I) Over-diagnosis A) Magnification of the mediastinum and pulmonary vasculature B) The effect of body habitus C) The effect of positioning (supine versus upright; rotation) II) Blind spots A) Superimposed on the aortic knob B) Medial apices C) Near the hila D) Subcarinal region E) Anterior/posterior costophrenic angles III) Understanding post-operative complications A) Mediastinal hematoma B) Hemothorax and extra-pleural hematoma C) Torsion D) Sternal dehiscence IV) Common acute diffuse lung abnormalities A) Hydrostatic pulmonary edema B) Diffuse aspiration C) Pneumonia D) Acute lung injury V) Easily overlooked support device complications A) Hyperinflated endotracheal tube balloon cuff B) Catheter fracture and migration C) Retained guide wire

CHEE-63   Thoracic Vasculitis: Survival Guide For A Radiologist

Participants
Llúria Cornellas Escayola, Barcelona, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is:- To review the most relevant features of the main thoracic-involving vasculitis and the role of imaging techniques in their diagnosis.- To depict the thoracic imaging findings most commonly associated with vasculitis.- To update some aspects concerning vasculitis classification, diagnosis and treatment

TABLE OF CONTENTS/OUTLINE

1. Background2. The role of the imaging techniques in vasculitis management3. Imaging findings in thoracic-involving vasculitis:- Large-vessel vasculitis- Behçet disease- ANCA-associated small-vessel vasculitis- Other thoracic-involving vasculitis

CHEE-64   Micro CT Assisted Cross-modality Super-resolution - Toward Observing Micrometer-scale Anatomical Structure From Clinical CT Utilizing AI

Participants
Tong Zheng, Nagoya, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To learn the concept of super-resolution and its applications in radiology images2. To learn what micro CT is and how we build micro CT - clinical CT dataset to aid super-resolution of clinical CT images3. To understand how our AI system performs super-resolution of clinical CT images utilizing pre-prepared micro - clinical CT dataset4. To understand how the super-resolution of clinical CT images helps radiologists' diagnosis

TABLE OF CONTENTS/OUTLINE

1. AI-based super-resolution: fundamental concepts and application in radiology imaging- Super-resolution of radiology images utilizing medical AI2. Review of micro CT image scanning of excised lung- Resected lung specimen creation- Anatomical structures observable on micro CT images3. Building micro CT - clinical CT database for aiding clinical CT super-resolution- Micro CT scanning and clinical CT scanning of resected lung- Building aligned lung micro - clinical CT dataset by aligning micro - clinical CT images4. AI system for clinical CT super-resolution- Training medical AI on aligned micro - clinical CT images dataset- Using AI for finding the best super-resolution result automatically5. Super-resolution results of clinical CT images and our contributions- Super-resolution results of lung clinical CT images- One of possible applications: helping radiologists to measure bronchus' maximum diameter more precisely.

CHEE-65   Update On Chronic Thromboembolic Pulmonary Hypertension Imaging: What Lies Ahead?

Participants
Marta Porta Vilaro, MD, Barcelona, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

- -To describe image findings in chronic thromboembolic pulmonary hypertension (CTEPH) - -To compare the utility of the different techniques used for the radiological evaluation of CTEPH - - To describe imaging methods for the pretreatment assessment and treatment guidance

TABLE OF CONTENTS/OUTLINE

- Background - Classification of pulmonary hypertension - Diagnostic approach to pulmonary hypertension of unknown etiology - Physiopathology of chronic thromboembolic pulmonary hypertension - Imaging techniques in the diagnostic algorithm of pulmonary hypertension - CT angiography features of CTEPH - Dual Energy CT Angiography (DECT) - Perfusion patterns in CTEPH - Ventilation/Perfusion Scintigraphy and DECT comparison - Other Applications of the spectral imaging - Main differential diagnosis of CTEPH - Digital angiography - Treatment algorithm - Pre and Post-Thromboendarterectomy Evaluation - Balloon pulmonary angioplasty: pretreatment assessment and treatment guidance

CHEE-66   C.H.E.S.T: Trainee-focused Approach To Portable Chest X-ray

Participants
Daniela Garcia, MBBS, Philadelphia, Pennsylvania (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Accurate interpretation of findings on portable chest x-ray can be challenging in critically ill patients 2. Critical findings can be

hidden on portable chest x-ray 3. Suboptimal technique impairs detection of normal and pathological findings 4. Comparison with previous studies improves diagnostic accuracy 5. Consistent, systematic approach may decrease the number of missed diagnoses in clinical practice

TABLE OF CONTENTS/OUTLINE

Portable chest x-ray is a first line imaging modality used on regular basis in clinical practice. Cost-effectiveness and time-saving are some of the strengths of this diagnostic tool; however, it bears considerable limitations in technique that impairs accurate interpretation, especially in the evaluation of critically ill patients. Historically, up to 30% of missed diagnoses have been acknowledged on chest x-ray. Familiarity with pitfalls like magnification, rotation, interpreter bias, among others must be addressed early in training to reduce missed diagnoses. Through an easy and memorable acronym in this image rich educational exhibit, we present a systematic approach targeted towards trainees with the goal of reducing missed diagnoses and errors in the interpretation of portable chest x-ray.

CHEE-67   Congo, Are You REaDy? Exploring The Cardiothoracic Manifestations Of Amyloidosis

Participants
Murillo Polizelli, MD, Sao Jose do Rio Preto, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Teaching Points:I. Present epidemiology and types of amyloidosis elucidating its pathophysiology.II. Identify the cardiothoracic manifestations III. Recognize the main differential diagnoses

TABLE OF CONTENTS/OUTLINE

Table of Contents/Outline:1. Amyloidosis: a systemic diseasea. Epidemiology and clinical featuresb. Pathophysiology and subtypesc. Non-thoracic findings - some tips for the radiologist2. Amyloidosis and the Chesta. Pulmonary amyloidosis subtypesb. Tracheal amyloidosisc. Mediastinal amyloidosisd. Cardiac amyloidosis3. Differential diagnosis for cardiothoracic amyloidosisa. Lungsb. Trachea and main bronchi c. Mediastinumd. Heart

CHEE-68   Imaging Adults In Extracorporeal Membrane Oxygenation (ECMO): What The Radiologist Should Know.

Participants
Israel Diaz, MD, Santiago, Chile (*Presenter*) Nothing to Disclose

TEACHING POINTS

Recognizing configurations variants and normal positioning of ECMO cannulas.How to identify displaced cannulas.Protocols for contrast enhanced studies in ECMO.ECMO-related complications.

TABLE OF CONTENTS/OUTLINE

ECMO systems: Venoarterial (VA-ECMO) or venovenous (VV-ECMO).Normal positioning of cannulas in different ECMO configurations: femoro-jugular VV-ECMO, femoro-femoral VV-ECMO, dual lumen cannula VV-ECMO, femoro-femoro-jugular VAV-ECMO, central VA-ECMO, peripheral VA-ECMO.Imaging modalities and ECMO: Ultrasound, portable chest radiographs, CT scans.Chest radiograph features: normal position of cannulas, what to include on the report, and how to recognize a displaced cannula.CT scan: How to perform a contrast enhanced study in patients on ECMO, contrast enhancement protocols in venoarterial and venovenous devices.ECMO related complications: Pneumothorax, pneumomediastinum, arterial dissection, pseudoaneurysm, hematoma.

CHEE-69   Targeted Therapy In Lung Cancer: Concepts And Radiological Implications

Participants
Ioannis Vlahos, MRCP,FRCR, Houston, Texas (*Presenter*) Director, Grayscale Ltd;Co-owner, Grayscale Ltd;

TEACHING POINTS

To understand:1. The principles of targeted therapy in lung cancer2. The associated impact on radiological appearances, surveillance and management.

TABLE OF CONTENTS/OUTLINE

Based on the multidisciplinary meeting proceedings of a tertiary lung cancer referral center at a major cancer center this case-based review will highlight current radiological issues in the management of lung cancer with targeted therapies.Topics covered will include:• A guide to targetable genes for radiologists• Mechanism, use and imaging of existing targeted therapy (EGFR, ALK)• Novel targeted therapies (ROS1, RET, BRAF, KRAS)• Distinct radiology/demographics of activated mutation lesions• Expected timelines of response, modified response assessment• Drug generations, expected differences in regional response (e.g. pulmonary versus brain), toxicity imaging• Treatment Resistance: expected effect duration, imaging escape mutations (e.g T790M, C797S)• When to re-biopsy (Loss/Gain of mutations, Small Cell Transformation, non-mutation resistance)?• Impact of liquid biopsy and next gen sequencing on physical biopsy• Impact of combined therapy on radiology assessment, outcome and combination toxicity

CHEE-7   Pictorial Review Of Ulcer-like Projections In Thrombosed False Lumen Of Aortic Dissection

Participants
Xi He, Nagasaki, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is:1. To explain the pathology of ulcer-like projections (ULPs)2. To explain the complications associated with ULPs.3. To show imaging findings of ULPs in thrombosed false lumen.4. To know clinical significances of different imaging findings of ULPs development.5. To discuss the therapeutic strategies and management of ULPs.

TABLE OF CONTENTS/OUTLINE

1. Explanation of pathology of ULPs.2. Explanation of complications related to ULPs.3. Explanation of CT findings of ULPs in different

developing stages.4. Explanation of clinical significances of CT findings of ULPs.5. Explanation of treatment strategies of ULPs in various circumstances.6. Illustrative cases- Presentation of CT findings of ULPs in thrombosed false lumen.- Presentation of complications of ULPs, including aneurysmal change or rupture of ULP, or both, and the relative effects.7. Discussion8. Directions and summary

CHEE-70   Acute Respiratory Distress Syndrome: Imaging Findings And Correlation With The Pathological Stage Of The Disease.

Participants
Alberto Paternain, MD, Pamplona, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

To review the definition and causes of acute respiratory distress syndrome (ARDS).To show the pathological stages of this nonspecific inflammatory condition of the lung.To illustrate the radiological findings (both on X-ray and CT) of the different phases of the disease. To identify and recognize possible complications related to ARDS with the different imaging tests.To provide the most relevant differential diagnosis.To review the management and prognosis of patients with ARDS in the ICU.

TABLE OF CONTENTS/OUTLINE

A. ARDS:- Definition (criteria).- Causes and clinical disorders associated with ARDS: direct and indirect lung injury. B. Pathophysiology.- Stages of the disease (exudative, inflammatory and fibroproliferative phases).C. Correlation of imaging findings with pathological stage of the disease.- Exudative or acute phase (1-7 days): anteroposterior density gradient.- Proliferative or intermediate phase (8-14 days): patchy airspace and reticular opacities; thickening of the alveolar septa; bronchiectasis and honeycombing, as signs of poor prognosis.- Fibrotic phase (>15 days): Thick reticular pattern and ground-glass opacifications in the anterior region of the lung; pulmonary cysts and bullae.- Resolution phaseD. Complications:- Barotrauma: pneumomediastinum and pneumothorax- Pneumonia and abscesses.?. Differential diagnosis: cardiogenic edema, diffuse hemorrhage and acute interstitial pneumonia.F. Management and prognosis.

CHEE-71   Get To The Heart Of The Matter: What Every Radiologist Needs To Know About CT TAVI/TAVR Planning.

Participants
Irline Cordeiro de Macedo Pontes, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Computed tomography (CT) in context of transcatheter aortic valve implantation (TAVI)/ transcatheter aortic valve replacement (TAVR) has become widely used. In this way, radiologists must be familiarized with the main parameters of such exams. Therefore, the aim of this exhibit is to:1. Review the anatomy of the thoracic aorta.2. Describe the CT protocol in the context of TAVI/ TAVR, including the technical parameters and contrast administration.3. Detail the key points which need to be assessed in a CT before and after TAVI/ TAVR.4. Highlight the essential components of the report.

TABLE OF CONTENTS/OUTLINE

1. Introduction: the increasing role of CT in context of TAVI/ TAVR.2. Anatomy of the thoracic aorta.3. CT protocol.4. Assessment:- Aortic root.- Coronary arteries.- Vascular access.- Incidental findings.- Post TAVI/TAVR.5. Report.

CHEE-72   Pulmonary Infection Or Malignancy: A Case-based Quiz With Radiologic-pathologic Correlations

Participants
Marcelo Mota, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

- To illustrate typical and atypical imaging features of the most common infections that mimic pulmonary malignancies in a quiz-based approach. - To integrate clinical, imaging and histopathologic data in creating a differential that may establish a diagnosis in challenging cases. - To review current and future strategies for benign versus malignant differentiation in the textural analysis era.

TABLE OF CONTENTS/OUTLINE

Introduction - Infectious diseases are common causes for pulmonary nodule, mass or nodal disease and can mimic or co-exist with malignancy. - Histopathological correlations are essential for precise diagnosis and appropriate treatment. Interactive case-based quiz - Illustrative cases with radiologic-pathologic correlations. Clinical and imaging findings - Clues for differential diagnosis. Present and future directions - Textural analysis and other new techniques. Take home messages

CHEE-73   Surgical Repair Of Chest Wall Abnormalities: What The Radiologist Needs To Know

Awards
Certificate of Merit

Participants
Thomas Battey, MD, Charlottesville, Virginia (*Presenter*) Nothing to Disclose

TEACHING POINTS

The management of congenital chest wall anomalies is commonly surgical. Imaging plays an important role in treatment planning and post-operative surveillance.After viewing the exhibit the learner will be able to:Understand relevant chest wall radiologic anatomy Recognize most common clinically significant congenital abnormalities of the chest wallDescribe characteristic imaging findings that impact managementIdentify related surgical interventions, postoperative imaging findings, and common complications

TABLE OF CONTENTS/OUTLINE

1. Illustration of radiologic chest wall anatomy2. Most common congenital abnormalities, imaging findings and surgical management thereof:Pectus carinatum/excavatum: Sternal depression/protrusion quantifiable with Haller index, treated with Nuss or Ravitch procedureJeune dysplasia: Bell-shaped narrow thorax causing chest wall rigidity, surgery tailored to patient anatomyPoland

syndrome: Nongenetic absence of unilateral pectoralis muscles, treated with omental flap reconstruction if lung herniation, lung/cardiac injury, or cosmetic concernsCleidocranial dysostosis: Incomplete ossification of the clavicles, improper development of pubic bones, vertebrae, long bonesSprengel Deformity: Elevation of the scapula, omovertebral barCervical rib: Supernumerary rib originating from C7, can cause thoracic outlet syndrome, treated with rib resection, vascular stenting3. Imaging findings of post surgical complications4. Conclusions

CHEE-74 Radiogenomics In Lung Cancer: New Approaches Toward Diagnosis And Treatment In The Precision Medicine Era

Participants
Karla Schoen, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

? Summarize basic concepts of genomics in lung cancer.? Describe the concept of radiogenomics and its role in a systems biology approach. ? Explain the radiogenomics workflow process. ? Present the most relevant applications of radiogenomics in lung cancer imaging, focusing on non-small lung cancer. ? Discuss the limitations and challenges to be overcome before its implementation into clinical routine.

TABLE OF CONTENTS/OUTLINE

? INTRODUCTION - General concepts: precision medicine, "omics" integrative framework, radiomics and radiogenomics ? LUNG CANCER MUTATIONS AND TARGETED THERAPIES - Systems Biology Approaches in Lung Cancer: genomics, next-generation sequencing and other "omics" research - Clinical perspectives: molecular pathways and therapeutic targets ? RADIOMICS AND RADIOGENOMICS - A PRACTICAL GUIDE - Image acquisition - Creation of a dataset - Image segmentation - Feature extraction and categories - Feature selection and prediction model - Validation ? RADIOGENOMICS APPLICATIONS IN NON-SMALL CELL LUNG CANCER - CT imaging - PET-CT imaging (metabolic radiogenomics) ? DATA INTERPRETATION - Systematic approach to evaluate the results published in the literature ? LIMITATIONS AND CHALLENGES - Limitations, pitfalls and challenges ? FUTURE DIRECTIONS - What is on the horizon?

CHEE-75 A Heavy Burden Of Chest Neoplasms: A Diverse Spectrum Of Radiologic-pathologic Correlation.

Awards
Certificate of Merit

Participants
Jossue Espinoza SR, MD, Lima 01, Peru (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Illustrate imaging features of the common and rare chest wall malignant neoplasms. 2. Emphasize the role of multiparametric MRI techniques in establishing the diagnosis, follow-up during and after treatment, and evaluation for residual disease after surgery. 3. Review histopathologic correlations of the common and rare chest wall malignancies. 4. Emphasize diagnostic difficulties, potential pitfalls and differential diagnoses of these masses.

TABLE OF CONTENTS/OUTLINE

The goals of this exhibit are to: Provide a pictorial review of the diverse imaging appearances of the chest wall neoplasms. Discuss specific imaging and pathological characteristics of the several rare and unusual chest wall malignancies. Familiarize the audience with the imaging features of the chest wall malignant masses, thereby helping in formulation of a complete differential diagnosis. Describe the importance of multiparametric MRI techniques that include: • DWI and exponential ADC maps in assessment of tumor cellularity • Perfusion MRI and dynamic contract enhanced imaging in estimation of vascularity, tissue perfusion and capillary permeability The entities include: Chondrosarcoma Osteosarcoma Ewing Sarcoma Plasmacytoma Liposarcoma Angiosarcoma Malignant peripheral nerve sheath tumor Metastasis Chest wall invasion by intrathoracic malignancies Lymphoma Radiation-associated malignancies

CHEE-76 High-attenuation Pulmonary Abnormalities - Pictorial Essay And Systematic Approach.

Participants
Ana Duarte, MBBS, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1- To review the conditions associated with both focal and diffuse lung high attenuation lesions.2- Help general radiologists to recognize the patterns and distribution of high attenuation lesions of the lung.3- To propose a new systematic approach to high-attenuation abnormalities based mainly on their distribution in the lung parenchyma.4- To illustrate image findings of diverse causes of high attenuation lesions of the lung.

TABLE OF CONTENTS/OUTLINE

(A) Focal high-attenuation lesions.(B) Diffuse high-attenuation lesions in upper lung fields.(C) Diffuse high-attenuation lesions in lower lung fields.(D) Non-preferential field distribution: perilymphatic, vascular and randomic high-attenuation lesions.

CHEE-77 Expecting The Unexpected: A Practical Imaging Review Of (un)expected Pathologies Of The Pulmonary Arteries.

Participants
Melody Lebouche, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Discuss the role of imaging in the initial evaluation of the pulmonary arteries.2. To review clinical and epidemiological features of different pulmonary artery diseases.3. To discuss and illustrate unusual conditions of pulmonary arteries, going beyond classic pulmonary embolism. 4. To provide tips and tricks on identifying pitfalls on pulmonary arteries evaluation and protocol optimization

TABLE OF CONTENTS/OUTLINE

1. The role of different imaging techniques in evaluating pulmonary arteries and their diseases- Radiography- Computed tomography (CT) and Computed tomography angiography- Angiography- Magnetic resonance2. Pulmonary thrombotic and non thrombotic embolism -Multiples types of embolism- Synthetic embolism: vertebroplasty cement, valve RA-PT with endocarditis, catheter tip, projectile embolus.- Chronic thromboembolism3. Aneurysm- Rasmussen4. Vasculitis- Behçet- Takayasu- Giant cell arteritis5. Neoplasm- Angiosarcoma- Pulmonary neoplasm involving pulmonary artery- Tumor embolism6. Congenital- Pulmonary artery agenesis- Pulmonary artery sling - Aortic origin of a pulmonary artery- ARCAPA and ALCAPA- Pulmonary atresia

CHEE-78   Imaging Of Thymus In The Textural Analysis Era: New Insights Into Radiologic-Pathologic Correlations

Participants
Samya Alves, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

This presentation aims to: Discuss the role of imaging in the evaluation of thymic lesions, focusing on benign versus malignant differentiation; Summarize the most important imaging and histopathologic features listed in the main staging systems for thymic malignancies; Review imaging and histopathologic features in the differentiation of low- and high-grade thymic malignancies; Present recent insights in the histology prediction of thymic lesions using textural analysis techniques.

TABLE OF CONTENTS/OUTLINE

NORMAL THYMUS: Normal anatomy, radiography, ultrasound, computed tomography and magnetic resonance imaging; Histopathology of the thymus: a guide for radiologists. BENIGN THYMUS: Case-based review with radiologic-pathologic correlations; Pearls and pitfalls. MALIGNANT THYMUS: Case-based review with radiologic-pathologic correlations; Pearls and pitfalls; Clinical-pathologic staging systems for thymic malignancies: Masaoka-Koga, World Health Organization (WHO) and International Thymic Malignancy Interest Group (ITMIG); Resectability assessment: what to report?. RADIOMICS AND TEXTURAL ANALYSIS: General concepts; Applications, challenges and perspectives in thymic malignancies.

CHEE-79   Getting Reacquainted With The Subclavian Artery

Awards
Identified for RadioGraphics
Cum Laude

Participants
Caroline Robb, MD, Saint Louis, Missouri (*Presenter*) Nothing to Disclose

TEACHING POINTS

• The subclavian artery is an important structure that, given its location at the periphery of the field of view, is often overlooked on routine chest, and head and neck imaging. • Radiologists should be aware of the normal anatomy of the subclavian artery in relation to surrounding structures, as well as common and uncommon anatomic variants. • Radiologists play a key role in evaluating the subclavian artery and determining its potential role in a variety of pathologies, including entities such as thoracic outlet syndrome, subclavian steal syndrome, vasculopathies, and trauma. • The subclavian artery can play a key role as a thoracic collateral vessel and may contribute to potential complications, including endoleak and hemoptysis. • Post-procedural changes from prior vascular access may mimic vascular pathology. Given the increasing utilization of the subclavian artery for vascular access, radiologists must be able to distinguish true subclavian arterial pathology from potential mimics.

TABLE OF CONTENTS/OUTLINE

• Review the normal anatomy of the subclavian artery, and common and uncommon anatomic variants. • Examine pathologies that can affect the subclavian artery, including thoracic outlet syndrome, subclavian steal syndrome, vasculopathies, and trauma. • Evaluate the subclavian artery's role as a collateral vessel and how associated complications may present. • Discuss the appearance of mimics of subclavian pathology and how to distinguish these mimics from true pathologic entities.

CHEE-8   Radiological Intervention Of Type 2 Endoleak After Endovascular Aortic Aneurysm Repair

Participants
Xi He, Nagasaki, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is:1. To explain various causes of type 2 endoleak after endovascular aortic aneurysm repair.2. To show imaging findings of type 2 endoleak after endovascular aortic aneurysm repair.3. To explain therapeutic strategies of type 2 endoleak after endovascular aortic aneurysm repair.4. To show interventional radiology procedures in the management of type 2 endoleak after endovascular aortic aneurysm repair.

TABLE OF CONTENTS/OUTLINE

1. explaination of various causes and therapeutic strategies of type 2 endoleak after endovascular aortic aneurysm repair.2. Illustrative cases- Review of imaging findings of type 2 endoleak after endovascular aortic aneurysm repair.- Review of interventional radiology procedures in the management of type 2 endoleak after endovascular aortic aneurysm repair.3. Discussion4. Directions and summary

CHEE-80   Thoracic Findings In Hepatic Cirrhosis Patient

Participants
Ana Duarte, MBBS, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1- To review and illustrate main chest CT complications in cirrhotic patients 2- To recognize how these pulmonary alterations may correlate with the patient's outcomes

TABLE OF CONTENTS/OUTLINE

(A) Brief epidemiology and pathophysiology of thoracic findings in a cirrhotic patient. (B) Cirrhosis, its complications and the Chest: - Hepatopulmonary syndrome. - Portopulmonary hypertension. - Intrathoracic portosystemic collateral vessels. - Hepatic hydrothorax. - SARS and Lung infections in cirrhotic patients. (C) Cirrhosis common cases and the Chest: - Hepatocellular carcinoma metastasis to the chest - Interstitial lung diseases induced by medications frequently used in patients with cirrhosis and their complications. (D) How chest alterations in the context of cirrhosis may affect patients prognosis and eligibility to liver transplantation

CHEE-81   Pseudoaneurysms Of The Chest: Infrequent But Lethal

Participants
Patricia Rios, MD, Santiago, Chile (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To review the main causes and clinical importance of pseudoaneurysms of the chest2. To describe imaging findings of pseudoaneurysms in different intrathoracic locations3. To review therapeutic options and illustrate imaging characteristics in post-treatment follow-up4. Outline the primary differential diagnosis

TABLE OF CONTENTS/OUTLINE

1. Definition of pseudoaneurysms2. Etiology of pseudoaneurysms of the chest3. Classification of pseudoaneurysms of the chest: aortic, pulmonary artery, pulmonary vein, and cardiac pseudoaneurysms4. Imaging findings in computed tomography angiography (CTA) of aortic pseudoaneurysms: aortic root, ascending and descending aorta. Differential diagnosis and post-treatment follow-up5. Imaging findings in CTA of pulmonary artery pseudoaneurysms. Selective pulmonary angiography treatment6. Imaging findings in CTA of pulmonary vein pseudoaneurysms (intrapericardial and extrapericardial). Treatment by Brockenbrough technique7. Imaging findings in CTA of cardiac pseudoaneurysms. Main differential diagnosis

CHEE-82   Differential Diagnosis Of Endobronchial Lesions - A Pictorial Essay

Participants
Ana Duarte, MBBS, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

(A) Discuss the role of imaging in detection and characterization of endobronchial lesions and the importance of a clear communication with the referring physician (B) Review the main pathologies that may present with endobronchial lesions and its imaging patterns on multimodality imaging and correlate them to bronchoscopy(C) Describe imaging pearls and pitfalls related to luminal lesions and familiarize to features that can help distinguish inflammatory from neoplastic lesions

TABLE OF CONTENTS/OUTLINE

The role of different imaging techniques - Radiography- Computed tomography (CT)- Magnetic resonance (MR)- PET/CTMain pathologies - cases from our institution - Malignant endobronchial neoplasms- Benign endobronchial neoplasms- Endobronchial vascular lesions- Endobronchial infections- Foreign body- Secretion / mucous plug - Amyloidosis (tracheobronchial)- BroncholithiasisDifferential diagnosis - a practical approachWhat is important to report - a suggestion of structured report

CHEE-83   Acute Aortic Syndrome: Think Fast, Act Faster! A Radiology Residents Guide

Participants
Laura Machado, MD, Darby, Pennsylvania (*Presenter*) Nothing to Disclose

TEACHING POINTS

-To describe pathophysiology (including emerging concepts) and characteristics CT findings pertinent for intramural hematoma, penetrating aortic ulcers and aortic dissection-Discuss worrisome features of each entity-Outline a practical approach for quick and effective radiology reporting

TABLE OF CONTENTS/OUTLINE

-Types of aortic syndromes: brief discussion on pathophysiology including emerging concepts on IMH etiology-Pictorial review of acute aortic syndromes with specific necessary information to include in the radiology report-Demonstrate worrisome features associated with risk of progression and death, such as size and depth of PAU and ulcer like projections as well as extension of IMH-Pseudoaneurysms imaging characteristics and how to differentiate from PAU-Discussion of appropriate treatment and brief review on postop imaging

CHEE-86   Lung Transplantation Related Complications On Chest Imaging: A Guide For The Radiologist

Participants
Damaris Goncalves, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purposes of this exhibit are: • To list the main indications for lung transplantation (LT) in adults; • To illustrate with computed tomography (CT) images the signs of LT; • To illustrate the main complications of LT surgery, organizing them according to the time after transplantation they tend to show up (whether immediately - in the first 24 hours; early - in up to 2 months; or late - more than 2 months after the procedure).

TABLE OF CONTENTS/OUTLINE

- Brief summary on LT; - Main indications for LT; - Signs of LT on imaging; - Classification of main complications according to time of onset after LT; - Chest images of immediate (pneumothorax, pneumomediastinum, medical device mispositioning), early (acute rejection, infection, pulmonary embolism, bronchial dehiscence) and late (chronic lung allograft dysfunction, bronchial stenosis, organizing pneumonia) complications of LT.

CHEE-87   Pulmonary Findings In COVID-19 Recovery Phases: What Do We Know So Far?

Awards
Certificate of Merit

Participants
Mariana Peleja, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is:1) To review usual and unusual cases from the recovery phases from the COVID-19 infection.2) To present imaging findings of post-COVID-19 pulmonary fibrosis.3) To discuss late pulmonary complications related to COVID-19 infection.4) To compare the differences between the acute and the recovery phases of COVID-19.5) To go through several COVID-19 aspects on chest CT and facilitate radiological understanding and diagnosis.6) To highlight their characteristics in order to familiarize radiologists with these conditions, preventing unfavorable patient outcome.

TABLE OF CONTENTS/OUTLINE

1) Evolutionary tomographic aspects of COVID-19 infection from response to recovery.2) Review of imaging findings according to illustrative cases of:a) Pulmonary fibrosis;b) Long-term infection;c) Reinfection;d) COVID-19 simultaneous infection with other pathogens;e) COVID-19 complications: pulmonary embolism and pneumomediastinum.3) Reporting language for CT findings related to COVID-19 recovery phase.4) Sample cases of pearls, pitfalls, diagnostic difficulties, and mimics.5) Summary and gained knowledge.

CHEE-88   Solitary Fibrous Tumors: Not So Solitary After All

Participants
Christopher Sears, MD, Charlottesville, Virginia (*Presenter*) Nothing to Disclose

TEACHING POINTS

Solitary fibrous tumors (SFTs) are rare neoplasms of mesenchymal origin, representing less than 2% of all soft tissue tumors. While initially thought to involve the pleura exclusively, numerous extra-pleural sites have been described, such that these so-called extra-pleural solitary fibrous tumors (ESFTs) are in fact more common.After reviewing this educational exhibit the learner will be able to:1) Recognize the most common ESFTs2) Describe the imaging characteristics of ESFTs according to location3) Recognize the most common differential diagnosis of ESFT4) Identify the role of imaging in the diagnosis and management of ESFTs

TABLE OF CONTENTS/OUTLINE

1) Overview of ESFTs2) Imaging Characteristics according to location: the role of imaging in diagnosis3) Case-based review of most common ESFTs and differential diagnosis

CHEE-89   What Radiologists Need To Know About Extracorporeal Membrane Oxygenation (ECMO): Expected And Abnormal Imaging Appearances

Awards
Certificate of Merit

Participants
Felipe Sanchez, MD, Toronto, Ontario (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is to:1. To review the basics concepts and different types of ECMO.2. To discuss the technical consideration for performing contrast-enhanced CT examinations in patients with ECMO.3. To illustrate the normal appearance and complications of ECMO in chest X-ray and chest CT.

TABLE OF CONTENTS/OUTLINE

1. Introduction2. Basics of ECMOa. Backgroundb. Types of ECMO: cannula position and indicationsi. Veno-venous ECMOii. Veno-arterial ECMOc. ECMO in the COVID-19 pandemic3. Technical considerations for contrast-enhanced CT during ECMOa. Parenchymal enhancement and CTAb. CT pulmonary angiography4. Normal imaging appearancea. Expected appearance on Chest radiographyb. Expected appearance on CT5. ECMO complicationsa. Abnormal cannula position/migrationb. Intracranial hemorrhagec. Intrathoracic complicationsi. Air collections.ii. Hemorrhagic complications.d. Abdominal complications6. Final considerations

CHEE-9   Test Your Knowledge: Lung Ultrasound From A-lines To Z-lines

Participants
Thomas Marini, MD, Rochester, New York (*Presenter*) Nothing to Disclose

TEACHING POINTS

Lung ultrasound is a versatile and highly sensitive and specific imaging modality, yet interpreting lung ultrasound is not a routine component of diagnostic radiology education in the United States. In this presentation, we review all aspects of lung ultrasound for the diagnostic radiologist in an image-rich quiz format including the clinical indications for lung ultrasound imaging, the physics of lung ultrasound, the imaging features of pulmonary pathology on lung ultrasound, and the relationship between lung ultrasound and chest x-ray.

TABLE OF CONTENTS/OUTLINE

Quiz questions will be predominantly case-based with example lung ultrasound images. Initial questions will focus on image acquisition in lung ultrasound and the basic clinical indications for its use. Questions involving ultrasound physics will involve both illustrative case examples and original illustrations. The remainder of the presentation will highlight pulmonary pathology on lung ultrasound including common entities like pneumonia, pulmonary edema, and pleural effusion as well as less frequently encountered disease states like pulmonary abscess, empyema, vaping-induced lung injury, and COVID-19 infection.

CHEE-90   Advanced Techniques And Clinical Utility Of Computed Tomography Temporal Subtraction

Participants
Takatoshi Aoki, MD, PhD, Kitakyushu, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To introduce advanced CT temporal subtraction techniques and their applications. 2. To recognize the clinical benefits of CT temporal subtraction method. 3. To understand the clinical implication and challenges of CT temporal subtraction method.

TABLE OF CONTENTS/OUTLINE

1. Introduction: Overview of CT temporal subtraction 2. Image registration method for CT temporal subtraction (feature-based registration, new image registration frameworks based on convolutional neural networks, etc.) 3. Application for CT temporal subtraction to reduce misregistration artifacts 4. Clinical studies of CT temporal subtraction for lung nodule detection 5. Clinical studies of CT temporal subtraction for bone lesion detection 6. Summary of the role of CT temporal subtraction and future challenges Summary; Temporal subtraction (TS) is one of the computer-aided detection techniques in which previous images are subtracted from current images so that interval changes are enhanced. We reviewed article introduces CT-TS techniques and their applications in assessing abnormalities on chest CT. To generate CT-TS images more precisely, further development of the region extraction methods and applications is desired.

CHEE-91   A Painful Path! A Comprehensive Imaging Review Of Pleural Fistulas From Diagnosis To Management

Awards
Identified for RadioGraphics
Certificate of Merit

Participants
Vaibhav Gulati, MBBS, New Delhi, India (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. The expanse of the pleural space and its proximate relationships with various visceral and extra-thoracic spaces and organs makes it susceptible to developing a variety of fistulas with varying prognostic and management implications. 2. Although the clinical presentation can be quite varied, the different pleural fistulas share a common set of diagnostic findings. Given their rarity and often subtle imaging findings, the diagnosis of a pleural fistula can be missed or delayed resulting in significant morbidity. 3. The majority of the plural fistulas are secondary to surgery or foreign body related but they can also occur de-novo with infection or inflammation. The diagnosis of pleural fistulas is on the rise with increasing frequency of advanced anatomic and non-anatomic thoracic surgeries, often with use of intensive chemoradiation regimens which can predispose to poor anastomotic healing, in an already challenging patient cohort.

TABLE OF CONTENTS/OUTLINE

• Clinical features and epidemiology• Pathogenesis• Review of available imaging modalities• Direct and ancillary imaging features• Case examples with clinical and imaging pearls• Imaging pitfalls• Brief approach to management• Summary Of the various types of pleural fistulas including: o Pleuro-cutaneous o Broncho-pleural o Alveolar-pleural o Nodo-pleural o Pleuro-esophageal o Gastro-pleural o Pleural-pericardial o Pleural-subarachnoid o Pancreatico-pleural o Biliary-pleural o Colo-pleural o Nephro-pleural

CHEE-92   Gone, But Not Forgotten: Long-term Sequelae Of Pulmonary Infections

Participants
Abdullah Al Khalifah, MBBS, Baltimore, Maryland (*Presenter*) Nothing to Disclose

TEACHING POINTS

• To discuss the specific organisms that can produce chronic post-infectious pulmonary changes.• To identify imaging manifestations of various pulmonary infections and their evolution from the acute to the chronic phase.• To highlight the importance of recognizing these imaging patterns in order to provide guidance on microbiology testing and patient treatment.

TABLE OF CONTENTS/OUTLINE

• Types of pulmonary infections leading to possible long-term sequelae:o Bacterial (septic emboli, abscess, non-tuberculous mycobacterial infection).o Tuberculosis (Ranke complex, Ghon's focus, upper lobe fibrosis).o Histoplasmosis (fibrosing mediastinitis, histoplasmoma).o Aspergillosis (ABPA and bronchiectasis, mycetoma, air crescent sign).o Viral (post-acute COVID-19 or post-ARDS fibrosis, organizing pneumonia).• Review of characteristic imaging findings of long-term sequelae.• Analysis of current understanding of how acute phase imaging findings evolve into specific long-term sequelae.• Discussion of possible guidance on microbiology testing and patient management.

CHEE-93   What Should We Know About Immunotherapy And Pulmonary Reactions?

Participants
Camila V. Machado, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

After attending to this exhibit, the learner should be able to 1. Recognize the main manifestations associated with immunotherapy 2. Understand the risk factors for immunotherapy related pneumonitis 3. Describe the radiological patterns of immunotherapy related pneumonitis 4. Recognize the sarcoid-like reaction 5. Identify possible differential diagnoses

TABLE OF CONTENTS/OUTLINE

- Introduction to immunotherapy and associated adverse reactions through the body - Focus on immunotherapy related pneumonitis: risk factors and symptoms - Radiological patterns of immunotherapy related pneumonitis (diffuse alveolar damage, organizing pneumonia, non-specific interstitial pneumonia and hypersensitivity pneumonitis) - Sarcoid-like reaction - Pseudoprogression - Differential diagnoses (infection, edema, recurrence / progression, alveolar hemorrhage, pulmonary infarction, idiopathic interstitial lung diseases)

CHEE-94   2020: The Big Changes In The Diagnosis Of Hypersensitivity Pneumonitis (hp) In Adults, What Does The Radiologist Need To Know?

Awards
Certificate of Merit

Participants
Alan Hummel, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. What is hipersensitivity pneumonitis? 2. What were the major changes that occurred in 2020 in the new Diagnostic protocol published by the American tharacic society? 3. New PH diagnostic criteria4. Nonfibrotic PH5. Fibrotic PH6. Tips to make your day-to-day easier

TABLE OF CONTENTS/OUTLINE

1)Key recommendations2) Clinical and pathological features - The basic3) Radiological features4) Nonfibrotic phenotype - Typical HP or Compatible with HP- Parenchymal infiltration;- Small airway disease;- Distribution;5) Fibrotic phenotype - Typical HP or Compatible with HP or Inteterminate for HP- Lung fibrosis pattern and distribution;- Abnormalities that can indicate small airway disease- When can I suggest the indeterminate pattern6) Usual interstitial pneumonitis- Tips on how to differentiate

CHEE-95   Diffusion Weighted Imaging Of The Chest: A Primer For Radiologists

Awards
Identified for RadioGraphics
Magna Cum Laude

Participants
Jordi Broncano, MD, Cordoba, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To review the physical mechanisms, acquisition schemes, artifacts, tips and tricks to adequately set up a diffusion weighted imaging (DWI) in a state - of - the - art chest magnetic resonance (ChMRI) protocol.2. To describe the clinical applications of DWI as a game - changer in the characterization of thoracic masses, staging chest tumors, differentiating potential pitfalls and treatment monitoring.

TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Physical basis and analysis of DWI • Monoexponential DWI • Intravoxel Incoherent Motion (IVIM) • Diffusion Kurtosis Imaging (DKI) • Computed DWI (cDWI) 3. How to set up DWI in a clinical ChMRI protocol • Important technical parameters • Cardiac and respiratory motion• Echo Planar Imaging DWI (EPI - DWI) • Turbo Spin Echo DWI (TSE - DWI) • Single shot vs. Multishot DWI • Artifacts: How to avoid them • Multiparametric ChMRI protocol 4. Clinical applications • Lung lesions o Lesion characterization o Lung cancer staging o Treatment monitoring • Mediastinal lesions • Cystic thoracic lesions • Chest wall tumors • Pitfalls: Value of multiparametric ChMRI • Surgical planning: hybrid DWI-CT 3D printing 5. Conclusions

CHEE-96   Aspergillosis Revisited

Awards
Certificate of Merit

Participants
Bruna Loureiro, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is:1. To conduct a brief review of the current classification from different forms of pulmonary aspergillosis and correlate it with the previously described patterns 2. Understand the clinical and immunological context of the host as a pathological basis for the different forms of disease involvement 3. Recognize the radiological findings from each form of aspergillus involvement in the lung, with emphasis on the chronic forms

TABLE OF CONTENTS/OUTLINE

1. Changes in pulmonary aspergillosis spectrum nomenclature2. Interplay between the pathogen and host immune dysfunction or hyperactivity3. Radiological findings in different forms of pulmonary aspergillosisa. Acute invasive aspergillosisb. Subacute invasive aspergillosisc. Chronic pulmonary aspergillosisi. Aspergillus noduleii. Single (simple) pulmonary aspergillomaiii. Chronic cavitary pulmonary aspergillosisiv. Chronic fibrosing pulmonary aspergillosisd. Allergic bronchopulmonary aspergillosis

CHEE-97   Imaging The Post-operative Lung And Pleura: What To Expect And What To Look Out For

Awards
Certificate of Merit

Participants
Cristina Marrocchio, MD, Trieste, Italy (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Be informed on the indications and types of surgical procedures of the lung and pleura.2. Be able to recognize the normal post-surgical chest X-rays findings and their evolution in time, in order to immediately recognize any abnormality.3. Review the CT findings that are to be expected immediately after the procedure and during follow-up.4. Have a comprehensive review of the early and late complications that may occur, their imaging appearance and the normal findings after surgical revisions.

TABLE OF CONTENTS/OUTLINE

1. Introduction: • Description of pulmonary surgical procedures (pneumonectomy, lobectomy and non-anatomical resections) and

surgical approaches (open or thoracoscopic). • Description of pleural surgical procedures, including pleurodesis and decortication.2. Chest X-rays and CT findings that are expected after surgery and their evolution in time, according to the pathophysiological compensatory mechanisms that occur in the thorax.3. Description of early complications, including:• Pulmonary edema, pneumonia, acute respiratory distress syndrome, atelectasis• Hemothorax, chylothorax, empyema• Bronchopleural fistula, persistent air-leak4. Description of late complications, including:• Infections• Bronchial anastomotic stenosis• Post-pneumonectomy syndrome• Esophageal-pleural fistula• Tumor recurrence

CHEE-98   Simplifying Lung Cancer Staging Classification

Participants
Marcelo Dutra, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purposes of this exhibit are: 1. To simplify the 8th edition of the Lung Cancer Stage Classification (LCSC).2. To demonstrate a didactic method for learning and reminding important information on lung cancer staging, highlighting imaging features which should be stated in the radiology report. 3. To present the main changes that occurred in this latest version compared to the previous one. 4. To illustrate different manifestations of lung lesions at imaging in everyday practice. 5. Characterize lesions that are not included in this classification.

TABLE OF CONTENTS/OUTLINE

- Simple 5-question model to guide lung cancer staging - Adequate technique for lesion measurement and evaluation - Images of the main presentations of lung cancers and their prognosis - Images of the main relations of the lung lesion with surrounding anatomical structures - Classification of the tumor according to: Size. Relation to the adjacent thoracic structures. Identification of metastasis for clinical management.

CHEE-99   Chest Signs From A To Z: An Iconographic Guide.

Participants
Marina R. Rocha, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

(1) Describe and discuss some radiological signs used in thoracic radiology, detected both in plain radiography, and in computed tomography. (2) Favor the diagnosis of pathologies corresponding to the signs, and their differential diagnoses. (3) Expand the knowledge of these signs to radiologists and non-radiologists. (4) Emphasize that the main signs, associated with relevant clinical data, allows for a closer diagnosis and better patient care.

TABLE OF CONTENTS/OUTLINE

Several radiological images will be presented in each case, representing the most relevant signs and findings in chest radiology, listed below:(1) Air broncogram sign. (2) Air crescent sign. (3) Bat wing sign. (4) Bulging fissure. (5) Cervicothoracic sign. (6) Continous diafragma sign. (7) Comet tail sign. (8) Crazy paving sign.(9) Donut sign. (10) Eggshell calcification. (11) Finger in glove sign. (12) Ginko leaf sign. (13) Golden S sign. (14) Hamptons hump. (15) Hillum overlay sign. (16) Honeycomb. (17) Kerley lines. (18) Luftsichel. (19) Mosaic pattern. (20) Reversed halo sign. (21) Scimitar sign. (22) Silhouette sign. (23) Sinet ring sign. (24) Split pleura sign. (25) Tram track sign. (26) Tree-in-bud sign. (27) Westermark sign.

CAEE-1   Photon Counting Detector CT In Cardiovascular Imaging (CVI) - The Future Is Here

Awards
Cum Laude

Participants
Prabhakar Rajiah, MD, FRCR, Rochester, Minnesota (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To review the physics & principles of photon counting detector (PCD) CT2. To discuss the advantages of PCD CT compared to conventional CT in cardiovascular imaging (CVI)3. To illustrate additional information and flexibility in CVI clinical applications using PCD CT in illustrative cases

TABLE OF CONTENTS/OUTLINE

PCD CT Physics & PrinciplesTechnologies of PCD CT- Single source, Dual sourceAdvantages of PCD CT- Multienergy binning- k-edge imaging- Improved spatial resolution- Elimination of electronic noise- Decreased artifacts- Lower radiation- Lower contrast dosesApplications of PCD CT in CVI with case examples- High iodine CNR- Low contrast dose, salvage of suboptimal studies, small vessel visualization- Perfusion imaging- Lungs, heart, muscles- Delayed iodine enhancement- Myocardial scar- Ultra-high resolution- Improved vascular definition, small vessels, stents, characterization of complex plaques, improved calcium scoring- Decreased artifacts- Calcium blooming, metal artifact, beam hardening- Decreased electronic noise- Useful in large patients- Potential for multi-contrast and novel contrast imaging - e.g- iodine & gadolinium- Approaches to radiation dose reduction - e.g., through use of virtual monoenergetic images- Advanced material separationLimitations, pitfalls- Additional, complex data- Noise in high-resolution mode

CAEE-10   Imaging Evaluation Of Congenital Abnormalities Of The Aorta: From Embriology To Pathology To 3d Modeling.

Participants
Sara Rodriguez, MD, Cali, Colombia (*Presenter*) Nothing to Disclose

TEACHING POINTS

Abnormalities of the aorta account for a great percentage of the congenital cardiac abnormalities. Aortic arch malformations account for almost 20% of all malformations and aortic coarctation by itself corresponds to up to 8%.Congenital aortic malformations are caused by genetic mutations or by environmental factors. Understanding of the normal embryological development will facilitate the interpretation of the pathologic conditions affecting the aorta.Computed tomography (CT) and Magnetic Resonance Imaging (MR) can give more detailed information on the anatomy and function; therefore, they are usually used as a preoperative complementary tool. CT and MR can also give valuable information regarding other mediastinal and lung abnormalities.When evaluating CHD, it is important to do a segmental analysis, assessing sidedness of the heart, situs, atrioventricular connections, ventricoartial connections, and the aorta and pulmonary vessels.The objectives of this article are to describe the embryological development of the aorta, to review the pathologic conditions and its imaging findings and to discuss associated cardiac abnormalities. As a secondary objective, we will present some 3D models of the aorta.

TABLE OF CONTENTS/OUTLINE

IntroductionImaging protocolsNormal development of the aorta (embryology)Abnormalities of the ascending aortaAbnormalities of the aortic archAbnormalities of the descending aorta3D printingConclusions

CAEE-11   Cardiovascular Imaging In Women- Spectrum Of Normal And Abnormal

Participants
Prabhakar Rajiah, MD, FRCR, Rochester, Minnesota (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To review the differences in normative values in women in cardiovascular imaging (CVI)2. To highlight differences in several critical parameters in women3. To illustrate the spectrum of cardiovascular abnormalities that affect women

TABLE OF CONTENTS/OUTLINE

Differences in quantitative CMR in women from men - Lower ventricular volumes & mass- Higher EF, strain- Higher native T1, ECV- do not increase with age- Higher T2- Smaller atrial volumesPathological conditionsA. Heart failure- Concentric modeling more common- Diastolic dysfunction common with ageB. Aortic stenosis- Lower mass, fibrosis, cavity size, stroke volume- Preserved EF, more diastolic dysfunctionC. Aortic regurgitation- LV dilation not seen, underestimates diseaseD. Coronary artery disease- Higher

nonobstructive coronary arteries- Higher rates of angina- MRI useful in acute coronary syndrome- Stress MRI in chronic syndrome for ischemia and microvascular dysfunctionE. MINOCA- Higher in women- Coronary microvascular dysfunction, coronary plaque erosion, TakotsuboF. Peripartum cardiomyopathy- Low EF, mid myocardial/subepicardial LGE, risk stratificationG. CMR In pregnancy-Dissection, coarctation, cardiomyopathy, myocarditis, complex CHDH. Breast cancer chemotherapy cardiotoxicity- Lower EF, abnormal strain- High T1, T2- LGEI. Connective tissue disease- Rheumatoid arthritis, systemic sclerosis, SLE, vasculitisJ. Women carriers- Muscular dystrophies, Fabry diseaseK. Turner syndrome- Bicuspid valve, coarctation, aortic dilation, PAPVR

CAEE-12　Pre-procedure And Post-procedure CT Angiogram In Transcatheter Bicaval Valve System Implantation

Participants
Ana Barrio Alonso, MD, Gijon, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

Pre-procedure and post-procedure CT protocol. Mandatory measurements on pre-procedure CT. Post-procedure complications assessment.

TABLE OF CONTENTS/OUTLINE

BackgroundTricuspid valve disease is a common condition which is currently undertreated. Most patients with severe tricuspid regurgitation (TR) require medical treatment since surgical intervention is associated with high in-hospital mortality rates. Over the last few years, several transcatheter options have been specifically developed for TR treatment. Transcatheter bicaval valve systems are self-expanding biological valves which are implanted into the superior and inferior cava veins to reduce cava reflux and tricuspid insufficiency symptoms.Findings and procedure detailsMeasurements on pre-procedure CT are necessary to select patients and valves size. We obtained images using a Gated-ECG Cardiac Dual Source Multidetector Computed Tomography (MDCT). Images were transferred to a 3D Multi-Planar Reconstruction software (3D MPR) and measurements were taken by trained radiologists. Control post-procedure CT was performed in all patients.ConclusionsTranscatheter bicaval valve system is an innovative procedure wich requires measurements on CT with a specific pre-procedure protocol. This measurements must be taken by trained personal. Post-procedure CT is mandatory in order to detect eventual complications.

CAEE-13　Nuclear Medicine 101 For A Cardiac Radiologist

Awards
Identified for RadioGraphics
Certificate of Merit

Participants
Prabhakar Rajiah, MD, FRCR, Rochester, Minnesota (*Presenter*) Nothing to Disclose

TEACHING POINTS

A cardiac imager should know the basics of nuclear medicine relevant to cardiovascular disease.1. To review the common nuclear medicine techniques used in cardiovascular imaging2. To illustrate the applications of common nuclear medicine techniques in cardiovascular diseases3. To correlate nuclear medicine findings with cardiac CT and/or MRI

TABLE OF CONTENTS/OUTLINE

1. Introduction2. Role and advantages of nuclear medicine in cardiovascular diseases (CVD)3. Techniques - SPECT, SPECT/CT, PET/CT, PET/MRI4. Discussion of the following nuclear medicine techniques, including basic technical aspects, interpretation, correlation with cardiac CT/MRI and comparative diagnostic performanceA. Myocardial ischemia Physiological (exercise) or pharmacological stressSPECT- 201-Thallium or 99-Technetium PETAmmonia (13-NH3) oxygen (15-O2)B. Myocardial infarction-Evaluation of viability PET- FDGSPECT- Thallium redistributionC. SarcoidosisFDG-PET + PerfusionD. Other inflammatory disordersFDG-PETE. AmyloidosisBone scintigrams - Tc pyrophosphate, Tc- DPD, Tc-HMDP for ATTR types11C-Pittsburgh compound B (PiB)18F-Sodium Fluoride (NaF)F. Quantification of ejection fractionTechnetium labeled RBCs MUGA scanG. Cardiac masses FDG PET- primary & metastatic tumorsGa68 DOTATATE - Neuroendocrine tumors- ParagangliomasH. VasculitisFDG, TSPO agents, fibroblast activation protein (FAP)I. Infections of prosthesis and graftsFDG-PETLabeled WBCs (Tc or In-111)Ga 68J. Heart failureImaging autonomic nervous system

CAEE-14　Cardiac Magnetic Resonance In Acute Myocardial Infarction. A Step By Step Guide.

Participants
Miguel Cruz, MD, Mexico City, Mexico (*Presenter*) Nothing to Disclose

TEACHING POINTS

• To review cardiac magnetic resonance (CMR) protocols in acute myocardial infarction (AMI).• Examine CMR sequences used in AMI and what information each of them provides: "must have" sequences and novel sequences that soon will be "must haves".• Provide a simple guide to interpreting CMR in AMI with endpoints and dobutamine stress imaging.• Outcomes and follow up.

TABLE OF CONTENTS/OUTLINE

1. A review of the impact of CMR in AMI.2. A review Imaging sequences: what you must have and what is novel.a. Must have: Scout, FSE, SSPF, T2, T2*, first pass perfusion, LGE.b. Novel: T1 and T2 Mapping and 3D angiography.c. Dobutamine stress.3. A step-by-step approach to sequence integration and interpretation in AMI.a. What each sequence means and how to proceed.4. Viability and myocardial salvage reasoning and interpretation algorithm in CMR for AMI.5. Outcomes and follow up.a. Complications: Aneurysm, thrombus, wall rupture.

CAEE-15　Outpouchings Of The Heart

Awards
Identified for RadioGraphics
Certificate of Merit

Participants

Cameron Hassani, MD, Los Angeles, California (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is: 1. Review the imaging appearances of various outpouchings of the heart, by chamber 2. Discuss the associated clinical findings for each outpouching, where relevant 3. Review associated imaging findings for each outpouching, where relevant

TABLE OF CONTENTS/OUTLINE

RA Subthebesian pouch Cavotricuspid isthmus RV Diverticulum Psuedoaneurysm (post cath) ARVD Constrictive pericarditis RVOT TOF aneurysm LA Accessory appendage Diverticula Septal pouch (incomplete closure) Interatrial septal aneurysm Heart transplant Partial absence of pericardium LV VSD (spontaneous closure) Patch aneurysm Ventricular Cleft (Myocardial Crypt) Diverticulum Aneurysm Apical Balooning Pseudoaneurysm Double left ventricle LVOT Pseudoaneurysm aortic mitral intervalvular fibrosa Sinus of Valsalva aneurysm (ruptured and non ruptured) Mimics Metastatic disease

CAEE-16   Precautions For Late Gadolinium Enhancement MRI Interpretation To Identify False Findings

Participants
Tomoyuki Kido, Toon, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

Cardiovascular magnetic resonance imaging (MRI) can evaluate cardiac disease from various directions. In particular, late gadolinium enhancement (LGE) MRI can visualize fibrosis of the myocardium and plays an important role in myocardial characterization in clinical practice. Occasionally, LGE MRI presents various false findings, making diagnosis difficult. It is important for radiologists to know the types of false findings on LGE MRI and precautions for accurate image interpretation. The purpose of this exhibit is: 1.To review the role and principle of LGE MRI. 2.To explain the types of false findings on LGE MRI and their solutions. 3.To show points to note in interpretation for accurate diagnosis.

TABLE OF CONTENTS/OUTLINE

1. Late gadolinium enhancement magnetic resonance imaging - Role, advantages, limitations. 2.Principle of LGE MRI. 3.Example images of false finding on LGE MRI. 4.How to reduce false finding on LGE MRI. 5.Points to note in interpretation of LGE MRI. 6.Future directions and summary.

CAEE-17   Diastology With Cardiac MRI- A Practical Guide

Awards
Identified for RadioGraphics
Magna Cum Laude

Participants
Prabhakar Rajiah, MD, FRCR, Rochester, Minnesota (*Presenter*) Nothing to Disclose

TEACHING POINTS

Diastolic dysfunction is an important cause of morbidity, accounting for 55 % of heart failure.1. To understand the basic concepts of normal and abnormal diastolic function2. To review the MRI techniques available for the evaluation of diastolic function3. To illustrate the role of MRI in the evaluation of patients with Heart Failure with preserved Ejection Fraction (HFpEF)

TABLE OF CONTENTS/OUTLINE

Diastolic functionEcho for diastolic function-normal, abnormal, pseudonormalDefinition of HFpEFMRI techniques for evaluation of diastolic functionA. Cine imaging-Left atrium (LA)---- LA relaxation---- LA enlargement----Contractile function- Left Ventricle (LV)----LV filling curve: Decreased peak filling rate & increased time to peak filling rates----LV fractional area change----Myocardial feature tracking- Abnormal LV relaxationB. Myocardial tagging-Abnormal LV relaxationC. Phase-contrast- Mitral inflow----E/A----Deceleration time of E peak filling velocity- Myocardial phase mapping----E/e' ratio- Pulmonary venous flow-----S, D, A waves- 4D flow----Intraventricular pressure gradients at late ejectionD. MR elastography- Increased myocardial stiffnessCase-based review of MRI in common causes of HFpEF- Infiltrative disorders (e.g. amyloid, sarcoid)- Storage disorders (e.g. Fabry disease)- Hypertrophic cardiomyopathy- Endocardial fibroelastosis- Radiation- Pericardial disorders- Hypertension, coronary artery disease

CAEE-18   Role Of Multimodality Imaging In The Planning And Follow-up Of Percutaneous Pulmonary Valve Implantation

Participants
Marguerite Faure, MA, Wilrijk, Belgium (*Presenter*) Nothing to Disclose

TEACHING POINTS

To discuss the role of percutaneous pulmonary valve implantation (PPVI) in patients with (repaired) congenital heart diseases involving the right ventricular outflow tract (RVOT). To show which transthoracic echocardiography (TTE) and MRI findings with regard to RV and pulmonary valve dysfunction contribute to establish the indication for PPVI. To demonstrate the role of computed tomography (CT) in pre-operative planning by evaluating the size and morphology of the RVOT and pulmonary trunk, valve sizing as well as assessing the risk of coronary compression. To give an overview of potential complications after PPVI including endocarditis. To discuss the role of TTE, MRI, CT, and positron emission tomography in the follow-up after PPVI to confirm normal valve functioning and possible complications.

TABLE OF CONTENTS/OUTLINE

1. Background of the PPVI procedure and commonly implanted valve types. 2. TTE, MRI, and CT analysis prior to PPVI: RV volume, valve functioning, quantification of pulmonary conduit, RVOT size and function and assessment of its morphology. 3. CT analysis prior to PPVI: assessment of coronary compression risk in candidate patients for PPVI. 4. Overview of potential complications after PPVI. 5. TTE, MRI, and CT imaging after PPVI: evaluating valve prosthesis, anatomical changes, and possible complications. Tips and tricks for image acquisition and interpretation with the different modalities. 6. MR imaging before and after PPVI: ventricular function and flow measurements including 2D and 4D flow in PPVI patients.

CAEE-19   Usefulness Of Simulated 3D-CT Imaging In Pulmonary Vein Isolation

Participants
Fumiaki Sasaki, BSC, Akita, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

In this exhibition, we will introduce pulmonary vein isolation (PVI) simulation 3D-CT images developed in our hospital. To understand the importance and efficacy of preoperative 3D-CT in PVI. To understand the observation points of preoperative 3D-CT in PVI. To emphasize that preoperative 3D-CT images can be used to simulate PVI in addition to understanding the anatomical structures. To emphasize that the suitable method of PVI can be selected from the 3D-CT.

TABLE OF CONTENTS/OUTLINE

Pathogenesis of atrial fibrillation. Anatomy of the left atrium and pulmonary veins. Types and characteristics of PVI method. Simulation image for radio frequency ablation (RFA). Simulation image for cryo balloon ablation (CBA). Utilization of 3DCT during PVI. Characteristics of pulmonary vein morphology that influence the difficulty of CBA.

CAEE-2   Utility Of Multi-modality Imaging In The Planning Of Complex TAVR Procedures

Awards
Certificate of Merit

Participants
Prabhakar Rajiah, MD, FRCR, Rochester, Minnesota (*Presenter*) Nothing to Disclose

TEACHING POINTS

TAVR has now been expanded to low-risk patients and several complex scenarios1. To review the complex clinical scenarios in which transcatheter aortic valve replacement (TAVR) is performed.2. To understand the role of multimodality imaging in the evaluation of complex TAVR3. To illustrate the specific measurements and adaptations required for CT in these complex situations.

TABLE OF CONTENTS/OUTLINE

Multimodality imaging in TAVR- Echo, CT, MRICT protocolsMRI in severe renal dysfunction- ProtocolReview of the following complex scenarios, with case examplesA. Low-flow low-gradient severe aortic AS- Aortic valve calcium score in CT (> 2000 in men, > 1200 in women)- Dobutamine stress echocardiography- Diagnostic algorithmB. Bicuspid valve- Morphological classification- Sizing of annulus- 2nd orthogonal plane parallel to device landing zone- Concomitant aortopathy- Horizontal aorta- < 30 degrees- Coronary artery anomalies- Coronary ostial heightC. Native aortic regurgitation- Large annulus- Poor visualization at fluoroscopy- Absent calcification- Impaired fixation in annulus- AortopathyD. Valve-in-valve (VIV) TAVR- Bioprosthetic valve evaluation- Prosthetic valve sizing- Virtual valve to coronary ostial distance- Coronary ostial height- Sinus of Valsalva diameter- Measurements for BASILICA procedureE. Concomitant valvular disease- Mitral regurgitation (30 %)- Tricuspid regurgitation (24 %)- Planning for other transcatheter interventionsF. Severe renal dysfunction

CAEE-20   Cardiac Amyloidosis. The Role Of Multimodality Evaluation

Participants
Patricia M. Carrascosa, MD, Buenos Aires City, Argentina (*Presenter*) Speakers Bureau, General Electric Company

TEACHING POINTS

To describe the role of each imaging modality in the diagnosis of cardiac amyloidosis. To show typical imaging findings of cardiac amyloidosis in echocardiography, cardiac MRI and radionuclide imaging. To emphasize advantages and disadvantages of each modality.

TABLE OF CONTENTS/OUTLINE

Definition, pathophysiology and classification of amyloidosis. Echocardiography - Acquisition technique - Description of imaging findings - Advantages and disadvantages Cardiac MRI - Acquisition technique - Description of imaging findings - Advantages and disadvantages Radionuclide imaging - Acquisition technique - Description of imaging findings - Advantages and disadvantages Sample cases illustrating the importance of multimodality approach Summary.

CAEE-21   Coronary Artery Calcium Scoring: Current Practice And Future Directions

Awards
Certificate of Merit

Participants
Leah Strickland, MD, Durham, North Carolina (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Understand the Agatston score (AS) including CT acquisition, interpretation, and predictive value 2. Understand the role of coronary artery calcium (CAC) scoring as it pertains to clinical guidelines 3. Discuss strengths/weakness of AS, alternative scoring methods, and future directions 4. Understand the role of CAC on non-gated CT exams

TABLE OF CONTENTS/OUTLINE

Background on AS: 1. CT acquisition 2. Derivation/interpretation of AS 3. Comparison of AS with alternative scoring methods (volume and mass scores) 4. Limitations of AS Current practice and clinical significance of CAC: 1. Predictive ability of AS for obstructive CAD2. Predictive ability of AS for major adverse cardiovascular events, importance of age, sex and race 3. Performance of AS compared to other risk assessment tools (Framingham Risk Score and Pooled Cohort Equation) 4. Recognition that CAC is a unique tool for risk stratificationA because it is a composite measure of cumulative risk factor exposure 5. Discussion of the 2019 American Heart Association (AHA)/American College of Cardiology (ACC) guidelines regarding role of CAC for patient risk stratification and preventive statin therapy 6. Clinical value of reporting of CAC on non-gated CT exams Future directions: 1. Improving CAC scoring beyond AS, including calcium density, CAC distribution, and lesion-specific assessment 2. Optimizing CT

acquisition, including dose reduction 3. Optimizing CAC assessment on non-gated CTs 4. Use of CAC scans for assessment of extracoronary biomarkers, such as epicardial fat etc.

CAEE-22   Vascular Rings And Slings: The Jewels Of Cardiac Angiographic Imaging

Participants
Kathleen Clancy, DO, Rochester, New York (*Presenter*) Nothing to Disclose

TEACHING POINTS

Vascular rings and slings have a rare incidence (less than 1%), recognizing them is important because in some cases surgical treatment is necessary to relieve symptoms related to vascular compression. We provide a pictorially rich, comprehensive review of the different anatomic imaging appearance of vascular rings and slings on cardiac angiography (CT and MR).

TABLE OF CONTENTS/OUTLINE

Case based review anatomic features of the different rings and slings, including double aortic arch (with/without atretic segments), right aortic arch with aberrant left subclavian, and pulmonary sling.Briefly discuss how patients will present, why imaging is important, and what complications to look for in each condition.Discuss the pros and cons of cardiac MRI versus cardiac CT imaging, with an emphasis on when to choose each imaging modality.Review the role of imaging in both pre-surgical planning and post-surgical evaluation/follow-up, including the role of 3D modeling, which will assist in the surgical management of these patients.

CAEE-23   Exploring The Role Of Epicardial Fat In Atherosclerotic And Inflammatory States

Participants
Nahom Seyoum, Baltimore, Maryland (*Presenter*) Nothing to Disclose

TEACHING POINTS

Current studies suggest that increased EFV can be an early predictor of coronary artery disease progression. Epicardial fat volume (EFV) can be quantified by 3D region of interest analysis of CT with radiodensity thresholds. However, uncertainty is present in existing studies on whether HIV and HCV infections promote early atherosclerosis and whether EFV plays a role in the inflammatory process of these infections.

TABLE OF CONTENTS/OUTLINE

I. What is fat and epicardial fat a. Location b. Function c. Epicardial fat as an active endocrine organ II. Pathologic effects of epicardial fat a. Myocardial inflammation b. Insulin resistance c. EFV and systolic and diastolic heart dysfunctionIV. Atherosclerosisa. Pathogenesisb. EFV as a biomarkerIV. Inflammatory states: HIV and Hepatitis C a. HIV 1. Evidence for increased rates of atherosclerosis, cardiovascular disease, and cardiovascular mortality 2. Association with increased EFV 3. EFV increase related to antiretroviral therapy and chronic inflammation 4. EFV - a connection between HIV infection and early atherosclerosis versus association with just one b. HCV 1. Evidence for increased rates of atherosclerosis, cardiovascular disease, and cardiovascular mortality 2. EFV significantly increased in chronic HCV patients, especially with cirrhosis 3. Therapeutic clearance and reduced cardiovascular risk 4. EFV - a connection between HCV infection and early atherosclerosis versus association with just oneIV. How to measure epicardial adipose on CT

CAEE-25   CT Comes To The Rescue: A Review Of Findings Missed On Echo

Participants
Muhammad Aziz, MBBS, Birmingham, Alabama (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Despite being the first line of diagnosis in evaluating congenital and acquired cardiovascular disease patients, echocardiography is limited due to several factors; including operator experience, filed of view, and artifacts among others.- Due to its excellent spatial and temporal resolutions, fast acquisition, wider field of view, and ability to tailor the CT technique along with improved postprocessing methods, CT significantly improves evaluation and detection of various subtle and otherwise difficult to image cardiovascular abnormalities misinterpreted or missed on echocardiography.- Using multiple case examples, review and emphasize the role of cardiac CTA as a problem-solving tool in a variety of cardiovascular diseases where echocardiography was unable to provide complete or entirely correct assessment.

TABLE OF CONTENTS/OUTLINE

- Review of cardiac CTA methods of image acquisition, different contrast protocols and modification options.- Using multiple multimodality image examples, highlight the ability of cardiac CTA to clarify, confirm or refute findings seen or missed on transthoracic or transesophageal echocardiography, including examples of postsurgical complications like; paravalvular leaks, dehiscence, pseudoaneurysms, abscesses and dissection, intracardiac thrombus, and congenital abnormalities.

CAEE-26   Clinical Benefits Of D-SPECT And A-SPECT Combination In Myocardial Perfusion Imaging

Participants
Takuji Nanno, Suita, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

Dedicated cardiac single-photon emission computed tomography (SPECT) with cadmium-zinc-telluride detectors (D-SPECT) provides superior image quality compared to conventional Anger SPECT (A-SPECT). Upright and supine images can be obtained by D-SPECT and shifting attenuation effects is useful to detect artifacts. However, it takes time and effort to acquire images in a different position in need of adjusting the imaging chair. Since planar images (PIs) cannot be acquired by D-SPECT, heart-to-lung-ratio (H/L) cannot be evaluated. In this study, we suggest acquiring supine A-SPECT images in a shorter scan time than usual for combining them with upright D-SPECT images. It has another benefit for creating virtual PIs (VPIs) from A-SPECT projection data and calculating the H/L ratio without obtaining conventional PIs. This study presents a novel method of integrating properly normalized D-SPECT and A-SPECT data and introduces the Combined Polar map (C-Polar map). The short-time protocol with Collimator Broad Correction and reconstruction in A-SPECT are explained. The methods of assessing the H/L ratio on VPI are also described. These techniques help to detect the false-positive caused by attenuation artifacts and improve the diagnostic sensitivity in MPI without decreasing patient throughput.

CAEE-27   Spontaneous Coronary Artery Dissection (SCAD): An Uncommon Diagnosis Of A Common PresentationPrimer For Cardiothoracic Radiologists

Participants
Mohammad Madani, MD, Sacramento, California (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is 1. To understand the epidemiology, risk factors, associations (including fibromuscular dysplasia), pathophysiology, clinical manifestation and management of spontaneous coronary artery dissection (SCAD). 2. To familiarize with the multi-modality imaging findings that can be seen in the setting of SCAD including those that indicate its severity, types and associated myocardial infarction. 3. To learn the role of coronary CTA (CCTA) for both initial diagnosis (including differentiation from atherosclerotic coronary artery disease and evaluation of related extra-coronary vascular pathologies) as well as its role for follow-up in patients with SCAD.

CAEE-29   Capturing The Heart: A Case-based Module On Improving Image Quality Of Challenging Coronary Computed Tomography Angiography

Participants
Rokas Liubauskas, MD, Boston, Massachusetts (*Presenter*) Nothing to Disclose

TEACHING POINTS

This interactive, case-based module highlights pitfalls and proposes solutions when obtaining diagnostic CCTA in five clinical scenarios: atrial fibrillation, chronic kidney disease, transplant evaluation, obesity, and contraindications to routine medications. Methods to ensure diagnostic CCTA quality in patients with atrial fibrillation include heart rate control, retrospective EKG-gating, whole-heart coverage scanners, and the development of intra-cycle motion correction algorithms. Protocol considerations in CKD include adequate pre- and post-procedural hydration, use of contrast/saline mix, high contrast injection rate, dual-energy CT, post-processing techniques (bone kernels). Liver and kidney transplant candidates can benefit from cohort-specific contrast selection, contrast volume adjustment. The utilization of specific image acquisition and reconstruction parameters is reviewed. For high BMI patients, tube output, contrast volume, and injection rate algorithms, iterative reconstruction are reviewed. Certain clinical scenarios prevent the use of typical pre-medication regimens. Alternative pre-medication options, including the indirect advantages of diltiazem and ivabradine, will be discussed.

CAEE-30   Hemoptysis In Congenital Heart Disease: Role Of The Radiologist

Awards
Certificate of Merit

Participants
Vimal Mondy, MBBS,MD, Trivandrum, India (*Presenter*) Nothing to Disclose

TEACHING POINTS

1.Hemoptysis is a rare but potentially lethal complication in congenital heart disease (CHD). 2.The various causes and factors contributing to hemoptysis in CHD include systemic arterial supply to lungs in the setting of congenital defects causing decreased blood flow, Eisenmenger syndrome, pulmonary arteriovenous malformations (PAVM), pulmonary venous congestion, pulmonary infections secondary to increased pulmonary blood flow, coagulopathy and anticoagulant toxicity, and associated malformations. 3.Imaging, especially multidetector CT (MDCT), plays an important role in identifying the source of hemoptysis in CHD. These include hypertrophied bronchial arteries, major aortopulmonary collaterals (MAPCAs) arising from the aorta or its branches, PAVM, shunts causing Eisenmenger syndrome, causes of pulmonary venous congestion like an obstructed total anomalous pulmonary venous circulation and associated malformations like pulmonary sequestration. 4.MDCT can identify the involved lung and lobe which has important implications in management. 5.The interventional radiologist plays a key role in by offering minimally invasive procedures like embolization of hypertrophied bronchial arteries, MAPCAs and PAVM, which are often the common sources of hemoptysis.

CAEE-31   Comprehensive Pre And Post-transcatheter Aortic Valve Implantation Assessment With Cardiac CT Angiography

Participants
Desiree Louise Batista, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

(1) To discuss the acquisition protocols in different CT systems and main pitfalls; (2) To review the post-processing workflow required for procedure planning; (3) To discuss the main uses of Cardiac for identifying post-TAVI complications: hypoattenuation affecting motion, thrombus and pannus differentiation.

TABLE OF CONTENTS/OUTLINE

(1) Introduction and Background; (2) Present the main acquisition protocols with different vendors including ultra-high pitch, variable high pitch, etc.; (3) Present the workflow for post-processing and adequate measurement of aortic annulus, coronary ostia and aorta; (4) Present common complications after TAVI in which cardiac CT adds valuable information; (5) Take-Home messages, future directions and teaching points.

CAEE-32 Rarest Of The Rare: Institutional Case-based Presentation Of Unusual Coronary Artery Anomalies Using 3D-Cinematic Renderings

Participants
Abtin Jafroodifar, MD, Syracuse, New York (*Presenter*) Nothing to Disclose

TEACHING POINTS

Review all types of coronary artery anomalies, including the underlying aortic and coronary anatomy, that a radiologist should be able to recognize. Identify and familiarize the rarest coronary artery anomalies based on imaging findings (ALCAPA, ARCAPA, high-take off, and single coronary artery). Learn to properly communicate and report coronary artery anomalies, as they can have an increased risk of mortality and morbidity.

TABLE OF CONTENTS/OUTLINE

1)Review normal coronary artery anatomy with 3D-cinematic rendered images and relevant imaging findings trainees should know to quickly evaluate coronary artery take-off and pathway. Briefly describe ascending aortic anatomy, including multiplanar imaging of aortic root and sinotubular junction. 2)Present a case-based review of more common configurations of coronary artery anomalies involving the aortic cusps, including anomalous right main, left main, and circumflex arteries. 3)Introduce the concept of anomalous coronary arteries arising from the pulmonary vasculature, using CT angiography and 3D-rendered images. Present our cases depicting anomalous left and right coronary arteries from the pulmonary artery (ALCAPA and ARCAPA), which have an incidence of 0.000003% and 0.002%, respectively. 4)Present high take off right main coronary artery arising from an ascending aortic diverticulum. 5)Present a single coronary artery case from our institution using CT angiographic and cinematic renderings. Illustrate Lipton's classifications of single coronary artery.

CAEE-33 Cardiac Septal Pathologies - More Than Holes In The Heart

Participants
Shradha Somani JR, MBBS,MD, Mumbai, India (*Presenter*) Nothing to Disclose

TEACHING POINTS

Knowing various congenital and acquired pathologies affecting interatrial and interventricular septa is important. Their identification on cardiac CT and cardiac MRI. Development of radiological approach to diagnose interatrial and interventricular pathologies.

TABLE OF CONTENTS/OUTLINE

Development and normal anatomy of interatrial septum Development and normal anatomy of interventricular septum Spectrum and classification of interatrial and interventricular septal pathologies Congenital pathologies of interatrial septum and interventricular septum Acquired pathologies of interatrial septum and interventricular septum Various ancillary findings suggesting septal pathologies Radiological approach for diagnosis of cardiac septal pathologies

CAEE-34 Heart Of Stone: Dismystifying Incidental Cardiac Calcification On Computed Tomography.

Participants
Pedro L. Lino, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is: 1) To review usual and unusual cases of incidental cardiac calcifications. 2) To correlate important findings with the anatomy and pathophysiology. 3) To highlight their characteristics in order to familiarize cardiologists, cardiothoracic surgeons, and radiologists with these conditions, preventing unfavorable patient outcome. 4) To discuss the role of the radiologist in the differential diagnosis of these incidental findings, guiding the management. 5) To suggest reporting recommendations for cardiac calcifications.

TABLE OF CONTENTS/OUTLINE

1) Applied pathophysiology and etiologies of cardiac calcifications: a) dystrophic b) metastatic c) idiopathic. 2) Classifications and associated conditions. 3) CT protocols in the evaluation of patients with suspect cardiac calcification. 4) Review of imaging findings according to illustrative cases of calcifications of: a) myocardium b) endocardium c) pericardium d) valves e) vessels: pulmonary artery f) epipericardial fat. 5) How do I report?: reporting recommendations. 6) Outcomes and complications. 7) Sample cases of pearls, pitfalls, diagnostic difficulties, and mimics. 8) Summary and take-home messages.

CAEE-35 Non-tumoral Cardiac Complications In Oncology Patients

Participants
Jitesh Ahuja, MD, MBBS, Houston, Texas (*Presenter*) Nothing to Disclose

TEACHING POINTS

Familiarize radiologists with: 1. Cancer therapeutic related cardiac dysfunction (CTRCD) and several other cardiac complications in oncology patients 2. Role of Cardiac MR (CMR)

TABLE OF CONTENTS/OUTLINE

Cardiac dysfunction is the 2nd most common cause of morbidity and mortality in oncology patients after cancer recurrence. Cancer

therapeutic agents including newer novel immunotherapeutic agents have improved cancer survival. At the same time, cardiac complications are increasing in oncology populations due to common risk factors for cardiac diseases and cancer, longer survival and adverse effects of cancer therapeutic agents. 1. Cancer therapy related complication a. CTRCD: chemotherapy and radiation therapy related left ventricular systolic dysfunction b. Myocarditis c. Pericarditis d. Iron overload 2. Complications due to cancer itself excluding cardiac tumors a. Cardiac amyloidosis b. Stress cardiomyopathy (Takotsubo) c. Cardiac bland thrombus 3. Newer CMR techniques may help identifying cardiac dysfunction at subclinical stage a. Parametric myocardial mapping (T1, T2, T2*) and extracellular volume (ECV) fraction b. Strain imagingEarly detection and management of cardiac complications is critical in this patient population to complete their cancer treatment and reduce cardiac morbidity and mortality

CAEE-36   State-of-the-art Imaging Of Adult Congenital Aortopathies

Participants
Katherine Moore, MBChB, BSC, Cardiff, United Kingdom (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) Understand embryology and key anatomical variants of the thoracic aorta2) Demonstrate imaging strategies for the investigation of adult aortopathy3) Highlight a spectrum of aortopathies on multimodality imaging with clinical correlation4) Appreciate the clinical work-up and surveillance of adult aortopathy patients

TABLE OF CONTENTS/OUTLINE

1) Embryology2) Anatomy and variants3) Imaging strategiesa. MRI sequences and parametersb. CT technique4) Syndromic aortopathiesa. Marfan syndromeb. Loeys-Dietz syndromec. Ehler-Danlos syndromed. Williams syndrome5) Non-syndromic aortopathiesa. Bicuspid aortic valveb. Coarctationi. Repair strategies and complicationsii. Differentiation from pseudocoarctationc. Familial thoracic aortic aneurysmd. Miscellaneous e.g. SMAD-3, ACTA-26) Clinical work-up and surveillance strategies in adult aortopathya. Special considerations: pregnancy/pre-pregnancy planning

CAEE-37   Advanced Imaging Of The Tricuspid Valve

Participants
Brian Pogatchnik, MD, Stanford, California (*Presenter*) Nothing to Disclose

TEACHING POINTS

• -Primary tricuspid regurgitation is due to structural abnormalities of the valve leaflets or chordae. • -Secondary/Functional tricuspid regurgitation is due to annular dilation, leaflet tethering and/or adverse right ventricular remodeling. It is the most common cause of severe tricuspid regurgitation. • -Transcatheter tricuspid valve replacement is a promising new technique that requires a firm understanding of the tricuspid valve apparatus for optimal valve sizing and deployment.

TABLE OF CONTENTS/OUTLINE

Imaging Techniques: -CT: Contrast technique, gating, reconstructions/analysis -MRI: Cardiac planes for TV, cine imaging, phase contrast (PC) / 4D flow imaging Anatomy: Annulus, leaflets, subvalvular apparatus, anatomic variation Tricuspid Stenosis: causes, imaging (doming, opening area, gradient, etc), interventions Tricuspid Regurgitation: Identifying primary (intrinsic valvular abnormality) versus secondary (dilated annulus, right ventricular enlargement, leaflet tethering) regurgitation. Methods of classifying severity (difference in right and left ventricular ejection fractions, PC/4D flow, coaptation defect). Masses: papillary fibroelastoma versus direct extension of other tumors Endocarditis: Appearance and complications Interventions: Imaging of surgical (repair/annuloplasty, replacement), transcatheter (clip, native valve replacement, valve in ring/valve) and their complications.

CAEE-38   More Than Marfan: Understanding The Imaging, Presentation And Complications Of Aortopathies

Awards
Identified for RadioGraphics

Participants
Kacie Steinbrecher, MD, Saint Louis, Missouri (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Aortopathies, both inherited and non-inherited, include a heterogenous group of disorders that are distinct from acquired, degenerative disease of the aorta- Inherited aortopathies can be divided between syndromic and non-syndromic diseases- Syndromic inherited aortopathies include Marfan syndrome, Loeys-Dietz syndrome, Turner Syndrome, and vascular Ehlers-Danlos syndrome- Non-syndromic inherited aortopathies include heritable thoracic aortic diseases defined by the presence of abnormal genes as well as bicuspid aortic valve- Non-inherited aortopathies include vasculitides and fibromuscular dysplasia- Identification of aortopathies has implications on both pharmaceutical and surgical management of the aorta - When inherited aortopathies are suspected, testing of family members is often warranted- Multimodality imaging provides insight to diagnosis, preoperative planning, and assessment of disease activity

TABLE OF CONTENTS/OUTLINE

- Review the clinical characteristics of patients with inherited aortopathies, particularly those which are syndromic- Discuss multimodality imaging findings that can aid in the diagnosis of various aortopathies- Review complications of various aortopathies including aneurysm, dissection/intimomedial defects, and wall/perivascular inflammation- Describe the implications of an aortopathy diagnosis on surgical management of the aorta- Identify imaging features which should be reported in patients presenting with a known history of an aortopathy

CAEE-39   Value Of CMR In Cardiac Remodeling: A Primer For Radiologist

Participants
Archana Rai, MD, Toronto, Ontario (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To review the types of cardiac remodeling, underlying pathophysiology and the value of cardiac magnetic resonance imaging (CMR) in guiding clinical management.2. To discuss main CMR derived biomarkers of cardiac remodeling that may have important

prognostic implications.

TABLE OF CONTENTS/OUTLINE

1. Background 2. Cardiac remodeling definition and pathophysiology• Adverse remodeling• Reverse remodeling 3. Cardiac imaging modalities for cardiac remodeling: Pros & cons 4. CMR biomarkers in cardiac remodeling 5. Physiologic remodeling: Exercise adaptation 6. Pathological remodeling:• Myocardial infarction• Pressure overload: Stenotic valvular heart disease, Hypertensive heart disease, Pulmonary hypertension• Inflammatory myocardial disease (myocarditis)• Dilated cardiomyopathy/volume overload• Hypertrophic cardiomyopathy• Cardiotoxicity• Adiposity related 7. Reverse remodeling• Medical treatment• Resynchronization therapy• Surgical interventions 8. Cardiac remodeling and prognosis 9. Conclusions

CAEE-4   Utility of CT and MRI In Tricuspid Valve Interventions

Awards
Identified for RadioGraphics
Cum Laude

Participants
Prabhakar Rajiah, MD, FRCR, Rochester, Minnesota (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To review the indications for tricuspid valve (TV) interventions2. To discuss the role of CT and MRI in the evaluation of TV interventions3. To illustrate the critical parameters needed for TV interventions.

TABLE OF CONTENTS/OUTLINE

A. Tricuspid valve pathologies- Regurgitation, stenosis, infections, massesB. Multimodality imaging- Echo, CT, MRIC. CT & MRI techniques and protocolD. Indications of treatmentE. Treatment Options- Surgery including minimally invasive- repair, annuloplasty, replacement- Transcatheter TV replacement (TTVR)F. Minimally invasive/transcatheter devices-Annuloplasty, coaptation devices, heterotopic caval valve- TTVR Devices-GATE, FORMA, CardiobandG. Establishing etiology of TR- Functional- LV disease,PHT, RV cardiomyopathies- Congenital (Ebstein's)- Pacemaker- InfectionH. Quantification of TR- MR- Indirect from PA flow and RV stroke volume or RV-LV stroke volume; Direct through 2D/4D flow- CT- RV-LV strokeI. Quantification of RV volumes and functionJ. Morphology of tricuspid apparatusK. Measurement of tricuspid annulus- AP, septolateral diameters, perimeter, areaK. Landing zone geometryL. Proximity to right coronary arteryCourse of artery in AV grooveM. Adjacent structures- Prominent papillary muscles, trabeculations, moderator bandN. Coplanar fluoroscopic anglesO. RVOT obstructionP. Access- Diameter of IVC, SVC, jugular veinsQ. Post-procedural complications- Recurrent TR- Infection- Thrombus- Pannus- Paravalvular leak

CAEE-40   Transcatheter Aortic Valve Replacement - Special Situations

Participants
Luis A. Sosa, MD, Menomonee Falls, Wisconsin (*Presenter*) Nothing to Disclose

TEACHING POINTS

Briefly review relevant anatomy and CT measurements for preoperative TAVR in normal trileaflet aortic valvesDiscuss the preoperative CT evaluation in presence of bicuspid aortic valve Review the preoperative CT evaluation in presence of prosthetic aortic valve

TABLE OF CONTENTS/OUTLINE

Anatomy of aortic valve and rootMeasurements in preoperative TAVR CT in bicuspid valve Relevance of Sievers, Bavard and Makkar/Yoon classifications for pre-procedure planning Supra-annular sizing using the circle methodMeasurement in preoperative TAVR CT in the presence of prosthetic valve (valve-in-valve) Intraluminal diameter Simulated new valve-in-valve New valve to coronary ostia

CAEE-41   Role Of Cardiac CT Angiography In Pre- And Post-Procedural Evaluation Of Percutaneous Left Atrial Appendage Occlusion With Watchman Device

Participants
Archana Rai, MD, Toronto, Ontario (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Role of Cardiac CT angiography (CCTA) in pre-procedural planning for left atrial appendage (LAA) occlusion with Watchman device in patients with atrial fibrillation. 2. Role of CCTA in post-procedural evaluation and assessment of post-procedural complications.

TABLE OF CONTENTS/OUTLINE

1. Background: Types of Watchman Device 2. Pre-procedural planning on CCTA• CT protocol, post-processing and role of MPR reconstructions• Assessment of morphology of LAA on CCTA-Chicken wing type-Windsock type-Cauliflower and cactus type • Determining the size of LAA ostium, depth and length of LAA from the landing zone • Interatrial septal anatomy • Presence of accessory LAA or diverticulum • To exclude LA/LAA thrombus: Role of prone CT imaging • Evolving role of pre-procedural software to plan the trans-septal device implantation 3. Transcatheter deployment of Watchman device under fluoroscopy and TEE guidance. 4. Post-procedural evaluation 1) Multimodality imaging for post-procedural evaluation a. Use of TEE and CCTA - Emerging Role of CCTA, especially during the COVID-19 pandemic. Follow up (approximately after 3-4 months) to ensure no leak and complete endothelialization, characterized by absence of contrast opacification in LAA. 2) Evaluation of post-procedural complications a. Peri-device leak b. Trans-fabric leak c. Device associated thrombus d. Device embolization 5. Conclusion

CAEE-42   Cardiac Allograft Vasculopathy: The Unknown To Known

Participants
Yura Ahn, MD, Seoul, Korea, Republic Of (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To know the definition of cardiac allograft vasculopathy (CAV) and its natural history, clinical characteristics, and histopathologic findings2. To differentiate the pathophysiology, clinical characteristics and imaging findings between CAV and coronary atherosclerosis3. To learn the imaging findings of cardiac allograft vasculopathy for early diagnosis and management of patients with cardiac transplantation4. To demonstrate the comparison of dynamic perfusion computed tomography findings between the patients with and without CAV in a single-centered retrospective study

TABLE OF CONTENTS/OUTLINE

1. Definition of Cardiac Allograft Vasculopathy (CAV) (natural history)2. Clinical characteristics (prevalence, laboratory tests, mortality, factors affecting CAV etc.)3. Histopathologic characteristics: comparison with coronary atherosclerosis4. Diagnosis and management of CAV5. Non-invasive imaging evaluation of CAV- Cardiac computed tomography (ECV, dynamic perfusion)- Cardiac magnetic resonance imaging (ECV, T1 map, perfusion)- Myocardial single-photon emission CT (SPECT)6. Invasive coronary angiography (intravascular ultrasound, IVUS)7. Histopathologic findings

CAEE-43 Mitral Valve Prolapse From Benign To Malignant

Awards
Certificate of Merit

Participants
Camila V. Machado, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

After attending to this exhibit, the learner should be able to1. Tell what is the diagnostic criteria for mitral valve prolapse (echocardiogram and MRI).2. Understand how MRI can be useful for the diagnosis and characterization of mitral valve prolapse.3. Recognize the main associated findings in the valve apparatus morphology.4. Recognize the main associated findings in the ventricular myocardium.5. Say which finding can be considered specific for mitral valve prolapse.6. Understand why mitral valve prolapse may have an association with sudden cardiac death.

TABLE OF CONTENTS/OUTLINE

1. Diagnosis of mitral valve prolapse (reference measures)2. Importance of MRI for the diagnosis and characterization of mitral valve prolapse (assessment of mitral apparatus morphology and myocardial fibrosis)3. The main associated findings in the valve apparatus morphology (elongated mitral leaflet, papillary muscle traction, mitral annular disjunction, mitral annulus dilatation)4. The main associated findings in the ventricular myocardium (systolic curling, ballerina foot deformity, left ventricle fibrosis close to the mitral annulus / basal LV, subendocardial / interstitial fibrosis at level of papillary muscles)5. Finding that can be considered specific for mitral valve prolapse (abnormal papillary muscle signal)6. Possible association between mitral valve prolapse and sudden cardiac death (changes in mitral morphology and ventricular myocardium that can serve as a substrate for complex arrhythmias)

CAEE-44 How To Report Preoperative CT For Common Cardiac Surgeries: A Primer For Community Radiologists

TEACHING POINTS

1. Emphasize the value of a multidisciplinary approach in preoperative evaluation of cardiac surgery patients - How radiologists can help2. Review information including incidental findings obtained on pre-op imaging which are relevant to the anesthesiologist and surgeon to assist in preoperative optimization and minimizing peri\postoperative pulmonary complications4. Review imaging consideration for open and minimally invasive surgery (MIS) cardiac surgeries requiring sternotomy and cardiopulmonary bypass (CPB)5. Review imaging consideration for each of the common open/MIS and transcatheter cardiac surgeries

TABLE OF CONTENTS/OUTLINE

1. What the anesthesiologist would want to know 2. Anesthetic considerations - pleural, pulmonary, cardiovascular anatomic findings and risk factors for peri\postoperative complications and morbidity including atelectasis, pneumothorax, and aspiration3. What the surgeon would want to know 4. General radiological evaluation of cardiac surgeries requiring CPB or sternotomy5. How to report preoperative CT of the common cardiac surgeries - Radiological approach to open and MIS coronary artery bypass graft, redo-sternotomy, open, MIS, and transcatheter valve surgeries6. Inclusive checklists for organized and systematic reporting of the pre-op CT evaluation of the common cardiac surgeries

CAEE-45 Spontaneous Coronary Artery Dissection (scad): An Uncommon Diagnosis Of A Common Presentation

Participants
Marcela Rosa, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The aim of this exhibit is: To review spontaneous coronary artery dissection (SCAD) pathophysiology, associated conditions and clinical presentation. To review and illustrate angiographic and multimodal imaging findings of SCAD, correlating findings in different imaging methods.

TABLE OF CONTENTS/OUTLINE

INTRODUCTION TO SCAD: pathophysiology, associated conditions and clinical presentation. Imaging findings of SCAD demonstrated by teaching cases from our department.

CAEE-46 Challenges In Diagnosis And Management of Spontaneous Coronary Artery Dissection: Pearls and Pitfalls on CT Evaluation

Participants
Ubenicio Dias JR, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1 - Definition and epidemiological aspects of Spontaneous Coronary Artery Dissection (SCAD). 2- Pathophysiology and clinical

aspects of SCAD.Imaging methods used in the evaluation of SCAD. 3- Imaging methods used in the evaluation of SCAD.4 - Technique, advantages, main findings and pitfalls in evaluation by Coronary CT Angiography in SCAD.

TABLE OF CONTENTS/OUTLINE

1. INTRODUCTION AND MANAGEMENT OF SCAD - SCAD epidemiology, pathophysiology, clinical concepts, treatment guidelines and algorithms.2. DIAGNOSTIC IMAGING (emphasis in Coronary CT Angiography) - Advantages and disadvantages of each imaging modality. Preparation. Imaging protocol and how to optimize it. Difficulties and how to overcome them. Systematic approach to evaluate. What the multidisciplinary team need to know.3. FINDINGS OF CORONARY CT ANGIOGRAPHY IN SCAD - Primary Features Secundary Features Additional Considerations Pitfalls4. FOLLOW-UP - The role of coronary CT angiography on follow-up. Normal expected imaging features and pitfalls on follow-up.5. INTERACTIVE CASE-BASED DIDACTICS - Challenging cases in SCAD to illustrate and solidify concepts6- FUTURE DIRECTIONS ON IMAGING - What's on the horizon for coronary CT angiography and other imaging methods.

CAEE-47   In The Thick Of It - Cardiac Imaging In Left Ventricular Hypertrophy

Participants
Suman Prabhakar, MBBS,MD, Bangalore, India (*Presenter*) Nothing to Disclose

TEACHING POINTS

• To briefly understand the pathophysiology and enumerate various causes of left ventricular hypertrophy (LVH). • To discuss the key imaging features of various causes of LVH which help in prompt diagnosis and management with implication on risk stratification and prognostication.

TABLE OF CONTENTS/OUTLINE

LVH is one of the commonest pathologies with various causes which on ECHO appears just as thickened myocardium, MRI plays a vital role in deciphering the various causes. We review various causes of LVH in a case-based format emphasizing on key imaging findings, prognostication and risk stratification. • The following simplified classification and cases will be discussed: 1. Pressure overload: Hypertension, subaortic membrane, aortic valvular stenosis, Supravalvular aortic stenosis, coarctation of aorta. 2. Volume overload: Valvular regurgitation. 3. Infiltrative cardiomyopathies: Amyloidosis, Anderson-Fabry disease, Sarcoidosis, LV non compaction. 4. Non infiltrative cardiomyopathy: Hypertrophic cardiomyopathy 5. Neoplasm This exhibit is targeted to residents interested in cardiovascular radiology. MRI plays a vital role in deciphering the various causes, quantification of fibrosis, LV morphometry, functional analysis and plays a major role in prognostication and follow up after treatment.

CAEE-48   Multimodality Imaging Of Palliative Shunts For Congenital Heart Diseases

Participants
Arzu Canan, MD, Dallas, Texas (*Presenter*) Nothing to Disclose

TEACHING POINTS

Non-invasive imaging plays an important role for assessing the anatomy and function of palliative shunts in patients with congenital heart diseases (CHD). Although echocardiography is usually the first-line imaging modality during patient follow up, diagnostic quality relies on operator experience and existence of acoustic windows. Diagnostic yield can be also constrained by limited field of view and altered anatomy after the surgery. Non-invasive cross-sectional imaging with computed tomography or magnetic resonance not only provides comprehensive assessment of altered cardiovascular anatomy, but also allows delineation of shunt patency and evaluation of complications. The goal of this exhibit is to review the imaging aspects of the shunts most used for CHD palliation, underscoring the advantages and disadvantages of different imaging modalities.

TABLE OF CONTENTS/OUTLINE

A. Introduction/background B. Palliative procedures: Indications/ Normal anatomy/ Imaging features/ Complications 1. Blalock-Taussig (BT) shunt 2. Davidson or Central shunt 3. Waterston-Cooley shunt 4. Damus-Kaye-Stansel shunt 5. Glenn shunt 6. Fontan shunt 7. Potts shunt C. Echocardiography: Indications/ Advantages/ Disadvantages D. Cardiac CT: Indications/ Advantages/ Disadvantages E. Cardiac MRI: Indications/ Advantages/ Disadvantages F. CT and MRI protocol for evaluation of palliative shunts G. Conclusion

CAEE-49   Multimodality Imaging In Cardiac Strain Analysis: From Subclinical Disease To Severe Cardiomyopathy

Participants
Jose de Arimateia Araujo Filho, MD,PhD, New York, New York (*Presenter*) Nothing to Disclose

TEACHING POINTS

To review the principles of cardiac strain analysis by echocardiography and cardiac magnetic resonance (CMR) imaging. To discuss the clinical value and specific advantages / disadvantages of these two imaging modalities in a comparative review. To illustrate the main applications of cardiac strain analysis in different clinical scenarios, focusing on its limitations and perspectives in clinical decision making.

TABLE OF CONTENTS/OUTLINE

1. Cardiac strain: Principles and techniques. 2. Speckle tracking echocardiography and CMR-feature tracking: intra- and intermodality agreement and variations. 3. Clinical applications: Quantification of global and regional left ventricular function; Ischemic versus non-ischemic cardiomyopathies and sub-clinical left ventricular dysfunction; Cardiotoxicity during chemotherapy; Risk assessment and prognosis; Heart failure with preserved ejection fraction; Miscellaneous (congenital heart disease, valvular heart disease, COVID-19 myocardial injury, etc); Others cardiac chambers (right ventricle strain, left atrial strain). 4. Future perspectives: standardization, automated image analysis and artificial intelligence tools.

CAEE-5   The Current State Of Nuclear Cardiac Imaging And Radiopharmaceuticals Of The Next Era

Participants
Kenneth Huynh, BS, Orange, California (*Presenter*) Nothing to Disclose

1. To demonstrate the utility of functional imaging in diagnosis and post-therapeutic surveillance of various cardiac diseases due to ischemic, inflammatory, infiltrative, and neurohormonal processes.2. To review the current options for nuclear cardiac imaging, including SPECT and PET options, with their characteristics, strengths, and shortfalls.3. To present the emerging options for nuclear cardiac imaging and discuss their advantages relative to current options.

TABLE OF CONTENTS/OUTLINE

The first component reviews and illustrates the current Nuclear Cardiology practice: Multigated exam (MUGA) for left ventricular ejection fraction with 99mTc-tagged RBC-SPECT/D; SPECT perfusion imaging with 99mTc-sestamibi and 99mTc-tetrofosmin; SPECT viability evaluation with Tl-201 chloride of decreasing use; Planar and SPECT/CT TTR amyloidosis evaluation with 99mTc-PYP; PET/CT myocardial perfusion imaging with 13N ammonia and 82Rb; PET/CT myocardial viability and sarcoidosis evaluation with 18F-FDG and 13N ammonia.The second part discusses the emerging novel radiopharmaceuticals: 18F-flurpiridaz, 18F-FBnTP, 18F-LMI1195, 18F-4F-MHPG, and 18F-3F-PHPG and their longer half-life imaging advantages.This educational exhibit is divided into four categories: ischemic, inflammatory, infiltrative, and neurohormonal, and will (1) review the current options of nuclear cardiac imaging per category, and (2) introduce novel agents and discuss their potential advantages in the diagnosis and surveillance of cardiac disease.

CAEE-50   Diagnostic Challenges In Cardiac Sarcoidosis: Can PET and CMR Be Of Help?

Participants
Juan Cruz Gallo, MD, Capital Federal, Argentina (*Presenter*) Nothing to Disclose

TEACHING POINTS

Sarcoidosis is a multi-system inflammatory disorder of unknown etiology characterized by the formation of non-caseating granulomas that can affect different organs. The prevalence of clinically evident cardiac involvement is ~5%, and is one of the major causes of disease-related death. Accurate diagnosis of cardiac sarcoidosis (CS) remains challenging because of the limitations of existing clinical criteria and the low diagnostic yield of endomyocardial biopsy related to the patchy and myocardial involvement.There is growing evidence of clinical relevance of combining cardiac magnetic resonance (CMR) and 18F-FDG PET for diagnosis, monitoring treatment response and progression of CS. CMR and 18F-FDG-PET evaluate different pathological processes, namely fibrosis via late gadolinium enhancement in the former and inflammation via labeled-glucose uptake of activated macrophages in the latter. Early and accurate detection of CS is of highest importance for therapeutic and prognostic purposes. Combining imaging modalities can improve the identification of the whole spectrum of myocardial involvement in CS patients (from early myocardial damage, inflammation to tissue fibrosis).

TABLE OF CONTENTS/OUTLINE

1) Cardiac sarcoidosis: definition, clinical-epidemiological data 2) Diagnostic Methods of myocardial inflammation: role of PET/CT 3) Assessment of myocardial fibrosis: role of CMR. 4) Evaluation of anti-inflammatory treatment response by PET/CT 5) Conclusions

CAEE-51   Cardiotoxicity In Cancer Treatment: New Frontiers In The Multimodality Diagnostic Approach

Participants
Roberto Torres, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To discuss the current definitions and controversies in the cardiotoxicity definition in oncologic patients 2. To review the role of cardiac imaging in the evaluation of oncologic cardiotoxicity, focusing on its value in clinical decision making 3. To illustrate a spectrum of cases utilizing different imaging modalities to evaluate cardiovascular effects related to cancer treatment

TABLE OF CONTENTS/OUTLINE

1. Cardiotoxicity: Definitions and controversies. 1.1 Chemotherapy: anthracyclines, trastuzumab and emerging drugs. 1.2 Radiotherapy: vascular toxicity, pericardial and heart valve disease. 1.3 Immune checkpoint inhibitors: myocarditis and immune-related adverse events. 2. Laboratorial markers: what the radiologist needs to know 3. Echocardiography imaging: left ventricular disfunction, 3D tissue doppler and speckle tracking imaging CT and US: vascular toxicity 4. Nuclear medicine: multigated radionuclide angiography, I-mIBG scintigraphy and FDG-PECTCT 5. Magnetic resonance imaging: edema, LGE, t1 and t2 mapping, feature-tracking myocardial strain 6. Clinical follow-up: early versus late cardiotoxicity 7. New technologies and future perspectives: new clinical and imaging markers

CAEE-53   All That Enhances Late, Is Not Ischemic : Pattern Based Approach Towards Late Gadolinium Enhancement In Cardiomyopathies, A Primer For Residents

Participants
Surbhi Singh, MD, Bangalore, India (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To familiarize the readers with different patterns of late gadolinium enhancement on cardiac MRI and pathologic conditions associated with them 2. To discuss various ischemic and non ischemic cardiomyopathies that show these patterns typically 3. To demonstrate other important cardiac MRI features that are diagnostic of these cardiomyopathies

TABLE OF CONTENTS/OUTLINE

A retrospective evaluation of 500 cardiac MRI from July 2019 to July 2021 , revealed presence of post-gadolinium myocardial enhancement on delayed T1 sequence at 10 mins - late gadolinium enhancement(LGE), in 260 case. Various patterns of late gadolinium enhancements were seen in ischemic and non ischemic cardiomyopathies(CMP). The various patterns identified were- I. ISCHEMIC - 1. Transmural 2. focal Subendocardial II. NON ISCHEMIC- 1. Subepicardial - Myocarditis, Sarcoidosis, Fabry's 2. Global subendocardial - Amyloidosis, Systemic Sclerosis 3. Mesocardial(Mid-Wall)- Dilated CMP, Sarcoidosis, Myocarditis, endomyocardial fibrosis 4. Patchy/RV Insertion Points- Hypertrophic CMP, Right Ventricle (RV) OverloadA pattern based approach towards late gadolinium enhancement patterns of cardiomyopathies is demonstrated in our poster

CAEE-55   Clinical Application Of Full-color Bionic 3D Printing In Transcatheter Aortic Valve Implantation

Participants
Xi Yu, Zhengzhou, China (*Presenter*) Nothing to Disclose

TEACHING POINTS

1.Explore the clinical application of full-color bionic 3D printing technology in transcatheter aortic valve implantation 2.Learn the basic workflow of a 3D printing model of the aortic valve 3.Learn how to use segmentation imaging software to generate the target anatomic structures 4.Learn the detailed procedure of digital imaging modeling of 3D printing

TABLE OF CONTENTS/OUTLINE

Background Objectives Technology Roadmap Conclusion

CAEE-56 The Added Value Of Cardiac MRI In The Evaluation Of Valvular Heart Disease

Awards
Certificate of Merit

Participants
Felipe Sanchez, MD, Toronto, Ontario (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is to:1. To briefly discuss the role of different imaging modalities in the evaluation of valvular heart disease.2. To illustrate the added value of different CMR sequences in the assessment of cardiac valves.3. To depict the normal appearance of the valvular apparatus and to review different valvular pathologies in which CMR plays a role.

TABLE OF CONTENTS/OUTLINE

1. Introduction2. Modalities used for assessment of valvular heart disease.a. Radiographyb. Echocardiographyc. CTd. MRI3. Cardiac MRI Techniques for valvular heart disease assessment.a. Assessment of valvular morphology, cardiac chamber size and function: cine and strain imagingb. Flow quantification: 2D Phase contrast and 4D-flowc. Tissue characterization: Parametric mapping and LGE4. AV valves assessment with MRI: normal and abnormal findings.a. Direct and indirect quantification methods for AV valvular regurgitationb. Mitral insufficiencyi. Etiology of mitral insufficiency: primary versus secondaryii. Severity stratification with cardiac MRc. Arrhythmic MVP and MADd. Tricuspid insufficiencyi. Tricuspid regurgitation mechanisms and severity quantification.5. VA valves assessment with MRI: normal and abnormal findingsa. Direct and indirect quantification methods for VA valvular regurgitationb. Aortic regurgitation: severity and risk stratification.c. Pulmonary regurgitation: severity and risk stratification.d. VA valve stenosis.6. Conclusion

CAEE-57 The Mad Heart - A Review of Mitral Annular Disjunction With Cardiac Echo And MRI Findings

Participants
Aishwarya Gulati, MD, Philadelphia, Pennsylvania (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Mitral annular disjunction (MAD) is associated with mitral valve prolapse (MVP) and malignant cardiac arrhythmia. 2. Cardiac ECHO, CT, and MRI are used in patients for pre-electrophysiology evaluation and MAD can be an incidental, less recognized finding on imaging. 3. Recognizing and quantifying MAD with MVP along with such as papillary muscle late gadolinium enhancement and myocardial fibrosis may have electrophysiology management implications.

TABLE OF CONTENTS/OUTLINE

1. Incidence and clinical significance 2. Anatomy of MAD 3. Pathophysiology of MAD 4. Cross sectional imaging findings 5. Quantification parameters of MAD 6. Late gadolinium enhancement findings of MAD and papillary muscles 7. Correlative electrophysiology mapping 8. MRI scan protocol

CAEE-6 Multimodality Imaging Of The Left Ventricular Outflow Tract

Participants
Prabhakar Rajiah, MD, FRCR, Rochester, Minnesota (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To review the anatomy of the left ventricular outflow tract (LVOT)2. To discuss the role of multimodality imaging in the evaluation of LVOT3. To illustrate the several pathological lesions that affect the LVOT4. To provide a diagnostic algorithm for LVOT lesions

TABLE OF CONTENTS/OUTLINE

IntroductionAnatomy of the LVOT & variations- Arterial supplyRole of multimodality imaging- Echo, CT, MRIReview of several LVOT pathologies with illustrative case examples using multimodality imaging- Hypertrophic cardiomyopathy- Aberrant papillary muscles-Hypertrophy, hypermobility, anomalous insertion, accessory muscles- Subaortic membrane- Fibrous/muscular- Congenital- AV septal defect, Shone complex, Tetralogy, Transposition of great arteries, Double outlet right ventricle, truncus, interrupted aortic arch, hypertrophied subaortic conus- Valvular diseases- Rheumatic disease- Non neoplastic masses- Vegetations, pseudoaneurysm, abscess, thrombus - - Neoplasms- Fibroelastoma, myxoma, metastasis, sarcoma- Post-surgical - Mitral valve repair, aortic surgery, pulmonary banding- Post-interventional- TMVR, TAVR- Membranous septum- Aneurysm, muscularized septum, large elongated septum- Dynamic obstruction- HCM, sepsis, hypovolemia, mitral valve replacement- Aging, idiopathic- Glycogen storage diseaseDiagnostic algorithm for LVOT lesionsLVOT evaluation for interventions- TAVR, TMVRSurgical management- Myomectomy, Konno procedure

CAEE-7 Mri Evaluation Of Valvular Disease- Basics To Advanced

Awards
Certificate of Merit

Participants
Prabhakar Rajiah, MD, FRCR, Rochester, Minnesota (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To review the role of MRI in the evaluation of valvular heart disease (VHD)2. To discuss the MRI sequences and planes used in VHD3. To illustrate the MRI quantification techniques used for grading stenotic and regurgitant lesions.4. To understand the role of MRI in providing information beyond the valve.

TABLE OF CONTENTS/OUTLINE

1. Introduction to VHD2. Role of imaging - Echocardiography, CT, MRI3. Indications of MRI in valvular heart disease- Suboptimal echo- Discordant findings- Eccentric jets- Multiple regurgitant jets- Evaluation of myocardium4. Morphological assessment of valve5. Quantification of lesionsA. Stenosis-Velocity, gradients, planimetryB. Regurgitation- Direct vs indirect- Cine imaging- LV/RV stroke volume- Phase-contrast MRI- Great vessel flow- Mitral/tricuspid regurgitant flow -Direct or indirect- Planimetry of Area of regurgitant orifice > 0.4 cm2 is significant- 4D flow- Valve tracking6. Mechanism of abnormality- Structural versus functional7. Normal and abnormal values8. Correlation with echo techniques9. Volumetric and functional changes in ventricles- Regurgitation-Ventricular/atrial enlargement, ventricular dysfunction- Increased LV/RV mass and volumes in stenosis10. Scarring/fibrosis in ventricles- Risk stratification- Late gadolinium enhancement- Parametric mapping11. Vascular changes- Dilated ascending aorta/pulmonary artery- Abnormal flow12. Indications of surgery for valvular pathologies13. Prognostic markers

CAEE-8   Myocardial T1 And T2 Mapping: Technique And Applications

Participants
James F. Glockner, MD, PhD, Rochester, Minnesota (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Myocardial T1 mapping can be used to identify abnormal myocardium and to quantify myocardial fibrosis. 2. Diffuse myocardial fibrosis often cannot be seen on late gadolinium enhancement images; elevated T1 values correlate with diffuse myocardial fibrosis .3. Myocardial T1 is markedly elevated in amyloidosis. 4. Elevated myocardial T1 can be correlated with prognosis in patients with amyloidosis and cardiomyopathies. 5. Myocardial T1 is also elevated in myocardial edema, and can be helpful in identifying patients with myocarditis. 6. T1 measurement of myocardium and blood pool before and after gadolinium administration can be used to measure myocardial extracellular volume. 7. ECV is elevated in acute myocardial injury as well as in diffuse myocardial fibrosis. 8. Myocardial T2 mapping is most often used to assess conditions associated with myocardial edema, such as myocarditis or acute infarction. 9. Myocardial T2* measurement can be used to quantify myocardial iron deposition.

TABLE OF CONTENTS/OUTLINE

1. Relaxation theory 2. Myocardial T1 measurement techniques 3. Measuring myocardial T1 - tips and common errors 4. Myocardial T1 mapping: clinical applications 5. Calculation of extracellular volume (ECV) 6. ECV measurement: clinical applications 7. Myocardial T2 measurement techniques 8. Myocardial T2 mapping: clinical applications 10. Myocardial T2* measurement: technique and clinical applications 11. Summary and conclusions

CAEE-9   Shunt Procedures For Palliation Of Congenital Heart Disease: A Pictorial Guide

Participants
Catarina Janicas, MD, Lisbon, Portugal (*Presenter*) Nothing to Disclose

TEACHING POINTS

Patients with congenital right ventricular inflow/outflow obstruction, in consequence of the reduced pulmonary flow, frequently present with hypoplastic pulmonary arteries, counter-indicating single-stage corrective procedures.Palliative shunts, originating from the aorta and its branches, from the superior vena cava, or from the right ventricle, have been developed to stimulate pulmonary artery growth.Cardiac CT and MR imaging, including CT and MR angiography, provide high-quality noninvasive depiction of palliative shunts and pulmonary artery growth. Likewise, potential shunt-related or other complications can be assessed, such as shunt stenosis, thrombosis and infection, as well as pulmonary artery aneurysms or congestive heart failure.

TABLE OF CONTENTS/OUTLINE

Learning ObjectivesIntroduction- Importance of pulmonary artery caliber in patients considered for Fontan procedure- Nakata Index and McGoon Ratio- Role of palliative shunts in stimulating pulmonary artery growthImaging of Palliative Shunt Procedures-Aortopulmonary shunts o Blalock-Taussig shunt (classic, modified)o Melbourne shunto Davidson shunto Ductus stentingo Internal mammary artery-to-pulmonary artery shunto Waterston shunto Potts shunt- Cavopulmonary shuntso Glenn shunt (uni-, bidirectional)- RV-to-pulmonary artery conduitso Sano shunt- Complicationso Stenosiso Thrombosiso Infectiono Pulmonary artery aneurysmo Congestive heart failure- CT or MR evaluation: defining which technique to chooseConclusionsReferences

VAEE

Vascular Education Exhibits

Sub-Events

VAEE-10   A Walk-through Lower Limb Arteries: Atherosclerosis And Beyond

Participants
Daniel Montel, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Review current CTA and MRA techniques and protocols for better evaluation of the lower-extremity vessels, and their limitations and pitfalls; - Showcase several interesting findings in run-off CTA / MRA - such as vasculitis, traumatic injuries, expected postoperative conditions and their complications, iatrogenic injuries, malformations, and atherosclerotic disease; - Learn to identify and describe findings and their anatomic location to best assist with patient diagnosis and treatment planning; - Ascertain how lower limb CTA/MRA can help with differential diagnosis and consequently teach radiologists how to recognize critical findings that should be promptly reported, as they may need early vascular intervention.

TABLE OF CONTENTS/OUTLINE

1- CTA and MRA techniques and protocols; 2- Atherosclerotic disease and other vascular age-related changes, such as aneurysm and dissection; 3- Surgical procedures including normal expected radiological findings and complications; 4- Iatrogenic and traumatic vascular injuries; 5- Other non-atherosclerotic vascular diseases, including vasculitis and thromboembolism; 6- Vascular malformations; 7- Take home messages.

VAEE-11   There Is Always Another Path To Take: What We Need To Know About Aortoiliac Occlusion

Participants
Daniel Montel, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Recognize the main etiologies of aortoiliac occlusion and stenosis. Understand imaging findings and possible collateral pathways and how to map and report them. Expected findings before and after treatment, knowing how to recognize signs of postoperative complications.

TABLE OF CONTENTS/OUTLINE

1- Introduction: general aspects of the aortoiliac occlusion and radiological findings; 2- Main etiologies and occlusion classification (suprarenal, transrenal, juxtarenal, infrarenal); 3- Collateral pathways in the aortoiliac occlusion: -systemic-systemic pathways arising from the dorsal aorta; - visceral-visceral pathways arising from the ventral aorta; - systemic-visceral pathways arising from the lateral aorta; 4- Surgical treatment modalities and the radiological findings that we may encounter such as aortoiliac endarterectomy, aortobifemoral bypass, axillobifemoral bypass (extra-anatomic technique), endovascular therapy and examples of complications; 5- Take home messages.

VAEE-12   Pelvic Hemorraghes And Other Vascular Injuries: How Can We Help The Interventional Radiologist?

Awards
Certificate of Merit

Participants
Silvia Cayon Somacarrera, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

The aim of this work is to show easy tips to determine on CT the most probable bleeding artery in pelvic hemorraghes based upon a map which shows an approximation of the zonal pelvic vascularization.

TABLE OF CONTENTS/OUTLINE

Vascular pelvic injuries are the major cause of morbidity and mortality in blunt trauma patients. Historically they have been evaluated with arteriography. However, the development of CT allows us to perform a rapid non-invasive evaluation, helping us to differentiate between arterial and venous bleeding which is very important when considering the most suitable treatment. Once we have identified there is arterial active bleeding, knowing the zonal pelvic vascularization map can help us determine the most probable bleeding artery so that the interventional radiologist can perform a more selective arteriography. The CT findings have generally been found to correlate with findings detected later in the arteriography. However, it has been seen that in 20-40% of patients who did not show active arterial bleeding on CT, actually had it on arteriography. This could be due to intermittent bleeding secondary to arterial spasm or temporary tamponade by the hematoma itself.

VAEE-13   Ultrasound Of Extracranial Cerebral Vessels: A Primer

Participants
Parker Freels, MD, Jacksonville, Florida (*Presenter*) Nothing to Disclose

TEACHING POINTS

US is an inexpensive, low risk, and non-invasive method for assessing hemodynamics, anatomy, and the extracranial vasculature pathology that affects the carotid and vertebral vasculature. There are three major components of a vascular ultrasound exam including grayscale analysis, color flow, and spectral doppler. US is dependent on operator capabilities, and proper technique is critical to appropriate image acquisition. The "3 P's" of extracranial cerebral vasculature US include: Probe, Position, and Protocol.

TABLE OF CONTENTS/OUTLINE

The physics and technique of vascular ultrasound acquisition will be reviewed (The "3 P's" - Probe, Position, and Protocol). This comprehensive sonographic assessment of the carotid and vertebral arteries will include: normal and abnormal flow patterns (with an emphasis on spectral doppler analysis), atherosclerotic disease, nuances of intimal-medial thickness & plaque characterization (The "3 S's" of plaque characterization: Sonolucency, Surface, Stability), NASCET criteria in evaluation of carotid stenosis, upstream vs. downstream lesions, antegrade vs. retrograde vertebral artery flow, assessment of pathology arising more centrally, pre and post carotid endarterectomy/stent evaluation, traumatic injuries and follow up guidelines, malignancy evaluation, and critical findings when evaluating vascular ultrasounds of the extracranial cerebral vessels. Pearls and pitfalls of extracranial cerebral vascular ultrasound will also be reviewed.

VAEE-14   **COVID-19 Pneumonia: Seeing Beyond What Meets The Eye With Subtraction CT**

Participants
Mario G. Santamarina, MD, Vina del Mar, Chile (*Presenter*) Nothing to Disclose

TEACHING POINTS

1- Review the main perfusion imaging findings in COVID-19 Pneumonia.2- Review the main perfusion imaging findings in Post COVID-19 Syndrome.3- Compare conventional and perfusion imaging findings with other non-COVID-19 pneumopathies.

TABLE OF CONTENTS/OUTLINE

- Principles of Lung Subtraction CT angiography.- Pictorial review of the main conventional and subtraction CT imaging findings in COVID-19 Pneumonia and Post-COVID-19 Syndrome.- Sample cases of subtraction CT imaging findings in other non-COVID-19 Pneumopathies.Outline:COVID-19 infection may lead in some patients to acute respiratory distress syndrome, where severe gas exchange impairment can occur even in early stages, with only minor lung airspace disease. This may suggest that the shunt associated with the gasless lung parenchyma is not sufficient to explain this hypoxemia. The fact that the virus binds to ACE2 as the functional receptor for cell entry could be key to understanding the vascular tone dysregulation and perfusion abnormalities that occur in COVID-19 pneumonia.The expected hypoxic pulmonary vasoconstriction could be impaired in areas where there is airspace disease. On the other hand, thrombosis-mediated and vasoconstriction-mediated perfusion defects can also contribute to V/Q mismatching and hypoxemia.Our main purpose is to show the imaging findings in patients with COVID-19 Pneumonia and Post-COVID-19 Syndrome using Lung Subtraction CT angiography, which is a technique used to evaluate pulmonary perfusion based on iodine distribution maps.

VAEE-16   **Anomalies Of Great Vessels Venous Return: Do All Paths Lead To The Right Atrium?**

Participants
Lucas Farias, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is: 1) To review usual and unusual cases of anomalies of the venous return. 2) To correlate important findings with the anatomy, embryology and pathophysiology. 3) To discuss image findings according to subgroups and classifications, in order to enhance surgeons and radiologists' skills. 4) To review CT and MRI protocols in the evaluation of patients with anomalies of great vessels venous return. 5) To highlight their characteristics in order to radiologists with these conditions, preventing unfavorable patient outcome.

TABLE OF CONTENTS/OUTLINE

1) Applied anatomy and embryology of the superior vena cava, inferior vena cava and pulmonary veins. 2) CT and MRI protocols in the evaluation of patients with suspected venous return anomaly. 3) Superior vena cava (SVC) anomalies: a. Left sided SVC; b. SVC duplication; c. Interrupted SVC. 4) Inferior vena cava (IVC) anomalies: a. Agenesis and hypoplasia; b. Pre-renal: azygos continuation of IVC; c. Renal: retroaortic left renal vein, circumaortic venous collar; d. Post-renal: transposition or left-sided IVC, duplication of IVC, retrocaval or circumcaval ureter, absent infrarenal inferior vena cava. 5) Pulmonary veins anomalies: a. Total anomalous pulmonary venous return (TAPVR); b. Partial anomalous pulmonary venous return (PAPVR) - Type I: Supracardiac; - Type II: Cardiac; - Type III: Infracardiac; - Type IV: Mixed. 6) Sample cases of pearls, pitfalls, diagnostic difficulties, and mimics. 7) Summary and take-home messages.

VAEE-17   **Perforator Flaps: A Pictorial Guide**

Participants
Ruben Guerrero Vara, MD, Barcelona, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) To review the most common perforator flaps used in reconstructive microsurgery. 2) To review vascular anatomy and describe

the technique to identify the best perforator on CTA for any of this flaps. 3) To correlate radiological images with schematic illustrations and surgical pictures to better understand any of the surgeries.

TABLE OF CONTENTS/OUTLINE

1) Perforator flap: definition and characteristics. 2) History of preoperative perforator flap aseessment before and after CTA. 3) Description of the most common flaps used in reconstructive microsurgery: DIEP, SIEA, ALTF, SGAP, TDAP and SCIP. 4) Review of our protocol of scanning to evaluate perforator arteries. 5) Clinical indication of each flap, anatomy of the artery it is based on and description of the appropiate point of reference for each case. 6) Depiction of examples of every flap including preoperative CTA images, schematic illustrations, surgical pictures and real images of the final result. 7) Conclusions

VAEE-18   Follow The Flow: Doppler Ultrasound Assessment Of Chronic Venous Insufficiency

Participants
Juliana Sitta, MD, Jackson, Mississippi (*Presenter*) Nothing to Disclose

TEACHING POINTS

• To review common lower extremity venous anatomy and variants, classification, and pathophysiology of chronic venous insufficiency (CVI)• To comprehend the role of ultrasound assessment in CVI • To describe ultrasound techniques and quality assessment • To discuss specific patterns of venous insufficiency and problem-solving techniques• To learn the current recommended reporting system

TABLE OF CONTENTS/OUTLINE

CVI is an extremely common pathology reported to be found in approximately 20% of the population. Although clinically significant, its assessment is commonly overlooked in clinical practice. Given the recent advancement in treatment techniques for superficial CVI, venous mapping has become imperative to accurately diagnose and to identify the source of reflux. This educational exhibit will review the lower extremity venous doppler ultrasound assessment components focusing on chronic insufficiency, including anatomy, classification, pathophysiology, and vascular doppler principles. We will review the role of ultrasound venous mapping in pre-surgical assessment and surveillance. Doppler ultrasound techniques for chronic venous insufficiency will be explored using didactic illustrations and sample cine case presentations. Quality assessment measures to ensure the validity of your vascular lab will be discussed. Finally, we will present a problem-solving section for common challenges such as ulcer assessment and atypical presentations.

VAEE-19   A Novel Simulation Method For Minimally Invasive Coronary Artery Bypass Grafting Utilizing Immersive Three-dimensional Virtual Reality System.

Participants
Koichi Osuda, RT, Hakodate, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

Minimally invasive coronary artery bypass grafting (MICS CABG) via left small thoracotomy has a lower risk of associated complications including mediastinitis, and expected rapid rehabilitation compared to median sternotomy approach. However, surgical procedures are technically demanding due to narrow operative field and deep working space. We developed a novel approach for simulating MICS CABG procedures utilizing immersive three-dimensional (3D) virtual reality (VR) system.

TABLE OF CONTENTS/OUTLINE

3D VR datasets were converted, using Computed Tomography data which has submillimeter spatial resolution. Patient-specific 3D VR models were successfully reconstructed without any misregistration and faithfully reproducing thoracic structures consisting of skin, rib, heart, aorta, coronary artery, internal thoracic artery (ITA), right gastroepiploic artery, and internal thoracic vein (ITV) in detail. Immersive 3D VR system is clinically available and enables surgeon to understand comprehensive anatomical structures, simulate surgical procedures like bi-lateral ITA harvesting. Furthermore, considering the bypass route, 3D precise measurement using VR system will be great support and promising for facilitating the graft design optimization. To accomplish MICS CABG safely, there will be contributions to clinical practice for preoperative accurate simulation using immersive 3D VR system.

VAEE-2   The 2020 STS And SVS Aortic Dissection Reporting Guidelines: What Radiologists Need To Know

Participants
Elliott K. Gozansky, MD, PhD, New York, New York (*Presenter*) Nothing to Disclose

TEACHING POINTS

In 2020, the Society of Vascular Surgeons and the Society of Thoracic Surgeons introduce a new reporting standards for Type B aortic dissections. The manuscript provides guidance well beyond what is suggested by the title and there are changes and material that radiologists would benefit from understanding. The aorta is now segmented into zones based on anatomic landmarks which enhances communication between physicians by improving clarity as to the extent of the dissection. Historically, the Stanford Type-A classification was utilized for dissections involving the ascending aorta with Type-B dissection being limited to the descending aorta. The new reporting standards more definitively delineates between dissection types and identifies a novel transition between Type-A and Type-B aortic dissections and how to describe a dissection when the entry tear cannot be identified. Finally, a systematic terminology was proposed but minor modifications are required for compatibility with radiology dictation systems and electronic medical records.

TABLE OF CONTENTS/OUTLINE

Review zonal segmentation of the aorta and distal branch vessels. Describe the new, more well defined, anatomical distinction between Type-A and Type-B dissections. Understand how the delineation of the entry tear determines dissection typing and how to report when the entry tear cannot be defectively identified. Discuss how to integrate the new standards into radiology reports.

VAEE-20   Contrast Enhanced Ultrasound Evaluation Of Abdominal Aortic Endovascular Stent Repair: Protocol, Pearls, ; Problem Solving

Awards

Participants
Lauren F. Alexander, MD, Jacksonville Beach, Florida (*Presenter*) Spouse, Stockholder, Abbott Laboratories;Spouse, Stockholder, AbbVie Inc;Spouse, Stockholder, General Electric Company

TEACHING POINTS

Repair of abdominal aortic aneurysm (AAA) and other acute aortic pathology can be performed with endovascular stents, but this treatment requires lifelong surveillance for potential endoleak and subsequent rupture. Multiphasic computed tomography (CT) has been the main imaging modality for surveillance and symptomatic evaluation, but ultrasound (US) serves as a useful alternative that avoids radiation and iodinated contrast. Color and spectral Doppler assessment are most commonly used, but contrast enhanced US (CEUS) is growing in use for surveillance and diagnosis in this patient population. After viewing this exhibit learners be prepared to:- Discuss typical endovascular aneurysm repair (EVAR) for acute aortic pathology - Describe a protocol for CEUS evaluation of AAA post EVAR - Recognize normal US findings after EVAR - Diagnose endoleak and other complications with Doppler and CEUS

TABLE OF CONTENTS/OUTLINE

1. Background a. Brief review of acute abdominal aortic pathology b. Typical EVAR techniques c. Role of imaging after repair 2. Ultrasound protocol for abdominal aorta evaluation after EVAR a. Grayscale b. Color & spectral Doppler c. CEUS 3. Case review of findings a. Typical AAA pretreatment b. EVAR without complications c. Endoleak & other complications

VAEE-21 Inflammatory Conditions Of The Aorta: A Pictorial Review

Participants
Andre Silva de Figueiredo, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

? Revisit basic concepts on the imaging evaluation of the aorta? Review the most relevant etiologies of aortitis and the most common imaging findings ? Discuss the role of multimodality imaging in the evaluation of inflammatory conditions of the aorta

TABLE OF CONTENTS/OUTLINE

• Multimodality imaging of diseases of the aorta o Ultrasound o Computed tomography o Magnetic resonance o Nuclear medicine ? Inflammatory conditions of the aorta: a pictorial review - Infectious aortitis: Illustrative cases - Noninfectious aortitis: Illustrative cases ? Pearls and pitfalls ? Invasive methods: when to perform? ? Summary and gained knowledge

VAEE-22 Complications In Endovascular Treatment Of Aortic Diseases: Diagnosis And Next Steps

Participants
Carla Machado, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To review the main complications post endovascular treatment of aortic diseases.2. To demonstrate the use of imaging methods to recognize most complications of endovascular treatment of the aorta, as well as the possible clinical and / or interventional approaches involved in the therapy of these entities.

TABLE OF CONTENTS/OUTLINE

Among the main complications of endovascular treatment of the aorta are endoleaks, prosthetic limb kinking and occlusion / thrombosis, prosthesis collapse and occlusion of the arterial branches.Demonstration of imaging findings mainly on computed tomographic angiography (CTA), the preferred diagnostic method for this analysis, through illustrations and cases of radiological practice, in addition to the role of interventional radiology in the treatment of these complications, mainly with the use of digital subtraction angiography (DSA).

VAEE-23 What All Radiologists Need To Know About Caval Obstruction And Venous Collaterals

Participants
Felipe Gomes, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

To illustrate with schematic figures and cases collateral venous pathways resulting from superior vena cava (SVC) obstruction (above or below the junction of the azygos arch), and from inferior vena cava (IVC) obstruction. To describe different etiologies, mechanisms and differential diagnoses of SVC and IVC obstruction. To discuss treatment options and the role of imaging to plan therapy. To discuss technical challenges of vena cava imaging, as well as post-therapeutic evaluation.

TABLE OF CONTENTS/OUTLINE

Caval obstruction is a common finding which permeates the everyday practice of multiple imaging subspecialties, including head and neck, thoracic, abdominal, vascular and interventional radiologists. Hence, to schematize in an easy way the collateral venous pathways developed secondary to caval obstruction is of wide interest to facilitate diagnosis and treatment. Herein we describe the collateral pathways resulting from caval obstruction in non-contrast and contrast-enhanced CT, MRI and angiography. Graphic representations of the sites of obstruction and respective formed collaterals are depicted, as well as the azygos / hemiazygos system participation to the collateral venous return. The normal anatomy and anatomical variations which might play a role in the collateral system development are detailed. The main causes of obstruction will be discussed: extrinsic compressions, tumoral invasion, thrombosis and traumatic injury.

VAEE-24 Go With The Flow: The Role Of Color Doppler Ultrasound In Dialysis Access

Awards
Certificate of Merit

Participants
Sofia Arizaga, MD, Mexico City, Mexico (*Presenter*) Nothing to Disclose

TEACHING POINTS

After the exhibit the reader would be ableTo understand the physiopathology of arteriovenous fistulas- To review preoperative vascular mapping- To recognize the maturation of the AVF- To identify adverse features and complications associated with fistulas

TABLE OF CONTENTS/OUTLINE

Table of contents 1.Introduction 2.Definition of AV fistulas 3. Physiopathology 4.Ultrasound Normal vascular mapping 5.Technical requirements and examination technique 6. AVF maturation and calculation of blood flow 7.Morphological assessment (B-mode) 8.Color Doppler examination 9.Monitoring/surveillance of the AVF (follow-up and early detection of complications) 10.Summary

VAEE-25   Carotid US: From Atherosclerosis To Vasculitis--a Pictorial Review For The General Radiologist

Participants
Marta Flory, MD, Davis, California (*Presenter*) Nothing to Disclose

TEACHING POINTS

Identify normal arterial waveforms on H&N US (CCA, ICA, ECA, VA). Review and know the NASCET criteria for evaluating atherosclerosis, and challenges to applying these criteria Recognize and diagnose important central pathology that is detectable on carotid US due to changes in waveform morphology (Pre steal, steal, AS, AR, cardiomyopathy, cardiopulmonary support devices) Diagnose other pathology seen in the carotid artery less frequently (AVF, pseudoaneurysm, thrombus, vasculitis, CCA-subclavian graft)

TABLE OF CONTENTS/OUTLINE

1-Principles of Doppler US2-Carotid and Vertebral Artery Waveform Review (Normal)3-Carotid Atherosclerosis: (Stenosis and NASCET criteria (with imaging examples); Sonographic NASCET Index; Tardus et Parvus; Atherosclerosis at other sites as manifested in Carotid Waveforms (Pre-steal, Steal, Dissection)) 4-Other Pathology causing Variations in Carotid Waveform morphology4a-Central Pathology: Valves, Heart and Devices (AS, AR (severe), Cardiomyopathy, Cardiopulmonary devices (IABP, ECMO, LVAD))4b-Trauma and Post Surgical Appearance (AVF, Pseudoaneurysm, CCA to Subclavian graft)4c-Vasculitis (Takayasus, GCA & Temporal Tap, FMD)

VAEE-27   Clinical Radiologists' Perspective Of ISSVA Classification Of Vascular Anomalies And Its Management: Cutting Through The Clutter.

Participants
Adarsh Hegde JR, MBBS, Jodhpur, India (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Explaining the latest ISSVA classification with emphasis on clinico-radiological correlation of various vascular anomalies. • Emphasizing on practicing specific and standardized nomenclature to a vascular anomaly in the case reporting. • The significance of each radiological modality in classifying the vascular anomalies with an imaging checklist. • Clinico-radiological algorithmic approach to a vascular anomaly which will aid in the further management.

TABLE OF CONTENTS/OUTLINE

1. Background 2. ISSVA classification of vascular anomalies (2018) with recent updates. 3. Role of imaging and checklist-Radiograph, Ultrasonography, Magnetic resonance imaging, Computed tomography, Digital subtraction angiography and Direct percutaneous phlebography. 4. Clinicoradiological algorithm-Approach to a suspected vascular anomalies taking ultrasound as the initial modality along with clinical information and MRI. 5. Case-based approach with examples- It includes vascular tumors, simple vascular malformations, syndromic associations and anomalies under provisionally unclassified group such as FAVA. 6. Mimickers of vascular anomalies- Neoplastic and Non-neoplastic aetiologies. 7. Management options and role of interventional radiology in the management of various vascular malformations with recent updates. 8. Take home message.

VAEE-28   Thoracic Outlet Syndrome: Unraveling The Anatomy, Organizing The Report, And Teaching The Protocols

Awards
Cum Laude

Participants
Natália Magero, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is1. To review thoracic outlet syndrome (TOS), covering the anatomy of the compartments involved, the main reported symptoms and the mechanisms by which the structures are affected.2. To describe the technique of examining computed tomography angiography (CTA) in a 320-detector row in order to demonstrate its efficiency and reproducibility.3. To make a brief tutorial on how to organize the report, highlighting the key points to be described and how to avoid the misdiagnosis.

TABLE OF CONTENTS/OUTLINE

A. Anatomy of compartments and compression mechanisms: -Scalene triangle -Costoclavicular space -Pectoralis minor spaceB. Symptoms of TOS: -Arterial -Venous -NeurogenicC. Image acquisition: -Advantages of cross-section CTA -Provocative maneuvers -Protocol parameters for the acquisitionD. Post-processing and Image analysisE. InnovationF. How to organize the report -Key points -Avoiding the misdiagnosis

VAEE-3   Post-TEVAR Imaging For Aortic Dissection

Awards
Identified for RadioGraphics

Participants
Jody Shen, MD, Palo Alto, California (*Presenter*) Nothing to Disclose

Thoracic endovascular aortic repair (TEVAR) is an evolving alternative technique to open surgical repair of patients with chronic aortic dissection. In addition to covering the entry tear with an endograft, several adjunct procedures are often required to achieve the goal of complete exclusion of false lumen flow. Challenges include a small true lumen in conjunction with a stiff flap and complex anatomy. Familiarity with post-operative imaging appearance is important to recognize expected changes and complications.

TABLE OF CONTENTS/OUTLINE

In this case-based review, we will discuss the purpose of and expected imaging findings of TEVAR for chronic aortic dissection. This education exhibit will describe the angiographic and CTA appearances of complicated techniques, such as the Provisional Extension To Induce Complete Attachment (PETTICOAT) technique, cheese-wire fenestration, false lumen embolization, and baffle stents.

VAEE-30   Cold-Blooded COVID-19: A Pictorial Review Of CTA Vascular Complications Of Torso And Extremity In Critically Ill Patients

Participants
Anna Gong, Baltimore, Maryland (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To provide an overview of imaging findings of vascular complications in critically ill COVID-19 patients using CT Angiography.2. Discuss the incidence of these complications and the importance of early radiological detection and the role of imaging in the management of these critically ill patients.

TABLE OF CONTENTS/OUTLINE

Introduction The COVID-19 pandemic caused by severe acute respiratory syndrome coronavirus-2 (SARS-CoV-2) is a multiorgan systemic illness. Anticoagulation strategy and thrombotic and bleeding complications in patients with COVID-19 are complex and can be clinically silent or obscure in presentation. Imaging plays an active role for appropriate diagnosis, which could potentially alter management.Thrombus Venous complications: • Deep vein thrombosis Arterial complications: • Pulmonary Artery • Aorta • Mesenteric ischemia • Renal vasculature • Peripheral vasculatureHemorrhage: • Lung • Mediastinal • Gastrointestinal • Genitourinary • Retroperitoneal • Peritoneum • Intramuscular hematomas chest, abdomen and extremityInfarcts • Renal • Hepatic • Colon • Spleen • PulmonaryVascular access-related complications: • Arterial dissections • Pseudoaneurysms • Catheter-related thrombosis

VAEE-31   Spectral Doppler Ultrasound: Simple Tools To Tackle Complex Pathology

Participants
Alexander Clinkenbeard, MD, Phoenix, Arizona (*Presenter*) Nothing to Disclose

TEACHING POINTS

Ultrasound directly visualizes vessels using grayscale and color Doppler imaging but can also indirectly assess vasculature's hemodynamics using spectral Doppler. Spectral Doppler assesses the velocity of red blood cells over time as well as their amplitude. A wide variety of waveforms can co-exist in physiologic and pathologic conditions. Knowledge of particular patterns provide the interpreter with the adequate tools to cinch the diagnosis and avoid pitfalls. Review spectral doppler findings from varied organs including waveforms, resistance patterns, and flow patterns to understand normal physiologic states. Review key artifacts, including aliasing and tissue vibration. Consider these factors (spectral Doppler findings and key artifacts) as a framework to approach vascular pathology.

TABLE OF CONTENTS/OUTLINE

Brief summary of arterial histology and physiology Rundown of commonly assessed organs and the normal expected spectral and color doppler findings Overview of the "indirectly" assessed components of vascular ultrasound Resistance patterns: resistive indices, high and low resistive end-organs, Waveform: velocity, mono-, bi-, and tri-phasic waveforms Flow patterns: plug, laminar and turbulent flow Artifacts: aliasing, spectral narrowing/broadening, vibration 4. Pathology: stenosis, arteriovenous fistula, pseudoaneurysm

VAEE-32   Multimodality Approach In Evaluation Of Vascular Pathologies In Female Pelvis

Participants
Margarita Revzin, MD, Wilton, Connecticut (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Familiarize radiologists with arterial and venous anatomy of female pelvis 2. Review role of imaging in evaluation of vascular pathologies in pelvis 3. Discuss characteristic appearance of various vascular pelvic pathologies 4. Provide an algorithmic approach to management of the pelvic vascular disease

TABLE OF CONTENTS/OUTLINE

1. Anatomy of pelvic vasculature: arterial system (aorta and its main branches, arterial system of the pelvis, arteriovenous system, pelvis venous plexus and main venous drainage). Hemodynamics and pathophysiology of arterial and venous systems 2. Role of imaging (ultrasound, CTA, MRA) in diagnosis and management of pelvic vascular pathologies in pelvis 3. Characteristic imaging appearance of various pelvic vascular pathologies a. Arterial: pelvic aneurysm (true and mycotic), pseudoaneurysm, AV fistula, dissection, proximal lower extremity arterial disease (LEAD) due to stenosis, occlusion, arterial rupture with and without active extravasation b. Small vessel and Capillary: Uterine AVM/AVF, pelvic AVM/AVF, rectus abdominis hemorrhage, bladder hemorrhage, hemoperitoneum, retained products of conception, placental insertion abnormality c. Venous: May-Thurner syndrome, Phlegmasia Cerulean Dolens, ovarian vein thrombosis, pelvic congestion syndrome, deep pelvic vein thrombosis, labial varices, round ligament varices 4. Algorithm of management of various vascular pathologies in the female pelvis

VAEE-33   Peripheral Arterial Doppler - From Basics To Interpreting Complex Waveforms

Participants
Carlos Padula, MD, Jacksonville, Florida (*Presenter*) Nothing to Disclose

• To understand the physiology of arterial waveforms in the extremities• To understand the pathophysiology of peripheral arterial diseases.• To understand and interpret the Doppler spectra in obstructive arterial lesions, including thromboembolism, stenosis, dissection, and compartment syndrome.• To review features of the Doppler spectra in non-obstructive arterial lesions, including hyperemia, pseudoaneurysm, and arteriovenous fistula.• To understand the effects of cardiovascular support devices on arterial waveforms

TABLE OF CONTENTS/OUTLINE

1. Anatomy of peripheral (upper and lower extremity) arteries.2. Ultrasound and Doppler technique and pitfalls3. Normal color and spectral Doppler appearance of peripheral arteries4. Waveform characterization - normal and abnormal (obstructive and non obstructive)5. Case examplesa. Proximal obstruction - acute and chronicb. Distal obstruction- acute and chronicc. Stent occlusiond. Bypass graft and complicationse. Traumatic arterial injuryf. Compartment syndromeg. Arterio-venous fistulah. Aneurysm (pseudoaneurysm) and dissectioni. Cardiac diseases - reduced output, aortic regurgitation, etcj. Cystic adventitial diseasesk. Cardiovascular support devices - aortic balloon pump, LVAD, ECMO, artificial heart

VAEE-34   When Adventitia Is The Advantage. A Case-based Review Of Aortic And Visceral Pseudoaneurysms

Participants
Roberth Escarria Panesso, MD, Mexico City, Mexico (*Presenter*) Nothing to Disclose

TEACHING POINTS

To review the normal anatomy of arterial wall and the differences between a false and true aneurysm To learn how to identify the pathophysiological mechanism that lead to the formation of Pseudoaneurysms through a case based presentation To recognize the main characteristics of Pseudoaneurysms and the most relevant differential diagnoses on contrasted tomography To know the follow up or surgical recommendations according to the location and radiological characteristics of the Pseudoaneurysms

TABLE OF CONTENTS/OUTLINE

This educational exhibit will be presented in a case review format. Teaching points and feedback information will be highlighted in the discussion of each case. The list of cases will help the reader to learn and understand the following: Tomography technical considerations. Etiology, pathophysiological mechanisms and main location. Normal anatomy of the arterial wall and radiological characteristics of the false aneurysms. Differential diagnoses. follow up or surgical recommendations for each case os Pseudoaneurysms. Summary References.

VAEE-35   Integrating And Optimizing 4D Flow In Cardiac Imaging Practice- A Practical Guide For Problem Solving

Awards
Cum Laude

Participants
Prabhakar Rajiah, MD, FRCR, Rochester, Minnesota (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. 4D flow is now increasingly incorporated in cardiac imaging. Technical parameters have to be optimized for the use of 4D flow2. To review the current applications of 4D flow in cardiac imaging3. To understand the key parameters required for optimization of 4D flow4. To provide practical tips and tricks for optimization of 4D flow

TABLE OF CONTENTS/OUTLINE

A. Introduction to 4D flow- Basic physicsB. Limitations of 4D flow- Long acquisition time- Long reconstruction- Long post processing- Respiratory gating and lower scan efficiency- Lower spatial resolution- limited by scan time and SNR-Lower temporal resolution- Limited by scan time and SNR, decreases accuracy- Higher noiseC. Practical tips and tricks for integrating 4D flow in practice with illustrative case examples- Intravenous contrast- Feraheme >> Multihance >> Other-Gd agents-4D flow net: reduce noise using AI based on synthetic 4D flow MRI data from computational fluid dynamics (CFD)- Slice thickness- Venc- Slightly greater than expected maximum velocity/scout- Background phase offsets, Eddy currents- Imaging planes to minimize artifacts-ECG gating- Motion-robust readouts and sorting of respiratory phases- Field of View- Acceleration - Compressed sensing, Parallel imaging- Reconstruction & post-processing- Use of AI- Artifacts

VAEE-4   Ferumoxytol MRI - Vascular Applications And Challenges

Participants
Prabhakar Rajiah, MD, FRCR, Rochester, Minnesota (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To review the principles of Ferumoxytol as a contrast agent in vascular imaging2. To review the advantages of Ferumoxytol3. To illustrate the applications of Ferumoxytol in vascular imaging4. To discuss a workflow to integrate the use of Ferumoxytol in cardiovascular imaging

TABLE OF CONTENTS/OUTLINE

Principles-Ultrasmall superparamagnetic iron oxide particle-Intravascular t ½ of 14-21 hours-Cleared by macrophages-No long-term depositionAdvantages in vascular imaging- Alternative to gadolinium-based agents, no renal excretion- No concerns about timing-Can be repeated if there are artifacts- High spatial resolution with long ECG/navigator gating- Arteries & veins in the same study-High signal for 4D flowWorkflow for Ferumoxytol- Safety screening, dose, injection rate, monitoring- Imaging sequence- Steady-state imaging using MRA, IR Navigator gated SSFPLimitations-Hypersensitivity reactions- Interferes with MRI for 24 hours- Signal loss if an inappropriate dose- Caution in those unable to metabolize ironApplicationsA. Aortic disease- Aneurysm, dissection, graft, Endoleak classificationB. Pulmonary arteries- Embolism, malformationsC. Vascular compression- Popliteal artery entrapment, median arcuate ligamentD. Renovascular-Renal transplant, Renal dialysis graftE. Occlusion- SVC, IVCF. Congenital heart disease- Complex vascular anatomy, Fontan ShuntG. 4D flow applicationsH. Structural heart disease- TAVR in patients with renal dysfunction

VAEE-5   Demonstration Of Collateral Pathways To The Artery Of Adamkiewicz Using Ultra-high-resolution CT Angiography

Participants
Kunihiro Yoshioka, MD, Morioka, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. to get know the advantage of the ultra-high-resolution CT angiography in depiction of the artery of Adamkiewicz.2. to get know the anatomical characteristics of collateral pathways to the artery of Adamkiewicz. 3. to get know the clinical application of the knowledge of collateral pathways to the artery of Adamkiewicz for open and endovascular repair.

TABLE OF CONTENTS/OUTLINE

Anatomy of the artery of AdamkiewiczAdvantage of the ultra-high-resolution CT for the demonstration of the artery of Adamkiewicz Anatomical characteristics of the collateral pathways to the artery of Adamkiewicz - Collateral pathways around spinal column - Collateral pathways in thoracic wall Clinical applications of the knowledge of the collateral pathways to the artery of Adamkiewicz - Open repair - Endovascular repair

VAEE-6   Leaky Valves: What The Radiologist Needs To Know About Varicose Veins And Venous Insufficiency

Awards
Identified for RadioGraphics

Participants
Cameron Adler, MD, Madison, Wisconsin (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Protocol for pretreatment sonographic evaluation of varicose veins and venous insufficiency 2. Methods of treating varicose veins 3. Common pitfalls in the pretreatment sonographic evaluation of varicose veins

TABLE OF CONTENTS/OUTLINE

1. Overview 2. Review of Normal Lower Extremity Venous Anatomy 2a. Deep Veins 2b. Superficial Veins 2c. Perforator Veins 3. Pathophysiology/causes of varicosities 3a. Extremity deep venous insufficiency with perforating vein insufficiency 3b. Saphenofemoral/saphenopopliteal insufficiency 3c. Calf-muscle pump failure 3d. Pudendal/pelvic vein insufficiency 4. Methods for Surgical Treatment of Varicose Veins 4a. Invasive Treatment 4a-i. Vein Stripping 4b. Minimally Invasive Treatments 4b-i. Endovenous Ablation 4b-ii. Ambulatory Phlebectomy 4b-iii. Sclerotherapy 5. Imaging Protocol 5a. Key Elements 6. Pitfalls 6a. Missing Deep Venous Reflux 6b. Very Superficial Course of Great Superficial Veins 6c. Central Venous Obstruction 6d. Mistaking Common Femoral Vein Reflux for Significant Deep Venous Reflux in the setting of Superficial Venous Insufficiency 6e. Variant Anatomy 6f. Pudendal/pelvic vein insufficiency connecting to extremity superficial veins 7. Summary of Key Learning Points

VAEE-7   Flow Reversal In Doppler Ultrasound: What Does It Mean ?

Participants
Hsin-Kai Wang, MD, Taipei, Taiwan (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Partial flow reversal is a normal physiological phenomenon in the vascular system. 2. To demonstrate pathological flow reversal that may be encountered in Doppler ultrasound. 3. To explain underlying mechanisms of pathological flow reversal.

TABLE OF CONTENTS/OUTLINE

Partial flow reversal: a physiological phenomenonAffected vessels in pathological flow reversal: artery, vein, portovenous.Causes of flow reversal: diminished forward driving force, downstream occlusion/stenosis, steal. Flow reversal of the splanchnic vessels: renal artery (renal vein thrombosis), portal vein / splenic vein (portal hypertension), hepatic vein (Budd-Chiari syndrome, venous outflow obstruction), testicular vein (varicocele), ovarian vein (pelvic congestion syndrome). Flow reversal of the peripheral arteries: vertebral artery (subclavian steal syndrome), external carotid artery (common carotid artery occlusion), distal artery of dialysis arterio-venous fistula. Flow reversal of the peripheral veins: saphenous vein (superficial venous insufficiency), superficial epigastric vein (superficial venous insufficiency/deep vein thrombosis), deep vein (deep vein insufficiency), internal jugular vein (central vein stenosis/occlusion).

VAEE-8   Imaging Of Adults On Extracorporeal Membrane Oxygenation (ECMO) During The COVID-19 Pandemic- What The Radiologist Needs To Know

Awards
Certificate of Merit

Participants
Simon Ponsel, MD, Berlin, Germany (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. llustrate the different types of ECMO as well as their respective functionality and usage. 2. Discuss imaging acquisition pitfalls in ECMO patients. 3. Review common general complications. 4. Explain and display specific complications for VV and VA ECMO respectively.

TABLE OF CONTENTS/OUTLINE

1. Introduction, 1a. Usage in the COVID-19 pandemic, 1b. ECMO functionality, 1c. Altered physiology and blood flow in ECMO patients, 1d. Usage of different ECMO types. 2. Imaging acquisition pitfalls, 2a. Contrast agent application, 2b. Acquisition timing, 2c. Alterations of circulation time and vessel flow. 3. General complication, 3a. Hematoma, 3b. Thrombosis, 3c. Intracerebral bleeding, 3d Cannula malposition, 3e. Liver dysfunction. 4. Specific complications, 4a. VV ECMO, 4b. VA ECMO. 5. Miscellaneous

VAEE-9   Participants **Prevalence And Imaging Features Of Extra-coronary Arteriopathies In Patients With Spontaneous Coronary Artery Dissection. A Case Series.**

Cara Owens, MBBS,PhD, London, United Kingdom (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Spontaneous coronary artery dissection (SCAD) is an infrequent diagnosis in patients presenting with acute coronary syndrome (ACS).2. There is a strong association with fibromuscular dysplasia (FMD), connective tissue diseases and systemic inflammatory diseases. 3. The American Heart Association advises vascular imaging from brain to pelvis to assess for underlying causes for patients with SCAD. 4. CT angiographic and MRI features of these underlying causes include extra-coronary artery aneurysms, dissections, beading, vessel tortuosity, stenosis and looping.

TABLE OF CONTENTS/OUTLINE

Introduction to SCAD:Prevalence, female predominance, proposed mechanism of dissection, risk factors, strong association with fibromuscular dysplasia (FMD), CT-angiographic screening of extra-coronary arteriopathies.Method:Retrospective case series of CT-angiographic findings for patients with a diagnosis of SCAD.Results: Nineteen percent of a total of 790 patients had imaging features of SCAD-associated extra-coronary arteriopathy with FMD (beading and dissection) predominating. The majority had disease in more than one vascular territory.Discussion: Results consistent with other studies with high prevalence of extra-coronary arteriopathies, particularly FMD. Supports role for CT-angiography for SCAD patients as it informs decisions about treatment, lifestyle management and surveillance.

Abstract Archives of the RSNA, 2021

Sub-Events

IREE-1   Inferior Phrenic Artery: Anatomy And Interventional Treatment

Awards
Identified for RadioGraphics
Cum Laude

Participants
Hyo-Cheol Kim, MD, Seoul, Korea, Republic Of (*Presenter*) Nothing to Disclose

TEACHING POINTS

The inferior phrenic artery (IPA) is the most common extrahepatic collateral artery supplying hepatocellular carcinoma (HCC). In addition, the IPA may be treated in patients with hemoptysis or iatrogenic bleeding. Cone-beam CT can provide the detailed vascular anatomy, which can make it possible to perform radioembolization through the IPA. The purpose of this exhibit is : (1) To review the vascular anatomy of IPA with cone-beam CT. (2) To list the pathologic conditions requiring angiography of the IPA. (3) To learn how to do intra-arterial therapy via the IPA without complications.

TABLE OF CONTENTS/OUTLINE

1. Vascular anatomy of IPA : A. vascular anatomy of right and left IPA B. communication with intercostal and internal mammary artery C. pulmonary shunt by azygoesophageal branch D. accessory gastric branch2. Pathologic conditions : HCC, hemoptysis, post-operative bleeding, post-RFA bleeding, gastrointestinal bleeding3. Technical considerations : A. Proper embolic materials. B. catheterization technique depending on origin site. C. prophylactic embolization of pulmonary shunt. D. protection of normal distal branch. E. treatment through collateral pathway. F. special consideration for radioembolization

IREE-10   Thyroid Nodule Ablation: What A Radiology Trainee Needs To Know

Participants
Navpreet Khurana, MBBS, Nagpur, India (*Presenter*) Nothing to Disclose

TEACHING POINTS

Thyroid nodules are commonly seen in females and elderly, and ultrasound is imaging modality of choice for screening. Benign nodules may require treatment if they are hyperfunctioning, cause pressure symptoms, or if the patient desires it. Surgical management of such nodules carries risk of complications such as hypothyroidism, hematoma formation, damage to recurrent and superior laryngeal nerves leading to hoarseness, infection, and hypoparathyroidism. There has been an upcoming and increasingly popular role of minimally invasive procedures utilising chemical and thermal energy for destroying nodules, hence it is important for a trainee to be familiar with the same. With this exhibit, we aim to review the existing literature and use cases to-Highlight the role of ablation in the treatment of thyroid nodules.Review the importance of ultrasound evaluation and TIRADS staging.Describe the indications, clinical outcomes, and complications of ethanol ablation, radiofrequency ablation, laser thermal ablation and microwave ablation. Review pre-operative patient preparation, procedural techniques and post-procedural follow-up.

TABLE OF CONTENTS/OUTLINE

Evaluation of a thyroid nodule.Key strategies for managing benign thyroid nodules.Indications for ablation procedures.Pre-procedural imaging and investigations.Procedural techniques, outcomes, post-procedural follow-up and complicationsCase based discussion.Conclusion.

IREE-11   Hybrid CT-Angiography (Angio-CT) For Acute Traumatic And Vascular Emergencies: A Case Based Review

Participants
Karan Nijhawan, MD, Chicago, Illinois (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) Review features and advantages of a hybrid CT/angiography (Angio-CT) system 2) Discuss the role of Angio-CT in the management of acute trauma and vascular emergencies 3) Case based review of interventions performed at our institution using Angio-CT in the setting of acute trauma and vascular emergencies

TABLE OF CONTENTS/OUTLINE

1) Introduction to Angio-CT- history, current uses, comparison to traditional C-arm fluoroscopy, impact on operational efficiency 2) Anatomy of the Angio-CT suite- design, components, key features 3) Challenges of acute trauma and vascular emergency management that are addressed by Angio-CT including reduced treatment time, enhanced imaging quality for localization, and versatility for simplifying complex procedures 4) Pictorial review of cases using Angio-CT to manage acute trauma and vascular

emergencies within authors' institution- including technique, imaging findings, and impact of Angio-CT on the workflow and outcome of each case 5) Future applications and summary

IREE-12   Enhanced Myometrial Vascularity: Associations, Diagnosis, Management, And Role Of Uterine Artery Embolisation

Participants
Navpreet Khurana, MBBS, Nagpur, India (*Presenter*) Nothing to Disclose

TEACHING POINTS

Historically, hypervascular myometrial lesions post dilatation & curettage have been referred to as acquired arteriovenous malformations in spite of angiogram revealing little to no significant arterio-venous shunting. Coupled with increased levels of beta human chorionic gonadotropin and evidence of trophoblastic tissue found in these patients, these foci of intense vascularity with mild AV shunting are now better represented by the term 'enhanced myometrial vascularity' (EMV). EMV can be a rare but life-threatening complication. Since there are no established guidelines on its management, the role of interventional radiology is important to provide a focused case-based treatment. The aim of this exhibit is to review the existing literature regarding association, diagnosis, and management of EMV with a case-based illustration such as EMV associated with retained product of conception (RPOC) and interstitial ectopic pregnancy. It will also discuss the role of uterine artery embolisation in the management of EMV.

TABLE OF CONTENTS/OUTLINE

Enhanced myometrial vascularity: PathophysiologyClinical presentationConditions associated with development of EMVDiagnostic imaging and criteriaManagement of EMVCase discussion and comparison with existing literature reviewCase 1 - RPOC with EMVCase 2 - Interstitial ectopic pregnancy with EMVConclusion

IREE-13   An Imaging Review Of Portal Hypertension Complications, Ectopic Varices And Their Various Treatments

Participants
Jessica Yoon, MD, Providence, Rhode Island (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Pathophysiology of portal hypertension and varices 2. Classification of varices 3. Common vs ectopic varices 4. Approaches and techniques in treatment

TABLE OF CONTENTS/OUTLINE

1. Portal hypertension 1a. Demographic and background information 1b. Pathophysiology 2. Hemodynamics of varices 2a. Occlusive etiology 2b. Non-occlusive etiology 3. Common vs. ectopic varices 3a. Prevalence 3b. Anatomic differences 3c. Complications 3d. Case-based examples of ectopic varices 3di. duodenal 3dii. rectal 3diii. para-stomal 3div. gallbladder 3dv. bladder 4. Interventions: approaches and techniques 4a. Types of access 4ai. antegrade (transplenic) 4aii. retrograde (transhepatic) 4aiii. direct stick (parastomal) 4b. Decompression 4bi. TIPS 4bii. Recanalization of occluded vein 4c. Obliteration 4ci. coil embolization, sclerotherapy, glue, combinations) 5. Conclusion

IREE-14   Alert The PERT: Leveraging Artificial Intelligence To Optimize Diagnosis And Management Of Acute Pulmonary Embolism Within A Large Urban Health System

Awards
Certificate of Merit

Participants
Ricki Korff, MD, New York, New York (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is:1. To present an overview of the stages of integration of artificial intelligence into a health system's pulmonary embolism (PE) diagnosis and management algorithm.2. To demonstrate the value of automated AI-generated notifications to clinical teams about concerning PE cases in a real-life clinical setting.3. To review future directions and refinement of an AI-generated PE notification system.

TABLE OF CONTENTS/OUTLINE

1. AI-assisted detection of pulmonary embolisma. Deciding which studies the PE detection algorithm should be run onb. Incorporation of AI-generated PE detection results into PACSc. Utilization of AI-generated PE detection results by radiologists2. AI-generated passive notification of radiologists about positive PE studies a. Triaging of studies3. AI-generated active notification of Pulmonary Embolism Response Team (PERT) clinicians about PEs with concerning features a. Assessment of location and extent of PEb. Integration of CT RV/LV ratio4. Overlay of relevant clinical data from the electronic medical recorda. Echo resultsb. Vitals, O2 requirementsc. Biomarkers: troponin, lactate, BNPd. Scores: PESI, sPESI, BOVA5. PERT team communication within a centralized encrypted chat environment a. HIPAA-compliant mobile application integrating imaging, clinical data, and case discussion

IREE-15   Combining Radioembolization And Immune Checkpoint Inhibitors For The Treatment Of Hepatocellular Carcinoma: Mutually Beneficial Therapies For A Challenging Disease

Participants
Suryansh Bajaj, New Haven, Connecticut (*Presenter*) Nothing to Disclose

TEACHING POINTS

Hepatocellular carcinoma remains a major cause of cancer-related mortality worldwide. While screening programs have improved early detection, many patients are diagnosed at later stages and are poor candidates for curative therapy. Therapeutic options for HCC have seen overwhelming growth within the past decade and there is multidisciplinary interest in combining therapies with potentially synergistic mechanisms. Various preclinical and clinical studies have shown promising results with the combined use of radiation and immunotherapy for multiple malignancies. With the advent of immunotherapies, there has been emerging interest in

the combined use of ICIs with transarterial Radioembolization (TARE). TARE is now a Food and Drug Administration approved therapy for HCC and, while less is known of the interaction of TARE and immunotherapy, its potential for synergism is promising.

TABLE OF CONTENTS/OUTLINE

Immune mechanisms in the pathogenesis of HCC.Role of immune checkpoint inhibitors and radiotherapy in HCC.Combination of radiotherapy and immune checkpoint inhibitors in HCC: Background of combination therapy use in different malignancies.Synergistic mechanisms and rationale for the use of combination therapy.Safety profileAbscopal effectsCurrent data and ongoing studiesLimitationsRole as bridge therapy in potential transplant recepients.Future directions: Need for reliable biomarkers, Other potential combination therapies (anti-VEGF), the prognostic significance of neutrophil : lymphocyte ratio.

IREE-16   **Safety, Quality, And Complications Of Central Venous Access Procedures**

Participants
Hiroki Horinouchi, Suita, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

Central venous (CV) access devices provide reliable and stable intravenous access for patients requiring blood transfusions, chemotherapy, and parenteral nutrition. The devices relieve patients from the stress of repeated needle pricks and phlebitis over weeks, months, or even years. CV access procedures are the most common procedures performed by interventional radiologists. However, the methods vary according to the operator or hospital, and we have not been able to completely prevent the complications related to the procedures from occurring. To improve safety and quality, radiologists should know the complications of CV access procedures and optimal evidence-based methods to prevent them.This exhibition aims to instruct the participants regarding; 1) The complications of CV access procedures and their causes, 2) The methods to promptly detect and manage the complications, 3) The tips and tricks of CV access procedures.

TABLE OF CONTENTS/OUTLINE

1. What are central venous (CV) access procedures? a. Indication b. Types of CV access devices 2. How to perform CV access procedures a. Preparation b. Needle insertion c. Placement d. Fixation, Dressing 3. Complications a. Hematoma, Hemorrhage b. Pneumothorax, Hemothorax c. Thrombosis, Thrombophlebitis d. Catheter malposition e. Catheter fracture, Catheter kinking f. Infection g. Others 4. Management of complications 5. Tips and tricks to improve for safety and quality

IREE-17   **Subclavian Steal Syndrome: An Underrecognized Manifestation Of Atherosclerosis.**

Participants
Suryansh Bajaj, New Haven, Connecticut (*Presenter*) Nothing to Disclose

TEACHING POINTS

Subclavian steal syndrome (SSS) is a hemodynamic phenomenon that causes decreased perfusion in the branches of the subclavian artery and retrograde flow of blood in the vertebral artery due to decreased anterograde flow caused by an occlusive lesion in the subclavian artery. The occlusive lesion is most commonly due to significant atherosclerotic disease. An overwhelming majority of patients remain asymptomatic and those with severe occlusion can present with symptoms involving the vertebrobasilar circulation (posterior circulation symptoms like transient ischemic attacks, vertigo, and dizziness) or ipsilateral arm ischemia. Diagnosis is usually made using Doppler ultrasonography (USG), but other cross-sectional imaging modalities (CTA and MRA) have shown increased prevalence than once thought. A thorough workup for SSS and other atherosclerotic lesions should be done in all such patients. Most patients can be managed conservatively by medical management. Symptomatic patients are managed with endovascular (PTA with or without stenting) first or surgical management in select cases. This exhibit will provide a concise look at the current literature along with the latest management guidelines and therapeutic options.

TABLE OF CONTENTS/OUTLINE

Current epidemiology and prevalence of the disease. An interesting case study requiring intervention. Clinical Presentation. Latest guidelines on diagnosis: Role of Doppler USG, CTA, MRA, and conventional angiography. Management: conservative, endovascular vs surgical.

IREE-18   **Adapting A Dialysis Service For The Delivery Of Percutaneous Arteriovenous Fistulas**

Awards
Identified for RadioGraphics
Certificate of Merit

Participants
Geoffrey Lie, MBBS,BSC, London, United Kingdom (*Presenter*) Nothing to Disclose

TEACHING POINTS

Pre-procedural planning, expertise to perform the procedure and post-procedural care are all essential to deliver an effective percutaneous arteriovenous fistula service• Pre-procedural planning: o Skilled vascular ultrasound practitioners provide an anatomical/procedural roadmap to screen patients. A proforma is mandatory to standardize record keeping o A vascular access multidisciplinary team (MDT) comprising Nephrologists, Vascular Access Surgeons, Dialysis Nurses, Anaesthetists and Interventional Radiologists (IR) to discuss the most suitable dialysis life plans for patients (as per KDOQI guidelines) and safeguard appropriate patient selection o Clinic to obtain informed patient consent, review patient co-morbidities, history of prior vascular access, and counsel for patient preference and lifestyle factors• Periprocedural: o IR team members must possess knowledge of the specific nuances related to procedure• Post-procedural care: o Ultrasound follow-up for complications and adequate fistula maturation o Dialysis nurses must be trained in needling cannulation sites specific to this fistula (eg. median cubital vein) o Established pathway for cases of non-maturation to plan for re-intervention or surgical adjunct procedures

TABLE OF CONTENTS/OUTLINE

1. Background: benefits of the percutaneous AV fistula 2. Algorithmic overview: our experience 3. Pre-procedural planning 4. Performing the procedure 5. Post-procedural care and follow up 6. Patient Case studies 7. Conclusion

IREE-19   **Interventional Radiology Management Of Complications From Iatrogenic Gastrointestinal**

Interventions

Participants
Harish Narayanan, MD, Phoenix, Arizona (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Gastrointestinal interventions are common and first line therapy for many gastrointestinal disorders. These therapies are safe; however, complications can occur.2. After a patient has undergone a gastrointestinal intervention and has significant abdominal pain or gastrointestinal bleeding, suspicion for complication should be high. CT angiography can be particularly useful in the diagnostic evaluation.3. Interventional radiology can manage complications from gastrointestinal interventions using various techniques.

TABLE OF CONTENTS/OUTLINE

In a case-based format, this educational exhibit will provide a pictorial review and discussion of various complications related to gastrointestinal interventions, the diagnostic imaging evaluation and the interventional radiologic management. Case 1 - Colonic Self Expanding Metal Stent (SEMS) causing left external iliac artery pseudoaneurysm Case 2 - Gastroduodenal SEMS causing aortoenteric fistula Case 3 - Lumen-apposing metal stent (LAMS) from gastrojejunostomy to excluded stomach causing pseudoaneurysm Case 4 - ERCP metallic biliary duct stent placement causing pseudoaneurysm Case 5 - Percutaneous pancreatic fluid collection/necrosis drain placement complicated by pancreatic pseudoaneurysm Case 6 - Rectus sheath hematoma after gastrostomy tube placement Case 7- Intraperitoneal abscess after gastrostomy tube placement

IREE-2   Percutaneous Drainage For Postoperative Fluid Collection After Hepato-biliary Pancreatic Surgery

Participants
Ryo Morita, MD, Sapporo, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To explain the basic treatment flow of percutaneous drainage after hepato-biliary pancreatic surgery, 2. To summarize the advanced puncture technique/catheter induction, 3. To explain the treatment of anastomotic leakage with percutaneous approach

TABLE OF CONTENTS/OUTLINE

1. Basics; Treatment concepts/strategy, Diagnosis and indication, Treatment outcome and complication, Safe and effective puncture(common access route, route of single space, puncture of abscess origin), Imaging guidance(US and CT, CT fluoroscopy), Drainage technique:Trocar Seldinger technique, Catheter induction, Postdrainage management (tube replacement / removal) and catheter care.2. Developmental matters/Case presentation; Right intercostal approach:Difficulties of puncturing via the thoracic cavity, Percutaneous drainage with preexisting surgical drains, Sinus tract puncture technique, Catheter induction with Navigation Map, Anastomotic leakage/external fistula (pancreatic fistula / bile leakage), Internal fistulization/drainage for anastomotic leakage(using a jejunostomy route, creating a the jejunostomy, or rendezvous techniques).3. Technical Tips/ Equipment for reliable tube placement after puncture; Puncture kit, Tube induction system, Guidewires, Catheters.4. Important point for postoperative drainage; Confirmation and understanding of surgical procedures, Careful procedure, Troubleshooting related to the puncture(bleeding, intestinal puncture, tube falling).

IREE-21   A Review Of Heparin-induced Thrombocytopenia And Heparin-coated Intravascular Devices

Participants
Erika Ysabelle Mojica, BA, Minot, North Dakota (*Presenter*) Shareholder, Catalyst Pharmaceuticals

TEACHING POINTS

Vascular diseases, including peripheral artery disease (PAD), continue to be significant causes of morbidity and mortality worldwide. Endovascular treatments of vascular diseases are quickly replacing higher risk surgeries, in large part due to rapid advances in therapeutic interventions including the development of viable vessel substitutes. Heparinized stents and endovascular grafts are increasingly used for treatment of PAD due to superior patency rates over bare metal stents. However, cases of heparin-induced thrombocytopenia (HIT), a potentially fatal immune-mediated complication of heparin exposure, have been recorded in patients who have received heparin-coated stents and vascular grafts. Notably, the development of HIT in patients receiving heparin-coated intravascular devices may be confounded by systemic exposure to heparin during the intraoperative or postoperative period. This educational exhibit will examine the current literature on HIT in patients with heparin-coated intravascular devices.

TABLE OF CONTENTS/OUTLINE

1. Present a case of thrombocytopenia post-placement of a heparin-coated graft in the setting of aortoiliac occlusion. 2. Review the pathogenesis, presentation, diagnosis, and treatment of HIT. 3. Describe approaches to heparin bonding in intravascular devices. 4. Summarize the current literature on HIT in patients who have received heparin-coated intravascular devices. 5. Discuss recommendations for management of HIT in patients with heparin-coated intravascular stents or grafts.

IREE-22   Role Of Novel Vasculomimetic Stent Use In A High Grade Juxta-anastomotic Outflow Vein Stenosis

Participants
Shivam Kaushik, Pine Hill, New Jersey (*Presenter*) Nothing to Disclose

TEACHING POINTS

Understanding the place of arteriovenous fistula (AVF) in management of chronic kidney diseaseReviewing the complications associated with AVF leading to its failureCase based review of endovascular management strategies used for AVF failurePathophysiology of outflow vein stenosis in AVF and its management using different endovascular techniques with special

focus on vasculomimetic stents.

TABLE OF CONTENTS/OUTLINE

Anatomy of AVFsDifferent techniques of AVF creationPathophysiology of various complications leading to AVF failureEndovascular management of AVF complications-- case based reviewRole of vasculomimetic stent in management outflow vein stenosis

IREE-23   Therapeutic Ultrasound Applications In The Abdomen And Pelvis

Awards
Identified for RadioGraphics

Participants
Anne Sailer, MD, New Haven, Connecticut (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Discuss principles of different modes of therapeutic ultrasound.2. Examine specifications of available/in-development therapeutic ultrasound devices offering applications in the abdomen and pelvis.3. Describe diseases and organs specific to abdomen and pelvis for which therapeutic ultrasound has been utilized with examples, published evidence, current clinical trials, regulatory status and US insurance coverage.4. Review possible future abdominopelvic applications of therapeutic ultrasound.

TABLE OF CONTENTS/OUTLINE

Principles of therapeutic ultrasound - Physics of different treatment modes including Hyperthermia, Thermal Ablation (Focused versus Directional) and Mechanical (Histotripsy). Advantages and disadvantages of MRI versus Ultrasound imaging guidance. Specifications of Devices (trademarked) - Exablate, Sonalleve, TULSA-PRO, Edison, Sonablate, Ablatherm, HAIFU JC. Abdominopelvic indications of therapeutic ultrasound with US or outside US approvals - Prostate (Cancer and BPH), Uterus (Fibroids and Adenomyosis), Renal Tumors, Liver cancer and Pancreatic cancer. Brief discussion of abdominopelvic indications of therapeutic ultrasound with published human pilot trials - Endometriosis, endometrial/cervical cancer, ectopic pregnancy, biliary cancer, colorectal cancer, renal stones, hypersplenism, obesity. Future applications of therapeutic ultrasound in abdomen and pelvis - Acute kidney injury, liver fibrosis, immunologic effects, drug delivery, twin-twin transfusion syndrome.

IREE-24   Venous Anatomy And Collateral Pathways Of The Pelvis: An Angiographic Review

Awards
Identified for RadioGraphics
Magna Cum Laude

Participants
Kenneth Zurcher, MD, Phoenix, Arizona (*Presenter*) Nothing to Disclose

TEACHING POINTS

The pelvic venous collateral system is complex and demonstrates anatomic variability, however a number of predictable paths exist based on causative pathology and level of obstruction Several broad categories of collateral pathways exist, including deep, superficial/iliofemoral, intermediate/reproductive, and portosystemic pathways The ability to accurately identify common collateral patterns on multiple imaging modalities can assist in delineating underlying obstructive patterns/pathology, and in planning procedural or surgical intervention.

