120 exams were performed on a clinical 1.5 T MRI on six different occasions with 20 healthy Goettingen minipigs, 50% low-dose(lCM)(0.005mmol/kg, gadoxetate) and 50% with normal-dose(nCM)(0.025mmol/kg). These included arterial, portal venous, venous, and hepatobiliary contrast phases(20 and 30 minutes). One animal had to be excluded due to incomplete examinations. Three of the 19 animals were chosen at random and withheld for validation (18 examinations). The remaining 16 animals (96 examinations) were used to train a GAN for image-to-image conversion from lCM to nCM (vCM).Following that, ROI measurements in the abdominal aorta, inferior vena cava, portal vein, liver parenchyma, and autochthonous back muscles were obtained, and the vascular and parenchymal CNR was determined. In addition, the nCM and vCM data were shown in a visual-Turing-test(VTT) to three consultant radiologists, who had to assess whether they would have reported both sequences identical(pathologically consistent) and which sequence was the nCM sequence.

RESULTS

Pooled vascular ($p<0.0001$) and parenchymal ($p<0.0001$) CNR increased significantly from lCM to vCM and were not significantly different between vCM and nCM exams (vascular CNR (mean±SD): lCM 17.6±6.0, vCM 41.8±9.7 and nCM 48.4±12.2; parenchymal CNR (mean±SD): lCM 21.6±6,1, vCM 30.2±7.0, nCM 32.4±8.7). On median, the consultant radiologist indicated that the nCM and vCM sequences are pathologically consistent in 100 percent of the studies and correctly identified the normal-dose series in 59.5 percent of the instances.

CONCLUSION

s This feasibility study on healthy minipigs demonstrates that, GAN-based contrast enhancement can lower the amount of hepatobiliary CA on MRI by up to 80% while retaining equivalent image quality.

CLINICAL RELEVANCE/APPLICATION

GAN-based contrast enhancement can reduce costs and exposure of patients to gadolinium-based CA.

W5B-SPIN-3

Ultrasonic Texture Features as Radiomic Biomarkers for Screening Cardiac Remodeling and Dysfunction

Wednesday, Nov. 30 12:45PM - 1:15PM Room: Learning Center - IN DPS

Participants
Quincy Hathaway, PhD, (*Presenter*) Nothing to Disclose

PURPOSE

Point-of-care ultrasound (POCUS) workflows allow for rapid screening of cardiac abnormalities for guiding appropriate early triage and management. Morphometry and textural features (radiomics) in POCUS images could aid in the rapid automated expert-level screening of left ventricular (LV) myocardial remodeling and dysfunction without requiring any quantitative measurements.

METHODS AND MATERIALS

We developed Machine-learning (ML) models using three clinical cohorts that included 1,915 subjects: 1) an expert-annotated registry of POCUS (n=943, 80% training and 20% internal validation), 2) a prospective institutional POCUS cohort for external validation (n=275), and 3) a prospective external validation ML model on high-end ultrasound systems (n=484) for a head-to-head comparison of radiomics-based prediction with standardized quantitative measurements obtained during comprehensive echocardiography. With radiomic features from the parasternal long axis, we developed an explainable ML model and a direct image-derived black-box convolutional neural network (CNN) model. Echocardiography of wildtype (n=10) and Leptr-/- (n=8) mice were assessed longitudinally at 3 and 25 weeks, and radiomic features of importance were correlated with histopathological features of myocyte disarray and hypertrophy.

RESULTS

The receiver operating characteristic (ROC) area under the curve (AUC) for predicting expert annotated LV myocardial remodeling and dysfunction was higher for texture-based interpretable ML than the black-box, deep learning model (0.84, 0.73 and 0.75 vs. 0.53, 0.59, and 0.58; P=0.0001 for internal and external POCUS and high-end ultrasound validation studies, respectively). Furthermore, the radiomics model predicted time-to-event outcomes in the external POCUS (100% vs. 82% survival, P=0.0001) and high-end ultrasound studies (93% vs. 85% survival, P=0.0031). Leptr-/- obese mice revealed LV remodeling through increased cardiomyocyte diameter (>20% increase, compared to controls) that positively correlated with two radiomics biomarkers of importance extracted from the interventricular septum (r = 0.79 and 0.90, P=0.0001), respectively.

CONCLUSION

s Texture-based ML models can be applied to cardiac POCUS to mirror an expert physician’s ability to screen for the presence of LV myocardial remodeling and dysfunction without quantitative measurements.

CLINICAL RELEVANCE/APPLICATION

Traditional cardiac point-of-care ultrasound requires expert-level interpretation to assess clinical findings; our model can automate the interpretation of left ventricular structural and functional changes without quantitative measurements.

Is It Time for Radiologists to Build AI? International Validation of Radiologist-trained AI Models to Identify Causes of Suboptimal Chest Radiographs

Wednesday, Nov. 30 12:45PM - 1:15PM Room: Learning Center - IN DPS

Participants
Giridhar Dasegowda, MBBS, Boston, MA (*Presenter*) Nothing to Disclose

PURPOSE

Generalizability of artificial intelligence (AI) models is a critical step towards its use in diverse clinical practices. Such efforts are hampered due to lack of data diversity in single study or country studies. Therefore, we assessed the performance of radiologist-trained AI models to differentiate suboptimal (sCXR) and optimal (oCXR) chest radiographs on a diverse multicenter data from 7 countries.

METHODS AND MATERIALS

Our IRB-approved study included 10,687 CXRs from adult patients (age > 18 years) from 7 countries (US, Brazil, Lebanon, India, Italy, Croatia, Iran: 14 imaging sites). The CXRs represented consecutive portable radiographs from each site. All de-identified CXRs were reviewed and annotated for the presence and causes of suboptimality on an AI server-based platform (CARPL AI). After annotation, all CXRs were uploaded into an AI building platform (Cognex Inc.) that allows non-programmers to build, train and test AI model for clinical applications. The platform allowed training (7508 CXRs: 3048 oCXR, 7508 sCXR from 7 sites, 2 country) and testing (3179 CXRs: 2490 sCXR, 689 oCXR from 7 other international sites) of 8 AI models for identifying various causes of sCXR. Receiver operating characteristics analyses were performed.

RESULTS

The AI models classified sCXR with missing apices, right CP angle and left CP angle lung with 98%, 96%, 98% accuracies, and AUCs (95% CI) of 0.84 (0.80-0.88), 0.92(0.89-0.95) and 0.93 (0.90-0.95), respectively. AI identified under- and over-exposure with 93% and 94% accuracy, with 0.93 AUC (95% CI 0.90-0.95) and 0.86 AUC (95% CI 0.82-0.90). The presence of low lung volume was identified with 92% accuracy, and 0.94 AUC (95% CI 0.91-0.96). Lungs obscured by overlying chin was identified with 95% accuracy and AUC of 0.94 (95% CI 0.91-0.96). The AI accuracy and AUC for patient rotation were 95% and 0.92 (95% CI 0.89-0.95), respectively.

CONCLUSION

s The eight AI models had high accuracy and generalizable performance for identifying suboptimal CXRs across 14 sites from 7 countries across four continents.

CLINICAL RELEVANCE/APPLICATION

International generalizability evaluation of AI models can help overcome lack of data diversity and representations from single country or site studies, which helps prove model trustworthiness.

W5B-SPIN-5

DeepLiverNet 2.0: A Deep Transformer Model for Liver Stiffness Classification Using T2-Weighted MRI Data

Wednesday, Nov. 30 12:45PM - 1:15PM Room: Learning Center - IN DPS

Participants
Redha Ali, PhD, Cincinnati, OH (*Presenter*) Nothing to Disclose

PURPOSE

To develop an improved version of DeepLiverNet 1.0 for categorically classifying the degree of liver stiffening using anatomic T2-weighted MRI in children and young adults with known or suspected pediatric chronic liver disease.

METHODS AND MATERIALS

Clinical axial T2-weighted fast spin-echo fat-saturated MRI images and 2D MR elastography liver stiffness measurements were clinically acquired from 1236 children and young adult patients with known or suspected pediatric chronic liver disease. We propose DeepLiverNet 2.0 in order to improve upon our prior work DeepLiverNet 1.0, that classified patients into one of two groups, no/mild liver stiffening <3 kPa or moderate/severe liver stiffening =3 kPa, which derived from MR elastography (Fig. 1). Specifically, we replaced the prior model's transfer learning block with the state-of-art Swin Transformer for latent imaging feature extraction. Swin Transformer is a hierarchical transformer implemented by shifting window partitions between consecutive self-attention layers. Such sliding window schema enhances efficiency by limiting self-attention computation to non-overlapping local windows while allowing for cross-window connection. Model performance was assessed using ten-fold cross-validation.

RESULTS

The proposed DeepLiverNet 2.0 model was able to categorically classify the severity of liver stiffening with an accuracy [mean ± standard deviation] 82.7 ± 0.02%, sensitivity 73.3 ± 4.0%, specificity 87.7 ± 4.0%, and AUC 0.84 ± 0.04. It outperformed the DeepLiverNet 1.0 model by a significant margin of 0.08 on AUC (0.76 ± 0.01; $P < 0.0001$), as well as on accuracy (77.8 ± 1.0%; $P < 0.0001$), sensitivity (67.2 ± 4.0%; $P = 0.004$), and specificity (83.4 ± 4.0% $P = 0.03$).

CONCLUSION

s By updating our previously developed feature extraction module using a state-of-the-art Swin Transformer, we have demonstrated that the proposed DeepLiverNet 2.0 model has better capability than DeepLiverNet 1.0 to stratify the severity of liver stiffening using anatomic T2-weighted MRI data in children and young adults with known or suspected pediatric chronic liver disease. Extensive model optimization is likely to further improve performance.

CLINICAL RELEVANCE/APPLICATION

Our DeepLiverNet 2.0 AI model can categorically classify the severity of liver stiffening using anatomic T2-weighted MRI in children and young adults. Model refinements and incorporation of clinical features may soon decrease the need for MR elastography.

Interventional Wednesday Poster Discussions - B

Wednesday, Nov. 30 12:45PM - 1:15PM Room: Learning Center - IR DPS

Sub-Events

W5B-SPIR-1 Super-selective Trans-arterial Embolization of Intractable Hematuria

Participants
Jong Hyouk Yun, MD, PhD, Busan, Korea, Republic Of (*Presenter*) Nothing to Disclose

PURPOSE

To evaluate the effectiveness and clinical outcomes of super-selective transarterial embolization (TAE) for the management of intractable hematuria.

METHODS AND MATERIALS

20 patients with intractable hematuria who underwent super-selective TAE from April 2014 to July 2021 were included in this retrospective study. Embolization of vesical arteries was performed in all 20 patients using gelfoam particle. The patients were divided into two groups based on the cause of hematuria; radiation cystitis group and cancer bleeding group. Retrospective evaluation of technical and clinical success rates, hematuria grade, serum hemoglobin level (g/dL), complications and mortality rate was performed. The hematuria was graded as follows: grade I, no hematuria; grade II, microscopic hematuria; grade III, macroscopic hematuria without transfusion; grade IV, macroscopic hematuria with intermittent transfusion; and grade V, macroscopic hematuria with daily transfusion. The Wilcoxon signed-rank test for continuous variables was performed to compare the pre- and post-embolization hematuria grade and serum hemoglobin level within each group.

RESULTS

The technical success rate was 100% (20/20 patients). Overall clinical success rate was 85% (17/20 patients), 90% (10/11 patients) in radiation cystitis group and 77% (7/9 patients) in cancer bleeding group. On follow-up, overall mean serum hemoglobin level significantly improved ($p < 0.001$), and also in radiation cystitis group ($p<0.001$) and cancer bleeding group ($p<0.004$). Hematuria grade also showed significant improvement in general ($p<0.001$), and also in radiation cystitis group ($p<0.004$) and cancer bleeding group ($p<0.017$). Minor complications were noted in 8/20 (40%) of the cases notably post embolization syndrome, which was well managed conservatively with analgesics and antipyretics. There was no major complication in both groups. Seven deaths occurred during the mean follow up period of 9.6 ± 31 months, however none of the deaths were procedure-related.

CONCLUSION

s Super-selective TAE seems to be a technically feasible and clinically effective treatment for intractable hematuria, both in radiation cystitis patients and cancer bleeding patients.

CLINICAL RELEVANCE/APPLICATION

There are several treatment options in intractable hematuria including peroral medication, intravesical agents endoscopic management and embolization. Super-selective TAE is a safe and effective treatment option to improve intractable hematuria, both in radiation cystitis patients and cancer bleeding patients.

W5B-SPIR-2 Radiomic Analysis of Post-treatment SPECT Imaging for Predicting Treatment Response Following Liver Radioembolization.

Participants
Kamil Bahit, (*Presenter*) Nothing to Disclose

PURPOSE

The distribution of yttrium-90 (Y90) microsphere deposition may predict outcomes following transarterial radioembolization (TARE) for the treatment of hepatocellular carcinoma (HCC). The purpose of this study was to quantify particle distribution on post-Y90 bremsstrahlung SPECT/CT scans using radiomic feature analysis and correlate findings with treatment response.

METHODS AND MATERIALS

Adult patients with HCC who underwent Y90 TARE were retrospectively enrolled from a single academic medical center. Overall survival and recurrence data were obtained following electronic medical record review. Pre-treatment contrast-enhanced CT or MR imaging was used to manually segment tumor volumes, which were fused with raw SPECT data from corresponding post-Y90 bremsstrahlung scans to generate a volume of interest (VOI). Radiomic features were then extracted from this VOI in 3D Slicer using the Radiomics module and modeled with tumor recurrence accounting for patient death using unsupervised (principal component analysis) and supervised (classification function analysis) parsimony modeling, along with a competing risk hazard regression analysis. Statistical significance was set at $p<0.05$.

RESULTS

34 patients with HCC treated using Y90 TARE (mean age 73.6 +/- 10.4 years; 85.3% male; mean single largest dimension of tumor 5.9 cm) were enrolled between April 2017 and December 2020. Unsupervised principal component analysis of 96 unique radiomic features yielded a 3-component model wherein a single component best predicted post-Y90 recurrence (HR: 0.61, 95% CI [0.38, 0.96]). Subsequent classification functional analysis demonstrated that the radiomic feature "Large Area Emphasis," a measure of image heterogeneity, yielded the single strongest association with patient outcomes. For every 1 unit increase in Large Area Emphasis on post-Y90 SPECT/CT images, the hazard of tumor recurrence increased by 68% (HR:1.680, 95% CI [1.31, 2.16], p<0.0001).

CONCLUSION

s Radiomic features derived from post-treatment bremsstrahlung SPECT/CT scans can predict outcomes following TARE for treatment of HCC, with greater heterogeneity in the distribution of Y90 activity associated with increased risk of tumor recurrence.

CLINICAL RELEVANCE/APPLICATION

Radiomic analysis of post-treatment SPECT imaging can aid in identifying patients with a high risk for tumor recurrence.

W5B-SPIR-6 Bronchial and Pulmonary Arteries Embolization in Patients with Lung Cancer: Long Term Results

Participants
Antoine Khalil, MD, PhD, Paris, France (*Presenter*) Spouse, Employee, sanofi-aventis Group;Research Consultant, Becton, Dickinson and Company;Research Consultant, GEMS;Research Consultant, Medtronic plc

PURPOSE

To analyze the bronchial (BAE) and pulmonary (PAE) arteries embolization outcomes in patients with lung cancer admitted to control or to prevent hemoptysis.

METHODS AND MATERIALS

All consecutive patients with primary lung cancer (44 adenocarcinoma, 30 squamous cell carcinoma, 18 other non-small cell, and 7 small cell lung cancer) and referred in our center for BAE or PAE between 21st September 2015 and 31st December 2021 were included in this observational retrospective review. Inclusion criteria were lung cancer histologically proved with a TNM classification (9 Stage I,II; 33 stage III; 57 stage IV) and bronchial and/or pulmonary arteriography performed. Arteriography outcomes were reported after the first-line treatment of hemoptysis along with management of early (< 1 month) and late (> 1 month) recurrences of hemoptysis. Overall and hemoptysis-free survival were also reported.

RESULTS

In the 99 (83 males, median age 64 y "Q1: 56.4; Q4:71.6) patients included in this cohort, 98 were treated to control hemoptysis and 3 to prevent massive hemoptysis in necrosis tumor before starting chemotherapy, immunotherapy or both. Two patients who were initially treated to prevent hemoptysis, later underwent embolization to treat non-massive hemoptysis. In 98 patients with hemoptysis, BAE alone was performed in first intention in 81 patients, PAE alone in 9 patients and both BAE PAE were performed in 8 patients. Immediate control of bleeding was achieved in 69/98 patients (70.4 %) in first-line treatment (57 with one session, 10 with two sessions and 2 with three sessions). A recurrence of hemoptysis was observed after the first month in 16/98 patients (16.3 %). The mean recurrence time after the first embolization was 284 days in these patients, with a median time of 169 days. The management of these late recurrences consisted in embolization in 7 patients (6 of them died due to the progression of disease) and exclusive medical treatment in 9 patients (2 died of massive hemoptysis and 2 due to the progression of the disease). Overall survival was 78.9 % at 1 month, 60.6 % at 6 months and 51 % at 12 months. Hemoptysis-free survival was 75.5 % at 1 month, 60.3 % at 6 months and 58.3 % at 12 months.

CONCLUSION

s Thoracic arteries embolization (systemic and pulmonary arteries) is effective and safe for hemoptysis support in patients with broncho-pulmonary cancer. Hemoptysis control was reached for 69 patients (70.4%) in first line treatment.

CLINICAL RELEVANCE/APPLICATION

Endovascular management of hemoptysis is safe and effective. The use of CT-angiography leads us to manage up to 10% of our patients with pulmonary artery embolization or stenting. In case of recurrence the re-embolisation could stop hemoptysis and prevent the death with massive hemoptysis

W5B-SPIR-7 Racial and Ethnic Disparities Among Participants in Hepatocellular Carcinoma Clinical Studies Evaluating Transarterial Therapies

Participants
Tushar Garg, MD, Baltimore, MD (*Presenter*) Conference Travel, Siemens Healthineers

PURPOSE

Over the past two decades, there has been rapid development in the use of transarterial therapies (TA) for the management of hepatocellular carcinoma (HCC). The race and ethnic representation of participants in these clinical trials are poorly understood. To look at the current status of racial and ethnic representation in TA therapies trials for HCC, we evaluated completed studies for their reporting of race and ethnicity and compared it to the current United States HCC population.

METHODS AND MATERIALS

The clinicaltrials.gov registry was queried in this cross-sectional study for completed US-based clinical studies evaluating the use of TA therapies for HCC in January 2022. The number of people affected with HCC by race and ethnicity was identified using the US population data from the US censuses and then combining it with the data collected from the SEER database. The underrepresentation (<1) and overrepresentation (>1) as the ratio of actual number of enrolled cases and the expected number of cases for each trial with 95% confidence intervals was estimated. Logistic regression and Pearson chi-square test were used for statistical analysis.

RESULTS

27 (34.2%) of the 79 eligible studies had appropriate data about the ethnic and racial composition of participants. There was no

27 (34.2%) of the 79 eligible studies had appropriate data about the ethnic and racial composition of participants. There was no statistical association between source of funding (NIH vs. other) and reporting of race and ethnicity (p=0.48). White and Non-Hispanic or Latino participants were overrepresented with a ratio of 1.15 (95% CI, 1.08-1.30; 1591 observed vs. 1307 expected) and 1.35 (95% CI, 1.27-1.43; 937 observed vs. 703 expected), respectively. All the other racial and ethnic groups were underrepresented: Black participants with a ratio of 0.79 (95% CI, 0.53-1.06; 188 observed vs. 311 expected), Asian participants with a ratio of 0.55 (95% CI, 0.19-0.91; 73 observed vs. 172 expected), and Hispanic or Latino with a ratio of 0.30 (95% CI, 0.15-0.46; 71 observed vs. 291 expected).

CONCLUSION

s In this cross-sectional study, racial and ethnic minorities were found to be underrepresented and poor reporting of these categories was seen in clinical trials.

CLINICAL RELEVANCE/APPLICATION

When designing future studies appropriate representation of different racial and ethnic groups should be considered and detailed reporting of participants in different racial and ethnic groups should be provided.

W5B-SPIR-8 Validation of an Ex vivo Renal Perfusion Model for Quantifying Microvascular Distribution of Embolic Microspheres

Participants
Daniel Derrick, BS, San Antonio, TX (*Presenter*) Nothing to Disclose

PURPOSE

An ex vivo model for preclinical characterization of microembolic agents and their microvascular distribution would be beneficial for guiding future in vivo studies. This study uses MicroCT analysis to evaluate the utility of an ex vivo perfusion model to assess the vascular distribution of LC beads (Boston Scientific) as a function of their diameter.

METHODS AND MATERIALS

Porcine left kidneys were harvested from a local butcher, flushed with heparinized saline, and transported to the laboratory on ice. The renal artery was cannulated and pulsatile perfusion with normal saline was initiated. A subsegmental artery was selected using a microwire and the tissue was dyed using Evan's blue to visually identify the embolization zone for sample submission. LC beads (40-90 µm) suspended in Visipaque contrast solution were delivered to the target zone until stasis was observed under fluoroscopy. Pre- and post-embolic digital subtraction angiography (DSA) images were collected. In the same kidney, a second subsegmental arterial zone was embolized with LC beads (70-150 µm) via the methods described. Tissue segments of each embolization zone were submitted for MicroCT analysis. Percent opacification profile at various vessel diameters was collected to assess microembolic distribution pattern. Additional tissue segments were analyzed by pathology to assess tissue integrity and embolization pattern.

RESULTS

Pre-embolization DSA demonstrated adequate arterial flow of contrast, cortical blushing, and venous return. Post-embolization DSA demonstrated no visualization of contrast flow to the embolized zone. MicroCT analysis of tissue samples embolized by 40-90 µm beads demonstrated the highest percentage of opacified tissue in vessels 60-90 µm in diameter (32.7%). Tissue embolized with beads 70-150 µm demonstrated the highest percentage of opacified tissue in vessels 298-338 µm (16.0%). Histology demonstrated well-preserved cortical and medullary tissue with 40-90 µm beads embolizing up to 80% of arterial vessels and 70-150 µm beads embolizing up to 70% of arterial vessels. Sphere edges marginated along the surface of the endothelium.

CONCLUSION

s By demonstrating the difference in vascular distribution between two microsphere sizes, this study demonstrates the utility of an ex vivo perfusion model to assess the vascular distribution of microembolic agents based on sphere diameter.

CLINICAL RELEVANCE/APPLICATION

This system provides an informative preclinical model which may provide benefits such as preserving resources and decreasing cost for interventional translational research. This model assesses the vascular distribution of microembolics and has the potential to contribute to additional innovations in future intravascular interventions.

Super-selective Trans-arterial Embolization of Intractable Hematuria

Wednesday, Nov. 30 12:45PM - 1:15PM Room: Learning Center - IR DPS

Participants
Jong Hyouk Yun, MD, PhD, Busan, Korea, Republic Of (*Presenter*) Nothing to Disclose

PURPOSE

To evaluate the effectiveness and clinical outcomes of super-selective transarterial embolization (TAE) for the management of intractable hematuria.

METHODS AND MATERIALS

20 patients with intractable hematuria who underwent super-selective TAE from April 2014 to July 2021 were included in this retrospective study. Embolization of vesical arteries was performed in all 20 patients using gelfoam particle. The patients were divided into two groups based on the cause of hematuria; radiation cystitis group and cancer bleeding group. Retrospective evaluation of technical and clinical success rates, hematuria grade, serum hemoglobin level (g/dL), complications and mortality rate was performed. The hematuria was graded as follows: grade I, no hematuria; grade II, microscopic hematuria; grade III, macroscopic hematuria without transfusion; grade IV, macroscopic hematuria with intermittent transfusion; and grade V, macroscopic hematuria with daily transfusion. The Wilcoxon signed-rank test for continuous variables was performed to compare the pre- and post-embolization hematuria grade and serum hemoglobin level within each group.

RESULTS

The technical success rate was 100% (20/20 patients). Overall clinical success rate was 85% (17/20 patients), 90% (10/11 patients) in radiation cystitis group and 77% (7/9 patients) in cancer bleeding group. On follow-up, overall mean serum hemoglobin level significantly improved ($p < 0.001$), and also in radiation cystitis group ($p<0.001$) and cancer bleeding group ($p<0.004$). Hematuria grade also showed significant improvement in general ($p<0.001$), and also in radiation cystitis group ($p<0.004$) and cancer bleeding group ($p<0.017$). Minor complications were noted in 8/20 (40%) of the cases notably post embolization syndrome, which was well managed conservatively with analgesics and antipyretics. There was no major complication in both groups. Seven deaths occurred during the mean follow up period of 9.6 ± 31 months, however none of the deaths were procedure-related.

CONCLUSION

s Super-selective TAE seems to be a technically feasible and clinically effective treatment for intractable hematuria, both in radiation cystitis patients and cancer bleeding patients.

CLINICAL RELEVANCE/APPLICATION

There are several treatment options in intractable hematuria including peroral medication, intravesical agents endoscopic management and embolization. Super-selective TAE is a safe and effective treatment option to improve intractable hematuria, both in radiation cystitis patients and cancer bleeding patients.

Radiomic Analysis of Post-treatment SPECT Imaging for Predicting Treatment Response Following Liver Radioembolization.

Wednesday, Nov. 30 12:45PM - 1:15PM Room: Learning Center - IR DPS

Participants
Kamil Bahit, (*Presenter*) Nothing to Disclose

PURPOSE

The distribution of yttrium-90 (Y90) microsphere deposition may predict outcomes following transarterial radioembolization (TARE) for the treatment of hepatocellular carcinoma (HCC). The purpose of this study was to quantify particle distribution on post-Y90 bremsstrahlung SPECT/CT scans using radiomic feature analysis and correlate findings with treatment response.

METHODS AND MATERIALS

Adult patients with HCC who underwent Y90 TARE were retrospectively enrolled from a single academic medical center. Overall survival and recurrence data were obtained following electronic medical record review. Pre-treatment contrast-enhanced CT or MR imaging was used to manually segment tumor volumes, which were fused with raw SPECT data from corresponding post-Y90 bremsstrahlung scans to generate a volume of interest (VOI). Radiomic features were then extracted from this VOI in 3D Slicer using the Radiomics module and modeled with tumor recurrence accounting for patient death using unsupervised (principal component analysis) and supervised (classification function analysis) parsimony modeling, along with a competing risk hazard regression analysis. Statistical significance was set at $p<0.05$.

RESULTS

34 patients with HCC treated using Y90 TARE (mean age 73.6 +/- 10.4 years; 85.3% male; mean single largest dimension of tumor 5.9 cm) were enrolled between April 2017 and December 2020. Unsupervised principal component analysis of 96 unique radiomic features yielded a 3-component model wherein a single component best predicted post-Y90 recurrence (HR: 0.61, 95% CI [0.38, 0.96]). Subsequent classification functional analysis demonstrated that the radiomic feature "Large Area Emphasis," a measure of image heterogeneity, yielded the single strongest association with patient outcomes. For every 1 unit increase in Large Area Emphasis on post-Y90 SPECT/CT images, the hazard of tumor recurrence increased by 68% (HR:1.680, 95% CI [1.31, 2.16], $p<0.0001$).

CONCLUSION

s Radiomic features derived from post-treatment bremsstrahlung SPECT/CT scans can predict outcomes following TARE for treatment of HCC, with greater heterogeneity in the distribution of Y90 activity associated with increased risk of tumor recurrence.

CLINICAL RELEVANCE/APPLICATION

Radiomic analysis of post-treatment SPECT imaging can aid in identifying patients with a high risk for tumor recurrence.

Bronchial and Pulmonary Arteries Embolization in Patients with Lung Cancer: Long Term Results

Wednesday, Nov. 30 12:45PM - 1:15PM Room: Learning Center - IR DPS

Participants
Antoine Khalil, MD, PhD, Paris, France (*Presenter*) Spouse, Employee, sanofi-aventis Group;Research Consultant, Becton, Dickinson and Company;Research Consultant, GEMS;Research Consultant, Medtronic plc

PURPOSE

To analyze the bronchial (BAE) and pulmonary (PAE) arteries embolization outcomes in patients with lung cancer admitted to control or to prevent hemoptysis.

METHODS AND MATERIALS

All consecutive patients with primary lung cancer (44 adenocarcinoma, 30 squamous cell carcinoma, 18 other non-small cell, and 7 small cell lung cancer) and referred in our center for BAE or PAE between 21st September 2015 and 31st December 2021 were included in this observational retrospective review. Inclusion criteria were lung cancer histologically proved with a TNM classification (9 Stage I,II; 33 stage III; 57 stage IV) and bronchial and/or pulmonary arteriography performed. Arteriography outcomes were reported after the first-line treatment of hemoptysis along with management of early (< 1 month) and late (> 1 month) recurrences of hemoptysis. Overall and hemoptysis-free survival were also reported.

RESULTS

In the 99 (83 males, median age 64 y "Q1: 56.4; Q4:71.6) patients included in this cohort, 98 were treated to control hemoptysis and 3 to prevent massive hemoptysis in necrosis tumor before starting chemotherapy, immunotherapy or both. Two patients who were initially treated to prevent hemoptysis, later underwent embolization to treat non-massive hemoptysis. In 98 patients with hemoptysis, BAE alone was performed in first intention in 81 patients, PAE alone in 9 patients and both BAE PAE were performed in 8 patients. Immediate control of bleeding was achieved in 69/98 patients (70.4 %) in first-line treatment (57 with one session, 10 with two sessions and 2 with three sessions). A recurrence of hemoptysis was observed after the first month in 16/98 patients (16.3 %). The mean recurrence time after the first embolization was 284 days in these patients, with a median time of 169 days. The management of these late recurrences consisted in embolization in 7 patients (6 of them died due to the progression of disease) and exclusive medical treatment in 9 patients (2 died of massive hemoptysis and 2 due to the progression of the disease). Overall survival was 78.9 % at 1 month, 60.6 % at 6 months and 51 % at 12 months. Hemoptysis-free survival was 75.5 % at 1 month, 60.3 % at 6 months and 58.3 % at 12 months.

CONCLUSION

s Thoracic arteries embolization (systemic and pulmonary arteries) is effective and safe for hemoptysis support in patients with broncho-pulmonary cancer. Hemoptysis control was reached for 69 patients (70.4%) in first line treatment.

CLINICAL RELEVANCE/APPLICATION

Endovascular management of hemoptysis is safe and effective. The use of CT-angiography leads us to manage up to 10% of our patients with pulmonary artery embolization or stenting. In case of recurrence the re-embolisation could stop hemoptysis and prevent the death with massive hemoptysis

Racial and Ethnic Disparities Among Participants in Hepatocellular Carcinoma Clinical Studies Evaluating Transarterial Therapies

Wednesday, Nov. 30 12:45PM - 1:15PM Room: Learning Center - IR DPS

Participants
Tushar Garg, MD, Baltimore, MD (*Presenter*) Conference Travel, Siemens Healthineers

PURPOSE

Over the past two decades, there has been rapid development in the use of transarterial therapies (TA) for the management of hepatocellular carcinoma (HCC). The race and ethnic representation of participants in these clinical trials are poorly understood. To look at the current status of racial and ethnic representation in TA therapies trials for HCC, we evaluated completed studies for their reporting of race and ethnicity and compared it to the current United States HCC population.

METHODS AND MATERIALS

The clinicaltrials.gov registry was queried in this cross-sectional study for completed US-based clinical studies evaluating the use of TA therapies for HCC in January 2022. The number of people affected with HCC by race and ethnicity was identified using the US population data from the US censuses and then combining it with the data collected from the SEER database. The underrepresentation (<1) and overrepresentation (>1) as the ratio of actual number of enrolled cases and the expected number of cases for each trial with 95% confidence intervals was estimated. Logistic regression and Pearson chi-square test were used for statistical analysis.

RESULTS

27 (34.2%) of the 79 eligible studies had appropriate data about the ethnic and racial composition of participants. There was no statistical association between source of funding (NIH vs. other) and reporting of race and ethnicity (p=0.48). White and Non-Hispanic or Latino participants were overrepresented with a ratio of 1.15 (95% CI, 1.08-1.30; 1591 observed vs. 1307 expected) and 1.35 (95% CI, 1.27-1.43; 937 observed vs. 703 expected), respectively. All the other racial and ethnic groups were underrepresented: Black participants with a ratio of 0.79 (95% CI, 0.53-1.06; 188 observed vs. 311 expected), Asian participants with a ratio of 0.55 (95% CI, 0.19-0.91; 73 observed vs. 172 expected), and Hispanic or Latino with a ratio of 0.30 (95% CI, 0.15-0.46; 71 observed vs. 291 expected).

CONCLUSION

s In this cross-sectional study, racial and ethnic minorities were found to be underrepresented and poor reporting of these categories was seen in clinical trials.

CLINICAL RELEVANCE/APPLICATION

When designing future studies appropriate representation of different racial and ethnic groups should be considered and detailed reporting of participants in different racial and ethnic groups should be provided.

Validation of an Ex vivo Renal Perfusion Model for Quantifying Microvascular Distribution of Embolic Microspheres

Wednesday, Nov. 30 12:45PM - 1:15PM Room: Learning Center - IR DPS

Participants
Daniel Derrick, BS, San Antonio, TX (*Presenter*) Nothing to Disclose

PURPOSE

An ex vivo model for preclinical characterization of microembolic agents and their microvascular distribution would be beneficial for guiding future in vivo studies. This study uses MicroCT analysis to evaluate the utility of an ex vivo perfusion model to assess the vascular distribution of LC beads (Boston Scientific) as a function of their diameter.

METHODS AND MATERIALS

Porcine left kidneys were harvested from a local butcher, flushed with heparinized saline, and transported to the laboratory on ice. The renal artery was cannulated and pulsatile perfusion with normal saline was initiated. A subsegmental artery was selected using a microwire and the tissue was dyed using Evan's blue to visually identify the embolization zone for sample submission. LC beads (40-90 µm) suspended in Visipaque contrast solution were delivered to the target zone until stasis was observed under fluoroscopy. Pre- and post-embolic digital subtraction angiography (DSA) images were collected. In the same kidney, a second subsegmental arterial zone was embolized with LC beads (70-150 µm) via the methods described. Tissue segments of each embolization zone were submitted for MicroCT analysis. Percent opacification profile at various vessel diameters was collected to assess microembolic distribution pattern. Additional tissue segments were analyzed by pathology to assess tissue integrity and embolization pattern.

RESULTS

Pre-embolization DSA demonstrated adequate arterial flow of contrast, cortical blushing, and venous return. Post-embolization DSA demonstrated no visualization of contrast flow to the embolized zone. MicroCT analysis of tissue samples embolized by 40-90 µm beads demonstrated the highest percentage of opacified tissue in vessels 60-90 µm in diameter (32.7%). Tissue embolized with beads 70-150 µm demonstrated the highest percentage of opacified tissue in vessels 298-338 µm (16.0%). Histology demonstrated well-preserved cortical and medullary tissue with 40-90 µm beads embolizing up to 80% of arterial vessels and 70-150 µm beads embolizing up to 70% of arterial vessels. Sphere edges marginated along the surface of the endothelium.

CONCLUSION

s By demonstrating the difference in vascular distribution between two microsphere sizes, this study demonstrates the utility of an ex vivo perfusion model to assess the vascular distribution of microembolic agents based on sphere diameter.

CLINICAL RELEVANCE/APPLICATION

This system provides an informative preclinical model which may provide benefits such as preserving resources and decreasing cost for interventional translational research. This model assesses the vascular distribution of microembolics and has the potential to contribute to additional innovations in future intravascular interventions.

W5B-SPMK-1 Clinical Assessment Of Iterative Metal Artifact Reduction (imar) Techniquein Reducing Metal Artifacts In Ct Examination Of Patients With Femoral Fracture After Metal Internal Fixation.

Participants
Liu Xing, (*Presenter*) Nothing to Disclose

PURPOSE

To explore the clinical value of iMAR technique in reducing metal artifacts in CT examination of patients with femoral fracture after metal internal fixation.

METHODS AND MATERIALS

Thirty patients with femoral fracture after metal internal fixation were prospectively collected and examined by Siemens single-source dual-energy CT(SOMATOM Definition Edge CT) The original data were reconstructed respectively in iMAR iterative reconstruction group (Group A) and conventional iterative reconstruction group (Group B).The CT and SD values of the high density artifacts, low density artifacts, the surrounding soft tissue areas and the same layer of contralateral artifact-free affected areas in the two groups of images were measured respectively, and the difference between the two groups was compared by paired t-test. Two senior radiologists used the 5-component table(1~5 points, non-assessable ~ excellent) method to score the metal artifacts removal ability of the two groups. Mann-Whitney U test was used to compare the subjective scores and the consistency of the scores was analyzed by Kappa test.

RESULTS

There was no significant difference in CT values at the opposite side of the same layer without artifacts (P>0.05). The CT values in Group A were significantly reduced in the high density artifact area (p<0.05), while significantly increased in the low density artifact area (p<0.05) and were more closer to the CT values in the corresponding anatomical areas at the opposite side of the same layer. In terms of image noise, SD values in each measurement area of group A's images are lower than those of group B, and are significantly lower in high density areas and low density areas (p<0.05). In terms of subjective score, the results of two groups of image evaluation are excellent consistent (Kappa=0.906, p<0.05).The subjective score of group A is significantly higher than that of the control group, and the subjective score is increased by 1.6(Group A:4.18±0.12, Group B:2.56±0.33; P<0.05).

CONCLUSION

s IMAR technique can significantly reduce metal artifacts around dental implants, correct CT values of surrounding tissues, help to accurately observe tissue structures around implants, improve image quality, which has great clinical application value.

CLINICAL RELEVANCE/APPLICATION

It is preferable to use iMAR technique in femoral fracture examinations as it allows better image quality and help to accurately observe tissue structures around implants.

W5B-SPMK-3 Feasibility Study of Synthetic MRI in Shoulder Imaging

Participants
Yabo Ni, Yinchuan, China (*Presenter*) Nothing to Disclose

PURPOSE

To investigate the feasibility of magnetic resonance image complication in volunteers shoulder scanning.

METHODS AND MATERIALS

67 healthy volunteers were recruited and scanned on a GE Architect 3.0T scanner using conventional anatomical imaging sequences (T2W-FSE in oblique coronal view and PDW imaging in oblique sagittal view) and magnetic resonance image compilation (Magic) sequence (in both oblique coronal and sagittal view). Two researchers scored the image quality of conventional and Magic sequence. The signal intensity of humeral cephalomedullary cavity and deltoid muscle, standard deviation of air was measured on conventional T2WI images and PDW images. The T2 and PD values of the humerus head medullary cavity and deltoid muscle were measured by Magic T2 mapping and PD mapping image. At the same time, region of interest(ROI) was drawn at the air of the conventional sequence image, and the ROI signal intensity was taken as the noise intensity of the conventional sequence and corresponding Magic sequence. Signal noise ratio (SNR) and carrier to noise ratio (CNR) were calculated according to the formula SNR=SI Humeral head pulp cavity *0.66/X Humeral head pulp cavity, CNR= (SI deltoid muscle -SI humeral head medullary cavity) *0.66/X air. One-way ANOVA was used to compare the CNR and SNR, rank test was used to compare subjective scores of images, and Kappa test was used to evaluate the consistency of subjective scores between the two physicians.

RESULTS

The image quality score of conventional sequence and Magic sequence was significantly different, the image quality score of conventional sequence at oblique coronal position 4.08±0.32 and oblique sagittal position 4.03±0.34 was higher than that of Magic sequence at oblique coronal position 3.21±0.38 and oblique sagittal position 3.19±0.13, the difference was statistically significant (P<0.05), and Kappa values were 0.733 and 0.753 respectively. On oblique coronal T2WI images, SNR 17.81±6.91 and CNR -3.20±1.03 of Magic sequence images were higher than those of conventional sequence SNR 7.69±3.09 and CNR -628.73±348.78, and the differences were statistically significant (P < 0.05). In oblique sagittal PDW images, SNR 27.11±1.54 and CNR 112.14±69.25 of Magic sequence images were higher than those of conventional sequence SNR 8.42±6.46 and CNR -876.13±461.51, and the difference was statistically significant (P<0.05).

CONCLUSION

s The quality of the shoulder image obtained by Magic sequence is similar to that obtained by conventional sequence scan, which can be used for MRI shoulder scanning.

CLINICAL RELEVANCE/APPLICATION

Synthetic MRI applied to the shoulder can obtain more quantitative parameters for quantitative diagnosis of the disease.

W5B-SPMK-4 An Investigation of 2D Magnetic Resonance Shoulder Imaging Using Deep Learning (DL) based Algorithm

Participants
Jing Liu, (*Presenter*) Nothing to Disclose

PURPOSE

To investigate the feasibility of deep learning-based MRI (DL-MRI) in the application of 2D shoulder imaging and compare its performance with conventional MR imaging (Non-DL MRI).

METHODS AND MATERIALS

Non-DL MRI and DL-MRI of 2D shoulder imaging (including Axial and Coronal Proton density (PD) weighted imaging (WI), Axial and Coronal T1WI and Sagittal T2WI) were performed for 51 patients (21M30F, mean age: 54±16). Three radiologists assessed image quality according to a five-point scale. And the lesions assessment was conducted by two radiologists independently. A Kendall W test was performed to assess interobserver agreement of the image quality scores. A nonparametric test (Wilcoxon test) was performed to compare the image quality. For lesion diagnosis, the interobserver and interstudy agreement were evaluated by kappa analysis. Paired t-tests were conducted for SNR and |CNR| comparison. A survey was conducted in 400 patients with DL-MRI among 20 radiologists.

RESULTS

The mean scan time for shoulder DL-MRI (6min1s) was nearly 50% decrease compared with that for Non-DL MRI (11min25sec). The image quality was higher in both PDWI and T2WI of DL-MRI compared with those of Non-DL MRI, and the image quality showed comparable in T1WI between DL-MRI and Non-DL MRI. Good interobserver agreement was found for image quality of all the MR sequences on both DL-MRI (Kendall W values range from 0.588 to 0.902, P < 0.001) and Non-DL MRI (Kendall W values range from 0751 to 0.865, P < 0.001). Both the SNRs and |CNR| were significantly higher in Ax PDWI, Cor PDWI, and Sag T2WI of DL-MRI by the paired t-test. The SNRs and |CNR| were slightly higher in Ax T1WI of DL-MRI, and comparable in Cor T1WI of DL-MRI with comparison of Non-DL MRI. High interobserver agreements for all the lesions in Non-DL MRI and DL-MRI (Table 4, kappa value = 0.913 to 1.000, P < 0.001) and interstudy agreements of all lesions' assessment were observed (kappa value = 1.000, with P < 0.001 in all cases). The results of satisfaction survey obtained 5 scores for both image quality and the diagnostic demands meets among all the radiologists.

CONCLUSION

s DL-MRI shoulder imaging can greatly reduce the scan time, while improve imaging quality of PDWI and T2WI compared to Non-DL MRI. It could be a clinical routine with greatly improved work efficiency in future.

CLINICAL RELEVANCE/APPLICATION

DL-MRI shoulder imaging can greatly reduce the scan time, while improve imaging quality of PDWI and T2WI compared to Non-DL MRI.

Sub-Events

W5B-SPMS-1 Learning the Assessment of Tumor Response Categories from Structured Radiology Reports

Participants
Matthias Fink, MD, BSc, Heidelberg, Germany (*Presenter*) Nothing to Disclose

PURPOSE

To use the data mining advantages of structured oncology reports (SOR) to train a deep NLP model aimed at rapid tumor response category (TRC) classification of patients from free-text oncology reports (FTOR), and to compare its performance against three conventional NLP algorithms and a human baseline.

METHODS AND MATERIALS

In this retrospective study, databases of three independent radiology departments were queried for SOR and FTOR from 03/2018-08/2021. An automated data mining and curation pipeline was developed to extract RECIST-related TRCs from SOR for ground truth definition. We trained Google's deep learning NLP algorithm BERT and three feature-rich NLP algorithms on automatically extracted and labelled SOR to predict the TRCs progressive disease (PD), stable disease (SD), partial response (PR), and complete response (CR) in FTOR. Models' F1 scores were compared against seven human annotators (two radiologists, two medical students, and three radiology technologist students) with a different level of radiological expertise. Lexical and semantic analyses of the reports were conducted to investigate human and model performance on FTOR.

RESULTS

Oncologic findings and TRCs were accurately mined from 9653/12833 (75.2%) queried SOR, yielding oncologic reports from 10455 patients (mean age, 60 years ± 14; 5303 women) that met inclusion criteria. On 802 FTOR, BERT achieved better TRC classification results (F1, 0.70; 95% CI: 0.68, 0.73) than the best-performing NLP reference Linear-SVC (F1, 0.63; 95% CI: 0.61, 0.66) and radiology technologist students (F1, 0.65; 95% CI: 0.63, 0.67), had similar performance to medical students (F1, 0.73; 95% CI: 0.72, 0.75), but was inferior to radiologists (F1, 0.79; 95% CI: 0.78, 0.81). Lexical complexity and semantic ambiguities in FTOR influenced human and model performance, revealing maximum F1-drops of -0.17 and -0.19, respectively.

CONCLUSION

s Data mining of SOR enabled an automated and accurate labeling approach to train a deep learning NLP model for ascertaining tumor response categories in free-text reports. The trained NLP model reached novice medical but not radiologists' performance in curating oncologic outcomes from radiology FTOR.

CLINICAL RELEVANCE/APPLICATION

Using structured radiology reports as a "science-ready" data resource for machine learning purposes without prior manual annotation effort by expert readers appears to be feasible. The developed NLP model may be able to extract clinically relevant oncologic end points from large volumes of longitudinal free text reports and offers a potential advantage as an automated clinical decision-support tool for patients referred for multidisciplinary tumor board assessment.

Lexical complexity and semantic ambiguities in FTOR influenced human and model performance, revealing maximum F1-drops of -0.17 and -0.19, respectively.

CONCLUSION

s Data mining of SOR enabled an automated and accurate labeling approach to train a deep learning NLP model for ascertaining tumor response categories in free-text reports. The trained NLP model reached novice medical but not radiologists' performance in curating oncologic outcomes from radiology FTOR.

CLINICAL RELEVANCE/APPLICATION

Using structured radiology reports as a "science-ready" data resource for machine learning purposes without prior manual annotation effort by expert readers appears to be feasible. The developed NLP model may be able to extract clinically relevant oncologic end points from large volumes of longitudinal free text reports and offers a potential advantage as an automated clinical decision-support tool for patients referred for multidisciplinary tumor board assessment.

W5B-SPNMMI-1 Utility of PET/MR Imaging for Therapy Response Assessment of Patients With Ewing Sarcoma: Preliminary Results

Participants
Johannes Grueneisen, Essen, Germany (*Presenter*) Nothing to Disclose

PURPOSE

To evaluate the clinical applicability of integrated PET/MR imaging for staging and monitoring the effectiveness of primary systemic treatment in Ewing sarcoma patients.

METHODS AND MATERIALS

A total of 11 juvenile patients (17.9 ± 3.3 years) with confirmed Ewing sarcoma, scheduled for induction polychemotherapy according to the VIDE-regimen, were prospectively enrolled for a PET/MR examination before, during and after the end of neoadjuvant therapy. Two experienced physicians analysed the imaging datasets. They were asked to identify all tumor lesions and to define treatment response according to the RECIST 1.1 and PERCIST criteria in all three examinations of each patient. Histopathological analysis after biopsy/surgery and follow-up imaging served as the reference standard.

RESULTS

In 7 of the 11 patients the primary tumor arose in the bone and in the remaining 4 patients in soft tissue. In 8 patients lymph node and/or distant metastases were detected at initial diagnosis. For RECIST analysis, the mean sum of the longest diameters was 97.2 ± 35.2 mm at the baseline examination, 85.4 ± 28.1 mm (-12.1%) at the first follow-up and 68.1± 26.9 mm (-29.9%) at the second follow-up scan. Mean activity (SUVpeak) of the hottest tumor lesions amounted to: 6.6 ± 2.5 at baseline, 3.6 ± 2.3 (-45.5%) at the first follow-up and to 2.8 ± 1.9 (-57.6%) at the second follow-up examination. According to the reference standard, a total of 3 patients achieved complete response (CR), 6 patients partial response (PR), whereas one patient showed stable disease (SD) and another patient progressive disease (PD). RECIST 1.1 categorized the response to treatment in 5/11 patients correctly and showed a tendency to underestimate the response to treatment in the remaining 6 patients. PERCIST defined response to treatment in 9/11 patients correctly, and misclassified 2 patients with a PR as CR.

CONCLUSION

s These preliminary results demonstrate a good diagnostic performance of integrated 18F-FDG PET/MRI for primary staging of patients with Ewing sarcoma and underline potential advantages of PERCIST over RECIST for assessing treatment effects of induction chemotherapy.

CLINICAL RELEVANCE/APPLICATION

PET/MRI may serve as a valuable imaging tool for initial evaluation and response assessment of juvenile patients with Ewing sarcoma, combining morphological and metabolic information, accompanied by a reasonable radiation dose for the patient.

W5B-SPNMMI-2 Development and External Validation of a Nomogram Based on 18F-FDG to Identify the Cancer-associated Cachexia

Participants
Yang Jiang, PhD, MD, (*Presenter*) Nothing to Disclose

PURPOSE

This study attempted to develop and validate a combined nomogram incorporating clinical information and PET features for identifying the risk of cancer-associated cachexia.

METHODS AND MATERIALS

FDG PET/CT data from 676 cancer patients were analyzed retrospectively. Patients were divided into a development cohort (n = 390) and an external validation cohort (n = 286) according to different medical centers. Results of the clinical laboratory tests for metabolic levels and organ and tissue-specific FDG uptake obtained from the cachexia and non-cachexia groups were compared statistically. Logistic regression analysis was performed to identify independent variables associated with cachexia in the

development cohort for generating the nomogram. The performance of the nomogram was tested using the data from an external validation cohort and evaluated by area under the receiver operating characteristic curve (AUC), calibration curve, and decision curves.

RESULTS

Based on the data from the development cohort of 390 patients (mean age, 61 years ± 12 [standard deviation]; 221 men) and a validation cohort of 286 patients (54 ± 14; 135 men), it is found that age (odds ratio [OR], 2.285; 95% confidence interval [CI]: 1.387, 3.765; P = 0.001), BMI (OR, 3.486; 95% CI: 1.718, 7.072; P = 0.001), hemoglobin (OR, 1.871; 95% CI: 1.120, 3.126; P = 0.02), maximum SUV of the liver (OR, 2.316; 95% CI: 1.422, 3.770; P = 0.001), and minimum SUV of the subcutaneous fat (OR, 2.991; 95% CI: 1.702, 5.259; P ? 0.001) were independently associated with cachexia. The nomogram incorporating these variables showed great discrimination (AUC = 0.763, 95% CI: 0.706-0.821), calibration and clinical net benefit in the external validation cohort.

CONCLUSION

s This study developed and externally validated a PET-based nomogram incorporating age, BMI, hemoglobin, maximum SUV of the liver, and average SUV of subcutaneous fat.

CLINICAL RELEVANCE/APPLICATION

Nuclear medicine physicians can help identify patients with high-risk cancer-related cachexia using the nomogram described in this study when reading patients' PET/CT images.

W5B-SPNMMI-3 A Novel Self-Assembling High Performance Organic Nanofluorophore for Intraoperative NIR-II Image-Guided Tumor Resection

Participants
Eric Tanifum, PhD, Houston, TX (*Presenter*) Consultant, Alzeca Biosciences, LLC;Stockholder, Alzeca Biosciences, LLC

PURPOSE

Oral cavity cancers are in the top 10 most common solid tumors worldwide. Surgery with adequate resection margins lead to higher survival and a reduction in local recurrence, but adequate resections are only achieved in 15-26% of cases due to the complex anatomy of the oral cavity and the lack of intraoperative guidance. Success with indocyanine green (ICG) have established the value of NIR imaging in precision tumor resection. NIR-II dyes which can selectively target solid tumors are highly desirable due to greater tissue penetration depth in the NIR-II window. We present a novel organic NIR-II dye XW-03-66 which self-assembles into nanoclusters in solution and selectively accumulates in mouse tumor models of oral cancer following intravenous administration, via the enhanced permeation and retention (EPR) effect

METHODS AND MATERIALS

XW-03-66 was synthesized from commercially available materials and the structure confirmed by NMR and MALDI. Spectroscopic data were collected using a UV-1600PC spectrophotometer and a NS3 NanoSpectralyzer. Cluster size was determined by Oblique Illumination Microscopy (OIM) and Atomic Force Microscopy (AFM). NIR-II imaging was conducted on a purpose-built instrument. MOC2 and MEER tumor models were used to assess intraoperative tumor resection procedures. Mice were administered a dose of 1 mg/Kg of the agent and surgery was performed 72 h post-injection. Imaging parameters: 470 mA, 500 ms/frame. Images processed and analyzed using ImageJ software.

RESULTS

XW-03-66 has an absorption maximum at 796 nm and a NIR-II fluorescence maximum 1018 nm. OIM and AFM analyses show that it self-assembles into nanoscale mesoscopic solute-rich clusters with a mean hydrodynamic diameter of 80 nm. Pharmacokinetic studies in nude mice (n = 4), show that it has a long systemic circulation half-life (6.5 h), and is cleared via the mononuclear phagocytic system (MPS). Long circulation allows the agent to traverse leaky vasculature and accumulate in solid tumors, enabling NIR-II image-guided tumor resection with adequate margins.

CONCLUSION

s XW-03-66 self assembles into mesoscopic solute-rich clusters in aqueous media. Following intravenous admiration, it passively accumulates in two different mouse tumor model of oral cancer by the EPR effect, enabling intraoperative NIR-II image-guided tumor resection.

CLINICAL RELEVANCE/APPLICATION

Reports show significant advances in clinical instrumentation for fluorescence image-guided surgeries. NIR-II dyes such as XW-03-66 which specifically label solid tumors will find broad applications in intraoperative image-guided tumor surgeries

W5B-SPNPM-1 Assessing Patient Comfort During MR Imaging at 0.55T and 1.5T - How Much Do Bore Size and Noise Matter?

Participants
Hanns-Christian Breit, MD, Basel, Switzerland (*Presenter*) Nothing to Disclose

PURPOSE

To assess patient comfort perception when imaged on a newly introduced 0.55T low-field MR scanner system with a wide bore opening compared to a traditional 1.5T MR scanner system.

METHODS AND MATERIALS

50 patients (mean age: 66.2±17.0 years, 28 men) undergoing MR examinations with an equivalent imaging protocol both at a 0.55T (MAGENTOM Free.Max, Siemens Shenzhen Magnetic Resonance Ltd.) and a 1.5T scanner system (MAGNETOM Avanto Fit, Siemens Healthcare GmbH) within a timeframe of three hours between 05/2021-06/2021 were included into the analysis. The 0.55T MR system provides a bore opening of 80 cm, while the diameter of the 1.5T scanner system's bore is 60 cm. Four patient groups were defined: (1) cranial or cervical spine MRI using a head/neck coil (n=27), (2) lumbar or thoracic spine MRI using only the in-table spine coils (n=10), (3) hip MRI using a large flex coil (n=8), (4) upper or lower extremity MRI using small flex coils (n=5). Maximum noise levels of all performed imaging protocols were measured in decibels (dB) during separate scans by a volume meter placed in the center of the bores. Following the 0.55T MR examination, patients evaluated (1) sense of space, (2) noise level, and (3) overall sensation on a 5-point Likert scale (range: 1= "much worse" to 5 = "much better") using a questionnaire.

RESULTS

Sense of space was perceived as "better" or "much better" by 84% of patients for imaging examinations performed on the 0.55T MR scanner system with the larger bore opening of 80 cm (mean score: 4.34±0.75). Similarly, 84% of patients rated noise levels as "better" or "much better" when imaged on the low-field scanner system (3.90±0.61). The overall sensation during the imaging examination at 0.55T was rated as "better" or "much better" by 78% of patients (3.96±0.70). Quantitative loudness assessment confirmed significantly reduced maximum noise levels for all MR imaging protocols performed on the 0.55T MR scanner system, compared to imaging at 1.5T, i.e. brain MRI (83.8±3.6 dB vs. 89.3±5.4 dB; p=.04), spine MRI (83.7±3.7 dB vs. 89.4±2.6 dB; p=.004) and hip MRI (86.3±5.0 dB vs. 89.1±1.4 dB; p=.04)

CONCLUSION

s Patients perceive MR imaging on the investigated 0.55T low-field MR scanner system as more comfortable given its larger bore opening and reduced noise levels during image acquisition.

CLINICAL RELEVANCE/APPLICATION

New concepts regarding bore design and noise level reduction of MR scanner systems may help to further reduce patient anxiety and improve well-being when undergoing MR imaging.

W5B-SPNPM-2 Emergency Department Brain MRI Utilization Patterns: With Prior Specialty Consultation vs. Without Prior Specialty Consultation

Participants
Zachary Mosher, BS, MEng, Minneapolis, MN (*Presenter*) Stockholder, Johnson & Johnson;Employee, Center for Diagnostic Imaging

PURPOSE

Although brain MRI is frequently used in management of patients in an Emergency Department (ED) and ED Observation Unit (EDOU)1, there is limited data on clinical pathways driving utilization. The purpose of this study is to characterize association of specialty consultation with MRI results and patient disposition.

METHODS AND MATERIALS

Brain MRI exams performed on ED patients at our institution between January 1, 2021, and June 30, 2021, were retrospectively reviewed to determine association of specialty consultation with imaging findings and patient admission. Findings in MRI reports were categorized as: 1. No intracranial abnormality 2. Chronic intracranial abnormality 3. Acute, non-vascular intracranial abnormality 4. Acute, vascular intracranial abnormality Chi square test was performed to compare subspecialty consultation prior to ordering brain MRI (neurology, other subspecialty, or none) with rates of acute MRI findings (score 3 or 4) and admission.

RESULTS

In the 6 month sample period 638 brain MRI studies were ordered on ED patients, with 370 (58.0%) following neurological consult, 67 (10.5%) following a specialty consult other than neurology, and 201 (31.5%) without a consult. A total of 137/638 (21.4%) brain MRI's demonstrated acute findings of, and 247/638 (38.7%) patients were admitted. There was no significant association between consultation and acute findings on MRI (?2 (df = 2, N=638) = 4.05, p = 0.13), but there was a strong association between consultation and admission (?2 (df = 2, N=638) = 21.65, p = 0.0002). Over half of the patients admitted had no acute findings on brain MRI 131/247 (53%), and this varied by consult status: 41.7% for non-neurological consultation, 30.1% neurological consult, and 14.5% of patients without prior consultation.

CONCLUSION

s For ED patients with specialty consultation prior to Brain MRI, the lack of association with acute findings and high rate of admission of patients with no acute findings suggests clinical rather than imaging factors drive decisions on disposition. In cases without specialty consultation, patients with a negative brain MRI were less likely to be admitted suggesting it may be used to triage patients amenable for discharge.

CLINICAL RELEVANCE/APPLICATION

For ED patients with specialty consult prior to Brain MRI, the lack of association with acute findings and high rate of admission of patients with no acute findings suggests clinical rather than imaging factors drive decisions on disposition.

W5B-SPNPM-3 Financial Value of a System Model for Managing Incidental Imaging Findings in Emergency Department Patients

Participants
Tianyuan Fu, MD, Cleveland, OH (*Presenter*) Nothing to Disclose

PURPOSE

To estimate the rate of actionable incidental findings (IF) in emergency department (ED) patients and evaluate the downstream revenue from a health system model for improving patient follow-up of radiologist recommendations.

METHODS AND MATERIALS

A pilot study was conducted at 11 community hospital EDs in a large health system between July 2021 and October 2021. 5,246 imaging exams, predominantly CT and MRI of the chest and abdomen, were reviewed. Using the ACR appropriateness criteria for IF identification and follow-up, 134 exams were flagged for review by a nurse navigator. After a chart review, 95 were deemed actionable cases (e.g. new diagnosis, clinically relevant, patient in system). We developed a range of estimates for downstream revenues within 3 months of IFs: (1) Expected Revenue: revenue expected from recommended diagnostic workflows standardized for each IF category; (2) Actual Revenue: revenue actually received by the system for diagnostic procedures related to each patient's IF; and (3) Actual Cancer-related Revenue: revenue received by the system for any encounter with a cancer diagnosis related to each patient's IF, where applicable. Data from the pilot study was used to estimate volumes and revenues associated with IFs across our entire health system by applying rates of IFs in the pilot to system imaging volumes.

RESULTS

Most frequently encountered IF's were lung nodules (39%), pancreatic (12%), and renal (12%) lesions. Of the 95 actionable cases, 9 new cancers were identified in the 3-month follow-up period. The annual estimated volume (rate) of actionable IFs system-wide is 2,018 (1.8%). The estimated Expected Revenue from IF enterprise-wide was estimated to be $1.2 million whereas the net Actual Revenue was $1.6 million.

CONCLUSION

s Actionable IFs were present in nearly 2% of body CT and MR exams in our community EDs. Extrapolation of downstream volumes and revenue from follow-up care to the entire health system provides valuable information to support a program infrastructure to improve patient-centered care of IF.

CLINICAL RELEVANCE/APPLICATION

Incidental findings may represent early malignancy or treatable conditions. A robust program for IF follow-up care can not only improve patient outcomes but also provide resources to scale closed-loop care across a large health system.

In the 6 month sample period 638 brain MRI studies were ordered on ED patients, with 370 (58.0%) following neurological consult, 67 (10.5%) following a specialty consult other than neurology, and 201 (31.5%) without a consult. A total of 137/638 (21.4%) brain MRI's demonstrated acute findings of, and 247/638 (38.7%) patients were admitted. There was no significant association between consultation and acute findings on MRI (?2 (df = 2, N=638) = 4.05, p = 0.13), but there was a strong association between consultation and admission (?2 (df = 2, N=638) = 21.65, p = 0.0002). Over half of the patients admitted had no acute findings on brain MRI 131/247 (53%), and this varied by consult status: 41.7% for non-neurological consultation, 30.1% neurological consult, and 14.5% of patients without prior consultation.

CONCLUSION

s For ED patients with specialty consultation prior to Brain MRI, the lack of association with acute findings and high rate of admission of patients with no acute findings suggests clinical rather than imaging factors drive decisions on disposition. In cases without specialty consultation, patients with a negative brain MRI were less likely to be admitted suggesting it may be used to triage patients amenable for discharge.

CLINICAL RELEVANCE/APPLICATION

For ED patients with specialty consult prior to Brain MRI, the lack of association with acute findings and high rate of admission of patients with no acute findings suggests clinical rather than imaging factors drive decisions on disposition.

W5B-SPNPM-3

Financial Value of a System Model for Managing Incidental Imaging Findings in Emergency Department Patients

Wednesday, Nov. 30 12:45PM - 1:15PM Room: Learning Center - NPM DPS

Participants
Tianyuan Fu, MD, Cleveland, OH (*Presenter*) Nothing to Disclose

PURPOSE

To estimate the rate of actionable incidental findings (IF) in emergency department (ED) patients and evaluate the downstream revenue from a health system model for improving patient follow-up of radiologist recommendations.

METHODS AND MATERIALS

A pilot study was conducted at 11 community hospital EDs in a large health system between July 2021 and October 2021. 5,246 imaging exams, predominantly CT and MRI of the chest and abdomen, were reviewed. Using the ACR appropriateness criteria for IF identification and follow-up, 134 exams were flagged for review by a nurse navigator. After a chart review, 95 were deemed actionable cases (e.g. new diagnosis, clinically relevant, patient in system). We developed a range of estimates for downstream revenues within 3 months of IFs: (1) Expected Revenue: revenue expected from recommended diagnostic workflows standardized for each IF category; (2) Actual Revenue: revenue actually received by the system for diagnostic procedures related to each patient's IF; and (3) Actual Cancer-related Revenue: revenue received by the system for any encounter with a cancer diagnosis related to each patient's IF, where applicable. Data from the pilot study was used to estimate volumes and revenues associated with IFs across our entire health system by applying rates of IFs in the pilot to system imaging volumes.

RESULTS

Most frequently encountered IF's were lung nodules (39%), pancreatic (12%), and renal (12%) lesions. Of the 95 actionable cases, 9 new cancers were identified in the 3-month follow-up period. The annual estimated volume (rate) of actionable IFs system-wide is 2,018 (1.8%). The estimated Expected Revenue from IF enterprise-wide was estimated to be $1.2 million whereas the net Actual Revenue was $1.6 million.

CONCLUSION

s Actionable IFs were present in nearly 2% of body CT and MR exams in our community EDs. Extrapolation of downstream volumes and revenue from follow-up care to the entire health system provides valuable information to support a program infrastructure to improve patient-centered care of IF.

CLINICAL RELEVANCE/APPLICATION

Incidental findings may represent early malignancy or treatable conditions. A robust program for IF follow-up care can not only improve patient outcomes but also provide resources to scale closed-loop care across a large health system.

W5B-SPNR-1 Minimum Number of Segmentations Required to Develop a Glioma Volumetric Auto-Segmentation Algorithm

Participants
Irene Dixe de Oliveira Santo, MD, New Haven, CT (*Presenter*) Nothing to Disclose

PURPOSE

Volumetric segmentation of gliomas provides valuable information on tumor morphology compared to the standard linear or two-dimensional measurements. However, it has yet to be implemented into routine clinical practice. Some of the major barriers include the amount of time required for manual segmentation and the high intra- and inter-reader variability. One possible solution may involve the use of fully automatic machine learning volumetric segmentation algorithms trained and validated on clinical imaging data.

METHODS AND MATERIALS

A U-Net-based segmentation algorithm was trained on 1251 gliomas from the multi-institutional BraTS 2021 dataset, and tested on our institution's internal database, consisting of images from 285 gliomas. Testing was divided into six batches, the first being comprised of 35 cases, and the remaining five containing 50 cases per batch. The algorithm's output consisted of "Whole" (FLAIR, hyperintensity), "Core" (PGSE or PGGE, T1c + hyperintensity), and "Necrotic" segmentations (PSGE or PGGE, central non-enhancement). DICE scores were calculated as a measure of overlap between the algorithm's segmentations and the manual segmentations by a board-certified neuroradiologist.

RESULTS

The DICE scores mean for whole tumor segmentation of the BraTS 2021-trained U-Net-based algorithm was 0.82 in the initial batch (n = 35). Gradual training using the subsequent five internal batches improved the DICE scores mean to approximately 0.84 for "Whole" segmentations. After completion of gradual training, DICE scores for the "Core" and "Necrotic" segmentations were found to be approximately 0.63, and 0.32, respectively.

CONCLUSION

s Our results have shown that the segmentation algorithm performance can be improved with batches as small as 50 cases. DICE scores were highest for "Whole" segmentations, followed by "Core," with substantially lower performance for "Necrotic" segmentations.

CLINICAL RELEVANCE/APPLICATION

The creation of fully automated volumetric segmentation algorithms from small datasets may allow this data to be incorporated into routine clinical practice facilitating treatment-response estimation or early recurrence prediction.

W5B-SPNR-10 Validating AI Model's Accuracy to Detect Intracranial Hemorrhage

Participants
Seema Al-Shaikhli, BS, (*Presenter*) Nothing to Disclose

PURPOSE

Timely detection of intracranial hemorrhage (ICH) is crucial to providing prompt life-saving measures. The application of artificial intelligence (AI) in detecting ICH has become increasingly prevalent as imaging utilization continues to rise. We aim to validate Viz.ai ICH, an AI application which identifies suspected ICH.

METHODS AND MATERIALS

A retrospective review of patients' radiology reports who received a non-contrast brain CT within a single institution between September 2021 and December 2021 was performed. Each report was reviewed for the presence of ICH and positive cases were categorized based on subtype, timing, and size/volume via imaging review by a neuroradiologist. The Viz.ai ICH output was reviewed for positive cases. Diagnostic performance was calculated by utilizing Viz.ai ICH as the index test and the radiologists' interpretation as the reference standard test.

RESULTS

A total of 4,203 non-contrast brain CTs were retrieved, of which 387 were positive per the radiology impression. Overall sensitivity

A total of 4,205 non-contrast brain CTs were retrieved, of which 307 were positive per the radiology impression. Overall sensitivity of Viz.ai ICH was 68%, specificity was 99%, positive predictive value was 90%, and negative predictive value was 97%. Subgroup analysis was performed based on hemorrhage subtypes intraparenchymal, subarachnoid, subdural, and intraventricular, of which the sensitivities were calculated to be 86%, 57%, 56%, and 42% respectively. Further stratification revealed sensitivity improves with higher acuity and volume/size across all ICH subtypes. Meningioma was found to be a common false-positive finding (3 of 22, 14%).

CONCLUSION

s Overall diagnostic performance of the considered AI model was very promising, particularly for large volume/size ICH. As the AI algorithm continues to improve, the positive impact on patient care will be substantial.

CLINICAL RELEVANCE/APPLICATION

Accurate detection of ICH is essential for providing prompt treatment. AI alerts the radiologist to the presence of hemorrhage within 1-2 minutes from scan completion leading to faster diagnosis.

W5B-SPNR-11 Super-dose: a deep learning method to increase the sensitivity of MRI in neuro-oncology via virtual contrast dose amplification

Participants
Samy Ammari, MD, PhD, Villejuif, France (*Presenter*) Nothing to Disclose

PURPOSE

Intravenous gadolinium-based contrast agents (GBCA) are particularly powerful to increase MRI sensitivity. However, the recent evidence of gadolinium deposition in various tissues prevents from simply increasing GBCA doses to further improve MRI diagnosis performance. In this study, we evaluate a deep learning method that amplifies the effects of GBCA injection on routine gradient echo brain T1 MRI.

METHODS AND MATERIALS

T1, T2-Flair, diffusion, quarter-dose T1ce (low-T1ce), standard-dose T1ce (T1ce) and T1ce with variable flip angles (vfa-T1ce) sequences were acquired during 250 MRI exams of patients with mixed conditions. A deep learning model was trained, using data from 150 exams, to virtually enhance low-T1ce into routine T1ce, using zero-dose sequences as complementary information. The trained model was then evaluated with the 100 remaining exams for its capacity to enhance the routine T1ce into relevant "super-dose" images (sup-T1ce). Tumor regions on synthetic sup-T1ce, routine T1ce and reference vfa-T1ce were analyzed in sub-regions by two experienced radiologists. Endpoints were to evaluate if sup-T1ce outperformed routine T1ce in terms of sensitivity (SE) and false detection rates (FDR).

RESULTS

Out of 187 masses diagnosed on vfa-T1ce, a significantly higher proportion was correctly identified on sup-T1ce than on T1ce (75% versus 59%, $p<0.001$). The FDR was slightly higher for sup-T1ce than for T1ce (0.14/case versus 0.05/case), but this difference was not significant. For both sup-T1ce and T1ce, no significant differences were found between examiners in terms of SE or FDR. Detection metrics improved when only larger lesions were considered, with SE reaching up to 96% for sup-T1ce and 88% for T1ce ($p=0.008$) at the 10 millimeters threshold. For all lesion sizes, the SE of sup-T1ce remained significantly higher than T1ce, and no statistical difference was found in terms of FDR.

CONCLUSION

s Our deep learning model significantly improved the sensitivity of routine contrast-enhanced brain T1 MRI sequences without degrading its specificity.

CLINICAL RELEVANCE/APPLICATION

A higher sensitivity of brain MRI may allow the detection of smaller tumors and thus earlier treatment onsets, ultimately improving patient survival.

W5B-SPNR-13 Direct Comparison of Traditional Machine Learning and Deep Learning Commercial Artificial Intelligence Solutions for Detection of Large Vessel Occlusion

Participants
Jacob Schlossman, (*Presenter*) Nothing to Disclose

PURPOSE

Despite the availability of commercial artificial intelligence tools for large vessel occlusion (LVO) detection, there is a lack of data comparing traditional machine learning and deep learning solutions in a real-world setting. The purpose of this study is to compare and validate the performance of two AI-based tools for LVO detection in anterior circulation stroke.

METHODS AND MATERIALS

This was a retrospective, single center study performed at a comprehensive stroke center using anonymized data from December 2020 to June 2021. A total of 263 CTA cases for suspected stroke were included. RAPID LVO is a traditional machine learning model which primarily relies on vessel density threshold assessment, while CINA LVO is an end-to-end deep learning tool implemented with multiple neural networks for detection and localization tasks. Ground truth was based off interpretation of the raw data from the CTA by radiology reports and confirmed by a board-certified neuroradiologist (9 years experience). Performance metrics were analyzed by location of LVO: ICA, M1 MCA, or both. Patients with isolated M2 middle cerebral artery (MCA) occlusions were analyzed separately.

RESULTS

There were 29 positive and 224 negative LVO cases. RAPID LVO demonstrated an accuracy of 0.86, sensitivity of 0.90, specificity of 0.86, PPV of 0.45, and NPV of 0.98, while CINA demonstrated an accuracy of 0.96, sensitivity of 0.76, specificity of 0.98, PPV of 0.85, and NPV of 0.97. Of the 29 positive LVO cases, there were 11 ICA LVOs and 23 M1 LVOs based on the ground truth. There were 5 patients who were observed as having both an ICA and M1 LVO. For ICA LVOs, RAPID demonstrated a sensitivity of .63, while CINA demonstrated a sensitivity of .22. For M1 LVOs, RAPID demonstrated a sensitivity of 0.80, while CINA demonstrated a

sensitivity of .70. Of the 10 M2 LVOs analyzed separately, there were 8 positive and 2 negative cases. CINA and RAPID both recognized the two negative cases as such. CINA successfully detected 3/8 positive M2 LVOs, while RAPID successfully detected 8/8.

CONCLUSION

s Both tools successfully detected the majority of ICA and M1 MCA occlusions. RAPID had overall higher sensitivity while CINA had higher accuracy and specificity. Interestingly, both tools were able to detect some, but not all M2 MCA occlusions.

CLINICAL RELEVANCE/APPLICATION

This is the first study to compare the performance of traditional and deep learning LVO tools in the clinical setting. Future research could assess how the tools impact radiology turnaround times and door-to-treatment times. As more automated LVO tools become commercially available, it will be paramount to conduct comparison studies to validate their performance and understand their limitations.

W5B-SPNR-14 Artificial Interlligence-based Evaluation of Brain Metastasis Enables Clinical Referral Suggestion: A Clinical Cohort Study

Participants
Hana Jeong, MD, Seoul, Korea, Republic Of (*Presenter*) Nothing to Disclose

PURPOSE

Artificial intelligence (AI) enables detection, lesion counts, and volumetry of brain metastasis. AI metastasis detection that incorporates black-blood imaging with reduced false positives may provide therapeutic guidance. We aimed to test clinical referral suggestions for patients with brain metastasis based on AI evaluation.

METHODS AND MATERIALS

In this retrospective study, we applied AI for brain metastasis on black-blood imaging for consecutive 131 patients who had been diagnosed and treated for newly developed brain metastases in solid tumors between October 2020 and April 2021. The algorithm detects, counts, and segments brain metastasis. Based on the number and volume of metastases detected by AI, initial clinical referrals were suggested as one of following 4 categories: short-term imaging follow-up without treatment (group A), surgery (B), stereotactic radiosurgery (C), and whole brain radiotherapy or systematic chemotherapy (D). Performance was validated by comparing with the actual clinical decisions according to the European Association of Neuro-Oncology (EANO)-European Society for Medical Oncology (ESMO) guidelines.

RESULTS

Total 131 patients were included (mean age 64.2 years, 59% male). The mean number and volume of AI detected metastases were significantly different among groups (Kruskal-Wallis test, P -= .001 and .001, respectively), with the largest number and volume in group D (mean number and volume, 27.8 and 5256.0mL), followed by group C (4.2 and 1141.1 mL), B (1.0 and 800.0 mL), and A (1.4 and 21.8 mL). AI system proposed the referral suggestions same as the actual clinical decisions with an accuracy of 84.0% (110/131) of the patients in the validation set.

CONCLUSION

s AI based evaluation of metastasis detection and volumetry can suggest clinical referrals, showing great accuracy compared to actual clinical decisions. It may be used in clinical settings where prompt and accurate treatment decisions are required.

CLINICAL RELEVANCE/APPLICATION

For patients with newly diagnosed brain metastasis, AI algorithm of detection and segmentation can aid in evaluation by providing prompt and consistent clinical referrals to clinicians, which can lead to better patient outcomes.

W5B-SPNR-15 Retrospective Study for Automated Detection of Critical Findings in Multiparametric Brain MRI Using 3D Neural Networks in Emergency Room According to Infarction Size

Participants
Jimin Kim, MD, Seoul, Korea, Republic Of (*Presenter*) Nothing to Disclose

PURPOSE

The early diagnosis of acute ischemic lesion is very crucial because the prognosis is highly dependent on time. The infarction size is one of the most important prognosis factors. In this paper, we validate a deep learning based research application according to clinical importance such as infarction size.

METHODS AND MATERIALS

833 MRI exams performed in emergency department were retrospectively reviewed by two neuroradiologists. Two were excluded due to severe metallic artifacts and cervical cord infarction. Reviewers were blinded to patient's information and each other's results. We categorized infarction into 5 visual classes according to size; Class 1 = lacunar infarction (n=80), Class 2 = smaller than one-half lobar infarction (n=48), Class 3 = larger than one-half lobar and up to one lobar infarction (n=19), Class 4 = multilobar infarction (n=21) and Class 5 = embolic infarction (n=43). Especially, lacunar infarctions were reviewed by three neuroradiologists because of their ambiguity. All 831 cases were also processed by an AI-based research application (NeuroTriage, Siemens Healthcare, Germany)

RESULTS

The research application showed sensitivity/specificity/area under the receiver operating characteristic curve (AUC) of 79.1%/92.3%/0.888 for overall infarction. For Class 1, the performance was 62.5%/92.3%/0.727. For Class 2, performance was 85.4%/92.3%/0.855. For Class 3, performance was 100%/92.3%/0.919. For Class 4, performance was 95.2%/92.3%/0.905. For Class 5, performance was 86%/92.3%/0.844. Mean diagnosis time was 64hr 47min 19sec for readers and 60.8sec for research application, with 99.9% time reduction.

CONCLUSION

s The diagnostic performance for acute infarction of research application was good to excellent except for Class 1 infarction, which was fair. It tends to show better performance in the infarction of higher clinical importance. This study shows how the performance is based on its clinical significance and it is very novel way in evaluating infarction through deep learning algorithm. The processing time of the application was significantly faster than of radiologists.

CLINICAL RELEVANCE/APPLICATION

Therefore, the application could aid the fast diagnosis and decision making of acute infarction in general situations and reduce time duration for stroke patients to receive appropriate treatment.

W5B-SPNR-16 Deep Learning Reconstruction vs. Hybrid-Type Iterative Reconstruction: Capability for Image Quality Improvements of Peritumoral Vessels and Predicting Surgical Risks for Intracranial Meningiomas on Contrast-Enhanced CT Angiography

Participants
Kazuhiro Murayama, MD, Toyoake, Japan (*Presenter*) Research Grant, Canon Medical Systems Corporation

PURPOSE

To determine the capability of deep learning reconstruction (DLR) for image quality improvements of peritumoral vessels and determine the relationship between peritumoral vessel number and surgical risk for intracranial meningiomas on contrast-enhanced ultra-high resolution CT angiography (CE-UHR-CTA) as compared with hybrid-type iterative reconstruction (IR).

METHODS AND MATERIALS

29 patients with intracranial meningiomas underwent brain CE-UHR-CTA and were reconstructed by DLR and hybrid-type IR and surgical resection. To assess surgical risk in each patient, surgical time and intraoperative bleeding volume were recorded. To determine the utility of DLR for CE-UHR-CTA, CT value of peritumoral vessels and SD of normal appearance white matter (NAWM) were assessed by ROI measurements at arterial and venous phases. Image J software was used to analyze particles to define the number of peritumoral vessels with the threshold. For quantitative image quality assessment, the number of vessels, SNR in peritumoral area and CNR between peritumoral vessel and NAWM were determined at each phase. To compare the quantitative indexes between two methods, CT values, SD, SNR, CNR and the number of peritumoral vessels on CE-UHR-CTA at each phase were compared between DLR and hybrid-type IR by Wilcoxon signed rank test. Then, number of peritumoral vessel on each CE-UHR-CTA were correlated with surgical risk by Pearson's correlation was performed.

RESULTS

CT values, SNR and CNR of DLR at each phase were significantly higher than those of hybrid-type IR ($p<0.05$). The number of peritumoral vessel on CE-UHR-CT reconstructed with DLR was significantly higher than that with hybrid-type IR ($p<0.05$). There was significant correlation between the number of peritumoral vessel on CE-UHR-CTA with DLR and surgical time (artery phase; $r=0.43$, $p<0.05$, venous phase; $r=0.40$, $p<0.05$), although there were no significant correlations between that on CE-UHR-CTA with hybrid-type IR at each phase and surgical time or between each CE-UHR-CTA and intraoperative bleeding volume ($p>0.05$).

CONCLUSION

s DLR has a potential for improving the depiction of peritumoral vessels and capability for predicting surgical risk for intracranial meningiomas on CE-UHR-CTA.

CLINICAL RELEVANCE/APPLICATION

DLR has a potential for improving the depiction of peritumoral vessels and capability for predicting surgical risk for intracranial meningiomas on CE-UHR-CTA.

W5B-SPNR-17 Unsupervised identification of MRI artifacts via integration of deep learning and image quality measures

Participants
Thomas Desilvio, Cleveland, OH (*Presenter*) Nothing to Disclose

PURPOSE

Brain MRI scans are widely used for neurological evaluation, but often can be compromised by artifacts (e.g., ringing, ghosting, motion). Identifying specific MRI artifacts is critical for refining imaging protocols and guiding post-processing and downstream analysis that can enhance clinical and research interpretation; but requires time intensive and often subjective effort. We present results for unsupervised identification of brain MRI artifacts via automated integration of deep learning with MR quality measures (QMs).

METHODS AND MATERIALS

Using cohorts from ABIDE-I (17 institutes, 1102 T1w MRIs, 3 reader quality ratings) a ResNet18 model was trained (n=454, 15 institutions) with labels of good quality (GQ) / poor quality (PQ), assigned based on rating agreement by 2+ readers. TCGA-GBM (5 institutes, 152 T1-POST MRIs) were then evaluated by three radiologists who labeled each scan as harboring each artifact type (ghosting, banding, motion, ringing) or otherwise; which was used as ground truth. Model inference was performed on the unseen TCGA-GBM cohort to yield 64 final-layer DL features per scan. 15 QMs (e.g., SNR, intensity-based contrast, variation, entropy measurements) via the MRQy tool were also extracted from each TCGA-GBM scan. 3 sets of features underwent unsupervised consensus clustering (see figure 1). Each clustering result was evaluated by identifying cluster correspondence with artifact type, and then calculating fraction of datasets per artifact group correctly clustered together to yield cluster overlap accuracy.

RESULTS

Combining DL and QMs achieved the best overall cluster overlap accuracies across all artifact types: 0.82 (banding), 0.78 (motion), 0.77 (ringing), and 0.84 (ghosting). QMs clustering achieved lower cluster overlap accuracies of 0.71 (banding), 0.75 (motion), 0.79 (ringing), and 0.80 (ghosting). DL features alone performed significantly worse with accuracies of 0.52 (banding), 0.63 (motion), 0.68 (ringing), and 0.66 (ghosting).

CONCLUSION

s Combined DL quality evaluation and image quality measures can enable unsupervised detection of brain MRI image artifacts.

CLINICAL RELEVANCE/APPLICATION

Detection of specific MRI image artifacts aids downstream image analysis and imaging protocol improvement. Deep learning and standard image quality measures appear complementary for this task.

W5B-SPNR-18 Tailoring radiologist behaviour by individualising F beta levels for predictions of an AI model

Participants
Peter R. Brotchie, MBBS, PhD, Fitzroy, Australia (*Presenter*) Consultant, Annalise-AI Pty Ltd

PURPOSE

When interpreting diagnostic imaging studies, radiologists rate of false negatives tends to higher than false positives on average, resulting in higher precision than recall. This is not desirable for critical findings where the cost of a false negative (eg. missed bleed) is greater than the cost of a false positive (eg. unnecessary MRI scan). The relative importance of recall and precision can be chosen for AI model predictions by choosing F-beta values for model thresholds. Our study assessed whether differences in F-beta values for the model findings influenced the radiologist precision and recall balance.

METHODS AND MATERIALS

A comprehensive CT brain convoluted neural network algorithm was used to investigate the effect of F-beta values of thresholds across a number of clinical findings, when comparing radiologist performance with and without the AI model assistance. F-beta values were chosen based on the criticality of the finding. The change in precision and recall for radiologists unassisted vs assisted was compared between groups of findings with F-beta values greater than 1, equal to 1 and lower than 1.

RESULTS

When unaided, radiologists' precision was higher than recall across all three groups of findings. When aided by the AI, radiologists' precision remained higher than recall for findings with an F-beta value of less than 1. However, for findings with F-beta values greater than 1 (critical findings), the recall significantly increased without a decrement in precision, resulting in higher recall than precision (Fig 1).

CONCLUSION

s Altering the F-beta levels for finding predictions by a CT brain AI model markedly changed the behaviour of radiologists when using the model, influencing them to significantly increase recall over precision for critical findings.

CLINICAL RELEVANCE/APPLICATION

This is a desirable result as the ratio of false positives to false negatives should be based on the criticality of a finding given that the cost of a false negative will be higher than a false positive for critical findings.

W5B-SPNR-2 Clinical evaluation of deep-learning model for an automatic scoring of Alberta Stroke Program Early CT Score (ASPECTS) on non-contrast CT: A comparison study to the consensus of experts

Participants
Jin Soo Lee, Suwon, Korea, Republic Of (*Presenter*) Nothing to Disclose

PURPOSE

Since the ASPECTS has been used in clinical practice for over 20 years, the most prominent problem is the inter-rater difference. It may result from the rater's experience, or it may be according to the infarction around the borderline. Due to these differences, there have been required to consistent ASPECTS calculation, and recently, software has been reported to produce coherent ASPECTS using deep-learning technique. Therefore, in this study, the clinical applicability of deep learning-based software will be evaluated by comparing to the consensus of two experienced experts.

METHODS AND MATERIALS

The non-contrast CT (NCCT) of 487 AIS patients were used for learning the model, and it was included only cases in which MRI were taken within an hour after NCCT scanning. For the model learning, one experienced stroke expert evaluated whether the occurrences of early ischemic change (EIC) and old infraction (OI) in NCCT images by referring to MRI, such as DWI, ADC, and FLAIR. 326 patients were registered in the clinical evaluation. The results of the model were compared with the consensus generated by two stroke experts. A comparison between the deep-learning model and the experts' consensus was conducted by the Bland and Altman (BA) agreement. Finally, with the consensus as the ground truth, the sensitivity and specificity of the model for 10 regions of interest (ROIs) were calculated.

RESULTS

The BA agreement had a mean difference of 0.032 [95% confidence interval (CI): -0.076 ~ 0.141], and the upper and lower limit of agreement (LOA) were 2.8 [95% CI: 2.615 ~ 2.986] and -2.736 [95% CI: -2.914 ~ -2.55], respectively. For ASPECTS calculation, sensitivity and specificity to detect the EIC for 10 ROIs were 0.628 [95% CI: 0.585 ~ 0.671] and 0.966 [95% CI: 0.961 ~ 0.97], respectively. Also, in the dichotomized analysis based on 4 points (=4 vs. >4), the sensitivity and specificity were 0.972 [95% CI: 0.959 ~ 0.985] and 0.619 [95% CI: 0.472 ~ 0.766], respectively.

CONCLUSION

s The deep-learning model proposed for automatic ASPECT scoring confirmed reasonable agreement and accuracy compared with expert consensus; therefore, it is highly recommended to use for assisting clinicians in clinical environment.

CLINICAL RELEVANCE/APPLICATION

This deep-learning model has been integrated into the commercial Heuron-cASPECTS software. It will be a useful tool for clinicians to make fast decision of diagnosis and treatment, especially, it will be valuable in remote regions where neuro-radiology expert may be limited.

Participants

W5B-SPNR-20 Multi-Center Radiomics Analysis Predict Pseudo-Progression vs. True Progression in Glioblastoma Patients

Murat AK, MD, Pittsburgh, PA (*Presenter*) Nothing to Disclose

PURPOSE

To discriminate progressive disease (PD) vs. pseudoprogression (PsP) utilizing the radiomics analysis in glioblastoma (GBM).

METHODS AND MATERIALS

We evaluated 686 patients from three institutions of which 487 were TP, and 199 were PsP. We segmented edema, contrast enhancement, necrosis, and hemorrhage for each patient. Their respective contralateral white matter (cWM) regions of interest (ROI). 205 texture features were extracted from each sequence's volume of interest (VOI), including 10 histogram-based first-order features and 195 second-order gray-level co-occurrence matrices features. After normalization, , the 195 second-order features were divided by their volume to produce 195 volume-independent—a total of 400 features extracted per VOI and 1600 features per patients. We removed features that are highly correlated (Pearson's correlation coefficient >0.80) and performed feature selection on the remaining features using the SHapley Additive exPlanations (SHAP) package that measures the feature importance. We split the cohort into 90% training and 10% testing. We used XGBoost algorithm to generate the radiomics model. The predictive performance of the models for classifying each lesion (PD versus PSP) was estimated using the receiver operating characteristic curve, summarized as the area under the curve.

RESULTS

Out of the 1600 total features, 1491 features correlated greater than 0.80. These highly correlated features were removed from the total set, leaving 109 features. Feature selection with SHAP method on 109 features identified 86 that contribute highly to the outcome prediction. 30 of the 86 were most relevant and were used for model building. Our model`s training set accuracy with 10-fold cross-validation was 80%, and the testing set accuracy was 81%, with sensitivity and specificity of 79% and 84%, respectively.

CONCLUSION

s Our study presents a radiomics model that can successfully differentiate between PD vs. PsP in GBM patients.

CLINICAL RELEVANCE/APPLICATION

PsP can mimic PD radiographically; our study presents a radiomics model for noninvasive, individualized prediction of PsP in GBM at the time of the clinical question.

W5B-SPNR-4 Investigationon the image quality of head and neck CTA using energy spectrum combined with adaptive iterative scanning and deep learning algorithm

Participants
Deng Jie, (*Presenter*) Nothing to Disclose

PURPOSE

To investigate the influence and application value of spectral CT single-energy imaging combined with adaptive iterative reconstruction (ASIR) technology and deep learning algorithm on head and neck CT angiography (CTA).

METHODS AND MATERIALS

Comparison of energy spectrum (40kev, 60kev, 80kev) scanning, adaptive statistical iterative reconstruction algorithm (Adaptive Statistical Iterative Reconstruction-Veo, ASIR-V) and deep learning algorithm (DLIR-L, DLIR-M, DLIR-H) in 88 patients undergoing head and neck CTA examinationimage quality, volume projection and maximum density projection processing were performed on a total of five sets of images. The effects of different reconstruction methods on the image quality of head and neck CTA were evaluated from the two aspects of objective measurement and subjective score.

RESULTS

Objective evaluation: The CT value, SD value, SNR, and CNR of images with different reconstruction methods in each blood vessel in the seven groups were statistically different in each part (P<0.05). Partial analysis of the aortic arch DLIR-H>DLIR-L>ASIR40%>60kev>80kev>40kev (24.72±5.72, P<0.005) was statistically significant, In the SNR comparison, the aortic arch part DLIR-H>DLIR-L>ASIR-40%>60kev>80kev>40kev (28.41±35.06P<0.05), Comparing the CNR part again, DLIR-H has the highest CNR in the aortic arch, middle cerebral artery, vertebral artery and basilar artery, respectively (80.71±112.93) and (76.57±84.33) (63.84±32.94) (59.51±29.48) (P<0.05), with statistical difference. Subjective evaluation: Between each group, the Kappa value of the subjective score of the two diagnostic group physicians for the image reconstruction quality was 0.72. The scores of VR reconstructed images showed no statistical difference between the groups (P=0.668). There was no statistical difference in the scores of MIP reconstruction images among the groups (P=0.467). CPR reconstruction image score DLIR-H group >DLIR-M group >DLIR-L group>ASiR-40% group>A3 group>A2 group>A1 group, there were significant differences in the scores among the groups (P<0.05).

CONCLUSION

s In terms of image quality of head and neck CTA examination, DLIR can reduce image noise, improve image SNR, and lower radiation dose than ASIR reconstruction technology and energy spectrum scanning. be applied in.

CLINICAL RELEVANCE/APPLICATION

Different reconstruction methods applied to head and neck CTA scanning, DLIR has more advantages than ASIR reconstruction and energy spectrum scanning technology.

W5B-SPNR-5 Faster, Lighter, Scalable: Harnessing data-mined line annotations for automated tumor segmentation on brain MRI

Participants

Vivek Yadav, MS, BEng, (*Presenter*) Stockholder, Moderna, Inc

PURPOSE

Tumor segmentation provides more accurate quantification of tumor burden versus linear measurement and is the major prerequisite step for radiomic analysis. While fully-supervised learning can yield high-performing segmentation models, the time and effort required to manually label large training sets limits clinical utility. We investigate whether datamined tumor line annotations can be utilized to develop a brain MRI tumor segmentation model without the need for manually segmented training data.

METHODS AND MATERIALS

In this retrospective study, a previously described tumor detection model trained using clinical line annotations mined from PACS was leveraged with unsupervised segmentation (Otsu thresholding) to generate pseudo-masks of enhancing tumors on T1-weighted post-contrast images. Pseudo-masks were used to train baseline segmentation models using Mask R-CNN and HRNet architectures, which were employed within a semi-supervised learning (SSL) framework to automatically refine the pseudo-masks. Following each self-refinement cycle, a new model was trained and tested on a held-out set consisting of 319 manually segmented images from 93 adult patients (278 intra-axial and 88 extra-axial tumors) and performance evaluated using Dice score (DSC). The SSL cycles continued until performance peaked or plateaued. Two deployment methods were compared: (1) conventional end-to-end segmentation, and (2) a hybrid pipeline combining end-to-end segmentation with detection plus patch-wise segmentation.

RESULTS

Baseline segmentation models achieved DSC of 0.838 (Mask R-CNN) and 0.841 (HRNet), which improved with self-refinement to 0.871 (after 8 cycles) and 0.873 (after 7 cycles), respectively. The hybrid pipeline (maximum DSC 0.884, Mask R-CNN) outperformed end-to-end segmentation (maximum DSC 0.873, HRNet).

CONCLUSION

s Line annotations mined from PACS can be harnessed in concert with unsupervised and semi-supervised techniques to achieve high-performing brain MRI tumor segmentation models, avoiding the need for manually segmented training data. This development pipeline provides a potential mechanism to rapidly establish tumor segmentation capabilities across imaging modalities.

CLINICAL RELEVANCE/APPLICATION

Accurate segmentation of tumors on brain MRI is achieved by leveraging clinical line annotations from PACS within an automated pipeline, avoiding the need for any manually segmented training data.

W5B-SPNR-6 Investigation on iodine suppression effect of virtual non-contrastedimages in different concentrations of iodine: A Phantom Study

Participants
Yaoxing Ma, (*Presenter*) Nothing to Disclose

PURPOSE

To investigate the value of virtual non-contrasted images in suppressing iodine in different concentrations of iodine.

METHODS AND MATERIALS

A polypropylene cylindrical phantom(QSP Phantom dimension) with nine tubes containing different concentrations of iodine (0, 2.5, 5, 10, 20 mgI/ml) was scanned using a spectral CT (Revolution, GE Healthcare) in gemstone spectral imaging (GSI) mode using fast kV switch (80/140 kV), the tube current is 485mA, the layer thickness is 1.25mm, the collimation width is 80mm,noise index (NI) 5HU, pitch 0.992:1. pre-ASiR-V 30% weight was used for gemstone spectral CT scanning. The CT and SD values of the images before and after iodine suppression of 20%, 10%, 5% and 2.5% iodine were measured. The area of region of interest (ROI) was 1 / 2-1 / 3 of the cross-sectional area of the somatosensory canal, and the size was consistent, The iodine suppression rate of different concentrations of iodine was calculated (iodine suppression rate = {(CT value 1-CT value 2) / CT value 1} * 100%, CT value 1 was the CT value of the image before iodine suppression, CT value 2 was the CT value of the image after iodine suppression). The difference between the two groups was compared by one-way ANOVA, and the difference was statistically significant ($P < 0.05$).

RESULTS

The CT value of iodine 20 before iodine suppression was 431.5 ± 67Hu, iodine 10, CT value was 211.89 ± 57Hu, iodine 5 CT value was 107.09 ± 82Hu, iodine 2.5, CT value was 53.93 ± 68Hu, the difference between the two groups was statistically significant ($P < 0.05$); The CT value of iodine 20 after iodine suppression was 14.34 ± 42Hu, iodine 10, CT value was 13.84 ± 80Hu, iodine 5 CT value was 15.2 ± 62Hu, iodine 2.5, CT value was 13.99 ± 46Hu, there was no significant difference between the two groups ($P > 0.05$). The iodine inhibition rates of iodine 20, 10, 5 and 2.5 were 96.67%, 93.45%, 85.77%, 74.02% respectively, and the iodine inhibition rates gradually decreased, and the difference between the groups was statistically significant ($P < 0.05$).

CONCLUSION

s From the evaluation of iodine suppression rate and CT value of virtual plain scan (VNC) images with different concentrations of iodine, the virtual plain scan (VNC) iodine suppression technology has a good effect on different concentrations of blood vessels.

W5B-SPNR-7 Can Machine Learning Be Better Than Biased Readers?

Participants
Rui Zhu, BSc, Toronto, ON (*Presenter*) Nothing to Disclose

PURPOSE

The purpose is to determine if machine learning algorithms can overcome reader biases and more closely match multiple reader consensus than individual readers' diagnostic accuracy when training a binary convolutional neural network (CNN) classifier. Training deep learning models in medical imaging requires large amounts of labeled data. It is common to divide the training data amongst multiple readers with varying levels of expertise to minimize the effort. Alternatively, multiple small datasets labeled by different readers are combined for training. In both scenarios the readers' consensus is not obtained leading to a biased dataset.

METHODS AND MATERIALS

This study used a binary-class chest X-ray dataset and corresponding labels of pediatric pneumonia obtained from Guangzhou Women and Children's Medical Center. Wrong labels are generated for biased readers by sampling from the probability distribution of their biases defined by Bernoulli distributions of producing an observed label given the true label. The true labels were assumed to be the consensus of the readers. The readers' performances were evaluated based on their annotations on the test set. The models' testing performances were compared to readers' performances. Resnet18 without transfer learning was used as baseline model. A variation of Resnet18 with modified loss function was used as an improvement on the baseline model.

RESULTS

The baseline model's test accuracy was higher than the average accuracy of the biased readers (59%-69%) by 2%-9% when the average accuracy of all readers was 73%-79%. The improved model with the modified loss function trained on a dataset containing 30% biased labels achieved 86% test accuracy, being higher than the average of all readers (69%), when readers' labels can compensate each other's errors. The improved model with the modified loss function produced more robust accuracies (79%-86%) than the baseline model (70%-83%) while varying the strengths and the types of the biases held by the readers.

CONCLUSION

s This study demonstrated that it is possible for machine learning algorithms to overcome individual readers' biases in training a binary CNN classifier. It is recommended to use robust loss functions as they are easy to implement and effective in mitigating biased labels.

CLINICAL RELEVANCE/APPLICATION

AI technology assists medical practitioners to analyze radiological images efficiently to inform patients of their condition timely. Our study focuses on training AI on datasets with biased labels.

W5B-SPNR-9 Effectiveness of a Convolutional Neural Network Artificial Intelligence Algorithm in the Detection of Intracranial Hemorrhage on Noncontrast CT Imaging

Participants
Ayden Jacob, Boca Raton, FL (*Presenter*) Consultant, Aidoc Medical Ltd

PURPOSE

Radiologic misdiagnosis of intracranial hemorrhage (ICH) may result in poor patient outcomes. This study aimed to assess the accuracy and clinical viability of an AI-based algorithm in the detection of ICH on noncontrast CT (NCCT) imaging.

METHODS AND MATERIALS

An FDA approved AI solution based on a convolutional neural network was used to assess 8468 NCCTs. Data was collected from 29 different facilities. Slice thickness ranged from 0.625 mm to 5mm. NCCTs were retrospectively processed through the AI solution and assigned a positive or negative for ICH allocation. Each report was analyzed by a natural language processing software and assigned a positive or negative for ICH allocation per the radiologist's interpretation. Cases were stratified as concordant, wherein the radiologist and AI interpretation agreed, and discordant, in which interpretations differed. NLP results for discordant cases were externally validated. 2 board certified neuroradiologists and 1 general radiologist assessed discordant NCCTS for ICH to determine ground truth by majority opinion.

RESULTS

98 AI positives were engaged with by the radiologist at the time of data collection and were excluded from the cohort. Concordant cases included 288 double positives (AI+/Rad+) and 7950 double negatives (AI-/Rad-). 132 discordant cases included 100 scans positive by AI and negative per radiologist's report (AI+/Rad-), and 32 scans negative by AI and positive by report (AI-/Rad+). Following consensus review by 3 radiologists, individual and combined accuracy metrics were acquired for both entities. Radiologist metrics included an accuracy of 99.1%, sensitivity of 94.5%, and a specificity of 99.9%. AI demonstrated an accuracy of 98.8%, sensitivity of 93.6%, and a specificity of 99.1%. Differences in accuracy and specificity were statistically significant ($p<.00001$) whereas sensitivity was not ($p=.61708$). Combined accuracy was 99.6% with minimal loss of specificity (99%). The radiologists detected 309 positive cases, and an additional 18 ICHs were detected by the AI solution, providing an added detection rate of 5.8%.

CONCLUSION

s This study demonstrates that an AI-solution can assist radiologists in the diagnosis of ICH. Radiologists leveraging AI-solutions have an increased sensitivity in the detection of ICH.

CLINICAL RELEVANCE/APPLICATION

The combined precision and accuracy of the AI-radiologist combination highlights the value of coupling a high sensitivity screening test (AI) with a higher specificity validation test (radiologist). Synergy between radiologists and AI solutions in the detection of ICH may improve patient outcomes through minimizing false negative rates.

Minimum Number of Segmentations Required to Develop a Glioma Volumetric Auto-Segmentation Algorithm

Wednesday, Nov. 30 12:45PM - 1:15PM Room: Learning Center - NR DPS

Participants
Irene Dixe de Oliveira Santo, MD, New Haven, CT (*Presenter*) Nothing to Disclose

PURPOSE

Volumetric segmentation of gliomas provides valuable information on tumor morphology compared to the standard linear or two-dimensional measurements. However, it has yet to be implemented into routine clinical practice. Some of the major barriers include the amount of time required for manual segmentation and the high intra- and inter-reader variability. One possible solution may involve the use of fully automatic machine learning volumetric segmentation algorithms trained and validated on clinical imaging data.

METHODS AND MATERIALS

A U-Net-based segmentation algorithm was trained on 1251 gliomas from the multi-institutional BraTS 2021 dataset, and tested on our institution's internal database, consisting of images from 285 gliomas. Testing was divided into six batches, the first being comprised of 35 cases, and the remaining five containing 50 cases per batch. The algorithm's output consisted of "Whole" (FLAIR, hyperintensity), "Core" (PGSE or PGGE, T1c + hyperintensity), and "Necrotic" segmentations (PSGE or PGGE, central non-enhancement). DICE scores were calculated as a measure of overlap between the algorithm's segmentations and the manual segmentations by a board-certified neuroradiologist.

RESULTS

The DICE scores mean for whole tumor segmentation of the BraTS 2021-trained U-Net-based algorithm was 0.82 in the initial batch (n = 35). Gradual training using the subsequent five internal batches improved the DICE scores mean to approximately 0.84 for "Whole" segmentations. After completion of gradual training, DICE scores for the "Core" and "Necrotic" segmentations were found to be approximately 0.63, and 0.32, respectively.

CONCLUSION

s Our results have shown that the segmentation algorithm performance can be improved with batches as small as 50 cases. DICE scores were highest for "Whole" segmentations, followed by "Core," with substantially lower performance for "Necrotic" segmentations.

CLINICAL RELEVANCE/APPLICATION

The creation of fully automated volumetric segmentation algorithms from small datasets may allow this data to be incorporated into routine clinical practice facilitating treatment-response estimation or early recurrence prediction.

Validating AI Model's Accuracy to Detect Intracranial Hemorrhage

Wednesday, Nov. 30 12:45PM - 1:15PM Room: Learning Center - NR DPS

Participants
Seema Al-Shaikhli, BS, (*Presenter*) Nothing to Disclose

PURPOSE

Timely detection of intracranial hemorrhage (ICH) is crucial to providing prompt life-saving measures. The application of artificial intelligence (AI) in detecting ICH has become increasingly prevalent as imaging utilization continues to rise. We aim to validate Viz.ai ICH, an AI application which identifies suspected ICH.

METHODS AND MATERIALS

A retrospective review of patients' radiology reports who received a non-contrast brain CT within a single institution between September 2021 and December 2021 was performed. Each report was reviewed for the presence of ICH and positive cases were categorized based on subtype, timing, and size/volume via imaging review by a neuroradiologist. The Viz.ai ICH output was reviewed for positive cases. Diagnostic performance was calculated by utilizing Viz.ai ICH as the index test and the radiologists' interpretation as the reference standard test.

RESULTS

A total of 4,203 non-contrast brain CTs were retrieved, of which 387 were positive per the radiology impression. Overall sensitivity of Viz.ai ICH was 68%, specificity was 99%, positive predictive value was 90%, and negative predictive value was 97%. Subgroup analysis was performed based on hemorrhage subtypes intraparenchymal, subarachnoid, subdural, and intraventricular, of which the sensitivities were calculated to be 86%, 57%, 56%, and 42% respectively. Further stratification revealed sensitivity improves with higher acuity and volume/size across all ICH subtypes. Meningioma was found to be a common false-positive finding (3 of 22, 14%).

CONCLUSION

s Overall diagnostic performance of the considered AI model was very promising, particularly for large volume/size ICH. As the AI algorithm continues to improve, the positive impact on patient care will be substantial.

CLINICAL RELEVANCE/APPLICATION

Accurate detection of ICH is essential for providing prompt treatment. AI alerts the radiologist to the presence of hemorrhage within 1-2 minutes from scan completion leading to faster diagnosis.

Super-dose: a deep learning method to increase the sensitivity of MRI in neuro-oncology via virtual contrast dose amplification

Wednesday, Nov. 30 12:45PM - 1:15PM Room: Learning Center - NR DPS

Participants
Samy Ammari, MD, PhD, Villejuif, France (*Presenter*) Nothing to Disclose

PURPOSE

Intravenous gadolinium-based contrast agents (GBCA) are particularly powerful to increase MRI sensitivity. However, the recent evidence of gadolinium deposition in various tissues prevents from simply increasing GBCA doses to further improve MRI diagnosis performance. In this study, we evaluate a deep learning method that amplifies the effects of GBCA injection on routine gradient echo brain T1 MRI.

METHODS AND MATERIALS

T1, T2-Flair, diffusion, quarter-dose T1ce (low-T1ce), standard-dose T1ce (T1ce) and T1ce with variable flip angles (vfa-T1ce) sequences were acquired during 250 MRI exams of patients with mixed conditions. A deep learning model was trained, using data from 150 exams, to virtually enhance low-T1ce into routine T1ce, using zero-dose sequences as complementary information. The trained model was then evaluated with the 100 remaining exams for its capacity to enhance the routine T1ce into relevant "super-dose" images (sup-T1ce). Tumor regions on synthetic sup-T1ce, routine T1ce and reference vfa-T1ce were analyzed in sub-regions by two experienced radiologists. Endpoints were to evaluate if sup-T1ce outperformed routine T1ce in terms of sensitivity (SE) and false detection rates (FDR).

RESULTS

Out of 187 masses diagnosed on vfa-T1ce, a significantly higher proportion was correctly identified on sup-T1ce than on T1ce (75% versus 59%, $p<0.001$). The FDR was slightly higher for sup-T1ce than for T1ce (0.14/case versus 0.05/case), but this difference was not significant. For both sup-T1ce and T1ce, no significant differences were found between examiners in terms of SE or FDR. Detection metrics improved when only larger lesions were considered, with SE reaching up to 96% for sup-T1ce and 88% for T1ce ($p=0.008$) at the 10 millimeters threshold. For all lesion sizes, the SE of sup-T1ce remained significantly higher than T1ce, and no statistical difference was found in terms of FDR.

CONCLUSION

s Our deep learning model significantly improved the sensitivity of routine contrast-enhanced brain T1 MRI sequences without degrading its specificity.

CLINICAL RELEVANCE/APPLICATION

A higher sensitivity of brain MRI may allow the detection of smaller tumors and thus earlier treatment onsets, ultimately improving patient survival.

Direct Comparison of Traditional Machine Learning and Deep Learning Commercial Artificial Intelligence Solutions for Detection of Large Vessel Occlusion

Wednesday, Nov. 30 12:45PM - 1:15PM Room: Learning Center - NR DPS

Participants
Jacob Schlossman, (*Presenter*) Nothing to Disclose

PURPOSE

Despite the availability of commercial artificial intelligence tools for large vessel occlusion (LVO) detection, there is a lack of data comparing traditional machine learning and deep learning solutions in a real-world setting. The purpose of this study is to compare and validate the performance of two AI-based tools for LVO detection in anterior circulation stroke.

METHODS AND MATERIALS

This was a retrospective, single center study performed at a comprehensive stroke center using anonymized data from December 2020 to June 2021. A total of 263 CTA cases for suspected stroke were included. RAPID LVO is a traditional machine learning model which primarily relies on vessel density threshold assessment, while CINA LVO is an end-to-end deep learning tool implemented with multiple neural networks for detection and localization tasks. Ground truth was based off interpretation of the raw data from the CTA by radiology reports and confirmed by a board-certified neuroradiologist (9 years experience). Performance metrics were analyzed by location of LVO: ICA, M1 MCA, or both. Patients with isolated M2 middle cerebral artery (MCA) occlusions were analyzed separately.

RESULTS

There were 29 positive and 224 negative LVO cases. RAPID LVO demonstrated an accuracy of 0.86, sensitivity of 0.90, specificity of 0.86, PPV of 0.45, and NPV of 0.98, while CINA demonstrated an accuracy of 0.96, sensitivity of 0.76, specificity of 0.98, PPV of 0.85, and NPV of 0.97. Of the 29 positive LVO cases, there were 11 ICA LVOs and 23 M1 LVOs based on the ground truth. There were 5 patients who were observed as having both an ICA and M1 LVO. For ICA LVOs, RAPID demonstrated a sensitivity of .63, while CINA demonstrated a sensitivity of .22. For M1 LVOs, RAPID demonstrated a sensitivity of 0.80, while CINA demonstrated a sensitivity of .70. Of the 10 M2 LVOs analyzed separately, there were 8 positive and 2 negative cases. CINA and RAPID both recognized the two negative cases as such. CINA successfully detected 3/8 positive M2 LVOs, while RAPID successfully detected 8/8.

CONCLUSION

s Both tools successfully detected the majority of ICA and M1 MCA occlusions. RAPID had overall higher sensitivity while CINA had higher accuracy and specificity. Interestingly, both tools were able to detect some, but not all M2 MCA occlusions.

CLINICAL RELEVANCE/APPLICATION

This is the first study to compare the performance of traditional and deep learning LVO tools in the clinical setting. Future research could assess how the tools impact radiology turnaround times and door-to-treatment times. As more automated LVO tools become commercially available, it will be paramount to conduct comparison studies to validate their performance and understand their limitations.

Artificial Interlligence-based Evaluation of Brain Metastasis Enables Clinical Referral Suggestion: A Clinical Cohort Study

Wednesday, Nov. 30 12:45PM - 1:15PM Room: Learning Center - NR DPS

Participants
Hana Jeong, MD, Seoul, Korea, Republic Of (*Presenter*) Nothing to Disclose

PURPOSE

Artificial intelligence (AI) enables detection, lesion counts, and volumetry of brain metastasis. AI metastasis detection that incorporates black-blood imaging with reduced false positives may provide therapeutic guidance. We aimed to test clinical referral suggestions for patients with brain metastasis based on AI evaluation.

METHODS AND MATERIALS

In this retrospective study, we applied AI for brain metastasis on black-blood imaging for consecutive 131 patients who had been diagnosed and treated for newly developed brain metastases in solid tumors between October 2020 and April 2021. The algorithm detects, counts, and segments brain metastasis. Based on the number and volume of metastases detected by AI, initial clinical referrals were suggested as one of following 4 categories: short-term imaging follow-up without treatment (group A), surgery (B), stereotactic radiosurgery (C), and whole brain radiotherapy or systematic chemotherapy (D). Performance was validated by comparing with the actual clinical decisions according to the European Association of Neuro-Oncology (EANO)-European Society for Medical Oncology (ESMO) guidelines.

RESULTS

Total 131 patients were included (mean age 64.2 years, 59% male). The mean number and volume of AI detected metastases were significantly different among groups (Kruskal-Wallis test, P -= .001 and .001, respectively), with the largest number and volume in group D (mean number and volume, 27.8 and 5256.0mL), followed by group C (4.2 and 1141.1 mL), B (1.0 and 800.0 mL), and A (1.4 and 21.8 mL). AI system proposed the referral suggestions same as the actual clinical decisions with an accuracy of 84.0% (110/131) of the patients in the validation set.

CONCLUSION

s AI based evaluation of metastasis detection and volumetry can suggest clinical referrals, showing great accuracy compared to actual clinical decisions. It may be used in clinical settings where prompt and accurate treatment decisions are required.

CLINICAL RELEVANCE/APPLICATION

For patients with newly diagnosed brain metastasis, AI algorithm of detection and segmentation can aid in evaluation by providing prompt and consistent clinical referrals to clinicians, which can lead to better patient outcomes.

Retrospective Study for Automated Detection of Critical Findings in Multiparametric Brain MRI Using 3D Neural Networks in Emergency Room According to Infarction Size

Wednesday, Nov. 30 12:45PM - 1:15PM Room: Learning Center - NR DPS

Participants
Jimin Kim, MD, Seoul, Korea, Republic Of (*Presenter*) Nothing to Disclose

PURPOSE

The early diagnosis of acute ischemic lesion is very crucial because the prognosis is highly dependent on time. The infarction size is one of the most important prognosis factors. In this paper, we validate a deep learning based research application according to clinical importance such as infarction size.

METHODS AND MATERIALS

833 MRI exams performed in emergency department were retrospectively reviewed by two neuroradiologists. Two were excluded due to severe metallic artifacts and cervical cord infarction. Reviewers were blinded to patient's information and each other's results. We categorized infarction into 5 visual classes according to size; Class 1 = lacunar infarction (n=80), Class 2 = smaller than one-half lobar infarction (n=48), Class 3 = larger than one-half lobar and up to one lobar infarction (n=19), Class 4 = multilobar infarction (n=21) and Class 5 = embolic infarction (n=43). Especially, lacunar infarctions were reviewed by three neuroradiologists because of their ambiguity. All 831 cases were also processed by an AI-based research application (NeuroTriage, Siemens Healthcare, Germany)

RESULTS

The research application showed sensitivity/specificity/area under the receiver operating characteristic curve (AUC) of 79.1%/92.3%/0.888 for overall infarction. For Class 1, the performance was 62.5%/92.3%/0.727. For Class 2, performance was 85.4%/92.3%/0.855. For Class 3, performance was 100%/92.3%/0.919. For Class 4, performance was 95.2%/92.3%/0.905. For Class 5, performance was 86%/92.3%/0.844. Mean diagnosis time was 64hr 47min 19sec for readers and 60.8sec for research application, with 99.9% time reduction.

CONCLUSION

s The diagnostic performance for acute infarction of research application was good to excellent except for Class 1 infarction, which was fair. It tends to show better performance in the infarction of higher clinical importance. This study shows how the performance is based on its clinical significance and it is very novel way in evaluating infarction through deep learning algorithm. The processing time of the application was significantly faster than of radiologists.

CLINICAL RELEVANCE/APPLICATION

Therefore, the application could aid the fast diagnosis and decision making of acute infarction in general situations and reduce time duration for stroke patients to receive appropriate treatment.

Deep Learning Reconstruction vs. Hybrid-Type Iterative Reconstruction: Capability for Image Quality Improvements of Peritumoral Vessels and Predicting Surgical Risks for Intracranial Meningiomas on Contrast-Enhanced CT Angiography

Wednesday, Nov. 30 12:45PM - 1:15PM Room: Learning Center - NR DPS

Participants
Kazuhiro Murayama, MD, Toyoake, Japan (*Presenter*) Research Grant, Canon Medical Systems Corporation

PURPOSE

To determine the capability of deep learning reconstruction (DLR) for image quality improvements of peritumoral vessels and determine the relationship between peritumoral vessel number and surgical risk for intracranial meningiomas on contrast-enhanced ultra-high resolution CT angiography (CE-UHR-CTA) as compared with hybrid-type iterative reconstruction (IR).

METHODS AND MATERIALS

29 patients with intracranial meningiomas underwent brain CE-UHR-CTA and were reconstructed by DLR and hybrid-type IR and surgical resection. To assess surgical risk in each patient, surgical time and intraoperative bleeding volume were recorded. To determine the utility of DLR for CE-UHR-CTA, CT value of peritumoral vessels and SD of normal appearance white matter (NAWM) were assessed by ROI measurements at arterial and venous phases. Image J software was used to analyze particles to define the number of peritumoral vessels with the threshold. For quantitative image quality assessment, the number of vessels, SNR in peritumoral area and CNR between peritumoral vessel and NAWM were determined at each phase. To compare the quantitative indexes between two methods, CT values, SD, SNR, CNR and the number of peritumoral vessels on CE-UHR-CTA at each phase were compared between DLR and hybrid-type IR by Wilcoxon signed rank test. Then, number of peritumoral vessel on each CE-UHR-CTA were correlated with surgical risk by Pearson's correlation was performed.

RESULTS

CT values, SNR and CNR of DLR at each phase were significantly higher than those of hybrid-type IR ($p<0.05$). The number of peritumoral vessel on CE-UHR-CT reconstructed with DLR was significantly higher than that with hybrid-type IR ($p<0.05$). There was significant correlation between the number of peritumoral vessel on CE-UHR-CTA with DLR and surgical time (artery phase; $r=0.43$, $p<0.05$, venous phase; $r=0.40$, $p<0.05$), although there were no significant correlations between that on CE-UHR-CTA with hybrid-type IR at each phase and surgical time or between each CE-UHR-CTA and intraoperative bleeding volume ($p>0.05$).

CONCLUSION

s DLR has a potential for improving the depiction of peritumoral vessels and capability for predicting surgical risk for intracranial meningiomas on CE-UHR-CTA.

CLINICAL RELEVANCE/APPLICATION

DLR has a potential for improving the depiction of peritumoral vessels and capability for predicting surgical risk for intracranial meningiomas on CE-UHR-CTA.

Unsupervised identification of MRI artifacts via integration of deep learning and image quality measures

Wednesday, Nov. 30 12:45PM - 1:15PM Room: Learning Center - NR DPS

Participants
Thomas Desilvio, Cleveland, OH (*Presenter*) Nothing to Disclose

PURPOSE

Brain MRI scans are widely used for neurological evaluation, but often can be compromised by artifacts (e.g., ringing, ghosting, motion). Identifying specific MRI artifacts is critical for refining imaging protocols and guiding post-processing and downstream analysis that can enhance clinical and research interpretation; but requires time intensive and often subjective effort. We present results for unsupervised identification of brain MRI artifacts via automated integration of deep learning with MR quality measures (QMs).

METHODS AND MATERIALS

Using cohorts from ABIDE-I (17 institutes, 1102 T1w MRIs, 3 reader quality ratings) a ResNet18 model was trained (n=454, 15 institutions) with labels of good quality (GQ) / poor quality (PQ), assigned based on rating agreement by 2+ readers. TCGA-GBM (5 institutes, 152 T1-POST MRIs) were then evaluated by three radiologists who labeled each scan as harboring each artifact type (ghosting, banding, motion, ringing) or otherwise; which was used as ground truth. Model inference was performed on the unseen TCGA-GBM cohort to yield 64 final-layer DL features per scan. 15 QMs (e.g., SNR, intensity-based contrast, variation, entropy measurements) via the MRQy tool were also extracted from each TCGA-GBM scan. 3 sets of features underwent unsupervised consensus clustering (see figure 1). Each clustering result was evaluated by identifying cluster correspondence with artifact type, and then calculating fraction of datasets per artifact group correctly clustered together to yield cluster overlap accuracy.

RESULTS

Combining DL and QMs achieved the best overall cluster overlap accuracies across all artifact types: 0.82 (banding), 0.78 (motion), 0.77 (ringing), and 0.84 (ghosting). QMs clustering achieved lower cluster overlap accuracies of 0.71 (banding), 0.75 (motion), 0.79 (ringing), and 0.80 (ghosting). DL features alone performed significantly worse with accuracies of 0.52 (banding), 0.63 (motion), 0.68 (ringing), and 0.66 (ghosting).

CONCLUSION

s Combined DL quality evaluation and image quality measures can enable unsupervised detection of brain MRI image artifacts.

CLINICAL RELEVANCE/APPLICATION

Detection of specific MRI image artifacts aids downstream image analysis and imaging protocol improvement. Deep learning and standard image quality measures appear complementary for this task.

Tailoring radiologist behaviour by individualising F beta levels for predictions of an AI model

Wednesday, Nov. 30 12:45PM - 1:15PM Room: Learning Center - NR DPS

Participants
Peter R. Brotchie, MBBS, PhD, Fitzroy, Australia (*Presenter*) Consultant, Annalise-AI Pty Ltd

PURPOSE

When interpreting diagnostic imaging studies, radiologists rate of false negatives tends to higher than false positives on average, resulting in higher precision than recall. This is not desirable for critical findings where the cost of a false negative (eg. missed bleed) is greater than the cost of a false positive (eg. unnecessary MRI scan). The relative importance of recall and precision can be chosen for AI model predictions by choosing F-beta values for model thresholds. Our study assessed whether differences in F-beta values for the model findings influenced the radiologist precision and recall balance.

METHODS AND MATERIALS

A comprehensive CT brain convoluted neural network algorithm was used to investigate the effect of F-beta values of thresholds across a number of clinical findings, when comparing radiologist performance with and without the AI model assistance. F-beta values were chosen based on the criticality of the finding. The change in precision and recall for radiologists unassisted vs assisted was compared between groups of findings with F-beta values greater than 1, equal to 1 and lower than 1.

RESULTS

When unaided, radiologists' precision was higher than recall across all three groups of findings. When aided by the AI, radiologists' precision remained higher than recall for findings with an F-beta value of less than 1. However, for findings with F-beta values greater than 1 (critical findings), the recall significantly increased without a decrement in precision, resulting in higher recall than precision (Fig 1).

CONCLUSION

s Altering the F-beta levels for finding predictions by a CT brain AI model markedly changed the behaviour of radiologists when using the model, influencing them to significantly increase recall over precision for critical findings.

CLINICAL RELEVANCE/APPLICATION

This is a desirable result as the ratio of false positives to false negatives should be based on the criticality of a finding given that the cost of a false negative will be higher than a false positive for critical findings.

Clinical evaluation of deep-learning model for an automatic scoring of Alberta Stroke Program Early CT Score (ASPECTS) on non-contrast CT: A comparison study to the consensus of experts

Wednesday, Nov. 30 12:45PM - 1:15PM Room: Learning Center - NR DPS

Participants
Jin Soo Lee, Suwon, Korea, Republic Of (*Presenter*) Nothing to Disclose

PURPOSE

Since the ASPECTS has been used in clinical practice for over 20 years, the most prominent problem is the inter-rater difference. It may result from the rater's experience, or it may be according to the infarction around the borderline. Due to these differences, there have been required to consistent ASPECTS calculation, and recently, software has been reported to produce coherent ASPECTS using deep-learning technique. Therefore, in this study, the clinical applicability of deep learning-based software will be evaluated by comparing to the consensus of two experienced experts.

METHODS AND MATERIALS

The non-contrast CT (NCCT) of 487 AIS patients were used for learning the model, and it was included only cases in which MRI were taken within an hour after NCCT scanning. For the model learning, one experienced stroke expert evaluated whether the occurrences of early ischemic change (EIC) and old infraction (OI) in NCCT images by referring to MRI, such as DWI, ADC, and FLAIR. 326 patients were registered in the clinical evaluation. The results of the model were compared with the consensus generated by two stroke experts. A comparison between the deep-learning model and the experts' consensus was conducted by the Bland and Altman (BA) agreement. Finally, with the consensus as the ground truth, the sensitivity and specificity of the model for 10 regions of interest (ROIs) were calculated.

RESULTS

The BA agreement had a mean difference of 0.032 [95% confidence interval (CI): -0.076 ~ 0.141], and the upper and lower limit of agreement (LOA) were 2.8 [95% CI: 2.615 ~ 2.986] and -2.736 [95% CI: -2.914 ~ -2.55], respectively. For ASPECTS calculation, sensitivity and specificity to detect the EIC for 10 ROIs were 0.628 [95% CI: 0.585 ~ 0.671] and 0.966 [95% CI: 0.961 ~ 0.97], respectively. Also, in the dichotomized analysis based on 4 points (=4 vs. >4), the sensitivity and specificity were 0.972 [95% CI: 0.959 ~ 0.985] and 0.619 [95% CI: 0.472 ~ 0.766], respectively.

CONCLUSION

s The deep-learning model proposed for automatic ASPECT scoring confirmed reasonable agreement and accuracy compared with expert consensus; therefore, it is highly recommended to use for assisting clinicians in clinical environment.

CLINICAL RELEVANCE/APPLICATION

This deep-learning model has been integrated into the commercial Heuron-cASPECTS software. It will be a useful tool for clinicians to make fast decision of diagnosis and treatment, especially, it will be valuable in remote regions where neuro-radiology expert may be limited.

Multi-Center Radiomics Analysis Predict Pseudo-Progression vs. True Progression in Glioblastoma Patients

Wednesday, Nov. 30 12:45PM - 1:15PM Room: Learning Center - NR DPS

Participants
Murat AK, MD, Pittsburgh, PA (*Presenter*) Nothing to Disclose

PURPOSE

To discriminate progressive disease (PD) vs. pseudoprogression (PsP) utilizing the radiomics analysis in glioblastoma (GBM).

METHODS AND MATERIALS

We evaluated 686 patients from three institutions of which 487 were TP, and 199 were PsP. We segmented edema, contrast enhancement, necrosis, and hemorrhage for each patient. Their respective contralateral white matter (cWM) regions of interest (ROI). 205 texture features were extracted from each sequence's volume of interest (VOI), including 10 histogram-based first-order features and 195 second-order gray-level co-occurrence matrices features. After normalization, , the 195 second-order features were divided by their volume to produce 195 volume-independent—a total of 400 features extracted per VOI and 1600 features per patients. We removed features that are highly correlated (Pearson's correlation coefficient >0.80) and performed feature selection on the remaining features using the SHapley Additive exPlanations (SHAP) package that measures the feature importance. We split the cohort into 90% training and 10% testing. We used XGBoost algorithm to generate the radiomics model. The predictive performance of the models for classifying each lesion (PD versus PSP) was estimated using the receiver operating characteristic curve, summarized as the area under the curve.

RESULTS

Out of the 1600 total features, 1491 features correlated greater than 0.80. These highly correlated features were removed from the total set, leaving 109 features. Feature selection with SHAP method on 109 features identified 86 that contribute highly to the outcome prediction. 30 of the 86 were most relevant and were used for model building. Our model`s training set accuracy with 10-fold cross-validation was 80%, and the testing set accuracy was 81%, with sensitivity and specificity of 79% and 84%, respectively.

CONCLUSION

s Our study presents a radiomics model that can successfully differentiate between PD vs. PsP in GBM patients.

CLINICAL RELEVANCE/APPLICATION

PsP can mimic PD radiographically; our study presents a radiomics model for noninvasive, individualized prediction of PsP in GBM at the time of the clinical question.

W5B-SPNR-4

Investigationon the image quality of head and neck CTA using energy spectrum combined with adaptive iterative scanning and deep learning algorithm

Wednesday, Nov. 30 12:45PM - 1:15PM Room: Learning Center - NR DPS

Participants
Deng Jie, (*Presenter*) Nothing to Disclose

PURPOSE

To investigate the influence and application value of spectral CT single-energy imaging combined with adaptive iterative reconstruction (ASIR) technology and deep learning algorithm on head and neck CT angiography (CTA).

METHODS AND MATERIALS

Comparison of energy spectrum (40kev, 60kev, 80kev) scanning, adaptive statistical iterative reconstruction algorithm (Adaptive Statistical Iterative Reconstruction-Veo, ASIR-V) and deep learning algorithm (DLIR-L, DLIR-M, DLIR-H) in 88 patients undergoing head and neck CTA examinationimage quality, volume projection and maximum density projection processing were performed on a total of five sets of images. The effects of different reconstruction methods on the image quality of head and neck CTA were evaluated from the two aspects of objective measurement and subjective score.

RESULTS

Objective evaluation: The CT value, SD value, SNR, and CNR of images with different reconstruction methods in each blood vessel in the seven groups were statistically different in each part (P<0.05). Partial analysis of the aortic arch DLIR-H>DLIR-L>ASIR40%>60kev>80kev>40kev (24.72±5.72, P<0.005) was statistically significant, In the SNR comparison, the aortic arch part DLIR-H>DLIR-L>ASIR-40%>60kev>80kev>40kev (28.41±35.06P<0.05), Comparing the CNR part again, DLIR-H has the highest CNR in the aortic arch, middle cerebral artery, vertebral artery and basilar artery, respectively (80.71±112.93) and (76.57±84.33) (63.84±32.94) (59.51±29.48) (P<0.05), with statistical difference. Subjective evaluation: Between each group, the Kappa value of the subjective score of the two diagnostic group physicians for the image reconstruction quality was 0.72. The scores of VR reconstructed images showed no statistical difference between the groups (P=0.668). There was no statistical difference in the scores of MIP reconstruction images among the groups (P=0.467). CPR reconstruction image score DLIR-H group >DLIR-M group >DLIR-L group>ASiR-40% group>A3 group>A2 group>A1 group, there were significant differences in the scores among the groups (P<0.05).

CONCLUSION

s In terms of image quality of head and neck CTA examination, DLIR can reduce image noise, improve image SNR, and lower radiation dose than ASIR reconstruction technology and energy spectrum scanning. be applied in.

CLINICAL RELEVANCE/APPLICATION

Different reconstruction methods applied to head and neck CTA scanning, DLIR has more advantages than ASIR reconstruction and energy spectrum scanning technology.

W5B-SPNR-5

Faster, Lighter, Scalable: Harnessing data-mined line annotations for automated tumor segmentation on brain MRI

Wednesday, Nov. 30 12:45PM - 1:15PM Room: Learning Center - NR DPS

Participants
Vivek Yadav, MS, BEng, (*Presenter*) Stockholder, Moderna, Inc

PURPOSE

Tumor segmentation provides more accurate quantification of tumor burden versus linear measurement and is the major prerequisite step for radiomic analysis. While fully-supervised learning can yield high-performing segmentation models, the time and effort required to manually label large training sets limits clinical utility. We investigate whether datamined tumor line annotations can be utilized to develop a brain MRI tumor segmentation model without the need for manually segmented training data.

METHODS AND MATERIALS

In this retrospective study, a previously described tumor detection model trained using clinical line annotations mined from PACS was leveraged with unsupervised segmentation (Otsu thresholding) to generate pseudo-masks of enhancing tumors on T1-weighted post-contrast images. Pseudo-masks were used to train baseline segmentation models using Mask R-CNN and HRNet architectures, which were employed within a semi-supervised learning (SSL) framework to automatically refine the pseudo-masks. Following each self-refinement cycle, a new model was trained and tested on a held-out set consisting of 319 manually segmented images from 93 adult patients (278 intra-axial and 88 extra-axial tumors) and performance evaluated using Dice score (DSC). The SSL cycles continued until performance peaked or plateaued. Two deployment methods were compared: (1) conventional end-to-end segmentation, and (2) a hybrid pipeline combining end-to-end segmentation with detection plus patch-wise segmentation.

RESULTS

Baseline segmentation models achieved DSC of 0.838 (Mask R-CNN) and 0.841 (HRNet), which improved with self-refinement to 0.871 (after 8 cycles) and 0.873 (after 7 cycles), respectively. The hybrid pipeline (maximum DSC 0.884, Mask R-CNN) outperformed end-to-end segmentation (maximum DSC 0.873, HRNet).

CONCLUSION

s Line annotations mined from PACS can be harnessed in concert with unsupervised and semi-supervised techniques to achieve high-performing brain MRI tumor segmentation models, avoiding the need for manually segmented training data. This development pipeline provides a potential mechanism to rapidly establish tumor segmentation capabilities across imaging modalities.

CLINICAL RELEVANCE/APPLICATION

Accurate segmentation of tumors on brain MRI is achieved by leveraging clinical line annotations from PACS within an automated pipeline, avoiding the need for any manually segmented training data.

W5B-SPNR-6

Investigation on iodine suppression effect of virtual non-contrastedimages in different concentrations of iodine: A Phantom Study

Wednesday, Nov. 30 12:45PM - 1:15PM Room: Learning Center - NR DPS

Participants
Yaoxing Ma, (*Presenter*) Nothing to Disclose

PURPOSE

To investigate the value of virtual non-contrasted images in suppressing iodine in different concentrations of iodine.

METHODS AND MATERIALS

A polypropylene cylindrical phantom(QSP Phantom dimension) with nine tubes containing different concentrations of iodine (0, 2.5, 5, 10, 20 mgI/ml) was scanned using a spectral CT (Revolution, GE Healthcare) in gemstone spectral imaging (GSI) mode using fast kV switch (80/140 kV), the tube current is 485mA, the layer thickness is 1.25mm, the collimation width is 80mm,noise index (NI) 5HU, pitch 0.992:1. pre-ASiR-V 30% weight was used for gemstone spectral CT scanning. The CT and SD values of the images before and after iodine suppression of 20%, 10%, 5% and 2.5% iodine were measured. The area of region of interest (ROI) was 1 / 2-1 / 3 of the cross-sectional area of the somatosensory canal, and the size was consistent, The iodine suppression rate of different concentrations of iodine was calculated (iodine suppression rate = {(CT value 1-CT value 2) / CT value 1} * 100%, CT value 1 was the CT value of the image before iodine suppression, CT value 2 was the CT value of the image after iodine suppression). The difference between the two groups was compared by one-way ANOVA, and the difference was statistically significant ($P < 0.05$).

RESULTS

The CT value of iodine 20 before iodine suppression was 431.5 ± 67Hu, iodine 10, CT value was 211.89 ± 57Hu, iodine 5 CT value was 107.09 ± 82Hu, iodine 2.5, CT value was 53.93 ± 68Hu, the difference between the two groups was statistically significant ($P < 0.05$); The CT value of iodine 20 after iodine suppression was 14.34 ± 42Hu, iodine 10, CT value was 13.84 ± 80Hu, iodine 5 CT value was 15.2 ± 62Hu, iodine 2.5, CT value was 13.99 ± 46Hu, there was no significant difference between the two groups ($P > 0.05$). The iodine inhibition rates of iodine 20, 10, 5 and 2.5 were 96.67%, 93.45%, 85.77%, 74.02% respectively, and the iodine inhibition rates gradually decreased, and the difference between the groups was statistically significant ($P < 0.05$).

CONCLUSION

s From the evaluation of iodine suppression rate and CT value of virtual plain scan (VNC) images with different concentrations of iodine, the virtual plain scan (VNC) iodine suppression technology has a good effect on different concentrations of blood vessels.

Can Machine Learning Be Better Than Biased Readers?

Wednesday, Nov. 30 12:45PM - 1:15PM Room: Learning Center - NR DPS

Participants
Rui Zhu, BSc, Toronto, ON (*Presenter*) Nothing to Disclose

PURPOSE

The purpose is to determine if machine learning algorithms can overcome reader biases and more closely match multiple reader consensus than individual readers' diagnostic accuracy when training a binary convolutional neural network (CNN) classifier. Training deep learning models in medical imaging requires large amounts of labeled data. It is common to divide the training data amongst multiple readers with varying levels of expertise to minimize the effort. Alternatively, multiple small datasets labeled by different readers are combined for training. In both scenarios the readers' consensus is not obtained leading to a biased dataset.

METHODS AND MATERIALS

This study used a binary-class chest X-ray dataset and corresponding labels of pediatric pneumonia obtained from Guangzhou Women and Children's Medical Center. Wrong labels are generated for biased readers by sampling from the probability distribution of their biases defined by Bernoulli distributions of producing an observed label given the true label. The true labels were assumed to be the consensus of the readers. The readers' performances were evaluated based on their annotations on the test set. The models' testing performances were compared to readers' performances. Resnet18 without transfer learning was used as baseline model. A variation of Resnet18 with modified loss function was used as an improvement on the baseline model.

RESULTS

The baseline model's test accuracy was higher than the average accuracy of the biased readers (59%-69%) by 2%-9% when the average accuracy of all readers was 73%-79%. The improved model with the modified loss function trained on a dataset containing 30% biased labels achieved 86% test accuracy, being higher than the average of all readers (69%), when readers' labels can compensate each other's errors. The improved model with the modified loss function produced more robust accuracies (79%-86%) than the baseline model (70%-83%) while varying the strengths and the types of the biases held by the readers.

CONCLUSION

s This study demonstrated that it is possible for machine learning algorithms to overcome individual readers' biases in training a binary CNN classifier. It is recommended to use robust loss functions as they are easy to implement and effective in mitigating biased labels.

CLINICAL RELEVANCE/APPLICATION

AI technology assists medical practitioners to analyze radiological images efficiently to inform patients of their condition timely. Our study focuses on training AI on datasets with biased labels.

W5B-SPNR-9

Effectiveness of a Convolutional Neural Network Artificial Intelligence Algorithm in the Detection of Intracranial Hemorrhage on Noncontrast CT Imaging

Wednesday, Nov. 30 12:45PM - 1:15PM Room: Learning Center - NR DPS

Participants
Ayden Jacob, Boca Raton, FL (*Presenter*) Consultant, Aidoc Medical Ltd

PURPOSE

Radiologic misdiagnosis of intracranial hemorrhage (ICH) may result in poor patient outcomes. This study aimed to assess the accuracy and clinical viability of an AI-based algorithm in the detection of ICH on noncontrast CT (NCCT) imaging.

METHODS AND MATERIALS

An FDA approved AI solution based on a convolutional neural network was used to assess 8468 NCCTs. Data was collected from 29 different facilities. Slice thickness ranged from 0.625 mm to 5mm. NCCTs were retrospectively processed through the AI solution and assigned a positive or negative for ICH allocation. Each report was analyzed by a natural language processing software and assigned a positive or negative for ICH allocation per the radiologist's interpretation. Cases were stratified as concordant, wherein the radiologist and AI interpretation agreed, and discordant, in which interpretations differed. NLP results for discordant cases were externally validated. 2 board certified neuroradiologists and 1 general radiologist assessed discordant NCCTS for ICH to determine ground truth by majority opinion.

RESULTS

98 AI positives were engaged with by the radiologist at the time of data collection and were excluded from the cohort. Concordant cases included 288 double positives (AI+/Rad+) and 7950 double negatives (AI-/Rad-). 132 discordant cases included 100 scans positive by AI and negative per radiologist's report (AI+/Rad-), and 32 scans negative by AI and positive by report (AI-/Rad+). Following consensus review by 3 radiologists, individual and combined accuracy metrics were acquired for both entities. Radiologist metrics included an accuracy of 99.1%, sensitivity of 94.5%, and a specificity of 99.9%. AI demonstrated an accuracy of 98.8%, sensitivity of 93.6%, and a specificity of 99.1%. Differences in accuracy and specificity were statistically significant ($p<.00001$) whereas sensitivity was not ($p =.61708$). Combined accuracy was 99.6% with minimal loss of specificity (99%). The radiologists detected 309 positive cases, and an additional 18 ICHs were detected by the AI solution, providing an added detection rate of 5.8%.

CONCLUSION

s This study demonstrates that an AI-solution can assist radiologists in the diagnosis of ICH. Radiologists leveraging AI-solutions have an increased sensitivity in the detection of ICH.

CLINICAL RELEVANCE/APPLICATION

The combined precision and accuracy of the AI-radiologist combination highlights the value of coupling a high sensitivity screening test (AI) with a higher specificity validation test (radiologist). Synergy between radiologists and AI solutions in the detection of ICH may improve patient outcomes through minimizing false negative rates.

W5B-SPOB-1 Cervical Cancer Heterogeneity: Spatial Habitats from Multiparametric MRI in Predicting Tumor Stages

Participants
Xinyue Liang, Shanghai, China (*Presenter*) Nothing to Disclose

PURPOSE

Tumors are commonly heterogeneous, which is informative for characterization, staging classification and outcome prediction. It is of great value to study noninvasive method for assessing intratumor heterogeneity in cervical cancer. This study aimed to assess the clinic feasibility and performance of the tumor heterogeneity characterized by spatial habitats from multiparametric MRI to predict FIGO stages of cervical cancer patients.

METHODS AND MATERIALS

Ninety-seven patients at different stages (FIGO IA-IIIC2) cervical cancer were involved in this study. All the MRI examinations were performed on a 3.0T MR scanner (uMR 780; United Imaging Healthcare, Shanghai, China) using T1-weighted (T1W), T2-weighted (T2W) and diffusion weighted imaging (DWI) (b = 0 and 1500 s/mm2). K-means clustering method was used for classifying different habitats, of which deriving the volume size and fraction. Clusters amounts 3, 4, 5 and 6 were initially set, and three spatial habitats were adopted for an explainable biological meaning. The performance of habitats analysis and mean ADC of the tumor between low FIGO stages (IA and IB) with high FIGO stages (II and III) of cervical cancer were assessed using the Mann-Whitney U test.

RESULTS

Three MRI habitats (hyperemia tissue, lipid tissue, and solid tissue habitat) were identified within the tumor, among which hyperemia tissue (high DW, high T2W, and low T1W values) was highly correlated with tumor stages ($p < 0.001$). The volume size and fraction of hyperemia habitat in high FIGO stage were significantly higher than those in low FIGO stage (AUC = 0.78 and AUC = 0.77, $p < 0.001$), outperforming mean ADC values (AUC = 0.59, $p > 0.05$). In addition, solid tissue and lipid tissue were insignificant in differentiating tumor stages ($p > 0.05$).

CONCLUSION

s Hyperemia tissue habitats from multiparametric MRI performed excellent discrimination of the tumor staging in cervical cancer.

CLINICAL RELEVANCE/APPLICATION

Habitat analysis from multiparametric MRI can provide a non-invasive and innovative approach towards intratumor heterogeneity, which is promising in differentiating cervical cancer stages.

W5B-SPOB-2 Multi-Plane Segmentation of Uterus, Endometrium and Uterine Fibroids From MR Images Using Self-Configuring NNU-Net

Participants
Xinyu Liu, MD, Beijing, China (*Presenter*) Nothing to Disclose

PURPOSE

Uterine fibroids are the most common gynecologic benign tumors and contribute to significant morbidity. MRI provides an accurate assessment of the number, location, and type of fibroids. However, the segmentation of uterus and uterine fibroids from MR images is difficult to achieve. We proposed a self-configuring MR imaging segmentation method based on the nnU-Net deep learning network.

METHODS AND MATERIALS

Two multi-plane (T2 sagittal and T2 axial images of the female pelvis MR images) datasets are used to validate the performance of the proposed uterus, endometrium, and uterine fibroids segmentation algorithm in this research. nnU-Net systematically addresses the configuration of entire segmentation pipelines and provides visualization and description of the most relevant design choices.

RESULTS

The dataset enrolls 199 patients with 5mm slice thickness MR volumes. They are randomly divided into 159 for training, and 40 for testing. The Dice similarity coefficient (DSC) of the uterus, endometrium, and uterine fibroids are 91.3%, 80.8%, and 77.0% in T2 sagittal MR images using the nnU-Net deep learning network; the hausdorff_95 (95HD) of these three are 7.426, 6.654 and

10.926mm. The DSC of the uterus, endometrium, and uterine fibroids are 92.0%, 73.4%, 79.6% in T2 axial MR images, the 95HD are 7.324, 11.057, and 9.716mm.

CONCLUSION

s We have proposed a self-configuring nnU-Net deep learning network method to segment uterus, endometrium, and uterine fibroids automatically.

CLINICAL RELEVANCE/APPLICATION

Correctly classifying and recognizing fibroids is essential for treatment planning and the prevention of complications.

Xinyu Liu, MD, Beijing, China (*Presenter*) Nothing to Disclose

PURPOSE

Uterine fibroids are the most common gynecologic benign tumors and contribute to significant morbidity. MRI provides an accurate assessment of the number, location, and type of fibroids. However, the segmentation of uterus and uterine fibroids from MR images is difficult to achieve. We proposed a self-configuring MR imaging segmentation method based on the nnU-Net deep learning network.

METHODS AND MATERIALS

Two multi-plane (T2 sagittal and T2 axial images of the female pelvis MR images) datasets are used to validate the performance of the proposed uterus, endometrium, and uterine fibroids segmentation algorithm in this research. nnU-Net systematically addresses the configuration of entire segmentation pipelines and provides visualization and description of the most relevant design choices.

RESULTS

The dataset enrolls 199 patients with 5mm slice thickness MR volumes. They are randomly divided into 159 for training, and 40 for testing. The Dice similarity coefficient (DSC) of the uterus, endometrium, and uterine fibroids are 91.3%, 80.8%, and 77.0% in T2 sagittal MR images using the nnU-Net deep learning network; the hausdorff_95 (95HD) of these three are 7.426, 6.654 and 10.926mm. The DSC of the uterus, endometrium, and uterine fibroids are 92.0%, 73.4%, 79.6% in T2 axial MR images, the 95HD are 7.324, 11.057, and 9.716mm.

CONCLUSION

s We have proposed a self-configuring nnU-Net deep learning network method to segment uterus, endometrium, and uterine fibroids automatically.

CLINICAL RELEVANCE/APPLICATION

Correctly classifying and recognizing fibroids is essential for treatment planning and the prevention of complications.

W5B-SPPD-1 A Comparative Study of Different Machine Learning Classifiers for Differentiating Pediatric Cerebellar Tumors: Medulloblastomas, Ependymomas and Pilocytic Astrocytomas

Participants
Bilgin Keserci, PhD, (*Presenter*) Nothing to Disclose

PURPOSE

The aim of this study is to comparatively investigate the role of machine learning (ML) classifiers in distinguishing pediatric cerebellar tumors.

METHODS AND MATERIALS

This retrospective study included preoperative magnetic resonance imaging (MRI) of 63 patients with pediatric posterior fossa tumors, including medulloblastomas (n=40), ependymomas (n=9), and pilocytic astrocytomas (n=14). Eighteen MRI features were extracted from T2-weighted (T2W) images, contrast-enhanced T1-weighted (CE-T1) images, fluid-attenuated inversion recovery (FLAIR) images and diffusion weighted images (DWIs). We compared five different machine learning classifiers (i.e., Logistic Regression (LR), Support Vector Machine (SVM), K-nearest Neighbors (KNN), Random Forest (RF) and Gradient Boosting (GBM) for differentiation of the 3 most common pediatric posterior fossa tumors. The diagnostic ability of ML classifiers was performed by means of standard performance metrics, including the area under the receiver operating characteristic curve (AUROC), accuracy, sensitivity, specificity, F1-score and average cross validation score in five folds cross-validation.

RESULTS

The KNN algorithm showed the best predictive performance with an AUROC of 0.96 and accuracy of 0.95, followed by the GBM, RF, LR and SVC classifiers, which yielded an AUROC of 0.93, 0.89, 0.86 and 0.82, and accuracy of 0.95, 0.9, 0.86 and 0.86, respectively. For all five different machine learning classifiers, specificity ranged from 0.71 to 1.0, sensitivity ranged from 0.86 to 1.0, F1-score ranged from 0.89 to 0.96, and average cross validation score ranged from 0.83 to 0.9. Medulloblastomas showed iso-intensity on T2W and FLAIR images meanwhile ependymomas and pilocytic astrocytomas appeared hyper-intensity on T2W and FLAIR images. Medulloblastomas and ependymomas were mostly high intensity on DWI, whereas pilocytic astrocytomas were usually low intensity on DWI.

CONCLUSION

s We have compared different ML classifiers for prediction of the most common posterior fossa tumors, and found that KNN algorithm achieved greater accuracy in tumor differentiation.

CLINICAL RELEVANCE/APPLICATION

It is crucial to develop a novel artificial intelligence-based noninvasive diagnostic tool to be implemented in a clinical setting. Such a tool would not only help in differentiating the tumor type and grade of the tumor but also assist in planning the treatment. It will also reduce the need for biopsy for diagnosis.

W5B-SPPH-1 Image Reconstruction for Dedicated TOF PET Brain Systems Without Transmission Data

Participants
Chien-Min Kao, PhD, Chicago, IL (*Presenter*) Stockholder, Walgreens Boots Alliance, Inc

PURPOSE

For PET imaging of the brain, dedicated systems of high resolution and sensitivity are necessary. For hybrid PET/MR imaging, integrated and insert systems are developed. These systems often lack a CT system to produce attenuation images needed for accurate reconstruction while quantification is important for staging brain disorders. It has been shown that TOF PET data alone may allow simultaneous activity and attenuation (SAA) image reconstruction. However, the standard maximum-likelihood attenuation-activity (MLAA) algorithm can be unstable. This work develops a constrained MLAA method to improve reconstruction.

METHODS AND MATERIALS

We apply the alternating direction method of multipliers (ADMM) to optimize the nonconvex cost function of the TOF PET data in SAA incorporating constraints on the total variations (TVs) on the attenuation (AT) and activity (AC) maps and also on the total level of the latter. Numerical AT and AC maps for the adult brain are created, the former includes a skull enclosing uniform water attenuation, whereas the latter contains the gray matter (GM), the white matter (WM), and a 1cm-diameter lesion (L) in the WM, using a 5:1:3 activity ratio (GM:WM:L). Two TOF resolutions, 200 and 600 ps, are examined. Data containing approximately 1-million events are generated. AT and AC maps obtained with our proposed (TV-MLAA) and the existing MLAA algorithms are compared with the known truths.

RESULTS

The AT and AC maps produced by MLAA grow increasingly noisier as iteration increases. In contrast, the AT and CT maps of the TV-MLAA remain stable and appear convergent. Visually, the AC maps of TV-MLAA show decreased noise but well-preserved boundary and contrast been the GM and WM with lesion readily identified, in comparison to those of MLAA. We also evaluate the contrast-to-noise ratio (CNR) of the lesion. For TV-MLAA, the CNRs are 1.01 for both TOFs, whereas for 100-iteration MLAA, the CNR is 0.55 at 200 ps but degrades to 0.36 at 600 ps.

CONCLUSION

s We develop the TV-MLAA algorithm for SAA reconstruction from TOF PET data, and consider 200 and 600 ps TOFs that bracket the present resolution range. At both resolutions, we show that the TV-MLAA algorithm stably yields qualitatively and quantitatively accurate AC maps. Based on our preliminary results, the lesion CNR achieved with TV-MLAA is two to three times that of MLAA.

CLINICAL RELEVANCE/APPLICATION

Quantitative PET imaging is important for brain disorders but unlike PET/CT systems attenuation maps of the brain may not be readily available when using the hybrid PET/MR and dedicated PET brain imaging systems. The TV-MLAA algorithm developed may be useful for these emerging imaging technologies by allowing accurate image reconstruction from TOF PET data alone.

W5B-SPPH-2 High-Resolution MRI and Diffusion-Weighted Imaging of the Human Pancreas at 5 Tesla

Participants
Liyun Zheng, Shanghai, China (*Presenter*) Nothing to Disclose

PURPOSE

The purpose of this study was to explore the feasibility of imaging the pancreas at 5T and evaluate the practical improvement of high-resolution magnetic resonance imaging (MRI) and diffusion-weighted imaging (DWI) at 5T as compared with 3T.

METHODS AND MATERIALS

Eighteen healthy subjects were recruited for this prospective study. MRI examinations were performed on both 3T and 5T scanners. The MRI sequences included T2-weighted fast spin-echo (FSE) and DWI with reduced field-of-view (FOV). Subjective image analysis with a 4-point Likert scale was performed by two experienced radiologists. Signal-to-noise ratio (SNR) and apparent diffusion coefficient (ADC) value were measured in the head, body, and tail of the pancreas. Coefficient of variation (CV) of ADC was calculated as CV(ADC)=SD(ADC)/mean(ADC). A series of paired Wilcoxon tests was used to compare the subjective image quality, mean ADC value, and CV of ADC between 3T and 5T measurements. $P < 0.05$ was considered statistically significant.

RESULTS

For T2-weighted images, there was no significant difference in image quality ratings between 3T and 5T ($P = 0.593$). At lower b-

value images (b = 0 s/mm2), the image quality ratings had no significant difference between different magnetic field strengths, while at higher b-value images (b = 800 s/mm2), the ratings were significantly higher at 5T (P = 0.046). The mean ratios of SNR at 5 T to 3 T of the T2 images for the pancreatic head, body, and tail were 1.16, 1.33, and 1.39, respectively. For the DWI images (b = 800 s/mm2), the corresponding ratios were 1.29, 1.40, and 1.24, respectively. The SNRs of both T2-weighted and DWI images were significantly higher at 5T than at 3T (P ranging from 0.0002 to 0.0095 for all comparisons). For both 3T and 5T, mean ADC values on pancreatic head were significantly higher than those of tail (P = 0.016 for 3T, and P = 0.018 for 5T), while no significant difference was observed between pancreatic head and body (P = 0.679 for 3T, and P = 0.445 for 5T). There was no significant difference in mean ADC values and CV of ADC between 3T and 5T (P > 0.05 for all comparisons).

CONCLUSION

s This initial study proved that 5T MRI can be used to acquire high-resolution pancreatic imaging with higher SNR and sufficient image quality.

CLINICAL RELEVANCE/APPLICATION

This initial study proved that 5T MRI can be used to acquire high-resolution pancreas imaging with higher SNR and sufficient image quality. Consequently, pancreas MRI at 5T may be useful for the diagnosis and management of pancreatic diseases.

W5B-SPPH-3 Clinical Evaluation of Rubidium-82 Generator for Cardiac PET Imaging

Participants
Rameshwar Prasad, PHD, Chicago, IL (*Presenter*) Nothing to Disclose

PURPOSE

Positron emission tomography (PET) using Rubidium-82 allows myocardial perfusion imaging and absolute functional assessment of ventricular function due to its higher diagnostic accuracy and its onsite generator-based availability in clinics. Precise and consistent production and infusion of contaminants-free Rubidium-82 is required for accurate myocardial estimates and radiation safety. In this study, we evaluated the performance of Rubidium-82 generator for high-throughput, high-volume cardiac PET imaging using constant flow and constant activity delivery techniques.

METHODS AND MATERIALS

Daily performance metrices of 10 strontium-82/rubidium-82 (82Sr/82Rb) generators (RUBY-FILL, Canada) were studied for over 20 months infusing over 5000 patients. An automated daily quality control (QC) procedure was performed on each day of clinical use and the eluted Rb-82 was measured by the onboard dose calibrator of the elution system. On-board dose calibrator constancy, Sr82/Rb82 and Sr85/Rb82 breakthrough were assessed. Percent deviation in delivered activity and duration are assessed for each patient (rest and stress) using constant activity (CA) and constant flow (CF) infusion methods.

RESULTS

Percent constancy deviation was 0.73 ±0.4. Sr82/Rb82 and Sr85/Rb82 breakthrough (% USP) were 5.1±1.4 and 0.87±0.6 respectively. Net delivered activity deviation (%) was higher for rest studies than stress whereas delivery duration (%) was higher for stress studies. Delivered activity deviation (%) for CF and CA were 0.01±0.18 and 0.03±0.54, respectively. Sr-82/Rb-82 and Sr-85/Rb-82 breakthrough was found higher than limits for 3 patients due to incorrect use of proscribed elution saline.

CONCLUSION

s RUBY-FILL™ Rb-82 generator provided consistent Rb-82 activities for high throughput clinical cardiac PET imaging. Sr-82/Rb-82 and Sr-85/Rb-82 breakthrough were within the radiation safety limits during the studied period of 20 months except a day. Constant flow is preferred infusion method based on our institutional experience.

CLINICAL RELEVANCE/APPLICATION

Generator based Rb-82 provides readily availability of radiotracer and weight-based quantitation of myocardial blood flow and perfusion with optimal radiation safety.

W5B-SPPH-4 Validation of a Deep Learning Model for COVID-19 Diagnosis from Portable and Stationary Dual-Energy Chest Radiography Units

Participants
Mena Shenouda, BS, (*Presenter*) Nothing to Disclose

PURPOSE

To validate a deep learning model for COVID-19 diagnosis from chest radiographs (CXRs) and to compare performance on images from portable units vs. stationary dual-energy subtraction units.

METHODS AND MATERIALS

A deep learning model trained on CXRs from a single institution was previously published. To validate this trained model, a large cohort of cases from the same institution was retrospectively collected as an independent test set. The data comprised the first CXR acquired <2 days after the patients' reverse transcription polymerase chain reaction (PCR) tests for the SARS-CoV-2 virus. Among the 12,251 patients, 2,464 (20.1%) had tested positive, and 9,787 (79.9%) had tested negative for the virus.CXRs of 9,471 (77.3%) patients were acquired using portable units, and CXRs of 2,780 (22.7%) patients were acquired using stationary units with COVID prevalences of 20.5% and 18.8%, respectively. The COVID diagnosis classification task was performed using standard images alone, soft-tissue images alone, and a combination of the two via feature fusion. Portable soft-tissue images were generated post-acquisition with commercial software. No model training or fine-tuning was performed.Classification between the radiographs of COVID-positive and COVID-negative patients was evaluated using the area under the receiver operating characteristic curve (AUC) as the performance metric.

RESULTS

Performance of the model on images from both modalities yielded AUC values [95% CI] of 0.69 [0.68, 0.70] for standard images, 0.67 [0.66, 0.69] for soft-tissue images, and 0.66 [0.65, 0.68] for their combination. For CXRs acquired from portable units, AUCs for standard images, soft-tissue images, and their combination were 0.70 [0.69, 0.72], 0.68 [0.67, 0.70], and 0.67 [0.66, 0.69],

respectively. For CXRs acquired from stationary units, AUCs for standard images, soft-tissue images, and their combination were 0.66 [0.64, 0.69], 0.64 [0.61, 0.67], and 0.64 [0.61, 0.67], respectively.AUCs were significantly higher for CXRs acquired from portable vs. stationary units (p=0.007, 0.004, and 0.04 for standard images, soft-tissue images, and their combination, respectively). Within both modalities, the highest AUC was achieved for standard CXRs.

CONCLUSION

s This study tested a previously trained model for radiography-based COVID-19 diagnosis on a large, independent in-house dataset with promising results.

CLINICAL RELEVANCE/APPLICATION

AI generalizability in the differentiation of COVID-positive and COVID-negative patients based on chest radiography was demonstrated on a large dataset from a single institution as a precursor to using the Medical Imaging and Data Resource Center (MIDRC) multi-institution initiative, which will further validate this model.

W5B-SPPH-5 Modified Diffusion Imaging With Phase-Contrast Using Motion-Compensated Diffusion Encoding (MDIP) For Quantification of Regional Cerebral Blood Flow

Participants
Genki Nambu, BA, (*Presenter*) Nothing to Disclose

PURPOSE

We recently developed a method of diffusion imaging with phase-contrast (DIP) for quantification of regional cerebral blood flow (rCBF), in which the total CBF (tCBF) from phase-contrast magnetic resonance imaging (PC-MRI) was used to convert the perfusion-related diffusion parameters (D*) in the brain. However, DIP is sensitive to brain pulsation and takes up to 10 min. To tackle these issues, we developed a modified DIP (mDIP) in which a motion-compensated diffusion gradient was applied, and the number of b-values were minimized.

METHODS AND MATERIALS

Eleven healthy volunteers (nine men and two women; mean age, 23.9 years) participated in this study. On a 3.0-T MRI, diffusion-weighted images of the whole brain were acquired using single-shot diffusion echo-planar imaging with the first-order motion-compensated diffusion gradient to reduce the brain pulsation effect. Further, the number of b-values was minimized (0, 10, 100, and 800 s/mm2) to shorten the scan time (1 min 55 sec). Next, we performed voxel-wise estimations of the D*, perfusion fraction (F), multiplication of D*and F (FD*), and restricted diffusion coefficient using biexponential function. Furthermore, PC-MRI was performed to obtain the tCBF from the volumetric flow rate at the main feeding arteries into the cranium (1 min 32 sec). By using the tCBF obtained from PC-MRI, we converted the FD* in the brain into absolute rCBF. We determined rCBF using mDIP and arterial spin labeling (ASL) and their correlations in gray and white matter (GM and WM, respectively) in healthy volunteers and assessed the relationship between the two methods.

RESULTS

The rCBF images obtained using mDIP and ASL provided good contrast between the GM and WM as well as general resemblance. A highly significant positive correlation between the mDIP and ASL in terms of rCBF was observed in GM ($R = 0.88$, $P < 0.05$), which was higher than that of DIP without motion-compensated diffusion gradient, whereas the correlation between the methods was still poor in WM ($P > 0.05$). The rCBF values in GM (41.5 ± 14.8 mL/100 g/min) and WM (16.6 ± 10.9 mL/100 g/min) obtained using mDIP were consistent with the values assessed using [15O]-water positron emission tomography reported in literature.

CONCLUSION

s mDIP makes it possible to quantitatively evaluate rCBF as well as standard diffusion parameters within 3 min 30 sec.

CLINICAL RELEVANCE/APPLICATION

mDIP makes it possible to quantitatively evaluate rCBF as well as standard diffusion parameters within 3 min 30 sec.

W5B-SPPH-6 Automatic Evaluation of Appropriateness for Abdominal Dynamic Contrast-Enhanced CT Phases Using Deep Convolutional Neural Network Trained by Quantitative Index for Dynamic Contrast-Enhanced CT Phases

Participants
Akira Yamada, MD, PhD, Matsumoto, Japan (*Presenter*) Nothing to Disclose

PURPOSE

To develop automated model for evaluating appropriateness of abdominal dynamic contrast-enhanced CT (DCE-CT) phases using convolutional neural network (CNN) and quantitative index for DCT-CT phases (Dynamic Phase Index, DPI).

METHODS AND MATERIALS

Sixty patients who underwent abdominal DCE-CT with 7 arterial phases (scan time = 22, 28, 34, 40, 46, 52, and 58 s after 100 mL of intravenous contrast media injection at 3 mL/s) for pre-operative evaluation were included in this study. Patients were randomly divided into training (38 patients) and validation (22 patients) cohorts. The appropriateness of each DCE-CT phase as arterial phase was evaluated by a board-certified radiologist qualitatively and classified into 3 labels, "too early", "adequate", and "too late". DPI as a quantitative index for DCE-CT phase was determined from combination of scan time and contrast enhancement in target vessels (left ventricle, abdominal aorta, right renal vein, supra mesenteric vein, and inferior vena cava) on DCE-CT. Three DCE-CT images at the level of left ventricle, right renal vein, and inferior vena cava were imported into pre-trained CNN (VGG-16) and image features were extracted for the random forest classifier. The classifier was trained according to two strategies that are qualitative and quantitative-qualitative models. In qualitative model, the imported DCE-CT images were classified into qualitative labels directly. In quantitative-qualitative model, DPI was first determined from imported DCE-CT images and then classified into qualitative labels according to optimized thresholds. The classification accuracy was compared between automated models and blinded visual assessment by a radiologist.

RESULTS

The classification accuracy for appropriateness of DCT-CT phase in a validation cohort was 0.90 (95%CI: 0.89-0.91) for quantitative-qualitative model, 0.84 (0.83-0.84) for qualitative model, and 0.79 (0.78-0.80) for visual assessment by a radiologist, respectively.

CONCLUSION

s The appropriateness of DCE-CT phases can be determined automatically using CNN with the better accuracy than a visual assessment by radiologist. The classification accuracy improves when the CNN was trained with use of quantitative index for DCE-CT phase compared to use of qualitative labels. In other words, DPI can be used as reliable quantitative index for DCE-CT phase.

CLINICAL RELEVANCE/APPLICATION

The proposed model enables accurate and automated selection of appropriate DCT-CT images from big data. This is important for building high quality image database for machine learning models. Furthermore, DPI as a quantitative index for DCE-CT phases can be used as one of reliable imaging features to develop machine learning based diagnostic models in future.

W5B-SPPH-7 Preliminary Report on Harmonization of First-Order Texture Metrics Using the Combat Tool in Water Phantom Data

Participants
Bino A. Varghese, PhD, Los Angeles, CA (*Presenter*) Nothing to Disclose

PURPOSE

Statistical harmonization approaches like ComBat have been shown to improve radiomics reproducibility, however its performance under varying noise scenarios have not been studied. We evaluate this capacity in CT radiomic features extracted from imaging a large water phantom acquired under varying dose and slice thickness conditions.

METHODS AND MATERIALS

CT scans were acquired on a 16 cm detector GE Revolution CT scanner with variations across 3 different slice thicknesses: 0.625mm, 1.25mm and 2.5mm and 5 different dose levels: CTDIvol of 13,86 mGy (standard dose) and 40, 50, 60 and 70% reductions of the standard dose varying one at a time. Water phantom images were reconstructed using filtered back projection. The texture panel of 70 features belonging to first-order CT texture analysis metrics was extracted using the Cancer Imaging Phenomics Toolkit, following automated segmentation of 4 volumes of interest. The Python version of neuroCombat was used.

RESULTS

Our results confirm that the ComBat algorithm effectively removes variations of all first-order statistical radiomic features from different dose levels and across the 3 slice thickness conditions. ComBat harmonized data exhibited lower dispersion around the mean compared to non-harmonized data. Furthermore, reduction in mean dispersion was larger in data from thicker slices.

CONCLUSION

s Despite evidence for Combat harmonization from clinical scan, our experiment using phantom demonstrated the capacity of Combat in removing variation from different dose and scan thickness levels. ComBat harmonization eliminates more variations from thicker slices.

CLINICAL RELEVANCE/APPLICATION

Factors affecting radiomics performance also affect radiomics harmonization efforts. Therefore, the impact of these factors on radiomic performance and harmonization should be considered in future radiomics studies.

W5B-SPPH-8 Robustness of Texture Biomarkers of Bone to Spatially Variant Blur in Ultra High Resolution CT

Participants
Gengxin Shi, (*Presenter*) Nothing to Disclose

PURPOSE

Compared to current conventional CT, the recently introduced Ultra-High Resolution CT (UHR CT) utilizes a new generation of detectors with ~2x finer pixels. In this setting, spatial resolution is dominated by factors other than pixel aperture, for example the spatially variant projection integration and view sampling blurs at fast scan speeds. We investigate the impact of these non-stationarities on texture biomarkers of bone obtained from UHR CT.

METHODS AND MATERIALS

Data was acquired with Canon Aquilion Precision CT operated in an UHR mode (0.25 mm pixels/slice thickness, 0.4x0.5 focal spot) and in a Normal Resolution (NR) mode (0.5 mm pixels/slice thickness, 0.8x1.2 mm focal spot). Scans were obtained at 0.35 sec/rotation and 1.5 sec/rotation. For texture analysis, human femur was imaged at 0 - 20 cm from the isocenter. Gray Level Concordance and Run Length Matrix (GLCM and GLRM) texture features were obtained in 42 volumes of interest (5 mm3) placed at homologous locations in the femoral head. For each radial distance, reproducibility of each texture feature was quantified as the Concordance Correlation Coefficient (CCC) against the feature value at the isocenter, where the view sampling blur is minimal

RESULTS

The visualization of trabecular bone is generally superior in UHR than NR, but the relative loss of spatial resolution at 150 mm from the isocenter and 0.35 sec rotation compared to 1.5 sec rotation is more pronounced in UHR. When texture features are used to quantify cancellous structures, the CCCs between the isocenter and 150 mm radial shift are generally gt;0.7 for the UHR mode and 1.5 sec scan, deteriorating by typically gt;20% for the 0.35 sec scan. The difference in CCC at 150 mm between the slow and fast acquisitions is less substantial in the NR mode (generally lt;10%).

CONCLUSION

s Due to the non-stationary spatial resolution associated with view sampling, texture features of bone derived from UHR CT exhibit substantial dependence on spatial location, especially for fast acquisitions. Ongoing work investigates the impact of this inter-scan

variability on radiomic models of bone health based on assays of texture biomarkers.

CLINICAL RELEVANCE/APPLICATION

Development of radiomic models of bone health from Ultra-High Resolution CT (UHR CT) data requires consideration of inter-scan texture variability due to spatially variant view sampling blur.

W5B-SPPH-9 Retrospective Review of Doses Delivered to the Uterus of Pregnant Women During CT Examinations

Participants
Joel Greffier, PhD, Nimes, France (*Presenter*) Nothing to Disclose

PURPOSE

To review the uterine doses (UD) calculated for pregnant women per CT acquisition and per CT examination in our Institution in the last 8 years.

METHODS AND MATERIALS

Consecutive pregnant women who underwent CT examination and for whom a UD calculation was performed by a medical physicist were retrospectively included from June 2014 to February 2022. UDs were computed per CT acquisition using the CT Expo 2.4 software and were summed up to obtain the total UD per CT examination. The CTDIvol and dose-length product (DLP) values were retrieved from the dose report and compared with those calculated by the software.

RESULTS

256 pregnant women were included, of mean age of 29.4±5.5 [18-48] years, at 24.5±10.4 week of amenorrhea [1-40]. UDs were computed for 339 CT acquisitions. The CTDIvol and DLP computed in the software were significantly higher than those retrieved on the dose reports ($P<0.05$). The highest UDs were reported for the abdomen-pelvis (10.93±5.74 [1.2-24.1] mGy), chest-abdomen-pelvis (9.79±7.09 [3.9- 22.1] mGy), pelvis (18.50±17.96 [5.8-31.2] mGy) and lumbar spine (10.24±11.38 [2.3- 29.6] mGy) examinations. The total UDs per CT examination were higher than 20 mGy for 10 pregnant women and the maximum total UD was 52.3 mGy

CONCLUSION

s The highest UDs were found for examinations directly exposing the pelvis. With current dose levels and in optimized practices, UDs per CT acquisition and CT examination were always below 100mGy. UD calculations could not be performed for CT examinations that did not directly expose the pelvis (UD<1mGy).

CLINICAL RELEVANCE/APPLICATION

Based on the results presented in this study and on our experience, we have also made recommendations for the management of pregnant women in CT.

Image Reconstruction for Dedicated TOF PET Brain Systems Without Transmission Data

Wednesday, Nov. 30 12:45PM - 1:15PM Room: Learning Center - PH DPS

Participants
Chien-Min Kao, PhD, Chicago, IL (*Presenter*) Stockholder, Walgreens Boots Alliance, Inc

PURPOSE

For PET imaging of the brain, dedicated systems of high resolution and sensitivity are necessary. For hybrid PET/MR imaging, integrated and insert systems are developed. These systems often lack a CT system to produce attenuation images needed for accurate reconstruction while quantification is important for staging brain disorders. It has been shown that TOF PET data alone may allow simultaneous activity and attenuation (SAA) image reconstruction. However, the standard maximum-likelihood attenuation-activity (MLAA) algorithm can be unstable. This work develops a constrained MLAA method to improve reconstruction.

METHODS AND MATERIALS

We apply the alternating direction method of multipliers (ADMM) to optimize the nonconvex cost function of the TOF PET data in SAA incorporating constraints on the total variations (TVs) on the attenuation (AT) and activity (AC) maps and also on the total level of the latter. Numerical AT and AC maps for the adult brain are created, the former includes a skull enclosing uniform water attenuation, whereas the latter contains the gray matter (GM), the white matter (WM), and a 1cm-diameter lesion (L) in the WM, using a 5:1:3 activity ratio (GM:WM:L). Two TOF resolutions, 200 and 600 ps, are examined. Data containing approximately 1-million events are generated. AT and AC maps obtained with our proposed (TV-MLAA) and the existing MLAA algorithms are compared with the known truths.

RESULTS

The AT and AC maps produced by MLAA grow increasingly noisier as iteration increases. In contrast, the AT and CT maps of the TV-MLAA remain stable and appear convergent. Visually, the AC maps of TV-MLAA show decreased noise but well-preserved boundary and contrast been the GM and WM with lesion readily identified, in comparison to those of MLAA. We also evaluate the contrast-to-noise ratio (CNR) of the lesion. For TV-MLAA, the CNRs are 1.01 for both TOFs, whereas for 100-iteration MLAA, the CNR is 0.55 at 200 ps but degrades to 0.36 at 600 ps.

CONCLUSION

s We develop the TV-MLAA algorithm for SAA reconstruction from TOF PET data, and consider 200 and 600 ps TOFs that bracket the present resolution range. At both resolutions, we show that the TV-MLAA algorithm stably yields qualitatively and quantitatively accurate AC maps. Based on our preliminary results, the lesion CNR achieved with TV-MLAA is two to three times that of MLAA.

CLINICAL RELEVANCE/APPLICATION

Quantitative PET imaging is important for brain disorders but unlike PET/CT systems attenuation maps of the brain may not be readily available when using the hybrid PET/MR and dedicated PET brain imaging systems. The TV-MLAA algorithm developed may be useful for these emerging imaging technologies by allowing accurate image reconstruction from TOF PET data alone.

High-Resolution MRI and Diffusion-Weighted Imaging of the Human Pancreas at 5 Tesla

Wednesday, Nov. 30 12:45PM - 1:15PM Room: Learning Center - PH DPS

Participants
Liyun Zheng, Shanghai, China (*Presenter*) Nothing to Disclose

PURPOSE

The purpose of this study was to explore the feasibility of imaging the pancreas at 5T and evaluate the practical improvement of high-resolution magnetic resonance imaging (MRI) and diffusion-weighted imaging (DWI) at 5T as compared with 3T.

METHODS AND MATERIALS

Eighteen healthy subjects were recruited for this prospective study. MRI examinations were performed on both 3T and 5T scanners. The MRI sequences included T2-weighted fast spin-echo (FSE) and DWI with reduced field-of-view (FOV). Subjective image analysis with a 4-point Likert scale was performed by two experienced radiologists. Signal-to-noise ratio (SNR) and apparent diffusion coefficient (ADC) value were measured in the head, body, and tail of the pancreas. Coefficient of variation (CV) of ADC was calculated as CV(ADC)=SD(ADC)/mean(ADC). A series of paired Wilcoxon tests was used to compare the subjective image quality, mean ADC value, and CV of ADC between 3T and 5T measurements. $P < 0.05$ was considered statistically significant.

RESULTS

For T2-weighted images, there was no significant difference in image quality ratings between 3T and 5T ($P = 0.593$). At lower b-value images (b = 0 s/mm2), the image quality ratings had no significant difference between different magnetic field strengths, while at higher b-value images (b = 800 s/mm2), the ratings were significantly higher at 5T ($P = 0.046$). The mean ratios of SNR at 5 T to 3 T of the T2 images for the pancreatic head, body, and tail were 1.16, 1.33, and 1.39, respectively. For the DWI images (b = 800 s/mm2), the corresponding ratios were 1.29, 1.40, and 1.24, respectively. The SNRs of both T2-weighted and DWI images were significantly higher at 5T than at 3T (P ranging from 0.0002 to 0.0095 for all comparisons). For both 3T and 5T, mean ADC values on pancreatic head were significantly higher than those of tail ($P = 0.016$ for 3T, and $P = 0.018$ for 5T), while no significant difference was observed between pancreatic head and body ($P = 0.679$ for 3T, and $P = 0.445$ for 5T). There was no significant difference in mean ADC values and CV of ADC between 3T and 5T ($P > 0.05$ for all comparisons).

CONCLUSION

s This initial study proved that 5T MRI can be used to acquire high-resolution pancreatic imaging with higher SNR and sufficient image quality.

CLINICAL RELEVANCE/APPLICATION

This initial study proved that 5T MRI can be used to acquire high-resolution pancreas imaging with higher SNR and sufficient image quality. Consequently, pancreas MRI at 5T may be useful for the diagnosis and management of pancreatic diseases.

Clinical Evaluation of Rubidium-82 Generator for Cardiac PET Imaging

Wednesday, Nov. 30 12:45PM - 1:15PM Room: Learning Center - PH DPS

Participants
Rameshwar Prasad, PHD, Chicago, IL (*Presenter*) Nothing to Disclose

PURPOSE

Positron emission tomography (PET) using Rubidium-82 allows myocardial perfusion imaging and absolute functional assessment of ventricular function due to its higher diagnostic accuracy and its onsite generator-based availability in clinics. Precise and consistent production and infusion of contaminants-free Rubidium-82 is required for accurate myocardial estimates and radiation safety. In this study, we evaluated the performance of Rubidium-82 generator for high-throughput, high-volume cardiac PET imaging using constant flow and constant activity delivery techniques.

METHODS AND MATERIALS

Daily performance metrices of 10 strontium-82/rubidium-82 (82Sr/82Rb) generators (RUBY-FILL, Canada) were studied for over 20 months infusing over 5000 patients. An automated daily quality control (QC) procedure was performed on each day of clinical use and the eluted Rb-82 was measured by the onboard dose calibrator of the elution system. On-board dose calibrator constancy, Sr82/Rb82 and Sr85/Rb82 breakthrough were assessed. Percent deviation in delivered activity and duration are assessed for each patient (rest and stress) using constant activity (CA) and constant flow (CF) infusion methods.

RESULTS

Percent constancy deviation was 0.73 ±0.4. Sr82/Rb82 and Sr85/Rb82 breakthrough (% USP) were 5.1±1.4 and 0.87±0.6 respectively. Net delivered activity deviation (%) was higher for rest studies than stress whereas delivery duration (%) was higher for stress studies. Delivered activity deviation (%) for CF and CA were 0.01±0.18 and 0.03±0.54, respectively. Sr-82/Rb-82 and Sr-85/Rb-82 breakthrough was found higher than limits for 3 patients due to incorrect use of proscribed elution saline.

CONCLUSION

s RUBY-FILL™ Rb-82 generator provided consistent Rb-82 activities for high throughput clinical cardiac PET imaging. Sr-82/Rb-82 and Sr-85/Rb-82 breakthrough were within the radiation safety limits during the studied period of 20 months except a day. Constant flow is preferred infusion method based on our institutional experience.

CLINICAL RELEVANCE/APPLICATION

Generator based Rb-82 provides readily availability of radiotracer and weight-based quantitation of myocardial blood flow and perfusion with optimal radiation safety.

Validation of a Deep Learning Model for COVID-19 Diagnosis from Portable and Stationary Dual-Energy Chest Radiography Units

Wednesday, Nov. 30 12:45PM - 1:15PM Room: Learning Center - PH DPS

Participants
Mena Shenouda, BS, (*Presenter*) Nothing to Disclose

PURPOSE

To validate a deep learning model for COVID-19 diagnosis from chest radiographs (CXRs) and to compare performance on images from portable units vs. stationary dual-energy subtraction units.

METHODS AND MATERIALS

A deep learning model trained on CXRs from a single institution was previously published. To validate this trained model, a large cohort of cases from the same institution was retrospectively collected as an independent test set. The data comprised the first CXR acquired <2 days after the patients' reverse transcription polymerase chain reaction (PCR) tests for the SARS-CoV-2 virus. Among the 12,251 patients, 2,464 (20.1%) had tested positive, and 9,787 (79.9%) had tested negative for the virus.CXRs of 9,471 (77.3%) patients were acquired using portable units, and CXRs of 2,780 (22.7%) patients were acquired using stationary units with COVID prevalences of 20.5% and 18.8%, respectively. The COVID diagnosis classification task was performed using standard images alone, soft-tissue images alone, and a combination of the two via feature fusion. Portable soft-tissue images were generated post-acquisition with commercial software. No model training or fine-tuning was performed.Classification between the radiographs of COVID-positive and COVID-negative patients was evaluated using the area under the receiver operating characteristic curve (AUC) as the performance metric.

RESULTS

Performance of the model on images from both modalities yielded AUC values [95% CI] of 0.69 [0.68, 0.70] for standard images, 0.67 [0.66, 0.69] for soft-tissue images, and 0.66 [0.65, 0.68] for their combination. For CXRs acquired from portable units, AUCs for standard images, soft-tissue images, and their combination were 0.70 [0.69, 0.72], 0.68 [0.67, 0.70], and 0.67 [0.66, 0.69], respectively. For CXRs acquired from stationary units, AUCs for standard images, soft-tissue images, and their combination were 0.66 [0.64, 0.69], 0.64 [0.61, 0.67], and 0.64 [0.61, 0.67], respectively.AUCs were significantly higher for CXRs acquired from portable vs. stationary units (p=0.007, 0.004, and 0.04 for standard images, soft-tissue images, and their combination, respectively). Within both modalities, the highest AUC was achieved for standard CXRs.

CONCLUSION

s This study tested a previously trained model for radiography-based COVID-19 diagnosis on a large, independent in-house dataset with promising results.

CLINICAL RELEVANCE/APPLICATION

AI generalizability in the differentiation of COVID-positive and COVID-negative patients based on chest radiography was demonstrated on a large dataset from a single institution as a precursor to using the Medical Imaging and Data Resource Center (MIDRC) multi-institution initiative, which will further validate this model.

Modified Diffusion Imaging With Phase-Contrast Using Motion-Compensated Diffusion Encoding (MDIP) For Quantification of Regional Cerebral Blood Flow

Wednesday, Nov. 30 12:45PM - 1:15PM Room: Learning Center - PH DPS

Participants
Genki Nambu, BA, (*Presenter*) Nothing to Disclose

PURPOSE

We recently developed a method of diffusion imaging with phase-contrast (DIP) for quantification of regional cerebral blood flow (rCBF), in which the total CBF (tCBF) from phase-contrast magnetic resonance imaging (PC-MRI) was used to convert the perfusion-related diffusion parameters (D*) in the brain. However, DIP is sensitive to brain pulsation and takes up to 10 min. To tackle these issues, we developed a modified DIP (mDIP) in which a motion-compensated diffusion gradient was applied, and the number of b-values were minimized.

METHODS AND MATERIALS

Eleven healthy volunteers (nine men and two women; mean age, 23.9 years) participated in this study. On a 3.0-T MRI, diffusion-weighted images of the whole brain were acquired using single-shot diffusion echo-planar imaging with the first-order motion-compensated diffusion gradient to reduce the brain pulsation effect. Further, the number of b-values was minimized (0, 10, 100, and 800 s/mm2) to shorten the scan time (1 min 55 sec). Next, we performed voxel-wise estimations of the D*, perfusion fraction (F), multiplication of D*and F (FD*), and restricted diffusion coefficient using biexponential function. Furthermore, PC-MRI was performed to obtain the tCBF from the volumetric flow rate at the main feeding arteries into the cranium (1 min 32 sec). By using the tCBF obtained from PC-MRI, we converted the FD* in the brain into absolute rCBF. We determined rCBF using mDIP and arterial spin labeling (ASL) and their correlations in gray and white matter (GM and WM, respectively) in healthy volunteers and assessed the relationship between the two methods.

RESULTS

The rCBF images obtained using mDIP and ASL provided good contrast between the GM and WM as well as general resemblance. A highly significant positive correlation between the mDIP and ASL in terms of rCBF was observed in GM ($R = 0.88$, $P < 0.05$), which was higher than that of DIP without motion-compensated diffusion gradient, whereas the correlation between the methods was still poor in WM ($P > 0.05$). The rCBF values in GM (41.5 ± 14.8 mL/100 g/min) and WM (16.6 ± 10.9 mL/100 g/min) obtained using mDIP were consistent with the values assessed using [15O]-water positron emission tomography reported in literature.

CONCLUSION

s mDIP makes it possible to quantitatively evaluate rCBF as well as standard diffusion parameters within 3 min 30 sec.

CLINICAL RELEVANCE/APPLICATION

mDIP makes it possible to quantitatively evaluate rCBF as well as standard diffusion parameters within 3 min 30 sec.

W5B-SPPH-6

Automatic Evaluation of Appropriateness for Abdominal Dynamic Contrast-Enhanced CT Phases Using Deep Convolutional Neural Network Trained by Quantitative Index for Dynamic Contrast-Enhanced CT Phases

Wednesday, Nov. 30 12:45PM - 1:15PM Room: Learning Center - PH DPS

Participants
Akira Yamada, MD, PhD, Matsumoto, Japan (*Presenter*) Nothing to Disclose

PURPOSE

To develop automated model for evaluating appropriateness of abdominal dynamic contrast-enhanced CT (DCE-CT) phases using convolutional neural network (CNN) and quantitative index for DCT-CT phases (Dynamic Phase Index, DPI).

METHODS AND MATERIALS

Sixty patients who underwent abdominal DCE-CT with 7 arterial phases (scan time = 22, 28, 34, 40, 46, 52, and 58 s after 100 mL of intravenous contrast media injection at 3 mL/s) for pre-operative evaluation were included in this study. Patients were randomly divided into training (38 patients) and validation (22 patients) cohorts. The appropriateness of each DCE-CT phase as arterial phase was evaluated by a board-certified radiologist qualitatively and classified into 3 labels, "too early", "adequate", and "too late". DPI as a quantitative index for DCE-CT phase was determined from combination of scan time and contrast enhancement in target vessels (left ventricle, abdominal aorta, right renal vein, supra mesenteric vein, and inferior vena cava) on DCE-CT. Three DCE-CT images at the level of left ventricle, right renal vein, and inferior vena cava were imported into pre-trained CNN (VGG-16) and image features were extracted for the random forest classifier. The classifier was trained according to two strategies that are qualitative and quantitative-qualitative models. In qualitative model, the imported DCE-CT images were classified into qualitative labels directly. In quantitative-qualitative model, DPI was first determined from imported DCE-CT images and then classified into qualitative labels according to optimized thresholds. The classification accuracy was compared between automated models and blinded visual assessment by a radiologist.

RESULTS

The classification accuracy for appropriateness of DCT-CT phase in a validation cohort was 0.90 (95%CI: 0.89-0.91) for quantitative-qualitative model, 0.84 (0.83-0.84) for qualitative model, and 0.79 (0.78-0.80) for visual assessment by a radiologist, respectively.

CONCLUSION

s The appropriateness of DCE-CT phases can be determined automatically using CNN with the better accuracy than a visual assessment by radiologist. The classification accuracy improves when the CNN was trained with use of quantitative index for DCE-CT phase compared to use of qualitative labels. In other words, DPI can be used as reliable quantitative index for DCE-CT phase.

CLINICAL RELEVANCE/APPLICATION

The proposed model enables accurate and automated selection of appropriate DCT-CT images from big data. This is important for building high quality image database for machine learning models. Furthermore, DPI as a quantitative index for DCE-CT phases can be used as one of reliable imaging features to develop machine learning based diagnostic models in future.

W5B-SPPH-7

Preliminary Report on Harmonization of First-Order Texture Metrics Using the Combat Tool in Water Phantom Data

Wednesday, Nov. 30 12:45PM - 1:15PM Room: Learning Center - PH DPS

Participants
Bino A. Varghese, PhD, Los Angeles, CA (*Presenter*) Nothing to Disclose

PURPOSE

Statistical harmonization approaches like ComBat have been shown to improve radiomics reproducibility, however its performance under varying noise scenarios have not been studied. We evaluate this capacity in CT radiomic features extracted from imaging a large water phantom acquired under varying dose and slice thickness conditions.

METHODS AND MATERIALS

CT scans were acquired on a 16 cm detector GE Revolution CT scanner with variations across 3 different slice thicknesses: 0.625mm, 1.25mm and 2.5mm and 5 different dose levels: CTDIvol of 13,86 mGy (standard dose) and 40, 50, 60 and 70% reductions of the standard dose varying one at a time. Water phantom images were reconstructed using filtered back projection. The texture panel of 70 features belonging to first-order CT texture analysis metrics was extracted using the Cancer Imaging Phenomics Toolkit, following automated segmentation of 4 volumes of interest. The Python version of neuroCombat was used.

RESULTS

Our results confirm that the ComBat algorithm effectively removes variations of all first-order statistical radiomic features from different dose levels and across the 3 slice thickness conditions. ComBat harmonized data exhibited lower dispersion around the mean compared to non-harmonized data. Furthermore, reduction in mean dispersion was larger in data from thicker slices.

CONCLUSION

s Despite evidence for Combat harmonization from clinical scan, our experiment using phantom demonstrated the capacity of Combat in removing variation from different dose and scan thickness levels. ComBat harmonization eliminates more variations from thicker slices.

CLINICAL RELEVANCE/APPLICATION

Factors affecting radiomics performance also affect radiomics harmonization efforts. Therefore, the impact of these factors on radiomic performance and harmonization should be considered in future radiomics studies.

W5B-SPPH-8

Robustness of Texture Biomarkers of Bone to Spatially Variant Blur in Ultra High Resolution CT

Wednesday, Nov. 30 12:45PM - 1:15PM Room: Learning Center - PH DPS

Participants
Gengxin Shi, (*Presenter*) Nothing to Disclose

PURPOSE

Compared to current conventional CT, the recently introduced Ultra-High Resolution CT (UHR CT) utilizes a new generation of detectors with ~2x finer pixels. In this setting, spatial resolution is dominated by factors other than pixel aperture, for example the spatially variant projection integration and view sampling blurs at fast scan speeds. We investigate the impact of these non-stationarities on texture biomarkers of bone obtained from UHR CT.

