.

#### RESULTS

For each pre-processed exam, 3354 radiomics features were calculated. Normalization of image intensity to right or ipsilateral (to FNH) liver lobe improved mean CCC (0.59 and 0.60 respectively vs 0.43 for no normalization) and was statistically significantly higher ( $p < 0.0001$ ) than any other normalization. BFC independently improved mean CCC overall ( $p < 0.0001$ ) and in pairwise comparison for right or ipsilateral liver vs. non-BFC when averaged over all phases. Right and ipsilateral liver normalization after BFC produced the most radiomic features (1180 and 1172, respectively) meeting lower 95% confidence interval bound for CCC  $> 0.5$ .

#### CONCLUSION

Reproducibility of radiomics features in liver is improved by pre-processing with normalization to right or ipsilateral liver lobe and with bias field correction. This study suggests the benefit of standardized MR image processing for radiomic analysis for radiomics-based biomarker development.

#### CLINICAL RELEVANCE/APPLICATION

Image pre-processing impacts the reproducibility of radiomics features on contrast-enhanced liver MRI. Standardizing image processing is important for biomarker development using liver MRI radiomics.

### Liver MRI-Derived Proton Density Fat Fraction: An Image-Derived Phenotype Causally Affects Pan-liver Disease Risk

Monday, Nov. 27 9:30AM - 10:30AM Room: E352

Tianyi Xia, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

Liver MRI-derived proton density fat fraction (MRI-PDFF) plays an important role in clinical trials. A better understanding of MRI-PDFF associated with pan-liver diseases might support its promotion. To quantify the genetically predicted causal effect of liver MRI-PDFF across the pan-liver disease. To quantify the genetically predicted causal effect of liver MRI-PDFF across the pan-liver disease.

#### METHODS AND MATERIALS

This population-based study was mainly derived from summary-level data and 378,436 individual data from UK Biobank and FinnGen. The primary analysis of Mendelian randomization (MR) analysis was conducted using the inverse-variance-weighted method to explore the causal association between genetically determined liver MRI-PDFF and pan-liver disease risk under Bonferroni correction. Logistic regression was performed to validate the association between liver MRI-PDFF PRS and pan-liver disease risk at individual-level data. Mediation analyses were performed using the multivariable MR framework.

#### RESULTS

Genetically predicted high liver MRI-PDFF was associated with increased risks of malignant liver neoplasm (odds ratio [OR], 4.52;  $P = 3.28 \times 10^{-9}$ ), alcoholic liver disease (OR, 1.91;  $P = 1.07 \times 10^{-4}$ ), fibrosis and cirrhosis of liver (OR, 3.03;  $P = 1.75 \times 10^{-14}$ ), fibrosis of liver (OR, 3.61;  $P = .002$ ), cirrhosis of liver (OR, 3.77;  $P = 7.37 \times 10^{-9}$ ), nonalcoholic steatohepatitis (OR, 7.66;  $P = 2.86 \times 10^{-8}$ ), and NAFLD (OR, 4.39;  $P = 6.10 \times 10^{-8}$ ), respectively. Additionally, individual-level evidence similarly supported the association described mentioned above based on the liver MRI-PDFF PRS (all  $P < .004$ ). The mediation analysis indicated genetically predicted high-density lipoprotein cholesterol, type 2 diabetes mellitus, and waist-to-hip ratio (25.1%-46.3% mediation effects) were related to the occurrence of fibrosis and cirrhosis of liver, cirrhosis of liver, and NAFLD via liver MRI-PDFF (all  $P < .005$ ).

#### CONCLUSION

The study provided evidence that the associations of genetically predicted liver MRI-PDFF with liver health, promoting MRI-PDFF in routine clinical practice.

#### CLINICAL RELEVANCE/APPLICATION

The liver MRI-PDFF has a causal association with pan-liver disease risk and is a mediator of metabolic phenotypes, to provide evidence for liver health monitoring.

### Results of the Non-invasive Biomarkers of Metabolic Liver Disease NIMBLE study 1.1 on the Reproducibility and Repeatability of US Fat Quantification Techniques in Non-alcoholic Fatty Liver Disease

Monday, Nov. 27 9:30AM - 10:30AM Room: E352

Arinc Ozturk, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

Non-alcoholic fatty liver disease (NAFLD) is the most common cause of liver disease worldwide. Non-invasive liver fat quantification is important for diagnosis and treatment response assessment. Ultrasound-based fat quantification methods include attenuation coefficient (AC), speed of sound (SoS), shear wave dispersion (SWD), controlled attenuation parameter (CAP), Ultrasound derived fat fraction (UDFF), viscosity, and hepatorenal index (HRI). Defining the reproducibility and repeatability of these quantitative biomarkers is relevant for clinical biomarker interpretation and for use as endpoints in clinical trials. The aim of this study was to quantify the inter-vendor reproducibility and operator repeatability and reproducibility of these measures.

#### METHODS AND MATERIALS

Prospective two-center study of adults with suspected or established NAFLD stratified by Fibrosis-4 Index (FIB-4). Participants underwent 6 examinations on different ultrasound systems and CAP on two days, each day by a different operator, less than a week apart. Operators and clinical investigators were blinded and a pre-specified scanning order was maintained. Different day/different operator reproducibility coefficient (RDCDDDO), same-day/same-operator repeatability coefficient (RCSDSO), and different-scanner reproducibility coefficient (RDCDS) were calculated for each biomarker. RDC reflects the smallest difference between two measurements due to change in underlying steatosis rather than measurement variability; lower is better.

#### RESULTS

40 participants (mean age 60 years, 60% female) with low (17), intermediate (15), and high (8) FIB-4 scores were recruited. Mean BMI was 30.9 kg/m<sup>2</sup>. Precision point estimates (RDCDDDO, RCSDSO) pooled across manufacturers were: HRI (82.4%, 73.6%), SWD (69.1%, 23.5%), CAP (26%, 21%), UDFF (57.8%, 37.3%), SoS (5%, 5%), AC (26%, 18%) and viscosity (43.2%, 34.1%). RDCDS was 80.8% and 51% for HRI and AC respectively [Table1].

#### CONCLUSION

SoS, AC, and CAP were the most reproducible and repeatable fat quantification biomarkers while HRI was the least. Variability across vendors was high. A  $\geq 26\%$  difference in different-day AC or CAP measurements constitutes a true patient change rather than measurement variability. UDFF and viscosity demonstrated intermediate performance. SWD was repeatable by the same operator, but less reproducible by different operators. The high variability between vendors means that the results are vendor dependent and not interchangeable.

#### CLINICAL RELEVANCE/APPLICATION

Non-invasive US-based steatosis assessment biomarkers are available on many US systems. Understanding expected quantitative biomarker variability guides clinical interpretation and clinical trial utilization.

M3-SSGI06-4

### Development and Validation of Quantitative Clinical Ultrasound Shear Wave Elastography Exam Quality Metrics

Monday, Nov. 27 9:30AM - 10:30AM Room: E352

Siddhi Hegde, MBBS (*Presenter*) Nothing to Disclose

#### PURPOSE

Interquartile range (IQR) to median (IQR/M) ratio is the quality metric for vibration controlled transient elastography which has been extrapolated to shear wave elastography (SWE) despite limited evidence. We 1) assess the performance of the existing IQR/M 30% threshold 2) characterize SWE discrimination as a function of IQR/M, and 3) propose body mass index (BMI) and skin to liver capsule distance (SCD) quality indices to predict low-quality (LQ) SWE exams.

#### METHODS AND MATERIALS

A single-center retrospective cross-sectional study of adult patients with suspected nonalcoholic fatty liver disease (NAFLD) with non-focal liver biopsy results and US 2D-SWE exams within 1 year was performed. Histopathological fibrosis stage =2 (NASH CRN or Brunt) was considered clinically significant fibrosis (CSF). All pathology slides were reviewed twice by an experienced pathologist to obtain fibrosis decision. A median value of <50 kilopascals (kPa) from at least 3 SWE measurements constituted a valid case. IQR was calculated using the MS Excel quartile.inc function. IQR/M was reported as a percentage. Receiver operator characteristic (ROC) curves to assess SWE prediction of CSF were plotted for high-quality (HQ) and LQ exams and area under the curve (AUC) was compared by DeLong's test. AUC vs number of included cases under the threshold was assessed across IQR/M thresholds. SCD was manually calculated by trained physicians on the first SWE image. AUCs assessed BMI and SCD prediction of LQ exams.

#### RESULTS

546 cases were included (49.4%, n=269 female) with mean (standard deviation) age of 52.1 (12.8) years. 162 (29.7%) cases had CSF. Median SWE predicted CSF with AUC of 0.69 (Odds ratio (OR) 1.06 (95% confidence intervals (CI) 1.04-1.09,  $p < 0.001$ ). At the standard IQR/M threshold of 30%, HQ AUC was 0.80 (OR 1.19, 95% CI 1.12-1.27) with inclusion of 58.6% cases. LQ SWE performed significantly worse (AUC 0.59, DeLong's test  $p < 0.001$ ). At an IQR/M threshold of 20%, HQ AUC was 0.82 (OR 1.42, 95% CI 1.28-1.59) with inclusion of 42.5% cases. At an IQR/M threshold of 60%, HQ AUC was 0.77 (OR 1.16, 95% CI 1.12-1.22) with inclusion of 80.4% cases. BMI and SCD were significant predictors of LQ exams (AUC= 0.6273, 0.7238 respectively, both  $p < 0.001$ ); SCD performance was superior (OR 3.12, 95% CI 2.31-4.29).

#### CONCLUSION

Low IQR/M predicts better SWE performance. IQR/M thresholds from 20% - 60% can prioritize accuracy or minimize non-diagnostic exams. The current standard threshold is an acceptable compromise. SCD better predicts LQ exams than BMI. SCD may predict LQ exams without requiring 10 SWE measurements.

#### CLINICAL RELEVANCE/APPLICATION

Optimal selection of a quantitative SWE quality threshold will maximize clinical diagnostic performance while minimizing non-diagnostic exams.

### AI-SCD: A Deep Learning Approach for Skin-to-Liver Capsule Distance Measurement to Optimize Shear Wave Elastography Performance

Monday, Nov. 27 9:30AM - 10:30AM Room: E352

Abder-Rahman Ali, MSc, PhD (*Presenter*) Nothing to Disclose

#### PURPOSE

Increased skin-to-liver capsule distance (SCD) degrades ultrasound shear wave elastography (SWE) measurements due to beam aberration and attenuation. We propose an SCD threshold to predict unreliable SWE exams and develop an artificial intelligence (AI)-measured SCD (AI-SCD) to automate the process.

#### METHODS AND MATERIALS

AI-SCD was trained using self-supervised learning (SimCLR) on 17,441 unannotated liver B-mode images, distinct from the cohort below, followed by fine-tuning on 495 radiologist-annotated images using ENet, a supervised learning approach for liver segmentation. The algorithm calculates AI-SCD along the image central axis using a pixel spacing and physical distance conversion factor. We then performed a single-center retrospective cross-sectional study of adult patients with suspected chronic liver disease with non-focal liver biopsy and SWE exams within 1 year. Clinically significant fibrosis (CSF) was considered stage = 2 (or = 3 for Ishak). Cases with SWE median stiffness (MS) <50 kilopascals (kPa) from at least 3 SWE measurements were included. Manual annotated-SCD and AI-SCD were estimated for each case using B-mode images. AUC was calculated for MS predicting CSF before and after stratifying by high and low Manual-SCD and AI-SCD using a threshold of 2.5 cm. AUCs were compared using the DeLong test considering  $p < 0.05$  to be statistically significant.

#### RESULTS

1,300 cases (621 women, 48%) with mean age  $50.8 \pm 14.1$  years were analysed. Fatty liver disease (600), viral hepatitis (114), nonspecific (263) and other causes (147) were the causes of liver disease in our dataset. 385 (29.6%) had CSF. Manual SCD (0.6 - 9.2 cm, median 2.0 cm) and AI-SCD (0.89 - 8.6 cm, median 2.03 cm) demonstrated moderate correlation (Pearson's  $r=0.68$ ,  $p < 0.001$ ), minimal bias (0.02 cm) and 95% limits of agreement of -1.05 to 1.09cm. MS was a significant predictor of CSF (AUC = 0.72, odds ratio = 1.085,  $p < 0.001$ ). AUC was higher for low Manual-SCD (988 cases, 76%) than high Manual-SCD (0.77 vs 0.58,  $p < 0.001$ ). AUC was higher for low AI-SCD (989 cases, 76.1%) than high AI-SCD (0.77 vs 0.6,  $p < 0.001$ ).

#### CONCLUSION

High SCD reduces SWE exam performance for predicting CSF. AI-SCD can reliably, precisely, and automatically estimate SCD to predict exams that are more likely to be nondiagnostic. This may be useful to select patients who will most benefit from SWE and guide remaining patients to alternate diagnostic strategies like biopsy or magnetic resonance imaging. AI-SCD may also provide a future pathway to automatically optimize SWE acquisition settings to maximize measurement quality.

#### CLINICAL RELEVANCE/APPLICATION

Automated SCD calculation may provide a future pathway to automatically optimize SWE acquisition settings to maximize measurement quality.

### Co-registration Techniques of MRI Rectum and ex vivo Rectal Whole-Mount Histology: A Feasibility Study

Monday, Nov. 27 9:30AM - 10:30AM Room: E352

Joao Manoel M. Santos, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

Accurate assessment of treatment response requires robust spatial anatomical correlation between histopathology and MRI to create reliable ground-truth labels for training radiomics algorithms. To achieve this, a multimodal radiology-pathology image registration workflow is necessary. This study aims to develop a radiology-pathology co-registration method that enables 1:1 automated spatial mapping between preoperative rectal MRI and ex vivo rectal whole-mount histology (WMH).

#### METHODS AND MATERIALS

The study population included 13 patients with rectal adenocarcinoma who underwent neoadjuvant therapy followed by TME from 2018 to 2022, with available WMH and both baseline and post neoadjuvant MRI. A multimodal radiology-pathology image registration workflow was developed. For each patient, 3 axial levels were identified: the center of the tumor bed, one superior and one inferior slice. Using 3 axial levels, the following steps were performed 1) Tumor bed, contours of the internal and external borders of the rectum and 8 corresponding landmarks were manually delineated on T2WI images and corresponding WMH images by a radiologist and a pathologist; 2) Rigid point-based registration of images with automated rescaling was computed via the delineated landmarks, and biomechanically constrained elastic deformable registration was computed from the initial rigid alignment between the annotated internal and external rectal contours to account for differences in MR and WMH rectal distension; 3) Outputs from the multimodal image fusion system were rendered in 3D Slicer to obtain accurate and precise visualization. Dice overlap and modified Hausdorff distance (MHD) of the segmented external, internal, and tumor bed contours were obtained.

#### RESULTS

When comparing the rigid point-based registration with deformable image registration, Dice overlap varied from 0.85 to 0.95 mm in the external rectal contour ( $p = 0.0028$ ), and 0.47 to 0.55 mm in the internal contour ( $p = 0.033$ ). MHD, which exhibits the distance to agreement of the delineated MR rectum and histological images, varied from 1.76 to 0.59 mm in the external rectal contour ( $p = 0.008$ ), and 1.67 to 1.23 mm in the internal contour ( $p = 0.01$ ).

#### CONCLUSION

This study showed promising results in terms of multimodal image fusion and precise anatomical correlation. Deformable registration significantly improves the internal and external contour agreement over rigid point-based registration.

#### CLINICAL RELEVANCE/APPLICATION

The clinical impact is related to increasing the accuracy of MRI in assessing treatment response of patients with rectal cancer after neoadjuvant therapy, allowing rectal preservation and thereby improving patients' outcomes and quality of life.

#### Sub-Events

### M3-SSGI07-1 Utility of Intracellular Enhanced Technique for Gadoteric Acid-enhanced Hepatobiliary-phase Magnetic Resonance Imaging

Shota Kondo (*Presenter*) Nothing to Disclose

#### PURPOSE

The sensitivity of gadoteric acid-enhanced hepatobiliary-phase (HBP) magnetic resonance imaging (MRI) is high for the detection of liver lesions. However, as gadoteric acid acts as both an extracellular- and hepatocyte-specific contrast agent, signals from the extracellular space may lower the contrast between the lesion and the surrounding hepatic parenchyma. To improve its hepatocyte-specific gadoteric acid enhancement, we developed an intracellular enhancement (ICE) technique that suppresses signals from the extracellular space with a motion-sensitized driven equilibrium pulse. To investigate the clinical applicability of our new technique we compared HBP images acquired with and without the ICE technique.

#### METHODS AND MATERIALS

We subjected 56 patients with suspected neoplastic hepatic lesions to gadoteric acid-enhanced HBP imaging with and without ICE (i+HBP, i-HBP). The images were acquired 10 and 20 min after gadoteric acid injection. A radiologist calculated the signal intensity ratio [(SI ratio) = region of interest (ROI)LIVER/ROI PV], where (ROI)LIVER is the mean SI of the hepatic parenchyma and ROI PV the mean SI at the confluence level of the right and left portal vein. The SI ratio obtained on i-HBP images obtained at 20 min was the reference standard. Superiority and equivalence with a pre-specified margin of 0.2, which is 10% of the mean SI ratio on 20-min i-HBP images, were assessed.

#### RESULTS

The SI ratio of 20-min i+HBP- was superior to 20-min i-HBP images (95% confidence interval (CI), 0.21 - 0.46). The SI ratio of 10-min i+HBP images was not superior, but equivalent (95% CI, -0.20 - -0.02) and the SI ratio of 10-min i-HBP images was neither superior nor equivalent to the 20-min i-HBP images (95% CI, -0.32 to -0.22).

#### CONCLUSION

On gadoteric acid-enhanced MRI scans acquired in the HBP, our ICE technique improved the SI ratio.

#### CLINICAL RELEVANCE/APPLICATION

As our ICE technique improved the SI ratio on HBP images, it may improve lesion detectability and shorten the time required for gadoteric acid-enhanced HBP imaging.

### M3-SSGI07-2 Comparison between Image Quality of Conventional T1-Weighted Image and Deep Learning Based T1-Weighted Image on Gadoteric Acid-Enhanced Liver MRI

Jeong Hee Yoon, MD (*Presenter*) Speaker, Bayer AG; Grant, Koninklijke Philips NV

#### PURPOSE

To compare image quality of T1-weighted image (T1WI) between conventional reconstruction and deep learning (DL)-based T1WI.

## METHODS AND MATERIALS

This prospective study enrolled 54 participants who were scheduled for gadoteric acid-enhanced MRI and signed informed consent. Gadoteric acid-enhanced liver MRI was performed at a 3T scanner (SIGNATM Premier, GE Healthcare). Precontrast, arterial, portal venous, transitional phase and hepatobiliary phases were obtained using commercially available 3D gradient sequence before and after standard dose of contrast media administration (0.025mmol/kg, Primovist or Eovist, Bayer) at a rate of 1 mL/sec. Arterial phases were obtained using MR fluoroscopy technique. Portal, transitional, hepatobiliary phases were obtained 60 sec, 3 min and 20 min after CM administration. Obtained T1WI were additionally reconstructed using DL-based reconstruction algorithm (AIRTm DL, GE Healthcare). Three radiologists independently reviewed the image noise, ringing artifacts, susceptibility artifacts, image texture and overall image quality of precontrast, arterial, portal venous and hepatobiliary phases on a five-point scale. Higher scores indicated less artifact and better image quality.

## RESULTS

A total of 54 participants (male = 38, mean age  $62 \pm 11$  years) were enrolled. DL reconstructed images showed significantly less image noise in all phases (3.31-3.91 on conventional T1WI vs. 3.59-3.86 on DL T1WI,  $P < 0.05$  for all). Ringing artifacts significantly decreased on DL images on all phases (3.71-3.83 on DL T1WI vs. 3.61-3.70 on conventional T1WI,  $P < 0.05$  for all) except precontrast phase ( $3.63 \pm 0.27$  vs.  $3.71 \pm 0.29$ ,  $P > 0.05$ ). No significant differences of susceptibility artifacts were noted between the two ( $P > 0.05$ ) for all phases. Although image texture was significantly plastic on DL images than conventional images in all phases (3.76-3.97 on conventional T1WI vs. 3.14-3.54 on DL T1WI,  $P < 0.05$  for all), overall image quality was significantly higher on DL T1WI (3.70-4.35) than conventional T1WI on all phases (3.35-3.99,  $P < 0.05$  for all).

## CONCLUSION

DL reconstruction algorithm is able to improve the image quality without additional scans on liver MRI.

## CLINICAL RELEVANCE/APPLICATION

DL reconstruction affords better image quality with lower artifacts in acquiring precontrast, arterial, portal venous, transitional phase and hepatobiliary phases on liver MRI.

## M3-SSGI07-3 Efficacy of a Novel Oral Borosilicate Contrast Agent for Gastrointestinal Signal Suppression in MRCP

Matthew S. Carr, MD (*Presenter*) Nothing to Disclose

## PURPOSE

Magnetic resonance cholangiopancreatography (MRCP) is a widely used non-invasive imaging method used to assess pancreaticobiliary diseases. Unfortunately, signal from fluid in the surrounding bowel may degrade evaluation of the biliary tree and pancreatic duct. The use of fasting and other negative oral contrasts (such as fruit juice) show variable clinical efficacy, patient tolerability, and product availability. We sought to evaluate the ability of an experimental dark borosilicate contrast material (DBCM) to reduce intraluminal bowel T2 signal and improve the visualization of pancreaticobiliary structures at MRCP.

## METHODS AND MATERIALS

In this IRB approved study, after standard MRCP protocol, six patients ingested 800 cc of DBCM and imaging was repeated, including coronal T2 weighted and MRCP images. On blinded and randomized data, two radiologists independently measured the intraluminal signal intensity in the stomach, duodenum, and common bile duct (CBD) using circular regions of interest on coronal slab MRCP images. The signal of the stomach and duodenum were normalized to the CBD. Qualitative visualization of the CBD, gallbladder, and pancreatic duct were rated on a 4 point Likert scale (0=not visualized to 4=well-delineated). Data was then analyzed using paired t-tests and inter-reader reliability was evaluated using intraclass correlation coefficients with  $p < 0.05$  denoting significance.

## RESULTS

There was significant decrease in normalized signal intensity measurements by both readers from before (pre) to after oral contrast (post) in the stomach (Reader 1 {R1}: 86.7%,  $p=0.026$ ; Reader 2 {R2}: 81.2%,  $p=0.034$ ) and in the duodenum (R1: 92.6%,  $p < 0.001$ ; R2: 80.1%,  $p < 0.0005$ ). For both readers, scans with DBCM showed significantly improved visualization of the CBD (R1: pre  $3.0 \pm 0.6$  vs. post  $3.8 \pm 0.40$ ,  $p=0.042$ ; R2: pre  $3.0 \pm 0.0$  vs. post  $3.8 \pm 0.4$ ,  $p=0.004$ ) and pancreatic duct (R1: pre  $2.3 \pm 1.0$  vs. post  $3.3 \pm 0.8$ ,  $p=0.012$ ; R2: pre  $2.0 \pm 1.1$  vs. post  $2.8 \pm 1.2$ ,  $p=0.042$ ) but not the gallbladder ( $p > 0.178$ ). There was good to excellent inter-reader reliability for signal intensity measurements in the stomach, duodenum, CBD, and for visibility ratings of the CBD and pancreatic duct ( $r = 0.77$  to  $0.98$ ,  $p < 0.003$ ), but poor for the visibility ratings of the gallbladder ( $r=0.10$ ,  $p=0.78$ ). No serious adverse events were seen in any patient.

## CONCLUSION

Novel DBCM oral contrast significantly decreased signal in the bowel and improved visualization of the CBD and the pancreatic duct relative to the standard MRCP protocol in 6 patient volunteers.

## CLINICAL RELEVANCE/APPLICATION

Use of DBCM significantly improved the anatomic visualization of the pancreatic duct and CBD at MRCP. Larger cohort study of DBCM for delineation of pancreaticobiliary disease is warranted.

### M3-SSGI07-5 **Prospective Evaluation and Comparison Between Resoundant 2D MR-Elastography and 2D/3D MR-Elastography Utilizing the Gravitational Transducer Concept**

Vitali Koch, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

Accurate non-invasive diagnostic methods are of utmost importance in nonalcoholic fatty liver disease (NAFLD). Magnetic resonance elastography (MRE) can quantify tissue biomechanics non-invasively and represents a promising technique to assess hepatic fibrosis. Here, we present preliminary results of a prospective study designed to investigate the diagnostic performance of 2D/3D-MRE utilizing the gravitational transducer concept combined with a GRE sequence, in comparison to the current product solution (2D-MRE Resoundant). Furthermore, we investigated the added value of 3D-MRE data when correlating imaging biomarkers with blood markers that reflect liver damage.

#### METHODS AND MATERIALS

Thirty-two participants with different stages of NAFLD were recruited. Patients were examined twice at 60Hz mechanical vibration frequency (Aera, 1.5T, Siemens Healthineers, Germany): firstly, using the Resoundant MRE system (2D-MRE, SE-EPI sequence, 11secs BH) and secondly, using the gravitational transducer approach (2D-MRE and 3D-MRE, GRE sequence, TE=9.2ms [in-phase] and fractional motion encoding at 30mT/m, 14secs BH). While 2D-MRE provides solely the magnitude of the complex shear modulus  $|G^*|$ , 3D-MRE allows for the additional quantification of both real and imaginary parts of  $G^*$ . Data extraction/analysis was performed twice by two experienced readers.

#### RESULTS

Elasticity values originating from 2D-MRE correlated very well between both methods ( $r=0.83$  [95% CI, 0.69 to 0.92],  $p<0.001$ ) with an excellent agreement in Bland-Altman plots. Interrater agreement was excellent ( $\kappa=0.91$ ). 3D-MRE (gravitational) correlated excellently with 2D-MRE (Resoundant) ( $r=0.95$  [95% CI, 0.90 to 0.98],  $p<0.001$ ). However, the Bland-Altman plot showed a clear bias with 2D-MRE overestimating stiffness values. 2D-MRE correlated to GOT in a binary fashion: for  $|G^*|<4\text{kPa}$  we found GOT<30, while for  $|G^*|>4\text{kPa}$  we found GOT>30. 3D-MRE on the contrary demonstrated correlations: for GOT<30 wave attenuation show a clear trend wrt GOT ( $r=-0.27$ ,  $P=0.37$ ), while for GOT>30 viscosity correlated very well to GOT ( $r=0.61$ ,  $P=0.047$ ). Viscosity for GOT<30 just clustered at low values, similarly to attenuation for GOT>30. Interestingly, shear modulus or wave speed did not show any pertinent correlations.

#### CONCLUSION

Gravitational MRE represents a novel and promising method for the non-invasive, accurate, and sensitive characterization of patients with NAFLD. 3D-MRE carries the potential to provide imaging biomarkers that correlate to liver damage.

## CLINICAL RELEVANCE/APPLICATION

Considering the disadvantages of liver biopsy for screening and monitoring of NAFLD, non-invasive methods that accurately assess liver damage represent very attractive alternatives.

### M3-SSGI07-6 **Dual-Frequency 3D Vector Magnetic Resonance Elastography (MRE) Acquisition Efficiency Improvement and Technical Repeatability**

Caixin Qiu, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

This study aims to improve the efficiency of dual-frequency 3D vector MRE image acquisition by analyzing the feasibility and repeatability of the intrinsic 2nd harmonic derived from single-frequency 30Hz MRE data, exploring the causes of technical failure, and validating the alternative forced dual-frequency 3D MRE to improve wave quality and success rate.

#### METHODS AND MATERIALS

We enrolled 80 patients in two cohorts. Cohort One of 66 patients who had single-frequency 30Hz MRE with 6 phase offsets and 60Hz MRE with 3 phase offsets. Cohort Two of 14 subjects with forced dual-frequency (30Hz+60Hz) 3D MRE with 6 phase offsets. Within them, 11 patients had within-day test-retest exams, and 22 patients had one-year follow-up exams, respectively. Image quality was scored by assessing wave penetration depth. Technical failure was defined as no wave or presence of artifacts. The intraclass correlation coefficient (ICC), Bland-Altman plots, and repeatability coefficient (RC) were used to assess measurement agreement and technical repeatability of liver stiffness.

## RESULTS

We achieved a 91% success rate with reliable liver stiffness measurement from the 2nd harmonic of 30Hz data in Cohort One. A successful baseline exam did not necessarily result in another success in the within-day repeated exams or one-year follow-ups (0/11, 5/22 failure rates for within-day and follow-ups, respectively). In successful cases, the Bland-Altman analysis and ICCs demonstrated excellent agreements (all ICCs > 0.90, P < 0.001) in liver stiffness measurement but moderate repeatability from 2nd harmonic of 30Hz data (RC=36.67%). Excellent repeatability from original 60Hz data (RC=11.86%). The quality scores at 2nd harmonic from 30Hz (median: 1, total:101) were significantly lower than those at conventional 60Hz (median: 2, total:140; Z=-4.523, p<0.001). In Cohort Two, most patients had high quality scores at 3 (13/14), and only one patient failed at 60Hz due to massive ascites.

## CONCLUSION

Most 2<sup>nd</sup> harmonic derived from 30Hz MRE data is sufficient for liver stiffness measurement at 60Hz. However, the intrinsic waves generated from system or tissue nonlinearity have suboptimal wave penetration. Consequently, this method has moderate within-day technical repeatability and unpredictable technical failure in repeated exams or follow-ups. Therefore, it is necessary to adopt the alternative forced dual-frequency 3D MRE to reliably improve image quality with shortened acquisition time and enhanced success rate.

## CLINICAL RELEVANCE/APPLICATION

Dual-frequency 3D MRE can acquire data at both 30Hz and 60Hz in one acquisition to improve imaging efficiency with better co-registration and shorter scan time.

### Utility of Intracellular Enhanced Technique for Gadoteric Acid-enhanced Hepatobiliary-phase Magnetic Resonance Imaging

Monday, Nov. 27 9:30AM - 10:30AM Room: E351

Shota Kondo (*Presenter*) Nothing to Disclose

#### PURPOSE

The sensitivity of gadoteric acid-enhanced hepatobiliary-phase (HBP) magnetic resonance imaging (MRI) is high for the detection of liver lesions. However, as gadoteric acid acts as both an extracellular- and hepatocyte-specific contrast agent, signals from the extracellular space may lower the contrast between the lesion and the surrounding hepatic parenchyma. To improve its hepatocyte-specific gadoteric acid enhancement, we developed an intracellular enhancement (ICE) technique that suppresses signals from the extracellular space with a motion-sensitized driven equilibrium pulse. To investigate the clinical applicability of our new technique we compared HBP images acquired with and without the ICE technique.

#### METHODS AND MATERIALS

We subjected 56 patients with suspected neoplastic hepatic lesions to gadoteric acid-enhanced HBP imaging with and without ICE (i+HBP, i-HBP). The images were acquired 10 and 20 min after gadoteric acid injection. A radiologist calculated the signal intensity ratio [(SI ratio) = region of interest (ROI)LIVER/ROI PV], where (ROI)LIVER is the mean SI of the hepatic parenchyma and ROI PV the mean SI at the confluence level of the right and left portal vein. The SI ratio obtained on i-HBP images obtained at 20 min was the reference standard. Superiority and equivalence with a pre-specified margin of 0.2, which is 10% of the mean SI ratio on 20-min i-HBP images, were assessed.

#### RESULTS

The SI ratio of 20-min i+HBP- was superior to 20-min i-HBP images (95% confidence interval (CI), 0.21 - 0.46). The SI ratio of 10-min i+HBP images was not superior, but equivalent (95% CI, -0.20 - -0.02) and the SI ratio of 10-min i-HBP images was neither superior nor equivalent to the 20-min i-HBP images (95% CI, -0.32 to -0.22).

#### CONCLUSION

On gadoteric acid-enhanced MRI scans acquired in the HBP, our ICE technique improved the SI ratio.

#### CLINICAL RELEVANCE/APPLICATION

As our ICE technique improved the SI ratio on HBP images, it may improve lesion detectability and shorten the time required for gadoteric acid-enhanced HBP imaging.

### Dual-Frequency 3D Vector Magnetic Resonance Elastography (MRE) Acquisition Efficiency Improvement and Technical Repeatability

Monday, Nov. 27 9:30AM - 10:30AM Room: E351

Caixin Qiu, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

This study aims to improve the efficiency of dual-frequency 3D vector MRE image acquisition by analyzing the feasibility and repeatability of the intrinsic 2nd harmonic derived from single-frequency 30Hz MRE data, exploring the causes of technical failure, and validating the alternative forced dual-frequency 3D MRE to improve wave quality and success rate.

#### METHODS AND MATERIALS

We enrolled 80 patients in two cohorts. Cohort One of 66 patients who had single-frequency 30Hz MRE with 6 phase offsets and 60Hz MRE with 3 phase offsets. Cohort Two of 14 subjects with forced dual-frequency (30Hz+60Hz) 3D MRE with 6 phase offsets. Within them, 11 patients had within-day test-retest exams, and 22 patients had one-year follow-up exams, respectively. Image quality was scored by assessing wave penetration depth. Technical failure was defined as no wave or presence of artifacts. The intraclass correlation coefficient (ICC), Bland-Altman plots, and repeatability coefficient (RC) were used to assess measurement agreement and technical repeatability of liver stiffness.

#### RESULTS

We achieved a 91% success rate with reliable liver stiffness measurement from the 2nd harmonic of 30Hz data in Cohort One. A successful baseline exam did not necessarily result in another success in the within-day repeated exams or one-year follow-ups (0/11, 5/22 failure rates for within-day and follow-ups, respectively). In successful cases, the Bland-Altman analysis and ICCs demonstrated excellent agreements (all ICCs > 0.90,  $P < 0.001$ ) in liver stiffness measurement but moderate repeatability from 2nd harmonic of 30Hz data (RC=36.67%). Excellent repeatability from original 60Hz data (RC=11.86%). The quality scores at 2nd harmonic from 30Hz (median: 1, total:101) were significantly lower than those at conventional 60Hz (median: 2, total:140;  $Z=-4.523$ ,  $p<0.001$ ). In Cohort Two, most patients had high quality scores at 3 (13/14), and only one patient failed at 60Hz due to massive ascites.

#### CONCLUSION

Most 2<sup>nd</sup> harmonic derived from 30Hz MRE data is sufficient for liver stiffness measurement at 60Hz. However, the intrinsic waves generated from system or tissue nonlinearity have suboptimal wave penetration. Consequently, this method has moderate within-day technical repeatability and unpredictable technical failure in repeated exams or follow-ups. Therefore, it is necessary to adopt the alternative forced dual-frequency 3D MRE to reliably improve image quality with shortened acquisition time and enhanced success rate.

#### CLINICAL RELEVANCE/APPLICATION

Dual-frequency 3D MRE can acquire data at both 30Hz and 60Hz in one acquisition to improve imaging efficiency with better co-registration and shorter scan time.

#### Sub-Events

#### **M3-SSIN02-1 Automated AI Processing, PACS Delivery, and Reporting using a Cloud-based System in a Multihospital Health System**

Neil R. Chaterjee, MD, PhD (*Presenter*) Nothing to Disclose

#### PURPOSE

The number of artificial intelligence (AI) algorithms both in the literature and available for commercial use has exploded in recent years, but clinical adoption remains limited. One major barrier towards adoption is seamless integration into the clinical workflow. Ideally, AI results would 1) be viewable within the picture archiving and communication system (PACS) and 2) easily inserted into the radiology report. Many companies offer AI solutions that claim to meet these criteria, but these solutions can have limitations such as poor integration with the electronic health record, loss of data control, lack of algorithm transparency, and cost. To meet this need, we developed a cloud-based software layer for automatic image analysis with seamless PACS and reporting engine integration. As a proof-of-concept, we developed an AI algorithm for reporting hepatic steatosis and deployed it in a live clinical environment.

#### METHODS AND MATERIALS

After a study is ended, an HL7 message is sent to the Vendor Neutral Archive (VNA). The VNA instructs PACS to move the study to the AI server hosted on a cloud computing program. The AI server processes the images and outputs 1) image overlays to PACS and 2) summary statistics as Common Data Elements (CDEs) in a DICOM Structured Report (DICOM SR). The DICOM SR is sent to the reporting engine via an HL7 router, permitting the CDEs to be inserted into a report via a macro.

#### RESULTS

All studies with appropriate CT codes were sent to the AI server after it was deployed at our hospital. 701 studies were processed in the first 14 days after deployment. The mean liver attenuation in studies where the liver attenuation algorithm ran was  $57 \pm 36$  HU.

#### CONCLUSION

We developed a cloud-based software solution to automatically run any arbitrary AI algorithm and seamlessly integrate results into PACS and clinical reports, and we demonstrate its use in a real-world clinical environment. This has the potential to significantly decrease the barrier to clinical AI adoption and generate large quantities of AI-processed data for research.

#### CLINICAL RELEVANCE/APPLICATION

We demonstrate the feasibility of implementing a cloud-based software layer for automatic AI analysis with PACS and reporting engine integration. This approach provides an option for institutions to seamlessly integrate AI into their clinical workflows while retaining control over their own data and AI algorithms, which we believe has the potential to increase clinical AI adoption. In our proof-of-concept application of a liver segmentation AI algorithm, this allows for opportunistic screening of hepatic steatosis in every patient that gets an abdominal CT.

#### **M3-SSIN02-2 Identifying High-priority STAT Imaging Studies using Natural Language Processing and Machine Learning Models**

Renaid Kim, BS (*Presenter*) Nothing to Disclose

## PURPOSE

Imaging studies at our institution can be ordered as routine, urgent, or STAT, but further stratification of study urgency is not available. Several prior studies have described how the "STAT" designation is overutilized and misused, further obscuring the actual urgency of an imaging order. All studies from the emergency room, for example, may be designated as STAT even when immediate intervention is not required with positive findings. Additionally, many outpatient studies ordered for routine follow up are ordered STAT. Our purpose was to create an automated system to identify priority STAT imaging studies that would require immediate intervention if positive, thereby avoiding delays in care.

## METHODS AND MATERIALS

Five hundred outpatient imaging studies ordered "STAT" were identified, and their free-text clinical indications were collected. After excluding orders for image-guided procedures and duplicate indications, 351 imaging studies remained in the dataset. For each study, 3 different radiologists evaluated the indication and assigned an integer score between 1 (most likely) and 5 (least likely) based on the likelihood of requiring medical or surgical intervention within 24 hours if positive. A simple majority was used for determining the final score. For studies with interrater score difference =2, a fourth radiologist adjudicated. Boolean features were generated from the free text based on n-grams, with  $1 \leq n \leq 7$ . A total of 15,348 n-grams were created. The dataset was split into 80% training and 20% test sets. To reduce the feature space dimension, the features with a variance less than 0.01 within the training set were removed, resulting in a total of 515 features. The models were trained to detect indications with scores of 1 and 2. Twenty-nine different classification models available in the lazypredict package were utilized.

## RESULTS

The Adaboost classifier achieved the best performance on the test set with the area under the receiver operating characteristic curve (AUROC) of 0.778 and an F1 score of 0.773, followed by the Ridge classifier which achieved an AUROC of 0.736 and an F1 score of 0.731. The perceptron classifier, nu-support vector classifier, and logistic regression models were among the other models that attained an AUROC greater than 0.7.

## CONCLUSION

Machine learning algorithms can use free-text clinical indications to identify studies that should be prioritized to prevent delays in life-saving interventions.

## CLINICAL RELEVANCE/APPLICATION

The STAT indication for imaging studies is often overutilized and misused. An automated, machine learning-driven system for prioritizing studies that could require immediate intervention can help avoid delays in providing life-saving care.

## M3-SSIN02-3 Consensus Based Macros: An Easy Tool to Improve the Quality of Radiology Reports Containing Incidental Imaging Findings

Tianyuan Fu, MD (*Presenter*) Nothing to Disclose

## PURPOSE

To assess the potential of using standardized consensus-based macros to improve tracking of actionable incidental findings (AIFs) across a large academic health system and to increase the number of AIFs reports satisfying the 2022 ACR Novel Quality Measure Set

## METHODS AND MATERIALS

Prior to our intervention, there was no structured method for documentation and for tracking the frequency of AIFs at our institution. Standardized system macros were created for pulmonary nodules and liver, gallbladder, pancreas, renal, adrenal, spleen, adnexal, and thyroid lesions and implemented in January 2022. Each macro includes the location of the lesion, one recommended follow-up modality, the time interval for follow-up, and reference to an evidence-based recommendation. Sources for recommendations included the Fleischner Guidelines and ACR Incidental Finding Committee White Papers. A "signature" code was also tagged to each macro option to allow for tracking. The macros were reviewed and approved by a team of academic subspecialty radiologists and regional radiologists in the community. Radiologists and residents were educated on macro usage through demonstrations in faculty meetings, noon conferences, step-by-step instructions on the department intranet homepage, and email communication. Web-based dashboards were generated to illustrate frequency of different types of AIFs over time

## RESULTS

From January to October 2022, 3991 pulmonary nodules (1324 of which required follow-up per guidelines), 205 liver (50), 317 pancreas (317), 306 renal, 13 spleen, and 505 thyroid (204) lesions were tracked using the macros. In a survey of radiologists participating in this initiative, 70% reported using the macros for some, most, or all AIFs, and 84% found the macros easy to adopt. Most found the macros helpful because they helped to save time (62% of respondents) and ensured appropriate and up-to-date follow up according to the most recent societal guidelines (92% of respondents). All respondents indicated they would recommend other faculty and residents use the macros. One of the reported factors which hindered

adoption was that radiologists needed to be reminded that system macros were available for a particular type of AIF. In addition, some found the macros to be wordy or had individual preferences regarding wording

## **CONCLUSION**

Standardized consensus-based macros are easy-to-use tools that support high quality impression statements and can also be potentially used to keep track of AIFs across large health systems

## **CLINICAL RELEVANCE/APPLICATION**

Many AIFs have time and modality specific follow up recommendations based on expert consensus. However, a significant proportion of these do not undergo appropriate follow up according to established guidelines

### **M3-SSIN02-4 Exploring the Potential of Large Language Models ChatGPT and GPT-4 for Data Mining of Radiology CT Reports on Lung Cancer**

Matthias A. Fink, MD, BSc (*Presenter*) Nothing to Disclose

## **PURPOSE**

To demonstrate the feasibility of using the Large Language Models (LLM) ChatGPT and GPT-4 to accurately mine oncological phenotypes from free-text CT reports.

## **METHODS AND MATERIALS**

The latest LLMs can learn in-context and solve new problems through textual prompts in a few- or zero-shot setting. This enables dynamic user interaction and on-the-fly problem-solving without retraining the models. In our retrospective study, we queried our database for free-text radiology CT reports on lung cancer from 09/2021 to 03/2023. Of 445 reports eligible for study inclusion, 25 were used for prompt engineering for LLMs to extract lesion diameters, anatomical locations, and metastatic disease spatial distributions from 420 remaining reports. The output was defined as data frame format in the given prompts. Performance was evaluated against manual measurement extraction and labeling of metastatic sites by four radiologists.

## **RESULTS**

ChatGPT and GPT-4 generated identical outputs with data frames of oncologic follow-up measurements and metastatic sites for all reports (420/420), fed into a rule-based NLP pipeline to match radiologists' ground truth annotations. ChatGPT accurately extracted 84% (2093/2492) of oncologic measurements on a per-lesion basis, while GPT-4 extracted 98.6% (2456/2492;  $P < .001$ ). This resulted in 67% (280/420) accuracy for ChatGPT and 96% (402/420) for GPT-4 in extracting all relevant oncologic measurements on report-level ( $P < .001$ ). ChatGPT identified sites of metastatic disease (12 organs) with 75.9% (73.0, 78.7), 94.1% (93.4, 94.7), and 91.3% (90.6, 92.0) sensitivity, specificity, and accuracy (CI in parentheses), respectively, while GPT-4 identified them with 94.6% (93.0, 96.0), 99.0% (98.7, 99.3), and 98.3% (98.0, 98.6), respectively.

## **CONCLUSION**

Accurate data mining of free-text CT reports using LLMs seems feasible. GPT-4 achieved excellent performance in curating oncological follow-up measurements and identifying spatial patterns of metastatic disease in patients with lung cancer, while ChatGPT had significantly lower performance.

## **CLINICAL RELEVANCE/APPLICATION**

LLMs offer new possibilities for flexible and accurate extraction of cancer phenotypes from radiology reports by using user-defined prompts to dynamically adjust the models' outputs. This provides a potential basis for large-scale labeling, database building, and visual grounding approaches in cross-sectional imaging.

### **M3-SSIN02-5 Natural Language Processing of Oncologic Radiology Reports: Predicting Response and Progression from Free Text Impressions**

Richard Kinh Gian Do, MD, PhD (*Presenter*) Author, RELX;Consultant, General Electric Company;Consultant, Bayer AG;Spouse, Author, Wolters Kluwer nv;Spouse, Committee Member, ALK-Abello A/S;Spouse, Consultant, JDP Therapeutics Inc;Spouse, Consultant, F. Hoffmann-La Roche Ltd

## **PURPOSE**

Radiologists routinely report treatment response and disease progression for cancer patients. This data is increasingly used to build Real World Evidence, to understand how cancer therapies perform in the "Real-World" after their regulatory approval. This study aims to use Natural Language Processing (NLP) to extract progression and response events from radiology reports.

## **METHODS AND MATERIALS**

In this IRB approved HIPAA compliant retrospective study, 3503 consecutive reports over a 4 month period were retrieved if they were prospectively labeled by radiologists with a departmental oncologic response standardized lexicon, which includes multiple categories including progression of disease (PD) and partial response (PR). In this lexicon, no complete response

category is used. A BERT-base-uncased model and tokenizer were used to predict the report response categories of PD and PR. Model performance was measured by accuracy, precision, recall, and F-1 scores, on a training/validation/test set split as 80%/10%/10%.