TABLE OF CONTENTS/OUTLINE

Provide anatomic review, causative etiologies, levels of obstruction, and clinical importance of collateral pathways as follows: Deep collateral pathway: azygos system, paraspinal and intra/extravertebral plexuses, and sacral venous plexus Superficial pathway: inferior and superficial epigastric veins, circumflex iliac vessels, iliofemoral collaterals, obturator, pudendal veins Intermediate/reproductive pathway: gonadal veins, ovarian/uterine plexuses Portosystemic pathway: inferior mesenteric vein and rectal vein collaterals, retroperitoneal collaterals

IREE-25   Interventional Radiology Management Of Liver Transplant Complications - Review And Update

Awards
Identified for RadioGraphics
Cum Laude

Participants
Sailen G. Naidu, MD, Phoenix, Arizona (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Interventional radiology plays a critical role in the care of liver transplant patients. Understanding post-operative anatomy and surgical technique is essential. 2. Complications generally occur at the anastomoses of the respective hepatic artery, portal vein, hepatic veins/IVC and the biliary system. 3. New techniques and perspectives have recently evolved, further enhancing the role of interventional radiology and improving overall liver transplant outcomes

TABLE OF CONTENTS/OUTLINE

Summary of surgical anatomy of liver transplantation showcasing the hepatic artery, portal vein, hepatic veins/IVC and biliary system Interventional radiology management of liver transplant complications with specific case examples and evidence-based recommendations. Hepatic artery - stenosis, thrombosis, arteriovenous fistula Portal vein - stenosis, thrombosis Hepatic vein/IVC - stenosis, thrombosis Biliary - strictures, leaks and ischemic cholangiopathy Update on Liver Transplant Interventions. This will emphasize new techniques and paradigm shifts in our understanding of liver physiology following liver transplantation Transsplenic portal vein recanalization Embolization of competing varices to increase portal flow Treatment of nonocclusive hepatic artery hyoperfusion due to portal hyperperfusion by splenic artery embolization TIPS following liver transplantation

IREE-26   Assessing Quality Of Care: A Primer For Interventional Radiologists

Participants
Helena Bentley, MD, Vancouver, British Columbia (*Presenter*) Nothing to Disclose

TEACHING POINTS

As modern healthcare systems become increasingly reliant on interventional radiology (IR) procedures ensuring appropriate quality of care is of utmost importance. This educational exhibit is intended to increase interventional radiologists' knowledge of foundational concepts in quality of care assessment.Upon review of this educational exhibit the reader will be better able: (1) to describe the domains of quality of care; (2) to outline the advantages and limitations of the use of each of the aforementioned domains in quality of care assessment; (3) to understand why process-based measures are most beneficial for assessing quality of care in IR; (4) to recall the construct of a quality indictor; and, (5) to identify the need for a feasible standardized approach to assessing the quality of care of patients undergoing IR procedures.

TABLE OF CONTENTS/OUTLINE

In keeping with Donabedian's historic paradigm the 3 domains of quality of care, structure, process, and outcome, shall be described and the advantages and limitations of each shall be outlined. Particular emphasis shall be placed on process-based measures of quality of care, with the benefits of assessing quality of care in IR using such measures being illustrated. Through use of illustrative cases from our high-volume, academic institution the need for a feasible standardized approach to assessing quality of care of patients undergoing IR procedures shall be formulated.

IREE-27   Percutaneous Transsplenic Portal Access: Indications And Technique.

Awards
Identified for RadioGraphics
Certificate of Merit

Participants
Mathew Smith, MD, Phoenix, Arizona (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Multiple diseases of the portal system require effective portal vein (PV) access for endovascular management. While percutaneous transhepatic or transjugular approaches remain the standard method of PV access, the transsplenic approach has gained recognition as an effective and safe technique in patients with contraindications to traditional approaches. 2. Treatments amenable to percutaneous transsplenic access (PTA) include recanalization of chronic PV occlusion, stenting of PV stenosis, portal vein embolization (PVE), embolization of gastric varices, or transjugular intrahepatic portosystemic shunt (TIPS) and post-liver transplant interventions 3. This educational exhibit will summarize the indications for PTA, patient work up, technique for access/closure, and common complications

TABLE OF CONTENTS/OUTLINE

1. Brief introduction to PTA 2. Indications a. Portal vein embolization b. Chronic obstruction c. Complicated transjugular intrahepatic portosystemic shunt d. Embolization and obliteration of TIPS e. Portal vein stenosis (stent placement) 3. Relevant anatomy and patient work up 4. Access 5. Closure/follow up imagining 6. Complications 7. Conclusion

IREE-28   Peripheral Arterial Disease Pre-procedure Imaging: When And How?

Participants
Dylan Later, Salisbury, North Carolina (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review the physical findings of PAD and their sensitivity/specificity. 2. Understand the difference between anatomic and physiologic imaging for PAD. 3. List the advantages and disadvantages of each anatomic and physiologic imaging modality in the workup of PAD. 4. Review clinical scenarios for which each imaging modality is best suited.

TABLE OF CONTENTS/OUTLINE

Purpose: To evaluate current imaging modalities in the evaluation of peripheral artery disease (PAD): intermittent claudication (IC) and chronic limb-threatening ischemia (CLTI). Background/Materials/Methods: PAD is underdiagnosed and undertreated in the US. Amputations result in significant morbidity to the patient and tremendous cost on the health care system; however, studies demonstrate that most patients have no attempt at revascularization prior to amputation. Up to 80% of patients with non-healing ulcers have PAD. Current evaluation of PAD includes history, clinical examination, and anatomic as well as physiologic imaging. There is not one perfect test for the evaluation of PAD; work-up depends on the clinical presentation. Imaging is imperative in the diagnosis and treatment planning of PAD. Conclusion: Clinical evaluation for ischemia has a poor negative predictive value and should not be used in isolation to triage patients with non-healing ulcers. This poster will describe the role of a number of emerging modalities and their accuracy in the evaluation of PAD and CLTI.

IREE-29   Coil Embolization Of Collaterals In Arteriovenous Fistula Steal Syndrome: Physics In IR

Participants
Shivam Kaushik, Pine Hill, New Jersey (*Presenter*) Nothing to Disclose

TEACHING POINTS

To review the complications associated with arteriovenous fistulas and their evaluationUnderstand the role of access ligation and banding in management of arteriovenous steal syndromeExplore the physics behind the role of collateral embolization in arteriovenous fistula management and its current role with the help of examples.

TABLE OF CONTENTS/OUTLINE

Pathophysiology of arteriovenous steal syndromeClinical presentationPhysical examination findingsInvestigationsUltrasonographyPre-procedural DSA imaging Treatment options for arteriovenous fistulasAccess ligationBandingCoil EmbolizationCase based discussion of

IREE-3   **Radioembolization Of Hepatocellular Carcinoma With Extrahepatic Collateral Blood Supply: Anatomic And Technical Considerations**

Participants
Hyo-Cheol Kim, MD, Seoul, Korea, Republic Of (*Presenter*) Nothing to Disclose

TEACHING POINTS

Radioembolization for hepatocellular carcinoma (HCC) has exploded in recent years. HCC typically received its blood supply from the hepatic artery, however, it can recruit a parasitic blood supply from extrahepatic collateral arteries (EHC). Whereas chemoembolization has been performed through EHC without serious complications, little experiences about radioembolization though EHC have been reported. The purpose of this exhibit is: (1) To review the key anatomy of EHC by using cone-beam CT. (2) To review when we suspect the presence of EHC supplying HCC. (3) To learn how to do safe radioembolization through EHC.

TABLE OF CONTENTS/OUTLINE

1) List of treated EHC 2) Vascular anatomy of EHC by using cone-beam CT and safe point of each EHC 3) Suggestive findings of EHC on CT/MR and cone-beam CT 4) Special considerations for radioembolization through EHC: dosimetry, embolization of pulmonary shunt, protection of normal vessel, and redistribution by proximal embolization.

IREE-30   **Placement And Management Of Percutaneous Transesophageal Enteric Access: A Pictorial Review**

Participants
Jessica M. Lee, MD, Guilford, Connecticut (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Peritoneal carcinomatosis and lack of a safe window to the stomach confer higher risk of complication from standard gastrostomy.2. Percutaneous transesophageal gastrostomy is a safe, effective, and well-tolerated alternative to transperitoneal enteric access. 3. Percutaneous transesophageal gastrostomy allows patients to avoid the discomfort of a chronic indwelling nasoenteric tube for decompression or feeding. 4. A fluid-filled balloon positioned within the esophagus at the thoracic inlet creates a percutaneous window between the trachea and left common carotid artery and provides a target for US guided percutaneous access.5. Per oral intake is not prohibited after transesophageal gastrostomy placement.

TABLE OF CONTENTS/OUTLINE

Table of Contents/Outline:1. Abstract 2. Introduction 3. Patient selection and preprocedural evaluation 4. Review of relevant anatomy 5. PTEG insertion technique 6. Postprocedural care7. Special circumstances (left thyroid in trajectory, gastrojejunal access, catheter exit site infection, catheter dislodgement, catheter adapters, recurrent laryngeal nerve palsy)

IREE-31   **No Contrast? No Problem! A Resident Primer For C02 Angiography.**

Participants
Christine Bashour, Westlake, Ohio (*Presenter*) Nothing to Disclose

TEACHING POINTS

Carbon dioxide angiography is an innovative approach to angiography in patients with contraindications to traditional iodinated contrast administration. This holds especially true in those with an anaphylactoid reaction to IV contrast or those who require renal preservation in the setting of renal failure. The gas' physical properties, particularly its viscosity and buoyancy, allows for interpretation of more traditional images as well as those that cannot be visualized with other forms of angiography. Carbon dioxide angiography is not without risk, but such risks can be prevented with proper knowledge and technique. This form of imaging can be used in both the diagnostic and interventional setting; this versatility highlights the importance educating radiologists on this contrast media and its uses.

TABLE OF CONTENTS/OUTLINE

1. Mechanism and Unique Physical Propertiesa. Safetyb. Displacement of blood within the vesselc. Low viscosityd. Buoyancye. Invisibility and Compressibilityf. Digital Subtraction Angiography2. Indicationsa. Diagnostic Indicationsb. Endovascular Indications3. Contraindicationsa. Cardiopulmonary and Positioning restrictionsb. Cerebral arteriographyc. Nitrous Oxide4. Pearlsa. Lack of renal toxicity and anaphylaxis riskb. High volume, low risk administrationc. Enhanced detection of vascular abnormalities5. Pitfallsa. Risk of neurotoxicity with cerebral imagingb. Risk of coronary artery gas embolismc. Risk of "vapor lock"d. Risk of bowel ischemia6. Case examples

IREE-32   **Contemporary Management Of Acute Pulmonary Embolism: The Evolution Of Catheter-based Therapy**

Awards
Identified for RadioGraphics

Participants
Tim Carlon, New York, New York (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is: Define massive and submassive pulmonary embolism and review risk stratification. Review different treatment options for pulmonary embolism including patient selection and procedural risks and benefits. Provide a practical approach to currently available endovascular treatment modalities for acute pulmonary embolism including large bore mechanical catheter directed thrombectomy, small bore catheter directed mechanical thrombectomy, catheter directed thrombolysis, and ultrasound-assisted catheter directed thrombolysis. Summarize the major trial results to date for endovascular treatment of pulmonary embolism and detail ongoing and upcoming endovascular clinical trials.

TABLE OF CONTENTS/OUTLINE

1. Types of Pulmonary Embolism and Clinical Coursea. Massive PEb. Sub-massive PEc. Non-massive PE2. Treatment Options for

Acute PEa. Patient selectionb. Medical managementc. Endovascular therapyd. Open surgery3. Endovascular Treatment Modalities for Acute PEa. Pulmonary angiography and pressure monitoringb. Large bore catheter directed embolectomyc. Small bore catheter directed embolectomyd. Catheter directed thrombolysise. Ultrasound-assisted catheter directed thrombolysisf. Risks and benefits of endovascular therapies4. Trial Results To-Date for Endovascular PE Intervention5. Ongoing and Upcoming Clinical Trials on PE Intervention

IREE-33   Nutcracker Syndrome: A Silent Enemy. Diagnosis, Endovascular Treatment And Its Complications.

Participants
Dario Herran de la Gala, MD, Santander, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

This exhibit will: 1) Review the anatomic crossroad and anatomic variations that can lead to Nutcracker Syndrome (NCS). 2) Describe the epidemiology, frequency and risks factor related to NCS. 3) Assess NCS diagnostic criteria on US, CT and Phlebography. 4) Describe endovascular treatment options available for NCS and how interventional radiologist play a major role. 4) Describe the complications that can appear after endovascular & surgical treatment of NCS.

TABLE OF CONTENTS/OUTLINE

Nutcracker syndrome (NCS) is a vascular compression disorder which refers to the compression of the left renal vein, most commonly between the superior mesenteric artery (SMA) and abdominal aorta. It's exact prevalence is unknown and it is thought to be underdiagnosed. It usually presents as a history of chronic flank or pelvic pain, with or without hematuria. Doppler US, CT and Phlebography can be used to diagnose NCS, using different direct and indirect parameters. Phlebography alongside with a typical clinical picture gives the definitive diagnosis. There are several approaches for NCS treatment: conservative, endovascular or surgical. In the last years endovascular approach has been proven to be a valid and noninvasive treatment option in which interventional radiologist play a major role. Positioning a stent inside in the left renal vein (LRV), widening its diameter and allowing a good venous return it's the preferred endovascular approach. Graft thrombosis or stent migration are the main complications of active treatment.

IREE-34   Experimental Models For Quantitative Vascular Imaging During Hepatic Interventions: From Virtual To Reality

Participants
Joe Whitehead, BS, Madison, Wisconsin (*Presenter*) Nothing to Disclose

TEACHING POINTS

Interventional radiologists rely on their qualitative interpretation of images to determine treatment endpoints and success. Quantitative vascular imaging techniques can provide functional information such as blood velocity and flow during interventional procedures but are not yet widely used. Quantitative imaging techniques must be validated and rigorously tested prior to being translated to clinical practice and used for clinical decision making. Validation of these algorithms can be limited by an inability to 1) acquire ground truth data, 2) replicate physiological and anatomical complexity, 3) reproduce dynamic processes. This exhibit introduces techniques for quantitative vascular imaging in IR and presents an overview of virtual, experimental, and animal models available for quantitative imaging during hepatic interventions.

TABLE OF CONTENTS/OUTLINE

A) Introduction to Quantitative Imaging in IR Clinical examples of qualitative imaging, clinical applications of quantitative imaging, need for clinically realistic ground truth models. B) Virtual Phantom Models Anatomical and functional virtual phantoms, virtual imaging phantoms. C) Phantom Models: 3D printing vascular phantoms, converting anatomical to functional, clinical example of 3D printed vascular model. D) Animal Models Ideal animal model characteristics, rabbit and swine animal models, clinical translatability of animal models. E) Future Directions of Each Model. F) Quiz Questions.

IREE-35   Decreasing Morbidity And Preventing Sterilization In The Treatment Of Postpartum ComplicationsA Collection Of Uncommon Cases Amenable To Angiographic Intervention

Participants
Sean Sullivan, MD, Pittsburgh, Pennsylvania (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. A great number of complications are known to manifest within the postpartum period, often offering a broad differential diagnosis which invariably prompts imaging evaluation. 2. While the large degree of clinical overlap accentuates the value of understanding common entities, the ability to differentiate vascular entities of the reproductive tract can correctly guide management and treatment of postpartum patients. 3. Angiographic intervention is an underutilized modality that can delay or obviate the need for surgery, offering patients a less morbid alternative which in some cases prevents sterilizing hysterectomy.

TABLE OF CONTENTS/OUTLINE

1. Review the visceral and vascular anatomy of the female reproductive tract including common variants. 2. Discuss our proposed approach to clinical and radiologic diagnosis of common postpartum complications. 3. Distinguish postpartum complications which are amenable to angiographic intervention from those that are not. 4. Case-based demonstration of successful postpartum embolizations.

IREE-36   Highlighting Vessels And Tissue Enhancement: Strengths Of Dual Energy CT For Vascular, Interventional Radiology, And Surgery Cases

Participants
Ali Erkin, DO, Boston, Massachusetts (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) Introduce the concept of Dual Energy CT.2) Present the physics which allow for Dual Energy CT acquisition.3) Educate and provide examples for clinical applications for Dual Energy CT.3) Dual Energy CT applications for interpreting CT pulmonary angiogram

studies and visualizing perfusion to the lung in the setting of acute PE.4) Dual Energy CT applications in gastrointestinal pathology. Specifically when questioning patterns of enhancement in mesenteric ischemia and delineating presence of intra-luminal iodinated contrast in acute GI bleeds.5) Dual Energy CT application in acute trauma to improve sensitivity for recognizing hematomas and improve the visualization of active extravasation.6) Dual Energy CT applications in increasing sensitivity for recognizing subtle enhancing structures in cases of acute inflammation and malignancy.

TABLE OF CONTENTS/OUTLINE

1) Dual Energy CT Technique.2) Dual Energy CT Applications, Including Metal Reduction and Iodine Mapping.3) Dual Energy CT Applications for Pulmonary Cases.4) Dual Energy CT for Gastrointestinal Cases.5) Dual Energy CT for Trauma.6) Dual Energy CT for Inflammation and Cancer.

IREE-37   Preoperative Pleural Mass Embolization: A Pictorial Review

Participants
Russ Guidry JR, MD, Hoover, Alabama (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Solitary fibrous pleural tumors are rare and account for less than 5% of pleural based tumors. 2. Surgical resection is often complicated by significant blood loss due to tumor size. 3. Pre-operative contrast enhanced computed tomography provides an accurate guide for the arterial supply: Thoracic (Mediastinal, Bronchial or intercostal arteries, subclavian branches), Extrathoracic (inferior Phrenic artery) 4. Arteriovenous fistula is frequently associated with these large solitary fibrous pleural tumor in angiography. 5. Pre-operative embolization is feasible, and safe and reduces operative blood loss. 6. Embolization is focused on tumor bed devascularization including particles, Gelfoam, coils and vascular plugs.

TABLE OF CONTENTS/OUTLINE

1. Introduction and Background: An overview of pleural masses with specific focus on solitary fibrous plural tumor will be presented with emphasis on complications arising from resection. 2. Case Series: 4 cases will be presented focusing on initial diagnostic imaging findings, angiographic findings, embolization overview, and outcome at tumor resection. 3. Discussion: Details of interventional procedure will be discussed with special attention paid to approach considerations, angiographic findings, and embolization endpoints. 4. Conclusions: Findings gleaned from the mentioned cases that may be generalizable in the context of prior literature will be listed. 5. References.

IREE-38   High Resolution Micro Computed Tomography For Translational Research In Radiology

Participants
Izzet Altun, Scottsdale, Arizona (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Describe the role of micro-CT in translational research. 2. Develop a deeper understanding of the potential usage of quantitative micro-CT imaging in radiology. 3-Discuss previously used quantitative micro-CT imaging methods. 4- Demonstrate in vivo and ex vivo scanning protocols.

TABLE OF CONTENTS/OUTLINE

Micro-computed tomography (micro-CT) offers a unique, non-destructive, analytical, and three-dimensional scanning opportunity to investigate in vivo and ex vivo research samples. In our translational research laboratory, we have extensive experience in scanning biomaterials, in-vivo animals, ex-vivo tissue samples, and 3D models.- Review the usage and physics of micro-CT imaging. -Describe the role of micro-CT scanners in translational research. -Illustrate three-dimensional images of various research samples that have a unique role to explore novel minimally invasive therapies. -Discuss different scanning protocols for various samples. -Discuss the difficulties during pre- and post-scanning period. -Review the commonly seen artifacts in micro-CT imaging. -Overview the commonly used quantitative image analysis methods.

IREE-39   Outside The Box: Non-traditional Uses Of Ultrasound Contrast In Abdominal And Interventional Radiology

Awards
Identified for RadioGraphics

Participants
Eric Pepin, PhD, MD, Farmers Branch, Texas (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Contrast-enhanced ultrasound (CEUS) has applications beyond characterization of focal lesions by intravenous injection.2. Direct urinary injection can provide functional assessments of the urinary tract when fluoroscopy is inaccessible or there are radiation concerns.3. Indwelling catheters can be evaluated with CEUS at the bedside.4. Intra-procedure uses include intracavitary injection, and assessment of post-biopsy hemorrhage.5. Endovascular stents can be evaluated for patency and endoleaks in patients unsuitable for CTA.

TABLE OF CONTENTS/OUTLINE

1. Review of principles of contrast-enhanced ultrasoundA. PharmacokinetcsB. Safety profile and contraindicationsC. Supplies and imaging technique2. Case-based review of diagnostic and interventional applications, with how to, dilutions, and interpretation pitfalls:A. Non-intravenous applications:i. Genitourinary functional studiesa. Cystogramb. Voiding cystourethrogramc. Retrograde urethrogramd. Hysterosalpingogramii. Tube checksa. Percutaneous nephrostomyb. Abscess catheterc. Cholecystostomyiii. Direct injectiona. Fistulogramsb. Intra-cavitaryc. Intra-lesionalB. Vascular applications other than lesion characterization:i. Biopsy targeting to improve yieldii. Post-biopsy assessment of active extravasationiii. Assessing EVAR and FEVAR for endoleak

IREE-4   Endovascular Management Of Visceral Pseudoaneurysms: "How To Do It"

Participants
Matthew Moccia, DO, Portland, Maine (*Presenter*) Nothing to Disclose

- Pseudoaneurysms or "false" aneurysms represent collections of blood between the outer two layers of a blood vessel- Pseudoaneurysms less commonly involve the visceral arteries; however, when they do, they require rapid treatment due to the potential for rupture- We will discuss the etiology and pathophysiology of visceral artery pseudoaneurysms- When treating visceral artery pseudoaneurysms, there are many techniques at the interventionalists disposal including embolization, stent placement and thrombin injection- We will review the various endovascular strategies available to manage visceral artery pseudoaneurysms through case examples

TABLE OF CONTENTS/OUTLINE

- Introduction and Objectives- Anatomical Considerations- Pre-procedure/Diagnostic Imaging- Indications and Contraindications- Procedural Techniques (pre-procedure planning/set-up, equipment, treatment strategy)- Post-procedure Imaging- Case Example(s)- Follow-up Management- Outcomes and Complications- Conclusion- References

IREE-40   Ultrasound Guided Phrenic Nerve Block: A Tutorial

Participants
Harish Narayanan, MD, Phoenix, Arizona (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Understand how to perform an ultrasound guided phrenic nerve block and its indications/use.2. Illustrate the steps localizing the phrenic nerve and administration of nerve block under ultrasound guidance.

TABLE OF CONTENTS/OUTLINE

Introduction and rationale in the use of phrenic nerve block, including prior to CT guided procedures. Anatomy review Pre-procedure Image review Contraindications/patient assessment Procedure Localizing the phrenic nerve under ultrasound guidance. Steps performing the nerve block. Post-procedure assessment of effectiveness with examples. Complications, side effects and contraindication of performing phrenic nerve block. Case studies

IREE-41   Type II Endoleak After Abdominal/thoracic Endovascular Repair (EVAR/TEVAR); How To Diagnose And Treat It In Patients With Renal Dysfunction

Participants
Yasuhiro Ushijima, MD, Fukuoka, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

To review the definition and hemodynamics of type II endoleak.To learn the diagnostics of type II endoleak using various and novel imaging modalities, especially under renal dysfunction.To learn the embolic procedure for type II endoleak.

TABLE OF CONTENTS/OUTLINE

1. Classification and definition of endoleak 2. Hemodynamics 3. Imaging modality: Angiography, CT (4D, dual energy), US (doppler, contrast-enhanced) 4. Embolic procedure: Transarterial approach, Percutaneous direct approach (translumbar, transabdominal, transthoracic) 5. Pitfalls

IREE-42   Novel Embolic Agents On The Horizon

Participants
Izzet Altun, Scottsdale, Arizona (*Presenter*) Nothing to Disclose

TEACHING POINTS

Review current embolization methods used by interventional radiologists. Evaluate both the benefits and limitations of current embolic agents. Examine the advantages of novel pre-clinical embolic materials. Discuss the mechanism, availability, cost, radiopacity, therapeutic effect, and the need for a special delivery system of embolic materials.

TABLE OF CONTENTS/OUTLINE

Transcatheter embolization is a minimally invasive procedure that uses embolic agents to intentionally block blood vessels for therapeutic purposes such as stopping the blood supply to the bleeding area or tumor vasculature. Currently, many types of embolic agents including metallic coils, microspheres, and liquids are available for clinical practice. Additionally, preclinical studies show promising results on novel embolic agents that can replace the currently used embolic agents. -Outline the current embolization techniques including their indications, efficacy, cost, availability, complications, drawbacks, and applicability. -Discuss the emerging novel embolic materials and the future of embolization. -Identify the main challenges to designing universal embolic material.

IREE-43   Ultrasound-guided Minimally Invasive Treatments Of Thyroid Cancer: Current Possibilities

Participants
Serena Carriero, San Donato Milanese, Italy (*Presenter*) Nothing to Disclose

TEACHING POINTS

In the last decades, the incidence of thyroid cancer has been increasing globally. In Europe, the incidence is estimated as 9 and 3 cases for 100.000 person-year respectively in male and female population. The growing detection is paralleled by an increase in surgical treatments. Minimally invasive treatments (MIT) are increasingly used in the treatment of patients with thyroid cancer (TC) to reduce the invasiveness of treatment or in patients unsuitable for surgery. This exhibit will: 1. Provide a background on TC and papillary thyroid microcarcinoma (PTMC) 2. Provide an overview of main MIT techniques, particularly focusing on radiofrequency and laser ablation 3. Describe the current potential application of MIT in patients with TC, including treatment of PTMC, unresectable TC, and neck lymph-node recurrences of TC.

TABLE OF CONTENTS/OUTLINE

1. Background on TC and PTMC 2. Techniques of MIT in thyroid cancers: Thermal ablation techniques (TA) and Ethanolol ablation (EA) 3. Clinical application of MIT in patients with thyroid cancers (with clinical cases): -PTMC -Unresectable TC -Lymph node metastases from TC 4. References.

IREE-44   Retrospective Validation Of A Virtual Platform For Personalized Thermal Ablation Planning Of Liver Tumors: Microwave Ablation Vs Intravascular Plasmonic Photothermal Ablation

Participants
Mir Hadi Razeghi Kondelaji, MS,MSc, Milwaukee, Wisconsin (*Presenter*) Nothing to Disclose

TEACHING POINTS

Introduction Commercial MWA probes can effectively ablate tissue however the control of the thermal and tissue damage contours is challenging and the therapy outcome depends on the skill of radiologist placing the probe. Emerging near-infrared resonant gold nanoparticle based plasmonic thermal therapy (PTT) promises control of tumor ablation via specifically targeted nanoparticles (NP) but has not been reported clinically for liver tumor ablation. We developed an integrated finite element (FE)-based simulation framework for comparing MWA and PTT in an image guided and personalized manner. Methods Anonymized pre and post MWA DICOM images of 10 patients with liver tumors were analyzed. Ablation zones for MWA and PTT were determined by simulating EM wave and NIR light propagation coupled with bioheat transfer for both methods. For MWA an Emprint system with 15-cm probe, and 2 cm antenna was modeled to deliver about 65 W to the tumor for ~5 minutes. PTT was simulated with a cylindrical laser probe (808nm) and power delivered to the tumor was about 4 W/cm2. The computational model was validated using post MWA ablation MRI scans. Results Via a retrospective study on anonymized liver tumor MWA associated CT and MRI datasets, we demonstrate that intra-arterial laser-nanoparticle ablation can maintain sufficient temperature for ablation similar to MWA, while restricting the ablation envelope to tumors without damaging substantial amount of normal tissue.

IREE-45   Current Strategies To Identify Patients That Will Benefit From Tace Treatment And Future Directions: A Practical Step-by-step Guide

Participants
Aline Maehringer-Kunz, MD, Mainz, Germany (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Treatment of hepatocellular carcinoma (HCC) depends on the stage of disease. - In the Western Hemisphere, the Barcelona Clinic Liver Cancer classification (BCLC) is the preferred staging system.- Approximately one-third of patients initially present with intermediate-stage disease. - For these patients, transarterial chemoembolization (TACE) is the treatment of choice. - The intermediate-stage comprises a heterogeneous subgroup of patients with considerable differences in tumor burden and liver function. - Due to these differences, not all patients benefit equally from TACE. - This exhibit provides a concise practical step-by-step guide on current strategies for patient selection and decision-making before and during TACE.

TABLE OF CONTENTS/OUTLINE

1. Clinical relevance- Incidence and mortality of HCC- Special features of intermediate-stage 2. Treatment decision before and during TACE: What are the most critical time points?3. Start of TACE treatment: Which patients are optimal candidates for TACE?- Tumor-associated, patient-associated, and treatment-associated factors4. During the course of treatment: How often and when should TACE be repeated?5. Scoring systems: Appropriate support for decision-making before and during TACE treatment?6. Key points7. Future perspectives

IREE-46   Vexing Varicoceles: A Pictorial Review Of Variant Venous Drainage Of The Pampiniform Plexus

Participants
Nathan Loudon, MD, Ann Arbor, Michigan (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Varicocele refers to pathologic dilatation of the pampiniform plexus, which primarily drains into the internal spermatic (gonadal) vein. 2. Anatomic variations in the venous drainage pathways of the pampiniform plexus are relatively common. 3. Failure of surgical or endovascular therapy for varicoceles may be the result of alternate drainage pathways, which can contribute to varicocele persistence or recurrence.

TABLE OF CONTENTS/OUTLINE

1. Review of classic anatomy a. Left internal spermatic vein b. Right internal spermatic vein 2. Variant anatomy and other draining veins a. Iliocaval and renal vein variants i. Duplicated or left-sided inferior vena cava (IVC) 1. Example: Figure 1, isolated right varicocele in patient with left-sided IVC ii. Renal vein duplication, circumaortic or retroaortic renal veins 1. Example: Figure 2, circumaortic renal vein b. Parallel channels in internal spermatic vein i. Example: Figure 3, persistent varicocele due to parallel channel after surgical varicocelectomy c. Alternate draining veins i. Saphenofemoral drainage via external pudendal vein 1. Example: Figure 4, external pudendal venogram ii. External iliac vein drainage via inferior epigastric and external spermatic vein (cremasteric vein) iii. Internal iliac vein drainage via vasal vein iv. Others: Retroperitoneal, peritoneal, ureteral, splenic, colonic, etc. 1. Example: Figure 5, portosystemic shunt mimicking varicocele

IREE-47   Complications Of Locoregional Therapy In The Treatment Of Liver Malignancy: Adverse Events From Common To Rare

Participants
Travis Merritt, MD, Saline, Michigan (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Increasing use of locoregional therapy (LRT) in the treatment of HCC has led to a lower prevalence of adverse events as techniques and tools are refined. However, the increased volume of LRT has resulted in an increasing incidence of uncommon or

rare adverse events- An understanding of uncommon adverse events can help radiologists recognize them when they occur, help guide appropriate therapy and aid in the application of standard processes to prevent significant morbidity and mortality in patients with HCC

TABLE OF CONTENTS/OUTLINE

1. Introduction:a. Brief overview of types of LRT b. Brief discussion of common complications after LRT for HCC (via case based examples)2. Pictorial review of rare and uncommon adverse events after LRT for HCCa. Intra-arterial (non radiation): transarterial embolization (TAE), transarterial chemoembolization (TACE) and drug eluting bead transarterial chemoembolization (DEB-TACE) b. Locoregional ablative: microwave ablation (MWA), radiofrequency ablation (RFA), and cryoablation c. External and internal radiation: stereotactic body radiotherapy (SBRT) and transarterial radioembolization (TARE)3. Provide practical techniques to avoid, recognize, and manage adverse events described

IREE-5   Not Just Renal Mass Ablation. The Role Of Interventional Radiology In Renal Cell Carcinoma Diagnosis And Management: A 2021 Update

Awards
Identified for RadioGraphics

Participants
Nathan Mickinac, MD, Mineola, New York (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Management of advanced renal cell carcinoma (RCC) is complex.2. Interventional Radiology (IR) plays an important role in a variety of aspects of RCC treatment, including embolization and ablation of renal masses varying sizes and locations.3. More data is needed to determine the appropriateness of and best timing of and/or specific technical aspects to approaching combination therapies (such as systemic therapy with ablation and/or embolization).

TABLE OF CONTENTS/OUTLINE

-Review basic concepts in advanced renal cell carcinoma (RCC)-Highlight mechanisms of action of systemic agents used in the treatment of advanced RCC-Detail which advanced RCC patients may benefit for IR therapies-Discuss the role of trans-arterial embolization in advanced RCC-Review the role of ablation in advanced RCC-Describe unique scenarios where IR intervention may be uniquely important, including patients with multiple renal masses, inherited syndromes, and/or poor renal function-Detail the rationale behind used of combination therapies in advanced RCC, such as immunotherapy and ablation in pursuit of the abscopal effect-Highlight future directions and areas of current research

IREE-50   The Many Facets Of Pain Relief

Participants
Fernanda Babler, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Review the most important anatomical concepts involved in low back pain and in spinal interventional proceduresUnderstand the indications and types of back pain injections as well as the procedures themselvesRecognize the common difficulties and possible complications of facet and epidural injections

TABLE OF CONTENTS/OUTLINE

1. INTRODUCTIONEpidemiology - and therefore the importance - of low back painMost common causesQuick review of management2. ANATOMICAL CONCEPTSLumbar vertebrae and diskFacet joint and its innervationSpinal nerve formationMeningeal spaces3. SPINAL INTERVENTIONAL PROCEDURESTypes and indications of back pain injectionsImaging guidance modalitiesPreparationTechnique4. CASE EXAMPLESSuccessful spinal interventional proceduresChallenging and not-so-successful proceduresPossible complications

IREE-51   Contrast-Enhanced Ultrasound In HCC Treatment Response Assessment After Microwave Ablation

Participants
Jeffrey Wang, MD, Ann Arbor, Michigan (*Presenter*) Nothing to Disclose

TEACHING POINTS

1.) Successfully treated HCC will show avascularity immediately post ablation with a slow temporal reduction in size. The surrounding liver may show variable hypervascularity from ablation-induced hyperemia. 2.) Residual tumor post ablation may show greyscale and CEUS features including nodular arterial phase hypervascularity and washout, or enhancement equivalent to the original tumor. 3.) If residual tumor is detected immediately after ablation, then immediate retreatment is recommended to ensure adequate ablation. 4.) Evaluation of treated HCC after MWA should occur immediately post procedure, at 1 month, and then every 3 months post procedure.

TABLE OF CONTENTS/OUTLINE

1. Introduction i.) Paradigm of thermal ablation for HCC ii.) Treatment response (TR) assessment of HCC after thermal ablation a.) Current practice (CT/MRI follow-up) b.)Role of CEUS (ACR CEUS-LI-RADS) 2. CEUS i.) How does it work? a.) Pharmacokinetics b.) Differences compared to CT and MRI contrast ii.) HCC: CEUS findings a.) Typical features of HCC b.) Mimics of viable tumor iii.) Pros/Cons of CEUS compared to other modalities a.) Cost b.) Safety c.) Efficacy d.) Limitations/False negatives/False positives 3. Emerging data evaluating CEUS in TR assessment of HCC after thermal ablation 4. Pictorial review i.) No residual disease: Concordant findings between immediate post CEUS/CECT/CEMRI and follow-up imaging ii.) Residual disease: Concordant findings between immediate post CEUS/CECT/CEMRI and follow-up imaging 5. Conclusion and future directions

IREE-52   Interventional Management Of Acquired Lymphatic Flow Disorders

Awards
Identified for RadioGraphics
Certificate of Merit

Participants
Kenneth Huynh, BS, Orange, California (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To present the spectrum of acquired lymphatic flow disorders and lymphatic dysregulation secondary to associated conditions.2. To visualize the imaging features of these lymphatic disorders, with emphasis on intranodal lymphangiography.3. To demonstrate and highlight the novel techniques utilized in lymphatic intervention.

TABLE OF CONTENTS/OUTLINE

Recent advancements in lymphatic imaging techniques have allowed deeper understanding and visualization of lymphatic flow abnormalities and facilitated the emergence of lymphatic interventions. This educational exhibit will (1) present the spectrum of acquired lymphatic flow disorders and secondary lymphatic dysregulation, including chyle leak, chylous ascites, intestinal lymphangiectasia, lymphangioleiomatosis, lymphatic malformations, protein-losing enteropathy, and secondary lymphedema, (2) show the characteristic imaging features of these disorders on lymphangiography, (3) discuss the medical therapy and maintenance of these lymphatic disorders, and (4) demonstrate novel lymphatic interventional techniques used in the management of these disorders, such as thoracic duct embolization, lymphatic sclerotherapy, and thoracic duct stenting. Procedural techniques including transabdominal approach, translumbar approach, retrograde approach, transhepatic approach, and direct puncture will be reviewed. Technical considerations and post-procedural outcomes will also be discussed.

IREE-53   Splenic Artery Embolization For Blunt Splenic Injury: When And How?

Participants
Katsuhiro Kobayashi, MD, Syracuse, New York (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) Discuss the indication of splenic artery embolization (SAE) for blunt splenic injury (BSI) based on current spleen organ injury scale or MDCT findings 2) Review splenic vascular anatomy relevant to splenic artery embolization (SAE) 3) Describe technique used for SAE and pros and cons of proximal vs distal embolization

TABLE OF CONTENTS/OUTLINE

1) Overview of BSI 2) Physiology of the spleen and clinical implications of splenectomy 3) Vascular anatomy of the spleen 4) AAST spleen organ injury scale (2018 version) 5) MDCT diagnosis of BSI (parenchymal and vascular injury) 6) Current management of BSI 7) SAE technique and pros and cons of proximal vs distal embolization 8) Complications associated with SAE 9) Conclusions

IREE-54   Thyroid Ablation: Radiofrequency Ablation Of Benign And Malignant Thyroid Nodules

Awards
Identified for RadioGraphics
Certificate of Merit

Participants
Patrick Navin, MBBCh,MRCPI, Rochester, Minnesota (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Learn indications for thyroid ablation and alternatives 2. Review relevant anatomy and structures at risk of injury during thyroid ablation. 3. Understand interventional radiologic techniques for performing thyroid ablation and review published outcomes

TABLE OF CONTENTS/OUTLINE

1. Indications for thyroid ablation and alternatives. • Discuss guidelines for thyroid ablation. • Indications: o Benign - large nodules causing compressive symptoms/cosmetic concerns o Benign - small autonomously functioning nodules o Malignant - micropapillary thyroid carcinoma • Other therapies: o Standard: surgery (in all cases), radioiodine (for autonomously functioning nodules) o Other ablative: ethanol, laser ablation, microwave ablation, focused ultrasound 2. Relevant cervical anatomy and structures at risk during thyroid ablation • Structures at risk: Recurrent laryngeal nerve, ansa cervicalis, vagus nerve, esophagus, trachea, skin, strap muscles • How to avoid injury: target selection, needle placement and visualization, hydrodissection 3. Techniques for performing thyroid ablation and published outcomes • Anesthetic, RF ablation (monopolar vs bipolar), needle approach, moving-shot vs overlapping ablations, appearance during and after ablation • Published outcomes: o benign symptomatic nodules - average volume reduction, need for retreatment, maintenance of thyroid function o autonomously functioning nodules-rate of normalization of thyroid function o micropapillary thyroid carcinoma-efficacy

IREE-55   CT-guided Celiac Plexus And Splanchnic Nerve Blocks: How We Do It

Participants
Andrew Sill, MD, Phoenix, Arizona (*Presenter*) Nothing to Disclose

TEACHING POINTS

Celiac plexus and splanchnic nerve blocks are effective in relieving intractable abdominal pain via temporarily or permanently blocking afferent nociceptive pathways arising from the upper abdominal viscera. These blocks are most often performed for abdominal pain secondary to malignant neoplasms of the pancreas, but may also be used to treat benign sources of chronic abdominal pain. The procedure can be safely performed under CT guidance with a variety of techniques and approaches tailored to each patient's individual needs and anatomy. Variations may include unilateral and bilateral approaches, differences in patient positioning (anterior, posterior, lateral oblique), and temporary versus permanent blocks.

TABLE OF CONTENTS/OUTLINE

1. Review of relevant anatomy and pathophysiology2. Indications for celiac plexus or splanchnic nerve block3. Step-by-step overview of procedure and variations4. Mitigation and management of potential complications5. Differences between celiac ganglia and splanchnic nerve blocks6. Reported patient outcomes and future directions

IREE-56   Endoscopy Assistance In Image-guided Percutaenous Interventions: An Emerging Tool For

Challenging Cases

Participants
Pouya Entezari, MD, Chicago, Illinois (*Presenter*) Nothing to Disclose

TEACHING POINTS

Endoscopic guidance is a valuable tool that can be incorporated into non-vascular procedures performed by interventional radiologists (IR). Besides biliary and gallbladder pathologies, endoscopy can be integrated into the IR management of gastrointestinal, genitourinary, and gynecological diseases to achieve better outcomes.

TABLE OF CONTENTS/OUTLINE

Introduction: - Potential benefits of utilizing endoscopes. -Devices. Interventions Under Endoscopic Guidance: A) Indications and Technical Aspects 1-Biliary Interventions. 2-Lithotripsy 3-Stent Retrieval. 4-Ablations 5-Biopsies. 6-Crossing Challenging Strictures. 7-Gallbladder Interventions. 8-Biloma Drainage 9-Gastrointestinal Interventions. 10-Urologic Interventions through urostomies and trans-urethral Procedures. 11-Gynecological Interventions B)Future of Endoscopy in IR -Training Credentialing and Billing -Device Improvement. C) Case Study Atlas of Image-Guided Procedures with Endoscopic Guidance

IREE-57   Image Guided Ablation Of Lung Nodules- A Case Based Learn It Yourself Approach

Participants
Sharmila Duraisamy, MD, Boston, Massachusetts (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Discuss the benefits of image guided ablation, principle behind the three commonly used techniques, advantages and drawbacks.2. Patient selection, anesthesia, pre-procedural planning, intra-procedural monitoring and post procedural follow up.3.Case based discussions on ablation, complication and treatment.

TABLE OF CONTENTS/OUTLINE

1) Role of image guided ablation and ablative techniques in the management of lung nodules, patient selection including number of nodules, their location and size. 2) common ablative techniques in clinical practice, their advantages and drawbacks.3) Use of general anesthesia vs conscious sedation in appropriate clinical settings and the ablative technique used.4)Patient positioning, pre-procedural planning with CT scan, importance of MPR, immediate and late follow up scans. 5)Recognizing the immediate and delayed complications and treatment.6) Interactive case based approach in learning lung ablation including a. Typical case of nodule ablation with no complications b. Temporal evolution of an ablated nodule c. Cavitary formation in an ablated nodule with resolution d. Ablation complicated by small pneumothorax e.large pneumothorax. f. Intractable pneumothorax due to bronchopleural fistula and management g. Pulmonary hemorrhage as a complication and its management. h. Recurrence in a previously ablated lesion. i. iatrogenic pneumothorax in the ablation of sub pleural nodules. j. ablation as a palliative measure for pain control in lesions with chest wall invasion

IREE-58   Endovascular Embolization Via Deep Dorsal Venous Access For The Management Of Erectile Dysfunction Resulting From Venous Insufficiency

Participants
Navpreet Khurana, MBBS, Nagpur, India (*Presenter*) Nothing to Disclose

TEACHING POINTS

Erectile dysfunction (ED) is estimated to affect 50% of the male population, with 10% being severely affected. The pathophysiology behind the development of vascular erectile dysfunction is multifactorial and poorly understood. Veno-occlusive dysfunction (VOD) and arterial insufficiency are the main causes of vasculogenic ED. VOD occurs due to the insufficiency of venous outlet obstruction. There have been recent developments in the role of interventional radiology to treat ED resulting from VOD. Endovascular management of VOD has been successfully done by pudendal vein embolisation using transfemoral approach. More recently, deep dorsal vein approach is being utilised for pudendal vein embolisation. It is important for a radiologist to be abreast with the advancements made in the field of interventional radiology to manage erectile dysfunction resulting from VOD. This educational exhibit will discuss the risk factors, diagnostic imaging and investigations, and management of VOD. This exhibit will highlight deep dorsal vein embolisation with a case-based review.

TABLE OF CONTENTS/OUTLINE

1. Erectile Dysfunction - causes, risk factors, pathophysiology2. Doppler imaging and diagnostic criteria for vascular erectile dysfunction3. Venous insufficiency causing ED - risk factors, diagnosis and management4. Endovascular management of venous insufficiency4a. Femoral vein approach - pudendal embolisation4b. Deep dorsal vein approach - pudendal embolisation

IREE-59   Intravascular Ultrasound For Transjugular Intrahepatic Portosystemic Shunt Creation: 'Tips' And Tricks

Participants
Josi Herren, DO, Chicago, Illinois (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Know the indications, contraindications, and workup for TIPS placement. 2. Recognize the benefits of using IVUS during TIPS. 3. Understand the correlation of CT/fluoroscopic anatomy with IVUS imaging during TIPS placement. 4. Learn to utilize IVUS guidance in a variety of scenarios, and how to troubleshoot during challenging cases. 5. Review TIPS complications, their management, and strategies to mitigate these risks intra-procedurally.

TABLE OF CONTENTS/OUTLINE

1.1. Overview of TIPS indications, contraindications, and fluoroscopic TIPS placement. 2.1. Benefits of IVUS: reduction in

1.1. Overview of TIPS indications, contraindications, and fluoroscopic TIPS placement. 2.1. Benefits of IVUS: reduction in fluoroscopy time/dose, contrast volume and needle passes. 3.1. TIPS Imaging atlas: CT/fluoroscopic correlation with IVUS, from posterior right to lateral left segments using the IVC as a rotational axis. 3.2. Hepatic and portal vein relationships pertinent to TIPS access. 3.3. Additional relevant hepatic and biliary anatomy. 3.4. Maneuvers using IVUS for portal access: right hepatic to posterior right portal vein, right hepatic to main right portal vein, middle hepatic to right/left portal vein. 4.1 Troubleshooting with IVUS: predicting the required needle curve, targeting out-of-plane portal veins, navigating out of the posterior right portal vein, sizing, and positioning of the stent. 5.1 Post-procedure management and associated complications.

IREE-6 Endovascular AV Fistula: An Overview Of Technique, Cases, Evidence And Outlook

Participants
Surbhi Trivedi, North Chicago, Illinois (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is to:1) Describe endovascular arteriovenous fistula (endoAVF) creation, which is an emerging alternative to surgical fistulas for dialysis access. 2) Outline the procedural steps of endoAVF creation and the current FDA-approved systems available. 3) Review current literature regarding endoAVF patient selection, exclusion criteria, outcomes and interventions. 4) Increase awareness of nonsurgical fistulas and discuss future directions of endoAVF.

TABLE OF CONTENTS/OUTLINE

1) Chronic kidney disease epidemiology. 2) Types of dialysis access in use, including endoAVF. 3) Indications for endoAVF. 4) Patient selection and contraindications. 5) Options for dialysis cannulation sites. 6) Bard WavelinQ (TM) EndoAVF System set-up and components. 7) Pre-procedure workflow including clinic evaluation, requisite imaging, and physical exam. 8) Procedural steps. 9) Post-procedure workflow. 10) Types of post-procedure interventions including patient cases. 11) Short and long term published results of endoAVF. 12) Our experience with endoAVF and other tips. 13) Future of endoAVF.

IREE-60 Anatomical Variants In Rectal Artery Embolization - Emborrhoid Technique: A Pictorial Essay

Awards
Identified for RadioGraphics
Certificate of Merit

Participants
Julien Panneau, Marseille, France (*Presenter*) Nothing to Disclose

TEACHING POINTS

Background Hemorrhoids are recognized as a very common cause of rectal bleeding. Its treatment has evolved considerably over the past ten years. Among the new minimally invasive methods, the "Emborrhoid" technique consists into selective embolization of hemorrhoidal arteries (branches of the superior rectal arteries). The embolization is performed essentially with micro-coils and possibly with microparticles. The aim of this pictorial essay is to illustrate the pelvic vascular anatomy relevant to Emborrhoid in order to provide a practical guide that includes the most common anatomical variants. Clinical findings Angiographic findings from 200 Emborrhoid procedures were reviewed retrospectively. The hemorrhoid arterial supply was classified into five different patterns as follows: Type I: codominant right and left superior rectal artery (SRA) anterior branches with accessory posterior trunk. Type II: codominant right, left and posterior branches of the SRA. Type III: unilateral vascularization by right or left SRA anterior branch. Type IV: unilateral SRA vascularization and contralateral middle rectal artery (MRA) dominance. Type V: bilateral MRA dominance. Teaching Points Describe the anatomical variations of hemorrhoid vascular supply. Propose an angiographic anatomical classification. Discuss the clinical implication for the embolization procedure (Emborrhoid)

TABLE OF CONTENTS/OUTLINE

Introduction Inferior mesenteric arteryRectal arterial supply Type 1 Type 2 Type 3 Type 4 Type 5Conclusion

IREE-61 Percutaneous AV Fistula Creation: A Comprehensive Pictorial Review

Participants
Manuel Betancourt Torres, MD, San Juan, Puerto Rico (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Illustrate pertinent vascular anatomy and review sonographic criteria for endoAVF creation2. Review advantages and disadvantages of endoAVF creation over surgical creation including clinical parameters, technical consideration and maturation.3. Provide pictorial review of creation technique as well as pitfalls and post creation endoAVF anatomy.4. Illustrate maturation criteria and endovascular techniques to assist maturation.5. Review possible complications.

TABLE OF CONTENTS/OUTLINE

1. Introduction2. Pertinent anatomy3. Criteria and considerations for endoAVF versus surgical AVF creation4. EndoAVF creation technique5. Imaging follow-up and interventions to assist maturation6. EndoAVF in dialysis access center: expectations and guide for cannulation7. Complications8. Protocol for endoAVF creation and follow-up

IREE-62 Advanced Endoscopy: Cholangioscopic Management Of Biliary Pathology In Our Favorite Vestigial Organ (The Gallbladder)

Participants
Anne Sailer, MD, New Haven, Connecticut (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Familiarize a radiologist with biliary anatomy specifically as it relates to the gallbladder and the role of cholangiographic and cholangioscopic imaging, and how the use of advanced biliary cholangioscopy can guide treatment intervention, such as video assisted biopsy, laser lithotripsy and percutaneous stone extraction in patients pursuing non-operative management of biliary pathology.2. Review advanced cholangioscopy technique, imaging optimization and protocol for evaluation of biliary pathology.3. Correlation between characteristic imaging findings of various biliary tract pathologies diagnosed on cross-sectional imaging,

intraprocedural cholangiogram, to intraprocedural cholangioscopic images, focusing on stones, strictures, and tumors.

TABLE OF CONTENTS/OUTLINE

1. Gallbladder and cystic duct anatomy and an overview of biliary drainage.2. Pathophysiology of biliary pathology with imaging correlation (cholelithiasis, intrahepatic, and extrahepatic biliary pathology).3. Algorithm for cholecytostomy drain management in non-operative candidates focusing on patients with acute or chronic cholecystitis.4. Long-term management of these patients and role of imaging in post intervention assessment and surveillance.5. Review of common post procedural complications (bleeding, infection, tube retraction, dislodgment, biliary leak, dropped stones, cholangitis, etc).

IREE-63   **Real-time 3d Modeling And Volumetric Analysis Metrics From Pre- And Intra-procedural Images To Guide Tumor Ablations**

Participants
Ben Hsieh, MS, Providence, Rhode Island (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. 1. Ablations can be planned by placing 3D models of ablation antennas and expected ablation zones in models of target tumors and relevant anatomical structures constructed from pre-procedure images. 2. 2. Pre-procedure models can be registered onto intra-procedure pre-antenna images to locate tumors without IV contrast. 3. 3. Expected ablation margins can be verified after antenna placement by registering expected ablation zone models onto intra-procedure post-antenna images.

TABLE OF CONTENTS/OUTLINE

1. 1. Preparation a. Tools: i. 3D Slicer ii. MeshLab b. 3D Models of Ablation Antennae 2. 2. Pre-Procedure Planning a. Imaging requirements b. 3D Models: i. Ablation antennae and targeted ablation zones ii. Target tumor(s) iii. Target organ iv. Relevant anatomical structures c. Considerations i. Anatomical limitations ii. Heat sinks iii. Organ functions 3. 3. Intra-Procedure Planning a. Imaging requirements b. Image registration c. Model registration 4. Intra-Procedure Verification a. Imaging requirements b. Antenna placement c. Shape analyses 5. 4. Limitations a. Imaging requirements b. Registration c. Time

IREE-64   **Diagnosis And Minimally Invasive Management Of Deep Vein Thrombosis**

Awards
Identified for RadioGraphics

Participants
Angelo Marino, DO, New Haven, Connecticut (*Presenter*) Consultant, Inari Medical, Inc;Speaker, Inari Medical, Inc

TEACHING POINTS

1. Discuss epidemiology, cases and clinical presentations of deep vein thrombosis (DVT) 2. Review role of imaging in the diagnosis of DVT 3. Briefly Describe imaging characteristics associated with different types and stages of DVT 4. Review main interventional therapies for management of DVT with emphasis on intraluminal thrombectomy

TABLE OF CONTENTS/OUTLINE

1. Anatomy and physiology of venous system 2. Imaging modalities for evaluation and characterization of DVT: Doppler ultrasound (US), CEUS Intraluminal US (IVUS), CTV, MRV, Conventional Angiogram (IR) 3. Imaging characteristics of blood clot: acute versus chronic; bland versus tumor thrombus 4. Case-based review of various techniques in management with thrombectomy acute and chronic bland and tumor thrombus

IREE-66   **Hemodynamic Measuring In Interventional Radiology: Rules Of 6**

Participants
Anne Sailer, MD, New Haven, Connecticut (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Familiarize a radiologist with hemodynamic measuring in Interventional Radiology.2. Review the anatomy, physiology, and key imaging findings of portal hypertension and pulmonary hypertension.3. Describe stepwise approach in the optimization and interpretation of intraprocedural hemodynamic measurements and how these guide treatments.4. Describe and briefly review the anatomy and role of imaging paramount to appropriate pressure measurements.

TABLE OF CONTENTS/OUTLINE

1. Review of relevant vascular anatomy (SCV, Right atrium, IVC, Hepatic veins, portal veins, pulmonary artery, pulmonary vein) and intervening capillary pathways 2. Physiology and hemodynamics of cirrhosis and pulmonary hypertension. Liver: Review of the subsets of portal hypertension, specifically which ones create gradients, and how these differences guide intervention: Prehepatic (portal vein thrombosis, portal veins stenosis, congenital abnormalities), Presinusoidal (hepatoportal sclerosis, granulomatous disease), Sinusoidal (cirrhosis, steatohepatitis, amyloidosisiv. Post sinusoidal: veno-occlusive disease), Post hepatic (Budd-Chiari, Cardiac failure). b.Lung: Review of pulmonary hypertensive physiology in acute, subacute and chronic pulmonary embolism.3. Review of pulmonary angiography and hepatic venography, pressure gradients, and waveforms, and how these guide intervention (thrombectomy/thrombolysis, Inari Flowtriever, TIPS, medical management).4. Pitfalls in equipment set up that affect gradient measurements.

IREE-67   **Inside Out: An Interventionalist's Guide To Intravascular Ultrasound**

Awards
Identified for RadioGraphics

Participants
John Weaver, MD, Chicago, Illinois (*Presenter*) Nothing to Disclose

TEACHING POINTS

- The learner will review intravascular ultrasound (IVUS) fundamentals, including commercially available systems, equipment

specifications and compatibility- The learner will be able to identify the normal intravascular sonographic findings and commonly encountered pathology- The learner will become familiar with current evidence supporting the use of IVUS for interventional precision- The learner will review the authors' approach to using IVUS

TABLE OF CONTENTS/OUTLINE

1.IVUS Fundamentals: Phased array versus radial IVUS and applications; Equipment specifications and compatibility2. iVUS Imaging Review; Normal intravascular sonographic features; IVUS artifacts; Commonly visualized pathology3. Supporting Evidence; Transjugular Intrahepatic Portosystemic Shunts; Venous Stenting; Peripheral Arterial Disease; Endovascular Biopsy4. Pearls from the Authors ("how we do it")

IREE-68   Robotic Devices For Endovascular Interventions: Fantasy Or Reality

Participants
Izzet Altun, Scottsdale, Arizona (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review the studies on robotic devices for minimally invasive endovascular therapies. 2. Demonstrate the design and fabrication of nano/mili/microrobots 3. Discuss the current and potential applications, limitations and safety of nano/mili/microrobots from the viewpoint of endovascular applications. 4. Explore the future of robotic devices in minimally invasive endovascular interventions.

TABLE OF CONTENTS/OUTLINE

1. Classification of small-scale robotics: a. tethered endovascular devices b. untethered mobile robots for endovascular interventions 2. Design and fabrication of robotic devices 3. Current and potential endovascular applications 4. Challenges and safety 5. Emerging devices for minimally invasive endovascular interventions 6. Summary & Conclusion

IREE-69   NBCA Embolization: How Can We Control The Delivery Of NBCA?

Participants
Hidemasa Takao, MD, Bunkyo-ku, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is:1. To review the basics of NBCA as an embolic agent and its use in various embolization procedures2. To review the injection techniques of NBCA with an emphasis on flow control3. To discuss how to control the delivery of NBCA to achieve successful embolization and avoid complications with example cases

TABLE OF CONTENTS/OUTLINE

Basics of NBCA as an embolic agentReview of the current use of NBCA in various proceduresInjection techniques of NBCA with and without flow controlControl of the delivery of NBCA with example casesSummary

IREE-7   Life-threatening Hemoptysis: Beyond The Bronchial Arteries

Awards
Certificate of Merit

Participants
Jaime Alonso Sanchez, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

- List the most common causes of life-threatening hemoptysis.- Explain the radiological management of hemoptysis.- Recognize most common findings of hemoptysis on radiological examinations.- Describe the techniques and materials used for an endovascular approach when treating bronquial and non-bronchial hemoptysis.

TABLE OF CONTENTS/OUTLINE

-Introduction-Massive hemoptisis: Definition, Causes and Diagnosis.-Radiological findings of hemoptisis.-Source of the hemoptisis: Bronchial and non-bronchial arteries.-Bronchial and non-bronchial artery embolization: technique and materials.-Pitfalls and cases: Non-bronchial hemoptysis (bleedings from intercostal arteries, internal mammary artery, thyrocervical artery trunk, lateral thoracic artery, inferior phrenic artery from our institution)

IREE-70   Complex Portomesenteric Interventions - Alternative Access For Technical Success

Participants
Shakthi Ramasamy, MBBS, Maywood, Illinois (*Presenter*) Nothing to Disclose

TEACHING POINTS

Transjugular intrahepatic portosystemic shunt (TIPS) is a procedure frequently used to alleviate portal hypertension and associated complications. After gaining entry through the preferred access - right internal jugular vein (IJV), a catheter is progressed to the hepatic vein and the portal system is then located by contrast. A needle is then used to gain access to the portal system and a stent is placed then ballooned up to grant a connection. The crucial step in the creation of TIPS is to puncture a suitable portal branch and then wire is guided through the main portal vein into the splenic or mesenteric veins. However, subacute/chronic portomesenteric occlusions may require alternative access sites as transjugular or transhepatic puncture for recanalization may not be technically feasible - additional access routes may be sought to achieve technical success. With this exhibit, we aim to review the existing literature and use cases to: Highlight the role of direct mesenteric venous puncture (i.e. direct SMV, IMV, and Splenic Vein) for achieving technical success with acute or chronic portomesenteric occlusions. Review the rationale for using a hybrid CT-Angiography technique Highlight the use of such techniques for complex cases Review preoperative patient preparation, procedural technique, and post-procedural follow-up

TABLE OF CONTENTS/OUTLINE

Evaluation of the two complex cases Rationale, Route and techniques for these interventions Pre-procedural imaging Outcome, and

post-procedural follow-up Case based discussion Conclusion

IREE-71   Anesthesiology Concepts For The Interventional Radiologist

Participants
Ana Beatriz Onofre Chen, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The increasing number of image guided procedures (IGP), along with the increasing concern with adequate assessment and management of pain, has reinforced the importance of Radiologists being able to provide effective and safe pain control. With the introduction of shorter-acting sedatives and opioids, reversal agents and the availability of noninvasive monitoring equipment, procedural sedation can now be safely administered in many healthcare settings. 1Provide a reference guide for radiologists who need pertinent and ready information on discomfort control. 2List the different classes of sedatives, analgesics, and anesthetics and identify in what circumstances they are most applicable to the radiologist, especially in image guided procedures. 3Consider the goals of procedural sedation, patient safety and determine if a particular patient requires pharmacological intervention. 4How to apply the techniques of IGP, such as nerve block injections during an interventional radiology procedure.

TABLE OF CONTENTS/OUTLINE

Sedation.Analgesia.Anesthesia: general, regional and local.Techniques,Preprocedural checklist,Intraprocedural monitoring of patients under sedation,Knowledge of the most common classes of sedatives and their concentration, maximum total doses, onset and duration of action. Be prepared to rescue patient from deep sedation. Know what kind of equipment and personnel are available in case of an emergency. Local anesthetic and imaging guided nerve block: anatomy, technic and complications.Postprocedure

IREE-72   PET CT-Ultrasound Fusion Biopsy: Review Of Technique And Its Value

Participants
Bryce Beutler, MD, Los Angeles, California (*Presenter*) Nothing to Disclose

TEACHING POINTS

Review technique of PET CT-Ultrasound fusion biopsyUnderstand role of PET CT-Ultrasound fusion biopsyHighlight advantages of PET CT-Ultrasound fusion biopsy

TABLE OF CONTENTS/OUTLINE

Provide an overview of the PET CT-Ultrasound fusion biopsy techniquePresent cases of PET CT-Ultrasound fusion biopsy in the neck, chest, abdomen and pelvisDiscuss the advantages that PET CT-Ultrasound fusion biopsy offers over other biopsy techniques.

IREE-73   Prostatic Artery Embolization (PAE): A Quest To Find The Prostatic Artery And Management Of Benign Prostatic Hyperplasia

Participants
Shivam Kaushik, Pine Hill, New Jersey (*Presenter*) Nothing to Disclose

TEACHING POINTS

To review basic prostate vascular anatomy and its impactTo learn about the anatomical angiographic classification categorizing origins of prostatic arteriesTo identify arterial variants and their clinical implicationsTo learn about the procedural steps in prostatic artery embolization (PAE)

TABLE OF CONTENTS/OUTLINE

Overview of relevant anatomy, pathophysiology and clinical presentation of benign prostatic hyperplasiaExisting management options for treating benign prostatic hyperplasiaReview of published literature on use of endovascular techniques for benign prostatic hyperplasiaRole of endovascular techniques:-Coil Embolization-Particle Embolization-Pre-procedural evaluationCone Beam CTAngiographyProcedural techniqueTreatment outcomePostprocedural follow up

IREE-74   The Role Of Intraoperative Neuromonitoring In Interventional Radiology Procedures: Preventing Permanent Nerve Damage

Participants
Anna Gong, Baltimore, Maryland (*Presenter*) Nothing to Disclose

TEACHING POINTS

Teaching Points:Intraoperative neuromonitoring (IONM) is an important component of multiple surgical procedures from parathyroidectomies to spine surgery. Still, IONM in interventional radiology has yet to be fully utilized and may prevent neural damage in a variety of IR procedures including vascular malformation embolization and tumor ablation. The purpose of this education exhibit is to:1. Reinforce the role of appropriate imaging and clinical evaluation of patients who may require neuromonitoring.• Neurosurgery and Orthopedic spine surgery started this• NeuroIR uses this for cerebrospinal AVM embolization • Embolization or ablation of soft tissue or vascular lesions with peripheral neural structures in close proximity2. Review the set-up and technical implementation of intraoperative neuromonitoring in interventional radiology• SEPs• MEPs• MNCS3. Describe how intraoperative neuromonitoring has been used to reduce neural damage• Vascular malformation - high flow• Vascular malformation - low flow• Thermal Ablation

TABLE OF CONTENTS/OUTLINE

· Assessing the appropriate use of intraoperative neuromonitoring for interventional radiology· Overview of IONM modalities and when to use each modality· The role of IONM in (1) high-flow vascular malformations (2) low-flow vascular malformations (3) tumor ablation· The role of provocative testing· Interpreting IONM findings· Conclusion

IREE-75-HC The Role Of Geniculate Artery Embolization In The Treatment Of Knee Osteoarthritis

Participants

Lynden Lee, Bronx, New York (*Presenter*) Nothing to Disclose

TEACHING POINTS

Knee osteoarthritis (OA) affects millions of adults in the United States alone. The workup and management of OA accounts for billions of dollars in healthcare spending. Primary management of OA includes lifestyle modifications and medications. Invasive measures include steroid injections and knee replacements; however, these are not without increased costs and risks to the patient. Geniculate artery embolization (GAE) is becoming an increasingly popular procedure amongst interventional radiologists as it offers a minimally invasive option and has been found to effectively increase quality of life. The purpose of this exhibit is to:1. Describe the epidemiology, risk factors, and clinical features of osteoarthritis.2. Review diagnostic and traditional treatment options.3. Display previous studies supporting the use of GAE and its role in treating OA.4. Highlight key imaging necessary for GAE procedures.5. State risks and complications associated with GAE.

TABLE OF CONTENTS/OUTLINE

1. Osteoarthritis Epidemiology and Costs2. Pathophysiology and Patient Presentation3. Diagnosis, Imaging, and WOMAC Score Assessment4. Common Medical and Surgical Treatment Options5. Indications, Contraindications, and Risks associated with GAE compared to other Treatment Options6. GAE Procedure and Case Presentation7. Implications for Clinical Practice

IREE-76-HC   Sclerotherapy Of Congenital Venous Malformations (CVM) Complicated With Localized Intravascular Coagulation: A Review Of IR Management With Case Examples

Participants
Robert Weinstein, Baltimore, Maryland (*Presenter*) Nothing to Disclose

TEACHING POINTS

To review the clinical presentation and management of CVM patients complicated with Localized Intravascular Coagulopathy (LIC) and outline a typical case presentation of an individual with LIC.

TABLE OF CONTENTS/OUTLINE

Background LIC is a coagulation disorder that has been associated with low-flow venous malformations. Diagnostic criteria for LIC includes D-dimer levels above .5mg/L, fibrinogen levels below 1g/L, and PT and PTT prolonged over 3 seconds, as well as other clinical factors. These characteristics place these patients at high risk of bleeding during interventional procedures, and therefore careful management is necessary to prevent adverse outcomes. Clinical Presentation Nine patients with a diagnosis of LIC were reviewed. These patients were between ages 9 and 73 years old, with an average age of 29. It was found that all 9 presented with elevated D-dimers, 3 with low fibrinogen, and 2 with elevated PT/aPTT. Treatment methods used for these patients included pre- and post-operative Enoxaparin, Apixaban, and Low-Molecular Weight Heparin. None of the patients experienced any adverse events during interventional procedures. Conclusion LIC is a condition which can lead to complications during interventional procedures, such as sclerotherapy. Complications include severe outcomes including Disseminated Intravascular Coagulation. Therefore, it is important for IR providers to be aware of the clinical presentation and current treatment methods for LIC while taking care of patients with low-flow vascular malformations.

IREE-8   Cystic Artery: Handball Or Dodgeball

Awards
Identified for RadioGraphics
Certificate of Merit

Participants
Hyo-Cheol Kim, MD, Seoul, Korea, Republic Of (*Presenter*) Nothing to Disclose

TEACHING POINTS

The cystic artery is commonly originating from the right hepatic artery. Intra-arterial therapy for hepatocellular carcinoma is usually performed beyond the origin of the cystic artery to prevent cholecystitis. When the cystic artery supplies HCCs or originates from the distal hepatic artery, interventional oncologists can not help but perform the procedure at the risk of cholecystitis. The purpose of this exhibit is : (1) To review the cystic artery anatomy and its variation. (2) To learn how to minimize the complications when the cystic artery is involved in chemoembolization or radioembolization. (3) To review the complications and their management related with the cystic artery.

TABLE OF CONTENTS/OUTLINE

A) Cystic artery. 1) its common and uncommon origin. 2) superficial and deep cystic artery. B) Cystic artery in chemoembolization.1) Embolization level : Ultraselective vs deep cystic artery vs main cystic artery.2) Lipiodol versus drug-eluting bead. 3) Additional embolization using gelatin sponge particles.C) Cystic artery in Radioembolization.1) When prophylactic embolization is needed.2) Prophylactic Embolization : permanent vs temporary.3) Selective radioembolization through the cystic artery. D) Complications and their management.1) Ischemic cholecystitis.2) Radiation cholecystitis. 3) Conservative management vs Percutaneous drainage vs surgical cholecystectomy

IREE-9   We've Got Your Back: The Proceduralist's Guide To Spinal Interventions

Participants
Jason Kim, MD, Converse, Texas (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Minimally invasive procedures have a wide range of safe and effective applications for the diagnosis and treatment of spine-related disorders. 2. Knowledge of the vertebral anatomy, procedure indications, patient selection and techniques is essential for maximizing treatment outcomes and minimizing complications.

TABLE OF CONTENTS/OUTLINE

1. Review vertebral anatomy pertinent to spinal interventions. 2. Introduce the general approach and principles for minimally invasive image-guided techniques. 3. Review the indications, contraindications, risks, preprocedure planning, techniques and

potential complications for various image-guided spinal procedures to include lumbar puncture, epidural injection, joint injection, nerve root injection, bone biopsy, disc biopsy, vertebroplasty, kyphoplasty, and thermal ablations.

Abstract Archives of the RSNA, 2021

<table>
<tr><td>MKEE

Musculoskeletal Education Exhibits</td></tr>
</table>

Sub-Events

MKEE-1 **Making Sense Of Sacral Fractures.**

Participants
Josephina A. Vossen, MD, PhD, Richmond, Virginia (*Presenter*) Nothing to Disclose

TEACHING POINTS

This exhibit will review sacral anatomy, improve detection of sacral injuries, instruct on how to utilize mechanism of injury to predict the type of sacral fracture, and educate regarding treatment of sacral fractures. Improved detection of traumatic sacral injuries can prevent delay in treatment that could result in long-term disability.

TABLE OF CONTENTS/OUTLINE

This exhibit will: - Review the anatomy and biomechanics of the osseous, myotendinous and ligamentous structures associated with the sacrum. - Describe and illustrate the commonly used classification of common injuries involving the sacrum, including acute traumatic fractures, insufficiency fractures and pathologic fractures. - Discuss an approach to reporting sacral fracture findings using the commonly used classification systems and emphasize pitfalls when reviewing these cases. - Describe treatment options and their imaging appearance.

MKEE-10 **Indications, Preoperative Planning And Complications Of Shoulder Arthroplasties: What The Orthopedic Surgeons Want To Know**

Participants
Daichi Hayashi, MD,PhD, Stony Brook, New York (*Presenter*) Author with royalties, Wolters Kluwer nv

TEACHING POINTS

To describe different types of shoulder arthroplasties;To discuss required preoperative imaging and pros and cons of various imaging modalities for assessment of postoperative complications;To learn the indications, requirements, and complications of various types of shoulder arthroplasties.

TABLE OF CONTENTS/OUTLINE

1.Background - discuss demographics and epidemiological data of shoulder arthroplasties; outcomes; biomechanics.2.Different types of arthroplasty hardware: indications and contraindications - Anatomic total shoulder arthroplasty - Reverse shoulder arthroplasty - Hemiarthroplasty - Humeral head resurfacing arthroplasty.3.Preoperative imaging for surgical planning Pros and cons of imaging modalities for assessment of postoperative complications - X-ray - Ultrasound - CT - MRI - Nuclear medicine.4.Complications that are common to all types of arthroplasties: infection, stress shielding and periprosthetic fractures, humeral component loosening, heterotopic ossifications, implant failure, nerve injury.5.Complications that are specific to different types of hardware: - Anatomic total shoulder arthroplasty: glenoid component loosening, rotator cuff tear; - Reverse total shoulder arthroplasty: Instability, anterosuperior dislocation, scapular notching (Sirveaux classification), scapular spine and acromion fractures; - Hemiarthroplasty and humeral head resurfacing arthroplasty: progressive glenoid osteoarthritis requiring conversion to total shoulder arthroplasty.6.Conclusion.

MKEE-100 **Ultrasound Assessment Of Common Patterns Of Peripheral Nerve Injury: A Systematic Approach**

Awards
Certificate of Merit

Participants
Rina Patel, MD, San Francisco, California (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) Ultrasound is critical part of the multimodality imaging approach to diagnosis of peripheral nerve disease, including identification of changes in nerve morphology, sites of compression, and adjacent anatomy and pathology. 2) Ultrasound is uniquely capable of performing a dynamic assessment of nerves and adjacent structures which can identify pathology potentially missed with other modalities. 3) A systematic approach to peripheral nerve imaging includes evaluation of extrinsic findings, intrinsic changes of the nerve, and distal muscle findings. 4) This systematic approach will aid in the identification of the most common types of peripheral nerve pathology, including extrinsic causes (ex. compressive mass or hardware), intrinsic alterations of the nerve (ex. transection or neuroma), and associated distal muscle changes (denervation edema or atrophy).

TABLE OF CONTENTS/OUTLINE

1) Normal Anatomy and Imaging Appearance. 2) Role of Imaging in Assessment of Peripheral Neuropathy. 3) 3 Step Approach to Imaging Evaluation of Peripheral Nerve Injury. 4) Common Patterns of Peripheral Nerve Injury, including the following: A. External

Compression by Hardware, Mass, and Variant Anatomy B. Anatomic Sites of Frequent Compression, such as Carpal Tunnel Syndrome C. Nerve Transection. D. Nerve Subluxation/Dislocation E. Neuroma. AND 5) Pitfalls/Limitations

MKEE-101   Triangular Fibrocartilage Complex (TFCC) Injury Made Simple

Awards
Certificate of Merit

Participants
Vitor Sato, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is to: 1. Illustrate and discuss the anatomy of triangular fibrocartilage complex (TFCC); 2. Describe and discuss with didactic cases different patterns of TFCC injuries, based on modified Palmer classification; 3. Show common and uncommon pitfalls that simulate TFCC injury, as well as differential diagnosis for its injury.

TABLE OF CONTENTS/OUTLINE

Introduction: general presentation of anatomy with MR imaging of TFCC, including the often-neglected complex anatomy of ulnocarpal ligaments and meniscal homolog; Present schematic cases to illustrate modified Palmer classification, as well as how to diagnosis distal radioulnar joint instability related to TFCC injury; Discuss and illustrate common and uncommon pitfalls and differential diagnosis of TFCC injury; Briefly show post-operative cases of this injuries; Bibliographical references with recent articles highlighting what's new in the topic.

MKEE-102   Chronic Kidney Disease: MSK Findings

Participants
Paulo de Tarso Perez, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is to: Briefly approach the pathophysiology and disorders in patients with chronic kidney disease; Review and didactically illustrate the musculoskeletal manifestations in chronic kidney disease with imaging findings on radiographs, computed tomography and magnetic resonance imaging.

TABLE OF CONTENTS/OUTLINE

Introduction: General presentation of the pathophysiology and metabolic disorders; Present a scheme with the main musculoskeletal findings; Provide didactic and illustrative cases of each disorder (hyperparathyroidism, rickets, amyloid arthropathy, avascular necrosis, infectious diseases, destructive spondyloarthropathy, crystal deposition and soft tissue calcification) Conclusions; Bibliographical references.

MKEE-103   Spinal Cord Compression: An Unusual Debut Of Frequent Systemic Diseases.

Participants
Jose Carlos Garcia-Gil Garcia, MBBCh, Madrid, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

- To review common systemic diseases that can cause spinal cord compression (SCC) as the initial presentation.- To illustrate the imaging spectrum of spinal cord involvement on these systemic entities, outlining subtle findings that may help the radiologist.- To emphasize the paramount role of the Computed Tomography (CT) and Magnetic Resonance Imaging (MRI) in the diagnosis and follow-up of SCC.

TABLE OF CONTENTS/OUTLINE

SCC is a medical emergency that requires prompt diagnosis and treatment to avoid irreversible spinal cord injury. Imaging tests play an essential role in the assessment of SCC confirming the clinical suspicion of SCC, grading the severity of the disease and assisting in narrowing down the differential diagnosis.The most common causes of SCC are neoplasms, especially metastasis, and degenerative disease. However, there are other systemic etiologies such as metabolic, inflammatory or infectious diseases that can be easily misdiagnosed that we must also bear in mind. In these cases, clinical-laboratory and imaging correlation is mandatory to achieve a correct diagnosis.A retrospective review was performed on all 55 patients with SCC diagnosed at our institution from January 2014 to January 2021. We present the key image findings and clinical-laboratory-pathologic correlation in several cases that illustrate SCC as the initial presentation of systemic disease and the clinical and radiologic follow-up.

MKEE-104   Simplifying Posterolateral And Posteromedial Corners Of The Knee

Participants
Camila Justino, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

To review with schematic drawings correlated with magnetic resonance imaging the anatomic structures of the posterolateral (PLC) and posteromedial (PMC) corners of the knee.To approach the different trauma mechanisms and clinical tests.To review the possible injuries to the structures of the PLC and PMC of the knee and the main patterns of injury, understanding the role of imaging in these injuries.

TABLE OF CONTENTS/OUTLINE

Posterolateral and posteromedial corners of the knee are responsible for stabilization of the knee. Untreated or concurrent corner injuries result in secondary osteoarthritis and rotational instability and may contribute to graft failure in anterior and posterior cruciate ligament reconstructions and poor clinical results.The radiologist's knowledge of the anatomy, the findings of the clinical tests and the understanding of the trauma mechanisms is very crucial for the radiologist to be fully aware of the spectrum of radiological appearances.The aim of this educational exhibit is to illustrate in a simple way with schematic drawings correlated with magnetic resonance imaging the anatomy of the posterolateral and posteromedial corners, trauma mechanisms and clinical tests, as

well as the identification of lesion patterns.

Radiological Assessment Of Synovial Disease

Participants
Luiza Porto, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Synovial joints are covered by the synovium, a tissue responsible forproviding nutrition and lubrication to the cartilage, which makes it essential for the functioning of the musculoskeletal system. There are several pathologies that affect the synovium, ranging from inflammatory, infectious, degenerative, traumatic, hemorrhagic, even neoplastic lesions. Due to the wide spectrum of existing synovial lesions, symptoms and clinical findings can often be nonspecific. Therefore, imaging has an essential role in the early detection of synovial diseases prior to irreversible joint damage.

TABLE OF CONTENTS/OUTLINE

Review synovial joints, their functions and histological findings.Discuss different radiological findings of synovial lesions, includinginflammatory, infectious, degenerative, traumatic, hemorrhagic, andneoplastic.Obtaining and understanding characteristic imaging findings ofsynovial diseases that enables a proper diagnosis and early treatment.Take home messages.References.

MKEE-107 **Musculoskeletal Applications Of Shear Wave Elastography: A Quantitative Ultrasound Tool**

Participants
Michael O'Bryant, DO, Hershey, Pennsylvania (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review the basic concepts of shear wave elastography (SWE) as a quantitative method of ultrasound evaluation 2. Review the various applications of SWE as an adjunct diagnostic tool for musculoskeletal disease 3. Review limitations of SWE within the musculoskeletal system

TABLE OF CONTENTS/OUTLINE

1. General Principles of shear wave elastography a. Comparison of SWE with strain elastography b. Highlight QIBA findings 2. Specific uses of SWE within the musculoskeletal system and review of current literature a. Characterize MSK injuries/lesions, provide quantitative information b. Predict impending injury c. Monitor healing d. Anatomical considerations i. Tendons ii. Muscles iii. Fascia iv. Nerves v. Ligaments vi. Soft Tissue Masses 3. Limitations of SWE in the musculoskeletal system a. Anisotropy b. Positional dependence c. Activity dependence d. Strain dependence 4. Future Direction and Summary a. Will SWE provide useful diagnostic information? b. Will SWE provide a competitive advantage?

MKEE-108 **Born To Run: Imaging Evaluation Of Runners' Injuries**

Participants
Ana Laura Silva, MD, SAO PAULO, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this study is: - To review the imaging appearance of typical patterns of bone, muscle and tendon injuries in runners. - To review some of the most widely used classifications and spectrum of injuries related to running. - To discuss the role of imaging studies in the correct diagnosis and appropriate treatment of these injuries.

TABLE OF CONTENTS/OUTLINE

The types of injuries that commonly affect runners are almost exclusively related to exertion. As expected, the lower limbs are the most frequently affected segment, with injuries that include sprains, muscle tears, avulsions, stress fractures, plantar fasciitis, chronic exertional compartment syndrome and muscle hernias. Apart from ankle sprains, traumatic injuries are rare. About 60% of the causes of pain in runners are related to errors in training, leading to typical injuries. Knowledge of the common and uncommon patterns of injuries in runners will facilitate the proper recognition of these injuries in imaging studies. We will review these conditions with illustrations and several cases from our institution.

MKEE-109 **ALTR, ARMD, And Trunnionosis - Clarifying Component Related Hip Arthroplasty Complications**

Awards
Certificate of Merit

Participants
Jonelle Petscavage-Thomas, MD,MPH, Hummelstown, Pennsylvania (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Discuss special techniques utilized to maximize CT/MR resolution of hip arthroplasty• Describe appearance of complications of hip prostheses• Describe benefits of different imaging modalities for complication workup

TABLE OF CONTENTS/OUTLINE

1. Indications and goals of joint arthroplasty2. General classification based on the following: a) What type of prostheses is it b) What are the components c) What are the bearing surfaces d) How are the components fixed to the bone3. Imaging Modalities for Surveillance: a) Serial radiographs b) CT scan c) MARS - Metal Artifact Reduction Techniques d) Ultrasound4) Complications of Hip Prosthesis - Infection, Osteolysis/Radiolucent line, Dislocation, Component malpositioning, Synovitis, Polyetheylene wear-induced synovitis, Adverse local tissue reaction - Metallosis, ARMD from metal on metal hips, Trunnionosis, Component impingement, Tendonitis - iliopsoas, Gluteal, Hamstring, Aseptic loosening, Pedestal formation, Pseudobursa formation, Periprosthetic Fracture

MKEE-11 **Does This Make Me Look Fat? Fat-containing Lesions In Bone**

Participants

Eddy Zandee van Rilland, MD, Boston, Massachusetts (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Fat-containing osseous lesions are generally benign and nonaggressive.2. Identifying intralesional fat using CT or MRI can aid in accurate diagnosis and ensure appropriate management, often preventing unnecessary biopsies.3. This presentation will provide a review of common fat-containing osseous lesions and discuss their clinical presentation, imaging appearance, and management recommendations.

TABLE OF CONTENTS/OUTLINE

Background Accurate assessment of osseous lesions on imaging can be challenging. Intralesional fat is highly suggestive of a benign process and seen in only a few tumor types and some non-neoplastic conditions. Identifying fat within a lesion, which can be confidently performed with CT or MRI, is therefore an important step in the evaluation of all osseous lesions. This presentation will provide a case-based review of fat-containing osseous lesions including their typical clinical presentation, imaging appearance, and management options for each lesion.Case Based Reviewa. Intraosseous lipomab. Parosteal lipomac. Intraosseous hemangiomad. Bone infarct e. Focal red marrowf. Paget diseaseg. Fibrous dysplasiah. Intraosseous dermoid cysti. Intraosseous hibernomaj. Involuting simple bone cystk. Treated bone metastasis

MKEE-110 The Forgotten Joint: Pathology Of The Proximal Tibiofibular Joint

Participants
Robert Robinson, MD, Boston, Massachusetts (*Presenter*) Nothing to Disclose

TEACHING POINTS

The proximal tibiofibular joint (PTFJ) is often overlooked during radiologic evaluation of the knee. Yet, there are important conditions involving the PTFJ that contribute to knee pain and lower extremity functional impairment.It is important to understand the normal anatomy of the PTFJ and recognize the various pathologies that can occur at this location.

TABLE OF CONTENTS/OUTLINE

Background: A deep understanding of the anatomy and recognition of common processes involving this joint is crucial when interpreting imaging studies of the knee.Imaging Considerations & Anatomical Review: The PTFJ is a synovial joint at the proximal articulation of the tibia and fibula and is the site of several tendinous/ligamentous attachments and is closely associated with the peroneal nerve. MRI, CT, and Ultrasound can play an important role when other testing is unrevealing. Primary imaging consideration involves understanding the normal anatomical components of the proximal tibiofibular joint and adjacent structures.Pathology of the Proximal Tibiofemoral Joint: Pathology of the proximal tibiofibular joint can be categorized into: Arthritis (osteoarthritis, inflammatory, synovial chondromatosis), Traumatic (fractures, dislocations, posterolateral corner injury), Neoplastic, and Neurogenic (ganglion compression of the peroneal nerve, intraneural ganglion). These conditions will be discussed, and the key imaging features and pitfalls will be highlighted.

MKEE-111 Ligament And Fibrocartilaginous Injuries Of The Fingers: The Importance Of Dynamic Maneuvers In Ultrasound Exam.

Participants
Juan Jover, Getafe, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this of this exhibit is:-To explain the mechanism of injury in ligament and fibrocartilaginous lesions of the fingers. -To emphasize the dynamic capability of ultrasound to evaluate ligament and fibrocartilaginous injuries of the fingers and correlates with MRI.

TABLE OF CONTENTS/OUTLINE

Anatomy of the finger pulley system and finger extensor hood. Mechanism of injury in ligament and fibrocartilaginous structures of the fingers. Radiological findings of ligament and fibrocartilaginous lesions of the fingers (pulley tear, collateral ligaments lesions, volar plate lesion): MRI and US. -Sample cases.

MKEE-112 Imaging Evaluation Of Long Thoracic Nerve: Correlation Between Magnetic Resonance And Neural Damages

Participants
Gabriela Camerin, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Understand the physical principles of Magnetic Resonance (MR) and its use in nerves evaluation. Comprehend clinic indications of diagnostic neurography of braquial plexus. Describe MRI limitations in nerve afecctions detection. Describe MRI neurography evaluation protocol of long thoracic nerve. Know the impact of long thoracic nerves injuries on clinical management.

TABLE OF CONTENTS/OUTLINE

INTRODUCTION Long thoracic nerve injuries and clinical findings.Epidemiology of long thoracic nerve injuries. ANATOMICAL CONCEPTS Brief description of braquial plexus anatomy. Anatomy variants. Muscle innervation. PHYSICAL CONCEPTS AND PROTOCOLO OF MR NEUROGRAPHY Neurography: image acquisition and post processing. Neural damages carachterization and additional findings MR limitations. MR NEUROGRAPHY OF DAMAGED LONG THORACIC NERVE: INTERACTIVE CASE-BASED DIDACTICS Sample MRI cases to illustrate and solidify new concepts. FUTURE DIRECTIONS

MKEE-113 Spectrum Of Injuries To The Thumb Metacarpal Joint Ulnar Collateral Ligament In American Football Players And Novel Treatment With Internal Brace Augmentation.

Participants
Kemp Knott, MD, Houston, Texas (*Presenter*) Nothing to Disclose

1. Describe the normal anatomy of the thump metacarpal (MP) ulnar collateral ligament (UCL) complex.2. Understand the spectrum of UCL injuries in American football players and significance of player position.3. Discuss the preoperative MRI classification in UCL injuries and treatment options including novel augmentation of primary repair or reconstruction with internal bracing.4. Discuss the postoperative radiographic and MRI findings in UCL injuries.

TABLE OF CONTENTS/OUTLINE

1. Normal anatomy of the thumb MP UCL complex.a. Normal anatomy, function, and imaging of the UCL proper and accessory ligament.b. Normal anatomy, function, and imaging of the dynamic stabilizers of the thumb MP.2. Spectrum of thumb MP UCL injuries in American football players with MR imaging classification.a. Partial tearb. Complete tear with <3mm retractionc. Complete tear with >3mm retractiond. Complete tear with Stener lesione. Combined UCL and RCL tear (unique to football players)f. Degenerated nonfunctioning UCL without acute tear3. Treatment options of thumb MP UCL injuriesa. Primary repairb. Tendon graft reconstructionc. Augmentation of primary repair or reconstruction with novel internal bracing using suture tape with intra-operative imaging.4. Postoperative imaging of thumb MP UCL injuriesa. Intact repairb. Failed repair5. Conclusion

MKEE-115   Postoperative Evaluation Of Tendon And Ligament Injuries In The Extremities

Awards
Certificate of Merit

Participants
Gabriela Camerin, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Comprehend clinic indications of post-operative imaging evaluation. Understand the physical principles of Magnetic Resonance (MR), Ultrasound and its use in tendons and ligaments evaluation. Understand physical principles of reduced-artifact sequences. Describe MR and Ultrasound limitations in post-operative image evaluation. Describe normal and pathological post-surgery MRI aspect of ligaments and tendons in hands and feet. Comprehend surgical indications for ligaments and tendons lesions in the extremities Understand clinical impact of surgical complications of extremities surgeries and what should be described.

TABLE OF CONTENTS/OUTLINE

INTRODUCTION Epidemiology of hands and feets soft tissue injuries. Clinical findings in main tendon and ligament extremities surgical complications and indications of post-surgical imaging. ANATOMICAL CONCEPTS Brief description of wrist and hand anatomy. Brief description of ankle and foot anatomy. PHYSICAL CONCEPTS AND PROTOCOL OF MR AND ULTRASOUND MRI: image acquisition and post processing - artifact reduction.Ultrasound physical concepts - how to avoid pittfalls. MR limitations. Ultrasound limitations. WHAT SHOULD BE DESCRIBED Normal post-opperative aspect of ligaments and tendons. Most important findings in pathological post-operative images. Structured report. DAMAGED TENDONS AND LIGAMENTS: INTERACTIVE CASE-BASED DIDACTICS Sample MRI cases to illustrate and solidify new concepts. FUTURE DIRECTIONS

MKEE-116   Whole-body Magnetic Resonance Imaging In Musculoskeletal Oncology: State Of The Art And Clinical Applications

Participants
Isabela Da Cruz, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Whole-body magnetic resonance imaging (WB-MRI) has gained importance in the field of musculoskeletal oncology over the last decades, consisting in a one-stop imaging method that allows a wide coverage assessment of both bone and soft tissue involvement. WB-MRI is valuable for diagnosis, staging and follow-up in many oncologic diseases and is especially advantageous in comparison to other imaging methods since it avoids redundant examinations and exposure to ionizing radiation in patients who often undergo long-term surveillance. The addition of diffusion-weighted sequences allows functional evaluation of neoplastic lesions, which is helpful in the assessment of viable tumor and response to treatment after neoadjuvant or adjuvant therapy. WB-MRI is an excellent alternative to FDG-PET/CT in oncologic patients, with comparable accuracy and the convenience of being radiation-free, fast to perform and available at similar cost. The development of new techniques and protocols makes WB-MRI increasingly faster, safer and more accessible, and it is important for referring physicians and radiologists to recognize the role of this imaging method in pediatric oncology.

TABLE OF CONTENTS/OUTLINE

1) Technical considerations and Protocols 2) Screening 3) Diagnosis and Staging 4) Follow-up Imaging and Treatment Response Assessment 5) Pediatric Oncology 6) Adult Oncology 7) WBMRI vs. PET-CT in Musculoskeletal Oncology 8) Future Directions

MKEE-117   Multimodality Imaging Of Synovitis In Osteoarthritis

Awards
Certificate of Merit

Participants
Eimantas Abelkis, MD, Vilnius, Lithuania (*Presenter*) Nothing to Disclose

TEACHING POINTS

Osteoarthritis is a chronic degenerative-inflammatory joint disease and one of the major causes of disability worldwide. Low-grade inflammation and its major manifestation - synovitis - have been recently recognized as crucial factors in OA pathogenesis. Synovitis is associated with joint pain and cartilage degeneration and can potentially be target of treatment.Synovial evaluation and quantification with non-invasive imaging tools is becoming increasingly important both in clinical practice and research.Ultrasound is easily accessible and inexpensive instrument for the initial evaluation of synovitis. Different techniques can be employed such as B mode, power Doppler and CEUS. Non-contrast MRI is incapable of reliably differentiating between inflamed synovium and fluid. Hoffa synovitis and effusion-synovitis are both used as indirect markers of synovial inflammation on non-enhanced MRI. Contrast-enhanced MRI perfectly delineates inflamed synovium while intraarticular fluid remains hipointense. Dynamic contrast-enhanced MRI is a sensitive tool to investigate perfusion of inflamed synovium as well as sensitively demonstrate

radiologic response to treatment.New techniques such as molecular imaging and advanced MR sequences are being investigated in synovitis diagnostics with promising results.

TABLE OF CONTENTS/OUTLINE

Inflammation in osteoarthritis.Normal vs inflamed synovium and correlation with symptoms.US techniques.Non-enhanced MRI.Static/dynamic contrast enhanced MRI.New emerging techniques.

MKEE-118   Tarsal Coalition: Don't Let It Fall Into Oblivion

Participants
Roberto Lima, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is: To improve knowledge of the different types of tarsal coalition and their imaging findings. Ilustrate the distinguishing features of tarsal coalition and pitfalls To have a clearer insight into the preoperative surgical planning

TABLE OF CONTENTS/OUTLINE

Tarsal coalitions are developmental anomalies of tarsal bones and are a cause of chronic ankle and hindfoot pain being a diagnosis often overlooked. They can be osseous, fibrous and cartilaginous in nature, most frequently encountered within the calcaneonavicular and talocalcaneal joints, although any joint can be affected. Diagnosis can often be made with conventional radiography, even when the diagnosis is not clinically suspected and advanced imaging modalities are useful for preoperative planning, identifying coalitions and degenerative changes within the foot. Rozansky et al. proposed a classification based on a 3D reconstruction by computer tomography describing 5 types of talocalcaneal coalitions which may guide through different surgical techniques including linear fibrocartilaginous, linear with posterior Hook, downward orientation with shingled talar portion, osseous, peripheral posterior. The importance of early diagnosis is in guiding definitive imaging, which assists in early management decisions.

MKEE-119   The Bleeding Joint - Haemophilic Arthropathy: A Guide For Imaging Evaluation

Participants
Eneas Cerqueira, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Haemophilic arthropathy refers to joint disease as a long-term consequence of repeated hemarthrosis. Around half of the patients with hemophilia will develop a severe arthropathy with a high morbidity. In this context, the purpose of this study is: didactically review pathophysiology of musculoskeletal manifestations of hemophilia, explaining how arthropathy develops; demonstrate with schematic illustrations and cases classical radiological findings of haemophilic arthropathy and possible complications of these patients in a multimodality approach; discuss how radiologists can assist physicians, providing information that could change clinical/surgical management of haemophilic patients.

TABLE OF CONTENTS/OUTLINE

Overview of the epidemiology, pathophysiology and clinical assessment of hemophilic patients. Demonstrate in an easy way the use of radiographic scores in predicting synovial hypertrophy. Exhibit the classical findings of haemophilic arthropathy with cases including radiographic and MRI evaluation and correlation. Present possible complications that these patients may manifest while in follow-up. Discuss the value of radiographs and MRI in prophylactic treatment. Differential diagnosis of hiposignal intra-articular masses, including intra-articular giant cell tumor, amyloidosis, inflammatory arthropathies, crystal deposit diseases, and others. Bibliographical references.

MKEE-12   Hip Arthroplasty. Normal Post-operative Appearances And Complications.

Participants
Michelle Ooi, MBBS, Wrightington, United Kingdom (*Presenter*) Nothing to Disclose

TEACHING POINTS

To identify different types of hip arthroplasties commonly used, emphasizing on key points relevant to post-operative imaging interpretation.To recognise normal/accepted findings following hip arthroplasty.To identify potential post-operative complications following hip arthroplasty on various imaging modalities including plain film, CT, MR, US and nuclear medicine studies.

TABLE OF CONTENTS/OUTLINE

1. Different types of hip arthroplasties commonly used (hemi vs. total hip replacements, unipolar vs. bipolar prosthesis)2. Different bearing surfaces in total hip replacements.3. Brief summary of CT and MRI techniques to reduce metal artefacts.4. Normal post-operative appearances of hip arthroplasties including accepted alignment and common radiological measurements used will be depicted.5. Potential post-operative complications illustrated using different modalities:-Aseptic vs septic (infection) loosening-Prosthetic dislocation, prosthetic fatigue fractures, stress reactions/periprosthetic fractures (including classification systems used for periprosthetic fractures on imaging)-Arthroplasty-related synovitis including metal-related adverse local tissue reaction (eg: metallosis, metal hypersensitivity, trunnionosis, intra-osseous pseudotumour), polyethylene wear and particle disease-Impingement syndrome (eg: iliopsoas and ischiofemoral impingement)-Abductor tendons insufficiency/tear following hip arthroplasties, heterotopic ossification-Nerve-related complications.

MKEE-120

Stuck-in-the-middle: A Radiographic Evaluation Of Impingement Syndrome

Participants
Andrea Ruiz Mojica, MS, San Juan, Puerto Rico (*Presenter*) Nothing to Disclose

TEACHING POINTS

Define Impingement Syndrome and its Pathophysiology.Anatomical Review of Impingement Syndrome in the most commonly affected joints.Provide examples of key imaging findings that are diagnostic indicators of Impingement Syndromes.

Impingement syndromes are defined as the entrapment of anatomic structures (soft tissues or bones) that result in chronic pain and limited range of motion of affected joints. The mechanical entrapment of these structures can be due to multiple etiologies, such as bony abnormalities, trauma, or chronic use. Untreated impingement syndrome can be the source of significant pain and distress in our patients, ultimately limiting their mobility and activities of daily life. The purpose of this educational exhibit is to review the characteristic imaging findings of impingement syndromes of the shoulder, hip, knee and ankle in order to provide a prompt diagnosis and prevent progression of these conditions .1. Introduction2. Objectives3. Impingement Syndromes: Pathophysiology Clinical Presentation Anatomical Overview & Classic Imaging Findings of SubtypesImpingement Syndrome of the Shoulder (Subacromial & Subcoracoid)Impingement Syndrome of the Hip (Femoroacetabular & Ischiofemoral) Impingement Syndrome of the Knee (Suprapatellar & Infrapatellar Fat Pad) Impingement Syndrome of the Ankle Intra-articular (Anterior, Posterior & Medial) Extra-articular (Talocalcaneal), Lateral Hindfoot4. Multiple cases in Quiz Format5. Conclusion

MKEE-121   Charcot Marie Tooth Disease: What The Radiologist Should Know

Awards
Identified for RadioGraphics
Certificate of Merit

Participants
Leah Waldman, MD, Durham, North Carolina (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is to: 1. Review the clinical and radiographic features of Charcot Marie Tooth (CMT) disease 2. Describe the complex?pes cavovarus deformity of CMT and how it is assessed on weightbearing radiographs 3. Discuss surgical correction of the CMT foot

TABLE OF CONTENTS/OUTLINE

Features - history, pathophysiology, presentation, pertinent multimodality imaging findings including 3D weight-bearing CT, treatment options, and prognosis Pathology specific to patients with CMT - fifth metatarsal fractures, stress fractures/response, callus formation, ulcerations/infection - illustrated with clinically correlated imaging Pes cavovarus deformity - due to imbalance between antagonistic muscles (weak peroneus brevis and relatively strong posterior tibial; weak tibialis anterior and relatively strong peroneus longus) manifesting as hindfoot varus, midfoot adduction, foot drop, and forefoot valgus Pes cavovarus assessment - calcaneal pitch, naviculo-cuboid overlap, metatarsal stacking, talonavicular coverage, relevant angle measurements Surgery - goals; different techniques based on specific corrections necessary, correlated with intraoperative imaging; and postoperative imaging evaluation with examples of surgical complications

MKEE-122   Imaging Approach In Differentiating Bone Lesions Having Fluid Fluid Levels.

Awards
Certificate of Merit

Participants
Amar Jakure, MBBS, Mumbai, India (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. presence of complete fluid-fluid levels is a classical finding of aneurysmal bone cysts; however other various bone pathologies shows fluid-fluid levels.2. Fluid-fluid levels in ABC does not have any solid component, while other lesions with fluid-fluid levels shows solid component, matrix and other features particular to that pathology.3. Differentiating fluid fluid levels seen in primary ABC and other lesions with secondary ABC can be done with help of features seen on MRI.4. ABC is an expansile lesion most commonly seen at metaphysis of long bones which shows septations within. 5. ABC has various shades of hyperintensity on T1Wimaging due to presence of various ages of blood in the vascular channels.

TABLE OF CONTENTS/OUTLINE

1. Classification of bone lesions having fluid fluid levels2. Pathophysiology and imaging characteristics of fluid-fluid levels3. Characteristics of fluid fluid levels seen in primary ABC and other lesions with secondary ABC4. Examples and image illusrations of lesions having luid fluid levels.

MKEE-123   Besides Colorful Images, What Diffusion Tractography Of Peripheral Nerve Can Add?

Participants
Jessica Gomes, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Explain what is Diffusion Tensor Imaging (DTI) and Tractography of peripheral nerves its relevance, applications and increasing clinical demand; • Simplify the physics and technical considerations behind DTI/Tractography. • Recognize the difficulties and potential artifacts of employing DTI to assess peripheral nerves and how to solve them; • Orientate how to perform image postprocessing; • Suggest an optimized acquisition protocol and its interpretation;

TABLE OF CONTENTS/OUTLINE

Introduction: What is Diffusion Tensor Imaging (DTI) and Diffusion Tractography? Peripheral nerve DTI aplications: Chronic compressive neuropathies, Traumatic injury and Neoplasms. Physics and what informations we can get from DTI: Fractional Anisotropy (FA), Axial Diffusivity (AD), Radial Diffusivity (RD), Mean Diffusivity (MD) and Tractography. Protocol suggestion and artifacts management Challenges of employing DTI to assess peripheral nerves; Potential artifacts/ biases and possible solutions; Image postprocessing: a stepwise approach Evaluation of results and sistematic interpretation FA, AD, RD, MD their meaning and electroneuromiography correlations Tractography/ DTI interpretations in the context of Chronic compressive neuropathies, Traumatic injury and Neoplasms. Conclusion and Take Home Messages

MKEE-124   We Can Go Further: The Role Of Opportunistic MRI On Bone And Muscle Quality

Participants
Lucas Silva, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Studies by magnetic resonance imaging (MRI) are common in daily practice and with the aging of the population there is an increased demand for this method. Osteoporosis and sarcopenia are common diseases in the elderly population and generate great morbidity and costs to the health care. The early diagnosis of these diseases brings great advances in the clinical management of these patients. MRI can be used as quantitative method to risk stratification for sarcopenia and osteoporosis in exams performed for other reasons, helping to reduce the cost of screening methods and the morbidity of patients. The purpose of this exhibit is: (1) To review the definition of opportunistic diagnosis and how they can be applied in routine examinations, including its advantages and limitations. (2) To demonstrate how to perform the opportunistic diagnosis by MRI. (3) To review the scientific papers available in the literature and demonstrate which are the best techniques to perform the diagnosis efficiently. (4) To demonstrate in practice how this method can be used in patients with chronic diseases and the correlation with Dual-energy X-ray absorptiometry (DXA).

TABLE OF CONTENTS/OUTLINE

(1) Definition of opportunistic MRI (2) Technical considerations (3) How to perform opportunistic MRI in routine examinations (4) Correlation of opportunistic MRI with DXA (5) Opportunistic diagnosis of osteoporosis and sarcopenia in patients with chronic diseases (6) Pittfalls (7) The future of opportunistic MRI and its implications in the daily practice of the radiologist

MKEE-125   Rethinking Hip Joint Capsule: Anatomy, Imaging Findings, Pathologies And Postoperative Changes

Participants
Henrique Santana, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The hip capsule is a fibrocartilaginous ligament complex that, along with the hip muscles and the labrum, makes the hip joint congruent, helping to stabilize and limit the multidirectional movement of this highly weight-bearing ball-socket joint. It is composed superficially by the iliofemoral, ischiofemoral and pubofemoral ligaments, and deeply by the orbicular zone ligament, delimiting a synovial cavity, with anatomical and functional association with the teres ligament and the labrum.Many pathologies may affect the hip capsule, such as inflammatory diseases, mechanical changes, systemic diseases, microcrystal deposits, and more rarely neoplasms. In light of the increasing number of surgical procedures involving the hip joint capsule such as capsulotomies and reconstructions with iliotibial band, post-operative findings and its association with biomechanical changes must be understood. Hip capsule abnormalities may result in joint instability and osteoarthritis, however its pathologies are often disregarded. In the systematic radiological assessment of the hip, the capsule should always be carefully assessed and the evaluation of its normal, abnormal and eventual post-operative findings is of high importance for the radiologists.

TABLE OF CONTENTS/OUTLINE

1. Anatomy and biomechanics 2. Normal imaging findings 3. Mechanical changes: - Degenerative changes- Instability- Trauma 4. Polymyalgia rheumatica/Adhesive capsulitis 5. Post-operative findings 6. Miscellaneous and systemic pathologies 7. Take-home message

MKEE-126   Low Back Pain Beyond The Lumbar Spine Disease.

Participants
Eduarda Bernal, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

? Know the anatomy and function of coccyx and sacroiliac joint.? Recognize causes of low back pain beyond the lumbar spine disease.? Be familiar with epidemiology, clinical presentation and causes of coccydynia and sacroiliac joint pain? Recognize the relevant imaging features in the evaluation of patients with low back pain.? Comprehend the indications of conservative and intervention management of coccydynia and sacroiliac joint pain

TABLE OF CONTENTS/OUTLINE

? INTRODUCTION- Anatomy and function of coccyx and sacroiliac joint.- Postacchini and Massobrio classification.? COCCYDYNIA AND SACROILIAC JOINT PAIN- Definition- Epidemiology- Pathology- Clinical presentation- Diagnosis? IMAGING MODALITIES- Dynamic Imaging- MR Imaging- Cases of coccydynia and sacroiliac joint pain? MANAGEMENT- Conservative management.- Injections- Radiofrequency treatment- Surgical interventions? FUTURE DIRECTIONS- Minimally invasive image-guided procedures.

MKEE-127   Image-based Approach To Synovial Masses

Awards
Certificate of Merit
Identified for RadioGraphics

Participants
Allison Khoo, MD, Saint Louis, Missouri (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Synovial masses present as diffuse or focal thickening of the synovial lining of a joint, bursa, or tendon sheath. Knowledge of articular anatomy is important to correctly localize a mass to the synovium.2. The differential for a synovial mass includes benign synovial proliferative pathology, inflammatory and infectious arthritis, deposition disease, vascular malformation, and malignancy.3. Interpreting the MRI signal characteristics of synovial masses is essential in the characterization of synovial disease and tailors the differential diagnosis. Further incorporation of additional radiographic and MRI findings with the clinical presentation help to arrive at the appropriate diagnosis.

TABLE OF CONTENTS/OUTLINE

I. Background: Synovial anatomy: Introduction of 3 broad categories of synovial disease by MRI signalII. Case-based review1. T1

1. Background: Synovial anatomy; Introduction of 3 broad categories of synovial disease by MRI signalII. Case based review1. T1 and T2 hypointense: Calcium (synovial osteochondromatosis, synovial chondrosarcoma, intraarticular synovial sarcoma, gout); Hemosiderin (pigmented villonodular synovitis, hemophilic arthropathy); Crystalline or Protein Deposition (amyloid arthopathy, gout); Flow void (arteriovenous malformation)2. T1 and T2 hyperintense: Fat (lipoma arborescens, synovial lipoma)3. T1 intermediate and T2 hyperintense: Inflammatory or Infectious synovitis (rheumatoid arthritis, tuberculous arthritis); Cartilage (synovial chondromatosis, synovial chondrosarcoma); Other (synovial hemangioma, intraarticular synovial sarcoma, synovial lymphoma)

MKEE-128   The Sternum And Sternoclavicular Joints: Advanced Imaging Techniques, Pathologies And Procedures

Participants
Adam Michalak, MD, Manhasset, New York (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Imaging of the anterior chest wall osseous and chondral structures has increased in frequency.• MR Imaging of the anterior chest wall requires special consideration with regards to technique, imaging planes and sequences, and differs from chest MRI indicated to assess the intrathoracic visceral structures.• MRI of the chest is susceptible to artifact of which there are techniques to minimize these artifacts.• Pathologies include fractures, infection, neoplasms- benign and malignant, inflammatory and degenerative arthritis.• Xiphoid process can mimic a palpable lesion and can vary in morphology.• It is important to assess the surrounding soft tissues, including the anterior mediastinum.

TABLE OF CONTENTS/OUTLINE

IntroductionImaging protocol for the Sternum/Manubrium/Xiphoid and Sternoclavicular Joints• Anatomy• Imaging Planes• Imaging Sequences• PositioningArtifact and reduction techniquesMore frequently encountered pathologies with imaging examples(Predominantly MRI with corresponding CT/US/Nuclear exams):• Trauma• Infection• Neoplasm• Degenerative/Inflammatory/CrystallineXiphoid morphology and variationsSoft tissue findingsProcedures

MKEE-129   Hands On Hands! Soft-Tissue And Bone Tumors Involving The Hand - Imaging Features

Participants
Guilherme Andrade, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Introduce soft-tissue and bone tumors of the hand and discuss their epidemiology, classifications, pathology and clinical aspects.2. Properly evaluate the imaging features of hand tumors and narrow the differential according to location, clinical features and presentation 3. Determine the correct diagnosis or narrow down the differential diagnosis for the requesting physician according to allimaging and clinical features.

TABLE OF CONTENTS/OUTLINE

1. Introduction.2. Review of epidemiology, classifications, pathology and clinical aspects of the hand soft-tissue and bone tumors.3. WHO Tumor Classification.4. General radiographic findings5. Cystic-appearing masses a) Ganglion cyst b) Epidermal inclusion cyst c) Synovial sarcoma6. Noncystic Masses Along Tendons and Aponeuroses a) Tenosynovial giant cell tumor b) Fibroma of tendon sheath c) Palmar fibromatosis.7. Adipocytic Tumors a) Lipoma b) Lipomatosis of nerve. 8. Vascular lesions a) Venous malformation b) Glomus tumor. 9. Nerve Tumors a) Schwannomas b) Neurofibromas.10. Bone tumors a) Chondroma b) Enchondroma c) Chondrosarcoma.11. Conclusion.

MKEE-13   Don't Get Fooled: Cartilage Variants That Can Mimic Pathology

Participants
Ryan Hoffman, DO, Jacksonville, Florida (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review the imaging manifestations of common cartilage variants that can mimic pathology.2. Compare with cartilage or osteochondral pathology that can have a similar appearance.

TABLE OF CONTENTS/OUTLINE

Introduction: Background on the importance of identifying cartilage and osteochondral variantsReview variants with case examples and corresponding true pathology (osteochondral lesions) where applicable.Cases 1. Tubercle of Assaki 2. Glenoid central bare spot 3. Capitellar Pseudodefect 4. Trochlear ridge 5. Supra-acetabular Fossa 6. Stellate Crease (acetabulum) 7. Dorsal defect of Patella 8. Notch of Harty.Conclusion.

MKEE-130   Depiction Of Bone Microstructures Using Ultra-high Resolution CT

Participants
Hiroshi Moriya, MD, Fukushima, Japan (*Presenter*) Advisor, NantWorks LLCResearch Grant, Canon Medical Systems Corporation

TEACHING POINTS

1. Clinical significance of fracture risk assessment2. Fracture risk assessment methods3. Technical advantages of ultra-high resolution CT (UHRCT)4. Trabecula visualization by UHRCT5. UHRCT findings of osteoporosis

TABLE OF CONTENTS/OUTLINE

1. Fractures severely reduce the quality of life of the elderly, so it is important to diagnose and prevent fracture risk. In particular, specific fracture prevention can be performed by identifying high-risk regions.2. Traditional fracture risk assessment method: Plain radiographs, DEXA, CT, and micro CT. CT can evaluate fracture scars, bone shape, bone cortex, trabecula. Micro CT has a spatial resolution of 0.08 to 0.16mm. Analyze of peripheral bone such as lower leg. Trabecula analysis of high-risk areas such as the femur and spine cannot be performed.3. UHRCT: In SHR mode (1024matrix, 0.25mm slice thickness, FOV 160mm), the voxel size becomes 0.15mm diameter. Any bone can be scanned using a spatial resolution comparable to that of micro CT.4. Trabecula visualization by UHRCT: Fine trabecular bones and bone structures are depicted with a small voxel. UHRCT can separate the trabecular bone in

bone marrow fat.5. UHRCT findings of osteoporosis: The trabecula is thin and sparse. The trabecular bone in the horizontal direction is decrease, and slightly thick trabecula in the vertical direction is conspicuous. Cortical bone volume, thickness, cancellous bone volume, and trabecular pattern can be analyzed.

MKEE-131   Cervical Trauma: Anatomy, Types Of Fractures, Ligaments Injury And Stable Vsunstable Lesions.

Participants
Wagner Hutterer SR, MD, Taboao da Serra, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is:1. To review anatomy and the mainly mechanism associated with cervical spinelesions.2. Correlate the different types of fracture and ligaments injury with the correspondingclinical repercussion emphasizing in differentiate stable vs unstableinjuries.3. To discuss epidemiology, criteria for requesting imaging exams4. To discuss about each type of fracture and how to diagnose it and make anaccurate assessment in a multimodality approach

TABLE OF CONTENTS/OUTLINE

1- Anatomy.2- Imaging exams indications.3- Institutional protocol (CR, CT and MRI)2- C1 fracture (Jefferson).3- Odontoid fracture.4- C2 fracture (Hangman's fracture).5- Facet dislocations.6- Interspinous ligaments injury7- Burst fracture of lower cervical spine8- Flexion and extension tear drop fracture.9- Occipital Cervical Dislocation.10- Occipital condyle fracture.

MKEE-132   Gout: Is It That Simple? Typical And Atypical Locations

Participants
Danielle Rumi, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is: 1. To briefly discuss the epidemiology, pathophysiology, and clinical presentation of gout. 2. To illustrate and revisit the classic radiological findings of gout in different imaging modalities, showing common and atypical joints involved by the disease, showing how challenging gout imaging diagnosis can be. 3. We will particularly emphasize the atypical locations that have a high risk of misdiagnosis, which has a particular interest not only to radiologists but also to clinicians. When in an atypical location, gout can also have an atypical clinical presentation making the imaging study essential for correct diagnosis and treatment.

TABLE OF CONTENTS/OUTLINE

• Briefly discuss the epidemiology, pathophysiology, and clinical presentation of gout.• Briefly present the typical and atypical joints involved by the disease.• Illustrate with multiple imaging modalities (MRI, CT, XR, and US) the deposition of monosodium urate crystals.• Provide an overview of key imaging findings, tips, and illustrative cases that could help radiologists to assist the physician's decision.• Conclusions.• Bibliographical references.

MKEE-133   Musculoskeletal Infection And Mimics

Participants
Jeffrey Belair, MD, Philadelphia, Pennsylvania (*Presenter*) Nothing to Disclose

TEACHING POINTS

After reviewing this educational exhibit, the reader will be able to:- Understand the modes of musculoskeletal contamination- Recognize the various types of musculoskeletal infection- Identify potential mimics of musculoskeletal infection and provide an appropriate differential diagnosis when applicable

TABLE OF CONTENTS/OUTLINE

1. Modes of contaminationa. Hematogenousb. Contiguous spreadc. Direct implantation2. Update on nomenclature3. Imaging techniques4. Types of infectiona. Cellulitis & abscess- Bland edema vs. devitalized tissue- Ulcers & sinus tractsb. Pyomyositisc. Infectious fasciitisd. Septic tenosynovitise. Septic bursitisf. Septic arthritis- Native joint- Prosthetic joint infection (PJI)g. Osteomyelitis- Intraosseous abscess- Pediatrics (vascularization, Brodie's abscess)- Sequestrum/cloaca/involucrum- Emphysematous osteomyelitish. Discitis-osteomyelitis5. Infection mimicsa. Inflammatory arthropathiesb. Crystalline deposition (HADD, CPPD, gout)c. Neuropathic (Charcot) arthropathyd. Tumors and tumorlike conditionse. Tissue necrosis/infarctionf. Trauma/fracture6. Reporting tips and recommendations

MKEE-134   Magnetic Resonance Imaging Of The Total Hip Arthroplasty: What Did They Cut Through?

Awards
Cum Laude

Participants
Ji Lin, MD, New York, New York (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Total hip arthroplasty (THA) is one of the most commonly performed joint replacement procedures, with a variety of surgical approaches currently in common usage.- Variations in operative technique may confuse imaging evaluation of the post-THA hip for radiologists and trainees who are unfamiliar with these surgical nuances. We will demystify common MRI findings after direct anterior approach (DAA) and posterior approach (PA) THA by reviewing the different surgical techniques and relevant anatomy.- Postoperative MRI findings of THA via anterior approach is compared to posterior approach with respect to the soft tissue structures violated, including the nerves at risk.- Risk of femoral nerve injury is greater with DAA while risk of sciatic nerve injury is greater with PA.- Findings on magnetic resonance (MR) neurography for post-operative femoral nerve palsy can clarify the nature of the nerve injury in order to guide appropriate treatment.

TABLE OF CONTENTS/OUTLINE

BackgroundPros and Cons of DAA vs. PA THASurgical Anatomy of DAA vs. PA THASurgical Anatomy of PA THA- Muscle Injury-

Capsular DehiscenceNerve Injury Following THA:- Denervation effect of muscle- Abnormal nerve size and signal- Scar- Transection- Management: surgical and non-surgicalConclusion

MKEE-135   Spondylodiscitis And Its Culprits: Imaging Hallmarks Based On Etiology

Participants
Luana Concha, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

To discuss the epidemiology of spondylodiscitis.To discuss the risk factors.To discuss the clinical presentation and the biochemical markers.To review the imaging hallmarks based on etiology.To review the differential diagnosis.

TABLE OF CONTENTS/OUTLINE

1. Introduction: Review of spondylodiscitis epidemiology and risk factors. 2. Clinical standpoint and importance of MRI role on spondylodiscitis diagnosis. 3. The hallmarks to differentiating between pyogenic, tuberculous, fungal infections. 4. The differential diagnoses and features that mimic spinal infection. 5. Take home messages and teaching points.

MKEE-137   Plantar Vein Thrombosis - A Difficult And Hardly Ever Remembered Diagnosis

Participants
Vivien Bonadio, MD, Bebedouro, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is: 1. To review the venous anatomy of the foot. 2. To approach the clinical scenario. 3. To discuss possible etiologies. 4. To correlate the plantar thrombosis through imaging findings in a multimodality approach (US, CT and MRI). 5. To approach differential diagnosis. 6. Treatment.

TABLE OF CONTENTS/OUTLINE

1. Venous anatomy of the foot. 2. Clinical scenario and possible etiologies. 3. Imaging findings in a multimodality approach (US, CT and MRI). 4. To approach differential diagnosis, including intermetatarsal bursitis, Morton neuroma, sesamoiditis, plantar fasciitis, tendon pathology, ganglion cyst and stress fracture. 5. Treatment. 6. Evolutive control.

MKEE-138   Soft Tissue Mineralization: Demystifying The Deposition

Awards
Certificate of Merit

Participants
Mohamed Elboraey, MBBCh, Jacksonville, Florida (*Presenter*) Nothing to Disclose

TEACHING POINTS

1- Soft tissue mineralization is commonly encountered on musculoskeletal imaging. A thorough understanding of the pathophysiology and imaging appearance of various soft tissue mineral deposits is crucial to avoid misdiagnosis and inappropriate intervention.2- Most soft tissue mineralization patterns can be distinguished on radiographs. The presence of soft tissue mineralization is often not perceived on MRI, but awareness of its presence can significantly impact the overall MRI interpretation. Therefore, comparison of any MRI exam with corresponding radiographs is essential. Even a negative radiograph provides important information in that it allows inclusion or exclusion of certain diagnostic considerations. 3- Incorporation of pertinent patient history, including clinical presentation, biochemical laboratory results, and concomitant comorbidities allows for greater confidence and accuracy in image interpretation.

TABLE OF CONTENTS/OUTLINE

1- Background on pathophysiology of soft tissue mineralization. 2- Classification of soft tissue mineralization by etiology, imaging pattern, and distribution: -Dystrophic -Vascular -Trauma -Metabolic -Neoplasm -Autoimmune -Infection 3- Illustrative examples of the most commonly encountered soft tissue mineralization deposits. 4- Special types: -Calcinosis universalis -Calcinosis cutis - Calcinosis circumscripta 5- Illustrative examples of utility of comparison radiographs during MRI interpretation.

MKEE-139   The Spectrum Of Achilles Pathology; What A Radiologist Needs To Know

Participants
Guillermo Granados Gonzalez, MD, Bogota, Colombia (*Presenter*) Nothing to Disclose

TEACHING POINTS

The Achilles tendon is made up of the soleus and gastrocnemius muscles, which are inserted in the posterior region of the calcaneus.In MRI, the Achilles tendon is easily visible because it is surrounded by fatty tissues, which help to define the anatomy and pathology of the Achilles tendon.Achilles tendon rupture is the most common tendon rupture, which can be complete or partial.Tendinosis is the term that should be used to refer to a non-inflammatory and degenerative process of the tendonThe term tendinitis involves an inflammatory reaction within the tendon, which leads to the development of enthesophytes.

TABLE OF CONTENTS/OUTLINE

The Spectrum of Achilles Pathology; What a a Radiologist Needs to KnowDisclosureAbbreviationsContentLearning objectivesAnatomyCinematics of the gaitImages:Routine X-raysAnatomical ClassificationPathologyAchilles tendon tear (Typical and atypical tear)ParatenonitisTendinosisInsertional tendinitisHaglund´s diseaseRetrocalcaneal bursitisRetro-Achilles bursitisTake home messagesReference

MKEE-14   A Pictorial Review Of Peri Prosthetic Fractures In Hip And Knee Replacement: A Radiologist's Guide To Key Clues In Reporting.

Participants

Javier Azpeitia Arman, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

-To describe the different types of Periprosthetic Fractures in hip and knee replacement.-To review the role of imaging techniques (plain radiograph, CT, MR) in the evaluation of periprosthetic fractures.-To understand usefulness and limitations of plain radiographs and CT in the evaluation of periprosthetic fractures. -To illustrate imaging findings which should be described in periprosthetic fracture reporting in different techniques (plain radiograph, CT, MR) in order to provide useful data for the orthopedic surgeon.

TABLE OF CONTENTS/OUTLINE

Periprosthetic fracture (PF) describes any fracture that occurs around an implanted orthopedic prosthesis, most commonly knee or hip arthroplasties, which may occur either intraoperatively or postoperatively. We review imaging of hip and knee replacement fractures, highlighting key concepts perceived as important variables by the surgeon and correlating images with clinical considerations and functional outcomes. We present: 1. A review of types of hip and knee replacement 2. Clinical considerations. 3. Imaging. -Imaging techniques: Plain radiographs, CT, MR. - Technique and limitations -Imaging findings. Parameters that should be evaluated. Different classifications of fractures. -Associated findings potentially obscuring fractures: metalware, loosening and osteolysis.

MKEE-140   Ultrasound Evaluation Of The Hand And Wrist: A Case-based Review

Participants
Natasha Honda, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is to:1-Familiarize the radiologist with normal sonographic anatomy of the hand and wrist. 2-Review technique and image optimization for sonographic evaluation of the hand and wrist pathologies. 3-Recognize characteristic imaging findings of various traumatic and non-traumatic pathologies diagnosed on ultrasound with a case-based review, highlighting dynamic imaging abilities of ultrasound, with correlation with other modalities when pertinent (i.e. MRI and radiography). 4-Briefly describe a step-wise approach in evaluation of inflammatory arthropathies and spondyloarthropaties in the hand and wrist. 5-Discuss the role of sonography in post-operative evaluation of the hand and wrist

TABLE OF CONTENTS/OUTLINE

• Introduction with a brief description and illustrations of the hand and wrist normal anatomy• A case-based literature review of the hand and wrist spectrum of pathologies, focused in sonographic evaluation, with schematic drawings, illustrations and MRI correlation, including unusual cases• Illustrative examples to highlight dynamic imaging abilities of ultrasound• Didactic cases to consolidate the knowledge• Conclusions• Bibliographical references

MKEE-141   Clinical Challenges Of Gluteal Pain: How Can The Radiologist Help?

Participants
Thaisa Gomes, MD, Campinas, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Review the anatomy of the sciatic nerve. Illustrate the anatomical structures of the subgluteal space. Expose the causes of gluteal pain related to non-discogenic sciatic.Discuss the differential diagnoses of non-neurogenic gluteal pain (sciatic-like).

TABLE OF CONTENTS/OUTLINE

Introduction:-Describe the possible conflicts of the sciatic nerve while crossing the subgluteal space.-Demonstrate non-neurogenic gluteal pain cases that can mimic sciatica.Image Techniques: Magnetic resonance images with protocols for evaluating the lumbosacral plexus, hips and pelvis.Clinical Applications:-Non-discogenic gluteal pain related to:-- tumor compressions;--piriformis syndrome;--inflammatory and infectious processes;--post-traumatic lesions;--post-surgical complications;--gynecological pathologies;--neurovascular conflicts;-Non-neurogenic gluteal pain (or sciatic-like) related to:--Sacroiliitis;--Fractures;--Hamstring enthesopathies;--;Ischiofemoral Impingement;--Bursitis;--Inflammatory and infectious processes;--Post traumatic soft tissue injuries.

MKEE-142   MRI Of Forefoot - Anatomy And Common Injuries Of Tendons, Plantar Plate And Ligaments

Participants
Vivien Bonadio, MD, Bebedouro, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is: 1. To review anatomy of forefoot - Tendons, Plantar plate, Ligaments. 2. To correlate the anatomy of tendons, plantar plate and ligaments with MRI images. 3. To approach injuries and expected image patterns.

TABLE OF CONTENTS/OUTLINE

1. Review general anatomy of tendons, plantar plate and ligaments. 2. MRI of flexor mechanism - anatomy and injuries. 3. MRI of plantar plate - anatomy and injuries. 4. MRI of extensor mechanism - anatomy and injuries. 5. MRI of collateral ligaments - anatomy and injuries.

MKEE-143   Manage The Mess: Infections In Implants, Flaps And Grafts

Participants
Meena Nedunchelian, MBBS, Coimbatore, India (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To describe the role of multimodality imaging in evaluating the spectrum of post-operative infections following orthopaedic implant placement.2. To highlight the key points in the differentiation of post-operative infections from expected post-operative appearances and other common as well as uncommon postoperative complications.

Imaging is often requested for diagnosis and to know the extent of infection following clinical suspicion. However, imaging can be challenging due to various complications occurring in the post-operative site which can mimic infection. A multimodality imaging approach is preferred in this scenario to evaluate bone, hardware and soft tissues since each imaging modality has a specific advantage over the other to provide definitive information regarding the above structures.It is crucial to diagnose infection at the earliest to prevent devastating complications. Apart from the early detection of infection, describing the extent of infection is of utmost importance. Soft tissue compartments and planes involved have to be adequately described for appropriate treatment. Knowledge of expected postoperative findings and common mimics of infection is essential for preventing unnecessary surgical intervention.In this exhibit, we will display the common appearances of infections in bones, joints and soft tissues following orthopaedic surgeries with implants, grafts and flaps along with a radiological checklist to be followed for diagnosis and reporting.

MKEE-144 Postoperative Foot - What The Radiologist Needs To Know

Participants
Vivien Bonadio, MD, Bebedouro, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is: To review the main foot orthopedic surgeries - indications, technics, expected image findings and main complications in a multimodality approach (CR, US, CT and MRI).

TABLE OF CONTENTS/OUTLINE

1. Review indications and technics of foot orthopedic surgeries. 2. Discuss which imaging modality provides the best evaluation for each kind of surgery. 3. Expected image findings and main complications in a multimodality approach (CR, CT, US and MRI). 4. The studied procedures include: Elective surgeries: - Arthrodesis; - Deformities, such as hallux valgus, varus and rigidus; - Tendon repair and transposition; - Ligament repair; - Osteochondral lesion repair. Emergency surgeries: - Ankle fracture - lateral, medial and posterior malleolus, such as tibiofibular syndesmosis injury and repair; - Talus and calcaneous fracture. 5. The complications includes: Non-union, Loosening, Disuse osteopenia, Reflex sympathetic dystrophy (Sudeck atrophy), Denervation, Infection.

MKEE-145 Oh My Hip, Again! A Multimodality Imaging Review Of Hip Arthroplasty Complications

Participants
Kaushik Chagarlamudi, MD, Cleveland, Ohio (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Review of various types of hip arthroplasty orthopedic hardware.- Immediate postoperative changes with normal anatomy following total hip arthroplasty- Expected normal findings at follow up evaluation- Common and uncommon complications of total hip arthroplasty on follow up exams

TABLE OF CONTENTS/OUTLINE

? Review of Total Hip Arthroplasty Orthopedic Hardware? Normal Anatomy and Expected Postoperative Changes Following Total Hip Arthroplasty? Evaluation after initial placement¦ Alignment and positioning? Evaluation during follow-up studies¦ Checklist, pearls, and pitfalls? Complications of Total Hip Arthroplasty? Component Loosening¦ Femoral component loosening¦ Acetabular component loosening? Polyethylene Wear? Osteolysis? Adverse Local Tissue Reaction¦ Metallosis¦ Pseudotumor (solid and cystic)? Heterotopic Ossification? Periprosthetic Fracture? Infection? Prosthesis dislocation. Component malposition

MKEE-146 "Don't Get On My Nerves" - MSK Ultrasound Evaluation And Treatment Options Of Nerve Pathology

Participants
Allen Wrubel, MD, Birmingham, Michigan (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review of normal sonographic appearance of nerves under ultrasound. 2. Review of anatomy of select superficial nerves with associated pathology including neuromas, scar tissue, transection, and hardware entrapment. o Review of treatment options, indications and imaging of lidocaine, steroid and phenol injections, percutaneous stimulation, radio frequency ablation, Sonex and IncobotulinumtoxinA treatments.

TABLE OF CONTENTS/OUTLINE

• Review of normal anatomic appearance of nerve tissue using MSK ultrasound. o Structure and Appearance o Differentiating nerve from surrounding muscle/tendon • Sonographic review of anatomy and pathology o Neuroma o Nerve Transection o Hardware Entrapment o Scar Tissue o Thoracic Outlet Syndrome • Review of Treatment Options o Lidocaine/Bupivacaine Injection o Steroid Injection o Phenol Injection o Methylene Blue Marking o Percutaneous Stimulation o Radiofrequency ablation o IncobotulinumtoxinA • Summary

MKEE-148 Weightbearing Imaging Of Progressive Collapsing Foot Deformity

Participants
Carlos Teixeira Lobo, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Discuss the recent recommendation to adopt the Progressive Collapsing Foot Deformity (PCFD) nomenclature in contrast to Adult Acquired Flatfoot Deformity (AAFD) and Posterior Tibial Tendon Dysfunction (PTTD); Review the new anatomical and pathological concepts involved in PCFD Discuss the previous classifications for PCFD, exposing their current limitations; Discuss the new classification for PCFD; Review the recommendations for radiographic evaluation of PCFD, with emphasis on the angular measurements necessary for the categorization of patients; Discuss the role of weightbearing computed tomography (WBCT) in the current understanding of PCFD and in the proposed new classification system; Review the findings that must be evaluated in the WBCT, unique to the method and important in the management of patients; Review the surgical reconstruction of PCFD;

TABLE OF CONTENTS/OUTLINE

Background - Overview of the new nomenclature PCFD; - Current imaging evaluation and its limitations; - Previous classification systems and current recommendation; - Anatomical aspects of PCFD; - Conventional radiographs for PCFD: recommended incidences; illustration of recommended angular measurements; - Weightbearing computed tomography: illustration of relevant findings; sagging of the medial arch; peritalar subluxation; hindfoot alignment; Foot Ankle Offset (FAO); posterior subtalar joint valgus; intrinsic valgus of the talus; - Illustrations of surgical reconstructions of PCFD

MKEE-149   Musculoskeletal Emergencies And Urgencies: An On-call Primer

Participants
Aishwarya Gulati, MD, Philadelphia, Pennsylvania (*Presenter*) Nothing to Disclose

TEACHING POINTS

After reviewing this educational exhibit, the reader will: 1. Understand imaging findings of joint, osseous, muscle, ligament, and tendon emergencies and urgencies, both typical presentations as well as commonly missed or subtle findings, particularly on advanced imaging modalities such as MRI and US. 2. Be aware of common blind spots and learn diagnostic clues to overcome common pitfalls. 3. Understand when to recommend appropriate follow-up.

TABLE OF CONTENTS/OUTLINE

Multimodality imaging (X-ray, CT, MRI, US) focusing on optimal imaging techniques, characteristic imaging findings, and diagnostic pearls and pitfalls of: 1. Infections a. Large and small joints b. Soft tissue c. Osteomyelitis 2. Trauma a. Acute osseous, muscle, tendon, and ligament traumatic injuries b. Foreign bodies 3. Vascular injuries - traumatic and incidentally imaged 4. Non-traumatic urgencies (osseous, soft tissue) 5. Recommending appropriate follow-up a. Radiographic findings requiring further imaging or other follow-up b. Suboptimal imaging requiring re-imaging or other evaluation with alternative modalities

MKEE-15   Ultrasound-guided Musculoskeletal Intervention Of The Ankle And Foot: Kicking Pain To The Curb

Awards
Certificate of Merit

Participants
Isaiah Tan, MD, Madison, Wisconsin (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To recognize the clinical presentation and imaging features of musculoskeletal conditions of the ankle and foot that may warrant US-guided intervention. 2. To review the indications, contraindications, interventional methods, potential complications, and expected outcomes of US-guided interventions of the ankle and foot. 3. To discuss the technical approaches to various US-guided musculoskeletal interventions of the ankle and foot.

TABLE OF CONTENTS/OUTLINE

1. US-guided procedure overview A. Equipment and scanning B. Medication considerations C. Safety and contraindications 2. Clinical and imaging overview A. Anatomy and pathophysiology B. Clinical and imaging findings in disease C. Differential diagnosis 3. Patient positioning, injection technique, outcomes, and complications A. Ankle i. Achilles tendon interventions a. Platelet-rich plasma injection b. Dry needling/fenestration ii. Retrocalcaneal bursa injection iii. Tendon sheath injections a. Common peroneal b. Posterior tibialis iv. Nerve blocks a. Tibial b. Deep peroneal c. Baxter's nerve B. Hindfoot i. Plantar fascia interventions a. Corticosteroid injection b. Platelet-rich plasma injection ii. Sinus tarsi injection iii. Subtalar joint injection C. Mid and forefoot i. Tarsometatarsal joint injection ii. Metatarsophalangeal joint injection iii. Intermetatarsal space interventions a. Bursitis corticosteroid injection b. Morton's neuroma (1) Alcohol ablation (2) Cryoablation

MKEE-150   Striking A Cord: Review Of Normal And Variant Anatomy Of The Distal Spinal Cord And Conus With Pathologic Discussion.

Participants
Elizabeth Dobben, MD, Detroit, Michigan (*Presenter*) Nothing to Disclose

TEACHING POINTS

Review of distal spinal cord normal anatomic appearance, and variants Review of pathology involving the distal cord

TABLE OF CONTENTS/OUTLINE

Review of Distal Spinal Cord Normal Anatomic Appearance and Variants Conus normal location Borderline Conus Position Terminal/Fifth Ventricle Low Lying Conus Review of Pathology Involving the Distal Cord Syrinx of the distal cord Tethered Cord Lipoma of Filum Terminale Low Lying Conus with Lipoma Diastomatomyelia Anterior Sacral Meningocoele Summary

MKEE-151   Radiological Approach To The Acute Finger

Awards
Certificate of Merit

Participants
Anas Saeed Bamashmos, MD, Trumbull, Connecticut (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Elucidate osseous finger anatomy with associated biomechanics. • Recognize the spectrum of traumatic entities involving the finger. • Describe the radiologist approach in evaluating finger injury, value of different imaging modalities, and associated complications. • Present common finger injuries classification systems used by orthopedic surgeons. • Highlight the management options for finger injuries. • Discuss imaging findings of non-traumatic acute finger pathologies such as osseous and soft tissue infections, foreign bodies, and acute ischemia.

TABLE OF CONTENTS/OUTLINE

• Overview of the anatomy of the finger, with an emphasis on how this anatomy influences the types of injuries that affect the

• Overview of the anatomy of the finger, with an emphasis on how this anatomy influences the types of injuries that affect the finger and where they occur. • Review the physiological anatomy of the finger and common injury mechanisms. • Define the pathogenesis, clinical manifestations, imaging findings, management, and prognosis for finger trauma. • Review the image guided and surgical procedures utilized to manage finger injuries. • Contrast the utilization of radiography, ultrasonography, computed tomography, and magnetic resonance imaging for finger injuries. • Highlight the common non-traumatic finger pathologies.

MKEE-152 Crystal-related Arthropathy: An Imaging Overview

Participants
Tatiane Moriwaki, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is to: 1. Review and illustrate the most frequent and some atypical presentations of crystal arthropathies with imaging findings on radiographs, ultrasound, computed tomography and magnetic resonance, based on the type of crystal deposit; 2. Illustrate and discuss differential diagnosis with didactic and challenging cases.

TABLE OF CONTENTS/OUTLINE

Introduction: general presentation of the epidemiology, pathophysiology and clinical findings of crystal arthropathies. Present a schematic illustration with the distribution and main imaging findings in the crystal arthropathies, besides providing didactic cases of the manifestations related to each type of crystal deposit. Discuss differential diagnoses and tips to help differentiate them from crystal arthropathies and illustrate with challenging cases. Bibliographical references with recent articles highlighting and what's new in the topic.

MKEE-153 Peripheral Ulnar-Sided Tears Of The Triangular Fibrocartilage Complex (TFCC): Multiplanar Approach And Characterization Of Injury Patterns With Focus On CT Arthrography

Participants
Gonzalo Serrano, MD, Vitacura, Chile (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Introduce new concepts regarding the layered anatomy of the TFCC, demonstrate the normal appearance of these components and illustrate the varied tear patterns of the peripheral ulnar TFCC using high resolution multiplanar CT arthrography.2. Introduce a novel CT arthrography sign to distinguish tears of the deep foveal fibers from those affecting the less important superficial components.

TABLE OF CONTENTS/OUTLINE

Details of the anatomy of the ulnar peripheral insertion of the fibrocartilage will be reviewed using high resolution multiplanar CT arthrography and illustrations. We will highlight the stratified structure of DRULs formed by superficial and deep fibers that insert in the distal ulnar in the styloid process and the fovea and their appearance on CT arthrography. Each set of fibers has volar and dorsal attachments resulting in four distinct attachment sites of these ligaments at the distal ulna. The different tear patterns that can be identified will be shown in a didactic way through illustrations and images. A new sign will also be introduced in the evaluation of foveal tears. Finally, the author's personal research data will be shown in the exhibit. We believe that accurate characterization of the various injuries seen in this area will lead to improved clinical radiological correlation and optimize patient management.

MKEE-154 The Atlanto-axial Joint. Osseous And Ligamentous Anatomy, Common And Important Clinical Cases

Participants
Susan Hesni, MBBS, London, United Kingdom (*Presenter*) Nothing to Disclose

TEACHING POINTS

The atlantoaxial joint is a complex joint with several osseous and ligamentous components. Knowledge of this anatomy can aid in the interpretation of both traumatic and non-traumatic pathologies of the cervical spine. The following topics will be discessed.1. The atlantoaxial joint may be affected by unique pathologies such as atlantoaxial instability and basilar invagination. Often, multi-modality imaging including plain radiography, CT and MRI may be required. 2. As well as unique pathologies, the atlantoaxial joint may be affected by similar pathologies to other joints in the body including degeneration, trauma and infection. 3. Fractures involving the atlantoaxial joint are particularly important as they may give rise to instability and resultant compromise of the craniocervical junction. In addition, the pattern of the fracture can determine the likelihood of non-union.4. Fractures involving the foramen transversarium should be treated with caution and CT angiographic imaging performed to assess the vertebral arteries.

TABLE OF CONTENTS/OUTLINE

1. To outline the normal osseous and ligamentous structures of the atlantoaxial joint with the aid of imaging.2. To highlight normal anatomical variants such as os odontoidium and congenital non-fusion of the posterior arch of C1.3. To explore a variety of traumatic and non-traumatic cases involving the atlantoaxial joint such as atlantoaxial subluxation/instability, osteomyelitis and basilar invagination.

MKEE-155 A Practical Guide To The Ribs: Anatomy, Protocols And Pathologies.

Participants
Cristyano Leite, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Comprehend clinic indications for imaging evaluation.Learn the anatomic landmarks and relationships of the thoracic cage.Recognize the most useful image methods.Understand role and limitations of thoracic Magnetic Resonance imaging (MRI).Know the most frequent and relevant rib pathologies.

TABLE OF CONTENTS/OUTLINE

INTRODUCTION- Epidemiology of the rib pathologies.- Imaging methods to evaluate rib lesions.ANATOMICAL CONCEPTS- Brief

description of the thoracic cage.- Brief description of the typical and atypical ribs.- Anatomy variants.MRI PROTOCOL MRI:- Most used protocols.- Suggested weighting.MOST RELEVANT RIB PATHOLOGIES: INTERACTIVE CASE-BASED DIDACTICS- Trauma: bone rib and cartilage fractures.- Bone and chondral neoplasms.- MRI Pitfalls.FUTURE DIRECTIONS- Ultrasound evaluation of the thoracic cage.

MKEE-156   Magnetic Resonance Imaging Based Neuropathy Score- Reporting And Data System (NS-RADS)- Multi-institutional Expert Consensus Guideline

Participants
Avneesh Chhabra, MD, Flowermound, Texas (*Presenter*) Consultant, ICON plc;Consultant, Treace Medical Concepts, Inc;Author with royalties, Wolters Kluwer nv;Author with royalties, Jaypee Brothers Medical Publishers Ltd;Speaker, Siemens AG;Medical advisor,ImageBiopsy Lab;Research Grant, ImageBiopsy Lab;

TEACHING POINTS

1.Gain knowledge of MRI-based neuropathy score- reporting and data system (NS-RADS) for the standardized description and reporting of peripheral nerve disorders.2.Learn and understand the different categories of NS-RADS for description of severity scales of nerve injury (NS-RADS, I0-5), entrapment (NS-RADS, E0-3), neoplasia (NS-RADS, N0-4), diffuse nerve disorder (NS-RADS, D0-2), and post-intervention state (NS-RADS, PI-0-3).3.Discuss how to describe regional muscle abnormalities (M0-M3).4.Understand the NS-RADS-NOS (not otherwise specified) category for imaging description of peripheral nerves and muscles.

TABLE OF CONTENTS/OUTLINE

1. Evidence-based and multi-institutional expert-consensus discussion of technical considerations and optimal parameters for MR imaging of peripheral nerves and muscles ('complete set', 'incomplete set', 'MR neurography', 'DWI/DTI').2. Discussion of coverage and billing/charges.3. Outlining of the lexicon and standardized terms to describe nerve disorder, muscle denervation, and short-segment vs. long-segment neuropathies.4. Illustration of different NS-RADS categories with relevant case examples.5. Discussion of terms to avoid during imaging descriptions and when to use NOS category.

MKEE-157   Chronic Ankle Instability And Microinstability: What You Should Know

Participants
Daisy Kase, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Chronic instability is a important cause of ankle pain with associated loss of function and limitation of movement. Ankle microinstability has been subject of studies among orthopedics, although many radiologists still haven't got familiarity with the term. In this context we aim to: Explain the concept of ankle instability and microinstability, describing didactically anatomy, mechanism of lesion and their treatments; Demonstrate with illustrations and cases the main imaging findings, possible complications and what to report; Correlate MRI findings and arthroscopy images in pre and post surgical treatment cases.

TABLE OF CONTENTS/OUTLINE

Review current theory of instability and microinstability, including anatomy of the ankle, mechanism of lesions, clinical assessment and treatment. Describe and demonstrate with MRI examples the anatomy of the anterior talofibular ligament fascicles related to microinstability.Exhibit the main findings of instability pre and post surgical treatment and complications associated.Demonstrate and explain, with arthroscopy images, surgical ligament repair, correlating with the post-operatory MRI.Overview what to look for and how to report on these patients' exams, aiming to assist the orthopedic community.Summary.

MKEE-158   The Many Faces Of Fascial Disorders In The Musculoskeletal System

Participants
Murilo Maciel, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this study is:• Review the normal imaging appearance of the fascial system• Discuss the fascial system pathologies, their imaging patterns and clinical correlation

TABLE OF CONTENTS/OUTLINE

The fascial system is composed of connective tissue distributed in superficial and deep layers, providing protection, lubrication and contributing to force transfer during muscle contraction. The pathological conditions of the fascia can be divided into trauma, tumor, inflammatory/infectious and deposit disease. Trauma may be due to acute injury or repeated microtrauma. Acute trauma may cause direct fascia disruption or cause dissociation between the superficial interface with the hypodermis or with the deep interface with the epimysium. Repetitive microtraumas are associated with thickening of the fascia and perifascial edema, as seen in plantar fasciitis and friction syndromes. Inflammatory and infection processes can be centered in the fascia, as seen in eosinophilic fasciitis, or be an extension of muscle inflammation, as seen in inflammatory myositis. Tumor lesions range from benign circumscribed nodules to local aggressive masses/malignant tumors. The imaging appearance is not specific and depends on the cellularity and components of the lesions. Deposit diseases may also affect fascia, including hydroxyapatite crystal deposition and cerebrotendinous xanthomatosis. Knowledge of the different injuries in the fascial system helps radiologists to identify possible patterns of lesions and improve diagnostic accuracy.

MKEE-159   Runner's Stress Fractures: When Running To Reduce Stress Fails.

Participants
Daniel Ramos SR, MD,MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Stress fractures are partial or complete fractures of bone resulting from high numbers of cyclical overloading, commonly seen in runners. Since the coronavirus disease-2019 (COVID-19) pandemic began, there has been a rising number of people suffering from stress fractures after sharply transitioning from sitting at home all day to rigorously exercising, trying to be healthy or to reduce daily stress. The purpose of this exhibition is to review physiopathology, risk factors and stress fractures different subtypes: low

risk and high risk, presenting a selection of cases to illustrate.

TABLE OF CONTENTS/OUTLINE

. Illustrated description of physiopathology. Presentation of the stress fractures risk factors and subtypes, showing their most common sites. Exhibit several cases of stress fractures and stress reaction, including: 1. Femoral neck. 2. Tibial plateau. 3. Ischiopubic ramus. 4. Calcaneus. 5. Metatarsus. Discuss stress injuries complications. Review the prognostic value of MRI grading for time to return to sports after bone stress injuries.

MKEE-16   Dynamic Ultrasound As A Problem-solving Tool: Techniques, Tips And Tricks

Awards
Cum Laude
Identified for RadioGraphics

Participants
Dyan V. Flores, MD, Ottawa, Ontario (*Presenter*) Nothing to Disclose

TEACHING POINTS

Sonography is useful for the investigation of musculoskeletal disorders. It is cost-effective, accessible, portable, lacks ionizing radiation and allows for dynamic evaluation. A number of musculoskeletal pathologies are optimally, or even only revealed upon dynamic assessment, through muscle contraction, probe compression, change in position, or maneuvering of a patient's extremity. In this educational exhibit, we will review techniques, tips and tricks for using dynamic ultrasound as a problem-solving tool.

TABLE OF CONTENTS/OUTLINE

Technical considerations Common dynamic techniques employed• Muscle contraction• Change in position• Movement of extremity to reproduce symptoms• Probe compression Common issues/problems in static imaging • Soft tissue injury (tendon instability, ligament insufficiency)• Impingement or friction• Joint stability• Nerve dislocation/subluxation• Muscle hernias• Subclinical effusion for aspiration• Challenging anatomy for interventions• Hardware-related symptoms • Cases, techniques, tips and tricks Shoulder Impingement Proximal biceps dislocationElbow • Posterolateral rotatory instability• Distal biceps tendon tear• Ulnar nerve dislocationWrist • Scapholunate ligament injury• UCL injury and joint instability• Stener lesion• Trigger fingerPelvis and hip• Snapping• ImpingementThigh and calf Muscle herniaAnkle and foot• Tendon instability and tearIntervention• Subclinical effusions• Optimizing anatomyHardware• Hardware-related symptoms

MKEE-160   Finger Injuries: Knowledge In The Palm Of Your Hand

Participants
Alejandra Ospina Gonzalez, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this study is:To review the normal anatomy and related injuries of the hand fingers, using ultrasound and MRI.To correlate injuries with clinical images and videos.

TABLE OF CONTENTS/OUTLINE

The fingers are composed by a complex capsuloligamentous and tendon structures which provide joint stability and control of motion. The thumb has particular anatomy that is related to this great range of motion and the unique opposable movement. The most comom finger lesions can be divide into five categories: Thumb trauma injuries, other finger traumatic injuries, trigger fingers, tumors, and arthropathies. Stener lesion is one of the most concerning finger lesions, and is characterized by the interposition of the adductor pollicis aponeurosis in a torn and retracted 1st metacarpophalangic ulnar collateral ligament. Other finger tendon and ligament injuries may also cause joint instability and can be associated with articular deformity. Trigger finger is a common lesion which occurs by repetitive microtrauma resulting in a stenosing tenosynovitis at the level of the A1 pulley. Although finger tumors are not frequent, recognition of the most common lesions is essential. Nevertheless, the fingers are synovial joints and can be affected by inflammatory arthropathies. It is important to evaluate the presence of joint effusion, synovitis, tenosynovitis, bone erosion, and osteitis. The knowledge of the normal anatomy of the fingers and their most common injuries can provide confidence to the radiologist when reporting these joints.

MKEE-161   Gluteal Aesthetic Procedures: A Practical Guide For Imaging Assessment

Participants
Vinicius Lourenco SR, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Gluteal augmentation was introduced in 1969 and is now one of the fastest-growing fields in plastic surgery. Can be performed using different techniques, such as solid silicone implant placement, autogenous fat augmentation and filler injection. The approach of this educational exhibition will be centered on the role of different imaging methods, mainly MRI, in the pre- and post-operative evaluation,the normal findings and possible complications, with the aim of creating a practical guide for a quick assessment.Implant insertion is the most frequently accepted method worldwide for buttocks augmentation. Currently, solid/semi-solid silicone implants are the only implants approved by the FDA for use in the buttocks in the USA and intramuscular placement is becoming more popular.Despite that, with the increasing demand for esthetic gluteal augmentation, we have seen an increasing number of complications from fat grafts and gluteal injections in our practice. CT and magnetic resonance imaging (MRI) are critical to document fat graft integration and volumetric variations produced in the buttocks after fat injection and to determine the level at which the foreign substance has been injected (muscle or subcutaneous fat).

TABLE OF CONTENTS/OUTLINE

Review the basic surgical and procedural techniques of gluteus augmentationReview the normal and abnormal postprocedural findings and common types of complications of each procedure Review MRI sequences capable to assess implant integrity and differentiate the main gluteus fillers

MKEE-162   Peripheral Nerves Tumors - A Practical Guide

Participants
Lucas Rocha, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Review the anatomy of the peripheral nerves.- Recognize the most important imaging features of peripheral nerves tumors.- Acknowledge benign versus malignant imaging characteristics.- Comprehend the imaging role and techniques.

TABLE OF CONTENTS/OUTLINE

INTRODUCTION- Peripheral nerves tumors definition, epidemiology and conditions associated. ANATOMICAL CONCEPTS- Peripheral nerves anatomy.- Key anatomical landmarks demonstrated by illustrations with MRI correlation.IMAGING TECHNIQUE - MRI protocol.- Ultrasound evaluation.- The role of computed tomography (CT). IMAGING INTERPRETATION- Imaging features and systematic approach.- Benign versus malignant characteristics.- What does the referring physician expect us to report ? INTERACTIVE CASES- Sample cases to illustrate and solidify the conceptsMANAGEMENT- Treatment algorithm.

MKEE-163   MR Imaging Of Fibroblastic And Myofibroblastic Soft Tissue Tumors: A Pictorial Essay

Participants
Rafael Il Jun Yoo, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is:1. Exhibit the various fibroblastic and myofibroblastic soft tissue tumours MRI findings according to their biological behaviour according to the latest WHO category (2020)2. Showcase relevant differential diagnosis of fibrogenic soft tissue tumors on MRI

TABLE OF CONTENTS/OUTLINE

Fibroblastic and myofibroblastic tumors are a subset of mesenchymal neoplasms that encompass a broad spectrum of tumors. At least 30% of the benign tumors of soft tissue are fibrohistiocytic and fibrous tumors, accounting for about 12% of paediatric soft-tissue tumors, whereas fibrosarcomas account for 3.6% of all adult sarcoma.The most common locations are the extremity and trunk wall tumours, 30% being superficial and 60% deep-seated.While the etiology of most benign and malignant tumors of soft tissue is unknown, in rare cases (<10%), chemical carcinogens, radiation, viral infection and immunodeficiency and genetic susceptibility may be associated of malignant soft tissue tumors. The large majority of soft tissue sarcomas seem to arise de novo.The likelihood of misdiagnoses between similar tumor entities as well as other differential diagnosis is high, and often leads to inappropriate tumor treatment, and thus, certain MR imaging features can support the diagnosis of fibroblastic or myofibroblastic tumor.

MKEE-164   Time To Thaw The Frozen Shoulder: A Review Of Capsulitis In Various Synovial Joints

Awards
Certificate of Merit

Participants
Elise Chua, MBBS, London, United Kingdom (*Presenter*) Nothing to Disclose

TEACHING POINTS

Although most commonly reported in the shoulder, adhesive capsulitis has been described in various joints with analogous imaging features.The purpose of this exhibit is to:1) Demonstrate the capsular anatomy and non-arthrographic MRI findings of capsulitis unique to each joint. 2) Review clinical features, aetiologies and literature on diagnosis and management of capsulitis in various joints.Radiologists should consider capsulitis in patients with pain and limited range of motion to facilitate management with NSAIDS, intra-articular injections and targeted physiotherapy.

TABLE OF CONTENTS/OUTLINE

1) Adhesive capsulitis of the shoulder- Clinical stages- Histopathology- MRI: thickening of coracohumeral ligament, axillary pouch and rotator interval joint capsule2) Cases of capsulitis in various joints- Clinical presentation: chronic pain, limitation of movement variable depending on synovial recess size and intrinsic motion of different joints- MRI: Joint capsule thickening and T2 signal hyperintensity, none or small effusion corresponding to joint volume reduction, high STIR signal of capsular ligaments- Elbow associated with synovial plica syndrome- Wrist in the prestyloid recess- Hip (often associated with labral tear)- Knee (abnormal signal of fat pad and extrasynovial cruciate ligaments)- Ankle (relation to inversion sprains and impingement syndromes)3) Review of treatment options and if outcomes resemble those of shoulder adhesive capsulitis.

MKEE-165   Various Computed Tomography (CT) Findings Of Failed Fusion After Spinal Surgery

Participants
Minsu Lee, MD, Seongnam-Si, Korea, Republic Of (*Presenter*) Nothing to Disclose

TEACHING POINTS

Spinal fusion surgeries are increasingly performed in recent decade, followed by a growing number of fusion failures. Accurate diagnosis of failed spinal fusion requires radiologist to have thorough knowledge of surgical techniques, normal findings according to the timeline, and CT findings of nonfusion. Here, we demonstrate representative cases of each imaging features of failed spinal surgery from our institution since past five years. The presented cases could be helpful in early and correct diagnosis of failed spinal fusion, avoiding adverse patient outcomes.

TABLE OF CONTENTS/OUTLINE

1. Surgical techniques and normal fusion process, A. Surgical technique; B. Normal CT findings in 3, 6, 12 and 24 months. 2. CT findings of delayed or failed fusion, A. Periscrew halo, lucency, cystic change; B. Endplate cystic change; C. Rod fracture; D. Screw fracture; E. Cage migration; F. Cage subsidence; G. Breakage of bone graft; H. Absorption of bone graft. 3. Summary and Take-home message

MKEE-166   The Ultimate Guide To High Resolution MRI Of Fingers And Nails

Participants
Thais de Souza, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

High field strength MRI scanners and optimized MRI coils has allowed detailed visualization of small structures and complex anatomy of fingers and nails. Dedicated coils provide the necessary signal to achieve the spatial resolution needed within a reasonable scanning time. In this context, high resolution MRI imaging has a new role in detecting nail apparatus disorders, such as trauma, infections, tumors and lesions in the context of systemic conditions.The purpose of this exhibit is to review finger and nail MRI protocol, including usage of ultrasound gel to improve nail analysis, and to compare imaging features between high resolution MRI and ultrasound. In didactic and illustrative way, we will review and correlate MRI and ultrasound imaging findings with sample cases.

TABLE OF CONTENTS/OUTLINE

INTRODUCTION - Clinical indications - MRI Protocol -- Loop Small coils -- The importance of ultrasound gel -- Patient positions -- MRI sequencesANATOMY CONCEPTSCOMPARISON BETWEEN HIGH RESOLUTION MRI AND ULTRASOUNDSAMPLE CASES - Retronychia - Onychomadesis - Glomus tumor - Trauma - Subungual exostosisTAKE HOME MESSAGES - Advantages of using gel ultrasound on MRI - Limitations of high resolution MRI when compared to ultrasound

MKEE-167   Radiographic Lines, Measurements, And Angles Of The Hip: A Pocket Guide

Participants
Antonio Pontes Filho, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this study is: • To review the basic radiographic anatomy of the hip in children and adults • To demonstrate the most useful lines, angles, and measurements of radiographic studies of the hip

TABLE OF CONTENTS/OUTLINE

• Introduction presenting the normal imaging pattern of hip and pelvis radiographs in children and adults, highlighting the standardized radiographic techniques and imaging views. • Objectively demonstrate the major anatomic landmarks utilized for an adequate evaluation on radiographic studies. • Demonstrate the main lines, angles and measurements of the hip, didaticly categorizing them according to the age group. In pediatric studies we will discuss acetabular index, Perkins and Hilgenreiner lines, Shenton line, Reimer migration index, grade of hip dysplasia, among others. The adult evaluation will include center-edge angle, acetabular angle, head-neck prominence and off set, alpha angle, coxa vara and coxa valga, acetabular protrusion, acetabular retroversion, among others. • Briefly correlate the measurements and lines with the most common pathologies of the hip, such as hip dysplasia and femoroacetabular impingement. • Provide didact and illustrative cases to consolidate the acquired knowledge. • Conclusions. • References.

MKEE-168   Ankle Postoperative Imaging: What The Orthopedic Surgeon Wants To Know

Participants
Vitor Sato, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is to: 1. Briefly approach to pre-operative imaging of fractures, deformities, arthritis (degenerative or inflammatory) and ligament, tendon and cartilage injury in the ankle; 2. Discuss the main indications of surgery procedure in this cases; 3. Review the normal post-operative imaging findings, orthopedic devices and complications of the procedures.

TABLE OF CONTENTS/OUTLINE

Introduction: general presentation of pre-operative imaging of potentially surgical conditions affecting the ankle joint; Present a schematic illustration of the main surgical procedures and orthopedic devices, providing didactic cases of each subgroup of surgical procedure; Discuss and also illustrate the main complications of the procedures and what the orthopedic surgeons want to know to guide treatment; Bibliographical references with recent articles highlighting what's new in the topic.

MKEE-169   Many Masks Of Myeloma: Atypical Presentations Of A Common Hematologic Malignancy

Participants
Anthony Chuprin, MD, Jacksonville, Florida (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Present and familiarize atypical findings of multiple myeloma namely osteosclerotic lesions, extraosseous plasma cell lesions and amyloidosis. 2. Identify differential diagnoses to consider when encountering the aforementioned lesions that would be atypical for myeloma.

TABLE OF CONTENTS/OUTLINE

1. Introduction - General features of multiple myeloma. 2. Review - general features, epidemiology, clinical presentation, and special attention to musculoskeletal multimodality imaging appearance for atypical presentations of multiple myeloma including osteosclerotic lesions, extraosseous plasma cell lesions and amyloidosis. 3. Discussion - brief overview of differential diagnoses to consider when encountering atypical findings of multiple myeloma including polyneuropathy, organomegaly, endocrinopathy, monoclonal gammopathy and skin changes (POEMS) syndrome and solitary extramedullary plasmacytoma. 4. Conclusion

MKEE-17   Let's Nail It! A Simple Ultrasound Guide To Nail Diseases

Awards
Magna Cum Laude

Participants

Carolina Almeida, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) The nail performs several functions as protection and enhancement of sensations. Knowing the anatomy and embryology of the nail apparatus is important to understand the image aspect of the lesions that affect them. 2) High-frequency ultrasound is the imaging modality chosen for nail examination due to its cost and avaibility.3) Demonstrate the differences and uses of 18MHz, 24 MHz and 33MHz probes and explain the examination technique to radiology residents.4) Make a pictorial essay of the main tumor lesions and their differential diagnoses, such as glomus tumors, neuromas, melanomas and onicomatricomas.5) Demonstrate the images of inflammatory diseases (autoimmune or not) that affect the nails and may be the initial manifestation of systemic diseases.6) The nail can be affected secondarily by adjacent lesions with another source, such as synovial cysts and foreign bodies.

TABLE OF CONTENTS/OUTLINE

1) Nail anatomy; 2) High-frequency ultrasound examination technique for nail;3) Tumor and tumor-like lesions;4) Inflammatory lesions;5) Differential diagnosis.

MKEE-170   The Tale Of The Talus: Approach To Talar Bone Fractures.

Participants
Ahmad Shaban, MD, Doha, Qatar (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Elucidate the normal radiological anatomy of the talus bone. - Illustrate the unique blood supply to the talus bone and the injuries with a high risk of osteonecrosis. - Describe the most common talar fractures and their mechanism of injury with valuable learning pearls and pitfalls. - Summarize the clinically relevant classification systems for talus fractures, including the Hawkins classification. - Discuss the most common and pertinent management options for talar fractures.

TABLE OF CONTENTS/OUTLINE

- Overview of talus anatomy and biomechanics. - Epidemiology of talar injuries. - Talus fractures and their mechanism of injury. - Talar fracture classification systems. - Management options for talar injuries.

MKEE-171   Stener And Stener-like Lesions: Removing Interposed Barriers To Understanding

Participants
Joao Ricardo Barros Oliveira, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Review and understand the Stener lesion and different types of Stener-like lesions of other anatomical regions in imaging studies, including in the knee, fingers and foot.

TABLE OF CONTENTS/OUTLINE

- Stener lesion corresponds to a complete tear of the distal insertion of ulnar collateral ligament (UCL) of the thumb metacarpophalangeal (MCP) joint, with interposition of the adductor pollicis aponeurosis between the retracted torn ligament and the MCP joint. This condition prevents healing and requires surgical repair1, 2. - In the MCP joints of the 2º to 5º fingers, there can be avulsion of the distal insertion of the collateral ligament (radial or ulnar) with interposition of the sagittal band between the torn ligament and the MCP joint3. - In the proximal interphalangeal (PIP) joints of the 2º to 5º fingers, the interosseous tendon can interpose between the torn collateral ligament (radial or ulnar) and the PIP joint3. - Knee's Stener-like lesion is represented by distal avulsion of the superficial medial collateral ligament (SMCL) and interposition of the pes anserinus tendons between the retracted torn ligament and its tibial insertion. That prevents healing and can prompt knee instability4. - In the hallux metatarsophalangeal (MTP) joint, there can be interposition of the extensor hood between a dislocated torn lateral collateral ligament5. - These injuries regularly require early surgical treatment1-4, due to the potential danger of ongoing instability, albeit conservative treatment can be considered in nondisplaced complete tears6.

MKEE-172   Glenohumeral Osteoarthrosis Radiological Approach, Primary Or Secondary

Participants
Cyndy Guia Yerovi, MD, Valencia, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

-Shoulder osteoarthritis (OA) is a common source of morbidity in the elderly population. New surgical techniques and the different types of shoulder prosthesis have opened a wide variability of treatment options for these patients. -Shoulder OA can be divided into primary or secondary, being rotator cuff massive chronic rupture the most frequent cause, other causes include fractures, avascular necrosis and chronic dysplasia. Radiological features are diagnostic. -XRAY is the main imaging technique, and it is enough for the diagnosis but for surgical planning CT/MR are essential. Xray also allows to differentiate primary and secondary OA - CT with MPR and 3D information: retroversion angle, glenoid morphology following Walch classification and bone stock. -MRI main goal is to check rotator cuff state for surgical decision on anatomical prosthesis or reverse arthroplasty. Other signs of shoulder OA can be depicted: subchondral cysts, chondral lesions, osteophytes. Massive rotator cuff arthropathy should be classified following Hamada modify classification -CONCLUSION: The knowledge of the different types of shoulder OA and the information that radiological modalities provide is essential for surgical planning. Using the same classification systems and structured report improves communication with our referral physicians.

TABLE OF CONTENTS/OUTLINE

General featuresClinical presentation Etiology Imaging findings -Plain Radiography -Computer Tomography -MRI Walch classification and measurements importance

MKEE-173   **Alterations In The Spinal Morphology And Its Relationship With Adjacent Structures That Jeopardizes Surgical Safety In Neurofibromatosis Patients With Spinal Deformity.**

Participants
Pushpa Bhari Thippeswamy, MD, MBBS, Bangalore, India (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To demonstrate alterations in vertebral morphology by multi modality imaging in neurofibromatosis (NF) patients with scoliosis and their surgical relevance.2. To familiarize the reader with changes in the relationship of the spine with adjacent structures which can complicate the surgery or have devastating consequence when overseen.

TABLE OF CONTENTS/OUTLINE

Scoliotic spine in NF might have several dystrophic features like vertebral scalloping and wedging, rib penciling, transverse process spindling, dysplastic pedicles, short curves with apical rotation, neural foraminal enlargement, paravertebral soft tissue mass. Presence of these features is significantly associated with rapid curve progression. However alterations in canal, pedicle and lamina are very important when surgery is indicated which is further complicated by the unique feature of body drift and vertebral rotation phenomenon. With body drift and rotation there is a possibility of rib head dislocation into the canal which can lead to cord injury during surgical manipulation. There is also a great deal of change in relationship with the spine and adjacent structures which needs special mention in the report to avoid devastating injuries during surgery. This exhibit provides detailed overview of surgically relevant findings in NF scoliosis.

MKEE-174   **Renal Osteodystrophy: Do You Know What To Find?**

Participants
Gabriela Souza, Brasilia, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Review of common signs of renal osteodystrophy.Describe expected findings at radiography, MDCT and MRI. Discuss imaging approach to evaluate the various findings that may appear in renal osteodystrophy.Using examples, review a spectrum of renal osteodystrophy.

TABLE OF CONTENTS/OUTLINE

Renal osteodystrophy is a variety of consecutive abnormalities of the musculoskeletal system because metabolic disorders of calcium and phosphate following chronic renal impairment (chronic renal insufficiency, hemodialysis, peritoneal dialysis, renal transplantation and administration of different medications).The pathophysiological and biochemical background of the disease occurs as a result of parathyroid cell hyperplasia with enlargement of the glands leading a secondary hyperparatireoidism. The hypersecretion of parathormone causes hipocalcaemia and increase of the phosphate and vitamin D, leading a extensive bone marrow fibrosis and increased osteoclastic bone resorption. The reflect of all metabolic impairment is the development of osteomalacia, rickets, deposition of calcium/phosphate compounds on soft tissues, osteopenia and osteosclerosis.With more advanced radiological techniques and early diagnosis/treatment of chronical renal disease, the management of radiological manifestations have changed and the typical features of advanced secondary hyperparathyroidism and of rickets/osteomalacia are now much less frequently revealed than previously.

MKEE-175   **Backbreaker! Imaging Review Of The Extramedullary Abnormalities Of The Adult Spine**

Participants
Hamza Alizai, MD, Valley Stream, New York (*Presenter*) Nothing to Disclose

TEACHING POINTS

The reader of this exhibit will be able to: • Provide comprehensive differential considerations for spine abnormalities not originating from the cord • Categorize spine lesions based on origin: dural coverings, vertebrae, discs and facet joints, and paraspinal tissues• Describe imaging features of each entity on radiographs, CT and MRI• Approach spine lesions using imaging characteristics such as topography, morphology, size and multiplicity

TABLE OF CONTENTS/OUTLINE

• Dural lesions: vascular lesions (epidural venous plexus engorgement, dural arteriovenous fistula), spinal cord herniation, arachnoid cysts and dural neoplasms, dural collections• Vertebral lesions: benign tumors (hemangioma, osteoid osteoma, osteoblastoma, osteochondroma, aneurysmal bone cyst, giant cell tumor, Langerhans cell histiocytosis), malignant tumors (metastasis, multiple myeloma, lymphoma, chordoma, Ewing Sarcoma, osteosarcoma, chondrosarcoma, fibrosarcoma), trauma, metabolic (osteoporosis, gout, calcium pyrophosphate dihydrate (CPPD) and calcium hydroxyapatite crystal deposition diseases, Paget disease, renal osteodystrophy, dialysis related spondyloarthropathy), infectious (bacterial and tuberculous), inflammatory (seropositive and seronegative spondyloarthropathies)• Disc and facet joint lesions: Disc protrusions and cysts, facet joint arthropathies• Lesions of the paraspinal tissues: ligament abnormalities, peripheral nerve lesions

MKEE-177   **Thumbs Up Or Down - MR Imaging Of 1st Carpometacarpal Joint Arthroplasty - Surgical Techniques, Normal Imaging Findings And Complications**

Participants
Diego Lemos, MD, Burlington, Vermont (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To learn the normal MR imaging appearance of different techniques for arthroplasty of the 1st carpometacarpal joint, including suspensionplasty and tendon interposition with ligament reconstruction, in the setting of basilar thumb arthritis 2. To learn the MR imaging appearance of postoperative complications and patterns of failure seen with different surgical techniques in the setting of 1st carpometacarpal joint arthroplasty due to basilar thumb arthritis

TABLE OF CONTENTS/OUTLINE

1. Introduction. 2. Normal anatomy of the 1st carpometacarpal joint 3. Classification system for severity of osteoarthritis of the 1st

carpometacarpal joint 4. Different surgical techniques with artworks and drawings in the setting of basal joint arthritis including tendon interposition with ligament reconstruction and suspensionplasty 5. Normal MR imaging appearance of different types of 1st carpometacarpal arthroplasty 6. MR imaging appearance of complications and different patterns of failure 7. Conclusions 8. References

MKEE-178   Carpal Instability On Plain Radiograph: The Great Challenge

Participants
Javier Cuetos, MD, Donostia-San Sebastian, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

- To know the carpal bone and articular anatomy.- To know the kinematics of the carpal bones.- To become familiar with the radiological projections that should be ordered depending on the clinical suspicion.- To understand the classification of carpal instability and the dynamic and evolutionary aspect of the process.- To identify the radiological signs that suggest carpal instability

TABLE OF CONTENTS/OUTLINE

Carpal instability is defined as an injury in which there is a loss of the normal alignment of the carpal bones and/or the radioulnar joint. The loss creates a disturbance of the normal balance of the carpal and radioulnar joints resulting in changes in range of motion. If undiagnosed, carpal instability can lead to progressive limitation of movement and later to osteoarthritis, chronic pain, and disability.In a patient with wrist pain, a plain radiograph is generally the first imaging test requested. There are various signs on plain radiography that suggest there may be carpal instability. On other occasions, these signs are not visible in routine projections but can be observed in specific projections that should be performed when suspected.This presentation aims to review both the anatomy and kinematics of the carpus in order to understand and identify which radiological signs to look for and avoid the underdiagnosis of this pathology.

MKEE-179   Multimodality Imaging Of Benign Hand Tumors And Mimics With Histopathological Correlation, Clinical And Surgical Relevance

Participants
Kanchan Dhanokar, MBBS,MD, Coimbatore, India (*Presenter*) Nothing to Disclose

TEACHING POINTS

• To describe the spectrum of typical and atypical benign tumors occurring in hand using multimodality imaging approach. • To highlight key imaging features for differentiating benign tumors with histopathological correlation and surgical relevance. • To demonstrate common lesions which mimic neoplasms by clinical and imaging features with histopathological correlation.

TABLE OF CONTENTS/OUTLINE

More than 90% of the tumours occurring in hand are benign and originate from a diverse range of ectodermal & mesodermal derivatives. Histopathology gives a definitive diagnosis; however, it is not available before surgical excision in most of the scenarios, prompting for accurate radiological diagnosis. The multimodality imaging approach is therefore crucial for detecting and differentiating these tumours for optimal surgical planning. Benign tumours follow certain characteristics regards to their locations and appearance in various imaging modalities, however, the proximity of the structures of the hand creates a significant challenge for localising the epicentre and differentiating them. A further difficulty is in diagnosing a few atypical lesions that present differently both in appearance and location. We attempt to describe the key imaging features of both typical and atypical lesions in the hand with surgical relevance for each along with histopathological correlation. Tumour mimics are not uncommon and may pose a diagnostic dilemma for which radiologist should be primed. Accurate diagnosis avoids unnecessary intervention.

MKEE-18   Distal Radioulnar Joint: Anatomy, Pathologic Conditions And Imaging Findings

Awards
Identified for RadioGraphics

Participants
Dyan V. Flores, MD, Ottawa, Ontario (*Presenter*) Nothing to Disclose

TEACHING POINTS

The distal radioulnar joint (DRUJ) is a synovial pivot-type joint between the radius and ulna that allows only one degree of motion: pronation and supination. Disorders of this joint are a common source of ulnar-sided wrist pain and can be classified into four types: (a) traumatic, (b) overuse/degenerative, (c) inflammatory and (d) neoplastic. The objectives of this educational exhibit are: 1. To discuss pertinent anatomy of the DRUJ, emphasizing the role of each structure to stability2. To understand imaging techniques in diagnosing DRUJ disorders 3. To review abnormalities of the DRUJ based on etiology

TABLE OF CONTENTS/OUTLINE

Anatomy Stabilizers Joint surfaces Joint capsule Triangular fibrocartilage complex Palmar and dorsal radioulnar ligaments Interosseous membrane Musculotendinous units - extensor carpi ulnaris and pronator quadratus Biomechanics Imaging considerations Pathology Trauma Triangular fibrocartilage complex tears Dislocation/subluxation Distal radial fractures Forearm fractures Acute and chronic instability Overuse/degenerative Ulnar impaction Ulnar impingement Osteoarthritis Inflammatory Rheumatoid arthritis Tendinitis Neoplasms Hereditary multiple exostoses Giant cell tumor

MKEE-180   Unfriendly Neighbors - Vascular Pathologies Leading To Spinal Pathology And Vice Versa.

Participants
Kanchan Dhanokar, MBBS,MD, Coimbatore, India (*Presenter*) Nothing to Disclose

TEACHING POINTS

• To describe the intricate vascular anatomy in relation to the adjacent spine. • To enumerate various spinal or vascular pathologies which can mimic or affect each other by a case-based approach using multimodality imaging.