METHODS AND MATERIALS

Data was acquired with Canon Aquilion Precision CT operated in an UHR mode (0.25 mm pixels/slice thickness, 0.4x0.5 focal spot) and in a Normal Resolution (NR) mode (0.5 mm pixels/slice thickness, 0.8x1.2 mm focal spot). Scans were obtained at 0.35 sec/rotation and 1.5 sec/rotation. For texture analysis, human femur was imaged at 0 - 20 cm from the isocenter. Gray Level Concordance and Run Length Matrix (GLCM and GLRM) texture features were obtained in 42 volumes of interest (5 mm3) placed at homologous locations in the femoral head. For each radial distance, reproducibility of each texture feature was quantified as the Concordance Correlation Coefficient (CCC) against the feature value at the isocenter, where the view sampling blur is minimal

RESULTS

The visualization of trabecular bone is generally superior in UHR than NR, but the relative loss of spatial resolution at 150 mm from the isocenter and 0.35 sec rotation compared to 1.5 sec rotation is more pronounced in UHR. When texture features are used to quantify cancellous structures, the CCCs between the isocenter and 150 mm radial shift are generally gt;0.7 for the UHR mode and 1.5 sec scan, deteriorating by typically gt;20% for the 0.35 sec scan. The difference in CCC at 150 mm between the slow and fast acquisitions is less substantial in the NR mode (generally lt;10%).

CONCLUSION

s Due to the non-stationary spatial resolution associated with view sampling, texture features of bone derived from UHR CT exhibit substantial dependence on spatial location, especially for fast acquisitions. Ongoing work investigates the impact of this inter-scan variability on radiomic models of bone health based on assays of texture biomarkers.

CLINICAL RELEVANCE/APPLICATION

Development of radiomic models of bone health from Ultra-High Resolution CT (UHR CT) data requires consideration of inter-scan texture variability due to spatially variant view sampling blur.

Retrospective Review of Doses Delivered to the Uterus of Pregnant Women During CT Examinations

Wednesday, Nov. 30 12:45PM - 1:15PM Room: Learning Center - PH DPS

Participants
Joel Greffier, PhD, Nimes, France (*Presenter*) Nothing to Disclose

PURPOSE

To review the uterine doses (UD) calculated for pregnant women per CT acquisition and per CT examination in our Institution in the last 8 years.

METHODS AND MATERIALS

Consecutive pregnant women who underwent CT examination and for whom a UD calculation was performed by a medical physicist were retrospectively included from June 2014 to February 2022. UDs were computed per CT acquisition using the CT Expo 2.4 software and were summed up to obtain the total UD per CT examination. The CTDIvol and dose-length product (DLP) values were retrieved from the dose report and compared with those calculated by the software.

RESULTS

256 pregnant women were included, of mean age of 29.4±5.5 [18-48] years, at 24.5±10.4 week of amenorrhea [1-40]. UDs were computed for 339 CT acquisitions. The CTDIvol and DLP computed in the software were significantly higher than those retrieved on the dose reports ($P<0.05$). The highest UDs were reported for the abdomen-pelvis (10.93±5.74 [1.2-24.1] mGy), chest-abdomen-pelvis (9.79±7.09 [3.9- 22.1] mGy), pelvis (18.50±17.96 [5.8-31.2] mGy) and lumbar spine (10.24±11.38 [2.3- 29.6] mGy) examinations. The total UDs per CT examination were higher than 20 mGy for 10 pregnant women and the maximum total UD was 52.3 mGy

CONCLUSION

s The highest UDs were found for examinations directly exposing the pelvis. With current dose levels and in optimized practices, UDs per CT acquisition and CT examination were always below 100mGy. UD calculations could not be performed for CT examinations that did not directly expose the pelvis (UD<1mGy).

CLINICAL RELEVANCE/APPLICATION

Based on the results presented in this study and on our experience, we have also made recommendations for the management of pregnant women in CT.

W5B-SPRO-1 Application of Energy-Spectrum CT to Assess Sensitivity to Heavy Ion Irradiation in RAT C6 Glioma

Participants
Yu feng Li, MMedSc, (*Presenter*) Nothing to Disclose

PURPOSE

To study the value of multi-parameter quantification of energy-spectral CT in assessing the efficacy and response of C6 glioma in rats irradiated with different doses of heavy ion beam (12C6+).

METHODS AND MATERIALS

C6 cells at logarithmic growth stage were implanted into the right basal ganglia region of Wistar rat brain with a small animal stereotactic apparatus to establish a rat C6 glioma model; energy-spectrum CT scans were performed before and on days 7 and 14 after irradiation with different doses (1.0Gy and 2.0Gy) of 12C6+ ion beam, and the best single-energy CT values, iodine concentration values and slope of energy-spectrum curves were detected in the solid tumor area, liquefied necrotic area and tumor peripheral area. The tumor-bearing rats were marked as dying when they refused to eat and drink or had severe physical impairment.

RESULTS

Compared with the sham-irradiated rats in the 0 Gy group, the tumors in the 1.0 Gy and 2.0 Gy irradiated rats showed an increase in tumor volume in the early stage (7 d), a slight increase in blood perfusion in the solid tumor area, a slight increase in iodine concentration and single-energy CT values, and an expansion of liquefied necrosis inside the tumor; in the later stage (14 d), the solid tumor area shrank, and multiple liquefied areas around the tumor occurred, and the single-energy CT values at 65 keV, iodine concentration and the slope of the energy spectrum in the solid tumor area decreased. The tumor volume in the 2.0 Gy irradiated rats (7d and 14d) was smaller than that in the 1.0 Gy irradiated group, and the iodine concentration and CT value in the solid tumor area were lower than those in the 1.0 Gy irradiated group. The 35-d survival rate of the irradiated rats (1.0 Gy=40% 2.0 Gy=55%) was significantly higher than that of the 0 Gy sham-irradiated group (0 Gy=29%).

CONCLUSION

s Quantitative parameters of energy-spectrum CT, including 65 keV single-energy CT values, slope of the energy-spectrum curve and iodine concentration, can respond to the inhibitory effect of 12C6+ ion beam on the growth and invasion of rat C6 gliomas. Therefore, energy spectrum CT can be used as a non-invasive and dynamic assay to assess the response of glioma after heavy ion irradiation.

CLINICAL RELEVANCE/APPLICATION

Radiation therapy is one of the important treatments for refractory or recurrent glioma. However, due to the high irradiation dose, the tendency to damage normal brain tissue, and the difficulties in precise irradiation dose fractionation and radiosensitivity assessment, it is essential to explore more optimal radiotherapy strategies and detection modes. 12C6+ has the advantages of inverted deep dose distribution and high relative biological effects, and may provide an effective treatment for malignant and recurrent brain tumors.

BREE-1 Imaging and Management of High-Risk Breast Lesions: An Update of Current Evidence

Awards
Cum Laude

Participants
Richard E. Sharpe JR, MD, MBA, Scottsdale, AZ (*Presenter*) Nothing to Disclose

TEACHING POINTS

High-risk breast lesions (HRL) are a group of specific heterogeneous lesions that can be associated with a synchronous or adjacent breast cancer and that confer an increased lifetime risk of breast cancer. Providing high quality care for patients with HRLs requires careful correlation of specific patient history and imaging characteristics with histopathologic or cytopathologic results for concordance by the physician performing the biopsy. High-risk and malignant diagnoses should routinely prompt multidisciplinary discussion to determine optimal management. Excise specific HRLs because of the risk of upgrading the diagnosis to ductal carcinoma in situ or invasive cancer. Excise ALL HRL lesions demonstrating radiology pathology discordance. For patients with >1 HRL diagnosis after core needle biopsy, management should be based on the HRL with the highest risk of upgrade.

TABLE OF CONTENTS/OUTLINE

Overview of image guided biopsy process. Explanation of types of high-risk breast lesions, imaging and pathological findings, and associated risks of upgrade to malignancy for each, including: atypical ductal hyperplasia, flat epithelial atypia, lobular hyperplasia (ALH, LCIS), papillary lesions, radial scars/complex sclerosing lesions, fibroepithelial lesions, and phyllodes. Update of the current evidence regarding imaging and pathological correlation and management of each lesion type. Presentation of high yield point of care summary practice resources to support efficient management of patients with high-risk lesions.

BREE-10 Breast Malignancy Subtypes with Hybrid Use of Accelerated and Abbreviated Breast MRI in Screening Higher-Than-Average Risk Patients

Participants
Ashley Huppe, MD, Kansas City, KS (*Presenter*) Nothing to Disclose

TEACHING POINTS

Breast cancer screening guidelines for higher-than-average risk patients are expanding. Therefore, a supplemental screening exam is needed that is both cost-effective and accurate for detection of malignancy. The widespread use of full protocol screening MRI has limitations, and novel techniques have been developed to address these drawbacks. While abbreviated MRI addresses the cost, patient discomfort and time constraints of full-protocol exams, accelerated techniques can improve specificity of abbreviated MRI by providing a temporal analysis of contrast enhancement. Given their recent emergence, many are unfamiliar with the distinctions between these techniques and associated imaging appearance of various malignancy subtypes. After this presentation, participants will be able to:-Review breast cancer screening guidelines for higher-than-average risk patients-Understand the differences between acquisition of accelerated and abbreviated MRI-Describe the applications and benefits of accelerated and abbreviated MRI-Appreciate appearance of malignancy subtypes on accelerated and abbreviated MRI

TABLE OF CONTENTS/OUTLINE

1) Introductiona) Summarize current guidelines for breast cancer screening in higher-than-average risk patientsb) Discuss benefits and limitations of full protocol screening MRIc) Review accelerated and abbreviated MRIi) Define terminologyii) Discuss differences, clinical applications and benefits2) Case-based review of appearance of malignancy subtypes on accelerated and abbreviated MRI used in the screening settinga) Ductal carcinoma in-situb) Invasive ductal carcinomac) Invasive lobular carcinomad) Multifocal disease3) Conclusion

BREE-100 The Various Faces of a Fibroadenoma

Participants
Natalia Orthmann, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is: 1. To emphasize the importance of fibroadenoma findings in the different methods, as it is a common finding of benign breast lesions. 2. To show the epidemiology, histological origin, imaging, anatomopathological correlation when possible, association with medication use, and differential diagnoses of the fibroadenoma. 3. To present fibroepithelial tumors, with emphasis on fibroadenoma and its types. 4. To review imaging findings of breast lesions suggestive of fibroadenomas. 5. To illustrate the different imaging methods to assess the fibroadenoma, such as Ultrasound (US), Mammography (MG), tomosynthesis

(TS) and Magnetic Resonance (MR)

TABLE OF CONTENTS/OUTLINE

1. Literature review focusing on fibroadenoma and its differential diagnoses. 2. To illustrate and discuss the pathology of fibroadenoma, highlighting epidemiology; subtypes; progression in different imaging methods. 3.Review of the pathological development of fibroadenomas and its differential diagnoses through illustrative cases. 4.Example cases with mammographic, ultrassonographic and pathologic correlation when available. 5.Summary and conclusion.

BREE-101 Breast and Beyond! Breast Manifestations of Systemic Diseases

Participants
Ayla Yamamoto Mota, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

-To describe breast manifestations of ordinary and rare systemic diseases in different modalities (ultrasound, mammography and MR)- To demonstrate the importance to know patient´s comorbidity and background

TABLE OF CONTENTS/OUTLINE

-Introduction - Ultrasound, mammography and MR images: clinical cases of breast manifestations of systemic diseases- Conclusion

BREE-102 A-Z of Triple Negative Breast Cancer

Participants
Tatiana Tucunduva, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

-Define Triple negative breast cancer (TNBC)-Review the histopathological aspects -Review the molecular aspects -Review the spectrum of findings (mammography, US and MRI) -Pitfalls -Worse prognostic factors -News in treatment

TABLE OF CONTENTS/OUTLINE

1. TNBC definition 2. Histological and molecular aspects of TNBC 3. the spectrum of findings:On mammography, the mass more often appears irregular in shape and spiculated margins and may even contain benign aspects. Most show no calcification and are rarely associated with DCIS, as rapid carcinogenesis bypasses this stage.On ultrasound, TNBC often appears as a hypoechoic mass with uncircumscribed margins.Magnetic resonance imaging (MRI) is the most sensitive method to evaluate TNBC and shows some typical features such as annular enhancement and an intralesional T2 hyperintense signal, factors suggestive of malignancy.4. PiffallsBecause some lesions do not show desmoplastic reactions due to the aggressiveness of most triple-negative breast cancers, some radiologic features may resemble benign (cysts) or probably benign (B3) lesions.5. Worse prognostic factor.Compared with other breast cancer subtypes, TNBC has a worse prognosis because it is highly invasive. About 45% have distant metastases and the mortality rate is about 40% within the first 5 years.6. News in treatmentDue to its molecular subtype, TNBC does not respond to the usual specific hormonal therapies. Therefore, even for smaller lesions, chemotherapy is the main systemic treatment.However, different subgroups within TNBC share some molecular features that allow targeted, individualized therapeutic intervention.

BREE-103 One View, What To Do? A Review of the Imaging Appearance and Management of the Breast Asymmetry

Participants
Cara Connolly, MD, Nashville, TN (*Presenter*) Nothing to Disclose

TEACHING POINTS

The breast asymmetry seen in one mammographic view has long been the subject of diagnostic dilemmas for mammographers. Retrospective reviews have reported up to one third of breast cancers may have been seen as asymmetries. However, most screening callbacks for asymmetries are attributed to summation artifact, the overlapping of normal breast tissue.With incorporation of tomosynthesis, the recall rate for asymmetries has decreased but continues to present screening and diagnostic challenges. This exhibit will incorporate examples of asymmetries on both standard 2D imaging and tomosynthesis with both benign and malignant results, as well as review the diagnostic algorithm for management.

TABLE OF CONTENTS/OUTLINE

Benign cases of asymmetries will include summation artifact, PASH, fibrocystic change, fat necrosis, fibroadenomatoid change and abscess.Biopsy-proven malignancies will be highlighted, including invasive ductal carcinoma, invasive lobular carcinoma, ductal carcinoma in situ, lymphoma, and angiosarcoma.

BREE-104 The Myriad of High Risk Breast Lesions: Review of Radiographic and Histologic Features and their Challenging Management

Awards
Certificate of Merit

Participants
Saba Naamo, MD, Danville, PA (*Presenter*) Nothing to Disclose

TEACHING POINTS

High risk lesions (HRLs) are pathologically diverse lesions with an uncertain malignant potential that attribute an elevated lifetime risk for breast cancer. With a wide spectrum of clinical and radiological features, core needle biopsy is required to diagnose HRLs and tailor their management. We review the clinical, radiographic and histologic features of each of the HRLs and their potential for malignant transformation. We will also dive into the controversy and complexity of the current management as well as recent literature to delineate a guide for appropriate clinical management and the fine balance of risk/benefit. Teaching points: Recognize the clinical presentation, multimodality imaging findings and histologic manifestation of the HRLs Describe radiographic features of

HRLs that are commonly associated with malignancy Management and guidelines based on current evidence Imaging surveillance for patients with HRLs

TABLE OF CONTENTS/OUTLINE

Table of contents: ? Introduction and overview of HRLs ? Describe individual HRLs including: ? Definition ? Common clinical and radiological multimodality presentation ? Radiographic/Histologic concordance ? Spectrum of current management and guidelines ? Surveillance of non-surgically/surgically excised lesions

BREE-105 Implementation of Synthetic Mammography: Benefits, Drawbacks, and Pitfalls

Awards
Identified for RadioGraphics
Certificate of Merit

Participants
Sona Chikarmane, MD, Newtonville, MA (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Synthetic mammography (SM) is a 2D reconstruction from digital breast tomosynthesis (DBT) developed to replace full-field digital mammography (DM) obtained after the DBT acquisition.• SM reduces radiation dose and shortens acquisition time for screening mammography.• Studies have shown that DBT+SM significantly reduced recall rates and had equal cancer detection rates compared to DBT+DM.• SM increases conspicuity of calcifications and architectural distortion; SM has demonstrated decreased conspicuity of asymmetries, with no change in detection of masses.• SM may lead to artifacts such as "pseudo-calcifications", blurring of skin edge, artifact from metallic foreign bodies, and may underestimate breast density.• Despite widespread availability, breast radiologists are slow to adopt SM due to concern about artifacts and dislike of contrast/appearance of findings on SM compared to DM.

TABLE OF CONTENTS/OUTLINE

1. Introduction to SM: definition, reason for development, and hesitation over utilization2. Screening performance metrics: recall rates, cancer detection rates, positive predictive value3. Findings on mammography: conspicuity of calcifications, masses, asymmetries and architectural distortion in DBT+SM vs. DBT+DM4. Breast density assessment on SM and DM and discussion of clinical implications5. Review of artifacts on SM6. Remaining challenges of implementation and potential to improve performance through artificial intelligence

BREE-106 The Male Breast - A Review of Clinical, Imaging Findings and Diagnostic Work-up

Participants
Josefa Galobardes Monge, MD, Parla, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

To review clinical presentation, imaging features and pathologic findings in male breast pathology. • To illustrate imaging findings (mammogram, contrast enhanced mammography, US, CT) of cases from our series of breast lesions in males with pathologic correlation. • To analyze and discuss the specific management of breast lesions in men including imaging and interventional procedures. • To emphasize pitfalls, diagnostic difficulties and differential diagnosis.

TABLE OF CONTENTS/OUTLINE

We present: Clinical signs and symptoms. Techniques in evaluation of male breasts. Mammograms, contrast enhanced mammography, US, MR, CT. Differential diagnosis. Imaging appearances (spiculated mass, circumscribed mass, microcalcifications). Diagnostic work-up and recommendations for management. Specific considerations in male patients different from women. Different entities illustrated include. Benign: gynecomastia (diffuse, nodular and dendritic), epidermal inclusion cyst, lipoma, hematoma, foreign body granuloma, papilloma, fibromatosis; Malignant: ductal carcinoma in situ (DCIS), invasive ductal carcinomas uni and bilateral, metastasis to the breast (lung cancer), lymphoma

BREE-107 High-risk Lesions Breast: A Diagnostic Dilemma for the Radiologist and Pathologist

Participants
Jacobo Emmanuel Garcia, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

To expose the relative risk associated with breast cancer in women biopsied with ultrasound or stereotaxic guidance with results of proliferative lesions.Know the high-risk lesions according to the Ellis classification.Identify the main radiological characteristics of high-risk lesions in mammography and ultrasound.Exhibit the pathological characteristics to identify proliferative lesions.Suggest adequate and individualized management in response to the pathology of high-risk lesions of the breast.

TABLE OF CONTENTS/OUTLINE

1. Definition of high-risk lesions of the breast.1.1. Ellis classification of lesions B3.1.2. Epidemiology and associated risk of proliferative lesions of the breast.1.3. Radiological findings of high-risk lesions of the breast.2. Breast intervention techniques2.1. Image-guided interventional techniques for obtaining samples of suspicious lesions.2.2. Pathological features that facilitate differentiation.23. The handling of the surgeon and the radiologist before the result of the pathologist, in B3 lesions.n lesiones B3.

BREE-108 Implementing AI CAD for Mammography - Learnings After Having Screened 55,000 Women

Participants
Karin Dembrower, MD, PhD, Stockholm, Sweden (*Presenter*) Nothing to Disclose

TEACHING POINTS

How to prepare radiologists and AI for implementation in mammography screeningWhat to expect as a radiologist when starting to use AIWhat are the results of combined radiologist and AI CAD mammography readingCase review highlighting important teaching

points

TABLE OF CONTENTS/OUTLINE

AI CAD in practicePreparing radiologists and AI for implementationRadiologist impressions, change over timePreliminary results of our study with AI as third readerReview of cases with important teaching points

BREE-109 Breast Cancer Disparities that Affect Black Women

Participants
Hillary Bui, DO, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Become familiar with breast cancer disparities that affect Black womenBecome familiar with screening guidelines' impact on Black womenUnderstand the importance of risk assessment by age 30Learn about social determinants of health

TABLE OF CONTENTS/OUTLINE

Case-based and interactive exhibit with answers and explanations appearing on mouse clicks.Case #1: Barriers to accessing careSocial Determinants of HealthEconomic factors (e.g., income, insurance, childcare, transportation)Education level, literacyLanguageMedical mistrustCase #2: Black woman at average risk diagnosed with Stage II breast cancer (BC) at 44Black women more likely to be diagnosed with BC <50 versus Non-Hispanic White Women (NHW)Black women more likely to be diagnosed with triple-negative BCBlack women more likely to be diagnosed at later stages of BC Black women have higher mortality associated with BC Importance of risk assessment by the age of 30, particularly in Black womenScreening guidelines for average-risk womenCase #3: Black woman at elevated risk diagnosed with multicentric DCIS at 31Black women more likely to be diagnosed with BC <35 versus NHWWhen to refer women for genetic counselingBlack women less likely to undergo genetic testing Screening guidelines for high-risk women ConclusionsInitiating screening mammography after age 40 disproportionately impacts Black womenOmitting risk assessment by age 30 disproportionately impacts Black women Breast radiologists should be aware of disparities in BC to provide optimal care

BREE-11 Community Outreach in Breast Imaging: What Radiologists Can Do to Close the Gap for the Underserved and Uninsured Population

Awards
Identified for RadioGraphics

Participants
Angel Su, MD, CYPRESS, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

After the Affordable Care Act was implemented, the uninsured population in the United States of America decreased significantly. However, since 2017, a steady increase has been noticed, reaching up to 28.9 million in 2019. Unfortunately, the largest increases continue to affect minorities disproportionally and the COVID-19 pandemic, which resulted in lockdowns that delayed screening mammograms, further highlighted these disparities. Radiologists, and more specifically, breast imagers, must recognize this situation as this population is disproportionally diagnosed at later stages, has a higher mortality rate, less continuity of care, and overall lower survival. The purpose of this abstract is to familiarize the radiologist with the uninsured and underserved population and how these patients are affected by breast cancer, demonstrate current statistics, and propose strategies that breast imagers can pursue individually or as a group to close the disproportional gap for the underserved.

TABLE OF CONTENTS/OUTLINE

1.Introduction. 2. Who are these patients: Analyzing the data. 3. Breast cancer in the uninsured and underserved population: approach, navigating the options and obstacles, disparities 4. What else can the breast imager do? A) Radiologist-Patient interaction B) Radiologist-Referring physician interaction C) Radiologist-Community interaction D) Radiologist and the Media E) Radiologist and Legislature. 5. Conclusion

BREE-110 AI for Mammography: What Radiologists Need to Know

Participants
Sieun Lee, MD, Yongin, Korea, Republic Of (*Presenter*) Nothing to Disclose

TEACHING POINTS

Teaching points - AI-CAD can improve the diagnostic performance of radiologists, and help close the learning gap for inexperienced readers.- Stand-alone AI-CAD has shown variable performance in previous studies, suggesting a cautious approach is needed to implement its use for triaging or workload reduction.- Future AI will predict the possibility of cancers beyond the current diagnosis of present abnormalities in combination with the clinical model, which will allow more stratified and personalized screening to take place.

TABLE OF CONTENTS/OUTLINE

Improving the accuracy of breast cancer diagnosis - How AI-CAD differs from conventional CAD in terms of false-positive results- Retrospective, but large-scale evidence for AI-CAD - Cancers missed by AI-CADImproving efficiency for radiologists - Triaging screening mammography - Recommendations for the best use of AI-CADPersonalized predictions of cancer risk- Better way to estimate breast density- New model that includes additional clinical risk factors- Suggestions for personalized screening

BREE-112 Looking Through BI-RADS Terminology for Contrast-Enhanced Mammography - An Updated Guide to Understand CEM Supplement

Awards
Certificate of Merit

Participants
Diana Galvis Zambrano, BSc, MD, Mexico City, Mexico (*Presenter*) Nothing to Disclose

TEACHING POINTS

1.To describe Contrast-enhanced mammography (CEM) technique and image adquisition. 2. To outline contrast enhanced mammography - breast imaging lexicon - from ACR BI-RADS supplement. 3. To illustrate different imaging findings, the correlation with other imaging techniques and the appropriate form to report based in the new CEM BI-RADS supplement. 4. To review and compare the advantages and drawbacks of each image model. 5. To understand how and what should be in the report of a CEM study.

TABLE OF CONTENTS/OUTLINE

1. Background and history of CEM. 2. Description of protocol and imaging adquisition in contrast-enhanced mammography and associated technical details. 3. Review the CEM breast imaging lexicon from BI-RADS supplement. 4. Case-based CEM BI-RADS lexicon supplement interpretation in multiple scenarios and patologies. 5. Correlation of radiological findings between CEM and other techniques. 6. Discuss actual indications, limitations and the future of CEM. 7. Take home points

BREE-113 To Freeze Or Not To Freeze? That Is The Question: Cryoablation For The Treatment Of Breast Cancer

Participants
Kenneth Tomkovich, MD, Freehold, NJ (*Presenter*) Consultant, IceCure Medical, Inc;Speakers Bureau, IceCure Medical, Inc

TEACHING POINTS

The purpose of this exhibit is: 1. Discuss the historical perspective of breast cancer treatment from radical mastectomy in the late 1800's to current practice. 2. To discuss the use of image guided cryoablation in the treatment of cancer in organs other than the breast. 3. To demonstrate the optimal technique to perform successful ultrasound guided cryoablation of primary breast cancer. 4. To illustrate important “new normal” imaging findings commonly seen following breast cancer cryoablation. 5. Review recent publications and abstracts on the topic of breast cancer cryoablation as an alternative to surgical lumpectomy.

TABLE OF CONTENTS/OUTLINE

History of surgical treatment for breast cancer. Cryoablation therapy application in organs other than the breast. Technique of ultrasound guided breast cancer cryoablation. Present the imaging findings post breast cancer cryoablation: Mammography, Ultrasound, MRI. Future implications based on a review of recent publications and abstracts.

BREE-114 The Horizontal Approach for Tomosynthesis and Stereotactic Guided Breast Biopsy: Review of Technique and Advantages

Participants
Janice Thai, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To expand the proceduralist’s armamentarium by introducing a different approach to performing stereotactic breast biopsy. 2. To demonstrate the horizontal approach technique, and highlight the technical advantages inherent to a needle trajectory that is parallel to the image detector.3. To inform the appropriate use of the horizontal approach in technically challenging anatomy/lesion location, including thin breast, superficial/retroareolar lesion, and posterior chest wall/inferior lesion.

TABLE OF CONTENTS/OUTLINE

• Review of patient positioning, targeting approach, procedural technique, and device set up based on the two most popular commercially available systems • Review of the advantages of the horizontal approach over the vertical approach, with real life case examples• Review of needle targeting error and problem solving for optimal efficiency• Review of tips and tricks to maximize technical success and patient comfort

BREE-115 Breast Radiofrequency Identification Marker Localization: Technique, Tips, and Troubleshooting

Participants
Jared Vearrier, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Understand technology behind radiofrequency identification (RFID) markers2. Pros/cons of using RFID markers compared to other localization methods3. Understand optimal technique for US and Stereotactic marker placement4. Learn tips and suggestions for troubleshooting challenging cases

TABLE OF CONTENTS/OUTLINE

Introduction-Utilization of wireless localization-TechnologyUS guided RFID Placement-Pros/Cons-Technique of US guided placement-Challenges and tip/tricks for RFID placement in a case base format**Larger biopsy makers can obstruct the deployment path of the RFID marker and result in posterior migration**Forward migration of the RFID marker along the biopsy track of large gauge biopsy needlesStereotactic/Tomosynthesis-Pros/Cons-Technique of Stereotactic placement**Two view stereotactic technique can be employed or a single view tomosynthesis guided technique.**Challenges:**Unrecognized motion during placement**Marker migration: 1) Accordion effect; 2) Migration along the biopsy track; 3) Floating in hematoma/displacement by a hematoma; 4) Resorption of air at the biopsy cavity/Changes to biopsy marker site after neoadjuvant chemotherapy; 5) RFID Marker displacement by biopsy marker**Difficulty seeing target on Tomosynthesis slice after applicator placementPost-Procedure Imaging-Utilization of post-procedure imagingConclusion-Breast RFID markers have various frequencies to aid in surgical excision and is a great alternative to other wireless localization devices-Awareness of the challenges that a radiologist can encounter during placement is important to avoid migration and misplacement during deployment

BREE-116HC Imaging Features Following Breast Explant Surgery: A Pictorial Essay

Participants
Yusuf Akpolat, MD, Houston, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Breast implants can be removed with breast explantation surgery (BES) for various reasons, including patient dissatisfaction

1. Breast implants can be removed with breast explantation surgery (BES) for various reasons, including patient dissatisfaction, capsular contracture, implant infection or rupture, breast implant-associated anaplastic large cell lymphoma, and a recently emerging phenomenon called breast implant illness.2. BES techniques include capsulotomy, partial, total, or en bloc capsulectomy. Adjunctive aesthetic or reconstructive procedures after BES include fat grafting, mastopexy, augmentation, and reconstruction with flaps. 3. The majority of the post-BES breast imaging findings are related to the surgical scar/bed, thus, confirming the type of explantation surgery is important.4. Imaging findings after BES include focal and global asymmetries, architectural distortions, calcifications, calcified and non-calcified fat necrosis, masses, hematomas, seromas, capsular calcifications, and silicone granulomas.5. Most importantly, since these patients have residual breast tissue, paying attention to suspicious imaging features is necessary.

TABLE OF CONTENTS/OUTLINE

1. Breast Explant Surgery Techniques2. Findingsa. Global Asymmetryb. Architectural Distortionc. Calcifications/Fat Necrosisd. Asymmetries and Masses Anterior to the Pectoralis Major Musclee. Implant Capsule/Calcificationsf. Silicone Granulomas/Free Siliconeg. Suspicious FindingsPlease visit the Learning Center to also view this presentation in hardcopy format.

BREE-117 Pregnancy-associated Breast Cancer: The Perfect Storm

Participants
Julia Colombo, MD, Buenos Aires, Argentina (*Presenter*) Nothing to Disclose

TEACHING POINTS

• There is clinical and imaging difficulty in making an accurate diagnosis of breast cancer due to typical changes occurring during pregnancy and lactation. • The vast majority of mammary alterations in pregnancy correspond to benign pathology. • The differential imaging diagnosis is complex due to the similar appearance in many cases to benign pathology • Any palpable area that remains for more than 2 weeks during pregnancy should be investigated. • Ultrasound is the first choice in the evaluation of masses. • Mammography is essential for its complementary contribution. • MRI during pregnancy should be used if the benefits outweigh the risks and the information cannot be obtained by any other method. • Core needle biopsy is of choice for final diagnosis. • Pregnancy-associated breast cancer tends to have a worse prognosis due to delayed diagnosis • The incidence is increasing in developed countries due to the postponement of motherhood.

TABLE OF CONTENTS/OUTLINE

• Definition of pregnancy-associated breast cancer (PABC) • Some peculiarities of pregnancy-associated breast cancer. • Imaging methods for the diagnosis of breast cancer during pregnancy and lactation. Safety and effectiveness. • Some cases of our daily practice. • Conclusion.

BREE-118HC Fast-Growing Fibroepitelial Breast Tumors: Tips for Proper Radio-Pathologic Correlation

Participants
Amanda Tavares, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Fibroepithelial neoplasms are the most common breast tumors in clinical practice, especially in younger women. Despite most of these lesions are benign, they can present significant growth. Due to the overlapping histopathologic features, the differential diagnosis between Fibroadenoma (FA) and Phyllodes Tumor (PT) may be difficult on core-needle biopsies and radiopathologic correlation may contribute to the management of those lesions. FA are the most common lesions and usually have slow growth pattern; however, they can increase due to hormonal changes, especially during pregnancy and lactation. FA variants (eg. complex, giant and juvenile FA) may also present as fast-growing tumors. At imaging, FA usually present as oval and circumscribed masses, with high-signal on T2-weighted images, homogeneous enhancement or dark internal septations, and persistent kinetics on magnetic resonance imaging (MRI). PT usually present as fast-growing tumors and may be benign, borderline or malignant. They usually have image characteristics similar to those of FA, but may show cysts or necrosis related to the tumor's rapid growth. There is higher risk of malignancy if the tumor presents non-circumscribed margins, irregular cystic walls, peritumoral edema, low signal on T2 sequences and low apparent diffusion coefficient.

TABLE OF CONTENTS/OUTLINE

Fibroepithelial neoplasms of the breast Clinical and histopathologic features Imaging and Differential Diagnosis SummaryPlease visit the Learning Center to also view this presentation in hardcopy format.

BREE-119 Nipple-Areolar Complex, What the Radiologist Should Know

Participants
Natalia Orthmann, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is: 1.To show the epidemiology, histological origin, imaging aspects in the different methods, anatomopathological and clinical correlation, when possible. 2.To review the imaging findings of the suggestive nipple-areolar complex and its differential diagnoses. 3.To illustrate the different imaging methods to assess the nipple-areolar complex, such as Ultrasound (US), Mammography (MG), tomosynthesis (TS) and Magnetic Resonance (MR). 4.To suggest techniques for better assessment of the nipple-areolar complex.

TABLE OF CONTENTS/OUTLINE

1.Literature review focusing on nipple-areolar complex diseases and its differential diagnoses. 2.To illustrate and discuss the pathology of nipple-areolar complex diseases, highlighting epidemiology; anatomy; progression in different imaging methods. 3. Review of the pathological development of nipple-areolar complex diseases through illustrative cases. 4. Example cases with mammographic, ultrasonographic, clinical and pathological correlation when available. 5. Examples of cases with suggestions of techniques for better evaluation of the nipple-areolar complex 6. Summary and conclusion.

BREE-12 Second look and Targeted Ultrasound Made Very Very Easy, a Case-Based Review

Participants

Sepideh Sefidbakht, MD, Powel, OH (*Presenter*) Nothing to Disclose

TEACHING POINTS

Understanding the relationship between location of lesions in ultrasound and mammogram and MRI is not always intuitive. This makes targeted and second look ultrasounds challenging to learn. Following a few simple rules and being aware of the pitfalls and peculiarities associated with each modality can accelerate the learning curve and enhance the accuracy of performing second look and targeted ultrasounds. Using simplified rules, 3D schematics and simple animations we will review the basic concepts of second-look and targeted ultrasound. Then using a case-based approach we will practice the basic concepts of second look and targeted US. The purpose of this exhibit is to:1-Review the basic concepts of correlating lesions between modalities (clockwise location, depth, shape size)2-Review the basic characteristics of the CC view in mammogram (depicting medial, lateral, superior inferior lesions and the role of rolled-over views)3_Review the basic characteristics and peculiarities of the of the MLO view in mammogram and how it affects where we see lesions; the concept of clockwise and counterclockwise rotation of the breast and how it affects lesion perception.4-Review the basic characteristics of the lesions seen in MRI (location, depth, concordance and discordance between extent of enhancement and US appearance)

TABLE OF CONTENTS/OUTLINE

• Looking for a nonpalpable lesion seen in MG or MRI; The Four Golden Rules• 3D depiction of lesions in CC view; The Four Golden Rules of the CC view• 3D depiction of lesions in MLO view; The Four Golden Rules of the MLO view• Second look ultrasound, The Four Golden Rules• Case-based practice of second look and targeted ultrasound

BREE-120 Are You Sure It's Cancer? Desmoid Tumors Mimicking Malignant Lesions

Participants
Natalia Lima, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purposes of this exhibit are:To review the main aspects of desmoid tumors and its ability to mimic malignant lesions;To exemplify, by using interesting cases from our breast radiology group, different types of presentation of desmoid tumors;To show the main conclusion for each clinical case;To emphasize the importance of knowing this kind of tumors and differential diagnoses in order to help in daily clinical practice.

TABLE OF CONTENTS/OUTLINE

Teaching cases showing the challenging aspects based on imaging findings and correlate with clinical and pathological findings in different scenarios, mimicking solid-cistic complex, increasing palpable mass, posterior masses and espiculated masses, as well as in gardner syndrome; Explanations about the behaviour of desmoid tumors, as a benign neoplasm but with aggressive characteristics.

BREE-121 Lactation Education: Breast MRI Pathology, Pearls, and Pitfalls

Awards
Identified for RadioGraphics

Participants
Kali Xu, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

- The lactating breast undergoes marked physiologic changes that can make conventional imaging evaluation with mammography and ultrasound challenging.- MRI is increasingly recognized as a safe and effective supplemental tool for both diagnostic evaluation and screening of lactating patients in the appropriate clinical setting.- Learning to recognize normal physiologic findings, common benign entities, and signs of malignancy in the lactating breast on MRI will improve diagnostic accuracy and facilitate proper clinical management.

TABLE OF CONTENTS/OUTLINE

I. Review clinical indications for breast MRI during lactation.II. Illustrate characteristic features of the lactating breast on MRI, including atypical scenarios (post-breast conservation, unilateral breastfeeding).III. Provide case examples of benign entities encountered during lactation (galactocele, lactating adenoma, fibroadenoma).IV. Review MRI features of pregnancy-associated breast cancer (PABC) using case examples illustrating a spectrum of pathology and clinical scenarios. Correlative mammography and ultrasound images will be incorporated where appropriate. Emphasis will be placed on demonstrating how breast MRI may depict more extensive disease than conventional imaging, leading to changes in clinical management.V. Discuss risks and benefits of FNA vs. core biopsy for sampling of suspicious imaging findings in lactating patients, with emphasis on careful correlation of radiologic, pathologic, and clinical findings to avoid delays in cancer diagnosis.

BREE-122 Breast Parenchymal Changes After Breast Conservative Treatment - What the Radiologist Must Know How to Differentiate

Participants
Almudena Gil Boronat, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

- To briefly review the breast cancer conservative treatment, whose current protocols include the use of adjuvant breast radiotherapy. - To explain the different breast parenchymal findings expected after conservative treatment, depending on the time elapsed after it. - To emphasize that although most of them are benign in nature, they can present suspicious radiological semiology, and it is important to know them in order to differentiate them from a local recurrence.

TABLE OF CONTENTS/OUTLINE

1. Quick review of adjuvant radiotherapy after breast-conserving surgery. 2. Explain the different types of glandular changes expected after conservative treatment depending on the time of evolution, classified as early changes, intermediate changes and late changes. 3. We focus on explaining the situations that generate the greatest difficulties to differentiate them from a local recurrence. 4. Conclusions. 5. Take home points. 6. Bibliography.

BREE-123 Pregnancy-associated Breast Cancer and the Role of Imaging in the Pregnant and Lactating Patient

Participants
Julia Kirsten, MD, Fenton, MO (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Describe the background, etiology, biomarker status and most common histological types behind pregnancy-associated breast cancer.2. Discuss screening and diagnostic guidelines and review current updates regarding the role of imaging for pregnant and lactating women.3. Review common benign pregnancy-related lesions, potential complications, radiation safety, and treatment of pregnancy-associated breast cancer.

TABLE OF CONTENTS/OUTLINE

1. Introduction to pregnancy-associated breast cancer and challenges in diagnosis2. Etiology, histological type, and biomarker status of pregnancy-associated breast cancer3. Clinical manifestations of pregnancy-associated breast cancer (palpable breast mass, unilateral milk rejection, etc)4. Initial imaging of breast cancer screening during pregnancy (high and elevated risk patients, 39 and under, summary of recommendations from ACR, ACOG, AJR)5. Initial imaging of breast cancer screening during pregnancy (40 years and older, summary of recommendations from ACR, ACOG, AJR)6. Initial imaging of breast cancer screening during lactation7. Initial imaging of pregnant women with a palpable breast mass8. Use of MRI in the pregnant/lactating patient (concerns regarding heat deposition into the fetus, damage to auditory nerves, gadolinium-induced fetal toxicity)9. Common benign pregnancy-related breast lesions10. Complications of biopsies in pregnant and lactating women (milk fistulas, increased risk of bleeding and infection, breast pseudoaneurysm)11. Radiation safety and recommendations12. Treatment of pregnancy-associated breast cancer13. Conclusion

BREE-124 Common Questions and Challenging Scenarios of the Daily Practice Using the BI-RADS® Atlas

Participants
Karina Pesce, MD, Capital Federal, Argentina (*Presenter*) Nothing to Disclose

TEACHING POINTS

1-Review the management recommendations suggested by the ACR for clinical cases that generate different inquiries during daily practice. 2-Describe the different clinical scenarios that constitute the exception to the rule in the management of categorization recommendations.

TABLE OF CONTENTS/OUTLINE

The American College of Radiology (ACR) has established the Breast Imaging Reporting and Data System (BI-RADS) to guide the breast cancer screening and diagnostic routine. This educational poster is aimed at doctors who are new to breast diagnosis and is intended to be a practical guide to solve the most frequent doubts following the recommendations of experts from the American College of Radiology. Frequently asked questions will be reviewed through clinical cases.

BREE-125 False Negatives in Breast Screening and How to Avoid Them

Participants
Agustina Graziani, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Identify the factors that influence false negative results in all diagnostic modalities.2. Analyze the causes of false negatives.3. Discuss possible strategies to avoid false negatives.

TABLE OF CONTENTS/OUTLINE

Breast cancer is a common disease among women and it is the second leading cause of death from cancer. Timely diagnosis allows detection in early stages, with better outcome, better prognosis and with fewer comorbidities in the instituted treatments.Diagnosis can be made with breast imaging either by mammography, ultrasound and magnetic resonance imaging. The percentage of false negatives on imaging studies in the literature varies between 8-10%, between 9 and 22% and 4.4% respectively.The most common causes that lead to a misdiagnosis can be classified as related to:1. The technical aspect of the imaging modality.2. The Patient.3. The Reporting physician.4. The lesion.Early detection of breast cancer is one of the most important prognostic indicators, and diagnostic errors in breast imaging represent missed opportunities for timely treatment.Improving diagnostic accuracy requires a multidimensional approach, however recognizing causes of false negatives allows us to adopt useful strategies to avoid them and thus favorably impact the reduction of morbidity and mortality.

BREE-126 Pseudoangiomatous Stromal Hyperplasia of the Breast (PASH) - Tips and Tricks for Diagnosis

Participants
Rosa M. Lorente-Ramos, MD, PhD, Madrid, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

To review pseudoangiomatous stromal hyperplasia of the breast, highlighting clinical presentation, pathological and imaging findings as well as differences from breast cancer To illustrate common and uncommon imaging findings in mammogram and contrast enhanced mammography (CEM), US, MR, of cases from our series with pathological correlation. To analyze and discuss the specific management of those lesions, including diagnostic difficulties and imaging work-up. To emphasize pitfalls and clues to differential diagnosis.

TABLE OF CONTENTS/OUTLINE

Pseudoangiomatous stromal hyperplasia (PASH) is a benign mesenchymal proliferating lesion. It is frequently found as an incidental histological finding in breast biopsies performed for other lesion but it can present as a mass (also called nodular PASH) or breast enlargement, which may mimic malignant lesions malignant lesions. Keys for differential diagnosis should be recognized. We present: - Definition. - Clinical presentation. - Pathological findings. - Imaging findings: Mammograms/CEM, US, MR. - Differential diagnosis. - Management and outcomes.

BREE-127 High-risk Breast Lesions - What the Radiologist Should Know About the Diagnostic and Therapeutic Implications

Participants
Ladys Camargo, MD, Ciudad Autonoma de Buenos Aires, Argentina (*Presenter*) Nothing to Disclose

TEACHING POINTS

Describe the lesions included in the histopathological B3 category of the Ellis classification. Correlate imaging and histopathological findings.Discuss the diagnostic algorithm and management of B3 lesions.

TABLE OF CONTENTS/OUTLINE

One of the main challenges of breast pathology is the diagnosis of lesions with indeterminate radiological characteristics and their proper management. The same occurs with the diagnosis of histological lesions considered to be of uncertain malignant potential, framed according to the Ellis histological classification as B3 lesions. Over time, personalized management has been favored to reduce overtreatment and thus lower the high healthcare costs associated with surgical excision. The main objective of this work is to provide a precise approach to high-risk lesions, correlating their imaging and pathology findings and discussing their proper management.1. Introduction.2- Classification of B3 lesions according to Ellis histological classification.3- Imaging characteristics of B3 lesions (mammography, US, MRI).4- Radio-Pathological correlation.5-Clinical cases.6- Diagnostic Algorithm.7-Discussion of the Management of B3 Lesions.8- Conclusions.9-Bibliography.

BREE-128 Male - Malignant or Mimic? A Seven-Year Institutional Review of Male Breast Biopsies with Radiology-Pathology Correlation

Participants
Esraa Hazim Hasan Al-Jabbari, MBCHB, Galveston, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. An overview of male breast findings which were biopsied and/or resected over the last seven-years (April 1st, 2015 -March 31st, 2022) within our institution. 2. Discuss imaging and pathologic features of some pertinent benign and malignant lesions of the male breast. 3. Highlight imaging features suggestive of a benign etiology to limit false negative biopsies. 4. Highlight the risk factors for male breast cancer. 5. Discuss potential breast cancer screening programs in at- risk male populations including trans-gender patients.

TABLE OF CONTENTS/OUTLINE

Introduction; Embryologic and anatomic overview of the male breast; Institutional experience with male breast findings; Malignant breast findings in males; Benign mimics of breast malignancies in males; Risk factors for male breast cancer; Potential screening guidelines in at - risk male population; Conclusion.

BREE-129 Dermatofibrosarcoma Protuberans: A rare Differential Diagnosis in Superficial Breast Lesions - Imaging Findings and Histopathological Correlation

Participants
Camila Acras, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

- To present the features of dermatofibrosarcoma protuberans (DFSP) in the breast through imaging findings on mammography (MG), ultrasonography (US), and magnetic resonance imaging (MRI) - To review the DFSP imaging signs, and discuss the differential diagnosis

TABLE OF CONTENTS/OUTLINE

- Introduction. - Identify and describe differential imaging findings, including the ones that can suggest the diagnosis of DFSP - Report the survey of institutional data from the analysis of the results of breast biopsies performed in recent years that confirmed histological diagnostic of DFSP - Report the institutional data from the analysis of the breast biopsies performed in recent years that confirmed histological diagnostic of DFSP - Conclusion.

BREE-13 Echogenic Breast Lesions: A Road Map for the Breast Radiologist

Participants
Luciano Fabrizio, Buenos Aires, Argentina (*Presenter*) Nothing to Disclose

TEACHING POINTS

1- Identify benign and malignant breast pathology that manifest as echogenic ultrasound lesions.2-Correlate ultrasonographic and mammographic findings.3-Correlate imaging findings with histopathological study.4-Discuss the diagnostic algorithm for echogenic breast lesions.5-Identify imaging key-points for each echogenic lesions.

TABLE OF CONTENTS/OUTLINE

-Introduction: echogenic images and their epidemiology.-Ultrasound key-points for characterizing benign and malignant entities.-Diagnostic algorithm.-Conclusions.-Annex I: characteristics table of benign and malignant echogenic lesions.-Annex II: diagnostic algorithm (categorization and biopsy indications).

BREE-130 Prone Tomosynthesis-guided Breast Biopsy: A Guide for Trainees and Experts Alike

Awards
Identified for RadioGraphics

Participants
Luciano Chala, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Step-by-step review of tomosynthesis-guided breast biopsy technique2. Discuss all indications, complications, and contraindications of the method.3. Share our experience with cases illustrating situations where tomosynthesis has helped improve our biopsies results.

TABLE OF CONTENTS/OUTLINE

- To obtain more accurate and reliable results, it is important to be familiar with the steps of tomosynthesis-guided biopsy. We demonstrate the technique step-by-step with actual photos from our daily practice so that residents can learn the procedure comprehensively.- In recent years, tomosynthesis-guided biopsy has gained popularity. We discuss all indications for this method and compare its limitations and complications with supine tomosynthesis-guided and stereotactic biopsies.- Tomosynthesis-guided breast biopsy in the prone position can sometimes offer advantages over other methods and even shorten the overall duration of the biopsy. We illustrate the following advantages with some cases: identification of lesions visible only on tomosynthesis, the possibility of lateral access in thin breast thickness, improved calcifications conspicuity, and identification of intravascular calcifications, which helps to distinguish them from linear calcifications and also allows better planning by avoiding blood vessels to reduce hemorrhage-related complications.

BREE-131 SOS Within the Breast: The Must-Knows of Handling Emergent Breast Cases

Participants
Kristina Michaudet, MD, Stanford, CA (*Presenter*) Nothing to Disclose

TEACHING POINTS

Breast emergencies are infrequent but can be diagnostically challenging especially during off hour nights and weekends. Very few experienced breast imagers nor specialized sonographers may be available during acute breast situations. Breast emergencies may present as complications of interventional procedures such as pseudoaneurysms or post biopsy hematomas. Numerous patients also return to the emergency department setting following mastectomy and reconstruction. Additionally, acute situations may be related to infection and inflammation in both cancer and non-cancer patients. Most importantly, a seemingly infectious process can masquerade an underlying mass and malignancy. The importance of follow up imaging for ED breast complaints is imperative.

TABLE OF CONTENTS/OUTLINE

The poster will be organized to include a review of both common and uncommon emergently presenting breast conditions. Examples of emergency breast cases including infection in puerperal and non puerperal cases will be showcased as well as first time presentation of malignancy through acute settings. Breast ultrasound utilization will be discussed along with the patient factors and characteristics which may be most pertinent for suspected infection and abscess. Management and knowledge of appropriate follow-up-protocols is key particularly for the non- breast imager encountering these unique cases on call. Emergency procedures and treatments such as embolization will be highlighted in cases of post biopsy complications such as bleeding and pseudoaneurysm formation.

BREE-132 Non-mass Lesion on Ultrasound - The New Finding to Incorporate

Awards
Certificate of Merit

Participants
Karen Mena Moreno, MD, Buenos Aires City, Argentina (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Analyze the correlations between histopathologic findings and non-mass breast lesions on ultrasound.2. Discuss the management of non-mass findings on ultrasound.3. Demonstrate the importance of recognizing non-mass lesions.

TABLE OF CONTENTS/OUTLINE

Introduction. Review of the definition and sonographic characteristics of non-mass findings.Description and correlation of breast imaging findings on mammography and MR.Clinical cases with histological correlation.Diagnostic algorithm. Treatment and management considerations. Discuss controversial cases. Take-home points. Conclusions.

BREE-14 Next Top Model: An Overview of Breast Cancer Risk Assessment Models

Participants
Pooja Agrawal, Houston, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Introduce breast cancer risk assessment models available for estimating an individual’s risk of developing breast cancer or risk for carrying a gene mutation that may predispose to developing breast cancer. 2. Review the strengths and limitations of each model and the model’s applicability to underrepresented populations. 3. Provide example cases and narratives that demonstrate the use of breast cancer risk assessment models for different women.

TABLE OF CONTENTS/OUTLINE

1. Introduction: Review breast cancer statistics including morbidity and mortality disparities amongst patient populations, define breast cancer risk assessment, review guidelines and recommendations for breast cancer risk assessment (American College of Radiology, Society of Breast Imaging, American Society of Breast Surgeons, American College of Obstetricians and Gynecologists), and discuss current utilization (or lack of utilization) of breast cancer risk assessment. 2. Review available risk models, including risk factors assessed, strengths, and limitations: Gail Model, Claus Model, BRCAPRO Model, IBIS aka Tyrer-Cuzick Model, Jonker Model, BOADICEA Model. 3. Demonstrate breast cancer risk assessment performance: Provide examples of how risk assessment is performed, review recommendations for patients found to be at high risk. 4. Show case examples of breast cancer risk assessment for women belonging to minority groups or underrepresented populations. 5. Conclusion and application of breast cancer risk assessment models to clinical practice

BREE-15 Problem-Solving Breast MRI

Awards
Identified for RadioGraphics
Certificate of Merit

Participants
Beatriu Reig, MD, MPH, New York, NY (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. MRI does not replace careful diagnostic workup with mammogram and ultrasound 2. Negative MRI should not obviate the need for biopsy for a suspicious finding detected on mammography/tomosynthesis or ultrasound 3. A negative MRI is reassuring in low-suspicion mammo/tomosynthesis findings such as asymmetries, focal asymmetries, and post-surgical change

TABLE OF CONTENTS/OUTLINE

1. Brief introduction a. Indications for MRI b. MRI Sensitivity/specificity 2. Indications for problem-solving MRI a. Equivocal or uncertain imaging i. Lesion visible on some but not all views ii. Change over time: true change versus technical difference iii. Change at surgical site iv. Sternalis muscle b. Negative imaging with clinical concern i. Suspicious nipple discharge c. BIRADS 4 lesions i. Difficult biopsy due to technical issues ii. Discordant biopsy iii. Tomosynthesis-only finding without tomo-guided biopsy capability 3. Inappropriate use of problem-solving MRI a. Preceding or replacing diagnostic mammo and US b. In lieu of biopsy of a suspicious finding identifiable by mammo, US, or clinical exam c. Evaluation of mammographic calcifications 4. Future directions a. Increasing use of tomosynthesis decreases need for problem-solving MRI i. Better evaluate equivocal findings ii. Biopsy one-view findings b. Triaging tool for active surveillance vs surgical excision for high risk lesions detected on percutaneous biopsy i. Low grade DCIS ii. ADH, atypia iii. Radial scar c. Improving accuracy leads to improved utility of problem solving MRI i. Diffusion weighted imaging ii. Artificial intelligence in MRI d. Problem solving MRI more feasible as MRI becomes faster and cheaper i. Abbreviated MRI impact ii. Increased MRI screening

BREE-16 The Use of Diffusion-weighted Sequence in the Evaluation of Breast Lesions: What the Radiologist Needs to Know

Participants
Giselle Mello, PhD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Review the fundamental principles of diffusion-weighted imaging (DWI).- Review the concepts of breast lesions cellularity.- Review the concepts of ADC mapping.- Illustrate with cases how to differentiate benign from malignant lesions and correlate the histopathologic findings with their ADC values to allow for earlier and more accurate diagnosis and individualized patient care.- Create a pictorial essay to illustrate the use of DWI to differentiate complex breast lesions with peripheral enhancement that, when combined with clinical and histopathologic findings, can provide valuable information for therapy.

TABLE OF CONTENTS/OUTLINE

1) Principles of diffusion-weighted imaging (DWI).2) The concept of apparent diffusion coefficient (ADC).3) Lesion cellularity.4) Benign and malignant DWI findings and their corresponding ADC values.5) Differentiation of complex peripheral enhancing breast lesions.6) DWI findings for predicting pathologic response in neoadjuvant treatment of breast cancer.7) A series of cases using DWI sequences and correlation of their ADC values with histopathological findings.

BREE-17 Anatomical Approach for the Imaging and Diagnosis of Nipple Areolar Complex Abnormalities

Awards
Certificate of Merit

Participants
Claudia Cotes, MD, Houston, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

The nipple areolar complex is a region of the the breast with a complex anatomy from which several benign and malignant pathology may arise. It is important to understand anatomic features of this region for an appropriate differential diagnosis when abnormalities in this area are encountered. The imaging evaluation of this region can be technically difficult due to superimposition of tissues in mammography and artifacts and/or technical limitations on ultrasound which can limit the appropriate diagnosis of these abnormalities. This exhibit will provide a review of the clinical and imaging findings of interesting pathologic processes in the nipple areolar complex utilizing an anatomical approach, as well as interactive examples of imaging technique for proper evaluation of this region. Workup algorithms based on the ACR appropriateness criteria for clinical findings related to the nipple areolar complex will also be provided.

TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Imaging Anatomy of the Nipple Areolar Complex 3. Imaging of the Nipple Areolar Complex: Tips and Tricks for optimal evaluation4. Anatomy based Pathology Review: a. Skin and Subcutaneous Soft Tissue: Sebaceous Cyst, Epidermal Inclusion Cyst, Montgomery Gland Cyst, Cellulitis/Abscess, Eczema, Paget Disease b. Breast Parenchyma and Connective Tissue: Adenoma, Fibroadenoma, Lipoma, Fibroadenolipoma, Abscess c. Ductal system: Ductal Ectasia, Intraductal Papilloma, Ductal Carcinoma In-Situ, Invasive Ductal Carcinoma 5. Workup Algorithms 6.Conclusion

BREE-19 Green is the New Pink- Reducing the Carbon Footprint of Breast Imaging Practices

Participants
Tom Soker, DO, Cleveland, OH (*Presenter*) Nothing to Disclose

TEACHING POINTS

Recognized as one of the greatest global health challenges of the 21st century, climate change poses substantial risks to the health and well-being of the world's population. With healthcare overall contributing up to 10% of greenhouse emissions in the United States, imaging has been identified as one of the major contributors. Therefore, breast radiologists should embrace

environmentally friendly strategies to mitigate future health effects. Specific learning objectives for this exhibit include: 1) Understand the current state of climate change and how it relates to medicine.2) Review how breast imaging practices currently contribute to climate change.3) Describe steps that breast imaging practices can take now to reduce their carbon footprint.4) Describe initiatives that breast imaging can embrace to further accelerate adoption of "greener" practices and engage the broader community.

TABLE OF CONTENTS/OUTLINE

Using text, schematics and cases, we will discuss the current challenges that breast imaging practices face and focus on specific steps that practices can take to reduce their carbon footprint and become "greener". 1) Reduce waste -- Decrease glove use; incorporate biodegradable disinfectant wipes; adopt electronic data entry; temperature off-hour modulation; off-hour power down of equipment, lights and computers. 2) Reuse/Recycle - sterilization of equipment rather than disposal; recycle packaging3) Greener workflow - routine same day interpretations and biopsies; adoption of telehealth; electronic transfer of imaging to outside facilities

BREE-2 Serving the Underserved: A Safety-net Framework to Provide High-quality, Comprehensive and Culturally Competent Breast Imaging Care

Awards
Identified for RadioGraphics
Magna Cum Laude

Participants
Berat Bersu Ozcan, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Groups that may experience breast cancer (BC) disparities include those defined by race/ethnicity, national origin, cultural beliefs, age, education, socioeconomic status, geographic location, disability, gender identity and sexual orientation. 2. BC screening increases early detection. Improving access supported through radiology-community partnerships using educational programs and community outreach can reduce disparities in BC mortality. 3. Women in safety-net systems who receive a BC diagnosis experience significant access related delays. Delays as short as 30 days affect BC outcomes. 4. Genetic factors contribute to higher mortality in Black and Hispanic women including significantly younger age at diagnosis and a higher incidence of aggressive hormone receptor-negative BC than White women. Black women with hormone-positive cancer have worse 21-gene assay scores and higher BC-specific mortality compared to Whites in all risk groups. 5. With the complexity of breast imaging, cancer care and safety-net systems, formal care coordination programs are essential to help women navigate through screening and diagnosis to treatment.

TABLE OF CONTENTS/OUTLINE

Define at-risk or vulnerable patient populations and the role of safety-net hospitals. Summarize population-based breast cancer screening programs and efforts in the United States. Review outcomes and health disparities for underrepresented minorities and underserved women in the United States. Discuss barriers to care and strategies to improve screening uptake and reduce breast cancer disparities.

BREE-20 A Comprehensive Look at Disparities in Breast Cancer in the Non-Hispanic Black, Hispanic, and Transgender Community and What Policy Changes Should be Considered

Participants
Frances Perez, MD, Houston, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

The incidence of breast cancer are higher for non-Hispanic Blacks (NHB) younger than 45 years of age than for non-Hispanic Whites (NHW) in that same age group. Approximately 30% of all breast cancer diagnosed in NHB and Hispanic woman are diagnosed in woman under the age of 50. According to the Surveillance, Epidemiology, and End Results (SEER) data, minority women are 72% more likely to present to with invasive disease at time of diagnostic when compared to NHW. Minority women as 58% more likely to be diagnosed with advanced-stage breast cancer under the age of 50. Currently, the World Professional Association of Transgender Health lack guidelines on breast cancer screening. Furthermore, large databases in the U.S, like the SEER and National Cancer Database (NCDB) do not capture non-binary genders.

TABLE OF CONTENTS/OUTLINE

Through a case based multimodality approach we will exhibit several clinical cases that demonstrate the degree of advance invasive disease that minority women present with under the age of 50. We will discuss the breast cancer screening barriers that transgender individuals face, and the implications that this lack of resource has in this patient population. Throughout this exhibit, we will identify the most salient contributing factors including social determinants of health, breast cancer incidences within different ethnic and cultural groups, the difference in tumor biology and genomic that contribute to a higher mortality, as well as disparities in breast cancer treatments. To conclude, we will discuss strategies that may be implemented in order to mitigate these diversity related disparities.

BREE-21 Imaging Approach and Challenges to Breast Cancer in Young Patients

Participants
Cara Connolly, MD, Nashville, TN (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review the diagnostic algorithm and appropriateness criteria for imaging studies in women less than age 40 and pregnant and lactating patients2. Review genetic syndromes that increase the risk of breast cancer in this age group3. Review the imaging appearance of pregnancy associated breast cancer and its mimics4. Present examples of malignancy highlighting the diagnostic dilemmas unique to this patient population.

TABLE OF CONTENTS/OUTLINE

Up to 7% of invasive breast cancers are diagnosed in patients less than 40 years old, with lower survival rates compared to older

age groups, and poorer outcomes disproportionately affecting young black women. Because routine screening does not typically include women in this age group, most cancers (up to 80%) are diagnosed when patients self-present with a breast complaint or lump, often at advanced stage. Further, breast cancers in this age group tend to be hormone-receptor negative with aggressive features.Breast cancer in pregnant and lactating patients in this age group presents an additional diagnostic dilemma due to the physiologic changes occurring in the perinatal period, often leading to misdiagnosis and delay in treatment.Example topics to be covered, including but not limited to, the following:-Diagnostic Imaging Workflow-Patients Under 40-Pregnant/Lactating Patients-Predisposing Genetic Syndromes and Germline Mutations-Pregnancy Associated Breast Cancer and Mimics-DCIS-Invasive Mammary Carcinoma

BREE-22 Delayed Diagnosis in Medically Underserved Individuals: Identifying Granulomatous Mastitis

Participants
Molly Downey, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Idiopathic granulomatous mastitis (IGM) is an uncommon inflammatory disease of the breast with nonspecific imaging findings which requires core needle biopsy for pathologic diagnosis.2. Though there is incomplete evidence on prevalence among racial or ethnic groups, many published studies suggest a Hispanic or non-Caucasian predominance. Premenopausal women with a history of lactation are most affected.3. Diagnosis of IGM is by histopathology findings of lobulocentric granulomatous inflammation, with the additional findings of suppurative lipogranulomas and Corynebacterium infection characteristic for cystic neutrophilic granulomatous mastitis (CNGM).4. Enhanced understanding by the radiologist of the symptoms, imaging appearance, and histopathologic features of IGM is essential to avoid late diagnosis or misdiagnosis, especially in medically underserved individuals.

TABLE OF CONTENTS/OUTLINE

1. Background of IGMa) Prevalence and demographicsb) Proposed pathophysiology of IGM and subtype CNGMc) Clinical presentationd) Diagnostic workupe) Histopathologic appearance of IGM and CNGM2. Case-based imaging review of IGM and mimicsa) IGM and CNGMb) Chronic abscessc) Infectious mastitisd) Diabetic mastopathye) Inflammatory breast cancer3. Treatment, disease course and prognosis4. Team-based approach for diagnosisa) Clinical presentation and referral to radiologyb) Communication with Pathologists

BREE-23 How to Reduce Missed Breast Cancer on Automated Breast Ultrasound

Participants
Sung Kim, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Ultrasound (US) is more commonly used for adjunctive screening for dense breast. Automated breast ultrasound (ABUS) is also commonly employed with advantage of its production of reproducible, high-resolution images and its reduced dependency on human operators. Supplementing mammography with ABUS screening resulted in positive outcomes that were similar to those associated with handheld US (HHUS) screening, including increased detections of invasive cancer and reduced rates of interval cancer. However, due to the large number of images in the scan, reading a full ABUS examination can be lengthy and cancers may be easily overlooked. Possible causes for missing breast lesions on US include perception errors of isoechogenic and heterogeneous echoic lesions, deep lesions, subareolar lesions, poor positioning or technique, misinterpretation, and subtle features of malignancy. Also ABUS encountered artifacts. Here, we review possible causes of missed cancers on ABUS and discuss methods to reduce them.

TABLE OF CONTENTS/OUTLINE

1. Pros and cons of automated breast ultrasound(ABUS)2. ABUS as a supplemental screening tool 3. Causes of missed cancers on ABUS 1) Technique and artifacts 2) Errors in detection 3) Errors in interpretation 4) Tumor morphology 5) True negative cases4. Solutions to reduce missed cancer

BREE-24 Breast Fibromatosis in Very Young Women - As Ugly and Benign as Ever, but with a Different Presentation: A Series of 6 Cases

Participants
Andres Vicentela, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Present our experience with breast fibromatosis (BF) in women younger than 25 years old which shows a different clinical and radiological pattern compared to the classic BF in older women (findings not yet described in actual literature).2. Give details of the imaging signs that characterize BF in mammography, ultrasound and MRI at this age range.3. Understand the natural history, prognosis and treatment options available

TABLE OF CONTENTS/OUTLINE

1. Introductiona. Definition of breast fibromatosis, demographics and typical clinical presentationb. Imaging findings on mammography, ultrasound and MRIc. Histopathology characteristics, natural history, prognosis and treatment options.2. Our experience in breast fibromatosis in women younger than 25 years old.a. Clinical presentationb. Imaging characteristics on different modalitiesc. Histopathologic findingsd. Surgical resolutione. Follow up3. Highlight the difference between classic BF and the pattern of this pathology in very young women.

BREE-25 From the Breast to the Bone: Multimodality Imaging Review of Osseous Metastases from Breast Cancer

Participants
Daniel Morgan, DO, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Understand the epidemiology of osseous metastatic disease in breast cancer and the imaging modalities that evaluate for osseous metastases2. Discuss mimics, pitfalls, and pearls when assessing for osseous metastatic disease in breast cancer3. Know

the imaging features of osseous metastases and their mimics to accurately diagnose metastatic disease and recognize when it is appropriate to biopsy an osseous lesion in question4. Examine current treatment options for osseous metastatic disease, the biology of the primary and metastatic lesions, and their treatment-related imaging features

TABLE OF CONTENTS/OUTLINE

Introduction:• Epidemiologic factors• Appropriate imaging evaluation to assess for osseous metastases• Most common locations for osseous metastasesOsseous Metastatic Disease as Initial Presentation:• Hip• Ribs• Spine compression fracture• Skull/skull baseDifferential Diagnosis:• Sternal metastasis vs hemangioma• Multiple sclerotic osseous metastases vs osteopoikilosis• Sacral metastasis vs insufficiency fractures or sacroiliitis• Enchondroma• Fibrous dysplasia• Aneurysmal bone cyst• Metastases from non-breast primary malignancyTreatment:• Local treatment• Systemic treatment• Treatment response/treatment related changes• Biology of breast cancer metastases

BREE-26 Rare Beauty in the Breast: Introduction to Unusual Breast Lesions

Awards
Certificate of Merit

Participants
Hee Jung Choi, MD, Mexico City, Mexico (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review general features of unusual benign and malignant breast lesions.2. Analyze multimodality imaging findings of each lesion and correlate the findings with the underlying histopathologic and clinical findings.3. Recognize breast imaging abnormalities and describe key findings of each imaging method that lead to perform interventional procedures.4. Discuss the imaging follow-up and management of uncommon breast lesions.

TABLE OF CONTENTS/OUTLINE

1. Analyze macroscopic and microscopic normal anatomy of the breast and identify the origins of unusual lesions.2. Identification of uncommon breast lesions by category:a. Benign and malignant breast neoplasms: lymphomas, neuroendocrine tumors, sarcomas, mucinous, apocrine and inflammatory carcinomas, breast metastases, benign and malignant phyllodes tumor, hamartoma and tubular adenoma.b. Mastitis and complications: acute mastitis, chronic granulomatous mastitis and breast abscess formation.c. Miscellaneous: neurofibromatosis, arteriovenous malformation, silicone mastopathy and foreign modeling agent reactions.d. Breast pathology in men: primary breast cancers and metastases, gynecomastia and tricoepithelioma.3. Review the key points of each disease:a. Epidemiologyb. Clinical presentationc. Histopathologic characteristicsd. Multimodality imaging findingse. Illustration of the examples4. Discuss the management of atypical breast lesions including treatment and imaging-guided diagnostic biopsies with an assessment of proper technique in mammography, contrast-enhanced mammography, ultrasound and MRI.

BREE-27 I Am Not Who You Think I Am: Benign Mimics of Breast Malignancy with Multimodality and Pathologic Correlation

Awards
Certificate of Merit

Participants
Toma Omofoye, MD, Houston, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

To demonstrate: 1. Common and uncommon benign entities may have imaging features typically associated with breast malignancy. 2. Imaging workup of "malignant-appearing but benign" breast lesions with multimodality appearance (Mammography, DBT, Ultrasound, Contrast-Enhanced Mammography, MRI, and/or Molecular Breast Imaging). The histopathologic correlation will be included where possible. 3. Appropriate broadening of differential diagnoses can aid in radiologic-pathologic correlation after percutaneous core biopsy.

TABLE OF CONTENTS/OUTLINE

Based on cases at a tertiary oncologic referral center, we review breast imaging lesions with suspicious imaging features mimicking primary breast malignancy. •Introduction • Inflammatory/Infectious: Idiopathic granulomatous mastitis, Diabetic/lymphocytic mastopathy, Infectious mastitis, Mondor disease • Systemic conditions: Amyloidosis, Sarcoidosis • Tumors: Granular cell tumor, Tubular adenoma, Nipple adenoma, Pseudoangiomatous stromal hyperplasia (PASH), Phyllodes, Papilloma, Fibromatosis, Neurofibroma • Proliferative lesions: Sclerosing adenosis, Complex sclerosing lesions, Stromal fibrosis • Anatomic findings: Sternalis muscle, Coopers ligament • Male breast: Gynecomastia, Hemangioma • Posttraumatic conditions: Fat necrosis, Foreign body reaction, Postsurgical scar • Conclusion

BREE-28 Contrast-enhanced Mammography Artifacts and Pitfalls - Tips and Tricks to Understand Them and to Avoid Image Misinterpretation

Awards
Identified for RadioGraphics

Participants
Rosa M. Lorente-Ramos, MD, PhD, Madrid, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

-To learn technique of contrast enhanced mammography (CEM). -To review CEM image artifacts and physical considerations causing artifacts related to digital mammography and specific to CEM.- To become familiar with pitfalls and diagnostic limitations in CEM and tips and tricks to avoid interference in image interpretation.

TABLE OF CONTENTS/OUTLINE

We review the basics of CEM highlighting artifacts and factors that may interfere with image interpretation. We present: 1. Basics of CEM. 2. Technique 3. Image artifacts. - Digital mammography artifacts: patient positioning, hair, antiperspirant, patient motion. -

Contrast-related: contrast splatter, timing of image acquisition after contrast administration, transient retention of contrast in vessels. -CEM specific: Air artifact. Improper positioning causing skin folds; Rim, halo or breast-within-a-breast artifact. Scattered radiation from differences in breast tissue thickness between chest wall end breast edge; Skin line artifact. Due to scattered radiation from non-uniform thickness of skin; Ripple artifact. Patient motion between HE and LE, sometimes respiratory movements or cardiac pulsations transmitted through the chest wall. 4. Pitfalls. Axillary tail and medial lesions near the chest wall not included in the imaging field- Background parenchymal enhancement. Negative Contrast Enhancement: imaging a cyst or coarse calcification. "Eclipse sign". Hematoma caused by biopsy obscuring contrast enhancement of breast cancer. "Crescent sign" enhancement of the wall of a simple cyst. False negative lesions. DCIS, low-grade infiltrating cancer (lobar, mucinous). False positive lesions. Skin lesions, lymph nodes, benign enhancing lesions.

BREE-29 (Nearly) Ouchless! Ultrasound-Guided Core Nipple Biopsy is within a Breast Imager's Wheelhouse

Participants
Sophia O'Brien, MD, Philadelphia, PA (*Presenter*) Nothing to Disclose

TEACHING POINTS

The nipple-areolar complex (NAC) is comprised of numerous cell types and can thus demonstrate a variety of benign and malignant pathologies (1). Due to its superficial location, the NAC is not amenable to stereotactic- or MR-guidance. Historically, suspicious nipple symptoms and imaging abnormalities have been evaluated via surgical biopsy or skin punch biopsy. More recently, however, there have been reports of ultrasound-guided core nipple biopsies (US-CNB) of suspicious nipple calcifications and nipple masses(Omofoye 2015, Burk 2021). This educational exhibit will describe how to perform US-CNB step-by-step, highlighting the unique approach and considerations for this specialized percutaneous procedure. The educational material will be supplemented with numerous images from US-CNB performed at our institution.1. Ultrasound-guided core nipple biopsy (US-CNB) can be performed safely for nearly all abnormalities seen on imaging2. Appropriate anesthesia eliminates patient discomfort during US-CNB3. US-CNB is adequate for diagnosis4. US-CNB is a feasible percutaneous sampling technique well within the breast imager's wheelhouse, thus avoiding surgery while maintaining nipple integrity and aesthetics

TABLE OF CONTENTS/OUTLINE

1. Background: NAC physiology and pathology2. Historical Nipple Sampling Techniques3. US-CNB: Technique and special considerations4. Cases to Highlight the technical teaching points

BREE-3 Breast Cancer Epidemiology and Imaging Patterns in Underserved Women

Participants
Scott Kleinpeter, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

African American women are 42% more likely to die from breast cancer, have a two-fold higher risk of triple negative breast cancer, and have a higher prevalence of BRCA1 and BRCA2 genetic mutations. African American women are 72% more likely to be diagnosed with invasive disease under age 50 and are 58% more likely to be diagnosed with advanced-stage disease under age 50. Factors affecting disparities in health outcomes include genetic risk factors, health literacy, income level, health insurance status, comorbidities, cultural beliefs, geographical location, and gender identity. Current screening recommendations for USPSTF are not race-based. Temporal differences in breast cancer peak diagnosis results in disproportionate effects of delayed screening on minority women due to younger average age at diagnosis (African American peak diagnosis in 40's vs. white peak diagnosis in 60's). Timely breast cancer risk assessment, genetic testing (if applicable), ACR recommended screening surveillance, and patient education are key components to improve breast cancer mortality. Increasing access to screening in vulnerable populations is a multidisciplinary task and radiologists play a key role in identifying imaging patterns and reaching patients at higher risk.

TABLE OF CONTENTS/OUTLINE

a. Review of published literature on disparities in breast cancer screening and mortality. b. Factors influencing breast cancer risk in vulnerable populations. c. Review of ACR screening recommendations for women at high risk. d. Case collection illustrating imaging patterns in our underserved population.

BREE-30 Challenging Scenarios in MRI Guided Procedures: Tips and Tricks to Maximize Technical Success

Participants
Janice Thai, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To illustrate technically challenging anatomy and lesion location for MRI guided breast biopsy or localization. 2. To demonstrate useful approaches and techniques for overcoming technical challenges in MRI guided procedures. 3. To review the management options and alternatives following failed procedures.

TABLE OF CONTENTS/OUTLINE

• Illustrative review of equipment set up, device, and patient positioning • Challenging case potpourri • Critical review of real-life cases and lessons learned from failed procedures • Review of preprocedural planning and procedural techniques to maximize technical success

BREE-31 Breast Imaging and Intervention During Pregnancy and Lactation

Awards
Certificate of Merit
Identified for RadioGraphics

Participants
Amy Fowler, MD, PhD, Madison, WI (*Presenter*) Author with royalties, RELX

TEACHING POINTS

Physiologic changes in the breast during pregnancy and lactation can pose diagnostic challenges on imaging and physical

examination. Recognition of expected physiologic changes and classically benign entities on imaging is important to avoid unnecessary intervention. Identification of suspicious imaging features prompting biopsy recommendation are critical to avoid delays in diagnosis of pregnancy-associated breast cancer, the most common invasive cancer diagnosed during pregnancy. This presentation will focus on the appropriate breast imaging evaluation and management during pregnancy and lactation. The exhibit will also highlight ACR guidelines for breast cancer screening based on age and risk profile during pregnancy and lactation.

TABLE OF CONTENTS/OUTLINE

I. Hormonal and histologic changes within the breast II. Expected physiologic changes on breast imaging a. Mammographic appearance (lactation) b. Sonographic appearance (pregnancy/lactation) c. MRI appearance (lactation) III. Breast cancer screening guidelines during pregnancy/lactation IV. Imaging workup for clinical symptoms during pregnancy/lactation a. Palpable mass, nipple discharge, focal pain V. Biopsy considerations for this patient population a. Techniques b. Complications including milk fistula VI. Imaging features and management of common benign and malignant entities a. Benign i. Galactocele ii. Lactational changes iii. Lactating adenoma iv. Fibroadenoma with lactational changes v. Mastitis, abscess vi. Granulomatous mastitis vii. Reactive lymph nodes viii. Accessory axillary breast tissue b. Malignant i. Pregnancy-associated breast cancer

BREE-32 The Many Faces of Triple Negative Breast Cancer

Awards
Cum Laude

Participants
Beatriz Adrada, MD, Houston, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Triple negative breast cancer (TNBC) is a heterogenous group of tumors defined by the absence of estrogen/progesterone receptors and lack of HER2 overexpression that confer a poor prognosis. • TNBCs are classified using six molecular subtypes according to their gene expression patterns: luminal androgen receptor, two mesenchymal-like subgroups (Mesenchymal M and MSL), immunomodulatory, and two basal-like subgroups (BL1, BL2). • Chemotherapy is the primary established systemic treatment for patients with TNBC. The treatment response differs depending on the molecular subtype, as well as the imaging features.

TABLE OF CONTENTS/OUTLINE

This educational exhibit will present a practical, multi-modality guide on approaching triple negative breast cancer (TNBC). A multi-modality review of the characteristic imaging features of TNBC will be presented, including features that may indicate whether a patient will respond to neoadjuvant chemotherapy. Imaging assessment of TNBC response to neoadjuvant chemotherapy will be detailed, including response patterns and imaging features that could indicate pathologic complete response (pCR). A clinical update on the recommended treatment of TNBC will be presented.

BREE-33 Axillary Imaging in Breast Cancer: When, Who and How?

Participants
Dogan Polat, MD, Dallas, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

• To illustrate axillary anatomy and imaging findings of metastatic axillary lymph nodes with various imaging modalities• To discuss role of axillary imaging to predict survival, tumor stage and recurrence in newly diagnosed breast cancer• Recognizing and management of axillary adenopathy after COVID-19 vaccination• To demonstrate importance of pre-operative axillary imaging in guiding treatment decisions regarding axillary lymph node dissection, sentinel lymph node biopsy, and neoadjuvant chemotherapy (NACT)• To showcase uses of axillary imaging to determine response to NACT • To demonstrate use of axillary imaging in identifying abnormal appearing lymph nodes for further sampling and biopsies • To compare advantages of different imaging modalities in the evaluation of the axilla• To explain possible pitfalls of axillary imaging in identifying lymph node metastasis and evaluation of response to neoadjuvant chemotherapy

TABLE OF CONTENTS/OUTLINE

• Overview of axillary imaging• Role of radiology in assessment of axillary nodes• Characteristic features of different axillary pathologies• Differential diagnosis, prognosis, and biopsy approaches• Challenging clinical cases with axillary imaging• Recognizing COVID-19 vaccine induced LAPs • Future directions and summary• Future directions and summary

BREE-34 Performance Benchmarks and Management Guidelines for BI-RADS Category 3 Assessment on Breast MRI

Awards
Identified for RadioGraphics

Participants
Onalisa Winblad, MD, Leawood, KS (*Presenter*) Nothing to Disclose

TEACHING POINTS

There is significant variability in radiologist usage of BI-RADS Category 3 assessment on breast MRI due to lack of robust data to guide management. No combination of MRI BI-RADS descriptors has proven to meet the "<2% but greater than 0% likelihood of malignancy" historical definition of BI-RADS Category 3, which is well supported in the literature for both mammography and ultrasound. This likely accounts for the substantial confusion and misuse of BI-RADS Category 3 assessment on breast MRI. Recent reports demonstrate increased utilization of breast MRI, partially due to improved access made possible by modern abbreviated protocols. Given the increasing volume of breast MRI, it is imperative that radiologists understand acceptable performance benchmarks and appropriate use of BI-RADS Category 3 on MRI to avoid unnecessary follow-up or missed cancer diagnosis.

TABLE OF CONTENTS/OUTLINE

I. Performance benchmarks for breast MRIII. Summary of ACR BI-RADS Atlas 2013 recommendations for assigning BI-RADS Category 3 on breast MRIIII. Review of scientific, peer-reviewed literatureA. Characteristics and outcomesB. Patient complianceC. False negativesIV. Guidelines for assigning BI-RADS Category 3 assessment on breast MRI supported by ACR BI-RADS Atlas and scientific

literatureV. BI-RADS Category 3 imaging case review

BREE-35 Ductography in the era of Breast MRI: Technique and Approach

Participants
Eduardo Cordero Castro, MD, Memphis, TN (*Presenter*) Nothing to Disclose

TEACHING POINTS

SYNOPSIS: Nipple discharge is the third most common complaint seen in breast centers. Spontaneous discharge causes patient anxiety. The incidence of nipple discharge in breast cancer is 5-12%. Characteristics of suspicious discharge include unilateral, single duct, spontaneous, bloody, or clear color. Imaging modalities used to evaluate patients include mammogram, US, MRI and ductgraphy. TEACHING POINTS: The learner will: 1. Review the incidence, clinical presentation, and management of nipple discharge. 2. Know the imaging protocols used to evaluate nipple discharge based on ACR appropriateness criteria. 3. Identify intraductal lesions by imaging that warrant further evaluation.

TABLE OF CONTENTS/OUTLINE

Introduction, Clinical presentation, Causes of nipple discharge, Imaging assessment, Differential considerations of intraductal lesions, Role of mammogram and US, MRI findings, Challenges of localizing MRI findings in the subareolar region, Recommended management of nipple discharge without imaging correlation, Recommended management of positive ductogram findings, Pictorial review of ductogram findings, complications during ductogram (bubbles, duct perforation, extravasation, fissurization, lymphatic uptake, incomplete filling), and positive ductogram findings. Clinical management, Algorithm for imaging patients with nipple discharge, Conclusion

BREE-36 Histological Special Types of Breast Cancer - How Special Are They? A Pictorial Essay

Awards
Certificate of Merit

Participants
Karina Pesce, MD, Capital Federal, Argentina (*Presenter*) Nothing to Disclose

TEACHING POINTS

Describe the imaging features histological special types of breast carcinoma.Identify the characteristics of each of these tumors that allow them to be differentiated from other breast carcinomas.Discuss the differential diagnosis and management.

TABLE OF CONTENTS/OUTLINE

Histological special types of breast cancer constitute a spectrum of lesions from low to high grade aggressiveness.They present different clinical, radiological, and pathological presentations, and although there are no pathognomonic characteristics, there are trends that every breast radiologist should be aware of.1-Introduction.2-Histological special types of breast cancer: The WHO spectrum.3-Appeareance mammography, ultrasound, and MRI.4-Discuss diagnostic challenges and management dilemmas the histological special types of breast cancer.5- Clinical cases with histological correlation.6-Take-home points.7-Conclusion.

BREE-37 Yikes, A Red Breast! - A Breast Imager's Approach to Diagnosis and Management

Participants
Joshua Weinstein, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Breast erythema is a common clinical complaint that can often cause substantial anxiety for patients. The differential is broad, ranging from benign dermatologic conditions, infectious or inflammatory processes, or neoplasms. In this exhibit, we will review this differential and present several exemplary cases of patients who initially presented with breast redness and were ultimately diagnosed with a variety of conditions, including inflammatory breast cancer, angiosarcoma, granulomatous mastitis, breast cellulitis, mastitis related to lactation, mastitis related to an infected foreign body, chronic mastitis, and radiation changes. By reviewing these entities, radiologists can familiarize themselves with the varying clinical presentations of the “red breast” to appropriately image and guide management.

TABLE OF CONTENTS/OUTLINE

1. Review the varied clinical presentations and differential diagnoses of breast erythema. 2. Discuss the role of multimodality imaging to diagnose the cause of breast redness. 3. Describe approach to management based on a combination of clinical and radiologic findings.

BREE-38 Ain't No Mountain High Enough! Review of Imaging, Histologic and Management Considerations of High-risk Breast Lesions

Participants
Hee Jung Choi, MD, Mexico City, Mexico (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review general features of high risk lesions with illustrations of classic cases using multimodality imaging methods and correlation of the image findings with the underlying histopathologic and clinical findings.2. Identify imaging and clinical risk factors for malignancy upgrades.3. Discuss current imaging follow-up and management, as well as controversies in high-risk breast lesions management after the diagnosis.

TABLE OF CONTENTS/OUTLINE

1. Analyze macro and microscopic normal anatomy of the breast and identify origin of each of the high-risk breast lesions.2. Identification of high-risk breast lesions by category:a. Atypical ductal hyperplasiab. Lobular breast neoplasia - Atypical lobular hyperplasia - Lobular carcinoma in situ (classic and pleomorphic)c. Papillary lesions - Benign papillary lesions - Intraductal papilloma with atypical hyperplasiad. Flat epithelial atypia e. Radial scar or complex sclerosis lesion3. Review the key points of each lesion: a.

Epidemiologyb. Clinical presentationc. Histopathologic characteristicsd. Multimodality imaging findingse. Malignancy upgrades risk percentages and risk factorsf. Recent guidelines for management g. Illustration of the classic cases4. Discuss and analyze the recent management and imaging follow-up guidelines.

BREE-39 Current Status of Optoacoustic Breast Imaging and Future Trends in Clinical Application: Is It Ready for Prime Time?

Participants
Berat Bersu Ozcan, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Optoacoustic imaging (OAI) uses non-ionizing, laser light to create thermoelastic expansion in tissues and detect resultant ultrasonic emission. Parametric maps of molecules (melanin, hemoglobin and lipids) that absorb light and scatter acoustic waves are fused with anatomic images, allowing scalable, relative real time molecular assessment in tissues.Since rapidly dividing cancer cells cause hypoxia and lead to tumor-driven angiogenesis, OAI can detect the presence and degree of relative hypoxia in cancers relative to normal tissue. This can increase the specificity of breast mass assessment without compromising the sensitivity compared to the grayscale US alone. Therefore, adjunctive use of OAI can decrease breast biopsies.Molecular subtypes of breast cancer show differing OAI features and levels of hypoxia. Luminal cancers have higher total external feature scores (9.3 vs 8.8; $p < .05$) and lower total internal feature scores (6.8 vs 7.7; $p < .001$) than triple negative and HER2+ cancers.OAI is a thriving field of research whose potential impact on the clinic can be high. However, larger multicenter cohort studies and clinical trials are needed to establish the trends observed and accelerate clinical translation.

TABLE OF CONTENTS/OUTLINE

1. Optoacoustic Imaging Principles 2. Why Optoacoustic Breast Imaging: Pros and Cons 3. Handheld versus Tomographic Optoacoustic Breast Imaging Technique 4. Current Clinical Applications and Future Directions5. Pitfalls and Lessons Learned

BREE-4 Multimodality Imaging Review of Metastases to the Breast

Participants
Jiewen Li, DO, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review normal breast anatomy allowing for metastases to the breast2. Discuss common and uncommon metastases to the breast3. Demonstrate imaging characteristics of metastases to the breast in a case-based approach

TABLE OF CONTENTS/OUTLINE

-Introduction-Definition of metastases to the breast-Typical patient population affected and prognosis-Anatomy of the breast to allow for metastases to the breast*Vascular/Hematogenous*Lymphatic*Direct extension-Common and uncommon metastases to the breast-Typical imaging appearance reported in literature*Mammogram*Ultrasound*MRI-Case-based approach to imaging appearance of extramammary
metastases*Lymphoma*Leukemia*Melanoma*Lung*Esophageal*Ovarian*Plasmacytoma*Thyroid*Renal*Sarcoma-Conclusion*Recognizing the most common imaging appearance of metastases to the breast can help guide appropriate management and further treatment*Metastases to the breast generally carry a poor prognosis and any delay in diagnosis can have significant impact*Metastases to the breast commonly manifest as an irregular mass and typically lack calcifications except for serous ovarian cancer

BREE-40 Ultrasound Computed Tomography of the Breast: Techniques, Tips and Tricks

Participants
Ken Oba, MD, Chuoku, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To review the physics principles of ultrasound computed tomography (UCT).2. To discuss the advantages of UCT compared to conventional clinical ultrasound imaging in breast imaging.3. To become familiar with normal and abnormal imaging findings.4. To understand the limitations of UCT in detection, diagnosis, local staging, and follow-up.

TABLE OF CONTENTS/OUTLINE

1. Basics of UCT.2. Technique3. Anatomy and breast density in UCT4. Controversies5. CasesCases include:-Benign lesionsFibroadenomaPhyllodes tumorHamartomaBreast lymphoma-Malignant lesionsInvasive ductal carcinomaDuctal carcinoma in situInvasive lobular carcinomaMucinous carcinomaBreast lymphoma-Artifacts-OthersHematomaPostoperative changeBreast reconstruction

BREE-41 Hiding in Plain Sight: Cancers in Dense Breasts

Awards
Identified for RadioGraphics

Participants
Alexis De La Cruz, DO, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Discuss dense breast tissue as it relates to cancer risk and value of supplemental screening in women2. Summarize prior trials and studies that have made an impact on current breast density guidelines3. Review current breast density legislation and future directions4. Illustrate mammographic clues/hints for identifying breast cancer in dense breasts using a case-based format

TABLE OF CONTENTS/OUTLINE

Introduction-Definitions** BI-RADS categories** Quantitative measurements- Factors that contribute to breast density** Age** Pregnancy/breastfeeding** Hormone replacement therapy** Bodyweight- Why does it matter?** Increased breast cancer risk**

Decreased sensitivity and specificity with mammography** Possible need for supplemental imaging-Breast density legislation** Current status**Future directionsAppropriateness Criteria/Screening Recommendations- Risk Stratification- Screening Modalities** Mammography, Digital Breast Tomosynthesis (DBT), Contrast-Enhanced Mammography (CEM), Ultrasound, MRI, Abbreviated MRI, FDG-PET breast dedicated, and Molecular Breast Imaging (MBI)Identification of high risk patients** Risk assessment toolsEvidence Based value of supplemental screening**Breast MRI** Breast UltrasoundRadiologic signs to look for in the evaluation of dense breasts using mammography- Subtle spiculation and distortion- Retroglandular fat findings- Nipple distortion and/or gradual retraction- Changes in mass density (increase inhomogeneity)- Halo effect (peripheral lucency)- Fat glandular interface density

BREE-42 Architectural Distortion of the Breast: Imaging, Diagnostic Challenges and Treatment

Participants
Israel Rodriguez Suarez, MD, Mexico City, Mexico (*Presenter*) Nothing to Disclose

TEACHING POINTS

Whit this educational exhibit the radiologist with be able to: a. Know the normal architecture of the breast in mammography. b. Differentiate between a spiculated mass, architectural distortion and pseudo distortion of the breast parenchyma in mammography. c. Use the imaging tools with an orderly approach to confirm an architectural distortion in mammography: spot compression views, tomosynthesis. d. Identify and characterize an architectural distortion by ultrasound and breast MRI. e. Choose the better imaging biopsy method according to each particular circumstance. f. Learn the differential diagnoses of architectural distortion to make an appropriate radiology pathology correlation. g. Know the current management proposals after percutaneous tissue diagnosis, including the usefulness of breast MRI and contrast enhanced mammography.

TABLE OF CONTENTS/OUTLINE

a. Introduction b. Definition c. Normal architecture of the breast d. Imaging of architectural distortion: Mammography, Tomosynthesis, Ultrasonography, Breast MRI. e. Image guided biopsy methods f. Differential diagnoses: Radial Scar or complex sclerosing lesion, Invasive ductal carcinoma, Tubular carcinoma, Invasive lobular carcinoma, Ductal carcinoma in situ, Postsurgical scar, Fat necrosis, Sclerosing adenosis, Focal fibrosis, Diabetic mastopathy. g. Management considerations: Follow up, surgical excision, vacuum assisted excision. Problem solving breast MRI and contrast enhanced mammography.

BREE-43 Breast Cancer Recurrence: Multi-modality Imaging in Patients Undergoing Breast Conservation Treatment

Awards
Certificate of Merit

Participants
Miral Patel, MD, Houston, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

Understanding the terminology and the different treatment options that are available for breast conservation can aid radiologists in detecting recurrence. The post treatment breast appearance will be reviewed as a baseline to understand what these changes look like. Furthermore, a review of the appearance of breast cancer recurrence in multiple cases amongst the various imaging modalities can aide radiologists in early detection.

TABLE OF CONTENTS/OUTLINE

This educational exhibit reviews: Breast conservation treatment (BCT): Definitions, surgical techniques and radiation treatmentExpected breast imaging findings after BCTMulti-modality case-based review of recurrence: Tips and tricks to distinguish expected post-operative and radiation changes from tumor recurrence on mammography, ultrasound, magnetic resonance imaging, molecular breast imaging, and contrast enhanced mammography

BREE-44 Sheep in Wolf's Clothing: The Many Faces of Granulomatous Mastitis

Participants
Tais Batista, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purposes of this exhibit areTo review the epidemiology and risk factors for the development of granulomatous mastitis;To discuss the main clinical presentations of these mastitis and its subgroups;To review the main differential diagnoses, as well as overlapping and confounding imaging factors, mainly with carcinomas;To discuss the experience of our institution in a 20 years time period regarding clinical aspects and difficulties in its diagnosis;To describe its histopathological features;To discuss the importance of the multimodality imaging findings in association with histopathological aspects to achieve an accurate diagnosis;To discuss the role of imaging in monitoring the therapeutic response.

TABLE OF CONTENTS/OUTLINE

Epidemiology of granulomatous mastitis and factors related to its prevalence in underserved populations;Main clinical presentations;Typical multimodality imaging findings (MRI, ultrasound and mammography) from cases of our radiology department;Diagnostic challenges, main differentials, and key points for early suspicion of this pathology;Particularities of treatment and imaging response after therapy;Summary and Conclusion.

BREE-45 Male Nipple Discharge: Beyond the Basics

Participants
Javier Azcona Saenz, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) To review the importance of male nipple discharge. 2) To expose the main causes of nipple discharge in men, both benign and malignant, together with their radiological manifestations. 3) To focus on the radiological findings of male breast carcinoma in all imaging techniques, including Digital Breast Tomosynthesis and Contrast-Enhanced Mammography.

TABLE OF CONTENTS/OUTLINE

1) Introduction. 2) Causes of male nipple discharge. 2.1) Benign: Gynecomastia, Mammary duct ectasia, Dermatitis, Papilloma, Abscess. 2.2) Malignant: Ductal carcinoma in situ, Invasive carcinoma, Papillary carcinoma of the breast, Others. 3) Characteristic imaging findings: Mammography/Tomosynthesis, Ultrasound, MRI, Contrast-enhanced mammography. 4) Conclusion. 5) References.

BREE-46 Pitfalls of Breast Imaging in the Emergency Room

Participants
Neha Khemani, MD, Boston, MA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Clinical breast symptoms seen in the ED are most often related to infection and inflammation2. Breast abscess is typically treated as an urgent condition requiring intervention (ultrasound-guided drainage or incision and drainage)3. Rarely, inflammatory symptoms can indicate malignancy, thus diagnostic accuracy and close follow-up are necessary to avoid a missed cancer diagnosis4. The purpose of this exhibit is to review common breast diagnoses seen in the ED and potential pitfalls of performing breast imaging after hours

TABLE OF CONTENTS/OUTLINE

1. Clinical breast symptoms encountered in the ED and indications for imaging 2. US imaging features of mastitis and abscess 3. Common diagnoses seen on after-hours breast ultrasound 4. Pitfalls of after-hours breast imaging with case-based examples: a. Variable experience of ER radiologist and sonographer in breast imaging b. Technically suboptimal exams c. Unavailability of mammography to fully characterize a lesion if needed d. Unavailability of breast imaging support staff to arrange for biopsy or follow-up care e. High grade breast carcinomas mimicking abscess 5. Strategies to ensure appropriate care and follow-up for patients with urgent breast complaints

BREE-47 There is More to the Breast than Cancer - A Pictorial Case-based Quiz and Review of Rare Benign Breast Lesions

Awards
Certificate of Merit

Participants
Ines Alonso Sanchez, MD, Bilbao, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Unusual breast benign lesions can be a diagnostic challenge for radiologists, and we should be familiar with their imaging and clinical features.- We must be aware of the limitations of the available breast imaging modalities and know that, in many cases, we need a biopsy to make the diagnosis. - A multidisciplinary approach to these entities is essential to manage them correctly.

TABLE OF CONTENTS/OUTLINE

Objective: This presentation aims to revise in quiz format a series of cases of unusual breast benign lesions and describe their imaging and clinical features to strengthen radiologists' skills to recognize and properly approach these conditions.Background:Most patients with breast pathology have concern that they have cancer. Therefore, in this area of practice, it is particularly important to be aware of potential diagnostic pitfalls to avoid emotional suffering to our patients. Findings:We present a series of cases of interesting benign breast lesions with different etiologies, such as inflammatory, vascular, tumors of neural origin, metabolic diseases, proliferative disorders and abnormal protein deposit diseases. Some of these lesions can mimic malignancies, and we should remember clinical features and patients' medical history may help lower the level of suspicion and the patients' emotional unease. Nevertheless, there are limitations of the imaging modalities, and in most cases, a biopsy is needed to make the diagnosis.Conclusions: Despite breast cancer being a common diagnosis; we may still face diagnostic challenges with unusual benign breast lesions which may sometimes mimic cancer.

BREE-48 Pregnancy Associated Breast Cancer - What Is It and How Not to Miss It

Participants
Haydee Ojeda-Fournier, MD, San Diego, CA (*Presenter*) Research Consultant, View Point Medical, Inc;Stock options, CureMetrix, Inc

TEACHING POINTS

Pregnancy-associated breast cancer (PABC) is defined as breast cancer diagnosed during pregnancy, within one year post-partum, or during lactation. Although rare, this disease has a more aggressive course and is often associated with a poorer prognosis. Several studies have found evidence of a delayed diagnosis in pregnant women. But lack of awareness among women and physicians is also believed to play a crucial role in delayed diagnosis. However, the majority of breast lesions during pregnancy and lactation are benign. Still, approximately 20% of breast masses prove to be malignant. By the end of this educational exhibit, the learner will: 1. Review the incidence, clinical presentation, and management of pregnancy-associated breast cancer. 2. Know the imaging protocols recommended to evaluate the pregnant or nursing patient based on ACR appropriateness criteria. 3. Identify lesions that should be biopsied during pregnancy and lactation.

TABLE OF CONTENTS/OUTLINE

Introduction; Define pregnancy-associated breast cancer; Clinical presentation of breast cancer during pregnancy or lactation; Review imaging recommendations for pregnant women vs. lactating women; Differential considerations of breast lesions during pregnancy; Mammogram and US findings of pregnant and lactating women; MRI considerations in the pregnant and lactating patient; Recommended management of breast masses without imaging correlation in pregnant and lactating patients; Recommended management of positive imaging findings; Pictorial review of PABC; Clinical management and outcomes of PABC; Algorithm for imaging pregnant and lactating patients so as not to miss a PABC; Conclusion.

BREE-49 A Primer on Imaging of Molecular Subtypes of Breast Cancer

Participants
Sepideh Sefidbakht, MD, Powel, OH (*Presenter*) Nothing to Disclose

TEACHING POINTS

_To review the clinical relevance of Breast Cancer subtypes and the implications for patient management and imaging._To review the basic pathologic and clinical characteristics of each major molecular subtype along with their typical imaging appearance._To show how this knowledge affects decision making using a case-based approach

TABLE OF CONTENTS/OUTLINE

_Introduction: basic pathology of molecular subtypes of breast cancer; how to diagnose and implications for patient management_Luminal A breast Cancer, Pathology, Prognosis, multimodality imaging characteristics_Luminal B breast Cancer, Pathology, Prognosis, multimodality imaging characteristics_HER2-enriched breast Cancer, Pathology, Prognosis, multimodality imaging characteristics_Basal-like breast Cancer, Pathology, Prognosis, multimodality imaging characteristics_Case-based review of typical and atypical presentations of various subtypes

BREE-50 Unusual Infections of the Breast - A Pictorial Review

Participants
Sabine Popp, MD, Vienna, Austria (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Unusual infectious diseases of the breast are uncommon but important for radiologists to be aware of, as they may be indistinguishable from breast cancer and are treatable. • Consider Tuberculosis in patients with a persistent abscess or atypical mass, especially if from a high Tuberculosis incidence country. • In patients with incidental breast calcification detected at screening from endemic countries, consider Schistosomiasis (amorphous, segmental distribution), Dracunculiasis (coarse linear, serpiginous) or chronic Filariasis (serpiginous, tubular and coiled). • Recurrent breast abscesses can be caused by rare organisms such as Actinomyces and Corynebacterium, therefore it is important to send a fine needle aspirate for microbiology to direct treatment. • In patients with nipple eczema, consider Lyme disease as a differential to Paget's disease, especially if regional lymphadenopathy is present.

TABLE OF CONTENTS/OUTLINE

• Learning objectives • Introduction • Organisms - for each of the below: epidemiology, clinical presentation, imaging features (mammography, ultrasound, MRI), diagnosis and treatment o Bacteria • Tuberculosis • Other mycobacteria • Actinomycosis • Lyme disease • Brucella • Cryptococcus o Parasites • Schistosomiasis • Filariasis • Cysticercosis • Hydatid cyst • Dracunculiasis • Other rare organisms • Differential diagnoses • Summary table • Conclusion

BREE-51 You've Got a Friend in Me: How Radiologists Can Help Patients and Multidisciplinary Colleagues in the Diagnosis and Management of Fibroepithelial Lesions

Awards
Cum Laude
Identified for RadioGraphics

Participants
Jody C. Hayes, BS, MD, Dallas, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. When a fibroepithelial lesion (FEL) is suspected, biopsy specimens should include the margin of the mass for a more definitive diagnosis on histopathology.2. For large masses, biopsy specimens should be taken from different areas to ensure adequate sampling as phyllodes tumors (PT) often demonstrate tumor heterogeneity with fibroadenoma-like regions.3. Surgical resection is indicated for rapidly growing biopsy-proven benign FEL or borderline PT whose growth rate exceeds 20% in largest dimension in a six-month interval.4. Staging chest CT should be performed for malignant PT due to their propensity for hematogenous spread with the lungs being the most common site.5. Frequent follow-up imaging with breast ultrasound or chest CTs may be indicated for locally aggressive malignant PT to identify early recurrence.

TABLE OF CONTENTS/OUTLINE

1. Define the spectrum of fibroepithelial lesions (FEL) with pertinent incidence and demographic information.2. Review imaging and pathologic findings for the spectrum of FEL.3. Discuss steps radiologists can take to help in the diagnosis and management of FEL with an emphasis on radiological, pathological, and clinical concordance.4. Define the role of imaging for the post-biopsy or post-surgical FEL patient.

BREE-52 Everything That Looks Like BI-RADS 5, But Is Not

Participants
Maria Ares-Rego, MD, Santiago de Compostela, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

To review the imaging features used in a BI-RADS 5 assessment.To ilustrate benign entities that can mimic malignancy (the most common are chronic and inflammatory mastitis, fat necrosis, complex sclerosing lesions, granular cell tumors, lymphocytic mastopathy, infection...); to describe imaging findings, clinical history.To review the specific imaging features of these benign entities depicted at mammography, US, MRI.To relate radiologic-pathologic correlation and clinical history to decide the management of a discordant biopsy result.To familiarize radiologist with the knowlegde of the variety of benign entities may be categorized as BI-RADS 5 to include them within the differential diagnostic.

TABLE OF CONTENTS/OUTLINE

Presentation of BI-RADS 5 clasification.Describe benign entities possibly classified as BI-RADS 5.Utility of imaging techniques.Imaging findings: specific features and clinical history.Management.Differential diagnostic

BREE-53 Difficult MRI-Guided, Vacuum-Assisted Core Biopsies of the Breast: Tips and Tricks

Participants

Wenhui Zhou, MD,PhD, Menlo Park, CA (*Presenter*) Nothing to Disclose

TEACHING POINTS

Magnetic resonance imaging (MRI) is the most sensitive method to detect abnormalities of the breast. Due to its limited specificity, MRI-detected lesions often require tissue sampling to establish the diagnosis. Breast imagers should be cognizant of patient, anatomical, and technical factors that predispose to a potentially difficult MRI-guided breast biopsy. The purpose of this educational exhibit is to demonstrate techniques and tools to safely and successfully biopsy breast lesions. Completing this educational exhibit will allow participants to 1) Appreciate patient, anatomical and technical factors that predispose to difficult MRI-guided breast biopsies 2) Recognize pre-procedural planning, techniques and tools to optimize lesion visualization, targeting and sampling 3) Implement this knowledge during MRI-guided biopsies to minimize MR cancellations, unsafe procedures and nondiagnostic samples.

TABLE OF CONTENTS/OUTLINE

This case-based exhibit will demonstrate procedural planning and tips for successful difficult-to-perform MRI-guided breast biopsies including: 1) for bilateral lesions, perform simultaneous biopsy using lateral to medial approaches bilaterally 2) for posterolateral lesions, apply arm-down and arm-up maneuvers to facilitate safe access route 3) for lesions offset from the obturator tip, re-target with a second introducer and directionally sample if necessary 4) for posteromedial lesions, utilize a tangential, oblique approach to allow adequate access to the target 5) for vague or obscured lesions, consider the use of a T2-weight or DWI sequence to improve visualization. We will summarize take-home points to facilitate transfer of knowledge.

BREE-54 How To Report a Contrast Enhanced Mammography (CEM) Study - An Illustrated and Practical Review of BIRADS 2022 Supplement for CEM

Awards
Certificate of Merit

Participants
Rosa M. Lorente-Ramos, MD, PhD, Madrid, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

-To review contrast enhanced mammography (CEM) basics and technique. -To analyze steps in interpretation of a CEM study. - To describe CEM lexicon and report structure. - To become familiar with normal and abnormal imaging findings in CEM providing correlation with imaging (mammogram, US, MR) and pathology.

TABLE OF CONTENTS/OUTLINE

We review the basics and state-of-the-art of CEM highlighting adequate interpretation of the exam according to the latest BIRADS recommendations for CEM reporting. 1. Basics of CEM. 2. Technique: Image acquisition: Low-energy images (LE) like a digital mammogram. Recombined images (substraction of the low-energy from the high-energy images) (RC). Signal from background breast tissue is cancelled highlighting areas of iodine uptake. 3. Image interpretation steps. -LE. Morphological assessment -RC. Functional assessment. 4. BIRADS lexicon for CEM. - General overview: breast density (LE), Background parenchymal enhancement (RC). - LE findings. - RC findings: mass, non-mass enhancement, enhancing asymmetry, lesion conspicuity. - Lesion description on both: morphology, internal enhancement pattern, extent of enhancement, lesion conspicuity. 5. Report structure. Indication, technique, previous exams, breast composition, findings description, assessment, management.

BREE-55 Staging Breast Cancer: A Case Based Review

Participants
Aline Guimaraes, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Staging Breast Cancer nowadays is not only about defining the anatomic extent of disease. The most recent edition of the AJCC (American Joint Committee on Cancer), the eighth edition, now incorporate prognostic biomarkers to more accurately predict clinical outcomes and treatment response on an individual basis. In this didactic exhibit, we will discuss each aspect of Breast Cancer Staging in a case-based review. It is imperative to know the potential and limitations of each imaging modality (mammography, ultrasound and magnetic resonance imaging) and what to look for and describe on the exams. It is also important to comprehend other relevant aspects such as tumor grade, ER (estrogen receptor), PR (progesterone receptor) and HER2 (human epidermal growth factor receptor 2) status. Fundamentally understanding these aspects will provide more prognostic information than the anatomic stage alone and contribute to improve medical practice.

TABLE OF CONTENTS/OUTLINE

1. Mental Map with the following information 1. AJCC Staging System (application criteria) 2. Breast Cancer Stage 2.1. Clinical Staging 2.2. Pathologic Staging 2.3. Posttherapy staging after Neoadjuvant Chemotherapy, Radiation Therapy and Hormonal Therapy 2.4. Nodal staging 2.5. Clinical staging of metastasis 2.6. Stage migration 2. Relevant aspects to consider in breast imaging when staging breast cancer 3. Case based review of aspects mentioned above

BREE-56 Review of Breast Anatomy - Normal Variants and Expected Physiologic Changes in the Breast

Participants
Hubert Huang, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

The female breast follows a predictable sequence of development. The mature adult breast is subject to a variety of physiologic effects during embryologic development, aging and hormonal changes. As a result, the female breast demonstrates a wide spectrum of normal appearance, some of which are congenital variants such as polythelia and polymastia, while others are acquired or physiologic but still considered normal, such as changes in density during pregnancy, lactation, and those typically seen with aging.Recognizing normal physiologic changes and anatomic variants can present a challenge to the radiologist. However, it is imperative to do so since the optimal modalities and views for evaluating these entities will differentiate them from potentially suspicious findings. We will present and discuss normal female breast development and anatomy, congenital and physiologic variants, and ways to avoid misdiagnoses.

TABLE OF CONTENTS/OUTLINE

1. We will review normal anatomy of the breast.2. We will discuss expected normal female breast developmental changes3. We will discuss variations in breast pattern and density in different physiologic conditions such as pregnancy and breastfeeding, as well as aging.4. We will discuss normal and congenital breast anatomic variants.5. We will review common and avoidable pitfalls of imaging variants that may mimic malignancy.

BREE-57HC Be Prepared - It's Not Because It's Rare that It Won't Happen! What the Radiologist Needs to Know About Angiosarcoma of the Breast

Participants
Amanda Tavares, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Angiosarcoma represents less 1% of soft tissue sarcomas and is a very aggressive tumor with a poor prognosis. It depicts approximately 0.04% of malignant breast neoplasms and 8% of breast sarcomas, presenting with rapid and silent growth. The radiological findings are nonspecific, but the radiologist must be aware of the imaging features to avoid misdiagnosis. Primary breast angiosarcoma has an unknown etiology, affects younger patients (30-40 years) and usually presents as a palpable mass. Bilateral involvement is often associated with pregnancy or contralateral metastatic spread. There are no pathognomonic findings on conventional imaging. Nonetheless, on magnetic resonance imaging, the persistent enhancement in the dynamic study with late concentric filling may suggest this diagnosis. There may be areas of necrosis, hemorrhage and infarction within the tumor.Secondary breast angiosarcoma often occurs after local radiation therapy, with a mean latency period of 5-6 years. Besides that, chronic breast lymphedema and genetic predisposition are also risk factors. It commonly occurs in older patients (over 60 years) and may manifest as a palpable mass or just thickening and discoloration of the skin. Imaging findings are similar to the primary form.

TABLE OF CONTENTS/OUTLINE

General aspects of angiosarcoma of the breast: Etiology, Prognosis, Diagnosis; Primary Breast Angiosarcoma; Secondary Breast Angiosarcoma; SummaryPlease visit the Learning Center to also view this presentation in hardcopy format.

BREE-58 Mimicking of an Abscess or Hematoma: Complex Mass Presentations of Triple Negative Breast Cancers

Awards
Identified for RadioGraphics

Participants
Dogan Polat, MD, Dallas, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

Triple negative breast cancers are 16% of breast cancers in non African American women and 27% of breast cancers in African American women, often associated with BRCA 1 mutation and aggressive features, and poor prognostic outcomeCarefully assess margins of anechoic masses or complex masses which favor abscesses or hematoma, particularly if there is no overlying skin thickening or secondary signs of infectionTriple negative breast cancers can have posterior acoustic enhancement sonographically (therefore look for irregular margins, wall thickening, solid components)Triple negative breast cancers can present as a round hyperdense mass mammographically, therefore caution if one notes a round (not oval) mass, especially hyperdense (on attachment)Triple negative breast cancer can mimic other benign processes such as fibroadenoma, therefore careful margin assessment is importantCarefully review the axilla mammographically on patients with a history of breast cancer, using comparison to prior studies

TABLE OF CONTENTS/OUTLINE

1. Review mammographic and sonographic appearances of triple negative breast cancers and define triple negative breast cancer.2. Recognize indistinct margins, thick walls, and lack of skin thickening in anechoic appearing irregular triple negative malignant masses and identify findings which raise concern for malignancy in these cases.3. Review margin assessment of masses on ultrasound, particularly the sides of margins in a partially circumscribed mass.4. Review metastatic patterns of triple negative breast cancer and mammographic assessment of the axilla in follow up of patients with history of breast cancer.

BREE-59 Fat-Containing Breast Masses: A Multi-Modality Review and Management Considerations

Participants
Alison Gegios, MD, Whitefish Bay, WI (*Presenter*) Nothing to Disclose

TEACHING POINTS

Fat-containing entities in the breast constitute a variety of predominantly benign conditions and rarely malignant neoplasms. This presentation will focus on the recognition and diagnosis of fat-containing breast lesions to facilitate appropriate management and avoid unnecessary work-up and interventions. It will also discuss scenarios in which biopsy of fat-containing breast masses may be warranted.

TABLE OF CONTENTS/OUTLINE

1. Imaging features consistent with fat on multiple modalities: • MRI• Ultrasound• Mammogram2. Imaging features and management of common and uncommon benign fat-containing lesions • Lipoma• Hamartoma• Fat necrosis• Oil cyst• Intramammary lymph node • Galactocele • Steatocystoma multiplex• Angiolipoma• Hibernoma

BREE-6 Much More Than Lymph Nodes! A Practical Approach to Axillary Imaging

Participants
Carolina Kiebert, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

To show axillary anatomy in the different imaging modalities To review the indications for axillary imaging To present clinical and

To show axillary anatomy in the different imaging modalities.To review the indications for axillary imaging.To present clinical and imaging findings of axillary masses according to the anatomical location of the lesion. To familiarize general radiologists with these findings in order to expedite accurate diagnosis.To discuss percutaneous interventions in axillary masses and the appropriate patient management depending on the diagnosis.

TABLE OF CONTENTS/OUTLINE

Radiologists are familiar with the evaluation of the axillary levels and staging of breast cancer, but we rarely discuss other pathologies that can be located in the axilla other than breast cancer lymph-node metastasis.Understanding the anatomy of the axilla can help radiologists to identify accurate diagnoses according to the anatomical location of the lesion once percutaneous biopsy may be inappropriate.This educational exhibit will compile anatomy and different findings with illustrative images from our radiology department.Knowledge of the clinical and imaging findings may improve detection of the differential diagnosis for such lesions, improving appropriate patient management.

BREE-60 Metaplastic Breast Carcinoma: Review of Imaging, Histopathology and Management Algorithm

Participants
Janice Thai, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To review the imaging spectrum of metaplastic carcinoma of the breast. 2. To review the histopathology and pathophysiology of this rare tumor subtype. 3. To review the treatment and management algorithm.

TABLE OF CONTENTS/OUTLINE

• Imaging review of common and uncommon features of metaplastic carcinoma • Review of unique histo and pathophysiology of metaplastic carcinoma. • Review of current evidence-based management algorithm

BREE-61 Spectrum of Mucinous and Mucocele-like Lesions: Imaging and Histopathologic Review

Participants
Janice Thai, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To review the imaging spectrum of mucinous and mucocele-like lesions. 2. To review the histopathology and distinct tumor/high risk lesion subtype. 3. To review the treatment and management algorithm.

TABLE OF CONTENTS/OUTLINE

• Imaging review of common and uncommon features of mucinous and mucocele-like lesions • Review of unique histo and pathophysiology of mucinous and mucocele-like lesions • Review of current evidence-based management algorithm

BREE-62 PET Mammography from Indications to Interpretation

Participants
Rasha M. Kamal, MD, Cairo, Egypt (*Presenter*) Nothing to Disclose

TEACHING POINTS

PEM is a specialized application of PET to visualize breast tissue metabolic changes with a much higher spatial resolution thus allowing the visualization of smaller tumor cells. In this educational exhibit the technique of PEM will be discussed in detail. The qualitative and quantitative (the PUV and Lesion to background activity) assessment of PEM images will be illustrated. The pattern of radiotracer uptake in the different histopathology and molecular subtype will be also discussed. The main indications of PEM include: - Enhanced lesion characterization. - Preoperative staging - Response to NAC therapy monitoring. - Post breast cancer surveillance. - Screening for women with dense breasts. - Metastases of unknown primary The advantages and disadvantages of PEM will be highlighted to allow the sound practice of this novel imaging modality.

TABLE OF CONTENTS/OUTLINE

1. Technique of PEM 2. Indications 3. Interpretation (quantitative and qualitative assessment 4. Advantages and disadvantages of PEM

BREE-63 Evolving Role of Nuclear Medicine and Molecular Imaging in Breast Cancer - A Case-based Multi-modality Pictorial Review with Teaching Pearls

Awards
Certificate of Merit

Participants
Fatima Elahi, DO, Lincolnwood, IL (*Presenter*) Nothing to Disclose

TEACHING POINTS

Breast cancer continues to be the most common cause of malignancy for women in the United States with current imaging standards centered around mammography, CT, ultrasound, and MRI. Nuclear Medicine (NM) and molecular imaging (MI) including PET CT have now become essential tools in the diagnosis and management of patients with Breast cancer. Often times the findings have resulted in decisions that change the course of treatment in about 24-48% of patients. We provide a case-based multimodality pictorial review of the evolving role of Nuclear Medicine and Molecular Imaging in the management of patients with breast cancer.

TABLE OF CONTENTS/OUTLINE

Our educational exhibit aims to 1) Highlight the impact of various NM and MI tracers and modalities such as Lymphoscitigraphy including Mannose-binding Tc-99m Tilmanocept for targeted lymphatic mapping and Sentinal node localization, mammo-scintigraphy (Molecular breast imaging (MBI)), MDP Bone scan, F-18 Sodium Fluoride PET CT, F-18 FDG PET CT, Hormonal receptor imaging

(such as F18-Fluoroestradiol PET CT); Radionuclide ventriculogram (MUGA Scan); Palliative treatment of painful bone metastasis using strontium-89/samarium 153; PET CT guided interventions and biopsy; 2) Case-based discussions highlighting the indications, sensitivity, and specificity rates and limitations of these studies; 3) Discuss challenging cases including axillary lymphadenopathy secondary to COVID 19 vaccination, FLARE phenomenon, somatostatin receptor-expressing breast cancers on Ga-68 DOTATATE PET CT, evaluating Post-operative breast for local recurrence and male breast cancer; 4) utility of texture analysis.

BREE-64 Overcoming Burnout Towards Brilliance in Breast Radiologists after COVID-19

Participants
Jay R. Parikh, MD, West University Place, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

Burnout has been recognized by the World Health Organization as a syndrome conceptualized as resulting from chronic workplace stress that has not been successfully managed. A previous study showed that there is a high prevalence of burnout across practicing clinical breast radiologists. Physician wellness (well-being) is defined by quality of life, which includes the absence of ill-being and the presence of positive physical, mental, social and integrated well-being.The unprecedented COVID-19 pandemic has brought challenges to the practicing breast radiologist. Initially, there was a reduced workload volume early in the pandemic which then rebounded into high volumes of breast screening and diagnostic studies. Coupled with his volume were challenges of maintaining family work-life balance and regular social isolation, compounding the negative work environment. The COVID-related work environment has previously been described as unsustainable for radiologists. Surveys of clinically practicing radiologists during COVID-19 have demonstrated a high rate of burnout and increased subjective stress by breast radiologists.Strategies that may be deployed post COVID-19 to mitigate radiologist burnout include implementing a culture in the workplace that prioritizes and promotes wellness, addressing operational inefficiencies and increasing resiliency of practicing breast radiologist.

TABLE OF CONTENTS/OUTLINE

A. Burnout. B. Burnout in Breast Radiologists C. COVID-19 Impact on breast radiology D. Implementing a culture of wellness. E. Addressing operational inefficiencies F. Increasing radiologist resiliency

BREE-65 Understanding Fibroepithelial Lesions of the Breast - A Primer for Residents and Fellows

Participants
Tara Retson, MD, PhD, San Diego, CA (*Presenter*) Research Consultant, CureMetrix, Inc;Stock options, CureMetrix, Inc

TEACHING POINTS

SYNOPSIS: Fibroepithelial lesions (FEL) of the breast are biphasic neoplasms with variable amounts of stromal and epithelial proliferation. They range from benign fibroadenomas to malignant phyllodes tumors, fibroadenomas being the most diagnosed breast lesion on core needle biopsy. Other FEL includes cellular and juvenile fibroadenoma and benign, borderline, and malignant phyllodes. TEACHING POINTS: By the end of this educational exhibit, the learner will: 1. Review the incidence, clinical presentation, and management of FEL of the breast. 2. Know the imaging protocols used to evaluate FEL, including mammogram, US, and MRI, based on age and ACR appropriateness criteria. 3. Understand the classification of FEL based on the WHO classification. 4. Identify FEL that is locally aggressive and warrants further surgical management.

TABLE OF CONTENTS/OUTLINE

Introduction; Clinical presentation of FEL; Differential considerations of FEL include differentiation of malignant phyllodes from metaplastic breast cancer and sarcoma; Understanding the grading of phyllodes tumors; Imaging assessment of FEL; Role of mammogram and US in the evaluation of FEL; MRI findings of FELs; Recommended clinical management of FEL; A pictorial review of FEL; Algorithm for imaging patients with suspected FEL; Conclusion

BREE-66 Superficial Lesions of the Breast - What Residents Need To Know?

Participants
Karen Caro, PhD, La Plata, Argentina (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To illustrate imaging features of superficial lesions of the breast. 2.Characteristics of superficial lesions of the breast. 3. Distinguish superficial lesions of the breast versus parenchymal lesions.

TABLE OF CONTENTS/OUTLINE

The thin epidermis is composed of several cell layers and contains no blood or lymphatic vessels and may not be distinguished from the dermis at imaging . However, within the dermis reside hair follicles, sebaceous glands, sweat glands, nerve endings, and bloodand lymph vessels. The hypodermis typically contains nerves, lymphatics, larger blood vessels, and fatty tissue. The importance of delimiting the layers of the skin and its components help us to identify the lesions that can originate at this level For example, the presence of a tract—which represents extension of the hair follicle from the dermis up through the epidermis—that extends from the lesion to the epidermal skin surface also confirms a dermal origin and is indicative of a sebaceous or epidermal inclusion cyst. It is so that in the present work we will analyze different images and their characteristics that will help us to define their probable origin. Conclusions The importance of identifying skin lesions and differentiating them from those located in the mammary parenchyma helps us to define BI-RADS, since many times we can perform controls or even biopsies, which can be avoided, through an adequate study of their location through image and do not forget the importance of a physical examination and questioning

BREE-67 What's Normal Anymore - Lymph Node Evaluation and the Changing Guidelines of COVID

Participants
Anna Hollen, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Review the impacts of COVID-19 vaccination on axillary lymphadenopathy.• Understand the approach to lymph node evaluation in breast practice.• Understand the differences between normal and abnormal lymph nodes.• Through case examples, understand when lymphadenopathy is benign and when further workup is necessary.

TABLE OF CONTENTS/OUTLINE

• Overview of COVID impacts, breast imaging society guidelines and institutional specific operational changes• Review of lymph node evaluation in breast practice and use of ultrasound• Normal vs. abnormal lymph node features• Case-based illustration of lymph node pathology and appropriate assessment/managementBenign reactive lymphadenopathy related to COVID vaccinationLymphomaBreast cancer unknown at time of workupMetastatic, known breast cancerMelanomaUnknown primary

BREE-68 Radial Sclerosing Lesions: An Updated Approach to Multidisciplinary Management

Participants
Allison Aripoli, MD, Kansas City, KS (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Radial sclerosis lesions (RSL) are benign lesions that often present with suspicious imaging features such as mammographic architectural distortion.2. RSL are often seen in association with other benign or high-risk proliferative lesions.3. Newer literature demonstrates lower malignancy upgrade rates of RSL, especially RSL without associated atypia, resulting in shifting management paradigm toward de-escalation of routine surgical excision of RSL.4. Upgrade of a "pure" RSL to atypia at surgical excision is an additional important consideration to provide relevant information for appropriate individual risk stratification and risk reduction.5. Radiology-pathology concordance and multidisciplinary review are essential for treatment decisions. Institutional review of upgrade rates can help define management.

TABLE OF CONTENTS/OUTLINE

1. Introductiona. Imaging appearance of RSL and overlap with malignancyb. Pathology reviewc. Association with other benign or high-risk proliferative lesions2. Historical shifts in understanding and managing RSLa. Older studies and upgrade ratesb. Newer studies and upgrade ratesc. American Society of Breast Surgeons Consensus Guidelines for management of RSLd. Factors related to risk of upgradee. Lack of consensus for management among contemporary studies3. Radiology-pathology concordance and multidisciplinary conference reviewa. De-escalation of routine surgical excision of concordant RSL based on contemporary published and institutional datab. Long-term follow-up and management

BREE-69 Pregnancy Associated Breast Cancer: Diagnostic Approach and Imaging Pitfalls

Participants
Charisma DeSai, MD, Dallas, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Definition: Pregnancy associated breast cancer (PABC) is cancer that develops during pregnancy, breastfeeding, or in the first year postpartum.2. Understand the epidemiology and pathophysiology of PABC.3. Review the risk factors associated with PABC and reasons for diagnostic delay.4. Review the expected breast imaging findings in the pregnant and lactating breast.5. Review the imaging and clinical findings of PABC.6. Review of ACR appropriateness criteria of breast screening and staging during pregnancy and lactation.7. Create a diagnostic approach to symptomatic breast during pregnancy and lactation.8. Explore the different surgical and systemic management options for PABC with respect to fetal and maternal safety.

TABLE OF CONTENTS/OUTLINE

1. Risk factors associated with PABC2. Expected imaging findings of the breast during pregnancy and lactation.3. Review of ACR appropriateness criteria of breast imaging and staging during pregnancy and lactation based on patient age and lifetime risk for breast cancer.4. Diagnostic approach to symptomatic breast during pregnancy and lactation5. Review of radiological findings in:- PABC.- Benign conditions associated with pregnancy and lactation: Breast abscess, lactational mastitis.- How to differentiate lactational mastitis and inflammatory breast cancer.6. Role of imaging guided biopsy.7 Treatment options for PABC including surgical management

BREE-7 Abdominopelvic Manifestations of Metastatic Breast Cancer and Treatment-Related Complications

Awards
Certificate of Merit

Participants
Annie Rhee, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Common sites of breast cancer metastases on abdominal/pelvic imaging are the liver and bones. Less common sites are the peritoneum, gastrointestinal tract, ovary, and retroperitoneum.2. Invasive lobular carcinoma metastases are often infiltrative, which can be difficult to evaluate in earlier stages of disease on imaging. Recognizing complications such as small bowel strictures or obstruction in patients with a history of breast cancer can prompt further investigation.3. Treatment related complications such as pseudocirrhosis, endometrial hyperplasia, and post-surgical changes should also be recognized in these patients.

TABLE OF CONTENTS/OUTLINE

Background: IDC ILCLiver Metastases Focal mass Diffuse infiltration Treatment-related pseudocirrhosis Bile Ducts Biliary obstruction Pancreas MetastasesMass vs infiltrative lesions Adrenal MetastasesDiffuse/nodular thickeningMass GI tract Stomach Linitis plastica Focal ulcerations Small bowel Infiltration obstruction Colon rectum Linitis plastica Ovarian Metastases Primary ovarian cancer in BRCA positive patients Uterus endometrium Metastases Infiltrative Tamoxifen related pathologyEndometrial spectrum (hyperplasia to carcinoma)AdenomyosisLeiomyomaUterine sarcoma Peritoneum Nodular vs infiltrative Retroperitoneum MetastasesInfiltrative fibrotic with urinary tract complications Lymph nodesDistribution of lymphatic spreadAbdominal wall Metastases Postsurgical changesDIEP flap Bones Metastases Blastic, lytic, mixed Pathologic fracture Treatment changes Conclusions

BREE-70 2022 New Trends in Breast Density - What Should We Know?

Awards
Identified for RadioGraphics

Participants

Flavia Sarquis, MD, Buenos Aires, Argentina (*Presenter*) Nothing to Disclose

TEACHING POINTS

Digital mammography (DM) is the most commonly utilized modality in asymptomatic women in the preventative setting, with continuous advancement in breast density measurement. Women with dense breasts have an increased risk of developing breast cancer. Breast density is the most common factor that may prompt women to seek additional screening beyond mammography to increase the likelihood of early cancer detection. After reading this educational exhibit the radiologist will know: Women with dense breasts have clear downsides of breast cancer screening facing an increased risk of late diagnosis. Early diagnosis and treatment are vital.The pandemic has taught us what needs to be done.The realistic limitations of mammography in dense breasts and the benefits of additional screening.Stratification of breast cancer prevention and screening requires mammographic density measures predictive of cancer.New recommendations of breast cancer screening in women with extremely dense breasts.

TABLE OF CONTENTS/OUTLINE

Breast density is a biomarker of objectively measurable characteristics that indicate an underlying physiological or pathological process.Current evidence on breast cancer screening in women with dense breasts.Added detection with supplemental screening.Principles of shared decision-making.Illustrative-based cases.Conclusions

BREE-71 T2 Hyperintense Breast Lesions on MRI - A Pictorial Guide for Residents

Participants
Maria Jose Chico, Buenos Aires, Argentina (*Presenter*) Nothing to Disclose

TEACHING POINTS

In this educational exhibit, through simple iconographic examples, we will teach residents how to identify and recognize the different benign and malignant lesions that may present with high signal intensity in T2 weighted images in breast magnetic resonance.Teaching points:1)To describe benign and malignant lesions which are hyperintense in T2 weighted images in breast MRI.2)To Illustrate with several examples adding helpful suggestions that will enable residents to make the correct diagnosis.

TABLE OF CONTENTS/OUTLINE

1-Introduction2-MRI technique3-Benign lesions: Cysts, Seroma, Hematoma, Intramammary lymph nodes, Apocrine cystic metaplasia, Cavernous hemangioma, Myxoid fibroadenoma, Benign Phyllodes tumor4- Malignant lesions: Mucinous/colloid carcinoma, Metaplastic carcinoma, Papillary carcinoma, Triple Negative Basal Like carcinoma, Necrotic/hemorrhagic invasive ductal carcinoma, Malignant Phyllodes, Metastases5- Conclusions

BREE-72 Demystifying Lesions and Artifacts - A Pocket Guide for Automated Breast Ultrasound

Participants
Fernanda P. Pereira, MD, PhD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

#Automated breast ultrasound (ABUS) is a valuable screening tool for breast cancer designed to overcome some of the issues regarding hand-held breast ultrasound (HHBUS), such as operator dependency, less experience with breast exams, low sensitivity and reproducibility. #ABUS main indication is to use as an adjunct method to mammography for screening asymptomatic women with dense breasts. #Correct identification of lesions and artifacts produced by ABUS is essential for the best evaluation, as acquisition is done by a technician and interpretation is performed by the specialist without knowing potential pitfalls during the exam.

TABLE OF CONTENTS/OUTLINE

1- Concept of automated breast ultrasound (ABUS); 2- ABUS: atlas of benign lesions; 3- ABUS: atlas of malignant lesions; 4- Main differences between ABUS and hand-held breast ultrasound (HHBUS); 5- ABUS: pitfalls and artifacts; 6- ABUS: other applications and final considerations.

BREE-73 Male Breast Cancer - Spectrum of Imaging Appearance and Current Imaging Recommendations

Participants
Soudabeh Fazeli Dehkordy, MD,MPH, San Diego, CA (*Presenter*) Nothing to Disclose

TEACHING POINTS

Synopsis: Imaging of the male breast is typical in routine radiology breast imaging. Most of the findings in male patients are benign, gynecomastia being by far the most common imaging diagnosis. Male breast cancer is uncommon, accounting for less than 1% of all breast cancers. The incidence of breast cancer in men is low, but it increases with age, and the 5-year survival rates are similar, stage by stage, between men and women. Men tend to present with more advanced stages of the disease. When axillary metastatic disease is present, the prognosis is worst and negatively affects the treatment. We reviewed 32 male breast cancer imaging studies from our teaching files, including mammograms, US, and MRI, to catalog the imaging presentations of breast cancer. TEACHING POINTS By the end of this educational exhibit, the learner will: 1. Review the incidence, clinical presentation, and management of male breast cancer. 2. Know the imaging protocols recommended to evaluate males based on ACR appropriateness criteria. 3. Identify the multimodality imaging appearance of malignant male breast lesions.

TABLE OF CONTENTS/OUTLINE

Introduction; Incidence and risk factor for male breast cancer; Clinical presentation of male breast cancer; Review of imaging recommendations for male breast; Differential considerations; Mammographic and US findings; MRI indications and appearance of male breast cancer; Recommended management of male breast cancers; Algorithm for imaging male patients with breast cancer and for follow up into survivorship; Conclusion.

BREE-74 The Imaging of Ductal Carcinoma in SITU - Where It Is and Where It's Going

Participants
Daniela Cunha, MD, Coralville, IA (*Presenter*) Nothing to Disclose

TEACHING POINTS

Ductal carcinoma in situ (DCIS) is the most prevalent form of breast cancer. It can be pathologically classified via the nuclear grade (low, intermediate, high) or by the architectural subtype (comedo, cribriform, micropapillary, solid, or mixed) with increased preference for nuclear grading. Approximately 75% of DCIS present with calcifications and mammography remains its main detection modality; ultrasound (US) may show a mass within a dilated duct but is nonspecific. Magnetic resonance imaging (MRI) however, is proving to be a useful supplementary tool in evaluating the extent of DCIS for surgical planning as well as a prognostic tool for predicting potential for upgrade from DCIS to invasive ductal carcinoma (IDC). While DCIS most commonly presents as a non-mass enhancement, IDC more often presents as an enhancing mass. With advancements in MRI, there is the potential to confidently differentiate low-grade from high-grade DCIS in the future.

TABLE OF CONTENTS/OUTLINE

DCIS - Pathology classification - Mammography findings - Ultrasound and MRI findings - Increasing importance of MRI in DCIS prognosis and treatment

BREE-75 Idiopathic Granulomatous Mastitis and Its Differential Diagnoses - A Practical Guide for Its Identification

Participants
Jorge Hernandez Espinoza, MD, CABA, Argentina (*Presenter*) Nothing to Disclose

TEACHING POINTS

Mention the main pathophysiological, demographic and clinical aspects of Idiopathic Granulomatous Mastitis (IGM). Recognize the most common findings of IGM in mammography, ultrasound and magnetic resonance imaging, and their main differential diagnoses.

TABLE OF CONTENTS/OUTLINE

Idiopathic granulomatous mastitis is a rare chronic inflammatory condition of the breast of unknown aetiology. It is commonly seen in women of childbearing age, but also in perimenopausal women. The diagnostic challenge is that it can mimic many conditions, including malignancy.The most common clinical presentation is a breast lump in any quadrant, or diffuse involvement of the breast. It manifests with axillary pain, erythema, edema or lymphadenopathy. Other chronic inflammatory pathologies considered in the differential diagnosis include plasma cell mastitis, tuberculosis, histoplasmosis, inflammatory carcinoma and Wegener's granulomatosis. Histopathology provides a definitive diagnosis, thus avoiding unnecessary mastectomies.On mammography it is common to find focal asymmetry, a darkened or irregularly shaped mass. On ultrasound, a large irregular hypoechoic parallel mass with tubular extensions is prominent. A hypoechoic and parallel circumscribed mass, or a mass with angular, lobulated, or indistinct margins, associated or not with posterior acoustic shadowing, has been reported. With color Doppler we can visualize the hypervascularization of the tissue surrounding the lesion. IGM in magnetic resonance imaging can be observed as a non-regional or segmental mass enhancement, or a mass enhancement with heterogeneous enhancement, lesions with enhancement of their margins or the presence of microabscesses.

BREE-76 Don't Forget the Pec! A Case-based Review of Pectoral Muscle Abnormalities on Breast Imaging

Awards
Certificate of Merit

Participants
Almir Bitencourt, MD, PhD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

- To show a multimodal review of the pectoral muscles in breast imaging.- To teach breast radiologists to evaluate the pectoral muscles, mainly in mammograms, MRI and ultrasound. - To illustrate some conditions focusing in abnormalities showed by interesting cases of our institutions. - To give hints on how not to obliviate the evaluation of these muscles in breast exams.

TABLE OF CONTENTS/OUTLINE

1. A description of pectoral muscles anatomy and functions. 2. An introduction of pectoral muscles imaging aspects in breast exams (mammograms, ultrasound and MRI). 3. To show the importance of pectoral evaluation to avoid misdiagnosis of lesions in this area.4. Interesting cases of pectoral muscles conditions: - Normal variations (Pectoralis quartus muscle, sternalis muscle, Langer’s axillary arch and Poland Syndrome); - Benign conditions (Subpectoral lipoma, pectoral muscle abscess, pectoral hemangioma and ossifying myositis); - Malignant conditions (sarcoma and lymphoma of the pectoral muscles).5. Most common pitfalls in pectoral muscles evaluation.

BREE-77HC The Wave of Silicone Explanation: What To Expect in Breast Images?

Participants
Amanda Tavares, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

In the past years, the term breast implant illness has becoming strong, especially with the power of social media, to describe physical and psychological symptoms possibly related to breast implants. The silicone is also discussed as a causal factor of ASIA syndrome (Autoimmune Syndrome Induced by Adjuvants). The exact mechanism whereby the implant can induce such diseases is uncertain, and there is still not enough scientific evidence to justify the diagnosis. Many patients report partial or complete resolution of symptoms after the silicone explant and plastic surgery societies already report an increase in the performance of such procedures. Regardless of the surgical technique used for implant removal and capsulectomy, steatonecrosis is a frequent complication. Volume restoration after explantation by autologous fat grafting will also present as oil cysts on imaging. Anterior capsulectomy is an alternative when the posterior capsule is adhered to the chest wall, increasing the risk of pneumothorax, in these cases the base of the capsule left intact can be seen in subsequent images. Breast and axillary residual free silicone may be a result of extracapsular rupture or even gel-bleeding of the removed implants, presenting as hyperdense nodules on mammography, dirty posterior acoustic shadowing on ultrasound, without significant enhancement on MRI. Correlation with previous exams and clinical history is essential to confirm the diagnosis and avoid unnecessary procedures.

TABLE OF CONTENTS/OUTLINE

Breast implant illness ASIA syndrome Breast imaging after silicone explantationPlease visit the Learning Center to also view this presentation in hardcopy format.

BREE-78 Multipictorial Review of Papillary Lesions: An Essential Guide for Residents!

Participants
Antonio Jose Cueva Guerrero, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

After the exhibit the reader will be able to: • Understand the ductal anatomy of the breast • Create a visual standard for the normal ductal pattern of the breast • Recognize papillary lesions from benign to malignant • Comprehend the use of each imaging modality for evaluating normality • Identify and be able to report pathology, using understandable parameters

TABLE OF CONTENTS/OUTLINE

- Introduction- Anatomy- Classification- Benign lesions- Malignant lesions- Imaging methods- Conclusions

BREE-79 Epithelial Lesions of The Breast: Solving Questions You Didn't Know You Have

Participants
Sofia Maksoud, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Benign epithelial and fibroepithelial lesions of the breast are responsible for about 80% of palpable lesions. Histologically, they are classified as fibrocystic changes and associated conditions. Fibrocystic changes are classified as non-proliferative, including cysts, or proliferative, including papillomas, radial scar, sclerosing adenoma, and ductal or lobular hyperplasia. Associate conditions include fibroadenomas and their variants, sclerosing lesions, papilloma and proliferative disease. Mammography, ultrasound and magnetic resonance imaging of the breasts may be helpful in differentiating benign from suspicious lesions in the breast. The objective of this study is to review, through a case-based presentation, the imaging aspect in these lesions, and the role of imaging in differing these conditions from suspicious malign findings.

TABLE OF CONTENTS/OUTLINE

Evaluation of cases of benign epithelial and fibroepithelial lesions of the breast from the digital file of our institution, demonstrating their presentation in different imaging modalities, including ultrasonography, mammography and magnetic resonance imaging, correlating them with the histopathological findings. The work also includes discussion of the topic based on the literature, teaching points and the references.

BREE-8 Pearls and Pitfalls of Automated Breast Ultrasound Interpretation

Awards
Certificate of Merit
Identified for RadioGraphics

Participants
Ashley Huppe, MD, Kansas City, KS (*Presenter*) Nothing to Disclose

TEACHING POINTS

There is increasing utilization of automated ultrasound (AUS) for breast cancer supplemental screening, in part due to increased breast density awareness and federal legislation requiring breast density notification. Given the unique nature of volumetric acquisition on AUS, many radiologists are unfamiliar with identification of breast cancer in the multiplanar format. Additionally, the wide format transducer can generate artifacts which can result in false positives. After this presentation, participants will be able to:· Discuss rationale and guidelines for supplemental screening and review currently available supplemental screening options· Describe benefits and limitations of AUS for breast cancer screening· Compare outcomes data between automated and handheld breast ultrasound screening· Learn the pearls of proper AUS interpretation including unique imaging features and knobology to increase cancer detection and avoid unnecessary callbacks· Review AUS challenges and pitfalls including recognition of artifacts and identification of benign findings

TABLE OF CONTENTS/OUTLINE

1. Introduction: supplemental screeninga. Rationaleb. Options2. AUS for breast cancer screeninga. Overviewi. Indications and limitationsii. Compare and contrast with handheld screeningiii. Techniqueb. Imaging interpretationi. Pearls1. Correlation with current and prior mammography and ultrasound images2. Visualization of lesions in at least two data sets3. Use of unique AUS tools for lesion characterization, including coronal/sagittal planes and software rotationii. Pitfalls1. Acquisition challenges2. Compression and shadowing artifact3. Identification of benign findings3. Conclusion

BREE-80 Axillary Region - Which Road? Beyond Lymph Node

Participants
Isabela Ferracini, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The most common metastatic presentation of breast cancer is enlarged lymph nodes with atypical characteristics in the axillary region, which is why this location must be carefully examined in all breast imaging exams. However, due to the various anatomical structures in this region, many conditions may also present with pain and/or palpable nodulation and are not distinguishable in physical examination, including pathologies that involve neural and vascular structures, subcutaneous tissue, bone and muscular structures, among others. In this way, a thorough evaluation of the armpits through the various modalities of imaging exams is an important tool in elucidating the diagnosis and determining the best treatment. The aim of this study is to address lymph node and non-lymph node axillary radiological findings and their main characteristics.

TABLE OF CONTENTS/OUTLINE

Cases containing mammography, ultrasound, computed tomography and magnetic resonance images and 3D reconstruction.

Cases containing mammography, ultrasound, computed tomography, and magnetic resonance images and 3D reconstruction, obtained from the digital file of our institution, were used. We approach a didact review of some of the most common conditions involving the axillary region, their imaging aspects and how to differentiate them in imaging exams, including teaching points and references.

BREE-81 All That Glitters is Not Gold - Malignant Breast Lesions with Hyperintense Signal on T2

Awards
Certificate of Merit

Participants
Marina Santos, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purposes of this exhibit are:1- To review our institution´s cases of malignant lesions presenting with high signal intensity on MRI T2-weighted images;2- To describe the aspects of these lesions: morphology, T1 and T2 WI features, enhancement pattern and diagnostic clues;3- To evaluate the histological factors that could causes high signal intensity on T2 WI on each lesion such as cystic component, mucinous or loose myxoid stroma, edema, hemorrhagic or necrotic changes;4- To explore the imaging aspects differentiating malignant from benign lesions with high T2 signal such as inflammatory, cystic or infectious etiologies.

TABLE OF CONTENTS/OUTLINE

1- Review cases of malignant lesions presenting with hyperintense signal on T2 WI from our radiology department, documented in multiple methods (MRI, ultrasound and mammography), such as:mucinous carcinoma;metaplastic carcinoma;papillary carcinoma;invasive ductal carcinoma;fibroepithelial tumours.2- Correlation of these cases with histopathological findings justifying the high signal on T2: extensive necrosis; cystic content; mucinous stroma.3- Review some benign differential diagnosis such as inflammatory, cystic and infectious etiologies.

BREE-82HC An Overview of Breast Plasmacytoma With Radiologic-Pathologic Correlation: Key Considerations and Major Features

Participants
Pooya Torkian, MD, Minneapolis, MN (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this project is to describe radiological and pathological findings of breast plasmacytoma in patients with multiple myeloma. We explore multimodality imaging results of mammography, ultrasound, positron emission tomography/computed tomography (PET/CT), CT, magnetic resonance imaging, and tomosynthesis. We provide a pictorial review of the most notable imaging findings of breast plasmacytoma for the awareness of radiologists and clinicians to improve the standard of care.

TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Overview of breast plasmacytoma in multiple myeloma 3. A pictorial review of imaging findings of breast plasmacytoma in mammography, ultrasound, PET/CT, CT, MRI, and tomosynthesis 4. Strengths and weaknesses of the different modalities 5. Discuss the future application of multimodality imaging in breast plasmacytomaPlease visit the Learning Center to also view this presentation in hardcopy format.

BREE-83 Breast Masses in Children and Adolescents: What Do We Need To Know?

Participants
Thais Kuwazuru, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The aim of this exhibition is to:1. Review the current concepts about breast disorders and normal breast development and its variations in children and adolescents.2. Discuss the differences between each imaging modality.3. Describe the rates of breast lesions in this age group in our hospital.4. Highlight the importance of this knowledge to guide the proper management of these patients

TABLE OF CONTENTS/OUTLINE

1. INTRODUCTIONa. Epidemiological profile of breast lesions in this population.b. Recommendations for screening, control and surveillance.2. IMAGING INTERPRETATIONa. Imaging techniques acquisition and protocols.b. Use of ACR BI-RADS and structured reporting of the findings on this population.3. STATISTICAL DATAa. Breast imaging data from in women under the age of 19 from our institution between January 2020 and April 2021.b. Correlation with literature data.4. INTERACTIVE CASE-BASED DIDATICSa. Sample cases to illustrate and solidify the concepts about the main findings in this population.5. FUTURE DIRECTIONS AND TAKE HOME MESSAGES

BREE-84 WANTED: Complete Radiological Response to Neoadjuvant Chemotherapy

Participants
Natalia Lima, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purposes of this exhibit are:1. To review the main aspects related to neoadjuvant chemotherapy response, including complete response, partial response, stable disease, and progressive disease.2. To evaluate the pathologic response (including pCR and residual cancer burden score - RCB) and correlate to radiologic response in some cases from our institution;3. To emphasize the importance of looking for residual lesions in all sequences of MRI, including T2, in order to avoid missing lesions;4. To show, based on interesting cases from our breast radiology group, different kinds of response to neoadjuvant chemotherapy in a variety of histological and imunohistochemical subtypes;

TABLE OF CONTENTS/OUTLINE

· Radiological response patterns to neoadjuvante chemotherapy:- Complete, partial (concentric and with peripheral lesions),

stability, progression of injury· Pathologic response using RCB and its parameters: - Primary tumor dimension - Cellularity - Size of the largest nodal metastasis - Number of positive lymphonodes· Concepts of radiologic and pathologic complete response· Teaching cases showing the challenging aspects based on imaging findings and correlate with clinical and pathological findings in different scenarios, such as: - Ductal carcinoma with tumoral seeding - Mucinous carcinoma mimicking a parcial response - Inflammatory carcinoma with complete response - Complete response of calcifications on a lobular carcinoma

BREE-85 Challenges in the Interpretation of Breast Findings In The Emergency Setting: Recommendations for the Non-Breast Imager

Awards
Identified for RadioGraphics

Participants
Steven Lee, MD, Bellaire, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

Emergencies in Breast Imaging are uncommon. Although infectious conditions such as mastitis and breast abscess are commonly encountered in the emergency department, many additional entities may be recognized, including breast cancer. Most emergency departments do not have mammography units, making the evaluation of these patients incomplete and this emphasizes the importance of ultrasound technique and imaging interpretation in this setting. This is especially important when images are reviewed remotely by the Breast Imaging team. With this exhibit, the learner will be exposed to imaging examples of breast emergencies in the ER/inpatient setting, technique tips and tricks for the ultrasound evaluation of the breast in the ER, relevant patient and imaging information that breast imagers require for remote interpretation, and appropriate recommendation, treatment, and follow up for patients in the emergency setting.

TABLE OF CONTENTS/OUTLINE

Introduction. Breast imaging emergencies in the ED and Breast Imaging Department: Mastitis, Abscess, Trauma/Hematoma, Fluid Collection, Masses, Pseudoaneurysm, Vasovagal Reaction. Ultrasound technique tips and tricks for evaluation in the ED. Algorithm for recommendations and follow up of breast imaging emergencies. Conclusion and Summary

BREE-86 LCIS and It's Variants - Review of What We Know

Participants
Joe Khoury, DO, MBA, Manhasset, NY (*Presenter*) Nothing to Disclose

TEACHING POINTS

Classic LCIS and atypical lobular hyperplasia (ALH) both demonstrate noninvasive proliferation of lobular cells within the TDLU. LCIS involves >50% of acini while ALH involves <50%. LCIS is a risk factor and non obligate precursor of invasive breast carcinoma. RR for development of breast cancer in those with LCIS is 9-10x the general population. Subsequent breast cancer can occur in either breast and includes DCIS and invasive cancers. Most often, LCIS is an incidental finding on pathology. However, there are known multimodality imaging findings associated with LCIS. Pure LCIS includes classic (cLCIS) and non classic types (including pLCIS). Management of LCIS continues to evolve. Upgrade rate to ILC ranges from 0-67% depending upon the study and histology Given low upgrade rates for cLCIS (0-5%), excision diagnosed on needle biopsy with concordant imaging and when no other lesions requiring excision are present is no longer routine. Cases are often recommended for follow up with PE, mammography and often MRI. Because of the higher upgrade rate of pLCIS and biologic behavior similar to DCIS, guidelines for pLCIS and LCIS with discordant imaging is surgical excision with negative margins, without RT. In studies, chemoprevention with Tamoxifen or an aromatase inhibitor in patients with LCIS resulted in a significant reduction in 10 year cancer risk. Bilateral prophylactic mastectomy has been considered an option by some but current guidelines prefer risk reducing endocrine agents.

TABLE OF CONTENTS/OUTLINE

BackgroundComparison of Classic and Pleomorphic LCISHistologyImaging CharacteristicsManagementCases

BREE-87 Rare But Mighty Breast Cancers: What the Future Holds

Participants
William Hiatt, MS, BS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review the current World Health Organization classification system of epithelial breast cancers 2. Introduce the recent expansion in molecular understandings of breast cancer, emphasizing six rarer epithelial tumor subtypes 3. Highlight the recent proposal of a new schema that unifies histological-molecular breast tumor analyses 4. Understand how these findings impact our patients' care via knowledge of known tumor behavior 5. Provide radiologic profiles of two tumor subtypes, metaplastic carcinoma and micropapillary carcinoma

TABLE OF CONTENTS/OUTLINE

1. How are we currently classifying tumors? 1a. Histological analysis vs. molecular classification 2. How are we expanding our molecular understanding of rarer breast tumors? 2a. Proposal of a novel schema that blends tumor histology biomarker data into a more unified classification system 3. Newly expanded molecular profiles of several rarer tumor types that further explain tumor morphology behavior 4. Imaging and Overview Profile: Metaplastic Carcinoma 5. Imaging and Overview Profile: Micropapillary Carcinoma 6. Future directions in rare breast radiology 7. References

BREE-88 Paradigms for Papilloma Management

Participants
Sherwin Chiu, MD,MPH, (*Presenter*) Nothing to Disclose

TEACHING POINTS

(1) Understand the clinical significance of intraductal papillomas.(2) Recognize the imaging findings associated with intraductal papillomas.(3) Review the current paradigm for management of intraductal papillomas.

TABLE OF CONTENTS/OUTLINE

(1) Significance: (a) Classically presents as unilateral nipple discharge. (b) Nipple discharge or dilated ducts warrant further evaluation. (c) Intraductal papillomas with atypia or discordance should be excised, however asymptomatic papillomas without suspicious imaging or atypia may be appropriate for surveillance.(2) Imaging Findings: (a) On mammography, papillomas may present as ductal dilatation and occasionally as a circumscribed mass with associated calcifications. (b) Ultrasound findings typically show a vascularized circumscribed mass with associated ductal dilatation. (c) On MRI, papillomas appear as an enhancing intraductal mass with associated ductal dilatation.(3) Management: (a) Historically, treatment required excisional biopsy or lumpectomy to exclude atypia or underlying malignancy. (b) Ultrasound guided vacuum removal of papillomas has shown promise in removing lesions without the need for surgery. (c) Clinical follow-up with ultrasound is becoming more favored for small, solitary papillomas without atypia due to low rates of malignancy upgrading.

BREE-89 Imaging the Male Breast: Gynecomastia, Male Breast Cancer, and Beyond

Awards
Identified for RadioGraphics
Magna Cum Laude

Participants
Heather Duke, MD, Chicago, IL (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Male breast complaints have increased in recent years, and it is therefore increasingly important for radiologists to be knowledgeable about imaging features of pathology that can occur in the male breast.2. Male breast pathology most commonly includes gynecomastia, and the chief differential consideration is male breast cancer. However, there are a number of other entities that can occur in the male breast of which radiologists should be aware, in order to perform adequate concordance of biopsy results with imaging findings.3. Male breast pathology can involve structures of the subcutaneous tissues, including skin, fat, muscle, blood vessels, lymphatics, and nerves. Alternatively, pathology can originate from ductal and stromal breast tissue in males, with lobular pathology being extremely rare given lack of progesterone-dependent lobular proliferation in males.

TABLE OF CONTENTS/OUTLINE

1. Male Breast Development and Important Differences from the Female Breast2. Gynecomastia (most common pathology) versus Male Breast Cancer3. Less Common But Important Male Breast Pathology and Imaging Findingsa. Skin - sebaceous/epidermal inclusion cystsb. Fat - lipoma and fat necrosisc. Muscle/Fascia - Desmoid tumord. Blood vessels/vascular tumors - vascular malformations, hemangioma, angiolipomae. Nerves - schwannomas, granular cell tumorsf. Lymphatics - intramammary lymph nodeg. Ductal tissue - intraductal papillomah. Stromal tissue - PASH, myofibroblastomai. Other - subareolar abscess, diabetic mastopathy

BREE-9 Breast Implant Associated Anaplastic Large Cell Lymphoma (BIA-ALCL): A Multimodality Imaging Review

Participants
Kanchan Phalak, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) Breast Implant Associated Anaplastic Large Cell Lymphoma (BIA-ALCL) manifests as a late-onset effusion or mass in patients with exposure to textured implants. 2) Breast ultrasonography is an appropriate test for initial evaluation of presenting clinical symptoms such as swelling and pain. 3) Cytologic or histologic analysis is important to distinguish BIA-ALCL from other pathologies. 4) Imaging modalities such as MRI, CT and PET can help characterize BIA-ALCL.

TABLE OF CONTENTS/OUTLINE

1) Clinical Issuesa. Etiology and Pathophysiology b. Presentation c. Demographics d. Natural History and Prognosis e. Treatment 2) Pathology a. General Features b. Staging, Grading, and Classification 3) Imaging Findings a. General Features b. Mammogram c. Ultrasound d. MRI e. PET-CT f. CT g. Image-Guided Biopsy 4) Differential Diagnosis 5) Pictorial review of cases

BREE-90 The ABC of PABC (Pregnancy Associated Breast Cancer): Playing Hide and Seek with the Radiologist

Participants
Martha Espitia Lopez, MD, Mexico, Mexico (*Presenter*) Nothing to Disclose

TEACHING POINTS

Know the definition of breast cancer associated with pregnancy. Know the physiological changes during pregnancy and lactation. Recognize normal and suspicious breast images in pregnancy and lactation.

TABLE OF CONTENTS/OUTLINE

Breast cancer is one of the most common cancers in pregnant and non-pregnant women. Pregnancy is considered a risk factor for the development of breast cancer. Breast cancer is now the most common malignancy diagnosed during pregnancy, with an estimated incidence of 1 in 3000 pregnancies in the United States. Gestational or pregnancy-associated breast cancer is defined as breast cancer that is diagnosed during pregnancy, in the first year postpartum, or at any time during lactation, but is often a late finding due to expected physiological changes in breast cancer. Ultrasound is the imaging study of choice due to its high sensitivity and in the absence of radiation. The tumors found in these patients are usually high grade with high cell proliferation, as well as negative hormone receptors. Histologically, the most frequent type is infiltrating ductal carcinoma, found in up to 80% of cases. The treatment for these patients should not be extended beyond the first trimester, after the twelfth week of gestation it is possible to start chemotherapy during the second and third trimesters, likewise mastectomy can be performed during this period. Radiotherapy is contraindicated during pregnancy, it can be performed after birth. Endocrine treatment begins after delivery.

BREE-91 Interesting Axillary Pathology in Breast Imaging

Participants
Joseph Hoang, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Axillary masses and lesions are occasionally discovered during routine screening and diagnostic breast imaging. In many instances, the masses are found to be lymph nodes, however, other uncommon pathologic entities exists in the axilla that are often overlooked. - Review axillary mass work up and clinical presentation of patients with palpable abnormality- Discuss abnormal, benign lymph node pathologies- Review primary breast malignancy in the axilla- Elucidate on several etiologies of axillary masses outside of breast tissue origin- Present interesting cases of axillary masses within the each category as delineated above

TABLE OF CONTENTS/OUTLINE

- Review typical patient presentation, pertinent imaging modalities and workup - Discuss criteria for benign lymph node morphology- Present and discuss abnormal lymph nodes with benign pathology- Present cases of primary breast cancers in the axilla not involved by a lymph node- Discuss and review etiologies of masses in the axilla outside of breast origin include: Vascular/Lymphatic origin, Dermal and fatty, Neurogenic origin, Musculoskeletal origin-Present cases of differing etiologies as included above.

BREE-92 The Dark Star of the Breast: A Confusing Lesion

Participants
Magaly Henriquez Urrea, MD, MSc, Mexico City, Mexico (*Presenter*) Nothing to Disclose

TEACHING POINTS

A radial scar (RS) is a pathologic process that consists of a central fibroelastic core with distorted and entrapped ducts, and peripherally, with ducts and lobules distributed in a radiating appearance. In addition, the fibroelastic core is contracted, with a "pulled inward" appearance.A specific pathologic characteristic of an RS is the intact myoepithelial cell layer. This is an important feature to differentiate it from an invasive carcinoma.The most typical appearance on digital mammography (DM) and on digital breast tomosynthesis (DBT) of a RS is the architectural distortion, with thin and long radiating spicules against a background of radiolucent fat, creating a "dark star" appearance.The most common ultrasound finding is a hypoechoic, irregular mass with indistinct margins. Posterior acoustic shadowing can also be seen.

TABLE OF CONTENTS/OUTLINE

Definition.Causes.Epidemiology and Clinical Presentation.Pathology.Imaging Findings. Mammography and tomosynthesis. Mammographic criteria. Ultrasound. Contrast-enhanced Mammography. Conclusion. References.

BREE-93 Redefining Needle Targeting Error in the Prone and Upright Stereotactic Breast Biopsy: Recognition and Problem Solving

Participants
Janice Thai, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. The traditional approach for the teaching of stereotactic breast biopsy regarding needle targeting error hinges on established convention that is largely based on the 2D prone stereotactic biopsy system (retired model). Recent advances in technology introduced an updated prone and upright systems, for which the convention of needle targeting error do not apply. This exhibit highlights the differences between the old and new prone models, as well as the upright model, pertaining to needle targeting error. 2. To illustrate the X, Y, and Z axes used to determine needle targeting error and approaches to overcome targeting errors.

TABLE OF CONTENTS/OUTLINE

• Review of the prone and upright stereotactic systems, regarding the X, Y, and Z axes and their directionality used in defining needle targeting error • Review of how needle error targeting is defined in both the prone and upright systems, and solutions to overcome needle targeting errors • Case review of real-life scenarios and problem solving

BREE-94 Male Breast Lesions - That We Need to Know

Participants
Samira Nader, MD, Buenos Aires, Argentina (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Recognize the radiological characteristics of the lesion that help to identify it as benign or malignant according to the BIRADS classification.- Describe the entities that most frequently affect the male breast, especially cancer and gynecomastia as its main simulator.

TABLE OF CONTENTS/OUTLINE

TABLE OF CONTENTS. Normal characteristics of the breast in men and their differences with respect to women. Types of most common lesions in the male breast. Generalities, incidence and risk factors of male breast cancer. Ultrasound and mammographic findings of male breast lesions; types of tumors found and their histopathological correlation. RESUME. Male breast cancer represents 1% of all breast cancers, and less than 1% of all cancers in men. Screening in men is not justified, which partly explains the later diagnosis. 90% of breast cancers in men express estrogen receptors and 80%, progesterone receptors. Biomarkers such as HER2 and Ki67 are taken as a reference to characterize breast tumors as in women. On mammography, a lobulated, irregular, high-density retroareolar mass with poorly defined or spiculated margins can be observed. Calcifications are present in 13-30% of cases, the pleomorphic type being rarer. Ultrasound may reveal a solid, hypoechoic, retroareolar mass with angled, spiculated or microlubulated margins, or a complex cystic mass. Taking a sample for histopathological study is generally performed under ultrasound guidance. Histologically, the vast majority are invasive ductal carcinoma (85-90%) or ductal carcinoma in situ.

BREE-95 Case-based Review of Contrast-enhanced Mammograms: False Positives and False Negatives with Strategies to Improve Cancer Detection and Staging

Awards
Identified for RadioGraphics
Cum Laude

Participants
Molly Carnahan, MD, Phoenix, AZ (*Presenter*) Nothing to Disclose

TEACHING POINTS

Similar to contrast-enhanced-MRI, false-positive (FP) CEM can occur with benign processes False-negative (FN) can occur in marked BPE, minimal lesional enhancement or lesions off the field-of-view Prompt repositioning should be performed to overcome FNs with positioning or medically located lesions Low-grade cancers may not enhance. Decision to pursue imaging guided biopsy should be based on the most suspicious imaging feature

TABLE OF CONTENTS/OUTLINE

CEM background Principles behind cancer detection New BIRADS lexicon Defining breast imaging modalities' diagnostic performance: true positive, true negative, FP and FN Understand causes of CEM FP and FN to improve these measures FP on CEM FP pathology (benign lesions) on CEM: case-based review How CEM FP compare to CE-MRI and MBI FN on CEM FN CEM (missed cancers): case-based review of errors Inadequate visualization of lesion or extent of disease Poor patient positioning Lesion off the FOV (ex. medial or posterior lesions) or abuts breast implants BPE obscuring lesion Lack of lesion enhancement No IV contrast on imaging (ex. missed bolus or contrast extravasation) Negative enhancement artifact obscuring cancer (ex. hematoma) Cancers with no enhancement Errors of characterization: lesions with seemingly benign features How CEM FN compare to CE-MRI and MBI Pearls for the reader Real time interpretations: prompt re-positioning if needed Suspicious calcifications, architectural distortion or masses should be biopsied regardless of CEM enhancement Technical limitations of CEM for posterior lesions and evaluating lymphadenopathy should be considered when staging new cancers

BREE-96 Interactive Case-Based Review of new Contrast-Enhanced Mammography BI-RADS Lexicon

Participants
Lyndia Moravia, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Teaching Points: CEM BI-RADS has recently been published to guide CEM interpretation. Including both low-energy (LE) and recombined imaging (RC) findings in exam interpretation is critical. The standard mammography lexicon is used to describe the LE findings. A new lexicon was developed to describe RC findings that is similar to the breast MRI but with changes specific to CEM. Key differences include the absence of the term 'focus', the addition of the term 'enhancing asymmetry', removal of the mass internal enhancement characteristic of dark internal septations, and removal of the non-mass enhancement internal enhancement pattern of clustered ring. In addition, when LE findings are seen with enhancement, internal enhancement pattern, lesion conspicuity compared to background parenchymal enhancement, and extent of enhancement relative to LE finding should be described.

TABLE OF CONTENTS/OUTLINE

1. Review the main elements of the new CEM BI-RADS. 2. Summarize the differences between MRI lexicon and CEM recombined imaging lexicon. 3. Emphasize the key points of the new CEM BI-RADS through an interactive case-based review.

BREE-97 How to Navigate Breast Tumor Board: A Resident and Fellow Primer

Participants
Atharva Thakore, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review the role of the radiologist in multidisciplinary breast tumor board.2. Understand the oncologic and surgical management of breast cancer in the context of pretreatment imaging.3. Identify imaging features important to clinical decision making.

TABLE OF CONTENTS/OUTLINE

Introduction? Getting to know the Interdisciplinary Team and their Role? Accreditation Standards and Quality Metrics? Breast Cancer Staging; Imaging vs Clinical? Imaging Presentation for Tumor Board? Elements to Include; Key Images--Tumor Size and Location; How to Take Measurements--Imaging Lymph Node StatusTumor Board Terminology and Concepts by Subspecialty?Medical Oncology--Tumor Markers/Receptors--Tumor Biology/Genetics--Indications for Neoadjuvant Chemotherapy--Reporting Response to Neoadjuvant Chemotherapy--Indications for Adjuvant Chemotherapy?Surgical Oncology--Surgical Axillary Management--SLNB vs ALND--Breast Conservation Surgery vs Mastectomy--Breast Conservation Surgery--Mastectomy/Nipple Sparing Mastectomy? Radiation Oncology--Whole Breast Radiation Therapy and Boost--Accelerated Partial Breast Irradiation--Chest Wall Irradiation--Regional Nodal IrradiationRecommendations?Preoperative Localization--Wire Localization--Virtual Navigation Clips--Bracketing? Further Evaluation--Second Look Ultrasound--MRI Biopsy--Axillary BiopsyConclusions:1. Understanding the principles of breast cancer oncologic management is valuable for the radiology trainee2. Clinically relevant imaging features should be highlighted and presented in multidisciplinary tumor board3. Make recommendations appropriate to a patient's specific tumor biology and treatment plan

BREE-98 All Roads Lead to Rome: Multi-modality Imaging of Benign and Malignant Pathologies of the Nipple Areolar Complex

Awards
Identified for RadioGraphics
Certificate of Merit

Participants
Mary Guirguis, MD, Houston, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

• *The normal imaging appearance of the nipple and the nipple areolar complex can be variable. • *Understanding the normal spectrum of imaging appearance across different breast imaging modalities is essential for the radiologist. • *Meticulously assessing the nipple areolar complex across different modalities while understanding its spectrum of imaging appearance allows for accurate identification of pathology in this region. • *Different benign and malignant pathological entities can be seen within the nipple and nipple areolar complex. • *Correlation with the patient's symptoms is key to understanding the imaging findings and clinical

management.

TABLE OF CONTENTS/OUTLINE

This educational exhibit will present a practical guide on how to approach the nipple areolar complex across different imaging modalities. Through a multi-modality case-based approach, we will present the spectrum of the normal appearance of the nipple and the nipple areolar complex. Imaging of benign and malignant pathologies that affect the nipple and nipple areolar complex will be presented across the different breast imaging and cross-sectional modalities. Tips, pitfalls, and practical approaches will be highlighted through a case-based multi-modality approach.

BREE-99 Multimodality Imaging of Postmastectomy Breast Reconstruction Techniques and Complications

Awards
Identified for RadioGraphics
Certificate of Merit

Participants
Faezeh Sodagari, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Breast reconstruction is commonly performed to restore chest symmetry in women undergoing mastectomy as part of breast cancer treatment or prophylaxis. Various reconstruction techniques are currently available including implant-based reconstruction or microvascular autologous reconstruction using pedicled or free flap techniques. The goal of this exhibit is to review surgical techniques used in postmastectomy reconstruction, imaging appearance of postoperative changes and complications, and imaging guidelines for the evaluation of the reconstructed breast.

TABLE OF CONTENTS/OUTLINE

1) Introduction: a) Surgical techniques used in breast reconstruction methods, including implant placement, pedicled flaps, free flaps and preoperative planning; b) Indications, contraindications, advantages, and disadvantages of different postmastectomy breast reconstruction techniques; c) Techniques for the reconstruction of the nipple-areolar complex 2) Normal postsurgical findings and their evolution in time such as edema and soft tissue emphysema 3) Imaging findings of early and late complications such as hemorrhage, infection, flap ischemia, fat necrosis, implant rupture 4) Implications of reconstruction method for radiation treatment planning 5) Multimodality evaluation of reconstructed breast for new or recurrent cancer including guidelines and controversies of MRI surveillance of reconstructed breast 6) Clinical outcomes and summary

BREE-1

Imaging and Management of High-Risk Breast Lesions: An Update of Current Evidence

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Awards
Cum Laude

Participants
Richard E. Sharpe JR, MD, MBA, Scottsdale, AZ (*Presenter*) Nothing to Disclose

TEACHING POINTS

High-risk breast lesions (HRL) are a group of specific heterogeneous lesions that can be associated with a synchronous or adjacent breast cancer and that confer an increased lifetime risk of breast cancer. Providing high quality care for patients with HRLs requires careful correlation of specific patient history and imaging characteristics with histopathologic or cytopathologic results for concordance by the physician performing the biopsy. High-risk and malignant diagnoses should routinely prompt multidisciplinary discussion to determine optimal management. Excise specific HRLs because of the risk of upgrading the diagnosis to ductal carcinoma in situ or invasive cancer. Excise ALL HRL lesions demonstrating radiology pathology discordance. For patients with >1 HRL diagnosis after core needle biopsy, management should be based on the HRL with the highest risk of upgrade.

TABLE OF CONTENTS/OUTLINE

Overview of image guided biopsy process. Explanation of types of high-risk breast lesions, imaging and pathological findings, and associated risks of upgrade to malignancy for each, including: atypical ductal hyperplasia, flat epithelial atypia, lobular hyperplasia (ALH, LCIS), papillary lesions, radial scars/complex sclerosing lesions, fibroepithelial lesions, and phyllodes. Update of the current evidence regarding imaging and pathological correlation and management of each lesion type. Presentation of high yield point of care summary practice resources to support efficient management of patients with high-risk lesions.

BREE-10

Breast Malignancy Subtypes with Hybrid Use of Accelerated and Abbreviated Breast MRI in Screening Higher-Than-Average Risk Patients

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Ashley Huppe, MD, Kansas City, KS (*Presenter*) Nothing to Disclose

TEACHING POINTS

Breast cancer screening guidelines for higher-than-average risk patients are expanding. Therefore, a supplemental screening exam is needed that is both cost-effective and accurate for detection of malignancy. The widespread use of full protocol screening MRI has limitations, and novel techniques have been developed to address these drawbacks. While abbreviated MRI addresses the cost, patient discomfort and time constraints of full-protocol exams, accelerated techniques can improve specificity of abbreviated MRI by providing a temporal analysis of contrast enhancement. Given their recent emergence, many are unfamiliar with the distinctions between these techniques and associated imaging appearance of various malignancy subtypes. After this presentation, participants will be able to:-Review breast cancer screening guidelines for higher-than-average risk patients-Understand the differences between acquisition of accelerated and abbreviated MRI-Describe the applications and benefits of accelerated and abbreviated MRI-Appreciate appearance of malignancy subtypes on accelerated and abbreviated MRI

TABLE OF CONTENTS/OUTLINE

1) Introductiona) Summarize current guidelines for breast cancer screening in higher-than-average risk patientsb) Discuss benefits and limitations of full protocol screening MRIc) Review accelerated and abbreviated MRIi) Define terminologyii) Discuss differences, clinical applications and benefits2) Case-based review of appearance of malignancy subtypes on accelerated and abbreviated MRI used in the screening settinga) Ductal carcinoma in-situb) Invasive ductal carcinomac) Invasive lobular carcinomad) Multifocal disease3) Conclusion

The Various Faces of a Fibroadenoma

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Natalia Orthmann, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is: 1. To emphasize the importance of fibroadenoma findings in the different methods, as it is a common finding of benign breast lesions. 2. To show the epidemiology, histological origin, imaging, anatomopathological correlation when possible, association with medication use, and differential diagnoses of the fibroadenoma. 3. To present fibroepithelial tumors, with emphasis on fibroadenoma and its types. 4. To review imaging findings of breast lesions suggestive of fibroadenomas. 5. To illustrate the different imaging methods to assess the fibroadenoma, such as Ultrasound (US), Mammography (MG), tomosynthesis (TS) and Magnetic Resonance (MR)

TABLE OF CONTENTS/OUTLINE

1. Literature review focusing on fibroadenoma and its differential diagnoses. 2. To illustrate and discuss the pathology of fibroadenoma, highlighting epidemiology; subtypes; progression in different imaging methods. 3.Review of the pathological development of fibroadenomas and its differential diagnoses through illustrative cases. 4.Example cases with mammographic, ultrassonographic and pathologic correlation when available. 5.Summary and conclusion.

A-Z of Triple Negative Breast Cancer

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Tatiana Tucunduva, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

-Define Triple negative breast cancer (TNBC)-Review the histopathological aspects -Review the molecular aspects -Review the spectrum of findings (mammography, US and MRI) -Pitfalls -Worse prognostic factors -News in treatment

TABLE OF CONTENTS/OUTLINE

1. TNBC definition 2. Histological and molecular aspects of TNBC 3. the spectrum of findings:On mammography, the mass more often appears irregular in shape and spiculated margins and may even contain benign aspects. Most show no calcification and are rarely associated with DCIS, as rapid carcinogenesis bypasses this stage.On ultrasound, TNBC often appears as a hypoechoic mass with uncircumscribed margins.Magnetic resonance imaging (MRI) is the most sensitive method to evaluate TNBC and shows some typical features such as annular enhancement and an intralesional T2 hyperintense signal, factors suggestive of malignancy.4. PiffallsBecause some lesions do not show desmoplastic reactions due to the aggressiveness of most triple-negative breast cancers, some radiologic features may resemble benign (cysts) or probably benign (B3) lesions.5. Worse prognostic factor.Compared with other breast cancer subtypes, TNBC has a worse prognosis because it is highly invasive. About 45% have distant metastases and the mortality rate is about 40% within the first 5 years.6. News in treatmentDue to its molecular subtype, TNBC does not respond to the usual specific hormonal therapies. Therefore, even for smaller lesions, chemotherapy is the main systemic treatment.However, different subgroups within TNBC share some molecular features that allow targeted, individualized therapeutic intervention.

One View, What To Do? A Review of the Imaging Appearance and Management of the Breast Asymmetry

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Cara Connolly, MD, Nashville, TN (*Presenter*) Nothing to Disclose

TEACHING POINTS

The breast asymmetry seen in one mammographic view has long been the subject of diagnostic dilemmas for mammographers. Retrospective reviews have reported up to one third of breast cancers may have been seen as asymmetries. However, most screening callbacks for asymmetries are attributed to summation artifact, the overlapping of normal breast tissue.With incorporation of tomosynthesis, the recall rate for asymmetries has decreased but continues to present screening and diagnostic challenges. This exhibit will incorporate examples of asymmetries on both standard 2D imaging and tomosynthesis with both benign and malignant results, as well as review the diagnostic algorithm for management.

TABLE OF CONTENTS/OUTLINE

Benign cases of asymmetries will include summation artifact, PASH, fibrocystic change, fat necrosis, fibroadenomatoid change and abscess.Biopsy-proven malignancies will be highlighted, including invasive ductal carcinoma, invasive lobular carcinoma, ductal carcinoma in situ, lymphoma, and angiosarcoma.

The Myriad of High Risk Breast Lesions: Review of Radiographic and Histologic Features and their Challenging Management

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Awards
Certificate of Merit

Participants
Saba Naamo, MD, Danville, PA (*Presenter*) Nothing to Disclose

TEACHING POINTS

High risk lesions (HRLs) are pathologically diverse lesions with an uncertain malignant potential that attribute an elevated lifetime risk for breast cancer. With a wide spectrum of clinical and radiological features, core needle biopsy is required to diagnose HRLs and tailor their management. We review the clinical, radiographic and histologic features of each of the HRLs and their potential for malignant transformation. We will also dive into the controversy and complexity of the current management as well as recent literature to delineate a guide for appropriate clinical management and the fine balance of risk/benefit. Teaching points: Recognize the clinical presentation, multimodality imaging findings and histologic manifestation of the HRLs Describe radiographic features of HRLs that are commonly associated with malignancy Management and guidelines based on current evidence Imaging surveillance for patients with HRLs

TABLE OF CONTENTS/OUTLINE

Table of contents: ? Introduction and overview of HRLs ? Describe individual HRLs including: ? Definition ? Common clinical and radiological multimodality presentation ? Radiographic/Histologic concordance ? Spectrum of current management and guidelines ? Surveillance of non-surgically/surgically excised lesions

Implementation of Synthetic Mammography: Benefits, Drawbacks, and Pitfalls

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Awards
Identified for RadioGraphics
Certificate of Merit

Participants
Sona Chikarmane, MD, Newtonville, MA (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Synthetic mammography (SM) is a 2D reconstruction from digital breast tomosynthesis (DBT) developed to replace full-field digital mammography (DM) obtained after the DBT acquisition.• SM reduces radiation dose and shortens acquisition time for screening mammography.• Studies have shown that DBT+SM significantly reduced recall rates and had equal cancer detection rates compared to DBT+DM.• SM increases conspicuity of calcifications and architectural distortion; SM has demonstrated decreased conspicuity of asymmetries, with no change in detection of masses.• SM may lead to artifacts such as "pseudo-calcifications", blurring of skin edge, artifact from metallic foreign bodies, and may underestimate breast density.• Despite widespread availability, breast radiologists are slow to adopt SM due to concern about artifacts and dislike of contrast/appearance of findings on SM compared to DM.

TABLE OF CONTENTS/OUTLINE

1. Introduction to SM: definition, reason for development, and hesitation over utilization2. Screening performance metrics: recall rates, cancer detection rates, positive predictive value3. Findings on mammography: conspicuity of calcifications, masses, asymmetries and architectural distortion in DBT+SM vs. DBT+DM4. Breast density assessment on SM and DM and discussion of clinical implications5. Review of artifacts on SM6. Remaining challenges of implementation and potential to improve performance through artificial intelligence

The Male Breast - A Review of Clinical, Imaging Findings and Diagnostic Work-up

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Josefa Galobardes Monge, MD, Parla, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

To review clinical presentation, imaging features and pathologic findings in male breast pathology. • To illustrate imaging findings (mammogram, contrast enhanced mammography, US, CT) of cases from our series of breast lesions in males with pathologic correlation. • To analyze and discuss the specific management of breast lesions in men including imaging and interventional procedures. • To emphasize pitfalls, diagnostic difficulties and differential diagnosis.

TABLE OF CONTENTS/OUTLINE

We present: Clinical signs and symptoms. Techniques in evaluation of male breasts. Mammograms, contrast enhanced mammography, US, MR, CT. Differential diagnosis. Imaging appearances (spiculated mass, circumscribed mass, microcalcifications). Diagnostic work-up and recommendations for management. Specific considerations in male patients different from women. Different entities illustrated include. Benign: gynecomastia (diffuse, nodular and dendritic), epidermal inclusion cyst, lipoma, hematoma, foreign body granuloma, papilloma, fibromatosis; Malignant: ductal carcinoma in situ (DCIS), invasive ductal carcinomas uni and bilateral, metastasis to the breast (lung cancer), lymphoma

Community Outreach in Breast Imaging: What Radiologists Can Do to Close the Gap for the Underserved and Uninsured Population

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Awards
Identified for RadioGraphics

Participants
Angel Su, MD, CYPRESS, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

After the Affordable Care Act was implemented, the uninsured population in the United States of America decreased significantly. However, since 2017, a steady increase has been noticed, reaching up to 28.9 million in 2019. Unfortunately, the largest increases continue to affect minorities disproportionally and the COVID-19 pandemic, which resulted in lockdowns that delayed screening mammograms, further highlighted these disparities. Radiologists, and more specifically, breast imagers, must recognize this situation as this population is disproportionally diagnosed at later stages, has a higher mortality rate, less continuity of care, and overall lower survival. The purpose of this abstract is to familiarize the radiologist with the uninsured and underserved population and how these patients are affected by breast cancer, demonstrate current statistics, and propose strategies that breast imagers can pursue individually or as a group to close the disproportional gap for the underserved.

TABLE OF CONTENTS/OUTLINE

1.Introduction. 2. Who are these patients: Analyzing the data. 3. Breast cancer in the uninsured and underserved population: approach, navigating the options and obstacles, disparities 4. What else can the breast imager do? A) Radiologist-Patient interaction B) Radiologist-Referring physician interaction C) Radiologist-Community interaction D) Radiologist and the Media E) Radiologist and Legislature. 5. Conclusion

AI for Mammography: What Radiologists Need to Know

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Sieun Lee, MD, Yongin, Korea, Republic Of (*Presenter*) Nothing to Disclose

TEACHING POINTS

Teaching points - AI-CAD can improve the diagnostic performance of radiologists, and help close the learning gap for inexperienced readers.- Stand-alone AI-CAD has shown variable performance in previous studies, suggesting a cautious approach is needed to implement its use for triaging or workload reduction.- Future AI will predict the possibility of cancers beyond the current diagnosis of present abnormalities in combination with the clinical model, which will allow more stratified and personalized screening to take place.

TABLE OF CONTENTS/OUTLINE

Improving the accuracy of breast cancer diagnosis - How AI-CAD differs from conventional CAD in terms of false-positive results- Retrospective, but large-scale evidence for AI-CAD - Cancers missed by AI-CADImproving efficiency for radiologists - Triaging screening mammography - Recommendations for the best use of AI-CADPersonalized predictions of cancer risk- Better way to estimate breast density- New model that includes additional clinical risk factors- Suggestions for personalized screening

Looking Through BI-RADS Terminology for Contrast-Enhanced Mammography - An Updated Guide to Understand CEM Supplement

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Awards
Certificate of Merit

Participants
Diana Galvis Zambrano, BSc, MD, Mexico City, Mexico (*Presenter*) Nothing to Disclose

TEACHING POINTS

1.To describe Contrast-enhanced mammography (CEM) technique and image adquisition. 2. To outline contrast enhanced mammography - breast imaging lexicon - from ACR BI-RADS supplement. 3. To illustrate different imaging findings, the correlation with other imaging techniques and the appropriate form to report based in the new CEM BI-RADS supplement. 4. To review and compare the advantages and drawbacks of each image model. 5. To understand how and what should be in the report of a CEM study.

TABLE OF CONTENTS/OUTLINE

1. Background and history of CEM. 2. Description of protocol and imaging adquisition in contrast-enhanced mammography and associated technical details. 3. Review the CEM breast imaging lexicon from BI-RADS supplement. 4. Case-based CEM BI-RADS lexicon supplement interpretation in multiple scenarios and patologies. 5. Correlation of radiological findings between CEM and other techniques. 6. Discuss actual indications, limitations and the future of CEM. 7. Take home points

To Freeze Or Not To Freeze? That Is The Question: Cryoablation For The Treatment Of Breast Cancer

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Kenneth Tomkovich, MD, Freehold, NJ (*Presenter*) Consultant, IceCure Medical, Inc;Speakers Bureau, IceCure Medical, Inc

TEACHING POINTS

The purpose of this exhibit is: 1. Discuss the historical perspective of breast cancer treatment from radical mastectomy in the late 1800's to current practice. 2. To discuss the use of image guided cryoablation in the treatment of cancer in organs other than the breast. 3. To demonstrate the optimal technique to perform successful ultrasound guided cryoablation of primary breast cancer. 4. To illustrate important "new normal" imaging findings commonly seen following breast cancer cryoablation. 5. Review recent publications and abstracts on the topic of breast cancer cryoablation as an alternative to surgical lumpectomy.

TABLE OF CONTENTS/OUTLINE

History of surgical treatment for breast cancer. Cryoablation therapy application in organs other than the breast. Technique of ultrasound guided breast cancer cryoablation. Present the imaging findings post breast cancer cryoablation: Mammography, Ultrasound, MRI. Future implications based on a review of recent publications and abstracts.

The Horizontal Approach for Tomosynthesis and Stereotactic Guided Breast Biopsy: Review of Technique and Advantages

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Janice Thai, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To expand the proceduralist's armamentarium by introducing a different approach to performing stereotactic breast biopsy. 2. To demonstrate the horizontal approach technique, and highlight the technical advantages inherent to a needle trajectory that is parallel to the image detector.3. To inform the appropriate use of the horizontal approach in technically challenging anatomy/lesion location, including thin breast, superficial/retroareolar lesion, and posterior chest wall/inferior lesion.

TABLE OF CONTENTS/OUTLINE

• Review of patient positioning, targeting approach, procedural technique, and device set up based on the two most popular commercially available systems • Review of the advantages of the horizontal approach over the vertical approach, with real life case examples• Review of needle targeting error and problem solving for optimal efficiency• Review of tips and tricks to maximize technical success and patient comfort

Imaging Features Following Breast Explant Surgery: A Pictorial Essay

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Yusuf Akpolat, MD, Houston, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Breast implants can be removed with breast explantation surgery (BES) for various reasons, including patient dissatisfaction, capsular contracture, implant infection or rupture, breast implant-associated anaplastic large cell lymphoma, and a recently emerging phenomenon called breast implant illness.2. BES techniques include capsulotomy, partial, total, or en bloc capsulectomy. Adjunctive aesthetic or reconstructive procedures after BES include fat grafting, mastopexy, augmentation, and reconstruction with flaps. 3. The majority of the post-BES breast imaging findings are related to the surgical scar/bed, thus, confirming the type of explantation surgery is important.4. Imaging findings after BES include focal and global asymmetries, architectural distortions, calcifications, calcified and non-calcified fat necrosis, masses, hematomas, seromas, capsular calcifications, and silicone granulomas.5. Most importantly, since these patients have residual breast tissue, paying attention to suspicious imaging features is necessary.

TABLE OF CONTENTS/OUTLINE

1. Breast Explant Surgery Techniques2. Findingsa. Global Asymmetryb. Architectural Distortionc. Calcifications/Fat Necrosisd. Asymmetries and Masses Anterior to the Pectoralis Major Musclee. Implant Capsule/Calcificationsf. Silicone Granulomas/Free Siliconeg. Suspicious FindingsPlease visit the Learning Center to also view this presentation in hardcopy format.

Pregnancy-associated Breast Cancer: The Perfect Storm

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Julia Colombo, MD, Buenos Aires, Argentina (*Presenter*) Nothing to Disclose

TEACHING POINTS

• There is clinical and imaging difficulty in making an accurate diagnosis of breast cancer due to typical changes occurring during pregnancy and lactation. • The vast majority of mammary alterations in pregnancy correspond to benign pathology. • The differential imaging diagnosis is complex due to the similar appearance in many cases to benign pathology • Any palpable area that remains for more than 2 weeks during pregnancy should be investigated. • Ultrasound is the first choice in the evaluation of masses. • Mammography is essential for its complementary contribution. • MRI during pregnancy should be used if the benefits outweigh the risks and the information cannot be obtained by any other method. • Core needle biopsy is of choice for final diagnosis. • Pregnancy-associated breast cancer tends to have a worse prognosis due to delayed diagnosis • The incidence is increasing in developed countries due to the postponement of motherhood.

TABLE OF CONTENTS/OUTLINE

• Definition of pregnancy-associated breast cancer (PABC) • Some peculiarities of pregnancy-associated breast cancer. • Imaging methods for the diagnosis of breast cancer during pregnancy and lactation. Safety and effectiveness. • Some cases of our daily practice. • Conclusion.

Fast-Growing Fibroepitelial Breast Tumors: Tips for Proper Radio-Pathologic Correlation

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Amanda Tavares, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Fibroepithelial neoplasms are the most common breast tumors in clinical practice, especially in younger women. Despite most of these lesions are benign, they can present significant growth. Due to the overlapping histopathologic features, the differential diagnosis between Fibroadenoma (FA) and Phyllodes Tumor (PT) may be difficult on core-needle biopsies and radiopathologic correlation may contribute to the management of those lesions. FA are the most common lesions and usually have slow growth pattern; however, they can increase due to hormonal changes, especially during pregnancy and lactation. FA variants (eg. complex, giant and juvenile FA) may also present as fast-growing tumors. At imaging, FA usually present as oval and circumscribed masses, with high-signal on T2-weighted images, homogeneous enhancement or dark internal septations, and persistent kinetics on magnetic resonance imaging (MRI). PT usually present as fast-growing tumors and may be benign, borderline or malignant. They usually have image characteristics similar to those of FA, but may show cysts or necrosis related to the tumor's rapid growth. There is higher risk of malignancy if the tumor presents non-circumscribed margins, irregular cystic walls, peritumoral edema, low signal on T2 sequences and low apparent diffusion coefficient.

Nipple-Areolar Complex, What the Radiologist Should Know

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Natalia Orthmann, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is: 1.To show the epidemiology, histological origin, imaging aspects in the different methods, anatomopathological and clinical correlation, when possible. 2.To review the imaging findings of the suggestive nipple-areolar complex and its differential diagnoses. 3.To illustrate the different imaging methods to assess the nipple-areolar complex, such as Ultrasound (US), Mammography (MG), tomosynthesis (TS) and Magnetic Resonance (MR). 4.To suggest techniques for better assessment of the nipple-areolar complex.

TABLE OF CONTENTS/OUTLINE

1.Literature review focusing on nipple-areolar complex diseases and its differential diagnoses. 2.To illustrate and discuss the pathology of nipple-areolar complex diseases, highlighting epidemiology; anatomy; progression in different imaging methods. 3. Review of the pathological development of nipple-areolar complex diseases through illustrative cases. 4. Example cases with mammographic, ultrasonographic, clinical and pathological correlation when available. 5. Examples of cases with suggestions of techniques for better evaluation of the nipple-areolar complex 6. Summary and conclusion.