## RESULTS

772/3503 (22%) reports were labeled with PD, and 385/3503 (11.0%) reports were labeled with PR. Accuracies for the first NLP model created to predict PR were > 99%/97%/95% for training/validation/test sets, respectively. Precision, recall, and F-1 for the PR test set were 98.3%, 90.8%, and 94.4%, respectively. For the PD category, accuracies for the second NLP model were > 99%/96%/98% for training/validation/test sets. Precision, recall, and F-1 for the PD test set were 97.7%/97.7%, and 97.7%, respectively.

## CONCLUSION

In this single institution study, BERT-based NLP can be used to extract progression and response events with high F-1 scores of over 90% when applied to radiology reports with free text impression. Further testing with multi-center reports will be sought next.

## CLINICAL RELEVANCE/APPLICATION

Real World Evidence is increasingly sought by the FDA to assess the performance of cancer therapeutics after regulatory approval. Understanding how cancer drugs perform in the "Real-World" and identifying the subset of patients most likely to benefit from different treatments is essential for the application of personalized medicine. Rapid extraction of progression and response events documented in radiology reports will facilitate this data collection process.

### M3-SSIN02-6 Development of an AI Model to Detect Diagnostic Errors in Radiology using Synthetic Error-Injected Reports

Dabin Min (*Presenter*) Nothing to Disclose

## PURPOSE

Reading radiologic exams is highly complex and prone to diagnostic errors. It is known that the errors occur in 3 to 4% of cases in daily practice and lead to inappropriate or delayed treatment. In this study, we aimed to develop an AI model that can detect most types of diagnostic errors known in the field of radiology.

## METHODS AND MATERIALS

Based on previous research that analyzed the errors in radiology, we developed an Error Generator (EG) that injects diagnostic errors into existing chest x-ray (CXR) reports. Our two board-certified radiologists collaborated to design the process of generating eight types of errors, including underreading (UR), satisfaction of search (SS), faulty reasoning (FR), false-positive findings (FP). We built a transformer-based vision-language model as an Error Detector (ED) and trained it on MIMIC-EG, which consist of 126,439 CXRs from MIMIC-CXR and their corresponding error-injected reports (EIR) generated by EG. We evaluated the binary classification performance of ED on three different datasets: MIMIC-EG (1,494 CXRs), IU-EG (2,994 CXRs), and MIMIC-R (1,494 CXRs). IU-EG is collected from IU-Xray dataset and their corresponding EIRs generated by EG to evaluate our method on unseen data. MIMIC-R consists of the same CXRs as the test split of MIMIC-EG but includes 100 EIRs generated by two radiologist and is used to assess the effectiveness on diagnostic errors made by human experts. To ensure a clinically relevant test setting, we conducted 100 bootstrap samplings in all of our tests, following a 4% error occurrence rate and distribution of error types as reported in related works. For the best possible baseline, we generated errors by swapping original reports with random ones and trained ED only with it (swapED).

## RESULTS

Our method showed performance on MIMIC-R with an AUC of 0.93 (SD=0.02). Furthermore, it exhibited significantly better results than the baseline on all datasets, achieving AUCs of 0.94, 0.88, and 0.93 on MIMIC-EG, IU-EG, and MIMIC-R, respectively, while the swapED yielded 0.77, 0.65, and 0.74, respectively ( $p < 0.001$  for all comparisons). The sensitivity for the four major error types (UR, SS, FP, and FR) in MIMIC-R was 0.82, 0.68, 0.50, and 0.70, respectively, at a specificity of 0.9, while the swapED's was 0.62, 0.44, 0.36, and 0.55, respectively ( $p < 0.001$  for all comparisons).

## CONCLUSION

The AI model trained with synthetic error-injected CXR reports demonstrated effective performance in detecting real-world diagnostic errors.

## CLINICAL RELEVANCE/APPLICATION

The developed model has the potential to be used as a support tool to reduce diagnostic errors, and enhance patient safety.

### Natural Language Processing of Oncologic Radiology Reports: Predicting Response and Progression from Free Text Impressions

Monday, Nov. 27 9:30AM - 10:30AM Room: S404

Richard Kinh Gian Do, MD, PhD (*Presenter*) Author, RELX;Consultant, General Electric Company;Consultant, Bayer AG;Spouse, Author, Wolters Kluwer nv;Spouse, Committee Member, ALK-Abello A/S;Spouse, Consultant, JDP Therapeutics Inc;Spouse, Consultant, F. Hoffmann-La Roche Ltd

#### PURPOSE

Radiologists routinely report treatment response and disease progression for cancer patients. This data is increasingly used to build Real World Evidence, to understand how cancer therapies perform in the "Real-World" after their regulatory approval. This study aims to use Natural Language Processing (NLP) to extract progression and response events from radiology reports.

#### METHODS AND MATERIALS

In this IRB approved HIPAA compliant retrospective study, 3503 consecutive reports over a 4 month period were retrieved if they were prospectively labeled by radiologists with a departmental oncologic response standardized lexicon, which includes multiple categories including progression of disease (PD) and partial response (PR). In this lexicon, no complete response category is used. A BERT-base-uncased model and tokenizer were used to predict the report response categories of PD and PR. Model performance was measured by accuracy, precision, recall, and F-1 scores, on a training/validation/test set split as 80%/10%/10%.

#### RESULTS

772/3503 (22%) reports were labeled with PD, and 385/3503 (11.0%) reports were labeled with PR. Accuracies for the first NLP model created to predict PR were > 99%/97%/95% for training/validation/test sets, respectively. Precision, recall, and F-1 for the PR test set were 98.3%, 90.8%, and 94.4%, respectively. For the PD category, accuracies for the second NLP model were > 99%/96%/98% for training/validation/test sets. Precision, recall, and F-1 for the PD test set were 97.7%/97.7%, and 97.7%, respectively.

#### CONCLUSION

In this single institution study, BERT-based NLP can be used to extract progression and response events with high F-1 scores of over 90% when applied to radiology reports with free text impression. Further testing with multi-center reports will be sought next.

#### CLINICAL RELEVANCE/APPLICATION

Real World Evidence is increasingly sought by the FDA to assess the performance of cancer therapeutics after regulatory approval. Understanding how cancer drugs perform in the "Real-World" and identifying the subset of patients most likely to benefit from different treatments is essential for the application of personalized medicine. Rapid extraction of progression and response events documented in radiology reports will facilitate this data collection process.

### Development of an AI Model to Detect Diagnostic Errors in Radiology using Synthetic Error-Injected Reports

Monday, Nov. 27 9:30AM - 10:30AM Room: S404

Dabin Min (*Presenter*) Nothing to Disclose

#### PURPOSE

Reading radiologic exams is highly complex and prone to diagnostic errors. It is known that the errors occur in 3 to 4% of cases in daily practice and lead to inappropriate or delayed treatment. In this study, we aimed to develop an AI model that can detect most types of diagnostic errors known in the field of radiology.

#### METHODS AND MATERIALS

Based on previous research that analyzed the errors in radiology, we developed an Error Generator (EG) that injects diagnostic errors into existing chest x-ray (CXR) reports. Our two board-certified radiologists collaborated to design the process of generating eight types of errors, including underreading (UR), satisfaction of search (SS), faulty reasoning (FR), false-positive findings (FP). We built a transformer-based vision-language model as an Error Detector (ED) and trained it on MIMIC-EG, which consist of 126,439 CXRs from MIMIC-CXR and their corresponding error-injected reports (EIR) generated by EG. We evaluated the binary classification performance of ED on three different datasets: MIMIC-EG (1,494 CXRs), IU-EG (2,994 CXRs), and MIMIC-R (1,494 CXRs). IU-EG is collected from IU-Xray dataset and their corresponding EIRs generated by EG to evaluate our method on unseen data. MIMIC-R consists of the same CXRs as the test split of MIMIC-EG but includes 100 EIRs generated by two radiologist and is used to assess the effectiveness on diagnostic errors made by human experts. To ensure a clinically relevant test setting, we conducted 100 bootstrap samplings in all of our tests, following a 4% error occurrence rate and distribution of error types as reported in related works. For the best possible baseline, we generated errors by swapping original reports with random ones and trained ED only with it (swapED).

#### RESULTS

Our method showed performance on MIMIC-R with an AUC of 0.93 (SD=0.02). Furthermore, it exhibited significantly better results than the baseline on all datasets, achieving AUCs of 0.94, 0.88, and 0.93 on MIMIC-EG, IU-EG, and MIMIC-R, respectively, while the swapED yielded 0.77, 0.65, and 0.74, respectively ( $p < 0.001$  for all comparisons). The sensitivity for the four major error types (UR, SS, FP, and FR) in MIMIC-R was 0.82, 0.68, 0.50, and 0.70, respectively, at a specificity of 0.9, while the swapED's was 0.62, 0.44, 0.36, and 0.55, respectively ( $p < 0.001$  for all comparisons).

#### CONCLUSION

The AI model trained with synthetic error-injected CXR reports demonstrated effective performance in detecting real-world diagnostic errors.

#### CLINICAL RELEVANCE/APPLICATION

The developed model has the potential to be used as a support tool to reduce diagnostic errors, and enhance patient safety.

M3-SSNR03

### Neuroradiology (Brain: Neoplasms (Diagnosis and Classification))

Monday, Nov. 27 9:30AM - 10:30AM Room: E353C

Virginia B. Hill, MD (*Moderator*) Medical Science Liaison, Alphabet Inc;;  
Chaitra A. Badve, MD (*Moderator*) Nothing to Disclose

#### Sub-Events

#### **M3-SSNR03-1 Radiology Report-guided Prediction of Pediatric Low-grade Neuroepithelial Tumors Genetic Markers using Deep Learning**

Sara Ketabi (*Presenter*) Nothing to Disclose

#### PURPOSE

Pediatric Low-Grade Neuroepithelial Tumor (PLGNT) is one of the most prevalent brain tumors in children. Accurate PLGNT treatment planning requires the identification of the tumor genetic markers, which is typically beyond the purview of radiologists. Nonetheless, the language they use in radiology reports for interpreting brain Magnetic Resonance Imaging (MRI) can potentially be used for diagnosing these genetic markers. In this study, we employ deep learning to investigate the predictive performance of radiology reports in PLGNT genetic marker diagnosis. We also identify important features for each genetic marker from our model to make the predictions more transparent.

#### METHODS AND MATERIALS

This REB-approved retrospective study contains brain MRI reports corresponding to 203 PLGNT patients aged between 5 and 18 diagnosed with BRAF fusion or BRAF V600E mutation, the two most common PLGNT genetic markers. The dataset was divided into training, validation, and test sets using nested 5-fold cross-validation, and Clinical-Longformer, a state-of-the-art language transformer for processing clinical text, was applied to the data. We selected the model with the highest validation Area Under the Receiver Operating Curve (AUC) to detect the most important text features using the gradients of the output class with respect to the input features.

#### RESULTS

Our optimal model achieved a mean test AUC of  $0.864 \pm 0.075$ . This result indicates that radiology reports provide informative descriptions of MR images that enable the model to classify BRAF status with high accuracy. Using the class-wise gradient analysis of the model, "seeding", "sac", "above", "than", "dnet", and "suprasellar" were identified as decisive keywords for predicting BRAF fusion. The top ranking keywords for predicting BRAF V600E mutation include "er", "astrocytoma", "keeping", "oligodendroglioma", "naa", and "above". These are aligned with clinical evidence as tumor location and pathological class have been established as correlated factors with PLGNT BRAF status.

#### CONCLUSION

Although radiologists are not trained to diagnose PLGNT genetic markers, their analysis and description of MR images can significantly aid in genetic marker classification. Moreover, our model's attention scores signify relevant text features such as location information and tumor pathological diagnosis, resulting in reliable and interpretable predictions.

#### CLINICAL RELEVANCE/APPLICATION

Using radiology reports to predict PLGNT genetic markers can reveal important keywords, which are interpretable by radiologists. This can lead to more effective diagnosis and subsequent treatment.

#### **M3-SSNR03-2 MRI Findings in Epstein-Barr Virus-Associated Primary Central Nervous System Lymphoma**

Dario Herran de la Gala, MD (*Presenter*) Nothing to Disclose

## PURPOSE

Epstein-Barr virus (EBV) associated Primary Central Nervous System Lymphoma (PCNSL) is a rare form of extranodal non-Hodgkin lymphoma that is strongly related to immunodeficiency. EBV-associated PCNSL imaging characteristics are described to be different from typical PCNSL. In immunocompromised patients, neurotoxoplasmosis is the main differential diagnosis. The aim of our study was to report the MRI features of a sample of patients with EBV-associated PCNSL with respect to the ones described in the literature for typical PCNSL and neurotoxoplasmosis.

## METHODS AND MATERIALS

We performed a single-center retrospective descriptive study after consulting consecutive patients from a stereotactic brain biopsy database of our adult tertiary medical center. The inclusion criterion was the presence of pathological diagnosis of EBV-associated PCNSL. MRI variables were collected and analyzed: lesion topography, contrast enhancement characteristics, the presence of intralesional hemorrhage, hypercellularity on DWI as well as the evidence of "concentric" and "eccentric" target signs. Two radiologists reviewed all MRI scans in a consensus analysis.

## RESULTS

Forty-one cases of EBV-associated PCNSL were collected. All but 5 patients had immunosuppression. Lesions were unilateral in 39.5% and bilateral in 60.5%. Lesions were multiple in up to 71.8% of cases. Heterogeneous contrast enhancement was present in 78.9% of cases, with 43.5% having ring-like enhancement. Leptomeningeal enhancement was found in 40.5% of cases, and within this group, 62.5% showed perivascular space enhancement. Lesions showed hypercellularity in 67.6% and intralesional hemorrhage in 85.7%. Susceptibility-weighted images (53.0%) and non-enhanced T1-weighted images (24.4%) were the sequences where hemorrhage was most frequently visualized. The "Eccentric target" sign was present in 18.0% of cases and the "concentric target" sign in 15.0% of cases.

## CONCLUSION

The diagnosis of EBV-associated PCNSL is challenging given its rarity. Our sample showed that multiple necrotic and hemorrhagic lesions are the MRI landmarks for EBV-associated PCNSL imaging diagnosis. Hypercellularity, typically seen in PCNSL, was often but inconstantly noticed. "Eccentric" and "concentric" target signs, classically attributed to CNS toxoplasmosis, were found in pathologically proven EBV-associated PCNSL. Neuroradiologists must be aware of this tumor entity, as well as of current MRI limitations in its distinction with neurotoxoplasmosis.

## CLINICAL RELEVANCE/APPLICATION

Radiologist should know EBV-associated PCNSL MRI features and be aware of the possible overlap with neurotoxoplasmosis lesions, one of its main differential diagnoses in immunocompromised patients.

## M3-SSNR03-4 A Comprehensive Analysis of Clinical, Molecular, and Imaging Characteristics of H3 K27- Altered Diffuse Midline Gliomas in Adults

Yongsik Sim, MD (*Presenter*) Nothing to Disclose

## PURPOSE

The aim of this study was to comprehensively investigate the clinical, molecular, and imaging characteristics of H3 K27-altered diffuse midline glioma (DMG) in adults.

## METHODS AND MATERIALS

Retrospective charts and imaging reviews were performed in 81 adult patients with H3 K27-altered DMG enrolled between 2015 and 2023. The clinical, molecular, imaging, and survival characteristics were analyzed. Cox analyses were performed to determine predictors of overall survival (OS) in H3 K27-altered DMG patients. From available data from the meta-analysis of 1,000 pediatric patients with high-grade glioma and DIPG, 365 pediatric patients (aged < 18 years) with H3 K27-altered DMG were compared with adult patients.

## RESULTS

The median patient age was 42.0 years (range 19.9-75.7 years). All patients (100%) were H3.3 K27-mutant subtype, with frequent p53 expression (32.1%) and ATRX loss (14.3%). The most common location of tumors was thalamus (30.9%), followed by spinal cord (28.4%), non-midline location (17.2%), and medulla (12.3%). The OS of H3 K27-altered DMG adult patients was 30.3 months (IQR 18.1-41.1), longer than H3 K27-altered DMG pediatric patients (30.3 vs. 12.0 months,  $P < 0.001$ ). On multivariable Cox analysis, older age at diagnosis (hazard ratio [HR] = 0.95,  $P < 0.001$ ), spinal cord location (HR = 0.39,  $P = 0.010$ ), and non-gross total resection of nonenhancing tumor (HR = 10.70,  $P = 0.005$ ) were independently associated with better OS.

## CONCLUSION

The current recommendation of testing H3 K27 alteration in midline-located tumors should be questioned. The prognosis of H3 K27-altered DMG in the adult is not discouraging as expected in pediatric counterparts, and promote the reconsideration of aggressive surgery as well as development of clinical trials in this relatively ignored condition.

## CLINICAL RELEVANCE/APPLICATION

This series describes the clinical, molecular, and imaging features of H3 K27-altered DMGs in adults. The prognosis of H3 K27-altered DMG in the adult is not discouraging as expected in pediatric counterparts. Our results suggest reconsideration of aggressive surgery in H3 K27-altered DMG in adults.

### M3-SSNR03-5 **Intra- and Peritumoral Radiomics for Distinguishing Circumscribed and Diffuse Gliomas: A Multicenter Validation Study**

Shuang Li (*Presenter*) Nothing to Disclose

## PURPOSE

Circumscribed astrocytomas (CAGs) are well-circumscribed tumors that have a more solid growth pattern, while diffuse gliomas (DGs) are characterized by invasive growth and infiltration of the brain parenchyma. Accurate preoperative differentiation between CAGs and DGs is essential for treatment planning and prognosis prediction.

## METHODS AND MATERIALS

We retrospectively analyzed MRI data from patients with CAGs and DGs across three institutions. After segmenting the tumor volume of interest (VOI), three VOIs (VOItumor and peritumoral, VOIwhole, and VOIinterface) were obtained that comprised the peritumoral region. Clinical and combined model (incorporating radiomics and clinical features) were also established. To address training dataset imbalance, we employed the Synthetic Minority Oversampling Technique (SMOTE). A 5-fold cross-validation on the training dataset determined the model's hyperparameters, and performance was assessed using receiver operating characteristic curve and precision-recall analysis.

## RESULTS

Finally, 475 patients (DGs:  $n = 338$ , CAGs:  $n = 137$ ) were included in this study. The VOIinterface radiomics model yield the best performance in distinguishing CAGs from DGs, with an AUC of 0.806 and AUPRC of 0.894 in the 5-fold cross-validation set. Using the ANOVA feature selector and SVM classifier, 7 features were selected. The AUC and AUPRC achieved were 0.912 and 0.972 on the internal validation dataset, and 0.897 and 0.930 on the external validation dataset. The combined model using interface radiomics and clinical features improved performance in the external validation set (AUC of 0.94 and PRAUC of 0.959).

## CONCLUSION

Radiomics models incorporating the peritumoral area show increased potential for distinguishing CAGs from DGs compared to intratumoral models. These findings may be promising for evaluating tumor nature before surgery and improving clinical management of glioma patients.

## CLINICAL RELEVANCE/APPLICATION

The application of intra- and peritumoral radiomics for differentiating CAGs and DGs enhances preoperative accuracy, which is vital for customizing treatment plans and anticipating patient outcomes. By including peritumoral radiomics features, clinicians can obtain a more comprehensive insight into the invasive growth patterns of DGs, facilitating better-informed treatment decisions.

#### Sub-Events

#### M3-SSNR04-1 Baseline and Longitudinal Radiologic Assessment of Brain Metastases Treated With Laser Interstitial Thermal Therapy (LITT)

Francesco Sanvito, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

To identify baseline imaging features of brain metastases (BM) predicting lesion progression free survival (PFS-L) after laser interstitial thermal therapy (LITT), and to characterize post-treatment longitudinal volumetric and diffusion imaging changes of long-term responding lesions.

#### METHODS AND MATERIALS

47 BM treated with LITT were retrospectively studied. BM were followed until clinical progression, radiologic progression according to the modified RANO criteria, or censoring. The association between pre-treatment imaging features and PFS-L was assessed with survival analyses. In responding lesions, longitudinal post-LITT volume shrinkage over time was fit to an exponential decay model, and changes in the apparent diffusion coefficient (ADC) were compared between pre-treatment scans, early post-treatment, 1 year follow-up and =2 years follow-up.

#### RESULTS

13 BM progressed after LITT, 17 met radiologic criteria for response after LITT, and 17 were stable at time of censoring. Pre-LITT enhancing volume  $<2.5$  cc ( $p=0.0004$ ) and sphericity  $=0.705$  ( $p=0.0026$ ) predicted longer PFS-L. BM meeting both cutoffs showed a cumulative PFS-L benefit ( $p<0.0001$ ). High sphericity was associated with complete thermal ablation ( $p=0.03$ ), and small volume tended to predict complete ablation ( $p=0.11$ ). Pre-LITT diffusion imaging did not predict PFS-L, while a subset of lesions ( $n=7$ ) with highly perfused hotspots (normalized rCBV  $>2.5$ ) had worse PFS-L ( $p=0.0012$ ). Immediate post-LITT volume was increased compared to pre-LITT ( $p<0.0001$ , median increase 80.3%), and the percentage of volume increase was not a predictor of PFS-L. In 15 out of 17 responding BM (88.2%), post-LITT shrinkage over time was described by an exponential decay ( $R^2$  ranging 0.92-1.0), with half-life ranging 0.3-5.4 months. ADC changes over time were heterogeneous across the 17 responding lesions. Preliminary analyses showed an overall significant ADC decrease immediately after the treatment (median change:  $-128 \times 10^{-6}$  mm<sup>2</sup>/s,  $p=0.03$ ) and a tendency towards a subsequent progressive ADC increase at 1 year (median change compared to post-LITT:  $+114 \times 10^{-6}$  mm<sup>2</sup>/s,  $p=0.37$ ) and at 2 years (median change compared to post-LITT:  $+481 \times 10^{-6}$  mm<sup>2</sup>/s,  $p=0.03$ ).

#### CONCLUSION

Brain metastases with pre-treatment large volume, low sphericity and high perfusion are more at risk of LITT failure. Lesions meeting criteria for response exhibit a characteristic exponential shrinkage over time, and show an overall ADC decrease followed by a long-term increase.

#### CLINICAL RELEVANCE/APPLICATION

Identifying pre-treatment features associated with treatment response aids patient selection for LITT, while characterizing longitudinal changes in responders defines the expected radiologic findings at follow-up.

#### M3-SSNR04-2 A Revised Molecular Recursive Partitioning Analysis using T2-FLAIR-Based Surgical Extent in Patients With Glioblastoma: A Multi-Center Validation Study

Dongyeong Kim, MD (*Presenter*) Nothing to Disclose

## PURPOSE

We sought to identify associations of T2-FLAIR based non-enhancing tumor based gross total resection (NE-GTR) among different molecular subgroups of glioblastoma in multi-center validation using molecular-based recursive partitioning analysis for glioblastoma (GBM-molRPA).

## METHODS AND MATERIALS

This multicenter cohort study included a prospective registry cohort and external validation with newly diagnosed glioblastoma patients with confirmed isocitrate dehydrogenase (IDH) and O-6-methylguanine-DNA methyltransferase (MGMT) promoter methylation status. Contrast-enhancing lesion-based GTR (CE-GTR) and NE-GTR were assessed by four neuroradiologists. Associations between the two GTR definitions and overall survival (OS) were evaluated. Two subsets according to IDH mutation, MGMT, and age were further compared for predictive value of OS between CE-GTR and NE-GTR.

## RESULTS

A total of 568 patients were included (216 from prospective set and 352 from external set). NE-GTR achieved better survival stratification than CE-GTR in both prospective and external sets (log-rank test,  $P < .001$ ). In patients with IDH wild-type and positive MGMT methylation status, NE-GTR showed stronger association with OS than CE-GTR (NE-GTR vs. CE-GTR in prospective and external set: HR 0.361 vs. 0.489; HR 0.563 vs. 0.605). Patients aged  $\geq 50$  years with IDH wild-type benefited from reduction of either the NE-GTR or CE-GTR (NE-GTR vs. CE-GTR in prospective and external set: HR 0.220 vs. HR 0.368; HR 0.393 vs. HR 0.352).

## CONCLUSION

NE-GTR provided better outcome stratification than CE-GTR and refined the GBM-molRPA stratification. NE-GTR enhanced long-term survival in patients with IDH wild-type glioblastoma and positive MGMT promoter methylation status.

## CLINICAL RELEVANCE/APPLICATION

The study compared the impact of NE-GTR and CE-GTR on molecular-based recursive partitioning analysis (GBM-molRPA) in patients with newly developed glioblastoma. NE-GTR was found to be more important for patients with IDH wild-type glioblastoma and positive MGMT promoter methylation status. The findings suggest that NE-based GTR improves outcome stratification over CE-based GTR and refines molecular-based RPA stratification.

## M3-SSNR04-3 Whole Brain Spectroscopy Guided Planning of Transducer Arrays for Enhanced Delivery of Tumor Treating Fields in Patients with Glioblastoma

Laiz L. Godoy, MD (*Presenter*) Nothing to Disclose

## PURPOSE

Due to infiltrative nature of glioblastomas (GBMs), an optimal delivery of tumor treating fields (TTFields) requires precise targeting of entire viable tumor. We hypothesize that whole brain spectroscopic imaging (WBSI) derived high-resolution choline/N-acetylaspartate (NAA) maps (voxel size =  $4.3 \times 4.3 \times 5.6 \text{mm}^3$ ) will more accurately delineate the tumor margins and identify a comprehensive target volume for TTFields delivery.

## METHODS AND MATERIALS

Six GBM patients underwent anatomical imaging, and WBSI on a 3T MRI. The processing steps for WBSI data involved field inhomogeneity and eddy current correction, K-space regridding, spatial and Fourier transformation. In each case, quality assurance was evaluated by considering the following metrics: Cramer-Rao lower bounds, line shapes, line width, CSF partial volume contribution, and degree of residual water and lipid signals. The choline/NAA maps, T2-FLAIR images were co-registered to post contrast (PC)-T1 images. One 3D-composite mask was drawn manually on PC-T1 and T2-FLAIR hyperintense tumor abnormalities and labeled as 'tumor mask'. Another mask was drawn on contralateral normal-appearing brain parenchyma by selecting a volume comparable to the tumor size and at the same slice level and was labeled as 'normal mask'. A mean value of choline/NAA was computed from normal mask, and mean + 1 standard deviation of choline/NAA was considered as threshold value. A tumor region corresponding to all voxels that exceeded the threshold choline/NAA value as measured from normal mask (which includes regions beyond contrast-enhancing regions and hyperintense signal abnormality on T2-FLAIR) was considered as "target volume" for TTFields delivery using a modified transducer array layout.

## RESULTS

Quality map analyses revealed that good quality metabolite maps were obtained from all patients. Figure 1 shows choline/NAA map and anatomical images from a representative GBM patient. As evident, an approximately 4 times more viable tumor cells were detected using metabolic maps compared to T2-FLAIR images. Number of voxels encompassing 3D-composite masks drawn on choline/NAA maps were found to be 1.6 to 4 folds higher than those drawn on anatomical images from 6 patients.

## CONCLUSION

Our preliminary results showed that WBSI derived metabolite maps project a more comprehensive representation of tumor's true spatial extent and provide more accurate margins of viable tumor cells for delivering enhanced dose of TTFields.

## CLINICAL RELEVANCE/APPLICATION

Alternative array configuration will allow for enhanced delivery of TTFields dose to all proliferating regions of a GBM, decreasing the rate of local recurrence and improvement in overall survival and the quality of life measures.

### **M3-SSNR04-4 Prospective Longitudinal Analysis of Imaging-based Spatiotemporal Tumor Habitats in Glioblastoma, IDH-wild Type: Implication in Patient Outcome using Multiparametric Physiologic MRI**

Hye Hyeon Moon, MD (*Presenter*) Nothing to Disclose

## PURPOSE

Heterogeneity in glioblastomas is associated with poor outcomes, and physiologic heterogeneity can be quantified with MRI. We analyzed associations between physiologic MRI-based tumor habitats and patient outcome and prospectively validated to predict time-to-progression (TTP) in glioblastoma patients after concurrent chemoradiotherapy (CCRT).

## METHODS AND MATERIALS

We prospectively enrolled 65 patients (mean age,  $57.9 \pm 11.6$  years, 34 women, NCT02613988) with IDH-wild type glioblastoma who underwent CCRT and obtained immediate post-op and 3 serial MRI scans with 3-month interval include diffusion-weighted imaging and dynamic susceptibility contrast imaging. Voxels from cerebral blood volume and apparent diffusion coefficient maps were grouped using k-means clustering into 3 spatial habitats (hypervascular cellular, hypovascular cellular, and nonviable tissue). A discrete habitat risk score was calculated by comparing changes in hypervascular cellular and hypovascular cellular habitats along serial MRI scans (post-op, post-CCRT #1, #2, and #3). The Kaplan-Meier method and Cox regression analysis were used to assess the association between TTP and habitat risk score.

## RESULTS

A cutoff for habitat risk score was increased of hypervascular cellular habitat ( $>0$  voxel) or hypovascular cellular habitat ( $>130$  voxels). The habitat risk score stratified patients according to low, intermediate, and high risk at post-CCRT #1 (mean TTP; 839 vs. 592 vs. 320 days, log-rank test;  $P < .001$ ), post-CCRT #2 (mean TTP; 949 vs. 348 vs. 282 days,  $P < .001$ ), and post-CCRT #3 scans (mean TTP; 950 vs. 487 vs. 343 days,  $P < .001$ ). A Cox regression analysis identified a habitat risk score between post-op and post-CCRT#1 was an independent predictor for TTP (hazard ratio, 4.75; 95% CI, 2.12-10.66,  $P < .001$ ).

## CONCLUSION

The habitat risk score, reflecting spatiotemporal habitats of vascularity and cellularity of tumor, successfully stratified TTP in patients with IDH wild-type glioblastoma. The habitat risk score at immediate post-CCRT imaging can be a useful predictor of early tumor progression and clinical outcomes in patients with post-treatment glioblastoma.

## CLINICAL RELEVANCE/APPLICATION

Spatial heterogeneity in glioblastoma indicates poor prognosis and therapy resistance. Clustering of multiparametric MRI can reflect spatial habitats of post-CCRT glioblastoma. We validated the habitat risk score based on spatiotemporal habitats and associated it with patient outcomes. Increase in habitat risk score at immediate post-CCRT scans was strongly associated with shorter time-to-progression. Our spatiotemporal habitat analysis could be a useful predictor for early tumor progression and clinical outcomes in patients with post-treatment glioblastoma.

### **M3-SSNR04-5 Differentiating Radiation Changes and Leptomeningeal Metastasis in Subependymal Lesion: Added Value of Perfusion MRI to Morphological Features**

Kyu Sung Choi, MD, PhD (*Presenter*) Nothing to Disclose

## PURPOSE

To investigate radiation-induced subependymal changes after Stupp protocol in adult-type high-grade diffuse gliomas and differentiate between radiation changes and progression in the evaluation of leptomeningeal disease (LMD)

## METHODS AND MATERIALS

This retrospective study reviewed 79 consecutive diffuse glioma patients (mean age,  $54.9 \pm 13.6$  years, 54 (68.4%) males) with new subependymal enhancement (SE) in the follow-up MRI after gross total resection and concurrent chemoradiation with temozolomide. For differentiating between radiation changes and true progression in SE evaluation, univariate correlation analysis was conducted to identify significant variables among SE interval, genetic mutation including isocitrate dehydrogenase (IDH), and 14 radiomic shape features and relative cerebral blood volume (rCBV). Subsequently, multivariate logistic regression was performed using the significant variables. For added value of rCBV, a log-rank test was conducted

between the multivariate logistic regression models with and without rCBV. The area under the receiver operating characteristic (AUROC) was obtained to assess diagnostic value of significant variables.

## RESULTS

23 out of 79 (21.1%) patients showed first subependymal lesions,  $7.93 \pm 8.18$  months after surgical treatment, and disappeared after  $5.79 \pm 5.75$  months after initial appearance on postoperative MRI. Elongated, small-sized lesions with lower rCBV tended to spontaneously regress: Elongation (odds ratio (OR)=1.22,  $p=0.02$ ), Mean 3D diameters (OR=2.08,  $p=0.01$ ), and rCBV\_p95 (OR=2.07,  $p=0.04$ ). The qualitative evaluation of shape revealed that thin and curvilinear shaped SE tended to regress (OR=0.03,  $p=0.03$ ), showing significant correlation with quantitative shape features ( $r=0.31$ ,  $p=0.005$ ). Shorter SE interval indicates progression (OR=0.90,  $p=0.02$ ) but showed no group difference ( $p=0.08$ ). In sub-centimeter lesions, rCBV showed added value in predicting outcomes ( $R^2=0.550$  vs  $0.658$ ;  $p=0.01$ , log-rank test). Radiation dose showed no significant difference between the progression and regression group ( $73.8 \pm 29.0$  vs  $70.8 \pm 22.6$  Gy,  $p=0.67$ ). IDH mutation status was not significant predictor both logistic regression models ( $p=0.19$ , and  $p=0.08$ ). AUROC for Elongation, Mean 3D diameters, rCBV\_p95, and SE interval was 0.702, 0.802, 0.729, and 0.702, respectively.

## CONCLUSION

Smaller, elongated lesions with lower rCBV are predictive for regression, when differentiating radiation changes from LMD progression in new subependymal enhancement.

## CLINICAL RELEVANCE/APPLICATION

Integrating morphological and perfusional characteristics of subependymal enhancement may help treatment decision-making, which may lead to improved patient outcomes.

## M3-SSNR04-6 Rules-based Volumetric Segmentation of Multiparametric MRI for Response Assessment in Recurrent High-Grade Glioma

Natarajan Raghunand, PhD (*Presenter*) Nothing to Disclose

## PURPOSE

Tumor volumetrics can augment imaging response assessment of high-grade glioma (HGG). We present an explainable algorithm to assign brain voxels on multiparametric MRI (mpMRI) to distinct tissue types. Intratumoral tissue type volumes were combined in a multivariable model to predict time-to-progression (TTP) in recurrent HGG (rHGG) treated with hypofractionated reirradiation, bevacizumab, and pembrolizumab ("immunoradiotherapy").

## METHODS AND MATERIALS

In this retrospective study, a rules-based algorithm was developed on calibrated, co-registered mpMRI images from 18 participants presenting a range of pathologic tissue types, including contrast-enhancing tumor (CE), hemorrhage, fluid, non-enhancing tumor (Edema1), and leukoaraiosis (Edema2). Algorithm-computed tissue type volumes were validated by Pearson correlation analysis against ground truth segmentations of enhancing tumor (ET), peritumoral edema (ED), and NCR/NET (necrotic core/non-enhancing tumor) in an external cohort of 235 HGG participants in the BraTS 2020 dataset. In a single-site study of rHGG treated with immunoradiotherapy (NCT02313272, 32 participants, 2015-2019), serial volumes of intratumoral tissue types and the time-on-treatment ( $t_{C1D1}$ ) at each scan date were used to predict TTP. The model was optimized by stepwise variable selection on Akaike Information Criterion with 10-fold cross-validation, and evaluated by its accuracy to predict whether progression would occur within  $n$  ( $=30, 60, \text{ and } 90$ ) days of a given scan date.

## RESULTS

The total study sample comprised 285 participants (rHGG test cohort ages 22-68 years, 65% male). On external validation, there was high correlation of CE with ET ( $R=0.85$ ;  $p<0.001$ ), and High FLAIR (Edema1+Edema2) with ED ( $R=0.87$ ;  $p<0.001$ ), with NET/NCR being moderately correlated with multiple tissue types ( $R=0.22-0.52$ ). A model using per-timepoint  $t_{C1D1}$  and volumes of CE and Fluid was 82.5% accurate for predicting whether progression would occur within 30 days of a given scan date.

## CONCLUSION

Logical rules based on domain knowledge were developed for segmenting brain mpMRI into distinct tissue types. This method is straightforward to implement, easy to understand, and more generalizable than supervised deep learning approaches. A formula for predicting TTP based on time-on-treatment and per-timepoint volumes of CE and Fluid is more explainable than black box deep learning classifiers and suitable for incorporation into the clinical workflow for assessing rHGG.

## CLINICAL RELEVANCE/APPLICATION

Temporal dynamics of intratumoral tissue type volumes can inform a collaborative dialogue between the neuro-oncologist and the neuroradiologist towards improved patient care in rHGG treated with complex multimodality regimens.

M3-SSNR04-1

### Baseline and Longitudinal Radiologic Assessment of Brain Metastases Treated With Laser Interstitial Thermal Therapy (LITT)

Monday, Nov. 27 9:30AM - 10:30AM Room: E353B

Francesco Sanvito, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

To identify baseline imaging features of brain metastases (BM) predicting lesion progression free survival (PFS-L) after laser interstitial thermal therapy (LITT), and to characterize post-treatment longitudinal volumetric and diffusion imaging changes of long-term responding lesions.

#### METHODS AND MATERIALS

47 BM treated with LITT were retrospectively studied. BM were followed until clinical progression, radiologic progression according to the modified RANO criteria, or censoring. The association between pre-treatment imaging features and PFS-L was assessed with survival analyses. In responding lesions, longitudinal post-LITT volume shrinkage over time was fit to an exponential decay model, and changes in the apparent diffusion coefficient (ADC) were compared between pre-treatment scans, early post-treatment, 1 year follow-up and =2 years follow-up.

#### RESULTS

13 BM progressed after LITT, 17 met radiologic criteria for response after LITT, and 17 were stable at time of censoring. Pre-LITT enhancing volume  $<2.5$  cc ( $p=0.0004$ ) and sphericity  $=0.705$  ( $p=0.0026$ ) predicted longer PFS-L. BM meeting both cutoffs showed a cumulative PFS-L benefit ( $p<0.0001$ ). High sphericity was associated with complete thermal ablation ( $p=0.03$ ), and small volume tended to predict complete ablation ( $p=0.11$ ). Pre-LITT diffusion imaging did not predict PFS-L, while a subset of lesions ( $n=7$ ) with highly perfused hotspots (normalized rCBV  $>2.5$ ) had worse PFS-L ( $p=0.0012$ ). Immediate post-LITT volume was increased compared to pre-LITT ( $p<0.0001$ , median increase 80.3%), and the percentage of volume increase was not a predictor of PFS-L. In 15 out of 17 responding BM (88.2%), post-LITT shrinkage over time was described by an exponential decay ( $R^2$  ranging 0.92-1.0), with half-life ranging 0.3-5.4 months. ADC changes over time were heterogeneous across the 17 responding lesions. Preliminary analyses showed an overall significant ADC decrease immediately after the treatment (median change:  $-128 \times 10^{-6}$  mm<sup>2</sup>/s,  $p=0.03$ ) and a tendency towards a subsequent progressive ADC increase at 1 year (median change compared to post-LITT:  $+114 \times 10^{-6}$  mm<sup>2</sup>/s,  $p=0.37$ ) and at 2 years (median change compared to post-LITT:  $+481 \times 10^{-6}$  mm<sup>2</sup>/s,  $p=0.03$ ).

#### CONCLUSION

Brain metastases with pre-treatment large volume, low sphericity and high perfusion are more at risk of LITT failure. Lesions meeting criteria for response exhibit a characteristic exponential shrinkage over time, and show an overall ADC decrease followed by a long-term increase.

#### CLINICAL RELEVANCE/APPLICATION

Identifying pre-treatment features associated with treatment response aids patient selection for LITT, while characterizing longitudinal changes in responders defines the expected radiologic findings at follow-up.

### **A Revised Molecular Recursive Partitioning Analysis using T2-FLAIR-Based Surgical Extent in Patients With Glioblastoma: A Multi-Center Validation Study**

Monday, Nov. 27 9:30AM - 10:30AM Room: E353B

Dongyeong Kim, MD (*Presenter*) Nothing to Disclose

#### **PURPOSE**

We sought to identify associations of T2-FLAIR based non-enhancing tumor based gross total resection (NE-GTR) among different molecular subgroups of glioblastoma in multi-center validation using molecular-based recursive partitioning analysis for glioblastoma (GBM-molRPA).

#### **METHODS AND MATERIALS**

This multicenter cohort study included a prospective registry cohort and external validation with newly diagnosed glioblastoma patients with confirmed isocitrate dehydrogenase (IDH) and O-6-methylguanine-DNA methyltransferase (MGMT) promoter methylation status. Contrast-enhancing lesion-based GTR (CE-GTR) and NE-GTR were assessed by four neuroradiologists. Associations between the two GTR definitions and overall survival (OS) were evaluated. Two subsets according to IDH mutation, MGMT, and age were further compared for predictive value of OS between CE-GTR and NE-GTR.

#### **RESULTS**

A total of 568 patients were included (216 from prospective set and 352 from external set). NE-GTR achieved better survival stratification than CE-GTR in both prospective and external sets (log-rank test,  $P < .001$ ). In patients with IDH wild-type and positive MGMT methylation status, NE-GTR showed stronger association with OS than CE-GTR (NE-GTR vs. CE-GTR in prospective and external set: HR 0.361 vs. 0.489; HR 0.563 vs. 0.605). Patients aged  $\geq 50$  years with IDH wild-type benefited from reduction of either the NE-GTR or CE-GTR (NE-GTR vs. CE-GTR in prospective and external set: HR 0.220 vs. HR 0.368; HR 0.393 vs. HR 0.352).

#### **CONCLUSION**

NE-GTR provided better outcome stratification than CE-GTR and refined the GBM-molRPA stratification. NE-GTR enhanced long-term survival in patients with IDH wild-type glioblastoma and positive MGMT promoter methylation status.

#### **CLINICAL RELEVANCE/APPLICATION**

The study compared the impact of NE-GTR and CE-GTR on molecular-based recursive partitioning analysis (GBM-molRPA) in patients with newly developed glioblastoma. NE-GTR was found to be more important for patients with IDH wild-type glioblastoma and positive MGMT promoter methylation status. The findings suggest that NE-based GTR improves outcome stratification over CE-based GTR and refines molecular-based RPA stratification.

### Whole Brain Spectroscopy Guided Planning of Transducer Arrays for Enhanced Delivery of Tumor Treating Fields in Patients with Glioblastoma

Monday, Nov. 27 9:30AM - 10:30AM Room: E353B

Laiz L. Godoy, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

Due to infiltrative nature of glioblastomas (GBMs), an optimal delivery of tumor treating fields (TTFields) requires precise targeting of entire viable tumor. We hypothesize that whole brain spectroscopic imaging (WBSI) derived high-resolution choline/N-acetylaspartate (NAA) maps (voxel size =  $4.3 \times 4.3 \times 5.6 \text{mm}^3$ ) will more accurately delineate the tumor margins and identify a comprehensive target volume for TTFields delivery.

#### METHODS AND MATERIALS

Six GBM patients underwent anatomical imaging, and WBSI on a 3T MRI. The processing steps for WBSI data involved field inhomogeneity and eddy current correction, K-space regridding, spatial and Fourier transformation. In each case, quality assurance was evaluated by considering the following metrics: Cramer-Rao lower bounds, line shapes, line width, CSF partial volume contribution, and degree of residual water and lipid signals. The choline/NAA maps, T2-FLAIR images were co-registered to post contrast (PC)-T1 images. One 3D-composite mask was drawn manually on PC-T1 and T2-FLAIR hyperintense tumor abnormalities and labeled as 'tumor mask'. Another mask was drawn on contralateral normal-appearing brain parenchyma by selecting a volume comparable to the tumor size and at the same slice level and was labeled as 'normal mask'. A mean value of choline/NAA was computed from normal mask, and mean + 1 standard deviation of choline/NAA was considered as threshold value. A tumor region corresponding to all voxels that exceeded the threshold choline/NAA value as measured from normal mask (which includes regions beyond contrast-enhancing regions and hyperintense signal abnormality on T2-FLAIR) was considered as "target volume" for TTFields delivery using a modified transducer array layout.

#### RESULTS

Quality map analyses revealed that good quality metabolite maps were obtained from all patients. Figure 1 shows choline/NAA map and anatomical images from a representative GBM patient. As evident, an approximately 4 times more viable tumor cells were detected using metabolic maps compared to T2-FLAIR images. Number of voxels encompassing 3D-composite masks drawn on choline/NAA maps were found to be 1.6 to 4 folds higher than those drawn on anatomical images from 6 patients.

#### CONCLUSION

Our preliminary results showed that WBSI derived metabolite maps project a more comprehensive representation of tumor's true spatial extent and provide more accurate margins of viable tumor cells for delivering enhanced dose of TTFields.

#### CLINICAL RELEVANCE/APPLICATION

Alternative array configuration will allow for enhanced delivery of TTFields dose to all proliferating regions of a GBM, decreasing the rate of local recurrence and improvement in overall survival and the quality of life measures.

### **Prospective Longitudinal Analysis of Imaging-based Spatiotemporal Tumor Habitats in Glioblastoma, IDH-wild Type: Implication in Patient Outcome using Multiparametric Physiologic MRI**

Monday, Nov. 27 9:30AM - 10:30AM Room: E353B

Hye Hyeon Moon, MD (*Presenter*) Nothing to Disclose

#### **PURPOSE**

Heterogeneity in glioblastomas is associated with poor outcomes, and physiologic heterogeneity can be quantified with MRI. We analyzed associations between physiologic MRI-based tumor habitats and patient outcome and prospectively validated to predict time-to-progression (TTP) in glioblastoma patients after concurrent chemoradiotherapy (CCRT).

#### **METHODS AND MATERIALS**

We prospectively enrolled 65 patients (mean age,  $57.9 \pm 11.6$  years, 34 women, NCT02613988) with IDH-wild type glioblastoma who underwent CCRT and obtained immediate post-op and 3 serial MRI scans with 3-month interval include diffusion-weighted imaging and dynamic susceptibility contrast imaging. Voxels from cerebral blood volume and apparent diffusion coefficient maps were grouped using k-means clustering into 3 spatial habitats (hypervascular cellular, hypovascular cellular, and nonviable tissue). A discrete habitat risk score was calculated by comparing changes in hypervascular cellular and hypovascular cellular habitats along serial MRI scans (post-op, post-CCRT #1, #2, and #3). The Kaplan-Meier method and Cox regression analysis were used to assess the association between TTP and habitat risk score.