TABLE OF CONTENTS/OUTLINE

There is a delicate relationship between the paraspinal vasculature and the adjacent spine. The pathologies affecting the spine can involve the adjacent vessel or mimic clinical features of vascular lesions. The same is also true for vascular pathologies influencing the spine. Clinical manifestations can be extremely non-specific causing missed or wrong diagnosis. Imaging plays a major role in localizing and diagnosing such pathologies hence crucial for diverting the patient to appropriate specialty & planning accurate management. We aim to present few such cases emphasizing the importance of awareness of such relationships and include these findings as a checklist in reporting format to avoid missed or wrong diagnoses. Examples include - Mycotic aortic pseudoaneurysm secondary to tubercular spondylodiscitis. Brachalgia secondary to compression by pathologies at lung apex like Pancoast tumor, thoracic isthmic aneurysm. Retroperitoneal fibrosis causing segmental IVC thrombosis leading to opening of abnormal peri vertebral venous channels with resultant epidural varices. Hypertrophic pachymeningitis associated with Takayasu arteritis causing spinal cord compression & myelopathic symptoms.

MKEE-181   Benign Bone Tumors: State Of The Art In Minimally Invasive Percutaneous Interventions- Essentials For Radiologists

Awards
Identified for RadioGraphics

Participants
Anderanik Tomasian, MD, Los Angeles, California (*Presenter*) Nothing to Disclose

TEACHING POINTS

Several minimally invasive, percutaneous, image-guided interventions are available to radiologists for treatment of painful benign bone tumors.Patients with benign bone tumors should be evaluated and treated in a multidisciplinary fashion.Recent advances in minimally invasive percutaneous interventions have expanded the role of radiologists in treatment of patients with benign bone tumors.Procedural protective measures may be implemented to minimize the possibility of complications.

TABLE OF CONTENTS/OUTLINE

Overview of benign bone tumorsPatient clinical evaluationPre-treatment imagingIndicationsMinimally invasive treatment options (Thermal and chemical ablation, Cementation, intra-tumoral injections)Recent advances in minimally invasive interventions and equipmentChallenging interventionsPost-treatment imagingThermal protectionComplications

MKEE-182   Ankle And Midfoot: US - MR Correlation In Evaluation Of Ligaments And Tendons.

Participants
Janette Franco Contreras, MD, San Luis Potosi, Mexico (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Describe the US features of normal anatomy and main pathologic conditions of the ankle and midfoot. 2. Find the MR imaging findings that correlate with the US features. 3. Discuss the role of MR imaging as an adjunct to US in evaluation of ankle and midfoot lesions.

TABLE OF CONTENTS/OUTLINE

-Disclosure. -Introduction. -Technique and Protocol at US. -Anatomical review. Common pathologic patterns: ligament injuries and endon injuries: anterior, posterior, lateral, and medial compartments. -Discussion. -Conclusion. - References

MKEE-183   Help! Paging The Musculoskeletal Radiologist For Chest Pain!

Participants
Jay Panchal, MBBS, Wigan, United Kingdom (*Presenter*) Nothing to Disclose

TEACHING POINTS

• To describe costochondral, chondro-sternal and sternoclavicular joint anatomy.• To review these joints and soft tissues with the aid of multimodality imaging including radiography, ultrasound, CT, MR and nuclear medicine studies.• To highlight classical imaging features of costochondral junction fractures.• To discuss the differential diagnoses of costochondral and sternoclavicular joint pathologies including their imaging features.• To recognize the importance of costal cartilage imaging particularly in professional and amateur athletes presenting with anterior upper chest wall pain.*?aß?e ?? ???te?ts/??t???e • Introduction to the costal cartilage injuries in professional and amateur athletes• Relevant radiological anatomy of the costochondral, chondro-sternal and sternoclavicular joints.• First costochondral cartilage fracture: Epidemiology, causes, presentation and imaging findings.• Brief management pertaining to first costochondral cartilage fracture in professional athletes and sportsmen.• Other possible etiologies of anterior upper chest wall pain and its imaging findings:o Sternoclavicular joint (Sports injury, inflammatory, infective, degenerative, miscellaneous including SAPHO)o Adjoining chest wall muscleso Costal neurovascular bundles

MKEE-184   Imaging Of The Forgotten Knee Joint: Proximal Tibiofibular Joint Anatomy And Pathology

Awards
Certificate of Merit

Participants
Edward Mardakhaev, MD, Bronx, New York (*Presenter*) Nothing to Disclose

TEACHING POINTS

The proximal tibiofibular joint (PTFJ) is often under-evaluated during clinical and imaging evaluation of the knee as well as a limited number of PTFJ publications in the literature.Review imaging anatomy and pathology of proximal tibiofibular joint

TABLE OF CONTENTS/OUTLINE

Anatomy (with imaging and illustrations)The articular facet of the fibular head and posterolateral facet of the lateral tibial condyle make up this arthrodial joint. Various morphologies are seen includingplanar trocoid or L-shaped double trocoid less frequent configurations The PTFJ participates in movements of the knee as well as the ankle. Approximately 10% of the time there is communication between the PTFJ and tibiofemoral joint capsule through the subpopliteal recess. Together with the anterior and

posterior proximal tibiofibular ligaments, the biceps femoris and fibular collateral ligament contribute to joint stability. The PTFJ can be a source of lateral knee pain and joint instability. A number of pathologies afflict the joint (with imaging): degenerative diseases, trauma, developmental disorders, inflammatory processes, infectious processes

MKEE-185   Anatomy, Imaging And Pathology Of The Pubic Symphysis

Participants
Marco Tsuno, Brasilia, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Review normal anatomy of the pubic symphysis.Briefly discuss biomechanics of the and pubic symphysis related structures.Discuss traumatic and overuse pathology, treatment options and complications. Outline causes of nontraumatic pathology.Describe the main pathologies involve this site, with cases demonstrating CT and MRI aspects of each condition.

TABLE OF CONTENTS/OUTLINE

1. Simplifying the complex anatomy and biomechanics of the pubic symphysis. 2. Pubic symphysis pathology can be divided into athletic and non-athletic pubalgia etiologies. Awareness of anatomy, common pathologies, imaging, treatment and complications are essential in meaningful evaluation of this typically neglected joint. 3. Summarize the main key points of some different diseases that affect pubic symphysis, with a focus on computed tomography and magnetic resonance findings, highlighting some pathologies like: athletic pubalgia, trauma, infection, inflammatory, tumor and tumor-like conditions.

MKEE-186   Ultrasound And MR Imaging Of Pelvic Tendon Injuries

Awards
Certificate of Merit
Identified for RadioGraphics

Participants
Dyan V. Flores, MD, Ottawa, Ontario (*Presenter*) Nothing to Disclose

TEACHING POINTS

Assessment of injuries of the tendons about the pelvis can be performed by organizing them based on anatomic location and function. This educational exhibit will review normal anatomy and biomechanics of pelvic tendons, and discuss ultrasound and MR imaging features of common pelvic tendon injuries.

TABLE OF CONTENTS/OUTLINE

US and MR imaging of pelvic tendon injuries: • Anterior/hip flexors Sartorius avulsion Rectus femoris avulsion injury Rectus femoris degloving injury Iliopsoas avulsion injury Psoas tendon Medial iliacus tendon Lateral iliacus muscle • Lateral/abductors and medial rotators Rotator cuff tear of the hip • Medial/adductors Athletic pubalgia or core muscle injury Rectus abdominis avulsion/stripping and muscle strain Adductor longus avulsion Aponeurotic plate injury • Posterior/extensors Hamstring tendons Tendinopathy Bone avulsion with or without retraction Myotendinous junction Intrasubstance tear

MKEE-188   Deep Learning In Spine Health Assessment

Participants
Abhinav Suri, BA, Philadelphia, Pennsylvania (*Presenter*) Nothing to Disclose

TEACHING POINTS

Complications from bone diseases are highly prevalent across the world. In the United States alone, nearly 1.5 million individuals suffer fractures due to bone diseases each year, leading to decreased mobility and increased mortality. One way to prevent fractures is to assess imaging studies for vertebral deformities and overall spine health; however, the process of making measurements necessary to diagnose individuals with deformities is time-consuming, leading to under-reported rates as high as 85% among radiologists. Deep learning algorithms offer solutions that can be applied to the world of medical imaging. Some of these algorithms can detect objects, find landmarks in each object, and produce segmentation delineating the exact pixel locations and border of each object. This exhibit will focus on explaining these algorithms and showing how they can be adapted for detecting vertebral body deformities and measuring other bone quality metrics.

TABLE OF CONTENTS/OUTLINE

At the end of this presentation, the learner should have knowledge of the following: 1. Semiquantitative method for vertebral deformity assessment (wedge, biconcave, and crush); 2. How neural networks can be used for feature detection in MR, CT, and X-Ray scans; 3. How Keypoint detection networks can be used for automated vertebral height quantification and deformity diagnoses; 4. How segmentation networks can be used to extract vertebral bodies and volumes; 5. How these automated measurements can be used for vertebral bone quality assessment

MKEE-189   Scapholunate And Lunotriquetral Instability Current. Concepts And New Diagnostic Strategies

Participants
Tomas Pascual, MMEd, Olivos, Vicente Lopez, Argentina (*Presenter*) Nothing to Disclose

TEACHING POINTS

To describe the gross and histologic anatomy of the scapholunate and lunotriquetral ligaments.To review the different stages of carpal instability non-dissociative, integrating images into the pathological process and clinical stage to obtain relevant information for an adequate treatment.To propose a new acquisition technique in MRI and CT arthrograms for identifying ligament injuries in their initial stage (pre-dynamic instability) that may go unnoticed in conventional tests.

TABLE OF CONTENTS/OUTLINE

Scapholunate and lunotriquetral ligament injuries are the most frequent cause of carpal instability and are responsible for a considerable degree of wrist pain and dysfunction, interfering with sports and other activities.An isolated injury of these ligaments

may be the harbinger of a relentless progression to abnormal joint mechanics, cartilage wear, and degenerative changes.Imaging methods play a crucial role in the diagnosis and staging of this type of injuries which, if not treated, can lead to wrist osteoarthritisHowever, these injuries may be hard to detect in their initial stages due to their small size, even when using complex methods such as MRI and CT arthrograms.In these cases, it is important to resort to additional diagnostic techniques which allow to increase the sensitivity and specificity of the tests.

MKEE-19   Pubic Symphysis: Anatomy, Pathologic Conditions And Imaging Findings

Awards
Cum Laude
Identified for RadioGraphics

Participants
Dyan V. Flores, MD, Ottawa, Ontario (*Presenter*) Nothing to Disclose

TEACHING POINTS

The pubic symphysis is an amphiarthrodial cartilaginous joint formed with a fibrocartilaginous disc lying between the hyaline cartilage-covered medial borders of the pubic bones. There is a wide range of abnormalities that can involve this joint, which may be traumatic, metabolic, inflammatory, infectious or neoplastic in nature. The objectives of this educational exhibit are: 1. To review osseous and soft tissue (ligament and musculotendinous) anatomy of the pubic symphysis 2. To discuss imaging techniques in diagnosing disorders of the pubic symphysis 3. To discuss abnormalities of the pubic symphysis (traumatic, metabolic, inflammatory, infectious or neoplastic)

TABLE OF CONTENTS/OUTLINE

Anatomy Osseous Developmental considerations Bladder exstrophy Physiologic variants Vacuum phenomenon Peripartum diastasis Soft tissues Ligaments Pubic ligaments Suspensory ligaments of the penis Pubocervical ligament Musculotendinous Rectus abdominis Proximal adductors Biomechanics Imaging considerations Pathology Trauma Athletic pubalgia Bones Osteitis pubis Soft tissues Capsule, proximal adductors, rectus abdominis Traumatic diastasis Insufficiency fracture Polytrauma Metabolic Hyperparathyroidism Pseudogout Inflammatory Ankylosing spondylitis Rheumatoid arthritis Infectious Osteomyelitis and septic arthritis Neoplastic Chondroid lesions

MKEE-190   A Step By Step Guide To Thoracic Outlet Ultrasound: What The Radiology Resident Needs To Know!

Participants
Antonio Jose Cueva Guerrero, MD, Mexico City, Mexico (*Presenter*) Nothing to Disclose

TEACHING POINTS

For a very long time, the thoracic outlet ultrasound has been a place of mystery and controversy between radiologists, that until this very moment. We are about to unveil a simple guide to understanding and evaluating this insidious location, easy to reproduce. After the exhibit the reader will be able to:- Understand the thoracic outlet ultrasonographic anatomy- Create a visual standard for the normal thoracic outlet- Recognize the main etiologies for thoracic outlet syndrome- Comprehend the use of each ultrasound mode for evaluating normality- Identify and be able to report pathology, using understandable parameters

TABLE OF CONTENTS/OUTLINE

- Introduction- Anatomy- Thoracic outlet syndrome- Ultrasound protocol & technique- Abnormal findings- Conclusions

MKEE-191   Ankle Syndesmosis - Orthopedic Update!

Participants
Joshua Gu, MD, Houston, Texas (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. The distal tibiofibular syndesmosis is composed of the AITFL, PITFL, and IOL.2. Common mechanism of injury: external rotation with adduction.3. Clinical tests: external rotation stress test, squeeze test, cotton/hook test.4. Recognition of injury is paramount. Missed injuries are catastrophic. Systematic pattern review of ligaments both pre- and post-operative is imperative.5. Management: surgical and non-surgical options.6. Surgical options: screw, plate, and tightrope fixation.7. Complications: hardware and biomechanical failure, heterotopic ossification, osteolysis, tendon dysfunction.

TABLE OF CONTENTS/OUTLINE

1. Detailed review of distal tibiofibular syndesmosis anatomy using cadaveric dissections, cartoons, radiographs, and photographs.2. Demonstration of normal syndesmosis appearance on imaging studies.3. Discussion of pathophysiology/injury mechanisms of syndesmotic injury.4. Multimodal radiologic evaluation of syndesmotic injury, with examples.5. Presentation of clinical/intraoperative tests, including external rotation test, squeeze test, and cotton/hook test, using diagrams, photographs, and videos. 6. Discussion of surgical and non-surgical management options, including screw, plate, and tightrope fixation, and respective advantages and disadvantages.7. Postoperative evaluation - clinical and radiological.8. Pitfalls. 9. Summary.

MKEE-192   MR Arthrography-Techniques And Concepts. Do We Still Need It?

Participants
Kristen McClure, MD, Philadelphia, Pennsylvania (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Conventional MRI has limitations despite increasing field strength and dedicated extremity coils, including evaluation of small structures, small perforations or tears, and post-operative tissue.2. MR arthrography remains useful in problem solving cases by joint distention, better visualization of internal joint structures, high contrast between Gadolinium and ligaments/fibrocartilage, showing direct communication between compartments, and utilizing T1 weighted imaging with increased signal to noise ratio.3. Arthrography injection techniques are similar across joints, including joint localization, local anesthetic, image guided needle advancement into the joint, confirmation with iodinated contrast, and subsequent injection of dilute gadolinium contrast agent.4. MR arthrography allows for improved evaluation of fibrocartilage structures, ligamentous/capsular pathologies, osteochondral

lesions, intraarticular bodies, and post-operative tissues in the shoulder, elbow, wrist, hip, knee, and ankle.

TABLE OF CONTENTS/OUTLINE

1. Limitations of conventional MRI. 2. General uses/benefits of MR Arthrography. 3. Current indications of MR Arthrography. 4. Imaging techniques of shoulder, elbow, wrist, hip, knee, and ankle joint injections, and subsequent MR imaging. 5. Problem solving cases demonstrating usefulness of MR arthography in a joint-centered organization, including the shoulder, elbow, wrist, hip, knee, and ankle. 6. Summary of the relevance of MR arthrography in current musculoskeletal imaging.

MKEE-193 Ultrasound Of Gouty Arthritis: With Multimodality Correlation

Participants
Seoyun Choi, MD, Jeonju-Si, Korea, Republic Of (*Presenter*) Nothing to Disclose

TEACHING POINTS

* What to find: Learn about specific and nonspecific US image findings of gouty arthritis. -Especially correlation with MRI will help readers to understand easily.* Where to look: Being familiar with common sites of gouty arthritis* What to consider: Being familiar with clinical manifestations of gout will help to make the right diagnosis* What to avoid: Being familiar with pitfalls of US in gouty arthritis. And being familiar with gout mimicking lesions.* The diagnosis of gouty may be difficult but possible even in the cases that have small tophi as only manifastation.

TABLE OF CONTENTS/OUTLINE

1. Strategies of US of Gouty Arthritis2. Ten clinical tips that help radiologists to make the right diagnosis3. Specific US findings of Gouty Arthritis4 Nonspecific US findings of Gouty Arthritis5. Correlation with radiograph 6. Correlation with MRI 7. Self-test cases8. Summary

MKEE-194 Vertebral Anomalies- Potential Cause For Misdiagnosis By Resident: A Multifaceted And Multimodality Imaging Review

Participants
Pradeep Roul, MBBS, Rishikesh, India (*Presenter*) Nothing to Disclose

TEACHING POINTS

After going through this, the reviewer will learn 1.The basic embryology and normal anatomy of the vertebral body and associated anatomical structure. 2.Imaging features of various types of vertebral anomalies in common imaging modalities. 3.Clinical symptoms, associated anomalies and potential misdiagnosis associated with each individual vertebral anomaly.

TABLE OF CONTENTS/OUTLINE

The vertebral column is wide spectrum of anomalies and classified according to anatomical part involved like anatomical variants of the body, neural arch, spinous process and accessory ossicles. 1. Anatomical variants of the body: hemi, block and butterfly vertebra. 2. Anatomical variants of neural arch: arcuate foramen, congenital anomalies of the posterior atlas arch, and transitional vertebrae anomaly (cervical rib, lumbar rib, lumbarization of S1, and sacralization of L5). 3. Anatomical variants of spinous process: unfused spinous process, deviated spinous process, and bifid spinous process. 4. Accessory ossicles: accessory ossicle of the anterior arch of the atlas, oppenheimer ossicle, os odontoideum, persistent ossiculum terminale and sesamoid ossicles of the nuchal ligament. we will described various imaging features, associated other congenital anomalies, potential misdiagnosis of other pathological conditions, and associated clinical importance with each conditions. By knowing this, the young resident can not put a wrong diagnosis and will always look for other congenital anomalies during image interpretations.

MKEE-195- DCE Perfusion MRI On Spinal Tumors And Mimics
HC
Participants
Ryo Kurokawa, MD, Ann Arbor, Michigan (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is:1. To review the physics and parameters of Dynamic Contrast Enhanced (DCE)-MRI 2. To demonstrate the DCE-MRI imaging findings of tumors (primary tumors, secondary cancer, and secondary sarcoma) 3. To show how DCE-MRI parameters can help differentiate tumor-mimicking benign conditions from tumors

TABLE OF CONTENTS/OUTLINE

1. What is DCE-MRI perfusion?- Physics- Parameters based on Tofts model 2. DCE-MRI imaging findings of tumors- Primary vertebral tumors- Metastatic cancers- Metastatic sarcomas 3. DCE-MRI imaging findings of tumor-mimics- Radiation necrosis- Hemangiomas- Vertebral reconversion

MKEE-196 Ultra-high Resolution Magnetic Resonance Neurography: An Interactive Atlas Of The Brachial Plexus And Upper Extremity Peripheral Nerves

Participants
Philip Colucci, MD, New York, New York (*Presenter*) Nothing to Disclose

TEACHING POINTS

Peripheral neuropathies are common and may become chronic and debilitating. Dedicated magnetic resonance imaging (MRI) of peripheral nerves, or MR neurography (MRN), is an important complement to electrodiagnostic and physical examination to guide management.Technical challenges inhibit more widespread use of MRN. State-of-the-art 3 Tesla MRI provides 1.0 mm isotropic spatial resolution in 8 minutes, which is inadequate for visualizing smaller nerves along their full course. 3D pulse sequences have longer acquisition times than comparable 2D sequences, resulting in increased susceptibility to motion artifact. Slow-flowing veins coursing alongside nerves may confound interpretation due to their similar size and signal intensity.Peripheral nerve anatomy, especially the brachial plexus, is complex. Currently available MRI atlases depict spatial relationships but are suboptimal for demonstrating peripheral nerves along their entire course. We employed prototype flexible coils, ferumoxytol for vascular suppression, and artificial intelligence-based image reconstruction with AIRTM Recon DL to achieve unprecedented spatial and

contrast resolution, creating in an in vivo, ultra-high resolution (0.4 mm isotropic) MRN atlas of the brachial plexus and upper extremity.

TABLE OF CONTENTS/OUTLINE

Monitor #1 (PowerPoint slides) - Acquisition parameters - Coil selection - Ferumoxytol - AIRTM Recon DL - Illustration of peripheral nerve anatomy - ReferencesMonitor #2 (RadStax) - Atlas of upper extremity peripheral nerve anatomy

MKEE-2   Dual X-ray Absorptiometry: What The Radiologist Needs To Know.

Participants
Dunya Imad, MD, New York, New York (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Dual-energy X-ray absorptiometry (DXA) is the method of choice for assessing bone mineral density (BMD) and is used in clinical practice to identify individuals at risk for pathologic fracture. • DXA image quality may be affected due to errors at 4 different time points: indication, acquisition, analysis, and interpretation. • Visual assessment of DXA is of high clinical importance and can identify metastatic bone lesions, fractures or objects that can artificially change the BMD. • The technologist's expertise plays a crucial role in the acquisition phase. This includes correct positioning of the patient, appropriate scanning and the identification of artifacts.

TABLE OF CONTENTS/OUTLINE

1. Quality considerations in DXA acquisition and interpretation; impact on diagnosis and management.2. DXA scans and the most common errors affecting its quality and utility.3. DXA scans and the most common errors affecting its quality and utility.4. Indications for ordering a DXA scan, recommendations for the correct acquisition, analysis and interpretation. 5. Conclusions

MKEE-20   Meniscal Ramp Lesion: Clarifying Concepts.

Participants
Sara Escoda, MD, Gijon, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

Meniscal ramp lesions are a special type of meniscal injury strongly associated with anterior cruciate ligament (ACL) tears that affect the periphery of the posterior horn of the medial meniscus and/or its meniscocapsular attachments.They have recently been shown to play a significant role in the stability of ACL deficient knees, so if they remain unrepaired during an ACL reconstruction, the stability of the knee may not be restored, predisposing it to meniscal and articular damage and ultimately to the failure of the ACL graft.These lesions, because of their location in a blind spot, can be unnoticed arthroscopically when using only standard anterior portals, so it is essential to identify them on preoperative MRI.Radiological findings are: vertical/oblique tears in the periphery of the posterior horn of the medial meniscus, and/or the presence of high signal in the mid-substance or in the meniscus attachments of the meniscotibial ligament and/or meniscocapsular ligament.

TABLE OF CONTENTS/OUTLINE

Concept of meniscal ramp lesion.Anatomy of the ramp zone.Epidemiology and risk factors.Implications on the biomechanics of the knee.Classification.Radiological features on MRI.

MKEE-21   "Knee-deep" In Knee Measurements On MRI And CT: What The Orthopedic Surgeon Wants To Know. A Practical Guide To Improve Diagnosis And Efficiency.

Participants
Cyrille Naim, MD, Brossard, Quebec (*Presenter*) Nothing to Disclose

TEACHING POINTS

Evaluation for superolateral Hoffa fat pad edema in knee MRIs should be part of the radiologist's checklist; it may be the only clue to symptomatic patellofemoral maltracking. Superolateral Hoffa fat pad edema should prompt a search for patella alta, trochlear dysplasia, and tibial tubercle lateralization, which are risk factors for patellofemoral joint instability. Lateral patellar tilting without subluxation in a context of anterior knee pain suggests Excessive Lateral Pressure Syndrome. For preoperative and postoperative total knee arthroplasty (TKA), multiple full-length lower limb parameters are used, notably for limb length discrepancy and genu varus malalignment. Relevant parameters to include in the radiology report can be determined with the referring orthopedic surgeons. Surgeons aim for relative external rotation of both tibial and femoral components of a TKA, to prevent patellar maltracking. Understanding measurement techniques, along with use of a universal report template for TKA component rotation, are important for accurate and efficient reporting.

TABLE OF CONTENTS/OUTLINE

1. Patellofemoral Disorders and Relevant Measurements on MRI a. Definitions b. Measurement techniques c. 3-Step approach d. Cases 2. Measurements Relevant to preoperative and postoperative TKA on full-length lower limb images 3. TKA Prosthetic Component Rotation Measurements on 2D-CT a. Femoral component rotation b. Tibial component rotation c. Cases

MKEE-22   Post-op Spine Troubles: What The Surgeon Needs To Know ?

Participants
Vishal Gaikwad, MD, Novena, Singapore (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) To review briefly the types and approaches of spinal stabilization/fusion surgeries. 2) To discuss common complications, unique to stabilization surgery. 3) To discuss what surgeons want to know in postoperative imaging of the spine.

TABLE OF CONTENTS/OUTLINE

1) Introduction. 2) Types and approaches to spinal stabilization/fusion surgeries -Decompression, fixation, stabilization and fusion,

deformity correction, and lesion excision and debridement. -Commonly used spinal implants and prostheses include screws and wires, static and extendable rods, bone grafts and biologic materials, interbody cages, and intervertebral disk prostheses. 3) Common complications unique to stabilization surgery. -Adjacent Segment Degeneration (common) -Proximal Junctional Kyphosis (only for Long segment fixation) -Non-union +/- Rod Breakage and screw loosening (Especially in smokers) -Screw Malposition (Rare with the use of Intraoperative CT in the past Decade) -Others: wrong-level surgery, dural tears/ arteriovenous fistula, epidural abscess, epidural hematoma, infection, arachnoiditis. 4) What surgeons look for in a postoperative spine. 5) Sample cases.

MKEE-23   Radiographs And CT Within Musculoskeletal MRI: Challenges, Optimization And Applications Of Zero Echo-Time Imaging

Awards
Identified for RadioGraphics
Magna Cum Laude

Participants
Ustun Aydingoz, MD, Ankara, Turkey (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To review technical aspects, challenges, and optimization of zero echo-time (ZTE) MR imaging that yields radiograph- or CT-like images, decreasing or even obviating the need for employing the latter imaging modalities that use ionizing radiation. 2. To describe already established and promising musculoskeletal applications of ZTE imaging. 3. To recognize pearls and pitfalls of radiograph- or CT-like images generated from MRI.

TABLE OF CONTENTS/OUTLINE

1. Technical background and optimization of zero echo-time (ZTE) imaging that yields radiograph- or CT-like images from an MRI examination. 2. Review of musculoskeletal applications of radiograph- or CT-like images thus generated from MRI. 3. Sample cases with pearls and pitfalls (e.g., glenoid bone stock estimation, glenoid on-track/off-track assessment, critical shoulder angle measurement, femoral head-neck junction morphometry, lateral center-edge angle measurement, calcific tendonitis mineral deposit load assessment, visualization of cortical encroachment of atypical cartilaginous bone lesions).

MKEE-24   Postoperative MR Imaging Of Cartilage Surgery Of The Knee

Participants
Randy Chang, MD, Los Angeles, California (*Presenter*) Nothing to Disclose

TEACHING POINTS

Articular cartilage is an integral part of a healthy joint, and pathology is commonly due to trauma or degenerative processes. However, lack of vascularity within the cartilage precludes spontaneous healing after injury. Surgical repair is necessary for not only symptom relief and restoration of joint function, but also to prevent the development of early osteoarthritis. Although direct visualization by arthroscopy continues to be the gold standard to assess the cartilage repair site, magnetic resonance (MR) imaging has shown to be an additionally viable, non-invasive method. The objectives are: 1) Understand the various types of cartilage repair surgeries. 2) Learn the corresponding arthroscopic and postoperative MR imaging appearances. 3) Appreciate the emerging technique utilizing biomaterial processed allograft. 4) Quiz to assess knowledge.

TABLE OF CONTENTS/OUTLINE

A. Introduction. B. Background and anatomy. C. Types of cartilage repair surgeries. D. Expected postoperative arthroscopic and MR imaging appearances will be highlighted with discussion: 1) Bone marrow stimulation (microfracture). 2) Mosaicplasty or osteochondral autograft transfer system (OATS). 3) Osteochondral allograft transplantation surgery. 4) Minced cartilage implantation (MCI), autologous chondrocyte implantation (ACI), and matrix-assisted chondrocyte implantation (MACI). E. Biomaterial processed allograft will be discussed as an emerging technique. F. Case- and question-based assessment of knowledge. G. Summary and conclusion

MKEE-25   Skeletal Manifestations In Lymphatic Diseases: Nonenhanced Magnetic Resonance Lymphography

Awards
Certificate of Merit

Participants
Clement Cholet, MD, Paris, France (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Know the basic anatomy and physiology of the skeletal lymphatic system. - Understand the standard nonenhanced 3D magnetic resonance lymphography protocol to characterize diffuse lymphatic diseases with skeletal manifestations. - Recognize osseous lesions of lymphatic origin and know their characteristics on nonenhanced magnetic resonance lymphography. - Know the various causes of lymphatic anomaly of the bones. - Identify the associated lymphatic anomalies on nonenhanced magnetic resonance lymphography.

TABLE OF CONTENTS/OUTLINE

1. Skeletal lymphatic system. 1.i. Normal anatomy. 1.ii. Physiology. 2. Nonenhanced 3D magnetic resonance lymphography. 2.i. Protocol. 2.ii. Interpretation guide. 3. Bone lesions of lymphatic origin. 3.i. Causes. 3.ii. Imaging characteristics. 3.iii. Complications. 4. Atlas of magnetic resonance lymphography findings in lymphatic diseases with skeletal involvement. 4.i. Case presentation. 4.ii. Magnetic resonance findings.

MKEE-26   Judging A Bone By Its Cover: A Radiologist's Guide To Periosteal Pathology

Awards
Cum Laude
Identified for RadioGraphics

Participants

Nick Barnthouse, MD, Leawood, Kansas (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Abnormalities of the periosteum are seen with a variety of benign and malignant conditions. 2. Periosteal pathology can derive from infectious, traumatic, metabolic, inflammatory, neoplastic, developmental, and drug-related etiologies. 3. Understanding the pathophysiology contributing to the imaging appearance of abnormal periosteum is an important skill for the radiologist and essential for detecting periosteal pathology. 4. Familiarity with the radiologic appearance of different types of periosteal reaction and knowledge of the diverse etiologies of periosteal conditions can aid the radiologist in producing a useful differential diagnosis and making appropriate clinical recommendations.

TABLE OF CONTENTS/OUTLINE

1. Normal periosteum a. Embryological development and maturation b. Periosteal geography: where it is and isn't 2. Periosteal reaction a. Pathophysiology b. Morphologic types: non-aggressive versus aggressive c. Approach to diffuse periosteal reaction 3. Case-based review of periosteal pathology a. Congenital/developmental b. Metabolic c. Drug-related d. Traumatic e. Neoplastic f. Inflammatory g. Infectious h. Vascular

MKEE-27   Multiple Faces Of Crystal Deposition Disease - Look Around That You May Find A Treasure.

Participants
Felipe A. de Oliveira, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Crystal deposition disease has multiple different presentations in the musculoskeletal system. The most common deposits are calcium pyrophosphate, sodium monourate and hydroxyapatite. Although the typical presentations are, respectively, chondrocalcinosis, podagra and calcareous tendinopathy of the rotator cuff, the atypical presentations correspond to a significant number of cases and, therefore, cannot be forgotten. This relatively heterogeneous group of diseases can affect tendons, ligaments, joint capsules, hyaline cartilage, and fibrocartilages throughout the body. In acute painful cases or relapse of the symptoms, inflammatory changes tend to be exuberant, both in clinical and radiological pictures, and may mimic other pathologies of diverse etiologies, such as myopathies, infectious, rheumatological or neoplastic diseases, or even fractures, as these patients often associate some minor traumatic events with the onset of symptoms. Especially on MRI, the correct diagnosis can be challenging, as the deposits may be imperceptible or may go unnoticed due to prominent soft tissues or osseous edema. This review will focus mostly on atypical presentations.

TABLE OF CONTENTS/OUTLINE

1. Background 2. Pathophysiology 3. Clinical and laboratorial findings 4. Imaging findings 5. Radiological approach a. Radiography b. Computerized tomography (CT) c. Ultrasound d. Magnetic Resonance 6. Diagnostic flowchart 7. Take-home points

MKEE-28   Dislocations About The Knee: Three Diagnoses You Need To Be Able To Make

Awards
Certificate of Merit

Participants
Kirkland Davis, MD, Madison, Wisconsin (*Presenter*) Nothing to Disclose

TEACHING POINTS

Radiologists can be the first to make the diagnosis of knee dislocations and help guide treatment. Three distinct dislocation patterns about the knee—tibiofemoral, patellar, and proximal tibiofibular—demonstrate characteristic imaging findings. In tibiofemoral dislocation, two or more major ligament tears will be present on MRI. Typically resulting from high-energy trauma, these injuries are increasingly recognized in obese patients with ultra-low-velocity mechanisms. Popliteal artery injuries can make tibiofemoral dislocation a limb-threatening condition and common peroneal nerve injuries contribute to long-term pain and dysfunction. Transient patellar dislocation is the most common dislocation about the knee, yet it is suspected in less than half of cases presenting for imaging. Marrow contusions of the inferomedial patella and peripheral lateral femoral condyle are pathognomonic on MRI. Recognizing predisposing anatomy can identify patients at higher risk for recurrence. Finally, proximal tibiofibular dislocations are rare. Displacement of the tibiofibular articulation is usually subtle and must be sought in all cases of knee injury. Associated injuries include tibia fracture and peroneal nerve injury.

TABLE OF CONTENTS/OUTLINE

1. Tibiofemoral dislocation a. Key facts b. Imaging examples c. Complications & treatment 2. Transient patellar dislocation a. Key facts b. Imaging examples c. Predisposing features d. Treatment 3. Proximal tibiofibular dislocation a. Key facts b. Imaging examples c. Pitfalls d. Treatment

MKEE-29   Carpal Instability - What The Radiologist Needs To Know

Participants
Jan Grunz, MD, Wuerzburg, Germany (*Presenter*) Research Consultant, Siemens AG

TEACHING POINTS

The term "carpal instability" describes different debilitating wrist conditions, in which the carpus is unable to maintain its normal range of motion and load transfer. Depending on the etiology and location of the dysfunction, four main groups can be discerned: dissociative, non-dissociative, complex and adaptive carpal instability. Being the most common form, dissociative carpal instability can further be distinguished in dorsal or volar intercalated segment instability, mostly contingent on the afflicted interosseous ligament. Traumatic lesions of the scapholunate ligament present the most frequent cause of instability and can occur in isolated fashion or in context with other carpal injuries. Early detection and treatment is essential to prevent a carpal collapse and the onset of secondary osteoarthritis. Stress imaging and fluoroscopy facilitate the differentiation between dynamic and static forms of carpal instability, with the latter only manifesting in concomitant injury of the extrinsic ligamentous stabilizers. However, just MRI or CT/MR arthrography can visualize the true extent of ligament discontinuity.

TABLE OF CONTENTS/OUTLINE

1) Imaging modalities in carpal instability 2) Forms of carpal instability 2.1) Dissociative carpal instability 2.1.1) Scapholunate dissociation 2.1.2) Lunotriquetral dissociation 2.1.3) Scaphoid nonunion 2.2) Non-dissociative carpal instability 2.2.1) Radiocarpal instability 2.2.2) Midcarpal instability 2.3) Complex carpal instability 2.4) Adaptive carpal instability

MKEE-3   Bone Marrow Malignancies: Understanding The Biology Being Depicted By Imaging

Awards
Certificate of Merit

Participants
Roberto Garcia Figueiras, MD, PhD, Santiago De Compostela, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

Bone Marrow (BM) malignancies are a heterogeneous group of tumors. Imaging phenotypes are a reflection of the interactions between tumor cells and the bone microenvironment. Conventional imaging techniques show clear limitations for tumor detection, characterization, staging and tumor response assessment in BM disorders. Advanced functional and molecular imaging techniques are changing the paradigm of imaging evaluation of the BM. The aim of this exhibit is:-To understand the main characteristics of BM microenvironment.-To discuss strengths and limitations of Imaging techniques in BM.-To review recent developments in functional and molecular imaging techniques and radiomics for the assessment of BM tumor involvement, including tumor characterization, prognosis, prediction, or response to therapy.

TABLE OF CONTENTS/OUTLINE

-BM microenvironment (the niche and the vicious cycle): tumor-bone interactions.-Biology of the BM relevant for imaging: molecular and histological explanation of imaging phenotypes of BM malignancies. -Strengths and limitations of conventional imaging techniques.-The role of advanced functional and molecular imaging techniques and multiparametric imaging in BM tumors.-How can next-generation imaging contribute to patient pathways in precision oncology?: detection and characterization of BM disease, tumor heterogeneity, prognosis, prediction, and response to therapy.-Future directions: imaging biomarkers and radiomics.

MKEE-30   Checklist For The Wrist MRI

Awards
Certificate of Merit

Participants
Asako Yamamoto, MD, Tokyo, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

To provide a guide for wrist MRI from image acquisition through a proposed systematic approach for image evaluation emphasizing normal anatomy and examples of commonly encountered pathology.

TABLE OF CONTENTS/OUTLINE

1) Explanation of the optimal coil, sequences and patient positioning 2) Demonstration of normal MR anatomy of the wrist, presented by anatomic group (a) Osseous morphology and alignment (b) Intrinsic ligaments of the wrist (c) Triangular fibrocartilage complex (d) Extensor compartments (e) Carpal tunnel and Guyon's canal 3) Examples of commonly encountered pathology to contrast and compare with normal MR wrist anatomy will be provided for each anatomic region. There will be an emphasis on key MR imaging findings, best plane for visualization, and imaging sequence. The pathological conditions exhibited include the followings: dorsal and volar intercalated segment instability, ulno-carpal abutment, Kienbock's disease, osteoarthritis, Madelung deformity, triangular fibrocartilage complex injury, luno-triquetral/ scapho-lunate ligaments injuries, de Quervain tenosynovitis, intersection injuries, extensor carpi ulnaris instability, carpal tunnel syndrome, Guyon's canal syndrome.

MKEE-31   Dual-Energy CT For Bone Marrow Imaging: "How To Do It"

Participants
Bernhard Petritsch, Wuerzburg, Germany (*Presenter*) Research Consultant, Siemens AG

TEACHING POINTS

To review the indications, contraindications and limitations of dual-energy computed tomography (DECT) in bone marrow imaging. To learn about the basic physical principles of DECT imaging with emphasis on bone marrow applications. To interpret dual-energy bone marrow CT scans of healthy subjects, patients with acute fractures or malignant bone marrow infiltration, and to learn about potential pitfalls of DECT in bone marrow imaging. To highlight the potential benefits of a dual-energy investigation as a comprehensive examination of osseous morphology and additional bone marrow information.

TABLE OF CONTENTS/OUTLINE

A. Basic principles of dual-energy computed tomography. B. Technical differences in data acquisition: Single-Source (Dual-layer detector; rapid kV-switching; Twin-Beam) vs. Dual-Source scanners (differences between 1st-3rd generation dual-source scanners). C. Post-processing: Material-decomposition algorithm, creation of VNCa ("virtual non-calcium") images. D. Data acquisition: Parameter settings for dual-energy CT of the extremities, spine and pelvis. E. Current applications of DECT for the detection of acute fractures: examples in the spine, pelvis and extremities. F. Current applications of DECT for the detection of malignant bone marrow infiltrations (e.g. in multiple myeloma): examples in the spine, pelvis and extremities. G. Pitfalls of dual-energy bone marrow Imaging; limitations of DECT for bone marrow imaging; alternative imaging modalities.

MKEE-32   Is That Surgery? Orthopedic Procedures That May Mimic Disease: What Radiologists Need To Know

Participants
Andrew Liu, MD, Rochester, New York (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Familiarize learner with a variety of common orthopedic surgical interventions. 2. Describe common imaging findings, indication, surgical approach, and/or composition of these implants.

Postoperative radiographs comprise a large portion of the musculoskeletal studies that a radiologist will encounter. As newer surgical techniques and implants have been adopted, radiologists must be able to recognize these implants on imaging and not confuse these orthopedic interventions with non-surgical bone pathology. Surgical implants such as the Cartiva® implant, Arthrex® bio-interference screw, and TightRope® implant are all radiolucent on radiographs and could be mistaken for lucent bone pathology if not recognized by the radiologist. Other procedures, like subchondroplasty, use bone substitute material to fill marrow defects or lesions and may be misinterpreted as focal sclerotic bone lesions. Bone graft harvest sites, tenodesis, and surgeries in which a bone or a portion of bone have been removed are also surgical interventions that may be confused with pathology by non-trained musculoskeletal radiologists.Our exhibit aims at presenting these orthopedic procedures by describing their imaging features, showing characteristic imaging examples, and describing the surgery and/or the composition of these implants. We hope the exhibit will familiarize the learners with these orthopedic procedures and lead to a better understanding of what to look for to avoid mistakes in post-surgical film interpretation.

MKEE-33   The Sural Nerve: Imaging Anatomy And Pathology

Participants
muhamad serhal, Beirut, Lebanon (*Presenter*) Nothing to Disclose

TEACHING POINTS

• To highlight the imaging anatomy of the sural nerve on ultrasound and MRI. • To demonstrate the imaging technique for evaluation of the sural nerve on ultrasound and to define useful landmarks to help identify it. • To demonstrate common pathologies of the sural nerve.

TABLE OF CONTENTS/OUTLINE

The sural nerve is a cutaneous, sensory nerve of the lower leg. It is formed by the fusion of the medial sural cutaneous nerve, a branch from the tibial nerve, and the lateral sural cutaneous nerve, a branch from the common peroneal nerve. Both nerves are superficial and fuse at the level of the mid to distal leg to form the sural nerve. The sural nerve courses along the posterolateral aspect of the leg along with the lesser saphenous vein, then along the lateral aspect of the Achilles tendon, behind the lateral malleolus and gives terminal cutaneous branches in the hindfoot. The sural nerve provides cutaneous innervation to the posterior calf and the lateral ankle and foot. Pathology of the sural nerve can be from traumatic etiologies, primary neural pathologies or secondary to surrounding soft tissue abnormalities. First, the superficial location of the nerve makes it vulnerable to iatrogenic injuries during surgeries of the ankle or Achilles tendon or during saphenous vein harvesting for a graft. Second, nerve sheath tumors can occur in the sural nerve similarly to other nerves. Third, the sural nerve can be involved by pathology of the surrounding superficial soft tissue such as a hematoma or primary lesions of the skin or subcutaneous fat.

MKEE-34   Clinical Usefulness Of Thin Slice (1mm) 2D MRI Of The Shoulder Joint Using Denoising Approach With Deep Learning-based Reconstruction (DLR) And Multiplanar Reconstruction (MPR) Images.

Awards
Certificate of Merit

Participants
Takahide Kakigi, MD, Kyoto, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

It is sometimes difficult to evaluate the structures of the shoulder joint in detail with the conventional (3mm) 2D MRI. By using DLR technology, we can obtain thin slice (1mm) 2D MRI images in clinically acceptable scan times for detailed evaluation of shoulder anatomy. By setting the resolution to 0.5 × 0.5 mm, slice thickness to 1mm, and gap to -0.3 mm, we were able to create thin MPR images from the 2D dataset, akin to 3D MRI. The purpose of this exhibit is: 1. To discuss the denoising technique by DLR. 2. To discuss the imaging techniques of thin slice 2D MRI with DLR. 3. To compare conventional (3mm) 2D MRI and thin slice (1mm) 2D MRI. 4. To review the MRI findings in patients with shoulder joint disease and learn the clinical usefulness of thin slice 2D MRI.

TABLE OF CONTENTS/OUTLINE

1. Considerations on why thin slice (1mm) 2D MRI is necessary. 2. Explanation of denoising technique by DLR. 3. Explanation of imaging techniques for thin slice (1mm) 2D MRI. 4. Review of representative cases with shoulder joint disease.

MKEE-37   Antibiotic Hip Spacers: What The MSK Radiologist Should Know

Participants
Josephina A. Vossen, MD, PhD, Richmond, Virginia (*Presenter*) Nothing to Disclose

TEACHING POINTS

This exhibit will review indication, imaging appearing and potential complications of antibiotic delivery devices in the hip. Increased knowledge and improved detection of complications can prevent delays in treatment that could result in long-term disability.

TABLE OF CONTENTS/OUTLINE

- Discuss the indications and contraindications for the use of antibiotic delivery devices. - Review of the most commonly used antibiotic spacers; including molded, antibiotic coated prostheses (ACP), handmade, partial resections (cup explant only), or prefabricated. - Describe and illustrate the expected imaging appearance of antibiotic delivery devices and an approach to reporting antibiotic spacer findings. A multimodality review will include radiographs, CT, MRI and CT/MR arthrography. Evaluation of leg length and offset, spacer head size, head/neck ratio, head/acetabular ratio, and Paprosky grading will be emphasized. Extended trochanteric osteotomy (ETO), osteotomy length, femoral stem bypassing distance, and osteotomy union rate will be discussed. - Describe complications and their imaging appearance, including dislocation, periprosthetic fracture, spacer fracture.

MKEE-38   Breaking Down The Brachial Plexus: Multimodality And Case Based Review

Participants
Aaron Brumbaugh, MD, Pittsburgh, Pennsylvania (*Presenter*) Nothing to Disclose

1) Brachial plexus pathology can lead to variable and often unclear symptomatology, prompting imaging evaluation. The radiologist should be familiar with the normal and abnormal appearance of the brachial plexus. 2) Despite the "classic" teaching, multiple anatomic variants of the brachial plexus exist, with variable nerve root contributions. 3) Given its oblique course, understanding the spatial localization of different segments of the brachial plexus is essential to accurately evaluate the plexus and localize pathology. 4) While MRI is the gold standard modality for brachial plexus assessment, ultrasound can be used for evaluation as well. Knowledge of bony landmarks and brachial plexus anatomy is essential for US evaluation, which can be a useful adjunct in problem solving cases and is frequently used in nerve blockade.

TABLE OF CONTENTS/OUTLINE

I. Review of the classic organization of the brachial plexus and common anatomic variants. II. Review the MRI, ultrasound, and CT appearance of the normal brachial plexus. IIA. Anatomic review of the nerve roots and trunks at the interscalene space IIB. Anatomic review of the divisions and cords at the supraclavicular fossa. III. Ultrasound considerations for brachial plexus imaging: advantages and limitations. IIIA. Approach and technique of sonographic evaluation at the interscalene space. IIIB. Approach and technique of sonographic evaluation at the supraclavicular fossa. IV. Case-based review of brachial plexus trauma. V. Case-based review of oncologic pathology of the brachial plexus

MKEE-39 High-resolution Ultrasound Imaging Of Conventional And Non-conventional Structures Of Thumb Metacarpophalangeal Joint. Correlation With Illustrations And Magnetic Resonance Imaging

Participants
Jorge Diaz, MD, Santiago, Chile (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review of the thumb metacarpophalangeal joint anatomy, with emphasis in conventional and non - conventional structures that could be evaluated by ultrasound.2. List technical aspects for an optimal ultrasound evaluation of the metacarpophalangeal joint, including recommendations for static and dynamic study.3. Describe the normal appearance on ultrasound of different structures of the joint, including structures not routinely evaluated by ultrasound, and various injuries of traumatic origin.

TABLE OF CONTENTS/OUTLINE

Details of the thumb metacarpophalangeal joint normal anatomy will be reviewed using high-resolution ultrasound images, illustrations and high-resolution Magnetic Resonance images, including structures such as: radial and ulnar collateral ligaments (proper and accessory), adductor and abductor pollicis brevis aponeurosis, volar plate-sesamoid bones complex and dorsal capsule, among others. Also, ultrasound appearence of different injuries will be shown, including: partial and total tears of collateral ligaments (including Stener lesion), injuries of the volar plate-sesamoid bones complex, in addition to the dynamic evaluation of the thumb adductor aponeurosis and ulnar collateral ligament.

MKEE-40 Shoulder And Hip Impingement Syndromes: Evolutionary And Kinematic Perspectives

Participants
Kengo Ikejima, MD, Tokyo, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Impingement of the shoulder and hip joints is one of the most common orthopedic conditions.2. We review the mechanisms of impingement using kinematic MRI. 3. We also explain why some impingements occur in terms of human evolution.

TABLE OF CONTENTS/OUTLINE

We compare the structure of the human hip and shoulder joints with those of other animals based on the evolution of bipedalism and lifestyle. 2. Next, we discuss the mechanisms of impingement in terms of the human joint structure. Hip joint - Femoroacetabular impingement - Iliopsoas impingement - Ischiofemoral impingement Shoulder joint- Subacromial impingement - Posterosuperior glenoid rim impingement - Subcoracoid impingement - Snapping scapula syndrome (scapular dyskinesis)

MKEE-42 Precision Of Bone Mineral Density Measurements In Dual Energy X-ray Absorptiometry. The Importance Of Quality Control.

Participants
Rosa M. Lorente-Ramos, MD, PhD, Madrid, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

• To review the procedure of dual-energy X-ray absorptiometry (DXA) studies in the evaluation of osteoporosis, highlighting quality control. • To analyze the most frequent operator-related mistakes and their consequences in accuracy failures. • To provide clue points to confirm in order to improve performance in DXA exams.

TABLE OF CONTENTS/OUTLINE

Dual energy X-ray absorptiometry (DXA) is the basic tool in the diagnosis of osteoporosis, and is also useful to assess fracture risk and monitor treatment. Accurate DXA measurements require adequate image acquisition, analysis, and data interpretation.We present: • Dual-energy X-ray absorptiometry (DXA) physics and technique. • Causes of mistakes in different steps of DXA study: - Before the study: Technologist training and competence, Daily calibration, Antropometric data, Choosing regions to scan. -During the study: Patient positioning. Anatomy centered in scan field, vertical and parallel to scan axis, Image acquisition: regions of interest correctly placed, Vertebral bodies correctly numbered, Vertebral Fractures excluded. -After the study: image interpretation: Parameters. Adequate use of T-score and Z-score; Report. Detection of vertebral fractures or bone diseases (osteoarthritis, metastases, Paget's disease), soft tissue lesions, detection of artifacts-foreign bodies.

MKEE-43 Magnetic Resonance Neurography Of Upper And Lower Extremity Nerve Injuries In Athletes

Participants
Christian S. Geannette, MD, New York, New York (*Presenter*) Nothing to Disclose

Teaching points: Nerve injuries can be difficult to diagnose and require a collaborative effort, with imaging playing a crucial role. Early recognition of nerve injuries is critical, to ensure early management and treatment, preventing potentially irreversible damage. Given its excellent contrast resolution, magnetic resonance neurography (MRN) can detect nerve abnormalities that may be difficult to detect on physical examination and/or inaccessible with electrodiagnostic testing. This electronic exhibit demonstrates MRN cases of upper and lower extremity nerve injuries in athletes, as outlined in the table of contents below:

TABLE OF CONTENTS/OUTLINE

Table of contents:1. Basics of MR Neurography 2. Classification of Nerve Injuries 3. Upper Extremity Injuries a. Brachial plexus (i. "Stinger"/"Burner" ii. Thoracic Outlet Syndrome) b. Suprascapular nerve (i. Labral tear) c. Axillary nerve (i. Shoulder Dislocation) d. Ulnar nerve (i. At the level of the elbow: Valgus overload in pitchers ii. At the level of the wrist: Hamate fracture) e. Postsurgical 4. Lower Extremity Injuries a. Lumbar plexus b. Sciatic nerve (i. Hamstring avulsion) c. Femoral nerve d. Common peroneal nerve (i. ACL disruption and posterolateral corner injury) e. Superficial Peroneal Nerve (i. Muscle herniation) f. Postsurgical

MKEE-44   Meniscus Roots, Ramps, Repairs, And Repercussions

Awards
Identified for RadioGraphics
Magna Cum Laude

Participants
Hanna Tomsan, MD, Darby, Pennsylvania (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Illustrate the anatomy of meniscal roots, meniscal periphery, and meniscocapsular junction, as well as relevant associated capsular and ligamentous structures. 2. Describe the stabilizing effects of meniscal roots and meniscocapsular structures, as well as the biomechanical effects of the tears in these structures. 3. Review the MRI features and clinical repercussions of meniscal root and meniscal periphery tears that may be missed at MRI and arthroscopy. 4. Provide an interactive case-based review of the meniscal root, meniscal periphery, and meniscocapsular junction injuries in order to facilitate the correct identification of these entities.

TABLE OF CONTENTS/OUTLINE

I. Anatomy and biomechanics of the osseous and capsular attachments of the menisci. The concept of "meniscal ramp" II. Meniscus ossicles: Etiology, distribution, associations, and imaging features III. Injuries of meniscus roots, ramps, and the meniscocapsular junction: Pre-op and Post-op A. Roots of the medial meniscus: 1. Injury mechanisms and associations 2. MRI findings and arthroscopic classification (LaPrade) B. Roots of the lateral meniscus: 1. Injury mechanisms and associations 2. MRI findings C. Ramp tears at the medial meniscus periphery and meniscocapsular junction 1. Injury mechanisms and associations 2. MRI findings and arthroscopic classification (5 subtypes) D. Lateral meniscus periphery and meniscocapsular junction 1. Injury mechanisms and associations 2. MRI findings and arthroscopy - Wrisberg rip vs. pseudotear

MKEE-45   Dual-energy CT In Musculoskeletal System: Current Concept And Clinical Utility

Participants
Takeshi Fukuda, MD, Tokyo, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

The potential utility of dual energy CT (DECT) in musculoskeletal (MSK) system has been expanding greatly in recent years. Nowadays, monoenergetic image is not only used for metal artifact reduction but also for tendon delineation with its characteristic transition of X-ray attenuation. Virtual non-calcium image, which is well investigated for its detectability of bone marrow edema can be applied for osseous tumor detection and intervertebral disc assessment. Iodine map can be used for evaluation of inflammatory lesions in arthritis, such as synovitis and enthesitis. In addition, DECT images can readily be quantified which enables objective therapeutic assessment. This includes, automatic volume calculation of monosodium urate crystal and iodine quantification on iodine map. In this exhibition, we comprehensively review current status of DECT in MSK system, from optimal scan settings to ways of interpreting the images by reviewing clinical cases.

TABLE OF CONTENTS/OUTLINE

1 Technology of obtaining dual energy data 2 Current concept and clinical utility 2.1Virtual Monoenergetic image a)Metal artifact reduction b)Tendon image 2.2Gout 2.3Virtual non-calcium image a)Bone marrow edema b)Bone tumor c)Intervertebral disc 2.4Iodine map for Inflammatory lesions in arthritis 3 Limitations and perspectives 4 Take Home Point

MKEE-46   Knee Ultrasound: Basic Anatomy And Pathology

Participants
Cristina Iniesta, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

The diagnostic performance of musculoskeletal ultrasound of the knee. A systematic review. Assessment of normal anatomy and ultrasound's semiology. Frequent pathology and its ultrasound findings.

TABLE OF CONTENTS/OUTLINE

Knee ultrasound is one of the most frequent radiological examinations performed on an outpatient basis, since it is an ideal technique for the study of superficial soft tissues. It allows a dynamic evaluation of the joint, as well as the comparison with the contralateral limb. It also offers the possibility of interacting with the patient and performing a short anamnesis and clinical examination, locating the exact region where the condition is referred. For its structured study, we will divide the knee into different compartments: anterior, medial, lateral and posterior. The injuries that we can find may affect the entire joint or a single element, including: traumatic pathology, degenerative, inflammatory and joint involvement such as arthritis or deposit diseases. Likewise, it is especially useful for the assessment of pain, inflammation and functional impotence in patients with knee replacement. We will review clinical cases in the adult and pediatric population. An orderly approach to the different compartments

that comprise the joint, adequate anatomical knowledge and basic notions about the main pathology, guarantee an efficient exploration, concluding with an accurate diagnosis in many pathologies and avoiding the performance of other more expensive complementary tests.

MKEE-47 Juxtacortical Lesions: Imaging Findings With Pathologic Correlation

Participants
Jennifer Levy, MD, Philadelphia, Pennsylvania (*Presenter*) Nothing to Disclose

TEACHING POINTS

(1) Discuss the key imaging, pathologic, and clinical features of six juxtacortical lesions (2) Compare and contrast these features to aid in radiologic and clinical diagnosis

TABLE OF CONTENTS/OUTLINE

(1) Benign (a) Florid Reactive Periostitis Ossificans (FRPO) (i) Radiologic features (ii) Pathologic features (iii) Clinical features (b) Bizarre Parosteal Osteochondromatous Proliferation (BPOP) (i) Radiologic features (ii) Pathologic features (iii) Clinical features (c) Periosteal Chondroma (i) Radiologic features (ii) Pathologic features (iii) Clinical features (2) Malignant (a) Periosteal Osteosarcoma (i) Radiologic features (ii) Pathologic features (iii) Clinical features (b) Parosteal Osteosarcoma (i) Radiologic features (ii) Pathologic features (iii) Clinical features (c) Periosteal Chondrosarcoma (i) Radiologic features (ii) Pathologic features (iii) Clinical features (3) Compare & Contrast (a) Juxtacortical Osteosarcoma Subtypes (i) Periosteal osteosarcoma (ii) Parosteal osteosarcoma (b) Inflammatory/Reactive Surface Lesions (i) Bizarre Parosteal Osteochondromatous Proliferation (ii) Florid Reactive Periostitis Ossificans

MKEE-48 Evaluating The Perioperative Spine: Beyond Degenerative Disc Disease And Hardware Complications

Awards
Identified for RadioGraphics
Cum Laude

Participants
Evan Pohl, MD, Winston Salem, North Carolina (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review the indications, techniques, and nomenclature for different types of cervical and lumbar spine fusions. 2. Describe a practical approach to perioperative image evaluation of the cervical and lumbar spine, emphasizing differences in early and late imaging evaluation. 3. Through case-based radiographic examples, use this approach to generate value-added reports for the spine surgeon.

TABLE OF CONTENTS/OUTLINE

Cervical spine 1. Indications for surgery. 2. Different types of cervical spine fusion, emphasizing correct nomenclature. 3. Review surgical techniques and indications. 4. Review hardware terminology. 5. How to approach preoperative and postoperative radiographic imaging. 6. How to generate a value-added report for the spine surgeon. 7. Case-based radiographic examples. Lumbar spine 1. Indications for surgery. 2. Different types of lumbar spine fusion, emphasizing correct nomenclature. 3. Review surgical techniques and indications. 4. Review hardware terminology. 5. How to approach preoperative and postoperative radiographic imaging. 6. How to generate a value-added report for the spine surgeon. 7. Case-based radiographic examples.

MKEE-49 Sacroiliac Dysfunction: Anatomy, Clinical Evaluation, Differential Diagnosis, Imaging And Surgical Fusion

Awards
Certificate of Merit

Participants
Leah Waldman, MD, Durham, North Carolina (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is to: 1. Review sacroiliac joint (SIJ) anatomy and the spectrum of variant morphologies 2. Define Sacroiliac Dysfunction and describe its pathophysiology, differential diagnoses, and treatment options 3. Showcase pertinent multimodality pre- and postoperative imaging findings

TABLE OF CONTENTS/OUTLINE

Normal SIJ anatomy and function - Fibrous and synovial portions - Ligamentous and muscular attachments - Morphologic variations and accessory SI joints Sacroiliac Dysfunction - Etiological factors include ligamentous laxity, spinal disorders, and minor trauma - Diagnosis is primarily clinical based on motion palpation and pain provocation tests - Imaging mostly normal; primarily performed to exclude other causes of sacroiliac pain Differential diagnosis with imaging examples - Spondyloarthritis - Infection - Metabolic disorders - Trauma - Degenerative Disease - Referred pain - Tumor Treatment options - Physical therapy - Manipulation - Steroid/anesthetic injection - SI joint fusion, including triangular titanium (iFuse) implants Potential surgical complications, illustrated with cases - Loosening - Malpositioning - Peri-implant fracture or stress response - Postoperative infection

MKEE-5 Pins And Needles In Hands, Wrists, And Arms - Pictorial Review Of Upper Extremity Peripheral Neuropathies

Participants
Daichi Hayashi, MD,PhD, Stony Brook, New York (*Presenter*) Author with royalties, Wolters Kluwer nv

TEACHING POINTS

1. To describe anatomy of the upper extremity peripheral nerves.2. To identify common sites of peripheral nerve entrapment/compression and underlying predisposing factors.3. To recognize imaging features of upper extremity neuropathies and associated clinical symptoms

Upper extremity peripheral nerves can be affected by various entrapment and compression neuropathies, involving brachial plexus, musculocutaneous, axillary, suprascapular, radial, ulnar, and median nerves. MRI and ultrasound help visualize these neuropathies to narrow down differential diagnoses. Our exhibit include the following contents.1. Background;2. Aanatomy, pathomechanism, clinical features, and imaging findings of the following upper extremity nerves:a. Brachial plexus at the thoracic outlet - thoracic outlet syndrome and Parsonage-Turner syndrome;b. Shoulder - musculocutaneous nerve; axillary nerve (quadrilateral space syndrome); suprascapular nerve;c. Upper arm and elbow - proximal radial nerve at upper arm; ulnar nerve (cubital tunnel syndrome); radial nerve and posterior interosseous nerve at elbow (radial tunnel syndrome and PIN syndrome); median nerve and anterior interosseous nerve at elbow (pronator syndrome, AIN syndrome);d. Wrist - ulnar nerve (Guyon canal syndrome); median nerve (Carpal tunnel syndrome); palmar cutaneous branch of the median nerve; superficial branch of radial nerve (Wartenberg syndrome).3. Conclusion

MKEE-50 Postoperative Elbow MRI: A Guide To Surgical Techniques And Imaging Interpretation

Participants
Lawrence Lo, MD, Baltimore, Maryland (*Presenter*) Nothing to Disclose

TEACHING POINTS

Elbow injuries are a growing problem particularly amongst overhead athletes. The goal of surgical management of elbow injuries is to restore the capsuloligamentous and osseous contributions to stability as much as possible. Postoperative MRI evaluation is difficult due to the variety of surgical techniques available, and a revision in setting of complications may be performed without imaging. The teaching points of this exhibit are the following: 1) Understanding of the different surgical techniques is essential to imaging interpretation; 2) Timing of surgery can influence MR characteristics of graft reconstruction or repair; 3) Normal postoperative findings can be very difficult to distinguish from complications due to the sensitive nature of MRI.

TABLE OF CONTENTS/OUTLINE

A variety of surgical techniques and postoperative imaging findings of the following surgeries will be discussed: 1) Ulnar nerve decompression; 2) Capitellar osteochondral graft reconstruction; 3) Ulnar collateral ligament reconstruction; 4) Distal biceps brachii tendon repair; 5) Distal triceps tendon repair; 6) Lateral collateral ligamentous complex reconstruction; 7) Common flexor and common extensor tendon repair.

MKEE-51 A Multimodality Review Of The Musculoskeletal Manifestations Of Hyperparathyroidism And What The Radiologist Needs To Know

Awards
Certificate of Merit

Participants
Jonathan Revels, DO, Albuquerque, New Mexico (*Presenter*) Nothing to Disclose

TEACHING POINTS

After reviewing this educational exhibit, the learner will have an improved understanding of: The difference between primary and secondary hyperparathyroidism The clinical and radiological workup of hyperparathyroidism The musculoskeletal manifestations of hyperparathyroidism on radiography, computed tomography, and magnetic resonance imaging The role of DEXA in evaluating patients with hyperparathyroidism

TABLE OF CONTENTS/OUTLINE

Background of primary and secondary hyperparathyroidism Clinical manifestations and evaluation of hyperparathyroidism Radiologic assessment of hyperparathyroidism on US, CT, nuclear medicine and dual-energy x-ray absorptiometry Radiologic manifestations of hyperparathyroidism in a case-based format Subperiosetal bone resorption Subchondral bone resorption Subligamentous resorption Rugger jersey spine Lucent bone lesions Brown tumors Calvarial "salt-and-pepper" appearance Other radiologic manifestations of hyperparathyroidism

MKEE-52 The Dark Horse Of Cartilaginous Lesions- Literally!

Participants
Aashna Karbhari, MD, Mumbai, India (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Chondroblastomas are benign locally aggressive cartilaginous neoplasms that usually present with insidious onset bone pain.2. Chondroblastomas are predominantly epiphyseal / apophyseal tumors affecting an immature skeleton.3. Distinctive features of chondroblastomas under a microscope like chicken-wire calcification and coffee bean nuclei.4. Chondroblastomas appear as lytic lesions with a sclerotic rim on X-ray and CT, and a considerable number show conspicuous low T2 signal intensity (owing to its different histological make up as compared to other cartilaginous lesions) and significant marrow edema on MRI.5. Expected post treatment changes with focus on role of PET in assessing complete response vs residual / recurrent tumors.6. Differential diagnosis of chondroblastomas with their distinctive features on histopathology.

TABLE OF CONTENTS/OUTLINE

• Review the pathophysiology, clinical features and management of chondroblastomas.• Elucidation of pathognomonic features of chondroblastomas on histopathology.• Illustrate the multimodality imaging features including X-ray, MRI and PET/CT of chondroblastomas at various typical and atypical locations.• Interpretation of post treatment changes in chondroblastomas and the role of PET/CT in assessing treatment response / residual disease.• Discuss various differential diagnoses with attention to their pathognomonic features on histopathology. • Review the importance of interdisciplinary coordination for improving outcomes in chondroblastoma patients.

MKEE-53 Fibrous Soft-tissue Tumors And Pseudotumors: A Comprehensive Review

Participants

María Merideno Garcia, MBBCh, Toledo, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

- To review the classification of fibrous soft-tissue tumors. - To illustrate the main imaging features and key findings with own-experience images. - To provide differential diagnosis clues to distinguish benign from malignant fibrous soft-tissue tumors.

TABLE OF CONTENTS/OUTLINE

A wide variety of fibrous lesions may appear in soft tissues, whose imaging findings are often nonspecific. Ultrasound and Magnetic Resonance Imaging play an essential role in defining their size, extension, and intrinsic characteristics. In those patients (especially in pediatric age), correct diagnosis is mandatory since it leads to the decision of conservative or surgical treatment. In this educational poster, we review the classification of fibrous soft tissue tumors and pseudotumors in the adult and pediatric population. We discuss benign and malignant tumors as elastofibroma, fibroma of the tendon sheath, solitary fibrous tumor, hemangiopericytoma, or sarcomas. Their differential diagnosis includes proliferative myositis, myositis ossificans, nodular fasciitis, and fibromatoses, among others. We illustrate the main findings and propose a radiological approach based on the recognition of imaging patterns.We emphasize diagnostic pearls and pitfalls.

MKEE-54   Role Of Musculoskeletal Radiologist In Elbow Joint Dislocation.

Awards
Certificate of Merit

Participants
Varun Dhir JR, DMRD,MBBS, Delhi, India (*Presenter*) Nothing to Disclose

TEACHING POINTS

• To compare the radiological features of Posterolateral rotatory instability (PLRI) vs posteromedial rotator instability (PMRI).• To understand the difference in the mechanism of injury and the pattern of ligamentous and osseous disruption in PLRI vs PMRI.• To highlight the role of the O'Driscoll and Wrightington classifications in elbow fracture-dislocation diagnosis and management.

TABLE OF CONTENTS/OUTLINE

1. Relevant elbow joint anatomy, emphasizing the detailed anatomy of the coronoid process.2. Elbow joint stabilizing structures.3. Mechanism of injury in PLRI vs PMRI.4. Plain radiographic findings in PLRI vs PMRI, highlighting relevant radiological signs (for example, the drop sign, the double contour sign).5. The role of CT in categorizing the injury and guiding the management, according to the O'Driscoll classification of coronoid process fractures6. The different patterns of ligamentous injuries and the role of MRI in assessing these. Radiological examples highlighting different injury patterns (for example, terrible triad injuries, coronoid process fractures and posterior band ulnar collateral ligament injuries) will be included.7. The role of radiology in suggesting the diagnosis and guiding the management.8. The different surgical treatment options for PLRI and PMRI. Post-operative plain radiographs demonstrating the different treatment option will be illustrated.9. The inclusive and simplified role of the Wrightington classification in complex elbow fracture-dislocation injuries.

MKEE-55   Spine Infection Imaging: The Role Of The Radiologist In The Diagnosis And Management

Participants
Silvia Cayon Somacarrera, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

To illustrate the imaging spectrum of findings in spine infection and its relationship with different pathogens: pyogenic, granulomatous, parasitic and fungal.To show key features in X-rays, CT and MR to make the diagnosis and to differentiate it from pitfalls and mimics. To discuss indications to perform image-guided percutaneous sampling procedures.

TABLE OF CONTENTS/OUTLINE

Spine infections are increasing in incidence due to aging population, immunosuppression and increased spinal instrumentation. In addition to this, the clinical presentation is often insidious and non-specific, thus, the ability of the radiologist to detect early or subtle imaging findings is vital to detect this pathology.In this presentation we depict several spine infections, including a wide variety of pathogens, in order to show imaging spectrum including pitfalls.Radiologists are not only important in the interpretation of radiological images, but also play a key role in the diagnostic algorithm performing image-guided percutaneous sampling procedures. Blood or urine cultures are positive in some cases but in others targeted sampling is necessary to identify the pathogen and in those cases is when the radiologist plays also an important role.

MKEE-56   The Big Nerve Problem: Imaging In Sciatic Nerve Pathologies

Participants
Aruna R. Patil, MD, FRCR, Bangalore, India (*Presenter*) Research Consultant, Koninklijke Philips NV

TEACHING POINTS

1.Radiological anatomy of Sciatic nerve - USG, CT, MRI2.Multiple focal and diffuse abnormalities of the nerve with pertinent imaging feature3.Address advances (neurography) in better depiction

TABLE OF CONTENTS/OUTLINE

The exhibit will cover:The anatomy of the sciatic nerve (illustration) and radiological anatomy.Motor supply of the nerve.Focal lesions: Schwannoma, neurofibroma, intraneural ganglion cyst, neurofibrosarcoma, in NF-1, intraneural lipoma. Diffuse: GBS, neuritis secondary to compression (Ischiofemoral impingement), radiation neuritis, malignant extension.Trauma - neuropraxia to complete transection , posterior hip dislocation.Extrinsic compression - by tumors, osteochondroma, labral cysts. Secondary involvement - by tumors, abscess.Sciatic nerve interventions - image guided injections. Advances - MR neurography and DTI

MKEE-57   The Brachial Plexus: What Can Go Wrong And How To Identify It

Awards

Participants
Philip Wong, MD, Atlanta, Georgia (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review the anatomy of the brachial plexus 2. Distinguish imaging and pathologic features of traumatic and non-traumatic abnormalities. 3. Provide an overview of management strategies.

TABLE OF CONTENTS/OUTLINE

Background The brachial plexus is a complex neural network that provides motor and sensory innervation to the upper extremity and chest. A variety of pathologies including, traumatic and non-traumatic, can be seen within the brachial plexus. These entities can often be difficult to identify and characterize by clinical exam alone, thus imaging proves to be an invaluable tool. Radiologists should be aware of the different brachial plexopathies and their imaging features to identify these abnormalities. Content This exhibit will review the anatomy of the brachial plexus. Traumatic and non-traumatic plexopathies will be explored along with their imaging features, focusing on US and MRI. Non-traumatic pathologies that will be covered include tumors, postradiation plexitis, acute brachial neuritis as well as polyneuropathies such as CIDP, Charcot-Marie-Tooth, amongst others. Treatment strategies will be discussed to provide a comprehensive review of these plexopathies. Summary The brachial plexus is a complex entity in which traumatic and nontraumatic plexopathies can be identified. Radiologists should be aware of the pathologic and imaging features of these findings in the brachial plexus, as well as correct management strategies to engage in a multidisciplinary management approach to improve patient care.

MKEE-58   The Clavicle: Anatomy, Imaging And Pathology

Participants
Ami Gokli, MD, Philadelphia, Pennsylvania (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Review development and normal anatomy of the clavicle (with original illustrations) - Discuss the biomechanics of the joints and how it changes during development - Illustrate and discuss normal variants and pathology with grading classification - Identify rare entities involving the clavicle

TABLE OF CONTENTS/OUTLINE

Anatomy and Development- Clavicle and associated joints, ossification centers, surrounding ligaments - Discuss developmental changes - Discuss biomechanics- original illustrationsDiagnosis - Clinical - Imaging - how to image the clavicle, imaging pitfallsPathology - Childhood variants and pitfalls (rhomboid fossa, ossification variants etc) - More common Pathology (cleidocranial dysostosis, pseudoarthrosis, physeal injury, SC joint injury, osteo, hyperparathyroid, ABC, osteochondroma, lymphoma, ewings sarcoma, LCH) - Rare pathology (Caffey Disease, Asphyxiating Thoracic Dysplasia, Osteogenesis Imperfecta, Holt-Oram syndrome, Thrombocytopenia with absent radius (TAR) syndrome, Synovitis Acne Pustulosis Hyperostosis Osteitis (SAPHO), Mucopolysaccharidoses)Conclusion

MKEE-59   Case-based Review Of The Sternum And Sternoclavicular Joints: What The Radiologist Needs To Know

Awards
Magna Cum Laude

Participants
Wilfred Manzano, MD, Palo Alto, California (*Presenter*) Nothing to Disclose

TEACHING POINTS

[1] Knowing the radiological landmarks of the sternum and sternoclavicular joints is critical to identifying a variety of pathologies.[2] The sternum and sternoclavicular joints have a number of anatomic variants that may mimic trauma, infection, neoplasm, or other pathologies.[3] While radiographs may provide a helpful initial overview of the sternum and sternoclavicular joints, CT is the modality of choice to characterize these structures.

TABLE OF CONTENTS/OUTLINE

[1] Overview[2] Normal Anatomy: Important Radiological Landmarks[3] Imaging Technique: Oblique Radiographs, Serendipity View, and the Importance of CT[4] Cased-based Review by Pathology[5] Congenital/Developmental Variants: Rhomboid Fossa; Episternal Ossicles; Sternal Foramen; Sternal Ossification Centers; Medial Clavicular Physis; Pectus Excavatum; Pectus Carinatum[6] Traumatic Processes: Sternoclavicular Dislocation; Costochondral Junction Fracture; Manubriosternal Subluxation; Sternal Fracture[7] Degenerative Processes: Osteoarthritis; Heterotopic Ossification[8] Infection and Inflammation: Ankylosing Spondylitis; Septic Arthritis; SAPHO[9] Neoplasm: Sclerotic Metastases; Chondrosarcoma; Radiation Osteonecrosis[10] Hardware: Sternal Dehiscence; Sternal Prosthesis[11] Conclusion

MKEE-6   Shoulder Injury Related To Vaccine Administration (SIRVA): Imaging Features Of Symptomatic Non-target Intramuscular Vaccination

Awards
Certificate of Merit

Participants
Tina Shiang, MD, Worcester, Massachusetts (*Presenter*) Nothing to Disclose

TEACHING POINTS

Shoulder injury related to vaccine administration (SIRVA) is an underreported, preventable complication related to non-target vaccination. With millions of people receiving intramuscular deltoid injections under the COVID-19 vaccination program, radiologists should know the imaging features observed in the clinical setting of SIRVA as well as the appropriate vaccine injection technique and management.1. Overview of intramuscular vaccines and important considerations for vaccine administration.2. Review

consequences and show imaging findings of incorrect vaccine injection technique (i.e. SIRVA) using a case-based approach.3. Discuss the management of SIRVA with subacromial/subdeltoid bursa steroid injection.

TABLE OF CONTENTS/OUTLINE

1. Types of intramuscular vaccines, considerations for intramuscular vaccine administration and troubleshooting incorrect injection techniquesa. Injection techniqueb. Landmarks and anatomic site of injectionc. Needle size (length and gauge) and body habitus2. Vaccine injection related complications (SIRVA)a. Adhesive capsulitis (intra-articular injection)b. Subacromial/subdeltoid bursitis (intra-bursal injection)c. Periostitis or osteitis (periosteal or intra-osseous injection)d. Fat necrosis (subcutaneous injection)e. Axillary or radial nerve injury3. Case-based review of MRI findings of correct intramuscular vaccine injection and SIRVA4. Ultrasound guided steroid injection of the subacromial/subdeltoid bursa for pain management

MKEE-60   Postoperative Spine: The Imaging Hardware For The Surgeon's Sake And The Patient's Safety

Participants
Vagner Salzani, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

To review indications for spine surgery and the imaging assessment of the hardware used. To recognize the normal postoperative spine imaging findings, focusing on CT and MRI. To discuss the postoperative complications. To review what is essential to report from Surgeon's perspective, aiming for optimal patient management.

TABLE OF CONTENTS/OUTLINE

1. Main indications for spinal surgery: decompression, stabilization, and excision of tumors. 2. Imaging assessment of the hardware and biomaterials used in surgery. 3. Normal postoperative findings. 4. Spine surgery complications: degeneration, collections, fistulas, cerebrospinal fluid leaks, and surgical site infections. 5. Radiological report: what the Surgeon wants to know.

MKEE-61   Myeloma Mimickers - Plasma Cell Disorders Beyond Multiple Myeloma

Participants
Matthew McCann, MD, Jacksonville, Florida (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Imaging findings of other plasma cell disorders can mimic multiple myeloma. 2. Prognosis and treatment differ significantly between multiple myeloma and other plasma cell disorders. 3. Diagnosis relies on imaging, tissue sampling, bone marrow biopsy, and thorough evaluation of laboratories and clinical history.

TABLE OF CONTENTS/OUTLINE

1. Introduction. 2. Overview of plasma cell physiology and pathophysiology. 3. Solitary extramedullary plasmacytoma: isolated plasma cell soft tissue tumor; lack of other intramedullary or extramedullary findings. Mimic: extramedullary multiple myeloma. 4. Plasma cell leukemia: proliferation of malignant plasma cell progenitors. Extramedullary manifestations are typical. Mimic: extramedullary and skeletal involvement of multiple myeloma. 5. POEMS syndrome: paraneoplastic syndrome with underlying plasma cell dyscrasia. Polyneuropathy is a mandatory diagnostic criterion. Mimic: multiple myeloma with osteosclerotic lesions. 6. Waldenstrom macroglobulinemia: proliferation of plasma and lymphoplasmacytic cells. Mimic: skeletal involvement of multiple myeloma. 7. Immunoglobulin light chain (AL) amyloidosis: deposits of immunoglobulin fragments produced by monoclonal plasma cell population. Mimic: amyloid deposits of multiple myeloma. 8. Conclusions 9. References

MKEE-62   Uncommon Pathology Of Pubic Symphysis

Participants
Gian Luca Desi, MD, Torino, Italy (*Presenter*) Nothing to Disclose

TEACHING POINTS

Radiologists should be aware that: 1) pubic symphysis is a proper joint; 2) even though the most common inflammatory pathology is the pubic chronic osteitis of the symphysis, there are other inflammatory involvements; 4) chronic instability of pubic symphysis does exist and causes pain in the suprapubic region or at inner thighs and it has radiographic/CT proper signs.

TABLE OF CONTENTS/OUTLINE

1) the anatomical and functional structure of pubic symphysis; 2) a review of x-rays/CT/MR features of the most uncommon inflammatory pubic disorders: rheumatologic arthritis (rheumatoid arthritis, psoriatic arthritis, ankylosing spondylitis), osteomyelitis (related to pregnancy/childbirth, urologic and gynecologic surgery); 4) the subpubic cartilaginous cyst: a gelatinous degenerating tissue which arises from fibrocartilagineous component of the symphysis, causing dysuria and a palpable mass; 3) radiological signs of pubic chronic instability, which may develops after major trauma: a shift in craniocaudal displacement, sclerosis, and erosion of pubic bones, metaplastic bone formation, which may require surgery.

MKEE-63   Image-Guided Therapeutic Injections Of The Pelvic Bursae: A Pictorial Review

Participants
Antoine Azar, MD, Jacksonville, Florida (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. The musculoskeletal anatomy of the pelvis is complex, with several naturally occurring and secondary adventitious bursae that deserve recognition by the radiologist2. These bursae can often get pathologically distended due to a variety of mechanical and inflammatory conditions3. Pain secondary to bursitis is commonly treated with image-guided steroid injection4. The aim of this exhibit is to review relevant anatomy, pathology, and image-guided injection techniques of the clinically relevant pelvic bursae

TABLE OF CONTENTS/OUTLINE

I. IntroductionII. Approach to Image-guided InterventionsIII. Iliopsoas Bursa a. Normal anatomy b. Abnormal MR appearance (bursitis) c. Image-guided steroid injection casesIV. Greater Trochanteric Bursa a. Normal anatomy b. Abnormal MR appearance

(bursitis) c. Image-guided steroid injection casesV. Ischiogluteal Bursa a. Normal anatomy b. Abnormal MR appearance (bursitis) c. Image-guided steroid injection casesVI. Ischial Bursa a. Normal anatomy b. Abnormal MR appearance (bursitis) c. Image-guided steroid injection casesVII. Ischiofemoral bursa a. Normal anatomy b. Abnormal MR appearance (bursitis) c. Image-guided steroid injection casesVIII. Conclusions

MKEE-64　Impact Factor: The Many Faces Of Ankle And Lateral Hindfoot Impingement Syndromes

Participants
Augusto Altoe, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To discuss the clinical presentation and pathophysiology of the ankle and lateral hindfoot impingement syndromes.2. To understand the anatomical basis involved in ankle impingement syndrome. 3. To describe the imaging patterns of the ankle and lateral hindfoot impingement syndromes.

TABLE OF CONTENTS/OUTLINE

1- Introduction: a. terminology, b. pathophysiology, and c. clinical presentation. 2- Classification according to the anatomic relationship of the tibiotalar joint: a. anterolateral, b. anterior, c. anteromedial, d. posteromedial, e. posterior impingement, f. extra-articular impingements. 3- Role of imaging methods for impact diagnosis: a. X-ray, b. Ultrasound, c. MR imaging, and d. MR arthrography. 4- Key Imaging features for each type of impingement, such as soft tissue or osseous abnormalities. 5- Identifying other causes of persistent ankle pain that may mimic or coexist with ankle impingement, such as occult fractures, cartilage damage, intraarticular bodies, osteochondral talar lesions, tendon abnormalities, and ankle instability. 6- Take home messages.

MKEE-65　Patellofemoral Instability: Through Patellar Maltracking To Torsional Deformities Of The Lower Limbs

Participants
Pedro Arruda, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The etiology of patellofemoral instability is multifactorial, and hip rotation, tibial tuberosity positioning, femoral groove and patellar articular facet anatomy, gait biomechanics, and imbalance of the knee extensor apparatus can all lead to poor alignment of the patella. The most sensitive and specific measurements for determining patellar instability are the trochlear groove angle, tibial tubercle-trochlear groove distance (TT-TG), patellar tilt, and patellar height. The unstable patellofemoral joint is less congruent than a stable joint throughout the range of knee movement. 10° to 20° of tibiofemoral flexion was shown to have the greatest difference in contact surface area between unstable and stable patellofemoral joints. A lateralized tibial tubercle as demonstrated by an increase in the TT-TG distance may be associated with a coexisting lower limb rotational malalignment. The effects of tibia and femur rotations on the patellofemoral joint contact pressures and areas are similar, but opposite in terms of the patellar facets affected.

TABLE OF CONTENTS/OUTLINE

1. Patellofemoral congruency a. Sulcus angle b. Patellar tilt c. Patellar deviation d. Patellar height 2. Patellar tracking a. Extension b. Flexion c. Quadriceps contraction 3. Torsional deformities a. Femoral torsion b. Tibial torsion c. Femorotibial rotation d. Cumulative torsional index 4. Translational deformities a. TT-TG b. Q angle

MKEE-66　Joints In Flame, What To Do Next? Primer For Radiology Residents On Inflammatory Arthritis

Participants
Andrea Saldana, MD, San Juan, Puerto Rico (*Presenter*) Nothing to Disclose

TEACHING POINTS

Review the pathophysiology of Inflammatory Arthritis and its clinical presentation.Discuss the distribution pattern associated with inflammatory arthritis.Use an algorithm to aid in narrowing the differential diagnosis of Inflammatory Arthritides and its subtypes.Provide case examples for classic imaging findings of inflammatory arthritis subtypes in conventional radiography, ultrasound (US), computed tomography (CT) and magnetic resonance imaging (MRI).

TABLE OF CONTENTS/OUTLINE

Inflammatory arthritides are characterized by bone erosions and uniform joint space narrowing on conventional radiography. However, different imaging studies allow for the identification of characteristic distribution patterns (proximal vs. distal), bone proliferations, and other pathognomonic features of each subtype of arthritis. Following the identification of bone erosions, the use of an algorithm based on characteristic patterns for each subtype on multiple imaging modalities can aid in establishing an accurate diagnosis to further prevent the development of irreversible joint changes and systemic complications associated with inflammatory arthritis.1. Introduction & Objectives2. Inflammatory Arthritis Algorithm3. Inflammatory Arthritis: Why does it occur? Clinical presentationConventional radiography, US, CT and MRI Imaging Findings4. Multiple cases in quiz format5. Conclusion

MKEE-67　How To Obtain Additional Bone Mineral Density Information From The Low-dose Chest CT Examination

Participants
Xinyu Li, Xi'an, China (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To demonstrate the importance of measuring bone mineral density (BMD). 2. To point out the pros and cons of obtaining the BMD by using quantitative CT (QCT). 3. To propose a new no-dose-increase way to obtain the BMD using low-dose chest CT imaging.

TABLE OF CONTENTS/OUTLINE

1. The importance of measuring BMD • Osteoporosis is associated with low BMD, increasing the risk for fractures. • BMD is an independent predictor for future fracture risk and all-cause mortality. 2. The pros and cons of obtaining BMD using QCT • QCT uses

CT imaging to obtain BMD resulting in more radiation dose compared with dual energy X-ray absorptiometry (DXA). • QCT provides 3D images to measure BMD to avoid the influence of unusual structures (metal implant, osteophyte, overlying soft tissue, aortic calcifications) or pathological changes (vertebral fractures and spinal degenerative changes) for more accurate BMD than DXA. 3. A new no-dose-increase way to obtain BMD • Low-dose chest CT screening examination commonly covers the first and second lumbar vertebra. • QCT could measure the BMD of lumbar vertebra from the low-dose chest CT imaging which requires no extra radiation dose to provide volumetric BMD. • Application of low-dose chest CT screening may be extended.

MKEE-68   The State Of Art Of Hallux Valgus Deformity: An Update On Imaging Techniques And The Newest Surgical Treatments

Awards
Certificate of Merit

Participants
Lucas Silva, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Hallux valgus is a triplanar deformity comprised of a valgus deformity of the proximal phalanx, a pronation deformity of the first metatarsal, and a lateral displacement of the sesamoid apparatus. It is a slowly progressive condition that results from a series of biomechanical changes, that frequently follow several sequential steps in the pathophysiology. Although the standard imaging of HV deformity includes 2-dimensional plain radiographs, it provides limited information because of the rotational, 3-dimensional nature of the deformity. Three-dimensional, weight-bearing CT, however, does offer 3-dimensional imaging while weight bearing, and this is enabling further insight into HV. There are a large variety of surgical procedures for the correction of HV, and newer minimally invasive techniques are becoming increasingly popular. Complications may present both early and late scenarios. Early complications include fracture of the osteotomy, hematoma, infection, nerve entrapment, and avascular necrosis. Late complications include hardware failure, nonunion, malunion, persistent infection, recurrence of deformity and HV hallux varus deformity.

TABLE OF CONTENTS/OUTLINE

(1) Pathophysiology, risk factors (2) Diagnostic criteria (3) Atavism (4) Classic radiographic measurement angles (5) The role of MRI (6) Weight-bearing CT (7) What the orthopedic surgeon needs to know (8) Conventional surgical treatment (9) Minimally invasive techniques (10) Post-operative angle measurements (11) Post treatment complications

MKEE-69   Opportunistic Assessment Of Sarcopenia By Ct And Mri

Participants
Davi Romao, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Computed tomography (CT) and Magnetic Resonance Imaging (MRI) exams have been used to obtain information on body composition through its ability to quantify fat and muscle in a transverse section. This assessment of body composition has been recognized as an important prognostic factor for clinical outcomes in cancer patients or with other morbidities.We will make a brief review of opportunities to assess sarcopenia evaluation making use of routine Abdominal and Chest CT/MRI .The purpose of this exhibit is:- Point out the main software tools for CT and MRI Sarcopenia Evaluation- Describe common pitfalls in the analysis of CT / MRI sarcopenia- Show examples of how the evolution of sarcopenia can impact clinical outcomes

TABLE OF CONTENTS/OUTLINE

I. INTRODUCTION II. TOOLS FOR BODY COMPOSITION ANALYSISIII. SARCOPENIA PARAMETERS- Skeletal Muscle Index- Skeletal Muscle Attenuation (CT)- Total Body Fat Mass and Total Body Fat-Free Mass Prediction- Visceral Fat Area and Subcutaneous Fat Area- Pitfalls and LimitationsIII. CASESIV. CONCLUSION

MKEE-7   From Walkin' To Rollin': A Review Of Cervical Spine Injuries In A Level 1 Trauma Center.

Participants
Andrew Mitchell, MD, Memphis, Tennessee (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review epidemiology of common cervical spine injuries.2. Review cervical spine measurements suggestive of injury on CT and radiographs.3. Review cervical spine injury classification systems.4. Case examples of common cervical spine injuries and fracture types.5. Review common resident misses and pitfalls.

TABLE OF CONTENTS/OUTLINE

1. Background: Epidemiology and general overview of cervical spinal injuries.2. Review anatomy of the cervical spine and radiographic/CT measurements useful in trauma.3. Case based review of common cervical injuries and fracture classification.4. Case based review of common resident and community misses, normal variants, and pitfalls.5. Summary: Conclusions/References.

MKEE-70   Place The Correct Shoes: A Comprehensive Review Of Stress Fractures In Recreational Runners

Participants
Vagner Salzani, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review etiology and epidemiology of stress fractures;2. Discuss the most common stress fractures in recreation runners;3. Review the classifications for stress fractures in most affect sites of recreational runners, using practical cases of our service;4. Discuss the differential diagnosis of stress fracture, including benign and malign causes;5. Overview of the management of stress features in recreational runners according to their radiological features, focusing on MRI and CT.

TABLE OF CONTENTS/OUTLINE

I- Introduction: a. terminology, b. pathophysiology, and c.epidemiology. II- Imaging features of stress fractures and their

classifications: a. tibial, b. metatarsals, c. fibular, d. talar, e. navicular, f. femoral head, and g. pelvic. III- Distinguish low-risk fractures from high-risk fractures. IV-Differential diagnosis, including illustrative cases of our practice: Muscle injuries (adductor strain and piriformis syndrome), infection/osteomyelitis, and pathologic fractures. V- Key imaging features that affect the management of stress fractures.

MKEE-71   Morphologic Changes Of Vertebral Bodies: An Imaging Guidebook.

Participants
Renato Masson, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is: 1. To review normal anatomy of vertebral bodies. 2. To evaluate the most common morphologic changes of vertebral bodies. 3. To create a systematic approach for differential diagnosis of vertebral body changes.

TABLE OF CONTENTS/OUTLINE

1- Basic anatomy. 2- Congenital: • Limbus vertebra. • Klippel-Feil. • NF1. • MPS. • Hemivertebra. 3- Inflammatory: • Ankylosing spondylitis. • Spondylodiscitis. • Chronic recurrent multifocal osteomyelitis. 4- Metabolic. • Sickle cell anemia. • Renal osteodystrophy. • Osteopetrosis. • Paget. 5- Neoplastic: • Enostosis. • Hemangioma. • Metastasis. • Langerhans cell histiocytosis. 6- Traumatic: • Compression fracture. • Burst fracture. • Insufficiency fracture. • Malignant fracture.

MKEE-72   Imaging Aspects Of Proximal Humerus Fractures And Post-operative Evolution With Emphasis On Reviewing Neer's Classification

Participants
Pedro Arruda, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Teaching points: 1. Fractures of the proximal humerus are frequent in women of advanced age, osteoporosis and after falling. 2. The displaced fracture segments follow the orientation of the force vectors exercised by the muscles that stabilize them. 3. Neer's classification is important for therapeutic planning, in addition to estimate the prognosis and predict complications. 4. Fractures of the proximal humerus, even if comminuted, without misalignment> 1.0 cm or without angulation = 45, are classified as "one part". 5. Anatomical neck fractures are more related to osteonecrosis of the humeral head, especially when the medial metaphyseal segment is displaced more than 2 mm or shorter than 8 mm. 6. The surgical and conservative treatments vary according to the degree of the Neer`s classification and fragments involved.

TABLE OF CONTENTS/OUTLINE

1. Knowledge of the anatomy and mechanism of trauma. 2. Understand the role of imaging exams in fractures of the proximal humerus and displacement. 3. Application of Neer's classification. 4. Understand the postsurgical findings according to each type of fracture.

MKEE-73   Plantar Plate: A Tiny Structure With Huge Importance - From Its Function And Anatomy To Its Tears

Participants
Sharon Rosemberg, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To review the anatomy of plantar plate complex of hallux and second to fifth toes. 2. To review MRI findings of plantar plate tears and turf toe/sand toe. 3. MRI findings of normal and altered plantar plates will be demonstrated by presenting cases of our department. 4. In this poster we intend to keep radiologists familiarized with the anatomy of these complex regions by using MR imaging and schematic drawings.

TABLE OF CONTENTS/OUTLINE

1.Plantar plate normal anatomy 2.MRI protocols 3.Plantar plate tears including : a. initial alteration - with no tearing b. partial thickness plantar plate tears c. complete plantar plate tear 4. Turf toe tears including: a. mild sprains b. partial tears c. full thickness tears.

MKEE-74   Imaging Evaluation Of Femoroacetabular Impingement. Our Experience With The Lisbon Agreement

Participants
Renato Masson, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is: 1. To review types and biomechanics of femoroacetabular impingement. 2. To show a suggested imaging protocol and why it is important. 3. To create a systematic approach for evaluating femoroacetabular impingement

TABLE OF CONTENTS/OUTLINE

1- The nature of impingement: a. Pincer-type, cam-type, and mixed-type. b. Normal and abnormal anatomy. c. Biomechanics. 2- Imaging evaluation: a. Radiography. b. The role of CT. c. MRI: why and how to perform it? 3- MRI evaluation: a. Labral injuries. b. Cartilage injuries. c. Bone morphology. d. Findings suggesting bad post-operative prognosis.

MKEE-75   Transforaminal Percutaneous Endoscopic Surgery. Radiologic Manipulation Signs Of A Microinvasive Spine Procedure

Participants
Pedro Arruda, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Transforaminal percutaneous endoscopic surgery for the lumbar spine under local anesthesia was recently initiated. In the

beginning, the procedure was used only for discectomy regarding soft disc herniation, with benefits that include minimal tissue traumatization and early recovery. It is expected high signal intensity of residual disc herniation in immediate postoperative MRI, which reduces at a short-term period. After some years, the procedure has also included foraminoplasty (foraminal decompression) and ventral facetectomy (lateral recess decompression) as additional steps. Regarding the foraminoplasty procedure, surgical decompression of stenotic lumbar foramina requires partial resection of the osteophytes, hypertrophic superior articulate process, and superior margin of the adjacent caudal pedicle which forms the borders of lumbar foramen. Our objective is to demonstrate the imaging surgical planning and postoperative findings regarding this microinvasive procedure.

TABLE OF CONTENTS/OUTLINE

1. Lumbar foraminal stenosis criteria a. Degree of stenosis b. Measurement done by radiographs c. Measurement done by CT and MRI 2. Types of percutaneous endoscopic surgery a. Discectomy b. Foraminoplasty c. Ventral facetectomy 3. Procedure steps a. Extraforaminal landing b. Endoscopic foraminal unroofing c. Full-scale foraminal decompression d. Optional discectomy 4. Postoperative image findings a. CT and radiography b. MRI 5. Procedure complications

MKEE-76 Pre And Postoperative Carpal Tunnel Release Parameters Analysis Associated With Open And Endoscopic Intraoperative Images

Participants
Pedro Arruda, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The onset of carpal tunnel syndrome is blamed on space-occupying lesions or pathological processes which narrow the space of the carpal tunnel. The median nerve flattening ratio is usually higher at the hook of the hamate bone level in patients with carpal tunnel syndrome. Also, the mean volar bowing of the retinaculum is increased in the pisiform level as well as in the hook of the hamate level. Surgical release of the median nerve is frequently needed when conservative treatment has failed. However, after surgical release, some patients continue to have symptoms, because failure of nerve decompression has numerous causes, Troublesome persistent or recurrent symptoms occur after the release in as many as 20% of patients, and approximately 10% of patients need reexploration. Endoscopic surgeries are now widely performed, with lower rates of syndrome recurrence. MRI depicts signs of nerve dysfunction but cannot replace electrophysiologic tests. MRI can be performed in association with EMG for patients with pain after carpal tunnel release.

TABLE OF CONTENTS/OUTLINE

1. Causes of recurrent carpal tunnel syndrome and anatomic parameters. 2. Carpal tunnel release procedure steps a. Open procedure b. Endoscopic procedure 3. Pre and post procedure evaluated parameters a. Median nerve cross-sectional area b. Median nerve caliber ratio c. Median nerve flattening ratio d. Median nerve signal intensity e. Palmar retinaculum bowing f. Carpal tunnel cross-sectional area g. Flexor retinaculum gap 4. Signs of recurrent carpal tunnel syndrome

MKEE-77 Extraarticular MRI Knee

Participants
Travis Smoot, MD, Columbia, Missouri (*Presenter*) Nothing to Disclose

TEACHING POINTS

The clinical diagnosis of intraarticular and extraarticular knee pathology often overlaps. The diagnosis of extraarticular findings of MRI knee depends on the specific anatomic location and signal characteristics. Differentiating extraarticular knee pathology is important because of the broad spectrum of severity and therefore differences in management. The appropriate diagnosis is pivotal in providing high quality care while reducing unnecessary follow-up and procedures.

TABLE OF CONTENTS/OUTLINE

Extraarticular MRI KneeDifferential-Based Approach: Background, Etiology, Imaging Features, and Differential Diagnosis. Cyst and Cyst-Like Lesions: Bursitis (Prepatellar, Pes Anserine), Morel-Lavallee Lesions, Popliteal (Baker's) Cyst, Ganglion Cyst (Proximal tibiofibular joint with compression of the peroneal nerve), Iliotibial (IT) Band Syndrome, Tophaceous Gout (Bilateral patellar intratendinous gout), and Synovial Sarcoma.Vascular: Deep Venous Thrombosis (DVT) and Popliteal Artery Aneurysm.

MKEE-78 What Joins The Groins: A Review Of Anatomy And Pathology Of The Pubic Symphysis

Awards
Identified for RadioGraphics

Participants
Lillian Niakan, MD,MBA, Temple, Texas (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review anatomy of the pubic symphyseal joint, pubic ligaments, and surrounding myotendinous attachments which contribute to anterior pelvic stability. 2. Illustrate various pathology of the pubic symphysis and surrounding soft tissues with different imaging modalities. 3. Emphasize that unrecognized pathology of the pubic symphysis can cause inguinal pain and can lead to anterior pelvic instability.

TABLE OF CONTENTS/OUTLINE

1. Types of joints a. Structural classification: fibrous, cartilaginous, synovial b. Functional classification: synarthroses, amphiarthroses, diarthroses 2. Anatomy of the pubic symphysis a. Bone landmarks b. Pubic symphyseal joint and fibrocartilaginous disc c. Ligaments (superior, inferior, anterior, and posterior pubic ligaments) d. Myotendinous attachments (anterior abdominal wall and thigh adductor musculature) 3. Pathology of the pubic symphysis on different imaging modalities a. Acute trauma (pubic diastasis) b. Parasymphyseal insufficiency fractures c. Postpartum symphyseal injury d. Athletic pubalgia e. Osteitis pubis f. Osteomyelitis g. Degenerative disease h. Spondyloarthropathy i. Parasymphyseal tumors 4. Treatment considerations

MKEE-8 Bench Press Blowout: Imaging Features Of Pectoralis Major Tears And Review Of Anatomy.

Participants

Peter Cormier, MD, Detroit, Michigan (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review normal imaging anatomy and function of the pectoralis major muscle.2. Understand the types of pectoralis major tears and their imaging appearance.3. Discuss the treatment of pectoralis major tears.

TABLE OF CONTENTS/OUTLINE

A. Normal anatomic appearance and function of the pectoralis major musclea. Describe origins of the clavicular and sternal heads.b. Describe common tendon and insertion site on the bicipital groove of the humerus.c. Describe blood supply, innervation and function of the pectoralis major muscle.B. Tearsa. Illustrate types of tears with relevant examples.b. Correlate imaging appearance with clinical exam and intraoperative images.C. Treatmenta. Factors that differentiate surgical from conservative managementb. Describe operative management.c. Normal imaging appearance status post surgical repair.

MKEE-80   **Beyond Schwannomas And Neurofibromas: A Review Of Benign And Malignant Lesions That Arise In Association With Nerves**

Awards
Certificate of Merit

Participants
Marco Aru, MD, Portland, Oregon (*Presenter*) Nothing to Disclose

TEACHING POINTS

After viewing this exhibit, the learner will be able to:1. List growing number of non-traditional nerve sheath tumors2. Identify entity specific multimodality key imaging features3. Appreciate basic histopathologic findings for each lesion4. Describe entity specific clinical findings5. Understand imaging findings of benign versus malignant entities6. Recognize post-traumatic tumor-like nerve lesions as "do not touch" 7. Discuss technique, risks and benefits of image-guided biopsy of nerve lesions

TABLE OF CONTENTS/OUTLINE

Introduction/background-Brief review of schwannoma and neurofibroma-Case-based review of benign and malignant tumors that arise in association with nerves including:Benign: Nerve sheath myxoma, Morton neuroma, PTEN hamartoma, perineurioma, hybrid nerve sheath tumor, choristoma, lipoma of nerve, intraneural ganglion, vascular malformation of nerve, etc.-Clinical vignette-Key multimodality imaging features-Relevant histopathologyMalignant: Synovial sarcoma, metastases, triton tumor, lymphoma of nerve, etc.-Clinical vignette-Key multimodality imaging features-Relevant histopathology-Review of "do not touch" post-traumatic neurogenic tumor-like lesions-Spindle and terminal traumatic neuromas-Imaging of benign versus malignant entities-Technique, risks and benefits of nerve lesion image-guided biopsy Summary

MKEE-81   **DenosumabInducedChangesinGiantCellTumorofBone:SpectrumOfImagingFindings**

Participants
Guiomar Pique Rey, DIPLPHYS, Tortosa, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

To understand the mechanism of action and treatment indications of denosumab in patients with giant cell tumor of bone. To illustrate the changes of the imaging features induced by denosumab therapy in the giant cell tumor of bone.To correlate imaging and pathological findings.

TABLE OF CONTENTS/OUTLINE

We reviewed retrospectively plain radiographs, CT scans and MR images of 39 patients with denosumab-treated GCT of bone over a ten-year period. GCT of bone is commonly a benign but locally aggressive tumor that is usually seen in the ends of long bones as an osteolytic, expansile, eccentric lesion with a narrow zone of transition. Treatment options include curettage with local adjuvant and complete en-bloc resection which should be considered in case of multiple recurrent or unresectable GCTB, impossible joint salvage, extensive cortex destruction, and extensive soft tissue involvement. Denosumab has become a new treatment option in those cases where surgical removal of the tumor cannot be achieved because it is sited in an inaccessible location, is very extensive, frequently recurrent, or disseminated. On conventional radiographs and CT scans, sclerosis and reconstitution of cortical bone are the most common findings indicating response to treatment. On MR imaging, tumors with pathologically-proved response demonstrate predominantly low signal intensity on T2WI and diminished contrast enhancement. Recognising imaging features indicative of a positive response to denosumab is important for therapeutic decision-making.

MKEE-83   **Give Me A Pulley Long Enough And I Will Move The World: An Ultrasonographic Review Of The Most Frequent Pulley Pathology**

Awards
Certificate of Merit

Participants
Javier Cuetos, MD, Donostia-San Sebastian, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

- To understand the anatomy, function, and biomechanics of finger pulleys.- To become familiar with the normal ultrasound appearance of pulleys. - To understand the force mechanisms that cause a pulley rupture and the static and dynamic ultrasound findings of this pathology.- To know the mechanism underlying the trigger finger, its ultrasound appearance and the bases for percutaneous treatment.

TABLE OF CONTENTS/OUTLINE

Pulley pathology is becoming more prevalent in part due to rock climbing's boom in popularity over the past few decades. The two main pathologies that will be reviewed are the pulley rupture (which mainly affects young climbers) and the trigger finger (more common in patients with a history of repetitive manual work).Given the technological progress of ultrasound devices and their great

definition, pulleys have become visible and valuable anatomical structures by ultrasound.The objective of this presentation is to review the normal ultrasound appearance of the pulleys as well as the underlying mechanism of each of the pathologies and their most characteristic ultrasound findings of each of them in static and dynamic exploration.

MKEE-84   Brach-ing The Rules Of Brachial Plexus MRI: How To Get The Most Out Of Your 3D Imaging

Participants
Michael Villalba, DO, Jacksonville, Florida (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Understand the MRI limitations of assessing brachial plexus lesions.2. Discuss the benefits and limitations of 3D STIR-SPACE sequences in evaluating the brachial plexus.3. Introduce the use of gadolinium-based contrast in 3D STIR-SPACE sequences for MRI of the brachial plexus.

TABLE OF CONTENTS/OUTLINE

- Background on MR Imaging of the Brachial Plexus- Benefits and Pitfalls of 3D STIR-SPACE Sequences- 3D STIR-SPACE Sequence with and without Gadolinium Contrast- Cases: 1. Brachial plexus sarcoma 2. Parsonage-Turner syndrome 3. Evaluate for radiation-induced brachial plexopathy- Conclusion and Summary

MKEE-85   Give Me A Heads Up!: A Primer On Skull Vault Lesions For Radiology Residents On Call

Participants
Carlos Narvaez, MD, Bogota, Colombia (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Skull vault lesions are frequently found incidentally during a routine Head CT. Radiology residents on call must be aware of these entities in order to be capable of distinguishing between which lesions are benign, and which are worth mentioning.-Radiology residents and radiologists need to educate others about these lesions to prevent unnecesary complementary studies.- Skull vault lesions can be classified according to their radiological pattern of bone involvement. They can behave as pseudolesions, lytic, sclerotic, or transdiploic lesions.- Meningioma, metastasis and lymphoma may behave as an intradiploic primary bone lesion, or as a transdiploic lesion originated from intracranial extra-axial soft tissues.- Metastatic lesions are the most common cause of malignant skull vault lesions found.- Recognition of some classical findings is key to assist in the differential diagnosis.

TABLE OF CONTENTS/OUTLINE

Introduction.Anatomic landmarks.Imaging Modalities and its limitations.Classification of skull vault lesions.Case-Based review.Conclusions.

MKEE-86   Pyomyositis And Mimics: Clinical And Imaging Clues To Diagnosis

Participants
Marco Tsuno, Brasilia, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is: 1. To review the pathophysiology, terminology, and classification of infectious myositis. 2. To revise the imaging findings of infectious myositis with different imaging modalities. 3. To discuss the differential entities that can mimic infectious myositis, focusing on pearls and potential pitfalls to make a correct diagnosis.

TABLE OF CONTENTS/OUTLINE

1. Introduction: Terminology, etiology, pathophysiology, clinical features. 2. Classification: Primary and secondary. Invasive phase; Suppurative phase; Late stage. 3. Review of imaging findings: 3.1. Plain radiography; 3.2. US; 3.3. CT; 3.4. Conventional MRI; 3.5. Advanced MRI (Diffusion and perfusion). 4. Other differential diagnosis: 4.1. Inflammatory Myopathy; 4.2. Traumatic soft-tissue injury; Muscular contusion; Intramuscular hematoma; DOMS / Rhabdomyolysis; Myositis Ossificans.4.3. Neoplasm and post-therapy soft tissue changes; 4.4. Myonecrosis. 4.5. Pseudoaneurysm. 5. Conclusion.

MKEE-87   Fat On A Whole New Level. Secondary Findings Aiding Fracture Detection On Radiography And Ct, From Classic To Newly Described Signs.

Participants
Benjamin Comora, DO, Philadelphia, Pennsylvania (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review classic signs aiding fracture detection. 2. Describe soft tissue, marrow and intra-articular findings of fracture on CT. 3. Discuss newly discovered secondary fracture signs on CT. 4. Review imaging findings related to traumatic injury to the marrow fat that may mimic other pathology.

TABLE OF CONTENTS/OUTLINE

1. Fat plane anatomy on radiographs and CT.2. Lipohemarthrosis. a. Technical and anatomical factors. b. Joint-specific considerations. 3. "Fat canvas" analysis to improve fracture detection on single energy (CT) in the setting of osteopenia. a. Common secondary soft tissue findings. b. Marrow analysis ("dripping blood" sign).4. Fat within the tendon sheath and bursae. a. Fat levels in the iliopsoas bursa b. Fat levels in wrist tendons ("floating fat sign"). c. Anatomic considerations and significance of fat-fluid levels in the tendons and bursae at various sites. 5. Post-traumatic fat lesions that may mimic other pathology. a. Pediatric cortical cyst-like lesions: typical clinical and radiographic findings, temporal evolution. b. Intramedullary fat globules: patients' demographics, variation of imaging appearance

MKEE-88   The Other Side Of The Wrist: Ulnar Wrist Pain.

Participants
José Prado, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

The purposes of this exhibit are: 1. To review the normal anatomy of the ulnar aspect of the wrist.2. To evaluate the biomechanics and pathology of common and not so common causes of ulnar wrist pain3. To create a systematic approach for reviewing MRI of these conditions.

TABLE OF CONTENTS/OUTLINE

1 - Basic and relevant anatomy 2 - Traumatic tear of the triangular fibrocartilage complex (TFCC) 2.1 - Traumatic 2.2 - TFC Detachment. 3 - Impingement syndromes 3.1 - Ulnocarpal impingement 3.2 - Ulnar styloid impaction 3.3 - Ulnar impingement syndrome 3.4 - Hamate-lunate impingement 3.5 - Triquetral impingement ligament tear (TILT) lesion 4 - Extensor carpi ulnaris tendon pathology 5 - Fractures 6 - Ulnar neuropathy 7 - Hypothenar hammer syndrome 8 - Ulnar-sided carpal coalition 9 - Inflammatory conditions 10 - Calcific tendinopathy 11 - Systematic approach of MRI findings in ulnar wrist pain

MKEE-89   High Frequency Ultrasound Uses In Botulinum Toxin A Injections: Guidance, Effects And Complications

Participants
Luciana Zattar, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Botulinum Toxin A (BTA) injection is the most common cosmetic procedure performed and its use continues to grow exponentially.In this context, the radiologist may be requested to recognize their usual aspects as well as to assess its possible effects.To achieve accurate and timely detection and appropriate approach of each case, High frequency ultrasound (HFUS/24-33MHz) is the most effective method since it provides optimal anatomical information of the skin and allows skin layers differentiation and changes.This study aims to discuss and illustrate the radiologist's role in the evaluation of BTA with HFUS.The purpose of this exhibit is:- To describe the pre procedure evaluation- To illustrate the anatomy of the skin and facial layers- To show and describe the main image patterns of BTA effects / skin changes- To highlight the importance of HFUS in dynamic evaluation- To propose a practical approach of skin changes in time / surveillance- To show possible complications related to the procedure

TABLE OF CONTENTS/OUTLINE

1.ANATOMY:Skin/facial layers2.PREPROCEDURE EVALUATION3.PROCEDURE4.EFFECTS/SKIN CHANGES EVALUATION AND SURVEILLANCE5.CONCLUSION

MKEE-9   Voriconazole Induced Periostitis: Pictorial Review With Multimodal Characterisation

Participants
Roland White, BMedSc,MD, Adelaide, Australia (*Presenter*) Nothing to Disclose

TEACHING POINTS

This multimodal characterisation of voriconazole induced periostitis is an important educational tool for radiologists and physicians, especially in a subset of the population who are immunosuppressed with haematological malignancy. Voriconazole causes a diffuse, and asymmetric periostitis, usually with a nodular and irregular morphology on imaging. The cognizance of voriconazole and its periosteal reaction morphology is paramount, as this pertinent information in a haematological malignancy subset may allow for differentiation between malignant infiltrate, hypertrophic pulmonary osteoarthropathy, and infection.

TABLE OF CONTENTS/OUTLINE

Voriconazole is a triflurinated azole drug, commonly used in immunosuppressed populations to treat invasive aspergillosis. Post marketing surveillance has identified a rare, painful periostitis secondary to elevated fluoride levels. Fluorine is incorporated into the extracellular matrix of bones in the form of fluroapatite, which increases osteoblastic activity and subsequent exostoses and periostitis. . This essay characterises voriconazole induced periostitis in two patients with haematological malignancy on multiple modalities - x-ray, computed tomography (CT), ultrasound (US), magnetic resonance imaging (MRI) and positron emission tomography (PET).

MKEE-90   Plantar Aponeurosis: Anatomy, Biomechanics And Radiological Spectrum Of Disorders

Awards
Certificate of Merit

Participants
Lucas Silva, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Plantar aponeurosis (PA) disorders cause pain and disability in general population, especially the plantar fasciitis. The plantar fasciitis is the most common PA injury and is estimated to induce more than 1 million patients to seek treatment annually and is usually related to chronic mechanical overload. In addition to plantar fasciitis, there are other disorders that affect the aponeurosis, such as rheumatoid arthritis, hydroxyapatite deposit, xanthoma, plantar fibromatosis, among others. The use of different available imaging methods assists in the correct diagnosis and management of the patient. The purpose of this exhibit is: (1) Review the anatomy, histology and biomechanics of the PA and demonstrate how these fundamentals are important in diagnostic imaging. (2) Demonstrate how the evaluation by different imaging methods can assist in the diagnosis of the various pathologies of the PA. (3) Systematic analysis of plantar aponeurosis injuries and a flowchart propose.

TABLE OF CONTENTS/OUTLINE

(1) Review of the anatomy and histology of the plantar aponeurosis. (2) Biomechanics (3) Physical examination and clinical findings. (4) Indirect findings of plantar fasciitis in plain radiography. (5) Ultrasound and Magnetic Resonance Imaging. (6) Imaging findings of PA injuries: plantar fasciitis, PA tear, plantar fibromatosis, xanthoma, hydroxyapatite deposition, infection and inflammatory diseases. (7) Pitfalls. (8) Systematic approach to aid radiologists in the correct diagnosis of a plantar aponeurosis disorder.

MKEE-91   **Fluroscopic Anatomy For Spine Intervention: With MR And CT Correlation**

Participants
Jee hyeon Lee, PhD, Bundang, Korea, Republic Of (*Presenter*) Nothing to Disclose

TEACHING POINTS

Fluoroscopic image-guided spinal intervention is commonly performed in symptomatic patients to relieve the pain. Knowledge of normal anatomy is required to perform an effective procedure and to reduce possible complication. The purpose of this article is to review elemental fluoroscopic anatomy related to spinal intervention and correlate with MRI and CT to improve understanding of the relevant anatomy.

TABLE OF CONTENTS/OUTLINE

1. Pain intervention 1-1 Epidural steroid injection i. Inter-laminar epidural steroid injection ii. Transforaminal epidural steroid injection iii. Caudal injection 1-2 Intraarticular facet joint injection 1-3 Percutaneous vertebroplasty2. CSF-related procedure 2-1 CSF tapping 2-2 Epidural blood patch3. Discography

MKEE-92   **Bone Lesions: Review Of Imaging Guidelines For Evaluating Treatment Response**

Participants
Alireza Abadi, MD, Mill Creek, Washington (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Comprehensive review of different methods to assess tumor response in bone lesions.• Review guidelines for treatment response assessment in novel therapies including immunotherapy and immunoradiotherapy.• Provide case examples employing the different response criteria.• Provide an overview on the role of radiomics in assessing tumor response.

TABLE OF CONTENTS/OUTLINE

Response criterias:Provide a summary of the available treatment response criteria. Discuss the advantages and disadvantages of each criteria in assessment of tumor response. Lastly, provide imaging examples of how to use the following criteria in daily practice:• WHO criteria• RECIST 1.0 Criteria• RECIST 1.1 Criteria• Choi Criteria• Modified Choi Criteria• MDA Criteria• irRC Criteria• irRECIST Criteria• iRECIST Criteria• PERCIST Criteria• Prostate Cancer Working Group 2 CriteriaGlimpse of the Future:• Novel approaches including quantitative diffusion-weighted MRI• Dynamic contrast-enhanced MRI• Radiomics• Radiogenomics ConclusionRECIST 1.1 is the most commonly used treatment response criteria but several of its shortcomings have become more apparent in clinical practice and in radiology. This exhibit reviews the different available treatment response criteria and explores novel techniques for evaluation of tumor recurrence and response. Radiologist familiarity with these guidelines is important to help provide more accurate reporting of disease status.

MKEE-93   **It'S The Truth. It'S Actual. It'S Only Artifactual - Optimizing Extremity MRI At The Scanner**

Participants
Patricia Ojeda, MD, Seattle, Washington (*Presenter*) Nothing to Disclose

TEACHING POINTS

? Review factors that influence MRI signal-to-noise ratio and acquisition time.? Identify common artifacts encountered on MRI of the extremities.? Demonstrate the modified patient positions detailed in this exhibit to optimize knee, elbow, ankle and shoulder MRI.

TABLE OF CONTENTS/OUTLINE

Outline: ? Factors Impacting MRI, SNR and Acquisition Time 1. SNR a) Small body parts can cause low signal b) Field inhomogeneity compromises signal c) Improper RF coil will lower signal 2) Acquisition Time a) Field-of-view b) Repeat sequence acquisition c) Extraneous sequences ? Common artifacts on MRI of the extremities 1) Motion 2) Magic angle artifact 3) Aliasing/wrap-around artifact 4) Susceptibility artifact ? Knee MRI a) Routine positioning 2) Limitations 3) Recommended Positioning 4) Recommended Technique 5) Benefits ? Elbow MRI a) Routine positioning 2) Limitations 3) Recommended Positioning 4) Recommended Technique 5) Benefits ? Ankle MRI a) Routine positioning 2) Limitations 3) Recommended Positioning 4) Recommended Technique 5) Benefits ? Shoulder MRI a) Routine positioning 2) Limitations 3) Recommended Positioning 4) Recommended Technique 5) Benefits ? Hand/Wrist MRI a) Routine positioning 2) Limitations 3) Recommended Positioning 4) Recommended Technique 5) Benefits ? Foot MRI a) Routine positioning 2) Limitations 3) Recommended Positioning 4) Recommended Technique 5) Benefits

MKEE-94   **Bulking Up - A Review Of Expanding Applications Of Quantitative Imaging Biomarkers Within Musculoskeletal Imaging**

Awards
Certificate of Merit

Participants
Elliot Breshears, MD, Seattle, Washington (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) Review current QIBA Profile claims with musculoskeletal imaging applications. 2) Identify areas of active research and future directions for quantitative musculoskeletal imaging modalities.

TABLE OF CONTENTS/OUTLINE

1) MR-based biomarkers: a) Cartilage Composition (T1?, T2)¦ QIBA Profile claims¦ Current MSK clinical applications¦ Future directions b) Dynamic Contrast-Enhanced (DCE) Imaging¦ QIBA Profile claims¦ Current clinical applications¦ Future directions c) Diffusion-Weighted Imaging¦ QIBA Profile claims¦ Current clinical applications¦ Future directions d) Arterial Spin Labeling¦ Areas of active research e) Diffusion Tensor Imaging (DTI)¦ Areas of active research f) Proton Density Fat Fraction¦ Areas of active research 2) 18F-FDG-PET/CT-based biomarkers: a) Standardized Uptake Value (SUV)¦ QIBA Profile claims¦ Current clinical applications¦ Future directions 3) Ultrasound-based biomarkers: a) Shear Wave Elastography (SWE)¦ Areas of active research b) Pulse-Echo Quantitative Ultrasound¦ Areas of active research

MKEE-95   Soft Tissue Sarcoma: Review Of Imaging Guidelines For Evaluating Treatment Response

Participants
Mehrzad Shafiei, MD, Seattle, Washington (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Review important characteristics of soft-tissue sarcomas for treatment response • Compare the strengths and weaknesses of different treatment response criterias• Review guidelines for treatment response assessment in novel therapies including immunotherapy and immunoradiotherapy.• Provide case examples employing the different response criteria.Provide an overview on the role of radiomics in assessing tumor response

TABLE OF CONTENTS/OUTLINE

1) Review of important tumor characteristics: • Size and tumor burden • Architecture • Vascularity • Metabolic activity • Density and signal intensity 2) Response criterias: Discuss the advantages and disadvantages of the following criteria in assessment of tumor response: • WHO criteria (1981) • RECIST 1.1 criteria (2009) • Modified RECIST criteria (2010)• Choi Criteria (2007) • Modified Choi Criteria (2009)• irRC criteria (2009) • irRECIST criteria (2013) • iRECIST criteria (2017) • PERCIST criteria (2009) 3) Future Perspective: • Novel quantitative modalities like diffusion-weighted MRI and Dynamic contrast-enhanced MRI• Radiomics • Radiogenomics

MKEE-96   Post Knee Arthroplasty Complications: What A Radiologist Should Say.

Participants
Stephen Belmustakov, MD, New York, New York (*Presenter*) Nothing to Disclose

TEACHING POINTS

- To review the different types of knee arthroplasty.- To recognize the role of imaging modalities in detecting post-op complications: radiograph, CT and MRI.- To identify the most common post-op complications.- To describe what should be included on the radiologist's reporting checklist.

TABLE OF CONTENTS/OUTLINE

1- Types of knee arthroplasty: prothesis design, degree of constraint, spacer fixation, posterior cruciate ligament retention vs removal.2- Role of radiology in diagnosing post-op complications. Strategies for imaging of knee arthroplasty, including dedicated metal artifact reduction techniques for CT and MRI.3- Most common knee arthroplasty complications: polyethylene wear (25%), aseptic loosening (24%), instability (21%), periprosthetic joint infections (17%), arthrofibrosis - patellar clunk syndrome (15%), component malalignment (12%), extensor mechanism deficiency (6.6%), avascular necrosis of the patella (4.2%), periprosthetic fractures (2.8%) and recurrent hemarthrosis.Recognize the normal and abnormal imaging appearances of knee arthroplasty. Review of the image findings of the knee arthroplasty complications on different modalities (radiographs, CT and MRI).4- Radiological report. Checklist and description of normal and abnormal post operative findings in a knee arthroplasty case.

MKEE-97   An Imaging Review Of Chronic Overuse Injuries In Cycling

Participants
Elizabeth Carr, BSC,MBChB, Stevenage, United Kingdom (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) A review of the biomechanics and risk factors for cycling overuse injuries 2) Clinical evaluation of cycling-related pathologies 3) Imaging review of common overuse pathologies associated with cycling

TABLE OF CONTENTS/OUTLINE

The popularity of cycling, both amateur and professional, has increased significantly over the past few years. This has led to a subsequent increase in the number of cycling-related injuries. Timely recognition of these pathologies is important as often a small change in bike setup can significantly improve or resolve symptoms.The knee is the most commonly affected site of cycling overuse injury. Cycling-related pathologies affecting the knee include patella tendinopathy, quadriceps tendinopathy, distal iliotibial band syndrome, pes anserine tendonitis, superolateral fat Hoffa's fat pad impingement, biceps femoris tendinopathy, and patellofemoral cartilage wear. Other sites of tendinopathy are also seen in cyclists, including proximal iliotibial band syndrome, Achilles tendinopathy, and wrist tendinopathies.Neuropathies are also seen in cyclists, predominantly of the wrist, foot, and perineum. Vascular complications such as external iliac artery endofibrosis and wrist arterial aneurysms and thrombosis have also been well documented.The aim of this educational poster is to review the imaging findings of chronic overuse injuries in cycling alongside the biomechanics and clinical presentation.

MKEE-98   Oh Yes! Your Problems Are Over! A Practical Guide: Glenohumeral Instability Before And After Surgery And Its Complications.

Participants
Renata Pucci, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this study is:To review the main anatomical structures of shoulder and mechanisms involved in glenohumeral instability.Familiarize radiologist with the common and uncommon imaging findings in shoulder exams before and after surgery to correct glenohumeral instability in different methods such as radiographs, computed tomography and magnetic resonance (MR).Describe the imaging findings in the most diverse methods of new surgical techniques to correct glenohumeral instability.To review the main imaging findings in postoperative complications.

TABLE OF CONTENTS/OUTLINE

Anatomical structures of shoulder.How to correlate anatomical and glenohumeral instability. Location.Coexisting lesions.We will be using cases from our Radiology department (Musculoskeletal Imaging Department) and digital illustrations to teach the main concepts and key imaging features of imaging correlation. Amongst other, our exhibition will contemplate:LatarjetRemplissageBankart repairBristowBristow- LatarjetEden HybinetteComplications

MKEE-99   Patellar Tracking "On The Move": Dynamic MRI And Ultrasound

Awards
Identified for RadioGraphics

Participants
Jiyoon Kim, DO, MS, FORTSON, Georgia (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Patellofemoral pain is highly prevalent and may be associated with patellar maltracking. 2. Patellar maltracking is a consequence of biomechanical imbalance of static and dynamic stabilizers that may involve fixed osseous anatomy, ligamentous dysfunction, and/or dynamic musculotendinous dysfunction.3. By identifying anatomic derangements, diagnostic imaging plays a key role in directing management. Although dynamic evaluation is currently only performed clinically, dynamic MRI and ultrasound may have a role in adding additional diagnostic value.

TABLE OF CONTENTS/OUTLINE

1. ANTERIOR KNEE PAIN a. Magnitude of problem b. Demographics c. Clinical management algorithm2. NORMAL PATELLOFEMORAL TRACKING a. Anatomy - Key anatomic landmarks b. Biomechanics - Static vs. dynamic c. Key imaging metrics3. PATELLOFEMORAL MALTRACKING a. Anatomic risk factors - Common findings b. Pathomechanics - Static vs. dynamic c. Key imaging metrics4. DYNAMIC MRI - How to do it a. MRI technique & key anatomic landmarks b. MRI findings -- normal vs. abnormal5. DYNAMIC ULTRASOUND - How to do it a. Ultrasound technique & key anatomic landmarks b. Ultrasound findings -- normal vs. abnormal

Printed on: 06/28/22

NMMIEE

Nuclear Medicine & Molecular Imaging Education Exhibits

Sub-Events

NMMIEE-1   Nuclear Medicine And Radiological Imaging Of Systemic Sarcoidosis: A Traditional Signs And Advanced Imaging

Participants
Takashi Norikane, Kita-gun, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

The major teaching points of this exhibit are: 1 Knowledge of typical and atypical findings of systemic sarcoidosis on PET and other modalities will avoid misinterpretation for pathologic processes. 2 Knowledge of FDG and other PET tracer imaging provides further findings for radiologists to diagnose accurately.

TABLE OF CONTENTS/OUTLINE

Modality: 18F-FDG PET/CT 11C-methionine PET/CT 18F-fluorothimidine PET/CT 67Ga-citrate scintigraphy 201Tl scintigraphy 123I-ß-methyliodophenyl pentadecanoic acid scintigraphy Involved organ: central nervous system, head and neck lung and thoracic lymph nodes heart abdomen muscle other

NMMIEE-10   Beware Of The Rare: Diffuse Liver Metastasis From Breast Cancer

Participants
Glaucia Oki, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Breast cancer is the second most common cancer in women after skin cancer. The most common breast cancer metastases sites are bones, lungs, brain, and liver. The pattern of liver metastasis most commonly consists of nodules. More rarely, metastatic spread can be so diffuse that it remains radiographically occult, and it should be suspected in case of acute hepatic failure. Liver biopsy has been recommended to confirm the diagnosis in these cases. We present four cases in which diffuse liver uptake of 18F-FDG correlates with hepatic diffuse metastatic disease. 18F-FDG PET/CT has the advantages of simultaneous demonstration of tomographic features, evaluation of metabolic activity, and detection of extra-hepatic lesions. Therefore, 18F-FDG PET/CT may be useful in making the differential diagnosis in cases of acute hepatic failure and may detect unusual patterns of liver metastatic disease. Although the liver is a frequent site of metastasis for many tumors, the diffuse pattern is relatively rare and have been reported in breast carcinoma, malignant melanoma, small cell carcinoma of the lung, gastric carcinoma, and Hodgkin's lymphoma. Diffuse liver metastasis has a very poor prognosis; therefore, early detection, when possible, is required.

TABLE OF CONTENTS/OUTLINE

To review epidemiological data and common sites of breast cancer metastases. To demonstrate diffuse liver metastasis from breast cancer detected by 18F-FDG PET/CT. To enumerate the differential diagnoses of diffuse liver metastasis.

NMMIEE-11   Imaging FDG In GCA, Clearer Than Ever On Digital PET

Participants
Peter George Maliha, MD, Montreal, Quebec (*Presenter*) Nothing to Disclose

TEACHING POINTS

Giant cell arteritis may present with different phenotypes: large vessel only, cranial arteries only or both. These phenotypes may be associated with different clinical outcomes.Recent technological advances have enabled PET/CT scanners to diagnose cranial disease in vessels previously too small to resolve. Previously fluorodeoxyglucose (FDG) PET/CT was only used to assess for large vessel involvement in Giant Cell Arteritis (GCA). It is now possible to diagnose cranial giant cell arteritis due to improved spatial resolution.The most visualized metabolically active cranial arteries in GCA are the vertebral, occipital, maxillary, and temporal arteries.The sensitivity of FDG PET/CT for the detection of GCA is likely decreased with immunosuppressive therapy such as corticosteroids.FDG PET/CT can detect other inflammatory pathologies associated with high ESR/CRP that clinically may present with GCA-like symptoms.

TABLE OF CONTENTS/OUTLINE

- Overview of GCA and the different phenotypes- Overview of the cranial artery anatomy- Overview of new digital PET/CT technology and improved image quality- Case reviews (3 cases) of cranial and large vessel GCA on FDG PET/CT- Overview of 7 alternative diagnoses found on FDG PET/CT when GCA was clinically suspected- Conclusion

NMMIEE-12 Reducing Misinterpretation Of Axillary Lymph Node Uptake On PET/CT Following MRNA COVID-19 Vaccine

Participants
Yael Eshet, MD, MSc, Kiryat Ono, Israel (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Recognize the substantial prevalence of radiotracer uptake on PET/CT after mRNA COVID-19 vaccine 2. Review uptake patterns more suggestive of response to vaccination rather than malignancy involvement 3. Discuss how incorporating practice guidelines can decrease misinterpretation

TABLE OF CONTENTS/OUTLINE

Avid unilateral axillary lymph node uptake has emerged as a major pitfall in patients undergoing PET/CT after receiving vaccinations (up to 45% in a recent publication). Although the lymph node uptake is likely the result of normal immune response, it can be mistaken for pathology, especially in patients referred for staging of breast cancer, melanoma and lymphoma. In this educational paper, we will emphasize methods of reducing misinterpretation, by incorporating practice guidelines and recognizing certain uptake patterns. Practice guidelines include an intake questionnaire to all patients prior to scan, including information regarding date of vaccination dose/s, side of injection, vaccine manufacturer, primary disease and use of immunosuppressive drugs. Imaging variables reducing misinterpretation include uptake in deltoid muscle, involvement of brachial or triangular intermuscular space lymph nodes, lymph node shape, and radiotracer used.

NMMIEE-13 Atlas Of Post-therapeutic Altered Physiologic Activity In 18F-FDG PET/CT Of Patients With Head And Neck Cancer

Participants
Eun Ji Han, Seoul, Korea, Republic Of (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. With physiologic activity being altered by direct removal, compensatory hypertrophy, and muscle denervation after head and neck cancer (HNC) surgery on FDG PET/CT images, it is not easy to differentiate from recurrent tumors when encountering an unfamiliar pattern of FDG uptake in daily practice. In order to interpret post-therapeutic PET/CT accurately, it is necessary to be familiar with various findings of altered physiologic activity. 2. It is important to be familiar with the common patterns of altered physiologic activity according to the types of surgery performed in HNC. 3. Correlation with detailed treatment history and careful review of 2D multiplanar reconstruction (axial, coronal, and sagittal planes) and maximum intensity projection images of the PET/CT study are important to differentiate post-therapeutic altered physiologic activity from recurrent tumor. Precise anatomical evaluation is also needed through correlation with other imaging studies such as enhanced CT and MRI. 4. FDG PET/CT scans taken immediately after surgery have intense uptake making it difficult to detect residual tumor in most cases, although this varies depending on the anatomical location or surgical method.

TABLE OF CONTENTS/OUTLINE

1. Introduction of altered physiologic activity following various types of surgery in patients with HNC. 2. Atlas of various post-therapeutic altered physiologic activity in FDG PET/CT cases and reviews. 3. Description of key points for differentiation from recurrent tumors.

NMMIEE-14 Pictorial Review Of FDG-PET/CT Findings Of Histiocytosis

Participants
Nicola Hughes, MBBCh, Boston, Massachusetts (*Presenter*) Nothing to Disclose

TEACHING POINTS

Histiocytoses are a rare group of disorders with a wide range of clinical and imaging manifestations which can affect any organ system. Knowledge of the classification groups and common imaging characteristics for each group can help guide the radiologist and narrow the differential diagnosis. Histiocytoses are often FDG-avid and there is a potential role for FDG-PET/CT to stage disease and assess treatment response.

TABLE OF CONTENTS/OUTLINE

Histiocytoses are a rare group of hematologic disorders characterized by abnormal proliferation of macrophages, monocytes or dendritic cells. The most recent classification was proposed by the Histiocyte Society in 2016 and includes Langherans-related disorders (L group), cutaneous and myocutaneous disorders (C group), malignant histiocytoses (M group), Rosai-Dorfman disease (R group) and hemophagocytic lymphohistiocytosis and macrophage activation syndrome (H group). With a wide range of imaging findings for over 100 subtypes of histiocytosis, the diagnosis is often challenging for the radiologist. The role of FDG-PET/CT has not yet been well-defined in histiocytosis, however there is potentially a role for staging disease and assessing treatment response, as with other hematologic malignancies. The exhibit will illustrate the range of FDG-PET/CT findings seen in the major classification groups of histiocytic disorders in adults.

NMMIEE-15 The HIDA Scan: A Scintillating Review

Awards
Certificate of Merit
Identified for RadioGraphics

Participants
Julia Mario, MD, Boston, Massachusetts (*Presenter*) Nothing to Disclose

TEACHING POINTS

Indications for HIDA imaging. A comprehensive collection of HIDA cases, including acute and chronic cholecystitis, biliary leak, Sphincter of Oddi dysfunction and more. Important considerations while interpreting HIDA scans. Pitfalls in HIDA interpretation. Effects of Opioids on HIDA imaging. Utility of SPECT/CT in HIDA scanning. How to think while performing physiologic imaging.

What is a HIDA scan? Historical perspective. Physiologic basis of imaging the biliary system using the HIDA scan. Radiopharmaceuticals used in HIDA imaging. Imaging protocol for the HIDA scan. A comprehensive case-based review of HIDA imaging with correlative imaging including ultrasound, CT and Interventional Radiology imaging. Dynamic and static imaging would be used as appropriate to highlight the pathology. Demonstration of various radiographic signs on HIDA, including rim sign and cystic duct sign.

NMMIEE-16 The Utility Of 18F-FES PET In Breast Cancer.

Awards
Cum Laude

Participants
Jeremy Ong, MBBS, Melbourne, Australia (*Presenter*) Shareholder, Telix Pharmaceuticals;Shareholder, Lantheus Holdings

TEACHING POINTS

16a-18F-fluoro-17ß-estradiol (FES) is a novel PET tracer that targets estrogen receptors (ER), enabling non-invasive localisation of ER expressing breast cancer. 18F-fluorodeoxyglucose (FDG) positron emission tomography (PET) imaging targets accelerated glycolysis, a hallmark of malignancy, and is highly accurate in evaluating disease burden but provides limited characterisation about the disease phenotype beyond its presence. ER drives cell growth and proliferation in up to 75% of breast cancers. ER expression has implications for prognosis, treatment and is therefore critical in breast cancer management. Biopsy is currently required to prove ER expression, but this can be confounded by sampling error or heterogenous ER expression over time and across sites of disease.

This exhibit will outline the principles of ER based imaging with FES PET/CT and detail clinical scenarios where FES PET/CT adds value. These include biopsy targeting in recurrent/metastatic disease, problem solving findings on FDG PET/other modalities and staging of FDG negative disease, characterisation of disease heterogeneity when performed with FDG PET and evaluation of the pharmacodynamics of ER targeted treatments.

NMMIEE-17 Tumor Heterogeneity: Implications For Theranostics And Beyond

Awards
Cum Laude

Participants
Jeremy Ong, MBBS, Melbourne, Australia (*Presenter*) Shareholder, Telix Pharmaceuticals;Shareholder, Lantheus Holdings

TEACHING POINTS

Tumor heterogeneity, where one or multiple sites of disease exhibit different molecular characteristics, is a ubiquitous, under-recognised phenomenon in oncology. In current practice, treatment of metastatic disease is often based on features from a single biopsy site, which may explain relatively low response rates to targeted treatments. Positron emission tomography (PET) enables imaging of specific molecular targets. By using multiple tracers, tumor heterogeneity can be detected and characterised. Molecularly targeted treatment is possible by exchanging the imaging radioisotope for a therapeutic radioisotope and this combination is the basis of theranostics. Combined or sequential treatment approaches are more likely to be successful than single agents when tumor heterogeneity is present.

This exhibit will outline the principles of theranostics and characterisation of tumor heterogeneity with PET imaging. The implications of heterogeneity on clinical management will be detailed, with examples incorporating glycolysis, the sodium/iodide symporter, somatostatin receptors, prostate specific membrane antigen and norepinephrine transporters. Visual presentation of tumor heterogeneity on PET/CT imaging is also discussed.

NMMIEE-18 Algorithmic Approach To F18 FDG-PET Uptake Patterns In Retroperitoneal Pathologies: Imaging Findings, Pitfalls And Artifacts

Awards
Certificate of Merit

Participants
Priya Pathak, MBBS,MD, Seattle, Washington (*Presenter*) Nothing to Disclose

TEACHING POINTS

Highlight retroperitoneal anatomy and normal biodistribution of F18 FDG in the retroperitoneum. Review the optimum FDG-PET technique in evaluation of the retroperitoneum. Overview of the FDG uptake patterns in spectrum of benign and malignant retroperitoneal entities, and algorithmic approach to the differential diagnosis. Correlate the uptake patterns of F18-FDG PET of retroperitoneal pathologies to the anatomic imaging. Discuss imaging pitfalls and artifacts.

Introduction FDG-PET indications for retroperitoneal imaging, and its role in initial diagnosis and follow up. Technique FDG-PET technique optimization with intravenous hydration, furosemide, catherization and retrograde bladder filling; bowel cleansing with iso-osmotic solution. Review of urinary, colonic and attenuation correction artifacts. Review of pathologies Primary retroperitoneal lesions: Non-neoplastic Retroperitoneal fibrosis, Erdheim chester disease, Castleman disease, Extramedullary hematopoiesis, Amyloidosis, Lymphangioma. Neoplastic Lymphoma, Sarcomas, Neurogenic tumors, Germ cell tumors, Desmoid. Organ based secondary retroperitoneal lesions: Benign and malignant lymphadenopathy; renal cysts, angiomyolipoma, renal cell carcinoma, oncocytomas, transitional cell carcinoma; ureteric duplication, ureteritis, lymphoma, carcinoma; adrenal pathologies; pancreatitis, pseudocyst, pancreatic neoplasms; duodenal and colonic pathologies; aortitis, dissections, aneurysms, graft infections

NMMIEE-19 Gastroenteropancreatic Neuroendocrine Tumors (GEP-NETs): Case-based Pictorial Review Of The

AJCC 8th Edition Staging System

Participants
Emad Chishti, BS, Lexington, Kentucky (*Presenter*) Nothing to Disclose

TEACHING POINTS

Review the underlying pathophysiology of GEP-NETs. Summarize recent treatment and management guidelines for GEP-NETs. Provide the audience with a case-based pictorial review of GEP-NETs applying the AJCC 8th edition staging system. Review key changes between the AJCC 7th & 8th edition staging system for GEP-NETs.

TABLE OF CONTENTS/OUTLINE

The incidence of neuroendocrine tumors (NETs), among which GEP-NETs are a significant proportion, is rising. Radiologists can benefit from developing familiarity with the staging system of these neoplasms. This educational exhibit will follow the following outline. I. Summary of the epidemiology and pathophysiology of GEP-NETs. II. Overview of anatomic (CT, MRI) and functional (PET, 68Ga-DOTADATE PET/CT, 18F-FDG PET/CT, & 111In-pentetreotide planar imaging, SPECT, SPECT/CT) imaging modalities used in the diagnosis, monitoring, and post-therapy assessment of GEP-NETs. III. Examples of AJCC 8th edition staging system application through case-based presentation of GEP-NETs of varying stages.

NMMIEE-2   Neurolymphomatosis: Insights Into A Uncommon But Important Entity (that Every Radiologist Should Know)

Participants
Sara Hunter, MD, Cleveland, Ohio (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Neurolymphomatosis is defined as direct lymphomatous involvement of cranial nerves, peripheral nerves, or nerve roots. It is considered one of the rarest subtypes of nervous system lymphoma.- The CNS international prognostic index (CNS-IPI) is a risk model which predicts the probability of nervous system relapse in diffuse large B cell lymphoma (DLBCL). Patients with DLBCL involving the adrenals, kidneys, uterus, or testis are at very high risk of nervous system relapse and require CNS prophylaxis at initial diagnosis. Patients with stage III/IV disease or more than one extranodal site of disease are also at elevated risk. - Prognosis for neurolymphomatosis is very poor, with average survival of a few months. Treatment consists of intrathecal methotrexate, systemic chemotherapy, and possibly radiation therapy.

TABLE OF CONTENTS/OUTLINE

- Brief overview of nervous system lymphoma - Neurolymphomatosis definition - Cases with cranial nerve involvement - Cases with peripheral nerve involvement - Factors which increase the risk of neurolymphomatosis - Treatment - Prognosis - Pitfalls

NMMIEE-20   Nuclear Medicine Imaging Of Side Effects And Adverse Events From Chemotherapy And Immunotherapy

Participants
Min Kong, MD, Phoenix, Arizona (*Presenter*) Nothing to Disclose

TEACHING POINTS

. To raise the awareness and familiarity of induced scintigraphic imaging features related to chemotherapy and immunotherapy . To illustrate, through case-based evidence, the expected and unexpected side effects and adverse events of these drugs on Nuclear Medicine imaging with emphasis on PET/CT.

TABLE OF CONTENTS/OUTLINE

Case-based materials, related to chemotherapy and immunotherapy, are presented with Nuclear Medicine imaging in correlation with radiologic cross-sectional imaging. The side effects and adverse events induced by Verurafenib, Pembrolizumab, Ipilimumab, Bevacizumab, Methotrexate, Cyclophosphamide, Nivolumab, and Sunitinib, at different organ systems of the body, are illustrated and discussed. The presented drug-induced side effects and adverse events include cutaneous rash, colitis, hypophysitis, thyroiditis, pancreatitis, duodenitis, enteritis, bowel perforation, pneumonitis, cardiovascular toxicity, synovitis, sarcoid-like manifestations, bullous pemphigoid, polyalgia rheumatica, keratoacanthoma, squamous cell carcinoma, and induced-lymphoma.

NMMIEE-21   F18-fluoroestradiol (FES) PET Imaging For Patients With Estrogen Receptor Positive Breast Cancer: An Illustration Of Cases

Participants
Avanti Gulhane, MD, Seattle, Washington (*Presenter*) Nothing to Disclose

TEACHING POINTS

1.F18-fluoroestradiol (FES), a radiolabeled estrogen analog, allows in vivo visualization of functional estrogen receptors (ER) with positron emission tomography (PET) in patients with breast cancer and is recently FDA approved for clinical use. 2.FES-PET can non-invasively detect ER-expressing tumors throughout the body, obviating the need for multiple invasive biopsies, accurately detect low F18-fluorodeoxyglucose (FDG) avid, poorly differentiated invasive lobular carcinoma, and minimize interpretation errors due to false-positive FDG uptake. 3.FES-PET imaging can assess true ER-positive metastatic tumor burden and guide patient selection for effective treatment with endocrine therapy in combination with CDK 4/6 inhibitors. 4.FES is often retained in the injected vein, extracted and metabolized by the liver, and excreted into the gastrointestinal tract, leading to physiologic high activity at these sites, requiring care in interpreting axillary findings and potentially limiting FES-PET evaluation of abdominal disease. 5.Physiologic FES uptake in uterus can be used as an internal control for image quality assessment.

TABLE OF CONTENTS/OUTLINE

1.Case Physiological FES uptake compared to FDG and potential limitations 2.Graph Average FES SUV in normal tissues 3.Case Higher avidity of FES than FDG in poorly differentiated invasive lobular carcinoma on PET 4.Utility of FES and FDG PET to establish tumor heterogeneity of ER-positive status 5.Case Interval imaging with FDG and FES PET for assessment of response to treatment

NMMIEE-22 18F-FDG Positron Emission Tomography (PET) Based Response Assessment In Malignancies - Current Standards And Evolving Considerations

Awards
Identified for RadioGraphics

Participants
Ashwin Parihar, MBBS, MD, Saint Louis, Missouri (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. 5-point Deauville score is useful for response assessment on interim and end-of-treatment PET and can predict recurrence and survival-related outcomes in lymphomas. 2. PET based response assessment criteria in solid tumors (PERCIST) - provides guidance on analysis requirements for baseline and follow-up PET to ensure comparability of the change in standardized uptake values and describes their thresholds for assessing response. 3. FDG PET is superior to conventional imaging for detection of immune-related adverse events (irAE), especially those (e.g. pneumonitis, colitis, hypophysitis, adrenal insufficiency) that may require cessation of therapy. Pseudo- and hyper-progression are unique patterns that impact management and require prompt identification.

TABLE OF CONTENTS/OUTLINE

1. FDG PET-based response assessment in lymphomas a. Deauville 5PS b. Value of interim, end of treatment PET in HD and NHL c. Incremental value over conventional imaging-based response assessment (e.g. bulky disease, marrow involvement) 2. FDG PET-based response assessment in solid tumors a. Requirements, application of PERCIST 1.0, benefits over RECIST b. PET-based quantitative metrics (e.g. TLG, MTV) in response assessment, predicting outcomes, and prognostication 3. FDG PET-based response assessment in immunotherapy a. Distinct patterns of response: identifying hyper- and pseudo-progression b. Review of immune response criteria (e.g. irPERCIST, LYRIC), interpretation c. Imaging features of iRAE, identification, and significance

NMMIEE-23 18F-Fluoroestradiol (FES) PET/CT: Current Applications And Future Directions

Participants
Sophia O'Brien, MD, Philadelphia, Pennsylvania (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. 18F-Flouroestradiol (18F-FES) is a radiolabeled estradiol analogue PET tracer which targets the Estrogen Receptor (ER)2. In 2020 18F-FES was FDA approved for detection of ER-positive lesions in patients with recurrent or metastatic breast cancer3. Studies have shown many other potential clinical uses of 18F-FES including identifying tumor and metastatic hormone receptor heterogeneity, demonstrating effective ER blockade by ER antagonist therapy, and clarifying FDG-avid findings4. A current clinical trial is investigating the use of 18F-FES to predict response to endocrine therapy in newly diagnosed metastatic breast cancer5. This educational exhibit will detail the above teaching points with image-rich slides, reviewing normal and abnormal 18F-FES PET/CT imaging findings

TABLE OF CONTENTS/OUTLINE

Background Brief review of breast cancer including incidence, cancer deaths, ER expression, and ER-targeted therapies18F-Fluoroestradiol (FES) - Molecular structure, normal distribution, safety profile- In vivo 18F-FES-uptake correlates with in-vitro ER-positive malignancy; - Discordance may indicate non-functional ER expressionCurrent Applications - FDA approval - detection of ER-positive lesions as adjunct to biopsy in patients with recurrent or metastatic breast cancerFuture Directions - Review of in vitro and in vivo studies demonstrating multiple potential clinical applications of 18F-FES as well as its limitations - Review of ongoing clinical trial(s) of FES at the time of exhibit submission

NMMIEE-24 Theranostics In Pediatric Neuroendocrine Malignancies: An Illustrated Review.

Participants
Aeman Muneeb, MBBS, Galveston, Texas (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Pathophysiology underlying neuroendocrine malignancies that are used as the basis for radionuclide imaging in children.2. Illustrate I-123 MIBG, Octreoscan, Ga-68 DOTATATE and F-18 FDG PET/CT findings in pediatric neuroendocrine tumors.3. Discuss therapeutic nuclear medicine options, including I-131 MIBG therapy and Lu-177 DOTATATE.

TABLE OF CONTENTS/OUTLINE

1. Overview of molecular mechanisms.2. SPECT imaging with MIBG and Octreoscan(Physiologic distribution, review of cases, correlative anatomic imaging)3. Ga-68 DOTATATE PET and FDG PET(Physiologic distribution, review of cases, correlative anatomic imaging)4. Therapeutic Nuclear Medicine (I-131 MIBG, Lu-177 DOTATATE)5. Future Directions (At-211 based therapies)

NMMIEE-25 Musculoskeletal Applications Of SPECT-CT In The Post-operative Patient Using A Novel 360 Degree Gamma Camera.

Participants
Robert Foley, MBBCh, Bath, United Kingdom (*Presenter*) Nothing to Disclose

TEACHING POINTS

SPECT-CT is an imaging technique that has a multitude of potential uses in the postoperative orthopedic patient. The aim of this educational exhibit is to demonstrate the clinical utility of a novel imaging technique, using a 12-headed gamma camera, in the investigation of a variety of important diagnoses in this patient population.

TABLE OF CONTENTS/OUTLINE

1. Biological and physical mechanisms of SPECT imaging.2. SPECT imaging options; radiotracer and gamma camera.3. Novel SPECT-CT gamma camera technique.4. SPECT-CT Protocol. 5. Clinical indications for SPECT-CT in the postoperative orthopedic patient.6. Pictorial review of patient cases and summary of the key evidence.

NMMIEE-26 PET/MRI Applications In Gynecologic Oncology

Awards
Certificate of Merit

Participants
Paul-Robert Derenoncourt, MD, Saint Louis, Missouri (*Presenter*) Nothing to Disclose

TEACHING POINTS

PET/MRI is becoming increasingly available and provides physiologic information from the PET with accurate localization to high soft-tissue contrast images from MRI. PET/MRI plays an important role in staging and assessing treatment response in patients with uterine and cervical cancers. PET/MRI is also useful in vulvar and vaginal malignancies since these primaries tend to be highly FDG avid. PET/MRI has limited role in ovarian malignancies but might be used as a problem solving tool in patients with indeterminate lesions, or patients with negative CT scan and persistent concern for disease recurrence.

TABLE OF CONTENTS/OUTLINE

Review of instrumentation and techniques Role of FDG PET/MRI in specific malignancies: Endometrial cancer Cervical cancer Ovarian cancer Vaginal cancer Vulvar cancer Future directions

NMMIEE-27 Hepatobiliary And Pancreatic Applications Of PET/MRI

Participants
Paul-Robert Derenoncourt, MD, Saint Louis, Missouri (*Presenter*) Nothing to Disclose

TEACHING POINTS

• PET/MRI combines physiologic information with superior soft-tissue contrast resolution from MRI.• In primary biliary pathologies, PET/MRI can assess disease severity, screen for malignancies, namely cholangiocarcinoma, delineate local tumor extent and regional spread, and assess response to treatment.• In hepatocellular carcinoma, PET/MRI can be useful in staging, as well as assessing treatment response after liver-targeted and systemic therapy.• In pancreatic tumors, PET/MRI can aid in the characterization and local staging, particularly of adenocarcinomas and neuroendocrine neoplasms, in addition to assessing spread to lymph nodes, metastatic disease in the liver, and evaluating treatment response.• In patients with colorectal and other malignancies, PET/MRI also plays a role in detecting liver metastases and evaluating response to treatment.• In patients with liver transplant, PET/MRI can be used for detecting recurrent HCC, recurrent sclerosing cholangitis, and post-transplant lymphoproliferative disorders.

TABLE OF CONTENTS/OUTLINE

• Introduction on PET/MRI techniques, clinical workflow, and reimbursement issues• Hepatobiliary and pancreatic applications of PET/MRI:o Cholanigocarcinomao Hepatocellular carcinomao Metastatic liver diseaseo Pancreatic ductal adenocarcinomao Pancreatic neuroendocrine neoplasms• Emerging tracers and applications

NMMIEE-28 Pediatric Body PET/MRI: A Pictorial Review Of The Most Common Applications

Participants
Paul-Robert Derenoncourt, MD, Saint Louis, Missouri (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Body PET/MRI is increasingly used in oncologic and non-oncologic applications in the pediatric population.• Oncologic applications include solid tumors, hematologic malignancies and patients with high-risk lesions such as plexiform neurofibromas.• Non-oncologic applications include congenital hyperinsulinism with F-DOPA PET/MRI, infectious and inflammatory processes, and cardiac applications.

TABLE OF CONTENTS/OUTLINE

• Background with focus on special considerations and challenges of pediatric body PET/MRI• Oncologic body applications of PET/MRI in the pediatric population:-Solid tumors, with emphasis on sarcomas-Hematologic malignancies, with emphasis on lymphoma-High-risk patients with plexiform neurofibromas• Non-oncologic body applications of PET/MRI in the pediatric population:-PET/MRI for other infectious and inflammatory processes-PET/MRI in congenital hyperinsulinism using FDOPA

NMMIEE-29 Unusual Sites Of Prostate Cancer Recurrence, Incidental Second Primary Malignancies, Physiological Variants And Pitfalls On F18-fluciclovine PET/CT - A Pictorial Review.

Participants
Ahmed Ebada Salem, MBBCh,MSc, Salt Lake City, Utah (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To briefly review the role of F18-Fluciclovine in the evaluation of recurrent prostate cancer and its biologic distribution2. Discuss physiologic variants of distribution and common pitfalls3. Present a pictorial review of unusual sites of recurrence and incidental tumors identified on F18-Fluciclovine PET/CT

TABLE OF CONTENTS/OUTLINE

1. Discussion of role of F18-Fluciclovine in evaluating recurrent prostate cancer status post prostatectomy or prior radiation treatment. 2. Describe the technique of performing the F18- Fluciclovine PET/CT and normal biodistribution of the tracer. List of criteria to interpret the imaging findings will be included.3. Describe the physiologic variants of tracer distribution and common pitfalls. Uptake within the ganglia is a common pitfall on these studies. Uptake can be seen in the sacral or lumbar ganglia as well as within the celiac or superior mesenteric ganglia.4. A broad range of unusual sites of metastatic disease - either in isolation or in combination with other usual sites of metastatic disease will be presented, including metastatic disease to hilar nodes, inguinal nodes, intraluminal urinary bladder metastatic implant etc. 5. Incidental primary malignancies and other conditions identified on F18-fluciclovine PET/CT, including primary lung malignancy, meningioma, renal oncocytoma will be included.

NMMIEE-3 The Light From The Unknown - PSMA PET/MR Staging For Prostate Cancer

Participants
juana martinez, MD,MD, NEW YORK, New York (*Presenter*) Nothing to Disclose

TEACHING POINTS

Teaching points• Prostate specific membrane antigen is overexpressed in prostate cancer cells making it an ideal radiotracer. • Benefits of using PSMA PET include enhanced localization of cancer for image guided biopsy and focal therapeutic intervention• Small prostatic lesions detected by the PSMA PET are better anatomically characterized on MR than CT, which potentially would result in upstaging the patient and alter clinical management.

TABLE OF CONTENTS/OUTLINE

Table of Contents/Outline1. Background - The importance of proper staging of prostate cancer at diagnosis and biochemical recurrence. 2. Introduction - What is PSMA? Why PSMA PET/MR and not just MR or PSMA PET/CT? 3. Technique - How to read PSMA PET/MR for staging at diagnosis. Differentiating physiologic activity from pathologic activity. Staging PSMA PET/MR at biochemical recurrence. 4. Conclusions.

NMMIEE-31 State Of The Art PET Imaging In The Pediatric Nuclear Medicine Clinic. An Overview.

Participants
Mehdi Djekidel, MD, Doha, Qatar (*Presenter*) Nothing to Disclose

TEACHING POINTS

PET use is limited in pediatrics compared to adults due to a different tumor landscape and cancer biology. Developments in hardware, software and FDA radiopharmaceutical approvals are changing this paradigm. Newer scanners and novel artificial intelligence algorithms promise a lower dose. Faster scanning will also decrease the need for sedation.

TABLE OF CONTENTS/OUTLINE

Oncology: FDG-PET is established in pediatric lymphomas and is the standard of care in Hodgkin Lymphoma. Early PET response has prognostic significance and is used to modulate/deescalate therapy and reduce late side effects. FDG-PET helps in other pediatric cancers such as sarcomas, germ cell tumors, langerhans cell histiocytosis and GIST. Gallium DOTATATE and Copper DOTATATE have a high sensitivity and accuracy in neuroblastomas, neuroendocrine tumors, insulinomas and meningiomas. FDOPA PET is useful in pheochromocytomas/paragangliomas. FDG has a role in malignant disease (50% of cases in peds vs 30% in adults). FDOPA also helps in brain tumor cases to evaluate for recurrence vs radiation treatment changes. In medullary thyroid cancer; FDOPA PET is the agent of choice at delineating the extent of disease. FDG PET is prognostic. Non Oncology: FDOPA PET is the gold standard in congenital hyperinsilunism. FDG is used in fever of unknown origin, implantable device infections, systemic inflammatory conditions, medically refractory epilepsy patients and encephalitis. Ammonia and rubidium PET myocardial perfusion imaging can be used in select cases to evaluate ischemia.

NMMIEE-32 PSMA-PET For Initial Staging Of Prostate Cancer

Awards
Certificate of Merit

Participants
Daniela Ferraro, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

I. Review risk assessment, TNM staging and patterns of disease spread of prostate cancer II. Comprehend PSMA expression in primary prostate cancer and its correlation to PSMA-PET semiquantitative parameters III. Present relevant imaging information for TNM assessment IV. Discuss the potential impact of staging PSMA/PET on patient management

TABLE OF CONTENTS/OUTLINE

1. Risk assessment, TNM staging and patterns of disease spread 2. PSMA expression in prostate cancer a. PSMA-expression and Gleason score b. PSMA-negative tumours c. Semiquantitative parameters 3. Relevant PSMA-PET information for TNM assessment (initial staging) a. Local staging i. primary tumour detection and localization ii. extraprostatic extension iii. multifocal tumour b. Nodal staging i. regional nodes ii. distant nodes c. Distant metastasis i. bone metastasis ii. visceral metastasis 4. Potential impact on patient management a. Change of therapy modality iii. Local vs. systemic b. Approach of N-disease iv. Major changes: surgery vs. radiotherapy v. Minor changes: surgical approach and radiotherapy field c. Approach of M- disease vi. Oligometastatic vs. polymetastatic

NMMIEE-33 Evaluation Of Vascular Graft Infection Using FDG-PET/CT

Participants
Yoshitaka Toyama, MD, Sendai, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

Vascular graft infection (VGI), although rare, carries a high risk of mortality. VGI is diagnosed by a combination of clinical, laboratory, and radiological findings. 18F-FDG PET/CT is the most valuable tool for assessing and diagnosing VGI. The methods for evaluating VGI using 18F-FDG PET/CT include assessing the intensity and pattern of uptake of FDG, and quantitative values. The combination of these methods and conventional evaluation method using CT can improve diagnostic accuracy. Unfortunately, however, 18F-FDG can also accumulate in non-infected grafts.

TABLE OF CONTENTS/OUTLINE

(1)Epidemiology of VGI (2)Current Criteria for the Diagnosis of VGI (3)Diagnosis of VGI using FDG-PET/CT (4)Pitfalls

NMMIEE-34 Practical Approach To Read A Brain FDG PET Scan In Suspected Dementia.

Participants
Magali Hovsepian, MD, Capital Federal, Argentina (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To learn the normal 18F-FDG biodistribution in the healthy brain. 2. To review current indications of brain PET scan in suspected dementia. 3. To review recommendations regarding patient preparation. 4. To learn a practical step-by-step approach to read a brain FDG PET scan. 5. To recognize characteristic metabolic patterns in the most common causes of dementia.

TABLE OF CONTENTS/OUTLINE

Dementia is a devastating disease, increasingly affecting aging population. Alzheimer disease (AD) is the most common cause of dementia (50-60%), but frontotemporal dementia (FTD) and dementia with Lewy bodies (DLB) are also frequent. Clinical and psychological test are often not completely reliable, and imaging biomarkers represent an essential aspect in the workup of this patients. Our exhibit proposes a practical approach to interpret a brain FDG PET scan in suspected dementia, illustrating the normal and abnormal patterns of brain glucose metabolism, and highlighting the characteristic metabolic patterns seen in the most common causes of dementia. TABLE OF CONTENTS: 1. Before brain PET, other common neurological conditions have to be ruled out with clinical evaluation and brain MRI. 2. Patient preparation before brain PET acquisition. 3. Normal brain FDG biodistribution. Key anatomic areas to review. 4. Step-by-step approach for interpreting brain PET scan. Recognition of typical metabolic patterns of the most frequent causes of dementia.

NMMIEE-35 PSMA-RADS: Looking For The Perfect Pattern

Participants
Paula Fernandes I, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Brief review of the PET-PSMA technique and guidelines. • List the main PET-PSMA imaging findings in patients with prostate cancer (PCa). • Describe the use of PSMA-RADS in cases of PCa.

TABLE OF CONTENTS/OUTLINE

• Introduction: A brief review of the PET-PSMA indications. • PET-PSMA protocol and technique. • Description of the PSMA-RADS categories with illustrated teaching cases from our department. • Prospects and challenges of using the PSMA-RADS classification.

NMMIEE-36 Uncommon Lymph Node Metastasis Of Prostate Cancer: Who Are They?

Participants
Larissa Gloria, BMedSc, Campos Dos Goytacazes, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Review epidemiological data about uncommon sites of prostate cancer (PCa) lymph node metastasis. We must show a case-based review illustrating 68Ga-PSMA findings from uncommon sites of lymph node metastasis from PCa in the post-prostatectomy follow-up during three years in a single institution.

TABLE OF CONTENTS/OUTLINE

Prostate cancer (PCa) metastasis increases the risk of cancer-specific mortality. In this context, it is well established that, beyond regional lymph nodes, the skeleton represents the most common metastatic site. However, recent observations suggest that some men with PCa might be affected by uncommon metastasis in the post-radical prostatectomy follow-up, defined as metastasis located at sites other than bone and regional lymph nodes. However, these findings were based on historical institutional series evaluating a small number of patients. Since the knowledge of the sites of metastasis is essential for therapeutic planning, our study aimed to report a series of cases in which atypical sites of PCa lymph node metastasis were detected by PET / CT with 68Ga-PSMA. Frequently some nomograms, for example, "The Briganti nomogram", and the recurrence of PCa are investigated by images of the prostate, such as computed tomography, magnetic resonance, and bone scintigraphy. However, this approach has limited sensitivity, particularly at low PSA levels. Therefore, PET / CT with 68Ga-PSMA has an effective role not only in detecting PCa metastasis but also in prognosis and treatment planning, defining an effective therapy.

NMMIEE-37 All That Glitters Is Not Gold: The Importance Of The Musculoskeletal Findings In Nuclear Medicine Imaging

Participants
Irline Cordeiro de Macedo Pontes, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Musculoskeletal alterations can be found in the different methods of nuclear imaging, from skeletal scintigraphy to Positron emission tomography-magnetic resonance imaging (PET-MRI). Therefore, the aim of this exhibit is to:1. Identify the most important nuclear imaging methods in the evaluation of the musculoskeletal system.2. Summarize the main indications of nuclear imaging in the assessment of musculoskeletal alterations.3. Correlate different imaging alterations, ranging from inflammatory and metabolic diseases to tumors in both magnetic resonance imaging (MRI) and nuclear imaging methods.4. Identify pitfalls in regard to musculoskeletal alterations in nuclear imaging.

TABLE OF CONTENTS/OUTLINE

Introduction the importance of nuclear imaging in the musculoskeletal system.Main imaging methods and their indications in musculoskeletal alterations, including- Skeletal scintigraphy.- Positron emission tomography/ magnetic resonance imaging (PET/ MRI).- 18F-FDG PET/CTCorrelation between nuclear imaging, MRI and computer tomography (CT)- Inflammatory alterations.- Metabolic diseases.- Infectious processes.- Bone tumors.Pitfalls- Physiological versus pathological uptake of the radiopharmaceuticals

NMMIEE-38 10 Real-life Radioisotope Safety Scenarios: With Great Power Comes Great Responsibility!

Participants
Harit Kapoor, MD, Dallas, Texas (*Presenter*) Nothing to Disclose

TEACHING POINTS

After viewing this fun yet informative presentation, the learner will be able to (i) Identify key issues/concerns related to selected typical "real-life" radioisotope safety situations, and (ii) Describe appropriate responses/actions in keeping with updated NRC guidelines.

TABLE OF CONTENTS/OUTLINE

Table of Contents / Planned Scenarios 1. 1) Inspection by state/federal nuclear regulatory agency 2. 2) Malfunctioning dose calibrator 3. 3) Dosage threshold for required Written Directive 4. 4) Precautions related to therapeutic radioiodine administration 5. 5) Discrepancy in therapeutic radioiodine dosage compared to prescribed dosage 6. 6) Wrong radiopharmaceutical administration 7. 7) Breastfeeding patient undergoing diagnostic nuclear scan 8. 8) Radiopharmaceutical injection site extravasation 9. 9) Surgery planned after radiopharmaceutical administration 10. 10) Radiopharmaceutical spill in the "hot lab"

NMMIEE-39 Theranostic Approach In Breast Cancer

Participants
Majid Assadi, MD, Bushehr, Iran, Islamic Republic Of (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To highlight potential of theranostics in the treatment of breast cancer 2. To review potential biological targets that can be used for a theranostic approach in breast cancers 3. To review recent advancements in new theranostic pairs for a theranostic approach in breast cancer

TABLE OF CONTENTS/OUTLINE

1. Overview of potential biological targets for a radiotheranostic approach for treating breast cancer 2. Overview and highlight the usefulness of Human Epidermal Growth Factor Receptor type two (HER-2) for theranostic oncology using 177Lu-trastuzumab 3. Overview and highlight the usefulness of Somatostatin receptors (SSTR) for theranostic oncology using 177Lu-DOTATATE. 4. Overview and highlight usefulness of fibroblast activation protein inhibitors (FAPIs) for theranostic oncology using 177Lu-FAPI

NMMIEE-4 Imaging Workup Of Primary Megaureter In Infants: With Focus On Renal Scintigraphy

Participants
Hedieh Khalatbari, MD, Seattle, Washington (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) Ureteral dilatation. A descriptive term for ureters with a luminal diameter of =7 mm. In well-hydrated neonates, normal ureters up to 3-4 mm may be seen transiently on ultrasound due to peristalsis. Ureteral dilatation may be due to intrinsic or extrinsic ureteral abnormalities that result in primary or secondary megaureter (MU) respectively. A primary MU is diagnosed once etiologies of a secondary MU have been excluded.2) Primary MU classification. a) An obstructive MU is usually due to an aperistaltic juxtravesical segment of ureter. b) A refluxing MU is due to a short intravesical course of the distal ureter resulting in vesicoureteral reflux; this is typically present with higher grades of vesicoureteral reflux. c) A nonobstructive and nonrefluxing MU is postulated to be secondary to a maturational imbalance between urinary production and the caliber of the outflow tract. d) An obstructive and refluxing MU is uncommon. 3) Postnatal anatomical imaging. Ultrasound, voiding cystourethrogram, and renal scintigraphy have complementary roles in diagnosing and classifying a primary MU. Renal scintigraphy determines split renal function and drainage of the upper urinary outflow tracts.4) Management. In contradistinction to secondary obstructive MU, most patients with primary obstructive MU will not require surgical intervention.

TABLE OF CONTENTS/OUTLINE

I. Introduction II. Embryology III. Ureteral dilatation IV. Imaging evaluation a. Ultrasoundb. Voiding cystourethrographyc. Renal scintigraphy V. Management VI. Conclusion

NMMIEE-40 A Multisystem Case-Based Review Of Immunotherapy-Related Adverse Events On 18F-FDG PET-CT

Participants
Mark Ehrhart, MD, Albuquerque, New Mexico (*Presenter*) Nothing to Disclose

TEACHING POINTS

The Increasing use of immunotherapy in oncology necessitates an understanding of immunotherapy-related adverse events (irAEs). Oncologic imagers can play a pivotal role in early identification of irAEs, which allows for prompt treatment of these adverse events or other necessary modifications to the oncologic therapy regimen. After reviewing this presentation, the learner will have an improved understanding of the: 1) Most commonly used checkpoint inhibitors. 2) More commonly encountered irAE in cases of PD1 inhibitors. 3) More commonly encountered irAE in cases CTLA-4 inhibitors.

TABLE OF CONTENTS/OUTLINE

Background including immunotherapy medication mechanisms of action, and common terminology criteria for adverse events Multisystem case-based review of irAE on 18F-FDG PET/CT including neurological, pulmonary, cardiovascular, abdominopelvic, endocrinological, musculoskeletal, etc.

NMMIEE-41 Motion Correction And Data-Driven Gating In PET/CT

Participants
Allan Thomas, PhD, Spring, Texas (*Presenter*) Nothing to Disclose

TEACHING POINTS

Respiratory motion and misregistration are well-established issues in PET/CT. Both problems can lead to poor PET quantitation and limited diagnostic confidence. Both external device and data-driven gating (DDG) techniques are available to minimize the effects of motion and improve the utility of PET/CT. This exhibit shows how motion and misregistration can impact the clinical value of PET/CT. It explains how data-driven gated PET/CT, which utilizes appropriate gating methods and related analysis of PET and CT data, can provide for motion correction and improved PET/CT registration. The benefits to the clinical applications of PET/CT for improved diagnostic confidence and PET quantitation are also highlighted. Finally, guidance is provided on how to implement advanced PET/CT protocols that include gating with minimal impact on clinical workflows.

TABLE OF CONTENTS/OUTLINE

Slide 1: Clinical examples of motion-induced issues in PET/CTSlide 2: Explanation of gating techniques, specifically DDG methods for PET and CTSlide 3: Clinical examples of improvements from average CTSlide 4: Clinical examples of improvements from DDG PET/CTSlide 5: Flowchart comparing clinical workflows to address PET/CT misregistration; clinical data showing benefits and impact of using average CT and DDG PET/CT to address motion issues

NMMIEE-42 Amino Acid PET-MRI In Gliomas: A Review From Molecular Principles To Clinical Applications

Participants
Hossein Shooli, MD, Bushehr, Iran, Islamic Republic Of (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To review the role of amino acids in intracellular metabolism.2. To review and compare transport mechanisms of natural and radiolabeled aminoacids for transport across the blood brain barrier (BBB).3. To review and compare different amino acid PET tracers for imaging gliomas. Toreview clinical indications for PET imaging in patients with glioma.4. To highlight usefulness of amino acid PET/MRI in clinical settings throughreviewing case series of glioma patients.5. To review recommended cutoffs for amino acid PET tracers in glioma imagingaccording to joint EANM/EANO/RANO/SNMMI recommendations.6. To review diagnostic performance of amino acid PET tracers for clinicalapplications using meta-analyses.

TABLE OF CONTENTS/OUTLINE

I. Overview and comparison of transport, uptake, and metabolism between naturaland radiolabeled amino acids.II. Overview of transport principles for natural and radiolabeled amino acids acrossthe BBB and their uptake/efflux mechanisms via cells.III. Overview of indications for PET scan in glioma imaging according to jointEANM/EANO/RANO/SNMMI recommendations.IV. Highlighting the usefulness of amino acid PET/MR in different clinical settingthrough reviewing some case series.V. Overview of recommended cutoffs for amino acid PET tracers in glioma imagingaccording to joint EANM/EANO/RANO/SNMMI recommendations.VI. Overview of diagnostic performance of amino acid PET tracers in differentclinical applications using available meta-analyses.

NMMIEE-43 Incidental Benign And Malignant Male Breast Pathology Detectable On Multi-Tracer Positron Emission Tomography/Computed Tomography (PET/CT): A Pictorial Review.

Participants
Sonya Khan, MD, Fullerton, California (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Familiarity with incidental male breast findings detectable on positron emission tomography/computed tomography (PET/CT) is key, particularly in determining which findings require additional work-up and which do not. This understanding is increasingly complicated by the emergence of newer, FDA-approved PET agents, which, in addition to F-18 fluorodeoxyglucose (FDG), localize to both benign and malignant male breast pathology.2. Benign gynecomastia, an increasingly common finding in pediatric and adult male patients, has a highly variable appearance and degree of tracer uptake on PET/CT—capable of mimicking or masking malignancy.3. Misinterpretation of PET radiotracer uptake in the male breast can result in inappropriate recommendations (including loss of patient/referring-provider confidence and poor resource utilization) or missed cancers.

TABLE OF CONTENTS/OUTLINE

1. Case-based review of incidental adult and pediatric male breast pathologies detectable on PET imaging performed at three teaching institutions with various agents, including:a. Rb-82;b. F-18 DCFPyL PSMA;c. NaF-18;d. FDG.2. Presentation of multimodality imaging correlates (SPECT, PET, MRI, ultrasound, CT, mammography) for each reviewed pathology.3. Evidence-based management, as relates to each pathology, including genetic and syndromic considerations, outlining appropriate patient-centered recommendations for the interpreting physician to make following accurate imaging interpretation.

NMMIEE-44 Troublesome Musculoskeletal Findings In The Workup Of Oncologic Patients Using Nuclear Medicine Studies

Participants
Fabiano N. Cardoso, MD, Miami, Florida (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is to: 1. Present a pictorial review of common and uncommon musculoskeletal benign pathologies that can mimic metastases on nuclear medicine studies and lead to unnecessary invasive procedures.2. Illustrate normal musculoskeletal variants that can be encountered in the routine evaluation of oncologic patients that could lead to misinterpretation by a general radiologist or a nuclear medicine physician.

TABLE OF CONTENTS/OUTLINE

• Introduction: Brief description about the increasing relevance and clinical utility of nuclear medicine studies in the workup of the oncologic patient. Provide a general overview about the normal pattern of uptake and distribution of the most commonly used radiopharmaceuticals in bone scintigraphy, SPECT/CT or PET/CT studies of oncologic patients. Present an illustrative review of the imaging findings of normal musculoskeletal variants and benign musculoskeletal disorders on bone scintigraphy, SPECT/CT, and

PET/CT studies, and how correlate them with other commonly available radiology exams, in order to avoid unnecessary procedures or further redundant, and costly, studies. Discussion with key points and take-home messages about frequently encountered musculoskeletal pitfalls and how to avoid mistake them for metastases. • Conclusions. • Bibliographical references.