Second look and Targeted Ultrasound Made Very Very Easy, a Case-Based Review

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Sepideh Sefidbakht, MD, Powel, OH (*Presenter*) Nothing to Disclose

TEACHING POINTS

Understanding the relationship between location of lesions in ultrasound and mammogram and MRI is not always intuitive. This makes targeted and second look ultrasounds challenging to learn. Following a few simple rules and being aware of the pitfalls and peculiarities associated with each modality can accelerate the learning curve and enhance the accuracy of performing second look and targeted ultrasounds. Using simplified rules, 3D schematics and simple animations we will review the basic concepts of second-look and targeted ultrasound. Then using a case-based approach we will practice the basic concepts of second look and targeted US. The purpose of this exhibit is to:1-Review the basic concepts of correlating lesions between modalities (clockwise location, depth, shape size)2-Review the basic characteristics of the CC view in mammogram (depicting medial, lateral, superior inferior lesions and the role of rolled-over views)3_Review the basic characteristics and peculiarities of the of the MLO view in mammogram and how it affects where we see lesions; the concept of clockwise and counterclockwise rotation of the breast and how it affects lesion perception.4-Review the basic characteristics of the lesions seen in MRI (location, depth, concordance and discordance between extent of enhancement and US appearance)

TABLE OF CONTENTS/OUTLINE

• Looking for a nonpalpable lesion seen in MG or MRI; The Four Golden Rules• 3D depiction of lesions in CC view; The Four Golden Rules of the CC view• 3D depiction of lesions in MLO view; The Four Golden Rules of the MLO view• Second look ultrasound, The Four Golden Rules• Case-based practice of second look and targeted ultrasound

Lactation Education: Breast MRI Pathology, Pearls, and Pitfalls

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Awards
Identified for RadioGraphics

Participants
Kali Xu, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

- The lactating breast undergoes marked physiologic changes that can make conventional imaging evaluation with mammography and ultrasound challenging.- MRI is increasingly recognized as a safe and effective supplemental tool for both diagnostic evaluation and screening of lactating patients in the appropriate clinical setting.- Learning to recognize normal physiologic findings, common benign entities, and signs of malignancy in the lactating breast on MRI will improve diagnostic accuracy and facilitate proper clinical management.

TABLE OF CONTENTS/OUTLINE

I. Review clinical indications for breast MRI during lactation.II. Illustrate characteristic features of the lactating breast on MRI, including atypical scenarios (post-breast conservation, unilateral breastfeeding).III. Provide case examples of benign entities encountered during lactation (galactocele, lactating adenoma, fibroadenoma).IV. Review MRI features of pregnancy-associated breast cancer (PABC) using case examples illustrating a spectrum of pathology and clinical scenarios. Correlative mammography and ultrasound images will be incorporated where appropriate. Emphasis will be placed on demonstrating how breast MRI may depict more extensive disease than conventional imaging, leading to changes in clinical management.V. Discuss risks and benefits of FNA vs. core biopsy for sampling of suspicious imaging findings in lactating patients, with emphasis on careful correlation of radiologic, pathologic, and clinical findings to avoid delays in cancer diagnosis.

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Almudena Gil Boronat, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

- To briefly review the breast cancer conservative treatment, whose current protocols include the use of adjuvant breast radiotherapy. - To explain the different breast parenchymal findings expected after conservative treatment, depending on the time elapsed after it. - To emphasize that although most of them are benign in nature, they can present suspicious radiological semiology, and it is important to know them in order to differentiate them from a local recurrence.

TABLE OF CONTENTS/OUTLINE

1. Quick review of adjuvant radiotherapy after breast-conserving surgery. 2. Explain the different types of glandular changes expected after conservative treatment depending on the time of evolution, classified as early changes, intermediate changes and late changes. 3. We focus on explaining the situations that generate the greatest difficulties to differentiate them from a local recurrence. 4. Conclusions. 5. Take home points. 6. Bibliography.

BREE-123

Pregnancy-associated Breast Cancer and the Role of Imaging in the Pregnant and Lactating Patient

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Julia Kirsten, MD, Fenton, MO (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Describe the background, etiology, biomarker status and most common histological types behind pregnancy-associated breast cancer.2. Discuss screening and diagnostic guidelines and review current updates regarding the role of imaging for pregnant and lactating women.3. Review common benign pregnancy-related lesions, potential complications, radiation safety, and treatment of pregnancy-associated breast cancer.

TABLE OF CONTENTS/OUTLINE

1. Introduction to pregnancy-associated breast cancer and challenges in diagnosis2. Etiology, histological type, and biomarker status of pregnancy-associated breast cancer3. Clinical manifestations of pregnancy-associated breast cancer (palpable breast mass, unilateral milk rejection, etc)4. Initial imaging of breast cancer screening during pregnancy (high and elevated risk patients, 39 and under, summary of recommendations from ACR, ACOG, AJR)5. Initial imaging of breast cancer screening during pregnancy (40 years and older, summary of recommendations from ACR, ACOG, AJR)6. Initial imaging of breast cancer screening during lactation7. Initial imaging of pregnant women with a palpable breast mass8. Use of MRI in the pregnant/lactating patient (concerns regarding heat deposition into the fetus, damage to auditory nerves, gadolinium-induced fetal toxicity)9. Common benign pregnancy-related breast lesions10. Complications of biopsies in pregnant and lactating women (milk fistulas, increased risk of bleeding and infection, breast pseudoaneurysm)11. Radiation safety and recommendations12. Treatment of pregnancy-associated breast cancer13. Conclusion

Common Questions and Challenging Scenarios of the Daily Practice Using the BI-RADS® Atlas

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Karina Pesce, MD, Capital Federal, Argentina (*Presenter*) Nothing to Disclose

TEACHING POINTS

1-Review the management recommendations suggested by the ACR for clinical cases that generate different inquiries during daily practice. 2-Describe the different clinical scenarios that constitute the exception to the rule in the management of categorization recommendations.

TABLE OF CONTENTS/OUTLINE

The American College of Radiology (ACR) has established the Breast Imaging Reporting and Data System (BI-RADS) to guide the breast cancer screening and diagnostic routine. This educational poster is aimed at doctors who are new to breast diagnosis and is intended to be a practical guide to solve the most frequent doubts following the recommendations of experts from the American College of Radiology. Frequently asked questions will be reviewed through clinical cases.

False Negatives in Breast Screening and How to Avoid Them

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Agustina Graziani, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Identify the factors that influence false negative results in all diagnostic modalities.2. Analyze the causes of false negatives.3. Discuss possible strategies to avoid false negatives.

TABLE OF CONTENTS/OUTLINE

Breast cancer is a common disease among women and it is the second leading cause of death from cancer. Timely diagnosis allows detection in early stages, with better outcome, better prognosis and with fewer comorbidities in the instituted treatments.Diagnosis can be made with breast imaging either by mammography, ultrasound and magnetic resonance imaging. The percentage of false negatives on imaging studies in the literature varies between 8-10%, between 9 and 22% and 4.4% respectively.The most common causes that lead to a misdiagnosis can be classified as related to:1. The technical aspect of the imaging modality.2. The Patient.3. The Reporting physician.4. The lesion.Early detection of breast cancer is one of the most important prognostic indicators, and diagnostic errors in breast imaging represent missed opportunities for timely treatment.Improving diagnostic accuracy requires a multidimensional approach, however recognizing causes of false negatives allows us to adopt useful strategies to avoid them and thus favorably impact the reduction of morbidity and mortality.

Pseudoangiomatous Stromal Hyperplasia of the Breast (PASH) - Tips and Tricks for Diagnosis

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Rosa M. Lorente-Ramos, MD, PhD, Madrid, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

To review pseudoangiomatous stromal hyperplasia of the breast, highlighting clinical presentation, pathological and imaging findings as well as differences from breast cancer To illustrate common and uncommon imaging findings in mammogram and contrast enhanced mammography (CEM), US, MR, of cases from our series with pathological correlation. To analyze and discuss the specific management of those lesions, including diagnostic difficulties and imaging work-up. To emphasize pitfalls and clues to differential diagnosis.

TABLE OF CONTENTS/OUTLINE

Pseudoangiomatous stromal hyperplasia (PASH) is a benign mesenchymal proliferating lesion. It is frequently found as an incidental histological finding in breast biopsies performed for other lesion but it can present as a mass (also called nodular PASH) or breast enlargement, which may mimic malignant lesions malignant lesions. Keys for differential diagnosis should be recognized. We present: - Definition. - Clinical presentation. - Pathological findings. - Imaging findings: Mammograms/CEM, US, MR. - Differential diagnosis. - Management and outcomes.

High-risk Breast Lesions - What the Radiologist Should Know About the Diagnostic and Therapeutic Implications

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Ladys Camargo, MD, Ciudad Autonoma de Buenos Aires, Argentina (*Presenter*) Nothing to Disclose

TEACHING POINTS

Describe the lesions included in the histopathological B3 category of the Ellis classification. Correlate imaging and histopathological findings.Discuss the diagnostic algorithm and management of B3 lesions.

TABLE OF CONTENTS/OUTLINE

One of the main challenges of breast pathology is the diagnosis of lesions with indeterminate radiological characteristics and their proper management. The same occurs with the diagnosis of histological lesions considered to be of uncertain malignant potential, framed according to the Ellis histological classification as B3 lesions. Over time, personalized management has been favored to reduce overtreatment and thus lower the high healthcare costs associated with surgical excision. The main objective of this work is to provide a precise approach to high-risk lesions, correlating their imaging and pathology findings and discussing their proper management.1. Introduction.2- Classification of B3 lesions according to Ellis histological classification.3- Imaging characteristics of B3 lesions (mammography, US, MRI).4- Radio-Pathological correlation.5-Clinical cases.6- Diagnostic Algorithm.7-Discussion of the Management of B3 Lesions.8- Conclusions.9-Bibliography.

Male - Malignant or Mimic? A Seven-Year Institutional Review of Male Breast Biopsies with Radiology-Pathology Correlation

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Esraa Hazim Hasan Al-Jabbari, MBCHB, Galveston, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. An overview of male breast findings which were biopsied and/or resected over the last seven-years (April 1st, 2015 -March 31st, 2022) within our institution. 2. Discuss imaging and pathologic features of some pertinent benign and malignant lesions of the male breast. 3. Highlight imaging features suggestive of a benign etiology to limit false negative biopsies. 4. Highlight the risk factors for male breast cancer. 5. Discuss potential breast cancer screening programs in at- risk male populations including trans-gender patients.

TABLE OF CONTENTS/OUTLINE

Introduction; Embryologic and anatomic overview of the male breast; Institutional experience with male breast findings; Malignant breast findings in males; Benign mimics of breast malignancies in males; Risk factors for male breast cancer; Potential screening guidelines in at - risk male population; Conclusion.

Prone Tomosynthesis-guided Breast Biopsy: A Guide for Trainees and Experts Alike

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Awards
Identified for RadioGraphics

Participants
Luciano Chala, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Step-by-step review of tomosynthesis-guided breast biopsy technique2. Discuss all indications, complications, and contraindications of the method.3. Share our experience with cases illustrating situations where tomosynthesis has helped improve our biopsies results.

TABLE OF CONTENTS/OUTLINE

- To obtain more accurate and reliable results, it is important to be familiar with the steps of tomosynthesis-guided biopsy. We demonstrate the technique step-by-step with actual photos from our daily practice so that residents can learn the procedure comprehensively.- In recent years, tomosynthesis-guided biopsy has gained popularity. We discuss all indications for this method and compare its limitations and complications with supine tomosynthesis-guided and stereotactic biopsies.- Tomosynthesis-guided breast biopsy in the prone position can sometimes offer advantages over other methods and even shorten the overall duration of the biopsy. We illustrate the following advantages with some cases: identification of lesions visible only on tomosynthesis, the possibility of lateral access in thin breast thickness, improved calcifications conspicuity, and identification of intravascular calcifications, which helps to distinguish them from linear calcifications and also allows better planning by avoiding blood vessels to reduce hemorrhage-related complications.

SOS Within the Breast: The Must-Knows of Handling Emergent Breast Cases

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Kristina Michaudet, MD, Stanford, CA (*Presenter*) Nothing to Disclose

TEACHING POINTS

Breast emergencies are infrequent but can be diagnostically challenging especially during off hour nights and weekends. Very few experienced breast imagers nor specialized sonographers may be available during acute breast situations. Breast emergencies may present as complications of interventional procedures such as pseudoaneurysms or post biopsy hematomas. Numerous patients also return to the emergency department setting following mastectomy and reconstruction. Additionally, acute situations may be related to infection and inflammation in both cancer and non-cancer patients. Most importantly, a seemingly infectious process can masquerade an underlying mass and malignancy. The importance of follow up imaging for ED breast complaints is imperative.

TABLE OF CONTENTS/OUTLINE

The poster will be organized to include a review of both common and uncommon emergently presenting breast conditions. Examples of emergency breast cases including infection in puerperal and non puerperal cases will be showcased as well as first time presentation of malignancy through acute settings. Breast ultrasound utilization will be discussed along with the patient factors and characteristics which may be most pertinent for suspected infection and abscess. Management and knowledge of appropriate follow-up-protocols is key particularly for the non- breast imager encountering these unique cases on call. Emergency procedures and treatments such as embolization will be highlighted in cases of post biopsy complications such as bleeding and pseudoaneurysm formation.

Next Top Model: An Overview of Breast Cancer Risk Assessment Models

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Pooja Agrawal, Houston, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Introduce breast cancer risk assessment models available for estimating an individual's risk of developing breast cancer or risk for carrying a gene mutation that may predispose to developing breast cancer. 2. Review the strengths and limitations of each model and the model's applicability to underrepresented populations. 3. Provide example cases and narratives that demonstrate the use of breast cancer risk assessment models for different women.

TABLE OF CONTENTS/OUTLINE

1. Introduction: Review breast cancer statistics including morbidity and mortality disparities amongst patient populations, define breast cancer risk assessment, review guidelines and recommendations for breast cancer risk assessment (American College of Radiology, Society of Breast Imaging, American Society of Breast Surgeons, American College of Obstetricians and Gynecologists), and discuss current utilization (or lack of utilization) of breast cancer risk assessment. 2. Review available risk models, including risk factors assessed, strengths, and limitations: Gail Model, Claus Model, BRCAPRO Model, IBIS aka Tyrer-Cuzick Model, Jonker Model, BOADICEA Model. 3. Demonstrate breast cancer risk assessment performance: Provide examples of how risk assessment is performed, review recommendations for patients found to be at high risk. 4. Show case examples of breast cancer risk assessment for women belonging to minority groups or underrepresented populations. 5. Conclusion and application of breast cancer risk assessment models to clinical practice

Problem-Solving Breast MRI

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Awards
Identified for RadioGraphics
Certificate of Merit

Participants
Beatriu Reig, MD, MPH, New York, NY (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. MRI does not replace careful diagnostic workup with mammogram and ultrasound 2. Negative MRI should not obviate the need for biopsy for a suspicious finding detected on mammography/tomosynthesis or ultrasound 3. A negative MRI is reassuring in low-suspicion mammo/tomosynthesis findings such as asymmetries, focal asymmetries, and post-surgical change

TABLE OF CONTENTS/OUTLINE

1. Brief introduction a. Indications for MRI b. MRI Sensitivity/specificity 2. Indications for problem-solving MRI a. Equivocal or uncertain imaging i. Lesion visible on some but not all views ii. Change over time: true change versus technical difference iii. Change at surgical site iv. Sternalis muscle b. Negative imaging with clinical concern i. Suspicious nipple discharge c. BIRADS 4 lesions i. Difficult biopsy due to technical issues ii. Discordant biopsy iii. Tomosynthesis-only finding without tomo-guided biopsy capability 3. Inappropriate use of problem-solving MRI a. Preceding or replacing diagnostic mammo and US b. In lieu of biopsy of a suspicious finding identifiable by mammo, US, or clinical exam c. Evaluation of mammographic calcifications 4. Future directions a. Increasing use of tomosynthesis decreases need for problem-solving MRI i. Better evaluate equivocal findings ii. Biopsy one-view findings b. Triaging tool for active surveillance vs surgical excision for high risk lesions detected on percutaneous biopsy i. Low grade DCIS ii. ADH, atypia iii. Radial scar c. Improving accuracy leads to improved utility of problem solving MRI i. Diffusion weighted imaging ii. Artificial intelligence in MRI d. Problem solving MRI more feasible as MRI becomes faster and cheaper i. Abbreviated MRI impact ii. Increased MRI screening

The Use of Diffusion-weighted Sequence in the Evaluation of Breast Lesions: What the Radiologist Needs to Know

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Giselle Mello, PhD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Review the fundamental principles of diffusion-weighted imaging (DWI).- Review the concepts of breast lesions cellularity.- Review the concepts of ADC mapping.- Illustrate with cases how to differentiate benign from malignant lesions and correlate the histopathologic findings with their ADC values to allow for earlier and more accurate diagnosis and individualized patient care.- Create a pictorial essay to illustrate the use of DWI to differentiate complex breast lesions with peripheral enhancement that, when combined with clinical and histopathologic findings, can provide valuable information for therapy.

TABLE OF CONTENTS/OUTLINE

1) Principles of diffusion-weighted imaging (DWI).2) The concept of apparent diffusion coefficient (ADC).3) Lesion cellularity.4) Benign and malignant DWI findings and their corresponding ADC values.5) Differentiation of complex peripheral enhancing breast lesions.6) DWI findings for predicting pathologic response in neoadjuvant treatment of breast cancer.7) A series of cases using DWI sequences and correlation of their ADC values with histopathological findings.

Anatomical Approach for the Imaging and Diagnosis of Nipple Areolar Complex Abnormalities

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Awards
Certificate of Merit

Participants
Claudia Cotes, MD, Houston, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

The nipple areolar complex is a region of the the breast with a complex anatomy from which several benign and malignant pathology may arise. It is important to understand anatomic features of this region for an appropriate differential diagnosis when abnormalities in this area are encountered. The imaging evaluation of this region can be technically difficult due to superimposition of tissues in mammography and artifacts and/or technical limitations on ultrasound which can limit the appropriate diagnosis of these abnormalities. This exhibit will provide a review of the clinical and imaging findings of interesting pathologic processes in the nipple areolar complex utilizing an anatomical approach, as well as interactive examples of imaging technique for proper evaluation of this region. Workup algorithms based on the ACR appropriateness criteria for clinical findings related to the nipple areolar complex will also be provided.

TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Imaging Anatomy of the Nipple Areolar Complex 3. Imaging of the Nipple Areolar Complex: Tips and Tricks for optimal evaluation4. Anatomy based Pathology Review: a. Skin and Subcutaneous Soft Tissue: Sebaceous Cyst, Epidermal Inclusion Cyst, Montgomery Gland Cyst, Cellulitis/Abscess, Eczema, Paget Disease b. Breast Parenchyma and Connective Tissue: Adenoma, Fibroadenoma, Lipoma, Fibroadenolipoma, Abscess c. Ductal system: Ductal Ectasia, Intraductal Papilloma, Ductal Carcinoma In-Situ, Invasive Ductal Carcinoma 5. Workup Algorithms 6.Conclusion

Green is the New Pink- Reducing the Carbon Footprint of Breast Imaging Practices

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Tom Soker, DO, Cleveland, OH (*Presenter*) Nothing to Disclose

TEACHING POINTS

Recognized as one of the greatest global health challenges of the 21st century, climate change poses substantial risks to the health and well-being of the world's population. With healthcare overall contributing up to 10% of greenhouse emissions in the United States, imaging has been identified as one of the major contributors. Therefore, breast radiologists should embrace environmentally friendly strategies to mitigate future health effects. Specific learning objectives for this exhibit include: 1) Understand the current state of climate change and how it relates to medicine.2) Review how breast imaging practices currently contribute to climate change.3) Describe steps that breast imaging practices can take now to reduce their carbon footprint.4) Describe initiatives that breast imaging can embrace to further accelerate adoption of "greener" practices and engage the broader community.

TABLE OF CONTENTS/OUTLINE

Using text, schematics and cases, we will discuss the current challenges that breast imaging practices face and focus on specific steps that practices can take to reduce their carbon footprint and become "greener". 1) Reduce waste -- Decrease glove use; incorporate biodegradable disinfectant wipes; adopt electronic data entry; temperature off-hour modulation; off-hour power down of equipment, lights and computers. 2) Reuse/Recycle - sterilization of equipment rather than disposal; recycle packaging3) Greener workflow - routine same day interpretations and biopsies; adoption of telehealth; electronic transfer of imaging to outside facilities

Serving the Underserved: A Safety-net Framework to Provide High-quality, Comprehensive and Culturally Competent Breast Imaging Care

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Awards
Identified for RadioGraphics
Magna Cum Laude

Participants
Berat Bersu Ozcan, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Groups that may experience breast cancer (BC) disparities include those defined by race/ethnicity, national origin, cultural beliefs, age, education, socioeconomic status, geographic location, disability, gender identity and sexual orientation. 2. BC screening increases early detection. Improving access supported through radiology-community partnerships using educational programs and community outreach can reduce disparities in BC mortality. 3. Women in safety-net systems who receive a BC diagnosis experience significant access related delays. Delays as short as 30 days affect BC outcomes. 4. Genetic factors contribute to higher mortality in Black and Hispanic women including significantly younger age at diagnosis and a higher incidence of aggressive hormone receptor-negative BC than White women. Black women with hormone-positive cancer have worse 21-gene assay scores and higher BC-specific mortality compared to Whites in all risk groups. 5. With the complexity of breast imaging, cancer care and safety-net systems, formal care coordination programs are essential to help women navigate through screening and diagnosis to treatment.

TABLE OF CONTENTS/OUTLINE

Define at-risk or vulnerable patient populations and the role of safety-net hospitals. Summarize population-based breast cancer screening programs and efforts in the United States. Review outcomes and health disparities for underrepresented minorities and underserved women in the United States. Discuss barriers to care and strategies to improve screening uptake and reduce breast cancer disparities.

A Comprehensive Look at Disparities in Breast Cancer in the Non-Hispanic Black, Hispanic, and Transgender Community and What Policy Changes Should be Considered

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Frances Perez, MD, Houston, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

The incidence of breast cancer are higher for non-Hispanic Blacks (NHB) younger than 45 years of age than for non-Hispanic Whites (NHW) in that same age group. Approximately 30% of all breast cancer diagnosed in NHB and Hispanic woman are diagnosed in woman under the age of 50. According to the Surveillance, Epidemiology, and End Results (SEER) data, minority women are 72% more likely to present to with invasive disease at time of diagnostic when compared to NHW. Minority women as 58% more likely to be diagnosed with advanced-stage breast cancer under the age of 50. Currently, the World Professional Association of Transgender Health lack guidelines on breast cancer screening. Furthermore, large databases in the U.S, like the SEER and National Cancer Database (NCDB) do not capture non-binary genders.

TABLE OF CONTENTS/OUTLINE

Through a case based multimodality approach we will exhibit several clinical cases that demonstrate the degree of advance invasive disease that minority women present with under the age of 50. We will discuss the breast cancer screening barriers that transgender individuals face, and the implications that this lack of resource has in this patient population. Throughout this exhibit, we will identify the most salient contributing factors including social determinants of health, breast cancer incidences within different ethnic and cultural groups, the difference in tumor biology and genomic that contribute to a higher mortality, as well as disparities in breast cancer treatments. To conclude, we will discuss strategies that may be implemented in order to mitigate these diversity related disparities.

Imaging Approach and Challenges to Breast Cancer in Young Patients

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Cara Connolly, MD, Nashville, TN (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review the diagnostic algorithm and appropriateness criteria for imaging studies in women less than age 40 and pregnant and lactating patients2. Review genetic syndromes that increase the risk of breast cancer in this age group3. Review the imaging appearance of pregnancy associated breast cancer and its mimics4. Present examples of malignancy highlighting the diagnostic dilemmas unique to this patient population.

TABLE OF CONTENTS/OUTLINE

Up to 7% of invasive breast cancers are diagnosed in patients less than 40 years old, with lower survival rates compared to older age groups, and poorer outcomes disproportionately affecting young black women. Because routine screening does not typically include women in this age group, most cancers (up to 80%) are diagnosed when patients self-present with a breast complaint or lump, often at advanced stage. Further, breast cancers in this age group tend to be hormone-receptor negative with aggressive features.Breast cancer in pregnant and lactating patients in this age group presents an additional diagnostic dilemma due to the physiologic changes occurring in the perinatal period, often leading to misdiagnosis and delay in treatment.Example topics to be covered, including but not limited to, the following:-Diagnostic Imaging Workflow-Patients Under 40-Pregnant/Lactating Patients-Predisposing Genetic Syndromes and Germline Mutations-Pregnancy Associated Breast Cancer and Mimics-DCIS-Invasive Mammary Carcinoma

Delayed Diagnosis in Medically Underserved Individuals: Identifying Granulomatous Mastitis

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Molly Downey, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Idiopathic granulomatous mastitis (IGM) is an uncommon inflammatory disease of the breast with nonspecific imaging findings which requires core needle biopsy for pathologic diagnosis.2. Though there is incomplete evidence on prevalence among racial or ethnic groups, many published studies suggest a Hispanic or non-Caucasian predominance. Premenopausal women with a history of lactation are most affected.3. Diagnosis of IGM is by histopathology findings of lobulocentric granulomatous inflammation, with the additional findings of suppurative lipogranulomas and Corynebacterium infection characteristic for cystic neutrophilic granulomatous mastitis (CNGM).4. Enhanced understanding by the radiologist of the symptoms, imaging appearance, and histopathologic features of IGM is essential to avoid late diagnosis or misdiagnosis, especially in medically underserved individuals.

TABLE OF CONTENTS/OUTLINE

1. Background of IGMa) Prevalence and demographicsb) Proposed pathophysiology of IGM and subtype CNGMc) Clinical presentationd) Diagnostic workupe) Histopathologic appearance of IGM and CNGM2. Case-based imaging review of IGM and mimicsa) IGM and CNGMb) Chronic abscessc) Infectious mastitisd) Diabetic mastopathye) Inflammatory breast cancer3. Treatment, disease course and prognosis4. Team-based approach for diagnosisa) Clinical presentation and referral to radiologyb) Communication with Pathologists

How to Reduce Missed Breast Cancer on Automated Breast Ultrasound

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Sung Kim, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Ultrasound (US) is more commonly used for adjunctive screening for dense breast. Automated breast ultrasound (ABUS) is also commonly employed with advantage of its production of reproducible, high-resolution images and its reduced dependency on human operators. Supplementing mammography with ABUS screening resulted in positive outcomes that were similar to those associated with handheld US (HHUS) screening, including increased detections of invasive cancer and reduced rates of interval cancer. However, due to the large number of images in the scan, reading a full ABUS examination can be lengthy and cancers may be easily overlooked. Possible causes for missing breast lesions on US include perception errors of isoechogenic and heterogeneous echoic lesions, deep lesions, subareolar lesions, poor positioning or technique, misinterpretation, and subtle features of malignancy. Also ABUS encountered artifacts. Here, we review possible causes of missed cancers on ABUS and discuss methods to reduce them.

TABLE OF CONTENTS/OUTLINE

1. Pros and cons of automated breast ultrasound(ABUS)2. ABUS as a supplemental screening tool 3. Causes of missed cancers on ABUS 1) Technique and artifacts 2) Errors in detection 3) Errors in interpretation 4) Tumor morphology 5) True negative cases4. Solutions to reduce missed cancer

Breast Fibromatosis in Very Young Women - As Ugly and Benign as Ever, but with a Different Presentation: A Series of 6 Cases

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Andres Vicentela, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Present our experience with breast fibromatosis (BF) in women younger than 25 years old which shows a different clinical and radiological pattern compared to the classic BF in older women (findings not yet described in actual literature).2. Give details of the imaging signs that characterize BF in mammography, ultrasound and MRI at this age range.3. Understand the natural history, prognosis and treatment options available

TABLE OF CONTENTS/OUTLINE

1. Introductiona. Definition of breast fibromatosis, demographics and typical clinical presentationb. Imaging findings on mammography, ultrasound and MRIc. Histopathology characteristics, natural history, prognosis and treatment options.2. Our experience in breast fibromatosis in women younger than 25 years old.a. Clinical presentationb. Imaging characteristics on different modalitiesc. Histopathologic findingsd. Surgical resolutione. Follow up3. Highlight the difference between classic BF and the pattern of this pathology in very young women.

From the Breast to the Bone: Multimodality Imaging Review of Osseous Metastases from Breast Cancer

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Daniel Morgan, DO, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Understand the epidemiology of osseous metastatic disease in breast cancer and the imaging modalities that evaluate for osseous metastases2. Discuss mimics, pitfalls, and pearls when assessing for osseous metastatic disease in breast cancer3. Know the imaging features of osseous metastases and their mimics to accurately diagnose metastatic disease and recognize when it is appropriate to biopsy an osseous lesion in question4. Examine current treatment options for osseous metastatic disease, the biology of the primary and metastatic lesions, and their treatment-related imaging features

TABLE OF CONTENTS/OUTLINE

Introduction:• Epidemiologic factors• Appropriate imaging evaluation to assess for osseous metastases• Most common locations for osseous metastasesOsseous Metastatic Disease as Initial Presentation:• Hip• Ribs• Spine compression fracture• Skull/skull baseDifferential Diagnosis:• Sternal metastasis vs hemangioma• Multiple sclerotic osseous metastases vs osteopoikilosis• Sacral metastasis vs insufficiency fractures or sacroiliitis• Enchondroma• Fibrous dysplasia• Aneurysmal bone cyst• Metastases from non-breast primary malignancyTreatment:• Local treatment• Systemic treatment• Treatment response/treatment related changes• Biology of breast cancer metastases

Rare Beauty in the Breast: Introduction to Unusual Breast Lesions

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Awards
Certificate of Merit

Participants
Hee Jung Choi, MD, Mexico City, Mexico (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review general features of unusual benign and malignant breast lesions.2. Analyze multimodality imaging findings of each lesion and correlate the findings with the underlying histopathologic and clinical findings.3. Recognize breast imaging abnormalities and describe key findings of each imaging method that lead to perform interventional procedures.4. Discuss the imaging follow-up and management of uncommon breast lesions.

TABLE OF CONTENTS/OUTLINE

1. Analyze macroscopic and microscopic normal anatomy of the breast and identify the origins of unusual lesions.2. Identification of uncommon breast lesions by category:a. Benign and malignant breast neoplasms: lymphomas, neuroendocrine tumors, sarcomas, mucinous, apocrine and inflammatory carcinomas, breast metastases, benign and malignant phyllodes tumor, hamartoma and tubular adenoma.b. Mastitis and complications: acute mastitis, chronic granulomatous mastitis and breast abscess formation.c. Miscellaneous: neurofibromatosis, arteriovenous malformation, silicone mastopathy and foreign modeling agent reactions.d. Breast pathology in men: primary breast cancers and metastases, gynecomastia and tricoepithelioma.3. Review the key points of each disease:a. Epidemiologyb. Clinical presentationc. Histopathologic characteristicsd. Multimodality imaging findingse. Illustration of the examples4. Discuss the management of atypical breast lesions including treatment and imaging-guided diagnostic biopsies with an assessment of proper technique in mammography, contrast-enhanced mammography, ultrasound and MRI.

I Am Not Who You Think I Am: Benign Mimics of Breast Malignancy with Multimodality and Pathologic Correlation

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Awards
Certificate of Merit

Participants
Toma Omofoye, MD, Houston, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

To demonstrate: 1. Common and uncommon benign entities may have imaging features typically associated with breast malignancy. 2. Imaging workup of "malignant-appearing but benign" breast lesions with multimodality appearance (Mammography, DBT, Ultrasound, Contrast-Enhanced Mammography, MRI, and/or Molecular Breast Imaging). The histopathologic correlation will be included where possible. 3. Appropriate broadening of differential diagnoses can aid in radiologic-pathologic correlation after percutaneous core biopsy.

TABLE OF CONTENTS/OUTLINE

Based on cases at a tertiary oncologic referral center, we review breast imaging lesions with suspicious imaging features mimicking primary breast malignancy. •Introduction • Inflammatory/Infectious: Idiopathic granulomatous mastitis, Diabetic/lymphocytic mastopathy, Infectious mastitis, Mondor disease • Systemic conditions: Amyloidosis, Sarcoidosis • Tumors: Granular cell tumor, Tubular adenoma, Nipple adenoma, Pseudoangiomatous stromal hyperplasia (PASH), Phyllodes, Papilloma, Fibromatosis, Neurofibroma • Proliferative lesions: Sclerosing adenosis, Complex sclerosing lesions, Stromal fibrosis • Anatomic findings: Sternalis muscle, Coopers ligament • Male breast: Gynecomastia, Hemangioma • Posttraumatic conditions: Fat necrosis, Foreign body reaction, Postsurgical scar • Conclusion

Contrast-enhanced Mammography Artifacts and Pitfalls - Tips and Tricks to Understand Them and to Avoid Image Misinterpretation

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Awards
Identified for RadioGraphics

Participants
Rosa M. Lorente-Ramos, MD, PhD, Madrid, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

-To learn technique of contrast enhanced mammography (CEM). -To review CEM image artifacts and physical considerations causing artifacts related to digital mammography and specific to CEM.- To become familiar with pitfalls and diagnostic limitations in CEM and tips and tricks to avoid interference in image interpretation.

TABLE OF CONTENTS/OUTLINE

We review the basics of CEM highlighting artifacts and factors that may interfere with image interpretation. We present: 1. Basics of CEM. 2. Technique 3. Image artifacts. - Digital mammography artifacts: patient positioning, hair, antiperspirant, patient motion. - Contrast-related: contrast splatter, timing of image acquisition after contrast administration, transient retention of contrast in vessels. -CEM specific: Air artifact. Improper positioning causing skin folds; Rim, halo or breast-within-a-breast artifact. Scattered radiation from differences in breast tissue thickness between chest wall end breast edge; Skin line artifact. Due to scattered radiation from non-uniform thickness of skin; Ripple artifact. Patient motion between HE and LE, sometimes respiratory movements or cardiac pulsations transmitted through the chest wall. 4. Pitfalls. Axillary tail and medial lesions near the chest wall not included in the imaging field- Background parenchymal enhancement. Negative Contrast Enhancement: imaging a cyst or coarse calcification. “Eclipse sign”. Hematoma caused by biopsy obscuring contrast enhancement of breast cancer. “Crescent sign” enhancement of the wall of a simple cyst. False negative lesions. DCIS, low-grade infiltrating cancer (lobar, mucinous). False positive lesions. Skin lesions, lymph nodes, benign enhancing lesions.

(Nearly) Ouchless! Ultrasound-Guided Core Nipple Biopsy is within a Breast Imager's Wheelhouse

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Sophia O'Brien, MD, Philadelphia, PA (*Presenter*) Nothing to Disclose

TEACHING POINTS

The nipple-areolar complex (NAC) is comprised of numerous cell types and can thus demonstrate a variety of benign and malignant pathologies (1). Due to its superficial location, the NAC is not amenable to stereotactic- or MR-guidance. Historically, suspicious nipple symptoms and imaging abnormalities have been evaluated via surgical biopsy or skin punch biopsy. More recently, however, there have been reports of ultrasound-guided core nipple biopsies (US-CNB) of suspicious nipple calcifications and nipple masses(Omofoye 2015, Burk 2021). This educational exhibit will describe how to perform US-CNB step-by-step, highlighting the unique approach and considerations for this specialized percutaneous procedure. The educational material will be supplemented with numerous images from US-CNB performed at our institution.1. Ultrasound-guided core nipple biopsy (US-CNB) can be performed safely for nearly all abnormalities seen on imaging2. Appropriate anesthesia eliminates patient discomfort during US-CNB3. US-CNB is adequate for diagnosis4. US-CNB is a feasible percutaneous sampling technique well within the breast imager’s wheelhouse, thus avoiding surgery while maintaining nipple integrity and aesthetics

TABLE OF CONTENTS/OUTLINE

1. Background: NAC physiology and pathology2. Historical Nipple Sampling Techniques3. US-CNB: Technique and special considerations4. Cases to Highlight the technical teaching points

Breast Cancer Epidemiology and Imaging Patterns in Underserved Women

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Scott Kleinpeter, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

African American women are 42% more likely to die from breast cancer, have a two-fold higher risk of triple negative breast cancer, and have a higher prevalence of BRCA1 and BRCA2 genetic mutations. African American women are 72% more likely to be diagnosed with invasive disease under age 50 and are 58% more likely to be diagnosed with advanced-stage disease under age 50. Factors affecting disparities in health outcomes include genetic risk factors, health literacy, income level, health insurance status, comorbidities, cultural beliefs, geographical location, and gender identity. Current screening recommendations for USPSTF are not race-based. Temporal differences in breast cancer peak diagnosis results in disproportionate effects of delayed screening on minority women due to younger average age at diagnosis (African American peak diagnosis in 40's vs. white peak diagnosis in 60's). Timely breast cancer risk assessment, genetic testing (if applicable), ACR recommended screening surveillance, and patient education are key components to improve breast cancer mortality. Increasing access to screening in vulnerable populations is a multidisciplinary task and radiologists play a key role in identifying imaging patterns and reaching patients at higher risk.

TABLE OF CONTENTS/OUTLINE

a. Review of published literature on disparities in breast cancer screening and mortality. b. Factors influencing breast cancer risk in vulnerable populations. c. Review of ACR screening recommendations for women at high risk. d. Case collection illustrating imaging patterns in our underserved population.

Breast Imaging and Intervention During Pregnancy and Lactation

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Awards
Certificate of Merit
Identified for RadioGraphics

Participants
Amy Fowler, MD, PhD, Madison, WI (*Presenter*) Author with royalties, RELX

TEACHING POINTS

Physiologic changes in the breast during pregnancy and lactation can pose diagnostic challenges on imaging and physical examination. Recognition of expected physiologic changes and classically benign entities on imaging is important to avoid unnecessary intervention. Identification of suspicious imaging features prompting biopsy recommendation are critical to avoid delays in diagnosis of pregnancy-associated breast cancer, the most common invasive cancer diagnosed during pregnancy. This presentation will focus on the appropriate breast imaging evaluation and management during pregnancy and lactation. The exhibit will also highlight ACR guidelines for breast cancer screening based on age and risk profile during pregnancy and lactation.

TABLE OF CONTENTS/OUTLINE

I. Hormonal and histologic changes within the breast II. Expected physiologic changes on breast imaging a. Mammographic appearance (lactation) b. Sonographic appearance (pregnancy/lactation) c. MRI appearance (lactation) III. Breast cancer screening guidelines during pregnancy/lactation IV. Imaging workup for clinical symptoms during pregnancy/lactation a. Palpable mass, nipple discharge, focal pain V. Biopsy considerations for this patient population a. Techniques b. Complications including milk fistula VI. Imaging features and management of common benign and malignant entities a. Benign i. Galactocele ii. Lactational changes iii. Lactating adenoma iv. Fibroadenoma with lactational changes v. Mastitis, abscess vi. Granulomatous mastitis vii. Reactive lymph nodes viii. Accessory axillary breast tissue b. Malignant i. Pregnancy-associated breast cancer

The Many Faces of Triple Negative Breast Cancer

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Awards
Cum Laude

Participants
Beatriz Adrada, MD, Houston, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Triple negative breast cancer (TNBC) is a heterogenous group of tumors defined by the absence of estrogen/progesterone receptors and lack of HER2 overexpression that confer a poor prognosis. • TNBCs are classified using six molecular subtypes according to their gene expression patterns: luminal androgen receptor, two mesenchymal-like subgroups (Mesenchymal M and MSL), immunomodulatory, and two basal-like subgroups (BL1, BL2). • Chemotherapy is the primary established systemic treatment for patients with TNBC. The treatment response differs depending on the molecular subtype, as well as the imaging features.

TABLE OF CONTENTS/OUTLINE

This educational exhibit will present a practical, multi-modality guide on approaching triple negative breast cancer (TNBC). A multi-modality review of the characteristic imaging features of TNBC will be presented, including features that may indicate whether a patient will respond to neoadjuvant chemotherapy. Imaging assessment of TNBC response to neoadjuvant chemotherapy will be detailed, including response patterns and imaging features that could indicate pathologic complete response (pCR). A clinical update on the recommended treatment of TNBC will be presented.

Performance Benchmarks and Management Guidelines for BI-RADS Category 3 Assessment on Breast MRI

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Awards
Identified for RadioGraphics

Participants
Onalisa Winblad, MD, Leawood, KS (*Presenter*) Nothing to Disclose

TEACHING POINTS

There is significant variability in radiologist usage of BI-RADS Category 3 assessment on breast MRI due to lack of robust data to guide management. No combination of MRI BI-RADS descriptors has proven to meet the "<2% but greater than 0% likelihood of malignancy" historical definition of BI-RADS Category 3, which is well supported in the literature for both mammography and ultrasound. This likely accounts for the substantial confusion and misuse of BI-RADS Category 3 assessment on breast MRI. Recent reports demonstrate increased utilization of breast MRI, partially due to improved access made possible by modern abbreviated protocols. Given the increasing volume of breast MRI, it is imperative that radiologists understand acceptable performance benchmarks and appropriate use of BI-RADS Category 3 on MRI to avoid unnecessary follow-up or missed cancer diagnosis.

TABLE OF CONTENTS/OUTLINE

I. Performance benchmarks for breast MRIII. Summary of ACR BI-RADS Atlas 2013 recommendations for assigning BI-RADS Category 3 on breast MRIIII. Review of scientific, peer-reviewed literatureA. Characteristics and outcomesB. Patient complianceC. False negativesIV. Guidelines for assigning BI-RADS Category 3 assessment on breast MRI supported by ACR BI-RADS Atlas and scientific literatureV. Ductography in the era of Breast MRI: Technique and Approach

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Eduardo Cordero Castro, MD, Memphis, TN (*Presenter*) Nothing to Disclose

TEACHING POINTS

SYNOPSIS: Nipple discharge is the third most common complaint seen in breast centers. Spontaneous discharge causes patient anxiety. The incidence of nipple discharge in breast cancer is 5-12%. Characteristics of suspicious discharge include unilateral, single duct, spontaneous, bloody, or clear color. Imaging modalities used to evaluate patients include mammogram, US, MRI and ductgraphy. TEACHING POINTS: The learner will: 1. Review the incidence, clinical presentation, and management of nipple discharge. 2. Know the imaging protocols used to evaluate nipple discharge based on ACR appropriateness criteria. 3. Identify intraductal lesions by imaging that warrant further evaluation.

TABLE OF CONTENTS/OUTLINE

Introduction, Clinical presentation, Causes of nipple discharge, Imaging assessment, Differential considerations of intraductal lesions, Role of mammogram and US, MRI findings, Challenges of localizing MRI findings in the subareolar region, Recommended management of nipple discharge without imaging correlation, Recommended management of positive ductogram findings, Pictorial review of ductogram findings, complications during ductogram (bubbles, duct perforation, extravasation, fissurization, lymphatic uptake, incomplete filling), and positive ductogram findings. Clinical management, Algorithm for imaging patients with nipple discharge, Conclusion

Yikes, A Red Breast! - A Breast Imager's Approach to Diagnosis and Management

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Joshua Weinstein, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Breast erythema is a common clinical complaint that can often cause substantial anxiety for patients. The differential is broad, ranging from benign dermatologic conditions, infectious or inflammatory processes, or neoplasms. In this exhibit, we will review this differential and present several exemplary cases of patients who initially presented with breast redness and were ultimately diagnosed with a variety of conditions, including inflammatory breast cancer, angiosarcoma, granulomatous mastitis, breast cellulitis, mastitis related to lactation, mastitis related to an infected foreign body, chronic mastitis, and radiation changes. By reviewing these entities, radiologists can familiarize themselves with the varying clinical presentations of the "red breast" to appropriately image and guide management.

TABLE OF CONTENTS/OUTLINE

1. Review the varied clinical presentations and differential diagnoses of breast erythema. 2. Discuss the role of multimodality imaging to diagnose the cause of breast redness. 3. Describe approach to management based on a combination of clinical and radiologic findings.

Current Status of Optoacoustic Breast Imaging and Future Trends in Clinical Application: Is It Ready for Prime Time?

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Berat Bersu Ozcan, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Optoacoustic imaging (OAI) uses non-ionizing, laser light to create thermoelastic expansion in tissues and detect resultant ultrasonic emission. Parametric maps of molecules (melanin, hemoglobin and lipids) that absorb light and scatter acoustic waves are fused with anatomic images, allowing scalable, relative real time molecular assessment in tissues.Since rapidly dividing cancer cells cause hypoxia and lead to tumor-driven angiogenesis, OAI can detect the presence and degree of relative hypoxia in cancers relative to normal tissue. This can increase the specificity of breast mass assessment without compromising the sensitivity compared to the grayscale US alone. Therefore, adjunctive use of OAI can decrease breast biopsies.Molecular subtypes of breast cancer show differing OAI features and levels of hypoxia. Luminal cancers have higher total external feature scores (9.3 vs 8.8; $p < .05$) and lower total internal feature scores (6.8 vs 7.7; $p < .001$) than triple negative and HER2+ cancers.OAI is a thriving field of research whose potential impact on the clinic can be high. However, larger multicenter cohort studies and clinical trials are needed to establish the trends observed and accelerate clinical translation.

TABLE OF CONTENTS/OUTLINE

Israel Rodriguez Suarez, MD, Mexico City, Mexico (*Presenter*) Nothing to Disclose

TEACHING POINTS

Whit this educational exhibit the radiologist with be able to: a. Know the normal architecture of the breast in mammography. b. Differentiate between a spiculated mass, architectural distortion and pseudo distortion of the breast parenchyma in mammography. c. Use the imaging tools with an orderly approach to confirm an architectural distortion in mammography: spot compression views, tomosynthesis. d. Identify and characterize an architectural distortion by ultrasound and breast MRI. e. Choose the better imaging biopsy method according to each particular circumstance. f. Learn the differential diagnoses of architectural distortion to make an appropriate radiology pathology correlation. g. Know the current management proposals after percutaneous tissue diagnosis, including the usefulness of breast MRI and contrast enhanced mammography.

TABLE OF CONTENTS/OUTLINE

a. Introduction b. Definition c. Normal architecture of the breast d. Imaging of architectural distortion: Mammography, Tomosynthesis, Ultrasonography, Breast MRI. e. Image guided biopsy methods f. Differential diagnoses: Radial Scar or complex sclerosing lesion, Invasive ductal carcinoma, Tubular carcinoma, Invasive lobular carcinoma, Ductal carcinoma in situ, Postsurgical scar, Fat necrosis, Sclerosing adenosis, Focal fibrosis, Diabetic mastopathy. g. Management considerations: Follow up, surgical excision, vacuum assisted excision. Problem solving breast MRI and contrast enhanced mammography.

Breast Cancer Recurrence: Multi-modality Imaging in Patients Undergoing Breast Conservation Treatment

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Awards
Certificate of Merit

Participants
Miral Patel, MD, Houston, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

Understanding the terminology and the different treatment options that are available for breast conservation can aid radiologists in detecting recurrence. The post treatment breast appearance will be reviewed as a baseline to understand what these changes look like. Furthermore, a review of the appearance of breast cancer recurrence in multiple cases amongst the various imaging modalities can aide radiologists in early detection.

TABLE OF CONTENTS/OUTLINE

This educational exhibit reviews: Breast conservation treatment (BCT): Definitions, surgical techniques and radiation treatmentExpected breast imaging findings after BCTMulti-modality case-based review of recurrence: Tips and tricks to distinguish expected post-operative and radiation changes from tumor recurrence on mammography, ultrasound, magnetic resonance imaging, molecular breast imaging, and contrast enhanced mammography

Sheep in Wolf's Clothing: The Many Faces of Granulomatous Mastitis

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Tais Batista, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purposes of this exhibit areTo review the epidemiology and risk factors for the development of granulomatous mastitis;To discuss the main clinical presentations of these mastitis and its subgroups;To review the main differential diagnoses, as well as overlapping and confounding imaging factors, mainly with carcinomas;To discuss the experience of our institution in a 20 years time period regarding clinical aspects and difficulties in its diagnosis;To describe its histopathological features;To discuss the importance of the multimodality imaging findings in association with histopathological aspects to achieve an accurate diagnosis;To discuss the role of imaging in monitoring the therapeutic response.

TABLE OF CONTENTS/OUTLINE

Epidemiology of granulomatous mastitis and factors related to its prevalence in underserved populations;Main clinical presentations;Typical multimodality imaging findings (MRI, ultrasound and mammography) from cases of our radiology department;Diagnostic challenges, main differentials, and key points for early suspicion of this pathology;Particularities of treatment and imaging response after therapy;Summary and Conclusion.

Male Nipple Discharge: Beyond the Basics

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Javier Azcona Saenz, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) To review the importance of male nipple discharge. 2) To expose the main causes of nipple discharge in men, both benign and malignant, together with their radiological manifestations. 3) To focus on the radiological findings of male breast carcinoma in all imaging techniques, including Digital Breast Tomosynthesis and Contrast-Enhanced Mammography.

TABLE OF CONTENTS/OUTLINE

1) Introduction. 2) Causes of male nipple discharge. 2.1) Benign: Gynecomastia, Mammary duct ectasia, Dermatitis, Papilloma, Abscess. 2.2) Malignant: Ductal carcinoma in situ, Invasive carcinoma, Papillary carcinoma of the breast, Others. 3) Characteristic imaging findings: Mammography/Tomosynthesis, Ultrasound, MRI, Contrast-enhanced mammography. 4) Conclusion. 5) References.

Pitfalls of Breast Imaging in the Emergency Room

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Neha Khemani, MD, Boston, MA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Clinical breast symptoms seen in the ED are most often related to infection and inflammation2. Breast abscess is typically treated as an urgent condition requiring intervention (ultrasound-guided drainage or incision and drainage)3. Rarely, inflammatory symptoms can indicate malignancy, thus diagnostic accuracy and close follow-up are necessary to avoid a missed cancer diagnosis4. The purpose of this exhibit is to review common breast diagnoses seen in the ED and potential pitfalls of performing breast imaging after hours

TABLE OF CONTENTS/OUTLINE

1. Clinical breast symptoms encountered in the ED and indications for imaging 2. US imaging features of mastitis and abscess 3. Common diagnoses seen on after-hours breast ultrasound 4. Pitfalls of after-hours breast imaging with case-based examples: a. Variable experience of ER radiologist and sonographer in breast imaging b. Technically suboptimal exams c. Unavailability of mammography to fully characterize a lesion if needed d. Unavailability of breast imaging support staff to arrange for biopsy or follow-up care e. High grade breast carcinomas mimicking abscess 5. Strategies to ensure appropriate care and follow-up for patients with urgent breast complaints

There is More to the Breast than Cancer - A Pictorial Case-based Quiz and Review of Rare Benign Breast Lesions

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Awards
Certificate of Merit

Participants
Ines Alonso Sanchez, MD, Bilbao, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Unusual breast benign lesions can be a diagnostic challenge for radiologists, and we should be familiar with their imaging and clinical features.- We must be aware of the limitations of the available breast imaging modalities and know that, in many cases, we need a biopsy to make the diagnosis. - A multidisciplinary approach to these entities is essential to manage them correctly.

TABLE OF CONTENTS/OUTLINE

Objective: This presentation aims to revise in quiz format a series of cases of unusual breast benign lesions and describe their imaging and clinical features to strengthen radiologists' skills to recognize and properly approach these conditions.Background:Most patients with breast pathology have concern that they have cancer. Therefore, in this area of practice, it is particularly important to be aware of potential diagnostic pitfalls to avoid emotional suffering to our patients. Findings:We present a series of cases of interesting benign breast lesions with different etiologies, such as inflammatory, vascular, tumors of neural origin, metabolic diseases, proliferative disorders and abnormal protein deposit diseases. Some of these lesions can mimic malignancies, and we should remember clinical features and patients' medical history may help lower the level of suspicion and the patients' emotional unease. Nevertheless, there are limitations of the imaging modalities, and in most cases, a biopsy is needed to make the diagnosis.Conclusions: Despite breast cancer being a common diagnosis; we may still face diagnostic challenges with unusual benign breast lesions which may sometimes mimic cancer.

Pregnancy Associated Breast Cancer - What Is It and How Not to Miss It

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Haydee Ojeda-Fournier, MD, San Diego, CA (*Presenter*) Research Consultant, View Point Medical, Inc;Stock options, CureMetrix, Inc

TEACHING POINTS

Pregnancy-associated breast cancer (PABC) is defined as breast cancer diagnosed during pregnancy, within one year post-partum, or during lactation. Although rare, this disease has a more aggressive course and is often associated with a poorer prognosis. Several studies have found evidence of a delayed diagnosis in pregnant women. But lack of awareness among women and physicians is also believed to play a crucial role in delayed diagnosis. However, the majority of breast lesions during pregnancy and lactation are benign. Still, approximately 20% of breast masses prove to be malignant. By the end of this educational exhibit, the learner will: 1. Review the incidence, clinical presentation, and management of pregnancy-associated breast cancer. 2. Know the imaging protocols recommended to evaluate the pregnant or nursing patient based on ACR appropriateness criteria. 3. Identify lesions that should be biopsied during pregnancy and lactation.

TABLE OF CONTENTS/OUTLINE

Introduction; Define pregnancy-associated breast cancer; Clinical presentation of breast cancer during pregnancy or lactation; Review imaging recommendations for pregnant women vs. lactating women; Differential considerations of breast lesions during pregnancy; Mammogram and US findings of pregnant and lactating women; MRI considerations in the pregnant and lactating patient; Recommended management of breast masses without imaging correlation in pregnant and lactating patients; Recommended management of positive imaging findings; Pictorial review of PABC; Clinical management and outcomes of PABC; Algorithm for imaging pregnant and lactating patients so as not to miss a PABC; Conclusion.

Unusual Infections of the Breast - A Pictorial Review

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Sabine Popp, MD, Vienna, Austria (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Unusual infectious diseases of the breast are uncommon but important for radiologists to be aware of, as they may be indistinguishable from breast cancer and are treatable. • Consider Tuberculosis in patients with a persistent abscess or atypical mass, especially if from a high Tuberculosis incidence country. • In patients with incidental breast calcification detected at screening from endemic countries, consider Schistosomiasis (amorphous, segmental distribution), Dracunculiasis (coarse linear, serpiginous) or chronic Filariasis (serpiginous, tubular and coiled). • Recurrent breast abscesses can be caused by rare organisms such as Actinomyces and Corynebacterium, therefore it is important to send a fine needle aspirate for microbiology to direct treatment. • In patients with nipple eczema, consider Lyme disease as a differential to Paget's disease, especially if regional lymphadenopathy is present.

TABLE OF CONTENTS/OUTLINE

• Learning objectives • Introduction • Organisms - for each of the below: epidemiology, clinical presentation, imaging features (mammography, ultrasound, MRI), diagnosis and treatment o Bacteria • Tuberculosis • Other mycobacteria • Actinomycosis • Lyme disease • Brucella • Cryptococcus o Parasites • Schistosomiasis • Filariasis • Cysticercosis • Hydatid cyst • Dracunculiasis • Other rare organisms • Differential diagnoses • Summary table • Conclusion

You've Got a Friend in Me: How Radiologists Can Help Patients and Multidisciplinary Colleagues in the Diagnosis and Management of Fibroepithelial Lesions

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Awards
Cum Laude
Identified for RadioGraphics

Participants
Jody C. Hayes, BS, MD, Dallas, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. When a fibroepithelial lesion (FEL) is suspected, biopsy specimens should include the margin of the mass for a more definitive diagnosis on histopathology.2. For large masses, biopsy specimens should be taken from different areas to ensure adequate sampling as phyllodes tumors (PT) often demonstrate tumor heterogeneity with fibroadenoma-like regions.3. Surgical resection is indicated for rapidly growing biopsy-proven benign FEL or borderline PT whose growth rate exceeds 20% in largest dimension in a six-month interval.4. Staging chest CT should be performed for malignant PT due to their propensity for hematogenous spread with the lungs being the most common site.5. Frequent follow-up imaging with breast ultrasound or chest CTs may be indicated for locally aggressive malignant PT to identify early recurrence.

TABLE OF CONTENTS/OUTLINE

1. Define the spectrum of fibroepithelial lesions (FEL) with pertinent incidence and demographic information.2. Review imaging and pathologic findings for the spectrum of FEL.3. Discuss steps radiologists can take to help in the diagnosis and management of FEL with an emphasis on radiological, pathological, and clinical concordance.4. Define the role of imaging for the post-biopsy or post-surgical FEL patient.

Difficult MRI-Guided, Vacuum-Assisted Core Biopsies of the Breast: Tips and Tricks

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Wenhui Zhou, MD,PhD, Menlo Park, CA (*Presenter*) Nothing to Disclose

TEACHING POINTS

Magnetic resonance imaging (MRI) is the most sensitive method to detect abnormalities of the breast. Due to its limited specificity, MRI-detected lesions often require tissue sampling to establish the diagnosis. Breast imagers should be cognizant of patient, anatomical, and technical factors that predispose to a potentially difficult MRI-guided breast biopsy. The purpose of this educational exhibit is to demonstrate techniques and tools to safely and successfully biopsy breast lesions. Completing this educational exhibit will allow participants to 1) Appreciate patient, anatomical and technical factors that predispose to difficult MRI-guided breast biopsies 2) Recognize pre-procedural planning, techniques and tools to optimize lesion visualization, targeting and sampling 3) Implement this knowledge during MRI-guided biopsies to minimize MR cancellations, unsafe procedures and nondiagnostic samples.

TABLE OF CONTENTS/OUTLINE

This case-based exhibit will demonstrate procedural planning and tips for successful difficult-to-perform MRI-guided breast biopsies including: 1) for bilateral lesions, perform simultaneous biopsy using lateral to medial approaches bilaterally 2) for posterolateral lesions, apply arm-down and arm-up maneuvers to facilitate safe access route 3) for lesions offset from the obturator tip, re-target with a second introducer and directionally sample if necessary 4) for posteromedial lesions, utilize a tangential, oblique approach to allow adequate access to the target 5) for vague or obscured lesions, consider the use of a T2-weight or DWI sequence to improve visualization. We will summarize take-home points to facilitate transfer of knowledge.

How To Report a Contrast Enhanced Mammography (CEM) Study - An Illustrated and Practical Review of BIRADS 2022 Supplement for CEM

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Awards
Certificate of Merit

Participants
Rosa M. Lorente-Ramos, MD, PhD, Madrid, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

-To review contrast enhanced mammography (CEM) basics and technique. -To analyze steps in interpretation of a CEM study. - To describe CEM lexicon and report structure. - To become familiar with normal and abnormal imaging findings in CEM providing correlation with imaging (mammogram, US, MR) and pathology.

TABLE OF CONTENTS/OUTLINE

We review the basics and state-of-the-art of CEM highlighting adequate interpretation of the exam according to the latest BIRADS recommendations for CEM reporting. 1. Basics of CEM. 2. Technique: Image acquisition: Low-energy images (LE) like a digital mammogram. Recombined images (substraction of the low-energy from the high-energy images) (RC). Signal from background breast tissue is cancelled highlighting areas of iodine uptake. 3. Image interpretation steps. -LE. Morphological assessment -RC. Functional assessment. 4. BIRADS lexicon for CEM. - General overview: breast density (LE), Background parenchymal enhancement (RC). - LE findings. - RC findings: mass, non-mass enhancement, enhancing asymmetry, lesion conspicuity. - Lesion description on both: morphology, internal enhancement pattern, extent of enhancement, lesion conspicuity. 5. Report structure. Indication, technique, previous exams, breast composition, findings description, assessment, management.

Staging Breast Cancer: A Case Based Review

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Aline Guimaraes, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Staging Breast Cancer nowadays is not only about defining the anatomic extent of disease. The most recent edition of the AJCC (American Joint Committee on Cancer), the eighth edition, now incorporate prognostic biomarkers to more accurately predict clinical outcomes and treatment response on an individual basis. In this didactic exhibit, we will discuss each aspect of Breast Cancer Staging in a case-based review. It is imperative to know the potential and limitations of each imaging modality (mammography, ultrasound and magnetic resonance imaging) and what to look for and describe on the exams. It is also important to comprehend other relevant aspects such as tumor grade, ER (estrogen receptor), PR (progesterone receptor) and HER2 (human epidermal growth factor receptor 2) status. Fundamentally understanding these aspects will provide more prognostic information than the anatomic stage alone and contribute to improve medical practice.

TABLE OF CONTENTS/OUTLINE

1. Mental Map with the following information 1. AJCC Staging System (application criteria) 2. Breast Cancer Stage 2.1. Clinical Staging 2.2. Pathologic Staging 2.3. Posttherapy staging after Neoadjuvant Chemotherapy, Radiation Therapy and Hormonal Therapy 2.4. Nodal staging 2.5. Clinical staging of metastasis 2.6. Stage migration 2. Relevant aspects to consider in breast imaging when staging breast cancer 3. Case based review of aspects mentioned above

Review of Breast Anatomy - Normal Variants and Expected Physiologic Changes in the Breast

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Hubert Huang, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

The female breast follows a predictable sequence of development. The mature adult breast is subject to a variety of physiologic effects during embryologic development, aging and hormonal changes. As a result, the female breast demonstrates a wide spectrum of normal appearance, some of which are congenital variants such as polythelia and polymastia, while others are acquired or physiologic but still considered normal, such as changes in density during pregnancy, lactation, and those typically seen with aging.Recognizing normal physiologic changes and anatomic variants can present a challenge to the radiologist. However, it is imperative to do so since the optimal modalities and views for evaluating these entities will differentiate them from potentially suspicious findings. We will present and discuss normal female breast development and anatomy, congenital and physiologic variants, and ways to avoid misdiagnoses.

TABLE OF CONTENTS/OUTLINE

1. We will review normal anatomy of the breast.2. We will discuss expected normal female breast developmental changes3. We will discuss variations in breast pattern and density in different physiologic conditions such as pregnancy and breastfeeding, as well as aging.4. We will discuss normal and congenital breast anatomic variants.5. We will review common and avoidable pitfalls of imaging variants that may mimic malignancy.

Be Prepared - It's Not Because It's Rare that It Won't Happen! What the Radiologist Needs to Know About Angiosarcoma of the Breast

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Amanda Tavares, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Angiosarcoma represents less 1% of soft tissue sarcomas and is a very aggressive tumor with a poor prognosis. It depicts approximately 0.04% of malignant breast neoplasms and 8% of breast sarcomas, presenting with rapid and silent growth. The radiological findings are nonspecific, but the radiologist must be aware of the imaging features to avoid misdiagnosis. Primary breast angiosarcoma has an unknown etiology, affects younger patients (30-40 years) and usually presents as a palpable mass. Bilateral involvement is often associated with pregnancy or contralateral metastatic spread. There are no pathognomonic findings on conventional imaging. Nonetheless, on magnetic resonance imaging, the persistent enhancement in the dynamic study with late concentric filling may suggest this diagnosis. There may be areas of necrosis, hemorrhage and infarction within the tumor.Secondary breast angiosarcoma often occurs after local radiation therapy, with a mean latency period of 5-6 years. Besides that, chronic breast lymphedema and genetic predisposition are also risk factors. It commonly occurs in older patients (over 60 years) and may manifest as a palpable mass or just thickening and discoloration of the skin. Imaging findings are similar to the primary form.

TABLE OF CONTENTS/OUTLINE

General aspects of angiosarcoma of the breast: Etiology, Prognosis, Diagnosis; Primary Breast Angiosarcoma; Secondary Breast Angiosarcoma; SummaryPlease visit the Learning Center to also view this presentation in hardcopy format.

Mimicking of an Abscess or Hematoma: Complex Mass Presentations of Triple Negative Breast Cancers

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Awards
Identified for RadioGraphics

Participants
Dogan Polat, MD, Dallas, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

Triple negative breast cancers are 16% of breast cancers in non African American women and 27% of breast cancers in African American women, often associated with BRCA 1 mutation and aggressive features, and poor prognostic outcomeCarefully assess margins of anechoic masses or complex masses which favor abscesses or hematoma, particularly if there is no overlying skin thickening or secondary signs of infectionTriple negative breast cancers can have posterior acoustic enhancement sonographically (therefore look for irregular margins, wall thickening, solid components)Triple negative breast cancers can present as a round hyperdense mass mammographically, therefore caution if one notes a round (not oval) mass, especially hyperdense (on attachment)Triple negative breast cancer can mimic other benign processes such as fibroadenoma, therefore careful margin assessment is importantCarefully review the axilla mammographically on patients with a history of breast cancer, using comparison to prior studies

TABLE OF CONTENTS/OUTLINE

1. Review mammographic and sonographic appearances of triple negative breast cancers and define triple negative breast cancer.2. Recognize indistinct margins, thick walls, and lack of skin thickening in anechoic appearing irregular triple negative malignant masses and identify findings which raise concern for malignancy in these cases.3. Review margin assessment of masses on ultrasound, particularly the sides of margins in a partially circumscribed mass.4. Review metastatic patterns of triple negative breast cancer and mammographic assessment of the axilla in follow up of patients with history of breast cancer.

Fat-Containing Breast Masses: A Multi-Modality Review and Management Considerations

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Alison Gegios, MD, Whitefish Bay, WI (*Presenter*) Nothing to Disclose

TEACHING POINTS

Fat-containing entities in the breast constitute a variety of predominantly benign conditions and rarely malignant neoplasms. This presentation will focus on the recognition and diagnosis of fat-containing breast lesions to facilitate appropriate management and avoid unnecessary work-up and interventions. It will also discuss scenarios in which biopsy of fat-containing breast masses may be warranted.

TABLE OF CONTENTS/OUTLINE

1. Imaging features consistent with fat on multiple modalities: • MRI• Ultrasound• Mammogram2. Imaging features and management of common and uncommon benign fat-containing lesions • Lipoma• Hamartoma• Fat necrosis• Oil cyst• Intramammary lymph node • Galactocele • Steatocystoma multiplex• Angiolipoma• Hibernoma

Much More Than Lymph Nodes! A Practical Approach to Axillary Imaging

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Carolina Kiebert, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

To show axillary anatomy in the different imaging modalities.To review the indications for axillary imaging.To present clinical and imaging findings of axillary masses according to the anatomical location of the lesion. To familiarize general radiologists with these findings in order to expedite accurate diagnosis.To discuss percutaneous interventions in axillary masses and the appropriate patient management depending on the diagnosis.

TABLE OF CONTENTS/OUTLINE

Radiologists are familiar with the evaluation of the axillary levels and staging of breast cancer, but we rarely discuss other pathologies that can be located in the axilla other than breast cancer lymph-node metastasis.Understanding the anatomy of the axilla can help radiologists to identify accurate diagnoses according to the anatomical location of the lesion once percutaneous biopsy may be inappropriate.This educational exhibit will compile anatomy and different findings with illustrative images from our radiology department.Knowledge of the clinical and imaging findings may improve detection of the differential diagnosis for such lesions, improving appropriate patient management.

PET Mammography from Indications to Interpretation

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Rasha M. Kamal, MD, Cairo, Egypt (*Presenter*) Nothing to Disclose

TEACHING POINTS

PEM is a specialized application of PET to visualize breast tissue metabolic changes with a much higher spatial resolution thus allowing the visualization of smaller tumor cells. In this educational exhibit the technique of PEM will be discussed in detail. The qualitative and quantitative (the PUV and Lesion to background activity) assessment of PEM images will be illustrated. The pattern of radiotracer uptake in the different histopathology and molecular subtype will be also discussed. The main indications of PEM include: - Enhanced lesion characterization. - Preoperative staging - Response to NAC therapy monitoring. - Post breast cancer surveillance. - Screening for women with dense breasts. - Metastases of unknown primary The advantages and disadvantages of PEM will be highlighted to allow the sound practice of this novel imaging modality.

TABLE OF CONTENTS/OUTLINE

Evolving Role of Nuclear Medicine and Molecular Imaging in Breast Cancer - A Case-based Multi-modality Pictorial Review with Teaching Pearls

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Awards
Certificate of Merit

Participants
Fatima Elahi, DO, Lincolnwood, IL (*Presenter*) Nothing to Disclose

TEACHING POINTS

Breast cancer continues to be the most common cause of malignancy for women in the United States with current imaging standards centered around mammography, CT, ultrasound, and MRI. Nuclear Medicine (NM) and molecular imaging (MI) including PET CT have now become essential tools in the diagnosis and management of patients with Breast cancer. Often times the findings have resulted in decisions that change the course of treatment in about 24-48% of patients. We provide a case-based multimodality pictorial review of the evolving role of Nuclear Medicine and Molecular Imaging in the management of patients with breast cancer.

TABLE OF CONTENTS/OUTLINE

Our educational exhibit aims to 1) Highlight the impact of various NM and MI tracers and modalities such as Lymphoscitigraphy including Mannose-binding Tc-99m Tilmanocept for targeted lymphatic mapping and Sentinal node localization, mammo-scintigraphy (Molecular breast imaging (MBI)), MDP Bone scan, F-18 Sodium Fluoride PET CT, F-18 FDG PET CT, Hormonal receptor imaging (such as F18-Fluoroestradiol PET CT); Radionuclide ventriculogram (MUGA Scan); Palliative treatment of painful bone metastasis using strontium-89/samarium 153; PET CT guided interventions and biopsy; 2) Case-based discussions highlighting the indications, sensitivity, and specificity rates and limitations of these studies; 3) Discuss challenging cases including axillary lymphadenopathy secondary to COVID 19 vaccination, FLARE phenomenon, somatostatin receptor-expressing breast cancers on Ga-68 DOTATATE PET CT, evaluating Post-operative breast for local recurrence and male breast cancer; 4) utility of texture analysis.

Overcoming Burnout Towards Brilliance in Breast Radiologists after COVID-19

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Jay R. Parikh, MD, West University Place, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

Burnout has been recognized by the World Health Organization as a syndrome conceptualized as resulting from chronic workplace stress that has not been successfully managed. A previous study showed that there is a high prevalence of burnout across practicing clinical breast radiologists. Physician wellness (well-being) is defined by quality of life, which includes the absence of ill-being and the presence of positive physical, mental, social and integrated well-being.The unprecedented COVID-19 pandemic has brought challenges to the practicing breast radiologist. Initially, there was a reduced workload volume early in the pandemic which then rebounded into high volumes of breast screening and diagnostic studies. Coupled with his volume were challenges of maintaining family work-life balance and regular social isolation, compounding the negative work environment. The COVID-related work environment has previously been described as unsustainable for radiologists. Surveys of clinically practicing radiologists during COVID-19 have demonstrated a high rate of burnout and increased subjective stress by breast radiologists.Strategies that may be deployed post COVID-19 to mitigate radiologist burnout include implementing a culture in the workplace that prioritizes and promotes wellness, addressing operational inefficiencies and increasing resiliency of practicing breast radiologist.

TABLE OF CONTENTS/OUTLINE

Understanding Fibroepithelial Lesions of the Breast - A Primer for Residents and Fellows

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Tara Retson, MD, PhD, San Diego, CA (*Presenter*) Research Consultant, CureMetrix, Inc;Stock options, CureMetrix, Inc

TEACHING POINTS

SYNOPSIS: Fibroepithelial lesions (FEL) of the breast are biphasic neoplasms with variable amounts of stromal and epithelial proliferation. They range from benign fibroadenomas to malignant phyllodes tumors, fibroadenomas being the most diagnosed breast lesion on core needle biopsy. Other FEL includes cellular and juvenile fibroadenoma and benign, borderline, and malignant phyllodes. TEACHING POINTS: By the end of this educational exhibit, the learner will: 1. Review the incidence, clinical presentation, and management of FEL of the breast. 2. Know the imaging protocols used to evaluate FEL, including mammogram, US, and MRI, based on age and ACR appropriateness criteria. 3. Understand the classification of FEL based on the WHO classification. 4. Identify FEL that is locally aggressive and warrants further surgical management.

TABLE OF CONTENTS/OUTLINE

Introduction; Clinical presentation of FEL; Differential considerations of FEL include differentiation of malignant phyllodes from metaplastic breast cancer and sarcoma; Understanding the grading of phyllodes tumors; Imaging assessment of FEL; Role of mammogram and US in the evaluation of FEL; MRI findings of FELs; Recommended clinical management of FEL; A pictorial review of FEL; Algorithm for imaging patients with suspected FEL; Conclusion

Superficial Lesions of the Breast - What Residents Need To Know?

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Karen Caro, PhD, La Plata, Argentina (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To illustrate imaging features of superficial lesions of the breast. 2.Characteristics of superficial lesions of the breast. 3. Distinguish superficial lesions of the breast versus parenchymal lesions.

TABLE OF CONTENTS/OUTLINE

The thin epidermis is composed of several cell layers and contains no blood or lymphatic vessels and may not be distinguished from the dermis at imaging . However, within the dermis reside hair follicles, sebaceous glands, sweat glands, nerve endings, and bloodand lymph vessels. The hypodermis typically contains nerves, lymphatics, larger blood vessels, and fatty tissue. The importance of delimiting the layers of the skin and its components help us to identify the lesions that can originate at this level For example, the presence of a tract—which represents extension of the hair follicle from the dermis up through the epidermis—that extends from the lesion to the epidermal skin surface also confirms a dermal origin and is indicative of a sebaceous or epidermal inclusion cyst. It is so that in the present work we will analyze different images and their characteristics that will help us to define their probable origin. Conclusions The importance of identifying skin lesions and differentiating them from those located in the mammary parenchyma helps us to define BI-RADS, since many times we can perform controls or even biopsies, which can be avoided, through an adequate study of their location through image and do not forget the importance of a physical examination and questioning

Radial Sclerosing Lesions: An Updated Approach to Multidisciplinary Management

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Allison Aripoli, MD, Kansas City, KS (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Radial sclerosis lesions (RSL) are benign lesions that often present with suspicious imaging features such as mammographic architectural distortion.2. RSL are often seen in association with other benign or high-risk proliferative lesions.3. Newer literature demonstrates lower malignancy upgrade rates of RSL, especially RSL without associated atypia, resulting in shifting management paradigm toward de-escalation of routine surgical excision of RSL.4. Upgrade of a "pure" RSL to atypia at surgical excision is an additional important consideration to provide relevant information for appropriate individual risk stratification and risk reduction.5. Radiology-pathology concordance and multidisciplinary review are essential for treatment decisions. Institutional review of upgrade rates can help define management.

TABLE OF CONTENTS/OUTLINE

1. Introductiona. Imaging appearance of RSL and overlap with malignancyb. Pathology reviewc. Association with other benign or high-risk proliferative lesions2. Historical shifts in understanding and managing RSLa. Older studies and upgrade ratesb. Newer studies and upgrade ratesc. American Society of Breast Surgeons Consensus Guidelines for management of RSLd. Factors related to risk of upgradee. Lack of consensus for management among contemporary studies3. Radiology-pathology concordance and multidisciplinary conference reviewa. De-escalation of routine surgical excision of concordant RSL based on contemporary published and institutional datab. Long-term follow-up and management

Pregnancy Associated Breast Cancer: Diagnostic Approach and Imaging Pitfalls

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Charisma DeSai, MD, Dallas, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Definition: Pregnancy associated breast cancer (PABC) is cancer that develops during pregnancy, breastfeeding, or in the first year postpartum.2. Understand the epidemiology and pathophysiology of PABC.3. Review the risk factors associated with PABC and reasons for diagnostic delay.4. Review the expected breast imaging findings in the pregnant and lactating breast.5. Review the imaging and clinical findings of PABC.6. Review of ACR appropriateness criteria of breast screening and staging during pregnancy and lactation.7. Create a diagnostic approach to symptomatic breast during pregnancy and lactation.8. Explore the different surgical and systemic management options for PABC with respect to fetal and maternal safety.

TABLE OF CONTENTS/OUTLINE

1. Risk factors associated with PABC2. Expected imaging findings of the breast during pregnancy and lactation.3. Review of ACR appropriateness criteria of breast imaging and staging during pregnancy and lactation based on patient age and lifetime risk for breast cancer.4. Diagnostic approach to symptomatic breast during pregnancy and lactation5. Review of radiological findings in:- PABC.- Benign conditions associated with pregnancy and lactation: Breast abscess, lactational mastitis.- How to differentiate lactational mastitis and inflammatory breast cancer.6. Role of imaging guided biopsy.7 Treatment options for PABC including surgical management

Abdominopelvic Manifestations of Metastatic Breast Cancer and Treatment-Related Complications

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Awards
Certificate of Merit

Participants
Annie Rhee, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Common sites of breast cancer metastases on abdominal/pelvic imaging are the liver and bones. Less common sites are the peritoneum, gastrointestinal tract, ovary, and retroperitoneum.2. Invasive lobular carcinoma metastases are often infiltrative, which can be difficult to evaluate in earlier stages of disease on imaging. Recognizing complications such as small bowel strictures or obstruction in patients with a history of breast cancer can prompt further investigation.3. Treatment related complications such as pseudocirrhosis, endometrial hyperplasia, and post-surgical changes should also be recognized in these patients.

TABLE OF CONTENTS/OUTLINE

2022 New Trends in Breast Density - What Should We Know?

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Awards
Identified for RadioGraphics

Participants
Flavia Sarquis, MD, Buenos Aires, Argentina (*Presenter*) Nothing to Disclose

TEACHING POINTS

Digital mammography (DM) is the most commonly utilized modality in asymptomatic women in the preventative setting, with continuous advancement in breast density measurement. Women with dense breasts have an increased risk of developing breast cancer. Breast density is the most common factor that may prompt women to seek additional screening beyond mammography to increase the likelihood of early cancer detection. After reading this educational exhibit the radiologist will know: Women with dense breasts have clear downsides of breast cancer screening facing an increased risk of late diagnosis. Early diagnosis and treatment are vital.The pandemic has taught us what needs to be done.The realistic limitations of mammography in dense breasts and the benefits of additional screening.Stratification of breast cancer prevention and screening requires mammographic density measures predictive of cancer.New recommendations of breast cancer screening in women with extremely dense breasts.

TABLE OF CONTENTS/OUTLINE

Breast density is a biomarker of objectively measurable characteristics that indicate an underlying physiological or pathological process.Current evidence on breast cancer screening in women with dense breasts.Added detection with supplemental screening.Principles of shared decision-making.Illustrative-based cases.Conclusions

T2 Hyperintense Breast Lesions on MRI - A Pictorial Guide for Residents

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Maria Jose Chico, Buenos Aires, Argentina (*Presenter*) Nothing to Disclose

TEACHING POINTS

In this educational exhibit, through simple iconographic examples, we will teach residents how to identify and recognize the different benign and malignant lesions that may present with high signal intensity in T2 weighted images in breast magnetic resonance.Teaching points:1)To describe benign and malignant lesions which are hyperintense in T2 weighted images in breast MRI.2)To Illustrate with several examples adding helpful suggestions that will enable residents to make the correct diagnosis.

TABLE OF CONTENTS/OUTLINE

1-Introduction2-MRI technique3-Benign lesions: Cysts, Seroma, Hematoma, Intramammary lymph nodes, Apocrine cystic metaplasia, Cavernous hemangioma, Myxoid fibroadenoma, Benign Phyllodes tumor4- Malignant lesions: Mucinous/colloid carcinoma, Metaplastic carcinoma, Papillary carcinoma, Triple Negative Basal Like carcinoma, Necrotic/hemorrhagic invasive ductal carcinoma, Malignant Phyllodes, Metastases5- Conclusions

Demystifying Lesions and Artifacts - A Pocket Guide for Automated Breast Ultrasound

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Fernanda P. Pereira, MD, PhD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

#Automated breast ultrasound (ABUS) is a valuable screening tool for breast cancer designed to overcome some of the issues regarding hand-held breast ultrasound (HHBUS), such as operator dependency, less experience with breast exams, low sensitivity and reproducibility. #ABUS main indication is to use as an adjunct method to mammography for screening asymptomatic women with dense breasts. #Correct identification of lesions and artifacts produced by ABUS is essential for the best evaluation, as acquisition is done by a technician and interpretation is performed by the specialist without knowing potential pitfalls during the exam.

TABLE OF CONTENTS/OUTLINE

1- Concept of automated breast ultrasound (ABUS); 2- ABUS: atlas of benign lesions; 3- ABUS: atlas of malignant lesions; 4- Main differences between ABUS and hand-held breast ultrasound (HHBUS); 5- ABUS: pitfalls and artifacts; 6- ABUS: other applications and final considerations.

Male Breast Cancer - Spectrum of Imaging Appearance and Current Imaging Recommendations

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Soudabeh Fazeli Dehkordy, MD,MPH, San Diego, CA (*Presenter*) Nothing to Disclose

TEACHING POINTS

Synopsis: Imaging of the male breast is typical in routine radiology breast imaging. Most of the findings in male patients are benign, gynecomastia being by far the most common imaging diagnosis. Male breast cancer is uncommon, accounting for less than 1% of all breast cancers. The incidence of breast cancer in men is low, but it increases with age, and the 5-year survival rates are similar, stage by stage, between men and women. Men tend to present with more advanced stages of the disease. When axillary metastatic disease is present, the prognosis is worst and negatively affects the treatment. We reviewed 32 male breast cancer imaging studies from our teaching files, including mammograms, US, and MRI, to catalog the imaging presentations of breast cancer. TEACHING POINTS By the end of this educational exhibit, the learner will: 1. Review the incidence, clinical presentation, and management of male breast cancer. 2. Know the imaging protocols recommended to evaluate males based on ACR appropriateness criteria. 3. Identify the multimodality imaging appearance of malignant male breast lesions.

TABLE OF CONTENTS/OUTLINE

Introduction; Incidence and risk factor for male breast cancer; Clinical presentation of male breast cancer; Review of imaging recommendations for male breast; Differential considerations; Mammographic and US findings; MRI indications and appearance of male breast cancer; Recommended management of male breast cancers; Algorithm for imaging male patients with breast cancer and for follow up into survivorship; Conclusion.

The Imaging of Ductal Carcinoma in SITU - Where It Is and Where It's Going

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Daniela Cunha, MD, Coralville, IA (*Presenter*) Nothing to Disclose

TEACHING POINTS

Ductal carcinoma in situ (DCIS) is the most prevalent form of breast cancer. It can be pathologically classified via the nuclear grade (low, intermediate, high) or by the architectural subtype (comedo, cribriform, micropapillary, solid, or mixed) with increased preference for nuclear grading. Approximately 75% of DCIS present with calcifications and mammography remains its main detection modality; ultrasound (US) may show a mass within a dilated duct but is nonspecific. Magnetic resonance imaging (MRI) however, is proving to be a useful supplementary tool in evaluating the extent of DCIS for surgical planning as well as a prognostic tool for predicting potential for upgrade from DCIS to invasive ductal carcinoma (IDC). While DCIS most commonly presents as a non-mass enhancement, IDC more often presents as an enhancing mass. With advancements in MRI, there is the potential to confidently differentiate low-grade from high-grade DCIS in the future.

TABLE OF CONTENTS/OUTLINE

DCIS - Pathology classification - Mammography findings - Ultrasound and MRI findings - Increasing importance of MRI in DCIS prognosis and treatment

Idiopathic Granulomatous Mastitis and Its Differential Diagnoses - A Practical Guide for Its Identification

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Jorge Hernandez Espinoza, MD, CABA, Argentina (*Presenter*) Nothing to Disclose

TEACHING POINTS

Mention the main pathophysiological, demographic and clinical aspects of Idiopathic Granulomatous Mastitis (IGM). Recognize the most common findings of IGM in mammography, ultrasound and magnetic resonance imaging, and their main differential diagnoses.

TABLE OF CONTENTS/OUTLINE

Idiopathic granulomatous mastitis is a rare chronic inflammatory condition of the breast of unknown aetiology. It is commonly seen in women of childbearing age, but also in perimenopausal women. The diagnostic challenge is that it can mimic many conditions, including malignancy.The most common clinical presentation is a breast lump in any quadrant, or diffuse involvement of the breast. It manifests with axillary pain, erythema, edema or lymphadenopathy. Other chronic inflammatory pathologies considered in the differential diagnosis include plasma cell mastitis, tuberculosis, histoplasmosis, inflammatory carcinoma and Wegener's granulomatosis. Histopathology provides a definitive diagnosis, thus avoiding unnecessary mastectomies.On mammography it is common to find focal asymmetry, a darkened or irregularly shaped mass. On ultrasound, a large irregular hypoechoic parallel mass with tubular extensions is prominent. A hypoechoic and parallel circumscribed mass, or a mass with angular, lobulated, or indistinct margins, associated or not with posterior acoustic shadowing, has been reported. With color Doppler we can visualize the hypervascularization of the tissue surrounding the lesion. IGM in magnetic resonance imaging can be observed as a non-regional or segmental mass enhancement, or a mass enhancement with heterogeneous enhancement, lesions with enhancement of their margins or the presence of microabscesses.

Don't Forget the Pec! A Case-based Review of Pectoral Muscle Abnormalities on Breast Imaging

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Awards
Certificate of Merit

Participants
Almir Bitencourt, MD, PhD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

- To show a multimodal review of the pectoral muscles in breast imaging.- To teach breast radiologists to evaluate the pectoral muscles, mainly in mammograms, MRI and ultrasound. - To illustrate some conditions focusing in abnormalities showed by interesting cases of our institutions. - To give hints on how not to obliviate the evaluation of these muscles in breast exams.

TABLE OF CONTENTS/OUTLINE

1. A description of pectoral muscles anatomy and functions. 2. An introduction of pectoral muscles imaging aspects in breast exams (mammograms, ultrasound and MRI). 3. To show the importance of pectoral evaluation to avoid misdiagnosis of lesions in this area.4. Interesting cases of pectoral muscles conditions: - Normal variations (Pectoralis quartus muscle, sternalis muscle, Langer's axillary arch and Poland Syndrome); - Benign conditions (Subpectoral lipoma, pectoral muscle abscess, pectoral hemangioma and ossifying myositis); - Malignant conditions (sarcoma and lymphoma of the pectoral muscles).5. Most common pitfalls in pectoral muscles evaluation.

The Wave of Silicone Explanation: What To Expect in Breast Images?

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Amanda Tavares, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

In the past years, the term breast implant illness has becoming strong, especially with the power of social media, to describe physical and psychological symptoms possibly related to breast implants. The silicone is also discussed as a causal factor of ASIA syndrome (Autoimmune Syndrome Induced by Adjuvants). The exact mechanism whereby the implant can induce such diseases is uncertain, and there is still not enough scientific evidence to justify the diagnosis. Many patients report partial or complete resolution of symptoms after the silicone explant and plastic surgery societies already report an increase in the performance of such procedures. Regardless of the surgical technique used for implant removal and capsulectomy, steatonecrosis is a frequent complication. Volume restoration after explantation by autologous fat grafting will also present as oil cysts on imaging. Anterior capsulectomy is an alternative when the posterior capsule is adhered to the chest wall, increasing the risk of pneumothorax, in these cases the base of the capsule left intact can be seen in subsequent images. Breast and axillary residual free silicone may be a result of extracapsular rupture or even gel-bleeding of the removed implants, presenting as hyperdense nodules on mammography, dirty posterior acoustic shadowing on ultrasound, without significant enhancement on MRI. Correlation with previous exams and clinical history is essential to confirm the diagnosis and avoid unnecessary procedures.

Epithelial Lesions of The Breast: Solving Questions You Didn't Know You Have

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Sofia Maksoud, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Benign epithelial and fibroepithelial lesions of the breast are responsible for about 80% of palpable lesions. Histologically, they are classified as fibrocystic changes and associated conditions. Fibrocystic changes are classified as non-proliferative, including cysts, or proliferative, including papillomas, radial scar, sclerosing adenoma, and ductal or lobular hyperplasia. Associate conditions include fibroadenomas and their variants, sclerosing lesions, papilloma and proliferative disease. Mammography, ultrasound and magnetic resonance imaging of the breasts may be helpful in differentiating benign from suspicious lesions in the breast. The objective of this study is to review, through a case-based presentation, the imaging aspect in these lesions, and the role of imaging in differing these conditions from suspicious malign findings.

TABLE OF CONTENTS/OUTLINE

Evaluation of cases of benign epithelial and fibroepithelial lesions of the breast from the digital file of our institution, demonstrating their presentation in different imaging modalities, including ultrasonography, mammography and magnetic resonance imaging, correlating them with the histopathological findings. The work also includes discussion of the topic based on the literature, teaching points and the references.

Pearls and Pitfalls of Automated Breast Ultrasound Interpretation

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Awards
Certificate of Merit
Identified for RadioGraphics

Participants
Ashley Huppe, MD, Kansas City, KS (*Presenter*) Nothing to Disclose

TEACHING POINTS

There is increasing utilization of automated ultrasound (AUS) for breast cancer supplemental screening, in part due to increased breast density awareness and federal legislation requiring breast density notification. Given the unique nature of volumetric acquisition on AUS, many radiologists are unfamiliar with identification of breast cancer in the multiplanar format. Additionally, the wide format transducer can generate artifacts which can result in false positives. After this presentation, participants will be able to:· Discuss rationale and guidelines for supplemental screening and review currently available supplemental screening options· Describe benefits and limitations of AUS for breast cancer screening· Compare outcomes data between automated and handheld breast ultrasound screening· Learn the pearls of proper AUS interpretation including unique imaging features and knobology to increase cancer detection and avoid unnecessary callbacks· Review AUS challenges and pitfalls including recognition of artifacts and identification of benign findings

TABLE OF CONTENTS/OUTLINE

1. Introduction: supplemental screeninga. Rationaleb. Options2. AUS for breast cancer screeninga. Overviewi. Indications and limitationsii. Compare and contrast with handheld screeningiii. Techniqueb. Imaging interpretationi. Pearls1. Correlation with current and prior mammography and ultrasound images2. Visualization of lesions in at least two data sets3. Use of unique AUS tools for lesion characterization, including coronal/sagittal planes and software rotationii. Pitfalls1. Acquisition challenges2. Compression and shadowing artifact3. Identification of benign findings3. Conclusion

Axillary Region - Which Road? Beyond Lymph Node

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Isabela Ferracini, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The most common metastatic presentation of breast cancer is enlarged lymph nodes with atypical characteristics in the axillary region, which is why this location must be carefully examined in all breast imaging exams. However, due to the various anatomical structures in this region, many conditions may also present with pain and/or palpable nodulation and are not distinguishable in physical examination, including pathologies that involve neural and vascular structures, subcutaneous tissue, bone and muscular structures, among others. In this way, a thorough evaluation of the armpits through the various modalities of imaging exams is an important tool in elucidating the diagnosis and determining the best treatment. The aim of this study is to address lymph node and non-lymph node axillary radiological findings and their main characteristics.

TABLE OF CONTENTS/OUTLINE

Cases containing mammography, ultrasound, computed tomography and magnetic resonance images and 3D reconstruction, obtained from the digital file of our institution, were used. We approach a didact review of some of the most common conditions involving the axillary region, their imaging aspects and how to differentiate them in imaging exams, including teaching points and references.

All That Glitters is Not Gold - Malignant Breast Lesions with Hyperintense Signal on T2

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Awards
Certificate of Merit

Participants
Marina Santos, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purposes of this exhibit are:1- To review our institution´s cases of malignant lesions presenting with high signal intensity on MRI T2-weighted images;2- To describe the aspects of these lesions: morphology, T1 and T2 WI features, enhancement pattern and diagnostic clues;3- To evaluate the histological factors that could causes high signal intensity on T2 WI on each lesion such as cystic component, mucinous or loose myxoid stroma, edema, hemorrhagic or necrotic changes;4- To explore the imaging aspects differentiating malignant from benign lesions with high T2 signal such as inflammatory, cystic or infectious etiologies.

TABLE OF CONTENTS/OUTLINE

1- Review cases of malignant lesions presenting with hyperintense signal on T2 WI from our radiology department, documented in multiple methods (MRI, ultrasound and mammography), such as:mucinous carcinoma;metaplastic carcinoma;papillary carcinoma;invasive ductal carcinoma;fibroepithelial tumours.2- Correlation of these cases with histopathological findings justifying the high signal on T2: extensive necrosis; cystic content; mucinous stroma.3- Review some benign differential diagnosis such as inflammatory, cystic and infectious etiologies.

An Overview of Breast Plasmacytoma With Radiologic-Pathologic Correlation: Key Considerations and Major Features

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Pooya Torkian, MD, Minneapolis, MN (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this project is to describe radiological and pathological findings of breast plasmacytoma in patients with multiple myeloma. We explore multimodality imaging results of mammography, ultrasound, positron emission tomography/computed tomography (PET/CT), CT, magnetic resonance imaging, and tomosynthesis. We provide a pictorial review of the most notable imaging findings of breast plasmacytoma for the awareness of radiologists and clinicians to improve the standard of care.

TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Overview of breast plasmacytoma in multiple myeloma 3. A pictorial review of imaging findings of breast plasmacytoma in mammography, ultrasound, PET/CT, CT, MRI, and tomosynthesis 4. Strengths and weaknesses of the different modalities 5. Discuss the future application of multimodality imaging in breast plasmacytomaPlease visit the Learning Center to also view this presentation in hardcopy format.

Breast Masses in Children and Adolescents: What Do We Need To Know?

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Thais Kuwazuru, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The aim of this exhibition is to:1. Review the current concepts about breast disorders and normal breast development and its variations in children and adolescents.2. Discuss the differences between each imaging modality.3. Describe the rates of breast lesions in this age group in our hospital.4. Highlight the importance of this knowledge to guide the proper management of these patients

TABLE OF CONTENTS/OUTLINE

1. INTRODUCTIONa. Epidemiological profile of breast lesions in this population.b. Recommendations for screening, control and surveillance.2. IMAGING INTERPRETATIONa. Imaging techniques acquisition and protocols.b. Use of ACR BI-RADS and structured reporting of the findings on this population.3. STATISTICAL DATAa. Breast imaging data from in women under the age of 19 from our institution between January 2020 and April 2021.b. Correlation with literature data.4. INTERACTIVE CASE-BASED DIDATICSa. Sample cases to illustrate and solidify the concepts about the main findings in this population.5. FUTURE DIRECTIONS AND TAKE HOME MESSAGES

WANTED: Complete Radiological Response to Neoadjuvant Chemotherapy

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Natalia Lima, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purposes of this exhibit are:1. To review the main aspects related to neoadjuvant chemotherapy response, including complete response, partial response, stable disease, and progressive disease.2. To evaluate the pathologic response (including pCR and residual cancer burden score - RCB) and correlate to radiologic response in some cases from our institution;3. To emphasize the importance of looking for residual lesions in all sequences of MRI, including T2, in order to avoid missing lesions;4. To show, based on interesting cases from our breast radiology group, different kinds of response to neoadjuvant chemotherapy in a variety of histological and imunohistochemical subtypes;

TABLE OF CONTENTS/OUTLINE

· Radiological response patterns to neoadjuvante chemotherapy:- Complete, partial (concentric and with peripheral lesions), stability, progression of injury· Pathologic response using RCB and its parameters: - Primary tumor dimension - Cellularity - Size of the largest nodal metastasis - Number of positive lymphonodes· Concepts of radiologic and pathologic complete response· Teaching cases showing the challenging aspects based on imaging findings and correlate with clinical and pathological findings in different scenarios, such as: - Ductal carcinoma with tumoral seeding - Mucinous carcinoma mimicking a parcial response - Inflammatory carcinoma with complete response - Complete response of calcifications on a lobular carcinoma

Challenges in the Interpretation of Breast Findings In The Emergency Setting: Recommendations for the Non-Breast Imager

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Awards
Identified for RadioGraphics

Participants
Steven Lee, MD, Bellaire, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

Emergencies in Breast Imaging are uncommon. Although infectious conditions such as mastitis and breast abscess are commonly encountered in the emergency department, many additional entities may be recognized, including breast cancer. Most emergency departments do not have mammography units, making the evaluation of these patients incomplete and this emphasizes the importance of ultrasound technique and imaging interpretation in this setting. This is especially important when images are reviewed remotely by the Breast Imaging team. With this exhibit, the learner will be exposed to imaging examples of breast emergencies in the ER/inpatient setting, technique tips and tricks for the ultrasound evaluation of the breast in the ER, relevant patient and imaging information that breast imagers require for remote interpretation, and appropriate recommendation, treatment, and follow up for patients in the emergency setting.

TABLE OF CONTENTS/OUTLINE

Introduction. Breast imaging emergencies in the ED and Breast Imaging Department: Mastitis, Abscess, Trauma/Hematoma, Fluid Collection, Masses, Pseudoaneurysm, Vasovagal Reaction. Ultrasound technique tips and tricks for evaluation in the ED. Algorithm for recommendations and follow up of breast imaging emergencies. Conclusion and Summary

LCIS and It's Variants - Review of What We Know

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Joe Khoury, DO, MBA, Manhasset, NY (*Presenter*) Nothing to Disclose

TEACHING POINTS

Classic LCIS and atypical lobular hyperplasia (ALH) both demonstrate noninvasive proliferation of lobular cells within the TDLU. LCIS involves >50% of acini while ALH involves <50%. LCIS is a risk factor and non obligate precursor of invasive breast carcinoma. RR for development of breast cancer in those with LCIS is 9-10x the general population. Subsequent breast cancer can occur in either breast and includes DCIS and invasive cancers. Most often, LCIS is an incidental finding on pathology. However, there are known multimodality imaging findings associated with LCIS. Pure LCIS includes classic (cLCIS) and non classic types (including pLCIS). Management of LCIS continues to evolve. Upgrade rate to ILC ranges from 0-67% depending upon the study and histology Given low upgrade rates for cLCIS (0-5%), excision diagnosed on needle biopsy with concordant imaging and when no other lesions requiring excision are present is no longer routine. Cases are often recommended for follow up with PE, mammography and often MRI. Because of the higher upgrade rate of pLCIS and biologic behavior similar to DCIS, guidelines for pLCIS and LCIS with discordant imaging is surgical excision with negative margins, without RT. In studies, chemoprevention with Tamoxifen or an aromatase inhibitor in patients with LCIS resulted in a significant reduction in 10 year cancer risk. Bilateral prophylactic mastectomy has been considered an option by some but current guidelines prefer risk reducing endocrine agents.

Rare But Mighty Breast Cancers: What the Future Holds

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
William Hiatt, MS, BS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review the current World Health Organization classification system of epithelial breast cancers 2. Introduce the recent expansion in molecular understandings of breast cancer, emphasizing six rarer epithelial tumor subtypes 3. Highlight the recent proposal of a new schema that unifies histological-molecular breast tumor analyses 4. Understand how these findings impact our patients' care via knowledge of known tumor behavior 5. Provide radiologic profiles of two tumor subtypes, metaplastic carcinoma and micropapillary carcinoma

TABLE OF CONTENTS/OUTLINE

1. How are we currently classifying tumors? 1a. Histological analysis vs. molecular classification 2. How are we expanding our molecular understanding of rarer breast tumors? 2a. Proposal of a novel schema that blends tumor histology biomarker data into a more unified classification system 3. Newly expanded molecular profiles of several rarer tumor types that further explain tumor morphology behavior 4. Imaging and Overview Profile: Metaplastic Carcinoma 5. Imaging and Overview Profile: Micropapillary Carcinoma 6. Future directions in rare breast radiology 7. References

Paradigms for Papilloma Management

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Sherwin Chiu, MD,MPH, (*Presenter*) Nothing to Disclose

TEACHING POINTS

(1) Understand the clinical significance of intraductal papillomas.(2) Recognize the imaging findings associated with intraductal papillomas.(3) Review the current paradigm for management of intraductal papillomas.

TABLE OF CONTENTS/OUTLINE

(1) Significance: (a) Classically presents as unilateral nipple discharge. (b) Nipple discharge or dilated ducts warrant further evaluation. (c) Intraductal papillomas with atypia or discordance should be excised, however asymptomatic papillomas without suspicious imaging or atypia may be appropriate for surveillance.(2) Imaging Findings: (a) On mammography, papillomas may present as ductal dilatation and occasionally as a circumscribed mass with associated calcifications. (b) Ultrasound findings typically show a vascularized circumscribed mass with associated ductal dilatation. (c) On MRI, papillomas appear as an enhancing intraductal mass with associated ductal dilatation.(3) Management: (a) Historically, treatment required excisional biopsy or lumpectomy to exclude atypia or underlying malignancy. (b) Ultrasound guided vacuum removal of papillomas has shown promise in removing lesions without the need for surgery. (c) Clinical follow-up with ultrasound is becoming more favored for small, solitary papillomas without atypia due to low rates of malignancy upgrading.

Imaging the Male Breast: Gynecomastia, Male Breast Cancer, and Beyond

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Awards
Identified for RadioGraphics
Magna Cum Laude

Participants
Heather Duke, MD, Chicago, IL (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Male breast complaints have increased in recent years, and it is therefore increasingly important for radiologists to be knowledgeable about imaging features of pathology that can occur in the male breast.2. Male breast pathology most commonly includes gynecomastia, and the chief differential consideration is male breast cancer. However, there are a number of other entities that can occur in the male breast of which radiologists should be aware, in order to perform adequate concordance of biopsy results with imaging findings.3. Male breast pathology can involve structures of the subcutaneous tissues, including skin, fat, muscle, blood vessels, lymphatics, and nerves. Alternatively, pathology can originate from ductal and stromal breast tissue in males, with lobular pathology being extremely rare given lack of progesterone-dependent lobular proliferation in males.

TABLE OF CONTENTS/OUTLINE

1. Male Breast Development and Important Differences from the Female Breast2. Gynecomastia (most common pathology) versus Male Breast Cancer3. Less Common But Important Male Breast Pathology and Imaging Findingsa. Skin - sebaceous/epidermal inclusion cystsb. Fat - lipoma and fat necrosisc. Muscle/Fascia - Desmoid tumord. Blood vessels/vascular tumors - vascular malformations, hemangioma, angiolipomae. Nerves - schwannomas, granular cell tumorsf. Lymphatics - intramammary lymph nodeg. Ductal tissue - intraductal papillomah. Stromal tissue - PASH, myofibroblastomai. Other - subareolar abscess, diabetic mastopathy

Breast Implant Associated Anaplastic Large Cell Lymphoma (BIA-ALCL): A Multimodality Imaging Review

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Kanchan Phalak, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) Breast Implant Associated Anaplastic Large Cell Lymphoma (BIA-ALCL) manifests as a late-onset effusion or mass in patients with exposure to textured implants. 2) Breast ultrasonography is an appropriate test for initial evaluation of presenting clinical symptoms such as swelling and pain. 3) Cytologic or histologic analysis is important to distinguish BIA-ALCL from other pathologies. 4) Imaging modalities such as MRI, CT and PET can help characterize BIA-ALCL.

TABLE OF CONTENTS/OUTLINE

1) Clinical Issuesa. Etiology and Pathophysiology b. Presentation c. Demographics d. Natural History and Prognosis e. Treatment 2) Pathology a. General Features b. Staging, Grading, and Classification 3) Imaging Findings a. General Features b. Mammogram c. Ultrasound d. MRI e. PET-CT f. CT g. Image-Guided Biopsy 4) Differential Diagnosis 5) Pictorial review of cases

The ABC of PABC (Pregnancy Associated Breast Cancer): Playing Hide and Seek with the Radiologist

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Martha Espitia Lopez, MD, Mexico, Mexico (*Presenter*) Nothing to Disclose

TEACHING POINTS

Know the definition of breast cancer associated with pregnancy. Know the physiological changes during pregnancy and lactation. Recognize normal and suspicious breast images in pregnancy and lactation.

TABLE OF CONTENTS/OUTLINE

Breast cancer is one of the most common cancers in pregnant and non-pregnant women. Pregnancy is considered a risk factor for the development of breast cancer. Breast cancer is now the most common malignancy diagnosed during pregnancy, with an estimated incidence of 1 in 3000 pregnancies in the United States. Gestational or pregnancy-associated breast cancer is defined as breast cancer that is diagnosed during pregnancy, in the first year postpartum, or at any time during lactation, but is often a late finding due to expected physiological changes in breast cancer. Ultrasound is the imaging study of choice due to its high sensitivity and in the absence of radiation. The tumors found in these patients are usually high grade with high cell proliferation, as well as negative hormone receptors. Histologically, the most frequent type is infiltrating ductal carcinoma, found in up to 80% of cases. The treatment for these patients should not be extended beyond the first trimester, after the twelfth week of gestation it is possible to start chemotherapy during the second and third trimesters, likewise mastectomy can be performed during this period. Radiotherapy is contraindicated during pregnancy, it can be performed after birth. Endocrine treatment begins after delivery.

Interesting Axillary Pathology in Breast Imaging

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Joseph Hoang, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Axillary masses and lesions are occasionally discovered during routine screening and diagnostic breast imaging. In many instances, the masses are found to be lymph nodes, however, other uncommon pathologic entities exists in the axilla that are often overlooked. - Review axillary mass work up and clinical presentation of patients with palpable abnormality- Discuss abnormal, benign lymph node pathologies- Review primary breast malignancy in the axilla- Elucidate on several etiologies of axillary masses outside of breast tissue origin- Present interesting cases of axillary masses within the each category as delineated above

TABLE OF CONTENTS/OUTLINE

- Review typical patient presentation, pertinent imaging modalities and workup - Discuss criteria for benign lymph node morphology- Present and discuss abnormal lymph nodes with benign pathology- Present cases of primary breast cancers in the axilla not involved by a lymph node- Discuss and review etiologies of masses in the axilla outside of breast origin include: Vascular/Lymphatic origin, Dermal and fatty, Neurogenic origin, Musculoskeletal origin-Present cases of differing etiologies as included above.

The Dark Star of the Breast: A Confusing Lesion

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Magaly Henriquez Urrea, MD, MSc, Mexico City, Mexico (*Presenter*) Nothing to Disclose

TEACHING POINTS

A radial scar (RS) is a pathologic process that consists of a central fibroelastic core with distorted and entrapped ducts, and peripherally, with ducts and lobules distributed in a radiating appearance. In addition, the fibroelastic core is contracted, with a "pulled inward" appearance.A specific pathologic characteristic of an RS is the intact myoepithelial cell layer. This is an important feature to differentiate it from an invasive carcinoma.The most typical appearance on digital mammography (DM) and on digital breast tomosynthesis (DBT) of a RS is the architectural distortion, with thin and long radiating spicules against a background of radiolucent fat, creating a "dark star" appearance.The most common ultrasound finding is a hypoechoic, irregular mass with indistinct margins. Posterior acoustic shadowing can also be seen.

TABLE OF CONTENTS/OUTLINE

Redefining Needle Targeting Error in the Prone and Upright Stereotactic Breast Biopsy: Recognition and Problem Solving

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Janice Thai, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. The traditional approach for the teaching of stereotactic breast biopsy regarding needle targeting error hinges on established convention that is largely based on the 2D prone stereotactic biopsy system (retired model). Recent advances in technology introduced an updated prone and upright systems, for which the convention of needle targeting error do not apply. This exhibit highlights the differences between the old and new prone models, as well as the upright model, pertaining to needle targeting error.
2. To illustrate the X, Y, and Z axes used to determine needle targeting error and approaches to overcome targeting errors.

TABLE OF CONTENTS/OUTLINE

• Review of the prone and upright stereotactic systems, regarding the X, Y, and Z axes and their directionality used in defining needle targeting error • Review of how needle error targeting is defined in both the prone and upright systems, and solutions to overcome needle targeting errors • Case review of real-life scenarios and problem solving

Male Breast Lesions - That We Need to Know

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Samira Nader, MD, Buenos Aires, Argentina (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Recognize the radiological characteristics of the lesion that help to identify it as benign or malignant according to the BIRADS classification.- Describe the entities that most frequently affect the male breast, especially cancer and gynecomastia as its main simulator.

TABLE OF CONTENTS/OUTLINE

TABLE OF CONTENTS. Normal characteristics of the breast in men and their differences with respect to women. Types of most common lesions in the male breast. Generalities, incidence and risk factors of male breast cancer. Ultrasound and mammographic findings of male breast lesions; types of tumors found and their histopathological correlation. RESUME. Male breast cancer represents 1% of all breast cancers, and less than 1% of all cancers in men. Screening in men is not justified, which partly explains the later diagnosis. 90% of breast cancers in men express estrogen receptors and 80%, progesterone receptors. Biomarkers such as HER2 and Ki67 are taken as a reference to characterize breast tumors as in women. On mammography, a lobulated, irregular, high-density retroareolar mass with poorly defined or spiculated margins can be observed. Calcifications are present in 13-30% of cases, the pleomorphic type being rarer. Ultrasound may reveal a solid, hypoechoic, retroareolar mass with angled, spiculated or microlubulated margins, or a complex cystic mass. Taking a sample for histopathological study is generally performed under ultrasound guidance. Histologically, the vast majority are invasive ductal carcinoma (85-90%) or ductal carcinoma in situ.

Case-based Review of Contrast-enhanced Mammograms: False Positives and False Negatives with Strategies to Improve Cancer Detection and Staging

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Awards
Identified for RadioGraphics
Cum Laude

Participants
Molly Carnahan, MD, Phoenix, AZ (*Presenter*) Nothing to Disclose

TEACHING POINTS

Similar to contrast-enhanced-MRI, false-positive (FP) CEM can occur with benign processes False-negative (FN) can occur in marked BPE, minimal lesional enhancement or lesions off the field-of-view Prompt repositioning should be performed to overcome FNs with positioning or medically located lesions Low-grade cancers may not enhance. Decision to pursue imaging guided biopsy should be based on the most suspicious imaging feature

TABLE OF CONTENTS/OUTLINE

CEM background Principles behind cancer detection New BIRADS lexicon Defining breast imaging modalities' diagnostic performance: true positive, true negative, FP and FN Understand causes of CEM FP and FN to improve these measures FP on CEM FP pathology (benign lesions) on CEM: case-based review How CEM FP compare to CE-MRI and MBI FN on CEM FN CEM (missed cancers): case-based review of errors Inadequate visualization of lesion or extent of disease Poor patient positioning Lesion off the FOV (ex. medial or posterior lesions) or abuts breast implants BPE obscuring lesion Lack of lesion enhancement No IV contrast on imaging (ex. missed bolus or contrast extravasation) Negative enhancement artifact obscuring cancer (ex. hematoma) Cancers with no enhancement Errors of characterization: lesions with seemingly benign features How CEM FN compare to CE-MRI and MBI Pearls for the reader Real time interpretations: prompt re-positioning if needed Suspicious calcifications, architectural distortion or masses should be biopsied regardless of CEM enhancement Technical limitations of CEM for posterior lesions and evaluating lymphadenopathy should be considered when staging new cancers

Interactive Case-Based Review of new Contrast-Enhanced Mammography BI-RADS Lexicon

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Participants
Lyndia Moravia, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Teaching Points: CEM BI-RADS has recently been published to guide CEM interpretation. Including both low-energy (LE) and recombined imaging (RC) findings in exam interpretation is critical. The standard mammography lexicon is used to describe the LE findings. A new lexicon was developed to describe RC findings that is similar to the breast MRI but with changes specific to CEM. Key differences include the absence of the term 'focus', the addition of the term 'enhancing asymmetry', removal of the mass internal enhancement characteristic of dark internal septations, and removal of the non-mass enhancement internal enhancement pattern of clustered ring. In addition, when LE findings are seen with enhancement, internal enhancement pattern, lesion conspicuity compared to background parenchymal enhancement, and extent of enhancement relative to LE finding should be described.

TABLE OF CONTENTS/OUTLINE

1. Review the main elements of the new CEM BI-RADS. 2. Summarize the differences between MRI lexicon and CEM recombined imaging lexicon. 3. Emphasize the key points of the new CEM BI-RADS through an interactive case-based review.

All Roads Lead to Rome: Multi-modality Imaging of Benign and Malignant Pathologies of the Nipple Areolar Complex

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Awards
Identified for RadioGraphics
Certificate of Merit

Participants
Mary Guirguis, MD, Houston, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

• *The normal imaging appearance of the nipple and the nipple areolar complex can be variable. • *Understanding the normal spectrum of imaging appearance across different breast imaging modalities is essential for the radiologist. • *Meticulously assessing the nipple areolar complex across different modalities while understanding its spectrum of imaging appearance allows for accurate identification of pathology in this region. • *Different benign and malignant pathological entities can be seen within the nipple and nipple areolar complex. • *Correlation with the patient's symptoms is key to understanding the imaging findings and clinical management.

TABLE OF CONTENTS/OUTLINE

This educational exhibit will present a practical guide on how to approach the nipple areolar complex across different imaging modalities. Through a multi-modality case-based approach, we will present the spectrum of the normal appearance of the nipple and the nipple areolar complex. Imaging of benign and malignant pathologies that affect the nipple and nipple areolar complex will be presented across the different breast imaging and cross-sectional modalities. Tips, pitfalls, and practical approaches will be highlighted through a case-based multi-modality approach.

Multimodality Imaging of Postmastectomy Breast Reconstruction Techniques and Complications

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - BR

Awards
Identified for RadioGraphics
Certificate of Merit

Participants
Faezeh Sodagari, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Breast reconstruction is commonly performed to restore chest symmetry in women undergoing mastectomy as part of breast cancer treatment or prophylaxis. Various reconstruction techniques are currently available including implant-based reconstruction or microvascular autologous reconstruction using pedicled or free flap techniques. The goal of this exhibit is to review surgical techniques used in postmastectomy reconstruction, imaging appearance of postoperative changes and complications, and imaging guidelines for the evaluation of the reconstructed breast.

TABLE OF CONTENTS/OUTLINE

1) Introduction: a) Surgical techniques used in breast reconstruction methods, including implant placement, pedicled flaps, free flaps and preoperative planning; b) Indications, contraindications, advantages, and disadvantages of different postmastectomy breast reconstruction techniques; c) Techniques for the reconstruction of the nipple-areolar complex 2) Normal postsurgical findings and their evolution in time such as edema and soft tissue emphysema 3) Imaging findings of early and late complications such as hemorrhage, infection, flap ischemia, fat necrosis, implant rupture 4) Implications of reconstruction method for radiation treatment planning 5) Multimodality evaluation of reconstructed breast for new or recurrent cancer including guidelines and controversies of MRI surveillance of reconstructed breast 6) Clinical outcomes and summary

CAEE-10 Mitral Annular Disjunction in Cardiac MR: What to Know and What to Look For

Awards
Identified for RadioGraphics

Participants
Jose Batista Araujo Filho, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) Mitral Annular Disjunction (MAD) definition and its association with Mitral valve prolapse (MVP) and ventricular arrhythmic events 2) The advantages of CMR in MAD diagnosis, stratification and prognosis 3) Update on state-of-the-art CMR new sequences for evaluating MAD

TABLE OF CONTENTS/OUTLINE

1) INTRODUCTION 1.1) Definition and importance of MAD 1.2) Association with MVP, ventricular arrhythmias and sudden cardiac death 1.3) Presence of MAD in normal subjects 2) CARDIAC MR (CMR) ROLE IN MAD 2.1) CMR advantages over echocardiography 2.2) How to measure the MAD distance properly 2.3) Other CMR findings useful for the diagnosis and prognosis 2.4) New CMR tools for MAD stratification (T1 mapping and Strain) 3) CMR IN MAD DIAGNOSIS 3.1) Case example of a long MAD 3.2) MAD association with MVP and regurgitation 3.3) Myocardial Fibrosis presence - late gadolinium enhancement (LGE) 4) CMR IN MAD STRATIFICATION 4.1) How to evaluate papillary muscle LGE 4.2) CMR T1 mapping importance 5) CHALLENGES IN MAD/TAKE HOME MESSAGES 5.1) MAD diagnostic pitfalls and its clinical relevance 5.2) Strain CMR as a new tool to assess regional contractile dysfunction 5.3) Red flags on MVP

CAEE-11 The Essential Three Roles of Imaging in the Management of Chronic Thromboembolic Pulmonary Hypertension

Participants
Satoshi Higuchi, MD, PhD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Chronic thromboembolic pulmonary hypertension (CTEPH), caused by stenosis and obstruction of the pulmonary arteries by organized thrombi, is a major cause of chronic pulmonary hypertension and life-threatening disease if untreated. The prognosis is improving as a treatment strategy has been established. The role of imaging is classified into three categories: 1) detection of perfusion defects for diagnosis, 2) assessment of vascular lesions to establish a treatment strategy, and 3) evaluation of cardiac function for assessment of treatment efficacy or prognosis. Participants will learn the pathophysiologic processes of CTEPH, the essential three roles of imaging in the management of CTEPH, and future perspectives of imaging in CTEPH.

TABLE OF CONTENTS/OUTLINE

1. What is CTEPH?2. The pathophysiologic processes of CTEPH3. The essential three roles of imaging in CTEPH a. Diagnosis: lung perfusion defects b. Establishment of treatment strategy: assessment of vascular lesions c. Assessment of treatment efficacy and prognosis: evaluation of cardiac function4. Future perspectives5. Summary

CAEE-12 Pre- and Post-Operative Imaging Findings of Chronic Thromboembolic Pulmonary Hypertension (CTEPH)

Participants
Yogesh Gupta, DO, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Illustrate the proposed pathophysiology of CTEPH. 2. Detail the role of pre-operative imaging with computed tomography angiography (CTA), dual energy CT (DECT), ventilation perfusion (V/Q) scintigraphy, magnetic resonance angiography (MRA), MR perfusion, and 4D phase contrast MR. 3. Provide radiological examples, practical tips for aiding in diagnosis and describing current diagnostic challenges. 4. Highlight key findings that the radiologist should convey to the interventionist to best help guide therapy. 5. Demonstrate clinical correlates from our Pulmonary Hypertension Center with post-procedural outcomes from pulmonary endarterectomy, percutaneous balloon pulmonary angioplasty, and percutaneous ultrasound accelerated thrombolysis (EKOS®) as well as outcomes from medical therapies including pulmonary vasodilators and anticoagulation. 6. Overview of emerging artificial intelligence technologies that may facilitate CTEPH diagnosis.

TABLE OF CONTENTS/OUTLINE

This pictorial review is designed for residents, fellows, general radiologists, thoracic radiologists, interventional radiologists, and non-radiology participants. The primary goals are to describe the pre- and post-operative imaging features of CTEPH with clinical correlation and post-surgical outcomes. This will be achieved by discussing: 1. CTEPH in the WHO classification scheme. 2. Clinical features of and risk factors for CTEPH 3. Pathophysiology of CTEPH 4. Diagnostic algorithm. 5. Multimodality imaging overview. 6. Overview of treatment options.

CAEE-13 3D Printing in Cardiovascular Diseases: State-of-the-Art

Awards
Cum Laude

Participants
Prabhakar Rajiah, MD, FRCR, Rochester, MN (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To review the principles and techniques of 3D printing 2. To discuss the utility of 3D printing in cardiovascular diseases (CVD) 3. To illustrate the applications of 3D printing in CVD

TABLE OF CONTENTS/OUTLINE

1. INTRODUCTION 2. 3D PRINTING PROCESS- Image acquisition; segmentation; mesh, 3D printing; air drying; fixation 3. SOURCE DATA- CT, MRI, Hybrid 4. IMAGE ACQUISITION RECONSTRUCTION STRATEGIES CT- ECG-gating, High contrast, high isotropic spatial resolution; MRI- Volumetric acquisition, high CNR sequences, ECG-gating, less artifacts 5. 3D MESH FILE FORMATS- STL, VRML, novel 6. 3D PRINTING METHODS- Material jetting, binder jetting, Vat polymerization, material extrusion, powder bed fusion 7. APPLICATIONS OF 3D PRINTING Identification of anatomic landmarks; Involvement of adjacent structures, relationship; Planning surgeries/interventions; Device size; Printing interventional wires; Education of trainees, patients; Communication with clinicians; 8. APPLICATIONS OF 3D PRINTING IN CVD WITH CASE EXAMPLES Congenital heart diseases (septal defects, complex CHD)- Surgical planning, roadmap; Structural heart disease (Aortic, pulmonary, mitral, tricuspid valve interventions, LAA closure)- Preprocedural planning, device selection, bench testing; Neoplasms- relationship/involvement of adjacent structures; Hypertrophic cardiomyopathy- Outflow anatomy, relationship to adjacent structures; Cardiac aneurysms/ pseudoaneurysms- Anatomy, relationship; Vascular disease- Chronic dissection, aneurysms, Marfan syndrome 9. ACCURACY LIMITATIONS 10. UTILITY OF AI 11. PITFALLS 12. TIPS ON SETTING UP A 3D PRINTING SERVICE

CAEE-16 Multi-modality Cardiac Imaging in Myocarditis Following COVID-19 Vaccination

Participants
Constantin Marschner, MD, Toronto, ON (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Myocarditis following COVID-19 vaccination is rare. However, adolescent and young adult males are at highest risk. Chest pain is the most common presenting symptom.2. Cardiac imaging plays an important role in the diagnosis of acute myocarditis following vaccination, with typical findings on cardiac MRI including subepicardial late gadolinium enhancement and co-localizing edema at the basal to mid inferior lateral wall. 3. The disease course is typically transient and mild, with resolution of symptoms within 1-3 weeks in most patients. Limited follow-up data demonstrates resolution of myocardial edema but persistence of late gadolinium enhancement in some patients. 4. Longer term follow-up is needed to determine whether persistent imaging abnormalities are associated with adverse outcomes, including arrythmias and heart failure.

TABLE OF CONTENTS/OUTLINE

The purpose of this educational exhibit is to:1. Review the incidence, pathophysiology, risk factors, and clinical outcomes of myocarditis following COVID-19 vaccination2. Demonstrate the role of cardiac imaging in establishing a diagnosis of myocarditis following vaccination including echocardiography, cardiac MRI, and PET 3. Illustrate multi-modality cardiac imaging findings in patients with myocarditis following vaccination, at the time of acute presentation and at follow-up

CAEE-17 Comprehensive Assessment of Cardiac Amyloidosis with Cardiac MRI: Morphology, Function and Tissue Characterization

Participants
Filipe Carvalho, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Cardiac amyloidosis is a challenging diagnosis that usually requires increased clinical awareness and multimodality evaluation for timely diagnosis.In this presentation, the reader should learn how to identify the spectrum of morphologic features of cardiac amyloidosis and to address the role of cardiac MRI in the main differential diagnosis. We will demonstrate the main delayed enhancement patterns with potential imaging pitfalls and discuss the applicability of new mapping techniques (native T1 and Extracellular Volume Fraction [ECV]) on the diagnostic and prognostic assessment

TABLE OF CONTENTS/OUTLINE

(1) Introduction and Background. (2) Present the main morphological features of cardiac amyloidosis: enlarged atria, left ventricle hypertrophy, diastolic dysfunction. (3) Discuss the role of tissue characterization with native T1 mapping, ECV, TI-scout, magnitude and PSIR delayed enhancement techniques in the prognostic and diagnostic assessment. (4) Illustrate the main imaging pitfalls and possible differential diagnosis. (5) Take-Home messages and teaching points.

CAEE-18 Cardiac MRI 2D Phase Contrast Flow Imaging: Pearls and Pitfalls

Participants
Claire Brookmeyer, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Review pearls and pitfalls in the application of phase contrast 2D flow imaging to cardiac MR. Emphasize important pitfalls in the

acquisition of phase contrast 2D flow sequences. Explain indications and utilization of 2D flow imaging to cardiac valvular stenosis and regurgitation, as well as intracardiac shunts.

TABLE OF CONTENTS/OUTLINE

Introduction: Background information on valvular stenosis and regurgitation, intracardiac shunt, Role of velocity and flow quantification in the detection and management of cardiac valvular pathologies and intracardiac shuns. Technical pearls and pitfalls: Basic physics concepts behind phase contrast imaging to determine flow, Imaging plane set up for aorta and main pulmonary artery, Slice location selection, VENC selection and aliasing, In-plane and Through-plane techniques, Temporal resolution. Imaging protocols and Post-Acquisition Processing: Steady state free precession cine sequences for Functional assessment, stroke volume quantification, Phase contrast sequences for velocity and flow assessment. Application: Regurgitation (Mitral, Aortic), Stenosis (Aortic, Mitral), Intracardiac shunt Qp/Qs

CAEE-19 Preprocedural Assessment of Left Atrial Appendage Closure Using Dedicated CT Image

Participants
Naoki Hosoda, (*Presenter*) Nothing to Disclose

TEACHING POINTS

To learn about the pre-procedural assessment for left atrial appendage treatment.To learn measurement method of LAA dimensions.To learn advantage of preoperative assessment for LAAC with CT.To learn about necessity of CT.

TABLE OF CONTENTS/OUTLINE

A. Pre-procedurally clarifies the intracardiac thrombus and LAA morphology.B. Usefulness of CT to measure in the same way as TEE.C. Risk assessment by morphology and simulation of optimal sheath selection using CT volume data.D. CT predicts not only the risk of the intervention based on anatomical features of the LAA but also the thrombus, device size, sheath type, optimal location for septal puncture and pre-procedurally clarifies LAA dimensions.

CAEE-2 Taking It to the Next Level - What's New with CAD-RADS 2022

Awards
Certificate of Merit

Participants
Arzu Canan, MD, Dallas, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

Purpose: The purpose of this educational exhibit is to review the update version of CAD-RADS (Coronary Artery Disease Reporting and Data System) and to highlight the changes compared to prior version with illustrative case examples. Major teaching point CAD-RADS not only provides a common and standardized lexicon for interpretation of coronary CT angiography findings but also provides specific recommendations for further management of patients. Although the main seven categories remain similar in the updated version, the new CAD-RADS scoring system allows for more comprehensive evaluation and description of coronary atherosclerosis with the addition of new features, such as plaque volume assessment and physiologic significance of stenosis.

TABLE OF CONTENTS/OUTLINE

This exhibit includes a systematic review of the CARD-RADS categories and modifiers, followed by case based examples. The systematic review includes 1. The rationale and the evidence for updated CAD-RADS will be reviewed 2. CAD-RADS Categories (0-5 and N): What is same and different with illustrative case examples3. Modifiers: N, S, G, V, etc.: What is the same and what is new with illustrative case examples 4. New features 5. Recommendations: What is same and different with illustrative case examples Conclusion It is of importance to understand the differences between the original and the newest version of CAD-RADS and to implement those changes into the clinical practice in order to improve communication and to facilitate decision making process for further management of patients. This exhibit equips the learner with the required knowledge in a practical illustrated manner.

CAEE-20 Cardiac Electrophysiology 101 and the Role of Radiologist

Awards
Identified for RadioGraphics

Participants
Prabhakar Rajiah, MD, FRCR, Rochester, MN (*Presenter*) Nothing to Disclose

TEACHING POINTS

Electrophysiology (EP) deals with diagnosis and management of heart rhythm problems. It is important for a cardiac radiologist to know the basics of EP and roles where they can contribute 1. To review the basic techniques used in cardiac EP 2. To correlate EP findings with cardiac CT/MRI 3. To understand the role of CT/MRI in cardiac EP

TABLE OF CONTENTS/OUTLINE

1. INTRODUCTION - Cardiac action potential, arrhythmia mechanisms 2. CARDIAC EP- Role, advantages 3. STANDARD EP TESTS- Catheters, measurement of electric potentials 4. ATRIAL FIBRILLATION/FLUTTER - a. EP for diagnosis and ablation; b. Pre-procedural CT/MR -for anatomy, thrombus, scar; c. Procedural- Electroanatomic mapping, ablation types; d. Post-procedural CT/MR- Vein stenosis, thrombus, bleed, esophagoatrial fistula, perforation, pericardial effusion; e. Left atrial appendage closure- Pre-procedural planning, post procedural complications 5. VENTRICULAR ARRHYTHMIAS -a. EP techniques for characterization; b. EP ablation; c. Scar (substrate) evaluation- detection, mapping, heterogeneity in MRI/CT ; d. Ablation procedure- electroanatomic mapping, CARTO; e. MRI-guided ablation 6. LV DYSYNCHRONY - a. Evaluation with MRI/strain; b. CRT procedure; c. Venous anatomy CT/MRI ; d. MRI/CT- Scar 7. SUDDEN CARDIAC DEATH a. Identifying at-risk patients; b. MRI/CT for diagnosis 8. BRADYCARDIA- Sinus, heart blocks - MRI, PET/CT for sarcoidosis 9. SYNCOPE - Table tilt test 10. COMPLEX CONGENITAL/POST-SURGICAL ANATOMY- Imaging guidance for navigation to appropriate chamber. 11. IMAGE GUIDED RETRIEVAL OF RETAINED LEADS

CAEE-21 Coronary CT Angiography with Myocardial Late Enhancement Protocol in the Emergency Room: Tips and Tricks

Participants
Lucas Farias, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is:- To review coronary CT angiography with myocardial late enhancement protocols in the evaluation of patients with chest pain.- To review the pharmacokinetics of late iodine enhancement at CT as alternative to the gadolinium at MRI.- To assess the utility of the coronary CT angiography with myocardial late enhancement protocol in the emergency room to exclude coronary obstruction in patients with suspected acute myocarditis.- To correlate important findings with the anatomy and pathophysiology.- To discuss image findings according to the patterns of late enhancement to differentiate between ischemic and nonischemic myocardial damage, to enhance radiologists' skills.- To review usual and unusual patterns of acute myocardial infarction, myocarditis and others non-ischemic cardiomyopathies. - To highlight their characteristics to familiarize radiologists with these conditions, preventing unfavorable patient outcome.

TABLE OF CONTENTS/OUTLINE

Table of contents/outline - Applied myocardial anatomy and vascularization. - Pharmacokinetics of late iodine enhancement. - Patterns of myocardial late enhancement. - CT angiography with myocardial late enhancement protocol. - Case series diagnosed with CT angiography with myocardial late enhancement protocol. - Sample cases of pearls, pitfalls, diagnostic difficulties, and mimics. - Summary and take-home messages.

CAEE-22 Can Spectral Cardiac CT Find New Clinical Value in Ischemic Heart Disease?

Participants
Junji Mochizuki, MSc,RT, (*Presenter*) Nothing to Disclose

TEACHING POINTS

To learn about special characteristic of spectral imaging : Dual layer Spectral cardiac CT.To learn about the use of spectral imaging coronary and myocardium evaluation.To illustrate various clinical applications using these techniques by presenting clinical images.

TABLE OF CONTENTS/OUTLINE

A. The virtual monochromatic image (VMI) allows evaluation of energy-dependent changes in CT number of coronary artery plaques.B. The low-energy VMI reduces the CT number of epicardial fat and clearly depicts the thrombus and coronary artery plaques.C. The VMI reduces beam-hardening artifacts. In addition, low-energy images can clearly detect areas of abnormal perfusion because the CT number of normal myocardium are increased.D. The extracellular volume function with iodine density imaging can accurately assess myocardial viability.

CAEE-23 Chronic Thromboembolic Pulmonary Hypertension (CTEPH): A Multimodality Imaging Review

Participants
Scott Adams, MD,PhD, Saskatoon, SK (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Chronic thromboembolic pulmonary hypertension (CTEPH) is defined as pulmonary hypertension due to persistent obstruction of the pulmonary arteries from pulmonary embolism despite at least 3 months of anticoagulation.2. Ventilation-perfusion (V/Q) scintigraphy has high sensitivity for CTEPH and is a first-line imaging modality for ruling out CTEPH. In addition, SPECT-CT offers increased sensitivity and specificity.3. CT pulmonary angiography has higher specificity than V/Q scintigraphy for CTEPH, but lower sensitivity. CT features include partial or complete filling defects, bands, and webs within the pulmonary arteries; pulmonary artery dilation; right ventricular dilation and hypertrophy; bronchial artery dilation; and mosaic attenuation of the lung parenchyma.4. Dual-energy CT has been shown to improve detection of distal CTEPH and provide additional information on pulmonary vascular reserve and parenchymal arterial perfusion.5. In the future, 4D-flow MRI may play a role in treatment selection and assessment of treatment response.

TABLE OF CONTENTS/OUTLINE

DefinitionPathophysiologyClinical presentation and patient demographicsImaging features- Radiography- CT, including high-resolution CT, CT pulmonary angiography, and dual-energy CT- MRI, including MR angiography and 4D-flow- Echocardiography- Conventional angiography- Ventilation/perfusion (V/Q) scintigraphy and SPECT-CTDiagnostic approach, including the role of imaging in diagnosis, patient selection for treatment, and post-operative follow-upClinical management options

CAEE-24 Cardiovascular Manifestations of Connective Tissue Disease

Participants
Jospeh Mansour, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

List the various cardiac and vascular entities that can occur with connective tissues diseasesDescribe the pathophysiology, risk factors, and management for each etiology.Illustrate the spectrum of imaging findings and differential diagnoses for each of these entities

TABLE OF CONTENTS/OUTLINE

Rheumatoid arthritisa. Pulmonary hypertensionb. Vasculitis and aortitisc. Aortic aneurysmd. CardiomyopathySystemic Lupus erythematosusa. Pericardial effusionb. Vasculitisc. Pulmonary embolismd. Lupus myocarditis and cardiomyopathye. Libman-Sacks endocarditisSclerodermaa. Pulmonary hypertensionb. Cardiomyopathyc. Infarcts and microvascular diseasePolymyositis and dermatomyositisa. Myocarditisb. Coronary artery diseaseSjogren syndromea. Pericardial effusionb. Cardiomyopathyc. Pulmonary hypertensionSUMMARY: Patients with connective tissue diseases can suffer from cardiovascular complications which may impact both morbidity and mortality. Diagnosing these entities can be challenging, both clinically and with imaging, and is often delayed. Familiarity with these conditions and their imaging features can help the radiologist recognize these entities and aid in diagnosis.

CAEE-25 State of the Art Cardiac MR Imaging of Ischemic Heart Disease

Awards
Certificate of Merit

Participants
Felipe Sanchez, MD, Toronto, Chile (*Presenter*) Nothing to Disclose

TEACHING POINTS

-1. Ischemic heart disease (IHD) is the worldwide leading cause of death and disability.2. Cardiac MR allows for the evaluation of global and regional cardiac function and provides superb myocardial characterization in a same evaluation.3. Cardiac MR can accurately depict myocardial edema, infarction, hemorrhage, and microvascular obstruction.4. Current Cardiac MR imaging strategies have widely accepted diagnostic and prognostic value.5. Emerging techniques and applications aim to improve prognostic and diagnostic performance of Cardiac MR.

TABLE OF CONTENTS/OUTLINE

-1. Significance of IHD.2. Basic physiopathology of IHD.3. Role of Cardiac MR in the workflow of IHD.4. Functional imaging.5. Edema imaging.6. Infarct characterization.a. Depicting myocardial infarct and "at risk" zones: classic and novel strategies.b. MVO and myocardial hemorrhage: role of T2*7. Stress perfusion.8. Novel tools for viability assessment and risk stratification.a. Feature tracking: Patterns of impaired myocardial contraction.b. Post-reperfusion hemorrhage, persistent edema, and adverse remodeling.c. 4D-flow in IHD.9. Technical considerations.

CAEE-26 Arrhythmogenic Cardiomyopathies: What the Imager Should Know

Awards
Identified for RadioGraphics
Certificate of Merit

Participants
Mauricio S. Galizia, MD, , (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Arrhythmogenic Cardiomyopathies (AC) are a group of myocardial diseases that are associated with ventricular arrhythmias and sudden cardiac death • Although arrhythmogenic right ventricular cardiomyopathy (ARVC) was the first disease described in which morphologic and structural ventricular abnormalities were associated with arrhythmias, AC can involve the right ventricle, the left ventricle, or both • The main sub-phenotypes of AC include the classical ARVC, left-dominant AC, and arrhythmogenic dilated cardiomyopathy • Many genetic mutations have been found to be associated with AC, most often genes that encode desmosome structural proteins • AC can be associated with ventricular systolic dysfunction and/or ventricular dilation. However, symptoms of arrhythmia or history of arrhythmic cardiac arrest can occur in patient with no structural myocardial abnormalities and may represent early developing AC • There are diagnostic criteria for ARVC; however, similar criteria for the other AC phenotypes is lacking

TABLE OF CONTENTS/OUTLINE

1. Definition of arrhythmogenic cardiomyopathy (AC). 2. Description of the desmosome and its constituent proteins: Desmoglein, desmocolin, plakophilin, junctional plakoglobin, desmoplakin 3. Association between AC and genetic diseases of the desmosome: difference between disease and phenotype. 4. Typical clinical presentation and imaging findings (with a greater focus on CMR) of the following phenotypes: Arrhythmogenic right ventricular cardiomyopathy (ARVC), left-dominant arrhythmogenic cardiomyopathy, arrhythmogenic dilated cardiomyopathy 5. Differential diagnoses and mimics: Dilated Cardiomyopathy, sarcoidosis, myocarditis

CAEE-27 Cutting the Edge of HCM: Tailored Planning of Surgical Myectomy in Obstructive Hypertrophic Cardiomyopathy

Awards
Magna Cum Laude
Identified for RadioGraphics

Participants
Sunhyang Lee, MD, Seoul, Korea, Republic Of (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To set the cardiac CT protocols and image analysis methods for simulation of successful surgical myectomy in patients with obstructive hypertrophic cardiomyopathy (HCM).2. To demonstrate tailored planning of surgical myectomy using multiphase cardiac CT images, especially volume rendering images and 3D printing

TABLE OF CONTENTS/OUTLINE

1. Classification of HCM based on surgical approach- Septal HCM- Apical HCM- Mixed, or diffuse type HCM- Combined abnormal papillary muscles2. Multiphase Cardiac CT Protocol3. CT Image Analysis Methods1) Cardiac function analysis (esp. apical, mixed, and diffuse type HCM)2) Surgeon's views- Trans-aortic view- Trans-apical view3) Papillary muscle evaluation4) Simulation of potential myectomy extent5) Comparison between pre- and post- myectomy CT images4. Various Examples1) Simulation of myectomy in septal HCM and comparison with postoperative CT2) Simulation of myectomy in diffuse HCM and comparison with postoperative CT3) Simulation of myectomy in mixed type HCM and comparison with postoperative CT4) Simulation of myectomy in HCM with abnormal papillary muscle

CAEE-28 Differential Diagnosis of Cardiac Amyloidosis: Pearls and Pitfalls

Participants
Patricia Oliveros Ordas, MD, Majadahonda, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

Cardiac amyloidosis (CA) is a rare disease caused by the extracellular deposition of insoluble fibrillar proteinaceous material in the

myocardium. Due to the complexity and multisystemic involvement of amyloidosis, a high index of suspicion for CA should be maintained. Typical MRI appearance of CA includes left ventricle myocardial thickening with preserved systolic function, increased atrial volume, and altered gadolinium kinetics with the presence of late enhancement with a subendocardial or transmural pattern. Other common causes of cardiomyopathy that may present as left ventricular hypertrophy should be excluded, such as depositional cardiomyopathies, hypertensive cardiomyopathy, hypertrophic cardiomyopathy, and cardiac sarcoidosis, among others. After reviewing our extensive casuistry and our sample of 80 patients with CA, we present the findings that will allow an easier differential diagnosis by imaging between these pathologies.

TABLE OF CONTENTS/OUTLINE

• Introduction: most frequent morphologic, functional and tissue characterization MRI findings in CA • Imaging differential diagnosis of CA that includes: * Depositional cardiomyopathies (Fabry's disease, Danon's disease) * Hypertensive cardiomyopathy * Hereditary cardiomyopathies * Cardiac sarcoidosis * Others • Conclusions

CAEE-29 MRI Mapping in the study of Myocardial Disease

Participants
Susana Otero Muinelo, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To illustrate the role of T1, T2 and T2* mapping MRI sequences and extracellular volume in myocardial diseases.2. To recognize findings of most common myocardial diseases on T1, T2 and T2* maps and correlate them with other findings on cardiac MRI.

TABLE OF CONTENTS/OUTLINE

Cardiac T1, T2 and T2* mapping can provide information about myocardial disease that remains undetected using conventional techniques. The quantitative approach allows noninvasive characterization of myocardial properties such as extracellular volume expansion, edema, or other abnormalities in tissue composition. Thus, increased T1-native due to fibrosis in hypertrophic cardiomyopathy or to amyloid deposition or shortened T1-native due to glycosphingolipids in Anderson-Fabry disease could be evaluated. T2 mapping can detect myocardial edema in myocarditis, Takotsubo cardiomyopathy or myocardial infarction, whereas low T2* can be useful in iron overload and hemorrhage. We present cases of hypertrophic, dilated and restricted cardiomyopathy, acute myocardial disease as myocarditis or Tako-Tsubo and infiltrative cardiomyopathies and review the advantages, limitations and applications of T1 and T2 mapping to characterize these ones and other myocardial diseases. Multiparametric cardiac MRI provides prognostic information of structural and functional characteristics and myocardial composition. Incorporation of myocardial mapping on clinical routine increases the usefulness of MRI for the diagnosis and characterization of myocardial diseases.

CAEE-3 Unraveling the Mysteries of Congenital Heart Disease: A Skills-based Approach

Awards
Cum Laude

Participants
Shravan Sridhar, MD, MS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Become familiar with common congenital heart diseases and morphologic features2. Learn of important imaging features3. Understand how management relies on imaging metrics4. Gain skills to use in practice5. Apply skills in the assessment of complex congenital heart diseases

TABLE OF CONTENTS/OUTLINE

1. Title2. Table of common CHD and skill list3. Bicuspid AV morphology (per 2021 consensus)4. Understanding management5. Skill 1: Peak speed quant with PC VENC (in-plane, through plane)6. Common shunts (ASD, VSD, PDA) and features that determine treatment (2018 AHA guidelines)7. Understanding management8. Skill 2: Qp/Qs quant9. Right-sided obstruction (pulmonic stenosis, tetralogy of Fallot, pulmonary atresia spectrum)10. Understanding management11. Skill 3: Valve regurgitation quantification with phase contrast velocity-encoded images, fractional pulmonary flow quantification12. Left-sided obstruction (coarctation, aortic stenosis, Williams syndrome, Shone complex)13. Understanding management14. Skill 4: Flow quant for coarctation15. TGA (D, L)16. Understanding management17. Skill 5: Anatomic mapping - situs, right, left, terms used in describing discordance (e.g. anatomic vs morphologic)18. Other conotruncal anomalies (truncus, DORV, DOLV)19. Understanding management20. Skill 6: Rules to diff between Tetralogy, truncus, DORV, and DOLV)21. Single ventricle (HLHS, HRHS, Ebstein's, tricuspid atresia, DORV)22. Understanding management23. Skill 7: Flow mapping, "checks and balances"24. PAPVR, TAPVR25. Understanding management26. Skill 8: Angiography27. References

CAEE-30 Multi-modality Imaging of Cardiac Paragangliomas - A Review

Participants
Joao Carvalho, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

? Paragangliomas are rare neuroendocrine tumors originating from autonomic paraganglia. Heart involvement is rare, accounting for <1% of primary cardiac tumors. Most cardiac paragangliomas are incidentally detected on echocardiography or CT, or during the work-up of symptomatic patients with elevated (nor)metanephrine levels or genetic predisposition. ? Most cardiac paragangliomas are located around the great vessels, coronary arteries (atrioventricular groove) or the atria, which can be explained by tumor origin from the paraganglia and the distribution of the cardiac plexus. ? On MRI cardiac paragangliomas typically have low to intermediate signal on T1, and high signal on T2. The tumors are strongly vascularized, with high uptake on first-pass perfusion, and heterogeneous on late gadolinium enhancement. ? Functional imaging with radiolabeled somatostatin analogues is indicated to screen for additional tumor locations or metastatic disease. ? Surgical excision is the only curative treatment. CT or invasive angiography should be performed pre-operatively to precisely delineate tumor vascularization and assess the need for revascularization. Paragangliomas can be vascularized by the left and/or right coronary artery, posing additional surgical challenges.

TABLE OF CONTENTS/OUTLINE

1. Background: epidemiology, clinical presentation. 2. Diagnosis: tumor location, tissue characteristics, vascularization. 3.

Management: metastatic/multiple disease, surgical planning, radionuclide therapy.

CAEE-31 Virtual Reality Imaging - Pre-operative Visualization Modality Equipped with Simultaneous Quantification for Valvular Disease

Participants
Yukihiro Nagatani, MD, Otsu, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is: 1. To review general outline of image data display algorithm adopted for virtual reality imaging (VRI) based on advanced visualization software and actual clinical application of VRI 2. To learn crucial anatomical distances and/or dimensions to be accurately measured in pre-operative assessment for valvular disease 3. To introduce valuable experimental model by using ex-vivo swine heart reproducing physiological movements of valves and myocardium 4. To review specific sequences for valvular disease in cardiac magnetic resonance imaging (MRI) from conventional to updated ones

TABLE OF CONTENTS/OUTLINE

ž VRI using visualization toolkit with reproducible 3-dimensional measurement ž Detailed description of experimental system enabling endscopic observation under physiological state and quantitative assessment of intramuscular vasculature by using ex-vivo swine heart. ž Clinical advantage with application of 3-dimensional or 4-dimenstional VRI: realization of easy and reliable measurement supported with visual assessment ž Anatomy, dynamics and disease of aortic valve and root including our endscopic observation result ž Various imaging sequences useful for valvular disease assessment: from conventional and high-speed cine images such as steady-state Free Processing and 4-dimenional flow MRI

CAEE-32 What Hides in the Epicardial Space? Differential Diagnosis of Epicardial Masses

Awards
Certificate of Merit
Identified for RadioGraphics

Participants
Adria Roset Altadill, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

- The epicardial space has a diversity of components that can be the origin of various types of masses. - The epicardial masses can be divided into tumoral, non-tumoral or pseudo-masses.

TABLE OF CONTENTS/OUTLINE

The location is a helpful feature in order to diagnose cardiac masses, but epicardial masses are usually dismissed. The epicardial space includes the epicardial fat and the visceral pericardium. It is composed of a lining of mesothelial cells and connective tissue, along with a variable amount of fat, containing coronary vessels, lymphatics and nerves. Due to its diversity of components, different kinds of masses can be found in the epicardial space. They can be divided into tumoral, non-tumoral or pseudo-masses. The epicardial tumoral masses include lipoma, lymphoma, angiosarcoma, mesothelioma and metastases. Regarding non-tumoral etiologies, IgG4-related coronary disease, Erdheim-Chester and hydatid infection can be encountered. Finally, there are epicardial pseudo-masses either secondary to lipomatosis, purulent pericarditis, coronary aneurysms or postsurgical changes. In this education exhibit we show examples of each case, emphasizing the distinguishing features and the clues for the differential diagnosis.

CAEE-33 To the Heart of the Matter: A Systematic Approach to Interpretation of Cardiac MR for Trainees

Awards
Identified for RadioGraphics

Participants
Aeman Muneeb, MBBS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Approach to reading a conventional cardiac MR. 1. How to identify and learn the contribution of each sequences commonly used in Cardiac MR studies 2. To recognize the normal appearance of the heart in the common Cardiac MR sequences (cardiac chamber size, thickness, signal characteristics, normal function on visual analysis, interpretation of basic quantification parameters for function and flows) 3. Understand common appearances of diseases of the cardiac structure, myocardium, valves and pericardium. 4. Visual analysis of the Myomaps (native T1, T2, T2*). 5. Basic principles of quantitative Myomaps analysis.

TABLE OF CONTENTS/OUTLINE

Step 1: Know your patient - review the clinical scenario and relevant prior imaging. Step 2: Anatomical assessment. Step 3: Visual assessment of function. Step 4 Hemodynamic Assessment - Function and Flow quantification parameters. Step 5: Tissue Characterization. Step 6: Differential diagnosis: Characteristic appearance of common diseases.

CAEE-34 Multimodality Imaging in Cardiac Masses

Participants
Ayaz Aghayev, MD, Newton, MA (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Cardiac masses are rare entities; however, they can be associated with high morbidity and mortality.- Cardiac masses broadly can be classified as non-neoplastic masses such as thrombus, normal/variant cardiac structures, and neoplastic masses (primary and secondary/metastatic tumors).- The educational exhibit will elucidate the diagnostic approach even before the imaging, based on the patient’s demographics, and prior disease/comorbidities.- On imaging, differential diagnosis can be elaborated based on the location of the tumor; for example, the most common benign myxoma is usually located in the left atrium and attached to the interatrial septum; primary cardiac malignancy - angiosarcoma - is exclusively located along the right atrium/ventricle as an

infiltrative mass.- The next step will focus on available imaging modalities for cardiac masses such as echocardiography (TTE/TEE), cardiac CT, cardiac MRI, and PET/CT, and their specific imaging characteristics for certain masses. For example, fat density lesion on a CT is consistent with lipoma; avid LGE in intramyocardial mass is a feature of fibroma, or Dotatate uptake in cardiac mass is diagnostic of paraganglioma.- Lastly in this educational exhibit, we will provide a proposed algorithm for patients with suspected cardiac masses or incidentally detected on echo/chest CT.

TABLE OF CONTENTS/OUTLINE

1. Cardiac mass classification.2. Diagnostic approach to the patient with suspected or incidentally detected cardiac mass.3. Available imaging modalities that can be utilized in cardiac masses.4. Key imaging features of cardiac masses- Cardiac CT, Cardiac MRI, and PET-CT (including pitfalls).5. Proposed algorithm for suspected cardiac masses.

CAEE-35 Potential Applications of Radiomics Based Texture Analysis in Cardiac Magnetic Resonance (CMR)

Participants
Avanti Gulhane, MD, Seattle, WA (*Presenter*) Nothing to Disclose

TEACHING POINTS

We will discuss potential applications for radiomic analysis of CMR studies. 1.As a proof of concept, we will describe technique for texture analysis of LGE-PSIR to identify first, second and higher order features in patients with ischemic and non-ischemic myocardial diseases. 2.Potential advantages of using radiomics texture analysis for quantitative assessment of CMR images. 3.Several texture features such as first order entropy, kurtosis, grey level co-occurrence matrix non uniformity, grey level run length matrix non uniformity and wavelet transform can be obtained using Pyradiomics, an open-source software. 4.We will illustrate comparative analysis of radiomic features in LGE images of a normal volunteer and patients with ischemic and non-ischemic heart diseases

TABLE OF CONTENTS/OUTLINE

Specific areas where CMR radiomics analysis may aid on diagnostic characterization will be described. Example of radiomic analysis obtained from LGE-PSIR will be illustrated by showing specific texture parameters that can be obtained. We will illustrate the method by showing examples of radiomic features in several diseases on CMR including myocardial infarction, hypertrophic cardiomyopathy, myocarditis, dilated cardiomyopathy and normal heart. Images will be sampled to 1x1x1 mm using linear interpolation and discretized to a fixed bin width of 25 units for the basic preprocessing within the Pyradiomics software. Examples of feature types extracted and analyzed are • First Order Statistics • Shape-based (2D and 3D) • Gray Level Co-occurence Matrix • Gray Level Run Length Matrix • Gray Level Size Zone Matrix • Neighbouring Gray Tone Difference Matrix • Gray Level Dependence Matrix • Wavelet-based features

CAEE-36 Mulmodality Imaging of Atrioventricular Groove Masses - Diagnostic Approach

Awards
Certificate of Merit

Participants
Prabhakar Rajiah, MD, FRCR, Rochester, MN (*Presenter*) Nothing to Disclose

TEACHING POINTS

The atrioventricular (AV) groove is the space that encircles the right and left AV valves. 1. To review the masses involving the atrioventricular (AV) groove. 2. To discuss the role of multimodality imaging in the diagnosis and characterization of these masses. 3. To illustrate the imaging appearances of several types of AV groove masses

TABLE OF CONTENTS/OUTLINE

• INTRODUCTION • ANATOMY OF AV GROOVE- Right coronary artery, left circumflex coronary artery, coronary sinus, fat, lymphatics, nerves. • MULTIMODALITY IMAGING- CT, MRI, Nuclear medicine, Echocardiography, cardiac catheterization • DISCUSSION AND ILLUSTRATION OF THE FOLLOWING MASSES IN THE AV GROOVE WITH CASE EXAMPLES AND PATHOLOGICAL CORRELATION A. VASCULAR LESIONS - Coronary artery aneurysm - Coronary bypass graft aneurysm/pseudoaneurysm - Cardiac chamber aneurysm/pseudoaneurysm - Coronary fistula - Vascular malformation B. INFLAMMATORY - IgG4 disease - Erdheim Chester disease - Vasculitis - Sarcoidosis - Hematoma C. BENIGN NEOPLASMS - Paraganglioma - Schwannoma - Hemangioma - Thymoma D. MALIGNANT NEOPLASMS - Sarcoma - Lymphoma - Metastases E. MISCELLANEOUS - Calcification and pericardial constriction - Caseous mitral annular calcification - Fatty proliferation - Pericardial hematoma - Intracameral RCA • DIAGNOSTIC APPROACH AND ALGORITHM - Infiltrative versus well-defined margins - Hypervascular versus hypovascular - Late gadolinium enhancement - High T2 signal

CAEE-37HC Pre- and Postoperative Imaging Evaluation of Ross Procedure Candidates: Anatomy, Complications, and What the Surgeon Wants to Know

Participants
Lisa Xuan, MD, BSc, Newmarket, ON (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. The Ross procedure is a technically complex cardiac surgery which replaces a diseased aortic valve with a native pulmonic autograft.2. There is growing interest for the Ross procedure in young patients, due to improved longevity and the ability of the native autograft to grow and adapt overtime.3. Preoperative cardiac MR evaluation is integral for patient selection and surgical planning, while postoperative surveillance aids in diagnosing complications and quantifying myocardial remodeling as a measure of success.4. Relevant cardiac anatomy and MR imaging findings of the Ross procedure are reviewed.5. Example cardiac MR protocols and synoptic reporting frameworks are provided, with details tailored for the cardiac surgeon, and can be utilized to foster a strong multidisciplinary Ross program.

TABLE OF CONTENTS/OUTLINE

Overview of Ross procedure surgical technique:- Indications- Illustrations of the procedure and pertinent cardiac anatomy (generated by our medical illustrator)Cardiac MR protocol and reporting:- Pre/postoperative protocols and follow-up intervals- Synoptic reporting frameworkReview of imaging:- What the cardiac surgeon wants to know- Relevant radiologic findings in pre and

post-operative Ross patients- Postoperative cardiac remodeling as a measure of success (e.g. left ventricular mass regression on cardiac MR)- Potential complications (e.g. pulmonic autograft failure (autograft annular dilatation))Clinical ImplicationsSummaryPlease visit the Learning Center to also view this presentation in hardcopy format.

CAEE-38 Multimodality Imaging of Valvular Infections

Awards
Certificate of Merit
Identified for RadioGraphics

Participants
Jordi Broncano, MD, Cordoba, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To analyze the role of advanced imaging in the diagnosis and management of patients with infective endocarditis (IE). 2. To describe the main imaging clues for accurate diagnosis of valvular and perivalvular features as well as extracardiac findings in IE. 3. To identify the potential pitfalls of IE and the main imaging tips for differentiating from IE.

TABLE OF CONTENTS/OUTLINE

1. Definition of IE: Modified Duke Criteria 2. Epidemiology in IE: Unveiling the high-risk patient 3. Role of Imaging in IE: Pros and Cons - Echocardiography: Transthoracic and transesophageal - Cardiac Computed Tomography - Positron Emission Tomography/Computed tomography (PET/CT) - Cardiac MRI: Is there a role for it? 4. Imaging Pearls in IE 4.1. Valvular disease - Vegetation - Leaflet perforation - Leaflet aneurysm 4.2. Perivalvular disease: - Dehiscence pseudoaneurysm - Perivalvular abscess - Perivalvular fistula 4.4. Extracardiac embolic events 5. Infective Endocarditis Masqueraders - Non-bacterial thrombotic endocarditis (Marantic Endocarditis) - Papillary fibroelastoma - Casseous Necrosis of the Mitral Valve (CNMV) - Lambl's Exscrecences - Valvular thrombosis - Inflammatory pannus - Myxoma - HALT - Cusp prolapse 6. Diagnostic imaging algorithm 7. Take Home points

CAEE-39 Stress Cardiac Magnetic Resonance Imaging: Our Experience in a Community Hospital Setting

Participants
Mahmoud Shalaby, MD, Lansdowne, PA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1- Describe the basic principles of stress cardiac magnetic resonance (CMR) perfusion imaging, including technique and imaging protocol.2- Discuss the clinical applications of stress CMR. 3- Illustrate stress CMR interpretation and data analysis. 4- Highlight stress CMR pitfalls and artifacts.

TABLE OF CONTENTS/OUTLINE

1- Stress CMR perfusion tracers; clinical applications and contraindications. 2- Pulse sequences and imaging protocols. 3- Stress CMR interpretation and data analysis; qualitative and quantitative interpretation. 4- Clinical applications of stress CMR in large-vessel and microangiopathy coronary artery disease. 6- Pitfalls and artifacts: - Dark rim artifact. - Susceptibility artifact. - Chemical shift artifact. 7- Limitations of stress CMR.

CAEE-4 Expanding Fractional Flow Reserve (FFR) CT: Challenges and Emerging Applications

Participants
Fabio Trindade, MD, Curitiba, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The aim of this exhibition is to review: 1) What is Fractional Flow Reserve (FFR) and its relevance in coronary artery disease (CAD). 2) Technical Aspects of Machine-learning-based FFRCT (ML FFRCT) calculation. 3) Current and potential contributions of FFRCT in CAD. 4) Advantages and challenges of Machine-learning-based FFRCT. 5) Emerging applications and future directions of FFRCT.

TABLE OF CONTENTS/OUTLINE

1. INTRODUCTION 1.1. FFR overview: definition, interpretation, invasive and non-invasive techniques 2. FFRCT: BRIEF REVIEW OF SUPPORTIVE EVIDENCE 3. ML-FFRCT : WHAT THE RADIOLOGIST NEEDS TO KNOW 3.1. Advantages and disadvantages 3.2. How to measure: a step-by-step approach 3.3. Limitations and pitfalls 4. ML-FFRCT IN REAL LIFE: INTERACTIVE CHALLENGING SCENARIOS 4.1. Myocardial bridging 4.2. Coronary stents 4.3. Coronary artery anomalies, including interarterial course 4.4. Coronary dissection 4.5. Other conditions 5. FUTURE DIRECTIONS AND EMERGING APPLICATIONS 6. TAKE HOME MESSAGES

CAEE-40 Indications and Imaging Findings of CMR in the Acutely Ill Patient

Participants
Daniel Vargas, MD, Denver, CO (*Presenter*) Nothing to Disclose

TEACHING POINTS

Cardiac MR is quickly becoming a powerful and increasingly utilized tool in the evaluation of acutely ill patients. To this end, institutions, radiologists and cardiologists should strive to have the infrastructure and preparation to offer CMR to hospitalized patients.The purpose of this exhibit is:1. Review CMR protocols for evaluation of acutely ill patients 2. Discuss CMR tools that may aid in shortening acquisition and/or improve image quality in this group of patients 3. Review the imaging findings and pitfalls of the most common conditions encountered in the inpatient setting

TABLE OF CONTENTS/OUTLINE

1. CMR protocol for acutely ill patients a. Basic and advanced sequences. b. Tools to shorten acquisition time. c. Tools to improve image quality. 2. Common indications and imaging findings in acutely ill patients. a. Elevated troponins (myocarditis, takotsubo, myocardial infarction, etc). b. Decreased ejection fraction / Heart failure (identifying cardiomyopathy, drug toxicity, etc). c. Arrhythmia and Heart-block. d. Intracardiac mass. e. Pericardial emergencies

CAEE-41 Congenital Coronary Artery Anomalies with Lethal Conditions or Sudden Death Risk; Coronary CT and Conventional Angiographic Evaluation

Participants
Keizo Tanitame, MD, Hiroshima, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

Numerous variations of coronary artery anomalies exist. Some are benign, but others are hemodynamically significant and potentially lethal. The anomalous origin of the coronary artery from the pulmonary artery is a potentially lethal condition. In the patients with anomalous origin of the coronary artery from the contralateral sinus or single coronary artery, coronary artery compression between aorta and pulmonary trunk is a risk factor of sudden death during exercise. Coronary artery fistulae are the most common hemodynamically significant abnormalities, and to-and-fro flow is seen in the dilated coronary arteries. Myocardial bridge is generally benign, but occasionally associated with angina, myocardial infarction, and sudden death. We demonstrate congenital coronary anomalies with lethal conditions or sudden death risk and discuss the radiological evaluation of their severity and treatment outcome.

TABLE OF CONTENTS/OUTLINE

1. Anomalous origin of the coronary artery from the pulmonary artery - Development of collaterals and retrograde blood flow from the anomalous coronary artery to the pulmonary artery on conventional coronary angiography 2. Multi-detector CT coronary angiography for evaluating anomalous origin of the coronary artery - Visualization of the anomalous origin and subsequent passage of the coronary artery 3. Anomalous origin of the coronary artery with a risk of sudden death - Coronary artery compression between aorta and right ventricular outflow tract 4. Congenital coronary artery fistulae - Evaluation of the size of the fistula and the degree of to-and-fro flow 5. Myocardial bridge - Cardiac CT evaluation of the depth and length of the bridge and the severity of systolic stenosis

CAEE-42 Out on the Road: Revisiting Coronary Artery Anomalies

Awards
Identified for RadioGraphics
Certificate of Merit

Participants
Lucas Farias, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is: 1) To review usual and unusual cases of congenital heart diseases. 2) To discuss the classification of coronary anomalies. 3) To understand coronary anomalies by associating schematic drawings with MPR and three-dimensional reconstructions, correlating them with coronary angiography (animated gif). 4) To correlate important findings with the anatomy, embryology, and pathophysiology. 5) To discuss image findings in order to enhance radiologists' skills. 6) To review CT protocols in the evaluation of patients with suspected coronary artery anomalies. 7) To highlight their characteristics in order to familiarize radiologists with these conditions, preventing unfavorable patient outcome.

TABLE OF CONTENTS/OUTLINE

1) Applied embryology and anatomy of the coronary arteries. 2) CTA protocols in the evaluation of patients with suspected coronary artery anomalies. 3) Anomalies of origination and course of coronary artery. 4) Anomalies of intrinsic coronary arterial anatomy. 5) Anomalies of coronary termination. 6) Anomalous anastomotic vessels. 7) Sample cases of pearls, pitfalls, diagnostic difficulties, and mimics. 8) Summary and take-home messages.

CAEE-43 Spectrum presentation of Chagas Cardiomyopathy (Ch-CMP) by CMR

Participants
Hector Manuel Medina, MD, Bogota, Colombia (*Presenter*) Nothing to Disclose

TEACHING POINTS

-Cardiac magnetic resonance (CMR) is useful to determine ventricular function and fibrosis in patients with Chagas cardiomyopathy (Ch-CMP). - In ch-CMP patients, inflammation and vascular disfunction causes severe vasodilation, which promotes tissue ischemia and fibrosis in water-shed segments. This can occur during the acute and chronic stages of the disease condition.In Ch-CMP, the most common scar locations are at the left ventricular apex and the basal inferolateral wall. These segments present with akinesis, and fibrosis noted in late gadolinium enhancement sequences (LGE), which can be transmural, sub-epicardial, mid-myocardial, and sub-endocardial.-CMR is also helpful in identifying ventricular thrombi in this population using perfusion, early gadolinium enhancement (EGE), and LGE.-The main differential diagnoses of Ch-CMP are Anderson-Fabry disease, ischemic cardiomyopathy, idiopathic cardiomyopathy, sarcoidosis disease and myocarditis.

TABLE OF CONTENTS/OUTLINE

Distribution of scar in Ch-CMPPhases of Ch-CMP include ventricular microaneurysm, ventricular aneurysm, severe heart failure and intracavitary thrombiFrequently used sequences and technique-Functional evaluation with maps of T1 and T2-Steady- state free precession (SSFP) in short axis, 3 chamberScar and fibrosis: Intravenous contrast (gadobutrol)- EGE- LGE

CAEE-45 Cardiac MRI Lessons Learned: Pearls and Pitfalls from Training to Remember as an Attending

Awards
Identified for RadioGraphics

Participants
Prabhakar Rajiah, MD, FRCR, Rochester, MN (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To review the lessons learned in cardiac MRI on sequences, protocols, interpretation, pitfalls and problem-solving. 2. To illustrate these key lessons with representative case examples.

TABLE OF CONTENTS/OUTLINE

1. PROTOCOLS Gadolinium versus Ferumoxytol, sequence adaptations; Cardiac devices- Adaptations (including wideband technique) 2. ARTIFACTS AND SOLUTIONS MOTION- Prospective triggering, real-time, compressed sensing; Single-shot, resp. nav. and gating; STIR- Pseudolesion subendocardium, edema from coil sensitivity; PERFUSION- Gibbs artifact; MRA- T2 shortening pseudofilling defects, subtraction misregistration; LGE- Ti selection (esp. amyloidosis), Partial voluming; PSIR artifacts; Failed fat suppression (vs pericarditis), normal blood pool in recesses; 3D WHOLE HEART- Partial voluming; 2D/4D FLOW- Aliasing; resolution limitation, Noise without contrast; T1 MAP- Motion, imaging in other phases; STRAIN- Diastolic fading; 3. ARTIFACTS AS SOLUTIONS SUSCEPTIBILITY- Iron quant; CHEMICAL SHIFT- fat identification 4. INTERPRETATIVE PITFALLS Pseudomasses (Crista terminalis, Taenia sagittalis, Chiari network, Coumadin ridge, lipomatous hypertrophy, MAC, focal HCM, pseudothrombus, moderator band, pericardial recess); CABG aneurysm vs neoplasm; Prominent trabeculations vs LV non compaction; LV apical thinning vs aneurysm; MVO vs spared myocardium; Benign fat vs ARVD; Valve leaflets- Bicuspid vs tricuspid; Pseudo vs true Coarctation; Ductus diverticulum vs aneurysm; Vasculitis vs IMH 5. BLIND SPOTS 6. TIPS TRICKS Long Ti for LGE in cardiac masses; 3D T1w imaging for pericarditis; VENC higher than predicted; Dark blood-LGE for subtle scars

CAEE-46 Getting to the Heart of Cardiac Masses: Pearls and Pitfalls

Participants
Andrea Cangiani Furlani, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) Overview of cardiac masses (primary neoplasms - benign and malignant -, metastasis, infectious, thrombus).2) 90% of primary cardiac tumors are benign. Metastases via various mechanisms are much more common than primary cardiac malignancies. Metastatic mechanisms determine imaging characteristics.3) Discuss in detail with illustrative cases the typical MRI and CT characteristics of specific cardiac neoplasms and their common differential diagnostic considerations, including pearls and pitfalls.

TABLE OF CONTENTS/OUTLINE

I. Overview. a)Locations of cardiac masses by chamber. b)Tips for distinguishing neoplasms from infection and thrombus. II. Benign cardiac neoplasms. a)Myxoma. b)Fibroelastoma. c) Fibroma, d) Lipoma. e) Cystic tumor of the AV node. f) Congenital cyst. III. Metastases. a)Hematogenous spread. b) Lymphangitic spread. c)Vascular invasion- IVC, SVC, pulmonary veins. d)Direct invasion. IV. Primary cardiac malignancies. a)Angiosarcoma. b)Other sarcomas. c)Lymphoma. The aims of this abstract are:1. To review etiology, location, and typical clinical scenarios of different cardiac masses.2. To review imaging findings of benign cardiac neoplasia (myxoma, fibroelastoma, fibroma, lipoma, hemangioma, cystic tumor, and differential diagnosis such as lipomatous hypertrophy of the interatrial septum). 3. To review the mechanisms of metastatic disease (hematogenous, lymphangitic, direct and vascular invasion).

CAEE-47 Coronary Artery Fistulas: a Pictorial Essay

Participants
Desiree Louise Batista, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

To describe classification and the main subtypes of coronary fistulas (CFs). To describe the hemodynamic implications on the cardiac structures/cavities of drainage. To describe the importance of coronary CT angiography (CCTA) for the diagnosis, course, path and drainage of CFs, as well as depiction of the relationship between the affected vessel and the nearby structures.

TABLE OF CONTENTS/OUTLINE

CF is an anomalous direct connection between one or more coronary arteries (CA) and a cardiac chamber (coronary-cameral fistula) or a large vessel (arteriovenous fistula). CFs can be congenital or acquired, single or multiple, isolated or associated with other congenital cardiac malformations. CFs originating from the right coronary artery are the most frequent (50-70%) and 40% of CFs drain into the right ventricle.The degree of shunting is associated with its size and the pressure gradient between the coronary and the draining site. Drainage to the right heart is related to left-to-right shunt, causing variable degrees of volume overload and pulmonary hypertension. Drainage to the LV may cause hemodynamic changes similar to aortic regurgitation. Drainage to the pulmonary artery and left atrium generates volume overload to the LV. There may be reduced myocardial flow distal to the fistula (coronary steal phenomenon), myocardial ischemia and progression to heart failure. The main complications are rupture, infarction and infective endocarditis. CCTA is the gold-standard non-invasive method to explore the complex anatomy of CFs, allowing 3D reconstructions and assessment of vessel of origin, pathway and site of drainage, which may aid to treatment decisions.

CAEE-48 1H-Magnetic Resonance Spectroscopy for Metabolic Imaging of Myocardial Trigylceride Content - How To Do It"

Participants
Bernhard Petritsch, MD, Wuerzburg, Germany (*Presenter*) Research Consultant, Siemens AG

TEACHING POINTS

To review the indications, contraindications, and limitations of 1H-Magnetic Resonance Spectroscopy (1H-MRS) of the myocardium. To highlight the potential benefit of a metabolic investigation embedded in a comprehensive examination of cardiac morphology and function. To learn about parameter settings for spectroscopic data acquisition, including voxel placement and positioning of a navigator for double (respiratory and ECG) triggered data acquisition. To interpret cardiac 1H-MR spectra of healthy subjects, patients suffering from congenital or acquired metabolic disorders, and to learn about potential pitfalls of spectroscopic imaging of the heart.

TABLE OF CONTENTS/OUTLINE

A. How does 1H-Magnetic Resonance Spectroscopy (1H-MRS) of the myocardium workB. Technical requirementsC. Spectroscopic data acquisition; positioning of respiratory motion gating navigator; voxel placement in the septumD. Spectroscopic data postprocessingE. Image analysis in healthy subjects and patients; age dependency of myocardial triglyceride content; Metabolic syndrome, Morbus FabryF. Pitfalls of cardiac 1H-MRSG. Limitations of cardiac 1H-MRS; alternative imaging modalities

CAEE-49 Novel Assessment of Physiological Mitral Valve Morphology and Surgical Simulation for MICS MVP via

3D Printed Cardiac Models and Immersive 3D Virtual Reality System

Participants
Koichi Osuda, RT, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Minimally invasive cardiac surgery (MICS) mitral valve plasty (MVP) has a lower risk of associated complications including mediastinitis, and advantage of quick rehabilitation compared to median sternotomy approach. However, surgical procedures are technically demanding due to narrow operative field and deep working space. To understand the comprehensive mitral anatomy, we attempt to create patient-specific 3D printed left atrioventricular models and developed a novel approach for simulating MICS MVP procedures via immersive 3D virtual reality (VR) system.

TABLE OF CONTENTS/OUTLINE

3D VR datasets were converted, using CT data which has submillimeter spatial resolution. 3D printed models and 3D VR systems were faithfully reproduced mitral complex structure consisting of mitral leaflets, chordae tendineae, papillary muscles, and prolapsing leaflet. 3D printed models and 3D VR systems enable surgeon to assess physiological morphology through cardiac cycle (systole to diastole),practically, though it is impossible to recognize that intraoperatively. Furthermore, this method allowed surgeon to simulate not only surgical procedures, but also appropriate intercostal thoracotomy approach position, and considering precise device size in advance. 3D printed models and 3D VR systems are clinically available and promising for facilitating the operation strategy optimization and assistant for MICS MVP procedures safely. There will be contributions to clinical practice for preoperative accurate assessment and simulation.

CAEE-5 State of the Art Imaging in Surveillance of Repaired Tetralogy of Fallot: Imaging in Therapeutic Planning and Risk Assessment

Awards
Certificate of Merit

Participants
Yoshiaki Ota, MD, Ann Arbor, MI (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is:1. Understand the central role of cardiac MR (CMR) in post repair Tetralogy of Fallot (TOF) to assess anatomic and functional sequelae2. Learn the role of MR in clinical decision making and prognostication3. Illustrate the spectrum of new imaging techniques and their applications in repaired TOF. 4. To learn the utility of imaging prior to and following transcatheter pulmonary valve replacement (TPVR).

TABLE OF CONTENTS/OUTLINE

Outline1. Background- Most common cyanotic congenital heart disease characterized by ventricular septal defect, pulmonary stenosis (right ventricular outflow obstruction), dextroposition of the aorta (overriding aorta), and right ventricular hypertrophy 2. Pathophysiology of repaired TOF- Role of imaging in assessing sequelae of repair, clinical decision making, planning TPVR, outcomes and prognosticationa. Imaging protocols for surveillance emphasizing new techniques such as 4D flow, parametric mapping, strain imaging b. MR derived parameters and their role in timing and planning of pulmonic valve intervention and risk assessment (ventricular size and function, presence and extent of Late Gadolinium Enhancement, regurgitation quantification, residual ventricular septal defect, and vascular anatomy)c. Indications for Pulmonary Valve Replacementd. Procedural aspects of TPVR and available devicese. Pre-intervention imaging for patients and device selection: protocols, imaging modalities, 3D printing f. Post-TPVR imaging and complicationsg. Future directions

CAEE-50 Three-dimensional (3D) Procedure Planning for Transcatheter Mitral Valve Replacement

Participants
Nicole Wake, PhD, Aurora, OH (*Presenter*) Employee, General Electric Company

TEACHING POINTS

A. Transcatheter Mitral Valve Replacement (TMVR) is a minimally invasive procedure that replaces the valve using a device that clips onto the faulty valve.B. Multi-detector computed tomography (MDCT) of the mitral valve and aortic outflow tract is important for appropriate patient and device selection.C. A multidisciplinary approach is required for patient selection and procedure planning.D. Planning for TMVR is traditionally performed by visualizing medical imaging data and using two-dimensional (2D) measurements to determine appropriate valve sizing.E. Three-dimensional (3D) visualization can provide enhanced visualization and superior planning regarding device sizing and placement.F. For complicated cases, 3D printing can be performed to create a precise model of the anatomy and allow for enhanced surgical planning.

TABLE OF CONTENTS/OUTLINE

1. Review of mitral valve disease.2. Overview of multi-detector computed tomography (MDCT) for mitral valve disease evaluation.3. Synopsis of currently available valves for TMVR procedures.4. Outline of two-dimensional (2D) image analysis and valve sizing.5. Description of three-dimensional (3D) visualization, image analysis, and device planning.6. Summary of 3D printing and use for planning TMVR.

CAEE-51 Spectrum of Imaging Findings in Takotsubo Cardiomyopathy

Participants
Camila V. Machado, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

After attending to this exhibit, the learner should be able:1. To understand both clinical and laboratory features of Takotsubo Cardiomyopathy.2. To recognize the major imaging findings of Takotsubo Cardiomyopathy on magnetic resonance imaging (MRI).3. To correlate the imaging findings on MRI, echocardiography and ventriculography.4. To understand the importance of cardiac MRI in the diagnosis of Takotsubo Cardiomyopathy and in the evaluation of differential diagnoses.5. To analyze the role of MRI in the

detection of acute complications and in the follow-up of the patients.

TABLE OF CONTENTS/OUTLINE

? Diagnosis of Takotsubo Cardiomyopathy ? Epidemiology ? Clinical findings, stressful events ? MRI, echocardiogram and ventriculography? Importance of MRI for the diagnosis and characterization of Takotsubo Cardiomyopathy ? Assessment of segmental changes in contractility (cine, strain) ? Assessment of myocardial edema (T2 weighted images, T1 and T2 mapping) ? Assessment of myocardial necrosis / fibrosis (late gadolinium enhancement)? Atypical manifestations of Takotsubo Cardiomyopathy (different patterns of contractile change)? The role of MRI in excluding other causes of chest pain ? Myocarditis / pericarditis ? Acute myocardial infarction ? Extracardiac pathologies (pulmonary, pleural, musculoskeletal)? The role of MRI in the detection of acute complications and the follow-up of the patients ? Heart failure, pleural/pericardial effusion, intracavitary thrombus, ventricular wall rupture

CAEE-52 Three-Dimensional Fusion Technique with CT and LGE-MRI for Cardiac Resynchronization Therapy

Participants
Yoshihiro Haga, Sendai, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

Cardiac resynchronization therapy (CRT) is an established treatment for patients with severe heart failure (HF). Factors influencing CRT response are Fig. 1. In particular, it is important to know the left ventricular (LV) lead location and the extent of myocardial scar. These can be assessed by the contrast computed tomography coronary venography (CTCV) or late gadolinium enhancement by cardiac magnetic resonance (LGE-CMR) imaging. However, these cannot be observed on the same three-dimensional image. Therefore, we devised a method that a three-dimensional fusion technique combined the two images derived from CTCV and LGE-CMR imaging.

TABLE OF CONTENTS/OUTLINE

1. Understanding the treatment of heart failure (HF) using cardiac resynchronization therapy (CRT). 2. Understanding the key points for a successful CRT. 3. Understanding the preoperative CT scan of CRT. 4. Understanding the importance of Fusion image with CT and LGE-CMR. 5. Features of CRT: International guidelines on CRT implantation 6. The key points for a successful CRT: QRS duration, LV scar tissue, LV read position, etc. 7. Fusion image with CT and LGE-MRI: three-dimensional fusion technique

CAEE-53 A New Evaluation Method for Coronary Plaque by DECT

Participants
Takayoshi Yamaguchi, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review the current status of coronary plaque assessment and summarize its limitations 2. Summary of advantages and disadvantages of Dual energy CT compared to Single energy CT 3. Questions about spectral analysis of plaques from coronary CTA 4. Explains new image analysis methods to improve plaque identification accuracy 5. Presenting the correlation between a new plaque evaluation method by CT and intravascular imaging

TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Explain the importance of assessing plaque characteristics using coronary CT 3. Comparison of plaque evaluation by coronary CT and IVUS or OCT 4. Explain the advantages of assessing plaque with dual energy CT 5. Limitations for assessing plaque in the arterial phase 6. Proposal of new imaging techniques and methods for improving the ability to characterize plaque tissue using dual energy CT 7. Explain the characteristics of the measured values in various types of plaque tissues and the changes in the spectral HU curve 8. Correlation between new tissue characterization method by DECT and evaluation by intravascular imaging

CAEE-54 Structured Pretransplant Cardiac CT Report in Adult Patients with Congenital Heart Disease: What the Radiologist Should Analyze

Participants
Rebeca Gil Vallano, Madrid, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

- To analyze the radiological findings, which cardiac surgeons need for the surgical planning of heart transplant in adults with congenital heart disease (CHD).- To propose a structured report of pretransplant cardiac CT.

TABLE OF CONTENTS/OUTLINE

Our hospital is a referral center for heart transplantation in pediatric and adult patients with CHD.Imaging tests - echocardiogram, magnetic resonance, and computed tomography (CT) - show the cardiac abnormal anatomy. CT additionally demonstrates other findings in these patients with complex anatomies and, in some cases, multisystem disorders (lung anatomy, aorto-pulmonary collaterals, previous surgeries, vascular accesses, rib cage, abdominal anatomy). In our work we will focus on the CT examination performed preoperatively.We will revise the CT acquisition technique, and we will evaluate its benefits, since this technique acquires 3D data with a wide field of view that allow a comprehensive evaluation of the anatomy with good spatiotemporal resolution and multiplanar reconstruction capacity.In the interpretation of these studies, it is very important to carry out a systematic and practical assessment of the preoperative aspects. For this reason, we use a structured report, which we will develop in detail and illustrate with cases from our center. We will emphasize the information needed by surgeons and show the methodology we use to obtain it. Radiologists have a fundamental role through the radiological report in the pretransplant surgical planning of adult patients with CHD.

CAEE-56 Advanced Cardiovascular Computed Tomography Imaging in Children with Congenital Variants and Anomalies of the Aortic Arch: From Volume Rendering to 3D Models and 3D Printing

Participants
Flavio Zuccarino, MD, Barcelona, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

To discuss the main indications for cardiovascular CT in newborns and children with congenital anomalies of the aortic arch (CAAA).To outline the key imaging findings, advantages and limitations of CT in CAAA, enhancing the usefulness of volume rendering (VR) and 3D models in differential diagnosis and the design of an optimal therapeutic approach.

TABLE OF CONTENTS/OUTLINE

We discuss, in a short background, the advantages and limitations of CT in CAAA diagnosis. We analyze different CT acquisition protocols depending on patient age and pathology. We organize CT findings of different CAAA as:Left-sided aortic arch anomalies. Right-sided aortic arch anomalies. Double aortic arch Cervical Aortic Arch Persistent Fifth Aortic Arch Interrupted Aortic Arch Aortic Arch Hypoplasia Coarctation Pseudocoarctation Gothic aortic arch We review key CT findings of different CAAA, focusing on 3D imaging reconstructions and 3D models. We define the relationship of the aorta to the airways, esophagus, and other cardiovascular and thoracic structures that play a pivotal role in CAAA diagnosis. We discuss potential differential diagnosis of CAAA.OUTLINE Radiologists should be familiar with CT key imaging findings and with the advantages and limitations of 3D advanced techniques to establish an optimal diagnostic approach and therapeutic management.

CAEE-57 ArrhythmogenicLeft Ventricular Cardiomyopathy (ALVC); Understanding Current Concepts

Participants
Daniel Ocazionez-Trujillo, MD, Houston, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Genotype-phenotype correlation studies have demonstrated that mutations in Desmoplakin and Filament C genes are the most common gene defects causing ALVC.- Patients with ALVC usually complain of symptoms of both arrhythmia (palpitations, chest tightness, syncope) and LV heart failure.- Imaging modalities in ALVC usually reveal severe LV dysfunction with preserved to mildly impaired RV function. Often this entity has been misdiagnosed as dilated cardiomyopathy, chronic myocarditis, myocardial infarction, or double ventricular involvement type ARVC.- Reported Cardiac MRI findings in ALVC include dilated left ventricle, fatty infiltration, irregular lateral wall contour with a “serrated” shape and areas of mesocardial and epicardial delayed enhancement in a "ring like" distribution involving the septal and lateral walls.

TABLE OF CONTENTS/OUTLINE

-Definition-Clinical presentation-Genetics-Imaging findings on Cardiac MRI-Differential diagnosis-Conclusion

CAEE-58 The Multiple Facets of Cardiac Amyloidosis -Diagnostic Imaging Overview

Participants
Aarushi Gupta, MD, MBBS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Diagnosis of cardiac amyloidosis is challenging and can be misinterpreted for hypertensive heart disease or hypertrophic cardiomyopathy, particularly in older patients with heart failure with preserved ejection fraction (HFpEF).• Recent treatment advances such as Tafamidis for ATTR amyloidosis (Transthyretin amyloidosis) can delay disease progression. An understanding of imaging features can help in early diagnosis and appropriate management of patients.• Echocardiography, cardiac MRI and nuclear Tc-99 pyrophosphate scan are complementary and can help in establishing the diagnosis.

TABLE OF CONTENTS/OUTLINE

1. Background on common types of cardiac amyloidosis:• AL (Light chain) and ATTR amyloid (hereditary and wild type)• Clinical manifestations of amyloidosis• How to differentiate ATTR from AL amyloidosis using clinical and biochemical parameters 2. Imaging in diagnosis of cardiac amyloidosis with focus on ATTR amyloidosis• Echocardiography, cardiac MRI and different LGE patterns (with discussion of QALE score)• Caveats in establishing diagnosis including technical challenges like determining the nulling time of myocardium• Recent advances in MR cardiac imaging including parametric tissue mapping (for diagnosis and prognosis) and myocardial strain (for early detection of LV dysfunction) 3. Discuss role of nuclear medicine techniques like Tc-99 pyrophosphate scan and recent American Society of Nuclear Cardiology (ASNC) guidelines for diagnosis •Correlative MR cardiac and Tc-99 pyrophosphate images will be provided 4.Discuss new disease modifying therapies for ATTR amyloidosis such as Tafamidis 5. Conclusion

CAEE-59 Cardiac Amyloid - Correlation of Cardiac Magnetic Resonance and Pathology

Participants
Navpreet Khurana, MBBS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Describe the classic imaging findings of cardiac amyloidosis (CA) on cardiac magnetic resonance (CMR). 2. Understand the conditions which can mimic CA on CMR - false positives. 3. Understand the incremental value of nuclear medicine.

TABLE OF CONTENTS/OUTLINE

1. Findings of CA on CMR. 2. Role of Nuclear Medicine in diagnosing CA. 3. Review of cases - positive CMR and positive pathology. 4. Review of cases - positive CMR and negative pathology. 5. Review of cases - negative CMR and positive pathology.

CAEE-6 Cardiac MRI in Congenital Heart Disease: Pearls and Pitfalls

Participants
Priyanka Garg, MBBS, MD, New Delhi, India (*Presenter*) Nothing to Disclose

TEACHING POINTS

Cardiac MRI is a powerful tool giving relevant anatomical and physiological information of cardiovascular structures in congenital heart disease. The purpose of this exhibit is to: 1. Discuss the various pearls and pitfalls relevant to planning, acquisition and interpretation of cardiac MR images. 2. Enumerate specific points that need special consideration while imaging in paediatric

patients. 3. Describe the role of cardiac MR imaging in patients with congenital heart disease.

TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Patient selection 3. Sedation requirement 4. ECG placement 5. Cardiac MR sequences 6. Cardiac MR planning 7. Phase contrast imaging 8. Angiographic imaging 9. Post processing including ventricular volumetry, flow assessment, shunt fraction and important formulae for regurgitant fraction 10. Role of cardiac MRI in congenital heart disease 11. Take home message

CAEE-60 Multimodal Imaging Characterization of Cardiac Tumors Emphasizing PET with Pathology Correlation Using the New 2021 WHO Classification

Awards
Identified for RadioGraphics

Participants
Maria Clara Lorca, MD, Pittsford, NY (*Presenter*) Nothing to Disclose

TEACHING POINTS

Due to their rarity and overlapping imaging characteristics, tumors and tumor-like conditions of the heart can be a radiological challenge. It's important to be familiar with their imaging presentation in order to improve diagnostic accuracy and avoid unnecessary invasive procedures.1. New 2021 WHO Classification of Cardiac Tumors2. Depict cardiac tumors and cardiac tumor-like radiological features3. Describe the importance of PET-CT in the diagnosis and follow up of cardiac tumors4. Discuss the cardiac tumor-like conditions including cardiac thrombus, mediastinal abscess, pericardial hematoma, pericardial cyst5. Describe the pearls and pitfalls that some entities demonstrate in the cardiac imaging, including benign entities that can appear as a cardiac pseudotumor

TABLE OF CONTENTS/OUTLINE

This education exhibit reviews biopsy-proven cases of cardiac lesions and their mimics and depict their radiological features, including images pearls and pitfalls.Review with clinical pictures, illustrative case examples, and original illustrations the cardiac tumors in a systematic fashion.Incorporate the new 2021 WHO classification of the cardiac tumors.Depict the imaging appearances of various types of cardiac tumor-like conditions and how to accurately differentiated them from cardiac tumors.

CAEE-61 Imaging of Acute and Chronic Cardiac Complications of COVID-19

Awards
Identified for RadioGraphics
Certificate of Merit

Participants
Felipe Sanchez, MD, Toronto, Chile (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Acute cardiac complications in patients with COVID-19 are relatively rare but include myocarditis, thrombosis and ischemia2. Cardiac imaging plays an important role in the diagnosis of acute myocardial injury in patients with COVID-19, with typical findings on cardiac MRI including edema, high native T1, and co-localizing late gadolinium enhancement3. Patients who have recovered from COVID-19 are at increased risk of cardiovascular disease, including those with persistent symptoms and post-acute sequelae of SARS-CoV-2 infection (or long COVID)4. Cardiac MRI can be useful in patients with persistent symptoms and functional impairement after COVID-19 to evaluate for the sequelae of myocarditis, left ventricular ejection fraction, strain, and parametric mapping

TABLE OF CONTENTS/OUTLINE

The purpose of this educational exhibit is to:1. Review the acute and chronic cardiac complications related to COVID-19 including incidence, pathophysiology, risk factors, and clinical outcomes2. Demonstrate the role of cardiac imaging in establishing a diagnosis of myocarditis following COVID-193. Illustrate multi-modality cardiac imaging findings in patients recovered from COVID-19 with persistent symptoms

CAEE-62 Pearls and Pitfalls in Cardiac Imaging

Participants
Furkan Ufuk, MD, Denizli, Turkey (*Presenter*) Nothing to Disclose

TEACHING POINTS

? To review the cardiac pseudotumors and challenging diagnoses ? To review the cardiac outpouchings and differential diagnoses ? To review the cardiac and coronary artery anatomic variations

TABLE OF CONTENTS/OUTLINE

1. Cardiac pseudotumors Right atrial pseudotumor due to prominent crista terminalis, lipomatous hypertrophy of the interatrial septum, caseous mitral annular calcification, focal hypertrophic cardiomyopathy, microvascular obstruction, left atrial appendage pseudothrombus, ventricular noncompaction. 2. Cardiac outpouchings: True and false left ventricular aneurysms, ventricular diverticula, ventricular clefts and crypts, atrial diverticula and aneurysms, interatrial septal aneurysm, sinus valsalva aneurysm, interventricular septal aneurysm, mitral-aortic intervalvular fibrosa pseudoaneurysm. 3. Cardiac and coronary artery anatomic variations and congenital lesions: Patent foramen ovale, interatrial septal pouch, coronary artery anomalies, coronary artery tortuosity, coronary artery fistulas, 4. Coronary artery lesions and pseudolesions: Coronary artery aneurysm, RCA pseudostenosis due to streak artifact, overestimation of stenosis due to calcified plaque, myocardial bridging. 5. Pulmonary vein abnormalities and anatomical variations: right top pulmonary vein, pulmonary venous varix, pulmonary vein thrombosis, partial anomalous pulmonary venous return, anomalous midline common ostium of the left and right inferior pulmonary veins

CAEE-63 Imaging of Left Ventricular Assist Device (LVAD) Driveline Infections and Other Common LVAD Complications

Participants

Mahati Mokkarala, MD, Saint Louis, MO (*Presenter*) Nothing to Disclose

TEACHING POINTS

Teaching Points:The purpose of this exhibit is to:1. Illustrate the common LVAD devices and components of the left ventricular assist device on CT2. Imaging characteristics of LVAD infections that lead to operative management. 3. Understand imaging of additional LVAD complications.