#### **RESULTS**

A cutoff for habitat risk score was increased of hypervascular cellular habitat ( $>0$  voxel) or hypovascular cellular habitat ( $>130$  voxels). The habitat risk score stratified patients according to low, intermediate, and high risk at post-CCRT #1 (mean TTP; 839 vs. 592 vs. 320 days, log-rank test;  $P < .001$ ), post-CCRT #2 (mean TTP; 949 vs. 348 vs. 282 days,  $P < .001$ ), and post-CCRT #3 scans (mean TTP; 950 vs. 487 vs. 343 days,  $P < .001$ ). A Cox regression analysis identified a habitat risk score between post-op and post-CCRT #1 was an independent predictor for TTP (hazard ratio, 4.75; 95% CI, 2.12-10.66,  $P < .001$ ).

#### **CONCLUSION**

The habitat risk score, reflecting spatiotemporal habitats of vascularity and cellularity of tumor, successfully stratified TTP in patients with IDH wild-type glioblastoma. The habitat risk score at immediate post-CCRT imaging can be a useful predictor of early tumor progression and clinical outcomes in patients with post-treatment glioblastoma.

#### **CLINICAL RELEVANCE/APPLICATION**

Spatial heterogeneity in glioblastoma indicates poor prognosis and therapy resistance. Clustering of multiparametric MRI can reflect spatial habitats of post-CCRT glioblastoma. We validated the habitat risk score based on spatiotemporal habitats and associated it with patient outcomes. Increase in habitat risk score at immediate post-CCRT scans was strongly associated with shorter time-to-progression. Our spatiotemporal habitat analysis could be a useful predictor for early tumor progression and clinical outcomes in patients with post-treatment glioblastoma.

### Differentiating Radiation Changes and Leptomeningeal Metastasis in Subependymal Lesion: Added Value of Perfusion MRI to Morphological Features

Monday, Nov. 27 9:30AM - 10:30AM Room: E353B

Kyu Sung Choi, MD, PhD (*Presenter*) Nothing to Disclose

#### PURPOSE

To investigate radiation-induced subependymal changes after Stupp protocol in adult-type high-grade diffuse gliomas and differentiate between radiation changes and progression in the evaluation of leptomeningeal disease (LMD)

#### METHODS AND MATERIALS

This retrospective study reviewed 79 consecutive diffuse glioma patients (mean age,  $54.9 \pm 13.6$  years, 54 (68.4%) males) with new subependymal enhancement (SE) in the follow-up MRI after gross total resection and concurrent chemoradiation with temozolomide. For differentiating between radiation changes and true progression in SE evaluation, univariate correlation analysis was conducted to identify significant variables among SE interval, genetic mutation including isocitrate dehydrogenase (IDH), and 14 radiomic shape features and relative cerebral blood volume (rCBV). Subsequently, multivariate logistic regression was performed using the significant variables. For added value of rCBV, a log-rank test was conducted between the multivariate logistic regression models with and without rCBV. The area under the receiver operating characteristic (AUROC) was obtained to assess diagnostic value of significant variables.

#### RESULTS

23 out of 79 (21.1%) patients showed first subependymal lesions,  $7.93 \pm 8.18$  months after surgical treatment, and disappeared after  $5.79 \pm 5.75$  months after initial appearance on postoperative MRI. Elongated, small-sized lesions with lower rCBV tended to spontaneously regress: Elongation (odds ratio (OR)=1.22,  $p=0.02$ ), Mean 3D diameters (OR=2.08,  $p=0.01$ ), and rCBV\_p95 (OR=2.07,  $p=0.04$ ). The qualitative evaluation of shape revealed that thin and curvilinear shaped SE tended to regress (OR=0.03,  $p=0.03$ ), showing significant correlation with quantitative shape features ( $r=0.31$ ,  $p=0.005$ ). Shorter SE interval indicates progression (OR=0.90,  $p=0.02$ ) but showed no group difference ( $p=0.08$ ). In sub-centimeter lesions, rCBV showed added value in predicting outcomes ( $R^2=0.550$  vs  $0.658$ ;  $p=0.01$ , log-rank test). Radiation dose showed no significant difference between the progression and regression group ( $73.8 \pm 29.0$  vs  $70.8 \pm 22.6$  Gy,  $p=0.67$ ). IDH mutation status was not significant predictor both logistic regression models ( $p=0.19$ , and  $p=0.08$ ). AUROC for Elongation, Mean 3D diameters, rCBV\_p95, and SE interval was 0.702, 0.802, 0.729, and 0.702, respectively.

#### CONCLUSION

Smaller, elongated lesions with lower rCBV are predictive for regression, when differentiating radiation changes from LMD progression in new subependymal enhancement.

#### CLINICAL RELEVANCE/APPLICATION

Integrating morphological and perfusional characteristics of subependymal enhancement may help treatment decision-making, which may lead to improved patient outcomes.

### Rules-based Volumetric Segmentation of Multiparametric MRI for Response Assessment in Recurrent High-Grade Glioma

Monday, Nov. 27 9:30AM - 10:30AM Room: E353B

Natarajan Raghunand, PhD (*Presenter*) Nothing to Disclose

#### PURPOSE

Tumor volumetrics can augment imaging response assessment of high-grade glioma (HGG). We present an explainable algorithm to assign brain voxels on multiparametric MRI (mpMRI) to distinct tissue types. Intratumoral tissue type volumes were combined in a multivariable model to predict time-to-progression (TTP) in recurrent HGG (rHGG) treated with hypofractionated reirradiation, bevacizumab, and pembrolizumab ("immunoradiotherapy").

#### METHODS AND MATERIALS

In this retrospective study, a rules-based algorithm was developed on calibrated, co-registered mpMRI images from 18 participants presenting a range of pathologic tissue types, including contrast-enhancing tumor (CE), hemorrhage, fluid, non-enhancing tumor (Edema1), and leukoencephalopathy (Edema2). Algorithm-computed tissue type volumes were validated by Pearson correlation analysis against ground truth segmentations of enhancing tumor (ET), peritumoral edema (ED), and NCR/NET (necrotic core/non-enhancing tumor) in an external cohort of 235 HGG participants in the BraTS 2020 dataset. In a single-site study of rHGG treated with immunoradiotherapy (NCT02313272, 32 participants, 2015-2019), serial volumes of intratumoral tissue types and the time-on-treatment ( $t_{C1D1}$ ) at each scan date were used to predict TTP. The model was optimized by stepwise variable selection on Akaike Information Criterion with 10-fold cross-validation, and evaluated by its accuracy to predict whether progression would occur within  $n$  ( $n=30, 60, \text{ and } 90$ ) days of a given scan date.

#### RESULTS

The total study sample comprised 285 participants (rHGG test cohort ages 22-68 years, 65% male). On external validation, there was high correlation of CE with ET ( $R=0.85$ ;  $p<0.001$ ), and High FLAIR (Edema1+Edema2) with ED ( $R=0.87$ ;  $p<0.001$ ), with NET/NCR being moderately correlated with multiple tissue types ( $R=0.22-0.52$ ). A model using per-timepoint  $t_{C1D1}$  and volumes of CE and Fluid was 82.5% accurate for predicting whether progression would occur within 30 days of a given scan date.

#### CONCLUSION

Logical rules based on domain knowledge were developed for segmenting brain mpMRI into distinct tissue types. This method is straightforward to implement, easy to understand, and more generalizable than supervised deep learning approaches. A formula for predicting TTP based on time-on-treatment and per-timepoint volumes of CE and Fluid is more explainable than black box deep learning classifiers and suitable for incorporation into the clinical workflow for assessing rHGG.

#### CLINICAL RELEVANCE/APPLICATION

Temporal dynamics of intratumoral tissue type volumes can inform a collaborative dialogue between the neuro-oncologist and the neuroradiologist towards improved patient care in rHGG treated with complex multimodality regimens.

### M3-SSPH03-1 Detectability of Noise Texture Changes in CT

Luuk J. Oostveen, DIPLPHYS (*Presenter*) Research Grant, Canon Medical Systems Corporation

#### PURPOSE

Noise texture, quantified by the noise power spectrum (NPS), influences lesion detection. In CT it is common to use the average NPS frequency ( $F_{av}$ ) or the peak frequency ( $F_{peak}$ ) as one-parameter NPS descriptors. This study aimed to develop a more complete model of the CT NPS and determine the human-observer detectability of changes in CT NPS.

#### METHODS AND MATERIALS

A model of CT NPS was created based on its ramp dominating the low spatial frequencies and an apodization downslope dominating the higher frequencies. The ramp was quantified by  $F_{peak}$ . The downslope was fitted to a half Gaussian resulting in its sigma ( $s$ ) used as descriptor of the downslope. A two-alternative-forced-choice observer study was performed to determine the detectability of changes in NPS. Five observers were shown three colored noise patches: two containing different realizations of the same colored noise, one of them defined as the reference patch, and one with different  $F_{peak}$  and/or  $s$ . The observer had to identify the patch similar to the reference one. The differences in  $F_{peak}$  and/or  $s$  that still resulted in 80% correct response were determined. As reference, an abdomen-kernel NPS and a chest-kernel NPS were used.  $F_{peak}$  and  $s$  were changed alone and at the same time, resulting in evaluating the differences perceived in 8 directions. An elliptical limiting detectability boundary was fit through the average limiting values from all observers and all directions. For each NPS tested,  $F_{av}$  and the noise texture contrast (Cnt) to the reference NPS was calculated as the integral of the absolute difference of the 2D NPSs. The experiment was repeated with 32 radiologists. However, each radiologist evaluated 1 direction only, with in total 2 radiologists per direction.

#### RESULTS

Changes in  $F_{peak}$  alone are not detectable below a change of 0.2 lp/cm and 0.3 lp/cm for the abdomen and chest NPS, respectively. For  $s$  alone, these values are 0.15 lp/cm and 2 lp/cm, respectively. These thresholds change if the other parameter also changes. However, the Cn needed to make a change detectable is limited ( $< 0.23HU^2$ ) but depends on the parameter being changed and the reference noise texture. As expected, different NPS with the same  $F_{av}$  can be discriminated. No significant difference was found in performance between radiologists and laymen.

#### CONCLUSION

$F_{peak}$  and  $F_{av}$  alone are insufficient to describe noise texture since textures with the same  $F_{peak}$  or  $F_{av}$  can be discriminable. Discrimination of noise texture changes depends on its frequency content. Radiologists do not discriminate noise texture changes better than laymen.

#### CLINICAL RELEVANCE/APPLICATION

For the development of non-linear reconstruction techniques and reconstruction kernels it is important to understand how human observers react to various noise textures.

### M3-SSPH03-2 Lesion Detection Versus Characterization: Patient-data-based Virtual Imaging Trial for Performance Evaluation of Deep Learning CT Noise Reduction

Zhongxing Zhou, PhD (*Presenter*) Nothing to Disclose

## PURPOSE

Accurate assessment of image quality for deep learning-based image reconstruction and noise reduction methods (DLIR) is challenging due to its high non-linearity and generalizability concerns. The highly non-linear spatial resolution and noise properties of DLIR may lead to different performance for two important clinical tasks: low-contrast lesion detection vs. characterization. The purpose of this study was to apply a newly developed patient-data-based virtual imaging trial framework to evaluate the performance of a DLIR method for these two tasks.

## METHODS AND MATERIALS

The patient-data-based virtual imaging trial framework consists of 4 steps: (1) lesion- and (2) noise-insertion in projection domain to generate images at different lesion and noise conditions, (3) DLIR processing of all noise realizations, and (4) calculation of index of detectability ( $d'$ ) using a channelized Hotelling observer (CHO). A ResNet-based deep convolutional neural network (DCNN) trained on patient images was evaluated. Lesions in a cylindrical shape (5-mm height, 15-mm diameter) with and without concave boundary were inserted in patient liver images. Ensembles of quarter dose projection data were generated by 600 independent noise realizations for each of the 4 lesion conditions: (1) lesion present (round lesion at -10HU), (2) lesion absent, (3) round lesion at -50HU, and (4) concave lesion at -50HU. For the lesion detection task,  $d'$  was measured using 600 pairs of lesion-present and absent images (conditions 1 and 2). For the lesion characterization task,  $d'$  was calculated using 600 pairs of images with round and concave lesions (conditions 3 and 4). Multiple reconstruction methods were evaluated, including filtered-backprojection (FBP), iterative reconstruction (IR), and the DCNN at 3 settings (weak, medium, and strong).

## RESULTS

DCNN improved  $d'$  for both tasks compared with FBP (detection: 2.24, 2.70, 2.49, 3.04, 3.80; characterization: 1.40, 1.44, 1.45, 1.61, 1.74, for FBP, IR, DCNN-weak, medium, and strong, respectively). However, the improvement of  $d'$  by DCNN over FBP was much lower for the characterization task (4%, 15%, and 24% for the 3 DCNN strengths, respectively) than for the detection task (11%, 36%, and 70%), which can be explained by a stronger blurring effect of DCNN for lesion boundary at higher strength settings.

## CONCLUSION

Using a patient-data-based virtual imaging trial, DLIR was demonstrated to have less performance improvement for a lesion characterization task than for a lesion detection task.

## CLINICAL RELEVANCE/APPLICATION

The reduced performance improvement by DLIR for lesion characterization compared to lesion detection implies that less radiation dose reduction is acceptable for a lesion characterization task.

## M3-SSPH03-3 Impact of Charge-sharing Effects on Noise Variance of Sinogram Projection Data in Photon-counting CT

Chengzhu Zhang, PhD, MS (*Presenter*) Nothing to Disclose

## PURPOSE

This study aims to introduce a modified estimator for sinogram noise in photon-counting CT that accounts for charge-sharing effects when native detector elements are binned. The new estimator incorporates a calibration constant derived from an air scan to accurately estimate the noise and improve image quality while avoiding repetitive patient scans.

## METHODS AND MATERIALS

We developed a noise variance estimator that accounts for charge-sharing effects in detector binning conditions to estimate sinogram noise variance accurately. The adjusted noise variance is obtained by multiplying the estimated noise variance from the Poisson distribution by a constant  $a$ , i.e.,  $\text{var}(y_i) = a/N_i$ . This constant can be calibrated using an air scan, eliminating the need for repetitive object or patient scans. We used data acquired from an experimental PCD-CT system with a CdTe-based PCD to validate the new model. We studied different detector configurations such as various binning factors, on/off of the anti-charge sharing function, different energy thresholds at 23.42, 26.03, 28.71, 31.45 keV, and different mAs levels.

## RESULTS

We found three key results: First, when the detector is not binned, the Poisson distribution does not need modification, i.e.,  $a=1$ . Second, the modification factor  $a$  increases as the number of binned detectors increases; Particularly,  $a=1.15$  for  $52(\text{slice}) \times 8(\text{axial})$  binning. Third,  $a$  significantly increases when anti-charge sharing is disabled and decreases as the energy threshold moves toward a higher energy end, indicating reduced charge-sharing effects.

## CONCLUSION

Our modified noise variance estimator accurately estimates the noise variance of sinogram projection data.

## CLINICAL RELEVANCE/APPLICATION

The proposed noise variance estimator has significant clinical relevance as it allows for improved measurement of noise properties of photon-counting CT.

### M3-SSPH03-4 **Assessment of 3D Image Quality Variations in the MIDRC Chest CT Database: A Multi-institutional Study of Imaging Systems and Protocols**

Ali Uneri, PhD (*Presenter*) Research Grant, Medtronic plc; Research Grant, Siemens AG; Research Consultant, The Phantom Laboratory; Research Consultant, SpineAlign Medical, Inc

#### PURPOSE

The Medical Imaging and Data Resource Center (MIDRC) database provides a vast collection of CT images in support of data-intensive imaging research. We report rigorous quantitation of image quality (IQ) metrics within the dataset as an important basis for understanding the provenance and IQ variation for such a broad range of scanners and protocols.

#### METHODS AND MATERIALS

Six institutions provided 252 scans using 11 CT scanner models from 4 vendors. An IQ test phantom (20-cm diameter Corgi™, The Phantom Laboratory) was scanned at low (31-38 mAs), medium (63-73 mAs), and high (94-112 mAs) exposure settings and reconstructed with smooth (mediastinum, "med") and sharp ("lung") kernels with standard ("std") (2.5-5 mm) and "thin" (0.5-2.0 mm) slice thickness. Automated analysis software measured contrast-to-noise ratio (CNR), 3D spatial resolution (modulation transfer function [MTF]), and 3D noise power spectrum (NPS) for each scanner and protocol.

#### RESULTS

Slight differences in protocol settings across institutions led to IQ variations, even for the same scanner model. Variations in slice thickness selection affected spatial resolution in the z-direction as captured by the 3D MTF. Convolution kernel selection affected contrast resolution and noise texture in ways that were quantifiably reflected in the CNR and 3D NPS. Across 15 scanners, the interquartile range (IQR) in axial MTF (f50) was 0.43-0.50 mm<sup>-1</sup> for standard and 0.71-0.80 mm<sup>-1</sup> for thin protocols. For lung-std and lung-thin protocols, the IQR in oblique MTF (f50) was 0.24-0.31 mm<sup>-1</sup> and 0.50-0.63 mm<sup>-1</sup>, respectively. Median CNR was 12.7-24.9 for med-std and 12.3-16.1 for med-thin.

#### CONCLUSION

This is the first multi-institutional study to analyze 3D IQ metrics for routine chest CT protocols across the broad range of devices contributing to the MIDRC dataset. Rigorous assessment and understanding of the variability of image characteristics is essential to establishing provenance of the data and is an important step in best utilizing the 100,000+ chest CT images in the database.

## CLINICAL RELEVANCE/APPLICATION

Thorough measurement and quantitation of the image characteristics and their variability can aid the design of machine learning methods and enhance their ability to generalize.

### M3-SSPH03-5 **Measuring Patient-specific and Local Noise Power Spectrum from a Single Photon Counting Detector CT Data Acquisition**

Chengzhu Zhang, PhD, MS (*Presenter*) Nothing to Disclose

#### PURPOSE

Measuring the noise power spectrum (NPS) in clinical X-ray CT exams is challenging since repeating scans to obtain independent samples under identical experimental conditions would expose patients to high radiation risks. Thus, this study aims to develop a reliable method to estimate patient-specific and pointwise NPS from a single CT acquisition.

#### METHODS AND MATERIALS

We propose a new statistical estimator from raw count data to estimate the noise variance in sinogram projection data. Using this estimator, we develop an analytical reconstruction algorithm to calculate the point-wise covariance between two image voxel locations. A Fourier transform is then applied to obtain the pointwise NPS for a chosen location and the ROI NPS via spatial averaging for every voxel inside the ROI. We validate the method using data from a benchtop photon-counting CT imaging system with a CdTe-based PCD (XC-Hydra FX50, Direct Conversion AB) on various physical phantoms.

#### RESULTS

Our proposed method enables patient-specific NPS measurement for regions of interest at any chosen position and accurately characterizes NPS with detailed spatial structures resulting from image content heterogeneity. Furthermore, the NPS measured using our method exhibits superior quality in terms of variance in measured NPS structures compared to the standard multi-acquisition measurement method. Spatial averaging of the pointwise NPS yields the conventional NPS for local regions of interest.

## CONCLUSION

We developed a new method to estimate patient-specific and local NPS from a single CT acquisition, which enables object-specific NPS measurement and can be used to optimize the imaging system for specific imaging tasks.

## CLINICAL RELEVANCE/APPLICATION

The experimental measured patient-specific local NPS can be used to optimize the imaging system to achieve the desired quantitative performance for specific imaging tasks, which can ultimately improve diagnostic accuracy and reduce patient radiation exposure.

### M3-SSPH03-6 **Impact of Focal Spot selection on Spatial Resolution in Clinical Photon-counting Detector CT**

Kishore Rajendran, PhD (*Presenter*) Nothing to Disclose

## PURPOSE

To quantitatively evaluate the impact of focal spot (FS) size of the X-ray tube on spatial resolution in clinical photon-counting detector (PCD) CT.

## METHODS AND MATERIALS

Spatial resolution phantoms - 25  $\mu\text{m}$  diameter tungsten wire and 50  $\mu\text{m}$  thick tungsten foil were scanned on a clinical PCD-CT system (Siemens NAEOTOM Alpha) using the ultra-high-resolution mode (120 x 0.2 mm collimation). Phantom images using two different FS sizes (sUHR - 0.4 x 0.5 mm<sup>2</sup>, UHR - 0.6 x 0.7 mm<sup>2</sup>) were acquired. In-plane and longitudinal resolution were measured using the modulation transfer function (MTF) and section sensitivity profile (SSP). CT images (T3D, 20 to 120 keV) were reconstructed using a sharp (Br89) kernel to quantitatively compare spatial resolution. To demonstrate the impact of FS size on anatomical images, a cadaver knee joint was scanned using the ultra-high-resolution mode with both FS sizes at matched radiation dose (20 mGy) after approval from our institutional biospecimens review board. Morphometric measurements for subchondral trabecular thickness and separation in a representative 3D volume of interest in the lateral femoral condyle were compared between the two FS sizes.

## RESULTS

For in-plane resolution, the cutoff frequency (0% MTF) were comparable (33 cm<sup>-1</sup>) but noticeable differences in 10% MTF values (sUHR: 30.6 cm<sup>-1</sup> vs. UHR: 28.9 cm<sup>-1</sup>) were observed between the two FS sizes. The longitudinal resolution values at 1-mm nominal section thickness were comparable for the two FS sizes with the full-width-at-half-maximum (FWHM) of the SSP at 1.20-1.21 mm. For the 0.2 mm nominal section thickness, the SSP-FWHM was 0.31 mm for sUHR FS and 0.38 mm for the UHR FS. Trabecular morphometry measurements in the cadaveric knee showed a 12.5% difference in mean trabecular thickness and 2.5% difference in mean trabecular separation between sUHR and UHR FS.

## CONCLUSION

Focal spot selection in a clinical PCD-CT system influenced both in-plane and longitudinal spatial resolution, with the smaller FS size yielding higher in-plane and longitudinal spatial resolution. Consequently, quantitative differences in anatomic bone trabecular measurements were observed based on the selected FS size.

## CLINICAL RELEVANCE/APPLICATION

Spatial fidelity of sub-millimeter anatomic structures imaged on PCD-CT can be improved by employing smaller x-ray focal spot, which may benefit quantitative applications relying on high spatial resolution.

### Detectability of Noise Texture Changes in CT

Monday, Nov. 27 9:30AM - 10:30AM Room: S405

Luuk J. Oostveen, DIPLPHYS (*Presenter*) Research Grant, Canon Medical Systems Corporation

#### PURPOSE

Noise texture, quantified by the noise power spectrum (NPS), influences lesion detection. In CT it is common to use the average NPS frequency ( $F_{av}$ ) or the peak frequency ( $F_{peak}$ ) as one-parameter NPS descriptors. This study aimed to develop a more complete model of the CT NPS and determine the human-observer detectability of changes in CT NPS.

#### METHODS AND MATERIALS

A model of CT NPS was created based on its ramp dominating the low spatial frequencies and an apodization downslope dominating the higher frequencies. The ramp was quantified by  $F_{peak}$ . The downslope was fitted to a half Gaussian resulting in its sigma ( $s$ ) used as descriptor of the downslope. A two-alternative-forced-choice observer study was performed to determine the detectability of changes in NPS. Five observers were shown three colored noise patches: two containing different realizations of the same colored noise, one of them defined as the reference patch, and one with different  $F_{peak}$  and/or  $s$ . The observer had to identify the patch similar to the reference one. The differences in  $F_{peak}$  and/or  $s$  that still resulted in 80% correct response were determined. As reference, an abdomen-kernel NPS and a chest-kernel NPS were used.  $F_{peak}$  and  $s$  were changed alone and at the same time, resulting in evaluating the differences perceived in 8 directions. An elliptical limiting detectability boundary was fit through the average limiting values from all observers and all directions. For each NPS tested,  $F_{av}$  and the noise texture contrast (C<sub>nt</sub>) to the reference NPS was calculated as the integral of the absolute difference of the 2D NPSs. The experiment was repeated with 32 radiologists. However, each radiologist evaluated 1 direction only, with in total 2 radiologists per direction.

#### RESULTS

Changes in  $F_{peak}$  alone are not detectable below a change of 0.2 lp/cm and 0.3 lp/cm for the abdomen and chest NPS, respectively. For  $s$  alone, these values are 0.15 lp/cm and 2 lp/cm, respectively. These thresholds change if the other parameter also changes. However, the C<sub>n</sub> needed to make a change detectable is limited ( $< 0.23HU^2$ ) but depends on the parameter being changed and the reference noise texture. As expected, different NPS with the same  $F_{av}$  can be discriminated. No significant difference was found in performance between radiologists and laymen.

#### CONCLUSION

$F_{peak}$  and  $F_{av}$  alone are insufficient to describe noise texture since textures with the same  $F_{peak}$  or  $F_{av}$  can be discriminable. Discrimination of noise texture changes depends on its frequency content. Radiologists do not discriminate noise texture changes better than laymen.

#### CLINICAL RELEVANCE/APPLICATION

For the development of non-linear reconstruction techniques and reconstruction kernels it is important to understand how human observers react to various noise textures.

### Lesion Detection Versus Characterization: Patient-data-based Virtual Imaging Trial for Performance Evaluation of Deep Learning CT Noise Reduction

Monday, Nov. 27 9:30AM - 10:30AM Room: S405

Zhongxing Zhou, PhD (*Presenter*) Nothing to Disclose

#### PURPOSE

Accurate assessment of image quality for deep learning-based image reconstruction and noise reduction methods (DLIR) is challenging due to its high non-linearity and generalizability concerns. The highly non-linear spatial resolution and noise properties of DLIR may lead to different performance for two important clinical tasks: low-contrast lesion detection vs. characterization. The purpose of this study was to apply a newly developed patient-data-based virtual imaging trial framework to evaluate the performance of a DLIR method for these two tasks.

#### METHODS AND MATERIALS

The patient-data-based virtual imaging trial framework consists of 4 steps: (1) lesion- and (2) noise-insertion in projection domain to generate images at different lesion and noise conditions, (3) DLIR processing of all noise realizations, and (4) calculation of index of detectability ( $d'$ ) using a channelized Hotelling observer (CHO). A ResNet-based deep convolutional neural network (DCNN) trained on patient images was evaluated. Lesions in a cylindrical shape (5-mm height, 15-mm diameter) with and without concave boundary were inserted in patient liver images. Ensembles of quarter dose projection data were generated by 600 independent noise realizations for each of the 4 lesion conditions: (1) lesion present (round lesion at -10HU), (2) lesion absent, (3) round lesion at -50HU, and (4) concave lesion at -50HU. For the lesion detection task,  $d'$  was measured using 600 pairs of lesion-present and absent images (conditions 1 and 2). For the lesion characterization task,  $d'$  was calculated using 600 pairs of images with round and concave lesions (conditions 3 and 4). Multiple reconstruction methods were evaluated, including filtered-backprojection (FBP), iterative reconstruction (IR), and the DCNN at 3 settings (weak, medium, and strong).

#### RESULTS

DCNN improved  $d'$  for both tasks compared with FBP (detection: 2.24, 2.70, 2.49, 3.04, 3.80; characterization: 1.40, 1.44, 1.45, 1.61, 1.74, for FBP, IR, DCNN-weak, medium, and strong, respectively). However, the improvement of  $d'$  by DCNN over FBP was much lower for the characterization task (4%, 15%, and 24% for the 3 DCNN strengths, respectively) than for the detection task (11%, 36%, and 70%), which can be explained by a stronger blurring effect of DCNN for lesion boundary at higher strength settings.

#### CONCLUSION

Using a patient-data-based virtual imaging trial, DLIR was demonstrated to have less performance improvement for a lesion characterization task than for a lesion detection task.

#### CLINICAL RELEVANCE/APPLICATION

The reduced performance improvement by DLIR for lesion characterization compared to lesion detection implies that less radiation dose reduction is acceptable for a lesion characterization task.

### Impact of Charge-sharing Effects on Noise Variance of Sinogram Projection Data in Photon-counting CT

Monday, Nov. 27 9:30AM - 10:30AM Room: S405

Chengzhu Zhang, PhD, MS (*Presenter*) Nothing to Disclose

#### PURPOSE

This study aims to introduce a modified estimator for sinogram noise in photon-counting CT that accounts for charge-sharing effects when native detector elements are binned. The new estimator incorporates a calibration constant derived from an air scan to accurately estimate the noise and improve image quality while avoiding repetitive patient scans.

#### METHODS AND MATERIALS

We developed a noise variance estimator that accounts for charge-sharing effects in detector binning conditions to estimate sinogram noise variance accurately. The adjusted noise variance is obtained by multiplying the estimated noise variance from the Poisson distribution by a constant  $a$ , i.e.,  $\text{var}(y_i) = a/N_i$ . This constant can be calibrated using an air scan, eliminating the need for repetitive object or patient scans. We used data acquired from an experimental PCD-CT system with a CdTe-based PCD to validate the new model. We studied different detector configurations such as various binning factors, on/off of the anti-charge sharing function, different energy thresholds at 23.42, 26.03, 28.71, 31.45 keV, and different mAs levels.

#### RESULTS

We found three key results: First, when the detector is not binned, the Poisson distribution does not need modification, i.e.,  $a=1$ . Second, the modification factor  $a$  increases as the number of binned detectors increases; Particularly,  $a=1.15$  for  $52(\text{slice}) \times 8(\text{axial})$  binning. Third,  $a$  significantly increases when anti-charge sharing is disabled and decreases as the energy threshold moves toward a higher energy end, indicating reduced charge-sharing effects.

#### CONCLUSION

Our modified noise variance estimator accurately estimates the noise variance of sinogram projection data.

#### CLINICAL RELEVANCE/APPLICATION

The proposed noise variance estimator has significant clinical relevance as it allows for improved measurement of noise properties of photon-counting CT.

### M3-SSR002-1 **Dosimetric Evaluation of Synthetic CT Used in Radiation Therapy for MRI Guided Liver SBRT**

Theodore Arsenault, BA, MS (*Presenter*) Nothing to Disclose

#### PURPOSE

We evaluated a deep learning-based synthetic computed tomography (sCT) generation method for magnetic resonance (MR)-only radiation treatment planning (RTP) in liver stereotactic body radiation therapy (SBRT). Conventional RTP workflows combine CT and MR, which can introduce registration errors and cause inefficient clinical workflows, potentially hurting adaptive planning. An MR-only RTP workflow using sCT generated from MR data can address these limitations by offering electron density information that is crucial for dose calculation but unavailable from MR data. We present and validate the clinical potential of a novel deep learning-based sCT generation method.

#### METHODS AND MATERIALS

We developed a conditional generative adversarial network (URcGAN) to generate sCT from MR Dixon images. Thirty-four patients underwent routine FDG-PET/CT and FDG-PET/MR scans. URcGAN was compared to two reference methods: transfer fuzzy clustering with active learning-based classification (TFCALC) and 7-class segmentation (7-Seg). A simulated spherical planning target volume (PTV) (25mm diameter) was drawn in liver segment V. An SBRT plan follows RTOG-1112 protocol using Pinnacle v16.2, delivering 50Gy in 5 fractions. Fluence was copied to sCT images, and dose recalculated for comparison.

#### RESULTS

URcGAN generates sCT in approximately 5 minutes that is of superior quality compared to the two reference methods. Quantitative accuracy of sCT by URcGAN (MAE=51±7 HU and NCC=0.992±0.003) exceeds that by TFCALC (MAE=161±24 and NCC=0.955±0.009) and 7-Seg (MAE=211±19 and NCC=0.93±0.01). For liver SBRT planning, URcGAN achieved passing rates of 95.26%, 99.90%, and 99.96% for gamma criteria of 1%/1mm, 2%/2mm, and 3%/2mm, respectively. Conversely, TFCALC and 7-Seg failed to reach the clinical acceptance rate for any gamma criteria.

#### CONCLUSION

Our study demonstrates that URcGAN is capable of generating sCTs that achieve clinically acceptable dosimetric accuracy for MR-only liver SBRT which was not the case for reference methods. Specifically, the proposed method achieved clinical acceptability of higher than 95% passing rate for all evaluated gamma criteria. Based on our findings, using DCNN for sCT generation may be feasible for MR-only workflow for liver SBRT.

#### CLINICAL RELEVANCE/APPLICATION

Our method of generating sCT from MR images achieves clinically acceptable dosimetric accuracy and enables an MR-only RTP which obviates CT and benefits from MR's superior soft tissue contrast for fast and accurate contouring. Overall, MR-guided liver SBRT using sCT contributes to a more effective and safer treatment outcomes for patients with inoperable liver tumors compared to conventional CT-based RTP.

### M3-SSR002-2 **Combining Intratumoral and Peritumoral Radiomics Features of Different Regions of Interest to Predict Pathological Good Response after Neoadjuvant Ahemoradiotherapy in Locally Advanced Rectal Cancer**

Siyuan Qin (*Presenter*) Nothing to Disclose

## PURPOSE

This study aimed to develop a radiomics model that integrates intratumoral and peritumoral features to predict pathological good response (pGR) to neoadjuvant chemoradiotherapy (nCRT) in patients with locally advanced rectal cancer (LARC). The study also aimed to compare the predictive performance of the model using different combinations of intratumoral and peritumoral regions of interest (ROIs).

## METHODS AND MATERIALS

This retrospective study collected data on patients diagnosed with LARC who underwent nCRT between 2013 and 2021. Patients were divided into training and validation groups at a ratio of 4:1, and five-fold cross-validation was performed to prevent overfitting. Intratumoral ROIs (ROIITU) were segmented on T2-weighted imaging, while peritumoral ROIs were segmented using two methods: ROIPTU\_2mm, ROIPTU\_4mm, and ROIPTU\_6mm, which were obtained by dilating the boundary of ROIITU by 2mm, 4mm, and 6mm, respectively; and ROIMR\_F and ROIMR\_BVLN, which were obtained by segmenting the fat and blood vessels + lymph nodes in the mesorectum. After feature extraction and selection, 11 logistic regression models were established using radiomics features derived from different ROIs or ROI combinations. The average area under the curve (AUC) was used to evaluate the performance of the models.

## RESULTS

The study included a total of 209 patients, consisting of 118 pGR and 91 non-pGR patients. The model that integrated ROIITU and ROIMR\_BVLN features had the highest predictive ability, with an AUC (95% confidence interval) of 0.936 (0.904-0.972) in the training group and 0.859 (0.745-0.974) in the validation group. This model outperformed models that used ROIITU alone (AUC=0.779), ROIMR\_BVLN alone (AUC=0.758), and other models.

## CONCLUSION

Radiomic features of intratumoral and different peritumoral ROIs have predictive value for pGR in LARC patients after nCRT. The model that integrates intratumoral and blood vessels + lymph nodes in the mesorectum features performs the best.

## CLINICAL RELEVANCE/APPLICATION

This study identified, for the first time, the predictive value of radiomics features of different components of the mesorectum in predicting the response to nCRT in LARC patients and established an optimal prediction model by combining intratumoral and peritumoral radiomics features. The optimal prediction model developed in this study may guide clinical decision-making, such as timely surgery or extended resection for patients who are not sensitive to nCRT and conservative treatment or local excision for patients who are sensitive to nCRT.

## M3-SSR002-3 A Dosimetric Comparison of Y-90 Radioembolization and External Beam Radiation Treatment For Liver Cancer

Kajetan Wysoczynski, BS (*Presenter*) Nothing to Disclose

## PURPOSE

The aim of this study is to compare the dose distribution and conformity of a liver cancer treatment performed with yttrium-90 (Y-90) microsphere radioembolization and a simulated plan for SBRT for a patient given a medium-sized lesion.

## METHODS AND MATERIALS

In this study, a typical patient with hepatocellular carcinoma (single 155 cc lesion) was treated using Y-90 microspheres with an injected activity of 2.27 GBq. We performed radioembolization dosimetry based on a PET scan acquired 24h post-treatment to measure Y-90 activity, using multiple organ and tumor contours delineated on whole-body CT. We also simulated a five-fraction treatment plan using a conventional SBRT linear accelerator with 5 mm leaf width. We compared dose distributions of the two modalities for several organs based on dose-volume histograms.

## RESULTS

The microsphere treatment delivered a mean dose of 390 Gy to the gross tumor volume and an average of 47 Gy to the liver volume. The five-fraction SBRT plan resulted in a mean tumor dose of 51 Gy and mean liver dose of 11 Gy. It is important to note that 2% of the tumor (D2) received at least 54 Gy in the plan, while Y-90 microspheres delivered 908 Gy at D2 of gross tumor volume. The patient received a 5 Gy lung dose with Y-90, but the SBRT plan predicted 0.36 Gy. This large dose with Y-90 is due to the lung shunt fraction of 14.6% for this patient.

## CONCLUSION

While microspheres can deliver extremely high radiation doses to the tumor in just one administration, SBRT is performed over 5 fractions in the USA. However, Y-90 microspheres deliver more radiation to surrounding lung tissue. Well-vascularized small tumors benefit the most from radioembolization, but dosage to surrounding organs requires analysis with more patients. To better gauge side effects from these very different radiation modalities, biological effective dose calculation will be performed. Other modalities, such as brachytherapy and proton therapy, will be included in further studies.

## CLINICAL RELEVANCE/APPLICATION

Liver cancer is a high-impact area in clinical practice with rising mortality. The most common treatment is resection, but the number of tumors, position, and complex vasculature often prevent surgery. Alternatively, Stereotactic Body Radiation Therapy (SBRT) can provide localized radiation dose with photons produced by a linear accelerator. Y-90 radioembolization is delivered through microspheres injected into the hepatic artery.

### M3-SSRO02-4 **Stereotactic Body Radiation Therapy (SBRT) Induced Lobectomy -- Time-Dependent Analysis of Future Liver Remnant Volume in Unresectable Hepatocellular Carcinoma (HCC)**

Wan Hang K. Chiu, FRCR (*Presenter*) Nothing to Disclose

#### PURPOSE

Stereotactic Body Radiation Therapy (SBRT) has emerged as an alternate locoregional treatment option in patients with Hepatocellular Carcinoma (HCC) with impressive results. However, little is known whether it can play a bridging role in unresectable HCC due to small future remnant ration (FLR) by inducing liver hypertrophy. In this study, we aim to perform a comprehensive time-dependent analysis of the liver volumes following SBRT.

#### METHODS AND MATERIALS

Between 2019 and 2021, a prospective single arm phase II study (START-FIT) recruited 33 patients with unresectable HCC who underwent transarterial chemoembolization (TACE), followed by SBRT (27.5-40.0 Gy in five fractions) and Avelumab (10 mg/kg). Serial cross-sectional imaging (contrast-enhanced computed tomography, CT or magnetic resonance imaging, MRI) were performed 3-monthly from baseline until disease progression, death or end of study period. The ipsilateral and contralateral liver lobar as well as tumor volumes, FLR and percentage of FLR hypertrophy from baseline (%FLR hypertrophy) were assessed in a dynamic fashion.

#### RESULTS

Ipsilateral lobe atrophy ( $p < 0.0001$ ), contralateral lobe hypertrophy ( $p = 0.0004$ ), tumour reduction ( $p = 0.0056$ ), and FLR hypertrophy ( $p = 0.0001$ ) were observed from 3 months after SBRT. The median %FLR hypertrophy reached around 30% (-13-158) after 12 months, although the fastest increase occurred within the first 3 months and slowly plateau thereafter. Of the 33 recruited patients, 18 (55%) patients were deemed to be amenable to surgical resection over a median follow-up period of 17.2 months (IQR 7.8-25.8).

#### CONCLUSION

SBRT may induce hypertrophy of the contralateral liver lobe while controlling primary tumour and limiting progression.

## CLINICAL RELEVANCE/APPLICATION

Our findings are of particular interest in the providing novel bridge-to-resection technique in patients with small FLR.

### M3-SSRO02-5 **Influence of Skeletal Muscle and Adipose Tissue on Postoperative Complications and Long-Term Prognosis in Colorectal Cancer Patients**

Tong Nie (*Presenter*) Nothing to Disclose

#### PURPOSE

The aim of this study is to explore the correlation of skeletal muscle and adipose tissue quantified by computed tomography (CT) with postoperative complications and long-term prognosis in colorectal cancer patients after surgical resection.

#### METHODS AND MATERIALS

This retrospective cohort study included 850 patients with colorectal cancer who underwent surgical resection at Wuhan Union Hospital between December 2014 and May 2018. Skeletal muscle and adipose tissue indexes were quantified with CT images at the third lumbar vertebra (L3) levels obtained within three months prior to surgery. Adipose tissue indexes include visceral fat area (VFA), subcutaneous fat area (SFA), and intermuscular fat area (IMFA), while skeletal muscle indexes include skeletal muscle area (SMA) and skeletal muscle radiodensity (SMD). The sex-specific optimal cut-off value for each body composition was defined by using the X-tile software. Logistic and Cox proportional hazards models were used to assess the associations between body composition with postoperative complications and overall survival (OS). Receiver operating characteristic (ROC) analysis was used to estimate the predictive ability of body composition combined with clinical indicators. Finally, decision curve analysis (DCA) and nomograms were used to evaluate the clinical usefulness of the models.

#### RESULTS

A total of 850 patients (492 males and 358 females) were included, the mean (SD) age was 57.8 (11.4) years. Logistic regression analysis indicated that patients with low SMD at the L3 level had higher postoperative complication rate (22.30% vs. 14.63%,  $P = 0.025$ ). Multivariate Cox regression analysis showed that IMFA (HR 1.543, 95% CI 1.060~2.246,  $P = 0.024$ ), SMA (HR 0.657, 95% CI 0.451~0.957,  $P = 0.028$ ) and SMD (HR 0.470, 95% CI 0.300~0.736,  $P = 0.001$ ) at the L3 level were

independent prognostic factors for OS. ROC analyses revealed the predictive accuracy of a combination of body composition and clinical indicators for OS with the area under the ROC curve of 0.823 ( $p < 0.05$ ). DCA demonstrated that the clinico-radiological nomograms were useful for predicting postoperative survival in colorectal cancer patients.

#### **CONCLUSION**

Patients with low SMD at the L3 level had higher postoperative complication rate. High IMFA, low SMD and low SMA at the L3 level were associated with shorter OS. The inclusion of body composition indicators in the prediction model can significantly improve the predictive performance of patient prognosis.

#### **CLINICAL RELEVANCE/APPLICATION**

The combination of CT-quantified body composition and clinical indicators could help physicians to recognize worse survival outcomes in colorectal cancer patients after surgery.

### **M3-SSRO02-6 Evaluation of Lymphatic Metastasis for Patients with Gastric Cancer using Spectral CT Quantitative Parameters**

Zhang Min (*Presenter*) Nothing to Disclose

#### **PURPOSE**

To explore the feasibility of spectral CT quantitative Parameters in distinguishing lymphatic metastasis in patients with gastric cancer.

#### **METHODS AND MATERIALS**

69 patients confirmed of gastric cancer with gastroscopy were preoperatively examined spectral CT and curative gastrectomy. The enrolled patients were divided into two groups according to Gastric Cancer with lymphatic metastasis or not based on postoperative pathology. spectral CT quantitative Parameters, volume iodine content and Slope of energy spectrum curve in both artery and venous phases were calculated. The differences of parameters in two groups were calculated with One-way analysis of variance (ANOVA). A receiver operating characteristic (ROC) analysis was applied to evaluate the diagnostic performance of meaningful spectral CT quantitative parameters.

#### **RESULTS**

Volume iodine content in venous phase of Gastric Cancer with lymphatic metastasis were  $27.89 \pm 0.89$  (100ug/cm<sup>3</sup>), it was  $33.45 \pm 1.37$  (100ug/cm<sup>3</sup>) in Gastric Cancer without lymphatic metastasis group. The above indicator were significantly different between Gastric Cancer with and without lymphatic metastasis groups. ( $p < 0.05$ ) For slope of energy spectrum curve in venous phases, volume iodine content in artery phase and Slope of energy spectrum curve in artery phases, there was no statistically significant difference between two groups. The area under the ROC curve for the diagnosis of lymphatic metastasis of gastric cancer by volume iodine content in venous phases was 0.759 (sensitivity 65.5%; specificity, 82.5%) with the cut-off value of 32.07 (100ug/cm<sup>3</sup>) and 2.41.

#### **CONCLUSION**

Spectrum enhanced CT can accurately evaluate the HER2 positive lymphatic metastasis of gastric cancer with certain quantitative parameters.

#### **CLINICAL RELEVANCE/APPLICATION**

Spectrum enhanced CT quantitative parameters are potential in diagnosing lymphatic metastasis of gastric cancer.

### Dosimetric Evaluation of Synthetic CT Used in Radiation Therapy for MRI Guided Liver SBRT

Monday, Nov. 27 9:30AM - 10:30AM Room: S501

Theodore Arsenault, BA, MS (*Presenter*) Nothing to Disclose

#### PURPOSE

We evaluated a deep learning-based synthetic computed tomography (sCT) generation method for magnetic resonance (MR)-only radiation treatment planning (RTP) in liver stereotactic body radiation therapy (SBRT). Conventional RTP workflows combine CT and MR, which can introduce registration errors and cause inefficient clinical workflows, potentially hurting adaptive planning. An MR-only RTP workflow using sCT generated from MR data can address these limitations by offering electron density information that is crucial for dose calculation but unavailable from MR data. We present and validate the clinical potential of a novel deep learning-based sCT generation method.

#### METHODS AND MATERIALS

We developed a conditional generative adversarial network (URcGAN) to generate sCT from MR Dixon images. Thirty-four patients underwent routine FDG-PET/CT and FDG-PET/MR scans. URcGAN was compared to two reference methods: transfer fuzzy clustering with active learning-based classification (TFCALC) and 7-class segmentation (7-Seg). A simulated spherical planning target volume (PTV) (25mm diameter) was drawn in liver segment V. An SBRT plan follows RTOG-1112 protocol using Pinnacle v16.2, delivering 50Gy in 5 fractions. Fluence was copied to sCT images, and dose recalculated for comparison.