NMMIEE-45 Neurological PET-CT Findings In Diseases Related To COVID-19

Participants
Milena Ouchar Sabino, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Describe neurological PET - CT imaging findings in patients after COVID-19 disease.- Describe the metabolic features of COVID-19 related diseases in FDG-positron-emission tomography (PET) / computed tomography (CT) imaging.

TABLE OF CONTENTS/OUTLINE

- Briefly describe normal uptake of FDG on encephalic structures.- Discuss the FDG uptake pattern in metabolic abnormalities on brain PET/CT: cases of encephalitis, memory loss, dementia associated with psychotic delirium and decreased level of consciousness, intraparenchymal cerebral hemorrhage, fever of unknown origin.- Atypical imaging appearance: pitiful and red flags on differential diagnosis.

NMMIEE-46 PSMA PET/MR For The Detection And Initial Staging Of Prostate Cancer And Its Impact To Patient Management

Awards
Magna Cum Laude

Participants
Adriano Basso Dias, MD, Toronto, Ontario (*Presenter*) Nothing to Disclose

TEACHING POINTS

Understand the role of PSMA PET/MR in the detection and local staging of clinically significant prostate cancerAssess the impact of PET/MR in the staging of nodal and distant metastatic diseaseRecognize the importance of PET/MR in the evaluation of disease burden (oligometastatic vs extensive disease)Highlight the implications of PET/MR on patient management

TABLE OF CONTENTS/OUTLINE

Principles in PSMA imaging Clinical indications for PSMA PET based on current guidelines Reporting systems proposed for prostate cancer staging (Prostate Cancer Molecular Imaging Standardized Evaluation - PROMISE) and lesion characterization (PSMA Reporting and Data System - PSMA-RADS)Impact of PET as an adjunct to multiparametric MRI on primary tumor detection and local staging PSMA PET/MR in primary staging of nodal and distant metastatic disease and for assessment of disease burden in comparison with conventional imagingImplications of PET/MR on disease management (locoregional vs systemic treatment vs targeted ablative metastasis-directed therapies) Therapeutic opportunities in the oligometastatic disease setting (targeted metastasis-directed ablative therapies). Case-based review with emphasis on changed management after PSMA PET/MR

NMMIEE-47 Pheochromocytoma And Paraganglioma: The Latest On This "Hot" Theranostic Topic

Awards
Certificate of Merit

Participants
Laszlo Szidonya, MD, PhD, Portland, Oregon (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Recognize the multiple germline mutations associated with pheochromocytomas and paragangliomas (PPGLs), and the known associated imaging phenotypes.2. Discuss the radiotracers used for functional imaging of PPGLs, and the role of each.3. Discuss the available radionuclide therapy options for non-resectable or metastatic PPGLs.

TABLE OF CONTENTS/OUTLINE

1. The three clusters of germline mutations associated with PPGL:a. Pseudohypoxia: including SDHx, VHL mutationsb. Kinase signaling: including NF1, HRAS, RET mutationsc. Wnt signaling2. Functional imaging:a. Indicationsb. Radiotracers used, and how the imaging phenotype is affected by the mutations detailed abovei. Tracers of the catecholamine pathways (focus on 123I-MIBG)ii. Tracers targeting somatostatin receptors (68Ga/64Cu -DOTATATE)iii. Metabolic imaging (18F-FDG)iv. Proposed imaging algorithm based on the germline mutation and tumor location3. Available radionuclide therapies, with a personalized medicine approach:a. How to decide on the most appropriate therapyb. Available therapies:i. 131I-MIBG (Azedra ®), FDA approved for non-resectable or metastatic PPGLsii. 177Lu-DOTATATE (Luthatera ®), FDA approved for gastro-entero-pancreatic neuroendocrine tumors, is an off-label therapeutic optionc. For each therapy:i. Patient eligibilityii. Pre-therapy dosimetry /dose determination (unique for 131I-MIBG)iii. Therapy administrationiv. Side effects and potential complications

NMMIEE-48 PET CT Simply Makes It Accurate: PSMA What You Need To Know, Pearls And Pitfalls

Participants
Aaron Perez Segovia, MD, Mexico City, Mexico (*Presenter*) Nothing to Disclose

TEACHING POINTS

To identify the physiological distribution of 68Ga-PSMA-11 and 18F-PSMA-1007To know the indications of PSMA PET CT in prostate cancerTo review examples of prostate cancer imaging in PET CTTo identify benign and malignant conditions that exhibit PSMA uptakeTo know what to do in dedifferentiate or PSMA negative prostate tumorTo recognize the Pitfalls in PSMA PET CT prostate imaging

TABLE OF CONTENTS/OUTLINE

IntroductionPSMA PET CT biodistribution (68Ga-PSMA-11 and 18F-PSMA-1007)PSMA PET CT indications and imaging in prostate

cancerBenign and malignant conditions that exhibit PSMA uptakeDedifferentiated and PSMA negative prostate tumors PSMA PET CT pitfallsConclusion

NMMIEE-49   Fluorine-18 Dihydroxyphenylalanine (18-F-DOPA) As An Advanced Tracer For Imaging In Pediatric Neuroblastoma: Clinical Role, Normal Patterns, Pearls And Pitfalls

Participants
Michal Eifer, MD, Ramat Gan, Israel (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Familiarize with physiological biodistribution of 18-F-DOPA 2. Appreciate the use of 18-F-DOPA for detection, staging and response assessment of neuroblastoma 3. Recognize typical imaging features, pearls and pitfalls

TABLE OF CONTENTS/OUTLINE

18-F-DOPA, a precursor of dopamine and catecholamines, has emerged as an advanced tracer for pediatric neuroblastoma, enabling the transformation from SPECT imaging with 123-I-MIBG to PET. In this educational paper, we will familiarize the reader with the tracer and its physiological biodistribution and potential pitfalls; introduce its role in detection of the primary lesion and metastasis, and its ability to assess response to treatment; show imaging features of typical clinical accompanying syndromes; compare with 123-I-MIBG; and show 18-F-DOPA imaging in other neoroblastic tumors.

NMMIEE-5   18F-FDG PET/CT Evaluation Of Thymomas And Histological Classification.

Participants
Vanessa Murad, MD, Bogota, Colombia (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Based on 2015 WHO classification, thymic epithelial tumors can be grouped into 3 large subgroups: low-risk thymomas (types A, AB, and B1), high-risk thymomas (types B2 and B3), and thymic carcinoma. 2. All thymomas, regardless of their histological grade, show some degree of FDG uptake, which tends to increase with the grade of malignancy. 3. Low-risk thymomas usually are non-invasive lesions with low metabolic activity, although type B1 can present a more aggressive behavior. High-risk thymomas are metabolically more active and have higher proliferation rates, so their FDG uptake is higher. 4. As tumor size and grade increase, the presence of necrosis also may increase, and therefore large low-risk tumors can present heterogeneous uptake patterns as well as high-risk tumors with necrosis; this finding should be interpreted in conjunction with others.

TABLE OF CONTENTS/OUTLINE

1. Thymomas and WHO classification: The most recent WHO classification divides thymomas into two main groups according to the morphology of the neoplastic epithelial cells and their nuclei. Depending on the epithelial component and cell atypia, they are also subdivided into specific subtypes. Each subtype has a different behavior, prognosis, and imaging features. 2. FDG PETCT imaging of thymomas: Even imaging findings can overlap among subtypes, there are certain characteristics that can be combined to make an accurate diagnosis based on findings. These characteristics are described in deep with demonstrative cases.

NMMIEE-50   Molecular Imaging In The Assessment Of Autoimmune, Infectious, And Post-infectious Encephalopathies: Insights On Differential Diagnosis And How Could PET Add Value To MRI

Awards
Certificate of Merit

Participants
Priscila Parro, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

i. Discuss current and emerging roles of PET and PET/MRI in autoimmune and infectious/post-infectious encephalopathy, focusing on [18F]FDG and neuroinflammation tracers. ii. Highlight the role of PET in paraneoplastic encephalopathies, addressing brain findings and the role of whole-body FDG-PET. iii. Discuss how integrating PET and MRI aids in the differential diagnosis with oncologic and neuroinflammatory conditions. iv. Recognize the importance of PET for assessing response to therapy and sequelae.

TABLE OF CONTENTS/OUTLINE

I. When and why to use the different PET tracers to evaluate autoimmune and infectious/post-infectious encephalopathies. Clinical setting: FDG-PET. Possible role of TSPO-PET in neuroinflammation. II. Specific FDG-PET and MRI findings of autoimmune and infectious/post-infectious encephalopathies: Autoimmune encephalopathy with cell-surface antibodies, onconeural antibodies and paraneoplastic syndromes: brain PET/MR and whole-body FDG-PET. Acute and subacute infectious encephalopathies. The emerging role of PET in long COVID-19. III. Treatment response and sequelae. IV. PET in the prediction of response to immunotherapy. V. Differential diagnosis: integrated PET/MRI in neurodegenerative, oncologic, other neuroinflammatory and idiopathic diseases.

NMMIEE-51   PET Imaging After Neoadjuvant Chemoradiation Therapy (NCRT): Tumor Response And Therapy-related Changes

Participants
Anne Gomes, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Discuss the current indications of neoadjuvant chemoradiation therapy in oncology assessed by PET imaging. Recognize the role of PET imaging with CT (PET/CT) and with MRI (PET/MRI) in therapy response assessment after neoadjuvant chemoradiation. Identify the expected side effects and unexpected complications of chemoradiation treatment according to the body region.

TABLE OF CONTENTS/OUTLINE

Neoadjuvant chemoradiation in oncology: which tumors benefit from PET assessment? ? Head and neck squamous cell carcinoma (HNSCC)? Non-small cells lung cancer (NSCLC)? Esophageal cancer? Gastric adenocarcinoma? Pancreatic adenocarcinoma? Rectal

adenocarcinoma? Sarcomas2. Assessment of tumor response to neoadjuvant chemoradiation? Patterns of disease response by PET? Complete and partial response? Stable disease? Progressive disease? How PET can guide the next treatment?3.Post treatment imaging of therapy-related changes? Expected side effects and unexpected complications? Head and Neck, e.g. mucositis and osteoradionecrosis? Thorax , e.g. pneumonitis? Abdomen and pelvis, e.g. fistulas? Musculoskeletal, e.g. insufficiency fracture? How to differentiate therapy-related changes from tumor by PET?4.Take-home messages

NMMIEE-53 From Beginning To End: The Multifaceted Role Of Radiology And Nuclear Medicine In The Diagnosis, Management, And Treatment Of Thyroid Malignancies

Participants
Justin Peacock, MD,PhD, San Antonio, Texas (*Presenter*) Nothing to Disclose

TEACHING POINTS

Global approach to imaging and radiopharmaceutical therapy in thyroid malignancies: 1. Demonstrate the role of US in evaluating thyroid nodules, utilizing ATA and/or TIRADS guidelines, as well as regional lymph nodes 2. Show the primary roles of CT and MRI: a. Staging local thyroid malignancy b. Identifying nodal metastases c. Evaluation for therapeutic response or progression of disease 3. Highlight the theragnostic roles of Nuclear Medicine: a. Use of radioiodines in the diagnosis and treatment of well-differentiated, thyroid cancer, including nodal/distant metastasis b. Assessing extent of non-radioiodine avid thyroid malignancies with 18F-FDG PET/CT c. Highlight the capabilities of somatostatin receptor theragnostics with 68Ga-DOTATATE PET/CT and Lu177-DOTATATE (Lutathera) therapy in medullary thyroid carcinoma and radioiodine-refractory thyroid carcinoma

TABLE OF CONTENTS/OUTLINE

I. Thyroid cancer overview II. Ultrasound applications in thyroid cancer imaging a. ATA guidelines b. TIRADS guidelines c. Thyroid nodule cases d. Evaluation of cervical lymph nodes III. CT and MR applications in thyroid cancer imaging a. Anatomic extent of disease b. Local and distant metastases c. Posttreatment follow-up IV. Nuclear Medicine theragnostics in thyroid cancer a. Radioiodine theragnostics b. 18F-FDG PET/CT diagnostics c. Somatostatin receptor theragnostics

NMMIEE-54 Cardiac Amyloidosis: The Nuclear Option

Awards
Certificate of Merit

Participants
Molly Roseland, MD, Northville, Michigan (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Previously considered an incidental finding on bone scintigraphy, nuclear medicine bone-localizing radiopharmaceuticals are now routinely used to aid in the diagnosis of ATTR cardiac amyloidosis.2. Both quantitative and semi-quantitative visual guidelines exist to suggest the presence of cardiac amyloidosis.3. PET amyloid agents may have a role in cardiac amyloidosis, with a greater detectability of AL amyloidosis.

TABLE OF CONTENTS/OUTLINE

I. IntroductionII. Cardiac amyloidosis A. Pathophysiology and Amyloid Subtypes B. Symptoms C. Diagnosis D. Treatment and PrognosisIII. Nuclear amyloid imaging A. Radiopharmaceuticals 1. 99mTc-PYP 2. 99mTc DPD/MHDP/HDP B. Imaging protocol 1. Planar/SPECT 2. 1 hour with optional 3 hour 3. Patient selectionIV. Interpretation A. Quantitative - H/CL ratio B. Semi-quantitative visual score C. Incidental findingsV. Other agents A. PET agents - possible use in AL amyloidosis 1. 11C PiB 2. 18F amyloid tagging agents B. Advantages and disadvantages of various agentsVI. Conclusion

NMMIEE-55 Incidental Emergencies On PET/CT Scan

Participants
Hina Shah, MD, Boston, Massachusetts (*Presenter*) Nothing to Disclose

TEACHING POINTS

Describe various incidental emergent findings observed on PET/CT scans performed for unrelated reason. Follow-up details would be provided wherever available These are usually sequela of the malignancy or related to the treatment. But in some cases are unrelated and are related to either known prior medical or surgical conditions. It is important to recognize these and alert the clinician so appropriate timely management can be provided.

TABLE OF CONTENTS/OUTLINE

Different case based presentation using multimodality images and videos would be used to highlight the incidental emergency findings in patient undergoing PET/CT scan for unrelated reasons.The organs/ cases would include (incomplete list)1. Brain metastasis2. Vascular abnormalities include thromboembolic phenomenon3. abdominal abnormalities like intestinal obstruction, pneumatosis, obstructive renal calculi

NMMIEE-56 Dense Breast. To Have Cancer Or Not, That´s The Question. Breast PET As An Invaluable Tool To Diagnose New Breast Cancer Lesions

Participants
Gisela Estrada, MD,PhD, Cancun, Mexico (*Presenter*) Nothing to Disclose

TEACHING POINTS

Recognize the incidence of new breast cancer lesions in patients with dense breast, using mammography and compared it with breast PET and the fusion of PET with mammography. To review the incidence of bilateral lesions and the added benefits in patients with implants.

TABLE OF CONTENTS/OUTLINE

METHODS. We review all the patients in the data base from 2016 to 2019. We include only patients with breast mammography in

order to perform the fusion with the breast PET. A total of 105 patients with dense breast were included. RESULTS. From the 105 patients with dense breast, 29 had density type D and 76 had density type C. 40 right, 59 left and 6 bilateral lesions. Invasive ductal breast cancer was the most common. 6 patients, all with breast density type D, had bilateral lesions, not suspected in the mammography. 16 patients with suspected lesions in the mammography were negative with breast PET, 5 of them with density type D. From the 8 patients with implants, the breast PET was positive in 5 patients. 16 patients had multifocal disease, 15 had multicentric disease, 16 had intraductal disease. In 34 patients the breast PET contributed with more information than the mammography. CONCLUSIONS. Breast PET is not affected by breast density or by hormonal status. In the patients with implants the breast PET was very useful. Breast PET can show multifocal or multicentric disease and intraductal involvement. In 30.8% of cases the breast PET contributed with more information than the mammography.

NMMIEE-6 Anatomic And Functional Imaging Of IgG4-Related Disease And Its Mimics

Awards
Identified for RadioGraphics

Participants
Kenneth Huynh, BS, Orange, California (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To review the spectrum of IgG4-related disease with a case-based review of associated mimicking entities.2. To review the multi-modality imaging of the IgG4-related disease spectrum, with emphasis on the importance of whole-body PET/CT in diagnosing IgG4-related diseases and evaluating therapeutic response.

TABLE OF CONTENTS/OUTLINE

IgG4-related disease (IgG4-RD) is a systemic sclerosing disease with lesions affecting nearly any organ. Common sites of involvement including the pancreas, biliary tree, salivary glands, periorbital tissue, lungs, kidneys, lymph nodes, aorta and retroperitoneum, and thyroid gland will be reviewed. Importantly, IgG4-RD is responsive to corticosteroids and rituximab therapy; prompt diagnosis is paramount to avoid delay in treatment and unnecessary pharmacologic/surgical intervention. Functional whole-body imaging with PET/CT is a useful adjunct for targeting extrapancreatic biopsy sites, monitoring therapy, and demonstrating disease relapse. This educational exhibit will (1) review the imaging features of the IgG4-RD spectrum and its associated mimics and (2) emphasize the role of PET/CT in localizing organ involvement and therapeutic surveillance of IgG4-RD.

NMMIEE-7 Not Just Donuts! A Refresher In Cardiac SPECT Perfusion

Participants
Heather Cole, MD, Nashville, Tennessee (*Presenter*) Nothing to Disclose

TEACHING POINTS

Coronary artery disease (CAD) is the leading cause of death for men and women in the US. One person dies every 36 seconds in the US from cardiovascular ischemic events. Therefore, high-risk CAD patients benefit from early coronary revascularization based on the extent of myocardial ischemia. It is widely accepted that single photon emission computed tomography (SPECT) has improved assessments of myocardial perfusion and has been utilized to identify revascularization candidates. Sestamibi and Tetrofosmin are the radiotracers most commonly used in myocardial perfusion imaging. These lipophilic agents passively diffuse across cell membranes and localize in the mitochondria. Not only are these radiotracers essential for identifying life threatening cardiac events, the ability of these agents to localize in metabolically active tissue allows for identification of non-cardiac pathology having a profound effect on a patient's outcome. Along these lines, we have collected an arsenal of case studies highlighting the incidental findings from cardiac SPECT imaging including malignancy, metabolic diseases, and chronic pathologies. The purpose of this presentation is to not only provide a refresher course for cardiac perfusion imaging, but also convey the significance of reviewing ALL the data provided by SPECT, not just the "donuts".

TABLE OF CONTENTS/OUTLINE

Imaging methodologies of SPECT. Identification of CAD. Exercise v pharmacologic stress. Anatomy. Single photon radiotracers overview. Case examples of non-cardiac pathology

NMMIEE-8 Applications Of PET/MRI In Peripheral Nerve Disorders

Awards
Certificate of Merit

Participants
Joshua Olson, MD, Rochester, Minnesota (*Presenter*) Nothing to Disclose

TEACHING POINTS

Integrated PET/MRI imaging allows for morphologic evaluation, tissue characterization, and provides quantitative information about molecular and physiologic changes that precede structural changes and help guide biopsy. PET and MRI play a complementary role in distinguishing benign and malignant peripheral nerve sheath tumors. PET/MRI can assist in the diagnosis of B-cell neurolymphomatosis, often an isolated site of disease presenting after disease progression or recurrence. Brachial and lumbosacral plexus PET/MRI is helpful in identifying perineural metastasis from breast, lung, and prostate carcinoma, with important tumor staging implications.

TABLE OF CONTENTS/OUTLINE

Review of integrated PET/MRI protocols and inherent strengths of each modality. PET radiotracers will include 18F-FDG, 11C-choline, and 18F-florbetapir Pictorial review of PET/MR applications in peripheral nerve pathologies, including: Peripheral nerve sheath tumors, including neurofibroma, schwannoma, perineurioma, neuromuscular choristoma, and hybrid nerve sheath tumors. Malignant peripheral nerve sheath tumors. Differentiating radiation change from perineural tumor spread. Perineural metastasis from lung, breast, and prostate primaries with a discussion on staging and treatment implications. Neurolymphomatosis, a rare condition characterized by lymphomatous involvement of the peripheral nerves. Peripheral nerve amyloidosis.

NMMIEE-9 18F-Fluoroestradiol PET/CT Utility For Breast Cancer Imaging

Participants
Matthew Covington, MD, Salt Lake City, Utah (*Presenter*) Consultant, inviCRO, LLC

TEACHING POINTS

1. 18F-Fluoroestradiol (FES)-PET/CT images radiolabeled estradiol bound to estrogen receptors (ERs), allowing systemic imaging of ERs at sites of breast cancer. 2. FES-PET/CT was FDA approved in 2020 for use in patients with recurrent or metastatic breast cancer as an adjunct to biopsy. 3. FES-PET/CT allows imaging of ER status for the entire tumor volume, thereby allowing body-wide assessment of tumor heterogeneity that may exist between the primary site and metastases or between various sites of metastatic disease. 4. FES-PET/CT may confirm sites of ER positive metastatic disease at sites of the body that are difficult to biopsy, such as within the brain or bones. 5. By depicting sites of ER+ disease, FES-PET/CT may be particularly well suited for evaluation of invasive lobular carcinoma (ILC), given the high rate of ER positivity with ILC, and known false negative examinations when imaging ILC with 18F-Fluorodeoxyglucose-PET/CT. 6. FES-PET/CT uptake may also predict subsequent response to hormonal therapies and act as an imaging test to confirm effective dosing of ER targeted therapies.

TABLE OF CONTENTS/OUTLINE

Introduction to FES-PET/CTMechanism of actionNormal distribution of uptakePotential indicationsEvaluation of systemic ER+ disease burdenAdjunct to biopsy for breast cancer evaluation.Utility at sites difficult to biopsy such as bone and brainInvasive lobular carcinoma stagingImaging to guide effective dosing of ER-targeted therapiesImaging case presentationComparison between FDG- and FES-PET/CTFuture directions

Abstract Archives of the RSNA, 2021

GIEE
Gastrointestinal Education Exhibits

Sub-Events

GIEE-1   **Imaging Update For Hereditary Abdominopelvic Neuroendocrine Tumors**

Awards
Certificate of Merit

Participants
Hanna Ferreira Dalla Pria, MD, Houston, Texas (*Presenter*) Nothing to Disclose

TEACHING POINTS

Updates in diagnostic criteria, treatment options, and classification of neuroendocrine tumors (NETs) have led to a better understanding of their physiopathology, and many of these have been linked to characteristic genetic alterations or familial/hereditary syndromes. Up to 25% of abdominopelvic NETs are related to hereditary syndromes. The updates in imaging, diagnosis, management, and surveillance strategies for hereditary neuroendocrine tumor syndromes allow for early detection and prolonged survival. Combinations of imaging and genetic/molecular evaluation approaches have improved the diagnostic and screening capabilities for hereditary NETs.

TABLE OF CONTENTS/OUTLINE

A brief review of abdominopelvic neuroendocrine tumors, highlighting the clinical and molecular pathology features that can be helpful in diagnosis and management.Imaging-based approach with teaching points for diagnosis and/or work-up of equivocal cases of several hereditary Gastroenteropancreatic and Genitourinary NETs on anatomic (CT/MRI) and functional (PET/CT and PET MRI) cross-sectional imaging.Evaluation of the primary hereditary NET, therapeutic response, and recurrence in these cases.Current guidelines for surveillance of hereditary NETs.Limitations of current imaging methods and new directions.Take-home messages.

GIEE-10   **Good Things Come To Those Who Wait!**

Participants
Aashna Karbhari, MD, Mumbai, India (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Wait and watch protocol for rectal cancer can be applied to select group of patients for organ preservation and improving patients' quality of life.2. More intensive surveillance protocol is needed for rectal cancer patients with complete clinical response post neoadjuvant chemoradiation (NACRT). 3. Patterns of complete response on MRI post NACRT in rectal cancer patients.4. Role of the radiologist in identifying tumor recurrence / residual tumor.5. Multidisciplinary approach and good communication are the key to success.

TABLE OF CONTENTS/OUTLINE

• Historical perspective: Emergence of Wait and Watch policy• Inclusion and exclusion criteria for patients eligible for wait and watch policy in the management of rectal cancer• Assessment of complete clinical response (radiology, clinical examination and endoscopic findings)• Surveillance protocol for watchful waiting post neoadjuvant chemoradiation therapy after complete clinical response, and further clinical management in cases of recurrence.• Illustrate the various patterns of complete response, residual tumor and disease recurrence post NACRT on rectal MRI.• Role of diffusion imaging weighted in assessing tumor viability • Role of intrarectal brachytherapy boost in select patients for potential wait and watch• Role of the tumor board in joint decision making• Overall outcomes in patients on wait and watch protocol

GIEE-100   **Distal Ileum And Appendiceal Endometriosis: A "Where's Waldo"-like Disease**

Participants
Joao Stern, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Endometriosis is a common disease affecting 5-10% of women of reproductive age, frequently multifocal with intra and extra-pelvic dissemination, as such the evaluation and mapping of disease can beneficiate of systematic interpretation and structured reporting, stimulating the reader to search for foci of endometriosis in all the compartments and visible structures, including base of cecum, distal ileum and appendix.- Although the bowel is the most common site of extragenital endometriosis, the ileum and appendix involvement are rare in comparison with the rectosigmoid junction and sigmoid colon, and as such are often overlooked in MR images.- Intestinal endometriosis can present as acute intestinal obstruction, thus the importance of early diagnosis and recognition in emergency contexts to improve surgical outcomes.- Appendiceal endometriosis may appear in many imaging patterns, radiologist should know the different features to recognize and diagnose appendix involvement.

TABLE OF CONTENTS/OUTLINE

Literature review.Cases demonstrating different presentations of appendiceal endometriosis and distal ileum endometriosis with and

without intestinal subocclusion/obstruction on CT and MR images.Practical tips to recognize appendix and distal ileum involvement in endometriosis.

GIEE-101   Artifacts In Contrast-enhanced Ultrasound: Don't Burst Your Bubble!

Awards
Magna Cum Laude
Identified for RadioGraphics

Participants
David Fetzer, MD, Dallas, Texas (*Presenter*) Research support, Koninklijke Philips NVResearch support, Siemens AGResearch support, GE HealthcareConsultant/Advisory Board, Philips HealthcareConsultant/Advisory Board, GE Healthcare

TEACHING POINTS

1) Similar to other imaging modalities, artifacts are encountered in contrast-enhanced ultrasound (CEUS), many of which are unique to this modality. 2) Some artifacts may simulate pathology or lead to erroneous diagnoses. 3) This education exhibit will list the various artifacts and inform the reader how to recognize and correct them to improve study quality and diagnostic confidence.

TABLE OF CONTENTS/OUTLINE

- Introduction: a. Briefly review microbubble formulation and pharmacokinetics; b. Discuss imaging techniques that optimize CEUS image quality;c. Review technical factors affecting study quality. - Artifacts with case examples and helpful tips for each: a. CEUS-specific Artifacts i. Non-linear artifacts: 1. Highly echogenic interfaces; 2. Incomplete subtraction of tissues; 3. Pseudo-enhancement; ii. Bubble Destruction: 1. Near-field signal loss; 2. In-plane signal loss; 3. Pseudo-washout; iii. Effects of Microbubbles: 1. Signal saturation; 2. Attenuation and shadowing; 3. Color Doppler enhancement; 4. Pulse-wave Doppler signal degradation. b. Non-specific US Artifacts i. Through-transmission and shadowing; ii. Poor acoustic penetration; iii. Refraction and reflection; iv. Reverberation

GIEE-102   Optional MRI Sequences for LI-RADS : Why, What, and How

Participants
Omar Kamal, MBChB, Portland, Oregon (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) Diffusion-weighted imaging, subtraction imaging and the hepatobiliary phase with gadobenate contrast are optional sequences according to the liver imaging reporting and data system (LI-RADS) technical recommendations.2) These optional sequences are often crucial for the characterization of hepatic observations.3) Optimal scanning technique enables good image quality and eliminates common artifacts.4) Knowledge of common associated pitfalls allows for accurate interpretation.

TABLE OF CONTENTS/OUTLINE

1)Background and overview Overview of LI-RADS MRI technical recommendations. 2)Diffusion weighted imaging Sequence description. Reasons for Optional Status. Added value: Diffusion restriction: an ancillary feature of malignancy in general, non-targetoid LR-M feature, helps differentiate true lesion vs perfusional changes, detect additional lesions, help identify parenchymal lesion when postcontrast identification is limited (tumor thrombus, infiltrative HCC), treatment response. Common artifacts/pitfalls. 3)Subtraction images Sequence description, reasons for Optional Status. Added value: In intrinsic high T1 signal observations: Confirm true arterial hyperenhancement and true washout. Common artifacts/pitfalls. 4)Hepatobiliary phase with gadobenate/gadoxetate: Sequence description. Reasons for Optional Status. Added value: Improved lesion conspicuity, prognostic information. Common artifacts/pitfalls: Focal hepatic parenchymal defects and impaired hepatobiliary function.

GIEE-103   Pancreas Adenocarcinoma: Using MRI For Staging To Surveillance With A Surgeon'S Perspective

Awards
Certificate of Merit

Participants
Mudassir Syed, DO, Jacksonville, Florida (*Presenter*) Nothing to Disclose

TEACHING POINTS

CT is the accepted modality for pancreas cancer staging and surveillance; however, at our institution MRI is the preferred modality. MRI provides superior contrast resolution, is as effective as CT for local staging and is more sensitive in detecting liver metastases and peritoneal implants. It is important for the radiologist to be familiar with staging and monitoring of pancreatic cancer and to recognize when MRI may offer an advantage. Additionally, understanding the surgeon's needs are vital as surgery offers the only potential cure in this disease with a typically dismal prognosis.The objectives of this exhibit include: * Discussion of imaging modalities for pancreas adenocarcinoma * Review of "need to know" findings for the surgeon * Analysis of imaging after neoadjuvant therapy * Assessment of findings during surveillance

TABLE OF CONTENTS/OUTLINE

1. Background 2. Imaging modalities a. CT b. MR c. PET 3. Imaging features of pancreas adenocarcinoma on MR 4. Differential diagnoses with case examples 5. Staging and Surgeon "need to know" 6. Imaging after neoadjuvant therapy 7. Surveillance imaging

GIEE-104   Ensuring Your LI-RADS Reporting Is In MiNT Condition - A Pneumonic For The Often Overlooked LI-RADS Decision Tree.

Participants
Deborah Kennedy, DO, Albuquerque, New Mexico (*Presenter*) Nothing to Disclose

TEACHING POINTS

[1] Have a basic understanding of LI-RADS reporting, which includes understanding the difference between the LI-RADS decision tree and the LI-RADS chart. [2] The LI-RADS criteria begins with the often overlooked decision tree, which is comprised of categories such as LR-M, LR-NC, and LR-TIV, all of which must be excluded before moving onto the well known LI-RADS chart. [3]

These categories can be easily remembered with the pneumonic MiNT (LR-M, LR-NC, and LR-TIV). [4] Finally, the LR-M category is comprised of multiple subcategories, which can be remembered with the alliteration LR-M for "Margin" (targeted lesions); "Mottled" appearance (infiltrative lesion), and "Marked" (Marked restricted diffusion).

TABLE OF CONTENTS/OUTLINE

[1] Background on when to apply LI-RADS criteria and the difference between the LI-RADS decision tree and table. [2] Emphasize the importance of proper characterization by initially utilizing the decision tree and subsequently applying the LI-RADS table. [3] Introduce the MiNT pneumonic for remembering the decision tree categories. [4] Examples will be given of each MiNT category to better recognize and accurately report them. These examples include images and diagrams to help solidify the pneumonic. [5] Introduce the "M" alliteration for remembering the subcategories of LR-M. [6] Additionally, examples will be given of the main LR-M subgroups. [7] Proper characterization leads to consistency and reproducibility in imaging reports, which in turn, leads to proper staging and management recommendations for HCC.

GIEE-105   Bag Of Tricks: Role Of Contrast-Enhanced Ultrasound In Evaluation Of Gallbaldder Pathology

Participants
Kanupriya Vijay, MBBS, MD, Jacksonville, Florida (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Conventional grayscale ultrasound (US) is very useful in identifying various gallbladder disease; however, assessment of microvascularity is needed to distinguish many benign from malignant disease processes.2. Contrast enhanced ultrasound (CEUS) is a straightforward and effective modality to differentiate such pathologies as tumefactive sludge from gallbladder cancer. 3. CEUS may be useful in differentiating benign wall thickening from chronic cholecystitis and gallbladder cancer. 4. CEUS can accurately demonstrate the microvascularity used to differentiate adherent biliary precipitate from polyps, and can help identify features of malignancy; Cholecystectomy tube injection of ultrasound contrast can be used to determine cystic duct patency and identify leak.

TABLE OF CONTENTS/OUTLINE

1. Introduction: a. Briefly review microbubble formulation and pharmacokinetics;b. Discuss imaging techniques with CEUS to optimize image quality;2. Case guided review of various gallbladder pathologies a. Benign i. Stones ii. Adenomyomatosis iii. Polyps iv. Chronic cholecystitis v. Tumefactive sludgeb. Malignant i. Gallbladder carcinoma ii. Malignant polyps3. Role of CEUS in interventions • Image guided biopsy• Evaluation of cholecystostomy tube for cystic duct patency and leaks4. Pitfalls

GIEE-106   Case Based Review: MRI Assessment Of Rectal Carcinoma After Neoadjuvant Chemoradiation Therapy

Awards
Certificate of Merit

Participants
Alon Slutzky, MD, New York, New York (*Presenter*) Nothing to Disclose

TEACHING POINTS

Discuss the treatment pathway of rectal carcinomas, including the potential of non-operative management. Review the MRI imaging protocol utilized in the evaluation of rectal carcinoma.Provide a pictorial representation of the MRI tumor response grading system.Practice assigning Tumor Response Grades utilizing cases from our large multicenter database.

TABLE OF CONTENTS/OUTLINE

Accurately assessing the response of rectal carcinoma following neoadjuvant chemoradiation therapy (CRT) is essential for restaging, prognostication and treatment planning. Although not universally adopted, the utilization of the five-point MRI Tumor Response Grading System allows for a standardized language that can be easily understood by colorectal surgeons, oncologists and patients. Knowledge of the varied imaging features of post-treatment rectal carcinomas will aid radiologists in diagnosing tumor response and identifying patients that may benefit from nonoperative management. • TNM staging of rectal carcinoma • Rectal carcinoma treatment options (TME, APE, LAR, Watch and Wait) • Imaging features of rectal carcinoma before and after neoadjuvant chemoradiation therapy • Case based review of each MR tumor response grade (1-5) • Review numerous cases and assign the appropriate mrTRG

GIEE-107   Help From Below: Gastric, Jejunal And Colon Interposition.

Participants
Bethsabel Rodriguez Encinas, MD, Tlalpan, Mexico (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Explaining the anatomy by fluoroscopy of gastric and intestinal interposition as esophageal replacement.- Indications for gastric and intestinal interposition.- Getting to know the protocol to adequately assess the transit of the bolus through gastric and intestinal interposition.- Identifying the different alterations found in postsurgical gastric and intestinal interposition patients.- Recognising the immediate complications of gastric and intestinal interposition.

TABLE OF CONTENTS/OUTLINE

1. Introduction to bolus swallow through intestinal interposition in postsurgical patients.a. Review of normal anatomy.b. Review of postsurgical anatomy.c. Fluoroscopy protocol.2. Bolus swallow protocol in intestinal interposition.a. Normal transit of the bolus under intestinal interposition conditions.b. Discerning different techniques of gastric and intestinal interposition.3. Alterations of the bolus transit under gastric and intestinal interposition conditions.a. Post-surgical complications.4. Summary.a. Pearls.

GIEE-108   Contrast-Enhanced Ultrasound To The Rescue: Leveraging CEUS To Resolve Indeterminate Findings At CT/MRI LI-RADS

Participants
David Fetzer, MD, Dallas, Texas (*Presenter*) Research support, Koninklijke Philips NVResearch support, Siemens AGResearch support, GE HealthcareConsultant/Advisory Board, Philips HealthcareConsultant/Advisory Board, GE Healthcare

- American College of Radiology Liver Imaging, Reporting and Data System (ACR LI-RADS) includes several integrated algorithms, including CT/MRI LI-RADS and Contrast-Enhanced Ultrasound (CEUS) LI-RADS for the diagnosis of hepatocellular carcinoma (HCC); - Technical and patient factors, confounders, and indeterminate imaging features may prevent definitive characterization of liver observation; - Emerging data suggest CEUS may demonstrate major features of HCC, such as arterial-phase hyperenhancement (APHE) and washout (WO) when not present at CT or MRI ; - CEUS helps differentiate HCC from non-HCC malignancies. - CEUS may be helpful in assessing treatment response when CT or MRI are contraindicated or indeterminate; - CEUS may guide procedures such as biopsies and targeted therapies.

TABLE OF CONTENTS/OUTLINE

- Briefly review ACR LI-RADS system, and the CT/MRI and CEUS diagnostic algorithms, focusing on key similarities and differences; - Emphasize benefits of CEUS that improve detection of APHE: contrast sensitivity; continuous imaging; ability to reinject contrast; - Describe the value of CEUS in patients with renal failure or contraindications to iodine or gadolinium contrast; - Discuss differences of contrast pharmacokinetics and impact on imaging technique: pure blood pool agent; rapid clearance; dynamic bubble stimulation and destruction;- Provide case examples of indeterminate CT and MRI findings clarified by CEUS; - Highlight the use of CEUS in procedure guidance and treatment response.

GIEE-109 Don't Trust Your Gut: Diagnostic Pearls In Eosinophilic And Other Autoimmune Entities Of The GI Luminal Tract

Participants
Miriana Mariussi, MD, Pilar, Argentina (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Reviewing the regulatory mechanism of the intestinal immune system • Identifying the autoimmune entities of the GI luminal tract • Presenting frequent cases and complications • Correlating the radiological features with endoscopic/colonoscopic and histologic findings • Providing key diagnostic findings

TABLE OF CONTENTS/OUTLINE

• Introduction • Autoimmune entities of the GI luminal tract explained: Eosinophilic esophagitis, Eosinophilic gastroenteritis, Celiac Disease, Microscopic Colitis (Collagenous colitis and Lymphocytic colitis), Inflammatory Bowel Disease (Crohn's disease and Ulcerative Colitis), Nodular Lymphoid Hyperplasia and Autoimmune Enteropathy. • Case-based approach with radiologic correlation • Imaging findings with endoscopic/colonoscopic and histologic correlations • Differential Diagnosis • Conclusion

GIEE-11 Fluoroscopy Of The Bile Ducts: Anatomic Variants, Stones Versus Air Bubbles, Benign And Malignant Pathologies And Bile Duct Leaks

Participants
William Thompson, MD, Albuquerque, New Mexico (*Presenter*) Nothing to Disclose

TEACHING POINTS

Fluoroscopic Cholangiography includes the procedures which use the injection of contrast agents into the biliary system. These procedures are performed by Radiologists, Surgeons and Gastroenterologists. The studies include ERCPs, Intraoperative and T-tube cholangiograms and percutaneous transhepatic cholangiograms. For appropriate patient management, Radiologists should have knowledge of normal biliary anatomy, anatomic variations and pathologic conditions of the bile ducts. After reviewing this exhibit radiologists will: 1. Understand how each study is performed, 2. Know the important anatomic variations and 3. Be able to recognize bile duct abnormalities.

TABLE OF CONTENTS/OUTLINE

Introduction. Test cases. Definition of each procedure. Normal bile duct anatomy. Anatomic variations. Stones versus air bubbles. Strictures. Non-strictured abnormalities. Bile duct leaks. Take Home Points

GIEE-110 Imaging Of Sinusoidal Obstruction Syndrome: Current Status And Emerging Role In Early Diagnosis.

Participants
Deepashri Basavalingu, MBBS, Seattle, Washington (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Sinusoidal obstruction syndrome/ Veno- occlusive disease (SOS/ VOD) results due to damage to the endothelium of hepatic sinusoids, often recognized in the clinical setting of stem cell transplantation. 2. Diagnosis of SOS/ VOD is done using clinical (for example, EBMT criteria) and imaging criteria (for example, Lassau criteria).3. In addition to liver ultrasound and doppler, elastography has an increasing role in sonographic evaluation of SOS/ VOD.4. Other imaging modalities such as CT and MRI may be useful in problem solving in complex cases with suspected SOS/VOD.

TABLE OF CONTENTS/OUTLINE

1. Background- what's in a name- sinusoidal obstruction syndrome/ veno- occlusive disease (SOS/VOD). 2. Pathophysiology of SOS/VOD. 3. Clinical presentation and clinical criteria used in the diagnosis of SOS/VOD in children and adults. 4. Overview of how early diagnosis can save lives and improve clinical outcomes.5. Grayscale, color and spectral doppler ultrasound findings in diagnosis of SOS/ VOD. 6. A review of imaging criteria in the diagnosis of SOS/VOD. 7. Can we catch it early- role of ultrasound elastography in children and adults and how we do it. 8. Monitoring and severity grading of SOS/VOD. 9. Role of other imaging modalities in the evaluation of suspected SOS/ VOD. 10.Imaging differentials for consideration and key findings. 11. Treatment and prognosis of SOS/ VOD.

GIEE-112 Advanced Applications Of Gadoxetic Acid-enhanced Magnetic Resonance Imaging: What To Expect?

Awards
Identified for RadioGraphics
Certificate of Merit

Participants
Sandra Baleato Gonzalez, MD, PhD, Santiago de Compostela, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

Gadoxetic acid is a gadolinium-based liver-specific MRI contrast agent that distributes into the vascular and extravascular spaces and progressively into the hepatocytes and bile ducts during the hepatobiliary phase. This information is particularly relevant for the detection characterization of focal liver lesions, but also has potential indications for the functional assessment of the liver and the biliary system.The aim of this exhibit is: To know physiopathology and imaging protocol for using this contrast.To establish main clinical applications.To describe tips, tricks, and pitfalls of its use.To review advanced applications for liver function assessment, staging of fibrosis and cirrhosis, tumor response, prediction of liver transplant graft survival, and risk assessment of liver failure after major resection.

TABLE OF CONTENTS/OUTLINE

1.Technique (sequences, injection).2. Work-flow and abbreviated protocols. 3. Clinical uses: 3.1. Focal Liver lesion: characterization.3.2. Treatment decision-making and follow-up in metastatic disease and hepatocellular carcinoma: staging, assessment of oncologic and functional resectability and use with international diagnostic guidelines and LI-RADS.3.3. Diffuse liver disease.3.4. Liver transplant assessment.3.5. Biliary tree.3.6. Pitfalls. 4. Multiparametric functional and molecular liver MRI including gadoxetic acid: a one stop shop tool.5. Biomarker: Prognostic and predictive value and response assessment.6. Future: Radiomics

GIEE-113   Mri Of Rectal Cancer: Challenges And Opportunities

Participants
Adam Wetzel, MD, Chambersburg, Pennsylvania (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. The rate at which people are diagnosed with colorectal cancer in the US is dropping among people 65 and older but rising in younger age groups.2. MRI plays an important role in the initial staging of rectal cancer as it helps determine the need for neoadjuvant treatment and surgical planning. 3. MRI after neoadjuvant chemotherapy can help identify suitable candidates for active surveillance when combined with endoscopic findings.4. Growing body of evidence suggests that computer extracted features (i.e. radiomics) from MR images can help identify patients who may or may not benefit from neoadjuvant treatment.

TABLE OF CONTENTS/OUTLINE

1. Introduction; 2. Rectal MRI technical considerations; 3. Initial Staging- T and N stage;- Imaging Biomarkers; 4. Restaging- MRI criteria; - Endoscopic Considerations. 5. Active Surveillance; 6. Role of Radiomics; 7. Conclusion

GIEE-114   Imaging Roadmap For Colorectal Liver Metastasis Assessment (CRLM)

Participants
Cairo Mendes JR, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Over one-half of patients with colorectal cancer develop liver metastases at some point and surgical resection associated with other regional treatments offers a chance of cure and long-term survival. Therefore, the aim of this study is to outline imaging appearances, the surgical rationale for patients with CRLM, and the imaging criteria used to determine which tumors are potentially resectable.To review radiological findings of CRLM;To exhibit a roadmap for the radiology report;To show the relevant informations to aid in surgical planning;To help the postoperative evaluation.

TABLE OF CONTENTS/OUTLINE

Preoperative evaluation with CT and MRI, including hepatobiliary specific agents;How to report?- anatomical variations- number, location, size and margins of lesions- relationship with adjacent structures- possible future liver remnantPostoperative evaluation.Specific surgical techniques: portal vein embolization, partial hepatectomy, ALPPS (Associating Liver Partition and Portal vein ligation), radiofrequency ablation and radioembolization.

GIEE-115   Roles Of MRI Evaluation Of Pelvic Recurrence In Patients With Rectal Cancer

Awards
Certificate of Merit

Participants
Patricia Dantas I, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purposes of this exhibit are:1. To review the most relevant risk factors for local recurrence in patients with rectal cancer in regard to MRI preoperative staging and histopathological results after surgery.2. To discuss the roles of follow-up imaging and endoscopic examinations.3.To illustrate imaging patterns and pitfalls of locally recurrent rectal cancer detected during imaging surveillance.4. To clarify significant MRI staging information to guide treatment options for pelvic recurrence.5. To propose a structured proforma to ascertain meaningful information to radiology reports.

TABLE OF CONTENTS/OUTLINE

- Review on the main imaging and histopathological findings related to increased risk of local recurrence.- Recognition of patterns of local recurrence imaging findings during follow-up (anastomotic recurrence; lateral recurrence; radial recurrence; peritoneal recurrence).- Pitfalls.- Illustrative key points during pelvic recurrence staging (bone invasion; vascular invasion; pelvic organs invasion; bowel invasion; pelvic wall invasion).- Discussion on resectability and unresectability criteria.- Checklist of information that aid surgical decisions.

GIEE-116   Optimizing CT/MR Imaging In The Cirrhotic Patient From Start To Finish

Participants

Anuradha Shenoy-Bhangle, MD, Boston, Massachusetts (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Highlight commonly encountered reasons for degradation of cross-sectional image quality in cirrhotic patients and discuss proactive measures to counter these reasons.2. Discuss preventative strategies to improve image quality and strategies to interpret the study despite the artifact.

TABLE OF CONTENTS/OUTLINE

1. Review commonly encountered patient-related reasons for quality degradation with cross-sectional imaging in cirrhotic patientsa. Claustrophobiab. Poor breath hold capabilityc. Pain/Discomfortd. Poor communication 2. Workflow solutions to address patient-related reasons to improve image quality a. Claustrophobia: -Opt for CT rather than MRIb. Poor breath hold capacity: -Abbreviated MRI where possible -Free breathing protocols 3. Identify artifacts and enumerate strategies to accurately interpret the study despite the artifact. Artifacts and strategies to be discussed include CT: -Improper contrast bolus timing-High BMI with suboptimal radiation dose -Beam hardening artefacts -Intrinsic hyperdense hepatic nodules limiting optimal evaluation of enhancement MRI: -Susceptibility artefact -Conductive and dielectric effects -Misregistration artefact -Diffusion and ADC mismatch -Hemorrhage causing false-positive restricted diffusion-Intrinsic T1-hyperintense signal causing false-positive arterial phase enhancement -False-positive washout appearance

GIEE-117   A Call To Action: Review Of Knowledge Gaps In The LI-RADS Treatment Response Algorithm (LR-TRA) Version 2017.

Participants
Anuradha Shenoy-Bhangle, MD, Boston, Massachusetts (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. LR-TRA is a standardized system for assessing and reporting hepatic observations following liver directed locoregional therapy (LRT) in patients with hepatocellular carcinoma (HCC).2. Familiarity with pitfalls associated with the LR-TRA, version 2017 is important for correct application of the algorithm. 3. Gaps in knowledge related to LR-TRA need to be addressed for future refinement and improvement of the algorithm.

TABLE OF CONTENTS/OUTLINE

Knowledge Gaps: 1. Can the LR-TRA accurately predict complete pathologic necrosis when applied to various types of locoregional therapies?2. Role of contrast-enhanced ultrasound (CEUS) in LRT assessment? 3. Can LR-TRA be accurately applied after radiation-based LRT?4. Inter-modality agreement between CT and MR for category assignment in LR-TRA for the same treated observation?5. Role of ancillary features in the LR-TRA?6. What is the most accurate approach to measure residual disease in cases of LR-TR Viable?7. Significance of the LR-TR equivocal category?

GIEE-118   Functional Gastrointestinal Disorders: Spectrum Of Multimodality Imaging Findings

Participants
Mohamed Badawy, BMBCh, Houston, Texas (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Pathophysiology and etiology of functional gastrointestinal (GI) disorders • Multi-modality imaging features of functional GI disorders from the pharynx down to the anorectal region • Algorithmic approach to the differential diagnosis of findings in each affected organ • Functional changes related to aging, radiation therapy, and different medications • Potential pitfalls in imaging diagnosis

TABLE OF CONTENTS/OUTLINE

Introduction Pathophysiology of functional gastrointestinal disorders Etiology (organ-related): i Pharynx: swallowing disorders, bulbar palsy, cricopharyngeal muscle dysfunction i Esophagus: gastroesophageal reflux disease (GERD), diffuse esophageal spasm, achalasia, scleroderma, esophagogastric outflow obstruction, poor contractility, nutcracker esophagus) i Gastroduodenal: gastroparesis, functional dyspepsia i Intestine: irritable bowel syndrome, intestinal pseudo-obstruction i Gall bladder and biliary: gallbladder and sphincter of Oddi dysfunction i Pancreatic functional disorders i Anorectal functional disorder i Functional abdominal pain in children i Functional changes in elderly, functional GI disorders and medication use (proton pump inhibitors, antidepressants, and narcotics), and radiotherapy related abnormalities Optimization imaging techniques Organ-specific imaging findings and differential considerations Effect of imaging findings on management options Conclusion

GIEE-119   Budd Chiari SyndromeFrom Diagnosis To Management;#8211; A Clinico;#8211;Radiological Perspective.

Participants
Poorvi Malik, MBBS, Ajmer, India (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To familiarize with etiopathogenesis and regional differences of different types of Budd Chiari Syndrome(BSC). 2. Imaging checklist in suspected cases of BCS. 3. To emphasize on the pitfalls and clues to diagnosis of differential diagnosis. 4. Optimizing patient selection for endovascular treatment. 5. Follow up imaging protocol. 6. Case based approach of Budd Chiari Syndrome and its management.

TABLE OF CONTENTS/OUTLINE

Background - Etiopathogenesis Regional differences between Asian and Western population • Imaging Checklist for suspected cases and role of imaging • Mimics • Management algorithm• Case based approach to diagnosis

GIEE-12   MDCT Evaluation Of Gastroduodenal Ulcer: Imaging Features With Endoscopic And Surgical Correlation

Participants

Dario Herran de la Gala, MD, Santander, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

This exhibit will: 1) Review the normal anatomy of the stomach and duodenum and the different causes of gastroduodenal ulcer. 2) Describe an appropriate CT protocol for the assessment of gastroduodenal ulcers. 3) To illustrate the spectrum of MDCT findings encountered in uncomplicated & complicated gastroduodenal ulcer with surgical and endoscopic correlation. 4) To establish a differential diagnosis of pathologies that can simulate peptic ulcer disease

TABLE OF CONTENTS/OUTLINE

Incidental diagnosis of Peptic Ulcer Disease (PUD) in patients undergoing MDCT is more common than we think. Albeit not the diagnostic technique of choice, MDCT can diagnose both complicated and uncomplicated PUD. Knowing the particular anatomy of the duodenum helps to better understand the possible complications of PUD and its differential diagnosis. Knowledge of radiological findings of uncomplicated PUD helps to prevent dangerous complications. Pneumoperitoneum around the hepatic hilum and hypoattenuation of the gastroduodenal wall are the main signs to look for in the setting of complicated PUD.

GIEE-121   The Power Of Diffusion Compels You: Importance Of Diffusion In The Interpretation Of Body Mri

Participants
Haresh Naringrekar, MD, Philadelphia, Pennsylvania (*Presenter*) Nothing to Disclose

TEACHING POINTS

Diffusion is often underutilized, sub-optimally acquired, or not even obtained. Diffusion can help identify findings that may be otherwise subtle on MRI due to its super dynamic range. Optimize diffusion for body MRI application: Optimal b-values to obtain, Optimizing signal to noise, Reducing patient motion artifact, Increasing NSA, Newer techniques (simultaneous multi-slice acquisition)Use diffusion to help identify abnormalities that are subtle on other sequences due to its superb dynamic range Find normal anatomic structures, Infectious and inflammatory causes, MalignancyPitfalls T2 Shine through, Normal structures that may mimic pathology, Poor technique

TABLE OF CONTENTS/OUTLINE

Optimizing diffusion sequences Signal to noise, Reducing patient motion, TE, NSA, Voxel size/FOV, Optimal B valueUsing diffusion to identify normal structures Endometrium, Ovaries in postmenopausal women, Adrenal glands, Bile ductsUsing diffusion to identify infectious/inflammatory findings Collections ,Cholecystitis, Appendicitis, Abscess, Enteritis/colitis, Infectious peritonitis, Inflammatory bowel diseaseUse diffusion to identify malignancy: Occult malignancy (especially bowel malignancies), Peritoneal spread of tumor, Pancreatic/renal primary neoplasms and metastases, Extent of disease especially in liver where it may be underestimatedPitfalls T2 shine through, Poor technique, Collapsed bowel, Iron Overload, Renal pathology

GIEE-122   Quantitative Imaging With Dual-energy CT In Abdomen

Participants
Nisanard Pisuchpen, MD, Bangkok, Thailand (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Dual-energy CT is an advanced imaging technique, allowing for several quantitative approaches for abdominal imaging. 2. Subjective imaging interpretation alone may be inadequate for disease evaluation, so quantification is essential as an objective tool for accurate information. 3. Combined anatomical and functional information by dual-energy abdominal CT enhances treatment planning and patient management. 4. Developing the standardized or validated criteria for different types of dual-energy CT scanners regarding quantification in abdominal imaging is needed.

TABLE OF CONTENTS/OUTLINE

1. Describe the principle and basic concepts of dual-energy CT. 2. Describe quantitative techniques from dual-energy CT that are currently applied in clinical practice for abdominal imaging. 3. Describe roles of dual-energy CT quantification for abdominal imaging in the diagnosis, guiding medical and surgical treatment, and assessing response to treatment and monitoring disease. 4. Provide pictorial examples for various clinical applications of quantitative imaging by dual-energy CT in abdominal imaging. 5. Discuss limitations, challenges, and future roles for developing quantification by dual-energy CT in abdominal imaging.

GIEE-123   3D Reconstructions In The Treatment Of Liver Malignancies: How Can Imaging Help Clinical Decision

Participants
Giovanna Torre, Sao paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

I.Recognize the most important imaging features to report in a preoperative planningII.Discuss the application on 3D reconstruction in hepatectomies III.Discuss the future directions of virtual reality technology and intraoperative navigation

TABLE OF CONTENTS/OUTLINE

INTRODUCTION• Cross-sectional imaging and the use of liver volumetrics and tridimensional reconstructions• Understand the benefit of 3D reconstructions for a safe surgeryLIVER ANATOMY CONCEPTS• Review the main landmarks of the segmental anatomy of the liver and discuss differences of segmentation based on portal perfusionLIVER SURGERIES• Main types of surgical approaches in hepatic lesions• What information the surgeon needs to know in preoperative planning for liver surgeries with metastatic disease• Calculation of the remaining liver volumeIMAGING TECHNIQUE• Preparation• CT protocol and software managementIMAGING EVALUATION• Didactic case-based approach for 3D reconstruction in liver surgeriesFUTURE DIRECTIONS• What's on the horizon for 3D liver reconstruction for liver surgeries

GIEE-124   Postoperative Biliary Complications: What The Radiologist Needs To Know

Participants
Alexandre Minoda, BMedSc, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

The aim of this exhibit is:- To conduct a brief review of the biliary tree anatomy and its common variants and the utility of preoperative imaging.- To describe the imaging appearances of normal postoperative changes after hepatobiliary surgery.- To list the postcholecystectomy and post liver transplant biliary complications.- To describe the CT, MR imaging and MR cholangiographic imaging features of the major biliary complications after cholecystectomy and liver transplant.

TABLE OF CONTENTS/OUTLINE

INTRODUCTIONAnatomy of the biliary tree and the most common anatomic variants.Biliary variants: implications for surgery-Evaluation before cholecystectomy- Evaluation before liver transplantation MRCHOLANGIOGRAPHIC TECHNIQUE AND UPPER ABDOMEN MRI PROTOCOLSNORMAL POSTOPERATIVE FINDINGS- After cholecystectomy- After liver transplantationIMAGING PATTERNS OF MOST COMMON POSTCHOLECYSTECTOMY BILIARY COMPLICATIONS- Biliary strictures- Biliary transection- Biloma-Hemobilia- Cholangitis- Cholangitic abscess- Fistulas- Cystic Duct Remnant Mucocele- Luschka duct lesionsIMAGING PATTERNS OF MOST COMMON POST LIVER TRANSPLANT BILIARY COMPLICATIONS- Biliary Cast Syndrome- Biloma- Anastomotic Stricture- Non Anastomotic stricture- Ischemic cholangitis- Donor-to-recipient common bile duct disproportion

GIEE-125 What Is New About Pancreatic Cancer Resectability: A Radiological Correlation Of The Nakao Mesenteric Approach

Participants
Helena de Souza, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

-Pancreatic cancer has a high mortality rate, due to its late diagnosis. Adenocarcinoma represents about 90% of diagnosed cases and mainly affects the head of the pancreas. Radiologists play an essential role in the diagnosis and evaluation of its treatment and prognosis rate. Surgery is the standard treatment, but it's constantly under debate for updates;-The radiological criteria for resectability consider the relationship between the tumor and the surrounding vessels, categorizing the lesions as "RESECTABLE", "BORDERLINE" and "IRRESECABLE". To help the surgeon's decision, the borderline classification is divided into two categories and predicts the chances of resectability;- New surgical techniques are being established. The surgical technique indicated as ideal is pancreatoduodenectomy (PD) isolated. A new mesenteric approach (Nakao's technique) can be considered a safer procedure than other conventional approaches to PD. Radiologists need to get familiar to that.- The objectives of this exhibit are to review the vascular anatomy of pancreas and the radiological criteria for resectability of pancreatic head cancer, with a radiological correlation of the new surgical technique (Nakao mesenteric approach) and the best report to help the surgeon's decision.

TABLE OF CONTENTS/OUTLINE

-Vascular anatomy of the pancreas;-Radiological criteria for resectability of pancreatic head cancer;-Radiological correlation with the new Nakao's surgical technique.

GIEE-126 The Many Faces Of The Fat Liver: A Guide To Recognize All Patterns Of Non-alcoholic Fatty Liver Disease (NAFLD) On Multiparametric Hepatic MRI

Participants
Kalinka Dolcan, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Review the burden of non-alcoholic fatty liver disease (NAFLD)- Definition and classification of NAFLD- Suggestion of Multiparametric hepatic MRI protocol for non-invasive evaluation NAFLD- Imaging patterns on Multiparametric Hepatic MRI of different stages NAFLD

TABLE OF CONTENTS/OUTLINE

INTRODUCTION- Epidemiology of NAFLD- Risk factors- Natural course of the diseaseDEFINITION AND CLASSIFICATION OF NAFLD-Non-Alcoholic Fatty Liver (NAFL)- Non-Alcoholic Steatohepatitis (NASH)- Diagnosis criteria for steatosis and fibrosisDIAGNOSIS METHODS AND LIMITATION- Biopsy- Ultrasound- CT- MRI- ElastographyDIAGNOSING AND STAGING- Multiparametric hepatic MRIMULTIPARAMETRIC HEPATIC MRI PROTOCOL- MR imaging techniqueNORMAL LIVER FINDINGS- Normal images of the liver, correlating didactic illustrations.IMAGING PATTERNS OF DIFFERENT STAGES OF NAFLD- Mild, moderate and marked NAFL- NASH with mild inflammation/fibrosis and advanced inflammation/fibrosis- Cirrhosis with and without steatosisFUTURE DIRECTIONS- Incorporate Multiparametric hepatic MRI as a diagnostic method for the diagnosis of NAFLD- Changing the natural course of the disease and its progression

GIEE-127 Beyond Pancreatic Adenocarcinoma: CT Findings For Rare Malignant Pancreatic Neoplasms

Participants
Marycarmen Flores Duenas, MD, Lima, Peru (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this poster is to show the findings on CT of the rare malignant neoplasms of the pancreas.Introduction: Pancreatic tumors can be primary or metastatic. The primary ones are divided into epithelial and non-epithelial. The epithelial ones are the most frequent and are subdivided into exocrine and endocrine, the most representative of the endocrine ones is adenocarcinoma with a frequency of 90-95%. Pancreatoblastoma: is a very rare malignant epithelial neoplasm, the majority has been detected in children, for more rarely can occur in adults, and the prognosis is worse. Pancreatic lymphoma: represents 1% of extranodal lymphomas and 0.5% of malignant pancreatic tumors. the 80% is represented by diffuse large B-cell lymphoma. Usually between 35-75 years of age and is predominantly male. Pancreatic sarcoma: is a Follicular dendritic cell sarcoma that predominantly occurs in the lymph glands and the extranodal pancreatic localization is very rare. Metastases to the pancreas, represents 2%-4% of pancreatic masses, they typically present as solitary masses, diffuse pancreatic involvement or enlargement, or multiple discrete lesions. Conclusion: It is important to take into account the variety of malignant tumors of the pancreas, and the radiological characteristics of the rarer lesions, to help in the final diagnostic orientation for multidisciplinary management.

TABLE OF CONTENTS/OUTLINE

Pancreatoblastoma.Pancreatic lymphoma.Pancreatic sarcoma.Metastases to the pancreas.

GIEE-129   Non-lithiasic Dilatation Of The Bile Duct: Now What?

Participants
María Loyola, Santiago, Chile (*Presenter*) Nothing to Disclose

TEACHING POINTS

Teaching points:Recognize the different differential diagnoses in patients with non-lithiasic dilatation of the bile duct. Describe the main imaging appearances of non-lithiasic dilatation of the bile duct in the different modalities.Recognize the importance of multidisciplinary management for optimal diagnosis and managementPropose a diagnostic approach for clinical scenarios.

TABLE OF CONTENTS/OUTLINE

Learning objetivesIntroductionObstructive Neoplasm Cholangiocarcinoma Gallbladder adenocarcinoma Pancreatic adenocarcinoma Metastasis -nflammatory AIDS cholangiopathy Biliary parasites Primary sclerosing cholangitis Post inflammatory Post pancreatitis Post radiation or chemotherapyNon obstructive Congenital Caroli disease Primary sclerosing cholangitis Choledochal cyst Infectious Recurrent pyogenic cholangitis Isquemic Post transplant Non transplantSchematic diagnostic approach

GIEE-13   Squeeze And Push! A, B, C...Defecography

Awards
Identified for RadioGraphics

Participants
Jonathan Revels, DO, Albuquerque, New Mexico (*Presenter*) Nothing to Disclose

TEACHING POINTS

Review the indications for a defecography exam Understand the techniques and protocols for fluoroscopic and MR defecography Step by step approach on how to perform and interpret fluoroscopic and MR defecography exams Compare fluoroscopy and MR defecography in evaluation of pelvic floor pathologies

TABLE OF CONTENTS/OUTLINE

Background Anatomy of pelvic floor Landmarks and normal measurements on fluoroscopy and MR Common clinical indications for pelvic floor imaging Overview the protocols and techniques (anatomic and functional evaluation) Case-based approach to pathologies: fluoroscopy and MR defecography Anterior compartment Cystocele Urethral hypermobility Middle compartment Prolapse of vaginal apex, uterus or cervix Posterior compartment • Enterocele/Sigmoidocele/Peritoneocele • Rectocele (with and without obstructed defecation) • Rectal Intussusception • Rectal/Anal Incontinence • Anismus/Dyssynergia

GIEE-130   Multimodality Approach Of Metabolic Syndrome

Participants
Fernanda Velloni, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

To contextualize the metabolic syndrome as a complex disease and a public health problem; To address the main topics related to metabolic syndrome including epidemiology, physiopathology, diagnosis, treatment and post-treatment evaluation;To discuss the multimodality approach emphasizing the use of new techniques such as: big data analytics for the comprehension of the whole scenario; artificial intelligence for opportunistic diagnosis; and abbreviated MRI protocols for non-invasive longitudinal follow-up;

TABLE OF CONTENTS/OUTLINE

Epidemiological features of metabolic syndrome by using big data analytics resources;Review of the physiopathology through the correlation of laboratory, pathology and imaging findings;Discussion of the diagnostic role of imaging in this context, including the advantages and disadvantages of each technique (US, CT and MRI);Demonstration of the opportunistic detection of biomarkers during unrelated abdominal CTs, which can be potentialized by the use of artificial intelligence algorithms;Discussion of the surgical and clinical treatment options as well as the expected and unexpected results;Presentation of the abbreviated MRI protocols as a tool for non-invasive longitudinal follow-up;Review the usefulness and future perspectives of a multimodality approach for the management of these patients, especially in the current context of precision medicine;

GIEE-131   Layered Detector Dual-energy CT In Abdominal Oncology: A Convincing Pictorial Review!

Awards
Certificate of Merit

Participants
Olivier Lucidarme, MD, Paris, France (*Presenter*) Speaker, Bracco Group;Speaker, F. Hoffmann-La Roche Ltd;Expert Witness, Bayer AG

TEACHING POINTS

With a layered detector, the spectral separation of the X-ray source is realized at the detector level, which allows perfect temporal registration and spatial registration with an excellent management of the noise. This system always acquires in DECT mode, allowing a retrospective spectral evaluation for all scans . Experience is still limited using this technology compared with other DECT techniques. Our purpose is to illustrate with numerous examples of the utility of this technology in abdominal oncology imaging, based on a two-year experience in a large oncology imaging department (over 10,000 CT scans).

TABLE OF CONTENTS/OUTLINE

We will: - Present the workflow enabled by the ability to perform retrospective spectral evaluation for all CT scans, including the reduction of the amount of iodinated contrast medium. - To illustrate the clinical added value of monochromatic virtual images at 40 kev compared to polychromatic images on a variety of hyperenhancing or hypoenhancing abdominal tumors (esophagus, stomach, liver, pancreas, biliary tract, kidney, urinary tract, small and large bowel, rectum and bladder). In our experience, these

monochromatic images should be the new standard in oncologic imaging. -Discuss and illustrate the place of other standard and advanced DECT reconstructions and the Basis material decomposition: the virtual non-contrast, the iodine map, the other monochromatic images, the Z effective map, the electron density map. -Discuss the impact on the place of this technique compared to MRI in our institution.

GIEE-132 Revisiting Response Assessment Of Colorectal Liver Metastases: Lessons Learned And Opportunities For Improvement

Participants
Sireesha Yedururi, MBBS, Sugar Land, Texas (*Presenter*) Nothing to Disclose

TEACHING POINTS

High-quality baseline studies are crucial for accurate response assessment The combined use of size and morphologic criteria is mandatory for accurate evaluation and both need to be included in the radiology report Optimal morphologic response predicts greater overall survival; yet is underutilized as a surrogate therapeutic endpoint. Criteria are easy to learn with established good inter-observer agreement

TABLE OF CONTENTS/OUTLINE

Introduction. Basic requirements for accurate response assessment. General principles of response assessment with a focus on morphologic response. Limitations of size based criteria. Impact on medical and surgical manag ement- Illustrative case review. Role of PET/CT and MRI. Conclusion

GIEE-133 Imaging and Radiomics in Hepatocellular Carcinoma (HCC): Current Update and Future Perspectives

Awards
Certificate of Merit

Participants
Natally Horvat, MD, PhD, New York, New York (*Presenter*) Nothing to Disclose

TEACHING POINTS

? Discuss the definition and general concepts of radiomics, textural analysis, radiogenomics, machine learning, and deep learning? Illustrate steps (pipeline) involved in radiomics research? List the most relevant applications of radiomics in HCC? Describe the limitations and challenges to be overcome before its implementation into clinical practice

TABLE OF CONTENTS/OUTLINE

? INTRODUCTION- Definition of textural analysis, radiomics and radiogenomics- General concepts of machine learning and deep learning? STEP BY STEP WORKFLOW INVOLVED IN RADIOMICS-? HCC RADIOMICS? Applications of radiomics in HCCo Histological findings (such as microvascular invasion, pathological grade, differentiating HCC from other mimicking malignancies)o Treatment response (eg. locoregional therapy - TACE, TARE; and immunotherapy - immune score)o Genomic signatureo Local recurrenceo Survivalo Post-surgical complications (eg. post-hepatectomy liver failure)? CHALLENGES, PITFALLS AND HOW TO OVERCOME THEMo Repeatability and reproducibilityo Segmentationo Overfittingo HCC endpoint and ground trutho Integration of genomics, radiomics and data from clinical endpoints? DATA INTERPRETATION- Systematic approach to evaluate the results of published studies in the literature and to conduct meaningful HCC radiomics research? FUTURE DIRECTIONS- What's on the horizon to improve its clinical applicability and acceptance

GIEE-134 Rectal Cancer After Neoadjuvant Therapy, When We Are Wrong

Awards
Cum Laude
Identified for RadioGraphics

Participants
Muhammad Awiwi, MD, Houston, Texas (*Presenter*) Nothing to Disclose

TEACHING POINTS

- To review the rates of false positive and false negative results on post-neoadjuvant chemoradiotherapy MRI.- To illustrate the most common pitfalls in the interpretation of post-neoadjuvant chemoradiotherapy MRI.- To review possible interventions that can be taken to avoid these common pitfalls.

TABLE OF CONTENTS/OUTLINE

- General introduction - Expected imaging findings of complete radiological response on post-neoadjuvant chemoradiotherapy MRI. - Common pitfalls in the interpretation of post-neoadjuvant chemoradiotherapy MRI. - Interventions to improve MRI quality before the exam. - Adjustments to imaging protocol to eliminate artefacts on post-neoadjuvant chemoradiotherapy MRI.

GIEE-135 Testicular Lesions And Contrast Enhanced Ultrasound: A Pictorial Review

Participants
Jonathan Gabriel, MBBS, London, United Kingdom (*Presenter*) Nothing to Disclose

TEACHING POINTS

Teaching Points:1.To review the principles of contrast-enhanced ultrasound (CEUS) in the assessment of focal testicular lesions. 2.To review a selection of benign and malignant testicular pathologies with a view to increasing familiarity of the appearances during CEUS. 3.To demonstrate histopathological correlation with CEUS findings. 4.To show interesting cases and pitfalls.

TABLE OF CONTENTS/OUTLINE

Outline:At our institution the use of contrast enhanced ultrasound has increased over the past 20 years and we have acquired a number of interesting cases of educational benefit. The cases reviewed in out exhibit have pathological correlation following

orchidectomy and where possible will be reviewed with histopathological images. The exhibit will be structured as follows:- Summary of learning objectives/teaching points- Review of common testicular lesions and their pathological classification- Summary of the common appearances of testicular lesions on B-mode and colour Doppler ultrasound- Pictorial case review: Germ cell tumours - Seminomas- Pictorial case review: Germ cell tumours - Non-seminomatous GCTs- Pictorial case review: Sex cord stromal tumours - Leydig cell tumours- Pictorial case review: Sex cord stromal tumours - Sertoli cell tumours- Pictorial case review: lymphoma- Pictorial case review: Pitfalls and Tumour mimics- Pictorial case review: interesting cases

GIEE-136 Rectal Adenocarcinoma After Neoadjuvant Therapy: Practical Guide And How To Avoid Common Mistakes

Participants
Natally Horvat, MD, PhD, New York, New York (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Understand the current indications and types of neoadjuvant therapy (NAT), including total neoadjuvant therapy• Know patient assessment after NAT• Comprehend rectal MRI technique, common difficulties, and how to overcome them• Know the role and limitations of restaging rectal MRI - when we are wrong• Recognize pelvic anatomy and key anatomical landmarks for surgical planning• Be familiar with future directions in rectal cancer after NAT

TABLE OF CONTENTS/OUTLINE

• INTRODUCTIONo General overview and definitions• NEOADJUVANT THERAPYo Indication and types of NAT• MANAGEMENT AFTER NATo Surgical techniqueso Interval reassessmento Watch-and-wait• MRI TECHNIQUEo Preparationo MRI protocolo Difficulties and how to overcome them• IMAGING INTERPRETATIONo Step-by-step approach to evaluate restaging MRIo What multidisciplinary team needs to knowo Template reporting system• CHALLENGING SCENARIOS - WHEN WE ARE WRONGo Post treatment changes within the tumor bedo Mucinous tumoro Mucin (or colloid) degenerationo Viable tumor within fibrotic scaro Magnetic resonance Tumor Regression Grade (ymriTRG)o DWI (artifacts, T2 shine-through, T2 dark-through)o Lateral pelvic lymph nodeso Tumor regrowth in patients on watch-and-wait• WHAT'S ON THE HORIZON TO ASSESS TREATMENT RESPONSEo PET/MRIo Radiomicso Novel MRI techniques: magnetization transfer ratio, lymph node contrast agentso Confocal laser endomicroscopyo Multi-omics and artificial intelligence in combined prediction models• INTERACTIVE CASE-BASED DIDACTICS

GIEE-137 Ultra-high-resolution CT With 1024-matrix Using A Novel Deep Learning Reconstruction Technique: How To Use It For Abdominal Imaging

Participants
Masatoshi Hori, MD, Kobe, Japan (*Presenter*) Research Grant, Canon Medical Systems Corporation

TEACHING POINTS

1. Understanding characteristics of the ultra-high-resolution CT with 1024-Matrix.2. Understanding the basics and applications of a novel deep learning reconstruction technique for ultra-high-resolution CT imaging.3. Understanding how radiologists can use ultra-high-spatial-resolution CT with the latest deep learning reconstruction technique for abdominal imaging.4. Understanding the prospect of the ultra-high-resolution CT for improvement in pre-treatment evaluations of tumors in the abdomen.

TABLE OF CONTENTS/OUTLINE

A. IntroductionB. Basic characteristics of an ultra-high-resolution CT with 1024-Matrix: Pros and ConsB-1. Spatial resolution: Matrix and slice thicknessB-2. Image noiseB-3. Radiation doseC. Deep learning reconstruction techniques for ultra-high-resolution CT with 1024-matrixC-1. Basics of deep learning reconstruction techniquesC-2. Comparison between the previous and the latest version of deep learning reconstructionC-3. Deep learning reconstruction techniques can significantly improve image qualityD. Clinical impact of the ultra-high-resolution CT with 1024-matrix using a novel deep learning reconstruction technique for abdominal imagingD-1. Pancreatic tumors can be better visualized and evaluated by ultra-high-resolution CTD-2. Liver tumors: Are there some benefits to use ultra-high-resolution CT?D-3. Vascular structuresD-4. OthersE. Conclusion

GIEE-138 Principles And Clinical Utility Of A Novel Contrast Enhancement Boost Technique For Abdominal CT

Participants
Masatoshi Hori, MD, Kobe, Japan (*Presenter*) Research Grant, Canon Medical Systems Corporation

TEACHING POINTS

1. Understanding principles of a novel postprocessing technique (contrast enhancement boost; CE Boost) for increasing the degree of contrast enhancement.2. Understanding the role of advanced 3-dimensional subtraction with non-rigid registration.3. Understanding the role of denoising process.4. Understanding the potential of combined use with other contrast enhancement technique such as low-keV dual energy CT or low-kVp imaging.5. Understanding the advantages and disadvantages of the technique by reviewing some clinical applications in abdominal imaging.6. Understanding how radiologists can use this technique for detecting and characterizing lesions in the abdomen.

TABLE OF CONTENTS/OUTLINE

A. Introduction ? Increasing the degree of contrast enhancement by postprocessingB. Principles of contrast enhancement boost (CE Boost) techniqueB1. Advanced 3D subtraction with non-rigid registration ? the core of the techniqueB2. Selection of image pair ? various images can be produced depending on the selectionB3. DenoisingB4. Number of summations ? an important parameterB5. Combined use of CE-boost and dual-energy low-keV CT can further increase the degree of contrast enhancementC. Applications of CE Boost technique for abdominal CTC1. Liver ? tumors can be better detected and characterizedC2. PancreasC3. Vascular structuresC4. Radiation dose reduction / OthersD. Conclusion

GIEE-139 To Be Viable Hcc Or Not To Be? That'S The Question

Participants
Jéssica Marques Silva, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Hepatocellular carcinoma is the most common primary liver malignancy. Treatment strategies involve tumor resection or liver

transplantation. Despite the fact that many patients have advanced disease or multifocal tumors, it is contraindicating radical treatment. Locoregional therapies may be used as a bridge for liver transplantation or in advanced tumors and/or when radical treatment is contraindicated. Locoregional therapies include radiofrequency ablation, percutaneous ablation with ethanol, cryoablation, microwave ablation, transarterial embolization or chemoembolization, chemoembolization with doxorubicin granules, transarterial radioembolization and external beam radiotherapy. Imaging assessment of the CHC response to locoregional therapy requires assessing the size of the tumor, the tumor margins, the presence of tumor necrosis, as well as the early detection of a viable tumor. The aim of this study is to demonstrate the types of locoregional treatment for liver injuries and the interpretations of the post-treatment image examination. The data were obtained through computed tomography and magnetic resonance images of patients admitted to an oncology reference service in Rio de Janeiro.

TABLE OF CONTENTS/OUTLINE

1) Signs of viability vs. tumor non-viability 2) Locoregional therapies 3) Take home message

GIEE-14 Perianal Fistula In Crohn's Disease: Imaging As A Therapeutic Guidance

Participants
Jérémy Dana, MD, Clichy, France (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Magnetic Resonance Imaging is the reference modality in perianal fistula to aid diagnosis and to guide surgical treatment.- Imaging report should be structured, standardized and should respond to specific problematics at the successive steps of surgical treatment: should the fistula be drained? Is the drainage complete? Should closure of the fistula be considered? How can imaging impact the choice of the closure technique? - Artificial Intelligence is revolutionizing imaging and can provide images with increased signal-to-noise ratio in a shorten acquisition time using the Deep Learning Reconstruction.

TABLE OF CONTENTS/OUTLINE

- Introduction to perianal fistula in Crohn's Disease: definition, epidemiology, physiopathology, modalities of treatment- Magnetic Resonance Imaging as a reference standard: an update in technical acquisition (Deep Learning Reconstruction)- Endorectal Ultrasound as a complementary tool to MRI- Drainage of the fistula: when and how?- Drainage of the fistula: complete, incomplete or failure?- Imaging keys to guide the next steps in therapeutic management including the choice of the modality of closure.

GIEE-140 Patterns Of Relapse And Complications Of Immunoglobulin G4-related Disease (IgG4-RD) In The Abdomen: Role Of Imaging

Participants
Jie-Ying Kowa, MBBS, London, United Kingdom (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To familiarise radiologists with the relapse patterns detected on imaging surveillance of patients with IgG4-RD2. To show the long-term morphologic changes and complications of the affected abdominal organs in IgG4-RD

TABLE OF CONTENTS/OUTLINE

IgG4-RD is a multisystem, idiopathic fibroinflammatory disorder that can affect various abdominal organs such as the pancreas, liver, and kidneys. IgG4-RD is a highly treatable condition and, along with the clinical improvement and monitoring of IgG4 concentrations, imaging allows for documenting morphologic changes in the affected organs and response to therapy. The relapsing-remitting nature is well recognized in this condition with relapses occur in 46-90% of patients within three years from diagnosis in the same affected organ or at a different anatomical site. Therefore, imaging surveillance can play a particularly important role in detecting relapse and guiding clinical management. If left untreated or in patients who don't respond to therapy, IgG4-RD may progress to irreversible organ damage which can be identified on imaging as organ atrophy or specific morphological changes such as cirrhosis.In our exhibit, you will: 1. Know the expected post-therapeutic morphologic changes of IgG4-RD in the abdomen 2. Recognize the patterns of IgG4-RD relapse in the abdomen 3. Be familiar with the abdominal imaging findings related to irreversible organ damage and long-term complications of IgG4-RD

GIEE-142 Standardized CT Protocols For The Study Of The Abdomen: A Refreshing Update

Participants
Davide Ippolito, MD, Monza, Italy (*Presenter*) Nothing to Disclose

TEACHING POINTS

To refresh the most important CT protocols, focusing on the main pathological findings in abdominal imaging, regarding standardized CT protocols.

TABLE OF CONTENTS/OUTLINE

The clinical indication for CT examination is considered the most important issue to determine which protocol should be employed, and, accordingly, the number of enhancing phases. The unenhanced phase can help to detect some pathological features (i.e. fat deposition, calcifications, blood products, and fluid collection) while the intravenous contrast media can help increasing diagnostic accuracy. In a standardized CT protocol, the arterial phase, starting about 35' from the bolus injection, is useful to identify hypervascular lesions (HCC, metastasis, hemangioma), to study the pancreatic parenchyma, and to identify bowel ischemia. Second, the portal venous phase, by obtaining a homogenous opacification and attenuation of abdominal organs about 80' from the bolus injection, helps to detect hypovascular lesions (metastasis, cysts, abscess), to better characterize different hepatic lesions (HCC, hemangioma), and the patency of venous system. Finally, the delayed phase (acquired at least 140' after injection) can help to depict fibrotic or stromal tissue (cholangiocarcinoma, fibrotic metastasis), and characterize adrenal lesions. By knowing the patient's history, previous CT examinations, and principal pathological pathways, the radiologist should acquire a tailored protocol to correctly answer to clinical issues, without losing diagnostic accuracy.

GIEE-143 Can I Finally Eat Again? MR Findings, Standardized Terminology, And Management Guidelines Of Crohn's Disease

Awards
Cum Laude

Participants
Elissandra Lima, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

To review the epidemiology, pathophysiology and classificationTo illustrate the spectrum of MRI features of Crohn's diseaseTo discuss recent consensus recommendations for imaging interpretation and clinical management

TABLE OF CONTENTS/OUTLINE

BackgroundPhysiopathology Phenotypes Imaging protocol CTE or MRE? How to choose Consensus recommendations (SAR/AGA)Extra-intestinal manifestationsUpdated glossary of terms for Crohn's disease evaluationDrug response, therapy exchange, and urgent surgical interventionTake-home messages

GIEE-145 Abdominal And Inguinal Hernias: A Hole In The Wall.

Participants
Carlos Riquelme, MD, Providencia, Chile (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Ultrasound is the imaging modality of choice for the characterization of hernias of the abdominal wall and inguinal canal, allowing not only anatomical but also dynamic evaluation in real-time.2. The use of computed tomography in the evaluation of abdominal wall hernias allows the detection and characterization of complications: bowel obstruction, incarceration, strangulation, etc.3. The radiology report must contain whether or not there is a hernia, its spontaneity or relation to the Valsalva maneuver, content and presence of complications.

TABLE OF CONTENTS/OUTLINE

1. Introduction2. Techniques for evaluation of hernias: ultrasound and CT3. Anatomy of the anterolateral abdominal wall abdomen and inguinal canala. Ultrasoundb. CT4. Types of herniasa. Groin: inguinal and femoralb. Anterolateral abdomen5. What do you need to know to perform the best ultrasound examination for hernias?a. Pearl and pitfallsb. Radiology report6. Complicated hernias7. Examples8. Summary

GIEE-146 How Does AI Reconstruct 3D Intestinal Structures Of Ileus And Intestinal Obstruction Cases From 3D CT? - Toward AI-based Emergency Diagnostic Assistance Of Intestinal Diseases

Participants
Hirohisa Oda, PhD, Nagoya, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. How intestines are reconstructed and visualized in 3D using our AI system2. How to utilize AI-based emergency diagnostic assistance of intestinal diseases

TABLE OF CONTENTS/OUTLINE

1. Emergency diagnosis of intestinal obstruction and ileus- Tracking intestines on CT without fecal tagging2. AI system for intestine reconstruction- Related systems for CT colonography- Targeting both small and large intestines- Intestine segmentation with weak annotation-- 3D U-Net-based weak annotation-- Distance maps for preventing incorrect shortcuts- Path extraction by graphical representation- Visualization for intuitively understanding routes-- Coloring scheme respecting paths3. Demonstration of our AI system- 3D intestinal structure reconstruction of intestinal obstruction patients from 3D CT- Intestine tracking on visualization results- Obstruction point findings

GIEE-147 The Man Behind The Basc: The Many Faces Of Cecal Bascule And Volvulus

Participants
Daniel Howard, DO, Rochester, New York (*Presenter*) Nothing to Disclose

TEACHING POINTS

Cecal bascule and volvulus are infrequently encountered causes of acute abdominal pain, requiring urgent surgical intervention. These can have a variety of appearances on CT, which can make accurate diagnosis challenging. A review of surgically confirmed cases from our institution reveal three basic patterns: the cecal flip, the cecal fold, and the cecal twist. Recognizing these signs can aid in swift and accurate diagnosis.

TABLE OF CONTENTS/OUTLINE

1. Review of normal cecal anatomy. 2. Schematic review of bascule/volvulus appearance on CT 3. Case examples illustrating: 3a. The cecal flip 3b. The cecal fold 3c. The cecal twist 4. Review of clinical management and outcomes. 5. Pearls and pitfalls of accurate diagnosis

GIEE-148-HC Advances In Radiological Methods For The Assessment Of Body Composition: Application To Predict The Clinical Outcomes In Solid Organ Transplantation

Participants
Omid Shafaat, MD, Baltimore, Maryland (*Presenter*) Nothing to Disclose

TEACHING POINTS

Using body composition in solid organ transplantation (e.g., liver and kidney) is rapidly expanding. Sarcopenia, which is defined as

loss of muscle mass that subsequently decreases muscle function, is strongly associated with the prediction of survival, post-surgical complications, and hospitalization. On the other hand, myosteatosis, which is the infiltration of fat into muscle and decreased muscle radiodensity, is also related to decreasing overall survival. In this educational exhibit, we will highlight the advances in radiological methods and application of body composition with emphasis on CT scans to predict the clinical outcomes of solid organ transplantations.

TABLE OF CONTENTS/OUTLINE

1)Definition 2) Pathophysiology and clinical impact 3) Different imaging techniques on body composition a. Dual-energy X-ray absorptiometry: Method b. CT scan i. Segmentation methods and tools ii. Selecting appropriate cross-sectional anatomical landmark iii. Quantification of subcutaneous adipose tissue (SAT) iv. Quantification of visceral adipose tissue (VAT) v. Quantification of abdominal muscle vi. Sarcopenic obesity vii. VAT/SAT ratio viii. Impact of contrast and slice thickening and the number of appropriate slice and reader ix. Challenges and pitfalls c. MRI: Method d. Ultrasonography: methods 4) Sarcopenia/Myosteatosis 5) Application of body composition in different solid organ transplantations 6) Application of artificial intelligence and machine learning in body composition of solid organ transplantation

GIEE-149-HC   Hepatic Steatosis And Fibrosis With Ultrasound Elastography And Fat Quantification: What Every Radiologist Needs To Know

Participants
Maria Lucia Brun, MD, Bogota, Colombia (*Presenter*) Nothing to Disclose

TEACHING POINTS

• To describe a "step-by-step" guideline for radiologist in how to perform an ultrasound liver elastography.• To explain the physical principles of ultrasound elastography.• To outline the clinical indications and uses of liver ultrasound elastography and fat quantification.• To review the cut-off values to determine liver fibrosis and liver steatosis and how to analyze them.• To exemplify through representatives cases the utility of liver ultrasound elastography and fat quantification.

TABLE OF CONTENTS/OUTLINE

1. Introduction2. Physical principles of US elastography3. Types of elastography4. Liver applications: indications and when to excluded5. How to perform an elastography?6. How to analyze the obtained data?7. Dispersion and attenuation imaging in steatosis and necroinflammatory changes8. Illustrative clinical cases9. Summary and conclusions10. References

GIEE-15   Embryology And Anatomy Of The Omentum, Mesentery And Peritoneum, Oh My!

Participants
Katherine Chung, MD, Stony Brook, New York (*Presenter*) Nothing to Disclose

TEACHING POINTS

The peritoneum, much like the pleura in the thoracic cavity, is a serous membrane consisting of a single layer of mesothelial cells. The specialized folds of the peritoneum are the mesentery and omentum: the mesentery suspends loops of bowel to the posterior abdominal wall, and the omentum extends from the stomach and connects it to adjacent organs. Despite these differences, the terms "mesentery" and "omentum" are often used interchangeably by radiologists, creating confusion for referring clinicians. In contrast to the lobes of lung, which are clearly distinguished by the double folds of visceral pleura, the compartments of the intraperitoneal cavity are less discernable. However, clearly differentiating omentum from mesentery has considerable implications for clinical and surgical management. The goal of this presentation is to differentiate the peritoneum from the mesentery and omentum with emphasis on anatomic and embryologic development of these structures while providing examples of pathologies that may affect the omentum and mesentery.

TABLE OF CONTENTS/OUTLINE

Introduction, Embryology of the gut, peritoneum, and its structures, Anatomy of the peritoneum, omentum, and mesentery, Greater and Lesser Omentum, Small bowel mesentery, Transverse mesocolon, Sigmoid mesocolon, Mesorectum, Mesoappendix, Clinical and Surgical Significance, Summary, Acknowledgements, References and Suggested Readings

GIEE-16   Systematic Assessment Of Obstructive Acute Abdomen: A Step-by-step Guide For Residents

Participants
Daniel Montel, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Evaluate the presence of intestinal obstruction, with a systematic approach, from categorizing the bowel dilatation to evaluating the obstruction etiology.- Recognize the level of intestinal obstruction, with tips on how to follow the dilated loops; - Identify complications and signs of severity in obstructive acute abdomen;

TABLE OF CONTENTS/OUTLINE

- Introduction; - How to identify an intestinal obstruction; - Tips on how to follow the dilated small bowel; - Patterns of bowel changes leading to obstruction and its main causes; - Sings of severity; - Take home messages.

GIEE-17   Pulp Fiction: An Interactive Guide To Splenic Lesions

Awards
Certificate of Merit

Participants
Matthew Nazarian, MD, New York, New York (*Presenter*) Nothing to Disclose

TEACHING POINTS

The spleen is a challenging organ to evaluate. While the vast majority of masses encountered in the spleen are benign, there is significant overlap in the imaging appearance of malignant pathologies. The characterization challenge is further exacerbated by the

fact that the majority of splenic lesions never undergo pathologic confirmation. This presentation will provide an interactive review of splenic abnormalities encountered in clinical practice. We will provide a framework to narrow the differential diagnosis utilizing an algorithm that includes whether the lesion is solid or cystic, single or multiple, vascular or nonvascular, and hemosiderin or non-hemosiderin containing. The presentation will include reference to the ACR White Paper on incidental splenic findings. Relevant anatomic and/or radiologic-pathologic correlation will be provided to assist in understanding the various disease processes.

TABLE OF CONTENTS/OUTLINE

1. Brief discussion of splenic anatomy & embryology2. Quiz-style case based review of cystic splenic lesions3. Quiz-style case based review of solid splenic lesions (single & multiple)4. "Anatomy/Pathology Corners" where relevant images will be displayed to provide a deeper understanding of the underlying pathophysiology5. Proposed algorithm for narrowing differential of splenic lesions

GIEE-18   Imaging Of Esophageal Cancer That Radiologists Need To Know: Preoperative Anatomical Variations, Surgical Techniques, And Postoperative Complications

Participants
Fumiko Yagi, MD, Shinjuku-ku, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

(1) Understanding anatomical variations about esophageal cancer surgery(2) Understanding surgical techniques for esophageal cancer(3) Learning about postoperative complications of esophageal cancer

TABLE OF CONTENTS/OUTLINE

I. IntroductionII. Anatomical variations-Variations of bronchial arteries-Variations of celiac and left gastric arteries-Variations of thoracic duct-Aberrant right subclavian artery-Azygos continuation of the inferior vena cava-OthersIII. Operation-Surgical techniques (Ivor Lewis esophagectomy, McKeown esophagectomy, left thoracoabdominal approach, transhiatal esophagectomy, others)-Bowel InterpositionIV. Postoperative complicationsAcute complications-Chylothorax-Iatrogenic bleeding (bleeding from the right gastroepiploic artery)-Thrombus/infarction (azygos vein thrombus, pulmonary embolism/deep vein thrombosis, peri-catheter thrombus, splenic infarction)-Pneumonia-Anastomotic leak, abscess/pyothorax-Lymphocele-OthersLate complications-Diaphragmatic hiatal hernia-Anastomotic stricture-Fistula-Recurrent nerve paralysis-Functional gastric emptying disorders-Reflux esophagitis-Local recurrence-Distant metastasis-Dissemination-Others

GIEE-19   Fundamentals Of Small Bowel Imaging: What A Resident Should Know

Awards
Identified for RadioGraphics
Certificate of Merit

Participants
Anup Shetty, MD, Saint Louis, Missouri (*Presenter*) Nothing to Disclose

TEACHING POINTS

For the radiologist-in-training, assessment of the small bowel can be challenging, in large part due to the overlapping imaging features of many small bowel pathologies. This case-based, pictorial, educational exhibit will:1. Identify and review the imaging characteristics of small bowel entities using multiple modalities, including fluoroscopy, CT, and MR.2. Provide an interpretive approach for the disease processes involving the small bowel, highlighting important imaging pearls and pitfalls.3. Discuss the interplay between clinical and imaging findings that aid in the correct diagnosis of small bowel entities to guide appropriate management.

TABLE OF CONTENTS/OUTLINE

Benign Diseases: Diverticulitis, malabsorption (celiac sprue, lymphangiectasia), inflammatory (Crohns, scleroderma, amyloidosis, infection)Trauma and Hemorrhage: blunt, penetrating, luminal bleeding, intramural hemorrhageVascular diseases: mesenteric ischemia (arterial, venous, non-occlusive, shock bowel), vasculitides (Henoch-Schonlein purpura/IgA vasculitis, polyarteritis, systemic lupus erythematosus)Obstruction: mechanical, closed loop, volvulusTreatment-related: graft versus host disease, radiation enteritis, NSAID enteropathy, ACE-inhibitor angioedemaBenign tumors: sporadic, polyposis-relatedMalignant tumors: adenocarcinoma, lymphoma, carcinoid, gastrointestinal stromal tumor, metastases

GIEE-2   All About Diffuse Pancreas Lesions: What Radiologists Should Know.

Participants
Shigeaki Umeoka, MD, Wakayama City, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

Diffuse pancreas lesion is a diagnostic challenge for radiologists and can be caused by a variety of benign and malignant disorders, including inflammation, hematologic diseases, and malignant tumors. Although it is important to differentiate between benign and malignant lesions in order to avoid unnecessary additional examination or treatment or to select the best treatment option, radiological diagnosis may be sometimes difficult. However, in some typical cases, clinical information and/or imaging characteristics may help narrow the differential diagnosis. The goal of this exhibit is 1. To illustrate with several examples, the imaging findings of diffuse pancreas abnormalities. 2. To simplify the diagnosis of diffuse pancreas lesions on the basis of imaging findings and clinical settings.

TABLE OF CONTENTS/OUTLINE

1.) Inflammation: Acute Pancreatitis, Chronic Pancreatitis, Autoimmune Pancreatitis, Drug-induced Pancreatitis, Traumatic Pancreatitis, 2.) Fat Replacement, 3.) Hematologic Disorders: Amyloidosis, Malignant Lymphoma, Leukemia, Hemochromatosis/Hemosiderosis, 4.) Malignant Tumors: Diffuse Pancreatic Adenocarcinoma, Islet Cell Carcinoma, Diffuse Metastasis 5.) Others: Sarcoidosis, Hypovolemic Shock

GIEE-20   How To GIST: Imaging Management Of Gastrointestinal Stromal Tumors

Awards

Participants
Salama Chaker, MD, Secane, Pennsylvania (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. In 2020, the NCCN created separate guidelines for management of GISTs, distinct from other soft tissue sarcomas, because of their unique sensitivity to molecular targeted therapies. 2. Contrast-enhanced CT is the workhorse for initial evaluation and imaging follow up. 3. Contrast-enhanced MRI is preferred for evaluation of rectal/duodenal GISTs and for suspected liver metastases. 4. PET/CT may be useful in cases where earlier assessment of response is important. 5. The imaging appearance of GISTs following therapy is variable and includes changes in size, density, wall thickness, and intra-tumoral soft tissue.6. Models for assessing treatment response of GISTs have evolved. Currently, the Choi criteria is the most widely utilized. 7. The NCCN specifies in their recommendations the type and timing intervals of imaging GISTs during and following treatment. These should be incorporated into the radiology report.

TABLE OF CONTENTS/OUTLINE

1. Review GIST markers, mutations, and immunotherapy.2. Synopsize different imaging modalities and their use in GISTs. 3. Illustrate imaging findings seen in response to therapy and review established response criteria. 4. Summarize the 2020 NCCN Guideline recommendations for imaging evaluation, follow-up intervals, and surveillance of GISTs. 5. Through case-based applications, demonstrate incorporation of these recommendations into radiology reports.

GIEE-21   MR Image Reconstruction Using Machine Learning: Early Use Examples In Abdominal Imaging And Future Directions.

Awards
Certificate of Merit

Participants
John Kirby, MD, Rochester, Minnesota (*Presenter*) Nothing to Disclose

TEACHING POINTS

Although MRI is a well-established tool for many clinical imaging applications, there are substantial limitations to clinical use, including long scan times, relatively low spatial resolution in comparison to CT, and limited signal to noise ration (SNR) in larger patients. Newer FDA-cleared image reconstruction techniques show great promise in overcoming some of these limitations in clinical practice.

TABLE OF CONTENTS/OUTLINE

Introduction/background: We will briefly review the general concepts of machine learning/deep learning (ML/DL) as a subset of artificial intelligence (AI), providing definitions and general concepts aimed towards the general radiologist and radiology resident. Use examples: We will review current clinical applications and benefits of ML image reconstruction for reducing scan time and improving SNR, resulting in better patient experiences, improved efficiency, and reduced cost. We will provide specific examples from our institution focusing mainly on clinical applications in abdominal imaging. Potential pitfalls: We will also review the caveats and potential pitfalls including concerns with a specific focus on hallucination in image creation and fragility of translating between different patient populations/data sets. Future directions: Finally, we will explore the potential directions of ML image reconstruction with an emphasis on the need for large volume data sets and clinical validation.

GIEE-22   Easy To Miss: Eosinophilic Gastrointestinal Disease - Tips And Tricks To Make The Diagnosis

Awards
Certificate of Merit

Participants
Camila Vendrami, MD, Chicago, Illinois (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Review the pathophysiology of eosinophilic gastrointestinal diseases (EGIDs) • Describe imaging and endoscopic findings of EGIDs • Differentiate EGIDs from common mimickers

TABLE OF CONTENTS/OUTLINE

EGIDs are characterized by dense infiltration of eosinophils in gastrointestinal tissues, leading to morphological and functional abnormalities. Clinical symptoms can be vague and overlap with other GI disorders. Histopathology is the gold standard for diagnosis, however, recognition of imaging features of these disorders aids in early diagnosis and therapy. 1. Introduction: overview a. Esophagitis b. Gastritis and enteritis c. Colitis d. Hepatitis e. Pancreaticobiliary disease 2. Classification 3. Imaging features a. Fluoroscopy: rings, strictures, furrowing, small caliber, barium tablet retention b. CT: Mucosal thickening, intestinal wall thickening, ascites, bowel obstruction/ intussusception c. MRI: Inflammatory bowel changes, heterogeneous appearance of the liver, biliary dilatation, and pancreatitis 4. Endoscopic features of Eosinophilic Esophagitis a. Inflammatory changes: longitudinal furrowing, esophageal edema/loss of vascular markings, exudates, friability b. Chronic fibrostenotic changes: small caliber, rings, strictures c. Review of EOE Endoscopic Reference Score (EREFS) 5. Differential diagnosis and mimickers of EGID 6. Limitations of imaging and endoscopy a. Imaging- Findings can be subtle or nonspecific. b. EGD- decreased esophageal caliber can be challenging to diagnose. 7. Conclusions

GIEE-23   Acute Gastrointestinal Bleeding Above And Below The Ligament Of Treitz - Differential Diagnosis And Role Of Imaging

Participants
Martin Halicek, PhD, Augusta, Georgia (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To discuss causes of acute gastrointestinal bleeding melena vs hematochezia. 2. To describe diagnostic approach according to

clinical presentation. 3. To describe role of different imaging modalities in the setting of acute GI bleeding and pitfalls.

TABLE OF CONTENTS/OUTLINE

GI bleeding is a common clinical condition frequently requiring hospitalization and intervention with significant morbidity and mortality. The etiology of acute GI bleeding above and below the ligament of Treitz will be discussed. Upper GI bleeding pathologies, including: gastric ulcer, gastritis, varices, gastric cancer, and aortoenteric fistula. Lower GI bleeding pathologies, including: diverticular disease, angiodysplasia, colorectal cancer, inflammatory bowel disease, Meckel's diverticulum, pseudomembranous colitis, and traumatic causes. The use of different imaging modalities in the diagnosis of GI bleeding and the role of interventional radiology in the treatment will also be discussed.

GIEE-24   The LI-RADS CT/MRI Lexicon, What Every Radiologist Should Know

Participants
Jennifer Foley, MD, San Diego, California (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Describe the development and purpose of the American College of Radiology Liver Imaging-Reporting and Data System (LI-RADS) Lexicon for CT and MR. 2. Define key imaging findings of hepatocellular carcinoma (HCC) and other Lexicon terms with visual correlation using high quality CT and MR examples. 3. Elaborate on term definitions with specific scenarios and examples, synonyms (if applicable), the type of term and what modality it is to be used with. 4. Review common pitfalls and clinical implications of Lexicon usage

TABLE OF CONTENTS/OUTLINE

1. Background & LI-RADS Lexicon Development 2. Case Based Review of the Lexicon Terms & Definitions , with pitfalls and clinical implications. Term categories: - Major findings of HCC - Phases of contrast- Key LI-RADS terms- Ancillary features favoring HCC in particular- Ancillary features favoring malignancy, not HCC in particular- Terms associated with ancillary findings and benign findings in patients at risk for HCC- Terms associated with LI-RADS-M and LI-RADS-TIV

GIEE-25   The Acute Abdomen In Pregnancy: Radiological Decision-making Tool And The Role Of MRI

Participants
Saigeet Eleti, MA,MBBCHIR, London, United Kingdom (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Acute abdominal pain in pregnancy poses a diagnostic challenge. The differential is wide, clinical assessment is difficult, and delays to diagnosis can cause maternal and fetal harm. Modalities not involve ionizing radiation are preferred. • Appendicitis is the most common cause of acute abdominal pain requiring emergent surgery. Competing causes include other gastrointestinal pathologies such as bowel obstruction; genitourinary pathologies such as ovarian torsion; and hepatobiliary pathologies such as gallstone-related disease • We present a radiological decision-making tool to guide imaging choices and best establish the underlying diagnosis in the acute pregnant abdomen. • Sonography remains first line, however anatomical visualisation can be limited due to displacement of adjacent structures by the gravid uterus. • MRI provides excellent cross-sectional soft tissue assessment of the abdomen and pelvis and is currently considered safe at any gestation as per the American College of Radiology Manual on MR Safety, 2020. With a limited protocol of sequences, a broad spectrum of pathologies can be evaluated. At our institution we have found diffusion weighted imaging of particular use to screen and highlight disease. • CT carries the highest exposure of ionizing radiation to the fetus, but may be necessary, particularly in cases of trauma. • Risks to the patient/fetus must be clearly explained.

TABLE OF CONTENTS/OUTLINE

1.Introduction 2.Radiological decision-making tool 3.US 4.MRI 5.CT 6.Explaining risk to the patient 7.Summary

GIEE-27   Imaging Of Rare Histologic Types Of Pancreatic Cancer

Participants
Mayumi Higashi, Ube, Yamaguchi, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

The accurate diagnosis of rare malignant solid epithelial tumors of the pancreas remains difficult because of their overlapping imaging features or limited information on their imaging findings. However, since the tumors have different tumor behavior and prognosis, it is important for the radiologists to be familiar with their imaging characteristics for optimal patient management and therapeutic planning. The purpose of this exhibit is: 1. To describe the WHO classification and clinical features of malignant solid epithelial tumors of the pancreas other than invasive ductal adenocarcinoma. 2. To review characteristic imaging findings on CT, MRI and SPECT/CT. 3. To highlight key differential diagnostic points of imaging findings.

TABLE OF CONTENTS/OUTLINE

This exhibit includes seven rare malignant solid epithelial tumors of the pancreas. · Characteristic clinical and imaging findings of 1. Exocrine neoplasms · Invasive ductal carcinomas (adenosquamous carcinoma, undifferentiated carcinoma, colloid carcinoma) · Acinar cell carcinoma 2. Neuroendocrine neoplasms (neuroendocrine tumor, neuroendocrine carcinoma) 3. Solid pseudopapillary neoplasm · Key imaging findings for the differential diagnosis, especially from invasive ductal adenocarcinoma

GIEE-28   Fluoroscopic Guided Contrast Examinations Of The Rectum And Colon: Essential Contributions To Clinical Decision-making.

Participants
Alberto Carbo, MD, Shreveport, Louisiana (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is to: • Review the fluoroscopic guided contrast techniques of the colon and rectum including double and single contrast examinations, pediatric studies, pre and postsurgical evaluations and functional defecography. • Debate the

evolution of the indications of fluoroscopic guided contrast examinations (FCE) since the development of colonoscopy and cross sectional imaging and their consequences on patient care. • Validate with sample cases the essential contributions of FCE in the diagnosis of controversial cases and clinical decision-making. • Discuss some roadblocks to performing these techniques, including operator expertise, lack of interest of young radiologists, radiation exposure, and lengthy consuming time for the low-revenue.

TABLE OF CONTENTS/OUTLINE

Present indications of FCE of colon and rectum: • Evaluation of the proximal colon in patients with incomplete colonoscopy and non diagnostic computed tomography. • Anatomic road map before surgery. • Diagnosis of rectal and colonic fistulas and perforations. • Detection of early and late postoperative complications. • Evaluation of distal and ostomy segments before ostomy take down. • Diagnosis of rectal and colonic strictures in newborn and pediatric patients. • Intussusception reduction. • Defecography for evaluation of anorectal syndromes and pelvic floor.

GIEE-29   Gallbladder And Biliary Tract Disease: Computed Tomography And Magnetic Resonance Imaging Features With Histopathologic Correlation

Participants
Hidemitsu Sotozono, MD, Kurashiki, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this study is1) To demonstrate the computed tomography (CT) and magnetic resonance (MR) imaging findings of the gallbladder and biliary tract diseases2) To illustrate the radiologic-pathologic correlation of gallbladder and biliary tract disease.

TABLE OF CONTENTS/OUTLINE

1) Image findings of gallbladder diseaseA) Inflammatory- Acute cholecystitis- Acute acalculous cholecystitis- Gangrenous cholecystitis- Emphysematous cholecystitis- Chronic cholecystitis- Xanthogranulomatous cholecystitis- Gallbladder tuberculosis- Gallbladder torsionB) Tumor-like (hyperplastic)- Gallbladder adenomyomatosis- Gallbladder polypC) Neoplastic- Gallbladder cancer- Metastatic tumor- Intracystic papillary neoplasm2) Image findings of biliary tract diseaseA) Inflammatory- Acute cholangitis- Acute obstructive suppurative cholangitis- IgG4-related cholangitis- Primary sclerosing cholangitis- Primary biliary cholangitis- Anti-Programmed cell death-1 immunotherapy-related secondary sclerosing cholangitisB) Neoplastic- Extrahepatic and Intrahepatic cholangiocarcinoma- Cholangiolocellular carcinoma- Intraductal papillary neoplasm of the bile ductC) Anomaly- Pancreatobiliary maljunction- Anatomical variations of the cystic duct

GIEE-3   A Review Of Esophageal Pathology In Barium Esophagram: The Aunt Minnie Approach.

Participants
Javier Azpeitia Arman, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

-Describe normal anatomy of the esophagus. - Review normal imaging appearances of the esophagus in barium esophagram. - Illustrate typical appearances of frequent and uncommon esophageal entities. CT and esophagoscopy correlates will also be shown.

TABLE OF CONTENTS/OUTLINE

Barium studies play an important role in evaluating the esophagus, Certain appearances of esophageal pathology in barium esophagram are pathognomonic. An illustrative case-based quiz will present a range of usual and unusual esophageal pathology highlighting key imaging findings. We present: - Study protocol. - Normal anatomy of the esophagus. - Imaging findings: Normal esophagus: physiological Impressions (aortic arch, left main bronchus, heart), "normal images" ("Glycogenic acantosis", "feline esophagus"). • Extrinsic compression: goiter, left atrial enlargement, abnormal vessels, osteophytes. • Indentations: esophageal web, cricopharyngeal bar. • Strictures: peptic, idiopatic eosinophilic esophagitis, caustic substance ingestion, radiation esophagitis. • Diverticula: Zenker's, epiphrenic, Killian-Jamieson. Motility disorders: achalasia (primary and secondary), presbyesophagus, difusse esophageal spasm. • Wall lesions: esophageal varices, esophageal intramural pseudodiverticulosis, leiomyoma, squamous cell carcinoma. • Surgery: antireflux techniques.

GIEE-30   Autoimmune Diseases Of The Gastrointestinal Tract: Review Of The Radiological Appearances

Participants
Pankaj Gupta, MD, Chandigarh, India (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. The gastrointestinal tract (GIT) may be involved in primary and systemic autoimmune diseases. 2. The primary autoimmune diseases of the bowel include eosinophilic gastroenteritis (EGE), Celiac disease, specific inflammatory diseases [ulcerative colitis (UC) and Crohn's disease (CD)], non-specific inflammatory diseases. 3. EGE is a rare inflammatory disorder of the GIT that predominantly involves the stomach and the small intestine. Imaging findings are diffuse mucosal fold thickening, mural thickening, layered appearance of bowel wall, and ascites. 4. The characteristics imaging findings of celiac disease are related to alteration of the small bowel fold pattern, including jejunoileal fold pattern reversal, mural thickening, hypotonia and jejunal dilatation, and intussusception. Celiac disease may be complicated by small bowel malignancy. 5. UC and CD have different imaging findings and clinical course. 6. Bowel may be involved as a part of collagen vascular diseases (systemic lupus erythematosus, rheumatoid arthritis, systemic sclerosis) and systemic vasculitides (polyarteritis nodosa, granulomatosis with polyangiitis).

TABLE OF CONTENTS/OUTLINE

1. Pathogenesis of autoimmune diseases of the GIT 2. Classification 3. Clinical features 4. Radiological and endoscopic modalities for evaluation 5. Spectrum of radiological appearances 6. Imaging appearances in specific diseases 7. Imaging appearances of extraintestinal manifestations 8. Differential diagnosis

GIEE-31   Imaging Of Luminal Gastrointestinal Tract Immunotherapy-related Adverse Events

Participants
Michael S. Gee, MD, PhD, Boston, Massachusetts (*Presenter*) Research Grant, Takeda Pharmaceutical Company Limited;Researcher, General Electric Company ;Researcher, Siemens AG

Luminal gastrointestinal (GI) immunotherapy-related adverse events (irAEs) are common and most are diagnosed by imaging.Any location in the GI tract can be affected.Early diagnosis is necessary to avert patient morbidity and requires that radiologists recognize the imaging features.Dual-energy CT (DECT) can increase conspicuity of pertinent findings.

TABLE OF CONTENTS/OUTLINE

Immune checkpoint inhibitors (ICIs) stimulate anti-tumor T cell activity against cancer cells and are associated with a unique spectrum of irAEs. Early diagnosis of irAEs is necessary to institute therapy and potentially discontinue immunotherapy treatment. Thus, it is important for radiologists to recognize the imaging features of irAEs. We review the mechanism of immunotherapy agents and associated irAEs, spectrum of luminal GI tract irAEs, illustrate case examples throughout the GI tract, and present imaging mimics. CT plays a key role in diagnosing irAEs including routine CT or PET-CT surveillance, CT angiography, and CT enterography. Dual-energy CT (DECT) examples are emphasized.Immunotherapeutic agentsImmune checkpoint Inhibitors (ICIs)Chimeric antigen receptor T-cell (CAR-T) therapyGI tract irAEsGastritisEnteritisColitisGI bleedingDiagnostic workupManagementMimicsIn conclusion, as ICI therapy gains wider use, irAEs will be increasingly encountered. Luminal GI tract irAEs can be life-threatening, so radiologists should be familiar with the imaging manifestations to facilitate diagnosis and treatment.

GIEE-32   Molecular Biomarkers Of Common Malignancies Of The Digestive System In Adults: A Primer For Radiologists

Awards
Certificate of Merit

Participants
Daniel Vargas-Zapata, MD, San Antonio, Texas (*Presenter*) Nothing to Disclose

TEACHING POINTS

Review genetics/oncological pathways related to molecular biomarkers of common malignancies of the digestive system in adults Discuss clinical implications of molecular biomarkers, including prognostic/predictive values & therapeutics targeted Describe the role of imaging in predicting biomarkers in select malignancies & in follow-up and surveillance

TABLE OF CONTENTS/OUTLINE

Introduction Esophageal Cancers: Mismatch repair (MMR), (MLH1, MSH2, MSH6, PMS2), microsatellite instability (MSI). PD-L1 IHC, HER2 (ERBB2) amplificationsGastric Adenocarcinoma: MMR IHC & MSIs on new diagnoses. PD-L1 & HER2 (ERBB2) IHC. EBV-associated GC. Genomically-stable tumor: Diffuse gastric cancer morphology & CDH1 mutations.Gastrointestinal Stromal Tumor: KIT or PDGFRA mutations; NF1, SDH genes, BRAF and NTRK alterations if KIT/PDGFRA negative. Colorectal Carcinoma: MMR, MSI on all new diagnoses. BRAF p.V600E mutation & MLH1 promoter methylation, KRAS and NRAS oncogenic mutations & HER2 (ERBB2) & NTRK Hepatocellular carcinoma NTRK IHC. DNAJB1: PRKACA fusion seen in fibrolamellar carcinoma. Hepatocellular adenomas: Inflammatory, HFN1a inactivated & B-catenin mutated Cholangiocarcinoma: FGFR2 fusions, MSI, NTRK fusions, BRAF p.V600E or IDH1/IDH2 mutations Pancreatic ductal adenocarcinoma: ALK, NRG1, NTRK, ROS1 fusions, BRAF, BRCA1/2, ERBB2(HER2), KRAS, PALB2 mutations, MMR deficiency. Pancreatic Neuroendocrine Carcinomas ATRX/DAXX with ALT-positive phenotype Imaging findings that correlate with biomarkers Conclusion

GIEE-33   Evaluation Of Hepatic Steatosis, Inflammation And Fibrosis In NAFLD By Imaging: An Overview

Participants
Jong Yeong Kim, Seoul, Korea, Republic Of (*Presenter*) Nothing to Disclose

TEACHING POINTS

• The purposes of this review are1. To explain the principal, clinical application, pros/cons and limitations of imaging techniques for hepatic steatosis, fibrosis and hepatitis2. To review the recently developed machine-learning based evaluations (computer aided diagnosis and radiomics) of conventional US, CT and MR images for the measurement of intrahepatic fat and fibrosis3. To discuss the future of these techniques, the possibility for wider clinical applications and roles in clinical trials for the treatment of diffuse liver disease

TABLE OF CONTENTS/OUTLINE

• Background• Hepatic steatosis1. US based techniques: 1) Gray scale imaging, 2) Controlled attenuation parameter 3) Attenuation imaging2. Unenhanced CT3. MRI based techniques: 1) Two point DIXON, 2) MR spectroscopy, 3) MRI-PDFF• Differentiation of NASH from simple steatosis1. Shear wave dispersion imaging2. Multiparametric MRI• Hepatic fibrosis1. US based techniques: 1) Transient elastography, 2) Shear wave-based elastography: Point SWE, ARFI, Supersonic shearwave2. MRI based techniques: 1) Diffusion weighted imaging, 2) Hepatocyte-specific contrast agent enhanced imaging, 3) MR elastography• Machine learning based evaluation of hepatic steatosis and fibrosis with US, CT, MR images• Can we replace liver biopsy by imaging studies for hepatic steatosis or fibrosis?• Conclusion

GIEE-34   The Role Of Cinematic Rendering In The Detection And Evaluation Of Suspected Hepatic Tumors: How We Do It

Participants
Elliot Fishman, MD, Owings Mills, Maryland (*Presenter*) Co-founder, HipGraphics, Inc;Stockholder, HipGraphics, Inc;Institutional Grant Support, Siemens AG;Institutional Grant Support, General Electric Company

TEACHING POINTS

This exhibit will focus on the incremental value of Cinematic Rendering (CR) for the evaluation of known or suspected liver tumors. We will review some of the basics of CR as it applies to the liver including the optimization of scan protocols, the role and use of CR presets to optimize workflow and lesion detection, as well as the role of CR in lesion characterization and staging. We will define the potential advantages of CR in lesion characterization and help define the "fingerprints" of various liver tumor. The role of CR in vascular mapping for tumor staging and potential therapy will also be addressed. Finally future directions lincuding augmented reality with HoloLens will be discussed and preliminary observations illustrated. The user in the end will have a fuller understanding of the role of CR in the evaluation of liver masses.

the presentation will include;1. principles of CR s directed toward the liver ad liver masses2. optimizing CT data acquisition for CR imaging3. how to create optimal CR images for a range of liver tumors as well as how to create vascular maps for these tumors4. review of the "fingerprints" for various benign (hemangioma, FNH)and malignant (hepatoma, cholangiocarcinoma, hepatic adenoma, metastases) hepatic masses.5. how to create a effecient workflow for CR imaging6. role of CR and MIP and VRT in the evaluation of complex hepatic pathology7. potential improvements in image visualization using augmented reality (HoloLens)8. future directions including the role of AI

GIEE-35 Omg: Omentum, Mesentery, And A Gamut Of Their Diseases

Participants
Katherine Chung, MD, Stony Brook, New York (*Presenter*) Nothing to Disclose

TEACHING POINTS

Primary diseases involving the mesentery and omentum are rare and thus easily overlooked. Due to their proximity to many upper abdominal and pelvic organs, the mesentery and omentum are often victim of inflammation, edema, hemorrhage, and neoplasm; less frequently, they are the origin of these processes. However, mesenteric and omental diseases often have nonspecific and overlapping imaging features, posing a diagnostic challenge to radiologists and necessitating reliance on clinical information. In addition, the terms "peritoneum", "mesentery", and "omentum" are often used interchangeably, although these structures are not the same. Effective treatment relies on both diagnostic and anatomical accuracy. The goal is to review a gamut of diseases involving the mesentery and omentum with an emphasis on their anatomic location.

TABLE OF CONTENTS/OUTLINE

Introduction, Definitions and Anatomy, Mesentery diseases, Sclerosing mesenteritis and its spectrum of diseases, Mesenteric abscess secondary to foreign body, Mesenteric cyst, Lymphangioma, Mesothelial cyst, Mature Cystic Teratoma, Peritoneal carcinomatosis, Peritoneal Gliomatosis, Pseudomyxoma peritonei, Mesenteric adenopathy, and Lymphoma, Mimickers of peritoneal diseases, Summary, Acknowledgments, References and Suggested Readings

GIEE-36 Dual-energy CT Evaluation Of Gastrointestinal Bleeding: Pearls And Pitfalls

Participants
Bari Dane, MD, New York, New York (*Presenter*) Nothing to Disclose

TEACHING POINTS

Virtual noncontrast (VNC) images created from a contrast-enhanced data acquisition can reduce radiation dose and afford accurate diagnosis.VNC images can assist with the differentiation of active bleeding, hyperdense enteric contents, hematoma, and enhancing masses.Low keV virtual monoenergetic images can increase the conspicuity of subtle gastrointestinal bleeding (GIB) and bowel abnormalities, improving diagnostic confidence. GIB can be diagnosed on single-phase dual-energy CT (DECT) scans by using VNC, low keV virtual monoenergetic reconstructions and iodine maps.

TABLE OF CONTENTS/OUTLINE

Accurate diagnosis of GIB with conventional CT typically requires multiple phases, including a noncontrast acquisition. DECT offers the unique ability to eliminate the noncontrast acquisition, affording significant radiation dose reduction. Additional post-processing techniques can increase the conspicuity of contrast extravasation and potentially minimize artifacts. In this exhibit, we provide a practical guide for utilizing and optimizing DECT for GIB. DECT GIB techniqueCTA protocolCTE protocolVNC instead of true noncontrastMinimum IV contrast dose for DECT versus standard CTDECT Post-ProcessingVNCVirtual monoenergetic: low and high KeVIodine overlaySeries to send to PACSDECT InterpretationEfficient interpretationLower quality (reduced IV contrast, motion) or single-phase examsActive GIBHyperdense enteric contentsEnhancing massDECT pitfalls and limitationsObese patientsField of viewImaging artifacts

GIEE-37 A Pictorial Review Of Classic Signs Of Hepatobiliary Radiology

Participants
Suryansh Bajaj, New Haven, Connecticut (*Presenter*) Nothing to Disclose

TEACHING POINTS

A myriad of classic radiological signs has been described in the literature across imaging modalities over the years. The liver and the biliary system can have a wide variety of pathologies and it is important to differentiate them on imaging. The presence of classic signs and the knowledge of their pathophysiology give the radiologists much more confidence to reach a particular diagnosis. This exhibit will review and describe some classic radiological signs associated with hepatic and biliary pathologies and will discuss their underlying pathophysiology, clinical relevance, and differential diagnosis.

TABLE OF CONTENTS/OUTLINE

1. Normal variants in liver anatomy such as Beavertail liver2. Examples of several hepatobiliary radiological signs such as Atoll sign, Bright dot sign, Cluster sign, Cottage leaf sign, Double target sign, Focal hepatic hot spot sign, Light bulb sign, Doughnut sign, Lollipop sign, Nodule in nodule appearance, Nutmeg liver, Periportal halo sign, Reverse target sign, Right posterior hepatic notch sign, Expanded gall bladder fossa sign, Snake/serpent sign, Sonographic halo sign, Starry sky appearance (USG), Turtleback sign, Water lily sign, Wheels within wheels sign, Spoke wheel sign, Interface sign, Hellmers sign, white liver sign, Scalloping sign, Patent track sign, Chiladiti sign, Flip-flop sign, Lucent liver sign, Corkscrew hepatic arteries.3. Pathophysiology, appearance, clinical relevance, and differential diagnosis of the radiologic signs will be discussed.

GIEE-38 Current Updates On Extrapancreatic Intraductal Papillary Mucinous Lesions: Horses, Zebras And The Unicorns!

Awards
Certificate of Merit

Participants

Nithin Banda, MD,BS, Pittsburgh, Pennsylvania (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Discuss morphology and histological subtypes of mass-forming intraepithelial tumors (counter parts of pancreatic IPMNs) composed of preinvasive neoplastic cells, now classified as intraductal papillary neoplasms of bile duct (IPNB), intracholecystic papillary-tubular neoplasms of gallbladder (ICPNs) and intra-ampullary papillary-tubular neoplasms (IAPNs) - Review multimodality imaging appearances of extrapancreatic papillary mucinous neoplasms. - Discuss imaging mimics of the extrapancreatic papillary mucinous lesions

TABLE OF CONTENTS/OUTLINE

- Present the list of extrapancreatic sites of papillary mucinous lesions including bile ducts, gallbladder, cystic duct and ampulla, and review the histological subtypes in each location (bile ducts, gallbladder and duodenal ampulla) - Describe the role of imaging in evaluation of the papillary mucinous lesions and present the spectrum of imaging appearances of the extrapancreatic papillary mucinous lesions on ultrasound, CT, MR and endoscopic ultrasound. - Review the imaging appearances of mimics of extrapancreatic papillary mucinous neoplasms including gallbladder sludge/hemobilia/primary adenocarcinoma/metastases, biliary strictures/sludge/stones, and ampullary adenoma/carcinoma. - Discuss current advances in diagnosis and management of extrapancreatic papillary mucinous neoplasms including role of molecular mutations and targeted therapy of actionable mutations

GIEE-39   A Multimodality Imaging Review Of Chronic Mesenteric Ischemia: What The Radiologist Needs To Know

Participants
Jonathan Revels, DO, Albuquerque, New Mexico (*Presenter*) Nothing to Disclose

TEACHING POINTS

After reviewing this education exhibit, the learner will have an improved understanding of: 1- The epidemiology, etiologies, and clinical presentation of chronic mesenteric ischemia 2- Multimodality imaging approach to establishing the diagnosis of chronic mesenteric ischemia 3- Current treatment approaches of chronic mesenteric ischemia

TABLE OF CONTENTS/OUTLINE

1- Review the background of chronic mesenteric ischemia including epidemiology, etiologies, and clinical presentation 2- Describe the role of radiologist in the diagnosis of chronic mesenteric ischemia including exclusion of alternative diagnoses 3- Demonstrate the imaging features of chronic mesenteric ischemia on CT, MRI, US, and catheter angiography 4- Review the current treatments available for chronic mesenteric ischemia

GIEE-4   Imaging Of Colonic Diverticulitis: Multimodality Approach, Controversies, And Future Directions

Participants
Victoria Tan, MD, HAMILTON, Ontario (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Suspected colonic diverticulitis (CD) is usually imaged with CT. CT can be used to accurately confirm or refute the diagnosis, to search for alternative diagnoses, and to identify a spectrum of potential severity and complications. Suspected or known CD can occasionally be imaged with other cross-sectional imaging modalities, including ultrasound, DECT and MRI.2. Acute CD can be complicated by perforation, peritonitis, abscess formation, fistula formation, small and/or large bowel obstruction, urinary tract obstruction, and colonic bleeding. Rare but important complications include septic thrombophlebitis, pseudoaneurysm formation in the abdominal aorta from associated septic seeding, and adnexal/uterine involvement.3. CT can be used to identify risk factors for progression from acute uncomplicated CD to complicated CD.4.Colonic malignancy can mimic CD and vice versa but there are imaging signs which may be helpful in differentiating between these diagnoses.

TABLE OF CONTENTS/OUTLINE

1. Introduction2. Multi-modality approach to imaging (CT, DECT, US, MR)3. Modified Hinchey classification4. Predictive factors for progression from uncomplicated to complicated diverticulitis5. Potential Complications6. Differentiating diverticulitis from malignancy

GIEE-40   Pearls And Pitfalls In The Evaluation Of Large Splenic Lesions: How We Do It

Participants
Elliot Fishman, MD, Owings Mills, Maryland (*Presenter*) Co-founder, HipGraphics, Inc;Stockholder, HipGraphics, Inc;Institutional Grant Support, Siemens AG;Institutional Grant Support, General Electric Company

TEACHING POINTS

The presence of a large (>5cm) splenic mass is challenging for the radiologist. Splenic lesions can range from benign to malignant tumors as well as abscesses , infarcts and a range of uncommon lesions. The key to reaching the best diagnosis is thru analysis of findings including;1. Solitary vs multiple lesions2. Solid vs cystic mass3. Sharply defined vs ill defined masses with ill defined masses suspicious for malignancy 4. Lesion enhancement patterns are critical.5.Lesion calcification (central vs peripheral calcification)6. Lesion relationship to splenic margins including shape changes of spleen. 7. Extra splenic findings (hepatic or renal lesions, adenopathy, ascites, lung nodules or mediastinal adenopathy)

TABLE OF CONTENTS/OUTLINE

The key findings that can be used for lesion classification include;1.Solitary lesions are often benign (cysts, hemangioma), although primary and metastatic lesions can be solitary.2. Benign lesions tend to have sharper margins than malignant lesions. angiosarcoma and lymphoma are infiltrating.3.Benign lesions can be difficult to diagnosis and be confused with a malignant mass. .4.Non-enhancement of the lesion and included in this category are splenic cysts and are usually benign 5.Hypervascular lesion-malignancies like angiosarcoma. Hemangiomas can have peripheral enhancement and can be challenging.6 Hypovascular lesion-hemangiomas are often hypovascular as are metastases as well as lymphomaCase studies illustrating this findings are provided with this exhibit..

GIEE-41   Ultrasound Quantification Of Liver Fat: Past, Present, And Future

Participants
David Fetzer, MD, Dallas, Texas (*Presenter*) Research support, Koninklijke Philips NVResearch support, Siemens AGResearch support, GE HealthcareConsultant/Advisory Board, Philips HealthcareConsultant/Advisory Board, GE Healthcare

TEACHING POINTS

- Paralleling rising obesity incidence, hepatic steatosis is remarkably common; - Ultrasound (US) is first-line modality in suspected liver disease; - Qualitative features of liver fat are widely used, however show variable performance with low sensitivity; - Semi-quantitative hepato-renal index (HRI) is useful, however suffers from confounding factors; - Fully quantitative techniques, including standardized measurement of attenuation coefficient, now clinically available; - Additional quantitative techniques, as well as multiparametric and artificial intelligence (AI)-based techniques show promise.

TABLE OF CONTENTS/OUTLINE

- Briefly review incidence of hepatic steatosis and association with: Metabolic syndrome; Heart attack/stroke; Non-alcoholic steatohepatitis, cirrhosis and hepatocellular carcinoma. - Emphasize need for liver fat assessment by US: Diagnosis (screening); Response to therapy (longitudinal follow up). - Detail widely used qualitative features of fatty liver, diagnostic performance of each and in combination; - Describe semi-quantitative HRI, benefits and drawback; - Discuss current and emerging quantitative techniques, including those currently available and those emerging as promising future tools: Attenuation and Backscatter Coefficient; Speed-of-Sound; RF analysis; Shear wave dispersion; Multiparametric and AI-based solutions. - Highlight current efforts by various organizations (AIUM; RSNA QIBA) to standardize techniques and reporting.

GIEE-42   **Precancerous Lesions Of Gastrointestinal, Hepatobiliary And Pancreatic Carcinoma: A Primer For Radiologists**

Participants
Kiyoyuki Minamiguchi, Kashihara, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of the exhibit is to recognize various cases of abdominal precancerous lesions, focusing on carcinogenesis, and to suggest a clinical significance such as early disease detection and disease-prevention.

TABLE OF CONTENTS/OUTLINE

Carcinogenesis is a multistep process in which cells accumulate multiple genetic alterations. In abdominal tumors, several different kinds of genetic alteration such as APC and KRAS mutation have been reported. Chronic infections and inflammatory diseases may contribute to the multistep carcinogenesis. The advance of radiology helps us detecting the precancerous lesions of various organs, such as villous adenoma of colon, and dysplastic nodule in the liver. Recognizing the imaging findings of precancerous lesions leads us not only to detect in early stages, but also to prevent the carcinogenesis. 1) Case presentations: We reviewed precancerous lesions in gastrointestinal and digestive system: a) Gastrointestinal tract: Villous adenoma and mucinous adenocarcinoma, Familial adenomatous polyposis and colorectal cancer. b) Liver: dysplastic nodule and hepatocellular carcinoma, bile duct adenoma and cholangiocarcinoma. c) Pancreas: PanIN and pancreatic carcinoma, IPMN and IPMC or colloid carcinoma, MCA and MCC, ITPN d) Gall bladder: ICPN In each case, we described the multimodality imaging features such as CT, MRI, US, and barium fluoroscopy. 2) Discussion: The clinical significance such as differential diagnosis, early disease detection and disease-prevention are mentioned.

GIEE-43   **Acute Appendicitis; An Update At The Light Of The 2019 Nijemegenconsensus Conference.**

Participants
Jean-Pierre Tasu, MD, PhD, Poitiers, France (*Presenter*) Speaker, Bayer AG;Consultant, Bracco Group;Research Grant, Terumo Corporation;Shareholder, TeleDiag

TEACHING POINTS

The use of clinical scores to exclude acute appendicitis (AA) and identify intermediate-risk patients needing of imaging is recommended. Ultrasonography (US) is the most appropriate first-line diagnostic tool in both adults and children. Contrast-enhanced low-dose computed tomography (CT) scan in patients with suspected AA and negative US findings is recommended. MRI is the second line examination in pregnant patients with suspected AA, after inconclusive US. Medical treatment with antibiotics is an effective alternative to surgery in children or young adult with uncomplicated AA in the absence of an appendicolith. Laparoscopic appendectomy should be the preferred approach over open appendectomy for both uncomplicated and complicated AA. Initial non-operative management with antibiotics and, if available, percutaneous drainage is recommended for complicated appendicitis with a periappendicular abscess.

TABLE OF CONTENTS/OUTLINE

The 2020 WSES (World Society of Emergency Surgery) guidelines on AA provide recommendations on diagnosis and management. This exhibit gives the key-points for radiologists. Recommendations are given according to their quality of evidence (QoE) marked as high, moderate, low, or very low and their strength (SoR) based on the level of evidence and qualified as weak or strong. Imaging patterns is given for US, CT and MRI. Two flow-chart algorithms for the diagnosis and management of acute appendicits to be used for adults and pediatric patient populations are given.

GIEE-44   **How To Use AI In Laxative-free CT Colonography For Colorectal Cancer Screening**

Participants
Hiroyuki Yoshida, PhD, Boston, Massachusetts (*Presenter*) Patent holder, Hologic, Inc;Patent holder, MEDIAN Technologies;

TEACHING POINTS

The teaching points of this exhibit are to (1) explain the role of laxative-free CT colonography in colorectal cancer screening, (2)

explain the role of artificial intelligence (AI) in realizing an effective laxative-free CT colonography examination, and (3) demonstrate how the use of AI enhances diagnostic performance in laxative-free CT colonography.

TABLE OF CONTENTS/OUTLINE

1. Introduction: The importance of colorectal cancer screening; Laxative-free CT colonography can revolutionize colorectal cancer screening; Results and implications of laxative-free CT colonography screening trials. 2. How it works: AI resolves current technical challenges of laxative-free CT colonography; How to use AI for computer-aided detection; How to use AI for electronic cleansing; How to use AI for computer-assisted diagnosis. 3. Case studies: Examples of how AI-enabled correct interpretation of a clinical laxative-free CT colonography case.

GIEE-45   **Macrovascular Invasion In Hepatocellular Carcinoma - Imaging And Pitfalls**

Participants
Roman Kloeckner, MD, Mainz, Germany (*Presenter*) Advisory Board, Guerbet SA;Speaker, Guerbet SA;Advisory Board, Bristol-Myers Squibb Company;Advisory Board, Sirtex Medical Ltd;Speaker, Sirtex Medical Ltd;Advisory Board, F. Hoffmann-La Roche Ltd;Speaker, F. Hoffmann-La Roche Ltd;Advisory Board, Boston Scientific Corporation;Speaker, Boston Scientific Corporation;Speaker, BTG International Ltd;Speaker, Siemens AG;Speaker, Eisai Co, Ltd

TEACHING POINTS

1. To understand the high clinical relevance of correct PVTT imaging2. To learn the imaging principles to identify PVTT3. To learn to differentiate PVTT against bland thrombus4. To raise awareness of the aggressive tumor behavior in patients with PVTT

TABLE OF CONTENTS/OUTLINE

1. Clinical relevance- Incidence and mortality of HCC and PVTT2. Classification of PVTT (Liver Cancer Study Group of Japan stages)3. Impact of PVTT on survival4. Differentiation of PVTT vs bland thrombus5. Case-based pictorial reviews- Bland thrombus vs PVTT- Unfavorable prognosis of PVTT with rapid progression- Concomitant hepatic vein tumor thrombus (HVTT)- Concomitant extrahepatic metastases6. Summary of important findings / teaching points

GIEE-46   **Pre-surgical Conditioning In Giant Hernias Or With Loss Of Domain; How We Do It And The Most Frequent Complications**

Participants
Almudena Gil Boronat, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

-To learn which patients are candidates for a pre-surgical conditioning treatment.-To explain how intramuscular injection of botulinum toxin and progressive pneumoperitoneum is carried out, as well as its benefits.-To become familiar with the main complications of conditioning techniques through a case-based review.-To emphasize that the main complications continue to be postoperative due to the high comorbidities of the patients

TABLE OF CONTENTS/OUTLINE

1. Quick review of the hernias' characteristics amenable to preconditioning treatment 2. How we perform the intramuscular eco-guided injection of botulinum toxin in our hospital 3. How we perform progressive pneumoperitoneum by CT-guided catheter insertion in our hospital. 4. We illustrate the few complications derived from both techniques through a case-based review and the main postoperative complications. 5. Conclusions 6. Bibliography

GIEE-47   **Acute Pancreatitis: A Ticking Bomb - Focusing On Its Multiple Complications.**

Participants
David Castanedo SR, MD, Santander, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To review the radiologic features of Acute Pancreatitis (AP). 2. To describe the wide variety of complications that may appear during the evolution of AP. 3. To focus on the diagnostic pearls for the recognition of the most lethal complications of AP.

TABLE OF CONTENTS/OUTLINE

1. Definition and standardized nomenclature of AP according to the Atlanta Revised Classification (2012). 2. Etiology of AP, diagnostic criteria and severity classification. 3. Interstitial Edematous Pancreatitis and Necrotizing Pancreatitis. 4. Severe complications of AP: 4.1. Fluid collections: Acute Peripancreatic Fluid Collection, Pseudocyst, Acute Postnecrotic fluid collection, Walled - off necrosis. 4.2. Superinfection. 4.3. Necrosis related complications: Infected Pancreatic Necrosis, Central Necrosis (disconnected duct syndrome) and Extra - pancreatic Fat Necrosis.4.4. Vascular related complications: Arterial pseudoaneurysm, Venous thrombosis. 4.5. Gastrointestinal complications: intestinal obstruction, intestinal perforation, ileus. 5. Conclusion. 6. References.

GIEE-48   **Digestive Stoma Complications: Key Imaging Findings**

Participants
Jesus Arenos-Abril, MD, Barcelona, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Stoma-related complications are a frequent cause of morbi-mortality of post-operative patients and radiology plays a crucial role in order to diagnose major part of them.- Radiology professionals must be familiar with the different surgery techniques, the main indications of digestive stoma derivation and be aware of the main complications and its imaging findings.- There are multiple types of complications appearing in different post-operative periods.- CT and MR are the principal imaging diagnostic techniques and can be performed in emergency room.

TABLE OF CONTENTS/OUTLINE

There has been a collaboration of Radiology and Surgery departments in order to collect different representative cases of the main

stoma complications and reflect them on this exhibit with the following structure:1. Definition of digestive stoma2. Surgery indications3. Types of derivations and surgery technique4. Normal imaging findings5. Digestive stoma complications- Skin complications- Parastomal hernias- Prolapse- Retraction- Necrosis- Stenosis- Parastomal fibrosis- Neoplastic implants- Parastomal varices and bleeding- Infection and abscess formation- Stomal inflammatory bowel disease recurrence- Stoma dehiscence6. Conclusions

GIEE-49   Complications Of Sacropexy: The Imaging Study View

Awards
Identified for RadioGraphics

Participants
Mohamed Haouari I, MD, Vanves, France (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Pelvic floor dysfunction constitutes a major public health issue. - Pelvic organ prolapse (POP) is among the manifestations of pelvic floor dysfunction. - Laparoscopic sacropexy is the reference standard treatment of symptomatic POP and produces excellent outcomes with few complications. - Although rare, complications can occur at each step of the surgical procedure, from the insertion to the removal of the trocars. - These complications raise diagnostic challenges for radiologists who are not specialized in pelvic and perineal imaging. - Complications may be specific or nonspecific and may occur early or after some time.

TABLE OF CONTENTS/OUTLINE

- Pelvic organ prolapse: definition, epidemiology, pathophysiology, and investigation modalities - Role of laparoscopic sacropexy in the treatment strategy for pelvic organ prolapse. - Description of the laparoscopic sacropexy technique - Examples of the imaging findings produced by early complications of each surgical step - Description of imaging findings in delayed complications

GIEE-5   Hepatic Metastases From Various Primaries; Organ-specific Metastasis And Imaging Features With Pathologic Correlation

Awards
Identified for RadioGraphics
Cum Laude

Participants
Kumi Ozaki, Fukui, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

Metastases are the most common malignant tumor in the liver, while the liver is one of the most affected organs to be involved with metastatic disease. The accurate detection and characterization of liver metastases are crucial since patients' management depends on it. The purposes of this presentation are; 1) to understand the basic mechanism of hepatic metastases in relation to organotropism; 2) to provide a general overview of imaging features of hepatic metastases from various primaries.

TABLE OF CONTENTS/OUTLINE

1. Introduction. 2. Knowledge of the various primaries and the frequency of hepatic metastases. 3. Organ-specific metastasis and role of tumor exosomes in the formation of pre-metastatic niche. 4. Metastasis process and epithelial-mesenchymal transition. 5. Hepatic fibrosis of chronic liver disease and it's influence to promoting pre-metastatic niche. 6. Desmoplastic reaction around the tumor and related imaging findings. 7. Key points of diagnostic imaging. 8. General overview of imaging features of hepatic metastases from various primaries. 9. Review several differential diagnoses of hepatic metastases. 10. Conclusion.

GIEE-50   Treatment Response Assessment After Radiation Therapy For Hepatocellular Carcinoma (HCC): Diagnostic Challenges

Participants
Matthew Carr, MD, San Diego, California (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Understanding the pathophysiology of radiation induced tumor cell death.2. Understanding the expected post-treatment imaging features after transarterial chemoembolization (TARE) and stereotactic body radiotherapy (SBRT) in the setting of hepatocellular carcinoma (HCC).3. Understanding the challenges in treatment response assessment after radiation (TARE/SBRT) therapy for HCC and common pitfalls in interpretation.

TABLE OF CONTENTS/OUTLINE

Brief overview of mechanism of radiation induced cell death.Pictorial review: 1. Describe imaging features of HCC treated with TARE or SBRT in addition to adjacent parenchymal changes. 2. Highlight the differences in post-treatment appearances of lesions following TARE and SBRT compared to other loco-regional therapies.Case based review: 1. Applying current treatment response algorithms to radiation therapy of HCC. 2. Describe challenges involved with image interpretation when applying current treatment response algorithms. 3. Highlight imaging features that improve on conventional criteria for assessing treatment response after radiation therapy and potential pitfalls in interpretation.Additional topics 1. Case based review of multidisciplinary treatment approach for diagnostic dilemmas. 2. A review of emerging data including radiology-pathology correlation.

GIEE-51   "I (ain't) Got Rhythm": Imaging GI Tract Motility Disturbances

Awards
Certificate of Merit

Participants
Jonathan Revels, DO, Albuquerque, New Mexico (*Presenter*) Nothing to Disclose

TEACHING POINTS

1- Review common and less commonly encountered GI motility disorders 2- Review the clinical and radiological approach in the

1- Review common and less commonly encountered GI motility disorders 2- Review the clinical and radiological approach in the diagnosis of these disorders 3- Review algorithmic approach to arrive at a differential diagnosis

TABLE OF CONTENTS/OUTLINE

1- Review the imaging features of common and uncommon GI motility disorders from esophagus to the large bowel such as achalasia, pyloric stenosis, intestinal obstruction and pseudo-obstruction, visceral myopathies and neuropathies, diverticular disease, systemic sclerosis, ileus, dumping syndrome, intestinal reflux and bacterial overgrowth, post-vagotomy motility disorders, etc. 2- Demonstrate imaging features of these conditions with correlative imaging including fluoroscopy with Cine imaging, CT, MRI, and relevant pathologic and surgical photos 3- Review clinical approach from the time suspected diagnosis, imaging, and follow up 4- Describe the role of radiologist in management of such patients 5- Algorithmic approach based on pattern of clinical and imaging findings to arrive at a differential diagnosis

GIEE-52   Transanal Total Mesorectal Excision (TaTME) In Rectal Surgery: Diffusion Tensor Tractography Can Be A Powerful Imaging Tool To Learn Anatomical Landmarks.

Participants
Yuko Someya, MD, Kyoto, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

Transanal total mesorectal excision (TaTME) is a promising surgical method which could outperform conventional rectal cancer surgery in both oncological and functional preservation. Direct clear visualization of the dissection plane, even in a narrow pelvis, under endoscopy from the anus is a major benefit to select the optimized dissection layer. Since the direction of the muscle fibers is concerned as an important intraoperative landmark, recognition of characteristic anatomy via transanal approach is required and a method for visualization for training is needed for surgeons. In this presentation, we review essential anatomy of anorectum and pelvic floor along with MR images, highlighting a potential benefit of diffusion tensor imaging (DTI), which is also helpful for extending knowledge of radiologists.

TABLE OF CONTENTS/OUTLINE

1. Introduction to the TaTME procedure (Advantages of TaTME, Candidates for TaTME, Possible complications) 2. The steps of TaTME procedures (Rectal purse-string suture, Rectotomy: open the rectal wall circumferentially, Dissection: Posterior Anterior Lateral, Neurovascular bundle dissection, Specimen extraction, Mechanical coloanal anastomosis), comparing information visualized by MR images. 3. Key structures (Anococcygeal lig., Muscle fibers from levator ani to conjoined longitudinal muscle of anal canal, Puborectalis m., Rectourethralis m., Denonvilliers' fascia)

GIEE-53   Current Applications Of Dixon-quant Technique In Abdominal Pathologies: A Case Base Review

Participants
Sonsoles Junquera, MD, Santiago de Compostela, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

Dixon techniques have being developed to simplify and accelerate MRI acquisition These sequences are one of the methods to suppress fat signal in MRI based on chemical shift-based techniques that use the in-phase/out-of-phase cycling of fat and water. DIXON allows us to obtain four contrast images in only one acquisition: fat-fraction, water-only, fat-only, and T2*. Fat-only images offer great potential for fat-quantification, which is useful to narrow the broad differential diagnosis of abdominal pathology since the presence of intralesional fat is typical of certain specific entities.The aim of this exhibit is -To review the technical aspects of Dixon sequences. -To discuss strengths and limitations of these sequences. -To illustrate possible pitfalls -To review main clinical applications of Dixon in abdominal disorders.

TABLE OF CONTENTS/OUTLINE

1. Technical aspects. 2. Advantages and disadvantages. 3. Applications in abdominal MRI - Liver: a) diffuse diseases (fat and iron storage) b) characterization of focal lesions- Gallbladder - Pancreas: diffuse/focal lesions- Kidneys - Adrenals - Retro and peritoneum - Bone marrow - Tumor response assessment 4. Pitfalls 5. Conclusions

GIEE-54   Long Term Course Of Crohn'S Disease: Clinical, Radiologic And Endoscopic Correlation

Awards
Certificate of Merit

Participants
Myung-Won You, MD, Seoul, Korea, Republic Of (*Presenter*) Nothing to Disclose

TEACHING POINTS

In this exhibition, we aimed to categorize and review the long-term disease courses in patients with Crohn's disease.

TABLE OF CONTENTS/OUTLINE

1. Clinical disease patterns- Vienna classification- Montreal classification2. Assessment of disease acitvity- Clinical activity index: Crohn's disease acitvity index (CDAI), Harvey-Bradshaw index(HBI)- serologic biomarkers: fecal calprotectin, C-reactive protein(CRP) etc.- Imaging: CT enterography, MR enterography- Endoscopy: Crohn's disease endoscopic index of severity(CDEIS), SES-CD- Pathologic exam3. treatment planning: 'treat-to-target'4. Long term disease courses: case review1) remission2) improved and stable3) chronic refractory4) chronic relapsing5. Predictors for disease courses

GIEE-55   Update On Electronic Cleansing In Single- And Dual-energy CT Colonography

Participants
Rie Tachibana, Boston, Massachusetts (*Presenter*) Nothing to Disclose

TEACHING POINTS

Electronic cleansing (EC) is used for subtracting orally tagged residual materials from CT colonography (CTC) images to improve the polyp detection sensitivity of virtual endoscopic fly-through reading. The teaching points of this exhibit are (1) to learn about the

history of EC in CTC, (2) to learn about recent progress in state-of-the-art AI solutions for EC, and (3) to demonstrate clinical outcomes of the state-of-the-art AI-based EC in single- and dual-energy CTC.

TABLE OF CONTENTS/OUTLINE

1. Introduction: Review the history of EC in CTC. 2. How EC works: Traditional EC; How does AI-based EC differ from traditional EC; State-of-the-art EC; self-supervised generative adversarial networks (GANs); How does dual-energy information improve the image quality of AI-based EC. 3. Case studies: examples of how the use of AI-based EC avoids the image artifacts of traditional EC algorithms in clinical single- and dual-energy CTC cases.

GIEE-56   Digging In: MR Imaging Of Perianal Fistulas In Patients With Crohn's Disease

Participants
Eric Ehman, MD, Rochester, Minnesota (*Presenter*) Nothing to Disclose

TEACHING POINTS

-MRI of the pelvis is used extensively to evaluate perianal Crohn's disease-Accurate reporting of fistula type, complexity, severity, and complications guides treatment options-Response assessment varies by treatment used-Perianal severity indices may be helpful for longitudinal response assessment

TABLE OF CONTENTS/OUTLINE

Perianal disease is commonly seen in Crohn's Disease (CD) and results in significant morbidity. Fistulas rarely resolve spontaneously and may be difficult to evaluate at physical exam. MRI of the pelvis provides a comprehensive evaluation of the perianal region and guides therapy as well as assesses treatment response.-Describe MRI technique for optimal imaging evaluation of the perianal region-Review Parks classification of perianal fistulas, and showcase complex features that portend surgical intervention-Provide a framework for clear and concise routine reporting of perianal disease-Describe currently proposed severity scoring systems for perianal disease (MAGNIFI)-Highlight therapies for perianal disease such as medications (biologics), surgical interventions (seton placement, fistulotomy, ligation, advancement flaps), and other treatments (fibrin glue injection, collagen plugs and novel stem cell impregnated plugs)-Case-based review of above treatments to illustrate healing or response to therapy

GIEE-57   Imaging Masterpieces Of Intestinal Obstruction: A Notable Collection To Unlock Your Mind

Participants
Paulo Antunes, MD, Niteroi, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Obstructive disorders of the gastrointestinal tract are common events in current medical practice. The signs and symptoms related to the multiple causes of intestinal obstruction are very similar in the majority of cases, which points out the relevance of CT evaluation in the emergency setting. Our objective is:To discuss the main imaging findings associated with the diagnosis of complex intestinal obstructions.To learn some tips and tricks to detect life-threatening complications, such as ischemia.

TABLE OF CONTENTS/OUTLINE

We will analyze several CT scans of patients with intestinal obstruction, use multiplanar reformats and surgical images, to create an interactive quiz, which will help us to understand the patterns of obstruction and its complications. Causes of obstruction that will be on the quiz: internal hernias, adherents causing simple and complex obstructions, uncommon cases such as phytobezoar and gossypiboma, parietal hernias, post-surgical internal hernias, large bowel, and gastric volvulus. We will demonstrate signs of complicated obstruction such as closed-loop obstruction, signs of ischemia, and bowel perforation.

GIEE-58   Eosinophilic Disorders Of The Gastrointestinal Tract And Beyond

Awards
Identified for RadioGraphics

Participants
Mariana Yalon, MD, Rochester, Minnesota (*Presenter*) Nothing to Disclose

TEACHING POINTS

Teaching Points:• Primary eosinophilic gastrointestinal disorders (EGIDs) are characterized by abnormal eosinophilic infiltration of various layers and segments of the GI tract in the absence of systemic or secondary causes of eosinophilia.• The clinical manifestations and radiological findings are dependent on the layers of the wall and segment of the GI tract involved.• Secondary EGIDs occur with hypereosinophilic syndrome, parasitic infections, drugs, inflammatory bowel disease, vasculitis, and other autoimmune disorders.

TABLE OF CONTENTS/OUTLINE

Table of Contents/Outline:• Overview of EGIDs (Etiology, Pathology, Clinical Presentation, Imaging features and Treatment).• Describe the imaging findings with illustrative examples of primary and secondary EGIDs: - Eosinophilic esophagitis (EoE)- Eosinophilic gastritis (EG)- Eosinophilic gastroenteritis (EGE) - Eosinophilic colitis (EC) - Eosinophilic hepatitis and cholangitis- Eosinophilic pancreatitis (EP)- Hypereosinophilia associated conditions *Parasitic infections *Primary hypereosinophilia *Drug induced *Inflammatory bowel disease

GIEE-59   Post Bariatric Abdominal Pain: A Practical Imaging Guide For The Evaluation On Emergency Room.

Participants
Paulo Antunes, MD, Niteroi, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

To clarify the importance of surgical anatomy knowledge, as well as the systematic evaluation of computed tomography in the context of urgency.To describe the main imaging findings in the emergency room of patients with Roux-en-Y reconstruction after bariatric surgery.To highlight the red flags that indicate surgical urgency and the small changes that are associated with less

common diagnoses in everyday life.

GIEE-6   **Imaging Assessment Of Treatment Response In Hepatocarcinoma: Is That Tumor Viable Or Not?**

Participants
Monica Munoz-Lopez, MD, Mexico City, Mexico (*Presenter*) Nothing to Disclose

TEACHING POINTS

-To review, in a case-based presentation, expected imaging appearances of treated hepatocellular carcinoma.-To understand the pathophysiology of imaging findings after the different types of systemic and locoregional therapies.-To recognize residual or recurrent tumor requiring further treatment.-To identify the main challenges in assessment, and the utility of multimodality imaging.

GIEE-60   **Can COVID-19 Pandemics Help Us To Understand Abdominal Anatomy? A Safe Travel Through The Extraperitonal Abdominal Spaces, Guided By The Dissecting Pneumomediastinum.**

Participants
Paulo Antunes, MD, Niteroi, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

To learn the anatomical pearl of the extraperitoneal abdominal spaces based on CT scans of patients with dissecting pneumomediastinum into the abdomen.To highlight the main signs that assist in the differentiation between peritoneal and extraperitoneal localization of the gas.

GIEE-62   **Catching The Wave: A Module For Performing And Interpreting MR Elastography**

Participants
Rekha Krishnasarma, MD, Nashville, Tennessee (*Presenter*) Nothing to Disclose

TEACHING POINTS

Magnetic resonance (MR) elastography has been demonstrated to be a reliable noninvasive technique for detection and staging of liver fibrosis. Protocols have allowed for MR elastography to be performed quickly and effectively. Our review consists of an overview of the theory, indications, and advantages of MR elastography. We also discuss the standard protocol, steps to acquiring a successful study, obtaining measurements, and review salient cases.

GIEE-63   **Body MRI Optimization: Quantitative MRI Pitfalls And How To Avoid Them**

Participants
Justin Yu, Phoenix, Arizona (*Presenter*) Nothing to Disclose

TEACHING POINTS

-Quantitative MRI holds much clinical utility and is increasingly commonly utilized in practice-There are certain artifacts/pitfalls that can occur with different quantitative methods-We summarize the presentation of some of these pitfalls and ways to fix and avoid them in 4 common qMRI methods-These methods are illustrated in the liver for this abstract, but may apply to other organs as well

image swapping, gadolinium contrast, non-standardized units of measurement, iron overload, workflow-R2* mapping--Iron overload, post processing methods, sequence selection, scanner field strength, confounding medications (e.g. ferumoxytol)-T1/T2 mapping--Technical considerations (parameter selection, sequence type), patient BMI, liver iron

GIEE-64   Moving Ahead: A Review Of Gastrointestinal Motility Disorders

Awards
Identified for RadioGraphics

Participants
Avinash Nehra, MD, Rochester, Minnesota (*Presenter*) Nothing to Disclose

TEACHING POINTS

Motility disorders can affect any portion of the gastrointestinal tract or combination of segments and can be primary or secondarily caused by a variety of diseases.Multiple diagnostic tests are available to evaluate for gastrointestinal motility abnormalities, each with unique advantages and limitations, including manometry, fluoroscopy, cross sectional (CT/MRI), and nuclear medicine imaging.With the development of new diagnostic technology, (ie. high resolution manometry and EndoFLIP) new motility disorders and subtypes of previous known disorders are being reported

TABLE OF CONTENTS/OUTLINE

Gastrointestinal tract motility disorders are common and mimic other disease processes, frequently leading to extensive evaluation and delayed diagnosis. Several diagnostic tests are available to evaluate for motility disorders, each with unique advantages and limitations. Technologic advances have led to the ability to identify new disorders or subtypes of previous known disorders. This exhibit reviews the common tests used to evaluate for motility disorders for each segment of the gastrointestinal tract and describes the findings for these disorders.• Esophagus: Achalasia, Connective tissue diseases, Diffuse esophageal spasm, Jackhammer esophagus, Post-bariatric dysmotility• Stomach: Diabetic and idiopathic gastroparesis, Opioid induced gastric atony, impaired gastric accommodation• Small bowel: Pseudo-obstruction, Scleroderma, Amyloid, IBS• Colon: Megacolon, Hirschsprung's disease, Pelvic floor dyssynergy

GIEE-65   Radiogenomics In Hepatobiliary Cancers

Participants
Aman Saini, DO, Phoenix, Arizona (*Presenter*) Nothing to Disclose

TEACHING POINTS

-Review radiogenomics, radiomics, and their emerging role in personalized cancer treatment. -Discuss key studies that examine the diagnostic, prognostic, and predictive abilities of radiogenomics in hepatobiliary cancers including HCC, cholangiocarcinoma and metastases. -Highlight challenges to radiogenomics adoption, future directions, and the role radiologists will play in multidisciplinary cancer care.

TABLE OF CONTENTS/OUTLINE

-Provide a background on hepatobiliary malignancies with a focus on HCC, Intrahepatic cholangiocarcinoma (ICC), and metastatic disease to the liver. -Discuss advances in genomics and the role of personalized therapy in cancer treatment. -Define radiogenomics and its process including imaging trait selection, genomic map creation, incorporation of clinicopathologic data, radiogenomic modeling, and model validation. -Define the related field of radiomics and review its role in the extraction of data from quantitative imaging features and how the subsequent combination of that data with clinical data can be used to monitor disease, select treatment, and predict outcomes. -Review radiogenomic/-omic literature involving HCC, ICC, and hepatic metastases. -Highlight the key findings of studies that demonstrate the diagnostic, prognostic, and predictive abilities of radiogenomics/-omics. -Discuss challenges to the adoption of radiogenomics into clinical practice. -Review future directions of the field and the role radiologists will play in multidisciplinary cancer management.

GIEE-66   Hepatic Elastography For Fibrosis And Steatosis Quantification: An Overview Of Applications, Limitations And Perspectives With Multimodality Imaging

Participants
Leonardo Marcelino, MD, SAO PAULO, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Understand how elastography techniques work and how they can beperformed.? Learn about the different imaging modalities of hepatic elastography (HE) andtheir applications, focusing on the benefits and drawbacks of ultrasound-basedtechniques.? Recognize relevant imaging features on different elastography methods,including magnetic resonance (MR) elastography.

TABLE OF CONTENTS/OUTLINE

• Introduction - HE concepts and techniques:o How elastography works: a multimodality approach.o Ultrasound elastography and MR elastography for assessingchronic liver disease.• Liver ultrasound elastography: state-of-arto How to perform: a step-by-step walkthrough.o Artifacts and pitfalls.o Current guidelines and recommendations.• Case-Based Review:o Case studies to illustrate various modalities of HE in adults and children, as well as their benefits and drawbacks, including:o Transient Elastography (TE)o Acoustic Radiation Force Impulse (ARFI)o Real-time Elastography (RT-E)o Shear-Wave Elastography (SWE)o Controlled Attenuation Parameter (CAP)o Attenuation Imaging (ATI)o Shear Wave Dispersion (SWD): investigate necroinflammatory changeso MR Elastography• Future Directions: new image modalities and next generation technologies.• Conclusion and key takeaways.

GIEE-67   Resident Primer On US And MR Elastography For Hepatic Fibrosis

Participants
Javad Azadi, MD, Baltimore, Maryland (*Presenter*) Nothing to Disclose

TEACHING POINTS

US and MRI elastography can be an intimidating concept for residents. With the continued advancement in elastography techniques and applications it is imperative that residents are comfortable in understanding, interpreting and reporting both US and MRI

elastography.-US and MRI Elastography are noninvasive methods to grade liver fibrosis-With MRI Elastography, you can also determine liver fat and liver iron levels-US Elastography can be both stand-alone procedure as well as be performed as an add-on to standard ultrasound exams of the liver-MRI Elastography requires special equipment and is typically performed as a dedicated procedure

GIEE-68   **The Dark Side Of The Bright Spot: Spectrum Of Pancreatic Neuroendocrine Neoplasms.**

Participants
Fernando Martos Martins, MD, Sao Roque, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Pancreatic neuroendocrine neoplasms (pNEN) are rare neoplasms that arise in the endocrine tissues of the pancreas. Functioning pNEN can secrete a variety of peptide hormones, including insulin, gastrin, glucagon, and vasoactive intestinal peptide, resulting in a myriad of clinical syndromes. Although nonfunctioning pNENs do secrete a number of substances, such as chromogranins, neuron-specific enolase, pancreatic polypeptide, and ghrelin, they do not present clinically with a hormonal syndrome as compared with their functional counterparts. The gross appearance of well-differentiated pNENs varies with size, ranging from smaller than 1 cm to larger than 20 cm. Smaller tumors tend to be more homogeneous, whereas larger tumors more commonly are heterogeneous with areas of cystic change, necrosis, and calcification. Atypical radiologic presentations pNEN may be mistaken as several different conditions, such as pancreatic adenocarcinoma, pseudocysts, metastasis, and forms of pancreatitis.

TABLE OF CONTENTS/OUTLINE

Discussion of the different forms of presentation of pNEN, describing the most typical radiological findings in each type. Presentation of rare imaging features found in unusual cases. Provision of a didactic approach of differential diagnoses. Easy-to-use take home messages to facilitate the handling of challenging cases.

GIEE-69   **Stuck In The Middle: A Systematic Approach For CT Assessment Of Jejunal Diseases**

Participants
Isabella Bertuol Kinoshita, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) Limitations of cross-sectional imaging in the past have once put hollow organ evaluation in an obscure place. CT technique improvements over the decades overcame most of these limitations, making small bowel findings increasingly more common in daily practice. However, still to this day, jejunal diseases are an ongoing challenge due to overlapping findings and scarce literature regarding this subject.2) Jejunal lesions are relatively rare and benign in most cases. Nonetheless, their prompt identification is crucial for patient management. They are not easily reached via endoscopic methods and accurate diagnosis may indicate or spare the patient from surgery and enterectomy.

TABLE OF CONTENTS/OUTLINE

1) Introduction: a brief review on small intestines anatomy and CT imaging protocols for jejunal evaluation.2) Case-based review of pathologic processes that develop along the jejunum. Representative cases will include intussusception, angioedema, inflammatory bowel disease, tuberculosis, adenocarcinoma, lymphoma, diverticula, GIST, metastasis, carcinoid, ectopic pancreas, benign polyps, hematoma and others.3) Flowchart-based approach for narrowing diagnostic possibilities through cross-sectional imaging.4) Take-home messages.5) References.

GIEE-7   **Everything About Complicated Cholecystitis: Survival Guide For On-call Radiologist**

Participants
Dario Herran de la Gala, MD, Santander, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

This exhibit will: 1) Describe the complications acute cholecystitis can have and its pathophysiology through a pictorial review. 2) Review the different complications that acute cholecystitis can have and its main imaging findings on US, CT and MRI.

TABLE OF CONTENTS/OUTLINE

Gallbladder pathology is the most frequent cause of right upper quadrant pain and its a common cause of acute abdomen. Its pathology ranges from simple biliary colic to acute cholecystitis and its complications. If untreated, it can lead to important mortality and morbidity rates. Acute cholecystitis and its complications requires a prompt diagnosis in which the radiologist plays a major role. If untreated, acute cholecystitis can evolve to either gangrenous cholecystitis, emphysematous cholecystitis, hemorrhagic cholecystitis, gallbladder perforation, gallstone ileus and even portal vein thrombosis (pylephlebitis). In this work we will review its key cross-sectional imaging findings helped by pictorial drawings.

GIEE-70   **Abdominal Imaging Peer Learning: Valuable Lessons Learned**

Participants
Sarah Ali, MD, Burlington, Massachusetts (*Presenter*) Nothing to Disclose

TEACHING POINTS

Our subspecialized department in a tertiary medical center transitioned from a score-peer review model to Peer Learning in 2017. Between 2017-2021, 1018 body imaging cases were submitted, 374 for great calls, 316 discrepancies and 297 for

discussion.Analysis of submitted abdominal cases revealed common themes in potential blindspots for our radiologists, the majority being incidental findings on studies for other indications. These themes suggest our radiologists may not review organ systems outside our subspecialty as closely and that certain locations/organs are challenging. This transparency into our practice has given us the ability to identify where we can collectively improve and where we should amplify our accomplishments.It is our hope that by sharing these common themes, we may be able to make other radiologist cognizant of potential preventable errors.

TABLE OF CONTENTS/OUTLINE

1.Introduction2.Themes among submissions on CT/MRI: Vascular pathology eg aneurysms, PE and DVT, Female pelvic pathology eg endometrial thickening, pelvic masses, Spinal/paraspinal, breast, gastric and pancreatic masses, Bowel findings on MRI, eg colonic masses on liver MRI, diverticulitis on pelvic MRI, Renal and adrenal masses not characterized with dual energy CT post-processing, Use of appropriate follow-up recommendations, Systems Issues eg recommending follow-up imaging for stable findings, mentioning important study details in the body but not the impression3.Future directions

GIEE-71   MRI Of Cholangitis: Simplified Interplay Between MRCP, DCE, DWI And MR Elastography

Participants
Manohar Roda, MD, Jackson, Mississippi (*Presenter*) Nothing to Disclose

TEACHING POINTS

• To review the diagnostic criteria of acute and chronic causes of cholangitis • To describe and illustrate magnetic resonance cholangiopancreatographic (MRCP) features in the spectrum of cholangitis etiologies, including ductal and parenchymal involvement • To discuss the additional value and imaging signs in DCE, DWI and MR elastography in different clinical scenarios of cholangitis

TABLE OF CONTENTS/OUTLINE

Pathologic signs are seen in less than 40% of patients and are not pathognomonic of cholangitis; thus, the final diagnosis often relies on laboratory and imaging findings. Magnetic resonance cholangiopancreatography (MRCP) is the standard for the evaluation of morphological changes of bile ducts. Aside from biliary ductal imaging features that are diagnostic of cholangitis, liver parenchymal changes are commonly identified. In recent years, the continued advancement of magnetic resonance imaging (MRI) techniques allowed for accurate non-invasive diagnosis and surveillance of biliary ductal changes and hepatic parenchymal disease progression. Our education exhibit will focus on the MRI assessment of cholangitis including acute and chronic causes such as infectious, inflammatory, iatrogenic, malignant, congenital, ischemic, traumatic and radiation or chemotherapy-induced. We will explore MRCP features and multiple imaging techniques like diffusion imaging, post contrast imaging, MR Elastography (MRE) that assist radiologists in the correct diagnosis, etiology assessment and treatment guidance of cholangitis.

GIEE-72   Sonographic Liver Elastography: An Overview And Pathologic Correlation At A Liver Transplantation Center

Participants
Paschalis Toskas, MD, Burlington, Massachusetts (*Presenter*) Nothing to Disclose

TEACHING POINTS

Acknowledge the clinical significance of hepatic fibrosis. Review fibrosis staging by pathology and elastography. Highlight imaging techniques of liver elastography. Learn basic physical principles of ultrasound elastography. Share a liver transplant institution's experience of reporting and comparing elastography results to biopsy specimen.

TABLE OF CONTENTS/OUTLINE

Background: Hepatic cirrhosis, and its dreadful consequence of hepatocellular carcinoma, remain a significant clinical and financial burden for our society. In search of less invasive methods than biopsy, liver fibrosis staging by imaging has become an area of strong interest, leading to the emergence of various quantification techniques by ultrasonography and MRI.Exhibit Goals: This project aims to familiarize the radiologist with these modern technologies, with a focus on ultrasonography, and also to conduct a comparison between ultrasonography and pathology in terms of fibrosis staging, from a perspective of an institutional experience.The big picture: Given the invasive nature of liver biopsy and the increasing need to care for a multiplying and aging population in a world of exorbitant medical costs, highlighting the role of ultrasound elastography is more relevant than ever before, in aiding the interdisciplinary teams of radiologists, gastroenterologists, oncologists, and other specialists involved in the care of this patient population.

GIEE-73   Tropical Calcific Pancreatitis: Etio-pathology, Clinical Presentation, Imaging Features, Diagnosis And Complications

Participants
Thara Pratap, DMRD,DMD, Ernakulam, India (*Presenter*) Nothing to Disclose

TEACHING POINTS

Tropical Calcific Pancreatitis (TCP) is a unique entity which has regional predisposition in tropical countries, in young non alcoholics, associated with malnutrition and has a rapid progressive course with diabetes and increased risk of adenocarcinoma. TCP is associated with a high risk of pancreatic cancer The differentiation between inflammatory and malignant pancreatic mass is based on the enhancement characteristics and ancillary features. Early diagnosis of pancreatic cancer in a background of TCP needs increased awareness by the reporting radiologist as an early diagnosis will improve patient survival.

TABLE OF CONTENTS/OUTLINE

Overview of TCP (Etiology, Pathology, Clinical Presentation, imaging findings and diagnosis). Describe the imaging findings in TCP and its complications, Differentiating features between benign and malignant masses, importance of early diagnosis of pancreatic cancer with images and illustrative examples. Management of TCP requires multidisciplinary approach involving radiologists, endoscopists and gastroenterologists.

GIEE-74   State-of-the-art Clinical Application Of Spectral-detector CT Technologies For Abdominal Imaging

Participants

Yasunori Nagayama, MD, Kumamoto, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

Spectral-detector CT provides spectral-based imaging such as virtual non-contrast imaging (VNC), virtual monochromatic imaging (VMI), and iodine density maps for all examinations, potentially facilitating the optimal lesion assessment and management for various abdominal pathologies. This presentation aims to provide the state-of-the-art clinical applications of spectral CT technologies for abdominal imaging and discuss the potential added values and current limitations.

TABLE OF CONTENTS/OUTLINE

1. Technical principles of spectral CT 2. Image acquisition and reconstruction process 3. Spectral-based imaging A) VNC B) VMI C) Iodine density map D) Effective Z E) Electron density F) Calcium suppression 4. Image characteristics 5. Clinical implementations A) Liver ? Hepatic tumor ? Fibrosis estimation ? Steatosis B) Biliary - Isoattenuating stones C) Pancreas ? Pancreatic tumor detection ? Diagnosis and staging with single venous phase CT ? Prognosis predictions D) Kidney ? Solid tumors ? Stones E) Adrenal gland - Adenoma diagnosis F) Intestinal tract ? Intestinal ischemia ? Active Crohn's disease ? Electronic cleansing in CT colonography G) Peritoneal - Peritoneal seeding H) Vascular ? Endoleak ? Assessments of arteries on venous phase CT I) Multiple organs - Contrast medium reduction 6. Current limitations and future directions A) Material decomposition accuracy B) Longitudinal variability in material density C) Integration with artificial intelligence technology

GIEE-75   Beyond Portal Vein: The Intra-abdominal Radiologic Venous Anatomy And Its Applicability In The Everyday Routine - Whats Every Radiologist Must Know.

Participants
Fernanda Mazzucato, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this study is to describe radiologic anatomy of the gastrointestinal venous system, without including the main portal vein, and its correlation with some abdominal pathology, such as hepatic pseudolesions, pancreatic cancer and the spreading of diseases.

TABLE OF CONTENTS/OUTLINE

I. Anatomy and nomenclature of the intra abdominal veins and its main branchesII. Correlation between this veins with some pathologies, such as:a. Hepatic pseudolesion (focal fat, focal fat sparing and perfusion changes) due to venous drainage to the hepatic parenchyma other than portal venous blood (so-called "the third inflow"), such as aberrant right and left gastric vein and aberrant pancreaticoduodenal vein.b. Pancreatic pathologic condition causing dilatation or occlusion of the gastrocolic trunk and gastroepiploic veins. Also, talking about pancreatic neoplasm resectability, it's fundamental to study the relation between the lesion and gastrocolic trunk and first jejunal trunk.c. Rectal cancer and metastatic dissemination pathways based on its location and venous drainage.

GIEE-76   The Mysterious Mesentery: Building A Differential For Solid And Cystic Masses

Participants
Nathaniel Linna, MD, Philadelphia, Pennsylvania (*Presenter*) Nothing to Disclose

TEACHING POINTS

A variety of primary and secondary solid lesions can arise from the mesenteries, a possible endocrine organ with various functions and histological tissue types.Many solid and cystic lesions are non-aggressive malignancies. An understanding of typical imaging characteristic on both CT and MR can help direct treatment and interventional decisions.Multi-parametric MRI scans often provide additional information for differentiating these masses, particularly the post-contrast dynamic enhancement imaging.

TABLE OF CONTENTS/OUTLINE

A review of the embryology, anatomy, and composition of the mesenteries, to aid in building differentials.A proposed flowsheet for developing a differential diagnosis of mesenteric masses, with branch points based on imaging features.Cases that demonstrate multimodality findings for mesenteric masses and how they fit into differentials. Examples as follows:Cystic Masses: lymphangioma, cystic mesothelioma, peritoneal inclusion cyst, etc.Solid Masses: desmoid, fatty masses, metastatic disease, lymphoma, etc.Discuss clinical significance and management of cystic and solid mesenteric masses.

GIEE-77   Retroperitoneum In The Emergency - CT Findings

Participants
Marina Bustamente, MD, Buenos Aires City, Argentina (*Presenter*) Nothing to Disclose

TEACHING POINTS

A differential diagnosis of an acute abdomen includes a wide range of causes among which we can categorize those related to the retroperitoneal space. Medical emergencies in this space are difficult to assess clinically due to their location and scarce manifestation of signs and symptoms. They can include vascular, iatrogenic, traumatic and infectious causes. Some of these pathologies need immediate treatment while others do not need surgery. In this context, the MDCT is a useful screening tool which increases the level of diagnostic certainty. Imaging with MDCT is the most widely used procedure to scan the retroperitoneal abdominal space in order to detect diseases. It is fast, accessible, non-invasive and of space-time high resolution. Furthermore, it allows for the implementation of post processing techniques as well as angiography studies which are invaluable for abdominal emergencies.TEACHING POINTS: 1 Differentiate the anatomy of the abdominal cavity and the retroperitoneal space. 2 Review the imaging features in acute retroperitoneal pathologies. 3 Show the useful radiology signs to identify the organ of origin. 4 To describe CT key features to make an accurate diagnosis and essential diagnostic clues to treatment.

TABLE OF CONTENTS/OUTLINE

CT usefulness in retroperitoneal emergency. CT signs to locate retroperitoneal pathologies. Anatomy. Pathology. Summary.