TABLE OF CONTENTS/OUTLINE

Content Organization:1. Basics on type and anatomy of drive line parts: - Description of multiple types of LVAD machines. Older models: Jarvik, Thoratec, Heartmate - Diagram of most recent LVAD machine, Heartmate III and components on CT.2. CT imaging of LVAD infections that lead to operative management - Drive line soft tissue thickening that can involve adjacent musculature, peritoneum - Drive line and adjacent left ventricular assist device fluid collection/abscess 3. Nuclear medicine imaging of LVAD infections - Description of PET/CT findings including increased FDG uptake by the driveline and LVAD - Comparison of PET/CT and white blood scintigraphy scans4. CT imaging of additional more local LVAD complications including the following: -Increased risk of LVAD structural, outflow and inflow cannula, pump systemic thrombosis - Increased risk of local hemorrhage - LVAD device and cannula mechanical breakage, device failure - Involvement of adjacent soft tissue and vascular structures5. CT imaging of more systemic, LVAD related, complications - Increased risk of right ventricular dysfunction and aortic valve disease - Increased risk of systemic hemorrhage (GI bleeding), thrombosis (stroke, PE).

CAEE-64 Spectrum of Cardiothoracic Imaging Findings in Drug Abuse

Participants
Gaurav Watane, MBBS, MD, Pittsburgh, PA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To recognize the emergent and non-emergent cardiothoracic imaging findings in the recreational drug abuse 2. To gain awareness through example cases of the associated complications 3. To discuss the complementary role of CT/MRI, PET/CT, and echocardiography in the management

TABLE OF CONTENTS/OUTLINE

1. Case-based review of the spectrum of cardiothoracic imaging findings in the recreational drug abuse; including infective endocarditis with or without vegetations, pulmonary embolism, septic emboli, thrombophlebitis, Spontaneous coronary artery dissection (SCAD), Vaping associated lung injury (EVALI)2. Current status of various imaging modalities and their limitations in the imaging of Cardiothoracic complications

CAEE-65HC Characterization of Atrial Masses through Cardiac Magnetic Resonance Imaging

Participants
Hector Manuel Medina, MD, Bogota, Colombia (*Presenter*) Nothing to Disclose

TEACHING POINTS

Teaching Points- Cardiac magnetic resonance (CMR) provides a reliable and detailed evaluation of cardiac masses.- While biopsy remains the cornerstone of diagnosis, CMR has been proven safe and effective at assessing atrial masses and determining its extension, vascular involvement and providing differential diagnoses.- Based on this assessment, a multidisciplinary medical and/or surgical management plan can be established.- Follow-up based on CMR after treatment yields an equivalent comparison, thus optimizing treatment decisions.

TABLE OF CONTENTS/OUTLINE

*?able of Contents/Outline: A Case-Based Approach- Epidemiology of the most common atrial masses.- Radiologic features and characterization (preliminary diagnosis through imaging) and correlation with biopsies.- CMR as an ideal tool for the diagnosis of atrial masses.- Use of steady-state free precession (SSFP), T1-weighted (T1W), short tau inversion recovery (STIR), early gadolinium enhancement (EGE), late gadolinium enhancement (LGE), and perfusion sequences.- Multidisciplinary medical and surgical management strategy formulation.- Useful tool for disease staging and follow-up.Please visit the Learning Center to also view this presentation in hardcopy format.

CAEE-66 Be Aware of the Heart in an Oncologic Scenario! Cardiac Metastases - A Pictorial Essay

Participants
Pedro Matta, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Review the main radiologic features that differentiate primary and secondary cardiac masses and and discuss the role of advanced cardiac imaging modalities in evaluating these lesions Describe anatomical landmarks involved in metastatic spread to the heart such as pericardium, epicardium, myocardium, valves and chambers. Understand the epidemiology, including prevalence, most common origins and histologic types of metastatic involvement of the heart. Propose a diagnostic workflow based on tumor features including size, borders, tissue invasion, site, pericardial involvement, single or multiple lesions and tissue characteristics , describing contrast enhancement, T1 and T2WI signal intensity. Identify the major red flags regarding imaging signs associated with cardiac involvement.

TABLE OF CONTENTS/OUTLINE

Major malignant secondary cardiac tumors , including epidemiology, pathophysiology and imaging findings: Poorly differentiated small cell type, Leukemic infiltrate and mass, Melanoma metastasis, Osteossarcoma metastasis and Angiossarcoma.The role of multimodality imaging techniques, such as US, CT, MRI, PETCT, in the evaluation of cardiac masses, listing advantages and disadvantages in diagnosis and surgical planning including Echocardiography, Computed tomography, Magnetic Resonance Imaging and PETCT.Differential diagnosis, potential pitfalls and artifacts to keep in mind when evaluating a potential cardiac mass.

CAEE-67 Radiologic Evaluation of Transcatheter Valve Replacements

Participants
Demetrios Raptis, MD, Frontenac, MO (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Discuss indications and contraindications for transcatheter valve replacement with emphasis on pulmonic, mitral, and tricuspid valve replacements and brief discussion of transcatheter aortic valves. Review preprocedural imaging work-up for transcatheter valve replacements specific to each valve. Case based review of complications of transcatheter valve replacements

TABLE OF CONTENTS/OUTLINE

Brief review of transcatheter aortic valve replacement Discuss indications for transcatheter valve replacements • Pulmonic • Mitral • Tricuspid Review preprocedural imaging of transcatheter valve replacements with emphasis on measurements and accesses routes both standard and alternative • Pulmonic • Mitral • Tricuspid Case based review of complications in transcatheter valve replacement including but not limited to: • Misplaced/malpositioned valves • Embolized valves • Outflow tract obstructions • Paravalvular prosthetic leaks • Hypo-attenuating leaflet thickening • Hypo-attenuation affecting motion • Coronary obstruction • Vascular complications/bleeding • Valve malfunction • Embolic phenomenon • Septic emboli

CAEE-7 Heterotaxy: What the Radiologist Needs to Know to Get It Right

Participants
Maria Clara Lorca, MD, Pittsford, NY (*Presenter*) Nothing to Disclose

TEACHING POINTS

Heterotaxy syndrome remains a diagnostic challenge, especially for radiology residents. While situs anomalies have a rare incidence, it is important to recognize them early in part due to their correlation with congenital heart disease. The aim of this project is to review the anatomic imaging appearance of heterotaxy syndrome on CT and MRI and how to incorporate heterotaxy findings into the segmental classification of congenital heart disease.

TABLE OF CONTENTS/OUTLINE

Become familiar with the anatomic imaging appearance of heterotaxy syndrome on CT and MR. Briefly review of the embryology, epidemiology, and terminology of heterotaxy syndrome, also known as situs ambiguous. Become familiarized with anatomic and physiologic imaging appearance of the more common forms of heterotaxy syndrome in the chest and abdomen (CT and MR), with a focus on right versus left isomerism.How to incorporate heterotaxy findings into the segmental classification of congenital heart disease using the three-part segmental notation utilized in the Van Praagh classification system.

CAEE-8 Cardiac Magnetic Resonance Imaging of Acute Myocarditis: A Review Focusing on Quantitative Evaluation Methods

Participants
Nobuko Tanitame, MD, Hiroshima, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

Acute myocarditis (AM) could result in arrhythmia, dilated cardiomyopathy or chronic heart failure. Although endomyocardial biopsy has been the gold standard in diagnosis of AM, it is invasive and has low diagnostic sensitivity. Cardiac magnetic resonance (CMR) imaging is currently considered to be the most comprehensive diagnostic tool in the evaluation of AM. Generally, T2- and T1-weighted imaging and late gadolinium enhancement (LGE) are used for diagnosing AM. Furthermore, novel quantitative techniques such as native T1, T2 mapping and extracellular volume (ECV) are recommended to allow more objective assessment of myocardial injury. We focus on quantitative methods, diagnostic strategy and pitfalls of CMR imaging in the patients with AM.

TABLE OF CONTENTS/OUTLINE

1. Recent development of CMR imaging and processing techniques 2. Establishment of standard values for quantitative analysis of CMR imaging 3. Cine MR imaging (ejection fraction, flow analysis using phase-contrast method) - Cardiac function, left and right ventricular asynergy 4. Black blood T2-weighted STIR (T2 mapping using T2-prep SSFP) - Myocardial edema 5. Native T1 mapping using MOLLI - Myocardial edema, hyperemia, necrosis, fibrosis 6. Gadolinium-enhanced perfusion CMR - Hyperemia, capillary leak 7. LGE (ECV using analysis software) - Myocardial necrosis, fibrosis 8. Representative cases and diagnostic pitfalls of AM

CAEE-9 2020: What Does the Radiologist Need to Know About Major Changes in the Diagnosis of Arrhythmogenic Cardiomyopathy?

Participants
Alan Hummel, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The goal of this exhibit is to: 1. Understand what arrhythmogenic cardiomyopathy is and what is its pathophysiology.2. Describe the significant changes in the diagnostic criteria that occurred in 2020.3. Outline the diagnostic criteria for the right ventricle.4. Discuss the "new" types of involvement: biventricular and isolated from the left ventricle.

TABLE OF CONTENTS/OUTLINE

1. Arrhythmogenic dysplasia of the right ventricle - the precursor;2. Review the basic anatomy of the right ventricle and their relationships3. What is arrhythmogenic cardiomyopathy?4. Is it possible to differentiate: myocardial fat vs fibrosis?5. Padua Criteria - Major changes in 2020.5.1. Padua Criteria - Exposing the Criteria5.2. Padua Criteria - Image5.3. Padua criteria - Other methods5.4. Morphofunctional criteria5.5. Structural criteria6. Morphofunctional abnormalities of the right ventricle6.1. Exposing the major and minor criteria6.2. Examples7. Morphofunctional abnormalities of the left ventricle7.1. Exposing the minor criteria7.2. Examples8. Structural abnormalities of the right ventricle8.1. Exposing the major criteria8.2. Examples9. Structural abnormalities of the left ventricle9.1. Exposing the major criteria9.2. Examples10. Diagnostic algorithm11. Summary in 1 slide

Mitral Annular Disjunction in Cardiac MR: What to Know and What to Look For

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CA

Awards
Identified for RadioGraphics

Participants
Jose Batista Araujo Filho, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) Mitral Annular Disjunction (MAD) definition and its association with Mitral valve prolapse (MVP) and ventricular arrhythmic events 2) The advantages of CMR in MAD diagnosis, stratification and prognosis 3) Update on state-of-the-art CMR new sequences for evaluating MAD

TABLE OF CONTENTS/OUTLINE

1) INTRODUCTION 1.1) Definition and importance of MAD 1.2) Association with MVP, ventricular arrhythmias and sudden cardiac death 1.3) Presence of MAD in normal subjects 2) CARDIAC MR (CMR) ROLE IN MAD 2.1) CMR advantages over echocardiography 2.2) How to measure the MAD distance properly 2.3) Other CMR findings useful for the diagnosis and prognosis 2.4) New CMR tools for MAD stratification (T1 mapping and Strain) 3) CMR IN MAD DIAGNOSIS 3.1) Case example of a long MAD 3.2) MAD association with MVP and regurgitation 3.3) Myocardial Fibrosis presence - late gadolinium enhancement (LGE) 4) CMR IN MAD STRATIFICATION 4.1) How to evaluate papillary muscle LGE 4.2) CMR T1 mapping importance 5) CHALLENGES IN MAD/TAKE HOME MESSAGES 5.1) MAD diagnostic pitfalls and its clinical relevance 5.2) Strain CMR as a new tool to assess regional contractile dysfunction 5.3) Red flags on MVP

The Essential Three Roles of Imaging in the Management of Chronic Thromboembolic Pulmonary Hypertension

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CA

Participants
Satoshi Higuchi, MD, PhD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Chronic thromboembolic pulmonary hypertension (CTEPH), caused by stenosis and obstruction of the pulmonary arteries by organized thrombi, is a major cause of chronic pulmonary hypertension and life-threatening disease if untreated. The prognosis is improving as a treatment strategy has been established. The role of imaging is classified into three categories: 1) detection of perfusion defects for diagnosis, 2) assessment of vascular lesions to establish a treatment strategy, and 3) evaluation of cardiac function for assessment of treatment efficacy or prognosis. Participants will learn the pathophysiologic processes of CTEPH, the essential three roles of imaging in the management of CTEPH, and future perspectives of imaging in CTEPH.

TABLE OF CONTENTS/OUTLINE

1. What is CTEPH?2. The pathophysiologic processes of CTEPH3. The essential three roles of imaging in CTEPH a. Diagnosis: lung perfusion defects b. Establishment of treatment strategy: assessment of vascular lesions c. Assessment of treatment efficacy and prognosis: evaluation of cardiac function4. Future perspectives5. Summary

CAEE-12

Pre- and Post-Operative Imaging Findings of Chronic Thromboembolic Pulmonary Hypertension (CTEPH)

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CA

Participants
Yogesh Gupta, DO, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Illustrate the proposed pathophysiology of CTEPH. 2. Detail the role of pre-operative imaging with computed tomography angiography (CTA), dual energy CT (DECT), ventilation perfusion (V/Q) scintigraphy, magnetic resonance angiography (MRA), MR perfusion, and 4D phase contrast MR. 3. Provide radiological examples, practical tips for aiding in diagnosis and describing current diagnostic challenges. 4. Highlight key findings that the radiologist should convey to the interventionist to best help guide therapy. 5. Demonstrate clinical correlates from our Pulmonary Hypertension Center with post-procedural outcomes from pulmonary endarterectomy, percutaneous balloon pulmonary angioplasty, and percutaneous ultrasound accelerated thrombolysis (EKOS®) as well as outcomes from medical therapies including pulmonary vasodilators and anticoagulation. 6. Overview of emerging artificial intelligence technologies that may facilitate CTEPH diagnosis.

TABLE OF CONTENTS/OUTLINE

This pictorial review is designed for residents, fellows, general radiologists, thoracic radiologists, interventional radiologists, and non-radiology participants. The primary goals are to describe the pre- and post-operative imaging features of CTEPH with clinical correlation and post-surgical outcomes. This will be achieved by discussing: 1. CTEPH in the WHO classification scheme. 2. Clinical features of and risk factors for CTEPH 3. Pathophysiology of CTEPH 4. Diagnostic algorithm. 5. Multimodality imaging overview. 6. Overview of treatment options.

3D Printing in Cardiovascular Diseases: State-of-the-Art

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CA

Awards
Cum Laude

Participants
Prabhakar Rajiah, MD, FRCR, Rochester, MN (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To review the principles and techniques of 3D printing 2. To discuss the utility of 3D printing in cardiovascular diseases (CVD) 3. To illustrate the applications of 3D printing in CVD

TABLE OF CONTENTS/OUTLINE

1. INTRODUCTION 2. 3D PRINTING PROCESS- Image acquisition; segmentation; mesh, 3D printing; air drying; fixation 3. SOURCE DATA- CT, MRI, Hybrid 4. IMAGE ACQUISITION RECONSTRUCTION STRATEGIES CT- ECG-gating, High contrast, high isotropic spatial resolution; MRI- Volumetric acquisition, high CNR sequences, ECG-gating, less artifacts 5. 3D MESH FILE FORMATS- STL, VRML, novel 6. 3D PRINTING METHODS- Material jetting, binder jetting, Vat polymerization, material extrusion, powder bed fusion 7. APPLICATIONS OF 3D PRINTING Identification of anatomic landmarks; Involvement of adjacent structures, relationship; Planning surgeries/interventions; Device size; Printing interventional wires; Education of trainees, patients; Communication with clinicians; 8. APPLICATIONS OF 3D PRINTING IN CVD WITH CASE EXAMPLES Congenital heart diseases (septal defects, complex CHD)- Surgical planning, roadmap; Structural heart disease (Aortic, pulmonary, mitral, tricuspid valve interventions, LAA closure)- Preprocedural planning, device selection, bench testing; Neoplasms- relationship/involvement of adjacent structures; Hypertrophic cardiomyopathy- Outflow anatomy, relationship to adjacent structures; Cardiac aneurysms/ pseudoaneurysms- Anatomy, relationship; Vascular disease- Chronic dissection, aneurysms, Marfan syndrome 9. ACCURACY LIMITATIONS 10. UTILITY OF AI 11. PITFALLS 12. TIPS ON SETTING UP A 3D PRINTING SERVICE

CAEE-16

Multi-modality Cardiac Imaging in Myocarditis Following COVID-19 Vaccination

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CA

Participants
Constantin Marschner, MD, Toronto, ON (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Myocarditis following COVID-19 vaccination is rare. However, adolescent and young adult males are at highest risk. Chest pain is the most common presenting symptom.2. Cardiac imaging plays an important role in the diagnosis of acute myocarditis following vaccination, with typical findings on cardiac MRI including subepicardial late gadolinium enhancement and co-localizing edema at the basal to mid inferior lateral wall. 3. The disease course is typically transient and mild, with resolution of symptoms within 1-3 weeks in most patients. Limited follow-up data demonstrates resolution of myocardial edema but persistence of late gadolinium enhancement in some patients. 4. Longer term follow-up is needed to determine whether persistent imaging abnormalities are associated with adverse outcomes, including arrythmias and heart failure.

TABLE OF CONTENTS/OUTLINE

The purpose of this educational exhibit is to:1. Review the incidence, pathophysiology, risk factors, and clinical outcomes of myocarditis following COVID-19 vaccination2. Demonstrate the role of cardiac imaging in establishing a diagnosis of myocarditis following vaccination including echocardiography, cardiac MRI, and PET 3. Illustrate multi-modality cardiac imaging findings in patients with myocarditis following vaccination, at the time of acute presentation and at follow-up

CAEE-17

Comprehensive Assessment of Cardiac Amyloidosis with Cardiac MRI: Morphology, Function and Tissue Characterization

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CA

Participants
Filipe Carvalho, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Cardiac amyloidosis is a challenging diagnosis that usually requires increased clinical awareness and multimodality evaluation for timely diagnosis.In this presentation, the reader should learn how to identify the spectrum of morphologic features of cardiac amyloidosis and to address the role of cardiac MRI in the main differential diagnosis. We will demonstrate the main delayed enhancement patterns with potential imaging pitfalls and discuss the applicability of new mapping techniques (native T1 and Extracellular Volume Fraction [ECV]) on the diagnostic and prognostic assessment

TABLE OF CONTENTS/OUTLINE

(1) Introduction and Background. (2) Present the main morphological features of cardiac amyloidosis: enlarged atria, left ventricle hypertrophy, diastolic dysfunction. (3) Discuss the role of tissue characterization with native T1 mapping, ECV, TI-scout, magnitude and PSIR delayed enhancement techniques in the prognostic and diagnostic assessment. (4) Illustrate the main imaging pitfalls and possible differential diagnosis. (5) Take-Home messages and teaching points.

Cardiac MRI 2D Phase Contrast Flow Imaging: Pearls and Pitfalls

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CA

Participants
Claire Brookmeyer, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Review pearls and pitfalls in the application of phase contrast 2D flow imaging to cardiac MR. Emphasize important pitfalls in the acquisition of phase contrast 2D flow sequences. Explain indications and utilization of 2D flow imaging to cardiac valvular stenosis and regurgitation, as well as intracardiac shunts.

TABLE OF CONTENTS/OUTLINE

Introduction: Background information on valvular stenosis and regurgitation, intracardiac shunt, Role of velocity and flow quantification in the detection and management of cardiac valvular pathologies and intracardiac shuns. Technical pearls and pitfalls: Basic physics concepts behind phase contrast imaging to determine flow, Imaging plane set up for aorta and main pulmonary artery, Slice location selection, VENC selection and aliasing, In-plane and Through-plane techniques, Temporal resolution. Imaging protocols and Post-Acquisition Processing: Steady state free precession cine sequences for Functional assessment, stroke volume quantification, Phase contrast sequences for velocity and flow assessment. Application: Regurgitation (Mitral, Aortic), Stenosis (Aortic, Mitral), Intracardiac shunt Qp/Qs

Preprocedural Assessment of Left Atrial Appendage Closure Using Dedicated CT Image

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CA

Participants
Naoki Hosoda, (*Presenter*) Nothing to Disclose

TEACHING POINTS

To learn about the pre-procedural assessment for left atrial appendage treatment.To learn measurement method of LAA dimensions.To learn advantage of preoperative assessment for LAAC with CT.To learn about necessity of CT.

TABLE OF CONTENTS/OUTLINE

A. Pre-procedurally clarifies the intracardiac thrombus and LAA morphology.B. Usefulness of CT to measure in the same way as TEE.C. Risk assessment by morphology and simulation of optimal sheath selection using CT volume data.D. CT predicts not only the risk of the intervention based on anatomical features of the LAA but also the thrombus, device size, sheath type, optimal location for septal puncture and pre-procedurally clarifies LAA dimensions.

Taking It to the Next Level - What's New with CAD-RADS 2022

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CA

Awards
Certificate of Merit

Participants
Arzu Canan, MD, Dallas, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

Purpose: The purpose of this educational exhibit is to review the update version of CAD-RADS (Coronary Artery Disease Reporting and Data System) and to highlight the changes compared to prior version with illustrative case examples. Major teaching point CAD-RADS not only provides a common and standardized lexicon for interpretation of coronary CT angiography findings but also provides specific recommendations for further management of patients. Although the main seven categories remain similar in the updated version, the new CAD-RADS scoring system allows for more comprehensive evaluation and description of coronary atherosclerosis with the addition of new features, such as plaque volume assessment and physiologic significance of stenosis.

TABLE OF CONTENTS/OUTLINE

This exhibit includes a systematic review of the CARD-RADS categories and modifiers, followed by case based examples. The systematic review includes 1. The rationale and the evidence for updated CAD-RADS will be reviewed 2. CAD-RADS Categories (0-5 and N): What is same and different with illustrative case examples3. Modifiers: N, S, G, V, etc.: What is the same and what is new with illustrative case examples 4. New features 5. Recommendations: What is same and different with illustrative case examples Conclusion It is of importance to understand the differences between the original and the newest version of CAD-RADS and to implement those changes into the clinical practice in order to improve communication and to facilitate decision making process for further management of patients. This exhibit equips the learner with the required knowledge in a practical illustrated manner.

Cardiac Electrophysiology 101 and the Role of Radiologist

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CA

Awards
Identified for RadioGraphics

Participants
Prabhakar Rajiah, MD, FRCR, Rochester, MN (*Presenter*) Nothing to Disclose

TEACHING POINTS

Electrophysiology (EP) deals with diagnosis and management of heart rhythm problems. It is important for a cardiac radiologist to know the basics of EP and roles where they can contribute 1. To review the basic techniques used in cardiac EP 2. To correlate EP findings with cardiac CT/MRI 3. To understand the role of CT/MRI in cardiac EP

TABLE OF CONTENTS/OUTLINE

1. INTRODUCTION - Cardiac action potential, arrhythmia mechanisms 2. CARDIAC EP- Role, advantages 3. STANDARD EP TESTS- Catheters, measurement of electric potentials 4. ATRIAL FIBRILLATION/FLUTTER - a. EP for diagnosis and ablation; b. Pre-procedural CT/MR -for anatomy, thrombus, scar; c. Procedural- Electroanatomic mapping, ablation types; d. Post-procedural CT/MR- Vein stenosis, thrombus, bleed, esophagoatrial fistula, perforation, pericardial effusion; e. Left atrial appendage closure- Pre-procedural planning, post procedural complications 5. VENTRICULAR ARRHYTHMIAS -a. EP techniques for characterization; b. EP ablation; c. Scar (substrate) evaluation- detection, mapping, heterogeneity in MRI/CT ; d. Ablation procedure- electroanatomic mapping, CARTO; e. MRI-guided ablation 6. LV DYSYNCHRONY - a. Evaluation with MRI/strain; b. CRT procedure; c. Venous anatomy CT/MRI ; d. MRI/CT- Scar 7. SUDDEN CARDIAC DEATH a. Identifying at-risk patients; b. MRI/CT for diagnosis 8. BRADYCARDIA- Sinus, heart blocks - MRI, PET/CT for sarcoidosis 9. SYNCOPE - Table tilt test 10. COMPLEX CONGENITAL/POST-SURGICAL ANATOMY- Imaging guidance for navigation to appropriate chamber. 11. IMAGE GUIDED RETRIEVAL OF RETAINED LEADS

Coronary CT Angiography with Myocardial Late Enhancement Protocol in the Emergency Room: Tips and Tricks

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CA

Participants
Lucas Farias, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is:- To review coronary CT angiography with myocardial late enhancement protocols in the evaluation of patients with chest pain.- To review the pharmacokinetics of late iodine enhancement at CT as alternative to the gadolinium at MRI.- To assess the utility of the coronary CT angiography with myocardial late enhancement protocol in the emergency room to exclude coronary obstruction in patients with suspected acute myocarditis.- To correlate important findings with the anatomy and pathophysiology.- To discuss image findings according to the patterns of late enhancement to differentiate between ischemic and nonischemic myocardial damage, to enhance radiologists' skills.- To review usual and unusual patterns of acute myocardial infarction, myocarditis and others non-ischemic cardiomyopathies. - To highlight their characteristics to familiarize radiologists with these conditions, preventing unfavorable patient outcome.

TABLE OF CONTENTS/OUTLINE

Table of contents/outline - Applied myocardial anatomy and vascularization. - Pharmacokinetics of late iodine enhancement. - Patterns of myocardial late enhancement. - CT angiography with myocardial late enhancement protocol. - Case series diagnosed with CT angiography with myocardial late enhancement protocol. - Sample cases of pearls, pitfalls, diagnostic difficulties, and mimics. - Summary and take-home messages.

Can Spectral Cardiac CT Find New Clinical Value in Ischemic Heart Disease?

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CA

Participants
Junji Mochizuki, MSc,RT, (*Presenter*) Nothing to Disclose

TEACHING POINTS

To learn about special characteristic of spectral imaging : Dual layer Spectral cardiac CT.To learn about the use of spectral imaging coronary and myocardium evaluation.To illustrate various clinical applications using these techniques by presenting clinical images.

TABLE OF CONTENTS/OUTLINE

A. The virtual monochromatic image (VMI) allows evaluation of energy-dependent changes in CT number of coronary artery plaques.B. The low-energy VMI reduces the CT number of epicardial fat and clearly depicts the thrombus and coronary artery plaques.C. The VMI reduces beam-hardening artifacts. In addition, low-energy images can clearly detect areas of abnormal perfusion because the CT number of normal myocardium are increased.D. The extracellular volume function with iodine density imaging can accurately assess myocardial viability.

Chronic Thromboembolic Pulmonary Hypertension (CTEPH): A Multimodality Imaging Review

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CA

Participants
Scott Adams, MD,PhD, Saskatoon, SK (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Chronic thromboembolic pulmonary hypertension (CTEPH) is defined as pulmonary hypertension due to persistent obstruction of the pulmonary arteries from pulmonary embolism despite at least 3 months of anticoagulation.2. Ventilation-perfusion (V/Q) scintigraphy has high sensitivity for CTEPH and is a first-line imaging modality for ruling out CTEPH. In addition, SPECT-CT offers increased sensitivity and specificity.3. CT pulmonary angiography has higher specificity than V/Q scintigraphy for CTEPH, but lower sensitivity. CT features include partial or complete filling defects, bands, and webs within the pulmonary arteries; pulmonary artery dilation; right ventricular dilation and hypertrophy; bronchial artery dilation; and mosaic attenuation of the lung parenchyma.4. Dual-energy CT has been shown to improve detection of distal CTEPH and provide additional information on pulmonary vascular reserve and parenchymal arterial perfusion.5. In the future, 4D-flow MRI may play a role in treatment selection and assessment of treatment response.

TABLE OF CONTENTS/OUTLINE

DefinitionPathophysiologyClinical presentation and patient demographicsImaging features- Radiography- CT, including high-resolution CT, CT pulmonary angiography, and dual-energy CT- MRI, including MR angiography and 4D-flow- Echocardiography- Conventional angiography- Ventilation/perfusion (V/Q) scintigraphy and SPECT-CTDiagnostic approach, including the role of imaging in diagnosis, patient selection for treatment, and post-operative follow-upClinical management options

Cardiovascular Manifestations of Connective Tissue Disease

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CA

Participants
Jospeh Mansour, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

List the various cardiac and vascular entities that can occur with connective tissues diseasesDescribe the pathophysiology, risk factors, and management for each etiology.Illustrate the spectrum of imaging findings and differential diagnoses for each of these entities

TABLE OF CONTENTS/OUTLINE

Rheumatoid arthritisa. Pulmonary hypertensionb. Vasculitis and aortitisc. Aortic aneurysmd. CardiomyopathySystemic Lupus erythematosusa. Pericardial effusionb. Vasculitisc. Pulmonary embolismd. Lupus myocarditis and cardiomyopathye. Libman-Sacks endocarditisScleroderma a. Pulmonary hypertensionb. Cardiomyopathyc. Infarcts and microvascular diseasePolymyositis and dermatomyositisa. Myocarditisb. Coronary artery diseaseSjogren syndromea. Pericardial effusionb. Cardiomyopathyc. Pulmonary hypertensionSUMMARY: Patients with connective tissue diseases can suffer from cardiovascular complications which may impact both morbidity and mortality. Diagnosing these entities can be challenging, both clinically and with imaging, and is often delayed. Familiarity with these conditions and their imaging features can help the radiologist recognize these entities and aid in diagnosis.

State of the Art Cardiac MR Imaging of Ischemic Heart Disease

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CA

Awards
Certificate of Merit

Participants
Felipe Sanchez, MD, Toronto, Chile (*Presenter*) Nothing to Disclose

TEACHING POINTS

-1. Ischemic heart disease (IHD) is the worldwide leading cause of death and disability.2. Cardiac MR allows for the evaluation of global and regional cardiac function and provides superb myocardial characterization in a same evaluation.3. Cardiac MR can accurately depict myocardial edema, infarction, hemorrhage, and microvascular obstruction.4. Current Cardiac MR imaging strategies have widely accepted diagnostic and prognostic value.5. Emerging techniques and applications aim to improve prognostic and diagnostic performance of Cardiac MR.

TABLE OF CONTENTS/OUTLINE

-1. Significance of IHD.2. Basic physiopathology of IHD.3. Role of Cardiac MR in the workflow of IHD.4. Functional imaging.5. Edema imaging.6. Infarct characterization.a. Depicting myocardial infarct and "at risk" zones: classic and novel strategies.b. MVO and myocardial hemorrhage: role of T2*7. Stress perfusion.8. Novel tools for viability assessment and risk stratification.a. Feature tracking: Patterns of impaired myocardial contraction.b. Post-reperfusion hemorrhage, persistent edema, and adverse remodeling.c. 4D-flow in IHD.9. Technical considerations.

Arrhythmogenic Cardiomyopathies: What the Imager Should Know

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CA

Awards
Identified for RadioGraphics
Certificate of Merit

Participants
Mauricio S. Galizia, MD, , (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Arrhythmogenic Cardiomyopathies (AC) are a group of myocardial diseases that are associated with ventricular arrhythmias and sudden cardiac death • Although arrhythmogenic right ventricular cardiomyopathy (ARVC) was the first disease described in which morphologic and structural ventricular abnormalities were associated with arrhythmias, AC can involve the right ventricle, the left ventricle, or both • The main sub-phenotypes of AC include the classical ARVC, left-dominant AC, and arrhythmogenic dilated cardiomyopathy • Many genetic mutations have been found to be associated with AC, most often genes that encode desmosome structural proteins • AC can be associated with ventricular systolic dysfunction and/or ventricular dilation. However, symptoms of arrhythmia or history of arrhythmic cardiac arrest can occur in patient with no structural myocardial abnormalities and may represent early developing AC • There are diagnostic criteria for ARVC; however, similar criteria for the other AC phenotypes is lacking

TABLE OF CONTENTS/OUTLINE

1. Definition of arrhythmogenic cardiomyopathy (AC). 2. Description of the desmosome and its constituent proteins: Desmoglein, desmocolin, plakophilin, junctional plakoglobin, desmoplakin 3. Association between AC and genetic diseases of the desmosome: difference between disease and phenotype. 4. Typical clinical presentation and imaging findings (with a greater focus on CMR) of the following phenotypes: Arrhythmogenic right ventricular cardiomyopathy (ARVC), left-dominant arrhythmogenic cardiomyopathy, arrhythmogenic dilated cardiomyopathy 5. Differential diagnoses and mimics: Dilated Cardiomyopathy, sarcoidosis, myocarditis

Cutting the Edge of HCM: Tailored Planning of Surgical Myectomy in Obstructive Hypertrophic Cardiomyopathy

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CA

Awards
Magna Cum Laude
Identified for RadioGraphics

Participants
Sunhyang Lee, MD, Seoul, Korea, Republic Of (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To set the cardiac CT protocols and image analysis methods for simulation of successful surgical myectomy in patients with obstructive hypertrophic cardiomyopathy (HCM).2. To demonstrate tailored planning of surgical myectomy using multiphase cardiac CT images, especially volume rendering images and 3D printing

TABLE OF CONTENTS/OUTLINE

1. Classification of HCM based on surgical approach- Septal HCM- Apical HCM- Mixed, or diffuse type HCM- Combined abnormal papillary muscles2. Multiphase Cardiac CT Protocol3. CT Image Analysis Methods1) Cardiac function analysis (esp. apical, mixed, and diffuse type HCM)2) Surgeon's views- Trans-aortic view- Trans-apical view3) Papillary muscle evaluation4) Simulation of potential myectomy extent5) Comparison between pre- and post- myectomy CT images4. Various Examples1) Simulation of myectomy in septal HCM and comparison with postoperative CT2) Simulation of myectomy in diffuse HCM and comparison with postoperative CT3) Simulation of myectomy in mixed type HCM and comparison with postoperative CT4) Simulation of myectomy in HCM with abnormal papillary muscle

CAEE-28

Differential Diagnosis of Cardiac Amyloidosis: Pearls and Pitfalls

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CA

Participants
Patricia Oliveros Ordas, MD, Majadahonda, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

Cardiac amyloidosis (CA) is a rare disease caused by the extracellular deposition of insoluble fibrillar proteinaceous material in the myocardium. Due to the complexity and multisystemic involvement of amyloidosis, a high index of suspicion for CA should be maintained. Typical MRI appearance of CA includes left ventricle myocardial thickening with preserved systolic function, increased atrial volume, and altered gadolinium kinetics with the presence of late enhancement with a subendocardial or transmural pattern. Other common causes of cardiomyopathy that may present as left ventricular hypertrophy should be excluded, such as depositional cardiomyopathies, hypertensive cardiomyopathy, hypertrophic cardiomyopathy, and cardiac sarcoidosis, among others. After reviewing our extensive casuistry and our sample of 80 patients with CA, we present the findings that will allow an easier differential diagnosis by imaging between these pathologies.

TABLE OF CONTENTS/OUTLINE

• Introduction: most frequent morphologic, functional and tissue characterization MRI findings in CA • Imaging differential diagnosis of CA that includes: * Depositional cardiomyopathies (Fabry's disease, Danon's disease) * Hypertensive cardiomyopathy * Hereditary cardiomyopathies * Cardiac sarcoidosis * Others • Conclusions

CAEE-29

MRI Mapping in the study of Myocardial Disease

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CA

Participants
Susana Otero Muinelo, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To illustrate the role of T1, T2 and T2* mapping MRI sequences and extracellular volume in myocardial diseases.2. To recognize findings of most common myocardial diseases on T1, T2 and T2* maps and correlate them with other findings on cardiac MRI.

TABLE OF CONTENTS/OUTLINE

Cardiac T1, T2 and T2* mapping can provide information about myocardial disease that remains undetected using conventional techniques. The quantitative approach allows noninvasive characterization of myocardial properties such as extracellular volume expansion, edema, or other abnormalities in tissue composition. Thus, increased T1-native due to fibrosis in hypertrophic cardiomyopathy or to amyloid deposition or shortened T1-native due to glycosphingolipids in Anderson-Fabry disease could be evaluated. T2 mapping can detect myocardial edema in myocarditis, Takotsubo cardiomyopathy or myocardial infarction, whereas low T2* can be useful in iron overload and hemorrhage. We present cases of hypertrophic, dilated and restricted cardiomyopathy, acute myocardial disease as myocarditis or Tako-Tsubo and infiltrative cardiomyopathies and review the advantages, limitations and applications of T1 and T2 mapping to characterize these ones and other myocardial diseases. Multiparametric cardiac MRI provides prognostic information of structural and functional characteristics and myocardial composition. Incorporation of myocardial mapping on clinical routine increases the usefulness of MRI for the diagnosis and characterization of myocardial diseases.

Unraveling the Mysteries of Congenital Heart Disease: A Skills-based Approach

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CA

Awards
Cum Laude

Participants
Shravan Sridhar, MD, MS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Become familiar with common congenital heart diseases and morphologic features2. Learn of important imaging features3. Understand how management relies on imaging metrics4. Gain skills to use in practice5. Apply skills in the assessment of complex congenital heart diseases

TABLE OF CONTENTS/OUTLINE

1. Title2. Table of common CHD and skill list3. Bicuspid AV morphology (per 2021 consensus)4. Understanding management5. Skill 1: Peak speed quant with PC VENC (in-plane, through plane)6. Common shunts (ASD, VSD, PDA) and features that determine treatment (2018 AHA guidelines)7. Understanding management8. Skill 2: Qp/Qs quant9. Right-sided obstruction (pulmonic stenosis, tetralogy of Fallot, pulmonary atresia spectrum)10. Understanding management11. Skill 3: Valve regurgitation quantification with phase contrast velocity-encoded images, fractional pulmonary flow quantification12. Left-sided obstruction (coarctation, aortic stenosis, Williams syndrome, Shone complex)13. Understanding management14. Skill 4: Flow quant for coarctation15. TGA (D, L)16. Understanding management17. Skill 5: Anatomic mapping - situs, right, left, terms used in describing discordance (e.g. anatomic vs morphologic)18. Other conotruncal anomalies (truncus, DORV, DOLV)19. Understanding management20. Skill 6: Rules to diff between Tetralogy, truncus, DORV, and DOLV)21. Single ventricle (HLHS, HRHS, Ebstein's, tricuspid atresia, DORV)22. Understanding management23. Skill 7: Flow mapping, "checks and balances"24. PAPVR, TAPVR25. Understanding management26. Skill 8: Angiography27. References

Multi-modality Imaging of Cardiac Paragangliomas - A Review

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CA

Participants
Joao Carvalho, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

? Paragangliomas are rare neuroendocrine tumors originating from autonomic paraganglia. Heart involvement is rare, accounting for <1% of primary cardiac tumors. Most cardiac paragangliomas are incidentally detected on echocardiography or CT, or during the work-up of symptomatic patients with elevated (nor)metanephrine levels or genetic predisposition. ? Most cardiac paragangliomas are located around the great vessels, coronary arteries (atrioventricular groove) or the atria, which can be explained by tumor origin from the paraganglia and the distribution of the cardiac plexus. ? On MRI cardiac paragangliomas typically have low to intermediate signal on T1, and high signal on T2. The tumors are strongly vascularized, with high uptake on first-pass perfusion, and heterogeneous on late gadolinium enhancement. ? Functional imaging with radiolabeled somatostatin analogues is indicated to screen for additional tumor locations or metastatic disease. ? Surgical excision is the only curative treatment. CT or invasive angiography should be performed pre-operatively to precisely delineate tumor vascularization and assess the need for revascularization. Paragangliomas can be vascularized by the left and/or right coronary artery, posing additional surgical challenges.

TABLE OF CONTENTS/OUTLINE

1. Background: epidemiology, clinical presentation. 2. Diagnosis: tumor location, tissue characteristics, vascularization. 3. Management: metastatic/multiple disease, surgical planning, radionuclide therapy.

Virtual Reality Imaging - Pre-operative Visualization Modality Equipped with Simultaneous Quantification for Valvular Disease

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CA

Participants
Yukihiro Nagatani, MD, Otsu, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is: 1. To review general outline of image data display algorithm adopted for virtual reality imaging (VRI) based on advanced visualization software and actual clinical application of VRI 2. To learn crucial anatomical distances and/or dimensions to be accurately measured in pre-operative assessment for valvular disease 3. To introduce valuable experimental model by using ex-vivo swine heart reproducing physiological movements of valves and myocardium 4. To review specific sequences for valvular disease in cardiac magnetic resonance imaging (MRI) from conventional to updated ones

TABLE OF CONTENTS/OUTLINE

ž VRI using visualization toolkit with reproducible 3-dimensional measurement ž Detailed description of experimental system enabling endscopic observation under physiological state and quantitative assessment of intramuscular vasculature by using ex-vivo swine heart. ž Clinical advantage with application of 3-dimensional or 4-dimenstional VRI: realization of easy and reliable measurement supported with visual assessment ž Anatomy, dynamics and disease of aortic valve and root including our endscopic observation result ž Various imaging sequences useful for valvular disease assessment: from conventional and high-speed cine images such as steady-state Free Processing and 4-dimenional flow MRI

What Hides in the Epicardial Space? Differential Diagnosis of Epicardial Masses

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CA

Awards
Certificate of Merit
Identified for RadioGraphics

Participants
Adria Roset Altadill, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

- The epicardial space has a diversity of components that can be the origin of various types of masses. - The epicardial masses can be divided into tumoral, non-tumoral or pseudo-masses.

TABLE OF CONTENTS/OUTLINE

The location is a helpful feature in order to diagnose cardiac masses, but epicardial masses are usually dismissed. The epicardial space includes the epicardial fat and the visceral pericardium. It is composed of a lining of mesothelial cells and connective tissue, along with a variable amount of fat, containing coronary vessels, lymphatics and nerves. Due to its diversity of components, different kinds of masses can be found in the epicardial space. They can be divided into tumoral, non-tumoral or pseudo-masses. The epicardial tumoral masses include lipoma, lymphoma, angiosarcoma, mesothelioma and metastases. Regarding non-tumoral etiologies, IgG4-related coronary disease, Erdheim-Chester and hydatid infection can be encountered. Finally, there are epicardial pseudo-masses either secondary to lipomatosis, purulent pericarditis, coronary aneurysms or postsurgical changes. In this education exhibit we show examples of each case, emphasizing the distinguishing features and the clues for the differential diagnosis.

To the Heart of the Matter: A Systematic Approach to Interpretation of Cardiac MR for Trainees

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CA

Awards
Identified for RadioGraphics

Participants
Aeman Muneeb, MBBS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Approach to reading a conventional cardiac MR. 1. How to identify and learn the contribution of each sequences commonly used in Cardiac MR studies 2. To recognize the normal appearance of the heart in the common Cardiac MR sequences (cardiac chamber size, thickness, signal characteristics, normal function on visual analysis, interpretation of basic quantification parameters for function and flows) 3. Understand common appearances of diseases of the cardiac structure, myocardium, valves and pericardium. 4. Visual analysis of the Myomaps (native T1, T2, T2*). 5. Basic principles of quantitative Myomaps analysis.

TABLE OF CONTENTS/OUTLINE

Step 1: Know your patient - review the clinical scenario and relevant prior imaging. Step 2: Anatomical assessment. Step 3: Visual assessment of function. Step 4 Hemodynamic Assessment - Function and Flow quantification parameters. Step 5: Tissue Characterization. Step 6: Differential diagnosis: Characteristic appearance of common diseases.

CAEE-34

Multimodality Imaging in Cardiac Masses

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CA

Participants
Ayaz Aghayev, MD, Newton, MA (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Cardiac masses are rare entities; however, they can be associated with high morbidity and mortality.- Cardiac masses broadly can be classified as non-neoplastic masses such as thrombus, normal/variant cardiac structures, and neoplastic masses (primary and secondary/metastatic tumors).- The educational exhibit will elucidate the diagnostic approach even before the imaging, based on the patient's demographics, and prior disease/comorbidities.- On imaging, differential diagnosis can be elaborated based on the location of the tumor; for example, the most common benign myxoma is usually located in the left atrium and attached to the interatrial septum; primary cardiac malignancy - angiosarcoma - is exclusively located along the right atrium/ventricle as an infiltrative mass.- The next step will focus on available imaging modalities for cardiac masses such as echocardiography (TTE/TEE), cardiac CT, cardiac MRI, and PET/CT, and their specific imaging characteristics for certain masses. For example, fat density lesion on a CT is consistent with lipoma; avid LGE in intramyocardial mass is a feature of fibroma, or Dotatate uptake in cardiac mass is diagnostic of paraganglioma.- Lastly in this educational exhibit, we will provide a proposed algorithm for patients with suspected cardiac masses or incidentally detected on echo/chest CT.

TABLE OF CONTENTS/OUTLINE

1. Cardiac mass classification.2. Diagnostic approach to the patient with suspected or incidentally detected cardiac mass.3. Available imaging modalities that can be utilized in cardiac masses.4. Key imaging features of cardiac masses- Cardiac CT, Cardiac MRI, and PET-CT (including pitfalls).5. Proposed algorithm for suspected cardiac masses.

Potential Applications of Radiomics Based Texture Analysis in Cardiac Magnetic Resonance (CMR)

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CA

Participants
Avanti Gulhane, MD, Seattle, WA (*Presenter*) Nothing to Disclose

TEACHING POINTS

We will discuss potential applications for radiomic analysis of CMR studies. 1.As a proof of concept, we will describe technique for texture analysis of LGE-PSIR to identify first, second and higher order features in patients with ischemic and non-ischemic myocardial diseases. 2.Potential advantages of using radiomics texture analysis for quantitative assessment of CMR images. 3.Several texture features such as first order entropy, kurtosis, grey level co-occurrence matrix non uniformity, grey level run length matrix non uniformity and wavelet transform can be obtained using Pyradiomics, an open-source software. 4.We will illustrate comparative analysis of radiomic features in LGE images of a normal volunteer and patients with ischemic and non-ischemic heart diseases

TABLE OF CONTENTS/OUTLINE

Specific areas where CMR radiomics analysis may aid on diagnostic characterization will be described. Example of radiomic analysis obtained from LGE-PSIR will be illustrated by showing specific texture parameters that can be obtained. We will illustrate the method by showing examples of radiomic features in several diseases on CMR including myocardial infarction, hypertrophic cardiomyopathy, myocarditis, dilated cardiomyopathy and normal heart. Images will be sampled to 1x1x1 mm using linear interpolation and discretized to a fixed bin width of 25 units for the basic preprocessing within the Pyradiomics software. Examples of feature types extracted and analyzed are • First Order Statistics • Shape-based (2D and 3D) • Gray Level Co-occurence Matrix • Gray Level Run Length Matrix • Gray Level Size Zone Matrix • Neighbouring Gray Tone Difference Matrix • Gray Level Dependence Matrix • Wavelet-based features

Mulmodality Imaging of Atrioventricular Groove Masses - Diagnostic Approach

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CA

Awards
Certificate of Merit

Participants
Prabhakar Rajiah, MD, FRCR, Rochester, MN (*Presenter*) Nothing to Disclose

TEACHING POINTS

The atrioventricular (AV) groove is the space that encircles the right and left AV valves. 1. To review the masses involving the atrioventricular (AV) groove. 2. To discuss the role of multimodality imaging in the diagnosis and characterization of these masses. 3. To illustrate the imaging appearances of several types of AV groove masses

TABLE OF CONTENTS/OUTLINE

• INTRODUCTION • ANATOMY OF AV GROOVE- Right coronary artery, left circumflex coronary artery, coronary sinus, fat, lymphatics, nerves. • MULTIMODALITY IMAGING- CT, MRI, Nuclear medicine, Echocardiography, cardiac catheterization • DISCUSSION AND ILLUSTRATION OF THE FOLLOWING MASSES IN THE AV GROOVE WITH CASE EXAMPLES AND PATHOLOGICAL CORRELATION A. VASCULAR LESIONS - Coronary artery aneurysm - Coronary bypass graft aneurysm/pseudoaneurysm - Cardiac chamber aneurysm/pseudoaneurysm - Coronary fistula - Vascular malformation B. INFLAMMATORY - IgG4 disease - Erdheim Chester disease - Vasculitis - Sarcoidosis - Hematoma C. BENIGN NEOPLASMS - Paraganglioma - Schwannoma - Hemangioma - Thymoma D. MALIGNANT NEOPLASMS - Sarcoma - Lymphoma - Metastases E. MISCELLANEOUS - Calcification and pericardial constriction - Caseous mitral annular calcification - Fatty proliferation - Pericardial hematoma - Intracameral RCA • DIAGNOSTIC APPROACH AND ALGORITHM - Infiltrative versus well-defined margins - Hypervascular versus hypovascular - Late gadolinium enhancement - High T2 signal

Pre- and Postoperative Imaging Evaluation of Ross Procedure Candidates: Anatomy, Complications, and What the Surgeon Wants to Know

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CA

Participants
Lisa Xuan, MD, BSc, Newmarket, ON (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. The Ross procedure is a technically complex cardiac surgery which replaces a diseased aortic valve with a native pulmonic autograft.2. There is growing interest for the Ross procedure in young patients, due to improved longevity and the ability of the native autograft to grow and adapt overtime.3. Preoperative cardiac MR evaluation is integral for patient selection and surgical planning, while postoperative surveillance aids in diagnosing complications and quantifying myocardial remodeling as a measure of success.4. Relevant cardiac anatomy and MR imaging findings of the Ross procedure are reviewed.5. Example cardiac MR protocols and synoptic reporting frameworks are provided, with details tailored for the cardiac surgeon, and can be utilized to foster a strong multidisciplinary Ross program.

TABLE OF CONTENTS/OUTLINE

Overview of Ross procedure surgical technique:- Indications- Illustrations of the procedure and pertinent cardiac anatomy (generated by our medical illustrator)Cardiac MR protocol and reporting:- Pre/postoperative protocols and follow-up intervals- Synoptic reporting frameworkReview of imaging:- What the cardiac surgeon wants to know- Relevant radiologic findings in pre and post-operative Ross patients- Postoperative cardiac remodeling as a measure of success (e.g. left ventricular mass regression on cardiac MR)- Potential complications (e.g. pulmonic autograft failure (autograft annular dilatation))Clinical ImplicationsSummaryPlease visit the Learning Center to also view this presentation in hardcopy format.

Multimodality Imaging of Valvular Infections

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CA

Awards
Certificate of Merit
Identified for RadioGraphics

Participants
Jordi Broncano, MD, Cordoba, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To analyze the role of advanced imaging in the diagnosis and management of patients with infective endocarditis (IE). 2. To describe the main imaging clues for accurate diagnosis of valvular and perivalvular features as well as extracardiac findings in IE. 3. To identify the potential pitfalls of IE and the main imaging tips for differentiating from IE.

TABLE OF CONTENTS/OUTLINE

1. Definition of IE: Modified Duke Criteria 2. Epidemiology in IE: Unveiling the high-risk patient 3. Role of Imaging in IE: Pros and Cons - Echocardiography: Transthoracic and transesophageal - Cardiac Computed Tomography - Positron Emission Tomography/Computed tomography (PET/CT) - Cardiac MRI: Is there a role for it? 4. Imaging Pearls in IE 4.1. Valvular disease - Vegetation - Leaflet perforation - Leaflet aneurysm 4.2. Perivalvular disease: - Dehiscence pseudoaneurysm - Perivalvular abscess - Perivalvular fistula 4.4. Extracardiac embolic events 5. Infective Endocarditis Masqueraders - Non-bacterial thrombotic endocarditis (Marantic Endocarditis) - Papillary fibroelastoma - Casseous Necrosis of the Mitral Valve (CNMV) - Lambl's Exscrecences - Valvular thrombosis - Inflammatory pannus - Myxoma - HALT - Cusp prolapse 6. Diagnostic imaging algorithm 7. Take Home points

Indications and Imaging Findings of CMR in the Acutely Ill Patient

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CA

Participants
Daniel Vargas, MD, Denver, CO (*Presenter*) Nothing to Disclose

TEACHING POINTS

Cardiac MR is quickly becoming a powerful and increasingly utilized tool in the evaluation of acutely ill patients. To this end, institutions, radiologists and cardiologists should strive to have the infrastructure and preparation to offer CMR to hospitalized patients.The purpose of this exhibit is:1. Review CMR protocols for evaluation of acutely ill patients 2. Discuss CMR tools that may aid in shortening acquisition and/or improve image quality in this group of patients 3. Review the imaging findings and pitfalls of the most common conditions encountered in the inpatient setting

TABLE OF CONTENTS/OUTLINE

1. CMR protocol for acutely ill patients a. Basic and advanced sequences. b. Tools to shorten acquisition time. c. Tools to improve image quality. 2. Common indications and imaging findings in acutely ill patients. a. Elevated troponins (myocarditis, takotsubo, myocardial infarction, etc). b. Decreased ejection fraction / Heart failure (identifying cardiomyopathy, drug toxicity, etc). c. Arrhythmia and Heart-block. d. Intracardiac mass. e. Pericardial emergencies

Congenital Coronary Artery Anomalies with Lethal Conditions or Sudden Death Risk; Coronary CT and Conventional Angiographic Evaluation

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CA

Participants
Keizo Tanitame, MD, Hiroshima, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

Numerous variations of coronary artery anomalies exist. Some are benign, but others are hemodynamically significant and potentially lethal. The anomalous origin of the coronary artery from the pulmonary artery is a potentially lethal condition. In the patients with anomalous origin of the coronary artery from the contralateral sinus or single coronary artery, coronary artery compression between aorta and pulmonary trunk is a risk factor of sudden death during exercise. Coronary artery fistulae are the most common hemodynamically significant abnormalities, and to-and-fro flow is seen in the dilated coronary arteries. Myocardial bridge is generally benign, but occasionally associated with angina, myocardial infarction, and sudden death. We demonstrate congenital coronary anomalies with lethal conditions or sudden death risk and discuss the radiological evaluation of their severity and treatment outcome.

TABLE OF CONTENTS/OUTLINE

1. Anomalous origin of the coronary artery from the pulmonary artery - Development of collaterals and retrograde blood flow from the anomalous coronary artery to the pulmonary artery on conventional coronary angiography 2. Multi-detector CT coronary angiography for evaluating anomalous origin of the coronary artery - Visualization of the anomalous origin and subsequent passage of the coronary artery 3. Anomalous origin of the coronary artery with a risk of sudden death - Coronary artery compression between aorta and right ventricular outflow tract 4. Congenital coronary artery fistulae - Evaluation of the size of the fistula and the degree of to-and-fro flow 5. Myocardial bridge - Cardiac CT evaluation of the depth and length of the bridge and the severity of systolic stenosis

Out on the Road: Revisiting Coronary Artery Anomalies

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CA

Awards
Identified for RadioGraphics
Certificate of Merit

Participants
Lucas Farias, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is: 1) To review usual and unusual cases of congenital heart diseases. 2) To discuss the classification of coronary anomalies. 3) To understand coronary anomalies by associating schematic drawings with MPR and three-dimensional reconstructions, correlating them with coronary angiography (animated gif). 4) To correlate important findings with the anatomy, embryology, and pathophysiology. 5) To discuss image findings in order to enhance radiologists' skills. 6) To review CT protocols in the evaluation of patients with suspected coronary artery anomalies. 7) To highlight their characteristics in order to familiarize radiologists with these conditions, preventing unfavorable patient outcome.

TABLE OF CONTENTS/OUTLINE

1) Applied embryology and anatomy of the coronary arteries. 2) CTA protocols in the evaluation of patients with suspected coronary artery anomalies. 3) Anomalies of origination and course of coronary artery. 4) Anomalies of intrinsic coronary arterial anatomy. 5) Anomalies of coronary termination. 6) Anomalous anastomotic vessels. 7) Sample cases of pearls, pitfalls, diagnostic difficulties, and mimics. 8) Summary and take-home messages.

CAEE-43

Spectrum presentation of Chagas Cardiomyopathy (Ch-CMP) by CMR

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CA

Participants
Hector Manuel Medina, MD, Bogota, Colombia (*Presenter*) Nothing to Disclose

TEACHING POINTS

-Cardiac magnetic resonance (CMR) is useful to determine ventricular function and fibrosis in patients with Chagas cardiomyopathy (Ch-CMP). - In ch-CMP patients, inflammation and vascular disfunction causes severe vasodilation, which promotes tissue ischemia and fibrosis in water-shed segments. This can occur during the acute and chronic stages of the disease condition.In Ch-CMP, the most common scar locations are at the left ventricular apex and the basal inferolateral wall. These segments present with akinesis, and fibrosis noted in late gadolinium enhancement sequences (LGE), which can be transmural, sub-epicardial, mid-myocardial, and sub-endocardial.-CMR is also helpful in identifying ventricular thrombi in this population using perfusion, early gadolinium enhancement (EGE), and LGE.-The main differential diagnoses of Ch-CMP are Anderson-Fabry disease, ischemic cardiomyopathy, idiopathic cardiomyopathy, sarcoidosis disease and myocarditis.

TABLE OF CONTENTS/OUTLINE

Distribution of scar in Ch-CMPPhases of Ch-CMP include ventricular microaneurysm, ventricular aneurysm, severe heart failure and intracavitary thrombiFrequently used sequences and technique-Functional evaluation with maps of T1 and T2-Steady- state free precession (SSFP) in short axis, 3 chamberScar and fibrosis: Intravenous contrast (gadobutrol)- EGE- LGE

Cardiac MRI Lessons Learned: Pearls and Pitfalls from Training to Remember as an Attending

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CA

Awards
Identified for RadioGraphics

Participants
Prabhakar Rajiah, MD, FRCR, Rochester, MN (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To review the lessons learned in cardiac MRI on sequences, protocols, interpretation, pitfalls and problem-solving. 2. To illustrate these key lessons with representative case examples.

TABLE OF CONTENTS/OUTLINE

1. PROTOCOLS Gadolinium versus Ferumoxytol, sequence adaptations; Cardiac devices- Adaptations (including wideband technique) 2. ARTIFACTS AND SOLUTIONS MOTION- Prospective triggering, real-time, compressed sensing; Single-shot, resp. nav. and gating; STIR- Pseudolesion subendocardium, edema from coil sensitivity; PERFUSION- Gibbs artifact; MRA- T2 shortening pseudofilling defects, subtraction misregistration; LGE- Ti selection (esp. amyloidosis), Partial voluming; PSIR artifacts; Failed fat suppression (vs pericarditis), normal blood pool in recesses; 3D WHOLE HEART- Partial voluming; 2D/4D FLOW- Aliasing; resolution limitation, Noise without contrast; T1 MAP- Motion, imaging in other phases; STRAIN- Diastolic fading; 3. ARTIFACTS AS SOLUTIONS SUSCEPTIBILITY- Iron quant; CHEMICAL SHIFT- fat identification 4. INTERPRETATIVE PITFALLS Pseudomasses (Crista terminalis, Taenia sagittalis, Chiari network, Coumadin ridge, lipomatous hypertrophy, MAC, focal HCM, pseudothrombus, moderator band, pericardial recess); CABG aneurysm vs neoplasm; Prominent trabeculations vs LV non compaction; LV apical thinning vs aneurysm; MVO vs spared myocardium; Benign fat vs ARVD; Valve leaflets- Bicuspid vs tricuspid; Pseudo vs true Coarctation; Ductus diverticulum vs aneurysm; Vasculitis vs IMH 5. BLIND SPOTS 6. TIPS TRICKS Long Ti for LGE in cardiac masses; 3D T1w imaging for pericarditis; VENC higher than predicted; Dark blood-LGE for subtle scars

CAEE-46

Getting to the Heart of Cardiac Masses: Pearls and Pitfalls

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CA

Participants
Andrea Cangiani Furlani, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) Overview of cardiac masses (primary neoplasms - benign and malignant -, metastasis, infectious, thrombus).2) 90% of primary cardiac tumors are benign. Metastases via various mechanisms are much more common than primary cardiac malignancies. Metastatic mechanisms determine imaging characteristics.3) Discuss in detail with illustrative cases the typical MRI and CT characteristics of specific cardiac neoplasms and their common differential diagnostic considerations, including pearls and pitfalls.

TABLE OF CONTENTS/OUTLINE

I. Overview. a)Locations of cardiac masses by chamber. b)Tips for distinguishing neoplasms from infection and thrombus. II. Benign cardiac neoplasms. a)Myxoma. b)Fibroelastoma. c) Fibroma, d) Lipoma. e) Cystic tumor of the AV node. f) Congenital cyst. III. Metastases. a)Hematogenous spread. b) Lymphangitic spread. c)Vascular invasion- IVC, SVC, pulmonary veins. d)Direct invasion. IV. Primary cardiac malignancies. a)Angiosarcoma. b)Other sarcomas. c)Lymphoma. The aims of this abstract are:1. To review etiology, location, and typical clinical scenarios of different cardiac masses.2. To review imaging findings of benign cardiac neoplasia (myxoma, fibroelastoma, fibroma, lipoma, hemangioma, cystic tumor, and differential diagnosis such as lipomatous hypertrophy of the interatrial septum). 3. To review the mechanisms of metastatic disease (hematogenous, lymphangitic, direct and vascular invasion).

CAEE-47

Coronary Artery Fistulas: a Pictorial Essay

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CA

Participants
Desiree Louise Batista, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

To describe classification and the main subtypes of coronary fistulas (CFs). To describe the hemodynamic implications on the cardiac structures/cavities of drainage. To describe the importance of coronary CT angiography (CCTA) for the diagnosis, course, path and drainage of CFs, as well as depiction of the relationship between the affected vessel and the nearby structures.

TABLE OF CONTENTS/OUTLINE

CF is an anomalous direct connection between one or more coronary arteries (CA) and a cardiac chamber (coronary-cameral fistula) or a large vessel (arteriovenous fistula). CFs can be congenital or acquired, single or multiple, isolated or associated with other congenital cardiac malformations. CFs originating from the right coronary artery are the most frequent (50-70%) and 40% of CFs drain into the right ventricle.The degree of shunting is associated with its size and the pressure gradient between the coronary and the draining site. Drainage to the right heart is related to left-to-right shunt, causing variable degrees of volume overload and pulmonary hypertension. Drainage to the LV may cause hemodynamic changes similar to aortic regurgitation. Drainage to the pulmonary artery and left atrium generates volume overload to the LV. There may be reduced myocardial flow distal to the fistula (coronary steal phenomenon), myocardial ischemia and progression to heart failure. The main complications are rupture, infarction and infective endocarditis. CCTA is the gold-standard non-invasive method to explore the complex anatomy of CFs, allowing 3D reconstructions and assessment of vessel of origin, pathway and site of drainage, which may aid to treatment decisions.

CAEE-48

1H-Magnetic Resonance Spectroscopy for Metabolic Imaging of Myocardial Trigylceride Content - How To Do It”

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CA

Participants
Bernhard Petritsch, MD, Wuerzburg, Germany (*Presenter*) Research Consultant, Siemens AG

TEACHING POINTS

To review the indications, contraindications, and limitations of 1H-Magnetic Resonance Spectroscopy (1H-MRS) of the myocardium. To highlight the potential benefit of a metabolic investigation embedded in a comprehensive examination of cardiac morphology and function. To learn about parameter settings for spectroscopic data acquisition, including voxel placement and positioning of a navigator for double (respiratory and ECG) triggered data acquisition. To interpret cardiac 1H-MR spectra of healthy subjects, patients suffering from congenital or acquired metabolic disorders, and to learn about potential pitfalls of spectroscopic imaging of the heart.

TABLE OF CONTENTS/OUTLINE

A. How does 1H-Magnetic Resonance Spectroscopy (1H-MRS) of the myocardium workB. Technical requirementsC. Spectroscopic data acquisition; positioning of respiratory motion gating navigator; voxel placement in the septumD. Spectroscopic data postprocessingE. Image analysis in healthy subjects and patients; age dependency of myocardial triglyceride content; Metabolic syndrome, Morbus FabryF. Pitfalls of cardiac 1H-MRSG. Limitations of cardiac 1H-MRS; alternative imaging modalities

Novel Assessment of Physiological Mitral Valve Morphology and Surgical Simulation for MICS MVP via 3D Printed Cardiac Models and Immersive 3D Virtual Reality System

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CA

Participants
Koichi Osuda, RT, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Minimally invasive cardiac surgery (MICS) mitral valve plasty (MVP) has a lower risk of associated complications including mediastinitis, and advantage of quick rehabilitation compared to median sternotomy approach. However, surgical procedures are technically demanding due to narrow operative field and deep working space. To understand the comprehensive mitral anatomy, we attempt to create patient-specific 3D printed left atrioventricular models and developed a novel approach for simulating MICS MVP procedures via immersive 3D virtual reality (VR) system.

TABLE OF CONTENTS/OUTLINE

3D VR datasets were converted, using CT data which has submillimeter spatial resolution. 3D printed models and 3D VR systems were faithfully reproduced mitral complex structure consisting of mitral leaflets, chordae tendineae, papillary muscles, and prolapsing leaflet. 3D printed models and 3D VR systems enable surgeon to assess physiological morphology through cardiac cycle (systole to diastole),practically, though it is impossible to recognize that intraoperatively. Furthermore, this method allowed surgeon to simulate not only surgical procedures, but also appropriate intercostal thoracotomy approach position, and considering precise device size in advance. 3D printed models and 3D VR systems are clinically available and promising for facilitating the operation strategy optimization and assistant for MICS MVP procedures safely. There will be contributions to clinical practice for preoperative accurate assessment and simulation.

State of the Art Imaging in Surveillance of Repaired Tetralogy of Fallot: Imaging in Therapeutic Planning and Risk Assessment

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CA

Awards
Certificate of Merit

Participants
Yoshiaki Ota, MD, Ann Arbor, MI (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is:1. Understand the central role of cardiac MR (CMR) in post repair Tetralogy of Fallot (TOF) to assess anatomic and functional sequelae2. Learn the role of MR in clinical decision making and prognostication3. Illustrate the spectrum of new imaging techniques and their applications in repaired TOF. 4. To learn the utility of imaging prior to and following transcatheter pulmonary valve replacement (TPVR).

TABLE OF CONTENTS/OUTLINE

Outline1. Background- Most common cyanotic congenital heart disease characterized by ventricular septal defect, pulmonary stenosis (right ventricular outflow obstruction), dextroposition of the aorta (overriding aorta), and right ventricular hypertrophy 2. Pathophysiology of repaired TOF- Role of imaging in assessing sequelae of repair, clinical decision making, planning TPVR, outcomes and prognosticationa. Imaging protocols for surveillance emphasizing new techniques such as 4D flow, parametric mapping, strain imaging b. MR derived parameters and their role in timing and planning of pulmonic valve intervention and risk assessment (ventricular size and function, presence and extent of Late Gadolinium Enhancement, regurgitation quantification, residual ventricular septal defect, and vascular anatomy)c. Indications for Pulmonary Valve Replacementd. Procedural aspects of TPVR and available devicese. Pre-intervention imaging for patients and device selection: protocols, imaging modalities, 3D printing f. Post-TPVR imaging and complicationsg. Future directions

Three-dimensional (3D) Procedure Planning for Transcatheter Mitral Valve Replacement

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CA

Participants
Nicole Wake, PhD, Aurora, OH (*Presenter*) Employee, General Electric Company

TEACHING POINTS

A. Transcatheter Mitral Valve Replacement (TMVR) is a minimally invasive procedure that replaces the valve using a device that clips onto the faulty valve.B. Multi-detector computed tomography (MDCT) of the mitral valve and aortic outflow tract is important for appropriate patient and device selection.C. A multidisciplinary approach is required for patient selection and procedure planning.D. Planning for TMVR is traditionally performed by visualizing medical imaging data and using two-dimensional (2D) measurements to determine appropriate valve sizing.E. Three-dimensional (3D) visualization can provide enhanced visualization and superior planning regarding device sizing and placement.F. For complicated cases, 3D printing can be performed to create a precise model of the anatomy and allow for enhanced surgical planning.

TABLE OF CONTENTS/OUTLINE

1. Review of mitral valve disease.2. Overview of multi-detector computed tomography (MDCT) for mitral valve disease evaluation.3. Synopsis of currently available valves for TMVR procedures.4. Outline of two-dimensional (2D) image analysis and valve sizing.5. Description of three-dimensional (3D) visualization, image analysis, and device planning.6. Summary of 3D printing and use for planning TMVR.

Spectrum of Imaging Findings in Takotsubo Cardiomyopathy

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CA

Participants
Camila V. Machado, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

After attending to this exhibit, the learner should be able:1. To understand both clinical and laboratory features of Takotsubo Cardiomyopathy.2. To recognize the major imaging findings of Takotsubo Cardiomyopathy on magnetic resonance imaging (MRI).3. To correlate the imaging findings on MRI, echocardiography and ventriculography.4. To understand the importance of cardiac MRI in the diagnosis of Takotsubo Cardiomyopathy and in the evaluation of differential diagnoses.5. To analyze the role of MRI in the detection of acute complications and in the follow-up of the patients.

TABLE OF CONTENTS/OUTLINE

? Diagnosis of Takotsubo Cardiomyopathy ? Epidemiology ? Clinical findings, stressful events ? MRI, echocardiogram and ventriculography? Importance of MRI for the diagnosis and characterization of Takotsubo Cardiomyopathy ? Assessment of segmental changes in contractility (cine, strain) ? Assessment of myocardial edema (T2 weighted images, T1 and T2 mapping) ? Assessment of myocardial necrosis / fibrosis (late gadolinium enhancement)? Atypical manifestations of Takotsubo Cardiomyopathy (different patterns of contractile change)? The role of MRI in excluding other causes of chest pain ? Myocarditis / pericarditis ? Acute myocardial infarction ? Extracardiac pathologies (pulmonary, pleural, musculoskeletal)? The role of MRI in the detection of acute complications and the follow-up of the patients ? Heart failure, pleural/pericardial effusion, intracavitary thrombus, ventricular wall rupture

Three-Dimensional Fusion Technique with CT and LGE-MRI for Cardiac Resynchronization Therapy

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CA

Participants
Yoshihiro Haga, Sendai, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

Cardiac resynchronization therapy (CRT) is an established treatment for patients with severe heart failure (HF). Factors influencing CRT response are Fig. 1. In particular, it is important to know the left ventricular (LV) lead location and the extent of myocardial scar. These can be assessed by the contrast computed tomography coronary venography (CTCV) or late gadolinium enhancement by cardiac magnetic resonance (LGE-CMR) imaging. However, these cannot be observed on the same three-dimensional image. Therefore, we devised a method that a three-dimensional fusion technique combined the two images derived from CTCV and LGE-CMR imaging.

TABLE OF CONTENTS/OUTLINE

1. Understanding the treatment of heart failure (HF) using cardiac resynchronization therapy (CRT). 2. Understanding the key points for a successful CRT. 3. Understanding the preoperative CT scan of CRT. 4. Understanding the importance of Fusion image with CT and LGE-CMR. 5. Features of CRT: International guidelines on CRT implantation 6. The key points for a successful CRT: QRS duration, LV scar tissue, LV read position, etc. 7. Fusion image with CT and LGE-MRI: three-dimensional fusion technique

A New Evaluation Method for Coronary Plaque by DECT

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CA

Participants
Takayoshi Yamaguchi, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review the current status of coronary plaque assessment and summarize its limitations 2. Summary of advantages and disadvantages of Dual energy CT compared to Single energy CT 3. Questions about spectral analysis of plaques from coronary CTA 4. Explains new image analysis methods to improve plaque identification accuracy 5. Presenting the correlation between a new plaque evaluation method by CT and intravascular imaging

TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Explain the importance of assessing plaque characteristics using coronary CT 3. Comparison of plaque evaluation by coronary CT and IVUS or OCT 4. Explain the advantages of assessing plaque with dual energy CT 5. Limitations for assessing plaque in the arterial phase 6. Proposal of new imaging techniques and methods for improving the ability to characterize plaque tissue using dual energy CT 7. Explain the characteristics of the measured values in various types of plaque tissues and the changes in the spectral HU curve 8. Correlation between new tissue characterization method by DECT and evaluation by intravascular imaging

Structured Pretransplant Cardiac CT Report in Adult Patients with Congenital Heart Disease: What the Radiologist Should Analyze

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CA

Participants
Rebeca Gil Vallano, Madrid, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

- To analyze the radiological findings, which cardiac surgeons need for the surgical planning of heart transplant in adults with congenital heart disease (CHD).- To propose a structured report of pretransplant cardiac CT.

TABLE OF CONTENTS/OUTLINE

Our hospital is a referral center for heart transplantation in pediatric and adult patients with CHD.Imaging tests - echocardiogram, magnetic resonance, and computed tomography (CT) - show the cardiac abnormal anatomy. CT additionally demonstrates other findings in these patients with complex anatomies and, in some cases, multisystem disorders (lung anatomy, aorto-pulmonary collaterals, previous surgeries, vascular accesses, rib cage, abdominal anatomy). In our work we will focus on the CT examination performed preoperatively.We will revise the CT acquisition technique, and we will evaluate its benefits, since this technique acquires 3D data with a wide field of view that allow a comprehensive evaluation of the anatomy with good spatiotemporal resolution and multiplanar reconstruction capacity.In the interpretation of these studies, it is very important to carry out a systematic and practical assessment of the preoperative aspects. For this reason, we use a structured report, which we will develop in detail and illustrate with cases from our center. We will emphasize the information needed by surgeons and show the methodology we use to obtain it. Radiologists have a fundamental role through the radiological report in the pretransplant surgical planning of adult patients with CHD.

Advanced Cardiovascular Computed Tomography Imaging in Children with Congenital Variants and Anomalies of the Aortic Arch: From Volume Rendering to 3D Models and 3D Printing

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CA

Participants
Flavio Zuccarino, MD, Barcelona, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

To discuss the main indications for cardiovascular CT in newborns and children with congenital anomalies of the aortic arch (CAAA).To outline the key imaging findings, advantages and limitations of CT in CAAA, enhancing the usefulness of volume rendering (VR) and 3D models in differential diagnosis and the design of an optimal therapeutic approach.

TABLE OF CONTENTS/OUTLINE

We discuss, in a short background, the advantages and limitations of CT in CAAA diagnosis. We analyze different CT acquisition protocols depending on patient age and pathology. We organize CT findings of different CAAA as:Left-sided aortic arch anomalies. Right-sided aortic arch anomalies. Double aortic arch Cervical Aortic Arch Persistent Fifth Aortic Arch Interrupted Aortic Arch Aortic Arch Hypoplasia Coarctation Pseudocoarctation Gothic aortic arch We review key CT findings of different CAAA, focusing on 3D imaging reconstructions and 3D models. We define the relationship of the aorta to the airways, esophagus, and other cardiovascular and thoracic structures that play a pivotal role in CAAA diagnosis. We discuss potential differential diagnosis of CAAA.OUTLINE Radiologists should be familiar with CT key imaging findings and with the advantages and limitations of 3D advanced techniques to establish an optimal diagnostic approach and therapeutic management.

ArrhythmogenicLeft Ventricular Cardiomyopathy (ALVC); Understanding Current Concepts

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CA

Participants
Daniel Ocazionez-Trujillo, MD, Houston, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Genotype-phenotype correlation studies have demonstrated that mutations in Desmoplakin and Filament C genes are the most common gene defects causing ALVC.- Patients with ALVC usually complain of symptoms of both arrhythmia (palpitations, chest tightness, syncope) and LV heart failure.- Imaging modalities in ALVC usually reveal severe LV dysfunction with preserved to mildly impaired RV function. Often this entity has been misdiagnosed as dilated cardiomyopathy, chronic myocarditis, myocardial infarction, or double ventricular involvement type ARVC.- Reported Cardiac MRI findings in ALVC include dilated left ventricle, fatty infiltration, irregular lateral wall contour with a “serrated” shape and areas of mesocardial and epicardial delayed enhancement in a "ring like" distribution involving the septal and lateral walls.

The Multiple Facets of Cardiac Amyloidosis -Diagnostic Imaging Overview

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CA

Participants
Aarushi Gupta, MD, MBBS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Diagnosis of cardiac amyloidosis is challenging and can be misinterpreted for hypertensive heart disease or hypertrophic cardiomyopathy, particularly in older patients with heart failure with preserved ejection fraction (HFpEF).• Recent treatment advances such as Tafamidis for ATTR amyloidosis (Transthyretin amyloidosis) can delay disease progression. An understanding of imaging features can help in early diagnosis and appropriate management of patients.• Echocardiography, cardiac MRI and nuclear Tc-99 pyrophosphate scan are complementary and can help in establishing the diagnosis.

TABLE OF CONTENTS/OUTLINE

1. Background on common types of cardiac amyloidosis:• AL (Light chain) and ATTR amyloid (hereditary and wild type)• Clinical manifestations of amyloidosis• How to differentiate ATTR from AL amyloidosis using clinical and biochemical parameters 2. Imaging in diagnosis of cardiac amyloidosis with focus on ATTR amyloidosis• Echocardiography, cardiac MRI and different LGE patterns (with discussion of QALE score)• Caveats in establishing diagnosis including technical challenges like determining the nulling time of myocardium• Recent advances in MR cardiac imaging including parametric tissue mapping (for diagnosis and prognosis) and myocardial strain (for early detection of LV dysfunction) 3. Discuss role of nuclear medicine techniques like Tc-99 pyrophosphate scan and recent American Society of Nuclear Cardiology (ASNC) guidelines for diagnosis •Correlative MR cardiac and Tc-99 pyrophosphate images will be provided 4.Discuss new disease modifying therapies for ATTR amyloidosis such as Tafamidis 5. Conclusion

Priyanka Garg, MBBS, MD, New Delhi, India (*Presenter*) Nothing to Disclose

TEACHING POINTS

Cardiac MRI is a powerful tool giving relevant anatomical and physiological information of cardiovascular structures in congenital heart disease. The purpose of this exhibit is to: 1. Discuss the various pearls and pitfalls relevant to planning, acquisition and interpretation of cardiac MR images. 2. Enumerate specific points that need special consideration while imaging in paediatric patients. 3. Describe the role of cardiac MR imaging in patients with congenital heart disease.

TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Patient selection 3. Sedation requirement 4. ECG placement 5. Cardiac MR sequences 6. Cardiac MR planning 7. Phase contrast imaging 8. Angiographic imaging 9. Post processing including ventricular volumetry, flow assessment, shunt fraction and important formulae for regurgitant fraction 10. Role of cardiac MRI in congenital heart disease 11. Take home message

CAEE-60

Multimodal Imaging Characterization of Cardiac Tumors Emphasizing PET with Pathology Correlation Using the New 2021 WHO Classification

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CA

Awards
Identified for RadioGraphics

Participants
Maria Clara Lorca, MD, Pittsford, NY (*Presenter*) Nothing to Disclose

TEACHING POINTS

Due to their rarity and overlapping imaging characteristics, tumors and tumor-like conditions of the heart can be a radiological challenge. It’s important to be familiar with their imaging presentation in order to improve diagnostic accuracy and avoid unnecessary invasive procedures.1. New 2021 WHO Classification of Cardiac Tumors2. Depict cardiac tumors and cardiac tumor-like radiological features3. Describe the importance of PET-CT in the diagnosis and follow up of cardiac tumors4. Discuss the cardiac tumor-like conditions including cardiac thrombus, mediastinal abscess, pericardial hematoma, pericardial cyst5. Describe the pearls and pitfalls that some entities demonstrate in the cardiac imaging, including benign entities that can appear as a cardiac pseudotumor

TABLE OF CONTENTS/OUTLINE

This education exhibit reviews biopsy-proven cases of cardiac lesions and their mimics and depict their radiological features, including images pearls and pitfalls.Review with clinical pictures, illustrative case examples, and original illustrations the cardiac tumors in a systematic fashion.Incorporate the new 2021 WHO classification of the cardiac tumors.Depict the imaging appearances of various types of cardiac tumor-like conditions and how to accurately differentiated them from cardiac tumors.

Imaging of Acute and Chronic Cardiac Complications of COVID-19

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CA

Awards
Identified for RadioGraphics
Certificate of Merit

Participants
Felipe Sanchez, MD, Toronto, Chile (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Acute cardiac complications in patients with COVID-19 are relatively rare but include myocarditis, thrombosis and ischemia2. Cardiac imaging plays an important role in the diagnosis of acute myocardial injury in patients with COVID-19, with typical findings on cardiac MRI including edema, high native T1, and co-localizing late gadolinium enhancement3. Patients who have recovered from COVID-19 are at increased risk of cardiovascular disease, including those with persistent symptoms and post-acute sequelae of SARS-CoV-2 infection (or long COVID)4. Cardiac MRI can be useful in patients with persistent symptoms and functional impairement after COVID-19 to evaluate for the sequelae of myocarditis, left ventricular ejection fraction, strain, and parametric mapping

TABLE OF CONTENTS/OUTLINE

The purpose of this educational exhibit is to:1. Review the acute and chronic cardiac complications related to COVID-19 including incidence, pathophysiology, risk factors, and clinical outcomes2. Demonstrate the role of cardiac imaging in establishing a diagnosis of myocarditis following COVID-193. Illustrate multi-modality cardiac imaging findings in patients recovered from COVID-19 with persistent symptoms

Pearls and Pitfalls in Cardiac Imaging

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CA

Participants
Furkan Ufuk, MD, Denizli, Turkey (*Presenter*) Nothing to Disclose

TEACHING POINTS

? To review the cardiac pseudotumors and challenging diagnoses ? To review the cardiac outpouchings and differential diagnoses ? To review the cardiac and coronary artery anatomic variations

TABLE OF CONTENTS/OUTLINE

1. Cardiac pseudotumors Right atrial pseudotumor due to prominent crista terminalis, lipomatous hypertrophy of the interatrial septum, caseous mitral annular calcification, focal hypertrophic cardiomyopathy, microvascular obstruction, left atrial appendage pseudothrombus, ventricular noncompaction. 2. Cardiac outpouchings: True and false left ventricular aneurysms, ventricular diverticula, ventricular clefts and crypts, atrial diverticula and aneurysms, interatrial septal aneurysm, sinus valsalva aneurysm, interventricular septal aneurysm, mitral-aortic intervalvular fibrosa pseudoaneurysm. 3. Cardiac and coronary artery anatomic variations and congenital lesions: Patent foramen ovale, interatrial septal pouch, coronary artery anomalies, coronary artery tortuosity, coronary artery fistulas, 4. Coronary artery lesions and pseudolesions: Coronary artery aneurysm, RCA pseudostenosis due to streak artifact, overestimation of stenosis due to calcified plaque, myocardial bridging. 5. Pulmonary vein abnormalities and anatomical variations: right top pulmonary vein, pulmonary venous varix, pulmonary vein thrombosis, partial anomalous pulmonary venous return, anomalous midline common ostium of the left and right inferior pulmonary veins

CAEE-63

Imaging of Left Ventricular Assist Device (LVAD) Driveline Infections and Other Common LVAD Complications

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CA

Participants
Mahati Mokkarala, MD, Saint Louis, MO (*Presenter*) Nothing to Disclose

TEACHING POINTS

Teaching Points:The purpose of this exhibit is to:1. Illustrate the common LVAD devices and components of the left ventricular assist device on CT2. Imaging characteristics of LVAD infections that lead to operative management. 3. Understand imaging of additional LVAD complications.

TABLE OF CONTENTS/OUTLINE

Content Organization:1. Basics on type and anatomy of drive line parts: - Description of multiple types of LVAD machines. Older models: Jarvik, Thoratec, Heartmate - Diagram of most recent LVAD machine, Heartmate III and components on CT.2. CT imaging of LVAD infections that lead to operative management - Drive line soft tissue thickening that can involve adjacent musculature, peritoneum - Drive line and adjacent left ventricular assist device fluid collection/abscess 3. Nuclear medicine imaging of LVAD infections - Description of PET/CT findings including increased FDG uptake by the driveline and LVAD - Comparison of PET/CT and white blood scintigraphy scans4. CT imaging of additional more local LVAD complications including the following: -Increased risk of LVAD structural, outflow and inflow cannula, pump systemic thrombosis - Increased risk of local hemorrhage - LVAD device and cannula mechanical breakage, device failure - Involvement of adjacent soft tissue and vascular structures5. CT imaging of more systemic, LVAD related, complications - Increased risk of right ventricular dysfunction and aortic valve disease - Increased risk of systemic hemorrhage (GI bleeding), thrombosis (stroke, PE).

Spectrum of Cardiothoracic Imaging Findings in Drug Abuse

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CA

Participants
Gaurav Watane, MBBS, MD, Pittsburgh, PA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To recognize the emergent and non-emergent cardiothoracic imaging findings in the recreational drug abuse 2. To gain awareness through example cases of the associated complications 3. To discuss the complementary role of CT/MRI, PET/CT, and echocardiography in the management

TABLE OF CONTENTS/OUTLINE

1. Case-based review of the spectrum of cardiothoracic imaging findings in the recreational drug abuse; including infective endocarditis with or without vegetations, pulmonary embolism, septic emboli, thrombophlebitis, Spontaneous coronary artery dissection (SCAD), Vaping associated lung injury (EVALI)2. Current status of various imaging modalities and their limitations in the imaging of Cardiothoracic complications

Characterization of Atrial Masses through Cardiac Magnetic Resonance Imaging

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CA

Participants
Hector Manuel Medina, MD, Bogota, Colombia (*Presenter*) Nothing to Disclose

TEACHING POINTS

Teaching Points- Cardiac magnetic resonance (CMR) provides a reliable and detailed evaluation of cardiac masses.- While biopsy remains the cornerstone of diagnosis, CMR has been proven safe and effective at assessing atrial masses and determining its extension, vascular involvement and providing differential diagnoses.- Based on this assessment, a multidisciplinary medical and/or surgical management plan can be established.- Follow-up based on CMR after treatment yields an equivalent comparison, thus optimizing treatment decisions.

TABLE OF CONTENTS/OUTLINE

*?able of Contents/Outline: A Case-Based Approach- Epidemiology of the most common atrial masses.- Radiologic features and characterization (preliminary diagnosis through imaging) and correlation with biopsies.- CMR as an ideal tool for the diagnosis of atrial masses.- Use of steady-state free precession (SSFP), T1-weighted (T1W), short tau inversion recovery (STIR), early gadolinium enhancement (EGE), late gadolinium enhancement (LGE), and perfusion sequences.- Multidisciplinary medical and surgical management strategy formulation.- Useful tool for disease staging and follow-up.Please visit the Learning Center to also view this presentation in hardcopy format.

Be Aware of the Heart in an Oncologic Scenario! Cardiac Metastases - A Pictorial Essay

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CA

Participants
Pedro Matta, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Review the main radiologic features that differentiate primary and secondary cardiac masses and and discuss the role of advanced cardiac imaging modalities in evaluating these lesions Describe anatomical landmarks involved in metastatic spread to the heart such as pericardium, epicardium, myocardium, valves and chambers. Understand the epidemiology, including prevalence, most common origins and histologic types of metastatic involvement of the heart. Propose a diagnostic workflow based on tumor features including size, borders, tissue invasion, site, pericardial involvement, single or multiple lesions and tissue characteristics , describing contrast enhancement, T1 and T2WI signal intensity. Identify the major red flags regarding imaging signs associated with cardiac involvement.

TABLE OF CONTENTS/OUTLINE

Major malignant secondary cardiac tumors , including epidemiology, pathophysiology and imaging findings: Poorly differentiated small cell type, Leukemic infiltrate and mass, Melanoma metastasis, Osteossarcoma metastasis and Angiossarcoma.The role of multimodality imaging techniques, such as US, CT, MRI, PETCT, in the evaluation of cardiac masses, listing advantages and disadvantages in diagnosis and surgical planning including Echocardiography, Computed tomography, Magnetic Resonance Imaging and PETCT.Differential diagnosis, potential pitfalls and artifacts to keep in mind when evaluating a potential cardiac mass.

Radiologic Evaluation of Transcatheter Valve Replacements

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CA

Participants
Demetrios Raptis, MD, Frontenac, MO (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Discuss indications and contraindications for transcatheter valve replacement with emphasis on pulmonic, mitral, and tricuspid valve replacements and brief discussion of transcatheter aortic valves. Review preprocedural imaging work-up for transcatheter valve replacements specific to each valve. Case based review of complications of transcatheter valve replacements

TABLE OF CONTENTS/OUTLINE

Brief review of transcatheter aortic valve replacement Discuss indications for transcatheter valve replacements • Pulmonic • Mitral • Tricuspid Review preprocedural imaging of transcatheter valve replacements with emphasis on measurements and accesses routes both standard and alternative • Pulmonic • Mitral • Tricuspid Case based review of complications in transcatheter valve replacement including but not limited to: • Misplaced/malpositioned valves • Embolized valves • Outflow tract obstructions • Paravalvular prosthetic leaks • Hypo-attenuating leaflet thickening • Hypo-attenuation affecting motion • Coronary obstruction • Vascular complications/bleeding • Valve malfunction • Embolic phenomenon • Septic emboli

Heterotaxy: What the Radiologist Needs to Know to Get It Right

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CA

Participants
Maria Clara Lorca, MD, Pittsford, NY (*Presenter*) Nothing to Disclose

TEACHING POINTS

Heterotaxy syndrome remains a diagnostic challenge, especially for radiology residents. While situs anomalies have a rare incidence, it is important to recognize them early in part due to their correlation with congenital heart disease. The aim of this project is to review the anatomic imaging appearance of heterotaxy syndrome on CT and MRI and how to incorporate heterotaxy findings into the segmental classification of congenital heart disease.

TABLE OF CONTENTS/OUTLINE

Become familiar with the anatomic imaging appearance of heterotaxy syndrome on CT and MR. Briefly review of the embryology, epidemiology, and terminology of heterotaxy syndrome, also known as situs ambiguous. Become familiarized with anatomic and physiologic imaging appearance of the more common forms of heterotaxy syndrome in the chest and abdomen (CT and MR), with a focus on right versus left isomerism.How to incorporate heterotaxy findings into the segmental classification of congenital heart disease using the three-part segmental notation utilized in the Van Praagh classification system.

Cardiac Magnetic Resonance Imaging of Acute Myocarditis: A Review Focusing on Quantitative Evaluation Methods

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CA

Participants
Nobuko Tanitame, MD, Hiroshima, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

Acute myocarditis (AM) could result in arrhythmia, dilated cardiomyopathy or chronic heart failure. Although endomyocardial biopsy has been the gold standard in diagnosis of AM, it is invasive and has low diagnostic sensitivity. Cardiac magnetic resonance (CMR) imaging is currently considered to be the most comprehensive diagnostic tool in the evaluation of AM. Generally, T2- and T1-weighted imaging and late gadolinium enhancement (LGE) are used for diagnosing AM. Furthermore, novel quantitative techniques such as native T1, T2 mapping and extracellular volume (ECV) are recommended to allow more objective assessment of myocardial injury. We focus on quantitative methods, diagnostic strategy and pitfalls of CMR imaging in the patients with AM.

TABLE OF CONTENTS/OUTLINE

1. Recent development of CMR imaging and processing techniques 2. Establishment of standard values for quantitative analysis of CMR imaging 3. Cine MR imaging (ejection fraction, flow analysis using phase-contrast method) - Cardiac function, left and right ventricular asynergy 4. Black blood T2-weighted STIR (T2 mapping using T2-prep SSFP) - Myocardial edema 5. Native T1 mapping using MOLLI - Myocardial edema, hyperemia, necrosis, fibrosis 6. Gadolinium-enhanced perfusion CMR - Hyperemia, capillary leak 7. LGE (ECV using analysis software) - Myocardial necrosis, fibrosis 8. Representative cases and diagnostic pitfalls of AM

CAEE-9

2020: What Does the Radiologist Need to Know About Major Changes in the Diagnosis of Arrhythmogenic Cardiomyopathy?

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CA

Participants
Alan Hummel, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The goal of this exhibit is to: 1. Understand what arrhythmogenic cardiomyopathy is and what is its pathophysiology.2. Describe the significant changes in the diagnostic criteria that occurred in 2020.3. Outline the diagnostic criteria for the right ventricle.4. Discuss the "new" types of involvement: biventricular and isolated from the left ventricle.

TABLE OF CONTENTS/OUTLINE

1. Arrhythmogenic dysplasia of the right ventricle - the precursor;2. Review the basic anatomy of the right ventricle and their relationships3. What is arrhythmogenic cardiomyopathy?4. Is it possible to differentiate: myocardial fat vs fibrosis?5. Padua Criteria - Major changes in 2020.5.1. Padua Criteria - Exposing the Criteria5.2. Padua Criteria - Image5.3. Padua criteria - Other methods5.4. Morphofunctional criteria5.5. Structural criteria6. Morphofunctional abnormalities of the right ventricle6.1. Exposing the major and minor criteria6.2. Examples7. Morphofunctional abnormalities of the left ventricle7.1. Exposing the minor criteria7.2. Examples8. Structural abnormalities of the right ventricle8.1. Exposing the major criteria8.2. Examples9. Structural abnormalities of the left ventricle9.1. Exposing the major criteria9.2. Examples10. Diagnostic algorithm11. Summary in 1 slide

Abstract Archives of the RSNA, 2022

CHEE

Chest Education Exhibits

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Sub-Events

CHEE-1 Postoperative Chest Imaging Findings: Pearls and Pitfalls

Awards
Certificate of Merit

Participants
Sofía Ventura- Diaz, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

To have an understanding of the different surgical techniques, including invasive and minimally invasive proceduresTo review the different types of lung resection To know the indications of thoracic surgeryTo recognize normal expected findings To identify potential complications in chest radiograhy and CT in order to optimize patient care in the postoperative period

TABLE OF CONTENTS/OUTLINE

Surgical techniques: minimally invasive techniques (video-assisted thoracoscopic surgery and robotic- assisted thoracic surgery) and open thoracotomies (Posterolateral, Shaw-Paulson, Anterolateral, axillary thoracotomy, thoracoabdominal incision, bilateral anterior transternal thoracotomy...)Types of lung resection and indications: sublobar resection (including wedge resection and segmentectomy), lobectomy, neumonectomy (intrapleural, extrapleural, intrapericardial)Normal findings for each type of resection in Radiographs and Computed TomographyComplications:• Airway and lung complications: Atelectasis, Pneumonia, Pulmonary edema, Acute respiratory distress syndrome, Air leak/bronchopleural fistula, Post pneumonectomy syndrome, lobar torsion, lung herniation.• Mediastinal and cardiovascular complications: Mediastinal hematoma, Acute mediastinitis/mediastinal abscess, Pneumopericardium, Cardiac herniation, Stump thrombus, Pulmonar Pseudoaneurysm. • Pleural and esophageal complications: Empyema, Hemothorax, Chylothorax, Esophageal anastomotic leak and esophagopleural fistula.

CHEE-10 Hidden in Plain Sight: Applications of the Aorto-Esophageal Ligament

Participants
Nanditha Guruvaiah, BSc, Staten Island, NY (*Presenter*) Nothing to Disclose

TEACHING POINTS

While it is not uncommon to see central mediastinal pathology on cross-sectional imaging, it is important to understand the pathway influencing the spread of disease at a radiological point of view. Mediastinal facial planes can be visualized in cross sectional imaging such as CT and MRI. However, MRI is more successful in identifying the mediastinal visceral fascia and the aorto-esophageal (AE) ligament; which courses from the anterior aspect of the aorta to the left lateral aspect of the esophagus. This recently discovered unknown anatomy aids us in understanding the possible pathway of spread of disease processes such as infection, air, fluid, and soft tissue (lipomas) in the mediastinum. CT and MRI could also be useful in determining the lymph node metastasis and tumor in growth in relation to the AE ligament. In addition, the aorto-esophageal ligament can be utilized in the preoperative planning of minimally invasive thoracic surgeries.

TABLE OF CONTENTS/OUTLINE

• Introduction to anatomy of Aorto-Esophageal Ligament• Classification of Mediastinal compartments on cross section imaging• Role of Imaging in identifying AE ligament - benefits and limitations• Application of AE ligament in imaging -Spread of disease (gas, fluid and soft tissue) in the mediastinum -Preoperative surgical planning-Oncology imaging, notably spread of lymph nodes• Case based learning • What Radiologists should know about AE ligament

CHEE-100 Interpreting the Unexpected: Diagnostic Imaging Findings in Mycobacterium Chimaera Infection

Participants
Andrew Moore, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Mycobacterium chimaera (MC) is an indolent infection that is often misdiagnosed or underrecognized. Having a high clinical suspicion and knowing its various imaging manifestations help avoid delay in diagnosis and allow for earlier treatment 2. Slowly developing or enlarging peri-sternotomy fluid collections, soft-tissue thickening or both, without other clinical findings to suggest acute infection may be seen with mycobacterium chimaera infection 3. PET/CT is a useful adjunct to suggest indolent infection in patients with unremarkable CT scans and in those with a high clinical suspicion of infection

TABLE OF CONTENTS/OUTLINE

1. Background/Epidemiology a. MC is a nontuberculous mycobacterium found in environment b. Disease manifestations include

disseminated, pulmonary and surgical site c. Water used in Heater-Cooler Devices (HCD) became contaminated by MC which is then aerosolized by HCD fans during cardiothoracic surgery d. Surgical site or disseminated disease occurs after cardiothoracic surgery where patient, implanted material or both become infected with aerosolized MC 2. Clinical Course of MC Infection 3. CT PET/CT Findings a. Sternotomy site b. Blurred vascular wall c. Insidious development of fluid collections and soft tissue thickening/tracts d. Persistent fluid collections despite treatment enhancement characteristics e. Disseminated disease 4. Conclusion

CHEE-101 Pulmonary Fungal Disease Patterns in CT: Recognizing and Differentiating

Participants
Isabela Oliveira, MD, Campinas, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Recognize the different radiologic patterns of fungal lung infections. Be familiar with the main fungal entities involved in certain radiologic patterns. Know the main differential diagnoses for the mentioned patterns. Differentiate between the entities involved in both immunocompetent and immunocompromised hosts.

TABLE OF CONTENTS/OUTLINE

1. Introduction. 2. Systematic approach - imaging patterns of thoracic fungal diseases: a. Ground glass opacities; b. Nodules; c. The halo and reversed halo signs; d. Miliary pattern; e. Mediastinal involvement; f. Airway disease; g. Cavitations. 3. Pattern-based differential diagnosis: Ground glass due to viral infection; Nodules related to lung metastasis; The halo and reversed halo sign related to organizing pneumonia; Miliary pattern related to neoplasia; Mediastinal involvement related to neoplasia; Airway disease related to viral respiratory tract infection; Cavitations related to vasculitis. 4. Major fungal pathogens according to imaging patterns and immunological status (immunocompetent vs. immunocompromised hosts).5. Summary

CHEE-102 Emergency and Critical Care Chest Radiography: Pitfalls and Pearls with CT Correlation

Participants
Seyed Mohammad Seyedsaadat, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Prompt diagnosis of many emergent conditions with chest radiography requires appreciation of subtle or easily misinterpreted radiographic findings; a systematic search pattern is essential for prompt detection. 2. Awareness of direct and indirect findings of pleural and parenchymal emergencies such as pneumothorax, hemothorax, bronchopleural fistula, empyema, laceration, and abscess can prevent treatment delays. 3. Early detection of abnormal mediastinal lines, stripes, and interfaces can be clues to life-threatening pathology such as aortic dissection, mediastinitis, and mediastinal hemorrhage. 4. Diaphragmatic injuries, fractures, and sternal dehiscence are frequently missed emergent radiographic findings, requiring a high level of suspicion and knowledge of common patterns of injury. 5. Attention to the position and the courses of the lines and tubes in their entirety on the chest radiograph can help to detect extrathoracic device misplacement or related complications.

TABLE OF CONTENTS/OUTLINE

Pitfalls and pearls of chest imaging in the emergency and critical care unit with CXR/CT correlation.Pleura (PTx on supine CXR, bronchopleural fistula, empyema)Lung Parenchyma (Cardiogenic vs noncardiogenic pulmonary edema, lung abscess)Heart and vessels (Traumatic aortic injury, mediastinal hematoma, mediastinitis)Diaphragm and chest wall (Diaphragmatic rupture, sternal dehiscence, fracturesLines and tubes (Vascular, cardiac, pleural, airway devices) PDF Upload.

CHEE-103 Osseous Lesions in Oncologic Patients

Participants
Alexander Sytov, (*Presenter*) Nothing to Disclose

TEACHING POINTS

The finding of an incidental focal osseous lesion in an oncologic patient poses a unique diagnostic challenge due to the heightened concern for metastasis. While the majority of osseous lesions are benign, many may closely resemble metastasis on imaging, prompting the need for clear methods of differentiation. By following an algorithm for categorizing osseous lesions, radiologists may confidently recommend follow-up imaging studies while avoiding unnecessary referrals.After reviewing this exhibit, the learner will be able to:- Employ a systematic method to characterize osseous lesions according to their density, composition, and cortical features- Identify imaging features that characterize osseous lesions as malignant or benign (such as: wide zone of transition, discontinuous cortex, soft tissue component replacing the medullary cavity, or extension beyond the margin of the bone)- Identify several frequently encountered benign osseous lesions that resemble metastasis- Establish an appropriate imaging algorithm to further characterize osseous lesions in these patients

TABLE OF CONTENTS/OUTLINE

- Introduction: imaging features of osseous lesions with special emphasis on features suggestive of malignancy- Pictorial review of several commonly encountered benign osseous lesions that resemble metastasis in oncologic patients- Imaging algorithm to further characterize osseous lesions

CHEE-104 Read Like A Pro: Tips and Tricks to Interpret Like a Cardiothoracic Radiologist

Awards
Certificate of Merit

Participants
Melissa Carroll, MD, Kansas City, KS (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Misconceptions in chest imaging may lead to excessive imaging, missed diagnoses, or inappropriate therapies, such as missed detection of malignancy manifesting as cyst associated lung cancer. Other misconceptions may lead to unnecessary follow up of nodules identified on incomplete thoracic exams.2. Knowledge of these misconceptions may lower costs, increase accuracy, and improve patient outcomes.

TABLE OF CONTENTS/OUTLINE

1. Background2. Malignancya. Lung cancer manifesting as cyst associated malignancy, persistent consolidation and subsolid noduleb. Incidental nodule on incomplete chest CTc. Intrapulmonary lymph node3. Diffuse Lung Diseasea. Reverse halo sign with pulmonary infarctb. DIPNECH as underdiagnosed diseasec. Patchy tree-in-bud opacities from infectious or aspiration bronchiolitis.d. Differentiating airspace enlargement with fibrosis from honeycombing.e. Dendriform pulmonary ossification due to pulmonary fibrosis or aspiration4. Mediastinuma. Pericardial recesses misinterpreted as lymphadenopathyb. Distinguishing normal thymus from mass5. Vasculara. Flow-related artifacts mimicking pulmonary embolism or dissectionb. Diffuse tree-in-bud opacities with excipient lung disease.c. Beaded vasculature with endovascular metastases6. Pleura/Chest Walla. Extrapleural fat deposition mimicking cardiomegaly or pleural effusionb. Elastofibroma mimicking chest wall mass7. Conclusion

CHEE-105 Unraveling the maze - Patterns of lung cancer lymphatic dissemination

Participants
Marcus Vinicius Silva Ferreira, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

This exhibition aims to review: • Anatomy of the lymphatic drainage of the lungs and mediastinal node stations. • Multimodality imaging staging of lung cancer, with focus on lymph node (LN) status and its importance to the appropriate lung cancer management. • Indications and impact of different types of lymphadenectomy: selective versus systematic node dissection. • A practical approach to lobe-specific nodal spread of lung cancer with imaging correlations.

TABLE OF CONTENTS/OUTLINE

1. BACKGROUND 1.1. Lung cancer overview 2. 8TH LUNG CANCER STAGE CLASSIFICATION 3. LYMPH NODE EVALUATION 3.1. Invasive and non-invasive approach to mediastinal nodal evaluation 3.2. Imaging characteristics of suspicious nodes 4. LYMPHATIC ANATOMY 4.1. Lungs and bronchial tree 4.2. Mediastinal Lymph nodes stations 5. LOBE-SPECIFIC PATTERNS OF LYMPHATIC SPREAD 5.1. Right upper lobe 5.2. Right middle lobe 5.3. Right Lower Lobe 5.4. Left Upper Lobe / Lingula 5.5. Left Lower Lobe 6. IS IT FEASIBLE TO ADOPT A SELECTIVE APPROACH? EVIDENCE SO FAR 7. NOVEL IMAGING TECHNIQUES AND FUTURE DIRECTIONS 8. TAKE-HOME MESSAGES

CHEE-106 Basics of Lung Cancer Related to Cysts and Enlarged Cystic Air-spaces: Survival Guide for General Radiologist

Participants
Laima Tamkeviciute, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Lung cancer can manifest as lung cysts or enlarged airspaces. 2. This type of lung cancer represents significant number of missed diagnosis. 3. The main concerning features of lung cysts and enlarged cystic air-spaces include: wall thickening or nodules, adjacent ground glass changes, multilocular cysts, increase in size or change of internal structure overtime. 4. Knowledge of the various imaging presentations of lung cancer is essential for timely diagnosis and treatment thus preventing development of invasive disease.

TABLE OF CONTENTS/OUTLINE

I. Introduction: 1. Why do we have to raise awareness about lung cysts and enlarged cystic air-spaces? 2. What is the mechanism and pathogenesis of lung cysts and enlarged cystic air-spaces? II. Imaging findings 1. How lung cysts and enlarged cystic air-spaces should be described? 2. What are the concerning features of lung cysts and enlarged cystic air-spaces? 3. How malignant cysts and enlarged air-spaces can change overtime? III. Conclusion and take home message

CHEE-109 Ultrasound Guided-Procedures in the Lung - What, When and How

Participants
Ivan Vollmer, MD, Barcelona, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

-To describe the indications for interventional procedures in pulmonary pathology.-To review the interventional lung procedures that can be performed with ultrasound guidance.-To analyze the advantages and disadvantages of ultrasound guidance.-To describe how each procedure is carried out.

TABLE OF CONTENTS/OUTLINE

The different interventional lung procedures that can be performed with ultrasound guidance will be reviewed:-Lung biopsy-Pneumonia puncture.-Lung abscess drainage.-Intraoperative localization of lung nodules.The specific indications for each lung procedure as well as its advantages of using ultrasound guidance over other techniques such as CT will be covered.Moreover, the technique that should be used in each procedure and the pre and post procedure recommendations will also be addressed.

CHEE-11 From Gemcitabine, through Checkpoint Inhibitors to CAR T Cell - Evolution of Managing Treatment Related Pneumonitis in Cancer: Beyond Diagnosis

Awards
Certificate of Merit

Participants
Kaustav Bera, MD, Cleveland, OH (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review cancer drugs that are primarily responsible for causing pneumonitis as well as differentiating it from other treatment related findings 2. Discuss the CT imaging patterns of drug-induced pneumonitis 3. Discuss potential mimics of drug-induced pneumonitis patterns including cytokine release syndrome in CAR-T cell therapy4. Discuss the crucial role of the radiologist in monitoring/management of treatment-related pneumonitis with a focus on established guidelines5. Discuss use-cases of common

anti-neoplastic agents causing pneumonitis - from Gemcitabine, through ICI to CAR-T cells

TABLE OF CONTENTS/OUTLINE

1. Discuss common anti-neoplastic agents that cause pneumonitis2. Enumerate prevalently reported imaging patterns of pneumonitis, along with their typical imaging findings3. Discuss other potential complications of anti-cancer therapy (Pleural effusions, Pneumonia, Worsening tumor burden, airway obstruction)4. Common mimics of drug-induced pneumonitis (atypical pneumonia, COVID-19, Cytokine release syndrome)5. Discuss presenting clinical symptoms and grading system for drug-induced pneumonitis (CTCAE and ASCO)6. Management guidelines for drug-induced pneumonitis with special focus on checkpoint inhibitors (ICI), targeted therapy, Antimetabolites (Gemcitabine) 7. How a Radiologist plays an important role in management8. Prognosis and clinical outcome of patients developing drug-induced pneumonitis9. Real-world cases showing management and clinical course of drug-induced pneumonitis in cancer therapies from Bleomycin, Gemcitabine to combination ICI and CAR-T cells

CHEE-110 Added Diagnostic Value of Portable Dual-energy Chest X-ray in a Non-radiological Reviewing Environment

Participants
Karim Karim, PhD, Waterloo, ON (*Presenter*) Officer, KA Imaging Inc

TEACHING POINTS

• Understand Dual-Energy Subtraction (DES) X-ray, the limitations of the old Dual-Exposure DES techniques, and how a Single Exposure portable detector can overcome these limitations. • Understand the clinical benefits enabled by portable Single Exposure Dual-Energy for small nodules identification, pneumonia, pneumothorax, and finding line and tube tips. • Learn about the added diagnostic value of dual-energy portable chest X-ray in a non-radiological reviewing environment for both regular and radiology trained clinicians.

TABLE OF CONTENTS/OUTLINE

This exhibit teaches the added diagnostic value of dual-energy X-rays (DEX) obtained using a novel portable multilayer detector in a reviewing environment simulating a non-radiological practice. A set of 28 AP images were obtained using a novel portable multi-layer DEX detector. A team of five (5) readers was recruited that included two fellowship-trained chest radiologists and the rest non-specialists. The team was provided with the conventional X-ray images first, and subsequently were unblinded to the corresponding DEX images. For both sets of images, the readers were asked to assess the presence of pulmonary nodules > 5 mm, pneumothorax, pneumonia (left and right lung), bone fractures, and tips of central and GI lines using a five point scale. Readers were also asked whether the additional DEX images (soft tissue, bone) impacted their confidence. Initial results show that DEX images, taken alongside CR, helped improve diagnostic confidence.

CHEE-111 Bronchoscopic Lung Volume Reduction: Pre and Post Procedure Imaging Assessment

Awards
Certificate of Merit

Participants
Daniel Green, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) Bronchosopic lung volume reduction is a non-pharmacologic treatment for severe COPD, 2) Less invasive alternative to lung volume reduction surgery,3) Goal is complete collapse of the most emphysematous lobe, 4) Imaging is necessary for patient selection, and radiologists have an important role in multidisciplinary discussion, 5) The main role of pre-procedure CT is assessment of emphysema severity, emphysema distribution, and fissure integrity, 6) Sagittal and coronal reconstructions are helpful for fissure integrity, 7) Pneumothorax is the most common complication but does not typically affect clinical outcome

TABLE OF CONTENTS/OUTLINE

1) Description of procedure, 2) Patient selection, 3) Chest CT protocol,4) Pre-procedure imaging assessment,5) Expected post-procedure imaging findings,6) Complications,7) Other bronchoscopic lung volume reduction techniques in development

CHEE-112 Postoperative Imaging After Surgery for Lung Cancer - From Relatively Common Complications to Rare Complications that Radiologists Need to Know

Participants
Makiko Murota, MD, Kitagun, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of the exhibit is: 1. To review surgical procedures and the postoperative changes for lung cancer. 2. To describe the imaging features of the complications after surgery. 3. To discuss how even rare complications can be radiologically significant.

TABLE OF CONTENTS/OUTLINE

1. The surgical procedures for lung cancer 2. The imaging findings of the normal postoperative changes: CXR and CT 3. The imaging features and the clinical manifestations of the complications after surgery: relatively common complications and rare complications 4. Summary

CHEE-113 Imaging of Mechanical Circulatory Support Devices For Right Ventricular Failure

Participants
Gregory Jew, MD, Rochester, NY (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review of options for acute mechanical right ventricular circulatory support including:The TandemHeart centrifugal flow pump (TandemLife, Pittsburgh, PA), the axial-flow Impella RP catheter (Abiomed Inc, Danvers, MA), the Protek Duo dual lumen cannula, and the veno-arterial extracorporeal membrane oxygenation (VA-ECMO).1a. Review of right ventricular bypass methods.1b. Review

of methods of oxygenation.2. Review of options for durable mechanical right ventricular circulatory support including: The CentriMag pump (St. Jude, Minneapolis, MN) RA-to-PA cannulation as well as commercially available LVADs, including the Jarvik and HeartWare devices.3. Review of common complications of RVADs including access site complications, pulmonary and other complications such as cannula malposition, and abandoned cannula.

TABLE OF CONTENTS/OUTLINE

1. Background/Indications for RVADs/RV Bypass and Oxygenation Methods.2. Imaging for percutaneous acute and durable mechanical circulatory support systems: Direct and indirect RV bypass systems: Protek Duo, VA-ECMO, Impella RP.Durable mechanical circulatory support systems: Jarvik, Centrimag.3. Access site complications of RVADs: access site hematoma, access vessel thrombosis, access site infection.4. Pulmonary complications of RVADs: pulmonary edema, organizing pneumonia, ARDS, septic emboli.5. Other complications of RVADs such as a malpositioned cannula, abandoned cannula, distal hemorrhage.

CHEE-114 Abnormal Gas on Chest X-Ray: A Primer with CT Correlation

Awards
Identified for RadioGraphics

Participants
Sameer Singhal, MD, Boston, MA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Gas collections in the lung tend to be spherical, while gas collections in the pleura tend to be longer in one dimension.2. Pneumopericardium appears as "clean" gas that is bounded by the superior pericardial recess, while pneumomediastinum is "dirty" gas that can track superiorly into the neck.3. It is critically important to scan the upper abdomen for incidental abnormal gas, including pneumatosis and pneumoperitoneum.

TABLE OF CONTENTS/OUTLINE

1. Abnormal air in the lungsa. Bullab. Cavitary consolidation2. Abnormal air in the pleuraa. Pneumothorax, including deep sulcusb. Hydropneumothorax - distinguish from intraparenchymal gas3. Abnormal air in the mediastinuma. Pneumopericardiumb. Pneumomediastinumc. Signs: ring-around-the-artery, continuous diaphragmd. Herniae. Post-surgical4. Abnormal air in the abdomena. Pneumoperitoneumb. Pneumobiliac. Portal venous gas and pneumatosis

CHEE-115 Pulmonary Manifestations of IgG4 Related Disease

Awards
Certificate of Merit

Participants
Santiago Restrepo, MD, San Antonio, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

IgG4 is a systemic fibroinflammatory disease characterized by dense infiltration of IgG4 positive plasma cells in the affected tissues with or without elevated plasma levels of IgG4.The inflammatory infiltration can lead to the development of fibrotic tumefactive lesions that may affect any tissue often mimicking a neoplastic process.Thoracic involvement may affect the lung parenchyma, airways, the interstitium, pleura and the mediastinum.Most common manifestation include pulmonary nodules, interstitial lung disease, peribronchovascular infiltration, lymphadenopathy and fibrosing mediastinitis.

TABLE OF CONTENTS/OUTLINE

Definition, Pathophysiology, Histopathology, Associated or related conditions, Common clinical phenotypes, Pulmonary disease, Fibrosing mediastinitis, Cardiovascular involvement

CHEE-116 Interstitial Lung Disease in Rheumatoid Arthritis

Participants
Elisa Antolinos Macho, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

- To know, identifiy and become familiar with the typical (and not so typical) radiological patterns of RA in lung involvement.- To suggest an early diagnosis in patients who have not shown any other RA manifestations and be able to offer a sooner treatment in these cases.

TABLE OF CONTENTS/OUTLINE

1. Introduction and generalities: rheumatoid arthritis is a multisystemic disease of uncertain etiology, with many factors involved (female sex, genetics, non genetic factors, biologic markers...).2. Extraarticular manifestations (EAM): although the typical manifestation is poliarthropaty, up to half of the patients who has RA, present extraarticular manifestations, more frequently in those who has positive analytic markers. Cardiovascular and respiratory EAM are the most important involvement in mobility and mortality terms.3. Pulmonary manifestations: An important group of the patients who undergoes this disease (60-80%) presents pulmonary involvement in the course of the disease, being interstitial involvement the second most important cause of mortality in these patients (after cardiovascular involvement). These manifestations can precede articular affectation up to 15% of the cases, and only in 10% of those, has significant clinical manifestations.4. Review of the typical patterns:- Usual Interstitial Pneumonia (UIP).- Non-Specific Interstitial Pneumonia (NSIP).- Organizing Pneumonia (OP).- Lymphocytic Interstitial Pneumonitis (LIP).5. Summary.

CHEE-117 Four-dimensional Angiography of Pulmonary Arteriovenous Malformation: How Do We Detect the Hidden" Last Normal Branch for Endovascular Therapy?

Participants
Shota Yamamoto, MD, PhD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Pulmonary arteriovenous malformations (PAVMs) are abnormal direct vascular communications between pulmonary arteries and veins which create high-flow right-to-left shunts. Even when asymptomatic, presence of PAVMs increases patients' risk of substantial morbidity and mortality mainly from the effects of paradoxical emboli. Potential complications include stroke, cerebral abscess, pulmonary hemorrhage and hypoxia. Transcatheter embolization eliminates the abnormal right-to-left-shunting. For more effective embolization, preventing recanalization after PAVMs embolization is the most important. Recently, the Japanese nationwide cohort study has revealed that embolization of the last normal branch was a key factor affected the prevention of recanalization. The last normal branch is generally identified on preoperative multi-detector CT, but the identification rate on the conventional angiography is low (39%). We performed dynamic imaging with Cone-beam CT utilizing two-step dilution and balloon catheter occlusion, which allows for precise assessment of vessel shape and number, the last normal branch and shunting points during the procedure. Its innovative four-dimensional angiography can detect the "hidden" normal last branch and smoothly execute the treatment straight away. This presentation reviews the updated imaging modalities regarding vascular structural understanding and planning the endovascular therapy of PAVMs.

TABLE OF CONTENTS/OUTLINE

i. Anatomical categories of PAVMs ii. What is the last normal branch of PAVM? Why is it important? iii. Imaging modalities for planning for embolization (4D angiography) iv. Ideal embolization based on anatomical structure

CHEE-118 Pulmonary Parenchymal Imaging Using Ultra-high Resolution CT - Estimating Lung Vascularity Using Radiologic Lung Weight

Participants
Hiroshi Moriya, MD, Fukushima, Japan (*Presenter*) Advisor, California Capital Equity, LLC;Research Grant, Canon Medical Systems Corporation

TEACHING POINTS

In UHRCT, the reliability of CT values of small structures is improved by reducing the partial volume effect due to the miniaturization of voxels. In particular, the contrast effect of small vessels with a diameter of 1 mm or less is enhanced. And the entire peripheral lung parenchyma can be displayed by deleting the cardiovascular image. This technique can display blood vessel distribution and contrast effect distribution (Moriya et al, Peripheral Pulmonary Artery Imaging Using Ultra-high Resolution CT - A New Method Of Evaluating Vascularity In The Lung Field CHEE-37 RSNA2021). On the other hand, the contrast effect and vascularity of the lung can be calculated using the radiologic lung density measurement, which is a method of converting the lung weight from the CT value. We present this technique and typical cases.

TABLE OF CONTENTS/OUTLINE

1. Method: UHRCT(SHR mode: 1024matrix 0.25mm), Workstation used: Ziostation2 (Segmentation of lung parenchyma, each lobe, lung + blood vessels of any thickness)2. Typical casesCase1(dynamic contrast CT before lung cancer surgery): Contrast-enhanced phase were well reflected in radiologic lung weight. Peripheral pulmonary vessel involvement was less than 10%. Case2(Pulmonary artery thromboembolism): Lung vascularity before and after treatment was calculated for each lobe. The therapeutic effect of the thrombus lesion was reflected in the radiologic lung weight.3. This method can be an easy pulmonary blood flow evaluation method.

CHEE-119 Step by Step: Radiological Features of Pulmonary Vascular disease Made Simple

Participants
Sofia Gambetta I, MD, MD, Pilar, Argentina (*Presenter*) Nothing to Disclose

TEACHING POINTS

[[Unsupported Character - Symbol Font &;]] Identifying pulmonary vascular disease and their causes. [[Unsupported Character - Symbol Font &;]] Providing methodological guidelines in order to approach the diagnosis of the pathologies that involve pulmonary vascularity. [[Unsupported Character - Symbol Font &;]] Presenting frequent and uncommon presentation of pulmonary vascular disease. [[Unsupported Character - Symbol Font &;]] Correlating the radiological features with clinical, histopathological and laboratory findings.

TABLE OF CONTENTS/OUTLINE

[[Unsupported Character - Symbol Font &;]] Introduction. [[Unsupported Character - Symbol Font &;]] Pulmonary vascular disease explained: Pulmonary hypertension, acute and chronic pulmonary thromboembolism, congenital and acquired pulmonary venous return anomalies, diffuse alveolar hemorrhage and vasculitis. [[Unsupported Character - Symbol Font &;]] Case-based approach with radiologic correlation. [[Unsupported Character - Symbol Font &;]] Imaging findings with clinical, laboratory and histological correlations. [[Unsupported Character - Symbol Font &;]] Diagnostic and therapeutic algorithm. [[Unsupported Character - Symbol Font &;]] Conclusion.

CHEE-12 Pulmonary Ablation: From Techniques to Complications

Awards
Certificate of Merit

Participants
Jose Maluf, MD, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Understand how pulmonary ablation works and it's role in thoracic malignancies treatment • Learn about the diferent techniques involved in pulmonary ablation • Recognize expected imaging features of the post ablation zone • Identify the main complications related to pulmonary ablation

TABLE OF CONTENTS/OUTLINE

• Introduction - General concepts about pulmonary ablation: o Current context o The procedure o Indications and contraindications o Imaging surveillance • Different techniques: o Radiofrequency ablation (RFA) o Microwaves ablation (MWA) o Cryoablation o Irreversible electroporation (IEP) • Post-ablation zone features: What to expect? • Case based review - Complications related to

pulmonary ablation: o Asseptical Pleuritis o Pneumothorax o Lung Hemorrahge o Aspergilloma o Bronchopleural Fistula o Air embolism o Rib fracture o Other complications • Future perspectives • Conclusions and key takeaways

CHEE-120 Vascular Complications of Infections: Beyond COVID-19

Participants
Babina Gosangi, MD, MPH, New Haven, MA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Vascular complications of infection can be divided into thromboembolic disorders and non-thromboembolic disorders.2. Thromboemboli from infections could be due to endothelial damage, hyperviscosity, embolization of vegetations containing infectious material or embolization of the culprit organism. Such conditions include COVID-19 infection, infectious endocarditis, Lemierre's syndrome and parasitic embolization into the pulmonary arteries (Echinococcus). 3. Vascular infections could also result from contiguous spread of infection from the adjacent organs causing inflammation of the vessels such as infectious aortitis associated with vertebral osteomyelitis, empyema or pneumonia. 4. Infections can damage the vessel wall and cause aneurysm such as Rasmussen's aneurysm or mycotic aneurysm.

TABLE OF CONTENTS/OUTLINE

• Introduction • Pulmonary embolism- COVID-19 infection• Septic infarcts- Infective endocarditis• Internal jugular vein thrombus- Lemierre’s syndrome • Infectious aortitis- Tuberculous aortitis, syphilitic aortitis, HIV aortitis, pyogenic aortitis• Mycotic aneurysm• Rasmussen’s aneurysm- Tuberculosis • Conclusion

CHEE-121 Emboli or Else? Beware the Pitfalls in CTEPH Diagnosis - Chronic Thromboembolic Pulmonary Hypertension Lookalikes in CT Pulmonary Angiography

Participants
Wagner Diniz de Paula, MD, PhD, Brasilia, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Recognize the signs of chronic pulmonary emboli and pulmonary hypertension on CT, review the pathophysiology of pulmonary hypertension in CTEPH, and learn clues to identify common and uncommon mimickers of CTEPH on CT.

TABLE OF CONTENTS/OUTLINE

Chronic thromboembolic pulmonary hypertension (CTEPH) results from pulmonary artery obstruction due to non-resolving pulmonary embolism (PE). Among PE survivors, CTEPH is estimated to occur in 1% to 5% of cases. It is a potentially treatable cause of pulmonary arterial hypertension (PAH) and, if left untreated, may progress to right heart failure and death.CT signs of PE, PAH and CTEPH will be reviewed and clues to differential diagnosis will be provided.Some conditions may simulate CTEPH on imaging, encompassing intravascular, extravascular, and vascular (parietal) causes. Intravascular mimickers of CTEPH include pulmonary arterial malignancies (primary intimal sarcoma, metastatic tumoral thrombi) and in situ pulmonary thrombosis due to long-standing PAH (e.g., in cyanogenic congenital heart disease and schistosomiasis). Extravascular causes comprise IgG4-related and granulomatous fibrosing mediastinitis. Vascular abnormalities include congenital anomalies such as proximal interruption of the pulmonary artery and acquired physiological disturbances related to pulmonary hypoxic vasoconstriction.

CHEE-122 CT in Acute Pulmonary Embolism: Filling Defects and Beyond

Awards
Certificate of Merit

Participants
Kaustav Bera, MD, Cleveland, OH (*Presenter*) Nothing to Disclose

TEACHING POINTS

1.Review the clinical, laboratory and diagnostic work up of patients suspected with acute pulmonary embolism (PE) 2. Discuss the typical and atypical CT appearance of acute PE and its mimics using an algorithmic approach 3. Discuss the important acute and emergent pathology beyond PE, that can mimic acute PE symptoms, visualized on a CT PE study 4. Briefly review additional incidental findings on a CT PE study 5.Illustrate newer advances in CT technology (Dual energy and multi-energy CT) and artificial intelligence methods for improved diagnostic assessment

TABLE OF CONTENTS/OUTLINE

1.When do you suspect an Acute PE - Risk factors, clinical history, symptoms, physical examination, laboratory findings 2.Clinical risk scores to determine whether imaging should be obtained in suspected Acute PE a. Wells score b. Pulmonary Embolism Rule-out criteria (PERC) c. Geneva score 3.Role of Bedside diagnostics in PE (Chest Radiograph, EKG, Ultrasound) and diagnostic signs.4.Discuss the algorithmic approach to obtain diagnostic imaging in PE 5.Imaging modalities including gold standard and alternatives to evaluate for PE 6. Imaging technique and challenges to obtain a diagnostic CT exam7. CT imaging in acute PE - primary and ancillary findings 8.Step wise approach to CT interpretation 9.Clinical examples showing conditions mimicking PE on CT imaging - Beyond filling defects a. Acute PE mimicking pathology (Acute aortic pathology, airway obstruction etc.) b. Other Urgent pathology (Pyelonephritis, abscess, arterial bleeds, DVT etc.) c. Incidental findings (Nodules, Nephrolithiasis, Cholelithiasis10.Newer imaging techniques for PE diagnosis 11. Future directions including role of Artificial Intelligence

CHEE-123 Spectrum of Pulmonary Aspergillosis

Awards
Certificate of Merit

Participants
Gerald Hefferman, MD, Somerville, MA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. The manifestations of pulmonary aspergillosis depend on the host immune state and underlying pulmonary disease.2. Non-

invasive infections by aspergillus are airway-centered (e.g. APBA, mycetoma), while invasive infections often manifest by destruction of pulmonary vasculature (e.g. angioinvasive aspergillosis).

TABLE OF CONTENTS/OUTLINE

1. Allergic bronchopulmonary aspergillosisa. High attenuation mucus2. Mycetomaa. Monod sign3. Angioinvasive aspergillosisa. Halo signb. Air crescent signc. COVID-19 superinfection4. Tracheobronchial aspergillosis5. Airway-invasive aspergillosis6. Chronic necrotizing aspergillosis

CHEE-124 A Radiological Guide to Connective Tissue Disorders associated Interstitial Lung Diseases (CTD-ILDs)

Participants
Aarushi Gupta, MD, MBBS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Describe high resolution CT (HRCT) patterns of various Connective Tissue Disorders associated Interstitial Lung Diseases (CTD-ILDs) with representative cases including usual interstitial pneumonia (UIP), non-specific interstitial pneumonia (NSIP), fibrosing organizing pneumonia (OP), lymphocytic interstitial pneumonia (LIP), follicular/obliterative bronchiolitis and other rare entities• Review common radiological signs used for diagnosis of CTD-ILDs including exuberant honeycombing, anterior upper lobe and straight edge sign• Brief overview of new concepts like Interstitial Pneumonia with Autoimmune Features (IPAF) and CTD associated Interstitial Lung abnormalities (CTD-ILAs), their radiological findings and management

TABLE OF CONTENTS/OUTLINE

1. Definition, epidemiology and clinical manifestations of CTD-ILDs 2. Radiological signs and patterns suggestive of CTD-ILDs on HRCT chest 3.Specific Imaging patterns seen in different CTD-ILDs (Rheumatoid arthritis, Systemic Sclerosis, Systemic Lupus Erythematosus, Polymyositis/Dermatomyositis, Sjogren syndrome) with representative cases 4. Overview of IPAF 5. Definition and management of CTD-ILAs 6. Conclusion-highlighting radiological pearls

CHEE-125 Pulmonary and Pleuropulmonary Blastomas

Participants
Santiago Restrepo, MD, San Antonio, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

Blastomas represent a group of primary malignancies with proliferation of immature element that look like fetal lung.They typically have a biphasic composition with malignant mesenchymal and epithelial immature component.Two types: Pleuropulmonary blastoma (PPB) seen in children and Pulmonary Blastoma (PB) seen in adults.PPPB is the most common primary lung malignancy in children, and most present in patients less than 6 years old.DICER1 mutation is seen in 66% of patients with PPB. Other DICER1 related tumors are seen in 40% of affected patients.Imaging presentation is misleading and often confused with other entities like CCAM, sequestration,congenital lobar emphysema etc.

TABLE OF CONTENTS/OUTLINE

Definition. DICER1 mutation. DICER1 associated tumors. 2015 WHO classification. Histopathology. Pathologic-radiologic correlation. Phenotypes and prognosis. Imaging manifestation. Differential diagnosis

CHEE-126 Post CABG Chest Radiography: How to Make the Complicated Uncomplicated

Participants
Justin Little, MD, Winston-Salem, NC (*Presenter*) Nothing to Disclose

TEACHING POINTS

Complications after coronary artery bypass grafting (CABG) are common and can range from simple atelectasis or pleural effusions to misplaced lines and other support apparatus issues, to more serious issues such as a pulmonary edema, mediastinal hematoma, or pneumothorax. Portable chest radiography is the mainstay of initial evaluation. It is fast with low radiation and gives the radiologist information that allows for quick action. Overlapping anatomic structures and support apparatus devices in combination with the limitations of portable radiography makes the diagnosis of CABG complications a radiologist's dreaded dilemma. Being able to quickly identify the most common complications is essential to maintaining efficiency and accuracy and preventing morbidity and mortality in the postoperative state.

TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Types of CABG (on-pump, off-pump, minimally invasive)3. Postoperative CABG complications -Immediate (< 24 hours) v. Subacute (1-7 days) v. Chronic (> 7 days)-Complication Categories:1. Lines and tubes2. Parenchymal 3. Mediastinal 4. Soft tissue/musculoskeletal4. Role of imaging: ICU plain chest radiography 5. How to report a postoperative CABG chest radiograph 6. Correlation with CT imaging for increased understanding 7. Algorithm for "next-step" recommendations for complications 8. Multidisciplinary approach and perspective of CT surgeons about the most clinically useful information from radiology

CHEE-127 Thinking Beyond Bronchogenic Carcinoma: A Primer of Rare Pulmonary and Pleural Pathologies

Participants
Ankush Jajodia, MD, MBBS, New Delhi, India (*Presenter*) Nothing to Disclose

TEACHING POINTS

LEARNING OBJECTIVES 1. To give an overview of some uncommon pulmonary and pleural pathologies. 2. To review the spectrum of imaging manifestations of uncommon entities in lung and pleura. 3. To highlight the importance of clinical history, immunohistochemistry and histopathology in arriving at the correct diagnosis.BACKGROUND: Due to their overlapping imaging appearance, imaging-based diagnosis of many rare neoplastic and non-neoplastic conditions affecting the lung and pleura can be challenging. Being familiar with some of the rare and unusual entities, along with relevant clinical history, can aid a radiologist in narrowing down the differential diagnosis. Thinking outside the box and looking for certain potential distinguishing features may help in making an early and accurate diagnosis. Key imaging features on CT and MRI for uncommon pulmonary and pleural pathologies will

be reviewed in this educational exhibit. These include spindle cell sarcoma of the lung, sclerosing pulmonary hemangioma, sclerosing pneumocytoma, pulmonary paraganglioma, pleural hemangioma, malignant peripheral nerve sheath tumor of the pleura and pleural epithelioid hemangioendothelioma. CONCLUSION: A wide range of pulmonary and pleural conditions exhibit imaging features that are similar to more common pathologies such as bronchogenic carcinoma and pleural metastasis. Awareness of additional less common conditions, as well as an understanding of their pathologic background, will aid in accurate diagnosis.

TABLE OF CONTENTS/OUTLINE

Pictorial depiction of rare cases

CHEE-128 Typical and Atypical Diseases involving the Pleura Radiologic-Pathologic Correlation

Participants
Patricia De Groot, MD, Houston, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

Primary benign lesions of the pleura are much less common than malignant diseases of the pleura. Distinguishing benign from malignant pleural diseases affects prognosis, treatment and outcomes. CT features suggesting malignancy are circumferential pleural thickening; nodular pleural thickening; parietal pleural thickening >1 cm; mediastinal pleural involvement. Malignant primary mesothelioma (MPM) is the most common primary malignancy of the pleura. However, pleural metastases are much more common than primary pleural tumors. The most common primaries metastasizing to pleura include lung, breast and GI carcinomas, particularly adenocarcinomas, and lymphoma. Some pleural tumors may manifest focally or be diffuse. Age, sex and clinical history play a part in both radiologic and pathologic diagnosis. We review helpful imaging findings in the differential diagnosis of pleural diseases and illustrate radiologic-pathologic correlation of benign and malignant pleural lesions.

TABLE OF CONTENTS/OUTLINE

Benign vs Malignant: Benign includes solitary fibrous tumor, lipoma, schwannoma, endometriosis, pleuritis.Primary malignant includes MPM, solitary fibrous tumor, liposarcoma, PNET, synovial sarcoma, vascular sarcoma.Secondary malignant includes metastatic disease from lung cancer, lymphoma, plasmacytoma.Focal versus Diffuse: Typical focal includes metastatic disease, solitary fibrous tumor, schwannoma, thymoma, lipoma.Atypical focal includes PNET, synovial sarcoma, liposarcoma, meningioma, endometriosis.Typical diffuse includes metastatic disease, MPM, fibrothorax, thymoma.Atypical diffuse includes lymphoma, synovial sarcoma, epithelioid hemangioendothelioma.

CHEE-13 Lung Ultrasound - Ugly Duckling into Swan: A Case-based Approach Demonstrating the Effectiveness of This Method in the Evaluation of Several Pediatric Lung and Pleural Pathologies

Participants
Marcos Brotto, , Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

During the pandemic caused by the SARS-CoV-2, lung ultrasound (US) has become a promising diagnostic method at the bedside mostly due to its fundamental role in patients who develop infection with severe acute respiratory syndrome. Since then, many studies have proven its value, especially in the pediatric age group. The high demand caused by the viral pneumonia pandemic intensified its use and consequently expanded its applicability in several situations, including pathologies accidentally detected, showing the high accuracy of the method. In addition, lung US provides dynamic data, feature that only ultrasound allows when compared to other imaging methods.For many reasons the pediatric population benefits a great deal from the use of US as a first line method, including the assessment of thoracic and pleural pathologies. US may also provide useful information that eliminates the need for more invasive or expensive studies, especially in cases with mild clinical changes.

TABLE OF CONTENTS/OUTLINE

The intention of this presentation is to demonstrate, through a series of cases, the extensive scope of ultrasound in the evaluation of the pediatric thorax. Demonstrate the main ultrasound findings in several parenchymal and pleural pathologies such as pneumonia, abscess, pleural effusion, empyema, among others, proving that the US can be used in the serial evaluation of these conditions. Discuss US radiological findings and their correlations with chest radiograph and chest tomography, and how sonographers can reproduce them adequately in many cases.

CHEE-14 Uncommon Non-thromboembolic Conditions Affecting the Pulmonary Vasculature - Beyond Thromboembolism

Awards
Certificate of Merit

Participants
Helena Peris, MD, Sabadell, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

- To review uncommon non-thromboembolic entities that change the morphology or density of the pulmonary arteries on CT or PET/CT.- To describe imaging features of rare conditions that mimic pulmonary thromboembolism and/or bronchial pathology or cause pulmonary hypertension.

TABLE OF CONTENTS/OUTLINE

I. Background:Some uncommon conditions unrelated to thromboembolism can affect the pulmonary arteries, changing the imaging appearance of vessels in the proximal and/or distal pulmonary vasculature. These entities show key CT or PET-CT findings; their knowledge allows us to make the proper diagnosis.II. Content:We classify the entities into four categories:- Neoplastic (benign or malignant): pulmonary artery sarcoma, intravascular metastases, pulmonary tumor thrombotic microangiopathy, and intravascular leiomyomatosis.- Inflammatory: vasculitis (Takayasu arteritis and Behçet's disease), thrombosis in situ.- Iatrogenic: embolization of non-biologic material or gas during invasive procedures such as vertebroplasty, embolization, or colonoscopy and 18 FDG embolism in a PET/CT.- Miscellaneous: excipient lung disease and pulmonary artery sheath hematoma, as a complication of acute aortic dissection.III. Conclusions:Detailed observation of the proximal and distal pulmonary arteries can provide diagnostic clues to unusual

conditions causing pulmonary hypertension, simulating pulmonary thromboembolism or bronchial pathology.

CHEE-15 How Radiologists Can Help Surgeons on the Planning of a Lung Segmentectomy - Significant Pulmonary Veins Variations

Participants
Vitor Bichuette, MD, Uberaba, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

To review pulmonary venous anatomy and the most common pattern of drainage. How a segmentectomy is performed, focusing on techniques to identify the intersegmental plane and the role of the pulmonary veins during the procedure. To explain anatomical variations of pulmonary veins, its significance in lung segmentectomies and how to identify them using computed tomography (CT). To present intraoperative complications related to pulmonary veins anomalies. Applications of CT with 3D reconstructions to reduce the risk of complications during the surgical procedure.

TABLE OF CONTENTS/OUTLINE

Introduction - General concepts of pulmonary venous anatomy Typical pattern of pulmonary venous drainage The use of CT to identify anatomical variations Lung segmentectomy's technique: • A step-by-step explanation of how to perform a lung segmentectomy. • Pitfalls and some anatomical variations to know during the surgical procedure. • The use of technologies to avoid intraoperative complications Case-Based Review: Sample cases explaining and demonstrating anatomical variations of the pulmonary veins and how CT can be used to identify and prevent intraoperative complications. This section will present illustrative cases of each: Separate veins draining the middle lobe Middle lobe vein emptying into the left atrium Direct drainage from segment 6R Vein draining the right superior lobe running posteriorly to the intermediate bronchus Lingular drainage emptying into the left inferior pulmonary vein Long common trunk of left pulmonary veins Future Directions: the role of CT with 3D reconstructions and 3D printing in lung segmentectomy planning Conclusion and key takeaways.

CHEE-16 Chronic Fibrous Interstitial Lung Diseases (CFILD) - Exploring Acute and Chronic Complications through an Imaging-based Approach

Participants
Alan Hummel, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is to: 1. Analyze the major complications of chronic interstitial lung disease, demonstrating both acute and chronic complications through didactic cases;2. Discuss how an imaging-based approach can be used to differentiate between acute and chronic complications.3. Distinguish between exacerbations and decompensations in chronic interstitial lung diseases, emphasizing the role of imaging in both characterization and etiologic investigation.

TABLE OF CONTENTS/OUTLINE

1.0. Chronic fibrosing interstitial pneumonia1.1. Basic evaluation algorithm (CDEF mnemonic)1.2. Imaging technical considerations2.0 Acute and chronic complications (the basics to memorize - with mnemonics)3.0 Acute complications3.1. Decompensation vs exacerbation3.2. Exacerbation3.2.1. idiopathic3.2.2. surgical procedures3.2.3. infectious trigger3.3. Acute decompensation3.3.1. pneumomediastinum3.3.2. pneumothorax3.3.3. Pulmonary thromboembolism3.3.4. infections3.3.5. Aspiration3.3.6. hydrostatic edema4.0 chronic complications4.1. aspergilloma4.2. tuberculosis4.3. Pulmonary hypertension4.4. pulmonary ossification4.5. neoplasms5.0. Summary6.0 References

CHEE-17 Fistulas of the Chest - An Unexpected Journey

Participants
Kristie Yang, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

This education exhibit will: 1) Review the types of fistulas that can occur within the chest, 2) Identify clinical and radiologic features of fistulas within the chest, and 3) Review complications and management of such fistulas.

TABLE OF CONTENTS/OUTLINE

1. Introduction2. Etiologies of various fistulas within the chest3. Clinical history and symptoms4. Imaging features ofa. Bronchopleural fistulasb. Esophageal-pleural fistulasc. Gastropleural fistulasd. Pancreaticopleural fistulase. Vascular fistulas5. Complications and management of fistulas6. Summary and conclusion

CHEE-18 Imaging of the Diaphragm: Anatomy, Variations, and Pathologic Conditions

Participants
Furkan Ufuk, MD, Denizli, Turkey (*Presenter*) Nothing to Disclose

TEACHING POINTS

? To review the radiological anatomy and function of the diaphragm. ? To review the anatomic variations of the diaphragm. ? To review the multimodality imaging findings in primary or secondary pathologic conditions of the diaphragm

TABLE OF CONTENTS/OUTLINE

1. Anatomy and function of the diaphragm: The diaphragm is the most important respiratory muscle and is the muscle structure that separates the abdominal and thoracic cavities. 2. Anatomic Variations: Common anatomic variations of the diaphragm include diaphragmatic slip, bundles (nodular crura), the extension of diaphragmatic muscle fibres onto the m.quadratus lumborum, and prominent or hypertrophic median and lateral arcuate ligaments. 3. Pathologic conditions of the diaphragm: A) Primary pathological conditions of the diaphragm: That includes eventration, diaphragmatic herniation, diaphragmatic injuries, diaphragmatic tumors and tumor-like lesions. B) Secondary pathological conditions of the diaphragm: That includes diaphragmatic paralysis, diaphragmatic weakness due to neuromuscular disorders or prolonged mechanical ventilation, and tumors that invade the diaphragm.

CHEE-19 A Primer for Diagnostic Imaging of Thymus - From Age Related Changes to Thymic Tumors and Everything in Between

Awards
Certificate of Merit

Participants
Daisuke Yamada, MD, Tokyo, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

The thymus is an organ that changes due to a variety of reasons, from aging to pathologic causes. Distinguish between benign and neoplastic changes can be challenging. Further, most thymic tumors are asymptomatic when detected, and histopathological diagnosis is not straightforward, so imaging plays an extremely important role in the evaluation of thymic lesions. In this presentation, we introduce the imaging spectrum of the thymus, from benign findings such as normal maturation and benign lesions to neoplasms.

TABLE OF CONTENTS/OUTLINE

Presentation goals:1. To demonstrate age-specific changes in normal thymus2. To demonstrate thymic hyperplasia depending on a variety of causes3. To demonstrate multimodality imaging findings of various mediastinal tumors based on WHO classificationIllustrative imaging/cases include:&1;Age-related changes in the thymus gland&1;Thymic hyperplasia of a variety of causes&1;Thymomas, including atypical variants&1;Thymic carcinoma&1;Thymic neuroendocrine tumor&1;Germ cell tumor of the mediastinum&1;Lymphoma of the mediastinum&1;Histiocytic and dendritic cell neoplasm of the mediastinum&1;Myeloid sarcoma and extramedullary acute myeloid leukemia&1;Soft tissue tumor of the mediastinum&1;Ectopic tumor of the thymus

CHEE-2 Pulmonary Vein Stump Thrombus after Lobectomy: Radiological Approach and What Radiologists Need to Know

Participants
Koji Takumi, MD,PhD, Kagoshima, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

Recently, a frequent occurrence of pulmonary vein (PV) stump thrombus following surgical treatment for lung cancer, especially left upper lobectomy, has been reported. The incidence of PV stump thrombus after left upper lobectomy ranged from 3.4% to 17.9%. Moreover, there is increasing evidence that PV stump thrombus is associated with postoperative cerebral infarction. It is important for radiologists to understand the occurrence mechanism, complications, and radiological features of PV stump thrombus after lobectomy to avoid misdiagnosis and improper patient management. The purposes of this exhibit are as follows: 1. To illustrate the etiology and epidemiology of PV stump thrombus after lobectomy. 2. To discuss the mechanism of PV stump thrombus formation after lobectomy based on radiological findings. 3. To review the complications and radiological imaging features of clinical cases of PV stump thrombus after lobectomy

TABLE OF CONTENTS/OUTLINE

1. Overview of the PV stump thrombus after lobectomy. 2. Clinicopathological and imaging features of PV stump thrombus after lobectomy and the complications. 3. Radiological approach to PV stump thrombus after lobectomy using 4D flow MRI, cine MRI, and 3D CT images

CHEE-20 Adult Primary Mediastinal Germ Cell Tumors: Update from the WHO Blue Book, 5th Edition (2021)

Participants
Cody Thornburgh, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Primary mediastinal germ cell tumors (MGCT) are rare and generally affect young men. Imaging findings when used in conjunction with serological markers and patient demographics can often identify the specific type of MGCT and allows differentiation from other malignant and benign entities. Correlating surveillance imaging with serological markers allows for increased confidence in determining post-treatment response from tumor recurrence.

TABLE OF CONTENTS/OUTLINE

BackgroundDefinitions and classification of MGCTa. WHO classificationb. Cell-line based classificationImaging and histochemical features of MGCT sub-typesa. Classic imaging patterns at presentation including radiography, CT PET/CTb. Use of biomarkers in diagnosis and responseComparison to other mediastinal tumorsa. Lymphomab. Thymic epithelial neoplasmsc. Thymic Hyperplasia, Normal Thymic tissued. Metastatic Diseasee. Ectopic thyroidCommon pitfalls in diagnosis and determining recurrencea. Growing teratoma syndromeb. Misclassification of benign thymic tissuec. Identifying surgical scar tissue as residual tumor

CHEE-21 Uncommon Causes of Interlobular Septal Thickening: How to Tell Them Apart?

Participants
Achala Donuru, MD, Philadelphia, PA (*Presenter*) Nothing to Disclose

TEACHING POINTS

Interlobular septal thickening is a frequent finding in patients with diffuse lung disease. While pulmonary edema and lymphangitic spread of tumor are the commonly encountered causes of interlobular septal thickening, there are several less common causes. It is important to differentiate the various diagnoses by the contour, distribution of interlobular septal thickening, other pulmonary and extrapulmonary findings. This presentation gives clues to the chest radiologists and pulmonologists to arrive at the final diagnosis.

TABLE OF CONTENTS/OUTLINE

Various causes of interlobular septal thickening will be discussed including infections (COVID-19 pneumonia, viral pneumonia, Pneumocystis carinii pneumonia), interstitial pneumonias (lymphocytic Interstitial pneumonia, non-specific interstitial pneumonia, eosinophilic pneumonia, and idiopathic pulmonary fibrosis), depositional/infiltrative conditions (pulmonary alveolar proteinosis,

pulmonary amyloidosis, Erdheim Chester disease, Niemann- Picks disease), malignancies (lymphoma, leukemia, Kaposi's sarcoma), congenital (congenital lymphangiectasia, diffuse pulmonary lymphangiomatosis, Yellow nail syndrome), iatrogenic (cytotoxic agents, radiation, lipoid pneumonia, silicone injection, EVALI/Vaping). Clues to differentiating the interlobular septal thickening based on type, distribution and other associated pulmonary and extrapulmonary findings will be reviewed.

CHEE-22 Ex Vivo Lung Perfusion (EVLP) and the Radiologist's Role

Participants
Zhao Zhang, DO, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. EVLP is an advanced preservation tool for lung transplantation and has expanded the donor pool by perfusing the lungs ex vivo allowing for longer preservation time.2. Radiologists may participate in the EVLP team to evaluate lung radiographs during EVLP.3. Diagnostic tests and treatments can be performed on the lungs to optimize the quality of the transplant organ.4. Radiologists may have an increasingly important role in the future of EVLP as more transplant centers adopt this strategy of lung preservation and distribution.

TABLE OF CONTENTS/OUTLINE

1. Overview, Background, Terminology2. Donor lung evaluation prior to EVLP3. Radiologist's role in EVLP with case examples a. Radiographic donor screening for masses, infection, contusion. b. Discuss potential radiographic exclusion criteria. c. Assessment of radiographic changes of the post perfusion lungs; correlating with other diagnostic tests d. Correctly identify complications (atelectasis vs pulmonary edema) e. Discuss how EVLP may impact radiologist training4. Conclusion

CHEE-23 A Practical Approach to Diaphragmatic Ultrasound: From Tricks to Tips

Participants
Niels Vinicius Padua Carvalho, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The aim of this exhibition is to review1. Multimodality anatomic imaging of diaphragm, focusing on ultrasonography (US)2. Technical and clinical aspects of diaphragmatic US, including a proposal for structured reporting3. Tips and tricks to evaluate diaphragm function (mobility) and trophism (diaphragm thickness and thickness fraction)4. Pathologic conditions detected through diaphragmatic US

TABLE OF CONTENTS/OUTLINE

1. INTRODUCTIONa. Anatomy of diaphragm with multimodality imagingb. Anatomic versus functional imaging2. DIAPHRAGM US: TECHNICAL ASPECTSa. Probes, positioning and acoustic windowsb. US modalities: B and M modesc. Step-by-step approach (videos and images)3. DIAPHRAGM US: CLINICAL ASPECTS a. Diaphragm paralysisb. Critically ill patients on mechanical ventilationc. Other respiratory diseases, including asthma, chronic obstructive pulmonary disease, cystic fibrosis, interstitial lung disease and COVID-19d. Neuromuscular disorderse. Pediatric patients4. DIAPHRAGM US: A PRATICAL APPROACH a. Tricks and tips b. Multimodality imaging correlations c. Structured reporting5. DIAPHRAGM US IN THE REAL WORLD a. Challenges and limitations of diaphragm US 6. FUTURE DIRECTIONS AND TAKE HOME MESSAGES

CHEE-24 Spectral CT in Cardiothoracic Imaging: Potential Applications that Radiologists Should Know

Awards
Cum Laude

Participants
Flavio Zuccarino, MD, Barcelona, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

To analyze spectral CT feasibility in cardiac and thoracic pathologies. To underline its advantages and limitations compared to conventional CT. To define the clinical scenarios in which spectral CT findings are key in patient's management.

TABLE OF CONTENTS/OUTLINE

We make a short introduction about spectral CT imaging techniques. We focus on Spectral GSI CT imaging that we used in the different cases of this exhibit. We describe Spectral CT findings in different cardiac and thoracic pathologies organized as: Vascular diseasesAcute Pulmonary embolismChronic Pulmonary embolismHemoptysisCongenital vascular diseases (Sequestration, MAV, others)Lung diseasesConsolidations (pneumonia, atelectasis, infarcts, organizing processes)Interstitial diseases (fibrosis, emphysema, post-covid, mosaic perfusion)Neoplasm (Lung neoplasm, mediastinal neoplasm and masses)Cardiac DiseasesAcute Myocardial Infarct, Myocarditis, Myocardial masses OUTLINE Spectral CT imaging is a relatively new technique which presents several advantages and may give functional data about different cardiac and thoracic diseases. Radiologists should be familiar with this technique that can play a pivotal role in patient management.

CHEE-25 Don't Touch the Animals: Chest Radiologists View- Zoonoses

Awards
Certificate of Merit
Identified for RadioGraphics

Participants
Hannah Hodges, MD, Albuquerque, NM (*Presenter*) Nothing to Disclose

TEACHING POINTS

Teaching points:1. Identify zoonotic organisms and their animal vectors to which humans are susceptible.2. Understand the cardiothoracic symptoms and clinical findings of infection.3. Recognize the multimodality radiologic appearances of these diseases.4. Learn laboratory and other testing that confirms the diagnosis.

TABLE OF CONTENTS/OUTLINE

Content Organization:1- Introductiona Organisms and animal vectors2- Cardiothoracic findings of Zoonosesa. Tularemiab. Plaguec. Anthraxd. Leptospirosise. Monkeypoxf. Hantavirusg. Echinococcus3- Radiologic assessmenta. Identifying features, morphology, and distributionb. Multimodality radiologic appearances4- Pitfallsa. Potential mimics 5- Summary

CHEE-26 Pitfalls in Thymic Imaging

Awards
Identified for RadioGraphics
Certificate of Merit

Participants
Maximiliano Klug, MD, Ramat Gan, Israel (*Presenter*) Nothing to Disclose

TEACHING POINTS

1- Thymic hyperplasia, thymic cysts and thymoma may be difficult to distinguish by CT imaging alone. MRI of the mediastinum helps in the differential diagnosis. 2- Chemical shift sequences can differentiate thymic hyperplasia from thymoma. Correct use of the Chemical-Shift-Ratio identifies cases of hyperplasia when the characteristic signal drop is not identified. Small lesions may not be measurable due to inaccurate ROI placement and calculation. DWI in small lesions may be challenging as well. 3- Thymic cysts are typically hyperintense on T2-weighted images (T2WI). Pitfalls in identifying cyst on T2WI include intermediate T2WI signal of some cysts due to proteinaceous content and pseudo-nodules due to cardiac motion. Careful inspection of T1 weighted images with and without intravenous contrast may overcome these limitations. 4- Newer thymic MRI protocols including delayed phases are important to distinguish malignant from benign thymic lesions. Nevertheless, longer MRI studies may be prone to additional artifacts due to breathing. Breathing correction and subtraction imaging may help. 5- Thymoma pleural metastases can be missed leading to erroneous staging. Typical overlooked locations are adjacent to atelectatic lung or the crux of the diaphragm.

TABLE OF CONTENTS/OUTLINE

1- To describe thymic imaging techniques and radiologic appearance of thymic entities. 2- To discuss pitfalls in interpretation and possible imaging solutions. 3- To discuss blind-spots in thymoma pleural metastatic disease.

CHEE-27 Unfamiliar Thoracic Anatomy: You Only Know What You Know

Participants
Mohamed Elboraey, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Understanding of thoracic anatomy is essential for accurate interpretation of thoracic imaging.- Some unfamiliar/less frequently encountered thoracic anatomic and variant structures can simulate pathology.- Prospectively differentiating these structures from true pathology will prevent overcalling pathologic processes and unnecessary downstream investigations.

TABLE OF CONTENTS/OUTLINE

- Review anatomic structures at CXR, CT, and MRI:a. Vasculature (inferior pulmonary vein confluence with left atrium; L SVC, cardiophrenic veins, azygos vein).b. Hilar anatomy (inferior pulmonary ligament vs sublobar septum).c. Pulmonary fissures (accessory or incomplete fissures, fissural lymph nodes).d. Pericardium (pericardial recesses simulating lymphadenopathy or mediastinal masses; mediastinal vs epicardial fat).e. Lymph nodes (unnamed stations, left supraclavicular lymph node vs vein confluence, extrapleural space nodes).f. Chest wall (axillary/breast variants, muscular arches).- Emphasize how radiologists can differentiate these entities from true pathology by imaging evaluation with case examples.

CHEE-28 Going with the Flow: Understanding Flow Artifacts

Awards
Identified for RadioGraphics
Magna Cum Laude

Participants
Caroline Robb, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Flow artifacts are commonly encountered in contrast-enhanced CT imaging studies and may be mistaken for important pathologic conditions, such as embolism or dissection.• Radiologists must be familiar with the appearance of flow artifacts and comfortable distinguishing these artifacts from true pathologic conditions.• By understanding the mechanics of flow artifacts, radiologists can better recognize the clinical settings that predispose to flow artifacts, such as pneumonia or altered cardiac output.• Radiologists must know how to troubleshoot a suspected flow artifact, including how to adjust imaging protocols, when to recommend additional imaging studies, and which additional imaging studies are most helpful.• Flow artifacts can be used as a tool when the radiologist encounters vascular pathology, such as when evaluating aortic dissection flaps.

TABLE OF CONTENTS/OUTLINE

• Discuss the physical mechanics of vascular blood flow and how these mechanics can give rise to flow artifacts.• Review how to distinguish flow artifact from true pathologic conditions, such as pulmonary embolism or aortic dissection.• Examine the causes of flow artifacts and how these artifacts may present in various clinical settings, such as pneumonia or altered cardiac output.• Discuss how to troubleshoot suspected flow artifact, including the utility of delayed image acquisition and MRI.• Evaluate how flow artifacts can be used as a diagnostic tool, such as when assessing aortic dissection flaps.

CHEE-29 Pericardial Recesses on Multidetector CT: Beyond Tips and Tricks Around the Heart

Participants
Alex Carvalho Monteiro, (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibition is: • Review common and uncommon cases related to the pericardial sinuses and recesses. • Correlate important findings with the anatomy of pericardial recesses. • Discuss imaging findings according to the classification of pericardial recesses to enhance radiologists' skills. • Highlight their characteristics for radiologists with these conditions, avoiding unfavorable patient outcome. • Despite its characteristic density, describe the importance of distinguishing them from pathologic process, as mediastinal lymphadenopathy, and mediastinal cystic mass. • Correlate with the impact on the onco-image.

TABLE OF CONTENTS/OUTLINE

• Applied anatomy of the pericardial recesses: superior pericardial recess, right lung recess, left lung recess, postcaval recess, right pulmonary venous recess, superior pericardial recess, transverse sinus, left pulmonary venous recess and oblique sinus. • Evaluation of cases of prominent recesses with variable extensions, which may be possible confounding mechanisms. • Examples of pearl cases, diagnostic difficulties, and mimicry. • Summary and take-home messages.

CHEE-30 Developments in Lung Cancer - What Radiologists Should Know About the WHO Classification Updates and Developments in Molecular Biology Research

Awards
Identified for RadioGraphics
Cum Laude

Participants
Tomoaki Sasaki, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Lung cancer is the leading cause of cancer death worldwide, and determination of the histological type is essential for management. Surgical resection is performed in the early stage, and the surgical specimen allows radiological-pathological investigation. In 2021, the WHO classification of thoracic tumors was updated. These revisions deal with lung cancer prognosis and recognize several new entities. Unfortunately, about 70% of lung cancers are unresectable when diagnosed. Histological diagnosis must therefore rely on molecular analysis of a small biopsy tissue. Accurate knowledge regarding the molecular biology and immunohistopathology of lung cancers has thus become crucial. Radiological imaging plays an important role in the management of both early and advanced stage lung cancers. Therefore, radiologists must be familiar with all updates made to the WHO classification and molecular biology. The aim of this presentation is 1) to understand the radiological-pathological correlations in surgical specimens according to the new WHO classification, 2) to update our knowledge of lung cancer molecular biology, and 3) to acknowledge the limitations of small biopsy samples.

TABLE OF CONTENTS/OUTLINE

1. Introduction: Revision of the WHO classification2. Radiological-Pathological correlations from surgical specimens: Adenocarcinomas, Squamous cell carcinomas, Sarcomatoid carcinomas, Neuroendocrine carcinomas, Salivary gland-type tumors, etc3. Molecular biology: EGFR, ALK, ROS1, HER2, RET, BRAF V600F, KRAS, NTRK, METamp, NRG1 fusion, PD-L1, etc4. Limitations of small biopsy samples5. Conclusion

CHEE-31 MRI of Anterior Mediastinal Masses: When to Image and Approach to Interpretation

Participants
Tetsuro Araki, MD, PhD, Philadelphia, PA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To understand appropriate settings to recommend MRI for the evaluation of anterior mediastinal masses (AMM). 2. To understand the main roles of MRI in characterization of AMM. 3. To understand key features for the differential diagnoses of AMM.

TABLE OF CONTENTS/OUTLINE

1. Indication of MRI for AMM a. Incidentally found AMM on CT or chest radiograph b. Preoperative characterization and staging of AMM c. Screening for associated findings of AMM (lymph nodes or pleural lesions) d. MRI protocols for AMMe. Alternative imaging options to MRI. 2. Main roles of MRI in characterization of AMM a. Cystic vs solid b. Benign vs malignant (Normal/hyperplastic thymus vs neoplasm) c. Risk stratification or staging 3. Key MRI features for the differentiation of AMM a. T1 and T2 signal intensity b. Enhancement on post contrast images c. Demonstration of microscopic fat on out of phase T1-weighted images d. Diffusion weighted images/ADC map 4. Case review of AMM a. Normal/hyperplastic thymus (fat saturated or non-saturated thymic hyperplasia) b. Thymic cyst/bronchogenic cyst c. Ectopic thyroid tissue/retrosternal thyroid goiter d. Thymic epithelial tumors (thymoma, thymic carcinoma, neuroendocrine tumors) e. Primary mediastinal large B-cell lymphoma (PMBCL) f. Thymolipoma/lipoma g. Metastasis 5. Summary

CHEE-32 Pitfalls and Tricks of Variants in Thoracic Imaging: Who Wants To Be... Normal?

Participants
Mariana Peleja, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is:- To play an adapted game show ("Who wants to be a millionaire") related to normal variants in thoracic imaging.- To illustrate normal variants in thoracic imaging.- To differentiate between normal and pathological cases in CT and MRI imaging.- To demonstrate cases of physiological uptake on PET/CT.- To go through several typical and atypical findings in thoracic imaging to facilitate radiological understanding and diagnosis.

TABLE OF CONTENTS/OUTLINE

- Interactive game show.- Interactive cases related to normal variants in thoracic imaging.- Reporting language for imaging findings related to the variants in thoracic imaging.- Review of imaging findings according to illustrative cases of:1.Chest wall;2.Diaphragm;3.Pleura;4.Lungs;5.Mediastinum: heart, great vessels, airways, esophagus, thymus, neural and lymphatic structures;- Summary and gained knowledge.

CHEE-33 Photon-Counting CT in Chest Applications

Awards
Certificate of Merit

Participants
Fides Schwartz, MD, Durham, NC (*Presenter*) Nothing to Disclose

TEACHING POINTS

Photon-counting computed tomography (PCCT) is a new technology in CT imaging. PCCT uses energy-resolving detectors, instead of integrating the entire x-ray signal (energy integrating detectors: EID), enabling spectral acquisitions without the need of specialized acquisition strategies (e.g., dual-source). PCCT records photons in different energy bins, starting at a minimum energy threshold, so electronic noise can be avoided altogether. PCCT detectors used a two-step conversion (x-rays to electrical signal), rather than the 3-step conversion EID (x-rays to light to electrical signal), and inherently have higher spatial resolution as no septa (dead space to separate voxels) are needed. This project is geared toward introducing the emerging technology of PCCT to the RSNA chest imaging community. The details of this technology will be explained using diagrams and examples of standard EID patient scans in comparison to PCCT scans to demonstrate the performance of the new scanner system. These examples will include tumor monitoring, lung cancer screening and contrasted chest CT.

TABLE OF CONTENTS/OUTLINE

1. PCCT - Detectors a. Comparison of energy-integrating vs photon-counting detectors b. How is higher spatial resolution of PCCT achieved? 2. PCCT - Photon Binning a. How does photon binning work? b. How are energy thresholds defined? c. How do thresholds help with electronic noise? 3. PCCT - Spectral Data a. How is it always available? b. What can it be used for?

CHEE-34 Wait, You Can See Motion on Chest Radiographs?! Dynamic Digital Radiography (DDR)

Participants
Donald Benson JR, MD, PhD, Little Rock, AR (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Dynamic digital radiography (DDR) is a newer technology enabling rapid acquisition of multiple sequential radiographs with field of view and spatial resolution similar to that of conventional radiography.2. The simultaneous acquisition of detailed anatomical and functional imaging enables identification and evaluation of potential lung nodules, diaphragmatic motion, chest wall motion and restricted lung motion.3. As a digital acquisition DDR enables computerized mathematical evaluation of lung areas, lung volumes, graphing diaphragmatic motion and potential pulmonary function parameters.

TABLE OF CONTENTS/OUTLINE

After a brief introduction to this technology, the following potential applications will be discussed:1. Improved evaluation of potential lung nodules.2. Evaluation of diaphragm function.3. Follow up evaluation of post-surgical chest patients.4. Potential assessment of pulmonary ventilation and perfusion.5. Comprehensive pre-operative lung transplant evaluation.6. Correlation of measured lung areas and estimated volumes with pulmonary function testing.7. Evaluation of diffuse lung disease, e.g., post-COVID patients, and patients with interstitial lung disease, chronic obstructive pulmonary disease, cystic fibrosis, among others.

CHEE-35 Lung Contrast-enhanced Ultrasound (CEUS): How I Do It

Awards
Identified for RadioGraphics

Participants
Sergio Jimenez Serrano, Barcelona, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this educational exhibit is:- To explain how to correctly perform a lung contrast-enhanced ultrasound (CEUS).- To describe the basics of pulmonary vascularization, which are fundamental to interpreting a lung CEUS.- To review the clinical situations in which lung CEUS may be useful in diagnosing and treating pulmonary pathology.

TABLE OF CONTENTS/OUTLINE

Pulmonary CEUS has experienced a constantly growing in the study of pulmonary pathology. In this educational exhibit we will focus on:- Explaining the exploration technique.- Reviewing the physiopathology of the pulmonary vasculature.- Reviewing the characteristic findings in CEUS in non-tumor entities such as:• Pulmonary atelectasis• Round atelectasis• Pulmonary infarction• Pneumonia• Lung abscess• Radiation pneumonitis- Describing the main findings that can help us differentiate between aggressive and non-aggressive pulmonary neoplasms (with examples).- Radiological findings in CEUS that can help us in the diagnosis of lymphoma or lung metastases.- The importance of CEUS in interventional procedures:• Evaluation of tumor necrosis.• Choice of puncture point.• Differentiate obstructive atelectasis from tumor lesion.• Avoid vascular structures.• Prevent the biopsy of benign lung lesions.

CHEE-36 Stick To Your Rib - A Radiologist Guide for Rib Cartilage Evaluation before Reconstruction Surgeries

Participants
Felipe A. de Oliveira, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

? Provide an overview of the normal costal arch cartilage anatomy, and how its used as autogenous graft material for cartilage reconstruction surgeries;? To explain how to evaluate the costal arch cartilages (degree of calcification, and calcification morphological patterns) on X-Ray, US and CT scan; ?Application of Artificial Intelligence assisting CT scan evaluation; ?To exemplify how to report the normal and abnormal crucial findings to the surgeon; ? To introduce the related surgical cartilage reconstructive techniques.

TABLE OF CONTENTS/OUTLINE

1) Costal arch cartilage overview. A) Anatomy of costal arch cartilage. B) Costal arch cartilage and its adjacent structures

anatomical relations. C) Histology of costal arch cartilage. 2) Costal arch cartilage employment as an autologous donor site for cartilage reconstructions surgeries - pros and cons. 3) Costal arch cartilage calcifications as a complicating factor for surgical outcomes. 4) Imaging evaluation, epidemiology and examples of costal arch cartilage calcifications. A) X-Ray. B) US. C) CT scan. 5) How to report. 6) Rib (costal arch) cartilage harvesting surgical technique. 7) Examples of cartilage reconstructive surgical techniques in which costal arch cartilage is employed. A) Rhinoplasty. B) Microtia otoplasty. C) General face reconstructive surgeries. 8) Take-home messages.

CHEE-37 Between the Walls: Understanding the Extrapleural Space and the Extrapleural Fat Sign

Participants
Guillem Dolz Alvarez De La Ballina, MD, Valldoreix, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

To review the normal anatomy of the extrapleural space (EPS).To describe the extrapleural fat sign (internal displacement of the adipose tissue layer), a clue to locating different conditions in the EPS.To show the many entities that can involve the EPS, emphasizing the role of CT.

TABLE OF CONTENTS/OUTLINE

Background:The EPS lies between the parietal pleura, the chest wall and diaphragm. It is a poorly understood anatomical compartment which can lead to diagnostic errors.Anatomical scheme.Extrapleural fat can be displaced, enlarged, or affected by:- Blood (extrapleural hematoma): from trauma, iatrogenic lesion of a thoracic vessel, aortic dissection or aneurysm rupture, spontaneous bleeding.- Air (extrapleural emphysema): barotrauma.- Fat: non-pathologic (obesity or estrogens), lipoma, chronic pleural conditions.- Edema/Infection: acute pleural exudates, empyema necessitatis.- Soft tissue: extramedullary hematopoiesis, neurogenic lesions, primary or metastatic pleural tumors, infiltration of lung tumor, chest-wall malignancies.- Calcium: chronic hematoma/empyema, asbestos related pleural disease.Conclusions:The extrapleural fat sign helps differentiate between pleural and extrapleural lesions. Conditions involving the EPS may require different treatment approaches than pleural or lung diseases.

CHEE-38 Leukemia and the Thoracic Plethora- Perplexities, Patterns and Problem Solving

Participants
Shubham Padashetty JR, MD, Mumbai, India (*Presenter*) Nothing to Disclose

TEACHING POINTS

Leukemia presents with multitude of disease related and various infective and noninfective presentations.Presentations include ground glass opacities, centrilobular nodules, interstitial septal thickening in various patterns. Mediastinal, pleural, nodal and bony involvement also need to be carefully looked for.Disease related manifestations include nodal, parenchymal, mediastinal and bony involvement, biopsy is necessitated in conditions when inflammatory and infective pathology is ruled out. Drugs and infection related injuries require both clinical and radiological approach based addressal with knowledge of specific pattern of presentations. For instance apical predominance with cystic changes are seen in PCP pneumonia, unsharp hazy ground glass changes with confluent centrilobular nodules seen in CMV pneumonia, tree-in-bud pattern in mycobacterial diseases. Non-contrast CT and HRCT thorax are a valuable tool in diagnosis, follow-up, serial correlation of presentations. They also aid in guiding image guided interventions when necessary. This educational exhibit aims to familiarize with various paradigms of presentations, pattern based understanding and clincobiochemical correlation, henceforth providing apt differentials. Clinical radiology plays a key role in reducing morbidity and mortality in hematolymphoid malignancies when timely approach and diagnosis helps early treatment.

TABLE OF CONTENTS/OUTLINE

1. Flow chart of pulmonary manifestations in leukemia 2. Disease related manifestations 3. Non infectious pulmonary complications 4. Infections and their patterns of involvement.

CHEE-39 Breast Implants in Chest CT: What Can We See?

Awards
Certificate of Merit

Participants
Vinicius Nobre, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is: To review the components of the most common breast implants and prostheses, as well the main pathological conditions involving them. To emphasize that chest computed tomography (CT), which is widely available and allows rapid image acquisition, can detect incidental findings involving breast implants. To discuss the pathophysiology of breast implants conditions and their imaging findings, especially on CT, correlating them with more specific studies for breast implant evaluation. To offer a didactic case-based review on the theme, proving teaching points and references, in order to allow radiologists to detect abnormalities involving breast implants in CT scans performed for different reasons.

TABLE OF CONTENTS/OUTLINE

Breast implants and their normal appearance in CT. Intracapsular breast implant rupture: Imaging findings, including signs such as the “keyhole”, “subcapsular", “linguine” and “droplet”, discontinuity of the elastomer, among others. Degrees of implant collapse: uncollapsed, minimal, partial and full collapse. Extracapsular breast implant rupture: Imaging findings, including extra capsular silicone and siliconomas. Diagnostic difficulties and mimics. Capsular contracture: Image findings. Breast implant rotation: Image findings. Other breast implants complications related to the theme. Summary and take-home messages.

CHEE-4 Extracorporeal Membrane Oxygenation [ECMO]: What the hECMO Am I Looking At?

Participants
Nina L. Terry, MD, JD, Hoover, AL (*Presenter*) Stockholder, Johnson & Johnson;Spouse, Stockholder, Johnson & Johnson;Stockholder, Kimberly-Clark Corporation;Spouse, Stockholder, Kimberly-Clark Corporation;Stockholder, Microsoft Corporation;Spouse, Stockholder, Microsoft Corporation;Spouse, Stockholder, Amge

TEACHING POINTS

1. For adults two major ECMO types function to bypass the lungs [veno-venous (VV)] or the heart and lungs [veno-arterial (VA)] with variable catheter types and positions for both. 2. ECMO catheters are imaged with radiographs, echocardiography and CT both incidentally and intentionally. 3. Radiologists should recognize appropriate configuration/positioning of the various types and be aware of potential complications for each. 4. Radiologists need to know the indications for contrast and the indications and contraindications for stopping ECMO or clamping the ECMO catheters to optimize image quality.

TABLE OF CONTENTS/OUTLINE

• Introduction o Overview of ECMO o Importance to the average radiologist • Normal catheter placement for ECMO o Venovenous ECMO § Single lumen vs. dual lumen catheters o Venoarterial ECMO § Peripheral vs. central catheterization § Comparing points of entry o Effect of cannula sizing on correct placement (especially emergency settings) • Comparing imaging modalities used to verify correct catheter placement o Echocardiography o Chest Radiograph [CXR] o Computed Tomography [CT] • Visualizing complications during/post catheter placement o Contrast CT or Non-contrast CT: Indications o Safety and technical issues in giving contrast to a patient on ECMO • Special cases to consider o ECMO during COVID-19 • Conclusion o Radiologists have an important role in diagnosis and patient safety with the growing use of ECMO technology

CHEE-40 "Reduce Fat Fast": A Systematic Approach to Fat-containing Lesions in Adult Thoracic Imaging and Its Differential Diagnosis.

Participants
Carlos Penaranda, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Approach the differential diagnosis of fat-containing lesions in the chest. 2. Recognize the fat-containing lesions, using radiologic features as Hounsfield Units (HU) measurement at computed tomography (CT), or the signal intensity characteristics of fat at magnetic resonance imaging (MR). 3. Correlate lesion location with the fat imaging characteristics to narrow the differential diagnosis.

TABLE OF CONTENTS/OUTLINE

1. Imaging characteristics of fat-containing lesions in the thorax employing ultrasound, computed tomography (CT) and magnetic resonance imaging (MR). 2. Schematic approach of various fat-containing lesions and their location in the chest. 3. Sample cases from our institution with their radiographic and epidemiological features.

CHEE-41 Inhalational Injuries in Burn Patients:Is Chest Radiography Still Relevant?

Participants
Jaime Fields, MD, Winston Salem, NC (*Presenter*) Nothing to Disclose

TEACHING POINTS

Pulmonary complications are a common cause of morbidity and mortality in burn patients. It is important that radiologists are familiar with these complications so that early and specific diagnosis is made on chest imaging. While admission radiographs are often normal or underestimates findings, within just a few days pulmonary complications can be severe. While CT is a useful tool, many burn patients do not undergo CT imaging of the chest. Thus it is important for radiologist to be familiar with the radiographic features of these complications and utilize timing after injury as a diagnostic tool.

TABLE OF CONTENTS/OUTLINE

• Pathophysiology of burns and radiographic correlation (what happens on alveolar level) • Timeline of pulmonary complications• Role of radiologist in utilizing this timeline when interpreting chest radiographs• Algorithm demonstrating management of inhalational injury• Findings suggestive of acute inhalational injury• With what frequency should chest radiographs be obtained?• Chest radiograph and CT correlation of varied imaging findings• ARDS as a complication of direct alveolar injury or secondary complications • Phases of ARDS• Delayed pulmonary complications• Long term complications: subglottic stenosis, bronchiectasis, bronchiolitis• Multidisciplinary approach • Role of imaging in follow up• Role of other imaging modalities not previously discussed• Bonus: Vaping associated lung injury chest radiograph and CT correlates

CHEE-42 Distinguishing Fraternal Twins on Chest Radiograph: Primer for Residents

Awards
Magna Cum Laude
Identified for RadioGraphics

Participants
Kaitlin Gibson, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Two distinct pathologies although similar in appearance on chest radiographs have nuanced differences (fraternal twins). Differentiating these may be challenging for residents.• Accurate differentiation is important as this impacts management strategies.• Case based review of radiographic "fraternal twins" with tips on differentiating two is presented.• Example: Large apical bulla is differentiated from pneumothorax by the convex margin of the bulla as compared to the parallel margin to chest wall in pneumothorax.• Length of air fluid levels is equal on frontal and lateral view in lung abscess and is unequal in empyema.• Diaphragmatic eventration has preserved sharp posterior costophrenic angle on lateral radiograph whereas flattened in paralysis, etc.

TABLE OF CONTENTS/OUTLINE

Case examples of fraternal twins with tips on differentiation1. Pneumothorax / large bulla2. Pneumothorax / pneumomediastinum3. Pneumomediastinum / pneumopericardium4. Lung abscess / empyema5. Diaphragmatic eventration / paralysis6. Hilar mass / enlarged pulmonary artery (Hilum convergence sign)7. Hilar mass / anterior/ posterior mediastinal mass (Hilum overlay sign)8. Anterior / posterior mediastinal mass (Cervicothoracic and thoracoabdominal signs)9. Lung mass / pleural/extra pleural mass10. Opaque hemithorax: atelectasis/ consolidation / pleural effusion11. Cardiomegaly / pericardial effusion12. Portal venous air / pneumobilia13.

Basilar atelectasis / subpulmonic effusion

CHEE-43 The Anomalies of Thoracic Vein in Adults

Participants
Makiko Murota, MD, Kitagun, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To review the anomalies of the thoracic systemic veins and the pulmonary veins. 2. To describe characteristic imaging features on multiple modalities, including chest radiograph, CT, and MRI. 3. To discuss the importance of clinical implications and the pitfall.

TABLE OF CONTENTS/OUTLINE

1. Normal anatomy 2. Embryology 3. The anomalies of the thoracic systemic veins: persistent left superior vena cava (PLSVC), postaortic left innominate vein (PALIV), azygous/hemiazygous continuation of inferior vena cava, azygous lobe, and others 4. The anomalies of the pulmonary veins: left common pulmonary vein, separate middle lobe vein, aberrant vein (right top pulmonary vein), partial anomalous pulmonary venous return, scimitar syndrome, meandering pulmonary vein and others

CHEE-44 Extracardiac Congenital Thoracic Vascular Anomalies - A General Radiologist's Guide

Participants
Sanjana Kamath, FRCR, MBBS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1.Congenital thoracic vascular anomalies can present in adulthood.2.Assessment of thoracic vasculature in compartments can simplify complex vascular anatomy aiding understanding and communication of results.3.CT is well placed to assess all vascular compartments within the thorax and provide datasets for 3D reconstructions to further communicate findings and plan surgical intervention.

TABLE OF CONTENTS/OUTLINE

Systemic venous pathology (including left SVC, anomalous drainage to left atrium and azygous continuation of the IVC). Pulmonary arteries (absence or disconnection of branch pulmonary artery, pulmonary stenosis e.g. in Edwards syndrome, patent ductus arteriosus, aortopulmonary window and arteriovenous malformations). Pulmonary veins (partial and total anomalous return, sinus venosus ASD and scimitar syndrome). Aortic (truncus arteriosus and hemitruncus, congenitally corrected transposition of the great arteries, right arch with anomalous left subclavian artery, left arch with anomalous right subclavian artery, double arch, coarctation, interruption of the arch, pulmonary sequestration).

CHEE-45 Beyond Aortopathies- Vascular Conditions Of The Thorax Associated With Genetic Conditions

Participants
Riddhi Borse, MD, New Haven, MA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Introduction to the vascular structures of the thorax.2. Enlisting various vascular conditions of the thorax associated with genetic conditions and discussing commonly associated imaging findings affecting the various vessels of the thorax.3. Detailed case-based description of thoracic imaging findings associated with inherited vascular conditions, along with common differential diagnoses.4. Developing a Checklist and Understanding the salient features to be reported when encountering these inherited vascular conditions of the thorax.

TABLE OF CONTENTS/OUTLINE

1. Description of various vascular conditions with genetic predisposition and their associated common thoracic imaging findings.2. Brief discussion on Ehlers Danlos, Marfan’s, Turners syndromes and associated constellation of imaging findings with a focus on related vascular thoracic imaging findings, case examples and common differential diagnoses.3. Brief discussion on BMPR2 and Factor V Leiden Mutations, associated constellation of imaging findings with a focus on related vascular thoracic imaging findings, case examples and common differential diagnoses.4. Brief discussion on Cystic Fibrosis, Hereditary hemorrhagic Telangiectasia's and associated constellation of imaging findings with a focus on related vascular thoracic imaging findings, case examples and common differential diagnoses.5. Enlisting salient imaging features to be added in the report based on what the clinician needs to know for each of the above listed conditions.

CHEE-46 Scimitar Syndrome - Taking a Sharper Look

Participants
Melissa Carroll, MD, Kansas City, KS (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review the definition and variations of scimitar syndrome with a focus on imaging findings.2. Familiarize the reader with common and uncommon congenital anomalies associated with scimitar syndrome to improve radiology exam interpretation.3. Discuss clinical presentation and complications of scimitar syndrome.

TABLE OF CONTENTS/OUTLINE

1. Background2. Definition a. Scimitar syndrome (hypogenic lung or congenital venolobar syndrome) refers to partial anomalous venous drainage of the right lung to the IVC with hypoplasia of the ipsilateral lung, systemic artery supply, and dextroposition of the heart b. Scimitar sign refers to the curved, tubular opacity adjacent to the right heart border on chest radiograph representing the anomalous vein and is considered pathognomonic for scimitar syndrome. Scimitar refers to a Turkish sword with a curved blade3. Types a. Infantile type presents in infancy and associated with congenital heart disease b. Childhood/adult type, which can be asymptomatic or result in recurrent infection.4. Imaging Findings a. Chest radiograph as a screening tool b. Contrast enhanced CT to define anatomy and identify other anomalies c. Phase contrast MRI to quantify shunt d. Pertinent radiology report findings for surgical planning5. Associated congenital anomalies a. Lungs and airways b. Vascular c. Cardiac6. Clinical considerations and complications a. Discuss range of clinical manifestations and presentation including congestive heart failure in infants and recurrent

infection in adults b. Cardiovascular complications c. Pulmonary complications d. Post surgical imaging7. Conclusion

CHEE-47 Pre- and Post-operative Evaluation of the Patient with Chronic Thromboembolic Pulmonary Hypertension

Participants
Tami Bang, MD, Aurora, CO (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Define chronic thromboembolic pulmonary hypertension (CTEPH) and describe its development 2. Review the imaging findings in CTEPH 3. Discuss surgical management of CTEPH 4. Review the role of the radiologist in the diagnosis, evaluation, and management of CTEPH

TABLE OF CONTENTS/OUTLINE

1. Definition of Chronic Thromboembolic Pulmonary Hypertension (CTEPH) 2. Pathophysiology of CTEPH 3. Multimodality Diagnosis of CTEPH (CT, Echo, V/Q scan, CMR, Angiography) 4. Surgical Management of CTEPH 5. What does the referring team need to know? a. Is the case operable b. What is the likelihood of RV recovery c. Are there accessible targets for endarterectomy?

CHEE-48 Chronic Pulmonary Embolism: What Radiologists Should Know

Participants
Marcelo Carvalho, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

- To review the major direct and indirect findings of both acute and chronic pulmonary embolism on CT angiography.- To discuss the role of iodine map in chronic pulmonary embolism.- To highlight other important differential diagnosis of chronic PE as well as potential pitfalls.

TABLE OF CONTENTS/OUTLINE

Introduction: basic concepts on chronic pulmonary embolism (epidemiology, pathophysiology, clinical findings and treatment goals)CTA protocol for pulmonary embolismAcute x chronic pulmonary embolism: a CTA-centered approachCurrent state of the iodine map in chronic pulmonary embolismOther differential diagnosis to keep in mindIdiopathic pulmonary hypertension and in situ thrombosisPulmonary artery sarcomaVasculitisCongenital anomaliesPotential pitfalls and artifacts in chronic pulmonary embolism

CHEE-49 Following the Contrast: How to Recognize Thoracic Flow Artifacts and Vascular Shunts on Thoracic Multidetector Computed Tomography

Participants
Elisenda Foraster, MD, Sabadell, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

To learn the causes of thoracic flow artifacts and provide clues to distinguish them from true filling defects.To be aware of persistent and anomalous cardiac communications that are relevant in clinical practice and its typical imaging findings.

TABLE OF CONTENTS/OUTLINE

I. Background Thoracic flow artifacts as well vascular and cardiac shunts can be challenging for radiologists to diagnose. We propose a practical approach to recognize the main causes and CT features in both situations.II. ContentA) Thoracic flow artifacts ("smoke"): non-opacified blood in a contrast-filled chamber, indicative of incomplete opacification.1. Pulmonary artery (mimicking pulmonary embolism): bilateral smoke (heart failure, early/fast scanning, transient interruption of contrast) or unilateral smoke (focal lung abnormality, collateral vessel inflow).2. Aortic pseudo-dissection.3. Left atrial appendage pseudo-thrombus.B) Congenital or acquired shunt (aberrant pathway): Abnormal passage of contrast between cardiac chambers or between vascular structures and cardiac chambers, indicative of an abnormal communication.1. Congenital atrial septal defect, patent foramen ovale, ventricular septal defect.2. Acquired: collateral venous pathway from stenosis or occlusion of the superior vena cava. III. Conclusions Recognizing smoke can help prevent misdiagnosis of important diseases like pulmonary embolism or aortic dissection, and detection of contrast aberrant-paths provide a diagnosis clue to the presence of shunts or vascular stenosis.

CHEE-5 Vasculitides: Diagnostic Tips and Tricks through Thoracic Imaging

Participants
Glenda Costa Feitosa, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Vasculitides are multi-systemic diseases that can lead to severe consequences if left untreated.There are several ways these disease processes can present on imaging. Thoracic imaging, for instance, has a lot to add when characterizing them, given the considerable importance of the great vessels of the mediastinum and the lung involvement commonly shown.Knowledge of typical findings that suggest a diagnosis of vasculitis is therefore a valuable asset for the radiologist and yields better outcomes.

TABLE OF CONTENTS/OUTLINE

Inflammatory diseases of the vessel walls can affect small, medium and large vessels in all segments of the body. These are often treatable diseases, bringing alleviation of the inflammatory activity and better overall outcomes. These diseases can be quite a challenge to diagnose, as they can present similarly to one another and have a nonspecific clinical course and laboratory features. The intention of this presentation is to demonstrate, through a series of cases, different vasculitides and diagnostic tips that helped suggesting these diagnoses through imaging, such as the vessels involved by parietal thickening and aneurysms, lung opacities and their temporal evolution, as well as some associations with patient characteristics and clinical features. Chest multidetector computerized tomography is the main method to be explored, an imaging modality that has a lot to offer in this task since the great mediastinal vessels and lungs are often involved.

CHEE-50 Mimickers of Chronic Thromboembolic Pulmonary Hypertension: A Pictorial Review

Participants
Albert Domingo Senan, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

Highlight the role of imaging tests in chronic thromboembolic pulmonary hypertension (CTEPH) focused on the detection and characterization of those pathologies that can mimic this disease, because both therapeutic management and prognosis are substantially different.

TABLE OF CONTENTS/OUTLINE

CTEPH represents a special form of PH potentially curable by surgical treatment (thromboendarterectomy). Imaging tests play a fundamental role in this disease: they confirm the diagnosis, establish the location and extension of the lesions in order to plan the most appropriate treatment (surgery vs. angioplasty vs. medical treatment) and they detect other associated injuries that may condition the patient management. They also allow diagnosis of other pathologies that may have been erroneously labeled as CTEPH. For this reason, it is essential to know what the mimicking pathologies are and the radiological signs that allow them to be detected. The main pathologies that can mimic CTEPH are sarcomas of the pulmonary arteries, large vessel vasculitis (Takayasu's arteritis), fibrosing mediastinitis, in stu thrombosis, pulmonary intravascular hydatid disease, and congenital interruption of the pulmonary artery. These pathologies and the keys to their diagnosis are reviewed.

CHEE-51 News Pathways in Thoracic Imaging: A Roadmap to Congenital Vascular Anomalies

Participants
Alex Dias, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review relevant anatomy, embryogenesis, and pathophysiology of congenital thoracic vascular anomalies. 2. Correlate clinical findings and complaints in childhood and adult life with imaging findings of vascular anomalies, according to subgroups and classifications. 3. Summarize imaging protocols and post-processing techniques. 4. Highlight the role of invasive and non-invasive imaging techniques for anomalies of the great thoracic vessels. 5. Discuss the relevance of multidisciplinary team meetings and the role of radiologists in patient care with case reviews.

TABLE OF CONTENTS/OUTLINE

1. Applied anatomy and embryogenesis of pulmonary arteries, pulmonary veins, aortic arch, and superior vena cava. 2. Congenital variants and anomalies: 2.1. Pulmonary arteries. 2.2. Pulmonary veins (total and partial anomalous pulmonary venous return). 2.3. Aortic arch. 2.4. Superior vena cava.3. Sample cases and outcome review: 3.1. State-of-the-art imaging protocols and post-processing techniques. 3.2. Current and potential diagnostic methods, including invasive and non-invasive studies. 3.3. Follow-up, treatment, and prognosis. 4. Congenital vascular anomalies: practical approach and structure reporting. 5. Summary and take-home messages.

CHEE-52 Venous Anatomic Variants In The Thorax

Participants
Riddhi Borse, MD, New Haven, MA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1.To understand normal vascular anatomy of the thorax, common and uncommon anatomic vascular variants. 2. To classify venous variant anatomy in the thorax based on draining veins. 3.To identify salient imaging features of described anatomic variants in a case based method, common differential diagnoses, and important points to be reported based on their clinical presentations.