#### RESULTS

URcGAN generates sCT in approximately 5 minutes that is of superior quality compared to the two reference methods. Quantitative accuracy of sCT by URcGAN (MAE=51±7 HU and NCC=0.992±0.003) exceeds that by TFCALC (MAE=161±24 and NCC=0.955±0.009) and 7-Seg (MAE=211±19 and NCC=0.93±0.01). For liver SBRT planning, URcGAN achieved passing rates of 95.26%, 99.90%, and 99.96% for gamma criteria of 1%/1mm, 2%/2mm, and 3%/2mm, respectively. Conversely, TFCALC and 7-Seg failed to reach the clinical acceptance rate for any gamma criteria.

#### CONCLUSION

Our study demonstrates that URcGAN is capable of generating sCTs that achieve clinically acceptable dosimetric accuracy for MR-only liver SBRT which was not the case for reference methods. Specifically, the proposed method achieved clinical acceptability of higher than 95% passing rate for all evaluated gamma criteria. Based on our findings, using DCNN for sCT generation may be feasible for MR-only workflow for liver SBRT.

#### CLINICAL RELEVANCE/APPLICATION

### Combining Intratumoral and Peritumoral Radiomics Features of Different Regions of Interest to Predict Pathological Good Response after Neoadjuvant Chemoradiotherapy in Locally Advanced Rectal Cancer

Monday, Nov. 27 9:30AM - 10:30AM Room: S501

Siyuan Qin (*Presenter*) Nothing to Disclose

#### PURPOSE

This study aimed to develop a radiomics model that integrates intratumoral and peritumoral features to predict pathological good response (pGR) to neoadjuvant chemoradiotherapy (nCRT) in patients with locally advanced rectal cancer (LARC). The study also aimed to compare the predictive performance of the model using different combinations of intratumoral and peritumoral regions of interest (ROIs).

#### METHODS AND MATERIALS

This retrospective study collected data on patients diagnosed with LARC who underwent nCRT between 2013 and 2021. Patients were divided into training and validation groups at a ratio of 4:1, and five-fold cross-validation was performed to prevent overfitting. Intratumoral ROIs (ROIITU) were segmented on T2-weighted imaging, while peritumoral ROIs were segmented using two methods: ROIPTU\_2mm, ROIPTU\_4mm, and ROIPTU\_6mm, which were obtained by dilating the boundary of ROIITU by 2mm, 4mm, and 6mm, respectively; and ROIMR\_F and ROIMR\_BVLN, which were obtained by segmenting the fat and blood vessels + lymph nodes in the mesorectum. After feature extraction and selection, 11 logistic regression models were established using radiomics features derived from different ROIs or ROI combinations. The average area under the curve (AUC) was used to evaluate the performance of the models.

#### RESULTS

The study included a total of 209 patients, consisting of 118 pGR and 91 non-pGR patients. The model that integrated ROIITU and ROIMR\_BVLN features had the highest predictive ability, with an AUC (95% confidence interval) of 0.936 (0.904-0.972) in the training group and 0.859 (0.745-0.974) in the validation group. This model outperformed models that used ROIITU alone (AUC=0.779), ROIMR\_BVLN alone (AUC=0.758), and other models.

#### CONCLUSION

Radiomic features of intratumoral and different peritumoral ROIs have predictive value for pGR in LARC patients after nCRT. The model that integrates intratumoral and blood vessels + lymph nodes in the mesorectum features performs the best.

#### CLINICAL RELEVANCE/APPLICATION

This study identified, for the first time, the predictive value of radiomics features of different components of the mesorectum in predicting the response to nCRT in LARC patients and established an optimal prediction model by combining intratumoral and peritumoral radiomics features. ### Evaluation of Lymphatic Metastasis for Patients with Gastric Cancer using Spectral CT Quantitative Parameters

Monday, Nov. 27 9:30AM - 10:30AM Room: S501

Zhang Min (*Presenter*) Nothing to Disclose

#### PURPOSE

To explore the feasibility of spectral CT quantitative Parameters in distinguishing lymphatic metastasis in patients with gastric cancer.

#### METHODS AND MATERIALS

69 patients confirmed of gastric cancer with gastroscopy were preoperatively examined spectral CT and curative gastrectomy. The enrolled patients were divided into two groups according to Gastric Cancer with lymphatic metastasis or not based on postoperative pathology. spectral CT quantitative Parameters, volume iodine content and Slope of energy spectrum curve in both artery and venous phases were calculated. The differences of parameters in two groups were calculated with One-way analysis of variance (ANOVA). A receiver operating characteristic (ROC) analysis was applied to evaluate the diagnostic performance of meaningful spectral CT quantitative parameters.

#### RESULTS

Volume iodine content in venous phase of Gastric Cancer with lymphatic metastasis were  $27.89 \pm 0.89$  (100ug/cm<sup>3</sup>), it was  $33.45 \pm 1.37$  (100ug/cm<sup>3</sup>) in Gastric Cancer without lymphatic metastasis group. The above indicator were significantly different between Gastric Cancer with and without lymphatic metastasis groups. ( $p < 0.05$ ) For slope of energy spectrum curve in venous phases, volume iodine content in artery phase and Slope of energy spectrum curve in artery phases, there was no statistically significant difference between two groups. The area under the ROC curve for the diagnosis of lymphatic metastasis of gastric cancer by volume iodine content in venous phases was 0.759 (sensitivity 65.5%; specificity, 82.5%) with the cut-off value of 32.07 (100ug/cm<sup>3</sup>) and 2.41.

#### CONCLUSION

Spectrum enhanced CT can accurately evaluate the HER2 positive lymphatic metastasis of gastric cancer with certain quantitative parameters.

#### CLINICAL RELEVANCE/APPLICATION

Spectrum enhanced CT quantitative parameters are potential in diagnosing lymphatic metastasis of gastric cancer.

### Science Session (Sustainability in Imaging)

Monday, Nov. 27 10:00AM - 10:30AM Room: Learning Center Theater 1

#### Sub-Events

#### **M3-STCE1- Energy and Greenhouse Gas Emission Savings Associated with Implementation of an Abbreviated Cardiac MRI Protocol**

Fadi Ibrahim, MD, BSc (*Presenter*) Nothing to Disclose

#### **PURPOSE**

MRI is one of the largest contributors to greenhouse gas (GHG) emissions in radiology. Overall energy use is proportional to the scan length. At our center, the standard cardiac MRI protocol was abbreviated in 2020 by moving the cine SSFP acquisitions immediately after GBCA injection. In standard protocols the 10 minutes post-injection was idle prior to initiation of late gadolinium enhancement imaging. Recent studies have demonstrated comparable image quality and diagnostic performance if SSFP images are acquired post-contrast. However, there is no data on associated GHG emissions. In this study we sought to evaluate the impact of implementing this abbreviated cardiac MRI protocol on energy-, cost- and GHG-savings, on per protocol, local and national levels.

#### **METHODS AND MATERIALS**

In this single-center retrospective cross-sectional study, a random selection of adult patients undergoing clinically indicated cardiac MRI between 2019-2020 were included. Exclusion criteria included early termination of the study. Total scan duration was calculated as the difference between DICOM time stamps from the first and last images acquired. Statistical analysis included Wilcoxon rank sum test. Standard and abbreviated protocols were compared with respect to total study duration, energy consumption, GHG emissions, and electricity cost. Energy savings were evaluated based on scanner-specific idle state power. GHG emission savings were calculated as kg CO<sub>2</sub> equivalents (CO<sub>2</sub>e) avoided using the US EPA calculator.

#### **RESULTS**

237 patients were included, 136 with the standard protocol (63% male, mean age 55±16 years) and 101 with the abbreviated protocol (58% male, mean age 49±18 years). Total study duration was shorter for the abbreviated versus standard protocol (37±7 min vs. 45±9 min, p<0.001). The 8 min time savings per study is equivalent to 1.9 kWh energy and 1.3 kg CO<sub>2</sub>e avoided per study. Based on local cardiac MRI volumes, this protocol change resulted in 7043 kWh energy savings, \$1620 in electricity cost savings, and 4,991 kg CO<sub>2</sub>e avoided per year. If extrapolated across the US, implementation of this abbreviated protocol would result in 278,000 kWh in energy-saving, \$55,600 in electricity cost-savings, and 197,014 kg CO<sub>2</sub>e avoided (comparable to 505,054 miles driven by an average gasoline-powered passenger vehicle) per year.

#### **CONCLUSION**

Abbreviated cardiac MRI protocols with a simple change in timing of SSFP acquisitions to minimize idle time and optimize scanner efficiency results in a substantial GHG reduction.

#### **CLINICAL RELEVANCE/APPLICATION**

Abbreviated protocols are often achieved by removing redundant sequences. Here we describe an alternative and complementary approach by optimizing protocol efficiency to achieve energy and GHG emission reductions.

#### **M3-STCE1- Diagnostic and Interventional Use-Phase Greenhouse Gas Emissions in a Hospital-based Medical Imaging Department**

Kate Hanneman, MD, MPH (*Presenter*) Speaker, Groupe Sanofi; Speaker, Amicus Therapeutics, Inc

## PURPOSE

Health care systems are major contributors to the global climate change crisis, including medical imaging. However, there is limited data on total greenhouse gas (GHG) emissions for both diagnostic and interventional procedures. The purpose of this analysis was to estimate the carbon footprint of use-phase emissions by imaging modality and procedure type in a large multi-site hospital medical imaging department to inform prioritization of sustainability efforts.

## METHODS AND MATERIALS

We performed a cross-sectional analysis of total use-phase GHG emissions for diagnostic and interventional radiology at a large medical imaging department covering 3 hospital systems and 5 hospital sites over 5 years (2018-2022). Five diagnostic modalities including radiography, ultrasound (US), computed tomography (CT), magnetic resonance (MRI) and nuclear medicine (NM) were evaluated along with interventional radiology procedures. Estimates were based on number of exams for each modality or number of interventional procedures and included scanner and equipment electricity use and all consumables and associated waste. The primary outcome was the greenhouse gas footprint, measured in carbon dioxide equivalent (CO<sub>2</sub>e) emissions.

## RESULTS

Across the entire medical imaging department, an average of 616,215 medical imaging tests and procedures were performed each year. Total imaging procedures were lowest in 2020 (538,316) as expected due to the COVID-19 pandemic, but were otherwise similar between years (range in other years, 620,431-642,443). Average total use-phase GHG emissions for all diagnostic and interventional procedures were 3441 metric tons CO<sub>2</sub>e per year, comparable to emissions generated from 766 gas-powered passenger vehicles driven for one year. The highest GHG contributors by exam/procedure were CT (37%, 1273 metric tons CO<sub>2</sub>e) and MRI (36%, 1249 metric tons CO<sub>2</sub>e). GHG emissions related to interventional procedures accounted for 448 metric tons CO<sub>2</sub>e (13% of the total). Despite much higher overall exam volumes for radiography and comparable volumes for US, their relative contributions were much lower (191 metric tons CO<sub>2</sub>e [6%] and 55 metric tons CO<sub>2</sub>e [2%], respectively) due to lower GHG emissions per exam.

## CONCLUSION

In a cross-sectional analysis across a large multi-site medical imaging department, use-phase GHG emissions were substantial with CT and MRI as the largest contributors.

## CLINICAL RELEVANCE/APPLICATION

To our knowledge this is the first report of cross-sectional use-phase emissions data across an entire medical imaging department including both diagnostic and interventional procedures. Given that CT and MRI are associated with highest use-phase emissions, initial sustainability efforts can be targeted to these modalities.

## M3-STCE1- Creation and Impact of a Multidisciplinary Green Radiology Leadership Team

3

Hayley Panet (*Presenter*) Nothing to Disclose

## PURPOSE

Health care contributes over 5% of total global greenhouse gas (GHG) emissions. Within the hospital setting, medical imaging departments are one of the largest contributors. Managing multiple priorities and achieving sustainable outcomes is challenging for leaders across health care organizations. There is currently limited data on the role of multidisciplinary leadership teams in improving sustainability in medical imaging. Therefore, we sought to create a diverse leadership team to evaluate the impact on GHG emissions and waste.

## METHODS AND MATERIALS

We engaged a multidisciplinary group of hospital leaders, physicians, engineers and hospital administrators interested in promoting sustainability. As a first step, a formal Green Radiology Leadership Team structure was established to foster collaboration and outline annual goals. This included formal appointment of a Radiologist and Hospital Administrator to engage members outside the imaging division including environmental engineers. Next, a current state assessment was completed to capture the existing hospital and radiology landscape which included energy consumption, waste generation, and staff engagement. Lastly, we created a blueprint for multidisciplinary collaborations that can be emulated in our groups and practice settings to address sustainability in radiology more broadly.

## RESULTS

The formal appointment of a Radiologist and Hospital Administrator as co-leads has accelerated the engagement and foundational support to sustainability initiatives within the imaging department and across the entire hospital organization. A hospital-wide committee with experts from building services and biomedical engineering was essential to assist with implementing targeted equipment monitoring. A schedule for power supply monitoring was created to track scanner device energy utilization and associated costing. Finally, engaging multidisciplinary staff resulted in increased awareness of GHG emissions and actions that can be taken to reduce them. Funding support was also awarded for multidisciplinary sustainability education and knowledge dissemination activities.

## **CONCLUSION**

Creating a formal leadership structure to develop and promote sustainability in medical imaging departments is critical to engage diverse stakeholders and mobilize teams for success.

## **CLINICAL RELEVANCE/APPLICATION**

All radiology medical imaging departments can leverage their hospital building team expertise and establish a joint governance structure to transfer learnings and facilitate local level improvements. In addition, these learnings can help other medical imaging partner with hospital departments and formulate Green Radiology programs in alignment to overall hospital goals.

M3-STCE2

### Science Session (Imaging of Immunotherapy)

Monday, Nov. 27 10:00AM - 10:30AM Room: Learning Center Theater 2

#### Sub-Events

#### **M3-STCE2- Early Detection of Trastuzumab Cardiac Toxicity by Cardiac MRI in HER-2 Positive Breast Cancer Patients** 1

Ali Mohammadzadeh Koupareh, MD (*Presenter*) Nothing to Disclose

#### **PURPOSE**

Immunotherapy agents have led to a new era of cancer treatment, yet its side effects management are challenging. One of immunotherapy agents in breast cancer is based on human epidermal growth factor receptor 2 (HER2), as trastuzumab, which has led to increase survival in HER-2 positive breast cancer when used in combination with other chemotherapeutic agents. Trastuzumab is known to cause cardiac toxicity mainly diagnosed by reduced left ventricle systolic function by means of echocardiography and detecting reduced left ventricle ejection fraction (LVEF). This effect is reversible by discontinuation of the drug. In this study our goal is to determine if cardiac MRI feature tracking can predict cardiac toxicity before it became evident on echocardiography.

#### **METHODS AND MATERIALS**

we enrolled 25 patients diagnosed with HER2 positive breast cancer who had normal cardiac function based on their initial echocardiography. As standard of care these patients who were under trastuzumab were studied by echocardiography every 4-6 weeks to detect any decline in LVEF. After two months of treatment cardiac MRI were done in patients who deemed to have normal cardiac function based on their echocardiographic findings. And patients followed by echocardiography for six months. Global longitudinal, Radial and circumferential strain measures were recorded, and these measures were compared to show if they are different among patients who developed cardiac toxicity - based on echocardiography - and those who did not.

#### **RESULTS**

among initial follow up three patients showed decreased LVEF and were excluded from study, of 23 remaining patients eventually five patients showed reduced LVEF. LVGLS and LVGCS measures were significantly lower in two months MRI in these patients than those who did not developed cardiac toxicity.

#### **CONCLUSION**

cardiac MRI feature tracking can potentially be used as an effective screening tool to detect subclinical cardiac toxicity and thus leads to better patient management and possibly reduced cardiac toxicity and improve patients survival.

#### **CLINICAL RELEVANCE/APPLICATION**

Trastuzumab cardiac toxicity is reversible upon drug discontinuation, our results support this idea that cardiac MRI can show cardiac toxicity before it is evident by reduced LVEF.

#### **M3-STCE2- Immunotherapeutic Efficacy in Cardiac Sarcoidosis Treatment Assessed by Cardiac MRI** 2

Ali Mohammadzadeh Koupareh, MD (*Presenter*) Nothing to Disclose

#### **PURPOSE**

Cardiac Sarcoidosis treatment is challenging, partly because of delayed diagnosis and chronic course of disease treatment with corticosteroids may lead to several side effects, thus steroid-sparing strategies are desired in this condition, we retrospectively report treatment efficacy in patients who received tocilizumab, infliximab and adalimumab and standard treatment, based on their cardiac MR findings.

## METHODS AND MATERIALS

Fifty patients, with known extra-cardiac sarcoidosis, and suspicious for cardiac sarcoidosis (CS) based on their initial imaging findings were enrolled. 12 patients received tocilizumab, 13 received infliximab and 11 received adalimumab in addition to corticosteroid and methotrexate, 14 patients were under steroid and methotrexate alone. Cardiac function tests as LVEF, RVEF, left ventricle strain analysis and LGE index were recorded in these groups. One-way ANOVA was used to assess for intergroup differences and post hoc test is done thereafter.

## RESULTS

Our study enrolled 50 patients with  $53.3 \pm 16.8$  years old and 33(66%) male treated for cardiac sarcoidosis, three patients who were under infliximab were excluded as they could not tolerate treatment and it was discontinued. Other patients in four groups showed improvement in cardiac function evidenced by increase in LVGLS, LVGCS and LVGRS and decrease in LGE index. One-way ANOVA test showed significant difference in LGE index change between four groups with maximum response in infliximab group. Strain changes were not significantly different between groups.

## CONCLUSION

immunotherapeutic agents are potent supplementary treatments and if used judiciously can improve patient management and outcome in cardiac sarcoidosis, although these treatments have adverse effects that need to be monitored in order to attain better outcomes.

## CLINICAL RELEVANCE/APPLICATION

By use of immunotherapeutic agents, steroid dose needed to control disease can be reduced to minimum and thus increase sarcoidosis patient's quality of life by mitigating steroid side effects.

## M3-STCE2- Deep Learning-based Harmonization of Multisite Pediatric Brain MRI Clinical Trials

3

Abhijeet Parida (*Presenter*) Nothing to Disclose

## PURPOSE

Leveraging the power of machine learning, rare pediatric diseases require multi-institutional collaboration and data. This often leads to inconsistent magnetic resonance imaging (MRI) analyses due to varying image acquisition protocols and quality. This study aims to develop and evaluate a 3D deep-learning framework that can harmonize MR images from multiple sites to enable reproducible data analysis for rare pediatric diseases.

## METHODS AND MATERIALS

We collected 180 T1-weighted MRI scans from three clinical sites using different device manufacturers (GE, Siemens, and Phillips), echo time/relaxation time (10.5/600, 2.5/1900, and 3.8/8.3 ms), and image resolutions (0.41x0.41 mm<sup>2</sup>, 0.82x0.82 mm<sup>2</sup>, and 0.94x0.94 mm<sup>2</sup>). Data from two sites were used to train a branched 3D deep neural style transfer network for harmonizing the differences in paired imaging protocols, while data from the third site were used for independent testing. The network was trained in an unsupervised manner to preserve patient anatomy and harmonize image intensity. The normalized Wasserstein distance (nWD) was employed to quantify the similarity between the intensity histograms and thus assess the quality of intensity harmonization. The relative absolute volume difference (rAVD) of gray matter and white matter, before and after harmonization, was used to assess the preservation of anatomy.

## RESULTS

The intensity harmonization between imaging protocols resulted in an average nWD of  $94.22 \pm 2.01\%$ , and rAVD of  $6.88 \pm 4.71\%$  for the gray matter and  $13.08 \pm 4.67\%$ , for the white matter. A high nWD and a low rAVD value indicate successfully harmonized MRI data from different clinical sites and protocols.

## CONCLUSION

The MRI harmonization algorithm successfully preserved patient anatomy while harmonizing image intensities for data acquired at multiple clinical sites that use different imaging manufacturers and acquisition protocols. This would allow using data from multiple sites to be reliably used for training machine learning models for various clinical outcomes.

## CLINICAL RELEVANCE/APPLICATION

Image harmonization has the potential to facilitate reproducible data analysis for large-scale multi-center clinical trials. Deep learning-based multi-site data harmonization can potentially assist in other areas of medical imaging, where consistent and reliable data analysis is essential for advancing clinical research and improving patient outcomes.

M4-SSMK03

### Musculoskeletal Imaging (Metabolic, Quantitative and Functional, Intervention)

Monday, Nov. 27 11:00AM - 12:00PM Room: E450A

Tony T. Wong, MD (*Moderator*) Nothing to Disclose  
Sonali Lala, MD (*Moderator*) Nothing to Disclose

#### Sub-Events

#### M4-SSMK03-1 Quantitative in Vivo Assessment of Wrist Trabecular Microarchitecture with Photon-counting-detector (PCD) CT

Anika Dutta, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

To demonstrate the feasibility of in vivo trabecular bone quantification in the wrist using photon-counting-detector (PCD) CT in ultra-high-resolution (UHR) mode.

#### METHODS AND MATERIALS

An anthropomorphic wrist phantom was scanned on a peripheral quantitative CT (pQCT) (Extreme II, SCANCO Medical AG) at 68 kV and reconstructed with an 82x82x82  $\mu\text{m}^3$  voxel size. The phantom was also scanned using the UHR mode of a PCD-CT system (Siemens NAEOTOM Alpha) at 120 kV and reconstructed with a Br96 kernel (limiting resolution 125 microns) using quantum iterative reconstruction (strength 3). The voxel size was 117x117x200  $\mu\text{m}^3$ . Additional reconstructions to mimic a state-of-the-art energy integrating detector (EID) were performed (Br76 at 0.4 mm slice thickness) to quantify the improvements in bone quality assessment offered by UHR-PCD-CT. Trabecular morphologic properties for 3 different carpal bones were measured using a semi-automated bone segmentation and quantification framework (BoneJ package, ImageJ, NIH Bethesda MD). The distal radius of 20 patients undergoing clinically indicated wrist CT on the PCD-CT system was retrospectively evaluated by quantitatively extracting metrics of bone volume ratio (BV/TV), trabecular thickness (Tb.Th) and spacing (Tb.Sp), using the same reconstruction settings as the phantom study.

#### RESULTS

Trabecular morphologic indicators from the phantom were overestimated using the EID-CT reconstruction setting (average Tb.Th, 0.97 mm), when compared to the pQCT reference (0.49 mm). UHR-PCD-CT provided a close match (0.47 mm) to the reference, demonstrating accurate trabecular quantification using a whole-body CT system. In the in vivo cohort, BV/TV, Tb.Th and Tb.Sp were significantly lower when using the UHR-PCD-CT reconstruction settings compared to the ones matching EID-CT, with average differences of 43%, 53% and 16%, respectively ( $p < 0.001$ ). Of the three metrics of bone quality, the quantitative assessment of trabecular bone thickness, was shown to benefit the most from the improved spatial resolution offered by PCD-CT.

#### CONCLUSION

This work demonstrates that UHR-PCD-CT can quantitatively assess bone microarchitecture *in vivo*, thus potentially serving as an opportunistic screening tool for osteoporosis. Of the three metrics of bone quality, trabecular bone thickness showed the most benefit from the improved spatial resolution offered by PCD-CT.

#### CLINICAL RELEVANCE/APPLICATION

The UHR capabilities of PCD-CT, combined with its intrinsic spectral properties, may enable an opportunistic comprehensive assessment of bone health at no additional radiation dose.

#### M4-SSMK03-2 Differentiation of Periarticular Mineralized Foci using Dual-energy CT

Jennifer Henneby, MBCh (*Presenter*) Nothing to Disclose

## PURPOSE

To investigate if atomic number (Z) and attenuation levels (HU) at high and low kV values obtained by dual-energy CT can differentiate between types of periarticular mineralized foci.

## METHODS AND MATERIALS

IRB-approved retrospective study. The study included 103 cases where peri-articular mineralized foci were seen on second and third generation dual-source dual-energy CT (Somatom Siemens Flash and Force, Siemens Healthineers). Two musculoskeletal radiologists evaluated the cases and classified them according to the most likely diagnosis based on the radiological appearance and clinical presentation into 3 categories: Carbonate apatite/hydroxyapatite deposition disease (HADD), monosodium urate (MSU) deposition and calcium pyrophosphate dihydrate deposition disease (CPPD). A third MSK radiologist evaluated if initial categorization differed. Three fellows in MSK radiology independently processed the cases with dual-energy CT using the Rho/Z application (Syngo.via, version VB40, Siemens Healthineers). A region of interest (ROI) of at least 1 sq mm was drawn over the dominant focus of mineralization and ROI size and Z and HU values were recorded at high, low and mixed kV energy levels.

## RESULTS

3 groups of cases each were created. Atomic number values for MSU, CPPD, HADD were 7.56 +/- 0.52, 9.16 +/- 0.91 and 10.88 +/- 1.23. An Anova test followed by a post-hoc Tukey's test was performed to assess for specific pairs that had significant difference in their mean Z and HU values at high and low kV. All groups had a significant difference ( $p < 0.001$ ) for Z values. The HADD group compared to the CPPD group and the HADD group compared to the MSU group had a significant difference at high and low kV energy levels. The CPPD group compared to the MSU group did not have a significant difference at high and low kV energy levels.

## CONCLUSION

The Z obtained by the Rho/Z application on DECT is able to differentiate between MSU, CPPD and HADD. The mean HU values at high and low kV values can differentiate between HADD and CPPD and between HADD and MSU.

## CLINICAL RELEVANCE/APPLICATION

Using DECT can narrow the differential diagnosis of peri-articular mineralized foci - reducing the clinical need for joint aspiration and associated risks and also guide treatment in clinical practice.

## M4-SSMK03-4 Development and Validation of a Deep Learning Model for Prediction of Bone Mineral Density and T-score Prediction in Chest X-rays: A Multi-center Study

YOICHI SATO, MD (*Presenter*) Nothing to Disclose

## PURPOSE

Although the number of patients with osteoporosis is increasing worldwide, diagnosis and treatment are presently inadequate. In this study, we developed a deep learning model to predict bone mineral density (BMD) and T-score from chest X-rays, which is one of the most common, easily accessible, and low-cost medical imaging examination methods. In addition to development, we performed external validation to evaluate a deep learning model's reproducibility and generalizability.

## METHODS AND MATERIALS

We trained, validated, and externally tested a deep learning model to predict BMD and T-score from chest X-rays. This retrospective study included consecutively collected results of dual-energy X-ray absorptiometry (DXA) and chest X-ray that had been obtained between 2010 and 2022 from 20 institutions. For the learning labels, we used (1) BMD (g/cm<sup>2</sup>) of the hip and (2) classification of T-score  $\leq -1.0$ ,  $\leq -2.5$  as the threshold. Of these radiographs, 17 institutions were used for training, validation, and internal testing. The 3 other institutions were used for external testing. We trained the deep learning model through ensemble learning of chest X-rays, age, and sex to predict the BMD using regression and T-score for multiclass classification. We assessed the following two metrics to evaluate the performance of the deep learning model in the internal-test dataset and external-test dataset: (1) the correlation coefficient, root mean square error (RMSE) and mean absolute error (MAE) between the predicted and true BMDs and (2) consistency in the T-score between the predicted class and true class.

## RESULTS

This study included 50,064 radiographs from 24,666 patients across 20 institutions. The training and validation dataset comprised 47,150 radiographs (23,151 patients), while the external test dataset included 2,914 radiographs (1,515 patients). The correlation coefficient, RMSE, and MAE for BMD were 0.68, 0.09, and 0.08, respectively. T-score predictions ( $\leq -1.0$ ) showed 79.0% accuracy, 96.6% sensitivity, and 34.1% specificity, while predictions ( $\leq -2.5$ ) demonstrated 79.7% accuracy, 77.1% sensitivity, and 80.4% specificity.

## CONCLUSION

These results suggest that the proposed deep learning model may be suitable for screening patients with osteoporosis by predicting the BMD and T-score from chest X-rays.

## CLINICAL RELEVANCE/APPLICATION

This model may be useful in that it allows screening of osteoporosis patients from chest X-rays, one of the most common and low-cost medical imaging modalities. If this deep learning model becomes available as a medical device, chest X-rays taken in a variety of settings, such as medical examinations, checkups, and hospitals, could be used to screen for osteoporosis.

### M4-SSMK03-5 **Prediction of Osteoporosis Associated Fractures: Evaluation of Dual-Energy CT-derived Metrics of the Lumbar Spine**

Simon S. Martin, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

To assess the association of dual-energy CT (DECT)-derived bone mineral density (BMD) assessment with the occurrence of osteoporosis-associated fractures in a follow-up period of 2 years.

#### METHODS AND MATERIALS

L1 of 160 patients (77 men, 83 women; mean age, 64.1 years, range, 19-94 years) who underwent dual-source DECT between 01/2016 and 12/2020 was retrospectively analyzed. Cortical HU, trabecular HU, cortical thickness, and phantomless DECT-based bone BMD were obtained from all examinations. Patient files and follow-up images of patients were examined for the occurrence of osteoporosis-associated fractures. Receiver-operating characteristic (ROC) analysis identified AUC values for BMD, HU values and cortical thickness, and logistic regression models were used to evaluate their associations with the occurrence of osteoporosis-associated fractures.

#### RESULTS

ROC curve analysis demonstrated a significantly higher AUC value for DECT-derived BMD compared to cortical HU, trabecular HU and cortical thickness (0.92 vs. 0.67, 0.62 and 0.59, respectively;  $P < .01$ ). Logistic regression models confirmed a significant association of lower DECT-derived BMD with the occurrence of osteoporosis-associated fractures (Odds Ratio, 0.87;  $P < .001$ ), but not of cortical HU, trabecular HU or cortical thickness ( $P > .05$  for all values, respectively).

## CONCLUSION

Dual-energy CT-derived bone mineral density assessment from routine examinations can be used to stratify the risk of sustaining osteoporosis-associated fractures during a follow-up period of 2 years.

## CLINICAL RELEVANCE/APPLICATION

We demonstrate the superiority of dual-energy CT over other methods for opportunistic osteoporosis screening. This information can be used to stratify the risk of patients to sustain fractures and to start patients at risk on osteoporosis treatment without the requirement to perform additional examinations.

### M4-SSMK03-6 **QCT-derived Volumetric Bone Mineral Density in the Evaluation of the Lumbar Spine: Comparison with DXA-based Areal Bone Mineral Density and Trabecular BoneScore**

Stefano Fusco (*Presenter*) Nothing to Disclose

#### PURPOSE

The application of quantitative computed tomography (QCT) to CT scans performed for other clinical reasons can provide valuable information about bone mineral density (BMD) in the setting of opportunistic screening for osteoporosis. We compared volumetric BMD (vBMD) derived from QCT to dual-energy x-ray absorptiometry (DXA)-based parameters such as areal BMD and trabecular bone score (TBS). We also aimed to assess the diagnostic accuracy of these parameters in discriminating between individuals with and without fragility fractures (FFs).

#### METHODS AND MATERIALS

We retrospectively enrolled subjects who underwent both a DXA scan and a non-enhanced chest/abdomen CT scan, with a maximum time lapse of six months between the two examinations. A so-called "asynchronous" calibration was performed on CT images to obtain vBMD values from QCT using QCT PRO v 6.1 software (Mindways Software Inc., Austin, TX). American College of Radiology ranges were used for QCT-vBMD to assign a diagnostic category (normal, osteopenic or osteoporotic status). T-score values were used for DXA diagnosis according to the World Health Organization criteria. TBS values were obtained from DXA on the same areas of BMD analysis. The presence of prevalent fragility fractures (FFs) was assessed at spine, hip and wrist.

## RESULTS

After applying the inclusion and exclusion criteria, our final sample comprised 105 subjects (87 women, mean age  $69 \pm 11$  years). Overall, 49 subjects (46.6%) presented at least one major fragility fracture. QCT diagnosis was as follows: osteoporosis = 59 (56.2%); osteopenia = 36 (34.3%); normal status = 10 (9.5%). DXA diagnosis was: osteoporosis = 25 (23.8%); osteopenia = 35 (33.3%); normal status = 45 (42.9%). A total of 38 subjects (36.2%) showed degraded microarchitecture according to TBS values. A moderate correlation was found between DXA-areal BMD and QCT-vBMD ( $r=0.446$ ) as well as between TBS and vBMD ( $r=0.524$ ), while a good correlation between aBMD and TBS ( $r=0.621$ ) was found. In order to assess the capability of discriminating between subjects with and without FFs, ROC curves were calculated: QCT-vBMD showed the best performance with an AUC of 0.748. On the other hand, AUC for DXA-aBMD was 0.575 and for TBS was 0.650.

## CONCLUSION

Opportunistic QCT evaluation diagnosed a higher prevalence of osteoporosis compared to DXA. vBMD and TBS performed better than DXA-aBMD in discriminating subjects with and without FFs.

## CLINICAL RELEVANCE/APPLICATION

QCT-based opportunistic screening for osteoporosis can partially overcome the limits of DXA, allowing to better identify patients at risk for fragility fractures

### Quantitative in Vivo Assessment of Wrist Trabecular Microarchitecture with Photon-counting-detector (PCD) CT

Monday, Nov. 27 11:00AM - 12:00PM Room: E450A

Anika Dutta, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

To demonstrate the feasibility of in vivo trabecular bone quantification in the wrist using photon-counting-detector (PCD) CT in ultra-high-resolution (UHR) mode.

#### METHODS AND MATERIALS

An anthropomorphic wrist phantom was scanned on a peripheral quantitative CT (pQCT) (Extreme II, SCANCO Medical AG) at 68 kV and reconstructed with an 82x82x82  $\mu\text{m}^3$  voxel size. The phantom was also scanned using the UHR mode of a PCD-CT system (Siemens NAEOTOM Alpha) at 120 kV and reconstructed with a Br96 kernel (limiting resolution 125 microns) using quantum iterative reconstruction (strength 3). The voxel size was 117x117x200  $\mu\text{m}^3$ . Additional reconstructions to mimic a state-of-the-art energy integrating detector (EID) were performed (Br76 at 0.4 mm slice thickness) to quantify the improvements in bone quality assessment offered by UHR-PCD-CT. Trabecular morphologic properties for 3 different carpal bones were measured using a semi-automated bone segmentation and quantification framework (BoneJ package, ImageJ, NIH Bethesda MD). The distal radius of 20 patients undergoing clinically indicated wrist CT on the PCD-CT system was retrospectively evaluated by quantitatively extracting metrics of bone volume ratio (BV/TV), trabecular thickness (Tb.Th) and spacing (Tb.Sp), using the same reconstruction settings as the phantom study.

#### RESULTS

Trabecular morphologic indicators from the phantom were overestimated using the EID-CT reconstruction setting (average Tb.Th, 0.97 mm), when compared to the pQCT reference (0.49 mm). UHR-PCD-CT provided a close match (0.47 mm) to the reference, demonstrating accurate trabecular quantification using a whole-body CT system. In the in vivo cohort, BV/TV, Tb.Th and Tb.Sp were significantly lower when using the UHR-PCD-CT reconstruction settings compared to the ones matching EID-CT, with average differences of 43%, 53% and 16%, respectively ( $p < 0.001$ ). Of the three metrics of bone quality, the quantitative assessment of trabecular bone thickness, was shown to benefit the most from the improved spatial resolution offered by PCD-CT.

#### CONCLUSION

This work demonstrates that UHR-PCD-CT can quantitatively assess bone microarchitecture *in vivo*, thus potentially serving as an opportunistic screening tool for osteoporosis. Of the three metrics of bone quality, trabecular bone thickness showed the most benefit from the improved spatial resolution offered by PCD-CT.

#### CLINICAL RELEVANCE/APPLICATION

The UHR capabilities of PCD-CT, combined with its intrinsic spectral properties, may enable an opportunistic comprehensive assessment of bone health at no additional radiation dose.

### Differentiation of Periarticular Mineralized Foci using Dual-energy CT

Monday, Nov. 27 11:00AM - 12:00PM Room: E450A

Jennifer Hennebry, MBBCh (*Presenter*) Nothing to Disclose

#### PURPOSE

To investigate if atomic number (Z) and attenuation levels (HU) at high and low kV values obtained by dual-energy CT can differentiate between types of periarticular mineralized foci.

#### METHODS AND MATERIALS

IRB-approved retrospective study. The study included 103 cases where peri-articular mineralized foci were seen on second and third generation dual-source dual-energy CT (Somatom Siemens Flash and Force, Siemens Healthineers). Two musculoskeletal radiologists evaluated the cases and classified them according to the most likely diagnosis based on the radiological appearance and clinical presentation into 3 categories: Carbonate apatite/hydroxyapatite deposition disease (HADD), monosodium urate (MSU) deposition and calcium pyrophosphate dihydrate deposition disease (CPPD). A third MSK radiologist evaluated if initial categorization differed. Three fellows in MSK radiology independently processed the cases with dual-energy CT using the Rho/Z application (Syngo.via, version VB40, Siemens Healthineers). A region of interest (ROI) of at least 1 sq mm was drawn over the dominant focus of mineralization and ROI size and Z and HU values were recorded at high, low and mixed kV energy levels.

#### RESULTS

3 groups of cases each were created. Atomic number values for MSU, CPPD, HADD were 7.56 +/- 0.52, 9.16 +/- 0.91 and 10.88 +/- 1.23. An Anova test followed by a post-hoc Tukey's test was performed to assess for specific pairs that had significant difference in their mean Z and HU values at high and low kV. All groups had a significant difference ( $p < 0.001$ ) for Z values. The HADD group compared to the CPPD group and the HADD group compared to the MSU group had a significant difference at high and low kV energy levels. The CPPD group compared to the MSU group did not have a significant difference at high and low kV energy levels.

#### CONCLUSION

The Z obtained by the Rho/Z application on DECT is able to differentiate between MSU, CPPD and HADD. The mean HU values at high and low kV values can differentiate between HADD and CPPD and between HADD and MSU.

#### CLINICAL RELEVANCE/APPLICATION

Using DECT can narrow the differential diagnosis of peri-articular mineralized foci - reducing the clinical need for joint aspiration and associated risks and also guide treatment in clinical practice.

### Development and Validation of a Deep Learning Model for Prediction of Bone Mineral Density and T-score Prediction in Chest X-rays: A Multi-center Study

Monday, Nov. 27 11:00AM - 12:00PM Room: E450A

YOICHI SATO, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

Although the number of patients with osteoporosis is increasing worldwide, diagnosis and treatment are presently inadequate. In this study, we developed a deep learning model to predict bone mineral density (BMD) and T-score from chest X-rays, which is one of the most common, easily accessible, and low-cost medical imaging examination methods. In addition to development, we performed external validation to evaluate a deep learning model's reproducibility and generalizability.

#### METHODS AND MATERIALS

We trained, validated, and externally tested a deep learning model to predict BMD and T-score from chest X-rays. This retrospective study included consecutively collected results of dual-energy X-ray absorptiometry (DXA) and chest X-ray that had been obtained between 2010 and 2022 from 20 institutions. For the learning labels, we used (1) BMD (g/cm<sup>2</sup>) of the hip and (2) classification of T-score = -1.0, -2.5 as the threshold. Of these radiographs, 17 institutions were used for training, validation, and internal testing. The 3 other institutions were used for external testing. We trained the deep learning model through ensemble learning of chest X-rays, age, and sex to predict the BMD using regression and T-score for multiclass classification. We assessed the following two metrics to evaluate the performance of the deep learning model in the internal-test dataset and external-test dataset: (1) the correlation coefficient, root mean square error (RMSE) and mean absolute error (MAE) between the predicted and true BMDs and (2) consistency in the T-score between the predicted class and true class.

#### RESULTS

This study included 50,064 radiographs from 24,666 patients across 20 institutions. The training and validation dataset comprised 47,150 radiographs (23,151 patients), while the external test dataset included 2,914 radiographs (1,515 patients). The correlation coefficient, RMSE, and MAE for BMD were 0.68, 0.09, and 0.08, respectively. T-score predictions ( $\leq -1.0$ ) showed 79.0% accuracy, 96.6% sensitivity, and 34.1% specificity, while predictions ( $\leq -2.5$ ) demonstrated 79.7% accuracy, 77.1% sensitivity, and 80.4% specificity.

#### CONCLUSION

These results suggest that the proposed deep learning model may be suitable for screening patients with osteoporosis by predicting the BMD and T-score from chest X-rays.

#### CLINICAL RELEVANCE/APPLICATION

This model may be useful in that it allows screening of osteoporosis patients from chest X-rays, one of the most common and low-cost medical imaging modalities. If this deep learning model becomes available as a medical device, chest X-rays taken in a variety of settings, such as medical examinations, checkups, and hospitals, could be used to screen for osteoporosis.

#### Sub-Events

#### **M4-SSPH04-1 Quantification of Coronary Artery Stenosis from Dense Calcifications using Ultra-High-Resolution Photon-Counting-Detector CT**

Emily Koons (*Presenter*) Nothing to Disclose

#### **PURPOSE**

To quantify differences in percent area stenosis in patients with coronary artery calcifications between conventional energy-integrating detector (EID) dual-source CT and ultra-high-resolution (UHR) photon-counting-detector (PCD) dual-source CT.

#### **METHODS AND MATERIALS**

After IRB approval and written informed consent, patients undergoing clinically indicated coronary artery CT angiography were prospectively recruited and scanned first on EID-CT (SOMATOM Force, Siemens) then PCD-CT (NAEOTOM Alpha, Siemens) on the same day. EID-CT was performed following our clinical protocol and images reconstructed using 0.6/0.3 mm slice thickness/increment, Bv40 kernel, 512 matrix size, and ADMIRE strength 4. PCD-CT scans were acquired with a retrospectively-gated UHR spiral technique and 120x0.2mm detector collimation. PCD-CT reconstruction parameters were set based on patient weight to achieve the benefits of UHR mode while addressing increased noise with increased patient size: Bv64 kernel, 0.2/0.1 mm for <70 kg; Bv60 kernel, 0.4/0.2mm for 70-110kg; and Bv60 kernel, 0.6/0.3mm for > 110 kg. All images were reconstructed with iterative reconstruction (QIR) strength 4 and 1024 matrix size at the cardiac phase selected by experienced CT technologists to minimize motion artifact. Percent area stenosis was assessed using commercial software (syngo.via, CT Coronary Vascular Definition, Siemens). For each patient, left main, left anterior descending, right coronary artery, and circumflex were reviewed and the most severe stenosis from dense calcification for each segment was quantified.

#### **RESULTS**

A total of 18 patients were enrolled having a total of 28 coronary artery stenoses. Stenosis grade from EID-CT was substantially reduced in PCD-CT, resulting in an average of 16% (SD=15%) area stenosis reduction. Of 28 lesions, 9 had no change in grade based on CAD-RADS, 5 went from severe to moderate; 8 from moderate to mild; 2 from mild to minimal; 2 from severe to mild, 1 from severe to minimal, and 1 from minimal to mild with use of PCD-CT.

#### **CONCLUSION**

Use of PCD UHR mode decreased percent area stenosis by an average of 16% relative to EID due to decreased blooming and improved resolution, resulting in 18 of 28 stenoses being downgraded in severity.

#### **CLINICAL RELEVANCE/APPLICATION**

Reduced blooming artifact and improved lumen visibility with use of PCD UHR mode potentially allows for more accurate non-invasive assessment of coronary artery disease.

#### **M4-SSPH04-2 Brain Perfusion CT without a CT System**

Shalini Subramanian, MS, BS (*Presenter*) Nothing to Disclose

## PURPOSE

Real-time perfusion imaging is highly desirable for effectively using endovascular thrombectomy (EVT) in treating ischemic stroke; the current standard of care is hindered by the lack of intra-operative perfusion imaging. To address this unmet clinical need, we propose an IPEN (intra-intervention perfusion with no C-arm rotation)-based method using X-ray angiographic (XA) images in the interventional suite.

## METHODS AND MATERIALS

IPEN is built on tomographic theory; wherein an object consists of homogenous regions-of-interest (ROIs) with known shapes. This makes  $N$  x-ray beams in a single projection sufficient to estimate values of  $N$  ROIs. IPEN for brain perfusion assessment comprises 3 steps: (1) create patient-specific brain ROIs from the arterial territory atlas, (2) determine head orientation with respect to XA images, and (3) estimate a dynamic time-enhancement curve (TEC) of ROIs. The proposed algorithm was evaluated by computer simulations using XCAT phantom updated for dynamic CT perfusion. Eight ischemic stroke cases were simulated, each presented thrombus occlusion in one of the 4 arteries—middle cerebral (MCA), anterior cerebral, posterior temporal, and posterior parietal. Intra-arterial contrast enhancement was simulated for each case, and bi-plane XA images were acquired. The scan was repeated 5 times. Using the XA images, IPEN was performed to estimate the TEC values. The accuracy of the estimated TEC was quantitatively assessed against the ground truth using normalized weighted root-mean-square error (RMSE) and linear correlation coefficient ( $R$ ).

## RESULTS

Fig. A shows an XA image with a left MCA occlusion. For this case, ROI-based dynamic contrast-enhanced volumes were generated using estimated and true TEC values. Fig B and Fig C qualitatively show great agreement between the estimated and true values in different brain ROIs, both healthy and ischemic. Quantitatively, the estimated TECs had excellent agreement with the true TECs: the RMSE was as low as  $5.0\% \pm 0.6\%$ , and the  $R$  values ranged 0.85-0.95 ( $P < 0.01$ ) for 8 cases. TECs estimated showed consistent performance for different cases over multiple scans. Overall, IPEN for brain perfusion qualitatively and quantitatively shows excellent performance.