GIEE-79   In And Out Of The Bag: A Pictorial Review Of Gallbladder Cancer On MRI

Awards
Cum Laude

Participants
Jordan LeGout, MD, Ponte Vedra Beach, Florida (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review the types, associations, and presentations of gallbladder cancer. 2. Establish an understanding of the growth patterns and patterns of spread of gallbladder cancer. 3. Review the staging of gallbladder cancer with MRI emphasis. 4. Familiarize with the appearance and management of gallbladder polyps. 5. Introduce and review the MRI features of the mimics of gallbladder cancer.

TABLE OF CONTENTS/OUTLINE

I. Introduction a. Epidemiology b. Associations c. Presentation II. Types of gallbladder cancer a. Types and frequencies (ex. adenocarcinoma, adenosquamous, etc.) b. Metastatic disease III. Growth patterns a. Frequency by location b. Growth patterns IV. Patterns of spread a. Adjacent organ invasion b. Lymphatic spread c. Hematogenous d. Peritoneal V. Staging VI. Polyps a. Appearance b. Management VII. Treatment/Prognosis VIII. Mimics a. Acute cholecystitis b.Chronic cholecystitis i. Xanthogranulomatous c. Adenomyomatosis d. Mirrizzi syndrome

GIEE-8   Current Update On The Role Of Endoanal Ultrasound: A Primer For Radiologists.

Participants
Pankaj Nepal, MD, Bridgeport, Connecticut (*Presenter*) Nothing to Disclose

TEACHING POINTS

To understand the technique, indications and role of endoanal ultrasound. To evaluate the performance of endoanal ultrasound when compared to transperineal and transvaginal approaches in evaluation of anal/perianal pathologies. To illustrate normal anatomy of internal and external anal sphincters at proximal, mid and distal anal levels. To illustrate 3D endoanal ultrasound reconstruction images in pre-operative assessment of abscess, fistula, defects, tumors, and postoperative complications.

TABLE OF CONTENTS/OUTLINE

Logistics: Endocavitary probe, scanning technique, simultaneous schematic and sonographic anatomy of anal sphincter. Sphincteric injury: Obstetric anal sphincter injury, trauma, iatrogenic Anal sphincteric fistula types, abscess and complications Postoperative complications: retained foreign body, sphincter atrophy, and repair of defect Anovaginal and anovulvar fistula Anorectal tumor: depth of invasion and sphincter involvement

GIEE-80   Multimodality Imaging Spectrum Of Crohn's Disease: A Pictorial Review

Participants
Alessandro Bozzato, MD, Trieste, Italy (*Presenter*) Nothing to Disclose

TEACHING POINTS

•Describe the imaging techniques and select the most appropriate modality for the assessment of each phase of Crohn's disease.
•Review the multimodality imaging patterns of Crohn's disease and its complications.

TABLE OF CONTENTS/OUTLINE

Introduction • Crohn's disease, a type of inflammatory bowel disease (IBD), is a chronic disease characterized by phases of quiescence and activity. Endoscopy remains the gold standard for the diagnosis of Crohn's disease, nevertheless also Computed Tomography (CT), Magnetic Resonance Imaging (MRI) and Multiparametric Ultrasound (MPUS) can be a useful tool in the assessment of mural changes and complications. Imaging techniques • Describe the imaging techniques used to evaluate Crohn's disease (MPUS, including gray-scale US, color and power Doppler, elastography, and contrast-enhanced US (CEUS),CT Enterography (CTE) and MR Enterography (MRE)). Show the application of cine-ultrasound and cine-MRI imaging in Crohn's disease. Multimodality imaging patterns • Illustrate the imaging patterns of Crohn's disease (bowel wall thickening, loss of the normal gut stratification, hyperemia, abnormal lymph nodes) and its complications (stricture, obstruction, ulceration, fistula, phlegmon and abscess).

GIEE-81   Radiomics In Pancreatic Ductal Adenocarcinoma: Is It Time?

Participants
Francesca Rigiroli, MD, Boston, Massachusetts (*Presenter*) Nothing to Disclose

TEACHING POINTS

1 Review of application of radiomics in pancreatic ductal adenocarcinoma (PDAC). 2 Analysis of the methods used for radiomics in PDAC. 3 Analysis of the challenges and limitations to research and broad applicability of radiomics. 4 Possible solutions and future development.

TABLE OF CONTENTS/OUTLINE

1 Radiomics has been applied in PDAC for different goals: diagnosis, differential diagnosis, staging, analysis of genetics and biology, prognosis. 2 Summary of the different methods applied, including patient selection, identification of the target, segmentation, feature extraction, feature selection. 3 PDAC poses particular challenges for the use of Radiomics, including small population for machine learning applications, poor prognosis and low number of patients undergoing surgery, different chemo and radiation therapies, lack of multi-center studies. 4 Reproducibility is currently a major challenge for the applicability of radiomics analysis on PDAC. Given the location and relationship with other structures, the analysis of only intratumoral radiomic features may be limited, it is essential to look at the tumor environment and relation with other structures such as vessels. 5 Possible solutions and future development.

GIEE-82   From EDGE To TIF: A Pictorial Primer Of Advanced Endoscopic Procedures

Participants
Fernanda S. Mazzariol, MD, Bronxville, New York (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review the gamut of advanced endoscopic procedures and how they are performed. 2. Discuss the relevant anatomy and the expected post-procedural imaging findings. 3. Discuss the indications and potential complications of advanced endoscopic procedures.

TABLE OF CONTENTS/OUTLINE

Content: Illustrated examples of the following advanced endoscopic procedures but not restricted to:1. Bariatric Procedures: Endoscopic gastric balloon, endoscopic sleeve gastroplasty, endoluminal gastric bypass revision.2. Drains and stents: Cystogastrostomy, retroperitoneal drainage for pancreatic necrosis, cholecystojejunostomy post Billroth II, EUS-guided cholecystoduodenostomy, EUS-guided cholecystogastrostomy, EUS-directed transgastric ERCP (EDGE), EUS-guided gastrojejunostomy, EUS-guided hepaticogastrostomy. 3. Myotomies and others: Peroral endoscopic myotomy (POEM), gastric peroral endoscopic myotomy (G-POEM), endoscopic cricopharyngeal myotomy, transoral incisionless fundoplication (TIF).

GIEE-83   Cystic Liver Lesions: An Update From The Radiologic Pathology Archives And Brigham And Womens Hospital

Participants
Khoschy Schawkat, MD, Boston, Massachusetts (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. While cysts with benign etiology dominate this category referred to as cystic liver lesions, a wide spectrum of diseases including malignant neoplasms and metastasis can present as such.2. Several imaging features including characterization of the wall and internal patterns such as septa, presence of fat, calcifications as well as contrast dynamics aid in characterizing cystic liver lesions through imaging.3. Additional clinical information such as age, sex, clinical history, and symptoms are crucial in characterization of cystic liver lesions.

TABLE OF CONTENTS/OUTLINE

Infectious Parasitic 1. Hydatic cyst 2. Amoebic abscessNon-parasitic 1. Pyogenic abscess 2. Fungal microabscessNon-infectious Developmental 1. Hepatic cyst a. Sporadic b. Genetic i. Polycystic liver disease ii. Von Hippel Lindau iii. Tuberous sclerosis 2. Bile duct hamartoma 3. Caroli diseaseNeoplastic 1. Benign a. Hemangioma i. Classic hemangioma ii. Cystic degeneration of hemangioma iii. Giant hemangioma 2. Premalignant a. Mucinous cystic neoplasm b. Intraductal papillary neoplasm of the bile duct 3. Malignant a. Cystic hepatocellular carcinoma b. Mucinous cholangiocarcinoma c. Undifferentiated embryonal carcinoma d. Cystic metastasisMiscellaneous 1. Subcapsular/intrahepatic pseudocyst 2. Traumatic a. Hematoma b. Biloma c. Seroma

GIEE-84   Mucinous Tumours Of The Abdomen And Pelvis: More Than Just Mucin! Pearls, Pitfalls And Key Learning Points.

Awards
Certificate of Merit

Participants
Francesca Castagnoli, MD, London, United Kingdom (*Presenter*) Nothing to Disclose

TEACHING POINTS

• How does the pathophysiology of mucinous neoplasms of the abdomen and pelvis differ from non-mucinous tumours?• Describe the unique clinical and imaging features of mucinous tumours: why are they important and how to recognize them.• Understand how to image mucinous neoplasms of the abdomen and pelvis.• How to interpret the post-treatment appearances of mucinous tumors - is disease still present?

TABLE OF CONTENTS/OUTLINE

• Pathology overview of Mucinous tumours and correlation with multimodality imaging. What are the characteristic appearances of Mucinous tumours of the abdomen, and why do we see them?• Where do you see Mucinous tumours of the abdomen - not just the GI tract! Case-based review of common sites such as colorectal, gastric, appendix, pancreas and less-common sites including prostate, bladder, cervix, intra-hepatic.• Imaging strategies for suspected Mucinous tumours, what modalities are most helpful?• Why is it important to recognise these on imaging? What are the implications for prognosis and treatment?• Mucinous tumours can mimic benign pathology and how to avoid this diagnostic pitfall.• Interpreting images in the post-treatment setting, is there still viable disease?

GIEE-85   Lumen-apposing Metal Stents (LAMS): Cutting Edge Applications And Their Imaging Appearance.

Participants
Inessa Goldman, MD, Bronx, New York (*Presenter*) Nothing to Disclose

TEACHING POINTS

To familiarize radiologists with main indications, applications, advantages and common adverse events of LAMS;To demonstrate various LAMS radiologic appearances draining peripancreatic collections (PPC);To present spectrum of other common and cutting edge applications of LAMS often encountered in practice.

TABLE OF CONTENTS/OUTLINE

1) Approcved use of LAMS to drain:a. Symptomatic pseudocysts(PC)b. Symptomatic walled-off necrosis (WON)2. Characteristic of LAMSa. Dumb-bell shape and wide lumen are main advantages.3. Most common adverse events a. bleeding, migration, stent obstruction.3) Possible variations in LAMS appearance in PPC:a. Multiple LAMS to drain different portions of larger collections;i. synchronous or metachronousb. Plastic pigtail biliary stents placed through LAMS may prevent migration;3) Other common applications of LAMS:a. Drainage of postsurgical leaksb. Gastrojejunostomy via LAMS to relieve gastric or duodenal obstruction by

malignancyc. Gallbladder (GB) drainage: i. Inoperable patients for drainage of GB in acute cholecystitis/cholangitis ii. Choledochoduodenostomy via LAMS to drain obstructed bile duct due to malignancyd. Drainage of perirectal and inaccessible pericolic abscessese. Temporary LAMS placement for strictures i. Benign for peptic ulcer disease ii. Temporary for gastric cancer prior to surgeryf. Gain entry to inaccessible bowel (i.e. LAMS between gastric pouch and excluded stomach to gain endoscopic approach for ERCP)

GIEE-86 Test Yourself. Subtle Clues To Critical Findings Of Extraluminal Gas On Plain Radiographs

Awards
Certificate of Merit

Participants
Lisa Richardson, MD, Albuquerque, New Mexico (*Presenter*) Nothing to Disclose

TEACHING POINTS

Radiographs are still utilized as a screening tool to triage many patients with abdominal pain, in spite of the advances in Computed Tomography, Magnetic Resonance Imaging, and Ultrasound. Any unexplained abdominal gas pattern can be a challenge for the radiologist. Often the abnormal gas pattern leads to the underlying etiology of the patient's symptoms and accurate interpretation is important for next steps management. There are many plain abdominal radiographic findings and signs of extraluminal gas and the radiologist must be familiar with them. Simple guidelines which can aid the radiologist in the interpretation of abdominal gas are gas in the wrong place as well as nonsense gas, which is usually retroperitoneal or in the abdominal wall.

TABLE OF CONTENTS/OUTLINE

Introduction. Extraperitoneal gas/gas in the wrong place causes and outcomes. Air under the hemidiaphragms; Continuous diaphragm sign. Rigler's Sign. Intraabdominal free air signs and figures. Gas that makes no sense; Retroperitoneal gas, causes and outcomes. Gas within the abdominal wall, causes and outcomes. Test yourself and Cases. Conclusion/Take Home points.

GIEE-87 Towards Response Assessment For Crohn's Disease Small Bowel Strictures (CD-SBS): A Roadmap For Radiologists

Awards
Certificate of Merit

Participants
Joel Fletcher, MD, Rochester, Minnesota (*Presenter*) Research Grant, Siemens AG;Research Grant, Pfizer Inc;Research Grant, Takeda Pharmaceutical Company Limited;Consultant, Takeda Pharmaceutical Company Limited;Research Grant, NEXTRAST, INC;Consultant, Medtronic plc;Consultant, Johnson & Johnson;Consultant, GlaxoSmithKline plc;Consultant, Boehringer Ingelheim GmbH

TEACHING POINTS

• New treatments for CD-SBS will require reproducible methods for measuring length, obstruction, and inflammation • The Stenosis Therapy and Anti-fibrotic Research (STAR) Consortium has developed radiologist training to guide reproducible measurements and observations of CD-SBS

TABLE OF CONTENTS/OUTLINE

Background Recent guidelines have defined Crohn's small bowel strictures as having proximal small bowel dilation = 3 cm; however, numerous ambiguities exist regarding how single vs. adjacent strictures are distinguished and measured. • A single stricture is defined by continuous inflammation (but may have varying regions of luminal narrowing) or two nearby segments with luminal narrowing • Maximum small bowel dilation ass'd with a stricture is generally proximal, but may occur within a stricture itself due to a dominant stenosing region • Post-Gd images are useful for identifying short segment strictures • Imaging findings of inflammation such as restricted diffusion and ulcerations are more challenging to identify in strictures due to heterogeneity • Strictures should be classified based on inflammation, multifocality, penetration and relationship to an enteric anastomosis Summary: A consistent approach to Crohn's disease small bowel strictures is needed to measure response to therapy in clinical and research settings.

GIEE-88 Dilemmas In Rectal Tumor Board: Simple Questions But Not So Simple Answers

Participants
Purvi Haria, DMRD, Mumbai, India (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Answer commonly asked question in rectal tumor board.• Emphasize findings that can change the treatment plan.• Highlight routinely encountered grey zones in rectal MRI reporting.• Understand what the surgeon wants to know.• Underscore the importance of multidisciplinary interaction.

TABLE OF CONTENTS/OUTLINE

The exhibit will discuss the various questions asked in the rectal cancer multidisciplinary tumor board, and help understand the correct answers to these questions. Examples include: • What is the extent of sphincter involvement? Is sphincter preserving surgery feasible? • Is the primary disease T2 or early T3, or is it advanced? • Which lymph nodes are involved? Is it an internal iliac or obturator node? Are the nerve roots involved? • Is it mesorectal fascia involvement or anterior peritoneal reflection involvement? • Is the tumor abutting the prostate or involving it? Should we do a standard TME, Denonvilliers fascia excision, prostatic shave, or prostatectomy? • Is there EMVI or not? • Is the presacral fascia involved, and at what level? • Does the mildly enlarged inguinal node need sampling? • Is this 'incidental' bone abnormality or cystic adnexal lesion metastatic? • Is there a fistula? Is there wall dehiscence post-treatment?

GIEE-89 Don't Mess With The Pancreas: Ultrasound Findings Of Native And Transplant Pancreas Not To Miss

Participants
Mudassir Syed, DO, Jacksonville, Florida (*Presenter*) Nothing to Disclose

TEACHING POINTS

Ultrasound (US) of the native pancreas can be challenging and is not typically first line imaging when pancreatic pathology is suspected. However, meticulous scanning technique and awareness of sonographic findings of pancreatic pathology is important information for the radiologist. After pancreatic transplant, US is the first line modality for evaluating the allograft and vasculature to look for complications. After reviewing this case based exhibit, the learner will:- Understand US technique for evaluating the native and transplant pancreas- Identify normal anatomy for the native pancreas - Recognize the sonographic appearance of pathology in the native pancreas- Describe the surgical anatomy of pancreas transplants- Describe complications of pancreas transplant- Determine when additional imaging of the pancreas is needed

TABLE OF CONTENTS/OUTLINE

1. Objectives 2. Background 3. Pancreas a. US technique with tips for visualizing the pancreas b. Normal anatomy c. Case examples (Pancreatitis 1. Acute interstitial 2. Necrotizing 3. Chronic 4. Complications) (Pancreas masses - Solid, Cystic) 4. Pancreas Transplant a. Review of surgical techniques b. Normal appearance c. Complications (Vascular, Parenchymal, Perigraft, Bowel) d. Problem solving (Contrast enhanced ultrasound to assess allograft perfusion and vascular complications, Ferumoxytol MRI to assess transplant vasculature).

GIEE-9   Molecular Subtype-based Therapy For Colorectal Cancer: An Update For Radiologists Involved In Oncology Multidisciplinary Team Meetings

Participants
Cinthia D. Ortega, MD,PhD, Sao Paulo, Brazil (*Presenter*) Speaker, Johnson & Johnson

TEACHING POINTS

Trends towards personalized medicine impact the management of patients with colorectal cancer (CRC), and molecular biomarkers now truly influence clinical decisions. Radiologists should be aware of the genetic basis for colon cancer molecular signatures and treatment options so that accurate imaging interpretation benefits patients. The purposes of this presentation are: to briefly review some oncogenic pathways in CRC; to refresh guidelines indications for both adjuvant and systemic treatments; to understand clinical and molecular (MSI (+/-), RAS & RAF mutations) tumor characteristics used as biomarkers in the clinical setting; to assess imaging response in the scenario of metastatic disease according to different systemic therapy options; to reinforce the role of radiologists to the mutidisciplinary team.

TABLE OF CONTENTS/OUTLINE

Summary of main hypothesis of molecular pathways involved in tumorigenesis (chromosomal instability (CIN), microsatellite instability (MSI) and CpG Island Methylator Phenotype (CIMP). Explanation on relationship between molecular markers and systemic treatment. Interpretation of staging exams and possible synchronous tumors, including HNPCC (Hereditary Non polyposis Colorectal cancer) syndrome. Sample cases: clinical decisions regarding RAS status and Cetuximab, microsatellite instability and decision regarding adjuvant treatment and metastatic treatment with immunotherapy.

GIEE-90   Doppler Ultrasound Evaluation For TIPS Stent Dysfunction

Participants
Joseph Owen, MD, Lexington, Kentucky (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Describe the indications for Doppler US evaluation of TIPS dysfunction2. Describe the effect of angle correction on velocities measured with Doppler Ultrasound3. List and obtain the key measurements for detection of transjugular intrahepatic portosystemic shunt (TIPS) stent dysfunction

TABLE OF CONTENTS/OUTLINE

1) Is Doppler US necessary, or is dysfunction better detected with clinical signs of portal hypertension recurrence?2) Review the concept of measuring velocity with ultrasound: a) Doppler Shift; b) Angle correction3) Discuss TIPS placement: a) Ideal placement; b) Covered vs uncovered stent use4) Review the signs of TIPS dysfunction: a) Recurrence of pathology that led to TIPS placement- i) Ascites, ii) Variceal Bleeding, iii) Pleural Effusion; b) Low main portal vein velocity; c) Low or high in-stent velocity; d) Change in velocity from prior study; e) Focal Aliasing; f) Reversal of flow in portal branches distal to the TIPS5) Compare and contrast accurate and inaccurate, or incomplete, TIPS evaluations on real cases

GIEE-91   "Nothing Likes To Live In A Cirrhotic Liver" And Other Truisms Taught By Our Mentors

Participants
Frank H. Miller, MD, Chicago, Illinois (*Presenter*) Advisory Board, Bayer AGAdvisory Board, Guerbet

TEACHING POINTS

· Review important imaging pearls taught to us by our mentors · Illustrate the common and atypical features of disease processes

TABLE OF CONTENTS/OUTLINE

This exhibit will review important pearls of wisdom taught by our most respected mentors, which have become invaluable in our daily clinical practice, many of which are not in textbooks. Main focuses will be on the hepatobiliary system and pancreas. 1. Introduction 2. "Nothing likes to live in a cirrhotic liver" a) Typical nodules associated with cirrhosis b) Nodules seen in general population (not in cirrhosis or atypical, i.e. hemangiomas) 3. Impact of fat in liver lesions and differentials: a) Fat-containing lesion in cirrhosis - consider HCC b) Hepatic steatosis- difficult to identify metastases on CT; MR/US helpful 4. Large solitary liver masses in older patients (often HCC) 5. Biliary cystic mucinous neoplasms: uncommon; usually mid-size/larger lesions (especially males) are still cysts 6. Contiguous peripheral enhancement, not nodular, usually bad - consider malignancy, atypical hemangioma 7. What is often called an "atypical hemangioma" is not in fact a hemangioma 8. Do not be swayed by the absence of biliary dilatation in peripheral intrahepatic cholangiocarcinoma 9. Pathology is not always definitive 10. Cystic hepatic lesions in setting of prior instrumentation/sphincterotomy: consider abscess 11. Abrupt terminating pancreatic duct even without discrete mass: suggests pancreatic cancer 12. Clinically unexplained pancreatitis: consider underlying cancer 13. Conclusions

GIEE-92   Value Of MR Imaging In Assessment Of Pancreatic Transplantation Complications

Participants
Emanoel Silva, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Pancreatic transplantation is a therapeutic strategy that aims to restore physiological glycemic control in diabetic patients who are difficult to control or with glomerulopathy. It is commonly performed in conjunction with cadaver donor kidney transplantation, however other techniques are possible, such as isolated pancreatic transplantation or years after kidney transplantation. The different surgical techniques have variations in vascular and enteric anastomosis, which make the interpretation of images challenging. Magnetic resonance imaging due to its excellent tissue characterization allows a detailed assessment of grafts and post-surgical complications such as hematomas and abscesses. Together with MR angiography, it also makes it possible to evaluate vascular structures, identifying abnormalities related to them. The purpose of this presentation is to make the radiologist familiar with the normal anatomy after transplantation and be able to identify abnormalities and complications with MR imaging.

TABLE OF CONTENTS/OUTLINE

? normal anatomy and pancreatic vascularization ? Post-transplant anatomy. ? Post-transplant complications: - pancreatitis; - necrosis; - seroma; - hematoma; - abscess; - Thrombosis. ? Conclusion.

GIEE-93   Post-COVID-19 Cholangiopathy: An Emerging And Challenging Diagnosis That Share Similarities With Secondary Sclerosing Cholangitis Of The Critically Ill Patient (SSC-CIP)

Participants
Irline Cordeiro de Macedo Pontes, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Discuss how to identify and diagnose irreversible hepatobiliary injury in COVID-19, as part of a broader spectrum of non-pulmonary manifestations in this disease.- Review cases of patients with no prior history of hepatobiliary disease and persistent cholestasis after cardiopulmonary and renal recovery.- Correlate imaging findings, using magnetic resonance cholangiopancreatography (MRCP) as main diagnostic method, with pathological features.- Introduce the concept that Post-COVID-19 Cholangiopathy may be a subtype or variant of SSC-CIP, both affecting patients after prolonged need of critical treatment.

TABLE OF CONTENTS/OUTLINE

Clinical scenarioPathophysiology- Biliary ischemia, toxic bile formation, cholangiocyte necrosis, microvascular changes, and other features present in this entity and also in SSC-CIP- Other particular features not previously observed in SSC-CIP, suggesting a role of direct hepatobiliary damage by the virusImaging findings- Diffuse intrahepatic biliary irregularities, strictures and dilatations- Normal or mild-damaged extrahepatic bile ducts- Biliary casts- Complications (bacterial cholangitis, ischemia and hepatic abscess)Treatment and prognosis- Clinical treatment- Biliary and abscess drainage- Secondary biliary cirrhosis- Liver transplant- Poor prognosis and death

GIEE-94   2021 Multimodality Update On Hepatic Adenomas

Awards
Identified for RadioGraphics
Certificate of Merit

Participants
Justin Tse, MD, Cerritos, California (*Presenter*) Research Grant, General Electric Company ;Research Grant, Bayer AG

TEACHING POINTS

-Clinical and histopathologic findings of hepatic adenomas (HCAs) based on Nault et al. 2017 reclassification system-Multimodality imaging findings for each subtype, with an emphasis on Gd-EOB-DTPA MRI-Emerging role of interventional radiology in locoregional treatment for hepatic adenomatosis and portal vein embolization-Implications for management and future research

TABLE OF CONTENTS/OUTLINE

1) Molecular genotype and risk factors of each HCA subtype using both the prior and new classification systems2) Potential complications of each HCA subtype and implications for clinical care3) Multimodality imaging finding of each HCA subtype, including mimics and pitfalls4) Role of interventional radiology

GIEE-95   Rectal Adenocarcinoma After Neoadjuvant Therapy: An Updated Review

Awards
Certificate of Merit

Participants
Giovanna Torre, Sao paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

I. Understand the current concepts of rectal carcinoma managementII. Comprehend the importance of restaging after CRT in the treatment planningIII. Systematic approach to the interpretation of MR images of patients with rectal cancer after chemoradiotherapy- Discuss the highlights findings on post-CRT MRI- Recognize the main pitfalls for image interpretation

TABLE OF CONTENTS/OUTLINE

MANAGEMENT OF RECTAL CANCER? Treatment guidelines? Upfront surgery X neoadjuvant therapy? Standard therapy for locally advanced rectal cancer (concurrent chemoradiotherapy followed by surgery and adjuvant chemotherapy) X Total neoadjuvant therapyINDICATIONS OF MRI IN RECTAL CANCER AFTER NEOADJUVANT THERAPY? Restaging after CRT? Selections of candidates to organ-preserving strategies such as watch-and-wait and local excision? Follow-up of complete responders? Guide surgical approach to reach for free-margin resectionIMAGING EVALUATION ON POST CRT MRI? MR tumor regression grade? Diffusion-weighted

imaging? Mucinous subtype? Lymph node assessment after CRT? Complications of radiation therapyFUTURE DIRECTIONS? Intentional complete response

GIEE-96   Imaging Assessment After Pancreaticoduodenectomy. Reconstructions Techniques: Normal Findings And Complications.

Awards
Magna Cum Laude

Participants
Lautaro Florentin, MD, Buenos Aires, Argentina (*Presenter*) Nothing to Disclose

TEACHING POINTS

Different surgical techniques are utilised for Pancreaticoduodenectomy reconstruction, depending on the surgeon's experienceRadiologists should be familiarized with different biliodigestive reconstruction in order to know normal postoperative findings as well as main complications related to each of themMost challenging complication diagnoses are pancreatic fistula, anastomosis stricture and tumor recurrency.

TABLE OF CONTENTS/OUTLINE

1) Introduction2)Anastomoses variations. Description and helpful tips for imaging recognitiona)Pancreatico-enteric anastomosisPancreaticojejunostomy vs. Gastrojejunostomy Duct-to-mucosaInvaginationb)Biliodigestive anastomosisHepaticojejunostomyCholedojejunostomy c)Gastrojejunostomy vs. Duodenojejunostomy. When and why?3) Intestinal reconstruction.a)Child vs. Y de Roux. Afferent and efferent limbs: Interactive imaging recognition4) Normal postoperative findings vs complications. Multimethod imaging assessmentNormal findings. How to avoid pitfalls.Complicationsi) Anastomoses-relatedPancreatic Fistula (PF). CT challenge: abscess vs PFBiliary Fistula. Clue key for diagnosis.Delayed gastric emptying. Imaging roleii) Intestinal loops relatedAfferent limb syndrome. Multimodality analysis.Intestinal obstruction.iii) GlobalStump pancreatitis. Singular CT findings Tumor recurrency. Making the diagnosis: implicance in prognosisHemorrhagePseudoaneurysmArterial and/or Venous thrombosis

GIEE-97   Pelvic Floor Disorders: A Self Guided Tour And Physical Examination Correlation

Participants
Kalinka Dolcan, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Understand the causes of dysfunctions of the pelvic floor-Comprehend the normal anatomy and measurements of pelvic floor on functional study-Recognize the pathologic findings that can involve the organs of the pelvis and its respective graduations (and correlation of physical examination findings and dynamic MR defecography)

TABLE OF CONTENTS/OUTLINE

INTRODUCTION- Epidemiology of the pelvic floor pathologies- Risk factors of dysfunctions of the pelvic floorMR IMAGING PROTOCOL- Exam preparation- MR imaging technique (rest, squeeze, strain, and defecation)NORMAL ANATOMY- Relevant anatomy of the pelveHOW TO MEASURE- Normal measurement and landmarks of pelvic floor, correlating schematic pictures and MRI imagesPATHOLOGY FINDINGS THAT INVOLVE THE ORGANS OF THE PELVIS- Findings on MRI and its respective graduation, correlating didactic MRI images.- Anterior compartmentBladder descent-Middle compartmentUterine/vaginal descent-Cul-de-sacEnterocele, peritoneocele, sigmoidocele- Posterior compartmentAnterior and posterior rectoceleIntussusceptions-Abnormal relaxationDescending perineal syndromeParadoxal puborectal contraction- Some examples of pathology involving supporting structuresFUTURE DIRECTIONS- Facilitate the reading of the functional examination of the pelvis- Suggestive structure report

GIEE-98   Targeted Radiation Therapy For Hepatic Malignancy: Indications, Techniques, And Post-treatment Appearances

Participants
Madeleine Sertic, MBBCh, Boston, Massachusetts (*Presenter*) Nothing to Disclose

TEACHING POINTS

Targeted radiation therapies have emerged as viable treatment options for unresectable or locally advanced hepatic malignancies.Image-Guided Radiation Therapy (IGRT) uses focused high-energy radiation or proton beam for targeted tumor therapy. Fiducial markers are inserted, and a planning CT creates a predictive model that maximizes tumor radiation and minimizes damage to adjacent organs. Expected post-radiation changes include a well-demarcated irradiation zone that is hyper-enhancing to the background liver and retains contrast on delayed phases. A lack of residual intra-tumoral enhancement indicates treatment response.Selective Internal Radiation Therapy (SIRT) involves intra-arterial administration of micron-sized particles containing radioisotopes, which deliver local radiotherapy. Post-SIRT changes include peritumoral edema and hemorrhage, which can result in transient increase in tumor volume. Lack of intra-tumoral enhancement indicates treatment response; peripheral enhancement may persist. Complications include atrophy of the treated lobe, hypertrophy of the untreated lobe, hepatic fibrosis, portal hypertension, ascites, and pleural effusions.

TABLE OF CONTENTS/OUTLINE

- Introduction to Targeted Radiation Therapy - Image-Guided Radiation Therapy o Indications o Technique § Stereotactic Radiotherapy § Proton Beam Radiation o Expected Post Treatment Appearance o Complications - Selective Internal Radiation Therapy o Indications o Technique o Expected Post Treatment Appearance o Complications

GIEE-99   Expected And Unexpected Jejunum In The Chest: Normal Appearance And Complications After Jejunal Interposition And Esophagojejunostomy

Participants
Sanna Herwald, MD, PhD, Menlo Park, California (*Presenter*) Nothing to Disclose

TEACHING POINTS

The jejunum is rarely found in the chest of patients who have not undergone surgery. However, in patients who have undergone

complex gastroesophageal surgeries, the presence of jejunum within the chest is not uncommon, and may be expected. The first focus of this presentation is jejunal interposition grafting, which can be used for esophageal reconstruction status post esophagectomy. The second focus is esophagojejunostomy, which can establish continuity of the digestive tract after total gastrectomy. Fluoroscopy is a key imaging modality for evaluating the expected post-operative anatomy and possible complications of these surgeries. The indications, normal post-operative imaging appearance, and examples of post-operative complications are reviewed.

TABLE OF CONTENTS/OUTLINE

Part 1, Jejunal interposition graft: 1. Indications 2. Anatomy 3. Normal imaging appearance 4. Peri-anastomotic leak 5. Enterocutaneous fistula 6. Malignant stricture. Part 2, Esophagojejunostomy: 1. Indications 2. Anatomy 3. Normal imaging appearance 4. Peri-anastomotic leak 5. Leak from the Roux limb blind end 6. Esophago-pleural fistula 7. Peri-anastomotic stricture, treated with stenting 8. Hiatal herniation with jejunoesophageal reflux.

Head and Neck Education Exhibits

Sub-Events

HNEE-1 Nasopharyngeal Carcinoma: Staging, Tumor Recurrence And Post-irradiation Complications. What The Radiologist Needs To Know?

Participants
KA MAN CHU, MBChB, Hong Kong, Hong Kong (*Presenter*) Nothing to Disclose

TEACHING POINTS

Knowledge on current state of nasopharyngeal carcinoma (NPC) imaging is important for the radiologist to provide better care for patient.Basic anatomy of nasopharynx and pathology of NPC will be discussed.Update and changes on AJCC 8th edition TNM classification will be highlighted. MRI staging of primary tumor will be illustrated, with emphasis on perineural spread as well. (a) The foramina and fissures within the central skull base offer a direct extension of tumor into cranium. (b)The pterygopalatine fossa serves as an important junction for tumor extension into nasal cavity (via sphenopalatine foramen), oral cavity (via greater palatine canal), masticator space (via pterygomaxillary fissure), orbit (via inferior orbital fissure) and middle cranial fossa (via foramen rotundum). (c) Tumor involvement of vidian canal should alert the radiologist to search for perineural spread along the greater superficial petrosal nerve (GSPN).Tumor recurrence detection using MRI will be illustrated. T2 weighted sequence and diffusion weighted imaging are important for differentiation between post irradiation change and tumor recurrence. Post irradiation complications including temporal lobe necrosis, osteoradionecrosis, vascular injury such as pseudoaneurysm and carotid blow out, and radiation induced neoplasms will be illustrated.

IntroductionAnatomy and PathologyAJCC 8th edition TNM classificationMRI staging of primary tumorTumor recurrencePost irradiation complications

HNEE-10 Vascular Imaging And Interventions In The Head And Neck

Participants
Mihran Khdhir, MBChB, Beirut, Lebanon (*Presenter*) Nothing to Disclose

TEACHING POINTS

Diagnostic and interventional radiology are pivotal in diagnosis and treatment of various extracranial head and neck vascular disorders. Vascular disorders of the head and neck region compromise a heterogenous group of pathologies and are encountered in both the emergency setting and non-emergent daily practice. A detailed understanding of cross-sectional and angiographic vascular anatomy, an awareness of the various vascular based pathologies and a grasp of meticulous interventional techniques, enable radiologists to make the correct diagnosis, evaluate the extent of disease, assess for potential complications, and even provide the appropriate management. The aim of this review is to familiarize radiologist with the multimodality imaging of head and neck vascular anatomy and disorders while navigating through the various interventional treatment techniques.

TABLE OF CONTENTS/OUTLINE

1. Vascular anatomy and anomalies. 2. Vascular stenosis and aneurysms. 3. Vascular emergencies and trauma. 4. Vasculitis. 5. Vascular malformations. 6. Vascular tumors 7. Non-vascular hypervascular lesions.

HNEE-11 The Management Of Neurofibromatosis Type 2 - What A Radiologist Should Know

Participants
Kyungmin Kim, MD, Manchester, United Kingdom (*Presenter*) Nothing to Disclose

TEACHING POINTS

Neurofibromatosis type 2 (NF2) is a tumor predisposition syndrome associated with multiple schwannomas, meningiomas and ependymomas. Management options comprise active surveillance, surgery, systemic anti-angiogenic therapy (bevacizumab) and stereotactic radiosurgery (SRS). The aim is to maintain quality of life for as long as possible and management decisions are best made by a multidisciplinary team. Imaging is central and patients with NF2 require regular MR surveillance of the head and spine to assess for disease progression and complications. Most patients undergo resection of at least one NF2-related tumor in their lifetime. The reporting radiologist should be familiar with common surgical approaches to accurately assess for recurrence and post-surgical complications. Adjunctive therapies such as implanted hearing augmentation devices (e.g. cochlear and auditory brainstem implants) can help maintain quality of life. Selected NF2 patients can benefit from bevacizumab or SRS.

TABLE OF CONTENTS/OUTLINE

- Introduction - Management options for NF2 1. Active surveillance 1.1 Imaging assessment 2. Surgery 2.1 Tumor resection 2.2 Adjunctive surgical treatment options 2.2.1 Implanted hearing augmentation devices 2.2.1a Cochlear Implant 2.2.1b Auditory Brainstem Implant 2.2.2 Eyelid weights 3. Bevacizumab 4. SRS - Conclusion

HNEE-12   I See Double! Searching For The Abnormal Cranial Nerve In Diplopia

Participants
Angela Guarnizo, MD, Bogota, Colombia (*Presenter*) Nothing to Disclose

TEACHING POINTS

Diplopia or double vision can be binocular due to orbital or neurological disorders including abnormalities in the brain, in the brainstem, within the subarachnoid space, in the cavernous sinus and/or superior orbital fissure. Monocular diplopia is secondary to lesions in the orbit. Causes of binocular diplopia include: ischemia, tumors, infection, inflammatory and vascular abnormalities. Imaging assessment with MRI of the brain and orbits with contrast is crucial to identify pathologies involving the nuclear, cisternal, cavernous and orbital segments of these cranial nerves. Ischemia, tumors and infection are the most common pathologies involving the nuclear segment of the III, IV and VI cranial nerves. Extrinsic compression due to aneurysms, tumors or brain herniation are common causes of cranial nerve palsy involving the cisternal segment. Lesions of the cavernous sinus can cause III, IV and VI cranial nerve palsy and deficits of the V1 and V2 cranial nerves. In patients with proptosis, pain in the eye and combination of III, IV and VI cranial nerve palsies a lesion of the orbital segment must be suspected. Infection, tumors, inflammatory conditions and lesions secondary to trauma should be included in the differential.

TABLE OF CONTENTS/OUTLINE

1. Objectives2. Diplopia: definition (monocular versus binocular diplopia)3. Anatomy of cranial nerves III, IV and VI 4. Imaging diagnostic approach 5. Common and infrequent pathologies involving the nuclear, the cisternal, the cavernous and the orbital segments of CN III, IV and VI.6. Summary

HNEE-13   18F-FDG PET/CT In Head And Neck Cancer: Usefulness And Pitfalls

Participants
Masafumi Sakai, MD, Tsukuba, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

18F-FDG PET/CT (PET/CT) is useful for the staging and assessment of post-treatment response and follow-up in head and neck (H&N) cancer. Cancer staging helps detect lymph node and distant metastases, second primary malignancies (SPMs), and primary lesions of metastasis from unknown primary sites. However, there are some pitfalls when using PET/CT to assess primary tumors and metastases. The post-treatment response assessment and follow-up findings indicate a high negative predictive value. Further, PET/CT can also yield false-positive results that mimic the findings of recurrence. Immune checkpoint inhibitors (ICIs) have recently been introduced for the treatment of H&N cancer. Immune-related adverse events (irAEs) caused by ICIs may result in false-positive findings on PET/CT. Radiologists should understand the usefulness and pitfalls of PET/CT in the diagnostic imaging of H&N cancer. The purposes of this exhibit are:1. To explain the usefulness and pitfalls of PET/CT in H&N cancer staging 2. To explain the usefulness and pitfalls of PET/CT in the assessment of post-treatment response and follow-up of H&N cancer

TABLE OF CONTENTS/OUTLINE

Usefulness and pitfalls of PET/CT in H&N cancer 1. Initial staging SPMs Unknown primary sites in cases of cervical lymph node metastasis Physiological uptake Inflammation False negatives Benign tumors Difficult-to-detect brain metastases Etc. 2. Post-treatment response assessment and follow-up Postoperative changes Postirradiation changes IrAEs Inflammation Benign tumors SPMs Etc.

HNEE-14   Head/Neck Fistulae

Participants
Maram Alafif, MD, San Diego, California (*Presenter*) Nothing to Disclose

TEACHING POINTS

(1) Acquired fistulae may occur due to surgical resection with symptoms mitigated by obturator/ prosthesis, or unintended fistulae as a complication of treatment, wound healing or tumor involvement. (2) Assessment of head/neck fistulae on imaging requires multi-planar tracking of the trans-spatial path and any branches. (3) Evaluation of adjacent structures is critical to evaluate for areas of osteomyelitis, bone exposure, and risk for arterial pseudoaneuysm or blow out. (4) Sampling may be necessary to exclude viable tumor, as PET imaging may not discriminate between inflammation and tumor.

TABLE OF CONTENTS/OUTLINE

Imaging examples are presented of the following fistulae, with case notes including key findings, pre-disposing factors and treatment: (1) Nasal-Oral (without and with obturator), (2) Oral-Antral, (3) Oral-Cutaneous, (4) Salivary-Cutaneous, (5) Submandibular-Tonsillar, (6) Pharyngo-Prevertebral, (7) Phayngo-Cutaneous, (8) Orbital-Sinonasal-Oral cavity, (9) Sinonasal-Skull base, (10) CSF-Pharyngeal, (11) Tracheo-esophageal, (12) Neopharyngeal-Cutaneous, (13) Esophageal reconstruction-Cutaneous

HNEE-15   Recognizing Complications Of Head/neck Radiation

Participants
Maram Alafif, MD, San Diego, California (*Presenter*) Nothing to Disclose

TEACHING POINTS

(1) It is important to recognize expected post-radiation imaging appearance in order to differentiate between symptomatic findings vs complications or recurrence. (2) Expected radiation induced changes include edema, fibrosis, accelerated atherosclerosis, dentition changes related to xerostomia, dysphagia and bone marrow fat replacement. (3) Complications include soft tissue necrosis, ulceration and fistula formation, bone and cartilage necrosis, vascular thrombosis. (4) Recurrence may occur within or at margins of treatment field, and radiation-related tumors may present years later. (5) Sampling may be necessary to exclude recurrence.

TABLE OF CONTENTS/OUTLINE

Comparison cases will be presented with side-by-side examples of expected post-radiation findings and complications including recurrence: (1) Mucosal: mucositis and submucosal edema, ulcer-ulceration vs tumor recurrence (2) Dentition changes vs

recurrence (3) Submandibular gland transfer vs recurrence (4) Denervation related changes vs perineural spread (5) Osteonecrosis vs tumor recurrence (6) Chondronecrosis vs tumor recurrence (7) Accelerated atherosclerosis vs pseudoaneurysm within tumor (8) Brain radiation necrosis vs tumor invasion (9) Recurrence vs new radiation-related primary tumor

HNEE-16   Desmoid Type Fibromatosis Of The Head And Neck: A Pictorial Review.

Participants
Tao Ouyang, MD, Hershey, Pennsylvania (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Desmoid type or aggressive fibromatosis (DF), is an uncommon mesenchymal tumor, with a tendency for infiltrative growth and local recurrence. The tumor is rare, with 2-4 new cases per million annually. Approximately 10% of all cases occur in the head and neck. • Differential diagnosis of DF in the head and neck includes: malignant soft tissue tumors, solitary fibrous tumor, neurogenic tumor and metastases. • There is an association with familial adenomatous polyposis (FAP) and Gardner syndrome although most occur sporadically. • The management of DF includes surgery, radiation and systemic therapies (hormonal therapy, chemotherapy and more recently immunotherapy). • Cross sectional imaging features include: involvement of the prevertebral space, involvement of the submandibular and masticator spaces, elongated shape, low signal non-enhancing bands on all MRI sequences, lack of necrosis, calcification or hemorrhage, and homogeneous contrast enhancement. MRI appearance maybe somewhat variable depending on size of lesion and treatment • Effect on adjacent bony structures on CT maybe helpful to distinguish DF from other entities in the head and neck • CT and MRI are most useful for treatment planning and follow up

TABLE OF CONTENTS/OUTLINE

BackgroundDifferential diagnosis of DFImaging appearance of DF in the head and neck• Paraspinal• Submandibular• Masticator space• ScalpImaging appearance after treatment (surgery or protein kinase inhibitor)Conclusion

HNEE-17   Can You See Me Now? A Review Of Diffusion-Weighted Imaging (DWI) Of The Orbit

TEACHING POINTS

1. Provide an overview of diffusion weighted imaging (DWI) in the orbits focusing on magnetic resonance imaging (MRI) physics and clinical interpretation.2. Review state-of-the-art DWI protocols (i.e. RESOLVE) that allow for increased image quality in the orbits.3. Review anatomy of the orbit.4. Review essential DWI manifestations of orbital pathology in the context of other conventional MR imaging findings.5. Highlight distinct benefits and limitations of DWI compared to other MRI sequences when evaluating orbital pathology.

TABLE OF CONTENTS/OUTLINE

Introductiono Conventional MR protocol (i.e. T1-weighted, T2-weighted, short tau inversion recovery) versus DWIo Common DWI applications for evaluation of central nervous system pathology (CNS)o Specific limitations of DWI in evaluation of orbital pathologyReview of MRI physics concepts underpinning DWIo Concept of random movement (Brownian motion)o Significance of variables contributing to water molecule displacement distribution (i.e. duration of measurement, temperature, type of molecule)o Role of apparent diffusion coefficient (ADC) mapDWI Techniqueo Common DWI sequences (i.e. single shot echo-planar imaging)o DWI artifacts to consider during image interpretationo Modified techniques for improved image quality (i.e. RESOLVE)Anatomy of the orbitCase-guided review of orbital pathology findings focusing on DWIo Comparison with conventional MR findingso Added value of including DWI for narrowing the differential diagnosis for orbital lesions

HNEE-18   Deadly Fungi. Invasive Fungal Infections In The Head And Neck

Awards
Identified for RadioGraphics

Participants
Mariko Kurokawa, MD, Ann Arbor, Michigan (*Presenter*) Nothing to Disclose

TEACHING POINTS

The aim of this review is to summarize the imaging findings of invasive fungal sinonasal infections, which sometimes lead to devastating clinical outcomes. Teaching points:• Recognize the spectrum of sinonasal invasive fungal infections and associated clinical features.• Identify the multimodal imaging findings of invasive fungal infections in the head and neck.• Describe epidemiologic characteristics and key imaging findings to narrow the differential diagnosis of these invasive sinonasal fungal infections.

TABLE OF CONTENTS/OUTLINE

I. IntroductionWhen to consider invasive fungal infection?The spectrum and clinical features of invasive fungal infectionII. Imaging Findings - CT and MRI -Typical findings of the invasive fungal infectionThe areas to evaluate for invasionComplications; Intracranial extension, intraorbital extension, vascular invasionIII. Case based review i. Intraorbital extension: Orbital apex syndrome, Ischemic optic neuropathy ii. Intracranial extension: Cavernous or venous sinus thrombosis, Cerebritis, Intracranial abscess, Meningitis (pachymeningitis and leptomeningitis) iii. Vascular invasion: Mycotic aneurysm, Vascular obstruction including embolic strokes , Acute infarction, Septic vasculitisIV. Summary

HNEE-19   Radiological Approach For The Preoperative Prediction Of Mastoid Extensions In Middle Ear Cholesteatoma

Participants
Akira Baba, Ann Arbor, Michigan (*Presenter*) Nothing to Disclose

TEACHING POINTS

The European Academy of Otology and Neurotology (EAONO) and the Japan Otological Society (JOS) newly proposed the STAM anatomical classification system (S1 = supratubal recess, S2 = sinus tympani, T = tympanic cavity, A = attic, and M = mastoid) as a part of the EAONO/JOS staging system for intraoperative evaluation of middle ear cholesteatoma extension. In particular, assessment of extension to the mastoid (M) in cholesteatoma is an important factor influencing the decision to perform

mastoidectomy. Therefore, it is important for radiologists to preoperatively evaluate for the presence of mastoid extensions. Although this is easy when cases are clear in preoperative imaging, there are often cases in which radiologists have difficulty assessing mastoid extensions. Therefore, radiologists need to know about a variety of radiological imaging features, including novel techniques for identifying mastoid extensions in middle ear cholesteatomas.

TABLE OF CONTENTS/OUTLINE

1. Staging of middle ear cholesteatoma 2. Radiological features of middle ear cholesteatoma 3. CT prediction of mastoid extension 4. MRI prediction of mastoid extension 5. Temporal subtraction CT prediction of mastoid extension

HNEE-2   **Where Is The Primary Tumor? Imaging Approach To Cervical Lymph Node Metastases From An Unknown Primary Tumor**

Awards
Identified for RadioGraphics
Cum Laude

Participants
Sota Masuoka, MD, kashiwa, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

Cervical lymph node (LN) metastasis causes initial symptoms in patients with head and neck cancer, even if the primary tumor is not clinically evident. Appropriate further workup, including imaging, is mandatory for detecting the primary tumor and choosing the optimal treatment modality. Imaging can help in the prediction and detection of the possible site of the primary tumor and aid in the final diagnosis of the tumor, including true occult primary tumors. Therefore, radiologists should know how to estimate the primary site based on the distribution and imaging findings of LN metastases and be familiar with the detailed local imaging anatomy for detecting a small primary tumor.The aims of this exhibition are:•To discuss the approach for estimating the primary site based on imaging findings of cervical LN metastases•To discuss the detailed local anatomy and imaging findings that provide clues for the detection of primary tumors

TABLE OF CONTENTS/OUTLINE

1. Introduction2. OverviewRole of imaging according to the ASCO and NCCN guidelinesClassification of unknown primary tumors based on AJCC, 8th editionImaging strategy for unknown primary tumors3. Case illustrationsPrediction of the primary site based on imaging findings of LN metastasis- Distribution of LN metastasis- Characteristic imaging findings of LN metastasesDetection of primary tumors- Detailed local anatomy- Imaging findings that provide clues for the detection of primary tumors4. Summary

HNEE-20   **CT And MRI Evaluation Of Head And Neck Cancer Treated With Chemoradiotherapy: Basics And State-of-the-art**

Awards
Magna Cum Laude

Participants
Akira Baba, Ann Arbor, Michigan (*Presenter*) Nothing to Disclose

TEACHING POINTS

Chemoradiation therapy (CRT) for head and neck cancer is evolving and becoming mainstream, and may now include targeted therapy. Post-CRT imaging aims mainly to determine the response to treatment and to detect local and neck recurrence. However, interpretation of images of post-CRT can be difficult even for experienced radiologist due to image modifications such as obscuration of local and surrounding structures. Furthermore, the clinical significance of post-CRT imaging findings has not yet been well established. While CT is the standard for evaluation due to its wide-detector coverage, high examination efficiency, and time resolution, MRI has shown the potential to achieve a greater differentiation between post-treatment changes and residual/recurrent lesion compared to CT. We outline both the basics and state-of-the-art of imaging evaluation of head and neck cancer post-CRT.

TABLE OF CONTENTS/OUTLINE

1. Post-CRT imaging modality and surveillance 2. Post-CRT local recurrence and control 3. Post-CRT neck relapse and control 4. Post-CRT state-of-the-art imaging

HNEE-21   **Recent Progress Of MR Imaging Findings For Estimating The Depth Of Invasion Of The Oral Cancer**

Participants
Akira Baba, Ann Arbor, Michigan (*Presenter*) Nothing to Disclose

TEACHING POINTS

The AJCC (8th edition) added a modification to the T categorization of the oral cavity, incorporating depth of invasion (DOI). In clinical practice, CT and MRI are widely used to depict tumor extensions and measure the radiological DOI (r-DOI) in the staging of malignant diseases of the head and neck. However, MRI and CT measurements of DOI might differ from pathological DOI (p-DOI) up to about 1 cm and in some cases are not always reliable. Lesions arising from the oral mucosa have adjacent anatomical structures, and MRI findings of invasion in such structures reflect a relatively large p-DOI. Lesions that are clinically and pathologically proven but undetectable on MRI are relatively superficial low-volume lesions and reflect a small p-DOI. Such MRI findings are easy to interpret and useful in estimatiing p-DOI.

TABLE OF CONTENTS/OUTLINE

1. DOI - DOI measurement method. - Usefulness and limitations of radiological DOI measurement 2. MRI findings for estimation of pathological DOI. - Styloglossus and hyoglossus muscle invasion in oral tongue cancer. - Buccal muscle invasion in buccal mucosa cancer - Buccal fat pad invasion in buccal mucosa cancer 5. Usefulness of undetectability on MRI - Undetectability of oral tongue cancer - Undetectability of buccal mucosa cancer - Undetectability of floor of mouth cancer

HNEE-22   **A, B, C (Easy As 1, 2, 3!): Alphabetic Clues To Head And Neck Involvement In Tumors Of**

Hematopoietic And Lymphoid Tissues

Awards
Certificate of Merit

Participants
Caitlin Henry, MD, New York, New York (*Presenter*) Nothing to Disclose

TEACHING POINTS

This exhibit will highlight the spectrum of head and neck involvement in tumors of hematopoietic and lymphoid origin, within an emphasis on radiological manifestations of extranodal disease. The audience will gain an understanding of the WHO classification of hematopoietic and lymphoid tissue neoplasms. Case presentation of hematolymphoid tumors of the head and neck will illustrate pertinent anatomic locations to include in the radiological search pattern. Clinical Pearls will be incorporated to tie each case together and encourage an interdisciplinary approach to the diagnostic workup. Finally, the "A to Z" framework will serve as a memory tool to highlight key clinical terminology and anatomic landmarks pertaining to hematopoietic and lymphoid tumors of the head and neck.

TABLE OF CONTENTS/OUTLINE

Introduction to the WHO classification of tumors of hematopoietic and lymphoid tissues including myeloid, lymphoid, and histiocytic/dendritic cell neoplasms; Review of fundamentals in diagnostic imaging and the spectrum of typical and atypical radiological findings of these tumors; Featured multimodality cases of hematopoietic and lymphoid neoplasms in the head and neck including: orbital, oropharyngeal, sinonasal, parotid, thyroid, perineural, cutaneous, and skull-base manifestations; Summary of teaching points and clinical pearls.

HNEE-23   Metastases To The Extraocular Muscles: MR Features Of Institutional 16 Cases And A Systemic Review Of Clinical Features

Participants
Nobuo Kashiwagi, Suita, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

Following a review of our institutional 16 patients with metastasis to the extraocular muscles which is the largest cohort to date, we present MR features with special attention to the number of lesions, shapes, margin characteristics, signal intensities on T1- and T2-weighted images, enhancement patterns. After a combination of patients from our institutions and from previous literature, we present clinical features including the primary tumor, presenting symptoms, affected muscles among the external ocular muscles, presence of metastasis to other organs, and presence of extra-orbital muscle metastases.

TABLE OF CONTENTS/OUTLINE

1. Summary of MR features in our 16 patients. 2. Summary of clinical features in 87 combined patients. 3. Presentation of illustrative cases. 4. Conclusions: MR features can be divided into two main patterns: a solitary and well-defined mass with the target appearance as an internal architecture and multi-muscular masses with an infiltrative nature. Regarding clinical features from the combined data, the most common primary tumors were breast cancer accounting for 30% of patients. The most common presenting symptom was proptosis and ocular symptoms were the first manifestation of malignancy in 17% of patients. Distant metastases to other organs were found in 82% of patients, but metastases to extra-orbital muscles were found in only 2 %.

HNEE-24   Cochlear Implant Atlas And Implications For The Radiologist

Awards
Certificate of Merit

Participants
Katherine Reinshagen, MD, Boston, Massachusetts (*Presenter*) Nothing to Disclose

TEACHING POINTS

After viewing this exhibit, the reader will be able to:1) Recognize the most common types of cochlear implant leads2) Accurately assess placement of the cochlear implant lead3) Develop an approach to the challenging cochlear implant case

TABLE OF CONTENTS/OUTLINE

Introduction:1) Epidemiology related to cochlear implant placement2) Preoperative imaging and important surgical landmarks3) Common types of cochlear implants from the three vendors approved in the US (Advanced Bionics, Cochlear, and MED-EL) with review of MR compatibilityIntraoperative and Postoperative Imaging of Cochlear Implants:1) Positioning for intraoperative radiographs (modified Stenvers view)2) Acquisition/reconstruction technique for postoperative CT3) Examples, tips, and pitfalls in imaging each deviceImaging of the Challenging Cochlear Implant Case1) Intracochlear malposition based on electrode location and depth, including tip fold-over2) Extracochlear malposition (eg. vestibular placement) 3) Implantation in cochlear malformation (eg. incomplete partition type 3) 4) Implantation in cochlear neo-ossification (eg. labyrinthitis ossificans)5) Facial nerve stimulation

HNEE-25   Eye Lens Exposure Reduction Method During Head CT Scanning

Participants
Miyu Haga, RT, Fukushima, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. The methods of reducing the exposure dose of the eye lens in head CT2. Gantry tilt mechanism: The gantry tilt mechanism is the technology that can reduce the exposure dose most. However, it is limited to patients who can be properly positioned. 3. Bismuth shielding: Bismuth protective shields are not recommended due to the artifacts that arise from the shield. 4. Organ-based tube current modulation (TCM): Although it is possible to reduce the tube current in the set direction, the dose reduction function operates over the entire imaging range because the imaging site cannot be limited.

TABLE OF CONTENTS/OUTLINE

How to use the new tube current modulation mechanism we devised: We will clarify the characteristics of the tube current modulation mechanism and explain the method we devised to use this mechanism properly. We used Organ Effective Modulation (OEM: Canon Medical Systems). The head phantom was scanned with and without OEM, and the SD change was compared with the dose rate. The dose rate was reduced by 49% at the setting position. SD rose 17%. The current OEM system cannot reduce exposure only within the target range. It reduces the dose over the entire scanning area. Therefore, although it is possible to reduce the exposure dose of the eye lens using OEM, it worsens the SD of the entire head. However, by using variable helical pitch scan (VHP: Canon Medical Systems) manually, OEM can be applied only to the eye lens area. By using the method we devised, it is possible to reduce the exposure dose only to the eye lens.

HNEE-27   The Dawn Of A New Era In The Diagnosis And Treatment Of Maxillofacial Tumors

Participants
Silvia Cayon Somacarrera, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

To learn about the role of the radiologist in 3D imaging analysis and planning in craniomaxillofacial surgery. To learn about the multidisciplinary management of head and neck cancer, including surgical, radiotherapy and pathological approaches.

TABLE OF CONTENTS/OUTLINE

We show six clinical cases of maxillofacial malignant tumors, that were resected using 3D analysis and planning. The cases that will be included are as follows: two maxillary sinus epidermoid carcinomas, one frontal sinus epidermoid carcinoma, one merkel cell carcinoma in the cheek, one gingival epidermoid carcinoma and one pseudolymphomatous angiosarcoma in the cheek. Clinical presentation, radiological studies, 3D planning for surgery and imaging planification for the radiotherapy treatment will be explained and illustrated with images, as well as pathological findings when relevant with regard to safety margins. The radiologist must play an active role in the diagnosis and treatment planification of these patients, being an important part of a multidisciplinary team. This implies bringing support to other colleagues in the treatment planification, especially when imaging is used to do so. Moreover, it is important for the radiologist to be familiar with all the steps followed by these patients in order to better understand the findings in the first follow-up imaging after treatment.

HNEE-28   Low-dose Head CT Using Deep Learning Reconstruction: Comparison Of Gray-white Matter Differentiation With Normal-dose Head CT

Participants
Natsumi Miura, RT, Fukushima, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

In the diagnosis of cerebral infarction by head CT, it is necessary to reduce image noise and improve the visibility of the epithelial boundary (gray-white matter differentiation). Although it is common to set the dose higher than other parts CT, a noise reduction reconstruction method using deep learning (DLR) has recently been developed. This presentation exhibits low-dose head CT images reconstructed by DLR to show clinical acceptance.

TABLE OF CONTENTS/OUTLINE

1. Usefulness and Limitations of Head CT in Diagnosis of Cerebral Infarction 2. Recommended scanning conditions 3. Overview of various noise reduction technologies 4. An example of image examination The cortical and medulla image quality characteristics of the low-dose head CT images reconstructed by DLR and the normal-dose head CT images were compared (5mm slice thickness, 512×512 pixels). The normal dose image (80mGy: Gold Standard: GS) was reconstructed by Filtered Back Projection (FBP). Low-dose images (40mGy) were reconstructed with DLR and hybrid iterative reconstruction (HIR). Cortical and medulla CT values, CT value difference (?CT), and SD values were compared (Wilcoxon matched-pair signed-rank test, P <0.05). ?CT was not significantly different in GS, HIR, and DLR. There was no significant difference in GS and DLR between cortical and medulla SD, but HIR was higher than GS and DLR. DLR has a better noise reduction effect than HIR, and it is possible to reduce the image noise of low-dose head CT as much as the GS image.

HNEE-29   Progress And Reversion In Mild Cognitive Impairment: An 8-year Follow-up MRI Study

Participants
Naoki Kodama, PhD, Niigata, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is: 1. To explain the progression of patients with mild cognitive impairment to Alzheimer's disease or dementia with Lewy bodies during eight-year follow-up study. 2. To review 20 cases in mild cognitive impairment followed for longitudinal. 3. To review cases with the conversion to Alzheimer's disease or dementia with Lewy bodies from mild cognitive impairment during the study. 4. To predict the possibility of conversion to Alzheimer's disease or dementia with Lewy bodies from mild cognitive impairment.

TABLE OF CONTENTS/OUTLINE

1. Learn approach for the diagnosis of probable Alzheimer's disease or dementia with Lewy bodies. 2. Appreciate mild cognitive impairment on long-term brain MR images. 3. Relationship between cognitive function or radiomic features and gray matter atrophy on MR images. 4. Review cases with the conversion to Alzheimer's disease or dementia with Lewy bodies from mild cognitive impairment. 5. Review cases with the no progress in mild cognitive impairment after eight years. 6. Review cases with revert from mild cognitive impairment to normal cognition. 7. Relationship between MR images and radiomic features in cases with revert from mild cognitive impairment to normal cognition. 8. Summary

HNEE-3   Virtual Neck Exploration Utilizing Parathyroid 4D Computed Tomography For Double Gland/Multigland And Ectopic Parathyroid Disease: Optimization For Detection And Surgical Success

Participants
Austin Liou, BA, Atlanta, Georgia (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Double gland disease (DGD)/multi-gland disease (MGD) and ectopic hyperfunctioning parathyroid glands acount for up to 33% and 6-16% of primary hyperparathyroidism (PH) respectively. They are major contributors to failed parathyroid exploration even with preoperative localizing imaging. 2. Meticulous CT technique and interpretation including radiologist-directed workstation image analysis paralleling surgeon's bilateral neck exploration pattern, what we term virtual neck exploration (VNE), substantially increase diagnostic yield and accuracy. 3. Accurate 3-dimensional measurement and precise report of individual gland location relative to adjacent surgical landmarks with supplemental volume rendered surgical map substantially shorten operating time and increase cure rate in this surgically challenging group.

TABLE OF CONTENTS/OUTLINE

1. Embryology, anatomy and surgical techniques of parathyroids pertaining to VNE/4D-CT. 2. Parathyroid CT scanning technique. 3. VNE workstation image analysis (including 3D volume rendering technique) paralleling surgical bilateral neck exploration for systematic interrogation of potential orthotopic and ectopic parathyroid locations. 4. Illustrative cases of how VNE enhances DGD/MGD and ectopic parathyroid adenoma detection. 5. Pearls to increase VNE accuracy. 6. Table incorporating VNE findings as central component of preoperative surgical planning.

HNEE-30   Imaging In Tongue Malignancy - What The Surgeon Wants To Know.

Participants
Anu Kamalasanan, MBBS, East Renfrewshire, United Kingdom (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Depth of invasion (DOI) is measured from the level of normal tissue at the basement membrane to deepest limit of enhancement. Radiological DOI is usually larger than the pathological DOI. In ulcerative lesions the DOI is larger than the lesion diameter and in exophytic lesions it is smaller than the lesion. - Elective neck dissection has been proven to increase overall survival and disease free survival in patients with T2 or greater tumors, even with N0 neck. Sentinel node biopsy is done in some centers if DOI is greater than 4mm.- On the sagittal plane, at least 1.5cm of normal tongue should be interposed between the tumor and vallecula for larynx preservation. - Involvement of mylohyoid or geniohyoid requires enbloc incontinuity resection of primary and neck dissection to avoid positive margin.- Involvement of hyoglossus, styloglossus, lateral pharyngeal wall and pterygomandibular raphae should be highlighted in the report as they influence surgical planning.

TABLE OF CONTENTS/OUTLINE

We aim to discuss - Normal imaging anatomy of the tongue . - TNM staging .- Imaging of tumor staging with examples.- Surgical options for treatment of tongue malignancy.- Emphasis on role of imaging in guiding surgical decision making. - Post treatment imaging.- Complications and their imaging features.

HNEE-31   Post Treatment Imaging In Head And Neck Malignancy

Participants
Maria Bobadilla Floristan, MD, Dundee, United Kingdom (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Post surgical leak after laryngectomy commonly occurs anteriorly at the junction between base of the tongue and the neopharynx. Sagittal evaluation on fluoroscopy with coned views of the anterior neopharynx are helpful- Focal, nodular enhancing soft tissue is suspicious of recurrence. Post operative soft tissue thickening is usually linear and uniform- Tumor recurrence in the presence of a surgical flap, usually occurs at the junction between flap and native tissue- Osteoradionecrosis may be differentiated from recurrence by presence of diffuse osteosclerosis, loss of trabeculation and diffuse rather than focal soft tissue thickening

TABLE OF CONTENTS/OUTLINE

- Discuss role of various modalities, including radiography, ultrasound, CT, MRI and PET-CT in follow up imaging of head and neck malignancies - Demonstrate normal appearance of post treatment neck - post surgery, chemotherapy and radiotherapy - Illustrate immediate, late and delayed complications secondary to surgery - fluid collections, vascular complications, nerve injury (recurrent laryngeal nerve, hypoglossal nerve), intracranial complications - Discuss various types of neck dissections, indications and findings- Discuss indications for surgical flaps, types of flaps, presurgical imaging and illustrate donor and recipient site pathology, leaks and fistula - Demonstrate post oncological treatment complications - osteoradionecrosis, sarcoma, post radiation encephalopathy and myelopathy - Illustrate with examples, disease recurrence in post treatment neck

HNEE-32   Tongue In Cheek: What The Radiologist Needs To Know About Anatomy And Pathologies Of The Hypoglossal Nerve

Participants
Shea Roddy, MBChB, Dundee, United Kingdom (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Hypoglossal nerve is a purely motor nerve and can be divided into five segments- cisternal, skull base, carotid space and sublingual segments2. Supranuclear disease causes deviation of tongue away from side of lesion, while disease at nuclear and infra nuclear levels causes deviation of tongue towards side of lesion and fasciculations3. Acute hypoglossal palsy is associated with diffuse ipsilateral oedema and mild mass effect4. Chronic hypoglossal palsy is associated with diffuse fatty infiltration and volume loss

TABLE OF CONTENTS/OUTLINE

1. Illustrate normal course of hypoglossal nerve from hypoglossal nucleus in medulla to its termination in sublingual space2. Discuss role of various imaging techniques and coverage required to evaluate hypoglossal nerve palsy3. Differentiate upper motor neuron and lower motor neuron types of hypoglossal palsy4. Features of acute and chronic hypoglossal palsy on imaging5. Discuss, with examples, various pathologies and their differential diagnosis that affect intracranial and extracranial segments of the hypoglossal nerve, causing hypoglossal nerve palsy

HNEE-33   Turn On The Lights Of Dangerousness: Emergencies And Potentially Life-threatening Conditions In The Head And Neck

Participants
Heber Colares Costa, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

To demonstrate that ear, nose, and throat (ENT) emergencies include mainly infections and trauma cases, which may affect critical structures and cause severe complications. To illustrate the regions' complex anatomy, which is essential for imaging interpretation and preventing the worst outcomes. To depict relevant ENT imaging pearls in emergency settings, emphasizing the severity of the condition, vascular and airway evaluation.

TABLE OF CONTENTS/OUTLINE

1. Overview anatomy of the nose, temporal bone, and pharynx. 2. Imaging protocol for the best assessment of ENT regions. 3. ENT trauma: clinical issues and imaging assessment, emphasizing the seriousness of the condition. 4. ENT infection: clinical issues and imaging assessment, emphasizing the severity of the condition and airway evaluation. 5. Take home messages and summary.

HNEE-34   **Post Covid-19 Related HFN Mucormycosis: An Imminent Threat In Endemic Countries.**

Participants
Mansi Jantre III, MBBS,MD, Thane, India (*Presenter*) Nothing to Disclose

TEACHING POINTS

Mucormycosis in long standing moderate to severe COVID-19 pneumonia patients is a looming threat with an alarming rise in endemic countries battling the pandemic. Predisposing conditions include diabetes mellitus, unrestrained use of immunosuppressive therapy like corticosteroids, Toclizumab and systemic immune dysregulation occurring in COVID-19. Extensive angioinvasion is attributable for rapid orbital and intracranial dissemination. Cross sectional imaging plays a crucial role in evaluating extent of disease and pre surgical planning for timely intervention. MRI is the preferred modality to assess intracranial and soft tissue involvement, skull base invasion, perineural spread and vascular involvement. Diffusion weighted sequences are particularly useful for detecting secondary ischaemic optic neuropathy. Typical overlapping CT features include proptosis, orbital inflammatory fat stranding, optic nerve thickening, sinusitis with erosion of sinus walls. Awareness of fairly characteristic imaging features in a background of high index of clinical suspicion are crucial to help subsequent early management.

TABLE OF CONTENTS/OUTLINE

In this exhibit we review key CT and MRI features of cases of COVID 19 related Mucormycosis, we have come across in our institution. We have illustrated classical cases of sinonasal, rhino-orbital and orbito-cerebral stages along with intraoperative and post operative outcome of illness.

HNEE-35   **Vision Loss: A Radiologic Approach To The Visual Pathway Abnormalities**

Participants
Loai Aker, MD, Doha, Qatar (*Presenter*) Nothing to Disclose

TEACHING POINTS

1- Review the radiological anatomy of the visual pathway. 2- Provide a simplified approach to various pathologies that may result in vision loss based on anatomical location. 3- Clinically correlate the imaging features to aid narrow the differential diagnoses. 4- Illustrate the CT and MRI features of different vision-threatening pathologies in a case-based approach.

TABLE OF CONTENTS/OUTLINE

1- Basic radiologic cross-sectional anatomy of the visual pathway. 2- Eye globe pathologies. 3- Optic nerve pathologies. 4- Retro-orbital pathologies. 5- Sellar and parasellar pathologies. 6- Optic tract, optic radiation and visual cortex pathologies.

HNEE-36   **A Multiparametric MRI Evaluation In Salivary Gland Tumors**

Awards
Certificate of Merit

Participants
Heber Colares Costa, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

To review the primary tumor lesions of the salivary glands. To evaluate the principal characteristics by magnetic resonance imaging. To illustrate the importance of advanced MRI sequences for the differential diagnosis of injuries.

TABLE OF CONTENTS/OUTLINE

1. Main lesions of salivary gland morphology, location, contour, extension to the muscular or subcutaneous planes. 2. Signal intensity in the primary sequences T1 and T2 (mixed benign tumor, Warthin's and low, intermediate, and high-grade malignant tumors). 3. Evaluation of advanced MRI sequences (diffusion-weighted sequence with ADC and perfusion sequence with enhancement curve) in diagnosis and post-therapy follow-up.

HNEE-37   **A Sight For Sore Eyes: Imaging In Painful Ophthalmoplegia**

Awards
Certificate of Merit

Participants
Jack Garnham, MBBS, London, United Kingdom (*Presenter*) Nothing to Disclose

TEACHING POINTS

The aim is to provide attendees with: A review of the anatomy of the orbit, the orbital apertures, and the cavernous sinus.A

structured discussion of the causes of painful ophthalmoplegia (POP), illustrated with a series of cases, including a selection of common causes and a smattering of rarities. A framework for planning and interpreting imaging in POP based on clinical lesion localisation. Insight into the role of neuroimaging (and supplementary body imaging) in the process of diagnosis and treatment from a multidisciplinary perspective.

TABLE OF CONTENTS/OUTLINE

POP is characterised by hemicranial pain and dysfunction of the ocular motor muscles. The list of potential aetiologies is extensive and includes inflammatory, vascular, neoplastic, and infectious processes, which share anatomical localisation to the orbit, the orbital apertures, and the cavernous sinus. It presents a substantial challenge to the assessing neurologist and radiologist; timely diagnosis and treatment is frequently required to prevent permanent visual impairment. Imaging plays a central role in the investigation of POP. To meet the challenge of appropriately targeting and accurately interpreting imaging, we will review the relevant anatomy, explore the causes of POP, and describe the process of lesion localisation as it pertains to the neuroradiologist. This will be integrated with a series illustrative cases compiled from a tertiary neurosciences centre in London, and will include a selection of the usual suspects and a handful of rarer conditions.

HNEE-38 Looking The Beauty Inside - A Multimodality Imaging Approach Of Facial Aesthetic Procedures And Its Complications

Participants
Isabela Alves, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Facial aesthetic procedures are increasingly being performed using injectable materials, implants and grafts so it is not uncommon to observe such findings on head and neck imaging. In this context, the radiologist has been requested to recognize these procedures as well as to assess possible complications. To achieve accurate and timely detection and appropriate approach, each method has a specific importance including high frequency ultrasound (HFUS/24-33MHz), computed tomography (CT) and magnetic resonance imaging (MRI). This study aims to discuss and illustrate the radiologist's role in the evaluation of facial aesthetic procedures, their complications and how imaging can be ancillary to avoid them. The purpose of this exhibit is: - To illustrate the anatomy of the skin and facial layers - To show the main image patterns of cosmetic fillers, surgery, implants and grafts (HFUS, CT and MRI) - To list, classify and describe the facial aesthetic procedure complications

TABLE OF CONTENTS/OUTLINE

ANATOMY Skin/facial layers MULTIMODALITY IMAGING APPROACH Imaging aspects of facial fillers and facial procedures (surgery, implants and grafts) on HFUS, CT and MRI COMPLICATIONS Acute: vascular, infectious/inflammatory, Late: granuloma, post-COVID 19 infectious and others

HNEE-4 MRI Findings Of Benign Tongue Tumors And Tumor-like Diseases With Radiologic-pathologic Correlation

Participants
Taylor Wu, MD,PhD, Guangzhou, China (*Presenter*) Nothing to Disclose

TEACHING POINTS

¦ Hemangioma and schwannoma are the two most common benign tongue tumors. Hemangioma is most common in the dorsal surface of the tongue and usually manifests as a prominent enhancement. Schwannomas typically appear as encapsulated masses with variable hyperintensity depending on the predominance of Antoni B fibers on T2-weighted images and heterogeneous enhancement.¦ Spindle cell lipoma (SCL) is most commonly located on the side of the midline of the tongue, with a clear boundary and a capsule. The MRI appearance of SLC is various depending on the distribution and ratio of fat and non-fat components. ¦ Both Epidermoid cysts and Dermoid cysts most often involve the floor of the mouth. On CT and MR imaging, the epidermoid cyst usually shows a well-defined, lobulated mass, and its attenuation or signal intensity is roughly similar to cerebrospinal fluid. Whereas imaging characteristics of dermoid cysts may have a thicker lining which can calcify and may enhance with contrast material and usually have the low negative attenuation values of contents (adipose, -60 HU to -90 HU).

TABLE OF CONTENTS/OUTLINE

We describe the imaging findings of benign tumors or tumor-like lesions, including Epithelial Tumors (Papillomas), Non-epithelial Tumors (Lipoma), Soft Tissue and Neural Tumors/Lesions (Hemangioma, Lymphangiomas, Schwannoma. Neurofibroma, RhabdomyomaLeiomyoma, Chondroma), Teratomas (Epidermoid cyst and Dermoid cysts), Others (Venous malformations, Thyroglossal duct cysts), Intermediate (Inflammatory pseudotumor).

HNEE-40 The Different Shades Of Thyroid Carcinoma. Do You Know Them All?

Participants
Nancy Margarita Gutierrez Castaneda, MD, Mexico City, Mexico (*Presenter*) Nothing to Disclose

TEACHING POINTS

To describe the general characteristics of thyroid carcinoma and the subtypes.To know the most affected organs in the thyroid carcinoma metastases.To identify the imaging studies that we must do and the radiological findings of each modality (radiography, CT scan, MRI, PET CT, SPECT CT and others).To associate the clinical presentation, the radiological studies and the histopathological result.To discuss the appropriate management of thyroid carcinoma based on recent literature guidelines and expert opinions.

TABLE OF CONTENTS/OUTLINE

Introduction.General features of thyroid carcinoma and the subtypes (Papillary, Follicular, Medullary, Anaplastic, Undifferentiated). Clinical presentation.Radiological findings of thyroid carcinoma in the different imaging modalities.Relationship between radiological and histopathological findings.Illustrative pathological cases. Conclusion

HNEE-41 The Roads To Misery: Complications Of Ear Infection.

Participants
Luiz Uchoa, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

To review adequate imaging protocols for evaluation of ear infection according to clinical suspicion.To demonstrate the imaging findings of ear infections, didactically divided in external ear, middle ear, inner ear and petrous apex.To illustrate complications of ear infections with CT and MR images.

TABLE OF CONTENTS/OUTLINE

Anatomical division of the ear.Visual systematization of infectious ear diseases.Illustrative cases of ear infections and their complications divided in external ear, middle ear, inner ear and petrous apex.Take home messages.

HNEE-42   Orbital Emergencies In A Blink: What The Radiologist Should Know

Participants
Eugenio Gil, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Present an overview of the anatomy and mechanism involved in orbital emergencies.2. To demonstrate the imaging appearances of typical and atypical orbital emergencies. 3. To develop a classification scheme with a list of pathologies based on the region of involvement and create a flowchart to help the radiologist avoid misinterpretations and improve diagnostic rate.

TABLE OF CONTENTS/OUTLINE

A. Introduction General Aspects Anatomic Considerations Mechanism Region of Involvement B. Evaluation Flowchart and Checklist C. Trauma Hemorrhages Retinal Detachment Choroidal Detachment Lens Dislocation Foreign Bodies Globe Rupture D. Infection Abscess Endophthalmitis E. Inflammation F. Vascular

HNEE-43   Open Your Eyes! Orbital Inflammatory And Infectious Diseases

Participants
Carolina Clementino, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Orbital inflammation is a vision-threatening condition that may be idiopathic or caused by an underlying disease. Considering continued advances in computed tomography (CT) and magnetic resonance imaging (MRI), it is of utmost importance that radiologists are able to recognize affected structures and suggest the correct etiology when feasible.The main goals of this exhibit are:Identification of normal orbital anatomy in CT and MRI.To review the morphological manifestations, the most common sites of involvement, and key imaging findings of inflammatory and infectious diseases.To apply a systematic approach to the radiologic characterization of those lesions.To show differential diagnoses that may mislead radiologists and how to identify them.

TABLE OF CONTENTS/OUTLINE

1- Anatomy review2 - Imaging findings of orbital inflammatory disease:DacryoadenitisMyositisNeuritis/PerineuritisCellulitisOrbital apicitisPeriscleritis3 - Imaging features and patterns that may suggest a specific etiology:Idiopathic orbital inflammationImmunoglobulin G4 related diseaseDysthyroid orbitopathy (Graves disease)SarcoidosisAmyloidosisGranulomatosis with polyangiitisHistiocytosisSjogren syndromeInfection (viral, bacterial, fungal, parasitic)Demyelinating disorders4 - Differential diagnosisPrimary tumorMetastasisLymphoproliferative disordersCarotid-cavernous fistulaCavernous sinus/ superior ophthalmic vein thrombosisVascular malformationIschemic neuropathy5 - Take-home messages

HNEE-44   51 Shades Of Gray-Recognizing The Evil Gray On T2 Weighted Imaging For Detection Of Recurrence In Post Surgically Treated Head And Neck Cancer

Participants
Jeevitesh Khoda, MD, Jammu, India (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Surgery with radiation forms the cornerstone of the management of locally advanced neck cancers. It is challenging to differentiate disease from healthy tissue in the setting of postsurgical changes. Clinicians must manage recurrence while it is still salvageable to pursue an improved survival. 2. In postsurgical subjects for cancers occurring in the oral cavity, plastic reconstruction with flaps and post-treatment trismus further impedes clinical examination. 3. Recurrent cancer and scar fibrosis resulting from post-radiation treatment changes will enhance post-contrast images. With superimposed anatomical changes induced in postsurgical settings, resulting in artifacts on diffusion sequences, the interpretation of valid tumoral restriction becomes challenging. 4. The calculation of ADC values in these artefactual regions would lead to erroneous interpretation and might lead to an increased risk of missing an early potentially salvageable recurrent cancer. Further quantitative ADC value interpretation is not carried out in routine clinical practice. ADC values when interpreted with diffusion may yield false-negative results in approximately 26%, missing cancers. 5. Recurrent tumors are described as intermediate "evil gray" T2 signal intensity on MR imaging.

TABLE OF CONTENTS/OUTLINE

Clinical cases with pictorial depiction shows the "different shades of gray" of recurrent tumours on MR with conventional T2WI, diffusion , post contrast and 18 FDG PET-CT (when available) in post surgical cases of head and neck cancers.

HNEE-45   Sleep Apnea: What The Clinician Wants To Know

Participants
Stephanie Nagano, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1- Sleep apnea is a condition caused by cessation of breathing throughout the night. This condition may cause daytime sleepiness, headaches, chronic arterial hypertension, and in extreme cases, can lead to traffic accidents, ischemic stroke and sudden death. 2- Obstructive apnea is the commonest type. Diagnosis is made by clinical aspects and polysomnography. Imaging methods are important to determine the obstruction topography, therefore, to guide therapeutic planning. 3- Computed tomography is the imaging method of choice, because of its availability, faster acquisition and lower cost when compared with MRI. It also allows for three-dimensional reconstructions and measurement of the upper airway area. All structures that may be associated with obstructive apnea, including the tongue, soft palate, tonsils, epiglottis and the hyoid bone are well evaluated by CT. 4- Treatment is individualized and depends on the location of the obstruction and its severity. Weight loss and continuous positive airway pressure (CPAP) are the most commonly used methods, but surgery may be required in some patients.

TABLE OF CONTENTS/OUTLINE

1- Introduction. 2- Definition, types and physiopathology of sleep apnea. 3- Superior airway anatomy involved with obstructive apnea. 4- Imaging methods. 5- Main measurements. 6- Pathological examples. 7- Conclusions.

HNEE-46   Congenital Anomalies Of The Craniovertebral Junction : A Pictorial Presentation

Participants
Bhanupriya Singh, MD, Lucknow, India (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To outline few characteristic congenital anomalies of the CVJ in the form of a pictorial presentation 2. The Craniovertebral junction (CVJ) is a collective term that refers to the occiput, atlas, axis and supporting ligaments that enclose soft tissue structures of the cervical medullary junction. (1) 3. A variety of congenital anomalies with the potential for causing neurological deficits to occur in this region(2) 4. Computed Tomography and Magnetic Resonance Imaging are rewarding in the detailed evaluation and diagnosis of common and uncommon abnormalities of the CVJ.(1)

TABLE OF CONTENTS/OUTLINE

1. Multiplanar reconstruction in coronal & sagittal planes was done after obtaining axial CT images. 2. Craniometric measurements used in radiologic assessment of CVJ anomalies include the Chamberlain line, Wackenheim clivus baseline, Welcher basal angle, and atlantooccipital joint axis angle. 3. A pictorial representation of a few of the representative congenital anomalies of CVJ are included in this study

HNEE-47   Imaging Of Free Flaps In Head And Neck Reconstruction Surgeries

Participants
Amit K. Agarwal, MD, MBBS, Jacksonville, Florida (*Presenter*) Consultant, Authentic4D;Stockholder, Gilead Sciences, Inc

TEACHING POINTS

1. To provide basic understanding of the free flap reconstruction techniques for Head and Neck surgeries through schematic diagrams, intra-operative photos and their imaging correlate 2. To discuss the imaging findings in immediate and late complications of free-flap reconstruction surgeries 3. To discuss pertinent findings to help differentiate local recurrence from conditions which can mimic tumor

TABLE OF CONTENTS/OUTLINE

1. Reconstructive ladder in head and neck surgery2. Graft versus Flaps3. Types of Flaps-Local-Regional/Pedicle-Free flap (focus on radial free forearm flap)4. Composition of flaps and common usage5. Post-operative anatomy (CT/MR)6. Immediate postoperative complications (ischemia, infection, bleeding, and dehiscence)7. Long-term complications (infection, fistulas, hardware exposure, osteonecrosis, recurrence)8. Conditions mimicking local recurrence

HNEE-48   A Comprehensive Review Of Vertebral Artery Dissection Imaging

Participants
Heber Colares Costa, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To review the anatomy of vertebral arteries, the pathophysiology, and types of dissection, as well as the risk factors and clinical presentations of vertebral artery dissection. 2. To re-examine the diagnostic imaging techniques, including CT angiography, MR angiography with emphasis on vessel wall imaging (3D T1 dark blood) and Digital subtraction angiography. 3. To point out imaging findings and pitfalls in daily cases.

TABLE OF CONTENTS/OUTLINE

1. 1. Vertebral artery anatomy. 2. Pathophysiology and types of dissection. 3. Diagnostic methods including CT angiography, vessel wall imaging and MR angiography, and digital subtraction angiography. 4. Vessel wall imaging in vertebral arteries dissection assessment: importance, imaging highlights, and pitfalls. 5. Sample cases and mimics. 6. Summary

HNEE-49   Stranger Things In Head And Neck Images: Radiologic Manifestations Of Hematologic Diseases.

Participants
Adrian Candido, MD, Capital Federal, Argentina (*Presenter*) Nothing to Disclose

TEACHING POINTS

Review relevant concepts of hematologic diseases and the way they are classified.Describe imaging findings spectrum of various hematologic diseases in multiple regions of the head and neck, specially infrequent presentations.Discuss clinical cases of our Institution and present additional Radiology and Pathology findings that guide the diagnosis.

TABLE OF CONTENTS/OUTLINE

Hematologic diseases. Classification (pathways).Clinical cases. Imaging findings and correlation with pathology.Scalp acute lymphocytic leukemia.Orbital mantle lymphoma.Orbital Burkitt´s lymphoma.Orbital granulocytic sarcoma.Orbital amyloidosis.Masticator and submandibular space granulocytic sarcoma.Masticator space plasmocitoma.Pharyngomucosal space B-cell lymphoma.Skull base granulocytic sarcoma.Perivertebral space multiple myeloma.Brachial plexus infiltration by Burkitt´s lymphoma.Summary.References.Contact.

HNEE-5   What's That Pain In My Neck? Imaging Manifestations Of Rheumatic Diseases In The Head And Neck

Awards
Certificate of Merit

Participants
Pattana Wangaryattawanich, MD, Bellevue, Washington (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Rheumatic diseases are diseases that affect joints, tendons, ligaments, bone and muscles and may involve multiple organs. They can be classified based on their pathogenesis, including: 1) autoimmune disorders such as rheumatoid arthritis; 2) autoinflammatory process such as chronic recurrent multifocal osteomyelitis; 3) metabolic causes such as gout and calcium pyrophosphate dihydrate (CPPD) crystal deposition disease and 4) degenerative joint disease. 2. Rheumatoid arthritis is the most common autoimmune-mediated inflammatory arthritides of the head and neck, most commonly affecting the atlantoaxial joint but also involving the temporomandibular and cricoarytenoid joints. 3. Crystal-induced arthropathy such as CPPD and calcium hydroxyapatite deposition disease can affect joints and soft tissues in the head and neck and cause unique imaging and clinical manifestations.

TABLE OF CONTENTS/OUTLINE

1) Introduction 2) Classification and pathogenesis of rheumatic diseases 3) Imaging manifestations of rheumatic diseases in the head and neck 4) Case-based presentation 5) Take home points

HNEE-50   Orthognathic Surgery For Radiologists: From Indications To Complications

Awards
Certificate of Merit

Participants
Carlos Alberto Coelho Neto, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is:- Review concepts, techniques and indications of orthognathic surgery, with a radiologic focus. - Demonstrate complications on post-operatory radiologic exams.

TABLE OF CONTENTS/OUTLINE

1) Introduction to orthognathic surgery, with definitions and statistics demonstrating this worldwide used method. 2) Common indications, including prognathism, retrognathia, craniofacial deformities, dental malocclusion and obstructive sleep apnea syndrome (OSAS). We highlight, with schemes and cases, concepts and measurements on radiological exams, such as the angle between sella, nasion and A/B points (SNA and SNB); the Angle classification for dental malocclusion; and imaging parameters on OSAS evaluation. 3) Discuss some widely used orthognathic surgical techniques: mandibular osteotomies, maxilla advancement and mentoplasties. We highlight expected early and late radiologic features on CT, showing esthetical and functional satisfactory results and comparing pre and post-operatory exams. 4) Demonstrate early and late complications,, with a radiologic focus, including infection (osteomyelitis, bone sequestrum and soft tissue abscesses) and fixation material issues (screw displacement, plaque fractures). 5) Discuss the alveolar inferior canal and nerve, detailing their anatomy with illustration and cases. Show complications such as involvement by the osteotomies and by the screws. 6) Conclusion.

HNEE-52   Radiologic Approach To Semicircular Canals Malformations

Participants
Virginia Simonini, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Semicircular canals (SCC) are part of the inner ear (IE), a sensory organ that responds to sound, gravity and movement, related with hearing and balance. They offer sensorial information about the rotational movements of the head through the endolymph internal circulation. The three SCC are arranged at different angles, allowing the perception of head movements.They start developing between the 6th and 8th fetal week and are completely formed by the end of the 22nd week. Developmental disorders may determine malformations such as dysplasias, incomplete development or total absence of SCC. They may appear in isolation or associated with other IE anomalies, sporadically or syndromically. The objectives of this exhibit are to review the anatomy and function of the SCC and demonstrate the evaluation in imaging of their main malformations.The imaging methods used to investigate SCC malformations are computed tomography (CT) for the bony labyrinth and magnetic resonance imaging (MRI) for the membranous labyrinth and neural structures, with multiplanar reformations and 3D reconstruction. In this exhibit the authors review how to evaluate cases of common crus aplasia, dysplasia, agenesis and anomalies of the CSS associated with other malformations of the IE and more frequent syndromes.

TABLE OF CONTENTS/OUTLINE

Illustrate normal SCC anatomy. Expose didactic cases of SCC malformations and how to evaluate them, illustrating described findings to consolidate the acquired knowledge.Bibliographical references.

HNEE-53   "Which Road Do I Take?": Tips And Tricks For Perineural Tumor Spread

Participants
Luiz Pedro Dos Santos, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purposes of this exhibit are:- To review the skull base and cranial nerve anatomical landmarks in order to evaluate the perineural spread.- To discuss the imaging modalities strengths and weaknesses.- To describe the imaging features of neoplastic and non-neoplastic lesions with perineural spread with sample cases from our database institution, highlighting the main pathways of dissemination. - To provide practical tips and discuss common pitfalls of perineural spread, emphasizing the utility of a systematic approach for accurate evaluation.

TABLE OF CONTENTS/OUTLINE

- Introduction- Skull base and cranial nerve normal anatomy- Main perineural pathways- Imaging modalitiesDifferential diagnosis- Practical tips and pitfalls - Take-home messages

HNEE-54   Tumor Or Radionecrosis? - The Tools For Diagnosis

Awards
Certificate of Merit

Participants
Samya Alves, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Imaging examinations have a fundamental role in head and neck cancer monitoring, including primary lesion and metastatic disease, especially in the assessment of treatment response and disease progression. Radiotherapy is currently a paramount therapy, whether neoadjuvant, adjuvant or palliative, though it carries some possible unfortunate outcomes, as radiation necrosis. The post treatment head and neck imaging is hence even more challenging, as we are expected to distinguish these outcomes from persistent or recurrent tumor, not at all an easy task. This exhibition aims to Revisit the imaging features of radionecrosis; Review the assessment for recurrence in head and neck tumors through CT, PET-CT and MRI; Discuss the role of advanced imaging techniques, such as diffusion-weighted (DWI) and dynamic contrast-enhanced (DCE) MRI in the differentiation between recurrence and post radiation findings; Illustrate concepts based on didactic cases and pathology correlation.

TABLE OF CONTENTS/OUTLINE

POST RADIOTHERAPY HEAD AND NECK IMAGING: Radionecrosis and Radiotherapy. CASE-BASED DISCUSSION: Sample cases to illustrate the concepts; Imaging Assessment and Techniques - CT, PET-CT and MRI; Hints for Differentiation between Tumor and Radionecrosis; Pathology Aspects

HNEE-56   Cochlear Implantation - A Systematic Approach To Preoperative Radiological Evaluation

Awards
Identified for RadioGraphics
Certificate of Merit

Participants
Shivaprakash Hiremath, DMRD,FRCR, Toronto, Ontario (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is to: • Review the basic anatomy of the inner ear, including the cochlear, vestibule, and semicircular canals • Describe the imaging findings that influence the choice of surgery in inner ear malformations • Illustrate the findings in congenital and acquired causes of sensorineural hearing loss that are amenable to cochlear implantation • Depict the anatomical factors that influence surgical approach during cochlear implantation

TABLE OF CONTENTS/OUTLINE

Ø Basic anatomy of the cochlea, vestibule, and semicircular canals Ø Congenital causes of sensorineural hearing loss § Complete labyrinthine aplasia § Cochlear hypoplasia and aplasia § Common cavity malformation § Incomplete partition anomalies § Vestibulocochlear nerve anomalies § Enlarged vestibular aqueductØ Acquired causes of sensorineural hearing loss § Labyrinthitis ossificans § Otosclerosis § Labyrinthine schwannomasØ Anatomical factors influencing surgical approach§ Mastoid pneumatization § Middle ear status § Round window and facial nerve § Dura-meatal distance § Arterial and venous variations

HNEE-57   Don't Feel The World Spinning - Imaging Aspect Of Vertigo And Dizziness

Awards
Certificate of Merit

Participants
Isabela Alves, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Dizziness affects 30% of the population over the age of 65 years and represents 4% of visits to the emergency department. It is classically dived in peripheral (vestibular) and central (central nervous system) etiologies, although the clinical differential is not always possible. It can be associated with a multiple of pathologies from the ear to the central nervous system. This study aims to discuss and illustrate the radiologist's role in the evaluation of vertigo and dizziness. The purpose of this exhibit is: - To illustrate the anatomy of the membranous and osseus labyrinth, middle and inner ear, internal auditory conduct and vestibular central nervous system pathway - To show the clinical findings to distinguish peripheral from central vestibular syndrome - To describe the imaging technique to investigate vertigo in different settings - To list, classify and describe the causes of vertigo in a case-based approach

TABLE OF CONTENTS/OUTLINE

ANATOMY Membranous and osseus labyrinth Middle and inner ear Internal auditory conduct Vestibular central nervous system pathway CLINICAL FINDINGS AND EXAM Benign paroxysmal positional vertigo (BPPV) - Dix-Hallpicke and supine roll test How differentiate clinically central from peripheral vertigo? IMAGING TECHNIQUES Pöschl and Stenvers reconstruction Acute: fast MRI protocol Meniere disease investigation: specific sequences CASE-BASED APPROACH Causes of vertigo and imaging findings

HNEE-58   Tips And Tricks Of Cervical Lymph Nodes With Ultrasound: Where We Are And Where We Are Going

Participants
Pedro Naime Araujo I, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Provide an overview of normal distribution of cervical nodes, and possible causes of unilateral and bilateral cervical adenopathy; - Review the normal and abnormal morphologic features of lymph nodes in the US; - Ascertain the utility of ultrasound B-mode, color and power Doppler for characterizing cervical lymph nodes; - Explain how contrast-enhanced ultrasound (CEUS) and shear-wave elastography (SWE) can be a tool in distinguish the etiology of lymphadenopathy.

TABLE OF CONTENTS/OUTLINE

1- Introductiona. Cervical lymph nodes anatomyb. Differential causes of adenopathy2- Ultrasound techniquesa. Classic: B-mode, color and power Dopplerb. Novel: CEUS and SWEi. Differentiation of benign from malignant lymph ii. nodes Evaluation of effects of treatment. 3- Pearls and Pitfalls4- Take-home messages

HNEE-59   Face To Face With Facial Nerve: Anatomy And Spectrum Of Diseases

Participants
Niedja Santos Goncalves Tsuno, Brasilia, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review the anatomy of the facial nerve from its origin in the pons to the extracranial segment.2. Review some facial nerve diseases with typical location in each segment and their radiological findings.3. Learn more about some important differential diagnoses for each nerve segment.

TABLE OF CONTENTS/OUTLINE

1. Simplifying the complex anatomy of the facial nerve and its segments (cisternal, canalicular, labyrinthine, tympanic, mastoid, extratemporal segment).2. Describe the relationship between facial nerve segments and adjacent anatomical structures like temporal bone, auditory canal and middle ear ossicles.3. Summarize the main key points of some different diseases that affect each facial nerve segment, with a focus on computed tomography and magnetic resonance findings, highlighting some pathologies like: Congenital duplication of the mastoid segment;Cochleofacial fistula secondary to cholesteatoma;Venous malformation;Ramsay Hunt syndrome;Facial nerve schwannoma;Herpetic polyneuropathy involving facial nerve;Bell's Palsy;Leptomeningeal carcinomatosis with facial nerve involvement;Traumatic injury of facial nerve;Demyelinating disorders;Sarcoidosis;Malignancy of parotid with facial nerve involvement;Fibrous dysplasia with facial nerve involvement.

HNEE-6   Normal Variants, And Benign And Malignant Lesions Of The Central Skull Base Associated With Notochordal Remnants

Participants
Hiroyuki Fujii, MD, Shimotsuke, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

The notochord plays a vital role in development of vertebrates. At the cephalic end, the course of the notochord forms an S shape in the central skull base. Although the notochord is a transient structure, various anatomic variants as well as benign and malignant pathologies can arise from the notochordal remnants. The purpose of this exhibit is:1. To review the normal development of the notochord. 2. To review the normal variants, and benign and malignant lesions associated with notochord remnants. 3. To discuss the differential diagnosis.

TABLE OF CONTENTS/OUTLINE

1. Embryology of the notochord 2. Anatomical locations of the notochord 3. Normal variants: Canalis basilaris medianus, Fossa navicularis.4. Benign lesions: Tornwaldt's cyst, Ecchordosis physaliphora, Benign notochordal cell tumor. 5. Malignant lesions: Chordoma.6. Differential diagnosis: Clival fracture, Retention cyst, Epidermoid cyst Arachnoid cyst, Neurenteric cyst, Meningioma, Hemangioma, Chondrosarcoma, Metastatic bone tumor, Invasive pituitary adenoma, Invasion of nasopharyngeal carcinoma, Plasmacytoma/multiple myeloma, Lymphoma, Skull base osteomyelitis, Fibrous dysplasia.

HNEE-60   Dental Anomalies: What The Radiologist Needs To Know.

Awards
Certificate of Merit

Participants
Gabriela Bandeira, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

To describe the events that occur during the development of the teeth and associated structures.To recognize the classification of dental anomalies.To integrate the knowledge of the development of the teeth with normal anatomy and developmental disturbances.To illustrate imaging findings related to dental anomalies.

TABLE OF CONTENTS/OUTLINE

1- Introduction2-Tooth Development and Eruption (initiation stage, bud stage, cap stage, bell stage, stages of apposition and maturation).3- Classification of dental anomalies:Developmental Abnormalities: number of Teeth (Supernumerary Teeth and Missing

Teeth), size of teeth (macrodontia and microdontia), eruption of teeth (transposition), altered morphology of teeth (fusion, concrescence,gemination, taurodontism, dilaceration, dens invaginatus, dens in dente, dilated odontome, dens evaginatus, amelogeneses imperfecta, dentinogenesis imperfecta, osteogenises imperfecta, dentin dysplasia, regional odontodysplasia, enamel pearl, talon cusp, turner's hypoplasia,congenital syphilis)Acquired Abnormalities: attrition, abrasion, erosion, resorption, secondary dentin, pulp stones, pulp sclerosis, hypercementosis.4- Illustrative cases of dental anomalies.5- Conclusion.

HNEE-61   Congenital Craniofacial Anomalies: A Rational On Imaging

Awards
Certificate of Merit

Participants
Gabriela Bandeira, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

To describe the events that occur during the development of the craniofacial structures.To integrate the knowledge of the development of craniofacial structures with normal anatomy and developmental disturbances.To illustrate imaging findings related to craniofacial anomalies.

TABLE OF CONTENTS/OUTLINE

1- Introduction2- Craniofacial development and segmentation: neural tube (prosencephalon - forebrain, mesencephalon - midbrain, rhombencephalon -hindbrain) and neural crest (cranial, vagal, trunk, or sacral).3- Craniofacial anomalies: Craniofacial anomalies of the frontonasal process: frontonasal dysplasia, holoprosencephaly spectrum (cyclopia, ethmocephaly, cebocephaly, agenesis of the primary palate, cleft palate and lip, piriform stenosis, single central incisor), Binder syndrome, others.Craniofacial anomalies of the first and second pharyngeal arches: microtia/anotia, facial microssomia (oculoauriculovertebral spectrum), Treacher Collins syndrome, others.Craniosynostoses: Crouzon syndrome, Apert syndrome, Pfeiffer syndrome, Jackson-Weiss syndrome, Saethre-Chotzen syndrome.4- Illustrative cases of craniofacial anomalies.5- Conclusion

HNEE-62   Don't Forget Nasal Cavity And Paranasal Sinus: Anatomy And Imaging Features Of Sinonasal Tumors.

Participants
Laura Fino Velasquez, MD, Bogota, Colombia (*Presenter*) Nothing to Disclose

TEACHING POINTS

To review the anatomy of the nasal cavity and paranasal sinuses. To determine the main imaging features to differentiate benign and malignant sinonasal tumors.To know and describe tumor-like conditions to avoid diagnostic errors in daily practice.To show the imaging findings of each pathology in different modalities (X-ray, CT, and MR).

TABLE OF CONTENTS/OUTLINE

1. Learning objectives. 2. Anatomy. 3. Imaging features of Benign Sinonasal Tumors. 3.1. Schneiderian papillomas. 3.2. Antrochoanal polyp. 3.3. Juvenile nasopharyngeal angiofibroma. 3.4. Fibrous-osseous lesions. 4. Imaging features of Malignant Sinonasal Tumors. 4.1. Squamous cell carcinoma. 4.2. Adenocarcinoma. 4.3. Olfactory neuroblastoma. ?4.4. Lymphoma. 4.5. Melanoma. 5. Tumor-like Entities. 6. When to suspect a malignancy? 7. Suggested Diagnostic Approach. 8. Structured reporting. 9. Teaching points. 10. References.

HNEE-63   Two For One: Cancer And A Rare Disease, Sarcomas In Head And Neck. Radiology Pathological Correlation Of Soft Tissue Sarcoma.

Participants
Vanessa Velezmoro Diaz, MEd, Lima, Peru (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this updated review is to offer an evaluation of soft tissue sarcoma in the head and neck region.Specifically, this paper aims at radiological evaluation in multidisciplinary management with an emphasis on pathological correlation. Another objective is to highlight the use of CT, classic and advanced MRI sequences and shows impact.

TABLE OF CONTENTS/OUTLINE

Introduction (generalities and New Tumor Entities and Subtypes in the 2020 WHO Classification of Soft Tissue Tumors). Imaging evaluation(CT and classic and advanced sequences MRI). Case review: Liposarcoma Rhabdomyosarcoma . Solitary fibrous tumor. Malignant perispherical nerve sheath tumor. Malignant fibrous histiocytoma. Sinovial sarcoma Pleomorphic sarcoma. Fibroblastic sarcoma. Unclassified sarcoma Treatment - prognosis - follow up Summary Bibliography

HNEE-64   Enhancement Of Facial-vestibulocochlear Nerve Complex On MRI: A Pictorial Review

Participants
Gurkawal Kaur, MBBS, New Delhi, India (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To review the key points of facial and vestibulocochlear nerve anatomy onMRI. 2. To illustrate imaging findings of various pathological entities resulting in abnormal enhancement of Facial-vestibulocochlear nerve complex on MRI.

TABLE OF CONTENTS/OUTLINE

1. Facial and vestibulocochlear nerve relevant anatomy.2. Causes of abnormal nerve enhancement: inflammation, infections (mucormycosis, tuberculosis), carcinomatous meningitis, schwannomas, meningiomas, metastasis, granulomatous processes. 3. Imaging appearance with case-based examples on Contrast Enhanced MRI.

HNEE-65   Different Methods Of Preoperative Prediction Of Cervical Nodal Metastasis In Papillary Thyroid Carcinoma

Participants
Yaoyuan Wu, Hefei, China (*Presenter*) Nothing to Disclose

TEACHING POINTS

The exhibition aims to introduce different methods of detecting cervical lymph nodes and improve the accurate preoperative diagnosis for cervical nodal metastasis, compared to the diagnostic performance of each method.

TABLE OF CONTENTS/OUTLINE

1.The methods of preoperative detecting cervical lymph nodes of papillary thyroid carcinoma were US, MRI, conventional CT, dual-energy CT and radiomics signature. 2.Illustrate the advantage and disadvantage of the five methods of preoperative detecting cervical lymph nodes in PTC patients, containing US, MRI, conventional CT, dual-energy CT and radiomics signature. 3.Calculate and compare the diagnostic performances of using US, MRI, conventional CT morphological features, dual-energy CT quantitative parameters and radiomics signature for predicting cervical nodal metastasis, with receiver operating characteristic curves. 4.Because some methods had low sensitivity but high specificity and some were opposite, the combination can complement each other. The AUC, sensitivity and specificity can improve to the best.

HNEE-67   Whats Behind The Ground-glass? Imaging Of Fibro-osseous Lesions Of Craniofacial Skeleton

Participants
Andrea De Sousa, BMBS, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purposes of this exhibit are:- To discuss and to illustrate through clinical cases the imaging features of the fibro-osseous lesions (FOL) of craniofacial skeleton correlating to current classification and histological aspects.- To identify and to classify the major fibro-osseous lesions of craniofacial skeleton, according to the region of involvement: jaws, paranasal sinuses, nasal cavity, temporal bone, skull base lesions and multifocal lesions.- To propose a practical algorithm for the systematic evaluation of the differential diagnosis.

TABLE OF CONTENTS/OUTLINE

The physiopathology of fibro-osseous lesionsMore important types of FOL of the craniofacial complexFibrous dysplasia;Ossifying fibroma;Cemento-osseous dysplasia and variants;Exostosis;OsteomaTopographic classification of FOL of craniofacial skeletonJaws lesions;Lesions of paranasal sinuses;Lesions of the nasal cavity;Lesions of the temporal bone;Skull base lesions; Multifocal lesionA pictorial review for the main imaging patterns of FOL through clinical cases from our institution's databaseDiagnostic AlgorithmFinal remarks

HNEE-68   Head And Neck Complications In Hospitalized Patients With COVID-19

Awards
Certificate of Merit

Participants
Felipe Lorenzo Marsolla, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Describe the clinical syndrome caused by SARS-CoV-2 and the most common symptoms related to the disease.Summarize the main head and neck complications in hospitalized patients with COVID-19 and present an outline role of imaging methods in the diagnosis, especially computed tomography (CT) and magnetic resonance imaging (MRI).Present a group-based approach following Inflammatory / infectious, Iatrogenic and vascular complications disorders

TABLE OF CONTENTS/OUTLINE

Introduction ApproachInflammatory / infectious Olfactory cleft mucosal thickeningInjury to the olfactory bulbs Parotitis Sinusitis Amygdalitis Fungal infection Mastoiditis Odontogenic complicationsIatrogenic Laryngeal stenosis Tracheal laceration with barotrauma Cricoid chondritis Tracheoesophageal fistulaVascular Arterial thrombosis/occlusions Venous thrombosisHaematomaTake-home messages

HNEE-69   Computed Tomography Of Ossicular Chain Disruption: A Pictorial Essay

Participants
Anagha Joshi, MD, MBBS, Mumbai, India (*Presenter*) Nothing to Disclose

TEACHING POINTS

To review the normal anatomy of the ossicular chain and to discuss the role of 2-D and 3-D computed tomography in the evaluation of post traumatic ossicular chain disruption.

TABLE OF CONTENTS/OUTLINE

Introduction: Trauma of the middle ear usually manifests as conductive hearing loss that can be due to laceration of the tympanic membrane, hemotympanum or ossicular damage. Ossicular dislocation or fracture is suspected if hearing deficit persists after resolution of hemotympanum or healing of the tympanic membrane.Anatomy: Salient features of ossicular chain anatomy are reviewed in axial, coronal and reformatted CT planes (3D). Typical landmarks in axial plane: Icecream cone, two dot, two dash are described and a checklist is prepared for detection of any abnormality in post traumatic injuries.Imaging findings: CT findings of the five types of dislocation are discussed: 1) Incudomalleolar joint separation 2) Incudostapedial joint separation 3) Dislocation of the incus 4) Dislocation of the malleoincudal complex and 5) Stapediovestibular disclocationTypes of ossicular fractures and other associated imaging findings are also discussed.Finally role of 3-D reconstruction and virtual otoscopy in evaluation of these injuries is highlighted. Summary: Thorough knowledge of the ossicular chain anatomy is essential for detection of the ossicular chain injuries. High resolution CT along with 3-D reconstruction is the modality of choice for early diagnosis and surgical planning of these injuries.

HNEE-7   Imaging Findings Of Melanoma In The Head And Neck With Emphasis On Dce Perfusion

Participants
Shotaro Naganawa, MD, Ann Arbor, Michigan (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To review imaging findings of melanoma in the head and neck2. To explain and demonstrate the typical and atypical imaging findings of treatment-related changes of brain metastases3. To explore the utility of Perfusion weighted imaging and Quantitative Susceptibility Mapping in melanoma management.

TABLE OF CONTENTS/OUTLINE

Imaging of brain metastases-With hemorrhage-Without hemorrhage-Leptomeningeal MetastasesTreatment related change-Psuedoprogression (SRS and immunotherapy)-Radiation induced cavernomaTreatment related complications-Hypophisiitis-SMART syndromeHead and Neck lesions-Bone metastasis-Muscle-Nasal cavity-ScalpUtility of Perfusion weighted image-Differentiating Melanoma from Pseudoprogression-Differentiating Melanoma from Capillary telangiectasiaUtility of Quantitative Susceptibility Mapping-Differentiating viable part of Melanoma from hemorrhagic change-Quantification of melanin amount in Melanoma

HNEE-70   Check Your Flow: Imaging Findings In Vascular Urgencies And Emergencies Of The Head And Neck

Participants
Maria Cristina Fialho, MD, Teresina, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The objectives of this exhibition are: • Review and illustrate the imaging findings of the main emergency vascular conditions of the head and neck. • Describe the major imaging patterns of the main emergency vascular disorders of non-traumatic and traumatic origin in the head and neck. • Discuss the main differential diagnosis and red flags that aid diagnosis.

TABLE OF CONTENTS/OUTLINE

• Image patterns of the main emergency vascular conditions of the head and neck: occlusion, dissection, pseudoaneurym, partial and total wall disruption, aneurysms, arteriovenous malformation / fistula, TIPIC syndrome (Carotidynia), arteritis, Lemierre syndrome, other thrombosis, • Differential diagnosis based on a pictorial review using representative cases from our institutional database. • Final considerations.

HNEE-71   A Case Based Approach Of The Oculosympathetic Pathway: A Review Of Horner Syndrome

Participants
Tabassum A. Kennedy, MD, Madison, Wisconsin (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) To identify the components of Horner syndrome and the Oculosympathetic pathway 2) Integrate clinical history with anatomic knowledge of the Oculosympathetic pathway to better localize pathology 3) Develop a focused differential diagnosis based on clinical symptoms and imaging findings

TABLE OF CONTENTS/OUTLINE

1) Introduction: Defining Terms- Horner Syndrome a. Horner syndrome is the clinical syndrome most commonly featuring ptosis, miosis and anhidrosis and is the result of disruption of ipsilateral sympathetic nerve fibers. 2) Anatomy of the Oculosympathetic pathway 3) Case Based Review a. First-order of Horner Syndrome b. Second-order Causes of Horner Syndrome c. Third-order Causes of Horner Syndrome 4) Conclusion a. Understanding the anatomy of the Oculosympathetic pathway, with central, preganglionic and postganglionic components, is critical for accurate interpretation of imaging in the setting of Horner syndrome. b. The identification of clinical features unique to the separate components of the sympathetic pathway should guide imaging selection and search pattern.

HNEE-72   It'S Time To Leave No Stone Unturned: Reviewing The Hyoid-larynx Complex And Styloid Process Anatomy And Associated Lesions

Participants
Camila Acras, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purposes of this exhibit are:- To illustrate the anatomical landmarks of the hyoid-larynx complex and styloid process.- To describe the common normal variants which may be mistaken for pathology.- To show the spectrum of pathologies affecting the hyoid-larynx complex and styloid process, according to a case-based approach.

TABLE OF CONTENTS/OUTLINE

- Anatomy and physiology of the hyoid-larynx complex and styloid process;- Imaging methods;- Differential diagnosis of lesions according to neoplasm, inflammatory/infectious, vascular, degenerative, and traumatic etiologies;- Imaging approach according to the anatomical involvement and clinical information;- Conclusion.

HNEE-73   Can You See It Crystal Clear? A Systematic Review Of Imaging Evaluation Of The Crystalline Lens.

Participants
Tiago Chamel, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To review the anatomy and physiology of the crystalline lens, making a correlation to its normal appearance in ultrasound, computed tomography and magnetic resonance imaging. 2. To propose a systematic evaluation in order to refine the radiologic propaedeutics of the lens. 3. To present imaging findings of some of the most relevant lens disorders.

HNEE-74   Temporomandibular Joint: Beyond Internal Derangement.

Participants
Niedja Santos Goncalves Tsuno, Brasilia, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. The internal derangement of the TMJ is a specific term defined as an abnormal positional and functional relationship between the disk and articulating surfaces. 2. Internal derangement is the most common TMJ disorder, however TMJ can be affected by several other conditions, although clinically the symptoms may be similar. 3. The purpose of this exhibit is to: Describe briefly review normal anatomy of the TMJ and adjacent structures.Illustrate the main pathologies involving these sites beyond internal derangement, with cases demonstrating CT e MRI aspects of each condition.

TABLE OF CONTENTS/OUTLINE

1. Simplifying the complex anatomy of the TMJ and adjacent anatomical structures like temporal bone, external auditory canal, masticator and parotid spaces.2. Summarize the main key points of some different diseases that affect the TMJ with a focus on computed tomography and magnetic resonance findings, highlighting some pathologies like: Infection such as tuberculosis;Congenital anomalies;Synovial osteochondromatosis;Inflammatory conditions like rheumatoid arthritis, juvenile idiopathic arthritis, psoriatic arthritis, TMJ involvement in inflammatory bowel disease and deposit disease of calcium pyrophosphate crystals dihydrate (CPPD);Fibrous Dysplasia; Primary tumors and metastases;Osteonecrosis;Osteoarthritis;Trauma;Post-surgical changes. 3. Conclusion.

HNEE-75   Don't Be Jaw-dropping: All We Need To Know Behind Mandibular Deficiency

Participants
Lucas Ghisleri, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purposes of this exhibit are: - Review retrognathia, hypognathia and micrognathia concepts and diagnose criteria, highlight that although most of the time retro or hypo and micrognathia are concomitant, they are different findings and shouldn't be used as synonyms because of the association of the latter with a wide range of congenital anomalies.- Review MRI and CT imaging evaluation, highlighting the importance of cephalometric evaluation.- Review the most common causes of vertical and transverse mandibular deficiency, passing though acquired causes such as osteoarthritis and congenital anomalies of the 1st and 2nd branchial arches and the most common syndromes that associates with the findings- Highlight Angle's classifications of occlusion: normal, Classes I, II and III malocclusions- Understanding the concept of overbite malocclusion

TABLE OF CONTENTS/OUTLINE

Introduction: Retrognathia and micrognathia definitions, embryology and physiopathology.Systematic Jaw Evaluation: Cephalogram: SNA and ANB angles evaluation.Micrognathia and Retrognathia Associated Image Findings: Acquired causes.Congenital causes and most common syndromes.

HNEE-76   Techniques Applied In Performing A Painless Thyroid Fna.

Participants
Asma Asma Malik, MBBS, Islamabad, Pakistan (*Presenter*) Nothing to Disclose

TEACHING POINTS

Learn to acquire painless FNA of thyroid using capsular infiltration of local anesthetic.

TABLE OF CONTENTS/OUTLINE

Fine needle aspiration (FNA) biopsy of thyroid nodules is one of the minimally invasive, safe and frequently performed procedure on outpatient basis. FNA can be performed under palpation guidance or ultrasound guidance. In addition to knowing the optimum technical skills, one must know the limitations of procedure, its indication and factors affecting the adequacy. FNA is a well tolerated procedure but pain is one of the few drawbacks of FNA, however pain score may vary in different people. Some reports have suggested that FNA can be done without local anesthesia when single puncture is used, however multiple punctures are requires for adequacy of the sample and in this case pain is the limitations.Techniques used to minimize the pain felt during the procedure include the use of the smallest needle size available (we use the needle form a 1 cc diabetic syringe), mixing of the local anesthesia with bicarbonate to neutralize the stinging effect of the acidic local anaesthetic, infiltration of the skin and in addition the thyroid capsule so that all subsequent needle enteries are painless. Since adopting this protocol and technique in our setup at Shifa International Hospital the patients have given excellect feedback especially those who have had a FNA performed prefiously. We will give a pictorial review of the techniques used in performing a painless thyroid procedure.

HNEE-77   NUT Cancers In Head And Neck Regions

Participants
Jay Thakkar, BMBS, Mumbai, India (*Presenter*) Nothing to Disclose

TEACHING POINTS

Molecular definition of the NUclear protein in Testis (NUT) carcinoma includes (15;19)(q14;p13.1) translocation in an undifferentiated squamous cell carcinoma primarily affecting the sinonasal region and thoracic cavity. Molecular derangements apart from the above described are considered as 'NUT variants'NUT cancers are largely underreported or misreported and are highly aggressive in nature with a median survival of around 6-9 months. Basic pathological, molecular information and knowledge of the

imaging features are essential for a reporting radiologist to raise the concern for the diagnosis.These cancers have a tendency to occur in midline and locally destructive. CT, MRI and PET/CT plays an important role in raising suspicion, staging and response assessment of these tumors.Lymph node involvement is uncommon in NUT carcinoma as compared to the conventional SCC and are usually non-necrotic when involved.Distant metastases to bone is frequently present at the time of diagnosis.

TABLE OF CONTENTS/OUTLINE

Introduction to histological and molecular pathology of the NUT cancersEpidemiology, Presentation and Clinical featuresGeneralized imaging features in head and neckSpecific imaging features in head and neckConclusion

HNEE-78   Application of 3D Printing Personalized Fenestration Surgical Guide Plate in Maxillary Bone Osteopenia

Participants
Sihui Chen, Zhengzhou, China (*Presenter*) Nothing to Disclose

TEACHING POINTS

It is difficult to perform surgical tooth implants in maxillary osteopenia patients. Sinus fenestration closely adjacent to vital structures and blood vessels. Accurately assessing and designing sinus fenestration site and fabricating a guide plate using 3D printing technology are of great help in surgery. We will introduce how to start a 3D model design, and print a computer-aided designed fenestration surgical guide plate model. Step 1:Obtain the anatomical structure of the maxilla: segmentation of bone structures with default threshold. Extract facial arteries around the maxillary sinus manually. Step 2:Maxillary fenestration area devise: Principles 1,The margin of fenestration area should be 3mm away from blood vessels, generally 3-5mm. 2. The distance between the edge of the region and the maxillary sinus wall should be greater than 1mm. Step 3:Maxillary fenestration guide plate model design: the distance is 2.2-4mm between the edge of the fenestration guide plate model and the edge of the fenestration area Step 4:Locational structures design: Boolean Subtraction is commanded between guide plate contour surface and fenestration area surface. Step 5:Design of connecting structure.Step 6: 3D printing process: SLS,3D printer: FS403P-M,Nylon material (high temperature resistant, biocompatible),etc.

TABLE OF CONTENTS/OUTLINE

1.Background 2.Overview of Workflow-3D printing of a computer-aided designed (CAD) surgical maxillary fenestration guide plate 3.Quality control 4.Clinical application.

HNEE-8   Brown Syndrome Or Superior Oblique Tendon Sheath Syndrome: Imaging Findings And Clinical Aspects.

Participants
Marcela Marsiglia, MD, PhD, Boston, Massachusetts (*Presenter*) Nothing to Disclose

TEACHING POINTS

To educate the audience on Brown Syndrome, also known as Superior Oblique Tendon Sheath Syndrome, a rare extraocular muscular disorder with well established radiological imaging findings.

TABLE OF CONTENTS/OUTLINE

Background: Superior Oblique Tendon Sheath Syndrome, or Brown syndrome, is defined as the inability to gaze upward beyond the horizontal level while adducting the eye due to an abnormality of the superior oblique tendon sheath complex. Clinical presentation / Symptoms: vertical diplopia, particularly in an upward gaze to the opposite side of the affected eye (on adduction). Imaging characteristics: Asymmetric thickening of the tendon of the affected superior oblique muscle with surrounding enhancing soft tissue is seen on different imaging modalities, including CT and MRI. Cases 1 to 5 Imaging findings Discussion: a) Extraocular muscles anatomy b) Anatomy of the Superior oblique muscle and tendonc) Ocular motion and function of each extraocular muscled) Gazes: diagrams and photose) Impairment on Brown Syndrome: radiological and clinical correlation with examples f) Brown Syndrome types: congenital and acquired g) Treatments: conservative and surgical Summary and Conclusions References

HNEE-9   Imaging Assessment Of Foreign Bodies In Head And Neck: Classification And Pictorial Guide

Awards
Certificate of Merit

Participants
Cristina Biosca, MD, Valencia, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

Radiologists are frequently consulted for the evaluation of foreign bodies. Their radiographic identification is essential for the management of these patients. The radiologist must be familiar with their findings and make a detailed report considering some key points. This manuscript presents a compilation of the most frequent foreign bodies, as well as other more infrequent ones.The head and neck regions contain multiple important structures: in addition to the brain, they contain the eye and the ear, the entrance of the gastrointestinal tract and the airway, and multiple anatomical orifices.They are made of different materials and can be identified on X-rays, ultrasound, CT or MR. The appropriate technique depends on sensitivity and availability, taking into account possible contraindications, advantages and limitations.We classify them into two groups depending on their relationship with the medical practice. Those related to the medical practice can be subclassified according to whether they have an iatrogenic origin or not. Those not related to the medical practice can be subdivided according to their entrance mechanism: ingestion, insertion into a cavity or hole, or penetrating foreign bodies through a wound.

TABLE OF CONTENTS/OUTLINE

IntroductionReport and key pointsImaging techniques: advantages, disadvantages. Technical considerationsClassification - Related to the medical practice: iatrogenic and non-iatrogenic - Not related to the medical practice: ingestion, insertion and penetrating foreign bodiesConclusion

Fetal Imaging

Participants
Camilo Jaimes Cobos, MD, Boston, Massachusetts (*Presenter*) Nothing to Disclose
Mariana Meyers, MD, Aurora, Colorado (*Presenter*) Nothing to Disclose
Gabrielle C. Colleran, MD, MBBCh, Dublin, Ireland (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1.Describe and illustrate the advantages and limitations of fetal MRI at 3.0 T and at 1.5 T2.Discuss strategies to optimize results at both field strengths: (a) reduce artifacts at 3.0 T and (b) maximize image quality at 1.5 T3.Present examples of clinical scenarios and indications where each field strength is advantageous and indications where they are interchangeable. This course will provide pediatric radiologists and other healthcare professionals updated information on the strengths and challenges of performing clinical fetal MRI at 3.0 T and 1.5 T. The course will also cover practical strategies to optimize image quality at both field strengths. To accomplish this, we will discuss key technical principles of fetal MRI and the most frequently utilized sequences, outline their practical implications, and share strategies to trouble shoot issues encountered in daily practice. The format will be a series of lectures by experienced fetal imagers followed by a moderator-led discussion of dilemmas based on real life cases that will emphasize take home points. The lectures and the discussion will be rich in clinical images and examples that highlight differences in performance between 3.0 T and 1.5 T. The course will also cover parameters of fetal MRI protocols at both field strengths and present a brief update on safety considerations of fetal MRI at 3.0 T.

ASRT@RSNA: Current Use of MRI in Radiation Oncology

Participants
Amy Heath, MS, RT, Poynette, Wisconsin (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1)Discuss the typical radiation oncology patient process.2)Learn current use of MRI scans during the simulation for external beam radiation therapy.3)Explain why MRI is preferred for brachytherapy treatment planning.4)Discuss currently commercially available MRI Linacs. 5)Review clinical applications for patients who have had treatment on MRI guided machines. Millions of people worldwide have been diagnosed with cancer, with approximately half of which are likely treated with radiation therapy. The field of radiation therapy, like many other specialties in the radiological sciences, has and continues to change at a remarkable pace. One significant change is the addition of Magnetic Resonance Imaging (MRI) into all steps of the radiation therapy process. This lecture will describe how MRI scans are being used throughout the radiation therapy process, as well as compare and contrast the equipment and images used for radiation therapy and diagnostic purposes.

Solving Your AI Roadmap Gaps: A Case-Based Approach and Test of Your Knowledge

Participants

Brad Genereaux, Santa Clara, California (*Presenter*) Employee, NVIDIA Corporation
Krishna Juluru, MD, New York, New York (*Presenter*) Nothing to Disclose
Kevin O'Donnell, Pacifica, California (*Presenter*) Employee, Canon Medical Systems Corporation
Stephen M. Moore, MS, Saint Louis, Missouri (*Presenter*) Consultant, 3DHISTECH Ltd;Consultant, Corista LLC;Consultant, Gestalt;Consultant, Hamamatsu Photonics KK;Consultant, Leica Biosystems Nussloch GmbH;Consultant, Pathcore Inc;Consultant, Koninklijke Philips NV;Consultant, F. Hoffmann-La Roche Ltd;Consultant, Sectra AB
Christopher J. Roth, MD, Durham, North Carolina (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1)Identify the 7 phases of a full AI-enabled ecosystem, and how it intersects with systems and workflows they already have. 2)Understand the boundaries of each participating system in AI-powered workflow, and how these systems can talk to one another. 3)Pinpoint the opportunities and challenges in creating an AI implementation roadmap, and how to overcome such challenges. 4)Recognize the role of Integrating the Healthcare Enterprise in standards-based interoperability for AI.

Bradley Erickson, MD, PhD, Rochester, Minnesota (*Presenter*) Board of Directors, VoiceIt Technologies, LLC;Stockholder, VoiceIt Technologies, LLC;Board of Directors, FlowSigma, Inc;Officer, FlowSigma, Inc;Stockholder, FlowSigma, Inc;Officer, Yunu, Inc;Stockholder, Yunu Inc

LEARNING OBJECTIVES

1) Collect, format, and standardize medical image data. Use MONAI transforms to pre-process data.2) Architect and train a convolutional neural network (CNN) in Pytorch for classification. 3) Use the trained model to evaluate on test dataset. Medical image classification plays an essential role in aiding clinical diagnosis and treatment. With the rapid development of artificial intelligence (AI) and computer vision (CV), deep learning-based methods become more accurate and applicable to a variety of clinical tasks ---- potentially serving as a valuable ally for radiologists and pathologists. In this course, learners will get a hands-on practical introduction to deep learning for radiology and medical imaging. An end-to-end training and evaluation example based on the MedNIST dataset will be covered. The MONAI deep learning platform will be introduced, which is a Pytorch-based, open-source framework for deep learning in healthcare imaging.

Acute Ischemic Stroke Imaging and Treatment: Debates and Controversies

Participants

Achala Vagal, MD, Cincinnati, Ohio (*Presenter*) Departmental Research Grant, Johnson & Johnson

Jeremy Heit, MD,PhD, Los Altos, California (*Presenter*) Consultant, Medtronic plcConsultant, Terumo CorporationConsultant, iSchemaView, IncScientific Advisory Board, iSchemaView, IncMedical Advisory Board, iSchemaView, IncBalt, STEM Trial Clinical Events Committee MemberVesalio, CLEAR Trial Clinical Events Com

Mahesh V. Jayaraman, MD, Providence, Rhode Island (*Presenter*) Nothing to Disclose

Yi Li, MD, Corte Madera, California (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1. To discuss the controversies in acute stroke imaging and treatment 2. Be able to recognize the arguments for and against differing imaging algorithms for triage and treatment. 3. Incorporate information from these discussions into personal clinical practice. Acute stroke care has undergone a paradigm shift in recent years and imaging is a common theme for clinical decision making. Although there are evidence based guidelines, there still remains a number of controversial topics such as best imaging strategies for early and late windows, treatment of large cores and use of AI in acute stroke. This will be a debate/discussion session of such controversial topics in acute ischemic stroke.

ASRT@RSNA: Anatomy of an Imaging Malpractice Lawsuit

Participants

Theodore Vanderlaan, Blue Diamond, Nevada (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

Anatomy of an Imaging Malpractice Lawsuit ObjectivesFollowing the presentation of Anatomy of an Imaging Malpractice Lawsuit the participant will:1.Be able to distinguish the four elements of Negligencea.Dutyb.Breachc.Harmd.Causation2.Be able to identify at least 3 sources that demonstrate a technologists duty3.Understand how breach and harm are determined in a medical malpractice case4.Be able to understand the two types of Causation, Actual and Proximate cause and describe the difference5.Understand the major differences between Criminal and Civil law6.Know and understand the steps in a medical malpractice lawsuit7.Be aware of the breadth of the discovery processa.Paper discoveryb.E-discoveryi.RISii.HISiii.PACSiv.VR8.Apply their understanding of Negligence to the case that is presented9.Declare a verdict for either the Plaintiff or Defendant10.List at least 5 methods to mitigate the risk of a malpractice lawsuit in their department. Anatomy of an Imaging Department Malpractice Lawsuit takes the participant through the typical elements of a malpractice case, compares and contrasts criminal lawsuits and civil cases, distinguishes the term negligence and how it is determined, and then applies it to a real malpractice case. Through the use of multimedia the participant will see how one malpractice case occurred in an imaging department and experience what it is like to be in a deposition from both the patients side as well as the technologist. The participants have the option of siding with the plaintiff or defendant and will decide the case that is presented. They will have the opportunity to compare their verdict to the actual outcome of the case. Finally, the presenter and participants will explore ways they can mitigate risk of a malpractice case in their own departments.

Hip Consensus & Controversies: The Labrum, Impingement Syndromes, & MR Arthrography

Participants
Miriam A. Bredella, MD, Boston, Massachusetts (*Presenter*) Nothing to Disclose
Donna Blankenbaker, MD, Fitchburg, Wisconsin (*Presenter*) Nothing to Disclose
Reto Sutter, MD, Zurich, Switzerland (*Presenter*) Nothing to Disclose
Sarah D. Bixby, MD, Boston, Massachusetts (*Presenter*) Nothing to Disclose
William E. Palmer, MD, Boston, Massachusetts (*Presenter*) Nothing to Disclose
James M. Linklater, MBBS, St Leonards, Australia (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1) Describe recent insights regarding the development and imaging assessment of femoroacetabular impingement. 2) Identify the best imaging modalities to diagnose labrum damage. 3) Know the pros and cons of different imaging techniques for evaluation of the articular cartilage. Recent scientific works have shed new light on hip diseases and on how they should be evaluated with imaging. Additionally, several consensus papers established recommendations on up-to-date imaging of femoroacetabular impingement. The lectures in this course cover new insights and ongoing controversies about how to best assess the labrum and articular cartilage, as well as the use of different imaging modalities, diagnostic criteria and thresholds for diagnosing femoroacetabular impingement.

Challenges in Pediatric Radiology Workflow

Participants
Rama Ayyala, MD, Cincinnati, Ohio (*Presenter*) Nothing to Disclose
Victor J. Seghers, MD, PhD, Houston, Texas (*Presenter*) Nothing to Disclose
Michael R. Aquino, MD, MS, Cleveland, Ohio (*Presenter*) Co-author with royalties, Reed Elsevier

LEARNING OBJECTIVES

1. To discuss burnout in pediatric radiology, with a specific focus on the impact of COVID-19. 2. To review remote working capabilities in pediatric radiology, including the benefits and challenges, as well as the impact of the COVID-19 pandemic.3. To describe the current common models of overnight pediatric radiology coverage, with a focus on the challenges associated with this and potential strategies for mitigation. Pediatric radiology is a rewarding subspecialty with unique challenges, especially related to workflow. This session will highlight these challenges, with a special focus on the impact of COVID-19. The session will include the following presentations: Discussion of burnout in pediatric radiology, and how it changed with COVID-19; Remote working capabilities in pediatric radiology utilizing survey data from the Society of Pediatric Radiology (SPR) members; and the challenges of 24/7 coverage in pediatric radiology, with a review of different models. The end of the session will include an extended time period for audience discussion. These challenges are critical to address for the future of pediatric radiology. The objective of this session is to not only educate the participant about these topics, but also to foster discussions, with the ultimate goal of identifying effective strategies to address these challenges.

Transcatheter Intervention Planning: Case Based Review

Participants

Prabhakar Rajiah, MD, FRCR, Rochester, Minnesota (*Presenter*) Nothing to Disclose
Jonathon Leipsic, MD, Vancouver, British Columbia (*Presenter*) Consultant, MVRx, Inc;Consultant, Heartflow, Inc;Consultant, Circle Cardiovascular Imaging Inc;Speakers Bureau, General Electric Company;Research Grant, Edwards Lifesciences Corporation;Speakers Bureau, Edwards Lifesciences Corporation;Support, Edwards Lifesciences Corporation;
Jacobo Kirsch, MD, Weston, Florida (*Presenter*) Medical Advisory Board, Zebra Medical Vision Ltd

LEARNING OBJECTIVES

1. Identify the role of imaging in pre- and post-procedural evaluation of common transcatheter interventional procedures 2. Review the key imaging features required for planning left atrial appendage closure, mitral and tricuspid valve interventions. 3. Explain the complications of transcatheter aortic valve replacement and left atrial appendage closure procedures Imaging plays an important role in the pre- and post-procedural evaluation of structural heart disease interventions. This session provides a case-based review of the role of imaging in common transcatheter interventional procedures. The topics include planning of mitral and tricuspid valve interventions, pre- and post-procedural evaluation of left atrial appendage closure and complications of transcatheter aortic valve replacement(TAVR).

Cardiovascular Imaging Manifestations of COVID-19: What the Radiologist Needs to Know

Participants

Kate Hanneman, MD, FRCPC, Toronto, Ontario (*Presenter*) Speaker, sanofi-aventis Group;Speaker, Amicus Therapeutics, Inc
Margarita Revzin, MD, Wilton, Connecticut (*Presenter*) Nothing to Disclose
Brian B. Ghoshhajra, MD, Boston, Massachusetts (*Presenter*) Research Grant, Siemens AG;Consultant, Koninklijke Philips NV

LEARNING OBJECTIVES

1.To discuss the role of cardiovascular imaging and optimal imaging protocols in patients with suspected cardiac injury related to COVID-19 or COVID-19 vaccination. 2.To describe cardiovascular imaging manifestations in patients who have recovered from COVID-19 and after COVID-19 vaccination. As of June 2021, coronavirus disease 2019 (COVID-19) caused by severe acute respiratory symptom virus 2 has affected over 180 million individuals globally with more than 3.9 million deaths. Early studies suggested that approximately 25% of patients requiring hospitalization with COVID-19 experience cardiovascular injury, defined by elevation in troponin. In these hospitalized patients, cardiovascular injury has been associated with a 5-10 fold increased risk of death. However, since most individuals survive the acute illness and do not require hospitalization, there is now growing concern for undetected cardiovascular injury in survivors. COVID-19 can result in cardiac complications including myocarditis, arterial and venous thromboembolism, and cardiomyopathy. There are also infrequent emerging reports of myocarditis and myocardial injury in a minority of patients after COVID-19 vaccination, which could potentially be related to the host immune response. This session will focus on cardiovascular imaging findings in patients who have recovered from COVID-19 and after COVID-19 vaccination.

Deep Learning Lab: Multimodal Fusion for Pulmonary Embolism Detection Using CTs and Patient EMR

Participants

Matthew P. Lungren, MD, Palo Alto, California (*Presenter*) Advisor, Segmed, Inc;Shareholder, Segmed, Inc;Advisor, Bunkerhill Health;Shareholder, Bunkerhill Health;Advisor, Microsoft Corporation;Employee, Amazon Web Services
Mars Huang, PhD, Stanford, California (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

Learning Objectives: 1) Understand key terminologies and techniques for multimodal fusion (early, late, joint) and learn the pros and cons of each strategy. 2) Gain practical experiences applying different fusion strategies to a real-world dataset for the task of Pulmonary Embolism detection. DLL43 : DLL: Multimodal Fusion for Pulmonary Embolism Detection Using CTs and Patient EMR. The practice of modern medicine relies heavily on the synthesis of information from multiple sources. Yet most deep learning models for medical imaging applications consider only pixel-value without data informing clinical context. As with human physicians, automated detection and classification systems that can successfully utilize both medical imaging data together with clinical data from the EHR (multimodal fusion), such as patient demographics, previous diagnoses, and laboratory values, may lead to better performing and more clinically relevant models. In this course, you will learn the fundamentals of different data fusion strategies and gain hands-on experiences applying them for the task of pulmonary embolism detection.

Cybersecurity for Radiology Practices

Participants
Benoit Desjardins, MD, PhD, Philadelphia, Pennsylvania (*Presenter*) Nothing to Disclose
Erik Decker, West Valley City, Utah (*Presenter*) Nothing to Disclose
Joshua Corman, Dover, New Hampshire (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1) Describe most frequent recent cyberthreats against medical centers and practices. 2) Provide overview of local and national initiatives to defend against those. 3) Describe the current status of security of medical devices. 4) Describe the impact of medical IoT on medical data security. 5) Describe how smaller providers can deal with cybersecurity with limited resources. Four years ago, the Hollywood Presbyterian Medical Center, a 434-bed hospital in California was the victim of a ransomware attack, where access to its medical data was blocked by cybercriminals. The hospital had to pay a ransom to get access to its data back. This was the first indication that US hospitals were vulnerable to cyberattacks. Although hospitals were an easy prey, there was insufficient predator interest in them until that point in time. Since then, it has been a feeding frenzy. In 2020, there were at least 80 publicly reported ransomware attacks against small or large hospitals. Large healthcare networks involving up to 400 medical centers such as United Healthcare Systems were brought down after attacks by ransomware, forcing patients to be transferred, surgeries cancelled, and ambulances redirected. These cyberattacks led to delayed care for some patients causing documented deaths.

The pandemic produced a triple threat for healthcare systems: (1) a rapid expansion of internet-connected technologies and services causing an expanded attack surface, (2) increase in many types of cyberattacks, and (3) fewer available resources to defend against cyberattacks. Phishing attacks pretending to originate from large medical entities such as the World Health Organization spread across the world like wildfire. Websites such as the Johns Hopkins COVID tracking site were duplicated and became major sources of worldwide malware distribution. National alerts about impending massive simultaneous cyberattacks against hospitals were issued by the FBI and Homeland Security, forcing hospitals to rapidly harden their systems. Nation states such as China and Russia attacked medical centers and vaccine developers to steal intellectual property. In December 2020, it was discovered that Russia had infiltrated the computer systems at many large government institutions, including Homeland Security, the Pentagon, the Treasury, the Commerce Department, the Postal Service and the National Institute of Health. Cyberattacks against healthcare were in the news daily. New pieces of legislation were passed by the federal government to help combat this surge of attacks. Whether we like it or not, cybersecurity has become a very important part of healthcare, and it is important to address this topic at RSNA, since every radiology practice in the country can easily become a victim of a cyber-attack.

This refresher course will bring the radiology community up to date on the latest developments in cybersecurity related to healthcare, including recent attacks, techniques of defense and recent legislation. The course will be presented by radiologists and top cybersecurity experts. The information technology issues will be addressed at a technical level appropriate for the radiology community at large, so this community is made aware of this growing era of digital warfare and its implications for their daily practice. This refresher course will bring the radiology community up to date on the latest developments in cybersecurity related to healthcare, including recent attacks, techniques of defense and recent legislation. The course will be presented by radiologists and top cybersecurity experts. The information technology issues will be addressed at a technical level appropriate for the radiology community at large, so this community is made aware of this growing era of digital warfare and its implications for their daily practice. Our refresher course will have **practical, actionable suggestions** that radiologists and

A Primer for Health Equity Research: Essential Skills for Health Equity & Disparities Research in Radiology (Sponsored by the RSNA Research Development Committee)

Participants

Lucy Spalluto, MD,MPH, Nashville, Tennessee (*Presenter*) Nothing to Disclose
Ruth C. Carlos, MD, MS, Ann Arbor, Michigan (*Presenter*) In-kind support, Reed Elsevier;Editor, Reed Elsevier;Travel support, General Electric Company
Elyse Park, PhD,MPH, Boston, Massachusetts (*Presenter*) Nothing to Disclose
Andrew Rosenkrantz, MD, New York, New York (*Presenter*) Nothing to Disclose
Christoph Lee, MD, Mercer Island, Washington (*Presenter*) Royalites, The McGraw-Hill CompaniesRoyalties, Oxford University PressRoyalties, Wolters Kluwer nvResearch Consultant, GRAIL, Inc.
Anand Narayan, MD,PhD, Cambridge, Massachusetts (*Presenter*) Nothing to Disclose
Efren J. Flores, MD, Boston, Massachusetts (*Presenter*) 1. Speaker Honorarium, Medscape2. Speaker Honoraria, Grand Rounds presentations (non-profit organizations)

LEARNING OBJECTIVES

1)To understand essential elements of health equity research frameworks around social determinants of health and health disparities.2)To learn about different data sources to conduct research in health disparities and health equity that will lead to successful scientific publications and grant funding. 3)To effectively design interventions to fit the needs of diverse patient populations and improve health outcomes among underserved populations. Transformational change in radiology research is necessary to equip radiologists to address health disparities, advance health equity and achieve better health outcomes among vulnerable patient populations. This session will provide radiologists with several high-priority topics in health disparities/health equity research that include epidemiology, implementation science, community based-participatory research, digital health, among others, followed by a live Q&A session with speakers.

SAT01

NIH Grantsmanship Workshop

Participants
Gayle Woloschak, PhD, Chicago, Illinois (*Presenter*) Nothing to Disclose
Maryellen Giger, PhD, Chicago, Illinois (*Presenter*) Advisor, Emalex Biosciences, Inc;Stockholder, Hologic, Inc;Royalties, Hologic, Inc;Shareholder, Quantitative Insights, Inc;Co-founder, Quantitative Insights, Inc;Shareholder, QView Medical, Inc;Royalties, General Electric Company;Royalties, MEDIAN Technologies;Royalties, Riverain Technologies, LLC;Royalties, Canon Medical Systems Corporation
Ruth C. Carlos, MD, MS, Ann Arbor, Michigan (*Presenter*) In-kind support, Reed Elsevier;Editor, Reed Elsevier;Travel support, General Electric Company
Michael W. Vannier, MD, Crete, Illinois (*Presenter*) Nothing to Disclose
Shumin Wang, PhD, Bethesda, Maryland (*Presenter*) Nothing to Disclose
Elizabeth A. Krupinski, PhD, Atlanta, Georgia (*Presenter*) Institutional research collaboration, Hyperfine Research, Inc;Institutional research collaboration, Microvascular Therapeutics, LLC;Consultant, Circle Cardiovascular Imaging Inc;Consultant, Centerstone, Inc.
David A. Mankoff, MD, PhD, Philadelphia, Pennsylvania (*Presenter*) Speaker, Siemens/PETNETAdvisory Board, ImaginAb, IncAdvisory Board, RefleXion Medical IncConsultant, Blue Earth Diagnostics LtdConsultant, General Electric CompanyResearch funded, Siemens AGSpouse, Owner, Trevarx Biomedical

LEARNING OBJECTIVES

1) Identify the parts of an NIH grant application. 2)Explain the current structure of the NIH and its agencies particularly focusing on grant reviews. 3)Examine a study section through an example mock study section Please note: This workshop is being held as an in-person event and will not be live- streamed or recorded. The goal of this course is to help participants understand the basic approach of how to write a grant (particularly for NIH) including all of the components of the grant itself and how to approach funding agencies within NIH for advice on process. The course includes didactic lectures, a question and answer session, and a mock study section that allows participants to learn about the process of review.

Acute and Chronic Lung Injury

Participants

Demetrios Raptis, MD, Frontenac, Missouri (*Presenter*) Nothing to Disclose
Travis Henry, MD, Durham, North Carolina (*Presenter*) Nothing to Disclose
Anu Brixey, MD, Portland, Oregon (*Presenter*) Research support, 4D Medical
Min Jae Cha, Seoul, Korea, Republic Of (*Presenter*) Nothing to Disclose
Ryoko Egashira, MD,PhD, Saga, Japan (*Presenter*) Speakers Bureau, Boehringer Ingelheim GmbH;Speakers Bureau, AstraZeneca PLC;Speakers Bureau, Shionogi & Co, Ltd;Speakers Bureau, KYORIN Holdings, Inc;Speakers Bureau, DAIICHI SANKYO Group;Speakers Bureau, Bayer AG;Speakers Bureau, Otsuka Holdings Co, Ltd;

LEARNING OBJECTIVES

1. Recognize the imaging appearances of acute lung injury and provide a relevant differential diagnosis of potential causes.2.Understand different management options for acute and chronic lung injury, and identify potential long term sequelae of lung injury on imaging. This course features five lectures that covers contemporary concepts of the imaging of acute and lung injury. Presentation topics include an overview of diffuse alveolar damage; imaging manifestations of novel causes of lung injury such as COVID-19 and EVALI; an overview of lung injury management with ECMO; and chronic sequelae of lung injury such as pleuroparenchymal fibroelastosis.

Lung, Mediastinum, Pleura - Case-based Multidisciplinary Review

Participants
Simon Lo, MD, Seattle, Washington (*Presenter*) Committee member, Elekta AB
Michelle S. Ginsberg, MD, New York, New York (*Presenter*) Speaker, Ultimate Opinions In Medicine LLC
David Johnstone, Milwaukee, Wisconsin (*Presenter*) Nothing to Disclose
Stephen Chun, MD, Houston, Texas (*Presenter*) Consultant, AstraZeneca PLC
Cristina Merkhofer, MD, Seattle, Washington (*Presenter*) Research Grant, Merck & Co, Inc

LEARNING OBJECTIVES

1)Review an early stage centrally located non-small cell lung cancer case with radiologist, radiation oncologist, thoracic surgeon and medical oncologist with a radiology focus. 2)Review a stage III non-small cell lung cancer case with radiologist, radiation oncologist, thoracic surgeon and medical oncologist with a radiology focus. 3)Review a non-metastatic mesothelioma case with radiologist, radiation oncologist, thoracic surgeon and medical oncologist with a radiology focus. This Case-Based Multidisciplinary Review will include a panel consisting of a diagnostic radiologist, radiation oncologist, thoracic surgeon, and medical oncologist who will discuss about the management of two lung cancer cases (stage I and III) and one mesothelioma case with a radiology focus.

Taking Action to Promote Gender Inclusion and Equity in Radiology: Opportunities for Leadership and Academic Development (Sponsored by RSNA Professionalism Committee)

Participants
Leah Sieck, MD, Indianapolis, Indiana (*Presenter*) Nothing to Disclose
Lucy Spalluto, MD,MPH, Nashville, Tennessee (*Presenter*) Nothing to Disclose
Vasantha D. Aaron, MD, Indianapolis, Indiana (*Presenter*) Nothing to Disclose
Anastasia L. Hryhorczuk, MD, Ann Arbor, Michigan (*Presenter*) Nothing to Disclose
Kate Hanneman, MD, FRCPC, Toronto, Ontario (*Presenter*) Speaker, sanofi-aventis Group;Speaker, Amicus Therapeutics, Inc

LEARNING OBJECTIVES

1) Discuss Gender Inclusion and Equity in Radiology 2) Discuss Opportunities for Leadership Development in Radiology to support women 3) Describe Professional Development programs that can be utilized to support, mentor, and sponsor women in radiology and in leadership roles This course will explore practical strategies that can be utilized to promote gender inclusion in radiology. Through lectures, speakers will share their experiences in constructing formal and informal programming to promote women in radiology, as well as the challenges that accompany these efforts. Participants should expect to learn tactics that they can add to their toolkit to create a positive, gender inclusive, environment in their radiology department or group.

Emergency Radiology Coverage: Clinical and Personnel Challenges

Participants

Ferco H. Berger, MD, Toronto, Ontario (*Presenter*) Nothing to Disclose
Aaron Sodickson, MD,PhD, Boston, Massachusetts (*Presenter*) Institutional research agreement, Siemens HealthineeersSpeaker honorarium, Siemens HealthineeersConsultant, Canon Medical Systems Corporation
Jennifer Uyeda, MD, Lexington, Massachusetts (*Presenter*) Consultant, Allena Pharmaceuticals, Inc
Emerson Wickwire, PhD, Baltimore, Maryland (*Presenter*) Institutional research support, Merck & Co, Inc;Institutional research support, ResMed Corp;Consultant, DayZz;Consultant, Eisai Co, Ltd;Consultant, WellTap;

LEARNING OBJECTIVES

1) Discuss important determinants of successful creation of a dedicated emergency radiology practice and how to staff it.2) Illustrate the benefits of integrating trainees into emergency radiology practice keeping in mind their responsibilities and learning goals.3) Identify factors to successfully maintain a thriving Emergency Radiology practice. Imaging volumes in the acute care setting continue to rise and demands of short turnaround times of final reports are increasing, making many centers shift to dedicated Emergency Radiology coverage, including after hours. However, creating and maintaining a thriving emergency radiology practice is challenging. In this session, we will provide the audience with a discussion of important aspects on how to create, staff and maintain an emergency radiology division, emphasizing that it is not a one-size-fits-all model. We will discuss how to best integrate trainees into emergency radiology practice, and explore the impact of after hours coverage on radiologists.

Principles of Cost Effectiveness Research

Participants
Stella Kang, MD,MSc, New York, New York (*Presenter*) Royalties, Wolters Kluwer nv
Pari V. Pandharipande, MD, MPH, Chestnut Hill, Massachusetts (*Presenter*) Nothing to Disclose
Bart Ferket, MD, PhD, New York, New York (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1) Describe basic principles of cost-effectiveness analysis.2) Identify imaging research questions that can be addressed using cost-effectiveness analysis.3) Participate in a hands-on introduction to cost-effectiveness analysis using TreeAge Pro software. This course will explain the basic principles and methods of cost-effectiveness analysis. Learners will be able to formulate a research question that can be addressed through cost-effectiveness analysis and conduct a cost-effectiveness analysis using a prepared model in Treeage Pro software. To allow hands-on experience with software, participants are highly encouraged to download the trial version of Treeage software at https://www.treeage.com/trial-download/, which has no cost but requires registration to obtain a unique user key. Please contact stella.kang@nyulangone.org or bart.ferket@mountsinai.org for the course materials.

Deep Learning Lab: Object Detection & Segmentation

Participants

Simukayi Mutasa, MD, Newport Beach, California (*Presenter*) Nothing to Disclose
Peter Chang, MD, Irvine, California (*Presenter*) Co-founder, Avicenna.ai;Stockholder, Avicenna.ai;Research Grant, Canon Medical Systems Corporation;Speakers Bureau, Canon Medical Systems Corporation;Research Grant, General Electric Company

LEARNING OBJECTIVES

Learning Objectives 1. Learn how to run a pre-generated google cloud compiler for implementing a convolutional neural network. 2. Learn how to tweak code for desired results. Course Description In this course, participants without a background in computer programming will use a cloud based compiler to get a hands on introduction in creating a convolutional neural network for object detection and segmentation utilizing a curated dataset. This is important for showing attendees the underlying ease and procedure for generating convolutional neural networks with curated datasets.

The Problem with Price: Controversies and Solutions

Participants
Gelareh Sadigh, MD, Atlanta, Georgia (*Presenter*) Research Grant, TailorMed Medical Ltd
Richard Heller III, MD, Chicago, Illinois (*Presenter*) Nothing to Disclose
Ed Gaines III, JD, Greensboro, North Carolina (*Presenter*) Officer, Zotec Partners LLC, a revenue cycle management company for radiologists.

LEARNING OBJECTIVES

1) Understand private insurance coverage related to unexpected out-of-network care (surprise medical billing)2) Understand the No Surprise Act and how it effects patients and physicians 3) Apply knowledge gained to improve advocacy and demand for price transparency For both patients and physicians, insurance coverage of unexpected out-of-network care has been a challenging issue. The No Surprises Act (NSA), which was passed in 2020 and addresses the issue of surprise medical billing, is aimed at protecting patients from unanticipated out-of-network costs. However, the new law may also have a substantial impact on the ability of physician practices to contract with commercial insurance companies. This session explores the NSA, its potential impact on patients and radiology practices, and the demand for price transparency. Data from states with constructs similar to the NSA will be discussed as examples of potential impacts to radiology practices.

Medicolegal Issues and Managing Risk

Participants
Stephen D. Brown, MD, Boston, Massachusetts (*Presenter*) Nothing to Disclose
Jonathan Mezrich, MD, Guilford, Connecticut (*Presenter*) Nothing to Disclose
Scott Grubman, Atlanta, Georgia (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1) Explain current developments in government healthcare fraud and abuse enforcement.2) Understand medicolegal issues in emergency radiology.3) Identify systems processes that facilitate open communication with patients and families about medical errors. This course will explore several timely medicolegal issues relevant to radiologic practice. 1) Healthcare Fraud and Abuse Enforcement: In 2020, despite the COVID-19 pandemic, the federal government recovered nearly $2 billion from healthcare providers under the False Claims Act. This presentation, by a former federal healthcare fraud prosecutor turned healthcare defense attorney, will discuss current trends in government healthcare fraud and abuse enforcement, and tips on how to stay off of the governments radar. 2) Medicolegal Issues in Emergency Radiology: Emergency Radiology is a subspecialty which is disproportionately impacted by liability risk given the pace, hours and patient acuity. The speaker, an emergency radiologist with a background as a practicing attorney, has published extensively on medicolegal topics.3) Error Disclosure Systems Considerations: Responsibly discussing medical errors with patients and families requires the implementation of principled, coordinated, enterprise-wide processes that support both patients and providers. This presentation, by a pediatric radiologist with extensive experience speaking on ethics, communication, professionalism and error disclosure, will discuss systems processes that facilitate open communication with patients and families about medical errors.

Jolie Jean, BA, Valley Stream, New York (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1. Delineate the history of African Americans in the field of radiology 2. Describe the importance of African Americans in radiology/radiation oncology 3. Describe the experiences of black radiologists and factors associated with career success and satisfaction.4. Describe strategies organizations can use to improve recruitment and retention of black faculty. The gender gap in radiology is slowly narrowing in the United States due to the tremendous efforts to foster career advancement for women by many radiology organizations. However diagnostic radiology is ranked at the bottom among 20 clinical disciplines in terms of racial diversity. To realize similar gains in racial diversity it is important to understand the experiences of black radiologists and radiation oncologists. This course explores the importance of black physician representation in radiology and radiation oncology and provides an insight into the experiences of Black radiologists and radiation oncologists which would aid institutional recruitment and retention efforts.

Ross Filice, MD, Washington, Dist. of Columbia (*Presenter*) Advisor, BunkerHill Health, IncShareholder, BunkerHill Health, IncSpeaker/Honorarium, GE HealthcareSpeaker/Clinical Trial Participant, Koios Medical

LEARNING OBJECTIVES

1) Learn how and when computer algorithms fail with case examples. 2) Identify clinical and medicolegal implications of machine failure. 3) Learn how to increase awareness of potential machine failure and some ways to overcome them. This course will describe the principles of AI with emphasis on how this can lead to errors of diagnosis or bias. Examples of this will also be given. Finally, approaches to minimize the chance of failure and ways to identify when the algorithm might have failed will be described.

MRI Safety

Participants

Emanuel Kanal, MD, Pittsburgh, Pennsylvania (*Presenter*) Consultant, Medtronic plc;Consultant, General Electric Company
Robert E. Watson JR, MD, PhD, Rochester, Minnesota (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

Attendees will become familiar with:A) The internationally standardized MR safety organizational oversight structure comprised of individuals serving 3 roles: 1) Magnetic Resonance Medical Director (MRMD); 2) Magnetic Resonance Safety Officer (MRSO); and 3) Magnetic Resonance Safety Expert (MRSE); the unique and complementary responsibilities of each role; and the certification of these positions by formal ABMRS testing regarding standardized domains of MR safety knowledge.B) The role that approved product labeling/"instructions for use" plays - and doesn't play - in determining whether or not one can, may, or should proceed with a requested MR imaging examination on a patient in whom there is a medical device or implant. Twenty years have now passed since 6 year old Michael Columbini was tragically killed by an oxygen tank inadvertently brought too close to the MR scanner in which he was about to be examined. During that time the field of MR safety has blossomed. Among the most critical advances in this field have been widespread efforts at increasing standardization in our collective approach to managing safety in MR environments.Perhaps among the most well recognized advances in the field of MR safety has been the generation of an international consensus requiring a standardized organizational structure for MR safety oversight. First published in late 2016, this consensus defines three positions: Magnetic Resonance Medical Directors, Magnetic Resonance Safety Officers, and Magnetic Resonance Safety Experts. Along with this formal oversight structure has been the simultaneous creation of the American Board of MR Safety and its development and implementation of formal certification of these three positions by objective testing of well defined standardized MR safety knowledge domains. Together these have markedly increased overall MR safety awareness and uniformity of knowledge among MR safety practitioners throughout our industry.One of the most vexing problems facing MR practitioners today is that of trying to assess whether one should proceed with a request for MR scanning of a patient in whom there is an implanted medical device. Ironically, there exists a nearly universal misunderstanding of the role that FDA (or other regulatory body) approved product labeling or "instructions for use" plays in determining the answer to this question. The second presentation in this MR Safety session will focus on clarifying the actual responsibilities of the Food and Drug Administration in this regard and the role - and lack thereof - of regulatory product labeling in clinical decision making regarding MRI of device patients.

Knee MRI: How I Do It

Participants
Bruce Forster, MD, Vancouver, British Columbia (*Presenter*) Stockholder, Canada Diagnostic Centres
Andrew J. Grainger, MD, Cambridge, United Kingdom (*Presenter*) Speakers Bureau, Canon Medical Systems Corporation
Kirkland Davis, MD, Madison, Wisconsin (*Presenter*) Nothing to Disclose
Lynne Steinbach, MD, Tiburon, California (*Presenter*) Nothing to Disclose
Donald L. Resnick, MD, San Diego, California (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1.Understand the approaches to MRI interpretation of common knee injuries.2.Identify dont miss lesions of ACL, posterolateral corner, menisci, bone/cartilage and extensor mechanism. Five compact 10 minute lectures will be offered by experienced MSK Radiologists, highlighting their tricks of the trade in interpretation of MRI of bone/cartilage, ACL, posterolateral corner, meniscal, and extensor mechanism injuries. The approaches illustrated will enhance diagnostic accuracy, and potentially improve patient outcomes in these common MSK injuries, and will be followed by a moderated question and answer session.

Valerie Vilgrain, MD, Paris, France (*Presenter*) Expert Witness, Bayer AG;Speaker, Canon Medical Systems Corporation;Speaker, General Electric Company;Advisory board, Guerbet SA;Expert Witness, Guerbet SA;Expert Witness, Zimmer Biomet Holdings, Inc;Speaker, Sirtex Medical Ltd;Expert Witness, Sirtex Medical Ltd;Investigator, AIdream;;
Maria del Pilar Bayona Molano, MD, Irving, Texas (*Presenter*) Nothing to Disclose
Bartley Thornburg, MD, Chicago, Illinois (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1.) Describe clinical and imaging sequelae of portal hypertension; 2) Explain established and emerging indications for portal interventions such as portosystemic shunt creation and variceal embolization; 3) Define the role of interventional radiology in the management of acute and chronic portomesenteric thrombosis;4) Identify medical and interventional strategies to manage complications of portal interventions including hepatic encephalopathy Liver cirrhosis is associated with high incidence and prevalence worldwide, with increasing incidence of lifestyle-related causes such as obesity, metabolic syndrome, and alcohol abuse. Interventional Radiologists play an increasingly prominent role in the multidisciplinary management of portal hypertension. This lecture-based course will review the epidemiology, medical management, imaging workup, endovascular procedures, and periprocedural care required for the care of patients with non-thrombotic and thrombotic disorders of the portomesenteric system.

W1-CMS15

Spine Emergencies

Participants

Laura L. Avery, MD, Boston, Massachusetts (*Presenter*) Nothing to Disclose
Christopher Potter, MD, Boston, Massachusetts (*Presenter*) Nothing to Disclose
Alexis Boscak, MD, Baltimore, Maryland (*Presenter*) Nothing to Disclose
Carlos H. Torres, MD,FRCPC, Ottawa, Ontario (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1. Review biomechanics, traumatology, and injury classification systems for the cervical and thoracolumbar spine.2. Identify complications of primary and metastatic spinal malignancy in the bones, epidural and intradural spaces.3. Explain the most relevant infectious processes of the spine. Spine Emergencies: high yield session focusing on diverse causes of emergent spine compromise, including traumatic, malignant, and infectious etiologies. The session will include classifying traumatic injuries, problem-solving spinal lesions in malignancy, and imaging common infections. The learner will improve time to recognition and confidence with the interpretation of these high acuity patients.

Imaging with Impact in GYN Oncology

Participants
Elizabeth A. Sadowski, MD, Madison, Wisconsin (*Presenter*) Nothing to Disclose
Priyanka Jha, MBBS, San Francisco, California (*Presenter*) Nothing to Disclose
Ashish Wasnik, MD, Ann Arbor, Michigan (*Presenter*) Royalties, Reed Elsevier;Research Grant, Sequana Medical NV;Royalties, Applied Morphomics Inc;Patent agreement, Applied Morphomics Inc
Yuliya Lakhman, MD, New York, New York (*Presenter*) Stockholder, Y-mAbs Therapeutics, Inc

LEARNING OBJECTIVES

At the completion of the course, learners will: (1) recognize key imaging features enabling risk stratification of adnexal masses; (2) identify principles of primary staging for ovarian, cervical, and endometrial cancer; and (3) adapt their search pattern to optimize recognition of recurrent gynecologic cancers. Gynecologic cancers have an important public health impact worldwide. Existing staging systems are clinically based, and radiologists may be unfamiliar with principles of staging and treatment. This course will review staging and patterns of recurrence for ovarian, endometrial, and cervical cancers. By working in context and proving clinically relevant interpretations, radiologists can be true partners in gynecologic cancer care.

Spain Presents: Why Do Spaniards Live So Long? Imaging of Longevity

Participants

Milagros Marti de Gracia, MD,PhD, Madrid, Spain (*Presenter*) Nothing to Disclose
Fatima Matute Teresa, MD, Madrid, Spain (*Presenter*) Nothing to Disclose
Nuria Bargallo, PhD, Barcelona, Spain (*Presenter*) Nothing to Disclose
Antonia Arjonilla Lopez, MD, Madrid, Spain (*Presenter*) Nothing to Disclose
Maria Fernandez-Velilla, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1) To introduce the concept of longevity as a demographic event of Spain, highlighting the influence of both the collective dietary habits and the health system on global life expectancy. 2) To describe the prevalence and incidence of cognitive impairment and neuroimaging findings related to neurodegenerative disease in Spain. 3) To illustrate the relationship of the Mediterranean diet with cardiovascular diseases and the available imaging modalities. 4) To describe the Spanish leading world model of organ donation and transplantation and the radiologist's role in the processes of organ donation, implantation and post-procedure follow-up. Special Remarks by Mary C. Mahoney, MD, President, RSNA. LIFE expectancy in Spain is already the highest in Europe and the fourth on earth, with a forecast average of 85.8 years. Some of the reasons that could be related to this life expectancy: environmental factors (high sunshine levels and a rather pleasant weather in most regions), the Mediterranean diet, physical activity, social relationships, as well as a robust public health system. Radiology plays a fundamental role in understanding the changes that occur related to health habits as well as the development of risk factors for different diseases.

Case-based Review: Post Surgical Breast, Post Radiotherapy, Implants, Breast Augmentation

Participants

Bonnie Joe, MD,PhD, San Francisco, California (*Presenter*) Institutional Research Grant, Kheiron Medical Technologies Institutional Research Agreement, GE Medical SystemsInstitutional Research Agreement, Siemens Healthineers
Thomas H. Helbich, MD, Vienna, Austria (*Presenter*) Grant, Siemens AG;Grant, Bracco Group;Grant, Guerbet SA;Grant, Hologic, Inc;Grant, Novomed GmbH
Jocelyn A. Rapelyea, MD, Washington, Dist. of Columbia (*Presenter*) Speakers Bureau, General Electric Company

LEARNING OBJECTIVES

1 Review expected imaging findings in the post-surgical breast and post-radiotherapy breast. 2) Recognize imaging findings of breast cancer recurrence. 3)Review imaging findings of breast augmentation including implants, breast implant removal, and how to evaluate implant integrity. This course will cover imaging appearance of post-surgical breast, post-radiotherapy breast, breast cancer recurrence, and breast implants and other forms of breast augmentation. Educational material will be presented using a case-based review format by breast imaging experts and will be followed by a live question and answer session.

AOSR-RSNA Joint Symposium: Optimizing Systems to Improve Value

Participants

Mary Mahoney, MD, Cincinnati, Ohio (*Presenter*) Royalties, Reed Elsevier;Editorial Advisory Board, Wolters Kluwer nv
Evelyn Lai Ming Ho, MBBS, MMed, Kuala Lumpur, Malaysia (*Presenter*) Nothing to Disclose
Marta Heilbrun, MD,MS, Atlanta, Georgia (*Presenter*) Nothing to Disclose
Meng Law, MBBS, Melbourne, Australia (*Presenter*) Nothing to Disclose
Wing Pong Chan, MD, Taipei, Taiwan (*Presenter*) Nothing to Disclose
Tessa S. Cook, MD, PhD, Philadelphia, Pennsylvania (*Presenter*) Grant, Siemens AG (ended)Grant, Independence Blue CrossGrant, RSNAGrant, ACR (ended)Grant, NIH MIDRCHonorarium, BJR (Ed board)Honorarium, Sectra (webinar speaker)

LEARNING OBJECTIVES

1). Learn a framework to evaluate if activities and projects improve value, quality, safety and cost for an organization. 2).Gain familiarity with machine learning and artificial intelligence tools that increase safety and improve workflows for the radiologist and a radiology department The RSNA/AOSR Joint Symposium: Optimizing Systems to Improve Value course will feature 4 International expert speakers, *Marta Heilbrun, Meng Law, Wing Chan and Tessa Cook*, who will deliver short didactic presentations followed by an interactive panel discussion moderated by the *RSNA president and AOSR leadership*. We will review concepts of quality, safety and cost to serve as guiding principles defining value for a radiology practice. Multiple machine learning and artificial intelligence platforms that address imaging quality and safety will be presented. We will share ideas to help the audience pitch investments in systems and informatics approaches to transform and improve our workspaces. At the end of the session, the audience will understand challenges and opportunities to innovate how we provide imaging care, using a quality improvement and safety framework.

Personalized Imaging: From Acquisition to Treatment

Participants

Robert Gillies, PhD, Tampa, Florida (*Presenter*) Consultant, HealthMyne, Inc;Investor, HealthMyne, Inc;Research support, HealthMyne, Inc;Consultant, Helix BioPharma Corp;Research support, Helix BioPharma Corp
Vikas Gulani, MD, PhD, Ann Arbor, Michigan (*Presenter*) Research support, Siemens AG;License agreement, Siemens AG;Spouse, License agreement, Siemens AG
Agata A. Exner, PhD, Cleveland, Ohio (*Presenter*) Research Consultant, Akrotome Imaging, Inc

LEARNING OBJECTIVES

As a result of this educational session, attendees should be able to:1)Describe the significant differences between (a) Precise and Personalized Medicine, (b) conventional and deep learning radiomics, (c) prognostic and predictive biomarkers. 2)Describe role of contrast agents, and Ultrasound contrast agents in particular, in advancing theranostic and nanomedicine-based pharmacologic interventions in oncology.3)Describe how imaging biomarkers, in particular multiparametric MRI or PET/CT, can be used to develop Decision Support Tools Modern medicine is evolving into increasing granularity in diagnosis and treatment. At initial presentation, this identifies disease, its subtype, its trajectory and ideally, and optimized initial treatment strategy; a process of "Precision Medicine". Once treatment is initiated, individual patients are longitudinally monitored to adjust and adapt therapy, ideally leading to optimal outcomes; a process known as "Personalized Medicine". Quantitative Imaging (QI) is playing an increasingly important role in delivering granular information for both precise and personalized care. In an increasing number of cases, quantitative imaging is being used to target the delivery of therapy; a process known as Theranostics. In this course, we will present exemplars of how such information can be obtained with routine, standard-of-care radiographic imaging.

Nuclear Cardiology: Read with the Experts

Participants

E. Gordon Depuey, MD, New York, New York (*Presenter*) Nothing to Disclose
Sharmila Dorbala, MD,MPH, Boston, Massachusetts (*Presenter*) Research Grant, Pfizer IncResearch Grant, General Electric CompanyResearch Grant, Attralus Research grant, Phillips, Consultant Pfizer Inc , General Electric Company Consultant, Janssen Consultant, Ionetix speaking honoraria

LEARNING OBJECTIVES

Systematically examine rotating planar projection images and reconstructed tomograms to assure technical integrity.Systematically examine rotating planar projection images to recognize and anticipate sources of MPI artifacts.Improve MPI interpretive confidence by avoidance of technical pitfalls and artifacts.Systematically review cardiac PET MPI and coronary flow reserve images to improve interpretive confidence.Systematically review cardiac PET FDG metabolic images for sarcoidosis and infective endocarditis to improve interpretive confidence Although myocardial perfusion SPECT (MPI) demonstrates high sensitivity and specificity in the detection of CAD, technical pitfalls and artifacts can significantly decrease test accuracy. In this course a stepwise, systematic approach to the review and interpretation of MPI images will be presented to enable technologists and interpreting physicians to avoid such pitfalls and artifacts and thereby increase their confidence in the performance and interpretation of MPI.Positron emission tomography/computed tomography (PET/CT) imaging is a powerful imaging modality for the assessment of cardiovascular diseases. It offers several advantages over single-photon emission computed tomography (SPECT) MPI including robust attenuation correction and absolute quantification of radiotracer activity. In this session, we will discuss cases to highlight interpretation of PET myocardial perfusion imaging, flow quantification and metabolic imaging with F-18 FDG to evaluate sarcoidosis and infective endocarditis.

Global Outreach in Interventional Radiology

Participants

Fabian Laage Gaupp, MD, New Haven, Connecticut (*Presenter*) Nothing to Disclose
Janice M. Newsome, MD, Atlanta, Georgia (*Presenter*) Nothing to Disclose
Azza Naif, MD, Dar es Salaam, Tanzania, United Republic Of (*Presenter*) Nothing to Disclose
Hammed Ninalowo, MD, Baltimore, Maryland (*Presenter*) Nothing to Disclose
Stephen Hunt, MD,PhD, Philadelphia, Pennsylvania (*Presenter*) Research Consultant, BTG International Ltd;Speakers Bureau, Galil
Medical Ltd;Research Grant, BTG International Ltd;Research Grant, Geurbet SA;Research Grant, Instylla Therapeutics
Charles Sanyika, MD, Johannesburg, South Africa (*Presenter*) Proctor, Cook Group Incorporated

LEARNING OBJECTIVES

1)Describe the extent and implications of the near complete lack of minimally invasive treatment options in LMIC, affecting more than half of the global population. 2)Understand hurdles to widespread implementation of IR training programs, including lack of expertise and lack of equipment, and describe proven and potential solutions. 3)Describe roles and examples of international collaboration in IR education, including sources of information and funding. More than half of the global population currently lacks adequate access to Interventional Radiology (IR). This means that billions worldwide cannot benefit from the many advantages of minimally invasive treatment options for the diagnosis and treatment of infection, cancer, trauma etc. The underlying reasons include lack of expertise, lack of IR training programs, and lack of IR equipment in most low- and middle-income countries (LMIC). Over the last five years, the first in country comprehensive IR training programs have emerged in sub-Saharan Africa, contributing to a better understanding of the extent of the problem and how it can be solved. This course will provide an overview of current global IR with lectures and discussions on the establishment of IR practices and training programs in LMIC, the state of the global IR equipment market, and how we can all benefit from international collaboration in IR.

Updates in Adnexal Imaging and Reporting

Participants
Maitray D. Patel, MD, Phoenix, Arizona (*Presenter*) Nothing to Disclose
Caroline Reinhold, MD, MSc, Westmount, Quebec (*Presenter*) Research Grant, Imagia Cybernetics Inc
Margarita Revzin, MD, Wilton, Connecticut (*Presenter*) Nothing to Disclose
Loretta Strachowski, MD, San Francisco, California (*Presenter*) Royalties, Reed Elsevier
Andrea Rockall, FRCR,MRCP, London, United Kingdom (*Presenter*) Speaker, Guerbet SA

LEARNING OBJECTIVES

1) Understand and utilize size-based management of adnexal simple cysts identified on ultrasound and simple-appearing cysts identified on CT. 2)Recognize features of complex adnexal masses on ultrasound and MR that enable definitive characterization and/or O-RADS categorization into tiers based on risk of malignancy. 3)Recommend appropriate management for adnexal masses based on O-RADS categorization. This course consists of five 12-minute presentations reviewing current approaches to categorizing adnexal masses based on imaging findings, emphasizing ultrasound and magnetic resonance imaging. The presentations review defining and characteristic imaging features of various types of adnexal masses, putting those observations in the context of the recently published Ovarian-Adnexal Reporting and Data System (O-RADS). O-RADS articulates a specific lexicon for describing pertinent ultrasound and MR observations, and it outlines a categorization scheme designed to facilitate accurate diagnosis, estimate risk of malignancy, and promote optimal patient management. Course participants will understand the most important observations in categorizing adnexal masses and how to use O-RADS; this is especially relevant moving forward because the O-RADS lexicon and categorization scheme have been added as a quality measure in Medicares Merit-based Incentive Payment System, thereby tied to reimbursement.

Wildberger, MD, PhD, Maastricht, Netherlands (*Presenter*) Institutional Grant, Agfa-Gevaert Group;Institutional Grant, Becton, Dickinson and Company;Institutional Grant, Cook Group Incorporated;Institutional Grant, Bayer AG;Speakers Bureau, Bayer AG;Institutional Grant, General Electric Company;Institutional Grant, OptiMed Technologies, Inc;Institutional Grant, Koninklijke Philips NV;Institutional Grant, Radiomics;Institutional Grant, Siemens AG;Speakers Bureau, Siemens AG

LEARNING OBJECTIVES

1) Describe recent advances in CT imaging protocols used in the emergency setting. 2) Discuss emerging CT technology being employed in emergency centers. This session is a lecture series on up to date CT protocols used in common clinical scenarios in emergency centers as well as emerging advancements in CT technology that can be utilized for emergency imaging. The session will focus on pediatric, trauma, orthopedic, stroke, and cardiovascular emergency patient populations.