TABLE OF CONTENTS/OUTLINE

1. Description of normal vascular anatomic structures within the thorax, common and uncommon anatomic variants. 2. Classification of venous anatomic variant anatomy in the thorax based on draining veins as follows:• Azygous Vein- Absent Azygous, Azygous Continuation of Inferior Vena Cava, Azygous Fissure variant in right upper lobe • Hemiazygos Vein- Left Superior Intercostal Vein, Hemiazygos continuation of the IVC, Accessory Hemiazygos Veins. • Superior Vena Cava- Persistent left SVC, Retroaortic Left Brachiocephalic Vein. • Pulmonary Vein- Partial and Total Anomalous Pulmonary Venous Return, Scimitar Syndrome, Accessory and Meandering Pulmonary veins 3. Brief description, salient imaging features, differential diagnoses and examples of anatomic variants draining into the azygous vein. 4. Important points to be included in reporting above listed anatomic variants from a clinical and interventional standpoint.

CHEE-53 Challenges and Pitfalls in Lung Cancer Screening

Participants
Hanna Ferreira Dalla Pria, MD, MD Anderson, Houston, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Updated USPSTF recommendations lung cancer screening (LCS). • LDCT Lung-RADS classification, reporting, and management recommendations with emphasis on challenging imaging findings and atypical patterns. • The spectrum of potential pitfalls in pulmonary nodule detection and characterization, including equivocal or atypical presentations, is important for avoiding misinterpretation that can alter patient management.

TABLE OF CONTENTS/OUTLINE

• Brief review of LCS history and impact, highlighting recently updated guidelines. • Interactive imaging-based approach with teaching points for diagnosis and/or work-up of equivocal cases with challenging imaging findings and atypical presentations on LDCT screening, chest CT and PET/CT imaging. • Discussion and Illustration of main LDCT screening pitfalls and causes of false positive and false negative screening results including, for example, artifacts related to CT technique, inflammatory and post-treatment changes mimicking neoplasm, cystic and cavitary lesions, pleural attached nodules, endobronchial lesions, temporary regression of malignant nodules. • Discussion and Illustration of main PET/CT pitfalls and false positive and false negative findings in the investigation of screen-detected nodules. • Limitations and new directions. • Take-home messages.

CHEE-54 COVID-19 Infection: Chest-CT of Complications During Acute Infection and Late Imaging Findings

Participants
Leonardo Kenji Mitsutake, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is:- Briefly review the epidemiology of COVID-19 infection and of post COVID-19 CT lungs abnormalities.- Describe and illustrate lung complications related to COVID-19 infection.- Describe post COVID-19 chest CT imaging protocols and technics.- Review the radiological management and follow-up protocols of post COVID-19 pneumonia.- Describe and illustrate the post COVID-19 CT lungs abnormalities, evolution patterns and complications.

TABLE OF CONTENTS/OUTLINE

1. Introduction: COVID-19 epidemiology review. Post COVID-19 CT lungs abnormalities epidemiology and predictors.2. Lung complications related to COVID-19 infection: Pneumothorax / Pneumodiastinum / Bronchopleural fistula. Co-infecction / superinfection. Vascular complications.3. Post COVID-19 Chest CT protocols.4. Post COVID-19 imaging follow-up: Review of societies recommendations and propositions.5. Key Imaging Findings: Main post COVID-19 CT findings. Imaging evolution patterns. Review of fibrotic-like changes. Post-treatment related complications.6. Take home messages.

CHEE-56 Systematic Approach of Congenital Chest Malformations

Participants
Taila Moura Fe, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purposes of this exhibit are:1. Make a multimodality-based didactic review of the various chest malformations. 2. Propose a didactic categorization of these conditions in: -Bronchopulmonary malformations. -Malformations of the pulmonary vessels. -Malformations of the thoracic wall and diaphragm 3. Illustrate those conditions based on cases from our chest radiology group.

TABLE OF CONTENTS/OUTLINE

We will discuss the following congenital chest malformations and focus on their imaging features using a multimodality approach in this exhibit.1. Bronchopulmonary malformations: -Bronchial atresia. -Accessory bronchus. -Bronchogenic cyst. -Congenital lobar overinflation. -Congenital pulmonary airways malformation (CPAM). -Pulmonary sequestration. -Pulmonary aplasia, hypoplasia, and agenesis. 2. Malformations of the pulmonary vessels: -Unilateral absence of the pulmonary artery. -Pulmonary artery sling. -Congenital pulmonary venolobar syndrome.3. Thoracic wall and diaphragm malformations: -Bochdalek hernia. -Morgagni hernia.

CHEE-57 Breasts on Thorax CT's - Better Not Turn a Blind Eye

Participants
Izabel Karam, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purposes of this exhibit are:To emphasize the importance of basic breast image knowledge for the general and thoracic specialized radiologist when reporting chest CTs;To review mammary anatomy;To illustrate several breast pathologies and its findings in chest CTs from our department in didactic sections to improve understanding.

TABLE OF CONTENTS/OUTLINE

To review the mammary anatomy:Thoracic wall (ribs and muscles);Mammary lobules and ducts;Areola and nipple;Neoplasms and other tumors:Fibroadenoma;Ductal invasive carcinoma;Metastases to breasts;Breast cancer in male patient;Evaluating local extension and lymphatic spreading;Male breasts;Infections and organized collections:Mammary abscess;Organizing hematomas;Post mammoplasty intramammary hematoma;Industrial silicone injection;Implant-related changes:Intrathoracic migration of breast implant after thoracoscopic surgery;Flipped implant;Postoperative abscess;Intracapsular implant rupture;Implant contraction;Implant-related lymphoma.

CHEE-58 Imaging Diagnosis as Biomarkers for Lung Cancer with Driver Oncogene Mutation / Gene Translocation in the Era of Personalized Medicine

Participants
Masahiro Yanagawa, MD, PhD, Suita, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

In the era of personalized medicine, imaging diagnosis plays an important part as biomarkers of the following items: prediction for pathological diagnosis, prediction for prognosis, prediction for driver oncogenes, evaluation of treatment response, and evaluation of side effects, etc. Imaging is not always perfect, but it can capture the whole image of lung cancer. This education exhibit focuses on CT imaging in lung cancer with driver oncogene mutation / gene translocation positive and quantitative analysis for predicting gene. It is much appreciated if our information would be useful in your clinical and research setting.

TABLE OF CONTENTS/OUTLINE

1. CT imaging in lung cancer with driver oncogene mutation/gene translocation positive: EGFR (epidermal growth factor receptor) mutation, ALK (anaplastic lymphoma kinase) rearrangement, ROS1 (c-ros oncogene) rearrangement, BRAF (v-raf murine viral oncogene homolog B1) mutation, MET exon 14 skipping-mutation, NTRK fusion, and Others [rearranged during transfection proto-oncogene (RET) fusion, KRAS mutation, and human epidermal growth factor receptor 2 (HER-2) mutation]. 2. CT imaging for an immune checkpoint inhibitor in lung cancer with programmed death ligand 1 (PD-L1). 3. Quantitative analysis for predicting gene: Radiomics approach. 4. Tailor-made medicine: Molecular-targeted therapies for driver oncogene mutations / gene translocations.

CHEE-59 Myocardial Assessment on CT: Don't Miss a Beat

Participants
Elizabeth Lee, MD, Ann Arbor, MI (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Although myocardium is typically evaluated with cardiac CT there is an opportunity to identify abnormalities on routine CTs done for other reasons. 2. Attention to myocardial contour, attenuation and enhancement patterns on a routine chest CT can enable detection of previously unsuspected disease.3. Recognition of myocardial abnormalities on routine chest CT will help in early detection of cardiac abnormalities and appropriate management.

TABLE OF CONTENTS/OUTLINE

Given the widespread use of chest CT, cardiac abnormalities are increasingly being identified on chest CTs often done for other reasons. While several reports have shown the value of incidentally discovered abnormalities (such as coronary anomalies) there is scant literature on myocardial abnormalities. These are challenging to detect, however, attention to this can enable diagnosis of unsuspected disease.The following myocardial abnormalities will be discussed:Attenuation: Differential attenuation between blood pool and myocardium (anemia); Fat deposition (tuberous sclerosis, prior infarct, arrhythmogenic cardiomyopathy, benign); Focal low attenuation (acute myocardial infarction (MI), acute myocarditis); Calcification (old MI, calcified tumor, renal failure) Morphology and enhancement: Thickened with diffuse heterogenous enhancement (infiltrative processes, Loeffler); Focal thickening with abnormal enhancement (acute MI, myocarditis); Normal thickness with focal heterogeneous enhancement (tumor, acute MI); Thinning (chronic MI, aneurysm/pseudoaneurysm) Future directions: Strain, role of artificial intelligence. Pitfalls: Artifacts can simulate myocardial pathology

CHEE-60 Taming the Broncho: An Imaging Guide to Acute Bronchial Disorders

Participants
Christopher Song, BS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) Various diseases of the bronchi can cause acute symptoms and physiologic abnormalities.2) We will apply a systematic approach to analyzing and characterizing bronchial disorders in the emergent setting. These disorders can be grouped into the following categories: endobronchial lesions, bronchiectasis, bronchial wall thickening, and bronchomalacia.3) Post-processing reconstructions should be utilized to better visualize and highlight characteristic imaging features.

TABLE OF CONTENTS/OUTLINE

Endobronchial lesions-Benign: Aspiration pneumonia, foreign body aspiration, broncholith, pulmonary hamartoma-Malignant: Carcinoid, adenoid cystic carcinoma, mucoepidermoid carcinoma, metastasisBronchiectasis - Cystic fibrosis- Graft versus host disease- Primary ciliary dyskinesia- Infection (e.g., nontuberculous mycobacterium, Pseudomonas aeruginosa)- Allergic bronchopulmonary aspergillosis- Tracheobronchomegaly- Williams-Campbell syndrome- Bronchial atresiaBronchial wall thickening- Bronchial asthma- Relapsing polychondritis- Tracheobronchial amyloidosis- Sarcoidosis- Granulomatous with polyangiitis- Infection (e.g. tuberculosis, Klebsiella)Bronchomalacia Bronchial trauma- Bronchopleural fistula- Bronchomediastinal fistula- Bronchial disruption/rupture

CHEE-61 Air trapping in Diffuse Lung Diseases: An Imaging Approach to the Differential Diagnosis with Pathologic Correlation (Mechanisms and Imaging Clues)

Awards
Certificate of Merit

Participants
Tomas C. Franquet, MD, PhD, Barcelona, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

Air trapping is a manifestation of many diverse entities such as infections, aspiration or inhalation of foreign substances, immunologic and connective tissue disorders, and miscellaneous causes. The presence of air trapping is an excellent clue to the diagnosis of small airways disease. Air trapping consists of focal zones of decreased attenuation commonly seen at expiratory thin-section CT scans of the lungs obtained during suspended expiration following a forced exhalation.The goals of this exhibit are to help the learner:1) To review a variety of diffuse lung diseases commonly associated with air trapping2) To emphasize the diagnostic value of volumetric expiratory CT 3) Present radiology-pathology correlation4) Provide and algorithmic approach to a differential diagnosis

TABLE OF CONTENTS/OUTLINE

1. Introduction. Review Diffuse lung diseases associated with air trapping2. Review the diagnostic value of volumetric expiratory HRCT scans in providing additional significant information in the evaluation of a variety of diffuse lung diseases with suspected airway abnormalities.3. Recognize pathologic mechanisms for air trapping in diffuse lung diseases land their impact on radiologic appearance4. Etiologies of air trapping related to diffuse lung diseases: Infectious Causes, Immunologically mediated, Drug-induced, Toxic/chemical fume inhalation, and miscellaneous causes/associations5. Algorithm to approach air trapping in diffuse lung diseases.6. Conclusion

CHEE-62 Recognizing the Many Faces of Thoracic Tuberculosis

Participants
Makiko Murota, MD, Kitagun, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

Mycobacterium tuberculosis infects one third of the world’s population and tuberculosis continues to be a major global public health problem. Imaging diagnosis of tuberculosis is sometimes challenging and complex. The purpose of the exhibit is: 1. To review the etiology of tuberculosis. 2. To describe the imaging features of tuberculosis, including the thoracic region other than the lungs. 3. To discuss the complications and sequelae.

TABLE OF CONTENTS/OUTLINE

1. The etiology of tuberculosis 2. The imaging findings of pulmonary tuberculosis: primary tuberculosis, postprimary tuberculosis including typical and atypical pattern, bronchial tuberculosis, tuberculoma, and miliary tuberculosis 3. The imaging features and the

clinical manifestations of complications and sequelae: lung parenchyma, airways, blood vessels, mediastinum, pleura, chest wall 4. The differential diagnosis 5. Summary

CHEE-63 Tropical Diseases - A Comprehensive Review of Thoracic and Abdominal Imaging Manifestations

Participants
Heli Rueda, MD, Bogota, Colombia (*Presenter*) Nothing to Disclose

TEACHING POINTS

To review the pathophysiology, histopathology, and imaging manifestations of thoracic and abdominal tropical diseases.To mention the imaging patterns of parasitic tropical diseases with their histological correlation.To conceptualize the role of imaging in the diagnosis of tropical diseases.

TABLE OF CONTENTS/OUTLINE

1. Introduction2. Tropical diseases classification and physiopathology.3. Epidemiology and Imaging findings of tropical diseases in computed tomography and its pathological correlation of:a. Parasites:I. Helminth Infections:1. Ascariasis2. Echinococcosis3. Paragonimiasis4. Strongylodiasisii. Protozoal Infections:1. Amebiasis2. Leishmaniasis3. Chagas disease4. Malariab. Bacterial:i. Salmonellosisii. Tuberculosisc. Fungal:i. Paracoccidiomycosisd.Viral:i. Dengue fever4. Conclusions.

CHEE-64 High-attenuation Mediastinal Abnormalities - Beyond Lymph Nodes Benign Calcifications

Participants
Lucimara Parajara, MD, Sao Bernardo Do Campo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

- To review the main causes of calcified mediastinal lymph nodes- To review conditions other than calcified lymph nodes that can cause high attenuation lesions in the mediastinum compartments

TABLE OF CONTENTS/OUTLINE

All radiologists are used to describing calcified mediastinal lymph nodes. We will discuss several other conditions that may present with a high-attenuation pattern in the mediastinum: - Calcified lymph nodes: a)Healed granulomatous infection b)Sarcoidosis c)Chronic silicosis - Calcified masses a)Thyroid pathologies b)Germ cell neoplasm c)Calcified mediastinal cysts d)Healed lymphoma - Calcified tissue involving mediastinal structures: a)Inflammatory pseudotumor b)Fibrosing mediastinitis c)Tracheobronchial amyloidosis - Other conditions: a)Pitfalls: azygos vein contrast, contrast inside lymphatic ducts b)Foreign body: device embolism, aspiration

CHEE-65 Multidisciplinary Panel of Sarcoidosis Beyond the Basics: A Primer on Unusual Cases

Participants
Jessica Marchi, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

To provide a brief overview of the fundamental classic radiologic and histologic findings of sarcoidosis. To demonstrate and discuss the others presentations of thoracic sarcoidosis that are outside the usual. To illustrate the correlation between radiological and histological findings, focusing on atypical cases.

TABLE OF CONTENTS/OUTLINE

Besides thoracic sarcoidosis's common findings (bilateral hilar lymph node enlargement, micronodules with a perilymphatic distribution, fibrotic changes, and bilateral perihilar opacities), one must remember its atypical manifestations and the possibility of concomitance with lung abnormalities of another nature. We will review the most common thoracic sarcoidosis presentations in this educational exhibit, as well as illustrate and describe atypical manifestations and complications. When pertinent, we will also include radiology-pathology correlation for the cases.

CHEE-66 Dynamic Chest Radiography for Pulmonary Vascular Diseases: Clinical Applications and Correlation with Other Imaging Modalities

Awards
Cum Laude

Participants
Yuzo Yamasaki, MD, PhD, (*Presenter*) Research Grant, Konica Minolta, Inc

TEACHING POINTS

1) To explain the basic principles of lung perfusion assessment using dynamic chest radiography (DCR) 2) To discuss the advantages of DCR compared to other imaging modalities 3) To review multiple, specific clinical applications of DCR for pulmonary vascular diseases and compare them with other imaging modalities

TABLE OF CONTENTS/OUTLINE

1) Basic principles of DCR •System composition •Acquisition techniques 2) Different acquisitions of DCR imaging •Lung perfusion images •Lung ventilation images 3) Different methods of DCR lung perfusion imaging •Cross-correlation method •Reference frame-subtraction method 4) Advantages compared to other imaging modalities •Readily available •No need for contrast media or radionuclides •Non-invasive •Low radiation exposure •Cost-effective 5) Clinical applications and correlation with other imaging modalities •Pulmonary arterial diseases - Acute pulmonary thromboembolism - Chronic thromboembolic pulmonary hypertension - Pulmonary arteriovenous malformation - Pulmonary arterial stenosis/occlusion •Pulmonary venous diseases - Partial anomalous pulmonary venous return - Pulmonary venous stenosis/occlusion 6) Limitations

CHEE-67 Imaging Technologies to Guide the Interventional Pulmonologist: Dynamic Digital Tomography and Dual Source CT.

Participants
Samuel McCollum, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Dynamic low dose evaluation of the airway with Digital Tomosynthesis (DTS) and Dual Source Computed Tomography can be used to monitor complex airway pathologies and airway devices. Having an institution-speci&7;c DTS may reduce use of CT imaging, loweringcost and radiation exposure. Dynamic DSCT imaging decreases radiation dose to conventional CT acquisition

TABLE OF CONTENTS/OUTLINE

1. An introduction to Digital Tomosynthesis and dynamic DSCT: Acquisition and Current Uses2. Case 1: 37-year-old male with post-intubation stricture—we discuss how the stenotic airway is poorly visualized by conventional radiograph, yet can be readily visualized using DTS.3. Case 2: 28-year old female with post-intubation stricture. We demonstrate how can provide a functional assessment of the airways by imaging the trachea in both the inspiratory and expiratory phase post-dilation4. Case 3: 67-year-old male with NSCLC complicated by malignant tracheal stenosis. We will see that DTS allows for visualization of an intraluminal mass.5. Case 4: 57 year old female with malignant stricture s/p stent placement with recurrent airway obstruction. DTS enabled low dose evaluation and monitoring of therapeutic interventions.6. Case 5: 72-year-old male with left lung transplant for usual interstitial pneumonia status post endobronchial stent placement. We show how DTS enables visualization of the endobronchial stent in both inspiration and expiration, again enabling one to monitor stability of airways and associated devices while avoiding the cost and radiation of CT imaging.7. Discussion

CHEE-68 From Lines Stripes to Cubes Cylinders: A 3D Visual Guide to Conventional Chest Radiography

Awards
Cum Laude
Identified for RadioGraphics

Participants
Albert Jiao, MD, Boston, MA (*Presenter*) Nothing to Disclose

TEACHING POINTS

Purpose Identification of anatomic structures in the chest on 2D conventional chest radiography may be challenging for new trainees. Due to the subtlety of pleural lining on CT, the concepts of expanded, effaced, or obliterated pleural borders on interaction with the mediastinum may be difficult to understand with radiographic and cross-sectional imaging correlation. 3D cinematic rendering, which can accentuate the draping effects of pleural borders, may provide a novel way to understand classic chest radiography. Teaching Points• Identify the anatomic structures in the chest that create the classic "lines and stripes" on chest radiography though the assist of 3D cinematic rendering (CR) depictions.• Recognize the abnormal appearances of the borders on CXR, and the corresponding appropriate pathologies in the differential diagnosis through a case-based teaching series.

TABLE OF CONTENTS/OUTLINE

Outline1. Normal pleural anatomy and mediastinal borders. 2. Anterior Junction Line. a. Anterior mediastinal mass differential. 3. Posterior Junction Line. a. Posterior mediastinal mass differential. 4. Aorto-pulmonic relationships. a. AP stripe AP window differential. 5. Paraspinal Lines. a. Right left paraspinal line differentials. 6. Posterior tracheal stripe differentials. 7. Azygosesophageal recess differentials

CHEE-69HC Practical Guide of US-guided Percutaneous Needle Biopsy (PCNB) for Thoracic Lesions

Participants
Hang Jun Cho, Daegu, Korea, Republic Of (*Presenter*) Nothing to Disclose

TEACHING POINTS

To guide clinical application of US-guided percutaneous needle biopsy (PCNB) for thoracic lesions.

TABLE OF CONTENTS/OUTLINE

1. Introduction of US-guided percutaneous needle biopsy (PCNB) - Indications - Advantages and limitations 2. US images of thoracic lesions - Subpleural lung lesions - Pleural lesions- Bony thorax lesions- Anterior mediastinal lesions- Soft tissue lesions 3. Procedure of US-guided PCNB - Localization of the lesion - Risk evaluation- Determination of the target - Acquisition of the tissue- Evaluation of immediate post-procedural complication4. Diagnostic performance and complication rate of US-guided PCNB - Diagnostic yield - Complication rate - CT guided vs. US guided PCNBPlease visit the Learning Center to also view this presentation in hardcopy format.

CHEE-7 Let Us Find the Nodule in a Haystack: A Quick Look through Current Techniques for Image-guided Preoperative and Intraoperative Localization of Small Lung Nodules Prior to Video-assisted Thoracoscopic Surgery Resection

Participants
Igor Radalov, MD, Barcelona, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) To define the characteristics of lung nodules amenable to image-guided localization before video-assisted thoracoscopic surgery (VATS) resection.2) To explain the advantages, disadvantages, and techniques of the different modalities available in the localization of lung nodules prior to VATS resection.3) To review the results of the different modalities available for the localization of lung nodules before VATS resection. Particular focus on new techniques: Radioactive tracer injection (ROLL) and radioactive seed placement.

TABLE OF CONTENTS/OUTLINE

1. Introduction.2. Lung nodules amenable for image-guided localization before VATS resection.3. Currently available modalities for lung nodule localization.3.1. Preoperative.3.1.1. Hookwire placement. 3.1.2. Microcoil placement. 3.1.3. Dye injection. 3.2.

Intraoperative.3.2.1. Ultrasound. 3.3. Mixed.3.3.1. Radioactive seed placement. 3.3.2. Radioactive tracer injection (ROLL). 4. Comparative results.4.1. Detection rate.4.2. Conversion to thoracotomy rate.4.3. Complications.5. Summarize.6. Conclusion.

CHEE-70 Thoracic Paragangliomas: Imaging Review and Considerations for Clinical Practice

Participants
Fiona McCurdie, MBChB, BA, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Paragangliomas (PGL) within the thorax: where do they occur and in whom? Experience from a specialist centre2. Multimodality imaging features of thoracic PGLs: strengths and challenges of imaging modalities; lessons from missed lesions3. Considerations for management and recommendations for screening and surveillance

TABLE OF CONTENTS/OUTLINE

1. Thoracic PGLs - what the general radiologist needs to knowa. Overview of pathophysiologyb. Succinate Dehydrogenase deficiency disordersc. Summary of literature - anatomical location and clinical presentation2. Our cohort of 17 thoracic PGL cases - two decades' experience in a specialist centrea. How the PGLs are identified: screening vs. surveillance vs symptomatic b. Locations of PGLs within the mediastinum: i. Superior ii. Anterior iii. Middle 1. Cardiac iv. Posterior v. Correlation symptoms and biochemistry c. Discussion of management: i. Surgical considerations ii. Medical including radionuclide therapy3. Radiological lessons:a. Common imaging findings i. CT - including cardiac CT ii. MRI - whole body, cardiac MRI iii. Functional imaging - Gallium Dotatate PET, FDG PET, MIBG SPECT, Octreotide iv. Plain radiographb. Key differential diagnosisc. Learning from errors: which imaging modalities are PGLs most frequently missed on? What do we learn when we look back in retrospect?4. Recommendations for imaging screening and surveillance

CHEE-71 Disorders with Ocular and Thoracic Involvement

Awards
Identified for RadioGraphics

Participants
Patrick Lang, MD, PhD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Numerous medical conditions have multiorgan imaging findings. Here, we review specifically the ocular and cardiothoracic findings of selected infectious, inflammatory, autoimmune, neoplastic, and hereditary disorders. These correlations are meant to remind the astute clinician that certain ophthalmologic signs should trigger a careful radiologic evaluation that includes imaging of the head and chest.

TABLE OF CONTENTS/OUTLINE

1. Introduction. 2. Examples of cases: a. Infectious conditions: aspergillosis, nocardiosis, COVID-19. b. Inflammatory conditions: sarcoidosis, IgG-4 sclerosing disease. c. Autoimmune conditions: Graves' disease, scleroderma, Sjogren's syndrome. d. Neoplastic conditions: uveal melanoma, lymphoma, lung cancer. e. Hereditary conditions: Marfan syndrome, Ehlers Danlos syndrome, tuberous sclerosis, neurofibromatosis type 1. 3. Conclusion.

CHEE-72 Tortuous Path: Congenital Anomalies of the Systemic Thoracic Veins

Participants
Carlos Marin, MD, PhD, Madrid, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To review the anatomy and embryology of the systemic thoracic veins. 2. To describe imaging findings in congenital anomalies of the systemic thoracic veins (CASTV). 3. To emphasize the physiologic consequences of these anomalies, and their impact in associated congenital heart diseases surgery.

TABLE OF CONTENTS/OUTLINE

Congenital anomalies of the systemic thoracic veins are commonly underdiagnosed, in part because they are often asymptomatic or have little or no clinical consequences. They are frequently discovered as an incidental finding in a radiological examination for unrelated reasons, but sometimes are diagnosed because an anomalous course of a central venous line or during a systematic study for congenital heart disease. In certain cardiac or thoracic surgical procedures it is of prime importance to diagnose these anomalies to prevent surgical failure or complications. Pulmonary venous anomalous connections to the systemic thoracic veins and Raghib syndrome can be symptomatic and diagnosed at early age or be discovered in adulthood in patients with right heart dilatation or cardiac symptoms. Besides azygos lobe, a well-known normal variant, the most common CASTV include: 1. Persistent left superior vena cava (SVC) (with or without absent right SVC). 2. Left superior intercostal vein variants. 3. SVC aneurysm. 4. Pulmonary venous anomalous connections to the SVC. 5. Absent inferior vena cava with an enlarged azygous vein. 6. Persistence of the levoatriocardinal vein. 7. Persistent left SVC with absence of the coronary sinus (Raghib syndrome). 8. Subaortic innominate vein. We describe the embryology, anatomy, physiology, imaging findings, and potential complications of these anomalies.

CHEE-73 The Role of Cinematic Rendering in the Analysis of Complex Vascular and Mediastinal Pathology: How We Do It

Participants
Elliot Fishman, MD, Owings Mills, MD (*Presenter*) Co-founder, HipGraphics, Inc;Stockholder, HipGraphics, Inc;Institutional Grant support, Siemens AG;Institutional Grant support, General Electric Company;Consultant, Exact Sciences Corporation;Consultant, Imaging Endpoints

TEACHING POINTS

1. Cinematic Rendering provides unique 3D capabilities allowing for detailed analysis of complex soft tissue and vascular anatomy allowing for improved analysis of chest and mediastinal pathology2. Cinematic rendering is especially valuable for evaluation of complex vascular pathology ranging from aortic dissection to aneurysm as well as coarctation of the aorta and coronary artery

anomalies3. 3D mapping is an important tool for transmitting critical information to the referring physician and the patient care team4. complex anatomy defined with cinematic rendering is helpful in pre-operative planning and in analyzing complex structures for robotic surgery5. Cinematic Rendering is a helpful tool for teaching residents and fellows in complex cases of vascular anatomy and anomalies

TABLE OF CONTENTS/OUTLINE

1.CT protocols for optimizing data acquisition for 3D mapping2. protocols and techniques used for Cinematic Rendering including the use of presets to optimize workflow and throughput3. representative case studies are presented using axial, multiplanar, MIP and Cinematic Rendering to show how we use the technique in clinical practice. The advantages of Cinematic Rendering in select clinical applications will be discussed4. case studies will be divided into section incuding;a. vascular anatomy and anomaliesb. aortic aneurysm including dissection, intramural hematoma, ulcerations and active bleedingc. congenital anomalies including coarctation of the aorta and arch anomaliesd. cardiac pathology including cardiac tumors including atrial myxoma and angiosarcoma, and coronary artery fistulae e. mediastinal masses that involve or are in close proximity to key vascular structures

CHEE-74 Pulmonary Vascular Diseases: Spectrum of Manifestations in the Chest

Participants
Juliana Sitta, MD, Jackson, MS (*Presenter*) Nothing to Disclose

TEACHING POINTS

Review of the pathophysiology and categorization of pulmonary vascular diseases. Describe imaging patterns on CT and traditional angiography. Analyze common and uncommon etiologies with a case-based review.

TABLE OF CONTENTS/OUTLINE

This presentation aims to discuss imaging findings in the diagnosis and categorization of pulmonary vascular diseases including acute pulmonary embolism, chronic thromboembolic pulmonary hypertension, pulmonary arteriovenous malformation, venous anomalies and mimics, hereditary hemorrhagic telangiectasia, granulomatous with polyangiitis, and microscopic polyangiitis. We will explore the spectrum of chest CT findings within the pulmonary vasculature, parenchyma, airways, mediastinum, and heart that help the radiologist narrow down the differential diagnosis. We will provide a review of the diagnostic criteria and key imaging findings, correlated with physiopathology and current categorization. We will also include a discussion of pros and cons of the currently available diagnostic tools and an update of the most recent imaging technical advancements. Additionally, a case-based review exemplifies common and uncommon pulmonary vascular pathologies.

CHEE-75 Pearls and Pitfalls in Pulmonary Vascular Disease

Awards
Certificate of Merit

Participants
Furkan Ufuk, MD, Denizli, Turkey (*Presenter*) Nothing to Disclose

TEACHING POINTS

? To review the spectrum of pulmonary vascular diseases and imaging features ? To review the clinical presentation associated with each pulmonary vascular disease

TABLE OF CONTENTS/OUTLINE

Pulmonary embolism, chronic thromboembolic pulmonary hypertension (CTEPH), pulmonary arterial hypertension (PAH), pulmonary arteriovenous malformations (PAVM), Portopulmonary hypertension, cavopulmonary pulmonary artery aneurysm/pseudoaneurysm, bronchial artery aneurysm/pseudoaneurysm, tumor thrombotic microangiopathy, in situ pulmonary artery thrombosis after receiving radiation therapy, pulmonary artery angiosarcoma, tumoral invasion of pulmonary artery or vein, pulmonary vein thrombosis, cement embolism, pulmonary vein varix, pulmonary veno-occlusive disease, pulmonary capillary hemangiomatosis, pulmonary sequestration, abnormal pulmonary venous return, pulmonary vasculitides.

CHEE-76 Multimodality Imaging of Pulmonary Embolism: A Guide for the Radiologist

Awards
Certificate of Merit

Participants
Flavio Zuccarino, MD, Barcelona, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

To describe imaging findings in Pulmonary Embolism (PE) at different imaging modalities. To underline advantages and limitations of these techniques and to define the clinical scenarios in which they are key in patient management.

TABLE OF CONTENTS/OUTLINE

After a short introduction about PE etiology and incidence, we review PE imaging findings at different non-invasive techniques.We organize PE typical imaging findings as: Chest Radiography, Chest Ultrasound, CT Angiography, Spectral CT, Cardiac MR, V/Q (ventilation/perfusion) scan.We discuss advantages and limitations of these imaging modalities as the potential differential diagnosis. We analyze the differences between acute and chronic PE, focusing especially on Spectral CT findings. We evaluate the impact of these imaging techniques on patient prognosis, especially focusing on CT and cardiac MR. ConclusionsOUTLINE PE represents a lifetreathing condition with a challenging diagnosis. Radiologists should be familiar with PE findings at all imaging modalities that may be key in patient management and treatment.

CHEE-77 New Imaging Modalities in the Diagnosis, Treatment, and Follow-up of Chronic Thromboembolic Pulmonary Hypertension: Correlation Between Dual Energy CT, Cone Beam CT and Digital Substraction Angiography.

Participants

Alfredo Paez Carpio, MD, Barcelona, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

To explain the basics and technique of dual-energy CT (DE-CT) and cone-beam CT (CB-CT), specifically during the management of patients with chronic thromboembolic pulmonary hypertension (CTEPH). To describe the imaging findings observed in the newly available imaging modalities: DE-CT and CB-CT in patients with CTEPH, with correlation with digital subtraction angiography (DSA).To explain the current role of DE-CTA and CB-CTA in the diagnosis, treatment and follow-up of patients with CTEPH.

TABLE OF CONTENTS/OUTLINE

1.- Introduction. 2.- Basic concepts of DE-CT and CB-CT. 2.1.- DE-CT basics and technique in the study of CTEPH. 2.2.- CB-CT basics and technique in the study of CTEPH. 3.- DE-CT and CB-CT in the diagnosis of suspected CTEPH. 3.1.- Added value compared to conventional CT and DSA. 3.2.- DE-CT imaging findings. 3.3.- CB-CT imaging findings. 3.4.- Correlation with DSA. 4.- DE-CT and CB-CT in the planning of invasive treatment for CTEPH. 4.1.- DE-CT and CB-CT in the planning of pulmonary endarterectomy. 4.2.- DE-CT and CB-CT in the planning of balloon pulmonary angioplasty. 4.3.- Added value of both techniques compared to conventional CT and DSA. 5.- Postprocedural CB-Ct ad DE-CT imaging findings. 5.1.- Normal spectrum of post-BPA and post-PEA imaging findings. 5.2.- Complications of BPA and PEA. 5.3.- Post-procedural imaging follow-up. 6.- Role of DE-CT and CB-CT in the long-term follow-up of patients with CTPEH. 7.- Current scientific evidence and status of both techniques in established diagnostic algorithms. 8.- Summarize. 9.- Conclusion.

CHEE-78 Bubbles in the Chest: A Pictorial Review of Cystic Lesions in the Paediatric Chest

Participants
Shrea Gulati, MBBS, MD, Delhi, India (*Presenter*) Nothing to Disclose

TEACHING POINTS

A wide spectrum of pathologies in the paediatric population can present as cystic lesions in the thorax. Imaging findings on chest radiography and computed tomography (CT) can provide diagnostic clues to the aetiology. Evolution of imaging findings on serial imaging can provide crucial diagnostic clues.

TABLE OF CONTENTS/OUTLINE

? Introduction ? Overview and classification of the cystic lesions in the paediatric chestClassification based on aetiology: Congenital cystic lesions - Congenital pulmonary airway malformation/ Hybrid lesion, Bronchogenic cyst, Cystic lung disease in neuro-cutaneous syndromes [Tuberous Sclerosis, Neurofibromatosis-1 (NF-1)], Syndromic cystic lung disease (Down's syndrome, Birt-Hogg-Dube syndrome)Acquired cystic lesions - Post infective- tuberculosis, pneumatocele, Diffuse lung disease-Lymphangioleiomyomatosis and Langerhans cell histiocytosis, Broncho-pulmonary dysplasia (BPD), End-stage Interstitial lung disease (ILD)/Diffuse lung disease (DLD), Post traumatic pneumatoceleMimics - Bronchiectasis, Pulmonary interstitial emphysema, Emphysema (alpha 1 antitrypsin deficiency)Classification based on pattern:Single simple cyst - Bronchogenic cyst, Post traumatic pneumatoceleSingle complex/ conglomerated cysts - Congenital pulmonary airway malformation/ Hybrid lesionMultiple bilateral cysts - Post infective- tuberculosis, pneumatocele, Diffuse lung disease-Lymphangioleiomyomatosis and Langerhans cell histiocytosis, BPD, End-stage ILD/DLD, Cystic lung disease in neuro-cutaneous syndromes (Tuberous Sclerosis, NF-1), Syndromic cystic lung disease (Down's syndrome, Birt-Hogg-Dube syndrome)

CHEE-79 Benign and Malignant Tumors of the Trachea

Participants
Daniel Vargas, MD, Denver, CO (*Presenter*) Nothing to Disclose

TEACHING POINTS

Tracheal neoplasms are rare, with less than 10% of these lesions considered benign. The radiologist is in a unique position of often being the first health team member to encounter these lesions.The objectives of this exhibit are:1. Discuss epidemiology of tracheal neoplasms2. Review the clinical and imaging presentation of some of the most common benign and malignant tracheal neoplasms. 3. Familiarize the radiologist with entities that act as mimics or pitfalls in the evaluation of the trachea

TABLE OF CONTENTS/OUTLINE

1. Benign Tracheal Neoplasms a. Tracheal Papilloma b. Hemangioma c. Paraganglioma d. Chondroma e. Hamartoma f. Neurogenic tumors 2. Malignant Tracheal Neoplasms a. Metastases b. Direct Invasion c. Squamous Cell Carcinoma d. Adenoid Cystic Carcinoma e. Mucoepidermoid Carcinoma f. Carcinoid Tumor g. Chondrosarcoma

CHEE-8 An Image is Worth a Thousand Words: Important Considerations about Connective Tissue Disease-Associated Interstitial Lung Disease

Participants
Bruna Alexandre, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Briefly review the main connective tissue disorders (CTD) typical clinical presentations and laboratory findings, and the expected pattern of interstitial lung disease (ILD) for each CTD;Introduce the readers to interstitial pneumonia with autoimmune features (IPAF);Recognize the most typical imaging features of ILDs and other thoracic manifestations of CTDs;Highlight the role of the radiologist in differential diagnosis and detecting complications.

TABLE OF CONTENTS/OUTLINE

INTRODUCTION: Connective tissue disorders (CTD) and their relation with interstitial lung diseases (ILD); CTD key points to diagnosis; Interstitial pneumonia with autoimmune features - when ILD takes the spotlight.IMAGING FINDINGS: Step by step approach and algorithm to evaluate connective tissue disease associated with interstitial lung disease (CTD-ILD); CTD-ILD: major patterns of involvement and suggestive signs at Chest CT; Other thoracic manifestations of connective tissue diseases.DIFFERENTIAL DIAGNOSIS AND COMPLICATIONS;TAKE-HOME MESSAGES

CHEE-80 Benign and Malignant Tracheobronchial Neoplasms: A Comprehensive Review with Radiologic,

Bronchoscopic and Pathologic Correlation

Awards
Identified for RadioGraphics

Participants
Alexander Phan, MD, New York, NY (*Presenter*) Nothing to Disclose

TEACHING POINTS

Tracheobronchial neoplasms are much less common than lung parenchymal neoplasms but can be associated with significant morbidity and mortality. They include a broad differential of both benign and malignant entities, extending far beyond more commonly known pathologies such as squamous cell carcinoma and carcinoid. Airway lesions may be incidental findings on imaging or present with symptoms related to airway narrowing or mucosal irritation, invasion of adjacent structures, or distant metastatic disease. While there is considerable overlap in clinical presentation, imaging, and bronchoscopic appearances, an awareness of potential distinguishing factors may help narrow the differential diagnosis. The authors review the epidemiology, imaging characteristics, typical anatomic distributions, bronchoscopic appearances, and histopathology of a wide range of neoplastic entities involving the tracheobronchial tree. Special attention is paid to any distinguishing features.

TABLE OF CONTENTS/OUTLINE

1. Primary malignant tumors: squamous cell carcinoma, malignant salivary gland tumors (adenoid cystic carcinoma and mucoepidermoid carcinoma), carcinoid, sarcomas, primary tracheobronchial lymphoma, and inflammatory myofibroblastic tumor. 2. Secondary malignant tumors (direct invasion or hematogenous spread). 3. Benign neoplasms: hamartoma, chondroma, lipoma, papilloma, amyloid, leiomyoma, neurogenic lesions, and benign salivary gland tumors (pleomorphic adenoma and mucous gland adenoma).

CHEE-81 Usual Interstitial Pneumonia (UIP): A Primer for Radiologists

Participants
Katherine Cheng, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Usual Interstitial Pneumonia (UIP) is the most common histologic pattern of fibrosis and has typical imaging findings on HRCT. 2. UIP is an imaging/histologic diagnosis while Idiopathic Pulmonary Fibrosis (IPF) is a multidisciplinary diagnosis. 3. While most patients with UIP pattern of fibrosis are diagnosed with IPF, this imaging pattern can be seen in other settings such as connective tissue related disease, hypersensitivity pneumonitis, asbestosis, vasculitis, familial pulmonary fibrosis, and drug reaction

TABLE OF CONTENTS/OUTLINE

1. Distinguish UIP from IPF 2. Review histologic and imaging patterns of UIP; review updated 2022 ATS criteria diagnosis for IPF. 3. Explore the differential diagnosis for UIP and associated imaging findings including IPF, connective tissue disease, hypersensitivity pneumonitis, asbestosis, vasculitis, familial pulmonary fibrosis, and drug reaction. 4. Present multidisciplinary approach to UIP including the clinical presentations and serologic markers that can aid the radiologist.

CHEE-82 Imaging Guide to Connective Tissue Disease Related Interstitial Lung Disease (CTD-ILD)

Participants
Yogesh Gupta, DO, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Provide a foundation for the clinical diagnosis of CTDs that may present with ILD including symptomatology and serologic markers. 2. Describe the radiologic and pathologic patterns of CTD-ILD 3. Review helpful imaging signs in the diagnosis of CTD-ILD. 4. Discuss idiopathic pneumonia with autoimmune features (IPAF). 5. Review the specific prognosis and management of CTD-ILDs, with comparison to ILDs secondary to other causes.

TABLE OF CONTENTS/OUTLINE

CTD-ILD represents an underdiagnosed subset of ILDs. The imaging appearance of CTD-ILDs can often precede the rheumatic signs with interpretation of these cases difficult for even experienced radiologists. The literature on CTD-ILD has progressed over recent years, underscored by the emergence of new diagnostic criteria and characteristic imaging patterns. This presentation will provide the radiologist with a comprehensive framework to best facilitate diagnosis and guide management of these diseases.This exhibit is designed for residents, fellows, as well as general and thoracic radiologists. The primary goal is to achieve better understanding of clinical and imaging features of various CTD-ILDs, drawing from our large multicenter patient database. 1. Clinical features of CTDs manifesting with ILD. 2. Pathophysiology of CTD-ILDs. 3. CT imaging characteristics of CTD-ILDs, including imaging signs. 4. Prognosis and management of CTD-ILDs.

CHEE-83 Breast Cancer in Women: Multidisciplinary Approach to the Kaleidoscopic Pulmonary Manifestations on CT

Participants
Cleonice Isabela Silva Muller, MD, PhD, (*Presenter*) Author with royalties, RELX;Author with royalties, Wolters Kluwer nv;Speaker, AstraZeneca PLC;Speaker, General Electric Company

TEACHING POINTS

Introduction Pulmonary abnormalities on computed tomography (CT) in women with breast cancer may be secondary to pulmonary metastases, radiotherapy or systemic treatment of the primary tumor or metastases, increased prevalence of other cancers, or be due to an unrelated cause. In this exhibit we review the range of pulmonary abnormalities seen on CT and present representative cases illustrating the value of multidisciplinary discussion based on weekly oncology tumor board meetings at out institution and systematic follow-up of all patients.1) To review the typical and atypical manifestations of pulmonary metastases at presentation and with progression or improvement. 2) To illustrate the CT findings of pulmonary complications related to treatment including radiation, chemotherapy, hormone therapy, targeted therapy and immunotherapy. 3) To discuss the differential diagnosis of

unrelated pulmonary abnormalities that may affect management. 4) To highlight the importance of multidisciplinary discussion in reaching a timely diagnosis.

TABLE OF CONTENTS/OUTLINE

1) Introduction; 2) Spectrum of manifestations and types of response of pulmonary metastases; 3) Pulmonary complications of radiotherapy; 4) Pulmonary complications of systemic therapy; 5) Unrelated pulmonary conditions; 6) Conclusions.

CHEE-84 Chest Ultrasound: US Technique, Normal anatomy, Pearls and Pitfalls

Participants
Heli Rueda, MD, Bogota, Colombia (*Presenter*) Nothing to Disclose

TEACHING POINTS

Review the appropriate technique and parameters to perform chest ultrasonography. Describe the normal anatomy of the chest wall, pleura, and lung parenchyma in ultrasound imaging, its pearls, and pitfalls. Illustrate the most common imaging findings in ultrasound of the pathologies involving the chest wall, diaphragm, pleura, and lung parenchyma.

TABLE OF CONTENTS/OUTLINE

IntroductionChest ultrasound techniqueAnatomy of the chest wall, pleura, and lung parenchyma in ultrasound.Common imaging findings in the pathology of:Chest Wall and diaphragm Diaphragm paralysisNeoplasic involvementPleuraPleural effusionPneumothoraxPleural thickeningLung ParenchymaAtelectasisConsolidationPulmonary edemaPulmonary nodulesConclusion

CHEE-85HC Suboptimal Chest Radiography - Applying Art to the Science of Mitigating the Mammoth Issue

Participants
Giridhar Dasegowda, MBBS, Boston, MA (*Presenter*) Nothing to Disclose

TEACHING POINTS

The audience will learn about the applied art and science in suboptimal chest radiographs (CXRs): 1. Various causes of suboptimal CXRs with case-based illustration 2. Impact of suboptimal CXRs: The missed and misinterpreted findings 3. How parallel suboptimality affects the representation of art: Connecting CXR illusions with artistic allusions 4. Where and how artificial intelligence (AI) helps in mitigating suboptimal CXRs

TABLE OF CONTENTS/OUTLINE

The four-part exhibit will begin with case-based illustrations of what makes CXRs suboptimal and/or rejected for repeat acquisition. The second part will illustrate the impact of suboptimality on CXR findings including the missed and misinterpreted ones. In the third part, the presenting authors will use their own self-drawn, painted artwork to highlight how suboptimality affects the representation of art and interpretation of suboptimal CXRs. The final part informs about the role of AI in mitigating suboptimal CXRs. The free-to-share and display exhibit will help raise awareness about suboptimal CXRs and inspire a positive downward trend in suboptimal CXR frequency which according to some exist in as much as 90% of all CXRs.Please visit the Learning Center to also view this presentation in hardcopy format.

CHEE-86 Perceptual Errors in Cardiothoracic Imaging

Participants
Siddhi Hegde, MBBS, Mangalore, India (*Presenter*) Nothing to Disclose

TEACHING POINTS

-Studies have shown some areas of radiology have miss rates and (false negative) and false-positive rates as high as 30% of daily reads. -Errors have a significant impact on patient care and increase healthcare costs and burdens. -Perceptual errors can be due to errors in scanning, recognition, or decision. -Identifying and understanding the causes of perceptual errors, increasing awareness amongst trainees, and improving educational models can improve detection and localization accuracy. -Perceptual training algorithms geared toward the reduction of perceptual errors may be a useful adjunct to conventional radiology training.

TABLE OF CONTENTS/OUTLINE

-Different types of diagnostic errors in radiology and their frequency -What radiologists need to know about perceptual errors in the setting of cardiothoracic imaging. -Table demonstrating different types of perceptual errors in radiology, definitions, and potential means to overcome them.

CHEE-87 "Down The Rabbit Hole": The Many Fistulous Pathways in the Thorax

Participants
Murilo Peixoto, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Fistulous tracts in the thorax can involve a number of different spaces and have multiple causes.These unusual communications are hard to depict well, and when only standard imaging protocols are used they are often overlooked or misinterpreted.Imaging acquisition techniques and tips can be used to alter the common protocols and demonstrate these tracts more conspicuously.

TABLE OF CONTENTS/OUTLINE

Acquired and congenital fistulous tracts of the thoracic region often pose significant diagnostic difficulties to the radiologist. Multiple spaces can be involved, such as the tracheobonchial tree, pleural space, the digestive tract (such as the esophagus and stomach), the lymphatic and the circulatory systems; and many etiologies can be the culprit, such as infectious or inflammatory diseases, neoplasms, surgical and medical procedures, and so on. This presentation is a series of cases, by no means exhaustive, of the many fistulous tracts within the thoracic region, some of which with an unusual presentation. Tips and techniques of imaging acquisition are presented, in order to help better depicting these conditions.

CHEE-88 Bronchial Morphology Changes after Lobectomy - Examination by Inspiratory and Expiratory

Imaging with Ultra-High-Resolution CT

Participants
Hiroshi Moriya, MD, Fukushima, Japan (*Presenter*) Advisor, California Capital Equity, LLC;Research Grant, Canon Medical Systems Corporation

TEACHING POINTS

Advances in CT technology and computer processing technology have made it easier to perform precise morphological disassembly and automatic extraction and volume measurement of anatomical structures. In the diagnosis after lobectomy, morphological changes such as thoracic deformity, pleural thickening, organizing pleural effusion, lung parenchyma, bronchi, and pulmonary arteries and veins can be analyzed. In particular, ultra-high-resolution CT (UHRCT) with improved spatial resolution can perform morphological measurement more precisely than conventional CT, so in addition to changes in the anatomical position of each lobe and the volume of the remaining lobe before and after excision.

TABLE OF CONTENTS/OUTLINE

Equipment and method: UHRCT (Aquilion Precision, SHR mode), inspiratory / expiratory imaging. Workstation (Ziostation 1K).Results: It was possible to calculate the spatial position of the residual lobe and the ventilation volume for each lobe. By automatic extraction of the bronchial tree, it was possible to depict 3-dimensional expansion and flexion.Bronchial flexion case: Right upper lobectomy. There is an air trapping in the middle lobe. Decreased ventilation of the middle lobe located at the apex of the lung, and flexion and stenosis of the bronchus at the expiratory phase were confirmed.Adhesion case: Partial resection of the right upper lobe. Extensive adhesions due to pleural dissemination. Ventilation of the middle lobe is restricted. The bronchus was confirmed to be patency.Summary: UHRCT is excellent for bronchial morphological analysis. Inspiratory and expiratory CT can be used to analyze changes in bronchial morphology, movement and rotation of the lobes.

CHEE-89 Cardiovascular Devices on Chest Radiographs

Participants
Taila Moura Fe, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purposes of this exhibit are: Examine the most common cardiovascular devices seen on chest radiographs. Describe each cardiovascular device, including its proper location, components, types, and major complications. Illustrate those cardiovascular devices, using both usual and unusual cases from our chest radiology group.

TABLE OF CONTENTS/OUTLINE

This exhibit will go over various cardiovascular devices that can be seen on a chest x-ray. The anticipated correct position, as well as the major complications associated with those devices, will be detailed and illustrated. Cardiac devices: - Pacemaker.- Ventricular assist device.-Occlusion devices.- Mitraclip.- Valve prosthesis.- Loop event recorder.Vascular devices: - Central venous catheter. - Port-a-cath. - Swan-Ganz catheter. - Intra-aortic balloon pump. - Extracorporeal membrane oxygenation (ECMO). - Exogenous material embolized.

CHEE-9 When Chest MRI Plays the Big Role: a Guide for Useful Applications on Daily Practice

Participants
Murilo Peixoto, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Thoracic lesions can have a wide variety of differential diagnoses. - Chest magnetic resonance imaging (MRI) can be helpful for narrowing down the different etiologies when lesions detected in other imaging methods demonstrate nonspecific features. - Chest MRI is an increasingly available method that uses no ionizing radiation and has sufficient spatial resolution for a number of usages.

TABLE OF CONTENTS/OUTLINE

Chest MRI is a widely underappreciated imaging modality, despite its large applicability in the evaluation of abnormalities of cardiovascular origin, of the mediastinum, the pleural space, the brachial plexus, the chest wall and even the lung parenchyma. It is thought that a broader usage of chest MRI is discouraged by the motion artifacts generated by cardiac and respiratory motions and the low signal-to-noise ratio yielded by the large amount of air in the lungs. However, there is great value in utilizing the multiple resources offered by MRI, such as T1, T2, diffusion, in-phase and out-of-phase sequences in order to narrow down the differential diagnoses of lesions found through other imaging methods such as computerized tomography (CT). MRI quality and availability is continuously increasing over the years, so radiologists are facing these diagnostic dilemmas more and more frequently, and knowledge of the behavior of thoracic lesions on MRI is also increasingly important. In this work, we intend to demonstrate how the resources offered by chest MRI can be used to narrow down the differential diagnoses of different thoracic lesions.

CHEE-90 A Pictorial Review of Pleural Disease: Multimodality Imaging and Differential Diagnosis

Awards
Identified for RadioGraphics
Certificate of Merit

Participants
Aya Yamada, Kashihara, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) To review the spectrum of clinico-radiological features of pleural diseases2) To discuss the clinico-radiological key findings in the differential diagnosis

TABLE OF CONTENTS/OUTLINE

1) Clinical findings of pleural diseases2) Illustrated findings of the following pleural anatomy and diseasesl Normal variants (incomplete fissure, accessory fissure)l Asbestos pleural diseases (pleural plaque, pleural mesothelioma)l Inflammatory and infectious

diseases (fibrinous pleuritis, TB/actinomycotic empyema)l Pleural tumors (solitary fibrous tumors, neurogenic tumors, desmoid-type fibromatosis)l Lymphoproliferative diseases (pyothorax associated lymphoma, methotrexate-associated lymphoproliferative disorders)l Miscellaneous (thoracic endometriosis, talc pleurodesis)3) Clinico-radiological key findings in the differential diagnosis

CHEE-91 Pulmonary Tuberculosis: Beyond The Typical Patterns

Participants
Matheus Garcia Lago Machado, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Discuss the physiopathology, epidemiology, and clinical manifestations of pulmonary tuberculosis (PTB). Learn to recognize the atypical distribution of small nodules and uncommon patterns of PTB. Review and illustrate imaging findings. Discuss the main differential diagnosis.

TABLE OF CONTENTS/OUTLINE

Comprehensive review of pulmonary tuberculosis: pathogenesis; epidemiology; clinical manifestations. Atypical distribution of small nodules and uncommon patterns clusters of non-coalescent small nodules; coalescent small nodules - Galaxy sign; nodular reversed halo sign; subpleural nodules and fissural nodularity; halo sign; mass-like consolidation; pulmonary artery pseudoaneurysm - Rasmussen's aneurysm; tracheobronchial abnormalities; endogenous reactivation. Main differential diagnosis.

CHEE-92 The Nerve of Some Chest Diseases: Conditions affecting the Thorax and Nervous System

Awards
Certificate of Merit

Participants
Girish S. Shroff, MD, Houston, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

A variety of systemic diseases may affect both the nervous system and the thorax, while other diseases primarily affecting the thorax may manifest with neurological abnormalities. Correlations of signs, symptoms, and imaging findings in the neurological system with those in the thorax can help guide further diagnostic work-up and treatment. We will illustrate the imaging appearance of several systemic/neurological diseases with thoracic manifestations as well as discuss conditions in the thorax that can lead to neurologic symptoms.

TABLE OF CONTENTS/OUTLINE

Inflammatory: Sarcoidosis Dermatomyositis/polymyositis IgG4 disease Infectious: COVID-19 Tuberculosis Invasive fungal infection Syphilis Malignancy: Myasthenia gravis and thymic abnormalities Meningioma with intrathoracic metastases Paraganglioma Vascular: Vasculitis (Giant Cell Arteritis and Takayasu Arteritis) Congenital: Tuberous sclerosis Hereditary hemorrhagic telangiectasia Neurofibromatosis type 1

CHEE-93 Something is Not Right in the Chest! Postoperative Thoracic Surgery Complications That Cannot be Overlooked in a CT Scan - A Pictorial Essay

Participants
Yuri Neves, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1-Discuss the role of radiology in postoperative thoracic evaluation. 2-Review normal postoperative findings of most common thoracic surgeries, such as lung ressections: segmentectomy, lobectomy, and pneumonectomy. 3-Recognize the imaging findings related to postoperative complications and what is important to report. 4-Highlight the radiologist role in decision-making within a multidisciplinary team when assessing thoracic surgery early and late outcomes.

TABLE OF CONTENTS/OUTLINE

1-Introduction: basic concepts on thoracic surgery (most common techniques and clinical scenarios, purpose / goals, highlights of operative technique). 2-CT protocols available and importance of x-ray analysis.3 - Normal postoperative findings (acute and chronic): Surgical threads; Band atelectasis and fibrotic streaks; Mediastinal and diaphragm shift; Compensatory remanescent lung hyperinflation; Pneumothorax (small); Pleural effusion (small or non-loculated).4-Postoperative complications and its findings: Empyema; Bronchopleural fistula; Re-expansion pulmonary edema; Airway and / or vascular stenosis or compressions; Kinking of bronchial branch; Post bronchoplasty bronchial stenosis (telescoping); Pulmonary torsion; Postpneumonectomy syndrome; Inadvertent pulmonary vein clamping; Hilar hematoma; Pulmonary hernia.

CHEE-94 Beyond 5Ts: Pearls and Pitfalls in Diagnosis of Anterior Mediastinal Masses

Participants
Tetsuro Araki, MD, PhD, Philadelphia, PA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To understand appropriate image modalities for anterior mediastinal masses (AMM). 2. To understand common differential diagnosis of AMM. 3. To understand key image finding in differential diagnoses of AMM.

TABLE OF CONTENTS/OUTLINE

1. Appropriate selection of image modalities for AMM a. Role of chest radiograph, CT, and MRI b. Additional imaging options (Dual-energy CT, PET/CT, SPECT) 2. Anatomy of mediastinum a. Mediastinal compartment suggested by Felson b. Cross sectional mediastinal compartment suggested by ITMIG c. Common lesions in each compartment 3. Review of 5Ts a. Thymic epithelial tumors: Top of differential of AMM? b. Thyroid tumor: Is MRI helpful? c. Teratoma: Macroscopic fat, when it's malignant? d. Terrible lymphoma: Why terrible? e. Thoracic aorta: not neoplastic, though f. Are 5Ts common as AMM? 4. Beyond 5Ts: More practical DD of AMM than 5Ts a. Lymph nodes b. Benign mediastinal lesions (Thymic cyst/pericardial cyst) • Unilocular vs multilocular thymic

cyst • Morgagni hernia c. Normal/hyperplastic thymus • Normal morphology of thymus • What is "normal" thymus for age and sex • True vs lymphoid hyperplasia d. Ectopic thyroid lesion 5. Key image features useful in differential a. CT density and MRI signal density on T1 and T2WI b. Solid vs cystic c. Microscopic and macroscopic fat d. Detection of calcification e. Diffusion weighted images/ADC map f. FDG uptake on PET/CT g. Iodine and fat quantification on DE-CT 6. Summary

CHEE-95 "Pop Under Pressure" - Common and Uncommon Imaging Findings in Barotrauma

Participants
Caleb Carroll, BS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Pulmonary barotrauma is typically diagnosed on imaging and can be associated with increased mortality therefore it is important to recognize and promptly manage barotrauma. Critical to diagnosis is a high suspicion especially in those at high risk.2. In addition to common imaging findings (pneumomediastinum, pneumothorax, pneumoperitoneum, and subcutaneous emphysema), few uncommon findings (pneumopericardium, broncho-pleural fistula, tension lung cyst, subpleural air cyst and air embolism) may be present.

TABLE OF CONTENTS/OUTLINE

1. Discuss definition, possible mechanisms and etiologies associated with pulmonary barotrauma.2. Epidemiology of barotrauma in different clinical scenarios.3. Illustrative cases showing common and uncommon manifestations of barotrauma.4. Briefly discuss clinical features, the prevention, diagnostic evaluation, and management of barotrauma.

CHEE-96 The Many Faces of Tracheal Pathology - CT Image-based Quiz and Review of Normal Variants and Main Tracheobronchial Diseases

Participants
Carlota Garcia de Andoin Sojo, MD, Bilbao, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

CT is the best non-invasive imaging modality to evaluate the trachea and its potential diseases. Most tracheal diseases cause stenosis and have different causes and treatments. The knowledge of their specific features in CT helps to approach the diagnosis.

TABLE OF CONTENTS/OUTLINE

Objectives To review tracheal diseases and their characteristic features on CT. To describe normal variants of the tracheobronchial tree.Findings: A CT image-based quiz will lead the review of:Normal Variants: The knowledge of the non-pathological variants of the tracheobronchial tree will avoid mistakes. The most frequent anatomical variants are tracheal bronchus and accessory cardiac bronchus.Tracheal pathology: Tracheal diseases are congenital or acquired and can be diffuse or focal. Most of them cause tracheal stenosis in asymptomatic patients. These pathologies can have iatrogenic, neoplastic, congenital origins or be related to systemic diseases. Neoplastic causes can be benign or malignant and include hamartomas, papillomas, lipomas, leiomyomas, epidermoid carcinomas, adenoid cystic carcinomas or metastases. Other origins are sabre-sheath trachea, tracheobronchomalacia, tracheobronchial amyloidosis, sarcoidosis, Wegener granulomatosis, relapsing polychondritis, tracheobronchopathia osteochondroplastica and inflammatory bowel disease with tracheobronchial involvement. The Mounier-Kuhn syndrome is a rare entity that causes tracheobronchomegalia.ConclusionSeveral tracheal diseases show slight symptoms and subtle CT findings. The knowledge of these entities enables radiologists to reduce the differential diagnosis and give information to plan future bronchoscopies and treatments.

CHEE-97 That Escalated Quickly: Etiology, Pathophysiology, and Imaging Findings of Rapidly Progressive Interstitial Lung Disease

Participants
Andrew Simmerman, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. The lungs' response to acute injury follows a predictable course even across disparate etiologies. Radiologists should recognize the typical imaging manifestations of RP-ILD along with their associated disorders.2. Acute complications of RP-ILD include pneumomediastinum and pneumothorax.3. RP-ILD may resolve or evolve into other chronic ILD patterns.

TABLE OF CONTENTS/OUTLINE

I. Overview of acute lung injury and healing process a. Acute/subacute i. Histology of diffuse alveolar damage (DAD) and organizing pneumonia (OP) ii. HRCT appearance of DAD and OP b. Chronic i. Resolution or fibrosisII. Defining RP-ILD a. Timeline b. Severity c. Alternative names in the literatureIII. Etiologies of RP-ILD, with example cases a. Connective tissue disease i. Various types: myositis, rheumatoid arthritis, scleroderma, lupus ii. Anti-melanoma differentiation-associated gene 5 dermatomyositis (high association with RP-ILD) b. Viral infection i. COVID-19/SARS/MERS ii. Influenza c. Acute Interstitial Pneumonia d. Acute Exacerbation of ILD e. Treatment-related pneumonitis i. Medications ii. Chemotherapy/immunotherapy iii. RadiationIV. Clinical significance of RP-ILD a. Treatment b. Prognosis: acute and chronic phases c. Follow-up

CHEE-98 Pulmonary Actinomycosis: CT Findings and Differential Diagnosis

Participants
Yoshie Kunihiro, MD, Ube, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

Pulmonary actinomycosis is a chronic suppurative infection caused by Actinomyces species and the infection occurs typically due to aspiration of endogenous organisms. There are a variety of CT findings of pulmonary actinomycosis, however, there are some key points for differential diagnosis. The purpose of this exhibit is: 1. To explain the clinical characteristics and the common CT findings of pulmonary actinomycosis. 2. To review the CT images of pulmonary actinomycosis with uncommon findings such as bronchiectatic form and endobronchial calcified nodule. 3. To discuss the differential diagnosis of pulmonary actinomycosis, including pulmonary tuberculosis, fungal infection, lung cancer and granulomatosis with polyangiitis.

TABLE OF CONTENTS/OUTLINE

(1) Clinical characteristics of pulmonary actinomycosis (2) CT findings of pulmonary actinomycosis (3) Sample cases (4) Differential diagnosis

CHEE-99 Thoracic Parasitic Disease: A Radiologic and Pathologic Review

Participants
Cecilia Davis-Hayes, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Parasitic diseases effect immunocompetent and immunocompromised patients worldwide. To create an accurate differential diagnosis for thoracic infections, radiologists must utilize both patient travel history and characteristic imaging findings. Understanding both imaging patterns and the geographic distribution of these diseases will help to narrow the differential and can impact clinical testing and management. Although some parasitic infections result in nonspecific imaging findings, familiarity with their imaging features as well as their epidemiological, clinical, and pathologic features may be helpful in to ensure the appropriate diagnosis and treatment.

TABLE OF CONTENTS/OUTLINE

1. Review endemic thoracic parasitic diseases A. Helminths i. Cestodes (tapeworm), e.g Echinococcus ii. Nematodes (roundworm), e.g Strongyloidiasis Ascariasis iii. Trematode (fluke), e.g. Schistosomiasis B. Protozoa i. Amebiasis ii. Trypanosomiasis (Chagas Disease)2. Epidemiology 3. Modes of transmission/ lifecycle 4. Geographic distribution 5. Clinical presentation 6. Imaging/ pathology findings

Postoperative Chest Imaging Findings: Pearls and Pitfalls

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Awards
Certificate of Merit

Participants
Sofía Ventura- Diaz, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

To have an understanding of the different surgical techniques, including invasive and minimally invasive proceduresTo review the different types of lung resection To know the indications of thoracic surgeryTo recognize normal expected findings To identify potential complications in chest radiograhy and CT in order to optimize patient care in the postoperative period

TABLE OF CONTENTS/OUTLINE

Surgical techniques: minimally invasive techniques (video-assisted thoracoscopic surgery and robotic- assisted thoracic surgery) and open thoracotomies (Posterolateral, Shaw-Paulson, Anterolateral, axillary thoracotomy, thoracoabdominal incision, bilateral anterior transternal thoracotomy...)Types of lung resection and indications: sublobar resection (including wedge resection and segmentectomy), lobectomy, neumonectomy (intrapleural, extrapleural, intrapericardial)Normal findings for each type of resection in Radiographs and Computed TomographyComplications:• Airway and lung complications: Atelectasis, Pneumonia, Pulmonary edema, Acute respiratory distress syndrome, Air leak/bronchopleural fistula, Post pneumonectomy syndrome, lobar torsion, lung herniation.• Mediastinal and cardiovascular complications: Mediastinal hematoma, Acute mediastinitis/mediastinal abscess, Pneumopericardium, Cardiac herniation, Stump thrombus, Pulmonar Pseudoaneurysm. • Pleural and esophageal complications: Empyema, Hemothorax, Chylothorax, Esophageal anastomotic leak and esophagopleural fistula.

CHEE-10

Hidden in Plain Sight: Applications of the Aorto-Esophageal Ligament

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Nanditha Guruvaiah, BSc, Staten Island, NY (*Presenter*) Nothing to Disclose

TEACHING POINTS

While it is not uncommon to see central mediastinal pathology on cross-sectional imaging, it is important to understand the pathway influencing the spread of disease at a radiological point of view. Mediastinal facial planes can be visualized in cross sectional imaging such as CT and MRI. However, MRI is more successful in identifying the mediastinal visceral fascia and the aorto-esophageal (AE) ligament; which courses from the anterior aspect of the aorta to the left lateral aspect of the esophagus. This recently discovered unknown anatomy aids us in understanding the possible pathway of spread of disease processes such as infection, air, fluid, and soft tissue (lipomas) in the mediastinum. CT and MRI could also be useful in determining the lymph node metastasis and tumor in growth in relation to the AE ligament. In addition, the aorto-esophageal ligament can be utilized in the preoperative planning of minimally invasive thoracic surgeries.

TABLE OF CONTENTS/OUTLINE

• Introduction to anatomy of Aorto-Esophageal Ligament• Classification of Mediastinal compartments on cross section imaging• Role of Imaging in identifying AE ligament - benefits and limitations• Application of AE ligament in imaging -Spread of disease (gas, fluid and soft tissue) in the mediastinum -Preoperative surgical planning-Oncology imaging, notably spread of lymph nodes• Case based learning • What Radiologists should know about AE ligament

CHEE-100

Interpreting the Unexpected: Diagnostic Imaging Findings in Mycobacterium Chimaera Infection

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Andrew Moore, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Mycobacterium chimaera (MC) is an indolent infection that is often misdiagnosed or underrecognized. Having a high clinical suspicion and knowing its various imaging manifestations help avoid delay in diagnosis and allow for earlier treatment 2. Slowly developing or enlarging peri-sternotomy fluid collections, soft-tissue thickening or both, without other clinical findings to suggest acute infection may be seen with mycobacterium chimaera infection 3. PET/CT is a useful adjunct to suggest indolent infection in patients with unremarkable CT scans and in those with a high clinical suspicion of infection

TABLE OF CONTENTS/OUTLINE

1. Background/Epidemiology a. MC is a nontuberculous mycobacterium found in environment b. Disease manifestations include disseminated, pulmonary and surgical site c. Water used in Heater-Cooler Devices (HCD) became contaminated by MC which is then aerosolized by HCD fans during cardiothoracic surgery d. Surgical site or disseminated disease occurs after cardiothoracic surgery where patient, implanted material or both become infected with aerosolized MC 2. Clinical Course of MC Infection 3. CT PET/CT Findings a. Sternotomy site b. Blurred vascular wall c. Insidious development of fluid collections and soft tissue thickening/tracts d. Persistent fluid collections despite treatment enhancement characteristics e. Disseminated disease 4. Conclusion

Pulmonary Fungal Disease Patterns in CT: Recognizing and Differentiating

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Isabela Oliveira, MD, Campinas, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Recognize the different radiologic patterns of fungal lung infections. Be familiar with the main fungal entities involved in certain radiologic patterns. Know the main differential diagnoses for the mentioned patterns. Differentiate between the entities involved in both immunocompetent and immunocompromised hosts.

TABLE OF CONTENTS/OUTLINE

1. Introduction. 2. Systematic approach - imaging patterns of thoracic fungal diseases: a. Ground glass opacities; b. Nodules; c. The halo and reversed halo signs; d. Miliary pattern; e. Mediastinal involvement; f. Airway disease; g. Cavitations. 3. Pattern-based differential diagnosis: Ground glass due to viral infection; Nodules related to lung metastasis; The halo and reversed halo sign related to organizing pneumonia; Miliary pattern related to neoplasia; Mediastinal involvement related to neoplasia; Airway disease related to viral respiratory tract infection; Cavitations related to vasculitis. 4. Major fungal pathogens according to imaging patterns and immunological status (immunocompetent vs. immunocompromised hosts).5. Summary

Emergency and Critical Care Chest Radiography: Pitfalls and Pearls with CT Correlation

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Seyed Mohammad Seyedsaadat, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Prompt diagnosis of many emergent conditions with chest radiography requires appreciation of subtle or easily misinterpreted radiographic findings; a systematic search pattern is essential for prompt detection. 2. Awareness of direct and indirect findings of pleural and parenchymal emergencies such as pneumothorax, hemothorax, bronchopleural fistula, empyema, laceration, and abscess can prevent treatment delays. 3. Early detection of abnormal mediastinal lines, stripes, and interfaces can be clues to life-threatening pathology such as aortic dissection, mediastinitis, and mediastinal hemorrhage. 4. Diaphragmatic injuries, fractures, and sternal dehiscence are frequently missed emergent radiographic findings, requiring a high level of suspicion and knowledge of common patterns of injury. 5. Attention to the position and the courses of the lines and tubes in their entirety on the chest radiograph can help to detect extrathoracic device misplacement or related complications.

TABLE OF CONTENTS/OUTLINE

Pitfalls and pearls of chest imaging in the emergency and critical care unit with CXR/CT correlation.Pleura (PTx on supine CXR, bronchopleural fistula, empyema)Lung Parenchyma (Cardiogenic vs noncardiogenic pulmonary edema, lung abscess)Heart and vessels (Traumatic aortic injury, mediastinal hematoma, mediastinitis)Diaphragm and chest wall (Diaphragmatic rupture, sternal dehiscence, fracturesLines and tubes (Vascular, cardiac, pleural, airway devices) PDF Upload.

CHEE-103

Osseous Lesions in Oncologic Patients

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Alexander Sytov, (*Presenter*) Nothing to Disclose

TEACHING POINTS

The finding of an incidental focal osseous lesion in an oncologic patient poses a unique diagnostic challenge due to the heightened concern for metastasis. While the majority of osseous lesions are benign, many may closely resemble metastasis on imaging, prompting the need for clear methods of differentiation. By following an algorithm for categorizing osseous lesions, radiologists may confidently recommend follow-up imaging studies while avoiding unnecessary referrals.After reviewing this exhibit, the learner will be able to:- Employ a systematic method to characterize osseous lesions according to their density, composition, and cortical features- Identify imaging features that characterize osseous lesions as malignant or benign (such as: wide zone of transition, discontinuous cortex, soft tissue component replacing the medullary cavity, or extension beyond the margin of the bone)- Identify several frequently encountered benign osseous lesions that resemble metastasis- Establish an appropriate imaging algorithm to further characterize osseous lesions in these patients

TABLE OF CONTENTS/OUTLINE

- Introduction: imaging features of osseous lesions with special emphasis on features suggestive of malignancy- Pictorial review of several commonly encountered benign osseous lesions that resemble metastasis in oncologic patients- Imaging algorithm to further characterize osseous lesions

Read Like A Pro: Tips and Tricks to Interpret Like a Cardiothoracic Radiologist

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Awards
Certificate of Merit

Participants
Melissa Carroll, MD, Kansas City, KS (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Misconceptions in chest imaging may lead to excessive imaging, missed diagnoses, or inappropriate therapies, such as missed detection of malignancy manifesting as cyst associated lung cancer. Other misconceptions may lead to unnecessary follow up of nodules identified on incomplete thoracic exams.2. Knowledge of these misconceptions may lower costs, increase accuracy, and improve patient outcomes.

TABLE OF CONTENTS/OUTLINE

1. Background2. Malignancya. Lung cancer manifesting as cyst associated malignancy, persistent consolidation and subsolid noduleb. Incidental nodule on incomplete chest CTc. Intrapulmonary lymph node3. Diffuse Lung Diseasea. Reverse halo sign with pulmonary infarctb. DIPNECH as underdiagnosed diseasec. Patchy tree-in-bud opacities from infectious or aspiration bronchiolitis.d. Differentiating airspace enlargement with fibrosis from honeycombing.e. Dendriform pulmonary ossification due to pulmonary fibrosis or aspiration4. Mediastinuma. Pericardial recesses misinterpreted as lymphadenopathyb. Distinguishing normal thymus from mass5. Vasculara. Flow-related artifacts mimicking pulmonary embolism or dissectionb. Diffuse tree-in-bud opacities with excipient lung disease.c. Beaded vasculature with endovascular metastases6. Pleura/Chest Walla. Extrapleural fat deposition mimicking cardiomegaly or pleural effusionb. Elastofibroma mimicking chest wall mass7. Conclusion

Unraveling the maze - Patterns of lung cancer lymphatic dissemination

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Marcus Vinicius Silva Ferreira, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

This exhibition aims to review: • Anatomy of the lymphatic drainage of the lungs and mediastinal node stations. • Multimodality imaging staging of lung cancer, with focus on lymph node (LN) status and its importance to the appropriate lung cancer management. • Indications and impact of different types of lymphadenectomy: selective versus systematic node dissection. • A practical approach to lobe-specific nodal spread of lung cancer with imaging correlations.

TABLE OF CONTENTS/OUTLINE

1. BACKGROUND 1.1. Lung cancer overview 2. 8TH LUNG CANCER STAGE CLASSIFICATION 3. LYMPH NODE EVALUATION 3.1. Invasive and non-invasive approach to mediastinal nodal evaluation 3.2. Imaging characteristics of suspicious nodes 4. LYMPHATIC ANATOMY 4.1. Lungs and bronchial tree 4.2. Mediastinal Lymph nodes stations 5. LOBE-SPECIFIC PATTERNS OF LYMPHATIC SPREAD 5.1. Right upper lobe 5.2. Right middle lobe 5.3. Right Lower Lobe 5.4. Left Upper Lobe / Lingula 5.5. Left Lower Lobe 6. IS IT FEASIBLE TO ADOPT A SELECTIVE APPROACH? EVIDENCE SO FAR 7. NOVEL IMAGING TECHNIQUES AND FUTURE DIRECTIONS 8. TAKE-HOME MESSAGES

Basics of Lung Cancer Related to Cysts and Enlarged Cystic Air-spaces: Survival Guide for General Radiologist

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Laima Tamkeviciute, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Lung cancer can manifest as lung cysts or enlarged airspaces. 2. This type of lung cancer represents significant number of missed diagnosis. 3. The main concerning features of lung cysts and enlarged cystic air-spaces include: wall thickening or nodules, adjacent ground glass changes, multilocular cysts, increase in size or change of internal structure overtime. 4. Knowledge of the various imaging presentations of lung cancer is essential for timely diagnosis and treatment thus preventing development of invasive disease.

TABLE OF CONTENTS/OUTLINE

I. Introduction: 1. Why do we have to raise awareness about lung cysts and enlarged cystic air-spaces? 2. What is the mechanism and pathogenesis of lung cysts and enlarged cystic air-spaces? II. Imaging findings 1. How lung cysts and enlarged cystic air-spaces should be described? 2. What are the concerning features of lung cysts and enlarged cystic air-spaces? 3. How malignant cysts and enlarged air-spaces can change overtime? III. Conclusion and take home message

Ultrasound Guided-Procedures in the Lung - What, When and How

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Ivan Vollmer, MD, Barcelona, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

-To describe the indications for interventional procedures in pulmonary pathology.-To review the interventional lung procedures that can be performed with ultrasound guidance.-To analyze the advantages and disadvantages of ultrasound guidance.-To describe how each procedure is carried out.

TABLE OF CONTENTS/OUTLINE

The different interventional lung procedures that can be performed with ultrasound guidance will be reviewed:-Lung biopsy-Pneumonia puncture.-Lung abscess drainage.-Intraoperative localization of lung nodules.The specific indications for each lung procedure as well as its advantages of using ultrasound guidance over other techniques such as CT will be covered.Moreover, the technique that should be used in each procedure and the pre and post procedure recommendations will also be addressed.

From Gemcitabine, through Checkpoint Inhibitors to CAR T Cell - Evolution of Managing Treatment Related Pneumonitis in Cancer: Beyond Diagnosis

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Awards
Certificate of Merit

Participants
Kaustav Bera, MD, Cleveland, OH (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review cancer drugs that are primarily responsible for causing pneumonitis as well as differentiating it from other treatment related findings 2. Discuss the CT imaging patterns of drug-induced pneumonitis 3. Discuss potential mimics of drug-induced pneumonitis patterns including cytokine release syndrome in CAR-T cell therapy4. Discuss the crucial role of the radiologist in monitoring/management of treatment-related pneumonitis with a focus on established guidelines5. Discuss use-cases of common anti-neoplastic agents causing pneumonitis - from Gemcitabine, through ICI to CAR-T cells

TABLE OF CONTENTS/OUTLINE

1. Discuss common anti-neoplastic agents that cause pneumonitis2. Enumerate prevalently reported imaging patterns of pneumonitis, along with their typical imaging findings3. Discuss other potential complications of anti-cancer therapy (Pleural effusions, Pneumonia, Worsening tumor burden, airway obstruction)4. Common mimics of drug-induced pneumonitis (atypical pneumonia, COVID-19, Cytokine release syndrome)5. Discuss presenting clinical symptoms and grading system for drug-induced pneumonitis (CTCAE and ASCO)6. Management guidelines for drug-induced pneumonitis with special focus on checkpoint inhibitors (ICI), targeted therapy, Antimetabolites (Gemcitabine) 7. How a Radiologist plays an important role in management8. Prognosis and clinical outcome of patients developing drug-induced pneumonitis9. Real-world cases showing management and clinical course of drug-induced pneumonitis in cancer therapies from Bleomycin, Gemcitabine to combination ICI and CAR-T cells

Added Diagnostic Value of Portable Dual-energy Chest X-ray in a Non-radiological Reviewing Environment

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Karim Karim, PhD, Waterloo, ON (*Presenter*) Officer, KA Imaging Inc

TEACHING POINTS

• Understand Dual-Energy Subtraction (DES) X-ray, the limitations of the old Dual-Exposure DES techniques, and how a Single Exposure portable detector can overcome these limitations. • Understand the clinical benefits enabled by portable Single Exposure Dual-Energy for small nodules identification, pneumonia, pneumothorax, and finding line and tube tips. • Learn about the added diagnostic value of dual-energy portable chest X-ray in a non-radiological reviewing environment for both regular and radiology trained clinicians.

TABLE OF CONTENTS/OUTLINE

This exhibit teaches the added diagnostic value of dual-energy X-rays (DEX) obtained using a novel portable multilayer detector in a reviewing environment simulating a non-radiological practice. A set of 28 AP images were obtained using a novel portable multi-layer DEX detector. A team of five (5) readers was recruited that included two fellowship-trained chest radiologists and the rest non-specialists. The team was provided with the conventional X-ray images first, and subsequently were unblinded to the corresponding DEX images. For both sets of images, the readers were asked to assess the presence of pulmonary nodules > 5 mm, pneumothorax, pneumonia (left and right lung), bone fractures, and tips of central and GI lines using a five point scale. Readers were also asked whether the additional DEX images (soft tissue, bone) impacted their confidence. Initial results show that DEX images, taken alongside CR, helped improve diagnostic confidence.

Imaging of Mechanical Circulatory Support Devices For Right Ventricular Failure

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Gregory Jew, MD, Rochester, NY (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review of options for acute mechanical right ventricular circulatory support including:The TandemHeart centrifugal flow pump (TandemLife, Pittsburgh, PA), the axial-flow Impella RP catheter (Abiomed Inc, Danvers, MA), the Protek Duo dual lumen cannula, and the veno-arterial extracorporeal membrane oxygenation (VA-ECMO).1a. Review of right ventricular bypass methods.1b. Review of methods of oxygenation.2. Review of options for durable mechanical right ventricular circulatory support including: The CentriMag pump (St. Jude, Minneapolis, MN) RA-to-PA cannulation as well as commercially available LVADs, including the Jarvik and HeartWare devices.3. Review of common complications of RVADs including access site complications, pulmonary and other complications such as cannula malposition, and abandoned cannula.

TABLE OF CONTENTS/OUTLINE

1. Background/Indications for RVADs/RV Bypass and Oxygenation Methods.2. Imaging for percutaneous acute and durable mechanical circulatory support systems: Direct and indirect RV bypass systems: Protek Duo, VA-ECMO, Impella RP.Durable mechanical circulatory support systems: Jarvik, Centrimag.3. Access site complications of RVADs: access site hematoma, access vessel thrombosis, access site infection.4. Pulmonary complications of RVADs: pulmonary edema, organizing pneumonia, ARDS, septic emboli.5. Other complications of RVADs such as a malpositioned cannula, abandoned cannula, distal hemorrhage.

Abnormal Gas on Chest X-Ray: A Primer with CT Correlation

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Awards
Identified for RadioGraphics

Participants
Sameer Singhal, MD, Boston, MA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Gas collections in the lung tend to be spherical, while gas collections in the pleura tend to be longer in one dimension.2. Pneumopericardium appears as "clean" gas that is bounded by the superior pericardial recess, while pneumomediastinum is "dirty" gas that can track superiorly into the neck.3. It is critically important to scan the upper abdomen for incidental abnormal gas, including pneumatosis and pneumoperitoneum.

TABLE OF CONTENTS/OUTLINE

1. Abnormal air in the lungsa. Bullab. Cavitary consolidation2. Abnormal air in the pleuraa. Pneumothorax, including deep sulcusb. Hydropneumothorax - distinguish from intraparenchymal gas3. Abnormal air in the mediastinuma. Pneumopericardiumb. Pneumomediastinumc. Signs: ring-around-the-artery, continuous diaphragmd. Herniae. Post-surgical4. Abnormal air in the abdomena. Pneumoperitoneumb. Pneumobiliac. Portal venous gas and pneumatosis

Pulmonary Manifestations of IgG4 Related Disease

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Awards
Certificate of Merit

Participants
Santiago Restrepo, MD, San Antonio, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

IgG4 is a systemic fibroinflammatory disease characterized by dense infiltration of IgG4 positive plasma cells in the affected tissues with or without elevated plasma levels of IgG4.The inflammatory infiltration can lead to the development of fibrotic tumefactive lesions that may affect any tissue often mimicking a neoplastic process.Thoracic involvement may affect the lung parenchyma, airways, the interstitium, pleura and the mediastinum.Most common manifestation include pulmonary nodules, interstitial lung disease, peribronchovascular infiltration, lymphadenopathy and fibrosing mediastinitis.

TABLE OF CONTENTS/OUTLINE

Definition, Pathophysiology, Histopathology, Associated or related conditions, Common clinical phenotypes, Pulmonary disease, Fibrosing mediastinitis, Cardiovascular involvement

Interstitial Lung Disease in Rheumatoid Arthritis

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Elisa Antolinos Macho, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

- To know, identifiy and become familiar with the typical (and not so typical) radiological patterns of RA in lung involvement.- To suggest an early diagnosis in patients who have not shown any other RA manifestations and be able to offer a sooner treatment in these cases.

TABLE OF CONTENTS/OUTLINE

1. Introduction and generalities: rheumatoid arthritis is a multisystemic disease of uncertain etiology, with many factors involved (female sex, genetics, non genetic factors, biologic markers...).2. Extraarticular manifestations (EAM): although the typical manifestation is poliarthropaty, up to half of the patients who has RA, present extraarticular manifestations, more frequently in those who has positive analytic markers. Cardiovascular and respiratory EAM are the most important involvement in mobility and mortality terms.3. Pulmonary manifestations: An important group of the patients who undergoes this disease (60-80%) presents pulmonary involvement in the course of the disease, being interstitial involvement the second most important cause of mortality in these patients (after cardiovascular involvement). These manifestations can precede articular affectation up to 15% of the cases, and only in 10% of those, has significant clinical manifestations.4. Review of the typical patterns:- Usual Interstitial Pneumonia (UIP).- Non-Specific Interstitial Pneumonia (NSIP).- Organizing Pneumonia (OP).- Lymphocytic Interstitial Pneumonitis (LIP).5. Summary.

Four-dimensional Angiography of Pulmonary Arteriovenous Malformation: How Do We Detect the Hidden" Last Normal Branch for Endovascular Therapy?

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Shota Yamamoto, MD, PhD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Pulmonary arteriovenous malformations (PAVMs) are abnormal direct vascular communications between pulmonary arteries and veins which create high-flow right-to-left shunts. Even when asymptomatic, presence of PAVMs increases patients' risk of substantial morbidity and mortality mainly from the effects of paradoxical emboli. Potential complications include stroke, cerebral abscess, pulmonary hemorrhage and hypoxia. Transcatheter embolization eliminates the abnormal right-to-left-shunting. For more effective embolization, preventing recanalization after PAVMs embolization is the most important. Recently, the Japanese nationwide cohort study has revealed that embolization of the last normal branch was a key factor affected the prevention of recanalization. The last normal branch is generally identified on preoperative multi-detector CT, but the identification rate on the conventional angiography is low (39%). We performed dynamic imaging with Cone-beam CT utilizing two-step dilution and balloon catheter occlusion, which allows for precise assessment of vessel shape and number, the last normal branch and shunting points during the procedure. Its innovative four-dimensional angiography can detect the "hidden" normal last branch and smoothly execute the treatment straight away. This presentation reviews the updated imaging modalities regarding vascular structural understanding and planning the endovascular therapy of PAVMs.

TABLE OF CONTENTS/OUTLINE

i. Anatomical categories of PAVMs ii. What is the last normal branch of PAVM? Why is it important? iii. Imaging modalities for planning for embolization (4D angiography) iv. Ideal embolization based on anatomical structure

Pulmonary Parenchymal Imaging Using Ultra-high Resolution CT - Estimating Lung Vascularity Using Radiologic Lung Weight

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Hiroshi Moriya, MD, Fukushima, Japan (*Presenter*) Advisor, California Capital Equity, LLC;Research Grant, Canon Medical Systems Corporation

TEACHING POINTS

In UHRCT, the reliability of CT values of small structures is improved by reducing the partial volume effect due to the miniaturization of voxels. In particular, the contrast effect of small vessels with a diameter of 1 mm or less is enhanced. And the entire peripheral lung parenchyma can be displayed by deleting the cardiovascular image. This technique can display blood vessel distribution and contrast effect distribution (Moriya et al, Peripheral Pulmonary Artery Imaging Using Ultra-high Resolution CT - A New Method Of Evaluating Vascularity In The Lung Field CHEE-37 RSNA2021). On the other hand, the contrast effect and vascularity of the lung can be calculated using the radiologic lung density measurement, which is a method of converting the lung weight from the CT value. We present this technique and typical cases.

TABLE OF CONTENTS/OUTLINE

1. Method: UHRCT(SHR mode: 1024matrix 0.25mm), Workstation used: Ziostation2 (Segmentation of lung parenchyma, each lobe, lung + blood vessels of any thickness)2. Typical casesCase1(dynamic contrast CT before lung cancer surgery): Contrast-enhanced phase were well reflected in radiologic lung weight. Peripheral pulmonary vessel involvement was less than 10%. Case2(Pulmonary artery thromboembolism): Lung vascularity before and after treatment was calculated for each lobe. The therapeutic effect of the thrombus lesion was reflected in the radiologic lung weight.3. This method can be an easy pulmonary blood flow evaluation method.

Vascular Complications of Infections: Beyond COVID-19

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Babina Gosangi, MD, MPH, New Haven, MA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Vascular complications of infection can be divided into thromboembolic disorders and non-thromboembolic disorders.2. Thromboemboli from infections could be due to endothelial damage, hyperviscosity, embolization of vegetations containing infectious material or embolization of the culprit organism. Such conditions include COVID-19 infection, infectious endocarditis, Lemierre's syndrome and parasitic embolization into the pulmonary arteries (Echinococcus). 3. Vascular infections could also result from contiguous spread of infection from the adjacent organs causing inflammation of the vessels such as infectious aortitis associated with vertebral osteomyelitis, empyema or pneumonia. 4. Infections can damage the vessel wall and cause aneurysm such as Rasmussen's aneurysm or mycotic aneurysm.

TABLE OF CONTENTS/OUTLINE

• Introduction • Pulmonary embolism- COVID-19 infection• Septic infarcts- Infective endocarditis• Internal jugular vein thrombus- Lemierre’s syndrome • Infectious aortitis- Tuberculous aortitis, syphilitic aortitis, HIV aortitis, pyogenic aortitis• Mycotic aneurysm• Rasmussen’s aneurysm- Tuberculosis • Conclusion

Emboli or Else? Beware the Pitfalls in CTEPH Diagnosis - Chronic Thromboembolic Pulmonary Hypertension Lookalikes in CT Pulmonary Angiography

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Wagner Diniz de Paula, MD, PhD, Brasilia, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Recognize the signs of chronic pulmonary emboli and pulmonary hypertension on CT, review the pathophysiology of pulmonary hypertension in CTEPH, and learn clues to identify common and uncommon mimickers of CTEPH on CT.

TABLE OF CONTENTS/OUTLINE

Chronic thromboembolic pulmonary hypertension (CTEPH) results from pulmonary artery obstruction due to non-resolving pulmonary embolism (PE). Among PE survivors, CTEPH is estimated to occur in 1% to 5% of cases. It is a potentially treatable cause of pulmonary arterial hypertension (PAH) and, if left untreated, may progress to right heart failure and death.CT signs of PE, PAH and CTEPH will be reviewed and clues to differential diagnosis will be provided.Some conditions may simulate CTEPH on imaging, encompassing intravascular, extravascular, and vascular (parietal) causes. Intravascular mimickers of CTEPH include pulmonary arterial malignancies (primary intimal sarcoma, metastatic tumoral thrombi) and in situ pulmonary thrombosis due to long-standing PAH (e.g., in cyanogenic congenital heart disease and schistosomiasis). Extravascular causes comprise IgG4-related and granulomatous fibrosing mediastinitis. Vascular abnormalities include congenital anomalies such as proximal interruption of the pulmonary artery and acquired physiological disturbances related to pulmonary hypoxic vasoconstriction.

CT in Acute Pulmonary Embolism: Filling Defects and Beyond

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Awards
Certificate of Merit

Participants
Kaustav Bera, MD, Cleveland, OH (*Presenter*) Nothing to Disclose

TEACHING POINTS

1.Review the clinical, laboratory and diagnostic work up of patients suspected with acute pulmonary embolism (PE) 2. Discuss the typical and atypical CT appearance of acute PE and its mimics using an algorithmic approach 3. Discuss the important acute and emergent pathology beyond PE, that can mimic acute PE symptoms, visualized on a CT PE study 4. Briefly review additional incidental findings on a CT PE study 5.Illustrate newer advances in CT technology (Dual energy and multi-energy CT) and artificial intelligence methods for improved diagnostic assessment

TABLE OF CONTENTS/OUTLINE

1.When do you suspect an Acute PE - Risk factors, clinical history, symptoms, physical examination, laboratory findings 2.Clinical risk scores to determine whether imaging should be obtained in suspected Acute PE a. Wells score b. Pulmonary Embolism Rule-out criteria (PERC) c. Geneva score 3.Role of Bedside diagnostics in PE (Chest Radiograph, EKG, Ultrasound) and diagnostic signs.4.Discuss the algorithmic approach to obtain diagnostic imaging in PE 5.Imaging modalities including gold standard and alternatives to evaluate for PE 6. Imaging technique and challenges to obtain a diagnostic CT exam7. CT imaging in acute PE - primary and ancillary findings 8.Step wise approach to CT interpretation 9.Clinical examples showing conditions mimicking PE on CT imaging - Beyond filling defects a. Acute PE mimicking pathology (Acute aortic pathology, airway obstruction etc.) b. Other Urgent pathology (Pyelonephritis, abscess, arterial bleeds, DVT etc.) c. Incidental findings (Nodules, Nephrolithiasis, Cholelithiasis10.Newer imaging techniques for PE diagnosis 11. Future directions including role of Artificial Intelligence

Post CABG Chest Radiography: How to Make the Complicated Uncomplicated

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Justin Little, MD, Winston-Salem, NC (*Presenter*) Nothing to Disclose

TEACHING POINTS

Complications after coronary artery bypass grafting (CABG) are common and can range from simple atelectasis or pleural effusions to misplaced lines and other support apparatus issues, to more serious issues such as a pulmonary edema, mediastinal hematoma, or pneumothorax. Portable chest radiography is the mainstay of initial evaluation. It is fast with low radiation and gives the radiologist information that allows for quick action. Overlapping anatomic structures and support apparatus devices in combination with the limitations of portable radiography makes the diagnosis of CABG complications a radiologist's dreaded dilemma. Being able to quickly identify the most common complications is essential to maintaining efficiency and accuracy and preventing morbidity and mortality in the postoperative state.

TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Types of CABG (on-pump, off-pump, minimally invasive)3. Postoperative CABG complications -Immediate (< 24 hours) v. Subacute (1-7 days) v. Chronic (> 7 days)-Complication Categories:1. Lines and tubes2. Parenchymal 3. Mediastinal 4. Soft tissue/musculoskeletal4. Role of imaging: ICU plain chest radiography 5. How to report a postoperative CABG chest radiograph 6. Correlation with CT imaging for increased understanding 7. Algorithm for "next-step" recommendations for complications 8. Multidisciplinary approach and perspective of CT surgeons about the most clinically useful information from radiology

Thinking Beyond Bronchogenic Carcinoma: A Primer of Rare Pulmonary and Pleural Pathologies

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Ankush Jajodia, MD, MBBS, New Delhi, India (*Presenter*) Nothing to Disclose

TEACHING POINTS

LEARNING OBJECTIVES 1. To give an overview of some uncommon pulmonary and pleural pathologies. 2. To review the spectrum of imaging manifestations of uncommon entities in lung and pleura. 3. To highlight the importance of clinical history, immunohistochemistry and histopathology in arriving at the correct diagnosis.BACKGROUND: Due to their overlapping imaging appearance, imaging-based diagnosis of many rare neoplastic and non-neoplastic conditions affecting the lung and pleura can be challenging. Being familiar with some of the rare and unusual entities, along with relevant clinical history, can aid a radiologist in narrowing down the differential diagnosis. Thinking outside the box and looking for certain potential distinguishing features may help in making an early and accurate diagnosis. Key imaging features on CT and MRI for uncommon pulmonary and pleural pathologies will be reviewed in this educational exhibit. These include spindle cell sarcoma of the lung, sclerosing pulmonary hemangioma, sclerosing pneumocytoma, pulmonary paraganglioma, pleural hemangioma, malignant peripheral nerve sheath tumor of the pleura and pleural epithelioid hemangioendothelioma. CONCLUSION: A wide range of pulmonary and pleural conditions exhibit imaging features that are similar to more common pathologies such as bronchogenic carcinoma and pleural metastasis. Awareness of additional less common conditions, as well as an understanding of their pathologic background, will aid in accurate diagnosis.

Typical and Atypical Diseases involving the Pleura Radiologic-Pathologic Correlation

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Patricia De Groot, MD, Houston, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

Primary benign lesions of the pleura are much less common than malignant diseases of the pleura. Distinguishing benign from malignant pleural diseases affects prognosis, treatment and outcomes. CT features suggesting malignancy are circumferential pleural thickening; nodular pleural thickening; parietal pleural thickening >1 cm; mediastinal pleural involvement. Malignant primary mesothelioma (MPM) is the most common primary malignancy of the pleura. However, pleural metastases are much more common than primary pleural tumors. The most common primaries metastasizing to pleura include lung, breast and GI carcinomas, particularly adenocarcinomas, and lymphoma. Some pleural tumors may manifest focally or be diffuse. Age, sex and clinical history play a part in both radiologic and pathologic diagnosis. We review helpful imaging findings in the differential diagnosis of pleural diseases and illustrate radiologic-pathologic correlation of benign and malignant pleural lesions.

TABLE OF CONTENTS/OUTLINE

Benign vs Malignant: Benign includes solitary fibrous tumor, lipoma, schwannoma, endometriosis, pleuritis.Primary malignant includes MPM, solitary fibrous tumor, liposarcoma, PNET, synovial sarcoma, vascular sarcoma.Secondary malignant includes metastatic disease from lung cancer, lymphoma, plasmacytoma.Focal versus Diffuse: Typical focal includes metastatic disease, solitary fibrous tumor, schwannoma, thymoma, lipoma.Atypical focal includes PNET, synovial sarcoma, liposarcoma, meningioma, endometriosis.Typical diffuse includes metastatic disease, MPM, fibrothorax, thymoma.Atypical diffuse includes lymphoma, synovial sarcoma, epithelioid hemangioendothelioma.

Lung Ultrasound - Ugly Duckling into Swan: A Case-based Approach Demonstrating the Effectiveness of This Method in the Evaluation of Several Pediatric Lung and Pleural Pathologies

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Marcos Brotto, , Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

During the pandemic caused by the SARS-CoV-2, lung ultrasound (US) has become a promising diagnostic method at the bedside mostly due to its fundamental role in patients who develop infection with severe acute respiratory syndrome. Since then, many studies have proven its value, especially in the pediatric age group. The high demand caused by the viral pneumonia pandemic intensified its use and consequently expanded its applicability in several situations, including pathologies accidentally detected, showing the high accuracy of the method. In addition, lung US provides dynamic data, feature that only ultrasound allows when compared to other imaging methods.For many reasons the pediatric population benefits a great deal from the use of US as a first line method, including the assessment of thoracic and pleural pathologies. US may also provide useful information that eliminates the need for more invasive or expensive studies, especially in cases with mild clinical changes.

TABLE OF CONTENTS/OUTLINE

The intention of this presentation is to demonstrate, through a series of cases, the extensive scope of ultrasound in the evaluation of the pediatric thorax. Demonstrate the main ultrasound findings in several parenchymal and pleural pathologies such as pneumonia, abscess, pleural effusion, empyema, among others, proving that the US can be used in the serial evaluation of these conditions. Discuss US radiological findings and their correlations with chest radiograph and chest tomography, and how sonographers can reproduce them adequately in many cases.

Uncommon Non-thromboembolic Conditions Affecting the Pulmonary Vasculature - Beyond Thromboembolism

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Awards
Certificate of Merit

Participants
Helena Peris, MD, Sabadell, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

- To review uncommon non-thromboembolic entities that change the morphology or density of the pulmonary arteries on CT or PET/CT.- To describe imaging features of rare conditions that mimic pulmonary thromboembolism and/or bronchial pathology or cause pulmonary hypertension.

TABLE OF CONTENTS/OUTLINE

I. Background:Some uncommon conditions unrelated to thromboembolism can affect the pulmonary arteries, changing the imaging appearance of vessels in the proximal and/or distal pulmonary vasculature. These entities show key CT or PET-CT findings; their knowledge allows us to make the proper diagnosis.II. Content:We classify the entities into four categories:- Neoplastic (benign or malignant): pulmonary artery sarcoma, intravascular metastases, pulmonary tumor thrombotic microangiopathy, and intravascular leiomyomatosis.- Inflammatory: vasculitis (Takayasu arteritis and Behçet's disease), thrombosis in situ.- Iatrogenic: embolization of non-biologic material or gas during invasive procedures such as vertebroplasty, embolization, or colonoscopy and 18 FDG embolism in a PET/CT.- Miscellaneous: excipient lung disease and pulmonary artery sheath hematoma, as a complication of acute aortic dissection.III. Conclusions:Detailed observation of the proximal and distal pulmonary arteries can provide diagnostic clues to unusual conditions causing pulmonary hypertension, simulating pulmonary thromboembolism or bronchial pathology.

How Radiologists Can Help Surgeons on the Planning of a Lung Segmentectomy - Significant Pulmonary Veins Variations

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Vitor Bichuette, MD, Uberaba, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

To review pulmonary venous anatomy and the most common pattern of drainage. How a segmentectomy is performed, focusing on techniques to identify the intersegmental plane and the role of the pulmonary veins during the procedure. To explain anatomical variations of pulmonary veins, its significance in lung segmentectomies and how to identify them using computed tomography (CT). To present intraoperative complications related to pulmonary veins anomalies. Applications of CT with 3D reconstructions to reduce the risk of complications during the surgical procedure.

TABLE OF CONTENTS/OUTLINE

Introduction - General concepts of pulmonary venous anatomy Typical pattern of pulmonary venous drainage The use of CT to identify anatomical variations Lung segmentectomy's technique: • A step-by-step explanation of how to perform a lung segmentectomy. • Pitfalls and some anatomical variations to know during the surgical procedure. • The use of technologies to avoid intraoperative complications Case-Based Review: Sample cases explaining and demonstrating anatomical variations of the pulmonary veins and how CT can be used to identify and prevent intraoperative complications. This section will present illustrative cases of each: Separate veins draining the middle lobe Middle lobe vein emptying into the left atrium Direct drainage from segment 6R Vein draining the right superior lobe running posteriorly to the intermediate bronchus Lingular drainage emptying into the left inferior pulmonary vein Long common trunk of left pulmonary veins Future Directions: the role of CT with 3D reconstructions and 3D printing in lung segmentectomy planning Conclusion and key takeaways.

Fistulas of the Chest - An Unexpected Journey

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Kristie Yang, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

This education exhibit will: 1) Review the types of fistulas that can occur within the chest, 2) Identify clinical and radiologic features of fistulas within the chest, and 3) Review complications and management of such fistulas.

TABLE OF CONTENTS/OUTLINE

1. Introduction2. Etiologies of various fistulas within the chest3. Clinical history and symptoms4. Imaging features ofa. Bronchopleural fistulasb. Esophageal-pleural fistulasc. Gastropleural fistulasd. Pancreaticopleural fistulase. Vascular fistulas5. Complications and management of fistulas6. Summary and conclusion

Imaging of the Diaphragm: Anatomy, Variations, and Pathologic Conditions

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Furkan Ufuk, MD, Denizli, Turkey (*Presenter*) Nothing to Disclose

TEACHING POINTS

? To review the radiological anatomy and function of the diaphragm. ? To review the anatomic variations of the diaphragm. ? To review the multimodality imaging findings in primary or secondary pathologic conditions of the diaphragm

TABLE OF CONTENTS/OUTLINE

1. Anatomy and function of the diaphragm: The diaphragm is the most important respiratory muscle and is the muscle structure that separates the abdominal and thoracic cavities. 2. Anatomic Variations: Common anatomic variations of the diaphragm include diaphragmatic slip, bundles (nodular crura), the extension of diaphragmatic muscle fibres onto the m.quadratus lumborum, and prominent or hypertrophic median and lateral arcuate ligaments. 3. Pathologic conditions of the diaphragm: A) Primary pathological conditions of the diaphragm: That includes eventration, diaphragmatic herniation, diaphragmatic injuries, diaphragmatic tumors and tumor-like lesions. B) Secondary pathological conditions of the diaphragm: That includes diaphragmatic paralysis, diaphragmatic weakness due to neuromuscular disorders or prolonged mechanical ventilation, and tumors that invade the diaphragm.

A Primer for Diagnostic Imaging of Thymus - From Age Related Changes to Thymic Tumors and Everything in Between

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Awards
Certificate of Merit

Participants
Daisuke Yamada, MD, Tokyo, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

The thymus is an organ that changes due to a variety of reasons, from aging to pathologic causes. Distinguish between benign and neoplastic changes can be challenging. Further, most thymic tumors are asymptomatic when detected, and histopathological diagnosis is not straightforward, so imaging plays an extremely important role in the evaluation of thymic lesions. In this presentation, we introduce the imaging spectrum of the thymus, from benign findings such as normal maturation and benign lesions to neoplasms.

TABLE OF CONTENTS/OUTLINE

Presentation goals:1. To demonstrate age-specific changes in normal thymus2. To demonstrate thymic hyperplasia depending on a variety of causes3. To demonstrate multimodality imaging findings of various mediastinal tumors based on WHO classificationIllustrative imaging/cases include:&1;Age-related changes in the thymus gland&1;Thymic hyperplasia of a variety of causes&1;Thymomas, including atypical variants&1;Thymic carcinoma&1;Thymic neuroendocrine tumor&1;Germ cell tumor of the mediastinum&1;Lymphoma of the mediastinum&1;Histiocytic and dendritic cell neoplasm of the mediastinum&1;Myeloid sarcoma and extramedullary acute myeloid leukemia&1;Soft tissue tumor of the mediastinum&1;Ectopic tumor of the thymus

Pulmonary Vein Stump Thrombus after Lobectomy: Radiological Approach and What Radiologists Need to Know

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Koji Takumi, MD,PhD, Kagoshima, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

Recently, a frequent occurrence of pulmonary vein (PV) stump thrombus following surgical treatment for lung cancer, especially left upper lobectomy, has been reported. The incidence of PV stump thrombus after left upper lobectomy ranged from 3.4% to 17.9%. Moreover, there is increasing evidence that PV stump thrombus is associated with postoperative cerebral infarction. It is important for radiologists to understand the occurrence mechanism, complications, and radiological features of PV stump thrombus after lobectomy to avoid misdiagnosis and improper patient management. The purposes of this exhibit are as follows: 1. To illustrate the etiology and epidemiology of PV stump thrombus after lobectomy. 2. To discuss the mechanism of PV stump thrombus formation after lobectomy based on radiological findings. 3. To review the complications and radiological imaging features of clinical cases of PV stump thrombus after lobectomy

TABLE OF CONTENTS/OUTLINE

1. Overview of the PV stump thrombus after lobectomy. 2. Clinicopathological and imaging features of PV stump thrombus after lobectomy and the complications. 3. Radiological approach to PV stump thrombus after lobectomy using 4D flow MRI, cine MRI, and 3D CT images

Adult Primary Mediastinal Germ Cell Tumors: Update from the WHO Blue Book, 5th Edition (2021)

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Cody Thornburgh, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Primary mediastinal germ cell tumors (MGCT) are rare and generally affect young men. Imaging findings when used in conjunction with serological markers and patient demographics can often identify the specific type of MGCT and allows differentiation from other malignant and benign entities. Correlating surveillance imaging with serological markers allows for increased confidence in determining post-treatment response from tumor recurrence.

TABLE OF CONTENTS/OUTLINE

BackgroundDefinitions and classification of MGCTa. WHO classificationb. Cell-line based classificationImaging and histochemical features of MGCT sub-typesa. Classic imaging patterns at presentation including radiography, CT PET/CTb. Use of biomarkers in diagnosis and responseComparison to other mediastinal tumorsa. Lymphomab. Thymic epithelial neoplasmsc. Thymic Hyperplasia, Normal Thymic tissued. Metastatic Diseasee. Ectopic thyroidCommon pitfalls in diagnosis and determining recurrencea. Growing teratoma syndromeb. Misclassification of benign thymic tissuec. Identifying surgical scar tissue as residual tumor

Uncommon Causes of Interlobular Septal Thickening: How to Tell Them Apart?

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Achala Donuru, MD, Philadelphia, PA (*Presenter*) Nothing to Disclose

TEACHING POINTS

Interlobular septal thickening is a frequent finding in patients with diffuse lung disease. While pulmonary edema and lymphangitic spread of tumor are the commonly encountered causes of interlobular septal thickening, there are several less common causes. It is important to differentiate the various diagnoses by the contour, distribution of interlobular septal thickening, other pulmonary and extrapulmonary findings. This presentation gives clues to the chest radiologists and pulmonologists to arrive at the final diagnosis.

TABLE OF CONTENTS/OUTLINE

Various causes of interlobular septal thickening will be discussed including infections (COVID-19 pneumonia, viral pneumonia, Pneumocystis carinii pneumonia), interstitial pneumonias (lymphocytic Interstitial pneumonia, non-specific interstitial pneumonia, eosinophilic pneumonia, and idiopathic pulmonary fibrosis), depositional/infiltrative conditions (pulmonary alveolar proteinosis, pulmonary amyloidosis, Erdheim Chester disease, Niemann- Picks disease), malignancies (lymphoma, leukemia, Kaposi's sarcoma), congenital (congenital lymphangiectasia, diffuse pulmonary lymphangiomatosis, Yellow nail syndrome), iatrogenic (cytotoxic agents, radiation, lipoid pneumonia, silicone injection, EVALI/Vaping). Clues to differentiating the interlobular septal thickening based on type, distribution and other associated pulmonary and extrapulmonary findings will be reviewed.

Ex Vivo Lung Perfusion (EVLP) and the Radiologist's Role

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Zhao Zhang, DO, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. EVLP is an advanced preservation tool for lung transplantation and has expanded the donor pool by perfusing the lungs ex vivo allowing for longer preservation time.2. Radiologists may participate in the EVLP team to evaluate lung radiographs during EVLP.3. Diagnostic tests and treatments can be performed on the lungs to optimize the quality of the transplant organ.4. Radiologists may have an increasingly important role in the future of EVLP as more transplant centers adopt this strategy of lung preservation and distribution.

TABLE OF CONTENTS/OUTLINE

1. Overview, Background, Terminology2. Donor lung evaluation prior to EVLP3. Radiologist’s role in EVLP with case examples a. Radiographic donor screening for masses, infection, contusion. b. Discuss potential radiographic exclusion criteria. c. Assessment of radiographic changes of the post perfusion lungs; correlating with other diagnostic tests d. Correctly identify complications (atelectasis vs pulmonary edema) e. Discuss how EVLP may impact radiologist training4. Conclusion

A Practical Approach to Diaphragmatic Ultrasound: From Tricks to Tips

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Niels Vinicius Padua Carvalho, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The aim of this exhibition is to review1. Multimodality anatomic imaging of diaphragm, focusing on ultrasonography (US)2. Technical and clinical aspects of diaphragmatic US, including a proposal for structured reporting3. Tips and tricks to evaluate diaphragm function (mobility) and trophism (diaphragm thickness and thickness fraction)4. Pathologic conditions detected through diaphragmatic US

TABLE OF CONTENTS/OUTLINE

1. INTRODUCTIONa. Anatomy of diaphragm with multimodality imagingb. Anatomic versus functional imaging2. DIAPHRAGM US: TECHNICAL ASPECTSa. Probes, positioning and acoustic windowsb. US modalities: B and M modesc. Step-by-step approach (videos and images)3. DIAPHRAGM US: CLINICAL ASPECTS a. Diaphragm paralysisb. Critically ill patients on mechanical ventilationc. Other respiratory diseases, including asthma, chronic obstructive pulmonary disease, cystic fibrosis, interstitial lung disease and COVID-19d. Neuromuscular disorderse. Pediatric patients4. DIAPHRAGM US: A PRATICAL APPROACH a. Tricks and tips b. Multimodality imaging correlations c. Structured reporting5. DIAPHRAGM US IN THE REAL WORLD a. Challenges and limitations of diaphragm US 6. FUTURE DIRECTIONS AND TAKE HOME MESSAGES

Spectral CT in Cardiothoracic Imaging: Potential Applications that Radiologists Should Know

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Awards
Cum Laude

Participants
Flavio Zuccarino, MD, Barcelona, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

To analyze spectral CT feasibility in cardiac and thoracic pathologies. To underline its advantages and limitations compared to conventional CT. To define the clinical scenarios in which spectral CT findings are key in patient's management.

TABLE OF CONTENTS/OUTLINE

We make a short introduction about spectral CT imaging techniques. We focus on Spectral GSI CT imaging that we used in the different cases of this exhibit. We describe Spectral CT findings in different cardiac and thoracic pathologies organized as: Vascular diseasesAcute Pulmonary embolismChronic Pulmonary embolismHemoptysisCongenital vascular diseases (Sequestration, MAV, others)Lung diseasesConsolidations (pneumonia, atelectasis, infarcts, organizing processes)Interstitial diseases (fibrosis, emphysema, post-covid, mosaic perfusion)Neoplasm (Lung neoplasm, mediastinal neoplasm and masses)Cardiac DiseasesAcute Myocardial Infarct, Myocarditis, Myocardial masses OUTLINE Spectral CT imaging is a relatively new technique which presents several advantages and may give functional data about different cardiac and thoracic diseases. Radiologists should be familiar with this technique that can play a pivotal role in patient management.

Pitfalls in Thymic Imaging

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Awards
Identified for RadioGraphics
Certificate of Merit

Participants
Maximiliano Klug, MD, Ramat Gan, Israel (*Presenter*) Nothing to Disclose

TEACHING POINTS

1- Thymic hyperplasia, thymic cysts and thymoma may be difficult to distinguish by CT imaging alone. MRI of the mediastinum helps in the differential diagnosis. 2- Chemical shift sequences can differentiate thymic hyperplasia from thymoma. Correct use of the Chemical-Shift-Ratio identifies cases of hyperplasia when the characteristic signal drop is not identified. Small lesions may not be measurable due to inaccurate ROI placement and calculation. DWI in small lesions may be challenging as well. 3- Thymic cysts are typically hyperintense on T2-weighted images (T2WI). Pitfalls in identifying cyst on T2WI include intermediate T2WI signal of some cysts due to proteinaceous content and pseudo-nodules due to cardiac motion. Careful inspection of T1 weighted images with and without intravenous contrast may overcome these limitations. 4- Newer thymic MRI protocols including delayed phases are important to distinguish malignant from benign thymic lesions. Nevertheless, longer MRI studies may be prone to additional artifacts due to breathing. Breathing correction and subtraction imaging may help. 5- Thymoma pleural metastases can be missed leading to erroneous staging. Typical overlooked locations are adjacent to atelectatic lung or the crux of the diaphragm.

TABLE OF CONTENTS/OUTLINE

1- To describe thymic imaging techniques and radiologic appearance of thymic entities. 2- To discuss pitfalls in interpretation and possible imaging solutions. 3- To discuss blind-spots in thymoma pleural metastatic disease.

Unfamiliar Thoracic Anatomy: You Only Know What You Know

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Mohamed Elboraey, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Understanding of thoracic anatomy is essential for accurate interpretation of thoracic imaging.- Some unfamiliar/less frequently encountered thoracic anatomic and variant structures can simulate pathology.- Prospectively differentiating these structures from true pathology will prevent overcalling pathologic processes and unnecessary downstream investigations.

TABLE OF CONTENTS/OUTLINE

- Review anatomic structures at CXR, CT, and MRI:a. Vasculature (inferior pulmonary vein confluence with left atrium; L SVC, cardiophrenic veins, azygos vein).b. Hilar anatomy (inferior pulmonary ligament vs sublobar septum).c. Pulmonary fissures (accessory or incomplete fissures, fissural lymph nodes).d. Pericardium (pericardial recesses simulating lymphadenopathy or mediastinal masses; mediastinal vs epicardial fat).e. Lymph nodes (unnamed stations, left supraclavicular lymph node vs vein confluence, extrapleural space nodes).f. Chest wall (axillary/breast variants, muscular arches).- Emphasize how radiologists can differentiate these entities from true pathology by imaging evaluation with case examples.

Going with the Flow: Understanding Flow Artifacts

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Awards
Identified for RadioGraphics
Magna Cum Laude

Participants
Caroline Robb, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Flow artifacts are commonly encountered in contrast-enhanced CT imaging studies and may be mistaken for important pathologic conditions, such as embolism or dissection.• Radiologists must be familiar with the appearance of flow artifacts and comfortable distinguishing these artifacts from true pathologic conditions.• By understanding the mechanics of flow artifacts, radiologists can better recognize the clinical settings that predispose to flow artifacts, such as pneumonia or altered cardiac output.• Radiologists must know how to troubleshoot a suspected flow artifact, including how to adjust imaging protocols, when to recommend additional imaging studies, and which additional imaging studies are most helpful.• Flow artifacts can be used as a tool when the radiologist encounters vascular pathology, such as when evaluating aortic dissection flaps.

TABLE OF CONTENTS/OUTLINE

• Discuss the physical mechanics of vascular blood flow and how these mechanics can give rise to flow artifacts.• Review how to distinguish flow artifact from true pathologic conditions, such as pulmonary embolism or aortic dissection.• Examine the causes of flow artifacts and how these artifacts may present in various clinical settings, such as pneumonia or altered cardiac output.• Discuss how to troubleshoot suspected flow artifact, including the utility of delayed image acquisition and MRI.• Evaluate how flow artifacts can be used as a diagnostic tool, such as when assessing aortic dissection flaps.

Pericardial Recesses on Multidetector CT: Beyond Tips and Tricks Around the Heart

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Alex Carvalho Monteiro, (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibition is: • Review common and uncommon cases related to the pericardial sinuses and recesses. • Correlate important findings with the anatomy of pericardial recesses. • Discuss imaging findings according to the classification of pericardial recesses to enhance radiologists' skills. • Highlight their characteristics for radiologists with these conditions, avoiding unfavorable patient outcome. • Despite its characteristic density, describe the importance of distinguishing them from pathologic process, as mediastinal lymphadenopathy, and mediastinal cystic mass. • Correlate with the impact on the onco-image.

TABLE OF CONTENTS/OUTLINE

• Applied anatomy of the pericardial recesses: superior pericardial recess, right lung recess, left lung recess, postcaval recess, right pulmonary venous recess, superior pericardial recess, transverse sinus, left pulmonary venous recess and oblique sinus. • Evaluation of cases of prominent recesses with variable extensions, which may be possible confounding mechanisms. • Examples of pearl cases, diagnostic difficulties, and mimicry. • Summary and take-home messages.

Developments in Lung Cancer - What Radiologists Should Know About the WHO Classification Updates and Developments in Molecular Biology Research

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Awards
Identified for RadioGraphics
Cum Laude

Participants
Tomoaki Sasaki, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Lung cancer is the leading cause of cancer death worldwide, and determination of the histological type is essential for management. Surgical resection is performed in the early stage, and the surgical specimen allows radiological-pathological investigation. In 2021, the WHO classification of thoracic tumors was updated. These revisions deal with lung cancer prognosis and recognize several new entities. Unfortunately, about 70% of lung cancers are unresectable when diagnosed. Histological diagnosis must therefore rely on molecular analysis of a small biopsy tissue. Accurate knowledge regarding the molecular biology and immunohistopathology of lung cancers has thus become crucial. Radiological imaging plays an important role in the management of both early and advanced stage lung cancers. Therefore, radiologists must be familiar with all updates made to the WHO classification and molecular biology. The aim of this presentation is 1) to understand the radiological-pathological correlations in surgical specimens according to the new WHO classification, 2) to update our knowledge of lung cancer molecular biology, and 3) to acknowledge the limitations of small biopsy samples.

TABLE OF CONTENTS/OUTLINE

1. Introduction: Revision of the WHO classification2. Radiological-Pathological correlations from surgical specimens: Adenocarcinomas, Squamous cell carcinomas, Sarcomatoid carcinomas, Neuroendocrine carcinomas, Salivary gland-type tumors, etc3. Molecular biology: EGFR, ALK, ROS1, HER2, RET, BRAF V600F, KRAS, NTRK, METamp, NRG1 fusion, PD-L1, etc4. Limitations of small biopsy samples5. Conclusion

MRI of Anterior Mediastinal Masses: When to Image and Approach to Interpretation

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Tetsuro Araki, MD, PhD, Philadelphia, PA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To understand appropriate settings to recommend MRI for the evaluation of anterior mediastinal masses (AMM). 2. To understand the main roles of MRI in characterization of AMM. 3. To understand key features for the differential diagnoses of AMM.

TABLE OF CONTENTS/OUTLINE

1. Indication of MRI for AMM a. Incidentally found AMM on CT or chest radiograph b. Preoperative characterization and staging of AMM c. Screening for associated findings of AMM (lymph nodes or pleural lesions) d. MRI protocols for AMMe. Alternative imaging options to MRI. 2. Main roles of MRI in characterization of AMM a. Cystic vs solid b. Benign vs malignant (Normal/hyperplastic thymus vs neoplasm) c. Risk stratification or staging 3. Key MRI features for the differentiation of AMM a. T1 and T2 signal intensity b. Enhancement on post contrast images c. Demonstration of microscopic fat on out of phase T1-weighted images d. Diffusion weighted images/ADC map 4. Case review of AMM a. Normal/hyperplastic thymus (fat saturated or non-saturated thymic hyperplasia) b. Thymic cyst/bronchogenic cyst c. Ectopic thyroid tissue/retrosternal thyroid goiter d. Thymic epithelial tumors (thymoma, thymic carcinoma, neuroendocrine tumors) e. Primary mediastinal large B-cell lymphoma (PMBCL) f. Thymolipoma/lipoma g. Metastasis 5. Summary

Photon-Counting CT in Chest Applications

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Awards
Certificate of Merit

Participants
Fides Schwartz, MD, Durham, NC (*Presenter*) Nothing to Disclose

TEACHING POINTS

Photon-counting computed tomography (PCCT) is a new technology in CT imaging. PCCT uses energy-resolving detectors, instead of integrating the entire x-ray signal (energy integrating detectors: EID), enabling spectral acquisitions without the need of specialized acquisition strategies (e.g., dual-source). PCCT records photons in different energy bins, starting at a minimum energy threshold, so electronic noise can be avoided altogether. PCCT detectors used a two-step conversion (x-rays to electrical signal), rather than the 3-step conversion EID (x-rays to light to electrical signal), and inherently have higher spatial resolution as no septa (dead space to separate voxels) are needed. This project is geared toward introducing the emerging technology of PCCT to the RSNA chest imaging community. The details of this technology will be explained using diagrams and examples of standard EID patient scans in comparison to PCCT scans to demonstrate the performance of the new scanner system. These examples will include tumor monitoring, lung cancer screening and contrasted chest CT.

TABLE OF CONTENTS/OUTLINE

1. PCCT - Detectors a. Comparison of energy-integrating vs photon-counting detectors b. How is higher spatial resolution of PCCT achieved? 2. PCCT - Photon Binning a. How does photon binning work? b. How are energy thresholds defined? c. How do thresholds help with electronic noise? 3. PCCT - Spectral Data a. How is it always available? b. What can it be used for?

Wait, You Can See Motion on Chest Radiographs?! Dynamic Digital Radiography (DDR)

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Donald Benson JR, MD, PhD, Little Rock, AR (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Dynamic digital radiography (DDR) is a newer technology enabling rapid acquisition of multiple sequential radiographs with field of view and spatial resolution similar to that of conventional radiography.2. The simultaneous acquisition of detailed anatomical and functional imaging enables identification and evaluation of potential lung nodules, diaphragmatic motion, chest wall motion and restricted lung motion.3. As a digital acquisition DDR enables computerized mathematical evaluation of lung areas, lung volumes, graphing diaphragmatic motion and potential pulmonary function parameters.

TABLE OF CONTENTS/OUTLINE

After a brief introduction to this technology, the following potential applications will be discussed:1. Improved evaluation of potential lung nodules.2. Evaluation of diaphragm function.3. Follow up evaluation of post-surgical chest patients.4. Potential assessment of pulmonary ventilation and perfusion.5. Comprehensive pre-operative lung transplant evaluation.6. Correlation of measured lung areas and estimated volumes with pulmonary function testing.7. Evaluation of diffuse lung disease, e.g., post-COVID patients, and patients with interstitial lung disease, chronic obstructive pulmonary disease, cystic fibrosis, among others.

Lung Contrast-enhanced Ultrasound (CEUS): How I Do It

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Awards
Identified for RadioGraphics

Participants
Sergio Jimenez Serrano, Barcelona, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this educational exhibit is:- To explain how to correctly perform a lung contrast-enhanced ultrasound (CEUS).- To describe the basics of pulmonary vascularization, which are fundamental to interpreting a lung CEUS.- To review the clinical situations in which lung CEUS may be useful in diagnosing and treating pulmonary pathology.

TABLE OF CONTENTS/OUTLINE

Pulmonary CEUS has experienced a constantly growing in the study of pulmonary pathology. In this educational exhibit we will focus on:- Explaining the exploration technique.- Reviewing the physiopathology of the pulmonary vasculature.- Reviewing the characteristic findings in CEUS in non-tumor entities such as:• Pulmonary atelectasis• Round atelectasis• Pulmonary infarction• Pneumonia• Lung abscess• Radiation pneumonitis- Describing the main findings that can help us differentiate between aggressive and non-aggressive pulmonary neoplasms (with examples).- Radiological findings in CEUS that can help us in the diagnosis of lymphoma or lung metastases.- The importance of CEUS in interventional procedures:• Evaluation of tumor necrosis.• Choice of puncture point.• Differentiate obstructive atelectasis from tumor lesion.• Avoid vascular structures.• Prevent the biopsy of benign lung lesions.

Stick To Your Rib - A Radiologist Guide for Rib Cartilage Evaluation before Reconstruction Surgeries

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Felipe A. de Oliveira, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

? Provide an overview of the normal costal arch cartilage anatomy, and how its used as autogenous graft material for cartilage reconstruction surgeries;? To explain how to evaluate the costal arch cartilages (degree of calcification, and calcification morphological patterns) on X-Ray, US and CT scan; ?Application of Artificial Intelligence assisting CT scan evaluation; ?To exemplify how to report the normal and abnormal crucial findings to the surgeon; ? To introduce the related surgical cartilage reconstructive techniques.

TABLE OF CONTENTS/OUTLINE

1) Costal arch cartilage overview. A) Anatomy of costal arch cartilage. B) Costal arch cartilage and its adjacent structures anatomical relations. C) Histology of costal arch cartilage. 2) Costal arch cartilage employment as an autologous donor site for cartilage reconstructions surgeries - pros and cons. 3) Costal arch cartilage calcifications as a complicating factor for surgical outcomes. 4) Imaging evaluation, epidemiology and examples of costal arch cartilage calcifications. A) X-Ray. B) US. C) CT scan. 5) How to report. 6) Rib (costal arch) cartilage harvesting surgical technique. 7) Examples of cartilage reconstructive surgical techniques in which costal arch cartilage is employed. A) Rhinoplasty. B) Microtia otoplasty. C) General face reconstructive surgeries. 8) Take-home messages.

Guillem Dolz Alvarez De La Ballina, MD, Valldoreix, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

To review the normal anatomy of the extrapleural space (EPS).To describe the extrapleural fat sign (internal displacement of the adipose tissue layer), a clue to locating different conditions in the EPS.To show the many entities that can involve the EPS, emphasizing the role of CT.

TABLE OF CONTENTS/OUTLINE

Background:The EPS lies between the parietal pleura, the chest wall and diaphragm. It is a poorly understood anatomical compartment which can lead to diagnostic errors.Anatomical scheme.Extrapleural fat can be displaced, enlarged, or affected by:- Blood (extrapleural hematoma): from trauma, iatrogenic lesion of a thoracic vessel, aortic dissection or aneurysm rupture, spontaneous bleeding.- Air (extrapleural emphysema): barotrauma.- Fat: non-pathologic (obesity or estrogens), lipoma, chronic pleural conditions.- Edema/Infection: acute pleural exudates, empyema necessitatis.- Soft tissue: extramedullary hematopoiesis, neurogenic lesions, primary or metastatic pleural tumors, infiltration of lung tumor, chest-wall malignancies.- Calcium: chronic hematoma/empyema, asbestos related pleural disease.Conclusions:The extrapleural fat sign helps differentiate between pleural and extrapleural lesions. Conditions involving the EPS may require different treatment approaches than pleural or lung diseases.

Leukemia and the Thoracic Plethora- Perplexities, Patterns and Problem Solving

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Shubham Padashetty JR, MD, Mumbai, India (*Presenter*) Nothing to Disclose

TEACHING POINTS

Leukemia presents with multitude of disease related and various infective and noninfective presentations.Presentations include ground glass opacities, centrilobular nodules, interstitial septal thickening in various patterns. Mediastinal, pleural, nodal and bony involvement also need to be carefully looked for.Disease related manifestations include nodal, parenchymal, mediastinal and bony involvement, biopsy is necessitated in conditions when inflammatory and infective pathology is ruled out. Drugs and infection related injuries require both clinical and radiological approach based addressal with knowledge of specific pattern of presentations. For instance apical predominance with cystic changes are seen in PCP pneumonia, unsharp hazy ground glass changes with confluent centrilobular nodules seen in CMV pneumonia, tree-in-bud pattern in mycobacterial diseases. Non-contrast CT and HRCT thorax are a valuable tool in diagnosis, follow-up, serial correlation of presentations. They also aid in guiding image guided interventions when necessary. This educational exhibit aims to familiarize with various paradigms of presentations, pattern based understanding and clincobiochemical correlation, henceforth providing apt differentials. Clinical radiology plays a key role in reducing morbidity and mortality in hematolymphoid malignancies when timely approach and diagnosis helps early treatment.

TABLE OF CONTENTS/OUTLINE

1. Flow chart of pulmonary manifestations in leukemia 2. Disease related manifestations 3. Non infectious pulmonary complications 4. Infections and their patterns of involvement.

Breast Implants in Chest CT: What Can We See?

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Awards
Certificate of Merit

Participants
Vinicius Nobre, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is: To review the components of the most common breast implants and prostheses, as well the main pathological conditions involving them. To emphasize that chest computed tomography (CT), which is widely available and allows rapid image acquisition, can detect incidental findings involving breast implants. To discuss the pathophysiology of breast implants conditions and their imaging findings, especially on CT, correlating them with more specific studies for breast implant evaluation. To offer a didactic case-based review on the theme, proving teaching points and references, in order to allow radiologists to detect abnormalities involving breast implants in CT scans performed for different reasons.

TABLE OF CONTENTS/OUTLINE

Breast implants and their normal appearance in CT. Intracapsular breast implant rupture: Imaging findings, including signs such as the “keyhole”, “subcapsular", “linguine” and “droplet”, discontinuity of the elastomer, among others. Degrees of implant collapse: uncollapsed, minimal, partial and full collapse. Extracapsular breast implant rupture: Imaging findings, including extra capsular silicone and siliconomas. Diagnostic difficulties and mimics. Capsular contracture: Image findings. Breast implant rotation: Image findings. Other breast implants complications related to the theme. Summary and take-home messages.

Extracorporeal Membrane Oxygenation [ECMO]: What the hECMO Am I Looking At?

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Nina L. Terry, MD, JD, Hoover, AL (*Presenter*) Stockholder, Johnson & Johnson;Spouse, Stockholder, Johnson & Johnson;Stockholder, Kimberly-Clark Corporation;Spouse, Stockholder, Kimberly-Clark Corporation;Stockholder, Microsoft Corporation;Spouse, Stockholder, Microsoft Corporation;Spouse, Stockholder, Amge

TEACHING POINTS

1. For adults two major ECMO types function to bypass the lungs [veno-venous (VV)] or the heart and lungs [veno-arterial (VA)] with variable catheter types and positions for both. 2. ECMO catheters are imaged with radiographs, echocardiography and CT both incidentally and intentionally. 3. Radiologists should recognize appropriate configuration/positioning of the various types and be aware of potential complications for each. 4. Radiologists need to know the indications for contrast and the indications and contraindications for stopping ECMO or clamping the ECMO catheters to optimize image quality.

TABLE OF CONTENTS/OUTLINE

• Introduction o Overview of ECMO o Importance to the average radiologist • Normal catheter placement for ECMO o Venovenous ECMO § Single lumen vs. dual lumen catheters o Venoarterial ECMO § Peripheral vs. central catheterization § Comparing points of entry o Effect of cannula sizing on correct placement (especially emergency settings) • Comparing imaging modalities used to verify correct catheter placement o Echocardiography o Chest Radiograph [CXR] o Computed Tomography [CT] • Visualizing complications during/post catheter placement o Contrast CT or Non-contrast CT: Indications o Safety and technical issues in giving contrast to a patient on ECMO • Special cases to consider o ECMO during COVID-19 • Conclusion o Radiologists have an important role in diagnosis and patient safety with the growing use of ECMO technology

"Reduce Fat Fast": A Systematic Approach to Fat-containing Lesions in Adult Thoracic Imaging and Its Differential Diagnosis.

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Carlos Penaranda, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Approach the differential diagnosis of fat-containing lesions in the chest. 2. Recognize the fat-containing lesions, using radiologic features as Hounsfield Units (HU) measurement at computed tomography (CT), or the signal intensity characteristics of fat at magnetic resonance imaging (MR). 3. Correlate lesion location with the fat imaging characteristics to narrow the differential diagnosis.

TABLE OF CONTENTS/OUTLINE

1. Imaging characteristics of fat-containing lesions in the thorax employing ultrasound, computed tomography (CT) and magnetic resonance imaging (MR). 2. Schematic approach of various fat-containing lesions and their location in the chest. 3. Sample cases from our institution with their radiographic and epidemiological features.

Inhalational Injuries in Burn Patients:Is Chest Radiography Still Relevant?

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Jaime Fields, MD, Winston Salem, NC (*Presenter*) Nothing to Disclose

TEACHING POINTS

Pulmonary complications are a common cause of morbidity and mortality in burn patients. It is important that radiologists are familiar with these complications so that early and specific diagnosis is made on chest imaging. While admission radiographs are often normal or underestimates findings, within just a few days pulmonary complications can be severe. While CT is a useful tool, many burn patients do not undergo CT imaging of the chest. Thus it is important for radiologist to be familiar with the radiographic features of these complications and utilize timing after injury as a diagnostic tool.

TABLE OF CONTENTS/OUTLINE

• Pathophysiology of burns and radiographic correlation (what happens on alveolar level) • Timeline of pulmonary complications• Role of radiologist in utilizing this timeline when interpreting chest radiographs• Algorithm demonstrating management of inhalational injury• Findings suggestive of acute inhalational injury• With what frequency should chest radiographs be obtained?• Chest radiograph and CT correlation of varied imaging findings• ARDS as a complication of direct alveolar injury or secondary complications • Phases of ARDS• Delayed pulmonary complications• Long term complications: subglottic stenosis, bronchiectasis, bronchiolitis• Multidisciplinary approach • Role of imaging in follow up• Role of other imaging modalities not previously discussed• Bonus: Vaping associated lung injury chest radiograph and CT correlates

Distinguishing Fraternal Twins on Chest Radiograph: Primer for Residents

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Awards
Magna Cum Laude
Identified for RadioGraphics

Participants
Kaitlin Gibson, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Two distinct pathologies although similar in appearance on chest radiographs have nuanced differences (fraternal twins). Differentiating these may be challenging for residents.• Accurate differentiation is important as this impacts management strategies.• Case based review of radiographic “fraternal twins” with tips on differentiating two is presented.• Example: Large apical bulla is differentiated from pneumothorax by the convex margin of the bulla as compared to the parallel margin to chest wall in pneumothorax.• Length of air fluid levels is equal on frontal and lateral view in lung abscess and is unequal in empyema.• Diaphragmatic eventration has preserved sharp posterior costophrenic angle on lateral radiograph whereas flattened in paralysis, etc.

TABLE OF CONTENTS/OUTLINE

Case examples of fraternal twins with tips on differentiation1. Pneumothorax / large bulla2. Pneumothorax / pneumomediastinum3. Pneumomediastinum / pneumopericardium4. Lung abscess / empyema5. Diaphragmatic eventration / paralysis6. Hilar mass / enlarged pulmonary artery (Hilum convergence sign)7. Hilar mass / anterior/ posterior mediastinal mass (Hilum overlay sign)8. Anterior / posterior mediastinal mass (Cervicothoracic and thoracoabdominal signs)9. Lung mass / pleural/extra pleural mass10. Opaque hemithorax: atelectasis/ consolidation / pleural effusion11. Cardiomegaly / pericardial effusion12. Portal venous air / pneumobilia13. Basilar atelectasis / subpulmonic effusion

The Anomalies of Thoracic Vein in Adults

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Makiko Murota, MD, Kitagun, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To review the anomalies of the thoracic systemic veins and the pulmonary veins. 2. To describe characteristic imaging features on multiple modalities, including chest radiograph, CT, and MRI. 3. To discuss the importance of clinical implications and the pitfall.

TABLE OF CONTENTS/OUTLINE

1. Normal anatomy 2. Embryology 3. The anomalies of the thoracic systemic veins: persistent left superior vena cava (PLSVC), postaortic left innominate vein (PALIV), azygous/hemiazygous continuation of inferior vena cava, azygous lobe, and others 4. The anomalies of the pulmonary veins: left common pulmonary vein, separate middle lobe vein, aberrant vein (right top pulmonary vein), partial anomalous pulmonary venous return, scimitar syndrome, meandering pulmonary vein and others

Extracardiac Congenital Thoracic Vascular Anomalies - A General Radiologist's Guide

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Sanjana Kamath, FRCR, MBBS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1.Congenital thoracic vascular anomalies can present in adulthood.2.Assessment of thoracic vasculature in compartments can simplify complex vascular anatomy aiding understanding and communication of results.3.CT is well placed to assess all vascular compartments within the thorax and provide datasets for 3D reconstructions to further communicate findings and plan surgical intervention.

TABLE OF CONTENTS/OUTLINE

Systemic venous pathology (including left SVC, anomalous drainage to left atrium and azygous continuation of the IVC). Pulmonary arteries (absence or disconnection of branch pulmonary artery, pulmonary stenosis e.g. in Edwards syndrome, patent ductus arteriosus, aortopulmonary window and arteriovenous malformations). Pulmonary veins (partial and total anomalous return, sinus venosus ASD and scimitar syndrome). Aortic (truncus arteriosus and hemitruncus, congenitally corrected transposition of the great arteries, right arch with anomalous left subclavian artery, left arch with anomalous right subclavian artery, double arch, coarctation, interruption of the arch, pulmonary sequestration).

Beyond Aortopathies- Vascular Conditions Of The Thorax Associated With Genetic Conditions

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Riddhi Borse, MD, New Haven, MA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Introduction to the vascular structures of the thorax.2. Enlisting various vascular conditions of the thorax associated with genetic conditions and discussing commonly associated imaging findings affecting the various vessels of the thorax.3. Detailed case-based description of thoracic imaging findings associated with inherited vascular conditions, along with common differential diagnoses.4. Developing a Checklist and Understanding the salient features to be reported when encountering these inherited vascular conditions of the thorax.

TABLE OF CONTENTS/OUTLINE

1. Description of various vascular conditions with genetic predisposition and their associated common thoracic imaging findings.2. Brief discussion on Ehlers Danlos, Marfan’s, Turners syndromes and associated constellation of imaging findings with a focus on related vascular thoracic imaging findings, case examples and common differential diagnoses.3. Brief discussion on BMPR2 and Factor V Leiden Mutations, associated constellation of imaging findings with a focus on related vascular thoracic imaging findings, case examples and common differential diagnoses.4. Brief discussion on Cystic Fibrosis, Hereditary hemorrhagic Telangiectasia's and associated constellation of imaging findings with a focus on related vascular thoracic imaging findings, case examples and common differential diagnoses.5. Enlisting salient imaging features to be added in the report based on what the clinician needs to know for each of the above listed conditions.

Scimitar Syndrome - Taking a Sharper Look

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Melissa Carroll, MD, Kansas City, KS (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review the definition and variations of scimitar syndrome with a focus on imaging findings.2. Familiarize the reader with common and uncommon congenital anomalies associated with scimitar syndrome to improve radiology exam interpretation.3. Discuss clinical presentation and complications of scimitar syndrome.

TABLE OF CONTENTS/OUTLINE

1. Background2. Definition a. Scimitar syndrome (hypogenic lung or congenital venolobar syndrome) refers to partial anomalous venous drainage of the right lung to the IVC with hypoplasia of the ipsilateral lung, systemic artery supply, and dextroposition of the heart b. Scimitar sign refers to the curved, tubular opacity adjacent to the right heart border on chest radiograph representing the anomalous vein and is considered pathognomonic for scimitar syndrome. Scimitar refers to a Turkish sword with a curved blade3. Types a. Infantile type presents in infancy and associated with congenital heart disease b. Childhood/adult type, which can be asymptomatic or result in recurrent infection.4. Imaging Findings a. Chest radiograph as a screening tool b. Contrast enhanced CT to define anatomy and identify other anomalies c. Phase contrast MRI to quantify shunt d. Pertinent radiology report findings for surgical planning5. Associated congenital anomalies a. Lungs and airways b. Vascular c. Cardiac6. Clinical considerations and complications a. Discuss range of clinical manifestations and presentation including congestive heart failure in infants and recurrent infection in adults b. Cardiovascular complications c. Pulmonary complications d. Post surgical imaging7. Conclusion

Following the Contrast: How to Recognize Thoracic Flow Artifacts and Vascular Shunts on Thoracic Multidetector Computed Tomography

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Elisenda Foraster, MD, Sabadell, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

To learn the causes of thoracic flow artifacts and provide clues to distinguish them from true filling defects.To be aware of persistent and anomalous cardiac communications that are relevant in clinical practice and its typical imaging findings.

TABLE OF CONTENTS/OUTLINE

I. Background Thoracic flow artifacts as well vascular and cardiac shunts can be challenging for radiologists to diagnose. We propose a practical approach to recognize the main causes and CT features in both situations.II. ContentA) Thoracic flow artifacts ("smoke"): non-opacified blood in a contrast-filled chamber, indicative of incomplete opacification.1. Pulmonary artery (mimicking pulmonary embolism): bilateral smoke (heart failure, early/fast scanning, transient interruption of contrast) or unilateral smoke (focal lung abnormality, collateral vessel inflow).2. Aortic pseudo-dissection.3. Left atrial appendage pseudo-thrombus.B) Congenital or acquired shunt (aberrant pathway): Abnormal passage of contrast between cardiac chambers or between vascular structures and cardiac chambers, indicative of an abnormal communication.1. Congenital atrial septal defect, patent foramen ovale, ventricular septal defect.2. Acquired: collateral venous pathway from stenosis or occlusion of the superior vena cava. III. Conclusions Recognizing smoke can help prevent misdiagnosis of important diseases like pulmonary embolism or aortic dissection, and detection of contrast aberrant-paths provide a diagnosis clue to the presence of shunts or vascular stenosis.

CHEE-5

Vasculitides: Diagnostic Tips and Tricks through Thoracic Imaging

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Glenda Costa Feitosa, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Vasculitides are multi-systemic diseases that can lead to severe consequences if left untreated.There are several ways these disease processes can present on imaging. Thoracic imaging, for instance, has a lot to add when characterizing them, given the considerable importance of the great vessels of the mediastinum and the lung involvement commonly shown.Knowledge of typical findings that suggest a diagnosis of vasculitis is therefore a valuable asset for the radiologist and yields better outcomes.

TABLE OF CONTENTS/OUTLINE

Inflammatory diseases of the vessel walls can affect small, medium and large vessels in all segments of the body. These are often treatable diseases, bringing alleviation of the inflammatory activity and better overall outcomes. These diseases can be quite a challenge to diagnose, as they can present similarly to one another and have a nonspecific clinical course and laboratory features. The intention of this presentation is to demonstrate, through a series of cases, different vasculitides and diagnostic tips that helped suggesting these diagnoses through imaging, such as the vessels involved by parietal thickening and aneurysms, lung opacities and their temporal evolution, as well as some associations with patient characteristics and clinical features. Chest multidetector computerized tomography is the main method to be explored, an imaging modality that has a lot to offer in this task since the great mediastinal vessels and lungs are often involved.

CHEE-50

Mimickers of Chronic Thromboembolic Pulmonary Hypertension: A Pictorial Review

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Albert Domingo Senan, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

Highlight the role of imaging tests in chronic thromboembolic pulmonary hypertension (CTEPH) focused on the detection and characterization of those pathologies that can mimic this disease, because both therapeutic management and prognosis are substantially different.

TABLE OF CONTENTS/OUTLINE

CTEPH represents a special form of PH potentially curable by surgical treatment (thromboendarterectomy). Imaging tests play a fundamental role in this disease: they confirm the diagnosis, establish the location and extension of the lesions in order to plan the most appropriate treatment (surgery vs. angioplasty vs. medical treatment) and they detect other associated injuries that may condition the patient management. They also allow diagnosis of other pathologies that may have been erroneously labeled as CTEPH. For this reason, it is essential to know what the mimicking pathologies are and the radiological signs that allow them to be detected. The main pathologies that can mimic CTEPH are sarcomas of the pulmonary arteries, large vessel vasculitis (Takayasu's arteritis), fibrosing mediastinitis, in stu thrombosis, pulmonary intravascular hydatid disease, and congenital interruption of the pulmonary artery. These pathologies and the keys to their diagnosis are reviewed.

News Pathways in Thoracic Imaging: A Roadmap to Congenital Vascular Anomalies

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Alex Dias, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review relevant anatomy, embryogenesis, and pathophysiology of congenital thoracic vascular anomalies. 2. Correlate clinical findings and complaints in childhood and adult life with imaging findings of vascular anomalies, according to subgroups and classifications. 3. Summarize imaging protocols and post-processing techniques. 4. Highlight the role of invasive and non-invasive imaging techniques for anomalies of the great thoracic vessels. 5. Discuss the relevance of multidisciplinary team meetings and the role of radiologists in patient care with case reviews.

TABLE OF CONTENTS/OUTLINE

1. Applied anatomy and embryogenesis of pulmonary arteries, pulmonary veins, aortic arch, and superior vena cava. 2. Congenital variants and anomalies: 2.1. Pulmonary arteries. 2.2. Pulmonary veins (total and partial anomalous pulmonary venous return). 2.3. Aortic arch. 2.4. Superior vena cava.3. Sample cases and outcome review: 3.1. State-of-the-art imaging protocols and post-processing techniques. 3.2. Current and potential diagnostic methods, including invasive and non-invasive studies. 3.3. Follow-up, treatment, and prognosis. 4. Congenital vascular anomalies: practical approach and structure reporting. 5. Summary and take-home messages.

Venous Anatomic Variants In The Thorax

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Riddhi Borse, MD, New Haven, MA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1.To understand normal vascular anatomy of the thorax, common and uncommon anatomic vascular variants. 2. To classify venous variant anatomy in the thorax based on draining veins. 3.To identify salient imaging features of described anatomic variants in a case based method, common differential diagnoses, and important points to be reported based on their clinical presentations.

TABLE OF CONTENTS/OUTLINE

1. Description of normal vascular anatomic structures within the thorax, common and uncommon anatomic variants. 2. Classification of venous anatomic variant anatomy in the thorax based on draining veins as follows:• Azygous Vein- Absent Azygous, Azygous Continuation of Inferior Vena Cava, Azygous Fissure variant in right upper lobe • Hemiazygos Vein- Left Superior Intercostal Vein, Hemiazygos continuation of the IVC, Accessory Hemiazygos Veins. • Superior Vena Cava- Persistent left SVC, Retroaortic Left Brachiocephalic Vein. • Pulmonary Vein- Partial and Total Anomalous Pulmonary Venous Return, Scimitar Syndrome, Accessory and Meandering Pulmonary veins 3. Brief description, salient imaging features, differential diagnoses and examples of anatomic variants draining into the azygous vein. 4. Important points to be included in reporting above listed anatomic variants from a clinical and interventional standpoint.

Systematic Approach of Congenital Chest Malformations

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Taila Moura Fe, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purposes of this exhibit are:1. Make a multimodality-based didactic review of the various chest malformations. 2. Propose a didactic categorization of these conditions in: -Bronchopulmonary malformations. -Malformations of the pulmonary vessels. -Malformations of the thoracic wall and diaphragm 3. Illustrate those conditions based on cases from our chest radiology group.

TABLE OF CONTENTS/OUTLINE

We will discuss the following congenital chest malformations and focus on their imaging features using a multimodality approach in this exhibit.1. Bronchopulmonary malformations: -Bronchial atresia. -Accessory bronchus. -Bronchogenic cyst. -Congenital lobar overinflation. -Congenital pulmonary airways malformation (CPAM). -Pulmonary sequestration. -Pulmonary aplasia, hypoplasia, and agenesis. 2. Malformations of the pulmonary vessels: -Unilateral absence of the pulmonary artery. -Pulmonary artery sling. -Congenital pulmonary venolobar syndrome.3. Thoracic wall and diaphragm malformations: -Bochdalek hernia. -Morgagni hernia.

Izabel Karam, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purposes of this exhibit are:To emphasize the importance of basic breast image knowledge for the general and thoracic specialized radiologist when reporting chest CTs;To review mammary anatomy;To illustrate several breast pathologies and its findings in chest CTs from our department in didactic sections to improve understanding.

TABLE OF CONTENTS/OUTLINE

To review the mammary anatomy:Thoracic wall (ribs and muscles);Mammary lobules and ducts;Areola and nipple;Neoplasms and other tumors:Fibroadenoma;Ductal invasive carcinoma;Metastases to breasts;Breast cancer in male patient;Evaluating local extension and lymphatic spreading;Male breasts;Infections and organized collections:Mammary abscess;Organizing hematomas;Post mammoplasty intramammary hematoma;Industrial silicone injection;Implant-related changes:Intrathoracic migration of breast implant after thoracoscopic surgery;Flipped implant;Postoperative abscess;Intracapsular implant rupture;Implant contraction;Implant-related lymphoma.

Imaging Diagnosis as Biomarkers for Lung Cancer with Driver Oncogene Mutation / Gene Translocation in the Era of Personalized Medicine

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Masahiro Yanagawa, MD, PhD, Suita, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

In the era of personalized medicine, imaging diagnosis plays an important part as biomarkers of the following items: prediction for pathological diagnosis, prediction for prognosis, prediction for driver oncogenes, evaluation of treatment response, and evaluation of side effects, etc. Imaging is not always perfect, but it can capture the whole image of lung cancer. This education exhibit focuses on CT imaging in lung cancer with driver oncogene mutation / gene translocation positive and quantitative analysis for predicting gene. It is much appreciated if our information would be useful in your clinical and research setting.

TABLE OF CONTENTS/OUTLINE

1. CT imaging in lung cancer with driver oncogene mutation/gene translocation positive: EGFR (epidermal growth factor receptor) mutation, ALK (anaplastic lymphoma kinase) rearrangement, ROS1 (c-ros oncogene) rearrangement, BRAF (v-raf murine viral oncogene homolog B1) mutation, MET exon 14 skipping-mutation, NTRK fusion, and Others [rearranged during transfection proto-oncogene (RET) fusion, KRAS mutation, and human epidermal growth factor receptor 2 (HER-2) mutation]. 2. CT imaging for an immune checkpoint inhibitor in lung cancer with programmed death ligand 1 (PD-L1). 3. Quantitative analysis for predicting gene: Radiomics approach. 4. Tailor-made medicine: Molecular-targeted therapies for driver oncogene mutations / gene translocations.

Myocardial Assessment on CT: Don't Miss a Beat

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Elizabeth Lee, MD, Ann Arbor, MI (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Although myocardium is typically evaluated with cardiac CT there is an opportunity to identify abnormalities on routine CTs done for other reasons. 2. Attention to myocardial contour, attenuation and enhancement patterns on a routine chest CT can enable detection of previously unsuspected disease.3. Recognition of myocardial abnormalities on routine chest CT will help in early detection of cardiac abnormalities and appropriate management.

TABLE OF CONTENTS/OUTLINE

Given the widespread use of chest CT, cardiac abnormalities are increasingly being identified on chest CTs often done for other reasons. While several reports have shown the value of incidentally discovered abnormalities (such as coronary anomalies) there is scant literature on myocardial abnormalities. These are challenging to detect, however, attention to this can enable diagnosis of unsuspected disease.The following myocardial abnormalities will be discussed:Attenuation: Differential attenuation between blood pool and myocardium (anemia); Fat deposition (tuberous sclerosis, prior infarct, arrhythmogenic cardiomyopathy, benign); Focal low attenuation (acute myocardial infarction (MI), acute myocarditis); Calcification (old MI, calcified tumor, renal failure) Morphology and enhancement: Thickened with diffuse heterogenous enhancement (infiltrative processes, Loeffler); Focal thickening with abnormal enhancement (acute MI, myocarditis); Normal thickness with focal heterogeneous enhancement (tumor, acute MI); Thinning (chronic MI, aneurysm/pseudoaneurysm) Future directions: Strain, role of artificial intelligence. Pitfalls: Artifacts can simulate myocardial pathology

Taming the Broncho: An Imaging Guide to Acute Bronchial Disorders

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Christopher Song, BS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) Various diseases of the bronchi can cause acute symptoms and physiologic abnormalities.2) We will apply a systematic approach to analyzing and characterizing bronchial disorders in the emergent setting. These disorders can be grouped into the following categories: endobronchial lesions, bronchiectasis, bronchial wall thickening, and bronchomalacia.3) Post-processing reconstructions should be utilized to better visualize and highlight characteristic imaging features.

TABLE OF CONTENTS/OUTLINE

Endobronchial lesions-Benign: Aspiration pneumonia, foreign body aspiration, broncholith, pulmonary hamartoma-Malignant: Carcinoid, adenoid cystic carcinoma, mucoepidermoid carcinoma, metastasisBronchiectasis - Cystic fibrosis- Graft versus host disease- Primary ciliary dyskinesia- Infection (e.g., nontuberculous mycobacterium, Pseudomonas aeruginosa)- Allergic bronchopulmonary aspergillosis- Tracheobronchomegaly- Williams-Campbell syndrome- Bronchial atresiaBronchial wall thickening-Bronchial asthma- Relapsing polychondritis- Tracheobronchial amyloidosis- Sarcoidosis- Granulomatous with polyangiitis- Infection (e.g. tuberculosis, Klebsiella)Bronchomalacia Bronchial trauma- Bronchopleural fistula- Bronchomediastinal fistula- Bronchial disruption/rupture

Air trapping in Diffuse Lung Diseases: An Imaging Approach to the Differential Diagnosis with Pathologic Correlation (Mechanisms and Imaging Clues)

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Awards
Certificate of Merit

Participants
Tomas C. Franquet, MD, PhD, Barcelona, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

Air trapping is a manifestation of many diverse entities such as infections, aspiration or inhalation of foreign substances, immunologic and connective tissue disorders, and miscellaneous causes. The presence of air trapping is an excellent clue to the diagnosis of small airways disease. Air trapping consists of focal zones of decreased attenuation commonly seen at expiratory thin-section CT scans of the lungs obtained during suspended expiration following a forced exhalation.The goals of this exhibit are to help the learner:1) To review a variety of diffuse lung diseases commonly associated with air trapping2) To emphasize the diagnostic value of volumetric expiratory CT 3) Present radiology-pathology correlation4) Provide and algorithmic approach to a differential diagnosis

TABLE OF CONTENTS/OUTLINE

1. Introduction. Review Diffuse lung diseases associated with air trapping2. Review the diagnostic value of volumetric expiratory HRCT scans in providing additional significant information in the evaluation of a variety of diffuse lung diseases with suspected airway abnormalities.3. Recognize pathologic mechanisms for air trapping in diffuse lung diseases land their impact on radiologic appearance4. Etiologies of air trapping related to diffuse lung diseases: Infectious Causes, Immunologically mediated, Drug-induced, Toxic/chemical fume inhalation, and miscellaneous causes/associations5. Algorithm to approach air trapping in diffuse lung diseases.6. Conclusion

Recognizing the Many Faces of Thoracic Tuberculosis

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Makiko Murota, MD, Kitagun, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

Mycobacterium tuberculosis infects one third of the world's population and tuberculosis continues to be a major global public health problem. Imaging diagnosis of tuberculosis is sometimes challenging and complex. The purpose of the exhibit is: 1. To review the etiology of tuberculosis. 2. To describe the imaging features of tuberculosis, including the thoracic region other than the lungs. 3. To discuss the complications and sequelae.

TABLE OF CONTENTS/OUTLINE

1. The etiology of tuberculosis 2. The imaging findings of pulmonary tuberculosis: primary tuberculosis, postprimary tuberculosis including typical and atypical pattern, bronchial tuberculosis, tuberculoma, and miliary tuberculosis 3. The imaging features and the clinical manifestations of complications and sequelae: lung parenchyma, airways, blood vessels, mediastinum, pleura, chest wall 4. The differential diagnosis 5. Summary

High-attenuation Mediastinal Abnormalities - Beyond Lymph Nodes Benign Calcifications

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Lucimara Parajara, MD, Sao Bernardo Do Campo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

- To review the main causes of calcified mediastinal lymph nodes- To review conditions other than calcified lymph nodes that can cause high attenuation lesions in the mediastinum compartments

TABLE OF CONTENTS/OUTLINE

All radiologists are used to describing calcified mediastinal lymph nodes. We will discuss several other conditions that may present with a high-attenuation pattern in the mediastinum: - Calcified lymph nodes: a)Healed granulomatous infection b)Sarcoidosis c)Chronic silicosis - Calcified masses a)Thyroid pathologies b)Germ cell neoplasm c)Calcified mediastinal cysts d)Healed lymphoma - Calcified tissue involving mediastinal structures: a)Inflammatory pseudotumor b)Fibrosing mediastinitis c)Tracheobronchial amyloidosis - Other conditions: a)Pitfalls: azygos vein contrast, contrast inside lymphatic ducts b)Foreign body: device embolism, aspiration

Multidisciplinary Panel of Sarcoidosis Beyond the Basics: A Primer on Unusual Cases

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Jessica Marchi, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

To provide a brief overview of the fundamental classic radiologic and histologic findings of sarcoidosis. To demonstrate and discuss the others presentations of thoracic sarcoidosis that are outside the usual. To illustrate the correlation between radiological and histological findings, focusing on atypical cases.

TABLE OF CONTENTS/OUTLINE

Besides thoracic sarcoidosis's common findings (bilateral hilar lymph node enlargement, micronodules with a perilymphatic distribution, fibrotic changes, and bilateral perihilar opacities), one must remember its atypical manifestations and the possibility of concomitance with lung abnormalities of another nature. We will review the most common thoracic sarcoidosis presentations in this educational exhibit, as well as illustrate and describe atypical manifestations and complications. When pertinent, we will also include radiology-pathology correlation for the cases.

Imaging Technologies to Guide the Interventional Pulmonologist: Dynamic Digital Tomography and Dual Source CT.

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Samuel McCollum, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Dynamic low dose evaluation of the airway with Digital Tomosynthesis (DTS) and Dual Source Computed Tomography can be used to monitor complex airway pathologies and airway devices. Having an institution-speci&7;c DTS may reduce use of CT imaging, loweringcost and radiation exposure. Dynamic DSCT imaging decreases radiation dose to conventional CT acquisition

TABLE OF CONTENTS/OUTLINE

1. An introduction to Digital Tomosynthesis and dynamic DSCT: Acquisition and Current Uses2. Case 1: 37-year-old male with post-intubation stricture—we discuss how the stenotic airway is poorly visualized by conventional radiograph, yet can be readily visualized using DTS.3. Case 2: 28-year old female with post-intubation stricture. We demonstrate how can provide a functional assessment of the airways by imaging the trachea in both the inspiratory and expiratory phase post-dilation4. Case 3: 67-year-old male with NSCLC complicated by malignant tracheal stenosis. We will see that DTS allows for visualization of an intraluminal mass.5. Case 4: 57 year old female with malignant stricture s/p stent placement with recurrent airway obstruction. DTS enabled low dose evaluation and monitoring of therapeutic interventions.6. Case 5: 72-year-old male with left lung transplant for usual interstitial pneumonia status post endobronchial stent placement. We show how DTS enables visualization of the endobronchial stent in both inspiration and expiration, again enabling one to monitor stability of airways and associated devices while avoiding the cost and radiation of CT imaging.7. Discussion

From Lines Stripes to Cubes Cylinders: A 3D Visual Guide to Conventional Chest Radiography

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Awards
Cum Laude
Identified for RadioGraphics

Participants
Albert Jiao, MD, Boston, MA (*Presenter*) Nothing to Disclose

TEACHING POINTS

Purpose Identification of anatomic structures in the chest on 2D conventional chest radiography may be challenging for new trainees. Due to the subtlety of pleural lining on CT, the concepts of expanded, effaced, or obliterated pleural borders on interaction with the mediastinum may be difficult to understand with radiographic and cross-sectional imaging correlation. 3D cinematic rendering, which can accentuate the draping effects of pleural borders, may provide a novel way to understand classic chest radiography. Teaching Points• Identify the anatomic structures in the chest that create the classic "lines and stripes" on chest radiography though the assist of 3D cinematic rendering (CR) depictions.• Recognize the abnormal appearances of the borders on CXR, and the corresponding appropriate pathologies in the differential diagnosis through a case-based teaching series.

TABLE OF CONTENTS/OUTLINE

Outline1. Normal pleural anatomy and mediastinal borders. 2. Anterior Junction Line. a. Anterior mediastinal mass differential. 3. Posterior Junction Line. a. Posterior mediastinal mass differential. 4. Aorto-pulmonic relationships. a. AP stripe AP window differential. 5. Paraspinal Lines. a. Right left paraspinal line differentials. 6. Posterior tracheal stripe differentials. 7. Azygosesophageal recess differentials

Thoracic Paragangliomas: Imaging Review and Considerations for Clinical Practice

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Fiona McCurdie, MBChB, BA, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Paragangliomas (PGL) within the thorax: where do they occur and in whom? Experience from a specialist centre2. Multimodality imaging features of thoracic PGLs: strengths and challenges of imaging modalities; lessons from missed lesions3. Considerations for management and recommendations for screening and surveillance

TABLE OF CONTENTS/OUTLINE

1. Thoracic PGLs - what the general radiologist needs to knowa. Overview of pathophysiologyb. Succinate Dehydrogenase deficiency disordersc. Summary of literature - anatomical location and clinical presentation2. Our cohort of 17 thoracic PGL cases - two decades' experience in a specialist centrea. How the PGLs are identified: screening vs. surveillance vs symptomatic b. Locations of PGLs within the mediastinum: i. Superior ii. Anterior iii. Middle 1. Cardiac iv. Posterior v. Correlation symptoms and biochemistry c. Discussion of management: i. Surgical considerations ii. Medical including radionuclide therapy3. Radiological lessons:a. Common imaging findings i. CT - including cardiac CT ii. MRI - whole body, cardiac MRI iii. Functional imaging - Gallium Dotatate PET, FDG PET, MIBG SPECT, Octreotide iv. Plain radiographb. Key differential diagnosisc. Learning from errors: which imaging modalities are PGLs most frequently missed on? What do we learn when we look back in retrospect?4. Recommendations for imaging screening and surveillance

Tortuous Path: Congenital Anomalies of the Systemic Thoracic Veins

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Carlos Marin, MD, PhD, Madrid, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To review the anatomy and embryology of the systemic thoracic veins. 2. To describe imaging findings in congenital anomalies of the systemic thoracic veins (CASTV). 3. To emphasize the physiologic consequences of these anomalies, and their impact in associated congenital heart diseases surgery.

TABLE OF CONTENTS/OUTLINE

Congenital anomalies of the systemic thoracic veins are commonly underdiagnosed, in part because they are often asymptomatic or have little or no clinical consequences. They are frequently discovered as an incidental finding in a radiological examination for unrelated reasons, but sometimes are diagnosed because an anomalous course of a central venous line or during a systematic study for congenital heart disease. In certain cardiac or thoracic surgical procedures it is of prime importance to diagnose these anomalies to prevent surgical failure or complications. Pulmonary venous anomalous connections to the systemic thoracic veins and Raghib syndrome can be symptomatic and diagnosed at early age or be discovered in adulthood in patients with right heart dilatation or cardiac symptoms. Besides azygos lobe, a well-known normal variant, the most common CASTV include: 1. Persistent left superior vena cava (SVC) (with or without absent right SVC). 2. Left superior intercostal vein variants. 3. SVC aneurysm. 4. Pulmonary venous anomalous connections to the SVC. 5. Absent inferior vena cava with an enlarged azygous vein. 6. Persistence of the levoatriocardinal vein. 7. Persistent left SVC with absence of the coronary sinus (Raghib syndrome). 8. Subaortic innominate vein. We describe the embryology, anatomy, physiology, imaging findings, and potential complications of these anomalies.

The Role of Cinematic Rendering in the Analysis of Complex Vascular and Mediastinal Pathology: How We Do It

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Elliot Fishman, MD, Owings Mills, MD (*Presenter*) Co-founder, HipGraphics, Inc;Stockholder, HipGraphics, Inc;Institutional Grant support, Siemens AG;Institutional Grant support, General Electric Company;Consultant, Exact Sciences Corporation;Consultant, Imaging Endpoints

TEACHING POINTS

1. Cinematic Rendering provides unique 3D capabilities allowing for detailed analysis of complex soft tissue and vascular anatomy allowing for improved analysis of chest and mediastinal pathology2. Cinematic rendering is especially valuable for evaluation of complex vascular pathology ranging from aortic dissection to aneurysm as well as coarctation of the aorta and coronary artery anomalies3. 3D mapping is an important tool for transmitting critical information to the referring physician and the patient care team4. complex anatomy defined with cinematic rendering is helpful in pre-operative planning and in analyzing complex structures for robotic surgery5. Cinematic Rendering is a helpful tool for teaching residents and fellows in complex cases of vascular anatomy and anomalies

TABLE OF CONTENTS/OUTLINE

1.CT protocols for optimizing data acquisition for 3D mapping2. protocols and techniques used for Cinematic Rendering including the use of presets to optimize workflow and throughput3. representative case studies are presented using axial, multiplanar, MIP and Cinematic Rendering to show how we use the technique in clinical practice. The advantages of Cinematic Rendering in select clinical applications will be discussed4. case studies will be divided into section incuding;a. vascular anatomy and anomaliesb. aortic aneurysm including dissection, intramural hematoma, ulcerations and active bleedingc. congenital anomalies including coarctation of the aorta and arch anomaliesd. cardiac pathology including cardiac tumors including atrial myxoma and angiosarcoma, and coronary artery fistulae e. mediastinal masses that involve or are in close proximity to key vascular structures

Pulmonary Vascular Diseases: Spectrum of Manifestations in the Chest

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Juliana Sitta, MD, Jackson, MS (*Presenter*) Nothing to Disclose

TEACHING POINTS

Review of the pathophysiology and categorization of pulmonary vascular diseases. Describe imaging patterns on CT and traditional angiography. Analyze common and uncommon etiologies with a case-based review.

TABLE OF CONTENTS/OUTLINE

This presentation aims to discuss imaging findings in the diagnosis and categorization of pulmonary vascular diseases including acute pulmonary embolism, chronic thromboembolic pulmonary hypertension, pulmonary arteriovenous malformation, venous anomalies and mimics, hereditary hemorrhagic telangiectasia, granulomatous with polyangiitis, and microscopic polyangiitis. We will explore the spectrum of chest CT findings within the pulmonary vasculature, parenchyma, airways, mediastinum, and heart that help the radiologist narrow down the differential diagnosis. We will provide a review of the diagnostic criteria and key imaging findings, correlated with physiopathology and current categorization. We will also include a discussion of pros and cons of the currently available diagnostic tools and an update of the most recent imaging technical advancements. Additionally, a case-based review exemplifies common and uncommon pulmonary vascular pathologies.

Multimodality Imaging of Pulmonary Embolism: A Guide for the Radiologist

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Awards
Certificate of Merit

Participants
Flavio Zuccarino, MD, Barcelona, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

To describe imaging findings in Pulmonary Embolism (PE) at different imaging modalities. To underline advantages and limitations of these techniques and to define the clinical scenarios in which they are key in patient management.

TABLE OF CONTENTS/OUTLINE

After a short introduction about PE etiology and incidence, we review PE imaging findings at different non-invasive techniques.We organize PE typical imaging findings as: Chest Radiography, Chest Ultrasound, CT Angiography, Spectral CT, Cardiac MR, V/Q (ventilation/perfusion) scan.We discuss advantages and limitations of these imaging modalities as the potential differential diagnosis. We analyze the differences between acute and chronic PE, focusing especially on Spectral CT findings. We evaluate the impact of these imaging techniques on patient prognosis, especially focusing on CT and cardiac MR. ConclusionsOUTLINE PE represents a lifetreathing condition with a challenging diagnosis. Radiologists should be familiar with PE findings at all imaging modalities that may be key in patient management and treatment.

Bubbles in the Chest: A Pictorial Review of Cystic Lesions in the Paediatric Chest

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Shrea Gulati, MBBS, MD, Delhi, India (*Presenter*) Nothing to Disclose

TEACHING POINTS

A wide spectrum of pathologies in the paediatric population can present as cystic lesions in the thorax. Imaging findings on chest radiography and computed tomography (CT) can provide diagnostic clues to the aetiology. Evolution of imaging findings on serial imaging can provide crucial diagnostic clues.

TABLE OF CONTENTS/OUTLINE

? Introduction ? Overview and classification of the cystic lesions in the paediatric chestClassification based on aetiology: Congenital cystic lesions - Congenital pulmonary airway malformation/ Hybrid lesion, Bronchogenic cyst, Cystic lung disease in neuro-cutaneous syndromes [Tuberous Sclerosis, Neurofibromatosis-1 (NF-1)], Syndromic cystic lung disease (Down's syndrome, Birt-Hogg-Dube syndrome)Acquired cystic lesions - Post infective- tuberculosis, pneumatocele, Diffuse lung disease-Lymphangioleiomyomatosis and Langerhans cell histiocytosis, Broncho-pulmonary dysplasia (BPD), End-stage Interstitial lung disease (ILD)/Diffuse lung disease (DLD), Post traumatic pneumatoceleMimics - Bronchiectasis, Pulmonary interstitial emphysema, Emphysema (alpha 1 antitrypsin deficiency)Classification based on pattern:Single simple cyst - Bronchogenic cyst, Post traumatic pneumatoceleSingle complex/ conglomerated cysts - Congenital pulmonary airway malformation/ Hybrid lesionMultiple bilateral cysts - Post infective- tuberculosis, pneumatocele, Diffuse lung disease-Lymphangioleiomyomatosis and Langerhans cell histiocytosis, BPD, End-stage ILD/DLD, Cystic lung disease in neuro-cutaneous syndromes (Tuberous Sclerosis, NF-1), Syndromic cystic lung disease (Down's syndrome, Birt-Hogg-Dube syndrome)

Benign and Malignant Tumors of the Trachea

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Daniel Vargas, MD, Denver, CO (*Presenter*) Nothing to Disclose

TEACHING POINTS

Tracheal neoplasms are rare, with less than 10% of these lesions considered benign. The radiologist is in a unique position of often being the first health team member to encounter these lesions.The objectives of this exhibit are:1. Discuss epidemiology of tracheal neoplasms2. Review the clinical and imaging presentation of some of the most common benign and malignant tracheal neoplasms. 3. Familiarize the radiologist with entities that act as mimics or pitfalls in the evaluation of the trachea

TABLE OF CONTENTS/OUTLINE

1. Benign Tracheal Neoplasms a. Tracheal Papilloma b. Hemangioma c. Paraganglioma d. Chondroma e. Hamartoma f. Neurogenic tumors 2. Malignant Tracheal Neoplasms a. Metastases b. Direct Invasion c. Squamous Cell Carcinoma d. Adenoid Cystic Carcinoma e. Mucoepidermoid Carcinoma f. Carcinoid Tumor g. Chondrosarcoma

An Image is Worth a Thousand Words: Important Considerations about Connective Tissue Disease-Associated Interstitial Lung Disease

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Bruna Alexandre, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Briefly review the main connective tissue disorders (CTD) typical clinical presentations and laboratory findings, and the expected pattern of interstitial lung disease (ILD) for each CTD;Introduce the readers to interstitial pneumonia with autoimmune features (IPAF);Recognize the most typical imaging features of ILDs and other thoracic manifestations of CTDs;Highlight the role of the radiologist in differential diagnosis and detecting complications.

TABLE OF CONTENTS/OUTLINE

INTRODUCTION: Connective tissue disorders (CTD) and their relation with interstitial lung diseases (ILD); CTD key points to diagnosis; Interstitial pneumonia with autoimmune features - when ILD takes the spotlight.IMAGING FINDINGS: Step by step approach and algorithm to evaluate connective tissue disease associated with interstitial lung disease (CTD-ILD); CTD-ILD: major patterns of involvement and suggestive signs at Chest CT; Other thoracic manifestations of connective tissue diseases.DIFFERENTIAL DIAGNOSIS AND COMPLICATIONS;TAKE-HOME MESSAGES

Benign and Malignant Tracheobronchial Neoplasms: A Comprehensive Review with Radiologic, Bronchoscopic and Pathologic Correlation

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Awards
Identified for RadioGraphics

Participants
Alexander Phan, MD, New York, NY (*Presenter*) Nothing to Disclose

TEACHING POINTS

Tracheobronchial neoplasms are much less common than lung parenchymal neoplasms but can be associated with significant morbidity and mortality. They include a broad differential of both benign and malignant entities, extending far beyond more commonly known pathologies such as squamous cell carcinoma and carcinoid. Airway lesions may be incidental findings on imaging or present with symptoms related to airway narrowing or mucosal irritation, invasion of adjacent structures, or distant metastatic disease. While there is considerable overlap in clinical presentation, imaging, and bronchoscopic appearances, an awareness of potential distinguishing factors may help narrow the differential diagnosis. The authors review the epidemiology, imaging characteristics, typical anatomic distributions, bronchoscopic appearances, and histopathology of a wide range of neoplastic entities involving the tracheobronchial tree. Special attention is paid to any distinguishing features.

TABLE OF CONTENTS/OUTLINE

1. Primary malignant tumors: squamous cell carcinoma, malignant salivary gland tumors (adenoid cystic carcinoma and mucoepidermoid carcinoma), carcinoid, sarcomas, primary tracheobronchial lymphoma, and inflammatory myofibroblastic tumor. 2. Secondary malignant tumors (direct invasion or hematogenous spread). 3. Benign neoplasms: hamartoma, chondroma, lipoma, papilloma, amyloid, leiomyoma, neurogenic lesions, and benign salivary gland tumors (pleomorphic adenoma and mucous gland adenoma).

CHEE-81

Usual Interstitial Pneumonia (UIP): A Primer for Radiologists

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Katherine Cheng, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Usual Interstitial Pneumonia (UIP) is the most common histologic pattern of fibrosis and has typical imaging findings on HRCT. 2. UIP is an imaging/histologic diagnosis while Idiopathic Pulmonary Fibrosis (IPF) is a multidisciplinary diagnosis. 3. While most patients with UIP pattern of fibrosis are diagnosed with IPF, this imaging pattern can be seen in other settings such as connective tissue related disease, hypersensitivity pneumonitis, asbestosis, vasculitis, familial pulmonary fibrosis, and drug reaction

TABLE OF CONTENTS/OUTLINE

1. Distinguish UIP from IPF 2. Review histologic and imaging patterns of UIP; review updated 2022 ATS criteria diagnosis for IPF. 3. Explore the differential diagnosis for UIP and associated imaging findings including IPF, connective tissue disease, hypersensitivity pneumonitis, asbestosis, vasculitis, familial pulmonary fibrosis, and drug reaction. 4. Present multidisciplinary approach to UIP including the clinical presentations and serologic markers that can aid the radiologist.

Imaging Guide to Connective Tissue Disease Related Interstitial Lung Disease (CTD-ILD)

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Yogesh Gupta, DO, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Provide a foundation for the clinical diagnosis of CTDs that may present with ILD including symptomatology and serologic markers. 2. Describe the radiologic and pathologic patterns of CTD-ILD 3. Review helpful imaging signs in the diagnosis of CTD-ILD. 4. Discuss idiopathic pneumonia with autoimmune features (IPAF). 5. Review the specific prognosis and management of CTD-ILDs, with comparison to ILDs secondary to other causes.

TABLE OF CONTENTS/OUTLINE

CTD-ILD represents an underdiagnosed subset of ILDs. The imaging appearance of CTD-ILDs can often precede the rheumatic signs with interpretation of these cases difficult for even experienced radiologists. The literature on CTD-ILD has progressed over recent years, underscored by the emergence of new diagnostic criteria and characteristic imaging patterns. This presentation will provide the radiologist with a comprehensive framework to best facilitate diagnosis and guide management of these diseases.This exhibit is designed for residents, fellows, as well as general and thoracic radiologists. The primary goal is to achieve better understanding of clinical and imaging features of various CTD-ILDs, drawing from our large multicenter patient database. 1. Clinical features of CTDs manifesting with ILD. 2. Pathophysiology of CTD-ILDs. 3. CT imaging characteristics of CTD-ILDs, including imaging signs. 4. Prognosis and management of CTD-ILDs.

Breast Cancer in Women: Multidisciplinary Approach to the Kaleidoscopic Pulmonary Manifestations on CT

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Cleonice Isabela Silva Muller, MD, PhD, (*Presenter*) Author with royalties, RELX;Author with royalties, Wolters Kluwer nv;Speaker, AstraZeneca PLC;Speaker, General Electric Company

TEACHING POINTS

Introduction Pulmonary abnormalities on computed tomography (CT) in women with breast cancer may be secondary to pulmonary metastases, radiotherapy or systemic treatment of the primary tumor or metastases, increased prevalence of other cancers, or be due to an unrelated cause. In this exhibit we review the range of pulmonary abnormalities seen on CT and present representative cases illustrating the value of multidisciplinary discussion based on weekly oncology tumor board meetings at out institution and systematic follow-up of all patients.1) To review the typical and atypical manifestations of pulmonary metastases at presentation and with progression or improvement. 2) To illustrate the CT findings of pulmonary complications related to treatment including radiation, chemotherapy, hormone therapy, targeted therapy and immunotherapy. 3) To discuss the differential diagnosis of unrelated pulmonary abnormalities that may affect management. 4) To highlight the importance of multidisciplinary discussion in reaching a timely diagnosis.

TABLE OF CONTENTS/OUTLINE

1) Introduction; 2) Spectrum of manifestations and types of response of pulmonary metastases; 3) Pulmonary complications of radiotherapy; 4) Pulmonary complications of systemic therapy; 5) Unrelated pulmonary conditions; 6) Conclusions.

Suboptimal Chest Radiography - Applying Art to the Science of Mitigating the Mammoth Issue

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Giridhar Dasegowda, MBBS, Boston, MA (*Presenter*) Nothing to Disclose

TEACHING POINTS

The audience will learn about the applied art and science in suboptimal chest radiographs (CXRs): 1. Various causes of suboptimal CXRs with case-based illustration 2. Impact of suboptimal CXRs: The missed and misinterpreted findings 3. How parallel suboptimality affects the representation of art: Connecting CXR illusions with artistic allusions 4. Where and how artificial intelligence (AI) helps in mitigating suboptimal CXRs

TABLE OF CONTENTS/OUTLINE

The four-part exhibit will begin with case-based illustrations of what makes CXRs suboptimal and/or rejected for repeat acquisition. The second part will illustrate the impact of suboptimality on CXR findings including the missed and misinterpreted ones. In the third part, the presenting authors will use their own self-drawn, painted artwork to highlight how suboptimality affects the representation of art and interpretation of suboptimal CXRs. The final part informs about the role of AI in mitigating suboptimal CXRs. The free-to-share and display exhibit will help raise awareness about suboptimal CXRs and inspire a positive downward trend in suboptimal CXR frequency which according to some exist in as much as 90% of all CXRs.Please visit the Learning Center to also view this presentation in hardcopy format.

Perceptual Errors in Cardiothoracic Imaging

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Siddhi Hegde, MBBS, Mangalore, India (*Presenter*) Nothing to Disclose

TEACHING POINTS

-Studies have shown some areas of radiology have miss rates and (false negative) and false-positive rates as high as 30% of daily reads. -Errors have a significant impact on patient care and increase healthcare costs and burdens. -Perceptual errors can be due to errors in scanning, recognition, or decision. -Identifying and understanding the causes of perceptual errors, increasing awareness amongst trainees, and improving educational models can improve detection and localization accuracy. -Perceptual training algorithms geared toward the reduction of perceptual errors may be a useful adjunct to conventional radiology training.

TABLE OF CONTENTS/OUTLINE

-Different types of diagnostic errors in radiology and their frequency -What radiologists need to know about perceptual errors in the setting of cardiothoracic imaging. -Table demonstrating different types of perceptual errors in radiology, definitions, and potential means to overcome them.

"Down The Rabbit Hole": The Many Fistulous Pathways in the Thorax

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Murilo Peixoto, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Fistulous tracts in the thorax can involve a number of different spaces and have multiple causes.These unusual communications are hard to depict well, and when only standard imaging protocols are used they are often overlooked or misinterpreted.Imaging acquisition techniques and tips can be used to alter the common protocols and demonstrate these tracts more conspicuously.

TABLE OF CONTENTS/OUTLINE

Acquired and congenital fistulous tracts of the thoracic region often pose significant diagnostic difficulties to the radiologist. Multiple spaces can be involved, such as the tracheobonchial tree, pleural space, the digestive tract (such as the esophagus and stomach), the lymphatic and the circulatory systems; and many etiologies can be the culprit, such as infectious or inflammatory diseases, neoplasms, surgical and medical procedures, and so on. This presentation is a series of cases, by no means exhaustive, of the many fistulous tracts within the thoracic region, some of which with an unusual presentation. Tips and techniques of imaging acquisition are presented, in order to help better depicting these conditions.

Bronchial Morphology Changes after Lobectomy - Examination by Inspiratory and Expiratory Imaging with Ultra-High-Resolution CT

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Hiroshi Moriya, MD, Fukushima, Japan (*Presenter*) Advisor, California Capital Equity, LLC;Research Grant, Canon Medical Systems Corporation

TEACHING POINTS

Advances in CT technology and computer processing technology have made it easier to perform precise morphological disassembly and automatic extraction and volume measurement of anatomical structures. In the diagnosis after lobectomy, morphological changes such as thoracic deformity, pleural thickening, organizing pleural effusion, lung parenchyma, bronchi, and pulmonary arteries and veins can be analyzed. In particular, ultra-high-resolution CT (UHRCT) with improved spatial resolution can perform morphological measurement more precisely than conventional CT, so in addition to changes in the anatomical position of each lobe and the volume of the remaining lobe before and after excision.

TABLE OF CONTENTS/OUTLINE

Equipment and method: UHRCT (Aquilion Precision, SHR mode), inspiratory / expiratory imaging. Workstation (Ziostation 1K).Results: It was possible to calculate the spatial position of the residual lobe and the ventilation volume for each lobe. By automatic extraction of the bronchial tree, it was possible to depict 3-dimensional expansion and flexion.Bronchial flexion case: Right upper lobectomy. There is an air trapping in the middle lobe. Decreased ventilation of the middle lobe located at the apex of the lung, and flexion and stenosis of the bronchus at the expiratory phase were confirmed.Adhesion case: Partial resection of the right upper lobe. Extensive adhesions due to pleural dissemination. Ventilation of the middle lobe is restricted. The bronchus was confirmed to be patency.Summary: UHRCT is excellent for bronchial morphological analysis. Inspiratory and expiratory CT can be used to analyze changes in bronchial morphology, movement and rotation of the lobes.

Cardiovascular Devices on Chest Radiographs

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Taila Moura Fe, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purposes of this exhibit are: Examine the most common cardiovascular devices seen on chest radiographs. Describe each cardiovascular device, including its proper location, components, types, and major complications. Illustrate those cardiovascular devices, using both usual and unusual cases from our chest radiology group.

TABLE OF CONTENTS/OUTLINE

This exhibit will go over various cardiovascular devices that can be seen on a chest x-ray. The anticipated correct position, as well as the major complications associated with those devices, will be detailed and illustrated. Cardiac devices: - Pacemaker.- Ventricular assist device.-Occlusion devices.- Mitraclip.- Valve prosthesis.- Loop event recorder.Vascular devices: - Central venous catheter. - Port-a-cath. - Swan-Ganz catheter. - Intra-aortic balloon pump. - Extracorporeal membrane oxygenation (ECMO). - Exogenous material embolized.

When Chest MRI Plays the Big Role: a Guide for Useful Applications on Daily Practice

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Murilo Peixoto, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Thoracic lesions can have a wide variety of differential diagnoses. - Chest magnetic resonance imaging (MRI) can be helpful for narrowing down the different etiologies when lesions detected in other imaging methods demonstrate nonspecific features. - Chest MRI is an increasingly available method that uses no ionizing radiation and has sufficient spatial resolution for a number of usages.

TABLE OF CONTENTS/OUTLINE

Chest MRI is a widely underappreciated imaging modality, despite its large applicability in the evaluation of abnormalities of cardiovascular origin, of the mediastinum, the pleural space, the brachial plexus, the chest wall and even the lung parenchyma. It is thought that a broader usage of chest MRI is discouraged by the motion artifacts generated by cardiac and respiratory motions and the low signal-to-noise ratio yielded by the large amount of air in the lungs. However, there is great value in utilizing the multiple resources offered by MRI, such as T1, T2, diffusion, in-phase and out-of-phase sequences in order to narrow down the differential diagnoses of lesions found through other imaging methods such as computerized tomography (CT). MRI quality and availability is continuously increasing over the years, so radiologists are facing these diagnostic dilemmas more and more frequently, and knowledge of the behavior of thoracic lesions on MRI is also increasingly important. In this work, we intend to demonstrate how the resources offered by chest MRI can be used to narrow down the differential diagnoses of different thoracic lesions.

Beyond 5Ts: Pearls and Pitfalls in Diagnosis of Anterior Mediastinal Masses

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Tetsuro Araki, MD, PhD, Philadelphia, PA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To understand appropriate image modalities for anterior mediastinal masses (AMM). 2. To understand common differential diagnosis of AMM. 3. To understand key image finding in differential diagnoses of AMM.

TABLE OF CONTENTS/OUTLINE

1. Appropriate selection of image modalities for AMM a. Role of chest radiograph, CT, and MRI b. Additional imaging options (Dual-energy CT, PET/CT, SPECT) 2. Anatomy of mediastinum a. Mediastinal compartment suggested by Felson b. Cross sectional mediastinal compartment suggested by ITMIG c. Common lesions in each compartment 3. Review of 5Ts a. Thymic epithelial tumors: Top of differential of AMM? b. Thyroid tumor: Is MRI helpful? c. Teratoma: Macroscopic fat, when it's malignant? d. Terrible lymphoma: Why terrible? e. Thoracic aorta: not neoplastic, though f. Are 5Ts common as AMM? 4. Beyond 5Ts: More practical DD of AMM than 5Ts a. Lymph nodes b. Benign mediastinal lesions (Thymic cyst/pericardial cyst) • Unilocular vs multilocular thymic cyst • Morgagni hernia c. Normal/hyperplastic thymus • Normal morphology of thymus • What is "normal" thymus for age and sex • True vs lymphoid hyperplasia d. Ectopic thyroid lesion 5. Key image features useful in differential a. CT density and MRI signal density on T1 and T2WI b. Solid vs cystic c. Microscopic and macroscopic fat d. Detection of calcification e. Diffusion weighted images/ADC map f. FDG uptake on PET/CT g. Iodine and fat quantification on DE-CT 6. Summary

"Pop Under Pressure" - Common and Uncommon Imaging Findings in Barotrauma

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Caleb Carroll, BS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Pulmonary barotrauma is typically diagnosed on imaging and can be associated with increased mortality therefore it is important to recognize and promptly manage barotrauma. Critical to diagnosis is a high suspicion especially in those at high risk.2. In addition to common imaging findings (pneumomediastinum, pneumothorax, pneumoperitoneum, and subcutaneous emphysema), few uncommon findings (pneumopericardium, broncho-pleural fistula, tension lung cyst, subpleural air cyst and air embolism) may be present.

TABLE OF CONTENTS/OUTLINE

1. Discuss definition, possible mechanisms and etiologies associated with pulmonary barotrauma.2. Epidemiology of barotrauma in different clinical scenarios.3. Illustrative cases showing common and uncommon manifestations of barotrauma.4. Briefly discuss clinical features, the prevention, diagnostic evaluation, and management of barotrauma.

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Carlota Garcia de Andoin Sojo, MD, Bilbao, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

CT is the best non-invasive imaging modality to evaluate the trachea and its potential diseases. Most tracheal diseases cause stenosis and have different causes and treatments. The knowledge of their specific features in CT helps to approach the diagnosis.

TABLE OF CONTENTS/OUTLINE

Objectives To review tracheal diseases and their characteristic features on CT. To describe normal variants of the tracheobronchial tree.Findings: A CT image-based quiz will lead the review of:Normal Variants: The knowledge of the non-pathological variants of the tracheobronchial tree will avoid mistakes. The most frequent anatomical variants are tracheal bronchus and accessory cardiac bronchus.Tracheal pathology: Tracheal diseases are congenital or acquired and can be diffuse or focal. Most of them cause tracheal stenosis in asymptomatic patients. These pathologies can have iatrogenic, neoplastic, congenital origins or be related to systemic diseases. Neoplastic causes can be benign or malignant and include hamartomas, papillomas, lipomas, leiomyomas, epidermoid carcinomas, adenoid cystic carcinomas or metastases. Other origins are sabre-sheath trachea, tracheobronchomalacia, tracheobronchial amyloidosis, sarcoidosis, Wegener granulomatosis, relapsing polychondritis, tracheobronchopathia osteochondroplastica and inflammatory bowel disease with tracheobronchial involvement. The Mounier-Kuhn syndrome is a rare entity that causes tracheobronchomegalia.ConclusionSeveral tracheal diseases show slight symptoms and subtle CT findings. The knowledge of these entities enables radiologists to reduce the differential diagnosis and give information to plan future bronchoscopies and treatments.