## CONCLUSION

IPEN was performed and evaluated using XA images demonstrating its feasibility in the interventional suite. IPEN for brain perfusion successfully estimated ROI-specific TEC values with high accuracy. Using these estimated TEC, we will be able to calculate reliable brain perfusion indices.

## CLINICAL RELEVANCE/APPLICATION

Real-time perfusion is vital to assess the risk-benefit of EVT before, and success during and after the procedure. In IPEN, using XA images provides volumetric assessment without workflow disruption.

## M4-SSPH04-3 Automated Local Motion Detection and Characterization for X-ray CT

Jiang J. Hsieh, PhD (*Presenter*) Former Employee, General Electric Company

## PURPOSE

Despite major advances in technology, CT images are frequently degraded by patient motion. Motion artifacts are often localized and temporally varying. Most hospitals rely on CT operators to detect motion artifacts, and image quality is highly dependent on the operator's experience. In this paper, an automated algorithm is proposed to detect and characterize motion in local regions.

## METHODS AND MATERIALS

We propose a data consistency metric (CM) derived during the reconstruction process. The CM takes advantage of the fact that around a small object (e.g., a blood vessel) the magnitude of the integrated intensity along a circular path for a single back-projected view is near zero. Therefore, the accumulative intensity difference (AID) is linear over views (AID is the average intensity inside an object ROI subtracting its integrated background intensity). When motion is present, the linear relationship no longer holds. The goodness of fit,  $R^2$ , of the linear regression for AID can be used to quantify the motion. CM is capable of characterizing local motions for each projection. In our previous study, CM was demonstrated for small objects with circular and oval cross-sections. In this paper, we generalize the algorithm to cover objects of arbitrary shapes by defining the object ROI as the minimum enclosing circle.

## RESULTS

Extensive computer simulations were used to demonstrate the efficacy of the proposed approach. We simulated projections of three closed packed cylindrical objects. The combined cylinders form an irregular shaped test object. Under motion-free conditions, CM is not impacted by the presence of nominal noise [ $R^2$  values are in the range of (0.9990, 0.9997)]. When motion is present,  $R^2$  value drops to 0.710 for views with the largest deviation from its nominal position. For further confirmation, we superimposed the simulated projection on a clinical chest scan. The goal is to test the algorithm's robustness in the presence of complex patient anatomies. Consistent results were obtained and  $R^2$  value drops to 0.738 for the worst views with motion.

## CONCLUSION

We developed a local consistency metric to detect and quantify patient motion. The proposed method detects patient motion on a view-by-view basis and characterizes motion over small local regions to address motion inhomogeneity inside patients. The algorithm is capable of generating image quality check for each CT examination and provides a useful guidance for artifact avoidance by identifying projection segments with the least motion.

## CLINICAL RELEVANCE/APPLICATION

We present a method to automatically detect patient motion and guide the operator to minimize image artifacts. The local-motion detection allows an optimal image reconstruction for each anatomical sub-region.

### M4-SSPH04-4 **Combining Coronary CT Angiography, Quantitative Myocardial Blood Flow, and Coronary Flow Reserve Measurement with a Low-Dose Comprehensive Cardiac CT Technique - Validation Versus $^{82}\text{Rb}$ PET**

Logan Hubbard, MD, PhD (*Presenter*) Nothing to Disclose

#### PURPOSE

The ability of dynamic CT perfusion to assess quantitative myocardial blood flow (mL/min/g) and coronary flow reserve (CFR) is of clinical merit, where its tiered use with coronary CT angiography (CCTA) further improves delineation and risk stratification of focal, diffuse, and microvascular coronary artery disease. Nevertheless, current dynamic CT perfusion techniques remain limited by (1) the high radiation dose characteristic to scanning over multiple cardiac cycles (>5 mSv), and (2) the inaccuracies in myocardial blood flow measurement as compared to quantitative PET. Hence, this work validates an accurate, low-dose comprehensive cardiac CT technique that combines CCTA with a new single-volume CT perfusion approach for quantitative myocardial blood flow and CFR measurement.

#### METHODS AND MATERIALS

Eleven patients with known or suspected coronary artery disease underwent rest and stress (regadenoson 0.4mg IV) imaging with quantitative  $^{82}\text{Rb}$  PET. After which, low-dose comprehensive cardiac CT imaging was performed, consisting of a CCTA protocol, a 10-minute delay, and a subsequent single-volume stress (regadenoson 0.4mg IV) CT protocol. For both protocols, the same triphasic contrast injection (Phase 1: 0.8 mL/kg; Phase 2: 30/70% mix of 0.1 mL/kg; Phase 3: 30mL saline; 5 mL/s) was performed, followed by dynamic bolus tracking with CCTA or stress CT acquisition, respectively. The dynamic bolus tracking, CCTA, and stress CT data were then utilized by a new single-volume CT perfusion approach to derive quantitative rest flow (from the CCTA), stress flow, and CFR measurements, which were compared to corresponding  $^{82}\text{Rb}$  PET measurements through regression, Pearson's correlation ( $r$ ), Lin's concordance correlation (CCC), root-mean-square error (RMSE; accuracy), and root-mean-square deviation (RMSD; precision).

#### RESULTS

Per-vessel flow (QCT) and CFR (CFRCT) measurements were related to corresponding  $^{82}\text{Rb}$  measurements (QPET; CFRPET) by  $QCT = 0.91 QPET + 0.18$  ( $r = 0.95$ ; CCC = 0.94; RMSE = 0.25 mL/min/g; RMSD = 0.23 mL/min/g) and  $CFRCT = 0.91 CFRPET + 0.14$  ( $r = 0.78$ ; CCC = 0.76; RMSE = 0.67; RMSD = 0.66). The median effective dose of the comprehensive cardiac CT technique, consisting of CCTA, quantitative rest and stress flow, and CFR combined, was 2.73 mSv (2.28 - 2.78), while the median effective dose of  $^{82}\text{Rb}$  PET was 3.7 mSv (3.2 - 4.1 mSv).

## CONCLUSION

Accurate, low-dose, quantitative CT myocardial blood flow and CFR measurement combined with CCTA is feasible with a new comprehensive cardiac CT technique.

## CLINICAL RELEVANCE/APPLICATION

Combining CCTA with low-dose, quantitative CT myocardial blood flow and CFR measurement has the potential to improve delineation and risk stratification of focal, diffuse, and microvascular coronary artery disease.

### M4-SSPH04-5 **Dielectrography: A Method for Detection of Human Neurological Disorders using Ultra-Wide-Band (UWB) Microwaves - phantom Design and Benchtop Validation**

Seena Dehkharghani, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

Stroke remains the second leading cause of death worldwide. Urgent diagnosis is critical; however, limited access to diagnostic imaging perpetuates immense imbalances in health outcomes, with the WHO estimating two-thirds of the world lacking in basic imaging. We have recently reported the remarkable potential of ultrawide band (UWB) microwaves for stroke detection using artificial neural networks. Prudent design of clinic-ready instrumentation demands rigorous bench validation, however, anatomically realistic test beds for hypothesis testing and validation are lacking. We present an experimental framework and test environment to facilitate development of UWB diagnostic systems for human use.

## METHODS AND MATERIALS

Aqueous and gelatinous head-mimicking dielectric phantoms were fabricated. Blood-mimicking models of varying shapes (e.g., spherical, star) and sizes up to 30 mm were introduced. Realistic human head models were 3D printed and filled with compartment-specific dielectric substrate. Modified antipodal Vivaldi antennas were engineered to support the UWB (0.8-10GHz) and high directivity demands. In house switch matrices were designed to interface to a high-performance vector network analyzer (VNA). Following dielectric calibrations, pilot 8 antenna array was tested with an 8x2 microwave switch matrix for 2-port scattering measurements at variable IF bandwidth (10-100 KHz). A robot navigation system was used for controlled (sub-mm) manipulation of the blood model with a pseudorandom trajectory at 127 positions on a Cartesian grid. Scan time for each location was ~10s. A 2D neural network was trained for classification and localization using the complex values from S-parameter matrices across UWB interrogation. The sensitivity and specificity of the network for multi-class detection and localization error (in mm) were reported.

## RESULTS

Fig 1 demonstrates experimental environment for UWB microwave testing, phantom development, and network performance. High overall sensitivity (>90%) and specificity (100%) for the presence of all hemorrhage classes is shown in the confusion matrix with associated heat map. Median absolute volumetric error for hemorrhage location was <1mm. Maximum operating power remained <3 dBm RMS, well below that of cellular devices. Scaled production costs are projected at \$10-30K for full-form human subject systems.

## CONCLUSION

We present an adaptable bioengineering test bed for hypothesis testing of UWB microwave imaging (MWI). The findings validate the unprecedented potential of low-energy MWI, leveraging advancements in deep neural networks. Human subjects scanning is underway.

## CLINICAL RELEVANCE/APPLICATION

An experimental test bed for development of human UWB MW instruments is introduced.

### M4-SSPH04-6 Simulating Lower-dose Exams in Whole-body Photon-counting-detector CT

Timothy N. Winfree, BS, MS (*Presenter*) Nothing to Disclose

## PURPOSE

To develop and validate a projection domain noise insertion algorithm to simulate lower-dose exams for photon-counting-detector (PCD) CT while avoiding the addition of pulse pileup effects.

## METHODS AND MATERIALS

We developed a projection-domain noise insertion algorithm to simulate lower-dose exams from existing exams performed on a PCD-CT scanner (NAEOTOM Alpha, Siemens). The noise model incorporated the effects of the bowtie filter and automatic exposure control (AEC). A map of the incident number of photons  $N_0(u,v)$  at each detector pixel when no object was in the beam was quantified in terms of noise equivalent quanta (NEQ), which was calculated from the variance in the log normalized projection data of each scan for both low and high threshold energies (T1 and T2). Additionally, projection data were acquired for eight different mAs levels (10, 20, 40, 80, 160, 320, 640, 1280) at 120 kV to investigate the impact of pulse pileup on the linearity of NEQ measurement. The noise insertion algorithm was validated using a 30cm water tank and an anthropomorphic phantom. The 30cm water phantom was scanned using 120kV at 320, 160, and 80 mAs. Starting from the 320 mAs data, lower dose data at 160 mAs and 80 mAs were simulated and compared with the acquired data. Noise Power Spectra (NPS) were calculated to assess the noise texture. An anthropomorphic phantom was scanned using 120 kV at 160, 80 and 40 mAs with AEC on and lower dose data at 80 mAs and 40 mAs were simulated. Noise was measured manually every 20 slices and compared between simulated and acquired images.

## RESULTS

NEQ profiles were linear up until 160 mAs in air scans, after which pulse pileup effects impacted the NEQ profile. To avoid propagating these effects into our noise-inserted images, we acquired the  $N_0$  profile at 20 mAs, and scaled the profile according to the actual mAs used for the scan we are inserting noise into. The NPS curves of simulated low dose images agreed well with that from measured images, differing by a maximum of 5.0%, 6.3%, 4.1%, and 6.1% for half-dose (HD) T1, HD T2, quarter-dose (QD) T1, and QD T2 images, respectively. Noise in the anthropomorphic phantom showed excellent agreement between measured and simulated images, with percent root mean square errors of 5.9%, 5.4%, 5.0%, and 4.6% for QD T1, HD T1, QD T2, and HD T2, respectively.

## CONCLUSION

An accurate noise insertion tool was developed for PCD-CT to synthesize lower dose images from existing exams by taking into account the impact of pulse pileup.

## **CLINICAL RELEVANCE/APPLICATION**

This noise insertion tool enables the generation of lower dose images from existing exams, which can be used to optimize radiation dose in scanning protocols and train deep-learning-based noise reduction algorithms for PCD-CT.

### Quantification of Coronary Artery Stenosis from Dense Calcifications using Ultra-High-Resolution Photon-Counting-Detector CT

Monday, Nov. 27 11:00AM - 12:00PM Room: S405

Emily Koons (*Presenter*) Nothing to Disclose

#### PURPOSE

To quantify differences in percent area stenosis in patients with coronary artery calcifications between conventional energy-integrating detector (EID) dual-source CT and ultra-high-resolution (UHR) photon-counting-detector (PCD) dual-source CT.

#### METHODS AND MATERIALS

After IRB approval and written informed consent, patients undergoing clinically indicated coronary artery CT angiography were prospectively recruited and scanned first on EID-CT (SOMATOM Force, Siemens) then PCD-CT (NAEOTOM Alpha, Siemens) on the same day. EID-CT was performed following our clinical protocol and images reconstructed using 0.6/0.3 mm slice thickness/increment, Bv40 kernel, 512 matrix size, and ADMIRE strength 4. PCD-CT scans were acquired with a retrospectively-gated UHR spiral technique and 120x0.2mm detector collimation. PCD-CT reconstruction parameters were set based on patient weight to achieve the benefits of UHR mode while addressing increased noise with increased patient size: Bv64 kernel, 0.2/0.1 mm for <70 kg; Bv60 kernel, 0.4/0.2mm for 70-110kg; and Bv60 kernel, 0.6/0.3mm for > 110 kg. All images were reconstructed with iterative reconstruction (QIR) strength 4 and 1024 matrix size at the cardiac phase selected by experienced CT technologists to minimize motion artifact. Percent area stenosis was assessed using commercial software (syngo.via, CT Coronary Vascular Definition, Siemens). For each patient, left main, left anterior descending, right coronary artery, and circumflex were reviewed and the most severe stenosis from dense calcification for each segment was quantified.

#### RESULTS

A total of 18 patients were enrolled having a total of 28 coronary artery stenoses. Stenosis grade from EID-CT was substantially reduced in PCD-CT, resulting in an average of 16% (SD=15%) area stenosis reduction. Of 28 lesions, 9 had no change in grade based on CAD-RADS, 5 went from severe to moderate; 8 from moderate to mild; 2 from mild to minimal; 2 from severe to mild, 1 from severe to minimal, and 1 from minimal to mild with use of PCD-CT.

#### CONCLUSION

Use of PCD UHR mode decreased percent area stenosis by an average of 16% relative to EID due to decreased blooming and improved resolution, resulting in 18 of 28 stenoses being downgraded in severity.

#### CLINICAL RELEVANCE/APPLICATION

Reduced blooming artifact and improved lumen visibility with use of PCD UHR mode potentially allows for more accurate non-invasive assessment of coronary artery disease.

### Brain Perfusion CT without a CT System

Monday, Nov. 27 11:00AM - 12:00PM Room: S405

Shalini Subramanian, MS, BS (*Presenter*) Nothing to Disclose

#### PURPOSE

Real-time perfusion imaging is highly desirable for effectively using endovascular thrombectomy (EVT) in treating ischemic stroke; the current standard of care is hindered by the lack of intra-operative perfusion imaging. To address this unmet clinical need, we propose an IPEN (intra-intervention perfusion with no C-arm rotation)-based method using X-ray angiographic (XA) images in the interventional suite.

#### METHODS AND MATERIALS

IPEN is built on tomographic theory; wherein an object consists of homogenous regions-of-interest (ROIs) with known shapes. This makes  $N$  x-ray beams in a single projection sufficient to estimate values of  $N$  ROIs. IPEN for brain perfusion assessment comprises 3 steps: (1) create patient-specific brain ROIs from the arterial territory atlas, (2) determine head orientation with respect to XA images, and (3) estimate a dynamic time-enhancement curve (TEC) of ROIs. The proposed algorithm was evaluated by computer simulations using XCAT phantom updated for dynamic CT perfusion. Eight ischemic stroke cases were simulated, each presented thrombus occlusion in one of the 4 arteries—middle cerebral (MCA), anterior cerebral, posterior temporal, and posterior parietal. Intra-arterial contrast enhancement was simulated for each case, and bi-plane XA images were acquired. The scan was repeated 5 times. Using the XA images, IPEN was performed to estimate the TEC values. The accuracy of the estimated TEC was quantitatively assessed against the ground truth using normalized weighted root-mean-square error (RMSE) and linear correlation coefficient ( $R$ ).

#### RESULTS

Fig. A shows an XA image with a left MCA occlusion. For this case, ROI-based dynamic contrast-enhanced volumes were generated using estimated and true TEC values. Fig B and Fig C qualitatively show great agreement between the estimated and true values in different brain ROIs, both healthy and ischemic. Quantitatively, the estimated TECs had excellent agreement with the true TECs: the RMSE was as low as  $5.0\% \pm 0.6\%$ , and the  $R$  values ranged 0.85-0.95 ( $P < 0.01$ ) for 8 cases. TECs estimated showed consistent performance for different cases over multiple scans. Overall, IPEN for brain perfusion qualitatively and quantitatively shows excellent performance.

#### CONCLUSION

IPEN was performed and evaluated using XA images demonstrating its feasibility in the interventional suite. IPEN for brain perfusion successfully estimated ROI-specific TEC values with high accuracy. Using these estimated TEC, we will be able to calculate reliable brain perfusion indices.

#### CLINICAL RELEVANCE/APPLICATION

Real-time perfusion is vital to assess the risk-benefit of EVT before, and success during and after the procedure. In IPEN, using XA images provides volumetric assessment without workflow disruption.

### Automated Local Motion Detection and Characterization for X-ray CT

Monday, Nov. 27 11:00AM - 12:00PM Room: S405

Jiang J. Hsieh, PhD (*Presenter*) Former Employee, General Electric Company

#### PURPOSE

Despite major advances in technology, CT images are frequently degraded by patient motion. Motion artifacts are often localized and temporally varying. Most hospitals rely on CT operators to detect motion artifacts, and image quality is highly dependent on the operator's experience. In this paper, an automated algorithm is proposed to detect and characterize motion in local regions.

#### METHODS AND MATERIALS

We propose a data consistency metric (CM) derived during the reconstruction process. The CM takes advantage of the fact that around a small object (e.g., a blood vessel) the magnitude of the integrated intensity along a circular path for a single back-projected view is near zero. Therefore, the accumulative intensity difference (AID) is linear over views (AID is the average intensity inside an object ROI subtracting its integrated background intensity). When motion is present, the linear relationship no longer holds. The goodness of fit,  $R^2$ , of the linear regression for AID can be used to quantify the motion. CM is capable of characterizing local motions for each projection. In our previous study, CM was demonstrated for small objects with circular and oval cross-sections. In this paper, we generalize the algorithm to cover objects of arbitrary shapes by defining the object ROI as the minimum enclosing circle.

#### RESULTS

Extensive computer simulations were used to demonstrate the efficacy of the proposed approach. We simulated projections of three closed packed cylindrical objects. The combined cylinders form an irregular shaped test object. Under motion-free conditions, CM is not impacted by the presence of nominal noise [ $R^2$  values are in the range of (0.9990, 0.9997)]. When motion is present,  $R^2$  value drops to 0.710 for views with the largest deviation from its nominal position. For further confirmation, we superimposed the simulated projection on a clinical chest scan. The goal is to test the algorithm's robustness in the presence of complex patient anatomies. Consistent results were obtained and  $R^2$  value drops to 0.738 for the worst views with motion.

#### CONCLUSION

We developed a local consistency metric to detect and quantify patient motion. The proposed method detects patient motion on a view-by-view basis and characterizes motion over small local regions to address motion inhomogeneity inside patients. The algorithm is capable of generating image quality check for each CT examination and provides a useful guidance for artifact avoidance by identifying projection segments with the least motion.

#### CLINICAL RELEVANCE/APPLICATION

We present a method to automatically detect patient motion and guide the operator to minimize image artifacts. The local-motion detection allows an optimal image reconstruction for each anatomical sub-region.

### Combining Coronary CT Angiography, Quantitative Myocardial Blood Flow, and Coronary Flow Reserve Measurement with a Low-Dose Comprehensive Cardiac CT Technique - Validation Versus $^{82}\text{Rb}$ PET

Monday, Nov. 27 11:00AM - 12:00PM Room: S405

Logan Hubbard, MD, PhD (*Presenter*) Nothing to Disclose

#### PURPOSE

The ability of dynamic CT perfusion to assess quantitative myocardial blood flow (mL/min/g) and coronary flow reserve (CFR) is of clinical merit, where its tiered use with coronary CT angiography (CCTA) further improves delineation and risk stratification of focal, diffuse, and microvascular coronary artery disease. Nevertheless, current dynamic CT perfusion techniques remain limited by (1) the high radiation dose characteristic to scanning over multiple cardiac cycles (>5 mSv), and (2) the inaccuracies in myocardial blood flow measurement as compared to quantitative PET. Hence, this work validates an accurate, low-dose comprehensive cardiac CT technique that combines CCTA with a new single-volume CT perfusion approach for quantitative myocardial blood flow and CFR measurement.

#### METHODS AND MATERIALS

Eleven patients with known or suspected coronary artery disease underwent rest and stress (regadenoson 0.4mg IV) imaging with quantitative  $^{82}\text{Rb}$  PET. After which, low-dose comprehensive cardiac CT imaging was performed, consisting of a CCTA protocol, a 10-minute delay, and a subsequent single-volume stress (regadenoson 0.4mg IV) CT protocol. For both protocols, the same triphasic contrast injection (Phase 1: 0.8 mL/kg; Phase 2: 30/70% mix of 0.1 mL/kg; Phase 3: 30mL saline; 5 mL/s) was performed, followed by dynamic bolus tracking with CCTA or stress CT acquisition, respectively. The dynamic bolus tracking, CCTA, and stress CT data were then utilized by a new single-volume CT perfusion approach to derive quantitative rest flow (from the CCTA), stress flow, and CFR measurements, which were compared to corresponding  $^{82}\text{Rb}$  PET measurements through regression, Pearson's correlation ( $r$ ), Lin's concordance correlation (CCC), root-mean-square error (RMSE; accuracy), and root-mean-square deviation (RMSD; precision).

#### RESULTS

Per-vessel flow (QCT) and CFR (CFRCT) measurements were related to corresponding  $^{82}\text{Rb}$  measurements (QPET; CFRPET) by  $QCT = 0.91 QPET + 0.18$  ( $r = 0.95$ ; CCC = 0.94; RMSE = 0.25 mL/min/g; RMSD = 0.23 mL/min/g) and  $CFRCT = 0.91 CFRPET + 0.14$  ( $r = 0.78$ ; CCC = 0.76; RMSE = 0.67; RMSD = 0.66). The median effective dose of the comprehensive cardiac CT technique, consisting of CCTA, quantitative rest and stress flow, and CFR combined, was 2.73 mSv (2.28 - 2.78), while the median effective dose of  $^{82}\text{Rb}$  PET was 3.7 mSv (3.2 - 4.1 mSv).

#### CONCLUSION

Accurate, low-dose, quantitative CT myocardial blood flow and CFR measurement combined with CCTA is feasible with a new comprehensive cardiac CT technique.

#### CLINICAL RELEVANCE/APPLICATION

Combining CCTA with low-dose, quantitative CT myocardial blood flow and CFR measurement has the potential to improve delineation and risk stratification of focal, diffuse, and microvascular coronary artery disease.

### Simulating Lower-dose Exams in Whole-body Photon-counting-detector CT

Monday, Nov. 27 11:00AM - 12:00PM Room: S405

Timothy N. Winfree, BS, MS (*Presenter*) Nothing to Disclose

#### PURPOSE

To develop and validate a projection domain noise insertion algorithm to simulate lower-dose exams for photon-counting-detector (PCD) CT while avoiding the addition of pulse pileup effects.

#### METHODS AND MATERIALS

We developed a projection-domain noise insertion algorithm to simulate lower-dose exams from existing exams performed on a PCD-CT scanner (NAEOTOM Alpha, Siemens). The noise model incorporated the effects of the bowtie filter and automatic exposure control (AEC). A map of the incident number of photons  $N_0(u,v)$  at each detector pixel when no object was in the beam was quantified in terms of noise equivalent quanta (NEQ), which was calculated from the variance in the log normalized projection data of each scan for both low and high threshold energies (T1 and T2). Additionally, projection data were acquired for eight different mAs levels (10, 20, 40, 80, 160, 320, 640, 1280) at 120 kV to investigate the impact of pulse pileup on the linearity of NEQ measurement. The noise insertion algorithm was validated using a 30cm water tank and an anthropomorphic phantom. The 30cm water phantom was scanned using 120kV at 320, 160, and 80 mAs. Starting from the 320 mAs data, lower dose data at 160 mAs and 80 mAs were simulated and compared with the acquired data. Noise Power Spectra (NPS) were calculated to assess the noise texture. An anthropomorphic phantom was scanned using 120 kV at 160, 80 and 40 mAs with AEC on and lower dose data at 80 mAs and 40 mAs were simulated. Noise was measured manually every 20 slices and compared between simulated and acquired images.

#### RESULTS

NEQ profiles were linear up until 160 mAs in air scans, after which pulse pileup effects impacted the NEQ profile. To avoid propagating these effects into our noise-inserted images, we acquired the  $N_0$  profile at 20 mAs, and scaled the profile according to the actual mAs used for the scan we are inserting noise into. The NPS curves of simulated low dose images agreed well with that from measured images, differing by a maximum of 5.0%, 6.3%, 4.1%, and 6.1% for half-dose (HD) T1, HD T2, quarter-dose (QD) T1, and QD T2 images, respectively. Noise in the anthropomorphic phantom showed excellent agreement between measured and simulated images, with percent root mean square errors of 5.9%, 5.4%, 5.0%, and 4.6% for QD T1, HD T1, QD T2, and HD T2, respectively.

#### CONCLUSION

An accurate noise insertion tool was developed for PCD-CT to synthesize lower dose images from existing exams by taking into account the impact of pulse pileup.

#### CLINICAL RELEVANCE/APPLICATION

This noise insertion tool enables the generation of lower dose images from existing exams, which can be used to optimize radiation dose in scanning protocols and train deep-learning-based noise reduction algorithms for PCD-CT.

### Added Value of Contrast-enhanced Digital Mammography (CEDM) in BI-RADS 3 Lesions

Monday, Nov. 27 12:15PM - 12:45PM Room: Learning Center

Christofis Charalambous, MD (*Presenter*) Nothing to Disclose

#### **PURPOSE**

The purpose of our study is to evaluate if our cancer detection rate in our institution for BI-RADS 3 lesions was less than 2%, and to assess if our detection rate could be improved by using contrast-enhanced digital mammography (CEDM).

#### **METHODS AND MATERIALS**

A total of 473 BI-RADS 3 patients depicted on screening mammogram from 2018 to 2020 were collected from our files. All the patients consented to undergo CEDM and biopsy at their next hospital visit. Contrast enhancement intensity categorized as follows: a) Type -1: negative enhancement, b) Type 0: no enhancement c) Type 1: moderate enhancement, d) Type 2: intense enhancement and/or e) Type BE: background enhancement. Pathology results confirmed 473 lesions in total.

#### **RESULTS**

18 (3,81%) out of the 473 lesions were diagnosed as malignant. The mean age of the patients was 56,22 years. On the contrary, 455 (96,89%) lesions were benign. The mean age of these patients was 51,04. Using CEDM's technique data a total of 5 (1,95%) out of 256 lesions with Type -1 and Type 0 enhancement were diagnosed as malignant and 251 (98,05%) were benign. Additionally, a total of 13 (5,99%) out of 217 lesions with any type of enhancement were proved as malignant and 204 (94,01%) were proved as benign. Negative or no enhancement of a BI-RADS 3 lesion at CEM technique shows 1,95% possibility to be malignant, which is 1,86% better than digital mammography alone.

#### **CONCLUSION**

Our study confirms CEDM's added value in BI-RADS 3 lesions evaluation, regarding the positive impact on more accurate staging in the first categorization.

#### **CLINICAL RELEVANCE/APPLICATION**

The use of CEDM on a BI-RADS 3 lesions could potentially predict more accurately benign entities, based on their type of enhancement, and thus play a key role as first line mammography.

### **Diagnostic Accuracy of Thoracic Photon-counting Computed Tomography for Locoregional Staging of Breast Cancer: A Prospective Trial**

Monday, Nov. 27 12:15PM - 12:45PM Room: Learning Center

Jakob Neubauer, MD (*Presenter*) Nothing to Disclose

#### **PURPOSE**

The aim of this study was to demonstrate the feasibility of complementary locoregional staging of breast cancer in thoracic photon-counting CT (PC-CT) and determine diagnostic performance compared to digital mammography (DM) with MRI as the reference standard.

#### **METHODS AND MATERIALS**

This prospective clinical cohort study included patients with newly diagnosed breast cancer and indication for CT staging of the thorax over a period of 12 months. Patients underwent contrast-enhanced thoracic PC-CT (NAEOTOM Alpha, Siemens Healthineers) and breast MRI in prone position. PC-CT and DM were rated by two independent radiologists regarding the diameter of the largest mass, infiltration of cutis/pectoral muscle/ thoracic wall, number of masses, adjacent DCIS, tumor conspicuity, and diagnostic confidence in a blinded fashion. Reference standard was generated from a consensus reading of MRI by an independent adjudication committee including all histopathological/clinical data. Statistical analysis comprised calculation of Cohen's kappa, Spearman's rho, and pooled measures of diagnostic accuracy.

#### **RESULTS**

Among 32 enrolled female subjects (mean age 59 [SD 13.0]) diagnostic accuracy for T-classification (TNM8thEd.) was higher for PC-CT compared to DM (0.94 vs. 0.50;  $p < 0.01$ ) and the number of detected tumor masses were more strongly correlated with the reference standard compared to DM (0.72 vs. 0.50;  $p < 0.01$ ). Furthermore, sensitivity and specificity for DCIS were higher in PC-CT compared to DM (0.83 and 0.99 vs. 0.25 and 0.80;  $p < 0.04$ ). Average kappa values for inter-reader reliability were higher for PC-CT than DM (mean 0.88 vs. 0.54, respectively;  $p = 0.01$ ).

#### **CONCLUSION**

Locoregional breast cancer staging using contrast-enhanced thoracic PC-CT outperformed digital mammography, with significant improvements in diagnostic accuracy for T-classification, number, and pattern of tumor masses.

#### **CLINICAL RELEVANCE/APPLICATION**

Contrast-enhanced thoracic PC-CT might help provide a more accurate locoregional staging for breast cancer compared to digital mammography.

### Contrast Enhanced Mammography: Results after 10 Years of Breast Cancer Screening

Monday, Nov. 27 12:15PM - 12:45PM Room: Learning Center

Nisim Rahman, BA (*Presenter*) Nothing to Disclose

#### PURPOSE

To evaluate the efficacy of contrast-enhanced mammography (CEM) in detecting breast cancer over a ten-year period in women with intermediate breast cancer risk or dense breasts.

#### METHODS AND MATERIALS

We conducted a retrospective analysis of all CEM examinations performed for screening purposes at our institution between 2012 and 2023. Demographic data, breast density scores, background enhancement, and BI-RADS scores were extracted using rule-based natural language processing (NLP) techniques. Biopsies performed following CEM examinations and their respective pathology results were also identified. Positive CEM results were defined as BI-RADS 3-5 or 0, while negative results were BI-RADS 1-2. BI-RADS scores of CEM and low-energy images (equivalent to 2D-mammography) were compared with biopsy results and imaging follow-up.

#### RESULTS

A total of 5424 CEM screening examinations were performed between the years 2012 and 2023 in 3484 women. The mean age was 54 years, and 18.2% of women (633/3484) had family history of breast cancer. Dense breasts (BI-RADS density score C-D) were observed in 88.3% (3076/3484) of the women, and 34.2% (1193/3484) had background parenchymal enhancement at CEM. A total of 367 biopsies were performed following CEM examinations, and 42 were malignant. CEM detected all cancer cases: sensitivity 100% (42/42), specificity 79.2% (4297/5424), PPV 3.6% (42/1169), NPV 100% (4297/4297). Eight interval cancers were identified during the first-year of follow-up. Of them six with a BI-RADS 0 score at CEM and supplemental MRI recommendation, and two with BI-RADS 3 scores at CEM and six months follow-up. CEM increased the cancer detection rate beyond 2D mammography, with an incremental cancer detection rate of 4/1000 screens.

#### CONCLUSION

CEM increased breast cancer detection rate compared to 2D mammography in women with dense breasts and intermediate breast cancer risk.

#### CLINICAL RELEVANCE/APPLICATION

This ten-year screening cohort supports the implementation of CEM for breast cancer screening in specific populations, including women with intermediate breast cancer risk and dense breasts.

### Seeing through Contrast: A Dosimetric Comparison of CEM-guided Biopsy and Other Mammography-guided Procedures

Monday, Nov. 27 12:15PM - 12:45PM Room: Learning Center

Rodrigo Alcantara, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

This study aims to evaluate the average glandular dose (AGD) of contrast-enhanced mammography (CEM) guidance in comparison with other mammography-guided techniques, including digital stereotactic breast biopsy (SBB) and digital breast tomosynthesis (DBT) guidance. Additionally, we investigate the relationship between AGD and compressed breast thickness (CBT) and estimate the percentage dose due to low-energy (LE) and high-energy (HE) images for routine and interventional CEM.

#### METHODS AND MATERIALS

We performed a retrospective analysis of 163 anonymized mammography-guided interventions, comprising 43 contrast-enhanced mammography (CEM)-guided interventions, all conducted using the same upright mammography unit. Our assessment focused on the overall average glandular dose (AGD) per image acquisition and modality, as well as its dependence on breast thickness. Additionally, we evaluated the AGD differences between low-energy (LE) and high-energy (HE) acquisitions for both CEM approaches.

#### RESULTS

Our study found that the AGD for a single CEM-guided biopsy acquisition (1.48 mGy) was similar to SBB (1.49 mGy) and a single DBT scout (1.55 mGy). The AGD increased with increasing breast thickness for all modalities, with a lower slope for CEM guidance compared to other modalities. Both SBB and CEM require a similar number of images per procedure, while DBT-guided biopsy requires fewer images and offers a lower AGD range. The AGD from a CEM was similar to SBB, even inferior for higher CBT. AGD proportions between LE and HE images are relatively similar for routine and single CEM-guided biopsy image acquisition, with overall dose increase predominantly attributed to LE images across all breast thicknesses.

#### CONCLUSION

Our findings indicate that the radiation dose from CEM guidance during mammography-guided biopsies is within the range commonly achieved for conventional SBB and lower than the values obtained for standard SBB at higher compressed breast thickness. CEM guidance presents great potential to improve the visibility of suspected findings, suggesting it can be a valuable tool for breast interventionism, not only for RC-only findings but also for other indications where increased visibility is required.

#### CLINICAL RELEVANCE/APPLICATION

This study provides important dosimetric information on the safety of CEM-guided biopsy, showing that it is a comparable and effective tool for breast interventionism, with similar radiation dose to other established procedures. Our results highlight the potential benefits of CEM-guidance in improving the visibility of suspected findings and increasing diagnostic accuracy in breast imaging.

### Uncovering the Unseen: The Potential of CEM for Invasive Lobular Carcinoma Detection

Monday, Nov. 27 12:15PM - 12:45PM Room: Learning Center

Rodrigo Alcantara, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

Invasive lobular carcinoma (ILC) can be challenging to detect due to its slow-growing nature and subtle appearance. The aim of this study was to determine the lesion conspicuity using contrast-enhanced mammography (CEM) and compare the diagnostic performance of CEM and MRI. We also assessed the correlation of the overall lesion size on imaging with the final histopathological report.

#### METHODS AND MATERIALS

We retrospectively selected 94 patients with a histopathological diagnosis of ILC who had undergone preoperative CEM between January 2018 and June 2022 at the Hospital del Mar in Barcelona. We collected data on CEM indication, breast density, background parenchymal enhancement (BPE), multicentricity/multifocality, lesion location, lesion findings on low energy (LE) and recombined (RC) images, lesion conspicuity, and lesion size in LE (mm). We also performed a comparative analysis between CEM and MRI for the 59 cases that had both modalities, and verified the agreement between the measurement of lesions in CEM and the sizes in MRI and the final histologic report.

#### RESULTS

CEM sensitivity in detecting ILC was 98%, and the lesion conspicuity was high in most cases. CEM was not inferior to MRI for ILC evaluation or tumor size assessment, with a positive correlation between CEM and MRI, CEM and histopathology, and MRI and histopathology. The difference between the mean lesion size for CEM and MRI compared to the mean lesion size reported by histopathology was not statically significant.

#### CONCLUSION

Despite ongoing debate about ILC's perceived weaker enhancement on CEM compared to invasive ductal carcinoma, our results showed that CEM can be a valuable alternative to MRI for ILC evaluation, providing a safe, immediately available, and rapid assessment of tumor extent.

#### CLINICAL RELEVANCE/APPLICATION

CEM can be a useful alternative to MRI for the preoperative assessment of patients with ILC. It can also help detect potentially larger tumor sizes than initially expected and aid in making appropriate targeting decisions.

M5A-SPBR-6

### Interobserver Agreement between Breast Imagers using the First Version of the BI-RADS CEM Lexicon

Monday, Nov. 27 12:15PM - 12:45PM Room: Learning Center

Ambra Santonocito, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

The purpose of this study was to assess the interobserver agreement of the CEM lexicon, which has been introduced as a supplement to the 5th edition of the BI-RADS mammography lexicon.

#### METHODS AND MATERIALS

IRB-approved single center retrospective study. Three breast imaging fellows reviewed 295 lesions in 246 routine clinical breast CEM according to the fifth edition of the BI-RADS lexicon for Mammography and to the first version of the BI-RADS lexicon for CEM. Readers were blinded to patient outcomes, and evaluated breast and lesion features on low energy images (ACR breast density, type of findings, associated architectural distortion), lesion features in recombined images (enhancement findings, lesion conspicuity, mass shape, mass margin, mass internal pattern of enhancement, non-mass distribution, non-mass internal pattern of enhancement, enhancing asymmetry) and also provided a final BI-RADS assessment for both images (MG BI-RADS and CEM BI-RADS assessment). Interobserver agreement was calculated for each evaluated feature using kappa ( $\kappa$ ) statistics.

#### RESULTS

Interobserver agreement for ACR breast density was substantial ( $\kappa = 0.622$ ). Interobserver agreement was moderate to substantial for breast density and findings assessment on both low-energy and recombined images, especially for type of findings ( $\kappa = 0.644$ ) and for enhancement findings ( $\kappa = 0.700$ ). Regarding mass enhancement, there was moderate agreement for shape ( $\kappa = 0.571$ ) and substantial agreement for margins ( $\kappa = 0.603$ ) and internal enhancement ( $\kappa = 0.648$ ). For non-mass enhancement, there was moderate agreement on distribution ( $\kappa = 0.445$ ) and internal enhancement ( $\kappa = 0.518$ ). However, agreement was only fair for asymmetric enhancement's descriptors (homogeneous vs heterogeneous,  $\kappa = 0.313$ ) and MG and CEM BI-RADS assessment ( $\kappa = 0.379$  and  $\kappa = 0.375$ , respectively).

#### CONCLUSION

Moderate and substantial interobserver agreement were demonstrated for breast density and findings assessment on both low-energy and recombined images. There was moderate to substantial agreement on most CEM BI-RADS lesion morphology descriptors, while the agreement was only fair for the descriptors of an enhancing asymmetry.

#### CLINICAL RELEVANCE/APPLICATION

Most of CEM-BIRADS lexicon features allow for an overall high inter-reader agreement, with a lower agreement regarding the descriptors of an enhancing asymmetry and overall BI-RADS assessment.

M5A-SPBR-7

### Can Contrast-enhanced Mammography (CEM) Categorize More Accurate B3 Lesions and Reduce Unnecessary Surgical Excisions?

Monday, Nov. 27 12:15PM - 12:45PM Room: Learning Center

Christofis Charalambous, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

a) To evaluate the upgrade rates of B3 lesions to malignancy b) To assess if we can get any benefit using CEM to avoid unnecessary open surgical excisions (OSE).

#### METHODS AND MATERIALS

This is a retrospective analysis of CEM examinations that performed in our institution from 2012-2015. The analysis included a total of 1092 CEM examinations. Contrast enhancement intensity was categorized in four categories as follows: a) "-1": negative enhancement, b) "0": no enhancement c) "1": enhancement and d) "BPE": background parenchymal enhancement. In addition to the CEM procedures, 776 core needle biopsies (CNB) were performed. The analysis found that 68 patients returned 71 B3 lesions at the pathology result. As a result, an open surgical excision (OSE) was then performed.

#### RESULTS

Out of the 71 B3 lesions, 16 (22.54%) were atypical ductal hyperplasia (ADH), 2 (2.82%) were flat epithelial atypia (FEA), 14 (19.72%) were lobular neoplasia (LN), 1 (1.41%) was phyllodes tumor (PT), 33 (46.48%) were papillary lesions (PL) and 5 (7.04%) were radial scars (RS). Using CEM's results these lesions were categorized as follows: 59 (83.1%) lesions had any type of enhancement either "1" or "BPE" and 12 (16.9%) of the lesions had "0" enhancement. None of the lesions had "-1" enhancement. After OSE, 18 (25.35%) lesions upgraded their histological result to a malignancy from which 6 (33.33%) were first categorized as ADH, 1 (1.85%) as FEA, 7 (38.88%) as LN, 1 (1.85%) as PT and 3 (16.66%) as PL. None of the radial scars upgraded their histological result. From these 18 lesions, 17 (94.44%) had any type of enhancement and 1 (5.56%) had no enhancement on CEM.

#### CONCLUSION

The findings of this study support the added value of contrast-enhanced mammography (CEM) in the evaluation of B3 lesions, as it can help to categorize these lesions more accurately. Notably, the absence of enhancement in a B3 lesion on CEM has a high negative predictive value, suggesting that it could be a useful tool for reducing the need for open surgical excisions.

#### CLINICAL RELEVANCE/APPLICATION

In our institution, the use of CEM could potentially result in a 16.9% reduction in OSE

### **Pectoralis Muscle Invasion by Breast Cancer: Can Digital Breast Tomosynthesis Combined with Contrast-enhanced Mammography Improve Diagnostic Confidence**

Monday, Nov. 27 12:15PM - 12:45PM Room: Learning Center

Olena O. Weaver, MD (*Presenter*) Research Grant, General Electric Company

#### **PURPOSE**

Pectoralis muscle invasion (PMI) by breast cancer (BC) cannot be confidently diagnosed by mammography. Breast MRI is more effective but has limitations. We evaluated a combination of contrast-enhanced mammography (CEM) and digital breast tomosynthesis (DBT) under the same compression for diagnostic accuracy and reader confidence in predicting PMI.

#### **METHODS AND MATERIALS**

Prepectoral cancers (defined as masses adjacent to pectoral muscle with no intervening fat plane) were retrospectively identified in patients with DBT/CEM for BC staging at a single institution. 5 radiologists independently reviewed CEM (low energy (LE) and recombined (RC)) and DBT images of the involved breast in craniocaudal (CC) and mediolateral oblique (MLO) projections, then MRI when available, evaluated predefined radiologic signs of PMI for each image, and graded their diagnostic confidence (Table 1). The ground truth was PMI on surgical pathology (SP). For patients with unavailable SP, or in those post neoadjuvant chemotherapy (NAC) with therapy response and no PMI on SP, radiologists' consensus on muscle and/or fascia enhancement on pre-NAC MRI was used as the ground truth. Measures of diagnostic accuracy, mean radiologist confidence and radiologist agreement for each image type/modality were calculated per radiologic sign, per view and per case.

#### **RESULTS**

Of 145 patients, 9 had prepectoral masses. PMI was present in 3 and absent in 6 cases, with the ground truth based on SP in 3 and on MRI in 6 cases. The range of accuracies for LE was 0.29-0.62 for CC and 0.56-0.67 for MLO. The accuracy of RC was 0.62 for CC and 0.78 for MLO. For CC views the accuracies of LE, RC, and DBT were 0.5, 0.5-0.62, and 0.29-0.5, respectively, with an overall CC DBT/CEM accuracy of 0.62. For MLO views the accuracies of LE, RC, and DBT were 0.67, 0.56-0.78, and 0.67, respectively, with an overall MLO DBT/CEM accuracy of 0.56. Breast MRI had higher per-case diagnostic accuracy than DBT/CEM (1 vs 0.78) with muscle enhancement as the most accurate MRI sign (1.0), followed by fascia enhancement (0.86). On a scale of 1-3, mean radiologist confidence per case was 1.9 for DBT/CEM (1.8-2.3 for LE, 1.6 -2.2 for RC, and 2.1 -2.4 for DBT) with poor agreement (-0.14); vs 2.7 for MRI with moderate to substantial agreement (0.56-0.6).

#### **CONCLUSION**

MRI is superior to DBT/CEM in accuracy and radiologist agreement for PMI. RC images improve the accuracy of non-enhanced images but have the lowest radiologist confidence among all modalities. DBT has lowest accuracy but highest confidence. Absence of SP on treatment-naïve BC and use of MRI as a surrogate limits this study.

#### **CLINICAL RELEVANCE/APPLICATION**

Although RC images marginally improve the accuracy of DBT/CEM for PMI, breast MRI remains the modality of choice for evaluation of prepectoral BC.

M5A-SPBR-9

### Can the ROI of Enhancement Predict the Histopathology of a Lesion on CESM

Monday, Nov. 27 12:15PM - 12:45PM Room: Learning Center

Tamara D. Suaris, MBBS, FRCR (*Presenter*) Nothing to Disclose

#### PURPOSE

Contrast-enhanced spectral mammography (CESM) is a rapidly emerging technique for the accurate staging of breast cancer. Can the enhancement levels in CESM be used to predict histology of a lesion?

#### METHODS AND MATERIALS

A retrospective analysis of patients undergoing CESM at St Bartholomew's Hospital, between November 2020 and November 2021, was performed. All lesions confirmed by imaging guided histopathology and had CESM enhancement characteristics analysed. The degree of contrast was quantitatively assessed by measuring the region of interest (ROI) difference between the enhancing lesion and background as a ratio, on both craniocaudal (CC) and mediolateral (ML) views. Statistical analysis was performed to determine whether the percentage signal difference between enhancing lesions and background (%RS) correlated to histopathological results. The %RS calculated for the 3 histological results were compared: invasive and non-invasive cancers and benign lesions.