Jinel A. Scott, MD, Brooklyn, New York (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1) Design metrics for Peer Learning programs 2) Analyze TAT benchmarks from ACR Grid Registry 3) Discuss Dashboarding for performance metrics 4) Describe new performance metrics 5) Understand how to operationalize strategic goals with performance metrics Currently, the majority of radiologists are assessed through performance metrics such as work performance in wRVU, report turn-around time (TAT) and participation in Peer Review. The former is a business metric and depends more on the practice's business plan than individual performance, TAT is hard to assess without benchmarking, and Peer Review has been heavily criticized for being punitive and inaccurate. This course through lectures and discussions describes new meaningful metrics that result in measurable improvement, such as Peer Learning participation, standardized reporting, and incidental findings management. Key skills to using performance metrics will be discussed. These include the use of dashboards as a means of assuring consistent and reliable data retrieval and sharing, as well as techniques for operationalizing strategic goals.

Practical Epilepsy Imaging: Pearls and Pitfalls / The Misses

Participants
Erik Middlebrooks, MD, Jacksonville, Florida (*Presenter*) Research Consultant, Varian Medical Systems, Inc;Research support, Varian Medical Systems, Inc;Consultant, Boston Scientific Corporation;Research support, Boston Scientific Corporation
Lily L. Wang, MBBS, Cincinnati, Ohio (*Presenter*) Nothing to Disclose
Steven M. Stufflebeam, MD, Charlestown, Massachusetts (*Presenter*) Co-founder, FIND Surgical Sciences Inc;Scientific Advisory Board, FIND Surgical Sciences Inc;Stockholder, FIND Surgical Sciences Inc
Prashant Raghavan, MD, Ellicott City, Maryland (*Presenter*) Speaker, Siemens AG

LEARNING OBJECTIVES

1) Understand considerations in development of a imaging protocols for evaluation of epilepsy. 2) Develop a robust search pattern for evaluation of patients with epilepsy. 3) Understand the role of functional imaging and source localization in assessing potential surgical epilepsy patients. Epilepsy is a common and debilitating disorder with an estimated prevalence of 3.4 million people in the U.S., alone. Neuroimaging plays a critical role in evaluating patients for potential therapy and can heavily influence outcomes. For instance, patients with potentially epileptogenic lesions identified on MRI are nearly three times as likely to have seizure freedom after surgery than those without MRI findings. Evaluation of chronic epilepsy is a complex, multidisciplinary process. In this lecture session, topics will broadly cover evaluation of epilepsy patients ranging from structural imaging, functional imaging, and integration with electrophysiology and other modalities. Upon completion, the audience should have an understanding of basic imaging protocols and interpretation of epilepsy MRI. In addition, participants will have an understanding of the role of functional MRI in predicting cognitive deficits from epilepsy surgery, as well as integration of multimodal source localization.

Multimodality Lymphatic Imaging: Update, Challenges, and Opportunities

Participants
Anup Shetty, MD, Saint Louis, Missouri (*Presenter*) Nothing to Disclose
Alexander C. Kagen, MD, New York, New York (*Presenter*) Chief Medical Officer, Nines, Inc;Board of Directors, Nines, Inc;Consultant, Nines, Inc;Speakers Bureau, Bayer AG
Joseph Dayan, MD, New York, New York (*Presenter*) Consultant, Stryker Corporation
Anna Lillis, MD, PhD, Dublin, Ohio (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1) Describe the causes and treatment of lymphedema and the imaging that guides management. 2) Explain the etiology and imaging features of central conducting lymphatic disorders. 3) Recognize challenges and opportunities in starting a MR lymphangiography program. Lymphatic imaging is of increasing interest as a growing number of adult and pediatric patients are affected by congenital, acquired and iatrogenic lymphatic disorders. Lectures within this course will review fundamentals of lymphatic imaging including the surgical perspective for lymphedema treatment, will discuss considerations in starting an MR lymphangiography program, and will review the imaging and management of congenital and acquired lymphatic disorders. Learners will be expected to be familiar with central and peripheral lymphatic disorders and principles of lymphatic imaging after attending the session.

Printed on: 06/28/22

Participants

Erik Shapiro, PhD, East Lansing, Michigan (*Presenter*) Founder, Shape Scientific LLC;Researcher, Bruker Corporation
Jocelyn A. Rapelyea, MD, Washington, Dist. of Columbia (*Presenter*) Speakers Bureau, General Electric Company
Gary Luker, MD, Ann Arbor, Michigan (*Presenter*) Institutional Research Grant, Polyphor, Ltd

LEARNING OBJECTIVES

1) Explain the current status of original scientific research and multi modality imaging of malignant tumors and it's implications on clinical care. 2) Attendees will learn optimal practice-based strategies to improve malignant diagnoses and patient management. 3) Identify imaging skill sets to solve the most pressing and complex problems in cancer imaging while underscoring the achievements and ingenuity of junior physician/scientists in cancer imaging. This session will focus on the importance of research and technological advances in the field of oncologic imaging. Attendees will be introduced to timely and relevant topics in imaging malignant tumors in a wide range of subspecialties. The session will highlight those achievements made by Young Investigators as defined by NIH early investigator guidelines.

Sub-Events

T4-RCP43   18F-fluciclovine PET/CT And 68GA-PSMA PET/CT Guidance Of Salvage Radiotherapy In Patients With Biochemical Recurrence Postprostatectomy: Interim Analysis Of A Secondary Endpoint From A Randomized Trial

Participants
Olayinka Abiodun-Ojo, MD,MPH, Atlanta, Georgia (*Presenter*) Nothing to Disclose

PURPOSE

We examined the potential influence of 18F-fluciclovine and 68Ga-PSMA PET/CT on salvage radiotherapy (RT) management decisions (planned secondary endpoint) in patients with biochemical recurrence postprostatectomy.*Methods and Materials 68 patients (accrual goal: 140) with detectable prostate-specific antigen (PSA) postprostatectomy were randomized to treatment planning guided by fluciclovine (mean dose: 9.96 ± 0.80 mCi) [arm A] or Ga-PSMA (mean dose: 5.07 ± 0.21 mCi) with 20 mg Lasix given unless contraindicated [arm B] in an ongoing prospective intention-to-treat clinical trial. Pre-PET RT plans were based on clinical history, histopathology findings at prostatectomy, PSA trajectory and conventional imaging findings. Post-PET RT plans were based on PET findings: no uptake or prostate bed (PB) only uptake - RT to PB only; pelvic nodal uptake - RT to PB+pelvis; extrapelvic nodal uptake - no RT. For each arm, pre- and post-PET management decisions were compared and significance of decision changes were determined using the Clopper-Pearson (exact) binomial method.*Results 3/68 patients dropped out before PET scanning. Of the remaining 65 patients analyzed, 32 (median PSA 0.29 ng/mL) underwent fluciclovine PET and 33 (median PSA 0.31 ng/mL) Ga-PSMA PET. No significant difference in PSA at PET (p = 0.48), Gleason score (p = 0.73) and surgery-PET interval (p = 0.94) between arms. On whole body analysis, positivity rate of fluciclovine was significantly higher than Ga-PSMA (96.9% vs 60.6%; p < 0.01). Overall RT decision change was 9/32 (28.1%) in arm A; in 4/32 (12.5%) patients, RT decision was withdrawn because of systemic disease detected on PET. 5/28 (17.9%) patients with sustained plans to undergo RT had treatment fields changed from RT to PB and pelvis to PB only. RT decision change was 12/33 (36.4%) in arm B; 5/33 (15.2%) patients had RT decision withdrawn because of extrapelvic uptake on PET. 7/28 (25.0%) patients with final decision to undergo RT had fields changed; 6/28 (21.4%) had fields reduced from RT to PB and pelvis to PB only, while 1/28 (3.6%) had fields increased from RT to PB only to PB and pelvis. Changes in overall RT decisions and fields were statistically significant (P < 0.01) for both arms.*Conclusions In this interim analysis, whole body positivity rate for fluciclovine was significantly higher than Ga-PSMA. Both fluciclovine and Ga-PSMA had a significant influence on salvage RT management decisions.*Clinical Relevance/Application For PCa patients with biochemical recurrence fluciclovine PET had higher positivity rate primarily due to superior ability to detect local recurrence compared with Ga-PSMA. Both fluciclovine and Ga-PSMA had a significant influence on salvage radiotherapy management decisions.

RESULTS

3/68 patients dropped out before PET scanning. Of the remaining 65 patients analyzed, 32 (median PSA 0.29 ng/mL) underwent fluciclovine PET and 33 (median PSA 0.31 ng/mL) Ga-PSMA PET. No significant difference in PSA at PET (p = 0.48), Gleason score (p = 0.73) and surgery-PET interval (p = 0.94) between arms. On whole body analysis, positivity rate of fluciclovine was significantly higher than Ga-PSMA (96.9% vs 60.6%; p < 0.01). Overall RT decision change was 9/32 (28.1%) in arm A; in 4/32 (12.5%) patients, RT decision was withdrawn because of systemic disease detected on PET. 5/28 (17.9%) patients with sustained plans to undergo RT had treatment fields changed from RT to PB and pelvis to PB only. RT decision change was 12/33 (36.4%) in arm B; 5/33 (15.2%) patients had RT decision withdrawn because of extrapelvic uptake on PET. 7/28 (25.0%) patients with final decision to undergo RT had fields changed; 6/28 (21.4%) had fields reduced from RT to PB and pelvis to PB only, while 1/28 (3.6%) had fields increased from RT to PB only to PB and pelvis. Changes in overall RT decisions and fields were statistically significant (P < 0.01) for both arms.

CLINICAL RELEVANCE/APPLICATION

For PCa patients with biochemical recurrence fluciclovine PET had higher positivity rate primarily due to superior ability to detect local recurrence compared with Ga-PSMA. Both fluciclovine and Ga-PSMA had a significant influence on salvage radiotherapy

management decisions.

T4-RCP43   Combining CT Radiomic And Pathomic Features From H;E Tissue Images For Prognosticating Outcome In P16+ Oropharyngeal Squamous Cell Carcinoma

Participants
Bolin Song, MS, Cleveland, Ohio (*Presenter*) Nothing to Disclose

PURPOSE

The current paradigm for low-risk patients with p16+ oropharyngeal squamous cell carcinoma (OPSCC) is to reduce the dosage of radio-chemo therapy (treatment de-intensification). The purpose of this study was to combine the pathomic features from digitized H&E images with CT radiomic features to create a prognostic classifier that could enable accurate risk stratification of p16+ OPSCC patients.*Methods and Materials 304 p16+ OPSCC cases from three institutions (N1=100, N2=94, and validation cohort N3=110) were included in this study. The radiomic signature capturing tumor CT textural heterogeneity was trained on pre-treatment CT scans from N1. The tumor infiltrating lymphocytes (TILs)-related features (pathomic) were trained on N2, which quantifies the spatial arrangement of the TILs proximity using network graph metrics. Next, 3 radiomic and 5 pathomic features most associated with disease-free survival (DFS) were identified from N1 and N2, respectively, and used to train Cox regression models. Median of the radiomic and pathomic signatures from N1, N2 were used as cut-off for defining high vs low-risk groups. We then applied the consensus clustering on isomap embedding of the rad-pathomic features on N3, from which two patient clusters were generated. Kaplan-Meier survival analysis was used to quantify the DFS difference between risk groups or clusters (Figure 1).*Results Hazard ratios (HR) for comparing DFS of high vs low-risk groups for the radiomic and the pathomic signatures in validation cohort N3 are 1.99 (95% CI, 0.896-4.42, p=0.0912) and 2.37 (95% CI, 1.09-5.16, p=0.0302). The two clusters from isomap of rad-pathomic resulted in an improved HR of 3.36 (95% CI, 1.52-7.39, p=0.00264). The rad-pathomic consensus matrix approach yielded higher sensitivity (0.88) in detecting recurrence than either individual radiomic (0.76) or pathomic signatures (0.76).*Conclusions Combing CT radiomic features with pathomic features from H&E slides enabled improved prognosis prediction for p16+ OPSCC.*Clinical Relevance/Application With additional validation, the fused rad-pathomic signature could allow for identifying p16+ OPSCC patients who will benefit from treatment de-intensification.

RESULTS

Hazard ratios (HR) for comparing DFS of high vs low-risk groups for the radiomic and the pathomic signatures in validation cohort N3 are 1.99 (95% CI, 0.896-4.42, p=0.0912) and 2.37 (95% CI, 1.09-5.16, p=0.0302). The two clusters from isomap of rad-pathomic resulted in an improved HR of 3.36 (95% CI, 1.52-7.39, p=0.00264). The rad-pathomic consensus matrix approach yielded higher sensitivity (0.88) in detecting recurrence than either individual radiomic (0.76) or pathomic signatures (0.76).

CLINICAL RELEVANCE/APPLICATION

With additional validation, the fused rad-pathomic signature could allow for identifying p16+ OPSCC patients who will benefit from treatment de-intensification.

T4-RCP43   Ga-68 FAPI Imaging Versus FDG-PET Imaging In Hepatocellular Carcinoma

Participants
Vineel Inampudi I, MD, Vijayawada, India (*Presenter*) Nothing to Disclose

PURPOSE

This study aims to assess the diagnostic accuracy of FDG PET-CT assessment of Hepatocellular Carcinoma and the benefit of using Ga-68 Fibroblast Activation Protein Inhibitor (FAPI) instead of FDG in the PET assessment of the same.*Methods and Materials This study is a prospective study that has been carried out at our institution on 850 patients between January 2015 to January 2021 who were diagnosed to have HCCs on PET-CT assessment with confirmation on either biopsy or AFP assessment. The SUVmax of these tumors using both FDG and Ga-68 FAPI were studied and compared.*Results 850 patients, had both FDG and Ga-68 FAPI assessment 1 day apart. 581 patients had lesions where the largest dimension was more than 5 cm while 269 patients had a largest lesion dimension of less than 5 cm. 443 patients had background cirrhosis and 407 patients did not have chronic liver disease. Out of the total 850 patients who underwent FDG PET-CT, 781 lesions were FDG avid and 69 lesions did not show FDG uptake while all 850 patients who underwent Ga-68 FAPI imaging showed lesion avidity. The mean SUVmax of HCCs among the 850 patients who underwent both imaging modalities 1 day apart was 4.39 + 2.1 for FDG and 12.29 + 6.86 for Ga-68 FAPI with a p value < 0.05 (significant). The sensitivity of FDG in detection of HCC was 92% and that of Ga-68 FAPI was 100%.*Conclusions Ga-68 FAPI PET assessment for Hepatocellular carcinomas is a useful imaging tool in terms of definitive assessment of malignancy and scores higher than FDG-PET in accuracy for diagnosing HCC and can possibly replace FDG in the future.*Clinical Relevance/Application Hepatocellular carcinoma is one of the most common malignancies in our country and is encountered across various age groups. Apart from a few clinical parameters, imaging forms a major part of the assessment of these malignancies which present as hepatic masses and the core question to be answered in every case is whether the mass is benign or malignant and if malignant, then whether it is hepatocellular carcinoma or another malignancy such as Cholangiocarcinoma. The use of multiple imaging characteristics on contrast enhanced CT scans has formed the basis of diagnosis however PET-CT assessment with FDG has been less accurate owing to the variable uptake by HCCs.

RESULTS

850 patients, had both FDG and Ga-68 FAPI assessment 1 day apart. 581 patients had lesions where the largest dimension was more than 5 cm while 269 patients had a largest lesion dimension of less than 5 cm. 443 patients had background cirrhosis and 407 patients did not have chronic liver disease. Out of the total 850 patients who underwent FDG PET-CT, 781 lesions were FDG avid and 69 lesions did not show FDG uptake while all 850 patients who underwent Ga-68 FAPI imaging showed lesion avidity. The mean SUVmax of HCCs among the 850 patients who underwent both imaging modalities 1 day apart was 4.39 + 2.1 for FDG and 12.29 + 6.86 for Ga-68 FAPI with a p value < 0.05 (significant). The sensitivity of FDG in detection of HCC was 92% and that of Ga-68 FAPI was 100%.

CLINICAL RELEVANCE/APPLICATION

Hepatocellular carcinoma is one of the most common malignancies in our country and is encountered across various age groups. Apart from a few clinical parameters, imaging forms a major part of the assessment of these malignancies which present as hepatic masses and the core question to be answered in every case is whether the mass is benign or malignant and if malignant, then whether it is hepatocellular carcinoma or another malignancy such as Cholangiocarcinoma. The use of multiple imaging characteristics on contrast enhanced CT scans has formed the basis of diagnosis however PET-CT assessment with FDG has been

less accurate owing to the variable uptake by HCCs.

T4-RCP43   Diagnosis Of Bone Marrow Metastases In Children And Young Adults With Solid Tumors:18F-FDG-PET Or DW-MRI?

Participants
Ali Rashidi, MD, Stanford, California (*Presenter*) Nothing to Disclose

PURPOSE

To compare the diagnostic performance of 18F-labeled fluorodeoxyglucose (18F-FDG) enhanced positron emission tomography (PET) and diffusion-weighted magnetic resonance imaging (DW-MRI) in the diagnosis of bone marrow metastases in children and young adults with solid malignancies.*Methods and Materials In a prospective clinical trial, we performed 64 simultaneous 18F-FDG-PET and DW-MRI scans (with a gadolinium chelate (gadobutrol, Gd) or an iron oxide nanoparticle compound (ferumoxytol)), including 21 baseline and 43 post-chemotherapy scans on twenty-three children and young adults (mean age 16.8 +/- 5.1 years, 16 males, 7 females) with bone marrow metastases. Four reviewers determined the presence or absence of 925 bone marrow metastases on 18F-FDG-PET and DW-MRI and measured the tumor-to-bone marrow contrast on 18F-FDG-PET and DW-MRI by calculating the difference between tumor and bone marrow standardized uptake values (SUV) and signal-to-noise ratios (SNR), respectively. The one-sample Wilcoxon test and Generalized Estimation Equation were used for statistical analysis.*Results At baseline, a high tumor-to-bone marrow contrast was detected in DW-MRI (SNR: 1069.57 +/- 815.45%) and 18F-FDG-PET (SUV: 1258.39 +/- 1325.95%, p=0.539). The sensitivities and specificities were 87.7% and 100%, respectively, for DW-MRI, as well as 95.4%, and 100% for 18F-FDG-PET, (p = 0.206). On post-treatment scans, the lesion-to-bone marrow contrast was higher on DW-MRI (SNR: 794.44 +/- 721.89%) compared to 18F-FDG-PET (SUV: 501.98 +/- 727.36 %; p=0.064). The sensitivities and specificities were 89.7% and 100% respectively, for DW-MRI and 89.1% and 100% for 18F-FDG-PET (p>0.999). Ferumoxytol-enhanced DW-MRI scans had higher diagnostic accuracy compared to Gd-enhanced DW-MRI scans (p=0.002). At both baseline and post-treatment scans, each modality missed lesions while the combination of DW-MRI and 18F-FDG-PET led to significantly higher sensitivities and specificities of 100% Compared to either technique alone (p<0.001).*Conclusions While either 18F-FDG-PET or DW-MRI can miss bone marrow metastases, the combined 18F-FDG-PET and DW-MRI is the most precise modality in the detection of bone marrow metastases in children and young adults.*Clinical Relevance/Application Both DW-MRI and 18F-FDG-PET can miss bone marrow metastases. The combined 18F-FDG-PET and DW-MRI can detect accurately the lesions missed on either modality alone.

RESULTS

At baseline, a high tumor-to-bone marrow contrast was detected in DW-MRI (SNR: 1069.57 +/- 815.45%) and 18F-FDG-PET (SUV: 1258.39 +/- 1325.95%, p=0.539). The sensitivities and specificities were 87.7% and 100%, respectively, for DW-MRI, as well as 95.4%, and 100% for 18F-FDG-PET, (p = 0.206). On post-treatment scans, the lesion-to-bone marrow contrast was higher on DW-MRI (SNR: 794.44 +/- 721.89%) compared to 18F-FDG-PET (SUV: 501.98 +/- 727.36 %; p=0.064). The sensitivities and specificities were 89.7% and 100% respectively, for DW-MRI and 89.1% and 100% for 18F-FDG-PET (p>0.999). Ferumoxytol-enhanced DW-MRI scans had higher diagnostic accuracy compared to Gd-enhanced DW-MRI scans (p=0.002). At both baseline and post-treatment scans, each modality missed lesions while the combination of DW-MRI and 18F-FDG-PET led to significantly higher sensitivities and specificities of 100% Compared to either technique alone (p<0.001).

CLINICAL RELEVANCE/APPLICATION

Both DW-MRI and 18F-FDG-PET can miss bone marrow metastases. The combined 18F-FDG-PET and DW-MRI can detect accurately the lesions missed on either modality alone.

T4-RCP43   Improved Response Prediction Based On Dual Energy CT Radiomics In Patients With Stage IV Melanoma Before Immunotherapy

Participants
Andreas Brendlin, Tuebingen, Germany (*Presenter*) Nothing to Disclose

PURPOSE

To assess the additive value of dual energy CT (DECT) over single energy CT (SECT) to radiomics based response prediction in patients with metastatic melanoma undergoing immunotherapy.*Methods and Materials A total of 140 consecutive patients with melanoma (58 female, 63±16 years) for whom baseline DECT tumor load assessment revealed stage IV and who were subsequently treated with immunotherapy were included. Best response was determined using the clinical reports (81 responders: 27 complete response, 45 partial response, 9 stable disease). Individual lesion response was classified manually in the style of RECIST 1.1 through 1291 follow-up examinations on a total of 776 lesions (6.7±7.2 per patient). The patients were sorted chronologically into a study and a validation cohort (each n = 70). The baseline DECT was examined using specialized tumor segmentation software, and radiomic features were analyzed for response predictors. Significant features were selected using univariate statistics with Bonferroni correction and multiple logistic regression. The area under the curve of the best subset was computed (AUROC). A random forest classifier with 10-fold internal cross-validation was trained on the study cohort and tested on the validation cohort to confirm the predictive performance.*Results A total of 4074 timepoint evaluations were performed. Multivariate statistics selected significant features for patient response in SECT (min. brightness, AUROC = 0.67, MI = 0.077 R^2 = 0.112, padj. = 0.001) and DECT (textural coarseness, AUROC = 0.71, MI = 0.064, R^2 = 0.121, padj. = 0.001), as well as lesion response in SECT (mean absolute voxel intensity deviation, AUROC = 0.67, MI = 0.088 R^2 = 0.115, padj. = 0.001) and DECT (iodine uptake metrics, (AUROC = 0.88, MI = 0.1 R^2 = 0.12, padj. = 0.001) Machine-learning application validated the additive predictive power of DECT (patient response AUROC SECT = 0.5, DECT = 0.75; lesion response AUROC SECT = 0.61, DECT = 0.85; p < 0.001).*Conclusions The new method of DECT-specific radiomic analysis provides a significant additive value over SECT radiomics approaches for response prediction in patients with metastatic melanoma preceding immunotherapy, especially on a lesion-based level. As mixed tumor response is not uncommon in metastatic melanoma, this lends a powerful tool for clinical decision-making and may potentially be an essential step towards individualized medicine.*Clinical Relevance/Application Considering mixed responses under immunotherapy, this approach can be a powerful additional tool for oncological decision-making.

RESULTS

A total of 4074 timepoint evaluations were performed. Multivariate statistics selected significant features for patient response in SECT (min. brightness, AUROC = 0.67, MI = 0.077 R^2 = 0.112, padj. = 0.001) and DECT (textural coarseness, AUROC = 0.71, MI = 0.064, R^2 = 0.121, padj. = 0.001), as well as lesion response in SECT (mean absolute voxel intensity deviation, AUROC = 0.67, MI = 0.088 R^2 = 0.115, padj. = 0.001) and DECT (iodine uptake metrics, (AUROC = 0.88, MI = 0.1 R^2 = 0.12, padj. = 0.001) Machine-learning application validated the additive predictive power of DECT (patient response AUROC SECT = 0.5, DECT = 0.75; lesion

response AUROC SECT = 0.61, DECT = 0.85; p < 0.001).

CLINICAL RELEVANCE/APPLICATION

Considering mixed responses under immunotherapy, this approach can be a powerful additional tool for oncological decision-making.

T4-RCP43   **Automatic MRI Analysis In Multiple Myeloma: A Framework Combining Deep Learning For Automatic Pelvic Bone Marrow Segmentation And Radiomics For Prediction Of Plasma Cell Infiltration In Multiple Myeloma Patients**

Participants
Markus Wennmann, MD, Heidelberg, Germany (*Presenter*) Nothing to Disclose

PURPOSE

To establish an automated framework including (I) automatic pelvic bone marrow (BM) segmentation from MRI and (II) a radiomics model to predict the plasma cell infiltration (PCI) in Multiple Myeloma (MM) patients.*Methods and Materials Five cohorts including a total of 541 MRIs from 270 patients were included; 158 patients had received MRI on one 1.5T MRI Scanner and had information on PCI from concomitant biopsy at the iliac crest available. MRIs without biopsy data were used for training of the nnU-Net only, which is state of the art for medical image segmentation. MRIs with biopsy data were split by date into a training-set (n=116) for both, nnU-Net and radiomics model, and an independent test-set for the framework (n=42). BM segmentations of the right and left pelvic bone on coronal T1tse images on the training cohort were used for training of the nnU-Net. A random forest classifier was trained on the pelvic radiomics features to predict PCI. The framework was then tested on the independent test-set. Dice scores report accuracy of segmentations and mean absolute error (MAE) in [%PCI] reports the accuracy of the PCI prediction. For comparison, two radiologists rated the diffuse infiltration according to 3 levels of severity (none-to-mild vs. moderate vs. severe). The mean PCI within each severity level from the training set was determined and assigned as a prediction to patients with the same level diffuse infiltration in the test-set (the radiologists` PCI prediction). This study was approved by the institutional review board.*Results The mean Dice score of the nnU-Net segmentation for right / left pelvic bone marrow on 8 cases of the test-set (last 8 by acquisition date) were 0.94 and 0.94, respectively, the mean Dice score between manual pelvic BM segmentation of two radiologists on these 8 cases were 0.87 and 0.88. The MAE of the prediction of PCI by the automated framework was 14.3 [%PCI]. The MAE of the radiologists PCI predictions were 16.1 [%PCI] (rater 1) and 16.7 [%PCI] (rater2).*Conclusions We established automatic BM segmentation with radiologist level precision, which is a critical step towards automated analysis of MM MRI. Radiomics analysis of these segmentations can predict PCI with considerable accuracy. Further improvement of the PCI prediction model is necessary and is currently in progress, by (I) adding T2 and DWI sequences, (II) adding 600 additional cases from a second institution, (III) a prospective, multi-scanner radiomics feature stability study (recruitment and measurements completed, data analysis in progress).*Clinical Relevance/Application Automatic bone marrow (BM) segmentation is a crucial step to automate reading of multiple myeloma (MM) MRI. Plasma cell infiltration (PCI) is a critical marker for staging and risk assessment in MM.

RESULTS

The mean Dice score of the nnU-Net segmentation for right / left pelvic bone marrow on 8 cases of the test-set (last 8 by acquisition date) were 0.94 and 0.94, respectively, the mean Dice score between manual pelvic BM segmentation of two radiologists on these 8 cases were 0.87 and 0.88. The MAE of the prediction of PCI by the automated framework was 14.3 [%PCI]. The MAE of the radiologists PCI predictions were 16.1 [%PCI] (rater 1) and 16.7 [%PCI] (rater2).

CLINICAL RELEVANCE/APPLICATION

Automatic bone marrow (BM) segmentation is a crucial step to automate reading of multiple myeloma (MM) MRI. Plasma cell infiltration (PCI) is a critical marker for staging and risk assessment in MM.

Role of Imaging in Cardio-Oncology

Participants
Lauren Baldassarre, MD, New Haven, Connecticut (*Presenter*) Nothing to Disclose
Susan Dent, Ottawa, Ontario (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1. Understand the utility of a multimodality cardiac imaging approach to cardio-oncology. 2. Explain which cardiac imaging is appropriate for the monitoring, diagnosis, and management of a variety of cardiotoxicities. Cardio-oncology is a rapidly growing field that addresses the cardiotoxic effects from cancer therapeutics. Cardiac imaging is central to the practice of cardio-oncology, as it plays a large role in the monitoring, diagnosis, and management of cancer patients. This lecture series will demonstrate the utility of the different cardiac imaging modalities in the assessment of a variety of cardiovascular disease states in cancer patients. The importance of a multidisciplinary approach amongst radiologists, cardiologists and oncologists in this field will be emphasized.

MESH Incubator Presents: The CORE Healthcare Innovation Bootcamp: Putting It Together - Crucial Aspects to Successful Implementation

Participants

Marc Succi, MD, Boston, Massachusetts (*Presenter*) Inventor, Frequency Therapeutics
Carl Berke, PhD, Boston, Massachusetts (*Presenter*) Nothing to Disclose
Michael S. Gee, MD, PhD, Boston, Massachusetts (*Presenter*) Research Grant, Takeda Pharmaceutical Company Limited;Researcher, General Electric Company ;Researcher, Siemens AG
Efren J. Flores, MD, Boston, Massachusetts (*Presenter*) 1. Speaker Honorarium, Medscape2. Speaker Honoraria, Grand Rounds presentations (non-profit organizations)
James Brink, MD, Boston, Massachusetts (*Presenter*) Board of Directors, Accumen Inc

LEARNING OBJECTIVES

1. Learn the process involved in forming a new healthcare company/startup, including cautionary tales about equity, founders, and conflict.2. Understand different types of investing, including benefits and drawbacks, from friends and family to venture and IPO.3. Understand structure of academic departments in order to implement equitable innovations in healthcare. Good ideas are necessary but not sufficient to successfully implement healthcare innovations. In this afternoon session from the MESH incubator, the program will focus on key steps to implementing your vision, product, idea, or company. This begins with teaching the fundamentals of startup formation as well as venture funding by a successful healthcare investor. Furthermore, understanding organization challenges in academic institutions, and tackling these challenges with an understanding of key issues in diversity, equity, and inclusion are required for systematic and equitable innovation two leaders in this arena will teach fundamental understanding in these areas.

Artificial Intelligence in the Hands of Medical Imaging and Radiation Therapy Professionals Part II: Getting Ready for a Future with AI (Sponsored by the Associated Sciences Consortium)

Participants
Susie Moseley, BS, RT, Albuquerque, New Mexico (*Presenter*) Nothing to Disclose
Sharon Wartenbee, RT, Sioux Falls, South Dakota (*Presenter*) Nothing to Disclose
Caitlin Gillan, BSC, MEd, Toronto, Ontario (*Presenter*) Nothing to Disclose
Hakon Hjemly, MSc,RT, Sorumsand, Norway (*Presenter*) Nothing to Disclose
Craig St George, ARRT,RT, Albuquerque, New Mexico (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1) Identify how artificial intelligence is being used in everyday activities and technologies in radiation therapy. 2) Explain the current and future effect of AI on workflows, ethics, and perceptions of practitioners and patients. 3) Discuss future applications of AI and ML technologies and how they might shape the profession. This is a two-part presentation titled Artificial Intelligence in the Hands of Medical Imaging and Radiation Therapy Professionals. Part I aims to identify the development and terminology of artificial intelligence (AI), machine learning (ML), and automation associated with the radiologic sciences. Additionally, current and proposed patient care practices for AI and ML will be discussed. Part II will cover practitioner trust, the role of education, future applications and effects of AI and ML in shaping the profession, and ethical responsibilities of health care facilities and employees when implementing AI and ML into everyday practice.

Trailblazers in Health Equity: Lessons Learned & Leadership Opportunities to Advance Health Equity in Radiology and Beyond (Sponsored by the RSNA Committee on Diversity, Equity & Inclusion)

Participants

Efren J. Flores, MD, Boston, Massachusetts (*Presenter*) 1. Speaker Honorarium, Medscape2. Speaker Honoraria, Grand Rounds presentations (non-profit organizations)
Carolyn Meltzer, MD, Los Angeles, California (*Presenter*) Nothing to Disclose
Yoshimi Anzai, MD,MPH, Salt Lake City, Utah (*Presenter*) Nothing to Disclose
Jacqueline A. Bello, MD, New York, New York (*Presenter*) Nothing to Disclose
Geraldine McGinty, MD, MBA, New York, New York (*Presenter*) Board member and Stockholder, NextGen Healthcare (NXGN)
Lucy Spalluto, MD,MPH, Nashville, Tennessee (*Presenter*) Nothing to Disclose
Valerie L. Ward, MD, MPH, Boston, Massachusetts (*Presenter*) Nothing to Disclose
Ruth C. Carlos, MD, MS, Ann Arbor, Michigan (*Presenter*) In-kind support, Reed Elsevier;Editor, Reed Elsevier;Travel support, General Electric Company

LEARNING OBJECTIVES

At the end of the presentation, attendees will be able to:1)Learn from for the experiences of current leaders as they candidly discuss experiences establishing efforts in health equity at their institutions. 2)Effectively identify strategies and opportunities for leadership development and growth in health equity in radiology and beyond. 3)Understand the value of developing key transdisciplinary collaborations to effectively lead organizational transformation into an equitable imaging care delivery environment. Radiology leaders, institutional leaders, and national organizations are committed to advancing health equity. To effectively catalyze organizational commitment to advancing health equity and broaden the impact of radiology in these institutional and national efforts, we will learn from the experience of influential radiology leaders who are at the forefront of these efforts.

AI Productivity ? The Dash for Cash (Sponsored by the Associated Sciences Consortium)

Participants

Jennifer Kroken, MBA, Lewisville, Texas (*Presenter*) Nothing to Disclose
Steven DeColle, Edmonton, Alberta (*Presenter*) Nothing to Disclose
Benjamin Strong, MD, Eden Prairie, Minnesota (*Presenter*) Officer, Virtual Radiologic Corporation
Rob Gontarek, Plano, Texas (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1) Explain how AI can be practically used and applied in billing and physician dictation 2) Identify the potential financial implications AI can have for a practice. AI has been well-recognized in the clinical environment of radiology but has also made tremendous inroads on the business side. The session will discuss the real-world use of AI to support billing and dictation including a discussion of reducing overhead, leveraging productivity and improving financial performance.

Protocol Optimization for Low Dose CT

Participants

Timothy Szczykutowicz, PhD, Madison, Wisconsin (*Presenter*) Consultant, AiDoc Medical Ltd;Consultant, Flowhow.ai;Consultant, medInt Holdings, LLC;Consultant, Alara, Inc;Consultant, AstoCT, Inc;Research Grant, General Electric Company;Research Grant, Canon Medical USA

Rebecca Smith-Bindman, MD, San Francisco, California (*Presenter*) Founder, Alara Imaging, Inc

Lawrence N. Tanenbaum, MD, Riverside, Connecticut (*Presenter*) Speaker, General Electric Company;Speaker, Siemens AG;Speaker, Guerbet SA;Speaker, Koninklijke Philips NV;Consultant, Enlitic, Inc;Consultant, icoMetrix NV;Consultant, Subtle Medical, Inc;Consultant, Columbo;Consultant, Canon Medical Systems Corporation;Consultant, FUJIFILM Holdings Corporation

LEARNING OBJECTIVES

1) Identify the magnitude of dose variations within centers and between centers. 2) Learn where how CT technology can enable lower doses, but also how CT practice culture often enables the largest dose reductions. 3) Identify hurdles to dose reduction efforts in the "real world" This is a lecture based session. We will open with a talk on the variability in dose our community sees for low dose CT applications like screening, renal calculi f/u, LCS, etc. We will make observations about the sources for this variation. Then we will transition to discussing what technology and practice culture behaviors enable Low dose. Finally, we will discuss protocol optimization in the real world; specifically how implementation of low dose protocols or low dose technology in the real world actually works.

Kartik Reddy, MD, Decatur, Georgia (*Presenter*) Nothing to Disclose
Susan Palasis, MD, Chicago, Illinois (*Presenter*) Nothing to Disclose
John A. Maloney, MD, Denver, Colorado (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

Course Objectives: 1) to identify strategies to work up challenging cases in the areas of neonatal encephalopathy, unwitnessed head trauma in a young child, pediatric stroke and pediatric orbit, 2) to demonstrate the use of appropriate imaging techniques, including advanced imaging in such scenarios. This case-based format will demonstrate how to approach the diagnostic work-up of challenging pediatric neuroradiology cases. The speakers will focus on neonatal encephalopathy, unwitnessed child trauma, pediatric stroke and pediatric orbital disease. At the end of the course, the audience will gain insights into 1) signs and symptoms that prompt urgent/emergent imaging, 2) how to use the most appropriate sequence of imaging modality considering the childs age/developmental state and clinical context, and 3) the value of detailed imaging, including advanced imaging sequences.

Nonischemic Cardiomyopathies: Case Based Review

Participants
Jadranka Stojanovska, MD, New York, New York (*Presenter*) Nothing to Disclose
Bradley Allen, MD, Chicago, Illinois (*Presenter*) Consultant, Circle Cardiovascular Imaging Inc;Speaker, Medscape, LLC
Jens Bremerich, MD, Basel, Switzerland (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1Differentiate CMR imaging for assessment of hypertrophic heart disease2.Discuss causes and imaging appearances of restrictive cardiomyopathy 3.Review diagnostic and management strategies, in particular the importance of CMR in guiding clinical management in right ventricular cardiomyopathy Cardiac MR imaging,' an important imaging modality to diagnose, differentiate, and guide clinical management of non-ischemic cardiomyopathy, has generated considerable excitement in cardiac imaging. Cardiac MR techniques, such as tissue characterization including, strain imaging and parametric mapping generate additional imaging findings that aid not only in the diagnosis but also the management of non-ischemic cardiomyopathy. This case based review session of non-ischemic cardiomyopathies will provide a deeper overview of the impact of MR in cardiac imaging. It will address how cardiac imaging physicians can diagnose, differentiate, and manage patients with non-ischemic cardiomyopathies. Topics of this multi-speaker session will cover: 1) differentiating hypertrophic heart disease 2) restrictive cardiomyopathy: causes and imaging appearance 3) the forgotten ventricle: right ventricular cardiomyopathy. The presentations will be case cased review at a level relevant to the RSNA audience.

Innovations in Dual and Multi-Energy CT

Participants

Wei Zhou, PhD, Aurora, Colorado (*Presenter*) Nothing to Disclose
Rick R. Layman, PhD, Houston, Texas (*Presenter*) Research Grant, Siemens AG;Consultant, General Electric Company;Research collaboration, MARS Bioimaging Ltd;
Daniele Marin, MD, Cary, North Carolina (*Presenter*) Research support, General Electric Company;Research support, Siemens AG;Research support, Bracco Group;Research Consultant, Bracco Group;Research Consultant, Bayer AG

LEARNING OBJECTIVES

1) Understand the basic principles of Dual and Multi-energy CT. 2) Discuss how Dual- and Multi-energy CT is implemented clinically, from acquisitions to post-processing. 3) Learn recent advances in Dual- and Multi-energy CT to benefit a variety of clinical applications. This session will have three speakers to cover the latest innovations in Dual- and Multi-energy CT. The first talk will introduce the technical approaches of clinical systems and emerging technology including photon counting detector. The second talk will discuss the experience when implementing Dual- and Multi-energy CT in clinical practice, including protocol management and image post-processing. Finally, the third talk will focus on a range of current and emerging applications of Dual- and Multi-energy CT for patients examination.

ASRT@RSNA: The Changing World of Contraband Smuggling

Participants

Barry Daly, MD, Baltimore, Maryland (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1. To describe newer formulations and packaging of concealed illegal drugs and recent advances in imaging techniques for their detection.2. To discuss the recent sharp increase in abuse of synthetic opioids and problems in the detection of this contraband.3. To describe efforts to detect and curtail contraband smuggling into and within prisons. The recent rapid growth of narcotic abuse worldwide may be described as the unseen Pandemic behind the Pandemic. The last 2 years have seen increasing addiction, with rapidly worsening overdose and related death rates in many countries. The purpose of this lecture is to describe the recent evolution of newer, more dangerous illegal drug formulations and recent advances in imaging techniques for drug detection and interdiction. The detection of concealed contraband drugs in hospital emergency rooms and in prisons is also addressed. The high prevalence of street drug use in the U.S. and many other countries should encourage radiographic technologists to be aware of this serious global health problem.

Controversy Session: To Look or Not to Look?Does Every Woman with Newly Diagnosed Breast Cancer Need Axillary Imaging?

Participants
Penelope Moyle, MBChB, Cambridge, United Kingdom (*Presenter*) Nothing to Disclose
Jessica Leung, MD, Houston, Texas (*Presenter*) Scientific Advisory Board, Subtle Medical, IncSpeaker, General Electric CompanySpeaker, Hologic, IncScientific Advisory Board, Seno Medical
Kelly K. Hunt, MD, Houston, Texas (*Presenter*) Institutional Research Grant, CairnSurgical, Inc;Institutional Research Grant, Eli Lilly and Company;Institutional Research Grant, Lumicell, Inc;Medical Advisory Board, ArmadaHealth

LEARNING OBJECTIVES

1)Understand the prognostic implications and treatment strategies of metastatic lymph nodes in the neo-adjuvant and non-neoadjuvant setting in early breast cancer .2)Understand the optimal imaging and biopsy techniques in the staging of early breast. The presence of axillary node metastases remains one of most important prognostic factors in breast cancer .The diagnosis of axillary metastases determines the need for systemic chemotherapy and radiation therapy. Controversy remains on when and how we should stage axillary lymph nodes in early breast cancer. Imaging is helpful in identifying metastases yet has poor sensitivity and specificity in many modalities which has led to criticism of over treatment of the axilla. With increasing neoadjuvant treatments, advanced imaging modalities and localisation of metastatic lymph nodes, many believe accurate staging optimises patient outcomes and reduces morbidity. This controversy session will explore this topic through three lectures: the prognostic information of metastatic axillary lymph nodes and ideal treatment in early breast cancer, the optimal imaging of the axilla and finally the optimal biopsy methods with cost effectiveness. The session with end with a discussion summarizing the evidence for us to make a balanced decision on how and when to image the axilla in early breast cancer .

Etta D. Pisano, MD, Boston, Massachusetts (*Presenter*) Nothing to Disclose
Sarah S. Avery, MD, Austin, Texas (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1)Using specific examples, explain the reasons that physician engagement on health policy is important for patients and the specialty of radiology.2)Describe the influence of clinical research on policy decisions.3)Identify multiple ways to become involved in advocacy efforts. Radiology does not exist in a vacuum. Lawmakers and regulators, as well as commercial insurance companies, influence how medical imaging services are accessed and reimbursed. This case-based lecture session explores the importance of radiologist-led advocacy, including examples of when research did and did not influence policy. Attendees should walk away from this session with an understanding of the importance of physician engagement on policy, as well as ways to become involved themselves.

Flexible Work Arrangements and Their Impact on Advancement of Women in Radiology (Sponsored by the American Association for Women in Radiology)

Participants

Kristin Porter, MD,PhD, Birmingham, Alabama (*Presenter*) Stockholder, Pfizer Inc;Medical Advisory Board, Bracco Group
Parisa Mazaheri, MD, St Louis, Mississippi (*Presenter*) Nothing to Disclose
K. Elizabeth Hawk, MD,PhD, Studio City, California (*Presenter*) Nothing to Disclose
Eric Ledermann, MBA,DO, Tampa, Florida (*Presenter*) Nothing to Disclose
Kay D. Lozano, MD, Centennial, Colorado (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1) Inform women in radiology and practice leaders regarding the A) potential benefits and B) negativeconsequences of flexible work arrangements, C) with special attention to during and after the COVID-19pandemic. Flexible scheduling arrangements have been suggested as an opportunity to improvephysician well-being, improve work-life integration, and increase retention, particularly ofwomen in radiology and during the pandemic. Incorporating more flexible work opportunitiesmay improve employee engagement and satisfaction in the workplace; however, there arefinancial and advancement implications for part-time work as well. The flexible schedulingsolution, while keeping more women in radiology, may be hindering their advancement.Drawing from the experience of women in radiology and radiology leaders across practicetypes, this educational panel will address the pros and cons of flexible scheduling,with particular emphasis on the advancement implications for women in radiology in thecontext of the COVID-19 pandemic.

Florian Fintelmann, MD, Boston, Massachusetts (*Presenter*) Research support, Boston Scientific Corporation
Anastasia Oikonomou, MD,PhD, Toronto, Ontario (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1.Understand challenges in diagnosing and treating lung cancer.2.Review expected imaging features related to therapy for lung cancer. This session focuses on lung cancer, a leading cause of death from cancer. The diagnosis and management of lung cancer is challenging. Therapy for lung cancer requires a multidisciplinary approach in which surgery, radiation therapy, chemotherapy, and immunotherapy have roles. An understanding of the typical findings and complications after therapy is important. Therefore, this lecture format session will cover lung cancer in the background of interstitial lung disease and current and future understanding of the potential role of radiomics in lung cancer. Lectures will review new targeted and immunotherapy approaches for treating lung cancer, covering aspects in regards to tumor response assessment on imaging and lung toxicity. Additionally, review will include discussion of imaging findings after radiotherapy; an awareness of these aids in both minimizing misdiagnosis and identifying tumor recurrence.

Essentials of Quality Research and Practice Standards

Participants

Marta Heilbrun, MD,MS, Atlanta, Georgia (*Presenter*) Nothing to Disclose
Matthew Davenport, MD, Ann Arbor, Michigan (*Presenter*) Royalties, Wolters Kluwer nv
Rajesh P. Shah, MD, Palo Alto, California (*Presenter*) Research support, Merit Medical Systems, Inc;Consultant, Intuitive Surgical, Inc;Consultant, F. Hoffmann-La Roche Ltd;Research support, Lucence Health;Consultant, Histosonics, Inc;Consultant, Artio Medical, Inc
Jenny K. Hoang, MBBS, Baltimore, Maryland (*Presenter*) Spouse, Employee, Merck & Co, Inc

LEARNING OBJECTIVES

1) Understand requirements for quantitative methodologies in Quality Improvement work. 2) Become familiar with national databases and development work that supports systems approaches to quality improvement. 3) Learn to incorporate registries and data capture into daily work in order to improve quality. The Essentials of Quality Research and Practice Standards course will feature 4 Quality Improvement expert speakers, Marta Heilbrun, Matt Davenport, Rajesh Shah and Jenny Hoang, who will deliver short didactic presentations followed by an interactive moderated panel discussion. We will go over the basic data requirements and considerations that are necessary for high impact quality improvement work. We will share ideas to help you develop your own quality improvement dashboards, using reporting tools and data registries. By the end of the session, participants will have concrete ideas and access to tools that facilitate participation in quality improvement activities at both a local level and on a national stage.

Natural Language Processing in 2021

Participants

Wendy Chapman, PhD, Salt Lake City, Utah (*Presenter*) Nothing to Disclose
Imon Banerjee, Atlanta, Georgia (*Presenter*) Nothing to Disclose
Barbara Jones, MD,MSc, Salt Lake City, Utah (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1. Describe potential roles for NLP for research and quality improvement 2. List some of the challenges of using NLP on clinical notes 3. Map the appropriate processing technique to a radiology information extraction problem Natural language processing (NLP) is a potentially powerful tool for extracting meaning from radiology reports. What you may not realize is the complexity involved in going on an NLP journey. This panel will provide a practical look at NLP for radiology by stepping through a real quality improvement project using NLP and comparing and contrasting the main methodologies being used in radiology today.

Deep Learning in MRI

Participants
Fang Liu, PhD, Boston, Massachusetts (*Presenter*) Nothing to Disclose
Matthew Rosen, PhD, Charlestown, Massachusetts (*Presenter*) Founder, HyperfineStockholder, HyperfineConsultant, HyperfineFounder, Vizma Life SciencesStockholder, Vizma Life SciencesConsultant, Vizma Life SciencesFounder, Intact Data ServicesStockholder, Intact Data ServicesConsultant, Intact Data ServicesFounder,
Greg Zaharchuk, MD, PhD, Stanford, California (*Presenter*) Research Grant, General Electric Company;Research Grant, Bayer AG;Stockholder, Subtle Medical, Inc;Advisory Board, Biogen Idec Inc
Li Feng, PhD, New York, New York (*Presenter*) Research support, Hyperfine Research, IncResearch collaboration, Hyperfine Research, Inc

LEARNING OBJECTIVES

1)Explain the basic principles of Deep Learning (DL) in MR image acquisition, reconstruction, and analysis. 2)Describe the principles and practical significance of several advanced DL clinical applications in MRI. 3) Recognize the limitations, challenges, and promises associated with DL in MRI. In this session, we will cover principles and basics that serve as the theoretical foundation of deep learning, and provide examples of how deep learning improves MRI for image acquisition, reconstruction, and analysis from both a technical and clinical point of view. Our speakers will give lectures for an overview of the emerging deep learning techniques applied in challenging MRI applications, including quantitative MRI, low field MRI, image transformation, and disease prediction using MRI. Learners are expected to recognize the important aspects of deep learning in MRI research and clinical practice, learn how to apply basic and advanced deep learning techniques to accelerate MRI acquisition, enhance image analysis, automate clinical workflows, and predict outcomes and prognosis.

Essentials in Head and Neck Radiology: Anatomy, Search Patterns, and Structured Reports

Participants

Matthew S. Parsons, MD, Saint Louis, Missouri (*Presenter*) Nothing to Disclose
Tanya Rath, MD, Scottsdale, Arizona (*Presenter*) Nothing to Disclose
Harprit Bedi, MD, Wellesley, Massachusetts (*Presenter*) Nothing to Disclose
Paul Bunch, MD, Winston Salem, North Carolina (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1.Review relevant imaging anatomy of the brachial plexus, paranasal sinuses, neck, and temporal bone2.Reveal key search patterns which aid in the interpretation of brachial plexus, paranasal sinuses, neck, and temporal bone examinations3.Promote the use of structured reports for these examinations as a manner to provide added value to ordering providers In the field of head and neck radiology, the evaluation of structures such as the brachial plexus, paranasal sinuses, and temporal bone can be challenging for the practicing radiologist. Through a series of didactic lectures, this essentials course will review relevant anatomy and reveal search patterns fundamental to the interpretation of these studies. Lecturers will also specify examples of structured reports that can provide added value to ordering providers.

Hands-on Course: 3D Printed Anatomic Models (Sponsored by the RSNA 3D Printing Special Interest Group)

Participants
Nicole Wake, PhD, Bronx, New York (*Presenter*) Employee, General Electric Company
Peter Liacouras, PhD, North Potomac, Maryland (*Presenter*) Nothing to Disclose
Amy Alexander, MS, Rochester, Minnesota (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1. Explain the workflow to create patient-specific 3D printed anatomical models from volumetric medical imaging data.2. Identify and apply image segmentation techniques used to create 3D printed anatomical models, including thresholding, region growing, and manual editing. 3. Describe and apply image post-processing techniques and 3D design principles required to save models in appropriate file formats (e.g. STL). Three-dimensional (3D) printed anatomic models derived from volumetric medical imaging data can enhance pre-surgical planning, provide real-time intra-operative guidance, and facilitate both patient and trainee education. In order to generate patient-specific anatomic models for 3D printing, imaging data must first be segmented and converted to virtual 3D models which represent the intended anatomy of interest; and these models are saved in a format such as the standard tessellation language (STL) which are compatible with 3D printers. This course, sponsored by the RSNA 3D Printing Special Interest Group, covers the use of industry-standard FDA-cleared software for the design and fabrication of patient-specific 3D anatomic models. Specifically, this course will explore image segmentation and image post-processing techniques to create patient-specific anatomic models for use in clinical practice.

LEARNING OBJECTIVES

1.Appreciate the motivation and collaborations in the establishment of MIDRC.2.Understand the methods for creating, de-identifying, curating, and transferring imaging data from clinical sites to the public commons.3.Attain a realistic appreciation of the process for clinical sites to contribute to MIDRC.4.Obtain exposure to the various research developments and applications involving machine intelligence and natural language processing by MIDRC investigators. This course will include presentations from five MIDRC investigators who will clarify the motivation behind the establishment of MIDRC in addressing the COVID-19 pandemic. They will give overviews of the work of over 80 investigators involved in developing the infrastructure of MIDRC and in conducting research in machine intelligence and natural language processing. Speakers will also describe the methods for creating, de-identifying, curating, harmonizing, and transferring imaging data from clinical sites to the public commons, and demystify the process for clinical sites to contribute to MIDRC.

Pelvic Pain: Non Pregnancy-related

Participants
Phyllis Glanc, MD, Toronto, Ontario (*Presenter*) Nothing to Disclose
Mary C. Frates, MD, Sharon, Massachusetts (*Presenter*) Nothing to Disclose
Gayatri Joshi, MD, Atlanta, Georgia (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1. Familiarize the learner with the sonographic appearance of common sources of gynecological and non-gynecological pelvic pain.
2. Improve the learners diagnostic acumen and ability to provide an appropriate differential for common and relatively uncommon sources of gynecological .3. Enhance the knowledge required to recommend appropriate imaging pathways for pelvic pain. This course will be divided into 3 segments with ample time for Q&A. The initial section will focus on ovarian causes of pelvic pain. At the end of this section, the learner will be able to describe the sonographic appearances of ovarian torsion, tubo-ovarian abscess, hemorrhagic cysts and other pathology of the ovary, and will be able to use US to help differentiate ovarian causes of pelvic pain.The second session will focus on non-ovarian gynecological sources of pelvic pain. At the end of this session the learner will be able to evaluate and diagnosis ectopic pregnancies, sequalae of deep infiltrating endometriosis and adenomyosis, IUD placement, in addition to other less common sources of gynecological pain.The last session will focus on non-gynecological causes of pelvic pain. At the end of this section the learner will be able to identify and diagnosis entities including but not limited to acute appendicitis, appendiceal mucocele, inflammatory bowel pathology and distal ureter or UJV calculi.

Participants
Nancy Kim, MD, Washington, Dist. of Columbia (*Presenter*) Nothing to Disclose
Scott Young, MD, Phoenix, Arizona (*Presenter*) Nothing to Disclose
Hye-Chun Hur, MD, MPH, Scarsdale, New York (*Presenter*) Author with royalties, Wolters Kluwer nv

LEARNING OBJECTIVES

1) Improve awareness about endometriosis to radiologists. 2) Recognize the US and MR appearance of endometriosis. 3) Optimize systematic reporting of endometriosis findings (structured reporting) to help our gynecology colleagues manage endometriosis. Endometriosis is a common cause of chronic pelvic pain and infertility in women of reproductive age. Imaging findings of endometriosis can be hiding in plain site on routine pelvic imaging. This course will be a lecture series with a short Q&A session going over US and MR appearances of endometriosis as well as discussing ways to help our gynecology colleagues with management of endometriosis. After this course, the attendee should be able to identify US and MR imaging features of endometriosis and consider structured reporting to help our gynecology colleagues.

Brandon Key, MD, Milwaukee, Wisconsin (*Presenter*) Consultant, Siemens

LEARNING OBJECTIVES

1) Identify new technologies for the treatment of musculoskeletal pathology that can be applied in daily practice. 2) Consider new safety measures to implement during treatment of musculoskeletal pathology. 3) Identify triage options for the different IR treatments used for musculoskeletal pathology. This didactic educational session focuses on the emerging Interventional Oncology treatment options for musculoskeletal tumors. Clinical approach will be discussed to help guide pre-procedure triage of patient care. Technical and safety factors will be reviewed using case examples. New and exciting applications will include microwave ablation in the spine, screw fixation, and the application of digital technologies. The session is designed to stimulate MSK IO experts and also encourage those who are interested to explore this bludgeoning niche.

Arthritis: When is it NOT Osteoarthritis

Participants

Carl S. Winalski, MD, Rocky River, Ohio (*Presenter*) Institutional service agreement, PAREXEL International Corporation;Institutional service agreement, CartiHeal Ltd;Research Consultant, Siemens AG;Stockholder, Pfizer Inc;;;;;;;;
Monique Reijnierse, MD, Leiden, Netherlands (*Presenter*) Research Consultant, ASAS Group, LLC
Donald Flemming, MD, Hershey, Pennsylvania (*Presenter*) Nothing to Disclose
Anne Cotten, MD, Lille, France (*Presenter*) Nothing to Disclose
Nele Herregods, MD, PhD, Lierde, Belgium (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1.Recognize pediatric-specific imaging characteristics of the most commonly involved joints in JIA 2.Describe the radiologic features of rapid idiopathic arthritis (RIA)3.Differentiate osteoarthritis from psoriatic arthritis and pseudolesions4.Characterize vertebral bony outgrowths based on origin and growth direction5.Differentiate hemochromatosis related arthropathy The specific diagnosis of an arthropathy is often challenging because the imaging presentation of these entities may overlap with each other. It is important for radiologists to recognize features and clues that support one diagnosis over another. The purpose of this course's lectures is to improve participant understanding of the imaging features of arthritis and increase confidence in their diagnosis.

Innovating Education During the COVID-19 Pandemic

Participants

Priscilla Slanetz, MD,MPH, Boston, Massachusetts (*Presenter*) Nothing to Disclose
Lilja Solnes, MD, Baltimore, Maryland (*Presenter*) Consultant, Lantheus Holdings;Research funded, Novartis AG;Research funded, Precision Molecular Imaging;Royalties, Reed Elsevier
Omer Awan, MD, Lutherville Timonium, Maryland (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

By the end of this session, participants will:1. Become familiar with several educational innovations implemented during the COVID-19 pandemic;2. Be able to identify educational obstacles with and solutions while transitioning back to a new normal of trainee education; and3. Understand the lasting impact of the pandemic on workplace culture and trainee education The COVID-19 pandemic led to substantial immediate change with regard to trainee education. In spring 2019, training programs rapidly adapted to a virtual learning environment. In addition to converting to remote case readouts and online education, several national organizations and resident-driven educational initiatives helped to meet the ongoing educational needs of trainees, especially for those at smaller programs. Now as we emerge from the pandemic, training programs are establishing a new normal which presents some unique challenges and opportunities. Finally, as we reflect back on the pandemic, there are some positive lasting changes including a renewed focus on wellness, greater inter-institutional collaborations, incorporation of new curricular topics related to health equity and crisis management, and new virtual faculty development programs designed to both enhance trainee education and advance the careers of early and mid-career faculty. The format of this session will be lecture based. By the end of the session, participants will leave with an awareness of new approaches to teaching the next generation of radiologists.

The Impact of Radiology Extenders

Participants

Saurabh Jha, MD, Philadelphia, Pennsylvania (*Presenter*) Nothing to Disclose
Ruth C. Carlos, MD, MS, Ann Arbor, Michigan (*Presenter*) In-kind support, Reed Elsevier;Editor, Reed Elsevier;Travel support, General Electric Company
Taj Kattapuram, MD, Arvada, Colorado (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1. Understand the economic and logistic arguments in favor of skill mix.2. Appreciate the arguments against non-physicians rendering radiology reports.3. Speculate on how the future of the field should influence the the type and quantity of labor. Physician extenders in radiology are controversial. Proponents contend that by absorbing cognitively simple work they allow radiologists to practice at the top of their license. Opponents fear that extenders are a slippery slope to devaluing of the field. The two points of view will be debated. The audience will appreciate the nuances of both sides of the argument

Data Sharing and Patient Privacy in the World of AI

Participants

Fred W. Prior, PhD, Little Rock, Arkansas (*Presenter*) Nothing to Disclose
John B. Freymann, BS, Rockville, Maryland (*Presenter*) Nothing to Disclose
Alistair Johnson, DPhil, Cambridge, Massachusetts (*Presenter*) Nothing to Disclose
Matthew P. Lungren, MD, Palo Alto, California (*Presenter*) Advisor, Segmed, Inc;Shareholder, Segmed, Inc;Advisor, Bunkerhill Health;Shareholder, Bunkerhill Health;Advisor, Microsoft Corporation;Employee, Amazon Web Services
Avishek Chatterjee, Maastricht, Netherlands (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1) Understand current HIPAA/GDPR policies and some of the challenges related to anonymization of medical images. 2) Identify the concepts of differential privacy and new privacy preserving initiatives.3) Discuss how radiomics and artificial intelligence (AI) analyses of medical images use anonymized open access data. The rapid growth of AI in medical imaging is heavily dependent on the availability of high-quality image data for testing and validation. Open access data sharing is critical to enable adequate sampling of the human population and the wide variety of disease states. It is equally critical to protect patient privacy and to comply with national and international regulations governing protected or sensitive health information and personally identifiable information. In the U.S. the HIPAA Privacy Rule establishes national standards to protect individuals' healthcare information. The General Data Protection Regulation (GDPR) acts similarly in the European Union. These two sets of regulations require images and other patient information to be de-identified, anonymized or pseudonymized depending on how the data will be used, but do so in significantly different ways. This course will explore these regulations as they relate to data sharing and discuss the challenges they pose. We will introduce the concepts of differential privacy and new privacy preserving initiatives particularly in relation to the use of images in AI applications. Finally, we will discuss how radiomics and machine learning, including deep learning, applications depend on anonymized, open access data and what alternatives there might be if such data sharing is not possible. The course will provide a blended learning experience by including a didactic component prior to a panel discussion.

LEARNING OBJECTIVES

1. Identify key imaging features of interstitial lung disease that lead to a useful categorization. 2. Describe the most recent Fleischner criteria for the diagnosis of Idiopathic pulmonary fibrosis. 3. Analyze the key imaging features of diffuse lung disease that lead to pulmonary fibrosis including: organizing pneumonia, idiopathic pulmonary fibrosis, acute interstitial pneumonia/ARDS, cigarette smoke related fibrosis and sarcoidosis. 4. Manage and contribute to a multi-disciplinary conference (MDD) that focuses on diffuse lung disease. The assessment of fibrotic diffuse lung injury is difficult and multidisciplinary diagnosis (MDD) is recommended for a more accurate diagnosis of the underlying disease. Radiologists are a key member of the MDD team. This session is designed to help the radiologist understand the strengths and weaknesses of the MDD. Ten cases of diffuse lung disease will be presented to 4 experienced chest radiologists. The complete DICOM set of images will be displayed to both the panelists and the participants. The panelists will describe the key features that support a diagnosis. The session will also allow the participants to gauge the degree of agreement between experienced chest radiologists. The Chief of Pulmonary Pathology at the Joint Pathology Center in Silver Spring will discuss the pathology in each case. The case review session will begin with short presentations providing a general approach to the imaging features of fibrotic lung disease, and explaining the current Fleischner criteria for idiopathic pulmonary fibrosis. The unknown cases can be viewed on your internet enabled phone, tablet or computer.

Anil Parwani, MD,PhD, Columbus, Ohio (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1.Understand Integrated Diagnostics and its role in filling clinical interspaces between specialties, particularly radiology and pathology.2.Appreciate contemporary Imaging Informatics and its central role in advancing and linking radiology and pathology practices.3.Be prepared to drive institutional programs in integrated diagnostics, building on imaging informatics cores in radiology and pathology. The term Integrated Diagnostics (ID) refers to a vision for the future where data from the entire diagnostic arsenal including imaging, pathology and molecular diagnostics, as well as clinical data from the Electronic Health Record (EHR), are aggregated and contextualized to enhance insights. Medical informatics, including Clinical Decision Support (CDS) tools, play a central role in the ID concept. By simply performing a myriad of diagnostic tests, radiology and pathology already play major, though often disconnected and relatively passive roles in medical diagnosis. The transition to discrete medical data, though challenging, has enabled the contemporary EHR. In the case of radiology and pathology, the digitization of medical image data now allows radiology and pathology to take common advantage of inexpensive digital archival and distribution systems to more efficiently link our data into the EHR, allowing us to more efficiently communicate our test results to referring physicians and patients. Digital image data also enables powerful Artificial Intelligence (AI) and Machine Learning (ML) techniques to improve the quality of our images and analyze them more efficiently and, possibly, more accurately. Incorporating these digital resources into an integrated Imaging Informatics environment now offers radiology and pathology the opportunity to not only better each others individual diagnostic processes by timely sharing of data and results, but, in combination, improve the overall diagnostic process. However, the current administrative and departmental separation of radiology and pathology restricts our ability to take common advantage of digital resources, limits intellectual interchange between the specialties, discourages coeducational opportunities, and contributes to the fragmented nature of health care. A robust Imaging Informatics organization and infrastructure, along with departmental reorganization and priority realignment could fill that gap, interspace, between the diagnostic giants of radiology and pathology. This course will present the basis of and need for more integrated diagnostics in general, but specifically between radiology and pathology. Real world experiences and practical steps towards this challenge will be discussed. Course content will include the Bayesian principles of diagnostics; contemporary medical informatics including CDS; medical applications of Artificial Intelligence (AI) and Machine Learning (ML) particularly as applied to medical image data; radiology and pathology workflow integration; and practice experience in ID. Session Format: Short didactic presentations; panel discussions; Q/A sessions with audience response; and Case based presentations.

Fundamental of Diffuse Lung Disease

Participants
Brett M. Elicker, MD, San Francisco, California (*Presenter*) Nothing to Disclose
David M. Naeger, MD, Denver, Colorado (*Presenter*) Nothing to Disclose
Joanna Escalon, MD, New York, New York (*Presenter*) Research Consultant, VinBrain (not relevant to the presentation)
Laura Heyneman, MD, Durham, North Carolina (*Presenter*) Author, RELX

LEARNING OBJECTIVES

1. List typical findings of diffuse lung disease on HRCT and their most common mimics2. Develop an approach to nodules, cysts, airspace opacity, and mosaic attenuation on HRCT3. Describe the role of high-resolution CT (HRCT) in the multi-disciplinary diagnosis of diffuse lung disease Fundamentals of diffuse lung disease will discuss typical findings of diffuse lung diseases on CT and their significance. The course will focus on pitfalls, differential diagnosis, and the role of HRCT in the multi-disciplinary approach.

Pearls and Pitfalls in Chest Radiography

Participants
Andetta R. Hunsaker, MD, Boston, Massachusetts (*Presenter*) Nothing to Disclose
H. Page McAdams, MD, Durham, North Carolina (*Presenter*) Consultant, MedQIA Imaging Core Laboratory Author, Reed ElsevierResearch Consultant, Novartis AGStockholder, Novartis AGStockholder, Abbott LaboratoriesStockholder, AbbVie IncStockholder, Bristol-Myers Squibb CompanyStockholder, CVS Health CorporationStoc
Gerald F. Abbott, MD, Boston, Massachusetts (*Presenter*) Nothing to Disclose
Mark S. Parker, MD, Richmond, Virginia (*Presenter*) Co-author, Thieme Medical Publishers, Inc

LEARNING OBJECTIVES

1) Show the value of a thorough search of both the frontal and lateral films in diagnosing lung malignancies which may otherwise be missed2) Identify key structures on the lateral chest film that will aid in diagnosis3) Review the many plain film findings in the wide differential diagnosis of pleural disease In this course we will show the value of plain film as the first line diagnostic tool in identifying lung and pleural malignancies. Thorough knowledge of the anatomy on Frontal and lateral chest radiographs is the basis of this course and will teach the attendees the large value in applying this knowledge to the timely diagnosis and management of incidental findings on these studies. This course is intended for anyone who is private practice, or in a specialty practice.

An Introduction for Radiologists to the Learning Healthcare System: Pragmatic Trials: Yes, We Can Randomize (Sponsored by the RSNA Research Development Committee)

Participants

Jeffrey (Jerry) Jarvik, MD,MPH, Seattle, Washington (*Presenter*) Royalties, Springer Publishing, LLC;Co-editor, Springer Publishing, LLC;Travel support, General Electric Company;Royalties, Wolters Kluwer nv;
Rebecca Smith-Bindman, MD, San Francisco, California (*Presenter*) Founder, Alara Imaging, Inc
Adrian Hernandez, MD, Durham, North Carolina (*Presenter*) Research Consultant, Amgen Inc;Research Consultant, AstraZeneca PLC;Research Consultant, Bayer AG;Research Consultant, Merck & Co, Inc;Research Consultant, Boston Scientific Corporation;Research Consultant, Bristol-Myers Squibb Company;Research Consultant, Cytogen Corporation;Research Consultant, Relypsa;Research Grant, Amgen Inc;Research Grant, AstraZeneca PLC;Research Grant, Bayer AG;Research Grant, American Regent;Research Grant, Merck & Co, Inc;Research Grant, Novartis AG;Research Grant, Verily Lifesciences LLC

LEARNING OBJECTIVES

1) To review approaches and challenges for embedding trials into routine clinical care. 2) To describe key aspects of a learning healthcare System that relate to Clinical Trials 3) To describe specific examples of embedded randomized clinical trials and review lessons learned As a group, radiologists have little exposure to learning healthcare systems (LHS). The goal of this course and a companion course is to educate radiologists about two important aspects of LHS: unique data/informatics issues and unique trial design issues. This course will focus on methods for conducting clinical trials as part of routine care as well as challenges and solutions of embedding of these trials within health care delivery systems. A companion course will focus on data issues confronted by radiologists who want to participate in LHS

Participants

Walter Wiggins, MD, PhD, Durham, North Carolina (*Presenter*) Nothing to Disclose
Kirti Magudia, MD,PhD, Durham, North Carolina (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

(1) Extract relevant data from radiology and pathology reports. (2) Understand how to manage and process image-based annotations. (3) Perform image registration and normalization. (4) Recognize features of data formats ideal for deep learning. This course will provide attendees with the essential tools to perform data processing and curation necessary for deep learning projects. Attendees will start with free text radiology and pathology reports as well as anonymized DICOM data and process data into a unified data file ready for deep learning applications.

Advanced Ultrasound Technology and Applications

Participants

Carl Herickhoff, PhD, Memphis, Tennessee (*Presenter*) Nothing to Disclose
Stephen McAleavey, PhD, Rochester, New York (*Presenter*) Research collaboration, Siemens AG;
Thaddeus Wilson, PhD, Memphis, Tennessee (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1) Explain the approach, capabilities, and limitations of conventional Doppler imaging techniques. 2) Present how new technologies are improving sensitivity and visualization of flow in smaller vessels (with high resolution and contrast) and how this could impact clinical practice. 3) Compare classic beam forming with software methods while looking at new transducer technology enabling these methods and look at what it all means for the sonographer/clinician To explore an in depth, look at advanced ultrasound technology and applications with the speakers hopefully offering a basis by which people new to the field will be able to understand the technologies being discussed, an update on current methods for current users and further offering a look at the direction these applications are taking in the future.

Case-based Review: Head and Neck Imaging

Participants
Greg Avey, MD, Madison, Wisconsin (*Presenter*) Research Consultant, General Electric Company
Caroline Robson, MBChB, Boston, Massachusetts (*Presenter*) Author with royalties, Reed Elsevier
Courtney Tomblinson, MD, Nashville, Tennessee (*Presenter*) Nothing to Disclose
Salman Qureshi, MBChB, Doha, Qatar (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1) Identify key imaging findings of both common and dont miss lesions in the head and neck. 2) Understand the evolving classification of tumors of the neck, temporal bone, and sinuses. 3) Review important imaging advances which enable improved diagnosis and care of patients with lesions in the head and neck. This case based review will examine the imaging appearance of common, important, and dont miss lesions of the paranasal sinuses and temporal bone as well as the adult and pediatric neck. Key differential diagnoses will be highlighted for each of these challenging areas, along with an emphasis on new and emerging tumor types and advanced / multimodality imaging findings. At the end of this course participants will have an increased understanding of how to diagnose and manage lesions of the paranasal sinuses, neck and temporal bone.

Lymphoma - Case-based Multidisciplinary Review

Participants
Sarah A. Johnson, MD, Toronto, Ontario (*Presenter*) Nothing to Disclose
Anca Prica, Toronto, Ontario (*Presenter*) Speaker, AstraZeneca PLC;Speaker, Kite Gilead
Chelsea Pinnix, MD,PhD, Houston, Texas (*Presenter*) Research Grant, Merck & Co, Inc;Speaker, Modernizing Medicine, Inc
Jillian Gunther, MD, PhD, Houston, Texas (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

Learning Objectives:At the conclusion of this course, the attendee should:- Have a high level of confidence in their assessment of key features in lymphoma staging.- Be more familiar with response assessment systems for lymphoma patients.- Become aware of clinically important aspects of Diagnostic Radiology reports for lymphoma patients. Course Description:Medical imaging plays a key role in lymphoma staging and response assessment. This course will focus on review of several lymphoma cases and their attendant key learning points. Supplemental information will be provided in lecture format by a multidisciplinary panel. Attendees are expected to gain an increased familiarity with important concepts in lymphoma staging and more detailed knowledge of formal response assessment.

Breast Oncodiagnostic Session

Participants

Anna Shapiro, MD, Syracuse, New York (*Presenter*) Nothing to Disclose
Bethany L. Niell, MD,PhD, Tampa, Florida (*Presenter*) Nothing to Disclose
Lisa Lai, MD, Syracuse, New York (*Presenter*) Nothing to Disclose
Abirami Sivapiragasam, MD, Jamesville, New York (*Presenter*) Advisor, Pfizer Inc;Advisor, Puma Biotechnology, Inc;Advisor, Immunomedics, Inc

LEARNING OBJECTIVES

1) Learn how to sequence multimodality imaging and interventions to provide specific diagnoses and map disease extent as well as assess responses to breast cancer therapies. 2) Describe the surgical options in the treatment of breast cancer. 3) Understand the principles of radiation therapy, including external and brachytherapy and various treatment fractionation and dose schedules. 4) Review new techniques to reduce dose to normal tissue and novel radiation therapy modalities. 5) Describe the role of systemic therapy and tools used to individualize treatment in breast cancer. Participants will obtain a better understanding of the pros and cons of neoadjuvant and adjuvant systemic therapies based on breast cancer subtypes. This course provides essential knowledge of most current therapeutic approaches in breast cancer care in case-based format. A comprehensive review of current diagnostic, surgical, radiation and medical oncologic management for breast cancer is included.

Chi Wan Koo, MD, Rochester, Minnesota (*Presenter*) Nothing to Disclose
Kimberly Kallianos, MD, San Rafael, California (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1. Understand the role of HRCT imaging in early detection, quantification, and management of pediatric and adult patients with interstitial lung disease2. Review characteristic HRCT imaging findings of specific common interstitial lung diseases3. Recognize pearls and pitfalls of HRCT imaging in children and adults Clinically relevant interpretation of HRCT requires knowledge of the clinical and imaging aspects of interstitial lung disease. This course aims to provide the practicing radiologist with greater understanding of the clinical role of high resolution CT. Discussion topics will include the imaging implications of new drug treatments in ILD, imaging aspects of immune related diseases, clinical importance of early interstitial lung abnormality, features of interstitial lung disease in children, use of machine learning in ILD and evolving aspects of drug induced ILD.

Oncologic Emergencies

Participants
Carolyn L. Wang, MD, Mercer Island, Washington (*Presenter*) Research Grant, General Electric Company
Sadia Qamar, MBBS, Toronto, Ontario (*Presenter*) Nothing to Disclose
Alexander Kessler, MD, Pittsford, New York (*Presenter*) Nothing to Disclose
Joseph Davis, MD, Durham, North Carolina (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1. Recognize common and uncommon oncologic emergencies involving the head, neck, cardiothoracic, abdomen and pelvis in adults and pediatric patient populations associated with the natural progression and/or recurrence of malignancy. 2.Recognize common and uncommon oncologic emergencies associated with various treatment options including chemotherapy, immunotherapy, surgery, and radiation.3.Review relevant radiological findings/patterns and imaging follow up for these oncologic emergencies that help guide treatment decisions for referring physicians. Oncology patients can develop acute emergencies that can be a de novo presentation, a complication related to the disease progression, recurrence or treatment. This session will focus on emergent conditions related to malignancy and their treatment, that the radiologist should know using a case-based format.

Case-based Review of Nuclear Medicine: PET/CT Workshop ? Prostate (In Conjunction with SNMMI)

Participants

Jonathan E. McConathy, MD, PhD, Birmingham, Alabama (*Presenter*) Research Consultant, Eli Lilly and Company;Research Grant, Eli Lilly and Company;Research Consultant, Blue Earth Diagnostics Ltd;Research Grant, Blue Earth Diagnostics Ltd;Research Consultant, General Electric Company;Research support, CytoSite Biopharma;Research Consultant, Canon Medical Systems Corporation;Research Consultant, ImaginAb, Inc;Spouse, Research Consultant, Baird Capital;Spouse, Research Grant, Navidea Biopharmaceuticals, Inc;Spouse, Research Grant, AbbVie Inc

Jeremie Calais, MD, Los Angeles, California (*Presenter*) Consultant, RadioMedix, IncConsultant, Blue Earth Diagnostics LtdConsultant, Lantheus HoldingsConsultant, Johnson & JohnsonConsultant, Curium SASConsultant, General Electric Company

LEARNING OBJECTIVES

1. Understand best clinical practices for use and interpretation of 18F-fluciclovine (Axumin) PET/CT for patients with prostate cancer. 2. Understand best clinical practices for use and interpretation of PSMA-targeted PET/CT for patients with prostate cancer. Novel PET/CT agents are revolutionizing the imaging and therapy of patients with prostate cancer. In this session, experts on 18F-fluciclovine (Axumin) and PSMA-targeted PET/CT will use clinical cases to demonstrate fundamentals of interpretation, as well as pearls and pitfalls to help improve interpretation of these studies.

Cardiac Imaging in Private Practice: Lessons Learned

Participants
Michael F. Morris, MD, Paradise Valley, Arizona (*Presenter*) Educator, Medtronic plc;
Richard L. Hallett II, MD, Carmel, Indiana (*Presenter*) Nothing to Disclose
Alastair Moore, MD, Dallas, Texas (*Presenter*) Speaker, Boehringer Ingelheim GmbH;Consultant, Boehringer Ingelheim GmbH

LEARNING OBJECTIVES

1) Identify unique benefits and challenges to creating, growing, and maintaining a cardiac imaging practice in private practice. 2) Identify emerging techniques in cardiac imaging that can be leveraged to improve patient care and/or service to referring clinicians. Cardiac imaging in private practice has evolved to encompass both bread-and-butter and newer, novel techniques in cardiac care. Course lectures will review the challenges, benefits, and opportunities involved in starting and growing a cardiac imaging practice. Specific attention to turf battles, reimbursement strategies, and training will be discussed. Time will be reserved for audience questions/participation. At course conclusion, participants should acquire deeper knowledge and practical information to improve their cardiac imaging practice.

GU Specific Diagnostic Classification Systems

Participants

Nicola Schieda, MD, Ottawa, Ontario (*Presenter*) Nothing to Disclose
Atul Shinagare, MD, Boston, Massachusetts (*Presenter*) Consultant, VirtualScopics, Inc;Consultant, Imaging Endpoints
Valeria Panebianco, MD, Rome, Italy (*Presenter*) Nothing to Disclose
Andrea Rockall, FRCR,MRCP, London, United Kingdom (*Presenter*) Speaker, Guerbet SA
Caroline Reinhold, MD, MSc, Westmount, Quebec (*Presenter*) Research Grant, Imagia Cybernetics Inc

LEARNING OBJECTIVES

1) Identify opportunities to improve clinical practice when implementing standardized reporting systems in the genitourinary system. 2) Recognize strengths and weaknesses of new GU based standardized reporting systems for kidney, bladder and ovary. 3) Explain current clinical applications of GU based standardized reporting and how artificial intelligence may change application in the future. In this 5 lecture course, learners will be introduced to new genitourinary standardized reporting systems for Bladder (VI-RADS), Kidney (Bosniak version 2019) and Ovary (O-RADS) applied to CT and MRI. Lectures will emphasize supporting evidence and strengths of diagnostic classification systems compared to unstructured reporting or other classification systems. Lectures will also focus on challenges and opportunities created by standardized reporting systems, how to integrate into a busy and modern clinical practice while maintaining or improving efficiency and how artificial intelligence may change reporting classification systems in the future.

Achille Mileto, MD, Rochester, Minnesota (*Presenter*) Research Grant, General Electric Company;Research support, Koninklijke Philips NV;

Jennifer Uyeda, MD, Lexington, Massachusetts (*Presenter*) Consultant, Allena Pharmaceuticals, Inc

LEARNING OBJECTIVES

Review basic concepts and diagnostic use of dual- and multi-energy CT techniques for the evaluation of the liver, pancreas, bowel, and other organs of the gastrointestinal tract.Describe specific ways to use dual- and multi-energy CT image reconstruction techniques to interrogate ambiguous densities, improve the conspicuity of lesions and contrast-enhancement, minimize artifacts, and improve diagnostic confidence.Summarize how to integrate dual- and multi-energy CT techniques into a busy clinical practice.Discuss the use of novel contrast agents with dual- and multi-energy CT. Dual- multi-energy CT techniques are increasingly being used to improve the CT evaluation of the gastrointestinal tract. This course will include five talks, followed by a question-and-answer session, to review the use of dual- and multi-energy CT techniques for abdominopelvic diagnoses. The latest concepts relevant to dual- and multi-energy CT applications will be reviewed, with focus on practical implementation for routine imaging, use in the emergency setting and oncologic imaging.

John Lichtenberger III, MD, Washington, Dist. of Columbia (*Presenter*) Nothing to Disclose
Myrna C. Godoy, MD, PhD, Houston, Texas (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1.Describe and differentiate the typical imaging manifestations of the various neuroendocrine malignancies.2.List key imaging findings that affect management and staging of mesothelioma and thymoma.3.Explain the role of imaging in guiding airway interventions and recognizing potential complications during the management of thoracic malignancies. This didactic session will focus on the important diagnostic imaging findings of and management implications for neuroendocrine malignancies, mesothelioma, thymoma, airway malignancies and other thoracic neoplasms less commonly encountered in clinical practice. After attending this session, the learner will be able to more accurately diagnosis these non-small cell thoracic malignancies and provide crucial imaging information which will impact patient care.

Practical Chest MRI

Participants

Lea Azour, MD, Mamaroneck, New York (*Presenter*) Nothing to Disclose
Christopher Francois, MD, Rochester, Minnesota (*Presenter*) Nothing to Disclose
Deepa Gopalan, MRCP, FRCR, Stockholm, Sweden (*Presenter*) Speakers Bureau, Bayer AG and Actelion
Yoshiharu Ohno, MD,PhD, Toyoake, Japan (*Presenter*) Research Grant, Canon Medical Systems Corporation;Research Grant, DAIICHI SANKYO Group

LEARNING OBJECTIVES

1) Identify opportunities to integrate chest MRI into clinical practice. 2) Describe current applications of chest MRI for evaluation of acute and chronic PE. 3) Highlight advancements in chest MRI for assessment of mediastinal masses and lung disorders. Practical Chest MRI will present a diverse cohort of experts synthesizing the value and clinical applicability of thoracic MRI! The session will explore MRI diagnosis and evaluation in three main compartments of thoracic pathology: thromboembolic disease, mediastinal lesions, and lung disorders. Presentations will be case-enriched, and include information on both exam acquisition and interpretation, facilitating attendee translation of updates into clinical practice.

Alda Tam, MD, Houston, Texas (*Presenter*) Consultant, Johnson & Johnson;Research Grant, Boston Scientific Corporation;Research Grant, Johnson & Johnson;Consultant, AstraZeneca PLC;Consultant, Endocare, Inc;

LEARNING OBJECTIVES

1) Provide update for current used treatment strategies for patients with hepatocellular carcinoma (HCC).2) Review developing treatment trends. Liver Cancer Interventions course will focus on current loco-regional therapy treatment options for patients with hepatocellular carcinoma and will review treatments in development.

Normal or Not? The Borderlands of Imaging Findings

Participants
Christian W. Pfirrmann, MD, MBA, Forch, Switzerland (*Presenter*) Nothing to Disclose
Russell C. Fritz, MD, Mill Valley, California (*Presenter*) Nothing to Disclose
Yulia Melenevsky, MD, Vestavia, Alabama (*Presenter*) Nothing to Disclose
Kathleen Emery, MD, Cincinnati, Ohio (*Presenter*) Nothing to Disclose
Marco Zanetti, MD, Baden, Switzerland (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1) To identify osseous variants on radiographs in correlation with cross-sectional imaging. 2) To learn to differentiate between normal developmental variants and true pathology in children and adolescents. 3) To know how to differentiate normal variants of the labrum and true lesions in the shoulder and hip joint. 4) To differentiate normal aging and asymptomatic findings from clinically relevant internal derangement of joints Normal variants and asymptomatic findings are very frequent and a major diagnostic challenge in imaging of the muskuloskelettal system. This course addresses the borderlands of imaging findings in a rapid-fire format. Relevance of findings are discussed and tips and tricks to differentiate for asymptomatic findings are presented.

Pulmonary Vascular Imaging: Current Issues

Participants

Stephanie Tan, MD, Brossard, Quebec (*Presenter*) Nothing to Disclose
Linda B. Haramati, MD, MS, New Rochelle, New York (*Presenter*) Nothing to Disclose
Seth J. Kligerman, MD, La Jolla, California (*Presenter*) Speakers Bureau, Boehringer Ingelheim GmbH;Author, RELX;Consultant, Riverain Technologies, LLC;Consultant, Bayer AG
Pamela Woodard, MD, Saint Louis, Missouri (*Presenter*) Nothing to Disclose
Mannudeep Kalra, MD, Lexington, Massachusetts (*Presenter*) Research Grant, Siemens AGResearch Grant, Riverain Technologies, LLCResearch Grant, Coreline Soft, Co Ltd

LEARNING OBJECTIVES

1. Explain the radiologists implications in overutilization, overdiagnosis and misdiagnosis related to pulmonary embolism.2. Describe the findings and expected complications of patients with pulmonary embolism in the setting of COVID-19.3. Assess the value of energy/spectral CT in the diagnosis and management of pulmonary embolism. Although radiologists play a crucial role in the diagnosis of pulmonary embolism, they may be unaware of the short- and long-term impacts of their interpretations, impacts which are non-negligible. Therefore, the subtle but important difference between overutilization, overdiagnosis and misdiagnosis in the context of pulmonary embolism are issues that will be discussed in this discussion session, laying out the latest data and sparking discussion about the concerns relevant to patients, clinicians and radiologists. Other hot topics in development which may affect current practice including pulmonary embolism in the setting of COVID and the value of dual energy/spectral CT will also be explored.

Review and Update on Blunt and Penetrating Abdominopelvic Trauma

Participants
James Lee, MD, Lexington, Kentucky (*Presenter*) Nothing to Disclose
Hei Shun Yu, MD, Boston, Massachusetts (*Presenter*) Nothing to Disclose
Felipe Munera, MD, Key Biscayne, Florida (*Presenter*) Nothing to Disclose
Christina LeBedis, MD, Newton, Massachusetts (*Presenter*) Nothing to Disclose
David Dreizin, MD, Baltimore, Maryland (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

Following this session on imaging blunt and penetrating abdominopelvic trauma, course participants will be able to: - Describe key findings that determine immediate operative, angiography or observation care pathways. - List the common imaging pitfalls encountered in the evaluation of abdominopelvic trauma. - Discuss current controversies and emerging frontiers in abdominopelvic trauma imaging. This course will be a lecture format review of imaging findings in blunt and penetrating abdominopelvic trauma. Discussion of finding that directly impact patient care pathways will be emphasized. Examples of pitfalls encountered in the evaluation of abdominopelvic trauma, controversies and emerging techniques in imaging will be discussed.

Hot Topics in Emergency Radiology

Participants
Krystal Archer-Arroyo, MD, Decatur, Georgia (*Presenter*) Nothing to Disclose
Constantine Raptis, MD, Saint Louis, Missouri (*Presenter*) Nothing to Disclose
Vincent M. Mellnick, MD, Saint Louis, Missouri (*Presenter*) Nothing to Disclose
Tarek N. Hanna, MD, Atlanta, Georgia (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

At the end of this session, participants will be able to:1. Summarize the fundamentals of dual energy and spectral computed tomography.2. Discuss the applications of multi-energy computed tomography in the trauma setting.3. Recognize potential drawbacks and artifacts of multi-energy computed tomography. This session will highlight some of the most current Hot Topics in Emergency Radiology, focusing on multi-energy CT, trauma CT protocols, and CT for esophageal emergencies.

Artificial Intelligence and Machine Learning in Emergency Radiology

Participants
Melissa Davis, MD, Atlanta, Georgia (*Presenter*) Nothing to Disclose
Robert Moreland, MD, Ottawa, Ontario (*Presenter*) Nothing to Disclose
Tim O'Connell, MD, Vancouver, British Columbia (*Presenter*) CEO, Emtelligent Software Ltd

LEARNING OBJECTIVES

1. Understand how new technologies in the field of machine learning and artificial intelligence align with Emergency Radiology Practice.2. Learn from implementations of artificial intelligence and machine learning in the Emergency Radiology setting.3. Explore the potential of new technologies within radiology. In this course we will learn about how artificial intelligence and machine learning tools can be implemented into the emergency radiology practice. This course will look at current and future applications as well as implementation needs for this particular setting. There will be three course lectures on this topic. Attendees should leave these lectures with an increased understanding of the potential tools in the market and how to leverage them in an emergent setting.

Imaging of Vascular Trauma: Optimize Imaging Techniques to Limit Imaging Time - How I Do It

Participants

Sameer Raniga, FRCR, MD, Muscat, Oman (*Presenter*) Nothing to Disclose
Avneesh Gupta, MD, Boston, Massachusetts (*Presenter*) Speaker, Philips Medical Systems
Jennifer Uyeda, MD, Lexington, Massachusetts (*Presenter*) Consultant, Allena Pharmaceuticals, Inc
Patrick Sutphin, MD,PhD, Boston, Massachusetts (*Presenter*) Stockholder, Gilead Sciences, Inc;Stockholder, Editas Medicine;Stockholder, CRISPR Therapeutics AG;Stockholder, Intellia Therapeutics;Stockholder, Pediatrix Medical Group;Stockholder, Amwell;Stockholder, Teladoc Health Inc.;Stockholder, Jazz Pharmaceuticals plc;Stockholder, ViewRay, Inc

LEARNING OBJECTIVES

After completing this course, the participants will be able to:1.Understand the MDCT technique optimization in assessing vascular trauma with special emphasis on optimizing protocols that limit the imaging time.2.How MDCT protocols impact the identification and characterization of different types of vascular injuries? Type: lecture-based. This session will provide an overview of evidence-based practice in imaging vascular trauma, emphasizing MDCT protocol optimization. We will discuss different MDCT technical parameters and protocols which limit the imaging time without compromising the image quality. We will focus on providing real-world clinical examples and cases illustrating the impact of MDCT protocols on the detection and characterization of vascular injuries. This session will be helpful for trainees, fellows, CT technologists, general and emergency radiologists dealing with vascular injury assessment in daily clinical practice.

Musculoskeletal Tumors: To Touch or Not to Touch?

Participants
Laura M. Fayad, MD, Baltimore, Maryland (*Presenter*) Nothing to Disclose
Mark D. Murphey, MD, Silver Spring, Maryland (*Presenter*) Nothing to Disclose
Behrang Amini, MD, PhD, Houston, Texas (*Presenter*) Nothing to Disclose
Connie Y. Chang, MD, Boston, Massachusetts (*Presenter*) Nothing to Disclose
Mark J. Kransdorf, MD, Scottsdale, Arizona (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

Learning objectives1) To review the imaging appearance of common benign musculoskeletal lesions in children and adults2) To identify imaging strategies for confidently diagnosing lesions that are benign or probably benign 3) To emphasize lesional features that suggest a potentially malignant nature DescriptionIn this educational course, we will review salient benign musculoskeletal lesions that are commonly encountered in clinical practice, in both pediatric and adult populations. Given that patients with benign musculoskeletal lesions present to clinics 100 times more frequently than those with malignant lesions, it is important for radiologists to recognize clearly benign entities and avoid a referral for biopsy. Through five lectures from experienced musculoskeletal radiologists, examples and strategies will be presented that help the radiologist arrive at the decision "to touch" or "not to touch" a lesion.

LEARNING OBJECTIVES

Understand strategies to better manage and prepare for the financial impact of pandemicsUnderstand operational changes to best equip radiology departments to manage a pandemicUnderstand radiology department culture and its effect on the pandemic response This course will consist of 3 lectures by radiology leaders who have actively led their departments through the COVID-19 pandemic. The course will cover the impact of COVID-19 on radiology practices from financial, operational and leadership perspectives, steps taken to manage the issues faced and potential approaches to manage future pandemics. This course will help radiologists and radiology leaders mitigate the adversity faced from future pandemics and better lead their departments through the associated hardship.

Multi-organ Assessment Local Treatment Response

Participants
Priyanka Jha, MBBS, San Francisco, California (*Presenter*) Nothing to Disclose
Mishal Mendiratta-Lala, MD, Ann Arbor, Michigan (*Presenter*) Nothing to Disclose
Aradhana Venkatesan, MD, Houston, Texas (*Presenter*) Research Grant, Siemens AG
Gaurav Khatri, MD, Dallas, Texas (*Presenter*) Nothing to Disclose
Stuart Silverman, MD, Boston, Massachusetts (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1. Review the standard imaging modalities for local therapy and post-treatment follow-up for hepatocellular carcinoma, renal, cervix and rectal cancers. 2. Develop a systematic approach to identify the expected imaging appearance and complications resultant from local therapy.3. Identify features of recurrence and differentiation from post treatment fibrosis. This lecture series will present local therapy options and standard imaging techniques for hepatocellular carcinoma, renal, cervix and rectal cancers. Imaging utilization during pre-therapy planning, immediate and late post-therapy evaluation will be reviewed. Following the session, the attendee should be knowledgeable in identifying key imaging-based planning assessment, identify complications and recurrence of cancer post therapy. Updated society guidelines for imaging of each of the above entities will be reviewed.

The Science and Practice of Image-Based Screening: Radiologist Educational and Leadership Opportunities

Participants

Hannah Milch, MD, Santa Monica, California (*Presenter*) Nothing to Disclose
Linda B. Haramati, MD, MS, New Rochelle, New York (*Presenter*) Nothing to Disclose
Edward F. Patz JR, MD, Durham, North Carolina (*Presenter*) Institutional research agreement, Laboratory Corporation of America Holdings;Founder, Grid Therapeutics, LLC;Advisory Board, AstraZeneca PLC;
Jonathan G. Goldin, MBChB, PhD, Santa Monica, California (*Presenter*) Founder, MedQIA Imaging Core Laboratory
Nogah Haramati, MD, Bronx, New York (*Presenter*) Nothing to Disclose
John Pellerito, MD, Syosset, New York (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1. Understand key screening concepts (goals, risks, biases) and the importance and limitations of the randomized controlled trials that drive screening recommendations. 2. Appreciate the growth of image-based screening practices over the past 50 years and the key evidence behind screening recommendations, with a particular focus on the following cancers and other diseases: osteoporosis, thyroid cancer, abdominal aortic aneurysms, breast cancer, and lung cancer.3. Describe challenges and recent advances affecting image-based screening - ie screening special populations, application of artificial intelligence and opportunities for radiologists to have a lead role in this field and improve patient care. Screening is a critical component of preventive care medicine. Radiologists are at the center of image-based screening, and yet have minimal training on the basic epidemiology and the evidence that drives current recommendations. Perhaps as a consequence, radiologists do not have a prominent role in the decision-making with respect to screening guidelines, on either a public health or an individual scale. For example, no radiologists serve as members of the United States Preventive Services Task Force (USPSTF), the leading organization that establishes national screening guidelines in the United States. Instead, the task force is made up of other clinicians with expertise in screening who lack expertise in imaging. This course is designed to review key epidemiological concepts and evidence with an eye towards enhanced educational and leadership opportunities for radiologists. This refresher course includes a series of short lectures from experts across the country in image-based screening.

RSNA/ESR Symposium: Practical Stroke Imaging and Mimics

Participants
Jean-Pierre Pruvo, MD, PhD, Lille, France (*Presenter*) Nothing to Disclose
Achala Vagal, MD, Cincinnati, Ohio (*Presenter*) Departmental Research Grant, Johnson & Johnson
Didier Leys, Lille, France (*Presenter*) Nothing to Disclose
Lotfi Hacein-Bey, MD, Sacramento, California (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1) To learn about definitions and clinical challenges of stroke mimics and chameleons. 2)To become familiar with the imaging signs and differential diagnosis of stroke mimics. 3)To learn about optimal patient triage in acute ischemic stroke in early and delayed time windows and for wake up strokes. This will be a case based discussion on stroke mimics and chameleons and also a practical review on using imaging in triage in early and late windows.

Partnering with Clinical Colleagues on a Point of Care Ultrasound Program

Participants
Summer Kaplan, MD, MS, Philadelphia, Pennsylvania (*Presenter*) Nothing to Disclose
Brenda Boardwine, RT, Durham, North Carolina (*Presenter*) Nothing to Disclose
Nilam Soni, MD,MS, San Antonio, Texas (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1. Define point of care ultrasound and how it differs from traditional radiology ultrasound. 2. Describe training, professional standards, informatics, and billing infrastructure needs in point of care ultrasound practice 3. Discuss how collaboration and integration of point of care ultrasound into imaging IT improves patient care. This informatics course offers an interactive panel highlighting pearls and pitfalls in radiology collaboration with clinical colleagues practicing point of care ultrasound (POCUS). Our speakers include Dr. Nilam Soni, an adult hospitalist and expert in POCUS, Ms. Brenda Boardwine, an imaging IT strategist overseeing POCUS integration, and Dr. Summer Kaplan, a pediatric radiologist with experience in radiology-POCUS collaboration and data mining. Short talks by these experts will highlight how informatics helps strengthen collaboration between radiologists and POCUS clinicians. Attendees will learn common informatics needs from the perspective of three different health systems and will understand how and why radiology practices can support POCUS programs at their home institutions.

Patient Voice: The Power of Patient Engagement on Education and Service Development (Sponsored by the Associated Sciences Consortium)

Participants
Charlotte Beardmore, MBA, London, United Kingdom (*Presenter*) Nothing to Disclose
Brandy Willis, MBA,RT, Houston, Texas (*Presenter*) Nothing to Disclose
Janice St. John-Matthews, BSC,MSc, Leeds, United Kingdom (*Presenter*) Nothing to Disclose
Laura Vasquez, PhD, ARRT, Chicago, Illinois (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1) Identify why service user engagement is important in radiology technologists/radiographers education 2)Show how service users can support training and work with imaging service professionals to deliver positive change for patients offering US and UK perspectives. 3)Describe approaches to supporting patient engagement across education and within service improvement.4)Assess barriers to optimal contributions. 5)Identify learning strategies to engage interprofessional stakeholders for role optimization. 6)Apply academic and practice partnerships to maximize opportunities. This session considers the role of service users (clients/patients) and careers in the design of and delivery of health professions education programmes specifically outlining how service users (clients/patients) and careers are embedded in radiology technologist/ radiographers programmes of study. The speakers will offer a range of takeaway toolkits to help support this important work. Patients are at the heart of practice and therefore attendance at this session is encouraged.

Innovations in MRI

Participants

Matthew Bernstein, PhD, Rochester, Minnesota (*Presenter*) Receive pension payments, GE
Yunhong Shu, PhD, Rochester, Minnesota (*Presenter*) Patent agreement, General Electric Company
Florian Knoll, New York, New York (*Presenter*) Advisor, Subtle Medical, Inc;Stockholder, Subtle Medical, Inc
Kawin Setsompop, Stanford, California (*Presenter*) Research Grant, Siemens AG;Royalties, General Electric Company;Royalties, Koninklijke Philips NV;Scientific Advisory Board, KinetiCor, Inc;Scientific Advisory Board, Subtle Medical, Inc

LEARNING OBJECTIVES

1) Identify recent strategies to accelerate MRI acquisitions. 2) Explain uses of AI and machine learning in MRI beyond diagnosis, such as for image reconstruction. 3) Identify novel MR systems including those that are portable or easier to site, or have high-performance gradients. The course "Innovations in MR" will provide three lectures on emerging topics that are having increasing impact on clinical practice. The presentation on Fast MRI explains recent advances in accelerated acquisition methods. The presentation on AI and Machine Learning focuses on applications beyond diagnostic interpretation, such as image reconstruction. Finally, New Directions MR Scanners focuses on recent innovations including portable or easy-to-site systems, as well as high-performance systems to further accelerate MRI acquisitions.

Deep Learning Lab: YOLO: Bounding Box Segmentation & Classification

Participants

Pouria Rouzrokh, MD,MPH, Rochester, Minnesota (*Presenter*) Nothing to Disclose
Bradley Erickson, MD, PhD, Rochester, Minnesota (*Presenter*) Board of Directors, VoiceIt Technologies, LLC;Stockholder, VoiceIt Technologies, LLC;Board of Directors, FlowSigma, Inc;Officer, FlowSigma, Inc;Stockholder, FlowSigma, Inc;Officer, Yunu, Inc;Stockholder, Yunu Inc

LEARNING OBJECTIVES

1. Define object detection deep learning models, their scope, and applications in medical imaging.
2. Introduce the object detection model You Look Only Once (YOLO) and explain about its general underlying principles, different versions, and recent advancements.
3. Using a public dataset of brain CT scans including different hemorrhage types, Demonstrate how to train a PyTorch implementation of YOLO v5 on custom medical imaging datasets, apply it on unseen images, and interpret the inference results. Deep learning is attracting more and more attention in all medical fields, especially medical imaging. Nowadays we have access to many valid and reliable deep learning models that can help radiologists in detecting pathologies, differentiating benign and malignant masses, segmenting organs, or even enhancing the quality of different imaging modalities. This course aims to further improve the toolbox diversity of those interested in applying deep learning to medical imaging by introducing an easy way to train and apply object detection deep learning models. These models are used to detect objects of interest in given images and put bounding boxes around them . We will start our course by a brief review of the field of object detection and then proceed to introduce You Look Only Once (YOLO), version 5, that is probably the most recognized and easy to use object detection model. This training is hands-on, and you will spend most of the course coding on Google Colab notebooks, so at least basic familiarity with Python and deep learning models (preferentially with PyTorch) are recommended. Also, please have your Gmail account set up and ready to use!

ASRT@RSNA: Technologist Story Telling Panel: An Experimental Learning Tool for Mental Health Education and Practice for Medical Radiation Technologists

Participants

Jennifer Carey, RT, Moncton, New Brunswick (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1. Provide general overview of the awareness of mental health among Canadian MRTs and the impact of mental health struggles on practice and wellbeing2. Provide a background on experiential learning philosophy for adult learners3. Demonstrate the use and impact of a MRT storytelling panel as a learning tool4. Provide an outline and considerations for hosting a MRT storytelling panel Recognition for Medical Radiation Technologist (MRT) education opportunities that focus on caring aspects of the profession is growing. While technology continues to dominate continuing education, opportunities for exploring technologists mental health are often overlooked. A recent national Canadian survey examining the mental health of MRTs in Canada found 57% feel moderate to high levels of emotional exhaustion at work.Experiential learning philosophy incorporates relational learning and storytelling. These elements enhance the learning experience of sensitive subject matter, like mental wellness. To address the gap in mental health promotion among MRT, a storytelling panel was developed where participants shared the impact of mental health struggles on their lives and practice. This crafted mechanism for sharing provided a unique opportunity for storytellers and learners. This session will discuss the background, development process and impact of a Technologist Storytelling Panel on Mental Health.

LEARNING OBJECTIVES

1) Review multiple head & neck cancer cases with radiologist, radiation oncologist and other specialties, highlighting radiology value added. This will be an interesting case session. The participants will be comprised of a head and neck radiologist, radiation oncologist, medical oncologist and surgeon. The intented goal of this session is to introduce the audience to a multidisciplinary tumor board and highlight the importance of imaging in staging, treatment and management.

ASRT@RSNA: How CT Protocols Affect Technologist Repeat Rates, Throughput, and Image Quality

Participants

Timothy Szczykutowicz, PhD, Madison, Wisconsin (*Presenter*) Consultant, AiDoc Medical Ltd;Consultant, Flowhow.ai;Consultant, medInt Holdings, LLC;Consultant, Alara, Inc;Consultant, AstoCT, Inc;Research Grant, General Electric Company;Research Grant, Canon Medical USA

LEARNING OBJECTIVES

1) Learn the factors motivating CT scans to be repeated 2) Understand the negative departmental and workflow issues arising from poor CT protocols 3) Obtain guidance on how to develop robust CT protocols as a physician/technologist/physicist team which will free technologists to focus on the patient at scan time, not CT scan parameters Repeated imaging is a source of: wasted time, wasted contrast agent, extra patient radiation exposure, and unpredictable exam scheduling. This course reviews what causes repeated imaging in CT, describes current methods to monitor and track repeated imaging, and offers solutions for sites wishing to decrease repeated imaging at their institutions. It is a lecture format. Attendees should walk away from this course understanding what repeats in CT are caused by, how often they happen, and how to reduce them at their own site.

Addressing Organizational Bias, Opportunity for Allyship, and Inclusive Leadership

Participants
Miriam A. Bredella, MD, Boston, Massachusetts (*Presenter*) Nothing to Disclose
Carolyn Meltzer, MD, Los Angeles, California (*Presenter*) Nothing to Disclose
Alexander M. Norbash, MD, San Diego, California (*Presenter*) Scientific Advisor, Penumbra, IncScientific Advisor, Stryker CorporationStockholder, Boston Imaging Core Lab, LLCResearch Grant, Canon Inc.
Cheri Canon, MD, Birmingham, Alabama (*Presenter*) Royalties, The McGraw-Hill Companies

LEARNING OBJECTIVES

1) Understand bias and how to counter it in yourself and others2) Develop a culture of inclusivity and belonging3) Identify strategies to increase diversity in radiology. A diverse biomedical workforce is essential for excellence in patient care. The physician workforce in radiology is predominately male and white. This interactive Hot Topic session will address conscious and unconscious biases, identify strategies to create a culture of inclusion with the goal to increase diversity and belonging in radiology.

Humanism in Radiology: Combatting Burnout and Robots (Sponsored by the RSNA Public Information Committee)

Participants
Susan John, MD, Houston, Texas (*Presenter*) Nothing to Disclose
Keith Herr, MD, Atlanta, Georgia (*Presenter*) Nothing to Disclose
Nicole Restauri, MD, Denver, Colorado (*Presenter*) Nothing to Disclose
Bettina Siewert, MD, Brookline, Massachusetts (*Presenter*) Editor, Wolters Kluwer nv;Reviewer, Wolters Kluwer nv;

LEARNING OBJECTIVES

1)Employ strategies in the workplace that foster caring and collaborative professionalism.2)Explore the healing power of narrative to combat burnout.3)Understand connection as an integral element of meaningful work Medical literature and lay news media have portrayed the growing challenges of burnout among physicians, including radiologists. Reports of impending displacement of radiologists by advanced computers and machine learning have added to stress in our specialty and may be discouraging medical students from pursuing diagnostic radiology as a career. Loss of autonomy, isolation, and dehumanization are important contributors to the burnout epidemic, and loss of professional identity and diminished engagement in patient care give credence to the rumors of radiologys demise. Creation of a more humanistic culture in radiology is one way to avert the crisis.Strategies to increase humanism in radiology involve finding ways to increase empathy, foster connectedness, and restore meaning in the workplace. This course will present methods that have been shown to improve radiologist engagement and joy in the work. The use of narrative to share experiences, developing gratitude practices, and developing a focus on personal and organizational values and fulfilling work tasks will be presented as methods to mitigate burnout and demonstrate value in radiology.

Practical Multi-Energy CT In Routine Clinical Practice

Participants

Savvas Nicolaou, MD, Vancouver, British Columbia (*Presenter*) Institutional research agreement, Siemens AG;Stockholder, Canada Diagnostic Centres

Jeremy Wortman, MD, Burlington, Massachusetts (*Presenter*) Consultant, United Imaging Healthcare Technology Group

Krystal Archer-Arroyo, MD, Decatur, Georgia (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1) Gain a practical approach to the interpretation of dual-energy CT2) Identify the advantages of multi-energy CT vs. conventional CT3) Explain how to optimize and maximize workflow and efficiency in interpreting dual-energy CT exams4) Discuss the different dual-energy application classes (eg. material decomposition, monoenergetic imaging)5) Work through practical cases illustrating the clinical value of dual-energy CT This session will cover the basics of spectral/dual-energy CT, the clinical value and common pitfalls of multi-energy CT in comparison to conventional CT, workflow considerations and optimization for a clinical practice, and applications of multi-energy CT with practical cases illustrating non-traumatic and traumatic applications.

Artificial Intelligence and Machine Learning in Oncologic Imaging

Participants

Walter Wiggins, MD, PhD, Durham, North Carolina (*Presenter*) Nothing to Disclose
Judy Gichoya, MBChB,MS, Atlanta, Georgia (*Presenter*) Consultant, Cook Group Incorporated;Advisor, Boston Scientific Corporation
Guido Davidzon, MD, Stanford, California (*Presenter*) Nothing to Disclose
Nina E. Kottler, MD, MS, San Diego, California (*Presenter*) Partner, Radiology Partners;Stockholder, Radiology Partners;Stockholder, Aidoc Medical;Stockholder, Rad AI

LEARNING OBJECTIVES

1) Explain the basic principles of data curation and AI model development for medical imaging.2) Identify important health disparities and access issues (especially for cancer screening), as well as potential methods to mitigate these issues with AI.3) Enumerate key considerations for integrating AI technologies into the clinical workflow.4) Recognize current and emerging applications for AI in tumor detection and staging. In this course, speakers will present a series of didactic lectures covering basic concepts in artificial intelligence (AI) and machine learning (ML) for radiology with a particular emphasis on new and emerging uses in oncologic imaging. Lectures will cover the basics of data curation and model development, disparity and access issues (with special attention to cancer screening) and how AI may worsen or be used to improve these problems, considerations for integrating AI into the clinical workflow, and current/emerging applications of AI for tumor detection and staging. The course will conclude with a question-and-answer session with the panel of speakers.

Benjamin Strong, MD, Eden Prairie, Minnesota (*Presenter*) Officer, Virtual Radiologic Corporation
Frank Chen, MD, Ponte Vedra, Florida (*Presenter*) Nothing to Disclose
Gautam A. Agrawal, MD, Reno, Nevada (*Presenter*) Co-founder, Vision Radiology

LEARNING OBJECTIVES

1) Gain a better understanding of the radiology job market, how to interview for a job, and evaluate a job offer. This symposium will help prepare residents and fellows for jobs as attending in both private practice and academics. 2)Learnabout personal finance and how artificial intelligence is being incorporated into the work place. The Resident and Fellow Symposium is a course targeted towards residents and trainees to gain a better understand of the radiology work place and prepare for life as an attending. The Symposium will begin with courses dedicated to the radiology job market, including current hiring practices, how to interview for jobs, and contract negotiation. The second half of the symposium will be dedicated to personal finance, how artificial intelligence can be reimbursed in practice, and a career panel with panelists from academic, private, hybrid, and tele-radiology practices.

Mimics in Pediatric Imaging: Do Not Miss!

Participants
Asha Sarma, MD, Nashville, Tennessee (*Presenter*) Nothing to Disclose
Sarah D. Bixby, MD, Boston, Massachusetts (*Presenter*) Nothing to Disclose
Monica Epelman, MD, Orlando, Florida (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1. Identify normal variants, developmental findings, and disease processes that may resemble one another on imaging of pediatric patients, focusing on the chest, abdomen, and pelvis, musculoskeletal system, and head and neck. 2. Recognize key clinical and imaging characteristics that help to differentiate among mimics in pediatric imaging. Many pathologies and developmental variants may bear resemblance to one another on imaging in pediatric patients. Radiologist awareness of key clinical and imaging features that help to differentiate among pathologies is essential to optimal diagnosis. In this lecture-based session, attendees will gain exposure to potential imaging mimics of disease in the chest, abdomen, and pelvis, musculoskeletal system, and head and neck. Clinically helpful pearls and pitfalls that will help to differentiate among disease entities and normal variants will be highlighted. Included cases will focus on pathologies that are often missed. Following the session, attendees will feel more comfortable in interpreting imaging studies including these organ systems in pediatric patients.

Deep Learning Lab: Basics of NLP in Radiology

Participants
Timothy Chen, San Jose, California (*Presenter*) Nothing to Disclose
Jae Ho Sohn, MD, San Francisco, California (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1)Understand common terminology and preprocessing techniques in NLP 2)Identify several classic and modern approaches used to capture semantic meaning in text 3)Learn how to implement a basic NLP pipeline from preprocessing to performance evaluation This session will feature a brief lecture introducing the basics of natural language processing (NLP) and highlight potential uses for it in radiology. The goal is to survey standard text preprocessing techniques and traditional NLP approaches as well as modern neural network based approaches. We will follow up the didactic portion with a hands-on Google Colab demo implementing discussed concepts for a text classification task. For best experience, we highly recommend attendees bring a laptop with a keyboard as well as have a Gmail account to access Google Colab.

Molecular Imaging and Targeted Therapy: NETS and Thyroid Cancer

Participants
Rathan M. Subramaniam, MD,PhD, Dunedin, New Zealand (*Presenter*) Nothing to Disclose
Delphine Chen, MD, Seattle, Washington (*Presenter*) Grant support and speaker honorarium, Telix Pharmaceuticals
Terence Z. Wong, MD, PhD, Durham, North Carolina (*Presenter*) Consultant, General Electric Company
Don Yoo, MD, Lexington, Massachusetts (*Presenter*) Consultant, Konica Minolta, Inc
Carina Mari Aparici, MD, San Francisco, California (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1) To discuss advances in neuroendocrine tumor imaging and therapy using radiopharmaceuticals. 2) To discuss advances in thyroid cancer imaging and therapy using radiopharmaceuticals. 3) To illustrate advances using a series of images from the field. This course will provide an update on molecular imaging and targeted therapy for endocrine tumors. There will be a series of lectures including a mix of core materials and new innovations. We will also include clinical pearls and pitfalls and illustrative case examples.

Infections and Inflammatory Cardiac Disorders: Case Based Review

Participants
Marco Francone, MD,PhD, Rome, Italy (*Presenter*) Nothing to Disclose
Jordi Broncano, MD, Cordoba, Spain (*Presenter*) Nothing to Disclose
Matthew Cham, MD, Kenmore, Washington (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1) To review the role of imaging in COVID-19 related myocardial injury.2) To evaluate the imaging clues in patients with native and prosthetic infectious endocarditis and potential pitfalls. 3) To describe the imaging pearls in the diagnosis of pericardial infection and inflammation. Infections and inflammatory cardiac diseases include a broad range of entities that can involve cardiac valves, endocardium, myocardium, pericardium, but also prosthetic valves or be associated to implantable devices. These conditions can have a subclinical presentation, and are associated to significant morbidity and mortality. This impact in healthcare systems has been recently exposed during the Coronavirus Disease (COVID-19) pandemic, where cardiac injury has been associated with excess of mortality. Imaging have an important role in prompt diagnosis, and may reduce the risk of complications and recurrence. In this course we will review, with case-based lectures, the role of imaging in the diagnosis and management of SARS-CoV-2 related myocardial injury, in cardiac valve infections and pericardial infections and inflammation.

Management of Cystic Pancreatic Lesions

Participants
Desiree Morgan, MD, Birmingham, Alabama (*Presenter*) Institutional Research Grant, General Electric Company
David M. Hough, MD, Rochester, Minnesota (*Presenter*) Nothing to Disclose
William W. Mayo-Smith, MD, Weston, Massachusetts (*Presenter*) Nothing to Disclose
Elizabeth Hecht, MD, New York, New York (*Presenter*) Nothing to Disclose
Hanna M. Zafar, MD, Philadelphia, Pennsylvania (*Presenter*) Nothing to Disclose
Eric Tamm, MD, Houston, Texas (*Presenter*) Institutional Research Grant, General Electric Company

LEARNING OBJECTIVES

1. Identify commonalities and differences in pancreatic cyst surveillance guidelines.2. Explain the role of imaging, cyst aspiration and genetic evaluation in patients with IPMN.3. Explore the evidence for pancreatic cyst risk stratification and apply in conjunction with imaging features. This course on management of patients with pancreatic cysts will educate the learner on key imaging features of cystic pancreatic lesions and explain the major surveillance management guidelines in the context of evidence based risk stratification. Six expert pancreatic speakers will present rapid summaries, followed by a panel discussion that will encourage real-time audience opinion and feedback.

Pancreatic Tumor Imaging

Participants

Avinash Kambadakone, MD, Boston, Massachusetts (*Presenter*) Advisory Board, Bayer AG;Research Grant, General Electric Company;Research Grant, Koninklijke Philips NV;Research Grant, PanCAN
Zhen J. Wang, MD, San Francisco, California (*Presenter*) Stockholder, Nextrast, Inc
Priya R. Bhosale, MD, Bellaire, Texas (*Presenter*) Nothing to Disclose
Suresh Chari, Houston, Texas (*Presenter*) Nothing to Disclose
Linda C. Chu, MD, Lutherville, Maryland (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1. Describe key imaging features for the diagnosis, staging, and response assessment in pancreatic cancer.2. Summarize the role of screening in patients at risks for developing pancreatic cancer.3. Discuss potential applications of artificial intelligence in pancreatic tumors.4. Explain recent advances in pancreatic neuroendocrine tumor imaging This course contains a series of short lectures and reviews the current state-of-the-art and recent advances in imaging of pancreatic adenocarcinoma and pancreatic neuroendocrine tumor. Attendees will also learn updates on pancreatic cancer screening and artificial intelligence applications in pancreatic cancer.

Digital PET in Current Radiology Practices

Participants
Osama R. Mawlawi, PhD, Houston, Texas (*Presenter*) Nothing to Disclose
Dustin Osborne, PHD, Knoxville, Tennessee (*Presenter*) Nothing to Disclose
Jun Zhang, PhD, Columbus, Ohio (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

At the end of this session, the audience should have gained knowledge of:1) The design characteristics of digital PET detectors and systems from various manufacturers. 2) The performance characterizations of PET systems from various manufacturers.3) PET systems options and clinical examples from the various manufacturers. PET scanners with digital detectors is one of the latest innovations in PET scanner system designs. This course will cover the detector design and system performance of digital PET scanners from various manufacturers. The course will also cover the resultant image quality for these systems as well as the various capabilities of these commercial systems.

Musculoskeletal Infection and Its Mimics: Pearls and Pitfalls

Participants
Jim S. Wu, MD, Lexington, Massachusetts (*Presenter*) Nothing to Disclose
Patrick Omoumi, MD, Lausanne, Switzerland (*Presenter*) Nothing to Disclose
Corrie M. Yablon, MD, Ann Arbor, Michigan (*Presenter*) Nothing to Disclose
Erin F. Alaia, MD, New York, New York (*Presenter*) Nothing to Disclose
Matthew Bucknor, MD, San Francisco, California (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1.Identify and describe imaging features of musculoskeletal infection. 2.Differentiation of osseous and soft tissue infection from important mimickers. 3.Avoid common pitfalls in the diagnosis of musculoskeletal infection. This session will cover imaging of musculoskeletal infection through case-based lectures. Lectures will cover infection of the soft tissues, the articulations, and imaging of acute and chronic osteomyelitis. Pearls and pitfalls of musculoskeletal infection will be emphasized as teaching points. At the completion of the course, the learner will be able to identify and describe imaging features of musculoskeletal infection, and will be able to differentiate infection from common and important mimics.

Pediatric - Case-based Multidisciplinary Review

Participants

Shannon MacDonald, MD, Boston, Massachusetts (*Presenter*) Nothing to Disclose
Michael S. Gee, MD, PhD, Boston, Massachusetts (*Presenter*) Research Grant, Takeda Pharmaceutical Company Limited;Researcher, General Electric Company ;Researcher, Siemens AG
Camilo Jaimes Cobos, MD, Boston, Massachusetts (*Presenter*) Nothing to Disclose
David Ebb, MD, Boston, Massachusetts (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1)Identify important imaging anatomy relevant to pediatric tumors.2) Explain the pros and cons of different imagingmodalities in pediatric oncology staging.3) Understand imaging and clinical considerations related to the treatment decisions in pediatric cancer. The course will be amultidisciplinary review of pediatric oncology cases that will include radiation oncology,medical oncology, and radiology perspectives and considerations for clinicalmanagement of pediatric oncology patients. Issues related to relevant imaging anatomy, imagingmodalities, radiation planning, and therapeutic options will be discussed. The format of the course will be amultidisciplinary case review and discussionmirroring that of a tumor board conference. This synopsis can be used as amarketing/promotional tool to gauge interest in the session. The expected outcome is that the audience will have familiarity with diagnostic imaging and treatment planning of pediatric cancer patients.

Gul Moonis, MD, South Orange, New Jersey (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1.Highlight different modalities and imaging techniques that improve postoperative head and neck assessment.2.Discuss expected postoperative appearances of the neck, sinuses, orbits, and temporal bones.3.Cover potential associated complications for each of these anatomic regions. Image interpretation of the postoperative head and neck is notoriously challenging. In order to provide accurate and useful reports, radiologists must understand the expected postoperative appearance and recognize associated complications. The lectures of this session cover postoperative imaging and interpretation of the neck, sinuses, orbits, and temporal bones.

Innovations in Hybrid Imaging

Participants

Ramsey Badawi, PhD, Sacramento, California (*Presenter*) Research Grant, Shanghai United Imaging Healthcare Co, Ltd;Institutional research agreement, Shanghai United Imaging Healthcare Co, Ltd
Ciprian Catana, MD, PhD, Charlestown, Massachusetts (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1) Describe the state-of-the-art hardware for hybrid imaging. 2) Explain software innovations in combining the multimodality information. 3) Identify current applications of artificial intelligence in hybrid imaging. This session will provide an overview of the recent developments in hybrid PET/CT and PET/MRI instrumentation. It will also present the latest progress in the integration of the multimodality information for research and clinical applications. Finally, the use of artificial intelligence for addressing remaining challenges in hybrid imaging and for performing advanced analyses of the multimodal datasets will be discussed.

Non Physician Radiology Providers (NPRP)

Participants
Jacqueline A. Bello, MD, New York, New York (*Presenter*) Nothing to Disclose
Eugenia Brandt, Washington, Dist. of Columbia (*Presenter*) Nothing to Disclose
Eric M. Rubin, MD, Media, Pennsylvania (*Presenter*) Nothing to Disclose
Timothy L. Swan, MD, Marshfield, Wisconsin (*Presenter*) Nothing to Disclose
William Thorwarth JR, MD, Reston, Virginia (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1) Understand the benefits, concerns and controversies regarding non-physician radiology providers (NPRP) use.2)Become familiar with state regulations for scope of practice and independent practice for nurse practitioners and physician assistants. 3)Gain peer-to-peer knowledge of the near- and long-term implications of NPRP use in radiology by participating in the open discussion session. Non-physician radiology providers are increasingly utilized in various capacities in practices across the country. State and national agencies have encouraged use of these physician extenders -- especially during the COVID-19 public health emergency (PHE). Nurse practitioner and physician assistant efforts to increase their scope of practice and gain independent practice through state legislative initiatives have created controversy.Radiologists are concerned that increased physician extender scope of practice and autonomy may impact care and limit patient access to radiologist expertise.An expert panel will discuss: The history of registered radiologist assistants, nurse practitioners and physician assistants in radiology State-based rules and regulations of scope of practice and PA and NP independent practice Controversies and concerns regarding use of these physician extenders The panel will then open the discussion for audience participation.

An Introduction to the Learning Healthcare System and Tackling the Critical Data Hurdles (Sponsored by the RSNA Research Development Committee)

Participants

Safwan Halabi, MD, Chicago, Illinois (*Presenter*) Advisor, Bunkerhill Health;Advisor, McKesson Corporation;
Caroline Chung, MD, FRCPC, Houston, Texas (*Presenter*) Research support, RaySearch Laboratories AB;Research support, Siemens AG
Charles Kahn JR, MD, Philadelphia, Pennsylvania (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1. To review approaches and challenges for aggregating structured data within a practice to support a Learning Health System. 2. To describe the value and key aspects of generating quantitative imaging to support a Learning Health System. 3. To describe specific examples of data management approaches and review lessons learned. This lecture sponsored by the RSNA Research Development Committee aims to provide the framework whereby healthcare professionals and researchers can help establish and contribute to a Learning Health System (LHS). An LHS is defined as a collaboration of science, informatics, incentives, and culture [which] are aligned for continuous improvement and innovation, with best practices seamlessly embedded in the delivery process, [with] patients and families active participants in all elements, and new knowledge captured as an integral by-product of the delivery experience.

Sudha A. Anupindi, MD, Philadelphia, Pennsylvania (*Presenter*) Nothing to Disclose
Mahmoud M. Al-Hawary, MD, Ann Arbor, Michigan (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1) Implement state-of-the-art MRI, CT, and ultrasound MRI techniques for evaluating children and adults with Crohns disease. 2) Understand the roles of MRI, CT, and ultrasound in diagnosing Crohns disease as well as characterizing intra-abdominal and perianal disease-related complications. 3) Accurately assess Crohns disease inflammatory activity and treatment response by imaging. Imaging, including MRI, CT, and ultrasound, is critical to the diagnosis and care (medical and surgical) of patients with Crohns disease. Using a series of short didactic lectures, participants will learn: effective patient preparation and state-of-the-art imaging techniques, how to accurately assess disease activity and treatment response, and the role of imaging in detecting and characterizing intra-abdominal and perianal disease-related complications. Attendees also will be exposed to the potential roles of ultrasound in evaluating patients with known and suspected Crohns disease, including how to get started in clinical practice.

LEARNING OBJECTIVES

1.Assess the individual risk of women for the development of breast cancer, taking familial, hormonal and imaging factors into
account2.Identify women for whom supplemental ultrasound may be beneficial, and discuss the pros and cons3.Identify women for
whom MRI may be beneficial; and discuss the pros and cons Breast screening has long been a one-size fits all technique, using
annual or biennial mammography to detect breast cancers early. Although for the average population this approach has shown to
reduce breast cancer specific mortality, the effect for the individual woman is highly variable. Mammography screening is still
associated with significant underdiagnosis of relevant breast cancers, and some populations, e.g. women with dense breasts, are
more affected by this than others. In this course, risk stratification techniques and supplemental (or alternative) screening
techniques are presented. After this course you will have a thorough understanding of risk stratification and screening possibilities.
You will be capable of discussing tailored breast cancer screening strategies for individual women.

Practical Aspects of MRI

Participants

Nicole Seiberlich, PhD, Ann Arbor, Michigan (*Presenter*) Royalties, Siemens AGResearch support, Siemens AG
Liliana Ma, PhD, Chicago, Illinois (*Presenter*) Nothing to Disclose
Kathryn Fowler, MD, San Diego, California (*Presenter*) Consultant, Bayer AG;Research support, General Electric Company;Research Grant, Pfizer Inc;Institutional Grant, MEDIAN Technologies;Consultant, General Electric Company
Kathryn Keenan, PhD, Boulder, Colorado (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1) Describe how differences in contrast can be induced by the selection of particular pulse sequence settings to differentiate tissues using MRI. 2) List several options for mitigating motion artifacts in MRI, and explain how images showing motion can be captured (i.e. cine imaging). 3) Explain the practical considerations involved in selecting the sequences to be included in an MRI protocol In this course, comprised of three 20-minute lectures, practical aspects of deploying Magnetic Resonance Imaging will be discussed. The aim of this course is to help radiologists to better understand the basics of MRI, and why clinical MRI exams are structured the way that they are. A detailed understanding of MRI physics is not required. MRI is complex due to the large number of parameters that can be adjusted and the unexpected artifacts that can arise, especially in the presence of motion. Determining an appropriate protocol for a clinical question balances the need for contrast between healthy and diseased tissue, the speed of the individual sequences, exam length, and the incremental diagnosic utility provided by adding to the protocol. This course will tackle these questions by focusing on three topics: 1) image contrast, and how it is generated and used to discriminate different tissues; 2) motion, including how it can be measured or reduced to avoid artifacts, and 3) protocol selection, specifically how appropriate protocols are chosen for clinical exams.

LEARNING OBJECTIVES

1) To discuss advances in imaging of dementia and Parkinsonism using radiopharmaceuticals. 2) To review imaging interpretation. 3) To illustrate advances and imaging interpretation with images from the field. This course will provide an update on molecular imaging and for neurologic applications. There will be a series of lectures including a mix of core materials and new innovations. We will also include clinical pearls and pitfalls and illustrative case examples.

ASRT@RSNA: Let's Get Lifted! Elevating Yourself as an Imaging Professional through Advocacy, Engagement and Ethics

Participants

Jennifer Clayton, MBA, RT, Albany, Oregon (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

Consider the ethical and legal aspects of serving patients, colleagues and our profession.Discuss the application of ARRT standards of ethics.Review disciplinary cases brought to licensure boards related to ethical or legal violations. Discuss legislative issues facing imaging professionals and the potential impact on patient interactions.Explain effective methods to personally engage in professionalism, advocacy and create awareness about the imaging field. During this presentation we will discuss various ethical and legal issues related to imaging. We'll also share information related to engagement, being actively involved as imaging professionals and the importance of advocacy.

LEARNING OBJECTIVES

1. To understand current landscapes and future directions for prostate embolization, MRI-guided prostate lesion biopsy, and MRI-guided prostate cancer ablation.2. To understand contemporary image-guided procedural treatment options for pelvic congestion, syndrome, female infertility, uterine fibroid disease, and uterine artery hemorrhage.3. To become familiar with state-of-the-art advances in lymphatic imaging and image-guided interventions for lymphatic disorders. Genitourinary intervention topics will include men's health sessions on 1) prostate interventions for benign and malignant disease and 2) the existing data and future directions for prostate embolization, as well women's health sessions on 1) pelvic venous and infertility interventions and 2) applications for uterine artery embolization. Lymphatic intervention topics will include sessions on 1) recent advances in lymphatic imaging and 2) state-of-the-art lymphatic interventions.

Update on Whole Body MRI for Adult Malignancies

Participants

Evis Sala, MD, PhD, Cambridge, United Kingdom (*Presenter*) Co-founder, Lucida Medical Ltd
Vasantha D. Aaron, MD, Indianapolis, Indiana (*Presenter*) Nothing to Disclose
Hebert Alberto Vargas, MD, New York, New York (*Presenter*) Nothing to Disclose
Anwar Padhani, MD,FRCR, Northwood, United Kingdom (*Presenter*) Advisory Board, Siemens AGSpeakers Bureau, Siemens AGAdvisory Board, Lucida Medical LtdStockholder, Lucida medical Ltd
Christina Messiou, MD, BMBS, London, United Kingdom (*Presenter*) I am a co-founder of Diafora (alongside the Institute of Cancer Research and The Royal Marsden) that has formed a joint venture, Celescan, with Sopra Steria

LEARNING OBJECTIVES

1.To illustrate the limitations of conventional imaging especially for malignant bone disease detection and response assessments2.To learn the strengths and limitations of different modalities and next-generation imaging probes used in advanced prostate cancer3.To exemplify how WB-MRI could help deliver the promise of precision oncology for patients with bone disease 4.To discuss indications for (whole body) PET/MRI imaging with focus on specific pathologies and identify challenges to implementing clinical PET/MRI programs This session will discuss the limitations of conventional imaging especially for malignant bone disease detection and response assessments. It will highlight that heterogeneity of clinical outcomes is related to imperfect classification systems, underlying genomic and molecular alternations and variable therapy effectiveness and the need for better diagnostic, prognostic, predictive, theragnostic and response biomarkers, including next-generation imaging. It will also discuss the role of WBMRI in prostate cancer and myeloma as well the role of PET in prostate cancer and whole body PET/MRI in specific pathologies. Finally, it will discuss physician barriers for adopting next-generation imaging and the need for better evidence on management impacts.

Practice Building in IR

Participants

Meridith J. Englander, MD, Albany, New York (*Presenter*) Medical Director, Capital District Physicians' Health Plan
Agnieszka O. Solberg, MD, Bismarck, North Dakota (*Presenter*) Owner, RadCX;Speakers Bureau, Argon Medical Devices, Inc;Owner, SunMountain Medical Consulting LLC;Spouse, Owner, SunMountain Medical Consulting LLC
Nicholas Petruzzi, MD, Galloway, New Jersey (*Presenter*) Medical Advisory Board, Boston Scientific Corporation;Speakers Bureau, Boston Scientific Corporation;Speakers Bureau, Abbott Laboratories;Speakers Bureau, ShockWave Medical;Speakers Bureau, Becton, Dickinson and Company
Aneesa S. Majid, MD, Chicago, Illinois (*Presenter*) CEO, ZipData, Inc;Proctor, Sirtex Medical Ltd;Owner, StrategiesMD, LLC
C. Matthew Hawkins, MD, Decatur, Georgia (*Presenter*) Nothing to Disclose
Stephanie Dybul, MBA,RT, Milwaukee, Wisconsin (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

Describe the many practice models that currently exist for Interventional Radiologists Understand recent updates to interventional radiology reimbursement and how to optimize your procedural and E/M coding and billing List some basic marketing techniques that can help grow your practice and understand the role of Social Media in patient and referring physician outreach Discuss why a diverse workforce can benefit an IR practice and identify steps to make your practice more inclusive Though medicine is a calling, healthcare is very much a business. You have the knowledge and skills to take care of your patients, but have you thought about practice building? How do you know what kind of practice you want? How do you grow referrals and grow your practice? How do you get paid for your procedural and non-procedural work? Why should you care about diversity and inclusion as an integral part of your practice building? Training fails to address the majority of these topics in training. This session covers a variety of topics, all relevant to practice development in IR.

The New Normal: Home Workstations, Teleradiology and Remote Reading

Participants

Mindy Yang, MD, Philadelphia, Pennsylvania (*Presenter*) Clinical Advisory Board, SolutionReach
Rishi Seth, MD, Ashburn, Virginia (*Presenter*) Shareholder, Hyperfine Research, Inc;Shareholder, Alphabet Inc
Omer Awan, MD, Lutherville Timonium, Maryland (*Presenter*) Nothing to Disclose
K. Elizabeth Hawk, MD,PhD, Studio City, California (*Presenter*) Nothing to Disclose
Samir S. Shah, MD, Gibsonia, Pennsylvania (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1) Identify technical requirements for deployment of remote reading solutions. 2) Discuss advantages and disadvantages of remote reading and remote education. 3) Discuss optimal strategies for successful deployment of remote reading models. Radiology has seen an unprecedented, exponential trend towards remote reading during the COVID-19 pandemic. As remote reading becomes a potential permanent fixture for many practices moving forward, this course will serve as a springboard for discussion of innovative solutions and cover both advantages as well as disadvantages of various models. We will explore multiple facets of teleradiology, from technical implementation, challenges faced, impact on radiologists as well as radiology resident trainees, and differences amongst practice needs.

Elbow, Wrist and Hand Imaging: Pearls and Pitfalls

Participants

Tetyana A. Gorbachova, MD, Huntingdon Valley, Pennsylvania (*Presenter*) Nothing to Disclose
Robert Boutin, MD, Stanford, California (*Presenter*) Nothing to Disclose
James Griffith, MD, Shatin, Hong Kong (*Presenter*) Nothing to Disclose
Rob Campbell, MBBCh, Liverpool, United Kingdom (*Presenter*) Nothing to Disclose
Catherine Petchprapa, New York, New York (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1) To review imaging features and technical and interpretational pitfalls in the diagnosis of the abnormalities of the elbow, wrist and hand. 2) To analyze the biomechanics and clinical significance of injuries to the elbow, wrist and hand. 3) To become familiar with the expected findings and complications in imaging of the post-operative wrist. This course is composed of a series of lectures focused on imaging of the elbow, wrist and hand, in a format of short didactic lectures and Q&A. Individual lectures will highlight the tips and pitfalls of imaging diagnosis of common conditions that occur in clinical practice including diagnostic interpretation of postoperative imaging.

Professionalism as an Educator in Radiology: Strategies to Engage Learners in Person and Virtually (Sponsored by RSNA Professionalism Committee)

Participants
Brandon Brown, MD, Indianapolis, Indiana (*Presenter*) Nothing to Disclose
Kate Hanneman, MD, FRCPC, Toronto, Ontario (*Presenter*) Speaker, sanofi-aventis Group;Speaker, Amicus Therapeutics, Inc
Aaron Kamer, MD, Indianapolis, Indiana (*Presenter*) Nothing to Disclose
Jesse L. Courtier, MD, San Francisco, California (*Presenter*) Founder, Sira Medical, Inc;Consultant, Sira Medical, Inc
David Sarkany, MD, Staten Island, New York (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1) Assess and define the role of in-person and didactic lectures for radiology trainees in the current environment. 2) Discuss practical tips for implementing innovative tools that can be used in radiology education, including platforms for audience participation, virtual and augmented reality, and web-based teaching. 3) Explore strategies to provide consistent and effective feedback to radiology trainees. Radiology educators have had to adapt quickly over the past 18 months as medical education has shifted to a virtual format. Innovative tools for education are increasingly relevant to radiologists who teach trainees and provide other educational content including continuing medical education. These educational tools can increase audience participation and engagement and are highly relevant in the current era where many teaching rounds and seminars have been moved to a virtual on-line environment. This session will provide practical tips for implementing innovative tools that can be used in radiology education, including platforms for audience participation, virtual and augmented reality, and web-based teaching. The session will also explore strategies to provide consistent and effective feedback to trainees, given the shifting dynamics of teaching and learning.

Deep Learning Lab: Working with Public Datasets: TCIA & IDC

Participants
Justin Kirby, Rockville, Maryland (*Presenter*) Nothing to Disclose
Andriy Fedorov, PhD, Arlington, Massachusetts (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1) Understand the capabilities and complementary nature of the TCIA and IDC repositories, including those related to identifying and visualizing relevant data, defining cohorts and retrieving the data for subsequent analysis; 2) Gain familiarity with the process of retrieving the data and applying a representative processing pipeline using free compute resources available via Google Colab; 3) Establish awareness about the related components of the broader NCI data science ecosystem, and the learning resources available to the community to facilitate the use of IDC and TCIA for cancer imaging research. The National Cancer Institute (NCI), of the National Institutes of Health (NIH), has made significant investments in the creation and development of public data repositories to enable and promote data sharing and secondary analysis of cancer imaging data through an open science approach. The two flagship repositories supported by NCI are The Cancer Imaging Archive (TCIA) (https://www.cancerimagingarchive.net/) and Imaging Data Commons (IDC) (https://imaging.datacommons.cancer.gov/). TCIA works directly with data submitters to implement de-identification, curation and hosting of imaging collections for download. IDC is an emerging repository within the NCI Cancer Research Data Commons (CRDC) (https://datacommons.cancer.gov/), which replicates de-identified public collections on the cloud, co-locating the imaging data alongside the analysis resources and tools, and other types of linked data. The purpose of this course is to introduce the attendees to the complementary capabilities of TCIA and IDC, and demonstrate how the data available in both TCIA and IDC can be accessed and utilized via hands-on examples with Google Colab notebooks. At the completion of this course the attendees are expected to be equipped with the knowledge needed to proceed with identifying and analyzing relevant datasets from TCIA and IDC.

Case-based Review of Nuclear Medicine: PET/CT Workshop ? Chest (In Conjunction with SNMMI)

Participants
Gary Ulaner, MD,PhD, Irvine, California (*Presenter*) Speaker, Siemens AG;Speaker,Lantheus Holdings;Research support, General Electric Company;Research support, F. Hoffmann-La Roche Ltd;Research support, Lantheus Holdings;Research support, Novartis AG
Rathan M. Subramaniam, MD,PhD, Dunedin, New Zealand (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1. Understand best clinical practices for use and interpretation of PET imaging in patient with lung cancer. 2. Understand best clinical practices for use and interpretation of FDG and FES PET/CT in patients with breast cancer. PET/CT has greatly impacted the imaging and therapy of chest malignancies, including longstanding value for staging of lung cancer, as well as novel Estrogen Receptor targeted imaging for breast cancer. In this session, experts on lung and breast cancers will use clinical cases to demonstrate fundamentals of interpretation, as well as pearls and pitfalls to help improve interpretation of FDG PET and FES (Cerianna) PET.

Nishita Kothary, MD, Stanford, California (*Presenter*) Research Grant, EchoPixel, Inc;Scientific Advisory Board, Quantum Surgical

LEARNING OBJECTIVES

1) Identify critical elements for building an IR research lab.2) Describe considerations unique to clinical trial design, grantsmanship and manuscript preparation in IR.3) Explain the role of Academic-Industrial Partnerships in building IR science. This educational session will focus on elements critical for the development of successful basic and/or translational research programs in IR. Leading clinician-scientists will deliver lectures that provide unique insights into building a lab, developing clinical trials, providing and receiving effective mentorship, writing grants that resonate with reviewers, preparing impactful manuscripts as well as cultivating academic-industrial partnerships. These lectures will empower attendees to develop and enhance their own research initiatives in IR.

MESH Incubator Presents: The CORE Healthcare Innovation Bootcamp: AI, Digital and More

Participants
Katherine Andriole, PhD, Branford, Connecticut (*Presenter*) Nothing to Disclose
Mark Zhang, DO, Boston, Massachusetts (*Presenter*) Nothing to Disclose
Marc Succi, MD, Boston, Massachusetts (*Presenter*) Inventor, Frequency Therapeutics
Florian Fintelmann, MD, Boston, Massachusetts (*Presenter*) Research support, Boston Scientific Corporation

LEARNING OBJECTIVES

1. Learning the basics of AI and ML as applied to healthcare, specifically radiology. Work through a real-world problem using AI (personal laptop required).2. Learn the basics of intellectual property in healthcare (patents, copyright, trademarks etc).3. Gain an understanding of the challenges towards implementing digital health solutions, and further challenges in commercializing digital solutions in the healthcare arena. Artificial Intelligence (AI), Machine Learning (ML), and digital health are rapidly influencing the healthcare landscape. This morning session from the MESH Incubator teaches the fundamentals of AI, ML, and digital health for emerging MD and non-MD innovators in healthcare, and allows the learner to visualize the landscape of these domains as they pertain to patient care. No prior knowledge of these topics is necessary to attend. This session will also teach the fundamentals of intellectual property, including patents, trademarks, and copyright, as applied to healthcare innovation.

Chaya Moskowitz, PhD, New York, New York (*Presenter*) Nothing to Disclose
Nancy Obuchowski, PhD, Cleveland, Ohio (*Presenter*) Research Consultant, Siemens AG;Research Consultant, IBM Corporation;Research Consultant, Elucid Bioimaging Inc;Research Consultant, Takeda Pharmaceutical Company Limited

LEARNING OBJECTIVES

1. Understand key concepts of study design and biases in imaging studies 2. Understand how to evaluate accuracy for a variety of different study designs This lecture will provide a survey of statistical methods used in imaging studies. The course will focus on concepts of study design and data analysis that are frequently used when evaluating imaging tests. Topics to be covered include ROC curves, multi-reader studies, localization accuracy, and common sources of bias. By the end of the lecture, attendees will have acquired an essential foundation of key statistical analysis methods used in evaluating imaging tests.

LEARNING OBJECTIVES

1) Identifying strategies for bringing research to the competitive marketplace.2)Presenting a proposal in a way that elicits interest from potential investors.3)Taking steps to secure investor funding while developing and protecting their intellectual property. 4)Identifying ways to generate business value through licensing and collaborations. This session is meant to be educational, fun, and interactive. The goal is to be of value to investigators who would like to learn more about pitching an idea to an academic chair, an industry rep, or Venture Capitalist. Similar to the format of the hit show, each pitcher/pitch team will be given 5 minutes to present their product/idea to a panel of leading experts from academia, patent law, industry, and venture capital. They will be put to the test in a rapid fire 5-minute Q&A session immediately following their pitch and will even take questions from the audience at the end of the session. Using a uniquely designed rubric, our panel will score and choose a winner live during this session.

LEARNING OBJECTIVES

1. Appreciate difficulties urinary excretion of PET tracers can cause for interpretation of images around the kidneys, ureters, and bladder. 2. Understand best clinical practices for use and interpretation of PET/CT in patients with neuroendocrine tumors. The kidneys, ureters, and bladder have caused difficulty in interpretation of multiple PET tracers, due to urinary tracer excretion. PET/CT has greatly impacted the imaging and therapy of neuroendocrine malignancies, including continuing improvements in somatostatin receptor-targeted PET. In this session, experts on kidneys/ureter/bladder and neuroendocrine tumors will use clinical cases to demonstrate fundamentals of interpretation, as well as pearls and pitfalls to help improve interpretation of PET studies.

Hania Abdulraouf Al-Hallaq, PHD, Chicago, Illinois (*Presenter*) Research Grant, Varian Medical Systems, Inc
Carri Glide-Hurst, PHD, Madison, Wisconsin (*Presenter*) Research collaboration, General Electric Company;Research collaboration, Modus Medical Devices Inc

LEARNING OBJECTIVES

1) Specify the role of image guidance and its limitations in radiotherapy. 2) Explain the current state-of-the-art image guidance modalities used in radiotherapy including IGRT, surface image guidance and MR guidance. 3) Outline various imaging doses to patients and offer guidance to optimize imaging dose. This educational session is targeted towards medical physicists who are interested in the current image guidance techniques and modalities used in Radiation Therapy. A brief review of the past, present and future of image guidance in radiotherapy will be followed by detailed discussions on Surface image guidance, MR image guidance and X-ray based image guidance. Perspectives on managing imaging doses in radiotherapy will be described along with calculations and measurement of imaging dose.

Lori Mankowski Gettle, MD, Madison, Wisconsin (*Presenter*) Stockholder, Elucent Medical

LEARNING OBJECTIVES

1- To understand basic principles of prostate MRI and PI-RADS v2.12- To provide guidance on location of clinically significant prostate cancers at prostate mpMRI3- To recognize benign intra-prostatic findings and pitfalls which can overlap with prostate cancer This course will include short lectures from experts in the field of prostate MRI and participants will be able to further utilize the presented lecture content in histopathologically confirmed prostate MRI sample cases with varying difficulty levels using RadPix platform. After each case evaluation, participants' questions will be answered by expert course faculty.

Case Based Breast Review: CESM & MRI

Participants
Jonathan James, BMBS, Nottingham, United Kingdom (*Presenter*) Nothing to Disclose
Masako Y. Kataoka, MD, PhD, Kyoto, Japan (*Presenter*) Speaker, Siemens AG;Speaker, Bayer AG;Author with royalties, Bayer AG;Author with royalties, Guerbet SA
Katja Pinker-Domenig, MD, New York, New York (*Presenter*) Speakers bureaus:European Society of Breast Imaging (active)Siemens Healthineers (ended)IDKD 2019 (ended)Olea Medical (ended) Consulting, AdvisoryConsultantGenentech, Inc.05/19-presentConsultantMerantix Healthcare05/20- presentConsultantAURA Health
Almir Bitencourt, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1) Explain breast cancer detection with CESM and MRI due to imaging of neoangiogenesis as tumor specific feature2) Identify the indications of CESM and MRI in breast imaging2) Understand the challenges and limitations of CESM and MRI in clinical breast imaging CESM has emerged as an alternative test to dynamic contrast-enhanced MRI for breast cancer detection through imaging of neovascularity as a tumor specific feature. This educational course will explain the technique and indications of CESM and summarize the indications of CESM and MRI in clinical breast imaging. Upon completion of this course participants will understand the current clinical applications and limitations of each individual technique.

Genitourinary - Case-based Multidisciplinary Review

Participants

Tristan Barrett, MBBS, Cambridge, United Kingdom (*Presenter*) Nothing to Disclose
Daniel A. Hamstra, MD, PhD, Dearborn, Michigan (*Presenter*) Consultant, Augmenix, Inc;Consultant, Boston Scientific Corporation
Nicole Curci, MD, Ann Arbor, Michigan (*Presenter*) Nothing to Disclose
Robert Dess, MD, Ann Arbor, Michigan (*Presenter*) Nothing to Disclose
Arvin George, MD, Ann Arbor, Michigan (*Presenter*) Research Consultant, TROD Medical;Researcher, Nanospectra Biosciences, Inc;Researcher, Koninklijke Philips NV;

LEARNING OBJECTIVES

1) To understand the typical imaging findings of prostate cancer on mpMRI. 2) To assess the impact of MRI on staging prostate cancer in a multidisciplinary setting.3) To assess the role of imaging in the diagnosis of prostate cancer through case examples. This course uses a case-based approach to diagnostic and management decision making in the work-up of patients presenting with prostate cancer. The panel includes radiologists, urologists and radiation oncologists.

Making the Most of Radiologist Peer-Learning Tools

Participants
Dorothy Sippo, MD, Westport, Connecticut (*Presenter*) Nothing to Disclose
Andrew Moriarity, MD, Grand Rapids, Michigan (*Presenter*) Nothing to Disclose
Mara Kunst, MD, Winchester, Massachusetts (*Presenter*) Nothing to Disclose
Nelly Tan, MD, Scottsdale, Arizona (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1. Identify strategies for a successful transition from peer-review to peer-learning.2. Describe the role of the conference in a Peer-Learning Program and practical considerations for a successful conference.3. Explain how peer-learning can impact clinical practice. This course will explore practical aspects of a successful Peer-Learning Program. Topics will include: (1) transitioning from peer-review to peer-learning, (2) approaches to peer-learning and self-review, (3) development and maintenance of peer-learning conferences, and (4) the impact of peer-learning on clinical practice. With a lecture format, followed by question and answer discussion, presenters will share best practices for peer-learning tools. This course will provide useful pearls and strategies for making the most out of your Peer-Learning Program.

Pediatric Chest and Beyond: New Pathology

Participants

Maddy Artunduaga, MD, Dallas, Texas (*Presenter*) Nothing to Disclose
R. Paul Guillerman, MD, Houston, Texas (*Presenter*) Nothing to Disclose
Marcelo Takahashi, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1) Recognize imaging patterns of recently described pediatric lung conditions, including EVALI and COVID-19, among others. 2) Review up-to-date imaging recommendations in the evaluation of patients with these new pediatric lung entities. This educational course reviews a spectrum of new lung conditions that can be encountered in the pediatric population. Lectures will focus on the imaging features of EVALI, COVID-19, filamin A mutation-related lung disease, pleuroparenchymal fibroelastosis and COPA syndrome, among others. After completing this course, learners are expected to identify the key imaging findings of each entity and to be cognizant of the latest imaging recommendations in the assessment of these patients.

Hossein Jadvar, MD, PhD, Pasadena, California (*Presenter*) Consultant, Blue Earth Diagnostics Ltd;Speakers Bureau, Lantheus Holdings;Advisory Board, RadioMedix, Inc;Researcher, ImaginAb, Inc;

Ayse Karagulle Kendi, MD, Rochester, Minnesota (*Presenter*) Investigator, Novartis AG

LEARNING OBJECTIVES

1) To discuss advances in prostate cancer imaging and therapy using radiopharmaceuticals. 2) To review clinical interpretation of PET/CT with Fluciclovine and PSMA-targeting agents. 3) To illustrate advances using a series of images from the field. This course will provide an update on molecular imaging and targeted therapy for prostate cancer. There will be a series of lectures targeting focussed on a hot topic. For example, the first PSMA targeted radiopharmaceutical was FDA approved in late 2020. We will also include clinical pearls and pitfalls and illustrative case examples.

LEARNING OBJECTIVES

1)Review objectives, study design, and results from high impact clinical trials of 2021.2)Discuss clinical implications of trial results. 3)Describe the need for any additional confirmatory or follow on trials. This special session will present abstract results from top-scoring clinical trials, paired expert discussants to support the translation of evidence to clinical practice.

M4-RCP48   **The Impact Of 18F-DCFPyL PET/CT On The Management Of Patients With Recurrent Prostate Cancer: Results Of A Prospective, Multicenter Trial.**

Participants

Ur Metser, MD, FRCPC, Toronto, Ontario (*Presenter*) Consultant, POINT Biopharma Inc

PURPOSE

To assess the disease detection rate of 18F-DCFPyL PET/CT (=PSMA PET) and the PET-directed change in the clinical management of men with suspected limited recurrent prostate cancer after primary therapy.*Methods and Materials This prospective, multicenter registry trial enrolled 1289 patients (Dec 2018-Sept 2020). Eligibility included biochemical failure after primary therapy, 0-4 sites of disease on conventional imaging (CT and bone scintigraphy) and one of the following predefined clinical cohorts: 1. Node positive or detectable serum PSA after radical prostatectomy (RP) 2. Post RP; 3. Post RP and pelvic radiotherapy; 4. Post RP or primary radiotherapy (RT) and androgen deprivation therapy; 5. Post lesion directed treatment for oligometastases (=4 sites); 6. Post primary RT.*Results 841/1289 men (65.2%) had disease detected with PSMA PET. PET detection rates among men with negative conventional imaging was 615/999 (61.6%). Detection rate of any lesion by serum PSA level (ng/ml) at enrollment were 160/424 (37.7%) for PSA <0.5; 107/171 (62.6%) 0.5-1.0 and 573/692 (82.8%) for PSA >1.0. On PSMA PET 399/1289 men (31.0%) had locoregional failure (limited to pelvis), 314/1289 men (24.4%) had oligometastatic disease and 128/1289 men (9.9%) had extensive metastatic disease (Table 1; results by cohort). Post PSMA PET, a change in planned management was recorded in 748/1289 men (58.0%) and in 371/1250 men (29.7%), there was a change in management intent, most commonly from palliative to potentially curative intent (255/1289; 19.8%); Figure 1. The most common change was conversion from observation or systemic therapy to salvage radiation or surgery for locoregional (236/1289;18.3%) or oligometastatic disease (132/1289; 10.2%). In 89 additional patients (6.9%) nodal-directed therapy was added to management plan after PET.*Conclusions PSMA-PET detects additional sites of disease compared with standard of care imaging in most men with biochemical failure and suspected low volume metastatic disease, resulting in frequent change in management including a change from palliative to curative/radical intent therapy in 20% of men. Long term follow-up is needed to determine whether this impacts disease control.*Clinical Relevance/Application The detection of additional disease sites on PSMA PET in men with biochemical failure after primary therapy and suspected low volume metastatic disease results in a frequent change in management.

RESULTS

841/1289 men (65.2%) had disease detected with PSMA PET. PET detection rates among men with negative conventional imaging was 615/999 (61.6%). Detection rate of any lesion by serum PSA level (ng/ml) at enrollment were 160/424 (37.7%) for PSA <0.5; 107/171 (62.6%) 0.5-1.0 and 573/692 (82.8%) for PSA >1.0. On PSMA PET 399/1289 men (31.0%) had locoregional failure (limited to pelvis), 314/1289 men (24.4%) had oligometastatic disease and 128/1289 men (9.9%) had extensive metastatic disease (Table 1; results by cohort). Post PSMA PET, a change in planned management was recorded in 748/1289 men (58.0%) and in 371/1250 men (29.7%), there was a change in management intent, most commonly from palliative to potentially curative intent (255/1289; 19.8%); Figure 1. The most common change was conversion from observation or systemic therapy to salvage radiation or surgery for locoregional (236/1289;18.3%) or oligometastatic disease (132/1289; 10.2%). In 89 additional patients (6.9%) nodal-directed

therapy was added to management plan after PET.

CLINICAL RELEVANCE/APPLICATION

The detection of additional disease sites on PSMA PET in men with biochemical failure after primary therapy and suspected low volume metastatic disease results in a frequent change in management.

M4-RCP48   Pivotal Trial Of Magnetic Resonance Imaging-guided Transurethral Ultrasound Ablation In Men With Localized Prostate Cancer: Three-year Follow-up And Multiparametric Magnetic Resonance Imaging Prediction Of Salvage Treatment

Participants
Steven Raman, MD, Santa Monica, California (*Presenter*) Consultant, Johnson & Johnson;Consultant, Bayer AG;Consultant, Merck & Co, Inc;Consultant, Amgen Inc;Consultant, Profound Medical Inc

PURPOSE

MRI-guided transurethral ultrasound ablation (TULSA) is a minimally invasive procedure for prostate ablation using directional ultrasound. The treatment is controlled in real-time using MRI thermometry feedback. We report 3 year outcomes from the pivotal TULSA-PRO Ablation Clinical Trial (TACT).*Methods and Materials TACT enrolled 115 men with organ-confined prostate cancer (=T2b, PSA =15 ng/ml, Grade Group 1-2) across 13 centers. Treatment was whole-gland sparing the urethra and urinary sphincter. Primary endpoints were safety and PSA reduction at 1 year. Secondary endpoints included 1 year prostate volume reduction, mpMRI, and 10 core biopsy. Three year follow-up included adverse events, quality of life and PSA for men who are salvage-free, and mpMRI prediction of salvage therapy.*Results Median (IQR) baseline age was 65 (59-69) years, median PSA 6.3 (4.6-7.9) ng/mL, with Grade Group (GG) =2 disease in 72/115 men (63%). Targeted prostate volumes of 40 (32-50) cc were ablated in 51 (39-66) min. Grade 3 adverse events in 9 (8%) men included GU infection, stricture, retention, urethral calculus and pain, and urinoma, all resolved before 1 year. There were no rectal injuries or Grade =4 events. By 3 years, 15 men (13%) received salvage treatment. At 1 year MRI and biopsy, median prostate volume decreased from 37 to 3 cc, GG2 disease was eliminated in 54/68 (79%) men, and 72/111 (65%) had no evidence of any cancer. Median PSA decreased 95% to a nadir of 0.26 ng/mL, stable from 0.53 ng/mL at 1 year to 0.70 ng/ml (n=56) at 3 years. Median IPSS decreased from 7 at baseline to 4 (n=61) by 3 years. Moderate urinary incontinence (Grade 2, pads) in 3 men (2.6%) at 1 year persisted to 3 years in 1 patient, with no new incontinence past 1 year. The rate of moderate erectile dysfunction (Grade 2, responding to medication) was 23% at 1 year and 24% at 3 years. Median change in IIEF-5 was -2 from baseline to 1 year, and nil from 1 to 3 years (n=61). Erections sufficient for penetration (IIEF Q2 =2) were maintained by 36/50 (72%) and 40/50 (80%) men at 1 and 3 years. On follow-up mpMRI, a visible lesion was predictive of persistent or recurrent disease and salvage therapy at 3 years (p=0.001; aOR 31.0, CI [6.4,150.0]).*Conclusions With 3 year follow-up, MRI-guided transurethral ultrasound ablation (TULSA) showed durable control of localized prostate cancer with low toxicity and stable quality of life. The presence of a visible lesion on follow-up mpMRI predicted for persistent or recurrent disease and salvage therapy.*Clinical Relevance/Application Whole-gland ablation using MRI-guided TULSA achieves effective disease control at 3 years with favourable functional and safety outcomes. The 1 year follow-up mpMRI is predictive of salvage therapy by 3 years.

RESULTS

Median (IQR) baseline age was 65 (59-69) years, median PSA 6.3 (4.6-7.9) ng/mL, with Grade Group (GG) =2 disease in 72/115 men (63%). Targeted prostate volumes of 40 (32-50) cc were ablated in 51 (39-66) min. Grade 3 adverse events in 9 (8%) men included GU infection, stricture, retention, urethral calculus and pain, and urinoma, all resolved before 1 year. There were no rectal injuries or Grade =4 events. By 3 years, 15 men (13%) received salvage treatment. At 1 year MRI and biopsy, median prostate volume decreased from 37 to 3 cc, GG2 disease was eliminated in 54/68 (79%) men, and 72/111 (65%) had no evidence of any cancer. Median PSA decreased 95% to a nadir of 0.26 ng/mL, stable from 0.53 ng/mL at 1 year to 0.70 ng/ml (n=56) at 3 years. Median IPSS decreased from 7 at baseline to 4 (n=61) by 3 years. Moderate urinary incontinence (Grade 2, pads) in 3 men (2.6%) at 1 year persisted to 3 years in 1 patient, with no new incontinence past 1 year. The rate of moderate erectile dysfunction (Grade 2, responding to medication) was 23% at 1 year and 24% at 3 years. Median change in IIEF-5 was -2 from baseline to 1 year, and nil from 1 to 3 years (n=61). Erections sufficient for penetration (IIEF Q2 =2) were maintained by 36/50 (72%) and 40/50 (80%) men at 1 and 3 years. On follow-up mpMRI, a visible lesion was predictive of persistent or recurrent disease and salvage therapy at 3 years (p=0.001; aOR 31.0, CI [6.4,150.0]).

CLINICAL RELEVANCE/APPLICATION

Whole-gland ablation using MRI-guided TULSA achieves effective disease control at 3 years with favourable functional and safety outcomes. The 1 year follow-up mpMRI is predictive of salvage therapy by 3 years.

M4-RCP48   Discussant for The Impact Of 18F-DCFPyL PET/CT On The Management Of Patients With Recurrent Prostate Cancer: Results Of A Prospective, Multicenter Trial

Participants
Steve Cho, MD, Madison, Wisconsin (*Presenter*) Research Grant, General Electric Company;Consultant, Novartis AG;Consultant, Lantheus Holdings;Consultant, Bristol-Myers Squibb Company;Consultant, Blue Earth Diagnostics Ltd;Consultant, Radmetrix

LEARNING OBJECTIVES

1)Review objectives, study design, and results from high impact clinical trials of 2021.2)Discuss clinical implications of trial results. 3)Describe the need for any additional confirmatory or follow on trials. This special session will present abstract results from top-scoring clinical trials, paired expert discussants to support the translation of evidence to clinical practice.

M4-RCP48   Discussant for Magnetic Resonance Guided Focused Ultrasound Versus External Beam Radiation Therapy For The Treatment Of Pain In Bone Metastases: A Phase II Trial

Participants
Bruce Haffty, MD, New Brunswick, New Jersey (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1)Review objectives, study design, and results from high impact clinical trials of 2021.2)Discuss clinical implications of trial results. 3)Describe the need for any additional confirmatory or follow on trials. This special session will present abstract results from top-scoring clinical trials, paired expert discussants to support the translation of evidence to clinical practice.

M4-RCP48   **Magnetic Resonance Guided Focused Ultrasound Versus External Beam Radiation Therapy For The Treatment Of Pain In Bone Metastases: A Phase II Trial**

Participants
Alessandro Napoli, MD, Rome, Italy (*Presenter*) Nothing to Disclose

PURPOSE

To assess the efficacy of MR guided Focused Ultrasound (MRgFUS) for the palliative treatment of painful bone metastases in comparison to external beam radiation therapy (EBRT).*Methods and Materials This prospective double-arm phase II study was conducted between January 2019 and March 2019. Participants with painful bone metastases were included in the trial and underwent either MRgFUS or EBRT. The primary end point was improvement in self-reported pain score assessed by using Visual Analogue Scale (VAS) 1 month after treatment. Secondary end point was the improvement in VAS at 12-month and quality of life (QoL) assessed by QoL Questionnaire Cancer 15 Palliative Care (C15-PAL) and QoL Questionnaire Bone Metastases 22 (BM22). Statistical analysis was conducted using a per-protocol principle.*Results 198 study participants were included; 100 participants (mean age, 63.2 years ± 13.4) underwent MRgFUS and 98 (mean age, 65.3 years ± 14.5) underwent EBRT. Response rate for the primary endpoint was 55% in the MRgFUS arm and 30% in the EBRT (p= 0.001). No significant difference between groups was found for BM22 and C15-PAL. Subtests analysis of C15-PAL for areas of physical function (p=0.002), appetite (p<0.001), nausea and vomiting (p<0.001), dyspnea (p<0.001) and quality of life (p<0.001) showed significant differences in favor of MRgFUS.*Conclusions MRgFUS in comparison to EBRT showed promising response when used as a palliative treatment in patients with painful bone metastases.*Clinical Relevance/Application MRgFUS may represent a valid option for the palliative treatment of patients with metastatic bone disease, with promising results in terms of pain relief and quality of life when compared to EBRT

RESULTS

198 study participants were included; 100 participants (mean age, 63.2 years ± 13.4) underwent MRgFUS and 98 (mean age, 65.3 years ± 14.5) underwent EBRT. Response rate for the primary endpoint was 55% in the MRgFUS arm and 30% in the EBRT (p= 0.001). No significant difference between groups was found for BM22 and C15-PAL. Subtests analysis of C15-PAL for areas of physical function (p=0.002), appetite (p<0.001), nausea and vomiting (p<0.001), dyspnea (p<0.001) and quality of life (p<0.001) showed significant differences in favor of MRgFUS.

CLINICAL RELEVANCE/APPLICATION

MRgFUS may represent a valid option for the palliative treatment of patients with metastatic bone disease, with promising results in terms of pain relief and quality of life when compared to EBRT

Review and Update on Imaging of Acute Abdominal Pain

Participants

Robin B. Levenson, MD, Newton, Massachusetts (*Presenter*) Nothing to Disclose
Kimberly Shampain, MD, Ann Arbor, Michigan (*Presenter*) Nothing to Disclose
Michael Patlas, MD,FRCPC, Hamilton, Ontario (*Presenter*) Royalties, Springer Nature
Aashish A. Patel, MD, Indianapolis, Indiana (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1.Review causes of acute abdominal pain, with a focus on acute urinary and GI related conditions 2.Identify key imaging findings and pitfalls of acute urinary and GI related conditions, as well as imaging features of potential complications. 3.Discuss current imaging protocol considerations Acute abdominal pain is one of the most common presenting symptoms of patients in the emergency setting. The differential diagnosis can be broad, clinical symptoms nonspecific, and thus, imaging often plays a critical role in diagnosis. It is important for radiologists to be familiar with key imaging features of various causes of abdominal pain to aid in making timely, appropriate diagnoses. The format of this educational session is lecture, didactic based. Topics to be discussed include urinary and gastrointestinal-related emergencies; imaging findings and pitfalls, review of the literature, update on imaging protocol considerations.

Looking Beyond the Hype: A Scientific Perspective on AI in Imaging

Participants

Paula M. Jacobs, PhD, Bethesda, Maryland (*Presenter*) Nothing to Disclose
Yan Chen, PhD, NOTTINGHAM, United Kingdom (*Presenter*) Nothing to Disclose
Charles Kahn JR, MD, Philadelphia, Pennsylvania (*Presenter*) Nothing to Disclose
Katherine Andriole, PhD, Branford, Connecticut (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1) Review practical examples of what current AI algorithms can and cannot do in medical imaging. 2) Learn the current state of AI in Imaging by critically reviewing some of the clinical trials in this area. 3) Understand current gaps in the scientific literature and discuss some potential pathways forward. Application of artificial intelligence/machine learning to various aspects of imaging has become ubiquitous in recent years, greeted by the popular press by uncritical enthusiasm or apocalyptic predictions of computers taking over the world. This hot topic session will feature short presentations by each of three experts exploring and evaluating aspects of artificial intelligence/machine learning as currently applied to various aspects of imaging, such as logistics and scheduling, image processing, and image interpretation. The panel will then discuss some provocative questions posed by the chair and by the audience.

Multimodal Imaging of Basic Vascular Anatomy and Vascular Variants

Participants
Filipe Caseiro Alves, MD, PhD, Coimbra, Portugal (*Presenter*) Nothing to Disclose
Sandeep S. Hedgire, MD, Lexington, Massachusetts (*Presenter*) Nothing to Disclose
Sara Zhao, MD, Boston, Massachusetts (*Presenter*) Nothing to Disclose
Richard D. White, MBChB, FRCR, Cardiff, United Kingdom (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1. To review arterial and venous anatomy in the chest, abdomen, and pelvis and common pitfalls encountered on imaging. 2. To understand the relevance of conventional anatomy and variants in the treatment of vascular disorders. The course features four lectures on arterial and venous anatomy in the chest, abdomen, and pelvis. Besides commonly encountered conventional arterial and venous anatomy, anatomical variants will be illustrated by multimodality imaging. Upon completion of the course, participants should be able to identify anatomical variants and understand their clinical relevance that affects image interpretation as well as aid procedure planning.

LEARNING OBJECTIVES

1) Understand the power of narrative to instill lessons in leadership; 2) Explain the difference between traditional command-and-control and newer influence styles of leadership. This course will use narratives and panel-based discussion to teach leadership skills critical for success for emerging radiology leaders. Presenters will illustrate how narratives can be used to inspire change, and how these narratives are especially useful when we are overwhelmed with data. Additionally, audience members will leave with an understanding how influence is the major currency for leadership in the future.

LEARNING OBJECTIVES

1)*Situacin actual de la formacin de postgrado en radiologa en su pas\Current status of postgraduate training in Radiology in your country. 2)Efectos de pandemia en los programas de formacin\Pandemic effects on training programs 3)Desafos en la formacin de radilogos para los prximos aos en su pas\Challenges in the training radiologists for the coming years in your country* The pandemic produced by the SARS-Cov2 virus has had a great impact on Latin American countries, which have been forced to modify undergraduate and graduate teaching in medicine.In the case of Radiology, the capacity of the reading rooms has been reduced and many radiologists are working remotely, from their homes. Lectures, clinical and academic meetings are also held virtually. In this context, the interaction between residents and staff has become a challenge.In this course, four leaders of radiology education from Mexico, Colombia, Argentina and Chile will show us how they have had to adapt, innovate and modify the way of teaching radiology residents in their respective countries. Likewise, the experts will share their vision of how resident education in radiology will be in the coming years.La pandemia producida por el virus SARS-Cov2 ha golpeado fuertemente a los pases latinoamericanos, los que se han visto obligados a modificar la docencia de pre y postgrado en medicina.En el caso de Radiologa, se han reducido los aforos de las salas de informe y muchos radilogos estn trabajando en forma remota, desde sus hogares. Las conferencias, reuniones clnicas y acadmicas tambin se realizan de manera virtual. En este contexto, la relacin entre residentes y staff se ha vuelto un desafo.En este curso, cuatro lderes de la educacin en radiologa e Mxico, Colombia, Argentina y Chile nos mostrarn cmo han debido adaptarse, innovar y modificar la forma de ensear a los residentes de radiologa en sus respectivos pases . Asmismo, los expertos nos mostrarn su vision sobre cmo ser la educacin en radiologa durante los prximos aos.

CNS - Case-based Multidisciplinary Review

Participants

Christina Tsien, MD, Washington, Dist. of Columbia (*Presenter*) Advisory Board, Blue Earth Diagnostics Ltd;Speakers Bureau, Varian, Inc;Speakers Bureau, Merck & Co, Inc
Soonmee Cha, MD, San Francisco, California (*Presenter*) Nothing to Disclose
Roger Stupp, MD, Chicago, Illinois (*Presenter*) Research Consultant, CarThera;Research Grant, CarThera;Committee member, Celularity, Inc;Scientific Advisory Board, CranioVation Inc;Scientific Advisory Board, Hemispherian AS;Research Consultant, InSightec Ltd;Consultant, GT Medical Technologies, Inc;Consultant, Triact Therapeutics Inc
Clark Chen, MD,PhD, Minneapolis, Minnesota (*Presenter*) Consultant, Medtronic plc;Consultant, MRI Interventions, Inc;Consultant, GT Medical

LEARNING OBJECTIVES

1. Review the recent updates to the 5th edition of the WHO Classification of Tumors of the CNS (2021). Emphasis will be on recognizing the implications of the substantial heterogeneity that exists amongst CNS tumor types and understanding the prognostic and predictive variables that help to guide selection of appropriate therapy. 2. Discuss key imaging modalities and imaging features to differentiate recurrent tumor and treatment effect and to identify brain tumor mimics. 3. Discuss the various treatment modalities, including surgery, radiotherapy, and chemotherapy, in managing gliomas, with emphasis on integrative or multi-modality strategies. Recent updates to the 5th edition WHO Classification of CNS tumors (2021) including the new tumor classifications will be discussed. The session will address the significant impact of molecular prognostic and predictive biomarkers that help to direct treatment selection for CNS tumors. The role of neuro-imaging in aiding clinicians improve the diagnosis, treatment and response assessment for CNS tumors will be emphasized. The session will follow "a rapid-fire" tumor board style to highlight the interactive multi-disciplinary treatment approach.References: 1. LEARNING OBJECTIVES

1) To review current response assessment criteria applicable to PET/CT. 2) To illustrate the application of these response assessment criteria in clinical practice. 3) To discuss advances in the field of FDG PET/CT and response assessment. This course will provide a review of response assessment and their application to clinical reporting of PET/CT. We will include an overview of response assessment criteria, pearls and pitfalls in applying the criteria in clinical practice and illustrative examples of how to apply response criteria with focus on the general radiologist, residents and fellows.

LEARNING OBJECTIVES

1. Review anatomy and ultrasound imaging techniques for common musculoskeletal ultrasound indications.2. Describe useful dynamic imaging techniques to enhance assessment of musculoskeletal conditions.3. Discuss ultrasound imaging of common pathologic musculoskeletal conditions. This session will review ultrasound appearances of normal anatomy including soft tissue structures and joints that are commonly requested for musculoskeletal assessment. Tips on how to optimize imaging to best evaluate the area of concern will be discussed. The hands-on demonstration will illustrate dynamic assessment and maneuvers to further enhance assessment and problem solving to improve diagnostic interpretation. Common pathologic musculoskeletal conditions will be discussed. At the end of the session, participants will improve their approach to ultrasound assessment of musculoskeletal structures and diagnosis of common pathologic musculoskeletal conditions.

Practice Standards: High-Value Structured Reporting

Participants
Shlomit Goldberg-Stein, MD, Manhasset, New York (*Presenter*) Nothing to Disclose
Olga R. Brook, MD, Boston, Massachusetts (*Presenter*) Nothing to Disclose
Victoria Chernyak, MD,MS, Bronx, New York (*Presenter*) Consultant, Bayer AG

LEARNING OBJECTIVES

1) Share a strategic roadmap on how to accomplish the rollout of structured radiology reporting in your organization. 2) Provide data for use in stakeholder negotiations on the value proposition of structured reporting. 3) Present data on the impact of ACR RADS on clinical patient outcomes. This course will share the latest data on the impact of standardized structured reporting systems on both the quality of radiology reporting and on patient clinical outcomes. Data will be presented in a format that can be used to highlight the value of structured reporting in stakeholder meetings. Finally, a strategic roadmap and resources will be shared to support the rollout of structured reporting within your organization. This educational course is in didactic lecture format.

Charles Kahn JR, MD, Philadelphia, Pennsylvania (*Presenter*) Nothing to Disclose
Curtis Langlotz, MD,PhD, Menlo Park, California (*Presenter*) Stockholder, whiterabbit.ai;Advisor, whiterabbit.ai;Stockholder, Galileo
CDS, Inc;Advisor, Galileo CDS, Inc;Stockholder, Bunker Hill, Inc;Board of Directors, Bunker Hill, Inc;Stockholder, Sirona Medical,
Inc;Advisor, Sirona Medical, Inc

LEARNING OBJECTIVES

(1)Enumerate common metrics used to assess clinical AI tool performance and some of their limitations. (2)Identify steps in the process of finding, evaluating and adopting a clinical AI tool for your practice. As clinical AI tools enter the radiology marketplace it is crucial to have a systematic approach to assess how these tools (1)fit clinical workflows, (2)how the AI tool is assessed and the relevance of these metrics to real world usage in your practice, and (3)how to choose, test, implement and monitor their usage at your site. Three experts will discuss the spectrum of solutions, the FDA's role in evaluating these tools, and provide a critical data based approach to assess them for practical use. Participants should understand categories of tools on the market, basic metrics used to report performance, pitfalls or misleading aspects to some AI metrics, and have an outline for how to approach the search for an AI solution for clinical use.