CHEE-97

That Escalated Quickly: Etiology, Pathophysiology, and Imaging Findings of Rapidly Progressive Interstitial Lung Disease

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Andrew Simmerman, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. The lungs' response to acute injury follows a predictable course even across disparate etiologies. Radiologists should recognize the typical imaging manifestations of RP-ILD along with their associated disorders.2. Acute complications of RP-ILD include pneumomediastinum and pneumothorax.3. RP-ILD may resolve or evolve into other chronic ILD patterns.

TABLE OF CONTENTS/OUTLINE

I. Overview of acute lung injury and healing process a. Acute/subacute i. Histology of diffuse alveolar damage (DAD) and organizing pneumonia (OP) ii. HRCT appearance of DAD and OP b. Chronic i. Resolution or fibrosisII. Defining RP-ILD a. Timeline b. Severity c. Alternative names in the literatureIII. Etiologies of RP-ILD, with example cases a. Connective tissue disease i. Various types: myositis, rheumatoid arthritis, scleroderma, lupus ii. Anti-melanoma differentiation-associated gene 5 dermatomyositis (high association with RP-ILD) b. Viral infection i. COVID-19/SARS/MERS ii. Influenza c. Acute Interstitial Pneumonia d. Acute Exacerbation of ILD e. Treatment-related pneumonitis i. Medications ii. Chemotherapy/immunotherapy iii. RadiationIV. Clinical significance of RP-ILD a. Treatment b. Prognosis: acute and chronic phases c. Follow-up

CHEE-98

Pulmonary Actinomycosis: CT Findings and Differential Diagnosis

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Yoshie Kunihiro, MD, Ube, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

Pulmonary actinomycosis is a chronic suppurative infection caused by Actinomyces species and the infection occurs typically due to aspiration of endogenous organisms. There are a variety of CT findings of pulmonary actinomycosis, however, there are some key points for differential diagnosis. The purpose of this exhibit is: 1. To explain the clinical characteristics and the common CT findings of pulmonary actinomycosis. 2. To review the CT images of pulmonary actinomycosis with uncommon findings such as bronchiectatic form and endobronchial calcified nodule. 3. To discuss the differential diagnosis of pulmonary actinomycosis, including pulmonary tuberculosis, fungal infection, lung cancer and granulomatosis with polyangiitis.

TABLE OF CONTENTS/OUTLINE

(1) Clinical characteristics of pulmonary actinomycosis (2) CT findings of pulmonary actinomycosis (3) Sample cases (4) Differential diagnosis

Printed on: 02/07/23

CHEE-99

Thoracic Parasitic Disease: A Radiologic and Pathologic Review

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - CH

Participants
Cecilia Davis-Hayes, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Parasitic diseases effect immunocompetent and immunocompromised patients worldwide. To create an accurate differential diagnosis for thoracic infections, radiologists must utilize both patient travel history and characteristic imaging findings. Understanding both imaging patterns and the geographic distribution of these diseases will help to narrow the differential and can impact clinical testing and management. Although some parasitic infections result in nonspecific imaging findings, familiarity with their imaging features as well as their epidemiological, clinical, and pathologic features may be helpful in to ensure the appropriate diagnosis and treatment.

TABLE OF CONTENTS/OUTLINE

1. Review endemic thoracic parasitic diseases A. Helminths i. Cestodes (tapeworm), e.g Echinococcus ii. Nematodes (roundworm), e.g Strongyloidiasis Ascariasis iii. Trematode (fluke), e.g. Schistosomiasis B. Protozoa i. Amebiasis ii. Trypanosomiasis (Chagas Disease)2. Epidemiology 3. Modes of transmission/ lifecycle 4. Geographic distribution 5. Clinical presentation 6. Imaging/ pathology findings

EREE

Emergency Radiology Education Exhibits

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - ER

Sub-Events

EREE-1 Blunt Splenic Injury: What's New and Important - A Review by the ASER (American Society of Emergency Radiology) Expert Panel

Participants
Aishwariya Vegunta, MD, Stratford, CT (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Severity grading of Blunt Splenic Injury (BSI) using American Association for the Surgery of Trauma (AAST) 2018 Organ Injury Scaling (OIS).2. Importance of detecting vascular injury and its impact on management. 3. Types of vascular injury: Contained Vascular Injury (CVI) and Active Splenic Hemorrhage (ASH). 4. Key Role of CT protocol in Vascular Injury Detection5. Management options: Operative vs. Conservative and future advances.

TABLE OF CONTENTS/OUTLINE

Table of Contents/Outline: ? Background/scope of the problem: Spleen is the second most common injured abdominal organ? Examples of Blunt Splenic Injury and grading using 2018 AAST OIS? Types of Splenic Vascular Injuries:a. Contained Vascular Injuryi. Pseudoaneurysmii. Arteriovenous fistulab. Active Splenic Hemorrhage (ASH)? Optimizing CT protocols- Arterial phase imaging/ multiphase acquisition increases sensitivity and improves differentiation of splenic vascular injury ? Management of BSI and the impact of CT detection of splenic vascular injury: Trend toward Nonoperative management (NOM) and role of splenic artery embolization (SAE) ? When NOM fails: Potential factors and next steps? Follow up imaging for delayed splenic rupture: When to do it and what to look for

EREE-10 A Pregnant Patient in Pain: What the ER Radiologist Needs to Know About the Findings, Reporting, and Significance

Participants
Dana Galvan, MD, Albuquerque, NM (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Improve understanding of the radiologic evaluation of pregnant patients in emergency settings, including the reporting of first and second/third trimester fetal sonography.2. Familiarize radiologists and in-training radiologists with the imaging appearance, incidence, and follow up recommendations of common emergent causes of maternal acute abdomen.3. To review key traumatic pathologies and findings in pregnancy such as uterine rupture and the Traumatic abruptio placenta scale.4. Highlight key findings of urgent special consideration cases of multiple gestations and emergent ectopic pregnancy findings.

TABLE OF CONTENTS/OUTLINE

-Introduction to emergency department visits during pregnancy including common presenting complaints, symptoms, and initial imaging modalities selected to investigate.-Review of maternal and fetal radiation exposure in the emergency setting, including effect on fetus and threshold doses.-Review of sonographic first trimester findings including SRU criteria, terminology, and findings for pregnancy failure.-Review of second trimester ultrasound findings including how to identify relevant findings, report findings, and their significance.-Sonographic placental and cervical pathologies of the second and third trimesters, with key imaging findings, clinical significance, and follow-up recommendations.-Common traumatic injuries including uterine rupture and review of the Traumatic Abruption Placenta Scale (TAPS).- Differential diagnosis, clinical significance, and follow-up recommendations of several maternal acute abdomen pathologies.-Imaging finding review of multiple gestation emergencies, ectopic and heterotopic pregnancies.

EREE-11 Age Estimation of Unidentified Cadavers Using Postmortem CT Imaging

Participants
Wataru Fukumoto, MD, PhD, Hiroshima, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

For the identification of unknown cadavers, an accurate estimation of the age at the time of death is needed. Classical methods assess morphological changes of the pubic symphysis, its auricular surface, and cranial sutures and teeth. However, as these assessments rely on the experience and expertise of the evaluator, their accuracy is limited, especially in elderly cadavers. Because postmortem computed tomography (PMCT) using multiplanar reconstruction- and 3D images reveals the bone structure clearly, it is superior to the classical methods. We introduce and describe the utility of age estimation methods based on PMCT.

TABLE OF CONTENTS/OUTLINE

1. Importance of age estimation in forensic science 2. Classical age estimation methods 3. Age estimation using PMCT images

1. Importance of age estimation in forensic science 2. Classical age estimation methods 3. Age estimation using PMCT images •Measurement of the bone density of the pubic symphysis •CT value and volumetric analysis of the proximal femur •Maturity of the medial clavicular epiphysis •The ossification score of the sternum and ribs •Evaluation of osteophytes in the vertebrae 4. A new approach for age estimation using PMCT and deep learning

EREE-12 Automated CT Perfusion (CTP) interpretation in Acute Stroke: Primer for On-call Radiologist

Awards
Certificate of Merit

Participants
Ashlesha Udare, MBBS, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To understand the growing need of emergency automated CTP evaluation 2. The 3 questions approach for fast and accurate interpretation

TABLE OF CONTENTS/OUTLINE

Background: AHA2018 AIS guidelines recommend perfusion imaging for INR subject selection at 6-24 hours after insult. Automated CTP using AI technology has been used in several recent large LVO endovascular therapy trials. Using case-based approach with 2 FDA approved AI solutions from our institution, we aim to acquaint the on-call radiologist interpreting automated CTP data using a simplified 3 questions approach 1. Is the CTP diagnostic/non-diagnostic? Understanding the basics of CTP acquisition and processing by the AI software. technical pitfalls: motion, contras bolus, AIF/VOF selection, erroneous calculation of perfusion abnormality near the skull base, truncation of dynamic curve, z-axis coverage.2. Is there infarct core volume measurement error?-Underestimated on CTP outputs in the extended time window if received IV tPA, leptomeningeal collaterals lead to partial reperfusion of completely infarcted: Noncontrast CT ASPECTS-Overestimated in cases of ghost infarct hyperacute stroke, early reperfusion: Stricter rCBF threshold for core infarct estimation.3. Is there ischemic penumbra measurement error?-Overestimated in proximal vessel stenosis, leukoriasis, fetal PCA: Evaluate CTA, MTT-Wrong inclusion of opposite hemisphere, beyond vascular territory by automated software-Stroke mimics, lacunar infarcts and posterior circulation strokes.Conclusion: Fast interpretation of the complex automated CTP data by a simplified 3 questions approach for the on-call radiologist and to optimize patient selection for reperfusion.

EREE-13 Emphysematous Osteomyelitis: A Review of Imaging Features and Pitfalls for the Emergency Radiologist to Avoid

Awards
Certificate of Merit

Participants
Kush Purohit, MD, MS, Pittsburgh, PA (*Presenter*) Nothing to Disclose

TEACHING POINTS

Discuss the pathogenesis and clinical presentation of emphysematous osteomyelitis (EO), a rare, lethal variant of osteomyelitis caused by infection from gas-forming organisms.Understand key x-ray features and limitations of radiography, including inconspicuous or radiographically occult intraosseous air.Describe the characteristic CT "pumice stone pattern" of irregularly irregular 2-5 mm intraosseous foci of gas.Discuss conventional MRI findings, including T1 hypointense and T2 hyperintense marrow signal abnormalities, and correlate with radiography and CT.Understand local susceptibility artifact from intraosseous air can obscure T1 and T2 signal abnormalities and may be misinterpreted as calcification or hemosiderin deposition, a potential pitfall for the emergency radiologist.Explore PET-MRI as a useful tool in diagnosing EO and localizing infection spread.

TABLE OF CONTENTS/OUTLINE

Emphysematous osteomyelitis background: Epidemiology, pathogenesis, clinical presentationRadiography: Typical features and pitfallsMRI: Review of imaging features. Susceptibility artifact as a major potential pitfall for the emergency radiologistCT: The most useful diagnostic study with characteristic "pumice stone pattern" of intraosseous gasPET-MRI: A useful emerging tool with review of typical imaging features

EREE-14HC Fistulas: From The Mouth To The Anus.CHAR(13) + CHAR(10)Our Experience Searching For An Accurate Diagnosis.

Participants
Rodrigo Loto, MD, Rosario, Argentina (*Presenter*) Nothing to Disclose

TEACHING POINTS

List to appropriate diagnostic imaging studies.Describe the anatomic locations, causes and clinical features of uncommon fistulas.How to do it. Identify the radiologic finding in the various types of fistulas.A fistulogram/sinogram is used to diagnose and assess the size and shape of fistulas and sinuses and prepare a treatment plan.Fistulograms are used to assess many types of fistulas, including those that form between: two loops of intestine the anal canal and skin near the anus the vagina and another body part such as the colon, rectum, small intestine or bladder.

TABLE OF CONTENTS/OUTLINE

This pictorial review shares our initial experience with MDCT fistulography in evaluating fistulas, demonstrates various components of fistulas, and discusses the types of fistulas. MDCT is the most common modality used for assessment of fistulas, especially with the use of fistulography. The injection of positive contrast well-delineates the fistulous tract and its branching pattern and connections. CT also enables multiplanar reconstruction and thin cuts for good anatomical details. Orally administered Contrast Media opacification may be helpful. is relatively well tolerated but it can be painful when injecting the contrast material into the fistulous tract. Is important identify the anatomic locations and clinical features to proceed. Fistulas are diverse in their anatomy and clinical presentation. Radiologists must be familiar with the radiologic findings for both accurate diagnosis and, in many cases, guidance of management planning.Please visit the Learning Center to also view this presentation in hardcopy format.

EREE-15 Recreational Drug Abuse- the Spectrum of Imaging Findings

Participants
Edward Choe, DO, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. The opioid epidemic coupled with the COVID-19 pandemic has drastically increased the prevalence of recreational drug abuse.2. Increasing prevalence of substance use should prompt radiologists to familiarize themselves with common and uncommon imaging patterns, and different routes of self-administration.3. Substance use will often have multisystem sequelae.4. Additional factors to consider when evaluating a patient should include but are not limited to concomitant infections such as HIV and hepatitis, the imaging features of which may complicate image interpretation.

TABLE OF CONTENTS/OUTLINE

The primary goal of this exhibit is to review the imaging findings of recreational drug abuse. Patients with substance use often present with a spectrum of multisystem abnormalities beyond direct soft tissue or vascular injury. Vascular complications include pseudoaneurysm, thrombophlebitis, and mycotic aneurysm. In the musculoskeletal system, findings include cellulitis, abscess, fasciitis and septic arthritis, discitis/osteomyelitis, and findings related to ischemia or immobility. In the CNS, complications include dural venous thrombosis, hemorrhage, ischemia, and sequelae of cerebral vasospasm such as PRES. Cardiovascular complications include valvular vegetations, septic emboli, dissection and myocardial infarct. Intra-abdominal complications include septic emboli with infarction of the spleen, kidneys, or bowel, as well as pancreatitis. The imaging findings of these entities will be illustrated, along with potential pitfalls associated with concomitant HIV and viral hepatitis.

EREE-16 Imaging Atlas of the AAST Organ Injury Scaling: Spleen, Liver and Kidney

Participants
Bárbara Santos, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Non-operative management of blunt abdominal trauma, including endovascular treatment, is increasingly applied, therefore, recognizing and defining the key imaging features of trauma-related injury is crucial. ?- The CT-based organ injury scaling established by the American Association for the Surgery of Trauma (AAST) is the most used to assess injury severity and guide clinical decision-making, a useful tool to those caring for the injured patient.?- The most significant change in the 2018 revision of AAST organ injury scale is the incorporation of CT diagnosed vascular injury. The presence of a vascular injury is associated with higher failure rates of nonoperative management, therefore higher grades are used in the presence of a vascular injury.

TABLE OF CONTENTS/OUTLINE

- Introduction?- CT protocol for trauma assessment.?- Changes made in the 2018 revision of the AAST Organ Injury Scaling for spleen, liver, and kidney and how its relate with clinical management.?- Definition by CT imaging of all general types of traumatic injuries on solid organs.?- Imaging atlas of the organ injury scaling established by AAST for spleen, liver, and kidney.?- Pitfalls on trauma-related evaluation of spleen, liver, and kidney.?- Take home messages.?

EREE-17 Pelvic Trauma for the Diagnostic and Interventional Radiologist: From Plain Film to Angioembolization

Participants
Javier Hernandez, BS, San Antonio, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

-Use cases to review significant diagnostic findings (plain film and CT) with corresponding angiographic findings for pelvic trauma.-Characterize the role of interventional radiology in the management of pelvic trauma.-Provide a clinical algorithm for initiating pelvic trauma angiography.

TABLE OF CONTENTS/OUTLINE

IntroductionPelvic Anatomy: Bony Landmarks with Vascular Associations, Iliac Artery Branch PatternsVariants of Interest: Corona mortis; Variable Origins of Inferior Gluteal, Internal Pudendal, Superior Gluteal and Obturator Artery.Pelvic Trauma Societal Guidelines WSES, ACR, EASTPlain film, CT and Angiographic findings Blush, Truncation, Pseudoaneurysm, Large Vessel Transection, Traumatic Arteriovenous FistulaMetrics of Intervention Radiology in Hemorrhagic Trauma Cumulative National Response Times, Frequency of Angiography in Pelvic TraumaClinical Algorithm for Pelvic AngiographyCase Presentations: Open Book Fracture, Superior Gluteal Artery Laceration, Bilateral Internal Iliac Transection, Multivessel Internal Iliac Artery EmbolizationOutcomes of Angioembolization: Mortality, Morbidity, RecurrenceConclusionClinical Implications In the setting of pelvic trauma, angiography and embolization serve as critical interventions to mitigate deterioration in hemorrhagic shock. Knowledge of unique vascular injuries and their imaging aid diagnosticians and interventionalists in facilitating clinical management.

EREE-18 The Puzzle Never Solved: Imaging of Abdominal Emergencies in Pregnancy, Still a Dilemma

Participants
Teodorescu Andreea, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

To illustrate the spectrum of different presentations of abdominal emergencies in pregnant pacients.To review the imaging findings of acute emergencies that will help us to think beyond specific conclusion in an emergency setting.To discuss the risks to the fetus from diagnostic imaging modalities and contrast agentsTo propose recommendations for emergency diagnostic imaging of pregnant patientsTo summarize the role of imaging(including ultrasound, CT, and MR imaging) in diagnosing acute and emergent pregnancy-related conditions using a CASE-BASED APPROACH.

TABLE OF CONTENTS/OUTLINE

Acute abdomen in pregnancy remains one of the most challenging diagnostic and therapeutic dilemmas today.The differential diagnosis during pregnancy is extensive in that the abdominal pain may be obstetric in nature or may be caused by diseases of other intraabdominal or intrapelvic structures. Because of the anatomic and physiologic changes that occur with pregnancy, localization of disease can be difficult. Appendicitis and complicated biliary pathology are the most frequent causes of non-obstetric

acute abdomen in the pregnant patient.Pathological causes of obstetric emergencies which are life-threatening include ruptured ectopic pregnancy, abruption, HELLP syndrome, acute fatty liver of pregnancy, and uterine rupture.Imaging studies are essential adjuncts in the diagnostic evaluation of acute emergency conditions due to clinical and laboratory masking in this subgroup. However, confusion about the safety of these modalities for pregnant women and their infants often results in unnecessary avoidance of useful diagnostic tests.

EREE-19 Small Bowel Diverticulosis And Diverticulitis: A Pictorial Review

Participants
Namita Bhagat, MD, Shelton, CT (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Small bowel diverticulosis is uncommon and is usually a disease of 6th-7th decade. Diverticulitis occurs in 6.5-10% patients. Other complications include perforation, bleeding and bowel obstruction. • Small bowel diverticulitis is a rare entity and is often overlooked as a cause of abdominal pain in the elderly because of resemblance of imaging features with other causes of acute abdominal pain and its anatomical location within the mesenteric border at surgery where these diverticuli are obscured by large penetrating blood vessels. • It is imperative to be familiar with imaging features and to look for clues which may suggest small bowel diverticulitis, such as the presence of non-inflamed diverticuli in adjacent small bowel and presence of a normal appearing appendix in cases of ileal diverticulitis. Delayed diagnosis leads to complications and can be fatal with mortality rate of 25-50%.• Accurate diagnosis on imaging aids in appropriate patient management, and may help reduce morbidity and mortality.

TABLE OF CONTENTS/OUTLINE

Describe etiology, pathophysiology and complications of small bowel diverticulosis and diverticulitis.To review the imaging findings of small bowel diverticulosis and diverticulitis on CT.Describe other differential diagnosis for causes of right lower quadrant pain which mimic imaging appearance: for example uncomplicated and complicated acute appendicitis, colonic diverticulitis, Crohn’s disease, acute typhlitis, Meckel’s diverticulitis, etc.

EREE-2 Paranasal Sinuses on Acute Head Imaging: What the Radiologist Needs to Know

Participants
Veronika Majcher, MD, Cambridge, United Kingdom (*Presenter*) Nothing to Disclose

TEACHING POINTS

Incidental findings involving the paranasal sinuses are common on CT and MR head scans performed in the acute setting. In the majority of cases, opacification of sinuses is secondary to mild inflammation and can be safely dismissed. However, recognising patterns and imaging features of paranasal sinus findings on these scans can opportunistically pick up pathology benefiting from further investigation or even identify the cause of presenting symptoms. After reviewing this exhibit, the reader will be able to: 1) Revise the basic anatomy and drainage pathways of the paranasal sinuses in order to understand patterns of disease; 2) review common and rarer benign and invasive paranasal sinus pathology using case examples; 3) recognise worrisome features that necessitate further investigation and referral.

TABLE OF CONTENTS/OUTLINE

1. Anatomy and imaging of the paranasal sinuses 2. Drainage pathways and patterns of disease 3. Interpretation and significance of pathological changes within paranasal sinuses a. Mucosal thickening b. Soft tissue density and bone changes c. Specific signs of acute/chronic/fungal disease 4. Signs of invasive and infiltrative disease a. Review areas 5. Complications of sinusitis

EREE-20 Emergency Radiology Peer Learning Pearls: Focus on Appendix Cases

Participants
Alyssa Sherwill, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

•Discuss the use of peer learning in evaluating cases of misdiagnosed appendicitis on CT, MRI, and ultrasound •Careful evaluation for defects in the appendiceal wall is crucial to assess for gangrenous appendicitis, particularly if there is an appendicolith •Air in the appendix is not reliable marker of a normal appendix, and can be mistaken on MRI as an appendicolith •Secondary ancillary findings of appendicitis may be subtle and should not be ignored •Many appendicitis overcalls are related to adjacent inflammatory processes •Appendiceal malignancy and mucoceles can simulate appendicitis

TABLE OF CONTENTS/OUTLINE

1.Introduction to Peer Learning 2.Complicated Appendicitis a.Gangrenous Appendicitis b.Perforated Appendicitis c.Remote Complications of Appendicitis 3.Missed Appendicitis a.Air in Appendix b.Subtle Ancillary Findings c.Appendiceal Location in Pregnancy d.Satisfaction of Search Bias 4.Appendicitis Overcalls a.Secondary Appendicitis i.Pelvic Inflammatory Disease ii.Cecal or Ascending Colonic Diverticulitis iii.Infectious or Inflammatory Enteritis iv.Bile Leak b.Endometriosis c.Cystic Fibrosis d.Chronic Appendicitis 5.Neoplastic Mimickers a.Appendiceal Mucinous Neoplasms b.Carcinoid c.Metastases

EREE-21 Stroke Alert!” ER Dilemma, What is Next? CT Perfusion (CTP) or Fast Brain MRI

Participants
Ahmed Moawad, MD, Darby, PA (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Reviewing the current imaging guidelines for acute stroke - Comparing the difference between fast MRI and CTP in diagnosis of different acute neurological deficit scenarios - Introducing the use of different imaging modalities in management decisions - Highlighting role of Fast MRI and CTP in follow up treated stroke.

TABLE OF CONTENTS/OUTLINE

Introduction - Fast brain MRI protocol CTP protocol and parameters - - - Current guidelines in stroke imaging - Limitation of fast brain MRI Drawbacks and pitfalls of CTP # Different scenarios of acute neurological deficit diagnosis - Accuracy of Fast MRI and

CTP in stroke diagnosis - Imaging in Ischemic stroke vs. Intra-cerebral hemorrhage - Stroke with unknown duration “Wake-up” - Transient ischemic attack - Stroke mimickers: Seizures, Hypoglycemia, Cerebral venous thrombosis, Acute multiple sclerosis flare, Migraine aura- Posterior fossa stroke - Lacunar infarct - Hyperacute infarcts - Hypoperfusion state: Cardiac failure, Shock, Chronic carotid artery occlusion# Management of ischemic stroke - Predicting outcome using imaging modalities and clinical scores Identification of final ischemic infarct core * Mismatch between initial infarct core - final infarct * Ghost infarct core - Identification of ischemic salvageable tissue (Penumbra) * Role of perfusion imaging (CTP and MR perfusion) * DWI in identification of penumbra* MRI vs. CTP for Thrombectomy Selection - DEFUSE 3 and DAWN trial - Management of stroke by DWI-FLAIR mismatch vs. CTP - WAKE UP vs. EXTEND trial# Follow up stroke treatment - Follow up hemorrhagic transformation - Assessment of reperfusion state and infarct volume

EREE-22 Spinal Hematomas: Pearls and Pitfalls for MRI Evaluation in Emergency Radiology

Participants
Maria Galante I, MD, Santander, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) To make a pictorial review of the main meningeal layers and the 4 spaces: epidural, subdural, subarachnoid and intramedullary space. 2) To identify in MRI technique the different types of spinal hematomas 3) To detail the most important imaging features of each type of hematoma, in order to differentiate one from another. 4) To describe the main alternative diagnosis 5) To highlight pitfalls that may be found during the imaging assessment. 6) To suggest an MRI protocol for the evaluation of spinal hematomas for non-subspecialized radiologists

TABLE OF CONTENTS/OUTLINE

Etiology of spinal hematomas Symptoms Anatomical Review of the spine: layers and spaces MRI appearance of blood in routine sequences MRI protocol for the evaluation of spinal hematomas in emergency radiology Epidural hematomas Subdural hematomas Subarachnoid Hemorrhage Intramedullary Hematoma Pitfalls and differential diagnosis Treatment Conclusions

EREE-23 Confronting and Overcoming Emergency Radiology Biases

Awards
Identified for RadioGraphics
Magna Cum Laude

Participants
Se-Young Yoon, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

- With the transition to peer learning review of cases, many diagnostic errors in radiology can be attributed to cognitive biases. Because of the high volume and rapid pace of emergency radiology, exam interpretations may be heavily reliant on biases and heuristics. Thus, a more focused evaluation of emergency radiology specific biases is needed to avoid diagnostic pitfalls.- We aim to review common biases in emergency radiology in this exhibit, organized by the expected stage of occurrence during the process of reading an imaging study.- Several cognitive biases that have not yet been defined in radiological publications, to the best of our knowledge, will be discussed. These include: triage cueing, contrast effect, provider bias, treater bias, and need for closure.- Emergency radiology peer learning case examples are provided to illustrate how and which biases may have occurred.- Strategies to recognize and overcome biases will be discussed, with an emphasis on those that may be more prevalent in the emergency setting.

TABLE OF CONTENTS/OUTLINE

- Cognitive biases commonly seen in emergency radiology-- Definitions and brief examples (list on slide #1)- Peer learning case examples illustrating various cognitive biases- Strategies in recognizing and overcoming biases

EREE-24 An Approach to Acute Traumatic and Non-traumatic Diaphragmatic Abnormalities

Awards
Identified for RadioGraphics
Certificate of Merit

Participants
Nicolas Murray, MD, FRCPC, Vancouver, BC (*Presenter*) Co-investigator, Siemens AG

TEACHING POINTS

Acute traumatic and non-traumatic diaphragmatic abnormalities are a heterogenous group of relatively uncommon pathologies affecting the normal structure and function of the diaphragm. These include diaphragmatic hernia, laceration, traumatic and spontaneous rupture, thoracoabdominal fistulae, infection, and endometriosis. Because the diaphragm is the primary inspiratory muscle, disruption to its integrity can cause clinically significant consequences. Imaging plays an essential role in investigation. However, these pathologies can be easily missed as findings are often subtle. Therefore, understanding the anatomy and radiologic findings allows for efficient and accurate diagnosis and management.

TABLE OF CONTENTS/OUTLINE

Diaphragm anatomy and normal variation. Introduction and differential diagnosis of acute diaphragmatic abnormalities. Imaging modalities for the diaphragm. Pathogenesis, incidence, clinical presentation, diagnosis, radiologic findings, and general management of non-traumatic and traumatic diaphragmatic abnormalities including (1) diaphragmatic hernias, (2) spontaneous diaphragm rupture, (3) endometriosis-related diaphragmatic disease, (4) trans-diaphragmatic fistula, (5) infection of the diaphragm, (6) blunt injuries, (7) penetrating injuries, and (8) traumatic diaphragm rupture. Summary of take-home points.

EREE-25 CT of Blunt Acute Thoracic Aortic Injury: A Primer for Diagnostic Radiologists

Awards
Certificate of Merit

Participants
Alok Mittal, MBBS, MD, Muscat, Oman (*Presenter*) Nothing to Disclose

TEACHING POINTS

-To identify and differentiate blunt traumatic aortic injuries from various normal variants and injury mimics on CT.-To illustrate direct and ancillary CT features of blunt traumatic aortic injuries.-To differentiate minimal and severe aortic injuries using original illustrations and animations.-To correlate aortic injuries with the most commonly used classification schemes.-To summarize the management algorithm and the role of interventional radiologists in acute aortic injury.

TABLE OF CONTENTS/OUTLINE

-MDCT protocol to diagnose and characterize aortic injury patterns.-Review of the anatomical variation and mimics.-Spectrum of aortic injuries on CT and how to correctly characterize them?-Aortic injury classification systems and simplified approach.-Common pitfalls- how to identify and avoid them?-Management of Aortic injuries and the role of the interventional radiologist.

EREE-26 Penile Trauma: From Diagnosis to Treatment

Participants
Victor Jabour, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purposes of this exhibit are: 1. To review the main indications of penis ultrasound in the context of urgency 2. To show the technique of the penis ultrasound 3. To show based on cases from our ultrasound group important structures that must be evaluated in the ultrasound of the penis 4. To review based on cases from our ultrasound group the main penile injuries in the context of emergency and the respective treatments

TABLE OF CONTENTS/OUTLINE

Main indications for penile ultrasound in an emergency setting 2 Penile ultrasound technique and documentation protocol used in our ultrasound group 3 Illustrate with cases from our ultrasound group the main penile injuries in the context of emergency and the respective treatments

EREE-27 Artificial Intelligence (AI) Imaging Algorithms in the ICU: Augmenting the Radiologist

Participants
Kaustav Bera, MD, Cleveland, OH (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Learn about the unmet needs when it comes to ICU imaging both from the point of view of the primary provider as well as the radiologist 2. How Artificial Intelligence (AI) algorithms can benefit both the ICU physician as well as the reading radiologist 3. Illustrate real-world use cases where AI-imaging algorithms are already in use in the ICU as well as potential high-yield use cases for AI4. Challenges and limitations that AI enabled tools need to overcome before seamless integration in ICU

TABLE OF CONTENTS/OUTLINE

1. Fundamentals of imaging in the ICUa. What the primary team physician wantsb. What the reading radiologist wantsc. Unmet need in the ICU which AI can fulfill2. A Brief Primer on AIa. AI, Machine Learning, Deep Learning - A Brief Primer.b.Framework of AI in clinical use 3. Modalities and use cases for AI in ICU Imaginga. Imaging to determine ICU Admission/Transfer i. AI to predict which COVID-19 patients need urgent mechanical ventilation ii. AI to diagnose cholecystitis, ascending cholangitis from US imaging iii. AI to automatically detect cord compression/cauda equina from spinal MRI iv. AI to detect stroke v. AI to detect hemorrhageb. Imaging within the ICU for monitoring/change in status i. AI for urgent pathology on Chest radiograph (Pneumothorax) ii. AI for lines/tubes detection on Chest radiograph iii. AI to detect Pulmonary Embolism iv. AI to detect Acute aortic pathology 4. Real world use cases of seamlessly integrated AI tools 5. How AI can benefit ICU management both for the radiologist and the physician 6. Future directions

EREE-28 CT Evaluation of Abdominal Emergencies in Oncologic Patients

Awards
Certificate of Merit

Participants
Joon-Il Choi, MD, PhD, Seoul, Korea, Republic Of (*Presenter*) Research Grant, Guerbet SA;Research Grant, Samsung Electronics Co, Ltd

TEACHING POINTS

1. To suggest tailored MDCT protocols for evaluating oncologic abdominal emergencies based on symptoms and clinical impressions 2. To familiarize with various common and uncommon medical risk factors of abdominal emergencies in oncologic patients and pertinent MDCT findings 3. To systemically evaluate causes of acute abdomen in oncologic patients in an MDCT

TABLE OF CONTENTS/OUTLINE

1. Tailored MDCT protocols for oncologic abdominal emergencies evaluation 1) Recommended routine protocol for a general indication in the emergency room 2) Symptom and clinical impression-based optimal protocols - Clinical scenarios: solid organ bleeding, hollow viscus bleeding, bowel obstruction, bowel perforation, biliary obstruction, acute renal failure 2. Various medical risk factors of abdominal oncologic emergencies 1) Therapy-related risk factors - Chemotherapeutic agent - External radiation therapy - Locoregional treatments - Recent major surgery - Other invasive therapeutic procedure 2) Immunocompromised host 3) Bleeding tendency of the host 3. A systematic radiologic approach for abdominal oncologic emergencies 1) An organ-based assessment for the causes of the acute abdomen in oncologic patients 2) MDCT findings of common oncologic abdominal emergencies 3) Proposed structured report form to facilitate a thorough evaluation of the abdomen

EREE-29 Bone-induced Streak Artifact Reduction in Emergency Abdominal CT Using the Deep Learning-based Image Reconstruction

Participants
Tetsuya Hirairi, MS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

The streak artifact, which is frequently observed in abdominal CT images obtained at the emergency trauma patients with arms-down positioning, is known to degrade diagnostic image quality. To solve this problem, deep learning-based image reconstruction is adapted to in emergency abdominal CT. Advanced intelligent Clear-IQ Engine (AiCE), is a type of deep learning-based image reconstruction, is compared with conventional hybrid Iterative reconstruction (HIR). Quantitative artifact estimation is evaluated by the normalize artifact index (nAI) with an abdominal phantom between two dense objects which is simulated arms down positioning. CT number inaccuracy is evaluated by abdominal CT images of 20 clinical patients with arms-down positioning by setting region of interest in the liver and the spleen. As a result, DLR method significantly decreased nAI and improved the CT number accuracy compared to HIR. It was suggested that DLR was useful for the bone-induced streak artifact reduction in emergency abdominal CT.

TABLE OF CONTENTS/OUTLINE

1. Clinical problems with conventional emergency CT.2. Deep learning-based image reconstruction technology AiCE.3. Normalize artifact index of the fantom simulated arms down positioning.4. Improvement of the CT number accuracy. 5. Clinical performance in Emergency CT.

EREE-3 No Time to Dye: How to Diagnose and Manage Critical Diseases with Non-contrast Enhanced CT

Participants
Yukiko Michishita, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) To share useful imaging findings of various critical diseases in non-contrast enhanced CT (NCECT), with emphasis on the significance of prompt response to treatment regardless of contrast enhanced CT (CECT). 2) To understand the settings where CECT is still required for appropriate treatment strategies as well as diagnosis.

TABLE OF CONTENTS/OUTLINE

To learn how to diagnose and manage critical diseases with NCECT, following topics are discussed; 1) Classical findings on CECT, 2) Useful findings on NCECT, 3) Clinical perspective, 4) Significance of prompt action according to findings on NCECT, 5) Diagnostic accuracy of NCECT, 6) Significance of CECT.Featured pathologies are as follows; A. Acute thromboembolisms: 1) Cerebral infarction, 2) Acute pulmonary embolism, 3) SMA embolism/thrombois, 4) Cerebral venous sinus thrombosis. B. Vascular diseases: 1) Acute aortic dissection, 2) SMA dissection, 3) Impeding rupture of aortic aneurysm. C. Bleedings: 1) Trauma and other bleeders, 2) Gastrointestinal bleeding, 3) Intracranial hematoma. D. Ischemia: 1) Bowel strangulation, 2) Non-occlusive mesenteric ischemia. E. Inflammatory diseases and others: 1) Gangrenous appendicitis, 2) Severe acute cholecystitis, 3) Severe acute pancreatitis, 4) Hepatic abscess, 5) Mycotic aneurysm.

EREE-30 Cervical Catastrophe: Identifying Tracheal Injury Before It Is Too Late

Participants
Ethan Jiang, BSc, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Early and accurate detection of tracheal trauma is crucial to reduce the significant morbidity and mortality associated with these injuries.2. A low threshold of suspicion for tracheal injury facilitates timely decision-making and intervention in the setting of trauma.3. Injuries to neighboring structures, such as the esophagus, are often concomitant to tracheal injury following blunt and penetrating neck trauma.

TABLE OF CONTENTS/OUTLINE

We outline an approach to suspected tracheal injury in the setting of trauma. The focus will be on using imaging to change clinical outcomes through early identification, especially when the clinical presentation is nonspecific.1. Overview of relevant neck anatomy. 2. Epidemiology of tracheal trauma. 3. Etiology, mechanisms, and pathophysiology; a) Blunt, penetrating, and iatrogenic tracheal trauma; b) Different anatomical sites of injury. 4. Clinical presentation predictive of impending deterioration. 5. Approach to diagnosis in cases of suspected tracheal trauma; a) Role of X-ray; CT, fluoroscopy, and bronchoscopy; b) Pearls and pitfalls of diagnosis. 6. Key imaging findings to guide non-operative vs surgical management. 7. Short- and long-term complications of tracheal injuries; a) Identifying concomitant injuries, such as esophageal trauma.

EREE-31 Revisiting the Renal Trauma: An Illustrated Journey

Participants
Ali Baykan, MD, Adiyaman, Turkey (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To describe the mechanisms of the renal trauma 2. To discuss imaging features of renal trauma and CT technique 3. To discuss the grading systems (The American Association for the Surgery of Trauma) related to renal trauma 4. To highlight the importance of kidney injuries in patients with abdominal trauma

TABLE OF CONTENTS/OUTLINE

Introduction Incidence, mechanism of kidney injury, clinical features, and indications for imaging in renal trauma Description of current American Association for the Surgery of Trauma kidney injury gradesManagement of kidney injury Conclusion

EREE-32 The Liver Trauma: Imaging and Multidisciplinary Approach

Participants
Ali Baykan, MD, Adiyaman, Turkey (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To describe the mechanisms of the liver trauma 2. To discuss imaging features of liver trauma and CT technique 3. To discuss the grading systems (The American Association for the Surgery of Trauma) related to liver trauma 4. To highlight the importance of liver injuries in patients with abdominal trauma

TABLE OF CONTENTS/OUTLINE

Introduction Incidence, mechanism of liver injury, clinical features, and indications for imaging in liver trauma Description of American Association for the Surgery of Trauma's updated liver injury scoring scale Multidisciplinary management of liver injury Conclusion

EREE-33 Pancreatic Trauma: Imaging and Illustrations of a Fragile Organ

Awards
Certificate of Merit

Participants
Ali Baykan, MD, Adiyaman, Turkey (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To describe the mechanisms of the pancreatic trauma 2. To discuss imaging features of pancreatic trauma and imaging (CT, MRCP, etc.) techniques 3. To discuss the grading systems (The American Association for the Surgery of Trauma) related to pancreatic trauma 4. To highlight the importance of pancreatic injuries in patients with abdominal trauma

TABLE OF CONTENTS/OUTLINE

Introduction Incidence, mechanism of pancreatic injury, clinical features, and indications for imaging in pancreatic trauma Description of American Association for the Surgery of Trauma's updated pancreatic injury scoring scale Multidisciplinary management of pancreatic injury Conclusion

EREE-34 Limitations of AI-based Hemorrhage Detection: Where AI Can't Help You (Yet)

Participants
Stefan Niehues, MD, Berlin, Germany (*Presenter*) Speaker, Bracco Group;Speaker, Guerbet SA;Speaker, Canon Medical Systems Corporation;Speaker, Teleflex Incorporated

TEACHING POINTS

Detection of intracranial hemorrhage is a reliable application of AI, but is susceptible to artifacts. False-positive findings are related to motion artifacts, beam hardening artifacts due to foreign material inside or outside the patient, calcifications i.e. after surgery or with patients with meningioma or metastasis.False-negative findings can occur in patients with subacute hemorrhage, very subtle subarachnoidal bleedings, intracranial contrast extravasation, and chronic subdural hematomas.

TABLE OF CONTENTS/OUTLINE

1) AI-based intracranial hemorrhage detection - basics and numbers 2) Correct findings3) False positives 4) False negatives5) Approaches for future developments

EREE-35 Delivering Clinical Impact in Emergency Departments: CXR xAI Pipeline for Comprehensive Clinical Risk Prediction

Participants
Michelle Chua, Brookline, MA (*Presenter*) Nothing to Disclose

TEACHING POINTS

Integration of clinical information and radiological findings is required for clinical risk predictionComprehensive risk prediction models may be developed using a fine-tuning approach, which is more efficient than a full training approachOur CXR xAI model was pre-trained to detect 20 radiographic featrues and subsequently used, in combination with clinical information, to predict oxygen requirement in ED patients with COVID-19Calibrated classifier confidence is displayed and comparable CXRs are extracted from the Model-Derived AtlasOur CXR xAI model captures a broad scope of cardiorespiratory pathophysiological manifestations and cardiothoracic comorbidities and may also be used, for example, to predict unplanned return to ED in patients with acute heart failure and elderly patients with community acquired pneumoniaAs CXRs are inexpensive and routinely obtained, fully automated risk prediction using radiographic features may improve the safety and quality of clinical care in EDs

TABLE OF CONTENTS/OUTLINE

Full training and fine-tuning approaches for comprehensive clinical risk predictionCXR xAI model architecture and case illustration for acute heart failureCOVID-19 xAI pipeline for prediction of oxygen requirement and model performance metrics

EREE-37 The Acute Abdomen: What the Surgeon Wants to Know - A Case-Based Survival Guide for the On-Call Resident

Awards
Identified for RadioGraphics

Participants
John Kirby, MD, Rochester, MN (*Presenter*) Nothing to Disclose

TEACHING POINTS

Abdominal pain is a common presenting symptom in the Emergency Department. Many life-threatening conditions can present as an "acute abdomen," requiring surgical intervention. The radiologist may be the first person to suggest the need for surgical evaluation and can provide key information to the surgeon regarding potential complications and pertinent normal variants. Understanding the surgeon's perspective can lead to concise reports, faster turnaround time, and improved outcomes.

TABLE OF CONTENTS/OUTLINE

Review common imaging modalities in the non-traumatic acute setting and preferred protocols for evaluating acute abdominal pain. Discussion of the five major categories of abdominal pain requiring surgical intervention; Ischemia, obstruction, infection, perforation, and active bleeding. Case-based review demonstrating examples of the most common etiologies from each of the major categories. Each case will include a discussion of significant findings to make the diagnosis, pertinent anatomical variants, and a summary table of relevant reporting findings to the surgeon. Many of our cases will contain a QR code that the viewer can scan with their mobile device to access an interactive PACS to review the case and more accurately simulate real-life scenarios. Conclusion: At the end of the exhibit, we hope that the reader will better understand findings relevant to the surgeon and can assist in identifying and reporting relevant potential complications.

EREE-38 Acute Mechanical SBO: A Step-by-step Guide for Radiology Residents!

Participants
Abdul-Rahman Abualruz, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Acute mechanical small bowel obstruction (SBO) is a common surgical emergency with high mortality rates when complicated by bowel ischemia (up to 40%). Computed Tomography (CT) has an essential role in confirming the SBO diagnosis, identifying the cause of obstruction, detecting associated variations, and evaluating severity. CT outperforms physical exam and laboratory testing with high specificity in predicting bowel ischemia which is crucial for correct and timely management of SBO.

TABLE OF CONTENTS/OUTLINE

Review clinical management guidelines of SBO. Critical imaging findings to look for and include in the radiology report that impacts clinical management presented via a suggested structured report for SBO. CT imaging evaluation of SBO (CT protocol, use of IV and PO contrast, added value of Dual Energy CT). Review CT imaging criteria for diagnosis of acute mechanical SBO. A pictorial review of causes of SBO (extrinsic vs. intrinsic etiologies) and pitfalls for correct interpretation with emphasis on: Adhesive vs. Non-adhesive SBO, Closed vs. Open loop obstruction, Partial vs. Complete obstruction, Specific CT findings that predict bowel ischemia. A step-by-step summary guide for SBO diagnosis.

EREE-39 The Value of Ultrasound in Bowel Pathology in the Emergency Room

Participants
Maria P. Moncayo Hinojosa, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) Highlight the diagnostic performance of ultrasound in acute bowel pathology.2) Review of the anatomy and histology of the bowel and its correlation with the ultrasound image.3) Exhibition of the technique and of the diagnostic keys for its correct interpretation.4) Ultrasound review of intestinal pathology and its correlation with computed tomography.

TABLE OF CONTENTS/OUTLINE

1) Introduction, generalities and anatomy of the bowel.2) Anatomical correlation between ultrasound and the histology of the bowel.3) General considerations and ultrasound exploration technique.4) How to recognize pathological intestinal loops?5) Radiological cases and surprise diagnoses in the ultrasound emergency room of our health center.5)Conclusions.

EREE-4 Revised American Association for the Surgery of Trauma (AAST) Scales

Awards
Identified for RadioGraphics
Cum Laude

Participants
Irene Dixe de Oliveira Santo, MD, New Haven, CT (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Review the usefulness of the American Association for the Surgery of Trauma Organ Injury Severity (AAST OIS) scale • Describe the main changes to the revised 2018 AAST OIS compared to the 1994 and 1989 AAST scales • Discuss imaging specifications and protocoling considerations in suspected organ injury due to blunt abdominal trauma • Provide an overview of the recommended management of solid injury organ trauma and how it is affected by grading

TABLE OF CONTENTS/OUTLINE

History, usefulness, and implications of grading in traumaValidation of the liver, spleen, and kidneys scales and impact on mortality, operative rate, and hospitalization costStandard CT protocol and technique, the benefit of dual-phase imaging, and indications of the excretory phaseThe role of alternative imagingRevised AAST grading with multiple examples from our institutionCurrent management guidelines

EREE-40HC Obstructive Hydrocephalus - Not So Simple After All

Participants
Michal Holesta, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Obstructive hydrocephalus is a severe condition, that can manifest with acute symptoms or slowly developing signs of increased intracranial pressure. This usually depends on the type of underlaying condition and the speed with which the hydrocephalus develops. We will overview common and rare causes of obstructive hydrocephalus, diagnostic algorithms and imaging findings on CT and MRI, including signs of transependymal edema, using cases from our clinical practice. We will also present several cases of rare causes of acute hydrocephalus, including colloid cyst, blood clot in aqueductus Sylvií (mimicking flow void on T2W) and neurosarcoidosis.

TABLE OF CONTENTS/OUTLINE

1. Overview, etiology and pathophysiology of obstructive hydrocephalus. Typical clinical symptoms. 2. Diagnostic algorithms and imaging findings on CT and MRI. Imaging signs of transependymal edema. 3. Case series of rare causes of acute hydrocephalus. 4. Treatment and follow-up of obstructive hydrocephalus. 5. Conclusion and key imaging points. Please visit the Learning Center to also view this presentation in hardcopy format.

EREE-41 Pearls and Pitfalls in postmortem imaging: Dead Men Do Tell Tales

Awards
Certificate of Merit

Participants
Yohei Ikebe, MD, PhD, Sapporo, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To summarize the typical and atypical postmortem changes 2. To review the diagnostic findings of postmortem imaging

TABLE OF CONTENTS/OUTLINE

1. introduction 1-A. role of postmortem imaging 1-B. methods of postmortem CT and MRI scan 2. early postmortem changes 2-A. hypostasis 2-B. vessel wall and vessel cavity 2-C. air way and pleural fluid retention 2-D. brain 2-E. others 3. late postmortem changes 3-A. putrefaction 3-B. autolysis 3-C. gastromalacia, oesophagomalacia 4. pitfalls 4-A. changes of cardiopulmonary resuscitation 4-B. course of postmortem changes 5. diagnostic findings 5-A. Acute hemorrhage (aortic dissection, aortic aneurysm rupture, etc.) 5-B. trauma 5-C. hanging 5-D. hypothermia 5-E. burn death 5-F. drowning

EREE-42 Making the Grade: A Pictorial Review of the Revised 2018 AAST Abdominal Solid Organ Injury Scales

Participants
Samuel Elias, MD, West Caldwell, NJ (*Presenter*) Nothing to Disclose

TEACHING POINTS

The goal of this exhibit is to provide a pictorial review of the revised 2018 AAST injury scoring scale for the liver, kidney, and spleen. Every injury grade for each organ is presented with an original diagram alongside the imaging criteria. Teaching points are presented in a clear manner and include descriptions of key radiologic terms, recognition of benign and pathologic mimics, protocoling technique, and clinical management considerations. Angiographic and intraoperative images from our interventional radiology and trauma surgeon colleagues are also included to help cultivate an appreciation of the multidisciplinary management of these injuries.

TABLE OF CONTENTS/OUTLINE

1) Introduction. 2) Spleen -Grades 1-5 (diagrams, definitions, teaching points, imaging pearls) -Cases (CT, angiographic, and/or intraoperative images with description of findings, management, and teaching points). 3) Liver -Grades 1-5 (diagrams, definitions, teaching points, imaging pearls) -Cases (CT, angiographic, and/or intraoperative images with description of findings, management, and teaching points). 4) Kidney -Grades 1-5 (diagrams, definitions, teaching points, imaging pearls) -Cases (CT, angiographic, and/or intraoperative images with description of findings, management, and teaching points). 5) Conclusion

EREE-43 Liver or Die Situation--Spleen better days: Reviewing the 2018 Updates of the AAST Liver and Spleen Injury Scoring Scales

Participants
Elias Gunnell, MD, Chapel Hill, NC (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Trauma is the most frequent cause of death in the first four decades of life, and the abdomen is the third most common site of injury. 2. The radiologist plays a crucial role in the evaluation and description of splenic and liver injury in abdominal trauma. 3. Accurate description of splenic and liver injury is a pivotal component of patient management and treatment selection. 4. Understanding the revised AAST Liver and Spleen Injury Scales is necessary for accurate description of abdominal trauma as operative rate and increased mortality are associated with increasing grades of injury.

TABLE OF CONTENTS/OUTLINE

This educational exhibit will discuss the updated 2018 American Association for the Surgery of Trauma (AAST) guidelines for injury scoring, pertaining to the liver and spleen. The presentation will include the following: - Briefly overview the statistics for abdominal trauma and incidence of liver and spleen injury. - Discuss the updated AAST Injury Scoring Scale and compare it to the previous version. - Review and illustrate the multiple grades of liver injury, with important imaging findings. - Review and illustrate the multiple grades of splenic injury, with important imaging findings. - Explain how patient management changes based on the grade of injury.

EREE-44 Imaging in Non-accidental Trauma - A Primer for Trainees

Participants
Surabhi Subramanian, MBBS,MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

• 1. Illustrate the mechanism and mode of presentation • 2. Outline the diagnostic imaging protocol • 3. Discuss the typical presentation and mimicker

TABLE OF CONTENTS/OUTLINE

Nonaccidental trauma is one of the prominent causes of childhood injury and death in the pediatric population. This exhibit will serve as a primer for radiology trainees to diagnose NAT in an emergency setting. The most common mechanism of NAT is violent

shaking. Some highly specific lesions of child abuse are metaphyseal fractures, multiple rib fractures of different ages, scapular fractures, sternal fractures, and posterior vertebral element fractures. More than 60 % of child abuse cases present in emergency settings. Radiologists can be the first to suggest the possibility of child abuse. Infant's head is larger in comparison to the body making them more prone to CNS injury. CT head, 3D reconstruction is especially helpful in detecting skull fractures. MRI is very sensitive to look for blood products in the brain and spine. The skeletal survey must be ordered for patients suspected with child abuse. Nuclear imaging is performed if skeletal survey is equivocal. Radiologists must be aware of highly suspicious radiological findings and mimickers of nonaccidental trauma.

EREE-45 Vascular Injury Following Trauma: A Pictorial Review of Findings on CT Angiography

Participants
Navpreet Khurana, MBBS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Describe the range of findings of vascular injury following blunt and penetrating trauma on CT angiogram. 2. Correlate findings on physical examination, CT angiogram, and catheter angiogram. 3. Appreciate the pitfalls of CT angiography, which lead to false positives and false negatives. 4. Describe the interventions for vascular injury.

TABLE OF CONTENTS/OUTLINE

1. CT angiogram protocol - how to optimize the detection of traumatic vascular injury. 2. Range of appearance of active bleeding on CT angiogram. 3. The value of the non-contrast acquisition. 4. Arterial spasm vs. arterial transection - similarities and differences in appearance. 5. Correlation of findings on CT angiogram with catheter angiogram. 6. Surgical interventions for vascular injury.

EREE-46 Trauma Drama: Breaking Down the 2018 AAST Scoring for Spleen and Liver

Participants
Katherine Copely, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Review the updated 2018 AAST guidelines for Spleen and Liver Injuries?Discuss the importance of imaging protocols?Recognize key features on CT images and correlating diagrams to improve recall and recognition?Examine challenging cases and pertinent pitfalls

TABLE OF CONTENTS/OUTLINE

The purpose of this presentation is to discuss the rationale for updating the AAST grading systems and what updates occurred between 1994 and 2018 focusing on the spleen and liver, the implications for patient care, as well as to discuss importance of imaging protocols in detecting these injuries.An illustrated table of spleen and liver injuries will be included to highlight the similarities and differences in grading criteria for each organ. Image intensive examples of each grade of liver and spleen injuries will comprise the bulk of the presentation. Challenging cases and pitfalls will help cement and allow practice of these key imaging findings.

EREE-47 Splenic Trauma: When the Neglected One Hurts

Participants
Ali Baykan, MD, Adiyaman, Turkey (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To describe the mechanisms of the splenic trauma 2. To discuss imaging features of splenic trauma and CT technique 3. To discuss the grading systems (The American Association for the Surgery of Trauma) related to splenic trauma 4. To highlight the importance of splenic injuries in patients with abdominal trauma

TABLE OF CONTENTS/OUTLINE

Introduction Incidence, mechanism of splenic injury, clinical features, and indications for imaging in splenic trauma Description of American Association for the Surgery of Trauma's updated splenic injury scoring scale Multidisciplinary management of splenic injury Conclusion

EREE-5 Nontraumatic Temporal Bone Emergencies: A Non-traumatizing Guide for Radiologists

Awards
Identified for RadioGraphics

Participants
Rodrigo Carneiro, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

- To identify important anatomic landmarks in the temporal bone.- To review the imaging technique and protocols for the evaluation of temporal bone emergencies.- To recognize the clinical presentations and imaging features of nontraumatic temporal bone emergencies

TABLE OF CONTENTS/OUTLINE

- Introduction- Temporal Bone Anatomy- Imaging Technique and Protocols - Clinical Presentations and Imaging Findings of Nontraumatic Temporal Bone Emergencies with Multiple Teaching Cases (External, Middle, and Inner Ear)- Conclusions- References

EREE-6 Acute Temporal Bone Pathology

Participants
Ashraf Abdulhalim, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. A simplified anatomic checklist-based approach can enable an emergency radiologist to accurately and efficiently identify acute temporal bone pathology, and this approach will be reviewed in this exhibit.2. The radiologist plays an important role by identifying key imaging findings and providing diagnoses that can direct treatment by prompting an emergency physician to admit a patient for inpatient management, order a surgical consult, or order further imaging to check for related complications. The absence of these findings are also pertinent negatives that enable clinicians to proceed with treatment in the ED or discharge a patient with outpatient follow-up.3. This exhibit will review traumatic and acute non-traumatic pathology in a case-based format, with emphasis on key imaging findings that affect management and prognosis.

TABLE OF CONTENTS/OUTLINE

I. Relevant anatomic structures and landmarks in the temporal bone for the emergency radiologistII. Checklist for non-traumatic and traumatic pathologyIII. Non-traumatic Pathologya. Infection i. Acute otitis externa ii. Malignant otitis externa iii. Coalescent mastoiditis with Bezold abscess iv. Temporomandibular joint abscessb. Aggressive neoplasm that might present with acute symptoms i. Langerhans cell histiocytosis ii. ParagangliomaIV. Traumatic Pathologya. Otic capsule violating versus non-otic capsule violating fractures b. Horizontal versus longitudinal fractures c. Isolated tympanic plate fracture d. Sutures/fissures that mimic fractures

EREE-7 Cardiac Findings Detectable on Non-Gated CT: What the Emergency Radiologist Needs to Know

Awards
Cum Laude

Participants
Dana Galvan, MD, Albuquerque, NM (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. After completing this educational exhibit, the learner will have an improved understanding of cardiac findings that can be identified on non-gated CT examinations, performed in the emergency setting.2. Be able to differentiate pathologic abnormalities based on key cardiac anatomic landmarks including the pericardium, myocardium, cardiac chambers, appendages, and coronary arteries.3. Recognize key device and procedural complications on non-gated CT emergency situations.

TABLE OF CONTENTS/OUTLINE

-Introduction to the use of non-gated chest CT as an imaging modality in the emergency setting-Anatomy review of normal cardiac anatomy as seen on non-gated CT with labeling of structures and normal size measurements -Pericardium radiologic abnormalities including differential diagnosis, clinical significance, and follow-up recommendations with case examples and imaging: Anemia, Congenital Absence, Effusions, Abnormal and Normal Enhancement, Defects, and Calcification-Myocardium radiologic abnormalities including differential diagnosis, clinical significance, and follow-up recommendations with case examples and imaging: Myocardial infarction, Abnormal and Normal Fat Deposition, Cardiomyopathies-Cardiac Masses radiologic abnormalities including differential diagnosis, clinical significance, and follow-up recommendations with case examples and imaging: Cardiac pseudo-masses, Cardiac Thrombus, Cardiac Neoplasms-Other Cardiac Anomalies Detected on Non-Gated CT including differential diagnosis, clinical significance, and follow-up recommendations with case examples and imaging: Engorged Coronary Arteries, Post-Procedural Complication, and Device Failures

EREE-8 Imaging Features of Torsion of Various Organs in the Whole Body

Awards
Identified for RadioGraphics

Participants
Akihiro Nakamata, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Torsion can present in various organs in the whole body, which cause a decreased blood flow due to twisted blood vessels. Therefore, emergent surgical intervention is often necessary to improve the blood flow. Radiologists should recognize imaging features of torsion of various organs in the whole body for the management of treatment options.The purpose of this exhibit is:1. To review a torsion of various organs in the whole body. 2. To discuss the clinical and imaging features of the torsion. 3. To classify various torsions into subtypes based on imaging findings reflecting the background pathology.

TABLE OF CONTENTS/OUTLINE

1. Subtypes based on imaging findings reflecting the background pathology. 2. Torsion of various organs in this presentation.Chest; Lung lobe, Extralobar sequestration, Solitary fibrous tumor of the pleura, Pericardial appendage, Pericardial fat pad. Abdomen; Accessory liver lobe, Spleen, Accessory spleen, Stomach, Small intestine, Cecum Transverse colon, Sigmoid colon, Gastrointestinal Stromal Tumor (GIST), Meckel's diverticulum, Epiploic appendage, Omentum. Pelvis; Ovary, Ovarian tumor, Paraovarian cyst, Fallopian tube, Uterus, Uterine leiomyoma, Parasitic leiomyoma, Testis, Testicular appendage.

EREE-9 Pictorial Review of Acute Appendicitis and Beyond

Participants
Claudia Gabriela Moldovanu, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

At the end of this educational exhibit, the audience will be able to differentiate the alternative diagnoses for the purpose of directing appropriate patient management.

TABLE OF CONTENTS/OUTLINE

Acute appendicitis is the most common diagnosis suspected in patients presenting in emergency rooms with acute abdominal pain. Early diagnosis depends on recognition of characteristic signs and symptoms: right lower quadrant or periumbilical pain, localized tenderness, fever, and leukocytosis. The differential diagnosis for an abnormal appendix on imaging includes other inflammatory/non-neoplastic and neoplastic processes. In this pictorial essay, we review the normal anatomy of the appendix and outline the pathogenesis, clinical manifestations, and imaging findings that are characteristic of acute appendicitis and its

complications, common or less common abnormalities (areas of focus include abdominopelvic abscess, peritonitis, pyelephlebitis, pyelethrombosis, and hepatic abscess). Inflammatory/nonneoplastic processes including serosal appendicitis, stump appendicitis, and foreign body appendicitis are discussed. Neoplastic considerations include appendiceal neuroendocrine tumors, mucinous and non-mucinous epithelial neoplasms, and lymphoma. A brief discussion of important pearls in the imaging assessment and diagnosis for each pathological presentation is then provided. It is important for the radiologist to be familiar with common imaging features and to be familiar with the various anatomical locations and other less common appendiceal abnormalities that can mimic or present concomitantly with acute appendicitis for accurate diagnosis and appropriate management.

EREE-1

Blunt Splenic Injury: What's New and Important - A Review by the ASER (American Society of Emergency Radiology) Expert Panel

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - ER

Participants
Aishwariya Vegunta, MD, Stratford, CT (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Severity grading of Blunt Splenic Injury (BSI) using American Association for the Surgery of Trauma (AAST) 2018 Organ Injury Scaling (OIS).2. Importance of detecting vascular injury and its impact on management. 3. Types of vascular injury: Contained Vascular Injury (CVI) and Active Splenic Hemorrhage (ASH). 4. Key Role of CT protocol in Vascular Injury Detection5. Management options: Operative vs. Conservative and future advances.

TABLE OF CONTENTS/OUTLINE

Table of Contents/Outline: ? Background/scope of the problem: Spleen is the second most common injured abdominal organ? Examples of Blunt Splenic Injury and grading using 2018 AAST OIS? Types of Splenic Vascular Injuries:a. Contained Vascular Injuryi. Pseudoaneurysmii. Arteriovenous fistulab. Active Splenic Hemorrhage (ASH)? Optimizing CT protocols- Arterial phase imaging/ multiphase acquisition increases sensitivity and improves differentiation of splenic vascular injury ? Management of BSI and the impact of CT detection of splenic vascular injury: Trend toward Nonoperative management (NOM) and role of splenic artery embolization (SAE) ? When NOM fails: Potential factors and next steps? Follow up imaging for delayed splenic rupture: When to do it and what to look for

EREE-10

A Pregnant Patient in Pain: What the ER Radiologist Needs to Know About the Findings, Reporting, and Significance

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - ER

Participants
Dana Galvan, MD, Albuquerque, NM (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Improve understanding of the radiologic evaluation of pregnant patients in emergency settings, including the reporting of first and second/third trimester fetal sonography.2. Familiarize radiologists and in-training radiologists with the imaging appearance, incidence, and follow up recommendations of common emergent causes of maternal acute abdomen.3. To review key traumatic pathologies and findings in pregnancy such as uterine rupture and the Traumatic abruptio placenta scale.4. Highlight key findings of urgent special consideration cases of multiple gestations and emergent ectopic pregnancy findings.

TABLE OF CONTENTS/OUTLINE

-Introduction to emergency department visits during pregnancy including common presenting complaints, symptoms, and initial imaging modalities selected to investigate.-Review of maternal and fetal radiation exposure in the emergency setting, including effect on fetus and threshold doses.-Review of sonographic first trimester findings including SRU criteria, terminology, and findings for pregnancy failure.-Review of second trimester ultrasound findings including how to identify relevant findings, report findings, and their significance.-Sonographic placental and cervical pathologies of the second and third trimesters, with key imaging findings, clinical significance, and follow-up recommendations.-Common traumatic injuries including uterine rupture and review of the Traumatic Abruption Placenta Scale (TAPS).- Differential diagnosis, clinical significance, and follow-up recommendations of several maternal acute abdomen pathologies.-Imaging finding review of multiple gestation emergencies, ectopic and heterotopic pregnancies.

EREE-11

Age Estimation of Unidentified Cadavers Using Postmortem CT Imaging

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - ER

Participants
Wataru Fukumoto, MD, PhD, Hiroshima, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

For the identification of unknown cadavers, an accurate estimation of the age at the time of death is needed. Classical methods assess morphological changes of the pubic symphysis, its auricular surface, and cranial sutures and teeth. However, as these assessments rely on the experience and expertise of the evaluator, their accuracy is limited, especially in elderly cadavers. Because postmortem computed tomography (PMCT) using multiplanar reconstruction- and 3D images reveals the bone structure clearly, it is superior to the classical methods. We introduce and describe the utility of age estimation methods based on PMCT.

TABLE OF CONTENTS/OUTLINE

1. Importance of age estimation in forensic science 2. Classical age estimation methods 3. Age estimation using PMCT images •Measurement of the bone density of the pubic symphysis •CT value and volumetric analysis of the proximal femur •Maturity of the medial clavicular epiphysis •The ossification score of the sternum and ribs •Evaluation of osteophytes in the vertebrae 4. A new approach for age estimation using PMCT and deep learning

Automated CT Perfusion (CTP) interpretation in Acute Stroke: Primer for On-call Radiologist

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - ER

Awards
Certificate of Merit

Participants
Ashlesha Udare, MBBS, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To understand the growing need of emergency automated CTP evaluation 2. The 3 questions approach for fast and accurate interpretation

TABLE OF CONTENTS/OUTLINE

Background: AHA2018 AIS guidelines recommend perfusion imaging for INR subject selection at 6-24 hours after insult. Automated CTP using AI technology has been used in several recent large LVO endovascular therapy trials. Using case-based approach with 2 FDA approved AI solutions from our institution, we aim to acquaint the on-call radiologist interpreting automated CTP data using a simplified 3 questions approach 1. Is the CTP diagnostic/non-diagnostic? Understanding the basics of CTP acquisition and processing by the AI software. technical pitfalls: motion, contras bolus, AIF/VOF selection, erroneous calculation of perfusion abnormality near the skull base, truncation of dynamic curve, z-axis coverage.2. Is there infarct core volume measurement error?-Underestimated on CTP outputs in the extended time window if received IV tPA, leptomeningeal collaterals lead to partial reperfusion of completely infarcted: Noncontrast CT ASPECTS-Overestimated in cases of ghost infarct hyperacute stroke, early reperfusion: Stricter rCBF threshold for core infarct estimation.3. Is there ischemic penumbra measurement error?-Overestimated in proximal vessel stenosis, leukoriasis, fetal PCA: Evaluate CTA, MTT-Wrong inclusion of opposite hemisphere, beyond vascular territory by automated software-Stroke mimics, lacunar infarcts and posterior circulation strokes.Conclusion: Fast interpretation of the complex automated CTP data by a simplified 3 questions approach for the on-call radiologist and to optimize patient selection for reperfusion.

Emphysematous Osteomyelitis: A Review of Imaging Features and Pitfalls for the Emergency Radiologist to Avoid

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - ER

Awards
Certificate of Merit

Participants
Kush Purohit, MD, MS, Pittsburgh, PA (*Presenter*) Nothing to Disclose

TEACHING POINTS

Discuss the pathogenesis and clinical presentation of emphysematous osteomyelitis (EO), a rare, lethal variant of osteomyelitis caused by infection from gas-forming organisms.Understand key x-ray features and limitations of radiography, including inconspicuous or radiographically occult intraosseous air.Describe the characteristic CT "pumice stone pattern" of irregularly irregular 2-5 mm intraosseous foci of gas.Discuss conventional MRI findings, including T1 hypointense and T2 hyperintense marrow signal abnormalities, and correlate with radiography and CT.Understand local susceptibility artifact from intraosseous air can obscure T1 and T2 signal abnormalities and may be misinterpreted as calcification or hemosiderin deposition, a potential pitfall for the emergency radiologist.Explore PET-MRI as a useful tool in diagnosing EO and localizing infection spread.

TABLE OF CONTENTS/OUTLINE

Emphysematous osteomyelitis background: Epidemiology, pathogenesis, clinical presentationRadiography: Typical features and pitfallsMRI: Review of imaging features. Susceptibility artifact as a major potential pitfall for the emergency radiologistCT: The most useful diagnostic study with characteristic "pumice stone pattern" of intraosseous gasPET-MRI: A useful emerging tool with review of typical imaging features

Fistulas: From The Mouth To The Anus.CHAR(13) + CHAR(10)Our Experience Searching For An Accurate Diagnosis.

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - ER

Participants
Rodrigo Loto, MD, Rosario, Argentina (*Presenter*) Nothing to Disclose

TEACHING POINTS

List to appropriate diagnostic imaging studies.Describe the anatomic locations, causes and clinical features of uncommon fistulas.How to do it. Identify the radiologic finding in the various types of fistulas.A fistulogram/sinogram is used to diagnose and assess the size and shape of fistulas and sinuses and prepare a treatment plan.Fistulograms are used to assess many types of fistulas, including those that form between: two loops of intestine the anal canal and skin near the anus the vagina and another body part such as the colon, rectum, small intestine or bladder.

TABLE OF CONTENTS/OUTLINE

This pictorial review shares our initial experience with MDCT fistulography in evaluating fistulas, demonstrates various components of fistulas, and discusses the types of fistulas. MDCT is the most common modality used for assessment of fistulas, especially with the use of fistulography. The injection of positive contrast well-delineates the fistulous tract and its branching pattern and connections. CT also enables multiplanar reconstruction and thin cuts for good anatomical details. Orally administered Contrast Media opacification may be helpful. is relatively well tolerated but it can be painful when injecting the contrast material into the fistulous tract. Is important identify the anatomic locations and clinical features to proceed. Fistulas are diverse in their anatomy and clinical presentation. Radiologists must be familiar with the radiologic findings for both accurate diagnosis and, in many cases, guidance of management planning.Please visit the Learning Center to also view this presentation in hardcopy format.

Recreational Drug Abuse- the Spectrum of Imaging Findings

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - ER

Participants
Edward Choe, DO, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. The opioid epidemic coupled with the COVID-19 pandemic has drastically increased the prevalence of recreational drug abuse.2. Increasing prevalence of substance use should prompt radiologists to familiarize themselves with common and uncommon imaging patterns, and different routes of self-administration.3. Substance use will often have multisystem sequelae.4. Additional factors to consider when evaluating a patient should include but are not limited to concomitant infections such as HIV and hepatitis, the imaging features of which may complicate image interpretation.

TABLE OF CONTENTS/OUTLINE

The primary goal of this exhibit is to review the imaging findings of recreational drug abuse. Patients with substance use often present with a spectrum of multisystem abnormalities beyond direct soft tissue or vascular injury. Vascular complications include pseudoaneurysm, thrombophlebitis, and mycotic aneurysm. In the musculoskeletal system, findings include cellulitis, abscess, fasciitis and septic arthritis, discitis/osteomyelitis, and findings related to ischemia or immobility. In the CNS, complications include dural venous thrombosis, hemorrhage, ischemia, and sequelae of cerebral vasospasm such as PRES. Cardiovascular complications include valvular vegetations, septic emboli, dissection and myocardial infarct. Intra-abdominal complications include septic emboli with infarction of the spleen, kidneys, or bowel, as well as pancreatitis. The imaging findings of these entities will be illustrated, along with potential pitfalls associated with concomitant HIV and viral hepatitis.

Imaging Atlas of the AAST Organ Injury Scaling: Spleen, Liver and Kidney

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - ER

Participants
Bárbara Santos, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Non-operative management of blunt abdominal trauma, including endovascular treatment, is increasingly applied, therefore, recognizing and defining the key imaging features of trauma-related injury is crucial. ?- The CT-based organ injury scaling established by the American Association for the Surgery of Trauma (AAST) is the most used to assess injury severity and guide clinical decision-making, a useful tool to those caring for the injured patient.?- The most significant change in the 2018 revision of AAST organ injury scale is the incorporation of CT diagnosed vascular injury. The presence of a vascular injury is associated with higher failure rates of nonoperative management, therefore higher grades are used in the presence of a vascular injury.

TABLE OF CONTENTS/OUTLINE

- Introduction?- CT protocol for trauma assessment.?- Changes made in the 2018 revision of the AAST Organ Injury Scaling for spleen, liver, and kidney and how its relate with clinical management.?- Definition by CT imaging of all general types of traumatic injuries on solid organs.?- Imaging atlas of the organ injury scaling established by AAST for spleen, liver, and kidney.?- Pitfalls on trauma-related evaluation of spleen, liver, and kidney.?- Take home messages.?

The Puzzle Never Solved: Imaging of Abdominal Emergencies in Pregnancy, Still a Dilemma

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - ER

Participants
Teodorescu Andreea, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

To illustrate the spectrum of different presentations of abdominal emergencies in pregnant pacients.To review the imaging findings of acute emergencies that will help us to think beyond specific conclusion in an emergency setting.To discuss the risks to the fetus from diagnostic imaging modalities and contrast agentsTo propose recommendations for emergency diagnostic imaging of pregnant patientsTo summarize the role of imaging(including ultrasound, CT, and MR imaging) in diagnosing acute and emergent pregnancy-related conditions using a CASE-BASED APPROACH.

TABLE OF CONTENTS/OUTLINE

Acute abdomen in pregnancy remains one of the most challenging diagnostic and therapeutic dilemmas today.The differential diagnosis during pregnancy is extensive in that the abdominal pain may be obstetric in nature or may be caused by diseases of other intraabdominal or intrapelvic structures. Because of the anatomic and physiologic changes that occur with pregnancy, localization of disease can be difficult. Appendicitis and complicated biliary pathology are the most frequent causes of non-obstetric acute abdomen in the pregnant patient.Pathological causes of obstetric emergencies which are life-threatening include ruptured ectopic pregnancy, abruption, HELLP syndrome, acute fatty liver of pregnancy, and uterine rupture.Imaging studies are essential adjuncts in the diagnostic evaluation of acute emergency conditions due to clinical and laboratory masking in this subgroup. However, confusion about the safety of these modalities for pregnant women and their infants often results in unnecessary avoidance of useful diagnostic tests.

Small Bowel Diverticulosis And Diverticulitis: A Pictorial Review

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - ER

Participants
Namita Bhagat, MD, Shelton, CT (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Small bowel diverticulosis is uncommon and is usually a disease of 6th-7th decade. Diverticulitis occurs in 6.5-10% patients. Other complications include perforation, bleeding and bowel obstruction. • Small bowel diverticulitis is a rare entity and is often overlooked as a cause of abdominal pain in the elderly because of resemblance of imaging features with other causes of acute abdominal pain and its anatomical location within the mesenteric border at surgery where these diverticuli are obscured by large penetrating blood vessels. • It is imperative to be familiar with imaging features and to look for clues which may suggest small bowel diverticulitis, such as the presence of non-inflamed diverticuli in adjacent small bowel and presence of a normal appearing appendix in cases of ileal diverticulitis. Delayed diagnosis leads to complications and can be fatal with mortality rate of 25-50%.• Accurate diagnosis on imaging aids in appropriate patient management, and may help reduce morbidity and mortality.

TABLE OF CONTENTS/OUTLINE

Describe etiology, pathophysiology and complications of small bowel diverticulosis and diverticulitis.To review the imaging findings of small bowel diverticulosis and diverticulitis on CT.Describe other differential diagnosis for causes of right lower quadrant pain which mimic imaging appearance: for example uncomplicated and complicated acute appendicitis, colonic diverticulitis, Crohn’s disease, acute typhlitis, Meckel’s diverticulitis, etc.

Paranasal Sinuses on Acute Head Imaging: What the Radiologist Needs to Know

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - ER

Participants
Veronika Majcher, MD, Cambridge, United Kingdom (*Presenter*) Nothing to Disclose

TEACHING POINTS

Incidental findings involving the paranasal sinuses are common on CT and MR head scans performed in the acute setting. In the majority of cases, opacification of sinuses is secondary to mild inflammation and can be safely dismissed. However, recognising patterns and imaging features of paranasal sinus findings on these scans can opportunistically pick up pathology benefiting from further investigation or even identify the cause of presenting symptoms. After reviewing this exhibit, the reader will be able to: 1) Revise the basic anatomy and drainage pathways of the paranasal sinuses in order to understand patterns of disease; 2) review common and rarer benign and invasive paranasal sinus pathology using case examples; 3) recognise worrisome features that necessitate further investigation and referral.

TABLE OF CONTENTS/OUTLINE

1. Anatomy and imaging of the paranasal sinuses 2. Drainage pathways and patterns of disease 3. Interpretation and significance of pathological changes within paranasal sinuses a. Mucosal thickening b. Soft tissue density and bone changes c. Specific signs of acute/chronic/fungal disease 4. Signs of invasive and infiltrative disease a. Review areas 5. Complications of sinusitis

Confronting and Overcoming Emergency Radiology Biases

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - ER

Awards
Identified for RadioGraphics
Magna Cum Laude

Participants
Se-Young Yoon, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

- With the transition to peer learning review of cases, many diagnostic errors in radiology can be attributed to cognitive biases. Because of the high volume and rapid pace of emergency radiology, exam interpretations may be heavily reliant on biases and heuristics. Thus, a more focused evaluation of emergency radiology specific biases is needed to avoid diagnostic pitfalls.- We aim to review common biases in emergency radiology in this exhibit, organized by the expected stage of occurrence during the process of reading an imaging study.- Several cognitive biases that have not yet been defined in radiological publications, to the best of our knowledge, will be discussed. These include: triage cueing, contrast effect, provider bias, treater bias, and need for closure.- Emergency radiology peer learning case examples are provided to illustrate how and which biases may have occurred.- Strategies to recognize and overcome biases will be discussed, with an emphasis on those that may be more prevalent in the emergency setting.

TABLE OF CONTENTS/OUTLINE

- Cognitive biases commonly seen in emergency radiology-- Definitions and brief examples (list on slide #1)- Peer learning case examples illustrating various cognitive biases- Strategies in recognizing and overcoming biases

An Approach to Acute Traumatic and Non-traumatic Diaphragmatic Abnormalities

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - ER

Awards
Identified for RadioGraphics
Certificate of Merit

Participants
Nicolas Murray, MD, FRCPC, Vancouver, BC (*Presenter*) Co-investigator, Siemens AG

TEACHING POINTS

Acute traumatic and non-traumatic diaphragmatic abnormalities are a heterogenous group of relatively uncommon pathologies affecting the normal structure and function of the diaphragm. These include diaphragmatic hernia, laceration, traumatic and spontaneous rupture, thoracoabdominal fistulae, infection, and endometriosis. Because the diaphragm is the primary inspiratory muscle, disruption to its integrity can cause clinically significant consequences. Imaging plays an essential role in investigation. However, these pathologies can be easily missed as findings are often subtle. Therefore, understanding the anatomy and radiologic findings allows for efficient and accurate diagnosis and management.

TABLE OF CONTENTS/OUTLINE

Diaphragm anatomy and normal variation. Introduction and differential diagnosis of acute diaphragmatic abnormalities. Imaging modalities for the diaphragm. Pathogenesis, incidence, clinical presentation, diagnosis, radiologic findings, and general management of non-traumatic and traumatic diaphragmatic abnormalities including (1) diaphragmatic hernias, (2) spontaneous diaphragm rupture, (3) endometriosis-related diaphragmatic disease, (4) trans-diaphragmatic fistula, (5) infection of the diaphragm, (6) blunt injuries, (7) penetrating injuries, and (8) traumatic diaphragm rupture. Summary of take-home points.

Artificial Intelligence (AI) Imaging Algorithms in the ICU: Augmenting the Radiologist

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - ER

Participants
Kaustav Bera, MD, Cleveland, OH (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Learn about the unmet needs when it comes to ICU imaging both from the point of view of the primary provider as well as the radiologist 2. How Artificial Intelligence (AI) algorithms can benefit both the ICU physician as well as the reading radiologist 3. Illustrate real-world use cases where AI-imaging algorithms are already in use in the ICU as well as potential high-yield use cases for AI4. Challenges and limitations that AI enabled tools need to overcome before seamless integration in ICU

TABLE OF CONTENTS/OUTLINE

1. Fundamentals of imaging in the ICUa. What the primary team physician wantsb. What the reading radiologist wantsc. Unmet need in the ICU which AI can fulfill2. A Brief Primer on AIa. AI, Machine Learning, Deep Learning - A Brief Primer.b.Framework of AI in clinical use 3. Modalities and use cases for AI in ICU Imaginga. Imaging to determine ICU Admission/Transfer i. AI to predict which COVID-19 patients need urgent mechanical ventilation ii. AI to diagnose cholecystitis, ascending cholangitis from US imaging iii. AI to automatically detect cord compression/cauda equina from spinal MRI iv. AI to detect stroke v. AI to detect hemorrhageb. Imaging within the ICU for monitoring/change in status i. AI for urgent pathology on Chest radiograph (Pneumothorax) ii. AI for lines/tubes detection on Chest radiograph iii. AI to detect Pulmonary Embolism iv. AI to detect Acute aortic pathology 4. Real world use cases of seamlessly integrated AI tools 5. How AI can benefit ICU management both for the radiologist and the physician 6. Future directions

Bone-induced Streak Artifact Reduction in Emergency Abdominal CT Using the Deep Learning-based Image Reconstruction

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - ER

Participants
Tetsuya Hirairi, MS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

The streak artifact, which is frequently observed in abdominal CT images obtained at the emergency trauma patients with arms-down positioning, is known to degrade diagnostic image quality. To solve this problem, deep learning-based image reconstruction is adapted to in emergency abdominal CT. Advanced intelligent Clear-IQ Engine (AiCE), is a type of deep learning-based image reconstruction, is compared with conventional hybrid Iterative reconstruction (HIR). Quantitative artifact estimation is evaluated by the normalize artifact index (nAI) with an abdominal phantom between two dense objects which is simulated arms down positioning. CT number inaccuracy is evaluated by abdominal CT images of 20 clinical patients with arms-down positioning by setting region of interest in the liver and the spleen. As a result, DLR method significantly decreased nAI and improved the CT number accuracy compared to HIR. It was suggested that DLR was useful for the bone-induced streak artifact reduction in emergency abdominal CT.

TABLE OF CONTENTS/OUTLINE

1. Clinical problems with conventional emergency CT.2. Deep learning-based image reconstruction technology AiCE.3. Normalize artifact index of the fantom simulated arms down positioning.4. Improvement of the CT number accuracy. 5. Clinical performance in Emergency CT.

No Time to Dye: How to Diagnose and Manage Critical Diseases with Non-contrast Enhanced CT

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - ER

Participants
Yukiko Michishita, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) To share useful imaging findings of various critical diseases in non-contrast enhanced CT (NCECT), with emphasis on the significance of prompt response to treatment regardless of contrast enhanced CT (CECT). 2) To understand the settings where CECT is still required for appropriate treatment strategies as well as diagnosis.

TABLE OF CONTENTS/OUTLINE

To learn how to diagnose and manage critical diseases with NCECT, following topics are discussed; 1) Classical findings on CECT, 2) Useful findings on NCECT, 3) Clinical perspective, 4) Significance of prompt action according to findings on NCECT, 5) Diagnostic accuracy of NCECT, 6) Significance of CECT.Featured pathologies are as follows; A. Acute thromboembolisms: 1) Cerebral infarction, 2) Acute pulmonary embolism, 3) SMA embolism/thrombois, 4) Cerebral venous sinus thrombosis. B. Vascular diseases: 1) Acute aortic dissection, 2) SMA dissection, 3) Impeding rupture of aortic aneurysm. C. Bleedings: 1) Trauma and other bleeders, 2) Gastrointestinal bleeding, 3) Intracranial hematoma. D. Ischemia: 1) Bowel strangulation, 2) Non-occlusive mesenteric ischemia. E. Inflammatory diseases and others: 1) Gangrenous appendicitis, 2) Severe acute cholecystitis, 3) Severe acute pancreatitis, 4) Hepatic abscess, 5) Mycotic aneurysm.

Cervical Catastrophe: Identifying Tracheal Injury Before It Is Too Late

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - ER

Participants
Ethan Jiang, BSc, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Early and accurate detection of tracheal trauma is crucial to reduce the significant morbidity and mortality associated with these injuries.2. A low threshold of suspicion for tracheal injury facilitates timely decision-making and intervention in the setting of trauma.3. Injuries to neighboring structures, such as the esophagus, are often concomitant to tracheal injury following blunt and penetrating neck trauma.

TABLE OF CONTENTS/OUTLINE

We outline an approach to suspected tracheal injury in the setting of trauma. The focus will be on using imaging to change clinical outcomes through early identification, especially when the clinical presentation is nonspecific.1. Overview of relevant neck anatomy. 2. Epidemiology of tracheal trauma. 3. Etiology, mechanisms, and pathophysiology; a) Blunt, penetrating, and iatrogenic tracheal trauma; b) Different anatomical sites of injury. 4. Clinical presentation predictive of impending deterioration. 5. Approach to diagnosis in cases of suspected tracheal trauma; a) Role of X-ray; CT, fluoroscopy, and bronchoscopy; b) Pearls and pitfalls of diagnosis. 6. Key imaging findings to guide non-operative vs surgical management. 7. Short- and long-term complications of tracheal injuries; a) Identifying concomitant injuries, such as esophageal trauma.

Limitations of AI-based Hemorrhage Detection: Where AI Can't Help You (Yet)

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - ER

Participants
Stefan Niehues, MD, Berlin, Germany (*Presenter*) Speaker, Bracco Group;Speaker, Guerbet SA;Speaker, Canon Medical Systems Corporation;Speaker, Teleflex Incorporated

TEACHING POINTS

Detection of intracranial hemorrhage is a reliable application of AI, but is susceptible to artifacts. False-positive findings are related to motion artifacts, beam hardening artifacts due to foreign material inside or outside the patient, calcifications i.e. after surgery or with patients with meningioma or metastasis.False-negative findings can occur in patients with subacute hemorrhage, very subtle subarachnoidal bleedings, intracranial contrast extravasation, and chronic subdural hematomas.

TABLE OF CONTENTS/OUTLINE

1) AI-based intracranial hemorrhage detection - basics and numbers 2) Correct findings3) False positives 4) False negatives5) Approaches for future developments

Delivering Clinical Impact in Emergency Departments: CXR xAI Pipeline for Comprehensive Clinical Risk Prediction

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - ER

Participants
Michelle Chua, Brookline, MA (*Presenter*) Nothing to Disclose

TEACHING POINTS

Integration of clinical information and radiological findings is required for clinical risk predictionComprehensive risk prediction models may be developed using a fine-tuning approach, which is more efficient than a full training approachOur CXR xAI model was pre-trained to detect 20 radiographic featrues and subsequently used, in combination with clinical information, to predict oxygen requirement in ED patients with COVID-19Calibrated classifier confidence is displayed and comparable CXRs are extracted from the Model-Derived AtlasOur CXR xAI model captures a broad scope of cardiorespiratory pathophysiological manifestations and cardiothoracic comorbidities and may also be used, for example, to predict unplanned return to ED in patients with acute heart failure and elderly patients with community acquired pneumoniaAs CXRs are inexpensive and routinely obtained, fully automated risk prediction using radiographic features may improve the safety and quality of clinical care in EDs

TABLE OF CONTENTS/OUTLINE

Full training and fine-tuning approaches for comprehensive clinical risk predictionCXR xAI model architecture and case illustration for acute heart failureCOVID-19 xAI pipeline for prediction of oxygen requirement and model performance metrics

The Acute Abdomen: What the Surgeon Wants to Know - A Case-Based Survival Guide for the On-Call Resident

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - ER

Awards
Identified for RadioGraphics

Participants
John Kirby, MD, Rochester, MN (*Presenter*) Nothing to Disclose

TEACHING POINTS

Abdominal pain is a common presenting symptom in the Emergency Department. Many life-threatening conditions can present as an "acute abdomen," requiring surgical intervention. The radiologist may be the first person to suggest the need for surgical evaluation and can provide key information to the surgeon regarding potential complications and pertinent normal variants. Understanding the surgeon's perspective can lead to concise reports, faster turnaround time, and improved outcomes.

TABLE OF CONTENTS/OUTLINE

Review common imaging modalities in the non-traumatic acute setting and preferred protocols for evaluating acute abdominal pain. Discussion of the five major categories of abdominal pain requiring surgical intervention; Ischemia, obstruction, infection, perforation, and active bleeding. Case-based review demonstrating examples of the most common etiologies from each of the major categories. Each case will include a discussion of significant findings to make the diagnosis, pertinent anatomical variants, and a summary table of relevant reporting findings to the surgeon. Many of our cases will contain a QR code that the viewer can scan with their mobile device to access an interactive PACS to review the case and more accurately simulate real-life scenarios. Conclusion: At the end of the exhibit, we hope that the reader will better understand findings relevant to the surgeon and can assist in identifying and reporting relevant potential complications.

Acute Mechanical SBO: A Step-by-step Guide for Radiology Residents!

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - ER

Participants
Abdul-Rahman Abualruz, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Acute mechanical small bowel obstruction (SBO) is a common surgical emergency with high mortality rates when complicated by bowel ischemia (up to 40%). Computed Tomography (CT) has an essential role in confirming the SBO diagnosis, identifying the cause of obstruction, detecting associated variations, and evaluating severity. CT outperforms physical exam and laboratory testing with high specificity in predicting bowel ischemia which is crucial for correct and timely management of SBO.

TABLE OF CONTENTS/OUTLINE

Review clinical management guidelines of SBO. Critical imaging findings to look for and include in the radiology report that impacts clinical management presented via a suggested structured report for SBO. CT imaging evaluation of SBO (CT protocol, use of IV and PO contrast, added value of Dual Energy CT). Review CT imaging criteria for diagnosis of acute mechanical SBO. A pictorial review of causes of SBO (extrinsic vs. intrinsic etiologies) and pitfalls for correct interpretation with emphasis on: Adhesive vs. Non-adhesive SBO, Closed vs. Open loop obstruction, Partial vs. Complete obstruction, Specific CT findings that predict bowel ischemia. A step-by-step summary guide for SBO diagnosis.

Obstructive Hydrocephalus - Not So Simple After All

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - ER

Participants
Michal Holesta, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Obstructive hydrocephalus is a severe condition, that can manifest with acute symptoms or slowly developing signs of increased intracranial pressure. This usually depends on the type of underlaying condition and the speed with which the hydrocephalus develops. We will overview common and rare causes of obstructive hydrocephalus, diagnostic algorithms and imaging findings on CT and MRI, including signs of transependymal edema, using cases from our clinical practice. We will also present several cases of rare causes of acute hydrocephalus, including colloid cyst, blood clot in aqueductus Sylvií (mimicking flow void on T2W) and neurosarcoidosis.

TABLE OF CONTENTS/OUTLINE

1. Overview, etiology and pathophysiology of obstructive hydrocephalus. Typical clinical symptoms. 2. Diagnostic algorithms and imaging findings on CT and MRI. Imaging signs of transependymal edema. 3. Case series of rare causes of acute hydrocephalus. 4. Treatment and follow-up of obstructive hydrocephalus. 5. Conclusion and key imaging points. Please visit the Learning Center to also view this presentation in hardcopy format.

Making the Grade: A Pictorial Review of the Revised 2018 AAST Abdominal Solid Organ Injury Scales

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - ER

Participants
Samuel Elias, MD, West Caldwell, NJ (*Presenter*) Nothing to Disclose

TEACHING POINTS

The goal of this exhibit is to provide a pictorial review of the revised 2018 AAST injury scoring scale for the liver, kidney, and spleen. Every injury grade for each organ is presented with an original diagram alongside the imaging criteria. Teaching points are presented in a clear manner and include descriptions of key radiologic terms, recognition of benign and pathologic mimics, protocoling technique, and clinical management considerations. Angiographic and intraoperative images from our interventional radiology and trauma surgeon colleagues are also included to help cultivate an appreciation of the multidisciplinary management of these injuries.

TABLE OF CONTENTS/OUTLINE

1) Introduction. 2) Spleen -Grades 1-5 (diagrams, definitions, teaching points, imaging pearls) -Cases (CT, angiographic, and/or intraoperative images with description of findings, management, and teaching points). 3) Liver -Grades 1-5 (diagrams, definitions, teaching points, imaging pearls) -Cases (CT, angiographic, and/or intraoperative images with description of findings, management, and teaching points). 4) Kidney -Grades 1-5 (diagrams, definitions, teaching points, imaging pearls) -Cases (CT, angiographic, and/or intraoperative images with description of findings, management, and teaching points). 5) Conclusion

Liver or Die Situation--Spleen better days: Reviewing the 2018 Updates of the AAST Liver and Spleen Injury Scoring Scales

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - ER

Participants
Elias Gunnell, MD, Chapel Hill, NC (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Trauma is the most frequent cause of death in the first four decades of life, and the abdomen is the third most common site of injury. 2. The radiologist plays a crucial role in the evaluation and description of splenic and liver injury in abdominal trauma. 3. Accurate description of splenic and liver injury is a pivotal component of patient management and treatment selection. 4. Understanding the revised AAST Liver and Spleen Injury Scales is necessary for accurate description of abdominal trauma as operative rate and increased mortality are associated with increasing grades of injury.

TABLE OF CONTENTS/OUTLINE

This educational exhibit will discuss the updated 2018 American Association for the Surgery of Trauma (AAST) guidelines for injury scoring, pertaining to the liver and spleen. The presentation will include the following: - Briefly overview the statistics for abdominal trauma and incidence of liver and spleen injury. - Discuss the updated AAST Injury Scoring Scale and compare it to the previous version. - Review and illustrate the multiple grades of liver injury, with important imaging findings. - Review and illustrate the multiple grades of splenic injury, with important imaging findings. - Explain how patient management changes based on the grade of injury.

Imaging in Non-accidental Trauma - A Primer for Trainees

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - ER

Participants
Surabhi Subramanian, MBBS,MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

• 1. Illustrate the mechanism and mode of presentation • 2. Outline the diagnostic imaging protocol • 3. Discuss the typical presentation and mimicker

TABLE OF CONTENTS/OUTLINE

Nonaccidental trauma is one of the prominent causes of childhood injury and death in the pediatric population. This exhibit will serve as a primer for radiology trainees to diagnose NAT in an emergency setting. The most common mechanism of NAT is violent shaking. Some highly specific lesions of child abuse are metaphyseal fractures, multiple rib fractures of different ages, scapular fractures, sternal fractures, and posterior vertebral element fractures. More than 60 % of child abuse cases present in emergency settings. Radiologists can be the first to suggest the possibility of child abuse. Infant's head is larger in comparison to the body making them more prone to CNS injury. CT head, 3D reconstruction is especially helpful in detecting skull fractures. MRI is very sensitive to look for blood products in the brain and spine. The skeletal survey must be ordered for patients suspected with child abuse. Nuclear imaging is performed if skeletal survey is equivocal. Radiologists must be aware of highly suspicious radiological findings and mimickers of nonaccidental trauma.

Vascular Injury Following Trauma: A Pictorial Review of Findings on CT Angiography

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - ER

Participants
Navpreet Khurana, MBBS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Describe the range of findings of vascular injury following blunt and penetrating trauma on CT angiogram. 2. Correlate findings on physical examination, CT angiogram, and catheter angiogram. 3. Appreciate the pitfalls of CT angiography, which lead to false positives and false negatives. 4. Describe the interventions for vascular injury.

TABLE OF CONTENTS/OUTLINE

1. CT angiogram protocol - how to optimize the detection of traumatic vascular injury. 2. Range of appearance of active bleeding on CT angiogram. 3. The value of the non-contrast acquisition. 4. Arterial spasm vs. arterial transection - similarities and differences in appearance. 5. Correlation of findings on CT angiogram with catheter angiogram. 6. Surgical interventions for vascular injury.

Trauma Drama: Breaking Down the 2018 AAST Scoring for Spleen and Liver

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - ER

Participants
Katherine Copely, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Review the updated 2018 AAST guidelines for Spleen and Liver Injuries?Discuss the importance of imaging protocols?Recognize key features on CT images and correlating diagrams to improve recall and recognition?Examine challenging cases and pertinent pitfalls

TABLE OF CONTENTS/OUTLINE

The purpose of this presentation is to discuss the rationale for updating the AAST grading systems and what updates occurred between 1994 and 2018 focusing on the spleen and liver, the implications for patient care, as well as to discuss importance of imaging protocols in detecting these injuries.An illustrated table of spleen and liver injuries will be included to highlight the similarities and differences in grading criteria for each organ. Image intensive examples of each grade of liver and spleen injuries will comprise the bulk of the presentation. Challenging cases and pitfalls will help cement and allow practice of these key imaging findings.

Acute Temporal Bone Pathology

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - ER

Participants
Ashraf Abdulhalim, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. A simplified anatomic checklist-based approach can enable an emergency radiologist to accurately and efficiently identify acute temporal bone pathology, and this approach will be reviewed in this exhibit.2. The radiologist plays an important role by identifying key imaging findings and providing diagnoses that can direct treatment by prompting an emergency physician to admit a patient for inpatient management, order a surgical consult, or order further imaging to check for related complications. The absence of these findings are also pertinent negatives that enable clinicians to proceed with treatment in the ED or discharge a patient with outpatient follow-up.3. This exhibit will review traumatic and acute non-traumatic pathology in a case-based format, with emphasis on key imaging findings that affect management and prognosis.

TABLE OF CONTENTS/OUTLINE

I. Relevant anatomic structures and landmarks in the temporal bone for the emergency radiologistII. Checklist for non-traumatic and traumatic pathologyIII. Non-traumatic Pathologya. Infection i. Acute otitis externa ii. Malignant otitis externa iii. Coalescent mastoiditis with Bezold abscess iv. Temporomandibular joint abscessb. Aggressive neoplasm that might present with acute symptoms i. Langerhans cell histiocytosis ii. ParagangliomaIV. Traumatic Pathologya. Otic capsule violating versus non-otic capsule violating fractures b. Horizontal versus longitudinal fractures c. Isolated tympanic plate fracture d. Sutures/fissures that mimic fractures

Imaging Features of Torsion of Various Organs in the Whole Body

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - ER

Awards
Identified for RadioGraphics

Participants
Akihiro Nakamata, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Torsion can present in various organs in the whole body, which cause a decreased blood flow due to twisted blood vessels. Therefore, emergent surgical intervention is often necessary to improve the blood flow. Radiologists should recognize imaging features of torsion of various organs in the whole body for the management of treatment options.The purpose of this exhibit is:1. To review a torsion of various organs in the whole body. 2. To discuss the clinical and imaging features of the torsion. 3. To classify various torsions into subtypes based on imaging findings reflecting the background pathology.

TABLE OF CONTENTS/OUTLINE

1. Subtypes based on imaging findings reflecting the background pathology. 2. Torsion of various organs in this presentation.Chest; Lung lobe, Extralobar sequestration, Solitary fibrous tumor of the pleura, Pericardial appendage, Pericardial fat pad. Abdomen; Accessory liver lobe, Spleen, Accessory spleen, Stomach, Small intestine, Cecum Transverse colon, Sigmoid colon, Gastrointestinal Stromal Tumor (GIST), Meckel's diverticulum, Epiploic appendage, Omentum. Pelvis; Ovary, Ovarian tumor, Paraovarian cyst, Fallopian tube, Uterus, Uterine leiomyoma, Parasitic leiomyoma, Testis, Testicular appendage.

Pictorial Review of Acute Appendicitis and Beyond

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - ER

Participants
Claudia Gabriela Moldovanu, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

At the end of this educational exhibit, the audience will be able to differentiate the alternative diagnoses for the purpose of directing appropriate patient management.

TABLE OF CONTENTS/OUTLINE

Acute appendicitis is the most common diagnosis suspected in patients presenting in emergency rooms with acute abdominal pain. Early diagnosis depends on recognition of characteristic signs and symptoms: right lower quadrant or periumbilical pain, localized tenderness, fever, and leukocytosis. The differential diagnosis for an abnormal appendix on imaging includes other inflammatory/non-neoplastic and neoplastic processes. In this pictorial essay, we review the normal anatomy of the appendix and outline the pathogenesis, clinical manifestations, and imaging findings that are characteristic of acute appendicitis and its complications, common or less common abnormalities (areas of focus include abdominopelvic abscess, peritonitis, pyelephlebitis, pyelethrombosis, and hepatic abscess). Inflammatory/nonneoplastic processes including serosal appendicitis, stump appendicitis, and foreign body appendicitis are discussed. Neoplastic considerations include appendiceal neuroendocrine tumors, mucinous and non-mucinous epithelial neoplasms, and lymphoma. A brief discussion of important pearls in the imaging assessment and diagnosis for each pathological presentation is then provided. It is important for the radiologist to be familiar with common imaging features and to be familiar with the various anatomical locations and other less common appendiceal abnormalities that can mimic or present concomitantly with acute appendicitis for accurate diagnosis and appropriate management.

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Sub-Events

GIEE-1 Split Scar Sign (SSS): How to Interpret It In The Context of Response to Neoadjuvant Treatment in Rectal Cancer

Participants
Ana Uski, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Describe the typical MRI imaging findings in cases of SSS+ and SSS-. Demonstrate the applicability of MRI in the context of neoadjuvant radiotherapy in rectal cancer and its potential limitations. Propose a structured report for local re-staging purposes.

TABLE OF CONTENTS/OUTLINE

Radical mesorectal excision surgery contributes substantially to patient morbidity in the context of rectal cancer. A number of clinical trials support the use of neoadjuvant radiation as a form of initial approach in an attempt at more conservative treatment, and responders to this modality have a favorable prognosis and similar outcomes to those who underwent radical surgery. In this context, MRI is the imaging modality of choice in response assessment to predict fibrosis or suspicious areas of viable neoplastic tissue. The split scar sign (SSS) is assessed on high-resolution T2-WI, positive or present when a thin regular 1-2 mm layer of hypointense "fibrosis" is well defined on the endoluminal aspect of the tumor site (corresponding to fibrous submucosa). Whenever the tumor site is not "organized" and this T2WI hypointensity layer is broken focally, the signal should be considered absent or negative. The positive or present SSS (+) has a very high specificity (97%) and positive predictive value (93/94%) for sustained complete response in case of neoadjuvant radiotherapy in rectal cancer. A good quality examination with the appropriate technique is necessary as well as the recognition of the imaging findings related to the presence or absence of this sign (SSS) and potential limitations of MRI.

GIEE-10 Management of Incidentally Detected Gallbladder Polyps: Review of Clinical Scenarios Using the 2021 SRU Gallbladder Polyp Consensus Guideline

Participants
Christopher Fung, MD, Edmonton, AB (*Presenter*) Stockholder, Mikata Health

TEACHING POINTS

Incidental gallbladder (GB) polyps are common, seen in 3-6% of the general population, often benign cholesterol polyps. Few GB polyps (6%) are neoplastic (intracholecystic papillary neoplasm, ICPN). While ICPNs have malignant potential, malignant transformation is believed rare. GB cancers also typically arise from flat dysplastic epithelium, not polyps. Yet the concern a small polyp may harbor a future or early neoplasm has led past guidelines to suggest relatively aggressive management; recent studies show significant overtreatment of predominantly benign GB lesions.In 2021 the Society of Radiologists in Ultrasound (SRU) convened a multidisciplinary committee to review current literature and construct updated guidelines for the management of incidentally detected GB polyps. The SRU Guidelines, to be published in 2022 (Radiology), stratify risk into three categories: Extremely Low, Low, and Indeterminate Risk. Clinical examples and common questions will be addressed.

TABLE OF CONTENTS/OUTLINE

1. Background and review of prior guidelines a. Overview of gallbladder polyps and underlying pathology b. Discussion of current literature and recommendations2. 2021 SRU Gallbladder Polyp Consensus Recommendations a. Applicable and excluded patient populationsb. Risk Categories: Extremely Low Risk, Low Risk, Indeterminate Risk3. Common and uncommon clinical scenarios a. Polyp measurement b. Sessile versus pedunculated c. Determination of growth d. Doppler assessment e. Multiple versus single gallbladder polyps f. The role of alternative modalities such as contrast-enhanced ultrasound and MRI g. Other risk factors: primary sclerosing cholangitis, age, ethnicity, geographic location

GIEE-100 Gastrointestinal Neuroendocrine Neoplasms on Multimodality Imaging With Emphasis on Dynamic CT: Case Review with Radiology Pathology Correlation

Awards
Certificate of Merit

Participants
Nobuyuki Takeyama, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

To describe the comprehensive categorization system between well-differentiated neuroendocrine tumors (NETs), poorly differentiated neuroendocrine carcinomas (NECs), and mixed neuroendocrine-non-neuroendocrine neoplasms (MiNENs) on the basis

of the WHO 2019 classification for gastrointestinal neuroendocrine neoplasms (GI-NENs). To review multimodality imaging of endoscopy, enteroscopy, endoscopic ultrasound, and cross-sectional images (CT, MRI, SPECT, and PET) in this case-based review presentation correlated with pathology.

TABLE OF CONTENTS/OUTLINE

1.Introduction including definition, epidemiology, genetic evidence, clinical features, and TNM staging in GI-NENs.2.Pathology of the WHO 2019 classification for grading and differentiation of GI-NENs to discuss differentiation, mitosis index, Ki-67 index and immunostaining. 3.Case-based review presentations with multimodality imaging for esophageal NEC, gastric NET, NEC and MiNEN, ampullary NET, duodenal NET, duodenal gastrinomas with MEN 1, small bowel NET, metastases of

GIEE-101 Anal Cancer Imaging: What We Know and What is On The Horizon

Awards
Certificate of Merit

Participants
Jessica Gomes, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Know the epidemiology, increasing number of cases, and risk factors of anal squamous cell carcinoma (SCC)Recognize the imaging differences between rectal adenocarcinoma and anal SCCBe familiar with future directions in anal SCC staging

TABLE OF CONTENTS/OUTLINE

INTRODUCTIONEpidemiologyRisk factorsRECTAL ADENOCARCINOMA X ANAL SQUAMOUS CELL CARCINOMA ANAL SCC TREATMENTChemoradiation therapy (CRT) and how to prevent sequelaeSurgeryTumor recurrence/persistenceAnal margin tumor approachROLE OF IMAGINGStaging scenarioRestaging scenarioTHE MOST RECENT CONSENSUSHow to stagingHow to restaging post CRTWHAT'S ON THE HORIZONINTERACTIVE CHALLENGING SCENARIOS

GIEE-102 Hepatobiliary and Pancreatic Tumor Board Primer for Radiologists: Review of AJCC Staging and NCCN Guidelines

Participants
Madiha Aslam, MD, Darby, PA (*Presenter*) Nothing to Disclose

TEACHING POINTS

Review of AJCC for radiological staging of hepatobiliary and pancreatic tumors. Review of NCCN guidelines for stage-based treatment planning of hepatobiliary and pancreatic tumors. Review of NCCN guidelines for follow up of post treatment hepato-bilio pancreatic tumors. Radiological implication of AJCC and NCCN guidelines in tumor boards for determining the further diagnostic steps and making decisions about the appropriate treatment. Pitfalls in imaging.

TABLE OF CONTENTS/OUTLINE

Tumor staging and stage-based treatment planning is a crucial step in appropriate cancer treatment and being a part of multidisciplinary team in tumor boards, radiologists play a critical role in diagnosing, characterizing, initial staging, determining resectability, and surveillance of cancer patients. This helps the rest of the team to choose the appropriate treatment therapies and determine the follow up interval for post treatment cases. We will provide a comprehensive review of the AJCC staging and NCCN guidelines for hepato bilio pancreatic tumors using multiple imaging modalities, which will help the radiologists in day-to-day tumor boards to solve the staging and decision dilemmas.

GIEE-103 Imaging Assessment of Small Gastrointestinal Lesions. How Can we Improve the Detection or Suspect of Early Tumors?

Participants
Tomas Lacerda, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

TEACHING POINTS:Initial malignant lesions may be an incidental finding.We must pay special attention to small findings in patients with a background that favors malignancy, such as neoplastic syndromes and a known primary tumor.Understand how we can and should improve our imaging protocol according to each patients background.Review when we should consider complementation with different methods and how to choose the best protocol.Understand which characteristics of small lesions may favour malignancy.Protocol pearls for certain tumor types.

TABLE OF CONTENTS/OUTLINE

Epidemiological considerations that may change our interpretation and pretest probability of a disease when characterizing a small lesion.Imaging examples of small lesions that were confirmed as malignant on follow up, biopsy or surgery: Neuroendocrine tumors; Initial metastasis; Small cholangiocarcinoma; Early CHCImaging protocol and imaging methods discussion regarding small lesions: When to include additional phases in our protocol; When to consider MRI evaluation; Hepatocyte-specific contrast indications; PET scan evaluation considerations.

GIEE-104 Do Not Forget the Pipes: Inferior Vena Cava: Abnormal Finding and Their Imaging Appearance

Participants
Teresa Garcia, MD, Buenos Aires, Argentina (*Presenter*) Nothing to Disclose

TEACHING POINTS

To review the usual anatomy and the most common congenital variants of the inferior vena cava (IVC).To describe the most used IVC imaging techniques, its relevance and usefulness.To highlight the pathologies that may affect the IVC and the associated radiological findings.To describe the most frequent IVC pitfalls.

TABLE OF CONTENTS/OUTLINE

Brief review of the anatomy and embryology of the inferior vena cavaImaging techniques and its relevance.Most common IVC congenital variants.Pathologies that can involve IVC (primary and secondary involvement)Pitfalls at IVC imaging and miscellaneous imaging.

GIEE-105 Acute Mesenteric Ischemia: A Primer

Participants
Ken Nakanote, MD, Salt Lake City, UT (*Presenter*) Nothing to Disclose

TEACHING POINTS

Understand the different etiologies of acute mesenteric ischemiaRecall the CT protocol used in the evaluation of acute mesenteric ischemiaEvaluate for the radiological features associated with each etiology of acute mesenteric ischemia

TABLE OF CONTENTS/OUTLINE

A. BackgroundB. Etiology and pathophysiologyC. Clinical presentationD. EvaluationImaging- ACR appropriateness guidelines- CT protocol- Imaging findings for different etiologies2. Non-imagingE. Treatment and managementF. Summary

GIEE-106 Demistifying the Mesentery: A Differential-Based Approach to Mesenteric Pathology

Participants
Daniel Schneider, MD, Ann Arbor, MI (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Review anatomy of the mesentery with illustrations - Review common and rare, focal and diffuse mesenteric pathologies with imaging examples - Present an imaging-based approach to various mesenteric pathology

TABLE OF CONTENTS/OUTLINE

1. Mesenteric anatomy 2. Differential diagnoses for mesenteric infiltration a. Edema i. Hepatic failure, hypoproteinemia ii. Venous thrombosis iii. Angioedema (angiotensin converting enzyme inhibitor-associated angioedema) b. Hemorrhage i. Trauma c. Inflammation i. Pancreatitis ii. Crohn’s disease iii. Post-operative iv. Sclerosing encapsulating peritonitis v. COVID-19 d. Neoplasm i. Peritoneal carcinomatosis ii. Lymphoma iii. Carcinoid iv. Mesothelioma v. Primary peritoneal serous neoplasm vi. Pseudomyxoma peritonei vii. Desmoid viii. Lymphangioma e. Sclerosing mesenteritis i. Mesenteric panniculitis ii. Retractile mesenteritis f. Idiopathic 3. Conclusion a. Mesenteric infiltration is often nonspecific and can pose diagnostic challenges to the radiologist. Knowledge of key imaging features associated with various mesenteric pathologies can help narrow the differential diagnosis in appropriate clinical setting.

GIEE-107 Seeing Through the Mist: An Interactive Tour of Mesenteric Pathology

Awards
Certificate of Merit
Identified for RadioGraphics

Participants
Amelia Kernizan, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Mesenteric lesions are frequently encountered incidentally on abdominal imaging. As many of the underlying etiologies appear similar on CT and/or MRI, they often pose a diagnostic dilemma. The broad differential diagnosis for these lesions ranges from benign etiologies including infection, inflammation, and benign neoplasia to malignant etiologies such as carcinoid, lymphoma and metastatic disease. Via a multiple-choice case-based approach, this presentation will provide a framework for approaching solid mesenteric lesions, while providing pathologic correlation to highlight their similarities and differences, as well as how the histology influences their imaging appearance.

TABLE OF CONTENTS/OUTLINE

I. Review of normal peritoneal anatomy and histology. II. Quiz-style case-based review of solid mesenteric masses. IIa. Discussion of sclerosing mesenteritis with cases of mesenteric panniculitis and retractile mesenteritis showing radiologic-pathologic correlation. IIb. Case of multiple mesenteric masses highlighting the differential and pertinent imaging findings. IIc. Case of mesenteric mass with associated small bowel masses. IId. Case of a 68Ga-DOTATATE-avid mass with potential pitfalls to avoid with this imaging modality. III. Summary with our method for approaching and differentiating between commonly encountered incidental mesenteric lesions.

GIEE-108 All Around the Liver: The Perihepatic Space and Why It Matters

Participants
Helena de Souza, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

- The perihepatic space is often involved in a spectrum of diseases, including intrahepatic lesions that extend into the capsule and conditions arising from adjacent or pelvic organs. It is covered by the peritoneum, and it includes the right subphrenic space, the subhepatic space, the lesser sac, and the left perihepatic space.- The distribution and dynamics of the peritoneal fluid influence the spread of inflammatory and tumor processes to the perihepatic space. The correct evaluation of this space is part of abdominal radiology workup and the knowledge of the main abnormalities is crucial for the best report.- The objectives of this exhibit are to highlight different etiologies of perihepatic involvement, from inflammatory/infectious diseases (stone-related abscesses, Fitz-Hugh-Curtis Syndrome, peritoneal tuberculosis, echinococcosis), endometriotic and metastatic lesions, to rare primary peritoneal tumors (peritoneal malignant mesothelioma, desmoplastic small round cell tumor, peritoneal serous papillary carcinoma, periportal plexiform neurofibroma, and hepatic hilum lymphoma), with illustrative cases (CT and MRI).

TABLE OF CONTENTS/OUTLINE

Background of the perihepatic space. Evaluation of the anatomy and physiology of the perihepatic space and its peritoneal fluid dynamic. Case-based review of a range of cases including the main and rarer abnormalities of the perihepatic space with respective MRI and CT findings. Radiological correlation with the peritoneal fluid flow distribution.

GIEE-109 GIST: What The Radiologist Should Know

Participants
Cristina Cano Pardo, MD, Pontevedra, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

To identify typical and atypical radiological findings of gastrointestinal stromal tumors (GIST).To know the radiological criteria used in GIST for the evaluation of tumor response.To review what factors have been proposed as relevant when predicting prognosis and response to treatment.

TABLE OF CONTENTS/OUTLINE

Relevant information towards the diagnosis of GIST will be clearly exposed using examples of different cases seen in our center.We will review the main radiological characteristics of GIST in order to suggest a correct differential diagnosis and adequately suggest this pathology.GIST complications and their different responses to treatment are not rare, especially in the emergency room. That is why we will display some key points to identify those situations and ensure a rapid diagnosis and treatment.Likewise, it is interesting to know the different response criteria to treatment so as not to confuse a favorable evolution with a progression of the disease.

GIEE-11 Vascular Ultrasound in the Setting of Post-kidney, Liver, and Pancreas Transplantation: The Ins and Outs of Post-surgical Anatomy and Need-to-know Pathology

Participants
Harrison Lee, MD, MBA, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Ultrasound is typically the first-line option for post-surgical evaluation in the setting of kidney, liver, and pancreas transplantation. A focused review of vascular complications across these organ transplantations can enable a comparative and more conceptual-based approach toward this topic.2. Kidney, liver, and pancreas transplantation can be performed using different surgical techniques leading to variable post-surgical vascular configurations.3. Post-transplant vascular complications differ across etiology, timing, and clinical presentations, largely falling into categories of thrombosis, stenosis, and post-biopsy complications, with early and accurate detection being essential to preventing graft failure.

TABLE OF CONTENTS/OUTLINE

I. Kidney transplantation A. Post-transplant vascular anatomy and variations B. Common indications for ultrasound C. Vascular complications 1. Renal artery thrombosis, stenosis 2. Renal vein thrombosis, stenosis 3. Post-biopsy vascular complications (arteriovenous fistula, pseudoaneurysm) II. Liver transplantation A. Post-transplant vascular anatomy and variations B. Common indications for ultrasound C. Vascular complications 1. Hepatic artery thrombosis, stenosis 2. Portal vein thrombosis, stenosis 3. Hepatic vein stenosis 4. IVC thrombosis, stenosis III. Pancreas transplantation A. Post-transplant vascular anatomy and variations B. Common indications for ultrasound C. Vascular complications 1. Thrombosis, stenosis 2. Post-biopsy vascular complications

GIEE-110 Up Your Game: A Masterclass on CT Contrast in Abdominal Imaging

Participants
Alex Chan, DO, Rochester, MN (*Presenter*) Nothing to Disclose

TEACHING POINTS

-Review how contrast agent distribution reflects physiology and provides a foundation for diagnosis, problem-solving, and avoiding imaging pitfalls.-Discuss diagnostic advantages and pitfalls related to iodinated contrast distribution, altered hemodynamics, x-ray interaction, and contrast timing.-Collaborative use of gained knowledge to focus on problem solving complex post-surgical cases

TABLE OF CONTENTS/OUTLINE

The goal of this education exhibit is to review how contrast agent distribution reflects physiology in normal and diseased states which provides the foundation for understanding how CT contrast agent enhancement patterns can be used for diagnosis, problem-solving, and avoiding imaging pitfalls. We will first discuss the physiologic redistribution effect of typical iodinated contrast agent from the intravascular to interstitial space. Next, we will discuss the effects of altered vascular hemodynamics, for example, in the setting of VA-ECMO and inhomogeneous venous return. Following, the physics of x-ray interaction with iodinated contrast will be discussed accompanied with its diagnostic challenges and exploitation with dual energy CT. Additionally, we will discuss the diagnostic sensitivity of various pathologies related to CT technique/contrast timing and explore the utility of bowel contrast agents. Throughout the presentation, we will use these main ideas to problem solve complex postsurgical patients. In conclusion, the audience will gain a higher level of understanding of CT contrast agents and apply these concepts to improve diagnostic confidence at daily practice.

GIEE-111 Imaging in The Spectrum of Periportal Soft Tissue Pathologies

Participants
Sinduja Sivaramalingam, DMRD, MBBS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1.Learning the anatomical structures involving the porta hepatis and their importance.2.To classify various periportal pathologies based upon the structure of origin.3.To study the radiological features of the individual pathologies, the unique patterns and differentiating points from other pathologies.

TABLE OF CONTENTS/OUTLINE

BACKGROUND:ANATOMY OF THE PORTA HEPATIS: ROLE OF IMAGING MODALITIES:CLASSIFICATION OF PERIPORTAL PATHOLOGIES BASED ON THE STRUCTURE OF ORIGIN1) DUCTAL AND PERI-DUCTAL PATHOLOGIES: • Cholangiocarcinoma (large duct carcinoma)-periductal and infiltrating, hilar types, advanced locally aggressive spread • Intraductal papillary neoplasm of the bile duct (IPNB)/ biliary papillomatosis • Primary neuroendocrine tumors of the bile ducts Cholangitis • IgG4 related sclerosing cholangitis • Langerhans cell histiocytosis - proliferative and fibrotic phase 2) LYMPH NODAL PATHOLOGIES: • Benign reactive hyperplasia of periportal nodes. • Infective nodes • Peritoneal carcinomatosis / Loco-regional spread of tumor 3) NERVES AND CONNECTIVE TISSUE:• Schwannoma, Neurofibroma • Sarcomas 4) POST SURGICAL OR POST TRANSPLANT CASES: • Periportal inflammatory soft tissue • Tumor recurrence • Post Transplant lymphoproliferative disorder.IMPORTANCE OF PREVIOUS IMAGES/ FOLLOW UP.ROLE OF TUMOUR MARKERS.CONCLUSION: Primary step in the diagnostic approach would be identification of the structure or epicenter of origin and then considering the relevant differentials.

GIEE-112 Test Your Knowledge: Reviewing Classic Hepatobiliary Radiologic Signs

Participants
Larissa Lima, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purposes of this quiz are:1. Recognize some classic radiologic signs (a way that makes easier to achieve diferent diagnosis).2. To discuss the pathophysiologic characteristics associated with these radiologic findings.3. Improve the memorize process making associations, since many signs use metaphorical language, such as comparision with objects.4. At the end of the quiz, the reader must be able to recognize these signs and associated pathologies, consolidating the acquired knowledge.

TABLE OF CONTENTS/OUTLINE

1. The presentation describes classic signs associated with hepatobiliary diseases through Computed Tomography (CT) and Magnetic Resonance (MR) images, in a cased-based quiz format.2. Illustrative key points: improve understanding of the correlation between the sign and pathophysiologic process involved.3. Pictorial review of most frequent hepatobiliary signs and associated disease, for example: adenomyomatosis (pearl neklace/rosary sign; hourglass gallbladder), inflamatory hepatic adenoma (atoll sign), hepatic hydatid disease (water-lily sign) and more.4. Key images that the radiologist must actively look to recognize the sign.

GIEE-113 Imaging of Small Bowel Tumors: What Radiologists Should Know

Participants
Kiyoka Maeba, MD, Kurashiki-City, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this presentation is:1) To demonstrate epidemiology of small bowel tumors and the characteristic imaging findings of ultrasound, endoscopy, computed tomography and magnetic resonance imaging including the radiologic-pathologic correlation.2) To learn about the differentiation between benign and malignant small bowel tumors by imaging of various modalities.

TABLE OF CONTENTS/OUTLINE

CONTENTS ORGANIZATIONDECISION TREE FOR SMALL BOWEL TUMORS BENIGN BOWEL TUMORS - Polyp/Polyposis syndromes- Lipoma - Ectopic endometriosis- HemangiomaMALIGNANT SMALL BOWEL TUMORS- Adenocarcinoma- Neuroendocrine tumor: NET- Gastrointestinal stromal tumor: GIST- Malignant lymphoma - Metastatic disease- Sarcoma

GIEE-114 Simplified Approach to Lateral Pelvic Nodes in Rectal Cancer Addressing Controversies, Categorization and Involvement

Awards
Certificate of Merit

Participants
Harmeet Kaur, MD, Houston, TX (*Presenter*) Stock options, Health Catalyst;Stock options, Nuance Communications, Inc

TEACHING POINTS

•What constitute LPLN compartments in the pelvisWhat are the boundaries of LPLN compartments on CT/MR •What are the pathways of lymphatic rectum and why are these important •What the most commonly involved LPLN compartments in rectal cancer What are the currently proposed size criteria for LPLN involvement?What are the circumstances in which these criteria should be applied?

TABLE OF CONTENTS/OUTLINE

Definition of LPLN compartments based on exisiting surgical literatureDefintion of boundaries of LPLN compartments on CT/MRSimplfied imaging criteria to define LPLN on cross sectional imagingClarification of pathways of lymphatic spread in the pelvis and how this impacts nodal invovlmentSurvey of the current criteria of LPLN involvment in the literature implcation for radiologistsSize crtiera for LPLN what do these really mean?

GIEE-115 Clinical And Radiological Features Of Hepatocellular Carcinoma: An Update In The Era Of Systemic Therapy

Awards
Cum Laude

Participants
Mariko Irizato, Kashihara, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of the exhibit is to update knowledge of hyperintense HCC on the hepatobiliary phase (HBP) of EOB-MRI, not only for diagnosis but also for early prediction of treatment effect, leading to personalized therapy in the future, and to recognize various cases of HCC with atypical imaging features on multimodality imaging.

TABLE OF CONTENTS/OUTLINE

With recent advances in systemic therapy for HCC, treatment strategies for HCC are changing. Now radiologists are required not only to diagnose but also to predict early treatment effects and contribute to appropriate treatment selection. As an imaging finding linked to predicting treatment effects, the signal intensity of HCC on HBP of EOB-MRI has recently attracted attention. Hyperintense HCC on HBP of EOB-MRI showed a correlation with the therapeutic effects of various treatments, such as immunotherapy, TACE, and hepatic arterial infusion chemotherapy (HAIC). HCC is also a genetically and molecularly diverse group. Actually, approximately 40% of HCCs do not show typical imaging features, such as Li-RADS major imaging feature of HCC, including hyperenhancement (APHE), portal venous phase, delayed phase washout, and capsule appearance. The atypical imaging features of HCC are generally associated with pathological type and molecular phenotype. Understanding HCC with atypical imaging features can improve diagnostic accuracy and help clinicians plan strategies for better treatment.1) Hyperintense HCC on HBP of EOB-MRIa) Etiology and Imaging findingsb) Treatment prediction: TACE, HAIC, and systemic therapy c) Differential diagnosis: the hepatic tumor with hyperintensity on HBP 2) Multimodality imaging of HCC with atypical imaging features

GIEE-116 MR of Anorectal Fistulas: Current and Evolving Concepts Simplified

Participants
Nabih Nakrour, MD, Boston, MA (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is to:Review anatomy of the anorectal region and MR imaging landmarks relative to anorectal fistula classification.Demonstrate the role of MR in presurgical planning for anorectal fistulas, including anatomic mapping, fistula track relation to the sphincters and pelvic organs, detecting internal and external fistula openings, assessing the degree of fistula complexity, and associate fluid collections.Discuss current and evolving concepts of anorectal fistula management and imaging features predicting prognosis.Validate with sample cases MR contribution to diagnosis and decision-making.

TABLE OF CONTENTS/OUTLINE

The present role of MR in diagnosis and management of anorectal fistula:-Anatomy of the anorectal regions and anal sphincters.MR protocols and optimizing imaging techniques in detecting anorectal fistulas.-Anorectal fistula classifications.Imaging manifestation and diagnostic pearls for each fistula subtype.Surgical approach and treatment options.Radiologic appearance of postsurgical devices.Example cases and illustrations of the above contents.

GIEE-117 Evaluating the Performance of Segmentation Models for Liver, Spleen, and Fat by Radiologists

Participants
Ari Borthakur, PhD,MBA, Philadelphia, PA (*Presenter*) Nothing to Disclose

TEACHING POINTS

Opportunistic screening (1) with abdominal CT examinations, capturing anatomic structures beyond the main clinical indication for performing the exam, may provide the opportunity for more comprehensive analyses of the entire abdomen and pelvis (2). It provides additional value to both patients, by uncovering incidental findings without additional scans, and providers, by improving both quality and service offerings, potentially mitigating risk and improving revenue without additional scan costs (3). The challenge, however, is that opportunistic screening has the potential to increase the burden of unnecessary work for providers. Artificial Intelligence (AI) based machine learning (ML) approaches can help reduce some of this burden particularly in the automation of tedious tasks like image segmentation (4). We present a comprehensive approach to evaluating the performance of an AI algorithm for fully automated CT-based body composition measurements (5) with automated reporting to PACS prior to deployment in routine clinical workflow.References Cited 1. P. J. Pickhardt, Radiology, 211561 (2022). 2. L. L. Berland et al., J Am Coll Radiol 7, 754-773 (2010). 3. P. J. Pickhardt et al., Radiology 249, 151-159 (2008). 4. J. Mongan, A. Vagal, C. C. Wu, Radiol Artif Intell 4, e220039 (2022). 5. M. T. MacLean et al., J Am Med Inform Assoc 28, 1178-1187 (2021).

TABLE OF CONTENTS/OUTLINE

A. Clinical need for an AI solution a. Current approaches to body organ segmentation b. Our solution i. Automated phenotyping ii. Structured reporting c. Impact on patient care d. Cost implicationsB. Evaluating the value of the output for radiologists a. Reader studies b. Analyses of Concordance

GIEE-118 Biliopancreatic Anatomic Variants: Radiologic Findings And Clinical Relevance

Participants
Kamila Albuquerque, Vila Velha, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Biliopancreatic anatomic variants are common and they are more frequently diagnosed nowadays due to the increasing number of patients submitted to radiology exams. Recognizing these variants is essential to avoid misdiagnosis of pathologies and in the preoperative of biliopancreatic surgeries. The purpose of this exhibit is to make a brief review of pancreatic and biliary tract embryology and review the main biliopancreatic anatomic variants and their clinical relevance.

TABLE OF CONTENTS/OUTLINE

Introduction with a schematic review of the embryology of the pancreas and biliary tract. Present with images from CT, MR, ERCP, and USG illustrative cases of biliopancreatic anatomic variants and anomalies including annular pancreas, pancreas divisum, ectopic pancreas, ansa pancreatica, pancreatic hypoplasia, circumportal pancreas, dorsal pancreatic agenesis, anomalous biliopancreatic junction, low cystic duct insertion, gallbladder duplication, Caroli disease, intrahepatic bile ducts variations, among others. Correlate each one of these cases with its clinical/surgical relevance. Summary and take-home notes.

GIEE-119HC Radiologic Review of Small Bowel Malignancies with Their Mimicking Lesions

Participants
Jongsoo Lee, MD, Incheon, Korea, Republic Of (*Presenter*) Nothing to Disclose

TEACHING POINTS

When radiologists inspect computed tomography (CT) images, small bowel malignancies are often easy to miss because of the small size, which can lead to mistake for normal small bowel due to their similar enhancement to small bowel or non-specific enhancement. In addition, small bowel malignancies are sometimes mistaken for masses from other origins, such as the uterus, rectum, or omentum. In this article, we illustrate various small bowel malignancies and their mimicking lesions with typical and atypical features on CT imaging as well as their clinical manifestations.

TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Small bowel gastrointestinal stromal tumor (GIST) 3. Small bowel adenocarcinoma 4. Small bowel lymphoma 5. Small bowel sarcoma 6. Small bowel plasmacytoma (Extramedullary plasmacytoma) 7. Small bowel neuroendocrine tumor (NET) 8. Mass-like small bowel lesions mimicking small bowel malignancies 9. Clinical history of small bowel malignancy: anemia, weight loss, vomiting, nonspecific abdominal pain Small bowel malignancies can be easily missed or misdiagnosed by radiologists because of their rarity, nonspecific symptoms, and overlapping imaging features, especially when manifesting with small sizes. However, if radiologists know some characteristic imaging features of small bowel malignancies and their mimicking lesions, and perform a careful inspection of the entire small bowel loops, especially when patients present with gastrointestinal bleeding symptoms, optimal detection and diagnosis of small bowel malignancies can be achieved.Please visit the Learning Center to also view this presentation in hardcopy format.

GIEE-12 High Frequency Imaging in Hepatobiliary Ultrasound: Zooming In

Awards
Identified for RadioGraphics

Participants
Michael Enea, DO, Philadelphia, PA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Understand the benefits and limitations of using a high frequency linear transducer (= 12 MHz) for adult hepatobiliary imaging and how it can improve confidence in ultrasound interpretations.2. Compare routine and high frequency imaging of liver parenchyma and surface contour in patients on a spectrum including normal, steatosis, fibrosis, and cirrhosis.3. Demonstrate the usefulness of high frequency liver imaging for focal hepatic lesions.4. Understand the advantage of high frequency imaging for biliary pathology including dilatation, sludge, and calculi.5. Compare low and high frequency imaging for the evaluation of gallbladder wall thickening, integrity, focal lesions, and calculi.

TABLE OF CONTENTS/OUTLINE

1. General- how technique affects high frequency imaginga. Variable transducer frequenciesb. Different machine settingsc. Patient habitus2. Livera. Diffuse parenchymal liver diseasei. Steatosis1. Homogeneous increased echogenicity2. Focal fatii. Fibrosis1. Coarse echotexture2. Correlate with shear wave elastographyiii. Cirrhosis1. Nodular surface2. Regenerative nodules3. Parenchymal atrophyb. Focal liver lesionsi. Hepatocellular carcinomaii. Metastasesiii. Cystsc. Otheri. Fulminant liver failureii. Periportal edemaiii. Portal thrombosis- benign and malignantiv. Varices3. Biliary Ductsa. Choledocholithiasisb. Biliary duct dilationc. Biliary castsd. Von Meyenburg Complexes4. Gallbladdera. Wall thickeningb. Integrity of walla. Adenomyomatosisb. Focal lesions: polyps, masses

GIEE-120 Imaging of External Hernias of The Abdomen: Revisited

Participants
Manabu Minami, MD, PhD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

External hernias of the abdomen are clinically common problems and frequently require imaging evaluation preoperatively. Various kinds of external hernias can occur in the abdominal wall. In the era of three-dimensional imaging using CT and MRI, a more precise evaluation of the structure of each hernia (hernia orifice, hernia sac, its content, and its covering) and complications such as inflammation, bowel obstruction/incarceration, and strangulation can be analyzed than before. In this presentation, we review various kinds of external hernias of the abdomen and show radiological anatomy using three-dimensional images with representative cases as well as their rare types. Understanding the membranous structures of the abdominal wall related to external hernias will be essential for GI radiologists to provide more critical information to surgeons in patient management and surgical planning.

TABLE OF CONTENTS/OUTLINE

1. General consideration of external hernias of the abdomen2. Classification of external abdominal hernias and their imaging findings: case presentations a. groin (inguinal): indirect (external), direct (internal), femoral, b. umbilical/periumbilical: cf. omphalocele, c. ventral (anterior): epigastric/hypogastric (linea alba), suprapubic, Spigelian (linea semilunaris), d. lumbar (lateral): superior lumbar (Grynfeltt-Lesshaft), inferior lumbar (Petit), e. pelvic floor (inferior): obturator foramen, sciatic foramen, perineal, f. cicatricial: traumatic, incisional, parastomal, trocar site3. Conclusions

GIEE-121 MR Enterography in Chron Disease: Detection of Complications

Participants
Maria Luisa Rosa, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

MR Enterography is the gold-standard method for studying the small-bowel in patients with Chron's Disease, not only to depict active inflammatory disease, but to exclude complications, as the presence of fibrostenosing and/or penetrating disease alters medical treatment and may imply surgical intervention.The aim of this work is to depict the imaging findings of complicated Crohn's disease on MR Enterography and discuss the correct terminology and potential differential diagnoses of such findings.

TABLE OF CONTENTS/OUTLINE

Through pictorial review we illustrate the different aspects of penetrating disease such as such as sinuses, simple and complex fistulas, inflammatory masses and abscesses, concentrating on what defines and differentiates them from pseudo-sacculations or deep ulcers and from adhesions, that can be misinterpreted on imaging studies as sinuses and fistulas, respectively. In regards to stenosing disease, we explain the criteria for defining a stricture and provide examples of strictures with and without active inflammation as the distinction is important for determining the treatment plan. We will also clarify the circumstances in which you

can consider a probable stricture even when there is no upstream dilation. We will discuss how to potentially differentiate occlusion due to peritoneal adhesions from fibrotic strictures; and from functional abnormalities sometimes seen in these patients who demonstrate dilated small bowel loops without mechanical obstruction.

GIEE-122 Do You Remember The Meckel Diverticulum?

Participants
Cristina Berastegi Santamaria, MD, Bilbao, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is: 1. To describe Meckel diverticulum´s characteristics 2. To review imaging findings of Meckel's diverticulum on computer tomography 3. To describe the radiologic features of complications of Meckel diverticulum 4. To correlate the histological findings with the radiological perspective

TABLE OF CONTENTS/OUTLINE

1. Embriology of Meckel diverticulum 2. Pathology of Meckel diverticulum 3. Review of imaging findings on CT and pathological correlation (sample cases) - Non complicated Meckel diverticulum - Complicated Mecel diverticulum Hemorrhage Bezoar Intestinal obstruction Diverticulitis Neoplasms Volvulation Intususpection 4. Conclussions and taking-home messages

GIEE-123 Anisakiasis: What Radiologists Need to Know

Participants
Ines Alonso Sanchez, MD, Bilbao, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Become familiar with the radiological findings of anisakiasis, because it is an underdiagnosed parasitosis with an increasing incidence worldwide.- Initial clinical suspicion is sometimes difficult as the symptoms are non-specific, and a multidisciplinary approach in important to make an accurate diagnosis.

TABLE OF CONTENTS/OUTLINE

Objectives: Review and describe the main clinical, radiological and epidemiological features of the different forms of Anisakiasis. Background: Anisakiasis is a zoonosis caused by accidental infection by Anisakis simplex due to the ingestion of raw or undercooked fish that affects mainly the gastrointestinal tract. Although the highest prevalence of anisakiasis is found in Asia and it is rare in the United States and Europe, the incidence is expected to increase worldwide as cultural globalization of food habits increases opportunities to eat raw or undercooked seafood. Imaging findings: Severe submucosal edema, ascites, fluid collection and mesenteric fat infiltration. Diagnosis: Clinical suspicion is helpful but difficult in some cases, especially in intestinal anisakiasis, and CT findings may suggest the possibility of anisakiasis when characteristic imaging features are present. Laboratory tests or endoscopic direct visualization give a definite diagnosis. Treatment: Generally symptomatic and in some cases endoscopic larvae removal. Conclusions: Anisakiasis is a rare and underdiagnosed parasitosis that affects the gastrointestinal tract. As its incidence is increasing worldwide, it is important that we are familiar with the characteristic clinical and radiological manifestations.

GIEE-124 The Many Faces Of Colitis: An Imaging Review

Participants
Gustavo Alonzo Correa I, MD, Mexico City, Mexico (*Presenter*) Nothing to Disclose

TEACHING POINTS

To describe the normal appearance of the colon in the different imaging modalities.To explain the appearances, pathogenesis and differential diagnosis of CT colonic enhancement patterns.To discuss the differential diagnosis of colitis based on imaging findings, epidemiology and clinical history.

TABLE OF CONTENTS/OUTLINE

IntroductionNormal anatomy of the colon in the different imaging modalitiesClassification of CT colonic enhancement patternsInfectious colitisPseudomembranous colitisNeutropenic colitis (Typhlitis)Radiation colitisInflammatory bowel diseaseIschemic colitisTake home points

GIEE-126 Post-operative Abdominal Complications Following Colorectal Surgery on CT: Pearls and Pitfalls

Awards
Certificate of Merit

Participants
Deevia Kotecha, MBChB, BSc, Wilmslow, United Kingdom (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) To illustrate the spectrum of early post-operative complications, emphasizing the importance of the timing of surgery.2) To distinguish expected post-operative CT appearances versus a complication, highlighting useful tips and potential pitfalls.3) To relate the type of surgery to key review areas on post operative imaging (including recent advances in endoluminal and robotic surgery).4) To discuss the utility of positive luminal contrast in problem solving.

TABLE OF CONTENTS/OUTLINE

The post-operative abdomen is challenging. Knowledge of the potential complications is important to every radiologist so that life-threatening conditions can be quickly diagnosed and treated.Post-operative GI complications covered will be broadly categorised into the following headings. A range of examples with key learning points will be illustrated and where relevant correlate with any pre-operative imaging.• Abnormal gas patternso Location and volume of free gas.o Retained surgical swabso Haemostatic agents.• Fluid collectionso Anastomotic leako Urinoma• Vascular complicationso Bowel ischemiao Arterio-venous fistulao Pseudo-aneurysm

GIEE-127 Improving CT Colonography Standards

Participants
Aishwariya Vegunta, MD, Stratford, CT (*Presenter*) Nothing to Disclose

TEACHING POINTS

Discuss various standards to maximize the quality of CT colonography.

TABLE OF CONTENTS/OUTLINE

Background: There is an increasing incidence of colorectal cancer which is a largely preventable disease if identified at precursor polyp stage and removed.CTC Performance standards: a. Patient Information and experience. b. Bowel Preparation: 1. Diet. 2. Catharsis: Dry versus wet agents and 3.Tagging of residual stool and fluid. Bowel preparation for same-day CTC after incomplete colonoscopy. c. Imaging: A. CT technique/ Scanning parameters and radiation risk. B. Colonic distension with carbon dioxide, using an automated insufflator. C. Scout to assess for adequate bowel distension. D. Dual-position scanning in Supine and prone positions versus decubitus position. d. Interpretation: A. Colonic and extracolonic findings are reported in a standard examination as per CT Colonography Reporting and Data System (C-RADS). B. Colonic interpretation involving primary 2-D and primary 3-D reviews. Flat lesions measuring 3 mm or less in height are better depicted with contrast tagging at 2D while 3D reviews are better at smaller polyp detection and greater conspicuity of polyps at or near the folds. C. CTC descriptors including polyp morphology, location and measurements. D. Pitfalls in CTC interpretation. e. Management decisions and interval surveillance: Follow-up recommendations on polyp management and role of surveillance CTC. f. CTC outcome measures: Audits and ACR's CTC registry.

GIEE-128 Roux-en-Y Gastric Bypass: Post-surgical Anatomy and Most Common Complications

Participants
Ines Alonso Sanchez, MD, Bilbao, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Review the Roux-en-Y gastric bypass surgical technique and understand the normal post-surgical anatomy and radiological findings. - Describe and explain the most frequent complications and their imaging manifestations using a series of cases from our institution as examples.

TABLE OF CONTENTS/OUTLINE

Background Obesity is a disease of epidemic proportions. Non-surgical treatment fails in 95% of the patients, and therefore bariatric surgery is the most effective, yet invasive, treatment. There are two surgical approaches for achieving weight loss: bypass procedures and restrictive procedures. Roux-en-Y gastric bypass is the most popular technique and obtains greater sustained weight loss and higher sustained long-term success than other techniques. Findings: As radiologists, we should be familiar with the anatomic changes caused by this surgery, in order to be able to recognize them and identify possible complications. Complications In this presentation, we describe the most common complications of gastric bypass surgery (mainly post-operative leaks, small bowel obstruction, gastro-gastric fistula and ulceration) and their imaging features based on cases of our centre. We revise the imaging techniques recommended to examine each type of complication and key findings to identify them. Conclusions Bariatric surgery is increasing dramatically, especially Roux-en-Y gastric bypass and radiologists should be able to recognize the anatomic changes that this surgery involves and the most frequent complications it may have.

GIEE-129 Barium Swallow Radiological Technique to Evaluate Hiatal Hernias and Other Commonly Associated Findings

Participants
Tatiana J. Ludena Camacho I, MD, Mexico City, Mexico (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Explain the anatomy thorough diagrams as well as the typical imaging findings.- Review the different types of hernia and much more frequently observed in radiological practice.- Simplify the correct technique for the execution of the esophagogram.- Present through real clinical cases usual findings during an esophagram.

TABLE OF CONTENTS/OUTLINE

1. Introduction.2. Anatomy3. Technique4. Hiatal hernias- Definitions.- Pearls and pitfalls.- Key terms of the radiographic lexicon terms.- Categories.5. Other common findings in Barium Esophagogram.6. Conclusions.

GIEE-13 Anatomic Basis of Rectal Cancer Staging: Clarifying Controversies and Confusion

Awards
Identified for RadioGraphics
Cum Laude

Participants
Muhammad Awiwi, MD, Houston, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

Despite the adoption of rectal MRI as a mandatory staging tool for rectal cancer, inconsistencies still exist in defining anatomic landmarks even among experts (Lambregts DMJ et al. 2022).

TABLE OF CONTENTS/OUTLINE

This exhibit aims to review controversies in anatomic issues, propose the best opinion based on the evolving literature, and discuss impact on management.Anatomic landmarks to be discussed include:Re-definition of the rectum and its upper/lower boundaries.-The anatomy of the anal sphincter and staging of tumors involving this structure.-The definition of circumferential resection margin (CRM) will vary depending on surgical procedure and does not equate to mesorectal fascia (MRF). -Clarify the difference between peritoneal involvement and mesorectal fascia involvement in the upper rectum.-Clarify the anatomic boundaries of lateral pelvic nodes and their clinical significance.

GIEE-130 Complications of Percutaneous Liver Procedures: Bleeding and Beyond

Participants
James Palmer, MD, Tucson, AZ (*Presenter*) Nothing to Disclose

TEACHING POINTS

1.) Percutaneous diagnostic and therapeutic liver procedures are commonly performed and range from biopsy to more invasive treatments such as ablation and biliary interventions. 2.) While these procedures are generally safe, major complications do occur usually at a rate of 0.1-5%. Bleeding is one of the most common complications and various manifestations of bleeding are important to recognize as they may require different treatment approaches. 3.) Non-hemorrhagic complications are diagnosed primarily by imaging and the radiologist should be aware of the range of complications so that timely treatment can be instituted.

TABLE OF CONTENTS/OUTLINE

1.) Brief overview of literature regarding complications of percutaneous liver procedures a.) Definition of minor vs. major complications 2.) Multimodality case-based review of complications with teaching points and discussion of treatment implications. a.) Hemorrhagic and Vascular i.) Subcapsular hematoma, hemoperitoneum ii.) Pseudoaneurysm, active bleeding, AVF iii.) Arterial vs. Venous bleeding iv.) Thrombosis b.) Biliary i.) Bile leak/biloma ii.) Stricture iii.) Hemobilia c.) Infectious i.) Liver abscess ii.) Biliary sepsis d.) Local i.) Organ injury (diaphragm, GB, stomach, colon) ii.) Residual/recurrent tumor iii.) Liver infarction iv.) Tumor seeding e.) Thoracic i.) Pneumothorax, hemothorax Hemopericardium

GIEE-131 Multimodality Imaging of Tumor Thrombus in Hepatocellular Carcinoma

Participants
Ulysses Torres, MD, PhD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

• To review and illustrate the vascular involvement in hepatocellular carcinoma (HCC) on ultrasound, computerized tomography (CT), and magnetic resonance imaging (MRI).• To prepare abdominal radiologists to identify the most common hepatic venous thrombosis sites on imaging in HCC, with emphasis on portal vein. • To present imaging features of tumor thrombosis according to LI-RADS v2018. • To present clinical cases from our institution with a multidisciplinary approach, some correlated with pathology results and individualized treatment. • To recognize potential pitfalls in image interpretation and differential diagnosis of tumor thrombus.

TABLE OF CONTENTS/OUTLINE

• Background: the importance of a multimodality assessment of vascular involvement in HCC, which can be subtle. • The impact of tumor thrombus on management in patient care. • Categorization according to LI-RADS v2018. • Illustrative cases of our institution with the main hepatic tumor thrombus sites with imaging features and interpretation on: o Ultrasound. o CT. o MRI. • Challenging cases of tumor thrombosis in HCC (as infiltrative carcinoma). • Differential diagnosis with hematic thrombosis. • Tips and tricks.

GIEE-132 Advanced CT Techniques In the Evaluation of Hepatocellular Carcinoma: Roles of Ultra-high-resolution CT, Dual-energy CT, Contrast Enhancement Boost Technique, and Radiomics

Participants
Masatoshi Hori, MD, Kobe, Japan (*Presenter*) Research Grant, Canon Medical Systems Corporation

TEACHING POINTS

1. Understanding the characteristics of advanced techniques such as 1024-matrix ultra-high resolution (UHR) CT, dual-energy CT, contrast enhancement boost (CE boost) technique, and radiomics. 2. Understanding how radiologists can use advanced techniques to detect and characterize hepatocellular carcinoma (HCC). 3. Understanding the prospects for advanced techniques to improve the management of patients with HCC.

TABLE OF CONTENTS/OUTLINE

A. Introduction B. Ultra-high-resolution (UHR) CT with a 1024 matrix B-1. Spatial resolution, image noise, and deep learning reconstruction B-2. Tumor margin can be better delineated, potentially resulting in improved assessment of microvascular invasion C. Dual-energy CT (DECT) C-1. Material decomposition C-2. Virtual monochromatic imaging (VMI) can enhance tumor-to-liver contrast C-3. Beyond the dual-energy CT: Hope for photon counting CT D. Contrast enhancement boost (CE boost) technique: a postprocessing technique for increasing the degree of contrast enhancement D-1. Principles: Roles of image subtraction, non-rigid registration, and denoising D-2. CE boost combined with multiphasic CT can improve the detection of small HCC D-3. CE boost can be combined with low-keV VMI in DECT to further increase the conspicuity of HCC E. Radiomics F. Clinical roles of the advanced techniques in evaluating HCC G. Conclusion

GIEE-133 Hepatic Hydatid Disease: Typical and Atypical Imaging Features with Clinical Correlation and Impact on Management

Awards
Certificate of Merit

Participants
Mohamed Ibrahim, MBBCh, Rochester, MN (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Understand the etiopathogenesis of hydatid disease 2. Highlight hepatic and extrahepatic hydatidosis imaging features (cardiac, brain, spine, muscular, subcutaneous, and adrenal) 3. Highlight different IR management for hepatic hydatid cysts

TABLE OF CONTENTS/OUTLINE

1. Etiopathogenesis of hydatid disease:• Historical overview• Echinococci types, lifecycle, infection sources, and clinical relevance• Hydatid cyst composition and imaging features 2. Imaging features of different stages:• WHO IWG 2001 management classification and radiological classification (Active vs transient vs inactive)• Extrahepatic lesions (brain, spleen, pulmonary, spine, pyriformis

muscle, subcutaneous and adrenal) • CT vs MRI, which is better? 3. Management; indications, contraindications, procedural steps, and imaging follow-up• Surgical: conservative (partial cystectomy, and deroofing) vs radical (pericystectomy vs hepatic resection)• IR options. Discussing PAIR cases and highlighting why it is better i. PAIR "Percutaneous puncture under sonographic guidance, Aspiration of a substantial amount, Injection of scolicidal agent, Re-aspiration) ii. D-PAI: Double puncture-aspiration-injection iii. PEVAC: Percutaneous evacuate on of cyst content

GIEE-134 Uncommon Primary Liver Tumors in Adults: An Image Review

Participants
Guillem Dolz Alvarez De La Ballina, MD, Valldoreix, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

To show the wide spectrum of unusual primary liver tumors that can arise from the different progenitor cells in the liver, and review the imaging findings of these uncommon lesions.To assess features that may help in the diagnosis of rare hepatic tumors.

TABLE OF CONTENTS/OUTLINE

Introduction to unusual hepatic tumorsDescription of hepatocellular tumors:- Fibrolamellar hepatocarcinoma- Hepatocoangiocarcinoma- HepatoblastomaReview of epithelial/cholangiocellular tumors:- Intraductal papillary tumor of the bile ducts- Cystic mucinous tumorMesenchymal tumors:- Angiomyolipoma- Angiosarcoma- Hepatic epithelioid hemangioendothelioma- Inflammatory myofibroblastic tumor- Solitary fibrous tumorPrimary hepatic neuroendrocrine carcinoma.Primary hepatic lymphoma.Others:- Necrotic nodule of the liver- Brucellar liver abscess (brucelloma).Conclusions

GIEE-135 In Between Peritoneal and Retroperitoneal Layers: The Spread of Disease in The Abdominal Cavity

Participants
Marcela Santos Conde, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Recognizing the types of disease spread in the abdominal cavity (interfascial, intraperitoneal, subperitoneal and transperitoneal). 2. Understanding the anatomy of the peritoneum and retroperitoneum and its correlation with disease spread. 3. Expected findings on disease spread in the abdominal cavity, from tumoral dissemination to inflamatory disease and trauma.

TABLE OF CONTENTS/OUTLINE

Introduction: general aspects of the disease spread in the peritoneum and retroperitoneum. Anatomy of the retroperitoneum as it relates to interfascial spread of diseases. Peritoneal cavity and the circulation of ascitic fluid as it relates to intraperitoneal disease spread. Anatomy of peritoneal ligaments and omental sacs as it relates to subperitoneal spread of diseases. Understanding the relation of retroperitoneal and peritoneal organs with the peritoneal membrane as it relates to transperitoneal spread of disease. Take home messages.

GIEE-136 Peritoneal MRI: Dedicated Protocol, Tips and Tricks

Awards
Certificate of Merit

Participants
Anais Delagnes, Angers, France (*Presenter*) Nothing to Disclose

TEACHING POINTS

-To know the MRI sequences to be performed and the order of execution-To understand usefulness of each sequence for the detection of peritoneal malignancies-To know how to adapt patient preparation and sequence parameters in case of MRI artifacts

TABLE OF CONTENTS/OUTLINE

Magnetic Resonance Imaging (MRI) has an emerging role in the exploration of peritoneal malignancy. The knowledge and the management of peritoneal pathologies have considerably evolved over the last decade, especially with the possibility of curative treatment of peritoneal metastatic disease. Peritoneal MRI is routinely performed in referral centers and play essential role at different stages of the management: for the selection of patients for curative surgery, in the preoperative phase to optimize mapping of lesions, and in surveillance for early detection of recurrence. A dedicated and detailed protocol is proposed to perform a peritoneal MRI. Each step are explained including the preparation of the patient, oral and intravenous contrast agent and drugs used. Then each sequences (recommended and optional) with their parameters and the optimized order of realization are detailed, as well as their usefulness to detect peritoneal lesions and their limits. Finally, tips and tricks to limit artifacts are given, in particular to reduce artifacts related to the MR technique like susceptibility artifact and related to the patient condition (for exemple the black hole artifact caused by the presence of ascites).

GIEE-137 Illustrative Cases of Acute Pancreatitis and Commonly Encountered Complications

Participants
Klaudio Gjeluci, MD, MS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Demonstrate the wide array of acute pancreatitis encountered on imaging.2. Discuss the utility of imaging.3. Evolution of interstitial edematous pancreatitis and necrotizing pancreatitis.4. Summarize the nomenclature of the 2012 Revised Atlanta Classification for acute pancreatitis.5. Review of common complications of acute pancreatitis through illustrative cases.

TABLE OF CONTENTS/OUTLINE

Utility of imaging in acute pancreatitis and complications:Limited in the early phase of the disease processClinical diagnosis: epigastric pain and elevated pancreatic enzymes three times the normal levelDiagnostic in cases where elevated pancreatic enzymes do not meet the threshold criteria. Typically, in late presentation of acute pancreatitisDetermining unclear etiologyGallstone pancreatitisObstructive neoplastic processPredictor of mortality in the late phase of disease processExtent of

necrosisInfectionLocal complications: pseudoaneurysm/bleeding, venous thrombosis, CBD stricture, pancreatic duct strictureDiscuss Case Examples with Imaging Findings:Acute interstitial edematous pancreatitisAcute necrotizing pancreatitis Acute pancreatic fluid collectionAcute necrotic collectionPseudocystWalled-off necrosisInfected walled-off necrosisBleeding splenic artery pseudoaneurysmLarge gastroduodenal artery pseudoaneurysmInteresting case of splenic vein thrombosis

GIEE-138 What Radiologists Should Know for The Early Detection of Small Pancreatic Ductal Adenocarcinoma

Participants
Yoshihiko Fukukura, MD, PhD, Kagoshima, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

Pancreatic ductal adenocarcinoma (PDAC) still has a dismal prognosis because of the difficulty in early diagnosis, although small PDAC has a good prognosis with a 5-year survival rate of 68.7% for stage IA disease. CT and MR are the most frequent imaging modalities used for evaluating patients with clinically suspected PDAC. However, these modalities often fail to demonstrate small PDAC. The possibility of diagnosing precursor lesions of the pancreas (pancreatic intraepithelial neoplasia [PanIN-3]) and small PDAC may greatly improve the prognosis of PDAC. The purpose of this exhibit is 1. To illustrate CT and MR imaging findings of PanIN and small PDAC 2. To discuss how to improve the detection of PDAC.

TABLE OF CONTENTS/OUTLINE

1. Summarize the definition, etiology, and clinical and histological features of PanIN and small PDAC (<20 mm) 2. Describe the characteristic CT and MR imaging findings of PanIN and small PDAC (<20 mm) with histopathological correlation 3. Highlight how to improve the detection of PDAC (tumor delineation and important secondary signs) 4. Discuss the diagnostic approach to potentially achieve earlier detection of PDAC 5. Summary: Knowledge of characteristic CT and MRI features and how to improve tumor delineation is important to improve the prognosis of patients with PDAC.

GIEE-139 Bubbles and Marbles in the Pancreas: Demystifying Cystic and Solid Pancreatic Lesions with Emphasis on Management

Participants
Katherine Chung, MD, Stony Brook, NY (*Presenter*) Nothing to Disclose

TEACHING POINTS

Imaging characteristics of cystic and solid lesions of the pancreas are well studied. However, with ongoing research in management and prognosis of these pancreatic lesions, it can be confusing for practicing radiologists and trainees to form recommendations for patients and clinicians. In this education exhibit, we will describe classic imaging findings of pancreatic lesions, review their clinical features, and discuss the latest recommendations on treatment options and management of these lesions. We present a pictorial review of cystic and solid lesions of the pancreas to guide radiologists on the management of these lesions.

TABLE OF CONTENTS/OUTLINE

Solid pancreatic lesions:? Ductal adenocarcinoma,? Neuroendocrine tumors, Metastasis, ? Lymphoma.Cystic pancreatic lesions:? Intrapancreatic Mucinous N?eoplasms (IPMN), Serous Cystadenoma, Mucinous cystadenoma?, Solid Pseudopapillary Neoplasm?. Mimickers?: Pseudocyst,? Duodenal diverticulum?.

GIEE-14 CT and MR Enterography in Celiac Disease: What Should Residents Know?

Awards
Identified for RadioGraphics

Participants
Andrea Penizzotto, DMRD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

The role of small bowel imaging is most important in patients with nonresponsive celiac disease and to exclude celiac disease related complications.The most specific imaging finding of celiac disease is the jejunoileal fold reversal pattern, but other findings are those of a nonspecific malabsorptive pattern.Ulcerative jejunitis, small bowel wall thickening, and small bowel dilation are more commonly seen in patients with refractory celiac disease.Ascites, pleural effusion and/or subcutaneous edema are related to severe malnutrition secondary to refractory celiac disease.

TABLE OF CONTENTS/OUTLINE

1) Introduction 2) Imaging protocolsCT enterography MR enterography3) Imaging analysis: Systemic approach4) Intestinal findingsIleal jejunizationJejunal fold flatteningFold pattern reversalIntestine wall thickeningBowel dilatationStrictureIntussusception5) Extra-intestinal findingsMesenteric adenopathyMesenteric vascular engorgementHyposplenismAscites6) ComplicationsUlcerative jejunoileitisMalignancyCavitary mesenteric lymph node syndrome7) Take home messages

GIEE-140 Mimickers of Pancreatic Adenocarcinoma: What to Watch for at Tumor Board and the Workstation

Participants
Andrea Esquivel Mora, MD, San Jose, Costa Rica (*Presenter*) Nothing to Disclose

TEACHING POINTS

Neoplastic and non-neoplastic pancreatic conditions can mimic pancreatic ductal adenocarcinoma (PDAC) on cross-sectional imaging. Our purpose is to: • Highlight distinguishing clinical and radiologic features that provide a clue to the correct (non-PDAC) diagnosis • Understand treatment and outcome implications for these mimics

TABLE OF CONTENTS/OUTLINE

Around 90% of pancreatic cancers are pancreatic adenocarcinoma while other pancreatic tumors are infrequently seen. This exhibit will highlight distinguishing radiologic and clinical features of PDAC mimics. 1. Uncommon exocrine pancreatic neoplasms.*Acinar cell carcinoma *Pancreatoblastoma *Squamous and Adenosquamous Ca *Colloid Carcinoma *Invasive IPMN *Mucinous

cystadenocarcinoma 2. Non-exocrine pancreatic neoplasms that can mimic pancreatic cancer. *Pancreatic neuroendocrine neoplasms *Metastasis 3. Benign mimics of pancreatic cancer: "groove pancreatitis", focal autoimmune pancreatitis, mass forming chronic pancreatitis, obstructive chronic pancreatitis, and focal steatosis 4. Key imaging features that can distinguish these entities from PDAC: multifocality, multiple ductal strictures, hemorrhage, duct-penetrating sign, low duct-to-parenchyma ratio, collateral duct dilatation, "sandwich sign", hyperenhancement, calcifications, and capsule like rim or loss of lobulations. 5. Clinical features that can support the differential diagnosis are the history of a primary tumor, sex, age, predisposing genetic syndromes, and serum markers (IgG4, tryptase).

GIEE-141 The Perceptual Problem in Pancreatic Imaging

Participants
Abraham Fourie Bezuidenhout, MD, Boston, MA (*Presenter*) Nothing to Disclose

TEACHING POINTS

Diagnostic errors are common and can affect overall patient care, none more so than in the setting of pancreatic ductal adenocarcinoma (PDAC). In the absence of a PDAC screening program for the general population, the onus of early diagnosis is primarily placed on radiologists which largely determine patient outcomes and is an understandable source of anxiety to radiologists. Diagnostic errors can occur at any time in the process, from initial perception to final image interpretation. Cognitive errors include perceptual challenges and a myriad of cognitive biases which are particularly common and impactful in pancreatic imaging. Becoming aware of perceptual challenges specifically related to PDAC as well as understanding the various biases, related to internal and external pressures, can allow radiologists to minimize diagnostic errors and thereby help improve patient outcomes. In this exhibit we will provide explanations, insight and a framework for understanding the basis of these diagnostic errors and potential avenues to minimize them.

TABLE OF CONTENTS/OUTLINE

What contributes to diagnostic errors in the setting of PDAC? What's the unique perceptual challenges of PDAC? Direct vs indirect signs of PDAC. Which cognitive biases are in play in pancreatic imaging? Internal and external factors contributing to bias. Common vs newly described biases as it pertains to pancreatic imaging. How to overcome biases with guidelines to create an environment of peer learning which enables systematic improvement, rather than viewing it as individual failures.

GIEE-142 Ultrasound: Lumps and Bumps in the Anterior Abdominal Wall

Participants
Marie Vogel, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Ultrasound is a low cost, low risk, widely accessible imaging tool that can serve as a first line imaging modality in characterizing superficial lesions.2. A thorough understanding of abdominal wall anatomy and scanning techniques will allow the radiologist to confidently identify common abdominal wall pathologies.? 3. By combining scanning technique, anatomic knowledge and patient history, the radiologist can troubleshoot challenging cases and confidently arrive at the correct diagnosis.

TABLE OF CONTENTS/OUTLINE

1. A brief overview of the advantages and disadvantages of ultrasound in the assessment of superficial lumps and bumps in the abdominal wall. ?2. Review the anatomy of the abdominal wall and its ultrasonographic appearance. ?3. Review use and limitations of ultrasound and key ultrasound scanning techniques.4. Case based presentation of common lumps and bumps, describing key ultrasound findings, scanning tips and tricks, common mimics and/or complications, clinical presentation and management of these pathologies including but not limited to: Subcutaneous lesions: lipoma and epidermal inclusion cyst; Hernias: direct versus indirect inguinal hernia, femoral hernia, incisional hernia; Sequelae of trauma and infection: hematoma, abscess, Moral Lavallee lesion; Neoplasms: desmoid tumor, liposarcoma, melanoma; Miscellaneous lesions: adenopathy, endometriosis.

GIEE-143 Ultrasound of the Portal Vein: ImPORTant Things to Know

Awards
Identified for RadioGraphics

Participants
Matthew Simon, MD, Philadelphia, PA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Understand normal ultrasound appearance of portal veins in grayscale, color and spectral Doppler 2. Recognize abnormalities of the portal vein including thrombus (bland and tumor), cavernous transformation and portal venous gas 3. Identify abnormal waveforms and abnormal direction of flow in the portal veins and formulate a differential diagnosis 4. Understand the normal ultrasound appearance of a TIPS and recognize complications

TABLE OF CONTENTS/OUTLINE

1. Normal ultrasound of portal vein a. Anatomy i. 3D rendering of portal venous system b. Grayscale c. Doppler i. Color ii. Waveforms iii. Velocities 2. Abnormalities of flow a. Slow flow b. Helical flow c. Abnormal flow due to portal hypertension i. Alterations of velocity and direction 1. Hepatofugal flow: partial and complete 2. Perihepatic varices: paraumbilical, coronary, gallbladder 3. Portal Vein Thrombosis a. Bland thrombus 1. Causes 2. Acute versus chronic 3. Differentiating occlusive from non-occlusive b. Tumor thrombus 1. Hepatocellular carcinoma and other tumors 2. Grayscale, cine clips 3. Doppler: arterial flow within thrombus c. Chronic occlusion/Cavernous Transformation 4. Portal venous gas a. Causes b. Differentiate from pneumobilia c. Gray scale and Doppler appearance 5. Other a. Effect of cardiac disease on portal system b. Portal fistula i. Portal-hepatic venous ii. Portal-hepatic arterial 6. TIPS a. Normal appearance on Grayscale and Doppler i. when to image a TIPS after insertion ii. protocol for imaging a TIPS iii. effect on other vessels b. Complications i. Thrombus ii. Stenosis

GIEE-144 Big Kids with Tummy Pains: Classically Pediatric Acute Abdominal Presentations in Adults

Participants
Neel Jain, MA, MBBS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review of the adult presentation of pediatric acute abdominal pathology with discussion of imaging findings. 2. Illustrated conditions include Meckel's diverticulum, intussusception, anatomical variants, intestinal malrotation, mesenteric adenitis. 3. Highlight important review areas and implications. 4. Insight into their clinical management.

TABLE OF CONTENTS/OUTLINE

Pediatric pathology is often not a primary focus for adult GI radiologists and clinicians. Whilst uncommon, pediatric abdominal pathologies can also present later in life. It is therefore crucial that the radiologist on call considers pediatric illnesses and underlying congenital structural abnormalities within their differential diagnosis. We present a case-based educational exhibit to familiarize radiologists with the key imaging findings.

GIEE-145 Hidden Gem: Ultrasonography Detection Differentiation of Sclerosing Cholangitis

Participants
Moran Drucker Iarovich, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Teaching Points • Review different etiologies of sclerosing cholangitis • Discuss specific SC manifestations, including: background, clinical presentation, mechanism, treatment • Emphasize sonographic features of each, to allow an educated query of appropriate diagnosis

TABLE OF CONTENTS/OUTLINE

Sclerosing cholangitis is a progressive cholestatic disease, characterized by inflammation, fibrosis strictures. It is divided into primary sclerosing cholangitis (PSC) secondary sclerosing cholangitis (SSC). PSC is idiopathic, often seen in young males with concomitant ulcerative colitis, while SSC denotes a spectrum of progressive cholestatic diseases which have an identifiable, even treatable cause. SSC etiologies are divided into five mechanistic categories: immune-mediated, drug-induced, infectious, obstructive, or ischemic. Differentiation between the various causes of sclerosing cholangitis is imperative for appropriate patient management. Ultrasound (U/S) is the primary imaging of choice for evaluation of the biliary tree, being accurate, available, cost-effective, impervious to motion, safe. U/S is underrecognized as a diagnostic and problem-solving tool in assessment of PSC SSC. U/S's high spatial resolution allows detection of fine ductal features not often seen by MRCP. Subcapular ducts are often only visible on U/S. As well, it has the highest sensitivity for detection of intrahepatic stones bile duct casts. However, lack of familiarity means that many diagnostic features of biliary diseases are often missed. In this review we will describe the typical U/S features of PSC SSC.

GIEE-146 Spectrum of Clinically Important Isolated and Concomitant Anatomical Variations of Biliary Ducts, Pancreatic Duct and Gall Bladder on MR Cholangiopancreatography (MRCP): What Not to Miss and What Radiologist Should Know to Help the Clinician in This Era of Advanced Hepato-Biliary Surgery!"

Participants
Aruna Pallewatte, MD, FRCR, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1)Learn embryological basis of anomalies of hepatic, biliary and pancreatic ducts 2) Optimal MRCP protocol/Physics 3) Know classification of anatomical variants in configuration of intra/extrahepatic biliary ducts(BD) with clinical relevance 4) Appreciate classification of cystic duct pancreatic duct (PD) variations based on course insertion 5) Classification MRI features of Gall bladder(GB) variations such as duplication, intrahepatic GB. 6) Learn incidence of variations with literature comparison 7)Learn clinical significance (eg longterm effects, Surgeon's needs) of identified hepato-biliary-pancreatic duct variations and how to document them accurately on pre-op MRCP report to answer clinical needs 8) Learn to avoid diagnostic pitfalls and mimics causing misinterpretation on MRI/MRCP

TABLE OF CONTENTS/OUTLINE

1) Introduction to spectrum of BD, PD,Cystic duct GB anatomical variants, aberrant anatomy embryological basis with illustrations 2)Optimised MRCP protocol 3) Huang classification of Right Left intra hepatic BD illustrated with our MRCP images -Demography incidence 4) Classification of extrahepatic BD, PD and cystic duct variants with our sample cases 5) MRCP of Intrahepatic GB, double GB and classification 6) Pictorial depiction of concomitant BD,PD,GB variants and choledochal cysts with sample MRI cases 7) Diagnostic Mimics pitfalls, clues to avoid them 8) Potential longterm complications of variants such as pancreatitis 9)Challenges to Hepatobiliary surgery and value of pre operative documenting of anatomical variants 10) Guidance for systematic MRI/MRCP reporting focused specially for hepatic transplantation, hepatic resection, ERCP, laparoscopic surgery etc.

GIEE-147 Gallbladder Malignancy and its Many Mimics

Participants
Matthew Carr, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Gallbladder Malignancy and its Many Mimics Teaching Points: 1. Gallbladder malignancy tends to predominantly present in several different ways on imaging as an: intraluminal mass lesion, asymmetric wall thickening, or polyp. 2: Many potential mimics of gallbladder malignancy exist. Use the clinical history, all available views, and all modalities to create a more informed differential. 3: How the lesion evolves (or doesn't evolve) over time can help narrow or change the differential. 4: Sometimes you don't know if it is malignancy or a benign process. When in doubt take it out! (Or biopsy).

TABLE OF CONTENTS/OUTLINE

Table of Contents: - 1. Different gall bladder malignancies and their presentations (some with rad-path correlation). - 2. Metastatic diseases to the gallbladder (including lung and melanoma).- 3. The different potential mimics of gall bladder cancer (cholecystitis, adenomyomatosis, etc) - 4. Multiple case-based examples where specifics of the patient presentation help aid the differential diagnosis. - 5. Multiple case-based examples where the temporal course of the lesion changes the differential. - 6. XanthogranIматous cholecystitis cases (the great mimicker) with rad path correlation.

GIEE-148 What Went Wrong? Hepatobiliopancreatic Postoperative Complications: A Primer for Radiologists

Awards
Certificate of Merit

Participants
Lucas Roberto Lelis Oliveira, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Recognize hepatobiliopancreatic (HBP) anatomy and anatomical variations. • Understand most common types of HBP surgeries. • Know radiologists role in the pre- and postoperative settings. • Recognize HBP postoperative complications through multimodality imagings.

TABLE OF CONTENTS/OUTLINE

INTRODUCTION: o Overview of frequency, relevance, and cost of HBP surgeries. o HBP anatomy including key anatomical variations as they relate to surgical complications. o Summary of most common types of HBP surgeries. 2. IMAGING ON THE PREOPERATIVE SETTING: o Presurgical roadmap to optimize the surgery and avoid complications. o Pros and cons of each imaging modality. 3. IMAGING ON THE POSTOPERATIVE SETTING: o Step by step didactic approach in assessing patients after HBP surgery: § Surgical notes; § What to ask to the multidisciplinary team; § Clinical notes and laboratory tests; § How to decide which imaging modality; § Best protocol; § Ultrasound approach; § CT approach; § MRI approach; § How to report and communicate; o Surgical complications: § Acute versus chronic; § Main groups: vascular, biliary, GI tract, infectious, other. 4. WHAT IS THE ROLE OF INTERVENTIONAL RADIOLOGY. 5. WHAT'S ON THE HORIZON. 6. INTERACTIVE CHALLENGING SCENARIOS.

GIEE-149 Back to the Basics: US Findings in Acute Cholecystitis-Tips for New Residents

Participants
Mariana De Los Ssantos Carmona, MD, Ciudad de Mexico, Mexico (*Presenter*) Nothing to Disclose

TEACHING POINTS

To show normal anatomy, pathology and its variants.-To identify in a simpler way the ultrasonographic characteristics of acute cholecystitis, in special for new residents.-To recognize different clinical characteristics that help to recognize acute cholecystitis.-To give advice for new residents when performing an ultrasound, to help base the most accurate diagnosis and thus decide on interdisciplinary management.-To be familiar with the sonographic technique, tips, pitfalls, limitations and troubleshooting for the right upper quadrant pain.-This discussion will help residents to reinforce the radiological and clinical features of acute cholecystitis, keeping in mind that interdisciplinary consensus remains the gold standard for diagnosis

TABLE OF CONTENTS/OUTLINE

1.Objectives.2.Review the anatomy of the gallbladder and its variants. 3.Discuss the global panorama about the importance of acute cholecystitis. 4.Explain the clinical characteristics based on Tokyo's criteria for acute cholecystitis as a multidisciplinary approach. 5.Discuss the algorithm of the ultrasound technique used to evaluate the right upper quadrant pain. 6.Recognize and illustrate the main ultrasonographic findings in this pathology. 7.Present a series of cases to exemplify the most important ultrasonographic findings of acute cholecystitis, as well tips for the correct approach. 8.Recognize differential diagnoses of right upper quadrant pain. 9.Conclusions. 10.References

GIEE-15 Clinical Photon Counting Abdominopelvic CT: A Crash Course!

Awards
Certificate of Merit

Participants
Bari Dane, MD, New York, NY (*Presenter*) Nothing to Disclose

TEACHING POINTS

Conventional CT uses energy integrating detectors (EID), in which x-rays create visible light that is converted to electrical pulses to create images. Photon counting CT (PCCT) detectors directly convert photons into electrical pulses, allowing electronic noise elimination and leading to significant dose reduction. Unlike EID, PCCT counts the energy of each photon, including low energy photons. This improves image contrast, makes every CT multienergy, and permits electronic baseline noise removal. Downsides include K-escape and charge sharing in PCCT can reduce spectral separation.

TABLE OF CONTENTS/OUTLINE

1. PCCT versus EID physics2. Clinical benefits a. Improved spatial and contrast resolution, without dose penalty - Small vessel visualization - Small lesion visibility and characterization in low contrast areas (pancreas, liver, peritoneum) - Better iodine contrast to noise ratio, lower intravenous contrast dose b. Multienergy every scan - Simultaneous high pitch and multienergy - Incidental finding characterization c. Remove electronic noise - Better image quality in obese patients - Lower dose CT - Better virtual noncontrast (VNC) image quality3. Current Version Pitfalls a. Cross-scatter artifact with dual-source mode b. Urographic phase derived VNC artifact c. Slower reconstruction time

GIEE-150 MRI Anal Fistula: Anatomy of Anal Canal

Participants
Christian Torres Ramirez, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Learning objectiveIdentify the anatomy of the anal canal by MRI to achieve an adequate classification of anal fistula.IntroductionThe anal fistula corresponds to an anomalous path that connects the anal canal with the skin. MRI is the imaging modality of choice due to its high resolution, allowing an adequate characterization of the anatomy and also greater precision in the classification of the anal fistula.Teaching pointsThe anal canal is limited between the dentate line and the anal verge. The layers of this wall are mucosa, submucosa and muscularis. The muscularis layer is composed from the innermost to the outermost layer, by the internal anal sphincter(IAS), the intersphincteric liner and the external anal sphincter(EAS). The IAS is a continuation of the

muscular layer of the rectum, and the EAS is composed of skeletal muscle.The MRI is the imaging modality recommended in ESGAR consensus.The protocol used in our institution is performed in 1.5 T and 3 T, the MRI sequences and the planes are axial, coronal and sagittal T2-weighted, and post-contrast T1-weighted sequences are performed. The axial acquisition performed align with respect to anal canal axis.By magnetic resonance imaging in axial T2-weighted sequences, the anal canal is a circumference of 5 layers: the innermost layer mucosa (hyperintense),submucosa (hypointense), IAS (hyperintense), intersphincteric liner (hyperintense) and the outermost layer EAS (hypointense). The Parks classification is used for anal fistula: intersphincteric, transsphincteric, suprasphincteric and extrasphincteric.

TABLE OF CONTENTS/OUTLINE

1. Learning objective2. Introduction3. Teaching points

GIEE-152 The Anterior and Sub-peritoneal Compartments of The Extraperitoneal Space: Comprehensive Imaging Review of Anatomy and Pathologies

Participants
Arvin Saremi, MS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Review the relevant anatomy of the structures participating in formation of the anterior extraperitoneal space Review characteristic imaging findings of common and uncommon pathologies involving this region

TABLE OF CONTENTS/OUTLINE

Normal embryology and anatomy of the anterior extraperitoneal space Development Transversalis fascia Umbilical prevesical fascia Umbilicovesical fascia Fascia around the round ligament Imaging characteristics with cadaveric correlation Abdominal above the umbilicus Retropubic or prevesical space of Retzius Prevesical, perivesical, and paravesical spaces The retroinguinal space of Bogros Connections to Subperitoneal pelvic space, presacral space and retoperitoneum Relationship to the vessels, median and medial umbilical ligaments Anatomical variations Abnormalities of the anterior extraperitoneal space Infection and abscess Post trauma changes Malignancies Relevance for extraperitoneal laparoscopic surgery Relevant considerations for percutaneous interventions

GIEE-153 All of the Guts, None of the Glory: An Overview of the Abdominal Radiograph

Participants
Elainea Smith, MD, Birmingham, AL (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review the most common bowel pathology and gas appearances on abdominal radiographs and understand clinical relevance.2. Discuss common and uncommon calcifications that can be seen on the abdominal radiograph.3. Highlight most common "corner" pitfalls to increase sensitivity for these commonly missed pathologies.

TABLE OF CONTENTS/OUTLINE

IntroductionBowel- Small bowel obstruction- Large bowel obstruction- Ileus- Enteritis/colitis- PneumatosisAir- Free intraperitoneal air- Portal venous gas- Retroperitoneal gas- Emphysematous cholecystitis- Emphysematous cystitisCalcifications- Renal stones- Gallstones- Calcified mass(es)- VascularCorners- Lung bases- Cardiac- Proximal thighsConclusion

GIEE-154 The Spectrum of Interpretive and Perceptual Biases in Abdominal Radiology

Awards
Identified for RadioGraphics

Participants
Jonathan Kruskal, MBChB, Boston, MA (*Presenter*) Nothing to Disclose

TEACHING POINTS

For abdominal radiologists, cognitive biases impact our interpretive and perceptual skills predisposing to diagnostic errors. Published data suggests that such biases are particularly common and impactful in abdominal radiology. A broad spectrum of recognized (common and less common) as well as newly emerging biases occur in abdominal radiology. Being aware of one’s personal diagnostic biases, as well as strategies for mitigating their occurrence, is likely to improve our diagnostic performance. Familiarity with the spectrum of biases enables cases to be categorized in the peer learning and improvement meeting.

TABLE OF CONTENTS/OUTLINE

What are cognitive biases? How do biases impact abdominal radiologists? How to construct your Personal Bias Profile? Brief explanations, clinical examples and strategies for mitigating the following biases: Common biases: anchoring, confirmation, availability, automation, bandwagon, satisfaction of search and of report, premature closure, zebra retreat, representative, outcomes, framing, attribution, context, authority, premature closure, provider, hindsight, alliterative, blind spot, regret, scout neglect and inattention biases. Newly recognized biases: hanging protocol, risk averse, clinical trial, demographic, productivity, follow up, trainee assumption, provisional report, structured report and remote reader biases.

GIEE-155 Drug-associated Hepatobiliary and Pancreatic Disorders: Pictorial Essay

Participants
Shintaro Ichikawa, MD, PhD, Hamamatsu, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

Various disorders of the hepatobiliary system and pancreas are caused by several drugs, and imaging diagnosis is often challenging. Familiarity with these conditions may improve diagnostic accuracy and patient management. The purpose of this presentation is to describe the imaging findings of drug-associated hepatobiliary and pancreatic disorders and to identify tips for correct diagnosis.

TABLE OF CONTENTS/OUTLINE

The following drug-associated hepatobiliary and pancreatic disorders are discussed along with their key imaging findings: 1. Drug-induced acute liver failure Imaging findings are non-specific and include hepatomegaly with heterogeneous parenchymal enhancement, periportal edema, gallbladder wall thickening, and ascites. 2. Sinusoidal obstruction syndrome (SOS) A diffuse hypointense reticular pattern in the hepatobiliary phase is a highly specific sign for the diagnosis. 3. Pseudocirrhosis Imaging manifestations may be identical to those of liver cirrhosis. 4. Immune-related adverse events (irAEs) Cholangitis and pancreatitis may develop after immune checkpoint inhibitors therapy. 5. Methotrexate-associated lymphoproliferative disorders It is visible as a periportal infiltrating hypodense mass on computed tomography and is weakly enhanced. 6. Amiodarone deposition in the liver 7. Ceftriaxone-associated gallbladder pseudolithiasis 8. Secondary iron overload

GIEE-156 "Don't Forget Me!" Said the Spleen: Multimodality Imaging of The Spleen and Its Pathology

Participants
Adrian Xu, MD, Salt Lake City, UT (*Presenter*) Nothing to Disclose

TEACHING POINTS

Know the normal anatomy of the spleenIdentify congenital anomalies of the spleen and their associated systemic pathologiesUnderstand the multiple imaging modalities used in the assessment of splenic pathologies and the pitfallsKnow and accurately diagnose focal and diffuse pathologies in the spleen on imaging

TABLE OF CONTENTS/OUTLINE

A. AnatomyB. Multimodality imaging of the spleen and associated pitfallsC. Splenic pathologies1. Congenital including asplenia and polysplenia and their associated imaging findings in other systems2. Focal massesi. Benignii. Indeterminantiii. Malignant3. Diffuse processes (Splenomegaly/granulomas)4. Otheri. Ruptureii. Infarctiii. Splenosisiv. PeliosisD. Summary

GIEE-158 Spectrum of Findings After Radiation-based Therapy In the Liver

Participants
Emre Altinmakas, MD, New York, NY (*Presenter*) Nothing to Disclose

TEACHING POINTS

Stereotactic body radiotherapy (SBRT) and transarterial radioembolization (TARE) with Yttrium-90 are the two commonly used treatment options for primary liver cancer and liver metastasis in patients unsuitable for surgery. Patients receiving such treatments require to undergo imaging surveillance with CT or MRI as there is possibility of incomplete tumor response. Careful assessment of these follow-up studies is essential to proper patient management. It is also crucial for radiologist to be aware of expected treatment-specific changes within the treatment zone as well as non-treated liver parenchyma following each type of treatment.The purposes of this exhibit are1. To discuss the concept of tumor response assessment after radiation-based therapies2. Demonstrate expected posttreatment changes within the targeted as well as surrounding non-targeted liver parenchyma following SBRT and TARE3. To review potential complications of radiation-based therapies

TABLE OF CONTENTS/OUTLINE

Table of contents/outline1. What are the optimal imaging follow-up strategies after radiation-based therapies for liver cancer?2. How should we assess response after SBRT?• Imaging features of non-viable tumor• Imaging features of viable tumor3. How should we assess response after TARE?• Imaging features of non-viable tumor• Imaging features of viable tumor4. What are the expected posttreatment findings within targeted region as well as surrounding off-target liver following TARE and SBRT?5. Potential complications of radiation-based therapies6. Summary

GIEE-159 Atypical Focal Nodular Hyperplasia: Don't Let It Fool You

Awards
Cum Laude

Participants
Brendan O'Connor, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

-Focal nodular hyperplasia (FNH) is a benign hepatic lesion with a typical imaging presentation at CT and MR imaging.-Rarely, FNH may show histological components that lead to an atypical imaging presentation mimicking other benign and malignant lesions. Atypical features include intralesional fat, iron, calcifications, sinusoidal dilatation, and significant growth. FNH occurring in an abnormal liver, defined as FNH-like lesions, may present a diagnostic challenge.-Illustrated overview of typical and atypical presentations of FNH and FNH-like lesions with representative rad-path correlation cases, along with key diagnostic clues for an accurate diagnosis of FNH and FNH-like lesions based on a constellation of multiple imaging features to include iso-to-hyperintensity on hepatobiliary phase imaging.

TABLE OF CONTENTS/OUTLINE

-Epidemiology, pathology of FNH-Typical features of FNH on CT and MR imaging (with extra-cellular and hepatobiliary Gd-based contrast agents).-Atypical imaging presentation of FNH to include steatotic and steatohepatitic FNHs, calcification, intralesional sinusoidal dilatation, abnormal growth and intralesional iron-Definition and pathology of FNH-like lesions.-Imaging presentation of FNH-like lesions.-Key clues for accurate diagnosis of FNH and FNH-like lesions and differential diagnosis with other hepatic lesions (e.g hepatocellular adenoma).

GIEE-16 Hepatocellular Carcinoma: A Primer for Residents

Awards
Certificate of Merit

Participants
Marika Pitot, MD, Rochester, MN (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) Review the typical imaging appearance of HCC on CT and MRI 2) Learn about the various patterns of HCC presentation 3) Review the recognized histologic subtypes of HCC with an emphasis on characteristic differentiating imaging features 4) Understand HCC imaging features that correlate with favorable versus poor outcome 5) Review LIRADS categorization with some examples

TABLE OF CONTENTS/OUTLINE

1. HCC overview a. Typical HCC appearance on imaging b. Patterns of presentation on imaging i. Nodular (expansive) - single, dominant nodule, with or without satellite nodules ii. Multifocal nodules iii. Infiltrative (massive) iv. Cirrhotomimetic v. Pedunculated c. Histologic growth patterns of HCC 2. Histologic subtypes of HCC a. Frequency b. Characteristic and "buzzword" imaging features 3. Favorable and poor prognostic features of HCCs a. Favorable imaging signs include single, small nodule with smooth margins, no necrosis, and homogenous enhancement. Other favorable features include low tumor stiffness on elastography, uptake of hepatobiliary contrast suggestive of beta-catenin activation, and occurrence in a normal or non-cirrhotic liver b. Poor prognostic imaging signs include large size at presentation, multifocality, evidence of necrosis, heterogeneous enhancement, ill-defined margins, and macroscopic vascular invasion. 4. LIRADS characterization overview a. Explanation of LIRADS categorization with examples

GIEE-160 This Is Not a Soap Bubble-What's Going on In The Liver?: A Surviving Guide for Radiological Workup of Cystic Liver Lesions

Participants
Gabriella Cagliari, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Cystic hepatic lesions are very common in daily practice. The differential diagnosis ranges from benign lesions with no clinical significance to malignant neoplasms and potentially lethal conditions. Some cystic hepatic lesions have classical findings, allowing a correct diagnosis based on imaging findings only. On the other hand, some presentations may be challenging. In most cases, familiarity with the most relevant radiologic key features in combination with critical clinical and laboratory information is enough for adequate lesion characterization. The purpose of this presentation is to review the main cystic liver lesions, recalling imaging features from typical to challenging cases; a series of diagnostic tips will be presented, as well as a practical guide on how to develop objective reasoning in face of such cases.

TABLE OF CONTENTS/OUTLINE

1) Review the most common liver cystic lesions and their imaging features with didactical cases.2) Provide a didactic approach to differential diagnoses.3) Tips that can be helpful in face of challenging cases.4) Surviving guide that can be useful for a quick consultation.

GIEE-161 A to Z of Focal Nodular Hyperplasia (FNH)

Participants
Sophie Cheshire, MBChB, FRCR, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Imaging features of FNH including typical findings and rarer features2. Multiple imaging modalities presented3. A unique method of presenting the findings using letters of the alphabet as an aide memoir

TABLE OF CONTENTS/OUTLINE

FNH is a common benign lesion, encountered on multiple imaging modalities. It is therefore important to recognise the key features of both typical and atypical lesions for accurate diagnosis in order to prevent unnecessary intervention. This display will include ultrasound examples, using both colour doppler and contrast enhanced techniques. All MRI sequences will be demonstrated with key learning points illustrated. The importance of liver specific contrast agents is highlighted, along with the pathology and aetiology of the lesion. The unique selling point for this presentation is the format which should be easy to remember and help in consolidating knowledge. The points to be covered using an A to Z format are as follows:Arterialisation, Biopsy, Contrast enhanced ultrasound, Doppler, Exophytic lesion, Fat, Glutamine synthetase, Hepatobiliary phase, Isointensity, Juicy orange, Kuppfer cells, Lobulated, MRI, Nodules, OATP receptors, Pathology, Question, Ring on hepatobiliary phase, Scar, Telangiectatic, Ultrasound, Vascular malformation, Washout, Xtra fun fact, Young, Zero malignant.

GIEE-162 Pumping Iron: Iron Overload Imaging

Participants
Timothy McMahon, MD, MS, New York, NY (*Presenter*) Nothing to Disclose

TEACHING POINTS

Iron is an essential mineral critical to oxygen transport but it can have a toxic effect at high concentration. Absorption is regulated, but primary hemochromatosis and hemosiderosis lead to toxicity. The liver stores and regulates iron. Primary hemochromatosis and hemosiderosis cause toxic buildup of iron in the liver which has characteristic imaging appearances. Primary hemochromatosis typically affects the liver and pancreas on MRI. Hemosiderosis, which is usually due to frequent blood transfusions secondary to various anemias, typically affects the liver, spleen, and bone marrow. Intravascular hemolysis can affect the kidneys. MRI can qualitatively and quantitatively assess iron overload and assists in diagnosing and managing hemochromatosis and hemosiderosis.

TABLE OF CONTENTS/OUTLINE

Intro Iron absorption, transport, and regulation Iron overload causes and clinical impact Diagnosis, treatment, and management of iron overload Imaging Noncontrast CT Typical appearance Confounding factors and differential with cases Dual energy CT Methodology and typical appearanceIron content quantification MRI Basic physics Qualitative assessment In/out of phase imaging analysisImaging patterns with case examples Quantitative assessment Methodology - Benefits and drawbacks Signal Intensity ratios T2/R2 relaxometry (FerriScan) T2* and R2* relaxometry Quantitative Susceptibility Mapping Example cases with effects of treatmentSQUID Biomagnetometry - Advantages, disadvantages, and relevance Conclusion

GIEE-163 A Multimodality Approach to Inflammatory Bowel Disease and Complications

Awards
Certificate of Merit

Participants
Weibo Fu, BS, Augusta, GA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) To review the pathophysiology of common imaging findings seen in inflammatory bowel disease. 2) To demonstrate barium enema, CT, and MRI findings of acute and chronic inflammatory bowel disease, associated findings, and diverse complications. 3) To discuss the advantages and disadvantages of currently available imaging modalities for inflammatory bowel disease.

TABLE OF CONTENTS/OUTLINE

Inflammatory bowel disease (IBD) most commonly occurs in North America and Europe, with an estimated combined patient population of 4-5 million in both regions. Incidence of IBD has been gradually rising since the mid-20th century, likely due to widespread changes in dietary patterns along with environmental factors. Cross-sectional imaging modalities such as computed tomography (CT) and magnetic resonance (MR) enterography are now more commonly utilized because of their ability to detect subtle changes in inflammation, high clinical sensitivity, and ability to detect complications such as a) fistulae, b) bowel obstruction, c) intussusception, and d) abscesses outside the bowel lumen. Though resolution for both CT and MR are comparable, MR has the added benefit of zero radiation exposure.