#### RESULTS

138 lesions were detected, consisting of 73 (52.9%) invasive cancers, 32 (23.2%) non-invasive cancers, and 32 (23.9%) benign lesions. Analysis of enhancement indices showed the following mean % RS: Invasive cancers (ML 1.64%, CC 1.51%), Non-invasive cancers (ML 0.98%, CC 1.02%), Benign lesions (ML 0.75%, CC 0.68%). The enhancement intensity of invasive cancers was significantly higher than that of non-invasive and benign lesions (in both views  $p < 0.01$ ). After the Bonferroni correction, the distribution of %RS in invasive and non-invasive cancers was statistically significant ( $p < 0.01$ , 95%CI -0.01 to 0.003). Similarly for the invasive lesions and benign lesions ( $p < 0.01$ , 95%CI 0.005 to 0.001), while the difference between non-invasive cancer and benign lesions was non statistically significant ( $p = 0.21$ , 95%CI -0.001 to 0.006).

#### CONCLUSION

There is a correlation between the degree of lesion enhancement in CESM among invasive cancers, non-invasive cancers, and benign lesions. Invasive cancers had the stronger enhancement. There is difference in the enhancement between invasive cancer and non-invasive cancers as well as invasive cancers and benign lesions. There is no difference between the non-invasive cancers and benign lesions.

#### CLINICAL RELEVANCE/APPLICATION

Quantitative analysis of enhancement levels in CESM is a feasible in the pre-operative assessment of women with breast cancer and can be used to predict histology of a lesion.

### Improving Dynamic Evaluation of Myocardial Gadolinium Concentration using Elastic Registration for T1 Mapping with Pharmacokinetics Modeling

Monday, Nov. 27 12:15PM - 12:45PM Room: Learning Center

Yasutoshi Ohta, MD, PhD (*Presenter*) Nothing to Disclose

#### PURPOSE

Developing a T1 mapping-based pharmacokinetic method to evaluate myocardial gadolinium concentration over time, and enhancing accuracy by optimizing elastic deformation registration

#### METHODS AND MATERIALS

Thirty-five subjects (66 yrs, IQR 65,76) referred for CMR examination were included in this study. In addition to routine examinations, including cine and LGE, Native T1 and dynamic T1 maps (2, 5, 9, and 15 min after contrast administration) were obtained using the MOLLI sequence. T1 maps were obtained at the base, mid, and apex of the left ventricle, and concentration maps without registration were calculated for each imaging time from the native T1map and the post-contrast T1map. Similarly, the concentration maps with elastic registration (ER) for the native T1 maps were calculated from the post-contrast maps as well. The time after contrast administration was calculated for each image in seconds from DICOM tags. Estimated myocardial concentration maps (mM/l) at each imaging time were generated from the parameters obtained from pharmacokinetic analysis using a two-compartment model for each time series concentration map with and without ER. The model fitting accuracy was evaluated by comparing the residuals with and without ER. Myocardium was extracted from each map, the measured myocardial concentration (MC) and the estimated concentration (EC) at the same post-contrast time of MC, and the mean difference ( $\Delta_{\text{mean}}$ ) and standard deviation ( $\Delta_{\text{SD}}$ ) between the MC and EC were measured. Gadolinium concentration of the blood pool was also evaluated for residuals with and without ER.

#### RESULTS

Analyzable dynamic T1 maps were obtained from all subjects. The fitting residuals in the myocardial contrast medium density analysis improved significantly from 0.746 to 0.822 by applying ER ( $p < 0.001$ ). The fitting residuals for the blood pool improved significantly from 0.848 to 0.875 by applying ER ( $p < 0.001$ ). The  $\Delta_{\text{mean}}$  with ER was significantly smaller than without ER: 2min; 0.031 vs. 0.026, 5min; -0.026 vs. -0.022, 9min; -0.025 vs. -0.022, 15min; 0.024 vs. 0.019, (without ER vs. with ER, respectively). The  $\Delta_{\text{SD}}$  was significantly reduced with ER compared to without ER at all imaging times (all; 0.05 vs. 0.03, 2min; 0.05 vs. 0.03, 5min; 0.06 vs. 0.04, 9min; 0.06 vs. 0.04 15min; 0.04 vs. 0.02mM/l) (all,  $p < 0.05$ ).

#### CONCLUSION

Employing elastic deformation registration in dynamic T1 mapping enhanced the accuracy of estimated concentrations derived from myocardial contrast medium pharmacokinetic analysis.

#### CLINICAL RELEVANCE/APPLICATION

The pharmacokinetic approach enables the creation of myocardial gadolinium concentration maps at any given time and the analysis of longitudinal properties such as contrast agent washout in myocardial tissues.

### Comparison of Myocardial Lesions by Pharmacokinetic Modeling Concentration Maps Over Time and General One-point LGE

Monday, Nov. 27 12:15PM - 12:45PM Room: Learning Center

Yasutoshi Ohta, MD, PhD (*Presenter*) Nothing to Disclose

#### PURPOSE

To investigate the feasibility of detecting myocardial lesions earlier than with conventional LGE timing, as well as to assess the temporal characteristics of these changes, utilizing gadolinium density maps generated from a pharmacokinetic model

#### METHODS AND MATERIALS

Thirty-five subjects (66 yrs, IQR 65,76) referred for CMR examination were included in this study. In addition to routine examinations, including cine and 10 minutes LGE, native T1 and dynamic T1 maps (2, 5, 9, and 15 min after contrast administration) were obtained using the modified Look-Locker inversion recovery sequence. Pharmacokinetic analysis of myocardial and blood pool gadolinium concentrations was performed using a two-compartment model, and predicted concentration maps (mmol/l) at 5, 7, 10, 15, 20, 25, and 30 minutes after contrast were generated from calculated parameters. In cases with positive LGE, the gadolinium concentration of the LGE lesion and remote myocardium, extracellular volume fraction ECV (ECV<sub>les</sub>, ECV<sub>remo</sub>) was calculated at each time point. The contrast ratio between the lesion and the remote myocardium was measured on the density map and LGE images. Changes in these indices at each time point were compared.

#### RESULTS

Hyperenhancement was observed in 20 cases in the LGE image. Lesions were detected at the same sites as LGE in all-time concentration maps. Gadolinium concentrations in the LGE area at each time were 0.48, 0.46, 0.41, 0.34, 0.27, 0.22, and 0.19, showing significant changes, respectively. Contrast concentration in remote myocardium was 0.29, 0.27, 0.24, 0.20, 0.16, 0.13, and 0.11, with significant changes each time. Contrast ratios were 0.25, 0.25, 0.26, 0.35, 0.34, 0.33, and 0.32, with significantly higher values after 15 minutes. The contrast ratio of LGE was 0.61. ECV<sub>les</sub> increased slightly over time to 43%, 45%, 46%, 47%, 47%, 48%, and 50%, but not significantly. ECV<sub>remo</sub> was 26%, 27%, 27%, 27%, 28%, 29%, and 29%, with no significant difference.

#### CONCLUSION

Though the gadolinium density map was inferior to LGE in contrast, lesions were detected at the same sites as LGE after 5 min. Lesion ECV could also be measured without significant change after 5-30 min.

#### CLINICAL RELEVANCE/APPLICATION

The evaluation with density maps can detect lesions as early as LGE after contrast and may allow evaluation of myocardial characteristics using contrast agent kinetic changes in the lesion.

### **Evaluation of Myocardial Mass Index Effect on Myocardial Function and Adverse Events in Hypertrophic Cardiomyopathic Patients with Normal Left Ventricular Ejection Fraction and Minimal Fibrosis, by Cardiac MRI Strain Analysis: A Prospective Study**

Monday, Nov. 27 12:15PM - 12:45PM Room: Learning Center

Hamid Chalian, MD (*Presenter*) Nothing to Disclose

#### **PURPOSE**

HCM patients are at risk of developing adverse cardiac events, so an effective risk stratification tool is desirable, strain value measurements by cardiac MRI are reproducible and can show subclinical myocardial deformity, which makes them a potential imaging marker to predict patient's outcome. We evaluated the pattern myocardial strain changes based on myocardial mass index by cardiac MRI in a group of HCM patients with normal left ventricular ejection fraction (LVEF) and low fibrosis.

#### **METHODS AND MATERIALS**

We evaluated cardiac magnetic resonance (CMR) and clinical data of 70 cases, including 50 HCM ( 62 % male) and 20 healthy ( 50% male) subjects. HCM cases inclusion criteria were; normal LVEF with a late gadolinium enhancement (LGE) percentage<10%, exclusion criteria were history of hypertension, valvular heart disease, infiltrative cardiac disorders, ischemic heart disease and renal impairment with estimated glomerular filtration rate (eGFR) less than 30mL/min. follow-up time is set to be 3 years, adverse events are defined as sudden cardiac death, aborted cardiopulmonary resuscitation (CPR), hospitalization because of heart failure or serious arrhythmic events. We clarified between-group differences by ANOVA and post hoc tests. Also Univariate, multivariate Cox regression and Kaplan-Meier analyses revealed the strain pattern differences between patient with favorable and unfavorable prognosis. P value<0.05 was considered significant.

#### **RESULTS**

LV global longitudinal, circumferential, and radial strains (GLS, GCS, and GRS) as well as LV myocardial mass index, were different between the control group and HCM cases (P value < 0.05). Even in HCM patients with normal myocardial mass index strain values were significantly lower than control group. A progressive decline in LVGLS, and LVGCS values were noted along with myocardial mass index increase. LVGLS, LVGCS, and LGE percentage predicted adverse events, and LVGCS was the most potent predictor of adverse events.

#### **CONCLUSION**

Increase in Myocardial mass index, independently cause myocardial contraction abnormalities evident by LV strains impairment despite normal EF and minimal myocardial scar index. CMR parameters, especially CMR feature tracking strain values, could predict adverse events in our study population.

#### **CLINICAL RELEVANCE/APPLICATION**

HCM can result in adverse cardiac events, but many patients are living an uneventful life, thus a screening method in HCM could optimize preventive approaches, strain measurement by CMR are potential imaging markers in this regard.

### **Differentiating Cardiac Amyloidosis from Hypertrophic Cardiomyopathy using Myocardial Atrial Strains Derived from Cardiac MRI**

Monday, Nov. 27 12:15PM - 12:45PM Room: Learning Center

Kentaro Ohara (*Presenter*) Nothing to Disclose

#### **PURPOSE**

Cardiac amyloidosis (CA) is a curable disease for which early diagnosis and treatment are vital. T1 mapping or late gadolinium enhancement (LGE) is a reliable method to differentiate amyloidosis from hypertrophic cardiomyopathy (HCM). However, there are several limitations to its usage, such as additional image acquisition, differences in T1 values due to equipment and facility, and the need for contrast materials for LGE. Recently, myocardial atrial and ventricular strains derived from magnetic resonance imaging (MRI) were developed to assess myocardial dysfunction in each chamber. This study aimed to evaluate the feasibility of using cardiac atrial or ventricular myocardial strains derived from MRI to differentiate CA from HCM.

#### **METHODS AND MATERIALS**

A total of 27 patients with CA and 76 patients with HCM underwent cardiac MRI; of these, 27 were identified with matched left ventricular ejection fraction (LVEF). The left ventricular strain (LVS), left atrial strain (LAS), right ventricular strain (RVS), and right atrial strain (RAS) were calculated from 4-chamber cine MRI images using a dedicated workstation. The diagnostic performance of CA for HCM was compared using receiver operating characteristic analysis.

#### **RESULTS**

LAS (CA:9.7%, HCM: 15%), RVS (CA:13.1%, HCM: 16%), and RAS (CA:10.4%, HCM: 20%) were significantly lower in the CA group than in the HCM group ( $P < 0.05$ ), whereas LVS showed no significant difference between the two groups (CA, 11%; HCM, 12.4%) ( $P = 0.21$ ). The areas under the curves were LVS, 0.60; LAS, 0.74; RVS, 0.68; and RAS, 0.82. The RAS and LAS showed significantly higher diagnostic performance than the LVS ( $P < 0.05$ ).

#### **CONCLUSION**

Myocardial atrial strain derived from MRI can differentiate CA from HCM with high diagnostic performance. Moreover, it reflects the pathophysiological differences between the two.

#### **CLINICAL RELEVANCE/APPLICATION**

The myocardial atrial strain derived from MRI does not require additional image acquisition or contrast administration. This simple and convenient method could be used to diagnose cardiac amyloidosis.

### Multimodal Imaging using FDG PET/MR and Adenosine Stress NH<sub>3</sub> PET was Used to Study Patients with Hypertrophic Cardiomyopathy

Monday, Nov. 27 12:15PM - 12:45PM Room: Learning Center

Eun-Jung Kong, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

Previous studies of FDG PET in HCM are lacking, but this modality can explain the inflammatory process that precedes myocardial fibrosis. The aim of the study was to compare regional inflammation by FDG uptake, fibrosis by LGE MRI, and microvascular dysfunction by adenosine stress NH<sub>3</sub> PET in patients with HCM.

#### METHODS AND MATERIALS

Between Jan 2016 and Apr 2018, a total of 25 patients were included in the retrospective study. FDG PET and MRI were simultaneously acquired using an integrated PET/MR scanner, and patients were prepared with a low carbohydrate diet to suppress physiologic myocardial uptake. FDG PET and LGE were analyzed using a 17-segment model, and myocardial flow was analyzed using commercial software (4DM) and compared with FDG PET and LGE.

#### RESULTS

Four patients were excluded due to improper physiologic myocardial suppression (n=1) or combined ischemic heart disease (n=3), leaving 21 patients (16 males, age 59±15 years) in the final analysis. All 21 patients showed abnormal FDG uptake (6.8±3.7 segments) and 20 patients showed LGE (5.7±3.1 segments). Mean stress myocardial blood flow was 1.89±0.59 mL/min/g. FDG uptake and LGE were observed in hypertrophic myocardium and, in some patients, in non-hypertrophic myocardium. Hypertrophic myocardium showed decreased stress myocardial flow compared with non-hypertrophic myocardium. Increased FDG uptake was related to LGE ( $\rho=0.805$ ,  $p<0.001$ ). Of the total 357 segments analyzed, 83.8% showed matched results (102 segments were both positive and 197 segments were both negative). Increased FDG uptake was also related to decreased stress flow ( $\rho=-0.512$ ,  $p=0.043$ ).

#### CONCLUSION

The study found that evaluation of HCM with FDG PET/MR and stress NH<sub>3</sub> PET was useful in evaluating inflammatory changes, fibrosis, and ischemic severity, to explain pathophysiology and to understand disease status. The study also newly found that FDG PET has a correlation with LGE and ischemia, which are known as poor prognostic factors

#### CLINICAL RELEVANCE/APPLICATION

The study also newly found that FDG PET has a correlation with LGE and ischemia, which are known as poor prognostic factors

### Imaging Features in Female Patients with Wild-type Transthyretin Amyloidosis Cardiomyopathy

Monday, Nov. 27 12:15PM - 12:45PM Room: Learning Center

Seitaro Oda, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

Wild-type transthyretin amyloid cardiomyopathy (ATTRwt-CM) is significantly male-dominated, but there are also female patients. However, sex-related differences in ATTRwt-CM remain unclear. This study aimed to assess imaging features in female patients with ATTRwt-CM.

#### METHODS AND MATERIALS

We retrospectively analyzed 106 consecutive patients who were diagnosed with ATTRwt-CM and evaluated sex-related differences in the imaging features including cardiac MRI and 99mTc-labeled pyrophosphate scintigraphy (99mTc-PYP).

#### RESULTS

Twelve patients (11.3%) were female. These female patients were significantly older at diagnosis ( $75.3 \pm 6.3$  years vs.  $80.6 \pm 4.4$  years;  $p < 0.01$ ). Cardiac MRI-measured left ventricular end-systolic volume was significantly lower ( $44.3 \pm 23.8$  ml vs.  $31.1 \pm 29.3$  ml;  $p < 0.05$ ) and the ejection fraction was significantly higher ( $51.6 \pm 14.1$  % vs.  $62.0 \pm 21.0$  %;  $p < 0.05$ ) in female patients. There was no significant gender difference in left ventricular mass ( $138.4 \pm 48.7$  g vs.  $115.0 \pm 75.7$  g;  $p = 0.26$ ). In T1 mapping, there was no significant difference in native T1 ( $1420.3 \pm 54.0$  ms vs.  $1427.3 \pm 77.5$  ms;  $p = 0.76$ ), but extracellular volume fraction (ECV) was significantly lower ( $56.6 \pm 13.3$  % vs.  $49.4 \pm 15.7$  %;  $p < 0.05$ ) in female patients. No significant difference in myocardial T2 value ( $51.0 \pm 4.5$  ms vs.  $51.0 \pm 3.0$  ms;  $p = 0.97$ ). The mean heart-to-contralateral ratio obtained using 99mTc-PYP was significantly lower in female patients ( $1.95 \pm 0.39$  vs.  $1.63 \pm 0.24$ ;  $p < 0.01$ ).

#### CONCLUSION

Female patients with ATTRwt-CM were predominantly older and had preserved left ventricular ejection fraction, weaker cardiac uptake of the 99mTc-PYP, and lower ECV value compared with male patients. These imaging features may contribute to the underdiagnosis of ATTRwt-CM in female patients.

#### CLINICAL RELEVANCE/APPLICATION

Female patients with ATTRwt-CM have different imaging features than the male counterparts, and we need to recognize these imaging features to avoid underdiagnosing it.

### Multimodal Classification Model for Gram-Positive and Gram-Negative Bacterial Pneumonia using Imaging and Clinical Features: Improving Antibiotic Treatment Decisions

Monday, Nov. 27 12:15PM - 12:45PM Room: Learning Center

Ru Wen (*Presenter*) Nothing to Disclose

#### PURPOSE

This study aimed to develop and validate a classification model that combines imaging features and clinical characteristics to accurately identify patients with Gram-positive and Gram-negative bacterial pneumonia, assisting clinical physicians in empirical antibiotic treatment.

#### METHODS AND MATERIALS

The study included patients with bacterial pneumonia who sought medical care at a tertiary hospital in China between 2010 and 2020. The patients were randomly divided into a training set and a validation set in an 8:2 ratio. The ResNet-18 model was used as the base model, and 512 features were extracted from the maximum lesion layer as deep features. Spearman correlation and mutual information were employed for dimensionality reduction, and the XGBoost model was utilized to construct the imaging model. The GBM model served as the classifier for establishing the clinical model. A logistic regression algorithm was employed to construct an imaging-clinical fusion model based on the individual scores of the imaging model and the clinical model. The classification performance of the clinical model, imaging model, and fusion model was compared using the DeLong test.

#### RESULTS

This study included data from 2423 patients with bacterial pneumonia. Among them, 563 cases were Gram-positive bacterial pneumonia, and 1860 cases were Gram-negative bacterial pneumonia. The imaging model and clinical model had AUCs of 0.719 and 0.827, respectively, in the test set. The fusion model achieved an AUC of 0.884 (95% CI: 0.868-0.898), sensitivity of 0.772, specificity of 0.822, and accuracy of 0.808 in the test set. The DeLong test results demonstrated that the performance of the fusion model was slightly higher than that of the individual imaging or clinical models ( $P < 0.05$ ). Nomogram results of the fusion model showed that clinical scores had the highest weight, and the fusion model exhibited good consistency between predicted probability and expected probability. Decision curve analysis (DCA) confirmed that the fusion model performed well in classifying bacterial pneumonia across most threshold probabilities.

#### CONCLUSION

In this study, we integrated multimodal data including imaging, laboratory tests, and clinical signs to classify gram-positive and gram-negative bacterial pneumonia. Our research demonstrates that the fusion of multiple modalities enhances the classification performance of the model.

#### CLINICAL RELEVANCE/APPLICATION

The fusion model we have developed enables accurate classification of bacterial pneumonia in patients based on CT images, laboratory tests, and clinical signs. It holds significant clinical value in avoiding unnecessary antibiotic usage and provides timely information for guiding clinical decisions and improving patient prognosis.

### Differentiating Imaging Features of Post Lobectomy Right Middle Lobe Torsion

Monday, Nov. 27 12:15PM - 12:45PM Room: Learning Center

Farah Tamizuddin, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

To identify differences in imaging features between patients with confirmed right middle lobe (RML) torsion compared to those with suspected RML torsion who did not have torsion.

#### METHODS AND MATERIALS

This retrospective study entailed a search of radiology reports from April 1, 2014 to April 15, 2021, yielding 52 patients with suspected torsion on imaging but ultimately no lobar torsion and 4 with confirmed torsion. This cohort was supplemented by 2 cases identified prior to the search period for a total of 6 confirmed RML torsion cases. Four thoracic radiologists including an adjudicator evaluated chest radiographs (CXR) and computed tomography (CT) exams for multiple imaging signs and features. A resident measured the angle between the RML bronchus and bronchus intermedius on coronal reformats of any CTs performed to exclude or confirm torsion for these patients. Fisher exact and Mann-Whitney tests were used to identify any significant differences in imaging features ( $P < .05$ ).

#### RESULTS

A reversed halo sign was more frequently seen in patients with confirmed torsion ( $P = .001$ ) compared to non-torsion patients (83.3% vs. 0% for 3 readers, including the adjudicator). Torsion patients had a higher percentage of ground-glass opacity (GGO) in the affected lobe compared to non-torsion patients (21.7% vs 13.9% for the adjudicator,  $P = .031$ ). The CT Coronal Bronchial Angle between RML bronchus and bronchus intermedius was larger ( $P = .035$ ) in torsion than non-torsion cases ( $121.3^\circ$  vs  $98.3^\circ$ ). A convex fissure towards the adjacent lobe on CT was more frequent in torsion patients (100% vs 27.3% for the adjudicator,  $P = .009$ ) and increased lobe volume on CT ( $P = .001$ ) occurred more often in confirmed torsion.

#### CONCLUSION

A reversed halo sign, greater proportion of GGO in the affected lobe, larger CT Coronal Bronchial Angle, fissural convexity, and larger lobe volume on CT may aid in early recognition of the rare yet highly significant diagnosis of lobar torsion.

#### CLINICAL RELEVANCE/APPLICATION

This paper is clinically relevant because RML torsion is a potentially life-threatening diagnosis and awareness of imaging signs and features associated with this diagnosis can aid radiologists in suggesting RML torsion earlier and more accurately, thus expediting patient care and optimizing patient outcomes.

### Frogspawn Sign: Special CT Features for the Diagnosis of Pulmonary Lymphatic Reflux Diseases

Monday, Nov. 27 12:15PM - 12:45PM Room: Learning Center

Qi Hao (*Presenter*) Nothing to Disclose

#### PURPOSE

The purpose of this study was to evaluate the value and the morphologic characteristics of the so-called "frogspawn sign" on high-resolution CT as the special CT feature for the diagnosis of pulmonary lymphedema and lymphatic dilatation caused by pulmonary lymphatic reflux diseases (PLRD). This sign has not been reported in the literature by our knowledge.

#### METHODS AND MATERIALS

We collected 580 patients with clinical and operative proven PLRD in the study, of which 86 cases had frogspawn sign on HRCT and MSCT lymphography. The imaging features of frogspawn sign were retrospectively reviewed by two chest radiologists who reached decisions by consensus. All patients were followed up for HRCT within 3-6 months.

#### RESULTS

The frogspawn sign was seen in 86 (15%) of 580 patients with PLRD, which consisted of diffuse inhomogeneous ground-glass opacity (GGO) with superimposed multiple discontinuous small nodules. The diffuse GGO showed bilateral asymmetrical (100%) and peripheral subpleural or peribronchovascular (14/86, 16%) distribution with predominance in the right middle or lower lung zone. The multiple small nodules appeared round-like or tree-in-bud (22/86, 26%) with 3-6mm in size, central or intrapleural distribution and no continuity or fusion between nodules and nodule-pleura. The spatial distance between the nodules is about 2-4mm. A dynamic changes of this sign was showed in all patients with obvious improvement (32/86, 37%) and aggravation (54/86, 64%) on the follow-up CT.

#### CONCLUSION

The frogspawn sign strongly favors a diagnosis of pulmonary lymphedema and lymphatic dilatation caused by PLRD. This sign is very important for judging the degree of lymphedema and the clinical stage.

#### CLINICAL RELEVANCE/APPLICATION

Pulmonary lymphatic reflux abnormalities are rare disorders characterized by developmental malformation of the bronchial-mediastinal lymph trunk and/or thoracic duct outlet anomaly. The frogspawn sign consisted of diffuse inhomogeneous ground-glass opacity (GGO) with superimposed multiple discontinuous small nodules and strongly favors a diagnosis of pulmonary lymphedema and lymphatic dilatation caused by PLRD.

### Exploring the Biological Significance of a Robust Radiomic Biomarker of Tumor Heterogeneity in Advanced Non-small Cell Lung Cancer Patients Treated with First-line Immunotherapy

Monday, Nov. 27 12:15PM - 12:45PM Room: Learning Center

Andrew W. Chen, BS, PhD (*Presenter*) Nothing to Disclose

#### PURPOSE

Tumor PD-L1 expression, the accepted predictive biomarker for pembrolizumab (PEMBRO) immunotherapy, is imperfect. We hypothesize that radiomic features, essentially high-throughput descriptors of tumor heterogeneity, can characterize molecular and histopathological tumor subtypes *in vivo*, and enable precision therapy selection.

#### METHODS AND MATERIALS

After IRB approval, a single-center retrospective analysis of pre-treatment CT for stage 4 NSCLC patients (n=342) treated with 1st-line PEMBRO-based therapy Region of interest (ROI) segmentation was performed with ITK-SNAP. Feature extraction on ROIs was performed with the CaPTk toolkit. OPNested Combat mitigated radiomic feature heterogeneity due to differences in contrast enhancement, kernel resolution, and voxel spacing. Clinical variable categories, age, sex, race, ECOG, BMI, smoking status, and tumor histology, were protected during harmonization to prevent removal. Principal component (PC) analysis reduced harmonized feature dimensionality; the first PC was taken as a radiomic signature for histological subtypes (adenocarcinoma, squamous cell, other) and tumor differentiation, using a linear support vector machine (SVM) classifier. For a subset (n=234), a radiomic signature characterized tumor differentiation subtypes (well, moderate, poor). The statistical significance of the radiomic signature's Spearman correlation coefficient (c) for genomic mutational expression categories (negative, positive, unknown) of NSCLC relevant-genes (EGFR, BRAF, ALK, ROS, MET, HER2) and tumor expression of PDL1 was also assessed.

#### RESULTS

The radiomic signature performed patient classification of histological subtype with an accuracy of 81.5% (AUC-0.59), and of tumor differentiation subtypes with an accuracy of 82.3% (AUC-0.62). Statistically significant correlations ( $p < 0.05$ ) were found between the radiomic signature and the following genomic mutational expression categories: ALK (c: 0.88), EGFR (c: 0.87) and ROS (c: 0.62).

#### CONCLUSION

The radiomic signature was shown to have correlations with genes relevant to NSCLC tumor progression and was able to identify tumor subtypes based on their molecular and histopathological characteristics, indicating its biological significance. Our future work involves building a multi-omic predictor (combining radiomic, genomic and clinical information) of progression-free survival to study patient response to PEMBRO-based therapy.

#### CLINICAL RELEVANCE/APPLICATION

The radiomic signature correlated significantly with NSCLC-related genes and identified tumor sub-types based on molecular and histological characteristics. These results help us better understand the biological meaning of radiomic descriptors.

### Lung Cancer Risk Using Never Smokers' Chest X-Rays: Validation of a Deep Learning-based Model

Monday, Nov. 27 12:15PM - 12:45PM Room: Learning Center

Anika Walia (*Presenter*) Nothing to Disclose

#### PURPOSE

Lung cancer is the most common cause of cancer death. In the United States, 10-20% of lung cancers occur in "never-smokers" - those who never smoked cigarettes or smoked fewer than 100 cigarettes in their lifetime. Centers for Medicare and Medicaid Services (CMS) lung cancer screening criteria do not recommend screening never-smokers; however, never-smokers often present with more advanced lung cancer than those who smoke. In this study, we tested whether a deep learning model CXR-Lung-Risk could identify never-smokers at high risk for lung cancer using chest x-rays (CXRs) from the electronic medical record.

#### METHODS AND MATERIALS

The CXR-Lung-Risk model was developed using 147,497 CXRs of 40,643 asymptomatic smokers and never-smokers from the Prostate, Lung, Colorectal, and Ovarian (PLCO) cancer screening trial to predict lung-related mortality risk based on a single CXR image as input. In this study, we externally validated the model in a separate cohort of never-smokers having routine outpatient CXR from 2013-2014. The primary outcome was 6-year incident lung cancer, identified using International Classification of Disease (ICD) codes. Continuous CXR-Lung-Risk scores were converted to low, moderate, and high-risk groups based on externally derived risk thresholds.

#### RESULTS

Of 24,333 patients (mean age  $63.4 \pm 8.21$  years; 44.3% male; 18,880 (80.5%) White, 1,789 (7.6%) Black, 789 (3.7%) Hispanic) included in the study, 32% (7774/24,333) were deemed high risk by CXR-Lung-Risk. 2.5% of the total cohort (616/24,333) developed lung cancer over 6 years of follow-up. CXR-Lung-Risk groups had a graded association with lung cancer risk, with 1.4% (37/2663) in the low-risk group (CXR-Lung-Risk <45), 2.2% (306/13896) in the moderate-risk group (45 < CXR-Lung-Risk < 55), and 3.5% (273/7774) in the high-risk group (CXR-Lung-Risk > 55). After adjusting for age, sex, race, previous lower respiratory tract infection, and prevalent COPD, there was still a 2.1 (95% CI [1.4,3.1];  $p < 0.001$ ) times greater risk of developing lung cancer in the high-risk group compared to low risk.

#### CONCLUSION

Using routine CXRs from the EMR, CXR-Lung-Risk identified never-smokers at high risk of lung cancer, a group in which lung cancer rates are increasing.

#### CLINICAL RELEVANCE/APPLICATION

CXR-Lung-Risk identified never-smokers at high risk of lung cancer, well above the >1.3% 6-year risk threshold where lung cancer screening CT is recommended by National Comprehensive Cancer Network guidelines.

### Feasibility of Extracellular Volume Fraction Measurement Derived from the Equilibrium Phase Dual-energy CT for Predicting Pathological Grades of Lung Cancer

Monday, Nov. 27 12:15PM - 12:45PM Room: Learning Center

Hiroaki Nagano, MD, PhD (*Presenter*) Nothing to Disclose

#### PURPOSE

To assess the diagnostic feasibility of extracellular volume (ECV) fraction measurement using the equilibrium phase dual-energy CT (DECT) for predicting the pathological grade of lung cancer.

#### METHODS AND MATERIALS

This study included 110 patients with lung cancer who underwent preoperative DECT examination and surgical resection. These patients were divided into a low-grade group (G1 and G2) and a high-grade group (G3 and G4) based on their histopathological differentiation. Iodine concentration (IC) and effective atomic number ( $Z_{\text{eff}}$ ) were measured using the equilibrium phases DECT, and ECV fraction was calculated based on IC of the lung cancer and the aorta. DECT parameters and ECV fraction were compared between the pathological grade groups using the Mann-Whitney U test. Receiver-operating characteristic (ROC) curve analysis was performed to evaluate the ability of IC,  $Z_{\text{eff}}$  and ECV fraction to diagnose a high-grade pathological group of lung cancer.

#### RESULTS

IC and  $Z_{\text{eff}}$  during the equilibrium phase and ECV fraction were significantly higher in the low-grade group than in the high-grade group (2.27mg/mL vs. 1.85mg/mL,  $p=0.006$ ; 8.46 vs. 8.29,  $p=0.012$ ; 45.2% vs. 35.0%,  $p<0.001$ ; respectively). The area under the ROC curve values of IC and  $Z_{\text{eff}}$  during the equilibrium phase and of ECV fraction to differentiate high-grade cancers from low-grade cancers were 0.688 (optimal cutoff, 1.80mg/mL; sensitivity, 60.9%; specificity, 73.6%), 0.672 (optimal cutoff, 8.43; sensitivity, 78.3%; specificity, 51.7%) and 0.750 (optimal cutoff, 30.9%; sensitivity, 47.8%; specificity, 94.3%), respectively.

#### CONCLUSION

IC,  $Z_{\text{eff}}$  and ECV fraction measurement using DECT can help predict the pathological grade of lung cancers. ECV fraction showed the best diagnostic performance.

#### CLINICAL RELEVANCE/APPLICATION

ECV fraction derived from the equilibrium phase dual-energy CT provides useful information to predict the pathological grades of lung cancers.

M5A-SPCH-8

### Impact of Duration of Diagnostic Workup on Prognosis for Early Lung Cancer: Validation using the NLST and IASLC Databases

Monday, Nov. 27 12:15PM - 12:45PM Room: Learning Center

Rowena Yip, PhD, MPH (*Presenter*) Nothing to Disclose

#### PURPOSE

Impact on prognosis of early stage lung cancer due to time delay for follow-up has been quantified in our previous publication using the I-ELCAP database. Here, our goal is to validate our published findings using two independent databases, the National Lung Screening Trial (NLST) and the International Association for the Study of Lung Cancer (IASLC).

#### METHODS AND MATERIALS

Using data collected from the CT arm of the NLST randomized trial (2002-2009) and the IASLC Lung Cancer Staging Project (1999-2010), we determined the size specific 5-year lung cancer (LC)-specific and overall survival rates as surrogates for cure rates. We estimated the change in LC diameter after delays of 90-, 180-, and 365-days using three representative LC volume doubling times (VDTs) of 60(fast), 120(moderate), and 240(slow). We then estimated the decrease in the lung cancer (LC) cure rate resulting from time between CT scans to assess for growth during the diagnostic workup.

#### RESULTS

Using the NLST data for a regression model of the 5-year LC survival rates on LC diameter, the estimated LC cure rate of a 4.0 mm LC with fast (60-day) VDT is 97.4%(95% CI: 97.1%-97.8%) initially, but it would decrease to 96.4%(95% CI: 95.9%-96.8%), 94.9%(95% CI: 94.2%-95.6%) and 89.6%(95% CI: 88.2%-89.6%) after delays of 90, 180, and 365 days, respectively. A 20.0 mm LC with the same VDTs has an initial lower LC cure rate of 87.2%(95% CI: 85.5%-88.9%) initially, and decreases more rapidly to 81.9%(95% CI: 79.4%-84.3%), 74.4%(95%CI:70.9%-77.9%) and 47.8%(95% CI: 40.7%-54.8%) after the same delays of 90, 180, and 365 days. Using the IASLC data for a regression model of the 5-year overall survival rates on LC diameter shows a similar trend.

#### CONCLUSION

Although the average tumor size was larger in these two databases, the average change in LC cure rate per unit increase in tumor size was comparable to our previous results. These findings support our earlier research indicating that the interval between scans required to evaluate the growth of lung nodules has a significant impact on prognosis, particularly for fast-growing and larger cancers. To determine the effectiveness of various management protocols, it is essential to quantify the degree of change in prognosis results caused by this delay.

#### CLINICAL RELEVANCE/APPLICATION

Timely follow-up is crucial for management of lung nodules. Our study shows that delays in CT scans have a significant impact on prognosis, emphasizing the need to quantify this effect for better management protocols.

### **Multicentre Randomised Controlled Trial to Assess the Impact of Online Training on the Diagnostic Performance of Emergency Department Clinicians in Interpreting CT Head Images: The Simulation Training for Emergency Department Imaging 2 (STEDI2) Trial**

Monday, Nov. 27 12:15PM - 12:45PM Room: Learning Center

Alex Novak (*Presenter*) Nothing to Disclose

#### **PURPOSE**

Delays in reporting of CT scans can impair patient flow in the Emergency Department (ED). Artificial Intelligence led applications are being evaluated to enable ED physicians to interpret CT Head scans, but their baseline interpretation capability is currently unknown. Here we present preliminary results for a trial to measure the accuracy of ED clinicians in interpreting CT head images, determine the impact of an online training simulation, and estimate potential impacts of clinician-led CT head interpretation on patient flow within the Emergency Department

#### **METHODS AND MATERIALS**

A multicentre NIHR Portfolio randomised controlled trial (CPMS: 52221, Clinicaltrials.gov: NCT05427838, ISRCTN: 41484, REC reference: 22/HRA/0743) was undertaken across 6 UK hospitals. Emergency medicine clinicians undertook a blinded baseline online assessment of accuracy in interpreting a dataset of 50 CT Head scans. After completing the baseline assessment, participants were offered an online training package on CT head interpretation, then repeated the assessment and recorded interpretation of up to 30 prospective clinical cases with further assessments repeated at 3 and 6 months. Training and assessment were delivered using the online platform [www.raiqc.com](http://www.raiqc.com). The primary outcome was measured changes in reporting accuracy/sensitivity/specificity as calculated in a pooled analysis. Subgroup analyses included diagnostic performance stratified by clinical role, level of seniority, pathological finding. For prospective clinical interpretations times participant and radiology reporting were recorded and compared.

#### **RESULTS**

From April 2022 until September 2023 206 participants undertook the study. Overall, there was a significant increase in participants' sensitivity (73.3% to 83%) and specificity (65.8% to 89.1%) in detecting the presence of an acute abnormality on the online assessment scans, with a similar increase seen across all pathology subgroups. Overall diagnostic performance for acute abnormality detection remained elevated compared to baseline at six months post training (sensitivity 80.6%, specificity 79.1%).

#### **CONCLUSION**

Online training can be used to significantly improve ED clinicians' ability to interpret CT Head scans.

#### **CLINICAL RELEVANCE/APPLICATION**

Our results demonstrate that dedicated online training can significantly improve the image interpretation accuracy of ED clinicians. Provision of a web-based self-directed simulation-based learning platform is a scalable way of delivering this training to departments with a high staff turnover. Further detailed analysis is ongoing and will provide a detailed basis for comparison with other forthcoming interventions such as AI-assisted image interpretation of CT head scans.

### Inter-modality Data Augmentation and Multi-view Reconstructions from CT to Radiography for the Detection of C-Spine Fractures

Monday, Nov. 27 12:15PM - 12:45PM Room: Learning Center

Duncan Ferguson, MD,BSC (*Presenter*) Nothing to Disclose

#### PURPOSE

Cervical spine fractures are a significant cause of morbidity and mortality worldwide. While ACR appropriateness criteria recommend the use of CT over X-ray, access to imaging can be limited in rural areas. The difference in sensitivity between CT and XR has been shown to be 100% and 63% respectively. Delayed diagnosis of C-spine fractures may lead to adverse outcomes. The goal of this project is to develop a model that can be used in areas where there are significant barriers to acquiring CT C-spines. Our objectives are as follows: To develop a method of reconstructing radiographs from CT To train a convolutional neural network using the reconstructed radiographs to detect C-spine fractures, using single and multiple views To assess the use of reconstructed radiographs as a method of data augmentation To test the model on real radiographs on a model trained on reconstructions.

#### METHODS AND MATERIALS

233 non-contrast CT C-spine studies with fracture labels were collected from a publicly available dataset. The dataset was divided into a training/validation (183) and test set (50). Sagittal, coronal, and oblique Average Intensity Projections (AvIPs) were created at a window width and level of 950/400. The EfficientNet V2-S model with pretrained weights was used as the initial model. A single channel model was trained and tested using sagittal AvIPs. Next, oblique AvIPs were added to the training set and the model re-trained. A multichannel model was trained and tested using sagittal and coronal AvIPs. A training and validation set was created using 5-fold cross validation for training of all models. 188 C-spine radiographs with fracture labels from a publicly available dataset were also used to test the two single channel models. The AUROC was plotted and Youden index used to determine the best threshold for prediction. Accuracy, specificity, and sensitivity were calculated for each model.

#### RESULTS

There is improved AUROC with oblique data augmentation using both AvIPs (from 0.60 to 0.65) and true radiographs (0.77 to 0.79) as the test set. Sens/Spec of 0.78/0.70 on true radiographs using the augmented model. The multichannel model performed better than the single channel augmented model (AUROC 0.73)

#### CONCLUSION

Inter-modality augmentation is possible to create a fair C-spine fracture model using 233 CTs. Multichannel model training can be used to optimize radiograph protocols to detect pathology.

#### CLINICAL RELEVANCE/APPLICATION

With improvement, an application in rural communities may result in expedited fracture detection. As well, an inter-modality data augmentation technique would assure preservation of labelling and be a valuable tool to enhance datasets.

### Evaluation of Contrast Enhanced Photon Counting Computed Tomography Performed in the Inpatient Setting

Monday, Nov. 27 12:15PM - 12:45PM Room: Learning Center

Benjamin G. Steyer, MD, PhD (*Presenter*) Nothing to Disclose

#### PURPOSE

Prior work demonstrating the benefits of photon-counting computed tomography (PCCT) has been performed in controlled research or selective outpatient settings. Given high capital costs of this technology, many scanners will serve general purpose, including application in inpatient settings. Here, we evaluate the performance of a clinical PCCT scanner employed in routine inpatient enhanced abdomen and pelvis imaging and directly compare image quality, image contrast and radiation dose to that of a prior state of the art dual energy CT (DECT) scanner.

#### METHODS AND MATERIALS

In this institutional review board-approved retrospective study, we identified patients ( $n = 35$ ) who had undergone a routine contrast enhanced CT of the abdomen and pelvis on a clinical PCCT scanner (NAEOTOM Alpha, Siemens Healthineers) and who had also undergone a DECT (SOMATOM Force, Siemens Healthineers) within twelve months. The following patient and scan characteristics were recorded: BMI, radiation dose (CTDI<sub>vol</sub>) and contrast volume. For quantitative comparison, we calculated contrast to noise ratio (CNR) and signal to noise ratio (SNR) for organ parenchyma as well as the great vessels for both PCCT and DECT exams.

#### RESULTS

Average BMI of patients undergoing contrast enhanced PCCT was 25.9 (range: 17.1 to 54.7). Average time between contrast enhanced PCCT and DECT was 42 days (range: 4 to 204 days). We observed a 9% decrease in scan dose (CTDI<sub>vol</sub>) in PCCT compared to DECT, 8.7 versus 9.8 mGy respectively ( $p=0.03$ ). Despite reduced dose, calculated CNR and SNR were significantly increased on PCCT versus DECT across all evaluated anatomic structures with the exception of liver, where no significant difference in SNR was observed.

#### CONCLUSION

Our real-world comparison of inpatient contrast enhanced abdomen and pelvis studies on PCCT and DECT indicates decreased radiation exposure (CTDI<sub>vol</sub>) can be achieved on clinical PCCT with increased quantitative metrics of image quality (CNR and SNR). Future planned analysis will focus on rigorous comparison of qualitative and quantitative metrics of image quality utilizing direct comparison of spectral data from both PCCT and DECT.

#### CLINICAL RELEVANCE/APPLICATION

In routine inpatient application, PCCT can provide quantitatively improved image quality compared to DECT at a reduced radiation dose.

### Low Dose Whole-liver CT Perfusion in Evaluating Residual Viable Tumor Tissue of Hepatocellular Carcinoma after Transcatheter Arterial Chemoembolization

Monday, Nov. 27 12:15PM - 12:45PM Room: Learning Center

Liqin Zhao, MD (*Presenter*) Nothing to Disclose

#### **PURPOSE**

To investigate the value of low dose whole liver CT perfusion (CTP) in evaluating the hemodynamics of residual viable tumor tissue of hepatocellular carcinoma (HCC) treated with transcatheter arterial chemoembolization (TACE).

#### **METHODS AND MATERIALS**

HCC patients treated with TACE were prospectively collected. All patients underwent low dose whole liver perfusion CT examination 4-6 weeks after TACE. Thirty HCC cases with residual tumor viable tissue were selected. The hepatic arterial fraction (HAF, %), capillary surface permeability (PS, ml/min/100g), blood volume (BV, ml/100g) and time to peak (TTP, s) of necrotic tissue (T1), residual viable tumor tissue (T2) and background liver tissue (T3) were obtained using liver tumor perfusion software. Univariate Wilcoxon signed rank was used for the comparison of the above parameters between T2 and T1, T3 groups.

#### **RESULTS**

35 HCC lesions with residual viable tumor tissue were found. The HAF, PS and BV of T2 were higher than those of T1 and T3 ( $P < 0.05$ ); there was no significant difference in TTP between T2 and T1 and T3 ( $P > 0.05$ ).

#### **CONCLUSION**

Low dose whole liver perfusion CT could reflect the hemodynamics of residual viable tumor tissue of HCC treated with TACE.

#### **CLINICAL RELEVANCE/APPLICATION**

It could provide valuable information for the selection of further treatment protocol for HCC patients.

### **DECT and MRI Indicators for Assessing Iron Overload and the Effectiveness of Iron Overload Therapy in Patients with Primary and Secondary Hemochromatosis**

Monday, Nov. 27 12:15PM - 12:45PM Room: Learning Center

Anna M. Titova, MD (*Presenter*) Nothing to Disclose

#### **PURPOSE**

Evaluation of MRI, CT parameters after chelation and hemoexfusion therapy in patients with iron overload, identification of the prognostic value of CT indicators in the assessment of moderate and severe iron overload.

#### **METHODS AND MATERIALS**

The design of the study is prospective. The study included the liver scans of 43 patients with hereditary hemochromatosis (HH), secondary transfusion-dependent hemochromatosis (TDH) receiving regular hemotransfusions, iron chelators. We evaluated age, frequency of hemotransfusions, chelating drug used. CT was performed on a Dual Energy computer CT scanner Siemens Somatom Definition 128. 27 patients (62.8%) reached repeated CT. MRI was performed on a Siemens Magnetom Espree high-field scanner with a magnetic field induction of 1.5 T.