Yvonne Lui, MD, New York, New York (*Presenter*) Research collaboration lead, Siemens AGResearch collaboration lead, Facebook AI Research

LEARNING OBJECTIVES

1) Understand the potential role of artificial intelligence (AI) in clinical applications of neuroradiology. 2) Describe ways that AI may assist in brain tumor and stroke imaging. This course is designed to provide an update on the developing role of AI in clinical applicatoins of neuroimaging, including brain tumor and stroke imaging. The educational format includes lectures and Q&A. The expected outcome of the session is that attendees will have an understanding of the potential and current clinical applications of AI in neuroimaging.

Madan Rehani, PhD, Boston, Massachusetts (*Presenter*) Nothing to Disclose
Rebecca Smith-Bindman, MD, San Francisco, California (*Presenter*) Founder, Alara Imaging, Inc

LEARNING OBJECTIVES

To understand the importance of dose optimization for CT, and to understand different perspectives on how to tackle this important area of patient safety in health care. Medical Imaging with Computed Tomography has been one of the most impactful and transformative aspects of medicine. But along with the potential benefits of medical imaging with CT come potential risks, including the risk of cancer from the radiation associated with CT. There is broad interest from diverse stakeholders radiologists, medical physicists, hospitals, policy makers and those involved in quality improvement in reducing the doses for CT, but how to reduce those doses is not so simple. The session will include short lectures from individuals who have worked on a range of approaches for reducing the radiation doses for CT from diverse perspectives and for diverse populations with various levels of success and failures. The experiences will range from efforts at the level of a single hospital system, to broad international efforts.

What's New in Fetal and Obstetric Imaging

Participants
Carol Benson, MD, Boston, Massachusetts (*Presenter*) Nothing to Disclose
Deborah Levine, MD, Weston, Massachusetts (*Presenter*) Editor, Reed Elsevier;Editor, Wolters Kluwer nv;
Edward R. Oliver, MD, PhD, Media, Pennsylvania (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1. Differentiate the roles of ultrasound, including the nuchal translucency, and other tests, such as NIPT, in screening for fetal abnormalities in the first trimester.2. Explain the new guidelines for the first trimester early anatomy sonogram.3. Differentiate the complete obstetrical sonogram from the detailed obstetrical scan in second and third trimester and understand the required components of the detailed obstetrical scan.4. Review the sonographic markers associated with placenta accreta spectrum and the prenatal ultrasound evaluation in at-risk pregnancies so that participants can incorporate the appropriate scanning techniques for evaluation in these high risk pregnancies. This lecture course will address topics in Obstetrical Ultrasound. First will be a discussion of screening in the first trimester and the strengths and weaknesses of the NIPT test, and why the nuchal translucency measurement may still be indicated after the test. Also discussed will be the new guidelines for the first trimester early anatomy scan, as well as the relationship of cesarean scar pregnancies to placenta accreta spectrum complications. To follow this will be a presentation covering the second and third trimester detailed sonogram and how the role the interpreting physician, whether a radiologist or maternal-fetal-medicine physician, is evolving. An explanation about the difference the complete obstetrical scan and the detailed scan will be provided. Lastly will be a presentation on placenta accreta spectrum, including the guidelines for sonographic evaluation, as well as the important role of MRI in some cases.

Best Practices in Radiology: Clinical Decision Support Rollout

Participants

Pamela T. Johnson, MD, Baltimore, Maryland (*Presenter*) Intellectual property, AgileMD;Future royalties, AgileMD
Hanna M. Zafar, MD, Philadelphia, Pennsylvania (*Presenter*) Nothing to Disclose
John Mongan, MD,PhD, San Francisco, California (*Presenter*) Research Grant, General Electric Company;Royalties, General Electric Company;Spouse, Employee, Annexon Biosciences;Spouse, Employee, AbbVie Inc
Keith D. Hentel, MD, MS, Briarcliff, New York (*Presenter*) Nothing to Disclose
Christopher J. Roth, MD, Durham, North Carolina (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1) Define the requirements of the CMS Advanced Imaging Appropriate Use Criteria mandate, slated to be fully operational January 1, 2022. 2) Describe solutions that different health systems have implemented to meet the regulation. 3) Understand the implementation process and how to overcome barriers. 4) Design research investigations using robust methodologies and clinical effectiveness outcome metrics to evaluate the utility of these tools. The Protecting Access to Medicare Act includes a regulation that medical providers are guided by appropriate use criteria (AUCs) when ordering advanced imaging (CT, MRI and nuclear medicine). This regulation is slated to become fully operational January 1, 2022. While many medical centers have licensed a CMS-approved clinical decision support mechanism (CDSM) to be in compliance, some remain unaware. The purpose of this session is to inform clinicians and administrators about the requirements of CMS' advanced imaging AUC mandate. The implementation process is time and labor intensive and requires engagement of radiology and nonradiology providers. Key steps include allocating resources to cover licensing costs, selecting a clinical decision support tool, integrating the tool into the electronic medical record, and educating ordering providers about changes to order workflow for CT, MRI and nuclear medicine scans as well as why they are required to consult AUCs through a CDSM at order entry. Experienced medical centers will share different CDSM solutions, provide guidance on how to overcome implementation hurdles, and highlight new opportunities they have identified with respect to clinical effectiveness, efficiency and research.

Shoulder Imaging: How I Do It

Participants

Michael J. Tuite, MD, Verona, Wisconsin (*Presenter*) Nothing to Disclose
Soterios Gyftopoulos, MD, Scarsdale, New York (*Presenter*) Nothing to Disclose
Nathalie J. Bureau, MD, MSc, Montreal, Quebec (*Presenter*) Research Grant, Siemens AG
Donald L. Resnick, MD, San Diego, California (*Presenter*) Nothing to Disclose
Mark W. Anderson, MD, Charlottesville, Virginia (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1) Describe techniques that improve efficiency and accuracy when interpreting MR imaging of challenging areas of the shoulder, including the rotator interval and the superior labrum. 2) Explain a concise and useful system for characterizing rotator cuff tears on ultrasound. Get Tips and Tricks from five experts in shoulder MR and US imaging. These how-I-do-it lectures will discuss five challenging aspects of shoulder imaging for which the speakers have developed techniques to improve their efficiency and accuracy. The speakers will share helpful tips on MR of the rotator interval, what to report for instability, how to differentiate SLAP lesions from normal variants, optimizing your MR imaging planes, and US of the rotator cuff. You will be able to integrate these useful pearls into your practice and read shoulder images like the experts.

Pediatric Small Parts Ultrasound: When to Worry or Not

Participants

Cassandra Sams, MD, Providence, Rhode Island (*Presenter*) Nothing to Disclose
Tess Chapman, MD,MA, Seattle, Washington (*Presenter*) Nothing to Disclose
Claudia M. Martinez Rios Arellano, MD, Ottawa, Ontario (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1. Recognize the spectrum of sonographic findings in pediatric thyroid carcinoma and features that differentiate benign from malignant thyroid nodules in children.2.Recognize normal sonographic appearances of breast development and describe imaging features of commonly seen benign breast masses3. Recognize key sonographic findings to suggest the presence of gonadal torsion, as well as worrisome features in the setting of trauma. Small parts in small people can be a large source of consternation. This session will address the normal and abnormal appearance of the pediatric thyroid, breast, and gonads to help radiologists know when to worry.

Improving Patient Experience through Human Design Thinking (Sponsored by the RSNA Public Information Committee)

Participants
Susan John, MD, Houston, Texas (*Presenter*) Nothing to Disclose
Achala Vagal, MD, Cincinnati, Ohio (*Presenter*) Departmental Research Grant, Johnson & Johnson
Ruth C. Carlos, MD, MS, Ann Arbor, Michigan (*Presenter*) In-kind support, Reed Elsevier;Editor, Reed Elsevier;Travel support, General Electric Company
Lucy Spalluto, MD,MPH, Nashville, Tennessee (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1) Apply human design thinking processes to create practical solutions to improve patient experience. 2) Use novel teaching methods to improve empathy and communication between physicians and patients 3) Develop a health equity curriculum through human design thinking As patients become increasingly engaged in their medical care, attention to the quality of the patient experience must become a priority in radiology departments and imaging facilities. Human centered design is an approach to problem-solving that uses the patient perspective through all phases of the process. This technique emphasizes human dignity, access, and abilities when developing solutions. Empathetic communication with patients is a key factor in designing patient-centered solutions. This course will introduce the concept of human design thinking and how it can be applied to improve patient experience and communication in radiology and to develop a curriculum to teach health equity in imaging.

Inflammatory Vascular Diseases: Imaging Findings and Complications

Participants
Constantine Raptis, MD, Saint Louis, Missouri (*Presenter*) Nothing to Disclose
Kohsuke Kudo, MD, Sapporo, Japan (*Presenter*) Research Grant, FUJIFILM Holdings Corporation
Linda C. Chu, MD, Lutherville, Maryland (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1. Review the imaging findings and important complications of inflammatory vascular conditions in the central nervous system 2. Explore the imaging findings of inflammatory vascular conditions in the thorax within the context of the Chapel Hill nomenclature system3. Discuss the imaging findings and complications of syndromic and non-syndromic heritable vascular diseases such as Marfan disease, Loeys-Dietz syndrome, and bicuspid aortic valve Inflammatory and heritable vascular diseases, or vasculopathies, represent a spectrum of noninfectious conditions that affect the vascular wall. These conditions can produce a wide array of clinical presentations and may result in important complications including aneurysm, stenosis, and dissection. Radiologists have an important role in the multidisciplinary approach to these diseases, as imaging findings are important pieces of their diagnostic and management puzzle. In this course, a discussion and case based review of inflammatory and heritable vascular diseases will be presented, with an emphasis on the central nervous system and thorax. After this course, attendees will be better equipped to tackle the challenges presented by these conditions.

Does Contrast Induced Nephropathy Really Exist?

Participants

Jill Jacobs, MD, New York, New York (*Presenter*) Nothing to Disclose
Brian B. Ghoshhajra, MD, Boston, Massachusetts (*Presenter*) Research Grant, Siemens AG;Consultant, Koninklijke Philips NV
Phillip M. Young, MD, Rochester, Minnesota (*Presenter*) Advisory Board, Arterys Inc

LEARNING OBJECTIVES

This course will underscore the current advantages and limitations of low dose contrast CT and MR angiography techniques for imaging the typically "brittle" TAVR patient population while trying to prevent exacerbation of renal insufficiency. This course will debate whether or not Contrast Induced Nephropathy exists and which modality, low dose contrast CT or MR angiography, is preferable to utilize in the typically "brittle" TAVR population with renal insufficiency.

Impact of COVID-19 on Breast Imaging and Modification of Practice

Participants
Rudolf Pijnappel, MD, PhD, Utrecht, Netherlands (*Presenter*) Nothing to Disclose
Emily F. Conant, MD, Philadelphia, Pennsylvania (*Presenter*) Research Grant, Hologic, Inc;Advisory Panel, Hologic, Inc;Research Grant, OM1, Inc;Research Grant, iCad, Inc;Advisory Panel, iCad, Inc;Speaker, Medscape, LLC
Stephen W. Duffy, London, United Kingdom (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1)Identify the long-term effect of prolonging the screening interval due to COVID-192)Explain the side effect of COVID-19 vaccination on axillary lymph nodes3)Impact on breast care in a clinical setting from COVID-19 The impact of COVID-19 was huge not only as infectious disease but also had its impact on Cancer care. Breast Cancer Screening programs were heavily hampered and some even were forced to stop for a couple of months. The long-term impact of this disturbance on outcome will be highlighted during this session. Not only the screening programs but also the clinical breast care suffered from COVID-19. The impact regarding breast practice will be evaluated in combination with the side effects of vaccination since axillary lymph node enlargement due to vaccination plays an important role in the clinical setting. Three lectures from Europe and the US will highlight the effect of COVID-19 on screening, outcome and clinical management of breast care.

The Report of the Future: Interactive Multimedia Reporting

Participants

Les Folio, MPH,DO, Tampa, Florida (*Presenter*) Institutional research agreement, Koninklijke Philips NV
Patricia Balthazar, MD, Atlanta, Georgia (*Presenter*) Nothing to Disclose
David Kwan, BSC, Thornhill, Ontario (*Presenter*) Nothing to Disclose
Seth Berkowitz, MD, Boston, Massachusetts (*Presenter*) Advisory Board, Change HealthcareResearch Grant, Change HealthcareResearch Grant, Koninklijke Philips NV

LEARNING OBJECTIVES

Understand how multimedia reports can add value to patients and referring physicians.List barriers to creating and distributing multimedia reports.Recite various approaches to interoperable multimedia report creation. We describe how interactive multimedia reports can add value to patients and referring physicians by clicking on clinical report text that directs one to the image annotation. Our first white paper was recently published in JDI that is clinically focused and describes how this reporting could benefit all image centric specialties such as dermatology and pathology. A common adoption barrier for advanced reporting shared by most participating centers is the current lack of interoperability between disparate electronic health records (EHR), picture archiving and communications systems (PACS), a variety of imaging modalities, acquisitions and capture devices. The largest challenge remains: the limited interoperability between radiologys most commonly used diagnostic image viewers and speech recognition-based reporting systems. Some radiology practices utilize innovative combined viewer and report creation applications which lower the IMR creation barrier significantly, though this is a minority of sites. Even if radiologists could easily create and distribute such reports, proprietary and site-specific output interfaces and integrations involving the downstream electronic health record (EHR) often erode IMR quality and value by displaying the IMR using portable document format (PDF) viewers with limited capabilities, rather than software able to manage the full interactive and multimedia features included by the application on which the report was created directly as it was created. We share examples of how to overcome these challenges with technical development requirements, including established and evolving standards. Dr. Berkowitz will explain how Beth Israel Deaconess became interactive and multimedia across various vendors and platforms.

The Enlarged Uterus: Fibroids and Adenomyosis

Participants

Susan M. Ascher, MD, Washington, Dist. of Columbia (*Presenter*) Nothing to Disclose
Mindy Horrow, MD, Philadelphia, Pennsylvania (*Presenter*) Spouse, Employee, Bristol-Myers Squibb Company
Malcolm Munro, MD, Tarzana, California (*Presenter*) Consultant, AbbVie Inc;Consultant, Sumitovant Biopharma Ltd;Consultant, Hologic, Inc;Consultant, Luitpold Pharmaceuticals, Inc;Consultant, DAIICHI SANKYO Group;Consultant, Pharmacosmos Therapeutics Inc;Stockholder, Gynesonics, Inc;Stockholder, UVision 360

LEARNING OBJECTIVES

1) Identify the US and MR features of fibroids and adenomyosis to include overlapping features2)Explain the role of imaging in the management of women with symptomatic fibroids and/or adenomyosis This course will focus on the pathophysiology, classification, and US and MR diagnosis of fibroids and adenomyosis. The course will emphasize imaging information critical to gynecologists caring for symptomatic women. The format is three lectures followed by a question and answer session.

LEARNING OBJECTIVES

Develop differential diagnoses for the five radiology subspecialties presented in this course Recognize imaging features that aid in differential diagnoses, allowing for a more specific diagnosis Learn evaluation of cases in a methodical and clinically applicable fashion This is an interactive and practice-based course for all radiologists at all levels. The format is case-based and rapid-fire evaluation of one's diagnostic skills. The participants are guided through a selection of the best cases from the RSNA Case Collection across 5 subspecialties.

Deep Learning Lab: Working with Public Datasets: TCIA & IDC

Participants
Andriy Fedorov, PhD, Arlington, Massachusetts (*Presenter*) Nothing to Disclose
Justin Kirby, Rockville, Maryland (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1. Understand the capabilities and complementary nature of the TCIA and IDC repositories, including those related to identifying and visualizing relevant data, defining cohorts and retrieving the data for subsequent analysis; 2. Gain familiarity with the process of retrieving the data and applying a representative processing pipeline using free compute resources available via Google Colab; 3. Establish awareness about the related components of the broader NCI data science ecosystem, and the learning resources available to the community to facilitate the use of IDC and TCIA for cancer imaging research. The National Cancer Institute (NCI), of the National Institutes of Health (NIH), has made significant investments in the creation and development of public data repositories to enable and promote data sharing and secondary analysis of cancer imaging data through an open science approach. The two flagship repositories supported by NCI are The Cancer Imaging Archive (TCIA) (https://www.cancerimagingarchive.net/) and Imaging Data Commons (IDC) (https://imaging.datacommons.cancer.gov/). TCIA works directly with data submitters to implement de-identification, curation and hosting of imaging collections for download. IDC is an emerging repository within the NCI Cancer Research Data Commons (CRDC) (https://datacommons.cancer.gov/), which replicates de-identified public collections on the cloud, co-locating the imaging data alongside the analysis resources and tools, and other types of linked data. The purpose of this course is to introduce the attendees to the complementary capabilities of TCIA and IDC, and demonstrate how the data available in both TCIA and IDC can be accessed and utilized via hands-on examples with Google Colab notebooks. At the completion of this course the attendees are expected to be equipped with the knowledge needed to proceed with identifying and analyzing relevant datasets from TCIA and IDC.

Controversies in Spine Intervention: To stick or not to stick?

Participants

Joshua Hirsch, MD, Boston, Massachusetts (*Presenter*) Consultant, Medtronic plc;Consultant, Relievant Medsystems, Inc;Committee member, Relievant Medsystems, Inc;Consultant, Persica Pharmaceuticals Limited;Committee member, Persica Pharmaceuticals Limited
Miriam Peckham, MD, Salt Lake City, Utah (*Presenter*) Nothing to Disclose
Peter G. Kranz, MD, Durham, North Carolina (*Presenter*) Nothing to Disclose
Afshin Gangi, MD,PhD, Strasbourg, France (*Presenter*) Consultant, AprioMed AB

LEARNING OBJECTIVES

1) Discuss indications and techniques for epidural patching, with a focus on patient selection and technical considerations specific to particular subtypes of spinal CSF leak2) Discuss the current evidence regarding a) efficacy of and b) indications for facet and sacroiliac joint interventional techniques including steroid/anesthetic injection, radiofrequency ablation, and platelet-rich plasma.3) Discuss the role radiologists might play in diagnosing and managing benign tumors of the spine. The focus will be the most frequent benign tumors of the spine which can be treated percutaneously with an emphasis on complication avoidance. 4) Understand the impact of augmentation on mortality in patients with vertebral compression fractures. This session will address several topical themes in the field of image-guided spine intervention, covering procedures for spinal pain, CSF leak, tumors, and vertebral compression fractures. Speakers will variably emphasize key questions about when each type of spine intervention is necessary, factors that promote success, practical considerations for the radiologist performing the procedure and/or general reasons to consider treatment vs. other therapy. Following the lecture, all speakers will participate in a panel discussion and engage the audience in a discussion about the questions and controversies surrounding these procedures.

Contrast Enhanced Mammography

Participants

Vasiliki Papalouka, MD, Cambridge, United Kingdom (*Presenter*) Nothing to Disclose
Marc Lobbes, MD, Maastricht, Netherlands (*Presenter*) Speaker, General Electric Company;Medical Advisory Board, General Electric Company;Speaker, Bayer AG;Medical Advisory Board, Bayer AG;Speaker, Guerbet SA;Medical Advisory Board, Guerbet SA
Christopher E. Comstock, MD, New York, New York (*Presenter*) Advisory Board, Bracco AG

LEARNING OBJECTIVES

1. Review the background, principals and technique of Contrast Enhanced Mammography (CEM) and discuss its current clinical applications, limitations and future directions;2. Discuss whether CEM is ready to replace breast magnetic resonance imaging, specifically for the indication of preoperative staging of women with breast cancer;3. Identify the limitations of current breast cancer screening techniques and review data on the use of CEM as a screening technique. In this course, three expert speakers will address the current status of Contrast Enhanced Mammography (CEM). A short introduction will be given on the techniques, the principles and potential clinical applications. More specifically, we will go into details whether CEM is ready to replace breast MRI for certain indications, zooming in on the preoperative staging of breast cancer as specific indication. Finally, the limitations of current breast cancer screening will be identified and we will discuss what future role CEM can play in screening, despite the slightly increased radiation dose and the use of iodinated contrast agents.

Thoracic Imaging Practice - Polling Session

Participants
Ioannis Vlahos, MRCP,FRCR, Houston, Texas (*Presenter*) Director, Grayscale Ltd;Co-owner, Grayscale Ltd;
Sanjeev Bhalla, MD, Saint Louis, Missouri (*Presenter*) Advisory Board, Precisa Gravimetrics AG
Brett M. Elicker, MD, San Francisco, California (*Presenter*) Nothing to Disclose
Ella Kazerooni, MD, Ann Arbor, Michigan (*Presenter*) Nothing to Disclose
Jo-Anne O. Shepard, MD, Boston, Massachusetts (*Presenter*) Editor with royalties, Reed Elsevier
Ann N. Leung, MD, Stanford, California (*Presenter*) Nothing to Disclose
Cristopher Meyer, MD, Middleton, Wisconsin (*Presenter*) Investor, Elucent Medical

LEARNING OBJECTIVES

1. The audience will become aware of latest imaging/reporting guidance for certain defined clinical/radiological scenarios.2. For situations where there is no formalized guidance on interpretation/reporting or practice, the audience will be able to assess their practice against the practice variation of the RSNA audience. The expert panel will show their choices and discuss their best recommendations. 3. The polling of areas of uncertainty in our practice and the expert panel discussion may define future areas for research and formalized radiological guidance. This is a new interactive course format. The attending audience will be polled on a series of cardiopulmonary imaging topics where practice may vary. This may include the audience opinion on how they might interpret, measure or report individual image findings, what imaging strategy they might select for different scenarios, what imaging/management guidance we might offer, or survey practice/technical variations.The same polling questions will be asked to a panel of experts to determine their practice choices and variability. The expert panel will present whether there is formal guidance on the different topic issues, or discuss between them their best recommendations for areas of uncertainty in current practice. The format of the course will be adjusted according to whether the meeting session is in person, or virtual, in view of uncertainty with regards to Covid.

Participants
Nancy McDonald, MS, Dallas, Texas (*Presenter*) Nothing to Disclose
Rennie Mohabir, MBA,RT, Valley Stream, New York (*Presenter*) Nothing to Disclose
Anzi Zhao, MS, Chicago, Illinois (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

By the end of this presentation, the attendees will be able to:Understand the background of eliminating patient shielding initiativeUnderstand rationales for eliminating patient shieldingUnderstand fetal risks from ionizing radiationKnow fetal dose from typical imaging examsIdentify shielding that will be discontinuedKnow Northwestern Medicines experience on eliminating patient shielding WHY ARE WE NOT SHIELDING PATIENTS ANY LONGER??????This course will help you understand the WHY, the WHAT and the RATIONALE of why you have been asked to eliminate patient shielding in most radiology procedures.

Abstract Archives of the RSNA, 2021

Controversies in Imaging Utilization

Participants
Rebecca Smith-Bindman, MD, San Francisco, California (*Presenter*) Founder, Alara Imaging, Inc
H. Gilbert Welch, MD,MPH, Thetford, Vermont (*Presenter*) Nothing to Disclose
Etta D. Pisano, MD, Boston, Massachusetts (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1) At the end of the session the attendees will understand the value of well-done radiology research with a focus on appropriate study design to inform clinical practice. Radiology plays a critically important role in the diagnosis, management and treatment of nearly every medical disease. Radiologists have been involved in some of the most exciting, transformative and innovative areas of medical discovery. However, the research that supports how imaging should be integrated into patient care to improve patient outcomes often falls short of the rigorous research that is used to support other areas of health care. Often a simplistic and false narrative is created that focuses on whether imaging is good or bad, without a more nuanced discussion and quantification of both the potential risks and the potential benefits that are associated with the use of a particular test that could then inform how new technologies should be used.

Advanced Techniques for Abdominal Imaging

Participants

Meghan G. Lubner, MD, Madison, Wisconsin (*Presenter*) Grant, Koninklijke Philips NV;Grant, Johnson & Johnson

Andrew Smith, MD, PhD, Birmingham, Alabama (*Presenter*) CEO, AI Metrics LLC ;Owner, AI Metrics LLC ;CEO, Radiostics LLC;Owner, Radiostics LLC;Research Grant, General Electric Company;Speaker, General Electric Company;Speaker, Canon Medical Systems Corporation;Speaker, AlgoMedica, Inc

Perry J. Pickhardt, MD, Madison, Wisconsin (*Presenter*) Advisor, Bracco Group;Advisor, Zebra Medical Vision Ltd;Advisor, Nano X Imaging;

Ajit H. Goenka, MD, Rochester, Minnesota (*Presenter*) Nothing to Disclose

Vikas Gulani, MD, PhD, Ann Arbor, Michigan (*Presenter*) Research support, Siemens AG;License agreement, Siemens AG;Spouse, License agreement, Siemens AG

LEARNING OBJECTIVES

1) Identify current quantitative CT and MRI applications in abdominal radiology.2) Discuss current uses of PET MRI in abdominal radiology.3) Explain how AI applications for body composition analysis can be used for opportunistic screening of high-risk conditions on a population level. 4) Review applications of artificial intelligence in evaluation and reporting of advanced GI/GU malignancies. As the practice of abdominal radiology advances, new quantitative approaches are becoming mainstream, and artificial intelligence (AI) applications are on the horizon, with some entering clinical practice. This lecture series will review abdominal radiology applications of quantitative CT and MRI, advanced applications of PET/MRI, and the use of artificial intelligence in body composition analysis and advanced GI/GU malignancies. We will review quantitative CT and MRI applications for staging liver fibrosis, measurement of liver fat, and radiomics analysis of GI/GU tumors. Advanced PET MRI topics will include current oncologic applications such as neuroendocrine, hepatic, colorectal, and GU tumors. The application of AI for quantitative body composition analysis allows for opportunistic screening of high-risk profiles and conditions on a population level, outperforming previously established clinical reference standards. Learn how these techniques can be used in multi-institutional studies and clinical practice. Finally, learn how AI can be applied to advanced GI/GU malignances to improve reporting accuracy, efficiency, and standardization. Can these AI applications be adapted to LI-RADS, PI-RADS and other difficult workflows?

Ryan K. Lee, MD, Philadelphia, Pennsylvania (*Presenter*) Nothing to Disclose
Rebecca Bromwich, PhD, Ottawa, Ontario (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1) Describe key concepts regarding ethical use of data, Algorithms and their clinical application to promote well being and minimize harm; 2) Discuss privacy issues related to AI in radiology, including informed consent and potential safeguards; 3) Examine legal responsibility related to the development and application of AI in Radiology and different liability models for different settings and forms of AI; 4) Assess bias in AI from clinically confounding attributes to technical factors and describe how to minimize the bias from training data to over time use in clinical practice; 5) Discuss the development of interpretable AI Systems for clinical radiology and the elements of decision-making behind classification decisions. Artificial intelligence (AI) is rapidly advancing, which may reshape modern radiology practice. It has also posed many new professionalism related challenges for radiologists. The goal of this course is to discuss how to manage these new challenges related to AI, including ethics, privacy and data protection, data ownership, legal and regulatory, transparency, and bias related issues. This course includes 5 lectures. Attendees will learn how to navigate these new professionalism challenges when applying AI in Radiology.

LEARNING OBJECTIVES

1. Learn about the latest updates on prostate imaging with special emphasis on MRI and PET imaging.2. Review the quality control efforts for prostate MR and explain the current and future applications of artificial intelligence on prostate imaging.3. Understand the potential roles and added value of PSMA PET and PET MR in the management of patients with prostate cancer. This session aims to provide a comprehensive update on the latest developments on prostate imaging with a special focus on MR and PET imaging. The presentations cover a well-balanced, broad scope from practical, updated tips for optimized prostate MR acquisition and interpretation to emerging techniques such as PET MRI. PSMA PET imaging and its role impacting the management of prostate cancer will be reviewed in addition to other hot topics in prostate MR including quality control efforts and artificial intelligence.

Luck J. Louis, MD, Vancouver, British Columbia (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1) Learn current applications and limitations in emergency ultrasound imaging.2) Review critical physiology and pathology depicted by ultrasound, with special focus on dynamic imaging. 3) Understand the vital role of ultrasound imaging in optimum emergent patient care This case-based course will highlight ultrasounds vital role in emergent patient care emphasizing right upper and lower quadrant pain, acute musculoskeletal disease, the genitourinary/reproductive system and pediatric abdomen/pelvic presentations. Ultrasound clinical and anatomic correlation will be emphasized, including high frequency and Doppler techniques. Differential diagnoses will include infection, inflammation, neoplasm, ischemia and hemorrhage primarily focusing on diseases requiring acute intervention. Our goal is to provide a broad update in the field while addressing new opportunities and challenges for everyday practice.

Artificial Intelligence in the Hands of Medical Imaging and Radiation Therapy Professionals Part I: The Current Status of AI in Our Practice (Sponsored by the Associated Sciences Consortium)

Participants

Susie Moseley, BS, RT, Albuquerque, New Mexico (*Presenter*) Nothing to Disclose
Sharon Wartenbee, RT, Sioux Falls, South Dakota (*Presenter*) Nothing to Disclose
Christina Malamateniou, PhD, MA, BSC, MEd, London, United Kingdom (*Presenter*) Nothing to Disclose
Melissa Pergola, RT, Albuquerque, New Mexico (*Presenter*) Siemens Healthineers, Past Employee (left June 2021)

LEARNING OBJECTIVES

1) Discuss the development and common terminology associated with artificial intelligence (AI). 2) Differentiate AI, machine learning (ML), and automation to identify what is and what isn't AI. 3) Discuss stakeholders' opinions regarding how the implementation of AI, ML and automated features will affect clinical practice, workflows, staffing, and patient care in medical imaging and radiation therapy facilities. 4) Identify how artificial intelligence is being used in everyday activities and technologies in medical Imaging. 5) Identify ways of preparing students for a future with artificial intelligence. This is a two-part presentation titled Artificial Intelligence in the Hands of Medical Imaging and Radiation Therapy Professionals. Part I aims to identify the development and terminology of artificial intelligence (AI), machine learning (ML), and automation associated with the radiologic sciences. Additionally, current and proposed patient care practices for AI and ML will be discussed. Part II will cover practitioner trust, the role of education, future applications and effects of AI and ML in shaping the profession, and ethical responsibilities of health care facilities and employees when implementing AI and ML into everyday practice.

Pediatric Lumps and Bumps: Imaging Differential Diagnosis

Participants
Ricardo Restrepo, MD, Miami, Florida (*Presenter*) Nothing to Disclose
Oscar M. Navarro, MD, Toronto, Ontario (*Presenter*) Nothing to Disclose
Neil Lall, MD, Atlanta, Georgia (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

To become familiar with a basic and succinct version of the ISSVA classification of vascular anomalies and with the imaging features of most common vascular anomalies (i.e. hemangiomas and vascular malformations) To describe sonographic findings of common pediatric lumps and bumps found in the head and neck.To describe sonographic findings of common pediatric lumps and bumps found below the neck. Lumps and bumps in pediatrics are very frequently encountered in every radiology practice.Most lumps and bumps in the pediatric population are benign and the differential diagnosis changes according to the childs age.This case-based interactive session will focus on the diagnostic approach outlining the importance of clinical information and a review of the most relevant imaging findings of common and unique pediatric lumps and bumps with emphasis on the use of ultrasonography. At the end of this session, radiologists will feel confident providing a differential diagnosis, diagnosing some specific entities and recognizing those that may require further diagnostic workup.

Priyanka Jha, MBBS, San Francisco, California (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1) Identify causes of recurrent pregnancy loss seen on imaging. 2) Explain tubal and ovarian etiologies for female infertility. 3) Describe the indications, limitations, and pitfalls of different imaging tests that evaluate female infertility. This lecture series will present new and standard imaging techniques for evaluating female infertility. The potential structural causes of recurrent pregnancy loss, including Mullerian duct anomalies, synechia, leiomyomas, and polyps, will be presented. Best practice for hysterosalpingogram (HSG) performance using oil or water-soluble contrast and hysterosalpingo-contrast sonography (HyCoSy) will be reviewed. The updated criteria for diagnosing polycystic ovarian syndrome (PCOS) will be presented. Following the session, the attendee should be knowledgeable in the imaging evaluation of female infertility.

Arun Krishnaraj, MD, MPH, Charlottesville, Virginia (*Presenter*) Nothing to Disclose
Andrew Gunn, MD, Vestavia Hills, Alabama (*Presenter*) Consultant, Boston Scientific Corporation;Speaker, Boston Scientific Corporation;Research support, Penumbra, Inc;Speaker, Terumo Corporation;Consultant, Varian Medical Systems, Inc;;

LEARNING OBJECTIVES

1. Identify methods for radiologists to optimize patient portal usage and engagement and why this is even more important because of the 21st Century Cures Act. 2. Describe how our work product, the radiology report, can be more patient centered.3. Better understand CMS Quality Payment Program and reimbursements for patient centric care through quality metrics and improvement activities. This course is designed to help radiologists better understand how patient centric radiology and informatics can be synergistic despite their seemingly opposite foundations. Radiologists will be given tools and ideas to implement and integrate informatics in ways to improve the patient experience.

Read Like the Experts: Hands-on Staging of Head and Neck Cancer

Participants
Amy Juliano, MD, Boston, Massachusetts (*Presenter*) Nothing to Disclose
Richard H. Wiggins III, MD, Salt Lake City, Utah (*Presenter*) Nothing to Disclose
Philip Chapman, MD, Durham, North Carolina (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1) Understand imaging anatomy of the nasopharynx, oropharynx, and larynx.2) Identify pertinent features of squamous cell carcinoma in these areas for diagnosis and staging. This session will provide a hands on experience to learn from the experts on head and neck cancer staging in the Nasopharynx, Oropharynx and Larynx. The session is geared towards those who interpret head and neck cancer imaging and would like a refresher on controversies and pitfalls related to this topic. The flipped classroom format will allow for an engaging learning experience.

Deep Learning Lab: NLP: Text Classification with RNNs & Transformers

Participants
Kirti Magudia, MD,PhD, Durham, North Carolina (*Presenter*) Nothing to Disclose
Walter Wiggins, MD, PhD, Durham, North Carolina (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

(1) Understand the basic steps required to prepare data for information extraction with natural language processing (NLP) tools. (2) Define the basic terminology of NLP for text analysis (e.g. preprocessing, parsing, tokenization). (3) Train an NLP model to classify chest radiograph reports as 'positive' or 'negative' for abnormal findings. This course will provide participants with the opportunity to learn the basic principles of information extraction from radiology reports by working through a step-by-step example using radiology reports from a chest radiograph data set. Learners will train a model to classify radiology reports as positive or negative for opacity. This session will cover basics of text analysis and concepts such as report parsing and preprocessing of text for NLP. No prior coding or machine learning experience is necessary.

Making Patients and Staff Safer in Interventional Procedures

Participants

A. Kyle Jones, PhD, Houston, Texas (*Presenter*) Nothing to Disclose
Stephen Balter, PhD, New York, New York (*Presenter*) Speakers Bureau, MAVIG, GmbHConsultant, ControlRad Systems, Inc
David Borrego, PHD, Washington, Dist. of Columbia (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1. Identify risks to patients and staff from fluoroscopically-guided interventions.2. Where possible, quantify the relative magnitudes of these risks.3. Formulate strategies for managing identified risks. This course will review risks, including radiation-related risks and other risks, to patients undergoing and staff participating in fluoroscopically-guided interventional procedures. Perspective on the magnitude of these risks will be provided, and strategies for managing risk will be discussed. Understanding risks and their magnitude is important for data-driven clinical decision-making, informed consent, and optimization of patient and staff protection.

Participants
Lifeng Yu, PhD, Rochester, Minnesota (*Presenter*) Nothing to Disclose
Guang-Hong Chen, PhD, Madison, Wisconsin (*Presenter*) Nothing to Disclose
Marc Kachelriess, PhD, Heidelberg, Germany (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

(1) Describe deep learning applications in CT image formation process, including image reconstruction and artifact reduction.(2) Explain current clinical implementations of deep learning methods on CT scanners and how to evaluate these methods. This course will provide an overview of deep learning applications in CT image formation, including image reconstruction and artifact correction. It will also summarize current clinical implementations of deep learning methods on CT scanners and describe how to appropriately evaluate these methods. Potential pitfalls of deep learning methods in CT image formation will be described. There are three lectures in this course:(1) Deep learning in CT reconstruction(2) Deep learning in CT artifact correction(3) Clinical implementation and evaluation

LEARNING OBJECTIVES

1) Explain the development of a standardized lexicon for liver imaging, and the advantages of its use in scientific publications and clinical practice. 2) Overview the latest scientific evidence supporting use of LI-RADS CEUS and CT/MRI Diagnostic Algorithms. 3) Explain nuances of LI-RADS Treatment Response Algorithm application when using different modalities and contrast agents. This education session covers high-yield concepts in Liver Imaging Reporting and Data System (LI-RADS). The engaging and informative course, taught by internationally renowned experts in liver imaging, consists of didactic lectures that discuss diagnostic and treatment response LI-RADS algorithms, and the standardized lexicon for liver imaging. The course offers learning opportunities for both novice and experienced LI-RADS users, as the faculty will highlight practical tips along with the overview of the latest scientific evidence, current challenges and future directions for all LI-RADS algorithms. The attendees will be introduced to the concept of a unified liver imaging lexicon, and the many advantages its adoption in scientific literature and clinical practice offers. The attendees are encouraged to bring questions and challenge the faculty.

Unprofessionalism in the Workplace

Participants
Jessica Robbins, MD, Madison, Wisconsin (*Presenter*) Nothing to Disclose
Kristin Porter, MD,PhD, Birmingham, Alabama (*Presenter*) Stockholder, Pfizer Inc;Medical Advisory Board, Bracco Group
Vikas Gulani, MD, PhD, Ann Arbor, Michigan (*Presenter*) Research support, Siemens AG;License agreement, Siemens AG;Spouse, License agreement, Siemens AG
Ann K. Jay, MD, Washington, Dist. of Columbia (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1) Identify strategies to recognize and mitigate unprofessional and disruptive behavior in the workplace. Unprofessional and disruptive behavior in the radiology workplace can be on the spectrum of overt to insidious. In this course, we will explore microaggressions, sexual harassment, professionalism transgressions, and disruptive behaviors due to mental illness. We will discuss how these behaviors may manifest themselves and provide examples of mitigation strategies.

Efficient and Focused Cardiac MRI

Participants

Christopher Francois, MD, Rochester, Minnesota (*Presenter*) Nothing to Disclose
Tim Leiner, MD, PhD, Rochester, Minnesota (*Presenter*) Speakers Bureau, Koninklijke Philips
James Carr, MD, Chicago, Illinois (*Presenter*) Institutional Research Grant, Siemens AG;Advisory Board, Siemens AG;Travel support, Siemens AG;Institutional Research Grant, Bayer AG;Advisory Board, Bayer AG;Travel support, Bayer AG;Speaker, Bayer AG;Institutional Research Grant, Guerbet SA;Advisory Board, Bracco Group

LEARNING OBJECTIVES

1.) Identify methods for optimizing clinical cardiac MR scan parameters to accelerate image acquisition. 2.) Summarize strategies for standardizing CMR protocols across a large imaging enterprise. 3.) Describe the use of advanced cardiac MR techniques to assess blood flow. This course will cover various aspects performing cardiac MRI using rapid techniques and focused protocols. Specifically, course content will include how accelerated image acquisition methods can lead to cardiac MRI studies being performed in 20 minutes, or less, and enable comprehensive evaluation of blood flow. In addition, the course will explore how using standardized protocols across an imaging enterprise leads to improvements in scanning and interpretation efficiency.

Non-traumatic Emergency Thoracic CT Angiography

Participants
Diana Litmanovich, MD, Boston, Massachusetts (*Presenter*) Nothing to Disclose
Stephen Ledbetter, MD, Boston, Massachusetts (*Presenter*) Nothing to Disclose
Rawan Abu Mughli, MD, Toronto, Ontario (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1) Understand common and differentiating features among the acute aortic syndromes. 2) Review the diagnostic criteria for acute pulmonary embolism and right ventricular dysfunction. 3) Consider the causes and imaging features of non thrombogenic pulmonary embolism. 4) Review common cardiac and coronary causes of acute chest pain in the ED. 5) Review the modern approach to non-invasive cardiac/coronary imaging in the ED. The series of lectures in this session will review the most common use cases for thoracic CT angiography in the non-traumatic setting. Speakers will specifically address acute aortic syndromes, pulmonary embolus, and acute coronary syndrome. Attendees can expect to strengthen their skills in the interpretation of thoracic CT angiography in the setting of non-traumatic chest pain.

Javier Villanueva-Meyer, MD, San Francisco, California (*Presenter*) Research Grant, General Electric Company

LEARNING OBJECTIVES

1. Understand indication and pitfalls of amyloid and tau imaging in patients with dementia
2. Understand mechanism and indications for PET tracers used in neurooncology-
3. Understand health economics of NeuroPET in clinical use. Dementia is a growing public health problem and the need for reliable biomarkers is of paramount importance. In this course, the role of amyloid and tau PET imaging biomarkers in the workup of dementias and treatment-related imaging findings will be discussed. Molecular imaging plays an important complementary role to MRI in neuro-oncology and an understanding of the underlying pathogenic mechanisms is needed for optimal interpretation. Neuro PET has the potential to improve diagnosis and inform therapy and prognosis, but if it is to become a clinical tool, it will be necessary to demonstrate its value. The session will conclude with a discussion of cost effectiveness of the technology.

State of the Art Coronary CT

Participants
Michelle Williams, MBCHB, BSC, Kelso, United Kingdom (*Presenter*) Speaker bureau for Canon Medical Systems and Siemens Healthineers.
Kristopher W. Cummings, MD, Phoenix, Arizona (*Presenter*) Nothing to Disclose
Jonathan Weir-McCall, MBBCh, FRCR, Cambridge, United Kingdom (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

Explain at least two benefits of the addition of FFRCT to routine coronary CTA in the evaluation of stable chest pain.Understand how to perform qualitative assessment of atherosclerotic plaque and its future utility in clinical practice.Describe the techniques for epicardial fat assessment and their utility in primary and secondary prevention Coronary CT can do much more than assess the presence and size of stenoses in the coronary arteries. This course will feature three lectures covering state-of-the-art techniques that can provide information aboutthe severity of coronary artery disease and future risk ofcardiovascular events, over and above the presence of coronary artery stenoses. It will coverphysiologicalassessment using CT-based fractional flow reserve, anatomical assessment using qualitative and quantitative atherosclerotic plaque assessment and discuss the information availableoutwith the coronary arteries in the epicardial fat.

Vivian S. Lee, MD, PhD, Salt Lake City, Utah (*Presenter*) Employee, Verily Lifesciences LLC;Shareholder, Verily Lifesciences LLC

LEARNING OBJECTIVES

1. Understand current value based payments for imaging2. Identify opportunities for payments and other incentives to drive value in imaging3. Identify barriers to change for value based payments for imaging This session will bring together national thought leaders in a panel session to discuss the current state of value based payments for imaging and future directions that will support goals around access and health equity as well as driving innovation and discovery. Moderators Drs, Rich Duszak and Geraldine McGinty will be joined by Dr. Sachin Jain, CEO of SCAN health plan and a hospitalist as well as Dr. Vivian Lee, a neuroradiologist by training, former health system Dean and CEO and now President of of Health Platforms at Verily Life Sciences, an Alphabet company.

Focused/Fast Abdomino-Pelvic MRI Protocols

Participants
Ivan Pedrosa, MD, Dallas, Texas (*Presenter*) Scientific Advisor, Health Tech International;Scientific Advisor, Merck & Co, Inc
Hersh Chandarana, MD, Scarsdale, New York (*Presenter*) As part of institutional Master Research Agreement:Equipment support, Siemens AGSoftware support, Siemens AG
Richard J. Bruce, MD, Madison, Wisconsin (*Presenter*) Shareholder, ImageMover
Kathryn Fowler, MD, San Diego, California (*Presenter*) Consultant, Bayer AG;Research support, General Electric Company;Research Grant, Pfizer Inc;Institutional Grant, MEDIAN Technologies;Consultant, General Electric Company
Jonathan Mezrich, MD, Guilford, Connecticut (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1) Identify opportunities to leverage information in the electronic medical record to facilitate protocoling and scheduling of abbreviated MRI exams2) Explain technical developments that enable fast acquisitions and opportunities to maximize efficiency in the reporting of abbreviated MRI exams3) Recognize the importance of engaging referring physicians and the financial and medico-legal implications of abbreviated MRI exams Indications for fast/focused MRI in abdomino-pelvic conditions continue to increase. We will review challenges and opportunities to maximize the efficiency in the implementation of such protocols in a busy clinical practice.

Data Curation for AI with Proper Medical Imaging Physics Context

Participants
Nicholas Bevins, PhD, Detroit, Michigan (*Presenter*) Nothing to Disclose
Zhihua Qi, PhD, Detroit, Michigan (*Presenter*) Nothing to Disclose
Ran Zhang, PhD, Madison, Wisconsin (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

(1) The fundamentals of data management in radiology; (2): Common methods for preparing clinical data for AI, including collection, anonymization, preprocessing, and others; and (3) Awareness of dataset bias in training deep neural network models and understanding how it affects a models generalizability. Medical physicists play unique roles in the trend of increasing AI utilization in the field of radiology. High-quality clinical datasets are of critical importance to the performance of AI models in clinical contexts. Neural network models are prone to spurious correlations in training data, or dataset bias, which leads to poor generalization performance. Using COVID-19 detection from chest radiographs as an example, this session will discuss the preparation and use of using well-curated datasets for both model training and testing.

3D Printing: Clinical Applications (Sponsored by the RSNA 3D Printing Special Interest Group)

Participants

Adnan Sheikh, MD, Vancouver, British Columbia (*Presenter*) Nothing to Disclose
Jonathan M. Morris, MD, Rochester, Minnesota (*Presenter*) Consultant, Medtronic plc;Speaker, Medtronic plc;Consultant, Merit Medical Systems, Inc;Speaker, Merit Medical Systems, Inc;Consultant, Landauer Inc;Speaker, Johnson & Johnson
Lumarie Santiago, MD, Houston, Texas (*Presenter*) Nothing to Disclose
David Ballard, MD, Saint Louis, Missouri (*Presenter*) Nothing to Disclose
Justin Ryan, PhD, San Diego, California (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1. Understand the preferred source imaging exam for 3D printing in breast diseases. 2. Appreciate the importance of multi-modality correlation during the segmentation process as a means to identify possible limitations in segmentation accuracy. 3. Recognize the impact of the intended use of 3D printed breast models in their design and post processing.4. Summarize current and emerging abdominal applications in 3D printing Review literature and consensus use recommendations for abdominal clinical applications of 3D printing. We shall review the workflow for 3D printing of breast diseases and review the preferred source imaging exam for 3D printed breast models. We will demonstrate how to use multi-modality correlation between breast MRI, mammography and other breast imaging studies to ensure accuracy of segmentation. We will address possible sources of error during the segmentation process and how to address them. We shall discuss how the intended use impacts model design including the anatomy to be included, planes of articulation, print ratio, post processing and material selection. The integration of temporal data in the creation of a 4D breast model will also be discussed.

Engaging the Mid-career Radiologist: Challenges, Retention and Opportunities (Sponsored by the RSNA Professionalism Committee)

Participants
Kate Hanneman, MD, FRCPC, Toronto, Ontario (*Presenter*) Speaker, sanofi-aventis Group;Speaker, Amicus Therapeutics, Inc
Brandon Brown, MD, Indianapolis, Indiana (*Presenter*) Nothing to Disclose
Tara Catanzano, MD, Springfield, Massachusetts (*Presenter*) Nothing to Disclose
Brent Wagner, MD, Tucson, Arizona (*Presenter*) Nothing to Disclose
Cheri Canon, MD, Birmingham, Alabama (*Presenter*) Royalties, The McGraw-Hill Companies

LEARNING OBJECTIVES

1.To identify challenges facing the mid-career radiologist2.To discuss opportunities and strategies for retention and engagement of mid-career radiologists including both academic and private practice perspectives 3.To evaluate faculty development programming for the mid-career radiologist Mid-career physicians are often defined as those who are more than 5 years beyond the completion of their training and more than 5 years from planned retirement. For many radiologists, the mid-career phase will span the majority of their working career. Mid-career radiologists may experience unique challenges including stagnation, lack of support and fulfillment at work, unclear path to more senior leadership positions, and increased academic productivity expectations. Although many institutions and groups have developed support systems and faculty development programs targeted to early-career faculty, there is very limited programming to support mid-career faculty. Therefore, there is a significant unmet need to support radiologists in this significant phase of their career.This session will focus on challenges facing the mid-career radiologist, and opportunities and strategies for retention and engagement including both academic and private practice perspectives.

Printed on: 06/28/22

Neonatal Imaging: A Primer for the NICU

Participants
Judy Squires, MD, Pittsburgh, Pennsylvania (*Presenter*) Nothing to Disclose
Ricardo Faingold, MD, Toronto, Ontario (*Presenter*) Nothing to Disclose
Bernard F. Laya, DO, Taguig, Philippines (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1) Review neonatal lung diseases and the role of imaging in evaluating.2) Examine the vital role of imaging in the diagnosis and management of neonatal intraabdominal pathology, including necrotizing enterocolitis.3) Review basic transfontanelle brain ultrasound imaging protocols, with normal and abnormal examples, including the role of advanced ultrasound techniques. In this neonatal imaging lecture course, learners will hear from 3 neonatal expert radiologists about chest, abdomen, and brain imaging techniques. Recent imaging advances will be highlighted to allow dissemination of the most up to date and high-yield information for learners to make direct improvements in their practices.

Printed on: 06/28/22

Review and Update on Blunt and Penetrating Thoracic Trauma

Participants
Scott Steenburg, MD, Indianapolis, Indiana (*Presenter*) Nothing to Disclose
Nupur Verma, MD, Gainesville, Florida (*Presenter*) Nothing to Disclose
Demetrios Raptis, MD, Frontenac, Missouri (*Presenter*) Nothing to Disclose
Mari Nummela, MD, Helsinki, Finland (*Presenter*) Stockholder, BBS-Bioactive Bone Substitutes PLC

LEARNING OBJECTIVES

1.Understand the importance of bullet/projectile tract in the setting of penetrating thoracic trauma. 2. Describe clinically relevant rib cage injuries, and the difference between clinical and radiological chest wall instability. 3. Distinguish lung injuries in blunt trauma from non-traumatic parenchymal findings. 4. List the CT appearances of traumatic aortic injuries. This session will provide a core review of blunt and penetrating thoracic trauma with updates on new concepts. Blunt aortic, lung, pleural, and chest wall injuries, as well as penetrating trauma will be reviewed.

Neuroradiology Reporting Do's and Don'ts

Participants

Wende Gibbs, MD, Scottsdale, Arizona (*Presenter*) Nothing to Disclose
C. Douglas Phillips, MD, New York, New York (*Presenter*) Nothing to Disclose
Jenny K. Hoang, MBBS, Baltimore, Maryland (*Presenter*) Spouse, Employee, Merck & Co, Inc
Adam Flanders, MD, Philadelphia, Pennsylvania (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1. Recognize the importance of structured reporting and checklists in reducing errors and improving communication with physician colleagues, patients and payers.2. Appreciate the inherent value of structured reporting in the routine training of AI models with existing clinical data.3. Understand the value of reporting templates and macros in radiology resident education. Course Description: This session will focus on the advantages and pitfalls of structured reporting format and standardization of language in radiology reporting with examples in Neuroradiology. There are few topics more controversial than the style of our reports, and no topic is more vital. The radiology report is the radiologists' final product. Thus, the perceived value of the report is a major measure of radiology's value.

W3-CNPM14

Engaging Patients: Opportunities and Challenges in Lung Cancer Screening

Participants

Matthew Cham, MD, Kenmore, Washington (*Presenter*) Nothing to Disclose
Arun Krishnaraj, MD, MPH, Charlottesville, Virginia (*Presenter*) Nothing to Disclose
David F. Yankelevitz, MD, New York, New York (*Presenter*) Consultant, Accumetra LLC;Stockholder, Accumetra LLC;Medical Advisory Board, Carestream Health, Inc;Royalties, General Electric Company;Consultant, AstraZeneca PLC;Consultant, Pfizer Inc
James L. Mulshine, MD, Chicago, Illinois (*Presenter*) Nothing to Disclose
Anita McGlothlin, BS, Washington, Dist. of Columbia (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1. To describe Shared Decision Making (SDM) and its role in lung cancer screening CT. 2. To illustrate the current pitfalls in the implementation of SDM. 3. To explore ways in which SDM can be improved to better serve its patient-centered purpose. Shared Decision-Making (SDM) has been mandated by CMS for Lung Cancer Screening CT since 2015. Although SDM is intended to be patient-centered, inconsistent and suboptimal decision aids have led to a reduced uptake of lung cancer screening. Two recent reports found only a 2% to 4% uptake of lung cancer screening among the at-risk population. Many patients opt against screening when provided with shared decision-making using currently available suboptimal decision aids. For shared decision-making to become effective and truly patient-centered, decision aids must contain accurate information. Additionally, a fair and balanced public policy effort must be made to offer lung cancer screening to those at high risk. This multi-disciplinary case discussion is presented from the perspectives of a radiologist, a pulmonologist, and a patient advocate, emphasizing the importance of collaboration in SDM and Lung Cancer Screening. ?This session aims to increase physician awareness of the flaws in the current implementation of SDM, to address these flaws, and to carry out these improvements in clinical practice.

R4-CPD10

Advanced Pediatric CT Techniques

Participants
Erica Riedesel, MD, Atlanta, Georgia (*Presenter*) Nothing to Disclose
Edward Lee, MD, MPH, Boston, Massachusetts (*Presenter*) Nothing to Disclose
Ladonna J. Malone, MD, Aurora, Colorado (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1) Understand advanced techniques in evaluation of pediatric cardiovascular disease by CT. 2) Identify clinical applications of Dual Energy CT to incorporate into pediatric radiology practice. 3) Learn up to date imaging techniques and characteristic imaging findings of pediatric congenital and acquired thoracic disorders Using a combination of case-based learning and lecture, this course will focus on advanced techniques in pediatric CT including cardiac CT, dual energy CT, and techniques in CT angiography.

Printed on: 06/28/22

Lung Cancer Screening

Participants
Denise R. Aberle, MD, Los Angeles, California (*Presenter*) Investigator, Johnson & Johnson;Research Grant, Johnson & Johnson
Jared D. Christensen, MD,MBA, Durham, North Carolina (*Presenter*) Advisory Board, Riverain Technologies, LLC
Terrance Healey, MD, North Scituate, Rhode Island (*Presenter*) Nothing to Disclose
Caroline Chiles, MD, Winston-salem, North Carolina (*Presenter*) Advisory Board, AstraZeneca PLC

LEARNING OBJECTIVES

1) Explain the revisions to lung cancer screening eligibility in the US.2)Implement tools for tracking lung nodules identified at screening CT.3)Recognize the challenges in applying Lung RADS to atypical lung lesions. 4)Understand how radiologists can optimize the risk: benefit ratio in their lung cancer screening patients Following an interruption in lung cancer screening as a result of COVID-19, CT screening for lung cancer screening has resumed at a rapid pace, with estimates of 1 million screens in the US this year. This course will bring the audience up to date on screening eligibility, and why these revised criteria are important. Follow-up of positive screens is critical in the detection and management of early stage lung cancers, and we will review the options that screening clinics have to ensure that this follow-up occurs. Lung-RADS, a tool designed to standardize reporting and management guidelines, is a living document, and the changes currently under review by the Lung-RADS committee will be discussed. CT screening for lung cancer can reduce lung-cancer specific mortality, but this benefit must be weighed in each patient against potential risks. We will describe the steps radiologists can take to mitigate the risks associated with CT screening.

Sub-Events

AI in Breast Imaging

Participants

Maryellen Giger, PhD, Chicago, Illinois (*Presenter*) Advisor, Emalex Biosciences, Inc;Stockholder, Hologic, Inc;Royalties, Hologic, Inc;Shareholder, Quantitative Insights, Inc;Co-founder, Quantitative Insights, Inc;Shareholder, QView Medical, Inc;Royalties, General Electric Company;Royalties, MEDIAN Technologies;Royalties, Riverain Technologies, LLC;Royalties, Canon Medical Systems Corporation
Fredrik Strand, MD,PhD, Stockholm, Sweden (*Presenter*) Speaker, Lunit Inc
Constance Lehman, MD,PhD, Boston, Massachusetts (*Presenter*) Institutional Grant, General Electric Company;Institutional Grant, Hologic, Inc;Co-founder, Clairity, Inc.

LEARNING OBJECTIVES

1. Develop critical thinking and understand terminology in the evaluation of AI systems for breast cancer screening and diagnosis.2. Attain a realistic appreciation for the opportunities and challenges in the implementation of AI in clinical practice. Build your knowledge with top experts in evaluating, implementing and understanding the wider impact of AI systems in breast cancer screening and diagnosis. There will be three lectures and a final panel discussion. We will cover the path from performing critical evaluation of AI systems, to understanding the implications of initial results from pioneering clinical AI studies, and to exploring opportunities and challenges when implementing AI in routine clinical practice. In the final panel discussion, all presenters are available to discuss important topics brought up by the participants, including feedback on their own AI projects.

Beverly G. Coleman, MD, Philadelphia, Pennsylvania (*Presenter*) Nothing to Disclose
Peter M. Doubilet, MD, PhD, Boston, Massachusetts (*Presenter*) Nothing to Disclose
Jill Langer, MD, Villanova, Pennsylvania (*Presenter*) Nothing to Disclose

LEARNING OBJECTIVES

1) Identify normal first trimester ultrasound findings and review diagnosis of pregnancy failure. 2) Describe the findings of ectopic pregnancy including non-tubal locations. 3) Understand the role of ultrasound and common findings in emergency in second and third trimester pregnancies. This course will teach the normal and abnormal findings seen on ultrasound throughout pregnancy from the first to third trimesters. In the first trimester, identification of whether an intrauterine pregnancy is present and whether the ultrasound appearance is normal has a critical impact on patient management. Ultrasound criteria can be applied to determine when a failed intrauterine pregnancy is present. Similarly, abnormal findings can be present that affect pregnancy prognosis but do not meet criteria for failure and are important to differentiate. Ectopic pregnancy in the first trimester is a clinical emergency and can present with a variety of ultrasound morphologies and locations which will be reviewed in detail. Emergencies in the second and third trimester, although rare, need rapid and accurate diagnosis to prevent maternal and fetal morbidity and mortality. This course will review the role of ultrasound in the second and third trimester, common pathologies and their ultrasound appearance.

Plenary Session: Radiology in the Value-Based Healthcare Arena: Player or Pawn?

Participants
James Brink, MD, Boston, Massachusetts (*Presenter*) Board of Directors, Accumen Inc

LEARNING OBJECTIVES

Dedication of the Plenary Lecture to the Memory of E. Robert Heitzman, MD (1927-2020)

The COVID-19 pandemic has heightened the need for quality healthcare at an affordable cost that is accessible to all. If we choose to enter this arena whole-heartedly, our future state is one in which healthcare stakeholders worldwide understand the critical role that radiology plays in advancing quality care at an affordable cost for disease prevention, detection, management, therapy, and monitoring. Similarly, radiologists understand uniformly the importance of their role in each of these domains and leverage tools that enhance their ability to provide subspecialized expertise to patients, the medical community, and the public at large, without limitations imposed by demographic or socio-economic status. To achieve these goals, the impact of radiology services on patient outcomes and quality of life must dominate the dialogue about legacy and novel technologies for imaging and image guided therapy. Diagnostic and technical efficacy are requisite inputs to studies involving diagnostic and therapeutic impact, patient outcome, and socio-economic benefit rather than as primary end points themselves. Radiologists are champions for health equity and are recognized for democratizing their services while embracing innovation that brings imaging advances to the population at large. Personalized imaging care integrates diagnostic data from all sources and leverages predictive analytics to anticipate and remedy future decrements in health and well-being. Owing to the relatively high cost of radiology services amid rapidly rising health care costs, methods must be developed and honed to ensure that imaging and image guided therapy services are used appropriately based on evidence-based guidelines. Tools that ensure uniform adoption of such principles through automation or semi-automation are uniformly distributed throughout the medical community worldwide. Adoption and use of the tools necessary to achieve these goals must be embraced by all members of the medical community, including those who interact with patients primarily and direct their care.

Plenary Session: Addressing the Continued Exclusion of Black Physicians in the US Radiation Oncology Workforce

Participants

Iris Gibbs, MD, Stanford, California (*Presenter*) Accuray Incorporated (honoraria for lectures)

LEARNING OBJECTIVES

Radiation Oncology continues to rank among the least diverse specialties by gender and race/ethnicity. Despite the overall doubling of radiation oncology residents in the United States between 1974 to 2016, the number of Black residents in radiation oncology remains alarmingly low at 23 in 2016 across 91 ACGME programs representing a drop from 31 in the 42-year period. More disturbingly, trends in Black radiation oncology faculty representation show steady declines since 2006 while Black faculty in academic medicine overall is slightly increasing. Furthermore, leadership positions in radiation oncology are nearly devoid of Black individuals. These trends are not likely to improve until strategies to confront structural racism, provide access to early exposure to the field, improve opportunities for leadership and eliminate other barriers to entry are addressed. Over the past year, issues of racial justice, racial health disparities and representation have been catapulted to institutional awareness and public discourse. The purpose of this presentation is to discuss strategies toward eliminating barriers to Black representation in radiation oncology.

Stella Kang, MD,MSc, New York, New York (*Presenter*) Royalties, Wolters Kluwer nv

LEARNING OBJECTIVES

1) Identify key abnormal findings on radiologic studies that are critical to making a specific diagnosis. 2) Construct a logical list of differential diagnoses based on the radiologic findings, focusing on the most probable differential diagnoses. 3) Determine which, if any, additional radiologic studies or procedures are needed in order to make a specific final diagnosis. 4) Choose the most likely diagnosis based on the clinical and the radiologic information. This session will employ an expert panel to discuss unknown cases in the fields of neuroradiology, musculoskeletal radiology, pediatric imaging, genitourinary imaging and gastrointestinal radiology. The material will include plain radiography, ultrasound, CT and MRI imaging with an overall theme of self-induced and/or iatrogenic disease. The expert readers will provide insights into how they approach clinical cases, pearls and pitfalls during the creation of a differential diagnosis, and keys to a final diagnosis in a light-hearted entertaining format.

Abstract Archives of the RSNA, 2021

LEARNING OBJECTIVES

Dedication of the 2021 RSNA Meeting Program to the Memory of Sanjiv S. Gambhir, MD, PhD (1962-2020) and Lawrence W. Bassett, MD (1942-2020)AAPM WelcomeChicago Radiological Society Welcome

The impact of COVID-19 has been far reaching, affecting using every aspect of our personal and professional lives. Our lives are different, the way we work is different, and even our thinking has been changed by all that we have experienced. Whether we are leading departments, on the frontlines caring for our patients, or anywhere in between, we have been required to rethink and reimagine everything - what we do, how we do it, and what truly matters to us. It is essential that we learn from the experiences of the past two years. Having responded to the short-term challenges, today we find ourselves considering the road ahead to envision the future state of our profession. As the crisis recedes, our work requires a shift from defense to offense, from reactivity to proactivity. We already have new priorities and soon will have new habits. The pandemic has uncovered a myriad of issues in our profession, from inequities in patient access to care to inefficiencies in our workflows. It would be a wasted opportunity to revert to previous operations unreflectively. Rather, we need innovative ways to conduct our work more effectively and empathically. We have already unveiled new ideas and new technologies that redefine what it means to be a radiologist. Using the tenets of quality-based and patient-focused care, we are creating unique paths forward, with collaboration, civility, inclusiveness, and diversity at our core. It is critical, now more than ever, to engage each other worldwide in finding global solutions to the challenges that face the medical imaging community. We also must ensure that our academic and society leaders reflect the diverse community we represent and strive to provide an equitable and inclusive community that serves the needs of all of our members, and ultimately provides better care to our patients.

Plenary Session: Ensuring an Inclusive, Respectful Workplace

LEARNING OBJECTIVES

*This session is only available for live viewing and will not be available on-demand. Dr. Michele H. Johnsons lecture: RSNA dedicates this plenary lecture to the memory of David B. Fraser, MD (1932-2020). Dr. Christine Poraths lecture: RSNA dedicates this plenary lecture to the memory of O. Wayne Houser, MD (1929-2020).

Incivility is prevalent in organizations, and it's getting worse. The costs of incivility are rising, too. Christine Porath will discuss the varied ways incivility wrecks performance and robs the bottom line. She will explain what civility buys you-and what you can focus on to be more effective. She will also share recommendations for what leaders should do to enhance their influence and craft a more respectful and thriving work environment.

QI04-C2   Improving Pre-procedure Lead Times In Pre And Post-procedure Care Area

Awards
Quality Improvement Reports Award
Identified for RadioGraphics

Participants
Pratik Rachh, MD,MBA, Atlanta, Georgia (*Presenter*) Nothing to Disclose

PURPOSE

In September 2019 our Academic Medical Center conducted a procedural Value Stream Analysis (VSA) and identified 6 Rapid Improvement Events (RIE's) focused on improving overall workflow for procedural patients. It was noted that there were significant delays in patient care related to workflow in the Pre and Post-Procedural Care Area (PPCA). The purpose of this project was to identify waste processes, brainstorm, and implement solutions for rapid improvement leveraging Lean process improvement principles.

METHODS

Team, Scope and Pre-work: A multidisciplinary team of leaders and frontline clinicians from Radiology and Anesthesia was formed to solve this complex problem. The project was facilitated by two radiology quality improvement managers. Project scope included workflows for procedural patients from the time of arrival in the PPCA to disposition. A five-day workshop was planned in November 2019. Two months prior to the workshop, the team started meeting on a weekly basis to collect baseline data, conduct time studies, and understand the current state by spending time in the gemba.Goal: At baseline (August 2019), 45% of patients were PPCA ready (time from arrival to marked procedure ready) within 60 minutes of their arrival. The goal of the PPCA RIE was to have 80% patients PPCA ready within 60 minutes of arrival.5 Day Workshop: On Day 1-2 of the workshop, the team was given training on foundational concepts of Lean, value add and non-value add processes, and wastes in processes. Then the team reviewed baseline data, process mapped the process, and identified areas of improvement. On Day 2 the team started brainstorming solutions. On Day 3 the team spent most of their time in the PPCA implementing several tests of change. Day 4 of the workshop the team continued working on the changes and started drafting Standard Work documents for future state workflow. On Day 5 the team reported out to Radiology and Enterprise leadership their work, and laid out 30-60-90 day plans to follow-up on pending items.Observations and Actions: Some of the key observations included nurses frequently moving in and out of the patient bays to retrieve forms and supplies. There was considerable heterogeneity in the amount and time of EMR documentation among nurses. The team sought to create 5S zones, standard work for placement of supplies and forms, and streamlining EMR documentation. During the 5 day RIE event and in the following weeks 9 interventions were proposed and tested .

RESULTS

The target goal was tracked for the subsequent 14 months post-implementation. 10 of the 14 months saw 80% or more PPCA patients in ready status within 60 min of arrival .

QI04-C3   Recommendations For Additional Imaging: A Novel Characterization Scheme For Ensuring Appropriate Follow-up

Participants
Jack Renfrew, MD, phoenix, Arizona (*Presenter*) Nothing to Disclose

PURPOSE

To measure the rate of recommendations for additional imaging (RAI) in radiology reports, the rate of compliance with recommendations for additional imaging (CRAI), and any improvement in compliance with notification of the ordering provider when RAI was not done.

METHODS

We developed a method of coding all radiology cases that parallels the American College of Radiology's Breast Imaging Reporting and Database System (BI-RADS), trained a group of radiologists in its use, developed an automated, computerized method to analyze reports to determine whether recommended imaging was performed, and developed a HIPAA compliant method of alerting the ordering physician when recommended imaging was not performed. We analyzed whether the notification of failure to image was acted upon.

RESULTS

Radiologists coded 237,917 reports with 3,558 RAI (1.50%). RAI varied across modalities with a high of 4.09% for CT and a low of 0.51% for radiography. Of the 3,444 RAI due for follow-up, 1,378 were done (40.0%) and 2,066 (60.0%) were not. We sent HIPAA compliant notifications to ordering physicians in cases of noncompliance, after which 450 further imaging studies (21.9%) were

performed increasing overall compliance to 53.4%.

QI04-C4   Working "Around The Clock" To Improve Shoulder MRI Patient Positioning

Participants
Jonathan Pierce, MD, Cleveland, Ohio (*Presenter*) Nothing to Disclose

PURPOSE

To evaluate the quality of shoulder MRI as it pertains to patient positioning at our institution before and after performing an educational intervention with MRI technologists in order to improve diagnostic image quality and interpretation of shoulder pathology.

METHODS

MRI exams of the shoulder performed at our institution during a 1 month period of time were identified. Patient positioning was retrospectively reviewed by 4 independent radiologists - 2 fellowship trained musculoskeletal radiologists (6 years and 14 years of experience, respectively), a PGY-4 radiology resident, and a PGY-3 radiology resident. Positioning (internal rotation, external rotation, or neutral) was determined based on the location of the bicipital groove relative to superimposed clock positions, in relation to the long axis of the scapular body. Clock positions and associated quality of the supraspinatus and subscapularis tendons were independently assessed and classified as "ideal," "intermediate," or "not ideal" depending on whether the tendons were viewed in plane on respective sagittal and coronal sequences. An educational intervention (PowerPoint presentation) was then performed with MRI technologists in order to detail appropriate patient positioning and explain why certain anatomy and pathological processes are better assessed on shoulder MRI when the shoulder is in external rotation. Live and recorded options were available. The MRI technologists were then surveyed regarding their impression of the presentation. Following the intervention, an additional population of MRI exams will be reviewed in order to determine whether the educational intervention resulted in an increased number of patients with ideal positioning during MRI acquisition.

RESULTS

A total of 130 exams fit the inclusion criteria. Pre-intervention results showed that all 4 readers agreed that 9:00 and 11:00 to 1:00 were not ideal. Additionally, all readers agreed that the 9:30 and 10:30 were intermediate (less ideal for the subscapularis and supraspinatus, respectively) and that 10:00 was the ideal position. By pooled average, 72.31% of cases were not ideal, 13.85% were intermediate ideal, and 13.85% were ideal.

QI04-C6   Clinical Decision Support (CDS) Implementation Decreases Reimbursement Denials For Lower Extremity Venous Doppler Ultrasound Exams

Participants
Micah G. Cohen, MD, Bryn Mawr, Pennsylvania (*Presenter*) Nothing to Disclose

PURPOSE

To decrease the rate of reimbursement denial by Centers for Medicare and Medicaid Services (CMS) for lower extremity venous doppler ultrasound exams related to inappropriate imaging utilization, after implementation of a CDS mechanism at the point of exam ordering by the referring clinician.

METHODS

Total number and percentage of CMS reimbursement denials for lower extremity venous doppler ultrasound exams were derived over a six-month period both before (July-December 2020) and after (July-December 2021) implementation of a CDS mechanism at the point of exam ordering by the referring clinician. Reimbursement denials were further stratified into categories pertaining to reason for denial, namely denials which were related to clinician documentation/inappropriate utilization, and those which were not. Relative frequencies of denials pertaining to documentation/inappropriate utilization, in number of denials/1000 exams, were tabulated for the control and experimental groups, prior to and after CDS implementation, respectively, and a Chi-Square test was performed to assess for statistical significance.

RESULTS

There were 588 total denials out of 3,870 lower extremity venous doppler exams which were billed prior to CDS implementation (15.2%). There were 488 total denials out of 3,565 lower extremity venous doppler exams which were billed for after implementation (13.6%). Of the 3,870 exams prior to implementation, 47 denials were related to clinician documentation (12.14 denials/1000 exams). Of the 3,565 exams after implementation, 24 denials were related to clinician documentation (6.73 denials/1000 exams). This corresponds to a reduction of 44.5% of denials related to documentation after implementation of CDS, with a Chi-Square value of 5.6402 (p=.017553).

QI04-C7   Use Of AI-enhanced PET Algorithms. A Validation Study Using The NEMA Body And The ACR/Esser Phantoms.

Participants
Eduardo Tinois, MSc, Campinas, Brazil (*Presenter*) Consultant, Bayer AG

PURPOSE

Throughout the evolution of diagnostic imaging, techniques to improve the signal-to-noise ratio have been taking advantage of computational solutions such as artificial intelligence. For PET scan images, the company Subtle Medical proposes, with its deep learning algorithm, to reduce image noise, obtaining the same quality standard with a decrease in the time and/or dose used in the original acquisition. The purpose of this work is to evaluate the application of the Subtle Medical (SM) processing algorithm in images obtained from simulators through objective parameters, observing its possible correlations with the processing performed in the installation (PT) equipment, PET/CT Siemens Biograph Horizon, in order to validate the safe use of the SM in clinical images.

METHODS

We used the body phantom recommended in performance tests for PET equipment, whose preparation methodology is in line with NEMA NU-2012 publication in the lesion/background ratio of 4:1, where the lesions have spherical shapes with diameters of 10mm, 13mm, 17mm and 22mm; 28mm and 37mm. Acquisition parameters followed the NEMA and clinic protocol of the radiative facility.

The initial specific activity was 0.14 mCi/kg and acquisitions were performed with time intervals in between, simulating concentrations of 0.12; 0.10; 0.08; 0.070; 0.06; 0.04 and 0.02 mCi/kg. The processing of the images was performed in the PT and SU software, and then the quantification of the coefficient of recovery (CR) and of variation (CV) of the hot and cold lesions and of the lung simulator was performed in both protocols adopted. It was also used the ACR/ESSER simulator in order to verify the discrepancies obtained for the parameter Standard Uptake Value (SUV) in the PT and SM processes. The device was prepared according to specifications of the American College of Radiology, "PET phantom instructions for evaluation of PET image quality." (2006) (ACR) and acquisition parameters followed ACR and clinical protocol. The initial specific activity was 0.14 mCi/kg and acquisitions were performed with time intervals in between, simulating concentrations of 0.12; 0.10; 0.08; 0.070; 0.06; 0.04 mCi/kg. Image processing was performed in PT and SM, and for both protocols and processing, quantification of the maximum, average, and minimum SUV of the bottom, bone, air, and water simulating inserts were performed.

RESULTS

For the body phantom, in both NEMA and clinical protocols, when comparing the PT and SM processing, a greater reduction in CR and CV was observed in hot and cold lesions in the SUV. Through linear regression and correlation analysis, it was observed that the SU does not introduce randomness in the CR with very strong correlation coefficient for the hot and cold lesions in both NEMA and clinical protocols. For the ESSER simulator, we observed maximum SUV values above those recommended by the ACR and average SUV within the established limits for both PT and SM processing.

QI04-C-HC1 Interviewing In A Pandemic: A Survey Of Radiology Residency Applicants Following The 2020-2021 Virtual Interview Season

Participants
Matthew Mader, MD, Kansas City, Kansas (*Presenter*) Nothing to Disclose

PURPOSE

As a public health policy response to the COVID-19 pandemic, the American Association for Medical Colleges strongly encouraged universal transition to a virtual interview setting for the 2020-2021 residency application cycle (AAMC, 2020). The consequences of this transition on the application process and match outcomes are unknown.Considering the financial and temporal constraints of traditional travel interviews, the virtual format may allow applicants to cast a wider net. Conversely, a surge in applications suggests increased competition for limited interview slots (Hammoud, et al., 2020). It is uncertain whether the ostensible limitations of virtual interviews may introduce applicant bias to the ranking of home versus external programs.

METHODS

A questionnaire was tailored to characterize the impact of the virtual interview process. Following NRMP Match Week, the questionnaire was distributed to our institution's radiology residency program applicants. Responses were anonymous.Demographic information, application statistics, expenses, online resources used, as well as perceptions of the virtual interview format were evaluated. Likert scale responses were provided to assess factors influencing the application and ranking process.

RESULTS

245 applicants were invited to complete the survey, yielding 48 complete responses. Demographics are detailed in Table 1. Application, interview, and expense statistics are summarized in Table 2.In preparation for interviews, most respondents reported visiting official program websites (N=38, 79%). Many also visited online forums and databases, including Reddit (N=32, 67%), AMA-FREIDA (N=24, 50%), and Doximity (N=23, 48%).Program location was identified as a key factor in rank selection, with 96% (N=46) of respondents citing this as important or very important.A major question of our study was whether the transition to virtual interviews made a significant impact on preferences and match outcomes. Chi-squared or Fisher's exact tests were conducted to compare two groups: those who ranked their home program highest (N=13) versus those who ranked an external program highest (N=35). Results are presented in Table 3.

QI04-B

Quality Improvement Reports Wednesday Poster Discussions

Sub-Events

QI04-B2   The Epidemiology Of CT In An Irish Paediatric Emergency Department

Participants
Johnny O'Mahony, MBBCh,MRCS, Dublin, Ireland (*Presenter*) Nothing to Disclose

PURPOSE

To evaluate the epidemiology of CT scans in an Irish Pediatric Emergency Department. In recent years, there has been a global movement towards more judicious use of computed tomography (CT) imaging in an attempt to reduce exposure of pediatric patients to ionizing radiation. In addition to the health risks involved, there are economic and resource utilisation implications. CT overuse may also result in further costs and longer patient stays due to the need to investigate incidental findings. The CT utilisation rates across national jurisdictions vary widely due to a number of structural, process and outcome related factors. There is no currently no published data describing the epidemiology of CT from an Irish Pediatric Emergency Department in a pediatric tertiary referral centre.

METHODS

We performed a retrospective study by searching the Irish National Integrated Medical Imaging System (NIMIS) for CT imaging studies performed at the request of the paediatric emergency department physicians from Our Lady's Children's Hospital Crumlin for the years 2018-2020 inclusive. These scans were then categorised into "working hours", i.e. 9am to 5pm Monday to Friday, excluding public holidays, and "out of hours". The scan reports were also analysed to ascertain if the scan had yielded a "positive" finding, i.e. evidence of pathology that would change the patients management or disposition (e.g. fit for discharge or needing to be admitted for specialty care). These data were tabulated and analysed using Microsoft Excel.

RESULTS

984 scans in total were identified, 275 in 2018, 336 in 2019 and 373 in 2020. Of these, an increasing proportion were performed out of hours over the timeline of the study period (49.1% in 2018, 54.5% in 2019 and 57.6% in 2020). The proportion of scans performed that yielded a positive result also increased each year within the study period, going from 26.5% in 2018, to 29.2% in 2019 and 30.2% in 2020.

QI04-B3   Eliminating Post-contrast Acute Kidney Injury (PC-AKI) In Patients With Advanced Kidney Disease: Guideline Adherence And Quality Improvement In Its Prevention

Participants
Raman Akif, MD, Leiderdorp, Netherlands (*Presenter*) Nothing to Disclose

PURPOSE

Without rigorous analysis in the patient population allegedly most susceptible for post contrast acute kidney injury (PC-AKI), guidelines have historically relied on expert opinion and (sub)analyses conducted in the context of larger studies with patients with an estimated glomerular filtration rate (eGFR) of 30 ml/min/1.73m2 or greater. As to contribute to the advancement of more appropriate, patient-centered decision making in the field of PC-AKI prevention, this study provides an in-depth evaluation of the implementation of post-contrast acute kidney injury guidelines in patients with severely decreased renal function and renal failure (i.e., an eGFR 15-29 mL/min/1.73m2 and <15 mL/min/1.73m2, respectively). We intended to assess the degree of adherence in cases of contrast-enhanced computed tomography scans (CECTs) based on quality indicators as described in Dutch the PC-AKI guidelines. Additionally, we aimed to contribute to contemporary discourse surrounding the efficacy of hydration in the prevention of post-contrast acute kidney injury with recommendations regarding contrast medium safety protocols.

METHODS

A single center observational cohort study was conducted. Primary analysis evaluated protocol adherence outcomes related to contrast administration in CECTs such as per-protocol kidney function assessment, adherence to hydration protocols, and the incidence of PC-AKI, defined as an increase in serum creatinine (sCr) of 25% or an absolute increase >0.5 mg/dL both temporally and causally related to contrast administration. All included cases and related variables were verified by manual case review. Double robust analysis consisting of propensity score matching and conditional logistic regression was used to evaluate the efficacy of hydration in the prevention of PC-AKI.

RESULTS

713 CT-scans from 500 patients were included for primary analysis regarding protocol adherence. Aspects related to the period preceding contrast administration (i.e., pre-contrast kidney function assessment and intravenous volume expansion on the day of contrast administration) largely adhered to guideline recommendations. Among 713 cases, 556 (78%) received intravenous hydration on the day of contrast administration, of which 347 cases involved per-protocol 1.4% hydration with sodium bicarbonate (70% of hydrated cases). Overall adherence regarding the timing of pre-contrast kidney function assessment was uniformly high (710 out of 713 cases, 99.5%). Notably, evaluation of post-contrast kidney function assessment revealed a significant difference in

post-contrast kidney function assessment adherence between the outpatient and inpatient cohort (34% (N = 64 / 190) versus 94% (N = 355 / 377), respectively [P = <0.001]). Additionally, a large discrepancy was found between serum Creatinine (sCR)-based PC-AKI and PC-AKI based on manual case review (117 vs. 27, respectively). Of the 27 cases in which PC-AKI was deemed likely, only one involved an outpatient CT scan as opposed to 26 inpatients (P = 0.010). Furthermore, Initial findings in an unadjusted comparison of patients stratified based on whether intravenous hydration was administered (N = 446) suggested a significant difference in sCr-based PC-AKI and emergent renal replacement therapy = 30 days after contrast administration (P = .000 and 0.048, respectively). Nearest neighbor propensity score matching of 148 cases further underlines the necessity of accurately determining contrast-induced nephropathy in patients with advanced kidney injury as much of what is considered PC-AKI is largely confounded by its known risk factors.

QI04-B5   Women In Radiology: A Perspective From A European Country

Participants
Silvia Cayon Somacarrera, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

PURPOSE

To carry out an analysis of the situation of women radiologists in Spain and comparing it to that of the United States, where there is abundant data and studies.

METHODS

We carried out a survey among main Spanish hospitals (>300 beds), with a response rate of 60% (70 hospitals out of 118). In the survey, we asked for the number of women in each of the following positions: radiology department chairs from 2000 to 2020, current section chiefs, radiologists, residents and residency programme directors. In addition to the survey, data provided by the Spanish Society of Radiology (SERAM), the European Society of Radiology (ESR) and the National Board of Radiology were also included. All data included the total number and a disaggregation by gender. We obtained the following data from SERAM: - Current residents, first year residents from 2000 to 2020, residents' representatives from 1990 to 2020- Current radiologists, current radiologists in each radiologysubspecialty, radiologists from 2000 to 2020, awarded radiologists from 1988 to 2020 (Profession Award, Research Award, Spanish Radiology Foundation Awards and Gold Medals). - Board of directors of SERAM from 1916 to 2020, board of directors of each subspecialty society from 2000 to 2020, SERAM congress scientific committees from 1957 to 2020. - Radiología (Spanish Journal of Radiology): chief editors from 1912 to 2020. From the National Board of Radiology: presidents and vicepresidents from 1985 to 2021.The ESR data included the number of current women ESR members and women participants in the 2019 ESR congress.The following data were acquired from other public sources, also divided by gender, that included all medical specialties: - Medical residents in Spain in 2020. - Medical residents from 2009 to 2020, divided by specialty core (surgical, medical, others). - First year medical residents from 2015 to 2020. We reviewed literature data from the US in order to detect trends in gender disparity among Radiology physicians workforce and compared it to data from Spain and Europe.

RESULTS

Women represent 55% of current Radiology workforce in Spain, being this proportion higher than in Europe (40%) and the US (26%). In Spain, from 2010 to 2020, the average percentage of female radiology residents is 60%, while in the US this percentage decreases to 26-29% in the last years. We detected a drop in the presence of women as we moved into 'leadership positions': current radiology residents (56% women), current radiologists (55% women), current section chiefs (42%) and current department chairs (23%). This was also patent when analyzing the board of directors of SERAM, in which only 11% and 33% of presidents and vicepresidents, respectively, have been women. The same trend is followed in the SERAM congress scientific committees where only 25% presidents and vicepresidents have been women. Similarly, inequalities have been found in representation of women in the editorial committees of journals. In 2017, only between 19% and 37% of the editorial boards of the journals Radiology, AJR, Academic Radiology and Journal of the American College of Radiology were women. In Spain, none of the chief editors of the Spanish Journal of Radiology ('Radiología') has ever been a woman. In Spain, another remarkable fact concerning gender inequalities is found in awarded radiologists: only 13% of 'Gold Medallists', the highest distinction awarded by SERAM, have been women, the first one ever in 2002. The percentage of feminization found in the total group of medical residents in Spain is approximately 65%, while in the radiology residents it reaches an average of 56%. Within radiology departments, most feminized subspecialties are, in decreasing order: paediatric radiology (59%), breast (58%), cardio-thoracic (57%), gastrointestinal-genitourinary (57%), emergency (56%), musculoskeletal (52%), neuroradiology (38%) and interventional radiolo

QI04-B6   Reducing Child Distress And Improving Satisfaction Using 3D-printed Scanners In Pediatric Cross-sectional Imaging

Participants
Mark Rocco, BS,MD, Arabi, Louisiana (*Presenter*) Nothing to Disclose

PURPOSE

Pediatric patients and their caregivers undergoing cross-sectional imaging procedures have been shown to benefit from Certified Child Life Specialists, whose role in radiology includes preparation prior to imaging exams. Child Life Services that employ the use of mock scanners have been shown to improve imaging quality, compliance, and reduce the need for sedation. We propose that pre-exam preparation with a functional mock 3D-printed scanner with light and sound capability will reduce child distress and improve caregiver and technologist satisfaction.

METHODS

Physical 3D printed CT and MRI scanner models were created using Meshmixer and Cura stereolithography software. Models were printed using an Ender-5 and Ender-5 plus FDM 3D printer. The models were scaled to accommodate average-sized action figures and doll toys. Scanner beds are functional. Additionally, standard electronic components were obtained and assembled to enable both light, movement, and sound capability, offering realistic volume and quality of various MRI sequences.

RESULTS

After a short survey, high satisfaction rates were obtained and expressed by the Certified Child Life Specialists team and cross-sectional imaging technologists in our Pediatric Radiology Department. The mock scanner toy function system was easily integrated into standard Child Life protocols.

QI04-B7   Efficacy Of Pineapple Juice As A Negative Oral Contrast Agent In Magnetic Resonance Cholangiopancreatography

Participants
Alba Pugliesi, MD, Ludwigsburg, Germany (*Presenter*) Nothing to Disclose

PURPOSE

-to illustrate the role of MRCP in biliary pathologies -to show our MRCP protocol-to optimize the MRCP protocol with the use of high natural manganese content Juice (pineapple juice)

METHODS

MRCP Indications:MRCP is very useful to: -Avoid unnecessary ERCP (pancreatitis / perforation)-Indispensable to evaluate biliary obstructions due to choledocholithiasis, iatrogenic strictures, cholangiocarcinoma or pancreatic carcinoma.The quality of magnetic resonance cholangiopancreatography (MRCP) images is frequently degraded by high signal from the gastrointestinal tract. Most signallers containing ferromagnetic, ferrimagnetic or superparamagnetic compounds used are poorly tolerated by the patients and lead to nausea, flushing, abdominal pain, vomiting. Pineapple juice (PJ) is an oral natural negative contrast agent that we have been using in MRCP for more than a year valuating the quality of magnetic resonance cholangiopancreatography (MRCP) images higher, usually degraded by high signal from the gastrointestinal tract.Benefits pineapple juice:-Very good compatibility-No undesirable effects - 92% taste very goodOur MRI protocol:1) PRE-Injection -Multiplanar localizer -2D coronal T2-w single-shot FSE -3D axial FS T1-w in- and out of phase GRE w -3D coronal heavily T2-w FSE respiratory triggered MRCP at high resolution - 2 glasses high natural manganese and/ or iron content Juice (pineapple, raspberry)INJECTION 0,025 mmol/kg body weight/0,1 ml/kg, 1-2 ml/s, 18-20 G, bolus triggering2) POST INJECTION -3D axial FS T1-w GRE arterial, portal venous and delayed phase with higher spatial resolution -Diffusion-weighted imaging (axial) -2D Axial T2-w FSE -3D axial and coronal fat-suppressed T1-w GRE performed at 15-30 min after contrast injection.Standard pancreas protocol combined with pineapple juice induced MRCP provides morphological and functional details of pancreatic parenchyma and pancreatic duct showing a better visualization of the ductal system.

RESULTS

Our evaluation demonstrated that PJ shortened T2 relaxation time and hence decreased T2 signal intensity on a standard MRCP sequence to a similar degree to a commercially available negative contrast agent. Electrothermal atomic absorption spectrometry assay demonstrated a high manganese concentration in PJ of 2.76 mg/dl, which is likely to be responsible for its T2 imaging properties.

QI02-B2 New Development And Clinical Evaluation Of A Patient Face Recognition System (PFRS) In The Radiology Department

Participants
Hiroyuki Ota, Kashiwa, Japan (*Presenter*) Nothing to Disclose

PURPOSE

Patient misidentification can cause result in serious incidents in medical operations. In fact, twelve incidents have occurred in our radiology department in the last five years. Facial image recognition systems have been used in many fields to assist with proper identification. The purpose of this study is to develop a Patient Face Recognition System (PFRS) based on facial recognition technology, and to apply it to the authentication flow during CT imaging examinations for clinical evaluation.

METHODS

The PFRS (P-FAS01, Canon Lifecare Solutions Inc., Kawasaki, Japan) consists of a camera for registering face images paired with authentication application software. The system is linked to the radiology information systems (RIS) and with a surveillance camera in the CT scan room. The target patient registers his/her face image when checking in at the CT reception desk and links this image to the examination order information in the RIS. When the patient enters the CT scan room, the face image is compared with the surveillance camera image, and the face information is judged to be matched (successful authentication) based onan authentication score from the facial feature extraction software. System performance was evaluated with 153 patients (mean age 64 years, male/female ratio 1:0.68) who agreed to participate in this study. The authentication success rate was calculated based on the authentication score. In addition, regression analysis was performed on the correlation between basic patient information (Age and BMI) and the authentication score.

RESULTS

The facial recognition system was implemented smoothly for all target patients. Among the patients, 144 patients were successfully authenticated, and the authentication success rate was 94.1%. The mean and standard deviation of the authentication scores of the successful cases were 628 and 131, respectively. There were 9 unsuccessful authentications, including 3 cases in which the authentication score did not reach 450 (authentication scores: 420, 437, and 447), and the remaining 6 cases were not scored. No correlation was found between basic patient information and authentication scores. (Age: R=-0.18, BMI: R=-0.02) Patient authentication in preparation for imaging examinations is a fundamental tasks. However, there are several reasons why misidentifications may occur which can lead to inadvertent errors, including the use of hats, masks and sunglasses, and other causes. Patient authentication is based on double-checking, and cases of unsuccessful authentication provide an incentive to alert the operator staff.

QI02-B3 Clinical Importance Of Secondary Imaging Interpretations In A Cancer Hospital And Its Impact On Patient Management.

Participants
Mayur Virarkar, MD, JACKSONVILLE, Florida (*Presenter*) Nothing to Disclose

PURPOSE

The purpose of this prospective study was to evaluate the quality of outside hospital imaging and associated reports submitted to us for reinterpretation related to clinical care at our tertiary cancer center. We compared the initial study interpretations to that of interpretations performed by subspecialty-trained abdominal radiologists at our center and whether this resulted in a change in patient treatment.

METHODS

We performed an institutional review board-approved prospective, single-institution study of 915 consecutive outside computed tomography (CT) and magnetic resonance (MR) abdominal imaging studies that had been submitted to our institution between August 1, 2020, through November 30, 2020. The assessed parameters included the quality and accuracy of the report, the technical quality of the imaging compared to that at our institution, the appropriateness of the imaging for staging or restaging, usage of oral and IV contrast, and CT slice thickness. Clinical notes, pathologic findings, and subsequent imaging were used to establish an accurate diagnosis and determine the effect on clinical treatment. Discrepancies between the initial and secondary interpretations were identified independently by a panel of radiologists to determine changes in treatment. The effects of discrepancies on treatment were evaluated based on current treatment guidelines.

RESULTS

Of 744 CT (81%) and 171 MR (19.0%) outside imaging studies, 65% had suboptimal quality compared to the images at our institution, and 31% were inappropriate for oncological care purposes. Only 21% of CT studies had optimal slice thickness of < 3 mm. Of the available outside reports provided, 34% had discrepant findings. Discrepancies between secondary and initial

interpretations were identified in 131 studies. Of the 88 confirmed discrepant studies, 42 patients (48%) had a change in treatment based on the secondary interpretation.

QI02-B4   Improving Patient Follow-Up Imaging Using Artificial Intelligence

Participants
Jung Yun, MD, Philadelphia, Pennsylvania (*Presenter*) Nothing to Disclose

PURPOSE

To improve patient compliance rates for follow-up imaging recommendations by implementing a natural language processing (NLP) algorithm and a tracking and reminder system that: (i) identifies patients who require follow-up imaging based on radiology reports; (ii) organizes follow-up recommendations by due date; and (iii) reminds patients of due or overdue recommendations.

METHODS

Our institution mails letters to patients with actionable findings in their radiology studies within 20 days of the examination to comply with the Patient Test Result Information Act (PA Act 112). All diagnostic radiology reports generated at our institution from January 1, 2020 through April 30, 2021 that complied with PA Act 112 were processed through a NLP algorithm (Within Health, Brooklyn, NY) to determine the recommended radiologic examination and the recommendation due date, which is based on a time interval that is either specified in the report or assumed to be 3 months from the date of the examination if no time interval was provided. The compliance range is the period in which a completed follow-up examination was deemed compliant with the recommendation and is defined in accordance with the American College of Radiology as the period that begins 30 days before and ends 60 days after the due date. The expiration date is defined as 60 days after the due date. Recommendations with completed follow-up examinations within the compliance range were deemed compliant. An automated tracking and reminder system (Within Health, Brooklyn, NY) was used to determine if follow-up imaging was scheduled or completed. The control group had an experimental period from January 1-February 28, 2021 and included all recommendations with expiration dates in this period. The intervention group had an experimental period from March 1-April 30, 2021 and included all recommendations with expiration dates in this period. A baseline compliance rate was calculated as the percentage of recommendations with completed or scheduled follow-up examinations at the beginning of the experimental period for the control and intervention groups. The at-risk population was defined as the number of recommendations at the beginning of the experimental period that did not have an associated completed or scheduled examination. Patients in the at-risk population of the intervention group received a short message service communication at the beginning of the intervention experimental period that encouraged them to speak to the ordering provider about actionable findings. Up to three additional notifications were sent to these patients unless the follow-up examination was either completed or scheduled. Patients in the at-risk population in the control group did not receive any communication during the control experimental period. The final compliance rates were calculated as the percentage of recommendations with completed or scheduled follow-up examinations at the end of the experiment period for each group. The percentage of recommendations in the at-risk-population that became compliant by the end of the experimental period was also calculated. In addition, the differences in the compliance rates and percentages of compliance rate change between the beginning and end of the experimental periods were also calculated. Fisher's exact test and chi-squared test were performed to compare the increase in compliance between the control group and intervention group. Statistical significance was set at P < 0.05.

RESULTS

The control group consisted of 364 recommendations and the intervention group consisted of 438 recommendations. At the beginning of the experimental period, 100 recommendations in the control group were compliant with a baseline compliance rate of 27.5% and 137 recommendations in the intervention group were compliant with a baseline compliance rate of 31.3%. The at-risk population was 264 recommendations in the control group and 301 recommendations in the intervention group. At the end of the experimental perio

QI02-B5   Assessing The Value Of Standardized Radiology Teaching Modules On Education Of Rotating Medical Students.

Participants
Nahill Matari, MS, Alpine, New Jersey (*Presenter*) Nothing to Disclose

PURPOSE

Medical students rotating through radiology are easily overwhelmed by the large amount of new information they are inundated with as the usual medical student curriculum does not include focused instruction in basic radiology. As educators while teaching medical students about radiology is important, it is also important to measure the effectiveness of the instructional methods. The purpose of this study is to demonstrate the effect of a standardized set of teaching modules on medical students' understanding of fundamental radiology principles.

METHODS

A standardized set of six teaching modules on fundamental radiology topics was developed for third and fourth year medical students rotating through our department to enhance their radiology training. Teaching modules in thoracic, gastrointestinal, genitourinary, ultrasound, musculoskeletal, and neuroradiologic imaging were created and presented to the medical students with the sessions moderated by radiology residents. A quiz consisting of ten questions testing fundamental radiology concepts was given to the students before and after the didactic series. Quiz scores were analyzed with descriptive statistics (mean, standard deviation, and confidence intervals) and a paired sample T-test to evaluate for statistical significance.

RESULTS

The average quiz scores of third (n=6) and fourth year medical students (n=11) significantly improved after the teaching modules. Third year medical students scored an average of 61.7% prior to the didactic series and 80.0% afterwards (P = 0.0001) while fourth year medical students scored 67.3% before and 79.1% after the series (P = 0.003). Quiz scores of the total population of medical students increased on average by 14.1%, 95% CI [8.6, 19.6] (Table 1).

QI02-B6   Tulip - The Ultrasound Labelling Improvement Project : A Quality Improvement Initiative To Decrease Specimen Labelling Errors

Awards
Quality Improvement Reports Award

Participants
Nirvikar Dahiya, MD, Phoenix, Arizona (*Presenter*) Nothing to Disclose

PURPOSE

Specimen labeling related errors occur in all healthcare settings and may include wrong labels, incomplete samples, or wrong specimen media. These can delay treatment, result in the wrong treatment, or require repeat procedures. An increase in the number of specimen-related errors in the MCA Radiology Ultrasound Division was identified after a period of increasing clinical volumes and a new electronic health record, despite multiple smaller interventions. A multidisciplinary team was convened to address this issue consisting of radiology process improvement specialists, ultrasound radiologists, ultrasound technologists, and radiology nurses. The group utilized DMAIC process improvement framework for this project. The baseline rate of specimen-related errors in the prior 6 months was .35 errors per 100 cases performed. The aim of this project agreed upon by the group was to decrease all specimen-related errors by 29% from a rate of .35 to a rate of .25 per 100 ultrasound procedures by May 1, 2021 without increasing turn-around-time for procedures.

METHODS

The baseline improvement measure was the number of specimen-related errors reported through the radiology Safety Event Reporting Form (SERF) system monthly per 100 Ultrasound procedures performed. The baseline balancing measure was the median turnaround time (TAT) in minutes, from the start of the procedure to the end of the procedure as documented in the electronic health records.The number of specimen-related errors by event type were reviewed collectively. A process map was generated through observation, which included specimen collection and handling. A failure modes effect analysis (FMEA) tool was used to pinpoint high risk process steps where errors could occur. Improvement ideas for the highest risk steps were evaluated using an Impact-Effort Grid.

RESULTS

Improvement ideas were generated using the Impact-Effort Grid and implemented including several major changes involving utilization of the electronic health record. Workflows were standardized between the ultrasound technologists, radiologists, and nursing staff. Physical changes are being implemented in the procedure rooms to ensure that all staff can access relevant information at the time of the procedure, and labels can be easily printed when needed. A control plan was finalized and implemented with monthly audits. Initial data (6 weeks) has shown zero specimen labelling events since the improvement phase began. There have been several good catches identified where potential errors were caught due to new changes in the workflow.

QI02-B8 Improving Operational Efficiency In Outpatient Radiology Using Artificial Intelligence

Awards
Quality Improvement Reports Award

Participants
Rajendra P. Kedar, MD, Tampa, Florida (*Presenter*) Nothing to Disclose

PURPOSE

Healthcare in general, and Radiology in particular, is suffering from ever-increasing costs and lowering reimbursement rates. We see that there has been a paradigm shift in many other industries around us, in the name of efficiency improvements: Agile methodologies in Information Technology, automation, and electro-mechanical systems in manufacturing, autonomous cars, Robo-advisors in finance, etc. It is very apparent to us that we risk becoming obsolete if we don't keep up with the new advances. Outpatient Radiology is a high fixed-cost business, where the marginal cost of performing an additional scan on an already existing machine is relatively low. Given that the machines are our most expensive resources, utilizing them to their maximum potential becomes necessary. This is not very dissimilar to an airline, where the capital-intensive nature calls for the highest operational efficiency. The reality for us is that over one-third of the available capacity of these machines is not utilized. This happens due to a variety of different reasons, most of them outside our control: Patient's no-shows, cancel or reschedule at the last minute, arrive late, etc. While there are a variety of technologies available to prevent some of these, such as reminder services, these factors cannot be completely eliminated. There are other factors on top of these, which contribute to making the capacity itself unavailable, such as unexpected maintenance, technologist calling off last-minute due to sickness, etc.

METHODS

The airlines seem to have a good handle on the problem. As per the Bureau of Transportation, on average, US Airlines had about 85% of the available seats occupied in 2019. We notice that they have solved the problem utilizing three different approaches: Having customers pay even in case of a no-show, asking for additional payment to reserve a specific seat (slot), and having smart overbooking models to predict, and pre-emptively fill, the capacity that would have been wasted otherwise. We, up until now, had not been able to do any of this, for various reasons. Starting last year, we have made significant headway in solving this problem. We brought on the power of Artificial Intelligence, which helps us predict the capacity that is about to go unutilized. We are able to couple that with a patient outreach module, which contacts the patients, offering capacity that is updating in real-time, and if the patient opts to come in, updates their appointment time in our RIS; all without any manual effort on our part. The process is so seamless and efficient that most of our operational staff don't even know that it is running in the background. All we see is the increased traffic of patients going in and out of the facility. As we made this change, we were able to monitor each and every patient who accepted the predicted slot, and we were able to compute the efficacy of the approach.

RESULTS

This approach has increased our overall machine utilization somewhere in the region of 600 to 800 basis points throughout our system. In the process, we were also able to tackle a related problem - obtaining the prior authorization of patients. Ensuring that a patient visit meets the prior auth requirements set out by payors and is ready to be scanned used to be a very manual process for us. We now have the capability to automate this process for more than 80% of our patient visits. This not only drastically reduces the manual errors in the process but also helps reduce the manual workload, and hence, personnel-related costs, by as much as 50%, for that department.

QI02-B9 Fast And Efficient Serial Tumor Assessment Without The Need For Dictation

Participants
David J. Vining, MD, Houston, Texas (*Presenter*) Royalties, Bracco Group;CEO, VisionSR, Inc;Stockholder, VisionSR, Inc

PURPOSE

Serial tumor assessment is often tedious and time-consuming when processing multiple exams containing numerous lesions. Furthermore, human and/or transcription error introduced during dictation may result in the reporting of incorrect measurements and/or image locations. To expedite the process and eliminate error, we interfaced an interactive multimedia reporting system to a PACS so that DICOM images and measurements can be input directly into a report without the need for dictation.

METHODS

We developed an interactive multimedia reporting system that uses an application-programming interface (API) to transmit DICOM images and data (i.e., metrics, series & image numbers) into a report as a radiologist measures tumors in a PACS display. After baseline tumors are recorded, the radiologist labels each finding with metadata to describe its anatomy and diagnosis. During subsequent exams, the radiologist performs the following steps to create links between serial findings: (1) the radiologist "activates" a prior annotated finding in the interactive report by clicking on it during an edit mode, (2) he/she measures a corresponding new finding in the PACS display, (3) the radiologist presses a speech microphone function button to initiate data transfer that is linked to the activated finding, and (4) the process is repeated for each finding that is being assessed. There is no need to dictate any description about the finding unless desired as the prior finding's metadata is transferred to the new finding and any measurement data is incorporated via the PACS interface. In the absence of additional dictation, automated text is generated to describe the finding, for example, "Metrics only recorded. The Liver, segment 6 - Metastasis measures 10 x 20 mm on image 50 of series 2." The new data are displayed in a graphical timeline along with any corresponding prior linked data. Findings designated as target lesions are used in the calculation of disease response criteria, including RECIST and/or immune-related response criteria.

RESULTS

Substantial time-savings averaging greater than 10 sec/finding is achieved using the automated process as it eliminates the need for redundant dictation of measurements and related image/series numbers for incorporation into the multimedia report. This time-savings is cumulative depending on the number of findings contained in a report. We have found that the system is efficient enough to allow for the capture of more findings per report so that our cancer-related reports contain disease measurements for 5 times or more the number of findings reported in a conventional radiology report, depending upon the number of findings present. Furthermore, the direct transmission of DICOM data into a report eliminates human and/or transcription errors when reporting tumor assessments.

QIO2-B-HC1 The Sonographic Murphy Sign: Does Analgesia Matter? A Single Center Retrospective Study Demonstrating Increased False Negative Diagnoses (missed Acute Cholecystitis) After Opioid Analgesia.

Participants
Elianna Goldstein, MD, Tripler Army Medical Center, Hawaii (*Presenter*) Nothing to Disclose

PURPOSE

There is an absence of diagnostic radiology based research on the impact of premedication on the sonographic Murphy sign (SMS). The SMS is defined as maximal tenderness elicited when the transducer probe is pressed over a sonographically localized gallbladder. Controversy exists regarding the diagnostic accuracy of the SMS when patients are given pain control medications prior to their right upper quadrant ultrasound. This study addresses the effect of opioid analgesia on the SMS and on final radiologic diagnosis with comparison of sensitivity and specificity of the SMS for acute cholecystitis with or without opioid analgesia. This study also addresses radiology/emergency department/pathology diagnostic concordance or discordance for acute cholecystitis.

METHODS

This study consists of a retrospective cohort chart review to test the null hypothesis: that assessment of the SMS is similar in patients who received and did not receive prior opioid analgesia. The study was conducted at diagnostic radiology residency program with a Level II, tertiary care emergency department. The attending radiology staff are board-certified or eligible and the emergency staff are board-certified. Ultrasound examinations were performed by experienced technologists all of whom had at least 7 years of experience. The research subjects consisted of 686 adult patients who presented to the emergency department with unspecified abdominal pain and had either a right upper quadrant or gallbladder ultrasound during the study period from January 1, 2018 to September 1, 2019. 29 of these ultrasound exams were repeat exams from patients who had been previously scanned at least once during the study period for a total of 715 ultrasound exams for 686 individual adult patients. 23 patients scanned had no gallbladder at the time of the exam, 9 patients had no annotation of present or absent SMS, and 1 patient had pathology done at an outside hospital; these patients were therefore excluded. 682 ultrasound exams were analyzed. Null hypotheses were tested regarding prior opioid analgesia and false positive and false negative radiologic exams. The null hypotheses that the sensitivity and specificity of the SMS did not change with prior opioid analgesia versus no prior opioid analgesia was also tested for radiographic diagnosis, emergency department diagnosis, and pathologic diagnosis.

RESULTS

Reject the null hypotheses that opioid administration does not affect the SMS (p &lt .001 with 2x3 chi square test). False positive radiologic diagnosis is not significantly affected by opioid administration (p=.0936, 2x2 chi square test). This represents 25 cases of false positive diagnosis of acute cholecystitis. False negative radiologic diagnosis is significantly affected by opioid administration (p &lt .0219, 2x2 chi square test). This represents 22 cases of radiologic missed cholecystitis. Premedication with opioids prior to ultrasound was significantly affected by a pathologic diagnosis of acute cholecystitis versus other diagnoses (p &lt .0001, 2x2 chi square test). The sensitivity and specificity of positive SMS are 41.4% and 91.5%, respectively. Accept the null hypothesis that opioid analgesia does not affect the sensitivity and specificity of the SMS for pathologic acute cholecystitis (p=.500 and p=.575, respectively, chi square test). Accept the null hypothesis that opioid analgesia does not affect the sensitivity and specificity of the SMS for pathologic acute cholecystitis (p=.500 and p=.575, respectively, chi square test). Accept the null hypotheses that opioid analgesia does not affect the sensitivity and specificity of the SMS for radiologic, emergency department, or pathologic acute cholecystitis, and that there is not significant difference in final diagnosis between radiology and emergency department (p=.736), radiology and pathology (p=.427) and pathology and emergency department (p=.704).

Abstract Archives of the RSNA, 2021

QI03-C3   Incorrect Count Intra-Operative Radiographic Protocol Quality Improvement

Participants
Abigail R. Cogman, DO, Salt Lake City, Utah (*Presenter*) Nothing to Disclose

PURPOSE

A retained surgical foreign body (FB) is considered a "never event" by the Joint Commission and Department of Health and Human Services. In the event of an incorrect surgical count, an intra-operative radiograph (IOR) is performed. Inadequate communication between surgery and radiology regarding the nature of the missing item could lead to misdiagnosis/misinterpretation of a retained FB on the IOR. This project aims to increase patient safety by improving communication, thus reducing the chance of this never event.

METHODS

A multi-disciplinary team of radiologists, surgeons, OR nursing team, and radiology technologists addressed the problem related to incorrect count IOR. One challenge was that radiologists did not know what a missing object looked like. A decision was made to take a radiograph of the missing object when the count was off. The policy was approved by the peri-operative executive committee. To measure the new policy's impact on radiologists' confidence, a two set survey was administered to radiologists (N=60), the first set without and later set with a radiographic example of the missing object. Radiologists were asked if the FB is present on IOR and to rate their confidence level on a scale of 1-5, 5 being the most confident. The total survey completion rate was timed.

RESULTS

There were similar rates of the accuracy of FB detection. However, the survey results illustrated that the number of radiologists rating their confidence at 4 or 5 increased from 42% to 85% with the addition of the missing object's radiograph. The time spent completing the survey was also decreased by an average of 25% with radiographic examples.

QI03-C4   Impact Of Breast Imaging Nurse Navigation On Care Timeliness, Compliance And Retention

Participants
Melissa Tannenbaum, MD, Boston, Massachusetts (*Presenter*) Nothing to Disclose

PURPOSE

The healthcare landscape continues to move towards value-based care models. The purpose of our study was to determine the impact of breast imaging nurse navigation (NN) on patient care time metrics, compliance, and care retention at our academic medical center after biopsy.

METHODS

An IRB-approved retrospective review of patients who underwent breast core biopsy was performed before (5/1/17-6/30/17) and after (5/1/19-6/30/19) the implementation of a breast imaging nurse navigator position at an academic medical center. Patients with breast aspirations, inpatients, and patients with stage 4 disease were excluded. In patients with multiple biopsies, the first biopsy was considered the index biopsy. Time points collected included core biopsy date, finalized pathology report date, result communication date, initiation of care post-biopsy date (another biopsy, clinic visit, MRI), and surgery date (when applicable). Follow-up recommendations were collected and classified as 6 month imaging follow-up, additional biopsies, breast MRI, breast care center appointment, and surgery. Compliance with recommendations was also captured. Other data collected included who contacted the patient with results (breast imaging staff including NN, referrer, other), breast pathology (benign, atypia, cancer) and patient demographic data (age, race/ethnicity, language, insurance type, and education level). Calculated time metrics included time from biopsy date to finalized pathology report, time from finalized pathology report to biopsy result communication, and time from result communication to recommended follow-up. Compliance was defined as those who arrived for follow-up appointment within one month. Care retention was defined as those patients with cancer diagnosis who underwent breast surgery at the home institution.

RESULTS

413 patients comprised our study population (mean age 54 years). 51% (210/413) were before (pre-NN) and 49% (203/413) were after (post-NN) nurse navigator implementation. 60% (248/413) patients identified as white, 17% (71/413) as Asian, 13% (55/413) as black/African American, 5% (21/413) as Hispanic/Latino, and 4% (18/413) as other/not specified. 81% (334/413) spoke English and 19% (79/413) were non-English speaking. 65% (268/413) had private insurance and 35% (145/413) had other insurance (Medicare, Medicaid, other). Incidence of cancer was 27.6% (58/210) in the pre-NN group and 20.2% (41/203) in the post-NN group. There was no significant difference in time from finalized pathology report to communication of results pre-NN vs post-NN, with median of 1 day. This was true regardless of language, race, or insurance. The patient was directly contacted to discuss biopsy results by breast imaging in 3% (6/210) pre-NN compared to 73% (148/203) post-NN (p<0.0001). In cases where breast imaging did not contact the patient directly, the patient was contacted with results by the referrer. Language did not impact

likelihood of being contacted with results by imaging. The median time from result communication to recommended follow-up and the time from biopsy date to surgery were significantly longer post-NN compared to pre-NN (14 vs. 7 days, p<0.0001; and 68 vs 49 days, p<0.0001, respectively). This remained when analyzed in patients with and without cancer. There was good compliance with our recommendations in both groups, 89% pre-NN and 88% post-NN (p=0.7). Those with private insurance were more likely to be compliant with recommendations (p=0.015). There was greater care retention at our institution post-NN (85%; 35/41) compared to pre-NN (78%; 45/58) though the difference was not statistically significant.

QI03-C6 A Performance Monitoring Framework Implementation At A Public Hospital's Radiology Department To Regularly Evaluate Performance Metrics Of A Chest Radiograph AI Model

Participants
Ivan Ho Mien, MBBS, PhD, Singapore, Singapore (*Presenter*) Nothing to Disclose

PURPOSE

Machine learning systems are increasingly showing potential for achieving clinical expert level performance. As such, there are growing efforts to deploy these systems in radiology practice. Accordingly, there is increasing recognition of the necessity to monitor performance of machine learning models after deployment in actual clinical workflow. Specifically, good performance on retrospective trial datasets does not guarantee acceptable future performance in routine real-world practice. This could be due to factors such as source data drift and changes in disease prevalence. Therefore, end-users relying on AI models need the ability to regularly and conveniently evaluate model performance relative to required specifications. Only then can they be informed about performance degradations and trigger the necessary model removal, revision, or refresh in a timely manner. To this end, we designed and implemented a performance monitoring framework to monitor the performance of a deep learning-based chest radiograph (CXR) classification model over time. Our approach enables collection and analysis of longitudinal model performance data and enables better visibility and greater reliability for end-users.

METHODS

We deployed a CXR classification system for triaging of studies with urgent findings at a major public hospital's radiology department. The system accepts CXRs from PACS as inputs and generates positive or negative inferences on 14 different labels specified in the publicly available CheXpert dataset. Our performance monitoring system first collates lists of CXRs forwarded to the AI system in 24-hour periods, then randomly samples 20 CXRs from each period for evaluation against their ground truth labels. These labels were obtained by manual annotation of sampled CXRs with the aid of their accompanying radiology reports. We computed performance metrics including accuracy, sensitivity, and specificity over time and visualized the results on a Shewhart control chart. To alleviate the burden of manual ground truth annotation, we also implemented the publicly available CheXpert natural language processing (NLP) enabled labeler to efficiently generate image labels. We then compared the manually and automatically generated labels with the AI model predictions. After implementation, we also surveyed end-user radiologists to assess their perception on the impact of our performance monitoring tools on their workflow and the reliability of the deployed AI system.

RESULTS

Our performance monitoring framework was able to integrate with existing healthcare IT and imaging infrastructure at our radiology department. Further, the graphical dashboard in our framework provided synoptic visual feedback on performance of the deployed model over time when conducting quality control and audits. End-users expressed increased reassurance and confidence operating alongside the AI model in the knowledge that a performance monitoring system is in place. Although image labels generated by automated NLP labelling are currently not as good as manual annotations, they do enable more efficient and passive performance monitoring for a higher volume of images.

QI03-C7 Leveraging 3D CAD Divergent Ray Simulation Tools To Improve Design, Accuracy And Evaluation Of A Radiographic Marker That Estimates Head Of Bed Angle In Portable Chest X-rays

Participants
Javier Mendez, BS, Bethesda, Maryland (*Presenter*) Nothing to Disclose

PURPOSE

Chest x-ray (CXR) examinations are performed daily on most intensive care unit (ICU) patients throughout the world. Portable CXR (pCXR) examinations are performed on patients in their hospital bed when they cannot be transported to the radiology department for an upright (erect) posteroanterior and lateral CXR. Radiologic technologists (RT) are required to place a lead radiographic marker indicating the left or right side of the patient. To optimize interpretation of the images, it is imperative to know the head-of-bed angle (HOBA) to evaluate serious conditions across serial pCXRs obtained over time, especially when differentiating effusions from consolidations (like pneumonia). Technologists frequently include a marker (in addition to the left or right) to indicate HOB position, e.g., "erect", semi-erect or "supine". However, these subjective arbitrary markers are not clinically useful due to lack of agreement on what angles to apply them. Therefore, pCXR interpretation by radiologists and intensive care physicians would be improved (and patient care as a result) with markers that objectively record HOBA. A marker prototype, X-clometer, was developed to mitigate this systematic deficiency of objective HOBA data. However, it was initially designed by experimentation without taking into consideration the divergent nature of the X-rays, which negatively impacted accuracies, especially in the outer edges of the cassette (sometimes up to 30° off). We redesigned the original prototype to significantly improve precision of HOBA estimation by simulating the pCXR environment with divergent X-rays using 3D CAD software.

METHODS

The pCXR system simulation (pCXRSS) includes the X-ray cassette, the pinhole-like X-ray source, the X-clometer, and the divergent X-rays from the X-ray source through the center of the rolling ball at selected angles (projection rays). The projection rays were simulated for 0°, 30, 45°, 60°, and 90° HOBA. Simulation was performed for a 43.2cm x 35.6cm X-ray cassette with the upper right corner of the inclinometer region of the X-clometer positioned within the field-of-view at 2cm and 2.5cm from the top and right edges of the cassette, respectively. The simulated X-ray source was centered and placed at 127cm distance in respect to the cassette. However, the system can be adopted to any cassette size/orientation, as well as the X-ray source and the X-clometer locations.Another major modification was rotating the channel's (tubular structure that provides a path for the ball to roll) plane of reference by 45° in respect to the cassette. Rotating the channel towards the X-rays allows to improve distribution of the markers. This allowed a more granular reading of the ball position in the 60° to 90° range, further improving accuracy of the HOBA estimation.pCXRSS was implemented in both Solidworks ®(Dassault Systèmes SolidWorks Corporation, Waltham, MA) and Fusion 360 (Autodesk Inc, San Rafael, CA).

RESULTS

The X-clometer (publically available on the NIH 3D Print Exchange) was evaluated by an experienced radiologist and several technologists. Preliminary results obtained with a chest phantom and clinical examinations at participating centers indicate an agreement between the HOBA recorded by the X-clometer on radiographs and physical inclinations of the bed set and recorded by the RT. Recently, a team of five RTs used the X-Clometer during clinical examinations over a period of two weeks. As a quality measure, HOBA recorded with the X-Clometer on 25 radiographs were within 5° of the manually noted HOBA on the hospital bed inclinometer.

QI03-C8   Quality And Cost Assessment For The First One Year Of A Radiology-based 3D Printing Section

Participants
Prashanth Ravi, PhD, Cincinnati, Ohio (*Presenter*) Nothing to Disclose

PURPOSE

Three-dimensional (3D) printing is increasingly performed within radiology departments for anatomic models, with limited printing of surgical guides. There is considerable anecdotal evidence that 3D printing adds value for specific clinical scenarios. However, to our knowledge there are no specific Quality Improvement (QI) reports that detail the quality delivered to a medical center. The 3D Printing section is new in comparison to the traditional sections in a radiology department, and thus quality metrics can be defined during program creation. In theory, these metrics could be shared across organizations to improve the overall quality of this new service offered by radiologists working in hospitals and medical centers, also known as at the Point of Care (PoC).

METHODS

This project was proposed by the department QI program, but was also reviewed by the institutional human research committee, after which the need for written informed consent was waived. All activities during the first one year of the 3D Printing Section structured within an academic radiology department were prospectively collected during a weekly institutional-wide 3D printing meeting. This meeting included all members of the radiology-based team, plus referring clinicians and as needed industry and/ or other representatives. Quality was a separate component of each meeting; these prospectively collected data were retrospectively reviewed for this project. As applicable, data was entered into the ACR/RSNA 3D printing registry, with separate databases maintained internally by the laboratory leadership. Quality points were defined for each service, and these were evaluated weekly. All laboratory costs (human resources, hardware, software, and materials) were tallied, so that the quality metrics could be assessed with respect to the first 1-year of costs of launching a medical 3D printing program with a radiology department at the PoC.

RESULTS

All minutes were captured from the 3D Printing Section weekly meeting, with formal quality assessment. There were additional ad hoc meetings outside of the weekly meetings - in general these meetings did not generate minutes and the data from these meetings were excluded from this QI project analyses. There was a roughly 3 month period of COVID-19 specific 3D printing (see run chart); these minutes and data were excluded from this QI project. The HR included one part-time radiologist and one full-time engineer. Four other radiologists consistently contributed to the QI project. Six referring physicians consistently provided QI feedback in the form of Likert scores and intraoperative measurements and/or photographs. The lab used one major commercial segmentation package plus several additional ad hoc software tools (e.g. for traditional 3D visualization and virtual reality). These were used when either requested or considered necessary by the radiologist. The laboratory 3D printed 88 patient specific models among those evaluated for segmentation, and provided 35 educational models as requested. Data from all patient specific models was captured for the ACR/RSNA 3D printing registry. The following areas were identified for QI: data transfer, volumetric image quality, segmentation, print failure, entry into the electronic medical record (EMR), Likert data feedback from referring clinicians, and model delivery. Data transfer quality was improved by documenting the best imaging series (e.g. thin section CT images) in the 3D printing report. Three patients did not have adequate image quality; specific 3D printing imaging protocols improved quality. There were 5 segmentation QI opportunities, and these decreased in monthly frequency during the 1-year evaluation with experience and feedback. Print failure is common, and specific costs associated with this QI opportunity were assessed. EMR reporting was improved with incremental integration of reports into the hospital-based system. Feedback from requesting physicians was problematic early in the first one year of the 3D printing

QI03-C-HC1 Sustainable Reduction In Complete Abdominal Ultrasound Downcoding Following Introduction Of Structured Reporting

Participants
Eric Pepin, PhD, MD, Farmers Branch, Texas (*Presenter*) Nothing to Disclose

PURPOSE

Complete abdominal ultrasound reporting requires inclusion of eight imaging elements: common bile duct, gallbladder, inferior vena cava, kidneys, liver, pancreas, spleen, and upper abdominal aorta (CPT® 76700). Reports including fewer than eight elements are downcoded to limited abdominal ultrasound (CPT® 76705), resulting in several negative outcomes, including lost revenue, potential for unnecessarily repeated exams, possible missed findings, time cost by radiologists and billers addressing reporting shortcomings, possible delays in patient management and compromised patient care, and dissatisfaction of referring clinicians. It was proposed that implementation of a structured report template including prompts for the required imaging elements would reduce the percentage of complete abdominal ultrasound studies that are downcoded to limited abdominal ultrasound studies by a statistically significant amount by the end of the first year.

METHODS

Retrospective analysis by L.A. and the Billing and Coding department at an academic medical center of Q4 2016 complete abdominal ultrasound studies determined the rate of down-coding for incomplete reporting. Subsequently, a mandatory structured report was created for complete abdominal ultrasound reports with input from radiology faculty and residents. Within the dictation software (PowerScribe 360; Nuance, Burlington, MA), the template was set to automatically populate in the report document when a complete abdominal ultrasound study was opened for interpretation. Billing and collection data were analyzed at monthly intervals for 5 months following implementation and also for quarterly comparisons 1-year and 2-years post implementation to determine the percentage of down-coded exams. A Pearson's Chi-squared test was used to determine statistical significance at the 95% level.

RESULTS

During FYQ2 2016, 26.6% (300 of 1128) of orders for complete abdominal ultrasound were downcoded to limited abdominal ultrasound due to reporting inadequacies. In the first full month following template implementation, the down-coding rate was 10%. The down-coding rates for FYQ2 in 2017 and 2018 were 2.6% and 3.1% respectively (p<0.01). At a difference of 0.22 RVU per exam for facility and non-facility services, the total quarterly fiscal impact was approximately $37,900 USD retained using 2017 Medicare reimbursement levels. The quarterly report addenda rate decreased by 64% in FYQ2 2017 and by 53% in FYQ2 compared to FYQ2 2016 (p<0.01).

QI01-A1   Improving Timely Post-procedural Documentation In The Electronic Health Record After Interventional Radiology Procedures

Participants
Albert C. Li, MD, Livingst, New Jersey (*Presenter*) Nothing to Disclose

PURPOSE

The medical record is the principal means of communication among healthcare providers in matters related to patient care and documentation should always be timely. According to an American hospital regulatory agency, The Joint Commission (TJC), when a high-risk procedural report cannot be immediately entered into the medical record, a progress note of brief contents is to be entered to the medical record before the patient is transferred to the next level of care as required by TJC. Such immediate post-procedural documentation is also supported by several American radiologic professional societies. The interventional radiologists were routinely documenting the procedure; however, it often was not documented prior to transfer to the next level of care. This project sets to address this deficiency.

METHODS

Aim was to obtain 85% compliance of timely post-procedural documentation in the electronic health record (EHR) by the interventional radiologist on all interventional radiology procedures prior to transfer to the next level of care within 4 weeks of implementation. A "SmartText," which is an EHR shortcut that allows customized text to populate a document, was created 4 weeks prior to implementation, tested by 3 interventional radiologists, and made available to all interventional radiologists. An email explaining the project scope and timeline along with detailed instructions and screenshots was sent to all interventional radiologists 2 weeks prior to implementation. After implementation, weekly emails to all interventional radiologists and key hospital stakeholders evaluated deidentified data and incorporated plan-do-check-act cycles. The weekly progress email served as an encouraging reminder.

RESULTS

Baseline immediate post-procedural documentation was 0%. By implementation, documentation increased to 95%. Documentation reached 100% by week 1 and was sustained through the final week of data collection.

QI01-A4   Using AI And Natural Language Processing To Identify Imaging Follow-up Recommendations

Awards
Quality Improvement Reports Award

Participants
Adam Kirell, MENG, New York, New York (*Presenter*) Employee, Within Health

PURPOSE

Half of all diagnostic follow-up recommendations are delayed or missed, resulting in 80,000 excess deaths per year, $40B in unnecessary services and readmissions, and $20B in lost hospital revenue. Radiology practices have limited visibility into the quantity and quality of follow-up recommendations. This study looks at the effectiveness of using AI for digital tracking of follow-up recommendations.A natural language processing (NLP) algorithm (Within Health) will accurately classify radiology reports with recommendations for imaging follow up, and extract key data. The NLP algorithm will maintain > 90% true positive rate and process reports with less time and effort when compared to manual tagging.

METHODS

The NLP rules based algorithm analyzed 1392 radiology reports dictated by board certified radiologists at a single academic hospital system. Rules (Table 1) were applied to each report to determine if the report contained a recommendation for further imaging. The reports were manually tagged by 3 staff members trained on NLP rules. The output from the NLP algorithm and processing time was compared to those from the manually tagged reports.

RESULTS

The NLP algorithm identified 872 reports that contained imaging recommendations and 520 reports that did not contain imaging recommendations. Manual review demonstrated 738 radiology reports containing imaging recommendations and 654 without. Of the 738 manually tagged positives, the NLP identified 725 (98.2%). Of the 654 reports that were manually tagged negative, the NLP identified 507 (77.5%) (Table 2). NLP processing time was 0 hours. Manually tagged processing time was 4 minutes per report (93 hours).

QI01-A5 Improving The Quality Of Follow-up Recommendations For Incidental Abdominal Aneurysms

Awards
Identified for RadioGraphics
Quality Improvement Reports Award

Participants
Natasha Larocque, MD, Hamilton, Ontario (*Presenter*) Nothing to Disclose

PURPOSE

National guidelines currently exist providing evidence-based management recommendations for a variety of incidental radiologic findings. However, penetration of these practices is relatively low on the local level. In order to improve implementation of this practice in our department, we proposed development of institutional guidelines that would be based on national guidelines with the feedback of local referring physicians. The purpose of this project is to use a gap analysis of national versus institutional guidelines to:1) Identify recommendations that can be developed and instituted at our hospital2) Assess impact of standardized institutional recommendations on imaging follow-up and specialist referrals

METHODS

A gap analysis between national and our institutional guidelines was performed. We identified abdominal aneurysm recommendations as a gap that could be improved with standardized institutional guidelines. In collaboration with our vascular surgery department, we developed evidence-based institution-specific guidelines for the management of abdominal aortic, renal, and splenic artery aneurysms. Macros containing these guidelines were then programmed into our dictation software. An educational session discussing these new recommendations was provided to the radiology department prior to implementation. The new abdominal aneurysm recommendations were implemented on February 1, 2021. A retrospective chart review was conducted for February 1-April 30, in 2019, 2020, and 2021 to assess the frequency of use of our new recommendations over a similar time frame, and to assess the impact on imaging follow-up and specialist referral.

RESULTS

Abdominal aortic aneurysms (AAA): In 2019, 2020 and 2021 a total of 90, 75 and 103 incidental AAAs were identified respectively. Reports recommended correct follow-up for AAAs in 8 (9%) cases in 2019, 13 (17%) cases in 2020 and 39 (38%) cases in 2021. In 2019 and 2020, 8 (9%) and 9 (12%) patients in these respective years had new vascular surgery consultations for AAA management following their scan. In 2019 and 2020, 15 (17%) and 13 (17%) patients in these respective years had imaging follow-up to re-assess the AAA.Splenic artery aneurysms (SAA): In 2019 and 2020, 46 and 25 incidental SAAs were detected, with 3 (7%) and 0 (0%) reports describing the correct follow-up in the respective years. Preliminary data from February and March 2021 detected 42 SAAs, with 12 (29%) reports containing correct follow-up recommendations.Renal artery aneurysms: In 2019 and 2020, 16 and 8 cases of RAAs were detected, with 0 (0%) reports describing the correct follow-up for 9 and 5 cases (in the respective years) that required follow-up due to size greater than 1.0 cm. Preliminary data from February and March 2021 identified 9 RAAs with 1 (17%) report including correct follow-up recommendations.

QI01-A6 Appropriateness Of Ultrasound Requests For Evaluation Of CT Detected Incidental Thyroid Nodules (ITNs)

Participants
Uzoma Nnajiuba, MBBS, Liverpool, United Kingdom (*Presenter*) Nothing to Disclose

PURPOSE

An ITN is a thyroid nodule not previously detected or suspected clinically but detected on imaging. Improvements in quality of imaging and fear of litigation has led to an increasing number of ITNs being detected on CT. However, there is significant variability in how these are reported by radiologists owing to a paucity of guidance from professional organisations. The nature of thyroid US means that there is a low threshold for performing invasive fine needle aspiration (FNA) on indeterminate nodules. Once FNA is performed it can be difficult to confirm benignity on cytology, thus triggering an anxiety inducing process of repeat FNA and ultimately diagnostic hemithyroidectomy with associated morbidity, which frequently reveals a benign lesion. This is in the context of thyroid cancer, which typically has an indolent course, even if confirmed, and especially if detected incidentally. The authors observed a high rate of US requests for evaluation of CT detected ITNs in their regional head and neck unit. They therefore sought to establish whether these US referrals were justified and how many of the ITNs proved to be malignant on cytology.

METHODS

A search was performed on the hospital RIS for all US or US + FNA requests generated from CT studies between 01/01/17 and 01/01/20. This produced 40 results. The CT study of each case was then reviewed to assess whether the referral was appropriate using the best available guidance in the literature, primarily the American College of Radiology (ACR) 2015 White Paper for Incidental Thyroid Nodules and the British Thyroid Association (BTA) 2014 Guidelines for the Management of Thyroid Cancer. An US referral was deemed appropriate if the CT appearances of the ITN were suspicious by the ACR criteria or the BTA criteria or were judged by the authors, one of which was a subspecialty head and neck radiologist with >5 years experience, to be suitably atypical for some other reason not stated in the guidelines. The authors also recorded the original indication for the C; whether the CT appearances represented a nodule or goitre; whether the reporting radiologist had explicitly recommended US evaluation; the US findings (U Classification), any subsequent FNA performed and the cytology results.

RESULTS

Of the 40 CTs, 20 described a thyroid goitre, 17 described a thyroid nodules, 2 described multiple nodules and 1 described some ill-defined low attenuation change. This is problematic as the available guidance applies on to thyroid nodules and not goitres. Further evaluation with US was explicitly recommend by the radiologist in 24 reports while 15 did not recommend US evaluation and the remaining scan report advised clinical correlation +/- US. Therefore a significant proportion of US requests were being made from non-radiologists without radiology recommendation. The authors deemed 20 US referrals to be appropriate, 17 inappropriate and were undecided on 3 cases. The undecided cases were those where the indication of the study was cancer related and therefore the authors were unsure whether detection of an ITN on CT in such cases would warrant US evaluation, even if the nodule did not meet ACR or BTA criteria. On US, 34 of the referred thyroids had benign (U2) appearances while 6 were U3 or greater and therefore underwent FNA. Of the 6 thyroid nodules aspirated, 5 were benign on cytology (Thy2) while one was an indeterminate follicular neoplasm (Thy3f) requiring diagnostic hemithyroidectomy to establish malignant potential. The patient with the Thy3f lesion was elderly and died from unrelated causes before any further investigation could occur.

QI01-A7   Improving Image Quality of Intrahepatic Portal Veins With Dual-energy Spectral CT Imaging Andadaptive Statistical Iterative Reconstruction

Participants
Jun Yao, Ankang, China (*Presenter*) Nothing to Disclose

PURPOSE

To investigate the clinical value of dual-energy spectral CT imaging and adaptive statistical iterative reconstruction (ASIR-V) in improving image quality of portal veins.

METHODS

Forty patients undergoing abdominal CT angiography of the portal veins using dual-energy spectral imaging mode on a GE Revolution CT were prospectively collected. The 120 kVp-like images were first reconstructed with 40% ASIR-V to simulate the conventional imaging condition in the control group. The spectral monochromatic images at 40-70 keV (intervals of 10 keV, 4 levels) were reconstructed in combination with 40%, 60%, 70%, 80% ASIR-V (4 levels) to generate 16 image sets in the study group. The CT numbers and their standard deviation (SD) of the intrahepatic portal vein were measured to calculate signal to noise ratio (SNR) and contrast to noise ratio (CNR). The subjective image quality was evaluated by two radiologists using a 5-point scoring system. The results were analyzed with one-way analysis of variance, paired sample t-test and Mann-Whitney U test.

RESULTS

CT values of intrahepatic portal vein increased with the decrease of photon energy. portal vein CNR and SNR at 40 keV reconstructed with 80% ASIR-V (7.20±2.62, 11.76±3.40) reached the maximal, similar to that at 50 keV with 80% ASIR-V (6.34±2.30, 11.44±3.29), and higher than those at 120 kVp-like images (2.42±0.96, 6.15±1.66) (all P<0.05). Images at 50 keV with 80% ASIR-V yielded a maximal subjective image quality score.

QI01-A8   Analysis Of True Time Burden When Adding Anesthesia And Contrast To Pediatric MRI: An Institutional Experience

Participants
Alain E. Sherman, MBA, Chicago, Illinois (*Presenter*) Nothing to Disclose

PURPOSE

Administration of anesthesia and gadolinium-based contrast agents adds time to magnetic resonance imaging (MRI) examinations and may pose unknown risks to pediatric patients. In addition, there is a growing body of literature in pediatric MRI showing that contrast may not be necessary for a variety of indications (e.g., sacroiliitis, inflammatory bowel disease, musculoskeletal infection). Furthermore, non-sedated MRI has been shown to be successful in pediatric age groups for acute brain, abdominal, and musculoskeletal imaging, indicating that many children can tolerate the procedure without the need for sedation. The present study sought to examine the time burden of anesthesia and intravenous contrast in pediatric MRI examinations. This information is essential to understand the true burden to the healthcare system, including overutilization of resources, costs, and, most importantly, risk to patients.

METHODS

A retrospective analysis of all pediatric MRI examinations (body, musculoskeletal, neuro) requiring anesthesia or intravenous contrast at a tertiary children's hospital over a two-year period (2018-2019) was performed. Step-by-step procedural workflow was analyzed, including early arrival, patient wait times, pre-procedural evaluation, IV placement, anesthesia care, contrast administration, pre- and post-contrast imaging. Mean time added by anesthesia care and contrast were calculated and presented as a percentage of total encounter duration.

RESULTS

Exams with anesthesia (N=4,688), comprised 19% of the total number of MRI examinations (N=24,125). Exams with IV contrast (N=9,373), comprised 38% of the total. The mean time added to the examination due to anesthesia care was 85 minutes, which comprised 65.2% of the average encounter. The mean total MRI encounter time including anesthesia care, was 131 minutes.

QI01-A9   Diagnostic Errors In Neuroradiology, Physician Experience Level And Tumor Board Participation At A Single Tertiary Academic Center

Participants
Michael Baggett, MD, Sacramento, California (*Presenter*) Nothing to Disclose

PURPOSE

The purpose of this study is to quantify and correlate the diagnostic error rates in radiological interpretation with the experience of the attending neuroradiologist reading the case at a tertiary academic medical center.

METHODS

The Neuroradiology Quality Assurance Database of diagnostic errors made by attending neuroradiologists in our institution was searched for misses from 2014 - 2020. Frequency of attendance at Head and Neck (H&N), Brain, and Pediatric Neuroradiology (PN) Tumor Boards (TB) as the presenting radiologist was collected. Post-fellowship years of clinical practice (CPY) and frequency of TB attendance were considered separate metrics of a radiologist's experience. Radiological errors were categorized as Total (T), H&N, Skull Base (SKB), Brain or PN diagnostic errors. Diagnostic error rate/1,000 interpreted studies, per attending neuroradiologist within each category was correlated with frequency of TB participation and with CPY using Spearman's rank correlation coefficients.

RESULTS

607 exams contained a diagnostic error. Spearman's rank correlation coefficients between Total TB participation and T, H&N, SKB, Brain error rates were: -0.89 (p=0.0002); -0.81 (p=0.002); -0.66 (p=0.03); -0.82 (p=0.002); respectively. Spearman's rank correlation coefficients between CPY and T, H&N, SKB, Brain and PN error rates were: 0.05 (p=0.88); 0.08 (p=0.82); 0.28 (p=0.41); -0.10 (p=0.77); -0.16 (p=0.63), respectively. Spearman's rank correlation coefficients between H&N TB and H&N, SKB error rates were: -0.79 (p=0.004); -0.65 (p=0.03). The Spearman's rank correlation coefficient between Brain TB attendance and Brain error

rates was -0.75 (p=0.008).

QI05-B1   The Introduction Of Cone Beam Computed Tomography (CBCT) In A District General Hospital

Participants
Dhurrika Raveendran, BDS, Southend-On-Sea, United Kingdom (*Presenter*) Nothing to Disclose

PURPOSE

CBCT images are increasingly becoming a vital tool for assessment and planning of various Oral & Maxillofacial surgery procedures, offering low-dose exposure and ease of acquisition. CBCT scans are particularly useful for pre-operative assessment and surgical planning prior to surgery enabling clinicians to use minimally invasive approaches. Prior to the introduction of a CBCT scanner at Southend University Hospital, patients who required CBCT scans following assessment by the Oral and Maxillofacial Surgery Department were referred externally to a local practice. Outsourcing of CBCT scans increased wait times and resulted in higher costs to the hospital. To overcome these issues, a new CBCT scanner was installed at Southend Hospital and radiographers were provided with training allowing the provision of a new service to patients. With the introduction of a CBCT device at Southend University Hospital, this project evaluates the quality of service provision, compliance and impact on the management of various oral surgical procedures. This project aims to determine whether the use of CBCT scans in the Oral and Maxillofacial surgery department at Southend University Hospital complies with the SEDENTEXCT guidelines. The aims and objectives are: • To determine whether CBCT scans were requested in accordance with SEDENTEXCT guidance. • To assess the diagnostic value of CBCT scans taken at Southend University Hospital. • To evaluate the impact the images had on the planning of various Oral & Maxillofacial surgery procedures.

METHODS

A retrospective review of 147 electronic records for all CBCT scans conducted between October 2019 and November 2020 was carried out. Data was collected in relation to patient demographics, indications for CBCT images, quality of CBCT scans and treatment plans before and after the CBCT scans were taken. A significant impact on treatment plan was identified for the following cases: • Surgical intervention vs conservative management • Open vs closed exposure of tooth • Surgical removal vs Exposure of impacted tooth • Removal vs Coronectomy of mandibular third molar • Change in the quantity of teeth that require removal.

RESULTS

98.6% of the CBCT scans requested were justified appropriately in accordance with the SEDENTEXCT guidelines and were commonly requested for pre-surgical assessment of unerupted teeth (38%), assessment of cysts (20.4%) and where radiograph suggests a direct inter-relationship between a mandibular third molar and ID canal for surgical planning of management (32.7%). In 30.6% of cases a significant impact was identified in treatment plan. Typically, scans requested between October 2019 and November 2020 were completed between 6.25 and 47.1 days, however, in March 2020 the number of days on average between scan request and acquisition increased to 81.2 days, likely due to the impact of the restrictions enforced in relation to the COVID-19 pandemic. The CBCT images reviewed fell short of the standards set by the SEDENTEXCT guidelines with 89.8% of scans were deemed diagnostically acceptable and 10.2% considered diagnostically unacceptable. Scans were considered diagnostically unacceptable mainly due to missing anatomy (60%) or movement artefact (33.3%).

QI05-B2   Virtually Yours! 5Th Annual Chicagoland Radiology Virtual Expo Planning And Execution: A Success Story

Participants
Kirti M. Kulkarni, MD, Chicago, Illinois (*Presenter*) Nothing to Disclose

PURPOSE

Due to the COVID-19 pandemic and remote working requirements in spring of 2020, the core committee members of the 5th Chicagoland Radiology Expo decided to plan for their first virtual version of the meeting for medical students. The Radiology Expo originated in November 2016 as an initiative from the Department of Radiology Diversity Committee at the University of Chicago, to improve the pipeline for and career advancement of women and other underrepresented minorities in medicine (URiMs) in radiology. Its success garnered much deserved attention from the ACR Commission for Women and Diversity, and in subsequent years, the Expo focused on introducing medical students to the fields of radiology and radiation oncology early on in their schooling. Although the Expo format was transformed to a virtual platform, our mission to demonstrate radiology's central role in medicine, connecting with and inspiring the medical students remained the same. The planning and execution were unique and challenging in many ways and this abstract showcases the intricacies of creating a virtual event catered to medical students across the world.

METHODS

Core committee members convened in May 2020 and divided the relevant Expo tasks broadly into 4 categories: (1) Funding & Sponsorship; (2) Program Content, with designated Chair to invite subspecialty speakers and to design breakout sessions; (3) Publicity, with team members promoting the event via social media, as part of a rigorous marketing campaign including direct correspondence with medical school Dean's offices across the nation; and (4) Resident and Fellow volunteering. Slack, a digital

platform was used for effective communication between the team members. The core committee members worked closely with IT team to design the event website, which included recorded content describing the Expo's mission and intended impact. The Expo was held 9am-2pm, Saturday, Nov 14, 2020 (www.chicagoradiologyexpo.org). Lineup of speakers included an opening keynote presentation by Dr. Richard Gunderman from Indiana University and closing remarks by Dr. Geraldine McGinty, President of the ACR. With our educational exhibits, students could experience interactive case-based read out sessions with radiologists. Panel discussions focused on topics such as diversity, work life balance, and pearls and pitfalls in residency application in these fields. One-on-one speed advising sessions were integral in fostering early connections between students and radiologists. A virtual exhibit hall encouraged relevant vendors to showcase products utilizing live and recorded presentations. Analytics data was obtained at the backend of the website hosted on Wix.com, the creative website building platform for the event. The data focused on online traffic generated a month before through 15 days after the event, while also surveying geographic distribution of attendees.

RESULTS

During the period of October 1-December 1, 2020, a total of 1897 visitors explored the website; on Expo day, approximately 586 visitors accessed the site, of which 59% were new visitors and 41% were returning visitors. 9.2% were international students from as far as India and Turkey. Out of 12 plenary and breakout events, the top two most popular were: Opening Keynote Address on Radiology: Past, Present, and Future; and Panel on Application Pearls.

QI05-B3 Applying Lessons Learned In Implementing Automated Workflows In An Academic Pediatric Radiology Department

Participants
Marla Sammer, MD, Houston, Texas (*Presenter*) Nothing to Disclose

PURPOSE

The purpose of this study is to share the lessons we learned in implementing vendor developed software driven partially automated workflows in our institution. Specifically, we deployed a partially automated workflow in the body section in March of 2019 and then analyzed the body section implementation process following go-live. Before go-live in the neuroradiology section, we defined discrete phases were improvements could be made based on the body section analysis, and applied these lessons to the implementation in neuroradiology in December of 2020.

METHODS

Following implementation of a partially automated workflow in the body section, a review was conducted of the implementation process by stakeholders including clinical leaders and users in multiple sections in Radiology, Radiology informatics, in-house Information Services (IS), and the software vendor. In review, we identified 5 discrete phases where improvements could be made: Planning, Building, Testing, Data Analysis, and Full Operationalization. Within each phase, metrics for success were then defined. These were used in designing the subsequent go-live project plan in the neuroradiology section.

RESULTS

Contributions of the established team including Clinical Radiology stakeholders, Radiology informatics, in-house IS, and the vendor to post go-live analysis is essential to improving subsequent processes. Customizing the go-live to address the nuances of a specific division is a labor intensive process which requires individuals who are both technically savvy and have medical knowledge. However, lessons learned in one section can be applied to another. Examples of identified areas of improvement from the initial implementation include iteratively testing the system prior to activation to improve trust, buy-in and customization. Additionally, one of the biggest adjustments in using a software driven automated worklist management system is the acceptance of a culture change with regard to reading workflow. Radiologists accustomed to self-selecting studies immediately as they appear on PACS need to adapt to some loss of autonomy; conversely others who typically contribute less will need to grow accustomed to the expectation of higher volumes. There will be late adopters not accepting the technology, and operating the software product on a limited basis in the background without interrupting workflows allows for data gathering. Data analysis is essential to iteratively improve the user experience and provide data driven feedback to radiologists; for example, based on feedback from the body section, we built a distribution simulation program using real data to experiment with different algorithm options prior to implementation in neuroradiology. Full operationalization of the software solution requires a coordinated effort by physician leaders and users, informatics leaders, the vendor support, and information services to successfully implement.

QI05-B4 Direct MRI Scheduling: Improving Patient Access To Imaging Care In An Underserved Patient Population

Participants
Shlomit Goldberg-Stein, MD, Manhasset, New York (*Presenter*) Nothing to Disclose

PURPOSE

To improve access to imaging care in an underserved, at-risk, primarily Hispanic and Black patient population with 80% of patients having Medicare/Medicaid as their primary insurance.

METHODS

An IT solution was implemented to enable MRI scheduling at the point of care in subspecialty clinics, a program we entitled MRI Direct Scheduling (MDS). This eliminates the need for patients to separately contact the Access Center for an imaging appointment and enables patients to leave their clinic visit with an imaging appointment time and with relevant screening and preparatory information already relayed to the patient. We felt this would help address existing barriers to imaging care including language and health literacy challenges associated with the need for patients to initiate an inbound call to the Access Center for scheduling, to appropriately respond to the MRI screening questions, and finally to understand any preparatory information over the phone. A standardized MDS training program was developed to support scheduling staff at the clinics. MDS was then implemented at four free-standing urban outpatient imaging facilities within a four-mile radius and with a total of seven MRI units. MDS was piloted by the Orthopedics Dept in December 2017. Descriptive statistics were collected on MDS utilization in 2017-2020 (note: 2020 data was impacted by COVID-19 outpatient volumes). Logistic regression model was applied to identify demographic factors significantly associated with MDS utilization (p<0.05).

RESULTS

25% of all Orthopedic MRI exams were scheduled through MDS indicating a high level of engagement with the program. Orthopedic

MRI volume growth of 39% and 38% accounted for the total MRI growth in 2018 and 2019, which saw an overall growth of 6% and 8% in MRI, respectively. MRI Orthopedic volume at our institution increased year-over-year in 2017 by 14%, in 2018 by 16%, and in 2019 by 16%. Ease of access to appointments was identified by Orthopedics leadership as a cause for this improvement in volume capture. Non- Hispanic White patients were 15% less likely to utilize Direct Scheduling compared to Hispanic and Non-Hispanic Black patients (p<0.01), even after controlling for age, indicating the target population was engaged with MDS. We also found that patients who utilized MDS were, on average, 5 years younger than patients using the traditional scheduling pathway (p<0.001).

QI05-B6   Performance Evaluation Of Artificial Intelligence-based Technology For Fast And Accurate Bolus-tracking Process In CT Angiography

Participants
Jie Liu, Zhengzhou, China (*Presenter*) Nothing to Disclose

PURPOSE

Process of bolus-tracking scans before CT angiography usually include monitoring location selection and region-of-interest (ROI) placement to generate time-density curve (TDC) triggering the CTA scan. In this study we aimed to evaluate the performance of an artificial intelligence-based technology (SmartPlan, GE Healthcare) for fast and accurate bolus-tracking process compared with manual operation by technicians.

METHODS

Two hundred CTA scans including the abdominal, pulmonary aorta and coronary CTA performed using the SmartPrep triggering technique were prospectively collected. The monitoring location for placing ROI by CT technicians for dynamic contrast-enhancement monitoring in bolus-tracking scans and TDC generated in the ROI were recorded as the control group; The scout scans and time-resolved images were then imported into the SmartPlan software to automatically determine the monitoring location for placing ROI and to generate TDC, and the results were recorded as the experimental group. The consistency and time consuming of the location selection and the peak value of TDC curve triggering the scan between the experimental and control groups were analyzed using paired sample t-test. P < 0.05 was considered statistically significant.

RESULTS

There was significant difference in monitoring position between the experimental group and control group (P<0.05). However, monitoring locations differences were found no real clinical impact due to physicians' personal judgement variation. There was no difference in the peak value of TDC curves between the experimental group (167.99±25.54) and the control group (169.61±30.98), (P=0.784).Time consuming were found significant decreased by 19.94 second in the experimental group compared with that in the control group(P<0.05)

QI05-B7   Pediatric Trauma CT: A Quality Initiative For A Better Patient Care

Participants
Gabor Volford, MD, Szeged, Hungary (*Presenter*) Nothing to Disclose

PURPOSE

To comply with the 2013/59/Euratom Basic Safety Standards Directive continuous monitoring of dose exposure data is mandatory. The standard clinical practice at our trauma center for paediatric CT exams requires protocols adapted to patient size and clinical indication. Recently, a new feature of our dose management system (Dosewatch™, GE, Milwaukee) was installed, which automatically raises an alert any time a paediatric patient is scanned with an optimizable protocol. The objective of this project was to implement a quality initiative to assess compliance and resultant radiation dose reduction with child-sized and optimized paediatric CT protocols.

METHODS

Paediatric CT meta data were retrospectively collected from January 2020 to March 2021 (Phase 1) at one trauma center institution. The exams which triggered an alert for optimizable protocol utilization were flagged, root cause analysis was put in place and appropriate solutions identified and implemented from April 2021 (Phase 2). Specifically the quality framework put in place for Phase 2 consisted of the following steps: 1. Justification of the ordered CT based on clinical indication prior performing the exam by engaging the radiologist; 2. Revision of the existing and implementing new paediatric protocols where needed; 3. Radiation Doses for Pediatric Patients established by "Child-Sizing" CT Scanning Parameters and available on site to the technologist; 4. Continuous training of the technologist (patient centering, scan length); 5. All pediatric exams are revised monthly by the dose management team (chief radiologist, radiographer and medical physicist) and optimization process is put in place if needed. The meta data collected before and after the quality initiative were analysed in terms of: % of optimizable protocols used on paediatric patients; median dose metrics (CTDIvol and DLP) and number of irradiations. The meta data were stratified per clinical indication and class age (0.-years,1-5 years,5-10years,10-15 years, 15-18 years). Only clinical indications with at least 20 exams were considered for this study.

RESULTS

A total of 337 exams' metadata was collected (age range 0-17 years) during Phase 1 and meta data collection is ongoing for Phase 2. The following clinical indications were identified: head and C-spine trauma (n=94 (27,9 %), lower extremities trauma (n=74, 22%), head trauma (n=66, 19,6%), upper extremities trauma (n=32, 9,5%) and whole-Body Trauma (n=14, 4,2%). While median dose level was still below European Dose Reference Levels, 95% of the Phase 1 exams were scanned using an optimizable protocol. Root cause analysis revealed the following reasons: concern about insufficient image quality, compliance with paediatric traumatologists expectation. Median CTDIvol/ DLP per clinical indication during Phase 1 varied in function of age: 25.9-40.8 mGy/490-951mGycm (head trauma); 41.3-45.9mGy/996-1546 mGycm (head and neck trauma); 1.18-10.5mGy/15-158mGycm (upper extremities trauma); 3.8-7.3mGy/124-318mGycm (lower extremities trauma). Preliminary results after the implementation of corrective actions show an average dose reduction of CTDIvol and DLP of 49.6% and 64.1% respectively for the most frequent clinical indication (head trauma). For lower extremities protocols preliminary results do not show an important reduction, mostly because of the well optimized low dose extremities protocols and less important differences in the size of the image anatomy, thought more statistical data need to be collected to confirm this hypothesis.

QI02-A1 Application Of Double Low-dose Contrast Agent And Optimal Gemstone Spectral Imaging In Head CT Angiography

Participants
Xin Huang, Xi'an, China (*Presenter*) Nothing to Disclose

PURPOSE

Our study aims to evaluate the image quality and feasibility of adopting double low-dose contrast medium (CM) and optimal gemstone spectral imaging (GSI) to perform head CTA.

METHODS

A prospective study was performed in 54 patients receiving CTA of the head with a 256-slice CT system (GE Revolution, GE Healthcare, USA). Patients were randomized into two groups with a volume of either 40 mL of CM (Lopamidol, 370 mg of iodine per mL) injected at a rate of 4.5 mL/s (General-Dose Group) or 25 mL of CM injected at a rate of 3.0 mL/s (Low-Dose Group). The following scanning methods of the two groups were conventional imaging and GSI respectively. The images were reconstructed and the data were sent to the working station for analysis. The CT value of basilar artery (BA), middle cerebral artery(MCA), and intracranial artery intracranial (ICA) were measured in monoenergetic images from 55 to 65 keV as well as conventional 100 kVp images. Qualitative assessment of monoenergetic images using maximum intensity projections (MIP) and multi-planar reformat (MPR) was performed by an independent reader for vascular enhancement on a 4-point scale (1-poor, 4-excellent).

RESULTS

Compared with conventional 100 kVp images, there was significant difference between the CT value of BA, MCA and ICA in 55 keV reconstructed images ($P < 0.05$). For qualitative scores of conventional and monoenergetic images, 60 ± 5 keV reconstructed images rated was substantially similar with 100 kVp images.

QI02-A2 Establishing A Peer Learning Program In Emergency Radiology

Participants
Eric Schmidt, Worcester, Massachusetts (*Presenter*) Nothing to Disclose

PURPOSE

To implement a peer learning program in our emergency department (ED) radiology division and evaluate its effectiveness as a continuing education tool and a replacement for peer review. Peer learning is an alternative to peer review inspired by non-punitive error reporting and the just culture patient safety model. It takes inspiration from other safety conscious industries such as aviation, which features a non-punitive venue for error reporting to promote participation and a focus on process improvement to mitigate consequences of inevitable human error. Key to the peer learning model in radiology is a separation of learning and process improvement from performance evaluation, which reduces fear and defensiveness and promotes participation and learning. The central component is the peer learning conference, where submitted cases are presented to the division, key teaching points are discussed, and process improvement ideas are solicited. Cases are typically identified during routine review of prior imaging, which yields increased error identification compared to traditional peer review and does not require dedicated time. We adapted previously described peer learning conference models to our setting, an ED radiology division, and evaluated its effectiveness.

METHODS

Our peer learning program represents a division with 11 faculty and one fellow and annual volume of 200,000 studies, within an academic department of 81 clinical faculty with annual volume of one million. Cases are reported using the Conserus peer learning software from Change Healthcare, commercially available software that allows one-click PACS integration for reporting and tracking of learning opportunities with minimal workflow interruption. Cases are categorized during reporting as great calls, perception or cognition errors including satisfaction of search, interesting follow up, or reporting or other technical issue. Radiologists across all divisions identify cases, allowing interdisciplinary feedback on the work of our ED radiologists. Cases are presented at a bimonthly remote videoconference attended by ED radiology faculty. Five to 15 cases are selected from the pool of submissions; selected cases present a valuable learning opportunity or demonstrate an opportunity for process improvement. To evaluate the conference's effectiveness as a learning tool, a short survey of ED radiology faculty with Likert scale scoring was administered initially and again after six months.

RESULTS

Cases submitted favored interesting followup (32%), perception error (27%), and great calls (23%) with process improvement opportunities only 5%. Submission rate increased roughly twofold over one year of use. Of these, cases selected for conference favored perception errors (46%), with great calls (17%) and process improvement opportunities (15%) the next most common categories. Cases were from a variety of anatomical regions with abdominal (35%) and musculoskeletal (29%) being the most common. A Likert scale survey focused on the effect of peer learning conference on learning and performance outcomes, and

average scores increased from 3.2 initially to 4.7 after six months.

QI02-A3   DICOM Lake: A Big Data Approach To Monitor PACS Protocols

Participants
Paulo E. Kuriki, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

PURPOSE

To perform a MR study, many parameters must be provided, such as repetition time, echo time, matrix size, slice thickness, number of averages (NEX), etc. Usually, these parameters are stored in groups called protocols. Depending on the type of study ordered, the imaging technician will select one of these protocols and acquire the images based on pre-defined parameters. Those parameters can be adjusted to increase the image quality or reduce the scan time. Finding a perfect balance can be a tough trade-off, even harder when a company has more than one scanner. Every time a study is performed, all these technical parameters come along attached to each DICOM image in pieces of information called data elements (DICOM Tags). When a study is sent to a PACS, these data are stored with all images. But giving the nature of a PACS and its purpose to serve mainly as an image repository, analyzing these metadata can be a challenge. DICOMweb is a relatively new technology that enables one to connect to the PACS using a REST API. Through it, it is possible to query and retrieve images or only metadata. Using Business Intelligence (BI) techniques, one can easily analyze all this data, identifying incorrect parameters and optimizing protocols in large scale. The aim of this study is to (1) develop an automatic pipeline to extract DICOM tags from the PACS using DICOMweb; (2) store those metadata in a data warehouse and (3) use BI techniques to identify protocols with potential to improvements.

METHODS

We developed an automatic pipeline using Airflow and DICOMWeb that queries our PACS through QIDO-RS daily. All metadata is then retrieved performing WADO-RS requests. DICOMWeb responses usually come in a nested json format. Those responses need to be flattened and theirs DICOM tag numbers converted to friendly names. Then, converted data is normalized and stored in a data warehouse server. Using BI Tools, reports are generated daily and submitted to radiology chiefs.

RESULTS

As a Proof of Concept (PoC), we retrieved metadata from 11,249 lumbar spine MR studies, totalizing 70,874 series acquired in 63 scanners from our company. All data were anonymized and stored in a data warehouse. We chose to analyze the Number of Averages (NEX) from each series, as this is known as having direct impact in study time length. We identified 282 series in the protocols of 54 scanners with potential to be optimized. Those protocols were adjusted according to radiologists' orientations and mean of NEX was decreased from 1.80 to 1.09. The optimized studies were then reviewed and validated by radiologists. By the end of the optimizations, the study mean time length was decreased by 39% without loss to clinical accuracy.

QI02-A4   Utility Of Intraoperative Radiographs To Exclude Foreign Body In Patients With Elevated BMI And Normal Surgical Counts

Participants
Michael Jin, MD, Coram, New York (*Presenter*) Nothing to Disclose

PURPOSE

Inadvertent retained foreign objects during the course of an intraabdominal or thoracic surgery is a significant but preventable cause of patient morbidity and mortality. Intraoperative radiographs are often performed for exclusion of retained foreign bodies in situations where there are incorrect counts. However, our institution maintains a policy of performing intraoperative radiographs in all patients with a Body Mass Index (BMI)>35, regardless of concern for retained objects. This policy was instituted as a result of a surgical case in which there was a retained foreign body in a patient with elevated BMI with correct surgical count. This policy has been in effect for at least nine years and has contributed to more intraoperative radiographs being performed, increased radiation, longer anesthesia times, and significant interruption of Radiologist workflow, as it requires an attending or senior resident to review the images prior to the patient being closed and transported out of the operating room. We were unable to find a similar policy at other institutions.1 Our study investigates the utility of intraoperative films in patients with BMI>35 performed in an academic hospital.

METHODS

All intraoperative images obtained in a two-year interval from January 1st, 2018 to December 31st, 2020 were evaluated in a retrospective study. The studies were categorized by indication (patients with BMI>35, level 1 trauma, incorrect surgical count) and cross-compared. Cases positive for misplaced surgical foreign body were correlated with indications to determine the added value of the intraoperative film.

RESULTS

487 intraoperative images were examined in this study (133 for patients with BMI>35, 9 for level 1 trauma, 345 for incorrect count). Of the 133 intraoperative imaging ordered for patients due to BMI>35, there was no positive case of retained foreign body. Similarly, no cases for level 1 trauma revealed inadvertent foreign body retainment. However, 21 of the 345 orders for incorrect surgical count indication were positive for misplaced surgical foreign body (6.09%) regardless of the patient's BMI.

QI02-A5   System Approach To Prevent Lost Studies And Improve Radiology Report Turn Around Time

Participants
Jacob Schick, BS, Millersville, Pennsylvania (*Presenter*) Nothing to Disclose

PURPOSE

MR Pelvis examinations may represent studies of the prostate to be read by body imaging (BI) radiologists. They may alternatively represent examinations of the thigh musculature to be read by musculoskeletal (MSK) radiologists. In our PACS and Radiology Information System (RIS), there was no way to differentiate these examinations as they are classified by the same CPT code. By default, the MR pelvis studies were listed on only the BI work list. Including them on the MSK work list would have clogged it up. This resulted in "lost" MSK MR Pelvis studies which did not receive timely reports. Some of these examinations had preliminary reports with substantiative changes made days later when found by the attending. The goals of this project were to create a solution to prevent "lost" exams, improve report turn around time (RTAT), and improve patient care.

METHODS

A pre-intervention list of 3 months of MR pelvis studies was obtained from the RIS. Audit logs were reviewed for each study to determine time to first view by BI and by MSK radiologists, time of report completion, time of preliminary report, and time of final signature. Mean times for time from completion to first MSK view and time to final report were calculated. Studies with delays in reporting resident misinterpretation were recorded. First intervention: an MSK reserve flag was placed in the PACS work list for the BI radiologists to use when they found an MSK study on their work list. The flag moved these studies onto the MSK reserve work list. After this intervention, another 3 months of data was analyzed. A second intervention was implemented where the technologists completing the studies and residents reading the studies were asked to also place the reserve flag. Additionally, if a BI radiologist placed a reserve flag on an ED or inpatient case, they were required to call or instant message an MSK attending to alert them of the study that needed urgent interpretation. After this, another 3 months of data was analyzed.

RESULTS

There was a significant improvement (p=0.0018) in time to view by MSK from pre-intervention mean of 1015 minutes (n=107) to post-intervention mean of 500 minutes (n=127). There was also a significant improvement (p=0.0033) in time to view inpatient and ED cases from 927 minutes to 357 minutes. Time from study completion to final signature also improved from a mean of 1764 minutes to 838 minutes, though not statistically significant (p=0.08). There were 5 cases of delay in reporting resident misinterpretation pre-intervention and none post intervention. Time to view overnight preliminary reports improved by 198 minutes after intervention.

QI02-A6   Prostate MRI With Recall System For Contrast: Effect On Efficiency And Cost Savings

Participants
Silvia D. Chang, MD, Vancouver, British Columbia (*Presenter*) Nothing to Disclose

PURPOSE

During the COVID-19 pandemic, prostate MRI scans had to be limited to urgent cases and most exams were deferred to a later date which exacerbated an already existing backlog of referrals with a waitlist of one year. A bi-parametric protocol without gadolinium was, therefore, implemented to maximize the use of resources with the establishment of a recall system for gadolinium, if necessary. The aim of this audit was to review the efficacy of this system.

METHODS

The bi-parametric prostate MRI protocol was instituted in the Radiology Department commencing July 27, 2020, for all patients excluding: post-treatment prostate cancer cases, patients with hip prosthesis or a pacemaker (due to expected suboptimal diffusion-weighted imaging (DWI) and logistical challenges respectively), and those who were commuting from out-of-town (more than 2 hours commute from the hospital owing to the subsequent difficulty in recall). These excluded patients were scheduled with the full protocol with gadolinium. The bi-parametric protocol consisted of axial, sagittal, and coronal T2-weighted sequences, DWI sequences with low and intermediate b-values to generate the apparent diffusion coefficient (ADC) map, and an acquired high b value DWI sequence with b value of 1500. These T2 and DWI sequences are in accordance with the Prostate Imaging and Reporting Data System version 2.1 (PI-RADS v 2.1). After the interpretation of the bi-parametric study, patients with a PI-RADS 3 lesion in the peripheral zone (PZ) or suboptimal scan for another reason requiring gadolinium were recalled to have the contrast-enhanced sequence. This was performed without additional sequences unless the DWI was suboptimal in the initial study, it was also repeated. A method was devised to code this recall system in the Picture Archival Communication System (PACS). The patient information was securely emailed to the MRI supervisor and an MRI booking clerk maintained a list of the patients that were recalled. An audit was subsequently done to determine the efficacy of the system.

RESULTS

A total of 1066 prostate MRI scans were performed from July 27, 2020, to April 19, 2021, out of which 157 were performed with gadolinium upfront and were excluded from the analysis. Amongst the 909 bi-parametric scans, only 52 (5.7%) were recalled for gadolinium. Out of these 52 cases, 11 (21.2%) were recalled owing to suboptimal DWI and the rest of the 41 cases were PI-RADS 3 lesions in the PZ (78.8%). The patients were recalled as early as the next day and 39 (75%) patients had their subsequent contrast scan within 2 weeks of the initial scan. On the assessment of post-gadolinium imaging, 29 (55.8%) were upgraded to PI-RADS 4 and 17 (32.7%) patients were not upgraded and remained as PI-RADS 3 lesions. Six patients (11.5% of 52, 0.66% of total) were pending for the subsequent scan at the time of audit. The recall system avoided gadolinium administration in 857 patients, saving 68,560 USD in direct costs. This includes the price of the gadolinium contrast and the material required for intravenous injection which equates to 80 USD per patient). The allotted MRI acquisition time for the additional contrast sequence was 6 minutes table time (this excluded the time taken in getting the patient on the table) for which routine institutional billing is 260 USD per patient. Thus the total cost for scan time and cost for contrast together was 340 USD per patient. Hence a total of 291,380 USD was saved in contrast & scanner time costs. This recall system is also beneficial to the patients in that they can be scheduled out of hours at times when physicians are not available to supervise contrast thereby decreasing the waiting times. By November 2020 within 4 months of implementing the protocol, the waiting time of 1 year had decreased to 2-3 weeks. Before COVID-19, the number of scans performed was 16-18 patients per week, currently increased to 28 patients per week after the institution of the bi-parametric protocol with the recall system. Obviating cont

QI02-A7   Engaging Advanced Practice Providers To Improve Patient Care And Drive Productivity In A Radiology Consult Practice At A Comprehensive Cancer Center

Participants
Mayur Virarkar, MD, JACKSONVILLE, Florida (*Presenter*) Nothing to Disclose

PURPOSE

The purpose of this study was to evaluate the effects on efficiency and patient care of the addition of advanced practice providers (APPs) to an abdominal radiology consult service.

METHODS

In this prospective study, the focus was on radiologist productivity and patient care for 3 months before and 3 months after integration of APPs into our abdominal radiology consult service. Radiologist productivity was measured according to RVUs/shift and the change in professional billing by the number of imaging studies interpreted by radiologists. The patient care metrics measured were prescribed protocol to patient appointment lead time and number of same-day prescribed imaging protocol changes.

RESULTS

We observed significant increases in the mean RVUs/shift (15.2 ± 0.9 versus 6.2 ± 1.8; P = .02), number of studies read per shift (10.1 ± 0.5 versus 4.4 ± 1.5; P = .003), revenue per shift hour ($756.20 ± $55.40 versus $335.40 ± $132.60; P = .007), and protocol prescription to patient appointment lead time (39.3 ± 6.7 days versus 16.3 ± 2.9 days; P = .005) after APP integration into the workflow. We also saw significant decreases in the mean prescribed CT (19.3% ± 0.6% versus 3.3% ± 0.6%; P = .001) and MRI (11.7% ± 0.6% versus 8.30% ± 0.12%; P = .011) protocol changes made on the same days as patient appointments in the post-APP integration workflow.

QI02-A8   Development Of A Communication And Tracking System For Incidental Imaging Findings Using Radiology Assistants, Electronic Communication And Clinical Decision Support

Participants
Christina LeBedis, MD, Newton, Massachusetts (*Presenter*) Nothing to Disclose

PURPOSE

To describe the development and evolution of a system for communication and tracking of incidental imaging findings at an urban academic safety net hospital using radiology assistants, electronic communication and clinical decision support over a 5-year period.

METHODS

Based on feedback from residents in our institution's Diagnostic Radiology training program citing workflow inefficiencies and hindrance to education, we identified the need for a dedicated assistant to communicate incidental findings detected on imaging studies. Simultaneously, lack of follow-up of incidentally detected imaging findings was recognized by our institution as a potential source for delay in diagnosis and medicolegal liability. Based on these factors, our institution funded a single full-time radiology assistant dedicated to communication of incidental findings in 2016. A system for flagging outpatient imaging studies with incidental findings by radiologists was created using PowerScribe 360. These studies were routed to the radiology assistant, who communicated the findings and recommendations to the ordering provider using Epic Inbasket messaging with a standard message template. An acknowledgement response from the ordering provider was required by the provider to close the communication loop. If not acknowledged, an escalation notification was sent to the ordering provider's supervisor. A second assistant was funded 2 years later based on the success of the incidental findings communication program and increasing volume of studies. A survey was sent to radiology residents and faculty before and after assistant implementation to assess daily time spent communicating with providers. In May 2021, we will transition our radiology information system (RIS) from GE RIS to Epic Radiant. This transition will allow for automated, instant communication of incidental findings, thereby eliminating the need for manual messaging by a radiology assistant. This system upgrade will allow us to expand our practice of notification to include studies obtained in the emergency department and inpatient setting. Simultaneously, manual acknowledgment from the ordering providers via inbasket messaging will be eliminated and replaced with discrete options within an Epic "Best Practice Advisory" (BPA), allowing for both message acknowledgment and ordering of recommended imaging studies with clinical decision support. Furthermore, we identified the top 12 most common incidental findings at our institution and built discrete referral pathways, with support from clinical and radiology subspecialists for each respective incidental finding. Finally, all overdue follow-ups will be tracked, and reminder messages will be sent to the ordering provider by the radiology assistants until completion of the recommended study is completed or justification for lack of completion is documented. Tracking of incidental findings in a spreadsheet will be replaced by a centralized database within Epic Radiant.

RESULTS

An initial baseline survey prior to implementing the first radiology assistant was completed by 16 attending radiologists and 30 radiology residents. After implementation of the radiology assistant program, 12 attending radiologists and 16 radiology residents completed the survey.Prior to the radiology assistant, daily communication times reported by residents were as follows: less than 30 minutes in 10% (3/30), 30 minutes to 1 hour in 70% (21/30), and greater than 1 hour in 20% (6/30). After implementation of the radiology assistant, daily communication times reported by residents were as follows: less than 30 minutes in 81.3% (13/16), 30 minutes to 1 hour in 18.8% (3/16), and 0% (0/16) greater than 1 hour, reaching statistical significance (p<0.001). Prior to the radiology assistant, daily communication times reported by attending radiologists were as follows: less than 30 minutes in 38% (6/16), 30 minutes-1 hour in 50% (8/16), and greater than 1 hour in 12.5% (2/16). After implementation of th

QI02-A-HC1   The Feasibility Of A New Built-in Specimen Radiography Solution For The Optimization Of Stereotactic Breast Biopsy Workflow

Participants
Olena Weaver, MD, Houston, Texas (*Presenter*) Consultant, General Electric Company;Research Grant, General Electric Company

PURPOSE

Specimen magnification radiography (SMR) is integral to stereotactic breast biopsy (SBB) workflow and is critical for the evaluation of retrieved tissue specimens. SMR is especially important for visualization of targeted mammographic microcalcifications within a specimen. The quality, efficiency, and speed of acquiring SMR are crucial, because its results affect the decision-making process and may alter the course of the procedure. The duration of SMR directly affects total procedure time, which influences the patient experience. Moreover, patient motion may occur while SMR is being acquired, since the breast remains in compression. SMR is often a rate-limiting and workflow-disrupting step of SBB. Some facilities perform SMR on dedicated mobile units housed within procedure rooms. This necessitates investment in capital equipment and requires additional space, unit handling time, and digital storage and transfer solutions. Other facilities use separate stationary mammography systems, which impedes workflow, as an extra suite must be kept available for SMR, limiting patient throughput in the facility. A built-in SMR function on a biopsy-enabled 2D/3D mammography system may mitigate this issue.

METHODS

We are describing our experience with implementing a new, FDA-cleared, built-in Sample Imaging feature on Pristina SerenaTM biopsy option for Senographe PristinaTM (GE Healthcare, Buc, France), which enables SMR on the same detector plate as the patient's breast, while the patient is still under compression. The SMR option consists of a combination of add-on software and hardware. The hardware is a manually operated collimator plate, designed to focus the x-ray beam to a small window in one corner of the detector plate to one side of the breast, limiting the exposure to the breast to scattered radiation only. SMR results from a single 2D radiographic acquisition performed with +15° or -15° angulation, depending on the position of the biopsy attachment and

the needle, without changing the biopsy setup. At present, the SMR feature is most feasible for the horizontal position of the detector plate; however, custom solutions for a vertical plate position are being developed. We performed stereotactic breast biopsies utilizing the built-in specimen radiography option, and subsequently imaged the specimen with either a dedicated portable specimen radiography unit or a stationary mammography system. The ability to visualize microcalcifications was compared between the built-in and conventional specimen radiography methods.

RESULTS

The built-in specimen radiography option can be effectively utilized within the stereotactic breast biopsy workflow. The learning curve for using this method by radiologists is steep, and the image quality produced by the built-in solution is at least noninferior to that produced by conventional methods.

QI01-B2   Optimizing Radiation Dose For Scanograms For Low Dose Chest CTs For Lung Cancer Screening

Participants
Josh B. Moosikasuwan, MD, Bronx, New York (*Presenter*) Nothing to Disclose

PURPOSE

To reduce the radiation dose utilized for the AP and lateral scout or scanogram portion of low dose chest CTs used for lung cancer screening.