GIEE-164 Prediction of Cirrhosis-related Complications at Dual-energy CT and MRI

Participants
Ra On Kang, MD, Jinju, Korea, Republic Of (*Presenter*) Nothing to Disclose

TEACHING POINTS

* Describe the clinical states of cirrhosis according to the development of disease complications (varices and decompensation events) with the progression of pathophysiological mechanisms and hemodynamic. * Discuss the clinical importance of noninvasive prediction of these complications in cirrhosis. * Discuss how and whether routine dual-energy CT (DECT) and MRI can predict future complications in cirrhosis based on the recent quantitative studies.

TABLE OF CONTENTS/OUTLINE

EpidemiologyClinical states in cirrhosis Management implications of clinical states of cirrhosisDECT and MRI-based techniques for prediction of cirrhosis-related complications- DECT- T1 mapping- T2 mappingFuture directionsSummary

GIEE-165 Multiparametric MRI of The Liver: Practical Tips For Starters

Participants
Marina Raze, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

-MAFLD, aprendendo mais sobre a nova 'epidemia'- Learn and review basic protocol sequences for a complete liver assessment- Execution and preparation tips- Limitations for measures of steatosis and iron overload- Illustrate the findings and correlate them with clinic application- Learn how to make illustrative radiology reports- Attention to the most common pitfalls

TABLE OF CONTENTS/OUTLINE

- Imaging protocols- Imaging aspects that may be mistaken- Pitfalls- Practical examples- Impact the liver evaluation and clinical application in everyday life- Ilustrated and structured report

GIEE-166 Evaluation of Hepatic Steatosis, Inflammation and Fibrosis in NAFLD by Imaging: An Overview

Participants
Jong Yeong Kim, MD, Seoul, Korea, Republic Of (*Presenter*) Nothing to Disclose

TEACHING POINTS

Since significant differences are found in the prognosis of NAFLD depending on histological findings including fibrosis and steatosis, exact diagnosis of these conditions is clinically crucial. Many studies for non-invasive methods to estimate the histological severity of NAFLD instead of liver biopsy have been undertaken, mainly in the field of radiological and biochemical examinations. The purposes of this review are 1) to explain the principal, clinical application, pros/cons and limitations of imaging techniques for hepatic steatosis, fibrosis and hepatitis 2) to review the recently developed machine-learning based evaluations (computer aided diagnosis and radiomics) of conventional US, CT and MR images for the measurement of intrahepatic fat and fibrosis, 3) to discuss the future of these techniques, the possibility for wider clinical applications and roles in clinical trials for the treatment of diffuse liver disease

TABLE OF CONTENTS/OUTLINE

• Background• Hepatic steatosis1. US based techniques 1) Gray scale imaging 2) Controlled attenuation parameter 3) Attenuation imaging2. Unenhanced CT 3. MRI based techniques 1) Two point DIXON 2) MR spectroscopy 3) MRI-PDFF• Differentiation of NASH from simple steatosis• Hepatic fibrosis1. US based techniques 1) Transient elastography 2) Shear wave-based elastography: Point SWE, ARFI, Supersonic shearwave2. MRI based techniques 1) Diffusion weighted imaging 2) Hepatocyte-specific contrast agent enhanced imaging 3) MR elastography• Machine learning based evaluation of hepatic steatosis and fibrosis with US, CT, MR images• Can we replace liver biopsy by imaging studies for hepatic steatosis or fibrosis?• Conclusion

GIEE-167 Don't Be So thick! A Practical Approach to Common and Uncommon Causes of Gastric Wall Thickening

Participants

Edward Lawrence, MD, PhD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Gastric wall thickening can present a diagnostic challenge due the overlapping features of normal rugal folds, inflammation, and neoplasm. Features that suggest true gastric wall thickening include altered wall enhancement, asymmetric thickening, adjacent stranding, or local adenopathy Lower attenuation (edema) or mural stratification favors a benign process related to infection or inflammation. Intermediate/soft tissue attenuation favors neoplastic processes such as lymphoma or adenocarcinoma. Additional diagnostic work-up will frequently include further evaluation with endoscopy and endoscopic biopsy

TABLE OF CONTENTS/OUTLINE

1. Basics of gastric wall evaluation 2. Tips and tricks a. Differentiating true versus pseudo-thickening b. Differentiating malignant versus benign thickening3. Malignant causes (e.g., linitis plastic, lymphoma, gastric adenocarcinoma)4. Benign causes - common (e.g., gastritis) and uncommon (e.g., Ménétrier's disease) a. Inflammatory/infiltrative b. Infectious

GIEE-168 Spaces and Places: A Radiologist's Roadmap to the Peritoneum and Retroperitoneum

Participants
Christopher Sears, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Teaching PointsThe peritoneum and retroperitoneum, with their myriad spaces, pouches, and ligaments, are difficult to comprehend, let alone identify on imaging. However, understanding how the peritoneal reflections limit, circulate, and react to disease can facilitate the correct diagnosis and proper care.After reviewing this education exhibit, the learner will be able to: Understand and identify structures and spaces of the peritoneum and retroperitoneum. Appreciate the significance of the peritoneum and retroperitoneum, with respect to the spread of and response to infection, the staging of cancers, and the severity and localization of traumatic injuries. Recognize how medical and surgical management changes when peritoneal borders are violated.

TABLE OF CONTENTS/OUTLINE

Outline1.) Overview of the anatomy, spaces, and pouches of the peritoneum and retroperitoneum.2.) Differences regarding the peritoneum of males and females.3.) Case-based demonstration of the significance of the peritoneum, with regards to management and outcomes in cancer, trauma. and infection.

GIEE-169 Unraveling the Superficial, Internal and Complex Hernias: Case-based Guide for Accurate Diagnosis

Participants
Hunter Sellers, BS, MD, Houston, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Hernias are a very common pathology found on imaging with a large variety of presentation types. We provide multiple examples of hernias, both superficial and internal. 2. Superficial hernias can occur anywhere along the anterior, lateral, or posterior abdominal wall and can be simple containing only fat, or complex containing organs. We have cases of these simple and complex hernias, and hernias which contain pathology in the hernia sac. 3. Internal hernias can be intimidating to radiologists who are unfamiliar with the specific imaging patterns, our goal is to provide examples of these hernias along with the etiologies to help improve diagnostic acumen and accuracy. 4. The important goal of reporting pertinent information of type of hernias to clinicians to ensure that patients receive the best treatment possible.

TABLE OF CONTENTS/OUTLINE

Discussion of superficial hernias, which include inguinal, umbilical, Spigelian, amyand, Richter, incisional and others.Elucidate internal hernias, which include paraduodenal, Foramen of Winslow, Petersen and others.Highlight features of complex hernias.Imaging tips on recognizing specific hernia types.Report pertinent information that the clinicians want to know.Conclusion.

GIEE-17 Imaging Diagnosis of Hepatocellular Carcinoma in the Era of Molecular Targeted Therapy and Immunotherapy

Awards
Certificate of Merit

Participants
Azusa Kitao, MD, PhD, Kanazawa, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To understand the mechanisms and application of molecular targeted therapy and immuno-therapy for HCC2. To know the role of imaging in evaluation and prediction of treatment response of HCC3. To learn the adverse events of these systemic therapies for HCC that can be assessed by imaging

TABLE OF CONTENTS/OUTLINE

1. History and treatment mechanisms-Molecular targeted therapy-Immunotherapy2. Application-Clinical and imaging criteria-Roles in multidisciplinary therapy3. Evaluation of treatment response-Guidelines, especially in modified response evaluation criteria in solid tumors (RECIST)-Imaging modalities and techniques: dynamic CT, dynamic MRI, contrast enhanced US and radiomics-Pitfalls4. Prediction of treatment response based on molecular subclassification of HCC-Molecular targeted therapy: dynamic CT, intravoxel incoherent motion (IVIM) and 18F-FDG PET/CT-Immunotherapy: gadoxetate-enhanced MRI5. Adverse reactions of molecular targeted therapy and immunotherapy-Tumor related reactions-Systemic reactionsSummaryThe radiologists should know the imaging features related to molecular targeted therapy and immunotherapy for HCC in the era of personalized medicine.

GIEE-170 Imaging Postoperative Abdomen: What A Radiologist Should Know?

Participants
Smily Sharma, MD, MBBS, Jodhpur, India (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) To understand the anatomical basis of common and uncommon surgical procedures2) To elaborate on the salient features of various pathologies encountered in cross-sectional imaging of the post-operative abdomen3) To illustrate the distinguishing imaging features of complications of laparotomy4) To propose an algorithmic approach to the differential diagnosis of various pathologies5) To highlight red flag imaging biomarkers with implications on management strategies

TABLE OF CONTENTS/OUTLINE

1) Introduction2) Radiological anatomy of common and uncommon abdominal surgeries3) Imaging of complications of Hepatobiliary surgeries including Whipple, Extended hepatectomy, Roux en Y jejunostomy, resection and anastomosis, rectal surgeries and Cholecystectomy4) Imaging of complications of Genitourinary surgeries including nephrectomy, hysterectomy and caesarean section5) Understanding the chronology and pathophysiology of early and late complications6) Tailored regimens of cross sectional imaging to optimise image acquisition7) Diagnostic challenges posed by sequelae of laparotomy including structures, adhesions and scar8) Endovascular management of Vascular complications of Abdominal surgery9) Conclusion

GIEE-171 Basics of RUQ Ultrasound for Trainees: Anatomy, How to Scan and Diagnoses to Know for Call

Awards
Identified for RadioGraphics
Magna Cum Laude

Participants
Gail Stanton, MD, Milwaukie, OR (*Presenter*) Nothing to Disclose

TEACHING POINTS

1.) Understand basic principles of ultrasound and how to acquire ultrasound images of the right upper quadrant. 2.) Review anatomy of the RUQ on cine ultrasound images including hepatobiliary, pancreatic and regional anatomy. 3.) Identify common pathology seen in the right upper quadrant, with a focus on high yield on-call ultrasound findings and diagnoses for trainees.

TABLE OF CONTENTS/OUTLINE

1.) Basic principles of ultrasound imaging. a.) Ultrasound probe selection and sonographic windows to assess the liver, gallbladder, and pancreas illustrated with images/movies. b.) Knobology basics: Image optimization for best image quality. 2.) Imaging review of labelled cine images of right upper quadrant anatomy. a.) Hepatobiliary - hepatic segments, vasculature, biliary system. b.) Pancreas and upper abdominal vasculature. c.) Regional anatomy - Bowel, right kidney, thorax. 3.) Review imaging of RUQ pathology. a.) Hepatic - diffuse liver disease, mass, abscess, TIPS, portal vein thrombus, portal vein gas. b.) Biliary - Cholecystitis, cholelithiasis, obstruction, choledocholithiasis, adenomyomatosis, gallbladder cancer, pneumobilia. c.) Pancreatic - pancreatic mass, pancreatitis. d.) Peritoneum.

GIEE-172 Fantastic 'Four': Imaging of Hepatic Segment 4 - Management and Surgical Implications

Awards
Certificate of Merit

Participants
Bryce Carson, MD, San Antonio, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

Discuss anatomy, embryology, arterial, portal venous supply hepatic venous drainage biliary drainage of segment 4 (S4)Review select pseudotumors, developmental, inflammatory, and neoplastic pathologies specific to S4Discuss the clinical significance of S4 vasculature, bile ducts in living donor liver transplant viability complications

TABLE OF CONTENTS/OUTLINE

IntroductionAnatomy: Couinaud, International Hepato-Pancreatico-Biliary Association New World Terminology ClassificationsEmbryologyHepatic arteriesPortal veinsHepatic veinsBile ductsImaging Modalities: US, CT MRIImplications of living donor transplant hepatic resection surgeries: Hepatic artery thrombosis, venous congestion post-operative bile leakPseudotumors: Focal fat deposition, sparing perfusion abnormalities due to aberrant vesselsHot quadrant lobe sign in superior vena cava syndromeTarget-like lesions in S4Ciliary Hepatic Foregut cystIngested gastric foreign bodies perforating S4: Toothpicks, fish bones wires bristles from grill cleaning brush Mucinous cystic neoplasm of the liver (MCN)Direct tumor extension from stomach gastrohepatic ligamentConclusion Clinical Implications Knowledge of arterial, portal venous, hepatic venous, bile duct anatomy of S4 vascular variations is crucial in successful liver donor liver transplant other left lobe resections. Focal fat sparing, deposition are more common in S4 due to peculiar venous drainage. Given embryologic origin in close proximity to esophagus stomach, MCN ciliated foregut cyst develop exclusively in S4.

GIEE-173 Utility and Limitations of 18F-FDG PET/CT For the Evaluation of Hepatic Lesions

Participants
Shota Kondo, Hiroshima, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

a. In well-to-moderately differentiated hepatocellular carcinoma (HCC), the 18F-flurodeoxy-glucose (FDG) uptake tends to be poor. A high FDG uptake is associated with histologically poor differentiation, microvascular invasion, and a poor prognosis. Therefore, 18F-FDG-PET is useful for estimating the malignancy grade of HCC. b. Although most intrahepatic cholangiocellular carcinomas (ICC) show elevated FDG uptake, in some the uptake may be poor. c. A marked FDG uptake may identify rare malignant hepatic tumors such as malignant lymphoma and leiomyosarcoma. d. As it is difficult to differentiate malignant hepatic tumors from inflammation with only the degree of FDG uptake, findings of other imaging modalities should be considered.

TABLE OF CONTENTS/OUTLINE

1. Molecular background of 18F-FDG 2. Technical and physiological pitfalls of 18F-FDG PET/CT 3. Imaging findings of various hepatic lesions on 18F-FDG-PET/CT scans 4. The advantages and limitations of 18F-FDG-PET/CT vis-à-vis other imaging modalities for the

diagnosis of hepatic lesions 5. The future prospects of nuclear imaging for the diagnosis of hepatic lesions

GIEE-174 Multimodality Comprehensive Imaging Review of Benign and Malignant Hepatic Vascular Abnormalities: Pearls and Pitfalls

Participants
Mohd Zahid, MD, Birmingham, AL (*Presenter*) Nothing to Disclose

TEACHING POINTS

Hepatic vascular lesions have a wide spectrum of clinical presentations and varying degrees of malignancies. They range from benign tumors such as hepatic hemangiomas, benign/low-grade malignancies such as hepatic small vessel neoplasia, tumors with high malignant potential such as hepatic perivascular epithelioid cell tumors, and hepatic hemangiopericytomas, other tumors with intermediate degrees of malignancy such as hepatic epithelioid hemangioendothelioma, up to malignancies developed more often in the context of immunodeficiency syndrome-Kaposi sarcomas, and high-grade malignancies with a poor outcome such as hepatic angiosarcomas. On Imaging, differentiation of primary malignant vascular tumors of the liver from benign neoplasms or vascular abnormalities is often difficult. After reviewing this exhibit, the learner will be able to:1. Understand the epidemiology, pathology, and imaging appearance of common and uncommon benign and malignant hepatic vascular lesions or neoplasms 2. Imaging tips to differentiate vascular lesions from other non-vascular abnormalities.

TABLE OF CONTENTS/OUTLINE

A. WHO Classification of hepatic vascular neoplasms B. Epidemiology and pathophysiology. C. Multimodality imaging of benign and vascular lesions with imaging tips and pitfalls

GIEE-175 Pearls in Imaging of Biliary and Vascular Complications of Orthotopic Liver Transplant

Participants
Ana Gonzalez, Chicago, IL (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) Orthotopic liver transplantation (OLT) is the definitive treatment for patients with end-stage liver disease accounting for 22.8% of all organ transplantations in the United States (OPTN).2) Although the advances in OLT have led to reduced morbidity and mortality, the procedure continues to be associated with a high rate of complications occurring in 25-30% of cases (NG 2015).3) We will highlight the surgical technique and anatomy of OLT with a brief overview of different anastomosis techniques.4) We will review the imaging techniques for peri- and post-operative evaluation of transplanted grafts including normal imaging appearance post-transplantation.5) We will summarize the most common post-operative complications following OLT with their associated radiologic findings and discuss possible interventional solutions.

TABLE OF CONTENTS/OUTLINE

Summary of OLT surgical approach Surgical anatomy with location of anastomoses for the hepatic artery, portal vein, inferior vena cava, and biliary duct system accompanied with illustrations.Imaging of transplanted grafts Grayscale and Doppler ultrasound for routine surveillance post-transplantation. Describe common waveform characteristics seen with specific complications.The use of CT and MRI to further explore suspected abnormalities followed by angiography.Common OLT complications with associated radiologic findings i. Biliary complications including biliary strictures and bilomas. ii. Vascular complications including arterial and venous stenosis, thrombosis, and pseudoaneurysm formation.Brief imaging review of OLT complications pre- and post- treatment with interventional radiology procedures.

GIEE-176 Imaging Findings of Post-chemotherapy Non-Metastatic Hepatic Parenchymal Changes

Participants
San Yu Leung, MBBS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Use of chemotherapy has revolutionized management of cancer in past decades. Liver toxicity is commonly observed among different types of chemotherapy drugs. The aim of this exhibit is to illustrate radiological features of various chemotherapy-associated hepatic parenchymal changes, with examples in different imaging modalities, and to demonstrate potential complications of these liver injury patterns with representative cases. Early recognition of these liver conditions allow prompt clinical action to be taken, thus optimizing management and avoiding severe complications.

TABLE OF CONTENTS/OUTLINE

1. Introduction 2. To illustrate cases and radiological features of: a. Pseudocirrhosis in breast cancer and non breast cancer patients with liver metastasis, as well as its potential complications b. Chemotherapy-related hepatic steatosis c. Chemotherapy-related hepatitis d. Chemotherapy-related cholangiopathy 3. Summary of key teaching points

GIEE-177 Ultrasound Based Hepatic Fat Quantification

Participants
Nuran Seneviratne, MA, MBBS, London, United Kingdom (*Presenter*) Nothing to Disclose

TEACHING POINTS

Non-alcoholic fatty liver disease (NAFLD) is a growing cause of cirrhosis, hepatocellular carcinoma and liver transplant.Currently, steatosis is graded by subjective assessment of liver echogenicity and attenuation, with significant interobserver variability and sub-optimal detection of mild or greater steatosis (S>0).Controlled Attenuation Parameter is widely used (found in the Fibroscan® system, Echosens). Different disease states and probes impact measurement and for S>0 steatosis, it has a high false negative rate and low sensitivity.Quantitative metrics are now offered by various vendors, relying on changes in backscatter, attenuation and the speed of sound found in steatotic livers.Attenuation Imaging (Canon) and Ultrasound Guided Attenuation Parameter (General Electric) show excellent S>0 performance in NAFLD and other aetiologies of hepatic steatosis compared to both MRI and histology. Fatty Liver Attenuation Index (Samsung) shows moderate performance at the S>0 task in 351 patients with mixed aetiologies of chronic liver disease at histologyUltrasound Derived Fat Fraction (Siemens Healthineers) obtains 15 point shear wave

and a steatosis percentage from a single large region of interest, also showing excellent S>0 performanceThese technologies are in their early stages. Larger clinical trials are needed to determine optimal steatosis grade cut-off values and compare results across vendors.

TABLE OF CONTENTS/OUTLINE

IntroductionQualitative AssessmentQuantitative AssessmentConclusion

GIEE-178 Diffuse Liver Disease and Its Quantification in MRI for Rookies

Participants
Camilo Soler Becerra, PhD, Bogota, Colombia (*Presenter*) Nothing to Disclose

TEACHING POINTS

• NAFLD is the most common chronic liver disease worldwide. It has increasing prevalence among adults and children.• Iron overload may lead to liver cirrhosis, hepatocellular carcinoma, and cardiac and endocrine complications.• Fibrosis is the final stage of diffuse liver disease, with its complications and which we want to anticipate.• Measurement of fat, iron overload and liver stiffness by MRI is a noninvasive and accurate approach.• Knowledge of the protocol and the post-process will lead more hospitals worldwide to diagnose and quantify these pathologies, being of great help to the patient and other specialties. For example, we observe two similar liver parenchyma in images A and B. Still, we identify greater hardness in image B when quantifying liver stiffness, which alerts us about an inflammatory process.

TABLE OF CONTENTS/OUTLINE

1. Introduction.2. FatFrac.3. Iron quantification.4. Elastography.5. Conclusions.

GIEE-179 The Falciform Ligament and Ligamentum Teres Hepatis Revisited

Participants
Tomoya Nishiyama, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

The falciform ligament and the ligamentum teres hepatis have been considered as insignificant embryological remnants that include umbilical artery and vein. The purpose of this educational exhibit is to spotlight the clinical importance of the falciform ligament and the ligamentum teres hepatis in the radiological perspective.

TABLE OF CONTENTS/OUTLINE

This education exhibit includes 4 categories;(i) clinical embryology;(ii) clinical anatomy;(iii) clinical use for packing material; (iv) pathological conditions and disease process. Schematic illustrations of the embryology and anatomy and case based-presentations using CT images, macroscopic specimens and operative findings will be presented.

GIEE-18 It Looks Like Liver Cancer, But What Is It Really?: Pearls and Pitfalls for Diagnosis of Pathological Entities Mimicking Liver Malignancies

Awards
Certificate of Merit

Participants
Hanna Ferreira Dalla Pria, MD, MD Anderson, Houston, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Recognize the most common mimickers of liver malignancies. • Illustrate key clinical and imaging findings that may help distinguishing benign from malignant liver lesions. • Discuss relevant tips including clinical information, and diagnostic workup which could help in making precise diagnosis • Discuss appropriate management options including, tissue sampling or follow-up.

TABLE OF CONTENTS/OUTLINE

1.Overview of liver findings on imaging modalities -Prevalence, relevance, costs -Cancer facts and statistics 2022 -ACR white paper recommendations for management of incidental liver lesions 2.Clinical and Pathological Background -Symptoms -Key pathological and laboratorial findings 3.Imaging-based approach to assess mimickers of liver malignancies on imaging -Background liver -Pattern of the liver findings -Combined clinical and imaging algorithm 4.Illustrate a spectrum of imaging findings, differentiation with pathological correlation -Benign nodules: e.g. atypical hemangiomas, inflammatory pseudotumor, FNH-like lesions. -Inflammatory: IgG4-related disease, eosinophilic hepatitis, confluent fibrosis.-Infectious: ex. parasitic infections, pseudotumoral granulomatosis, abscess.-Precancerous: ex. dysplastic nodules, bile duct adenoma. -Miscellaneous: ex. vascular shunts, infarction.5.Multidisciplinary liver tumor board -What do non-radiologist liver physicians and surgeons need to know -What do radiologists need to ask. 6. Interactive case examples -Sample cases to illustrate challenging scenarios and provide tips to reach a specific diagnoses

GIEE-180 Ultrasound and Computed Tomography in The Evaluation of Mesenteric Lesions

Participants
Snehal Kose, MBBS, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Explain the anatomy and contents of the mesentery Describe ultrasound (USG) and computed tomographic (CT) features of primary and secondary solid mesenteric lesions, mesenteric cystic lesions, secondary mesenteric involvement in inflammatory/ infectious conditions like tuberculosis and inflammatory bowel disease and vascular lesions affecting mesentery. Highlight the importance of cross sectional imaging in diagnosis, detection of complications and management of mesenteric lesions Discuss a stepwise algorithm to approach mesenteric lesions for providing thoughtful differentials

TABLE OF CONTENTS/OUTLINE

Anatomy and contents of the small bowel mesentery USG and computed tomographic (CT) features of - Primary mesenteric solid neoplasms Mesenteric cystic lesions Unilocular cysts Multilocular cysts Secondary mesenteric solid lesions and their routes of spread Deposits Lymphadenopathy Stellate mesentery Mesenteric involvement in tuberculosis and inflammatory bowel disease Vascular anomalies of mesentery SMA thrombosis with acute mesenteric ischemia SMA-SMV arteriovenous fistula Complications due to mesenteric lesions Bowel Urological Vascular Management of mesenteric lesions Image guided biopsy Planning surgical strategy Stepwise algorithm for imaging evaluation of mesenteric lesions

GIEE-181 Diagnostic Approach to Peritoneal Lesions

Participants
Mihran Khdhir, MBChB, (*Presenter*) Nothing to Disclose

TEACHING POINTS

A wide spectrum of abnormalities affect the peritoneum; including neoplastic, infectious, and inflammatory etiologies as well as spread of ectopic tissues. Anatomy of the peritoneal cavity and its ligaments determine the patterns of disease spread. In this educational exhibit, we provide a comprehensive radiologic diagnostic approach to peritoneal lesions based of the predominant composition (solid, cystic, hemorrhagic, calcific, lipomatous, and gas containing). Each entity will be discussed briefly along with illustrated images of various cases.

TABLE OF CONTENTS/OUTLINE

Peritoneal Anatomy; Outline of Diagnostic Approach to Peritoneal Lesions; Solid Lesions; Cystic Lesions; Hemorrhagic Lesions; Calcific Lesions; Lipomatous Lesions; Gas Containing Lesions

GIEE-182 Peritoneal Carcinomatosis on CT and MR: How Not to Miss A Single Case

Participants
Ana Veron, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

To depict the most frequent and the not so common sites and imaging features of peritoneal carcinomatosis on CT and MR. To propose how to systematically look for peritoneal implants on CT and MR,acknowledging the technical limitations.To describe the differential diagnosis and pitfalls

TABLE OF CONTENTS/OUTLINE

IntroductionThe peritoneum is the second most common metastatic localization for abdominal tumors, only surpassed by the liver. Peritoneal metastases in tumors of an extraabdominal origin occur less frequently.Early diagnosis of peritoneal carcinomatosis based on imaging findings is not always easy but it is essential in staging and managing primary tumors.CT is usually the first diagnostic tool but its performance is poor when it comes to detecting subcentimetric implants and those in anatomically difficult sites. MR has proved to have a better performance due to its better contrast resolution. Material and methodsThe revision of 300 peritoneal carcinomatosis cases from our database (comprising tumors of digestive origin, breast, gynecologic, testicular, renal, neuroendocrine, melanoma, lung, head and neck and soft tissue) has allowed us to establish a systematic diagnostic approach.Examples of the how and where to look for peritoneal implants, bearing in mind the anatomical sites and the major pathways of spread will be described, enhancing the added value of multiplanar reconstructions.Typical and less common presentations will be described using a case-based approach.Despite the non-specificity of the imaging findings,in some cases there are helpful hints to suggest the origin of the primary tumor.Examples of pitfalls and differential diagnosis will also be discussed.

GIEE-183HC MR Defecography For the Evaluation of Pelvic Floor Dysfunction

Participants
EUNBYUL CHO, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Among the worldwide women, pelvic floor disoreder is common health problem which is hard to say other people. and it is significant problem lowering their quality of life and causing to morbidity. Pelvic floor disorder means overall pelvic floor functional disorders caused by impairment of the ligament, fasiae, muscles supporting the pelvic organs.Conventional defecography is performed with fluoroscopy after injection of barium contrast to rectum. But it can evaluate pelvic floor disorder concentrating posterior compartment of pelvic floor and has risk of exposure to ionizing radiation to patient and doctor. MR defecography is dynamic study to evaluate pelvic floor disorder during defecation using US gel in real time and has been proven accurate and reliable for checking multiple compartments of pelvic floor. It is used to diagnosis of rectocele, intussusception, and anismus. we review normal female pelvic floor anatomy and MR defecography which can accurate diagnosis of pelvic floor disorder involving all three compartments of pelvic floor and improve the postoperative results. Our teaching points are as follows. To review normal anatomy of the pelvic floor, To compare MR defecography to fluor defecography, To ntroduce the concepts of the integral theory ; anatomically-based diagnostic methods locate damaged structure.

TABLE OF CONTENTS/OUTLINE

1) Subdivisions of female pelvic anatomy (three compartment) : anterior compartment -middle compartment -posterior compartment 2) Defecation function evaluation 3) Comparison of fluoro defecography and MR defecography. 4) Introduce the concepts of the integral theoryPlease visit the Learning Center to also view this presentation in hardcopy format.

GIEE-184 MRCP Image Optimization

Participants
Khyati Bidani, MBBS, New Delhi, India (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Using ultrafast technique (RARE< HASTE< SSFSE) reduces artifacts and improves acquisition time2. Use breathing independent sequences

TABLE OF CONTENTS/OUTLINE

1. Applications of MRCP (Congenital anomalies, choledocholithiases, biliary strictures, cystic pancreatic tumors, biliary injuries).2. Common indications (Failed MRCP, contraindication to MRCP and post biliary-enteric anastamosis case).3. Advantages and disadvantages of MRCP over ERCP4. Techniques (2D Vs. 3D).5. Factors affecting image quality.6. Artifacts (Susceptibility, motion and other artifacts).7. Image optimization techniques.

GIEE-185 Gastric Cancer: Pearls, Pitfalls and Lessons Learned from The Multidisciplinary Tumor Board

Participants
Stephen Kwak, MD, Rochester, NY (*Presenter*) Nothing to Disclose

TEACHING POINTS

Gastric carcinoma is one of the most common malignancies worldwide and is currently the fourth leading cause of cancer-related deaths. While early gastric cancers are limited to the mucosa and submucosa and usually manifest as focal wall thickening with possible ulceration, advanced cancers involve the muscularis propria or even deeper, manifesting as diffuse, infiltrative thickening with ulceration and possible linitis plastica. Upper gastrointestinal endoscopy is currently accepted as the gold standard for detection of gastric cancer, while Multidetector Computed Tomography (MDCT) is preferred for staging of the tumor. MDCT allows for assessment of tumor depth, lymph node involvement, and disease spread which may be through subperitoneal dissemination, direct invasion, transperitoneal dissemination, or hematogenous spread. Careful preoperative staging is essential for proper surgical treatment, as complete resection of the tumor and surrounding lymph nodes is the only cure. In this exhibit we will discuss the MDCT technique and imaging features of gastric cancer with treatment approaches and various pearls and pitfalls learned during our experience at gastric cancer tumor board.

TABLE OF CONTENTS/OUTLINE

Introduction; Staging of gastric cancer; Imaging modalities; Treatment algorithm; Medical management; Surgical management; Imaging; Pearls and Pitfalls

GIEE-186 Postoperative Upper Gastrointestinal Fluoroscopy: What the Radiologist Needs to Know

Participants
Matheus Fritzen, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Describe the surgical anatomy and normal imaging findings of the main upper gastrointestinal surgeries in fluoroscopy. - Evaluate the main imaging findings of the routine use of postoperative contrast swallow. - Illustrate the major complications of upper gastrointestinal surgeries.

TABLE OF CONTENTS/OUTLINE

- Describe major headings (e.g., anatomy, physiology, imaging techniques, etc.) - Describe the following surgeries and identify the major complications of these: Bariatric Surgery (Sleeve and Y-Roux), gastrectomy, Nissen fundoplication, hiatus hernia repair, Peroral endoscopic myotomy (POEM)- Imaging in postoperative barium or iodine contrast to diagnose the main postoperative complications.

GIEE-187HC Preoperative MRCP for Laparoscopic Cholecystectomy: What Radiologists Need to Know

Participants
Young-Hwan Lee, MD, Iksan, Korea, Republic Of (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To clarify the role of MRCP in preoperative evaluation of acute or chronic cholecystitis. 2. To understand the normal variations of bile duct anatomy to avoid surgical injury in laparoscopic cholecystectomy. 3. To describe the useful MRCP findings for differential diagnosis of various wall thickening gallbladder lesions.

TABLE OF CONTENTS/OUTLINE

1. Review of various MRCP techniques 2. Classification of bile duct anatomy using MRCP of a total of 879 patients were examined before laparoscopic cholecystectomy.Cases of bile duct injury during cholecystectomy were added. 3. Representative cases of gallbladder diseases, such as acute cholecystitis, chronic cholecystitis, gallstones, adenomyomatosis, xanthogranulomatous cholecystitis, Mirizzi syndrome, cholangitis with common bile duct stones, and wall thickening type gallbladder carcinoma, were included, and their imaging findings with literature review were illustrated.Conclusion: MRCP is a useful method for preoperative evaluation of biliary anatomy to prevent surgical complications. In various cases such as inflammatory and malignant diseases, accurate diagnosis is possible through preoperative MRCP.Please visit the Learning Center to also view this presentation in hardcopy format.

GIEE-188 The Typical and Atypical Appearances of Pancreatic Neuroendocrine Tumors: The Role of CT Angiography and Cinematic Rendering

Participants
Elliot Fishman, MD, Owings Mills, MD (*Presenter*) Co-founder, HipGraphics, Inc;Stockholder, HipGraphics, Inc;Institutional Grant support, Siemens AG;Institutional Grant support, General Electric Company;Consultant, Exact Sciences Corporation;Consultant, Imaging Endpoints

TEACHING POINTS

1. Understand how to use multiphase CT with CT angiography and 3D mapping with Cinematic Rendering to optimize detection of pancreatic neuroendocrine tumors2. understand the range of appearance of pancreatic neuroendocrine tumors and how to distinguish them from other pancreatic tumors3. learn how to optimize staging of pancreatic neuroendocrine tumors by creating vascular 3D maps for staging of vascular involvement and for pre-op surgical planning4. understand the challenges and pitfalls in the diagnosis of pancreatic neuroendocrine tumors5. understand how cinematic rendering can be valuable in small tumor detection and staging of larger tumors

TABLE OF CONTENTS/OUTLINE

1. CT scan protocols and role of dual phase imaging and CTA2. role of Cinematic Rendering and how to optimize cinematic rendering for lesion detection and staging.3. learn how to geerate and interpret the images created by Cnematic rendering4. case studies and examples showing typical and atypical appearances5. potential pitfalls and challenges6. role of CT and AI in the near time to help build on cinematic rendering over tme.

GIEE-189 Covid-19- Associated Secondary Sclerosing Cholangitis: Imaging Features on Magnetic Resonance Imaging and Magnetic Resonance Cholangiopancreatography

Participants
Manon Germann, Zurich, Switzerland (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Prolonged cholestasis in critically ill patients after severe COVID-19 infection may indicate the presence of secondary sclerosing cholangitis (SSC).• Affected patients are at high risk of progression to biliary cirrhosis requiring liver transplantation.• Since differential diagnosis to other causes of cholestatic liver injury can be difficult based on clinical and laboratory findings alone, imaging with MRI and MRCP can be crucial to help confirm the diagnosis.• COVID 19-associated SSC mostly affects intrahepatic bile ducts showing strictures with or without upstream dilatation, bile duct beading, vanishing ducts and periductal edema.• The extrahepatic bile ducts are typically spared.• Changes of the liver parenchyma are commonly observed including patchy arterial enhancement, reduced uptake of hepatobiliary contrast agent and signal changes on T2- and diffusion weighted-images.• Hepatic macrovascular changes and periportal lymphadenopathy are not typically seen.

TABLE OF CONTENTS/OUTLINE

1) Background a. Epidemiology b. Pathogenesis c. Clinical presentation d. Diagnosis 2) Imaging findings a. Biliary tree b. Liver parenchyma c. Hepatic vessels d. Other findings 3) Clinical implication and prognosis 4) Conclusion

GIEE-19 Response Evaluation Criteria in GI Cancers: What to Use and How to Measure: An Emerging Challenge in the Era of Novel Cancer Treatments

Awards
Identified for RadioGraphics

Participants
Francesca Castagnoli, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Therapeutic response is assessed by tumour diameter measurements (WHO, RECIST 1.1, and iRECIST), tumour enhancement (mRECIST, EASL, RECICL) or CT density (CHOI). Metabolic response is measured on PET by the standardized uptake value (SUV) normalized to the lean body weight (PERCIST).• Novel therapeutics and therapy-induced non-tumoral changes can lead to interpretation pitfalls. • In rectal cancer, MRI-derived tumour regression grade (TRG) infers pathological response to guide treatment and disease prognosis.• Functional imaging, radiomics, artificial intelligence and machine learning provide new and early biomarkers of response but require further qualification.

TABLE OF CONTENTS/OUTLINE

• GI Cancer therapies: 1) FDA-approved chemotherapies, targeted therapies and immunotherapies 2) external/internal radiotherapy • Imaging response criteria: when, where and how?• Patterns of response, stable disease and progression.• Atypical response patterns: pseudo-progression, hyper-progression, dissociated response, abscopal effect.• Potential pitfalls from non-tumoral effects of treatment: Hepatic steatosis, Sinusoidal obstruction syndrome, Others.• MRI-TRG [after Mandard/Rodel] applied to rectal cancer after neoadjuvant treatment.• LI-RADS, a structured reporting system, for treatment response of hepatocellular carcinoma.• Imaging response evaluation after neoadjuvant treatments of pancreatic cancer.• Functional imaging: DCE-MRI, DWI and others; myth or reality?• Radiomics: summary of current evidence.• AI and machine learning: potential applications

GIEE-190 Hyperthermic Intraperitoneal Chemotherapy (HIPEC): A Radiological Primer

Participants
Mary Renton, MBBCh, (*Presenter*) Nothing to Disclose

TEACHING POINTS

- The treatment of peritoneal carcinomatosis has been revolutionised by cytoreductive surgery with hyperthermic intraperitoneal chemotherapy (HIPEC).- HIPEC is used in a combined approach immediately following surgery and involves heated chemotherapy agents being temporarily instilled into the abdominopelvic cavity.- The associated high morbidity means an optimised patient selection process is vital.- We review key patterns of peritoneal disease and their prognostic implications.- We summarise common and important HIPEC complications.

TABLE OF CONTENTS/OUTLINE

- Background into the clinical indications and outcomes for HIPEC.- Review of common sites of peritoneal disease and types (nodular, mass or plaque-like).- Review of prognostic imaging features, including, gastrointestinal involvement, mesenteric and retroperitoneal lymphadenopathy, ureteric obstruction, psoas or pelvic sidewall involvement and gastrohepatic ligament disease.- Review of radiological contraindications to HIPEC, including extra-abdominal metastases and massive retroperitoneal lymphadenopathy.- Review of post-HIPEC complications, including ascites, splenic/ovarian venous thrombosis, pseudoaneurysm, haemoperitoneum, lymphocyte, perihepatic hematoma, pancreatic fistula and ureteric injury.- Importance of radiological assessment in the selection and management of HIPEC patients.

GIEE-191 Spleen Doppler and Elastography: What the Radiologist Needs to Know

Participants
Mariana Del Rio Gonzalez, MD, Monterrey, Mexico (*Presenter*) Nothing to Disclose

TEACHING POINTS

1- To review splenic and vascular anatomy. 2- To discuss the differences in Strain and Shear Wave Elastography. 3- To identify the different techniques of Shear Wave Elastography. 4- To learn the indications and adequate protocol of splenic Doppler and Elastography. 5- To teach how to interpret and report findings.

TABLE OF CONTENTS/OUTLINE

1. Introduction2. Splenic anatomy: A) Parenchyma B) Circulation3. Elastography: A) Strain vs Shear Wave4. Shear Wave Techniques: A) 1D Transient Elastography B) Point Shear Wave Elastography C) 2D Shear Wave Elastography5. Indications6. Protocol: A) Technique B) Errors C) Artifacts7. Report: A) Interpretation B) Suggested Reporting

GIEE-2 In Search of Harmony: Where Do We Still Disagree in the Radiological TNM Staging of Rectal Cancer?: A Pictorial Review Based on the Published Findings of a Recent International Survey and Multidisciplinary Expert Consensus

Participants
Ulysses Torres, MD, PhD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Recently, a global online survey was carried out among 321 experts from 32 countries to identify points of controversy in the applicability of the TNM system (8th ed.) for the radiological staging of rectal cancer. A total of 16 problem areas were identified, grouped in topics related to clinical tumor staging in low-rectal cancers, definitions for cT4b and cM1a disease, definitions for mesorectal fascia involvement, evaluation of lymph nodes versus tumor deposits, and staging of lateral lymph nodes.- These critical areas remain considerable points of dissensus even among experts in rectal cancer imaging, and their awareness by residents, general radiologists, and even abdominal radiologists is paramount for better and more consistent use of the TNM system in the everyday radiological practice.- An illustrated case-based review with schematic drawings may be a didactical and straightforward way of exhibiting such a range of controversies, facilitating their comprehension by a general audience. Secondarily, it may also help make more understandable the points of consensus proposed and published by the international multidisciplinary panel of specialists.

TABLE OF CONTENTS/OUTLINE

1) Presentation of the 16 problem areas identified, illustrating them with schematical drawings. 2) Imaging-based review with didactical clinical cases exhibiting such critical points of controversies. 3) Tips on how to report the radiological findings in such cases in the light of the consensus proposed by the panel of experts.

GIEE-20 Early Detection of Pancreas Adenocarcinoma: Time to Give Up or Time to Double Survival?

Participants
Hala Khasawneh, MBBS, Rochester, MN (*Presenter*) Nothing to Disclose

TEACHING POINTS

Highlight the emerging concepts and recent advances in the domain of early detection of pancreas ductal adenocarcinoma (PDA): 1. Dire prognosis of PDA: Early detection is the only intervention with the highest potential to improve outcomes 2. Rationale for early detection: Substantial differences in the 5-year survival between stage I (26-months) versus stage IV disease (4.8-months) 3. Challenges of early detection including inability of imaging to identify early PDA 4. Emerging evidence supporting the role of Artificial Intelligence (AI) to augment imaging-based screening efforts for early detection of PDA in high-risk cohorts

TABLE OF CONTENTS/OUTLINE

1. PDA as an almost uniformly fatal disease2. Rationale for early PDA detection: What is "early" PDA and why is it critical to detect PDA at a stage when surgical cure is a possibility? 3. Challenges and opportunities for population-based screening for PDA a) The Define (D)-Enrich (E)-Find (F) protocol as an emerging paradigm 4. High-risk cohorts: a) Familial PDA and subjects with germline mutations b) New-onset diabetes (NOD) with high Enriching New-Onset Diabetes for Pancreas Cancer model (END-PAC) score c) Potential precursor lesions such as intraductal papillary mucinous neoplasms 5. Limitations of imaging to detect early or incidental PDA: a) Imaging findings of early PDA b) Factors contributing to missed PDA on imaging 6. AI tools being developed to augment screening efforts for PDA: a) Pancreas segmentation tools b) Imaging signature of pancreatic carcinogenesis at the prediagnostic stage c) AI-augmented detection of PDA on CTs 7. Potential utility of molecular imaging for early detection of PDA

GIEE-21 Imaging of Young-onset Colorectal Cancer

Participants
James Fish, MBBS, London, United Kingdom (*Presenter*) Nothing to Disclose

TEACHING POINTS

Young onset colorectal cancer is defined as a colorectal tumour diagnosed at < 50 years. The incidence of young-onset colorectal cancer is on the rise, currently constituting approximately 10% of all cases. As such, reporting radiologists should have a good understanding of the imaging features and considerations associated with such patients including: • The risk factors and pre-disposing conditions associated with young-onset colorectal cancer. • The imaging manifestations frequently encountered on CT and MRI with correlation to histopathology and genetic markers. • Imaging appearances during the disease course including complex surgical management.

TABLE OF CONTENTS/OUTLINE

A case based educational exhibit including multiple examples of young-onset colorectal cancer with referenced teaching points. To include: • Demographics and epidemiology • Risk factors associated with young-onset colorectal cancer and associated imaging features. Including Hereditary syndromes (e.g. Lynch syndrome), genetic mutations and inflammatory bowel disease • Imaging presentations on MRI and CT with histopathological and genetic correlation, including synchronous or metasynchronous cancers. • Staging imaging and imaging during the disease course. • Post-treatment appearances, including complex surgical management e.g. exenteration, pelvic side wall clearance and peritoneal therapies. • Risk stratification and follow-up imaging surveillance.

GIEE-22 Posttreatment Challenges in Rectal Cancer MRI: A Systematic Approach

Awards
Cum Laude

Participants
Lucas Roberto Lelis Oliveira, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Understanding the critical role that MRI plays in rectal cancer staging and restaging. • Comprehend that several histopathologic changes may occur within rectal tumors after chemoradiation treatment, such as fibrosis or increased mucin production. • Radiologists play a crucial role in "watch-and-wait" programs for select patients with rectal cancer and should understand how to differentiate the several types of response, as well as how these posttreatment changes may be evaluated with high-spatial-resolution MRI.

TABLE OF CONTENTS/OUTLINE

• INTRODUCTION: o Rectal cancer treatment guidelines overview: § Selecting whether primary surgery or neoadjuvant treatment is an optimal approach; § Neoadjuvant treatment options: chemoradiotherapy versus total neoadjuvant therapy (TNT). o Primary tumor and nodal assessment with MRI. • ASSESSMENT OF TREATMENT RESPONSE: A SYSTEMATIC APPROACH. o Posttreatment changes in the primary tumor o Tumor Restaging: Histopathologic and MRI regression grades: § Identifying incomplete/poor responders, as well as "near-complete" and complete responders. o Patterns of tumor response: shrinking versus fragmentation; fibrosis and increased mucin production. • "WATCH-AND-WAIT": PATIENT SELECTION AND CURRENT CONTROVERSIES. • FUTURE DIRECTIONS IN RECTAL CANCER TREATMENT AND IMAGING. • TAKE HOME MESSAGES.

GIEE-23 #PRO TuMor# Becoming a PRO in Rectal TuMor: A Simple Way and Quiz Not to Miss the Tumoral Regression Grade After Neoadjuvant Therapy

Participants
Aaron Alarcon Novillo, Rio De Janeiro, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

> To demonstrate the importance of the radiologist in the context of rectal cancer, with a special interest in post-neoadjuvant evaluation.> To familiarize radiologists with the tumor regression grade (TRG) and its importance.> To demonstrate a simple way to minimize possible errors in the tumor regression grade (TRG).> To train the correct characterization of the tumor regression grade (TRG) based on recent cases using a simple way.

TABLE OF CONTENTS/OUTLINE

IntroductionRectal neoplasm is the third most common type of tumor in men and the second in women. Surgical treatment with total mesorectal excision is the gold standard, however, in cases of locally advanced tumors at diagnosis, neoadjuvant chemotherapy and radiotherapy are required. Magnetic resonance imaging is one of the mainstays in the management of patients with rectal tumors, providing primary staging and re-staging after neoadjuvant therapy. In the latter context, the response to treatment is evaluated by MRI, which provides the tumor regression grade (TRG) and re-staging, fundamental factors directly related to patient survival, which is again managed according to the imaging findings.We evaluated several MRI scans of post-neoadjuvant rectal tumors, with emphasis on the adequate qualification of the TRG, and we also developed a simple sequence of questions with a mnemonic (PRO TuMor) to assist in the proper characterization of the TRG, reducing possible errors.At the end of the presentation, we selected some MRI images in a quiz format for training purposes, using PRO TuMor.

GIEE-24 Post Pancreatic Surgery Complications: Diagnostic Imaging Approach

Awards
Identified for RadioGraphics
Certificate of Merit

Participants
Ayman H. Gaballah, MD, FRCR, Columbia, MO (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Review indications of pancreatic surgeries • Illustrate types of pancreatic surgeries • Discuss complications of pancreatic surgeries and their imaging features, including pancreas transplant • Highlight management options of these complications

TABLE OF CONTENTS/OUTLINE

1. Introduction a. Normal anatomy b. Indications for pancreatic surgery 2. Approaches to pancreatic surgeries: a. Endoscopic b. Minimally invasive- laparoscopic and robotic c. Open pancreatectomy 3. Types of pancreatic surgeries: a. Necrosectomy and abscess drainage b. Lateral pancreaticojejunostomy (Puestow) c. Beger procedure d. Frey procedure e. Pancreaticoduodenectomy (Whipple's procedure) f. Distal/central pancreatectomy g. Total pancreatectomy h. Pancreatic transplant surgery 4. Normal postoperative imaging findings 5. Multimodality Imaging features of post-surgical complications: a. Pancreatico-biliary complications i. Transient fluid collection ii. Biliary leaks/bilomas iii. Pseudocysts iv. Pancreatitis v. Pancreatic fistulas 1. Pancreatic-enteric fistulas 2. Pancreatic-cutaneous fistulas vi. Anastomotic stenosis vii. Infections (abscess and peritonitis) viii. Local disease recurrence b. Vascular complications i. Arterial injuries ii. Hematomas iii. Arteriovenous fistulas iv. Vascular thrombosis c. Bowel complications i. Delayed gastric emptying ii. Bowel ischemia iii. Bowel injury iv. Anastomotic leak v. Anastomotic stenosis vi. Afferent loop syndrome d. Solid-organ complications: (e.g., liver infarction, splenic injury, etc.) e. Abdominal compartment syndrome f. Pancreatic transplantation i. Rejection ii. Vascular complications Inflammation, infection, necrosis

GIEE-25 The Postoperative Pancreas

Participants
Ryan Clayton, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

* Review indications for various pancreatic surgeries and circumstances under which they are done.* Understand the postoperative anatomy after common and uncommon pancreatic surgeries, as seen on radiologic studies including CT, MRI, Ultrasound, fluoroscopy and nuclear medicine.* Be aware of the complications of the postoperative pancreas, and their imaging appearance. * After reviewing this material, the radiologist will more easily and accurately identify normal postoperative anatomy after pancreatic surgeries (both common and uncommon), leading to improved diagnosis of potential complications and avoiding pitfalls such as misinterpreting postoperative anatomy as pathology.

TABLE OF CONTENTS/OUTLINE

* Indications, anatomy and radiologic appearance of common pancreatic procedures: Whipple procedure (Classic, Pylorus-sparing), Distal pancreatectomy, Total pancreatectomy, Puestow procedure. Devices (CIVA sheet, Cystgastrostomy device).* Complications of common pancreatic procedures and their radiologic appearance: Leaks (Anastomotic leak, Pancreatic fistula, Bile leak), Other collections (Abscess, Hematoma), Strictures (Gastrojejunal anastomotic stricture, Bile duct stricture, Pancreatic duct stricture), Delayed gastric emptying, Vascular complications (Portomesenteric venous thrombosis, Portomesenteric venous stenosis, Aneurysms and pseudoaneurysms), Tumor recurrence.

GIEE-26 Out of Place: Ectopic and Accessory Tissues

Awards
Certificate of Merit

Participants
Patricia Dantas I, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purposes of this exhibit are:1) Review the most relevant imaging findings of ectopic and accessory tissue types, using a didactic approach by illustrations and cased-based imaging.2) Review the pathophysiology and embryology that are related to ectopic tissues, helping to understand the imaging findings in Computed Tomography (CT) and Magnetic Resonance (MR) imaging.3) Discuss the relevance of different ectopic tissue imaging presentations correlating with possible clinical complications.4) Improve knowledge about the main differential diagnoses and the main patterns of image appearance that are the key points to clarify diagnostic challenges.

TABLE OF CONTENTS/OUTLINE

1) Pictorial review of most frequent image findings of different ectopic and accessory tissue types.2) Cased-based review of ectopic tissue clinical presentation, frequent location, imaging findings, possible complications and differential diagnosis: pancreas, spleen, liver, gallbladder, leiomyomatosis, genitourinary system and endometriosis.3) Illustrative key points: improve understanding of the correlation between embryology and ectopic tissue imaging findings.4) Highlight the relevant imaging findings that aid surgical decisions.5) Conclusions and "take home messages": consolidate the acquired knowledge.

GIEE-27 Postoperative Complications of Hepatobiliopancreatic Surgeries: Where To Look?

Participants
Cristiane Costa, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Revisit the surgical techniques involving the pancreas, liver, and bile ducts for the various pathologies that involve these organs. To review the most relevant complications of hepatobiliopancreatic surgeries and correlate with the imaging findings of computed tomography (CT), magnetic resonance imaging (MRI), and cholangiopancreatography (MRCP). Illustrate the cases of complications and demonstrate the therapeutical options.

TABLE OF CONTENTS/OUTLINE

Surgical techniques of hepatobioliopancreatic surgeries. Imaging protocols. Advantages and disadvantages of CT, MRI, and MRCP. Expected findings on postoperative imaging evaluation. Key sites where the radiologist should actively look for complications. Illustrate with cases the imaging findings of complications that must be described in the report. Demonstrate surgical and non-surgical treatment options.

GIEE-28 Fixing The Edges: A Critical Analysis of Rectal Carcinoma After Neodjuvant Therapy

Participants
Paulo Antunes, MD, Niteroi, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To recognize the MRI pitfalls in restaging rectal cancer after neoadjuvant treatment with chemotherapy and/or radiotherapy. 2. Test the limits of MRI rectal cancer re-staging emphasizing the difference between the misdiagnosis that is a limitation of the MRI and those that can be avoided thru a careful analysis by the radiologist

TABLE OF CONTENTS/OUTLINE

Introduction: Basic concepts of image analysis in rectal carcinoma after neoadjuvant treatment.Discussion- Correlation between MRI TRG scoring and histopathological TRG in selected cases. - Is that fibrosis or tumor cells? Follow-up results for patients eligible for watch and wait; - Mesorectal e pelvic nodes: the assessment of response comparing MRI and histopathologic or MRI follow-up;- Detecting complete clinical response after neoadjuvant therapy.ConclusionSummary with pearls and best tips of the analysis of MR rectal carcinoma after neoadjuvant treatment.

GIEE-29 Cruisin' the Lumen: Fluoroscopic Evaluation of Normal and Abnormal Gastrointestinal Tract Luminal Anatomy in the Postoperative Setting

Awards
Cum Laude

Participants
Sonia Gaur, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Fluoroscopy is a cost-effective method of postoperatively distending the esophagus, stomach, and bowel to assess for postoperative anastomotic leak and other complications. Learning fluoroscopy requires exposure to high volume of cases including those performed in the postoperative setting.2. Identify common postoperative settings in which fluoroscopy is performed for anatomic evaluation.3. Review normal postoperative luminal anatomy and the fluoroscopic appearance of postoperative complications.4. Review fluoroscopic techniques that are helpful in diagnosing postoperative complications.

TABLE OF CONTENTS/OUTLINE

1. Introduction - commonly encountered postprocedural scenarios in the fluoroscopy suite2. Postoperative scenarios including explanation of surgery, expected postoperative appearance, possible complications, and corresponding normal and abnormal fluoroscopic cases. Technique and important views will be emphasized for each case. Case selection includes -- a) Zenker's diverticulotomy/diverticulectomy; b) evaluation for iatrogenic esophageal perforation; c) transhiatal esophagectomy; d) hiatal hernia repair; e) bariatric surgery (gastric sleeve surgery roux-en-y gastric bypass); f) percutaneous gastrostomy evaluation and g) colorectal surgeries (low anterior resection, ileoanal J-pouch creation, ileocolonic anastomosis).

GIEE-3 Surgery or Follow-up? That is the Question: The Diagnostic Dilemma of Intraductal Papillary Mucinous Neoplasms

Awards
Certificate of Merit

Participants
Akio Tamura, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

The diagnosis of intraductal papillary mucinous neoplasms (IPMNs) is complex because adherence to the clinical guidelines depends on numerous imaging features and clinician opinions. The rate of accuracy of diagnostic guidelines for the presence of advanced dysplasia or cancer is 50-80%. Therefore, a small percentage of patients will be overtreated and some patients with IPMNs with high-grade dysplasia or cancer will be overlooked. This educational exhibit explains the key diagnostic imaging aspects of IPMNs and suggests methods to solve this dilemma in real-world clinical practice.

TABLE OF CONTENTS/OUTLINE

1. Why do IPMNs matter? 2. Algorithm for the management of suspected IPMNs 3. Solving the imaging dilemma of IPMN 4. Pancreatic cystic disease vs. IPMN

GIEE-30 Diffuse Infiltrative Small Bowel Disease and Its Mimics

Awards
Identified for RadioGraphics

Participants
Preet Dhillon, MD, Rochester, MN (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review the differential for a diffuse infiltrative small bowel disease process. 2. Present the clinical presentation and imaging findings of several diffusely infiltrative diseases within the small bowel, in order to delineate the unique features of each entity. 3. Review entities that may mimic infiltrative bowel disease on imaging.

TABLE OF CONTENTS/OUTLINE

The presentation will present the following disease categories and examples of infiltrative bowel disease within them. A non-exhaustive list of example cases by category is provided. 1. Infectious: Mycobacterium avium intracellulare (MAI), Whipple disease, Histoplasmosis, Coccidiomycosis 2. Inflammatory: IgA vasculitis, graft-vs-host disease, radiation enteritis 3. Neoplastic: Metastatic lobular breast carcinoma, acute myelogenous leukemia, diffuse large B-cell lymphoma, post-transplant lymphoproliferative disorder 4. Other: Amyloidosis, endometriosis, hemorrhage, lymphangiectasia Summary: An infiltrative small bowel disease will manifest as a segmental or diffuse degree of small bowel wall thickening. Although these disease processes may share many characteristics, there are key clinical and imaging attributes of each that can be examined. This education exhibit aims to present several cases demonstrating disease processes in which the small bowel is diffusely infiltrated. The unique features of each disease entity will be examined in order to best differentiate them, with additional cases presented as potential mimics.

GIEE-31 Postoperative Colon Tract: What's That Hookup and What Could Go Wrong?

Participants
Aman Khurana, MD, Lexington, KY (*Presenter*) Nothing to Disclose

TEACHING POINTS

Review indications and techniques of the common colonic surgical procedures with diagrammatic depiction. Multimodality imaging review of the normal post-surgical anatomy and associated complications with diagrammatic correlation. Summarize the appropriate imaging workup of patients suspected of postoperative gastrointestinal complications.

TABLE OF CONTENTS/OUTLINE

1. Review indications for colon surgeries and relevant variants that would alter surgical approach (robotic vs. other). 2. Review post-surgical anatomy of ileal-anal anastomosis, Hartmann pouch and its reversal, APR, colostomy complications and reversal, rectopexy, etc. 3. Imaging of post-operative complications such as anastomotic leaks, afferent loop syndrome, and parastomal hernias, lower abdominal resection, etc. 4. Review multimodality imaging evaluation including the role of barium studies, CT, MRI, and relevant endoscopic correlation. 5. Algorithmic approach in the setting of unknown surgical anatomy.

GIEE-32 Advanced CT Imaging Techniques for Characterization of Suspected Hepatocellular Carcinoma: Spectral CT, Low kVp Technique, Deep Learning, and Beyond

Participants
Amir Borhani, MD, Chicago, IL (*Presenter*) Institutional research agreement, Siemens AG

TEACHING POINTS

1. Advanced CT techniques and novel CT-based software are increasingly used in daily clinical practice. These new approaches can improve accuracy of CT in detection and characterization of focal liver lesions while ensuring optimized radiation dose and image quality. 2. The appropriate use of these new techniques can improve characterization of focal hepatic lesions in at-risk population.

TABLE OF CONTENTS/OUTLINE

Current Status of CT in Liver Imaging • Overview of techniques and protocols • Dosage and timing of iodinated contrast o Effect on detection and conspicuity of hepatic lesions • ACR LI-RADS CT technical recommendations Spectral CT: Dual-energy and Multi-energy CT • Overview of basic principles of spectral CT • Review of current acquisition techniques • Advantages of spectral CT for LI-RADS classification • Suggested protocols and workflow Low kVp CT • Overview of physical principles of mass attenuation coefficient • Advantages and disadvantages of low kVp CT imaging • Added value of low kVp CT technique for LI-RADS classification Deep Learning (DL) Techniques • Background • Novel DL-based noise reduction and image reconstruction techniques • Role in detection and characterization of focal hepatic lesions o Computer-assisted detection (CAD) Novel Post-Processing Techniques • Background • Image subtraction o Value in assessment of focal hepatic lesions and classification

GIEE-33 Congestive Hepatopathy: Pathophysiology, Workup, and Typical and Atypical Imaging Findings with Pathological Correlation

Participants
Marta Flory, MD, Redwood City, CA (*Presenter*) Nothing to Disclose

TEACHING POINTS

Understand the pathophysiology of congestive hepatopathy and its effects on the liver parenchyma Recognize the imaging findings of congestive hepatopathy Know the benign and malignant lesions that develop in congested livers and how to use imaging features and techniques to distinguish them

TABLE OF CONTENTS/OUTLINE

1. Liver vascular anatomy and sinusoidal architecture2. Pathophysiology of congestive hepatopathy3. Etiologies of congestive hepatopathy4. Imaging findings of congestive hepatopathy a. Diffuse liver abnormalities b. Focal lesions associated with congestive hepatopathy5. Challenges and pitfalls in imaging of congestive hepatopathy a. Assessment of hepatic fibrosis b. Differentiation of benign hypervasular lesions from hepatocellular carcinoma c. Proposed algorithm for workup of focal hepatic lesions in setting of congestive hepatopathy?

GIEE-34 Upset Stomach: CT and Fluoroscopic Imaging of the Stomach after Surgery, Endoscopic Interventions, and Unusual Devices

Awards
Identified for RadioGraphics

Participants
Preethi Raghu, MD, San Francisco, CA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) Review normal postsurgical CT and fluoroscopic imaging appearance after gastric surgical interventions for weight loss, reflux management, and gastroparesis treatment.2) Discuss normal postprocedural CT and fluoroscopic imaging appearance after endoscopic sleeve gastroplasty, transoral incisionless fundoplication (TIF), gastric peroral endoscopic myotomy (G-POEM), and other specialized endoscopic procedures.3) Recognize the normal CT and fluoroscopic appearance of various gastric devices, including those used for weight loss, reflux management, and pancreatitis.4) Understand the CT and fluoroscopic imaging appearance of the complications associated with these gastric surgeries, procedures, and devices.

TABLE OF CONTENTS/OUTLINE

1) Postsurgical Stomach:a) Roux-en-Y gastric bypassb) Laparoscopic sleeve gastrectomyc) Laparoscopic bandingd) Nissen/complete fundoplicatione) Toupet/partial fundoplicationf) Gastric pacemaker placement.2) Postprocedural Stomach:a) Endoscopic sleeve gastroplastyb) Transoral incisionless fundoplication (TIF)c) Transgastric Rendezvous techniqued) Endoscopic Ultrasound Directed Transgastric ERCP (EDGE)e) Gastric Peroral Endoscopic Myotomy (G-POEM).3) Unusual Devices:a) LINX Reflux Management Systemb) Intragastric balloonc) AspireAssist Deviced) Axios stent and drainagee) Metallic gastric stent for cancer

GIEE-35 Choices, Choices, Choices: What Your Multidisciplinary HCC Treatment Team Wants to Know?

Participants
Omar Kamal, MD, MSc, Portland, OR (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Different treatment options exist for hepatocellular carcinoma (HCC) including surgical, locoregional and systemic therapies. Appropriate choice of therapy is crucial to improve clinical outcomes. 2. HCC treatment guidelines incorporate different clinical and imaging variables to guide treatment options. 3. Radiologists need to be familiar with how imaging findings can change treatment planning for HCC and what is the crucial information that the multidisciplinary liver team (MDLT) wants to know.

TABLE OF CONTENTS/OUTLINE

1. Brief overview of HCC management: a. Surveillance. b. Overview of HCC staging and treatment options. i. Describe various treatment options. ii. Status of stereotactic body radiation therapy (SBRT). iii. Goals of noncurative treatments. c. HCC imaging features and role of biopsy in diagnosis and management. 2. Tumor burden and treatment considerations: a. Single vs. Multipleb.

Size. c. Location in relation to other structures. 3. Liver status and treatment considerations: a. Background liver disease. b. Liver volume. c. Signs and symptoms of Portal hypertension. d. Portal vein thrombosis. e. Arterial anatomy. f. Metastasis. g. Liver transplant candidacy. h. Performance status. 4. Treatment response: a. Size vs. viability. b. LI-RADS treatment response criteria. c. Specific challenges for TARE and SBRT. 5. Common questions for radiologists during MDLTs.

GIEE-36 Peritumoral Area of Focal Liver Lesions: Imaging-pathological Correlation and Clinical Significance

Awards
Certificate of Merit

Participants
Kumi Ozaki, MD, PhD, Fukui, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

Peritumoral area of focal liver lesions is the liver parenchyma adjacent to focal hepatic lesions, which is often altered due to compression of the tumors, drainage of blood flow of the lesion, vascular or bile duct invasion as well as due to malignant infiltration in some cases. These histological findings are plainly reflected in the imaging findings. In some tumors, the imaging findings of peritumoral area could be helpful for an accurate diagnosis and could be biomarkers of malignant grades or prognosis. The radiologist should pay attention to not only the tumor itself but also peritumoral area.

TABLE OF CONTENTS/OUTLINE

1. Introduction. 2. The definition of "peritumoral area," and several imaging findings of peritumoral area. 3. Imaging-pathological correlation of peritumoral area of each lesion as follows; peritumoral arterial enhancement (corona enhancement) of hepatocellular carcinoma, peritumoral hyper- or hypointensity on hepatobiliary phase of hepatocellular carcinoma, peritumoral arterial enhancement and peritumoral hypointensity on hepatobiliary phase of colorectal liver metastases, peritumoral hyperintensity on hepatobiliary phase of liver metastases from neuroendocrine tumor, and peritumoral arterial enhancement (arterioportal shunt) of cavernous hemangioma. 4. Non-existence of peritumoral changes of simple cysts or focal nodular hyperplasia 5. Clinical significance of peritumoral area of each lesions such as microvascular invasion, prognosis, the effect of chemotherapy, and the influence on the results of radiomics analyses. 6. Summary of the clinical significance of peritumoral area of focal liver lesions. 7. Conclusion.

GIEE-37 Why Do Mucin-producing Cystic Neoplasms of the Liver Confuse Us?: Top Tips To Get the Right Diagnosis

Awards
Certificate of Merit

Participants
Sofia Santos, MD, Lisbon, Portugal (*Presenter*) Nothing to Disclose

TEACHING POINTS

This exhibit intends to: (1)To clarify and to compare the old and the new nomenclature of mucin-producing cystic neoplasms of the liver.(2)To summarize the characteristic features of hepatic mucinous cystic neoplasms (MCN) and intraductal papillary neoplasms of the bile duct (IPNB). (3)To highlight the key differences between MCN and IPNB and to present the main differential diagnoses. (4)To understand the impact of an adequate differential diagnosis.The main teaching points are: Mucinous cystic neoplasms of the liver are rare neoplasms that include hepatic mucinous cystic neoplasms (MCN), previously known as cystadenoma and cystadenocarcinoma, and intraductal papillary neoplasms of the bile duct (IPNB). The keys for distinguishing MCN and IPNB are based on the presence of bile ductal communication (only in the case of IPNB) and the presence of sub-epithelial ovarian stroma (only in the case of MCN). The differential diagnosis encompasses non-neoplastic cystic lesions and cystic metastases. The five top tips to the radiologist are: (1) to look for ductal communication, (2) to assess for bile duct dilation, (3) to look for thickened enhancing septa, mural solid nodules and calcifications, (4) to take into account location and number of lesion(s), and (5) to review the clinical data (namely primary extra-hepatic malignancy).

TABLE OF CONTENTS/OUTLINE

- Mucin-producing cystic neoplasms of the liver: the old and the new nomenclature- Hepatic mucinous cystic neoplasms (MCN) and intraductal papillary neoplasms of the bile duct (IPNB): epidemiologic, clinical, histological, and imaging features- MCN versus IPNB: top tips to the radiologist- Therapeutic insights- Diagnostic flowchart

GIEE-38 Imaging Assessment after Partial Hepatectomies: Surgical Technique and Type of Parenchymal Transection Performed: Normal Findings and Complications

Participants
Juan C. Spina JR, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1- In the last two decades there has been an increase in the number of hepatic surgeries performed, together with an improvement in surgical techniques and new dissection devices. 2- Radiologists play a key role in the process of surgical planning and post surgical evaluation. Knowledge of types of resection is important to interprete postsurgical liver appearence. 3- In the acute post surgical period, imaging helps to identify complications and contribuites to define treatment.

TABLE OF CONTENTS/OUTLINE

1) Introduction. 2) Type of hepatectomies and technique- left hepatectomy, right hepatectomy, trisegmentectomy, segmentectomy, atypical segmentectomy, alpps, mini alpps.- liver hanging maneuver- Pringle Maneuver- liver transection methods: clamp crushing, electric scalpel, CUSA, water jet, tissue link. When and why?. 3)- Imaging findings after hepatectomies.- Normal findings: fluid collection, hypodense line, hepatic perfusion abnormalities, air bubbles, omentun adipose tissue, extraluminal gas.- Pathologic findings: biloma, hematoma, abscess, pulmonary complications. Tips for the correct diagnosis and differentiation. Example cases and evaluation test. Conclusion

GIEE-39 Liver MR Elastography: A Case-based Approach on Quality Control and Main Technical Failures

Participants
Marcelo Mota, (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Review the basic principles of elastography, focusing on the liver • Summarize the liver magnetic resonance elastography technique • Describe the steps in the evaluation and quality control of elastography images • Recognize the main causes of low-quality and nondiagnostic elastograms • Illustrate with didactic cases some technical failures of liver MR elastography and how to potentially correct them

TABLE OF CONTENTS/OUTLINE

? INTRODUCTION - Important concepts - Basic principles of elastography ? LIVER MR ELASTOGRAPHY TECHNIQUE - Typical liver MR elastography configuration - Raw data and post-processed images ? IMAGES QUALITY CONTROL - How to evaluate elastography images and ensure their quality ? LOW-QUALITY AND NONDIAGNOSTIC ELASTOGRAMS - Main causes of technical failures during the liver MR elastography ? INTERACTIVE CASE-BASED DIDACTICS - Sample cases to illustrate and solidify the concepts - How to potentially correct low-quality and nondiagnostic elastograms ? TAKE HOME MESSAGES

GIEE-4 Postoperative Complications of Hepatobiliary Surgery: An Imaging Review

Awards
Certificate of Merit

Participants
John Kirby, MD, Rochester, MN (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Review normal liver segmentation, vascular, biliary anatomy, and variants • Recognize the normal appearance of the postoperative liver • Recognize early complications such as abscess, parenchymal necrosis, and bile leak • Describe pertinent vascular findings such as active bleeding, pseudoaneurysm, stenoses, and thrombosis • Understand the post ablation appearance of the liver and potential complications • Many of our cases will contain a QR code that will allow the reader to open a fully functional PACS interface on their mobile device

TABLE OF CONTENTS/OUTLINE

• Background: Liver surgery is a common procedure and complication rates can be as high as 50%. With the high-risk nature, radiologists can play an important role in the early detection and management of potential complications. • Review normal hepatic anatomy including the conventional segmental divisions, vasculature, and biliary system. • Terminology including wedge resections, segmentectomy, and hepatectomy to assist the radiologist in reviewing operative reports and accurately describing imaging findings. • Normal/expected post operative appearances • Case based examples illustrated utilizing multiple modalities to demonstrate common complications that radiologists may encounter: o CT and MR examples of early complications requiring hospital admission o Vascular and biliary complications and interventions o Utility of nuclear medicine studies o Evaluation of long-term complications. o Post ablation appearance and potential complications.

GIEE-40 Colitis in Cancer: Going Beyond Immune Checkpoint Inhibitors: Diagnosis, Monitoring and Management

Participants
Kaustav Bera, MD, Cleveland, OH (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To review cancer drugs that are primarily responsible for causing colitis 2. Review the different etiologies of colitis and imaging findings that help differentiate them from cancer-therapy associated colitis 3. To discuss the CT imaging patterns of colitis of different etiologies 4. To discuss the crucial role of the radiologist in monitoring/management of treatment-related colitis. 5. Review established grading and management guidelines for treatment related colitis

TABLE OF CONTENTS/OUTLINE

1. Discuss common anti-neoplastic agents that cause colitis 2. Enumerate etiologies of colitis, along with their typical imaging findingsi) Immune checkpoint inhibitor associated colitisii) Drug-induced colitisiii) Infectious colitis -a. Neutropenic colitisb. Pseudomembranous colitisiv) Radiation induced colitis v) Inflammatory - Ulcerative colitis/Crohn disease vi) Ischemic colitis 3. Discuss clinical findings, history and risk factors for developing colitis 4. Discuss mimics of colitis a. Diverticulitis b. Appendicitis c. Epiploic appendagitis 5. Discuss presenting clinical symptoms and grading system for drug-induced colitis6. Management guidelines for drug-induced colitis with special focus on checkpoint inhibitors (ICI), targeted therapy, Car-T cell therapy 7. How a Radiologist plays an important role in monitoring and management 8. Prognosis and clinical outcome of patients developing drug-induced colitis 9. Real-world cases showing management and clinical course of drug-induced colitis in cancer therapies from to combination ICI and CAR-T cells as well as additional causes of colitis in cancer patients

GIEE-41 Fundamentals of Response Evaluation for Abdominal Tumors

Participants
Marcelo Cortes, MD, Petropolis, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

? Overview of the application of tumor response criteria and quantitative imaging and its benefits for clinical trials and novel oncology therapeutics. ? The role of radiologists in the standardization of tumor evaluation for clinical trials. ? Basics on response assessment and quantitative analysis of the most prevalent abdominopelvic tumors. ? Updates in imaging management and surveillance strategies for abdominal tumors. ? The role of imaging and genetic/molecular evaluation

TABLE OF CONTENTS/OUTLINE

Based on extensive imaging experience from a leading cancer center: ? A brief review of abdominopelvic tumors, highlighting the

Based on extensive imaging experience from a leading cancer center: ? A brief review of abdominopelvic tumors, highlighting the clinical and laboratory features that can be helpful in diagnosis and management. ? Review of the main criteria for clinical trials and clinical decision support employed to evaluate abdominopelvic tumors, for instance, RECIST 1.1, irRECIST, iRECIST, irRC, Lugano, Cheson, EASL, imRECIST, itRECIST, PERCIST, RECIL, and Choi. ? Tumor metrics criteria evaluation for abdominal tumors response compared to radiomics and imaging genomics role. ? Evaluation of immunotherapy: main concepts and practical application of tumor response evaluation. ? Interactive imaging-based approach with teaching points for response evaluation, work-up and recurrence of abdominopelvic tumors, challenges of immunotherapy evaluation, and equivocal cases on anatomic (CT/MRI) and functional (PET/CT and PET MRI) cross-sectional imaging. ? Current guidelines. ? Limitations of current imaging methods and new directions. ? Take-home messages.

GIEE-42 Typical and Atypical Findings in Cirrhotic Liver: Pearls and Pitfalls for Diagnosis of Benign and Malignant Lesions

Participants
Xiaoyang Liu, MD, PhD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Case-based review on imaging pitfalls and pearls of focal liver lesions in cirrhosis.2. The distortion of normal liver parenchyma by fibrous and regenerative tissue can change the typical appearance of many benign lesions, causing misdiagnosis as malignancy.3. As the most common primary malignancy arising from cirrhotic liver, hepatocellular carcinomas (HCC) can have atypical imaging appearance.4. Contrast enhanced ultrasound (CEUS) can provide characterization of focal liver lesions in additional to CT and MRI to achieve accurate diagnosis.

TABLE OF CONTENTS/OUTLINE

Technical pitfalls in cirrhotic liver imaging: 1) HCC may be nearly isointense to background liver on heavily T2 weighted MR images. 2) CT and MRI can miss early enhancement pattern of HCC due to mistiming. 3) Replacement of liver parenchyma by fibrous and regenerative tissue in cirrhosis can lead to decreased penetration by ultrasound.Benign lesions mimicking malignancy: 1) Regenerative nodules. 2) Siderotic nodules. 3) Confluent fibrosis. 4) Hemangioma with pseudo washout.Atypical appearance of HCC 1) Hypovascular. 2) Cystic. 3) Fat containing HCC. 4) Nodule in nodule HCC.Other malignancies mimicking HCC 1) Intrahepatic cholangiocarcinoma. 2) Metastases.CEUS providing added value to CT and MRI, for differentiation of benign versus malignant lesions 1) HCC washout not shown on CT or MRI, but demonstrated by CEUS, due to the purely intravascular nature. 2) More sensitive detection of arterial hyperenhancement, due to its real-time nature.

GIEE-43 2022 Update of the Barcelona Clinic Liver Cancer Recommendations: What the Radiologist Needs to Know

Awards
Certificate of Merit

Participants
Vikrant Khare, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Teaching Points Although many hepatocellular carcinoma staging systems exist, the Barcelona Clinic Liver Cancer (BCLC) staging system is the most widely validated system which provides guidelines for therapy based on tumor stage and underlying liver function. Following the BCLC treatment guidelines has survival benefits for HCC patients, and the 2022 expanded upon its previous iteration for a more personalized and individualized approach, taking into consideration local technical and expertise availability in conjunction with the tumor profile. Knowledge of the imaging findings for each BCLC stage and understanding the updated treatment recommendations for each stage are required to ensure appropriate clinical decisions and management for each patient This exhibit aims to highlight the imaging appearance of HCC for various BCLC stages while highlighting the key differences in the 2022 version

TABLE OF CONTENTS/OUTLINE

OutlineBrief background on HCC and the BCLC staging systemHighlight key updates of the BCLC 2022 staging systemCase based review illustrating the key imaging features of each stageBCLC-0, very early stageBCLC-A, early stageBCLC-B, intermediate stageBCLC-C, advanced stageBCLC-D, terminal stageCase-based review highlighting the various treatment options recommended by the updated BCLC system for each stage, with an emphasis on locoregional interventional treatments

GIEE-44 Imaging Findings of Early Gastrointestinal and Hepatobiliary Cancers: Pitfalls and Pearls

Awards
Certificate of Merit

Participants
Alecio Lombardi, MD, San Diego, CA (*Presenter*) Nothing to Disclose

TEACHING POINTS

Describe the imaging modalities of choice for the detection of early gastrointestinal and hepatobiliary cancers; Understand MRI technique and protocols, common challenges, and how to overcome them; Highlight imaging pearls and pitfalls for the characterization of early lesions on each modality; Underscore imaging characteristics that help in the differential diagnosis; Recognize key anatomical landmarks for surgical planning; Know what to include in the radiology report; Discuss future directions in the image analysis of early gastrointestinal and hepatobiliary cancers.

TABLE OF CONTENTS/OUTLINE

INTRODUCTION: General overview and definitions; Common gastrointestinal and hepatobiliary cancers. IMAGING TECHNIQUE: Modalities of choice; Sensitivity, specificity, and accuracy across methods; Protocols; Difficulties and how to overcome them to obtain high-quality images. IMAGING INTERPRETATION: Structured imaging analysis; Piftalls and pearls; Anatomic Landmarks: What the Surgeon whants to know?; What should be included in the tadiology report. STRATEGIES TO OVERCOME THE CHALLENGING CASES: Imaging characteristics that help in the differential diagnosis; WHAT'S ON THE HORIZON TO ASSESS EARLY GASTROINTESTINAL AND HEPATOBILIARY CANCER: Dual-energy CT; Digital Subtraction Angiography; DWI; Radiomics; Artificial

Intelligence applied to image acquisition, reconstruction; Quantitative Imaging Analysis; PET/MRI; New nuclear medicine radionuclides; Nanoparticles.

GIEE-45 Renal Transplant Complications From A-Z: A Multimodality Case Based Review

Participants
Meghan Stanton, MD, Syracuse, NY (*Presenter*) Nothing to Disclose

TEACHING POINTS

• The kidney is the most commonly transplanted solid organ and therefore it is imperative that the radiologist be familiar with the surgical procedure, as well as the post operative complications. • Understanding the general timeline of specific complications in order to narrow the differential of imaging findings. • Recognize the imaging findings of the most common and the rare postoperative complications related to renal transplantation.

TABLE OF CONTENTS/OUTLINE

• Review of the renal transplant surgical procedure and normal post-operative anatomy • Imaging modalities used to assess the allograft • Complication timeline • Perinephric fluid collections • Vascular complications • Collecting system complications • Parenchymal abnormalities • Abdominopelvic complications • Conclusion

GIEE-46 Mimickers of Pancreatic Cancer: Lessons Learned

Awards
Identified for RadioGraphics
Magna Cum Laude

Participants
Camila Vendrami, MD, Chicago, IL (*Presenter*) Nothing to Disclose

TEACHING POINTS

· Review of characteristic and atypical pancreatic ductal adenocarcinoma imaging and clinical findings · Review of imaging and clinical features that allow differentiation between pancreatic ductal adenocarcinoma and its mimickers

TABLE OF CONTENTS/OUTLINE

Pancreatic ductal adenocarcinoma is the most common primary tumor of the pancreas. Several pancreatic conditions can mimic the appearance of pancreatic ductal adenocarcinoma, including inflammatory conditions, uncommon primary pancreatic tumors, and metastases to the pancreas. Imaging differentiation between these lesions and pancreatic ductal adenocarcinoma can be difficult because of overlapping features; however, knowledge of their typical imaging characteristics and clinical presentation may assist in their differentiation. 1. Introduction 2. What key imaging and clinical features of pancreatic ductal adenocarcinoma suggest this diagnosis and what are the atypical findings? 3. What clinical and imaging features differentiate mimickers (acute and chronic pancreatitis, groove pancreatitis, autoimmune pancreatitis, high-grade neuroendocrine tumors, metastases, other less common benign and malignant tumors) from pancreatic ductal adenocarcinoma? 4. Take home points

GIEE-47 Liver MR Elastography: Practical Guidance for Interpretation and Reporting

Awards
Magna Cum Laude

Participants
Guilherme M. Cunha, MD, Seattle, WA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) Review principles of MR elastography (MRE) for noninvasive assessment of liver fibrosis. 2) Summarize the literature on diagnostic accuracy of MRE in different liver disease etiologies. 3) Review pitfalls and confounders. 4) Provide guidance on liver MRE reporting and interpretation. 5) Discuss future directions.

TABLE OF CONTENTS/OUTLINE

1) Introduction: Stiffness as a biomarker of liver fibrosis and clinical significance. 2) Basic principles of MRE. 3) Clinical application detection and staging of liver fibrosis, liver stiffness and histology fibrosis stages, contexts of use and populations. 4) Diagnostic performance: overview of meta-analyses, MRE sequence, disease-specific MRE-determined liver stiffness thresholds. 5) Pitfalls and confounders a. Technical: improper hardware setup, left lobe vs right lobe, wave frequency dependencies, region of interest (ROI) placement. b. Biological: steatosis, iron overload, inflammation, cholestasis and venous congestion, expiration vs inspiration, fasting vs postprandial state. 6) Image interpretation Image analysis and interpretation (wave and elastograms), ROI approaches, stiffness thresholds and disease-specific interpretation. 7) Reporting: what to report, how to report it, QIBA recommendations. 8) Future directions: new contexts of use and applications, technical innovations.

GIEE-48 A Beginners Guide to Liver Iron Quantification: What a Radiology Resident Ought to Know

Participants
Archit Dikshit, MBBS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

(1) Iron overload could be due to primary hemochromatosis (hereditary) or secondary hemochromatosis (acquired by blood transfusions) and can cause serious complications including liver cirrhosis and heart failure. (2) MRI based iron quantification is increasingly being preferred to biopsy which is invasive, and not representative in inhomogenous distribution and serum ferritin which can be inaccurate in inflammatory states. (3) MRI based liver iron quantification is the recommended technique for estimating liver iron concentration in patients with increased serum Ferritin levels and assessing its trend in patients with repeated blood transfusions. (4) Superparamagnetic property of iron is the basis of quantification by MRI as it creates magnetic field inhomogeneity (estimated by QSM), which leads to signal drop of liver (measured by SIR method) and shortening of T2 and T2* times (measured by relaxometry). (5) The choice of method of iron quantification is made according to the availability of resources, and level of iron

overload. (6) In cases with very high iron overload, R2* based relaxometry mapping gives error and use of signal intensity ratio method is preferred.

TABLE OF CONTENTS/OUTLINE

(1) Iron metabolism (2) Iron Overload and its clinical implications (3) Monitoring of Iron Overload (4) Clinical Indication for liver iron quantification (5) Principle of MRI based Iron Quantification (a) Principles (b) Relaxometry: T2 and T2* (c) Signal Intensity Ratio (SIR) Method (d) Quantum Susceptibility Mapping (QSM) Method (6) Merits and Demerits of MRI based Iron Quantification methods in practical usage (a) T2 Relaxometry (b) T2* Relaxometry (c) SIR (d) QSM (7) How to practically use different tools and methods

GIEE-49 Ultrasound of the Abdominal Wall: Pearls and Pitfalls

Participants
Christian Burgos-Sanchez, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

-Recognize normal anatomy of the abdominal wall-Know and identify the types of hernias that occur in the abdominal wall-Identify normal and pathologic conditions that may clinically mimic hernias

TABLE OF CONTENTS/OUTLINE

1. Introductiona. Hernia general terms and definitionsb. Hernia ultrasound protocolc. Normal abdominal wall anatomy2. Abdominal wall hernia casesa. Umbilical herniab. Indirect inguinal herniac. Direct inguinal herniad. Spigelian herniae. Lumbar herniaf. Incisional hernia3. Abdominal wall pathology mimicking herniaa. Lipomab. Cellulitisc. Post op fat necrosisd. Rectus sheath hematomae. Endometrioma in C-section scarf. Lung cancer metastasis4. Inguinal pathology mimicking herniaa. Metastatic lymph nodeb. Hydrocelec. Rhabdomyosarcomad. Spermatic cord lipomae. Encysted hydrocelef. Undescended testicle5. Vascular pathology mimicking herniaa. Varicose veinsb. Pseudoaneurysmc. Thrombosed veins6. Conclusion and summary

GIEE-5 The Portal Vein: A Comprehensive Review

Awards
Identified for RadioGraphics

Participants
Ben Layton, BMBS, FRCR, Blackburn, United Kingdom (*Presenter*) Nothing to Disclose

TEACHING POINTS

Combining radiological case examples with succinct explanation and illustrations this exhibit will provide a comprehensive summary of the portal vein (PV). This will:• Guide the radiologist in successful description of PV anatomy and branching patterns leading to optimal surgical approach. • Teach recognition and correct interpretation of rare topographic portal vein variations such as circumportal pancreas and preduodenal PV. • Provide an understanding of the appearances, associations and complications of PV shunts including congenital (E.g., Abernethy malformations, hereditary hemorrhagic telangiectasia) and acquired shunts (E.g., cirrhosis, traumatic). • Examine all pathology of the PV, including tips to differentiate between bland and tumour thrombus and explain sequelae with case examples (E.g., cavernous transformation, THAD/hepatic artery buffer response and portal bilopathy) • Deliver an overview of the newly described disease entity “porto-sinusoidal vascular disorder” clarifying the nomenclature associated with it and distinguishing it from cirrhosis and non-cirrhotic portal hypertension

TABLE OF CONTENTS/OUTLINE

Portal vein anatomy: branching pattern variations and extrahepatic topographyMalformations of the portal vein: associations and sequelaeDisease processes affecting the portal veinPortal vein interventionSummary and recommendations

GIEE-50 Beyond the Images: A Simplified Approach for Rectal Cancer Mimics and Variants

Participants
Katherine Wei, MD, Orange, CA (*Presenter*) Nothing to Disclose

TEACHING POINTS

This exhibit aims to provide an overview of the different benign and neoplastic mimickers of rectal cancer that can be encountered and provide an evidence-based framework for how to approach the differential diagnoses for rectal masses.

TABLE OF CONTENTS/OUTLINE

Different categories of rectal masses/rectal cancer mimickers to be discussed include: -Large rectal masses: In addition to advanced stage or poorly differentiated adenocarcinoma, high grade neoplasms such as poorly differentiated squamous cell carcinoma, high-grade neuroendocrine tumor, adenosquamous carcinoma, or lymphoma may be considered. If the tumor is eccentrically located, non-epithelial/mesenchymal tumors such as gastrointestinal stromal tumor or tumor of adjacent organ origin should be in the differential. -Anorectal junction masses of unknown histology: These lesions present a dilemma, as staging and treatment of anal cancer differ from rectal adenocarcinoma. -Precancerous/early-stage rectal cancer: These lesions have differing morphological and enhancement patterns compared to more locally advanced disease. -Benign rectal masses: Differentials include vascular malformations/hemangiomas, solitary rectal ulcer syndrome, and endometriosis implants. -Metastasis, including direct invasion of adjacent organs and commonly confused non-rectal cancer origin metastasis.

GIEE-51 Beyond Infectious, Inflammatory, or Ischemic” Morphologic Approach to Bowel Wall Thickening

Participants
Nabih Nakrour, MD, Boston, MA (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is to: Identify imaging patterns of wall thickening in the stomach, small bowel, and colon.Discuss the differential diagnosis of bowel wall thickening based on imaging characteristics, morphology, distribution, secondary signs, and clinical presentation. Present correlative endoscopic gross images when available.

TABLE OF CONTENTS/OUTLINE

The presentation will include Anatomic layers of the bowel wall. Pathophysiology of bowel wall thickening including wall layers involvement with edema, hemorrhage, inflammatory and neoplastic cells, fatty deposits, and fibrotic replacement. Differential diagnosis, example cases, and concurrent endoscopic images of gastric wall thickening are classified into diffuse, segmental, focal, and multifocal wall thickening. Differential diagnosis, example cases, and concurrent capsule endoscopic images of bowel wall thickening are classified into diffuse, segmental, and nodular fold thickening. Differential diagnosis, example cases, and concurrent colonoscopy images of bowel wall thickening are classified into diffuse, segmental, and nodular fold thickening. Address secondary signs favoring one diagnosis over others.

GIEE-52 Periampullary Disorders: Running Away From the Obvious - A Pictorial Essay of Periampullary Lesions

Awards
Certificate of Merit

Participants
Ulysses Torres, MD, PhD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

• To review the general anatomy of the ampullary region and its variants with schematic drawings correlated with CT and MRI. • Expose the possible periampullary disorders categorized into four large groups (anatomical variations, tumoral, inflammatory, and miscellaneous). To unravel the main differential diagnoses of periampullary involvement with didactic cases, literature review, and main imaging aspects.

TABLE OF CONTENTS/OUTLINE

Diagram and educational schematic drawings for diagnostic of the ampullary and periampullary lesions, dividing them as:- Anatomical variations: including cases of pancreas divisum, annular pancreas, and independent drainage of the common bile duct and pancreatic duct. - Tumoral disorders: including cases of a duodenum GIST, a papilla tumor, and a Frantz Tumor - Inflammatory disorders: such as paraduodenal pancreatitis, bulging duodenal papilla, and HIV papillitis. - Miscellaneous disorders: presenting other kinds of periampullary involvement, including a case of collateral circulation mimicking a neoplastic pathology, ischemic cholangiopathy, and intradiverticular papilla.

GIEE-53 Body MRI Pulse Sequences: An Atlas and User Guide

Awards
Identified for RadioGraphics
Certificate of Merit

Participants
Anup Shetty, MD, Saint Louis, MO (*Presenter*) Nothing to Disclose

TEACHING POINTS

Body MRI protocols can be daunting for the new trainee or novice reader, with a multitude of pulse sequences and a wide variety of acronyms. Understanding of basic MRI physics provides a framework for how to optimally use these sequences in clinical practice. Knowledge of the sequences as building blocks also informs efficient protocol design. This exhibit will:1) Highlight basic MRI physics principles that underpin core body MRI sequences2) Provide a framework of the families of sequences used in body MRI protocols, including individual vendors sequence names and key parameters3) Illustrate technical considerations and clinical utility of each sequence through case examples4) Describe how to build efficient protocols for indications such as liver masses, pancreaticobiliary imaging, renal/adrenal imaging, pelvic imaging, and imaging the moving patient

TABLE OF CONTENTS/OUTLINE

- relevant body MRI physics: single-shot, free-breathing, respiratory navigation, chemical shift, hepatobiliary contrast- sequence families: single-shot fast-spin echo, balanced steady-state free-precession, diffusion-weighted, spoiled gradient echo (chemical shift, quantitative multi-echo imaging, dynamic imaging), high resolution/small field of view imaging- for each sequence: vendor names/acronyms, key sequence parameters (TR, TE, flip angle, acquisition time, breath-holding strategy), technical considerations (SNR, artifacts, sensitivity to motion and susceptibility, need for fat suppression), and clinical applications- body MRI protocols: what sequences to include and why, using examples such as liver mass, pancreaticobiliary, renal/adrenal, and pelvic imaging, and how to image the moving patient

GIEE-54 Success is Best When Shared: A Multidisciplinary Interpretation of Rectal Adenocarcinoma Regression

Participants
Olivia Errecondo, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

? To review the role of MRI in restaging rectal cancer, emphasizing the use of T2 weighted images and diffusion weighted images. ? To describe the basis of neoadjuvant treatment in rectal cancer, making a brief analysis of the Prodige, Opra and Rapido Trial. ? To accomplish a description of the tumor regression grade system (TRG) using cases from our database as examples. ? To highlight the importance of multidisciplinary approach between imaging findings, endoscopy and histopathologic results.

TABLE OF CONTENTS/OUTLINE

? Introduction. ? Rectal MRI basis. ? Neoadjuvant chemoradiotherapy in rectal cancer. ? TRG review. ? Conclusion.

GIEE-55 Hepatic Nodular Regenerative Hyperplasia: Radiologic-Pathologic Correlation

Participants
Arpan Patel, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

This educational exhibit will aim to: Describe and define Nodular Regenerative Hyperplasia (NRH) from a clinical, radiological and

This educational exhibit will aim to: Describe and define Nodular Regenerative Hyperplasia (NRH) from a clinical, radiological and histopathological perspective with the use of CT and MRI imaging. Compare and contrast NRH from other liver pathology. Distinguish NRH from other adaptive liver reactions that precede non-cirrhotic portal hypertension. Describe the causes and associations of NRH.

TABLE OF CONTENTS/OUTLINE

• NRH Background o NRH and other liver adaptive reactions causing non-cirrhotic intrahepatic portal hypertension o Epidemiology o Aetiology and pathogenesis • Histopathological-Radiological correlation with CT and MRI Imaging o Molecular background o Imaging features • Imaging pearls and pitfalls o Mimics of NRH o Appearance with hepatobiliary phase Gadoxetic Acid- enhanced MR imaging • Summary

GIEE-56 Imaging Techniques for Quantification of Liver Fat and Iron

Participants
Sarah Bastawrous, DO, Seattle, WA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review the importance of identifying liver fat and iron in the general population and in patients with liver disease. 2. Discuss ultrasound and MR imaging techniques for detection and quantification of liver fat and iron. 3. Illustrate these imaging techniques with clinical vignettes, including pearls and pitfalls.

TABLE OF CONTENTS/OUTLINE

1. Background and clinical importance of identifying abnormal accumulation of liver fat and iron. 2. Risks, clinical implications, impact on health care costs and mortality in patients with abnormal liver fat or iron. 3. Benefits of early detection and intervention in patients with abnormal fat and/or iron in the liver. 4. Ultrasound and MR imaging techniques for detection and quantification of liver fat and iron, including physical concepts, technique, interpretation, limitations, and future trends. 5. Multimodality case-based examples and appropriate clinical indications. 6. How to calculate and report fat and iron content.

GIEE-57 Back to our Origins: Abdominal Radiography and Its Uses

Participants
Elisa Antolinos Macho, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Going over current abdominal X-ray purposes and indications. - Optimal technique review and basic projections. - Learning basic radiological anatomy. - Knowing most common abnormalities and underlying disease.

TABLE OF CONTENTS/OUTLINE

Indications Technique Basic projections 1) AP supine view 2) AP erect view 3) Lateral decubitus view 4) PA erect view Regional anatomy - Air (luminogram) - Organ silhouettes - Fat stripes - Bone Abdominal X-Ray semiology - Hepatobiliary Hepatomegaly, Splenomegaly, Cholelithiasis, Calcified cysts - Genitourinary Urolithiasis and other calcified structures - Gastrointestinal Bowel obstruction (Small bowel obstruction, large bowel obstruction and volvulus), and pneumoperitoneum - Foreign bodies - Medical devices

GIEE-58 MRI Findings of the Rectum and Anus: Beyond Tumor Staging

Awards
Certificate of Merit

Participants
Sergio Jimenez Serrano, Barcelona, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this educational exhibit is:- To analyze the different pathological processes that can be found in the imaging modalities intended for the characterization and staging of rectoanal or perirectal pathology, beyond the adenocarcinoma and squamous neoplasia.- To illustrate the characteristic image features of these processes, especially on MRI, emphasizing those aspects that can be clues to orientate the diagnosis.

TABLE OF CONTENTS/OUTLINE

We have realized a retrospective review of patients in whom an imaging study, mostly MRI, has been requested to evaluate recto-anal or perirectal diseases in the last 12 years and whose definitive diagnosis has been other than primary neoplasia (adenocarcinoma or squamous neoplasia) or perianal fistula extension study. The final diagnosis was histologically confirmed. In this way, we present 44 patients and we have classified them into six groups:- Inflammatory/infectious pathology. - Endometriosis.- Neoplastic pathology Benign: schwannoma, leiomyoma, myelolipoma, hemangioma, diffuse rectal hemangiomatosis. Malign: neuroendocrine tumor, melanoma, plasmablastic lymphoma, undifferentiated pleomorphic sarcoma.- Secondary neoplastic involvement ? highlights a rare and specific form of involvement such as rectal linitis.- Congenital and developmental lesions.- Other benign processes.

GIEE-59 Pancreas-kidney Transplant: Imaging Before, During and After Transplant

Participants
Carlos Felipe Reyna, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

To better understand pancreas-kidney transplant, its technique and complications using a didactic approach using images and illustrations.To show the different imaging methods for evaluating transplant complications, such as Computed Tomography (CT) and Ultrasound (US).To highlight the surgical complications using cases from our database and the importance of their detection.To highlight the importance of a structured report.

TABLE OF CONTENTS/OUTLINE

1. Review of the pancreas-kidney transplant and its technique through illustrations and images.2. Explore pancreas-kidney complications supported by cross-sectional imaging cases, such as CT and US.3. Preoperative and postoperative knowledge of pancreas-kidney transplant is mandatory for surgical planning and thus helping to identify postoperative complications. This information must be a part of the structured report.4. Summary and take home messages.

GIEE-6 Tough to Swallow: Adventures in Postoperative GI Fluoroscopy

Participants
Elainea Smith, MD, Birmingham, AL (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review the most common gastrointestinal surgical procedures performed and common indications - from pharynx to anus.2. Discuss case examples of the expected postoperative appearance of these procedures.3. Highlight the most common post operative complications and their fluoroscopic appearance.

TABLE OF CONTENTS/OUTLINE

IntroductionPharynx- LaryngectomyEsophagus- Zenker's diverticulectomy and diverticuolotomy- Reflux management devices (such as Linx device)- POEM- Esophagectomy- Hiatal hernia repair- Heller myomotomyStomach- Fundoplication- Sleeve gastrectomy- Roux-en-Y gastric bypass- Total gastrectomySmall bowel - Gastrostomy or gastrojejunostomy catheters- Whipple procedure- Pylorus sparing whippleLarge bowel- Partial colectomy- LAR versus APRSummary

GIEE-60 Strictures in Crohn's Disease: What a Radiologist Needs to Know

Participants
Antonio Bevere, Rome, Italy (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Illustrate how to recognize bowel stenosis in Patients with Crohn's disease (CD), show the differences between inflammatory and fibrotic strictures, and explain their implication on the treatment choice. - How to describe intestinal stenosis in CD patients and which information should be included in the report to guide the management. - Exclude other potential differential diagnosis, including adhesive disease and bowel cancer.

TABLE OF CONTENTS/OUTLINE

Stricture is a frequent complication in CD. The precise definition of stricture has not been defined yet, and varies across studies, comprising either luminal stenosis with intestinal wall thickening with or without pre-stenotic dilatation, and lesion-causing stenosis lower than 1 cm. The site of strictures usually follows the distribution of inflammation, frequently involving the ileum. Even though CT- and MR-enterography offer great visualization of the intestinal tract, defining strictures remains challenging. Assessing strictures, the transition point should be carefully evaluated to establish the cause of bowel obstruction and exclude other potential differential diagnosis, including adhesive disease and bowel cancer. In addition, in CD inflammation and fibrosis are strictly connected mechanisms, which usually coexist in the same Patient and even in the same intestinal tract in varying degrees, making the diagnosis even more complex. MR exams can accurately differentiate between inflammatory and fibrotic strictures, guiding the correct treatment choice. Inflammatory strictures are treated with anti-inflammatory drugs; on the other hand, fibrotic strictures are treated mechanically with intestinal resection or endoscopic dilatation.

GIEE-61 Clinical and Radiological Scores for Assessing Inflammation in Crohn's Disease

Participants
Jordi Rimola, MD, PhD, (*Presenter*) Consultant, Alimentiv Health Trust;Speaker, Takeda Pharmaceutical Company Limited;Consultant, Johnson & Johnson;Consultant, Boehringer Ingelheim GmbH;Research Grant, AbbVie Inc

TEACHING POINTS

1-To familiarize radiologists with activity indices of Crohn’s disease (CD) used by gastroenterologists including clinical and endoscopic scores2-To describe the main validated activity scores and other imaging biomarkers for assessing inflammation in patients with CD3-To provide a practical guide on the correct use and interpretation of imaging biomarkers in CD4-To discuss the potential contribution of imaging biomarkers in assessing therapeutic efficacy and to applied as endpoints in clinical research

TABLE OF CONTENTS/OUTLINE

1- Limitation of endoscopy as reference standard to assess inflammation and therapeutic response in patients with CDCross-sectional imaging may overcome these limitations and offers additional advantages2- Description of Magnetic Resonance Enterography (MRE) and intestinal ultrasound (IUS) activity scores have been developed and validatedDetailed list of MRE and IUS activity scores and other imaging biomarkers (e.g.motility) in CDEvidence supporting their satisfactory inter- and intra-reader reproducibility, and validity against a range of reference standardsOptimal use and interpretation. Not forget ulcerative colitis3-Rational and limitations to consider activity scores as endpoints in clinical research in CD.

GIEE-62 Rectal MR: A Refresher on Low Rectal Cancers at Initial Staging

Awards
Identified for RadioGraphics
Certificate of Merit

Participants
David Kim, MD, Madison, WI (*Presenter*) Shareholder, Elucent Medical

TEACHING POINTS

1. The ‘anorectal junction to tumor’ distance can estimate potential distal surgical margin and thus helps to determine the surgical approach. 2. MRF involvement at the pelvic floor can be inferred by the T category status for low cancers. 3. Cancer involvement of the anal sphincter in the context of T staging is remains undefined by AJCC. The recommendation is to be descriptive. It is

important to have a strong grasp of anal sphincter anatomy to accurately describe tumor involvement with particular emphasis regarding the tumor relationship to the intersphincteric space. 4. External iliac and inguinal lymph nodes are regional (N+) not M disease when there is cancer involvement of the anal sphincter. 5. The histology of the tumor must be confirmed as adenocarcinoma. If squamous in histology, a low cancer is staged and treated as an anal cancer.

TABLE OF CONTENTS/OUTLINE

Background • Rectal MR and clinical staging • Classification (high/mid/low) Low rectal cancers (special considerations) • Anatomy of the anal sphincter • Treatment approaches • Staging issues and areas of controversy • Histology Summary

GIEE-63 MR and CT Enterography: Expanding the Knowledge and Digesting the Information

Participants
Martin Horwarth, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1 - Review the imaging findings for inflammatory bowel disease when using enterography protocols in CT and MR.2 - Illustrate these findings and correlate them with the correct terms to use on radiology reports.3 - Showcase the most common pitfalls that can be mistaken for active inflammatory disease and what to look for besides the bowel.

TABLE OF CONTENTS/OUTLINE

1 - Advantages and disadvantages of CT and MR.2 - Exam protocols.3 - Imaging findings in Crohn's disease and their descriptors.4 - Imaging findings in non-specific intestinal inflammatory conditions.5 - Pitfalls that may be mistaken for active inflammation.6 - Other sites of interest for when analyzing a patient with Crohn's disease.

GIEE-64 When it is NOT Appendicitis: What to Look for in Appendiceal Disease Besides Inflammation

Participants
Joao Stern, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Review literature in appendiceal malignancies and benign disease.- Demonstrate images patterns of the different diseases of the appendix- Postulate a flowchart to investigate appendiceal disease

TABLE OF CONTENTS/OUTLINE

Appendicitis is one of the most common acute abdominal inflammatory disease and demands surgical treatment. Other appendix afflictions are rare in comparison and frequently overlooked. Radiologists must know the different diagnosis, to recognize when it’s not appendicitis and impact the surgical or clinical management.

GIEE-65 Icing on the Cake: Added Value of Dual Energy CT (DECT) in Challenging Biliary Pathologies

Participants
Victoria Kim, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Understand basic technique of dual energy CT (DECT) imaging.2. Describe the role of DECT in complex biliary pathologies.3. Show how DECT aids appropriate management of challenging biliary cases.

TABLE OF CONTENTS/OUTLINE

1. Background: DECT has a variety of emerging clinical applications. By acquiring images at both high and low x-ray energies, computer software analysis can estimate chemical composition of materials. Images are reconstructed to enhance or suppress appearance of different materials. CT is often first choice of cross-sectional imaging in outpatient and acute care settings due its relative ease of acquisition and lower cost compared to MRI. DECT is a particularly useful tool in imaging biliary pathologies to add greater information and value from a single imaging encounter.2. Gallstone disease: Noncalcified cholesterol stones are less apparent on single-energy contrast enhanced CT, but attenuate differently at various energies and are better visualized on monoenergetic images.3. Postoperative cases: Iodine map and virtual non-contrast (VNC) images distinguish true postoperative abscesses.4. Biliary malignancy: Iodine map and VNC images distinguish enhancing tissue versus biliary hematoma.5. Other pathology: In unusual cases such as gallbladder volvulus, iodine map and VNC images identify gallbladder ischemia and expedite management.VI. Conclusions: DECT has an exciting range of applications for biliary pathology, aiding in appropriate management and minimizing additional studies and delayed care.

GIEE-66 Save Your Tears for Another Day: Unmasking Pancreatic Adenocarcinoma

Participants
Ahmed Elsakka, MD, Rutherford, NJ (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Recognize early focal pancreatic abnormalities on CT associated with subsequent diagnosis of early-stage pancreatic ductal adenocarcinoma (PDAC).• Understand the role and limitations of radiology on primary staging and restaging.• Comprehend common imaging pitfalls and benign mimickers of PDAC.• Recognize post-surgical complications.• Recognize different patterns of recurrence on imaging.• Understand imaging response to CRT and current limitations. • Be familiar with future directions on PDAC.

TABLE OF CONTENTS/OUTLINE

1.INTRODUCTION oWorld prevalence and cancer Facts and statistics 2022. oRelevance, costs. 2.TREATMENT SUMMARY 3.ROLE OF IMAGING oEarly detection oInitial staging oCommon pitfalls •Vascular involvement from surgical perspective •Peritoneal carcinomatosis versus inflammatory changes or congestion. •Regional and extra-regional nodal metastasis. •Perineural invasion: myth or fact? oMimickers •Pancreatitis. •Duodenal diverticulitis. •Prominent pancreatic lobulations. •Uneven fat deposition oRestaging •Imaging criteria and limitations. oTumor recurrence •Common locations. •Imaging patterns. •Role of follow up comparison 4.RADIOSURGICAL CORRELATION oWhen we were wrong 5.POST-OPERATIVE COMPLICATIONS oPre-surgical red flags.

oConcerning imaging findings. 6.MULTIDISCIPLINARY TUMOR BOARD oWhat they need to know and what we need to ask 7.WHAT'S ON THE HORIZON

GIEE-67 NCCN Guideline Driven Gastrointestinal Tract Tumor Board: A Primer for Radiologists

Participants
Basem Jaber, MD, Darby, PA (*Presenter*) Nothing to Disclose

TEACHING POINTS

* Demonstrating a radiologist's role in the clinical management of GI tumors.* Reviewing NCCN guidelines for GI tumors.* Highlighting the use of different imaging modalities in management decisions.* Identifying possible pitfalls in multidisciplinary tumor board discussions from a radiology standpoint.

TABLE OF CONTENTS/OUTLINE

GI tract cancers are one of the most common malignancies discussed during multidisciplinary tumor board meetings. The National Cancer Committee Network (NCCN) publishes guidelines that are considered the gold standard for management of malignancies. This exhibit is a pictorial review of cancers of the stomach, small bowel, colon and rectum with emphasis on the NCCN guidelines.Key points:* Description of the role of imaging in cancer staging.* Multimodality imaging for initial workup.* Outline of impact of radiology on the surgical management and medical treatment of GI cancers.* Highlight of potential conflicts and pitfalls in tumor boards discussions.* Imaging principles for active surveillance.

GIEE-68 Multimodality Approach to Complications of Pancreatitis

Participants
Kaustubh Shiralkar, MD, Houston, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

Acute and chronic pancreatitis may lead to a wide array of complications which can be visualized on imaging. Our exhibit will focus on understanding the use and unique advantages of ultrasound, CT, and MRI including secretin enhanced MRI to better characterize complications of acute and chronic pancreatitis to aid in management decisions. Acute pancreatitis may lead to numerous local complications including acute peripancreatic fluid collections, necrosis with or without superimposed infection, fistula formation, and vascular complications such as hemorrhage from erosion of nearby vessels, pseudoaneurysm formation, and adjacent venous thrombosis. Chronic pancreatitis may lead to pseudocyst formation with possible dissection into the mediastinum or adjacent peritoneal compartments, parenchymal atrophy or enlargement with or without calcifications, and decreased exocrine reserve which may be evaluated on secretin enhanced MRI. This exhibit will also focus on effective reporting for management and clinical decision making.

TABLE OF CONTENTS/OUTLINE

Peripancreatic fluid collections, pancreatic and peripancreatic necrosis, emphysematous pancreatitis, fistula formation, vascular complications, chronic pancreatitis pseudocyst formation, ductal stenosis

GIEE-69 Congenital Cystic Lesions of the Biliary Tract: A Pictorial Review

Participants
Abel Gonzalez Huete, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To explain congenital cystic lesions of the biliary tree: congenital hepatic fibrosis, biliary hamartomas (von Meyenburg complexes), autosomal dominant polycystic disease, Caroli disease and choledochal cysts. 2. To review the embryology, physiology and pathogenesis. 3. To illustrate the imaging findings. 4. To discuss their differential diagnosis illustrated by sample cases.

TABLE OF CONTENTS/OUTLINE

1. Introduction. 2. Embryopathogenesis. 3. Anomalies of the intrahepatic bile ducts. - Congenital hepatic fibrosis: Etiopathogenesis, Imaging findings. - Biliary hamartomas (von Meyenburg complexes): Etiopathogenesis, Imaging findings (Ultrasound, CT, MR), Differential diagnosis. - Caroli disease: Etiopathogenesis, Types (Caroli disease proper, Caroli Syndrome), Imaging findings (Ultrasound, CT, MR), Complications, Differential diagnosis. - Autosomal dominant polycystic disease: Etiopathogenesis, Imaging findings (Ultrasound, CT, MR), Complications, Extrahepatic associations. 4. Anomalies of the extrahepatic bile ducts. - Choledochal cysts: Etiopathogenesis, Imaging findings, Classification, Complications. 5. Summary.

GIEE-7 Multimodality Imaging Evaluation of Gastroenteropancreatic Neuroendocrine Neoplasms: A Diagnostic Challenge

Participants
Monica Munoz-Lopez, MD, Mexico City, Mexico (*Presenter*) Nothing to Disclose

TEACHING POINTS

- To review the origin, pathophysiology and classification of gastroenteropancreatic neuroendocrine neoplasms.- To recognize the utility of anatomical and somatostatine receptor functional imaging in the diagnosis, staging, prognosis and selection of treatment.- To identify, in a case- based review, the main challenges and pitfalls of functional imaging in the diagnosis and follow- up of GEP NETs.- To understand the radiologists role in the selection of treatment with theranostic agents.

TABLE OF CONTENTS/OUTLINE

- Introduction to gastroenteropancreatic neuroendocrine neoplasms (GEP NENs): origin, pathophysiology and clinical syndromes- The WHO 2019 classification of GEP NENs: well- differentiated neuroendocrine tumor versus poorly differentiated neuroendocrine carcinoma- Multimodality anatomical and somatostatine receptor imaging criteria in diagnosis and staging- Pitfalls in interpretation of somatostatine receptor imaging- Prognostic value of dual positron emission tomography imaging with 18F-FDG and 18F-OC for NENs- Overview of theranostic agents for treatment of NENs

GIEE-70 Multimodality Imaging of Biliary Tract Conditions: What Radiologists Should Know

Awards
Identified for RadioGraphics

Participants
Camila Vendrami, MD, Chicago, IL (*Presenter*) Nothing to Disclose

TEACHING POINTS

· Review of biliary tract imaging technique · Identify the multimodality imaging features of benign and malignant conditions of the biliary tract · Discuss pitfalls in the interpretation of MR imaging and CT findings in the biliary tract

TABLE OF CONTENTS/OUTLINE

The biliary tract may be affected by a wide variety of pathologic conditions, some with similar clinical presentations. Biliary tract imaging plays a key role in determining the etiology, location, and severity of the condition and any complications. Imaging also guides management of biliary tract diseases including the most appropriate intervention when required. 1. Introduction 2. Imaging technique: what are the uses and how are standard MR cholangiopancreatography, 3D isotropic MR cholangiopancreatography and contrast-enhanced MR cholangiography and DECT performed? 3. What features characterize, on multimodality imaging including but not malignant to benign biliary (choledochal cysts including Caroli disease, cholangitis, recurrent pyogenic cholangitis, primary sclerosing cholangitis, ischemic cholangiopathy) and pre-malignant and malignant conditions (intraductal papillary neoplasm of the bile duct-IPNB-, cholangiocarcinoma and metastases)? 4. Review imaging pitfalls in the biliary tract imaging: blooming artifact, physiologic variants of the biliary system and pulsation/compression artifact 5. Take home points

GIEE-71 Extramural Venous Invasion in Rectal Cancer Before and After Neoadjuvant Therapy Beyond Classic Findings: Recognition of Detailed Characteristics and Tumor Deposit

Participants
Akitoshi Inoue, MD, PhD, Rochester, MN (*Presenter*) Nothing to Disclose

TEACHING POINTS

Extramural venous invasion (EMVI) is a well-investigated prognostic factor predicting poor survival in rectal cancer despite no statement in American Joint Committee on Cancer TNM staging system. EMVI was described as an expanded, irregular vessel with intermediate tumor-signal intensity; however, detailed characteristics such as the number, diameter, and location of the involved vessel, and treatment response are gathering attention, aiming to predict precise patient outcomes and stratify risk. Tumor deposits (TDs), defined as cancer nodules located in the mesorectum without evidence of underlying lymph node architecture on histopathology, are recently reported as irregular nodules in the mesorectum directly interrupting the course of the vein with tapering into the vein on MRI. MR-detected TDs are reported to be a prognostic factor as well as pathological TDs. The purposes of this exhibit are:1. To review imaging findings of EMVI and TDs in rectal cancer2. To discuss the clinical significance of EMVI and TDs in contemporary therapeutic strategy in rectal cancer.

TABLE OF CONTENTS/OUTLINE

1. Detection of EMVI and imaging pitfalls 2. What are TDs? Imaging findings and cutting-edge knowledge. 3. Detailed characteristics of EMVI and difference between EMVI and TDs 4. Assessing response of EMVI and TDs after neoadjuvant therapy 5. Summary

GIEE-72 Closing the Loop on Challenging and Complex Small Bowel Obstructions

Participants
Michael Hartung, MD, Madison, WI (*Presenter*) Consultant, Innovenn, Inc;Consultant, Otsuka Holdings Co, Ltd

TEACHING POINTS

1. Complex small bowel obstructions often bring both diagnostic and management dilemmas to the radiology and surgical teams.2. The radiologist plays a major role in providing a confident interpretation of the baseline CT exam that influences management and follow-up.3. Complex small bowel obstructions can be divided up into mechanical, neoplastic, and closed-loop categories.The key findings that raise the concern of closed-loop physiology include the beak sign, asymmetric edema, clustered loops with radial vessels, dilated C or U-shaped loops, and swirling narrowed vasculature. 4. Important mimics and pitfalls to consider when evaluating a complex bowel case include ischemia, angioedema, inflammatory enteritides, and graft versus host disease.

TABLE OF CONTENTS/OUTLINE

A. Defining simple versus complex small bowel obstruction- Mechanical- Abdominal and pelvic external hernias- Gallstone ileus - Afferent loop syndrome- EndometriosisB. Neoplastic- Benign- Primary tumors- Secondary tumorsC. Closed-loop- Key signs of CLO- Adhesive disease- Internal hernia- Gastric bypass related- VolvulusD. Mimics and pitfalls- Non-obstructive ischemia- Angioedema- Inflammatory enteritides (vasculitis, eosinophilic, IBD)- Radiation and GVHDE. A practical approach to reporting challenging cases

GIEE-73 Bariatric Surgery: Imaging of Normal Post Operative Appearance and Complications

Participants
Adina Laufer, MD, New York, NY (*Presenter*) Nothing to Disclose

TEACHING POINTS

The goal of this exhibit is to familiarize the participants with the surgical anatomy of the most common forms of bariatric surgery. Participants can then use that knowledge as a basis to identify complications of bariatric surgery and corresponding CT and fluoroscopic imaging features.Upon completion of this educational exhibit, participants will be familiar with the normal CT and fluoroscopic imaging appearance as well as the CT and fluoroscopic appearance of postoperative complications for the most commonly performed bariatric procedures. Familiarity with this subject will allow for prompt diagnosis and management for bariatric patients.

TABLE OF CONTENTS/OUTLINE

CT and GI fluoroscopic appearance of:-Gastric bypass-Gastric band-Sleeve gastrectomyThis exhibit will highlight the CT and

fluoroscopic appearance for the gamut of postoperative complications including but not limited to: -leaks-strictures-marginal ulcers-hernias-small bowel obstruction-intussusception-gastroesophageal reflux

GIEE-74 The Art of Letting It Flow: Small Bowel Follow-Through in the Age of Cross-Sectional Imaging

Awards
Identified for RadioGraphics

Participants
Shamus Moran, MD, Seattle, WA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) Review the indications, contraindications, and technique for the small bowel follow-through2) Review the normal fluoroscopic appearance of small bowel anatomy3) Provide a practical algorithmic approach to small bowel pathologies on fluoroscopy with an emphasis on clinical significance4) Discuss the role of the small bowel follow-through in small bowel motility assessment5) Fluoroscopic - cross-sectional imaging correlation

TABLE OF CONTENTS/OUTLINE

Introduction. Indications, contraindications, and technique. Discussion of the following entities with case examples and an approach for diagnosis and further managementMotility Assessment:• Normal small bowel transit times• Bedside SBFT for assessment of small bowel obstruction.Congenital: • Duplication cyst communicating with ileum• Cystic fibrosis• Meckel's diverticulum• Malrotation.Infectious:• Ascariasis• Giardiasis• Mononucleosis• Strongyloides• Tuberculous enteritis• Typhoid ileitis• Whipple's disease.Inflammatory: • Crohn disease (stenosis, diffuse mucosal thickening, colonic fistulae, enteroenteric fistula, sacculation, polyp, cobble stone)• Eosinophilic enterocolitis• Radiation enteritis• Scleroderma• Celiac Sprue• Amyloidosis• Henoch-Schoenlein Purpura• GVHD• Sclerosing mesenteritis. Neoplastic: • Adenocarcinoma• Carcinoid• Gastrointestinal stromal tumors• Lymphoma• Zollinger-Ellison syndrome• Metastasis. Miscellaneous: • Ischemia• Intestinal neuropathy• Small bowel - small bowel intussusception• Diverticulosis• Hypoalbuminemia

GIEE-75 Ulcerative Colitis on MR Enterography: Beyond the Scope of Endoscope!

Awards
Identified for RadioGraphics

Participants
Mehrnam Amouei, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Ulcerative colitis (UC) is a chronic inflammatory disease that can present at various stages of disease activity. Ileocolonoscopy and biopsy are the tests of choice to diagnose ulcerative colitis and assess disease severity. The value of MR enterography (MRE) is its usefulness in transmural/extramural assessment and identification of disease complications and extraintestinal manifestations. On the other hand, a complete colonoscopy might be unachievable in some patients, even in the expert hands, due to anatomical limitations or disease severity. However, this role is less emphasized compared to Crohn's disease due to the gradual course of UC, which is confined to the mucosa/submucosal layers of the colon. Beyond describing UC extension and severity, after completing this educational material, the readers will be able to recognize the value of MRE in: 1. Assessment of GI tract abnormalities beyond the colon in UC. 2. Identifying acute complications related to UC. 3. Describing benign and malignant disorders superimposed on UC. 4. Diagnosis of post-surgical complications in UC.

TABLE OF CONTENTS/OUTLINE

Ø Background Ø Technical considerations Ø Imaging features of UC variants in MRE Ø Acute complications Ø Extra-colonic manifestations Ø Benign disorders superimposed on UC Ø Malignant disorders superimposed on UC Ø Post-surgical imaging findings and complications Ø Mimickers Ø A practical algorithm for interpretation of MRE in UC Ø Conclusion Ø References

GIEE-76 Liver Transplant Primer For Radiologists: A Question-Based and Case-Based Review

Awards
Certificate of Merit

Participants
Roberta Catania, MD, Chicago, IL (*Presenter*) Institutional Research Grant, Siemens AG

TEACHING POINTS

1. Familiarity with surgical techniques for deceased-donor and living-donor liver transplantation and postoperative anatomy 2. Familiarity with pertinent variant anatomies affecting the future transplant and role of imaging for their pre-operative assessment 3. Familiarity with role of imaging in early post-operative assessment of liver allograft 4. Familiarity with the common post-transplant complications and their imaging findings

TABLE OF CONTENTS/OUTLINE

[All information will be presented and highlighted in an interactive questions-based and case-based format.]Indications• Current and expanding indications for liver transplantation• The issues with organ availability and organ allocationSurgical Techniques• Surgical techniques for deceased liver transplant• Surgical techniques for living donor liver transplant• Postsurgical anatomyPretransplant evaluation• Imaging assessment of recipient for surgical candidacy• Imaging assessment of living donor candidate o Overview of different imaging techniques and protocols o Pertinent variant biliary and vascular anatomy that may affect surgical planning o Segmentation and calculation of liver volumesPostoperative complications• Early post-operative complications• Delayed post-operative complications o Post-Transplant Lymphoproliferative Disorder (PTLD) and other malignancies

GIEE-77 Diffuse Bile Ducts Abnormalities: A Case Base Review with Histopathologic Correlation

Participants
Francisco Manuel Moreno SR, (*Presenter*) Nothing to Disclose

TEACHING POINTS

o To provide a comprehensive review of bile pathway anatomy and a basic approach to Its histology o To be able to identify abnormal appearance of the biliary tree on radiologic images, image patterns and the most common causes of diffuse biliary tree diseases o To include anatomopathological correlation for the pathologies reviewed so the radiologic signs associated to each entity can be better understood. o Key signs to be considered to differentiate malignance from other diseases

TABLE OF CONTENTS/OUTLINE

1. Overview 2. Possible etiologies3. Case based - review with histopathologic correlation4. Pearls5. Conclusions

GIEE-78 Vascular Complications of Hepatopancreatobiliary Surgeries and Liver Transplant

Participants
Dayhane De Souza, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1 - To demonstrate the vascular reconstructions techniques in hepatopancreatobiliary surgeries, including the liver transplant scenario.2 - To recognize the vascular surgical complications and how to elaborate a structured report that may help the clinical management.3 - To Illustrate the different imaging methods for evaluating vascular complications, such as Computed Tomography (CT) and ultrasonography (US).

TABLE OF CONTENTS/OUTLINE

1 - Illustration of typical imaging features of vascular complications supported by the use of graphics and cross-sectional imaging cases, such as arterial and venous stenosis and thrombosis.2 - Knowledge of hepatic vascular reconstruction is mandatory for early recognition of postoperative complications. 3 - Summary and take home messages.

GIEE-79 A Step-by-Step Approach to the Understanding of Dysphagia: What Not to Miss in a Swallow Mechanism!

Participants
Yumi Kimura Sandoval, MD, Mexico City, Mexico (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Recognize the importance of swallow mechanism in the diagnostic algorithm of dysphagia- Learn the indications and technique used in the performance of a swallow mechanism- Review the normal anatomy of the oral cavity, oropharynx, hypopharynx, and esophagus- Understand the physiology and different phases involved in deglutition- Case-based review of the main radiologic signs and features observed in deglutition alterations leading to dysphagia

TABLE OF CONTENTS/OUTLINE

1. Normal anatomy - Oral cavity - Oropharynx - Hypopharynx - Esophagus - Anatomic variants2. Indications and technique of swallow mechanism - Useful projections - Oral contrast consistencies3. Deglutition physiology - Oral phase - Pharyngeal phase - Esophageal phase4. Deglutition pathology a) Oral phase: - Lip incompetence - Leakage to the oropharynx - Nasopharyngeal refluxb) Pharyngeal phase: - Functional alterations: penetration, aspiration, asymmetry, stasis, cricopharyngeal disfunction- Structural alterations: esophageal web, Killian Jamieson`s diverticulum, Zenker`s diverticulumc) Esophageal phase: - Functional: achalasia, diffuse esophageal spasm - Structural: epiphrenic diverticulum

GIEE-8 From A to Z(ebras): Vascular Findings and Complications After Liver Transplant

Participants
Heba Albasha, MD, Cincinnati, OH (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Review surgical techniques of liver transplant with a focus on vascular anatomy.• Discuss imaging findings of common vascular complications after liver transplant.• Understand and recognize unique imaging findings of uncommon vascular findings and complications of liver transplant.

TABLE OF CONTENTS/OUTLINE

1. Liver transplant surgical techniques a. Review of liver transplant anatomy, including that of conventional, piggyback, deceased donor, and split liver techniques 2. Imaging work-up of liver transplant complications 3. Hepatic artery complications a. Hepatic artery thrombosis b. Hepatic artery stenosis c. Hepatic artery kinking d. Reversal of hepatic arterial flow e. Hepatic arterial-portal venous fistula f. Hepatic artery pseudoaneurysm 4. Portal vein complications a. Portal vein thrombosis b. Portal vein stenosis c. Portal vein compression d. Portal vein size discrepancy e. Portal steal f. Primary nonfunction 5. Hepatic vein/IVC complications a. IVC thrombosis b. IVC stenosis c. Venocaval anastomotic stricture

GIEE-80 LR-M in LI-RADS v2018: Non-HCC Malignacies and Atypical HCC

Awards
Cum Laude

Participants
Tatsuyuki Tonan, MD, Kurume, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

Illustrate the malignant tumor (non-HCC malignancies and atypical HCC), which are classified as LR-M in the LI-RADS v2018 as follows: 1. The definition of LR-M criteria including "targetoid" and "nontargetoid" imaging appearance on EOB-enhanced MRI. 2. The relationship between the targetoid/nontargetoid imaging appearances and pathological findings (i.e., fibrosis, peliotic change, mucin, cell density/ ischemia, necrosis). 3. The relationship between delayed (or persistent) extracellular contrast enhancement effects and targetoid imaging appearances. 4. Exhibit of non-HCC malignancies with targetoid or nontargetoid imaging appearance

(i.e., intrahepatic cholangiocarcinoma, cholangiolocellular carcinoma, sarcomatous HCC, neuroendocrine tumors, mucinous carcinoma, intraductal papillary neoplasm of the bile duct and primary hepatic lymphoma). 5. New knowledge about the atypical HCCs with targetoid or nontargetoid imaging appearance favoring non-HCC malignancies.

TABLE OF CONTENTS/OUTLINE

LI-RADS v2017 introduced an important update to the LI-RADS-M (LR-M; probably or definitely malignant but not HCC specific) category to clarify appropriate use. Specifically, LR-M was modified as follows: "targetoid mass" including peripheral hypercellularity and central stromal fibrosis or "nontargetoid mass" including an infiltrative appearance, marked diffusion restriction, necrosis or severe ischemia, in addition to features that suggest a non-HCC malignancy in radiologist's judgment. While these imaging findings are not specific finding, to understand these imaging findings are helpful in the diagnosis of hepatic tumors, and is important in assignment of the LI-RADS.

GIEE-81 Post-Operative CT Findings After Whipple Procedure: Normal Findings and Complications

Participants
Vamshi Mugu, MD, Rochester, MN (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) Identify components of post-operative anatomy for a) Standard Whipple b) Pylorus-sparing Whipple2) Identify normal post-operative findings and distinguish them from complications

TABLE OF CONTENTS/OUTLINE

1) Conventional Whipple consists ofa) Partial pancreatectomy and pancreaticojejunostomyb) Duodenectomyc) Distal gastrectomy and gastrojejunostomyd) Cholecystectomy and hepaticojejunostomy2) Pylorus-sparing Whipple consists ofa) Partial pancreatectomy and pancreaticojejunostomyb) Partial duodenectomy and duodenojejunostomyc) Cholecystectomy and hepaticojejunostomy3) Common normal post-operative findingsa) Post-operative anatomy: 1) Hepaticojejunostomy 2) Pancreaticojejunostomy 3) Gastrojejunostomyb) Vascular reconstructionsc) Jejunal limb edema4) CT appearance of post-operative complicationsa) Delayed gastric emptying (a clinical diagnosis)b) Pancreatic fistulac) Biliary leakd) Hemorrhagee) Acute pancreatitisf) Vascular thrombus

GIEE-82 Fat's All Folks: A Case-Based Tour of Benign and Malignant Abdominopelvic Lesions

Participants
Alana Fruauff, MD, BS, New York, NY (*Presenter*) Nothing to Disclose

TEACHING POINTS

Intralesional fat within the abdominopelvic viscera narrows differential diagnosis for benign and malignant disease processes. Abdominal and pelvic fat distribution can help diagnose co-existent and unrecognized disease. The presence of fat within a lesion does not automatically suggest a benign diagnosis. It is critical for radiologists to identify when a fat-containing lesion is most likely malignant.

TABLE OF CONTENTS/OUTLINE

1. Introduction of fat-containing lesions and typical appearance on ultrasound, CT, and MRI2. Case-based review of benign and malignant fatty lesions in the following locations: a. Right upper abdomenb. GI tractc. Renal and adrenal glandsd. Reproductive systeme. Retroperitoneum f. Mesentery/peritoneum

GIEE-83 GISTS and the Limits of RECIST: State of the Art Imaging and Treatment of Gastrointestinal Stromal Tumors

Participants
Xin Zhan, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

GIST is the most common single type of sarcoma and the most common mesenchymal tumor in the GI tract. Teaching points include 1) Approximately 25% of GIST are discovered incidentally. GISTs have 3 morphologic patterns: spindle, epithelioid, and Wild-Type which can be associated with genetic syndromes and worse prognosis. 2) The diagnostic workup of GIST consists of the initial imaging with contrast-enhanced CT(CECT), detection of metastasis with CECT or PET/MRI, and definitive diagnosis by histopathology. Given its propensity for the stomach, CT protocols for GIST can be optimized with changes in patient position, use of oral water, CO2 crystals or positive enteric contrast. Multiphase CECT is useful in differentiating enhancement patterns of GIST vs other tumors. 3) Surgery remains the standard of care for localized tumors, but systemic therapy may be indicated based off unfavorable tumor locations, metastases, and genetic mutations. New biologic treatments (Imatinib, Sunitinib) have changed the clinical management of GIST and radiomic response evaluation continues to evolve to better assess disease progression. RECIST focuses on unidimensional, anatomic measurements, CHOI evaluates both anatomic and functional measurements, while PERCIST measures the metabolic response of tumors. We will discuss the strengths and weaknesses of these different criteria and how they impact patient management.

TABLE OF CONTENTS/OUTLINE

GIST Outline:- Pathophysiology- Clinical manifestations- Diagnostic imaging modalities/imaging features- Optimizing imaging protocols - Differential diagnoses on imaging- Treatment options, new biologic drugs- Radiomics (RECIST, PERCIST, CHOI) strengths and weaknesses

GIEE-84 What Do You Look at Plain Radiograph Abdomen?

Participants
Axel Torres Monarrez, MD, Tlalpan, Mexico (*Presenter*) Nothing to Disclose

TEACHING POINTS

* To review the indications, limitations, and benefits of plain abdominal radiographs.* To discuss the basic projections in the

abdominal radiograph.* To show normal anatomy and its variants.* To analyze the systematic approach for interpretation of abdominal radiographs and provide a guide for residents.* To recognize normal bowel from the abnormal small and large bowel. * To be familiarize with descriptive terms for common bone and soft tissue abnormalities seen on abdominal radiographs.* To review abnormal calcification on an abdominal radiograph. * To review the lines, tubes, and other devices commonly seen on AXR including their purposes and proper positions.

TABLE OF CONTENTS/OUTLINE

1. Review of indications, advantages, and disadvantages of plain abdominal radiographs. 2.Discuss the basic projections in the abdominal radiograph. 3.Explain the normal anatomy and its variants. 4.Discuss the algorithm for the evaluation of abdominal x-ray. 5. Present a series of cases to exemplify the most important diseases presented in AXR: - Abnormal calcifications: solid organs, hollow organs, and others. -Classification of bowel gas patterns: intraluminal and extraluminal. -Fluid/Soft Tissue Density: intraluminal and extraluminal. - Displacement of Structures: splenomegaly and hepatomegaly. - Bone and soft tissue abnormalities: osteophytes, neoplasms, post traumatic, and metabolic. 6. Recognize and illustrate devices commonly seen on AXR, the lines, tubes, and drains with demonstrative cases. 7. Conclusions and a complete section of key points of what residents need to know of abdominal X-rays. 8. References.

GIEE-85 Cosmetic Surgery in the Abdomen and Pelvis: Post-Operative Appearances and Complications

Participants
Madeleine Sertic, MBBCh, Boston, MA (*Presenter*) Nothing to Disclose

TEACHING POINTS

Since the turn of the 21st century, there has been a significant increase in the number of Cosmetic Surgeries performed. In 2020 alone, there were more than 2 million cosmetic procedures in the United States, including over 200,000 liposuction procedures, over 90,000 abdominoplasties, and more than 20,000 gluteal augmentation surgeries. While most of these cases do not undergo routine pre- or post-operative imaging, the increased incidence of these surgeries has led to an increased number of post-op patients who are imaged for other reasons. It is important to understand the expected post-operative appearances of these procedures so as to not misdiagnose pathology, and to correctly identify complications, if present.The expected post-surgical appearances and possible complications vary depending on the specific surgery. Gluteal injections and implants can be complicated by silicone granuloma formation or implant rupture. Abdominoplasty with gluteal fat transfer (i.e. "Brazilian Butt Lift") can be complicated by fat embolism; the risk varies with the surgical technique used. Complications for most procedures include infection, hematoma, and dehiscence.

TABLE OF CONTENTS/OUTLINE

Background on Cosmetic SurgeryAbdominal Wall Augmentationo Liposuctiono Abdominoplasty§ Abdominoplasty with Gluteal Fat TransferGluteal Augmentationo Implantso InjectionsPelvic Augmentationo Cosmetic Phalloplastyo Cosmetic LabiaplastyComplicationso Hematomao Infectiono Dehiscenceo Fat Embolismo Granuloma Formationo Implant Rupture

GIEE-86 Utilization of Perfusion CT to Improve the Diagnostic Accuracy of Pancreatic Cancer

Participants
Konno Yoshihiro, PhD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

The accuracy improvement of diagnostic imaging of pancreatic cancer including the early lesion is necessary. Functional information obtained by perfusion CT (PCT) would be able to address unmet clinical needs in conventional diagnostic imaging based on morphological images. We have developed a novel protocol that incorporates volumetric PCT into multiphasic contrast-enhanced CT, enabling broad clinical use. Besides reducing radiation exposure, this method provides high-resolution perfusion information through parametric map fused with morphological images. In general, pancreatic cancer is depicted as a decreased area of blood flow and blood volume and a prolonged area of mean transit time compared with the background pancreatic parenchyma. Imaging assessment using PCT increased the diagnostic accuracy of small pancreatic cancers and helped detect minute lesion that was not visible as a mass. Perfusion information is associated with histopathological features, and its detailed examination may be useful in the management of pancreatic cancer.

TABLE OF CONTENTS/OUTLINE

1. Clinical issues in imaging diagnosis of pancreatic cancer. 2. Development of PCT imaging protocol. 3. High-resolution perfusion imaging: Parametric map analysis. 4. Reduction of exposure dose. 5. Imaging evaluation of pancreatic cancer using PCT. 6. Clinical usefulness and research applications.

GIEE-88 The Forgotten Organ: Role of Contrast Ultrasound in the Evaluation of Splenic Lesion

Participants
Paula Garcia, MEd, PhD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

• To assess the role of contrast enhanced ultrasound (CEUS) in the characterization of non-traumatic splenic focal lesions. • To review the technique used and the main fundamentals of CEUS as well as the main indications. • To analyze the different focal splenic lesions through representative cases with special emphasis on the semiology of the lesions and their behavior after the injection of ultrasound contrast material.

TABLE OF CONTENTS/OUTLINE

Focal splenic lesions (FSL) are rare compared to those of other organs such as the liver and are often discovered incidentally. Conventional ultrasound and Doppler ultrasound have a limited role in the characterization of FSL, many of them being non-specific due to the wide spectrum of radiological manifestations they may present. CEUS is an accessible, inexpensive and safe technique that can help in the characterization of FSL. We analyzed the main imaging findings supporting us in the anatomopathological diagnosis, through representative cases performed in our center of both benign (simple cyst, abscesses, cystic lymphangioma, hemangioma, hamartoma) and malignant (lymphoma, metastasis) lesions.CEUS has an added role in the characterization of FSL allowing to see the enhancement of lesions in real time. Therefore, the spleen presents a special appetite for contrast due to the unique histological characteristics of this organ. CEUS may become a good alternative when other diagnostic techniques such as

computed tomography (CT) and magnetic resonance imaging (MRI) are not available.

GIEE-89 Role of Ultrasound Contrast in the Evaluation of Gallbladder Pathology

Participants
Kanupriya Vijay, MBBS, MD, Jacksonville, FL (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Conventional grayscale ultrasound (US) is useful in evaluating various gallbladder diseases; however, assessment of microvascularity is often needed for detailed wall assessment and to distinguish many benign from malignant processes. 2. Contrast-enhanced ultrasound (CEUS) is an easy and effective modality to differentiate conditions such as tumefactive sludge from gallbladder cancer. 3. CEUS may be useful in differentiating benign wall thickening from adenomyomatosis and chronic cholecystitis and gallbladder cancer. 4. CEUS can accurately demonstrate the microvascularity used to differentiate adherent biliary precipitate from polyps, and can help identify features of malignancy. 5. Cholecystectomy tube injection of ultrasound contrast can be used to determine cystic duct patency and identify leak.

TABLE OF CONTENTS/OUTLINE

1. Introduction:a. Briefly review microbubble formulation and pharmacokineticsb. Discuss imaging techniques with CEUS to optimize image quality 2. Case guided review of various gallbladder pathologies a. Benign i. Stones ii. Adenomyomatosis iii. Polyps iv. Chronic cholecystitis v. Tumefactive sludge b. Malignant i. Gallbladder carcinoma ii. Malignant polyps 3. Role of CEUS in interventions a. Image guided biopsy b. Evaluation of cholecystostomy tube for cystic duct patency and leaks 4. Pitfalls

GIEE-9 Retrorectal Cystic Lesions: Utility of Magnetic Resonance Imaging for a Forbidden Space

Participants
Lautaro Florentin, MD, Buenos Aires, Argentina (*Presenter*) Nothing to Disclose

TEACHING POINTS

- The retrorectal cystic lesions include a wide spectrum of etiologies.- The magnetic resonance imaging (MRI) allows approximate the diagnosis and to determine complications.- Diffusion weighted imaging (DWI) sequence is a cornerstone to suggest the presence of a solid component within the cyst.- Surgical management is mainly influenced by the MRI findings. The third sacral vertebra (S3) level is the key point for surgical approach selection.

TABLE OF CONTENTS/OUTLINE

1) Introduction and anatomy2) Differential diagnosis. Definition and imaging characteristics a) Developmental cysts - Dermoid cysts - Epidermoid cysts - Retrorectal cystic hamartomas (tailgut cysts) b) Malignancy - Rectal carcinomas with atypical presentations - Metastases c) Abscess d) Others - Vascular malformations - Granulomas3) MRI advantagesa) Intracystic content characterization - What to look for? (Size, lobulations, septum, walls, dense, fat and/or solid component) - Malignancy signs - Complications: infection and fistula. b) Malignant transformation - Why does it matter? Prognosis and management implications. - How to diagnose? DWI/ADC utility. Avoiding pitfalls: teratomas and dense-content lesions. c) Surgical planning. What radiologist apports to the surgeon? - Surgical approach selection. The S3 level. - Non-surgical treatment. The MRI role

GIEE-90 When the Bile Goes Sour: A Case-based Review of Unusual Complications of Biliary Procedures

Participants
Cynthia Borborema, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

To review the expected imaging appearance after hepatobiliary surgeries. To list radiologic features of early and late usual biliary postsurgical complications to provide a practical resource for radiologists to standardize examination. To illustrate cases of unusual complications after biliary procedures to improve the clarity and clinical impact of radiology reports.

TABLE OF CONTENTS/OUTLINE

Anatomy of the normal biliary tract. Most common variants of the biliary tree and their surgical relevance. Role of imaging in surgical planning and relevant report information. List of most common biliary surgeries and procedures. Epidemiological background of biliary procedures and associated complications. Usual complications after biliary procedures (biliary and nonbiliary, early and late ones), including key patient history, risk factors, imaging findings, and pitfalls. Unusual postsurgical biliary complications, including right hepatic artery pseudoaneurysm, post-cholecystectomy Mirizzi syndrome, late cholangitis after Kasai procedure, lung abscess due to retained gallstones, subcapsular liver hematoma after cholecystectomy, foreign-body granuloma caused by dropped gallstones simulating abdominal wall tumor, and others. Diagnostic tools, including magnetic resonance cholangiopancreatography (MRCP). Optimal imaging protocols.

GIEE-91 Misses and Misinterpretations of Pancreatic Adenocarcinoma: Recognizing Its Atypical Manifestations

Participants
Pavan Shah, MD, Sayreville, NJ (*Presenter*) Nothing to Disclose

TEACHING POINTS

Pancreatic adenocarcinomas are highly lethal and timely detection is key to improving patient prognosis. While most cases present with typical features of pancreatic ductal dilatation, hypo enhancing mass and mass with restricted diffusion, some cases can present a diagnostic dilemma and are frequently misdiagnosed. Recognizing the atypical features helps in early diagnosis. We present atypical cross-sectional imaging findings of pancreatic adenocarcinoma.To review the epidemiology, pathology, and prognosis of pancreatic ductal adenocarcinomaTo describe typical imaging characteristics of PDAC along with atypical features to improve diagnostic accuracyTo discuss optimization of imaging techniques with the goal of preventing diagnostic delays and improving prognosis

TABLE OF CONTENTS/OUTLINE

Introduction, epidemiology, clinical manifestations, histopathology, typical CT/MRI findings, atypical CT/ MRI findings including

lesions without pancreatic ductal dilatation, lesions without restricted diffusion, lesions masquerading as cystic lesions, lesions presenting as acute pancreatitis, groove pancreatitis. Discussion on optimization of CT technique including use of dual energy, optimization of MRI techniques including use of MRCP, and T1 weighted sequences. Conclusion.

GIEE-92 Inflammatory Bowel Disease: Fluoroscopic Assessment and Postoperative Complications

Awards
Certificate of Merit

Participants
Linda Kelahan, MD, Chicago, IL (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Revisiting fluoroscopic findings in inflammatory bowel disease (IBD) with cross sectional correlation. 2. Outline possible surgical interventions for IBD. 3. Steps to successful fluoroscopic evaluation prior to ileostomy reversal 4. Fluoroscopic assessment of postoperative surgical complications.

TABLE OF CONTENTS/OUTLINE

1. Introduction a. Definition of IBD b. Epidemiology 2. Multimodality imaging of IBD a. Small bowel follow-through and barium enema examination. i. Technique ii. Imaging findings b. Cross sectional imaging findings 3. Fluoroscopic evaluation prior to ileostomy reversal a. Evaluate records to determine anatomy and surgical anastomoses b. Scout images in multiple obliquities c. Water-soluble fluoroscopic LGI steps to success d. Troubleshooting common complications during LGI: how to navigate enterocutaneous fistulas, severe anastomotic strictures, no contrast progression into the ostomy bag, multiple anastomoses. 4. Common surgical procedures (Fluoroscopic assessment of the altered anatomy) a. Small bowel resection b. Small bowel strictureplasty c. Total abdominal colectomy with ileorectal anastomosis d. Total abdominal colectomy with end ileostomy e. Colectomy (segmental/total) f. Proctectomy g. Restorative proctocolectomy with ileal pouch anal anastomosis h. Balloon dilatation 5. Postoperative complications: Fluoroscopic assessment with cross sectional correlation a. Strictures b. Pelvic infections c. Anastomotic site leakage d. Pouch failure e. Pouch cancer f. Fecal incontinence 6. Conclusion and take-home messages

GIEE-93 Early Postoperative GI Tract Evaluation: From Expected Findings to Complications

Awards
Identified for RadioGraphics

Participants
Louise Cavalcanti, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Distinguishing frequent and expected postoperative image findings after gastrointestinal tract surgical procedures from complications is essential in the early postoperative period, as well as detecting signs of possible complications that require further investigation.2. Intraperitoneal free air and fluid, fat stranding and bowel dilatation are extremely common findings in the early postoperative image and, although are expected, they can sometimes represent signs of complications. The imaging characteristics and evolution are key for this differentiation.3. Contrast-enhanced CT is the imaging method of choice for the evaluation of patients in the early postoperative period, with good characterization of gas and free fluid and the possibility of using positive oral contrast in patients with suspected anastomotic leakage or bowel perforation.

TABLE OF CONTENTS/OUTLINE

a. Introduction. b. CT protocol for early postoperative evaluation. c. Evaluation of intraperitoneal air: residual postoperative pneumoperitoneum or complication? d. Evaluation of intraabdominal fluids: sterile postoperative content or infected collections - imaging features and score systems. e. Fat stranding patterns of the mesentery that may suggest postoperative complications. f. Identification of dilated bowel and differentiation between metabolic, obstructive or ischemic conditions. g. Other expected postoperative findings and major early complications. h. Take home messages.

GIEE-94 Magnetic Resonance Imaging Evaluation of Perianal Fistulas: Making It Easier For Surgeons and Radiologists!

Participants
Joao Manoel Santos, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is:- To review usual and unusual cases of perianal fistulas.- To correlate important findings with the anatomy and pathophysiology.- To discuss image findings according to Parks and St James's University Hospital classifications, in order to enhance surgeons and radiologists' skills.- To review MRI protocols in the evaluation of patients with perianal fistulas.- To highlight their characteristics in order to familiarize surgeons and radiologists with these conditions, preventing unfavorable patient outcome.

TABLE OF CONTENTS/OUTLINE

Applied anatomy of the anal sphincter complex.MRI protocols in the evaluation of patients with perianal fistula.Parks classification with sample cases of:- Intersphincteric Suprasphincteric- Transsphincteric- Extrasphincteric.St James's University Hospital classification with sample cases of:- Grade 1: simple linear intersphincteric fistula- Grade 2: intersphincteric fistula with an abscess or secondary track- Grade 3: transsphincteric fistula- Grade 4: transsphincteric fistula with an abscess or secondary track in the ischiorectal or ischioanal fossa- Grade 5: supralevator and translevator disease.Correlation between Parks and St James's University Hospital classifications.Submucosal fistula.How do I report?- Location- Track o Relationship to sphincters o Simple or complex? Sample cases of pearls, pitfalls, diagnostic difficulties, and mimics.Summary and take-home messages.

GIEE-95 Most Common Gastrointestinal Post-surgical Anatomy on CT: A Pictorial Review. Radiologists- Don´t Be Afraid

Participants

Louise Cavalcanti, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Radiological evaluation of the post-operative abdomen can be challenging and knowledge of normal post-operative anatomy is important to identify possible complications. 2. The intention of this pictorial review is to describe the most important gastrointestinal surgical techniques, their clinical indications and show their normal post-operative appearance on computed tomography (CT). 3. Besides that, this essay provides some signs to identifying the procedure, which can be helpful particularly when surgical history is missing, with recognition of the organ(s) involved, determination of what was resected and familiarity with the type of anastomoses used.

TABLE OF CONTENTS/OUTLINE

a. Introduction b. Imaging methods and protocols for postoperative evaluation. c. Identification of mechanical stapling patterns and radio-opaque markers from the anastomosis. d. Evaluation of gastric surgical techniques, including bariatric procedures and expected results. e. Evaluation of small bowel surgical techniques. f. Evaluation of the most common colorectal surgical techniques, including Hartmann procedure and restoration of intestinal continuity. g. Take-home messages.

GIEE-96 A "Spectral-acular" Ileus

Participants
Reza Al-Saudi, MD, Belfast, United Kingdom (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Gallstone ileus represents a rare cause of small bowel obstruction. 2. Sensitivity of CT in the diagnosis of gallstone ileus is > 90%. 3. CT diagnosis of gallstone ileus is dependent on establishing the features of Rigler's triad - small bowel obstruction, pneumobilia, and an ectopic calcified gallstone. 4. 15% - 20% of gallstones are radio-opaque. This fact limits the Radiologist's ability to definitively establish the presence of an ectopic gallstone, although this presence is usually inferred based on associated features. 5. Spectral CT offers numerous advantages over standard CT. Spectral CT utilises the principle that elements and by extension mixed-composition materials cause differing attenuation of photons (via photo-electric absorption) at energy levels near the k-edge of the element in question, as compared to the remainder of the energy spectrum. The differing behaviour of elements across the energy spectrum allows material differentiation and the determination of material composition. 6. Effective atomic number (Z effective), mono-energetic (mono keV), and iodine density spectral reformats all aide in material differentiation. Z effective reformats provide the most reliable and reproducible results in relation to the detection of radio-lucent gallstones.

TABLE OF CONTENTS/OUTLINE

1. Introduction. 2. Role of conventional CT. 3. Conventional CT vs Spectral CT. 4. Spectral CT - options for diagnosis.

GIEE-97 Pancreas Allograft biopsies: What do you need to know?

Participants
Dayhane De Souza, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1 - Describe the anatomy of the main pancreatic transplantation technique.??2 - Discuss the Pancreas graft biopsy and Percutaneous needle biopsy technique guided by Ultrasound (US) and Computed Tomography (CT).3 - Discuss the sample of the pancreas considered adequate for evaluation.

TABLE OF CONTENTS/OUTLINE

1 - Review indications for pancreas transplantation and causes of graft injury.2 - Illustrate anatomy and surgical techniques supported by the use of graphics and cross-sectional imaging cases. 3 - Discuss the indication for pancreas graft biopsy and biopsy access routes.4 - Discuss what constitutes a satisfactory graft sample and what are the histopathological findings.5 - Summary and take home messages.

GIEE-98 Hepatocellular Lesions In Patients with Vascular Liver Diseases : Radiologic-Pathologic Correlation

Participants
Mayu Uka, (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is: 1)To review imaging features on contrast enhanced CT, MRI of hepatocellular nodules found in vascular liver diseases with histopathological correlations. 2) To discuss the point of differential diagnosis.

TABLE OF CONTENTS/OUTLINE

Hepatocellular nodules have been recognized in vascular liver diseases (Budd-Chiari syndrome, congenital portosystemic shunt, hereditary hemorrhagic telangiectasia, extrahepatic portal vein obstruction and congenital heart disease etc.). They may be related to portal venous deprivation, venous outflow obstruction, or arterial diseases, imbalances in arterial, portal, and venous blood flow have been reported to cause nodule formation. These nodules include nodular regenerative hyperplasia, large regenerative nodule, partial nodular transformation, focal nodular hyperplasia, and others, as well as hepatocellular adenoma and hepatocellular carcinoma, which are true neoplastic lesions. Some confusions in their identification and overlap in their definitions exist. This exhibit will describe the imaging appearances of each type of hepatocellular nodules found in the vascular liver diseases, by correlating with histology, and provide some clues for their differential diagnosis.

GIEE-99 Deep Learning Reconstruction of MR Imaging: Technical Features and Clinical Impact on Abdominal MR Imaging

Participants
Hiromitsu Onishi, MD, Suita, Japan (*Presenter*) Research Grant, General Electric Company;Speakers Bureau, General Electric Company

TEACHING POINTS

Deep learning reconstruction (DLR) has been introduced by several vendors to improve MR image quality. DLR has various benefits such as effective noise reduction in the diagnosis with MR imaging. The purpose of this presentation is: 1. To illustrate technical features of DLR compared with conventional reconstruction, 2. To discuss image quality of MR imaging using DLR, and 3. To discuss clinical impact on MR study in the diagnosis of abdominal diseases.

TABLE OF CONTENTS/OUTLINE

1. Overview 2. Principle of DLR 3. Difference from the conventional reconstruction technique 4. Sequences applicable to DLR: fast spin echo T2WI, single-shot fast spin echo T2WI, DWI, small field-of-view DWI, fast imaging employing steady-state acquisition (FIESTA), etc. 5. Effective reduction of image noise with DLR 6. Improved spatial resolution with DLR 7. Reduction of truncation artifacts with DLR 8. What purpose can DLR be used for in clinical practice? To improve image quality, to increase the spatial resolution of the images, to save acquisition time, or combination of them 9. Clinical impact on the diagnosis of liver diseases 10. Clinical impact on the diagnosis of pancreatic diseases 11. Summary

Split Scar Sign (SSS): How to Interpret It In The Context of Response to Neoadjuvant Treatment in Rectal Cancer

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Ana Uski, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Describe the typical MRI imaging findings in cases of SSS+ and SSS-. Demonstrate the applicability of MRI in the context of neoadjuvant radiotherapy in rectal cancer and its potential limitations. Propose a structured report for local re-staging purposes.

TABLE OF CONTENTS/OUTLINE

Radical mesorectal excision surgery contributes substantially to patient morbidity in the context of rectal cancer. A number of clinical trials support the use of neoadjuvant radiation as a form of initial approach in an attempt at more conservative treatment, and responders to this modality have a favorable prognosis and similar outcomes to those who underwent radical surgery. In this context, MRI is the imaging modality of choice in response assessment to predict fibrosis or suspicious areas of viable neoplastic tissue. The split scar sign (SSS) is assessed on high-resolution T2-WI, positive or present when a thin regular 1-2 mm layer of hypointense "fibrosis" is well defined on the endoluminal aspect of the tumor site (corresponding to fibrous submucosa). Whenever the tumor site is not "organized" and this T2WI hypointensity layer is broken focally, the signal should be considered absent or negative. The positive or present SSS (+) has a very high specificity (97%) and positive predictive value (93/94%) for sustained complete response in case of neoadjuvant radiotherapy in rectal cancer. A good quality examination with the appropriate technique is necessary as well as the recognition of the imaging findings related to the presence or absence of this sign (SSS) and potential limitations of MRI.

Management of Incidentally Detected Gallbladder Polyps: Review of Clinical Scenarios Using the 2021 SRU Gallbladder Polyp Consensus Guideline

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Christopher Fung, MD, Edmonton, AB (*Presenter*) Stockholder, Mikata Health

TEACHING POINTS

Incidental gallbladder (GB) polyps are common, seen in 3-6% of the general population, often benign cholesterol polyps. Few GB polyps (6%) are neoplastic (intracholecystic papillary neoplasm, ICPN). While ICPNs have malignant potential, malignant transformation is believed rare. GB cancers also typically arise from flat dysplastic epithelium, not polyps. Yet the concern a small polyp may harbor a future or early neoplasm has led past guidelines to suggest relatively aggressive management; recent studies show significant overtreatment of predominantly benign GB lesions.In 2021 the Society of Radiologists in Ultrasound (SRU) convened a multidisciplinary committee to review current literature and construct updated guidelines for the management of incidentally detected GB polyps. The SRU Guidelines, to be published in 2022 (Radiology), stratify risk into three categories: Extremely Low, Low, and Indeterminate Risk. Clinical examples and common questions will be addressed.

TABLE OF CONTENTS/OUTLINE

1. Background and review of prior guidelines a. Overview of gallbladder polyps and underlying pathology b. Discussion of current literature and recommendations2. 2021 SRU Gallbladder Polyp Consensus Recommendations a. Applicable and excluded patient populationsb. Risk Categories: Extremely Low Risk, Low Risk, Indeterminate Risk3. Common and uncommon clinical scenarios a. Polyp measurement b. Sessile versus pedunculated c. Determination of growth d. Doppler assessment e. Multiple versus single gallbladder polyps f. The role of alternative modalities such as contrast-enhanced ultrasound and MRI g. Other risk factors: primary sclerosing cholangitis, age, ethnicity, geographic location

Hepatobiliary and Pancreatic Tumor Board Primer for Radiologists: Review of AJCC Staging and NCCN Guidelines

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Madiha Aslam, MD, Darby, PA (*Presenter*) Nothing to Disclose

TEACHING POINTS

Review of AJCC for radiological staging of hepatobiliary and pancreatic tumors. Review of NCCN guidelines for stage-based treatment planning of hepatobiliary and pancreatic tumors. Review of NCCN guidelines for follow up of post treatment hepato-bilio pancreatic tumors. Radiological implication of AJCC and NCCN guidelines in tumor boards for determining the further diagnostic steps and making decisions about the appropriate treatment. Pitfalls in imaging.

TABLE OF CONTENTS/OUTLINE

Tumor staging and stage-based treatment planning is a crucial step in appropriate cancer treatment and being a part of multidisciplinary team in tumor boards, radiologists play a critical role in diagnosing, characterizing, initial staging, determining resectability, and surveillance of cancer patients. This helps the rest of the team to choose the appropriate treatment therapies and determine the follow up interval for post treatment cases. We will provide a comprehensive review of the AJCC staging and NCCN guidelines for hepato bilio pancreatic tumors using multiple imaging modalities, which will help the radiologists in day-to-day tumor boards to solve the staging and decision dilemmas.

Demistifying the Mesentery: A Differential-Based Approach to Mesenteric Pathology

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Daniel Schneider, MD, Ann Arbor, MI (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Review anatomy of the mesentery with illustrations - Review common and rare, focal and diffuse mesenteric pathologies with imaging examples - Present an imaging-based approach to various mesenteric pathology

TABLE OF CONTENTS/OUTLINE

1. Mesenteric anatomy 2. Differential diagnoses for mesenteric infiltration a. Edema i. Hepatic failure, hypoproteinemia ii. Venous thrombosis iii. Angioedema (angiotensin converting enzyme inhibitor-associated angioedema) b. Hemorrhage i. Trauma c. Inflammation i. Pancreatitis ii. Crohn’s disease iii. Post-operative iv. Sclerosing encapsulating peritonitis v. COVID-19 d. Neoplasm i. Peritoneal carcinomatosis ii. Lymphoma iii. Carcinoid iv. Mesothelioma v. Primary peritoneal serous neoplasm vi. Pseudomyxoma peritonei vii. Desmoid viii. Lymphangioma e. Sclerosing mesenteritis i. Mesenteric panniculitis ii. Retractile mesenteritis f. Idiopathic 3. Conclusion a. Mesenteric infiltration is often nonspecific and can pose diagnostic challenges to the radiologist. Knowledge of key imaging features associated with various mesenteric pathologies can help narrow the differential diagnosis in appropriate clinical setting.

Seeing Through the Mist: An Interactive Tour of Mesenteric Pathology

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Awards
Certificate of Merit
Identified for RadioGraphics

Participants
Amelia Kernizan, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Mesenteric lesions are frequently encountered incidentally on abdominal imaging. As many of the underlying etiologies appear similar on CT and/or MRI, they often pose a diagnostic dilemma. The broad differential diagnosis for these lesions ranges from benign etiologies including infection, inflammation, and benign neoplasia to malignant etiologies such as carcinoid, lymphoma and metastatic disease. Via a multiple-choice case-based approach, this presentation will provide a framework for approaching solid mesenteric lesions, while providing pathologic correlation to highlight their similarities and differences, as well as how the histology influences their imaging appearance.

TABLE OF CONTENTS/OUTLINE

I. Review of normal peritoneal anatomy and histology. II. Quiz-style case-based review of solid mesenteric masses. IIa. Discussion of sclerosing mesenteritis with cases of mesenteric panniculitis and retractile mesenteritis showing radiologic-pathologic correlation. IIb. Case of multiple mesenteric masses highlighting the differential and pertinent imaging findings. IIc. Case of mesenteric mass with associated small bowel masses. IId. Case of a 68Ga-DOTATATE-avid mass with potential pitfalls to avoid with this imaging modality. III. Summary with our method for approaching and differentiating between commonly encountered incidental mesenteric lesions.

All Around the Liver: The Perihepatic Space and Why It Matters

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Helena de Souza, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

- The perihepatic space is often involved in a spectrum of diseases, including intrahepatic lesions that extend into the capsule and conditions arising from adjacent or pelvic organs. It is covered by the peritoneum, and it includes the right subphrenic space, the subhepatic space, the lesser sac, and the left perihepatic space.- The distribution and dynamics of the peritoneal fluid influence the spread of inflammatory and tumor processes to the perihepatic space. The correct evaluation of this space is part of abdominal radiology workup and the knowledge of the main abnormalities is crucial for the best report.- The objectives of this exhibit are to highlight different etiologies of perihepatic involvement, from inflammatory/infectious diseases (stone-related abscesses, Fitz-Hugh-Curtis Syndrome, peritoneal tuberculosis, echinococcosis), endometriotic and metastatic lesions, to rare primary peritoneal tumors (peritoneal malignant mesothelioma, desmoplastic small round cell tumor, peritoneal serous papillary carcinoma, periportal plexiform neurofibroma, and hepatic hilum lymphoma), with illustrative cases (CT and MRI).

TABLE OF CONTENTS/OUTLINE

Background of the perihepatic space. Evaluation of the anatomy and physiology of the perihepatic space and its peritoneal fluid dynamic. Case-based review of a range of cases including the main and rarer abnormalities of the perihepatic space with respective MRI and CT findings. Radiological correlation with the peritoneal fluid flow distribution.

GIST: What The Radiologist Should Know

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Cristina Cano Pardo, MD, Pontevedra, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

To identify typical and atypical radiological findings of gastrointestinal stromal tumors (GIST).To know the radiological criteria used in GIST for the evaluation of tumor response.To review what factors have been proposed as relevant when predicting prognosis and response to treatment.

TABLE OF CONTENTS/OUTLINE

Relevant information towards the diagnosis of GIST will be clearly exposed using examples of different cases seen in our center.We will review the main radiological characteristics of GIST in order to suggest a correct differential diagnosis and adequately suggest this pathology.GIST complications and their different responses to treatment are not rare, especially in the emergency room. That is why we will display some key points to identify those situations and ensure a rapid diagnosis and treatment.Likewise, it is interesting to know the different response criteria to treatment so as not to confuse a favorable evolution with a progression of the disease.

Vascular Ultrasound in the Setting of Post-kidney, Liver, and Pancreas Transplantation: The Ins and Outs of Post-surgical Anatomy and Need-to-know Pathology

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Harrison Lee, MD, MBA, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Ultrasound is typically the first-line option for post-surgical evaluation in the setting of kidney, liver, and pancreas transplantation. A focused review of vascular complications across these organ transplantations can enable a comparative and more conceptual-based approach toward this topic.2. Kidney, liver, and pancreas transplantation can be performed using different surgical techniques leading to variable post-surgical vascular configurations.3. Post-transplant vascular complications differ across etiology, timing, and clinical presentations, largely falling into categories of thrombosis, stenosis, and post-biopsy complications, with early and accurate detection being essential to preventing graft failure.

TABLE OF CONTENTS/OUTLINE

I. Kidney transplantation A. Post-transplant vascular anatomy and variations B. Common indications for ultrasound C. Vascular complications 1. Renal artery thrombosis, stenosis 2. Renal vein thrombosis, stenosis 3. Post-biopsy vascular complications (arteriovenous fistula, pseudoaneurysm) II. Liver transplantation A. Post-transplant vascular anatomy and variations B. Common indications for ultrasound C. Vascular complications 1. Hepatic artery thrombosis, stenosis 2. Portal vein thrombosis, stenosis 3. Hepatic vein stenosis 4. IVC thrombosis, stenosis III. Pancreas transplantation A. Post-transplant vascular anatomy and variations B. Common indications for ultrasound C. Vascular complications 1. Thrombosis, stenosis 2. Post-biopsy vascular complications

Up Your Game: A Masterclass on CT Contrast in Abdominal Imaging

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Alex Chan, DO, Rochester, MN (*Presenter*) Nothing to Disclose

TEACHING POINTS

-Review how contrast agent distribution reflects physiology and provides a foundation for diagnosis, problem-solving, and avoiding imaging pitfalls.-Discuss diagnostic advantages and pitfalls related to iodinated contrast distribution, altered hemodynamics, x-ray interaction, and contrast timing.-Collaborative use of gained knowledge to focus on problem solving complex post-surgical cases

TABLE OF CONTENTS/OUTLINE

The goal of this education exhibit is to review how contrast agent distribution reflects physiology in normal and diseased states which provides the foundation for understanding how CT contrast agent enhancement patterns can be used for diagnosis, problem-solving, and avoiding imaging pitfalls. We will first discuss the physiologic redistribution effect of typical iodinated contrast agent from the intravascular to interstitial space. Next, we will discuss the effects of altered vascular hemodynamics, for example, in the setting of VA-ECMO and inhomogeneous venous return. Following, the physics of x-ray interaction with iodinated contrast will be discussed accompanied with its diagnostic challenges and exploitation with dual energy CT. Additionally, we will discuss the diagnostic sensitivity of various pathologies related to CT technique/contrast timing and explore the utility of bowel contrast agents. Throughout the presentation, we will use these main ideas to problem solve complex postsurgical patients. In conclusion, the audience will gain a higher level of understanding of CT contrast agents and apply these concepts to improve diagnostic confidence at daily practice.

Imaging in The Spectrum of Periportal Soft Tissue Pathologies

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Sinduja Sivaramalingam, DMRD, MBBS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1.Learning the anatomical structures involving the porta hepatis and their importance.2.To classify various periportal pathologies based upon the structure of origin.3.To study the radiological features of the individual pathologies, the unique patterns and differentiating points from other pathologies.

TABLE OF CONTENTS/OUTLINE

BACKGROUND:ANATOMY OF THE PORTA HEPATIS: ROLE OF IMAGING MODALITIES:CLASSIFICATION OF PERIPORTAL PATHOLOGIES BASED ON THE STRUCTURE OF ORIGIN1) DUCTAL AND PERI-DUCTAL PATHOLOGIES: • Cholangiocarcinoma (large duct carcinoma)-periductal and infiltrating, hilar types, advanced locally aggressive spread • Intraductal papillary neoplasm of the bile duct (IPNB)/ biliary papillomatosis • Primary neuroendocrine tumors of the bile ducts Cholangitis • IgG4 related sclerosing cholangitis • Langerhans cell histiocytosis - proliferative and fibrotic phase 2) LYMPH NODAL PATHOLOGIES: • Benign reactive hyperplasia of periportal nodes. • Infective nodes • Peritoneal carcinomatosis / Loco-regional spread of tumor 3) NERVES AND CONNECTIVE TISSUE:• Schwannoma, Neurofibroma • Sarcomas 4) POST SURGICAL OR POST TRANSPLANT CASES: • Periportal inflammatory soft tissue • Tumor recurrence • Post Transplant lymphoproliferative disorder.IMPORTANCE OF PREVIOUS IMAGES/ FOLLOW UP.ROLE OF TUMOUR MARKERS.CONCLUSION: Primary step in the diagnostic approach would be identification of the structure or epicenter of origin and then considering the relevant differentials.

Test Your Knowledge: Reviewing Classic Hepatobiliary Radiologic Signs

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Larissa Lima, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purposes of this quiz are:1. Recognize some classic radiologic signs (a way that makes easier to achieve diferent diagnosis).2. To discuss the pathophysiologic characteristics associated with these radiologic findings.3. Improve the memorize process making associations, since many signs use metaphorical language, such as comparision with objects.4. At the end of the quiz, the reader must be able to recognize these signs and associated pathologies, consolidating the acquired knowledge.

TABLE OF CONTENTS/OUTLINE

1. The presentation describes classic signs associated with hepatobiliary diseases through Computed Tomography (CT) and Magnetic Resonance (MR) images, in a cased-based quiz format.2. Illustrative key points: improve understanding of the correlation between the sign and pathophysiologic process involved.3. Pictorial review of most frequent hepatobiliary signs and associated disease, for example: adenomyomatosis (pearl neklace/rosary sign; hourglass gallbladder), inflamatory hepatic adenoma (atoll sign), hepatic hydatid disease (water-lily sign) and more.4. Key images that the radiologist must actively look to recognize the sign.

Clinical And Radiological Features Of Hepatocellular Carcinoma: An Update In The Era Of Systemic Therapy

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Awards
Cum Laude

Participants
Mariko Irizato, Kashihara, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of the exhibit is to update knowledge of hyperintense HCC on the hepatobiliary phase (HBP) of EOB-MRI, not only for diagnosis but also for early prediction of treatment effect, leading to personalized therapy in the future, and to recognize various cases of HCC with atypical imaging features on multimodality imaging.

TABLE OF CONTENTS/OUTLINE

With recent advances in systemic therapy for HCC, treatment strategies for HCC are changing. Now radiologists are required not only to diagnose but also to predict early treatment effects and contribute to appropriate treatment selection. As an imaging finding linked to predicting treatment effects, the signal intensity of HCC on HBP of EOB-MRI has recently attracted attention. Hyperintense HCC on HBP of EOB-MRI showed a correlation with the therapeutic effects of various treatments, such as immunotherapy, TACE, and hepatic arterial infusion chemotherapy (HAIC). HCC is also a genetically and molecularly diverse group. Actually, approximately 40% of HCCs do not show typical imaging features, such as Li-RADS major imaging feature of HCC, including hyperenhancement (APHE), portal venous phase, delayed phase washout, and capsule appearance. The atypical imaging features of HCC are generally associated with pathological type and molecular phenotype. Understanding HCC with atypical imaging features can improve diagnostic accuracy and help clinicians plan strategies for better treatment.1) Hyperintense HCC on HBP of EOB-MRIa) Etiology and Imaging findingsb) Treatment prediction: TACE, HAIC, and systemic therapy c) Differential diagnosis: the hepatic tumor with hyperintensity on HBP 2) Multimodality imaging of HCC with atypical imaging features

Evaluating the Performance of Segmentation Models for Liver, Spleen, and Fat by Radiologists

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Ari Borthakur, PhD,MBA, Philadelphia, PA (*Presenter*) Nothing to Disclose

TEACHING POINTS

Opportunistic screening (1) with abdominal CT examinations, capturing anatomic structures beyond the main clinical indication for performing the exam, may provide the opportunity for more comprehensive analyses of the entire abdomen and pelvis (2). It provides additional value to both patients, by uncovering incidental findings without additional scans, and providers, by improving both quality and service offerings, potentially mitigating risk and improving revenue without additional scan costs (3). The challenge, however, is that opportunistic screening has the potential to increase the burden of unnecessary work for providers. Artificial Intelligence (AI) based machine learning (ML) approaches can help reduce some of this burden particularly in the automation of tedious tasks like image segmentation (4). We present a comprehensive approach to evaluating the performance of an AI algorithm for fully automated CT-based body composition measurements (5) with automated reporting to PACS prior to deployment in routine clinical workflow.References Cited 1. Biliopancreatic Anatomic Variants: Radiologic Findings And Clinical Relevance

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Kamila Albuquerque, Vila Velha, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Biliopancreatic anatomic variants are common and they are more frequently diagnosed nowadays due to the increasing number of patients submitted to radiology exams. Recognizing these variants is essential to avoid misdiagnosis of pathologies and in the preoperative of biliopancreatic surgeries. The purpose of this exhibit is to make a brief review of pancreatic and biliary tract embryology and review the main biliopancreatic anatomic variants and their clinical relevance.

TABLE OF CONTENTS/OUTLINE

Introduction with a schematic review of the embryology of the pancreas and biliary tract. Present with images from CT, MR, ERCP, and USG illustrative cases of biliopancreatic anatomic variants and anomalies including annular pancreas, pancreas divisum, ectopic pancreas, ansa pancreatica, pancreatic hypoplasia, circumportal pancreas, dorsal pancreatic agenesis, anomalous biliopancreatic junction, low cystic duct insertion, gallbladder duplication, Caroli disease, intrahepatic bile ducts variations, among others. Correlate each one of these cases with its clinical/surgical relevance. Summary and take-home notes.

Radiologic Review of Small Bowel Malignancies with Their Mimicking Lesions

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Jongsoo Lee, MD, Incheon, Korea, Republic Of (*Presenter*) Nothing to Disclose

TEACHING POINTS

When radiologists inspect computed tomography (CT) images, small bowel malignancies are often easy to miss because of the small size, which can lead to mistake for normal small bowel due to their similar enhancement to small bowel or non-specific enhancement. In addition, small bowel malignancies are sometimes mistaken for masses from other origins, such as the uterus, rectum, or omentum. In this article, we illustrate various small bowel malignancies and their mimicking lesions with typical and atypical features on CT imaging as well as their clinical manifestations.

TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Small bowel gastrointestinal stromal tumor (GIST) 3. Small bowel adenocarcinoma 4. Small bowel lymphoma 5. Small bowel sarcoma 6. Small bowel plasmacytoma (Extramedullary plasmacytoma) 7. Small bowel neuroendocrine tumor (NET) 8. Mass-like small bowel lesions mimicking small bowel malignancies 9. Clinical history of small bowel malignancy: anemia, weight loss, vomiting, nonspecific abdominal pain Small bowel malignancies can be easily missed or misdiagnosed by radiologists because of their rarity, nonspecific symptoms, and overlapping imaging features, especially when manifesting with small sizes. However, if radiologists know some characteristic imaging features of small bowel malignancies and their mimicking lesions, and perform a careful inspection of the entire small bowel loops, especially when patients present with gastrointestinal bleeding symptoms, optimal detection and diagnosis of small bowel malignancies can be achieved.Please visit the Learning Center to also view this presentation in hardcopy format.

High Frequency Imaging in Hepatobiliary Ultrasound: Zooming In

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Awards
Identified for RadioGraphics

Participants
Michael Enea, DO, Philadelphia, PA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Understand the benefits and limitations of using a high frequency linear transducer (= 12 MHz) for adult hepatobiliary imaging and how it can improve confidence in ultrasound interpretations.2. Compare routine and high frequency imaging of liver parenchyma and surface contour in patients on a spectrum including normal, steatosis, fibrosis, and cirrhosis.3. Demonstrate the usefulness of high frequency liver imaging for focal hepatic lesions.4. Understand the advantage of high frequency imaging for biliary pathology including dilatation, sludge, and calculi.5. Compare low and high frequency imaging for the evaluation of gallbladder wall thickening, integrity, focal lesions, and calculi.

TABLE OF CONTENTS/OUTLINE

1. General- how technique affects high frequency imaginga. Variable transducer frequenciesb. Different machine settingsc. Patient habitus2. Livera. Diffuse parenchymal liver diseasei. Steatosis1. Homogeneous increased echogenicity2. Focal fatii. Fibrosis1. Coarse echotexture2. Correlate with shear wave elastographyiii. Cirrhosis1. Nodular surface2. Regenerative nodules3. Parenchymal atrophyb. Focal liver lesionsi. Hepatocellular carcinomaii. Metastasesiii. Cystsc. Otheri. Fulminant liver failureii. Periportal edemaiii. Portal thrombosis- benign and malignantiv. Varices3. Biliary Ductsa. Choledocholithiasisb. Biliary duct dilationc. Biliary castsd. Von Meyenburg Complexes4. Gallbladdera. Wall thickeningb. Integrity of walla. Adenomyomatosisb. Focal lesions: polyps, masses

Imaging of External Hernias of The Abdomen: Revisited

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Manabu Minami, MD, PhD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

External hernias of the abdomen are clinically common problems and frequently require imaging evaluation preoperatively. Various kinds of external hernias can occur in the abdominal wall. In the era of three-dimensional imaging using CT and MRI, a more precise evaluation of the structure of each hernia (hernia orifice, hernia sac, its content, and its covering) and complications such as inflammation, bowel obstruction/incarceration, and strangulation can be analyzed than before. In this presentation, we review various kinds of external hernias of the abdomen and show radiological anatomy using three-dimensional images with representative cases as well as their rare types. Understanding the membranous structures of the abdominal wall related to external hernias will be essential for GI radiologists to provide more critical information to surgeons in patient management and surgical planning.

TABLE OF CONTENTS/OUTLINE

1. General consideration of external hernias of the abdomen2. Classification of external abdominal hernias and their imaging findings: case presentations a. groin (inguinal): indirect (external), direct (internal), femoral, b. umbilical/periumbilical: cf. omphalocele, c. ventral (anterior): epigastric/hypogastric (linea alba), suprapubic, Spigelian (linea semilunaris), d. lumbar (lateral): superior lumbar (Grynfeltt-Lesshaft), inferior lumbar (Petit), e. pelvic floor (inferior): obturator foramen, sciatic foramen, perineal, f. cicatricial: traumatic, incisional, parastomal, trocar site3. Conclusions

MR Enterography in Chron Disease: Detection of Complications

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Maria Luisa Rosa, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

MR Enterography is the gold-standard method for studying the small-bowel in patients with Chron's Disease, not only to depict active inflammatory disease, but to exclude complications, as the presence of fibrostenosing and/or penetrating disease alters medical treatment and may imply surgical intervention.The aim of this work is to depict the imaging findings of complicated Crohn's disease on MR Enterography and discuss the correct terminology and potential differential diagnoses of such findings.

TABLE OF CONTENTS/OUTLINE

Through pictorial review we illustrate the different aspects of penetrating disease such as such as sinuses, simple and complex fistulas, inflammatory masses and abscesses, concentrating on what defines and differentiates them from pseudo-sacculations or deep ulcers and from adhesions, that can be misinterpreted on imaging studies as sinuses and fistulas, respectively. In regards to stenosing disease, we explain the criteria for defining a stricture and provide examples of strictures with and without active inflammation as the distinction is important for determining the treatment plan. We will also clarify the circumstances in which you can consider a probable stricture even when there is no upstream dilation. We will discuss how to potentially differentiate occlusion due to peritoneal adhesions from fibrotic strictures; and from functional abnormalities sometimes seen in these patients who demonstrate dilated small bowel loops without mechanical obstruction.

Anisakiasis: What Radiologists Need to Know

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Ines Alonso Sanchez, MD, Bilbao, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Become familiar with the radiological findings of anisakiasis, because it is an underdiagnosed parasitosis with an increasing incidence worldwide.- Initial clinical suspicion is sometimes difficult as the symptoms are non-specific, and a multidisciplinary approach in important to make an accurate diagnosis.

TABLE OF CONTENTS/OUTLINE

Objectives: Review and describe the main clinical, radiological and epidemiological features of the different forms of Anisakiasis. Background: Anisakiasis is a zoonosis caused by accidental infection by Anisakis simplex due to the ingestion of raw or undercooked fish that affects mainly the gastrointestinal tract. Although the highest prevalence of anisakiasis is found in Asia and it is rare in the United States and Europe, the incidence is expected to increase worldwide as cultural globalization of food habits increases opportunities to eat raw or undercooked seafood. Imaging findings: Severe submucosal edema, ascites, fluid collection and mesenteric fat infiltration. Diagnosis: Clinical suspicion is helpful but difficult in some cases, especially in intestinal anisakiasis, and CT findings may suggest the possibility of anisakiasis when characteristic imaging features are present. Laboratory tests or endoscopic direct visualization give a definite diagnosis. Treatment: Generally symptomatic and in some cases endoscopic larvae removal. Conclusions: Anisakiasis is a rare and underdiagnosed parasitosis that affects the gastrointestinal tract. As its incidence is increasing worldwide, it is important that we are familiar with the characteristic clinical and radiological manifestations.

Post-operative Abdominal Complications Following Colorectal Surgery on CT: Pearls and Pitfalls

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Awards
Certificate of Merit

Participants
Deevia Kotecha, MBChB, BSc, Wilmslow, United Kingdom (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) To illustrate the spectrum of early post-operative complications, emphasizing the importance of the timing of surgery.2) To distinguish expected post-operative CT appearances versus a complication, highlighting useful tips and potential pitfalls.3) To relate the type of surgery to key review areas on post operative imaging (including recent advances in endoluminal and robotic surgery).4) To discuss the utility of positive luminal contrast in problem solving.

TABLE OF CONTENTS/OUTLINE

The post-operative abdomen is challenging. Knowledge of the potential complications is important to every radiologist so that life-threatening conditions can be quickly diagnosed and treated.Post-operative GI complications covered will be broadly categorised into the following headings. A range of examples with key learning points will be illustrated and where relevant correlate with any pre-operative imaging.• Abnormal gas patternso Location and volume of free gas.o Retained surgical swabso Haemostatic agents.• Fluid collectionso Anastomotic leako Urinoma• Vascular complicationso Bowel ischemiao Arterio-venous fistulao Pseudo-aneurysm

Improving CT Colonography Standards

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Aishwariya Vegunta, MD, Stratford, CT (*Presenter*) Nothing to Disclose

TEACHING POINTS

Discuss various standards to maximize the quality of CT colonography.

TABLE OF CONTENTS/OUTLINE

Background: There is an increasing incidence of colorectal cancer which is a largely preventable disease if identified at precursor polyp stage and removed.CTC Performance standards: a. Patient Information and experience. b. Bowel Preparation: 1. Diet. 2. Catharsis: Dry versus wet agents and 3.Tagging of residual stool and fluid. Bowel preparation for same-day CTC after incomplete colonoscopy. c. Imaging: A. CT technique/ Scanning parameters and radiation risk. B. Colonic distension with carbon dioxide, using an automated insufflator. C. Scout to assess for adequate bowel distension. D. Dual-position scanning in Supine and prone positions versus decubitus position. d. Interpretation: A. Colonic and extracolonic findings are reported in a standard examination as per CT Colonography Reporting and Data System (C-RADS). B. Colonic interpretation involving primary 2-D and primary 3-D reviews. Flat lesions measuring 3 mm or less in height are better depicted with contrast tagging at 2D while 3D reviews are better at smaller polyp detection and greater conspicuity of polyps at or near the folds. C. CTC descriptors including polyp morphology, location and measurements. D. Pitfalls in CTC interpretation. e. Management decisions and interval surveillance: Follow-up recommendations on polyp management and role of surveillance CTC. f. CTC outcome measures: Audits and ACR's CTC registry.

Roux-en-Y Gastric Bypass: Post-surgical Anatomy and Most Common Complications

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Ines Alonso Sanchez, MD, Bilbao, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Review the Roux-en-Y gastric bypass surgical technique and understand the normal post-surgical anatomy and radiological findings. - Describe and explain the most frequent complications and their imaging manifestations using a series of cases from our institution as examples.

TABLE OF CONTENTS/OUTLINE

Background Obesity is a disease of epidemic proportions. Non-surgical treatment fails in 95% of the patients, and therefore bariatric surgery is the most effective, yet invasive, treatment. There are two surgical approaches for achieving weight loss: bypass procedures and restrictive procedures. Roux-en-Y gastric bypass is the most popular technique and obtains greater sustained weight loss and higher sustained long-term success than other techniques. Findings: As radiologists, we should be familiar with the anatomic changes caused by this surgery, in order to be able to recognize them and identify possible complications. Complications In this presentation, we describe the most common complications of gastric bypass surgery (mainly post-operative leaks, small bowel obstruction, gastro-gastric fistula and ulceration) and their imaging features based on cases of our centre. We revise the imaging techniques recommended to examine each type of complication and key findings to identify them. Conclusions Bariatric surgery is increasing dramatically, especially Roux-en-Y gastric bypass and radiologists should be able to recognize the anatomic changes that this surgery involves and the most frequent complications it may have.

Complications of Percutaneous Liver Procedures: Bleeding and Beyond

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
James Palmer, MD, Tucson, AZ (*Presenter*) Nothing to Disclose

TEACHING POINTS

1.) Percutaneous diagnostic and therapeutic liver procedures are commonly performed and range from biopsy to more invasive treatments such as ablation and biliary interventions. 2.) While these procedures are generally safe, major complications do occur usually at a rate of 0.1-5%. Bleeding is one of the most common complications and various manifestations of bleeding are important to recognize as they may require different treatment approaches. 3.) Non-hemorrhagic complications are diagnosed primarily by imaging and the radiologist should be aware of the range of complications so that timely treatment can be instituted.

TABLE OF CONTENTS/OUTLINE

1.) Brief overview of literature regarding complications of percutaneous liver procedures a.) Definition of minor vs. major complications 2.) Multimodality case-based review of complications with teaching points and discussion of treatment implications. a.) Hemorrhagic and Vascular i.) Subcapsular hematoma, hemoperitoneum ii.) Pseudoaneurysm, active bleeding, AVF iii.) Arterial vs. Venous bleeding iv.) Thrombosis b.) Biliary i.) Bile leak/biloma ii.) Stricture iii.) Hemobilia c.) Infectious i.) Liver abscess ii.) Biliary sepsis d.) Local i.) Organ injury (diaphragm, GB, stomach, colon) ii.) Residual/recurrent tumor iii.) Liver infarction iv.) Tumor seeding e.) Thoracic i.) Pneumothorax, hemothorax Hemopericardium

Multimodality Imaging of Tumor Thrombus in Hepatocellular Carcinoma

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Ulysses Torres, MD, PhD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

• To review and illustrate the vascular involvement in hepatocellular carcinoma (HCC) on ultrasound, computerized tomography (CT), and magnetic resonance imaging (MRI).• To prepare abdominal radiologists to identify the most common hepatic venous thrombosis sites on imaging in HCC, with emphasis on portal vein. • To present imaging features of tumor thrombosis according to LI-RADS v2018. • To present clinical cases from our institution with a multidisciplinary approach, some correlated with pathology results and individualized treatment. • To recognize potential pitfalls in image interpretation and differential diagnosis of tumor thrombus.

TABLE OF CONTENTS/OUTLINE

• Background: the importance of a multimodality assessment of vascular involvement in HCC, which can be subtle. • The impact of tumor thrombus on management in patient care. • Categorization according to LI-RADS v2018. • Illustrative cases of our institution with the main hepatic tumor thrombus sites with imaging features and interpretation on: o Ultrasound. o CT. o MRI. • Challenging cases of tumor thrombosis in HCC (as infiltrative carcinoma). • Differential diagnosis with hematic thrombosis. • Tips and tricks.

Advanced CT Techniques In the Evaluation of Hepatocellular Carcinoma: Roles of Ultra-high-resolution CT, Dual-energy CT, Contrast Enhancement Boost Technique, and Radiomics

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Masatoshi Hori, MD, Kobe, Japan (*Presenter*) Research Grant, Canon Medical Systems Corporation

TEACHING POINTS

1. Understanding the characteristics of advanced techniques such as 1024-matrix ultra-high resolution (UHR) CT, dual-energy CT, contrast enhancement boost (CE boost) technique, and radiomics. 2. Understanding how radiologists can use advanced techniques to detect and characterize hepatocellular carcinoma (HCC). 3. Understanding the prospects for advanced techniques to improve the management of patients with HCC.

TABLE OF CONTENTS/OUTLINE

A. Introduction B. Ultra-high-resolution (UHR) CT with a 1024 matrix B-1. Spatial resolution, image noise, and deep learning reconstruction B-2. Tumor margin can be better delineated, potentially resulting in improved assessment of microvascular invasion C. Dual-energy CT (DECT) C-1. Material decomposition C-2. Virtual monochromatic imaging (VMI) can enhance tumor-to-liver contrast C-3. Beyond the dual-energy CT: Hope for photon counting CT D. Contrast enhancement boost (CE boost) technique: a postprocessing technique for increasing the degree of contrast enhancement D-1. Principles: Roles of image subtraction, non-rigid registration, and denoising D-2. CE boost combined with multiphasic CT can improve the detection of small HCC D-3. CE boost can be combined with low-keV VMI in DECT to further increase the conspicuity of HCC E. Radiomics F. Clinical roles of the advanced techniques in evaluating HCC G. Conclusion

In Between Peritoneal and Retroperitoneal Layers: The Spread of Disease in The Abdominal Cavity

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Marcela Santos Conde, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Recognizing the types of disease spread in the abdominal cavity (interfascial, intraperitoneal, subperitoneal and transperitoneal). 2. Understanding the anatomy of the peritoneum and retroperitoneum and its correlation with disease spread. 3. Expected findings on disease spread in the abdominal cavity, from tumoral dissemination to inflamatory disease and trauma.

TABLE OF CONTENTS/OUTLINE

Introduction: general aspects of the disease spread in the peritoneum and retroperitoneum. Anatomy of the retroperitoneum as it relates to interfascial spread of diseases. Peritoneal cavity and the circulation of ascitic fluid as it relates to intraperitoneal disease spread. Anatomy of peritoneal ligaments and omental sacs as it relates to subperitoneal spread of diseases. Understanding the relation of retroperitoneal and peritoneal organs with the peritoneal membrane as it relates to transperitoneal spread of disease. Take home messages.

TEACHING POINTS

-To know the MRI sequences to be performed and the order of execution-To understand usefulness of each sequence for the detection of peritoneal malignancies-To know how to adapt patient preparation and sequence parameters in case of MRI artifacts

TABLE OF CONTENTS/OUTLINE

Magnetic Resonance Imaging (MRI) has an emerging role in the exploration of peritoneal malignancy. The knowledge and the management of peritoneal pathologies have considerably evolved over the last decade, especially with the possibility of curative treatment of peritoneal metastatic disease. Peritoneal MRI is routinely performed in referral centers and play essential role at different stages of the management: for the selection of patients for curative surgery, in the preoperative phase to optimize mapping of lesions, and in surveillance for early detection of recurrence. A dedicated and detailed protocol is proposed to perform a peritoneal MRI. Each step are explained including the preparation of the patient, oral and intravenous contrast agent and drugs used. Then each sequences (recommended and optional) with their parameters and the optimized order of realization are detailed, as well as their usefulness to detect peritoneal lesions and their limits. Finally, tips and tricks to limit artifacts are given, in particular to reduce artifacts related to the MR technique like susceptibility artifact and related to the patient condition (for exemple the black hole artifact caused by the presence of ascites).