#### **RESULTS**

The median age was 34 y.o. [33.00; 53.50] for HH and 52 y.o [36.00; 62.00] for TDH. After therapy in the general group, T2\* values increased by 26%, LIC decreased by 21.2%, DED (dual energy difference)HU 140 and 80 mean by 17.6%, DER (dual energy ratio) HU 140 and 80 mean by 3%, DEI (dual energy index) HU 140 and 80 mean by 92.8%, 80 max by 3%, DEDHU 140 and 80 max by 19%, DERHU 140 and 80 max by 2.5% after therapy. In patients with HH, liver T2\* increased by 4.6 times, LIC decreased by 5.5 times, DEDHU 140 and 80 mean by 35.1%, DERHU 140 and 80 mean by 7.8%, DEIHU 140 and 80 mean by 93.6%, DEDHU 140 and 80 max by 29.3%, DEIHU 140 and 80 max by 21.6%. In patients with TDH, LIC decreased by 18.9%, DEIHU 140 and 80 mean by 92.2%. A value of 80 mean=85.5, 140 mean=71.5, M0.3 mean=76, DEIHU 140 and 80 mean=0.007996 and DEDHU 140 and 80 mean=18.5 predict the probability of severe iron overload.

#### **CONCLUSION**

In patients after chelation therapy and hemoexfusion therapy, MRI and CT indicators decrease. The values of CT 80 mean $\geq$ 85.5, 140 mean $\geq$ 71.5, M0.3 mean $\geq$ 76, DEIHU 140 and 80 mean $\geq$ 0.007996, DEDHU 140 and 80 mean $\geq$ 18.5 can predict LIC values of more than 11 mg/g.

#### **CLINICAL RELEVANCE/APPLICATION**

The threshold of hepatic iron overload which can be diagnosed by measuring CT parameters, mainly with dual-energy scanning, was determined.

### Shear Wave Elastography and Attenuation Imaging for the Prediction of Risk of Events in Patients with NAFLD

Monday, Nov. 27 12:15PM - 12:45PM Room: Learning Center

Yudai Fujiwara (*Presenter*) Nothing to Disclose

#### PURPOSE

Common causes of mortality in non-alcoholic fatty liver disease (NAFLD) are cardiovascular events (CVEs), extrahepatic malignancies, and liver-related events (LREs). We aimed to determine the value of fibrosis and steatosis as determined by non-invasive ultrasound-based biomarkers for the prediction of the major events in patients with NAFLD.

#### METHODS AND MATERIALS

During a period 2016-2020, we accumulated a prospective cohort of 279 patients with NAFLD, who underwent shear wave elastography (SWE) together with ultrasound-guided attenuation parameter (UGAP) and liver biopsy within a day, and followed them until December 2022. SWE and UGAP were determined by LOGIQ E9 (GE Healthcare) with a C1-6-D convex probe. The cutoff values of liver stiffness measurements (LSM) by SWE and attenuation coefficient (AC) by UGAP for advanced liver fibrosis stage (F=2) and mild steatosis grade (S=1) were determined by the area under the curve analysis. According to the values, we classified patients into group A (low LSM and low AC), group B (low LSM and high AC), group C (high LSM and high AC), and group D (high LSM and low AC). Cumulative incidence ratio (CIR) of CVE, extrahepatic malignancy or LRE was calculated by Kaplan-Meier analysis and compare among the groups by log-rank test.

#### RESULTS

1) The median LSM values for each stage of liver fibrosis were 6.13 kPa in F0, 6.81 kPa in F1, 8.47 kPa in F3, and 10.23 kPa in F4 ( $p < 0.001$ ). The median AC values for each grade of steatosis were 0.42 dB/cm/MHz in S0, 0.55 dB/cm/MHz in S1, 0.68 dB/cm/MHz in S2, and 0.72 dB/cm/MHz in S3, ( $p < 0.001$ ). 2) 36 patients experienced one or more events during the observation period with a median of 4.1 years. Diabetes mellitus and AC were found to be independently associated with CIR of CVE (8.76%/5 years among all patients). Similarly, LSM was found to be associated with CIR of LRE (5.01%/5 years). 3) CIR of CVE, extrahepatic malignancy or LRE in groups A, B, C, and D was calculated to be 0.0%, 12.8%, 28.5%, and 46.7%, the values of which were significantly different among the groups ( $p < 0.05$ ).

#### CONCLUSION

A combination of ultrasound-based biomarkers LSM and AC determined by 2D SWE and UGAP may be a help for identifying NAFLD patients at a high risk of subsequent life-threatening events.

#### CLINICAL RELEVANCE/APPLICATION

Our prospective cohort study suggested that a combination of SWE and UGAP non-invasively assesses tissue characteristics of NAFLD and contributes to prediction of subsequent major life-threatening events.

### **Multiparametric Quantitative Ultrasound: Assessment of High-risk Steatohepatitis in Patients with Metabolic Dysfunction-associated Fatty Liver Disease**

Monday, Nov. 27 12:15PM - 12:45PM Room: Learning Center

Hong Ding, MD (*Presenter*) Nothing to Disclose

#### **PURPOSE**

Metabolic dysfunction-associated fatty liver disease (MAFLD) affects almost 25% of the adult population worldwide. Early diagnosis and intervention for high-risk steatohepatitis in liver steatosis can prevent disease progression and improve prognosis. Non-invasive detection and quantification are important for the timely management and prevention of the progression of liver steatosis. This study aimed to investigate the clinical value of the predictive model of multiparametric quantitative ultrasound for the non-invasive assessment of high-risk steatohepatitis.

#### **METHODS AND MATERIALS**

The shear wave elastography (SWE), shear wave dispersion (SWD) and attenuation imaging (ATI) examinations were performed on 194 patients with metabolic dysfunction-associated fatty liver disease (MAFLD) who would undergo liver biopsy in Huashan Hospital, Fudan University from June 2021 to September 2022. Based on pathological SAF scoring system, high-risk steatohepatitis is defined as steatohepatitis with greater and clinically significant fibrosis, and a total activity score =4 of steatosis, hepatocyte ballooning and hepatic lobular inflammation. The binary logistic regression was used to identify factors influencing high-risk steatohepatitis. The predictive models were established by using R language. The diagnostic performance for high-risk steatohepatitis was assessed by using the area under curve (AUC), and AUCs were compared by using the Delong test.

#### **RESULTS**

There were 46 cases of high-risk steatohepatitis. Quantitative ultrasound parameters of elastic modulus, dispersion slope and attenuation coefficient, and blood markers including alanine aminotransferase (ALT), aspartate aminotransferase (AST) and high-density lipoprotein cholesterol (HDL-C) were the factors influencing high-risk steatohepatitis (all  $P < 0.05$ ). The AUCs of elastic modulus, dispersion slope, attenuation coefficient, multiparametric ultrasound model, blood markers model and ultrasound combined with blood markers model for diagnosing high-risk steatohepatitis were 0.764, 0.758, 0.634, 0.786, 0.745 and 0.802, respectively. Delong test showed the ultrasound combined with blood markers model had significantly better predictive properties than blood markers model and attenuation coefficient ( $P=0.017$ ,  $P < 0.001$ , respectively).

#### **CONCLUSION**

The combination of multiparametric quantitative ultrasound is useful for the non-invasive diagnosis of high-risk steatohepatitis with positive clinical value.

#### **CLINICAL RELEVANCE/APPLICATION**

This multiparametric quantitative ultrasound is useful for the non-invasive diagnosis of high-risk steatohepatitis.

### Contrast Enhanced CT Based Radiomics for Predicting Postoperative Re-bleeding in Cirrhotic Patients

Monday, Nov. 27 12:15PM - 12:45PM Room: Learning Center

Xin Yang (*Presenter*) Nothing to Disclose

#### PURPOSE

To investigate the feasibility of contrast enhanced CT-based radiomics in predicting postoperative esophagogastric variceal re-bleeding (EGVR) after laparoscopic splenectomy and azygoportal disconnection (LSD) in liver cirrhosis patients with portal hypertension.

#### METHODS AND MATERIALS

Preoperative contrast-enhanced CT examinations of 182 patients receiving LSD were enrolled. Patients were divided into with and without EGVR groups basing one year follow-up. 145 patients were enrolled randomly into training and validation cohorts in the ratio of 7:3, respectively. 37 patients were used in independent testing group. All radiomic features were extracted from CT images of the portal venous phase. Regions of interest (ROIs) were delineated on liver and spleen at the hilum level, respectively. The liver volumes of interest (VOI) and spleen VOI were automatically extracted. The least absolute shrinkage and selection operator (LASSO) regression was used to obtain optimal features from combined ROIs, as well as combined VOIs features, and incorporated into a logistic regression classifier to construct a model. The EGVR predictive performance of radiomics models was evaluated by the area under receiver-operating characteristic curve (AUC).

#### RESULTS

The constructed radiomics models showed good predictive efficacy and outperformed the clinical characteristics models. The best performance of radiomics model was the logistic regression model constructed by 8 features extracted from the ROIs of liver combining with spleen, with AUC of 0.931 and 0.914 for the training and validation group, respectively. An AUC of 0.858 in the independent testing group was obtained.

#### CONCLUSION

Contrast enhanced CT-based radiomics model can predict the risk of EGVR after LSD in patient with cirrhotic portal hypertension.

#### CLINICAL RELEVANCE/APPLICATION

The rate of esophagogastric vein bleeding in patients with cirrhotic portal hypertension is about 30%, with a 20% increase in mortality after six weeks. A 1 year prospectively study showed that the incidence of EGVR in patients after LSD is 13.4%, which is a lethal complication. Therefore, it is necessary to find a convenient way to predict EGVR, and our study provided a non-invasive way for the prediction of re-bleeding after LSD.

### Non-invasive Liver Fibrosis Assessment with CT-based Iodine-uptake Parameters and Hepatosplenic Volumetric Indices

Monday, Nov. 27 12:15PM - 12:45PM Room: Learning Center

Kenichiro Yoshida (*Presenter*) Nothing to Disclose

#### PURPOSE

To evaluate the diagnostic performance of iodine uptake parameters and hepatosplenic volumetric indices measured from multiphase hepatic CT to predict liver fibrosis severity in patients who underwent liver resection.

#### METHODS AND MATERIALS

Ninety-one patients with pathologically proven liver fibrosis who underwent multiphase hepatic CT during the portal-venous phase (PVP) and 3-min delayed phase (DP) were included. The hepatic extracellular volume fraction (ECV) was calculated as  $([1 - \text{hematocrit}] \times [\text{hepatic iodine uptake during DP/aortic iodine uptake during DP}] \times 100)$ . The iodine washout rate (IWR) was calculated as  $([\text{hepatic iodine uptake during PVP} - \text{hepatic iodine uptake during DP}]/\text{hepatic iodine uptake during PVP} \times 100)$ . The liver volume (LV) and spleen volume (SV) normalized to body surface area (LV/BSA and SV/BSA, respectively) were quantified on PVP images using a deep learning algorithm. The correlations between the imaging parameters and the pathologic liver fibrosis stages were assessed using Spearman's correlation coefficient. The areas under the receiver operating characteristic curves (AUCs) to predict liver fibrosis severity were calculated for each imaging parameter. Multivariable logistic regression analysis was performed to identify independent predictors for hepatic cirrhosis, and combined diagnostic performance was assessed.

#### RESULTS

Patients with F2-4 ( $n = 37$ ), F3-4 ( $n = 16$ ), and F4 ( $n = 13$ ) showed higher ECV, lower IWR, and higher SV/BSA than those with F0-1 ( $n=54$ ), F0-2 ( $n=75$ ), and F0-3 ( $n=78$ ), respectively (all  $p < 0.05$ ). The highest correlation with fibrosis stages was attained in IWR ( $r = -0.593$ ), followed by SV/BSA ( $r = 0.383$ ), ECV ( $r = 0.381$ ), and LV/BSA ( $r = 0.062$ ). The AUC ranges of ECV, IWR, LV/BSA, and SV/BSA for predicting liver fibrosis severity were 0.667-0.717, 0.843-0.882, 0.507-0.560, and 0.685-0.819, respectively. IWR and SV/BSA were independent predictors of cirrhosis, with combined AUCs of 0.881.

#### CONCLUSION

IWR and SV/BSA can allow better prediction of liver fibrosis severity compared with ECV and LV/BSA in multiphase hepatic CT.

#### CLINICAL RELEVANCE/APPLICATION

IWR and SV/BSA may be served as a non-invasive imaging biomarker for predicting liver fibrosis severity on routine multiphase CT.

### Feasibility Study of Bone Mineral Metabolism in Chronic Kidney Disease Based on Dual-energy CT

Monday, Nov. 27 12:15PM - 12:45PM Room: Learning Center

Wei Huang (*Presenter*) Nothing to Disclose

#### PURPOSE

To evaluate the accuracy of dual-energy CT (DECT) in assessing bone mineral metabolism in patients with chronic kidney disease (CKD) .

#### METHODS AND MATERIALS

The abdominal dual-energy CT images of 53 patients with CKD were retrospectively analyzed, and the images of T12-L4 vertebral bodies were analyzed by decalcification virtual plain scan technology. The images were processed and analyzed using the virtual non-contrast (VNC) software in the Dual-Energy tab of the Syngo Via CT post-processing workstation. The T12 - L4 vertebral body was measured on the median coronal image, the ROI was manually outlined along the outer edge of the vertebral body, and various measurements automatically given by the software were recorded: CT value of calcium (Contrast media, CM), mixed energy image (Mixing ratio of 0.6) CT value (Regular CT value, rCT), calcium concentration (Calcium density, CaD) and fat content percentage (Fat fraction, FF). Pearson correlation analysis was applied to explore the relation between clinical laboratory testing indicators and these parameters.

#### RESULTS

The contrast media, rCT, CaD in the hemodialysis patients were significantly lower than those in early stage CKD (  $p < 0.01$ ). The CM, rCT and CaD values of vertebral body were negatively correlated with Ca ( $r = 0.486, 0.389, 0.598$ , respectively, all  $p < 0.01$ ), There was no correlation between FF and Ca.

#### CONCLUSION

Dual-energy CT VNCA technique may constitute a valid alternative method for quantifying the mineral content and marrow fat composition of bone in the diagnostic assessments of bone mineral metabolism in chronic kidney disease.

#### CLINICAL RELEVANCE/APPLICATION

Using abdominal dual-energy CT images may additionally evaluate bone abnormalities early in CKD patients.

### Development of a Radiomics Model for CT-based Clear Cell Likelihood Score in Small Solid Renal Masses

Monday, Nov. 27 12:15PM - 12:45PM Room: Learning Center

Taekmin Kim, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

To develop an explainable CT radiomics-based model for diagnosing clear cell renal cell carcinoma (ccRCC) among small (= 4 cm) solid renal masses.

#### METHODS AND MATERIALS

This retrospective study included 159 patients (50 women; median age 58 years [IQR 50-65 years]) with pathologically confirmed renal solid masses (= 4 cm). Two radiologists independently evaluated mass-to-cortex ratio and heterogeneity score (on a 5-point Likert scale) in corticomedullary phases, and evaluated a five-tiered CT score for diagnosing ccRCC. Interpretable radiomics model was constructed using the CT radiomics features which were associated with mass-to-cortex ratio (first-order statistics of the mass and renal cortex) and heterogeneity score (first-order statistics and texture features of the mass). Diagnostic performance of diagnosing ccRCC were compared between five-tiered CT score and radiomics model.

#### RESULTS

The masses comprised 52.8% of ccRCC (84/159) and 47.2% (75/159) of other histologic diagnoses. The mass-to-cortex ratio and heterogeneity score were significantly higher in ccRCC than in other diagnoses ( $0.87 \pm 0.18$  vs.  $0.58 \pm 0.21$  and  $4.1 \pm 0.9$  vs.  $2.5 \pm 1.1$ , respectively,  $P < 0.001$  for both). CT score = 4 achieved an AUC of 0.851 with sensitivity, specificity, and PPV of 72.6%, 80%, and 80.2%, respectively. The radiomics-based mass-to-cortex ratio and radiomics-based heterogeneity score obtained intraclass correlation coefficient of 0.89 (95% CI 0.85-0.92) and 0.82 (95% CI 0.76-0.86) compared with the original values, respectively. Diagnostic performance of radiomics model for identifying ccRCC obtained AUC of 0.913, which was superior to that of CT score (difference between areas 0.06,  $P = 0.02$ )

#### CONCLUSION

The CT-based radiomics algorithm, which was constructed using the features correlated with two key parameters, showed good performance of diagnosing ccRCC in small renal masses.

#### CLINICAL RELEVANCE/APPLICATION

CT-based clear cell likelihood score (ccLS) could provide lower cost and greater accessibility for patients, but validation for diagnostic performance and inter-reader agreement are needed. We developed a CT radiomics model for identifying ccRCC, which has a potential to easily apply in clinical practice.

### Succinate Dehydrogenase-deficient Renal Cell Carcinoma: Characterization of Imaging Features for Precision Diagnosis

Monday, Nov. 27 12:15PM - 12:45PM Room: Learning Center

Aditi Chaurasia, MBBS (*Presenter*) Nothing to Disclose

#### PURPOSE

Succinate dehydrogenase-deficient RCC is a rare, newly defined distinct renal cancer subtype under WHO tumor classification, confirmed by immunohistochemistry showing loss of staining of SDHB in tumors. Our aim is to investigate the imaging findings of SDHB-deficient renal tumors to facilitate accurate tumor characterization.

#### METHODS AND MATERIALS

The study included 20 SDH-deficient tumors from 16 patients with pathogenic variations in SDHB gene. Cross-sectional and PET imaging scans from this cohort was retrospectively evaluated by two radiologists and one nuclear medicine specialist. Clinical findings such as demographics, family history, extra-renal findings and metastases were recorded. Tumor imaging characteristics on CT and MRI included were laterality, size, homogeneity, morphology, margins, internal content, T1 and T2 signal intensity, enhancement features, and restricted diffusion.

#### RESULTS

A total of 16 patients (median age 31 years, IQR 19-41, 8 men) were identified with 68.8% of patients having a known family history of SDHB mutation. 81.3% of lesions were solitary and majority were solid (86.7% on CT, 87.5% on MRI) with well-defined margins in >62.5% of lesions, without evidence of internal fat, calcifications, and vascular invasion. On MRI, 87.5% of lesions had T2 intensity equal or more than cortex but less than CSF, and 100% of lesions demonstrated restricted diffusion. 100% of lesions showed enhancement with degree greater than 75% for most lesions on CT and MRI. On PET, all renal masses showed radiotracer uptake (mean SUVmax 31.9, mean SUVmean 7.1). 43.8% of patients demonstrated extra-renal manifestations and 43.8% distant metastasis.

#### CONCLUSION

SDHB-associated RCC is predominantly noted in young patients with no gender predilection. On imaging, SDH-deficient RCC are frequently unilateral, solitary, and solid with well-defined margins demonstrating avid enhancement with variability in enhancement pattern and showing restricted diffusion.

#### CLINICAL RELEVANCE/APPLICATION

The present article is a pilot study to characterize the findings of newly defined SDH-deficient RCC in patients having germline variation in SDHB gene on morphological and PET imaging to aid in early and accurate tumor identification.

### **Intravoxel Incoherent Motion Diffusion-weighted Imaging in Nasopharyngeal Cancer: Comparison between Turbo Spin-echo and Echo-planar Imaging Techniques**

Monday, Nov. 27 12:15PM - 12:45PM Room: Learning Center

Yuan Liu (*Presenter*) Nothing to Disclose

#### **PURPOSE**

To assess the qualitative and quantitative indicators between turbo spin-echo(TSE)-IVIM and echo-planar imaging(EPI)-IVIM in patients with nasopharyngeal cancer.

#### **METHODS AND MATERIALS**

Thirty patients with nasopharyngeal carcinoma underwent a pre-treatment staging MRI examination (Ingenia 3.0T , Philips Healthcare, the Netherlands). The IVIM images were evaluated subjectively and objectively for anatomical structures (nasopharyngeal lesions, turbinate, spinal cord and temporal pole). Subjective evaluation indicators(five-point scale for susceptibility artifacts, geometric distortion, lesion conspicuity and overall image quality) were compared with Wilcoxon signed rank test. Quantitative indicators were compared with paired t-test of signal-to-noise ratio(SNR), contrast-to-noise ratio (CNR), ADC and IVIM-derived parameters. Bland-Altman and coefficient of variance(CV) was performed to analyse reproducibility and robustness between ADC and IVIM-derived parameters of TSE-IVIM and EPI-IVIM.

#### **RESULTS**

TSE-IVIM performed significantly better than EPI-IVIM of the qualitative indicators in nasopharyngeal lesions, turbinate and temporal pole( all  $p < 0.001$ ), while no significant difference in spinal cord(table 1). SNR and CNR of TSE-IVIM were significantly lower than EPI-IVIM in spinal cord and temporal lobe, while no significant difference in the nasopharyngeal lesions and turbinate(table2).  $f$  values of TSE-IVIM showed significant lower than EPI-IVIM in the nasopharyngeal lesions, and ADC and  $D^*$  values of TSE-IVIM showed significant higher than EPI-IVIM in spinal cord (table3). CV of TSE-IVIM mainly showed lower percentage than EPI-IVIM. Bland-Altman analysis showed wide limits of agreement(LoA) in the nasopharyngeal lesions and turbinate(table4,figure1).

#### **CONCLUSION**

For better image subjective scores and no significant lower SNR and CNR, TSE-IVIM performed better image quality and more stable quantitative indicators in the nasopharyngeal lesions and turbinate area, which were more noticeable for magnetic sensitivity artifacts. For the different  $f$  values and wide LoAs between two sequences in the nasopharyngeal lesions , we recommended to use TSE-IVIM on follow-up of patients with nasopharyngeal lesions.

#### **CLINICAL RELEVANCE/APPLICATION**

TSE-IVIM provide better image quality and greatly reduce the susceptibility artifacts and geometric distortion in nasopharynx. TSE-IVIM benefit the accuracy and stability for IVIM-derived parameters. We recommend to use TSE-IVIM on follow-up for nasopharyngeal lesions.

### Feasibility of Using Multi-frequency Magnetic Resonance Elastography for Evaluating the Parotid Glands In Healthy Volunteers

Monday, Nov. 27 12:15PM - 12:45PM Room: Learning Center

Man Ting Tian, MEd (*Presenter*) Nothing to Disclose

#### **PURPOSE**

To assess the feasibility of using multifrequency magnetic resonance elastography (MRE) for evaluating the parotid glands in healthy volunteers.

#### **METHODS AND MATERIALS**

Six healthy volunteers were divided into two groups. Three volunteers had a passive driver placed on the occiput during scanning (occiput group), while the other three had a passive driver placed on the right face (right face group). Both groups underwent multifrequency MRE(60, 90, 120, and 150 Hz) of parotid gland at 3 Tesla. The image quality of the MRE waveforms, elastograms was evaluated.

#### **RESULTS**

In the occiput group, the shear wave propagation from the occiput region to the parotid gland was distant, resulting in significant attenuation and interference. The image quality was higher at 60 Hz, but lower at 90 Hz and 120 Hz. Volunteers could not tolerate the scan at 150 Hz and the scan was terminated. In the right face group, the attenuation and interference of the shear wave propagation were smaller. The image quality was high at all frequencies (60, 90, 120, and 150 Hz). However, because the arrival time of the shear wave in the bilateral parotid gland was different, this group was more suitable for observing the right parotid gland.

#### **CONCLUSION**

The appropriate frequency for the occiput group to evaluate the parotid gland was 60 Hz, while the appropriate frequencies for the right face group were 60 Hz, 90 Hz, 120 Hz, and 150 Hz.

#### **CLINICAL RELEVANCE/APPLICATION**

Multifrequency MRE can be applied to healthy parotid glands, and may be further applied to the study of parotid gland tumors and diffuse lesions such as Sjogren's syndrome in the future.

### Validation of a Fluorescent MET-Targeting Probe for Assisting Biopsy in OPMDs

Monday, Nov. 27 12:15PM - 12:45PM Room: Learning Center

Jingbo Wang, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

The objective of this study is to investigate the use of a topically applied mesenchymal-epithelial transition factor (MET) targeting probe, cMBP-ICG, in conjunction with near-infrared targeted fluorescent imaging (NIRFI) to improve the accuracy of biopsy site selection for oral potentially malignant disorders (OPMDs). This approach aims to reduce the rate of missed detection of intermediate-high grade dysplasia (IHD) and oral squamous cell carcinoma (OSCC).

#### METHODS AND MATERIALS

The acute toxicological properties of cMBP-ICG were evaluated in mice. The progression of OPMDs to OSCC was simulated in mice treated with 4-NQO and monitored using MRI and NIRFI. Tongue tissue was evaluated for pathological characteristics and MET expression. The detection rate of IHD was compared between NIRFI-assisted and standard biopsy in mice. An exploratory clinical trial involving six subjects with OPMDs evaluated the consistency between NIRFI-assisted and physician-selected biopsy sites using Cohen's kappa statistic.

#### RESULTS

No significant differences were observed in CBC and blood biochemical test results before and after administration of cMBP-ICG. Low-grade dysplasia was present in 62 cases and IHD was present in 34 cases. Carcinoma in situ was present in 21 cases and invasive carcinoma was present in 5 cases. The average signal-to-background ratio and mean fluorescence intensity of neoplasia with higher malignancy than IHD were  $6.3 \pm 2.7$  and  $17.4 \pm 8.9$  arbitrary units, respectively. The mean values of MET-positive area for the four pathological types were  $31.0 \pm 11.9\%$ ,  $57.8 \pm 18.9\%$ ,  $70.4 \pm 13.8\%$ , and  $85.5 \pm 8.4\%$ , respectively. NIRFI-assisted biopsy had a missed detection rate and a detection rate of IHD of  $0.0085 \pm 0.04$  and  $0.66 \pm 0.27$ , respectively, while standard biopsy had a missed detection rate and a detection rate of IHD of  $0.36 \pm 0.2$  and  $0.39 \pm 0.25$ , respectively. There was a statistically significant difference between the two groups ( $P < 0.01$ ). In contrast, there was no statistically significant difference between the two groups in the missed detection rate and detection rate of carcinoma. The OR value related to group assignment was less than 1 for the missed detection rate of IHD and greater than 1 for all detection rates. For the six enrolled patients, NIRFI-assisted biopsy was performed at all sites consistent with experienced clinicians, with a kappa value of 0.39 and a P-value of 0.19.

#### CONCLUSION

Compared to standard biopsy, the use of cMBP-ICG in conjunction with NIRFI may improve the detection of IHD.

#### CLINICAL RELEVANCE/APPLICATION

The NIRF probe cMBP-ICG and NIRF imaging system may provide a non-invasive method for biopsy sampling assistance, potentially changing the clinical protocol for OPMDs, and improving the early diagnosis rate of OSCC.

### Development and Validation of Deep Learning Based Automated Detection of Cervical Lymphadenopathy in Patients With Lymphoma for Treatment Response Assessment: A Bi-institutional Feasibility Study

Monday, Nov. 27 12:15PM - 12:45PM Room: Learning Center

Ji Su Ko, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

To train and evaluate a deep learning (DL) model for the accurate detection and segmentation of abnormal cervical lymph nodes (LN) on head and neck contrast-enhanced CT scans in patients diagnosed with lymphoma and evaluate the clinical utility of the DL model in response assessment.

#### METHODS AND MATERIALS

This retrospective study included patients who underwent CT for abnormal cervical LN and lymphoma assessment between January 2021 and July 2022. Patients were grouped into the development (n=76), internal test 1 (n=27), internal test 2 (n=87), and external test (n=26) cohorts. A 3D SegResNet model was used to train the CT images. The volume change rates of cervical LN across longitudinal CT scans were compared among patients with different treatment outcomes (Stable, response, and progression). Dice similarity coefficient (DSC) and Bland-Altman plot were used to assess the model's segmentation performance and reliability, respectively.

#### RESULTS

No significant differences in baseline clinical characteristics were found across cohorts (age, P=0.55; sex, P=0.13; diagnoses, P=0.06). The mean DSC was  $0.39 \pm 0.2$  with a precision and recall of 60.9% and 57.0%, respectively. Most LN volumes were within the limits of agreement on the Bland-Altman plot. The volume change rates among the three groups differed significantly (progression (n=74), 342.2%; response (n=8), -79.2%; stable (n=5), -8.1%; all P<0.01).

#### CONCLUSION

Our proposed DL segmentation model is reliable for quantifying the cervical LN burden on CT in patients with heterogeneous lymphoma. Longitudinal changes in cervical LN volume, as predicted by the DL model, are useful for treatment response assessment.

#### CLINICAL RELEVANCE/APPLICATION

DL-based auto segmentation model could effectively detect and quantify cervical LN burden in patients with lymphoma across longitudinal CT scans, which could ultimately improve guidance for treatment response assessment.

### Deep Learning Based Multi-Modal Segmentation of Oropharyngeal Squamous Cell Carcinoma on CT and MRI Using Self-Configuring nnU-Net

Monday, Nov. 27 12:15PM - 12:45PM Room: Learning Center

DONGJUN LEE, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

To evaluate deep learning-based segmentation models for oropharyngeal squamous cell carcinoma (OPSCC) using CT and MRI with nnU-Net.

#### METHODS AND MATERIALS

This retrospective study included 91 patients with OPSCC. The patients were grouped into development (n=56), test 1 (n=13), and test 2 (n=22) cohorts. In development cohort, OPSCC was manually segmented on CT, MR, and co-registered CT-MR, which served as ground truth. The multimodal and multichannel input images were then trained using a self-configuring nnU-Net framework. For evaluation metrics, dice similarity coefficient (DSC; 1=perfect and 0=no overlap) and mean Hausdorff distance (HD; near 0=good) were calculated for two test cohorts. Pearson's correlation and Bland-Altman analyses were performed between ground truth and prediction volumes. Kruskal-Wallis tests were performed to compare DSC and HD of the three models.

#### RESULTS

All three models achieved robust segmentation performances with DSC of  $0.64 \pm 0.33$  (CT),  $0.67 \pm 0.27$  (MR), and  $0.65 \pm 0.29$  (CT-MR) in test cohort 1 and  $0.57 \pm 0.31$  (CT),  $0.77 \pm 0.08$  (MR), and  $0.73 \pm 0.18$  (CT-MR) in test cohort 2. No significant differences were found in DSC among the models. HD of CT-MR ( $1.57 \pm 1.06$  mm) and MR models ( $1.36 \pm 0.61$  mm) were significantly lower than that of CT model ( $3.48 \pm 5.0$  mm) ( $P=0.037$  and  $P=0.014$ , respectively). The correlation coefficients between ground truth and prediction volumes for CT, MR, and CT-MR models were 0.88, 0.93, and 0.9, respectively.

#### CONCLUSION

The self-configuring nnU-Net framework yielded a reliable and accurate segmentation of OPSCC on CT and MRI. The multimodal CT-MR model showed promising results for the simultaneous segmentation on CT and MRI.

#### CLINICAL RELEVANCE/APPLICATION

The multimodal segmentation models trained with the nnU-Net framework provided reliable and accurate segmentations of OPSCC on both CT and MR, which can be applied to facilitate clinical staging, radiation therapy planning, and treatment response assessment.

### Structure-Preserving Image Quality Improvement of Cone Beam CT Using Deep Learning

Monday, Nov. 27 12:15PM - 12:45PM Room: Learning Center

Won-Jin Yi, PhD, MS (*Presenter*) Nothing to Disclose

#### PURPOSE

The purpose of this study is to increase the image quality and HU accuracy of CBCTs while preserving anatomical structures. We applied contrastive learning-based GAN for unpaired image translation to the quality improvement of CBCT images.

#### METHODS AND MATERIALS

We generate CT-like images from CBCT images using a patchwise contrastive learning-based GAN model. Our model is trained on unpaired CT and CBCT datasets of 30 patients with the novel combination of loss, composed of semantic relation consistency loss, spatially correlative loss, and reconstruction loss. We used a customized feature extractor pretrained on our training dataset to calculate the spatially correlative loss. We evaluate the quality of the images generated by our model in terms of Frechet inception distance (FID), peak signal-to-noise ratio (PSNR), mean absolute error (MAE), and root mean square error (RMSE). Additionally, the structure preservation performance is assessed by the structure score. Furthermore, we performed the ablation study by progressively adding components of the loss to analyze the impact of the various components on the performance.

#### RESULTS

The generated CT-like images by our model are significantly superior to those generated by various baseline models in terms of FID, PSNR, MAE, RMSE, and structure score. The spatially correlative loss and the reconstruction loss in our model provided the complementary benefits of preserving the anatomical structures of the input CBCT images and improving the image quality to be similar to CT images.

#### CONCLUSION

The generated CT-like images by our model were significantly superior to those generated by various baseline models in terms of FID, PSNR, MAE, RMSE, and structure score. We demonstrate that our model provides complementary benefits of preserving the anatomy of the input CBCT images and improving the image quality to be similar to those of CT images.

#### CLINICAL RELEVANCE/APPLICATION

Cone-beam CT (CBCT) is widely used in dental clinics but exhibits limitations in assessing soft tissue pathology because of its lack of contrast resolution and low Hounsfield Units (HU) quantification accuracy. The proposed method considerably enhanced CBCT's quality and HU accuracy while preserving the anatomical structure. We demonstrated that our framework enables detailed visualization of soft tissues and accurate quantification of HU in CBCT. This work could allow for accurate quantification of HU, suggesting the possibility of using CBCT in more clinical situations.

### Quantitative Pharmacokinetic Parameter $K^{trans}$ Map Assists in Regional Segmentation of Nasopharyngeal Carcinoma in Dynamic Contrast-enhanced Magnetic Resonance Imaging (DCE-MRI)

Monday, Nov. 27 12:15PM - 12:45PM Room: Learning Center

Zhou Liu, MD, PhD (*Presenter*) Nothing to Disclose

#### PURPOSE

Accurate segmentation of nasopharyngeal carcinoma (NPC) lesion areas from dynamic contrast-enhanced magnetic resonance imaging (DCE-MRI) facilitates subsequent diagnostic and prognostic workups. Traditionally, anatomical DCE-MRI-based NPC segmentation using deep learning has achieved fair results but still needs further improvement. Hence, we investigate the incremental benefit of incorporating pharmacokinetic parameter maps into anatomical DCE-MR image segmentation tasks by taking advantage of the hemodynamic contrast between NPC and surrounding tissue.

#### METHODS AND MATERIALS

In this paper, a pharmacokinetic parameter  $K^{trans}$  map of NPC is used as prior information and combined with anatomical DCE-MRI data to improve the performance of segmentation models. A novel model, multi-input branch residual U-Net (MBRU-Net), which extracts features from both anatomical DCE-MR images and  $K^{trans}$  maps and fuses them to improve the segmentation performance, is introduced. The effectiveness of the multibranch network is validated by comparing MBRU-Net with deep residual U-Net (ResU-Net) with DCE-MRI +  $K^{trans}$  data. Additionally, different models (U-Net, segmentation network (SegNet), recurrent residual U-Net (R2U-Net), and ResU-Net) are trained with DCE-MRI and DCE-MRI +  $K^{trans}$  data separately and compared to validate the effectiveness of multimodal data using the Dice coefficient (Dice).

#### RESULTS

Our proposed MBRU-Net achieves the best Dice in this study ( $67.39 \pm 15.79\%$ ), higher than ResU-Net's Dice ( $65.57 \pm 17.52$ ) based on DCE-MRI and  $K^{trans}$  data. U-Net, SegNet, R2U-Net, and ResU-Net achieve better results in terms of segmenting tumor regions with DCE-MRI +  $K^{trans}$  data than those of the corresponding models with DCE-MRI data alone, where U-Net has the best performance (DCE-MRI +  $K^{trans}$ : DCE-MRI =  $66.31 \pm 17.80\%$ :  $61.10 \pm 24.14\%$ ).

#### CONCLUSION

It is beneficial to add a pharmacokinetic parametric ( $K^{trans}$ ) map as prior information to the conventional anatomical MRI-based segmentation task, and multibranch network structures perform better than single-branch network structures in terms of NPC segmentation.

#### CLINICAL RELEVANCE/APPLICATION

|  $K^{trans}$  map as a priori information is beneficial for the segmentation of NPC on DCE-MRI, which might facilitate diagnostic and prognostic workup.

### Comparison of Human and AI-based Medical and Non-medical Segmentation Algorithms

Monday, Nov. 27 12:15PM - 12:45PM Room: Learning Center

Matthias F. Froelich, MD (*Presenter*) Consultant, Smart Reporting GmbH; Consultant, Guerbet SA

#### PURPOSE

To evaluate the comparative performance of human and AI-based segmentation, especially in the context of novel algorithms, not trained exclusively on (sectional) imaging data.

#### METHODS AND MATERIALS

A challenging CT slice with suboptimal contrast was selected. Manual segmentation was performed by a radiologist using 3D-Slicer. Automated segmentation algorithms (Total Segmentator fast/standard mode, Segment Anything in four settings) were run on the image. No further adjustment of the segmentation was performed. A total of 7 radiologists (3-11 yrs experience), evaluated the segmentations in blinded approach.

#### RESULTS

Human segmentation took 18:23 min, compared to AI-based approaches which took a maximum of 1:12 min. 5 radiologists (62.5%) identified the human segmentation correctly, which was rated best (> 50% very or somewhat closely correct segmentation). For the AI-based approaches, the Total Segmentator Standard Mode was ranked best (at least moderately closely 100%). The results are summarised in the figure attached.

#### CONCLUSION

AI-based segmentation is significantly faster than human segmentation. In challenging cases with suboptimal contrast, models trained on imaging data exclusively may still be superior to other models.

#### CLINICAL RELEVANCE/APPLICATION

Segmentation is a task that should be performed automatically by AI.

### Comparative Analysis of Spectral Characteristics of Monoenergetic CT Reconstructions for Different Kidney Stone Types Scanned on Photon-Counting-CT

Monday, Nov. 27 12:15PM - 12:45PM Room: Learning Center

Alexander Hertel, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

The aim of this study is to investigate the potential of using the radiomics profile of different monoenergetic reconstructions of photon-counting CT (PCCT) scans to differentiate various types of kidney stones. The study seeks to explore the relationship between radiomics features and the underlying composition of kidney stones, with the ultimate goal of developing a more accurate and non-invasive approach to diagnose and classify kidney stones. The learning objective of this study is to contribute to the development of a more personalized and precise approach to the diagnosis and treatment of kidney stone disease. The learning objective of this study is to contribute to the development of a more personalized and precise approach to the diagnosis and treatment of kidney stone disease.

#### METHODS AND MATERIALS

Photon-counting CT (PCCT) is a novel imaging technology that has shown great promise in Radiomics analysis, e.g. due to its high feature stability. In this study, we scanned 150 different types of kidney stones, including Xanthine, Brushite, Carbonateapatite, Cystine, and others, using a PCCT. Monoenergetic reconstructions of the scans were created using the Syngo Via software (version VB60A\_HF02) from Siemens in 30 keV steps from 40 to 190 keV. The stones were semi-automatically segmented using the MITK-Workbench software (v2022.10), and radiomics features were then extracted using a Docker container based on Pyradiomics (Version 3.0.1). Statistical analyses, including cluster analyses and the creation of box plots, were performed using R-Statistics (Version 2023.03.0+386) to explore the potential of radiomics for differentiating between different types of kidney stones.

#### RESULTS

In the study it could be shown that especially in the monoenergetic reconstructions with low keV values (40 and 70keV) a differentiation of the different kidney stone types, among other things on the basis of the average HU values, is possible, since these differed significantly depending on the kidney stone type. In contrast, no significant differences were found for the higher keV values.

#### CONCLUSION

Radiomics evaluations of monoenergetic reconstructions with low keV values (40 and 70keV) of photon counting CT scans can help differentiate and characterize renal stones noninvasively, potentially optimizing therapy.

#### CLINICAL RELEVANCE/APPLICATION

Non invasive differentiation of kidney stones to potentially optimize therapy.

M5A-SPIN-4

### Dual-Energy CT-derived Imaging Features: Diagnostic and Prognostic Value of Radiomics Features and Iodine Maps in Patients with Mediastinal Masses

Monday, Nov. 27 12:15PM - 12:45PM Room: Learning Center

Vitali Koch, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

To assess the diagnostic and prognostic value of radiomics features and dual-source dual-energy CT (DECT) based material decomposition in patients with benign and malignant mediastinal masses.

#### METHODS AND MATERIALS

This retrospective study included 90 patients (38 males, mean age  $61 \pm 12$  years) with pathologically confirmed mediastinal masses who underwent contrast-enhanced DECT between 10/2014 and 04/2023. All patients were evaluated by two experienced readers regarding conventional radiomics features, as well as DECT-based texture features including attenuation (HU), iodine density (mg/ml), and fat fraction (%). Data comparisons were performed using analysis of variance (ANOVA) and chi-square statistic tests. Cox regression tests and receiver operating characteristic curve analysis were used to predict outcomes and discriminate between benign and malignant mediastinal masses.

#### RESULTS

Of the 90 mediastinal masses, 28 (31%) were lymphomas, 6 (7%) were mediastinal tumors, and 9 (10%) were thymic carcinomas. Values differed significantly between benign and malignant mediastinal masses regarding DECT-based texture features ( $p < 0.04$ ) and 30 radiomics features ( $p < 0.03$ ). The area under the curve to differentiate between benign and malignant formations was 0.980 (95% CI, 0.893-1.000;  $p < 0.001$ ) for the combination of DECT imaging parameters and radiomics features, yielding a sensitivity of 100% and specificity of 91%. During a follow-up of 60 months (IQR, 52-60 months), the multiparametric approach including radiomics features, DECT parameters, and clinical parameters showed good prognostic power to predict all-cause mortality (c-index = 0.896 [95% CI, 0.802-0.970],  $p = 0.001$ ).

#### CONCLUSION

A multiparametric approach including conventional radiomics features and DECT-based texture features facilitates accurate, non-invasive discrimination between benign and malignant mediastinal masses with high sensitivity and specificity.

#### CLINICAL RELEVANCE/APPLICATION

Early detection of malignant masses is of utmost importance to avoid delays in treatment initiation. Combining radiomics features, DECT-derived imaging parameters, and clinical parameters through computational assessment of texture features has the potential to identify masses with an increased risk of malignancy.

M5A-SPIN-5

### **HASKE: A Low-Resource PACS Platform for Improving Diagnostic Imaging Access in Sub-Saharan Africa**

Monday, Nov. 27 12:15PM - 12:45PM Room: Learning Center

Udunna Anazodo, PhD (*Presenter*) Nothing to Disclose

#### **PURPOSE**

The delivery of diagnostic imaging in low-and-middle income countries (LMICs) is challenged by high costs of infrastructure acquisition and shortage of experts, particularly in Sub-Saharan Africa (SSA). One of the main issues accentuating this challenge is the availability of picture archiving and communication systems (PACS) for distribution, archiving and managing of images due to poor availability of quality internet service, high cost of computing infrastructure for hosting and distributing PACS and lack of skilled administrators to effectively maintain the system. Poor access to PACS contributes to poor diagnostic outcomes as the few available radiologists who serve a large population over a vast geographical area, are unable to access images for proper diagnosis. To improve PACS access in resource limited settings, we propose a redistributable PACS platform, HASKE (light in Hausa) accessible to radiologists, physicians, and patients based open-source tools, designed for use in low bandwidth environments and for ease of management.

#### **METHODS AND MATERIALS**

HASKE is designed (Figure 1) to provide a low-resource solution for rapid access to images with standard features for 1) onsite and cloud/remote archiving system, 2) integrated zero footprint DICOM viewer, 3) a straightforward DICOM query interface, 4) mobile phone accessibility, and 5) low maintenance requirements for easy management by non-IT health personnel.

#### **RESULTS**

The pilot open-source PACS tool is currently in use at three imaging facilities in Nigeria will be scaled up to provide a Health Level 7 (HL7) vendor-neutral PACS platform to ensure ease of integration, especially given the nature of medical device procurement in SSA (third party vs. original equipment manufacturers [OEMs]).

#### **CONCLUSION**

The HASKE PACS platform represents a significant step towards improving access to diagnostic imaging in SSA and other resource-limited settings. The platform is designed to overcome prevailing challenges from lost images either through non availability of storage systems or poorly interpreted due to the lack of accessibility to the radiologist. HASKE is designed to help clinicians with limited resources to distribute images better and readily read and share imaging findings to transform disease management in SSA. By utilizing open-source tools, the platform is scalable and affordable, making it accessible to radiologists, physicians, and patients, alike.

#### **CLINICAL RELEVANCE/APPLICATION**

While HASKE address the immediate need for diagnostic image data management, it ultimately will enable health equity and inclusion of resource limited settings in imaging data science and artificial intelligence (AI) solutions, where AI is has the greatest potential to improve local health outcomes.

### A Platform for Automatically Extracting Imaging Biomarkers from Ischemic and Hemorrhagic Stroke Patients

Monday, Nov. 27 12:15PM - 12:45PM Room: Learning Center

Rajat Dhar, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

Imaging biomarkers of primary and secondary injury provide critical insights into disease progression and prognosis. Quantifying lesions (infarct or hemorrhage) and associated edema volume can be time-consuming and impractical in large multi-institutional cohorts. We present a cloud-based image repository and computational platform that can archive, analyze, and output multi-dimensional imaging biomarkers from brain CTs of ischemic and hemorrhagic stroke patients.

#### METHODS AND MATERIALS

The Stroke NeuroImaging Phenotype Repository (SNIPR), based on the XNAT platform, has archived serial imaging from large stroke cohorts from multiple institutions. It allows the implementation of image analysis pipelines wrapped in Docker containers. In this study, we deployed containerized pipelines to analyze lesion and edema volume from both ischemic and hemorrhagic (ICH) stroke cohorts. Scans within each imaging session are first classified (using metadata and a deep learning-based classifier), allowing selection of 'axial brain CT' scans which can be processed (incl. DICOM to NIFTI conversion, brain extraction, and normalization), followed by (U-net-based) segmentation of infarct and hemorrhage lesions as well as peri-hematoma edema (in ICH) and displacement of CSF (for both ischemic stroke and ICH). The ratio of hemispheric CSF volumes was calculated in both groups. Net water uptake (NWU) is calculated in the infarct group as the relative density of infarct vs. Mirrored regions. Resulting segmentation masks are stored, while the biomarker results are stored as CSV files and presented as novel data types that can be viewed on a session, subject, or project level. A superimposed view of the lesion and edema/CSF masks over the NCCT image and a summary of the measurements are also held in a PDF.