METHODS

The mA was incrementally decreased from the factory presets of 50/100 mA to 10/20 mA for the AP/lateral scanograms. At each incremental decrease, both the technologist and radiologist determined whether there was any adverse effect on setting up the anatomical boundaries just above the lung apex and just below the posterior costophrenic angles, and on the automatic dose modulation and image quality of the subsequent helical portion of the exam. Then, 30 consecutive patients who had a prior low dose chest CT with the original scanogram factory settings performed within the past 4 years on a 64-detector CT scanner were scanned with the reduced dose 10/20 mA AP/lateral scanograms on that same scanner. The mAs for the scanograms, and the CTDIvol and the dose length products (DLPs) for the helical portion of the chest CTs for these 30 patients were analyzed. Statistical analysis was performed using paired t-test.

RESULTS

At each incremental decrease of mA, there was no adverse affect on the CT exam. In the 30 patients analyzed, all of the lungs were included on the helical portion. The average mAs used for these 30 patients for the reduced dose AP, lateral and total (AP+lateral) scanograms were 35±4, 84±6, and 119±19, compared with 201±35, 401±70, and 603±105 for prior CTs done using factory presets, resulting in an approximate dose reduction of 5x. The average CTDIvol for the helical portion of the CT was 3.4±1.2 mGy for both CTs done with scanograms with and without the dose reduction (p value=0.68), indicating that the dose reduction for the scanograms did not affect the automatic dose modulation used during the helical portion. The average DLP for the 30 CTs done with the reduced dose scanograms was 126±46 mGy cm, which was lower compared with the 139±48 mGy cm for those done with regular dose scanograms; this was unexpectedly statistically significant (p value=0.002), suggesting an additional benefit of this quality improvement initiative from improved technique used by the CT technologists from scanning less of the abdomen or neck.

QI01-B4   Shared Management Strategy For Division Leadership In Radiology: Effects On Productivity, Turn-around Time, And Physician Engagement

Participants
Elisabeth Garwood, MD, Worcester, Massachusetts (*Presenter*) Nothing to Disclose

PURPOSE

Shared leadership strategies, particularly in complex settings, have demonstrated a positive impact on team effectiveness and performance when compared to traditional, hierarchical leadership models. Although team approach and shared responsibility are familiar and common concepts within radiology, shared leadership is relatively novel and little guidance exists for healthcare professionals on how to effectively implement this concept.

METHODS

We transitioned from a hierarchical to a shared leadership model following a musculoskeletal (MSK) radiology division chief vacancy. A shared leadership model was developed by classifying all responsibilities into four broad categories, dividing the roles and responsibilities of a traditional division chief among four faculty members with complementary skill sets: 1. Workflow and Information technology, 2. Musculoskeletal interventional and diagnostic ultrasound service, 3. Education, 4. Quality and Operations.Performance indicators of clinical productivity, academic productivity, turn-around time, moonlighting expenditures, faculty retention, and educational engagement were collected at several time points during the shared leadership model, aggregated for the first fiscal year under this model (10/2019 to 10/2020) and compared to the immediate preceding year under hierarchical leadership (9/2018 to 9/2019).

RESULTS

With shared leadership, we achieved improved efficiency according to the performance metrics of increased clinical productivity, increased academic productivity, reduced moonlighting expenditures, and faster turn-around time, and fostered an environment of high physician engagement.

QI01-B5   Reduced Contrast Agent Volume Using A Heart-rate Dependent Scanning Protocol In Coronary Computed Tomography Angiography For Patients With Chronic Obstructive Pulmonary Disease

Participants
Peiji Song, Jinan, China (*Presenter*) Nothing to Disclose

PURPOSE

The aim of this study was to evaluate the feasibility of a personalized CT scanning protocol that was tailored to patients' heart rate and free-breathing for coronary CTA of patients with chronic obstructive pulmonary disease (COPD).

METHODS

A total of 400 patients with chronic obstructive pulmonary disease (COPD) who need to undergo the coronary CTA were prospectively randomized into two groups (patients with vascular occlusion were excluded). For each patient in Group A (n = 200), a total of 70mL contrast agent was injected with a rate of 5 mL/s. The routine auto-trigger protocol was applied by setting the ascending aorta threshold as 80 HU.For each patient in group B(n=200): free-breathing after trigger for scanning and monitoring level was placed on ascending aorta; scans were performed with injection of 30mL contrast agent (Iopamidol 370mgI/ml) with a rate of 5 mL/s and the scan timings were set according to patients' heart rate (HR): HR> 80 bmp, scanning trigger timing: 14-17S after the injection of contrast agent and initiated manually with a delay of 2 s;HR=60-80bmp, scanning trigger timing: 20-23s after the injection of contrast agent and initiated manually with a delay of 2 s. HR<60bmp, scanning trigger timing: 26-29 after the injection of contrast agent and initiated manually with a delay of 2s. All the CTA scans were completed on a 16cm-detector CT in one heartbeat. The CT values of left anterior descending artery (LAD), left circumflex artery (LCX) and right coronary artery (RCA) were measured. Two experienced radiologists evaluated the image quality using a 5-point scale (1-unassessble to 5-excellent

RESULTS

No difference was found between the two groups in the CT values of RCA (382.3±95.3 vs. 369.1±77.0 HU), LAD (384.9±80.2 vs. 375.4±65.9 HU), or LCX (385.4±93.9 vs. 372.0±74 HU; p > 0.05). Subjective ratings of image quality (Table 2) were not statistically different between the two groups (p > 0.05).

QI01-B6 Mind Your T's And Z's: Discovery And Correction Of Dual Energy X-ray Absorptiometry Cross-calibration Bias

Participants
Samuel Fahrenholtz, PhD, Scottsdale, Arizona (*Presenter*) Stockholder, Nanox.

PURPOSE

Dual energy x-ray absorptiometry (DXA) is the standard of care for screening and diagnosis of osteoporosis, as well as treatment response monitoring. Diagnosis of osteoporosis relies solely on the numerical values calculated during the exam. Inaccurate T-scores will directly lead to misdiagnosis of osteoporosis with potential over treatment or under treatment. Cross-calibration bias is an underrecognized source of error that can directly influence T-scores and treatment decisions.The International Society of Clinical Densitometry (ISCD) provides practical guidance for maintaining the accuracy and precision of clinical DXA. Accuracy and precision are principally maintained through frequent phantom measurements and occasional technologist precision assessments. Patients are additionally recommended to return to the same DXA unit to maintain longitudinal precision. However, consolidation of healthcare is increasing the frequency of a single patient being scanned on multiple scanners over years, making cross-calibration critical. Our practice includes two DXA scanners on two campuses, and a single patient may be scheduled at either location. Our referring physician colleagues had noticed increasing variation in T-scores in patients with multiple prior studies and questioned the presence of a potential technical defect.

METHODS

To confirm the DXA discrepancy, we looked at patients with multiple scans and compared bone mineral density (BMD) changes at our site compared to partner healthcare sites. A data discrepancy was identified, but not the error source. Therefore, our team of physicists, radiologists, technologists, and a referring physician evaluated a series of proposed error sources and associated solutions. First, we asked the vendor to evaluate the two units. Second, we did a technologist precision assessment -- the test-retest procedure to establish the least significant change (LSC). Third, we estimated the frequency of patients that change scanners at longitudinal monitoring. Fourth, we evaluated the quality of patient positioning in images. Fifth, we evaluated the cross-calibration between the two DXA units by ten repeated measurements of a single vendor phantom at both units.

RESULTS

Our initial comparison to two partner healthcare sites confirmed the DXA discrepancy. Listing the possible problems and solutions, first, our vendor's assessment stated the two units were operating correctly. Second, the result of the precision assessment was that our technologists' LSC values were within ISCD recommended limits. Third, we found that in a cohort of 20 patients with multiple longitudinal scans, 15 patients had switched DXA units at least once. Fourth, our evaluation of patient position errors in images did not explain the discrepancy. Fifth, our evaluation of the cross-calibration of the two units definitively indicated a discrepancy of 3.8%.

QI01-B7 Standardization Of Pediatric Renal/Bladder Ultrasounds Within A Radiology Group Practice

Participants
Rebecca Scalabrino, DO, Jackson, New Jersey (*Presenter*) Nothing to Disclose

PURPOSE

Prompt accurate diagnosis of significant uropathies is necessary to prevent long-term complications such as diminished renal function and identify candidates for early intervention. Lack of standardized terminology and reporting metrics often leads to high inter-interpreter variability in dictation reports and confusion amongst clinical teams. A radiology group practice implemented a novel pediatric renal/bladder ultrasound technologist worksheet and dictation template with the goal of facilitating detailed standardized communication and identifying high risk patients while avoiding unnecessary expenditure of healthcare resources.

METHODS

Primary retrospective data collection/analysis included 81 pediatric renal/bladder ultrasounds performed over a 12-month period at 5 affiliated sites. A literature review of current guidelines of pediatric genitourinary ultrasound imaging was performed. Based on the literature review, which included a landmark multidisciplinary consensus statement, a new ultrasound technologist worksheet and

radiologist dictation template were constructed. Key features included avoiding nonspecific descriptors such as "hydronephrosis" and detailing the severity of urinary tract dilation (UTD) using empirically based sonographic findings such as the anteroposterior renal pelvis diameter (APRPD). Ultrasound technologists and pediatric radiologists were briefed on the new templates, which included a PowerPoint presentation. Following successful implementation, an additional retrospective data analysis of 40 pediatric renal/bladder ultrasounds was performed from the same 5 affiliated sites over a 6-month period to remeasure key metrics.

RESULTS

Pre and post-implementation data analysis revealed a significant increase in the percentage of finalized reports which included an accurately measured APRPD, as well as an appropriate standardized description of UTD by pediatric radiologists. Specifically, this included the mention of pelviectasis and/or caliectasis as opposed to nonspecific descriptors such as "hydronephrosis" or "collecting system fullness". One unexpected finding was a slight decrease in the percentage of ultrasound technologists using appropriate descriptors of UTD post-implementation.

QI01-B8 Notification Of Incidental Imaging Findings And The Value Added To Healthcare

Participants
Adriano Tachibana, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

PURPOSE

Since 2016, our institution has created and has improved the "Follow-up Program for Relevant Incidental Findings", which consists in a close follow-up of patients who discovered incidental imaging findings while performing exams mainly during their visit to the emergency department. The program helped many patients to monitor, diagnose and stablish an early treatment of many diseases including malignant tumors, and demonstrated focus on continuous improvement on quality of care, patient safety and aggregated healthcare value.Personalizing care and making the patient aware of the importance of engaging in their own health care can guarantee better outcomes. However, few studies aimed to quantify these benefits. The main objectives are to demonstrate the degree of patient compliance with our recommendations, the final outcomes of the incidental findings, possible impacts on prognosis and a cost analysis of complementary diagnostic procedures in order to perform a cost-effectiveness analysis.

METHODS

We analyzed data from 2019 and 2020 that included: number of patients in the program, number of patients communicated and informed about the findings, outcomes (benign, malignant, still in follow-up and lost follow up or exams performed in another service) and financial impact based on how much was expended in our institution for diagnostic purposes. We chose the referred period due to a new methodology for process improvement that was implemented in 2019 and remained constant throughout 2020.

RESULTS

During the studied period, 195 patients were included, 172 were contacted and communicated about the findings. Among the patients contacted, 69 (40.1%) had benign findings, 19 (11%) were malignant, 36 (20.9%) are still in follow-up or investigation and 48 (27.9%) were considered indeterminate (lost contact or investigation was performed in another service with unknown results). The global Sars-CoV-2 pandemic should be considered to decrease the number of exams performed in 2020, consequently reducing the number of incidental findings. The higher percentage of patients with ongoing follow up and indeterminate findings also can be related to the pandemic. Diagnostic investigation was made at our hospital in 94 patients (48%). Costs of the complementary investigation included laboratory tests (3,117 tests), imaging exams (121 - Computed Tomograph /43 - Magnetic Resonance Imaging / 76 - Ultrasound / 201 - X-Ray / 29 - PET-CT), biopsies (12), and other diagnostic procedures (33 - endoscopy or colonoscopy / 36 - cardiac exams / 9 - scintigraphs) have the total value of R\$ 936,635.17 (US\$ 174,592.26) over the two years. The mean value invested to diagnose each malignancy was US\$ 9,189.07.

QI01-B9 Which One Are We Talking About? Assignment Of Numerical Addresses To Distinguish Findings In The Same Anatomical Location And/or Image

Participants
David J. Vining, MD, Houston, Texas (*Presenter*) Royalties, Bracco Group;CEO, VisionSR, Inc;Stockholder, VisionSR, Inc

PURPOSE

The identification and communication of information about image findings located in the same anatomical location and/or image can be challenging (e.g., when describing metastases in the same pulmonary lobe or liver segment). We devised a solution that automatically assigns numerical "addresses" (i.e., identifiers) to individual image findings within an interactive multimedia report to facilitate clear and accurate communication.

METHODS

We developed an interactive multimedia reporting solution that records key images and voice descriptions of image findings, tags the images with metadata using natural language processing to indicate the anatomical location and radiological diagnosis of each finding, and assembles a multimedia report with related information linked in timelines. A timeline represents a "finding" which comprises one or more "items" (i.e., key images). Multiple findings located in the same anatomical location and/or image can be difficult to distinguish because of the assignment of the same metadata (e.g., Right upper lung + Metastasis), thus we created a solution that distinguishes findings by automatically assigning a numerical address to each finding based on when it is first recorded in the report. The concept is similar to assigning a numerical street address to describe a precise location.

RESULTS

The interactive multimedia reporting system is in use at our institution. The concept of applying numerical addresses to image findings is beneficial for the distinction of multiple lesions that exist in the same anatomical location and/or image, particularly for use in surgical planning or when correlating lesions that have undergone local therapy (e.g., ablation or stereotactic radiosurgery). This simple yet powerful concept facilitates clear communication and eliminates ambiguity that often exists in conventional radiology reporting.

QI01-B-HC1 Efficacy Of Implementing A Combined Online And Hands-on Basic Ultrasound Curriculum For 3rd Year Medical Students.

Participants

Timothy Wulfestieg, DO, Aiea, Hawaii (*Presenter*) Nothing to Disclose

PURPOSE

Ultrasound (US) is a ubiquitous modality, with increased clinical use in medical resident education. Despite its emergence, many medical schools lack a formal curriculum.1 Medical students rotating through this project's medical center did not have an ultrasound curriculum, which impacted learning potential on rotations involving hands-on US procedures (i.e. emergency room and internal medicine). Utilizing national recommendations, this project sought to implement a basic resident-run US curriculum for third year medical students, with the goal of providing foundational knowledge and nascent confidence with point of care ultrasound usage.

METHODS

In the fall of 2020, a partnership was established between the radiology residency of our tertiary care center and a local medical school with the goal of implementing a basic hands on US curriculum. The developed material was based on the SRU/AMSER national curriculum recommendations, and included topics of US fundamentals and normal anatomic imaging. Fundamental subjects included: advantages and disadvantages of US, physics, sonographic probes, image optimization, modes of US, safety, terminology, and artifacts. Reviewed normal sonographic anatomy included: neck vasculature, thyroid, heart, liver, biliary tree, pancreas, epigastric vasculature, spleen, kidneys, lungs, tendons, musculature, and dynamic venous compression. A large group didactic was presented online, and a month later four, 4-hour small group hands-on sessions were completed at the hospital's Simulation Center. Each hands-on session consisted of three demonstration tables with a volunteer radiology resident patient, 2-4 medical students per table, and 2-3 floating instructors (which included both attending and resident instructors). The radiology resident volunteers and instructors were provided a brief review of the curriculum prior to the hands-on sessions to ensure uniform student guidance. The efficacy of the online lecture was measured with a twelve question pre- and post-test, administered via an online survey website, which utilized anonymized test IDs. The students also completed an exit survey after the hands-on portion. Statistical analysis of the tests was performed with SAS and Microsoft Excel software, and included tallies, mean, standard deviation, Wilcoxon signed rank and McNemar's tests for statistical significance. All students were exposed to three US machines: FujiFilm Sonosite Edge II, Sonosite MicroMaxx, and handheld Butterfly Network IQ probe.

RESULTS

A total 32 students took the pre-test, while only 23 students also took the post-test. Analyzing the 23 student cohort, the average pre-test score was 41%, and average post-test score 80%. The highest pre-test score was 8 of 12 correct, and the highest post-test score was 12 of 12 correct. The worst pre-test score was 1 of 12 correct, with the lowest post-test score improving to 5 of 12. All the above are statistically significant with a p-value <0.001. The pre- and post-data was also paired and analyzed for performance based upon topic of ultrasound. The students had greatest pre-existing knowledge of the differences between US and CT, with 96% correct pre-test and 100% correct post-test. In contrast, initially 0% selected "megahertz" as the frequency of US imaging, which improved post-test to 70% correct. Complete comparative data is provided in Figure 1 (see included PDF). The hands-on exiting surveys used a 5-point scale (5 representing the best score), with average scores of 4.9 and 5.0 regarding overall rating of the course and to what degree the student's would recommend the course to their peers. The pre- and post-tests offer one limitation of the study, as the same test was utilized for both. This was by design, as the pre-test was used as a mechanism to prime attention, and the post-test as an opportunity to enforce repetition. Another limitation involves the robustness of results provided, as generally only one question of each topic was

QI03-B2   Optimizing Usage Of Pre-procedural Antibiotics In Interventional Radiology Procedures.

Participants
Xavier Mohammed, MD, Charlottesville, Virginia (*Presenter*) Nothing to Disclose

PURPOSE

The purpose of this study was to (1) determine how historic peri-procedural antibiotic usage at a single institution was significantly different from available guidelines, (2) measure whether the rate of procedural related infectious complications changed after the implementation of local multi-specialty developed guidelines, and (3) quantify the change in cost of peri-procedural antibiotic usage before and after implementing guidelines.

METHODS

Institutional antibiotic guidelines were established with available national guidelines and related literature in a multidisciplinary fashion with infectious disease, pharmacy, and interventional radiology. A graphical local guideline was created to help guide treatment teams on antibiotic use. Following local institutional review board approval, retrospective review was then performed after initiation of the guideline for two temporally identical 7 month cohorts: one before guideline implementation (2019) and one after (2020). Procedural volume, type of procedure, and use of antibiotics was recorded.

RESULTS

Prior to implementation of guidelines (2019), a total of 1506 procedures were performed using peri-procedural antibiotics out of 4000 total procedures (37.65%). With specific attention to central line placement, 586 procedures utilized peri-procedural antibiotics out of 1698 overall line placements (34.51%). There were 5 central line associated bloodstream infections (CLABSI) events out of all central line placements (0.29%). After implementation of guidelines (2020), a total of 806 procedures were performed using peri-procedural antibiotics out of 4083 total procedures (19.74%). 175 procedures utilized peri-procedural antibiotics out of 1478 overall line placements (11.84%). There were 4 CLABSI events out of all central line placements (0.27%). The difference in number of patients in the pre-guideline arm and post-guideline arm for both total procedures and central line placements was not statistically significant (p=0.59 and p=0.3 respectively). The number of patients receiving peri-procedural antibiotics, both in the total procedure and sub-group of central line placements, decreased significantly over the two study periods. The overall usage of antibiotics dropped 17.91% (37.65% to 19.74%) with an odds ratio of 2.46 (95% CL 2.22-2.72, p<0.001), and dropped 22.67% (34.51% to 11.84%) in the sub-group of central line placements with an odds ratio of 3.95 (95% CL 3.27-4.77, p<0.001). Additionally no statistically significant change in CLABSI rate was observed before and after implementing guidelines to the central line placement groups; the rate of CLABSI was 0.29% before, and 0.27% after (p=0.89). Finally, there was a 35% decrease in total cost of antibiotics for all patients receiving peri-procedural antibiotics before and after the implementation of the guidelines.

QI03-B3   Innovating Care Delivery In Radiology Using A Results Clinic To Manage Completion Of Imaging Follow-up

Participants
Debra Whorms, MD, Philadelphia, Pennsylvania (*Presenter*) Nothing to Disclose

PURPOSE

Radiologists routinely recommend imaging follow-up for unexpected actionable findings. However, closing the loop on these findings often creates an additional cognitive burden for our physicians and advanced practice provider (APP) colleagues who order imaging. Furthermore, literature has shown that when there is a mismatch between the clinical specialty of the ordering physician/APP and the body region in which the finding is located, there is an increased risk of incomplete or missed follow-up. We sought to innovate care delivery for patients with incidental findings by introducing an enterprise-wide collaboration between the departments of Radiology, Medicine, and Surgery, to facilitate the management of imaging follow-up and help more patients complete recommended, clinically indicated imaging. The first use case for the Results Clinic (RC) was closing the loop on the follow-up of incidental pulmonary nodules (IPNs). IPNs, which are ubiquitous in the general population and predominantly benign, represent a particular burden. Non-adherence to IPN follow-up can contribute to delayed diagnosis and treatment, poor patient outcomes, and legal and economic impacts. Pulmonologists are unnecessarily burdened with referrals for management of likely benign IPNs, decreasing access for patients who need high specialty pulmonology care.

METHODS

The RC was deployed in a limited scope, to coordinate follow-up of IPNs in patients followed by our colleagues in Urology, Otorhinolaryngology, and Neurosurgery. The RC dashboard updates daily, and uses structured templates for lung nodule reporting in our practice to identify patients with IPN follow-up recommendations. Connections to data streams from our electronic medical record (EMR) and radiology report database are used to automatically determine if patients have completed recommended follow-up in our health system. Patients diagnosed with lung cancer or on hospice care were deemed ineligible for a consult to the RC, since

they were already actively being managed. For patients with incomplete follow-up, the RC notifies the referring physician/APP and offers to manage the follow-up. If the referring physician/APP chooses to consult the RC, an APP in the Department of Medicine connects with the patient to arrange a virtual visit to discuss the need for follow-up. If the patient elects to have further care in our health system, a follow-up chest CT is ordered according to Fleischner Society guidelines. The RC facilitates the patient's completion of their follow-up exam, and manages the patient until the nodule is characterized as benign or deemed to require further clinical management. In the latter case, the patient is then referred to Pulmonology or Thoracic Surgery for biopsy or surgical resection. Throughout the process, the original referring physician/APP is kept abreast of the next steps in the follow-up. If the patient does not complete the recommended follow-up, the RC makes a series of attempts to connect with the patient. If these are unsuccessful, the RC discharges the patient from their care and notifies both the patient and their referring physician/APP.

RESULTS

During the first 2 months of implementation, 61 patients with IPNs and incomplete follow-up were identified, and their referring physicians/APPs were contacted. The RC was consulted to manage the follow-up for 13 (21%) patients. The RC consult was declined for 6 (10%) patients, either because they were being managed by their primary care physicians or because the follow-up was no longer clinically relevant (e.g., the patient was on hospice). No response was received after two electronic prompts and one phone call for 9 (15%) patients. Of the 13 patients referred to the RC, 9 (69%) have scheduled or completed their telemedicine visits. 1 patient declined follow-up for their nodule, and 1 patient could not be contacted.

QI03-B4   Impact Of An Automated Screening Management Platform On Completion Of Imaging-based Screening

Participants
Debra Whorms, MD, Philadelphia, Pennsylvania (*Presenter*) Nothing to Disclose

PURPOSE

Hepatocellular carcinoma (HCC) is the fourth leading cause of cancer-related death worldwide, and approximately 6,000 patients in our health system alone are at risk for HCC. The American Association for the Study of Liver Disease (AASLD) guidelines recommend screening at-risk patients with abdominal ultrasound every 6 months. However, our pilot work demonstrated a wide range of rates of compliance with HCC screening in our health system, from 15-20% in patients followed by primary care physicians (PCPs) to 60% in patients followed by hepatologists. The literature indicates that 5-year survival for patients with late-stage HCC is only 2.4%; yet more than 60% of patients are diagnosed at this stage. Identifying patients at risk for HCC in the electronic medical record (EMR) is a non-trivial effort; fundamentally, patients with cirrhosis or chronic hepatitis B infection should be screened, but there are more than a dozen additional criteria required to accurately identify these patients in the EMR. Both physician and patient barriers to screening completion exist. We chose to identify and intervene upon physician barriers that lead to decreased screening in this at-risk population.

METHODS

Using an algorithm that combines natural language processing of radiology reports with complex queries of the EMR, we created a dashboard to identify patients at risk for HCC and determine their screening status. Compliance with screening was defined as any liver imaging (abdominal ultrasound, abdominal MRI, or liver protocol CT) within the preceding 7 months (recommended time interval + 1 month grace period). We piloted the manual creation of pended orders in the EMR for screening abdominal ultrasounds for patients at risk for HCC and overdue for q6 month screening. A small pilot in one PCP practice was well received, so we expanded to a total of 7 intervention practices and designated 1 control practice whose patients were not enrolled in the intervention. We also developed an automated system to use the dashboard, identify patients with upcoming PCP appointments, and automatically pend screening orders to their outpatient encounters in the EMR without any human intervention. Upon opening the encounter, the PCP would be alerted to the presence of the pended order, which was accompanied by a detailed explanation, and prompted to sign or cancel the order. PCPs who canceled orders were contacted for feedback as to why they felt screening was not appropriate. We evaluated the satisfaction of clinicians who participated in the initial single practice pilot, and studied the trend of signed orders in the intervention practices vs. the control practice.

RESULTS

A baseline of January 1, 2019 was designated against which to compare numbers of at-risk patients, numbers of patients with signed screening orders, and numbers of patients with screenings completed. The single-practice pilot was conducted in August 2019, and the additional 6 practices were onboarded in November 2019. By December 1, 2019, all 7 intervention practices were active in our system, representing a total of 1084 at-risk patients. There were 35 at-risk patients in the control group. The attached figure summarizes the number of signed orders for the control practice (red) and intervention practices (green) from January 2019 through April 2021. From January 2019 through November 2019, between 36-50% of the at-risk patients in the control practice and 40-48% in the intervention practices had a signed HCC screening order. From December 2019 through March 2020, the number of signed screening orders dropped to 30-36% for the control practice and increased to 46-49% for the intervention practices. The COVID-19 pandemic may have impacted the trends between April and June 2020, when many elective imaging appointments and PCP visits were canceled or rescheduled. During this time, 39-42% patients in the control practice and 42-47% patients in the intervention practices had screening orders signed. Since July 2020, the number of patients with si

QI03-B5   Improving Report Times Of On Call Breast Ultrasounds

Participants
Peter Duden, MD, Charlottesville, Virginia (*Presenter*) Nothing to Disclose

PURPOSE

Inpatient and emergency department breast ultrasound studies are relatively infrequent and may present a workflow dilemma to on-call residents and staff. At our institution, residents give these studies preliminary reports, and either clinical instructors or Breast Imaging attendings generate final reports. It has been shown that absence of a defined protocol has led to delays of more than 24 hours in final interpretation, thereby diminishing value to referring providers and possibly contributing to suboptimal patient care (Eberhardt, 2018).This abstract details a practice quality improvement (PQI) project implementing a written directive for on-call breast ultrasound studies. The directive details the workflow from the Radiology resident's initial preliminary report to the final report signed by the clinical instructor or Breast Imaging attending, as well as transfer of assigned overnight studies by reading room coordinators to department-specific daytime attending worklists. Primary endpoints considered were preliminary report and final signature turnaround times, focusing on studies from the emergency department (ED).

METHODS

This retrospective study included 45 women who received breast ultrasounds in the ED during "after-hours," defined as outside the normal business hours of 8am-5pm, Monday through Friday, from July 2019 through November 2020. Of these 45 patients, 15 received ultrasounds following the implementation of a new, written protocol in July 2020 informing on-call residents when to contact Breast Imaging clinical instructors, and to whom they should send their preliminary interpretations for final signature.The protocol states that breast ultrasounds performed on patients in the ED between the hours of 9pm and 6am (overnight) should be sent to Musculoskeletal (MSK) clinical instructors for final signature, and to Breast Imaging clinical instructors between 5pm and 9pm on week nights, and from 8 am to 5 pm on weekends.To further standardize this process, reporting templates were entered into the Picture Archive and Communication System (PACS) to assist residents with generating preliminary reports. Average time elapsed between preliminary report and final signature were computed. A comparison of the average time elapsed before and after protocol implementation for each ED study final signed by either MSK clinical instructors (or other non-Breast Imaging attendings) or Breast Imaging clinical instructors/attendings was done using a t-test with Welch's correction, which does not assume equal variance or standard deviation.

RESULTS

Following implementation of our protocol, there was a statistically significant overall decrease in the average final signature time to only 4 hours 36 minutes in the post implementation group (n = 23) compared to an average final signature time of 15 hours 35 minutes in the pre implementation group (n = 30) with a p-value of 0.01. Only one study following protocol implementation exceeded 14 hours in final signature time lapse (44 hours), compared to 15 studies previously, with 85 hours being the maximum time lapse. There was no significant difference in average preliminary report times pre and post-implementation where they remained under 65 minutes for each cohort of studies, with the overall pre-implementation average being 30 minutes, and the overall post-implementation average being 55 minutes.

QI03-B8   First Experience With A Centralized Regional Clinical And Dose Management System

Participants
Alberto Perez-Rozos, MSc, Sevilla, Spain (*Presenter*) Nothing to Disclose

PURPOSE

Andalusian is a region in the south of Spain with a population of 8,5M habitants. The analysis of the CT equipment installed in the Andalusian public Health Service in 2016 indicated marked aging, exceeding the recommendations in this regard (average life 10 years). They lacked some technology obsolescence including dose reduction systems (iterative reconstruction, dose modulation in organs ...) and the ability to record doses to a centralized system, therefore using more radiation than was necessary for the studies.For these reasons we develop the project "Energy Footprint", which involves the installation of 68 (57 replacement and 11 expansion) CT equipment in 25 hospitals and in a period of six moths, with the goal of standardize technical and clinical performance, homogenize technical protocols, and improve image quality and radiation dose.

METHODS

The project incorporates a singular facility called "Advanced Center for Diagnostic Imaging" (CADI) that will centralize the exploitation of data, training, availability and productivity and will coordinate homogenization of technical protocols and dose reduction efforts. CADI's start-up and design is carried out by a specific committee.Dependent on the CADI Committee, two main working groups are set up focused on the standardization of protocols and dose management, made up of radiologists, medical physicist and radiographers from the 24 centers involved.The main objective of the working groups is reduce the variability of clinical practice by harmonizing the examination protocols by creating a library of corporate protocols based on evidence and clinical indications with adequate optimization of dose and image quality.In every center or radiation protection area is created the "local committee for dose and protocols management" as an executive task group to implement the recommendations and resolutions from the regional committee. The members of this local task group are radiographers, radiologists and medical physicists. More than 200 professionals are involved in the different task groups of the projects.

RESULTS

In the first moths of the project more than 80% of the CT have been installed and connected to CADI systems.Medical physicist have validated dosimetry indicators, including CTDI, DLP, and dose to organs calculations. A system of alerts for outliers radiation dose have been set up and validated. Automated analysis of defined indicators have been setup for more than 30000 CT studies/moth.A centralized management system for technical protocols has been used to homogenize nomenclature and technical parameters for protocols.Task group for Clinical protocols has the responsibility of define steps to validate protocols and standardize nomenclature. First findings of this task group include:• Detected a great variability of nomenclature of the same protocols between the different centers.• Definition of a common nomenclature creating a first list of protocols (starting with neuroimaging).• Need to include new protocols appropriate to the evidence and clinical indications• Need to establish a guideline to identify the needs of protocols, assessment, design, and implementation.Task group for Radiation Dose has the responsibility to validate dose estimation procedures, trazability of dose indexes, dose reporting procedures, conduct the radiation dose management system, and perform the analysis and monitoring of doses associated with clinical procedures.

QI03-B9   Implementation Of Common Data Elements In An Interactive Multimedia Reporting System

Participants
David J. Vining, MD, Houston, Texas (*Presenter*) Royalties, Bracco Group;CEO, VisionSR, Inc;Stockholder, VisionSR, Inc

PURPOSE

The RSNA defines common data elements (CDEs) as "standardized sets of questions and allowable answers used to express observations in diagnoses" (https://www.radelement.org/). CDEs are a vital component of structured reporting as they provide details about a disease using standardized medical terminology that can be indexed, searched and transmitted across electronic medical record systems. However, widespread adoption and implementation of CDEs remains limited. We have developed an interactive multimedia reporting system that provides a framework for using CDEs in an interactive multimedia reporting environment.

METHODS

We developed an interactive multimedia reporting system that records key images and voice descriptions of image findings, tags the images with metadata referenced to an ontology (i.e., controlled vocabulary) using natural language processing, and assembles a

multimedia report with related information arranged in graphical timelines. The metadata that tags each finding consists of Anatomy term and Pathology (i.e., diagnosis) terms. The automatic labeling of a finding with Anatomy and Pathology terminology triggers the display of an associated CDE menu that informs and guides a radiologist about what details to describe about a particular diagnosis. As the radiologist dictates additional description of a finding, the natural language processing system searches the transcribed text for CDE elements to populate the appropriate fields in the multimedia report. The framework that supports the CDEs allows for menus of questions and answers to be constructed with pick lists of single or multiple-choice answers, or it may consist of fill-in-the blank fields that allow for the input of free-form text and/or metrics. CDEs may be applied to the Anatomy OR Pathology terms separately or in combination as an Anatomy-Pathology term pair as this schema allows for versatility in the application of CDEs. The ontology used to label image findings consists of hierarchies of Anatomy and Pathology terms, and CDEs applied to a parent term within the hierarchies may be transmitted to a child term (i.e., inheritance) or blocked by design. CDEs applied to a particular anatomical structure, for example "muscle," may be transmitted to all occurrences of muscle terminology (i.e., transference).

RESULTS

The ontology used in the reporting process currently consists of 1794 Anatomy terms and 21,821 Pathology terms (diagnoses). A total of 1387 CDEs have been implemented in the system, including CDEs referencing the American College of Radiology's RADS reporting schema (https://www.acr.org/Clinical-Resources/Reporting-and-Data-Systems) and the RSNA's RadElement repository. The principles of inheritance and transference of CDE properties provide for an efficient way to manage and maintain the ever-growing CDE library.

QI03-B-HC1 Automated Detection Of Knee X-ray Laterality Marker Errors Using Machine Learning

Participants
Anders Lenskjold, MD,MMedSc, Portuguese Cove, Nova Scotia (*Presenter*) Research grant, Radiobotics;Consultant, Radiobotics;Consultant, MindSea;Consultant, Copenhagen Game Lab

PURPOSE

Severe consequences can arise from radiologic reports of the wrong anatomical side (laterality). For radiographic examinations of the extremities, patients and healthcare providers depend on the correct laterality description to prescribe proper treatment plans, including surgeries. Humans can identify laterality mismatches with little or no effort and sense if something does not add up. To the best of the authors' knowledge, existing computer algorithms do not have the same heuristic ability. The purpose of this study is to identify mismatches between the anatomical structure, radiographic markers, and DICOM tags (Digital Imaging and Communications in Medicine) of knee radiographs and develop an automated machine learning (ML) tool to detect the mismatches, including analyzing the laterality of the anatomical structure on plain radiographs of knees.

METHODS

We re-analyzed plain lateral knee radiographs of consecutive patients in 2017 from production PACS with Danish Patient Safety Authority approval for quality improvement purposes to identify mismatches between the radiographic markers, the anatomical structures of the knee, and DICOM tags. Obvious mismatches had already been detected and removed in the clinical setting. Therefore, the dataset only represents the undetected mistakes. We used a commercially available CE-approved and FDA-off-labeled machine-learning-based product to determine the anatomical laterality of the lateral radiographs based on the orientation of the patella. National Danish standards have patella on the right side of the femur in the left-sided images and vice versa. We used the ML-based product as the reference standard in the analyses. The study team manually identified and annotated the radiographic markers for later training and validation of an automated machine learning tool. We flagged images with 1) missing markers, 2) mismatch between markers, 3) unclear labeling including flipped lead markers, and 4) mismatch between ML laterality, markers, and DICOM tags. The proposed quality improvement tool is in a developing phase by the research team in collaboration with an ML health tech company.

RESULTS

A total of 676 plain lateral knee radiographs from 508 imaging studies were analyzed. The ML tool for laterality detection achieved an accuracy of 99.9 % (675/676), and 6.1 % (41/676) of the images had visible orthopedic hardware known to potentially perplex machine learning algorithms. The dataset had a balanced 'left' and 'right' laterality representation of 51.9 % (351/676) and 48.1 % (325/676), respectively. We found 5.5 % (37/676) of images with no markers, and one radiograph had both 'left' and 'right' markers in the same image. Furthermore, 5.9 % (40/676) of images used ambiguous lead labeling, such as flipped and cropped markers. We found rotated lead markers (> 90 degrees) in 21.0 % (142/676) of all images. While they are not ideal for uncomplicated radiologic readings, we did not categorize them as mislabels in this study.In 13.2 % (89/676) of all images, our approach flagged a mismatch between markers and anatomical laterality from the ML-product's reports. In 14.8 % (75/508) of the analyzed studies, the radiology department would have to reassess the patient to determine the correct laterality. When considering mismatches with DICOM tags, we found a 21.2 % (143/676) mismatch between markers, anatomical laterality, and DICOM tags. We saw a majority of the mismatches in the left-sided DICOM tags.

QI05-A1   **Evaluation Of The Role Of The Breast Imaging In The Management Of Patients With A B1 Histopathological Outcome**

Participants
Aishah Azam, BSC,MBBS, London, United Kingdom (*Presenter*) Nothing to Disclose

PURPOSE

A B1 outcome at histopathology is whereby the biopsy sample is inadequate or normal breast tissue has been sampled. The rate of B1 outcomes varies across different centers with rates ranging from 0.4-17% (1). A high B1 rate can lead to over-investigation and undue stress for patients whereas a low B1 rate can lead to a false assurance and high rate of missed cancers. The aim of this project was to assess the pathway of patients with a B1 histopathological outcome and provide meaningful suggestions to ensure appropriate management.

METHODS

Retrospective data was collected on patients who underwent a breast biopsy between January 2019 and January 2020 with a histopathological outcome as B1. Data recorded included patient demographics, clinical suspicion, ultrasound report, other imaging acquired at the time, and the formal histopathological report. The initial ultrasound was then further analyzed to characterize the lesion type, whether any radiological diagnosis was suggested, the number of biopsies obtained, and whether the images of the needle through the lesion was saved in 2 planes. The findings of subsequent investigations were also recorded.

RESULTS

Approximately 9.3% of patients who underwent a breast biopsy in 2019 had a B1 histopathological outcome (134/1442 patients, age range: 20-92). 68% of these cases were targeting symptomatic lesions in patients, and 32% were incidental areas picked up by the radiologist (based on 2nd look MRI; mammogram/US findings). In terms of lesion types that had a B1 outcome; 60/134 cases biopsied were well-defined masses, 42 cases were ultrasound areas of distortion, 20 cases were complex cysts, 7 cases were intraductal lesions, 3 cases were microcalcifications and 2 cases were lymph nodes. 84% of the cases had imaging in at least one plane, and 56% demonstrated imaging of the needle through the lesion in 2 planes. 101/134 cases underwent at least 2 core biopsies at the time of initial evaluation, with 15/134 only undergoing one biopsy. 18/134 cases did not record the number of biopsies performed. 83% had a suggested radiological diagnosis with 94% as these benign lesions and 6% of these as potential malignant lesions. Although a significant majority of these were suggested as benign, only 13% of the reports said a B1 outcome would be acceptable. In total 50/134 cases were re-called for a repeat biopsy (37%). Of these 34/50 patient initially had images saved in 2 planes and the remaining with either no images saved or in 1 plane only (4 and 12 respectively). 18/50 cases remained as B1 on repeat biopsy, 27 cases were upgraded to B2, 1 case was upgraded to a B3 lesion and 4 cases were upgraded to malignancy (3%). The 4 cases that were upgraded to malignancy each had suspicious examination findings, high risk clinical history or suspicious imaging findings on alternative imaging modalities. 2/4 of these patients didn't have the number of cores included in the ultrasound report, and 2 of these patients had imaging in 1 plane only. 84/134 of the patients initially diagnosed with B1 had no repeat biopsy. For 26/84 of these cases the ultrasound was repeated and there were no concerning imaging features so biopsy was felt unnecessary. Of the remaining 58 cases, 21 cases were prospectively reported by the radiologist as a B1 outcome being acceptable so no further repeat imaging was required. 37/58 cases were retrospectively reviewed along with clinical information and the B1 outcome was deemed acceptable by the Radiologist and the patient was reassured and discharged.

QI05-A2   **Deep Learning Diagnoses And Grades Childhood Adenoidhypertrophy With High Precision**

Participants
Sheng He, PhD, Taiyuan, China (*Presenter*) Nothing to Disclose

PURPOSE

Investigating and evaluating the feasibility, accuracy, and reliability of deep learning artificial intelligence (AI) methods to automatically measure adenoid hypertrophy in children from nasopharynx lateral radiographs.

METHODS

Radiograph images were manually annotated and divided into training, validation, and test datasets. Training and validation groups were used to train the multi-class U-Net and ResUNet deep learning image segmentation methods, then both methods were used to segment the test set images. The test set results for both segmentation methods were compared to determine which one had the best performance, and the best one was used to automatically measure Adenoid/Nasopharyngeal (A/N) ratios via Matlab measuring model. These ratios were compared to A/N values manually measured by three different physicians: chief, attending, and resident, where chief physician results were considered the "gold standard"

RESULTS

ResUNet demonstrated better test set segmentation performance compared to U-Net, and obtained overall more accurate A/N

measurements than that for attending and resident physicians. This was applicable for both normal, as well as moderately and pathologically hypertrophic adenoids, where ResUNet had 93.75%, 93.02%, and 96% accuracy, respectively, compared to 100%, 83.72%, and 96% for attending physicians, as well as 68.75%, 69.77%, and 84% for residents. Furthermore, ResUNet measured A/N in less time than for any manual physician measurement.

QI05-A3   Critical Findings In The Era Of Chaos

Participants
Maria Rueda, MD, Bogota, Colombia (*Presenter*) Nothing to Disclose

PURPOSE

Physician-to-physician communication as part of patient safety has been emphasized by the Joint Commission. In our institutional Radiology Department operational standards, we have established which critical findings and imaging reports not expected in a diagnostic image performed in emergency care, hospitalized, or ambulatory patients need to be communicated immediately to the attending physician within one hour of imaging acquisition. Critical finding reports in daily studies is an essential aspect of our quality improvement; therefore, for us, the completion of this standard needs to achieve 100% each month. Nonetheless, in the era of COVID-19, it has been hard to keep up with these standards given the uprise of ICU studies. This work aimed to create strategies to optimize critical finding reports and ensure our standard operational completion.

METHODS

Every month, we conduct statistics on critical finding completion. After seeing a drop in this standard completion in three consecutive months, we decided to use the ¨5 WHY¨ and the fishbone strategies to solve this problem. We first asked radiologists why they thought critical finding reports were not being completed. After identifying the problem, we worked on creating a structured critical finding report to improve accessibility. We also made email follow-ups each month when essential findings were not reported within the hour to understand specific circumstances.

RESULTS

At the beginning of the pandemia, critical finding reports dropped from 100% to 80% in April, March, and June 2020. After performing a survey, many radiologists argued uncertainty, fear and stress were the leading cause of distraction. After creating the structured report finding Radiologists found it easier and more accessible to inform. Additionally, after the email follows ups we encountered specific scenarios. In the ICU routine chest x-rays in COVID patients, critical findings could not be reported within the hour because of the higher volume and shortage of staff. This particular case, especially in the night shift critical findings report, was declared the next day by the thoracic radiologist.

QI05-A5   Implementation Of A Smart CDS Tool For Improved Lumbar Spine MRI Ordering.

Participants
Gregory Parker, MD, Philadelphia, Pennsylvania (*Presenter*) Nothing to Disclose

PURPOSE

Medicare has elected to reduce inappropriate imaging, such as MRI of the lumbar spine (MRI-LS) for nonspecific low back pain through clinical decision support (CDS). Yet, CDS can only generate an appropriateness score when a structured indication is selected and high rates of free-text order entry have been observed. We evaluated the effect of an AI tool that suggested structured indications for MRI-LS orders on appropriateness scores by ordering provider type.

METHODS

In October 2020 our urban tertiary care academic medical center updated our CDS with an AI tool that automatically suggested structure indications for free-text only order indications. We compared all orders for MRI-LS placed by APPs and physicians at our main orthopedic outpatient clinic between 11/2019-2/2020 (i.e. before the automated prompt was implemented) and 11/2020-2/2021 (i.e. after the prompt was implemented). Providers who did not order at least one MRI-LS during both the before and after study period were excluded. Differences in the order scores and provider type before and after AI tool implementation were compared using Chi Square.

RESULTS

Only 22 out of 75 (29%) of orthopedic providers entered at least one MRI-LS order during the both the pre- and post-intervention study periods; this included 10 APP and 12 physicians. There was no overall change in the appropriateness score before and after use of the tool (p=0.397). The number of orders outside of guidelines was significantly different before (34/354, 10%) and after (48/314, 15%) the AI tool was implemented (p=0.0256). The majority of orders were appropriate and did not change before (273/354, 77%) and after (223/314, 71%) implementation of the tool (p=0.0719). Inappropriate orders comprised 3% of all orders before (11/354) and 2% after (6/314) implementation of the tool (p=0.327). APPs were more likely to order appropriate studies with the AI tool than MDs (p=0.0003), and less likely to order studies outside of guidelines (p=<.0001).

QI05-A7   Quality In Musculoskeletal Radiology: Can We Measure The 'Perfect' Report?

Participants
Dhiren Shah, MBBS, FRCR, London, United Kingdom (*Presenter*) Nothing to Disclose

PURPOSE

Defining and improving the quality of reports is notoriously difficult in radiology. The largely subjective nature of an individual radiologist's reports, influenced by individual training and experience, makes consistency and agreement on quality almost impossible to achieve. Whilst reporting guidelines and recommendations may include structured frameworks, quality metrics are sparse and rarely subspecialty focused. Although a report is the primary communication between the radiologist and referrer, radiologists rarely receive any direct training in quality. The ultimate measure of quality is end-user satisfaction; however, teleradiology and remote reporting - hastened by the coronavirus pandemic - have diminished the opportunities where such feedback can be obtained, and duly used to drive up report quality. We therefore propose a method of establishing a quality dashboard among a group of radiologists in a department by using the most pertinent of all metrics: end-user feedback, which in the case of our QI study, pertains to specific feedback from an orthopaedic surgeon regarding what they value in MRI knee reports.

METHODS

A senior orthopaedic knee surgeon with 8 years consultant experience was asked to provide quality metrics with weighted importance (rated from 1 to 10) for MRI knee reports performed for trauma. Knee MRI scans were used as these were the most frequently performed of all musculoskeletal MRI studies, and hence had the greatest potential for quality improvement from the widest number of radiologists. Nine metrics were identified as important from the orthopaedic perspective: certainty; answering the clinical question; readability; report length; suggesting additional management; timeliness; lack of spelling errors; sentence structure.Thereafter, the degree to which each metric could be satisfied in a report was agreed upon by consensus of the authors. The maximum score for each parameter was the weighted rating listed by the surgeon. For example, timeliness was rated 4/10 in importance and hence only assigned a maximal value of 4 in the scoring system.A series of 50 MRI adult (age 18 to 50) knee scans for investigation following trauma, performed at two out of three hospitals in our acute hospital group from January to April 2018, were scored. Subsequently, a 'Quality in Radiology Seminar' was delivered by a musculoskeletal radiologist to an audience of 20 staff and resident radiologists, introducing quality concepts, with particular reference to report style, communication, and quality metrics. A repeat assessment of 50 MRI adult knee scans performed during March to April 2021 was undertaken.(The original proposed date of March to April 2020 for the second part of the study was postponed, due to the change in service use in London hospitals during 2020, which were seriously affected by Covid-19).

RESULTS

In the initial series, answering the clinical question and suggesting further management were done well, however important metrics including certainty and readability scored less than 75%. Equivocal phrases such as 'indeterminate for' and 'possibly' were utilised, and there was lack of separation of the report into logical and easily readable sections. A number did not mention relevant negatives such as 'bone marrow signal' and 'posterolateral corner structures', possibly due to the general brevity of reports. Only 14% of reports were verified within the 48-hour target set.The repeat assessment demonstrated significant improvement in the majority of the metrics, with certainty improving from 7.3 to 9.3 (maximum possible 10), timeliness from 0.6 to 2 (maximum possible 4), and total score improving from 38.5 to 44.8 (maximum possible 54). Reports were on average longer (199 versus 165 words), likely reflecting inclusion of more relevant negatives, although repetition of findings was seen.

QI05-A-HC1 The Transition To Peer Learning

Participants
Christopher G. Roth, MD,MS, Philadelphia, Pennsylvania (*Presenter*) Nothing to Disclose

PURPOSE

The purposes of this project are to create a peer learning system that preempts the punitive impact and rote nature of traditional peer learning and maximize peer learning opportunities.

METHODS

We developed an API layered on the PACS to substitute for 1) the prior report review window and 2) the traditional peer review process conducted through the ACR RadPeer system in our department. This system anonymizes the report and replaces the traditional scoring system with a consensus-based assessment system developed by our Peer Review Committee, which includes the following categories: Great Call!; Concur, Constructive Feedback and Discrepancy. Submissions are entered during the delivery of care without an impact on workflow efficiency. The system features an administrative dashboard for the peer review physician to assign a second reviewer, render final adjudication after second review and then provide feedback to the reviewee all at the PACS point-of-care.We compared the peer review/learning submissions and department median prior to and after implementation for the entire department to assess engagement and we compared the number of feedback communications provided quarterly. We also surveyed the faculty to assess their satisfaction with the new peer learning system.

RESULTS

Total peer review/learning submissions increased from 6115 and 6451 for the 2 quarters preceding implementation to 8426, 8310 and 9150 for the 3 quarters following implementation. The department median increased from 80 and 96.5 for the 2 pre-implementation quarters to 112, 127 and 136.5 for the 3 post-implementation quarters. Feedback data and survey result data are unavailable at this time.

QI04-A1 Surge In Remote Reading Due To The COVID-19 Pandemic And The Need For Optimized Remote Reading Environments

Participants
Spencer Martens, BA, Chicago, Illinois (*Presenter*) Nothing to Disclose

PURPOSE

With the need for social distancing and increased workplace safety requirements during the COVID-19 pandemic, many radiologists began interpreting studies remotely on home workstations. The initial aim of this study investigates how ambient light levels in remote reading environments affect radiologists' ability to detect low contrast image features.

METHODS

To understand factors that impact an individual's ability to detect low contrast image features in their remote environment, radiologists were asked to provide their remote reading room layout noting the position of their workstation relative to other light sources. We developed a 10-bit test pattern on PACS to assess minimum detectable contrast at display background gray values of 0%, 4%, 10%, 20%, 60%, and 98%. The pattern was displayed at fixed display window width/level settings of 1024/512. Letters of varying contrast were randomly placed on the backgrounds, and participating radiologists reported the lowest contrast letter they were able to detect. They also provided the time of day, sunlight conditions, and display monitor used.

RESULTS

Initial data was collected from 20 UChicago radiologists. Multiple trends limiting ability to detect low contrast image features emerged including but not limited to: 1) high ambient light levels in remote reading environment due to window or light fixture sources shining on monitor; 2) sunny conditions during study interpretation without black-out curtains; 3) consumer grade display monitors.Physicians who failed to optimally detect low contrast letters at background gray values of 0% and 4% were provided a calibrated lux meter and asked to make alterations to their remote reading environment including room layout, blackout curtains, and monitor position. Limited re-test data from select physicians following room setup alteration reflect promising increases in low contrast image feature detection with ambient light values corrected to 75 lux or below.

QI04-A2 Comparison Of The Image Quality Of Brain CT Angiography In Deep Learning Reconstruction, Filtered Back Projection, And Hybrid Iterative Reconstruction

Participants
Daehyun Hwang, MD,PhD, Seoul, Korea, Republic Of (*Presenter*) Nothing to Disclose

PURPOSE

Advancements in the development of deep learning reconstruction (DLR) have led to better outcomes including low radiation exposure and excellent imaging quality. Several studies have utilized DLR in the abdominal, chest, and brain CT imaging and cardiopulmonary CTA and found better imaging quality compared to other image reconstruction algorithms. asset:$ResourceStore:/Source/merops/fragments/ID0EYHAE.xmlHowever, no study has investigated the application of deep learning image reconstruction to brain CTA protocols. Our study aimed to assess the image quality of brain computed tomography angiography by comparing deep learning reconstruction with filtered-back projection (FBP) and hybrid iterative reconstruction (HIR).

METHODS

A total of forty-three consecutive patients underwent brain CTA with a protocol consisting of a tube voltage of 120 kVp, tube current of 150 mAs, 0.5 second gantry rotation time, and 0.5 mm slice thickness. The slice interval was 0.25 mm implemented by the double slice technique. Images were reconstructed using three different algorithms: FBP, HIR, and DLR. The image noise, CT attenuation value (HU), signal-to-noise ratio (SNR), and contrast-to-noise ratio (CNR) were measured in the right and left cavernous segment of the internal carotid artery (ICA), right and left vertebral artery, basilar apex, right and left M1 segment of a middle cerebral artery and used for the objective assessment of the image quality among three different image reconstructions (Fig. 1). To perform these measurements, one investigator placed the ROIs in the exact same location of the same patient in all image algorithms including the FBP, HIR, and DLR images. The images were subjectively evaluated by two neuroradiologists (each with reading experience longer than five years).

RESULTS

Objective analysis: In all patients, the average noise was 19.80±5.57, 16.51±6.00, and 10.95±3.77 in the FBP, HIR, and DLR analysis, respectively (p < 0.001). The amount of noise reduction with the use of DLR was approximately 33.68% and 44.70% compared with HIR and FBP, respectively. There was no significant difference in the attenuation of the thalamus, and right and left cavernous segments of the ICA in all image reconstructions. The CNR was significantly higher in the DLP (34.28±15.42) than HIR (18.90±7.68) and FBP (15.62±5.74) in all patients (p < 0.001), resulting in an average improvement of 44.86% and 54.43% compared with HIR and FBP, respectively. Similarly, the SNR was significantly higher in the DLP (30.27±14.45) than in HIR

(13.51±5.38) and FBP (16.28±7.12), representing an average increase in the SNR by 46.22% (DLR vs. HIR) and 55.37% (DLR vs. FBP) (p<0.001) (Fig. 2). Subjective analysis: The subjective image quality scores of DLR were significantly higher compared to those of the HIR and FBP (p<0.001) images. The interobserver agreement for subjective image analysis obtained a k value of 0.77 representing a good coefficient. Increased number of cortical branches and well-demonstrated lacerum and cavernous segments of ICA in the DLR. In addition, the excellent vessel delineation wall and sharp vessels were more evident in DLR than in HIR and FBP (Fig. 3). Furthermore, both observers judged the quality of the images to be highest with DLR than with FBP and HIR after assessing two sample images of patients with surgically clipped and coiled aneurysms by reducing blooming artifacts (Fig. 4 - 5).

QI04-A3 Can Artificial Intelligence (AI) Completely Replace Human Reader In Mammography Screening Program? A Retrospective Evaluation With Digital Mammography (DM) And Digital Breast Tomosynthesis (DBT)

Participants
Esperanza Elias Cabot, Cordoba, Spain (*Presenter*) Nothing to Disclose

PURPOSE

To investigate whether the use of AI alone as a screening tool could achieve similar sensitivity with an acceptable recall rate, in comparison to different screening scenarios with radiologists: single reading of DM, double reading of DM, single reading of DBT and double reading of DBT.

METHODS

A consecutive cohort of 15,999 DM/DBT screening exams (with 113 cancers, including 15 interval cancers) was retrospectively collected from a previous trial study (Tomosynthesis Cordoba Screening Trial) comparing DM and DBT in a paired cohort. Each DM and DBT screening exam was independently double read by radiologists without consensus. All of the included exams were processed by an AI system Transpara®(version 1.7.0, ScreenPoint Medical BV, Nijmegen, Netherlands). The most suspicious findings detected by the system are marked in every exam and are assigned a score between 1 and 100 indicating the increasing likelihood that a visible cancer is present in the mammogram. Only cancer lesions correctly localized by AI were considered true positives. The stand-alone performance of the AI system was independently computed for DM and DBT exams in terms of area under the receiver operating characteristic curve (AUC, ROC) (95% confidence intervals). The screening recall rate and sensitivity were compared between each original screening setting and the fully-automated AI at different cutoff points using a paired data McNemar test at a significance level alpha of 0.05.

RESULTS

The AI system achieved an AUC of 0.942 (0.914-0.965) for DBT and AUC of 0.927 (0.894-0.957) for DM. During the original single human reader with DM, 498 women were recalled (3.11%, 95% CI) and 66 cancers were detected (sensitivity 58.41%). In the AI autonomous scenario (cutoff 82), 218 women were recalled (1.36%, 95% CI) and 69 cancers were detected (sensitivity 61%). Difference in recall rate -1.75%. During the original double human reader with DM, 808 women were recalled (5.05%, 95% CI) and 76 cancers were detected (sensitivity 67.26%). In the AI autonomous scenario (cutoff 76), 406 women were recalled (2.54%, 95% CI) and 77 cancers were detected (sensitivity 68.14%). Difference in recall rate -2.6%. During the original single human reader with DBT, 482 women were recalled (3.01%, 95% CI) and 87 cancers were detected (sensitivity 76.99%). In the AI autonomous scenario (cutoff 65), 1474 women were recalled (9.21%, 95% CI) and 88 cancers were detected (sensitivity 77.88%). Difference in recall rate +6.2%.During the original double human reader with DBT, 707 women were recalled (4.42%, 95% CI) and 92 cancers were detected (sensitivity 81.42%). In the AI autonomous scenario (cutoff 57), 2671 women were recalled (16.69%, 95% CI) and 93 cancers were detected (sensitivity 82.30%). Difference in recall rate +12%.

QI04-A4 Trainees Unite: The First National Interventional Radiology Trainee Research Collaborative

Participants
Indrajeet Mandal, Reading, United Kingdom (*Presenter*) Nothing to Disclose

PURPOSE

Interventional Radiology has developed into one of the most rapidly growing specialties in Medicine. As the field expands, it is vital to ensure our practice is evidence-based. Trainee-led research collaborative have been shown to be a highly successful model of producing high-quality, multi-centre research projects. Trainee collaboratives were first proposed in the UK over 10 years ago in surgery. Since then, many other specialties have created their own trainee research collaboratives. The Royal College of Radiologists (RCR) in the United Kingdom formed the first trainee research collaborative in radiology - RADIANT - in 2019. Academic interventional radiology is still within its infancy. Generating interest in an academic career amongst trainees is vital to ensure that the future of the specialty continues its culture of innovation in an evidence-based manner. We created a new national trainee research collaborative in interventional radiology. To our knowledge, there are currently no national or international trainee research networks in interventional radiology.

METHODS

The UK National Interventional Radiology Trainee Research (UNITE) Collaborative was created in January 2021. Members of the British Society of Interventional Radiology Trainee Committee (BSIRT) and Interventional Radiology Juniors (IRJ) group collaborated on this joint venture. The aims of the group were to increase interest in academic interventional radiology and to run undertake multi-centre research projects.Launching the collaborative first consisted of forming a steering committee. This committee included members from both BSIRT and IRJ and included trainees across multiple stages of training. An advisory panel was selected, which consisted of active researchers in the field. Further working groups were created for each individual project run under the initiative. Proposals for a multi-centre research project were submitted by members of the BSIRT and IRJ groups. After consideration by the UNITE steering committee and advisory panel, studies were selected for implementation on a national scale. The first project selected was the Multicentre Audit of Cholecystostomy and Further intervention (MACAFI) Audit, a retrospective cohort study looking into the outcomes of cholecystostomy for acute cholecystitis. A second study - RADFEM - was also selected. This study is a national survey-based study looking into vascular access techniques amongst UK interventional radiologists performing mechanical thrombectomy for stroke.Additionally, a monthly journal club was established to generate interest in academic interventional radiology. High impact papers within interventional radiology were selected for discussion. Each session consisted of a trainee presentation of the paper, followed by a multi-disciplinary panel discussion. Feedback was collected through an online form distributed to attendees after each session and response rate (RR) calculated. Attendees were asked to rate how strongly they agreed or disagreed with a series of statements about the session.

RESULTS

The MACAFI Audit has recruited a total of 100 collaborators at 60 sites so far. Data collection is currently in progress. The anticipated mean dataset size is 30 patients per site, resulting in a predicted raw dataset size of 1800 patients. The RADFEM study protocol has been published, and the project is in progress.The first 3 journal club sessions (January 2021-March 2021) received a total of 190 attendees. A total of 63 responses was received (RR=33%). A total of 90% agreed or strongly agreed with the statement "The session was a good way to keep up with latest evidence"; 79% agreed or strongly agreed with the statement "The session taught me to critically appraise"; 78% agreed or strongly agreed with the statement "I am more likely to consider a career in academic IR".

QI04-A5   A Deep Learning Reconstruction Algorithm (dlir): Assessment On Low-dose CT Image Quality And Diagnostic Accuracy Ofarteriosclerotic Occlusive Disease

Participants
Yilin Chen, Fuzhou, China (*Presenter*) Nothing to Disclose

PURPOSE

To evaluate the effects of a state-of-the-art deep learning image reconstruction (DLIR) algorithm on low-dose CT image quality of patients with arteriosclerotic occlusive disease

METHODS

Seventy-eight patients underwent lower extremity arterial CT angiography on Revolution CT platform (GE Healthcare) . Four sets of CT images were reconstructed with ASiR-V 50%,and three levels of DLIR (DLIR-L,DLIR-M,DLIR-H) with 0.625mm slice thickness and 80kVp low-dose scanning voltage. The Signal-to-noise ratio (SNR) and contrast-to-noise ratio (CNR) as well as standard deviation(SD) values of lower extremity artery branches(Iliac Arteries, Femoral arteries, Popliteal Arteries and Anterior Tibial arteries) were measured with the same region of interest (ROI) tThe overall image quality include subjective noise, sharpness, artifacts and diagnostic confidence were independently assessed by two radiologists using a five-point scale from 1 (unacceptable) to 5 (excellent). We used Dunnett T3 test to test the SNR, CNR and SD, and we compared image quality scores with Wilcoxon test. The measurements between the four groups were analyzed using SPSS20.0, with $P<0.05$ indicating statistically significant difference.

RESULTS

SNR, CNR and SD values illustrated a progressive image quality performance as DLIR strength increases ($P <0.01$) . SNR, CNR and SD values of DLIR-L, DLIR-M as well as DLIR-H were better than ASiR-V, and images in DLIR-H group showed the lowest SD and the highest SNR and CNR among the four reconstruction algorithm groups.($P <0.05$). As for the subjective analysis, the image quality scores of DLIR-med and DLIR-high tended to be better in terms of small vessels compared with ASiR-V ($p <0.05$). Furthermore, DLIR-H achieved the best scores including SD, CNR, SNR and overall image quality scores among four reconstruction algorithm groups ($P <0.05$).

QI04-A6   Improved Operational Support For Advanced MRI Through Coordinated Real-Time Physicist Collaboration

Participants
Puneet Sharma, PhD, Atlanta, Georgia (*Presenter*) Nothing to Disclose

PURPOSE

As MRI utilization continues to grow, there is greater importance to improve workflow efficiency, while maintaining high image quality, consistency, and patient satisfaction. Our large academic institution relies on clinical MR physicists for protocol optimization, dedicated technologist training, and radiologist collaborations to support the advanced cross-sectional MR imaging, which averages over 250 exams per day. This diversity of MRI exams often requires escalation and resolution of complex quality and safety issues, in order to ensure continued imaging benefit and value. The prevailing method for radiologists and MR personnel to address recurring or immediate technical challenges with MR physicists are through email correspondence, phone call, or imaging feedback reports. These approaches introduce significant delays and are impractical for proximate questions related to patient scanning, especially when physicist availability is uncertain. The purpose of this quality initiative is to improve the communication reliability and efficiency between radiology staff and MRI physicists for addressing significant technical concerns during daily clinical routine. Accordingly, we propose a new communication workflow, termed "Physicist-of-the-Day" (POD), which enables direct instant messaging with specially designated MRI physicists. We expect the novel workflow to allow more immediate collaboration and resolution to radiologist and staff inquiries.

METHODS

Our institution employs three MRI physicists, each, serving 26 MRI systems across a 30-mile geographic radius. The existing physician scheduling system, Qgenda (Atlanta, GA, USA), was leveraged to establish specific scheduling for the MRI physicists during weekday hours. A total of 10 hrs per day (50 hrs per week) was designated for scheduling, with each day divided into two "shifts": a) 8am - 12pm; and b) 12pm - 6pm. Since one physicist was 25% committed to Radiation Oncology duties, the weekly target share was distributed as {13.6, 18.2, 18.2} hrs among the three physicists. Each week, the physicists collaborated to establish their upcoming Qgenda schedule, accounting for the appropriate distribution and other availability constraints. Our department recently implemented Microsoft Teams (Redmond, WA, USA) as a tool for internal communications and other reference material, such as file sharing, imaging protocols, and project collaborations. All Qgenda schedules were posted weekly on an MRI-specific "Team", consisting of all department radiologists, MR technologists, supervisors and managers. For instant communication, we encouraged all MRI-Team members to use the chat feature to share images and request consultation from designated POD physicists during assigned hours. After hours requests were directed to a physicist group channel. The MRI-Team also allowed video or audio sharing on applicable workstations, along with issue tagging. All chat solicitations during POD were categorized, as relating to: a) imaging protocols, which includes sequence modifications or optimization tasks; b) image quality/artifacts/education; c) safety, which includes scanning constraints and medical devices. In addition, the physicists categorized the solicitor (radiologist/technologist), and whether issue resolutions occurred the same day. Since most prior solicitations with the physicists were ad hoc, no relevant communication data were available for direct comparison. However, a formal imaging feedback log between radiologists and MR supervisors has existed, which aimed to collect and distribute notifications via automated weekly emails. We collated frequency and response rate from this database as a measure of prior performance.

RESULTS

A total of 349 shifts and 1730 hours (48.1 hrs/wk) were scheduled between August 2020 and April 2021 using Qgenda and MS Teams, with a weighted distribution of 13.6, 16.8, and 17.7 hrs/wk among the three physicists. Over this span, 130 POD requests (3.6 per week) were made to th

QI04-A7   Measuring Improvement In A Multinational Healthcare Organization

Participants
Chryssa Paraskevopoulou, Athens, Greece (*Presenter*) Nothing to Disclose

PURPOSE

The aim of this study is to present the impact of the introduction of organizational clinical standards in a multinational healthcare organisation in the improvement of patient safety through clinical audit. This study seeks to assess whether actions taken have had tangible benefits and as such, retrospective reviews and assessments are embedded as standard approaches.

METHODS

A suite of clinical safety standards was introduced at Group level in 2018 to harmonise approaches and embed best practice, moving away from the prior approach where standards were developed at individual country business level based on local requirements. At the time of implementation, audits were undertaken to benchmark initial compliance to the new higher standards such that any subsequent progress could be analysed. The first comparative survey was undertaken between October to December 2020 involving 187 diagnostic imaging centres in 11 European countries. Self-assessment questionnaires, comprising of 39 questions aligned with the initial 2018 benchmarking exercise, covering: incident reporting and analysis of unintended and accidental radiation exposures, justification of imaging examinations using ionising radiation, contrast media management and Magnetic Resonance (MR) safety, were distributed to assess compliance with a 95% standard. Results were compared to those collected in 2018 to evaluate the level of improvement through continuous education of the personnel.

RESULTS

The average overall compliance was 97% compared to 80% in 2018. All centres (100%) performed incident reporting and analysis of unintended and accidental radiation exposures compared to 92% in 2018. Compliance to justification of imaging examinations using ionising radiation was 96% compared to 74% in 2018, contrast media management 95% (70% in 2018) and MR safety 99% (83% in 2018).

QI04-A-HC1 Reading Room Assistance Pilot: Improving Radiologist Workflow

Participants
Michael Hoy, MD, Philadelphia, Pennsylvania (*Presenter*) Nothing to Disclose

PURPOSE

Clinical work in the radiology reading room is often interrupted by phone calls. The effects of interruptions have been shown to increase errors in many hospital settings. Yu et all found that on call radiologists are interrupted as frequently as every 4 minutes by telephone calls. Burnout is an important factor in maintaining staff viability and effectiveness, and is an identified problem based on the most recent faculty survey at our institution, with the high frequency of phone calls and distractions being a known dissatisfier for physicians. Most phone call interruptions are not urgent, do not require immediate communication and are amenable to less immediate and distracting forms of communication. A preliminary assessment reveals that a substantial proportion of calls emanates from technologists and do not require immediate communication and are amenable to alternative forms of communication. Other frequent communications originate from clinicians requesting a preliminary interpretation or clarification and the vast majority are not emergent. We incorporated the use of a 3rd-party company to provide "reading room assistance" (RRA) to field the phone calls that were previously directly targeting the reading rooms and physicians/radiologists delivering patient care interpreting imaging studies involving the assimilation of massive data requiring maximal concentration and focus. The initial pilot study involved RRA staff directing calls to the appropriate people, and prioritizing communicating with radiologists in the body reading room via an electronic messaging tool. Our specific aim was to decrease phone calls to the reading room by 50% within the first quarter. Our secondary aim was to improve workflow and satisfaction measured by physician survey results, with technologist results as the balancing measure.

METHODS

A resident assigned to "protocoling duty" recorded the phone calls he or she received during the day before and after implementation of reading room assistance. We also sent out a survey to all radiology housestaff and attendings and technologists before implementation, in order to assess attitudes toward workflow. Repeat surveys after implementation were delayed by COVID-19 and are currently being distributed. We recorded 18 days of phone calls prior to implementation of the reading room assistants, as well as 20 days of phone calls after implementation. The incoming phone calls were broadly classified into protocol related, wet reads, contrast related and miscellaneous subtypes.

RESULTS

The average number of phone calls to the reading room before our intervention was 34.7 ± 4.7. The average number of phone calls to the reading room after our intervention was 20.7 ± 2.2. Using a two sample T-test, there was a significant difference between the two groups. The p-value is < .0001. The result is significant at p < .05. The largest percentage of the phone calls were protocol related, accounting for 60% (94/157) of all phone calls to the reading room before intervention and 45% (49/110) post intervention.

QI03-D1   Hepatocellular Carcinoma Surveillance At A Quaternary Centre In The United Kingdom - An Assessment Of Local Adherence And Deviations To European Association For The Study Of The Liver And American Association For The Study Of Liver Diseases Guidance

Participants
Tavleen Gill, MBBS,BSC, Southall, London, United Kingdom (*Presenter*) Nothing to Disclose

PURPOSE

This study evaluated a quaternary centre, auditing adherence and identifying key deviations to EASL guidelines for the surveillance/diagnosis of at-risk patients for Hepatocellular Carcinoma. European Association for the Study of the Liver published the "EASL Clinical Practice Guidelines: Management of hepatocellular carcinoma" in 2018 in the Journal of Hepatology. It outlines the gold standard for HCC surveillance and nodule investigation pathways with which we compare our quaternary centre. American Association for the Study of Liver Diseases published the "Diagnosis, Staging, and Management of Hepatocellular Carcinoma" Practice Guidance in 2018 in Hepatology Journal. We use this to allow further comparison and contextualise deviations from EASL.

METHODS

This quality improvement project directly compared surveillance/investigation pathways with EASL guidance. Incidence rates of correct follow up vs. deviation were measured, alongside time interval between investigation stages. This allowed for an understanding of appropriateness and timeliness of the HCC surveillance programme. Standards were set at 100% adherence, as EASL guidance would be considered the gold standard for a specialist programme in the UK. This would mean all nodule seen on USS surveillance should be investigated following the EASL pathway as described in the Clinical Practice Guidelines. The authors present a retrospective cohort study. At risk adults commencing ultrasound surveillance for HCC at a specialist Quaternary Unit in the United Kingdom, between 01 Jan 2015 to 30 June 2015 were identified. The data underwent inclusion/exclusion criteria to identify a cohort of 140 individuals with 1010 scans over a 5-year period (2015-2020). Sequence and time intervals between initial surveillance imaging and further imaging/biopsy were assessed.

RESULTS

USS detected nodules <1cm were appropriately followed-up in 74.3% of cases, (mean 133.0 days, median 108.5 days). Nodules >1cm were appropriately followed-up in 93.7% of cases, with CT and MRI used as 1st modality 28.6% and 71.4% respectively. CT (mean 28.4 days, median 23.0 days); MRI (mean 56.7 days, median 41.0 days). Indeterminate nodules at first modality imaging were appropriately followed-up for second modality in only 26% of cases (mean 48.8 days, median 46.0 days).Total nine biopsies were undertaken (mean 80.7 days, median 66.0 days). Three malignant diagnoses (33%), six benign pathology (67%). The results are summarised in Figure 1, where EASL practice guidance is assessed for adherence and deviations from our local data.

QI03-D2   Multidisciplinary Cardiology Imaging Reporting Team: Initial 10-month Experience In A Tertiary Cardiology Hospital During COVID-19 Pandemic

Participants
Claudio Mesquita, MD,PhD, Niteroi, Brazil (*Presenter*) Speakers Bureau, SERVIER;Speakers Bureau, Pfizer Inc

PURPOSE

Integrating multiple specialties in a single meaningful report requires coordinated multispecialty collaboration. To meet this need, we developed a new strategy: a cardiovascular integrated report. In this report, we provide the first analysis of this experience in a tertiary cardiology hospital during the COVID-19 pandemic.

METHODS

The Multidisciplinary Cardiology Imaging Reporting Team (MCIRT) includes specialists in cardiovascular medicine, cardiovascular surgery, echocardiography, nuclear medicine, and radiology. MCIRT is organized as a team discussion that meets weekly in-person or online (as COVID-19 pandemic social distancing rules determine) and generates a single integrated report of cardiovascular imaging studies as demanded by requesting physicians or by the imaging team. We prospectively obtained clinical, diagnostic aspects, and decision-making data during the first 10 months of experience. Clinician satisfaction was evaluated by direct feedback.

RESULTS

In 10 months, there were 56 clinical cases that were reported as an integrated one. Coronary artery disease (CAD) was the most common etiology demanding integrated reports (23 cases - 41%), most frequently including coronary CT angiography and myocardial perfusion scintigraphy. The second commonest disease was cardiac infectious endocarditis (IE) in 8 cases (14%). The other diagnosis reported were cardiac amyloidosis (CA - 5), dilated cardiomyopathies (5), myocarditis (4), valvopathy (3), hypertrophic cardiomyopathy (2), pulmonary hypertension (2), coronary fistula (1), COVID-19 complication (1), cardiac tumor (1) and pacemaker complication (1). In two cases a direct decision of cardiac surgery was made during MCIRT meeting. The online

discussion was limited because of internet instability in less than 5% of cases. The impact on decision-making and clinician satisfaction was significant.

QI03-D3 Addressing Delays And Deficiencies In Radiology Workflows Through Measurement Of CT Timestamp Accuracy

Participants
Neil Bhatia, Atlanta, Georgia (*Presenter*) Nothing to Disclose

PURPOSE

Patient safety events related to timestamp discrepancies between the imaging modality, the PACS, and the EMR prompted this quality improvement project. We focused on the specific modality of CT due to the importance of timely CT imaging for high acuity indications such as cerebrovascular accidents and the relative frequency of CT imaging, since imaging turn-around-time is often a key performance indicator for health systems. Incorrect timestamps associated with imaging modalities may contribute to radiologist worklist derangements that can subsequently result in delayed treatments and ultimately adverse patient outcomes. This project identified and quantified timestamp deviations associated with CT machines at one large academic hospital and proposed and implemented interventions to address these deviations.

METHODS

The problem statement was as follows: as of January 11, 2021, there is an average time stamp deviation of 12 minutes and 30 seconds between scanner time and coordinated universal time (UTC) across 5 CT machines in the inpatient and clinic settings at a single hospital site, providing inaccurate data about the time to care for patients. Our goal was to have the time-stamp deviation between the modality and UTC to be less than 60 seconds on 100% of CT scanners by March 1st, 2021. The baseline state and improvement states were established by undertaking a manual audit of the 5 CT scanners. The timestamp deviation was calculated by subtracting the time associated with each scanner from the UTC as shown on a cellular device. Baseline was established over 2 audits conducted 3 months apart in time. Technologist perceptions of the problem and other contributing factors were explored during the audits. A fishbone analysis of these factors was generated. The problem was presented at Radiology Department-wide meeting. A focus group was convened after this presentation to brainstorm solutions. Proposed solutions included manual correction of timestamps by technologists as part of their daily workflow and an automated approach that would configure each scanner to refer to a network time protocol (NTP) service. The test of change was implemented based on the automated approach. Partnering with a contracted imaging service company, each scanner was manually configured to refer to the NTP service, which was to subsequently be managed by institutional information services. Reconfiguration of each scanner required a short reboot of about 15 minutes. Times were arranged with managers at affected sites to minimize impact to patient care. A third manual audit was then conducted post-intervention to determine the effect of our automated solution on timestamp deviations. Box-and-Whisker plots were created showing the mean and distribution of timestamp deviations across each of the 3 audits.

RESULTS

The data from each audit quantified the magnitude and direction of timestamp deviations for each CT machine. The initial audit demonstrated that 4 out of 5 machines showed timestamps that were in the future relative to UTC. Two scanners were at least 20 minutes ahead of UTC. One out of 5 displayed a time in the past or behind relative to UTC. The mean timestamp deviation was 8.8 minutes with a standard deviation of 13.1 minutes. The second audit showed that 2 scanners were at least 20 minutes in the future. Two other scanners had no timestamp deviation, and 1 scanner was unable to be accessed for auditing. The mean timestamp deviation for the second audit was 12.5 minutes with a standard deviation of 14.6 minutes. The post-intervention audit of the 5 scanners revealed no timestamp deviations relative to UTC.

QI03-D5 Trainee And Faculty Perceptions Of Remote Pacs Workstations And Next Steps In A Large Academic Medical Institution

Participants
Srini Tridandapani, MD, PhD, Birmingham, Alabama (*Presenter*) Co-founder, CameRad Technologies, LLC;Spouse, Co-founder, CameRad Technologies, LLC;Officer, CameRad Technologies, LLC;Spouse, Officer, CameRad Technologies, LLC

PURPOSE

Remote workstations were rapidly deployed in our academic radiology practice in late March 2020 in response to the COVID-19 pandemic. Surveys of the radiology trainees and faculty were conducted seven- and thirteen-months following workstation deployment to assess the impact on radiology education and faculty wellness, as well as assess the desired trajectory of remote work in academic setting.

METHODS

Surveys were distributed via email to all trainees and all radiology faculty in October 2020 and April 2021, with a two-week deadline for completion. The April survey is currently still open for responses at the time of the submission of this abstract. Questions were primarily multiple choice with 5-point Likert scale with a few free text responses.

RESULTS

In October 2020, 81% (n=39/48) of trainees, 44% (n=22/50) of on-site faculty, and 89% (n=25/28) of remote faculty responded to the survey. The majority of trainees (51%, n=20/39) reported remote work had a negative impact on education, greatest among lower level residents (p<.001). The majority of radiologists with remote workstations (78%, n=18/23) reported improved sense of wellbeing and lower stress levels (88%, n=22/25) as a result of access to remote work options. A simple majority of trainees (49%, n=19/39) and a majority of faculty (63%, n=29/46) desired to see remote work expand in the October survey. Only 7% of faculty (n=3/46) and 24% of trainees (n=9/39) desired to see remote work discontinue. In preliminary data from the April 2021 survey, 40% (n=19/48) of trainees, 34% (n=17/50) of onsite faculty, and 75% (n=21/28) of remote faculty have responded. The majority of trainees (58%, n=11/19) report that remote work has had a negative impact on education. The majority of radiologists with remote workstations (81%, n=17/21) still reported improved sense of wellbeing and lower stress levels (71%, n=15/21) as a result of access to remote work options. An overwhelming majority (90%, n=19/21) of those with remote workstation state it is a high or very high priority to have access to a remote workstation in the future. A majority of onsite faculty (59%, n=10/17) were interested in obtaining access to a remote workstation. While the majority of faculty (66%, n=25/38) continued to advocate for expansion of remote work, only 21% (n=4/19) of trainees maintained this view. However, the majority of trainees (58%, n=11/19) voted for remote work continue for those with access. The majority of trainees in both surveys reported high to very high interest in access to a remote workstation in their future jobs.

Knowledge Is Power: How To Educate Your Patients About Breast Biopsy Markers

Participants
Tiffany Chan, MD, Los Angeles, California (*Presenter*) Nothing to Disclose

PURPOSE

To determine if providing a patient-friendly biopsy marker educational handout would improve patient knowledge and comfort with receiving a marker clip. Biopsy markers serve many purposes regardless of whether the biopsy result is benign, high risk, or malignant. However, during the informed consent of breast biopsies performed at our institution, we frequently encounter concerns from patients regarding biopsy markers. These extensive conversations would delay procedural start time, disrupt clinic workflow, and result in the patient declining the biopsy marker.

METHODS

An informational handout about biopsy marker clips was developed to address commonly encountered questions during the informed consent process. An IRB-exempt, prospective, 4 question questionnaire was then created with responses utilizing the 5 point Likert scale. At all clinical sites that offered biopsies, the handout was provided to each biopsy patient to read while awaiting consent with the physician. The technologist would collect each survey upon completion. A spreadsheet was created to record questionnaire responses. Incomplete surveys were excluded. A paired T test and Wilcoxon non parametric test were used for statistical analysis.

RESULTS

141 completed forms were included in the analysis.Questions 1 and 3 were identical and asked the patient, "Please rate your understanding about Breast Biopsy Markers from 1-5, with 1 being Least Knowledgeable' and 5 being Most Knowledgeable", before and after reading the handout, respectively. The mean score for Question 1 was 2.59 (95% confidence interval: 2.34 - 2.84, standard deviation 1.52). The mean score for Question 3 was 4.26 (95% confidence interval: 4.1-4.4, standard deviation 0.95). The difference in the mean score between Question 1 to Question 3 was an increase by 1.67 (95% confidence interval: 1.44-1.91, with standard deviation 1.42). This was statistically significant ($p<0.001$). Questions 2 and 4 were identical and asked the patient, "Please rate your comfort level of receiving a Breast Biopsy Marker during today's biopsy, from 1-5, with 1 being 'Least Comfortable' and 5 being 'Most Comfortable'", before and after reading the handout, respectively. The mean score for Question 2 was 3.4 (95% confidence interval: 3.2-3.6, standard deviation 1.42). The mean score for Question 4 was 4.20 (95% confidence interval: 4.03-4.37, standard deviation 1.04). The difference in the mean score between Question 2 to Question 4 was an increase by 0.8 (95% confidence interval: 0.61-0.99, standard deviation 1.15). This was statistically significant ($p<0.001$).

QI03-D7 **Improving Acute Imaging Workflow In A Large Multi-tertiary Teaching Hospital**

Participants
Ammaarah Said I, MBBS, London, United Kingdom (*Presenter*) Nothing to Disclose

PURPOSE

The role of imaging is becoming increasingly vital to the management of inpatients (IP) and those presenting to emergency departments (ED). Time taken in studies being performed and reported is crucial in ensuring patients are managed promptly and thus targets for treatment, discharge and admission are met, maintaining patient safety. Therefore, it is vital to ensure acute radiology services are as efficient and streamlined as possible. As such, we aimed to evaluate and improve the acute radiology service provided in a multi-tertiary London hospital (a non-major trauma centre). We aimed to address delays in scanning, reporting, communication and documentation of urgent findings, as well as improving imaging workflow patterns.

METHODS

All acute cross sectional imaging performed over a two week period (01/09/20 to 11/09/20) and all whole body trauma imaging performed over a six month period (06/04/20 to 20/09/20) was acquired from electronic patient records. Preliminary analysis was undertaken to assess current practice. National and local reporting targets and trauma reporting standards for major trauma centres were used to inform targets. The following standards were agreed upon:Trauma Related Standards:[A] All trauma head CT studies should be reported within one hour of being scanned (as per national guidelines 'NICE Head Injury' 2019)[B] All whole body trauma CT studies should have a primary survey within five minutes of being scanned (as per national guidelines 'Standards of practice and guidance for trauma radiology in severely injured patients,' 2nd edition RCR, 2017)[C] All whole body trauma CT studies should have a full report within one hour of being scanned (as per 'Standards of practice and guidance for trauma radiology in severely injured patients,' 2nd edition RCR)[D] All whole body trauma CT studies should have the final report reviewed by a consultant radiologist within 24 hours of the radiology trainee report (as per local guidelines)Non-trauma related standards:[E] All non-trauma ED body CT studies should be reported within two hours of request (as per local guidelines)[F] All IP CT studies should be reported within four hours of request (as per local guidelines)After primary data collection the following interventions were implemented:1. An automatic primary survey template for body trauma scans2. A 'trauma protocolling' button to highlight trauma scans on reporting lists3. Encouraged reporters to document communication of urgent findings4. Encouraged radiographers to inform reporters once trauma body scan performed5. Increased number of acute reporters during peak hours6. A twice daily radiographer-radiologist handover to schedule non-urgent scans to off peak timesSubsequently, we conducted another cycle of data collection and analysis to review the impact of these interventions. Whole body trauma data was collected over a two month period (20/12/20 - 22/02/21), whilst other reporting data was collected over a one week period (15/03/21 - 19/03/21).

RESULTS

[A] CT Head reporting improved from 81% to 84% compliance with reduction in median time from scan to report from 33 minutes pre-intervention to 27 minutes post-intervention[B] The number of primary surveys released increased from 12% to 72%, however average time taken increased from 24 to 32 minutes[C] Average time to issue final reports for whole body trauma CT remained static from 1 hour 11 minutes to 1 hour 15 minutes[D] Average time for consultant review of whole body trauma CT reports improved from 5 hours 45 minutes to 4 hours 43 minutes[E] ED reporting improved from 61% to 69% compliance with static median reporting times of 1 hour 43 minutes to 1 hour 42 minutes[F] IP reporting improved from 52% to 54% compliance with median reporting times of 3 hours 48 minutes to 3 hours 51 minutesThe communicati

QI03-D8 **Sonographer And Resident Driven Quality Improvement Curriculum For First-year Radiology Residents**

Participants

Brian Blumhof, MD, Philadelphia, Pennsylvania (*Presenter*) Nothing to Disclose

PURPOSE

Radiology offers a plethora of imaging modalities, but unique among these, ultrasound is highly dependent upon the user to produce high quality images. Radiology residents quickly develop the ability to interpret images, but independently acquiring diagnostic quality sonographic images remains a concern among trainees. The aim of this quality improvement (QI) project is to produce a resident and sonographer driven educational ultrasound curriculum to improve overall resident confidence and technical skills in acquiring diagnostic ultrasound images.

METHODS

Eleven first year radiology residents participated in a six-month ultrasound scanning curriculum, held after clinic hours, which utilized standardized patients, sonographer driven scanning lessons, and a supplemental written curriculum. Participating residents completed subjective confidence surveys and objective scanning skills examinations prior to the course, at the course mid-point, and at completion. Residents rated their overall scanning confidence utilizing a 5-point Likert scale. Objective scanning skills examinations tested each resident's ability to produce diagnostic quality ultrasound images. These exams were observed and graded by a research sonographer and specific image quality metrics were assessed.

RESULTS

To date, data of two consecutive subjective surveys completed by all participating residents and two consecutive objective examinations completed by 91% of residents has been analyzed. Interval pre- and post-intervention data for multiple outcomes were compared using the Wilcoxon signed ranks test along a Likert scale, with initial analysis showing no statistically significant change in a balancing measure assessing resident satisfaction with time spent learning radiology outside of work hours. There was improvement in residents' overall subjective confidence to adequately perform and document an ultrasound examination (p=0.006) as well as specifically with renal (p=0.005) and gallbladder (p=0.006) studies. Objective data showed that, as a cohort, residents demonstrated improvement in ability to perform and document transverse axis gallbladder examinations (p=0.023) with trend toward significant improvement in long-axis gallbladder examinations (p=0.111). Final data analysis is pending.

QI03-D9   **Interventional Radiology Patient-centric Procedural Videos: A Quality Improvement Project Designed To Increase Patient Understanding**

Participants
Zak Boggs, MSc,MS, Columbus, Ohio (*Presenter*) Nothing to Disclose

PURPOSE

Interventional radiology (IR) procedures continue to evolve and regularly employ the latest device technologies and image-guidance for performance of minimally-invasive complex interventions, which are often abstract to patients and the lay public. This quality improvement project aimed to evaluate patient procedural understanding and then attempted to improve understanding and awareness through the creation of patient-centric educational videos.

METHODS

This is a single-center prospective study conducted at a tertiary academic medical center from September 2020 to May 2021. This study was considered exempt by our Institutional Review Board and was conducted with patient consent. Patients undergoing port placement, tunneled central line placement, port removal, chemoembolization, radioembolization, or ablation procedures were shown the corresponding procedural video prior to their intervention, and subsequently offered a voluntary survey in the peri-procedural area. The 13-question survey utilized a 5-point Likert scale to assess patient understanding of anatomy/body structures, risks, benefits, and alternatives, as well as basic demographics and overall understanding of the aforementioned IR procedures. The physician then addressed any questions or concerns with the patient face-to-face. Baseline data was established from 115 patient surveys administered prior to video creation, and data is presented in a run chart. After video creation and implementation, an additional 114 patients were surveyed.

RESULTS

Of the 114 patients surveyed post-video implementation, 64% (n=73) had a high school education, 18% (n=20) graduated from college, and 18% (n=21) had a graduate degree. All patients spoke English as a primary language. Sixty-six percent (n=75) of the patients had never undergone the same procedure before. Patient average understanding ratings were based on a 5-point Likert scale. Pre versus post video viewing average ratings are as follows: 3.5 versus 4.7 (p < 0.01) for understanding of the involved anatomy, 3.6 versus 4.7 (p < 0.01) for understanding of procedure risks, 4.0 versus 4.8 (p < 0.01) for understanding of procedure benefits, and 3.6 versus 4.8 (p < 0.01) for overall procedure understanding.

Sub-Events

QI03-A1 **Utilizing Patient Portal To Allow Self-scheduling Of Screening Mammograms To Maximize Utilization Of Available Capacity And Enhance Patient Experience**

Participants
Julie Limfueco, BSN, Lakewood, California (*Presenter*) Nothing to Disclose

PURPOSE

Utilizing our Epic Patient Portal to allow patients to self-schedule screening mammogram appointments, in order to provide a more efficient process. Our department originally piloted patient self-scheduling for ultrasound procedures beginning in November 2020. This project was highly successful, and a decision was made to implement self-scheduling for screening mammography. By using the patient portal, patients avoid phone calls to our busy call center and have increased visibility for appointment availability, resulting in increased patient satisfaction and a reduction of unfilled appointment slots on our breast imaging schedule.

METHODS

Working with our IT analysts, appointment templates were created and made available to patients in our Epic Patient Portal, MyChart. Appointments can be made via a "ticket scheduling" process where the patient receives a notification that an order has been placed for a screening mammogram and they are directed to schedule directly in the MyChart portal. Patients are also able to "direct schedule" annual screening mammograms based on due date, without the need for a physician order. Patients are presented with all available appointment times, for any applicable locations, to schedule at their convenience. Logic has been built into the process to validate authorization status and ensure that appointments are appropriate for locations provided. The screen shots below illustrate the process from the patient's perspective. We have built in specific questions that guide the process and determine if self-scheduling is appropriate for the visit. Patients with issues or conditions not appropriate for self-scheduled screening mammograms are directed to call our call center to complete the scheduling process. We have built-in logic that restricts availability by payor for our off-site clinics that have payor based restrictions.

RESULTS

We have seen high numbers of active participation for all areas currently using our self-scheduling process, with a corresponding increase in screening mammography volumes.

QI03-A3 **Direct Access And Skill Mix Can Reduce Telephone Interruptions And Imaging Wait Times: Improving Radiology Service Effectiveness, Safety And Sustainability**

Participants
Christopher Watura, FRCR,MBChB, London, United Kingdom (*Presenter*) Nothing to Disclose

PURPOSE

The most common telephone calls during radiology reporting have been shown to be those for requesting scans to be vetted. These types of calls are not always necessary in routine circumstances. Radiology backlogs due to the ever increasing demand for imaging and the subsequent anxious wait times endured by patients have been compounded by the COVID-19 pandemic. Recent 'Getting it Right the First Time' and Sir Mike Richard's reports emphasise that there has never been a more important time to streamline radiology workflow and maximise utilisation of existing resources, such as the digitised systems for requesting imaging tests and skill mix. Furthermore, telephone interruptions may be associated with a higher chance of an error in a report.We aimed to take characterisation of these telephone calls an important step further, by actually trialling concepts for reducing them and simultaneously observing the effect on imaging wait times.

METHODS

Prospective study conducted at a teaching hospital in two cycles, pre and post-interventions.In each cycle, radiology registrars were asked to record all incoming calls to the 'hot' phone over a 1 week period (10 reporting sessions) during in-hours (9am-5pm), using a pre-prepared spreadsheet.Average wait time between scan request and completion was calculated for the each cycle using data exported from PACs.Excel was used for statistical analysis.The interventions were conceptualised based on our results from the first cycle (below). The actions were twofold:1. Created new flow diagrams to allow radiographers to accept routine requests for plain CT head and CT KUB scans, in- and out-of-hours. Timeframes for performing the scans dependent on the clinical risk factors present and indications for when a radiologist should still be contacted to vet and protocol a scan were clearly stated.2. Sustained communication of the new pathways with all stakeholders, including radiologists, service leads and junior medical staff.To establish awareness of the new protocols, we communicated with stakeholders, including radiologists, service leads and junior medical staff, in a variety of settings.

RESULTS

Data collection forms were returned for 8 of the 10 reporting sessions pre- and post-intervention (80% response rate). Not all calls were recorded, due to the time constraints on reporting radiologists who also had to fulfill their other duties.Requests for scans to

be vetted were the most frequent reason for calls, comprising 71% (87/122) pre-intervention. 69% (60/87) of vetting was for CT. Of these, CT heads were most frequent (23%). CT KUBs were also common (10%).92% (112/122) of calls were from junior clinicians.After intervention, calls for vetting CT heads reduced by 30% and for vetting CT KUBs by 100%. The number of CT heads performed pre- and post-intervention was 123 and 117 respectively, and for CT KUBs this was 27 and 20.The mean average wait time between CT head request and scan completion pre- and post- intervention was 5.2 and 3.2 hours respectively, demonstrating a 40% reduction. Calculating change in wait time for CT KUB requests was of limited value, as some of these are scheduled as outpatient studies.Radiologists, radiographers and referrers reported a high level of satisfaction with the improved reporting environment and organisational efficiency.

QI03-A4   Clinical Correlation: Establishing A Diagnostic Radiology Patient Consultation Service

Participants
Shira Steinberger, MD, New York, New York (*Presenter*) Nothing to Disclose

PURPOSE

To increase radiologists' visibility and value by establishing a diagnostic radiology consultation program. To confirm patients' desire for radiologic consultations and assess the impact on smoking cessation, no show rates, patient anxiety, and health literacy.

METHODS

Through a partnership with the Mount Sinai Pulmonary fellows clinic, we established a diagnostic radiology consultation program. We installed a PACS within a consultation room and cardiothoracic radiology fellows and senior residents conducted one-on-one encounters to review chest CT's with patients. Pre and post imaging surveys assessed patient understanding of imaging results, anxiety levels, willingness to stop smoking, and the role of the radiologist. Measurable metrics including future appointment compliance and smoking cessation rates were tracked. Pre and post surveys were distributed to patients seen in pulmonary clinic who did not undergo an image review consultation as a control group. 84 patients enrolled in this ongoing study, 48 image review consultations and 36 controls.

RESULTS

26% of image review patients and 13% of controls were current smokers. 45% identified as Hispanic and 21% as African American. 44% of image review patients and 28% of controls did not know their CT scan results prior to their appointment. On post image review, 98% had a good understanding of their CT scan results. After radiologic consultation 77% had an increased desire to stop smoking, in comparison to 56% of controls. 67% of patients had decreased anxiety after reviewing their CT scan. Pre image review, 77% identified radiologists as physicians, increasing to 90% post image review. 95% wanted to meet with a radiologist again to review future imaging. 100% found meeting with a radiologist helpful. On 6 month follow up, 8% of image review patients quit smoking compared with 0% of controls.

QI03-A5   A Quality Improvement Program To Improve The Communication Of Clinically Important Findings On CT And MR Enterography

Participants
Ryan Bailey, MD, Jacksonville, Florida (*Presenter*) Nothing to Disclose

PURPOSE

Radiology reports have inherent variability, as they are read by different radiologists with differing levels of focus in inflammatory bowel disease. This variation may result in a report which is more difficult to interpret or overlooks salient findings. In the setting of inflammatory bowel disease, magnetic resonance (MRE) and computed tomography enterography (CTE) provide important information for clinical decision making. We sought to standardize enterography reports at our institution in a collaborative effort between radiology and gastroenterology. Our goal was to ensure that specific diagnostic criteria utilized to guide clinical management were consistently and clearly communicated to the referring clinician, thereby improving patient care.

METHODS

After identifying stakeholders within the radiology and gastroenterology departments, we created a scoring questionnaire which included both subjective and objective measures of report clarity, efficacy, and inclusion of pertinent findings. Subsequently, 50 consecutive patients who underwent CTE and 30 consecutive patients who underwent MRE from 2/1/2020-3/15/2020 were identified. The original reports were first reviewed by the stakeholder gastroenterologists on our team and scored with the questionnaire. Following analysis of our baseline data, we reviewed the available literature and collaboratively developed a structured reporting template. Two blinded experienced gastrointestinal radiologists re-interpreted these studies utilizing the new template. The new reports were divided and reviewed by the same three stakeholder gastroenterologists, and, when possible, the studies were reviewed by the ordering physician. The same questionnaire was used for evaluation of the new reports. Scores for both the old and new reports were recorded in a secure internal database.

RESULTS

At baseline, we found that 40 reports (50% of total) were missing findings deemed clinically important by the reviewing gastroenterologists. In addition, subjective measures of referring clinician satisfaction regarding report clarity and ability to extract pertinent findings varied widely with poor average scores of 7.6/10 and 7.1/10, respectively. Following implementation of the standardized reporting template, inclusion of all clinically pertinent data was achieved in 77 reports (96.3%). Subjective measures of referring clinician satisfaction also improved significantly, scoring 9.9/10 for both report clarity and ability to extract pertinent findings (p&lt0.01 for both). Most importantly, new information included in the standardized reports would have resulted in a change in clinical management for 20 patients (25% of total).

QI03-A6   Generation And Implementation Of Inter-Departmental Workflow Interventions Between Interventional Radiology And Medicine

Participants
Michael Jin, MD, Coram, New York (*Presenter*) Nothing to Disclose

PURPOSE

Communication failure accounts for the majority of unexpected adverse patient events. Interventional Radiology (IR) is responsible

for performing many types of procedures in the inpatient setting, therefore a streamlined workflow between IR and Medicine teams must exist to ensure both rapid and accurate communication. At our university hospital, there have been incidents where the internal medicine staff were unable to contact IR regarding procedure details, including time of procedure and complications that arose during procedures; this is indicative of communication breakdown between these two teams. Such inefficiency in correspondence can result in discharge delays, prolonged NPO times, and disruption to patient treatments, ultimately leading to patient frustration and creating the potential for increased patient morbidity. Intervention in communication and workflow patterns surrounding IR procedures has shown potential to decrease NPO times, and improve other areas by extension. We aim to enhance IR and Medicine workflow as a means to increase patient satisfaction, decrease NPO periods, and improve patient outcomes after IR interventions.The goal of this study is to improve communication and establish an efficient workflow between IR and Medicine departments. Our objectives are to identify failure modes and barriers to communication, devise interventions to solve these problems, revise the current workflow procedures, and later assess whether these interventions were effective at improving procedural timing and patient experiences.

METHODS

We employed Six Sigma DMAIC methodology to conduct QI and facilitate timely and accurate communications between Medicine and IR teams. This process entails defining, measuring, analyzing, improving, and controlling problems within a process. Pre-intervention, a 6-point questionnaire was given to medicine residents to assess perception of the timeliness of IR procedures and the impact of IR procedures on discharge times and duration of NPO status. Multidisciplinary meetings amongst IR, Medicine, and informatics teams were conducted to identify failure modes in the current workflow and appropriate strategies were implemented to address these existing obstacles.

RESULTS

Results of the preintervention survey (n = 29) reflected delays in IR procedure times after placement of orders, with 79% of participants responding that it took 2 or more days for the IR procedure to occur. Further, 55% responded that IR procedures play a role in delaying discharge in 25% of patients, with an additional 35% responding that IR procedures delayed discharges in 50-75% of patients. Of delayed discharges, 45% of participants answered discharge was delayed to next afternoon, and 31% answered a delays were of two or more days. The average NPO duration was 8-24 hours for each procedure ordered. Based on our intervention process map of the current workflow, 3 critical failure modes were identified: 1) communication breakdown regarding time and potential delay in procedure, 2) prolonged NPO duration for procedures, and 3) lack of post-procedure documentation. Pursuant to these results, we are in the process of implementing a bidirectional dashboard system within the EMR to address communication barriers with the aim of having procedural delays of an hour or more being updated by radiology nursing staff on the dashboard. Additionally, the IR post-operative policy was revised to mandate documentation entry within 24 hours of the procedure. Finally, a meeting is to be held between IR and Medicine teams to discuss these new interventions as well as provide general information and brief written guidelines of required NPO times of common IR procedures.

QI03-A7   Implementing QATrack+ QC Database For Report Generation And Data Analysis

Participants
Min Yang, MS, Oklahoma City, Oklahoma (*Presenter*) Nothing to Disclose

PURPOSE

QATrack+ is a free and open-source online form-based data-entry and database application that can be used to collect data from medical physics surveys and store the information in the cloud or on a dedicated server, in house. Current physics survey reports in many departments are saved as Excel and pdf files. Large amounts of time and effort are required to extract the information from years of Excel data to perform desired data analysis such as image quality and dose trends to improve patient care. Incorporating the available integrated scheduling system may reduce unintended missed surveys and the multiplatform (computer/tablet/smartphone) functionality will be useful providing access to and comparing to prior year's results. Native reports generated from QATrack+ may not be adequate to file as final reviewable/distributable medical physics survey reports (for diagnostic work); however, data can be extracted and Excel-type spreadsheets or pdf reports can be automatically generated using python scripting and packages.

METHODS

Implementation of a working server system is explored, by adding applicable tests for diagnostic annual and acceptance surveys. Useful data extraction is investigated utilizing the QATrack+ API (Application Programming Interface). QATrack+, Python coding and LibreOffice were combined together to automate the interface interrogation for the server and provide appropriate data constructs to produce professional level reporting and final documentation.

RESULTS

Investigation of the online system provides a customizable selection for testing requirements. Many individual tests can be re-used or modified for multiple modalities or survey types. Surveys are reviewed and approved by appropriate groups on the server/database, and the QATrack+ JSON API is used to access or export data. Python code was created to selectively extract data from the server and provide information in a usable format for report generation. The data was organized and placed in LibreOffice Calc utilizing an appropriate template (an Excel-type spreadsheet, with variable placeholders). The automatically generated spreadsheet survey report results in a final report nearly identical to current practice forms (Excel spreadsheets) and can be accessed using LibreOffice or Excel.

QI03-A8   Machine Learning Based On Multi-label Classification For Determination Of Urinary Stone In Vivo With Mixed Compositions

Participants
Xian Li, Guangzhou, China (*Presenter*) Nothing to Disclose

PURPOSE

To predict the composition of urinary stones by using parameters analysis of Revolution energy spectrum CT and machine learning based on multi-label classification modeling. The scan of Revolution energy spectrum CT was taken before operation, and the infrared spectroscopy analysis after operation was used as the gold standard.

METHODS

291 composition labels were retrospectively collected from 159 patients, which included 96 male and 63 female patients, aged 10-

291 composition labels were retrospectively collected from 159 patients, which included 96 male and 63 female patients, aged 16-87 years (median, 56 years). All patients performed preoperative energy spectrum CT scan (switching tube voltage: 80 kVp~140 kVp, tube current: 260 mA). Multiple single energy CT images (40 keV~140 keV) were produced, and the energy spectrum analysis was conducted on the output 70 keV single energy image in the AW 4.6 workstation. The stone composition prediction was formulated as a multi-label classification problem, which was modeled with the extracted ESA features as input and solved by the open source tool kitsscikit-multilearn and MEKA. Tenmulti-label classification methods (e.g., binary relevance methods, label powerset methods, pairwise and threshold methods, updateable methods) were tested, and the ten-fold cross-validation and the discriminative accuracies (ACC) were reported. These patients underwent removal surgery operation of urinary stone at the First Affiliated Hospital of Guangzhou Medical University. All the stone samples were sent for composition analysis by infrared spectroscopy techniques, and the results were used as the gold standard for stone composition. The composition labels included single or mixed compositions, including carbapatite (calcium phosphate, CP), calcium oxalate monohydrate (COM), calcium oxalate dehydrate (COD), uric acid (UA), and struvite (STR).

RESULTS

Multiple parameters were obtained, including the effective atomic number (Zeff), the mean CT values (40 keV~140 keV), and various based densities in material separation image (e.g., water, iodine, brushite, cysteine bone, fat). 733 measured data were analyzed, which had 308 ESA features totally. Four multi-label classification methods were found to demonstrate overall classification ACC>80%. The best overall classification ACC of 87.4% was achieved by the Label Combination (LC) method, followed by the Fourclass Pairwise (FW) method with ACC of 83.6%. For each composition, the LC method yield CP (87.4%), COM (90.2%), COD (85.8%), UA (96.6%0, and STR (95.1%) were observed. On the other hand, the FW method scored CP (87.4%), COM (89.8%), COD (82.5%), UA (96.5%), and STR (95.2%) were detected. Moreover, the RAKEL (CP 87.4%, COM 89.9%, COD 82.0%, UA 96.2%, and STR 95.0%) and MULAN method (CP 85.9%, COM 90.0%, COD 85.0%, UA 95.8%, and STR 95.0%) obtained the overall ACC of 83.5% and 82.9%, respectively. No statistical differences were found between the four methods. Prediction accuracies for the UA and SRT were higher than other methods.

QI03-A-HC1 Reference Implementation Of A Learning Healthcare System To Optimize Supplemental Breast Cancer Screening

Participants
Lisa R. Stempel, MD, Glencoe, Illinois (*Presenter*) Nothing to Disclose

PURPOSE

Each year 37 million American women are screened for breast cancer and yet the optimal use of supplemental screening for woman at higher risk of breast cancer remains unclear. A learning healthcare system (LHS) that draws knowledge from each patient's experiences is a potential strategy for evaluation and iterative refinement of risk-based breast cancer screening guidelines. A LHS consists of an iterative cycle of guideline modeling, guideline implementation, and data analyses to inform guideline refinement. In this program we create a reference implementation of a LHS for breast cancer supplemental screening.

METHODS

The LHS is implemented at the Rush University System for Health Breast Imaging Center in Chicago, IL. First, we developed local recommendations for risk-based supplemental screening based on national guidelines. Risk assessment is recommended for woman without a personal history of breast cancer (PHBC) ages 25-75. Supplemental automated whole breast ultrasound (ABUS) is recommended for woman with dense breasts and MRI for woman at high risk or for those with a PHBC that have a hereditary cancer gene mutation, dense breasts, or were diagnosed at age less than 50. In July 2020, we implemented a comprehensive program to prospectively assess breast cancer risk in all eligible patients presenting for a mammogram and decision support for risk-based supplemental screening recommendations. Structured clinical documentation at the point of care enables downstream data analytics to assess the distribution of the patient population, adherence to recommendations and the supplemental screening cancer detection rate.

RESULTS

From July 20, 2020 to April 20, 2021, 18815 patients presented for mammograms. Figure 1 summarizes the risk-based population distribution and eligibility for supplemental screening. 46% of patients were eligible for supplemental screening (12% MRI, 34% ABUS).

QDP-QI-1   Back To The Future: Improving Reading Of Screening Mammograms With A Batched Workflow Utilizing A Live Reading Room Transcriptionist

Awards
Quality Improvement Reports Award

Participants
Wahida Rahman, MD, Ann Arbor, Michigan (*Presenter*) Nothing to Disclose

PURPOSE

Screening mammograms contribute to a large workload in the breast imaging department. At our institution, an average of 500-600 offline screening mammograms are performed each week. Timely issuance of the final radiology report is important to provider and patient satisfaction. Staffing shortages and clinic holiday closures led to the accumulation of a backlog of unread screening mammograms with a peak report turnaround time of 198 hours. Additional off-hours staffing did not provide immediate relief to the backlog, thus requiring more robust and efficient workflows of interpreting screening mammograms.

METHODS

To create a more efficient, but less onerous and sustainable method of providing timely reads on screening mammograms, we increased the number of uninterrupted, batch reading screening mammogram shifts (S). In this shift, the radiologist was assigned on average 50 screening mammograms and was provided the assistance of a live reading room transcriptionist. The transcriptionist reviewed the electronic medical record including patient intake information and sent completed, draft reports for the radiologist's signature. Weekly department screening mammogram report turnaround times were obtained. Radiologist survey data were also collected to evaluate time for study interpretation in the new batch screening workflow to compare it to the traditional interrupted workflow. The total number of studies and time for interpretation was recorded for each shift. The radiologists also rated the level of fatigue and distraction during their shift using a 10-point survey scale, 10 representing high levels. To account for differences in interpretation of conventional 2D digital mammography and tomosynthesis studies, each DM study was awarded 1 point and each tomosynthesis study 2 points. There were 3 study groups - radiologist assigned to the uninterrupted batch screen reading with assistance of a live transcriptionist (S), interrupted reading with a trainee but no transcriptionist (T), and interrupted reading without a trainee or transcriptionist (N). Linear mixed effects regression was used to assess the relationship between independent transcriptionist and trainee usage, and the dependent variables, fatigue and distraction rating. Separate models were fit for the fatigue and distraction outcomes. Assignment type and points were included as covariates, and a random effect for rater was included to account for heterogeneity among raters.

RESULTS

Prior to the intervention, the mean report signing turnaround time ($\pm$ SD) was 83.3 $\pm$ 46.6 hours. Turnaround time decreased to 53.0 $\pm$ 34.7 hours after the intervention. The average number of S shifts ($\pm$ SD) increased from 2.2 $\pm$ 1.5 to 5.1 $\pm$ 1.1 after the intervention. Average number of weekly offline screening mammogram examinations ($\pm$ SD) before and after the intervention was 589.2 $\pm$ 116.7 and 523.8 $\pm$ 94.3. The average time ($\pm$ SD) to read each study point in the N, T, and S groups was 3.0 $\pm$ 0.7, 2.4 $\pm$ 0.8, and 2.9 $\pm$ 1.0 minutes, respectively. The distraction rating ($\pm$ SD) for N, T, and S groups was 6.3 $\pm$ 2.6, 4.8 $\pm$ 2.7, and 2.3 $\pm$ 1.7 and the fatigue rating ($\pm$ SD) was 5.5 $\pm$ 1.5, 4.2 $\pm$ 2.9, and 2.6 $\pm$ 1.3, respectively. Distraction and fatigue were significantly lower in the S group compared to the N group ($p < 0.00003$, $p < 0.0002$, respectively).

QDP-QI-12   Appropriate Imaging Of The Pregnant Patient: Bump In The Road

Participants
Preethi Raghu, MD, San Francisco, California (*Presenter*) Nothing to Disclose

PURPOSE

As a Level 1 trauma center, we have well-established protocols for imaging pregnant patients in the critical/trauma setting. However, guidelines for imaging pregnant patients in the non-trauma setting were non-standardized and varied by institution, which created confusion for ordering clinicians. They desired a timely imaging diagnosis without excessive need for urine or serum pregnancy testing, as well as clarity and consistency on how to inform patients of the potential risks to the fetus. Herein we detail our experience with a multidisciplinary quality improvement initiative to streamline the process of imaging pregnant patients outside of the trauma setting. After several incidents of inappropriate cross-sectional imaging of these patients noted by radiology, as well as reports of delayed throughput noted by the ER, we embarked on this multipronged process improvement effort.

METHODS

Although there are theoretical potential risks to the fetus with various imaging modalities of the abdomen and pelvis, this information is gleaned from a small number of retrospective reviews on the topic, as a randomized controlled trial would not be feasible in this clinical cohort. We performed an extensive review of the literature to understand and consolidate best available information to help guide our ordering colleagues. Then, we held several multidisciplinary focus sessions to brainstorm and implement

a new workflow regarding these issues. Our multidisciplinary team included various stakeholders:1. CT/MRI technologists, who were placed in the uncomfortable position of getting a verbal confirmation of pregnancy status in patients who had altered mental status or needed an interpreter, both of which exacerbated delays and errors.2. Radiologists, who had the responsibility of intervening on inappropriate imaging performed on these patients, but often these errors were only found retrospectively.3. ED physicians, who often noted delays in throughput due to institutional requirement for serum or urine pregnancy test in all premenopausal patients. They also wanted guidance on informed consent for imaging pregnant patients.4. Obstetricians, who operated using guidance from ACOG, and sometimes ordered these exams as consultants in the ER.5. Risk management, who provided insight on patient-facing forms such as the informational sheets and informed consent form, to ensure patient accessibility and fulfillment of medicolegal regulations. Using guidance and verbiage from ACR, ACOG, and various institutional guidelines, we crafted an informed consent form for use in specific cases as detailed below. Additionally, we created a graphic information sheet detailing radiation risk with simple terminology for our patients. These sheets are being translated into multiple languages and will be readily accessible at key locations within the emergency department.

RESULTS

The new proposed workflow for our institution below clarifies the aforementioned issues:1. Any female patient ages 12-52 years old requires just a verbal yes/no documentation of pregnancy status by the ordering provider prior to any imaging.2. If CT abdomen/pelvis or MRI of any body part is requested, a serum or urine pregnancy test must be on file given the potential risks to the fetus if patient is later found to be pregnant. For example, low-dose protocols, noncontrast exams, and shortened exam length can be considered if patient is known to be pregnant beforehand.3. If CT involving the abdomen or pelvis is requested despite positive pregnancy test, a signed informed consent is obtained by the ordering provider.4. For all exams using ionizing radiation in a pregnant patient, an information sheet is handed to the patient explaining potential risks and radiation dose in simple terms. In addition to incorporating this workflow into a clinical algorithm for ordering clinicians, we also modified the official institutional guidelines on imaging of

QDP-QI-13 The Image Of COVID-19 In A Public Radiology Service In The State Of Sao Paulo: An Overview

Participants
Mario Abizaid, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

PURPOSE

The Coronavirus pandemic (Sars-Cov2) is already considered humanity's worst health crisis in the modern age, with about 3.2 million deaths and 153 million cases in the world, causing irreparable social, human and financial impacts. Brazil appears on the list as the 3rd place in number of cases, with 14.8 million people infected, behind only India, with 19.9 million, and the 2nd place in number of deaths, with 408 thousand deaths, behind only the USA, with an estimated human loss of about 577 thousand lives, until the date this was written. The estimate of infected and deaths directly competes with the impact on health systems, with the exposure of vulnerable populations and groups, the economic support of the financial system and the population, the mental health of people in times of lockdown and the fear of illness and death risk. In this scenario, it is speculated that there was a massive reduction of the world GDP per capita in about 4.2% in the year of 2020, with regional variations, being the worst falls in China (34.7%) and in the USA (4, 9%). Following the global trend, Brazilian GDP decreased by about 4.1% in 2020, with progressive reductions in the year 2021, which represents a loss of around 6 billion dollars in the year 2020 alone. In contrast to the negative figures, public health expenditures increased considerably in this period, and, added to the abrupt drop in tax collection estimated at about 6.9%, totaling an estimated loss of approximately $ 106 billion in public money, a crisis took place in an attempt to balance the fall in resources with the increase in spending demand. Thus, some health sectors such as radiology had their budgets drastically reduced, in an attempt to direct spending to sectors considered to be of greatest urgency (Intensive care beds, respirators, emergency rooms, supplies and drugs), causing a fall without precedents in the number of imaging tests performed. The work aims to illustrate how the pandemic impacted the performance of exams in one of the largest public services in the state of São Paulo, the Diagnostic Imaging Service II (SEDI II), and to measure the damage and the consequences of this impact.

METHODS

The study is based on comparative analysis data from a teleradiology service that brings together five medium and high complexity hospitals in the state of São Paulo, Brazil. From the careful analysis of these data, graphs and tables were developed in order to demonstrate in a pictorial way the impact of the SARS-COv-2 pandemic on the public health system. The service keeps tracks of all COVID cases by unit, age group, sex and behavior over time through an online panel available to all staff (data base exemple).

RESULTS

A data survey was was filled with all the exams that took place in the State Service of Diagnostic Imaging II (SEDI II), which is responsible for 6 large health establishments in the state of São Paulo. With the analysis of the data it was possible to observe a significant drop in the absolute number of exams, in most modalities, except in the computed tomography (CT) modality, which followed a behavior that was contrary to the others. In 2019, SEDI II performed 390,959 exams (chart A), including Computed Tomography, Mammography, conventional and contrasted X-ray, Magnetic Resonance, Bone Densitometry and Ultrasonography. This number dropped to 363,133 (chart B) in 2020, representing a 10% drop in the total number of tests, resulting in a drop never seen before in the service, and which could have been worse had it not been for the increase in the number of requested CT scans. Among the CT scans performed in 2019, 14,743 scans were of the Chest modality, with a huge increase to 35,948 in the year 2020 (chart C), which represents an increase of about 143%, which was caused by the increased incidence of Coronavirus infection that year. Regarding the total number of CT scans performed, 140,745 were made in 2019, and 155,094 in 2020, resulting in a 10% increase in the absolute value, which can be att

QDP-QI-14 Technetium Pyrophosphate Scintigraphy: Changes To Our Practice

Participants
John Archer, MD, Boston, Massachusetts (*Presenter*) Nothing to Disclose

PURPOSE

We aimed to implement a standardized 99mTechnetium pyrophosphate (99mTc-PYP) imaging protocol for cardiac transthyretin (ATTR) amyloidosis using 3-hour planar and SPECT/CT in accordance with a multi-society group updated protocol recommendations in response to false positives due to blood pool at 1 hour imaging (addendum pending publishing), and reduce reporting errors describing technique by updating our system dictation templates.

METHODS

We used a plan-do-study-act model to implement the new imaging protocol at two academic hospitals and update our system dictation templates to reduce errors in reporting technique. Informational presentation on these changes was distributed to nuclear medicine technologists, residents, fellows, and attending physicians in July 2020. Adherence to the new protocol and frequency of report technique errors were evaluated.

RESULTS

From January 1, 2019 to June 30, 2020, a total of 73 exams were performed at two academic hospitals, with protocols determined by the 2016 ASNC practice parameters. During this time, 97.3% of patients received SPECT/CT imaging, with 43.1% imaged at 1 hour, and 54.2% imaged at 3 hours. Overall, 44.4% of patients were imaged at 1 hour only. The most common interpretation was "Strongly Suggestive" (51.4%), followed by "Not Suggestive" (33.3%), and "Equivocal" (15.3%). Technique reporting errors were common, occurring in 75.3% of all reports. The failure to modify the system template to document the correct technique was the most common source of technique reporting errors. Following implementation of the new imaging protocol, all patients received planar and SPECT/CT imaging at 3 hours. A decrease in "Strongly Suggestive" interpretations (29.2%) and an increased in "Not Suggestive" interpretations (58.3%) was observed. A decrease in technique reporting errors was observed, seen in 8.3% of reports following the implementation of the updated system dictation templates.

QDP-QI-15 Improving The Tracking And Management Of Actionable And Incidental Imaging Findings

Participants
Rekha Mody, MD, Cleveland, Ohio (*Presenter*) Nothing to Disclose

PURPOSE

Demonstrate the increase in activities taken towards resolution of actionable imaging findings secondary to implementation of standardized imaging reporting templates, Epic alert tags and best practice alerts (BPAs), closed loop Result Tracking functionality and integration with existing Epic Healthy Planet primary care dashboard for enhanced care coordination creating a high reliability safety framework.

METHODS

We implemented a structured 4-click standardized imaging report template for radiologists to be included after the impression field with multiple key elements: Acuity rating-actionable or incidental acuity ratings to differentiate between urgent and critical findings. Imaging finding with an associated 4 character routing code and schema to classify findings by organ-system. Recommended imaging exam-with the recommendation provided matching 1:1 with the exact Epic order to ensure the recommended imaging exam is actually performed. A suggested time range for follow-up. We then developed specific interfaces for each recommendation and time frame to allow for the result to be tracked through radiant-like functionality within Epic and drive downstream workflows. Each interface begins a hard-wired information cascade within Epic with enhanced Epic notification functions including special icon alerts within chart review and provider in-basket and BPA/storyboard alerts with embedded imaging order links, aiding providers to more easily order the recommended imaging exam. Also, extractions into Epic after visit and discharge summary reports and MyChart allow providers seeing patients for emergent problems to be alerted of actionable results on discharge and for patients to be reminded to follow-up. We also created a safety framework supported by a workforce of licensed independent providers (LIPs) to help manage the actionable imaging findings in a coordinated fashion. Using the existing Epic Healthy Planet dashboard structure, we integrated results tracking functionality into the dashboard of patients with actionable findings and created a time-based criteria for follow-up easily visualized by color coding columns to create a coordinated system of divided and centralized responsibility. If the provider who ordered the study with an actionable result does not take action, primary care providers can resolve recommendations for patients on their care team and subspecialty providers can provide faster care leading to increased access and decreased time to treatment. As a final layer in the safety framework, a group of primary care providers monitors the global list via specified this time based metric to ensure that patients with actionable results do not slip through the cracks. This integrated solution follows the patient through completion of the recommended imaging test and also cohesively approaches the management of actionable results and the workflows that might need to occur after imaging findings are identified as important and in need of possible management beyond follow up imaging such as a biopsy or subspecialty referral.

RESULTS

The imaging institute began using a standardized reporting template for lung nodules meeting Fleischner criteria at the end of 2018. Over a nearly two year period, from that time to the implementation of the new reporting template for all actionable findings, approximately 20,902 lung or other abnormalities were flagged. However, at this time there was no process in place to track and monitor whether appropriate follow-up of these potential actionable findings were performed and there was no understanding of the distribution of findings by organ system. A retrospective analysis of a small subset of patients with key words search text string including versions of "recommended" demonstrated less than 20% of recommended follow-up imaging was actually performed in the time period prior to the structured templates for reporting actionable or incidental findings. Since the implementation of the new radiology structured reporting, approx

QDP-QI-16 Evaluating The Readability Of Online Educational Materials Targeted To Radiology Patients

Participants
Nancy Phu, BS, San Jose, California (*Presenter*) Nothing to Disclose

PURPOSE

The purpose of this study was to evaluate the readability of online radiological information accessible to patients from recognized educational resource websites, academic institutions, and large private practice groups. In a world moving towards patient-centered and patient-directed healthcare, online access to medical records and exam reports has allowed patients to play a more active role in governing their health. This is particularly relevant in radiology where diagnoses are most often communicated through a written report rather than direct interaction. One barrier to this is the limited health literacy in the general population. The average reading grade level for an American is at 7-8th grade, whereas studies in 2014 and 2019 showed popular patient-centered radiology information to be written at the 10th-14th grade level. If common patient resources/reports can be matched to the comprehension level of the patient, better patient autonomy and outcomes can be achieved.

METHODS

Three websites from each source of information provider (institutional resource, academic health institution, and private practice group) were selected for analysis. Radiologyinfo.org, Choosingwisely.org, and Imagegently.org are three common/popular

informational websites, created and vetted by the American College of Radiology (ACR) and Radiological Society of North America (RSNA). The top three academic institutions, Stanford University, University of Pennsylvania, and Washington University at St. Louis were selected based on the extent of their research grant funding, from the published 2017 rankings released by the Blue Ridge Institute for Medical Research. The largest private practice groups, Radiology Associates of North Texas, Radia, and Advanced Radiology Services, were listed on Radiology Business. For each information provider, we sampled the text found on their patient information landing page with the Readability Test Tool, Test by Direct Input feature from Webfx.com to measure their readability metrics. We compared readability scores (Flesch-Kincaid reading ease, Flesch-Kincaid grade level, and automated readability index) and text statistics of the landing page content on RadiologyInfo.org with similar pages from recognized health institutions and private practice groups. Texts originating from titles, subtitles, and hyperlinks were excluded from the study.

RESULTS

The average Flesch-Kincaid grade level of each category was found to be institutional website: 15th, academic institution: 17th, and private practice group: 14th, with Stanford's content being regarded with the highest grade level (20th) and ImageGently's content the lowest grade level (11th). The averages of the Flesch-Kincaid reading ease were institutional website: 22.5, academic institution: 15, and private practice group: 28.3, with Stanford having the lowest reading ease (3.2) and RANT having the highest (40.2).Each webpage had a variable amount of text content, with Radia providing the most information on each imaging modality and RadiologyInfo providing the least text on their patient information landing page. The institutional websites had an average of 159 words, of which 29% words were considered complex. There was an average of about 28 words in each sentence. Academic institutions had an average of 301 words, of which 29.82% were considered complex words. There was an average of 24 words in a sentence. Private practice groups had an average of 458 words, of which 23.03% were considered complex words. There was an average of about 21 words in a sentence.

QDP-QI-17   Automated Radiology Report Impression Generation Through Natural Language Processing (NLP) Model.

Participants
Abhi Jain, DO, Philadelphia, Pennsylvania (*Presenter*) Nothing to Disclose

PURPOSE

To demonstrate non-inferiority of customized radiology report impressions generated by a natural language processing (NLP) algorithm.

METHODS

A retrospective random selection of 120 radiology reports of computed tomography (CT) scans of the chest, abdomen, and/or pelvis performed at our institution from 2015-2020 were processed through an NLP algorithm (Rad AI, Berkeley, CA). The baseline NLP algorithm was initially trained on approximately 50 million radiology reports. The algorithm was subsequently fine-tuned to the style of individual radiologists at our institution by analyzing their historical reports. Thus, using the findings section of the report, the NLP algorithm attempts to generate a radiology report impression that is clinically relevant and accurate while also adapted to the style of each individual radiologist. The only difference between the radiologist-generated and NLP-generated reports was the impressions.Four attending radiologists and three first-year radiology residents were presented either all or a random subset of the 120 radiology reports for grading. Reports that were dictated or finalized by any of the reviewers were excluded. The radiologist-generated and NLP-generated reports were presented at the same time, side-by-side in a random fashion with the reviewer blinded to the source of the report. Each impression was graded on a scale of 1-5. Grade 1 included impressions that were "completely irrelevant or gibberish". Grade 2 included impressions that were "relevant, but not usable, either due to accuracy or wording". Grade 3 included impressions that were "usable as is but are worded weirdly or needs something changed". Grade 4 included impressions that were "really good, but there are ways it could be better". Grade 5 included impressions that were "great and likely cannot be improved further". The reviewer also indicated whether they preferred one impression over the other or if there was no preference. Impressions with grades 3-5 were deemed usable in a report and impressions with grades 1-2 were unusable for reports. A z-test was used for statistical analysis.

RESULTS

A total of 590 evaluations were assessed from 120 reports. The average grade for the radiologist-generated impressions (baseline) was 3.95 (SD 0.87) and the average grade for the NLP-generated impressions (experiment) was 3.90 (SD 0.83) with p= 0.197. The unusable rate, impressions with grades 1-2, was 7.63% for the NLP-generated impressions and 7.46% for the radiologist-generated impressions. Amongst the usable reports, those with grades 3-5, there was a 36% preference for radiologist-generated impressions, a 32% preference for NLP-generated impressions, and a 32% for no preference. For usable reports with the same grade, there was a 13% preference for the radiologist-generated impression, a 9% preference for the NLP-generated impression, and 78% for no preference.

QDP-QI-18   Combined Flipped And Traditional Classroom Learning Experience For Gi Radiology Education

Participants
Faryal Shareef, MD, Phoenix, Arizona (*Presenter*) Nothing to Disclose

PURPOSE

Flipped classroom learning is an approach to education in which students are assigned didactic material to be learned independently, followed by classroom time which is dedicated to the application and critical thinking of the material learned. We combined flipped classroom with traditional lectures in GI radiology education and studied resident's feedback for a month-long GI curriculum during the COVID 19 pandemic. We hypothesized that this method of teaching would combine both resident's internal motivation and ability to self-direct their learning with reinforcement of the learning material in class by case-based exercises, overall leading to higher retention of material presented.

METHODS

22 radiology residents participated in a month of lectures covering GI topics with both flipped and traditional lecture styles. The flipped model consisted of independent learning through the assignment of GI Videos from the 2020 Society of Abdominal Radiology (SAR). This was followed by online faculty run GI conferences with review of material learned independently as well as information assimilation via peer problem solving through cases. Residents subsequently completed surveys about their learning experience. A semi-anonymized evaluation (registration of PGY level only) using the Likert scale was used. The survey included questions in regards to forms of learning, satisfaction, and retention of material.

RESULTS

22 residents participated in the study with 31.8% PGY2, 9.1% PGY3, 22.7% PGY4, and 36.4% PGY5 participation. In regards to learning style, all 22 residents selected visual learner (100%) and 54.5% of residents selected solitary learning style. 63.6% residents rated the independent learning materials as excellent and 36.4% as good or adequate. No resident rated the content as poor. Overall residents felt like completing the assigned homework was convenient with more than half (68.2%) rating convivence as good or excellent and 31.8% rating it as poor. Residents overall reported feeling little pressure to complete the assignments, with 59.1% of residents reporting minimal to no pressure and only 4.5% reporting very high pressure. The percentage of subjective material retention overall was 62%, with PGY2's reporting 55% subjective retention and PGY 5's reporting 68%. 100% of PGY2 learned new material from the assigned homework whereas 25% of the PGY 5's did not feel they learned anything new. Overall 86% of residents recommended flipped classroom learning, including 100% of PGY2's.

QDP-QI-19   A Single-Centre Audit Of The ACR BI-RADS 3 Assessment Category Utilization

Participants
Jessica Common, MD, Hamilton, Ontario (*Presenter*) Nothing to Disclose

PURPOSE

To evaluate 24-month outcomes of breast lesions assessed at our centre as probably benign (Breast Imaging Reporting and Data System [BI-RADS] category 3) with an expected malignancy rate of <2%.

METHODS

All female patients with a mammographic and/or ultrasound finding assessed as BI-RADS 3 at our institution between January 1-December 31, 2017 were included. Sensitivity and cancer yield were calculated at 24 months.

RESULTS

Among 517 women (median age, 52 years; range, 13-89 years) with a BI-RADS 3 assessment, 349 completed 24 months of follow-up (68%). 168 women were lost to follow-up (32%). A total of 30 lesions were biopsied at or before 24 months, and 6 were classified as malignant (cancer yield, 6 of 349 women [1.7%]; positive biopsy rate, 6 of 30 women [20.0%]). No lesions downgraded to BI-RADS 1 or 2 were classified as malignant at 24 months (false negative, 0; sensitivity, 100%).

QDP-QI-2   Implementation Of Comprehensive Unit-based Safety Program For The Prevention Of Catheter Associated Bloodstream Infections

Awards
Identified for RadioGraphics
Quality Improvement Reports Award

Participants
Ravi Chanthriga Eturajulu, BSC,MBA, Kuala Lumpur, Malaysia (*Presenter*) Nothing to Disclose

PURPOSE

The growing use of peripherally inserted central catheters (PICC) has led to the recognition of the risk of central line-associated bloodstream infections (CLABSIs). Comprehensive Unit-Based Safety Programs (CUSP) are purported strategies for the reduction of CLABSIs. CUSP can improve teamwork and safety culture and help clinical teams learn from mistakes through the integration of safety practices into daily work. This study, therefore, aims to evaluate the implementation of CUSP for the reduction of PICC-associated bloodstream infections (BSI).

METHODS

CUSP was implemented with team-based approach at a medical imaging department of a teaching hospital in collaboration with staff members from infection control department. At the organizational level, a clinical quality assurance (CQA) committee was formed and goals of reducing hospital acquired infections (HAI) announced. At the unit level, the CUSP model was applied using an implementation science framework. Infrastructure to support quality improvement efforts was initiated by creating a coordinating team and engaging clinical department staff, which included radiologists, radiographers, medical doctors, and nurses. Performance data was transparently shared during CQA-HAI meetings. The duration of the study was 18 months, which included the pre intervention (from October 2019 to June 2020) and post intervention (from July 2020 to March 2021) phases. During this duration, all PICC insertion requests from a surgical ward were included in this study. During the post intervention phase, all PICC insertions conducted at the medical imaging department were evaluated to determine infection control practices and BSI events. A series of interventions was implemented with changes in the workflow including patient education (pre and post procedure) using a PICC patient information leaflet, staff training and awareness of CUSP model, implementation of chlorhexidine bath prior to PICC procedure, chlorhexidine skin antisepsis, hand hygiene and maximal sterile barrier precautions. In addition, a silver alginate coated dressing together with a PICC stabilization device was used to standardize dressing as routine care. Safety rounds was established 24 hours and 48 hours post PICC procedure by the medical imaging team comprised of medical doctor, radiographer, and nurse to check on the PICC line. A monitoring checklist comprised of signs of complications, local anomaly, presence of general signs of fever or painful infusion, general cleanliness, and patient awareness of line care was observed and documented into the checklist. Process evaluation was carried out by recording the total number of safety rounds, attendance, problems identified, and interventions administered. Progress evaluation was done by the CUSP team and CLABSI rates measured based on the number of PICC-associated BSI per 1,000 central line days preceding CUSP implementation. A central line care bundle compliance checklist to document daily monitoring was implemented at the surgical ward level. The infection control practitioners monitored the events of PICC-associated BSI rates and the compliance to the care bundle. As part of monitoring progress, the multidisciplinary CUSP team met regularly to review the PICC-associated BSI events and discussed issues with implementation of central line bundle and compliance to the intervention elements. Any new scientific evidence or research relevant to the project was disseminated amongst the team members. Corrective actions were continued until desirable results were achieved.

RESULTS

102 PICC lines were inserted during the pre-intervention (n=34) and post intervention (n=68) phase of this study. Following CUSP intervention, PICC-associated BSI rates had reduced from 3.4 per 1,000 central line days pre-intervention to 2.7 per 1,000 central line days post-intervention. Correspondingly, BSI rate had reduced from 8.8% to 5.9%.

QDP-QI-20   Re-envisioning On-call Radiology Resident Workflows: Impact On Residents' Experiences

Participants
Shara Kim, MD, Hamilton, Ontario (*Presenter*) Nothing to Disclose

PURPOSE

At many teaching hospitals, radiology residents are responsible for providing preliminary interpretations on overnight cases which are actionable by referring clinicians. This independent experience allows residents to work on important skills such time management, triaging, protocolling, and communication and has been identified as a valuable learning experience. At our institution, there are total of 26 radiology residents responsible for on-call coverage of 4 teaching hospitals, 1 community hospital, and 2 urgent care centers which include pediatric, trauma and stroke subspecialty care. A resident survey within our program demonstrated a desire for more detailed and personalized feedback during these independent on-call periods. Unfortunately, providing personalized feedback to on-call residents is difficult for many reasons including a high volume of cases, need to maintain reasonable turn-around times, spatial separation from attending radiologists, and differences in scheduled work hours. However, providing timely and relevant feedback is a critical component of medical education and is a core competency in radiology residencies. Prior studies have shown that automated tools such as report change comparison can help to facilitate meaningful feedback, motivate residents to compare reports more frequently, and increase satisfaction. Our aim was to minimize barriers to providing effective feedback and improve overall learning experience for on-call residents.

METHODS

Graduated changes were made to the on-call workflow using the A3 thinking process, which is a structured problem-solving method focused on continuous improvement. Root cause analysis was performed using a Fishbone diagram (Figure 1) to identify factors contributing to decreased resident satisfaction on the quality of on-call report feedback. Interventions were developed to target the most readily modifiable root causes, which included: workflow reorganization to match the daytime workflow, use of structured report templates, and implementation of an automated report comparison function. Anonymous online surveys were conducted pre- and post-implementation to evaluate resident satisfaction. The pre-implementation survey also assessed resident's opinions on the need for change and gathered input of what changes the residents felt would be beneficial to improve learning experience. Four question types were used, including multiple choice questions, multi-answer questions allowing multiple responses, five-point Likert scale questions and free-text responses. Results were analyzed quantitatively using percentages and qualitatively for emerging themes.

RESULTS

22 out of 25 and 15 out of 21 residents during different academic years responded to the pre-implementation and 7-weeks post-implementation surveys, respectively. There was strong support from the residents to redevelop the on-call reporting workflow to improve feedback on the pre-implementation survey. 82 percent strongly agreed that receiving feedback on on-call reports was an important part of their development and learning as a radiology trainee. 91 percent agreed that following up on the final reports to review any discrepancies and misses was a form of receiving feedback. Residents agreed or strongly agreed that they would like more detailed feedback on follow up recommendations (77 percent) and report content (82 percent). Recurring themes for barriers that made follow up of on-call reports difficult included poor home accessibility and lack of an easily accessible list of all on-call preliminary reports. Some of the suggestions to improve the process of following up on-call reports included use of more structured report templates and implementation of a graded disagreement system. The post-implementation survey results were overall positive. 87 percent agreed or strongly agreed that the changes were beneficial to overall call experience and learning. Residents also either agreed or strongly agreed that the changes provided more detailed feedback on follow up recommendations (60 percent), report syntax (67 percent) and report content (60 percent). 55 percent felt they received adequate on-call feedback post-implementation compared to 23 percent pre-implementation. 73 percent agreed or strongly agreed that the report comparison function was beneficial. 40 percent agreed or strongly agreed that the use of structured templates was helpful to compare reports while 40 percent were neutral to this change. Post-implementation respondents identified technical barriers as the main ongoing inconvenience to case follow-up.

QDP-QI-3   A CT Quality Control Audit Program Based On Automated Analysis And Alerts

Participants
Emi Eastman, BA, Los Angeles, California (*Presenter*) Nothing to Disclose

PURPOSE

A continuous quality control (QC) program is an essential part of computed tomography (CT) quality assurance to ensure patient safety and consistent clinical performance. The American College of Radiology (ACR) requires that the continuous QC program be monitored by a Qualified Medical Physicist (QMP). In a clinical setting with multiple sites and scanners, this monitoring activity often entails a constant, detailed, and laborious review of records by a medical physicist. The purpose of this study was to minimize the amount of human review time by developing a self-regulating program to monitor CT QC results that can detect and report both missing and out-of-tolerance results.

METHODS

To transition from physical to digital records, we created a set of electronic forms using Microsoft Excel for technologists to use to record the QC results. The forms were stored on a cloud drive that both technologists and physicists have access to. The forms incorporate limits specified by both the vendors and the ACR for each of the QC tests. The daily test record includes CT number, noise, the presence of artifacts, and uniformity. The weekly test includes SMPTE pattern check. The monthly test includes visual inspections of the console and gantry, laser alignment, and vendor-recommended quantitative tests such as spatial resolution, contrast scale, slice thickness, and low contrast resolution. These digital forms are reviewed automatically by a Python-based program at a user-defined frequency. Our institution used the program daily to search the forms for out of tolerance results—either a warning or failure depending on the specified upper and lower limits— and weekly to identify missing entries. When an out-of-tolerance result is detected, the program sends an email alert to a group of defined users. The program also maintains a record of all out-of-tolerance results detected throughout the month in a separate file. The Pandas library was used for all data manipulation, while the Pywin32 library was used to create copies of the original files for our records and send out email alerts. The program automatically runs at our defined frequency using Windows Task Scheduler on a desktop computer. The accuracy of the program was evaluated for 16 weeks, and the results were compared to human performance of the same task. In addition, the total number of missing records were compared before and after the implementation of the automated QC program to evaluate the behavior change of the technologists performing the QC.

RESULTS

The results of a manual review of the QC records agreed with the results reported in the email alerts with the accuracy of 100%. For our enterprise health system with 16 CT scanners, implementing the automated program saves 60 minutes of a medical physicist's time per week, or 50 hours per year. In addition, the program detected missing entries that the human review did not capture. After the first two weeks of implementation, the number of missing QC results detected each week decreased from 12 and 14 in the first and second week, respectively, to a median of 2 each week for the following 14 weeks. The continuous and detailed monitoring by the program in combination with the routine, weekly follow-up by the physicists led to more timely QC entries by the technologists and an overall decline in missing QC records.

QDP-QI-4   An Automated CT Protocol Reformatting Program For Protocol Documentation And Review

Participants
Emi Eastman, BA, Los Angeles, California (*Presenter*) Nothing to Disclose

PURPOSE

The American College of Radiology (ACR) and the Joint Commission (TJC) require the ongoing review and management of computed tomography (CT) protocols by a team of radiologists, physicists, and technologists. Manually reviewing a single protocol across multiple scanners is a laborious task and is aggravated by the large amount of protocols on each CT scanner. For institutions with multiple CT scanners from different vendors, acquiring protocols and comparing parameters is complicated by vendor-specific naming conventions, variable protocol templates, and immutable documents. The purpose of this study was to develop a software solution that automatically reformats the protocol files exported from CT scanner consoles into a consolidated, vendor-independent format to facilitate and expedite the protocol review process.

METHODS

Some institutions have opted to manually create a protocol book containing all of the acquisition and reconstruction parameters. This would be a tremendous task for the more than 1000 protocols across 16 CT scanners at our hospital. We proposed taking advantage of the exported protocol files (in either CSV or XML formats) to create a digital protocol book that is updated regularly. Since these files are not reader- nor print-friendly, a Python script-based program was created to identify and store values for the following parameters: tube potential (kV), tube current (mA), automatic exposure control reference, pitch, minimum and maximum tube current (if applicable), tube rotation time (sec), collimation, computed tomography dose index (CTDI), CTDI notification value (if applicable), dose-length product (DLP), slice thickness, slice interval, displayed field of view (DFOV), reconstruction kernel, and iterative reconstruction algorithm setting. The program was created for and tested on protocol export files from multiple Siemens, GE, Canon (formerly Toshiba), and Philips scanners. Each value was extracted from the exported protocol files, and calculations were automatically performed when needed to account for differences in reported parameters between vendors (e.g. Philips reports mAs, while GE reports mA). An additional Python program was written to identify changes between two sets of protocols from the same scanner exported at different points in time. The program highlights any changes in parameters for each protocol, identifies protocols that have been renamed, identifies new protocols, and identifies the deleted protocols. Both programs primarily use the Pandas library for data manipulation and the xlsxwriter library to apply formatting to the resulting Excel worksheets.

RESULTS

The consistent, vendor-neutral format accelerates the identification of relevant protocol parameters, speeding up protocol documentation and expediting the review process. By maintaining an organized set of protocols with information directly from the scanners, we reduce the risk of human entry errors present when manually entering values into a protocol book. The additional protocol comparison program automatically identifies changes in protocols between two points in time, allowing the protocol management team to quickly review the changes for accuracy.

QDP-QI-5   One Stop Shop: Comprehensive Quality Improvement Screenings For Patients Eligible For Low-dose Lung CT And Colonoscopy In A Mammography Setting

Participants
Leah Marcantel, RN,BSN, Lake Charles, Louisiana (*Presenter*) Nothing to Disclose

PURPOSE

Over 2020 and 2021, many health systems across the country have identified increasing lung cancer and colon cancer screenings as a system quality initiative. Christus Ochsner is no exception. Most systems however, put this initiative primarily in the primary care setting. While that is effective, primary care can get very busy and can have variations in workflow across different clinics. This study looks at if patients are being missed for low-dose lung CT and standard of care colon screenings and whether or not we can improve patient capture and uptake to those programs by screening in the mammography setting due to its high patient volume.

METHODS

Patients coming in for a screening mammogram are given a simple questionnaire to complete. They are then flagged if they meet national guideline criteria for low-dose lung CT and colon screenings. A nurse navigator then reaches out to these patients to get them scheduled for the appropriate services.

RESULTS

Over a 7-week period, 1,519 patients were screened with our questionnaire while getting a screening mammogram. There was no negative feedback from the patients about the length or complexity of the survey and all completed the questionnaire without assistance. 88 patients (5.8%) met criteria for low-dose lung CT and 237 patients (15.6%) were out of date with their standard of care colon screenings. Of the patients that were contacted for low-dose lung CT, 50% were already being followed through their primary care provider but 50% were new patients and all were interested in getting the low-dose lung CT. Of the patients that were contacted for colon screenings, 53% were already being followed through their primary care provider but 47% were new patients. Of the newly identified patient group, 30% opted for a FIT test while the remaining 70% opted to schedule a colonoscopy.

COVID-19 Inspired Move To Transperineal Ultrasound-guided Prostate Biopsy Eliminates The Risk Of Post-procedural Sepsis.

Participants
Jack Power, MRCPI, DUBLIN, Ireland (*Presenter*) Nothing to Disclose

PURPOSE

Sepsis related to transrectal ultrasound-guided (TRUS) biopsy is increasing worldwide because of the increasing prevalence of multi drug resistant bacteria. Transperineal ultrasound-guided prostate (TP) biopsy has been shown to reduce the risk of sepsis but, traditionally, has required patients to undergo a general anaesthetic which entails its own risk, as well as using valuable theatre time. More recently, an approach under local anaesthetic, in an outpatient setting, has been described. The COVID-19 global pandemic forced a temporary suspension of many elective services at our institution including TRUS. Motivated by a desire to conserve resources and avoid hospital admissions for TRUS-related complications, this opportunity was used to introduce outpatient TP biopsy under local anaesthetic to patients with a high clinical suspicion of prostate cancer. As our services reopened we transitioned completely to TP for all prostate biopsies.This presentation compares post-procedural sepsis rates of outpatient transperineal prostate (TP) biopsy, with our previous years' experience of transrectal ultrasound-guided prostate (TRUS) biopsy.

METHODS

Audit approval was received through the hospital ethics committee. Four hundred ninety patients who underwent TP biopsy from April 2020 to April 2021, across two sites, were included in the audit. Patients' mean age was 62, with a median PSA of 6. Over 90% of patients had a multi-parametric prostate MRI prior to biopsy. Patients were referred from either urology clinics or a rapid access prostate cancer service. Standardised procedure involved taking 12 18-gauge samples, 5 from the peripheral gland on either side and 1 from the transitional zone on either side. If a target was identified on pre-procedure MRI, additional samples were taken. All patients were followed up the day after their procedure with a phone call and were then reviewed with biopsy results in clinic 2 weeks post procedure. Complications, including post-procedural sepsis, urinary tract infection (UTI), urinary retention, significant rectal or urinary haemorrhage were recorded, as was length of hospital stay, if admitted. Definitions for post procedural infection and sepsis were defined prior to commencement.These results were compared with 590 who underwent TRUS biopsy in the year 2019.

RESULTS

There were 0/490 cases of postprocedural sepsis in the TP group. There were 2/490 (0.4%) cases of urinary retention, with both patients presenting to the ED and being then managed in the community. In the TRUS group 23/590 (3.9%) were diagnosed with sepsis (8 blood culture confirmed, 15 clinically diagnosed). 9/590 (1.5%) were diagnosed with UTIs requiring oral antibiotics, 1/590 (0.17%) went into acute urinary retention and 1/590 (0.17%) had a severe rectal bleed requiring hospitalisation.Direct comparison of post-procedural sepsis rates between TRUS biopsy (23/590) and TP biopsy (0/490) using a Chi-Square contingency table found the results to be statistically significant (Chi squared: 17.692 with 1 degrees of freedom; P<0.0001).

QDP-QI-7 **Building A High Reliability Safety Net For Incidental Finding Follow Up: Fully Automated, Electronic Information Transfer Bridge From The Radiology Report To A Community Practice Office Level Report**

Awards
Quality Improvement Reports Award

Participants
Pamela T. Johnson, MD, Baltimore, Maryland (*Presenter*) Intellectual property, AgileMD;Future royalties, AgileMD

PURPOSE

Incidental findings are commonly discovered on CT and MRI and may require additional characterization with an alternative radiology test or surveillance imaging to confirm benignity. Many radiology practices incorporate standardized management recommendations in report impressions, derived from American College of Radiology white papers, Fleischner Society and other nonradiology specialty society guidelines, to facilitate management by the ordering provider. The challenge rests in ensuring that patients undergo recommended follow-up imaging months to years later. Existing solutions include assigning a radiology staff member to oversee the list of patients with incidental findings that require follow up and intervene if the recommended imaging test is not performed in the time interval advised.We previously developed a solution to ensure that emergency department (ED) patients are informed of incidental findings. If reported while the patient is in the ED, the recommended follow up test is listed in the ED After Visit Summary (AVS). If the recommendation was added to the report after the patient is discharged from the ED, it is transferred to a report in Epic managed by an ED nurse who communicates the information to the patient.For the ambulatory practice, where primary care providers may manage multiple patients with a variety of incidental findings, we decided to create a more innovative solution. The goal was to enhance the incidental finding report in Epic by1) mapping the recommendation to the office from which the original examination was ordered2) compiling a report listing all the patients in that practice who need follow up imaging and3) facilitating the tracking of recommendation completion

METHODS

Radiology and medicine providers designed a report for Epic that includes the patient's name and medical record number, the incidental finding identified that required additional imaging, the exam that needed to be scheduled and the date by which the subsequent exam should have been performed.To facilitate electronic information transfer, the existing standardized recommendation macros were enhanced so discreet data elements are transferred to Epic from Powerscribe through an HL7 interface. Within the voice dictation system, additional custom fields were added to the existing template as pick lists items that tie to the selections built out in the Epic. The voice dictation system would add these fields to the bottom of the reports at HL7 CE segments. We then updated the existing HL7 Engine processing rule for ORU messages received from the dictation system to not only add the ST segments for Incidental Findings but also to convert the newly created CE segments to ST segments before they are sent into the EMR/HIS by the HL7 engine. The follow up time interval is listed as a "due date" and the recommended imaging test as an IMG code in the office level report.On the community practice receiving end, the reports are filtered to only show the user orders originating from the practice office. This is done by checking that the original ordering department matches their login department. The discrete recommendations can be tracked with newly created report that the provider's staff can monitor to ensure that the necessary follow up imaging or referral is performed in the recommended time period.

RESULTS

The platform was piloted for thyroid nodules and abdominal aortic aneurysm (AAA) surveillance in 3 practices and successfully communicated the information from the radiology dictation to each office level report. Office administrators are able to access the report to ensure that the exam is conducted by the due date or that the physician declined the recommendation (Figure 1). Once the follow up imaging test is performed, the patient is automatically removed from the list.Following roll out we identified the need for enhancements, including the ability for the ordering physician to easily dismiss the order if

QDP-QI-8   Raising The Bar In Imaging Stewardship: Electronic Determination Of Appropriate Patient And Exam Selection

Participants
Pamela T. Johnson, MD, Baltimore, Maryland (*Presenter*) Intellectual property, AgileMD;Future royalties, AgileMD

PURPOSE

Effective January 2021, CMS requires providers to consult appropriate use criteria (AUC) delivered by a CMS-approved clinical decision support mechanism (CDSM) in the electronic medical record (EMR) when ordering advanced imaging (CT, MRI, Nuclear Medicine) in 8 Priority Clinical Areas (PCA). To focus on the PCAs with high caliber evidence, our institution became a CMS approved Qualified Provider Led Entity (QPLE) in 2019 designated to develop AUCs, which are integrated into the EMR using an approved CDSM.While use of a CMS approved CDSM obviates prior authorization for Medicare patients, many commercial payers still require traditional prior authorization processes for advanced imaging, which includes documentation of medical necessity. Accordingly, our AUCs were designed to (1) ensure that the provider selected the most efficacious imaging test for the suspected clinical condition and (2) confirm that a patients' history and physical exam findings reflect a reasonable likelihood of the pathology in question.Described here is the evidence identified in the literature and rules for MRI orders in hip and shoulder pain. This report focuses on common MRI indications in the ambulatory setting: suspected rotator cuff or SLAP injury in patients with shoulder pain, and suspected labral tear, femoral acetabular impingement (FAI) and ischiofemoral impingement in patients with hip pain.

METHODS

Multiple searches of the literature from 1990 to present were performed by an informationist in conjunction with subject specialist to identify research investigations, systematic reviews, meta-analyses and clinical practice guidelines evaluating the utility of MRI in patients with shoulder pain or hip pain. Results from the search strategy were screened in duplicate by two radiology faculty, followed by the same process for full text review. From each publication, one or more rules about imaging appropriateness and patient selection criteria were extracted into evidence tables. Each publication was graded using Oxford Centre for Evidence Based Medicine Levels of Evidence. A multispecialty physician team that included orthopedic surgeons, radiologists, and internal medicine physicians used the evidence to design exam and patient selection criteria.

RESULTS

Literature reviews revealed strong evidence with respect to hip and shoulder MRI appropriateness in these conditions, as detailed in evidence tables. However, high caliber studies identifying reliable physical exam findings for the conditions were lacking. Accordingly, available evidence and consensus clinical expertise were synthesized to define patient selection criteria for each condition.HIP MRIDiagnostic Test Appropriate Use Rules 1. Hip radiographs should be undertaken prior to MRI (ideally with modified Dunn)2. MRI is highly effective for diagnosing ischiofemoral impingement3. MRA is highly effective for diagnosing labral pathology and cartilage lesion4. Imaging with a 3T MR is better than 1.5T MR for evaluating labral and chondral pathology5. Consider diagnostic injection in suspected FAI, especially for low sensitivity, low prevalence situations6. Diagnostic arthroscopy may still have a role in the absence of MRI diagnosis for hip pathologyMRI Medical Necessity Rules In addition to groin or buttock pain, patients must be <50 years of age and have 2 of the following indicators:Radiographic indicators1. absence of joint space narrowing2. Cam or Pincer3. crossover sign or ischial spine sign4. OS acetabulae Clinical indicators 1. pain at the end of hip range of motion2. reproducible groin pain on hip flexion/adduction/internal rotation3. "positive" response to an intra-articular injection4. prior hip arthroscopy or open hip procedureSHOULDER MRIDiagnostic Test Appropriate Use Rules1. Radiographs should be pe

QI04-D1   The Dax Probe "a Game Changer" Quality Improvements For Ceus In Patients With Large Bmi And Gross Fatty Liver

Participants
Christine Merrill, Calgary, Alberta (*Presenter*) Nothing to Disclose

PURPOSE

Although Contrast Enhanced Ultrasound (CEUS) is safe, readily available and is widely accepted by patients, the obesity epidemic and fatty liver have proven to be a huge technical challenge to ultrasound, and most specifically to CEUS, Penetration of far field structures and the ability to image them has proven to be difficult with greater clinical impact in CEUS than in standard gray scale imaging. The current presentation addresses a major technical limitation in CEUS related to penetration and imaging at depth, including bubble resolution, sensitivity and destruction. It will focus on the DAX probe technology by Siemens and how it overcomes these issues, creating a significant positive clinical impact in management/diagnosis and treatment for patients in an obesity epidemic.

METHODS

50 patients, with BMI over 40, undergoing a standard liver ultrasound in our facility were selected for this evaluation. All patients underwent a standard liver greyscale and CEUS examination. Following a failed attempt at US/CEUS, the scan was repeated with the DAX probe, including both greyscale and CEUS images. Images were collected and qualitative side by side comparisons were made between the conventional curvilinear abdominal probe and the DAX probe, a specialized probe designed for imaging at depth. Comparison between images were made to assess image quality. The images were evaluated by the following criteria. Bubble sensitivity, the ability of the probe to see the microbubble as a finite dot. Bubble destruction, the ability of the probe to maintain bubbles over time, in the near and far field. Penetration, the ability to visualize the liver/lesion in the far field at greater than 10cm depth. Specific evaluations include: 1. Depth of penetration in the early Arterial Phase (AP), at 1min and at 4min, following the injection of a microbubble contrast agent. Including Depth assessment at 5 to 10cm, 10 to 12cm, and greater than 12cm. 2. Resolution of known liver masses through the liver parenchyma; Including, those not identified, those identified sufficiently for measurement, and those identified sufficiently for arterial and PVP enhancement . 3. Duration of bubble life allowing for continued clinical evaluations in the Portal Venous Phase (PVP) Including: Yes, ability to determine washout and No, inability to determine washout.

RESULTS

BMI and fatty liver have independent negative impact on depth resolution and penetration. Patients with BMI > 40 all showed reduced penetration, with the majority showing penetration only to 5-10cm on the standard probe. DAX uniformly improved this penetration, such that patients with BMI < 30 showed penetration to over 12 cm as a standard. In patient with BMI > 30, visualization at depth greater than 10cm was variable. Liver mass resolution with the DAX probe, and its ability to determine Arterial Phase Hyper enhancement (APHE) and washout, produced dramatic results converting 75 percent of non diagnostic scans on standard probes into diagnostic quality exams. Significant improvement in image quality was achieved in most patients. Including the addition of many cases that were clinically non diagnostic, without the advantage of DAX imaging.

QI04-D2   Improving Communication: The End Of The Pager Is Nigh

Participants
Natasha Akhlaq, MD,BEng, Ottawa, Ontario (*Presenter*) Nothing to Disclose

PURPOSE

The use of antiquated technology such as pagers and fax machines still encompasses much of the communication with physicians at our institution, particularly between radiologists and out-of-institution clinicians. This mode of communication results in significant barriers causing misunderstandings and delays in patient care. Although the physical pager itself may have been replaced with a mobile app, the premise remains the same requiring the use of a switchboard to contact a radiologist where it may be unknown if the radiologist is on service or even has received the page. It moreover results in an interruption of workflow for the radiologist. Physicians or other allied health professionals desiring to contact a radiologist may refrain from doing so unless absolutely needed because of these factors which contributes furthermore to the disjointed and often one-sided communication. The aim of this project was to provide not only a simple communication method for non-emergent cases in order to reach radiologists, but also to ensure timely and closed loop communication occurred. This would pave the way for a more team centered approach to patient care and would alleviate any barriers to communication with radiologists perceived by physicians and other allied healthcare workers.

METHODS

A single email address managed by an administrative assistant was created and every radiology report starting on April 1, 2016 has included automatically a line stating, "for report clarification, please contact [this email]". The administrative assistant screens the

emails to ensure the request is within the scope of report clarification and then routes it to the specific radiologist who had reported that study. The reporting radiologist uses "reply all" to answer the clarification request and the communication loop is closed. For patient privacy concerns, if a non-secure email (eg. Hotmail) is used, the radiologist issues an addendum to the report itself and indicates this in the "reply all" email. The requester receives the addendum in the usual secure communication method. Subsequent improvements that have been made since initiation include allowing fax in requests to be scanned and sent to the email if a requester does not use email communication. Analysis was completed by obtaining data sets from the beginning, middle, and just before the implementation of a new EMR system. Each data set included 100 requests each which were analyzed to determine (1) if they were in or out of the scope for report clarification, and if out of scope, how the request was redirected or what led to the wrong email being used; (2) if in scope, what were commonly requested clarifications; and (3) what was the average turnaround time (if available).

RESULTS

Out of 300 requests, 49 requests were deemed outside of the scope of the email address. From these, 18 were sent by patients, 5 were related to booking studies, and 6 were related to imaging or biopsies being denied. Out of the 251 in scope requests, 68 were for general clarifications, 60 were for a missed finding or second look, 57 were typographical errors, and 39 were related to follow up. The remaining requests were related to miscellaneous or clerical error. The average number of requests received per day was 2 and the average turnaround time (when known) for a response was 2 days.

QI04-D3 Increased Bleeding Risk After Image Guided Percutaneous Random Liver Biopsy In Patients Undergoing Workup For Cardiac Transplant

Participants
Alexandra Morris, MD, Detroit, Michigan (*Presenter*) Nothing to Disclose

PURPOSE

Patients undergoing image-guided percutaneous random liver biopsy as part of a pre-cardiac transplant workup were observed to have a markedly increased incidence of hemorrhagic post-procedure complications (20%) compared to patients undergoing liver biopsy for other indications (0.4%). Hemorrhagic post-procedure complications were defined as hemoperitoneum and/or subcapsular hematoma identified at post-procedure imaging. Post-procedure imaging was obtained based on clinical concern of post-procedure complications including hemorrhage. The purpose of this study is to determine the incidence of post biopsy hemorrhage in the pre-cardiac transplant patients relative to other patient populations and propose a new safety protocol to reduce the bleeding risk in patients undergoing image-guided percutaneous random liver biopsy as part of a pre-cardiac transplant workup. By assessing various factors that may contribute to an increased bleeding risk in this patient population and reviewing the effects on outcomes after proposed safety measures are implemented, we will be able to propose new guidelines for liver biopsy in this specific patient population.

METHODS

An IRB approved retrospective database review of all patients who underwent percutaneous image guided liver biopsy between 1/1/19 and 12/31/20 tabulated the hemorrhagic complication rate of the pre-cardiac transplant population versus the complication rate in all other patients. A collaborative risk mitigation process involving cardiology, cross-sectional interventional radiology, and vascular interventional radiology was instituted in an effort to reduce the hemorrhagic complication rate. These strategies were employed and complication rates in this subset of high-risk patients after the implementation of the safety protocols were recorded and compared.

RESULTS

For patients undergoing percutaneous liver biopsy for all indications other than patients being evaluated for cardiac transplant at our institution, the hemorrhagic complication rate overall was 0.4% (5/1225). In patients undergoing a liver biopsy as part of the workup for a cardiac transplant, the hemorrhagic complication rate was substantially higher at 20% (5/25) (Figure 1). We believe this is likely due to patient comorbidities, including elevated right heart pressures and anticoagulation requirement. We implemented multiple measures to reduce risk of complication including pre-procedural interventions as well as an alteration in how the procedure was performed. Improved clinical screening was employed to decrease the number of patients requiring biopsy. Prior to the procedure, we flag these high risk patients through orders in the electronic medical record to alert the team and schedule biopsies in the morning with close monitoring post-procedure in extended 24 hour overnight recovery with serial hemoglobins. Additionally, anticoagulation is held prior to the procedure using the Society of Interventional Radiology consensus guidelines for procedures with high risk of bleeding and anticoagulation is not resumed for 24 hours since all observed bleeding complications occurred in this time period. During the procedure, we obtain a single 18-gauge core sample only and perform routine placement of a gelfoam slurry at the biopsy site. Additionally, in patients with proven elevated right heart pressure, we utilize trans-jugular liver biopsy instead of percutaneous biopsy. Preliminary data since implementing these changes over the past six months is limited with no hemorrhagic complications observed in the 3 core biopsies performed in pre-cardiac transplant patients. While the preliminary data is promising, we will continue to gather data on these high risk patients after implementation of the safety measures to ensure continued improvement in complication rates.

QI04-D4 A Chat Bot Interface For Instant Access To Radiology Departmental Resources And Protocols

Participants
Satyam Ghodasara, MD, Philadelphia, Pennsylvania (*Presenter*) Nothing to Disclose

PURPOSE

Our radiology department, part of a quaternary academic medical center, maintains an internal website to host policies and information for trainees, attendings, and staff. The site includes dozens of phone numbers for the various reading rooms and technologists across the multitude of hospitals that our department covers, as well as departmental protocols for handling critical events, such as intravenous contrast reactions and extravasations, power outages, and IT downtimes. Over the years, many resources have accumulated on this website, making it more frustrating and less efficient to find information when it is needed. This is especially problematic during call shifts—when these resources are most valuable—and when onboarding new staff who must learn both the departmental policies and infrastructure as well as the website's complicated structure.One solution to this problem is a chat bot. A chat bot can provide instantaneous access to any resource in response to a natural language query. This can enable radiologists to quickly handle a broad range of issues that may unexpectedly arise on call, while minimizing time taken away from image interpretation and patient care. Additionally, the natural language interface allows new staff to use the chat bot to find critical information without a substantial learning curve. In this work, we assess the feasibility of creating a chatbot for a radiology

department and evaluate its early performance.

METHODS

Our group used Microsoft's QnA Maker (a simple tool requiring no coding knowledge) to develop a chat bot, which was then hosted on Microsoft Azure, a cloud computing service. Our department uses Microsoft Teams for video calls and communication among staff. Teams also includes a chat function allowing for text-based communication not only from person-to-person, but also with chat bots hosted on Azure. As our department is already familiar with Teams, we deployed the primary interface for our QnA Maker chat bot inside of Teams itself to minimize barriers to use and provide a new feature without needing new software.To create the chat bot's knowledge base, plain-text answers were paired with various phrasings of plain-text questions. These pairings were saved in the knowledge base using the QnA Maker interface. The answers serve as the possible range of outputs from the chat bot, and the questions serve as potential inputs that could solicit the paired answer. For example, "emergency department phone" and "ED phone" are saved as two questions that are both paired with a single list of our emergency department's phone numbers (the answer). Once deployed inside of Teams, QnA Maker matches natural language queries provided by the user to the questions within its knowledge base. QnA Maker then returns the answer paired with the best matching question. These pairings were created for all of the phone numbers in our department. Additional pairings were created between imaging modality assignments for each of our radiology subspecialty divisions and specific shifts (i.e., mappings to identify which divisions are responsible for reading particular imaging modalities during specific shifts).To evaluate the utility of our chat bot, we supplied 20 unique natural language queries and assessed each of the responses as either adequate or inadequate. Responses were deemed adequate if they answered the given query without needing to rephrase the input or consult an additional resource to obtain the requested information.

RESULTS

13 of 20 natural language queries (65%) inputted to the chat bot resulted in adequate responses. In 5 of the 7 inadequate responses, the chat bot returned the correct information but for the wrong location. For example, when provided with "Main ED phone" as the input, the chat bot returned the emergency department phone number for a sister hospital within our health system rather than the main hospital's emergency department phone number.

QI04-D5   Impact Of Multidisciplinary Team Review On The Management And Surgical Upgrade Rates Of High-risk Breast Lesions Identified On Imaging-guided Needle Biopsy

Participants
Dogan Polat, MD, Dallas, Texas (*Presenter*) Nothing to Disclose

PURPOSE

To compare the surgical excision, cancer upgrade and chemoprophylaxis rates before and after the implementation of multidisciplinary management review (MDC) to guide the management of high-risk breast lesions in our institution.

METHODS

We retrospectively reviewed all high-risk breast lesions (atypical ductal hyperplasia, atypical lobular hyperplasia, lobular carcinoma in-situ, atypical papilloma, and radial scar) diagnosed before and after implementation of MDC in 08/2018 on imaging-guided biopsies. MDC involves obtaining input of multiple specialties including radiology, pathology, genetics, surgical and medical oncology disciplines to determine an optimal management strategy. Lesion size, biopsy variables (number of core samples and needle size used, percent of lesion removed at biopsy) ; pathological severity extent and number of atypical foci are reviewed along with patient risk factors and comorbidities. We compared surgery and upgrade rates of lesions referred to MDC to lesions to nonreviewed ones or those identified prior to MDC implementation using Fisher exact test.

RESULTS

Of 747 high-risk breast lesions identified between 2014-2020, 527 (70.5%) were before, 220 (29.5%) after MDC implementation. Surgical excision rate was significantly lower post-MDC (68.1% vs 30.5%, OR:4.8, 95%CI:3.5-6.8, p<0.001) while cancer upgrade rate did not change significantly (16.4% without vs 22.4% with MDC, p>0.05). Of 220 lesions diagnosed post-MDC, 81(38.8%) underwent MDC review and 139 (63.2%) did not. Surgery rates (33.1% without vs 25.9% with MDC, p>0.05) and upgrade rates (21.7% without vs 23.8% with MDC, p>0.05) of lesions did not change significantly with MDC review. Chemoprevention uptake increased significantly post-MDC (18.7% before vs 26.4% post-MDC, OR:1.5, 95%CI:1.06-2.3, p=0.02), while rate was lower for MDC-reviewed lesions post-MDC (30.5% without and 18.5% with MDC, p=0.04). Compliance with MDC recommendation was 54% for surgery and 45% for chemoprevention recommendation.

QI04-D6   Close Monitoring Of Barotrauma In Critically Ill COVID-19 Patients-Need Of The Hour

Participants
Tanushree Banerjee JR, MBBS, Mumbai, India (*Presenter*) Nothing to Disclose

PURPOSE

Management of critically ill COVID-19 positive patients has proven to be a major challenge for the medical fraternity due to several complications one of which is barotrauma. Increased incidence of barotrauma (pneumothorax, pneumomediastinum and subcutaneous emphysema) has been noted in critically ill COVID -19 patients in several studies. The exact mechanism for the same is not known yet but is hypothesised to be due to increased lung parenchymal frailty and increased intrathoracic pressure due to coughing and mechanical ventilation. It has also been studied that the morbidity and mortality is higher in these patients and these patients can develop subsequent recurrent episodes of barotrauma. In this study we aimed to closely monitor patients in COVID dedicated ICU through bedside radio-graphs for early signs of barotrauma and immediately conveyed the same to the intensivists for undertaking urgent measures for decreasing/reversing the barotrauma complications.

METHODS

Critically ill COVID-19 patients admitted in COVID dedicated ICU were monitored through bedside radio-graphs obtained on 12-24 hourly basis (as per clinical and radiological discretion). Patients with subtle features of barotrauma were immediately identified and the information regarding the same was conveyed to the clinicians on an urgent basis. The clinicians and intensivists undertook measures to arrest/reverse the barotrauma and follow up radiograph was obtained for these patients at 12 hour interval. Measures that were undertaken by the intensivists were- • In intubated patients - o optimisation of PEEP was done to the lowest possible value (maintaining a balance between the minimum PEEP required and preventing worsening of barotrauma). o Increasing supplemental oxygen concentration • In patients with spontaneous pneumothorax- o Increasing supplemental oxygen concentration

First repeat radio-graph following the measures was taken at 12 hour interval and if decrease/no change was noted in barotrauma, subsequent radiographs were obtained at 24 hour intervals.

RESULTS

The stringent initiative was undertaken over a period of 6 months from November 2020 to April 2021 and data was collected and analysed to study the trend of admissions of critically ill COVID-19 patients in the ICU ,number and percentage of patients requiring intubation and those developing barotrauma both spontaneous and post mechanical ventilation. The number of patients admitted in COVID dedicated ICU rose in February with very few patients needing intubation and developing barotrauma.However the percentage of patients requiring intubation rose from mid-March and was about 53.8% in April. From this it could be interpreted that the disease severity encountered in mid-March to April was high. A possible explanation for this could be increased virulence and severe disease caused by double mutant strain (E484Q and L452R mutation) of COVID -19 virus which was discovered in the Indian population during the same time span.The number and percentage of patients developing barotrauma also rose significantly from mid-March to April. The possibilities for this rise could be due to increased number of intubations and/or because of the increased frailty of the lung parenchyma due to the mutant virus.On the positive side it was noted that undertaking measures to prevent further barotrauma, led to reversal of these complications in a significant fraction of these patients.

QI04-D7 Building Trust And Empathy: Effect Of A Radiology Clinical History In The Radiologist-Patient Relationship

Participants
Eduardo Hernandez-Rangel, MD, Monterrey, Mexico (*Presenter*) Nothing to Disclose

PURPOSE

The imaging requisition form (IRF) is the prevailing communication system where the referring physician communicates with the radiologist. The IRF has clinical information that directly impacts the imaging study interpretation quality. Radiologists need to rely on the accuracy of the information, that it is timely, correct, and relevant.Worldwide in many practice environments, a radiologist usually has no direct contact with a patient and does not have access to the patient clinical information while making the imaging interpretation.Some studies evaluated the utility of adequate communication between patients and diagnostic imaging technologists to obtain relevant clinical information and create notes for the radiologist. Although this practice proved a significant improvement for interpreting imaging examinations, the radiologist work can be considered only as a commodity service provider rather than a certified medical doctor or an expert medical consultant that treats patients using medical imaging.The Patient-Centered Radiology Practice Initiative by the RSNA supports the concept of communicating directly with patients, and according to their results, the main limitation is the time and workload.The purpose of our project is the application of a clinical history performed by radiology residents before outpatients imaging computer tomography or magnetic resonance imaging study, to obtain an adequate clinical context, current symptoms, past medical history, and treatment to support the imaging studies interpretation. Also, we see it as an opportunity for direct communication between the radiologist and patient.

METHODS

We included a total of 883 outpatient computed tomography (CT) or magnetic resonance imaging (MRI) studies from November 2nd, 20 to May 1st, 21. Patients arrived 30 minutes before their scheduled appointment for clinical history.In a private interrogation area, first-year radiology residents took a medical history, including the surgical history, family medical history, social history, contrast allergies, and medications/treatment the patient is taking or may have recently stopped. For a female patient, age-appropriate questions about their last menstrual period and their pregnancy history. A senior resident or radiology attending evaluated the information in the radiology requisition compared with the clinical history, the need for detailed information, application or elimination of specific acquisition techniques. Finally, the patent answered a small survey about their satisfaction with the clinical history.

RESULTS

40.7 % (423/883) of the radiology requisitions mentioned the pertinent clinical condition, which corresponds to a 95 % confidence interval of 32.5-49.3 %. 83% (732/883) of the clinical history performed by radiology residents mentioned the pertinent condition. The condition rate in the radiology requisition is correlated significantly with the clinical history rate (?2 test, P<0.00001).In 39.6 % (350/883) of the cases, a specific requisition technique was requested, especially for brain MRI and head and neck pathologies.96 % (850/883) of the patients replied that they prefer to be evaluated with a brief clinical history and informed by a radiologist before their imaging study, and 88% referred to be comfortable for the radiologist to discuss their imaging findings if necessary.

QI04-D-HC1 Automated Generation Of Customized Impression Generation For Radiology Reports Through Natural Language Processing (NLP) Model.

Participants
Eric Purdy, PhD, Berkeley, California (*Presenter*) Employee, Rad AI

PURPOSE

To demonstrate superior customization of the impression in a production-deployed natural language processing system

METHODS

We use NLP-based models to generate customized radiology report impressions using the findings section as an input. The baseline models are trained on tens of millions of reports. Then the models get trained individually for each radiologist, on their historical reports, to be able to produce an impression that is customized in the unique voice of each radiologist.3600 chest radiograph reports from 12 radiology practices were run through an impression-generating model, and ROUGE-L scores were calculated. ROUGE-L scores for previous models in the literature are taken from the respective papers. All scores are reported on a realistic distribution of chest radiographs; privacy and other concerns prevent us from comparing two of these models on the same dataset.

RESULTS

We observed large increases relative to published values from the literature in the ROUGE-L score, a standard measure of text similarity. This demonstrates that the produced summaries are better customized to the style of each individual radiologist.