Illustrative Cases of Acute Pancreatitis and Commonly Encountered Complications

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Klaudio Gjeluci, MD, MS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Demonstrate the wide array of acute pancreatitis encountered on imaging.2. Discuss the utility of imaging.3. Evolution of interstitial edematous pancreatitis and necrotizing pancreatitis.4. Summarize the nomenclature of the 2012 Revised Atlanta Classification for acute pancreatitis.5. Review of common complications of acute pancreatitis through illustrative cases.

TABLE OF CONTENTS/OUTLINE

Utility of imaging in acute pancreatitis and complications:Limited in the early phase of the disease processClinical diagnosis: epigastric pain and elevated pancreatic enzymes three times the normal levelDiagnostic in cases where elevated pancreatic enzymes do not meet the threshold criteria. Typically, in late presentation of acute pancreatitisDetermining unclear etiologyGallstone pancreatitisObstructive neoplastic processPredictor of mortality in the late phase of disease processExtent of necrosisInfectionLocal complications: pseudoaneurysm/bleeding, venous thrombosis, CBD stricture, pancreatic duct strictureDiscuss Case Examples with Imaging Findings:Acute interstitial edematous pancreatitisAcute necrotizing pancreatitis Acute pancreatic fluid collectionAcute necrotic collectionPseudocystWalled-off necrosisInfected walled-off necrosisBleeding splenic artery pseudoaneurysmLarge gastroduodenal artery pseudoaneurysmInteresting case of splenic vein thrombosis

What Radiologists Should Know for The Early Detection of Small Pancreatic Ductal Adenocarcinoma

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Yoshihiko Fukukura, MD, PhD, Kagoshima, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

Pancreatic ductal adenocarcinoma (PDAC) still has a dismal prognosis because of the difficulty in early diagnosis, although small PDAC has a good prognosis with a 5-year survival rate of 68.7% for stage IA disease. CT and MR are the most frequent imaging modalities used for evaluating patients with clinically suspected PDAC. However, these modalities often fail to demonstrate small PDAC. The possibility of diagnosing precursor lesions of the pancreas (pancreatic intraepithelial neoplasia [PanIN-3]) and small PDAC may greatly improve the prognosis of PDAC. The purpose of this exhibit is 1. To illustrate CT and MR imaging findings of PanIN and small PDAC 2. To discuss how to improve the detection of PDAC.

TABLE OF CONTENTS/OUTLINE

1. Summarize the definition, etiology, and clinical and histological features of PanIN and small PDAC (<20 mm) 2. Describe the characteristic CT and MR imaging findings of PanIN and small PDAC (<20 mm) with histopathological correlation 3. Highlight how to improve the detection of PDAC (tumor delineation and important secondary signs) 4. Discuss the diagnostic approach to potentially achieve earlier detection of PDAC 5. Summary: Knowledge of characteristic CT and MRI features and how to improve tumor delineation is important to improve the prognosis of patients with PDAC.

Bubbles and Marbles in the Pancreas: Demystifying Cystic and Solid Pancreatic Lesions with Emphasis on Management

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Katherine Chung, MD, Stony Brook, NY (*Presenter*) Nothing to Disclose

TEACHING POINTS

Imaging characteristics of cystic and solid lesions of the pancreas are well studied. However, with ongoing research in management and prognosis of these pancreatic lesions, it can be confusing for practicing radiologists and trainees to form recommendations for patients and clinicians. In this education exhibit, we will describe classic imaging findings of pancreatic lesions, review their clinical features, and discuss the latest recommendations on treatment options and management of these lesions. We present a pictorial review of cystic and solid lesions of the pancreas to guide radiologists on the management of these lesions.

TABLE OF CONTENTS/OUTLINE

Solid pancreatic lesions:? Ductal adenocarcinoma,? Neuroendocrine tumors, Metastasis, ? Lymphoma.Cystic pancreatic lesions:? Intrapancreatic Mucinous N?eoplasms (IPMN), Serous Cystadenoma, Mucinous cystadenoma?, Solid Pseudopapillary Neoplasm?. Mimickers?: Pseudocyst,? Duodenal diverticulum?.

CT and MR Enterography in Celiac Disease: What Should Residents Know?

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Awards
Identified for RadioGraphics

Participants
Andrea Penizzotto, DMRD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

The role of small bowel imaging is most important in patients with nonresponsive celiac disease and to exclude celiac disease related complications.The most specific imaging finding of celiac disease is the jejunoileal fold reversal pattern, but other findings are those of a nonspecific malabsorptive pattern.Ulcerative jejunitis, small bowel wall thickening, and small bowel dilation are more commonly seen in patients with refractory celiac disease.Ascites, pleural effusion and/or subcutaneous edema are related to severe malnutrition secondary to refractory celiac disease.

TABLE OF CONTENTS/OUTLINE

1) Introduction 2) Imaging protocolsCT enterography MR enterography3) Imaging analysis: Systemic approach4) Intestinal findingsIleal jejunizationJejunal fold flatteningFold pattern reversalIntestine wall thickeningBowel dilatationStrictureIntussusception5) Extra-intestinal findingsMesenteric adenopathyMesenteric vascular engorgementHyposplenismAscites6) ComplicationsUlcerative jejunoileitisMalignancyCavitary mesenteric lymph node syndrome7) Take home messages

Mimickers of Pancreatic Adenocarcinoma: What to Watch for at Tumor Board and the Workstation

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Andrea Esquivel Mora, MD, San Jose, Costa Rica (*Presenter*) Nothing to Disclose

TEACHING POINTS

Neoplastic and non-neoplastic pancreatic conditions can mimic pancreatic ductal adenocarcinoma (PDAC) on cross-sectional imaging. Our purpose is to: • Highlight distinguishing clinical and radiologic features that provide a clue to the correct (non-PDAC) diagnosis • Understand treatment and outcome implications for these mimics

TABLE OF CONTENTS/OUTLINE

Around 90% of pancreatic cancers are pancreatic adenocarcinoma while other pancreatic tumors are infrequently seen. This exhibit will highlight distinguishing radiologic and clinical features of PDAC mimics. 1. Uncommon exocrine pancreatic neoplasms.*Acinar cell carcinoma *Pancreatoblastoma *Squamous and Adenosquamous Ca *Colloid Carcinoma *Invasive IPMN *Mucinous cystadenocarcinoma 2. Non-exocrine pancreatic neoplasms that can mimic pancreatic cancer. *Pancreatic neuroendocrine neoplasms *Metastasis 3. Benign mimics of pancreatic cancer: “groove pancreatitis”, focal autoimmune pancreatitis, mass forming chronic pancreatitis, obstructive chronic pancreatitis, and focal steatosis 4. Key imaging features that can distinguish these entities from PDAC: multifocality, multiple ductal strictures, hemorrhage, duct-penetrating sign, low duct-to-parenchyma ratio, collateral duct dilatation, “sandwich sign”, hyperenhancement, calcifications, and capsule like rim or loss of lobulations. 5. Clinical features that can support the differential diagnosis are the history of a primary tumor, sex, age, predisposing genetic syndromes, and serum markers (IgG4, tryptase).

The Perceptual Problem in Pancreatic Imaging

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Abraham Fourie Bezuidenhout, MD, Boston, MA (*Presenter*) Nothing to Disclose

TEACHING POINTS

Diagnostic errors are common and can affect overall patient care, none more so than in the setting of pancreatic ductal adenocarcinoma (PDAC). In the absence of a PDAC screening program for the general population, the onus of early diagnosis is primarily placed on radiologists which largely determine patient outcomes and is an understandable source of anxiety to radiologists. Diagnostic errors can occur at any time in the process, from initial perception to final image interpretation. Cognitive errors include perceptual challenges and a myriad of cognitive biases which are particularly common and impactful in pancreatic imaging. Becoming aware of perceptual challenges specifically related to PDAC as well as understanding the various biases, related to internal and external pressures, can allow radiologists to minimize diagnostic errors and thereby help improve patient outcomes. In this exhibit we will provide explanations, insight and a framework for understanding the basis of these diagnostic errors and potential avenues to minimize them.

TABLE OF CONTENTS/OUTLINE

What contributes to diagnostic errors in the setting of PDAC? What's the unique perceptual challenges of PDAC? Direct vs indirect signs of PDAC. Which cognitive biases are in play in pancreatic imaging? Internal and external factors contributing to bias. Common vs newly described biases as it pertains to pancreatic imaging. How to overcome biases with guidelines to create an environment of peer learning which enables systematic improvement, rather than viewing it as individual failures.

Ultrasound: Lumps and Bumps in the Anterior Abdominal Wall

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Marie Vogel, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Ultrasound is a low cost, low risk, widely accessible imaging tool that can serve as a first line imaging modality in characterizing superficial lesions.2. A thorough understanding of abdominal wall anatomy and scanning techniques will allow the radiologist to confidently identify common abdominal wall pathologies.? 3. By combining scanning technique, anatomic knowledge and patient history, the radiologist can troubleshoot challenging cases and confidently arrive at the correct diagnosis.

TABLE OF CONTENTS/OUTLINE

1. A brief overview of the advantages and disadvantages of ultrasound in the assessment of superficial lumps and bumps in the abdominal wall. ?2. Review the anatomy of the abdominal wall and its ultrasonographic appearance. ?3. Review use and limitations of ultrasound and key ultrasound scanning techniques.4. Case based presentation of common lumps and bumps, describing key ultrasound findings, scanning tips and tricks, common mimics and/or complications, clinical presentation and management of these pathologies including but not limited to: Subcutaneous lesions: lipoma and epidermal inclusion cyst; Hernias: direct versus indirect inguinal hernia, femoral hernia, incisional hernia; Sequelae of trauma and infection: hematoma, abscess, Moral Lavallee lesion; Neoplasms: desmoid tumor, liposarcoma, melanoma; Miscellaneous lesions: adenopathy, endometriosis.

Ultrasound of the Portal Vein: ImPORTant Things to Know

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Awards
Identified for RadioGraphics

Participants
Matthew Simon, MD, Philadelphia, PA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Understand normal ultrasound appearance of portal veins in grayscale, color and spectral Doppler 2. Recognize abnormalities of the portal vein including thrombus (bland and tumor), cavernous transformation and portal venous gas 3. Identify abnormal waveforms and abnormal direction of flow in the portal veins and formulate a differential diagnosis 4. Understand the normal ultrasound appearance of a TIPS and recognize complications

TABLE OF CONTENTS/OUTLINE

1. Normal ultrasound of portal vein a. Anatomy i. 3D rendering of portal venous system b. Grayscale c. Doppler i. Color ii. Waveforms iii. Velocities 2. Abnormalities of flow a. Slow flow b. Helical flow c. Abnormal flow due to portal hypertension i. Alterations of velocity and direction 1. Hepatofugal flow: partial and complete 2. Perihepatic varices: paraumbilical, coronary, gallbladder 3. Portal Vein Thrombosis a. Bland thrombus 1. Causes 2. Acute versus chronic 3. Differentiating occlusive from non-occlusive b. Tumor thrombus 1. Hepatocellular carcinoma and other tumors 2. Grayscale, cine clips 3. Doppler: arterial flow within thrombus c. Chronic occlusion/Cavernous Transformation 4. Portal venous gas a. Causes b. Differentiate from pneumobilia c. Gray scale and Doppler appearance 5. Other a. Effect of cardiac disease on portal system b. Portal fistula i. Portal-hepatic venous ii. Portal-hepatic arterial 6. TIPS a. Normal appearance on Grayscale and Doppler i. when to image a TIPS after insertion ii. protocol for imaging a TIPS iii. effect on other vessels b. Complications i. Thrombus ii. Stenosis

Big Kids with Tummy Pains: Classically Pediatric Acute Abdominal Presentations in Adults

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Neel Jain, MA, MBBS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review of the adult presentation of pediatric acute abdominal pathology with discussion of imaging findings. 2. Illustrated conditions include Meckel's diverticulum, intussusception, anatomical variants, intestinal malrotation, mesenteric adenitis. 3. Highlight important review areas and implications. 4. Insight into their clinical management.

TABLE OF CONTENTS/OUTLINE

Pediatric pathology is often not a primary focus for adult GI radiologists and clinicians. Whilst uncommon, pediatric abdominal pathologies can also present later in life. It is therefore crucial that the radiologist on call considers pediatric illnesses and underlying congenital structural abnormalities within their differential diagnosis. We present a case-based educational exhibit to familiarize radiologists with the key imaging findings.

Hidden Gem: Ultrasonography Detection Differentiation of Sclerosing Cholangitis

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Moran Drucker Iarovich, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Teaching Points • Review different etiologies of sclerosing cholangitis • Discuss specific SC manifestations, including: background, clinical presentation, mechanism, treatment • Emphasize sonographic features of each, to allow an educated query of appropriate diagnosis

TABLE OF CONTENTS/OUTLINE

Sclerosing cholangitis is a progressive cholestatic disease, characterized by inflammation, fibrosis strictures. It is divided into primary sclerosing cholangitis (PSC) secondary sclerosing cholangitis (SSC). PSC is idiopathic, often seen in young males with concomitant ulcerative colitis, while SSC denotes a spectrum of progressive cholestatic diseases which have an identifiable, even treatable cause. SSC etiologies are divided into five mechanistic categories: immune-mediated, drug-induced, infectious, obstructive, or ischemic. Differentiation between the various causes of sclerosing cholangitis is imperative for appropriate patient management. Ultrasound (U/S) is the primary imaging of choice for evaluation of the biliary tree, being accurate, available, cost-effective, impervious to motion, safe. U/S is underrecognized as a diagnostic and problem-solving tool in assessment of PSC SSC. U/S's high spatial resolution allows detection of fine ductal features not often seen by MRCP. Subcapular ducts are often only visible on U/S. As well, it has the highest sensitivity for detection of intrahepatic stones bile duct casts. However, lack of familiarity means that many diagnostic features of biliary diseases are often missed. In this review we will describe the typical U/S features of PSC SSC.

Spectrum of Clinically Important Isolated and Concomitant Anatomical Variations of Biliary Ducts, Pancreatic Duct and Gall Bladder on MR Cholangiopancreatography (MRCP): What Not to Miss and What Radiologist Should Know to Help the Clinician in This Era of Advanced Hepato-Biliary Surgery!"

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Aruna Pallewatte, MD, FRCR, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1)Learn embryological basis of anomalies of hepatic, biliary and pancreatic ducts 2) Optimal MRCP protocol/Physics 3) Know classification of anatomical variants in configuration of intra/extrahepatic biliary ducts(BD) with clinical relevance 4) Appreciate classification of cystic duct pancreatic duct (PD) variations based on course insertion 5) Classification MRI features of Gall bladder(GB) variations such as duplication, intrahepatic GB. 6) Learn incidence of variations with literature comparison 7)Learn clinical significance (eg longterm effects, Surgeon's needs) of identified hepato-biliary-pancreatic duct variations and how to document them accurately on pre-op MRCP report to answer clinical needs 8) Learn to avoid diagnostic pitfalls and mimics causing misinterpretation on MRI/MRCP

TABLE OF CONTENTS/OUTLINE

1) Introduction to spectrum of BD, PD,Cystic duct GB anatomical variants, aberrant anatomy embryological basis with illustrations 2)Optimised MRCP protocol 3) Huang classification of Right Left intra hepatic BD illustrated with our MRCP images -Demography incidence 4) Classification of extrahepatic BD, PD and cystic duct variants with our sample cases 5) MRCP of Intrahepatic GB, double GB and classification 6) Pictorial depiction of concomitant BD,PD,GB variants and choledochal cysts with sample MRI cases 7) Diagnostic Mimics pitfalls, clues to avoid them 8) Potential longterm complications of variants such as pancreatitis 9)Challenges to Hepatobiliary surgery and value of pre operative documenting of anatomical variants 10) Guidance for systematic MRI/MRCP reporting focused specially for hepatic transplantation, hepatic resection, ERCP, laparoscopic surgery etc.

Gallbladder Malignancy and its Many Mimics

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Matthew Carr, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Gallbladder Malignancy and its Many Mimics Teaching Points: 1. Gallbladder malignancy tends to predominantly present in several different ways on imaging as an: intraluminal mass lesion, asymmetric wall thickening, or polyp. 2: Many potential mimics of gallbladder malignancy exist. Use the clinical history, all available views, and all modalities to create a more informed differential. 3: How the lesion evolves (or doesn't evolve) over time can help narrow or change the differential. 4: Sometimes you don't know if it is malignancy or a benign process. When in doubt take it out! (Or biopsy).

TABLE OF CONTENTS/OUTLINE

Table of Contents: - 1. Different gall bladder malignancies and their presentations (some with rad-path correlation). - 2. Metastatic diseases to the gallbladder (including lung and melanoma).- 3. The different potential mimics of gall bladder cancer (cholecystitis, adenomyomatosis, etc) - 4. Multiple case-based examples where specifics of the patient presentation help aid the differential diagnosis. - 5. Multiple case-based examples where the temporal course of the lesion changes the differential. - 6. Xanthogranlmatous cholecystitis cases (the great mimicker) with rad path correlation.

Clinical Photon Counting Abdominopelvic CT: A Crash Course!

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Awards
Certificate of Merit

Participants
Bari Dane, MD, New York, NY (*Presenter*) Nothing to Disclose

TEACHING POINTS

Conventional CT uses energy integrating detectors (EID), in which x-rays create visible light that is converted to electrical pulses to create images. Photon counting CT (PCCT) detectors directly convert photons into electrical pulses, allowing electronic noise elimination and leading to significant dose reduction. Unlike EID, PCCT counts the energy of each photon, including low energy photons. This improves image contrast, makes every CT multienergy, and permits electronic baseline noise removal. Downsides include K-escape and charge sharing in PCCT can reduce spectral separation.

TABLE OF CONTENTS/OUTLINE

1. PCCT versus EID physics2. Clinical benefits a. Improved spatial and contrast resolution, without dose penalty - Small vessel visualization - Small lesion visibility and characterization in low contrast areas (pancreas, liver, peritoneum) - Better iodine contrast to noise ratio, lower intravenous contrast dose b. Multienergy every scan - Simultaneous high pitch and multienergy - Incidental finding characterization c. Remove electronic noise - Better image quality in obese patients - Lower dose CT - Better virtual noncontrast (VNC) image quality3. Current Version Pitfalls a. Cross-scatter artifact with dual-source mode b. Urographic phase derived VNC artifact c. Slower reconstruction time

MRI Anal Fistula: Anatomy of Anal Canal

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Christian Torres Ramirez, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Learning objectiveIdentify the anatomy of the anal canal by MRI to achieve an adequate classification of anal fistula.IntroductionThe anal fistula corresponds to an anomalous path that connects the anal canal with the skin. MRI is the imaging modality of choice due to its high resolution, allowing an adequate characterization of the anatomy and also greater precision in the classification of the anal fistula.Teaching pointsThe anal canal is limited between the dentate line and the anal verge. The layers of this wall are mucosa, submucosa and muscularis. The muscularis layer is composed from the innermost to the outermost layer, by the internal anal sphincter(IAS), the intersphincteric liner and the external anal sphincter(EAS). The IAS is a continuation of the muscular layer of the rectum, and the EAS is composed of skeletal muscle.The MRI is the imaging modality recommended in ESGAR consensus.The protocol used in our institution is performed in 1.5 T and 3 T, the MRI sequences and the planes are axial, coronal and sagittal T2-weighted, and post-contrast T1-weighted sequences are performed. The axial acquisition performed align with respect to anal canal axis.By magnetic resonance imaging in axial T2-weighted sequences, the anal canal is a circumference of 5 layers: the innermost layer mucosa (hyperintense),submucosa (hypointense), IAS (hyperintense), intersphincteric liner (hyperintense) and the outermost layer EAS (hypointense). The Parks classification is used for anal fistula: intersphincteric, transsphincteric, suprasphincteric and extrasphincteric.

The Spectrum of Interpretive and Perceptual Biases in Abdominal Radiology

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Awards
Identified for RadioGraphics

Participants
Jonathan Kruskal, MBChB, Boston, MA (*Presenter*) Nothing to Disclose

TEACHING POINTS

For abdominal radiologists, cognitive biases impact our interpretive and perceptual skills predisposing to diagnostic errors. Published data suggests that such biases are particularly common and impactful in abdominal radiology. A broad spectrum of recognized (common and less common) as well as newly emerging biases occur in abdominal radiology. Being aware of one's personal diagnostic biases, as well as strategies for mitigating their occurrence, is likely to improve our diagnostic performance. Familiarity with the spectrum of biases enables cases to be categorized in the peer learning and improvement meeting.

TABLE OF CONTENTS/OUTLINE

What are cognitive biases? How do biases impact abdominal radiologists? How to construct your Personal Bias Profile? Brief explanations, clinical examples and strategies for mitigating the following biases: Common biases: anchoring, confirmation, availability, automation, bandwagon, satisfaction of search and of report, premature closure, zebra retreat, representative, outcomes, framing, attribution, context, authority, premature closure, provider, hindsight, alliterative, blind spot, regret, scout neglect and inattention biases. Newly recognized biases: hanging protocol, risk averse, clinical trial, demographic, productivity, follow up, trainee assumption, provisional report, structured report and remote reader biases.

Drug-associated Hepatobiliary and Pancreatic Disorders: Pictorial Essay

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Shintaro Ichikawa, MD, PhD, Hamamatsu, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

Various disorders of the hepatobiliary system and pancreas are caused by several drugs, and imaging diagnosis is often challenging. Familiarity with these conditions may improve diagnostic accuracy and patient management. The purpose of this presentation is to describe the imaging findings of drug-associated hepatobiliary and pancreatic disorders and to identify tips for correct diagnosis.

TABLE OF CONTENTS/OUTLINE

The following drug-associated hepatobiliary and pancreatic disorders are discussed along with their key imaging findings: 1. Drug-induced acute liver failure Imaging findings are non-specific and include hepatomegaly with heterogeneous parenchymal enhancement, periportal edema, gallbladder wall thickening, and ascites. 2. Sinusoidal obstruction syndrome (SOS) A diffuse hypointense reticular pattern in the hepatobiliary phase is a highly specific sign for the diagnosis. 3. Pseudocirrhosis Imaging manifestations may be identical to those of liver cirrhosis. 4. Immune-related adverse events (irAEs) Cholangitis and pancreatitis may develop after immune checkpoint inhibitors therapy. 5. Methotrexate-associated lymphoproliferative disorders It is visible as a periportal infiltrating hypodense mass on computed tomography and is weakly enhanced. 6. Amiodarone deposition in the liver 7. Ceftriaxone-associated gallbladder pseudolithiasis 8. Secondary iron overload

Spectrum of Findings After Radiation-based Therapy In the Liver

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Emre Altinmakas, MD, New York, NY (*Presenter*) Nothing to Disclose

TEACHING POINTS

Stereotactic body radiotherapy (SBRT) and transarterial radioembolization (TARE) with Yttrium-90 are the two commonly used treatment options for primary liver cancer and liver metastasis in patients unsuitable for surgery. Patients receiving such treatments require to undergo imaging surveillance with CT or MRI as there is possibility of incomplete tumor response. Careful assessment of these follow-up studies is essential to proper patient management. It is also crucial for radiologist to be aware of expected treatment-specific changes within the treatment zone as well as non-treated liver parenchyma following each type of treatment.The purposes of this exhibit are1. To discuss the concept of tumor response assessment after radiation-based therapies2. Demonstrate expected posttreatment changes within the targeted as well as surrounding non-targeted liver parenchyma following SBRT and TARE3. To review potential complications of radiation-based therapies

TABLE OF CONTENTS/OUTLINE

Table of contents/outline1. What are the optimal imaging follow-up strategies after radiation-based therapies for liver cancer?2. How should we assess response after SBRT?• Imaging features of non-viable tumor• Imaging features of viable tumor3. How should we assess response after TARE?• Imaging features of non-viable tumor• Imaging features of viable tumor4. What are the expected posttreatment findings within targeted region as well as surrounding off-target liver following TARE and SBRT?5. Potential complications of radiation-based therapies6. Summary

Atypical Focal Nodular Hyperplasia: Don't Let It Fool You

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Awards
Cum Laude

Participants
Brendan O'Connor, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

-Focal nodular hyperplasia (FNH) is a benign hepatic lesion with a typical imaging presentation at CT and MR imaging.-Rarely, FNH may show histological components that lead to an atypical imaging presentation mimicking other benign and malignant lesions. Atypical features include intralesional fat, iron, calcifications, sinusoidal dilatation, and significant growth. FNH occurring in an abnormal liver, defined as FNH-like lesions, may present a diagnostic challenge.-Illustrated overview of typical and atypical presentations of FNH and FNH-like lesions with representative rad-path correlation cases, along with key diagnostic clues for an accurate diagnosis of FNH and FNH-like lesions based on a constellation of multiple imaging features to include iso-to-hyperintensity on hepatobiliary phase imaging.

TABLE OF CONTENTS/OUTLINE

-Epidemiology, pathology of FNH-Typical features of FNH on CT and MR imaging (with extra-cellular and hepatobiliary Gd-based contrast agents).-Atypical imaging presentation of FNH to include steatotic and steatohepatitic FNHs, calcification, intralesional sinusoidal dilatation, abnormal growth and intralesional iron-Definition and pathology of FNH-like lesions.-Imaging presentation of FNH-like lesions.-Key clues for accurate diagnosis of FNH and FNH-like lesions and differential diagnosis with other hepatic lesions (e.g hepatocellular adenoma).

Hepatocellular Carcinoma: A Primer for Residents

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Awards
Certificate of Merit

Participants
Marika Pitot, MD, Rochester, MN (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) Review the typical imaging appearance of HCC on CT and MRI 2) Learn about the various patterns of HCC presentation 3) Review the recognized histologic subtypes of HCC with an emphasis on characteristic differentiating imaging features 4) Understand HCC imaging features that correlate with favorable versus poor outcome 5) Review LIRADS categorization with some examples

TABLE OF CONTENTS/OUTLINE

1. HCC overview a. Typical HCC appearance on imaging b. Patterns of presentation on imaging i. Nodular (expansive) - single, dominant nodule, with or without satellite nodules ii. Multifocal nodules iii. Infiltrative (massive) iv. Cirrhotomimetic v. Pedunculated c. Histologic growth patterns of HCC 2. Histologic subtypes of HCC a. Frequency b. Characteristic and "buzzword" imaging features 3. Favorable and poor prognostic features of HCCs a. Favorable imaging signs include single, small nodule with smooth margins, no necrosis, and homogenous enhancement. Other favorable features include low tumor stiffness on elastography, uptake of hepatobiliary contrast suggestive of beta-catenin activation, and occurrence in a normal or non-cirrhotic liver b. Poor prognostic imaging signs include large size at presentation, multifocality, evidence of necrosis, heterogeneous enhancement, ill-defined margins, and macroscopic vascular invasion. 4. LIRADS characterization overview a. Explanation of LIRADS categorization with examples

This Is Not a Soap Bubble-What's Going on In The Liver?: A Surviving Guide for Radiological Workup of Cystic Liver Lesions

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Gabriella Cagliari, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Cystic hepatic lesions are very common in daily practice. The differential diagnosis ranges from benign lesions with no clinical significance to malignant neoplasms and potentially lethal conditions. Some cystic hepatic lesions have classical findings, allowing a correct diagnosis based on imaging findings only. On the other hand, some presentations may be challenging. In most cases, familiarity with the most relevant radiologic key features in combination with critical clinical and laboratory information is enough for adequate lesion characterization. The purpose of this presentation is to review the main cystic liver lesions, recalling imaging features from typical to challenging cases; a series of diagnostic tips will be presented, as well as a practical guide on how to develop objective reasoning in face of such cases.

TABLE OF CONTENTS/OUTLINE

1) Review the most common liver cystic lesions and their imaging features with didactical cases.2) Provide a didactic approach to differential diagnoses.3) Tips that can be helpful in face of challenging cases.4) Surviving guide that can be useful for a quick consultation.

A to Z of Focal Nodular Hyperplasia (FNH)

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Sophie Cheshire, MBChB, FRCR, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Imaging features of FNH including typical findings and rarer features2. Multiple imaging modalities presented3. A unique method of presenting the findings using letters of the alphabet as an aide memoir

TABLE OF CONTENTS/OUTLINE

FNH is a common benign lesion, encountered on multiple imaging modalities. It is therefore important to recognise the key features of both typical and atypical lesions for accurate diagnosis in order to prevent unnecessary intervention. This display will include ultrasound examples, using both colour doppler and contrast enhanced techniques. All MRI sequences will be demonstrated with key learning points illustrated. The importance of liver specific contrast agents is highlighted, along with the pathology and aetiology of the lesion. The unique selling point for this presentation is the format which should be easy to remember and help in consolidating knowledge. The points to be covered using an A to Z format are as follows:Arterialisation, Biopsy, Contrast enhanced ultrasound, Doppler, Exophytic lesion, Fat, Glutamine synthetase, Hepatobiliary phase, Isointensity, Juicy orange, Kuppfer cells, Lobulated, MRI, Nodules, OATP receptors, Pathology, Question, Ring on hepatobiliary phase, Scar, Telangiectatic, Ultrasound, Vascular malformation, Washout, Xtra fun fact, Young, Zero malignant.

Pumping Iron: Iron Overload Imaging

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Timothy McMahon, MD, MS, New York, NY (*Presenter*) Nothing to Disclose

TEACHING POINTS

Iron is an essential mineral critical to oxygen transport but it can have a toxic effect at high concentration. Absorption is regulated, but primary hemochromatosis and hemosiderosis lead to toxicity. The liver stores and regulates iron. Primary hemochromatosis and hemosiderosis cause toxic buildup of iron in the liver which has characteristic imaging appearances. Primary hemochromatosis typically affects the liver and pancreas on MRI. Hemosiderosis, which is usually due to frequent blood transfusions secondary to various anemias, typically affects the liver, spleen, and bone marrow. Intravascular hemolysis can affect the kidneys. MRI can qualitatively and quantitatively assess iron overload and assists in diagnosing and managing hemochromatosis and hemosiderosis.

TABLE OF CONTENTS/OUTLINE

Intro Iron absorption, transport, and regulation Iron overload causes and clinical impact Diagnosis, treatment, and management of iron overload Imaging Noncontrast CT Typical appearance Confounding factors and differential with cases Dual energy CT Methodology and typical appearanceIron content quantification MRI Basic physics Qualitative assessment In/out of phase imaging analysisImaging patterns with case examples Quantitative assessment Methodology - Benefits and drawbacks Signal Intensity ratios T2/R2 relaxometry (FerriScan) T2* and R2* relaxometry Quantitative Susceptibility Mapping Example cases with effects of treatmentSQUID Biomagnetometry - Advantages, disadvantages, and relevance Conclusion

A Multimodality Approach to Inflammatory Bowel Disease and Complications

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Awards
Certificate of Merit

Participants
Weibo Fu, BS, Augusta, GA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) To review the pathophysiology of common imaging findings seen in inflammatory bowel disease. 2) To demonstrate barium enema, CT, and MRI findings of acute and chronic inflammatory bowel disease, associated findings, and diverse complications. 3) To discuss the advantages and disadvantages of currently available imaging modalities for inflammatory bowel disease.

TABLE OF CONTENTS/OUTLINE

Inflammatory bowel disease (IBD) most commonly occurs in North America and Europe, with an estimated combined patient population of 4-5 million in both regions. Incidence of IBD has been gradually rising since the mid-20th century, likely due to widespread changes in dietary patterns along with environmental factors. Cross-sectional imaging modalities such as computed tomography (CT) and magnetic resonance (MR) enterography are now more commonly utilized because of their ability to detect subtle changes in inflammation, high clinical sensitivity, and ability to detect complications such as a) fistulae, b) bowel obstruction, c) intussusception, and d) abscesses outside the bowel lumen. Though resolution for both CT and MR are comparable, MR has the added benefit of zero radiation exposure.

Evaluation of Hepatic Steatosis, Inflammation and Fibrosis in NAFLD by Imaging: An Overview

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Jong Yeong Kim, MD, Seoul, Korea, Republic Of (*Presenter*) Nothing to Disclose

TEACHING POINTS

Since significant differences are found in the prognosis of NAFLD depending on histological findings including fibrosis and steatosis, exact diagnosis of these conditions is clinically crucial. Many studies for non-invasive methods to estimate the histological severity of NAFLD instead of liver biopsy have been undertaken, mainly in the field of radiological and biochemical examinations. The purposes of this review are 1) to explain the principal, clinical application, pros/cons and limitations of imaging techniques for hepatic steatosis, fibrosis and hepatitis 2) to review the recently developed machine-learning based evaluations (computer aided diagnosis and radiomics) of conventional US, CT and MR images for the measurement of intrahepatic fat and fibrosis, 3) to discuss the future of these techniques, the possibility for wider clinical applications and roles in clinical trials for the treatment of diffuse liver disease

TABLE OF CONTENTS/OUTLINE

• Background• Hepatic steatosis1. US based techniques 1) Gray scale imaging 2) Controlled attenuation parameter 3) Attenuation imaging2. Unenhanced CT 3. MRI based techniques 1) Two point DIXON 2) MR spectroscopy 3) MRI-PDFF• Differentiation of NASH from simple steatosis• Hepatic fibrosis1. US based techniques 1) Transient elastography 2) Shear wave-based elastography: Point SWE, ARFI, Supersonic shearwave2. MRI based techniques 1) Diffusion weighted imaging 2) Hepatocyte-specific contrast agent enhanced imaging 3) MR elastography• Machine learning based evaluation of hepatic steatosis and fibrosis with US, CT, MR images• Can we replace liver biopsy by imaging studies for hepatic steatosis or fibrosis?• Conclusion

Don't Be So thick! A Practical Approach to Common and Uncommon Causes of Gastric Wall Thickening

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Edward Lawrence, MD, PhD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Gastric wall thickening can present a diagnostic challenge due the overlapping features of normal rugal folds, inflammation, and neoplasm. Features that suggest true gastric wall thickening include altered wall enhancement, asymmetric thickening, adjacent stranding, or local adenopathy Lower attenuation (edema) or mural stratification favors a benign process related to infection or inflammation. Intermediate/soft tissue attenuation favors neoplastic processes such as lymphoma or adenocarcinoma. Additional diagnostic work-up will frequently include further evaluation with endoscopy and endoscopic biopsy

TABLE OF CONTENTS/OUTLINE

1. Basics of gastric wall evaluation 2. Tips and tricks a. Differentiating true versus pseudo-thickening b. Differentiating malignant versus benign thickening3. Malignant causes (e.g., linitis plastic, lymphoma, gastric adenocarcinoma)4. Benign causes - common (e.g., gastritis) and uncommon (e.g., Ménétrier's disease) a. Inflammatory/infiltrative b. Infectious

Spaces and Places: A Radiologist's Roadmap to the Peritoneum and Retroperitoneum

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Christopher Sears, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Teaching PointsThe peritoneum and retroperitoneum, with their myriad spaces, pouches, and ligaments, are difficult to comprehend, let alone identify on imaging. However, understanding how the peritoneal reflections limit, circulate, and react to disease can facilitate the correct diagnosis and proper care.After reviewing this education exhibit, the learner will be able to: Understand and identify structures and spaces of the peritoneum and retroperitoneum. Appreciate the significance of the peritoneum and retroperitoneum, with respect to the spread of and response to infection, the staging of cancers, and the severity and localization of traumatic injuries. Recognize how medical and surgical management changes when peritoneal borders are violated.

TABLE OF CONTENTS/OUTLINE

Outline1.) Overview of the anatomy, spaces, and pouches of the peritoneum and retroperitoneum.2.) Differences regarding the peritoneum of males and females.3.) Case-based demonstration of the significance of the peritoneum, with regards to management and outcomes in cancer, trauma. and infection.

Unraveling the Superficial, Internal and Complex Hernias: Case-based Guide for Accurate Diagnosis

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Hunter Sellers, BS, MD, Houston, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Hernias are a very common pathology found on imaging with a large variety of presentation types. We provide multiple examples of hernias, both superficial and internal. 2. Superficial hernias can occur anywhere along the anterior, lateral, or posterior abdominal wall and can be simple containing only fat, or complex containing organs. We have cases of these simple and complex hernias, and hernias which contain pathology in the hernia sac. 3. Internal hernias can be intimidating to radiologists who are unfamiliar with the specific imaging patterns, our goal is to provide examples of these hernias along with the etiologies to help improve diagnostic acumen and accuracy. 4. The important goal of reporting pertinent information of type of hernias to clinicians to ensure that patients receive the best treatment possible.

TABLE OF CONTENTS/OUTLINE

Discussion of superficial hernias, which include inguinal, umbilical, Spigelian, amyand, Richter, incisional and others.Elucidate internal hernias, which include paraduodenal, Foramen of Winslow, Petersen and others.Highlight features of complex hernias.Imaging tips on recognizing specific hernia types.Report pertinent information that the clinicians want to know.Conclusion.

Utility and Limitations of 18F-FDG PET/CT For the Evaluation of Hepatic Lesions

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Shota Kondo, Hiroshima, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

a. In well-to-moderately differentiated hepatocellular carcinoma (HCC), the 18F-flurodeoxy-glucose (FDG) uptake tends to be poor. A high FDG uptake is associated with histologically poor differentiation, microvascular invasion, and a poor prognosis. Therefore, 18F-FDG-PET is useful for estimating the malignancy grade of HCC. b. Although most intrahepatic cholangiocellular carcinomas (ICC) show elevated FDG uptake, in some the uptake may be poor. c. A marked FDG uptake may identify rare malignant hepatic tumors such as malignant lymphoma and leiomyosarcoma. d. As it is difficult to differentiate malignant hepatic tumors from inflammation with only the degree of FDG uptake, findings of other imaging modalities should be considered.

TABLE OF CONTENTS/OUTLINE

1. Molecular background of 18F-FDG 2. Technical and physiological pitfalls of 18F-FDG PET/CT 3. Imaging findings of various hepatic lesions on 18F-FDG-PET/CT scans 4. The advantages and limitations of 18F-FDG-PET/CT vis-à-vis other imaging modalities for the diagnosis of hepatic lesions 5. The future prospects of nuclear imaging for the diagnosis of hepatic lesions

Multimodality Comprehensive Imaging Review of Benign and Malignant Hepatic Vascular Abnormalities: Pearls and Pitfalls

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Mohd Zahid, MD, Birmingham, AL (*Presenter*) Nothing to Disclose

TEACHING POINTS

Hepatic vascular lesions have a wide spectrum of clinical presentations and varying degrees of malignancies. They range from benign tumors such as hepatic hemangiomas, benign/low-grade malignancies such as hepatic small vessel neoplasia, tumors with high malignant potential such as hepatic perivascular epithelioid cell tumors, and hepatic hemangiopericytomas, other tumors with intermediate degrees of malignancy such as hepatic epithelioid hemangioendothelioma, up to malignancies developed more often in the context of immunodeficiency syndrome-Kaposi sarcomas, and high-grade malignancies with a poor outcome such as hepatic angiosarcomas. On Imaging, differentiation of primary malignant vascular tumors of the liver from benign neoplasms or vascular abnormalities is often difficult. After reviewing this exhibit, the learner will be able to:1. Understand the epidemiology, pathology, and imaging appearance of common and uncommon benign and malignant hepatic vascular lesions or neoplasms 2. Imaging tips to differentiate vascular lesions from other non-vascular abnormalities.

TABLE OF CONTENTS/OUTLINE

A. WHO Classification of hepatic vascular neoplasms B. Epidemiology and pathophysiology. C. Multimodality imaging of benign and vascular lesions with imaging tips and pitfalls

Pearls in Imaging of Biliary and Vascular Complications of Orthotopic Liver Transplant

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Ana Gonzalez, Chicago, IL (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) Orthotopic liver transplantation (OLT) is the definitive treatment for patients with end-stage liver disease accounting for 22.8% of all organ transplantations in the United States (OPTN).2) Although the advances in OLT have led to reduced morbidity and mortality, the procedure continues to be associated with a high rate of complications occurring in 25-30% of cases (NG 2015).3) We will highlight the surgical technique and anatomy of OLT with a brief overview of different anastomosis techniques.4) We will review the imaging techniques for peri- and post-operative evaluation of transplanted grafts including normal imaging appearance post-transplantation.5) We will summarize the most common post-operative complications following OLT with their associated radiologic findings and discuss possible interventional solutions.

TABLE OF CONTENTS/OUTLINE

Summary of OLT surgical approach Surgical anatomy with location of anastomoses for the hepatic artery, portal vein, inferior vena cava, and biliary duct system accompanied with illustrations.Imaging of transplanted grafts Grayscale and Doppler ultrasound for routine surveillance post-transplantation. Describe common waveform characteristics seen with specific complications.The use of CT and MRI to further explore suspected abnormalities followed by angiography.Common OLT complications with associated radiologic findings i. Biliary complications including biliary strictures and bilomas. ii. Vascular complications including arterial and venous stenosis, thrombosis, and pseudoaneurysm formation.Brief imaging review of OLT complications pre- and post- treatment with interventional radiology procedures.

Imaging Findings of Post-chemotherapy Non-Metastatic Hepatic Parenchymal Changes

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
San Yu Leung, MBBS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Use of chemotherapy has revolutionized management of cancer in past decades. Liver toxicity is commonly observed among different types of chemotherapy drugs. The aim of this exhibit is to illustrate radiological features of various chemotherapy-associated hepatic parenchymal changes, with examples in different imaging modalities, and to demonstrate potential complications of these liver injury patterns with representative cases. Early recognition of these liver conditions allow prompt clinical action to be taken, thus optimizing management and avoiding severe complications.

TABLE OF CONTENTS/OUTLINE

1. Introduction 2. To illustrate cases and radiological features of: a. Pseudocirrhosis in breast cancer and non breast cancer patients with liver metastasis, as well as its potential complications b. Chemotherapy-related hepatic steatosis c. Chemotherapy-related hepatitis d. Chemotherapy-related cholangiopathy 3. Summary of key teaching points

Ultrasound Based Hepatic Fat Quantification

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Nuran Seneviratne, MA, MBBS, London, United Kingdom (*Presenter*) Nothing to Disclose

TEACHING POINTS

Non-alcoholic fatty liver disease (NAFLD) is a growing cause of cirrhosis, hepatocellular carcinoma and liver transplant.Currently, steatosis is graded by subjective assessment of liver echogenicity and attenuation, with significant interobserver variability and sub-optimal detection of mild or greater steatosis (S>0).Controlled Attenuation Parameter is widely used (found in the Fibroscan® system, Echosens). Different disease states and probes impact measurement and for S>0 steatosis, it has a high false negative rate and low sensitivity.Quantitative metrics are now offered by various vendors, relying on changes in backscatter, attenuation and the speed of sound found in steatotic livers.Attenuation Imaging (Canon) and Ultrasound Guided Attenuation Parameter (General Electric) show excellent S>0 performance in NAFLD and other aetiologies of hepatic steatosis compared to both MRI and histology. Fatty Liver Attenuation Index (Samsung) shows moderate performance at the S>0 task in 351 patients with mixed aetiologies of chronic liver disease at histologyUltrasound Derived Fat Fraction (Siemens Healthineers) obtains 15 point shear wave and a steatosis percentage from a single large region of interest, also showing excellent S>0 performanceThese technologies are in their early stages. Larger clinical trials are needed to determine optimal steatosis grade cut-off values and compare results across vendors.

Diffuse Liver Disease and Its Quantification in MRI for Rookies

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Camilo Soler Becerra, PhD, Bogota, Colombia (*Presenter*) Nothing to Disclose

TEACHING POINTS

• NAFLD is the most common chronic liver disease worldwide. It has increasing prevalence among adults and children.• Iron overload may lead to liver cirrhosis, hepatocellular carcinoma, and cardiac and endocrine complications.• Fibrosis is the final stage of diffuse liver disease, with its complications and which we want to anticipate.• Measurement of fat, iron overload and liver stiffness by MRI is a noninvasive and accurate approach.• Knowledge of the protocol and the post-process will lead more hospitals worldwide to diagnose and quantify these pathologies, being of great help to the patient and other specialties. For example, we observe two similar liver parenchyma in images A and B. Still, we identify greater hardness in image B when quantifying liver stiffness, which alerts us about an inflammatory process.

TABLE OF CONTENTS/OUTLINE

1. Introduction.2. FatFrac.3. Iron quantification.4. Elastography.5. Conclusions.

The Falciform Ligament and Ligamentum Teres Hepatis Revisited

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Tomoya Nishiyama, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

The falciform ligament and the ligamentum teres hepatis have been considered as insignificant embryological remnants that include umbilical artery and vein. The purpose of this educational exhibit is to spotlight the clinical importance of the falciform ligament and the ligamentum teres hepatis in the radiological perspective.

TABLE OF CONTENTS/OUTLINE

This education exhibit includes 4 categories;(i) clinical embryology;(ii) clinical anatomy;(iii) clinical use for packing material; (iv) pathological conditions and disease process. Schematic illustrations of the embryology and anatomy and case based-presentations using CT images, macroscopic specimens and operative findings will be presented.

Diagnostic Approach to Peritoneal Lesions

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Mihran Khdhir, MBChB, (*Presenter*) Nothing to Disclose

TEACHING POINTS

A wide spectrum of abnormalities affect the peritoneum; including neoplastic, infectious, and inflammatory etiologies as well as spread of ectopic tissues. Anatomy of the peritoneal cavity and its ligaments determine the patterns of disease spread. In this educational exhibit, we provide a comprehensive radiologic diagnostic approach to peritoneal lesions based of the predominant composition (solid, cystic, hemorrhagic, calcific, lipomatous, and gas containing). Each entity will be discussed briefly along with illustrated images of various cases.

Peritoneal Carcinomatosis on CT and MR: How Not to Miss A Single Case

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Ana Veron, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

To depict the most frequent and the not so common sites and imaging features of peritoneal carcinomatosis on CT and MR. To propose how to systematically look for peritoneal implants on CT and MR,acknowledging the technical limitations.To describe the differential diagnosis and pitfalls

TABLE OF CONTENTS/OUTLINE

IntroductionThe peritoneum is the second most common metastatic localization for abdominal tumors, only surpassed by the liver. Peritoneal metastases in tumors of an extraabdominal origin occur less frequently.Early diagnosis of peritoneal carcinomatosis based on imaging findings is not always easy but it is essential in staging and managing primary tumors.CT is usually the first diagnostic tool but its performance is poor when it comes to detecting subcentimetric implants and those in anatomically difficult sites. MR has proved to have a better performance due to its better contrast resolution. Material and methodsThe revision of 300 peritoneal carcinomatosis cases from our database (comprising tumors of digestive origin, breast, gynecologic, testicular, renal, neuroendocrine, melanoma, lung, head and neck and soft tissue) has allowed us to establish a systematic diagnostic approach.Examples of the how and where to look for peritoneal implants, bearing in mind the anatomical sites and the major pathways of spread will be described, enhancing the added value of multiplanar reconstructions.Typical and less common presentations will be described using a case-based approach.Despite the non-specificity of the imaging findings,in some cases there are helpful hints to suggest the origin of the primary tumor.Examples of pitfalls and differential diagnosis will also be discussed.

MR Defecography For the Evaluation of Pelvic Floor Dysfunction

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
EUNBYUL CHO, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Among the worldwide women, pelvic floor disoreder is common health problem which is hard to say other people. and it is significant problem lowering their quality of life and causing to morbidity. Pelvic floor disorder means overall pelvic floor functional disorders caused by impairment of the ligament, fasiae, muscles supporting the pelvic organs.Conventional defecography is performed with fluoroscopy after injection of barium contrast to rectum. But it can evaluate pelvic floor disorder concentrating posterior compartment of pelvic floor and has risk of exposure to ionizing radiation to patient and doctor. MR defecography is dynamic study to evaluate pelvic floor disorder during defecation using US gel in real time and has been proven accurate and reliable for checking multiple compartments of pelvic floor. It is used to diagnosis of rectocele, intussusception, and anismus. we review normal female pelvic floor anatomy and MR defecography which can accurate diagnosis of pelvic floor disorder involving all three compartments of pelvic floor and improve the postoperative results. Our teaching points are as follows. To review normal anatomy of the pelvic floor, To compare MR defecography to fluor defecography, To ntroduce the concepts of the integral theory ; anatomically-based diagnostic methods locate damaged structure.

TABLE OF CONTENTS/OUTLINE

1) Subdivisions of female pelvic anatomy (three compartment) : anterior compartment -middle compartment -posterior compartment 2) Defecation function evaluation 3) Comparison of fluoro defecography and MR defecography. 4) Introduce the concepts of the integral theoryPlease visit the Learning Center to also view this presentation in hardcopy format.

Gastric Cancer: Pearls, Pitfalls and Lessons Learned from The Multidisciplinary Tumor Board

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Stephen Kwak, MD, Rochester, NY (*Presenter*) Nothing to Disclose

TEACHING POINTS

Gastric carcinoma is one of the most common malignancies worldwide and is currently the fourth leading cause of cancer-related deaths. While early gastric cancers are limited to the mucosa and submucosa and usually manifest as focal wall thickening with possible ulceration, advanced cancers involve the muscularis propria or even deeper, manifesting as diffuse, infiltrative thickening with ulceration and possible linitis plastica. Upper gastrointestinal endoscopy is currently accepted as the gold standard for detection of gastric cancer, while Multidetector Computed Tomography (MDCT) is preferred for staging of the tumor. MDCT allows for assessment of tumor depth, lymph node involvement, and disease spread which may be through subperitoneal dissemination, direct invasion, transperitoneal dissemination, or hematogenous spread. Careful preoperative staging is essential for proper surgical treatment, as complete resection of the tumor and surrounding lymph nodes is the only cure. In this exhibit we will discuss the MDCT technique and imaging features of gastric cancer with treatment approaches and various pearls and pitfalls learned during our experience at gastric cancer tumor board.

Preoperative MRCP for Laparoscopic Cholecystectomy: What Radiologists Need to Know

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Young-Hwan Lee, MD, Iksan, Korea, Republic Of (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To clarify the role of MRCP in preoperative evaluation of acute or chronic cholecystitis. 2. To understand the normal variations of bile duct anatomy to avoid surgical injury in laparoscopic cholecystectomy. 3. To describe the useful MRCP findings for differential diagnosis of various wall thickening gallbladder lesions.

TABLE OF CONTENTS/OUTLINE

1. Review of various MRCP techniques 2. Classification of bile duct anatomy using MRCP of a total of 879 patients were examined before laparoscopic cholecystectomy.Cases of bile duct injury during cholecystectomy were added. 3. Representative cases of gallbladder diseases, such as acute cholecystitis, chronic cholecystitis, gallstones, adenomyomatosis, xanthogranulomatous cholecystitis, Mirizzi syndrome, cholangitis with common bile duct stones, and wall thickening type gallbladder carcinoma, were included, and their imaging findings with literature review were illustrated.Conclusion: MRCP is a useful method for preoperative evaluation of biliary anatomy to prevent surgical complications. In various cases such as inflammatory and malignant diseases, accurate diagnosis is possible through preoperative MRCP.Please visit the Learning Center to also view this presentation in hardcopy format.

Covid-19- Associated Secondary Sclerosing Cholangitis: Imaging Features on Magnetic Resonance Imaging and Magnetic Resonance Cholangiopancreatography

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Manon Germann, Zurich, Switzerland (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Prolonged cholestasis in critically ill patients after severe COVID-19 infection may indicate the presence of secondary sclerosing cholangitis (SSC).• Affected patients are at high risk of progression to biliary cirrhosis requiring liver transplantation.• Since differential diagnosis to other causes of cholestatic liver injury can be difficult based on clinical and laboratory findings alone, imaging with MRI and MRCP can be crucial to help confirm the diagnosis.• COVID 19-associated SSC mostly affects intrahepatic bile ducts showing strictures with or without upstream dilatation, bile duct beading, vanishing ducts and periductal edema.• The extrahepatic bile ducts are typically spared.• Changes of the liver parenchyma are commonly observed including patchy arterial enhancement, reduced uptake of hepatobiliary contrast agent and signal changes on T2- and diffusion weighted-images.• Hepatic macrovascular changes and periportal lymphadenopathy are not typically seen.

TABLE OF CONTENTS/OUTLINE

1) Background a. Epidemiology b. Pathogenesis c. Clinical presentation d. Diagnosis 2) Imaging findings a. Biliary tree b. Liver parenchyma c. Hepatic vessels d. Other findings 3) Clinical implication and prognosis 4) Conclusion

Response Evaluation Criteria in GI Cancers: What to Use and How to Measure: An Emerging Challenge in the Era of Novel Cancer Treatments

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Awards
Identified for RadioGraphics

Participants
Francesca Castagnoli, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Therapeutic response is assessed by tumour diameter measurements (WHO, RECIST 1.1, and iRECIST), tumour enhancement (mRECIST, EASL, RECICL) or CT density (CHOI). Metabolic response is measured on PET by the standardized uptake value (SUV) normalized to the lean body weight (PERCIST).• Novel therapeutics and therapy-induced non-tumoral changes can lead to interpretation pitfalls. • In rectal cancer, MRI-derived tumour regression grade (TRG) infers pathological response to guide treatment and disease prognosis.• Functional imaging, radiomics, artificial intelligence and machine learning provide new and early biomarkers of response but require further qualification.

TABLE OF CONTENTS/OUTLINE

• GI Cancer therapies: 1) FDA-approved chemotherapies, targeted therapies and immunotherapies 2) external/internal radiotherapy • Imaging response criteria: when, where and how?• Patterns of response, stable disease and progression.• Atypical response patterns: pseudo-progression, hyper-progression, dissociated response, abscopal effect.• Potential pitfalls from non-tumoral effects of treatment: Hepatic steatosis, Sinusoidal obstruction syndrome, Others.• MRI-TRG [after Mandard/Rodel] applied to rectal cancer after neoadjuvant treatment.• LI-RADS, a structured reporting system, for treatment response of hepatocellular carcinoma.• Imaging response evaluation after neoadjuvant treatments of pancreatic cancer.• Functional imaging: DCE-MRI, DWI and others; myth or reality?• Radiomics: summary of current evidence.• AI and machine learning: potential applications

Hyperthermic Intraperitoneal Chemotherapy (HIPEC): A Radiological Primer

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Mary Renton, MBBCh, (*Presenter*) Nothing to Disclose

TEACHING POINTS

- The treatment of peritoneal carcinomatosis has been revolutionised by cytoreductive surgery with hyperthermic intraperitoneal chemotherapy (HIPEC).- HIPEC is used in a combined approach immediately following surgery and involves heated chemotherapy agents being temporarily instilled into the abdominopelvic cavity.- The associated high morbidity means an optimised patient selection process is vital.- We review key patterns of peritoneal disease and their prognostic implications.- We summarise common and important HIPEC complications.

TABLE OF CONTENTS/OUTLINE

- Background into the clinical indications and outcomes for HIPEC.- Review of common sites of peritoneal disease and types (nodular, mass or plaque-like).- Review of prognostic imaging features, including, gastrointestinal involvement, mesenteric and retroperitoneal lymphadenopathy, ureteric obstruction, psoas or pelvic sidewall involvement and gastrohepatic ligament disease.- Review of radiological contraindications to HIPEC, including extra-abdominal metastases and massive retroperitoneal lymphadenopathy.- Review of post-HIPEC complications, including ascites, splenic/ovarian venous thrombosis, pseudoaneurysm, haemoperitoneum, lymphocyte, perihepatic hematoma, pancreatic fistula and ureteric injury.- Importance of radiological assessment in the selection and management of HIPEC patients.

In Search of Harmony: Where Do We Still Disagree in the Radiological TNM Staging of Rectal Cancer?: A Pictorial Review Based on the Published Findings of a Recent International Survey and Multidisciplinary Expert Consensus

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Ulysses Torres, MD, PhD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Recently, a global online survey was carried out among 321 experts from 32 countries to identify points of controversy in the applicability of the TNM system (8th ed.) for the radiological staging of rectal cancer. A total of 16 problem areas were identified, grouped in topics related to clinical tumor staging in low-rectal cancers, definitions for cT4b and cM1a disease, definitions for mesorectal fascia involvement, evaluation of lymph nodes versus tumor deposits, and staging of lateral lymph nodes.- These critical areas remain considerable points of dissensus even among experts in rectal cancer imaging, and their awareness by residents, general radiologists, and even abdominal radiologists is paramount for better and more consistent use of the TNM system in the everyday radiological practice.- An illustrated case-based review with schematic drawings may be a didactical and straightforward way of exhibiting such a range of controversies, facilitating their comprehension by a general audience. Secondarily, it may also help make more understandable the points of consensus proposed and published by the international multidisciplinary panel of specialists.

TABLE OF CONTENTS/OUTLINE

1) Presentation of the 16 problem areas identified, illustrating them with schematical drawings. 2) Imaging-based review with didactical clinical cases exhibiting such critical points of controversies. 3) Tips on how to report the radiological findings in such cases in the light of the consensus proposed by the panel of experts.

Early Detection of Pancreas Adenocarcinoma: Time to Give Up or Time to Double Survival?

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Hala Khasawneh, MBBS, Rochester, MN (*Presenter*) Nothing to Disclose

TEACHING POINTS

Highlight the emerging concepts and recent advances in the domain of early detection of pancreas ductal adenocarcinoma (PDA): 1. Dire prognosis of PDA: Early detection is the only intervention with the highest potential to improve outcomes 2. Rationale for early detection: Substantial differences in the 5-year survival between stage I (26-months) versus stage IV disease (4.8-months) 3. Challenges of early detection including inability of imaging to identify early PDA 4. Emerging evidence supporting the role of Artificial Intelligence (AI) to augment imaging-based screening efforts for early detection of PDA in high-risk cohorts

TABLE OF CONTENTS/OUTLINE

1. PDA as an almost uniformly fatal disease2. Rationale for early PDA detection: What is "early" PDA and why is it critical to detect PDA at a stage when surgical cure is a possibility? 3. Challenges and opportunities for population-based screening for PDA a) The Define (D)-Enrich (E)-Find (F) protocol as an emerging paradigm 4. High-risk cohorts: a) Familial PDA and subjects with germline mutations b) New-onset diabetes (NOD) with high Enriching New-Onset Diabetes for Pancreas Cancer model (END-PAC) score c) Potential precursor lesions such as intraductal papillary mucinous neoplasms 5. Limitations of imaging to detect early or incidental PDA: a) Imaging findings of early PDA b) Factors contributing to missed PDA on imaging 6. AI tools being developed to augment screening efforts for PDA: a) Pancreas segmentation tools b) Imaging signature of pancreatic carcinogenesis at the prediagnostic stage c) AI-augmented detection of PDA on CTs 7. Potential utility of molecular imaging for early detection of PDA

Imaging of Young-onset Colorectal Cancer

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
James Fish, MBBS, London, United Kingdom (*Presenter*) Nothing to Disclose

TEACHING POINTS

Young onset colorectal cancer is defined as a colorectal tumour diagnosed at < 50 years. The incidence of young-onset colorectal cancer is on the rise, currently constituting approximately 10% of all cases. As such, reporting radiologists should have a good understanding of the imaging features and considerations associated with such patients including: • The risk factors and pre-disposing conditions associated with young-onset colorectal cancer. • The imaging manifestations frequently encountered on CT and MRI with correlation to histopathology and genetic markers. • Imaging appearances during the disease course including complex surgical management.

TABLE OF CONTENTS/OUTLINE

A case based educational exhibit including multiple examples of young-onset colorectal cancer with referenced teaching points. To include: • Demographics and epidemiology • Risk factors associated with young-onset colorectal cancer and associated imaging features. Including Hereditary syndromes (e.g. Lynch syndrome), genetic mutations and inflammatory bowel disease • Imaging presentations on MRI and CT with histopathological and genetic correlation, including synchronous or metasynchronous cancers. • Staging imaging and imaging during the disease course. • Post-treatment appearances, including complex surgical management e.g. exenteration, pelvic side wall clearance and peritoneal therapies. • Risk stratification and follow-up imaging surveillance.

TEACHING POINTS

• Understanding the critical role that MRI plays in rectal cancer staging and restaging. • Comprehend that several histopathologic changes may occur within rectal tumors after chemoradiation treatment, such as fibrosis or increased mucin production. • Radiologists play a crucial role in "watch-and-wait" programs for select patients with rectal cancer and should understand how to differentiate the several types of response, as well as how these posttreatment changes may be evaluated with high-spatial-resolution MRI.

TABLE OF CONTENTS/OUTLINE

• INTRODUCTION: o Rectal cancer treatment guidelines overview: § Selecting whether primary surgery or neoadjuvant treatment is an optimal approach; § Neoadjuvant treatment options: chemoradiotherapy versus total neoadjuvant therapy (TNT). o Primary tumor and nodal assessment with MRI. • ASSESSMENT OF TREATMENT RESPONSE: A SYSTEMATIC APPROACH. o Posttreatment changes in the primary tumor o Tumor Restaging: Histopathologic and MRI regression grades: § Identifying incomplete/poor responders, as well as "near-complete" and complete responders. o Patterns of tumor response: shrinking versus fragmentation; fibrosis and increased mucin production. • "WATCH-AND-WAIT": PATIENT SELECTION AND CURRENT CONTROVERSIES. • FUTURE DIRECTIONS IN RECTAL CANCER TREATMENT AND IMAGING. • TAKE HOME MESSAGES.

#PRO TuMor# Becoming a PRO in Rectal TuMor: A Simple Way and Quiz Not to Miss the Tumoral Regression Grade After Neoadjuvant Therapy

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Aaron Alarcon Novillo, Rio De Janeiro, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

> To demonstrate the importance of the radiologist in the context of rectal cancer, with a special interest in post-neoadjuvant evaluation.> To familiarize radiologists with the tumor regression grade (TRG) and its importance.> To demonstrate a simple way to minimize possible errors in the tumor regression grade (TRG).> To train the correct characterization of the tumor regression grade (TRG) based on recent cases using a simple way.

TABLE OF CONTENTS/OUTLINE

IntroductionRectal neoplasm is the third most common type of tumor in men and the second in women. Surgical treatment with total mesorectal excision is the gold standard, however, in cases of locally advanced tumors at diagnosis, neoadjuvant chemotherapy and radiotherapy are required. Magnetic resonance imaging is one of the mainstays in the management of patients with rectal tumors, providing primary staging and re-staging after neoadjuvant therapy. In the latter context, the response to treatment is evaluated by MRI, which provides the tumor regression grade (TRG) and re-staging, fundamental factors directly related to patient survival, which is again managed according to the imaging findings.We evaluated several MRI scans of post-neoadjuvant rectal tumors, with emphasis on the adequate qualification of the TRG, and we also developed a simple sequence of questions with a mnemonic (PRO TuMor) to assist in the proper characterization of the TRG, reducing possible errors.At the end of the presentation, we selected some MRI images in a quiz format for training purposes, using PRO TuMor.

Post Pancreatic Surgery Complications: Diagnostic Imaging Approach

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Awards
Identified for RadioGraphics
Certificate of Merit

Participants
Ayman H. Gaballah, MD, FRCR, Columbia, MO (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Review indications of pancreatic surgeries • Illustrate types of pancreatic surgeries • Discuss complications of pancreatic surgeries and their imaging features, including pancreas transplant • Highlight management options of these complications

TABLE OF CONTENTS/OUTLINE

1. Introduction a. Normal anatomy b. Indications for pancreatic surgery 2. Approaches to pancreatic surgeries: a. Endoscopic b. Minimally invasive- laparoscopic and robotic c. Open pancreatectomy 3. Types of pancreatic surgeries: a. Necrosectomy and abscess drainage b. Lateral pancreaticojejunostomy (Puestow) c. Beger procedure d. Frey procedure e. Pancreaticoduodenectomy (Whipple's procedure) f. Distal/central pancreatectomy g. Total pancreatectomy h. Pancreatic transplant surgery 4. Normal postoperative imaging findings 5. Multimodality Imaging features of post-surgical complications: a. Pancreatico-biliary complications i. Transient fluid collection ii. Biliary leaks/bilomas iii. Pseudocysts iv. Pancreatitis v. Pancreatic fistulas 1. Pancreatic-enteric fistulas 2. Pancreatic-cutaneous fistulas vi. Anastomotic stenosis vii. Infections (abscess and peritonitis) viii. Local disease recurrence b. Vascular complications i. Arterial injuries ii. Hematomas iii. Arteriovenous fistulas iv. Vascular thrombosis c. Bowel complications i. Delayed gastric emptying ii. Bowel ischemia iii. Bowel injury iv. Anastomotic leak v. Anastomotic stenosis vi. Afferent loop syndrome d. Solid-organ complications: (e.g., liver infarction, splenic injury, etc.) e. Abdominal compartment syndrome f. Pancreatic transplantation i. Rejection ii. Vascular complications Inflammation, infection, necrosis

The Postoperative Pancreas

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Ryan Clayton, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

* Review indications for various pancreatic surgeries and circumstances under which they are done.* Understand the postoperative anatomy after common and uncommon pancreatic surgeries, as seen on radiologic studies including CT, MRI, Ultrasound, fluoroscopy and nuclear medicine.* Be aware of the complications of the postoperative pancreas, and their imaging appearance. * After reviewing this material, the radiologist will more easily and accurately identify normal postoperative anatomy after pancreatic surgeries (both common and uncommon), leading to improved diagnosis of potential complications and avoiding pitfalls such as misinterpreting postoperative anatomy as pathology.

TABLE OF CONTENTS/OUTLINE

* Indications, anatomy and radiologic appearance of common pancreatic procedures: Whipple procedure (Classic, Pylorus-sparing), Distal pancreatectomy, Total pancreatectomy, Puestow procedure. Devices (CIVA sheet, Cystgastrostomy device).* Complications of common pancreatic procedures and their radiologic appearance: Leaks (Anastomotic leak, Pancreatic fistula, Bile leak), Other collections (Abscess, Hematoma), Strictures (Gastrojejunal anastomotic stricture, Bile duct stricture, Pancreatic duct stricture), Delayed gastric emptying, Vascular complications (Portomesenteric venous thrombosis, Portomesenteric venous stenosis, Aneurysms and pseudoaneurysms), Tumor recurrence.

Out of Place: Ectopic and Accessory Tissues

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Awards
Certificate of Merit

Participants
Patricia Dantas I, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purposes of this exhibit are:1) Review the most relevant imaging findings of ectopic and accessory tissue types, using a didactic approach by illustrations and cased-based imaging.2) Review the pathophysiology and embryology that are related to ectopic tissues, helping to understand the imaging findings in Computed Tomography (CT) and Magnetic Resonance (MR) imaging.3) Discuss the relevance of different ectopic tissue imaging presentations correlating with possible clinical complications.4) Improve knowledge about the main differential diagnoses and the main patterns of image appearance that are the key points to clarify diagnostic challenges.

TABLE OF CONTENTS/OUTLINE

1) Pictorial review of most frequent image findings of different ectopic and accessory tissue types.2) Cased-based review of ectopic tissue clinical presentation, frequent location, imaging findings, possible complications and differential diagnosis: pancreas, spleen, liver, gallbladder, leiomyomatosis, genitourinary system and endometriosis.3) Illustrative key points: improve understanding of the correlation between embryology and ectopic tissue imaging findings.4) Highlight the relevant imaging findings that aid surgical decisions.5) Conclusions and “take home messages”: consolidate the acquired knowledge.

Postoperative Complications of Hepatobiliopancreatic Surgeries: Where To Look?

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Cristiane Costa, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Revisit the surgical techniques involving the pancreas, liver, and bile ducts for the various pathologies that involve these organs. To review the most relevant complications of hepatobiliopancreatic surgeries and correlate with the imaging findings of computed tomography (CT), magnetic resonance imaging (MRI), and cholangiopancreatography (MRCP). Illustrate the cases of complications and demonstrate the therapeutical options.

TABLE OF CONTENTS/OUTLINE

Surgical techniques of hepatobioliopancreatic surgeries. Imaging protocols. Advantages and disadvantages of CT, MRI, and MRCP. Expected findings on postoperative imaging evaluation. Key sites where the radiologist should actively look for complications. Illustrate with cases the imaging findings of complications that must be described in the report. Demonstrate surgical and non-surgical treatment options.

Fixing The Edges: A Critical Analysis of Rectal Carcinoma After Neodjuvant Therapy

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Paulo Antunes, MD, Niteroi, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To recognize the MRI pitfalls in restaging rectal cancer after neoadjuvant treatment with chemotherapy and/or radiotherapy. 2. Test the limits of MRI rectal cancer re-staging emphasizing the difference between the misdiagnosis that is a limitation of the MRI and those that can be avoided thru a careful analysis by the radiologist

TABLE OF CONTENTS/OUTLINE

Introduction: Basic concepts of image analysis in rectal carcinoma after neoadjuvant treatment.Discussion- Correlation between MRI TRG scoring and histopathological TRG in selected cases. - Is that fibrosis or tumor cells? Follow-up results for patients eligible for watch and wait; - Mesorectal e pelvic nodes: the assessment of response comparing MRI and histopathologic or MRI follow-up;- Detecting complete clinical response after neoadjuvant therapy.ConclusionSummary with pearls and best tips of the analysis of MR rectal carcinoma after neoadjuvant treatment.

Cruisin' the Lumen: Fluoroscopic Evaluation of Normal and Abnormal Gastrointestinal Tract Luminal Anatomy in the Postoperative Setting

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Awards
Cum Laude

Participants
Sonia Gaur, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Fluoroscopy is a cost-effective method of postoperatively distending the esophagus, stomach, and bowel to assess for postoperative anastomotic leak and other complications. Learning fluoroscopy requires exposure to high volume of cases including those performed in the postoperative setting.2. Identify common postoperative settings in which fluoroscopy is performed for anatomic evaluation.3. Review normal postoperative luminal anatomy and the fluoroscopic appearance of postoperative complications.4. Review fluoroscopic techniques that are helpful in diagnosing postoperative complications.

TABLE OF CONTENTS/OUTLINE

1. Introduction - commonly encountered postprocedural scenarios in the fluoroscopy suite2. Postoperative scenarios including explanation of surgery, expected postoperative appearance, possible complications, and corresponding normal and abnormal fluoroscopic cases. Technique and important views will be emphasized for each case. Case selection includes -- a) Zenker's diverticulotomy/diverticulectomy; b) evaluation for iatrogenic esophageal perforation; c) transhiatal esophagectomy; d) hiatal hernia repair; e) bariatric surgery (gastric sleeve surgery roux-en-y gastric bypass); f) percutaneous gastrostomy evaluation and g) colorectal surgeries (low anterior resection, ileoanal J-pouch creation, ileocolonic anastomosis).

Surgery or Follow-up? That is the Question: The Diagnostic Dilemma of Intraductal Papillary Mucinous Neoplasms

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Awards
Certificate of Merit

Participants
Akio Tamura, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

The diagnosis of intraductal papillary mucinous neoplasms (IPMNs) is complex because adherence to the clinical guidelines depends on numerous imaging features and clinician opinions. The rate of accuracy of diagnostic guidelines for the presence of advanced dysplasia or cancer is 50-80%. Therefore, a small percentage of patients will be overtreated and some patients with IPMNs with high-grade dysplasia or cancer will be overlooked. This educational exhibit explains the key diagnostic imaging aspects of IPMNs and suggests methods to solve this dilemma in real-world clinical practice.

TABLE OF CONTENTS/OUTLINE

1. Why do IPMNs matter? 2. Algorithm for the management of suspected IPMNs 3. Solving the imaging dilemma of IPMN 4. Pancreatic cystic disease vs. IPMN

Diffuse Infiltrative Small Bowel Disease and Its Mimics

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Awards
Identified for RadioGraphics

Participants
Preet Dhillon, MD, Rochester, MN (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review the differential for a diffuse infiltrative small bowel disease process. 2. Present the clinical presentation and imaging findings of several diffusely infiltrative diseases within the small bowel, in order to delineate the unique features of each entity. 3. Review entities that may mimic infiltrative bowel disease on imaging.

TABLE OF CONTENTS/OUTLINE

The presentation will present the following disease categories and examples of infiltrative bowel disease within them. A non-exhaustive list of example cases by category is provided. 1. Infectious: Mycobacterium avium intracellulare (MAI), Whipple disease, Histoplasmosis, Coccidiomycosis 2. Inflammatory: IgA vasculitis, graft-vs-host disease, radiation enteritis 3. Neoplastic: Metastatic lobular breast carcinoma, acute myelogenous leukemia, diffuse large B-cell lymphoma, post-transplant lymphoproliferative disorder 4. Other: Amyloidosis, endometriosis, hemorrhage, lymphangiectasia Summary: An infiltrative small bowel disease will manifest as a segmental or diffuse degree of small bowel wall thickening. Although these disease processes may share many characteristics, there are key clinical and imaging attributes of each that can be examined. This education exhibit aims to present several cases demonstrating disease processes in which the small bowel is diffusely infiltrated. The unique features of each disease entity will be examined in order to best differentiate them, with additional cases presented as potential mimics.

Postoperative Colon Tract: What's That Hookup and What Could Go Wrong?

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Aman Khurana, MD, Lexington, KY (*Presenter*) Nothing to Disclose

TEACHING POINTS

Review indications and techniques of the common colonic surgical procedures with diagrammatic depiction. Multimodality imaging review of the normal post-surgical anatomy and associated complications with diagrammatic correlation. Summarize the appropriate imaging workup of patients suspected of postoperative gastrointestinal complications.

TABLE OF CONTENTS/OUTLINE

1. Review indications for colon surgeries and relevant variants that would alter surgical approach (robotic vs. other). 2. Review post-surgical anatomy of ileal-anal anastomosis, Hartmann pouch and its reversal, APR, colostomy complications and reversal, rectopexy, etc. 3. Imaging of post-operative complications such as anastomotic leaks, afferent loop syndrome, and parastomal hernias, lower abdominal resection, etc. 4. Review multimodality imaging evaluation including the role of barium studies, CT, MRI, and relevant endoscopic correlation. 5. Algorithmic approach in the setting of unknown surgical anatomy.

Advanced CT Imaging Techniques for Characterization of Suspected Hepatocellular Carcinoma: Spectral CT, Low kVp Technique, Deep Learning, and Beyond

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Amir Borhani, MD, Chicago, IL (*Presenter*) Institutional research agreement, Siemens AG

TEACHING POINTS

1. Advanced CT techniques and novel CT-based software are increasingly used in daily clinical practice. These new approaches can improve accuracy of CT in detection and characterization of focal liver lesions while ensuring optimized radiation dose and image quality. 2. The appropriate use of these new techniques can improve characterization of focal hepatic lesions in at-risk population.

TABLE OF CONTENTS/OUTLINE

Current Status of CT in Liver Imaging • Overview of techniques and protocols • Dosage and timing of iodinated contrast o Effect on detection and conspicuity of hepatic lesions • ACR LI-RADS CT technical recommendations Spectral CT: Dual-energy and Multi-energy CT • Overview of basic principles of spectral CT • Review of current acquisition techniques • Advantages of spectral CT for LI-RADS classification • Suggested protocols and workflow Low kVp CT • Overview of physical principles of mass attenuation coefficient • Advantages and disadvantages of low kVp CT imaging • Added value of low kVp CT technique for LI-RADS classification Deep Learning (DL) Techniques • Background • Novel DL-based noise reduction and image reconstruction techniques • Role in detection and characterization of focal hepatic lesions o Computer-assisted detection (CAD) Novel Post-Processing Techniques • Background • Image subtraction o Value in assessment of focal hepatic lesions and classification

Congestive Hepatopathy: Pathophysiology, Workup, and Typical and Atypical Imaging Findings with Pathological Correlation

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Marta Flory, MD, Redwood City, CA (*Presenter*) Nothing to Disclose

TEACHING POINTS

Understand the pathophysiology of congestive hepatopathy and its effects on the liver parenchyma Recognize the imaging findings of congestive hepatopathy Know the benign and malignant lesions that develop in congested livers and how to use imaging features and techniques to distinguish them

TABLE OF CONTENTS/OUTLINE

1. Liver vascular anatomy and sinusoidal architecture2. Pathophysiology of congestive hepatopathy3. Etiologies of congestive hepatopathy4. Imaging findings of congestive hepatopathy a. Diffuse liver abnormalities b. Focal lesions associated with congestive hepatopathy5. Challenges and pitfalls in imaging of congestive hepatopathy a. Assessment of hepatic fibrosis b. Differentiation of benign hypervasular lesions from hepatocellular carcinoma c. Proposed algorithm for workup of focal hepatic lesions in setting of congestive hepatopathy?

Choices, Choices, Choices: What Your Multidisciplinary HCC Treatment Team Wants to Know?

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Omar Kamal, MD, MSc, Portland, OR (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Different treatment options exist for hepatocellular carcinoma (HCC) including surgical, locoregional and systemic therapies. Appropriate choice of therapy is crucial to improve clinical outcomes. 2. HCC treatment guidelines incorporate different clinical and imaging variables to guide treatment options. 3. Radiologists need to be familiar with how imaging findings can change treatment planning for HCC and what is the crucial information that the multidisciplinary liver team (MDLT) wants to know.

TABLE OF CONTENTS/OUTLINE

1. Brief overview of HCC management: a. Surveillance. b. Overview of HCC staging and treatment options. i. Describe various treatment options. ii. Status of stereotactic body radiation therapy (SBRT). iii. Goals of noncurative treatments. c. HCC imaging features and role of biopsy in diagnosis and management. 2. Tumor burden and treatment considerations: a. Single vs. Multipleb. Size. c. Location in relation to other structures. 3. Liver status and treatment considerations: a. Background liver disease. b. Liver volume. c. Signs and symptoms of Portal hypertension. d. Portal vein thrombosis. e. Arterial anatomy. f. Metastasis. g. Liver transplant candidacy. h. Performance status. 4. Treatment response: a. Size vs. viability. b. LI-RADS treatment response criteria. c. Specific challenges for TARE and SBRT. 5. Common questions for radiologists during MDLTs.

Peritumoral Area of Focal Liver Lesions: Imaging-pathological Correlation and Clinical Significance

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Awards
Certificate of Merit

Participants
Kumi Ozaki, MD, PhD, Fukui, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

Peritumoral area of focal liver lesions is the liver parenchyma adjacent to focal hepatic lesions, which is often altered due to compression of the tumors, drainage of blood flow of the lesion, vascular or bile duct invasion as well as due to malignant infiltration in some cases. These histological findings are plainly reflected in the imaging findings. In some tumors, the imaging findings of peritumoral area could be helpful for an accurate diagnosis and could be biomarkers of malignant grades or prognosis. The radiologist should pay attention to not only the tumor itself but also peritumoral area.

TABLE OF CONTENTS/OUTLINE

1. Introduction. 2. The definition of “peritumoral area,” and several imaging findings of peritumoral area. 3. Imaging-pathological correlation of peritumoral area of each lesion as follows; peritumoral arterial enhancement (corona enhancement) of hepatocellular carcinoma, peritumoral hyper- or hypointensity on hepatobiliary phase of hepatocellular carcinoma, peritumoral arterial enhancement and peritumoral hypointensity on hepatobiliary phase of colorectal liver metastases, peritumoral hyperintensity on hepatobiliary phase of liver metastases from neuroendocrine tumor, and peritumoral arterial enhancement (arterioportal shunt) of cavernous hemangioma. 4. Non-existence of peritumoral changes of simple cysts or focal nodular hyperplasia 5. Clinical significance of peritumoral area of each lesions such as microvascular invasion, prognosis, the effect of chemotherapy, and the influence on the results of radiomics analyses. 6. Summary of the clinical significance of peritumoral area of focal liver lesions. 7. Conclusion.

Why Do Mucin-producing Cystic Neoplasms of the Liver Confuse Us?: Top Tips To Get the Right Diagnosis

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Awards
Certificate of Merit

Participants
Sofia Santos, MD, Lisbon, Portugal (*Presenter*) Nothing to Disclose

TEACHING POINTS

This exhibit intends to: (1)To clarify and to compare the old and the new nomenclature of mucin-producing cystic neoplasms of the liver.(2)To summarize the characteristic features of hepatic mucinous cystic neoplasms (MCN) and intraductal papillary neoplasms of the bile duct (IPNB). (3)To highlight the key differences between MCN and IPNB and to present the main differential diagnoses. (4)To understand the impact of an adequate differential diagnosis.The main teaching points are: Mucinous cystic neoplasms of the liver are rare neoplasms that include hepatic mucinous cystic neoplasms (MCN), previously known as cystadenoma and cystadenocarcinoma, and intraductal papillary neoplasms of the bile duct (IPNB). The keys for distinguishing MCN and IPNB are based on the presence of bile ductal communication (only in the case of IPNB) and the presence of sub-epithelial ovarian stroma (only in the case of MCN). The differential diagnosis encompasses non-neoplastic cystic lesions and cystic metastases. The five top tips to the radiologist are: (1) to look for ductal communication, (2) to assess for bile duct dilation, (3) to look for thickened enhancing septa, mural solid nodules and calcifications, (4) to take into account location and number of lesion(s), and (5) to review the clinical data (namely primary extra-hepatic malignancy).

TABLE OF CONTENTS/OUTLINE

- Mucin-producing cystic neoplasms of the liver: the old and the new nomenclature- Hepatic mucinous cystic neoplasms (MCN) and intraductal papillary neoplasms of the bile duct (IPNB): epidemiologic, clinical, histological, and imaging features- MCN versus IPNB: top tips to the radiologist- Therapeutic insights- Diagnostic flowchart

Imaging Assessment after Partial Hepatectomies: Surgical Technique and Type of Parenchymal Transection Performed: Normal Findings and Complications

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Juan C. Spina JR, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1- In the last two decades there has been an increase in the number of hepatic surgeries performed, together with an improvement in surgical techniques and new dissection devices. 2- Radiologists play a key role in the process of surgical planning and post surgical evaluation. Knowledge of types of resection is important to interprete postsurgical liver appearence. 3- In the acute post surgical period, imaging helps to identify complications and contribuites to define treatment.

TABLE OF CONTENTS/OUTLINE

1) Introduction. 2) Type of hepatectomies and technique- left hepatectomy, right hepatectomy, trisegmentectomy, segmentectomy, atypical segmentectomy, alpps, mini alpps.- liver hanging maneuver- Pringle Maneuver- liver transection methods: clamp crushing, electric scalpel, CUSA, water jet, tissue link. When and why?. 3)- Imaging findings after hepatectomies.- Normal findings: fluid collection, hypodense line, hepatic perfusion abnormalities, air bubbles, omentun adipose tissue, extraluminal gas.- Pathologic findings: biloma, hematoma, abscess, pulmonary complications. Tips for the correct diagnosis and differentiation. Example cases and evaluation test. Conclusion

Liver MR Elastography: A Case-based Approach on Quality Control and Main Technical Failures

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Marcelo Mota, (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Review the basic principles of elastography, focusing on the liver • Summarize the liver magnetic resonance elastography technique • Describe the steps in the evaluation and quality control of elastography images • Recognize the main causes of low-quality and nondiagnostic elastograms • Illustrate with didactic cases some technical failures of liver MR elastography and how to potentially correct them

TABLE OF CONTENTS/OUTLINE

? INTRODUCTION - Important concepts - Basic principles of elastography ? LIVER MR ELASTOGRAPHY TECHNIQUE - Typical liver MR elastography configuration - Raw data and post-processed images ? IMAGES QUALITY CONTROL - How to evaluate elastography images and ensure their quality ? LOW-QUALITY AND NONDIAGNOSTIC ELASTOGRAMS - Main causes of technical failures during the liver MR elastography ? INTERACTIVE CASE-BASED DIDACTICS - Sample cases to illustrate and solidify the concepts - How to potentially correct low-quality and nondiagnostic elastograms ? TAKE HOME MESSAGES

Postoperative Complications of Hepatobiliary Surgery: An Imaging Review

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Awards
Certificate of Merit

Participants
John Kirby, MD, Rochester, MN (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Review normal liver segmentation, vascular, biliary anatomy, and variants • Recognize the normal appearance of the postoperative liver • Recognize early complications such as abscess, parenchymal necrosis, and bile leak • Describe pertinent vascular findings such as active bleeding, pseudoaneurysm, stenoses, and thrombosis • Understand the post ablation appearance of the liver and potential complications • Many of our cases will contain a QR code that will allow the reader to open a fully functional PACS interface on their mobile device

TABLE OF CONTENTS/OUTLINE

• Background: Liver surgery is a common procedure and complication rates can be as high as 50%. With the high-risk nature, radiologists can play an important role in the early detection and management of potential complications. • Review normal hepatic anatomy including the conventional segmental divisions, vasculature, and biliary system. • Terminology including wedge resections, segmentectomy, and hepatectomy to assist the radiologist in reviewing operative reports and accurately describing imaging findings. • Normal/expected post operative appearances • Case based examples illustrated utilizing multiple modalities to demonstrate common complications that radiologists may encounter: o CT and MR examples of early complications requiring hospital admission o Vascular and biliary complications and interventions o Utility of nuclear medicine studies o Evaluation of long-term complications. o Post ablation appearance and potential complications.

Colitis in Cancer: Going Beyond Immune Checkpoint Inhibitors: Diagnosis, Monitoring and Management

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Kaustav Bera, MD, Cleveland, OH (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To review cancer drugs that are primarily responsible for causing colitis 2. Review the different etiologies of colitis and imaging findings that help differentiate them from cancer-therapy associated colitis 3. To discuss the CT imaging patterns of colitis of different etiologies 4. To discuss the crucial role of the radiologist in monitoring/management of treatment-related colitis. 5. Review established grading and management guidelines for treatment related colitis

TABLE OF CONTENTS/OUTLINE

1. Discuss common anti-neoplastic agents that cause colitis 2. Enumerate etiologies of colitis, along with their typical imaging findingsi) Immune checkpoint inhibitor associated colitisii) Drug-induced colitisiii) Infectious colitis -a. Neutropenic colitisb. Pseudomembranous colitisiv) Radiation induced colitis v) Inflammatory - Ulcerative colitis/Crohn disease vi) Ischemic colitis 3. Discuss clinical findings, history and risk factors for developing colitis 4. Discuss mimics of colitis a. Diverticulitis b. Appendicitis c. Epiploic appendagitis 5. Discuss presenting clinical symptoms and grading system for drug-induced colitis6. Management guidelines for drug-induced colitis with special focus on checkpoint inhibitors (ICI), targeted therapy, Car-T cell therapy 7. How a Radiologist plays an important role in monitoring and management 8. Prognosis and clinical outcome of patients developing drug-induced colitis 9. Real-world cases showing management and clinical course of drug-induced colitis in cancer therapies from to combination ICI and CAR-T cells as well as additional causes of colitis in cancer patients

Fundamentals of Response Evaluation for Abdominal Tumors

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Marcelo Cortes, MD, Petropolis, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

? Overview of the application of tumor response criteria and quantitative imaging and its benefits for clinical trials and novel oncology therapeutics. ? The role of radiologists in the standardization of tumor evaluation for clinical trials. ? Basics on response assessment and quantitative analysis of the most prevalent abdominopelvic tumors. ? Updates in imaging management and surveillance strategies for abdominal tumors. ? The role of imaging and genetic/molecular evaluation

TABLE OF CONTENTS/OUTLINE

Based on extensive imaging experience from a leading cancer center: ? A brief review of abdominopelvic tumors, highlighting the clinical and laboratory features that can be helpful in diagnosis and management. ? Review of the main criteria for clinical trials and clinical decision support employed to evaluate abdominopelvic tumors, for instance, RECIST 1.1, irRECIST, iRECIST, irRC, Lugano, Cheson, EASL, imRECIST, itRECIST, PERCIST, RECIL, and Choi. ? Tumor metrics criteria evaluation for abdominal tumors response compared to radiomics and imaging genomics role. ? Evaluation of immunotherapy: main concepts and practical application of tumor response evaluation. ? Interactive imaging-based approach with teaching points for response evaluation, work-up and recurrence of abdominopelvic tumors, challenges of immunotherapy evaluation, and equivocal cases on anatomic (CT/MRI) and functional (PET/CT and PET MRI) cross-sectional imaging. ? Current guidelines. ? Limitations of current imaging methods and new directions. ? Take-home messages.

Typical and Atypical Findings in Cirrhotic Liver: Pearls and Pitfalls for Diagnosis of Benign and Malignant Lesions

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Xiaoyang Liu, MD, PhD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Case-based review on imaging pitfalls and pearls of focal liver lesions in cirrhosis.2. The distortion of normal liver parenchyma by fibrous and regenerative tissue can change the typical appearance of many benign lesions, causing misdiagnosis as malignancy.3. As the most common primary malignancy arising from cirrhotic liver, hepatocellular carcinomas (HCC) can have atypical imaging appearance.4. Contrast enhanced ultrasound (CEUS) can provide characterization of focal liver lesions in additional to CT and MRI to achieve accurate diagnosis.

TABLE OF CONTENTS/OUTLINE

Technical pitfalls in cirrhotic liver imaging: 1) HCC may be nearly isointense to background liver on heavily T2 weighted MR images. 2) CT and MRI can miss early enhancement pattern of HCC due to mistiming. 3) Replacement of liver parenchyma by fibrous and regenerative tissue in cirrhosis can lead to decreased penetration by ultrasound.Benign lesions mimicking malignancy: 1) Regenerative nodules. 2) Siderotic nodules. 3) Confluent fibrosis. 4) Hemangioma with pseudo washout.Atypical appearance of HCC 1) Hypovascular. 2) Cystic. 3) Fat containing HCC. 4) Nodule in nodule HCC.Other malignancies mimicking HCC 1) Intrahepatic cholangiocarcinoma. 2) Metastases.CEUS providing added value to CT and MRI, for differentiation of benign versus malignant lesions 1) HCC washout not shown on CT or MRI, but demonstrated by CEUS, due to the purely intravascular nature. 2) More sensitive detection of arterial hyperenhancement, due to its real-time nature.

2022 Update of the Barcelona Clinic Liver Cancer Recommendations: What the Radiologist Needs to Know

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Awards
Certificate of Merit

Participants
Vikrant Khare, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Teaching Points Although many hepatocellular carcinoma staging systems exist, the Barcelona Clinic Liver Cancer (BCLC) staging system is the most widely validated system which provides guidelines for therapy based on tumor stage and underlying liver function. Following the BCLC treatment guidelines has survival benefits for HCC patients, and the 2022 expanded upon its previous iteration for a more personalized and individualized approach, taking into consideration local technical and expertise availability in conjunction with the tumor profile. Knowledge of the imaging findings for each BCLC stage and understanding the updated treatment recommendations for each stage are required to ensure appropriate clinical decisions and management for each patient This exhibit aims to highlight the imaging appearance of HCC for various BCLC stages while highlighting the key differences in the 2022 version

TABLE OF CONTENTS/OUTLINE

OutlineBrief background on HCC and the BCLC staging systemHighlight key updates of the BCLC 2022 staging systemCase based review illustrating the key imaging features of each stageBCLC-0, very early stageBCLC-A, early stageBCLC-B, intermediate stageBCLC-C, advanced stageBCLC-D, terminal stageCase-based review highlighting the various treatment options recommended by the updated BCLC system for each stage, with an emphasis on locoregional interventional treatments

Imaging Findings of Early Gastrointestinal and Hepatobiliary Cancers: Pitfalls and Pearls

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Awards
Certificate of Merit

Participants
Alecio Lombardi, MD, San Diego, CA (*Presenter*) Nothing to Disclose

TEACHING POINTS

Describe the imaging modalities of choice for the detection of early gastrointestinal and hepatobiliary cancers; Understand MRI technique and protocols, common challenges, and how to overcome them; Highlight imaging pearls and pitfalls for the characterization of early lesions on each modality; Underscore imaging characteristics that help in the differential diagnosis; Recognize key anatomical landmarks for surgical planning; Know what to include in the radiology report; Discuss future directions in the image analysis of early gastrointestinal and hepatobiliary cancers.

TABLE OF CONTENTS/OUTLINE

INTRODUCTION: General overview and definitions; Common gastrointestinal and hepatobiliary cancers. IMAGING TECHNIQUE: Modalities of choice; Sensitivity, specificity, and accuracy across methods; Protocols; Difficulties and how to overcome them to obtain high-quality images. IMAGING INTERPRETATION: Structured imaging analysis; Piftalls and pearls; Anatomic Landmarks: What the Surgeon whants to know?; What should be included in the tadiology report. STRATEGIES TO OVERCOME THE CHALLENGING CASES: Imaging characteristics that help in the differential diagnosis; WHAT'S ON THE HORIZON TO ASSESS EARLY GASTROINTESTINAL AND HEPATOBILIARY CANCER: Dual-energy CT; Digital Subtraction Angiography; DWI; Radiomics; Artificial Intelligence applied to image acquisition, reconstruction; Quantitative Imaging Analysis; PET/MRI; New nuclear medicine radionuclides; Nanoparticles.

Renal Transplant Complications From A-Z: A Multimodality Case Based Review

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Meghan Stanton, MD, Syracuse, NY (*Presenter*) Nothing to Disclose

TEACHING POINTS

• The kidney is the most commonly transplanted solid organ and therefore it is imperative that the radiologist be familiar with the surgical procedure, as well as the post operative complications. • Understanding the general timeline of specific complications in order to narrow the differential of imaging findings. • Recognize the imaging findings of the most common and the rare postoperative complications related to renal transplantation.

TABLE OF CONTENTS/OUTLINE

• Review of the renal transplant surgical procedure and normal post-operative anatomy • Imaging modalities used to assess the allograft • Complication timeline • Perinephric fluid collections • Vascular complications • Collecting system complications • Parenchymal abnormalities • Abdominopelvic complications • Conclusion

Mimickers of Pancreatic Cancer: Lessons Learned

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Awards
Identified for RadioGraphics
Magna Cum Laude

Participants
Camila Vendrami, MD, Chicago, IL (*Presenter*) Nothing to Disclose

TEACHING POINTS

· Review of characteristic and atypical pancreatic ductal adenocarcinoma imaging and clinical findings · Review of imaging and clinical features that allow differentiation between pancreatic ductal adenocarcinoma and its mimickers

TABLE OF CONTENTS/OUTLINE

Pancreatic ductal adenocarcinoma is the most common primary tumor of the pancreas. Several pancreatic conditions can mimic the appearance of pancreatic ductal adenocarcinoma, including inflammatory conditions, uncommon primary pancreatic tumors, and metastases to the pancreas. Imaging differentiation between these lesions and pancreatic ductal adenocarcinoma can be difficult because of overlapping features; however, knowledge of their typical imaging characteristics and clinical presentation may assist in their differentiation. 1. Introduction 2. What key imaging and clinical features of pancreatic ductal adenocarcinoma suggest this diagnosis and what are the atypical findings? 3. What clinical and imaging features differentiate mimickers (acute and chronic pancreatitis, groove pancreatitis, autoimmune pancreatitis, high-grade neuroendocrine tumors, metastases, other less common benign and malignant tumors) from pancreatic ductal adenocarcinoma? 4. Take home points

Liver MR Elastography: Practical Guidance for Interpretation and Reporting

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Awards
Magna Cum Laude

Participants
Guilherme M. Cunha, MD, Seattle, WA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) Review principles of MR elastography (MRE) for noninvasive assessment of liver fibrosis. 2) Summarize the literature on diagnostic accuracy of MRE in different liver disease etiologies. 3) Review pitfalls and confounders. 4) Provide guidance on liver MRE reporting and interpretation. 5) Discuss future directions.

TABLE OF CONTENTS/OUTLINE

1) Introduction: Stiffness as a biomarker of liver fibrosis and clinical significance. 2) Basic principles of MRE. 3) Clinical application detection and staging of liver fibrosis, liver stiffness and histology fibrosis stages, contexts of use and populations. 4) Diagnostic performance: overview of meta-analyses, MRE sequence, disease-specific MRE-determined liver stiffness thresholds. 5) Pitfalls and confounders a. Technical: improper hardware setup, left lobe vs right lobe, wave frequency dependencies, region of interest (ROI) placement. b. Biological: steatosis, iron overload, inflammation, cholestasis and venous congestion, expiration vs inspiration, fasting vs postprandial state. 6) Image interpretation Image analysis and interpretation (wave and elastograms), ROI approaches, stiffness thresholds and disease-specific interpretation. 7) Reporting: what to report, how to report it, QIBA recommendations. 8) Future directions: new contexts of use and applications, technical innovations.

A Beginners Guide to Liver Iron Quantification: What a Radiology Resident Ought to Know

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Archit Dikshit, MBBS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

(1) Iron overload could be due to primary hemochromatosis (hereditary) or secondary hemochromatosis (acquired by blood transfusions) and can cause serious complications including liver cirrhosis and heart failure. (2) MRI based iron quantification is increasingly being preferred to biopsy which is invasive, and not representative in inhomogenous distribution and serum ferritin which can be inaccurate in inflammatory states. (3) MRI based liver iron quantification is the recommended technique for estimating liver iron concentration in patients with increased serum Ferritin levels and assessing its trend in patients with repeated blood transfusions. (4) Superparamagnetic property of iron is the basis of quantification by MRI as it creates magnetic field inhomogeneity (estimated by QSM), which leads to signal drop of liver (measured by SIR method) and shortening of T2 and T2* times (measured by relaxometry). (5) The choice of method of iron quantification is made according to the availability of resources, and level of iron overload. (6) In cases with very high iron overload, R2* based relaxometry mapping gives error and use of signal intensity ratio method is preferred.

TABLE OF CONTENTS/OUTLINE

(1) Iron metabolism (2) Iron Overload and its clinical implications (3) Monitoring of Iron Overload (4) Clinical Indication for liver iron quantification (5) Principle of MRI based Iron Quantification (a) Principles (b) Relaxometry: T2 and T2* (c) Signal Intensity Ratio (SIR) Method (d) Quantum Susceptibility Mapping (QSM) Method (6) Merits and Demerits of MRI based Iron Quantification methods in practical usage (a) T2 Relaxometry (b) T2* Relaxometry (c) SIR (d) QSM (7) How to practically use different tools and methods

The Portal Vein: A Comprehensive Review

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Awards
Identified for RadioGraphics

Participants
Ben Layton, BMBS, FRCR, Blackburn, United Kingdom (*Presenter*) Nothing to Disclose

TEACHING POINTS

Combining radiological case examples with succinct explanation and illustrations this exhibit will provide a comprehensive summary of the portal vein (PV). This will:• Guide the radiologist in successful description of PV anatomy and branching patterns leading to optimal surgical approach. • Teach recognition and correct interpretation of rare topographic portal vein variations such as circumportal pancreas and preduodenal PV. • Provide an understanding of the appearances, associations and complications of PV shunts including congenital (E.g., Abernethy malformations, hereditary hemorrhagic telangiectasia) and acquired shunts (E.g., cirrhosis, traumatic). • Examine all pathology of the PV, including tips to differentiate between bland and tumour thrombus and explain sequelae with case examples (E.g., cavernous transformation, THAD/hepatic artery buffer response and portal bilopathy) • Deliver an overview of the newly described disease entity "porto-sinusoidal vascular disorder" clarifying the nomenclature associated with it and distinguishing it from cirrhosis and non-cirrhotic portal hypertension

TABLE OF CONTENTS/OUTLINE

Portal vein anatomy: branching pattern variations and extrahepatic topographyMalformations of the portal vein: associations and sequelaeDisease processes affecting the portal veinPortal vein interventionSummary and recommendations

Beyond the Images: A Simplified Approach for Rectal Cancer Mimics and Variants

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Katherine Wei, MD, Orange, CA (*Presenter*) Nothing to Disclose

TEACHING POINTS

This exhibit aims to provide an overview of the different benign and neoplastic mimickers of rectal cancer that can be encountered and provide an evidence-based framework for how to approach the differential diagnoses for rectal masses.

TABLE OF CONTENTS/OUTLINE

Different categories of rectal masses/rectal cancer mimickers to be discussed include: -Large rectal masses: In addition to advanced stage or poorly differentiated adenocarcinoma, high grade neoplasms such as poorly differentiated squamous cell carcinoma, high-grade neuroendocrine tumor, adenosquamous carcinoma, or lymphoma may be considered. If the tumor is eccentrically located, non-epithelial/mesenchymal tumors such as gastrointestinal stromal tumor or tumor of adjacent organ origin should be in the differential. -Anorectal junction masses of unknown histology: These lesions present a dilemma, as staging and treatment of anal cancer differ from rectal adenocarcinoma. -Precancerous/early-stage rectal cancer: These lesions have differing morphological and enhancement patterns compared to more locally advanced disease. -Benign rectal masses: Differentials include vascular malformations/hemangiomas, solitary rectal ulcer syndrome, and endometriosis implants. -Metastasis, including direct invasion of adjacent organs and commonly confused non-rectal cancer origin metastasis.

Beyond Infectious, Inflammatory, or Ischemic" Morphologic Approach to Bowel Wall Thickening

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Nabih Nakrour, MD, Boston, MA (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is to: Identify imaging patterns of wall thickening in the stomach, small bowel, and colon.Discuss the differential diagnosis of bowel wall thickening based on imaging characteristics, morphology, distribution, secondary signs, and clinical presentation. Present correlative endoscopic gross images when available.

TABLE OF CONTENTS/OUTLINE

The presentation will include Anatomic layers of the bowel wall. Pathophysiology of bowel wall thickening including wall layers involvement with edema, hemorrhage, inflammatory and neoplastic cells, fatty deposits, and fibrotic replacement. Differential diagnosis, example cases, and concurrent endoscopic images of gastric wall thickening are classified into diffuse, segmental, focal, and multifocal wall thickening. Differential diagnosis, example cases, and concurrent capsule endoscopic images of bowel wall thickening are classified into diffuse, segmental, and nodular fold thickening. Differential diagnosis, example cases, and concurrent colonoscopy images of bowel wall thickening are classified into diffuse, segmental, and nodular fold thickening. Address secondary signs favoring one diagnosis over others.

Periampullary Disorders: Running Away From the Obvious - A Pictorial Essay of Periampullary Lesions

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Awards
Certificate of Merit

Participants
Ulysses Torres, MD, PhD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

• To review the general anatomy of the ampullary region and its variants with schematic drawings correlated with CT and MRI. • Expose the possible periampullary disorders categorized into four large groups (anatomical variations, tumoral, inflammatory, and miscellaneous). To unravel the main differential diagnoses of periampullary involvement with didactic cases, literature review, and main imaging aspects.

TABLE OF CONTENTS/OUTLINE

Diagram and educational schematic drawings for diagnostic of the ampullary and periampullary lesions, dividing them as:- Anatomical variations: including cases of pancreas divisum, annular pancreas, and independent drainage of the common bile duct and pancreatic duct. - Tumoral disorders: including cases of a duodenum GIST, a papilla tumor, and a Frantz Tumor - Inflammatory disorders: such as paraduodenal pancreatitis, bulging duodenal papilla, and HIV papillitis. - Miscellaneous disorders: presenting other kinds of periampullary involvement, including a case of collateral circulation mimicking a neoplastic pathology, ischemic cholangiopathy, and intradiverticular papilla.

Body MRI Pulse Sequences: An Atlas and User Guide

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Awards
Identified for RadioGraphics
Certificate of Merit

Participants
Anup Shetty, MD, Saint Louis, MO (*Presenter*) Nothing to Disclose

TEACHING POINTS

Body MRI protocols can be daunting for the new trainee or novice reader, with a multitude of pulse sequences and a wide variety of acronyms. Understanding of basic MRI physics provides a framework for how to optimally use these sequences in clinical practice. Knowledge of the sequences as building blocks also informs efficient protocol design. This exhibit will:1) Highlight basic MRI physics principles that underpin core body MRI sequences2) Provide a framework of the families of sequences used in body MRI protocols, including individual vendors sequence names and key parameters3) Illustrate technical considerations and clinical utility of each sequence through case examples4) Describe how to build efficient protocols for indications such as liver masses, pancreaticobiliary imaging, renal/adrenal imaging, pelvic imaging, and imaging the moving patient

TABLE OF CONTENTS/OUTLINE

- relevant body MRI physics: single-shot, free-breathing, respiratory navigation, chemical shift, hepatobiliary contrast- sequence families: single-shot fast-spin echo, balanced steady-state free-precession, diffusion-weighted, spoiled gradient echo (chemical shift, quantitative multi-echo imaging, dynamic imaging), high resolution/small field of view imaging- for each sequence: vendor names/acronyms, key sequence parameters (TR, TE, flip angle, acquisition time, breath-holding strategy), technical considerations (SNR, artifacts, sensitivity to motion and susceptibility, need for fat suppression), and clinical applications- body MRI protocols: what sequences to include and why, using examples such as liver mass, pancreaticobiliary, renal/adrenal, and pelvic imaging, and how to image the moving patient

Success is Best When Shared: A Multidisciplinary Interpretation of Rectal Adenocarcinoma Regression

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Olivia Errecondo, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

? To review the role of MRI in restaging rectal cancer, emphasizing the use of T2 weighted images and diffusion weighted images. ? To describe the basis of neoadjuvant treatment in rectal cancer, making a brief analysis of the Prodige, Opra and Rapido Trial. ? To accomplish a description of the tumor regression grade system (TRG) using cases from our database as examples. ? To highlight the importance of multidisciplinary approach between imaging findings, endoscopy and histopathologic results.

TABLE OF CONTENTS/OUTLINE

? Introduction. ? Rectal MRI basis. ? Neoadjuvant chemoradiotherapy in rectal cancer. ? TRG review. ? Conclusion.

Hepatic Nodular Regenerative Hyperplasia: Radiologic-Pathologic Correlation

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Arpan Patel, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

This educational exhibit will aim to: Describe and define Nodular Regenerative Hyperplasia (NRH) from a clinical, radiological and histopathological perspective with the use of CT and MRI imaging. Compare and contrast NRH from other liver pathology. Distinguish NRH from other adaptive liver reactions that precede non-cirrhotic portal hypertension. Describe the causes and associations of NRH.

TABLE OF CONTENTS/OUTLINE

• NRH Background o NRH and other liver adaptive reactions causing non-cirrhotic intrahepatic portal hypertension o Epidemiology o Aetiology and pathogenesis • Histopathological-Radiological correlation with CT and MRI Imaging o Molecular background o Imaging features • Imaging pearls and pitfalls o Mimics of NRH o Appearance with hepatobiliary phase Gadoxetic Acid- enhanced MR imaging • Summary

Imaging Techniques for Quantification of Liver Fat and Iron

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Sarah Bastawrous, DO, Seattle, WA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review the importance of identifying liver fat and iron in the general population and in patients with liver disease. 2. Discuss ultrasound and MR imaging techniques for detection and quantification of liver fat and iron. 3. Illustrate these imaging techniques with clinical vignettes, including pearls and pitfalls.

TABLE OF CONTENTS/OUTLINE

1. Background and clinical importance of identifying abnormal accumulation of liver fat and iron. 2. Risks, clinical implications, impact on health care costs and mortality in patients with abnormal liver fat or iron. 3. Benefits of early detection and intervention in patients with abnormal fat and/or iron in the liver. 4. Ultrasound and MR imaging techniques for detection and quantification of liver fat and iron, including physical concepts, technique, interpretation, limitations, and future trends. 5. Multimodality case-based examples and appropriate clinical indications. 6. How to calculate and report fat and iron content.

MRI Findings of the Rectum and Anus: Beyond Tumor Staging

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Awards
Certificate of Merit

Participants
Sergio Jimenez Serrano, Barcelona, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this educational exhibit is:- To analyze the different pathological processes that can be found in the imaging modalities intended for the characterization and staging of rectoanal or perirectal pathology, beyond the adenocarcinoma and squamous neoplasia.- To illustrate the characteristic image features of these processes, especially on MRI, emphasizing those aspects that can be clues to orientate the diagnosis.

TABLE OF CONTENTS/OUTLINE

We have realized a retrospective review of patients in whom an imaging study, mostly MRI, has been requested to evaluate recto-anal or perirectal diseases in the last 12 years and whose definitive diagnosis has been other than primary neoplasia (adenocarcinoma or squamous neoplasia) or perianal fistula extension study. The final diagnosis was histologically confirmed. In this way, we present 44 patients and we have classified them into six groups:- Inflammatory/infectious pathology. - Endometriosis.- Neoplastic pathology Benign: schwannoma, leiomyoma, myelolipoma, hemangioma, diffuse rectal hemangiomatosis. Malign: neuroendocrine tumor, melanoma, plasmablastic lymphoma, undifferentiated pleomorphic sarcoma.- Secondary neoplastic involvement ? highlights a rare and specific form of involvement such as rectal linitis.- Congenital and developmental lesions.- Other benign processes.

Pancreas-kidney Transplant: Imaging Before, During and After Transplant

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Carlos Felipe Reyna, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

To better understand pancreas-kidney transplant, its technique and complications using a didactic approach using images and illustrations.To show the different imaging methods for evaluating transplant complications, such as Computed Tomography (CT) and Ultrasound (US).To highlight the surgical complications using cases from our database and the importance of their detection.To highlight the importance of a structured report.

TABLE OF CONTENTS/OUTLINE

1. Review of the pancreas-kidney transplant and its technique through illustrations and images.2. Explore pancreas-kidney complications supported by cross-sectional imaging cases, such as CT and US.3. Preoperative and postoperative knowledge of pancreas-kidney transplant is mandatory for surgical planning and thus helping to identify postoperative complications. This information must be a part of the structured report.4. Summary and take home messages.

Antonio Bevere, Rome, Italy (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Illustrate how to recognize bowel stenosis in Patients with Crohn's disease (CD), show the differences between inflammatory and fibrotic strictures, and explain their implication on the treatment choice. - How to describe intestinal stenosis in CD patients and which information should be included in the report to guide the management. - Exclude other potential differential diagnosis, including adhesive disease and bowel cancer.

TABLE OF CONTENTS/OUTLINE

Stricture is a frequent complication in CD. The precise definition of stricture has not been defined yet, and varies across studies, comprising either luminal stenosis with intestinal wall thickening with or without pre-stenotic dilatation, and lesion-causing stenosis lower than 1 cm. The site of strictures usually follows the distribution of inflammation, frequently involving the ileum. Even though CT- and MR-enterography offer great visualization of the intestinal tract, defining strictures remains challenging. Assessing strictures, the transition point should be carefully evaluated to establish the cause of bowel obstruction and exclude other potential differential diagnosis, including adhesive disease and bowel cancer. In addition, in CD inflammation and fibrosis are strictly connected mechanisms, which usually coexist in the same Patient and even in the same intestinal tract in varying degrees, making the diagnosis even more complex. MR exams can accurately differentiate between inflammatory and fibrotic strictures, guiding the correct treatment choice. Inflammatory strictures are treated with anti-inflammatory drugs; on the other hand, fibrotic strictures are treated mechanically with intestinal resection or endoscopic dilatation.

GIEE-61

Clinical and Radiological Scores for Assessing Inflammation in Crohn's Disease

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Jordi Rimola, MD, PhD, (*Presenter*) Consultant, Alimentiv Health Trust;Speaker, Takeda Pharmaceutical Company Limited;Consultant, Johnson & Johnson;Consultant, Boehringer Ingelheim GmbH;Research Grant, AbbVie Inc

TEACHING POINTS

1-To familiarize radiologists with activity indices of Crohn’s disease (CD) used by gastroenterologists including clinical and endoscopic scores2-To describe the main validated activity scores and other imaging biomarkers for assessing inflammation in patients with CD3-To provide a practical guide on the correct use and interpretation of imaging biomarkers in CD4-To discuss the potential contribution of imaging biomarkers in assessing therapeutic efficacy and to applied as endpoints in clinical research

TABLE OF CONTENTS/OUTLINE

1- Limitation of endoscopy as reference standard to assess inflammation and therapeutic response in patients with CDCross-sectional imaging may overcome these limitations and offers additional advantages2- Description of Magnetic Resonance Enterography (MRE) and intestinal ultrasound (IUS) activity scores have been developed and validatedDetailed list of MRE and IUS activity scores and other imaging biomarkers (e.g.motility) in CDEvidence supporting their satisfactory inter- and intra-reader reproducibility, and validity against a range of reference standardsOptimal use and interpretation. Not forget ulcerative colitis3-Rational and limitations to consider activity scores as endpoints in clinical research in CD.

Rectal MR: A Refresher on Low Rectal Cancers at Initial Staging

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Awards
Identified for RadioGraphics
Certificate of Merit

Participants
David Kim, MD, Madison, WI (*Presenter*) Shareholder, Elucent Medical

TEACHING POINTS

1. The 'anorectal junction to tumor' distance can estimate potential distal surgical margin and thus helps to determine the surgical approach. 2. MRF involvement at the pelvic floor can be inferred by the T category status for low cancers. 3. Cancer involvement of the anal sphincter in the context of T staging is remains undefined by AJCC. The recommendation is to be descriptive. It is important to have a strong grasp of anal sphincter anatomy to accurately describe tumor involvement with particular emphasis regarding the tumor relationship to the intersphincteric space. 4. External iliac and inguinal lymph nodes are regional (N+) not M disease when there is cancer involvement of the anal sphincter. 5. The histology of the tumor must be confirmed as adenocarcinoma. If squamous in histology, a low cancer is staged and treated as an anal cancer.

TABLE OF CONTENTS/OUTLINE

Background • Rectal MR and clinical staging • Classification (high/mid/low) Low rectal cancers (special considerations) • Anatomy of the anal sphincter • Treatment approaches • Staging issues and areas of controversy • Histology Summary

MR and CT Enterography: Expanding the Knowledge and Digesting the Information

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Martin Horwarth, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1 - Review the imaging findings for inflammatory bowel disease when using enterography protocols in CT and MR.2 - Illustrate these findings and correlate them with the correct terms to use on radiology reports.3 - Showcase the most common pitfalls that can be mistaken for active inflammatory disease and what to look for besides the bowel.

TABLE OF CONTENTS/OUTLINE

1 - Advantages and disadvantages of CT and MR.2 - Exam protocols.3 - Imaging findings in Crohn's disease and their descriptors.4 - Imaging findings in non-specific intestinal inflammatory conditions.5 - Pitfalls that may be mistaken for active inflammation.6 - Other sites of interest for when analyzing a patient with Crohn's disease.

When it is NOT Appendicitis: What to Look for in Appendiceal Disease Besides Inflammation

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Joao Stern, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Review literature in appendiceal malignancies and benign disease.- Demonstrate images patterns of the different diseases of the appendix- Postulate a flowchart to investigate appendiceal disease

TABLE OF CONTENTS/OUTLINE

Appendicitis is one of the most common acute abdominal inflammatory disease and demands surgical treatment. Other appendix afflictions are rare in comparison and frequently overlooked. Radiologists must know the different diagnosis, to recognize when it’s not appendicitis and impact the surgical or clinical management.

Icing on the Cake: Added Value of Dual Energy CT (DECT) in Challenging Biliary Pathologies

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Victoria Kim, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Understand basic technique of dual energy CT (DECT) imaging.2. Describe the role of DECT in complex biliary pathologies.3. Show how DECT aids appropriate management of challenging biliary cases.

TABLE OF CONTENTS/OUTLINE

1. Background: DECT has a variety of emerging clinical applications. By acquiring images at both high and low x-ray energies, computer software analysis can estimate chemical composition of materials. Images are reconstructed to enhance or suppress appearance of different materials. CT is often first choice of cross-sectional imaging in outpatient and acute care settings due its relative ease of acquisition and lower cost compared to MRI. DECT is a particularly useful tool in imaging biliary pathologies to add greater information and value from a single imaging encounter.2. Gallstone disease: Noncalcified cholesterol stones are less apparent on single-energy contrast enhanced CT, but attenuate differently at various energies and are better visualized on monoenergetic images.3. Postoperative cases: Iodine map and virtual non-contrast (VNC) images distinguish true postoperative abscesses.4. Biliary malignancy: Iodine map and VNC images distinguish enhancing tissue versus biliary hematoma.5. Other pathology: In unusual cases such as gallbladder volvulus, iodine map and VNC images identify gallbladder ischemia and expedite management.VI. Conclusions: DECT has an exciting range of applications for biliary pathology, aiding in appropriate management and minimizing additional studies and delayed care.

Save Your Tears for Another Day: Unmasking Pancreatic Adenocarcinoma

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Ahmed Elsakka, MD, Rutherford, NJ (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Recognize early focal pancreatic abnormalities on CT associated with subsequent diagnosis of early-stage pancreatic ductal adenocarcinoma (PDAC).• Understand the role and limitations of radiology on primary staging and restaging.• Comprehend common imaging pitfalls and benign mimickers of PDAC.• Recognize post-surgical complications.• Recognize different patterns of recurrence on imaging.• Understand imaging response to CRT and current limitations. • Be familiar with future directions on PDAC.

TABLE OF CONTENTS/OUTLINE

1.INTRODUCTION oWorld prevalence and cancer Facts and statistics 2022. oRelevance, costs. 2.TREATMENT SUMMARY 3.ROLE OF IMAGING oEarly detection oInitial staging oCommon pitfalls •Vascular involvement from surgical perspective •Peritoneal carcinomatosis versus inflammatory changes or congestion. •Regional and extra-regional nodal metastasis. •Perineural invasion: myth or fact? oMimickers •Pancreatitis. •Duodenal diverticulitis. •Prominent pancreatic lobulations. •Uneven fat deposition oRestaging •Imaging criteria and limitations. oTumor recurrence •Common locations. •Imaging patterns. •Role of follow up comparison 4.RADIOSURGICAL CORRELATION oWhen we were wrong 5.POST-OPERATIVE COMPLICATIONS oPre-surgical red flags. oConcerning imaging findings. 6.MULTIDISCIPLINARY TUMOR BOARD oWhat they need to know and what we need to ask 7.WHAT'S ON THE HORIZON

NCCN Guideline Driven Gastrointestinal Tract Tumor Board: A Primer for Radiologists

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Basem Jaber, MD, Darby, PA (*Presenter*) Nothing to Disclose

TEACHING POINTS

* Demonstrating a radiologist's role in the clinical management of GI tumors.* Reviewing NCCN guidelines for GI tumors.* Highlighting the use of different imaging modalities in management decisions.* Identifying possible pitfalls in multidisciplinary tumor board discussions from a radiology standpoint.

TABLE OF CONTENTS/OUTLINE

GI tract cancers are one of the most common malignancies discussed during multidisciplinary tumor board meetings. The National Cancer Committee Network (NCCN) publishes guidelines that are considered the gold standard for management of malignancies. This exhibit is a pictorial review of cancers of the stomach, small bowel, colon and rectum with emphasis on the NCCN guidelines.Key points:* Description of the role of imaging in cancer staging.* Multimodality imaging for initial workup.* Outline of impact of radiology on the surgical management and medical treatment of GI cancers.* Highlight of potential conflicts and pitfalls in tumor boards discussions.* Imaging principles for active surveillance.

Multimodality Approach to Complications of Pancreatitis

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Kaustubh Shiralkar, MD, Houston, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

Acute and chronic pancreatitis may lead to a wide array of complications which can be visualized on imaging. Our exhibit will focus on understanding the use and unique advantages of ultrasound, CT, and MRI including secretin enhanced MRI to better characterize complications of acute and chronic pancreatitis to aid in management decisions. Acute pancreatitis may lead to numerous local complications including acute peripancreatic fluid collections, necrosis with or without superimposed infection, fistula formation, and vascular complications such as hemorrhage from erosion of nearby vessels, pseudoaneurysm formation, and adjacent venous thrombosis. Chronic pancreatitis may lead to pseudocyst formation with possible dissection into the mediastinum or adjacent peritoneal compartments, parenchymal atrophy or enlargement with or without calcifications, and decreased exocrine reserve which may be evaluated on secretin enhanced MRI. This exhibit will also focus on effective reporting for management and clinical decision making.

TABLE OF CONTENTS/OUTLINE

Peripancreatic fluid collections, pancreatic and peripancreatic necrosis, emphysematous pancreatitis, fistula formation, vascular complications, chronic pancreatitis pseudocyst formation, ductal stenosis

Printed on: 02/07/23

Congenital Cystic Lesions of the Biliary Tract: A Pictorial Review

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Abel Gonzalez Huete, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To explain congenital cystic lesions of the biliary tree: congenital hepatic fibrosis, biliary hamartomas (von Meyenburg complexes), autosomal dominant polycystic disease, Caroli disease and choledochal cysts. 2. To review the embryology, physiology and pathogenesis. 3. To illustrate the imaging findings. 4. To discuss their differential diagnosis illustrated by sample cases.

TABLE OF CONTENTS/OUTLINE

1. Introduction. 2. Embryopathogenesis. 3. Anomalies of the intrahepatic bile ducts. - Congenital hepatic fibrosis: Etiopathogenesis, Imaging findings. - Biliary hamartomas (von Meyenburg complexes): Etiopathogenesis, Imaging findings (Ultrasound, CT, MR), Differential diagnosis. - Caroli disease: Etiopathogenesis, Types (Caroli disease proper, Caroli Syndrome), Imaging findings (Ultrasound, CT, MR), Complications, Differential diagnosis. - Autosomal dominant polycystic disease: Etiopathogenesis, Imaging findings (Ultrasound, CT, MR), Complications, Extrahepatic associations. 4. Anomalies of the extrahepatic bile ducts. - Choledochal cysts: Etiopathogenesis, Imaging findings, Classification, Complications. 5. Summary.

Multimodality Imaging Evaluation of Gastroenteropancreatic Neuroendocrine Neoplasms: A Diagnostic Challenge

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Monica Munoz-Lopez, MD, Mexico City, Mexico (*Presenter*) Nothing to Disclose

TEACHING POINTS

- To review the origin, pathophysiology and classification of gastroenteropancreatic neuroendocrine neoplasms.- To recognize the utility of anatomical and somatostatine receptor functional imaging in the diagnosis, staging, prognosis and selection of treatment.- To identify, in a case- based review, the main challenges and pitfalls of functional imaging in the diagnosis and follow- up of GEP NETs.- To understand the radiologists role in the selection of treatment with theranostic agents.

TABLE OF CONTENTS/OUTLINE

- Introduction to gastroenteropancreatic neuroendocrine neoplasms (GEP NENs): origin, pathophysiology and clinical syndromes- The WHO 2019 classification of GEP NENs: well- differentiated neuroendocrine tumor versus poorly differentiated neuroendocrine carcinoma- Multimodality anatomical and somatostatine receptor imaging criteria in diagnosis and staging- Pitfalls in interpretation of somatostatine receptor imaging- Prognostic value of dual positron emission tomography imaging with 18F-FDG and 18F-OC for NENs- Overview of theranostic agents for treatment of NENs

Multimodality Imaging of Biliary Tract Conditions: What Radiologists Should Know

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Awards
Identified for RadioGraphics

Participants
Camila Vendrami, MD, Chicago, IL (*Presenter*) Nothing to Disclose

TEACHING POINTS

· Review of biliary tract imaging technique · Identify the multimodality imaging features of benign and malignant conditions of the biliary tract · Discuss pitfalls in the interpretation of MR imaging and CT findings in the biliary tract

TABLE OF CONTENTS/OUTLINE

The biliary tract may be affected by a wide variety of pathologic conditions, some with similar clinical presentations. Biliary tract imaging plays a key role in determining the etiology, location, and severity of the condition and any complications. Imaging also guides management of biliary tract diseases including the most appropriate intervention when required. 1. Introduction 2. Imaging technique: what are the uses and how are standard MR cholangiopancreatography, 3D isotropic MR cholangiopancreatography and contrast-enhanced MR cholangiography and DECT performed? 3. What features characterize, on multimodality imaging including but not malignant to benign biliary (choledochal cysts including Caroli disease, cholangitis, recurrent pyogenic cholangitis, primary sclerosing cholangitis, ischemic cholangiopathy) and pre-malignant and malignant conditions (intraductal papillary neoplasm of the bile duct-IPNB-, cholangiocarcinoma and metastases)? 4. Review imaging pitfalls in the biliary tract imaging: blooming artifact, physiologic variants of the biliary system and pulsation/compression artifact 5. Take home points

Extramural Venous Invasion in Rectal Cancer Before and After Neoadjuvant Therapy Beyond Classic Findings: Recognition of Detailed Characteristics and Tumor Deposit

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Akitoshi Inoue, MD, PhD, Rochester, MN (*Presenter*) Nothing to Disclose

TEACHING POINTS

Extramural venous invasion (EMVI) is a well-investigated prognostic factor predicting poor survival in rectal cancer despite no statement in American Joint Committee on Cancer TNM staging system. EMVI was described as an expanded, irregular vessel with intermediate tumor-signal intensity; however, detailed characteristics such as the number, diameter, and location of the involved vessel, and treatment response are gathering attention, aiming to predict precise patient outcomes and stratify risk. Tumor deposits (TDs), defined as cancer nodules located in the mesorectum without evidence of underlying lymph node architecture on histopathology, are recently reported as irregular nodules in the mesorectum directly interrupting the course of the vein with tapering into the vein on MRI. MR-detected TDs are reported to be a prognostic factor as well as pathological TDs. The purposes of this exhibit are:1. To review imaging findings of EMVI and TDs in rectal cancer2. To discuss the clinical significance of EMVI and TDs in contemporary therapeutic strategy in rectal cancer.

TABLE OF CONTENTS/OUTLINE

1. Detection of EMVI and imaging pitfalls 2. What are TDs? Imaging findings and cutting-edge knowledge. 3. Detailed characteristics of EMVI and difference between EMVI and TDs 4. Assessing response of EMVI and TDs after neoadjuvant therapy 5. Summary

Closing the Loop on Challenging and Complex Small Bowel Obstructions

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Michael Hartung, MD, Madison, WI (*Presenter*) Consultant, Innovenn, Inc;Consultant, Otsuka Holdings Co, Ltd

TEACHING POINTS

1. Complex small bowel obstructions often bring both diagnostic and management dilemmas to the radiology and surgical teams.2. The radiologist plays a major role in providing a confident interpretation of the baseline CT exam that influences management and follow-up.3. Complex small bowel obstructions can be divided up into mechanical, neoplastic, and closed-loop categories.The key findings that raise the concern of closed-loop physiology include the beak sign, asymmetric edema, clustered loops with radial vessels, dilated C or U-shaped loops, and swirling narrowed vasculature. 4. Important mimics and pitfalls to consider when evaluating a complex bowel case include ischemia, angioedema, inflammatory enteritides, and graft versus host disease.

TABLE OF CONTENTS/OUTLINE

A. Defining simple versus complex small bowel obstruction- Mechanical- Abdominal and pelvic external hernias- Gallstone ileus - Afferent loop syndrome- EndometriosisB. Neoplastic- Benign- Primary tumors- Secondary tumorsC. Closed-loop- Key signs of CLO- Adhesive disease- Internal hernia- Gastric bypass related- VolvulusD. Mimics and pitfalls- Non-obstructive ischemia- Angioedema- Inflammatory enteritides (vasculitis, eosinophilic, IBD)- Radiation and GVHDE. A practical approach to reporting challenging cases

Bariatric Surgery: Imaging of Normal Post Operative Appearance and Complications

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Adina Laufer, MD, New York, NY (*Presenter*) Nothing to Disclose

TEACHING POINTS

The goal of this exhibit is to familiarize the participants with the surgical anatomy of the most common forms of bariatric surgery. Participants can then use that knowledge as a basis to identify complications of bariatric surgery and corresponding CT and fluoroscopic imaging features.Upon completion of this educational exhibit, participants will be familiar with the normal CT and fluoroscopic imaging appearance as well as the CT and fluoroscopic appearance of postoperative complications for the most commonly performed bariatric procedures. Familiarity with this subject will allow for prompt diagnosis and management for bariatric patients.

TABLE OF CONTENTS/OUTLINE

CT and GI fluoroscopic appearance of:-Gastric bypass-Gastric band-Sleeve gastrectomyThis exhibit will highlight the CT and fluoroscopic appearance for the gamut of postoperative complications including but not limited to: -leaks-strictures-marginal ulcers-hernias-small bowel obstruction-intussusception-gastroesophageal reflux

Ulcerative Colitis on MR Enterography: Beyond the Scope of Endoscope!

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Awards
Identified for RadioGraphics

Participants
Mehrnam Amouei, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Ulcerative colitis (UC) is a chronic inflammatory disease that can present at various stages of disease activity. Ileocolonoscopy and biopsy are the tests of choice to diagnose ulcerative colitis and assess disease severity. The value of MR enterography (MRE) is its usefulness in transmural/extramural assessment and identification of disease complications and extraintestinal manifestations. On the other hand, a complete colonoscopy might be unachievable in some patients, even in the expert hands, due to anatomical limitations or disease severity. However, this role is less emphasized compared to Crohn's disease due to the gradual course of UC, which is confined to the mucosa/submucosal layers of the colon. Beyond describing UC extension and severity, after completing this educational material, the readers will be able to recognize the value of MRE in: 1. Assessment of GI tract abnormalities beyond the colon in UC. 2. Identifying acute complications related to UC. 3. Describing benign and malignant disorders superimposed on UC. 4. Diagnosis of post-surgical complications in UC.

TABLE OF CONTENTS/OUTLINE

Ø Background Ø Technical considerations Ø Imaging features of UC variants in MRE Ø Acute complications Ø Extra-colonic manifestations Ø Benign disorders superimposed on UC Ø Malignant disorders superimposed on UC Ø Post-surgical imaging findings and complications Ø Mimickers Ø A practical algorithm for interpretation of MRE in UC Ø Conclusion Ø References

A Step-by-Step Approach to the Understanding of Dysphagia: What Not to Miss in a Swallow Mechanism!

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Yumi Kimura Sandoval, MD, Mexico City, Mexico (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Recognize the importance of swallow mechanism in the diagnostic algorithm of dysphagia- Learn the indications and technique used in the performance of a swallow mechanism- Review the normal anatomy of the oral cavity, oropharynx, hypopharynx, and esophagus- Understand the physiology and different phases involved in deglutition- Case-based review of the main radiologic signs and features observed in deglutition alterations leading to dysphagia

TABLE OF CONTENTS/OUTLINE

1. Normal anatomy - Oral cavity - Oropharynx - Hypopharynx - Esophagus - Anatomic variants2. Indications and technique of swallow mechanism - Useful projections - Oral contrast consistencies3. Deglutition physiology - Oral phase - Pharyngeal phase - Esophageal phase4. Deglutition pathology a) Oral phase: - Lip incompetence - Leakage to the oropharynx - Nasopharyngeal refluxb) Pharyngeal phase: - Functional alterations: penetration, aspiration, asymmetry, stasis, cricopharyngeal disfunction- Structural alterations: esophageal web, Killian Jamieson`s diverticulum, Zenker`s diverticulumc) Esophageal phase: - Functional: achalasia, diffuse esophageal spasm - Structural: epiphrenic diverticulum

Tatsuyuki Tonan, MD, Kurume, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

Illustrate the malignant tumor (non-HCC malignancies and atypical HCC), which are classified as LR-M in the LI-RADS v2018 as follows: 1. The definition of LR-M criteria including "targetoid" and "nontargetoid" imaging appearance on EOB-enhanced MRI. 2. The relationship between the targetoid/nontargetoid imaging appearances and pathological findings (i.e., fibrosis, peliotic change, mucin, cell density/ ischemia, necrosis). 3. The relationship between delayed (or persistent) extracellular contrast enhancement effects and targetoid imaging appearances. 4. Exhibit of non-HCC malignancies with targetoid or nontargetoid imaging appearance (i.e., intrahepatic cholangiocarcinoma, cholangiolocellular carcinoma, sarcomatous HCC, neuroendocrine tumors, mucinous carcinoma, intraductal papillary neoplasm of the bile duct and primary hepatic lymphoma). 5. New knowledge about the atypical HCCs with targetoid or nontargetoid imaging appearance favoring non-HCC malignancies.

TABLE OF CONTENTS/OUTLINE

LI-RADS v2017 introduced an important update to the LI-RADS-M (LR-M; probably or definitely malignant but not HCC specific) category to clarify appropriate use. Specifically, LR-M was modified as follows: "targetoid mass" including peripheral hypercellularity and central stromal fibrosis or "nontargetoid mass" including an infiltrative appearance, marked diffusion restriction, necrosis or severe ischemia, in addition to features that suggest a non-HCC malignancy in radiologist's judgment. While these imaging findings are not specific finding, to understand these imaging findings are helpful in the diagnosis of hepatic tumors, and is important in assignment of the LI-RADS.

Post-Operative CT Findings After Whipple Procedure: Normal Findings and Complications

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Vamshi Mugu, MD, Rochester, MN (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) Identify components of post-operative anatomy for a) Standard Whipple b) Pylorus-sparing Whipple2) Identify normal post-operative findings and distinguish them from complications

TABLE OF CONTENTS/OUTLINE

1) Conventional Whipple consists ofa) Partial pancreatectomy and pancreaticojejunostomyb) Duodenectomyc) Distal gastrectomy and gastrojejunostomyd) Cholecystectomy and hepaticojejunostomy2) Pylorus-sparing Whipple consists ofa) Partial pancreatectomy and pancreaticojejunostomyb) Partial duodenectomy and duodenojejunostomyc) Cholecystectomy and hepaticojejunostomy3) Common normal post-operative findingsa) Post-operative anatomy: 1) Hepaticojejunostomy 2) Pancreaticojejunostomy 3) Gastrojejunostomyb) Vascular reconstructionsc) Jejunal limb edema4) CT appearance of post-operative complicationsa) Delayed gastric emptying (a clinical diagnosis)b) Pancreatic fistulac) Biliary leakd) Hemorrhagee) Acute pancreatitisf) Vascular thrombus

Fat's All Folks: A Case-Based Tour of Benign and Malignant Abdominopelvic Lesions

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Alana Fruauff, MD, BS, New York, NY (*Presenter*) Nothing to Disclose

TEACHING POINTS

Intralesional fat within the abdominopelvic viscera narrows differential diagnosis for benign and malignant disease processes. Abdominal and pelvic fat distribution can help diagnose co-existent and unrecognized disease. The presence of fat within a lesion does not automatically suggest a benign diagnosis. It is critical for radiologists to identify when a fat-containing lesion is most likely malignant.

TABLE OF CONTENTS/OUTLINE

1. Introduction of fat-containing lesions and typical appearance on ultrasound, CT, and MRI2. Case-based review of benign and malignant fatty lesions in the following locations: a. Right upper abdomenb. GI tractc. Renal and adrenal glandsd. Reproductive systeme. Retroperitoneum f. Mesentery/peritoneum

GISTS and the Limits of RECIST: State of the Art Imaging and Treatment of Gastrointestinal Stromal Tumors

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Xin Zhan, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

GIST is the most common single type of sarcoma and the most common mesenchymal tumor in the GI tract. Teaching points include 1) Approximately 25% of GIST are discovered incidentally. GISTs have 3 morphologic patterns: spindle, epithelioid, and Wild-Type which can be associated with genetic syndromes and worse prognosis. 2) The diagnostic workup of GIST consists of the initial imaging with contrast-enhanced CT(CECT), detection of metastasis with CECT or PET/MRI, and definitive diagnosis by histopathology. Given its propensity for the stomach, CT protocols for GIST can be optimized with changes in patient position, use of oral water, CO2 crystals or positive enteric contrast. Multiphase CECT is useful in differentiating enhancement patterns of GIST vs other tumors. 3) Surgery remains the standard of care for localized tumors, but systemic therapy may be indicated based off unfavorable tumor locations, metastases, and genetic mutations. New biologic treatments (Imatinib, Sunitinib) have changed the clinical management of GIST and radiomic response evaluation continues to evolve to better assess disease progression. RECIST focuses on unidimensional, anatomic measurements, CHOI evaluates both anatomic and functional measurements, while PERCIST measures the metabolic response of tumors. We will discuss the strengths and weaknesses of these different criteria and how they impact patient management.

TABLE OF CONTENTS/OUTLINE

GIST Outline:- Pathophysiology- Clinical manifestations- Diagnostic imaging modalities/imaging features- Optimizing imaging protocols - Differential diagnoses on imaging- Treatment options, new biologic drugs- Radiomics (RECIST, PERCIST, CHOI) strengths and weaknesses

What Do You Look at Plain Radiograph Abdomen?

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Axel Torres Monarrez, MD, Tlalpan, Mexico (*Presenter*) Nothing to Disclose

TEACHING POINTS

* To review the indications, limitations, and benefits of plain abdominal radiographs.* To discuss the basic projections in the abdominal radiograph.* To show normal anatomy and its variants.* To analyze the systematic approach for interpretation of abdominal radiographs and provide a guide for residents.* To recognize normal bowel from the abnormal small and large bowel. * To be familiarize with descriptive terms for common bone and soft tissue abnormalities seen on abdominal radiographs.* To review abnormal calcification on an abdominal radiograph. * To review the lines, tubes, and other devices commonly seen on AXR including their purposes and proper positions.

TABLE OF CONTENTS/OUTLINE

1. Review of indications, advantages, and disadvantages of plain abdominal radiographs. 2.Discuss the basic projections in the abdominal radiograph. 3.Explain the normal anatomy and its variants. 4.Discuss the algorithm for the evaluation of abdominal x-ray. 5. Present a series of cases to exemplify the most important diseases presented in AXR: - Abnormal calcifications: solid organs, hollow organs, and others. -Classification of bowel gas patterns: intraluminal and extraluminal. -Fluid/Soft Tissue Density: intraluminal and extraluminal. - Displacement of Structures: splenomegaly and hepatomegaly. - Bone and soft tissue abnormalities: osteophytes, neoplasms, post traumatic, and metabolic. 6. Recognize and illustrate devices commonly seen on AXR, the lines, tubes, and drains with demonstrative cases. 7. Conclusions and a complete section of key points of what residents need to know of abdominal X-rays. 8. References.

Cosmetic Surgery in the Abdomen and Pelvis: Post-Operative Appearances and Complications

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Madeleine Sertic, MBBCh, Boston, MA (*Presenter*) Nothing to Disclose

TEACHING POINTS

Since the turn of the 21st century, there has been a significant increase in the number of Cosmetic Surgeries performed. In 2020 alone, there were more than 2 million cosmetic procedures in the United States, including over 200,000 liposuction procedures, over 90,000 abdominoplasties, and more than 20,000 gluteal augmentation surgeries. While most of these cases do not undergo routine pre- or post-operative imaging, the increased incidence of these surgeries has led to an increased number of post-op patients who are imaged for other reasons. It is important to understand the expected post-operative appearances of these procedures so as to not misdiagnose pathology, and to correctly identify complications, if present.The expected post-surgical appearances and possible complications vary depending on the specific surgery. Gluteal injections and implants can be complicated by silicone granuloma formation or implant rupture. Abdominoplasty with gluteal fat transfer (i.e. "Brazilian Butt Lift") can be complicated by fat embolism; the risk varies with the surgical technique used. Complications for most procedures include infection, hematoma, and dehiscence.

TABLE OF CONTENTS/OUTLINE

Background on Cosmetic SurgeryAbdominal Wall Augmentationo Liposuctiono Abdominoplasty§ Abdominoplasty with Gluteal Fat TransferGluteal Augmentationo Implantso InjectionsPelvic Augmentationo Cosmetic Phalloplastyo Cosmetic LabiaplastyComplicationso Hematomao Infectiono Dehiscenceo Fat Embolismo Granuloma Formationo Implant Rupture

Utilization of Perfusion CT to Improve the Diagnostic Accuracy of Pancreatic Cancer

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Konno Yoshihiro, PhD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

The accuracy improvement of diagnostic imaging of pancreatic cancer including the early lesion is necessary. Functional information obtained by perfusion CT (PCT) would be able to address unmet clinical needs in conventional diagnostic imaging based on morphological images. We have developed a novel protocol that incorporates volumetric PCT into multiphasic contrast-enhanced CT, enabling broad clinical use. Besides reducing radiation exposure, this method provides high-resolution perfusion information through parametric map fused with morphological images. In general, pancreatic cancer is depicted as a decreased area of blood flow and blood volume and a prolonged area of mean transit time compared with the background pancreatic parenchyma. Imaging assessment using PCT increased the diagnostic accuracy of small pancreatic cancers and helped detect minute lesion that was not visible as a mass. Perfusion information is associated with histopathological features, and its detailed examination may be useful in the management of pancreatic cancer.

TABLE OF CONTENTS/OUTLINE

1. Clinical issues in imaging diagnosis of pancreatic cancer. 2. Development of PCT imaging protocol. 3. High-resolution perfusion imaging: Parametric map analysis. 4. Reduction of exposure dose. 5. Imaging evaluation of pancreatic cancer using PCT. 6. Clinical usefulness and research applications.

The Forgotten Organ: Role of Contrast Ultrasound in the Evaluation of Splenic Lesion

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Paula Garcia, MEd, PhD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

• To assess the role of contrast enhanced ultrasound (CEUS) in the characterization of non-traumatic splenic focal lesions. • To review the technique used and the main fundamentals of CEUS as well as the main indications. • To analyze the different focal splenic lesions through representative cases with special emphasis on the semiology of the lesions and their behavior after the injection of ultrasound contrast material.

TABLE OF CONTENTS/OUTLINE

Focal splenic lesions (FSL) are rare compared to those of other organs such as the liver and are often discovered incidentally. Conventional ultrasound and Doppler ultrasound have a limited role in the characterization of FSL, many of them being non-specific due to the wide spectrum of radiological manifestations they may present. CEUS is an accessible, inexpensive and safe technique that can help in the characterization of FSL. We analyzed the main imaging findings supporting us in the anatomopathological diagnosis, through representative cases performed in our center of both benign (simple cyst, abscesses, cystic lymphangioma, hemangioma, hamartoma) and malignant (lymphoma, metastasis) lesions.CEUS has an added role in the characterization of FSL allowing to see the enhancement of lesions in real time. Therefore, the spleen presents a special appetite for contrast due to the unique histological characteristics of this organ. CEUS may become a good alternative when other diagnostic techniques such as computed tomography (CT) and magnetic resonance imaging (MRI) are not available.

Role of Ultrasound Contrast in the Evaluation of Gallbladder Pathology

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Kanupriya Vijay, MBBS, MD, Jacksonville, FL (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Conventional grayscale ultrasound (US) is useful in evaluating various gallbladder diseases; however, assessment of microvascularity is often needed for detailed wall assessment and to distinguish many benign from malignant processes. 2. Contrast-enhanced ultrasound (CEUS) is an easy and effective modality to differentiate conditions such as tumefactive sludge from gallbladder cancer. 3. CEUS may be useful in differentiating benign wall thickening from adenomyomatosis and chronic cholecystitis and gallbladder cancer. 4. CEUS can accurately demonstrate the microvascularity used to differentiate adherent biliary precipitate from polyps, and can help identify features of malignancy. 5. Cholecystectomy tube injection of ultrasound contrast can be used to determine cystic duct patency and identify leak.

TABLE OF CONTENTS/OUTLINE

1. Introduction:a. Briefly review microbubble formulation and pharmacokineticsb. Discuss imaging techniques with CEUS to optimize image quality 2. Case guided review of various gallbladder pathologies a. Benign i. Stones ii. Adenomyomatosis iii. Polyps iv. Chronic cholecystitis v. Tumefactive sludge b. Malignant i. Gallbladder carcinoma ii. Malignant polyps 3. Role of CEUS in interventions a. Image guided biopsy b. Evaluation of cholecystostomy tube for cystic duct patency and leaks 4. Pitfalls

Retrorectal Cystic Lesions: Utility of Magnetic Resonance Imaging for a Forbidden Space

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Lautaro Florentin, MD, Buenos Aires, Argentina (*Presenter*) Nothing to Disclose

TEACHING POINTS

- The retrorectal cystic lesions include a wide spectrum of etiologies.- The magnetic resonance imaging (MRI) allows approximate the diagnosis and to determine complications.- Diffusion weighted imaging (DWI) sequence is a cornerstone to suggest the presence of a solid component within the cyst.- Surgical management is mainly influenced by the MRI findings. The third sacral vertebra (S3) level is the key point for surgical approach selection.

TABLE OF CONTENTS/OUTLINE

1) Introduction and anatomy2) Differential diagnosis. Definition and imaging characteristics a) Developmental cysts - Dermoid cysts - Epidermoid cysts - Retrorectal cystic hamartomas (tailgut cysts) b) Malignancy - Rectal carcinomas with atypical presentations - Metastases c) Abscess d) Others - Vascular malformations - Granulomas3) MRI advantagesa) Intracystic content characterization - What to look for? (Size, lobulations, septum, walls, dense, fat and/or solid component) - Malignancy signs - Complications: infection and fistula. b) Malignant transformation - Why does it matter? Prognosis and management implications. - How to diagnose? DWI/ADC utility. Avoiding pitfalls: teratomas and dense-content lesions. c) Surgical planning. What radiologist apports to the surgeon? - Surgical approach selection. The S3 level. - Non-surgical treatment. The MRI role

When the Bile Goes Sour: A Case-based Review of Unusual Complications of Biliary Procedures

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Cynthia Borborema, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

To review the expected imaging appearance after hepatobiliary surgeries. To list radiologic features of early and late usual biliary postsurgical complications to provide a practical resource for radiologists to standardize examination. To illustrate cases of unusual complications after biliary procedures to improve the clarity and clinical impact of radiology reports.

TABLE OF CONTENTS/OUTLINE

Anatomy of the normal biliary tract. Most common variants of the biliary tree and their surgical relevance. Role of imaging in surgical planning and relevant report information. List of most common biliary surgeries and procedures. Epidemiological background of biliary procedures and associated complications. Usual complications after biliary procedures (biliary and nonbiliary, early and late ones), including key patient history, risk factors, imaging findings, and pitfalls. Unusual postsurgical biliary complications, including right hepatic artery pseudoaneurysm, post-cholecystectomy Mirizzi syndrome, late cholangitis after Kasai procedure, lung abscess due to retained gallstones, subcapsular liver hematoma after cholecystectomy, foreign-body granuloma caused by dropped gallstones simulating abdominal wall tumor, and others. Diagnostic tools, including magnetic resonance cholangiopancreatography (MRCP). Optimal imaging protocols.

Misses and Misinterpretations of Pancreatic Adenocarcinoma: Recognizing Its Atypical Manifestations

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Pavan Shah, MD, Sayreville, NJ (*Presenter*) Nothing to Disclose

TEACHING POINTS

Pancreatic adenocarcinomas are highly lethal and timely detection is key to improving patient prognosis. While most cases present with typical features of pancreatic ductal dilatation, hypo enhancing mass and mass with restricted diffusion, some cases can present a diagnostic dilemma and are frequently misdiagnosed. Recognizing the atypical features helps in early diagnosis. We present atypical cross-sectional imaging findings of pancreatic adenocarcinoma.To review the epidemiology, pathology, and prognosis of pancreatic ductal adenocarcinomaTo describe typical imaging characteristics of PDAC along with atypical features to improve diagnostic accuracyTo discuss optimization of imaging techniques with the goal of preventing diagnostic delays and improving prognosis

TABLE OF CONTENTS/OUTLINE

Introduction, epidemiology, clinical manifestations, histopathology, typical CT/MRI findings, atypical CT/ MRI findings including lesions without pancreatic ductal dilatation, lesions without restricted diffusion, lesions masquerading as cystic lesions, lesions presenting as acute pancreatitis, groove pancreatitis. Discussion on optimization of CT technique including use of dual energy, optimization of MRI techniques including use of MRCP, and T1 weighted sequences. Conclusion.

Inflammatory Bowel Disease: Fluoroscopic Assessment and Postoperative Complications

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Awards
Certificate of Merit

Participants
Linda Kelahan, MD, Chicago, IL (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Revisiting fluoroscopic findings in inflammatory bowel disease (IBD) with cross sectional correlation. 2. Outline possible surgical interventions for IBD. 3. Steps to successful fluoroscopic evaluation prior to ileostomy reversal 4. Fluoroscopic assessment of postoperative surgical complications.

TABLE OF CONTENTS/OUTLINE

1. Introduction a. Definition of IBD b. Epidemiology 2. Multimodality imaging of IBD a. Small bowel follow-through and barium enema examination. i. Technique ii. Imaging findings b. Cross sectional imaging findings 3. Fluoroscopic evaluation prior to ileostomy reversal a. Evaluate records to determine anatomy and surgical anastomoses b. Scout images in multiple obliquities c. Water-soluble fluoroscopic LGI steps to success d. Troubleshooting common complications during LGI: how to navigate enterocutaneous fistulas, severe anastomotic strictures, no contrast progression into the ostomy bag, multiple anastomoses. 4. Common surgical procedures (Fluoroscopic assessment of the altered anatomy) a. Small bowel resection b. Small bowel strictureplasty c. Total abdominal colectomy with ileorectal anastomosis d. Total abdominal colectomy with end ileostomy e. Colectomy (segmental/total) f. Proctectomy g. Restorative proctocolectomy with ileal pouch anal anastomosis h. Balloon dilatation 5. Postoperative complications: Fluoroscopic assessment with cross sectional correlation a. Strictures b. Pelvic infections c. Anastomotic site leakage d. Pouch failure e. Pouch cancer f. Fecal incontinence 6. Conclusion and take-home messages

Early Postoperative GI Tract Evaluation: From Expected Findings to Complications

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Awards
Identified for RadioGraphics

Participants
Louise Cavalcanti, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Distinguishing frequent and expected postoperative image findings after gastrointestinal tract surgical procedures from complications is essential in the early postoperative period, as well as detecting signs of possible complications that require further investigation.2. Intraperitoneal free air and fluid, fat stranding and bowel dilatation are extremely common findings in the early postoperative image and, although are expected, they can sometimes represent signs of complications. The imaging characteristics and evolution are key for this differentiation.3. Contrast-enhanced CT is the imaging method of choice for the evaluation of patients in the early postoperative period, with good characterization of gas and free fluid and the possibility of using positive oral contrast in patients with suspected anastomotic leakage or bowel perforation.

TABLE OF CONTENTS/OUTLINE

a. Introduction. b. CT protocol for early postoperative evaluation. c. Evaluation of intraperitoneal air: residual postoperative pneumoperitoneum or complication? d. Evaluation of intraabdominal fluids: sterile postoperative content or infected collections - imaging features and score systems. e. Fat stranding patterns of the mesentery that may suggest postoperative complications. f. Identification of dilated bowel and differentiation between metabolic, obstructive or ischemic conditions. g. Other expected postoperative findings and major early complications. h. Take home messages.

Magnetic Resonance Imaging Evaluation of Perianal Fistulas: Making It Easier For Surgeons and Radiologists!

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Joao Manoel Santos, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is:- To review usual and unusual cases of perianal fistulas.- To correlate important findings with the anatomy and pathophysiology.- To discuss image findings according to Parks and St James's University Hospital classifications, in order to enhance surgeons and radiologists' skills.- To review MRI protocols in the evaluation of patients with perianal fistulas.- To highlight their characteristics in order to familiarize surgeons and radiologists with these conditions, preventing unfavorable patient outcome.

TABLE OF CONTENTS/OUTLINE

Applied anatomy of the anal sphincter complex.MRI protocols in the evaluation of patients with perianal fistula.Parks classification with sample cases of:- Intersphincteric Suprasphincteric- Transsphincteric- Extrasphincteric.St James's University Hospital classification with sample cases of:- Grade 1: simple linear intersphincteric fistula- Grade 2: intersphincteric fistula with an abscess or secondary track- Grade 3: transsphincteric fistula- Grade 4: transsphincteric fistula with an abscess or secondary track in the ischiorectal or ischioanal fossa- Grade 5: supralevator and translevator disease.Correlation between Parks and St James's University Hospital classifications.Submucosal fistula.How do I report?- Location- Track o Relationship to sphincters o Simple or complex? Sample cases of pearls, pitfalls, diagnostic difficulties, and mimics.Summary and take-home messages.

Most Common Gastrointestinal Post-surgical Anatomy on CT: A Pictorial Review. Radiologists- Don´t Be Afraid

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Louise Cavalcanti, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Radiological evaluation of the post-operative abdomen can be challenging and knowledge of normal post-operative anatomy is important to identify possible complications. 2. The intention of this pictorial review is to describe the most important gastrointestinal surgical techniques, their clinical indications and show their normal post-operative appearance on computed tomography (CT). 3. Besides that, this essay provides some signs to identifying the procedure, which can be helpful particularly when surgical history is missing, with recognition of the organ(s) involved, determination of what was resected and familiarity with the type of anastomoses used.

TABLE OF CONTENTS/OUTLINE

a. Introduction b. Imaging methods and protocols for postoperative evaluation. c. Identification of mechanical stapling patterns and radio-opaque markers from the anastomosis. d. Evaluation of gastric surgical techniques, including bariatric procedures and expected results. e. Evaluation of small bowel surgical techniques. f. Evaluation of the most common colorectal surgical techniques, including Hartmann procedure and restoration of intestinal continuity. g. Take-home messages.

A "Spectral-acular" Ileus

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Reza Al-Saudi, MD, Belfast, United Kingdom (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Gallstone ileus represents a rare cause of small bowel obstruction. 2. Sensitivity of CT in the diagnosis of gallstone ileus is > 90%. 3. CT diagnosis of gallstone ileus is dependent on establishing the features of Rigler's triad - small bowel obstruction, pneumobilia, and an ectopic calcified gallstone. 4. 15% - 20% of gallstones are radio-opaque. This fact limits the Radiologist's ability to definitively establish the presence of an ectopic gallstone, although this presence is usually inferred based on associated features. 5. Spectral CT offers numerous advantages over standard CT. Spectral CT utilises the principle that elements and by extension mixed-composition materials cause differing attenuation of photons (via photo-electric absorption) at energy levels near the k-edge of the element in question, as compared to the remainder of the energy spectrum. The differing behaviour of elements across the energy spectrum allows material differentiation and the determination of material composition. 6. Effective atomic number (Z effective), mono-energetic (mono keV), and iodine density spectral reformats all aide in material differentiation. Z effective reformats provide the most reliable and reproducible results in relation to the detection of radio-lucent gallstones.

TABLE OF CONTENTS/OUTLINE

1. Introduction. 2. Role of conventional CT. 3. Conventional CT vs Spectral CT. 4. Spectral CT - options for diagnosis.

Hepatocellular Lesions In Patients with Vascular Liver Diseases : Radiologic-Pathologic Correlation

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Mayu Uka, (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is: 1)To review imaging features on contrast enhanced CT, MRI of hepatocellular nodules found in vascular liver diseases with histopathological correlations. 2) To discuss the point of differential diagnosis.

TABLE OF CONTENTS/OUTLINE

Hepatocellular nodules have been recognized in vascular liver diseases (Budd-Chiari syndrome, congenital portosystemic shunt, hereditary hemorrhagic telangiectasia, extrahepatic portal vein obstruction and congenital heart disease etc.). They may be related to portal venous deprivation, venous outflow obstruction, or arterial diseases, imbalances in arterial, portal, and venous blood flow have been reported to cause nodule formation. These nodules include nodular regenerative hyperplasia, large regenerative nodule, partial nodular transformation, focal nodular hyperplasia, and others, as well as hepatocellular adenoma and hepatocellular carcinoma, which are true neoplastic lesions. Some confusions in their identification and overlap in their definitions exist. This exhibit will describe the imaging appearances of each type of hepatocellular nodules found in the vascular liver diseases, by correlating with histology, and provide some clues for their differential diagnosis.

Deep Learning Reconstruction of MR Imaging: Technical Features and Clinical Impact on Abdominal MR Imaging

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GI

Participants
Hiromitsu Onishi, MD, Suita, Japan (*Presenter*) Research Grant, General Electric Company;Speakers Bureau, General Electric Company

TEACHING POINTS

Deep learning reconstruction (DLR) has been introduced by several vendors to improve MR image quality. DLR has various benefits such as effective noise reduction in the diagnosis with MR imaging. The purpose of this presentation is: 1. To illustrate technical features of DLR compared with conventional reconstruction, 2. To discuss image quality of MR imaging using DLR, and 3. To discuss clinical impact on MR study in the diagnosis of abdominal diseases.

TABLE OF CONTENTS/OUTLINE

1. Overview 2. Principle of DLR 3. Difference from the conventional reconstruction technique 4. Sequences applicable to DLR: fast spin echo T2WI, single-shot fast spin echo T2WI, DWI, small field-of-view DWI, fast imaging employing steady-state acquisition (FIESTA), etc. 5. Effective reduction of image noise with DLR 6. Improved spatial resolution with DLR 7. Reduction of truncation artifacts with DLR 8. What purpose can DLR be used for in clinical practice? To improve image quality, to increase the spatial resolution of the images, to save acquisition time, or combination of them 9. Clinical impact on the diagnosis of liver diseases 10. Clinical impact on the diagnosis of pancreatic diseases 11. Summary

Participants
Hiroaki Takahashi, MD, PhD, Rochester, MN (*Presenter*) Nothing to Disclose

TEACHING POINTS

Normal perirenal lymphatic drain is difficult to identify on conventional imaging. It is partially visualized by CT- and MRI-lymphangiogram. It is also occasionally depicted as pyelolymphatic backflow on retrograde pyelogram, intravenous urogram and CT urogram secondary to acute rise of pressure in the collecting system. However, the knowledge of perirenal lymphatic flow is of clinical importance to understand the conditions involving the perirenal retroperitoneal lymphatics and behavior of lymph node metastases from renal or upper tract urothelial malignancy. This exhibit will review the fundamental concept about perirenal lymphatic systems, and imaging assessment for non-neoplastic and neoplastic conditions involving the perirenal lymphatics. Further, differential diagnosis and treatment strategy of these conditions are discussed. The purposes of this exhibit are: 1. To review the fundamental anatomy, physiology and imaging of normal perirenal lymphatic systems. 2. To review the imaging findings, differential diagnoses and treatment options for various conditions associated with perirenal lymphatic systems.

TABLE OF CONTENTS/OUTLINE

1. Overview of the lymphatic system. 2. Fundamental anatomy and physiology of perirenal lymphatic systems. 3. Imaging of perirenal lymphatics and their communication with other lymphatic chains. 4. Imaging findings of various conditions of perirenal lymphatic systems with discussion of their differential diagnoses and treatment strategies. 5. Summary

GUEE-10 Malignant Neoplasms of the Penis with Radiologic Pathologic Correlation

Participants
Jamie Marko, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Most malignant tumors of the penis are squamous cell carcinomas (SCC) arising from the mucosal lining of the glans, coronal sulcus and foreskin. Non-epithelial tumors do not demonstrate the same anatomical predilection. 2. HPV infection is associated with subtypes of penile SCC. Additional risk factors are lack of circumcision, phimosis, chronic inflammation, lichen sclerosis, smoking, and radiotherapy. 3. Penile cancer commonly presents as a discrete mass, ulcer or erythematous lesion on the glans or foreskin in a male in their 5th or 6th decade of life. 4. Imaging may be used to evaluate the local extent of a penile neoplasm and to detect metastases. Penile SCC has a predictable pattern of spread from the inguinal lymph nodes (LN) to the pelvic LN and lastly to the periaortic LN. Systemic metastases, including to the liver, lungs, mediastinal LN, are a late event.

TABLE OF CONTENTS/OUTLINE

1. Review penile anatomy with an emphasis on frequent sites of tumor origin and local spread. We will emphasize the anatomic structures that affect local staging and impact management. 2. Illustrate the pathologic spectrum of malignant penile neoplasms. The pathologic descriptions will serve as the basis for understanding the imaging appearances. 3. Describe the multimodality imaging evaluation of penile cancer. 4. Illustrate the spectrum of penile cancer at imaging providing radiologic-pathologic correlation.

GUEE-11 Benign Lesions of the Urinary Tract Mimicking Malignancy - Test Your Skills with this Case-based Review

Participants
Javier Azpeitia Arman, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

To illustrate equivocal imaging findings of upper and lower urinary tract lesions including normal variants, inflammatory/infectious diseases and benign tumors mimicking genitourinary malignancy. To analyze the correlation between cystourethrogram, IVU, US, CT and MR imaging features with pathology in urinary tract lesions. To emphasize pitfalls, diagnostic difficulties and differential diagnosis.

TABLE OF CONTENTS/OUTLINE

Although a mass or a thickening in the upper and lower urinary tract may be caused by urothelial carcinoma, several benign and

malignant entities should also be included in differential diagnosis. We review images of the urinary tract (pelvicalyceal system, ureters, bladder and urethra) in different entities mimicking cancers in a quiz format, with clues to interpretation and providing images of malignant lesions for comparison. Imaging findings (cystourethrogram, IVU, US, CT and MR) and pathologic correlation will be presented. How pathologic correlation informs imaging interpretation will be highlighted. The list of cases presented includes: inflammatory diseases (pielitis and cystitis cystica, eosinophilic ureteritis and cystitis, Keratinizing desquamative squamous metaplasia (cholesteatoma) of the ureter, polypoid, papillary, granulomatous BCG), secondary to chemotherapy or irradiation, benign tumors (papilloma, leyomioma), extrinsic lesions (prostate hyperplasia and carcinoma, uterine and ovarian tumors, colonic cancer, diverticulitis, Crohn´s disease, varicose ureteral veins), filling defects (lithiasis, ureterocele, blood clot), addition images (diverticula).

GUEE-12 Keeping it Retro: Reflecting on the Spaces, Planes, Pathologies of the Retroperitoneum

Awards
Certificate of Merit

Participants
Jessica Lovett, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is to: 1. Review abdominopelvic anatomy, including the borders of the peritoneum and retroperitoneum. 2. Identify imaging findings to localize abdominal pathology to the peritoneum versus the retroperitoneum. 3. Examine the imaging signs used to localize pathology to a particular organ or space, focusing on retroperitoneal pathology. 4. Distinguish the pathways of spread of disease amongst the retroperitoneal compartments and surrounding compartments. 5. Apply these concepts with illustrative, interactive cases.

TABLE OF CONTENTS/OUTLINE

1. Anatomic borders of the peritoneal and retroperitoneal compartments within the abdomen and pelvis, and communicating foramina. 2. Localizing signs to assist radiologists in localizing pathology to peritoneum, retroperitoneum, or a specific organ. 3. Key imaging findings and differential diagnosis, with focus on retroperitoneal pathology. 4. Relevance of anatomical boundaries and disease spread for surgical planning. 5. Challenging cases to demonstrate teaching points.

GUEE-13 Follow the Yellow Brick Road: An Educational Review of Current Imaging in Urethral Stricture Disease with a Focus on MRI

Participants
Daniel Harris, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Provide important definitions and principles in urethral stricture disease including a brief overview of clinical assessment, treatment, and current diagnostic imaging guidelines as suggested by the AUA and EAU. \2. In-depth discussion of retrograde urethrography, sonourethrography, and magnetic resonance urethrography including their advantages, disadvantages, and best uses with examples from our practice including our own protocol for each imaging modality. \3. Suggest supported uses for magnetic resonance urethrography by compiling case series data from over the last decade. Then, discuss an example case where multiple imaging modalities were used, providing direct comparison of magnetic resonance urethrography to the other modalities. \

TABLE OF CONTENTS/OUTLINE

1. Introduction: definitions, clinical assessment, and treatment modalities for urethral strictures2. Imaging modality sections: Current uses, advantages, disadvantages, potential future applications for each respective modality \2a. Retrograde urethrography, Sonourethrography, Magnetic resonance urethrography \2b. Table summarizing MRU case findings from prominent case series \3. Example case: comparison of modalities

GUEE-14 Adrenal Lesions Inside Out" - A Pictorial Review of the Correlation Between Radiologic and Anatomopathological Patterns of Benign and Malign Adrenal Lesions

Participants
Camila Franco, BMedSc, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review adrenal gland anatomy and discuss how it is important in the evaluation of adrenal lesions 2. Discuss the role of imaging and pathological evaluation in the assessment of adrenal gland lesions 3. Review the most common and uncommon imaging and anatomopathological patterns of benign and malign adrenal lesions. 4. Understand the correlation between radiologic and anatomopathological findings

TABLE OF CONTENTS/OUTLINE

Adrenal gland lesions have a prevalence of 4-7% in imaging tests among adults. The prevalence of these lesions increases with the greater availability of imaging tests and as the population gets older. Once the adrenal gland is made of different types of tissues that produce various types of hormones, adrenal lesions may present different features. This pictorial review will discuss:1. Adrenal gland anatomy and histology review 2. The role of different imaging and anatomopathological techniques in evaluation of adrenal lesions (a) Ultrasound (b) Computed tomography (c) Magnetic resonance (d) PET/CT (e) Gross specimen evaluation (f) Histology - Morphological criteria - Immunohistochemical studies (g). Molecular pathology 3. Different (usual and unusual) imaging and anatomopathological patterns of benign and malign adrenal lesions and how they correlate (a) Adenoma (lipid-rich and lipid-poor) (b) Aldosteronoma (c) Myelolipoma (d) Hematoma (e) Macronodular adrenal bilateral hyperplasia (f) Neural crest tumors (g) Cysts (h) Pheochromocytoma (i) Adrenocortical carcinoma (j) Metastatic neoplasms (k) Miscellaneous

GUEE-15 What Do We See When We Don't See the Bladder? Review of the Main Urinary Diversion Techniques and Their Complications

Awards
Certificate of Merit

Participants
Alba Salgado Parente, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review the different types of urinary diversion techniques.2. To understand the common findings to be expected in a postoperative study using the different imaging techniques (MDCT, MRI, fluoroscopy).3. To recognize the main postoperative complications, both early and late, grouped according to pathological groups.

TABLE OF CONTENTS/OUTLINE

1. Introduction2. Radiological protocol for post-operative evaluation (MDTC, MRI, fluoroscopy, US).3. Main surgical techniques and expected post-operative findings.3.1 Cutaneous incontinent diversions: Cutaneous diversion (Uretero-ureterocutaneostomy), Ileal conduit.3.2 Continent diversions: Indiana pouch, Orthotopic Bladder Replacement.4. Post-operative complications: Pictorial review4.1 Collecting system: Hydronephrosis, Urolithiasis, Urinary leakage, Ureteral stricture.4.2 Intestinal loops: Alteration of the intestinal rhythm, Intestinal leakage, Stomal stricture, Parastomal herniation, Fistulas, ileal conduit necrosis.4.3 Infection: pyelonephritis, abscesses, and other collections (hematoma, lymphocele).4.4 Tumoral: Local recurrence, Distant recurrence.5. Systematic approach to urinary diversions5.1 What type of urinary diversion surgery has been performed?5.2 Points of particular interest when assessing the presence of each type of complication6. Take home messages7. Bibliography

GUEE-16 Radiological Lexicon for Renal Mass Characterization: Pictorial Review

Participants
Rebeca Gil Vallano, Madrid, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Revise a list of standardized terms employed to describe renal masses: basic imaging, CT, MR and miscellaneous terms.• Correlate each term with several cases from our institution with pathologic correlation.

TABLE OF CONTENTS/OUTLINE

Radiology reports need to employ a standardized language to improve their understanding for the rest of radiologists, clinicians and patients.In february 2021 the Society of Abdominal Radiology disease-focused panel on renal cell carcinoma published a consensus statement of recommended terms to be employed when reporting renal masses at CT and MR. We have revised the 31 terms described in this consensus: 14 basic terms such as definition of solid or cystic mass, 8 CT terms for example macroscopic fat or CT enhancement, 6 MR terms as MR enhancement and 3 miscelaneous terms like growth rate. Each term will be reviewed, explained and illustrated with different cases of our institution. In addition, we will offer an interesting anatomopathological approach to the cases presented.Knowledge of this lexicon will improve radiological reports, decrease interobserver variability, and facilitate communication with physicians.

GUEE-17 To Infinity and Beyond: Present and Future of Contrast Enhanced Ultrasound (CEUS) in Renal Transplant

Awards
Certificate of Merit
Identified for RadioGraphics

Participants
Tomas Fernandez, MD, Barcelona, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

Assessment of renal transplant complications with CEUS. Review of unusual and latest complications associated with up-to-date surgical techniques and immunosuppressant therapies. Future of CEUS on renal transplant patients, focusing on radiomics.

TABLE OF CONTENTS/OUTLINE

Immediate complications Intrasurgical ultrasound in robot renal transplant. CEUS in hyperacute rejection. CEUS in acute tubular necrosis. CEUS in cortical necrosis. CEUS in arterial and venous thrombosis. CEUS in compartimental syndrome. CEUS in segmentary infarcts. Living renal donor transplant pseudostenosis.Urological complications: CEUS guide for nephrostomy. CEUS anatomy of the intracavitary upper urinary tract (UUT). CEUS in UUT leak. CEUS in the differentiation of benign and malignant diseases of UUT. CEUS in ureteral kinking and stenosis.Collections CEUS in posttransplant collections. Late subcapsular linfocele and sinusal lymphatic ingurgitation due to mTOR. Subcapsular hematoma due to hemorragic cyst. Presurgical ureteral map for marsupialization of lymphoceles. CEUS in renal infection.Malignancies associated with renal transplant: Malignancies associated with immunosuppression and more prevalence of tumors due to extended age inclusion on donor lists. Malignancies associated with acquired cystic disease in long hemodialysis. Known malignancies, partial nephrectomy ex vivo. CEUS in active surveillance of complicated cysts and biopsied benign tumors.Biopsy CEUS as a guide for biopsy. CEUS in arteriovenous fistula and pseudoaneurysm. CEUS in the diagnosis of active bleeding. CEUS in US-guided thrombin treatment of pseudoaneurysm/bleeding.Future: CEUS perfusion. Elastography. Radiomics.

GUEE-18 What's New in Classification, Pathology, Imaging Findings, and Management of Renal Cell Carcinomas? 2022 Update for Radiologists

Participants
Varshaa Koneru, Telangana, India (*Presenter*) Nothing to Disclose

TEACHING POINTS

Review updated, current classification of renal cell carcinomas (RCCs) that are based on histomorphology/molecular diagnostic criteria with special emphasis on novel tumor entities Discuss select pathologic/molecular features and genetic alterations that influence natural history, prognosis, metastatic disease targeted therapies Describe imaging findings of existing ‘new’ RCCs with an update on radiogenomics of select tumors Review novel treatment strategies for metastatic RCCs role of imaging in assessing efficacy of novel drugs

TABLE OF CONTENTS/OUTLINE

Introduction RCC Classification: Existing tumors, New tumors Emerging entities Pathology Updates: Molecular signatures, histopathology patterns TNM staging Imaging Findings Clear cell RCC Papillary RCC Chromophobe RCC Oncocytoma other oncocytic-hybrid tumors Clear cell papillary RCC Tubulocystic RCC MiTF Family RCC: Xp11 translocation TFEB-fused Acquired cystic disease-associated RCC SMARCB1-deficient RCC: Medullary carcinoma unclassified RCC with medullary phenotype Mucinous tubular spindle cell carcinoma Metanephric adenoma related tumors Hereditary RCC syndromes: Fumarate-deficient RCC, Succinate Dehydrogenase-deficient RCC Birt-Hogg-Dube syndrome RCC in Post-Radiation/Chemotherapy Multilocular Cystic Neoplasm of Low Malignant Potential RCC in Neuroblastoma Survivors Thyroid-like Follicular RCCs RCCs associated with ALK-Gene Rearrangements Molecular Imaging biomarkers Novel targeted therapies Role of Imaging Summary RCCs are genetically heterogeneous and demonstrate characteristic molecular features imaging findings that dictate prognosis survival

GUEE-19 Biochemical Recurrence of Prostate Cancer: Where Cancer Recurs, Where MRI Fails, and Where PSMA PET Fails?

Awards
Identified for RadioGraphics

Participants
Muhammad Awiwi, MD, Houston, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

Prostate cancer can recur in up to 40% of patients who receive treatment (radical prostatectomy, androgen deprivation therapy, or radiotherapy) and the definition of biochemical recurrence varies according to the treatment type.There are typical sites of prostate cancer recurrence, but the disease can also recur in unusual sites in the pelvis. These sites should be interrogated when interpreting pelvic MRI.Both MRI and PSMA-PET have limitations/pitfalls and they complement each other.

TABLE OF CONTENTS/OUTLINE

To review the definition of biochemical recurrenceTo review expected imaging findings after prostate cancer treatmentDescribe common sites of prostate cancer recurrenceDescribe uncommon sites of prostate cancer recurrence in the pelvisDescribe potential pitfalls of MRI and PSMA-PET in detection of recurrent prostate cancer.

GUEE-2 Renal Mass Imaging with the Clear Cell Likelihood Score v2: A User Guide

Awards
Identified for RadioGraphics

Participants
Anup Shetty, MD, Saint Louis, MO (*Presenter*) Nothing to Disclose

TEACHING POINTS

Solid small renal masses (SSRM), defined as < 4 cm in diameter, are increasingly detected but can be complex to manage. A framework for approaching the SSRM is critical in providing optimal management, as clear cell RCC is the most common and aggressive subtype, and a high likelihood of this diagnosis can influence management. The recently updated MRI clear cell likelihood score (ccLS) provides the radiologist with tools to optimize their assessment of the SSRM. This exhibit will:1) Familiarize the reader with the ccLS and why it was developed2) Discuss key considerations in MRI protocol, eligibility criteria, and imaging features for using the ccLS algorithm3) Illustrate how to use the ccLS algorithm to assess the SSRM through a series of cases4) Highlight pitfalls of the ccLS algorithm and other considerations in MRI of SSRM not included in ccLS

TABLE OF CONTENTS/OUTLINE

- ccLS: rationale (moving beyond "is it enhancing, does it contain fat") and diagnostic performance- MRI protocol- Eligibility criteria and imaging features- How to use the algorithm- Case examples of working through the algorithm and pitfalls, including offramps when the ccLS is inappropriate to utilize (fat-rich angiomyolipoma, cystic renal mass, hemorrhagic renal cysts)- Reporting using ccLS: template and nomenclature- Potential management strategies based on ccLS

GUEE-20 Multicenter Lessons from Adrenal Multidisciplinary Tumor Boards: Expert Evidence-Based Views of the Society of Abdominal Radiology Adrenal Neoplasm Disease Focused Panel

Awards
Certificate of Merit

Participants
Ryan Chung, MD, Boston, MA (*Presenter*) Consultant, ScanMed, LLC;Stockholder, ScanMed, LLC

TEACHING POINTS

While some adrenal pathology is easily diagnosed radiologically, there are many common errors in adrenal imaging that may arise due to a lack of familiarity with technical, anatomic, physiologic, hemodynamic, and biologic factors. This is compounded by a deficiency of modern clinical and radiologic knowledge of adrenal pathology. These challenges arise when the radiologist encounters atypical presentations of common benign and malignant adrenal masses, mimics of benign and malignant adrenal masses, and rare adrenal pathology. This may lead to misdiagnosis, suboptimal management, and potentially adverse outcomes. In this exhibit, we present cases commonly encountered in clinical practice and presented to adrenal multidisciplinary tumor boards of major tertiary centers. Evidence-based expert views will be discussed to provide clues to the correct diagnosis and further guide appropriate management. 1. Describe common errors encountered in clinical practice and presented to adrenal multidisciplinary tumor boards of major tertiary centers 2. Illustrate relevant technical, anatomic, pathophysiologic, hemodynamic, and biologic factors leading to these errors 3. Review evidence-based literature and discuss expert opinions to provide useful tips in diagnosis 4. Correlate cross-sectional imaging findings with clinical and pathologic findings

TABLE OF CONTENTS/OUTLINE

1. Technical errors 2. Atypical presentations of common benign masses 3. Atypical presentations of common malignant masses 4. Benign mimics of malignant masses 5. Malignant mimics of benign masses 6. Rare adrenal pathology

GUEE-21 Participants

Postoperative Changes and Complications of the Urinary Tract at Imaging

Weibo Fu, BS, Augusta, GA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) To review changes to the anatomy of the genitourinary tract after urological procedures 2) To provide imaging examples of postoperative appearance and complications of the urinary tract 3) To distinguish between expected and unexpected postoperative imaging findings following urological surgery and image-guided procedures

TABLE OF CONTENTS/OUTLINE

The incidence of urological pathologies such as renal cell carcinoma and renal stones has risen over time, in part due to improved detection with increased use of imaging in clinical practice. In turn, rates of urologic interventions performed have also increased, some of which include a) partial nephrectomy, b) ureteroneocystostomy, c) cryoablation, d) diversions, and e) neobladder placement. Potential complications can arise from these procedures such as a) hematomas, b) conduits, c) strictures, and d) lymphoceles. Such complications are important to distinguish from common postoperative changes in clinical practice. Computed tomography scan is the most common imaging modality used when potential complications are suspected, though MRI may be considered for complex cases. For radiologists to provide appropriate recommendations for care following surgical urology procedures, a clear understanding of normal and abnormal post-operative anatomy is necessary.

GUEE-22 Imaging Peyronie disease Before and After Treatment: A Guide for Radiologists Urologists

Participants
Lauren F. Alexander, MD, Jacksonville Beach, FL (*Presenter*) Spouse, Stockholder, Abbott Laboratories;Spouse, Stockholder, AbbVie Inc;Spouse, Stockholder, General Electric Company;Spouse, Stockholder, Myriad Genetics, Inc

TEACHING POINTS

Ultrasound (US) is primary imaging modality for assessment of plaque and erectile dysfunction in patients with Peyronie disease to guide medical vs. surgical treatment planning; however, magnetic resonance imaging (MRI) and computed tomography (CT) can be used in the pretreatment and post treatment setting as well. After reviewing this exhibit the learner will: (1) Understand the pathophysiology of acute and chronic fibrosing Peyronie disease. (2) Recognize US findings of Peyronie plaques and US Doppler features of erectile dysfunction. (3) Describe role of noncontrast CT for calcified Peyronie plaques. (4) Determine when to use imaging after penile surgery. (5) Recognize normal and abnormal imaging findings of penile implants.

TABLE OF CONTENTS/OUTLINE

A. Background (1)Pathophysiology of Peyronie's disease (2)Clinical exam findings: acute and chronic phases (3) AUA management algorithm B. Pre-treatment imaging with case examples (1) Penile US grayscale: plaque Doppler: erectile function (2) CT and MR when to use, typical protocols, findings (C) Surgical treatment options (1) tunical plication vs. plaque incision/excision +/- grafting (2) role of penile prothesis (D) Post operative imaging (1) typical findings complications

GUEE-23 Post-treatment MRI in Cervical Cancer - What To Look For

Participants
Mayra V. Soares, MD, Brasilia, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Basic technical key points of pelvic MRI for a targeted assessment.Quick review of the latest FIGO MRI staging system, with the anatomical landmarks.Correlation between staging and therapeutic options.MRI findings of post-treatment and post-intervention procedures.Challenges in differentiating post-treatment and tumor recurrence.Identify the main complications of cervical cancer treatments.

TABLE OF CONTENTS/OUTLINE

Introduction: recurrency up to 30% of treated patients, which 66% occur in the next 2 year post initial treatment and 90% until 5 year, and survival rate can reach 15-20%.Technical points: MRI high-resolution oblique T2WI planes (small thickness and FOV) are critical to evaluate lesions.Anatomical landmarks: pelvic intricate anatomy requires the understanding of its compartments, cervix zones, vessels, sidewalls, ligaments, and lymph nodes.Staging and therapeutic correlation: Stage IIB (parametrial invasion) as a landmark for prognosis and therapeutics decision. Lower stages allow surgery with or without RT/QT. Stages IIB requires neoadjuvant treatment before reassessment.Main treatments MRI findings: trachelectomy and fertility-preserving treatment; hysterectomy/lymphadenectomy; RT/QT.Acute (vaginal edema/erythema, cystitis) and chronic (stenosis, fistulations, enteritis, insufficiency fractures, and urological) complications.

GUEE-24 Prostate MRI Quality - A Pictorial Review Using the PI-QUAL Score

Participants
Francesco Giganti, MD, London, United Kingdom (*Presenter*) Nothing to Disclose

TEACHING POINTS

The PI-RADS guidelines set out the minimal technical requirements for the acquisition of multiparametric MRI of the prostate.The rapid diffusion of prostate MRI has led to variability in vendor and scan quality across the world. The Prostate Imaging Quality (PI-QUAL) score was created to standardize the reporting of prostate MRI quality.Our education exhibit has 3 teaching points:1) PI-RADS technical requirements for good quality prostate MRI; 2) Application of the PI-QUAL score; 3) Pictorial review of images from different vendors and magnets and quiz.

TABLE OF CONTENTS/OUTLINE

All those involved in the acquisition and interpretation of prostate MRI (radiologists, MR physicists and radiographers) should be aware of the PI-RADS technical recommendations and could benefit from a learning module on the PI-QUAL score. We will: 1) discuss the technical requirements (e.g., FOV, in-plane resolution, b values, etc) for a good quality prostate MR scan for each sequence, as outlined in the PI-RADS document; 2) discuss the PI-QUAL score and its ambition to standardize image quality both at a center level (i.e., up-to-date MR scanners and dedicated radiologists/radiographers highly experienced in prostate MRI) and at a

patient level (i.e., patient-related artefacts such as rectal air/stools or movement should be minimized with prior preparation); 3) present a set of images of adequate and suboptimal image quality (ranging from PI-QUAL 1 to PI-QUAL 5) to stress the importance of reducing practice variability in prostate MRI; 4) discuss the current limitations of PI-QUAL and what should be addressed in the next version.

GUEE-25 Beyond Prostatic Adenocarcinoma - Confusing MRI Findings and How to Recognize Them

Participants
Camila Reifegerste, MD, Curitiba, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Review normal prostate anatomy and possible neoplasm mimickers. Review benign conditions of the prostate that may mimick neoplasia. Review some rare histological subtypes of prostate neoplasia. To propose a systematic approach of the prostate MRI that allows differentiating findings suggestive of clinically significant neoplasia from the more common pitfalls.

TABLE OF CONTENTS/OUTLINE

Prostate cancer is the most common neoplasm in American men and the second leading cause of cancer death in this population. Its diagnosis is based on rectal examination, elevated prostate specific antigen (PSA), ultrasound-guided prostate biopsy and magnetic resonance imaging (MRI), which has become an important tool in detection of possible neoplasms, risk stratification and follow-up, thanks to the standardization of examination protocols and their interpretation with the development of the Prostate Imaging-Reporting and Data System (PI-RADS). Since prostate MRI is becoming more relevant in clinical decision making, it is important that the radiologist be familiar with pitfalls in its interpretation, whether they are normal anatomical structures, benign prostate changes, or even rare malignant neoplasms, different from traditional adenocarcinoma. That’s why we propose a review of challenging cases, in order to discuss some of these pitfalls.

GUEE-26 V Steps to Assess VI-RADS

Participants
Vivianne Reis Guimaraes, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Practice guide for radiologists, identify five steps in the process to create a systematic approach to report bladder MRI findings as well as define the risk of muscle invasion.2. Provide radiologists an overview of Vesical Imaging-Reporting and Data System (VI-RADS) that indicates the possibility of detrusor muscle invasion by bladder cancer through the five-point scoring system.3. Discuss resources for radiologists to improve diagnostic performance through VI-RADS.

TABLE OF CONTENTS/OUTLINE

Step 1: Bladder wall anatomy and appearance of the muscularis propria on MRI.Step 2: Staging and how to subdivide bladder cancer into with and without muscle invasion.Step 3: Technical considerations about MR equipment and protocol.Step 4: Scoring tumors using appearances in T2W images, DWI and DCE to create an overall risk of muscle invasion score.Step 5: Final VI-RADS score and likelihood of muscle invasion.

GUEE-27 Gender Affirming Genitourinary Surgeries - What Surgeons Do and What We Need to Know

Participants
Susana Fernandez, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

Define the concept of gender incongruence and transgender.Learn different types of genitourinary procedures employed for gender affirming surgery.Review imaging modalities used to evaluate surgical changes and complications.Show different cases presented at our institution.

TABLE OF CONTENTS/OUTLINE

Gender incongruence is defined as a discrepancy between gender identity and the assigned sex. Those individuals in whom gender incongruence exists are referred to as transgender. The gender affirming therapy involves multidisciplinary care that can improve quality of life of transgender people. Genital reconstruction surgery includes vaginoplasty, phalloplasty and metoidioplasty. Radiology department plays an important role in this process. We have reviewed affirming surgeries performed at our institution in the last 10 years.78 patients have undergone this process, 67 transwomen and 11 transmen. Surgical procedures performed were: 67 vaginoplasty, 6 phalloplasties (using most often anterolateral flaps) and 5 metoidioplasties. These surgeries and normal surgical changes will be explained and reviewed. Frequent complications such as fistulas (5), leaks (1) and stenosis (4) which are recurrent in some patients, will be exposed. Retrograde urethrocystography and cystourethrography are the methods of choice for postoperative assessment, allowing the diagnosis of most common complications. TC, RM or enema are other imaging techniques that may be necessary. They will be illustrated with different imaging techniques and images of different surgeries.

GUEE-28 Expect the Unexpected - Postoperative and Postintervention Imaging of the GU Tract

Participants
Janelle West, MD, Pelham, AL (*Presenter*) Nothing to Disclose

TEACHING POINTS

- To understand expected appearance of genitourinary structures after common and uncommon surgeries and interventions- To illustrate acute and chronic complications of genitourinary organs following intervention and/or surgery-To briefly discuss potential treatment of complications secondary to genitourinary interventions

TABLE OF CONTENTS/OUTLINE

? Introduction? Renal: Expected appearance post ablation, Expected appearance post partial nephrectomy, Postablation renal infarct, Postablation residual/recurrent tumor, Postablation bleeding, Postablation organ injury/fistula, Post partial nephrectomy pseudoaneurysm? Ureter: Postsurgical stricture, Postsurgical leak/urinoma? Bladder: Expected appearance of augmented urinary

bladder/neobladder/ileal conduit/Indiana pouch, Augmented bladder rupture, Ileal conduit leak/rupture, Recurrent tumor in ileal conduit, Bladder neck leak status post prostatectomy? Urethra: Expected appearance post urethroplasty, Expected appearance status post transurethral resection of the prostate, Urethral leak status post urethroplasty, Urethral leak status post diverticulectomy, Recurrent urethral stricture status post TURP and brachytherapy, Urethrocutaneous fistula? Male GU: Expected appearance of penile prosthesis and artificial urinary sphincter, Postintervention arteriovenous fistula, Malfunctioning artificial urinary sphincter, Malpositioned penile prosthesis, Recurrent penile cancer status post penectomy, Puboprostatic fistula status post brachytherapy/pelvic radiation? Female GU: Post DC uterine AVF (and subsequent embolization), Recurrent GYN malignancy, Retained products of conception

GUEE-29 Imaging Findings Following Renal Tumor Treatment

Participants
Leonardo Kenji Mitsutake, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is to:- Brief review renal cancer epidemiology and the main societies management guidelines.- Describe CT and MRI renal mass protocols.- Describe and illustrate the main initial and late imaging findings after renal tumor treatment.- Discuss the most frequent complications following renal tumor treatment.

TABLE OF CONTENTS/OUTLINE

1. Introduction:- Renal cancer epidemiology.- Society guidelines (AUA and EUA) for renal cancer management.- Overview the approach for renal cancer treatment (systemic treatment, radical and partial nephrectomy, ablation treatment). 2. Diagnostic Imaging evaluation:- CT and MRI renal mass protocols. 3. Imaging findings after renal tumor treatment:- Procedure complications.- Initial and late expected post-treatment imaging features.- Features of tumor recurrence. 4. Take home messages.

GUEE-3 "Mesh Mash"- Multimodality Imaging of Pelvic Floor Repair

Awards
Cum Laude
Identified for RadioGraphics

Participants
Kanupriya Vijay, MBBS, MD, Jacksonville, FL (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review the expected postsurgical appearances after surgical and non-surgical repair of pelvic floor/urethral dysfunction. 2. Ultrasound is superior to MRI for assessing synthetic slings in suburethral space and evaluate for complications such as urethral erosion and vaginal exposure. 3. Ultrasound can accurately demonstrate the distribution of injected bulking agent, and determine the need and location for reinjection; as well as migrated bulking agent. 4. Radiologists play an important role in the detection of normal and abnormal appearances of postsurgical pelvic floor repair, and guide for future intervention.

TABLE OF CONTENTS/OUTLINE

1. Introduction: a. Briefly review pelvic floor dysfunction and various surgical and nonsurgical treatment options 2. Discuss imaging techniques and protocol: a. Ultrasound b. MRI 3. Case based review of various treatment options: a. Normal imaging appearances b. Complications: i. Misplacement ii. Urethral erosion iii. Vaginal exposure iv. Infection

GUEE-30 Ups and Downs in the Andes: Soft Tissue Sarcomas of the Genitourinary Tract with Radiologic-pathologic Correlation

Awards
Certificate of Merit
Identified for RadioGraphics

Participants
Jorge Huayanay, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Soft tissue sarcomas of the genitourinary tract are uncommon, constituting less than 2% of all soft tissue sarcomas. This presentation will Illustrate imaging features of these rare soft tissue sarcomas of the genitourinary tract. 2. The exhibit will review the spectrum of histopathologic correlations. 3. This review will emphasize diagnostic difficulties, potential imaging pitfalls and differential diagnoses of these entities.

TABLE OF CONTENTS/OUTLINE

The goals of this exhibit are to: Provide a pictorial review of the diverse imaging appearances of the soft tissue sarcomas of the genitourinary tract. Discuss specific imaging and pathological characteristics of the soft tissue sarcomas of the genitourinary tract. Familiarize the audience with the imaging features of the soft tissue sarcomas of the genitourinary tract, thereby helping in formulation of a complete differential diagnosis. These major featured entities include: • Renal leiomyosarcoma • Perirenal and pararenal liposarcoma • Vesical rhabdomyosarcoma • Prostate sarcomas • Paratesticular liposarcoma • Penile sarcoma • Uterine rhabdomyosarcoma • Uterine endometrial stromal sarcoma • Uterine adenosarcoma

GUEE-31 MR Imaging of the Penis - What a Radiologist Needs to Know

Awards
Certificate of Merit

Participants
Pankaj Nepal, MD, Bridgeport, CT (*Presenter*) Nothing to Disclose

TEACHING POINTS

To emphasize role of MRI in the evaluation of penile pathologies To illustrate normal MR anatomy of the penis, and its importance on