#### RESULTS

The analysis pipelines were implemented on 2649 CT sessions (ischemia:442 and ICH:2207) from three research centers. Axial brain scans could be found in the majority (74%) of sessions. Pipelines were completed in 1407 (71%), with biomarker extraction, including infarct/hemorrhage volumes, CSF ratio, and NWU. The platform can analyze around 1000 images in a week.

#### CONCLUSION

The study presents a cloud-based image archive and analysis pipeline to calculate biomarkers in axial brain CT. It allows multi-centric collaboration and analyses of thousands of images at a time that would facilitate ongoing stroke research worldwide. The platform will be extended to include more image analysis pipelines useful for stroke research.

#### CLINICAL RELEVANCE/APPLICATION

This platform can assist in quantifying infarction, hemorrhage, and edema in large volumes of serial brain CT scans of ischemic and hemorrhagic stroke patients, facilitating stroke research.

### Complex Convolutional Neural Networks for Denoising Accelerated Submillimeter Magnetic Susceptibility Brain MRI

Monday, Nov. 27 12:15PM - 12:45PM Room: Learning Center

Bryan Quah, MSc (*Presenter*) Nothing to Disclose

#### PURPOSE

Magnetic susceptibility-based imaging using submillimeter isotropic 3D echo-planar imaging (3D-EPI) enables the detection of biomarkers for neurological disorders, such as the central vein sign and paramagnetic rim lesions in multiple sclerosis. Recent developments combining 3D-EPI acquisition with CAIPIRINHA undersampling, have shown to significantly reduce scan times. However, this comes at the cost of a reduced signal-to-noise ratio (SNR) which we address here using a complex denoising deep learning method.

#### METHODS AND MATERIALS

3T brain MRI scans from 52 adults scanned at three imaging sites were used. T2\*-weighted magnitude and phase images were acquired at 650  $\mu\text{m}$  isotropic using 3D-EPI without parallel imaging (Acquisition Time, AT:  $\sim 6$  minutes), and with parallel imaging using CAIPIRINHA at different acceleration factors: R=2, (AT:  $\sim 4$  minutes), R=3 (AT:  $\sim 3$  minutes) and R=4 (AT:  $\sim 2$  minutes). The subjects were divided into 2 datasets: a training set (N=41) for the network to learn the denoising task and a testing set (N=11) to evaluate the model performance. The training set consists of data acquired without CAIPIRINHA while the testing set consists of data acquired with CAIPIRINHA at the 3 acceleration factors. We developed a 2-dimensional convolutional neural network to denoise the complex valued data created from the magnitude and phase 3D-EPI images. Our developed network extends the convolution and rectified linear unit operations to the complex domain. Peak signal-to-noise ratio (PSNR) and structural similarity index measure (SSIM) were calculated before and after denoising.

#### RESULTS

Upon visual inspection, the denoised magnitude and phase images displayed improved image quality while the visibility of brain features and disease-related biomarkers were preserved. The average PSNR values measured across the cohort were increased after denoising at all acceleration factors (+29% for R=2; +34% for R=3; +41% for R=4). Meanwhile, the SSIM values measured remained high for all acceleration factors (mean  $\pm$  SD: 0.959  $\pm$  0.014 for R=2; 0.951  $\pm$  0.021 for R=3; 0.942  $\pm$  0.023 for R=4).

#### CONCLUSION

We developed a complex denoising deep learning approach to efficiently improve the image quality of accelerated submillimeter magnetic susceptibility brain MRI scans. Even at high acceleration factors (R $\geq$ 3), our method was able to restore the significant loss in SNR while maintaining structural details.

#### CLINICAL RELEVANCE/APPLICATION

Our study demonstrates the feasibility of efficiently denoising accelerated magnetic susceptibility brain MRI with complex convolutional neural networks. Our proposed method opens the door for ultra-fast submillimeter SWI and QSM imaging in the clinical setting.

### Prediction of Response to Treatment and Outcome of Trans-arterial Chemoembolization in Patients with Hepatocellular Carcinoma Using Artificial Intelligence: A Systematic Review Study

Monday, Nov. 27 12:15PM - 12:45PM Room: Learning Center

Pedram Keshavarz, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

This study reviews the efficacy of different AI models for prediction of hepatocellular carcinoma treatment response to transarterial chemoembolization (TACE) including the overall survival (OS).

#### METHODS AND MATERIALS

This systematic review was performed according to Preferred Reporting Items for Systematic Reviews and Meta-analyses (PRISMA) guidelines. We conducted a literature search in online databases, including Scopus, Medline (PubMed), Web of Science, Embase, and Google Scholar. The random-effect models were utilized to calculate pool sensitivity, specificity, predictive values, summary receiver operator characteristic (ROC), and area under curve (AUC) based on the "Standards for Reporting Diagnostic accuracy studies" (STARD) guidelines.

#### RESULTS

The systematic review cohort included 21 studies with 4,489 patients. The AI algorithm AUC for predicting HCC response to TACE ranged from 0.32-0.97. Radiomics and non-radiomics feature based models had similar pooled AUCs of 0.76 (95%CI: 0.73-0.79) and 0.75 (95%CI: 0.70-0.80), respectively. Compared to the most widely utilized machine learning methods relying on logistic regression, other AI-based methods such as convolutional neural networks (CNN) and support vector machine (SVM) had AUCs of 0.93 (95%CI 0.84-1.00) and 0.79 (95%CI, 0.77-0.81) respectively. Of all predictive feature models, models combining both CT or MR images with clinical features had higher AUCs of 0.78 (CT+clinical, 95%CI 0.74-0.83) and 0.81 (MR+clinical 95%CI 0.78-0.84) respectively, relative to models based on clinical features alone, AUC 0.67 (95%CI 0.53-0.80).

#### CONCLUSION

AI models showed acceptable performance in prediction of treatment response to TACE and post-TACE OS. CNN method utilizing a combination of cross-sectional images findings and clinical characteristics had superior performance compared to sole clinical features.

#### CLINICAL RELEVANCE/APPLICATION

The prediction of post-TACE, HCC treatment response by AI methods was feasible and significant in all studies. Contributing medical data is vital in improving predictions' confidence and stability, while it can significantly enhance accuracy and reduce the burden on the healthcare systems for investigating all the clinical and radiological features to determine the potential TACE responders. Comprehensive studies are required to introduce a highly accurate and reliable AI prediction model and reduce heterogeneity between outcomes.

### Predicting Survival of Lung Ablation Patients using Deep Learning-Based Automatic Segmentation and Radiomics Analysis

Monday, Nov. 27 12:15PM - 12:45PM Room: Learning Center

Hossam A. Zaki, BS (*Presenter*) Nothing to Disclose

#### PURPOSE

To identify radiomic features predictive of survival following image-guided thermal ablation (IGTA) of lung tumors segmented using a deep learning approach.

#### METHODS AND MATERIALS

This HIPAA-compliant study was performed with a waiver for informed consent following institutional review board approval. Between January 1, 2004 and July 14, 2022, adult patients who underwent IGTA for primary and metastatic lung tumors were retrospectively identified. Using pre-procedure CT imaging data, lung zones were automatically segmented using a pre-trained U-Net, which was trained on a large dataset that covers significant visual variability and includes tumors in the segmentation. Following this, we used a U-shaped encoder-decoder transformer architecture (UNETR) to segment lung tumors. The model was trained on lung CT scans with tumor annotations. We then applied the pre-trained model to patients who underwent IGTA. Radiomic features were extracted from the lung segmentations. We utilized features related to the shape of the segmentation, including surface area, volume, and diameter. These radiomic features were then used to predict days-to-death of the patients using a Cox proportional hazards model. Death records were extracted from the electronic medical record and/or obituary data.

#### RESULTS

154 consecutive patients were evaluated (median age, 74.6 years; 46.4% Male). Of these patients, 119 experienced the mortality event, with a mean time to death of 3.6 years (minimum 0.6 years; maximum 14.2 years) following the initial IGTA procedure. Median tumor size was 1.8 cm (minimum 0.6 cm; maximum 5.2 cm), and 138 patients (90%) had primary lung cancer. The initial lung tumor segmentation using UNETR achieved a DICE score of .72, indicating a 72% overlap of the predicted segmentation and the ground-truth. The survivability prediction task using radiomic features achieved a c-index of .69, showing a 69% chance the model will correctly predict which subject has a longer survival time out of a random pair. The most predictive features were flatness and diameter along the row, with a c-index of .57 and .55, respectively. Flatness indicates the elongation of the tumor, while diameter indicates the length in a certain axis, both of which relate to tumor growth patterns.

#### CONCLUSION

Radiomic feature analysis of lung tumors following segmentation by transformer-based UNET may predict long-term survival following image-guided thermal ablation of pulmonary malignancies.

#### CLINICAL RELEVANCE/APPLICATION

The incorporation of a survival prediction model based on radiomics features extracted from pre-procedure CT imaging by a deep learning algorithm may allow interventional radiologists to modify treatment approaches to optimize outcomes for patients.

### Assessing ChatGPT's Proficiency in Generating Differential Diagnoses Based on Transcribed Vascular and Interventional Radiology Findings

Monday, Nov. 27 12:15PM - 12:45PM Room: Learning Center

Kenneth N. Huynh, DO (*Presenter*) Nothing to Disclose

#### PURPOSE

To assess the accuracy and reliability of ChatGPT3.5 and ChatGPT4 in producing a differential diagnosis from transcribed radiological findings of specific vascular and interventional radiology (VIR) cases.

#### METHODS AND MATERIALS

A sample of 20 cases specific to VIR imaging were evaluated. Cases were selected from a radiology textbook, from which the answers were used as the gold standard. The case images and history were converted into standardized prompts that contained purely descriptive language of the cases and a query for the most likely diagnosis, top three differential diagnoses, and the corresponding explanations and references from the medical literature. These prompts were fed into the ChatGPT3.5 and ChatGPT4 algorithms. Generated responses were analyzed for accuracy by comparison with the original literature and reliability through manual verification of the generated explanations and citations. The top 1 accuracy and the top 3 accuracy were defined as the percentage of generated responses that matched the original diagnosis and the complete differential provided by the original literature. An additional differential diagnosis score was defined as the proportion of differentials that matched the original literature's answers for each case. Comparisons were made between the results of the two algorithms using a one-tailed two proportion z-test method.

#### RESULTS

The top 1 accuracy and top 3 accuracy, for ChatGPT3.5 versus ChatGPT4 were 85.0% compared to 85.0% ( $p = 0.5$ ) and 30.0% compared to 15.0% ( $p = 0.13$ ), respectively. The average differential diagnosis score of ChatGPT3.5 versus ChatGPT4 was 60.0% compared to 56.7% ( $p = 0.42$ ). ChatGPT3.5 and ChatGPT4 hallucinated 48.3% versus 13.4% ( $p < 0.00001$ ) of the references provided and generated 1 false statement versus 0 false statements, respectively.

#### CONCLUSION

The two generations of ChatGPT were able to generate a differential diagnosis for prompts containing descriptive radiological findings. The accuracy of top 1 diagnoses matched the expert literature from which the cases originated with reasonable accuracy, with no statistically significant improvement between the 3.5 to the 4<sup>th</sup> generation algorithm. However, responses from both algorithms matched the top 3 diagnoses from the expert literature a minority of the time. The well-known hallucination effect was encountered more commonly in the generation of citations than the generation of factual statements, which improved with the newest algorithm.

#### CLINICAL RELEVANCE/APPLICATION

ChatGPT and Large Language Models (LLM) have a large potential to impact clinical and educational medicine. Knowledge of the accuracy and erroneous possibilities of these algorithms will provide a better understanding of the limitations of these new tools.

### Identification of Inferior Vena Cava (IVC) Filters on CT, X-ray and MRI Radiological Reports with a Natural Language Processing (NLP) Based Tool for Management of Clinical Follow Up

Monday, Nov. 27 12:15PM - 12:45PM Room: Learning Center

Yifan Wang, MD, MS (*Presenter*) Nothing to Disclose

#### PURPOSE

Many patients with IVC filters don't get proper follow up and their filters are not removed even when it is not further needed. Many of the patients who are lost to follow up are undergoing other imaging studies in their lifetime with the presence of an IVC filter gets documented in radiological reports. NLP can assist in discovering those patients with IVC filters and help clinicians in monitoring and clinical follow up. The study aims to measure the effectiveness of an NLP solution in discovering IVC filters in radiological reports and explore the role of AI in improving follow up of patients with IVC filters.

#### METHODS AND MATERIALS

Radiological reports of CT, X-ray, and MRI studies from a large academic health system generated between 7/1/2021 and 7/31/2021 were selected for analysis. Follow-up was reviewed up to 20 months after the initial report dates. Radiological reports were analyzed for the presence of mention of an IVC filter using an NLP solution. The NLP positive cases were reviewed to measure: the positive agreement rate of the solution in identifying patients with inferior vena cava (IVC) filter using radiological reports, the number of cases identified that were eligible for IVC removal, the number of cases identified that were eligible for IVC removal and not currently scheduled and the number of IVC removal procedures that resulted from the solution case identification.

#### RESULTS

NLP solution classified 225 reports as positive for the presence of an IVC filter. The positive agreement rate was 99.56% (224/225). On secondary review by 4 clinicians, 164 unique cases were identified. 51.2% (84/164) filters were not placed by IR, and 20.1% (33/164) filters were non-retrievable type. 4.3% (7/164) identified cases had IVC filter related major complications. In 20 months follow up 57.3% (94/164) of the identified cases were eligible for removal at time of the scan, however only 12.8% (12/94) of the filters removed and 87.2% (82/94) of the cases had not been followed or scheduled. Particularly, 45 filters had been present for at least 5 years and 30 out of these 45 filters were eligible for removal.

#### CONCLUSION

The NLP based solution accurately identified patients with IVC filters using the radiological reports. A significant number of the patients that had IVC filters did not have clinical follow up or their filters removed despite eligibility.

#### CLINICAL RELEVANCE/APPLICATION

This is the first report to evaluate the efficacy of IVC filter detection using the commercial product AIDOC. Using radiological reports, NLP has the potential to greatly enhance follow-up management for patients with IVC filters, not only at their home institutions but also for those whose filters were discovered incidentally.

M5A-SPIR-5

### Generative Learned Models for Synthesis of Realistic Soft-Tissue Deformable Motion with Controllable Magnitude in Interventional Cone Beam CT

Monday, Nov. 27 12:15PM - 12:45PM Room: Learning Center

Alejandro Sisniega, PhD (*Presenter*) Research Grant, Siemens AG; Research Grant, Micro-X Ltd; Research Grant, Izotropic Corporation

#### PURPOSE

Cone-beam CT (CBCT) is a ubiquitous tool for guidance in interventional radiology, yet susceptible to motion artifacts from a combination of quasi-periodic motion and aperiodic, local, motion. Deep autofocus showed potential for compensation of deformable motion but requires large and diverse datasets of motion-corrupted CBCT, paired with the source motion, for training. Reliable simulation of complex motion remains an open challenge. This work reports a generative model for simulation of realistic deformable motion with controllable magnitude, via observation of unpaired, motion-corrupted data.

#### METHODS AND MATERIALS

The generative model receives a motion-free volume as baseline anatomy, and a random perturbation, to synthesize a random, anatomy-aware 4-dimensional motion field. The model implements a variation of the CycleGAN architecture, with spatial transformers coupling the anatomical context to the spatiotemporal motion field. A customized GAN loss was designed to learn an amplitude control code (ACC) yielding controllable motion magnitude, and it was trained in an unsupervised fashion using solely motion-corrupted CBCT volumes. The model was exercised in a proof-of-concept study with (N=144) simulated CBCT including known motion, providing a controlled validation scenario before extension to clinical data. A test set with 594 motion fields was synthesized (9 anatomies, 6 random perturbations, and 11 amplitude control codes).

#### RESULTS

Synthetic motion fields showed magnitude in line with the training set with median amplitude of 26 mm vs 32 mm in training (15 mm vs 17 mm IQR). The spatial distributions of synthetic motion agreed with underlying anatomy, with soft-tissue regions showing large motion distortion with a preference towards anterior parts of the anatomy (median 26 mm) and rigid regions around the spine remaining stationary (median 3.6 mm), in agreement with trends in training data. Variation of the ACC resulted in nearly linear increase in motion amplitude in soft-tissue regions with no significant variation of the spatial distribution. Variation of the random perturbation code resulted in different spatial allocation of motion but no change in magnitude for equivalent control codes.

#### CONCLUSION

Random synthetic motion with anatomically realistic spatial distribution, amplitude, and direction was achieved with a learned generative model via observation of motion-corrupted CBCT. The proof-of-concept study opens the way to application of the model in clinical scenarios.

#### CLINICAL RELEVANCE/APPLICATION

This work presents an unsupervised motion synthesis model able to generate anatomically-realistic motion vector fields, enabling the generation of large training datasets for development of deep autofocus methods.

### Evaluating Artificial Intelligence for the Diagnosis of Acute PE

Monday, Nov. 27 12:15PM - 12:45PM Room: Learning Center

Yifan Wang, MD, MS (*Presenter*) Nothing to Disclose

#### PURPOSE

Pulmonary embolism (PE) is a severe medical condition, with a high mortality rate if left untreated. A pulmonary embolism response team (PERT) is a multidisciplinary group of providers that provide consultation and care to patients with PE. Artificial Intelligence (AI) has the potential to improve the care provided by a PERT team by notifying members of the team immediately about suspected cases and enabling appropriate therapies to occur in a timely fashion by assisting with the rapid coordination of care amongst a PERT. This study aims to evaluate cases identified by an AI solution across a health system. The health system studied is composed of a main campus (hub) that is capable of performing all current PE therapies and multiple other hospitals (spokes) within the system that can provide limited therapies for PE. This study assesses if AI can correctly identify PE cases of a significant risk stratification and those that may benefit from transfer from a spoke hospital to the hub hospital for additional care.

#### METHODS AND MATERIALS

A retrospective cohort of patients at 3 spoke hospitals undergoing computed tomography pulmonary angiography (CTPA) between 01/2019 -12/2020 was analyzed using an AI solution. A positive finding was defined as the AI solution detecting moderate to large central PE thrombi and a right ventricle to left ventricle (RV/LV) ratio greater than 1.3. CT parameters were obtained from radiological interpretation and data on clinical PERT activation and interventions at each site were obtained by chart review. Metrics measured included the European Society of Cardiology (ESC) PE risk stratification score, PERT consultation, transfer of patients from a spoke-to-hub, and treatment strategy. The findings were compared to historical averages from the hub/main campus.

#### RESULTS

A total of 43 cases from 3,787 CTPA scans were identified by the algorithm, of which 92.5% (37/40) were intermediate-high or high-risk PE based on the ESC risk stratification. Comparing spoke hospitals to the hub hospital, 55% (22/40) vs 100% (133/133) of the identified cases had a PERT consultation and 22% (9/40) versus 70% (93/133) of identified cases received an advanced therapy (catheter or surgical therapies, systemic thrombolytics or mechanical support). Only 5% (2/40) of the identified cases resulted in a spoke-to-hub transfer.

#### CONCLUSION

The use of AI may help optimize the coordination and care of PERT patients by correctly identifying intermediate and high-risk PE cases, those that may require a PERT consultation, and identifying patients who may benefit from transfer to a hub hospital for advanced therapies.

#### CLINICAL RELEVANCE/APPLICATION

AI may have the ability to assist in detection of acute PE and coordination of care amongst clinicians across a health system.

### Quantitative Study of Bone Marrow Edema Due to Acute Fractures with Dual-energy Spectral CT Imaging

Monday, Nov. 27 12:15PM - 12:45PM Room: Learning Center

Yanan Zhu (*Presenter*) Nothing to Disclose

#### PURPOSE

To determine the utility of material density and CT attenuation value measurements in dual-energy spectral imaging for differentiating bone marrow edema due to acute bone fractures from the normal bone marrow.

#### METHODS AND MATERIALS

24 patients who presented with acute fractures from November 2017 to March 2018 underwent dual-energy spectral CT imaging on a 16cm wide-detector CT scanner. The virtual monochromatic images and water-calcium material decomposition (MD) images were reconstructed. The monochromatic CT images with color-coded water-calcium MD image overlay were reviewed by two radiologists to identify bone fractures and the associated bone marrow edema. The CT attenuations and water(calcium) concentrations were measured from the CT images and water(calcium) MD images, respectively for bone marrow edema and normal bone marrow. Receiver operator characteristic (ROC) curve analysis was used to determine the diagnostic accuracies of these measurements.

#### RESULTS

The water(calcium) concentrations ( $1040.28 \pm 33.55 \text{mg/cm}^3$ ) in the areas with bone marrow edema were significantly higher than in the normal bone marrow ( $1011.11 \pm 45.83 \text{mg/cm}^3$ ) ( $p < 0.001$ ). The CT attenuation values in the 70keV images were  $210.18 \pm 108.63 \text{HU}$  and  $133.44 \pm 134.06 \text{HU}$  in the areas with bone marrow edema and with normal bone marrow, respectively ( $p < 0.001$ ). The Area under the curve (AUC) for ROC analysis using the water(calcium) concentration was 0.771, significantly higher than the value of 0.719 using the CT attenuation measurement ( $p < 0.05$ ).

#### CONCLUSION

The measurement parameters, especially the water(calcium) concentration measurement in bone marrow obtained in the dual-energy spectral CT imaging, have high accuracy in differentiating bone marrow edema from normal bone marrow.

#### CLINICAL RELEVANCE/APPLICATION

Dual-energy spectral CT imaging provided a novel and accurate method to quantitatively evaluate the bone marrow edema due to acute bone fractures.

### **The Use of Monochromatic CT Images Overlaid with Water-calcium Material Decomposition Images in Dual-energy Spectral Imaging for Identifying Bone Marrow Edema Due to Acute Bone**

Monday, Nov. 27 12:15PM - 12:45PM Room: Learning Center

Yanan Zhu (*Presenter*) Nothing to Disclose

#### **PURPOSE**

To determine the utility of identifying bone marrow edema due to acute bone fractures using the monochromatic CT images overlaid with color-coded water-calcium material decomposition (MD) images in dual-energy spectral imaging.

#### **METHODS AND MATERIALS**

24 patients who presented with acute bone fractures underwent dual-energy spectral imaging on a 16cm wide-detector CT scanner from November 2017 to March 2018. The virtual monochromatic images and water-calcium MD image pairs were reconstructed. The monochromatic CT images overlaid with color-coded water-calcium images were reviewed by two radiologists, and the fractures and associated bone marrow edema were identified. The CT attenuations and water(calcium) concentrations of the areas with bone marrow edema and with normal bone marrow were measured from the CT images and water(calcium) MD images, respectively. These values were compared with paired t-test. Kappa values were calculated between the two readers on the identification of the areas with and without bone marrow edema.

#### **RESULTS**

There was bone marrow edema associated with every bone fracture and the overlay images had higher confidence and clarity to identify the areas of edema than the CT images alone. The Kappa value was 0.878 between the two readers on the identification of the areas with and without bone marrow edema on color-coded water-calcium images. The water(calcium) concentrations ( $1040.28 \pm 33.55 \text{mg/cm}^3$ ) in the areas with bone marrow edema were significantly higher than in the normal bone marrow area ( $1011.11 \pm 45.83 \text{mg/cm}^3$ ) ( $p < 0.001$ ). The CT attenuation values in the 70keV images were  $210.18 \pm 108.63 \text{HU}$  and  $133.44 \pm 134.06 \text{HU}$  in the areas with and without bone marrow edema, also had a significant difference between the two areas ( $p < 0.001$ ).

#### **CONCLUSION**

The monochromatic CT images overlaid with color-coded water-calcium images in dual-energy spectral CT imaging on a 16cm wide-detector CT is sensitive and quantitative to identify the bone marrow edema due to acute bone fracture.

#### **CLINICAL RELEVANCE/APPLICATION**

The monochromatic CT images overlaid with water-calcium images in spectral CT can provide an alternative to MRI for detecting the bone marrow edema due to acute bone fractures.

### Evaluation of Radiosynoviorthesis as a Palliative Treatment in Advanced Arthropathies

Monday, Nov. 27 12:15PM - 12:45PM Room: Learning Center

Marta Gallego Verdejo, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

Radiosynoviorthesis consists of intra-articular injection of radionuclides to achieve a local therapeutic action in patients with chronic or resistant arthropathies in whom other treatments have failed. This study aims to demonstrate the effectiveness of radiosynoviorthesis in treating chronic synovitis at three levels: clinical, functional, and radiological. Additionally, it will study the safety of the technique.

#### METHODS AND MATERIALS

It is a descriptive and retrospective study with a multidisciplinary approach (radiology, radiophysics and nuclear medicine). The current sample consists of 15 patients referred for treatment with radiosynoviorthesis from various hospitals between 2019 and 2022. However, we expect to expand to 30 patients in the coming months, when the controls will be carried out. Each patient is evaluated before and after treatment using a pain visual analog scale (VAS) from 0 (no pain) to 10 (maximum pain) and a functionality scale depending on the treated articulation. Immediately after the puncture, scintigraphy is performed to assess the adequate distribution of the radionuclide in the joint. Also, an ultrasound control is performed before and approximately 3 months after radiosynoviorthesis.

#### RESULTS

In preliminary results, the mean VAS score lessened from 7.07 before radiosynoviorthesis to 3.47. Similarly, they show an upgrade in the functional scale from 41.47 % to 70.06 % (values expressed as a percentage of the maximum score for each test). In addition, some patients have exhibited an improvement in synovial hyperemia in the ultrasound control, with a reduction in effusion and synovial thickening. Furthermore, it has been confirmed that it is a safe technique, with a low incidence of complications in the treatments performed.

#### CONCLUSION

Radiosynoviorthesis (RSO) is a good treatment for patients with chronic or resistant pathology of the synovial membrane in whom the first lines of treatment have not been effective. It brings improvements at the clinical and functional levels, with a reduction in ultrasound synovitis signs in some patients. It also has a low complication rate, which makes it an effective and safe alternative in the treatment of chronic arthropathies.

#### CLINICAL RELEVANCE/APPLICATION

It is a safe procedure that can bring clinical and functional improvement to patients with limiting arthropathies that can substantially improve their quality of life.

### Optimizing US-guided Lavage for Rotator Cuff Calcific Tendinitis: The Effect of Corticosteroids Injection Pre vs. Post-procedure

Monday, Nov. 27 12:15PM - 12:45PM Room: Learning Center

Miguel Barrio Piqueras I, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

The purpose of this study is to determine whether the pre or post-procedure injection of corticosteroids during US-guided lavage of rotator cuff calcific tendinitis affects the outcome.

#### METHODS AND MATERIALS

At our institution, 124 patients with calcific tendinitis of the rotator cuff were treated with US-guided lavage between 2020 and 2021. In 71 patients, a corticosteroid was injected into the subacromial bursa following the lavage (corticosteroid-after group). The remaining 53 patients (corticosteroid-before group) received the injection before undergoing the procedure. Characteristics of calcification were recorded in terms of number, size, location and type according to Gartner and Hayer's classification. Other variables assessed were calcium extracted, number of adverse events and follow-up. Data were analysed using SPSS 25.0 software, and a p-value < 0.05 was considered statistically significant.

#### RESULTS

Both groups showed no significant differences regarding sex ( $p = 0.612$ ) or age ( $p = 0.883$ ). The only reported adverse effect was vasovagal syncope in 7 patients (13.2%) in the corticosteroid-before group and 11 patients (15.5%) in the corticosteroid-after group ( $p = 0.721$ ). The percentage of patients in which a significant amount of calcium was extracted was similar in both groups (54.7% vs 54.9%;  $p = 0.981$ ). The type of calcification was the only factor that showed a statistical association with this outcome (68.5% for type 1 and 2 calcifications; 20% for type 3 calcifications;  $p < 0.01$ ). Finally, the number of patients who required further intervention during follow-up was 23 (43.4%) in the corticosteroid-before group and 41 (57.7%) in the corticosteroid-after group ( $p = 0.943$ ).

#### CONCLUSION

Administration timing of corticosteroid injection before or after calcium deposit removal does not impact treatment outcomes or incidence of adverse effects. Both approaches are equally effective, (however, US guidance should always be recommended to ensure accurate placement and prevent potential complications).

#### CLINICAL RELEVANCE/APPLICATION

The order in which this procedure is performed has been arbitrary, with no comprehensive study conducted on the optimal approach. Our study suggests that patients exhibit similar tolerance levels regardless of the treatment sequence.

### Intra-articular Injections of the Foot: An Evaluation of Physician Ordering Practices of Ketorolac and Kenalog

Monday, Nov. 27 12:15PM - 12:45PM Room: Learning Center

Justin Choi, BS (*Presenter*) Nothing to Disclose

#### PURPOSE

Intra-articular steroid injections are widely utilized to provide therapeutic relief and diagnostic evaluation of foot pain. Nonsteroidal anti-inflammatory injectants may offer a safer profile and have been shown to provide similar levels of pain relief as steroids. This study sought to evaluate physician preferences for injection agents for intra-articular foot injections.

#### METHODS AND MATERIALS

An IRB-approved retrospective review was performed using radiology data mining system (Nuance mPower) to identify patients who received intra-articular foot injections from 2011-2023 at a single academic institution. Study participants were eligible if they received an image-guided foot injection and divided into two cohorts: 1) injection with Kenalog and 2) injection with ketorolac. Demographics, BMI, diagnosis, site, agent, pre and post pain scores, treatment history, and ordering provider were recorded. The Visual Analogue Scale was used to collect the pain score. The difference between the pre and post pain scores determined the delta pain score. The Mann-Whitney U test was used to compare the delta pain score between the cohorts. Categorical variables were compared using Pearson's chi-square test.

#### RESULTS

Forty one of the 182 injections were with ketorolac. Eighty four percent of the patients were female and the average age was 65.5 years-old. Fifty percent of patients had a BMI =30. Osteoarthritis was the most common diagnosis for Kenalog and ketorolac injections (95% and 51%, respectively,  $p<0.01$ ) while the tarsometatarsal joints were the most common sites for both cohorts (82% and 37%, respectively,  $p<0.01$ ). Out of the four ordering providers identified, Provider 1 ordered ketorolac for 85% of the injections and Provider 2 ordered Kenalog for 91% of the injections ( $p<0.01$ ). Sixty seven percent of patients who received a kenalog injection and 3% of patients who had ketorolac injections required serial injections ( $p<0.01$ ). Twenty one percent of cohort 1 and 34% of cohort 2 underwent surgery after injections ( $p=0.26$ ). The mean delta scores reported for the Kenalog cohort and ketorolac cohort were -4 and -1, respectively ( $p<0.01$ ).

#### CONCLUSION

There was a clear preference in the type of agent ordered by each provider without a significant difference in post-injection surgical treatment rates. In recent years, there was an increase in usage of ketorolac and for a wider range of injection sites and diagnoses compared to Kenalog. Future studies could quantitate efficacy of intra-articular injections for foot pain by injectant.

#### CLINICAL RELEVANCE/APPLICATION

Ketorolac is a low-cost option for diagnostic and therapeutic intra-articular injections of the foot that offers a safety profile comparable to steroids, without significant differences in outcomes.

### Quantitative DWI Assessment of Changes in Graft Maturity at 6 and 12 Months after Anterior Cruciate Ligament Reconstruction and Correlation with Clinical Scores

Monday, Nov. 27 12:15PM - 12:45PM Room: Learning Center

Feiyuan Zhang (*Presenter*) Nothing to Disclose

#### PURPOSE

To quantify the status of graft remodeling using DWI functional MRI at 6 and 12 months after anterior cruciate ligament reconstruction (ACLR) and its correlation with the corresponding clinical function score.

#### METHODS AND MATERIALS

Forty-four patients who underwent ACLR between August 2020 and October 2021 and fifteen volunteers were recruited prospectively. Patients underwent 3.0T conventional MRI and DWI scans in 6 and 12 months after ACLR to measure ADC values of the intra-articular segment graft and its three segments (proximal, middle, and distal). IKDC, Lysholm scores were performed at each time point. Differences between 6 and 12 months postoperatively in ADC changes were compared using the Wilcoxon test. Correlation between ADC values of the intra-articular segment of the graft and clinical scores (IKDC, Lysholm score) in 6 and 12 months was analyzed using the Pearson correlation coefficient.

#### RESULTS

ADC values for the overall intra-articular segment of the ACL graft and its three parts (proximal, middle, and distal) decreased significantly from 6 to 12 months ( $P < 0.05$ ). There was no significant correlation between the ADC values of the grafts and the clinical scores (IKDC, Lysholm scores) at 6 and 12 months postoperatively. The ADC values of the distal segment of the intra-articular segment of the graft were higher than those of the middle and proximal segments at 6 months postoperatively ( $P < 0.05$ ), while the ADC values of the three segments in 12 months were similar.

#### CONCLUSION

The graft continued to mature from 6 months to 12 months after ACLR. The ADC values measured by the graft decreased but were not consistent with clinical function scores, suggesting that DWI and ADC are a finer reflection of changes in graft maturity than clinical scores.

#### CLINICAL RELEVANCE/APPLICATION

DWI can indicate the change of graft maturity and guide the recovery time of ACLR patients after surgery.

### Metal Suppression Using a New Generation Low-Field MRI; In Vitro Assessment in a Pig Knee Model

Monday, Nov. 27 12:15PM - 12:45PM Room: Learning Center

Johanna Luitjens, MD (*Presenter*) Consultant, Smart Reporting

#### PURPOSE

To evaluate the artifact size reduction using a metal artifact correction (SEMAC) sequence at 0.55T and 3T in porcine knee specimens with metal hardware compared to standard sequences. This study aims to assess the feasibility of metal suppression on a novel 0.55T system, to optimize the pulse sequence parameters and to compare them with imaging at 3T as standard of reference.

#### METHODS AND MATERIALS

Steel and titanium screws with 2.2mm diameter were implanted in 12 porcine knee specimens before imaging at 0.55T (Siemens Free.Max) and 3T (Siemens Vida) MRI using turbo spin echo (TSE), view angle tilting (VAT factor 50 and 100), and combined VAT and SEMAC (VAT100+SEMAC) in proton-density (PD) and T2 short TI inversion recovery (STIR) TSE pulse sequences. Sizes of metal artifacts were measured, and the visualization of the bone and cartilage, cruciate ligaments, joint effusion, and growth plate close to the metal artifact as well as the overall image quality, were assessed using a 5-point Likert scale. Wilcoxon-signed-rank tests were performed to determine the differences in image quality between 0.55T and 3T MRI.

#### RESULTS

The size of the metal artifacts for titanium was smaller in normal PD ( $p=0.002$ ), PD VAT100 ( $p=0.019$ ), PD VAT100+SEMAC ( $p=0.01$ ), and T2 STIR VAT50 ( $p=0.04$ ) at 0.55T MRI compared to 3T MRI. For stainless steel screws, almost all sequences showed smaller artifact sizes using 0.55T compared to 3T MRI ( $p<0.001$  for PD, PDVAT50/100, PD VAT100+SEMAC, T2 STIR VAT50/100, T2 STIR VAT100+SEMAC), only in T2 STIR no difference could be found. Close to stainless steel screws, the visualization of the growth plate and the bone was significantly better at 0.55T MRI in all sequences ( $p<0.001$ ). Results from PD with VAT100 and PD VAT100+SEMAC showed better visualization of growth plates close to the titanium screws at 0.55T MR compared to 3T MRI. For all other sequences, the visualization of the growth plates did not differ close to titanium screws between both systems. PD VAT100+SEMAC, PDVAT100, and standard T2 STIR FSE sequences showed better image quality at 0.55T compared to 3T MRI. For all other sequences (PD, PDVAT50, T2 STIR 50/100, TS VAT100+SEMAC), the image quality did not differ between field strengths.

#### CONCLUSION

Our results show that imaging of metal hardware using a novel 0.55T MRI system, in particular, if combined with SEMAC techniques, especially by using factor VAT50, is superior compared to 3T MRI. The visualization of anatomical structures at 0.55T MRI is not inferior compared to 3T MRI.

#### CLINICAL RELEVANCE/APPLICATION

New generation low-field MRI at 0.55T reduces metal artifacts in musculoskeletal imaging, leading to improved visualization of potential hardware complications and thus enhancing patient care.

### Impact of Weight Loss on Knee Joint Synovitis over 48 months and Mediation by Local Subcutaneous Fat: Data from the Osteoarthritis Initiative

Monday, Nov. 27 12:15PM - 12:45PM Room: Learning Center

Maximilian T. Loeffler, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

Synovitis and joint effusion are characteristics of the inflammatory phenotype of osteoarthritis (OA). Weight gain promoted the development of synovitis in a previous study. The purpose of this study was to investigate the effect of weight loss on synovitis progression and to assess whether subcutaneous fat (SCF) around the knee mediates the relationship between weight loss and synovitis progression.

#### METHODS AND MATERIALS

We included 234 overweight and obese participants (BMI  $\geq 25$  kg/m<sup>2</sup>) from the Osteoarthritis Initiative (OAI) with  $>10\%$  weight loss (n=117) or stable overweight ( $<\pm 3\%$  change, n=117) over 48 months matched for age and sex. Effusion-synovitis and Hoffa-synovitis using the MRI Osteoarthritis Knee Score (MOAKS) as well as SCF were assessed in unenhanced MRI studies at baseline and 48 months. Average joint-adjacent SCF (ajSCF) was calculated as the arithmetic mean of medial, lateral, and anterior SCF measurements. Odds-ratios (ORs) for synovitis progression over 48 months ( $=1$  score increase) were calculated in logistic regression models adjusting for age, sex, baseline BMI, Physical Activity Scale for the Elderly (PASE), and baseline SCF measurements. Mediation of the effect of weight loss on synovitis progression by a pathway through local SCF change was assessed.

#### RESULTS

The odds for effusion-synovitis progression decreased with weight loss and ajSCF decrease (OR=0.61 and 0.56 per standard deviation [SD] decrease, 95%-confidence interval [CI] 0.44-0.83 and 0.40-0.79,  $p=0.002$  and  $0.001$ , respectively). In contrast, the odds for Hoffa-synovitis progression increased with weight loss and ajSCF decrease (OR=1.47 and 1.48 per SD decrease, CI 1.05-2.04 and 1.02-2.13,  $p=0.024$  and  $0.038$ , respectively). Decrease in ajSCF mediated 39% of the effect of weight loss on effusion-synovitis progression.

#### CONCLUSION

Effusion-synovitis progression was slowed by weight loss and decrease in local subcutaneous fat. Hoffa-synovitis characterized by fluid in the infrapatellar fat pad increased at the same time, suggesting a decreasing fat pad rather than active synovitis. Decrease in local subcutaneous fat partially mediated the systemic effect of weight loss on synovitis progression.

#### CLINICAL RELEVANCE/APPLICATION

Local subcutaneous fat around the knee that can be easily measured in unenhanced MRI influences the progression of effusion-synovitis. Signal alterations in Hoffa's fat pad are non-specific for synovitis and should be interpreted with caution, particularly, in patients with weight loss.

### Outcomes and Surgical Revision of Meniscus Allograft Transplant

Monday, Nov. 27 12:15PM - 12:45PM Room: Learning Center

Timothy McIntyre (*Presenter*) Nothing to Disclose

#### PURPOSE

To evaluate factors influencing outcomes of meniscal allograft transplant as measured by both patient reported outcomes and complications requiring surgical revision of the meniscus.

#### METHODS AND MATERIALS

Patients undergoing meniscal allograft transplant between 2002 and 2022 at one institution were reviewed. Patient reported outcomes were measured as symptom and function scores via written survey during clinic visits and surgical revision of the meniscus following transplant was recorded. Surgical revision of the transplanted meniscus included meniscectomy, revision transplant, and joint arthroplasty. Univariate and multivariate analyses were performed to evaluate the effect of various prognostic factors on these two outcome measures.

#### RESULTS

81 patients were evaluated (median age 25 years, interquartile range 18-34, 44 patients were men). Patients showed a mean improvement in symptom score post-transplant of  $1.26 \pm 1.84$  ( $p < 0.001$ ). Patients without associated non-meniscal knee injuries showed a symptom improvement of  $2.26 \pm 1.66$  compared to  $0.83 \pm 1.87$  for those with these injuries ( $p = 0.006$ ). Interval time from meniscectomy to transplant was shown to have a spearman correlation coefficient of  $-0.293$  (95% CI  $-0.500$  to  $-0.051$ ,  $p = 0.017$ ) for symptom score improvement and  $-0.247$  (95% CI  $-0.462$  to  $-0.002$ ,  $p = 0.047$ ) for function score improvement. On multivariate analysis, age  $< 25$  years at the time of meniscectomy was found to be associated with increased need for post-transplant revision surgery (OR 0.18, 95% CI 0.03 - 0.96,  $p = 0.045$ ), as was post-transplant reinjury (OR 10.39, 95% CI 2.52 - 42.92,  $p = 0.001$ ).

#### CONCLUSION

Meniscal transplant provides symptomatic improvement for patients, which may be limited by the presence of concomitant non-meniscal injuries and increased time between meniscectomy and transplant. Age  $< 25$  years and reinjury are associated with increased likelihood of revision surgery following transplant, likely due to initial traumatic injury or traumatic reinjury.

#### CLINICAL RELEVANCE/APPLICATION

Meniscal allograft transplant is an increasingly used option for treating meniscal injury to preserve long term function of the knee. Previous studies have varied in choice of outcome measure, failure criteria, and sample size.

### Quantitative Assessment of Activity in Idiopathic Inflammatory Myopathy by Magnetic Resonance Image Complication (MAGiC)

Monday, Nov. 27 12:15PM - 12:45PM Room: Learning Center

Zhaorong Tian, MD (*Presenter*) Nothing to Disclose

#### PURPOSE

The study explored the feasibility of using Magnetic resonance image compilation (MAGIC) parameters to quantitatively evaluate changes of thigh muscles in idiopathic inflammatory myopathy (IIM), in order to provide a quantitative index for the evaluation of thigh muscle inflammatory activity in IIM. And to investigate the correlation between thigh muscle T1,T2 values and serum creatinine kinase (CK).

#### METHODS AND MATERIALS

Seventy patients with IIM proven by diagnostic criteria were enrolled in the study along with 30 healthy control subjects. According to clinical findings according to the International Myositis Assessment and Clinical Studies Group (IMACS), the 70 patients were divided into an active group (41 cases) and an inactive group (29 cases). All subjects were scanned using a SIGNATM Architect 3.0T MRI scanner by T1WI, FS-T2WI and MAGIC sequence of the thigh muscle. Two radiologists with 10 years of experience in musculoskeletal system diagnosis measured the T1, T2 values of active group, the inactive group, and the healthy control group thigh muscles on the Magic axial image. The T1,T2 values of thigh muscles in the active, inactive, and healthy groups were compared using one-way analysis of variance (ANOVA). Receiver operating characteristic (ROC) curves were used to analyze the diagnostic efficacy of T1,T2 values for activity of idiopathic inflammatory myopathy. A Spearman correlation coefficient model was used to correlate the mean T1,T2 values of thigh muscle with CK.  $P < 0.05$  was considered statistically significant.

#### RESULTS

The T1 values ( $516.11 \pm 82.42$ )ms in the active group of IIM were lower than those in the inactive group ( $794.24 \pm 84.38$ )ms, lower than those in the healthy control group ( $1184.73 \pm 178.23$ )ms, ( $T = -10.693$ ,  $p < 0.001$ ); T2 values of active groups in IIM ( $93.84 \pm 17.15$ )ms, were higher than inactive groups ( $65.07 \pm 9.7$ )ms, higher than those in the healthy control group ( $45.24 \pm 6.7$ )ms, ( $T = -10.013$ ,  $p < 0.001$ ). The areas under the ROC curves (AUCs) of T1,T2 values between the active and inactive groups of IIM,  $0.921$  (95%CI,  $0.846-0.967$ ),  $0.963$  (95%CI,  $0.912-0.993$ ), respectively. The T1,T2 values of thigh muscles in the IIM were positively correlated with CK, and the correlation coefficients ( $r$ ) were  $0.946$ ,  $0.969$  (all  $p < 0.001$ ), respectively.

#### CONCLUSION

MAGIC parameters can be used to quantitatively assess the activity of IIM, but also be used to demonstrate severity of damaged muscles in IIM, and T2 values can serve as a potential biomarker of disease activity. MAGIC provided imaging bases for the clinical diagnosis of IIM.

#### CLINICAL RELEVANCE/APPLICATION

MAGIC parameters can be used to quantitatively assess the activity and severity of damaged muscles of IIM, provided imaging bases for the clinical diagnosis of IIM.

### Association Between Severity of Heart Failure < Myocardial Amyloid Deposition on <sup>99m</sup>Tc pyrophosphate Scintigraph < Echocardiography in Patients with Familial Amyloid Polyneuropathy

Monday, Nov. 27 12:15PM - 12:45PM Room: Learning Center

Hiroshi Kanaya (*Presenter*) Nothing to Disclose

#### PURPOSE

We investigated the relationship between heart failure severity and myocardial amyloid deposition in patients with familial amyloid polyneuropathy (FAP) using <sup>99m</sup>Tc-pyrophosphate (PYP) scintigraphy and echocardiography.

#### METHODS AND MATERIALS

Subjects were 71 cases diagnosed with FAP by histopathological diagnosis and genetic testing. Ejection fraction (EF), brain natriuretic peptide (BNP), and cardiac troponin T (TnT) were used as indexes of severity of heart failure. Echocardiography and PYP scintigraphy were performed within 3 months of the blood test. In PYP scintigraphy, the heart to contralateral (H/CL) ratio was calculated in planar image. Pearson's correlation coefficient was calculated for the relationship between the index of the severity of heart failure and the H/CL ratio, also echocardiogram index such as interventricular septum thickness in diastole (IVSTd), posterior wall thickness in diastole (PLVWd) and the ratio of mitral velocity to early diastolic velocity of the mitral annulus (E/e').

#### RESULTS
